Christian Science is a way of life for most believers, whether in the church or outside it. It determines to a very considerable degree not only their ultimate aims, but also their day-to-day behaviour in many respects. Christian Science is relatively puritan in its sumptuary practices. It attempts through appropriate disciplines to develop in its members a serenity that is much needed in the modern age. It encourages an optimistic outlook on life favourable to the best functioning of the total organism, which is increasingly recognized by the medical profession as a psychosomatic whole, in which the mental or spiritual as well as the physical is seen as a highly determinative factor in healthful living. Finally, it leads to a dependence upon Christian Science principles of healing, many believers in this respect going far beyond the teachings of the founder herself (who specifically described emergency instances in which temporary medical, surgical or dental aid was permissible) in refusing any help at all from materia medica.

CHRISTIANSEN, SIGURD WESLEY (1891–1947), Norwegian novelist and playwright whose work is distinguished by its penetrating study of character and sense of Christian values, was born at Drammen, Nov. 17, 1891. His first book was *Seieren* (1915); *Vort eget liv* (1918) and *Ved Golgata* (1920) showed increasing maturity. His trilogy *Indgangen, Sverdene* and *Riket* (1925–29), a family epic, shows remarkable grasp of plot and structure, and *To levende og en dod* (1931; Eng. trans., *Two Living and One Dead,* 1932) is a psychological detective story. His trilogy consisting of *Drömmen og livet* (1935), *Det ensomme hjerte* (1938) and *Menneskenes lodd* (1945), which explores the conflicts of the creative mind, is generally considered his greatest work. Of his plays the best is *En reise i natten* (1931). Christiansen's writing is inspired by moral passion and treats of the problems of guilt and atonement. He died at Drammen, Oct. 23, 1947. (G. RN.)

CHRISTIAN SOCIALISM is a term that has been used to denote a wide variety of social doctrines and movements that have attempted to give a basic, structural application to the social principles of Christianity. In the 19th century the term socialism in this context was employed in a loose sense, denoting, in opposition to laissez-faire individualism, a Christian demand for some form of political or economic action in the interest of all the people. Christian socialists usually did not demand the common ownership and control of the means of production and exchange. Roman Catholic Christian socialism, for example, promoted certain reforms to improve social relations, but its ultimate aim, in accord with papal encyclicals. was the establishment of a neofeudal corporative system, an order quite different from what is usually called socialism. In the 20th century, Christian social and industrial reform movements have been more and more referred to as the Christian social, the Protestant social or the Catholic social movement. The term Christian socialism tends to be reserved for those movements which attempt to combine the fundamental aims of socialism with the religious and ethical con-

victions of Christianity. It is this sort of Christian socialism that is mainly dealt with here.

Christian Socialism in England. — Although anticipations of Christian socialism are to be found in early Christian "communism of love" and in the radical sects of the middle ages, of the "left wing" of the Reformation and of the 17th century (*e.g.*, the Diggers in England), the term Christian socialism was first appropriated by the broad churchmen J. F. D. Maurice, Charles Kingsley (the novelist), J. M. Ludlow and others, who entered on public propaganda immediately after the collapse of the Chartist uprising of 1848. Their general purpose was to vindicate for "the Kingdom of Christ" its "true authority over the realms of industry and trade," and "for socialism its true character as the great Christian revolution of the 19th century." Four years after Karl Marx characterized religion as "opiate for the people," Kingsley (probably unaware of Marx's phrase) asserted that the Bible had been wrongly used as "an opium-dose for keeping beasts of burden patient nhile they were being overloaded" and as a "mere book to keep the poor in order" (in *Politics for the People*, 1848). Greatly stirred by the sufferings of the poor, the group vigorously criticized socially conservative Christianity and laissez-faire industrialism, extoling "the Bible principles" of self-sacrifice and co-operation as against self-interest and competition.

Reviving the co-operative movement, they favoured copartnership and profit sharing in industry; they organized the Council for Promoting Working Men's Associations. which gave rise to or encouraged producers' and consumers' co-operatives; they aided in securing the enactment in 1852 of the Industrial and Provident Partnerships bill, the Magna Carta of the modern co-operative movement; and they instituted workers' education by founding the Working Men's college in London (1854). The movement as such continued for only a decade.

In 1877 Stewart Headlam founded the (Anglo-Catholic) Guild of St. Matthew, which espoused a composite of doctrines drann from Maurice, from Tractarianism and from Fabian socialism. Somewhat similar if less definitely socialistic ideas gained influence after the turn of the century through the support of certain high churchmen who founded the Christian Social union (1889).

Subsequent to Headlam's effort numerous Christian socialist organizations were formed, both in the established church and among the free churches. Prominent among these were the interdenominational Christian Socialist league, originating in the early 1880s, the labour churches (organized in 1891) and the (Anglican) Church Socialist league (founded in 1906), which emanated from the industrial north of England and brought the churches closer to labour and socialist movements. Following internal dissension the Church Socialist league was succeeded in 1923 by the League of the Kingdom of God. which called for a generically Catholic Christian sociology looking toward the establishment of a neomedieval social system. The (official Anglican) Industrial Christian fellowship, founded in 1919, was of a mediating character.

The later (predominantly Free Church) Socialist Christian league and the (Anglo-Catholic) Order of the Church Militant made explicit demand for the communal control of the means of life and regarded socialism as the economic expression of Christianity. The Malvern declaration of 1941, drawn up by Anglicans under the leadership of Archbishop William Temple, was considered to be left wing in character, but it was criticized for its "vagueness" by the Council of Clergy and Ministers for Common Ownership (founded in 1942). More sympathetic to Marxist philosophy was the (Free Church) Christian Left, which, under the leadership of John Macmurray, flourished in the 1930s and which viewed it to be "the religious mission of the working class to achieve Socialism."

Christian Socialism on the Continent. — The precursors of this movement on the continent are dealt with in SOCIALISM. Roman Catholic Christian socialism (now called the Catholic social movement) was the first of its kind on the continent, but it was not socialistic except in the sense of a clerical socialism.

In France the Protestant Association for the Practical Study of Social Questions (founded in 1888) was mainly concerned with the need for social reform. T. Fallot, one of its principal founders, opposed bourgeois, individualistic Protestantism and strove for a Protestant socialism that would achieve liberty through co-operation and through resisting an "artificial and deadly" equalitarian socialism.

Until World War I, Protestant left-wing views were for the most part mildly social-reformist in character. In the 20th century Protestant socialists found their most effective mediums of expression in the periodical *Le Christianisme Social* (founded in 1877). edited by Élie Gounelle, and in the Fédération du Christianisme Social. In this group one of the most influential Christian socialists of the second quarter of the century was André Philip, an economist, a prolific writer on Christianity and socialism and a leader in labour and government circles.

Outstanding among German Protestant Christian socialists in the 19th century were Rudolf Todt, Adolf Stöcker (who deviated into anti-Semitism), Friedrich Naumann and J. C. Blumhardt. The state socialists Todt and Stocker (anti-Marxist and in the throne and altar tradition) were. like the Catholic groups, opposed by the Social Democrats. Naumann took a more democratic attitude toward the worker and also believed it desirable for churchmen to co-operate with a revisionist social democracy. A still more favourable attitude toward social democracy mas adopted by Blumhardt, who held that the Kingdom of God can be hindered by the churches and can be advanced by seemingly anti-Christian secular movements; indeed, he joined the Social Democratic party.

In the early part of the 20th century Hermann Kutter, "the Zurich Savonarola," held that the Social Democrats were revolutionary because God is; God's Kingdom must go forward in a revolutionary way despite, and even because of, the sluggishness of the churches. Leonhard Ragaz of Zurich, who looked forward to a socialist society organized in freedom and love, was the connecting link with post-World War I movements in Switzerland and Germany. Christian socialism now assumed a great variety of forms. Some Christian socialists (1) held that socialism is the logical consequence of Christianity; (2) others made socialism into a religion; (3) others tried to bring about understanding and interpenetration between the churches and the organized socialist proletariat; and (4) still others tried to uncover the roots of both Christianity and Marxist socialism toward the end of understanding more critically the affinities and the needed correctives. Representative of the third type was the League of Religious Socialists of south Germany, which included both Protestants and Catholics in its membership. Philosophically and theologically the most important and fruitful was the (Berlin) Kairos circle, which belonged to the fourth type mentioned and which for the decade preceding the Nazi revolution was under the leadership of the theologian Paul Tillich and the economist Eduard Heimann. After 1933 Tillich and Heimann went to the U.S., where this type of religious socialism exercised an influence. Tillich's writings appeared in translation in countries of the orient as well as of the occident. After World War II Protestant socialists in Germany came together in the Gemeinschaft für Christentum und Sozialismus, Bund der Religiosen Sozialisten, which in the 1950s began the publication of the magazine *Christ und Sozialist*.

Movements similar to the above-mentioned types have appeared also in other European countries; they were especially successful in the Scandinavian countries. Of intellectual significance in the 1930s and 1940s was the religious-socialist "personalist" philosophy of the one-time Marxist, theosophical Russian Orthodox writer Nikolai Berdyaev, whose antecedents appear in the writings of 19th-century Russian lay theologians such as Fëdor Dostoievski and Leo Tolstoi. In the 1950s certain French Roman Catholics. including the "worker-priests," promoted a sympathetic interpretation of Marxism. Typical of a vigorous and discriminating concern for Marx's social analysis was the influential volume *La Pensée de Karl Marx* (1956) *by* the French Jesuit Jean Yves Calvez.

Developments in America. — As the result of the absence of an archaic period in the history of the U.S., neofeudal and

patriarchal forms of Christian socialism have played a small role; Puritan activism, the Enlightenment and radical democratic tendencies have been more in evidence. Although ethical rationalism and deism exercised considerable influence in 18th-century religion and politics. although semiutopian Fourierist communities were established in the 1840s and 1850s and although progressive social concerns during this period found strong advocates in the Unitarians W. E. Channing, Joseph Tuckerman and Theodore Parker, a social Christianity was not widely expounded until after the Civil War.

Social Christianity's outstanding leaders down to the 1930s were R. H. Newton (an Episcopalian), Washington Gladden, Josiah Strong, G. D. Herron (Congregationalists), Shailer Mathews (a Baptist), Bishop Francis J. McConnell (a Methodist) and F. G. Peabody and J. H. Holmes (Unitarians). Of these men only Herron and Holmes were socialists.

As early as 1849 Henry James. Sr., had argued the identity of the aims of Christianity and socialism. Largely under the leadership of W. D. P. Bliss, an Episcopalian who had been a member of the Knights of Labor, the Society of Christian Socialists was organized in 1889. Vigorously criticizing economic individualism and its ruinous progeny of plutocracy, industrial crises and wage slavery. the society attempted to show that "the aim of socialism is embraced in the aim of Christianity."

In the first quarter of the 20th century numerous Christian socialist or quasi-socialist groups were formed, as, for example, the nondenominational Christian Socialist fellowship (1906), the (pacifist) Fellowship of Reconciliation (started in England in 1914 and extended to the U.S. in 1915). the (Episcopalian) Christian Socialist league (1911–19), followed by the Church League for Industrial Democracy.

This period was the heyday of the Social Gospel movement, which, in the spirit of evolutionism and evangelical humanitarianism, interpreted the Kingdom of God as requiring social as well as individual salvation. Its most influential exponent was Walter Rauschenbusch (a Baptist), who demanded "a new order that would rest on the Christian principles of equal rights and democratic distribution of economic power." He distinguished sharply between the ultimate presuppositions of Christian socialism and those of secular socialism. Influences from this movement extended to Japan (*e.g.,* through T. Kagawa), China, South America and India.

Following World War I Marxist doctrine and also radically democratic doctrine began to play a larger role. Harry F. Ward (a Methodist) and his disciples mere moving toward a Christian Marxism which showed a marked sympathy with Russian communism. In the 1930s and 1940s a neo-Marxist and theologically neo-orthodox Christian socialism gained wide attention under the leadership of Reinhold Niebuhr (an Evangelical); attacking the "utopian naturalism" of Marxism and the overoptimism of the "liberal" Social Gospel, the nondenominational Fellowship of Socialist Christians, founded in 1932, undertook a "Christian espousal of socialism" as the logical next step in a technical society; and the group published a magazine, *Christianity and Society.*

The National Religion and Labor foundation (1932 *et seq.*), the Fellowship of Southern Churchmen (1934 *et seq.*) and the (Canadian) Fellowship for a Christian Social Order (1934 *et seq.)* advocated similar economic policies, as did the United Christian Council for Democracy (1936 *et seq.)* which provided a means of common action for the left-wing organizations of six liberal Protestant denominations.

Beginning in 1939 *The Protestant Digest,* later named *The Protestant,* a journal edited by Kenneth Leslie (a Baptist), served as a medium of expression for Christian, Jewish and secular left-wing and neo-Xarxist viewpoints. The Highlander Folk school (Monteagle. Tenn., 1932 *et seq.)* espoused a Christian socialist gospel, co-operatives, unionism and adult education among rural and industrial workers. In most of these groups the promotion of social planning or of the welfare state tended to replace gradualist socialism as the remedy proposed for the ills of capitalism.

Although it has not been markedly successful in attracting the alienated working classes to the churches! Christian socialism has done much to stimulate churchmen to give a radical social application to Christian ethics in an industrial society.

CHRISTIE, SIR WILLIAM HENRY MAHONEY (1845–1922), eighth astronomer royal, greatly increased the scope of the royal observatory. He was born at Woolwich, London. on Oct. 1, 1845. Educated at King's college, London, and Trinity college, Cambridge, he was appointed chief assistant at the royal observatory, Greenwich, in 1870 and astronomer royal in 1881. Christie introduced the then new fields of photography and spectroscopy into the work of the royal observatory, without slighting the "fundamental" astronomy which had been traditional at Greenwich since its foundation in 1675, and for this purpose he increased the instrumentation of the observatory to include a 28-in. visual refractor, a 26-in. photographic refractor and a 30-in. reflector. An equatorial was presented by the surgeon Sir Henry Thompson, and new buildings were erected (1890–97) for the library and workshop, and for the increased staff. Christie founded the *Observatory Magazine* in 1877. He made several expeditions to observe eclipses of the sun and obtained important photographs at the eclipses of 1898, 1900 and 1905. President of the Royal Astronomical society from 1890 to 1892, Christie was created commander of the Bath in 1897 and promoted knight commander of the Bath in 1904. He attended many international astronomical conferences. He died at sea, near Gibraltar, on Jan. 22. 1922. (O. J. E.)

CHRISTINA, queens of Spain: see MARIA CRISTINA.

CHRISTINA (1626–1689), queen of Sweden from 1644 to 1654, daughter of Gustavus II Adolphus and Maria Eleonora of Brandenburg, was born in Stockholm on Dec. 8, 1626. After her father died in battle Christina, the only heir, became queen-elect at the age of six. By his orders she was educated as a prince, with the learned Johannes Matthiae as her tutor, while five regents headed by the chancellor Axel Oxenstierna (*q.v.*) governed the country. Her brilliance and strong will were evident even in her childhood. Oxenstierna himself instructed her in politics and first admitted her to council meetings when she was 14.

When Christina attained majority and became queen in 1644, she opposed Oxenstierna and there was constant friction between them thereafter, particularly concerning the war in Germany, later known as the Thirty Years' War. In spite of his opposition, she was a prime mover, with the aid of Adler Salvius, one of Sweden's delegates at the peace congress, in gaining the peace of Westphalia and ending the war. An assiduous politician, Christina kept the bitter class rivalries that broke out after the war from lapsing into civil war, but was unable to solve the desperate financial problems caused by the long years of fighting. In the end, she had to recall Oxenstierna. Her passion was culture and learning. She rose at five in the morning to read, and she invited eminent foreign writers, musicians and scholars to her court. One of them was Descartes, who taught her philosophy and who died in Stockholm (1650). For her wit and learning all Europe called her the Minerva of the North; but she was extravagant, too free in giving away crown lands and intent on a luxurious court in a country that could not support it and did not want it. Her reign was nevertheless beneficent: it saw the first Swedish newspaper (1645) and the first country-wide school ordinance; science and literature were encouraged, and new privileges were given to the towns; trade, manufactures and mining also made great strides.

Christina's abdication after ten years of rule shocked and confused the Christian world. She pleaded that she was ill and that the burden of ruling was too heavy for a woman. The real reasons were her aversion to marriage and her secret conversion to Roman Catholicism, which was forbidden in Sweden. As her successor she chose her cousin, Charles X Gustavus, who was crowned on June 6. 1654, the day of her abdication. Christina left Sweden immediately.

At the end of Dec. 1655 Pope Alexander VII received Christina in splendour at Rome. However, he was soon disillusioned with his famous convert, who opposed public displays of piety. Although she was far from beautiful (short and pock-marked. with a humped right shoulder). Christina by her manners and personality created a sensation in Rome. Missing the activity of ruling, she entered into negotiations with the French chief minister, Cardinal Mazarin, and with the duke of Modena to seize Naples (then under the Spanish crown), intending to become queen of Naples and to leave the throne to a French prince at her death. This scheme collapsed in 1657 during a visit by Christina to France. When staying at Fontainebleau, she ordered the summary execution of her equerry, the marchese Gian Riccardo Monaldeschi, alleging that he had betrayed her plans to the Holy See. Her refusal to give reasons for this action, beyond insisting on her royal authority, shocked the French court, nor did the pope welcome her return to Rome.

In spite of this scandal Christina lived to become one of the most influential figures of her time, the friend of four popes and a magnificent patroness of the arts. Always extravagant, she had financial difficulties most of her life: the revenues due from Sweden came slowly or not at all. She visited Sweden in 1660 and in 1667. On the second journey, while staying in Hamburg, she had Pope Clement IX's support in an attempt to gain another crown, that of her second-cousin John Casimir, who had abdicated the throne of Poland; but her failure seemed to please her since she could return to her beloved Rome. There she had formed a strong friendship with Decio Cardinal Azzolino, a clever, charming, prudent man, 'leader of the group of cardinals called the *squadrone volante* and active in church politics. It was generally believed in Rome that he mas her lover, a view sustained by her letters which were decoded in the 20th century. With him, she, too, became active in church politics, insisting for years on the pursuance of the Christian war against the Turks. Pope Innocent XI, who pushed this war to its victorious conclusion, stopped her pension at her o n urgent request, in order to add it to the war treasury. In 1681, having secured a trustworthy administrator for her lands in Sweden, Christina at last became financially secure.

Christina's extraordinary taste in the arts has influenced European culture since her time. Her palace, the Riario, now the Corsini, on the Lungara, contained the greatest collection of Venetian paintings ever assembled as well as other notable paintings, sculpture and medallions. There forgathered men of letters and musicians. The Arcadia academy, which she founded for philosophy and literature. still exists in Rome. It was at her instigation that the first public opera house in Rome was opened, the Tordinona, and it was she who recognized the genius of and sponsored Alessandro Scarlatti, who became her choirmaster, and Arcangelo Corelli, who directed her orchestra. Bernini, her friend, considered her his saviour when she commissioned Baldinucci to write his biography while he was being discredited in 1680. Her enormous collection of books and manuscripts is now in the Vatican library. She was renowned, too, for her militant protection of personal freedoms, for her charities and as protectress of the Jews in Rome.

Christina died in the Riario palace on April 19, 1689. She made Cardinal Azzolino her heir, but he followed her in death two months later. Her tomb is in St. Peter's in Rome. A selection of Christina's letters and an edition of *pensées* by her were both published in 1907.

CHRISTINE DE PISAN (1364–c. 1430). French writer of Italian descent, who wrote many poems—of uneven quality—in the courtly love tradition, was born in Venice in 1364. Her father, who was from a small town near Bologna, entered the service of the French king, Charles V, and his family followed him to Paris in 1368. After spending a pleasant yet studious childhood at the French court, Christine at 15 married Étienne du Castel, who became a secretary in the royal household. When the king died in 1380, her father lost his office; he died some time later. Her husband died in 1389. Finding she had to support herself and her three young children, Christine turned to a literary career. She wrote her first *ballades* in memory of her husband, and, as these poems met with success, she persevered. Her collections of *ballades (Cent Balades, Balades de divers propos* and *Cent Balades d'amans et de dames), rondeaux, lais* and *complaintes,* in which she expresses her feelings with grace and sincerity, were followed by numerous works unfortunately marred by an excessive display of learning and too much allegory. Her patrons included Louis d'Orléans, the duc de Berry, Philip the Bold, and Queen Isabella of Bavaria; and, in England, the earl of Salisbury, who had her son Jean du Castel sent over from France and brought him up as his own son.

Among her works in verse, mention should be made of her *Débat des deux amans,* the *Dit des trois jugemens amoureux,* the *Dit de la pastoure,* the *Dit de Poissy* and the *Bpistre d'Othéa à Hector,* all on the themes of courtly love. The *Épistre du dieu d'amours* (1399) and the *Dit de la Rose* (1401) defend women against the satire of Jean de Meun in the *Roman de la Rose.* The *Chemin de long estude* (1402), a work of greater range, tells, in over 6,000 lines, the story of an imaginary journey to the firmament where Dame Raison is found proclaiming that only a king who is wise, good and just could remedy the evils of mankind. The *Mutacion de fortune* (1403), the longest of her rhymed works (24.000 lines), is essentially a compilation 'in which mythology, ancient history and contemporary events are to be found side by side, but it begins with an interesting autobiography.

Having become famous, Christine was asked by Philip, duke of Burgundy, the regent, to write the life of the deceased king. She did so in her *Livre des fais et bonnes moeurs du sage roy Charles V* (1404; critical ed. by S. Solente, 2 vol., 1936–40). Other prose works followed: the *Citk des dames* (1405), in which Christine gathers from all over the world women whose heroism and virtue have made them famous; the *Livre des trois vertus* (1406), a collection of moral lessons for the instruction of women in the various spheres of society; and the *Avision Christine* (1405; critical ed. by M. L. Towner, 1932) in which she told the story of her life, as a reply to her detractors, in a strange allegorical manner.

Grieving over the evils of France—the civil war between the Armagnac and Burgundian factions, the madness of the king, the rebellion of the Cabochiens and the English occupation—Christine dedicated her *Lamentation* (1410) to the queen, and in the *Livre de la paix* (1413) she urged harmony between the men of her country. After the defeat at Agincourt and the death of the duc de Berry, to comfort whose daughter she composed a short treatise entitled *Épistre de prison de vie humaine,* she retired in 1418 to a convent, probably at Passy (now part of Paris), where she wrote a *Mkditation sur la passion.* In 1426 the death of her elder son Jean du Castel came as a new blow to her. In 1429 she made herself heard for the last time in a joyful lyrical outburst inspired by Joan of Arc's early victories. She must have died soon after, but nothing is known of the actual circumstances of her death.

BIBLIOGRAPHY.—Her many works have not yet been published in their entirety. Modern editions include *Oeuvres poétiques,* ed. by M Roy, 3 vol. (1886–96; incomplete); *Le Chemin de Long estude,* ed. by R. Püschel (1881; 2nd ed., 1887); *Épistre de prison de vie humaine,* ed. by S. Solente in *Bibliothèque de l'École des Chartes,* vol.

lxxxv (1924); *Dittié sur Jeanne d'Arc* in J. E. J. Quicherat. *Procès de Jeanne d'Arc* (1841–49), vol. v. Critical studies: *see* M. Pinet, *Christine de Pisan, ktude biographique et littéraire* (1927), which supersedes previous biographical studies. (L.-F. F.)

CHRISTISON, SIR ROBERT, BART. (1797–1882), Scottish toxicologist, physician and foremost authority of his time on legal medicine, was born in Edinburgh on July 18, 1797. He studied in London under John Abernethy and Sir William Lawrence, and in Paris under Pierre J. Robiquet and M. J. B. Orfila. In 1822 he became professor of medical jurisprudence at Edinburgh. In 1829 his Treatise on Poisons was published, and he became medical officer to the crown in Scotland, and from that time until 1866 he was called as a witness in many celebrated criminal cases, notably in the case of William Burke and William Hare (1829). Instructions drawn up by him for the examination of corpses for legal purposes became the accepted guide for the purpose. He may be said to have placed legal jurisprudence on a scientific basis. In 1832 he gave up the chair of medical jurisprudence for that of medicine and therapeutics, which he held until 1877. His work on the pathology of the kidneys and on fevers brought him many honours, including a baronetcy in 1871. Christison died at Edinburgh on Jan. 23, 1882.

See *The Life of Sir Robert Christison* (1885–86), edited by his sons, which contains his autobiography, with chapters on his work.

CHRISTMAS, on Dec. 25, the Feast of the Nativity of Our Lord, commemorating the birth of Jesus Christ, is the most popular commemoration of the church year. Its observance as the birthday of the Saviour is attended with secular customs often drawn from pagan sources; indeed, both Christmas and Epiphany, which falls 12 days later on Jan. 6, are transformed pagan celebrations of the winter solstice, and so closely linked that their origins cannot be discussed separately.

Christmas on Dec. 25 is first known to have been celebrated in Rome in the second quarter of the 4th century, when it commemorated the birth of Christ; there was as yet no Epiphany. In the eastern part of the empire a festival on Jan. 6 commemorated the manifestation (Gr. *epiphaneia*) of God in both the birth and the baptism of Jesus (in Jerusalem, however, only the birth was remembered), and there was as yet no Christmas. In the course of the 4th century the celebration on Dec. 25 was adopted in the east (except in Jerusalem), and became the day when the birth was commemorated, Jan. 6 retaining its connection with the baptism. In the west the process worked out differently: Epiphany became a kind of doublet of Christmas, commemorating the visit of the Magi to the infant Christ, the baptism being relegated to a mere mention in the octave (the eighth day after the feast).

December 25 in Rome.—This was the date of a pagan festival in Rome, chosen in A.D. 274 by the emperor Aurelian as the birthday of the unconquered sun (*natalis solis invicti*), which at the winter solstice begins again to show an increase of light. At some point before A.D. 336 the church at Rome established the commemoration of the birthday of Christ, the sun of righteousness, on this same date. The evidence is contained in the chronography of A.D. 354 (an almanac for the use of Christians), which includes a Christian martyrology beginning with an entry for Dec. 25: "Christ born in Bethlehem of Judaea" (natus *Christus* in *Betleem Iudaea*). It is possible, however, to show from another part of this chronography that Christmas was celebrated in Rome at least as early as 336, and that it stood at the beginning of the church year.

January 6 in Egypt.—Clement of Alexandria (c. A.D. 200) reports that the followers of the Gnostic Basilides in Egypt celebrated the day of Christ's baptism on Jan. 10, though others said Jan. 6 was the correct date. In either case the date was thought to be the historical anniversary of the actual event. Clement does not give the name of this festival. The earliest reference to Jan. 6 as a festival of the church in Egypt, as opposed to a commemoration by Gnostics, comes from nearly two centuries later. Between 380 and 400 John Cassian made two visits to Egypt, where he noted that Epiphany was kept as the festival of both the birth and the baptism of Christ.

Introduction of Christmas in the Eastern Empire.—The first evidence for the celebration of Christmas as a separate festival in the eastern empire comes from the capital, Constantinople. In the year 380 Gregory of Nazianzus delivered his 38th oration on the festival of the Theophany, when Christ appeared to men and was born in the flesh. In 381 Gregory's 39th oration, on Epiphany, here called the festival of lights, commemorated the baptism of Christ, the true light. In this oration he speaks of Christmas as recently past and reminds his audience that at Christmas they followed the star, worshiped with the Magi, were bathed in light with the shepherds, glorified God with the angels, took Christ in their arms with Simeon and confessed him with Anna. Now, however, at Epiphany, there is another event and another mystery, the baptism.

If in Constantinople, as in contemporary Egypt, Epiphany up until Gregory's two sermons had been celebrated as a unitive festival of the nativity and the baptism, then the careful way he distinguishes the events accompanying the nativity remembered at Christmas from the baptism as the subject of Epiphany is most naturally explained. At all events it appears that Christmas and Epiphany had not been for long distinct, and the introduction of the former as the celebration of the nativity of the incarnate Son of God may well have been closely connected with the struggle against the Arians, who denied the divinity of Christ.

Christmas began to be celebrated at about the same time in Antioch as in Constantinople. In his Pentecost sermon in 386 St. John Chrysostom refers to three great festivals, Epiphany, Pascha and Pentecost, and gives the ground for celebrating each of them. At Epiphany. he says, "God 'appeared upon earth and lived among men' (Bar. iii, 37); since God the only-begotten Child of God was with us." It seems therefore that there was no Christmas, and Epiphany (as in nearby Jerusalem) may have meant the nativity. for there is no mention of the baptism. Later in the same year the situation seems to have changed, for in his sermon on the martyr Philogonius delivered on Dec. 20 Chrysostom looks forward to Christmas as the birthday of Christ and the festival from which all the others come. This sermon also refers to the visit of the Magi as commemorated at Christmas. Five days later, in his Christmas sermon, Chrysostom says that this day has been known among the Antiochenes for less than ten years, though it has been known longer in the west. It is clear that there was some opposition to the new date, as there was also to the name of the festival. In his sermon preached on Epiphany in 387 Chrysostom explains that the name Epiphany (manifestation) ought not to be applied to Christmas, as some held, but to the festival on Jan. 6, for Christ only became manifest to all at his baptism. It appears that the opposition to Christmas at Antioch was not lasting, for the so-called Apostolic Constitutions. which reflect conditions there at the end of the 4th century, speak of the Nativity on Dec. 25 and the Epiphany on Jan. 6.

The introduction of Christmas to other parts of the east can be passed over more quickly. Gregory of Nyssa (d. c. 396), preaching on the Epiphany as the festival of the baptism, says that the Nativity had been observed a few days previously. The separation of the nativity and the baptism into two different days in Egypt is first known in 432, when Paul of Emesa preached a Christmas sermon there. No doubt the Council of Ephesus in 431, with its insistence on the eternal divinity of the child born of Mary, had given an impetus to this celebration. In Jerusalem opposition to Christmas lasted long; it was not until the 6th century that the Nativity was finally detached from Jan. 6 and celebrated on Dec. 25. In the Armenian church Christmas is still not kept, the Nativity being observed on Jan. 6.

Religious Practices.—In the Eastern Church Christmas commemorates the birth of Christ, together with the visit of the shepherds, who were told the good news by an angel on the same day (cf. Luke ii, 11), and the adoration of the Magi, about the time of whose arrival no precise indication is given in the Bible (see Matt. ii, 1 ff.). In the Western Church the birth and the shepherds only are remembered, for the adoration of the Magi is attached to Epiphany. This usage goes back to 5th-century Rome but the evidence concerning it is obscure and scanty.

In the Roman Catholic Church three Masses are said on Christmas day, the first being at midnight and the second at dawn. Churches usually display a crib or creche with plaster or wooden figures of the Holy Family, the worshiping shepherds and the animals of the stable in which Christ was born. Such cribs are sometimes also set out by families in their homes at Christmas time.

Joy at the birth of the Saviour is popularly expressed at Christmas by the singing of carols (see CAROL). (X.)

Traditional Customs.—The traditional customs connected with Christmas have been derived from several sources as a result of the coincidence of the feast of the Nativity of Christ and the pagan agricultural and solar observances at midwinter. In the Roman world the Saturnalia (Dec. 17–24) was a time of merry-making and exchange of presents (see SATURN). But, though Christmas festivities were indirectly influenced by these customs, the fact that Christmas was celebrated on the birthday of the unconquered sun gave the season a solar background, connected with the kalends of January (Jan. 1. the Roman New Year) when houses were decorated with greenery and lights, and presents were given to children and the poor.

To these solstitial observances were added the Germano-Celtic yule rites when the Teutonic tribes penetrated into Gaul, Britain and central Europe. Yuletide brought its own tradition of feasting and mortuary customs, to combine with Roman solstitial and transitional New Year rites. Special food and good fellowship, the Yule log and Yule cakes, greenery and fir trees, wassailing, gifts and greetings, all commemorated different aspects of this festive season.

Fires and lights, the symbols of warmth and lasting life, have always been associated with the winter festival, in both pagan and Christian contexts. Evergreens, as symbols of survival, have a long association with Christmas festivities, probably dating from the 8th century when St. Boniface completed the Christianization of Germany and dedicated the fir tree to the Holy Child to replace the sacred oak of Odin. The belief that the holy thorn at Glastonbury, Eng., blooms on the old Christmas day (Jan. 6), having sprung according to legend from the staff of Joseph of Arimathea, is an example of a widespread belief that certain trees miraculously blossom or bend their branches downward at Christmas. At midnight cattle and horses are also said to turn to the east and kneel.

In the United States traditional Christmas customs were at first suppressed (as in England under the Commonwealth), because of the Puritan objection to them as pagan in origin, but since the middle of the 19th century the celebrations have become increasingly popular and commercialized. Christmas is traditionally regarded as the festival of the family and of children under the name of whose patron, St. Nicholas (*q.v.*), presents are given.

See ADVENT; EPIPHANY; CHURCH YEAR; see also references under "Christmas" in the Index volume. (E. O. J.)

CHRISTMASBERRY (Heteromeles arbutifolia), a handsome American tree or tall shrub of the rose family (Rosaceae, *q.v.*), usually called toyon and less often the California holly. It is native chiefly to the chaparral belt of the Sierra Nevada and coast ranges.

It grows up to 30 ft. high and bears oblong, pointed, evergreen leaves and numerous small, white flowers in large, terminal clusters. followed in late autumn by bright red, hollylike fruits. It is very popular for Christmas decoration, being sold in the Pacific coast cities in the same manner as holly in the eastern United States. It differs from the closely related Photinia in having 10 stamens instead of 20.

Attempts to grow this handsome plant have not been very successful in England, where it is hardy only in southern Surrey and southwestward. In the United States the plant is grown almost nowhere except on the Pacific coast and in Louisiana.

The Christmasberry tree, *Schinus* terebinthifolius, is the so-called Brazilian pepper tree. See PEPPER TREE. (N. TR.; X.)

CHRISTMAS CARD: see GREETING CARD.

CHRISTMAS ISLAND, the name of two islands, one in the central Pacific ocean and the other in the Indian ocean.

1. One of the Line Islands, central Pacific, 150 mi. N. of the equator in longitude 157° 30' W., Christmas Island is a low atoll whose shallow lagoon in the west has two entrances separated by Cook islet. The over-all area of about 220 sq.mi. also includes many brackish lakes. Discovered by Capt. James Cook on Christmas eve 1777, the island was annexed by Great Britain in 1888 and incorporated in the Gilbert and Ellice colony in 1919. The United States has disputed the British claim for over a century. There is no indigenous population but Gilbertese labour has been used on the coconut plantation. In 1956 and later years airfields and installations prepared by British service personnel stationed at "London" and "Paris" on either side of the lagoon entrance were used in connection with test nuclear explosions. (J. Gu.)

2. An isolated Australian dependency in the Indian ocean, 256 mi. S. of Java head, 575 mi. E.N.E. of the Cocos (Keeling) islands and about 900 mi. N.W. of the Australian coast. Pop. (1957) 2.619. Area about 62 sq.mi. The island is mainly a limestone plateau rising in the west to 1,170 ft. at Murray hill. It was discovered by the British mariner Richard Rowe in 1615; surveys made in 1886–87 disclosed formations of almost pure calcium phosphate and the island was annexed by Great Britain in 1888. In that year the first settlement was made by George Clunies Ross, whose son in 1897 obtained a concession to work the phosphate deposits. Incorporated in the settlement of Singapore in 1900, the island was transferred to Australian sovereignty in 1958. Most of the people are Malaysians or Chinese employed by the phosphate undertaking. (L. D. S.)

CHRISTMAS MØLLER, GUIDO LEO JOHN (1894–1948), Danish statesman and foreign minister in 1945, was born on April 3, 1894. In 1920 he became a Conservative member of the folketing. Energetic and determined, he soon became a leading member of his party and from 1932 was its chairman. Under him conservative policy became more active and independent and the party co-operated with the Social Democratic-Radical government in an attempt to modify the suffrage laws and alter the structure of parliament. When the measure was rejected in a referendum in 1939, Christmas Møller resigned as party chairman. After the German occupation of Denmark in April 1940, he entered the coalition government and, in July, became minister of commerce. A bold critic of the Germans, he was forced to withdraw from the government in Oct. 1940 and from the folketing in Jan. 1941. He soon became a leader of the Danish resistance and helped to found an underground newspaper. In May 1942 he fled to London where, as chairman of the Danish council, he tried to explain and justify developments in Denmark to the Allies, while actively backing the resistance movement. In May 1945 he became foreign minister in the first postwar government. He again became chairman of the Conservative party, but his insistence that Denmark's frontier with Germany should remain unchanged brought him into conflict with the party majority, and he resigned in Oct. 1947. He failed to secure re-election as an independent in the 1947 elections. He died on April 13, 1948.

CHRISTMAS ROSE: see HELLEBORE.

CHRISTODORUS (OF COPTOS in Egypt) (fl. c. A.D. 500) was primarily an epic poet, but his surviving works comprise two epigrams and a description in hexameters of 80 statues in the gymnasium of Zeuxippus at Constantinople which is regarded by some critics as a literary model for this genre. It forms the second book of the Palatine anthology (see ANTHOLOGY) and is also of some importance for the history of art.

According to the Suda lexicon he was also the author of *Patria,* accounts of the foundation of various cities such as Constantinople and Thessalonica; Lydiaka, the mythical history of Lydia;

Isaurika, the conquest of Isauria by Anastasius; three books of epigrams; and many other works no longer extant.

Litt.,* ii, pt. 2 (1913). For the epigrams with translation, *see* W. R. Paton (ed.), *Greek Anthology,* ii, bk. vii, 697, 698, "Loeb Series" (1925). (J. M. HY.)

CHRISTOPHE, HENRY (1767–1820), king of northern Haiti, was born a slave in the British West Indies and was a lieutenant of Toussaint l'Ouverture (*q.v.*) in the war for Haitian independence. When the French attempted to reconquer the colony Christophe surrendered in 1802, but later joined Jean Jacques Dessalines in ousting them and commanded the army under that ruler. After Dessalines' death. Christophe established a separate state in north Haiti, ruling as King Henry I after 1811. He promoted agriculture and trade by forcing the peasants to work under military rule, and built the famous citadel. After suffering a stroke in 1820, he shot himself on Oct. 8, 1820, and his kingdom became part of the Haitian republic. *See* HAITI: *History.*

(D. G. MO.)

CHRISTOPHER, SAINT (? 3rd century), patron of wayfarers, was martyred, according to tradition, under the emperor Decius *c.* A.D. 250. He is the hero of many later legends, which represent him as a giant who, after being converted, devoted his life to carrying travelers across a river. One day a small child asked to be taken across; but in the middle of the river the child became so heavy that Christopher staggered under the burden. "Had I borne the whole world on my back," he said, "it could not have weighed heavier than you." "Marvel not," was the reply, "for you have borne upon your back the world and Him who created it." Hence Christopher is generally represented in art carrying the Christ Child on his back. He is one of the 14 auxiliary saints, or holy helpers. His feast day is July 25 in the western church and May 9 in the Orthodox Church.

See C. Johnson, *St. Christopher* (1938). (H. C. G.)

CHRISTOPHER (CHRISTOPHORUS) (d. 904), antipope. This cardinal's name appears in many lists of the popes, but he is now regarded as having been an antipope. In 903 he drove Leo V from the papal chair, but in 904 was driven out in turn by the supporters of Bishop Sergius, who became Pope Sergius III. It is said that both Christopher and his victim Leo were strangled in prison. (D. AR.)

CHRISTOPHER OF BAVARIA (1416–1448), king of Denmark Norway and Sweden, was born in Feb. 1416, the son of John, count of the Upper Palatinate, and Catherine of Pomerania. In Oct. 1439 the Danish *rigsraad* invited him to take the crown as successor to the deposed Eric of Pomerania, his maternal uncle On April 9, 1440, he was proclaimed king of Denmark. The country soon settled into a period of peace, marred only by the Jutland peasant rising of 1441, which was quelled. In the same year Sweden accepted Christopher as king, and in 1442 Norway followed, thus confirming the Northern union and restoring peace throughout Scandinavia. In 1443 he was crowned in Ribe as Denmark's *archirex.* When he died, without issue, in Jan. 1448. the union once more fell apart. (A. E. CN.)

CHRISTUS, PETRUS (*c.* 1420–1472/73), Flemish painter, the closest of Jan van Eyck's followers, was born at Baerle in Brabant, in 1444 acquiring citizenship rights at Bruges, where he worked until his death. Following the example of Jan van Eyck, he added a date and signature, usually in the form "PETRUS XPI," to some of his pictures. These include "Edward Grymeston," 1446 (earl of Verulam's collection); "A Carthusian," 1446 (New York); "St. Eligius," 1449 (New York); "Virgin and Child," 1449 (Lugano); altar wings with "Annunciation," "Nativity" and "Last Judgment," 1452 (Berlin); and the "Virgin With SS. Jerome and Francis." probably 1457 (Frankfurt).

Among other pictures ascribed to him are two versions of the "Nativity" (Washington, D.C.; New York), three versions of the "Lamentation Over the Dead Christ" (Brussels; New York; Paris), the "Virgin With a Carthusian" (Berlin) and two portraits (Berlin; London).

Although his work is most like Jan van Eyck's, some of his motifs and compositions show that Christus was no stranger to the different tradition exemplified by Robert Campin and Rogier van der Weyden. These borrowings from more powerful spirits tend to overshadow and confuse his personal development. Compared with Van Eyck's all-seeing eye or with Rogier's emotional force his pictures seem empty, conventional and phlegmatic. Nevertheless, they remain admirable for their careful construction and jewellike execution.

The Frankfurt "Virgin With Saints" is the earliest Netherlandish picture with a single vanishing point.

See E. Panofsky, *Early Netherlandish Painting* (1954). (D. KG.)

CHROMATICISM, a musical term signifying the use of notes extraneous to the mode or scale in which a piece is written and introduced to intensify melodic design or harmonic texture. The term derives from the Greek, *chroma* ("colour"), the chromatic tetrachord in Greek music consisting of four notes. A, F♯, F, E, marked by two semitone intervals. Possibly under the influence of oriental melodies, the intervals of the Greek tetrachords were modified or coloured by fractions of a tone, such inflections being known as the *chroai.*

In medieval music chromaticism was associated with the theory of *musica ficta* which provided for the introduction of notes foreign to the modes. In the 16th and 17th centuries chromaticism was widely used to illustrate or underline literary associations, notably in the English and Italian madrigals. An early English example is John Danyel's "Chromatic tunes most like my passions sound" (1606). With the establishment of the major and minor scales of tonality chromaticism was integrated into contrapuntal technique. Chromatic themes were used as subjects for fugues. At the same period chromatic harmony was used in cantatas, oratorios and operas for dramatic or pictorial purposes, notably to convey disintegration in "The Representation of Chaos" in Haydn's *Creation.* The expressive resources of chromaticism were progressively explored by Mozart, Beethoven and the romantic composers.

At the end of the 19th century a much wider use was made of chromaticism and this was soon to present a dilemma. From the technical viewpoint chromatic features in classical or romantic harmony had been mainly used for the purpose of modulation to another key. In the works of César Franck and Alexander Scriabin chromaticism and modulation were almost constant. In the works of Wagner chromatic inflections were increased to a point which frequently obscured or undermined the sense of tonality. As a result, the function of chromaticism as a means of intensifying expression was correspondingly reduced. Later composers either rejected the tonal scale in favour of a chromatic scale in which none of the 12 notes in the octave is allowed to predominate, or established harmonic systems based on personal conceptions of chromaticism. (E. LR)

CHROMATOGRAPHY is a term that describes a number of physical methods used in chemistry and biology to separate and identify mixtures of chemical compounds. Although the term unfortunately implies that colour (chroma) is a necessary part of the detection procedure, no such limitation exists in fact, and the methods can be applied to coloured and uncoloured compounds alike.

The principle behind all variants lies in the repeated subjection of a mixture of chemical compounds to extraction by liquid or adsorption on a solid surface. The mixture is moved physically past a stationary phase, which may be either a solid or a liquid immobilized in the pores of a solid. The various components of the mixture migrate from the moving phase into the stationary phase and back again into the moving phase. This process is repeated many times during the course of travel. If differences in solubility or adsorption exist between the components of the mixture, the more strongly adsorbed or more soluble compounds will gradually lag behind the less strongly adsorbed or less soluble ones In sufficient time a complete separation can thus be brought about.

The moving phase may be a mixture of gases. a mixture of liquids or a liquid containing dissolved solids. The table summarizes several possible combinations and the common names by which techniques are known.

Name	Mixture	Stationary phase	Movingphase
Gas chromatography	Gas or vapour	Liquid (held by solid)	Gas
Partition chromatography	Liquids or dissolved solids	Liquid (held by solid)	Liquid
Paper chromatography	Liquids or dissolved solids	Liquid (held by solid)	Liquid
Adsorption chromatography	Gas or vapour	Solid	Gas
Adsorption chromatography	Liquids or dissolved solids	Solid	Liquid
Ion exchange chromatography	Ions in solution	Solid	Liquid

Two basically different physical separating principles are involved; *i.e.*, separation due to differences in solubility in two immiscible phases (partition chromatography), and separations due to differences in adsorption on a solid surface (adsorption and ion exchange chromatography). The former method, although historically more recent, has found wider use, particularly in biochemical research where the separation of small amounts of complex mixtures is difficult. However, for convenience, the adsorption methods will be discussed first.

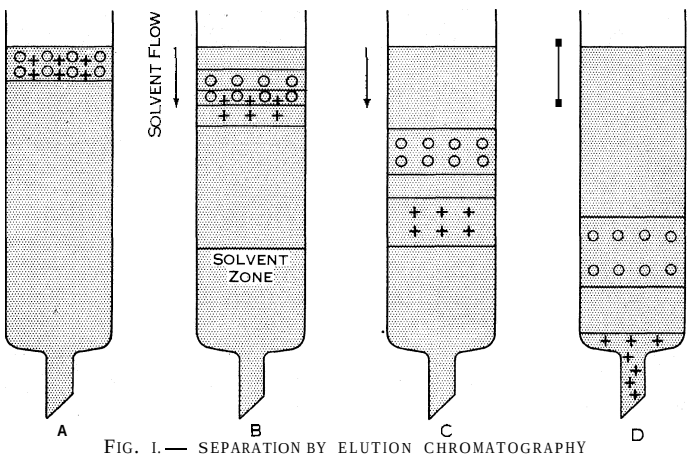

FIG. 1.— SEPARATION BY ELUTION CHROMATOGRAPHY

Stages in the separation of two components: (A) mixture applied to the top of a packed column; (B) partial separation of the mixture after application of solvent. Note that solvent front is ahead of either component; (C) complete separation. At this point components could be separated by sectioning the column; (D) the faster moving component leaving the column together with the solvent

The invention of adsorption chromatography is attributed to the Russian botanist M. S. Tswett, whose earliest publication on the separation of leaf pigments appeared in 1903. Prior to Tswett's work, petroleum chemists were aware of the separation possibilities of solid adsorbents. Tswett, however, provided the clearest insight into the elementary processes occurring on adsorption columns. Although his publications remained unrecognized and unapplied for nearly 30 years, a rapid growth began in 1931, when R. Kuhn and coworkers demonstrated the efficacy of the method in the separation of vitamin A fractions. The method has been applied to a wide variety of classes of compounds, including the chlorophylls. blood pigments, dyestuffs, fats, sugars, amino acids, hormones, alkaloids, vitamins and enzymes.

Elution Chromatography.— The technique of adsorption chromatography is quite simple, the apparatus consisting of a tube filled with a solid adsorbent through which a mixture is allowed to flow. The sample is introduced-at the top of the column. In the method known as elution chromatography, the sample is swept through the column by a solvent that is continuously introduced at the top and that flows through the tube by gravity or is aided in its flow by pressure on the top or suction at the bottom of the column. As shown in fig. 1, the mixture is gradually separated into its components, which move as bands (or zones) down the column. Adsorbent and solvent have to be chosen so that the components of the mixture will establish a suitable distribution ratio between the amount remaining in the solvent and the amount adsorbed on the surface. If adsorption on the solid is low, the separation effect for a given column length will be low. On the other hand, if the solid adsorbs very strongly, the rate of progress of the substance through the column will be slow and the separations will require a long time.

Choice of Adsorbents.—Since the method can be applied to so many different classes of compounds, it is difficult to generalize about suitable adsorbents or solvents. Under no circumstances, however, must the adsorbent be soluble in the solvent, nor must it react with or decompose the substances that it is intended to separate. Furthermore, for ease in locating the position of the zones it is desirable for the adsorbent to be colourless. This requirement is not as stringent as the first two since it is frequently more convenient to collect the separated samples after complete elution at the bottom of the column rather than to identify the bands while they are still adsorbed on the solid. Another important requirement for a successful adsorbent material is availability in reproducible form so that similar results can be obtained with different charges of the same substance. The absence of strict reproducibility is to some extent responsible for the eclipse of adsorption methods by partition techniques.

Commonly used adsorbents include such inorganic compounds as alumina, magnesia, fuller's earth, lime and calcium carbonate and, in the organic field, sucrose, starch and charcoal. Adsorbents cannot easily be classified according to their strength of adsorption without specifying the particular solvent and material that is being adsorbed. Well-dried aluminas and activated carbons, however, show strong adsorption characteristics under most conditions whereas the organic solids are generally weak in their adsorption behaviour. Since the nature of the solid has such pronounced effects on the separation of mixtures, it is clearly desirable to have adequate quantitative information concerning its activity. The surface structure of a given adsorbent and not merely its chemical nature plays a major role. The fine distinction made by structural effects can be shown by silica gel, whose adsorptive powers toward a particular dye can be increased more than tenfold by preparing the gel in the presence of the dye. In a manner not fully understood, the surface of the gel is adjusted to the shape of the dye in whose presence it was prepared, with the result that the gel shows markedly smaller attractions toward dyes that differ even only slightly in molecular structure. In view of this sensitivity, reproducible results can be obtained only by the strictest maintenance of uniformity and stringent control during the manufacture of the adsorbent.

Several physical measurements can be used to determine the characteristics of various batches of the same adsorbent. The heat of wetting of a particular liquid on a known amount of adsorbent is a useful measurement although it may fail if the solid is composed of a mixture of particles having widely different surface structures. A more direct determination consists of the measurement of the rates of movement of bands of known compounds along the column. Column packings can then be specified by the packing density of the solid in the column (which is a function of the method by which the column was prepared, as well as the particle size and shape of the solid), by the rate of flow of the developing solvent through the column and by the ratio of flow velocity of the substance being adsorbed to the flow velocity of the solvent. This latter term (commonly designated R_f), when specified for particular systems of solvent and adsorbent, is useful in indicating the relative ease of separation of two substances. If R_f values of two compounds differ by less than 10%, resolution is likely to be unsatisfactory.

Choice of Solvents.—The solvent has the multiple function of introducing the mixture onto the column, of resolving the mixture into components and removing the components from the column. The solvent plays its role by competing with the materials to be separated for the various adsorption sites on the solid. Solvents differ widely in their adsorption behaviour on solid surfaces. The choice of solvent will depend on the nature of the substances to be separated and on the adsorbing surfaces. For the more frequently used hydrophilic adsorbents, such as the aluminas, the sequence of increasing eluting power is: petroleum ether, benzene, chloroform, diethyl ether, ethyl acetate, acetone, ethyl alcohol, methyl alcohol, water and pyridine. Thus pyridine, as the strongest solvent, can be used for the resolution of substances that are

held with great tenacity on the solid adsorbent. Although this sequence is generally maintained in measuring the eluting power toward a single substance, it is frequently observed that in the presence of several substances or in case of mixed solvents inversions in the above order are found. This occurrence can be applied usefully, for example, as proof of the purity of a substance that can be considered established if no further resolution into components takes place on a variety of adsorbents and from a number of solvents.

After separation, the zones can be located in a variety of manners. When the tube is transparent and the components coloured. the bands can be seen readily. Frequently, colourless substances will fluoresce under ultraviolet light. A less satisfactory procedure is to remove the entire packing from the column and treat it with a thin line of a substance that forms a coloured reaction product with the adsorbed substances. Sugars, for example, can be located with permanganate solution. If the chromatographic process is continued until the bands of the various fractions appear in the effluent, identification can be made by any one of a number of physical measurements; *e.g.,* determination of refractive index or thermal conductivity.

See ADSORPTION: *Applications of Adsorption.*

Partition Chromatography. — The technique of partition chromatography has assumed greater importance than has adsorption chromatography for two reasons: it can readily be adapted to the separation of very small amounts of mixtures (paper chromatography), and it also deals with a simpler principle of separation. Partition chromatography depends on the fact that dissolved substances are in continual transport between a moving carrier phase and a stationary liquid phase. Under near-equilibrium conditions the distribution of a dissolved substance between these two phases depends upon its relative solubilities therein. The ratios of the concentrations of substances in the two phases are very often independent of the absolute concentration, in contrast with the ratios encountered in adsorption chromatography. This fact is of great importance in preventing unwanted spreading out (tailing) of the adsorption bands.

The technique utilizes a porous solid to immobilize the stationary liquid phase. The carrier can be either a liquid or a gas. The only requirements are that the substances to be separated be soluble in both phases and that the phases themselves show no appreciable miscibility. If the stationary liquid is held by a granular solid, such as silica gel, the apparatus and manipulations are very similar to adsorption chromatography.

If the moving phase is a gas, a wide variety of classes of compounds such as hydrocarbons, organic solvents, etc., can be separated as vapours. In gas chromatography the stationary liquid phase should be kept at sufficiently low temperature so that it remains in the column indefinitely. Glycerol, silicone fluids, dinonyl phthalate and other high-boiling iiquids can be used as the stationary liquid phase. The separated gases are detected by measurement of either thermal conductivity or gas density. The method gives quantitative results and can detect quantities as small as 0.1% by volume.

Paper Chromatography. — A remarkable modification of partition chromatography has become a most powerful and widely used analytical tool, viz., the use of sheets of paper as the means of stabilizing a stationary water or other liquid phase. Paper will absorb enough water from a humid atmosphere so that no additional moistening is required. Apart from its simplicity of operation, paper chromatography is admirably suited to micromanipulations. This is of particular importance in biochemical work where the sample quantities are frequently small.

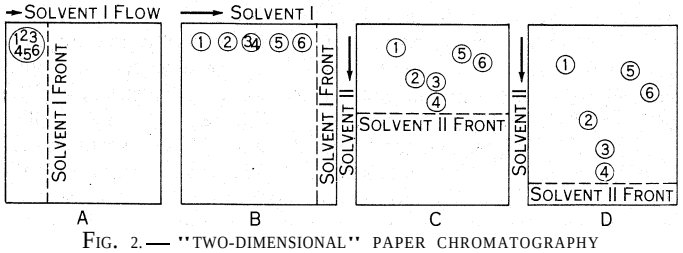

FIG. 2. — "TWO-DIMENSIONAL" PAPER CHROMATOGRAPHY

Steps in the separation of a six component mixture: (A) solvent i beginning to separate components initially mixed together; (B) partial separation achieved but components 3 and 4 not separate; (C) further separation achieved by use of solvent II and chromatographing at right angles to previous flow; (D) separation of all components. Spot positions can be located by means of coiour reagents

The method consists of applying. the mixture as a spot in one corner of the paper. Developing solution is then allowed to flow down the paper by capillary action, thereby resolving into a number of individual spots. To prevent solvent evaporation during development, the paper is held in a glass jar and surrounded by an atmosphere saturated with the solvent. If the solvent flowing in one direction is not able to separate all the components satisfactorily, the paper may be turned through **90°** and further development carried out with another solvent or solvent mixture (fig. 2). As many as **16** components can be separated using the "two-dimensional" technique. This procedure has become standard practice for the separation of complex amino acid mixtures and of peptides. It has also been widely employed in the separation of carbohydrates, steroids, purines and a long list of simple organic compounds. Inorganic ions can also readily be separated on paper. Solvents are chosen for the particular problem. Phenol, collidine and butanol-acetic acid are commonly used for amino acids and sugars. If the spots are colourless they can be detected either through reagents sprayed onto the paper to form coloured compounds of the substance, or by observation under fluorescent light. A very sensitive detection technique consists of using radioactive tracers in making the chromatogram and then exposing the chromatogram to a photographic film, so that the radiation indicates the position of the spots by self-exposure.

Ion Exchange Chromatography. — A more specialized case of chromatography makes use of ion exchange resins as the immobile solid phase and can be used to separate ionized compounds. Instead of adsorption, the substances displace inorganic ions from the solid and are in turn displaced by a developer containing ions that are even more strongly held by the solid. Ion exchange materials are available as two major types in which either an anion or cation is exchangeable. A remarkable application of this method is the separation of compounds of the rare earth group on cation exchange columns. For a detailed discussion of ion exchange chromatography *see* ION EXCHANGE: *Applications.*

Techniques used less frequently and confined to more specialized application include paper chromatography in which the stationary phase is an organic solvent rather than water; a modification of ion exchange chromatography in which paper is coated with an inorganic substance exhibiting ion exchange properties; and paper chromatography in which an electric current applied at a right angle to the direction of the solvent flow provides further resolution of ions in accordance with their mobilities.

Without chromatographic separations the resolution of complex mixtures would not only be difficult but would also require time-consuming manipulations and large sample sizes. Major advances in the understanding of the chemical steps in photosynthesis, protein structure and metabolic pathways can be attributed to the availability of chromatographic techniques. They have become an important aid in chemical analysis.

BIBLIOGRAPHY. — In view of the rapid development of techniques and applications, review articles are frequently published in scientific journals and these should be consulted. *Analytical Chemistry* publishes valuable surveys every two years. *See* also R. CHROME STEEL: *see* IRON AND STEEL; STAINLESS STEEL.

CHROMITE, a member of the spinel group of minerals, is an oxide of chromium and ferrous iron. It is the chief commercial source of chromium and its compounds. The earliest worked deposits of chromite were those in the serpentine of the Bare hills near Baltimore, Md. The principal producing areas of chromite are, in the order of their importance, Southern Rhodesia in the Federation of Rhodesia and Nyasaland, U.S.S.R., Turkey, Re-

public of South Africa, Republic of the Philippines, Yugoslavia, India, Greece and New Caledonia. Chrome ore is used in manufacturing special steels and alloys, as a metallurgical refractory and in manufacturing chemicals used in dyeing, tanning and pigments.

Chromite crystallizes in regular octahedra (see SPINEL), but is usually found as grains or as granular to compact masses. In its iron-black colour with submetallic lustre and absence of cleavage it resembles magnetite (magnetic iron ore) in appearance, but differs from this in being only slightly, if at all, magnetic and in the brown colour of its powder. The hardness is 5.5; specific gravity, 4.5. The theoretical formula $FeCr_2O_4$ corresponds with chromic oxide (Cr_2O_3) 68%, and ferrous oxide 32%; the ferrous oxide is, however, usually partly replaced by magnesia and the chromic oxide by alumina and ferric oxide, so that there may be a gradual passage to picotite or chrome spinel. Much of the material mined as ore does not contain more than 40% to 50% of chromic oxide. (W. F. FG.)

CHROMIUM. The element chromium was first isolated in 1797 by L. N. Vauquelin from the mineral crocoite which was discovered in 1765 in Russia by P. S. Pallas. It is from the Greek *chromos,* meaning colour, due to the varied colour of its compounds. The green colour of emerald, serpentine and chrome mica, and the red colour of the ruby, are due to chromium.

Although chromium is widely dispersed in natural deposits, it is never found in the uncombined state. Chromite, $FeO.Cr_2O_3$, is the only important ore of chromium, and the major producing areas are Southern Rhodesia in the Federation of Rhodesia and Nyasaland, the U.S.S.R., Republic of South Africa, Turkey and the Philippines; the principal U.S. mine is in Montana. The chemical composition of chrome ore varies between 42% and 56% chromic oxide, Cr_2O_3, and 10% to 26% FeO. Most of the ores mined are of a sufficiently high grade to be marketed without beneficiation.

Chromite was first used to make chromium chemicals about 1800 to 1816, and was first employed as a refractory in 1879. Although a patent was granted on a chromium steel in 1865, it was not until much later—1904 to 1913—that chromium became important metallurgically in steelmaking. The chief uses of chromite are metallurgical, refractory and chemical.

USES

Metallurgical. — The metallurgical use is derived from the addition of chromium to iron, nickel and other metals to increase their strength. and corrosion and oxidation resistance. It is added to steel in the form of ferrochromium, containing about 70% chromium as a high- or low-carbon grade alloy.

High-carbon ferrochromium (4% to 6% carbon) is used in producing steels in which chromium and carbon must be present. The chromite used for ferrochromium production contains a minimum of 48% chromic oxide and a usual ratio of chromium to iron of about three to one, although a considerable amount of alloy with ratios different than three to one is used in the steel industry. Coke is employed as the reducing agent. The charge is fed into the top of an open-top, submerged arc furnace, and the molten metal collects at the bottom of the furnace and is cast into chill molds. After cooling, it is broken up into lumps and is graded.

For steels in which carbon is detrimental, low-carbon ferrochromium is produced. A silicon reduction of chromite is used. This is a two-step process. In the first stage, a high-silicon ferrochromium substantially carbon-free is produced in a submerged arc furnace. This product is then treated in open-arc-type furnaces with a synthetic slag containing chromic oxide. The alloy produced has a carbon content in the range 0.03% to 0.15%.

A ferrochromium of very low carbon content (0.01% carbon) is made by heating high-carbon ferrochrome with ground quartzite in a high vacuum with the removal of carbon as carbon monoxide.

For making alloys of the chromium-nickel, heat-resisting type, chromium copper and other nonferrous alloys, a chromium metal low in iron is desired. Metal of this grade may be produced by thermal or electrolytic methods. In the thermal processes. chromic oxide is reduced with aluminum or silicon. Although both reactions are exothermic, not enough heat is generated in the silicon reduction to complete the reaction, and this reaction is carried out in an electric arc furnace. Other thermal methods, such as the reduction of chromic chloride by hydrogen or magnesium, produce a high-grade metal, but these methods have not been exploited.

A very high grade of metal may be made by wet electrolysis of chromic acid and sulfate or chrome alum. The metal is contaminated with oxygen and hydrogen. The oxygen can be removed by heating the metal in hydrogen at a high temperature, and hydrogen may be eliminated by heating the metal at 400° C. Oxygen can also be eliminated by heating the metal with carbon in a vacuum. Fusion electrolysis of chromic chloride in a potassium chloride-sodium chloride electrolyte has produced chromium metal, but this process is not used commercially. Metal produced by the dissociation of chromium iodide at a low temperature in a vacuum with the subsequent deposition of the liberated chromium on a filament heated to a high temperature is the purest form of chromium that has been made.

Pure chromium metal may be arc-cast by consumable or nonconsumable electrode techniques or formed by powder metallurgy methods. The ingots so produced possess a certain degree of workability and may be hot-forged and sheath-rolled to a degree.

Steels containing chromium in amounts up to about 3% have improved physical properties and are more susceptible to heat-treatment than plain carbon steels. In conjunction with other elements such as molybdenum, nickel, manganese and vanadium, the steels of this type are used for springs, roller and ball bearings, dies, rails and high-strength structures. Steels containing 5% to 6% chromium have increased resistance to oxidation and corrosion and are used in the oil industry in the form of tubes. Another group of steels, known as stainless irons or steels because of their superior resistance to oxidation and atmospheric corrosion, contain 10% to 18% chromium. The susceptibility to heat-treatment and corrosion resistance of this group depends on the carbon content. The low-carbon varieties (0.10% carbon or lower) cannot be hardened by heat-treatment if the chromium content is over about 13%. Their corrosion resistance is good, and the higher chromium steels may be used as automobile trim and in handling nitric acid. Steels with about 13% chromium and 0.3% carbon are heat-treatable and are used for cutlery. High-carbon (1% to 2%) steels of this type are used when hardness and abrasion resistance are of importance; for example, special tool and die steels. Chromium contents of 25% to 30% impart excellent oxidation-resisting properties to steels, and they are used for furnace parts, burner nozzles, heat exchangers, kiln linings, etc. (see also STAINLESS STEEL).

Other alloying elements, such as nickel and manganese, can be added with chromium to steels to form the austenitic types of which the 18% chromium-8% nickel variety is probably the best known. These stainless steels are resistant to oxidation and corrosion and retain their strength at high temperatures much better than the plain chromium steels. They are used where resistance to creep at high temperatures is required. They sometimes contain additions of molybdenum, tungsten, columbium or titanium to add strength and corrosion resistance to the alloy or to stabilize the carbides present.

There are a great number of other alloys containing chromium, such as the Stellites, electrical resistance materials and turbine alloys. Chromium is also added to cast iron (*q.v.*) to increase its tensile strength and wear and heat resistance.

Refractory. — Next in importance to the metallurgical application of chromium is the use of chromite as a refractory. A typical analysis of a chromite suitable for refractory purposes would be 38% to 48% Cr_2O_3, 12% to 24% Al_2O_3, 14% to 24% Fe_2O_3, 14% to 18% MgO, and under 10% SiO_2. The usefulness of chromite as a refractory is based on its high melting point, moderate thermal expansion, stability of crystalline form at elevated temperatures and its neutral chemical behaviour.

The melting point frequently given for chromite is the value 2,180° C. These refractories are among the heaviest produced, and the specific gravity varies between 4 and 4.6. Their thermal stability is one of the most valuable properties, as there are no polymorphous forms to cause sudden volume changes on heating.

Chromite exhibits some shrinkage on heating which is caused by the silicates present. Cuban ore at 1,500° C. shows a linear shrinkage of 1.5%.

Chrome refractories are available in the form of molded brick and shapes, plastic mixtures consisting of moistened aggregates which are rammed in place, castables composed of dry aggregates and a binder which after mixing with water can be poured like concrete, and mortars and cements for laying brickwork. Crushed raw ore is also sold for patching or filling holes.

Bricks comprised of 100% chrome ore have been largely replaced by bricks composed of mixtures of chrome ore and magnesia for greater refractoriness, volume stability and resistance to spalling. One of the refractories used in the fused-cast condition is composed of 80% alumina and 20% chromite. This product is the most corrosion-resistant refractory commercially available and is very resistant to a variety of fluxes, slags and glasses.

Chemical. — The third application of chromite is for the production of chrome chemicals. For this purpose, the ore should contain a minimum of 45% Cr_2O_3, and the iron content may be higher than for the other applications. The production of sodium dichromate is usually the first step in making chemicals. This reagent is produced by heating the ore with soda ash and then leaching out soluble chromate which is converted to the dichromate by treatment with sulfuric acid.

One of the chief uses of chromium chemicals is for the production of pigments. Chrome oxide green, which is nearly pure Cr_2O_3, is the most stable green pigment known. It is used for colouring roofing granules, cements and plasters. It is also employed as a fine powder for polishing purposes. Chromium yellow varies greatly in the shades available and is essentially lead chromate. This pigment makes an excellent paint for both wood and metal. Zinc yellow, a basic zinc chromate, is used as a corrosion-inhibiting primer on aircraft parts fabricated from aluminum or magnesium. Molybdate orange is a combination of lead chromate with molybdenum salts. Chromium green is a mixture of lead chromate with iron blue. This pigment has excellent covering and hiding power and is widely used in paints. Pigments account for about one-third of the primary production of chromium chemicals.

The textile industry accounts for about 10% of the primary production of these chemicals. They are used as mordants, in textile-printing compounds and in aftertreatments. Both trivalent and hexavalent compounds (see Compounds, below) are employed, and such reagents as basic chromic acetate, basic chromic chloride, chromic fluorides, bisulfites, lactates, bromates, oxalates and thiocyanates are employed.

About 25% of the chromium chemicals produced go into chrome tanning. Practically all types of leather tanned use chrome reagents in the form of basic chromic sulfates which, in turn, are produced from the dichromate.

The insolubilizing action of chromium chemicals is used for hardening photographic films and in photoengraving.

Over one-fourth of the primary chromium chemicals are used in metal surface treatments and corrosion control. Such applications are: chromium plating; chromizing; anodizing aluminum; treatment of zinc and magnesium; dips for iron, steel, brass and tin; inhibitors for brines and recirculating water systems; and for a large number of combinations in the oil and gas industries.

These chemicals also find important use for organic oxidations such as the production of synthetic dyes, saccharin, benzoic acid, anthraquinone, camphor, synthetic fibres, bleaching and the purification of chemicals. Other chemical uses are: application as an analytical reagent; for inorganic and electrochemical oxidations; in electric dry cells, slushing compounds, phosphate coatings and catalysts; and in the manufacture of sponge rubber.

PHYSICAL AND CHEMICAL PROPERTIES

Chromium is one of the transition elements appearing in the sixth group of the periodic table. Its chemical symbol is Cr; its atomic number is 24; and it has an atomic weight of 52.01. Natural isotopes of the following mass numbers and relative abundance occur: Cr^{50}(4.49%), Cr^{52}(83.78%), Cr^{53}(9.43%) and Cr^{54}(2.30%). Radioactive isotopes of masses 49, 51 and 55 have been reported.

Chromium is body-centred cubic in structure with a lattice constant at 20° C. of $a_0 = 2.8787$ kx units. A transition to a face-centred structure at 1,830° C. has been reported. The distribution of the 24 electrons in the various energy levels is $1s^2$, $2s^2$, $2p^e$, $3s^2$, $3p^6$, 3d5 and $4s^1$. The density of chromium is 7.19 g./cm.^{3} at 20° C.

The melting and boiling points of the metal are 1,903 ± 10 and 2,480° C., respectively. The linear coefficient of expansion is 6.2×10^{-6} per degrees centigrade. The specific heat is found to be 0.1 cal./g./° C. at 25° C. The values for the entropy are 5.68 cal./degree/mole for solid chromium and 44.64 for gaseous chromium. The latent heat of fusion is 80.75 cal./g., and the latent heat of vaporization is 1,470 cal./g. at the boiling point.

Referred to copper, the volume electrical conductivity equals 12.2% for high-purity chromium, a specific resistance of about 13 microhm-cm. at 20° C. being obtained. The metal does not exhibit superconductivity down to 0.082° K.

Chromium is paramagnetic and the average of two reported mass-susceptibility values is 3.29×10^{-6} c.g.s. unit.

Chromium is steel-gray in colour and when electroplated reflects white light 77%. Its refractive index varies between 1.64 and 3.38 with wave lengths between 2,570 and 6,080 Å. Total emissivity at 100° C. in a nonoxidizing atmosphere is 0.08.

The Brinell hardness of as-cast metal varies between 110 and 170, and that of electrodeposited metal between 500 and 1,250, depending upon the hydrogen content. Annealed electrodeposited metal gives a value between 70 and go. At a Knoop hardness of zoo, a tensile strength of 70,000 pounds per square inch (p.s.i.), and a Young's modulus of 36,000,000 p.s.i. have been reported for annealed electrolytic chromium. Other elastic properties are: compressibility, 0.42×10^{-5} p.s.i.; modulus of compression, 23.5×10^6 p.s.i.; modulus of shear, 10.4×10^6 p.s.i.; and Poisson's ratio, 0.31. The static and sliding coefficients of friction at room temperature of steel against chromium-plated steel are 0.17 and 0.16, respectively.

Chromium may be joined by brazing, using a low-melting-point silver alloy, a potassium fluoborate flux and a reducing flame.

Compounds. — Three series of compounds are formed by chromium: (1) chromous compounds, CrX_2; containing divalent chromium; (2) chromic compounds, CrX_3; containing trivalent chromium; and (3) hexavalent chromium compounds such as chromates and dichromates. Univalent and pentavalent chromium compounds have also been reported.

Chemical Reactions. — Chromium reacts with the anhydrous halogens, hydrogen chloride and hydrogen fluoride, at temperatures about 600° C. Aqueous HF, HCl, HBr and HI slowly dissolve chromium. Dilute sulfuric acid slowly dissolves chromium with the evolution of hydrogen while the metal liberates SO_2 in boiling concentrated acid. At room temperature, fuming nitric acid and aqua regia have no effect on chromium. Many oxidizing agents such as chlorine or bromine water, concentrated nitric, phosphoric, chloric and perchloric acids cause passivity in chromium due to the formation of a thin oxide layer on the metal surface under certain conditions. In the passive state, chromium is not attacked by dilute mineral acids. Chromium is only slightly attacked by acetic acid and not at all by formic, citric or tartaric acids.

Wet or dry air has little effect on chromium at ordinary temperatures. Superficial oxidation takes place in both oxygen and air at elevated temperatures and the metal burns in oxygen at 2,000° C. Water vapour oxidizes chromium at a bright-red heat, but the metal shows no reaction with sea water or aerated rain water at ordinary temperatures.

Alkali hydroxide attacks chromium at a red heat, but it is unaffected by fused alkali carbonates. Chromium reacts with sulfur vapour (700° C.), hydrogen sulfide (red heat) and sulfur dioxide (red heat). Phosphorus attacks the metal at 800° C. Carbon monoxide oxidizes the metal at or above 1,000° C. Molten chromium dissolves up to 4% nitrogen by weight. Ammonia reacts with chromium at 850° C. to form a nitride, and hot nitric oxide forms both nitride and oxide with chromium, Chromium also forms a hydride, and it reacts at high temperature with carbon,

silicon or boron. Calcium vapour has very little effect on the metal at a red heat, and under oxidizing conditions chromium attacks porcelain at 1,600° C.

For equilibrium diagrams of chromium with other metals *see* references cited in *Bibliography*.

Toxicology.—Pure metallic chromium, as well as chromite and the trivalent compounds, do not produce any serious damage to the body tissues, and the toxic action of chromium is confined to the hexavalent compounds. These latter compounds exert an extremely irritative, corrosive and in some cases toxic action on the human body. Under certain conditions, these hexavalent compounds cause denaturation and precipitation of tissue proteins. In industrial exposure, they affect chiefly the skin and respiratory tract. The skin reactions cause chrome ulcers and dermatitis. Inhalation of chromate dust or chromic oxide mist causes perforation of the nasal septum, cancer of the respiratory tract and chronic irritation or congestion. The maximum allowable concentration of dusts and mists in the air measured as CrO_3 is 0.1 mg./m.^{3} of air for daily eight-hour exposures.

Analysis.—Chromium can be detected in compounds by the formation of a green borax bead, by the yellow colour of chromates formed on fusion with potassium nitrate, and by the red-violet colour produced by the reaction of dichromates with diphenyl carbazide. In standard qualitative analysis procedure, the chromium is precipitated along with aluminum as the hydroxide as it is not precipitated by hydrogen sulfide in acid solution. Chromium is usually determined quantitatively by oxidation to dichromate followed by titration with a ferrous iron solution of known strength.

CHROMOSOME. So called because of their affinity for certain dyes. the chromosomes are minute bodies seen in the dividing cells of which the bodies of animals and plants are composed. The word was first used by Wilhelm von Waldeyer-Hartz (1888). Their characteristic configurations and remarkable behaviour in cell division, in the process of development and in the union and formation of the reproductive elements, have been the subject of a large body of research since their discovery in 1873 by Anton Schneider, Walter Flemming, Otto Biitschli and others. The progress achieved during the three decades that followed their discovery made it possible, when Mendel's law of segregation was rediscovered in the opening years of the 20th century, to identify the structural mechanism predicted by him. From that time on intensive study of the behaviour of the chromosomes in relation to breeding experiments resulted in the building up of one of the most spectacular generalizations of modem biology—the chromosome-gene theory, an exposition of which is given in the article CYTOLOGY.

See HEREDITY; GENE; *see* also references under "Chromosome" in the Index volume.

(L. T. H.)

CHROMOSPHERE. The solar chromosphere (literally, the colour sphere of the sun) is the attenuated envelope some thousands of kilometres thick that lies immediately above the bright surface or photosphere of the sun. Above the chromosphere lies the hot extensive corona that extends outward for hundreds of thousands of kilometres. *(See* SUN.)

Although the chromosphere can be observed outside of solar eclipses with the slit of a spectrograph placed on the limb of the sun or with the Lyot coronagraph, the best views are obtained at the time of solar eclipses when the chromosphere appears as a bright red crescent just after the white bright photosphere has been occulted. The red colour is due to the *Ha* line of hydrogen, the most abundant gas in the solar atmosphere. The radiations of ionized calcium (H and K lines) are yet stronger, but they fall in a spectral region where the sensitivity of the eye is very low.

Photographs obtained under conditions of best viewing indicate that the chromosphere has a nonuniform structure. It consists of many individual filaments or spicules. The gas between the spicules is believed to have a different temperature and density from the gas in the spicules. A nonhomogeneous chromosphere, consisting of alternate hot and cold columns, seems necessary to explain certain of the spectroscopic anomalies exhibited by the chromosphere.

The spectrum of the chromosphere shows the same lines as the dark-line photospheric spectrum, but the intensities are different. The lines of hydrogen are relatively more prominent, and there also appear lines of helium which are missing from the dark-line solar spectrum. Some of the differences can be explained by the effects of the lower chromospheric density, but others cannot be interpreted in terms of any model in which the temperature and density depend only on the height.

Structure of Chromosphere Deduced From Radio Data

Height (in kilometres)	$N\epsilon \times 10^{10}$	$T\epsilon$°K.
2,000	8.20	6,900°
2,500	4.80	7,000
3,000	3.04	7,180
3,500	2.02	7,310
4,500	0.876	7,700
5,500	0.607	11,000
6,500	0.357	30,200
7,500	0.209	66,000
8,500	0.131	145,000
9,500	0.095	327,000
10,500	0.0765	630,000
11,500	0.0660	757,000

Numerous chromospheric models have been proposed by various writers but none has been successful in explaining all of the observations. One of the most powerful techniques for the study of the outer solar envelopes is provided by radio astronomy. Much of the time the radio-frequency solar radiation consists of both a nonthermal noise component and a thermal component which is produced simply by the high temperature of the sun. Near sunspot minimum there are times when the nonthermal noise virtually disappears and the thermal noise alone can be observed. The maximum depths in the chromosphere or corona from which radio-frequency emission of a given frequency can escape depend on the frequency: the higher the frequency, the deeper the layer. The intensity of the radiation will depend on the temperature of the emitting layers. By making use of these principles and by using some of the optical data as a guide, it is possible to obtain the run of density and temperature and height. The temperatures and

PHOTOGRAPH SHOWING THE CHROMOSPHERE

densities thus obtained are of course mean values averaged over any "hot" and "cool" columns that may exist. Observations from spectrographs flown in artificial satellites offered further means of obtaining data on the structure of the chromosphere.

The table gives the structure of the chromosphere deduced with the aid of the radio data and shows the steep decline in the electron density N_e (electrons per cubic centimetre) and the sharp temperature rise between 4,500 and 6,500 km. At the very lowest level the optical spectroscopic data indicate a temperature of about 4,000° K. in the cool regions. Above 12,000 km. the chromosphere merges into the corona, which has a temperature of 1,000,000°.

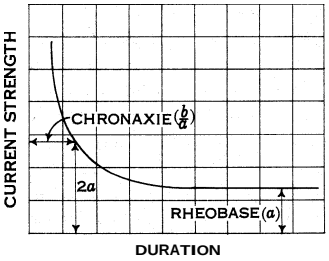
CHRONAXIE (CHRONAXIA), a term introduced by Louis Lapicque in 1909 to define the character of the stimulus that is required to excite various types of living tissue, particularly muscle and nerve. The most convenient form of stimulus is an electric current, since this can be made to excite (*i.e.,* to cause the tissue to display its characteristic activity) without doing any damage. It is found that a current must fulfill three conditions if it is to excite: (1) it must flow for more than a certain minimal duration; (2) the final strength must exceed a certain value; and (3) the rate of increase of the current from zero must exceed a definite velocity. The need for a minimal duration is shown by the fact that a current alternating at 1,000,000 cycles a second is powerless to excite any tissue in the body, and the surgical technique of diathermy is based on this.

The curve relating minimal duration and minimal strength has the form shown in the figure, and as a first approximation it obeys the formula of Weiss, $i = a + \frac{b}{t}$, where i is the current, t its duration and a and b are constants. Lapicque showed that curves of the same form are obtained from the most diverse tissues, ranging from the human nerve, where the minimal duration is less than .0001 sec., to the cells of a plant where it may be longer than 1 sec. Thus, the character of the stimulus for a given tissue can be defined at once if the constants a and b for that tissue are known. The constant a (the rheobase) is given by the minimal current strength at long durations. The other constant b is the more important, for it determines the slope of the curve and it can be fixed by measuring the chronaxie, which is equal to $\frac{b}{a}$ and is the least duration required when the current strength is $2a$. The true form of the curve differs somewhat from that given by Weiss's equation, and it has been used as a basis from which to deduce the mechanism of excitation. In Lapicque's hands the measurement of the chronaxie also was used to investigate the passage of the state of excitation from one tissue to another (*e.g.,* from nerve to muscle). (E. D. A.)



FORM OF A STIMULATING CURRENT IN LIVING TISSUE
The curve shows the relation between the strength and the duration of the smallest current which will excite a living cell. The chronaxie and the rheobase are the two constants which define the curve

CHRONICLE. Chronicles, records of noteworthy events both natural and cultural, arranged in chronological order, represent a more detailed and sophisticated form of annals (*q.v.*). Insofar as they are bare statements of fact, given without comment and compiled without inductive purpose, chronicles differ essentially from history (Gr, *historia,* "inquiry"), which is understood as being concerned not only to describe but also to interpret the actions of men. Nevertheless few chronicles are entirely free of tendentiousness; from the earliest times their compilers began to select data in order to exalt a reigning house or a religion, or to provide moral *exempla.*

Antiquity. — Chronicles were compiled by the inventors of writing. Many ancient Chinese principalities had their "spring and autumn annals"; those of the state of Lu (722–481 B.C.) have survived, probably because they were edited by Confucius. The Semites made calendars, regnal lists and genealogies and often included in them records of phenomenal events. In translating the Scriptures St. Jerome gave the name Chronicon to the Hebrew book entitled "Events of the Times"; but the Yahwist sections of the Pentateuch, the books of Joshua and Samuel and the first two chapters of Kings provide earlier and better examples of chronicle form.

In Greece the example of Hellanicus of Lesbos, who composed a chronicle of events from 683 to 404 B.C., was followed by the atthidographers, writers such as Androtion and Philochorus (4th and 3rd centuries B.C.) who chronicled the history of Attica and of Athens (see ATTHIS). Ephorus (*q.v.*) wrote a universal history, covering about 750 years, and the grammarian Apollodorus (fl. 2nd century B.C.) wrote a chronicle of events from the fall of Troy to his own times. In Rome from very early times the pontifex *maximus* was required to exhibit annually his whitened board (album) on which were listed the names of officials and the events of the past year. Chronicles compiled from these lists were thus called *Annales Maximi,* and the name annalist (*q.v.*) is usually given to all Roman historians before Sallust. Later, some grammarians followed Verrius Flaccus (see VERRIUS FLACCUS, MARCUS) in distinguishing chronicles (*annales*) and history (historiae) as accounts respectively of past or of current events: Tacitus, for instance, in his Annals wrote of events that occurred before his birth or in his early childhood, and in his Histories described his own times. This specific terminology, however, was not followed by the medieval historiographers of western Europe, whose work the word "chronicle" particularly denotes.

Early Christian. — The Christian view of history was essentially different from that of classical paganism. Greco-Roman philosophers and historians usually viewed human history as a cyclic departure from and return to some idealized golden age, set in the past or in the future. In their view, the universe of time extended indefinitely: Pliny the Elder could report that the Babylonians had recorded astrological data for 720,000 years. But early Christians, under the influence of Semitic messianic doctrines, saw the hand of God in every event and regarded time as a fixed and limited framework, of which the Creation, the Incarnation and the Last Judgment were the beginning. middle and end. St. Theophilus (c. 180), bishop of Antioch, whose *Apology* to Autolycus included a chronicle, set the pattern for the Christian interpretation of events. He explicitly stated his several purposes: to emphasize the culture and antiquity of the Hebrews, the rise and fall of earthly empires, the Advent as the key to typology, and the growth of the visible church.

Belief in the millennium (the return of Christ to rule on earth for 1,000 years) strongly influenced the writings of early fathers such as Hippolytus and Sextus Julius Africanus. They were thus concerned not only to demonstrate the unique position of the chosen people among the Gentiles but to calculate and predict the time of the Second Advent. The tracts of such chronologists therefore normally consisted of two parts: formulas for the computation of time, and lists of events in sacred and profane history. Their chronica were normally divided into six ages (aetates): the first two running from Adam to Noah and from Noah to Abraham; then the three ages mentioned in St. Matthew's Gospel (i, 17), namely from Abraham to David, from David to the Babylonian captivity and from the captivity to the Incarnation; and finally the last age, from the Incarnation to the Second Advent. These ages were variously calculated, but no version assumed a period longer than 6,000 years between the creation of the world and the coming of Christ. Each thereby created its mundane era. These eras were eventually displaced in western Europe by the "Christian era," calculated by Dionysius Exiguus in 525, which numbered the sixth age alone. The practice of associating with chronicles formulas for calculating time was followed as late as the 8th century; the shorter and the longer chronicles of Bede (703 and 725) each form part of a textbook on the theory and practice of chronology or *computus.*

While Christians formed a persecuted or barely tolerated religious minority, they naturally found millennarian doctrine at-

tractive. But during the 4th century, after the conversion of the emperor Constantine, Christianity became not only an accepted but a favoured and protected religion; and the prognostic calculations of Christian writers were employed to predict the Last Judgment. St. Augustine in *The City of God* wrote of the Roman empire as a vehicle divinely ordained for the birth and propagation of Christianity; but he also set it in context with the other great empires of antiquity. From the 4th century, Christian chroniclers tended to include in their records various Gentile events, according to their individual taste and the sources available to them. The real prototype of western chronicles is that of the historian Eusebius of Caesarea, who improved and expanded the work of Africanus. creating a concordance by inscribing in parallel columns events which occurred among the several ancient peoples. St. Jerome adapted it in Latin and extended the record to the year 378. Writers such as Idatius of Galicia and Prosper of Aquitaine extended Jerome's chronicle to the years 468 and 455 respectively. but they rioted only events in western Europe, primarily those in their own regions.

Medieval. — After the chaos and destruction of the Merovingian period, men came to appreciate that the monastic chronicles could provide valuable evidence of social position, property rights and franchises. The Carolingian compilers after 750, still self-effacing and often anonymous, became increasingly prolix and often quite worldly in their choice of items to record. Maintenance of such records became a duty of virtually every community, religious and secular, though the Christian aims and methods of the earlier chroniclers were in the main continued. Until the 12th century all compilers, with the two notable exceptions of Nithard and Aethelweard, were clerks (*clerici*), usually monks and often schoolmasters. Some chronicles of the medieval period are clearly annalistic in form, being either jottings made on Easter tables or collections of items copied from such tables or from regnal or consular lists. The more famous chronicles are less severely chronological. As medieval historiography became less consciously religious, compilers injected some personality and style into their records. aping the scholastic classics, and they often discussed causes and topics without strict adherence to chronology. Their scribes described such works indiscriminately as *chronica* or *historiae*. In the main, however, chronicles continued to provide succinct dry records of indisputable events and phenomena such as legations, councils, coronations, deaths, earthquakes, eclipses and wars, securely set in a framework of time.

The Judaeo-Christian doctrines of chosen people and of divinely ordered classes, such as Levites and Scribes, provided the incentive for chronicling the activities of national, religious and local groups. The *Liber pontificalis* is a record of the see of Rome, arranged according to the reigns of popes; and almost every western diocese came to have its bishops' book. Cassiodorus and Jordanes composed histories of the Goths, Isidore of Seville of the Visigoths, Vandals and Suebi, Gregory of Tours of the Franks and Paulus Diaconus of the Lombards. In these works pure chronology often was sacrificed to larger, usually moral, purposes; the races which they described were each regarded as designed by God for a particular mission. Nevertheless, Gregory, for example. began his *History* from the time of Adam, including an epitome of Jerome's chronicle. Bede's *Ecclesiastical 'History of the English Nation* (731), despite the title and its marked contrast with his more scholastic chronicles, is similarly grounded; and it first introduced into historiography the Christian era of Dionysius. Otto of Freising in his chronicle to 1146 developed St. Augustine's theme of *The City of God*. Works like the *Liber historiae Francorum* (727) by an unknown monk of St. Denis are more purely chronographic. The so-called *Annals of Lorsch* (Frankish annals up to the year 829), composed by clerks of the royal chapel, show the rising interest of secular rulers in exalting their achievements and confirming their claims. These tendencies are even more evident in the *Annales Bertiniani*, composed by the prelates Prudentius of Troyes and Hincmar of Reims in the time of Charles II the Bald (d. 877). Newly converted peoples such as the Saxons, Poles, Hungarians and Scandinavians used historical writing to establish their place among nations. The Normans produced an unusually large number of chronicles, starting from those of Dudo of St. Quentin (*c*. 1000) in northern France and of Amatus of Monte Cassino (*c*. 1050) in southern Italy. Chronicles of pilgrimages were made from the 4th century onward, and the crusaders' chronicles were composed in a variety of forms not only by participants but by those who remained at home. The first vernacular chronicles were Anglo-Saxon, begun in the reign of Alfred the Great in England, and one version (MS. "E") was extended to 1154. Robert Wace chronicled the acts of the Norman dukes in 16,547 rhymed tetrameters of *romans*. Geoffrey of Monmouth purposely and deftly mingled the chronicler's and epic writer's styles in his *Historia Britonum*, thereby launching the Arthurian tradition.

Modern.—Although some historians of the later middle ages, such as Geoffroy de Villehardouin, Giovanni Villani and Jean Froissart, all of whom wrote in the vernacular, remained essentially chroniclers, the growing tendency to adopt an epic or discursive style paved the way for the revival of classical canons of form and criticism at the time of the Renaissance and Reformation. Yet the chronicle type of historical writing, based now on more exacting standards of scholarship, was continued by church historians such as Caesar Baronius, whose *Annales Ecclesiastici* (1588–1607) covered church history up to the year 1198. Moreover, from the 17th century onward, scholars began to publish great collections of the manuscript records and chronicles relating to their countries' past: for instance in France Dom Martin Bouquet brought out the first eight volumes of *Rerum Gallicarum et Francicarum scriptores* (1738–), and in Italy Ludovico Muratori was responsible for the series *Rerunz italicarum scriptores* (1723–51). Also, the Romantics at the end of the 16th century overcame the neoclassical distaste for chronicles, and even in fiction such titles as Sir Walter Scott's *Chronicles of the Canongate* (1.827) and Prosper Mérimée's *Chronique du règne de Charles IX* (1829) became acceptable. Finally. in the 19th century, governments were willing to subsidize the editing and publication of national records. Germany began the magnificent series *Monumenta Germaniae historica* (1826–). and Great Britain gave to a wide range of scholars the opportunity to investigate the country's past by bringing out the "Rolls Series" *(Chronicles and Memorials of Gveat Britain and Ireland,* 1858–96). By the combined study of these chronicles and of important record sources modern historians have some chance of formulating a realistic portrait of medieval times.

BIBLIOGRAPHY.—The Eusebius-Jerome chronicle was edited (1923) by J. K. Fotheringham; other early Christian chronicles are printed in *Chronica minora,* ed. *by K.* Frick (1892). For later chronicles *see* T. Mommsen (ed.) *Chronica minora* (1892–98), *i.e.,* vol. ix, xi, xiii of *Auctores Antiquissimi* in the "M.G.H. Series." Modern editions of some chronicles, with Eng. trans., are to be found in the series *Nelson's Medieval Classics* (1949–), ed. by V. A. Galbraith *et al. See* also Benedetto Croce, *Theory and History of Historiography,* Eng. trans. from 2nd ed. by D. Ainslie (1921); R. L. Poole, *Chronicles and Annals* (1926); F. CHRONICLES, BOOKS OF THE (in the Douai version of the Bible. Paralipomenon), two narrative books of the Old Testament written in Hebrew prose, except for one inserted canto from the Psalms (I Chron. xvi, 8–36). The name "Chronicles" derives from Jerome (*c*, A.D. 400), who explained the Hebrew title "Events of the Days" as "*Chronicon* of the whole sacred history." "Events of the Days" is an imitation of the titles of certain historical books referred to in the books of Kings; *e.g.,* "The rest of the acts of Ahab . . . , are they not written in the events of the days of the Kings of Israel?" (I Kings xxii. 39) and "acts of Jehoshaphat . . . written in the events of the days of the kings of Judah?" (I Kings xxii, 45). Similar references are found also in Chronicles itself. The imprecision of "Events of the Days" without any further qualification is due partly to the extent of the subject matter, for Chronicles begins with Adam and goes beyond the last king of Judah. Moreover, the real aim of the

author is to present a history of the Jerusalem "church."

Originally Chronicles and Ezra formed a single book, to which the book of Nehemiah was added later, parts of Ezra being dovetailed into the records of Nehemiah. Oddly enough, the order suggested by the sense (I Chron., II Chron., Ezra, Neh.) is not followed in the Hebrew text, where Ezra and Nehemiah come first, followed by Chronicles at the very end of the Old Testament. The reason why Ezra and Nehemiah were placed first is probably that in building up the canon they were regarded as more important in that they contained fresh information. That Chronicles were thus "left aside" may account for the choice of *Paraleipomena* ("Omissions") as the Greek title of the books, but the usual and perhaps correct explanation is that Chronicles contains stories, speeches and observations that were omitted from the parallel account in the books of Kings. On this view "Omissions" really means "Appendices" (*i.e.*, to the books of Kings). In the Septuagint, Chronicles comes next after the books of Kings and is followed by Ezra and Nehemiah, which is the order usually preserved in Christian translations of the Old Testament. The division into I and II Chronicles, which is unnecessary to the sense, also goes back to the Septuagint. In the middle ages it was even found in Jewish Bibles.

Contents.—Chronicles can be divided into four parts:

1. An extensive genealogy from Adam to Saul; *i.e.*, covering the story of Judah before the monarchy (I Chron. i–ix).
2. The fall of Saul and the rise and rule of David, together with instructions about worship and the building of the Temple (I Chron. x–xxix).
3. The reign of Solomon (II Chron. i–ix).
4. The story of Judah and Jerusalem from the division of the kingdom to the destruction of Jerusalem and the exile in Babylon (II Chron. x–xxxvi); in order to end on a positive note the first three verses of Ezra, which look forward to the return to Jerusalem, are inserted as a conclusion to Chronicles.

Relationship to Samuel and Kings.—Even from a translation of the Hebrew text it is easy to see that the chronicler (as the author of Chronicles is usually called) is closely dependent on I Sam.–I1 Kings for all but the first nine chapters of his work. Sometimes he even repeats the actual words of his model, though slight textual variations suggest that the Hebrew copy he had before him differed a little from that of the canon and corresponded to that which lies behind the Septuagint. A fragment of II Sam. found in the caves at Qumran shows such a text, which is closely related to that of the chronicler.

It was not only the books of Samuel and Kings, however, that the chronicler was able to consult. Writing no earlier than 350 B.C. (see below) he had at his disposal the books of the Old Testament from Genesis to II Kings, which were by then already included in one corpus; *i.e.*, he had the final version of the "priestly document" (Gen. to Num., plus the death of Moses in Deut. xxxiv) and the "deuteronomistic history" from Deuteronomy to II Kings (see PENTATEUCH). From the first of these two he took information about the sanctuary and the sacrificial and priestly office, from the second his most important historical material (the story of David and his successors) together with the judgments on religious offenses.

The leading theme of Chronicles, derived also from this second source and shared by the prophet Ezekiel, is that a person receives his deserts. Thus, if a king's reign is long and successful, this is the reward of God for a life led in obedience to his will. Conversely, a king suffers misfortune only if he has sinned. Thus the illnesses of Asa and Jehoram are punishments from God (II Chron. xvi; xxi), and Uzziah is afflicted with leprosy for a sin that is not recorded in the earlier tradition (II Kings xv, 3–5). The story of Manasseh provides a particularly good example of the chronicler's moralistic rewriting of history: the fact that Manasseh had a long reign in spite of his grave sins. which were punished by deportation to Babylon, is explained by his later repentance and the reform of his ways after he had been allowed to return (II Chron. xxxiii). Though the chronicler may have heard an oral tradition of Manasseh's tribute to Esarhaddon (and though perhaps Manasseh also was summoned to the king at Damascus), most of the story is his own free invention (cf. II Kings xxi, 1–17). The unfortunate end of the devout Josiah, who died in the battle of Megiddo, is accounted for by his failure to obey a command of God that had come to him from his enemy (II Chron. xxxv, 20–24; cf. II Kings xxiii, 29).

In the story of David and Solomon, whose portraits allowed of no shadow, the chronicler's solution was to leave out the stories found in the original (II Sam.–I Kings xi) that did not fit into his picture. David is, of course, king of all Israel; in the war with the Ammonites the murder of Uriah for the sake of Bathsheba is suppressed. No rising, not even Absalom's, against the rule of David is mentioned, and when sovereignty passes to David's son Solomon there are none of the disorders reported in I Kings i ff. The chronicler's omission of impeccably neutral information about Solomon (his judgments, division of territory, wisdom, poetry) probably is due to a desire to pass immediately from the divine confirmation of the kingship (II Chron. i) to Solomon's own great work, the building of the Temple. The description of the Temple differs in various points from that of I Kings vi ff., probably because the chronicler had in mind the newly rebuilt Temple of 515 B.C. The embarrassing fact that Solomon had to cede a piece of Israelite land to the king of Tyre in return for deliveries of cedar, etc., is completely transformed: the land becomes a gift from Hiram (Huram) to Solomon (II Chron. viii, 2). There is of course no mention of Solomon's foreign wives or his idolatry, which in the chronicler's source was the immediate reason for the end of the greater kingdom.

Although in several places the chronicler gives fantastic figures for Jewish as well as for enemy troops, it is the help of God, who marvelously intervenes, that is decisive in all Judah's victories. If the message of the prophets is attended to and the king's address to his people is filled with trust in God, then singers may lead the army, for the victory is with God: the enemy will be defeated or will destroy himself. Levites and singers are mentioned on various occasions (*e.g.*, the office of the Levites in connection with the ark), and it is not improbable that the chronicler was associated with these groups. It is a pointer in the same direction that he reports extensively on religious reforms and feasts (*e.g.*, II Chron. xxx, xxxv).

Since Judah and Jerusalem determine the theme, the chronicler mentions the northern kingdom and the kings of Israel only when warlike or friendly meetings make it absolutely necessary. Among the sermonlike addresses of the prophets and kings, those addressed to "the hostile brothers" (of the northern kingdom) are especially remarkable (*e.g.*, II Chron. xxx). They are told that they should join of their own free will the one true "church" of Jerusalem. Their secession was an error and their repentance will also contribute to the salvation of those deported from the northern kingdom. Thus Chronicles is an apologia for orthodox Judaism.

Other Sources.—The books of Samuel and Kings do not provide all the information that appears in Chronicles, so the existence of other sources has been suspected. The chronicler does in fact refer to certain documents, about which, as they have not survived, only speculation is possible. Among these allusions are: "So all Israel was enrolled by genealogies; and these are written in the Book of the Kings of Israel" (I Chron. ix, 1); "The acts of Asa, from first to last, are written in the Book of the Kings of Judah and Israel" (II Chron. xvi, 11); "Accounts of his [*i.e.*, Joash's] sons, and of the many oracles against him, and of the rebuilding of the house of God are written in the Commentary [Heb. *midrash*] on the Book of the Kings" (II Chron. xxiv, 27); "The rest of the acts of Abijah, his ways and his sayings, are written in the story [midrash] of the prophet Iddo" (II Chron, xiii, 22); and "Now the rest of the acts of Solomon, from first to last, are they not written in the history of Nathan the prophet, and in the prophecy of Ahijah the Shilonite and in the visions of Iddo the seer concerning Jeroboam the son of Nebat?" (II Chron. ix, 29). It has been suggested that the *midrash* (paraphrased in the Targum as "copy") on the book of Kings is a title of a later history of the kings, a collective name that includes all the other sources mentioned. But in that case, why was it necessary to

refer to the other sources under their separate names? A more probable theory is that the chronicler invented some of his material (perhaps the sermons) and drew some of it from oral tradition but tried to give the impression that such passages were in fact extracts from written sources in the style of Samuel and Kings.

In both the prologue and the main narrative there is material that has no didactic purpose — on wars (II Chron. xiv: xx; xxvi); on settlements (I Chron. iv); on cities of the Levites (I Chron. vi; cf. Josh. xxi); on fortifications. the armed forces. crown possessions and the succession (II Chron. xi–xii; xxi. 3; xxvi. 10–15; xxvii. 3 ff.). It is hard to decide how far this traditional material has undergone alteration and whether far more recent events may not have played a part in modifying it in individual cases Much suggests reminiscences of the great period of Judah's history under Josiah (*e.g.*, the list in I Chron. xxvii, 25–31, given there as the royal possessions of David).

Date. — Although Chronicles gives a unified impression at first glance, it is clear that the original work has been added to here and there at a later period. sometimes considerably. That is true, for example, of the genealogical prologue (I Chron. i–ix) in which the genealogies of David and Saul were originally missing. It is true also of a large section of David's religious observances. This is clearly shown by the repetition of I Chron. xxiii, 2 in xxviii, 1. Among the religious ordinances various layers are recognizable; I Chron. xxiv–xxv and xxvii are particularly late. perhaps dating from the Maccabaean period. But even the narrative itself is not of a single cast, as is suggested by various repetitions (*e.g.*, II Chron. xvii. 5 and xviii, 1; the intervening material has been added later). Whether these additions were made by a later chronicler is an open question.

If it is true that Chronicles, written as an apologia for orthodox Judaism, presupposes the opposition of Jews and Samaritans. the earliest date would be about 400 B.C. But the date must in fact be pushed forward somewhat since in the book of Ezra the chronicler has used a chronicle written in Aramaic (Ezra iv. 6–vi. 18) where the succession of the Persian kings has been confused (Xerxes in iv. 6; Artaxerxes I in iv, 7; Darius in iv, 24; and Artaxerxes II in vii 1). This is conceivable only at a time when precise knowledge of the period had been lost. The source containing information about the work and person of Ezra that was used in compiling Ezra vii refers, according to the modern view, to an event in 398 B.C. (seventh year of Artaxerxes II, Ezra vii, 8). The main part of Chronicles therefore cannot be placed earlier than the last 30 years of the 4th century B.C. The great crisis under the Seleucid Antiochus IV (the Maccabaean mars) would be too late a date, since the help of foreign (Persian) kings would then hardly have been so unreservedly praised The approximate date must be about 300 B.C. and for the final additions perhaps about 200 B C.

Religious Significance. — In this threefold work (I Chron., II Chron.. Ezra), which was an appendix to the record of the governor Nehemiah, the chronicler aims to show how the theocracy in Judah and Jerusalem came about. first through various well-deserved judgments of God but also, under the will of God, through the aid of the kings of Persia. The devout community worships joyfully in the Temple with sacrifice and praise. obeys the Law of bloses, now exalted to absolute greatness, and thus. sheltered and cut off from the world, achieves what one might almost call a static existence without history. For this reason the eschatological expectation is as good as totally missing. although this is proclaimed not only by the older prophets but also by Haggai and Zechariah, the prophets of salvation at the time of the rebuilding of the Temple (520 B.C.). Although the prophecy of Nathan about the house of David is repeated in I Chron. xvii, corresponding to II Sam. vii. neither there nor elsewhere is there any mention of the hope of a change. with political consequences, through the coming of the Messiah.

CHRONOGRAPH. A chronograph is (1) an instrument which makes a graphical record of a sequence of events accurately co-ordinated with the passage of time; (2) the complete instrumentation used for measuring the velocity of projectiles or. less commonly, other moving objects; or (3) an instrument (properly chronoscope) which gives a visual indication of the time between two events without making a graphical record Almost any oscillograph (*i.e.*, an instrument for indicating alternating-current wave form or other electrical oscillations) may be used as a chronograph if an appropriate time scale is provided.

A chronograph in the industrial sense is an instrument which can be used to measure elapsed time in terms of split seconds, seconds or minutes. In addition, some chronographs indicate day, month, year and phases of the moon on separate dials or openings which are superimposed on the face of the timepiece. A chronograph differs from conventional timepieces in that it performs a variety of functions other than just measuring mean time.

One form of chronograph is the stop watch commonly used in sporting events such as track, yachting, basketball or football (see WATCH). Another type is the instrument used in aircraft to record elapsed flying time. This is accomplished by means of a button which the pilot pushes as he takes off. setting the chronograph in motion. Upon landing he pushes the button again, stopping the instrument. The actual elapsed time is shown on the dial in terms of hours. minutes and split seconds.

Pilots can also use a chronograph as a navigational aid to tell what their ground speed is. To determine ground speed between two known points, either visually or by radio signal, a pilot merely has to look at his chronograph and see how long it took him to cover the distance. Stated another way. when time and distance are known factors, speed can be determined, or when speed and distance are known factors. time can be determined.

The first chronograph was invented in 1680 by Daniel Quare, an Englishman. It was a form of repeating watch which sounded the hours when a lever was pushed. The first ones were called "squeeze watches" because the owner had to push or squeeze a pin which protruded from the case. From this simple beginning came the present-day alarm watch which can be set to ring a bell or buzzer at any predetermined time.

In addition to the above uses, there are chronographs for virtually every function where measurement of time is important. For example, one form of chronograph is often used by doctors to tell them at a glance how often the pulse is beating. Another type is used by manufacturers to determine the length of time it takes to produce parts. The number and variety of modern chronographs is virtually unlimited. In many cases if a person wants a chronograph for a specific purpose. and the chronograph is not already on the market, it can be specially made. (R. F. S.)

ASTRONOMICAL CHRONOGRAPHS

Writing Chronograph. — For many years the commonest form of time-recording device in astronomical work was the writing chronograph. and instruments of this type were still widely used in the second half of the 20th century. A writing chronograph utilizes one or more pens, or scribers, writing on paper which moves at a uniform speed beneath them. Sometimes paper tape in roll form is used, while in other cases paper sheets are wrapped around cylindrical drums on which the pens draw spiral lines. The motion of the paper is actuated by weight-driven or electric motors, the speed usually being controlled by centrifugal governors. In the commonest form of the single-pen drum chronograph. the drum makes either one or two revolutions per minute. The pen is actuated by an electromagnet which is opposed by a spring. When the electric current flowing in the magnet is interrupted. the spring pulls the pen a short distance to the side, producing a jog in the line. A clock or chronometer is connected to produce timing signals, either on every second or on certain seconds of the minute.

When such a sheet is removed from the drum, the record for each minute (or half minute) appears as one line across the sheet, and the jogs in the line produced by the timing signals serve as marks for setting a scale. The timing signals should be of short duration so that they will interfere as little as possible with the signals being measured. In the usual forms of the single-pen chronograph it is possible to make measurements accurately to a hundredth of a second. When two pens are used, one of them serves to record the timing signals and the other records the signals which are being measured, thus eliminating interference between the two sets of signals. Several pens are used when signals from more than one source are recorded simultaneously.

Printing Chronograph. — Efforts to reduce the time required for analyzing the results of measurements with writing chronographs led to the development of printing chronographs. These devices generally print figures from rotating type wheels, which are periodically synchronized with a controlling clock by means of electric timing signals. In a typical instrument of this kind, three wheels alongside each other carry type to print the minute, second and hundredth of a second. The duration of the contact between the paper and the moving type wheels must be very brief. so as not to interfere with the continuous rotation of the wheels. This is generally accomplished by employing printing hammers which rebound quickly after pressing the paper against the type. One kind of printing chronograph, which was used at the U.S. Naval observatory, printed a series of small marks instead of figures. and the time to the nearest $\frac{5}{1,000}$ sec. was read from the positions of these marks.

Errors and Their Elimination. — Although the instruments so far described in this section are of much historical interest. they were becoming obsolete at mid-20th century because of their limited accuracy. Since they depend on the motion of mechanical parts. they cannot accurately measure intervals to a thousandth of a second By driving the writing chronograph at high speed and employing a light pen, its errors could probably be reduced to two or three milliseconds. but the work of measuring the record mould be burdensome. This work can, of course. be eliminated by the use of a printing chronograph. The accuracy of the old style printing chronograph is not very high, however, since the printing hammers have variable reaction times, and in addition there are errors resulting from the imperfect synchronization of the type wheels with the controlling clock.

The elimination of the errors which are caused by the moving mechanical parts has been made possible by the use of electron tubes and their associated equipment. These tubes make it possible for very feeble currents to control powerful ones without the use of mechanical relays, and with negligible time delay. Moreover, they have made possible a new type of timekeeper, the quartz-crystal controlled oscillator. In this device the vibrating crystal takes the place of the pendulum. Since the frequency of the crystal oscillations is high, a means is provided of dividing the second into small parts. Alternating current of various frequencies may be generated, making it possible to operate synchronous motors in unison with the crystals.

Spark Chronograph. — One of the earliest types of chronographs ahich was capable of accuracy to the millisecond was the spark chronograph. Instruments of this type perforate or mark the recording paper by means of electric sparks. Frequently the paper is waxed or chemically treated to make the record more legible. Such chronographs are particularly suited to making continuous comparisons of precision clocks. In a typical device of this kind, paper from a roll moves slowly under a row of 100 electrodes extending across the width of the paper. When a signal to be timed is received. a spark jumps from one of the electrodes through the paper to a fixed metallic ground strip. The position of the electrode from which the spark jumps indicates the time of the signal. In such a machine, designed by Alfred Loomis, an electric distributor connects the spark source with the electrodes in rotation. The period of rotation is $\frac{1}{10}$ sec.. therefore each electrode is connected during an interval of 1 millisecond. In an instrument designed at the U.S. bureau of standards, the distributor is eliminated, and a rotating cylinder with a spiral ridge is substituted for the fixed ground strip. The sparks then jump from the electrode nearest to the spiral ridge at the time. If clock signals on every second are used to trigger the spark, it will jump from the same electrode every tenth revolution of the distributor or cylinder, provided that the clock does not gain or lose with respect to the chronograph mechanism. A straight line of perforations will then appear on the paper. If the clock gains or loses, however, the line of perforations will move to the right or left across the paper. Signals from several clocks may be recorded simultaneously, and the relative gain or loss of each clock with respect to the others may be determined.

Strobotron Flasher. — One form of chronograph which does not make permanent records. but which makes possible easily made readings having errors of less than a millisecond, is the strobotron flasher. A glass dial is mounted on one of the shafts of the movement of a quartz-crystal controlled clock. The dial usually rotates once per second, and has a scale engraved near its periphery, divided into milliseconds, with each tenth division numbered. A microscope is mounted so as to give a view of a fixed reference line superimposed on a portion of the rotating scale. Since the dial rotates in a dark chamber, nothing is visible except when incoming signals cause a stroboscopic lamp to flash. Although the duration of each flash is less than $\frac{1}{100}$ millisecond, the persistence of vision makes it possible for the scale to be read. In fact, it is not difficult for a practised observer to estimate the tenth of a division. In this manner readings accurate to two or three tenths of a millisecond are possible.

Decimal Counter. — Another type of chronograph. which usually does not provide permanent readings but may be adapted to operate a printing mechanism, is the decimal counter. This device. which was introduced at the Royal Greenwich observatory, requires a high precision electrical oscillator that produces an alternating current of a frequency corresponding to the fraction of a second to which the measurements are to be made. A frequency of 100.000 cycles per second is often used. At the beginning of each second a signal from the controlling clock starts an electronic counter, which then counts the number of oscillations until a signal from another source stops the count. This count gives the decimal fraction of the second, according to the controlling clock, when the signal which terminated the count was received. The results of the count may be exhibited by an array of small neon lamps, arranged in rows of ten, or they may be shown in figures by a mechanical device.

Cathode-Ray Chronograph. — The U.S. Naval Research laboratory designed a device which exhibits a row of marks on the face of a cathode-ray tube once each second. Each mark in the row is produced one millisecond later than the mark to its left. By means of three dials it is possible to set the device so that the first mark in the series is produced at the beginning of the second, according to the controlling clock, or any number of milliseconds later. Any other signal may be superimposed upon the pattern of the marks, and its time of occurrence thereby measured.

This method is chiefly useful for the comparison of a clock with a radio time signal. Since the operator may see the actual build-up of the radio wave as it comes from the receiver. it is possible for him to judge the reliability of weak signals. The field of view may be photographed, thereby providing a permanent record of the radio signal pattern. (P. SR.)

CHRONOGRAPH EQUIPMENT

Chronograph equipment may be as simple as a stop watch or as complex as the means of co-ordinating observations made on a guided missile range covering thousands of square miles. The term may include the equipment used for observation as well as the recording instrument, but in all cases consideration of the characteristics of the observing equipment should influence the choice of recording equipment.

Consideration of a simple chronograph, a stop watch, will illustrate this point. A stop watch is used to record the elapsed time between two events. The observing device is a human being who must push a button starting the watch in reaction to the first event, and again push a button stopping the watch in reaction to

the second event. The possible errors in such a system include errors made by the observing instrument, the human being; error in the watch, either in starting or in its running rate; and error in resolution of the watch, *i.e.*, the error in accuracy to which it can be read. There is obviously little utility in providing a watch with a reading accuracy of $\frac{1}{100}$ sec. if the human is subject to errors of $\frac{1}{10}$ sec. More accurate chronographic equipment must reduce the errors in observation, in rate and in resolution.

Errors in observation in a system of chronograph equipment are illustrated in the discussion of velocity chronographs below. The range of accuracies available in rate and resolution may be illustrated by discussion of various chronographs.

Le Boulengé Chronograph. — The Le Boulengé chronograph, invented by Capt. Paul Émil le Boulengé of the Belgian artillery, was widely used for the measurement of short time intervals, particularly at ordnance proving grounds, up until the end of World War I. In this instrument the distance of free fall under the acceleration of gravity is used as the basis of time measurements. The first event, the start of the time interval to be measured, breaks the current in an electromagnet, allowing a weight, a long rod, to fall freely. The time t for the weight to fall a distance of s cm. is given in seconds by the equation obtained from the simple relation for the free fall of an object starting from rest, $s = 3gt^2$, by solving for t, *i.e.*, $t = \sqrt{2s/g}$, where g is the acceleration of gravity in centimetres per second per second and has a value at sea level ranging from 978.039 to 983.217 depending upon the latitude. The second signal, at the end of the interval, releases a second weight. This weight, in turn, releases a trigger, which allows a knife to fly out and mark the falling rod. If both weights are released simultaneously, the knife makes a mark at a distance s_0 corresponding to the dead time, $t_0 = \sqrt{2s_0/g}$. The actual time between the two signals is given by $t - t_0$. Under the conditions of measurement an error of $\frac{1}{1,000}$ in. in the measurement of the distances s and s_0 corresponds to an error of the order of $\frac{1}{20,000}$ sec. in the time. Because the actual errors are larger, the instrument has been superseded by other methods.

Aberdeen Chronograph. — The Aberdeen chronograph was developed during World War I for the U.S. army as a convenient and more accurate instrument than the Le Boulengé chronograph. It consists of a hollow cylindrical drum rotated by a synchronous motor operating from alternating current with an accurately controlled, or accurately measured, frequency of 60 cycles per second. A strip of waxed paper is held by centrifugal force against the inside surface of the drum and is marked by sparks that are triggered by the events being recorded. The sparks jump through the paper to the drum from sharp metallic needle points mounted close to the inner surface of the paper. The paper speed is exactly 1,500 cm. per second and an error of $\frac{1}{4}$ mm. in the measurement of the distance between two spark marks corresponds to an error of $\frac{1}{60,000}$ sec. An instrument of similar design with a more slowly rotating drum is used for measuring the time between the firing of a gun and the bursting of its explosive shell.

Galvanometer Chronograph. — The galvanometer chronographs include both direct-writing and photographic types. In the former, a pen is moved directly by a galvanometer in a direction perpendicular to the direction of motion of a moving strip of paper. Electric currents due to the events being recorded cause the pen, or pens, to be deflected and the events recorded. The paper may be driven at a constant known rate, as by a synchronous motor, or timing marks from a standard frequency generator may be traced by another pen. Both inking and electrical pens are used, the latter tracing on a special conducting paper by passing an electric current between the pen and a platen. The direct-writing types are generally limited in response to about 100 cycles per second, although with care a resolution of $\frac{1}{1,000}$ sec. may be attained.

In the photographic recording galvanometer chronograph, a light beam is reflected from the mirror of an oscillographic galvanometer to a photosensitive paper. (For a general discussion of galvanometers, *see* INSTRUMENTS, ELECTRICAL 'MEASURING.) A specialized version of this type is the drum-camera chronograph. In this instrument a strip of photosensitive paper is attached to the outer surface of a drum which rotates inside of a light-tight box, and at the same time moves slowly along its axis to prevent overlapping of traces made on successive turns. The reflected light from the galvanometer enters through a slit and makes a trace on the paper; deflections of the galvanometer are thus recorded. On the same record another galvanometer, driven by a standard frequency generator, produces time marks. The timing galvanometer is usually vibrated in the direction of motion of the photosensitive paper and with an amplitude such that the forward velocity of the beam of light, at the centre of its swing where it crosses the slit, is the same as that of the paper. Thus, during that phase of the motion, a sharp, intensely exposed line is produced on the paper, while in the opposite phase of the motion the light is not in contact with the paper long enough for production of a photographic image. Because of the lower mass of the moving parts, the photographic recording galvanometer chronographs have a considerably higher resolution than the direct-writing types, and time measurements with an accuracy of about ten microseconds may be achieved. In a more refined version of the drum-camera chronograph, the image of the luminous spot of a cathode-ray tube is focused onto the paper. The signals to be recorded are applied to the transverse deflecting plates of the cathode-ray tube and time marks are made by deflecting the beam at one-millisecond intervals to form short pips on the trace. From such a record. the time between two signals can be determined with an error of about two microseconds.

Raster Chronograph. — The accuracy and resolution of such a system is limited by the speed at which the photographic medium can be moved past the cathode-ray spot. In a modification designed to give greater time resolution, the cathode-ray beam is swept transversely to the motion of the photographic paper or film with a saw-toothed motion, at an accurately controlled frequency of 1,000 cycles per second. The signals are applied to the longitudinal plates, deflecting the beam in the direction of motion of the paper. Thus the linear distance on the record corresponding to 1 millisecond is equal to the amplitude of the sweep. The drum speed need be sufficient only to separate one sweep from the next. The resulting recording is similar to the raster (the pattern of scanning lines) of a television screen, and the instrument is called a raster chronograph. Measurement of the position of a signal along the sweep need be accurate only to 1 part in 100 to provide time resolution of 10 microseconds. A form of the raster chronograph which is capable of a tenfold higher resolution of time is one in which the cathode-ray beam scans the screen with several linear horizontal sweeps, each being separated from the preceding by a small vertical distance. The signals are applied to the vertical plates, and a photograph of the entire pattern is taken with an ordinary camera. If the lines of the raster are swept with a frequency of 10,000 saw-tooth cycles per second and the position of the signals can be determined within 1% of the sweep amplitude, the times can be determined within 1 microsecond. About 100 horizontal sweeps for a total time of 0.01 sec. are all that can normally be accommodated; this limits the usefulness of this type of device. In another form of raster chronograph which overcomes this limitation, a saw-tooth sweep of 10,000 cycles per second is photographed on 35-mm, film moving continuously. By this means a record lasting up to 100 sec. with a time resolution of 1 microsecond may be achieved.

Electronic-Counter Chronograph. — During the years just preceding World War II, and during that war, the electronic-counter chronograph came into use on an ever increasing scale. This device is based upon an electronic counting circuit first used by Wynn-Williams in England for counting radioactive rays registered by a Geiger counter. It has the great advantage that the time, in units of ten, or even of one, microseconds, can be read directly from the face of the instrument. The complete instrument consists of three parts: a crystal-controlled oscillator, which supplies consecutive pulses at the rate of 100,000 per second (or in the faster instrument at some higher rate), a gate circuit, which is opened by the signal from the first screen and is closed

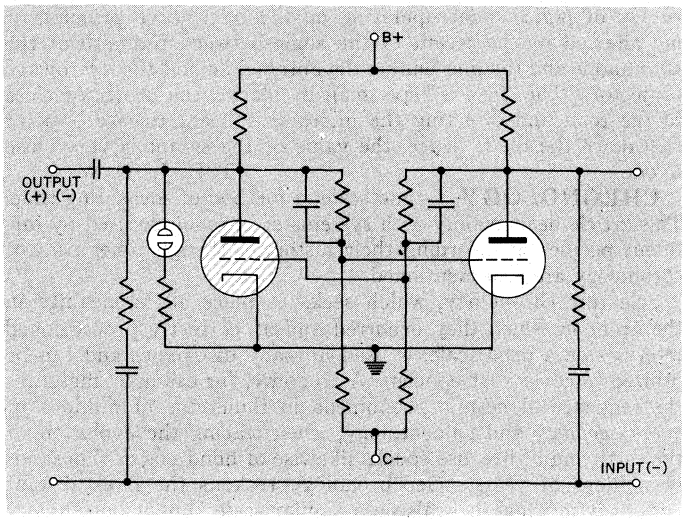

DIAGRAM OF ONE ELEMENT OF ELECTRONIC COUNTER CHRONOGRAPH (*see* TEXT)

by the signal from the second screen; and a counting circuit. which registers the number of pulses getting through the gate during the interval while it is open.

In its simplest form the counting circuit consists of a cascaded series of similar circuit elements, each of which may be called a binary pair. One such binary pair consists of two triodes connected together with resistors and capacitors in a so-called trigger circuit which allows one of the triodes to be in a 'conducting state while the other is held in the nonconducting state (see fig.). **A** negative pulse applied to the input point of the circuit reverses the state of the circuit, putting the triode which was formerly conducting into the nonconducting state. A small neon tube connected across one of the triodes glows when that side of the circuit is nonconducting. Finally, a negative pulse is generated by such a binary pair at every second alternation, and this may be used as the input pulse for the next binary pair in cascade. If a series of such circuits is restored to an initial state in which all neon glow tubes are extinguished. and a sequence of pulses is then fed into the input point of the first stage, the first lamp will glow after one pulse has been received, the second will glow after two pulses, the first and second will glow after three pulses, the third will glow after four pulses and so on. The total count is equal to the sum of a series of terms of the form 2^n where n has the values, *0,* 1, 2—etc., corresponding to the first, second, third, etc., stages, respectively, and only those terms are to be included in the sum for which the corresponding neon lamps are glowing. By a slight modification, a circuit containing 4 such stages may be made to recycle to the initial state after 9 pulses have been received, instead of after the 15th. as would be the case without the modification. Thus, four binary pairs can be made to form a decade counter and the resulting numbers come out in the decimal system. The conventional electronic-counter chronograph used for measuring the speed of projectiles contains four such decades and it is pulsed at the rate of *100,000* pulses per second. Its range of measurement thus extends from *0.00001* sec. to *0.1* sec. and it gives the time between two signals to the nearest 0.00001 sec. Other counting circuits have operated at more than 1,000,000 pulses per second, and *10,000.000* pulses per second may not be impossible to count in this way. Similar circuits are available using transistors. Pulse rates of *30–50* million pulses per second can be handled by these circuits.

(N. W. A.)

VELOCITY CHRONOGRAPHS

The velocity of an object can be determined by measuring the time required for the object to travel a measured distance and dividing the distance by the time. A velocity chronograph usually consists of two signaling devices and a chronograph proper. The signaling devices (called screens in military usage because of the Aberdeen screen described below) are designed to detect the passage of the object past either end of the measured distance, and the chronograph records the two signals resulting from the passage. Velocity chronographs are used primarily by the military for measuring the velocity of projectiles. However. the devices used by police for measuring the speed of automobiles are also velocity chronographs. A common signaling device for police use is a pneumatic tube laid across the road. A clock which is started and stopped by the pressure in the pneumatic tube serves as the chronograph. The police-radar chronograph operates on the same principle as the microwave Doppler chronograph described below.

In the design of a velocity chronograph, particularly for ballistic applications, the first consideration is the accuracy required. In many of the military applications, accuracies of *1* ft. per second are necessary. and with projectiles traveling as fast as *3.000* ft. per second. the error must be less than 0.03%. Various methods of time measurement have been devised, and accuracies to 1 microsecond or less are possible. If 1 microsecond is to be less than 0 03% of the total time. the total time must be at least *0.003* sec. At a velocity of *3.000* ft. per second, the distance must therefore be about *10* ft. measured to within 0 *003* ft. The distance between two screens *10* ft. apart can be measured to this accuracy, but because of uncertainties as to the position of the projectile when the screen gives a signal, it is generally advisable to use a longer base line.

Screens.—At least eight different types of screens have been used in the measurement of projectile velocities, the selection depending upon the conditions of the test and the accuracy required. One of the oldest is the Le Boulengé screen, a component of the Le Boulengé chronograph already described. This screen consists of a frame on which a fine wire is strung in many loops to form a fine network. A signal is produced when an electric current passing through the wire is interrupted as the projectile pierces the network. Since electrical contact may be made through the projectile itself. this type of screen is subject to excessive error. The mass of the wire itself may also appreciably change the velocity of the projectile. An improved version uses a grid of conducting ink on a thin sheet of paper.

The Aberdeen screen, first used extensively at the Aberdeen (Md.) proving ground of the U.S. army ordnance department, consists of two conducting foils separated by an insulating sheet. A signal is generated when contact is made between the two foils by the nose of the projectile. The screen has the advantage that it can be used many times. However. it may appreciably alter the velocity of the projectile, and there is intrinsic uncertainty about the time at which contact is first established.

The solenoid screen. widely used in many proving grounds, avoids the two main objections to the Le BoulengC and Aberdeen screens. It derives its signal from the voltage generated by magnetic induction when the magnetized projectile passes through a large circular coil of wire. The current induced in the circuit containing the solenoid coil flows first positively as the magnetic flux through the coil increases; when the magnetic centre of the projectile reaches the centre plane of the coil, the current reverses quickly and flows in the negative direction; finally. as the projectile recedes from the coil, the current falls gradually to zero. The sharp crossover from positive to negative current is generally used as the signal for marking the time of passage of the projectile. The exact position of the projectile at the time when this sharp crossover occurs is never known. It can be assumed, however, that the position of the projectile relative to the coils is not significantly different as it passes through the two successive coils There may be some error caused by differences in yaw of the projectile as it passes through the two coils, or by differences in the centring alignment of the coils with respect to the trajectory.

Electrostatic induction has also been used to produce signals. In this case the screen consists of an insulated loop of wire which forms an antenna through which the projectile passes after it has acquired a static charge of electricity. The potential of the antenna gradually rises as the projectile approaches; it reaches a maximum when the projectile is centred in the loop; and then it

falls again gradually to zero as the projectile recedes. By means of a suitable amplifier, the point of maximum potential can be converted into a pulse of short duration which serves as the desired signal.

Photoelectric screens have been used in two forms. In the telephoto screen an image of the silhouette of the projectile against the light background of the sky is projected by means of a lens upon an opaque disk containing a transparent slit at its centre. As the image passes over the slit, a photocell located behind the disk receives less illumination, and this causes a change in current through the cell. The sudden increase in illumination when the square base of the projectile image leaves the slit is converted in the amplifier into a sharp pulse which serves as the signal. This type of screen can be used with a 90-mm. or larger shell at distances of 200 ft. from the trajectory, and it thus forms a useful component of a field chronograph. It has the advantage of convenience in setting up, especially for firing tests at high angles of elevation. In another form of photoelectric screen the projectile is fired between a linear light source and a parallel slit behind which is mounted a photocell. When the light is cut off from the photocell by the shadow of the projectile there is a change in current which is used to generate a signal in much the same way as in the telephoto screen. This type of screen is used extensively in closed ranges for measuring velocities and drag coefficients of small-arms projectiles.

"Acoustic" screens operating from the impact of the bow shock wave of the projectile upon a microphone have also been used, but variations in the distance between microphone and trajectory introduce errors. The change in the angle of the bow wave with the velocity of the projectile is another source of error if the projectile experiences an appreciable change in velocity between the two screens.

Spark Photography. — For the most accurate measurements of velocity, the method of spark photography has distinct advantages (see PHOTOGRAPHY, SPARK). In one form the projectile is fired between a photographic plate and a spark gap. An acoustic pickup or one of the other forms of screens already described may be used to trigger the spark while the projectile is in front of the plate. The electric pulse generated by the spark constitutes a signal of less than one microsecond duration and the exact position of the projectile at the instant the spark is fired can be inferred from measurements made on the shadow of the projectile recorded on the plate. In another form, used by the German army during World War II, a photograph of the projectile was made with two stereoscopic cameras of conventional design using the light of an electric spark for illuminating the projectile against a dark background. After the plates were developed. the exact position of the projectile at the instant the spark was fired was reconstructed by reprojecting the images, using the cameras themselves as projectors. Again the spark served as a signal for the time measurements.

Microwave Chronograph. — The microwave Doppler chronograph differs from the velocity chronographs described above in that no screens are used. It is based upon the microwave techniques developed during World War II and has many advantages for field use. In this instrument electromagnetic radiations in the centimetre range of wave lengths are projected from behind the gun along a beam which intersects the trajectory and is as nearly parallel to it as the configuration of the gun will allow. Radiant energy reflected backward from the base of the projectile is modified in frequency by the Doppler effect (see LIGHT. Waves and Interference: Doppler *Effect*) and is received in the same instrument and allowed to beat against the outgoing frequency. Each of the resulting beats corresponds to an increment in the path of the radiation of one wave length of the initial frequency. Half of this distance multiplied by the secant of the angle between the trajectory and the line joining the projectile with the microwave projector is the corresponding distance through which the projectile has moved. In the microwave chronograph an electronic counter records the total number of such units of distance, while another electronic counter records the number of oscillations of a quartz crystal for measurement of the time. The accuracy of police radar operating on the microwave principle is not affected by the secant of the angle between the path of the automobile and the line joining the automobile and the microwave projector. The angle is kept small by placing the projector close to the road and directing the microwave beam toward a point well down the road; hence, the value of the secant is very close to one. (T. H. J.; N. W. A.)

CHRONOLOGY, a time scale, a method of measuring time. This article deals mainly with systems of chronology used by different peoples in recording their history, although other uses of chronology are also mentioned.

Scientific chronology, which seeks to place all happenings in the order in which they occurred and at correctly proportioned intervals on a fixed scale, is used in many disciplines and can be utilized to cover vast epochs. Astronomy, for example, measures the sequence of cosmic phenomena in thousands of millions of years; geology and paleontology, when tracing the evolution of the earth and of life. use epochs likewise of hundreds or thousands of millions of years. Geochronology reckons the more distant periods with which it deals on a similar scale; but it descends as far as human prehistoric and even historic times, and its shorter subdivisions consist only of thousands of years. (For details of these time scales, see COSMOLOGY; STAR; GEOLOGY; PALEONTOLOGY; GEOCHRONOLOGY.) Shortest of all are the chronological scales used in the recording of human events in a more or less systematic and permanent manner. They vary in scope, accuracy and method according to the purpose, degree of sophistication and skill of the peoples using them, as do the calendrical systems with which they are inextricably bound up; throughout this article, frequent reference therefore will be made to the article CALENDAR.

It is difficult to fix ancient historical chronologies in relation to scientific chronology. The terms of reference of ancient peoples were vague and inconsistent when judged by modern standards, and many of their inscriptions and writings have inevitably disappeared. The gaps in their records are increasingly filled in, and their inconsistencies removed, by the results of archaeological excavation. Guided by these findings, scholars can confirm, refute or amend chronological reconstructions already tentatively made. (See ARCHAEOLOGY.) Astronomical calculation and dating by radioactive carbon content are also extremely helpful in the work of fixing ancient chronologies (see RADIOCARBON DATING).

The article is organized as follows:

I. CHINESE

Chinese legendary history can be traced back to 2697 B.C., the first year of the Yellow Emperor. Huang Ti, followed by his many successors and by the Three dynasties, the Hsia (2205–1766 B.C.), the Shang (c. 1766–c. 1123 B.C.) and the Chou (c. 1122–256 B.C.). Recent archaeological findings, however, have shown that authentic chronology began with the Shang dynasty, though the exact date

of its end remains a controversial topic among experts. The oracle bone inscriptions of the last nine Shang kings (1324–1123 B.C.) record the number of months up to the twelfth, with periodical additions of a thirteenth month. and regular religious services on the summer and winter solstice days. which indicates the adjustment of the length of the lunar year by means of calculations based on the solar year. Individual days in the inscriptions are named according to the designations in the sexagenary cycle formed by the combination of the 10 celestial stems and 12 terrestrial branches (see CALENDAR : Chinese Calendar). Every set of 60 days is divided into six ten-day "weeks." Also recorded are numerous eclipses which can be used to verify the accuracy of the Shang chronology. In the oracular sentences of the last Shang king. Chou-hsin. the year of his reign is referred to as "the king's nth annual sacrifice."

From the beginning of the following (Chou) dynasty the word "year" was etymologically identical with "harvest." Thus, "King X's nth harvest" meant the nth year of his reign. The lunar month was then divided into four quarters—Clz'u-chi, Tsai-sheng pa, Chi-sheng pa and *Chi-szu* pa—and the practice of using the 60 cyclical names for the days was continued. Thus in the inscription on a Chou bronze vessel a typical date would read: "In the king's nth harvest, in the nth quarter of the nth month, on the day X-y, etc."

The tradition of recording events by referring to the king's regnal year continued until 163 B.C. when a new system, nien-hao (reign-year title), was introduced by Emperor Wen of the former Han dynasty (202 B.C.–A.D. 8). Thereafter every emperor proclaimed a new nien-hao for his reign at the beginning of the year following his accession (sometimes an emperor redesignated his nien-hao on special occasions during his reign). In order to date any event in Chinese history, it is necessary to convert the year in the period of the designated nien-hao into the western calendar.

During the Chou dynasty the civil year began with the new moon which occurred before or on the day of the winter solstice. This "first month" of the Chou year (Chou cheng) was equivalent to the eleventh month of the Hsia year (Hsia *cheng*) or to the twelfth month of the Shang year. The First Emperor (Shih Huang Ti) of the short-lived Ch'in dynasty (221–207 B.C.) made the year begin one month earlier; *i.e.*, with the lunation before the one in which the winter solstice occurred. The Ch'in year was continuously used until 104 B.C., when Emperor Wu promulgated the T'ai-ch'u calendar by reverting to the Hsia cheng; *i.e.*, by taking the third month of the Chou year, or the second lunation after the winter solstice, as the first month of the civil year. This lunar year (or Hsia cheng) was used till the last day of the Ch'ing or Manchu dynasty (1644–1912). When in 1912 the first republic was founded, the solar year was officially adopted, but successive governments kept the nien-hao tradition by referring any date to the number of years since the establishment of the republic; *e.g.*, 1948 was chronicled "the 37th year of the Republic." It was in 1949, when the People's Republic of China was proclaimed, that the old system was replaced by the Gregorian calendar.

(WU S.-C.)

II. HINDU

Two kinds of chronological system have been used in India by the Hindus from antiquity. The first requires the years to be reckoned from some historical event (frequently from the consecration or accession of a king or from the beginning of a dynasty). The second starts the reckoning from the position of some heavenly body. The historical system is the commoner in modern times, and exists side by side with Muslim and international systems successively introduced.

1. Reckonings Dated From a Historical Event.—The inscriptions of Asoka (mid-3rd century B.C.) give the first epigraphical evidence of the mode of reckoning from a king's consecration (abhiseka). In these inscriptions (Middle-Indian language in India or Greek and Aramaean in what is now Kandahar, Afg.) the dates are indicated by the number of complete years elapsed since the king's consecration. But the earlier existence of a reckoning of duration of reigns and dynasties is evidenced by the testimony of the Greek historian Megasthenes, who in 302 B.C. was the ambassador of Seleucus I Nicator, founder of the Seleucid empire, to the court of Chandragupta Maurya. Asoka's grandfather. According to Negasthenes. the people of the Magadha kingdom, with its capital, Pataliputra (Patna), kept very long dynastic lists, preserved, though with many contradictions and discrepancies. in the later Sanskrit puranas (legends of the gods and heroes) and later Buddhist and Jain chronicles. They generally indicate, in years or parts of years, the duration of each reign.

Similar records of other periods and regions exist, so that a relative chronology may be established. Unfortunately, it is not always possible to connect them with any absolute chronology. the precise dates of the reigns given being still unsettled. For example, in the Scythian period of the history of northern India, several inscriptions are dated from the beginning of the reign of Kanishka, the greatest king of the Asian (Kushan) invaders, but his dates are still uncertain (A.D. 78, 128–129, 144. etc., have been suggested for the beginning of a Kanishka era).

Other records give regnal years which can be linked with absolute chronology through other data; e g., those of several rulers of the Rashtrakutas of the Deccan. of the Pallava Tamil kingdom. etc.

The dynastic eras, founded by several rulers and kept up or adopted by others, are also numerous. The most important were: the Licchavi era (A.D. 110) used in ancient Nepal; the Kalakurikedi era (A.D. 248) founded by the Abhira king Isvarasena, first used in Gujarat and Maharashtra and later (until the 13th century) in Madhya Pradesh and as far north as Uttar Pradesh; then there were the Valabhi era (A.D. 318, employed in Saurashtra) and the Gupta era (A.D 319) used throughout the Gupta empire and preserved in Nepal until the 13th century These differed only in the starting point of the year—the month Karttika (October–November) for the first, Chaitra (March–April) for the second. Later came the era of the Thakuri dynasty of Nepal (AD. 595) founded by Amsuvarman; the Harsakala (AD. 606), founded by Harsha (Harshavardhana), long preserved also in Nepal; the western Chalukya era (A.D. 1075) founded by Vikramaditya Tribhuvana Malla and fallen into disuse after 1162; the Laksmana era (A D. 1118) founded by the king Laksmanasena of Bengal, still used throughout Bengal in the 16th century and preserved until modern times in Mithila; the Rajyabhisekasaka or Marathi era (1673), founded by Sivaji, but ephemeral.

Later, instead of the beginning of a reign or of a dynasty, the death of a religious founder was adopted as the starting point of an era. Among the Buddhists, the death of the Buddha and among the Jains the death of the Jina were taken as the beginning of eras. The Jain era (*virasamvat*) begins in 528 B.C. Several Buddhist sects (no longer existing in India) adopted differentdates for the death (nirvana) of the Buddha. The Buddhist era prevailing in Ceylon and in the Indochinese peninsula (Burma, Thailand, Laos. Cambodia) begins in 544 B.C.

Historical events. now obscure, were the basis of the two most popular Indian eras: the Vikramakala and the Sakakala.

The Vikrama era (58 B.C.) is said in the Jain book *Kalakakaryakathanka* to have been founded after a victory of King Vikramaditya over the Sakas. But some scholars credit the Scytho-Parthian ruler Azes with the foundation of this era. It is sometimes called the Malava era because Yikramaditya ruled over the Malava country, but it was not confined to this region, being widespread throughout India. The years reckoned in this era are generally indicated with the word *vikramasamvat* or simply *samvat.* They are elapsed years. In the north the custom is to begin each year with Chaitra (March–April) and each month with the full moon. But in the south and in Gujarat the years begin with Karttika (October–November) and the months with the new moon; in part of Gujarat the new moon of Ashadha (June–July) is taken as the beginning of the year. To reduce Vikrama dates to dates A.D., 57 must be subtracted from the former for dates before Jan. 1 and 56 for dates after.

The Saka or Salivahana era (A.D. 78), now used throughout India. is the most important of all. It has been used not only in many Indian inscriptions but also in ancient Sanskrit inscriptions

in Indochina and Indonesia. The reformed calendar promulgated by the Indian government from 1957 is reckoned by this era. It is variously alleged to have been founded by King Kanishka or by the Hindu king Salivahana or by the satrap Nahapana. According to different practices the reckoning used to refer to elapsed years in the north or current years in the south and was either solar or luni-solar. The luni-solar months begin with full moon in the north and with new moon in the south. To reduce Saka dates (elapsed years) to dates A.D.. 78 must be added for a date within the period ending with the day equivalent to Dec. 31, and 79 for a later date. For Saka current years the numbers to be added are 77 and 78. In the Republic of India the official Saka year is the elapsed year, starting from the day following that of the vernal equinox. A normal year consists of 365 days, while the leap year, now introduced. has 366. The first month is Chaitra, with 30 days in a normal year and 31 in a leap year; the five following months have 31 days. the others 30.

A Nepalese era (A.D. 879) of obscure origin was commonly used in Nepal until modern times. The years were elapsed, starting from Karttika, with months beginning at new moon.

Another era, the use of which is limited to the Malabar coast (Malayalam-speaking area) and to the Tirunelveli district of the Tamil-speaking area, is connected with the legend of the hero Parasurama. an avatar (incarnation) of the god Vishnu. It is called the Kollam era (A.D. 825). Its years are current and solar; they start from the entering of the sun into the zodiacal sign of Virgo in north Malabar, and from its entering into Leo in south Malabar. It is sometimes divided into cycles of 1.000 years reckoned from 1176 B C. Thus A.D. 825 would have been the first year of its third millennium.

2. Eras Based on Astronomical Speculation. — During the period of elaboration of the classical Hindu astronomy, which was definitively expounded in the treatises called siddhantas and by authors such as Aryabhata (b. A.D. 476), Varahamihira, Brahmagupta (7th century A D.), etc., were developed the ancient Vedic notions on the cycle of years embracing round numbers of solar and lunar years together. On the one hand, greater cycles were calculated in order to include the revolutions of planets, and the theory was elaborated of a general conjunction of heavenly bodies at 0° longitude after the completion of each cycle. On the other hand. cosmologists speculated as to the existence of several successive cycles constituting successive periods of evolution and involution of the universe. The period calculated as the basis of the chronology of the universe was the *maha* yuga, consisting of 4,320,000 sidereal years. It was divided into four yugas or stages, on the hypothesis of an original "Good Order" (dharma) established in the first stage, the krita yuga, and gradually decaying in the three others, the treta-, *dvapara-* and *kali-yugas*. The respective durations of these four yugas were 1,728,000, 1,296,000, 864,000 and 432,000 years. However, according to the astronomer Aryabhata, the duration of each of the four yugas was the same; *i.e.*, 1,080,000 years. The basic figures in these calculations were derived from the brahmanical reckoning of a year of 10,800 muhurta (see CALENDAR: Hindu Calendar), together with combinations of other basic numbers such as 4 phases, 27 nakshatras, etc. The movement of the equinoxes was at the same time interpreted not as a circular precession but as a libration at the speed of 54″ per year. It is in accordance with these principles that the calculation of the beginning of the kali yuga was done, in order to fix for this chronology a point starting at the beginning of the agreed world cycle. Such a beginning could not be observed as it was purely theoretical, consisting of a general conjunction of planets at longitude 0°, the last point of the nakshatra Revati (Pisces). It has been calculated as corresponding to Feb. 18, 3102 B.C. (old style), 0 hour, and taken as the beginning of the Kali era. In this era, the years are mostly reckoned as elapsed and as solar or luni-solar.

In Hindu tradition the beginning of this era was connected with (1) events of the Mahabharata war; (2) King Yudhisthira's accession to the throne; (3) 36 years later, King Pariksit's consecration; (4) Lord Krishna's death. Its years are still regularly given in Hindu almanacs.

An era resting upon a fictitious assumption of a complete 100-year revolution of the Great Bear (saptarsi) around the northern pole was the Saptarsi or Laulika era (3076 B.C.), formerly used in Kashmir and the Punjab. The alleged movement of this constellation has been used in purana compilations and even by astronomers for indicating the centuries.

Two chronological cycles were worked out on a basis of the planet Jupiter's revolutions, one corresponding to a single year of Jupiter consisting of 12 solar years, and the other to five of Jupiter's years. The second, the Brhaspatrikaka, starts, according to different traditions, from A.D. 427 or from 3116 B.C. Before A.D. 907 one year was periodically omitted in order to keep the cycle in concordance with the solar years. Since 907 the special names by which every year of the cycle is designated are simply given to present years of the almanac.

Side by side with Hindu and foreign eras adopted in India. several eras were created in the country under foreign influence, chiefly of the Mogul emperor Akbar: Bengali San (A.D. 593); Amli of Orissa and Vilayati (A.D. 592); Phasli (A.D. 590, 592 or 593 according to the district); Sursan of Maharashtra (599).

(J. L. A. F.)

III. EGYPTIAN

The chronology of ancient Egyptian history is still only imperfectly known. The Egyptians. like other ancient peoples, dated events not by an era but by the regnal years of individual kings. In the earliest dynasties, a recurrent cattle census provided the only dating criterion. Egyptian monuments only very rarely contain statements of a general chronological nature; for instance. the compiler of the Turin papyrus noted that 955 years had elapsed between the beginning of the 1st dynasty and the end of the 8th; the inscription of Mes estimates that 59 years have intervened between the death of Amenhotep III (1379 B.C.) and a date late in the reign of Horemheb: and a Ramesside stela commemorates the 400th anniversary of the founding of the Hyksos capital of Avaris by King Nubti. perhaps an early Hyksos ruler. Although the Egyptians themselves were meticulous chroniclers and kept full records of the succession of their Pharaohs and the length of reign of each in years, months and even days, and also compiled annals recording the main events of each year, most of this detailed information is lost. Only fragments survive in, for example, the Palermo stone, containing part of the annals of some early dynastic and Old Kingdom Pharaohs, and in extracts preserved in inscriptions of the New Empire, including the various king lists which have wholly or partly survived. The latest and most complete of these lists is the one compiled from older sources by the priest-historian Manetho in the 3rd century B.C. for the (lost) history of Egypt which he wrote in Greek for the king Ptolemy I Soter. This list is preserved in the works of the 3rd-century Christian chronologer Sextus Julius Africanus and of the church historian Eusebius of Caesarea and was re-edited about A.D. 800 by the Byzantine chronicler and ecclesiastic George the Syncellus in his Epitome of Ancient History. Manetho's transliteration of Egyptian names into Greek, further mutilated by the misspellings of copyists, renders it often difficult to identify his royal names with those of the monuments and the native king lists. Of the latter the most detailed and reliable is the Turin papyrus, which, like Manetho. arranged the Pharaohs into family groups or dynasties and gave the length of the reign of each; but this valuable document is in a sadly fragmentary condition and ends before the New Empire. Shorter lists containing kings' names alone were inscribed upon monuments; of these three survive: (1) the list of Thutmose III from Karnak, now in the Louvre museum, Paris, containing 61 names; (2) the list of Seti I from his temple at Abydos containing 76 names and copied by his son Ramses II; (3) the Saqqarah list of 58 names, found in the tomb of a Ramesside architect. These lists omit kings considered illegitimate or unimportant at the time of compilation.

Valuable though the king lists are to the historian, they have to be used with caution when attempting to reconstruct the chronological framework of Egyptian history; in certain epochs, for instance, it appears that rival kings or even whole dynasties, listed

consecutively by Manetho, were ruling at the same time. Contemporary monuments sometimes provide evidence of the exact length of a king's reign or of overlaps between the reigns of father and son resulting from coregencies (as when the 30th year of one Pharaoh is said to be the 10th of another). The autobiographies of nobles who held office under successive Pharaohs, the dates on the funerary stelae of Apis bulls which were born in the reign of one Pharaoh and died at a stated age in the reign of another, and even the quayside records of Nile levels can provide chronological data; sometimes the approximate age of the few surviving royal mummies can be estimated anatomically. With the aid of such data, a system of relative chronology can be tentatively reconstructed. and within this sequence may be placed all known rulers of importance. with the proviso that in times of divided rule and confusion, such as the First and Second Intermediate periods, even the names of some who claimed the title of Pharaoh may be missing.

It remains to establish an absolute chronology for Egyptian history in terms of universal chronology. Fixed dating points are obtained by various methods. There are a few synchronisms with dated events in the history of neighbouring peoples. These are especially valuable for the later history of Egypt: for example. the invasion of Palestine by Sheshonk I (Shishak) is fixed to about 930 B.C. by biblical and Assyrian evidence. and for the Ethiopian and Saite Pharaohs there are synchronisms with Assyrian kings whose dates are well established. Before the reign of Tiglath-pileser I (1116–1076 B.C.), however, the Assyrian king lists contain uncertainties, and synchronisms during the Ramesside period and earlier between Egypt and its neighbours can only be approximately fixed. Ramses II fought the Hittite king Mursili II and concluded a treaty with his successor Hattusili III in the 5th month of the 21st year of his reign; the peace is indirectly referred to in a letter written by Hattusili to the Kassite king Kadashman Kharbe III, whose dates are approximately known by links with Assyrian history. Similarly, the Amarna letters say that Amenhotep III died very shortly before Kadashman Kharbe II, and that both this Pharaoh and his son Amenhotep IV (Ikhnaton) were contemporaries of Ashur-uballit of Assyria. In the 13th dynasty. Pharaoh Neferhotep sent presents to a prince of Byblos who is mentioned in the archives of the last king of Mari shortly before the latter's defeat by Hammurabi of Babylon; this fact would be of more value were the date of Hammurabi not a subject of dispute among scholars.

Archaeological synchronisms, obtained when an Egyptian object is found in some neighbouring country in a dated context, or when a dated foreign import is found in Egypt, are of rare occurrence and give only approximate results. For example, Sumerian motifs and objects of the late phase of protoliterate civilization in Mesopotamia, called the Jamdat Nasr period, to the north of Babylon. are found in association with the latest predynastic culture in Egypt, but the time-bridge thus established can be estimated only to within a century or two. Early dates can be estimated by the carbon-14 method, but again the result is subject to a wide margin of possible error. Four samples of a cypress beam from the tomb of the Pharaoh Sneferu at Meydum when analyzed by this method gave an average age of 4802 ± 210 years; *i.e.*, they indicated that the king was buried probably between 3060 and 2640 B.C. The death of Sesostris III was similarly calculated at between 1850 and 1490 B.C., but in this case a more accurate date, 1843 B.C., with a margin of error of perhaps only four years, has been obtained by the use of astronomical calculations.

This last is the most valuable. because the most accurate, method of obtaining absolute dates in Egyptian history. Astronomical observations were made by the priests from very early times in connection with the festivals of astral deities, and a few of their results have been preserved. A papyrus at Leiden. for instance. gives the date of a new-moon festival as the 27th day of the 6th month of year 52 of Ramses II. The only possible years within the 13th century B.C. in which a new moon could have been observed on that date in lower Egypt are 1250, 1239 and 1228; other than astronomical considerations make the first of these dates the most probable. More valuable than such observations, however, are the dates recorded for the heliacal risings of Sothis or Sirius, the Dog star. During a brief period each year, after long invisibility, the star is visible about 42 minutes before sunrise. This reappearance coincides more or less with the annual rise of the Nile. and the festival of Sothis was therefore associated with this phenomenon. It is twice mentioned as occurring on a specific date in the civil calendar. One of the Kahun papyri states that Sothis rose heliacally on the 1st day of the 8th month of year 7 of Sesostris III; the date of this event can be calculated astronomically as falling between 1876 and 1864 B.C. The other Sothic date occurs in the Papyrus Ebers, which states that the festival of Sothis was celebrated on the 9th day of the 11th month of year 9 of Amenhotep I; *i.e.*, in approximately 1540 B.C. A third date, during the reign of Thutmose III, falls between 1474 and 1464 B.C., but here the regnal year is missing.

Thus with the aid of Manetho and the other king lists, especially the Turin papyrus, approximate dates B.C. can be obtained for the Middle Kingdom and for the earlier period of the New Empire. Yet even the Sothic dates are subject to possibilities of error that have led certain scholars to deny their validity for determining chronology In the first place Egyptologists are not unanimous that all ancient Egyptian observations of solar and related phenomena were made in the latitude of Memphis or Heliopolis. some consider that the capital city (sometimes Thebes and sometimes located in the Fayyum area or in the delta) was a more likely site. If Thebes and not Heliopolis had been the observation post. a reduction in date of about 20 years would result In the second place. the feast of Sothis may not have been celebrated on the day of the first viewing of the star, but on a subsequent day. after due preparation and when the star was visible for long enough to enable an adequate liturgy to be addressed to it. There is also doubt as to the actual length of the "Sothic cycle", *i.e.*, the period of 1,460 (4 X 365) years taken by the calendar to return to its starting point. (In fact, the figure of 1 460 years is too rigid and makes no allowance for variations in observation; it should rather be reckoned as between 1.460 and 1.456 years) In historical times the Egyptian year was divided into three seasons each containing four months of 30 days apiece. Observation of recurrent natural phenomena, however (whether of the annual rise of the Nile or of an annual cycle of lunar months). soon made it evident that a calendar of 360 (12 × 30) days was too short, and accordingly five epagomenal days were added at the end of the last month The resultant 36:-day civil year was convenient enough but still not accurate, for the true solar year is slightly longer; *i.e*, approximately 365¼ days

When this calendar was first devised, the rise of the Nile was heralded, perhaps by a heliacal rising of Sothis. on the 1st day of the 1st month of the season of Inundation, but as time went on an ever-widening gap separated the inundation from the calendrical New Year's day, and in time the season names, Inundation. Sowing and Harvest, ceased to correspond at all with the seasons themselves. Every four years, therefore, the festival of "the Going Up of Sothis" fell one whole day earlier: it was thus carried backward through the seasons until on the 1,461st year of the Sothic cycle the Dog star rose again on New Year's day and the two festivals once more coincided The Egyptians themselves, however, had no knowledge of such an era, nor did they base calculations upon it. But in the 3rd century AD. the Roman scholar Censorinus noted that in A D 139 the tno New Year's days had coincided, and backward calculations on the basis of a 1.460-year cycle give the dates 1321, 2781 and 4241 B.C as probable commencements for earlier "cycles." Many scholars consider that the calendar must have been invented about 2781 B C., which would bring it within the 2nd or 3rd dynasty Others. denying an astronomical origin for the civil calendar. would ascribe its invention to the 1st dynasty or to the genius of Imhotep, the minister of King Zoser in the 3rd dynasty.

In spite of doubts of the validity of Sothic dating and uncertainties due to lack of information on the lengths of the reigns even of some well-known Pharaohs, an approximate chronology for the latter half of Egyptian history is agreed Before the Middle Kingdom, all is still uncertain. The First Intermediate period, to

which Manetho gives four dynasties. may have been quite short, judging by the evidence of archaeology. Dates varying by as much as 100 or 150 years are given for the earlier dynasties of the Old Kingdom, while "Menes," the founder of the first dynasty of united Egypt. is variously dated. by archaeologists and historians, to 3200. 3400. 3100, 3000 and 2850 B.C. (M. S. DR.)

IV. BABYLONIAN AND ASSYRIAN

1. Mesopotamian Chronology, **747** to 539 **B.C.**—The source from which the exploration of Mesopotamian chronology started is a text called Ptolemy's canon. This king list covers a period of about 1.000 years, beginning with the kings of Babylon after the accession of Nabonassar in 747 B C. The text itself belongs to the period of the Roman empire and was written by a Greek astronomer resident in Egypt. Proof of the fundamental correctness of Ptolemy's canon has come from the ancient cuneiform tablets excavated in Mesopotamia, including some that refer to astronomical events, chiefly eclipses of the moon Thus by the time excavations began a fairly detailed picture of Babylonian chronology was already available for the period after 747 B.C Ptolemy's canon covers the Persian and Seleucid periods of Mesopotamian history. but this section will deal only with the period up to the Persian conquest (539 B.C.) which marks the end of Babylonian history

As regards the chronology of Assyria, the chief problem in the early years of Assyriology was to reconstruct a sequence for the period after 747 B C. This was done chiefly by means of the *limmu* lists, or eponym lists. several of which were found by early excavators. These texts are lists of officials who held the office of *limmu* for one year only, and whom historians also call by the Greek name of eponym. Annals of the Assyrian kings were being found at the same time as eponym lists, and a number of these annals, or the campaigns mentioned in them, were dated by eponyms who figured in the eponym lists. Moreover, some of the Assyrian kings in the annals were also kings of Babylonia and as such were included in Ptolemy's canon.

Good progress was therefore being made when. soon after 1880. two chronological texts of outstanding importance were purchased by the British museum. One of these, now known as king list A. is damaged in parts, but the end of it is well preserved, and this coincides with the first part of Ptolemy's canon, down to 626 B.C. The other text, the Babylonian Chronicle, also coincides with the beginning of the canon, though it breaks off earlier than king list A. With the publication of these texts the first phase in the reconstruction of Mesopotamian chronology was over. For the period after 747 B.C. there remained only one serious lacuna; *i.e.*, the lack of the eponym sequence for the last 40 years or so of Assyrian history. This had not been established by the early 1960s.

2. Assyrian Chronology Before **747 B.C.**—German excavations at Ashur, ancient capital of Assyria, yielded further eponym lists. By World War I the full sequence of eponyms was known from about 900 to 650 B.C. A further fragmentary list carried the record back to about 1100 B.C., and on this basis Assyrian chronology was reconstructed, with little error, back to the accession of Tiglath-pileser I in 1116 B.C. Failing another eponym list, a king list was needed for substantial further progress. King lists found at Ashur proved disappointing. Those fairly well preserved did not include figures for the reigns, and those with figures were very badly damaged.

In 1933, however, an expedition of The University of Chicago discovered at Khorsabad. site of ancient Dur Sharrukin, an Assyrian king list going back to about 1700 B.C. But for the period before 1700 B C the list is damaged and otherwise deficient; and Assyrian chronology prior to this date is far from clear

Before 747 B C it was the custom of the Assyrian kings to hold eponym office in their first or second regnal year. Thus in an eponym list the number of names between the names of two successive kings usually equals the number of years in the reign of the first of the two kings. It would have been easy to compile a king list from an eponym list. and there is evidence that this Assyrian king list was compiled from an eponym list probably in the middle of the 11th century B.C. As an eponym list is a highly reliable chronological source, since omission of a name entails an error of only one year, the king list. if based on one. will have preserved much of the structure of older eponym lists. now lost. (Except for one fragment. no known eponym list goes back further than the beginning of the 11th century B.C.)

3. Babylonian Chronology Before **747 B.C.**—The Old Babylonian period in Mesopotamian history starts with the fall of the last Sumerian dynasty, the 3rd dynasty of Ur, shortly before 2000 B.C. according to the chronology here adopted. But it should be remembered that more than a century was to elapse thereafter before the accession of Sumuabu, the earliest king yet known to have reigned in the city of Babylon.

In the long interval between the beginning of the Old Babylonian period and 747 B.C. there are two substantial gaps in chronology, each about two centuries long. The earlier gap is in the 2nd millennium and covers most of the 16th and 15th centuries: *i.e.*, approximately the years 1600–1400 B.C. The later gap is in the 1st millennium and runs from the short reign of Ninurta-kudurri-usur II in about 941 B.C. to the accession of Nabonassar in 747 B.C. During these gaps the names of most of the kings are known, as well as the order. but usually not the length. of their reigns.

For the interval between the two gaps king list A provides figures from the accession of Kurigalzu II in about 1345 B.C. to Ninurta-kudurri-usur II in about 941 B.C. Though exact figures are not available for the earlier half of the 14th century B.C., other sources, chiefly letters from Babylonian kings to the Egyptian kings Amenhotep III and Amenhotep IV (Ikhnaton) found at Tell el-Amarna in Egypt, yield a close chronological outline back to Kurigalzu I who was reigning in 1400 B.C.

During this period of Babylonian history. texts were dated by the regnal year of a reigning king, and a considerable number are dated to the reigns for which king list A provides figures. These texts confirm the king list to the extent that none is dated by regnal years higher than the figures in king list A except for Kudurri-Enlil. This indicates that at least for the period from which these texts date (*i.e.*, *c.* 1350–1050 B.C.) king list A is a reliable source, though not completely free from error. There is reason to believe that it omits the seven years of Assyrian rule under Tukulti-Ninurta I, and it is certain that the figure it gives for Kudurri-Enlil should be corrected from six to nine.

A second means of checking the reliability of king list A is provided by the chronicles. annals and other historical inscriptions which show that a given Assyrian king was contemporaneous with a given Babylonian king. There are no fewer than 15 such synchronisms between 1350 and 1050 B.C., and when king list A is compared with the Assyrian king list they all fit in easily. Only one of them, however. enables the beginning and end of the Babylonian reign to be closely determined in relation to the beginning and end of the corresponding Assyrian reign. This synchronism shows that the two-year reign of the Assyrian king Ashared-apil-Ekur (1076–75 B.C.) is entirely comprised within the 13-year reign of the Babylonian king Marduk-shapik-zeri. The Assyrian's dates are probably correct to within one year. Hence if Marduk-shapik-zeri be dated so that equal proportions of his reign fall before and after that of Ashared-apil-Ekur, a date is obtained for the former which should not be in error by more than six years. This synchronism constitutes a key to the structure of Babylonian chronology by providing the base date for all the reigns in the interval 1400–941 B.C. for which king list A gives figures. All the dates thus obtained, naturally, are subject to the six-year margin of error.

There is other evidence to show that the error is not likely to have been much greater. Thus the Babylonian material and the Tell el-Amarna letters show that Burnaburiash II came to the throne a little before 1380 B.C., and that the event occurred not long before the accession of Ikhnaton in Egypt. Quite independently the combined evidence of the Egyptian material and the Hittite records yields about 1379 B.C. as a closely correct date for the accession of Ikhnaton.

As regards the chronological gaps in the 1st and 2nd millenniums B.C., there are some fairly close approximate dates for the kings of Babylonia between 940 and 747 B.C., although no figures are

available for their reigns. This is because there is plenty of information on the chronology and history of Assyria during this period, and a number of the Babylonian kings then reigning are mentioned in connection with wars and treaties between Assyria and Babylonia.

The gap in the 2nd millennium, however, is not so easy to fill. The number of Babylonian kings between Karaindash and Kurigalzu II (c. 1345) shows that Karaindash must have died very soon after 1420. the date of the accession of the Assyrian king Ashur-bel-nisheshu, a contemporary of Karaindash. Similarly the number of kings and generations between Burnaburiash I and Karaindash renders improbable a date after 1500 B.C. for the former. On the other hand a synchronism between him and the Assyrian Puzur-Xshur III makes it difficult to date Burnaburiash before 1550 B.C. There is reason to believe that the Kassite king Agumkakrime was reigning about 24 years after the end of the 1st Babylonian dynasty, uhich the Kassites had overthrown; but his exact position within the Kassite dynasty is uncertain, though his father, Tazzigurumash, was the sixth or seventh king of that dynasty. Finally, it is known that a son of Burnaburiash I, Ulamburiash, brought to an end the dynasty of the Sea Land. a country near the Persian gulf which had broken away from Babylon. This dynasty. in king list A. follows on the 1st dynasty of Babylon, although in fact it began during the reign of Samsuiluna, the sixth king of the 1st dynasty. Whether any of the kings of the dynasty of the Sea Land ever ruled over Babylon is very uncertain.

These are the only significant chronological landmarks within the gap which follows the end of the 1st dynasty. The fact that the magnitude of this gap is uncertain constitutes the main problem in the chronology of the 2nd millennium B.C., and it affects also the chronology of the preceding, Sumerian period. The problem is not yet solved. Observations of the planet Venus made during the reign of King Ammi-saduqa, less than 50 years before the end of the 1st dynasty, permit only certain possible dates for his reign. Translated into dates for the end of the dynasty, the three most likely possibilities are 1649, 1595 and 1587 B C. Space will not allow discussion of the evidence, which is not conclusive, and leaves uncertain what choice should be made among the three. The chronology adopted here is based on the second of these dates for the end of the 1st Babylonian dynasty; *i.e.,* 1595 B C.

Prior to this gap in the 2nd millennium B.C. there is a period of five centuries with a well-established chronological structure. All the kings in the major city-states are known, as well as their sequence and the length of their reigns. Which sets of dates should be assigned to these reigns, however, depends on the date adopted for the end of the 1st dynasty of Babylon. This period of five centuries extends from the beginning of the 3rd dynasty of Ur to the end of the 1st dynasty of Babylon; *i.e.,* on the chronology adopted here. 2113–1595 B.C. During this period the Babylonians dated their history not by regnal years but by the names of the years. Each year had an individual name, usually from an important event which had taken place in the preceding year. The lists of these year names, called year lists or date lists, constitute as reliable a source in Babylonian chronology as do the eponym lists in Assyrian chronology. One of the events which almost invariably gave a name to the following year was the accession of a new king. Hence the first full regnal year of a king was called "the year (after) NN became king." In Assyria the number of personal names in an eponym list between the names of two successive kings normally equaled the number of years in the reign of the first king; and similarly in Babylonia the number of year names between two year names of the above kind nearly always equaled the number of years in the reign of the first king. Just as in Assyria the eponym lists are almost certainly the source of the king lists. so in Babylonia the king lists are based on the year lists. Several of these king lists, compiled at a time when the year lists were still in use, survive. One gives the 3rd dynasty of Ur and the dynasty of Isin, another gives the dynasty of Larsa. Both may be school texts.

The 3rd dynasty of Ur and the dynasty of Isin also figure in the Sumerian king list, which reaches far back into the Sumerian period. The original version probably ended before the 3rd dynasty of Ur, but later scribes brought it up to date by adding that dynasty as well as the dynasty of Isin.

The figures for the 1st dynasty of Babylon are missing in king list A but are given in another list, known as king list B. In the older source from which king list B was copied some of the figures for the kings of the 1st dynasty were damaged, and the author of king list B tried to make good this deficiency by substituting estimates. The 1st dynasty is, however, so well represented in the year lists that its chronology is known in almost every detail.

For two other important, cities in the Old Babylonian period, Eshnunna and Mari, there are neither king lists nor year lists, but only synchronisms with the city of Babylon at the time of Hammurabi. These synchronisms provide a basis for an outline at least of the chronology of those two city-states. (M. B. Ro.)

V. JEWISH

The era at present in vogue among the Jews (*lizira* or *libri'* ath *'olam;* from the creation of the world, *i.e., Anno Mundi,* abbreviated to A.M.) came into popular use about the 9th century A.D.; it is traceable in dates recorded much earlier. This era has five styles conventionally indicated by Hebrew letters used as numerals and combined into mnemonics, which state the times of occurrence of the epochal mean conjunctions or *moladim* (see CALENDAR: Jewish Calendar) or the orders of intercalation in the 19-year cycle or both. These mnemonics are as follows:

1. For the first style, DKTH (= 4th day of the week, 20 hours counted from 6 P.M., 408 *halaqim, i.e.,* 22⅔ minutes in the 21st hour).

2. For the second style, BHRD (= 2nd day, 5 hours, 204 *h.)* and GWH·DZT (indicating the years 3, 6, 8, 11, 14, 17 and 19 as leap years).

3. For the third style, WYD (= 6th day, 14 hours, 0 h.) and BHZYGWH (*i.e.,* years 2, 5, 7, 10, 13, 16 and 18 are leap years).

4. For the fourth style, GKBTT'W (= 3rd day, 22 hours, 876 h.) and *'DWTBHZ* (years 1, 4. 6, 9, 12, 15 and 17 are leap years).

5. For the fifth style, GBGGGBG (*i.e.,* the intervals between the leap years in the 19-year cycle are 3, 2, 3, 3, 3, 2 and 3 years, so that the years 3, 5, 8, 11, 14, 16 and 19 are leap years).

The respective epochs of these styles fall in the years 3762–3758 B.C., inclusive. By about the 12th century A.D. the second style, that which is in use at the present day, whose epoch is on Sunday (= Monday, because of the Jewish way of beginning the calendar day at 6 P.M.), Oct. 7, 3761 B.C., superseded the other styles of the era *Anno Mundi.*

The styles of this era arise from variations in the conventional rabbinical computation of the era of the creation. This computation, like hundreds of other calculations even more variable and no less arbitrary, is founded on synchronisms of chronological elements expressed in the terms of biblical and early postbiblical Jewish eras.

The biblical era *Anno* Mundi underlies the dating of events (mainly in the book of Genesis) prior to the Exodus from Egypt. This period of biblical chronology abounds in intractable problems. These are due: (1) To discrepancies between the Jewish and Samaritan Hebrew texts and the Greek version known as the Septuagint. From the creation to the birth of 'Abraham there are 1,946 years according to the Jewish Hebrew text, 2,247 years according to the Samaritan Hebrew text and 3,412 years according to the Septuagint. (2) To apparent inconsistencies in some of the synchronisms. For example, the period of the Egyptian bondage of Israel is given as 400 years (Gen. xv, 13), 430 years (Ex. xii, 40–41, Hebrew text) and 435 years (Ex. xii. 40–41, according to some manuscripts of the Septuagint) ; none of these figures seems to be reconcilable with the data (Ex. vi, 16–vii, 7) about the length of the life of Moses' ancestors and about his age at the time of the Exodus. (3) To uncertainties about the method of reckoning; *e.g.,* whether predating or postdating is used, etc.

During the period from the Exodus to the founding of Solomon's Temple, the only continuous biblical era (chiefly in the remaining books of the Pentateuch) is the era of the Exodus. With regard to a crucial date expressed in this era—"In the four hundred and eightieth year after the people of Israel came out of the land of

Egypt. in the fourth year of Solomon's reign over Israel, in the month of Ziv, which is the second month. he began to build the house of the Lord" (I Kings vi, 1)—there is again a discrepancy between the Hebrew text and the Greek of the Septuagint Other problems to be met nith during this period are due to the obscurity of chronological data in the book of Judges and in I and II Samuel.

During the following period, the Bible uses the eras of the regnal years of monarchs (the kings of Judah, Israel and Babylon) and of the Babylonian exile. This period of biblical chronology likewise poses numerous problems, mainly due to apparent inconsistencies of the synchronisms; e g., in the period from the accession of Rehoboam of Judah and of Jeroboam of Israel to the fall of Samaria "in the sixth year of Hezekiah [of Judah], which was the ninth year of Hoshea king of Israel" (II Kings xviii, 10) the years of the reigns of the southern kingdom exceed those of the northern kingdom by 25 years.

The biblical data might be easier to harmonize if the occurrence of coregencies were assumed. Yet, as an ever-variable factor, these evidently would not lead to the determination of the true chronology of this period. and scholars therefore seek additional information from sources outside the Bible. Such a source has been found in the inscriptions on Assyrian monuments, which are dated by the so-called eponym lists. Substantial use also has been made of the data in the king list known as Ptolemy's canon (compiled in the 2nd Christian century) commencing in 747 B C. with the reigns of the Babylonian kings (see above, *Babylonian* and Assyrian). However, scholars differ widely in their interpretation of a great many details, and numerous chronological problems remain altogether unsolved. Only a few dates in this period can be fixed mith any degree of confidence.

After the Babylonian exile, as evidenced by the data in the Bible and the Aswan papyri. the Jews reckoned by the years of the Persian kings. The chronological problems of this period are due to the apparent disorder in the sequence of events related in the biblical books of Ezra and Nehemiah and to the difficulty of identifying some of the Persian kings in question. For example, the King Artaxerxes of these books may stand for Artaxerxes I Longimanus (reigned 465–424 B C), for Artaxerxes II Mnemon (reigned 404–359 or 358 B.C.) or, in the case of Ezra at any rate, for Artaxerxes III Ochus (reigned 359 or 358–338 or 337 B.C.).

From the Grecian period onward. Jews used the Seleucid era (especially in dating deeds: hence its name *Minyan Shetaroth*, or Era of Contracts). In vogue in the east until the 16th century and possibly still used by some Yemenite Jews, this is the only Jewish era of antiquity that survived. The others soon became extinct: they mere the national eras dating (1) from the accession of the Hasmonaean princes (e g , Simeon the Hasmonaean in 1431 142 B.C); and (2) from the anti-Roman risings ("era of the Redemption of Zion") in the years 66 and 131 of the common (Christian) era. Dates have also been reckoned from the destruction of the Second Temple (*lehorban* hab-bayith). The various styles of the latter, as also of the Seleucid era and of A.M , have often led to erroneous conversions of dates The respective general styles of these eras correlate as follows: 3530 A M. = year 381 of the Seleucid era = year 1 of the Era of the Destruction = year 69/70 of the common (Christian) era.

The earliest Jewish chronologies have not survived. Of the work of the Alexandrian Jew Demetrius (3rd century B.C), which deduced Jewish historical dates from the Scriptures, only a few fragments are extant. In the Book of Jubilees, events from the creation to the Exodus are dated in jubilee and sabbatical cycles of 49 and 7 years. Scholars differ as to the date and origin of this book (see CALENDAR: Jewish Calendar). The era of the creation therein is unlikely to have been other than hypothetical

The earliest and most important of all the Jewish chronologies extant is the Seder *'Olam* Rabbah, transmitted. according to talmudic tradition, by Rabbi Jose ben Halafta in the 2nd Christian century. The author, whose date is unknown. was possibly the first to use the rabbinic Era of the Creation. His chronology extends from the creation to Bar-Cochba in the days of the Roman emperor Hadrian; but the period from Nehemiah to Bar-Cochha (*i.e.,* from Artaxerxes I or II to Hadrian) is compressed into one single chapter. The Persian phase shrinks to a mere 54 years. the variant reckoning of 250 years being corrupt (the typographically similar Hebrew numerals *RN* and *ND,* or 250 and 54, are easily confused).

The smaller work *Seder 'Olam Zuta,* probably written in the 8th century A.D., completes the Rabbah. It aims to show the Babylonian exilarchs, of whom it enumerates 39 generations, as lineal descendants of David.

Megillath Ta'anith ("Scroll of Fasting"), although recording only the days and months of the pear without the dates of the years, is nevertheless an important source for Jewish chronology. It lists events on 35 days of the year which have been identified nith events in five chronological periods: (1) pre-Hasmonaean; (2) Hasmonaean; (3) Roman (up to A.D. 65); (4) the war against Rome (65–66); (5) miscellaneous. The authors, or rather the last revisers, are identified mith Zealot partisans guided by Hananiah ben Hezekiah ben Gurion and his son Eliezer. A Latin translation exists. (ER WI.)

VI. GREEK

The concept of chronography, *i.e.,* of fixing the time-sequence of past events, did not develop in Greece until about the mid-5th century B C. The difficulties which therefore surrounded the chronology of earlier Greek history were recognized by Thucydides, writing at the end of that century. and the only modern advantage in overcoming them is the existence of archaeological evidence, which can be used side by side with the literary sources but which also raises its own problems of interpretation.

The first theories about the dating of earlier Greek history were developed chiefly through the study of various lists, such as those of the Olympic victors drawn up by Hippias of Elis, of holy officials such as the Argive priestesses, or secular ones such as the Athenian archons (both used by Thucydides and others) and genealogies of royal and aristocratic families such as the Spartan king lists.

1. Spartan King Lists.—The Olympic victor lists were distrusted even by Plutarch; and it is doubtful whether by 776 B.C., when they purport to begin, writing was current in Greece. so that the names were probably recorded only in oral tradition.

An indication of how far the Spartan king lists were used by ancient historians and how far they were reliable may be found in the fact that while Herodotus. writing in the 5th century. places the lawgiver Lycurgus in the Agiad royal line. later writers, including Ephorus (writing in the 4th century) place him in the Eurypontid line, showing that there cannot have been agreement as to the content of these lists, or that information in them was liable to be distorted. Some names too are clearly fictitious; *e.g.,* Lycurgus' father, Eunomos ("of good laws"), is clearly a reference to Lycurgus' lawgiving. Names earlier than Agis and Eurypontus. eponyms of the royal lines, may be mere inventions to synchronize with other genealogies, as well as to explain the names of the three tribes and the existence of the double kingship. Archaeology. however, shows that the dating given for the Trojan War and the great migrations (traditionally known as "the Return of the Heraclidae"). which was certainly related to the Spartan king lists, was approximately correct. The chronological scheme of Eratosthenes dates the Trojan War to 1192–83 B.C., the Thessalian and Dorian migrations to 1124–04; before him. Thucydides dated the Dorian invasion to the 80th year after the fall of Troy (probably both reflected Hellanicus, who had written a history of Troy).

The evidence of imported Mycenaean pottery fixes the end of the period of the settlement of Troy VIIa (identified with the Troy of Priam and of the Trojan War) at about 1250 B.C. This agrees well enough with the date given by Herodotus and is not irreconcilable with the scheme of Eratosthenes if allowance is made for different estimates of the length of a generation Archaeological evidence also supports the placing of the date of the migrations some time after 1200. It remains doubtful. however, whether the king lists were adapted to fit ancient tradition about those dates or whether they were themselves substantially reliable in spite of detailed anomalies.

2. Athenian Archon Lists.—The Athenian archon lists for the early period were based chiefly on the traditions of the aristocratic families such as the Alcmaeonidae and Pisistratidae and on the body of popular legend. Tradition could supply a framework for accurate dating, for example, the chronology of the Pisistratid tyrannies in Herodotus, and this was worked up in the 4th–3rd centuries B.C. by the Atthidographers, writers like Androtion and Cleidemus who wrote histories of Attica. But one important question is how the archon names were linked to events. since the list as a rule did not contain annotations. In some cases. such as the dating of Cylon to the archonship of Megacles, the two names were evidently linked in the tradition, but there must have been various blocks of dates whose relationship with each other would remain in doubt. One case in which they may have been wrongly related is the supposed 30-odd-year interval between Solon (archon 594–593 or 592–591) and the first tyranny of Pisistratus (561–560) in the Attic tradition, which is filled in with "anarchies" (i e., years in which there was no archon). Many scholars would like to bring down the date of the Solonian reforms (whatever they may have been) to about 575, which would also relate Solon more easily to Croesus. Amasis and Philocyprus, as Herodotus does. It is unlikely that for the period of the tyrannies and before the reforms of Cleisthenes any help was given by extant decrees in pinpointing dates, and the so-called "laws of Solon" were simply the body of old laws prior to the revision of 410–403. The difficulty of forming a sound chronology even for a period almost contemporary is shown by the problems encountered by Thucydides in the chronology of the period known as the Pentekontaetea or Fifty Years (480–431); and Thucydides also criticized the method of dating by relation to eponymous officials, which allowed a wide margin of inaccuracy because the various eponyms took office at different times of the year and because the official and campaigning years did not coincide and could therefore be confused; for example, a period dated by two eponymous officials might cover a few weeks or nearly t o years. When dates could not be extracted from the tradition and were based solely on calculation, they are now known to be generally wrong; an example is Herodotus' dating of Gyges, tyrant of Lydia, which the Assyrian records show to be 40 years too early. Genealogical tables with their exclusively "father to son" descent and equalized generations are too schematic to carry historical weight, except insofar as they may reflect a genuine tradition with which they have been synchronized.

3. Checking Dates Calculated by Ancient Historians.—This is often difficult because of the fragmentary state of surviving texts and the loss of most of the relevant lists (though, for instance, a fragment of the Athenian archon list has survived) In many cases the interpretation of earlier datings depends upon the evidence of later chronographers. and much of the most valuable chronographical work, such as that of Eratosthenes, survives only at second hand, through Diodorus or Eusebius, the Parian chronicle (*qq.v.*) and "Suidas." It is then necessary to distinguish between the sources of these late works in order to evaluate their various datings. Eusebius, for example, being bedeviled by his desire to correlate all history with the Bible. This. again. is quite apart from the further difficulty of determining what figures are intended, which is frequently uncertain as a result of the corruption of the texts (see below, Christian).

4. Contribution of Archaeology.—Archaeology has furnished much of modern knowledge of Greek prehistory from Neolithic times onward. both adding to, confirming and checking other sources such as the Homeric and other poems, myths and histories. This knowledge has been acquired both through direct excavations, such as those at Knossos. Mycenae, Troy. Pylos and Korakou. and also by comparison with the archaeology of Egypt and the near east, which provide most of the links of Greek to world history and are thus most important for chronology. The evidence of archaeology has also been helpful for 7th- and 6th-century chronology (for example in checking foundation dates of colonies) and has made possible, *e.g.*, the dating of the introduction of hoplite warfare, on nhich depends much modern interpretation of mainland history from the 8th to the 6th centuries. (X.)

VII. ROMAN

The establishment of a sound chronology for Roman history, as for Greek, depends on the assessment of the evidence available. which falls into two categories, literary and archaeological.

1. Literary Evidence.—Although by the late 3rd century B.C. Eratosthenes was working on the systematization of chronography. and a series of learned historians had used the documentary method —notably. for Roman history, Timaeus (*q.v.*) of Tauromenium, to whom are probably due many of the synchronizations of Roman history with Olympiads—unfortunately this tradition of documentation and concern for chronology did not immediately pass over into Roman historiography. According to Cicero in De *oratore,* the earliest Roman historians did no more than "compile year-books"; for example, Fabius Pictor in the late 3rd century B.C., L. Calpurnius Piso in the 2nd and the so-called "Sullan annalists" in the 1st (see ANNALISTS). Of these authors it is possible to judge only at second hand, and only those of the 1st century were much used directly by the historians whose work survives in any quantity, notably Livy, Dionysius of Halicarnassus and Diodorus Siculus. In these authors, as in other 1st-century historians such as Sallust, there is little concept of documentation or research other than comparison of literary sources: for none was chronology a direct concern, and in many cases dramatic effectiveness and validity as *exemplum* would take priority over fidelity to truth. Apart therefore from the Greek Polybius, who treated the rise of Roman power in the Mediterranean from 264 to 146 B.C. and regarded himself as the successor of Timaeus, it mas not until Cicero's time that the conception of historical scholarship developed in Rome. Cicero's friend Atticus not only was concerned to draw up a chronological table in his Liber *annalis* but had undertaken research to that end, and the great scholar M. Terentius Varro and a little later the learned M. Verrius Flaccus produced a vast body of erudite work, nearly all lost. To this source must probably be ascribed the Fasti *Capitolini,* a list of magistrates from the earliest republic to the contemporary period, set up in the regia (the office and archive of the *pontifices*) at the end of the 1st century B.C. This work. being inscriptional, is sometimes given precedence over literary evidence, but as a compilation should be subjected to the same evaluative scrutiny.

2. Sources Used by Roman Historians.—The traditionally early extant bodies of law such as the Twelve Tables (*q.v.*) were of little chronological value, and juristic *commentarii* were liable to mislead through their zeal for precedent; while Cicero, in spite of Polybius' claim to have inspected early treaties preserved in the *aerarium* (*q.v.*), definitely states in De *legibus* that there were no public records of early laws. A source frequently referred to is the *Annales maximi,* a collection made in 130 B.C. of the annual notices displayed on a white board by the *pontifices,* and containing notes of food prices. eclipses, etc. Dionysius of Halicarnassus implies that they gave a date for the foundation of the city, but is reluctant to accept their authority; and one of the eclipses is referred to by Cicero (De *republica,* i, 25) as being mentioned also by Ennius. but unfortunately the number of the year "from the foundation of the city" (A.U.C., ab *urbe conditâ* or *anno* urbis *conditae*) is corrupt in the text. Although it is possible to calculate the dates of eclipses astronomically in terms of the modern era, it is difficult to link these to Roman chronology because of the uncertainty of the figures and because of the anomalous state of the Roman calendar before the Julian reform (see CALENDAR: *Western* Calendar). Another difficulty is that the early records were said to have been burned in 390 B.C.; also that they would probably have been largely unintelligible if authentic.

Livy quotes the 1st-century annalist Gaius Licinius Macer as having found in the temple of Juno Moneta "linen rolls" giving lists of magistrates; but he also says that Macer and Aelius Tubero both cited the rolls for the consuls of 434, but gave different names. In any case. it is unlikely that the list could have been older than the temple. which dates from 344 B.C. It is clear that the chief sources for the lists were family pedigrees, such as those of the Claudii Marcelli, Fabii and Xemilii drawn up by Atticus; but Cicero and Livy agree that tendentious falsifications had in many cases corrupted the records, and other sus-

picious facts are the appearance of obviously later or invented *cognomina* or third names and of plebeian gentile names for the earliest period. when only patricians bore them. Many scholars. however. accept the general authenticity of the lists — one reason being the appearance in them of extinct patrician families — but prefer Livy's version to that of the Capitoline lists. which show signs of late revision. often give names in incorrect order and contain other anomalies. (See also FASTI.)

The question therefore remains whether Roman chronography was dependent on the lists of magistrates or whether these were adapted to fit other known datings. The apparent advantages of the existence of a terminal date, the "foundation of the city." is illusory for Roman chronology, since it depended on back reckoning and was not agreed even in antiquity. It is difficult to imagine how a genuine contemporary "fix" of such a date could be preserved, though parallels may be seen in the foundation dates of colonies. *e.g.,* in Thucydides, which are roughly substantiated on other grounds. There may have been traditions about the intervals between certain events, but the accepted reckoning of 244 years of kingly rule seems to be a calculation merely, based on the conventional 35-year generation for the rule of the seven legendary kings. Polybius claimed that the dating of the first republican consulship to 508/7 (supported by Dionysius) could be substantiated by an extant copy of a contemporary treaty. Combined with the traditional kingly period this would give a foundation date of 751–750 reckoned inclusively (Polybius' dating, with which Diodorus and Cicero agree). 752–751 exclusively (so Cato in the *Origines*). But Polybius and Dionysius disagree about the date of the sack of Rome, Polybius (and Diodorus) giving the year of the Peace of Antalcidas (387–386), Dionysius that of Pyrgion's archonship at Athens (388–387), though this may be simply a case of ambiguous overlap. In any case, the chronological scheme worked out by Varro pushes these dates back two years by adding two colleges of *decemviri,* and the modern modification accepts one of these. giving a foundation date of 753–752 for the Varronian 754–753. But it remains uncertain whether the dating depended on the magistrate lists or whether these were "doctored" to synchronize with given dates or intervals, whether these were traditional or calculated in some other way. Anomalies such as Livy's five-year anarchy 15 years after the Gallic invasion, Diodorus' repetition of magistrates' names, and the "dictator years" in the lists are perhaps attempts to synchronize the various pedigrees.

3. Contribution of Archaeology. — Archaeology can provide many dates useful to the detailed study of Roman history, especially from coins and inscriptions, but for the general scheme of early chronology its value is mainly negative. It shows, for example. that Rome rather evolved over 200–300 years than was "founded," though a "foundation" date might perhaps refer to the first common celebration of the *Septimontium* or festival of the seven hills; again, if that dating is dependent on the seven kings, archaeology shows that the tradition about them, though it may preserve genuine names and events, is largely legendary.

4. Datings After 1st Century **B.C.**—In this better-documented period datings to consul years. or later to the years of tribunician or other powers of the emperors, are normally intelligible, despite a few notorious cruxes, although up to the Julian reform the state of the calendar has to be taken into account. In parts of the empire, however. different eras were used, *e.g.,* that of the Seleucids, and from the 4th century A.D. dates mere often calculated in terms of the *indictio,* which had come to mean the 15-year period covering three quinquennial tax assessments; a method which continued in use for many centuries in spite of difficulties such as lack of synchronization among the various provinces.

(JR. W.)

VIII. CHRISTIAN

The Christian era is the era now in general use throughout the world. Its epoch. or commencement, is Jan. 1, 754 A.U.C. = *anno urbis conditae,* "from the foundation of the city [of Rome]"; Christ's birth was at first believed to have occurred on the Dec. 25 immediately preceding. Years are reckoned as before or after the Nativity, those before being denoted by the letters B.C. (before Christ) and those after by A.D. (*Anno Domini,* "in the year of the Lord"). Chronologers admit no year zero between 1 B.C. and A.D. 1. The precise date of commencing the annual cycle was widely disputed almost until modern times. Dec. 25. Jan. 1, March 25 and Easter day each being favoured in different parts of Europe at different periods.

The Christian era was invented by Dionysius Exiguus, a monk of Scythian birth resident in Italy (*fl.* c. A.D. 496–540): it was a by-product of the dispute which had long vexed the churches as to the correct method of calculating Easter (for which see EASTER). Many churches, including those in close contact with Rome, followed the 95-year tables evolved by Theophilus, bishop of Alexandria. and by his successor. St. Cyril; but some western churches followed other systems, notably the 532-year cycle prepared for Pope Hilarius (c. 465) by Victorius of Aquitaine. In 525, at the request of Pope St. John I, Dionysius Exiguus prepared a modified Alexandrian computation based on Victorius' cycle. He discarded the Alexandrian era of Diocletian, reckoned from A.D. 284. on the ground that he "did not wish to perpetuate the name of the Great Persecutor, but rather to number the years from the Incarnation of Our Lord Jesus Christ."

This, on grounds that appear to have been historical rather than computistic. Dionysius reckoned to have occurred in 753 A.U.C.; but the Gospels state that Christ was born under Herod (*q.v.*) the Great; *i.e.,* at the latest in 750 A.U.C. Dionysius' dating was questioned by the English saint Bede in the 8th century and rejected outright by the German monk Regino of Prüm in the 9th. Nevertheless it has continued in use to the present day; and as result the Nativity is reckoned to have taken place in or shortly before the year 4 "B.C." when Herod died.

The new chronology was not regarded as a major discovery by its author; Dionysius' own letters are all dated by the indiction (see below). The use of the Christian era spread through the employment of his new Easter tables. In England the era was adopted with the tables at the Synod of Whitby in 663. But It was the use, above all by Bede, of the margins of the tables for preserving annalistic notices. and the consequent juxtaposition of historical writing with calendrical computations. that popularized the new era. Outside Italy it is first found in England (in a charter of 676), and shortly after in Spain and Gaul. It was not quickly adopted in royal diplomas and other solemn documents. however, and in the papal chancery it did not replace the indiction until the time of John XIII (965–972). The era did not become general in Europe until the 11th century: in most of Spain it was not adopted until the 14th, and in the Greek world not until the 15th.

Of the alternative chronologies used by Christians the most important were: (1) the indiction: (2) the Era of Spain; (3) the Era of the Passion. The indiction (*indictio*) was a cycle of 15 years originally based on the interval between imperial tax assessments but during the middle ages always reckoned from the accession of Constantine in 312. Years were given according to their place in the cycle of 15. the number of the indiction itself being ignored. This chronology was the most widespread in the early middle ages, but its use diminished rapidly in the 13th century. although public notaries continued to use it until the 16th. The Era of Spain was based on an Easter cycle which began on Jan. 1, 716 A.U.C. (38 B.C.), marking the completion of the Roman conquest of Spain. First recorded in the 5th century. it was in general use in Visigothic Spain of the 6th and 7th centuries and. after the Arab invasions, in the unconquered Christian kingdoms in the north of the Iberian peninsula. It was abolished, in favour of the Era of the Incarnation, in Catalonia in 1180, in Xragon in 1350. in Castile in 1383 and in Portugal in 1422. The Era of the Passion. commencing 33 years after that of the Incarnation. enjoyed a short vogue. mainly in 11th-century France. (J. A. R.)

IX. PRE-COLUMBIAN AMERICAN

A. MAYA AND MEXICAN

1. Lowland Maya. — The calendar of the lowland Maya is partly based upon a year of 365 days, but in counting from one

date to another the Maya never used that year. No glyph for it exists and no name for it is found in Maya writings of the colonial period; in the Maya view 365 days were one tun (360-day period) and five days. The five days formed an interlude when life was in a state of suspension; they were nameless and extremely unfortunate. There were no intercalations of leap days. (See CALENDAR: Middle American Calendars.)

Units for counting time were the tun of 360 days and its multiples in a vigesimal system: the katun (20 tuns); the baktun (20 katuns); the pictun (20 baktuns); the calabtun (20 pictuns): and the kinchiltun (20 calabtuns). In practice few reckonings were carried beyond the baktun, but there were rare occasions when a term beyond the kinchiltun may have been used. The tun itself was divided into 18 uinals ("months") each of 20 kins or days. Maya numerals are transcribed with periods between each unit, starting with the largest. Thus, 9.10.6.5.9 means 9 baktuns, 10 katuns, 6 tuns, 5 uinals, 9 kins. By this vigesimal system the Maya recorded the time elapsed from a particular date, 4 Ahau 8 Cumku (often written incorrectly. Cumhu), which came at the end of 13 baktuns and which was. at the same time, the starting point of their era. By it they fixed dates in the "Long Count," as this system of recording is called. The position of a date in the Maya era is shown by what is termed an Initial Series because, on the carved monuments of the Classic period, it usually begins the inscriptions. For example, the Calendar Round date 8 Muluc (one of the 260-day positions). falling on 2 Zip (second day of the third month in the 365-day year), will recur every 52 years, but expressed as an Initial Series (9.10.6.5.9 8 Muluc 2 Zip) its position is pinpointed in what amounts almost to eternity. Its next recurrence will be 9.12.19.0.9 8 Muluc 2 Zip.

The Initial Series commences with an introductory glyph containing the name-glyph of the deity who rules over the 20-day month (Zip in the above example) reached by the series. Then follow the glyphs for the periods in descending order of length, starting with the baktun, each with its appropriate numeral attached, and after these the terminal date. More often than not the day (8 Muluc in this example) is separated from the month position (2 Zip) by the name-glyph of the god who rules over the night and by the lunar series which records the age of the moon and its number in a group of five or six lunations on the date in question. In such cases the month follows immediately after the last glyph of the lunar series.

A shorter method of recording dates in the Long Count was by means of "Period Endings," that is, by the end of baktuns, katuns, half katuns, 13 tuns or 5 or 15 tuns. For example, a date 13 Ahau 13 Muan, 13 tuns, inscribed on a stone at Palenque, can only occur at 9.17.13.0.0, for as it will not repeat for 949 tuns, it would be outside the range of Maya inscriptions placed 949 tuns earlier or later. A Period Ending such as 1 Ahau 8 Kayab, completion 10 katuns. is even more securely fixed. It has the Long Count position 9.10.0.0.0 1 Ahau 8 Kayab. and will not repeat in that position for 18.980 tuns; *i.e.,* more than 18.000 years.

A much abbreviated form of Period Ending was sometimes used in Classic times: it is nearly universal in the post-Columbian records written in Maya with European characters. In this system only the day Ahau on which the katun ends is given. As there are 13 days Ahau it follows that a date recorded as Katun 4 Ahau will repeat every 13 katuns (257 Gregorian years). As the day Ahau repeats every 20 days and all Maya units (tun and multiples of a tun) are divisible by 20, a Maya period can only end on that day.

Calendar Round dates were sometimes placed in the Long Count by adding the glyph of the god who ruled the night. There were nine of these gods who, ruling in succession, formed a re-entering cycle of nine nights. As the 18,980 days which form a Calendar Round are not divisible by 9, but leave a remainder of 8. each successive Calendar Round is accompanied by a different god of the night in retrogressive order. A date with the glyph of the appropriate god is therefore securely placed in a period of 468 years.

Many dates on the monuments of the Classic period are connected with one another by distance numbers or "secondary series," which comprise so many kins, uinals, tuns and so on. These numbers and periods. in contrast to the periods of the Initial Series, are given in ascending order of size. with but a few rare exceptions, and are usually followed by a glyph which indicates, by means of variable affixes to the counting sign. whether the count is forward or backward. For example. the Tablet of the 96 Glyphs, at Palenque, opens with the date 9.11.0.0.0 12 Ahau 8 Ceh. There follow a distance number of 11 kins, 1 uinal, 2 tuns, the count forward glyph and the date 9 Chuen 9 Mac. Tables shoa that the date reached by the addition. 9 11.2.1.11, corresponds to the Calendar Round date given. Another distance number, this time of 17 kins, 4 uinals, 8 tuns, 2 katuns, with the count forward glyph, is followed by the Calendar Round date 5 Lamat 6 Xul Added to the last date, the distance number reaches the Long Count position 9.13 10.6.8, to which the date 5 Lamat 6 Xul corresponds. Several dates were often linked together in this way or by direct addition to the starting date. and, with that fixed. their position in the Long Count is unequivocable The last inscribed date of a series is often that of the monument's dedication Thus, the Tablet of the 96 Glyphs has as its last and undoubtedly dedicatory date 13 Ahau 13 Muan 13 tuns. with the clearly established Long Count position 9.17.13 0.0, which is 6 katuns and 13 tuns (approximately 130 Gregorian years) later than the opening date of 9.11.0.0.0 12 Ahau 8 Ceh.

Practically all Maya dates, both on the monuments and in the Dresden codex. were counted from the base 13.0.0.0.0 4 Ahau 8 Cumku. which was already approximately 3 000 years in the past when the Long Count came into use. This date surely represents some mythological event, perhaps the last re-creation of the world. According to the most generally accepted correlation with the Gregorian calendar it is the equivalent of Aug. 12. 3113 B.C. Dated monuments of the Classic period cover a span of 617 years The earliest is Stela 29, Tikal (found in 1959), with the Initial Series 8 12.14.8.15 (AD. 292); the latest is 10.4.0.0.0 recorded. as a form of Period Ending. at Uxmal, at Chichen-Itzá and on a jade bead The date 10.5.0 0.0 may be recorded on a stela at the small site of San Lorenzo, Campeche. The latest Initial Series in the Dresden codex extends the use of the series another two centuries. but there were probably few Maya priests who understood the Initial Series when Maya culture was extinguished by the Spaniards.

The Long Count reached an almost illimitable distance into the past and could be extended similarly into the future One calculation on a stone tablet at Palenque leads nearly 1,250,000 years into the past, but the farthest probings of eternity seem to have been made at Quiriguá, where there are recordings, on different stelae, of 13 kinchiltuns ending on 1 Ahau 3 Zip and 7 Ahau 3 Pop According to one reconstruction of the greater Maya periods these would have fallen 90.000.000 years and 400,000,000 years in the past respectively. Even if complete proof of these interpretations is elusive, there is no doubt at all that the Maya thought in terms of millions of years a millennium before western Europe abandoned the belief that the world was only about 6,000 years old.

The Maya conceived of time as a journey through eternity in which the deified numbers carried the periods on their backs, the load supported by a tumpline (a band passing round the brow). At the end of each day's journey there was a resting place at which the carriers whose periods were completed exchanged places. Thus, at the end of the day 9.10.6 5.9 8 Muluc 2 Zip, the god of number 9 who carried the burden of the baktun, the god of number 10 who carried the katun, and the gods of numbers 6 and 5 who carried the tun and the uinal respectively rested; the god of number 9 who had carried the kin, the god of 8 who had carried the day and the god of 2 who had carried the month handed over to the gods of numbers 10, 9 and 3 so that the procession restarted as 9 10 6.5.10 9 Oc 3 Zip, the bearers of the periods for the following day. Much imagery and ritual grew out of this concept of the passage of time. which survives in the sculptural art of the Classic period. The fine full-figure glyphs of Stela D, Copán, represent vividly the moment at which the gods are putting down their burdens at the end of the day 9.15.5.0 0 10 Ahau

8 Ch'en. and the god of the night is rising from the ground with the night sky as his burden.

The Maya concept of time also embraced the belief that events were linked with particular katuns. The return, for example, of a katun 8 Ahau would bring a repetition of events which had happened in the previous katun 8 Ahau, 257 Gregorian years before, and of those in the one before that. 514 years past. Thus. by studying the past one could foretell the future. This belief brought into being, or was itself the product of, a fatalistic attitude and an unusual inability to distinguish between past and future. This mingling of events in different katuns with the same name has been a severe handicap to students of Maya history and chronology.

The correlation of the Maya calendar with the Gregorian depends on a number of factors. The 260-day count of the Maya survives to this day among several Maya groups in the highlands of Guatemala, and although these centres are isolated from one another, their counts are in complete agreement. Jan. 1, 1960. was the day 13 Eb in all these villages, although the villagers' name for this day would have varied according to their dialect. Projected backward. the equation Jan. 1, 1960 = 13 Eb is valid for double entries of this kind in the 16th. 17th and 18th centuries, and for the time of the Spanish conquest of Guatemala (1524). It gives the equation 12 Kan = July 15. 1553 (old style). This is in complete agreement with the best evidence on the Aztec calendar and with the present-day calendar of the remote Mixe of Oaxaca: it is one day off the equation which can be deduced from the writings of Bishop Diego de Landa. who was in Yucatán during the first years of the Spanish conquest of this area and left a full account of the Maya calendar. It can be brought into agreement with Landa by assuming that he omitted to allow for the leap day of 1552 in his calculation, something which could easily have happened.

As the Maya calendar has survived four centuries of Spanish attempts to exterminate it without losing a single day, it is reasonable to suppose that there was no break in pre-Spanish times. when it was universal and a part of the national religion. The fact that it synchronizes with the Aztec and Mixe counts is very strong evidence against any such break. However, 12 Kan 1 Pop, like every other Calendar Round date. repeats every 52 years. and so the equation of 12 Kan with July 15, 1553, does not alone serve to correlate the Maya and Gregorian calendars. The Spanish conquest of Yucatán, completed in 1542, fell very shortly after the completion of a katun 13 Ahau. These two occurrences allow a choice of four Long Count positions, each 260 years apart, for the 12 Kan 1 Pop of July 15, 1553. Each would be either correct to the very day or else 260. 520 or even, in two cases. 780 years wrong. Lunar data on monuments of the Classic period eliminate three of these positions: the lunar series which accompanies most Initial Series records the age of the moon upon each such date. Thus the Maya recorded that on the date 9.17.0.0.0 13 Ahau 18 Cumku there was a new moon (it is not completely certain whether they calculated from the disappearance of the old moon. from conjunction or from the appearance of the new crescent. so there is room for a one- or two-day error here). By converting the Maya into the Gregorian date according to the various correlations, it is easily seen that only one of these places a new moon at 9.17.0.0.0. This is the Goodman-Martinez-Thompson correlation! according to which the katun 13 Ahau of the Spanish conquest was 11.16.0.0.0 13 Ahau 8 Xul. and which makes 9.17.0.0.0 the date Jan. 23. A.D. 771.

This correlation similarly meets the test of dates for heliacal risings of the planet Venus obtained from the tables in the Dresden codex; the other correlations fail here. It is also supported by archaeological evidence. particularly that obtained from the study of pottery and of the sequence of cultures in distant Tula and the Valley of Mexico. The technique of carbon-14 dating at first favoured a correlation which made Maya dates 260 years earlier, but with refinement of the technique and with reliance not on isolated specimens but on multiple runs from a single sample the carbon-14 evidence came into line with the rest in support of the 11.16.0.0.0 correlation.

2. Highland Maya. — The calendar of the highland Maya group called the Cakchiquel is the only other knonn era in ancient Middle America. Their system was purely vigesimal the units being the kih sun or day, the uinak of 20 kih the a of 20 uinak and the may of 20 a As it was functioning at the time of the Spanish conquest of Guatemala, the starting point was a certain revolt at Iximche in A D 1493 Thus the era was only about 30 years old when the Spaniards arrived, although it is reasonable to suppose that there had been previous eras. But there is no direct evidence of this and there are no calendrical texts on stone monuments in the Cakchiquel area The 400-day a ran concurrently with the 260-day count and this synchronized perfectly with all other 260-day counts in Middle America. The unit was probably the a (the name comes from that of the day of the revolt which started the era); for may, the next highest unit, means "tnenty" in highland Maya languages Thus the 400-day a would correspond in function to the 360-day tun of the lowland Maya

B. Aztec

The chronological system of the Aztec and related peoples of central Mexico was based on the Calendar Round of 52 years. The completion of this was called the *xiuhmopilli,* "the binding up the years," represented in sculpture as a neat bundle of rods tied together rather like the Roman fasces. At the conclusion of the 52 years very elaborate ceremonies were held to save the world from the destruction then expected to overwhelm it. At the time of the Spanish conquest the 52-year cycle started with 2 Tochtli, but there is a source indicating that it originally commenced with 1 Acatl, the previous year-bearer. There is weak evidence that the *xiuhmopillis* were numbered to form a greater epoch, and in the Aztec Codex Bourbon the arrangement of the nine gods of the nights gives ground for believing that Calendar Round dates were differentiated by their accompanying gods of the nights. This would have produced a cycle of 468 years such as certainly was used by the lowland Maya. Such a system was not used in the historical codices, so that much confusion resulted: the same event is placed by different scholars at varying numbers of Calendar Rounds before the Spanish conquest.

Maya year-bearers fell on the first day of the year. but there is far less certainty with respect to the Aztec bearers. It has been argued that the Mexican year was named from the last day of the year. Thus the year-bearer 3 Calli which gave its name to the Aztec year in which the Spanish conquered Tenochtitlán. the present Mexico City (Gregorian Aug. 1521), was the last (360th) day of that year, and fell on Jan. 18, 1522 (old style). This view, however, has been strongly opposed. Other scholars hold that several unsynchronized calendars functioned at the same time in central Mexico.

Histories covering several centuries are given in several Mixtec hieroglyphic codices, but a dated event can be assigned to a particular Calendar Round only by its position in the sequence of painted events. In Mixtec codices month positions are never given, merely the day name and the year-bearer of the year in which it fell. Of the chronological systems of the Zapotec and La Venta (Olmec) cultures very little is known. Rarely, La Venta monuments have arrangements of bars and dots resembling the Maya Initial Series of the Dresden codex, but there is no certainty that they functioned in the same way or that they were counted from the same base of 13.0.0.0.0 4 Ahau 8 Cumku, as has been assumed without any evidence. (J. E. S. T.)

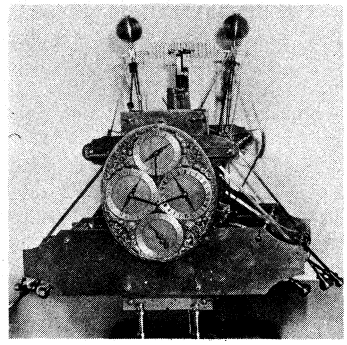
CHRONOMETER. A timekeeping device of great accuracy, particularly one used for determining longitude at sea. The word was originally used to denote any time-measuring instrument. The first instance of its employment in connection with marine timekeeping is to be found in Jeremy Thacker's "The Longitudes Examined . . . " (London. 1714).

History.—The possibility of determining longitude at sea by the use of a timekeeper was first pointed out by the Flemish astronomer Gemma Frisius, in a work on navigation published at Antwerp in 1530. At that date, however, and for long afterward, the mechanical difficulties in the way of constructing an accurate marine timekeeper appeared to be insurmountable. The first attempt to put Frisius' suggestion into practice was made in 1662–70 by the celebrated Dutch scientist Christiaan Huygens of Zulichem, who constructed several marine timekeepers controlled by pendulums and subjected them to actual tests at sea. It was found that the timekeeping of the machines was quite unreliable, owing to the effects of temperature and of the ship's motion. Many later inventors fared no better, but during 1729–60 John Harrison, a self-taught Yorkshire carpenter, invented and constructed four practical marine timekeepers, with the fourth of which (now preserved, in going order, at Greenwich observatory) he won the reward of £20,000 offered in 1714 by the British government for any means of determining a ship's longitude within 30 nautical miles at the end of a six weeks' voyage. It may be noted that a timekeeper fulfilling this condition would have to keep time within three seconds per day—a standard which, at the date when the reward was offered, had not been attained by the best pendulum clocks on shore.



BY COURTESY OF THE TRUSTEES OF THE NATIONAL MARITIME MUSEUM, GREENWICH, AND THE LORDS COMMISSIONERS OF THE ADMIRALTY

FIRST OF FOUR MARINE TIMEKEEPERS DEVELOPED BY JOHN HARRISON

Harrison's mechanism, although unquestionably efficient, was complicated, delicate and costly—the Board of Longitude paid Larcum Kendall, a London watchmaker, £450 for a duplicate of the No. 4 timekeeper. Accordingly, it had little direct effect upon the evolution of the modern chronometer. But in 1765 Pierre Le Roy, of Paris, invented and constructed a marine timekeeper whose mechanism embodied, in an embryonic but perfectly recognizable form, practically all the essential features of the modern chronometer. This machine, or a contemporary duplicate, is preserved in the Conservatoire des Arts et Métiers in Paris. Le Roy's work was followed up by Ferdinand Berthoud in France and by John Arnold and Thomas Earnshaw in England. The last-named produced, as early as 1785, several chronometers which, both in appearance and mechanism, are scarcely distinguishable from the machine of today.

Description.—The modern chronometer is, broadly speaking, a large, well-made watch, suspended in gimbals (a set of two bearings at right angles, connected by a ring) and so poised as to remain horizontal whatever the inclination of the ship. It is thus safeguarded from those alterations of position which slightly affect the timekeeping of even the best watches. In addition, it differs somewhat in its mechanism from an ordinary watch. the spiral balance spring and lever escapement of the latter being replaced by a helical balance spring and a spring detent or "chronometer" escapement. This form of escapement is mechanically superior to any other, and requires no oiling, but it is unsuitable for use in pocket watches, because if stopped it has no tendency to restart itself. For the purpose of equalizing the force of the mainspring, almost all chronometers are fitted with a device known as a "fusee," which has for some time past been discarded in watches, and chronometer compensation balances, by which the effects of heat and cold upon their timekeeping are practically nullified, also differ in some respects from the ordinary watch type, as well as being considerably larger and heavier.

Accuracy.—The modern chronometer is capable, with fair usage, of going with what must be regarded, in view of the unfavourable conditions to which it is necessarily exposed on board, as astonishing accuracy. Both during the official tests at Greenwich observatory (which were held annually, on practically unaltered lines. from 1844 to 1914) and in their subsequent service afloat, many hundreds of chronometers have shown themselves capable of keeping time in all ordinary variations of temperature for six months at a time with an error not exceeding a second a day—an amount which, in a month's voyage along the equator, would involve an error in the ship's final position of less than eight nautical miles.

U.S. Marine **Chronometer.**—During the years 1942 to 1944 a marine chronometer of very high precision was developed in the United States by the Hamilton Watch company. In general appearance, this chronometer is like any other, but certain changes have been made in the escapement. The hairspring used is nickel steel; the balance wheel is uncut and has a stainless steel rim with an invar arm. There are a number of timing screws, as in a watch, which permit very close adjustment of the rate. This chronometer shows a practically uniform variation with temperature. with daily rates at 5° C. and 35° C. differing by only a few tenths of a second. The rate during run-down remains uniform for 48 hours after winding.

CHRYSANDER, KARL FRANZ FRIEDRICH (1826–1901), German musical scholar, a founder of modern musicology. Born July 8, 1826, at Liibtheen, Mecklenburg, he studied at Rostock until 1855. He devoted most of his life to research on Handel, whose complete works he published singlehandedly and at his own expense in 93 volumes (1858–94); the *Deutsche Handelgesellschaft*, founded in 1856 to promote the edition, existed only nominally. His biography of Handel (three volumes, 1858–67), though unfinished, remains a classic, despite errors of judgment and the additional findings of later scholars. He also edited the works of other 17th- and 18th-century composers; and inaugurated the German *Denkmäler* movement, which by publishing library editions of the music of earlier periods has contributed greatly to knowledge and appreciation of it. He died at Bergedorf, near Hamburg. Sept. 3, 1901. (H. GA.)

CHRYSANTHEMUM, a genus of about 100 species of annual or perennial herbs of the family Compositae (*q.v.*); popularly the name given to forms of certain old world species of this genus which have been remarkably developed by cultivation. Most varieties of the so-called Chinese and Japanese chrysanthemums extensively grown by gardeners and florists are blended hybrids or other forms derived from C. *morifolium* and *C. indicum*, natives of eastern Asia. Other species of interest to flower growers are *C. coccineum* (pyrethrum), *C. parthenium* (feverfew) and *C. frutescens* (marguerite). Other representatives of the genus are C. *balsamita* (costmary) and C. *leucanthemum* (ox-eye daisy), the latter often a pestiferous weed.

J. HORACE MCFARLAND CO.

MARGUERITE CHRYSANTHEMUM (C. FRUTESCENS)

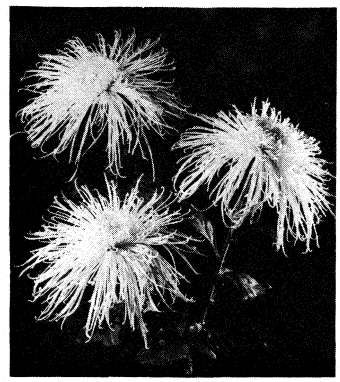
The common chrysanthemum has probably been known for at least 2.500 years. In Japan, where it can be traced back many centuries, it is the national flower. Breynius in 1689 was the first European to mention the chrysanthemum, giving it the name of *Matricaria japonica maxima*. Pierre Louis Blancard introduced the first large-flowering chrysanthemum into England in 1789. This first flowered in 1790. Just when the plant was introduced into the United States is uncertain, although horticultural chrysanthemums were exhibited in Philadelphia in 1827 and in Boston the next year. The work of hybridization was first taken up by H. P. Walcott and later in the 1880s by John Thorpe, who organized the Chrysanthemum Society of America in 1890.

The only species of economic importance are certain forms of C. *coccineum*, much grown for the aromatic flower heads, the source of pyrethrum powder, widely used in insecticides.

Chrysanthemums are popular with the gardeners, both professional and amateur, as an exhibition flower because of their great size and variety of shape and colour, and also because some varieties are extremely hardy, which permits their use in the perennial garden. Chrysanthemums owe their popularity with commercial growers not so much to their value as a crop as to the fact that they may be planted in the late spring and early summer when the greenhouse otherwise would be empty. Moreover, the chrysanthemum is a quick-maturing crop, many varieties being grown without artificial heat, since they bloom from late August to December.

The cultural requirements for chrysanthemums may be adjusted to many rotation schemes, so that the same greenhouse may be used for growing other floral crops, such as calendulas, sweet peas, stocks, snapdragons, annuals and lilies.

Propagation. — The chrysanthemum is generally propagated by cuttage, seedage or division. Cuttage is by far the most satisfactory, since insects and diseases may be controlled by the careful selection of clean stock. Plants grown from cuttings make better growth, give better flowers and are easier to stake and tie in the garden. Nearly all chrysanthemums grown in commercial greenhouses are produced from cuttings. Division is practised by many outdoor gardeners. Seedage is practised only by breeders who seek new varieties.



JOHN J SIMPKINS FROM NATIONAL AUDUBON SOCIETY

SPIDER CHRYSANTHEMUM, HORTICULTURAL VARIETY

Plants for propagation are packed in flats, benches or cold frames, after the flowering season, and wintered over in either a cold greenhouse or frame. In March or April the strong shoots are ideal for making cuttings two to four inches long. If aphides are present, the cuttings should be placed in a 1-to-500 or 1-to-800 solution of nicotine sulfate in water before planting. Cuttings root best in clean sand. which should be firmly packed and watered. The bed should be lightly shaded for a few days to prevent wilting. Wilted cuttings generally die, but if they root the resulting plants are stunted. Syringing on warm days will help to keep the cuttings fresh. A temwerature of 50° F. is sufficient, but auicker rooting is obtained if 60° F. is maintained.

When the roots are about one-half inch long the plants should be potted in a fibrous loam soil. If allowed to remain too long in the cutting bed, they become hard and are not responsive to good culture. The plants are usually ready for their permanent quarters by early June or July. A good fibrous, well-drained loam is the ideal soil medium for chrysanthemums. If this soil is packed before planting or directly afterward, the new growth becomes firmer and the internodes shorter. Newly set plants should be watered only lightly. since wet soil is unfavourable for their growth. The tops of the plants may. however, be syringed often to keep them fresh.

The planting distances vary with the different types. Commercial growers vary the planting of the large flowering chrysanthemums as follows: 6 by 6 in., 7 by 8 in., 7½ by 8 in. and 10 by 10 in. Pompons are planted 12 by 12 in. and 12 by 15 in. inside, while outdoors 15 by 15 in. and 18 by 18 in. is the general practice.

As soon as the plants are placed they should be staked and tied. The tying should be done as the plant grows so that the stem will remain straight. When the stem becomes 6 in. long the plant should be "topped" (top pinched out). if more than one stem is desired. Topping should continue for small-flowered plants until August. Watering, syringing and tying are of chief importance during the summer months.

The plants should be kept as cool as possible by spraying and syringing and by wetting the walks.

In the late summer and early fall "disbudding" becomes a factor. The first bud to appear is generally the crown bud. This bud will flower early and give a large flower. but the shape, colour and habit are not so desirable for commercial use as are flowers from lateral buds. The crown bud is surrounded by vegetative shoots, one of which may be saved to produce the desired flower bud. The terminal bud of the final shoot is surrounded by other buds, which should be removed if only one large flower is desired.

If the soil is a good composted fibrous loam. no fertilizer should be given until the bud is selected. Thereafter, liquid manure should be given once a week until the buds show colour. Continued use of any fertilizer, especially those that are too strong, will cause the flowers to "blast" and "burn." The foregoing cultural directions apply equally as well to the chrysanthemums in the garden. Systematic fumigation and the propagation of clean stock are the greatest factors in the prevention and control of pests. Upward of 3,000 named varieties of the chrysanthemum are listed in catalogues and horticultural works. and new forms are constantly being produced.

Kinds of Chrysanthemums. — Gardeners have several methods of sorting the over 3,000 varieties in cultivation. The simplest

and most practical comprises only two types: (1) those grown in the greenhouse and forced for winter bloom, comprising mostly the incurved group in the classification below; and (2) the hardy chrysanthemums for outdoor culture which bloom from August to frost, depending on the variety.

Specialists and breeders have a much more elaborate scheme of classification. mostly depending on the number, shape and arrangement of the ray flowers.

The six main types, and some subdivisions of them, are:

1. Singles. With not more than five roas of rays, the head never doubled, hence an open daisylike head.

2. Anemone-Flowered, Resembling group 1 but with a prominent central, cushionlike disk. A subdivision of this, the so-called "irregular anemone," has the rays irregularly arranged.

3. Pompons. With very small, usually globose heads.

4. Incurved. Having very large, close, tight showy heads of hundreds of incurving rays.

5. *Incurving.* Resembling no. 4 but the incurved rays irregularly and loosely arranged.

6. *Reflexed.* With the inner rays incurving but the outer rays drooping or reflexed.

Many subdivisions of these basic classes are preferred by some specialists but most of them are minor. Some of these are known as spoon, quill, thread, spider, etc. There is also a profuse-flowered, cushionlike plant known as azaleamum (not an azalea).

CHRYSIPPUS (c. 280–206 B.C.), Greek philosopher, third head of the Stoic school. born at Soli in Cilicia (Diogenes Laertius, vii. 179). He went to Athens and studied possibly under Zeno, certainly under Cleanthes. He is reported also to have studied under Arcesilaus and Lacydes in the Middle Academy, where he perfected his outstanding skill as a dialectician. He was probably the only Stoic with a genuine scientific interest in pure logic. a subject to which he devoted more than 300 works ("If the gods have any logic, then it is that of Chrysippus," Diog. Laert., vii, 180). In addition to refining earlier logical doctrine, he laid the foundations of propositional logic.

His intense intellectual industry led him to systematize Stoic teaching, which survived to later ages chiefly in the form given to it by Chrysippus. More than 700 treatises are attributed to him. but only fragments survive. The style is said to have been crabbed, the argument lucid. See also STOICS.

CHRYSLER, WALTER PERCY (1875–1940), U.S. automotive industrialist who pioneered in developing high-compression engines and other improvements, was born April 2, 1875, in Wamego, Kan. He began work as an apprentice in a Union Pacific machine shop. He was plant manager for American Locomotive company when, in 1912, he left to become works manager of the Buick company, at half his previous salary. By 1916 he was president of the company. In 1920, having made Buick the strongest unit of General Motors, he resigned. His retirement lasted six months. He then assumed direction of Willys-Overland company and of Maxwell-Chambers Motor company, which became the Chrysler corporation in 1925. When Chrysler and Dodge merged in 1928, the Chrysler corporation became a major company in the U.S. automotive industry.

Chrysler died Aug. 18, 1940, at Great Neck, N.Y. His autobiographical Life of an American *Workman* was published in 1937 (new edition, 1950). (J. R. LT.)

CHRYSOBERYL, a yellow or green gem stone, remarkable for its hardness. being exceeded in this respect only by corundum and diamond. Highly prized as a gem, chrysoberyl is not infrequently cloudy, opalescent and chatoyant, displaying a luminous band like that seen in a cat's eye in the dark, and is then known as "cymophane," from the Greek for cloud The cloudiness is referable to the presence of multitudes of microscopic cavities. Some of the cymophane when cut with a convex surface forms the most valuable kinds of cat's-eye (*q.v.*). Alexandrite (*q.v.*) is a remarkable and highly prized dichroic variety of chrysoberyl, changing colour from green to red when viewed from different directions.

Most chrysoberyl comes from Brazil, chiefly from the state of Minas Gerais; fine twinned crystals occur at Collintina in Esperito Santo. The cymophane is mostly from the gem gravels of Ceylon. Chrysoberyl occurs chiefly in granite pegmatites and mica schist, and as stream pebbles and grains. In the United States, it is found at various localities in New England, notably Greenaood and Stoneham, Me., and Haddam, Conn. It is known also in the province of Quebec, from near Gwelo in the Federation of Rhodesia and Nyasaland. and in the Ural Mountains. Chrysoberyl is an oxide of beryllium and aluminum ($BeAl_2O_4$), and it is orthorhombic in crystallization. The crystals often are twinned to form pseudohexagonal aggregates. Chrysoberyl is often mistaken by its colour for chrysolite (*q.v.*), and has been termed oriental chrysolite, but it is a harder and denser mineral. A contrast of their chief character follows:

	Chrysoberyl	Chrysolite
Hardness	8.5	6.5 to 7
Specific gravity	3.65 to 3.75	3.34 to 3.37
Chemical composition	$BeAl_2O_4$	Mg_2SiO_4

Chrysoberyl has been synthesized commercially by the flame-fusion process, but the material is inferior in quality to the finest natural gems. See GEM. (CL. F.)

CHRYSOCOLLA, a hydrous copper silicate occurring as a decomposition product of copper ores. It is found in most copper mines, especially in arid regions. It is never found as crystals, but always as encrusting and botryoidal or rounded, grapelike masses. It is green or bluish-green in colour, and often has the appearance of opal or enamel, being translucent and having a conchoidal fracture with vitreous lustre; sometimes it is earthy in texture. Some specimens are used as ornamental stones in place of turquoise. Not being a definite crystallized substance, it varies widely in chemical composition. the copper oxide (CuO), for example, varying in different analyses from 17% to 67%. The hardness (2 to 4) and specific gravity (2.0 to 2.8) are also variable. The mineral occurs in the upper parts of veins of copper ores, and has resulted from their alteration by the action of naters containing silica in solution. Pseudomorphs of chrysocolla after various copper minerals (e g., cuprite) are not uncommon. The name chrysocolla, from the Greek for gold and glue, was applied by Theophrastus and other ancient writers to materials used in soldering gold, one of which, from Cyprus may have been identical nith the mineral now known by this name. Borax, which is used for this purpose, has also been called chrysocolla.

CHRYSOLITE, a transparent green gem stone. The name chrysolite, from the Greek, meaning "golden stone," has been applied to various yellowish gems, notably to topaz, to some kinds of beryl and to chrysoberyl. The true chrysolite of the modern mineralogist is a pale green olivine (*q.v.*). For comparison of the chief characteristics of chrysolite and chrysoberyl, which is often mistaken for it, see CHRYSOBERYL.

CHRYSOLORAS, MANUEL (*c.* 1350–1415), Greek scholar, was a pioneer in spreading Greek literature in the west. Born in Constantinople c. 1350, he was a pupil of the philosopher Gemistus Pletho. The Byzantine emperor Manuel II Palaeologus sent him to Italy to get help against the Ottoman Turks. From 1394 onward he traveled in Europe and accompanied Manuel on his tour of the European countries. After Manuel's return to Constantinople in 1403, he remained for the most part in the west.

He was engaged in promoting Greek studies; he taught Greek at Florence and was well known as a translator of Homer and Plato. He was also active in trying to arrange for a general council to discuss the union of the Greek and Latin churches. He was on his way to the Council of Constance, having been chosen to represent the Greek Church, when he died suddenly on April 1j, 1415. He left the *Erotemata* ("Questions"), a Greek grammar based on the question and answer method; some letters; the *Syncrisis,* a comparison of old and new Rome (in which Rome and Constantinople confront each other) ; and a Latin translation of Plato's *Republic.*

JOHN CHRYSOLORAS, a relative of the above, had also studied and taught at Constantinople and had then gone to Italy, and he shared Manuel's reputation as one of those who spread the influence of Greek letters in the west. His daughter married the Italian humanist, Francesco Filelfo.

CHRYSOSTOM, SAINT JOHN (c. 347–407), Christian orator, scriptural exegete, patriarch of Constantinople and Church Father, one of the four great doctors of the East, was born at Antioch about 347. Schooled in rhetoric and law under the pagan sophist Libanius, he gave early promise of the eloquence which earned his surname (from the Greek for "golden-mouthed"). Baptized in 370, he quit his legal practice to study Scripture as a monk and hermit. Broken health forced his return to Antioch where he was ordained priest in 386 and began his brilliant preaching career. His fame spread throughout Christendom. When Patriarch Nectarius of Constantinople died, many rivals sought the post. Emperor Arcadius settled the dispute by calling John to the capital, where, in 398, he was consecrated bishop by Theophilus, patriarch of Alexandria. Zealous for reform, John stripped his household to give to the poor; he called the clergy to task; he berated the rich for not regarding their wealth as a trust and charity to the poor as their chief obligation. A host of enemies thus arose, led among the clergy by Theophilus, who had supported a rival candidate for John's bishopric, and at court by the empress Eudoxia, who took John's assaults on luxury as meant for her and believed reports that he had referred to her as Jezebel. In 403, after John had sheltered some Egyptian monks whom Theophilus had excommunicated, Theophilus came to Constantinople, summoned an illegal synod and deposed John *in absentia* on trumped-up charges, including high treason for the alleged slander of Eudoxia. John left for exile, but threats of tumult among the people occasioned his immediate recall. Two months later, the riotous dedication of a statue of Eudoxia in the cathedral square moved John to remonstrate, possibly in a sermon which spoke of "Herodias again asking for John's head on a platter." This sermon may have been spurious, but Eudoxia's rage was genuine. The edict of exile was reissued, and in 404 John left Constantinople for the last time. He appealed to Pope Innocent I, who, with the western emperor Honorius, ordered a new synod. Their envoys were imprisoned at Constantinople, the synod never convened, and Innocent broke off communion with the guilty parties until John's name, only posthumously, was restored to honour. From exile John corresponded with his church and friends who often visited him at Cucusus in Armenia. Even this solace was gone after he was ordered to more remote Pityus. He got as far as Comana in Pontus, where he died in 407, exclaiming, "Glory to God for all things!"

John's oratorical style was elaborate, sinewy and incisive. He often had to chide the people for applauding in church. As an exegete, he was the outstanding representative of the Antiochene school and gave the Scriptures their literal and grammatical sense. He seldom used allegory but spoke plainly and combined penetrating insight into the meaning of Scripture with a genius for its personal application; each sermon had its moral or social lesson. Both the Greek and Latin Churches revere him as a Father and a proponent of orthodox dogma. The Greek Orthodox Church celebrates his feast on Nov. 13, the Latin Church on Jan. 27.

St. John Chrysostom's works include many treatises (*e.g., On the Priesthood),* sermons (*e.g., On the Statues, For Eutropius*), significant commentaries on Scripture (*e.g.,* on *Genesis, Psalms, Matthew, John, Acts* and *Romans)* and over 200 letters. The standard text is in J. P. Migne. *Patrologia graeca,* vol. xlvii–lxi. Some important works have been translated in *Nicene and Post-Nicene Fathers* (1889–90).

See also references under "Chrysostom, Saint John" in the Index volume.

See C. Baur, *S. Jean Chrysostome et ses oeuvres* (1907), for a critique of the enormous literature on Chrysostom. D. Attwater, in his excellent biography *St. John Chrysostom* (1939), notes mvst of the lamentably few works in English. (P. W. Hs.)

CNRYSOTILE, a variety of serpentine, is the principal mineral used in commerce under the name asbestos (*q.v.*). A hydrous silicate of magnesia, chrysotile is characterized by a fine, more or less silklike fibrous structure. The name is derived from the Greek words for gold and down or hair, literally "hair of gold."

CHUANG, a term applied to one of a group of tribes called T'ai or Thai, once inhabiting most of the lowlands of south China but now chiefly applied to the cultural descendants of these tribes in Kwangsi province of south China.

Characteristic cultural traits of the Chuang include a preference for valley lands adjacent to streams, wet-rice cultivation with the use of buffalo or oxen, and platform houses on piling. Social customs differing from the Chinese customs include premarital sexual freedom and free marriage without middlemen, the bride staying at home with her parents until the birth of the first child. at which time the marriage is considered consummated. Magical rites, sorcery with human figurines, the ancestral cult and burial in coffins (but also at times the practice of cremating the dead) are other distinguishing elements.

The Chuang or T'ai culture appears to have had its maximum geographical spread during the early period of its contact with Han Chinese culture about 2,500 years ago, evolving in the regions of Szechwan and the lower Yangtze valley. The advance of the Han Chinese culture and empire pushed the T'ai culture and its exponents southward. Today, the cultural heirs of these early people include the Thai of Thailand, the Lao of Laos, the Shan (*q.v.*) of Burma, and the south China tribes of Pa-yi, T'ai-lii and T'ai-noi in Yiinnan, of Chung-chia (*q.v.*) in Kweichow and of Chuang in Kwangsi. These different groups still retain strong linguistic and cultural affinities.

Within China, in 1953, the Communist regime organized the tribespeople, where locally dominant, into so-called autonomous minority districts or regions. Thus, there came into being a T'ai autonomous district in Yünnan and a Chuang autonomous region in Kwangsi. In the latter region, people of this ethnic and blood group in the second half of the 20th century were reported to constitute about 34% of the estimated total population of about 20,000,000. (H. J. Ws.)

CHUANG-TZU (d. *c.* 300 B.C.), "Master Chuang," Chinese philosopher, whose fame rests entirely upon the book known as *Chuang-tzu.* Little is known about his life. Although the book clearly includes the work of more than one author, Chuang-tzu is credited with having written its most important sections. It may include the earliest writings of the Taoist school of philosophy and is one of the most important works of Taoism (*q.v.*). It is indeed one of the outstanding books of philosophy in any language and may possibly be the hardest to understand. Its ideas, never obvious, are expressed in such abstruse Chinese that different translators derive quite different meanings from the same passage.

Taoist philosophy arose in a time when life was becoming increasingly regimented. The Taoists declared their independence from everything. The *Chuang-tzu* relates that one day when Chuang-tzu was fishing, two ambassadors from the great state of Ch'u came to invite him to become its prime minister. He declined without even turning his head, refusing to interrupt his fishing. The story is historically dubious but typically Taoist. There are various types of Taoism, but that most characteristic of the *Chuang-tzu* regards all government as bad and holds that all things will go well if left to themselves. In any case the wise

person will avoid both government and society. Many of the characters in the *Chuang-tzu* are recluses, fishermen or farmers, living close to nature.

The "Tao," the central conception of Taoist philosophy, is Nature, the totality of everything that exists. Thus it is the great substance, in which all other substances are included. But the fundamental meaning of the word *tao* is "way," and "the Tao" for the Taoists means both the substance of the cosmos and the manner in which it acts. This is not unlike the tendency of modern physics to explain matter in terms of energy. It has been observed that the ancient Taoist conception of the universe is in many ways similar to the thinking of contemporary biologists and physicists. The Taoist like the physicist holds that, while all things are constantly changing, for each action there is a simultaneous reaction, so that the cosmic balance is forever the same. While there seem to be differences in things, therefore, these do not exist from the cosmic point of view, which the Taoists hold to be all that matters.

The second chapter of the *Chuang-tzu* says:

> There is nothing that is not (from the point of view of something else) a "that," and nothing that is not (from its own point of view) a "this." But nothing can see itself as a "that," but only as a "this" These conceptions produce each other. . . . The idea of "right" depends on that of "wrong," and vice versa. Therefore the sage does not look at things in this way, but from the point of view of the whole. He sees the ultimate identity of the "this" and the "that," and recognizes that for each individual there is a different conception of "right" and "wrong," depending upon the point of view. . . . To cause the "this" and the "that" not to be opposed to each other is the pivot of the Tao. It is only at the pivot of the circle of existence that we find the unchanging centre which corresponds to the endless transformations of the periphery.

Reality, thus, cannot be divided, and since all parts of the whole are inseparably related individual objects do not really exist. Furthermore, everything is ceaselessly changing. Thus words cannot truly stand for reality. since they designate parts of the whole, and since they cannot change; words like "mile," "pound" and "true" are useless if their meaning is not constant, but there are no constant realities to correspond to them. Consequently thinking, which necessarily operates with such abstract terms, does not reveal facts about the real world. Thus we cannot *know* reality, but since we are part of it we may *by not thinking* apprehend it intuitively. This Taoist position has been called mystical, but it differs fundamentally from most mysticism in that the Taoist state of communion with ultimate reality is not usually either a transient or an ecstatic experience. Neither do the Taoists consider man's mind to be akin to the essential stuff of the cosmos.

Since Taoism deplores activity it might seem to point to death as the ideal state, but only a few passages in the *Chuang-tzu* carry matters this far and suicide is never advocated. In general the *Chuang-tzu* is far from pessimistic, but is full of an almost naïve delight in the wonderful working of nature. This book has profoundly influenced the Chinese character; some of its aphorisms circulate as proverbs even among the uneducated. It has made for skepticism, tolerance and a slightly humorous detachment. Some of the Buddhist monks who founded Zen Buddhism were close students of the *Chuang-tzu,* and it seems clearly to have influenced Zen (*q.v.*).

The best translation of the first seven chapters of the *Chuang-tzu,* which are considered its earliest part, is Fung Yu-lan, *Chuang Tzu* (1933). The best complete translation is James Legge, "The Writings of Kwang-zze," in *Sacred Books of the East,* vol. xxxix–xl *(1891;* reprinted *1959).* The most accurate translation of most but unfortunately not all of the work is in German, that of Richard Wilhelm, *Dschniang Dsi (1912).* (H. G. C.)

CHUB, a name applied to several minnows (Cyprinidae) common in Europe and North America. Most chubs have broad heads and strong jaws. They eat numbers of small fishes including their own young. During spring many of them dig pits in the bottom of streams, and bring in small rocks and pebbles on which the eggs are laid.

Chubs attain rather large size. The European chub (*Leuciscus cephalus*) may weigh *12* lb.; the North American species seldom exceed *18* in. and *2* lb. The creek chub (*Semotilus atromaculatus)* and various members of the genus *Hybopsis* inhabit eastern North America. Members of the genera *Gila* and *Siphateles* are the chubs of western North America. All chubs are good bait fish, and the largest individuals can be used for sport or food. (C. Hu.)

CHUBB, THOMAS *(1679–1747).* English deist, regarded by Voltaire as one of the most logical of his school *(see* DEISM), was born at East Harnham, near Salisbury, on Sept. *29, 1679.* The son of a maltster, he was apprenticed to a glovemaker and subsequently norked for a tallow chandler. He appeared as an author during the Arian controversy uith an essay, *The Supremacy of the Father Asserted,* published with help from William Whiston (*q.v.*) in *1715.* He then went to London to live for a time, apparently as a servant, in the house of the master of the rolls, Sir Joseph Jekyll, but eventually returned to Salisbury, where he died on Feb. *8, 1747.* Chubb's works include *Discourse Concerning Reason* (1731), *The True Gospel of Jesus Christ Vindicated (1739)* and *Dzscourse on Miracles (1741).* They betray the deficiencies of the autodidact, and he was often treated disparagingly by more erudite theological controversialists. His tracts tended to limit the Christian religion to three fundamental tenets: belief in the divinely ordained moral law; belief in the need of sincere repentance for sin; and belief in future rewards and punishments. The *Discourse on Miracles* took the position that they provided merely a "probable proof" of revelation. His *Posthumous Works,* two volumes. appeared in *1748.* (F. E. M.)

CHUBUT, a southern province of Argentina and part of the area generally known as Patagonia (*q.v.*), is bounded on the east by the Atlantic and on the west by Chile. Pop. *(1960) 142.195;* area *86,751* sq mi. Except for the Andean foothills, which are forested and fertile, and the land along the banks of the Chubut river, the country consists of arid plateaus cut by deep canyons. The scrub vegetation is scanty. There are some shallow saline lakes. and there are large lakes among the Andes.

The fertility oi the Chubut valley is threatened by salts which have come to the surface after many years of irrigation. Rainfall is slight and strong winds blow constantly, raising clouds of dust. A party of Welsh nationalists arrived in *1865* and founded the nell-knonn Welsh colony, which was incorporated in the Argentine republic in *1884.* Chubut was accorded the rank of a province in 1955.

The provincial capital is Rawson (pop. [1956 est.] *2,507).* the busiest commercial centre is Trelew *(7,795)* and the best port is Puerto Madryn on Golfo Nuevo. Rawson and Trelew are connected with Madryn by rail. The Welsh established sheep ranches in the sheltered upper valleys, and wool is the province's chief product. (GE. P.)

CHUCK-A-LUCK : *see* **DICE.**

CHU HSI (CHU-TZU) (1130–1200), the most influential Chinese thinker after the 3rd century B.C., public official and scholar, came of a family that for two generations had held moderately important government posts. His father, Chu Sung, dismissed from the ministry of personnel after patriotically opposing a projected peace with the Tungusic occupiers of north China, retired to a mountain valley inland from the port of Foochow. There Chu Hsi spent his youth. Left fatherless at *13,* the younger Chu continued his education with neighbouring scholars whom his father had recommended. At the early age of *17* he passed the difficult final civil service examination and became recorder in a subprefecture, where he proceeded to reform management of taxation and police, improve the library and the standards of the local school, and draw up a code of proper formal conduct and ritual, none being available. Transferred to the custodianship of a sacred mountain temple, he met Li T'ung, who influenced his future thinking decisively. Li was one of the ablest followers of the 11th-century Neo-Confucians who had created a new metaphysical system to compete with Buddhist and Taoist philosophy and regain the Confucian intellectual ascendancy lost for nearly a millennium. Chu's boyhood teachers had been Confucian scholars, but like many in their time they had also studied and practised Buddhism and Taoism. Chu had followed their example. But while he now retained respect and sympathy for the other beliefs, his allegiance turned definitely to Confucianism.

His life thereafter was increasingly dedicated to Confucian studies. He continued his civil service career and administered several important prefectures. He promoted local welfare diligently and successfully, but in leisure hours and in occasional periods of retirement he found time for intensive study of the classics, observation of nature, teaching and writing. While administrator of Nan-k'ang, near Lake P'o-yang, he revived the once-famous private academy of the White Deer Grotto, which had been founded in the 9th century and in the 10th century enjoyed an endowment of land and regularly more than a thousand students, but had later fallen to ruin. The prestige restored to it by Chu was to last through eight centuries. On several occasions during his career Chu was invited to the imperial court, and seemed destined for more influential positions, but his invariably frank and forceful opinions and his uncompromising attacks on corruption and political expediency each time brought his dismissal or a new post conveniently distant from the capital. On the last occasion, near the end of his life, his enemies retaliated with virulent accusations concerning his views and conduct, and he was barred from political activity. He was exonerated and invited once more to the capital in the year before his death, but remained in the vicinity of his early home, to which he had returned, and devoted his last days to writing and teaching.

A generation after his death, tablets in Chu Hsi's honour were officially placed in Confucian temples. In later centuries, rulers more authoritarian than those he had criticized, discreetly forgetting his political and intellectual nonconformity, made his philosophic system the sole orthodox creed, which it remained until the end of the 19th century.

Chu Hsi's philosophy emphasized logic. consistency and conscientious observance of classical authority, especially that of Confucius and his follower Mencius. Chu answered questions on the nature of man and the cosmos raised by the Buddhists and Taoists but not explicitly treated by early Confucians. His ideas sometimes reflected non-Confucian theories and concepts, but he scrupulously based his explanations on Confucian 'texts. His commentaries on the latter sought to establish the essential consistency of statements in early Confucian canonical writings. He held that the universe has two aspects: the formless and the formed. The formless is supreme natural law, which determines the patterns of all created things. This law combines with a gaseous matter to produce things having form. In human beings the law (manifested as human nature) is essentially perfect, and defects—including vices—are introduced into the body and mind through impurities of matter. Man may eliminate his mental imperfections through study, "investigation of things." This last term has been variously understood, but it is possible that Chu intended a kind of study that could have opened the path to scientific investigation; he himself looked for natural explanations of such phenomena as the appearance of sea fossils on mountain tops. Chu differed with the eminent contemporary Neo-Confucian Lu Chiu-yüan (Lu Hsiang-shan), who saw no duality between natural law and matter and believed in human perfectability through meditation. In his political thought, Chu criticized vigorously the imperial system based on force and motivated by desire and selfishness; like others of his school he accepted as an ideal the more benevolent methods of ancient kings who governed through virtuous example.

Chu Hsi left voluminous writings, including the thereafter authoritative textual commentaries on the classics; his major philosophic treatise, Modern Thought; critical essays on the classics and on later Confucian thinkers; and a great digest of Chinese history to illustrate the operation of moral laws. Soon after his death his disciples published several compendia of his lectures and conversations (among the earliest preserved examples of vernacular Chinese) and an extensive collection of his poems, letters, government papers and other documents. Most of these writings are preserved in modern editions. See also CONFUCIANISM.

CHUKCHI, a group of people, about 12,000 in number, inhabiting the northeasternmost part of Siberia. the Chukchi peninsula, on the Asian shore of Bering strait in the Kamchatka *oblast*, U.S.S.R. They are divided into two chief subgroups, Reindeer and Maritime Chukchi. The Reindeer Chukchi inhabit the interior of the peninsula; Maritime Chukchi inhabit the arctic and Bering coasts. They form part of a larger linguistic group called the Paleo-Asiatic or Paleo-Siberian language family, which includes neighbouring peoples, Koryak and Kamchadal (Itelmen) and probably Eskimo; the inclusion of Eskimo is under discussion (see PALEO-ASIATIC LANGUAGES).

The climate is rigorous and much of the cultural arrangements are concerned with problems of cold and snow. The livelihoods of the two subdivisions are indicated by their names: the Reindeer Chukchi live, in addition to hunting and fishing, from domesticated herds of reindeer which they pasture in the tundra. These herds supply them with means of transport, milk and meat for food, and pelts for clothing and shelter. The Maritime Chukchi live by hunting arctic sea mammals, seals and whales, and by fishing.

Their dwellings vary according to their subsistence pattern. Maritime Chukchi live in fixed villages; their houses are semi-subterranean, with an earth cover of great antiquity in the north. Reindeer Chukchi are nomadic and live in tents, changing residence according to seasonal change in pasture of their herds. Transportation is on sledges pulled by reindeer or dogs harnessed in pairs. The Maritime Chukchi travel in boats with wooden frames and skin covers.

The social organization is simple, there being no fixed classes or ranks. However, they are divided into clans. An important social institution is the *varat*, a group of families closely connected and interdependent for mutual support. The commonest form of marriage arrangement is bride service, in which the son-in-law works for a specified period for his bride's family. In past centuries they also had slaves.

Their religion is a form of shamanism (*q.v.*), wherein a man acquires, after painful experiences, a spirit-familiar with which he communicates in a state of trance. Shamanist ceremonies are conducted for divination and healing. Chukchi have other spirits with which they populate this world and the afterlife.

Much of the knowledge about these people has been gained by the work of political exiles of the tsarist period who lived among them, the most valuable being that of V. G. Bogoraz. At present they are undergoing changes of sovietization, being settled on collective farms.

CHUKCHI SEA (CHUKOTS SEA; Russian CHUKOTSKOYE MORE), a coastal sea of the Arctic ocean, directly north of the Bering strait, through which it connects with the Bering sea, lying between Wrangel Island in the west: the Alaskan coast in the east and the continental slope in the north. Ice covers the whole sea in winter but retreats northward between July and October, permitting coastal navigation both eastward and westward. Some warm water enters the sea through the Bering strait (which is too shallow to permit much, however), while ice-bearing currents flow southeastward along the Siberian coast. Seals of several species and walrus are indigenous, while whales and many sea birds are summer visitors. (T. E. A.)

CHUKOT (CHUKCHI) **NATIONAL OKRUG** (Russian CHUKOTSKI NATSIONALNY OKRUG), an administrative district (created 1930 within the former Far Eastern territory) covering extreme northeastern Siberia. It has been part of Magadan oblast of the Russian Soviet Federated Socialist Republic, U.S.S.K., since 1953. Area 284,826 sq.mi. The population (46,689 in 1959) is now chiefly Russian but includes about 11,000 Chukchi (*q.v.*), 1,100 Asiatic Eskimo on the shores of Bering strait, and some Eveny (Lamut), Koryak, Yakut and Yukaghir elements. In the north there is a true arctic climate, with the warmest monthly mean not exceeding 40° F., but the Bering sea coast is warmer. Elevations reach 5,900 ft., but much of the region is low-lying

tundra. Trees are found only in the south. The average growing period for vegetation nowhere exceeds 98 days a year. Fauna includes bear, fox, uolf. wolverine, squirrel and lemming and other small rodents. Birds and insects abound, and salmonoid fish are found in the rivers. Seal and walrus breed on the coast.

The main industries are reindeer-raising, hunting, fishing and mining. The first three have been practised for many years, but with Soviet rule collectivization was introduced and mining developed. Hunting is for fur-bearers, which are also bred on collective farms, and for sea mammals. The tin mines in the Chaun region and at Iultin have national significance. Coal is obtained at Ugolny on the Bering sea coast and near Anadyr (*q.v.*), the administrative centre. The ports of Pevek, on Chaun bay, and Provideniya on the Bering sea are important stopping places on the Northern Sea route, a maritime link developed in the 1930s and responsible for the economic growth of the northern part of the region. (T. E. A.)

CHULALONGKORN (RAMA V; full name SOMDETH PHRA PARAMINDA MAHA CHULALONGKORN) (1853–1910), king of Thailand. eldest son of King Mongkut, was born on Sept. 20, 1853, and succeeded his father on the throne on Oct. 1, 1868. The young king, who had according to custom been brought up in a Buddhist monastery, retired into seclusion until he came of age in 1873, the government being entrusted to a regency. He then took the step, unprecedented for an eastern Asian potentate, of traveling outside his dominions, in India and the Netherlands Indies. The fruits of his appreciation of foreign institutions appeared in the reforms he instituted in Thailand: abolition of slavery, simplification of court etiquette, grant of liberty of conscience, erection of schools and hospitals and development of the army and navy. He established a standard coinage. postal and telegraph services, and the policing, sanitation and lighting of Bangkok. Several of his sons, including the crown prince, were educated in England. and he himself visited Europe in 1897. He died at Bangkok on Oct. 23, 1910.

CHULA VISTA, a town of San Diego county, Calif., U.S., on the east side of San Diego bay south of National City. is a part of the San Diego metropolitan area. Chula Vista's city limits almost touch the Mexican border. The name of the city is derived from both Spanish and Indian, vista being Spanish for "view" and *chula* meaning "pretty" in a Mexican dialect.

The town was founded during the Southern California land boom of 1888 by the San Diego Land and Town company as a suburban area of fruit farms of from 2½ to 10 ac. It was incorporated in 1911. Subsequently truck gardening increased in importance. Population growth was slow until after World War II, when development of the aircraft industry in the San Diego area contributed to the growth of Chula Vista as a residential community. There are plants manufacturing subassemblies in the town itself. For comparative population figures see table in CALIFORNIA: *Population.* (A. P. N.)

CHUMBI VALLEY lies on the southern slope of the Himalayas between Bhutan and Sikkim. Before the border dispute between India and China in the early 1960s reduced trade to nearly nothing, the most-used trade route between India and Tibet passed through the valley, which belongs to Tibet. Its average elevation is 9,500 ft.. and the climate is delightful all year. A large amount of Tibetan wool, yak tails and borax formerly were exported annually from the region to India in exchange for petroleum, textiles, hats, dried nuts and cooking utensils. A motor road, opened to traffic in Nov. 1955, joins Lhasa with Phari and Yatung, two principal tonns in the Chumbi valley. and Yatung is connected by highway with Gangtok, capital of Sikkim. The Chumbi valley was occupied by the British in 1904–08 during the Younghusband expedition. Under the Tibet trade regulations of 1908 China granted Great Britain the right to maintain a trade agency and armed guards at Yatung. This treaty was superseded by the Indochina agreement on trade with Tibet of 1954, in which India was permitted to retain its trade agency but promised to withdraw its military escorts. The trade agreement lapsed after 1961. (T.-L. S.)

CHUMNUS, NICEPHORUS (*c.* 1250–1327), Byzantine scholar and statesman, left a number of writings, some still unpublished, including letters and orations on occasional philosophical and religious topics, some of which are also of historical value. He belonged to a family distinguished for its service in church and state, owning extensive property around Thessalonica. Chumnus came at an early age to Constantinople where he was educated by George (Gregory) of Cyprus. He held imperial office and about 1272–75 went on a mission to Persia. He rose to be prefect of the secretariat, and became chief minister of Andronicus II. In 1303 his daughter Irene married Andronicus' son. the despot John. Toward the end of 1309 he became governor of Thessalonica and his influence seems to have been overshadowed by Theodore Metochites (*q.v.*). He took the monastic habit and name of Nathaniel shortly before his death in Constantinople on Jan. 16, 1327.

He was deeply attached to the classical tradition, in so far as it did not conflict with Christian teaching. In the lively intellectual controversies of his day he sided with the "ancients" against the "moderns"; this led to a rift with Theodore Metochites whose ardent pursuit of mathematics and astronomy he bitterly attacked. Though moved by keen intellectual curiosity he was a man of letters rather than of learning, and thus typical of the more conservative element in cultured court circles of late 13th-century Byzantium.

BIBLIOGRAPHY.—Orations and philosophical and religious writings ed. by J. F. Boissonade, *Anecdota Graeca,* vol. 1 and 5 (1829, 1833), and in J. P. Migne *Patrologia Graeca,* vol. 140 (1865). CHUMPHON, the name of a province (changwat) and its capital in peninsular Thailand on the east coast of the Isthmus of Kra. The town, with a population of 10,355 in 1957 (est.), is located on the Southern railway 185 mi. S.S.W. of Bangkok. Rice, fruit, charcoal and tin are shipped from its roadstead harbour. It is one of the important fishing ports on the Gulf of Siam. The changwat has an area of 2,219 sq.mi., and in 1960 it had a population of 165,158. Much of the province is too hilly for cultivation. (T. F. B.)

CHUNCHO (ANTI), a term used to distinguish several South American Indian tribes on the eastern slope of the Andes, *e.g.*, the Arawak (*q.v.*), Campa and others, from the Quechua and the Aymara (*q.v.*) of the highlands. (J. H. SD.)

CHUNG-CHIA (P'U-YI), an ethnic group, related to the Siamese, inhabiting large parts of Kweichow province in southwestern China. They have been in southern China since early times and were found in Kiangsi during the 6th and 7th centuries B.C. Their language is similar to Thai, but they had no written script of their own until recently when the Chinese Communists supplied them with a script based upon the Latin alphabet. Animistic beliefs and superstitious practices are prevalent. An account in Chinese records of A.D. 1730 relates that the Chung-chia were a group of former Chinese banished to Kmeichow in pre-Christian times. However, they were most likely a Thai group forced from more favoured agricultural lowlands into the poorer valley lands of the Kweichow plateau and hills. As with other Thai-related ethnic groups, they are fond of wet valley-bottom locations where they may practise wet-rice cultivation.

The Chung-chia or P'u-yi in 1951 were reported to number about 1,600,000 in Kweichow, mostly distributed in the south of the province and centred in and about the hsien or districts of Ts'e-heng and Wang-mo in the valley of the Nan-P'an Chiang (river). It is possible that this figure included the related T'ung tribes. The Chinese Communist estimates of 1953 listed about 1,248,000 P'u-yi and about 690,000 T'ung persons. The latter inhabit the districts east of the P'u-yi where Hunan, Kwangsi and Kweichow provinces join.

Rfany of the P'u-yi have become so sinicized that they are no longer counted as tribesmen. In the higher hills around these valley tribes in Kweichow are numerous Miao (*q.v.*), hill tribesmen who traditionally have practised a slash-burn shifting cultivation. The Communist regime has organized their districts into a number of so-called "autonomous minority nationality districts." Thus, in southern Kweichow is the Ch'ien-nan (South Kweichow) P'u-yi and Miao autonomous *chou* (district). T'ung and Miao tribes in eastern Kweichow are similarly organized. (H. J. Ws.)

CHUNGKING (CH'UNG-CH'ING), Yangtze river port and primary commercial emporium of the important and densely populated inland basin of Szechwan province in western China, 1,400 mi. from the sea. Pop. (1953 census) 1,772,500. The core of the city occupies a rocky peninsula between the Yangtze river and the confluence of the Kialing, the most easterly of the great rivers draining the Red basin. Chungking therefore is the natural gateway through which Szechwan communicates with the rest of China by river, and the city serves as the primary regional trade centre for all of west China and much of eastern Tibet.

Chungking claims a long and colourful history as a centre of independent kingdoms and rebellious regional rulers. A local leader was deputized as the regional ruler under the Chou kings about 1100 B.C. In the 4th century B.C. the city became the capital of the kingdom of Pa, which was absorbed under the Ch'in dynasty near the end of the 3rd century B.C. Numerous rebellions against dynastic rulers were centred on Chungking, and the revolution that overthrew, the Ch'ing dynasty began there in Sept. 1911. The treaty of Peking opened Chungking as a treaty port in 1890, but river navigational problems prevented steamer traffic for some years. Although amphibious planes had established regular schedules to the city in late 1931 and motor roads were in existence outside the city, the first roads for wheeled traffic inside Chungking proper were built only in 1933.

Chungking was the wartime capital of China from Oct. 1938 to 1945. In 1940 the municipal limits were extended to include territory on all river banks at the confluence of the Kialing with the Yangtze, increasing the area to 116 sq.mi. Extensive damage to the city was caused by Japanese bombings from 1938 to 1941. The city became a U.S. air base during 1944–45.

Commercial trade and handicraft manufacturing predominated prior to 1937. Beginning in 1938 many coastal industries and down-river Chinese moved to Chungking to escape the Japanese, and by 1945 the city had grown markedly, industry augmenting its trade patterns. The Communist Chinese continued the industrialization of the city, which lies down-river from important coal deposits. Small steel plants, chemical and fertilizer manufacturing, cement, cotton and silk textiles, and food processing are the major industrial activities.

A rail line between Chungking and Chengtu, in northwest Szechwan, begun by the Nationalists, was completed by the Communists in 1952, and Chungking became connected to the rest of China by rail in 1956, via the Chengtu-Pao-chi line, tying into the Lung-hai system. Chungking is a centre of highway transport and an air terminal. (J. E. SR.)

CHUQUICAMATA, copper-mining company town in Antofagasta province, Chile. Pop. (1952) 24,018, (1959 est.) 30,476; elevation 9,000 ft. The ore body is the largest proved copper deposit known. Large-scale open-pit mining of oxide ores began in 1915. Annual capacity of the foreign-owned operation has been expanded to 250,000 tons of metal. Depletion of the oxide ores and the potential of underlying sulfide ores resulted in the addition (1952) of a flotation and smelting unit to the older leaching and electrolytic plant. Copper is shipped, and food and supplies carried to the desert country mine, from Antofagasta (*q.v.*) by way of a spur from the Antofagasta-Bolivia railway. Highway carriers operate on surfaced roads between the coast (Antofagasta and Tocopilla) and the mine. Water requirements are met by a net of aqueducts which reaches almost to the Bolivian frontier. *See* also CHILE: *Mining.* (J. T.)

CHUQUISACA, a department in southeastern Bolivia (pop. [1959 est.] 320,189; area 19,893 sq.mi.), was established in 1826. It is bounded north by the departments of Cochabamba and Santa Cruz, south by Tarija, west by Potosi and east by Paraguay and Santa Cruz. From 1563 to 1776 the *audiencia* of Charcas, established in Chuquisaca, covered most of the territory of modern Bolivia and included the administrative districts of Paraguay. Buenos Aires and Tucumán, southern Peru and the coastal region of Atacama. With the founding of the viceroyalty of La Plata in 1776, Charcas became Alto Peru and retained that name until the republic was founded in 1825. Chuquisaca gained a leading position as a centre of culture and learning, and its influence outside Charcas earned it the title of "the Athens of America." *(See* BOLIVIA: History.)

Geographically the department consists of plateaus and lowlands with contrasting arid and humid climatic conditions. The eastern plains are subject to annual inundations followed by extreme aridity. The Pilcomayo river flows northwest to southeast into the Paraguay. Livestock grazing and the cultivation of cereals are the principal occupations on the plateau. Sugar cane, corn, rice. tobacco and tropical fruits are grown in the lowlands. Mineral resources comprise gold, silver, iron, copper and sulfur. The highway and railaay linking Sucre and Potosi are the main arteries of communication in the department. Sucre (*q.v.*), the legal capital of Bolivia, is also the departmental capital. (J. L. TR.)

CHUR (Fr. COIXE; Ital. COIRA; Romansh QUERA), a city of eastern Switzerland, capital of Graubiinden (Grisons) canton, is located on the Plessur, 119 km. (74 mi.) S.E. of Ziirich by rail. Pop. (1960) 24,825. The town is situated 1,949 ft. above sea level, at the entrance to the deep Schanfigg (Plessur) valley. The cathedral of St. Lucius was built 1178–1282 on the site of an older church and the episcopal seminary nearby stands on the ruins of a 6th-century foundation. The Raetian museum contains a collection of local historical objects. Chur is the terminus of a standard-gauge railway from Sargans. Its main industry is tourism. but it is also an important trading centre, especially for Valtelline wine. The meeting point of routes from Italy over several of the Alpine passes, it was important in Roman times when it was known as Curia Rhaetorum. The episcopal see, first mentioned in 452. probably existed a century earlier. The bishops became princes of the empire in 1170 and played an important role in the history of Graubunden (*q.v.*).

CHURCH, FREDERICK EDWIN (1826–1900), U.S. landscape painter, the most prominent member of the Hudson river school of American artists, was born at Hartford, Conn., on May 4, 1826. He was a pupil of Thomas Cole at Catskill, N.Y., where his first pictures were painted. Developing unusual technical dexterity, Church from the beginning sought for his themes such marvels of nature as Niagara falls, volcanoes in eruption and icebergs. He was greatly influenced by the writings of Alexander Humboldt, and visited South America in 1853 and 1857. He portrayed the beauties of the Andes and tropical forests with great skill. In the management of light, colour and the phenomena of rainbow, mist and sunset his renderings were plausible and effective. In their time these paintings awoke the wildest admiration and sold for extravagant prices—collectors in the United States and in Europe eagerly seeking them. In 1849 Church was made a member of the National Academy of Design. His "Great Fall at Niagara" (1857) is in the Corcoran Art gallery, Washington, D.C. Among his other canvases are "Andes of Ecuador" (1855), "Heart of the Andes" (1859), "Cotopaxi" (1862), "Jerusalem" (1870) and "Morning in the Tropics" (1877). After 1877 illness left him incapable of work. He died on April 7, 1900, at his house on the Hudson river above New York city, where he had lived and worked for many years.

CHURCH, GEORGE EARL (183s-I~IO), U.S. geographer whose explorations of the Amazon made him the leading authority on that region of South America, was born in New Bedford, Mass., on Dec. 7, 1835. He was educated as a civil engineer, and was early engaged on the Hoosac tunnel. In 1858 he joined an exploring expedition to South America. During the American Civil War he served (1862–65) in the army of the Potomac, rising to the command of a brigade and the rank of colonel; and in 1866–67 he was war correspondent of the ***New*** York Herald in Mexico. His Amazonian explorations took place subsequently (1868–79). In 1880 he was appointed U.S. commissioner to report on Ecuador, and in 1895 visited Costa Rica to report on its debt and railways. He wrote extensively on South and Central American geography, and became a vice-president of the Royal Geographical society (London), and in 1898 president of the geographical section of the British association. Church died on Jan. 4, 1910.

CHURCH, SIR RICHARD (1784–1873), British soldier and philhellenist, who commanded the Greek forces during the War of Greek Independence, was born at Cork, Ire., the second son

of Matthew Church, a Quaker merchant there. Before he was 16, he ran away from school to join the army, becoming an ensign in the 13th (Somersetshire) light infantry and serving under Sir Ralph Abercromby in Egypt in 1801. Having accompanied Sir James Craig's secret expedition to Calabria in 1805 and fought at the battle of Maida (1506). he then served as captain commandant of upper Capri (1806–08) and carried out several missions on the French-occupied mainland. He nas Gen. John Oswald's chief of staff on the expedition (1809) to the Ionian Islands where he met Theodoros Kolokotrones and other Greeks in exile from the mainland Already a philhellenist and sympathetic toward ideas of Greek independence, he obtained permission to form two Greek regiments in English pay, his object being to give the Greeks military training. These regiments were disbanded in Sept. 1814. In vain Church pleaded the Greek cause not only in London but at the congress of Vienna. He entered the service of the Neapolitan government in 1816, became military governor of Apulia in 1817 and was made in 1820 commander in chief of Sicily, whence he was almost immediately expelled by the revolutionaries. When the Greeks rebelled in 1821, he "sighed to be with them." but did not arrive in Greece until March 1827. In April he was appointed commander in chief of the Greek forces.

After his campaigns in western Greece (see GREEK INDEPENDENCE, WAR OF), Sir Richard (he had been knighted in 1822) dramatically resigned his command before the national assembly of Argos (Aug. 1829) in protest against the government of Count Kapodistrias. to which he and other British philhellenists encouraged opposition. In 1830, in a pamphlet sent to England for the information of parliament, he pleaded for the recognition of the frontier he had won for Greece. After the convention of 1832, he settled permanently in Greece and became a Greek citizen, member of the council of state and inspector general of the army. He was the confidential adviser to Sir Edmund (later Baron) Lyons. first British minister to Greece, and he played a conspicuous part in the revolution of 1843. He died in Athens on March 30, 1873.

See Stanlev Lane-Poole, *Sir Richard Church* (1890) ; *E* M. Church, *Sir Richard Church in Italy and Greece (1895).* (D. DN.)

CHURCH, RICHARD WILLIAM (1815–1890), dean of St. Paul's cathedral, London, one of the most distinguished Anglican preachers and writers of the 19th century, played a mediating role in the ritualist controversies and was one of the few churchmen of his day who took a balanced and positive view of the scientific and intellectual developments of the period. Born on April 25, 1815. at Lisbon, he spent many years in Florence, went to Oxford in 1833. was elected a fellow of Oriel college (1838) and became an intimate friend of J. H. Newman (*q.v.*). He was closely associated with the Tractarians, and in 1844 as junior proctor in the university was influential in preventing the public censure of Newman's Tract 90. Nemman's conversion in 1845 did not shake his own allegiance to the Church of England, nor did it break up their personal friendship. From 1852 to 1871 he was rector of Whatley, Somerset, and became well known for the quality of his writing in the Anglican paper the *Guardian* on historical, literary and theological themes. In 1871 his friend Gladstone persuaded him to accept the deanery of St. Paul's. He died in Dover on Dec. 9, 1890.

Of a quiet but singularly generous disposition, Church combined a deep-rooted belief in the Catholic nature of the Church of England. with a remarkable liberality of outlook. His book The Oxford *Movement* (published 1891) is, after Newman's Apologia, the finest account of the events of 1833–45 to come from a contemporary hand. He had a great love of Dante and published an influential work, Dante and *Other* Essays (1888).

See B. A. Smith, *Dean Church* (1958). (A. MACD. A.)

CHURCH. The word "church" refers both to the Christian religious community and to the building used for Christian worship. This article, which deals separately with the two subjects, is intended only as a summary. As Christians differ greatly in their beliefs about the nature of the church, further information should be sought in the individual articles on each church. The section on church buildings can be supplemented by the relevant architectural articles.

THE RELIGIOUS COMMUNITY

Emergence of the Church. — The Greek word ecclesia, which came to mean "church," was originally applied in the classical period to an officialassembly of citizens. In the Septuagint translation of the Old Testament (3rd–2nd centuries B.C.) the term ecclesia is used for the general assembly of the Jewish people especially when gathered for a religious purpose such as hearing the Law (Deut. ix, 10; xviii, 16; etc.). In the New Testament it is used of the whole body of believing Christians throughout the world (*e.g.*, Matt. xvi, 18), of the believers in a particular area (*e.g.*, Acts v. 11) and also of the congregation meeting in a particular house — the "house-church" (e g., Rom. xvi, 5).

The conclusion is natural that as there is continuity from the Septuagint to the New Testament in the use of the word, so there should be a continuity in that which it represents. In fact it has been the traditional view among theologians that there is a church of the Old Testament as well as of the New. After the Jews had returned to Palestine from exile in Babylon they had tried, under the teaching of Ezekiel and the later practice of Ezra and Nehemiah, to refashion their nation on the lines of a church. When the people as a whole failed to respond, the faithful were taught to look forward to a messianic kingdom in which the remnant would enjoy the full privileges of the covenant, as both a kingdom and a church.

Jesus Christ proclaimed the coming of that Kingdom. It was indeed expressed in his own person. He had come not to destroy all that had been taught before but to fulfill the promise it contained. Those who attached themselves to him in faith and allegiance were already in the Kingdom. It is sometimes said that Jesus expected the Kingdom to come in a more explicit sense. putting an end to the present temporal age. immediately upon his own sacrificial death, and that therefore he had no need of a church. It is true that the term church is only twice put into his mouth (Matt. xvi, 18; xviii, 17), that these references are merely incidental and that even so they are suspect to some scholars on critical grounds. It can scarcely be denied however that in gathering round him a picked band of followers and using them for the propaganda of the Kingdom, Jesus had already formed the nucleus of an organization and revealed a purpose for a church.

History. — In any case that is how his immediate followers interpreted the situation. They themselves were the remnant; they had succeeded to the promises; they were the new Israel, the heirs of the old church in a new guise. Inspired by the events of the resurrection and the descent upon them of the Holy Spirit they set themselves with immense fervour to carry out the task allotted to them. Twenty years after the crucifixion St. Paul was so full of the church. its opportunities and its needs that the thought of the Kingdom had already begun to fall into the background. In fact a theology of the Kingdom never was worked out. When its full coming mas seen to be delayed, attention was inevitably riveted on its current representative, the church.

As the first task of the church was to proclaim the gospel of the Kingdom. the second was to shepherd those who were converted. It was natural that the efforts to hold the flock together should follow the lines already familiar in the organization of Judaism. It is evident from the scrolls discovered at Qumran that even a semimonastic sect like the Essenes took the greatest care to emphasize the notes of authority and unity among themselves. That the early Christian community did the same from the start is learned from Acts. Their first corporate action was to fill the place in the apostolic band left vacant by the death of Judas (Acts i. 15–26).

The nascent Christian church was soon disowned and even persecuted by the Jewish authorities. It set up its own headquarters in Jerusalem corresponding to the Sanhedrin and directed its evangelism from there. When Christianity reached the provincial towns of the Roman empire, the story of imitation was repeated. Rebuffed from the local synagogue, the Christians were compelled to build up an organization of their own. They appear to have repeated the system with which they were already familiar. As the synagogue was ruled by elders, so the local Christian community must be ruled by elders. St. Paul, whose conversion had

brought great accessions of gentiles to the church not only in Syria but also in Asia Minor and Europe, saw to it that elders (Gr. presbyteroi) were appointed in every city (Acts xiv, 23; Tit. i, 5). (See also MINISTRY, THE CHRISTIAN.)

What was even more important than arrangements for the ministry was the decision as to what should determine membership in the church. At first the Christian community was an enclave within Judaism. a special synagogue of such Jews as accepted Jesus as Messiah. But hard upon the success of the gentile mission came the question whether the new converts must first become Jews before they could become Christians. Must they be circumcised as well as baptized? At the Jerusalem council (Acts xv) it was decided that henceforth acceptance of the Christian faith and baptism mould be sufficient to qualify for membership; circumcision would not be demanded. Later, under the stress of persecution. when it was necessary to afford the fullest possible support to all believers. this rule would be further relaxed to allow of the inclusion of catechumens. Not only the baptized but also those who were under preparation for baptism would count as Christians.

It is probable that persecution hastened the organization of the ministry. When Jewish opposition made it clear that Christianity had no claim to be a national religion, the Roman government soon began to look upon it as a dangerous international organization and an "unlicensed" religion. In self-defense against the sporadic persecution that followed the church had to tighten its discipline and define its ministry Clement of Rome. writing about A.D. 96. rebukes the Corinthians for allowing disturbances in the orderly succession of officers Ignatius, bishop of Antioch. journeying to his death in the Roman arena about 115, exhorts the churches, to which he writes on his way, to rally round their bishop as the one sure centre of the resistance movement. By the fourth quarter of the century other dangers had appeared in the shape of heresy (false doctrine) and schism (breach of unity); and a formidable rival of the church had arisen in the theosophical body known as the Gnostics, who claimed to have an esoteric doctrine handed down through their teachers from the Christ himself (see GNOSTICISM). Irenaeus, bishop of Lyons (*c.* 185), found in the bishops the main defense against this corrosive influence of false teaching. particularly in the bishops of the great apostolic sees By this time the three orders of bishop, priest and deacon stood out clearly as the essential structure of the ministry (*see* HOLY ORDERS). The general system of the "great" or "catholic" church was thus now clearly developed and was to hold together through the further period of conflict with the Roman empire.

When that period ended in first the toleration (313) and then the establishment (381) of the church in the empire, it was succeeded by a period of grave internal troubles over questions of faith and order. The government, anxious to use a common religion as the means of cementing together the various elements that made up the empire. placed its resources at the disposal of the bishops in order that they might meet together from the four corners of the civilized world and settle their differences. There followed the four great councils universally recognized as "ecumenical." Nicaea (325), Constantinople (381), Ephesus (431) and Chalcedon (451), at which, in correction of the one-sided doctrines of certain Christian teachers, the fundamental truths about the Trinity and about the person of Christ were stated. At Nicaea the relation of Jesus to the Godhead mas defined in a test creed for bishops which, slightly adapted, has since become, under the name of the Nicene Creed, a part of Christian worship. At Chalcedon the doctrine that Christ is one person in two natures, divine and human, received what has since been recognized as its final form in the Chalcedonian definition (see also COUNCIL; CREED).

These agreements were not reached without leaving behind some dissentients The Nestorians (q v.), who divided Christ into two persons, and the Monophysites (*q.v*), aho united his two natures into one, used these theological differences as an excuse to free countries lying on the eastern borders of the empire from the dominance of Constantinople In the 7th century this dissidence made the area an easy prey to the invading Muslims The consequent losses in turn accelerated the development of bad feeling between Constantinople and Rome, while theological disagreements affordedan excuse for the ventilation of personal and political rivalries. The chief doctrinal point at issue concerned the Trinity, the Eastern Church holding that the Father is the sole source of the Spirit, the Western that the Spirit proceeds also from the Son. On both the political and the religious level, the papal claim to jurisdiction over the Eastern patriarchates as well as the Western proved unacceptable to the Byzantine empire. In the 11th century the result was the great schism between east and west, between Orthodox and Catholic. uhich has not yet (in spite of one nearly successful attempt in the 15th century; see FERRARA-FLORENCE, COUNCIL OF) been healed.

Throughout the later middle ages east and west each developed its own type of spirituality and its own method of aorking with the state. As in the ith century, the disunity of Christians again gave an opportunity to Islam. In 1453, to the consternation of Christendom, Constantinople was captured by the Turks. Thereafter the Orthodox in Asia Minor, Greece and eastern Europe apart from Russia became, like the separated Monophysite and Nestorian Christians, subordinate groups in a Muslim world. In these countries it was the church that kept the nation distinct from its conqueror and that in the 19th century led the movement for freedom from the Turks. In the 20th century Orthodoxy became better known in the west largely through widespread emigration to the United States and the exodus of Russian theologians after the communist revolution in 1917. The Eastern Orthodox form one united church, though its traditional organization in national groups sometimes causes practical difficulties for its members dispersed in the west.

During the 16th century the Western Church was split by schism as heterodox opinions. familiar since the times of John Wycliffe and John Huss. achieved a fresh vogue, drawing strength from the revival of Greek studies and from a widespread anticlericalism among the people. The invention of printing propagated the doctrines of reformers such as Luther, Calvin and Zwingli and gave Protestantism such a widespread and popular basis that the church. despite the work of the Counter-Reformation, could no longer prevent those of different dogmatic views from establishing their onn ministries and forms of worship. But the feeling that a state must have religious as well as political cohesion died very hard. and for about 100 years western Europe mas troubled by religious warfare, particularly within France and Germany. The strife was at length stilled by exhaustion and by the growing spirit of toleration and of indifference nurtured by the rationalist movement of the 18th and 19th centuries. All branches of the Western Church suffered in some measure from the effects of this movement, partly from the direct assaults upon religion made by its adherents and partly because it led to a decline of doctrinal conviction among their members. Ultimately most denominations met the danger by a reassertion of the supernatural element in Christianity; for example. the Church of England in the renewed stress upon dogma inaugurated by the Oxford movement, and the Roman Catholic Church in the condemnation of modernism by St. Pius X in 1907.

Missionaries of the various branches of the church were often the pioneers in the opening up of America, Asia, Australasia and Africa; the divisions of Western Christendom thus were repeated in the new states. But the divisions among Christians, often passively accepted at home, proved a greater embarrassment and scandal in the mission field, and it is perhaps not surprising that the great 20th-century movement toward reunion first achieved practical results in these areas (see ECUMENICAL MOVEMENT). Some protestant denominations merged in 1925 to form the United Church of Canada; and the Church of South India, established in 1947, represents the culmination of a movement in which former Anglican, Methodist, Congregational, Presbyterian. Lutheran and Dutch Reformed churches have taken part. The World Council of Churches (*q.v.;* established 1948) exists to further the integration of belief and action; the Roman Catholic Church also has shown much concern with the need to recover Christian unity.

Statistics about church membership are notoriously difficult to acquire and to interpret, but it has been estimated that in the mid-20th century about one-third of the world's population was

Christian. In round terms, of the 900,000,000 Christians half were Roman Catholic (450,000,000) and a sixth Orthodox (150,-000.000). while the remaining third (300,000,000) belonged to more than 600 other churches. The influence and importance of some of these are much greater than their relatively small membership would suggest.

Doctrine. — In view of the tendency to division shown by the church in history, it is pertinent to inquire what the church in fact believes itself to be. There are, it is true, divisions in it that are natural and in no way hinder its essential unity. In view of the commonly expressed belief in the communion of saints. most Christians mould accept the traditional division of the church into militant, expectant and triumphant, meaning the church on earth. the church in "hades" or purgatory and the church in heaven. But this of course does not allow for any divisions here upon earth. The Roman Catholic and Eastern Orthodox church alike regard these divisions as irrelevant, each believing that its own respective organization is exclusively to be identified with the church that Christ founded (without. however, denying all possibility of salvation to those outside it). The same claim has been made in the past by some of the smaller churches, though these generally tend now to assert the ideal unity of the church while making every effort to approximate as closely as possible to it in effective organization. The fact that many Christians hold nominal beliefs and do not act like followers of Christ has been noted since the 4th century, when the church ceased to be persecuted. To account for this St. Augustine propounded the theory that the real church is an invisible entity known only to God. Luther used this theory to excuse the divisions of the church at the Reformation, holding that the true church has its members scattered among the various Christian bodies but that it is independent of any organization known upon earth. The majority of Christians, however, while recognizing the obvious truth that God alone can know the hearts of men, still believe that Jesus intended to found one visible church here upon earth. The growing acceptance of that view is one of the most impressive features of Christian thought in the 20th century.

The four marks or characteristics by which the church is said to be distinguished are recited in the Creed: one, holy. catholic and apostolic. The first, that of "unity," appears to be contradicted by the diversity referred to above. It is held however that since baptism is the rite of entry into the church, the church must consist of all baptized people, who form a single body irrespective of the denomination to which they belong. It is held also that since, as St. Paul contends, the church is the Body of Christ, and each baptized person is "grafted" into him, there is a mystical unity that binds together all the members in Christ in spite of their superficial divisions. The "holiness" of the church does not mean that all its members are morally perfect but that as the special sphere of the Holy Spirit it forms a school of character in which the members are trained in holiness. The term "catholic" meant originally the universal church as distinct from the local churches, but it came to imply the "great" church as contrasted with the sects. The term also embodies the idea of authoritative and orthodox doctrine as opposed to the teaching of heretics and schismatics. Finally the title "apostolic" implies that the church is "built upon the foundation of the apostles and prophets. Christ Jesus himself being the chief cornerstone" (Eph. ii. 20). In other words, in both its teaching and ministry the church is historically continuous with the apostles and so with the earthly life of Jesus.

The importance of these distinguishing marks is that they are signs and expressions of an inward and spiritual life. The outward organization is a sacramental means of an inner vitality, that of Christ and his Spirit, in which all the members share. The church does not merely perpetuate the horizontal line of history linking the present believer with the past life of Jesus of Nazareth; it also presents a vertical line striking directly from the Christ enthroned in heaven to the heart of the believer upon earth here and now. The method of this communication is twofold. The first is psychological, in which the faith of the Christian responds to the challenge of Christ and accepts his rule in obedience and love. Those Christians who lay specially great stress on the experience of personal conversion are inclined to regard this first method as the one of overwhelming importance. The second is ontological, by which the believer is first incorporated into Christ by baptism and then continually nourished by participation in the sacrament of the Eucharist. The life thus engendered in the soul of the Christian is nourished in the regular worship that is the primary duty of the church and in the atmosphere of brotherly love that should characterize the community. As the original followers of Christ after his ascension "devoted themselves to the apostles' teaching and fellowship, to the breaking of hread and the prayers" (Acts ii. 42), so the Christians of today follow the same practice and receive the same benefits.

The church is intended to follow Christ under the inspiration of the Holy Spirit in a may of life that marks it off from the world in which it is set. Although this aim is far from being fully realized, it cannot be denied that the church, throughout its history, has inculcated a high standard of morality. If in some instances, as in its persecution of heretics, it has grossly misinterpreted the teaching of Jesus, it has nevertheless been largely responsible for the building up of what is known as western civilization, and has conferred considerable benefits on mankind. As the leaven that leavens the whole lump it may perhaps be said to exercise a less conspicuous but more penetrating influence in the 20th century. Its task in the world is to inspire each individual to contribute his abilities toward preparing the way for the coming of the Kingdom of God by proclaiming that coming and facilitating its progress. (J. W. C. W.)

THE BUILDING

Early Christian. — The first meetings for Christian worship were held in the homes of converts, in rooms which in many cases may have been set aside and furnished for this particular purpose. Christianity spread within the Roman empire into Asia Minor, Greece and Rome itself with surprising rapidity, but continued persecution from the time of Nero until the so-called Edict of Milan (313). which granted religious tolerance, made secrecy necessary. Gatherings and services therefore took place in private houses and catacombs (*q.v.*) where existing subterranean cells could be enlarged and used with little fear of discovery. These small chapels cut in the rock. of which the best known are those in Rome, are the first examples of Christian architecture in its simplest form.

As the church grew and gained recognition, the old desire of men to erect buildings to the glory of their God found fresh outlet. When Constantine I (d. 337) embraced the Christian faith, he gave it an endorsement that immediately widened the prospects for church building.

Early church buildings are generally said to have been adapted from the existing common form of the Roman basilica (*q.v.*). A rectangular plan with entrance at one end and projecting semicircular apse at the other was divided into a wide nave or central space with lower-roofed aisles along each side. The altar was centrally placed at the junction of nave and apse, with seats behind for the bishop and clergy, as magistrates' seats had been arranged behind an altar for the taking of oaths in secular basilicas. A screen (Lat. cancelli) stood between the altar and the congregation, reserving the sanctuary for the priesthood. This screen later gave its name to the chancel and enclosed an area for use by the choir. In some churches an additional open space before the altar, the bema, formed part of the sanctuary and may be regarded as forerunner of the transepts. Two ambos or pulpits were also placed at the sides of the chancel for reading of Scripture. From that on the left the Gospel was read and from that on the right the Epistle.

The church was approached through the porch or narthex, often by may of a cloistered atrium. Penitents and those not admitted to full church membership could listen to the services from the narthex.

The so-called basilican church, with long open nave, side aisles and apsidal end, admirably fulfilled its function as a building for the celebration of the Eucharist. Whatever the detail of its

derivation, it was certainly rooted firmly in the architectural traditions of the Roman empire, and churches of this type dating from an early period have been found throughout the Mediterranean area where Rome had dominated. *(See* also EARLY CHRISTIAN ARCHITECTURE.)

Byzantine. — An alternative type of church plan also occurs at an early date but has had less significant influence on the development of Christian architecture. This is the circular or polygonal centralized plan usually roofed with a dome and deriving from earlier tomb and temple forms. An interior colonnade provided an encircling aisle or ambulatory and in most cases an apse was added, linked to the central space by the usual bema. Examples occur in Armenia. Greece and Italy, nith the 6th-century Byzantine churches of I-Ingia Sophia, at Istanbul. Turkey, and S Vitale, at Ravenna, Italy, remaining as two of the finest. Except for such ceremonies as baptism. this form was more suited to the eastern rite than to the congregational nature of the Roman services. Although St. Mark's. Venice, was reconstructed on a Greek cross plan in the 11th century and imitated a century later in the church of St. Front, Périgueux, France, these are isolated instances in the west, while in the Balkans and in Russia variations on the centralized plan persisted into the middle ages and beyond. *(See* also BYZANTINE ARCHITECTURE.)

Romanesque.—The coronation of Charlemagne in 900 preceded the restoration of some degree of order for troubled successors in the west to the Roman empire. More settled conditions encouraged a fresh approach to art and architecture, and from confused and nidely separated sources the Romanesque style emerged. It was characterized by the return to masonry-vaulted roofs, probably influenced by the remains of classical Roman buildings still then nidely extant. Northern Italy, Germany. France and Britain — as a result of the Norman conquest — all produced differing developments until Romanesque in its turn gave way to Gothic in the 12th century with the introduction of the pointed arch and many-ribbed vault in place of the round arch and barrel vault.

An aisled nave was almost universal in larger Romanesque churches. with a chancel or presbytery between this and the east end to accommodate the larger numbers of clergy and monks. At the junction of nave and chancel transepts were added, producing a cruciform plan shape. The semicircular apse was still commonly used, but less frequently in England than elsewhere.

From early Christian times it had been the custom for a tomb or relics of saints to be placed beneath the altar or in the crypt. Many of these relics increasingly became objects of veneration and pilgrimage. Thus, circulation space for processions and for large numbers of people made the ambulatory a necessary feature. *(See* also ROMANESQUE ARCHITECTURE.)

Gothic. — The religious fervour that transmuted the massive northern Romanesque into the fine flowering of Gothic in Germany. England and France also produced substantial endowments for the saying of masses in chantries or chapels. Many additional altars were required in the greater churches for this purpose, and these most frequently opened off the ambulatory, giving rise to the characteristically French Gothic chevet or series of chapels surrounding the east end. The most important of these was usually the lady chapel dedicated to the Blessed Virgin.

While abbey churches and cathedrals served the needs of monastic or urban communities, village life centred on the small parish church, of which some of the finest and most varied examples occur in England. Many of these occupy sites of early Saxon churches. though few pre-Conquest structures remain. Most parish churches may be classified according to three basic types of plan. The first consists of a simple rectangular nave with smaller rectangular or apsidal sanctuary, and in the second a chancel is introduced between nave and sanctuary. The third type developed as in the earlier, larger churches into the cruciform plan with added transepts and central tower.

Elaborate schemes of symbolism have been put forward in relation to church plans and other architectural features, but it is doubtful nhether most of these are valid. The piecemeal extensions and reconstructions that took place throughout the medieval period tend to discount the idea of the church plan as representing the body of Christ crucified.

Separation of clergy from laity continued until the Renaissance. The timber rood screen was the simplest form of barrier, surmounted by the crucifix and with open traceried panels beneath. It is the nearest Western approach to the closed iconostasis of the Eastern Church. In English cathedrals and collegiate churches, a stone screen separated choir from nave. Later in many cases the organ was supported on this screen in an ideally central position. Occasionally in monastic churches both rood screen and choir screen were built to give seclusion to the monks. In France and Germany, nhere the larger churches more commonly were of lay origin. the solid dividing screen was rare.

As the middle ages advanced. the churches became the setting for works of art in stone, marble, alabaster, wood and stained glass. From the beginning, colour played a large part in internal effect. Pigments were lavishly employed on ceilings, on the surface of piers and walls and on furniture as well as in the richness of great areas of stained glass. In such prodigality of colour, the medieval mind found the fullest satisfaction of its religious ideals. (*See* also GOTHIC ARCHITECTURE.)

Renaissance. — The revival of Roman architecture began, naturally enough, in Italy. where the tradition had survived and where Gothic building had never been widespread. Gradually it spread to the rest of Europe, with modifications based on local conditions. In northern Europe the Reformation checked the building of churches. and in England no great church nas built between the completion of Bath abbey (c. 1539) and Sir Christopher Wren's St. Paul's cathedral (begun in 1675). As Wren had observed. the main requirement of the reformed religion was a preaching space or auditorium, and most of his city churches are skilful variants on a basic rectangular plan with only a shallow recess for the altar. This plan persisted in England throughout the 18th century and is seen in many North American churches of this period. Even on the continent, in countries untouched by the Reformation. the Renaissance produced a similar plan.

The Counter-Reformation within the Roman Catholic Church also encouraged the spread of the baroque hall-type preaching church which was closely associated with the Jesuits, in which the domed cruciform plan had contracted, reducing the side aisles to a series of small chapels and the sanctuary to a low platform with altar rail, set once more in a small apse. The church of the Gesù in Rome became the prototype for innumerable churches, particularly in Austria and Bavaria, where exuberance of decoration developed into the light and colourful rococo.

Similar trends of baroque church design in France and Spain were gradually curtailed by the growth of a severe neoclassicism. *(See* also RENAISSANCE ARCHITECTURE; BAROQUE AND POST-BAROQUE ARCHITECTCRE.)

19th Century. — With the waning vigour of classic forms, the 19th century became an age of eclecticism in architecture. The Gothic revival competed with Greek, Roman and Byzantine designs but in northern Europe came to supersede all others in being considered the most suitable form of church building. The church plan itself varied little whether the outward dressings were Gothic or classic.

The Oxford movement within the Anglican Church, reacting against the scientific materialism of mid-Victorian England, turned for visual expression to medievalism. A reinterpretation of the ideals of the earlier period and of its forms and decoration became the life work of such men as John Ruskin and William Morris.

A gradual change of outlook preceded the more fundamental changes that have occurred in the 20th century and that are dealt with at length in the article on RELIGIOUS ARCHITECTURE.

(E C. D.)

CHURCH AND STATE. Before the advent of Christianity the religious and political orders were not clearly defined. Men worshiped the gods of the particular state in which they lived. religion in such cases being but a department of the state. In the case of the Jewish people the revealed Law of the Scripture constituted the Law of Israel. The Christian concept of the secular

and the spiritual is founded on the words of Christ: "Render to Caesar the things that are Caesar's, and to God the things that are God's" (Mark xii, 17). Two distinct. but not altogether separate. areas of man's life and activities had to be distinguished; hence a theory of two powers came to form the basis of Christian thought and teaching from earliest times.

In the apostolic age the apostles, living under a pagan empire. taught respect for and obedience to the governing powers, even nhen the ruler was not a good ruler. But this obedience did not extend to commands that contradicted the divine lam; obedience to God took precedence over obedience to man. A part of man's life, and that the most important, was governed by a higher lam outside political jurisdiction.

Among the Fathers of the Church the emphasis on the primacy of the spiritual was even more emphatic. Most of these early Christian leaders lived in a period when Christianity had become the religion of the empire. They insisted upon the independence of the church and the right of the church to judge the actions of the secular ruler, who, after all, was a son of the church. was within the church and could claim no exemption from the law of God as interpreted by the church. In the 5th century Pope Gelasius I reminded the emperor that there are two powers by which the world is governed, the power of civil authority and the power of the priests, and that the priests bear a heavier responsibility in that they have the care of man's immortal soul. The life eternal is man's destiny; the present life is a period of trial in preparation for the life to come.

The divine lam, therefore, is superior to any man-made ordinance or command. Another law, however, governs men and is evident to the reason of men without a knowledge of the Scriptures. This is the universal and unchanging natural law, a law spoken of by Cicero and the pagan Stoics, which teaches men to observe the rights of other men in their lives and property. Its first principle is "Do good and avoid evil," engraved, as St. Paul said, in men's hearts. If this law is natural to men, it was created by the God of nature. Two lams, therefore, govern men as rulers, the natural law and the divine law.

Middle Ages.—With the decline of the Roman empire in the west, civil authority, not by design but by necessity, fell into the hands of the only educated class that remained—the churchmen. The church, which formed the only organized institution, undertook the slow and difficult mission of converting the barbarians who had overrun the empire. Against great odds it brought the humanizing teachings of Christianity to rough uncivilized peoples. While it still steadfastly taught the doctrine of the two poners, for several generations it held both. In the east the empire, with civil authority centred in Constantinople and attacked on its borders by barbarians and Muslims, carried on a precarious existence till the 15th century. While within it the Christian doctrine of the supremacy of the spiritual was asserted. the two powers, civil and ecclesiastical, for the most part were lodged firmly in the hands of the emperor. Throughout the history of the Byzantine empire the civil authorities dominated the ecclesiastical.

In the west, where the church had assumed temporal power, the independence of the ecclesiastical authority mas defended even after the restoration of civil authority. In 800, under Charlemagne, the empire was restored in the west. For many centuries afterward the civil power took as advisers the educated class. the churchmen, but as the civil power grew in strength and prestige under vigorous rulers conflict with the ecclesiastical powers increased. Kings and emperors found that large areas of their domains were held under the jurisdiction of bishops and abbots. The civil rulers demanded not only control of the ecclesiastics but also the right of naming and investing them, and by the 10th century these powers had been gathered into the hands of rulers in many parts of Europe. The general result was not a happy one for the church. Men who had little learning, secular or ecclesiastical, nere able to obtain high positions in the church largely through political connections. A general lowering of religious fervour, devotion and even morals among the clergy brought vigorous action from a line of reforming popes, the most famous of whom was Gregory VII. Gregory's efforts to bring under control of the church the naming and investiture of bishops brought him into conflict uith the emperor Henry IV. In the ensuing struggle Henry was brought temporarily into submission, but, regaining the support of many of his nobles, drove Gregory into exile, where he died. (See also GREGORY; INVESTITURE.)

The following centuries were marked by a dramatic struggle between emperors and kings and the popes. Nonetheless, during the 12th and 13th centuries the papal power greatly increased. During the period of most intense struggle both disputants accepted the theory of the two powers, but the application of the theory became more difficult as the civil power attempted to extend its jurisdiction into fields hitherto largely occupied by ecclesiastics. Two events in particular aided the civil power in the struggle: The recovery of Roman law, framed as it was during the period of absolute rule by the emperors, furnished the defenders of civil rulers with strong arguments in defense of temporal power; and the growth of the nation-states, which brought a greater national sense to the people, aided the civil rulers in their struggles against the universal papal authority. Despite the recurring disputes between the church and the civil powers it was still possible in the 12th century for people on both sides to hold to the ideal of one Christian commonwealth with the two powers representing two aspects of life. As Charles Howard McIlwain has written:

> The contest was not for either party a struggle between "Church and State" in our modern sense, for neither of them could conceive of a society that was not at the same time both Church and State. The *civitas Dei* and the *civitas terrena* were only two aspects of the life of man on earth which must remain mingled together till death or the day of judgment, as St. Augustine had said. Society was but one, and the State and the Church alike were only different aspects of this oneness The contest for supremacy was not between two rival institutions, a State and a Church, it was between two sides of human life, two elements in the constitution of man, two powers that claimed his obedience, the *regnum* and the *sacerdotiunz (The Growth of Political Thought in the West;* New York, The Macmillan Co., 1932).

In the 13th century the greatest scholar of the age, St. Thomas Aquinas, borrowing from Aristotle, aided in raising the dignity of the civil power by declaring the state a perfect society (the other perfect society was the church), a positive good in the natural order for the promotion of men's temporal needs, and a necessary good inasmuch as men could not live without a civil society. The state did not exist solely to restrain the evil in men, for, Aquinas asserted, some form of government was necessary even in a society of angels.

The medieval struggle between secular and religious power came to a climax in the 14th century. The leading nations of Europe had now grown in strength and internal unity. The universities, among the greatest contributions of the middle ages to western civilization, had turned out leaders in Roman and canon law. Learned laymen were now assuming positions of importance at the courts of kings. The endeavours of the popes to settle the constant wars among the nations embroiled them ever more deeply in the groning complexities of international politics. The independence of the church within the nations in the maintenance of its own courts and administration challenged the policy of internal unity that the strong monarchs now pursued.

France, the most powerful of the nations, was governed during the first part of the 14th century by Philip IV the Fair, whose aim was not merely the spread of French power but also control of the papacy and attainment of the title of Roman emperor. The papacy in the early years of the century was occupied by one of the great canonists of the time. Boniface VIII. The immediate cause of the dispute was the right of the king to tax church property in the event of war. Canon law forbade a king to tax such property to support a war against another Christian king without the consent of the church; Philip proceeded to tax church properties in one of his recurring wars with England. The ensuing dispute, which raged for several years, involved all the old questions of the proper spheres of the religious and the secular powers. The distinct difference in this controversy, however, which neither side appeared to recognize, was the rising force of nationalism. Noteworthy too was the prominence of lawyers, both royalist and

canon. The subtleties, the distinctions, to say nothing of the rigidities of the arguments on both sides lent to this particular controversy a flavour lacking in previous centuries. Even older arguments when put forth by the canonist Pope Boniface had a ring of severity and dogmatism lacking in most earlier papal statements. (See also BONIFACE.)

Giles of Rome put forth a theory that all secular power mas derived from the church. Equally extreme was the royalist defender Pierre Dubois in claiming supreme authority of the king over the pope. More moderate views came from the theologian John of Paris. who claimed that the state existed by natural law, with a proper end or purpose of its own, and not owing its creation to the church: both church and state oaed their existence to God, each with its own independent ends to serve; the church served spiritual ends and for its purposes used spiritual means; it was not justified in calling upon the state to serve its ends: the church enjoyed a primacy, but a primacy of prestige and not a primacy of poner. Not many years later. Marsilius of Padua was to declare in his *Defensor pacis* that all poner in church and state was derived from a primary assembly of the people. The church was just another social agency in the state, and as such derived whatever privileges or powers it enjoyed from the state. (See MARSILIUS.) The medieval struggle between priestly and kingly powers came to a disastrous close for the papacy, first in the removal of the popes to Avignon under French influence. and second with the Great Schism attendant upon an effort to bring the popes back to Rome Church discipline was relaxed and church prestige fell in all parts of Europe.

While the struggle of the middle ages did at times involve an ungodly power effort. it was by no means for the most part of that nature. Whatever natural vigour and esteem Christianity enjoys today it owes in no small measure to the efforts of churchmen in the middle ages to preserve the church from domination by the secular powers. In addition some of the most treasured theories of popular government nere enumerated by canonists—the source of authority in the people, limited executive poner and the binding force of law on rulers Of this period William Ebenstein says, in writing of John of Salisbury. a papal apologist:

> From the modern secularist viewpoint, the church ought to stay in its place and not contend with the state for temporal power. But John of Salisbury and the papal apologists, in seeking to curb the authoritarian claims of kings and princes, or to gain at least equal authority ior the church, were (knowingly or unknowingly) fighting a cause that was larger than their own: the whole issue of human liberty was at stake, and it was a more important issue than the rivalry for power and supremacy that raged between popes and emperors. And though John of Salisbury and the medievalists did not solve this larger issue, neither have the secularists: Is the state, even the democratic state, to have absolute and complete authority, or must there he some competing principles of allegiance that will make it difficult, or impossible, for the state to become an all-absorbing Leviathan? The church can no longer, as in the Middle ages, play the part of a competing major source of loyalty and authority, but thus far no institution or idea is in sight that can be relied on to do the job. The democratic state—precisely because of its popular source of support—has by no means abolished the possibility of tyranny and repression . . . (Great Political *Thinkers, Plato* to *the Present,* 3rd ed., copyright 1951, © 1956, 1960; reprinted by permission of Holt, Rinehart and Winston, Inc.)

The Reformation. — The immediate effect of the Reformation was a great increase in the power of the state both in Catholic and in Protestant countries. Christianity in its fractured condition could offer no effective opposition to a strong ruler. Assuming the position of head of church and state, rulers now claimed divine right for their positions. (See KING: *Divine* Riglzt of Kings.) Both Luther and Calvin taught absolute obedience to rulers. even to tyrants. except in matters involving violation of God's law; resistance in any case should be passive. In Lutheran countries the churches in many cases reflected the trends of German nationalism and were to all intents and purposes arms of the state. In Calvin's Geneva the political order was subordinated to the ecclesiastical order; no pope of the middle ages had asserted the supremacy in theory and practice of the church with greater vigour than did Calvin. Some of the extreme sectarians of the Reformation proclaimed a doctrine of Christian anarchy, substituting the Bible alone as the law for all people.

In England Henry VIII broke the ties with Rome and assumed the headship of the Church of England. While the break and the assumption of leadership by the king were revolutionary, few revolutionary changes were made in ritual and doctrine. The reign of Henry's successor, the young Ed ard VI, saw more changes in the direction of Calvinism. Elizabeth I, however, stressed a middle course that was in no sense acceptable to the more Calvinistically inclined members of the Church of England, the Puritans, who sought to reform the established church still further along Calvinist lines. Their aim was not a separation of church and state but a reform of the established church. Under the Stuart kings certain groups within the Puritan ranks developed theories that proclaimed the independence of the church from the state. (See also PURITANISM.)

In the 17th century there were few who believed that diversity of religious belief and a church unconnected with the civil power were possible in a unified state. Common religious standards were looked upon as a principal support of the political order. Nevertheless, the idea that religious dissent should be tolerated was growing, especially among the leaders of the new commercial classes. One might, however, still hold a belief in a state church along with an acceptance of toleration of religious dissent. That a state should be neutral in religion or not confess a definite faith was more novel as a point of view than toleration of religious dissent.

America. — Increasing persecution of the Puritan groups in England through the 17th century resulted in the settlements in New England. These settlers, whatever their early ideas on separation of church and state happened to be, did not provide for separation in the new colonies. In Plymouth and Massachusetts Bay rigid conformity to the church ideas of the settlers was enforced. In all the colonies, with the exception of Rhode Island, Pennsylvania and for a time Maryland, established churches were the rule, though laws regulating religious belief differed, as did the rigour of enforcement.

The 1st amendment to the United States constitution provided that congress could not establish a religion; it had been provided in the constitution, as first written, that no religious test could be required for holding public office under the national government. The 1st amendment was the result of agitation by four groups: the men such as Jefferson; Franklin, Madison and others who were affected by the ideas of the French Enlightenment; the leaders of established churches who feared that one church would be established to the exclusion of the others; those churchmen (particularly in New England) viho wanted to protect already established churches from congressional action; and the Baptists, growing in number, who held to the separation idea as a principle of their creed. The word separation, however, does not appear in United States law.

The migration of the 1840s brought to America thousands of people whose tradition was Roman Catholic. Fears that the new immigrants would receive public funds for their separate educational facilities resulted in many states' adopting restrictive clauses in their constitutions against such a practice. The 20th century saw the 1st and 14th amendments to the constitution applied with considerable strictness by the courts in the field of education. These judicial decisions prohibited aid to private education or the introduction of any form of religious belief or teaching in public schools. Roman Catholics and not a few Protestants believe that the new interpretation of the constitution came to place a restriction on religion in favor of secularism and nonreligion. Others believe, however, that a constant watch must be kept on governmental action to make sure that no favour is shown to religion in any form.

General. — There exists no one set pattern throughout the world of the relation of church and state. In the western world, where the Judaic-Christian tradition is strong, the pattern runs all the way from establishment, as in England and the Scandinavian countries; through the Spanish arrangement. with close working relations between church and state and limited toleration for others; through simple recognition of the official primacy of one church without state support, as in Ireland; through the policy of benevolent neutrality on the part of the state with regard to all

religions, as in the United States; to the declared "lay state" found in France. Where the overwhelming part of a population is of one religious belief, complete separation cannot exist, since the organs of government will always reflect the social conscience of the great mass of the people in some degree (as in the recognition of Sunday or in the use of prayers and religious exercises in public functions as in the United States). The natural and supernatural parts of men's activities will touch at some points and will be institutionalized according to the needs and traditions of different societies.

In the modern western world certain component parts of church-state relationship have come to be recogcized. (1) The first of these is the primacy of the spiritual, as traditionally stated: God is to be obeyed rather than man, or man's conscience is to be followed. (2) The second is freedom of religious action where the common good is not endangered by such action; this means religious toleration on the part of the state with the accompanying privilege of public worship, preaching and publication. (3) The third might be called co-operation. On this point there will be differences of opinion, but in its most elemental form it means that no unnecessary political restrictions be placed upon religion or its institutions. It appears in its positive aspects in exempting churches from taxation or the clergy from military service. It signifies, too, no hostility on the part of the state to religion.

CHURCH ARMY, an organization of lay evangelists within the Anglican Church, was founded in the slums of London in 1882 by Wilson Carlile (y v.). The society almost from the outset was concerned as much with social work and rehabilitation as with preaching.

At the conclusion of a two-year residential course of training students are commissioned as officers of the Church Army, the men being called captains and the women sisters. Some ofi'icers later undergo a further specialized course of training: *e.g.,* for moral welfare work. About 200 officers serve on the staff of parish churches in England as specialists in evangelism. while others have an itinerant ministry. Among the latter there are a number of children's missioners and about 40 officers living on mission caravans. In the summer. camps, house parties and beach missions are organized at seaside resorts. Several prisons are served by resident evangelists, and a prisoners' families department is operated from the headquarters in London.

The practical demonstration of Christian charity includes running about 70 homes and hostels, caring for old people, men and women on probation and discharged prisoners, young folk having to live away from home, unmarried mothers, poor families in need of holidays, etc. By 1939 over 900 houses and flats had been built by Church Army Housing, Ltd., and during 1945–60 more than 50 large houses were converted into 600 "Churchill" flatlets for elderly people. Other activities in England include youth clubs, centres for members of the armed forces, a visual aid department, printing press and secondhand clothing department.

There are autonomous societies in the United States, Canada, New Zealand and Australia, the latter including a few aborigines among its officers. West Indians are trained in London for service in Jamaica or England, and East Africans in Nairobi for a ministry within the areas of detribalization. English officers serve as missionaries in India, the West Indies, Kenya and in Tanganyika, where the Wilson Carlile school for blind boys is situated.

CHURCH COMMISSIONERS, in the Church of England. are the successors to two corporations that have ceased to exist. Queen Anne's bounty and the Ecclesiastical commissioners. Under a number of acts of parliament and measures of the church assembly the Church commissioners, mainly through a board of governors, perform administrative and financial functions including pastoral reorganization and the management of funds which help to provide stipends, houses and pensions for the clergy of the Church of England and to contribute toward the cost of new church buildings.

In 1703 Queen Anne by letters patent, authorized by statute established a corporation, the "Governors of the Bounty of Queen Anne for the Augmentation of the Maintenance of the Poor Clergy." To this corporation, first fruits (annates; *q.v.*) and tenths (decimae) of the annual profits, originally paid by the clergy to the papal exchequer and later appropriated to the crown by Henry VIII (1532 and 1534), or commuted sums in lieu, were payable until their abolition by the First Fruits and Tenths measure (1926). This income was devoted to the augmentation of poor livings, mainly by helping toward the cost of the upkeep of parsonage houses.

The Ecclesiastical commissioners were created by act of parliament in 1836 as the result of two royal commissions appointed in 1835. Subsequent legislation not only greatly extended their administrative powers but also had the effect of vesting in them a great deal of church property, some of it allocated to specified objects, but the remainder forming a large common fund out of which provision was to be made for the cure of souls in parishes where assistance was needed, a provision which in practice has been implemented largely by the augmentation of the stipends of the clergy, though its scope is in fact wider and grants have been made for church schools.

By the Church Commissioners measure, 1947, Queen Anne's bounty and the Ecclesiastical commissioners mere amalgamated into one body called the Church commissioners. with all the rights, functions and funds of both bodies. The two archbishops and all the diocesan bishops are ex officio commissioners, as are also a large number of other persons, including the lord chancellor, the speaker of the house of commons, the lord chief justice and the lord mayor of London. The three treasurers of the Church commissioners, the first and third of whom are salaried officials, are known as Church Estates commissioners.

CHURCHILL, CHARLES (1731–1764), English poet, wrote lampoons and polemical satires in heroic couplets, and was the last writer to use the form consistently for this purpose with poetic distinction. Born in Vine street, Westminster, in Feb. 1731, Churchill was educated at Westminster school. Delayed in taking orders by an early and imprudent marriage, he was, however, ordained in 1756, and in 1758, on his father's death, succeeded him as curate of a Westminster parish. In 1761 or 1762 he became friends with John Wilkes (*q.v.*), and his collaboration with Wilkes thereafter earned him an honourable place in the history of parliamentary democracy and civil liberties. But he made his name independently in 1761, with The *Rosciad,* a satire on the London stage which named every prominent actor of the day unfavourably, except Garrick; the brilliant and immediate success of this poem brought fame and money to the bankrupt parson, and Churchill launched himself on the town. For he resembled Wilkes not only in energy and courage but also in profligate tastes, and by June 1762 he was a member of the Hell Fire club at Medmenham abbey and separated from his wife. He resigned his clerical position, and in 1763 published *The Prophecy of Famine,* the first of several political satires attacking the government; a quarrel with Hogarth (*q.v.*) produced Churchill's *Epistle* to *William Hogarth* in June 1763. He gave new cause for scandal this year by an elopement with Elizabeth Carr. In 1764, when Wilkes was outlaaed and in France. Churchill defended him in *The Duellist,* and wrote *The Candidate* and other poems. He traveled to Boulogne to meet Wilkes, but fell ill and, broken by disease and dissipation died on Nov. 4, 1764.

Churchill's writing taken couplet by couplet, or even page by page, is brilliant and memorably pungent, but in his poems considered as wholes the lack of any consistent standpoint in the satirist is evident and damaging.

See his *Poetical Works,* ed *by* Douglas Grant (1956); *see* also Kenneth Hopkins, *Portraits* in *Satire* (1958). (D. A. DE.)

CHURCHILL, LORD RANDOLPH HENRY SPENCER (1849–1895), English politician, who acquired great popularity and considerable influence for a brief period in the 1880s as a result of his vociferous campaign for "Tory democracy." The third son of John, 7th duke of Marlborough, by Frances, daughter of the 3rd marquess of Londonderry, he was born at Blenheim palace, Woodstock, Oxfordshire, on Feb. 13, 1849. He was educated at Eton and at Merton college, Oxford. In 1874 he was elected to parliament in the Conservative interest for Woodstock.

By 1878 he had begun to force himself on the public attention as a critic of the Conservative leadership and the practitioner of a brilliant type of satirical oratory. He did not emerge fully into prominence, however, until the parliament of 1880–85, when, in alliance with three other Tory backbenchers, Sir Henry Drummond Wolff, Sir John Gorst and Arthur Balfour, he formed what became known as the "fourth party." The object of this group was to preach a political gospel announced as "Tory democracy," and it received a considerable impetus from the sentiments aroused by the death of Disraeli (1881). Lord Randolph distinguished himself by the vigour and wit with which he assailed W. E. Gladstone's administration, and by independence toward the leaders of his own party. His campaign had two aims, to encourage the parliamentary opposition to attack the government with more vigour, and to convert Conservatism into a popular political movement. An excellent opportunity of pursuing the first aim was given by the case of Charles Bradlaugh, a convinced atheist who had been elected in 1880 and who claimed the right to make an affirmation of allegiance instead of taking the oath. When this was denied him, he came forward to take the oath, but again was debarred. Lord Randolph was able to pose as the champion of the church, the defense of which was the traditional preoccupation of Toryism, and, at the same time. to enjoy himself at the expense of Gladstone, whose piety and churchmanship did not prevent him from defending Bradlaugh's right to sit.

Lord Randolph had from the first been deeply interested in the Irish question and had had exceptional opportunities for studying it while acting as unofficial private secretary to his father, the viceroy from 1876 to 1880. Though wholeheartedly committed to the maintenance of the union, he had always contended that the troubles of Ireland largely arose from generations of mismanagement, and that more foresight and enlightenment would dispose of the need for coercive measures. Lawlessness in Ireland and the systematic obstructionism of the Irish M.P.'s (led by C. S. Parnell) at Westminster occupied much of the government's attention at this time, and led it to appeal for special powers in Ireland.

The majority of the Conservative party was inclined to accept the government's reasoning, but Lord Randolph and his friends looked with suspicion on the view that coercion was inevitable and could not reconcile themselves to a bipartisan policy. As the parliament drew to its close Lord Randolph's attitude had become more pronounced, and an agreement, whether formal or tacit remains obscure, had arisen between him and the Parnellites to the effect that the Conservatives would oppose coercion in return for Irish support at the general election. This understanding caused the Conservative leaders much distress. Subsequent events seemed to show that coercion was the only effective alternative to home rule; Lord Randolph's critics maintained that by saddling his party with this embarrassing commitment he had driven the Liberals to a home rule policy, and had therefore unwittingly frustrated one of the chief aims of Toryism.

Simultaneously with these activities in the house, Lord Randolph was trying to create a popular Conservative movement in the country, and it is in these activities that the chief permanent interest of his career lies. He was prominent among the founders of the Primrose league, a movement dedicated to the upholding of church, constitution and the traditional national virtues, and inspired by a desire to perpetuate Disraeli's memory. He also tried to secure real power for the representatives of the constituencies in the Conservative party's central organization, and to prevent the popular element in party organization from being a mere sham. This brought him into still more bitter conflict with the party leadership and more particularly with Lord Salisbury, whom he had hitherto admired as an exponent of aristocratic conservatism. When in 1884 Lord Randolph was elected chairman of the Central Union of Conservative Associations, victory seemed to be in sight, but Lord Salisbury, who in matters of party organization favoured government by consent rather than democracy, abhorred these moves, and the result was a party split.

As the general election of 188j approached, the need for healing this split became paramount. Lord Randolph was now one of the most popular figures in the country and acknowledged as a brilliant parliamentarian. Lord Salisbury therefore readily responded to suggestions of mediation. Lord Randolph, having done much to create a popular Conservative organization, agreed to resign the chairmanship to make way for Sir Michael Hicks Beach, a candidate committed to neither side in the quarrel and one who could be trusted, in the absence of Lord Randolph, to control the new forces which had been unleashed. It was now necessary to listen to Lord Randolph when shaping the strategy of the party, and he was chiefly responsible for persuading the opposition to confine itself to detailed criticisms of Gladstone's Agricultural Workers' Enfranchisement bill in 1884, which led to its acceptance in an amended form. After the Tories were returned at the general election of 1885, Lord Randolph was put at the India office, where it was felt that his sphere of activity would be sufficiently circumscribed to make it possible to contain him safely in the government. There he distinguished himself by extraordinary industry and mastery of detail until the fall of the Conservatives in Jan. 1886. When the Conservatives returned to power in Aug. 1886 Lord Salisbury, with some apprehension, appointed him to the exchequer and to the leadership of the house of commons.

In these posts, Lord Randolph was entitled to be consulted on all matters of domestic policy, and, with a considerable following in the country, he soon made it clear that he proposed to control the government. Lord Salisbury tried in vain to make peace between Lord Randolph and his colleagues, and eventually fell back on a waiting policy, the essence of which was that the prime minister should efface himself until such time as the chancellor became unendurable. This point was reached when Lord Randolph presented to the cabinet his first budget, a brilliant piece of financial contrivance which, however, involved a cutting of the service estimates unacceptable to the service ministers and to the rest of the cabinet and constituted an implicit criticism of the whole conduct of foreign policy.

Lord Randolph offered his resignation (Dec. 20, 1886) and, to his infinite surprise, it was immediately accepted. The general expectation was that the withdrawal of this powerful minister would lead to a complete disruption of the government, but the support that Lord Randolph had built up in the country disintegrated with pathetic rapidity.

The last years of Lord Randolph's life were a period of almost unmitigated personal tragedy. He suffered from a crippling disease which killed him by inches and which long travels failed to arrest. He began to lose interest in politics and to devote much time to the turf but he continued to sit as a backbench Conservative until his death. Although his speeches were rare and sometimes almost incomprehensible, the house listened to him with respectful attention, his old adversary, Gladstone, always punctiliously attentive and seizing every opportunity to show him courtesy. He died in London on Jan. 24, 1895.

The judgment of posterity has been that Lord Randolph did not succeed in the effort to produce a new brand of popular conservatism, and that indeed he was concerned principally, though possibly unconsciously, with equipping the Conservative party to win mass support for what was in essence a specifically Radical policy of reform at home and peace abroad. His most indisputable gift was a power of oratory which did not spare personalities, but which was combined with a charming and generous disposition.

Lord Randolph Churchill married, in April 1874, Jennie, daughter of Leonard Jerome of New York, by whom he had two sons, Sir Winston Churchill being the elder.

CHURCHILL, WINSTON (1871–1947), U.S. author of historical novels, was born in St. Louis, Mo., Nov. 10, 1871. Graduated from the U.S. Naval academy in 1894 and having private means, he soon devoted himself to writing. His first novel, *The Celebrity*, appeared in 1898. His next, *Richard Carvel* (1899), a novel of Revolutionary Maryland in which the hero serves as a naval officer under John Paul Jones, sold nearly 1,000,000 copies. Then followed another great success, *The Crisis* (1901). a novel of the Civil War, in which the heroine is a descendant of Richard Carvel; and *The Crossing* (1904). which tells of Kentucky pioneers during the Revolution. These romantic tales of America's past were Churchill's most popular. His later work consisted chiefly of novels on political issues, such as *Coniston* (1906) and *Mr. Crewe's Career* (1908), or on religious or social problems. such as *The Inside of the Cup* (1913) and *A Far Country* (1915). In 1899 Churchill became a resident of Cornish, N.H., where he lived for almost 50 years. From 1903 to 1905, he served in the New Hampshire legislature, and in 1912 was a Progressive candidate for the governorship. He died on March 12. 1947, in Winter Park, Fla.

See C. C. Walcutt, *The Ronzantic Compromise in the Novels of Winston Churchill* (1951).

CHURCHILL, SIR WINSTON LEONARD SPENCER (1874–), British statesman, the great national leader during World War II, was born on Nov. 30, 1874, prematurely. at Blenheim palace, Oxfordshire. In his veins ran the blood of both the English-speaking peoples whose unity, in peace and in war, it was to be his constant purpose to foster. Through his father, Lord Randolph Churchill, he was directly descended from the 1st duke of Marlborough, while his mother. Jeanette Jerome, a noted beauty, was the daughter of a self-made New York businessman, Leonard W. Jerome.

After the conventional preparations of governesses and preparatory schools, the young Churchill entered Harrow, where his conspicuous lack of success at his studies seemingly justified his father's decision to enter him on an army career. In 1893 he entered the Royal Military college. Sandhurst, where he applied himself happily and seriously to his work, passing out (graduating) in 1894, 8th in a class of 150. In 1895, the year of his father's tragically early death. Churchill entered the 4th hussars. Initially the only prospect of action was in Cuba, where he spent a couple of months reporting the Spanish-American War for the *Daily Graphic* (London). In 1896 his regiment went to India where he saw service as both soldier and journalist with the Malakand field force (1897). Reprinted in *The Story of the Malakand Field Force* (1898), his dispatches attracted such wide attention as to launch him on the career of author which he intermittently pursued throughout his life. In 1898 he wrote *Savrola* (1900), a Ruritanian romance. and got himself attached to Sir Herbert Kitchener's Nile expeditionary force in the same dual role of soldier and correspondent. *The River War* (1899) brilliantly describes the campaign.

POLITICAL CAREER BEFORE 1939

The five years after Sandhurst saw Churchill's interests expand and mature, and in 1899 he resigned his commission and entered politics by fighting a by-election at Oldham as a Conservative. He lost, but found immediate solace in reporting the South African War for the *Morning Post* (London). In South Africa he won fame for his part in rescuing an ambushed armoured train and for his success in escaping from a Boer prison camp. Returning to Britain a popular hero, he won Oldham in the "khaki" election of 1900 and laid the foundations of the private income virtually indispensable to a rising politician by earning £10,000 on lecture tours in Great Britain and the United States.

A self-assurance redeemed from arrogance only by a kind of boyish charm made Churchill from the first a notable house of commons figure, but it was some time before he mastered parliamentary debate. He excelled in the set speech rather than in the impromptu; Lord Balfour said of him that he carried "heavy but not very mobile guns." In matter as in style he modeled himself on his father, as his admirable biography, *Lord Randolph Churchill* (1906; rev. ed., 1952), makes evident, and from the first he wore his Toryism with a difference, advocating a fair peace for the Boers and deploring high military expenditure.

Liberal Minister.—In 1904 Joseph Chamberlain's open advocacy of tariff reform brought Churchill to a parting of the ways. He joined the Liberal party and won renown for the shameless audacity of his attacks on Chamberlain and Arthur Balfour. He acquired a reputation for radicalism and displayed a liberalism which bore evident marks of the influence of two colleagues in particular, John Morley and David Lloyd George. In 1906; rejected by Oldham, he secured a notable victory over William Joynson-Hicks in Manchester and began his ministerial career as undersecretary of state for the colonies in the ne Liberal government. He soon gained credit for his able defense of the policy of conciliation and self-government in South Africa. When H. H. Asquith assumed the premiership in 1908, Churchill was made president of the board of trade. The same year he married Clementine Hozier; it was a marriage that provided a happy background for his turbulent career.

At the board of trade Churchill emerged as a social reformer. He put on the statute book the eight-hour bill for the mines launched by his predecessor, Lloyd George, and went on to check the evils of "sweating" by setting up trade boards, and to reduce unemployment by establishing labour exchanges. He was Lloyd George's ally in devising the provocative budget of 1909 and as president of the Budget league his oratorical broadsides at the house of lords were as lively and devastating as Lloyd George's own. Indeed Churchill, an alleged traitor to his class, earned the lion's share of Tory animosity. In 1910 Churchill became home secretary. He showed a keen interest in prison reform but was soon less happily involved in a wave of industrial unrest. His action in calling in the military to aid the police in the Welsh miners' strike in Tonypandy and in the dock and railway strikes lost him much of his radical following.

The Agadir crisis affected Churchill profoundly, and when Asquith transferred him to the admiralty in Oct. 1911 he went to work with a conviction of the urgent need to bring the navy to a pitch of instant readiness. His first task was the creation of a naval war staff; to assist him in this and other reforms he persuaded Adm. Sir John Fisher to interrupt his retirement and accept the chairmanship of the commission on oil supplies from which came the important decision to make the government a joint owner of the Anglo-Persian Oil company. Meanwhile Churchill's general political activities continued. He moved the second reading of the Irish Home Rule bill in 1912 and was its fierce champion in the bitter disputes that ensued; even so, through his friendship with F. E. Smith (afterward earl of Birkenhead) and Austen Chamberlain he was a principal figure in the abortive, behind-the-scenes negotiations for a coalition.

World War I.—War came as no surprise to Churchill. He had already held a test naval mobilization and had ordered the fleet not to disperse after the naval review in July 1914. In the cabinet he insisted on the need to resist Germany and on Aug. 2, on his own responsibility, ordered the naval mobilization which guaranteed complete readiness when war was declared. The conflict called out all Churchill's energies. In Oct. 1914, when Antwerp was falling, he characteristically rushed in person to organize its defense; resistance was prolonged for only five days but it enabled the Belgian army to escape and the channel ports to be saved. He recalled Fisher to be first sea lord but signs of strain appeared in 1915 when Churchill became an enthusiast for the Dsrdanelles expedition, of which Fisher disapproved. When the naval attack faltered and was called off by Adm. J. M. de Robeck on the spot, the admiralty war group and Asquith both supported De Robeck rather than Churchill. Churchill came under heavy political attack, largely inspired by Fisher, who resigned in protest against Churchill's conduct of the admiralty. Preoccupied with departmental affairs, he was quite unprepared for the storm that broke about his ears. In the maneuvers that produced the first coalition government Churchill had no part and the Conservatives,

with the sole exception of Sir William Maxwell Aitken (soon Lord Beaverbrook), insisted on his being demoted from the admiralty to the duchy of Lancaster. There he was given special responsibility for the Gallipoli campaign without, however, any powers of direction. Reinforcements were too few and too late; the campaign failed; evacuation was ordered in the autumn.

In Nov. 1915 Churchill resigned from the government and returned to soldiering, seeing active service in France as lieutenant colonel of the 6th Royal Scots fusiliers. But though he entered with zest into the perils and excitements of the front line, his heart was still at Westminster. In June 1916 when his battalion was merged he did not seek another command but instead returned to parliament as a private member. He had no part in the intrigue which led to the Lloyd George coalition and it was not until 1917 that the Conservatives would consider his inclusion in the government. In March 1917 the publication of the Dardanelles commission report demonstrated that he was at least no more culpable than his colleagues for the fiasco. Meanwhile his contributions to debate, especially in the secret session on the battle of the Somme, made a notable impression on the house of commons.

In July 1917, despite Tory protests, Lloyd George appointed Churchill minister of munitions. In that post he was able to stimulate production of the tank, the decisive weapon of World War I, development of which he had largely inspired at the admiralty. Paradoxically, it was not until the war was over that Churchill returned to a service department. In Jan. 1919 he became secretary of war, charged nith the difficult job of handling demobilization. On one front, the Russian, British troops were still fighting. Vehement in his denunciation of the Bolsheviks, Churchill made no secret of his belief that the Allies should support the White Russian armies. In May 1919 the Allied Supreme council agreed in somewhat ambiguous terms to help the White Russian commander, Adm. A. V. Kolchak, and also withdraw their own troops. Churchill poured in supplies and organized a volunteer force of 8,000 to provide cover for British withdrawal. Evacuation was effected almost without loss. Churchill was widely attacked for his policy. Unrepentant, he was instrumental in having arms sent to the Poles in 1920 when they invaded the Ukraine; his reward was the bitter hostility of the British Labour movement.

In and Out of Office, 1921–29.—In 1921 Churchill moved to the colonial office, where his principal concern was with the mandated territories in the middle east. For the costly British army in Iraq he substituted the Royal Air Force as an agency of law and order and at a conference in Cairo, with T. E. Lawrence as his main adviser, arranged some settlement of Arab affairs. Churchill played only a minor role in the negotiation of the Irish treaty of 1921, but after its passage he was largely instrumental in preserving peace between the Irish Free State and Ulster and in strengthening the new Irish government. "Tell Winston," said Michael Collins, the Irish leader, "we could never have done anything without him."

When in 1922 the insurgent Turks threatened the peace of Europe. Churchill was foremost in urging a firm stand at Chanac (now Canakkale) on the Dardanelles. But the robust tone of his communiqué announcing the government's intentions, though it checked the Turks, also alarmed opinion in the dominions and at home and undoubtedly contributed to the collapse of the coalition. In the ensuing political debacle Churchill suffered severely; as a firm believer in a centre party as a bulwark against Socialism, he faced his Dundee constituents in 1922 as a "Lloyd George Liberal" who still wanted a coalition. Crippled by a sudden attack of appendicitis, he was not able to appear in public until two days before the election, and then only in a wheel chair. He was defeated by more than 10,000 votes. He thus found himself, as he said, all at once "without an office, without a seat, without a party and without an appendix."

Churchill found some solace in painting and writing. The years 1922–24 saw the completion of a war history which was also an autobiography, *The World Crisis*, six volumes (1923–31). It netted its author £20,000 with which he purchased Chartwell, his country house in Kent. When Stanley Baldwin appealed to the country in 1923 on the tariff issue Churchill offered himself to West Leicester as a free-trade candidate of the reunited Liberal party. He lost by 4,000 votes. In March 1924, deploring Asquith's decision to support the installation of a Labour government, he appeared in the new guise of "Independent Anti-Socialist" in a by-election in the Abbey division of Westminster. Again he was defeated, by the official Conservative candidate, but only by 43 votes, and his campaign was conspicuous for the wide support it won from prominent Conservative leaders. Six months later, at the general election, he mas easily returned for the safe Conservative seat of Epping under the label "Constitutionalist." Baldwin offered him the chancellorship of the exchequer. Surprised, Churchill accepted; dumbfounded, the country interpreted it as a move to reabsorb into the party all the right-of-centre elements of the former coalition.

In the five years that followed, Churchill so far departed from his early radicalism as to appear, repeatedly, as the natural spokesman for the Tory die-hards. At the exchequer he was bored with economic issues and in his handling of financial questions displayed a rigid orthodoxy. His first move was to restore the gold standard, a disastrous measure, unsparingly exposed by John Maynard Keynes in *The Economic Consequences of Mr. Churchill* (1925), from which flowed deflation, unemployment, the miners' strike and so the general strike of 1926. Churchill had no remedy except the introduction in 1926 of an unsuccessful "'economy" bill. He regarded the general strike solely as an attempt to hold the nation to ransom and he was foremost in the cabinet in resisting a negotiated settlement and insisting on a militant response. During the strike he published and edited the official newspaper. the *British Gazette*, with its propagandistic and frequently inflammatory tone. Churchill was obsessed in this period by the international menace of Communism. and it seemed in keeping that, while on holiday in Italy, he should praise Benito Mussolini's Fascist movement as having "rendered a service to the whole world."

Churchill's tenure of the exchequer was otherwise notable mainly for his abortive betting tax and for his 1928 schemes for the rerating of agriculture and industry. In 1929, when the government fell, Churchill would have liked a Tory-Liberal reunion, but Baldwin preferred to put Labour in power. Next year an open rift developed between them. On Baldwin's acceptance of the plan for Indian self-government, Churchill resigned from the shadow cabinet to become the leading spirit of the Indian Defence league. He fought the Government of India bill to the bitter end.

Political Wilderness.— Thus when in 1931 Baldwin led his party into Ramsay MacDonald's National government, Churchill's exclusion was a foregone conclusion. Though Churchill remained in the commons, he was exiled from power, largely distrusted by both major parties, thought to lack judgment and stability. regarded as a guerrilla fighter impatient of discipline, a clever man who liked to associate with clever men—Birkenhead, Beaverbrook, Lloyd George—and who despised the necessary humdrum associations and compromises of practical politics. Painful though this decade of political exile was for a man of spirit at the peak of his energies, the enforced withdrawal seems in fact to have had a maturing, strengthening effect upon him.

Churchill did not lack occupation. In addition to a supplementary volume of *The World Crisis*, an engagingly fresh, even ironic piece of autobiography, *My Early Life* (1930), appeared, to be followed two years later by *Thoughts and Adventures* (1932). But the great continuing enterprise of the decade was *Marlborough; His Life and Times*, four volumes (1933–38), begun as a refutation of the criticisms contained in Macaulay's *History*, but becoming, as it unrolled its massive length, an evocation of British leadership in a warring Europe by a Churchill entrusted with his country's destiny.

During the 1930s the growing menace of Hitler's Germany caused a steadily mounting anxiety in Churchill's mind. Before a supine government and a doubting opposition. Churchill. supported only by a small personal following, argued the seriousness of the German threat and the need to prevent the *Luftwaffe* from securing parity with the Royal Air Force. When Baldwin became prime

minister in 1935 he persisted in excluding Churchill from office, although in offering him membership of the secret committee on air defense research he did enable him to work on some vital national problems. Churchill's ceaseless advocacy of British rearmament imparted no urgency to Baldwin's administration. They differed over the Abyssinian war, Churchill being initially cool to sanctions lest they drive Mussolini into Hitler's arms, but equally convinced that, once in, Great Britain should have seen the matter through. In the crisis preceding Edward VIII's abdication Churchill vainly sought to plead the king's cause, but struck no responsive national chord.

When Neville Chamberlain succeeded Baldwin the gulf between the Cassandralike Churchill and the Conservative leaders widened. Repeatedly the accuracy of Churchill's information on German rearmament plans and progress was confirmed by events; repeatedly his warnings were ignored. Only in Anthony Eden did Churchill feel any confidence; when Eden resigned as foreign secretary in Feb. 1938, "the dark waters of despair," in Churchill's words, overwhelmed him. As German pressure mounted on Czechoslovakia Churchill urged the government to effect a joint declaration of purpose by Great Britain, France and the U.S.S.R. When the Munich settlement was made Churchill laid bare its implications, insisting that it represented "a total and unmitigated defeat." In March 1939 Churchill and his group pressed for a national government and at last sentiment in the country, recognizing him as the nation's spokesman, began to agitate for his return to office. As long as peace lasted, Chamberlain ignored all such persuasions.

WORLD WAR II

On Sept. 3, 1939, Great Britain declared war on Germany; the same day Chamberlain appointed Churchill first lord of the admiralty. On Sept. 11 Churchill received a congratulatory note from Pres. Franklin D. Roosevelt and replied over the signature "Naval Person"; a memorable correspondence had begun. At once Churchill's restless energy began to be felt throughout the administration as his ministerial colleagues as well as his own department received the first of those pungent minutes which preserved the remotest corners of British wartime government from any hazard of lassitude or stagnancy. However, all his efforts failed to energize the torpid entente during the so-called phony war, before the German seizure of Norway in April 1910. The failure of the Narvik and Trondheim expeditions, dependent as they were on naval support, could not but evoke some memories of the Dardanelles and Gallipoli, so fateful in the previous war for Churchill's reputation. This time, however, the public had a better appreciation of the facts and when the government was censured in May it was a~ Chamberlain that the critics loosed their shafts.

Prime Minister. — On May 10, 1940, with the news of the German invasion of the Low Countries, Chamberlain resigned. He wanted Lord Halifax to succeed him, but when Halifax declined to serve. Chamberlain advised the king to call Churchill to be prime minister. That very evening Churchill received Labour and Liberal adherence to a coalition government under his premiership. He formed a war cabinet of five, with himself as minister of defense and leader of the house of commons, Chamberlain, Lord Halifax and the Socialists Clement Attlee and Arthur Greenwood. There were other appointments equally momentous, notably Ernest Bevin's as minister of labour. Offers were made to Lloyd George, but he declined them. The result was a real government of national unity in which Churchillian magnanimity secured the services of both old foes and old friends, and the nation closed ranks in face of the common peril. On May 13 Churchill faced the house of commons for the first time as prime minister. He warned members "I have nothing to offer but blood. toil, tears and sweat." He announced his policy: "to wage war, by sea, land, and air, with all our might and with all the strength that God can give us." He proclaimed one aim: "Victory — victory at all costs, victory in spite of all terror; victory, however long and hard the road may be." The commons gave him a unanimous vote of confidence.

War Policy and Aims. — Brought thus to the pinnacle of power through a series of trials which, however taxing, could be seen to constitute a lifelong preparation for the hour of supreme crisis, Churchill exuded confidence and inspired it in all around him. A few simple principles animated his policy throughout the years that followed. Hitler's Germany was the enemy; nothing should distract the entire British people from the task of effecting its defeat. Anyone who would share this burden was an acceptable ally, even a Communist, To save Great Britain from defeat the friendship of the United States was indispensable; for winning the war its active alliance was devoutly to be desired. Strategically, the war must be fought so as not to repeat for Great Britain the catastrophic bloodlettings of World War I. No shibboleths — of orthodox economics, social convention, class privilege and. least of all, military etiquette or tradition — should stand in the way of the nation's total prosecution of the war. The prime minister should delegate freely, but interfere continuously, regarding nothing as too large or too small for his attention. He should query, prod and prime his service chiefs but never go against their collective judgment. He should enjoy sweeping powers but never forget the parliament which conferred them, finding in the house of commons both an instrument of national leadership and a source of personal strength.

All this the nation soon learned for itself and, learning, took Churchill to its heart. On May 22, 1940, parliament within a day passed legislation placing all "persons, their services and their property at the disposal of His Majesty." After the evacuation of Dunkirk, Churchill warned parliament of the risk of invasion, in terms not of possible defeat but of confident defiance:

> . . . we shall not flag or fail. We shall go on to the end . . . whatever the cost may be, we shall fight on the beaches, me shall fight on the landing-grounds, we shall fight in the fields and in the streets, we shall fight in the hills; we shall never surrender, and even if, which I do not for a moment believe, this island or a large part of it were subjugated and starving, then our Empire beyond the seas, armed and guarded by the British Fleet, would carry on the struggle, until, in God's good time, the New World, with all its power and might, steps forth to the rescue and liberation of the Old.

Faced with the swift collapse of France, Churchill made repeated personal visits to the French government in an attempt to keep France in the war, culminating in the celebrated offer of Anglo-French union on June 16, 1940. When all this failed, Churchill warned the house of commons that the battle of Britain was about to begin.

> But if we fail, then the whole world, including the United States, including all that we have known and cared for, mill sink into the abyss of a new Dark Age, made more sinister, and perhaps more protracted, by the lights of perverted science. Let us therefore brace ourselves to our duties, and so bear ourselves that, if the British Empire and its Commonwealth last for a thousand years, men will say, "This was their finest hour."

While the battle of Britain raged Churchill was everywhere, at fighter headquarters, inspecting coast defenses or the home guard, solicitously visiting victims of the "blitz," smoking his cigar, giving his "V" sign, broadcasting frank reports to the nation, laced with touches of grim Churchillian humour and splashed with Churchillian rhetoric. Utterly individualistic, he was also the perfect personification of the people he led.

Meanwhile, via transatlantic cable and telephone, the former "Naval Person" had developed a personal relationship with President Roosevelt which soon bore fruit in the exchange of U.S. destroyers for British bases and the concept of lend-lease or mutual aid. The former evoked from Churchill the prophecy that "the English-speaking democracies . . . will have to be somewhat mixed up together," a process "like the Mississippi, it just keeps rolling along." In Aug. 1941 Churchiil administered a powerful impetus to this process by his first meeting with the president in Placentia bay, Nfd.. the product of which was the Atlantic charter.

The "Grand Alliance."—When Hitler launched his sudden attack on the U.S.S.R., Churchill had a far-reaching decision to make. He announced it in a broadcast on June 22. 1941, in which he refused to "unsay" any word he had previously spoken against Communism but insisted that "the Russian danger is . . . our danger" and promised that "we shall give whatever help we can

to Russia and the Russian people." He followed this with a personal message to Stalin, the first of many, for which, as he said, "... I received many rebuffs and only rarely a kind word." Nevertheless, from that time he constantly endeavoured to win Soviet trust and to construct a "grand alliance," incorporating the U.S. and the U.S.S.R. In Sept. 1941 he sent Lord Beaverbrook on a personal mission to the Soviet Union; in Dec. 1941, Anthony Eden. At the same time Mrs. Churchill headed a large and successful charitable appeal for "Aid to Russia."

The Japanese attack on Pearl Harbor (Dec. 1941) altered. in Churchill's eyes, the whole prospect of the war. "I knew," he wrote, "the United States was in the war . . . there was no more doubt about the end." He sailed immediately to Washington and there, as a guest in the White House, hammered out with Roosevelt a set of Anglo-American accords: the pooling of both countries' military and economic resources under a combined chiefs of staff; the establishment of unity of command in the southwestern Pacific (a precedent to be followed in all Anglo-American theatres of war); finally, agreement on the basic strategy that the defeat of Germany should have priority over the defeat of Japan. The grand alliance was now fully in being. Churchill's main concern for the next three and a half years was to foster it.

In this, the respect and affection between him and Roosevelt were of crucial importance. They alone enabled Churchill, in the face of relentless pressure from Stalin and ardent advocacy by the U.S. chiefs of staff, to secure the rejection of the plan for launching a second front in 1942. In Aug. 1942 Churchill himself flew to Moscow to advise Stalin of the Allied decision and to bear the brunt of his displeasure. At home, too, he came under fire in 1942: first in January after the reverses in Malaya and the far east, and later in June when Tobruk fell during his second visit to Washington. In each case the main argument of his critics was that Churchill was trying to do too much, particularly in acting as both premier and minister of defense. On neither occasion did his critics muster much support in the commons—3 in the opposition lobby in January and 25 in June. In Feb. 1942 there was some reconstruction of the cabinet, mainly to permit the retirement of Beaverbrook from the ministry of supply and the inclusion of Sir Stafford Cripps as leader of the house of commons. To some degree this reflected a "leftward" movement of the government, and although in November Cripps, at his own request, moved to aircraft production. his place in the cabinet was taken by Herbert Morrison and popular interest in social reform quickened. Indeed the publication of the Beveridge report on social insurance provoked from Churchill, as a Liberal redivivus, a broadcast endorsement in March 1943.

Military Successes and Political Problems. — The Allied landings in north Africa necessitated another meeting between Churchill and Roosevelt, this time in Casablanca in Jan. 1943. There Churchill argued for an early, full-scale attack on "the underbelly of the Axis" but won only a grudging acquiescence from the Americans. There, too, was evolved the "unconditional surrender" formula. Churchill paid the price for his intensive travel (including Tripoli, Turkey and Algeria) with an attack of pneumonia, for which, however, he only allowed the briefest of respites. In May he was in Washington again, arguing against persistent U.S. aversion to the "underbelly" strategy; in August at Quebec, working out the plans for "Overlord," the cross-channel assault. When he learned that the U.S. was planning a large-scale invasion of Burma in 1944 his fear that their joint resources would not be adequate for a successful "Overlord" revived. In Nov. 1943 at Cairo he urged on Roosevelt priority for further Mediterranean offensives, but at Teheran, in the first Big Three meeting (Nov.–Dec. 1943), he failed to retain Roosevelt's adherence to a completely united Anglo-American front. The president, though consulting in private with Stalin, refused to see Churchill alone; for all their friendship there was also an element of rivalry between the tno western leaders which Stalin skilfully exploited. On the issue of Allied offensive drives into southern Europe Churchill was outvoted. Throughout the meetings Churchill had been unwell and on his way home he went down again with pneumonia. Recovery was rapid but it was mid-Jan. 1944 before his convalescence was complete. By May he was proposing to watch the D-day assaults from a cruiser; only the king's personal plea dissuaded him.

With military successes came political problems. After the Quebec conference in Sept. 1944 Churchill flew to Moscow to try to conciliate the Soviets and the Poles and to obtain an agreed division of spheres of influence in the Balkans. He authorized British armed intervention in Greece to prevent a Communist take over, and at Christmas flew to Athens to effect a settlement. Much of what passed at the Yalta conference of Feb. 1945, including the far east settlement, concerned only Roosevelt and Stalin, and Churchill did not interfere. He fought to save the Poles but was forced to rely on Soviet promises which were soon broken. Warned by this experience. he urged the U.S. to allow the Allied forces to thrust into eastern Europe as far and as fast as possible, but he met with no response from Gen. Dwight D. Eisenhower or Gen. George C. Marshall. Churchill. who saw, as he said, an "iron curtain" descending on Europe. went to Potsdam in a worried mood. But in the final decisions of the conference he had no part; halfway through he had to return to England and tender his resignation to the king.

Electoral Defeat. — As early as 1944, with victory in prospect. party political stirrings and dissensions had begun to reappear, and by May 1945 all parties in the coalition wanted an early election. Churchill wished the coalition to continue until Japan was defeated, but he could not carry his colleagues with him. On June 15. 1945, parliament was dissolved and a lively election campaign followed. In this Churchill was more zestful than judicious, indulging. seemingly at Beaverbrook's suggestion, in extravagant prophecies of the appalling consequences of a Labour victory and identifying himself wholly with the Conservative cause. His campaign tours were a triumphal progress but it was the war leader, not the party leader, that the crowds were cheering. They preferred Labour's careful, if sweeping, reform program to Churchill's flamboyance. On July 25 the last serviceman's vote was in and the world, to its astonishment, learned that Britain's architect of victory was out.

POSTWAR POLITICS

Leader of the Opposition. — For the next six years Churchill led the Conservative opposition, entering with relish into the rough and tumble of parliamentary warfare but confining his criticisms, mainly, to the domestic and imperial policies of Labour. In foreign policy, even when ostensibly criticizing the government, he was in fact often saying for it what it could not say for itself. Thus on March 5, 1946. at Fulton, Mo., he pleaded for Great Britain and the United States to unite as guardians of the peace and set out frankly the menace of Soviet policies. Less successfully, perhaps because less consistently, he emerged as an advocate of European union. At Ziirich, Switz., on Sept. 19, 1946, he urged the formation of "a council of Europe," and followed it up by attending the first assembly of the council at Strasbourg in 1949. Churchill mas highly critical of what he called Labour's imperial policy of "scuttle" and the granting of independence in India and Burma. He opposed the reduction of the house of lords' veto from two years to one and, of course, the successive measures of nationalization. Meanwhile, in private, he was at work on his history, The *Second World War,* six volumes (1948–54).

The general election of Feb. 1950 afforded Churchill his long-awaited opportunity to seek again for a personal mandate. He abstained from the extravagances of 1945 and campaigned with his party rather than above it; even so his personality, his zest in combat and his oratory dominated the election. His Edinburgh speech of Feb. 15 in which, contemplating the horrors of an atomic armaments race, he called for "a parley at the summit," echoed round the world, a kind of obverse of the Fulton speech of four years before. The onslaught shook Labour, but left it still in office. What Churchill called "one more heave" was administered in Oct. 1951. Churchill again took the lead in the campaign with vigour. He pressed the government particularly hard on their handling of the Iranian oil-nationalization crisis and in return had to withstand charges of warmongering. The electorate returned the Conservatives with a majority of 26 over Labour and Churchill

formed a government in which the more liberal Conservatives predominated, though the Liberal party itself declined Churchill's suggestion of office. Some notable Churchillians were included, among them Lord Cherwell, his former scientific adviser, as paymaster general. Anthony Eden was foreign secretary.

Prime Minister Again. — The domestic labours and battles of his administration were far from Churchill's main concern. Indeed critics sometimes complained of a lack of direction in these areas and of a certain slackness in the reins of government. Undoubtedly Churchill was getting older and reserving more and more of his energies for the great agonizing issues of foreign affairs, peace and war. One of his first acts was to visit Washington (and also Ottawa) in Jan. 1952 to repair what he regarded as the damage done to the "fraternal association" since 1945. The visit helped to check U.S. fears that the British would desert the Korean war, harmonized attitudes toward German rearmament and, distasteful though it was to Churchill, resulted in the acceptance of a U.S. naval commander in chief of the eastern Atlantic.

The year 1953 was in many respects a gratifying one to Churchill, bringing him the Nobel prize for literature, the Order of the Garter and the coronation of Queen Elizabeth II (which drew out all his love of the historic and the symbolic). After Stalin's death in the same year, he appealed once more for summit talks and planned a Bermuda meeting with President Eisenhower to arrange them. However, a sudden stroke wrecked these plans, although he effected a remarkable recovery by October. The next year, 1954, brought war in Indochina and another visit to Washington which may have been decisive for peace. There was also the crisis of the European Defense community which Churchill and Eden solved by the device of Western European union. Churchill's 80th birthday on Nov. 30 was the occasion of a unique all-party ceremony of tribute and affection in Westminster hall. In 1955. "arming to parley," Churchill authorized work on a British H-bomb while still striving for a summit conference. However, age robbed him of this last triumph; on April 5, 1955, his expected resignation took place only a few weeks before his chosen successor, Sir Anthony Eden, announced plans for the four-power conference at Geneva.

Retirement. — Although Churchill laid down the burdens of office, amid the plaudits not only of the nation but of the world, "the member for Woodford" remained in the commons to become "father" of the house and even, in 1959, to fight and win yet another election. He published another major work, The *History of the English-Speaking Peoples*, four volumes (1956–58). He also headed the trust, founded in May 1958, to build and endow a new college at Cambridge university, to be called Churchill college. *See* also references under "Churchill, Sir Winston Leonard Spencer" in the Index volume.

CHURCHILL RIVER (MISSINIPI or ENGLISH), a river of northern Saskatchewan and Manitoba, Can., named after former Fort Churchill, which was established at its mouth in 1685. It rises in Methy lake, just east of the Alberta border at an altitude of 1,460 ft., and empties into Hudson bay. Its headwaters and tributaries draw water from eastern Alberta. Flowing for about 1,000 mi. easterly through Saskatchewan and through Manitoba in a northeasterly direction. it has a winding course, consisting of lake expansions, rapids and falls. The largest lakes on its course are Peter Pond lake, Churchill lake, Lac Ile-8-la-Crosse, Snake lake. Granville lake and Southern Indian lake. Among the tributaries of the Churchill, the Montreal river discharges the nater of Montreal lake and Lac la Ronge. while the Reindeer river drains Reindeer lake and is one of two outlets of Wollaston lake. Between Frog and Methy portages (480 mi.) Churchill river formed part of the old *voyageur* route from Winnipeg to the Athabasca and Mackenzie rivers.

At the mouth of the river on the west side of Hudson bay is a railway terminus and transatlantic harbour. The great hydroelectric potential along the river has been developed only at Island falls in eastern Saskatchewan. (AN. KR.)

CHURCHING OF WOMEN, the Christian ceremony of thanksgiving on the part of mothers shortly after the birth of their children. Unlike the Mosaic ceremony (Lev. xii), it is not a rite of purification from uncleanness. In ancient times the ceremony was usual but not obligatory in England. In the Greek and Roman Catholic churches it is not obligatory but is encouraged. Custom differs, but the usual date of churching is the 40th day after confinement, in accordance with the biblical date of the presentment of the Virgin Mary and the Child Jesus at the Temple. It mas formerly regarded as unlucky for a woman to leave her house after confinement until she went to be churched. It was not unusual for the churching service to be said in private houses.

In the *Rituale Romanum (titulus* vii, *c. 3)* the rite is called the Blessing of a Woman after Childbirth. The mother kneels at the church door (more commonly at the altar rail), holding a lighted candle. The priest sprinkles her with holy water and recites Psalm xxiii (xxiv). Then he leads her into the church, saying in Latin: "Enter into the temple of God, Adore the Son of Blessed Mary the Virgin, who has granted thee [the grace of] the birth of a child." The mother "kneels before the altar and prays, thanking God for the gifts given her"; and the priest utters a prayer for her temporal and external happiness and that of her child. Finally, he invokes upon her the abiding "peace and blessing" of the Trinity. The ceremony as performed in the Church of England is very similar, but the blessing and sprinkling with holy water are omitted.

CHURCH MUSIC. Christian church services, like the Jewish temple rites from which they derived, have always used music as a means of enhancing verbal communication and heightening the emotional effect of the liturgy. Words when sung or chanted enjoy greater carrying power both physically, as in the vast interior of an abbey or cathedral, and psychologically, since a melody may call to mind texts otherwise in danger of being forgotten. In chant, there is a division between what is sung by the priest and his assistants and what is sung by the congregation. In the former, elements of virtuosity hinting at professional execution are often found, whereas the latter must be relatively simple. Hence the difference between the chant for a Gradual, Alleluia or Offertory, and that for a hymn, a psalm or a canticle. These characteristics are generally true of the music of Eastern churches as well as of the Roman Catholic Church, whose music underwent continual revision with a view to standardization during the middle ages. Because of the widespread acceptance of Roman chant in its basic form and the prevailing differences in pronunciation and performance between one nation and another, this vast body of music was in fact prone to local deviations until a fairly late date.

Two branches of the Roman Church maintain to this day non-Roman types of chant that were originally connected with the localities concerned: the diocese of Milan, where the Ambrosian chant (*q.v.*) is still sung, and Toledo, the home of Mozarabic chant. Ambrosian chant was formerly held to be of earlier origin than Roman, but it is possible that part of it may be a later and more ornate form of certain common antecedents. Mozarabic chant was evolved by Christian communities in those parts of Spain under Arab domination before the 11th century. Only the plainsong (*q.v.*) of the Roman Church has influenced polyphonic music to any degree, the first written signs of the movement toward polyphony being almost contemporary with the vast extensions made to the chant of Mass and Office by means of trope, sequence (*qq.v.*) and liturgical drama. From the 10th century onward there gradually emerged also a vast number of hymns, of which only a small proportion are still sung, since the mortality rate of texts is greater than that of melodies.

The use of polyphony was from the earliest times restricted to major feasts, often including the patron saint of the cathedral or its dedication festival. Elaborate ecclesiastical rules determined the portions of the Mass or Office that might be set polyphonically, but these were often disregarded because of the sensuous appeal of the new art. Professional singers delighted in solo or duet virtuoso performances, accompanied by the organ or possibly by a group of instruments. By the end of the 12th century, the art of harmony had matured, especially in France where the early

polyphonic tropes of Limoges had stimulated the later and more spectacular *ovgana* of Leonin and Perotin, both associated with the Parisian school of composers. Musicians of other nations studied in Paris, and brought to Spain, Italy, Germany and England some of the secrets of vocal polyphony, which were in due course modified.

The 14th century saw a proliferation of locally produced verbal tropes, and these were set to music by more or less trained practitioners of the art, often in a relatively simple homophonic manner. This may have been part of a trend away from the overdecorative compositions of the former age, although subtlety of an unusual kind persisted in French circles, where the old *ordo* or reiterated note group was expanded to form the new and complex isorhythm, a structural feature sometimes pervading all voice parts. Isorhythmic technique was applied to the motet (*q.v.*) as well as to sections of the Mass and is present in certain movements of the Mass by Guillaume de Machaut, one of several cyclic Masses written during the second half of the 14th century.

Church music during the later middle ages became progressively more direct in its method and expression, the former subtlety of rhythm being replaced by a strong feeling for tonality and a penchant for order and symmetry. Guillaume Dufay (*q.v.*) and his followers in France and the Netherlands, John Dunstable (*q.v.*) and Lionel Power in England, and many anonymous imitators throughout Europe brought a new freshness and force to liturgical music, written for princely chapels and court ceremonies rather than for abbey and cathedral services. Music had reached a pitch of perfection, and it could be properly interpreted only by the finest singers and players. Manuscripts containing liturgical polyphony used in monasteries frequently do not mention composers by name, for the *Opus Dei* was a matter for communal concern and not a vehicle for display. But in spite of attacks on its manner and content, church music survived to play a considerable part in the arts of the Renaissance. The techniques of the Netherlanders Jakob Obrecht and Jean d'Okeghem were taken over by the Henrician composers in England, and to some extent by Josquin Desprès, who brought clarity and lyricism to an art that had sometimes leaned toward the sombre. Cristóbal de Morales in Spain; his countryman Tombs Luis de Victoria, who lived for many years in Rome; Lassus, the international and prolific writer of church music in all forms; and later in the 16th century William Byrd and Palestrina—all helped to develop Renaissance church music to a high peak of expression.

This same period also saw the growth of liturgical organ music, used originally when and where there was no choir (*q.v.*) capable of singing polyphony. It was the organist who played harmonized settings of plainsong hymns, canticles and Masses, alternating his verses with the plainsong of choir or congregation, and in due course the organ was used to accompany singing as well as to alternate with it. The rise of the verse anthem in England and the baroque motet in Italy (see ANTHEM; MOTET) made demands on the organist's ability to improvise accompaniments. In Venice a splendid new concept of church music was due to Andrea and Giovanni Gabrieli and their followers, chief among them Monteverdi and Alessandro Grandi, who made dramatic use of spatial contrasts and opposing forces of strings, wind and voices. Eventually an anthem without an orchestra was unthinkable, and the music of Lully, Alessandro Scarlatti, Purcell and John Blow continued to stress instrumental participation.

Church music in Germany, from the time of the Reformation, had followed a clear-cut path. The chorale (*q.v.*), or hymn melody, was an all-important ingredient of motet and organ solo, and later in the 17th century it pervaded the cantata also. The music of Heinrich Schutz, Franz Tunder and Dietrich Buxtehude possessed a sweetness and gravity that slowly led music into a position of the greatest importance in church services. Bach's morning service at Leipzig went on for several hours, and music was used to accompany practically every part of the service except the sermon. This genuinely liturgical music marked a high point in Protestant church music, and in the history of church music as a whole (*see* HYMN). Anthems, motets and Masses continued to be written in all Christian countries of Europe and the new world, but with few exceptions they were routine works. The great composers of the day wrote music set to liturgical texts but often with the concert hall rather than the church in mind. The resounding Masses of the early Viennese masters, especially Haydn, who cheerfully used trumpets and drums in his scores, remained a local product that other countries and other churches could hardly hope to use.

The Masses of Beethoven, Schubert and Anton Bruckner, the motets of Rossini and Brahms, the organ music of César Franck and Max Reger, the requiems of Verdi and Berlioz—all belong to the extremely varied development of church music during the 19th century. One result of this revival was a series of attempts to write music in 16th-century style, and though much of this was no more than elegant pastiche it did serve to draw composers of church music away from the earlier romantic flamboyance. About the middle of the 20th century some of the more advanced composers contributed music for use in church. Roger Sessions, Benjamin Britten and Olivier Messiaen are among several distinguished composers who led the way in showing new paths for an art form of great antiquity.

CHURCH RATE, the name of a tax formerly levied in each parish in England arid Ireland for the benefit of the parish church. Out of this rate were defrayed the expenses of carrying on divine service, repairing the church edifice and paying the salaries of the officials connected with it. The church rate was made by the churchwardens (see CHURCHWARDEN) together with the parishioners and was a personal charge imposed on the occupier of land or of a house in the parish. Though it was compulsory, much difficulty was found in collecting it. This was especially so in the case' of Nonconformists, who had conscientious objections to supporting the established church; and in Ireland, where the population was preponderantly Roman Catholic, the grievance was specially felt and resented. The agitation against church rates led in 1868 to the passing of the Compulsory Church Rate Abolition act. In the 20th century the parochial church council may collect an entirely voluntary church rate, though it is doubtful whether this is ever done. But parliament has by various statutes imposed upon local authorities the obligation to reimburse parochial church councils out of the general rate for the cost of maintaining churchyards and disused burial grounds. (E. G. Mo.)

CHURCHWARDEN, in the Church of England, one of the lay guardians of a parish church. The office dates from the 14th century, but the original duties of the maintenance of the edifice and goods of the church, with the financial obligations involved; were transferred to the parochial councils in 1921. Duties that remain are rhe provision of necessaries for divine service, the allocation of seats and the keeping of order during divine service. The duty of the presentment of offenses against ecclesiastical law has lapsed since the 19th century. The wardens are officers of the bishop, though locally elected. By virtue of their office they become leading laymen in the parish and have a pastoral importance greater than their legal duties would suggest.

There are usually two churchwardens in a parish, but sometimes more, elected annually at Easter. They are riearly always chosen from the parochial electoral roll, which includes nonresident worshipers as well as resident members of the Church of England, but some other lay householders are also eligible. Canon law requires that the churchwardens be chosen by joint consent of the minister and parishioners, but if there is no agreement the minister is to choose one and the electors the other. There is a strong custom in many parishes for the second method, which is legally prescribed in new parishes. Each churchwarden subscribes before the ordinary a declaration that he will execute his office faithfully.

In other parts of the Anglican communion churchwardens are generally the parochial lay officers, and discharge much the same duties as do the English officials, but their financial responsibilities are often greater; their duties tnay be determined by canons or by diocesan regulations. In the Protestant Episcopal Church in the United States, as in some other provinces, the usual practice is for the parishes to elect both churchwardens.

CHURCHYARD, THOMAS *(c. 1520–1604),* English writer whose "aptness to take any theam" gave him contemporary fame as the author of occasional verse, pamphlets on his experience at the wars, pageants for the queen, historical and antiquarian works, all reflecting the varied aspects of his crowded career. Born at Shrewsbury, about 1520, he served in the household of Henry Howard, earl of Surrey, and then became a soldier of fortune. For 30 years he fought in almost every campaign in Scotland, Ireland, the Low Countries and France, in the service of the Holy Roman emperor Charles V, in the English force, or, finally, under the prince of Orange. On his return he repaired to court and was employed to devise pageants for the queen's progresses to Bristol in 1574 and Norwich in 1578, but a passage in his *Generall Rehearsall of Warres* (1579, with the running title *Churchyardes Choise)* offended Elizabeth I, and Churchyard fled to Scotland. He was restored to favour about 1584, and in 1593 received a small pension from the queen. He died in London in 1604, and was buried on April 4.

Churchyard's earliest work was *A Myrrour for Man* (about 1552), and he wrote prolifically for the rest of his life. *The Firste Part of Churchyardes Chippes* (1575) was followed by numerous "discourses," occasional verses, broadsides and tracts describing the wars in which he had fought. "The Legend of Shore's Wife," his most popular poem, mas contributed to William Baldwin's *Mirror for Magistrates* (1563), and *Tlze Worthiness of Wales* (1587) in prose and verse retains some antiquarian interest. Despite Thomas Nashe's declaration in his *Foure Letters Confuted* that Churchyard's "aged Muse . . . may well be grandmother to our grandiloquentest poets at this present," however, most of his works were forgotten even within his lifetime. His works have never been completely printed and copies are extremely rare.

Other extant works of Churchyard include: *The Thre First Bookes of Ovids De Tristibus, translated into English* (1572); *A Lamentable and Pitifull Description, of the Wofull Warres in Flaunders* (1578); *A Light Bondell of Livly Discourses Called Churchyardes Charge* (1580); and *Churchyards Challenge* (1593). For his biography *see* his "Tragicall Discourse of the Cnhappy Man's life," in *Churchyardes Charge* and G. Chalmers (ed.), *Churchyard's Chips Concerning Scotland* (1817). *See* also *Churchyardes Chippes,* ed. by J. P. Collier (1870); *Worthiness of Wales,* pub. by the Spenser society (1876).

CHURCHYARD, a piece of consecrated ground attached to a parochial church and used as a burial place. *See* CEMETERY; DEATH (LEGAL ASPECTS).

CHURCH YEAR (CHRISTIAN YEAR or LITURGICAL YEAR) represents the sanctifying of the seasons for the purposes of Christian worship. Though based on the weekly Lord's day, it is generally thought of in terms of the annual festivals. Its structure is formed by the six festivals of Christmas, Epiphany. Good Friday, Easter, Ascension and Pentecost or Whitsunday (*qq.v.*). The first five of these commemorate events in the earthly life of Jesus Christ; the last commemorates the descent of the Holy Spirit upon the apostles, which began the work of the church.

All holy days, including those kept in honour of the saints as well as those devoted to Christ, form part of the church year, but this article is confined to the development of the church year as a whole, in the Western and Eastern Orthodox churches, without discussing the individual festivals that either supplement the main structure or are inserted independently of it.

Origins.—The details of the early development of the church year are difficult to trace. Information about the celebration of an individual festival sometimes can be gleaned from casual references in the writings of the period, but conclusions about the whole church cannot be drawn from statements which may refer to only one locality. Similarly, evidence provided by surviving early sermons, calendars and lectionaries is almost always local. The early history of the church year thus often has to be pieced together from scattered, often ambiguous, contemporary information about individual festivals.

As the earliest members of the church were Jews as well as Christians, they naturally kept the Jewish liturgical year, with its ordered series of festivals and holy seasons *(see* JEWISH HOLIDAYS). Of these the chief was the Passover, which Christian Jews undoubtedly associated not only with the deliverance of the Jews from Egypt but also with the deliverance of Jesus from death after his sacrifice on the cross. Similarly, Christian associations must have been present in the minds of Christians celebrating the Jewish festival of Pentecost. These two were the only festivals which the church carried over from its Jewish past. At the beginning of the 3rd century and possibly earlier the Pascha, as the Greeks translated the Hebrew Pesach (Passover), was not merely Easter but a unitive three-day festival in commemoration of both the death and the resurrection of Jesus. At the same period two events, the ascension. and the descent of the Holy Spirit, also were remembered together at Pentecost.

The Pascha and Pentecost were movable feasts, as Good Friday, Easter, Pentecost and Ascension still are; *i.e.,* they are not kept on a fixed day in the calendar but vary in date from year to year depending on the incidence of the first full moon after the vernal equinox *(see* further CALENDAR; EASTER). Christmas and Epiphany, the other two festivals which form the structure of the church year, were not taken over from Judaism and are fixed to certain dates in the calendar. The older of them, Epiphany, on Jan. 6, is first known to have been kept in the 3rd century, though it may be older. It celebrated the manifestation (Gr. *epiphaneia*) of God to the world in Jesus Christ, a revelation shown especially in the nativity and the baptism of Jesus. Epiphany therefore, like the early Pascha and Pentecost, was a unitive festival, commemorating two events.

In the course of the 4th century, after the cessation of persecution and the acceptance of Christianity as a permitted religion in the Roman empire (313), three new festivals, Christmas, Good Friday and Ascension, were introduced. Each of these seems to have taken over the functions of one of the three existing unitive festivals (Epiphany, Pascha and Pentecost). Thus, the nativity was now celebrated at Christmas, the baptism at Epiphany, the passion on Good Friday, the resurrection at Easter, the ascension on Ascension day and the descent of the Holy Spirit at Pentecost.

The evolution of Good Friday and Easter out of the earlier Pascha took place at Jerusalem. probably in the third quarter of the 4th century. In the second quarter of the same century the birth of Christ was already being kept on Dec. 25 in Rome. Before the end of the century its relationship to and distinction from Epiphany had been worked out in the eastern half of the empire, notably in Constantinople, Cappadocia and Antioch. It was probably in this same area that Ascension became detached from Pentecost and kept on its own, 40 days after Easter.

This pattern of development however did not prevail immediately throughout the whole church. Time was required for the new ideas to spread and in some cases to overcome ecclesiastical conservatism. And in fact divergencies remained. Jerusalem apparently did not include the baptism in the early unitive Epiphany. and as late as the 6th century the separate celebration of Christmas had not been firmly established there. In Rome Epiphany, which became a kind of extension of Christmas, celebrated the adoration of the Magi, with the baptism remembered only in the octave, and this usage has become normative in the west. Nevertheless, by the end of the 4th century the basic pattern of the church year had been established, commemorating the major events of Christ's earthly life from the nativity to the ascension, followed by the descent of the Holy Spirit at Pentecost.

Jerusalem.—The impetus for the early development of the church year was provided by Jerusalem. the city where the passion, the crucifixion and the resurrection had actually taken place and with which the earthly presence of Jesus was intimately connected. It is common liturgical practice to read at a festival the biblical lection appropriate to the day concerned, but in Jerusalem alone

it is possible throughout Holy Week and the season of Easter to choose lections that are suitable not only to the time but also to the place of the event commemorated. Most of the holy sites in the 4th century were provided with churches or chapels, some being imperial foundations; among these were the great basilica on Golgotha. the sanctuary of the cross also on Golgotha and the Anastasis ("Resurrection"), known in the west as the Holy Sepulchre. Jerusalem now became a centre for pilgrimage, and the local church took full advantage of its liturgical opportunities. Fortunately there is extant, though not complete, an account of Jerusalem practice near the end of the 4th century written by Etheria. a nun who went on pilgrimage from Galicia in western Spain to the holy places in Palestine and elsewhere. A summary of the information she gives about the Holy Week and Easter services in Jerusalem, with their hymns and biblical readings "appropriate to the day and to the place." will show the unique influence of the holy city on the liturgical development of this season, during which the bishop with his congregation followed step by step the movements of Christ as recorded in the Gospels.

On the Saturday evening before Holy Week the people went to Bethany, where in the sanctuary called the Lazarium the gospel. beginning "Six days before the Passover, Jesus came to Bethany" (John xii, 1), was read. In the evening of Palm Sunday the gospel of the triumphal entry into Jerusalem (Matt. xxi, 9) was read at the Mount of Olives, and the people, bearing branches of palms or olives in their hands, escorted the bishop, as Christ had once been escorted. with hymns and anthems, into the city, where a late evening service was then held in the Holy Sepulchre. Similarly on the Monday, Tuesday and Wednesday of Holy Week services with hymns and lections suitable to the day and the place were held. On Wednesday evening the lection, concerning Judas Iscariot's visit to the high priest to arrange the betrayal of Jesus, was accompanied by such loud exclamations of grief that no one present could refrain from tears. On Thursday afternoon all the people received communion at the sanctuary of the cross. and in the evening they went to the church on the Mount of Olives where there was a cave in which Christ had taught his disciples on that day. The night was spent in services and in a procession to Gethsemane, where the lection of the arrest of Jesus was again accompanied by tears and wailing. It began to grow light on Friday morning when the procession reached the sanctuary of the cross. Here the trial narratives from the Gospels were read. On their way home the people prayed at the column where Jesus was scourged, and after a brief rest returned to the sanctuary to adore the relic of the cross preserved there. Then from the sixth to the ninth hour they gathered in the open air outside the sanctuary to hear lections referring to the passion from the Psalms, the Prophets, the Gospels, the Acts and the Epistles, and to take part in appropriate hymns and prayers. The last lection was the account of the death of Jesus in John's Gospel. Then in the Holy Sepulchre the lection about the burial was read, and those who were able kept vigil there all night with hymns and anthems.

The paschal vigil proper — that is, the vigil of the Saturday night — took place in the great church, nhere the bishop brought those who had just been baptized in the Holy Sepulchre, and the Eucharist was celebrated. The people then moved to the Holy Sepulchre for the Easter lection and a second celebration of the Eucharist. After the evening service in the Holy Sepulchre the people went to the church on Mt. Zion. where the lection was that of the appearance of Jesus to his disciples on Easter day at that very spot (John xx, 19 ff.). Special services were held during Easter week, and on the Sunday after Easter the lection from the same chapter about the incredulity of Thomas was read at Zion.

Clearly this complex structure of Holy Week observances was new to Etheria. Since the middle of the previous century Holy Reek had been kept throughout the church as a period of fasting and preparation for Easter, but there is no evidence elsewhere for the historical sense whereby the worshipers actually took part in the events of the eight days preceding the resurrection of Jesus Christ. It is from Jerusalem that the Palm Sunday procession and the Veneration of the Cross on Good Friday were later adopted throughout Christendom. No doubt the enthusiasm of returning pilgrims, such as Etheria, helped to spread the Jerusalem practices to other lands, where they might not have evolved of themselves without the presence of the holy sites.

The Jerusalem church had another contribution to make to the development of the liturgical year: this was in the order and cohesion that came from concentrating attention in an advancing movement from Epiphany to Pentecost. The aim was to make the life of Christ more real and contemporary to the worshipers by leading them realistically from place to place in the sacred narrative at the appropriate times, from the nativity at Bethlehem to the ascension on the Mount of Olives, and to the coming of the Holy Spirit to the disciples in the upper room at Zion. Although some modification was necessitated when these practices were transplanted elsewhere, the structure has remained; the life of Christ is manifested afresh to the church in every liturgical year, unobscured by later additions and complexities that periodically require reform.

Byzantine System. — The Orthodox Eastern Church regards the church year as beginning with Easter, the greatest of the festivals, commemorating the victory of Christ over sin and death. Lent, the period of fasting and prayer in preparation for Easter. thus comes at the end of the year, which concludes with the Easter vigil. Christmas and Epiphany, which always fall on Dec. 25 and Jan. 6 respectively. do not form part of this series; they are found in the Menaion, which contains the readings for each fixed holy day from Sept. 1 (the beginning of the Byzantine civil year) to Aug. 31, and corresponds to the western Proper of the Saints (see below).

The cycle of the Byzantine movable feasts depending on Easter was fixed by the 9th century. Those Sundays that have no special name are called after the subject of their gospel lection. The series is as follows:

Easter
Sunday of Thomas
Sunday of the myrrh-bearing woman
Sunday of the paralytic
Sunday of the Samaritan woman
Sunday of the blind man
Ascension day on the following Thursday
Sunday of the 1st ecumenical council
Pentecost
Trinity (kept the day after Pentecost)
A series of 17 Sundays of Matthew and 14 Sundays of Luke
Sunday of the publican and the Pharisee
Sunday of the prodigal son
Sunday of abstention from meat (apocreo)
Sunday of eating cheese (tyropkagou)
First to fifth Sundays in Lent (which begins the day after tyrophagou)
Palm Sunday
Holy Week, ending with Good Friday, Holy Saturday and the Easter vigil.

Though this series in its present form had not been fully developed by the late 4th century, the principle of it, whereby Easter stood at the beginning. was already present then. In this church year the conception of a sacred cycle moving from the nativity to the ascension and Pentecost is overshadowed by the idea that Easter, the greatest festival, is in a different category from Christmas and Epiphany. This conception of the church year is probably more primitive than that which arose in Jerusalem, for Christmas and Epiphany mere introduced into the cycle of feasts later than Easter and Pentecost. which had Jewish antecedents.

It is not easy to trace this church year beginning with Easter back to its original area. It seems however that it was shared by Antioch and Constantinople in the 4th century. The so-called Apostolic Constitutions, which reflect the usage of the Antiochene church at the end of that century, include instructions about the keeping of fasts and festivals; the order in which they are mentioned is: Holy Week, Easter, Ascension, Pentecost, Christmas, Epiphany. Here, although Christmas and Epiphany are put in the same series as Easter, and Easter is not right at the beginning, the structure obviously is more similar to the Byzantine system than to the Jerusalem one. A further point of similarity between the Byzantine and Antiochene year is the prominence given to Saturday (Sabbuton), the Jewish Sabbath, which remains a liturgi-

cal day in the Orthodox Eastern calendar; Saturday, like Sunday, has its special lections, and fasting is forbidden on Saturday as on Sunday.

Western System. — It was the Jerusalem system, with its cycle from the Nativity to Pentecost. that was taken over by the Western Church and later underwent modifications and additions. In the Roman missal the Proper of the Time (*i.e.*, the temporal cycle) runs as follows:

Four Sundays in Advent, the first of which is the Sunday nearer Nov. 30
Christmas day (Dec. 25)
St. Stephen's day (Dec. 26)
St. John the apostle's day (Dec. 27)
Holy Innocents' day (Dec. 28)
Sunday within the octave of Christmas
St. Thomas à Becket's day (Dec. 29)
St. Silvester's day (Dec. 31)
Octave of Christmas (Jan. 1)
Sunday before Epiphany
Epiphany (Jan. 6)
Six Sundays after Epiphany
Septuagesima Sunday
Sexagesima Sunday
Quinquagesima Sunday
Ash Wednesday (the first day of Lent, three days after Quinquagesima)
Six Sundays in Lent, the fifth of which is Passion Sunday, inaugurating Passiontide, and the sixth Palm Sunday
Holy Week
Easter day
Five Sundays after Easter
Ascension day on the following Thursday
Sunday after Ascension day
Pentecost
Twenty-four Sundays after Pentecost, of which the first is Trinity Sunday followed by Corpus Christi on the next Thursday.

(If Easter is early there are fewer Sundays after Epiphany. if Easter is late there are fewer Sundays after Pentecost.)

The developments to note are the addition of the two seasons of Advent and Septuagesima and the inclusion of the saints' days after Christmas, all other saints' days being in the Proper of the Saints.

Advent is a penitential season of preparation for the first coming of Christ in humility at Christmas and for his second coming in glory at the end of the world. It was an early innovation introduced perhaps as early as the 5th century in Gaul. At first, however. Advent was placed at the end of the calendar. not at the beginning where it now stands. There is a parallel here with the Byzantine liturgical conservatism whereby Christmas and Epiphany, though they find a place in the system, do not dislodge Easter from its position at the head of the year, and the preparatory season of Lent is calendrically divorced from Easter to which it is directed. In the west. however, logic prevailed, and the season of Advent was transferred in about the 7th or 8th century to its present position where it begins the church year. It may be pointed out that the Proper of the Saints begins at the same time, with the vigil of St. Andrew on Nov. 29. whereas in the Byzantine system. as mentioned above. it starts in September quite separately from the movable year's commencement at Easter.

The season of Septuagesima — that is, the two and a half weeks before Lent which include the Sundays called Septuagesima. Sexagesima and Quinquagesima — is a kind of anticipation of Lent and forms a parallel to the two weeks running from the Monday before *apocreo* to the Sunday of *tyrophagou* in the Byzantine system. This season was introduced in the 6th century by Pope Gregory I, who was familiar with Byzantine custom. The names of the Sundays — Septuagesima ("70th"), Sexagesima ("60th") and Quinquagesima ("50th") — are only approximations; the next Sunday. Quadragesima ("40th"). from which these three are numbered in reverse order, really does fall on the 40th day (not 40th Sunday) before Good Friday.

The inclusion of five saints' days (during the octave of Christmas) in the Proper of the Time, not in the Proper of the Samts. is a curious feature. Three of these are saints of the early church who were connected closely with Christ: St. Stephen was the first martyr, St. John was "the disciple whom Jesus loved," and the Holy Innocents suffered for Christ as involuntary martyrs shortly after his birth. The first two of these feast days have been celebrated since at least the 4th century and the third since the 5th century. St. Thomas à Becket was martyred on Dec. 29, 1170, and there is no clear reason why his name should figure in the Proper of the Time instead of in the Proper of the Saints. St. Silvester, remembered on the last day of the civil year, was pope during the rule of Constantine I, who gave peace to the church and founded many churches in Jerusalem, Rome and Constantinople.

Proper of the Saints (Western Church). — The other saints' days form a separate list, which includes also the festivals of Christ unconnected with the main cycle of the church year; for instance. the Transfiguration (Aug. 6) and the Exaltation of the Cross (Sept. 14). Local commemoration at the tomb of a martyr on the day of his martyrdom, practised since the second half of the 2nd century, was extended to other places as the fame of the martyr grew, and after persecution ceased holy persons who had not been martyred were similarly remembered annually on the appropriate day (see SAINT). Saints' days. being mostly unconnected with each other, do not form a cycle which can be discussed as a whole. Three, however, depend on the date of Christmas: the Annunciation (*q.v.*) of the Blessed Virgin Mary (March 25, nine months before Christmas), the nativity of John the Baptist (June 24. six months before Christmas; cf. Luke i, 26) and the Purification of the Blessed Virgin Mary (Feb. 2, 40 days after Christmas; see CAUDLEMAS). The remaining festivals of the Blessed Virgin, including the Assumption (*q.v.;* Aug. 15), are not linked chronologically with any event in the life of Christ.

The increase in number and importance of saints' days at various times has threatened to obscure the cycle of the church year, and prunings periodically have had to be made. Saints' days are transferred if in any year they fall on the same day as a major festival; the Annunciation, for instance, is transferred if it occurs in Holy Week or on Easter day. There is indeed a tendency to avoid placing a saint's day in the period of penitence covered by Lent, which accounts for the relatively fewer feast days in February, March and April.

Reformed Churches. — None of those churches which underwent the Reformation retained the church year in its full traditional form.

Lutherans preserved the main structure, though with minor variations in different countries, but the Proper of the Saints was greatly curtailed. Their chief innovations are the transference of the Transfiguration from Aug. 6 to the last Sunday after Epiphany and the eschatological interpretation given to the last three of the Sundays after Trinity (these Sundays, as in Anglican churches, being named after Trinity instead of after Pentecost). Each Sunday and holy day has an introit, collect, epistle, gradual and gospel.

In the Church of England the Proper of the Seasons was retained, with a collect, epistle and gospel for each Sunday and for the following holy days: Christmas, the Circumcision. Epiphany, Ash Wednesday. each day in Holy Week, Easter Monday and Tuesday, Ascension day, Whit-Monday and Whit-Tuesday. The calendar in the Book of Common Prayer contains about 80 saints' days, of which only those commemorating New Testament saints or events in their lives have special collects. epistles and gospels. Some of the prayer books used by other churches in the Anglican communion have increased the number of saints' days and propers for them.

Presbyterians a-ere more radical in their attitude. They tended to retain only the major festivals. though in Scotland even these were rejected. There has been a tendency however in the 20th century to reinstate some of the rejected festivals and holy seasons.

Some of the radical decisions evoked by the Puritan movement and the ensuing conflicts in Great Britain did not directly affect the Reformed churches on the continent. These retained the great festivals of the church year and also seasons such as Lent. Special days such as Ascension and All Saints also continued to be observed. The system of Sunday epistles and gospels, conforining

to the seasons of the year, was not abolished though it fell into disuse in some of these churches. It enjoyed a general revival in the 20th century.

CHURL. The word ceorl in Old English law denoted the free peasant who formed the basis of Anglo-Saxon society. Originally he paid various dues directly to the king. owed suit of court and in time of war was required to serve in the fyrd, the national levy. But ceorls had insufficient resources easily to survive misfortune, and although a document of the early 11th century shows that some ceorls prospered and even attained the rank of thegn, the class as a whole suffered a steady depression. As early as the 7th century ceorls were paying to lords dues originally owed direct to the king; if provided with a homestead and stock as well as with land, they also gave labour services. By the reign of King Alfred (871–899) a ceorl was equated with a Danish freedman. Ceorls retained their wergild of 200s. (one-sixth that of a thegn) until the system became obsolescent by the early 12th century, and their obligation to attend local courts proclaimed them freemen. But after the Norman conquest disaster or intermarriage brought many into the great class of unfree villeins. The word churl, perhaps because it long existed only in a spoken vernacular and denoted a depressed and subject peasant, had acquired its pejorative sense by the 14th century and was so used by Chaucer.

CHURRIGUERA, JOSÉ (1665–1725), Spanish architect, called the Spanish Michelangelo because he combined his art with sculpture and painting, was born on March 21, 1665, at Madrid. Under Philip V. he was the foremost Spanish architect. designing the Royal Academy of Fine Arts, church façades and altars in Madrid, and the entire town of Nuevo Baztán (1709–13). His altars show baroque genius for grandiose, theatrical effects, both sculptural and pictorial. They are complex, rhythmically harmonious in vibration and movement and profusely decorated with statues. His altar at San Esteban, Salamanca (1693–96), over 90 ft. high, has six huge twisted and garlanded columns; set at different depths in a concave-convex plan. He died on March 2, 1725, at Madrid.

The name churrigueresque is given to the phase of Spanish baroque architecture lasting from about 1650 to 1740 and characterized by the use of the spiral column and lavish decoration. However, the style was not created by Churriguera, and he was conservative in his use of it.

See A. Garcia y Bellido, "Estudios del barroco espafiol," in *Archivo español de arte y arqueología,* vol. v, pp. 21–86 (1929).

CHURUBUSCO, a suburb of Mexico City on the river of the same name. Pop. (1950) 1.392. It contains a massive stone convent constructed by the Franciscans in 1768 on the site of an Aztec temple. It was there that Mexican forces under Gen. A. L. de Santa Anna and United States forces under Gen. Winfield Scott met in a brisk battle on Aug. 20, 1847, following the brief skirmish known as the battle of Contreras (*q.v.*). Pressing on after the victory at Contreras, Gen. William J. Worth's division suddenly encountered stout resistance at the bridgehead and convent at Churubusco. A spirited assault by the U.S. forces overcame the stubborn Mexican resistance after a three-hour carnage which left hundreds on both sides dead, wounded or prisoners. Among the prisoners taken by the Americans mere members of the San Patricio battalion, U.S. deserters fighting for Mexico, many of whom were subsequently hanged by General Scott. The following day. Aug. 21, 1847, Santa Anna and Scott opened peace negotiations which soon broke down.

Churubusco was in precolonial times a town of considerable importance called Huitzilipocho by the Aztecs. (R. B McCK.)

CHUSAN: see CHOU-SHAN-CH'UN-TAO.

CHUVASH AUTONOMOUS SOVIET SOCIALIST REPUBLIC, in the Russian Soviet Federated Socialist Republic. U S S.R. lies on the right bank of the middle Volga, between Gorki and Kazan. Pop. (1959) 1,097,859. Area 7,066 sq mi. It is drained by tributaries of the Volga, notably the Sura in the west of the republic, the Bolshoi Tsivil and Maly Tsivil in the centre and the Kubnpa in the east. Most of the area consists of the so-called Chuvash plateau — low, gently rolling hills, much cut up by ravines — which forms the extreme northern end of the Yolga upland and drops gradually to the terraces and flood plain of the Yolga. In the west, along the Sura, are extensive sands of old alluvial origin. The boundary between the forest and forest-steppe natural zones crosses the republic The Sura sands are densely forested with pine. In the north are areas of mixed and deciduous forests, with oak, on gray forest earths. Much of the original forest cover has been removed by overcutting. In the east and southeast are patches of black earth soils. almost all of which are under the plow. Along the Volga and Sura are flood plain meadows. A small part of the republic lies across the Volga on the left bank opposite Cheboksary. The climate is continental. with an annual range of about 60" F. and long, cold winters. Rainfall is low: 15–18 in. a year.

The republic was first formed as an autonomous oblast in 1920, becoming an autonomous republic in April 1925 and from 1929 to 1936 formed part of Gorki *krai.* In 1959 about 75% of the population were Chuvash, the remainder being mostly Russians, Mari (Cheremis), Mordvins and Tatars. The Chuvash are a Turkic people, related to the Bulgars who originally inhabited the middle Volga area. In 1959 the Chuvash numbered 1,470.000 in the U S S R. as a whole. They were already a settled agricultural people when their domain was overrun by the Russians in the 16th century and there was never any considerable Russian colonization of the area. Most of the present Russian population is concentrated in the towns. Urban population in 1959 numbered 267.789. or 24% of the total. The administrative centre. Cheboksary (q v.) has 83.000 inhabitants. Of the other towns the most important are Alatyr, Kanash and Shumerlya. Over-all population density — 155 per square mile — is well above the average; even counting rural population alone, the density is 117 per square mile. As such a density indicates, the republic is predominantly agricultural. almost half of its area being arable land, Nearly two-thirds of the sown area is under grain crops, with rye easily the most important, followed by oats and spring wheat. Hemp, potatoes and vegetables, especially peas, are important and small quantities of flax and *markhorka* tobacco are grown. Along the Volga, fruit-growing is important Animal husbandry. including cattle, pigs and sheep, is well developed and the acreage under maize (corn) and other fodder crops has been greatly increased. The numbers of livestock per 100 ac. of agricultural land are far above the average for the central regions of European Russia. Dairy produce and meat are supplied to the large urban areas of the Moscow district and Gorki. Poultry and honey are other agricultural products of the republic.

Industry, which scarcely existed before the Revolution, has shown considerable development, particularly since World War II. The timber industry is one of the most important. and sawmilling and timber-processing are carried on in most of the towns. Cheboksary, which is also a river port, produces textiles, alcohol and leather goods, and is the site of a Chuvash regional museum. Alatyr (pop. [1956 est] 34,700), a centre of the grain-growing area, has locomotive and automobile works. Shumerlya, which developed during the 1930s. produces furniture, veneers, flooring and tannin from the local oaks. Mariinski Posad (with shipbuild-

ing) and Kozlovka are the chief timber centres on the Volga. Prefabricated houses, sleepers (railroad ties), pit-props and matchwood are produced. Food-processing and textile and leather manufacture are widespread. A chemical industry has developed at Vurnary, based on wood chemicals and local supplies of phosphorites from Buinsk Shale oil from Buinsk and Ibresi and peat from the Volga flood plain are the only local fuels, but a large hydroelectric plant was constructed after 1960 on the Volga above Cheboksary. Cheboksary and Alatyr have thermal power stations.

Communications in the Chuvash republic are good. In addition to the Volga, the main Moscow–Kazan–Trans-Siberian railway traverses the area, with branches from Kanash north to Cheboksary and south to Saransk and Penza. Motor roads link Cheboksary to Gorki. Kazan and Ulyanovsk, and the republic has a well-developed road network. (R. A. F.)

CHŪZENJI-KO, Japanese lake within Nikkō National park. Tochigi prefecture, north central Honshii. at 1.271 m. (4.170 ft.) elevation. is a noted resort, famous for its shrines. Volcanic Mt. Nantai, 2,484 m. (8,150 ft.), towers above its northern shore, with lesser elevations around most of its irregular coast line (23.3 kms. [14.4 mi.]). Fed by small rivers in the west and northwest, Chiizenji-ko is deepest in the east, about 170 m. (558 ft.). Its waters occupy a structural depression that has been deepened further by a lava obstruction at its eastern end, from which emerges the Daiya river, its sole outlet. The splendid scenery, temples and hot springs, boating and fishing attract scores of tourists in summer and autumn. (J. D. Ee.)

CIALDINI, ENRICO, Duca di Gaeta (1813–1892), Italian soldier and statesman who made his name in the wars of the Risorgimento, was born at Castelvetro in Modena on Aug. 10, 1813, the son of a civil engineer. Having taken part in the insurrection in Modena in 1831, he fled to France and then went to Spain to fight the Carlists. Returning to Italy in 1848, he commanded a regiment at the battle of Novara. He commanded one of the Sardinian brigades in the Crimean War. In the Italian war of 1859 he organized the alpine brigade and led the 4th division at Palestro; in that of 1860–61 he led the Sardinians into the papal states, won the battle of Castelfidardo, took Ancona. conducted the successful siege of Gaeta (for which he received his ducal title) and reduced Messina and the last Bourbon resistance. Sent to oppose the Garibaldian expedition of 1862, he won the battle of Aspromonte. King's lieutenant at Naples (1862–66) and a senator from 1864, he resumed command of an army corps in the Italo-Austrian war of 1866, but dissensions between him and Gen. A. La Marmora led to the defeat at Custozza. In Oct. 1867 and in Dec. 1869 he was invited to form a cabinet, but failed. In Aug. 1870 he advocated Italian intervention on the French side in the Franco-German War. From 1876 to 1882 he was Italian ambassador in Paris, but had to resign when the Italian foreign minister P. S. Mancini published a dispatch of his complaining that the former French premier W. H. Waddington had treated him with arrogance. Cialdini died at Leghorn on Sept. 8, 1892.

Bibliography.—G. Marcotti, *Il Generale Enrico Cialdini* (1892); N. Nisco, *Il Generale Enrico Cialdini e i suoi tempi* (1893); Prince Adam Wizniewski, *Le Général Cialdini* (1913).

CIAMICIAN, GLACOMO LUIGI (1857–1922), Italian chemist whose most important researches were in organic chemistry. He was born at Trieste on Aug. 22, 1857. Educated at Trieste and Vienna, he took his doctorate in 1880 at the University of Giessen. He became assistant to Stanislao Cannizzaro (*q.v.*) and later reader in the Institute of General Chemistry of the University of Rome. In 1887 he was appointed professor of general chemistry in the University of Padua. In 1889 he accepted the chair of chemistry at the University of Bologna and retained this post until his death on Jan, 2, 1922. From 1910 to 1922 he was a member of the Italian senate, concerning himself mainly with education and the chemical industry.

Ciamician stressed the application of organic to biological chemistry. An investigation of the compounds in animal tar led him early in his career to important researches on pyrrole. A monograph, *Il Pirralo e i suoi derivati* (1888), gained the royal prize of the Accademia dei Lincei. Ciamician was also a pioneer in the chemistry of vegetable products. At first he worked on organic compounds of vegetable origin and later became interested in the chemistry of the substances in the living plant and their biological significance. The essential oil of celery was the subject of an important early investigation; later he inoculated plants and seeds with alkaloids and their constituents. His researches on the chemical action of light are noteworthy. Ciamician's later researches were on the theory of electrolytic dissociation, on solvates, on the nature of chemical affinity and on the valency of atoms. He published about 170 papers and delivered lectures before the German and French chemical societies and the International Congress of Applied Chemistry at New York city in 1912. A street in Trieste was named for him.

CIANO, GALEAZZO, Conte di Cortellazzo (1903–1944), Italian Fascist statesman, foreign minister from 1936 to 1943, in the Fascist government of his father-in-law Benito Mussolini, was born at Leghorn on March 18, 1903. His father, the conte Costanzo Ciano, distinguished himself in the Italian submarine attack on Pola in World War I, and the young Galeazzo took part with him in the Fascist march on Rome in 1922.

After studying law at Rome university and working briefly in journalism, Ciano entered the Italian diplomatic service and held posts in Rio de Janeiro, in Peking, at the Vatican, and, as consul general, at Shanghai. In 1930 he married Mussolini's eldest child, Edda. He became minister of propaganda in 1934. An enthusiastic aviator, he led a bomber squadron in the war against Ethiopia. On his return to Rome he was made foreign minister (June 1936).

Ciano vigorously advocated Italian intervention in the Spanish Civil War, the invasion of Albania and the Axis pact with Nazi Germany. Subsequently, however, his enthusiasm for Germany waned, and his diary records the humiliation that he felt at the Germans' arrogance toward their ally. Even so, he swayed the vacillating Mussolini into entering World War II on the German side after the collapse of France in June 1940.

After successive Axis defeats in 1942 Ciano joined those members of the Fascist party who wanted a separate peace with the Allies. Mussolini, suspicious of his loyalty, relieved him of his post as foreign minister in Feb. 1943. Ciano was then appointed ambassador to the Vatican. During the historic session of the Fascist grand council on July 24, 1943, he was among those who forced Mussolini's resignation. Having disappeared from Rome while Marshal Pietro Badoglio's government was preparing charges of peculation against him (Ciano's private fortune was immense), he was captured in hiding in northern Italy by partisans of his father-in-law and the Germans in Oct. 1943. Brought to trial on a charge of treason he was found guilty and executed at Verona on Jan. 11, 1944.

Ciano's diaries from 1939 to 1943 were published in English in 1946. His *L'Europa verso la catastrofe* (a collection of diplomatic papers) also appeared in English in 1948.

CIBBER, CAIUS GABRIEL (1630–1700), Danish sculptor and the father of the actor and dramatist Colley Cibber (*q.v.*), was born at Flensburg, the son of the king's cabinetmaker. He was sent to Italy at the royal expense, but before 1660 he was in England working as foreman to John Stone (1620–67). His earliest important work was the large relief showing "Charles II Succouring the City of London After the Great Fire" on the monument near London bridge (1674). A few years later he made the famous statues of "Raving Madness" and "Melancholy Madness" for the gate of Bedlam hospital (now Guildhall museum) and in 1677 a fine tomb at Withyham, Sussex, for the Sackville family.

Between 1688 and 1691 he was working at Chatsworth, Derbyshire, where he made the figures of Apollo and Pallas on the staircase, those of Faith and Justice in the chapel and much garden sculpture. He was employed by Sir Christopher Wren to carve the pediment on the east park front of Hampton court and some of the architectural detail at St. Paul's cathedral, though he died in London before his work on the latter was completed. His work, which shows the influence of Holland as well as of Italy, is competent though somewhat provincial. All of his known works are in England. and his reputation in his own day was good. (M. D. Wy.)

CIBBER, COLLEY (1671–1757), English actor, dramatist and poet laureate, born in London on Nov. 6, 1671, was the son of the Danish sculptor Caius Gabriel Cibber (*q.v.*) and Jane Colley, who claimed descent from William of Wykeham, founder of Winchester college. Cibber attended the free school at Grantham, Lincolnshire, where he distinguished himself as a fluent writer, but he failed of election to Winchester college in spite of his claim to be of "founder's kin." In 1688 he "met the revolution" by serving with a company of volunteers raised by the duke of Devonshire to aid William of Orange. He attached himself as an actor to Thomas Betterton's (*q* v.) company at Drury Lane in 1690.

Marrying in 1693, and finding his earnings as a minor actor inadequate for the support of a growing family. Cibber wrote a play for the purpose of providing himself with a satisfactory role. This play. *Love's Last Shift* (1696). became a landmark in the history of the theatre; it is generally considered the first sentimental comedy, a form of drama that dominated the stage until it was challenged nearly a century later by Goldsmith and Sheridan. The play's immediate effect, however, was to establish Cibber as an important playwright and as one of the leading actors in London "For a young fellow," declared Lord Dorset. "to show himself such an actor and such a writer in one day was something extraordinary" The dramatist William Congreve. with perhaps less enthusiasm, also acknowledged the play's success; and Sir John Vanbrugh honoured it with a sequel. *The Relapse* (1696). in which the character Sir Novelty Fashion reappears as Lord Foppington. TRO years later Cibber mas included among the dramatists castigated in Jeremy Collier's *True View of the Immorality and Profaneness of the English Stage.* In 1700 Cibber produced his famous adaptation of *Richard III,* which. though it was frequently condemned as a travesty on Shakespeare, held the stage as the preferred acting version until the original was restored by Henry Irving in 1871. In 1702 Cibber produced *She Would and She Would Not* and in 1704 *The Careless Husband,* designed especially for Anne Oldfield.

At this time Cibber entered upon a series of complex intrigues in order to attain a position in management. In 1706 he left Drury Lane for the Haymarket, where he produced *The Double Gallant* (1707), returning to Drury Lane in 1708 as a shareholder. By 1710, with Robert Wilks and Thomas Doggett, he acquired control of the patent. Thus was formed the famous "triumvirate" of actor-managers, under which (Doggett was later replaced by Barton Booth) the theatre prospered as it never had before. After the death of Queen Anne and the rise of Whig dominance. Sir Richard Steele, then prominent in Whig politics, joined the managers in obtaining a new patent. Cibber demonstrated his gratitude to the Whigs by producing the *Nonjuror* (1717), freely adapted from Molière's *Tartuffe.* This play provoked the animosity of all anti-Whig factions, but it brought Cibber a generous gift from the king and doubtlessly led later to his appointment as poet laureate. In 1728 he completed *The Provoked Husband,* a play left unfinished by Vanbrugh at his death in 1726. Mrs. Oldfield, Cibber's leading actress. died in 1730, the year he became laureate. her loss being followed in 1733 by that of Wilks, his first partner in management. The next year Cibber sold his share of the patent and announced his retirement. but he did not make his final appearance until, at the age of 74, he played in his own adaptation of Shakespeare's *King John* (Feb. 15, 1745).

In 1740 he published *The Apology for the Life of Colley Cibber, Comedian,* upon which a contemporary wit remarked that Cibber had "lived his life in order to apologize for it." But Horace Walpole pronounced it "worthy of immortality," and Swift sat up all night to read it. Apart from its general interest, it contains the best account of the theatre in Cibber's day and an excellent study of the art of acting as it was practised by his great contemporaries.

In the edition of 1743 Cibber was substituted for Lewis Theobald as the hero of Pope's *Dunciad,* an act of meaningless spleen on the part of Pope that did his own poem great harm and resulted in the undeserved depreciation of Cibber's reputation. Cibber had been subject to attack throughout his career, especially in the political journals and pamphlets of the day. Samuel Johnson was contemptuous of him, as he was of all actors, and expressed his contempt with characteristic bluntness. Henry Fielding, anti-Whig always, attacked Cibber frequently, especially in *Joseph Andrews* and in the *Historical Register for 1736,* a comedy in which Cibber appears as Ground Ivy. But these and other attacks Cibber always met with irritating indifference. "The only way I knew how to stop authors of this stamp," he explained, "was to become insignificant." He had adopted the same attitude toward Pope's stinging attack in his *Epistle to Dr. Arbuthnot* (1735). Pope's antagonism began as early as 1717, following the production of the *Nonjuror,* though Cibber explains it as having originated in a trivial altercation over a farce. *Three Hours After Marriage* (also 1717), written by John Gay with the co-operation of Pope and Arbuthnot. Whatever the cause. Cibber did not break his silence until he learned that Pope was revising the *Dunciad* and was elevating him to the place of doubtful eminence as the hero of the satire. To this he responded with *A Letter From Mr. Cibber to Mr. Pope, inquiring into the motives that might induce him in his satirical works to be so frequently fond of Mr. Cibber's name* (1742). The next year he wrote *A Second Letter....* When the promised revision appeared, with an insulting preface by Warburton, Cibber published *Another Occasional Letter....* (1744). Pope's death following the publication of the third letter brought the controversy to an end. Altogether Cibber had the better of the argument. He scored heavily against the splenetic but sensitive poet, causing him. according to Johnson, to writhe in anguish. Also, by the substitution of the sprightly comedian for the pedantic Theobald, much of the satire lost its point.

Cibber's faults were many, but they certainly did not include dullness. He had written and adapted nearly 30 plays, some of them very good. He was a great theatrical manager. "He was," says Hazlitt, "a man of wit and pleasantry in conversation, a diverting mimic, an excellent actor, an admirable critic, and one of the best comic writers of his age."

Cibber died on Dec. 11, 1757, and was buried in the old Danish church, east London.

Bellchambers and in 1889 by R. W. Lowe. (M. Rs.)

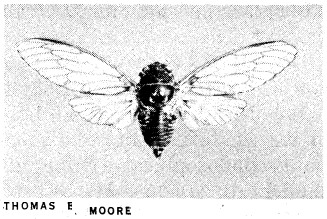
CIBBER, THEOPHILUS (1703–1758), English actor and playwright, son of Colley Cibber (*q.v.*), was born on Nov. 26. 1703. His first appearance on the stage was in 1721. In 1731 and 1732 he acted for his father as manager of Drury Lane, serving also as actor-manager of the Haymarket in 1734. He was a capable actor, his best role being Pistol in *Henry IV,* but his plays are worthless. There is perhaps no contemporary reference to Cibber that does not set him down as a scoundrel. He traded dishonestly on his father's name, engaged in blackmail, in shameless plagiarism and in scandalous lawsuits to obtain money. He died in a shipwreck while on his way to play in Dublin at the Theatre Royal. (M. Rs.)

CIBORIUM, in ecclesiastical usage, is (1) a chalice-shaped, covered, metal cup in which the sacramental bread for the Eucharist is reserved; and (2) a baldachin (*q.v.*).

CICADA, the common name for medium- to large-sized homopterous insects of the family Cicadidae, order Hemiptera, having two pair of membranous wings, prominent compound eyes, three simple eyes (ocelli) and fore femora spined below. Male cicadas produce very loud noises by vibrating paired dorso-lateral membranes (timbals) located at the base of the abdomen. In some species the "song" is musical, but most North American cicadas produce rhythmical ticks, buzzes or whines. Paired hearing organs (tympana) are located ventrally at the base of the abdomen in both males and females, and both sexes possess large tracheal air sacs. Females are not known to "sing." Eggs are usually laid in woody tissues, and hatching nymphs burrow into the ground, where they feed on the juices sucked from roots of perennial plants. Nymphs usually undergo five molts during the several year period required for all species to reach adulthood. Both adults and nymphs imbibe copious amounts of plant fluids and eliminate much liquid.

Cicadas are not ordinarily considered pests. Over 2,000 species

are known, only one of which occurs in southern England, while 180 species are known in the United States and Canada. Most species are tropical. They range in size from $\frac{3}{4}$ in. to several inches in length. and occur in deserts, grasslands and forests.



THOMAS E. MOORE

DORSAL VIEW OF ADULT MALE CICADA (OKANAGANA CANADENSIS)

Besides the dog-day cicadas (*Tibicen* species and others) that appear yearly in midsummer, there are periodic cicadas These smaller Magicicada species, with reddish eyes and wing veins instead of the green and black of dog-day cicadas. are among the most fascinating and best known cicadas. There are three northern North American species of 17-year cicadas (often erroneously called 17-year "locusts") and three southern species of 13-year cicadas found from Oklahoma eastward. These species occur in very large numbers in chronologically and geographically isolated broods, always intimately associated with oak woods, but contact between 13- and 17-year broods is likely. Song has been shown to be the primary isolating mechanism among the three species occurring together in any one brood. as well as the primary congregating mechanism for both males and females of each species.

The three species of either 17- or 13-year cicadas are readily recognized by differences in songs, behaviour and morphology; however. the three species of either group have remarkably similar cognates in the other. Males of each species have three distinct sound responses: (1) a congregational song, the production of which is regulated by daily fluctuations in climatic conditions and by hearing songs produced by other males; (2) a courtship song. which is usually but not invariably produced prior to copulation; and (3) a disturbance squa k produced by individuals captured, held, disturbed into flight or otherwise irritated.

Cicadas have been an important source of human food dating from at least the time of ancient Greek culture; newly emerged adults are particularly used They also are kept as pets in many lands. Formerly cicadas were often used in various folk medicines in several oriental and Mediterranean countries. They have been prominent as religious and monetary symbois. and in the mythology. literature and music of many cultures.

When adult cicadas are numerous, especially during years when the periodical species emerge, egg-laying activities of the females may cause some damage to young saplings. *See* also HEMIPTERA; INSECT.

See J. G. Myers, Insect Singers; a Natural History of the Cicadas (1929); R. D. Alexander and T. E. Moore, Ohio J. *Sci.* 58, 2:107–127 (1958). (T. E. M.)

CICELY (*Myrrhis* odorata), family Umbelliferae (*q.v.*), a perennial herb with a leafy hollow stem two to three feet high, much-divided leaves, whitish beneath, a large sheathing base and terminal umbels of small white flowers, of which only the outer ones are fertile. The fruit is dark brown, long (three-fourths to one inch), narrow and beaked. The plant is a native of central and southern Europe, and is found in parts of England and Scotland in pastures, usually near houses. It has aromatic and stimulant properties and mas once used as a potherb.

CICERO, MARCUS TULLIUS (106–43 B.C.), Roman statesman, barrister, scholar and writer, who in vain upheld republican principles in the civil struggles which destroyed the republic of Rome. who as an orator ranks in greatness with Demosthenes and Edmund Burke, and whose correspondence illuminates the political, social, literary and economic life of the late republic. He was the son of a Roman knight and came, like Gaius Marius. from Arpinum (Arpino). Admirably educated in Rome and in Greece, he did military service in 89 under Pompeius Strabo (the father of Pompey), and first appeared in the courts defending Quinctius in 81. His brilliant defense in 80 or early 79 of Sextus Roscius (Pro Roscio Amerino) established his reputation at the bar, and he started his public career as quaestor in western Sicily (at Lilybaeum) in 75. His skill as a barrister was confirmed in 70 by his unorthodox prosecution of Gaius Verres (governor of Sicily, 73–71 B.C.) for extortion: restricting himself to a short speech, he relied on the evidence of witnesses to secure a condemnation.

As praetor in 66 he made his first important political speech when, against Q. Catulus and leading *optimates* (the conservative element in the senate). he spoke (Pro lege *Manilia* or De *imperio* Gnaei *Pompei*) in favour of conferring on Pompey the command against Mithradates. His relationship with Pompey, whose hatred of M. Licinius Crassus he shared was to be the focal point of his career in politics. His election as consul for 63 was achieved through a swing of optimate votes in his favour.

Consulship 63.—In the first of his consular speeches he opposed the agrarian bill of Servilius Rullus in the interest of the absent Pompey, but his chief concern, the harder because he mistrusted his colleague Gaius Antonius, was to discover the revolutionary intentions of Catiline (*q.v.*) who, defeated in 64, stood again at the consular elections in 63 (over which Cicero presided. wearing armour beneath his toga). Catiline was unsuccessful, and now planned revolution—armed uprisings in Italy and arson in Rome. Cicero had difficulty in persuading the senate of the danger. The "last decree" (*senatus consultum ultimum*), something like a proclamation of martial law, was passed on Oct. 22; on Nov. 8, after escaping an attempt at assassination, Cicero delivered the first speech against Catiline in the senate, and Catiline left Rome that night. Evidence incriminating the conspirators in Rome was secured on the night of Dec. 2–3 through Gallic envoys (Allobroges) who were arrested leaving Rome, and on Dec. 5, after a senatorial debate when Cato spoke for execution and Caesar against, they were executed on Cicero's responsibility (Antonius being out of Rome). Cicero, announcing their death to the crowd with the single word, vtxerunt ("they are dead"), received a tremendous ovation from all classes, the inspiration of his subsequent appeal in politics to concordia ordinum, "concord between the classes." He was hailed by Catulus as "father of his country." This was the climax of his career.

In his exposure of the conspiracy he acted admirably. as even his critics agreed (*e.g* M. Junius Brutus, who called him optimus *consul,* and Sallust in the Conspiracy of Catiline), but though he never regretted the execution of the conspirators. its legality was doubtful. Its authority was the "last decree." but this administrative enactment. first employed in 121, which contravened the fundamental right of a Roman citizen to trial before execution, had never been approved by the *populares* (such as Caesar), and had

indeed been challenged with Caesar's encouragement in summer 63 nhen Gaius Rabirius, whom Cicero defended, was tried for murder.

Combination of Pompey, Caesar and **Crassus,** and Cicero's **Exile.**—Cicero declined Caesar's invitation to join the political alliance of Caesar, Crassus and Pompey at the end of 60, and also Caesar's offer in 59 of a place on his staff in Gaul. When P. Clodius, whom Cicero had antagonized by speaking and giving evidence against him when he was tried for profaning the mysteries of the Bona Dea early in **61,** became tribune in 58, Cicero nas in danger, and in March, disappointed by Pompey's refusal to help him, Caesar still being in the neighbourhood, he fled from Rome, and on the folloning day Clodius carried a bill forbidding the execution of a Roman citizen without trial. Clodius then carried a second law, of doubtful legality, declaring Cicero an exile. Through his gangsters he destroyed Cicero's house on the Palatine. bought in 62 from Crassus for 3,500,000 sesterces. and his villas at Tusculum and Formiae. The Palatine site was consecrated to be a shrine of Liberty.

Cicero went first to Thessalonica, and then to Illyricum. In **57,** thanks to the activity of, particularly, Pompey. the consul Lentulus Spinther and the tribunes T Annius Milo and Publius Sestius. he was recalled on Aug. 4. Cicero landed at Brundisium (Brindisi) on that day, and traveled, warmly acclaimed, to Rome, where he arrived a month later. His precipitate departure from Rome, which he had previously deplored, he now represented as an act of altruistic heroism

Alignment of Cicero with Pompey, Caesar and **Crassus.**—In winter 57–56 he sought to recover his standing in politics. but his hope of estranging Pompey from Caesar was frustrated when Pompey renewed his compact with Caesar and Crassus at Luca in April 56. Cicero now agreed, under pressure exerted through Pornpey, to align himself with Pompey, Caesar and Crassus in politics, and committed himself in writing to this effect (the "palinode"). The speech *De provinciis consularibus* marked his change of front. Though obliged to accept a number of distasteful briefs (in particular the defense of P. Vatinius, Caesarian tribune of 59, and A Gabinius, the unfriendly consul of 58), he abandoned public life for scholarship. and in the next few years completed the *De oratore* (55) and *De republica* (started in 54, finished in 52), and started the *De legibus* (52). In 52 he nas delighted when Milo killed Clodius. but failed disastrously in his defense of Milo (later written up for publication, the *Pro Milone*).

In 51 he was forced. as a consequence of Pompey's provincial law of 52, to govern the province of Cilicia for a year. with a strong subordinate staff uhich included his brother Quintus and Gaius Pomptinus, both ex-praetors and experienced soldiers The threat of Parthian aggression did not materialize, but some brigands were suppressed on Mount Amanus. The senate granted a *supplicatio* (a period of public thanksgiving), and Cicero hoped for a triumph on his return to Rome. He certainly governed Cilicia uith conspicuous integrity.

Civil War 49–45.—He was back in the neighbourhood of Rome when Caesar invaded Italy in Jan. 49 Cicero met Pompey outside Rome on Jan. **17** and accepted a commission to supervise recruiting in Campania. He did not leave Italy with Pompey on March 17. His indecision testified by his correspondence, was not discreditable though his criticism of Pompey's strategy was inexpert Caesar would have welcomed his co-operation. and in an intervien aith him on March 28 Cicero showed great courage in stating his own terms—his intention of proposing in the senate that Caesar should not pursue the war against Pompey any further—though they were terms which Caesar could not possibly accept He sailed from Gaeta to join Pompey on June 7; in 48 he left Pompey's camp for Dyrrachium because of illness; refused the command of the republican forces after Pompey's defeat at Pharsalus; and returned to Italy in Oct 48, after receiving a guarantee of safety from Caesar He disapproved utterly of Caesar's dictatorship; yet he realized that in the succession of battles (which continued until 45) he would have been one of the first victims of Caesar's enemies had they triumphed. This was his second period of intensive literary production, works of this period including the *Brutus, Paradoxa, Orator* in 46, *De finibus* (45), *Tusculanae disputationes, De natura deorum* and *De officiis,* finished after Caesar's murder, in 44

Death of Caesar; Cicero's Attacks on **Antony.**—Cicero was not involved in the conspiracy to kill Caesar on March 15 44, and was not in the senate when he was killed On March **17** he spoke in the senate in favour of a general amnesty. but after this returned to his philosophical writing, and planned to visit his son, then a student at Athens. He returned to Rome at the end of August, honever. and his 14 Philippic orations, so called in imitation of Demosthenes' speeches against Philip II of Macedonia, the first delivered on Sept 2, 44, the last on April 21, 43, survive to record his vigorous re-entry into politics His policy was to make every possible use of Caesar's adopted son Octavian, whose mature intelligence he badly underestimated, and to drive the senate, against its onn powerful inclination toward compromise, to declare war on Xntony in Cisalpine Gaul. No letters survive to show how Octavian deceived Cicero in the interval betneen the defeat of Antony in Cisalpine Gaul on April 14 and his march on Rome to secure the consulship in August. It was in May that Octavian learned of Cicero's unfortunate remark that "the young man should be given praise, distinctions—and then the *coup de grâce*"—*Laudandum adulescentem, ornandum, tollendum* The triumvirate of Octavian, Antony and Lepidus was formed at the end of October. The proscriptions followed. Cicero, proscribed, was caught and killed near Caieta on Dec. 7. His head and hands were displayed on the *rostra* at Rome

Political Judgment.— In politics Cicero constantly exaggerated the shortcomings of his opponents and the virtues of his friends. As a "new man" he was never accepted by the dominant circle of *optimates,* and he attributed his own political misfortunes after 63 partly to the jealousy. partly to the spineless unconcern of complacent *optimates.* The close political association with Pompey for nhich he longed was never achieved. He was more ready than Cato to compromise from motives of expediency but, though he came to admit in the *De republica* that republican government required the presence of a ponerful individual—a *gubernator* or *moderator,* an idealized Pompey perhaps—to ensure its stability, he showed little appreciation of the intrinsic weaknesses of Roman republican administration (the failure of legislation to check bribery, the absence of machinery for enforcing law and order in Rome. the powerlessness of the government to control the armies). His appeal in 63 and later to the concepts of *concordia ordinum* and *consensus Italiae* and his eloquent but unconvincing demonstration in the *Pro Sestio* in 56 that there uas no fundamental incompatibility between *optimates* and *populares* did not touch the fringe of the real problems.

Cicero's marriage to Terentia, a woman of wealth and breeding, in 80. produced, probably in 79, a daughter Tullia, and in 65, a son Marcus. He divorced Terentia in late 47 or early 46, and married Publilia, a girl of **15,** for her money. Tullia, to whom he was devoted, married three times, and died in Feb. 45. Soon afterward Cicero divorced his second wife. His brother and nephew were killed in the proscriptions of 43; his unattractive son Marcus escaped fought at Philippi, was reconciled to Octavian, and became consul in 30. Though barristers were forbidden by law to receive more than a token fee. Cicero's money was made at the bar (often through legacies of grateful clients). He was extravagant, especially in the number of his villas. and continually in difficulty over money.

Cicero's Letters.— From Cicero's correspondence between **67** and July 43 B C. over 900 letters survive, and of the 835 nritten by Cicero himself. 416 (the first written in 67, the last in Nov. 44) were to his friend, financial adviser and publisher, the knight T Pomponius Atticus, and 419 to one or other of some 94 different friends, acquaintances and relatives. There are 92 letters written to Cicero by 31 different correspondents (who include Caesar, Cato, Pompey. Mark Antony and RI. Brutus) and 20 uhich were exchanged betneen third parties (including dispatches of generals to the Roman government). There are far more letters from the late than from the early part of the period (nearly 400 from the three years 45–43 B C , including 26 of the 31 surviving letters of the correspondence nith Brutus). There are only 30 letters earlier than 60 B C (inclusive), none of them from the year of Cicero's

consulship. Of the 27 letters to his brother Quintus, two were written uhen Quintus governed Asia in 59, two when Cicero was in exile in 58 and 18 when Quintus was on Pompey's staff in Sardinia in 57–56 or on Caesar's staff in Gaul in 54.

The number, large as it is, obviously constitutes only a small portion of the letters which Cicero wrote and received. Many letters which were current in antiquity have not survived, for instance the vainglorious account of the suppression of Catiline's conspiracy, mentioned in the Pro *Sulla* and Pro *Plancio,* which Cicero sent to Pompey at the end of 63; Pompey hardly as much as acknowledged it and Cicero was mocked about it in public later. Many letters were evidently suppressed for political reasons after Cicero's death. That is why nothing survives of the letters written by Atticus, of Cicero's correspondence with Octavian in 44–43 or of his letters to Atticus later than Nov. 44.

There are four collections of the letters: to Atticus (Ad *Atticum*) in 16 books; to his friends (Ad familiares) in 16 books; to Brutus; and, in three books, to his brother (Ad Quintum *fratrem*). His most unguarded and self-revelatory letters were to Atticus and Quintus. In his letters to Atticus he constantly resorted to Greek quotations and tags for the mot juste.

The idea of publishing some of his letters was entertained by Cicero in 45, and in July 44 his freedman Tiro had collected about 70 which were to form the basis of the publication. These doubtless included specimens of elaborate fine writing like the invitation to L. Lucceius in 56 to write a monograph on Cicero's consulship, which Cicero himself thought a particularly good letter. But the publication did not take place in Cicero's lifetime and in the event it included much of a trivial nature, for instance the 81 letters of personal recommendation, mostly to provincial governors on behalf of friends, which constitute Ad familiares xiii.

The letters Ad jamiliares were collected and published by Tiro, grouped generally, but not with complete uniformity, according to the person of the correspondent. The letters to Atticus—"in eleven volumes"—were first mentioned by Cornelius Nepos in his Life *of Atticus* (first edition, 35 or 34 B.C.) as a repository of valuable information on contemporary history, as yet unpublished. The earliest quotation from a letter to Atticus is (c. A.D. 63–65) by Seneca and. since the scholarly Asconius in those of his admirable commentaries on Cicero's speeches which survive (written c. A.D. 54–57) never used the evidence of Cicero's letters to Atticus, they were generally held to have been published under Nero, until in 1947 J. Carcopino suggested that writers earlier than Asconius, even Horace in book ii of his Satires, used information derived from Cicero's letters to Atticus as well as to his friends. He claimed that both publications, carried out in 34–33 B.C., were the work of Xtticus, M. Agrippa (his son-in-law), Tiro and Cicero's son Marcus, a part of Octavian's propaganda campaign against Antony before Actium, with the object of discrediting not merely Antony but republicanism and its protagonists, in particular Cicero himself. No part of this theory has won acceptance, apart from the suggestion that the silence of Asconius is not conclusive. It is possible that the letters to Atticus were published at that date, but not for the motive which Carcopino suggests. Octavian's sanction being given rather as a belated act of repentance for his part in Cicero's murder.

The letters constitute a primary historical source such as exists for no other part of the ancient world. They often enable events to be dated with a precision which would not otherwise be possible, and they have been used, though with no very great success, to discredit the accuracy of Caesar's commentaries on the civil war. Cicero's personal character has been assailed most unfairly on the basis particularly of his extravagant despair in exile and his (understandable) indecision in the early months of 49. On the other hand his reporting of events. naturally enough, is not objective, and he was capable after an interval of misremembering or misrepresenting past events so as to enhance his own credit. (J. P. V. D. B.)

Cicero **as a Poet.**—Cicero is a minor but by no means negligible figure in the history of Latin poetry. His best-known poems (which survive only in fragments) were the epics De *consulatu* suo (On His *Consulship*) and De *temporibus suis* (On His Life and Times). These were criticized in antiquity by Quintilian and others for their self-praise, and one line was assailed, for instance by Juvenal in the *Tenth* Satire, for sound and sense: o *fortunatam natam* me consule Romam, "O happy state of Rome to date your birthday from my consulate." Some lines from his *Marius,* describing an eagle seizing a snake, have power. Cicero's verse is technically important; he refined the hexameter, using words of two or three syllabies at the end, to ensure coincidence of the natural word accent with the ictus or beat of the metre, and applying rhetoric to his treatment of poetry; he is one of those who made possible the achievement of Virgil. Unsympathetic toward contemporary Alexandrian movements, his work nonetheless influenced individual contemporaries, perhaps Catullus and also Lucretius. Fragments of his translations from Aratus, Homer and the Greek dramatists also survive.

Cicero as an **Orator.**—Cicero made his reputation as an orator alike in politics and in the law courts, where he preferred appearing for the defense (though his prosecution of Verres is perhaps his most famous case) and generally spoke last because of his emotive powers. Unfortunately not all his cases were as morally sound as the attack on Verres. In his day Roman orators were divided between "Asians" with a rich, florid, grandiose style. of which Q. Hortensius nas the chief exponent, and the direct simplicity of the "Atticists" such as Caesar and Brutus. Cicero refused to attach himself to any school. He was trained by Molon of Rhodes, whose own tendencies were eclectic, and he believed that an orator should command and blend a variety of styles. He made a close study of the rhythms which were likely to appeal to an audience, especially in the closing cadences of a sentence or phrase (*clausulae*). The Polish scholar T. Zielinski examined 17,902 of these, and showed that Cicero preferred to end his sentences with the rhythms $-\cup-/-\overline{\cup}$ (esse *conversos*) $-\cup-/-\cup\overline{\cup}$ (*voce consentiunt*) $-\cup-/-\cup-\overline{\cup}$ (*publicae molientem*) with their variants $---/-\cup\overline{\cup}$ (*admirandum* dies) and $---/-\cup-\overline{\cup}$ (*conscripti paenitebit*). These were called "genuine" (V or verae). Others possible (L or licitae) were modifications of these, of which the most important was the familiar $-\cup\cup\cup/-\overline{\cup}$ (esse *videatur*) which is prominent in Pro lege *Manilia.* Between them these account for 86% of the *clausulae.* Cicero's rhetoric was a complex art-form, and the ears of the audience were keenly attuned to these effects. He himself tells us in Orator (214) that he heard Carbo win thunderous applause for an effective double-trochee *clausula*—"temeritas filii cōmprŏbāvĭt"—and says that the whole effect would have been spoiled by "comprobavit filii temeritas." Of the speeches, 58 have survived, some in an incomplete form; it is estimated that about 48 have been lost. Some of the speeches were revised for publication; the most notable is Pro *Milone.* Cicero's original speech was unsuccessful, and he rewrote it and sent it to Milo in exile at Massilia (Marseilles) who had the wit and grace to say that if the revised version had been given he would never have sampled the excellent local fish. It is in any event unlikely that procedure in a Roman court permitted the sort of continuous address which the published speeches represent, and we know that Cicero relied to some extent on improvisation. Nonetheless, we need not suppose that the versions we have are radically altered from the originals.

Cicero in *Brutus* (322) implicitly gives his own picture of his own equipment as an orator—a thorough knowledge of literature, a grounding in philosophy, legal expertise, a storehouse of history, the capacity to tie up an opponent and reduce the jury to laughter, the ability to lay down general principles applicable to the particular case, entertaining digressions, the power of rousing the emotions of anger or pity, the faculty of directing his intellect to the point immediately essential. This is not unjust. It is the humanitas of the speeches which turns them from an ephemeral tour de force into a lasting possession. This may be seen supremely in Pro *Archia*—"Studies of this kind" (literature and philosophy) "are the food of the young, the diversion of the old, an adornment to success, a refuge for consolation in adversity, a private delight without being a public disadvantage. our constant companions at night, abroad or in the country." His humour is at its best in his bantering of the Stoics in Pro *Murena* (61 et seq.) in order to discredit Cato, who was among the prosecutors: at its most biting

when he is attacking Clodia in *Pro Caelio*. His capacity for arousing anger may be well seen in the staccato opening sentences of the first speech against Catiline; for arousing pity in the last page of *Pro Milone;* his technique in winning a case against the evidence is exemplified by *Pro Cluentio,* a speech in an inordinately complex murder trial; Cicero later boasted of "throwing dust in the jurymen's eyes."

Ancient critics stressed his forcefulness and fullness. These qualities are well described by the anonymous work. formerly attributed to Longinus, *On the Sublime,* contrasting his diffuseness with the terseness of Demosthenes: "Cicero, like a spreading conflagration, ranges and rolls far and wide; his inner fire is abundant and unextinguishable; he applies it in varying intensity at different points, and keeps it fed with relays of fuel." His fullness revolutionized the writing of Latin; he is the real creator of the "periodic" style in which phrase is balanced against phrase, and subordinate clauses woven into a complex but seldom obscure whole. His style formed the style of Renaissance Europe. The critic Quintilian, an ardent Ciceronian, declared that his name was synonymous with oratory and the historian Livy that a second Cicero would be needed to praise him adequately.

Cicero made a significant contribution to literary theory. His early *De inventione* is slight. but between 55 and 46 B.C. he gave an important survey of oratorical principle and practice, notably in *De oratore, Brutus* and *Orator.* In his broad, spacious, artistic treatment he invokes classical principles. The aim of oratory is threefold — docere, *delectare, movere;* it must be instructive, attractive and emotive. For the first the orator needs a well-stored mind; for the second a sense of balance between the exoticism of the "Asians" and the starkness of the "Atticists"; for the third a sound understanding of psychology. Great oratory comes from a combination of *ingenium, exercitatio* and *studium,* natural capacity, training and a sound liberal education.

Cicero as a Philosopher. — In his younger days Cicero studied under the Epicurean Phaedrus *(c. 140–70* B.C.), the Stoic Diodotus (d. *c.* 60 B.C.) and the Academic Philo of Larissa *(c.* 160–80 B.C.), and thus had a thorough grounding in three of the four main schools of philosophy. Epicureanism he rejected. though his friend Atticus remained an adherent. During his travels in the east in 79–*77* he came to a high admiration for Antiochus of Ascalon (*q.v.*), an Academic with leanings to Stoicism, and the great Stoic Poseidonius (*q.v.*). Cicero called himself an Academic. but this applied chiefly to his theory of knowledge, in which he preferred to be guided by probability rather than to allege certainty; he justified in this way contradictions in his own works. In ethics he was much more inclined to dogmatism, and mas more attracted by the Stoics: but for his authority he looked behind the Stoics to Socrates. Similarly, he approved of the Stoic account of the order and constancy of nature, but corrected their excesses by reference to Plato and Aristotle. In religion he was an agnostic most of his life, but had religious experiences of some profundity during an early visit to Eleusis, and at the death of his daughter in 45; he usually writes as a theist, but the only religious exaltation in his writings is to be found in the *Somnium Scipionis (Scipio's Dream)* at the end of *De republica* with its sublime vision of a future life.

Cicero did not write seriously on philosophy before about *54,* a period of uneasy political truce, when he seems to have begun *De republica,* following it with *De legibus* (begun in *52).* These were an attempt to interpret Roman history in terms of Greek political theory. Cicero rejected democracy, oligarchy and monarchy (the best of the three) in favour of a mixed constitution, such as he imagined Rome to possess. An interesting feature of his theory is the presence of a *moderator* or *rector,* a philosophical autocrat. which was later used to buttress the position of the emperor.

The bulk of his philosophical writings belong to the period between Feb. *45* and Nov. *44.* His output mas astonishing: to those works listed below must be added the lost *De consolatione,* called out by his daughter's death; *Hortensius,* an exhortation to the study of philosophy, which proved an instrument in St. Augustine's conversion; and *De gloria.* Most important are the difficult *Acadeinica (Academic Philosophy)* which defends suspense of judgment: *De finibus* or *The Supreme Good* (Is it pleasure, virtue, or something more complex?); *Tusculanae Disputationes* or *Tabletalks at Tusculum* (Is death an evil? Is pain an evil? Can a wise man suffer distress? Mental perturbation? Is virtue sufficient for blessedness?); *De natura deorum; De oficiis (Moral Obligation).* Cicero, except in the last book of *De officiis,* lays no claim to originality in these works. Writing to Atticus, he says of them "apographa sunt; . . . verba tantum adfero quibus abundo." ("They are transcripts; I simply supply words, and I've plenty of those.") His aim was to provide Rome with a kind of philosophic encyclopaedia. He derived his material from Stoic. Academic, Epicurean and Peripatetic sources. Much work has been done in identifying these. Some are obvious: *De amicitia* comes from Theophrastus (*q.v.*) and the first two books of *De officiis* from Panaetius (*q.v.*). The form he used was the dialogue, but his models mere Heracleides Ponticus (*q.v.*) and Aristotle rather than Plato. His general method may be seen in *De finibus* where first the Epicurean view, and next the Stoic view are expounded and criticized, and the last book gives an account of the views held in common by Academics and Peripatetics. Cicero's importance in the history of philosophy is as a transmitter of Greek thought. In the course of this he gave Rome and therefore Europe its philosophical vocabulary. We owe to Cicero words such as *quality, individual, vacuum, moral, property, induction, element, definition, difference, notion, comprehension, infinity, appetite* and many others; in *Academica 2, 17–22* he gives a fascinating account of the difficulties which confronted him. In this way he has molded our ways of thinking, and in a century during which some have sought to compass philosophy within the bounds of linguistics it is well not to underestimate him. He was once valued, and is still worth reading, for his content. Petrarch said: "You could sometimes fancy that it is not a pagan philosopher but a Christian apostle who is speaking." Today we are more inclined to echo Voltaire's "We honour Cicero, who taught us how to think." The highest tribute came from his great adversary Julius Caesar: "It is better to have extended the frontiers of the mind than to have pushed back the boundaries of empire" (Pliny, *Naturalis Historia,* 7, *31). See* also references under "Cicero. Marcus Tullius" in the Index volume.

Works. — Speeches : *Pro Quinctio* (81), *Pro Roscio Amerino* (80 or early 79), *Pro Roscio Comoedo* (77?), *In Caecilium divinatio, In Verrem actio* i, *actio* ii, 1–5 (70), *Pro Tullio, Pro Fonteio, Pro Caecina* (69). *Pro lege Manilia, Pro Cluentio* (66), *Contra Rullum* i–iii. *Pro Rabirio, In Catilinam* i–iv, *Pro Murena* (63), *Pro Sulla, Pro Archia* (62), *Pro Flacco* (59), *Post reditum ad Quirites* and *Post reditum in senatu, De domo sua (57). De haruspicum responso, Pro Sestio, In Vatinium, Pro Caelio, De provinciis consularibus, Pro Balbo* (56), *In Pisonem* (55), *Pro Plancio, Pro Rabirio Postumo* (54), *Pro Milone* (52), *Pro Marcello, Pro Ligario* (46), *Pro rege Deiotaro* (45), *Philippicae* i–xiv *(44–43).* Critical : *De inventione* (84), *De oratore* i–iii *(55). Oratoriae partitiones* (54?), *De optimo genere oratorum* (52), *De republica* i–vi *(51;* completed 52), *Brutus, Paradoxa Stoicorum, Orator* (46). *Academica* i–ii, *De finibus* i–v, *Tusculanae disputationes* i–v, *De natura deorzim* i–iii. *De divinatioize* i–ii! *De fato, De senectute, De amicitia, De oficiis* i–iii, *Topica* (45–44), *De legibus* (begun in *52* but published posthumously). Letters: *Ad Atticum* i–xvi, *Ad familiares* i–xvi, *Ad Quintum fratrem* i–iii, *Ad Brutum* i–ii.

(Jo. Fe.)

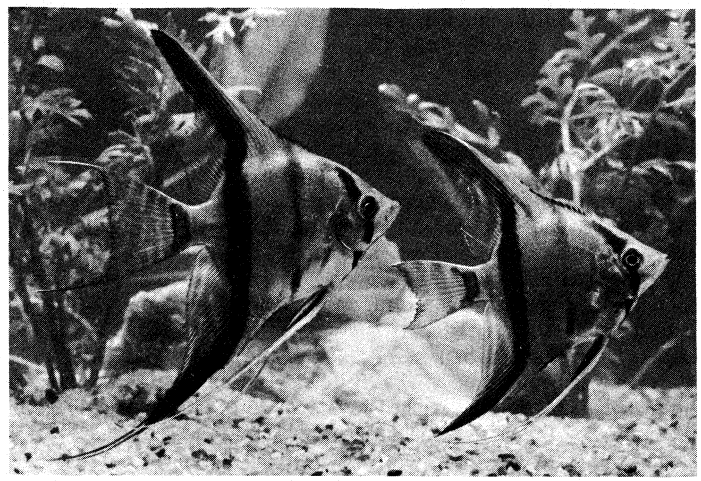
CICERO, a city of Cook county, Ill., U.S., adjoins Chicago on the west. The population was 69,130 in 1960. (For comparative population figures *see* table in ILLINOIS: *Population.)* Although settlers had appeared in the 1830s, there were only ten families when the township was organized (1857). The town was incorporated in 1867, and a city charter was granted in 1869. Growth on this rich, but swampy, land was slow until just after the American Civil War, when land speculators and farmers entered the region. Portus Weare, a Chicago grain merchant, opened the Morton Park division and built a 20-room house. Economic growth continued, but Cicero lost territorially to Chicago and by the formation (1901) of Berwyn and Oak Park. Cicero is an important manufacturing centre drawing on adjacent towns for labour. Manufactures include a variety of steel, brass and copper products. Early settlers came from England, Germany, Ireland and eastern United States (Cicero was named for Cicero, N.Y.), but southern and eastern Europeans later became predominant.

In the 1920s Al ("Scarface") Capone made Cicero the headquarters of his speak-easies and gambling enterprises. (M. Ws.)

CICHLID. The perchlike fishes of the family Cichlidae include specimens used for pond culture and food as well as for the aquarium. They are all relatively small (rarely over 12 in.), deep-bodied species found in lakes, rivers and brackish lagoons of Central and South America, Africa, Syria, Madagascar and India. They are scientifically characterized by having a single nostril on each side (rather than two on each side) and the lower pharyngeal bones coalesced or united by suture. Their geographical distribution was formerly considered to favour the idea of the connection between South America and Africa, but their importance in this regard is discounted by the fact that many species enter brackish water and some the sea, and by the possibility that earlier oceanic populations are now extinct. The presence of cichlids in Madagascar, where none of the true fresh-water African families is represented, indicates that their dispersal has been accomplished through saline waters.

The American species number about 250, the African 400; none of the genera is common to the two continents. The Indian *Etroplus* is an isolated genus, related only to *Paretroplus* of Madagascar, in which island three genera are endemic, the two others being related to African genera, Among the African cichlids an extraordinary diversity and specialization is attained in the great lakes: Lake Tanganyika has about 100 species, nearly all of which belong to genera found nowhere else; Lake Nyasa has nearly as many endemic species, some of which have evolved on parallel lines to those of Tanganyika. The lake-dwelling genera, which differ from each other especially in modifications of the mouth and teeth, make use of every kind of animal and vegetable food available in the lakes.

Many cichlids are beautifully coloured and are favourite aquarium fishes. *Cichlasoma cyanoguttatum* of Mexico, covered with bright blue spots, is one of the really handsome species. The fresh-water angelfish, *Pterophyllum scalare,* and a few related species,



BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY

FRESH-WATER ANGELFISH (PTEROFHYLLUM SCALARE), A CICHLID POPULAR IN AQUARIUMS

of the Amazon have the body very deep and strongly compressed and the dorsal and anal fins high. The South American discus or pompadour fish, *Symphysodon discus,* is another cichlid popular with aquariists *(see* AQUARIUM: *Aquariums in the Home).* One of the African mouthbreeders. *Tilapia mossambica,* which reaches a length of 18 in., is an important food fish, being cultivated in fish ponds in many tropical areas *(see* FISH CULTURE: *Tropical Pond Culture).*

In many old-world cichlids the female fish keeps the eggs in her mouth until they hatch, and for a time swims with her brood, opening her mouth for the little fishes to swim in when danger threatens. In other species the eggs are laid in a hollow scooped out by the male; both parents guard the nest until the eggs hatch, at which time the mother may take the young into her mouth.

(C. Hu.)

CICOGNARA. LEOPOLDO, CONTE (1767–1834), Italian critic and art histdrian, was born at Ferrara on Nov. 17, 1767. A residence of several years at Rome, devoted to the study of the antiquities and galleries, was followed by visits to Naples and Sicily. He then visited Florence, Milan, Bologna and Venice, acquiring an extensive knowledge of their art treasures and buildings. In 1795 he took up his abode at Modena, and was for 12 years engaged in politics, becoming minister plenipotentiary of the Cisalpine republic at Turin. Napoleon decorated him with the iron crown; and in 1808 he was made president of the Academy of Fine Arts at Venice.

In 1808 appeared his treatise *Del bello,* dialogues on the beautiful, a formulation of ideas of the neoclassic school. This was followed (1813–18) by his *Storia della scultura dal suo risorgimento in Ztalia al secolo di Napoleone.* The book was designed to complete the works of J. J. Winckelmann and J. Seroux d'Agincourt, and is illustrated with 180 plates in outline. His *Fabbriche pi3 cospicue di Venezia,* two superb folios containing about 150 plates, was published (1815–20) under the auspices of Francis I of Austria. Charged by the Venetians with the presentation of their gifts to the empress Caroline at Vienna. Cicognara added to the offering an illustrated catalogue of the objects it comprised; this book, *Ontaggio delle Provincie Venete alla maestà di Carolina Augusta,* has since become of great value to the bibliophile. In 1821 he published at Pisa a *catalogue raisonné,* rich in bibliographical lore, of his fine library, the result of 30 years of loving labour, which in 1824 was purchased by Pope Leo XII and added to the Vatican library. Cicognara's work in the academy at Venice led to the foundation of a gallery for the reception of Venetian pictures. He died in Venice on March 5, 1834.

CICONIIDAE, the ornithological name for the stork family of birds, a group of short-necked but long-legged waders. *See* ADJUTANT BIRD; HAMMERKOP; JABIRU; STORK.

CID, THE (Arabic *sid,* "lord"), is the popular sobriquet by which RODRIGO DÍAZ DE VIVAR *(c.* 1043–1099), most famous of

medieval Spanish captains, has been known in Spain since his own day. It is frequently linked with another sobriquet, of Romance origin, *Campeador,* "winner of battles." There is a substantial heroic history of Rodrigo Díaz, in both poetry and prose, originating in the 12th century, but this is of more concern to the student of literature than to the historian (see SPANISH LITERATURE). There are, however, some acceptable historical sources from which his biography may be established. These include some contemporary documents, the *Historia* Roderici (a very nearly contemporary private Latin chronicle of his life) and a detailed narrative of his conquest of Yalencia written by Ibn Alkama, an Arab historian living in the city at the time.

Rodrigo Diaz was born at Vivar, near Burgos, about 1043, his father, Diego Laínez, being a member of the Castilian minor nobility. He was brought up at the court of Ferdinand I by the latter's eldest son. Sancho. Details of his early career are uncertain, but he seems to have distinguished himself in Ferdinand's later campaigns and, when Sancho succeeded to the Castilian throne (1065), the young Cid was appointed to the high military office of standard-bearer. His successful generalship during Sancho's reign established his military reputation.

The Cid had taken a prominent part in the campaign which enabled Sancho to seize the throne of León from his younger brother, Alfonso. His position was. therefore, of some difficulty when Sancho was killed at the siege of Zamora (1072) and Alfonso returned from exile to become king of both León and Castile. Nevertheless, he remained at Xlfonso's court for nearly a decade and, in 1074, even married the king's own niece. Jimena. daughter of the count of Oviedo. In 1079 the Cid was with the army of Alfonso's tributary, al-Mutamid (al-Motamid) of Seville, when al-Mutamid defeated an invasion by Abdullah of Granada. Alfonso's favourite, Count Garcia Ordofiez, happened to be on the Granadine side and was captured by the Cid. This affair renewed Alfonso's dormant suspicions of him, and when it was followed. in 1081, by an unauthorized incursion on a large scale into the Moorish kingdom of Toledo, over which Alfonso had established a protectorate, the Cid was ordered into exile.

He now removed himself to the Moorish kingdom of Saragossa. whose kings he served for a number of years. leading successful campaigns on their behalf against the count of Barcelona (1082) and Sancho Ramírez of Aragon (1084). He also became chief political adviser to his Moorish employers (who regarded him highly) and acquired that familiarity with Islamic politics, law and customs which was to prove invaluable for his later career.

A temporary reconciliation with Alfonso in 1083 had soon broken down, but the king's difficulties in meeting the invasion of Spain by the Almoravids led him to readmit the Cid to his favour in 1087. The Cid's interest were by this time wholly concentrated on eastern Spanish affairs, and he turned his attention to the task of securing Alfonso's suzerainty over the extensive Moorish kingdom of I'alencia. In 1089 he extracted a written assurance from Alfonso that any lands won by him from the Moors would belong to himself and his heirs in perpetuity. When, later in the same year. he was again banished, he proceeded with the subjugation of Valencia more or less as a private venture.

The conquest of Valencia by the Cid was an extremely complicated affair: it began in 1089, when he made its king, al-Kadir, his tributary; entered its second stage in 1092, when al-Kadir was murdered by the cadi Ibn Yehhaf; and ended in June 1094. when the city capitulated to the Cid's troops after a prolonged siege. During these proceedings. the Cid relied on his talent for political intrigue almost as much as on military force. playing off against each other both the rival groups within the city and his own rivals for its control outside it — Alfonso himself. the Almoravids and, the king of Saragossa. Several months after the surrender the Cid broke the terms of the capitulation that he had made with Ibn Yehhaf and executed him in a brutal manner; motives of cupidity and vengeance were responsible. at least in part, for this act. Determined Almoravid attempts to recover the city were defeated by the Cid at the battles of Cuarte (1094) and of Bairén (1097). The semiroyal status that the former knight from Vivar had by now achieved was shown when, soon afterward, his daughters Cristina and Maria married the Navarrese prince Ramiro and Ramon Berenguer III, count of Barcelona, respectively.

The Cid died in Valencia on July 10. 1099. Three years later his wife, Jimena, had to give up the city. as it was impossible to hold it indefinitely against the Almoravids. The Cid's body was removed to the monastery of San Pedro de Cardefia. near Burgos, where the monks gradually made it the centre of an elaborate cult which sought to portray the Cid as a near saint.

The task of evaluating the Cid's career historically is a delicate one because of his status as a national hero. It is clear from all sources that he was a remarkably successful field commander consistently achieving brilliant victories over superior enemy forces by boldness in action balanced. however, by cunning and careful preparation. There is little evidence of any religious motive behind his career, particularly before the coming of the Almoravids The force which drove him seems to have been the pursuit of poner and wealth. In these respects his attitude was entirely typical of that of other Christian Spaniards in pre-Almoravid Spain. The truth behind his quarrels with Alfonso VI is uncertain. but it would be rash to absolve the Cid of all blame by attributing responsibility to that exceptionally able monarch. The deeds of the Cid cannot be said to have made any great material contribution to Spanish history: he did not take part in Alfonso's most critical campaigns: his greatest achievement, the conquest of Valencia. proved ephemeral.

Nevertheless the Cid's life fired the popular imagination as that of no other medieval Spaniard was able to do. This was the result not only of his invincibility in the field but also of the fact that after his career as a courtier had been ruined, he had continued to win fame. riches and rank solely by the exercise of his sword and his intelligence despite the king's disapproval and the active opposition of the great magnates.

CIDER is the name applied in most European countries to the expressed juice of apples that has undergone fermentation. In North America, the freshly expressed juice that has not been subjected to any permanent preservative treatment is generally called sweet cider, while that permitted to undergo some natural fermentation is designated as hard cider. The expressed juice of apples that has been treated by some method to prevent spoilage while in hermetically sealed cans or bottles is marketed as apple juice in most countries, although U.S. consumers often refer to it as cider.

Apple juice or cider is relatively low in content of protein, fat, ascorbic acid and vitamin A and contains a moderate amount of carbohydrates. However, about 75% of the carbohydrates consists of sugars that are readily assimilated by man. Ascorbic acid (vitamin C) content varies with varieties and the extent to which oxidation takes place during processing. It is easily added, however. and much of the juice produced in America contains ascorbic acid comparable in amount to that present in citrus juices. The pomace is considered equal to silage as a feed for cows and sheep.

Cider as an **Alcoholic** Beverage. — Many varieties of apples are grown in several European countries especially for use in the manufacture of an alcoholic beverage of fine quality. France has the largest acreage of such cider apple orchards. particularly in Normandy and Brittany. England has an extensive acreage. in the western and southwestern counties and in other scattered localities. Germany, Switzerland and Spain also produce substantial quantities. Some fermented cider is produced in Canada from varieties gro n chiefly for table use; manufacture in the United States has not attained commercial importance.

Cider making in Europe prior to the 20th century was confined to the farms on which the fruit was grown and most of the indifferent product was consumed locally. The development of better

manufacturing techniques led to a marked improvement in the quality of the cider and the establishment of many cider factories.

Cider manufactured in France must be produced by the fermentation of the juice of fresh apples or a mixture of apples and pears and must conform to specific standards for the different kinds, designated by different names. English cider has been extremely variable because of a lack of legal standards other than those requiring apple juice to be the basis of the beverage and regulations pertaining to metallic contamination.

However. because of the nature of the raw material. there is much variability even in the beverage produced under the most restrictive regulations. Sugar content of freshly expressed juice commonly ranges from 6% to 20%, acid content from 0.1% to 1.25%, and tannin content from 0.05% to 0.75%. Fermentation is related to varying nitrogen content of the juice. According to the nature of the juice. therefore, the finished product may be sneet or dry, strongly or lightly alcoholic. highly acid or low in acidity; astringency and degree of bitterness may also vary. Distinctive local characteristics result from environmental conditions such as soil and climate. Individual makers, however, aim at definite standards by blending the local varieties to suit the tastes of their consumers.

In making cider. the apples may be ground by being fed from a hopper to a revolving drum or cylinder in which are fixed toothed knives that project about $\frac{1}{16}$ in. above the surface of the drum. The fruit is thus grated to a fine pulp or pomace. Another method is to pass the apples through a hammer mill. In either case the pomace is fed onto the bed of a press nhere it is built up into "cheeses," consisting of a series of layers. each wrapped in strong, open-meshed cloths. These cheeses or layers of pulp are separated from their neighbours by slatted wooden racks to facilitate drainage of the juice. Power-driven hydraulic presses are used to express the juice.

The extracted juice is conveyed directly into fermenting vats or casks. If the fermented cider is to be sweet, the juice must be filtered at an early stage to make possible the retention of the desired percentage of unfermented sugar. If a dry cider is desired, fermentation must proceed until all or most of the sugar is converted to alcohol. Natural fermentation resulting from the wild yeasts present on the apples is the usual practice but some makers pasteurize the fresh juice and then add pure cultures of selected yeasts. Filtration, which is usually done within three months after grinding, may be accomplished by forcing the turbid juice under pressure through a thick layer of paper pulp or other fibrous material. Some makers centrifuge the juice prior to filtration Flavour is improved by aging for a few months, or even two or three years, after filtration. Some cider is carbonated at the time it is bottled; some is conditioned by the champagne process, in which fermentation takes place under pressure, in tightly closed glass containers.

Sweet Cider or **Apple** Juice.— Prior to 1930 sweet cider was made on many farms in the United States from surplus or offgrade apples and sold in bulk or in large bottles or jugs during the autumn months. No treatment to prevent fermentation was provided other than occasional addition of sodium benzoate. Limited quantities are still made in this way but the development of various manufacturing techniques made possible the commercial production of a pasteurized juice, packed in hermetically sealed containers for all-year consumption, which now supplies most of the market demand in North America. This product is generally designated as apple juice although a few packers label it as cider. It is made from apples that do not meet specifications for fresh fruit marketing because of superficial blemishes, poor colour, or small size. Few of the market varieties make a satisfactory juice when used singly. Most packers blend two to four varieties for each batch of juice. In the manufacture of sweet cider the apples are washed thoroughly, passed over grading belts where fruits showing decay or insect infestation are removed, and ground with a grater or a hammer mill; the pulp is then built up into cheeses and the juice expressed as described for making alcoholic cider. The yield of juice is 7 to 8.5 U.S. gallons or 6 to 7 imperial gallons per 100 lb. of fruit.

Europeans-prefer a juice that is mellowed by holding it for a few months in large tanks under pressure supplied by introducing carbon dioxide into the tanks. Americans generally prefer. the flavour of freshly pressed juice.

The usual processing procedure for making a clear juice is to clarify and filter the juice: flash pasteurize it, fill the juice into enamel-lined cans, close the cans and cool immediately. If an unclarified or cloudy juice is to be packed, the apples are often sprayed with ascorbic acid when they are ground to prevent darkening of the juice by oxidation and to reduce the amount of sedimentation in the finished product. A juice intermediate between the clear and unclarified product may be made by passing previously screened juice through a centrifuge. This process is continuous and eliminates the need for tanks.

It is very difficult to filter freshly pressed juice unless one of the following clarifying treatments precedes filtration: (1) add gelatin and tannin to produce a flocculent precipitate; (2) clarify with an enzyme preparation; (3) flash heat to 180° F. and cool immediately; or (4) flash heat and cool and add bentonite. Filters that use a filtering medium such as diatomaceous earth are generally preferred. Cold sterilization accomplished by forcing the juice through special pads to remove yeasts and bacteria has not proved practical in North America but has been used successfully in some European areas.

Flash pasteurization is accomplished by pumping a thin layer or film of juice between plates or through tubes that are heated by steam or hot water. The juice is heated to 170° to 190° F. in a few seconds and this hot juice is filled directly into cans or bottles. The containers are closed immediately, inverted to bring the hot juice in contact with the cover or closure, and are then cooled under water sprays or in running water.

CIENFUEGOS, a city in Las Villas province and one of the chief ports of Cuba, about 140 mi. E.S.E. of Havana on the south coast of the island. Pop. (1953) 57,991 (1961 mun. est.) 107,526. It is located on a broad, level peninsula opposite the narrow entrance of a fine, sheltered bay of Jagua (Bahia de Cienfuegos) and is built on a rectangular pattern with wide streets, numerous parks and promenades and attractive buildings.

The city serves as the trading centre for the fertile lands of southern Las Villas province and has become one of the most prosperous and modern cities of Cuba. Its port handles the exportation of raw sugar and molasses from about 1; sugar mills. In addition to large quantities of sugar cane, the hinterland produces significant amounts of coffee, tobacco, henequen, rice and fruit. Livestock are also raised. The main industries in the city are coffee-processing and tobacco-manufacturing plants, distilleries and fish canneries. Nearby at Central Soledad is a botanical garden established by Harvard university for research in tropical agriculture. Cienfuegos is well served by railways, highways and airways. It served as an international airlines centre until Camagüey became important.

Bahia de Cienfuegos was visited by Columbus in 1494 but attracted no permanent settlement until 1738; the fortress Castillo de Jagua was erected 1740–45 at the entrance of the bay as a protection against pirates. The city was actually founded in 1819 as Fernandina de Jagua by Luis d'Clouet, a French colonel from Louisiana. The first nucleus of population consisted of 46 colonists from Bordeaux, France, as part of a colonization scheme; by 1824 there were 1,238 inhabitants. Though destroyed by a storm in 1825 it was rebuilt and renamed Cienfuegos in honour of José Cienfuegos, who participated in its founding. (D. **R.** D.)

CIESZYN (Ger. TESCHEN; Czech. TESIN), a Polish town in the Katowice ***wojewodztwa*** (district), lies on the Polish-Czechoslovak frontier. Pop. (1960) 23,000. The town is picturesquely

situated in the Cieszyn foothills on the Olza river (a tributary of the Oder), at the edge of the Moravian Gate which divide the Carpathians from the Sudetenland. The eastern (and older) part of the town, on the right bank of the Olza, belongs to Poland; the newer part, on the left bank, to Czechoslovakia. Cieszyn was one of the oldest Silesian castles defending the approach to the Moravian Gate. In 1282 it was the capital of an independent principality, whose ruler acknowledged vassalship in 1291 to the king of Bohemia. Like Bohemia. it came under the rule of the Habsburgs. (See TESCHEN for the history of the duchy and region.) In 1939 Cieszyn was occupied by German forces. Metal and electrotechnical industries have been developed in Cieszyn. There are also plants for the manufacture of watches, chemicals, wood products, paper and food products. The local people have preserved one of Poland's finest regional costumes and their own dialect.

(K. M. WI.)

CIEZA DE LEÓN, PEDRO DE (c. 1518–1560), Spanish soldier and chronicler of Peru, was probably born in Seville, or possibly in Llerena (Extremadura). H e sailed for the Indies as a young man and was in Cartagena in 1534. He went with Alonso de Heredia to Darién in 1535 and in 1538 accompanied Juan Vadillo on his perilous journey up the Cauca valley in Colombia. When Vadillo was deserted by his men Cieza de León joined Jorge de Robledo's expedition and defended him when he was tried in Panamá. Afterward he served with Sebastián de Belalcizar in Colombia and was rewarded with an estate. He was ordered to go to Peru in 1545 but instead joined Jorge de Robledo's forces again, being obliged to hide when Robledo was captured and beheaded. In 1547 he arrived in Peru to help Pedro de la Gasca assert royal authority over Gonzalo Pizarro and his rebellious followers. He returned to Spain in 1550, after traveling in the mining region of Peru and visiting Cuzco to obtain details of the Incas.

From 1541 onward, Cieza de León kept a careful diary and, because of this, Pedro de la Gasca made him his official chronicler and gave him access to state papers. The result was his monumental and accurately observed *Crónica del Peru.* Part i, geographical and anthropological, was published in Seville in 1553. Part ii. giving a firsthand account of the Inca civilization, remained in manuscript in the Escorial library until 1880. Part iii, dealing with the conquest of Peru. has been lost. Part iv, on the civil wars of the conquerors, is incomplete. Three of the projected five books, on the wars of Las Salinas, Chupas and Quito, mere published in 1877. These works are among the principal sources of information about the prehistory of the Andean area and the early history of Peru. The English translations by Sir Clements R. Markham (1864, 1883. 1913. 1918. 1923) should be used cautiously. (J. C. J. M.)

CIGAR. Columbus and the conquistadors who followed him in Cuba. Mexico, Central America and Brazil found the Indians smoking a primitive form of cigar—a long, thick bundle of twisted tobacco leaves. wrapped in a dried palm or maize leaf. The Spanish word cigarro, from which cigar is derived, probably was an adaptation of ***sik'ar,*** the Mayan term for smoking. By 1600 the cigar had been introduced into Spain, where it was a symbol of conspicuous wealth for two centuries before it was widely used in other European countries.

United States.— In New England. as in Latin America, the cigar was among the forms of tobacco used by the Indians and adopted by the newcomers. Within a fen years after the settlement of Connecticut in 1633 the colonists had obtained the seed of the Cuban tobacco plant. The fragrance of the Havana leaf could not be reproduced in alien soil, but the transplanted product made a blander smoke than the indigenous one. In the mid-18th century many storekeepers took barrels of homemade cigars in trade. These they usually sent to coastal towns to be peddled to sailors, or sold at low prices to inns. which set up cigar barrels from which patrons were invited to help themselves.

In 1762 Israel Putnam, later a Revolutionary general, served nith the British forces in the occupation of Havana, and returned to Connecticut with a large supply of Havana cigars. Putnam's adventures had already made him a celebrity. and his example enhanced the prestige of the cigar. Before the Revolution enough of a market for cigars had developed to warrant the establishment of factories in Connecticut, New York and Pennsylvania. One of the Pennsylvania factories was in Conestoga, famed also for the Conestoga wagon. Its product: a long, thin cigar, became known as the "stogie." Later this term was applied at random to low-priced cigars.

In the early years of the 19th century the term "twofer" was coined for cigars selling at two for a cent, and cigars containing some Havana tobacco sold for a cent apiece. Even at these prices, cigar smoking ranked as an expensive taste in the pre-Civil War era, which was largely one of a barter economy. However, the popularity of the cigar grew steadily. A Currier and Ives print of 1876 depicts a cigar-smoking Uncle Sam.

The cigar faced formidable competition from the cigarette after 1880, when the Bonsack cigarette-manufacturing machine began cutting the cost of the light smoke. Cigar-making machines were slower in development; the first of these was in operation in Newark, N.J., in 1919.

"Twofer" came to signify two for 25 cents, for a cigar made of domestic wrapper and binder, with a blend of domestic and Havana filler. This priced medium-grade cigars out of the market for many smokers, and led to a classic remark by Thomas R. Marshall, vice-president in the Woodrow Wilson administration. After hearing a senator discourse at length on the needs of the country, Marshall offered his own diagnosis: "What this country needs is a really good five-cent cigar." The cigar industry was unable to produce a five-cent cigar that was widely acceptable to consumers until the early 1950s, when the "homogenized tobacco leaf" was developed. This product, used for binders, consists of leaf that has been pulverized and formed into thin sheets—a process that eliminates the previous wastage of about 30% of the binder leaf and effects a saving that can be passed on in the form of lower price or a better grade of leaf. By the 1960s, the production of five-cent cigars constituted about 40% of total unit cigar volume.

Composition.— A cigar consists of three parts: filler, binder and wrapper. The filler is the inner core which forms the body and shape of the cigar. The binder is the leaf in which the filler is wrapped to form what is known as the cigar bunch. The wrapper is the outer covering of the cigar consisting of a ribbon of leaf rolled spirally around the cigar bunch. Wrapper leaf must be strong, elastic and silky in texture and of even colour, in addition to possessing good flavour and burning properties. It is the most expensive leaf of all.

Sources of Supply of Cigar Leaf.—The most celebrated tobacco-growing area in the world is the Vuelta Abajo region in the province of Pinar del Rio in western Cuba, where most of the wrapper leaf for Havana cigars is produced. Cuba produces wrapper. binder and filler leaf; other well-known cigar-leaf-growing districts in the island are Partidos, southwest of Havana, which produces a wrapper called Candela used extensively in the American market, and Remedios, also known as Vuelta Arriba, in the centre of the island. Cuban wrapper leaf is used on Jamaican cigars. In addition to Cuba, the principal sources of supply of cigar leaf are, for wrappers, Sumatra. North Borneo. Connecticut and Florida in the United States, and Italy; for binders. Sumatra, Java, and Wisconsin: U.S.; for filler, Sumatra, Java, Brazil: Jamaica; the Philippines, and Pennsylvania, U.S.

Manufacture.— The correct maturing and blending of the leaves are of prime importance and can be achieved only if sorting and grading at the tobacco farms are accurate and consistent. The manufacturer has to decide how long each grade of leaf will take to finish maturing in bond or factory and to ensure that each cigar contains the right amount of each grade in it.

First the leaves must be "stemmed" (*i.e.,* the midrib must be removed) and this cannot be done until they have been softened by moisture. Then the tobacco—wrapper, binder and filler—must be brought to the hand-maker or to the making-machine in the right blend and in the right condition and fed into the cigars in the right proportions. The classic method of hand-rolling is by knife and board with no other aids. The filler for handmaking is "long"; *i.e.,* it consists of whole sections of leaves laid longitudinally to form the "bunch." The filler for machine-making can be "long" or "short" according to the type of machine employed. "Short"

filler consists of particles of leaf not laid in any particular direction. With "short"-filler machines it is possible to achieve an evenly blended and even-drawing cigar. In many factories semi-mechanical aids to handmaking are used; *e.g.*, molds in which to hold up the bunch before wrapping and "aprons" with which to roll the binder around the bunch. At a rough approximation a good hand-maker will make about 100–150 large cigars or more smaller ones in a day. The average machine will make about 12–15 cigars a minute.

The wrapper is applied spirally and. since each leaf has two halves, left and right, the spiral will run left-handed or right-handed. If the wrong hand of leaf is used, the veins will run across the cigar instead of lengthways or the wrong side of the wrapper will show.

Colour Classification. — The main colour classifications of cigars are: claro (CCC). light; colorado-claro (CC), medium; colorado (C), dark; colorado-maduro (CM), very dark; and maduro (M), exceptionally dark. The last two are seldom seen in the United States or the United Kingdom. Although the colour of the wrapper is no indication of the strength of a cigar, considerable care is exercised in the matching of colour. Good-quality cigars may be sorted into as many as 20 different shades to ensure that all cigars in a box have a uniform appearance.

Size and Shape Descriptions. — These appear after the brand name; *e.g.*, La Corona corona denotes a corona shape and size cigar of the La Corona brand. (Corona, as a size and shape description, is in universal use and is not restricted to the La Corona brand.) The following are some of the descriptions used: Corona, a straight-shape cigar with rounded top (the end placed in the mouth) about $5\frac{1}{2}$ in. long; petit corona or corona chica, about 5 in long; très petit corona, about $4\frac{1}{4}$ in. long; half a corona, about $3\frac{3}{4}$ in. long; Lonsdale, same shape as a corona, about $6\frac{1}{2}$ in. long; ideales. a slender torpedo-shaped cigar, tapered at the lighting end, about $6\frac{1}{2}$ in. long; bouquet. a small torpedo-shaped cigar; Londres. a straight cigar, about $4\frac{3}{4}$ in. long. A panatela is a longish, thin cigar open at both ends, usually about 5 in, in length with a straight shape but sometimes possessing a "shoulder" (*i.e.*, slightly drawn in) at the mouth end. Originally it had a finished top that had to be cut off before smoking. A cheroot is a thin cigar open at both ends, usually thicker and stubbier than a panatela. and sometimes slightly tapered. A whiff in Britain is a small cigar open at both ends, about 33 in. in length.

Conditions of Storage. — Cigars should be kept in a fairly dry and warm (not hot) atmosphere, care being taken to maintain constant conditions. The temperature should be from 64" to 67° F., with a relative humidity of about 53%–57%.

Great Britain and Europe. — The cigar was slow in spreading from Spain to other European countries. American sailors helped make it known in Hamburg and Rome, where it was being manufactured on a small scale in the late 1780s. Veterans of the 1814 campaign against Napoleon's forces in Spain brought the cigar to Britain, but it was an expensive luxury. The introduction in 1823 of an import duty on manufactured tobacco products three times as high as that on unmanufactured tobacco made them even more expensive. By 1827 cigar smoking was sufficiently prevalent in London to attract the attention of the cartoonist. Several British cigar manufacturers exhibited at the Great Exhibition of 1851 and in the second half of the 19th century other British firms took up manufacture. F. W. Fairholt, writing in 1859, reported that the taste for cigars, which 30 years earlier were quite an aristocratic luxury, had greatly increased and that prices ranged from the "Penny Pickwick," named after Charles Dickens' celebrated hero, to a shilling or more for a really fine cigar. But any further expansion in the popularity of cigars in Britain was cut short by the advent of the Virginia cigarette in the last quarter of the 19th century. From the outset, the British public liked the mild Virginian flavour, and the invention of the high-speed cigarette-making machine enabled cigarettes to be produced far more cheaply than the cheapest cigar. The very high rate of tobacco duty also contributed to the low level of cigar consumption in the U.K., since the effect of the duty is more apparent on a single cigar than on a cigarette or a pipe of tobacco.

Imported Havana and Jamaican cigars have a high reputation among connoisseurs, but many discriminating cigar smokers appreciate the fine quality of the best British cigars. made in the U.K. of Havana leaf, which are much lower in price Owing to wartime restrictions and dollar stringency, imports of Havana cigars into Britain were suspended during World War II and were only resumed in 1952 on a limited scale. During this period the market in the U K. for high-class Jamaican cigars was developed and, by the time imports of Havana cigars were resumed, the Jamaican cigar had established a place for itself, although at a level of sales lower than immediately after the war. Jamaican cigars are generally considered in the U.K. to be slightly milder in flavour than Havanas and, since less duty is paid on them, they are less expensive Most of the cigars smoked in Britain, however, are manufactured in the U.K. In the early 1960s about one-fifth of the cigars sold in the U.K. uere imported, compared with one-third in 1938.

During World War II sales of cigars in the U.K fell to under 1,000.000 lb. a year and it was not until 1958 that they again reached the 1938 figure. A notable development in the postwar years was the rise in popularity of small-size cigars of the miniature and whiff type, which accounted for about 80% of the total U K. cigar consumption in the early 1960s. The small cigar was chiefly responsible for making cigar smoking a year-round pleasure, instead of being confined mainly to the Christmas season and special occasions.

In Europe the domestic cigar is a good deal cheaper than in Great Britain because of the lower import duties on leaf tobacco. The Dutch, who are big manufacturers of cigars — using mostly Indonesian and Brazilian leaf — began exporting cigars and whiffs on a significant scale to the U.K. in the early 1950s. These cigars and whiffs, which are sold at prices near to those of comparable British brands, are very mild and obtained some popularity Germany also is a cigar-smoking nation and has a big domestic production, using mostly East Indian and some domestic-grown leaf; German manufacture barely meets home consumption. Another big cigar-smoking country is Denmark. The basis of most European cigar brands is East Indian, Brazilian and some Havana leaf. See TOBACCO; CIGARETTE

See Fernando Ortiz, *Cuban Counterpoint (1947)*; Robert K. Heimann, *Tobacco and Americans (1960).* **(A. H. MA.; X.)**

CIGARETTE. The term cigarette, denoting a paper-wrapped roll of finely cut tobacco, is an adaptation of the Spanish *cigarro*. Its original meaning was "little cigar," but cigarette tobacco is usually of a different type, milder than that of the cigar (q v.).

The Aztecs had a primitive cigarette, in the form of tobacco stuffedinto a hollow reed or cane tube. Other natives of Mexico, Central America and parts of South America crushed tobacco leaves and rolled the shreds in corn husk or other vegetable nrappers. However. it was the cigar rather than the prototype of the cigarette that the conquistadors borroned from the Indians and brought to Spain as a luxury of the wealthy class. Paper-wrapped cigarettes were improvised early in the 16th century by the beggars of Seville, who picked up discarded cigar butts, shredded them and rolled them in scraps of paper. These poor man's smokes were known as *papeletes* or *cigarillos* It was not until late in the 18th century that they acquired respectability. Spreading then to Italy and Portugal, they were carried by Portuguese traders to the Levant and Russia. The French and British troops fighting each other on Spanish soil in the Napoleonic campaign of 1814 became familiar with the light smokes. as well as nith cigars. It was in France that they acquired the name of cigarettes

A cigarette factory powered by steam was set up in Havana in 1853. In 1854 a commentator on the social scene in New York, R. T Trall, complained that some of the fashionable ladies were "aping the silly ways of some pseudo-accomplished foreigners, in smoking tobacco through a weaker and more feminine article, which has been most delicately denominated cigarette." However, the widespread use of the cigarette in the English-speaking world dates from the end of the Crimean War. nhich introduced the British soldiery to Turkish cigarettes. A cigarette factory was established in London in 1856, using Latakia tobacco. Curiously,

although British taste switched later to straight Virginia cigarettes. the American public developed a preference for a blend including some Turkish tobacco.

United States.—Early manufacture in the U S. was entirely by hand, either in factories or by the smoker (the "roll-your-own" method). The paper was often any type available, but later it nas imported from France, where linen was reworked for this purpose. Equipment in early factories was extremely simple. Essentially the process consisted of hand-rolling on a table followed by pasting and hand-packaging. In 1883 girls working in these factories earned a maximum of $9 for rolling 15,000 to 18.000 cigarettes per week. The tobacco was reduced to granules or flakes by hand-crushing or beating.

A shredding or cutting machine was patented in 1860 by W. H. Pease, but was not widely used for many years A crude cigarette-manufacturing machine was exhibited at the Philadelphia Centennial exposition in 1876. In 1880 James A. Bonsack patented a cigarette machine with several basic features. The prepared tobacco was fed onto a continuous strip of paper that entered a forming tube. In the tube the paper formed a cyclinder. passing a pasting brush before being closed. A rotary cutting knife was activated by differential gears to permit intermittent action, and cut the cigarette into the proper length. In 1884 a printing attachment was added. Each of these crude machines did the work of about 50 hand-rollers, making nearly 100,000 cigarettes per day, and reduced the cost of manufacture from 80 to 30 cents per 1.000. Production increased from 500,000,000 cigarettes in 1880 to 1,000,-000,000 in 1885 and 4,000,000,000 in 1895.

Consumer preference for tobacco products thereafter shifted enormously. Plug or chewing tobacco and snuff were dominant in 1850, while pipe srnoking reached its peak in the next half century. Cigars continued in unchallenged favour until 1920, when their consumption was equaled by cigarettes. Cigarette consumption reached half of total tobacco consumption by 1938 and three-fourths by 1950. In 1960, 80% of the money spent on tobacco in the U.S. was used to purchase cigarettes.

The composition of the American cigarette changed several times. Turkish cigarettes, composed wholly of tobacco imported from the orient, were favoured first, but their popularity was soon shared by Virginia types, using tobacco from the Carolinas and Virginia. With the outbreak of World War I the supply of oriental tobacco to the United States was virtually cut off, and the supply of flue-cured tobacco became inadequate. The American blend, which then appeared, contained Burley and Maryland tobaccos in addition to flue-cured and Turkish, and continued thereafter with no marked changes.

Mechanization entered the cigarette industry to a marked degree in the first half of the 20th century. Tobacco from the farm may have the midribs removed by a stemming machine; this constitutes so-called green stemming. After drying, packing in hogsheads and aging up to three years, the tobacco is moistened and stemmed if this was not previously done. With certain classes of tobacco a thresher can be used for the same purpose. Blowers are used to remove dust and foreign matter.

A series of treatments alternately using moist and dry heat is used for domestic tobacco. Blending of all types in the proper proportions is done in revolving drums. This is followed by a storage known as bulking to ensure equal distribution of moisture. Cutting is done by machines equipped with self-sharpening rotary blades that shred the tobacco into strips only a few hundredths of an inch wide. After several days' storage, the blended mixture is made into cigarettes.

In general, four classes of tobacco are used in American blend cigarettes. Flue-cured or bright, the largest component, is grown in Virginia, North Carolina, South Carolina, Georgia and Florida. A high sugar and low nicotine content is desirable in bright tobacco. Burley. an air-cured class, second in importance, is grown in Kentucky. Tennessee, Ohio, Indiana, Missouri, Virginia, West Virginia, North Carolina and limited areas in other states. In the cigarette, Burley counteracts the acid smoke of bright to produce a neutral reaction. Maryland, also an air-cured type, has limited use to improve burning properties and aid aroma.

Turkish tobacco, imported into the U.S. mainly from Turkey and Greece, but also from Syria, Yugoslavia and Italy, is classed as aromatic tobacco but is also desirable because of its low nicotine content and mild taste. A modest quantity of aromatic tobacco is grown in the mountainous parts of North Carolina.

Standard machines produce 1,200 cigarettes a minute. Packaging machines, working tuice as fast, wrap 20 cigarettes at a time in paper-backed foil, paper label and cellophane. Refinements in cigarette-making machinery resulted in notable increases in speed of operation. Uniformity was improved, for example, by microfeed controls, in which twin beams of nucleonic particles compare the density of the cigarette rod with a standard The current thus generated and amplified finally regulates the feed mechanism automatically. Filter-tip attachments insert a double-length filter plug between two cigarettes, detach the tipping material and cut the assembly in two.

While packages of 20 cigarettes wrapped in paper, foil and cellophane are the most common unit, sliding boxes of 20s, "flat 50s" and tins of 50 are available. Cartons of 10 packages are packed in cases of 50 cartons for shipment. All of the packing is done by automatic machines.

Dependence of the U.S. industry on France for cigarette paper was no longer necessary after the early 1930s. Linen paper of the highest purity, made from flax straw, supplied the demand for cigarette papers. (O. E. S.)

Production of cigarettes in the U.S. increased about 600% between 1915 and 1930; a rise of about 110% occurred during and after World War II. A decline in domestic sales occurred in 1953 and 1954, following publication of research reports, accepted by some medical authorities and disputed by others, that linked cigarette smoking with lung cancer. The upward trend in sales was resumed in 1955, and by the early 1960s total production reached almost 500,000,000,000 units. Filter-tip cigarettes, which accounted for only 1.4% of production in 1952, had risen to above 50% of production in the early 1960s.

Great Britain.—Popular taste in the United Kingdom favours the Virginia cigarette. Sweetening ingredients are not permitted in cigarettes sold in the United Kingdom. Joseph Baker, cigar merchant and tobacconist, of Cheapside, London, writing in 1845, referred to the cigarette (which he described as "a pinch of Maryland placed within a square 'slip of paper") as rarely being used in the United Kingdom, save by foreign visitors, though the Spanish paper necessary for the purpose might be had at most tobacconists. The first cigarettes that came on the market were of the Turkish or oriental type. Virginia cigarettes were introduced around 1870 and soon ousted the oriental type in popular favour. The latter still retained a certain social cachet up to World War I but by the beginning of the 20th century the Virginia cigarette was already well in the ascendancy. Virginia tobacco grown in the U.S. is the principal tobacco used in cigarette manufacture in the United Kingdom, but large quantities of similar-type tobacco imported from the Federation of Rhodesia and Xyasaland, Canada and India are also used. The description "Virginia tobacco" is commonly used in many countries as applying to flue-cured tobacco leaf wherever grown.

Originally all cigarettes, including those produced in factories, were hand made. It is generally accepted that Robert Peacock Gloag became the first to manufacture cigarettes in England for sale when he opened a factory at Walworth, London, in 1856. The early cigarettes he produced, made by hand, were extremely crude and, in order to prevent the tobacco from escaping, the ends were turned in. The tobacco used was Latakia dust, the paper yellow tissue and there was a cane mouthpiece, in the Russian style. The cigarettes were put up in bundles of ten, to be retailed at 6d. In the 1860s–1870s Polish and Russian cigarette makers were employed by London tobacconists. The first Virginia cigarettes were hand made but by that time hand-making was of high standard.

The advent of the cigarette-making machine played a major part in the popularization of the cigarette and the development of the cigarette trade. In 1883 W. D. and H. O. Wills, who had been manufacturing cigarettes since 1871, bought the English

patent in the Bonsack machine, the first really efficient cigarette-making machine to be invented, and put it into production. As a result they were able to make considerable reductions in their cigarette prices. The cheapness of cigarettes, combined with their convenience, made a wide appeal to the public, and sales mounted.

In the British manufacturing process the leaf first must be moistened to make it pliable for stemming (*i.e.*, removing the stalk or midrib). The next process is to cut the leaf into fine shreds. The cut tobacco is then conditioned, usually in large rotary drums, where it is first subjected to heat to remove excess moisture and then cooled. Handmade cigarettes are relatively rare, but for smokers who wish to make their own, various "roll-your-own" devices are on the market. In factory production. cigarette-making machines can produce from 1,000 to 1,500 or more cigarettes per minute, according to the size and type of cigarette. The cigarette paper is put up in bobbins of definite width and is fed into a narrow trough at the side of the machine. The name of the brand is imprinted on the paper at regular intervals so that it will appear on each finished cigarette. The shredded tobacco or "rag" falls upon or is drawn by suction onto the paper, which moves into a funnel-shape tube, passing a device that gums the edges, the paper then being automatically folded over the tobacco, thus forming a continuous length that is then cut into cigarettes by a revolving knife.

In the United Kingdom the type of package widely used is known as a hull and slide carton, usually containing 10 or 20 cigarettes. The cigarettes are automatically packed by machinery by which they are counted, wrapped in foil and tissue and placed in a cardboard slide. The slide is then inserted into a hull of cardboard. The machines are also capable of placing an insert in the package if necessary. The hinged lid, or "flip top," carton has also become popular. The packages of many brands of cigarettes in the U.K. are wrapped in moisture-proof transparent film in order to protect them from the varied conditions of humidity prevalent in the British Isles.

At the beginning of the 20th century four-fifths of the tobacco consumed in the U.K. was used in pipe tobaccos and only about one-eighth in cigarettes. By 1914 cigarettes were fast catching up with pipe tobaccos and by the end of World War I they had overtaken them. Afterward cigarettes rapidly went ahead and by the 1960s accounted for well over four-fifths of the total U.K. tobacco consumption.

In the early 1960s approximately 240,000,000 lb. of tobacco were used annually in cigarettes for home consumption, compared with 155,000,000 lb. in 1938 and 13,000,000 lb. in 1901. The increase in smoking by women contributed to the rise in cigarette consumption. The prejudice against smoking by women was first broken in World War I but it was not until the late 1920s and the 1930s that smoking by women started to become at all general in the United Kingdom. Even by 1939 consumption of cigarettes by women accounted for only about an eighth of the total consumption of cigarettes in the U.K. By the 1960s the proportion had risen to nearly one-third, and over two-fifths of the female population aged 15 and over were smokers.

There are two main popular classes of cigarettes, the medium size and the smaller size.

In the 1950s there was a considerable rise in popularity of tipped cigarettes; *i.e.*, cigarettes tipped with some material other than tobacco. These are not a modern innovation: there were tipped cigarettes on the market in the 19th century but up to World War II their sales were extremely small. In 1949 the leading United Kingdom manufacturers introduced new tipped brands with the object of producing more cigarettes from the then limited supplies of leaf tobacco and also of offsetting to some extent the effect of the enormous increase in the tobacco duty by providing cheaper cigarettes for smokers of limited means. Since in the United Kingdom the duty is assessed on the weight of the leaf tobacco used, it is possible to sell tipped brands at lower prices than untipped brands of corresponding size, as less tobacco is used in the tipped cigarettes. The British smoker is conservative and it was some time before tipped cigarettes became at all popular, but undoubtedly the main factor in their increased popularity was their lower price. This is borne out by the fact that the most popular tipped brands are in the medium size and smaller size classes of cigarettes. King-size or long-size tipped brands, which mostly sell at the same retail price as the medium-size untipped cigarettes, had only a limited success in the U.K. and at the end of 1959 they accounted for just over 1½% of total cigarette sales in the country. The pattern of the cigarette trade in the United Kingdom in the early 1960s was therefore very different from that in the United States and some other countries, where tipped cigarettes accounted for half or more of the cigarette trade and king-size cigarettes had achieved considerable success.

The effect of the duty on prices of cigarettes in the United Kingdom is shown by the fact that in 1960 the duty paid to the government on a packet of untipped cigarettes accounted for nearly three-quarters of the retail price. (A. H. MA.; X.)

Europe.—Development of the cigarette industry in France, Belgium and other western European countries is quite comparable to that in the United States and Great Britain. The mechanization of the industry is aided by the use of different machines developed in several countries, notably Sweden and Switzerland. Average cigarette consumption in European countries usually ranges from one-third to two-thirds the U.S. usage. See also TOBACCO.

(O. E. S.)

CIGNANI, CARLO, CONTE (1628–1719), Italian painter who carried on the Bolognese baroque tradition in his use of ample, generalized forms, fluently turning poses, deep colours and blended contrasts of light and shadow, was born at Bologna on May 15, 1628, and trained there chiefly under Francesco Albani. In sentiment his work was characteristic of a tradition that derived its elements in the first place from Correggio, but Cignani was influenced also by Correggio directly, and his masterpiece, the "Assumption of the Virgin" in the cupola of Forli cathedral, was closely based on Correggio's cupola in Parma cathedral. He executed numerous altarpieces, mythological scenes and several fresco decorations (*e.g.*, in the ducal palace, Parma). He died at Forli on Sept. 6. 1719.

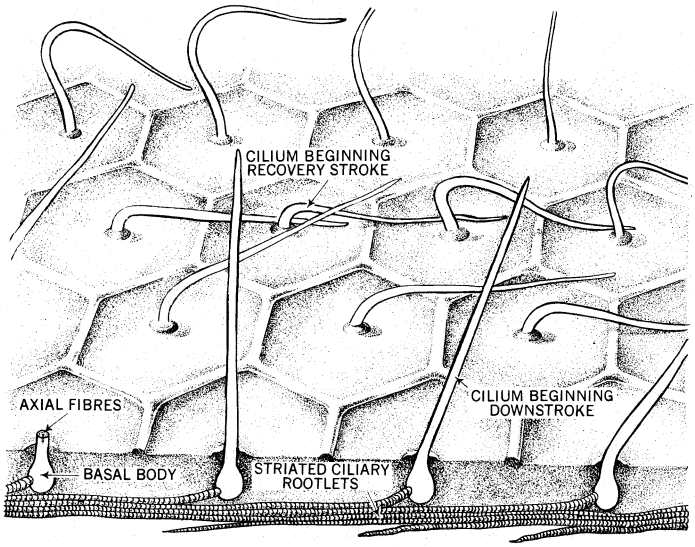
His son FELICE CIGNANI (1660–1724) and nephew PAOLO CIGNANI (1709–64) were also painters. (M. W. L. K.)

CIGOLI, LODOVICO CARDI DA (1559–1613), Italian painter, architect and poet whose work reflected the many cross-currents in Italian art between the decline of Michelangelesque mannerism and the beginnings of the baroque, was born at Cigoli, Tuscany, on Sept. 21, 1559. He worked both in Florence and in Rome and trained under Alessandro Allori and Santi di Tito. There are few consistent characteristics in his earlier work beyond some north Italian strength of colour and lighting. He was an innovator in sentiment rather than in style and, like Federigo Barocci, foreshadowed baroque emotions. From 1595 onward he began to reflect the new realistic tendencies. These qualities are well illustrated in his "Ecce Homo" (*c.* 1607; Pitti palace. Florence). His architecture (*e.g.*, the court of the Palazzo Nonfinito, Florence, 1604) shows Palladian elements. He died in Rome. June 8, 1613. (M. W. L. K.)

CILEA, FRANCESCO (1866–1950), Italian composer whose operas are distinguished by their melodic charm. He was born at Palmi, Calabria, on July 26, 1866, and while studying at the Naples conservatory produced an opera, Gina, which secured him a commission from Edoardo Sonzogno, the publisher. In 1897 appeared his first important work, *L'Arlesiana,* based on Alphonse Daudet's drama. *Adriana Lecouvreur* followed in 1902. Cilea held several teaching appointments, among them the directorship of the Naples conservatory (1916–35). Besides his operas he composed some chamber music. He died at Varazze, near Genoa, on Nov. 20, 1950.

See E. Moschino, *Sulle opere* di *Francesco Cilea (1932).* (DY. H.)

CILIA are microscopic filamentous projections of the living protoplasm of cells. They are capable of thrashing or undulating and propelling the cell to which they are attached through the surrounding watery medium, or of causing water currents to sweep by the cell. They are generally shorter, thinner and more numerous than related organelles called flagella (see FLAGELLUM). Cilia and flagella, however, have the same basic structure (see below).



CILIARY APPARATUS OF THE PROTOZOAN PARAMECIUM IN VARIOUS PHASES OF PENDULAR MOTION

Cilia are found on the surface of certain protozoa (ciliates), on the sperm of some plants and on the cells of certain surfaces (ciliated epithelia) in multicellular animals.

Functions.— With the curious exception of two large groups of invertebrate animals, the roundworms (nematodes) and the crustacean arthropods, all animals depend on the movement of cilia or flagella for the performance of certain vital functions. The motility of these organelles provides the power for the locomotion of many unicellular algae and protozoa and for many multicellular animals such as rotifers, sea gooseberries and many aquatic larvae. The spermatozoa of most animals are propelled by flagellar movement and may thereby reach and fertilize an egg. Sedentary animals often depend on ciliated surfaces for the creation of water currents to bring in food and to provide for respiration; such is the function of the ciliated gills of clams and of sea squirts.

In some animals ciliated surfaces are very important in the movement of internal fluids and small particles. For example, cilia circulate the cerebrospinal fluid within the ventricles of the brain and spinal cord, and surfaces such as the lining of the air passages (lungs, windpipes, nasal cavities) are efficiently cleansed by the action of cilia sweeping away small particles of dust, bacteria, etc., that become lodged in the thin layer of surface moisture.

Food is carried through the digestive tracts of snails and clams entirely by the motion of cilia. Ciliary action is also responsible for transporting eggs in mammals from the ovary through the oviducts.

In addition to providing various types of motion, cilia may have a sensory function. The retinal rods of the eyes of mammals are ciliary derivatives, and some cilia are responsive to touch (thigmotactic); when stimulated, they will cease beating.

Structure and Mechanism.— Cilia are distinguished from other filamentous projections by their motility and by the presence of axial fibres within the shaft. Studies of cilia and flagella with the electron microscope have shown that all these filaments contain two central longitudinal fibres surrounded by a cylinder of nine peripheral longitudinal fibres. The bundle of fibres is enclosed by a thin membranous sheath which is continuous at the base of a cilium with the outermost membrane of the cell. The central fibres usually end at the level of the cell surface, but the nine peripheral fibres continue into the cell to form a basal body variously known as a basal granule, kinetosome or blepharoplast. Often additional fibres arise from the basal body and extend into the cell. These fibres, which are often striated, are called ciliary rootlets.

Cilia appear capable of movement only when connected to their respective basal granules. None of the other cellular organelles are directly necessary for motility since isolation of fragments of cytoplasm containing cilia attached to basal granules does not interrupt the ciliary movement. The ciliary rootlets are presumed to function in the co-ordination of the phase of beating between cilia or groups of cilia. By techniques of microdissection, it has been possible to sever the ciliary rootlets which interconnect certain groups of cilia in the protozoan *Euplotes;* the groups of cilia continued to beat, but not in the normal co-ordinated fashion.

The movement of a particular cilium may be of four types: (1) pendular movement, in which the shaft bends only at the base during the effective stroke, but bends from base to tip on the recovery stroke, all movement being in one plane; (2) circular movement, in which the shaft remains straight and the tip describes a circle; (3) undulatory movement, in which consecutive waves of bending pass in a plane outward from the base; and (4) gyratory movement, in which the whole filament is thrown into a gyre or rotating spiral. Intergrades and combinations of these simplified movements occur. In general, cilia proper show the first two movements and flagella the last two.

The mechanism of ciliary movement is unknown. Two points, however, are clear: the power for the movement of the cilium or flagellum is generated throughout the length of the filament (that is, they are not passively moved by some pull arising from within the cell body), and the bending must be caused by an active shortening of some element on one side of the filament. Ciliary movement can be envisaged as a contraction, initiated at one side of the base (producing bending toward that side) and subsequent progression of the contraction to the other side of the cilium and toward the tip (producing straightening and undulation). Ciliary contraction has been likened to the contraction of muscle fibres; indeed, there are some physiological and biochemical similarities between both of these contractile structures, such as the presence of the enzyme adenosine triphosphatase, important in the release of biological energy.

See also references under "Cilia" in the Index volume.

(F. M. C.)

CILIATA, one of the classes of the phylum Protozoa (*q.v.*) characterized by the permanent possession of cilia (*q.v.*) or organelles derived from these (membranelles, etc.), which serve as locomotory and food-catching devices. They are among the most highly differentiated protozoans; free agents, sessile types and parasites occur in this class.

CILICIA, a district of Asia Minor comprising approximately the Seyhan and Itchel *iller* of Turkey. It is bounded to the north and west by the Taurus range, to the east by the Anti-Taurus, and to the south by the Mediterranean. It is geographically divided into two contrasting regions, defined by the Romans as *campestris* and *aspera* ("the plain" and "the rugged"). The northern frontier of Cilicia Campestris is formidable, with one major pass, the Cilician Gates (Gulek Bogazi) through which runs the main road from Anatolia toward Syria and Iraq. In the southeast corner of the plain, it passes through the less impressive Amanian Gates, guarded by the foothills of Mt. Amanus and the slopes of Misis Dag. Westward lies the rich Aleian plain, formed of alluvium brought down from the Taurus by the Cydnus (Tarsus Irmagi) and the Sarus (Seyhan); to the northeast is a slightly higher plain, watered by the Pyramus (Ceyhan), with occasional limestone outcrops, many of them still crowned by medieval fortresses.

West of the Aleian plain, the natural entrance to Cilicia Aspera is at Lamos (Lamas), where the rocky spurs of the Taurus reach down to the Mediterranean. Communications are difficult except near the coast and up the valley of the Calycadnus (Goksu Nehri). Further, apart from the small fertile plain at its mouth and a few pockets of earth amid the rocks, there is barely any agricultural land. In Roman times, aqueducts carried water to the coast and to some interior settlements. Pines were grown for shipbuilding, and olives planted on terraces by the seashore, but the ancient harbours of Elaeusa and Corycus, from which timber and oil were exported, are now silted up. Game is still plentiful and the sea and rivers abound with fish. *Cilicies,* the goat-hair cloth used in antiquity for tent-making is still woven.

History.— Under the Hittite empire, Eastern Cilicia (Kizzuwatna) was at first independent, but was later reduced to vassal-

age. At the turn of the first and second millenniums, myth suggests and archaeology confirms the arrival of Mycenaean settlers near the mouth of the Pyramus; these were reinforced along the coast during the Greek colonization period, and Celenderis in Cilicia Aspera was actually a member of the Delian league. Under the Persians, the district enjoyed semiautonomous status under native kings called by the common title of Syennisis, and in 333 B.C. Alexander marched through the Gates unopposed. After his death, the Seleucids occupied Cilicia, and founded, among other cities, Seleucia (Silifke) on the Calycadnus, later renowned for its culture and learning. In 102 B.C., the Romans made Cilicia a province though Cilicia Aspera remained infested by pirates until Pompey defeated them at Coracesium (67 B.C.). Within a century and a half, by the absorption of the client territories of Castabala and Elaeusa and the foundation of Augusta, Neronias and Flaviopolis, Rome completed the urbanization of Cilicia Campestris, while old cities like Tarsus on the Cydnus, Adana on the Sarus, and Mallos, Mopsuestia, Anazarbus and Hieropolis Castabala on the Pyramus flourished the more.

Evangelized by St. Paul himself, Cilicia is rich in early Christian monuments, especially in Cilicia Aspera, where, of the many monasteries founded, the 5th-century example at Alahan northeast of Mut (Claudiopolis), is outstanding. Cilicia produced many saints and one famous heretic, Theodore of Mopsuestia (*q.v.*). From the 7th century until 964, when Nicephorus Phocas reconquered it for Byzantium, Muslim Arabs occupied Cilicia Campestris.

In 1080 the Armenians who fled southwestward before the Seljuks established in the Taurus a principality, later destined under Leo II (1187–1219) surnamed the Great, to become a kingdom comprising Cilicia Campestris and the coastlands of Aspera (see ARMENIA). It fell in 1375 to the Egyptian Mamelukes. In 1515 Ottoman Turks occupied the plain, having mastered Cilicia Aspera during the preceding century.

In 1833 the Egyptian Mohammed Ali Pasha occupied Cilicia as far west as the Gates, but was forced to evacuate it seven years later. After World War I, part of Cilicia was awarded to France by the treaty of Sèvres, but in the face of stubborn Turkish resistance, during which some of the medieval fortresses were reoccupied by Nationalist troops, France in 1921 abandoned its claims.

In modern times, with the building of new roads and the consequent expansion of the cotton and citrus industries, Cilicia is one of the most prosperous territories of the Turkish republic.

CILLI, ULRICH, COUNT OF (c. 1406–1456), German magnate, the position of whose family domains (on the southeastern frontier of the Holy Roman empire) served to make him a power in imperial and Hungarian affairs. The son of Frederick II of Cilli (Celje, now in Slovenia), he was married in 1432 to Catherine, daughter of the great despot of Serbia, George Brankovich. When the emperor Sigismund made him and his father princes of the empire (1436), the Habsburgs felt their status in Styria to be prejudiced and began a dispute with the Cillis that went on, intermittently, till 1443, when the Cillis acknowledged Habsburg suzerainty. Even so, meanwhile, the Habsburg German king Albert II made Ulrich regent of Bohemia in 1438, and Ulrich helped to secure the coronation of Albert's posthumous son Ladislas as László V of Hungary in 1440. Intervention in Hungary proper, together with attempts to assert themselves in Bosnia (from 1443) and in Croatia, led to conflict between the Cillis and the Hungarian statesman János Hunyadi (*q.v.*). Successful in 1446, Hunyadi had to come to terms with them after he fell into Brankovich's hands (1448). Having forced the emperor Frederick III to surrender László V to his guardianship in 1452, Ulrich became the virtual ruler of Hungary in 1453, when Hunyadi resigned the governorship He was made king's lieutenant by Laszlo V in 1456, but on Nov. 8 he was murdered in Belgrade by János' son László Hunyadi. The male line of the Cillis died with him (his father had died in 1454).

CIMA, GIOVANNI BATTISTA (CIMA DA CONEGLIANO) (c. 1459–1517?), Italian painter of the Venetian school whose style was marked by a freshness of observation of nature, and airy, luminous colour and design, was probably a pupil of Bartolomeo Montagna, and was later influenced by Giovanni Bellini. He was born at Conegliano on the southern slopes of the Alps. His earliest dated picture is the altarpiece of 1489 in the Museo Civico of Vicenza. He was then 30 years old and his style was fully developed and altered very little during the course of his long life. In 1492 he settled in Venice and in that year was commissioned to paint an altarpiece for the cathedral of Conegliano which is still in its original place.

Most of his important works are in Venice; there are also pictures by him at Bologna, Modena and Parma and in many of the great galleries in Europe.

See B Berenson, *Venetian Painters of the Renaissance* (1903).

CIMABUE, GIOVANNI (CENNI DI PEPO) (1240?–after 1302?), Italian painter and mosaicist who provided a link between the Byzantine pictorial style and the early Italian Renaissance, was born probably at Florence. To a great extent he worked in the Byzantine tradition of design and coloration, but invested his solemn, monumental forms with a new mass and volume, and planned his large decorative schemes (such as the frescoes in the upper basilica of San Francesco at Assisi) with a quality of stylistic unity and aptness to their architectural setting which was unprecedented in Italian painting. Although very few facts are known about Cimabue's life, his fame among his contemporaries is attested to by the famous lines from Dante's ***Divine*** Comedy (*Purg.* xi, 94–96):

> Credette Cimabue nella pintura
> Tener lo campo; ed ora ha Giotto il grido,
> Si che la fama di colui' oscura.

("Cimabue thought to hold the field in painting, and now Giotto has the cry, so that the fame of him is obscured.") Cimabue's principal precursor in Tuscan painting was Coppo di Marcovaldo, and his most noteworthy immediate successor was Giotto.

Although there is no documentary evidence that a single picture attributed to Cimabue was painted by him, it is generally agreed that, despite their poor state of preservation, the frescoes at Assisi (*c.* 1277–81) most attest to his genius. Some of these scenes from the New Testament possess an unsurpassed power of tragic expressiveness and are designed with a sense of unity and consistency in spatial composition which was unequaled in his time. Many of the frescoes were probably executed by Cimabue's assistants, possibly under his personal direction: In the lower church of the same basilica Cimabue. succeeding Giunta da Pisa. is said to have adorned the south transept painting above the altar of the Conception. a colossal "Virgin and Child Between Four Angels." as well as a large figure of "St. Francis." In 1301 he was appointed capomaestro of the mosaics of the cathedral of Pisa. where he executed a majesty in the apse—"Christ in Glory Between the Virgin and John the Evangelist," a mosaic, now much damaged. The style of this work differs somewhat from that at Assisi, some of the linear dynamics being sacrificed for the equilibrium of volumes and the monumental dignity of the human form. Among other extant works possibly the most important is the "Madonna and Child" with eight angels. and some prophets in niches (Uffizi, Florence). A year before his death, Cimabue joined with Arnolfo di Cambio as architect for the cathedral at Florence.

According to a story related by Lorenzo Ghiberti, writing in mid-15th century. Cimabue was the master of Giotto whom he found as a shepherd boy of ten, in the pastures of Vespignano, drawing with a coal on a slate the figure of a lamb. Cimabue took him to Florence, and instructed him; and aiter Cimabue's death Giotto occupied a house which had belonged to his master in the Via del Cocomero. Another painter with whom Cimabue is said to have been intimate was Gaddo Gaddi.

CIMAROSA, DOMENICO (1749–1801), one of the principal Italian composers of comic operas. He was born of a poor family on Dec. 17, 1749, at Aversa in the kingdom of Naples. His parents were anxious to give him a good education and after moving to Naples they sent him to a free school there. Beginning in 1761 he studied for 11 years at the conservatory of Sta. Maria di Loreto, where his masters included Antonio Sacchini and probably Niccolò Piccini.

He began his career by writing the comic opera *Le Stravaganze del Conte*, performed at the Teatro de' Fiorentini at Naples in 1772. The success of his first opera was followed by *L'Italiana in Londra* (Rome, 1779), a work that is still performed in Italy. From 1784 to 1787 Cimarosa lived in various Italian cities, composing both serious and comic operas that were produced in Rome, Naples, Florence, Vicenza, Milan and Turin. In 1787, at the invitation of Catherine II, he went to St. Petersburg as court musician, replacing Giovanni Paisiello. He produced two operas in St. Petersburg in 1788 and 1789, and in 1791 proceeded to Vienna at the invitation of Leopold II. There at the Burgtheater on Feb. 7. 1792, he produced his masterpiece, *Il Matrimonio Segreto* ("The Secret Marriage"), one of the highest achievements in comic opera and the work upon which his reputation was based early in the second half of the 20th century. In 1793 he returned to Italy, where *Il Matrimonio Segreto* and many others of his works were enthusiastically received. New works of this period included *Le Astuzie Femminili* (Naples, 1794) and his tragic masterpiece, *Gli Orazi ed i Curiazi* (Venice. 1796).

His chief residence was now in Naples, and during the occupation of the city by the French Republican troops in 1799. Cimarosa openly showed his republican sympathies. so that on the return of the Bourbons he was imprisoned. After being released. he left Naples broken in health and died in Venice on Jan. 11. 1801, of inflammation of the intestines. The nature of his fatal illness led to the rumour of his having been poisoned by his enemies; a formal inquest proved the charge to be unfounded.

Cimarosa was a prolific composer whose music abounds in fresh and never-failing melody. His numerous operas are remarkable for their apt characterizations and abundant comic life. His main fault is his repetitiveness. Among his instrumental works, which, like his operas, have been successfully revived, are many sparkling harpsichord sonatas and a concerto for two flutes.

(CS. CH.)

CIMARRON RIVER rises in northeastern New Mexico, U.S., in Colfax and Union counties near Capulin Mountain National monument, and flows for 600 mi. emptying into the Arkansas river at Keystone, Okla. From its source the Cimarron flows east through the northern Oklahoma panhandle, bends northward through the southeast corner of Colorado and the southwest corner of Kansas over land with low rainfall. The river bed in this area is dry except during spring and early summer or during occasional floods. South of Coldwater, Kan., where annual precipitation exceeds 20 in., the Cimarron re-enters Oklahoma as a permanent stream. From there to the Arkansas, about 250 mi., it flows over humid land with annual rainfall of 30 to 40 in.

The Cimarron has played an important part in the history of the western United States. The direct route of the Santa Fe trail coursed along the river valley for 100 mi. in southwestern Kansas and travelers-knew the Oklahoma panhandle as the "Cimarron cutoff." No cities of any size are located on the Cimarron but Guthrie, Kingfisher, Fairview, Cushing and Yale, in Oklahoma, and Folsom, N.M., are located near the river. Land drained by the Cimarron is used to raise beef cattle and hard winter wheat.

(M. J. L.)

CIMBALOM, the Magyar name for an elaborate form of dulcimer (*q.v.*). Used in small instrumental ensembles in Hungary for the performance of light music, it has a chromatic compass of four octaves and, unlike the earlier dulcimer. a foot mechanism for damping the strings. The strings are set in vibration by two small, spoon-shaped hammers. The number of strings to each note varies from three to five, some of which are "bridged" into two or three parts. The hammer heads are covered on each side with hard and soft leather to produce two distinct tone qualities. Hungarian players of the cimbalom perform mainly by ear and add to the effect of a small orchestra with florid extemporization. The cimbalom was used in a large orchestra by Kodály in *Hdry Jdnos* and in smaller combinations by Stravinsky in his *Ragtime* and *Renard.*

CIMBRI, one of the ancient German tribes which created a threat to the Romans in the late 2nd century B.C. They came from Jutland, called the Cimbric peninsula by Roman writers, where the modern Himmerland (Aalborg) bears their name. Over-

population and a great encroachment by the sea caused them to emigrate southward, up the Albis (Elbe) river and across the Danuvius (Danube), where they were repulsed by the Scordisci near the modern Belgrade. Turning west, in 113 they defeated a Roman army at Noreia in Noricum (near Klagenfurt) and then passed along the northern Alpine foothills into Gaul, numbering, with their allies the Teutoni and other tribes, a host of perhaps 500,000. In 109 and 107 two consuls, M. Junius Silanus and L. Cassius Longinus, were defeated in the Rhodanus (Rhône) valley and near Tolosa (Toulouse); and in 105 the Roman armies under the proconsul Q. Servilius Caepio and the consul Gnaeus Mallius hfaximus lost 80,000 men at Arausio (Orange) (see ARAUSIO, BATTLE OF). The terror at Rome was now intense and Gaius Marius (*q.v.*) was put in command; but the invaders gave the new general time to reorganize while they passed into Spain, where they failed to overcome the Celtiberians. In 103 they marched back into northern Gaul, but in 102 their forces were divided for an attack on Italy. The Teutoni were destroyed by Marius at Aquae Sextiae (Aix-en-Provence); the Cimbri moved eastward to cross the Brenner pass and drove back Q. Lutatius Catulus from the neighbourhood of Tridentum (Trento). In 101 Marius and Catulus combined forces, and the entire army of the Cimbri was annihilated at Campi Raudii near Vercellae (Vercelli).

Remnants of the Cimbri survived in Jutland, whence they sent envoys to Augustus in A.D. 5. Traces of the tribe's wanderings are found in dedications to Mercury of the Cimbri at Miltenberg and Heidelberg.

(G. E. F. C.)

CIMICIFUGA, a genus of perennial herbs of the buttercup family (Ranunculaceae; *q.v.*), comprising 12 species widely distributed in the north temperate zone; the bugbanes. The root of C. foetida was used as a preventive against vermin and that of the North American black snakeroot or black cohosh (C. *racemosa*) as an emetic.

The genus is distinguished from Actaea, baneberry, by the elongate panicles of small, white floaers (instead of short thick clusters) and by the one to eight follicles or dry fruits (instead of one berry) developed from each flower. Some species are used in partially shaded spots in the wild flower garden.

(L. BN.; X.)

CIMMERIANS, an ancient people, first spoken of by Homer, according to whom they lived in a country of fog and darkness on the confines of the inhabited world (Odyssey, xi, 13–19). Herodotus, in his account of Scythia, and other ancient authors, regarded them as the early inhabitants of southern Russia, after whom the Bosporus Cimmerius (Kerch strait) and other places were named (Herodotus, History, iv, 11–13). They were driven by the Scythians through the Caucasus into western Asia. where they became known for their savage plundering. Strabo. however, identified them with the Thracian Treres and credited them with invading Asia Minor via the Balkans and Dardanelles (*Geographica,* xiv, 1. 40). Assyrian sources call them Gimirrai. and their name has also been identified mith the biblical Gomer, son of Japheth (Gen. x. 2–3).

In Assyrian and Greek records the Cimmerians were sometimes confused aith the Scythians, but the following reconstruction of their history is the most reasonable: they assaulted Urartu (Armenia) about 714 B.C. In 705 B.C., being repulsed by Sargon II of Assyria, who fell in the battle, they turned aside into Asia Minor, seizing Sinope (Sinop) on the Black sea; in 696–695 B.C., they defeated Midas and conquered Phrygia; in 679 B C. they were driven by Esarhaddon from the Assyrian border. In 652 B.C., by taking Sardis. the capital of Lydia, they reached the summit of their power. Then their decline began and their final defeat may be dated from 637 or 626 B.C. when they were routed by Alyattes of Lydia. Thereafter they disappeared from the stage of history but probably settled in Cappadocia, as the Armenian name of that country. *Gamir,* suggests.

The origin of the Cimmerians is obscure. Linguistically they are usually regarded as Thracian, or as Iranian, or at least to have had an Iranian ruling class; the names of their most famous rulers in Asia Minor, Teuspa. Tugdamme (known to Herodotus as Lygdamis) and his son Sandakhsatra, were Iranian. Despite several theories to the contrary it is unlikely that Herodotus and other ancient authors invented the story of the Cimmerians retreating from the North Pontic area. It may be assumed, therefore, that they did live there, but attempts to define their original homeland more precisely, to recognize an archaeological equivalent, or even to fix the date of their expulsion from their country by the Scythians, have not so far been completely successful.

The following are the main theories: Most scholars agree that the Cimmerians lived north of the Caucasus and the Sea of Azov. It is plausible to identify them with the "Catacomb" culture which was ousted from that territory by the "Srubna" culture advancing from beyond the Volga, just as were the Cimmerians by the invading Scythians, but this upheaval took place in the second half of the 2nd millennium B.C. and a gap of several centuries separates it from the appearance of historic Cimmerians in Asia. No self-evident intermediate stages link these events, although there are vague hints of such. Many Russian archaeologists connect the early Cimmerians with late Bronze Age remains north of the Sea of Azov and on the Lower Dnieper (*c.* 11–7th century B.C.), calling them the "Cimmerian" culture; but this construction ignores several vital points in the written records. It is even less justifiable to place them in the central Caucasian highlands assigning them to the Early Iron Age "Koban" culture (c. 11–8th century B.C.), or to associate them with Bronze Age and Early Iron Age remains of the Ukraine west of the Dnieper (c. 1200–700 B.C.). Some authors identify them with "Thraco-Cimmerian" remains of the 8–7th century B.C. found in the southwestern Ukraine and in central Europe; these may, perhaps, be looked upon as traces of the western branch of the Cimmerians who, under fresh Scythian pressure. eventually invaded the Hungarian plain and survived there to about 500 B.C. A split of the defeated Cimmerians into an Asian and a western branch can in fact be deduced from the description by Herodotus.

(T. SU.)

CIMON (*c.* 505–450 B.C.), Athenian general and statesman, who played an active part in building up the Athenian empire in the period following the Greco-Persian Wars, and whose conservatism and policy of friendship mith Sparta mere opposed to the policy of Pericles. He was the son of Miltiades, then tyrant of the Thracian Chersonese. and his second wife Hegesipyle. daughter of a Thracian prince, Olorus. For his father's return to Athens and subsequent career, see MILTIADES. The very large fine imposed on Miltiades after the expedition to Paros had to be paid by Cimon after his father's death in 489. He served at Salamis in 480. and under Aristides in 478 on the campaign to Cyprus and Byzantium commanded by the Spartan regent Pausanias, at the end of which the east Greek allies threw off Spartan control and formed the Delian league under the leadership of Athens. He was probably in command when the Athenians soon afterward expelled Pausanias from Byzantium, and certainly in 476 at the arduous siege of Eion at the mouth of the Strymon river in Thrace. In 475 he took Scyros, expelling the pirates, and found and brought home to Athens the supposed bones of Theseus, which greatly increased his popularity.

It is not told who commanded at the siege of Carystus in Euboea, or at the reduction of Naxos which had revolted from the league, probably in 470. But Cimon led the allied fleet in the campaign (probably of 469, though it has been dated later) in which Phaselis in Lycia was brought over to Athens, with many other com-

munities in Lycia and Pamphylia, and the Persians were decisively defeated by land and sea at the mouth of the Eurymedon river with the loss of 200 ships. Part of the spoils was used to build up the south wall of the acropolis at Athens. At the city Dionysia of 468, when the competition of tragedies came on, the judges handed over their task to Cimon and his fellow generals, and they awarded Sophocles his first prize. In 465 he was clearing the last Persians from the Thracian Chersonese when the large island of Thasos revolted from Athens. Cimon defeated the Thasians, and reduced the town after a long siege which ended in 463.

By now his popularity had waned a little, and the radical democrats Ephialtes and Pericles (*qq.v.*) mere agitating for reform. Cimon was put on trial after his return from Thasos, on the charge of taking bribes from Alexander I of Macedonia to refrain from annexing territory on the mainland. but he was easily acquitted.

In 462 Sparta appealed for help against the Messenians, who had revolted at the time of the great earthquake in 464 and were now besieged on Mt. Ithome. Cimon with difficulty obtained his dispatch with 4,000 men to Ithome, but the Spartans soon dismissed the Athenian contingent, alone of their allies, as politically unreliable. The insult caused Athens to break off its alliance with Sparta (the panhellenic alliance against Persia which had been formed at the time of Xerxes' invasion) and join instead with Argos and Thessaly. It is not quite clear where Cimon was when Ephialtes carried his reform of the Areopagus (*q.v.*), but after his return to Athens he attempted without success to repeal it, and in the following spring (161) he was ostracized.

The story that he was recalled after the battle of Tanagra (158 or 457) is almost certainly untrue, and he is not heard of again until 451, when the ten years of his exile would be up. The Athenians had now given up the war in Greece, after the disaster in Egypt in 454. and were ready for peace with Sparta *(see* GREECE: *Ancient History)*. Cimon negotiated a five years' truce. and in 450 led an allied expedition to Cyprus, where he died at the siege of Citium. His forces subsequently won a double victory at Cyprian Salamis and brought back his bones to Athens.

Cimon's foreign policy of friendship with Sparta greatly helped the development of Athens' hegemony after the Greco-Persian Wars, but inevitably ran into difficulties as Athens' power increased. With Aristides, he must rank as the main architect of the Athenian empire, and he mas a great naval commander. His marriage with Isodice, of the Alcmaeonidae (*q.v.*), was probably of political importance, and his famous wealth and generosity also helped his career. The charge that he lacked culture was denied by his friend the poet Ion of Chios, but his culture was that of the generation before Pericles.

UNITED PRESS INTERNATIONAL, INC.

LEFT: CINCHONA TREES, THE BARK OF WHICH IS THE SOLE SOURCE OF QUININE: MATURE TREES (FOREGROUND) AND YOUNG TREES (BACKGROUND) GROWING IN JAVA. RIGHT: STRIPPING BARK FROM A MATURE TREE

CINCHONA, an important genus of shrubs and trees of the madder family (Rubiaceae; *q.v.*), closely related to coffee and ipecac. The 38 species are native to the warm. moist Amazonian slopes of the Andes from Colombia to Bolivia at elevations of 5,000–8.500 ft.. a few above and some below this. They have opposite leaves and pink or whitish, sometimes fragrant. usually cymose, flowers in lilaclike clusters. A few of the species are of world importance because their bark is the only source of the alkaloid quinine (*q.v.*), the specific for malaria. Cinchona also contains other alkaloids which individually or as a mixture called totaquina are of considerable value in medicine.

The medicinal value of cinchona bark was unknown to the Incas, and it is not mentioned in Garcilaso de la Vega's *Royal Commentaries on the Incas* or in Pedro de Cieza de Leon's *Chronicles of Peru,* published in 1553. The oft repeated tale of the first use and introduction of cinchona bark to Europe by the countess of Chinchon in 1638 was completely disproved by A. \$'. Haggis in 1941, as the wife of the viceroy of Peru never had malaria, died at Cartagena on her way to Spain and hence could not have carried cinchona bark to Europe. Who took it there, and when, will probably never be settled. It was known to the Jesuits at Lima about 1630, hence its common appellation of Jesuits' bark and Peruvian bark. The first mention in European medical literature mas by Herman van der Heyden in his *Discours et advis sur les flus de ventre douloureux* (1643).

For the next 200 years cinchona bark was ruthlessly exploited. especially after the isolation of its chief constituent by Joseph Pelletier and J. B. Caventou in 1820 had demonstrated that the quinine content dictated its price. Bark depletion seemed so inevitable that J. K. Hasskarl for the Dutch and Sir Clements Markham for the English were sent to South America between 1859–63 in an attempt to introduce cinchona culture to Java and India. Both expeditions failed because they did not secure varieties of high quinine content. In Dec. 1865 there arrived in Java a pound of seed from Charles Ledger of Puño, Peru, collected on the banks of the upper Marmoré river in Bolivia.

The progeny of these, and subsequent skilful cultivation by the Dutch, resulted in Java becoming the world source of cinchona bark and hence of quinine. Part of the Ledger seed was planted by the British at their government cinchona station in Madras. where it failed. That failure was disastrous, for India has the highest incidence of malaria in the world and the inferior Indian varieties have never yielded enough quinine. Private planters abandoned its culture for more profitable crops; and government plantations were supplemented by importation from Java. Dutch bark production is derived from *Cinchona ledgeriana.* The only other species grown commercially in Java is *C. succirubra,* which yields quinidine, cinchonine and cinchonidine.

See also CINCHONA BARK, ALKALOIDS OF; QUININE.

(N. TR.; X.)

CINCHONA BARK, ALKALOIDS OF. About 30 distinct alkaloids have been isolated from cinchona bark, of which quinine is by far the most important, followed by quinidine, cinchonidine and cinchonine.

Quinine,$C_{20}H_{24}O_2N_2$.—Quinine is still an important substance in the treatment of malaria in spite of the newer synthetic compounds now largely used. It is used in the form of its salts. The sulfate, $(C_{20}H_{24}O_2N_2)_2$, H_2SO_4, $2H_2O$, is sparingly soluble in water. The bisulfate, $C_{20}H_{24}O_2N_2H_2SO_4$, $7H_2O$, is more soluble;

the solution is levorotatory and shows a strong blue fluorescence. For injection the dihydrochloride. $C_{20}H_{24}O_2N_2 \cdot 2HCl$ is usually preferred. The monohydrochloride, $C_{20}H_{24}O_2N_2 \cdot HCl \cdot 2H_2O$, is also used in conjunction with urethane for the treatment of varicose veins.

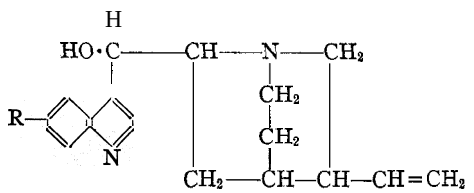
Quinidine, $C_{20}H_{24}O_2N_2$ (also called conquinine).—This alkaloid, which is a dextrorotatory isomeride of quinine, crystallizes from alcohol in colourless prisms and melts when dry at 171.5° C. It forms two series of salts analogous with those of quinine.

Cinchonine $C_{19}H_{22}ON_2$.—This alkaloid crystallizes from alcohol in rhombic prisms and melts at 264° C. It is dextrorotatory in solution and like the other cinchona alkaloids yields two series of salts with acids.

Cinchonidine, $C_{19}H_{22}ON_2$.—This levorotatory isomeride of cinchonine (*see* above) crystallizes from alcohol in large colourless prisms, melting at 207° C., and corresponds with quinine in being levorotatory in solution, but is unlike it in showing no fluorescence in dilute sulfuric acid. It forms two series of salts analogous with those of quinine described above.

General.—The reactions of the four alkaloids can all be accounted for on the basis of the accompanying structural formula which was developed by P. Rabe (1909), and which represents them as containing a quinoline (left) and a quinuclidine (right) nucleus. joined by a secondary alcohol group.

The difference between the two pairs—(1) quinine and quinidine and (2) cinchonine and cinchonidine—is that in the first pair, R on the quinoline nucleus is a methoxyl (CH_3O) group, while in the second pair, R is hydrogen. Within each pair the two alkaloids differ stereochemically only; *i.e.*, in the spatial arrangement of the atoms. Confirmation of the structures that are assigned



Cinchona Alkaloids, Type Formula

to the cinchona alkaloids involved great difficulty. It was attained in 1931 with the synthesis of dihydroquinine and dihydroquinidine by Rabe and with that of quinine itself by R. B. Woodward and W. E. Doering in 1944.

(T. A. H.; L. F. SL.; T. M. SP.)

CINCINNATI, a city and seat of Hamilton county, O., U.S., on the right bank of the Ohio river opposite the mouth of the Licking river. Cincinnati is about 116 mi. S.W. of Columbus, about 281 mi. by rail S.E. of Chicago and about 755 mi. by rail W.S.W. of New York city. Through the city flows Mill creek; to the east the Little Miami and to the west the Great Miami empty into the Ohio. Pop. (1960) city, 502,550; standard metropolitan statistical area (which includes Hamilton county in Ohio and Campbell and Kenton counties in Kentucky), 1,071,624. Other cities in the metropolitan area are Norwood (*q.v.*) in Ohio and Newport and Covington (*qq.v.*) in Kentucky. (For comparative population figures *see* tables in OHIO: *Population* and KENTUCKY: *Population.)*

Cincinnati is on two plateaus—one about 600 ft., the other 100–150 ft. above low water—and on hills (400–460 ft.) which enclose these terraces on three sides. The city has a river frontage of about 27 mi. Bridges connect the city with Covington and Newport, Ky.; the suspension bridge between Cincinnati and Covington (1,057 ft. between towers), designed by John A. Roebling, was built in 1867 and rebuilt and enlarged in 1897.

On the terraces the streets generally intersect at right angles, but on the hills irregularly. The wholesale district is for the most part in the "bottoms." Manufacturing is scattered widely with the largest concentration also in the "bottoms" area of the city. Many of the finer residences are on the enclosing hills.

History.—The site of Cincinnati was a centre of the mound-builder civilization. La Salle is said to have been the first white man to pass this point on his way down the river in 1669. In 1788 John Cleves Symmes (1742–1814), New Jersey congressman, purchased for himself and others 1,000,000 ac. of land between the two Miami rivers from the U.S. government. Columbia, the first settlement, was founded near the mouth of the Little Miami in 1788. Six weeks later a town was laid out opposite the mouth of the Licking river and in Feb. 1789 a third settlement was begun at North Bend. John Filson named the second of these settlements Losantiville, a word which he himself fashioned from elements of Latin, Greek, French and Delaware Indian, and which he intended to mean "the town opposite the mouth of the Licking." Ft. Washington was built there in 1789. In the following year Gen. Arthur St. Clair, newly appointed governor of the Northwest Territory, created Hamilton county, changed the name of Losantiville to Cincinnati in honour of the Society of the Cincinnati, the Revolutionary officers' society, and made it the county seat. Gen. Anthony Wayne's victory at Fallen Timbers in 1794 opened the country to settlement. Cincinnati was incorporated as a town in 1802 and became a city in 1819.

In 1811 the "New Orleans," the first steamboat on western waters. passed Cincinnati and opened a new era in the commercial life of the region. The Miami canal was completed to Dayton in 1832 and the first section of the Little Miami railway was laid in 1843. Steamboat building and manufacturing began to grow. River commerce reached its height in 1852 with 8.000 steamboat arrivals.

In 1842 Cincinnati was one of the few U.S. cities admired by Charles Dickens but by the late 1840s another British visitor, a Mrs. Houston, called it "a city of pigs, a monster piggery." Small wonder that it received the nickname of "Porkopolis"; between 1842 and 1852, 27% of the hogs packed in the United States were packed there. As the grain fields moved west the meat packing industry went with them and Cincinnati lost its primacy to Chicago and St Louis, Mo.

Although Cincinnati had close commercial and cultural ties with the south it became an important station on the Underground Railroad prior to the American Civil War and sided with the North when war came. In 1862 the fear of a threatened invasion by a Confederate force under Gen. Edmund Kirby-Smith caused the city to be put under martial law for a time, but the invasion did not take place.

Population Trends.—The early settlers in Cincinnati came mainly from the middle states, especially from New Jersey and Pennsylvania, and from the southern states of Kentucky and Virginia. By 1815 there were emigrants from all of the 17 other states in the union and from most of the countries of central and western Europe. It was not until the middle of the 19th century that Cincinnati began to have a large foreign-born population. Early immigrants came mainly from the central and northwestern European lands and by 1850 comprised nearly one-half the total population of the city. Germans were the most numerous, followed by Irish, English, Scots and Welsh. Of all the foreign-born groups the Germans were the most rapidly assimilated. They began the development of agriculture and grape culture in the area and also made significant contributions to the cultural life of the community, especially in music. By the 1890s the section of the city north of the canal was known as the Over-the-Rhine region. Since then the German population has spread throughout most of the areas of the city. In the 1880s some thousands of Italians and Russians moved to Cincinnati, the number of Russians reaching its peak in 1910 and the Italians in 1920. By the middle of the 20th century, however, Cincinnati had a small foreign-born population as compared with other industrial centres of the area. The non-white population, mainly Negro, was then approximately 11% of the total population but has increased since that time.

Government.—Since 1924 Cincinnati has had a council-manager form of government. There is a council of nine who for 32 years were elected by proportional representation. In 1957 this method was abandoned. The council elects one of its members as mayor and selects the city manager for an indefinite term. The mayor presides at meetings of the council and appoints the city auditor and members of independent commissions and boards.

The city manager prepares the budget, appoints heads of departments, and enforces legislation enacted by the council.

The rapid growth of Cincinnati led to the adoption of a city master plan in 1925. A revised metropolitan master plan completed in 1948 called for the redevelopment of the downtown water front, a system of motor expressways and off-street parking facilities, the reclamation of blighted areas and the protection of residential neighbourhoods.

Industry. — The Cincinnati metropolitan area has over 1,800 industrial plants producing a great variety of products. Cincinnati is a foremost producer of machine tools. playing cards and soap. It is also a leader in the production of building materials, cans, chemicals, children's vehicles, clothing, coffins and burial cases, cosmetics, electric motors and machinery, electrotypes, foundry and machine shop products, jet engines, malt and distilled liquors, mattresses, meat packing, motor vehicles and parts, office furniture, paper and paper products. pianos and organs, plastics and plastic products, printers inks, printing and publishing, processed seeds, sheet metal products, shoes, sporting goods, steel mill products and valves. Cincinnati is also a major bituminous coal shipping centre of the United States.

Transportation. — The city is served by the Cincinnati Transit company, operating diesel and gas buses and trolley buses. In the early 1960s a major road-building program was completed, providing 30 mi. of expressways in Cincinnati and 50 mi, in Hamilton county. Eight trunk line railroads radiate from the city. The Union terminal, completed in 1933, can accommodate 17,000 people and 216 trains daily. The Cincinnati Southern railway is municipally owned but is leased to and operated by a privately owned railroad. Other forms of transport include certified water freight carriers; numerous contract and private barge lines and several passenger carriers; airlines operate from Lunken Municipal airport and the Greater Cincinnati airport in Boone county, Ky.

Education and Cultural Activities. — The system of public-supported education includes in addition to the usual kinds of schools, one* six-year college preparatory school, a vocational school and several special schools, and is completed by the University of Cincinnati, created under the Ohio municipal university act of 1870. The university was established by uniting Cincinnati college (1819), the Cincinnati Astronomical society (1842) and McMicken university (1859). The college of medicine (1819) and the college of law (1833) of the university are the oldest institutions of their kinds west of the Alleghenies. The co-operative system of technological education based on the idea that college instruction should be combined with practical work in industry was originated at the University of Cincinnati by Dean Herman Schneider.

There are Roman Catholic and Concordia Lutheran parochial schools and three Roman Catholic institutions of higher learning: Xavier university for men, founded in 1831 by Bishop Fenwick, and Our Lady of Cincinnati (1935), and Mt. St. Joseph-on-the-Ohio, Mt. St. Joseph, O. (1920), both for women. There are no Catholic seminaries within Cincinnati, but Mt. St. Mary of the West (1829) is in Norwood. The Institutum Divi Thomae (1915), primarily devoted to scientific research, is no longer under diocesan jurisdiction.

The Hebrew Union college (founded 1875) is the oldest rabbinical college in the United States. On Jan. 25, 1950, it was merged with the Institute of Religion of New York. Its archives are a depository for documents on American Jewish history and its library has an eminent Judaical collection as well as an outstanding collection on Spinoza.

Other institutions of higher learning are the Ohio Mechanics institute, a private technical college founded in 1828; Salmon P. Chase college (1893); the Art academy (1887); and the College-Conservatory of Music (formed in 1955).

Cincinnati has a large public library, established in 1867, and two excellent special libraries: the John Uri Lloyd library, with material in the fields of pharmacy, botany and the natural sciences; and the library of the Historical and Philosophical Society of Ohio, which has excellent collections of books and manuscripts on the history of the old northwest.

By 1825 musical academies and choral societies were numerous in Cincinnati. It was, however, the large influx of Germans in the 1840s and later that promoted music most. A sangerfest was held in 1849 and again in 1870, when a hall was built for it. Under Theodore Thomas (1835–1905) the Cincinnati Musical Festival association was incorporated and its biennial May festivals began in 1873. The Springer Music hall was built in 1875–78 and the Cincinnati College of Music was endowed in 1878. Theodore Thomas was director of the college until 1881 and of the May festivals until his death. The sangerfest met in Cincinnati for the third time in 1870 and its jubilee was held there in 1899. Choral societies have been important in musical life, as have the Cincinnati Conservatory of Music (1867), the Cincinnati Symphony orchestra (1893) and the summer opera performances.

A number of early U.S artists, including the sculptors Frederick Eckstein and Hiram Powers, lived in Cincinnati, where German influence greatly promoted the visual arts. In 1877 the Woman's Art Museum association brought about the building of the Art museum. An art academy was erected in 1887 near the Art museum. Frank Duveneck (*q.v.*) was for some time director of the academy and the Duveneck room in the museum contains a great many of his works. The Taft House museum (1932) was a gift to the city from Charles P. Taft and his wife; it included their home and art collection. The Rockwood pottery (1880) was the first in the United States to devote its attention exclusively to art ware.

Notable monuments in the city are the Tyler Davidson bronze fountain (1871) designed by August von Kreling; James A. Garfield by Charles H. Niehaus; William Henry Harrison by L. T. Rebisso; Abraham Lincoln by George Grey Barnard; the Galbraith memorial; and a monument to Ohio volunteers killed in the American Civil War.

In 1958 the *Cincinnati Post* bought the *Cincinnati Times-Star* to form the *Cincinnati Post-Times-Star;* this and the *Cincinnati Enquirer* becoming the only daily newspapers published in the

BY COURTESY OF CINCINNATI CHAMBER OF COMMERCE

city. The Cincinnati Literary club celebrated its centennial in 1949.

Within close vicinity of the Cincinnati College of Medicine are the General hospital and the Children's, Christian R. Holmes, Jewish, Good Samaritan, Christ, Bethesda and Deaconess hospitals. A Veterans administration hospital was completed in 1951; Drake memorial and Longview state hospital for the mentally ill are also in Cincinnati.

The U.S. government building, Union terminal, Hamilton county courthouse and the city hall are monumental structures. Notable among the hundreds of churches are St. Peter in Chains, erected 1845 by Archbishop John B. Purcell, used as the cathedral church until 1938, restored and rehabilitated by Archbishop Karl Alter, and dedicated Nov. 3, 1953; St. Francis de Sales; the First (1835) and Second Presbyterian (1872); and Christ Church (1835) rebuilt and dedicated April 12, 1956. The city is the seat of a Roman Catholic archbishopric and a Protestant Episcopal bishopric.

Parks and Recreation.— Cincinnati parks are under a park board of three members appointed by the mayor. The board was created in 1908 when the city owned 488 ac. of parks; in the latter part of the 20th century the city's parks comprised about 4,000 ac. and in addition there were more than 50 playgrounds. In general, the parks are located on hilltops, affording a view of the downtown area, the Ohio river and the neighbouring hills. A few of the larger parks are Mt. Airy forest, the first municipal forest in the United States, containing a spectacular collection of vegetation native to the area; Eden park, overlooking the Ohio river and the location of the Irwin M. Krohn conservatory, featuring displays of tropical and greenhouse plants and special flower exhibits, and the Cincinnati Art academy; Ault park, where there is open-air dancing in the pavilion during the summer; Burnet woods, adjacent to the University of Cincinnati campus, with boating available on the lake; and Alms park, from which there is an especially fine view of the Ohio river. The Cincinnati Zoological gardens (founded 1875, acquired by the city in 1933) have the Fleischmann aquarium, containing native and tropical fish; lion and ape houses; and over 1,000 birds, mammals and reptiles. A summer opera with Metropolitan stars has been held at the zoological gardens each year since 1921.

Taft, *City Management* (1933); Cincinnati City Planning Commission, *Cincinnati Metropolitan Master Plan* (1949) (R. C. McG.)

CINCINNATI, SOCIETY OF THE, a hereditary, military and patriotic organization formed by officers of the American Revolutionary army, was established in May 1783, shortly before the army was disbanded. Founded to promote friendship, to perpetuate the rights for which they had fought, and to aid members and their families in case of need, the Cincinnati took their name from the Roman citizen-soldier, Lucius Quinctius Cincinnatus (*q.v.*), whom they professed to follow.

The "Institution," or constitution of the society, was adopted May 13, 1783, at a meeting at Baron von Steuben's headquarters at Newburgh-on-the-Hudson, N.Y. It provided that membership was to pass through eldest male descendants or, should the line fail, through collateral branches judged worthy of membership. French officers who had served in America in the war were invited to organize a branch of the society in France. Provision was also made for honorary membership. More than 2,000 officers signed the rolls as original members and each contributed the one month's pay required to join. They organized branches in each of the 13 American states and in France. Gen. George Washington was elected the first president-general of the society, and Maj. Gen. Henry Knox (*q.v.*), with whom the plan for the Cincinnati originated, was elected secretary-general. Washington served until his death in 1799 when he was succeeded by Alexander Hamilton. James Monroe was also an original member. Benjamin Franklin and Gouverneur Morris were among early honorary members.

The hereditary feature and the restriction of membership to officers brought the society almost immediately under strong attack. Judge Aedanus Burke of South Carolina in a widely circulated pamphlet accused the Cincinnati of conspiring to create "a race of hereditary patricians or nobility," and Thomas Jefferson was one of the society's most influential critics. Attacks prompted the society at its first general meeting, in May 1784, to abolish the hereditary principle for membership, but the action was not ratified by the state societies; the hereditary qualification thus remained in effect.

Early opposition, together with the dispersion and the death of original members, hampered the growth of the society, and some of the state societies became dormant. By 1835, societies remained only in Massachusetts, New York, New Jersey, Pennsylvania, Maryland and South Carolina; these continued, and in the late 19th century all of the defunct societies were revived. L'Ordre de Cincinnatus, organized in France and permitted to wear the emblem of the society by Louis XVI, was dispersed by the French Revolution and was not revived until the 1920s.

The revived societies flourished both in the United States and in France. Branches remained restricted to each of the original 13 American states and France, but membership was widely scattered. In 1937, Larz Anderson, a member, bequeathed the society his home in Washington, D.C., as a headquarters and museum. The society has established medals, prizes and scholarships to promote education.

The insignia of the society, designed by Maj. Pierre Charles L'Enfant (*q.v.*), comprised a gold eagle suspended by a blue and white ribbon "emblematic of the union of America and France" and bearing the figure of Cincinnatus ready to leave his plow to defend his country. The city of Cincinnati, O., was named in honour of the society in 1790. (N. E. CU.)

CINCINNATUS, LUCIUS QUINCTIUS (b. c. 519 B.C.), in ancient Rome dictator (*q.v.*) and one of the early heroes. He worked his own small farm. A persistent opponent of the plebeians, he resisted the proposal of Gaius Terentilius Harsa (462 B.C.) to draw up a code of written laws applicable equally to patricians and plebeians. According to Roman tradition Cincinnatus was twice dictator. In 458 he rescued the consular army which was besieged by the Aequi. Defeating them in one day. he entered Rome in triumph, before returning to his farm. In 439 he became dictator to check Spurius Maelius who was accused of aspiring to be king The story of his success against the Aequi is probably historically accurate, but details given by Livy (late 1st century B C) are not credible.

See Livy, *History of Rome,* iii, 26–29; *H*. Last, in *Cambridge Ancient History,* vol vii, pp 501 ff. (1928).

CINCLIDAE, a family of small birds that can walk under water. They are about the size of a thrush, have thick and oily plumage that enables them to withstand severe cold and are found in the northern hemisphere. *See* DIPPER.

CINDERELLA, the heroine of an almost universal fairy tale (*i.e.,* little cinder girl). Its essential features are (1) the persecuted maiden whose youth and beauty bring upon her the jealousy of her stepmother and sisters: (2) the intervention of a fairy or other supernatural instrument on her behalf; (3) the prince who falls in love with and marries her. In the English version, a translation of Perrault's *Cendrillon,* the glass slipper which she drops on the palace stairs is due to a mistranslation of *pantoufle en vair* ("a fur slipper"), mistaken for en *verre.* It has been suggested that the story originated in a nature myth, Cinderella being the dawn, oppressed by the night clouds (cruel relatives) and finally rescued by the sun (prince).

CINEAS (3rd century B.C.), a Thessalian, the chief adviser of Pyrrhus (*q.v.*), king of Epirus. He was regarded as the most eloquent man of his age. He tried to dissuade Pyrrhus from invading Italy. and after the defeat of the Romans at Heraclea in Lucania (280 B.C.) was sent to Rome to discuss terms of peace. These terms, which are said by Appian to have included the freedom of the Greeks in Italy and the restoration to the Bruttii. Apulians and Samnites of all that had been taken from them, were rejected. Two years later Cineas was sent to renew negotiations on easier terms. The resdlt was a cessation of hostilities. and Cineas crossed over to Sicily to prepare for Pyrrhus' campaign. Nothing is related of him thereafter. He is said to have made an epitome of the *Tactica* of Aeneas (4th century B.C.), probably

referred to by Cicero, who writes of a Cineas as the author of a treatise *De re militari.*

CINEMA: *see* MOTION PICTURES.

CINERARIA, the earlier name, still used by florists, for cultivated ornamental plants originated from species of *Senecio.* There are two distinct types, the garden species, of which one of the commonest is the dusty miller, S. *cineraria,* and the greenhouse varieties of S. *cruentus,* commonly referred to simply as cinerarias. Greenhouse cinerarias are of two types: one a dwarf, compact-growing plant with large flowers in dense clusters; the other a taller-growing variety with larger, more spreading clusters of small star-shaped flowers. These are known horticulturally as stellate varieties of *Cineraria cruentus.* Both are easily grown from seed and are sold commercially as potted plants. The very free-flowering stellate varieties are more popular than are the large-flowered types, and through a careful selection and crossing of varieties many beautiful colours are available.

T. H. EVERETT

CINERARIA (SENECIO CRUENTUS)

For a succession of blooming plants during the late winter and spring months seeds are first sown in August in the cool greenhouse. As soon as the seedlings can be handled conveniently they are put in 23-in. pots. Later they are shifted to three-inch pots as the root system develops. The final shift into six-inch flowering pots is made early in January. Soil for cinerarias should be of a light, porous character and a mixture of one-half fibrous loam, one-half leaf mold with a liberal sprinkling of sharp sand suits them admirably. They grow best in a night temperature of from 45° to 50° F. with an increase of about 10° during the day. The soft succulent character of foliage and stems makes cinerarias especially liable to be attacked by insect pests. The plants should be frequently fumigated with nicotine preparations or sprayed with nicotine solutions.

CINNA, in ancient Rome the cognomen, or third name, of a patrician family of the gens Cornelia.

LUCIUS CORNELIUS CINNA (d. 84 B.C.), leader of the popular party in Rome opposed to the legislation of L. Cornelius Sulla (*q.v.*), was consul successively from 87 to 84 B.C. After serving in the Social War (90–88), Cinna became consul in 87. When Sulla left for the east. Cinna repealed his laws and threatened him with prosecution. His proposed revival of the law of Sulpicius Rufus about newly enfranchised citizens caused riots in Rome, and Cinna was expelled. He at once collected an army. Gaius Marius (*q.v.*) joined him and they captured Rome. Proscriptions followed, and the death of Marius on Jan. 13, 86, left Cinna in control. He remained consul, with L. Valerius Flaccus in 86, and with Gnaeus Papirius Carbo in 85–84. He was responsible for some economic measures and for giving the recently enfranchised Italians fair voting rights. In 84 he prepared to advance against Sulla, but was killed in a mutiny at Ancona. His daughter Cornelia married Julius Caesar.

LUCIUS CORNELIUS CINNA, praetor in 44 B.C., son of the above, sided with Caesar's murderers.

GNAEUS CORNELIUS CINNA, consul in A.D. 5, the praetor's son (the *Cinna* of Corneille), was pardoned by the emperor Augustus for alleged conspiracy (about 16–13 B.C.2). (H. H. SD.)

CINNA, GAIUS HELVIUS (1st century B.C.), Roman poet. wrote a mythological epic poem *Smyrna.* He was a friend of the poet Catullus, whom he accompanied to Bithynia in the suite of the praetor Memmius. Suetonius. Valerius Maximus. Appian and Dio Cassius all state that. at Caesar's funeral. a certain Helvius Cinna was killed by mistake for Cornelius Cinna, the conspirator. The last three writers add that he was a tribune of the people, while Plutarch states that the Cinna who was killed by the mob was a poet. This points to the identity of Helvius Cinna the tribune with Helvius Cinna the poet. The chief objection to this view is based upon two lines in the 9th eclogue of Virgil, supposed to have been written in 41 or 40 B.C., which seem to imply that Helvius Cinna was then alive. But such an interpretation of the passage is not absolutely necessary. Apart from the *Smyrna* Cinna is credited with having written a *Propempticon Pollionis,* a poem in the form of a "send-off" to his friend Asinius Pollio. In both these poems. the language of which was so obscure that they required special commentaries, his model appears to have been Parthenius of Nicaea.

BIBLIOGRAPHY.—J. A. Weichert, *Poëtarum Latinorum Vitae* (1830); A. Kiessling, "De C. Helvio Cinna Poëta" in *Commentationes Philologicae in honorem T. Mommsen* (1878); Teuffel-Schwabe, *Teuffel's History of Roman Literature,* with Eng. trans. (1900).

CINNABAR, sometimes written cinnabarite, is red mercuric sulfide, or native vermilion. Cinnabar is the principal ore of mercury (*q.v.*). The chief producing areas are Almaden, Spain, where it has been mined for 2,000 years; Idria, Yugos.; and the Monte Amiata district. Italy. Cinnabar also is mined in commercial quantities in the U.S. in Alaska, Arizona, California, Idaho, Nevada, Oregon and Texas, in Mexico and the U.S.S.R. Cinnabar is generally found in a massive, granular or earthy form, of bright red colour, but it occasionally occurs in crystals with a metallic adamantine lustre. The crystals belong to the hexagonal system and are generally of rhombohedra1 habit, sometimes twinned. Fine specimens come from the provinces of Kweichow and Hunan, China.

Cinnabar presents a remarkable resemblance to quartz (*q.v.*) in its symmetry and optical characters. Like quartz it exhibits circular polarization, and A. des Cloizeaux showed that it possessed 15 times the rotatory power of quartz (*see* LIGHT). Cinnabar has a high refractive power, its mean index for sodium light being 3.08. The hardness of cinnabar is 3, and its specific gravity 8. The formula is HgS. Hepatic cinnabar is an impure variety in which cinnabar is mixed with bituminous and earthy matter. Metacinnabar is a black cubic dimorphous form of mercury sulfide.

(W. F. FG.)

CINNAMON. The bark of the cinnamon tree, *Cinnamomum zeylanicum,* laurel family, native to Ceylon and adjacent India. This is not the biblical cinnamon, which is thought to be cassia, *Cinnamomum cassia.* Yet it ranks high among the spices of the east, in the pursuit of which fortunes were gained and empires built.

World production, several thousand tons annually, comes mostly from Ceylon, even though the species has been introduced around the world. Holdings of Singhalese princes and the later English overlords gave way to small private plantations.

The continuously pollarded trees (bushy and shrublike) produce suckers or "water sprouts," the bark from which contains up to 1% of a volatile oil high in cinnamic aldehyde, responsible for the cinnamon fragrance.

The bark is stripped in summer, when abundant sap permits easy peeling. Cut twigs, preferably second-year growth, are trimmed of the shiny, simple leaves and hand peeled at the peeling shed. Sections of inner bark, thoroughly dried and scraped free of epidermis, make the hollow, tubelike "quills" of commerce. Fragments are salvaged, as they can be pulverized to yield powdered cinnamon or cinnamon extract.

Cinnamon was once more valuable than gold; it was sought for embalming and witchery in Egypt, for rites in the Tabernacle and as a flavour in medieval Europe. Later it was the most profitable spice in the Dutch East India company trade. In modern times it finds most use in bakery goods and as a home flavouring. Oil distilled from the chips is said to be medicinal. (R. W. SY.)

CINNAMON STONE: *see* GARNET: *Varieties.*

CINNAMUS, JOHN (fl. 2nd half of the 12th century), Byzantine historian, was probably imperial secretary *(basilikos grammatikos)* to Manuel I Comnenus (1143–80), whom he accompanied on his campaigns in Europe and Asia Minor. His history of the period 1118–76, continuing the *Alexiad* of Anna Comnena, covers the reigns of John II and Manuel I, down to the unsuccessful campaign against the Turks of Iconium when the Byzantines were routed at Myriocephalum. Cinnamus was probably

an eyewitness of the events of the last ten years which he describes. The work breaks off abruptly, and appears to be in an incomplete form. The author's hero is Manuel, but in spite of his conviction that the Greek east was superior to the Latin west and his opposition to papal claims he retains considerable objectivity.

CINO DA PISTOIA (whose real name was CINO SIGIBULDI) (c. 1270–*c.* 1336), Italian poet and one of the group described by Dante as of the "*dolce* stil nuovo" (see ITALIAN LITERATURE). He was born in Pistoia between 1265 and 1270, and in c. 1290 went to the University of Bologna to study law, remaining there for about ten years. A member of the faction of the Blacks, in 1300 he was exiled with them from Pistoia but was allowed to return in 1306. In 1309 he was sent as ambassador to Florence. Like Dante, of whom he was a friend, Cino had great political hopes of the emperor Henry VII's expedition to Italy; after the emperor's death (1313), he devoted himself to his juridical studies. On completing, in 1314, his commentary on the first nine books of Justinian's Codex, he obtained his doctorate at Bologna. Between 1321 and 1331 he was successively professor of law at Siena, Florence, Perugia and Naples. He then retired to Pistoia, where he died in 1336 or 1337.

Cino's sonnets and *canzoni,* written in the style of the stil *nuovo* school, even if with a more realistic psychology, possess literary interest rather than poetical value. Dante, however, considered him among "those who have most sweetly and subtly written poems in Italian" (De vulgari *eloquentia,* i, 10) and a line of Cino's (la dolce vista e 'l *bel* guardo soave) was included by Petrarch in one of his own poems.

See G. M. Monti, *Cino da Pistoia giurista* (1924); *G.* Zaccagnini, *Le rime di Cino da Pistoia* (1925). **(G. A.)**

CINQ-MARS, HENRI COIFFIER DE RUZÉ, MARQUIS DE (1620–1642), the last favourite of Louis XIII of France and the leader of the last great conspiracy against the cardinal de Richelieu, was a younger son of the marshal d'Effiat (Antoine Coiffier), whose territorial name Effiat he liked to use. Richelieu, who took him under his protection on the marshal's death (1632), decided in 1639 that the king's favourite, Marie de Hautefort, was to be dismissed from court and that Cinq-Mars might take her place. The king accepted him readily. Cinq-Mars was made grand *écuyer* de France ("grand master of the stable"; hence his designation as Monsieur le Grand, just as the inferior premier *écuyer* was Monsieur le Premier) and experienced the peculiar effects of Louis XIII's favour: intimate confidences, with jealousy and bickering followed by reconciliations drawn up as formal treaties between them. Impatient of this limited role (which impeded his love affairs and obliged him to go hunting, against his inclination), Cinq-Mars sought political influence, but was brusquely rebuffed by Richelieu when he tried to enter the council chamber. He then decided to get rid of his old benefactor. His participation in the abortive conspiracy of the comte de Soissons (Louis de Bourbon) in 1641 escaped detection. He then began a fresh plot with Gaston, duc d'Orléans (*q.v.*), and Frédéric Maurice, duc de Bouillon, for a coup *d'état* against Richelieu. Early in 1642 an agent was sent to Madrid to get Spanish help. the secret "treaty of Spain" was signed by Philip IV on March 13. Cinq-Mars went with Louis from Karbonne to besiege the Spaniards in Perpignan, but Richelieu, who was ill and felt himself in danger, went instead to Arles. There, on June 11, a document came into his hands proving the treason of the plotters. which he sent at once to Louis, now back at Narbonne. On June 13 Cinq-Mars was arrested, hiding in an attic. Bouillon was arrested in Piedmont on June 23; Orléans confessed his guilt. Brought to trial, Cinq-Mars and François-Auguste de Thou, a far less guilty conspirator, were beheaded at Lyons on Sept. 12, 1642.

It is doubtful what the compromising document was. If it was a copy of the treaty, who betrayed it to Richelieu?

(J. G. R.-S.)

CINQUECENTO, a term used to describe that period of the Italian Renaissance between 1500 and 1600. The word is often applied to the artistic styles prevalent at that time, and particularly to the classicism of the high Renaissance.

CINQUE PORTS, the name of a confederation of maritime towns in southeast England, formed during the 11th century to furnish ships and men for the king's service and still surviving in the 20th century. The ports originally constituting the confederation were five in number—Hastings, Romney. Hythe, Dover and Sandwich (*qq.v.*), but there were afterward added the "antient towns" of Winchelsea and Rye (*qq.v.*) with the privileges of "head ports." More than 30 other towns in Kent and Sussex were attached to the head ports as limbs or members; there were corporate members, their membership being confirmed by royal charter, and noncorporate members associated with their head port by private agreement. The ports constituted the only federation of towns in England.

The Cinque ports provided the permanent nucleus of the royal fleet until the 14th century., They were probably first associated in the reign of Edward the Confessor for the defense of the coast and the cross-channel passage. After the Norman conquest their importance grew and their privileges were increased. At first the confederation was informal and had no permanent rules or institutions. Loosely linked by their common duties to the crown, their geographical position and their common economic interest in fishing, the ports were flourishing independent boroughs in their own rights, more closely tied to their "limbs" than to each other.

The Cinque ports reached their greatest importance in national affairs during the 13th and 14th centuries, when their duties and privileges were extended. They were first jointly granted liberties by charter in 1278. They played an important part in the civil wars of the 13th century, and as a result the crown tried to gain more control over them, giving the ports a common officer. the lord warden, and making the court of Shepway independent of other royal courts. Administrative unity was thus first imposed from without, and not developed by the portsmen themselves. After the 14th century the Cinque ports lost their monopoly of sea power. They continued to contribute to the navy, but their contributions declined in importance as the conditions of naval warfare changed, and in 1588 the ports sent only five ships against the Armada. Their decline was accelerated by the changing coast line, some ports silting up while others were gradually eroded.

The constitutional organization and permanent institutions of the Cinque ports were mainly developed between the 14th and 17th centuries. As they declined in importance the ports needed to act together to defend their privileges. To meet this need the court of Brodhull gradually developed into a representative assembly which dealt with local affairs and combated any encroachments on the members' ancient rights. The court of Guestling was another federal institution, developed later, and ultimately the two combined as the "courts of Brotherhood and Guestling."

The highest officer in the Cinque ports is the lord warden, who is also constable of Dover castle. One of the most important permanent features of the Cinque ports organizatiqn was his position as admiral of the ports, with maritime jurisdiction. Walmer castle is the official residence of the lord warden. Sir Winston Churchill was appointed to the office in 1941 by King George VI.

The court of admiralty of the Cinque ports holds a jurisdiction concurrent with the admiralty court, coextensive but not exclusive within limits extending from Shore Beacon in Essex to Redcliff. near Seaford in Sussex, and seaward to a point 5 mi. off Cape Gris-Nez. The judge sits as the official and commissary of the lord warden, just as the judge of the high court of admiralty sat as official and commissary for the lord high admiral. The Cinque ports' court is probably the older of the two, since the lord warden holds the more ancient office (The Lord Warden v. King in His *Office* of Admiralty, 1831. 2 Hagg. Admy. Rep. 438). Of old, the court sat sometimes at Sandwich, sometimes at other ports, but the regular place for the sitting of the court was for a long time at St. James's church, Dover, which was destroyed in

World War II. For convenience, the judge later sat at the royal courts of justice, and the last full sitting was in 1914.

The registrar who, according to general civilian practice, acts as the judge's deputy, deals at Dover with the matters which keep the ports' jurisdiction alive. Appeal is to the sovereign in council, advised by the judicial committee. For details of the jurisdiction cf. the Cinque Ports act, 1821. (For the barons of the Cinque ports see BARON.)

CINTRA: see SINTRA.

CINYRAS, the legendary first king of Paphos in Cyprus. He was traditionally the founder of the famous cult of Aphrodite there and the ancestor of a line of priest-kings. He also was said to have been the father of Adonis. Homer, in the Iliad, describes Agamemnon as wearing a magnificent breastplate, the gift of Cinyras, but later tradition describes how Cinyras, having failed in his promise to help the Greeks against Troy, was punished by the Greek invasion of Cyprus. (H. W. PA.)

CIPRIANI, GIOVANNI BATTISTA (1727–1785), Italian painter, was the first exponent in England of neoclassicism as championed in Rome by Pompeo Batoni and Anton Raphael Mengs, and thus played an important part in directing English academic taste. He was the pioneer of what may be called the "Adam" style in decorative painting. Born in Florence, Cipriani was a pupil of the Anglo-Florentine painter Ignazio Hugford and was influenced by Antonio Domenico Gabbiani.

His early work is now represented by the painted organ curtain in Sta. Maria Maddalena dei Pazzi, Florence, and by two altarpieces at Pistoia. In 1750 he went to Rome, where he encountered the dawning taste for the neoclassic and met members of the English colony. The architect Sir William Chambers and the painter Joseph Wilton brought him to England in 1756 with the Florentine sculptor Giovanni Battista Capezzuoli. From then on he lived in England and died in Hammersmith on Dec. 14, 1785. He collaborated with Wilton and Capezzuoli in 1760–62 on the ornamentation (restored in 1953) of George III's state coach, designed by Chambers. He became a foundation member of the Royal Academy in 1768.

Cipriani's other important decorative works include the ceilings of the library at Buckland house, Berkshire (after 1757), and the tapestry room at Hagley hall, Worcestershire (before 1760), both of which still show baroque qualities; the painted room at Standlynch (now Trafalgar) house, Wiltshire (after 1766), an example of illusionistic wall painting with a continuous landscape with figures, certainly his most charming work; and the four allegorical panels surrounding Sir Joshua Reynolds' figure of "Theory" in the cove of the ceiling of the Royal Academy, Somerset house (1780). Cipriani was also a prolific draftsman of classical and allegorical subjects. (E. C.-MY.)

CIRCAR (SARKAR) was a term applied to a subdivision of a subah, or province of the Mogul empire of India. The Northern Sarkars figured in British diplomacy during their rivalry with the French for control of India and afterward in their attempts to secure the aid of the nizam of Hyderabad against Haidar Ali. These Northern Sarkars correspond to the modern Srikakulam district southward to the Nellore district inclusive, and were then named Chicacole, Rajahmundry. Ellore, Kondapalli and Guntur. They were the richest parts of Andhra Pradesh (*q.v.*), Guntur being strategically as well as economically valuable.

CIRCASSIA: see CHERKESSIA.

CIRCASSIAN (CHERKESS), a Caucasus mountain people divided into two chief groups, the Adygei (Cherkess proper) and the Kabardians. The Adygei are at times referred to as the lower Cherkess and the Kabardians as the upper Cherkess. They inhabit the northwestern parts of the Caucasus in the vicinity of the Black sea; some live along the middle course of the Kuban river, and a large group lives in Anatolia, Turk.

According to the Soviet census of 1959, there was a total of 284,000 persons in both divisions of the Cherkess; the Adygei numbered 80.000 and the Kabardians 204,000. About four-fifths of the Cherkess live in the Soviet Union, and about one-fifth live in Turkey. There were approximately 67,000 Cherkess listed in the Turkish census of 1945.

By their linguistic affiliation the Cherkess are a part of the larger Abkhaz-Adygei group. which, in addition to the Cherkess, includes Abkhaz, Abazin and Ubykh. All these languages are localized in the Caucasus and in neighbouring areas. They are spoken chiefly in the Soviet Union, with the exception of the Cherkess of Turkey and the Ubykh. The Ubykh moved from the Caucasus to Turkey in the 19th century and have remained there since. The entire group of languages is more distantly related to the Georgian (Gruzin) group, and together these two groups form the so-called Caucaso-Iberian family. These various linguistic groups have many members who live close together and have a common genesis. However, few of the tongues are mutually comprehensible. The entire Caucasus area is characterized by the prolixity of languages in a small compass. It has been known from the times of classical antiquity as a "mountain of languages." (See also CAUCASIAN LANGUAGES.)

A large part of the Cherkess live in the plain immediately to the north of the Caucasus. Another part live in the mountain piedmont, and a small portion live in the upland and mountainous parts of their country. The Cherkess economy is typical of the Caucasus peoples both in subsistence pattern and technology. In their traditional economy they are a mixed pastoral and farming people, with a minor dependence on orchards for fruit growing. They long had a primitive plow of their own and were at one time famous in many parts of the world for their woolen cloth. More recent products of note are their felts and horses.

According to the great Caucasus scholar V. F. Miller, the Cherkess have existed in their locality from times antedating the period of classical antiquity. Greek and Roman writers describe the Cercetae, Heniochae, Maeotae, Sindi. Zichi and other tribes of the area who form an early link in the chain of Cherkess cultural history. Pastoralism was of great importance among these early peoples.

There is an Iranian element in their vocabulary dating from preclassical times. The north Iranian Schuths, later Ossetes, had a strong influence upon them. However, Miller has sho n that this is not a genetic relationship but rather one of borrowing.

Their traditional society had a group of princes, pshi, who elected a supreme prince, *vali.* Below this rank were the nobles, *uork* and *uzden* (vali and uzden are derived from the Turkish). The princes and nobles controlled the herds and soil, while the mass of the people were organized in a complex system of subordinate ranks, living in extended families and tribes. Families were patriarchal and in part polygynous. Slavery was maintained until recent times.

The Kabardians had a more complex organization than the Adygei or Cherkess proper, who had a weakly developed aristocracy and no princedom. Both had a type of primitive village commune. the *psukho.*

Officially, the Cherkess religion is Sunni Muslim, which came to them from the Crimea and Turkey during the 16th–18th centuries. Christianity had been introduced from the 6th century on through Byzantium and Georgia but disappeared. Pre-Christian cults, associated with thunder, fertility rites and the sacred grove, were reported in modern times.

Women traditionally held a low place in Cherkess society; they were to be found in harems of oriental potentates and magnates. In the winter they were often confined to the hearth for lack of warm clothing.

The Circassians were subjected by Russia in 1864 and have subsequently diminished in number and territory. In the present

period they live chiefly in the Karachai-Cherkess Autonomous *oblast* (*q.v.*) of the Russian Soviet Federated Socialist Republic and in the Kabardino-Balkar Autonomous Soviet Socialist Republic (*q.v.*).

CIRCE, in Greek legend, a famous sorceress. the daughter of Helios and the ocean nymph Perse. She was able by means of drugs and incantations to change human beings into the forms of wolves or lions. and with these beings her palace was surrounded. Odysseus visited her island, Aiaie, with his companions, whom she changed into swine, but the hero, protected by the herb moly, which he had received from Hermes, compelled her to restore them to their original shape. He lived with her for a year, and when he determined to leave she instructed him how to sail to the House of Hades in order to learn his fate from the prophet Teiresias. Upon his return she also gave him directions for avoiding the dangers of the journey home.

Greco-Italian tradition placed her island near Italy, or located her on the promontory Circei. *See* also Picus; Scylla and Charybdis.

CIRCEO, MONTE, an isolated promontory on the southwest coast of Italy, about 80 mi. S.E. of Rome, dominating the landscape at the southern end of the Pontine marshes, opposite Terracina. It consists of a conspicuous ridge of limestone, 3½ mi. long by 1 mi. wide, rising to a height of 1,175 ft. and connected with the mainland by a low saddle of Tertiary deposits, nowhere more than 53 ft. high. From the sea in particular it bears all the appearance of an island. and its association with the legend of Circe was already well established in classical times. The modern village of San Felice Circeo (pop. [1957] 2,772). toward the east end of the promontory, occupies the site of the ancient Circei. About 8,000 ac. are preserved as a national park, notable particularly for its flora. The numerous coastal grottoes have yielded plentiful traces of Paleolithic settlement. referable to two distinct phases. the one (Pontinian) Mousterian in character, the other (Circeian) Middle Aurignacian. In 1939 a Neanderthal skull came to light in association with the former, in circumstances suggestive of ritual cannibalism. Previously a Volscian fortress, Circei became a Latin colony in 393 B.C. As a site for wealthy villas Cicero compares it with Antium, and the emperors Tiberius and Domitian both possessed residences in the neighbourhood. During the middle ages the castle of San Felice changed hands many times and was twice totally destroyed, in 846 by the Saracens and in 1411 by Alfonso of Aragon. Its principal function was that of a papal outpost against attack by sea. As late as 1727 Tunisian pirates carried off 27 inhabitants.

The remains of an enclosure of massive quasi-cyclopean masonry high up on the mountain are those of the acropolis of the colony of 393 B.C.; it was linked by a wall with the lower city. An artificial platform on the summit is that of a temple dedicated to Circe, apparently identified as Venus. Around San Felice and at the opposite end of the promontory there are the remains of several large villas. Among them, partly excavated and yielding much fine statuary. is that of Domitian on the lagoon called Lago di Paola near the small town of Sabaudia. There are many traces of ancient fisheries and oyster beds. The district produces an excellent table wine.

CIRCLE, a curve consisting of all those points of a plane that lie at a fixed distance from a particular point in the plane, called the centre.

The circle is the simplest example of a plane curve and alone possesses the property of being exactly alike at all points. If the curve is turned in its plane about its centre, the new position taken up is the same as the original position. This property constitutes the "roundness" of the circle, and distinguishes it from other plane curves. A circle may be traced upon a plane by the continuous movement of a point rigidly connected with the centre, as in the use of compasses, and it is in part the simplicity of this construction that explains the fundamental importance of this curve. The tracing of a circle is a much simpler problem than the tracing of a straight line, since the common method of drawing the latter, with the aid of a ruler, only reproduces the straight line already constructed along the ruler's edge. A difference in the use of the word "circle" is observable between the older writers and those of the present century. With the former the word is understood to mean the part of the plane enclosed by the curve, while the curve itself is called the circumference. The latter consider the circle and its circumference identical, except that the latter is often spoken of as the measure of the former; and the enclosed portion of the plane is spoken of as the *interior,* not as the circle itself.

The straight line joining the centre to a point on the circle, *e.g.,* OP or OQ (fig. 1). is called a radius; from the definition of a circle, the radii drawn to various points on the circle are equal. 4 straight line drawn through the centre and having its ends on the circle, *e.g.,* EOH (fig. 1), is called a diameter; evidently all diameters of the same circle are equal in length, and twice as long as a radius. A straight line, such as ABC (fig. 1), joining any two points on a circle is called a chord; and the greatest possible chord is a diameter. The portion of the circle intercepted between two points is called an arc. Any two points on the circle divide it into two arcs; thus, in fig. 1, ADC is the minor arc, and APEC the major arc, between A and C. The figure composed of an arc and the chord joining its extremities is a segment of the circle. In fig. 1, ADCB and APECB are respectively the minor and major segments made by the chord AC. A sector of a circle is the figure formed by two radii and one of the arcs joining their extremities. The angle between these radii and within the sector is called the angle of the sector. Thus ODKC (fig. 1) is a sector, and DOC its angle.

Geometrical Properties.—A number of properties of the circle are direct results of the symmetry and regularity of the curve. For instance, if two chords in the same circle are equal, the arcs of the corresponding segments are equal, they have equal angles, they have equal arcs, and contain equal areas! etc. A useful property of this kind is that *every chord is bisected by the perpendicular drawn to it from the centre.* This allows the centre to be found when the circle is given, and the circle to be drawn when three points on it are given. Thus, to construct the circle through H, P and Q, draw the perpendicular bisectors LO and RO to H P and PQ as in fig. 1, and take as centre the point O where these meet.

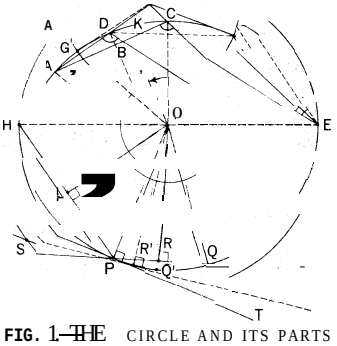

FIG. 1.—THE CIRCLE AND ITS PARTS
Showing the radius OP or OQ, diameter EOH, chord ABC, minor arc ADC, major arc APEC, minor and major segments ADCB and APECB, sector ODKC and the angle of sector DOC

A less evident property is that, *when any arc is taken, the angle between the lines joining its end points to the centre is double the angle between the lines joining these end points to any point on the remaining part of the circle, each angle being measured in the position facing the arc.* In fig. 1, by using the minor arc CD, the angle COD is double the angle CED, and also double the angle CAD. By using the major arc APE, the outer (reflex) angle AOE is double either ACE or ADE. An immediate consequence is that the angle ACE is equal to the angle ADE. Here A, C, D and E are any four points on a circle so placed that C and D lie on the same arc having A and E for end points. The theorem is commonly stated in the form: *angles in the same segment are equal.* (To exhibit the segment it is necessary to join AE.) It is a property of wide application, and numerous instances of it may be seen in fig. 1 by joining various pairs of points. Thus the angles

CAD, CED, CGD, CQD (when the lines CQ, QD and CG are drawn) are equal. In particular, *the angle in a semicircle is a right angle.* Closely related to this is the theorem that *a four-sided figure whose four corners all lie on the same circle has the sum of either pair of opposite angles equal to two right angles.* The converse is true that if the sum of one of the pairs of opposite angles of a four-sided plane figure is two right angles, a circle may be drawn to pass through the four corners.

It is readily seen that a straight line whose shortest distance from the centre is less than the radius cuts a circle in two points, and that a line whose shortest distance is greater than the radius does not meet the circle at any point. The intermediate case occurs when the line is at a distance from the centre equal to the radius, as is the case with SPT (fig. 1). Such a line has only one point in common with the circle; it is said to touch the circle and is called a tangent to the circle. The tangent at any point of a circle is the line through that point drawn at right angles to the radius; thus OPT is a right angle. The tangent at P is the limiting position approached by a chord PQ, drawn through P, as the other extremity Q approaches P. The chord must be prolonged as shown in the figure, in order that it may not be lost as its length vanishes. It is known that the perpendicular OR from the centre falls on the middle point of the chord. As Q moves to Q', R moves to R', and, as Q approaches P, R approaches P also. Finally the right angle ORQ approaches the limiting position OPT, and the chord PQ, prolonged sufficiently, is finally represented by the tangent PT at right angles to the radius OP. This second view of a tangent, as the limiting form of a short cord, is more generally applicable than the former, being valid for curves other than circles. It also enables many tangent theorems to be recognized as the limiting forms of related theorems on chords, and leads to a better understanding of tangent relations.

From a point F outside a circle two tangents may be drawn. The points of contact G and G' of these may be found by first drawing the tangent at a point P on the circle, finding with the compasses a point S on this such that OS = OF, and then finding G and G' on the circle and at a distance from F equal to PS. *The angle made by a tangent with a chord through its point of contact is equal to the angle in the segment on the other side of the chord.* Thus the angle FGD is equal to the angle GED. An important theorem on intersecting chords follows readily from the law of equal angles in a segment. *If two chords intersect, the product of the distances of the extremities from the point of intersection is the same for either chord.* Thus, in fig. 1, AC and DE intersect at B. The figure represents the case where AB contains 4.5 units, BC 3.2 units, DB 1 unit, and BE 14.4 units. It will be seen that $4.5 \times 3.2 = 1 \times 14.4$. The relation remains true when the chords have to be prolonged to meet outside the circle, as AD and CE, meeting at F. In the figure AF = 7.2. DF = 3.2, CF = 1.6 and EF = 14.4, so that $AF \times DF = CF \times EF$, each being 23.04. In the case of external intersection each of the equal products is also equal to the *square of the distance from the point of intersection.* In the figure, FG = 4.8, the square of which is 23.04. This is one of the cases where the tangent represents a chord whose ends are coincident.

Circle Constructions. — The circle plays an important part in the problems of constructive geometry. This will be easily understood when it is remembered that, in the traditional view, a geometrical solution means a solution by ruler and compasses; that is, the only steps available are to rule a straight line through two given points and to draw a circle having a given centre and radius. It is therefore a matter of importance to the student of geometry to be able to construct circles to satisfy various standard sets of conditions; and several of these processes will be indicated briefly:

1. *Circle tlzrough three given points.* The method of finding the centre by the right bisectors of the joining lines has already been given. When the three points are thought of as the corners of a triangle, the circle is said to be circumscribed to the triangle.

2. *Circle touching three given straight lines.* Bisect the angles between two of the lines *l* and *m,* obtaining a pair of bisector lines *a* and *b.* Bisect in the same way the angles between *1* and the third line *n* by a pair of bisectors *c* and d. The centre of a circle touching *1* and *m* must be equidistant from *l* and *m,* and so must lie either on *a* or on *b.* The centre of a circle touching *1* and *n* must be either on *c* or on *d.* Four solutions are obtained, the positions of the centre being the intersections of *a* and *c,* of a and *d,* of *b* and *c,* and of *b* and *d* The circle that lies between the given lines and touches them is said to be inscribed to the triangle

3. *Circle through two given points and touching a given line* (which does not pass between the points). Let A and B be the given points, and *1* the given line (fig. 2). Let AB cut *1* at O. Draw any circle *c* through A and B, by taking as centre any point on the right bisector of AB. Draw the tangent OT touching *c* at T. Find points H and K on *l* so that KO = OH = OT. The circle c_1 through A, B and H and the circle c_2 through A, B and K will each be a solution of the problem. The proof is briefly that $OH^2 = OK^2 = OT^2 = OA \times OB$, so that OH and OK are each of the right length for a tangent from O.

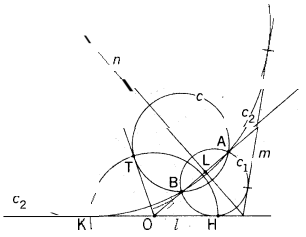

FIG 2 — CONSTRUCTION OF A CIRCLE THROUGH TWO GIVEN POINTS AND TOUCHING A GIVEN LINE AND THROUGH A GIVEN POINT TOUCHING TWO GIVEN LINES (see TEXT)

4. *Circle through a given point and touching two given lines.* Let *1* and *m* (fig. 2) be the given lines, and A the given point. Draw *n,* the bisector of that angle between *l* and *m* in which A lies. Draw AL perpendicular to *n* and prolong to B so that LB = AL. The circles c_1 and c_2 constructed as in 3 to pass through A and B and to touch *1* will then constitute the two solutions of the problem.

Circle constructions in which some of the conditions are that the circle should touch certain given circles require refined geometrical methods. A celebrated case of this type is Apollonius' problem: *to construct a circle to touch three given circles.* If the three circles are entirely external to one another, this problem admits of eight solutions. A number of problems of this kind, credited to Jakob Steiner and others, are discussed by Coolidge *(see* bibliography). It is often useful to remember that a circle through two given points may have its centre anywhere on the right bisector of their joining line, and that a circle touching two given intersecting straight lines has its centre anywhere on either of the lines bisecting the angles between them. A circle through a given point and touching a given line has its centre on a curve known as a parabola; but this fact is not of much direct assistance in finding constructions.

In many cases a point moving under specified conditions traces a circular path. The definition of the circle shows that this curve is the locus (or path) of a variable point whose distance from a fixed point remains constant. But there are numerous other ways in which the circular path may be recognized. If the base of a triangle is fixed, and the angle at the vertex is of constant magnitude, the moving vertex traces an arc of a circle as long as it remains on the same side of the fixed base; the property involved here is that of equal angles in a segment. If the base of a triangle is fixed, and the other two sides are in constant ratio, the moving vertex traces a circle which encloses one of the fixed vertices. If the sum of the squares of the distances of a variable point from two fixed points is constant, the point traces a circle whose centre is halfway between the two fixed points.

Analytic Treatment. — Taking for axes of reference two lines, OX and OY, at right angles (fig. 3) and, drawing PN perpendicular to OX from any point P, denote by *x* and *y* the measurements ON and NP. The two quantities *x* and *y* are called the co-ordinates of P, and the position of P depends on their values. The point P is denoted by *(x, y).* If C is a fixed point *(h,* k), P will be restricted to a circle of centre C and radius *r* provided CP = *r; i e.,* $CP^2 = r^2$, or $CL^2 + LP^2 = r2$, if CL is perpendicular to NP; therefore

$$(x - h)^2 + (y - k)^2 = r^2 \qquad (1)$$

This is the *equation of the circle.* The variable point P will lie on the circle if, and only if, *(1)* is satisfied.

The equation

$$x^2 + y^2 + 2ax + 2by + c = 0 \qquad (2)$$

may be written in the form $(x + a)^2 + (y + b)^2 = a^2 + b^2 - c$, which is equivalent to *(1)* if $h = -a$, $k = -b$ and $r^2 = a^2 + b^2 - c$. The last of these conditions is not possible for any real value of r if $a^2 + b^2 - c$ is negative; but, if $a^2 + b^2 - c$ is positive, equation *(2)* is seen to represent a circle whose centre is $(-a, -b)$ and *radius* $\sqrt{(a^2 + b^2 - c)}$. The constants a, b and c in *(2)* may be determined to satisfy specified conditions, and the circle becomes then definitely fixed. For instance, if the circle is to pass through three given points, the co-ordinates of these must satisfy equation *(2)*, and, on substituting them for x and y, three equations are obtained giving a, b and c. If the point (x, y) is not on the circle, but outside it, as at P′ (fig. *3)*, the left-hand side of equation *(2)* is not equal to zero, but, when written as $(x + a)^2 + (y + b)^2 - (a^2 + b^2 - c)$, or $(x - h)^2 + (y - k)^2 - r^2$, is seen to represent $CP'^2 - CT^2$ (if P′T is a tangent), which can be plotted as $P'T^2$.

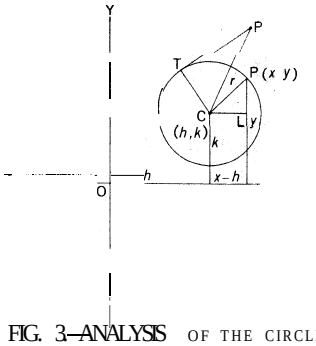

FIG. 3.—ANALYSIS OF THE CIRCLE TO DETERMINE ITS EQUATION (see TEXT)

A point (x, y) from which the tangent to the circle (2) is equal to the tangent to the circle

$$x^2 + y^2 + 2a'x + 2b'y + c' = 0 \qquad (3)$$

satisfies the equation

$$x^2 + y^2 + 2ax + 2by + c = x^2 + y^2 + 2a'x + 2b'y + 1$$
$$i.e.,\ 2(a - a')x + 2(b - b')y + (c - c') = 0$$

This equation, if the circles *(2)* and *(3)* have not the same centre, is of the first degree, so that the point (x, y) lies on a fixed straight line, called the radical axis of the circles. If the circles *(2)* and *(3)* have two points in common, the radical axis is the line joining these points. The equation $x^2 + y^2 + 2kx + c = 0$ represents, for different values of c, different circles of which any two have OY for radical axis. These circles are said to form a coaxial system. If c is negative, all the circles pass through the same two points on OY. If c is positive, none of the circles intersects. In either case one circle of the system may be found to pass through any given point not on OY.

The equation of the tangent at a point (x_1, y_1) on the circle *(2)* may be shown to be

$$x_1x + y_1y + a(x + x_1) + b(y + y_1) + c = 0 \qquad (4)$$

If, however, (x_1, y_1) is not on but outside the circle, equation *(4)* represents the polar of (x_1, y_1), that is, the straight line joining the points of contact of tangents from (x_1, y_1).

Mensuration **of** the Circle.—The ratio of the length of the circumference to the diameter is the same for all circles. This number can only be calculated approximately, and is 3.141592-*65358979323846* as far as *20* places of decimals. The true value of this number is always denoted by π, and has been recognized from antiquity as a most important constant.

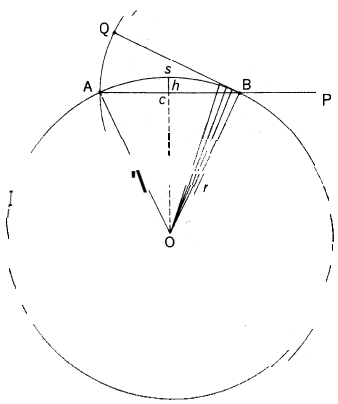

FIG. 4.—METHOD OF DETERMINING THE AREA OF A CIRCLE (see TEXT)

The fraction $\frac{22}{7}$ may be used as a rough approximation to **a.** Mathematicians have devoted an incredible amount of time to the calculation of this number, even reaching hundreds of decimal places. It is difficult to believe, however, that more than about ten figures could ever be put to any practical use; in fact 3.1415-*926* is likely to serve well enough. If r is the radius, the length of the whole circumference is $2\pi r$.

Let s measure the arc AB, c the chord AB, and h the distance from the middle of the arc to the chord. By dividing up the area of the sector AOB as suggested (fig. *4)*, and reasoning from the sum of a number of small triangles, it is inferred that the *area of the sector* is $\frac{1}{2}rs$; the area of the whole circle is $\frac{1}{2}r \times 2\pi r = \pi r^2$.

It has long been known that no construction by ruler and compasses can furnish a straight line of length equal to that of the circumference of a given circle, or a square equal in area to a given circle; though in ancient times "squaring the circle" was considered an important unsolved problem. Also a straight line cannot be constructed equal to any given arc of a circle, though approximate methods exist which work well for an arc which is not too large compared with the radius. For instance, produce AB to P, making $BP = \frac{1}{2}$ AB. With centre P and radius PA draw an arc cutting at Q the tangent at B. Then BQ = the arc AB approximately. For an arc forming a quarter circle the error is about one part in *300.* For $\frac{1}{36}$ of the circumference the error is less than one in a million. An approximate relation between c, h and s is $s = c + 8h^2/(3c)$. For a value of h less than $\frac{1}{12}$ of c, this gives s to within $\frac{1}{10,000}$ of its value. The radius of the circle does not appear in this relation. As an example of its use, if $c = 144$, and $s = 144.2$, then $h = 3.3$.

CIRCUIT, in electrical engineering, is a path for transmitting electric current. *See* ELECTRICITY: *Direct-Current Circuits;* ELECTRICITY, CONDUCTION OF; also references under "Circuit" in the Index volume.

CIRCUIT COURT, one of many titles for judicial tribunals, usually applied to trial courts of general jurisdiction but occasionally, as with the United States courts of appeal, to intermediate appellate courts. The title originally referred to a court that made a circuit traveling through the geographic area assigned to it. *See* COURT; ASSIZE. (P. B. K.)

CIRCUIT RIDER, a characteristic American Methodist frontier institution, was originated in England by John Wesley and taken to America by Francis Asbury (*q.v.*) and his fellow labourers in *1771;* in fact, however, Robert Strawbridge had been riding circuit in the colonies since about *1764.* Asbury himself for *45* years traveled on horseback at the rate of *5,000* mi. a year, preaching twice a day on weekdays and three times on Sunday.

Each circuit was under the supervision of a Wesleyan conference preacher who might have any number of lay assistants. Any young man who showed aptness for public speaking and willingness to endure the hardships of traveling in the saddle for weeks over wild country might become an assistant and finally a circuit rider. The salary was $64 a year until *1800,* when it was raised to *$80* with the horse furnished by the circuit. There were few meeting-houses. and services were held in cabins, barrooms or in the open. Circuit riders were a considerable religious and moral force along the frontier, and they were largely responsible for the even distribution of Methodism throughout the United States. Best known of them was Peter Cartwright (*q.v.*), whose *Azrtobiography (1856;* often reprinted) is one of the best sources of information on the circuit rider's life.

See W. W. Sweet (ed), *The Rise of Methodism in the West.*

CIRCULATION OF BLOOD means the movement of the blood through the body, from the heart by way of the arteries and back to the heart by way of the veins. Its function is to carry nutrient and oxygen to the body tissues and to remove from them the waste products of metabolism.

The unicellular organism receives all the supplies necessary for its growth and maintenance directly from its environment, either by diffusion of substances held in solution or by direct intake of foodstuffs, which undergo chemical disintegration in vacuoles containing liquid into which the necessary enzymes are secreted. In the multicellular organism, such direct intake of foodstuffs by diffusion by every individual cell is impossible, for only the outer

layer of cells is in contact with the environment and this layer is usually protected by some form of membrane that is impermeable to water and food substances.

The vascular system has been developed to convey nutrient materials, etc., to the various parts of the organism, and the blood serves as intermediary between the environment and the organs of the body. This function can be fulfilled only if the blood is in continuous circulation, carrying nutrient materials and oxygen to the tissues and conveying the waste products of metabolism from the tissues to the places where they are excreted. The heart is the organ that provides the necessary energy for this circulation, and the blood vessels are the channels that convey the blood to and from the tissues.

In the case of most invertebrate animals, the blood or analogous fluid is not all enclosed in blood vessels, and the various tissues lie freely in the fluid, which is kept in constant motion. In the higher animals, however, the blood is entirely enclosed in a system of tubes. and the nutrient substances, etc., are brought into contact with the cells only after their diffusion through the thin walls of the finest blood vessels. By the force of cardiac contraction, the blood is driven through the tissues by way of thick-walled tubes, the arteries. and back to the heart by a system of thinner-walled vessels, the veins. In the tissues the blood passes through a fine meshwork of capillaries, the walls of which consist of a single layer of delicate cells. which allow a free interchange of material to take place between the blood within and the tissue fluids outside the vessel.

This article is organized as follows:

I. THE HEART

In fishes (fig. 1 [A]) the heart consists of one atrium and one ventricle. The blood is received from the great veins into the atrium. By the contraction of the atrium the blood is forced into the ventricle, and this, when it contracts, sends the blood on to the bulbus arteriosus. The blood passes through the branchial arteries into the gills, where it takes up oxygen, and then flows on into the aorta, by which it is distributed to the organs of the body. From the capillaries of these organs the blood is collected by the veins and is carried once more back to the atrium. The fish heart is thus entirely on the venous side of the vascular system.

In amphibia, such as the frog, the heart consists of two atria and but one ventricle (fig. 1 [B]). The right atrium receives venous blood from the body and by its contraction forces the blood into the ventricle. From the ventricle the blood passes into the aorta, whence it is carried partly by the pulmonary artery to the lungs, partly by other arteries to the different organs of the body. The blood, which has passed through the lungs and has been oxygenated, flows through the pulmonary veins to the left atrium, whence it passes into the ventricle and mixes with the venous blood which is arriving from the right atrium. The pulmonary circulation is thus merely a branch of the general or systemic circulation. The bulbus arteriosus in the frog is divided into two parts by means of a spiral valve, by which a partial separation of the blood coming from the right and left atria is effected, and the venous blood from the right atrium is directed especially into the pulmonary artery.

FIG. 1.— DIAGRAM OF CIRCULATORY SYSTEM IN (A) FISH. (B) AMPHIBIAN (FROG). (C) MAMMAL. ILLUSTRATING DEVELOPMENT OF VASCULAR SYSTEM AND SEPARATION OF SYSTEMIC CIRCULATION FROM PULMONARY CIRCULATION

1. Course of the Circulation in Mammals.—In mammals and birds the heart has become entirely divided into two halves. right and left, which have no direct communication with one another (fig. 1 [C]). The right atrium receives the venous blood from all parts of the body. From the right atrium, the blood passes to the right ventricle, and from there it is forced into the lungs along the pulmonary artery. In the lungs it loses wastes, takes up oxygen and then is returned by the pulmonary veins to the left atrium and to the ventricle. The left ventricle forces the blood into the aorta, whence by the branching arteries it is carried to all parts of the body.

There are thus two circulations—the one pulmonary, from the right side of the heart to the pulmonary artery and the capillaries of the lungs and to the left side of the heart by the pulmonary veins; the other systemic, from the left side of the heart, by the aorta, to the arteries and capillaries of the body tissues and organs. from which by the veins to the right side of the heart.

A schematic representation of the circulatory system is given in fig. 2. The muscular walls of the right ventricle are much thinner than those of the left ventricle. This is so because the energy required of the left ventricle must exceed that of the right ventricle, as resistance in the systemic circuit exceeds that in the pulmonary circuit.

The heart becomes filled with venous blood during its relaxation, or diastole, and forces the blood into the arteries during its contraction, or systole. The large arteries are of smaller capacity than the corresponding veins, and their walls are essentially extensile and elastic. The small arteries and arterioles are essentially muscular tubes and can vary considerably in diameter. The arterioles open into the capillaries, and these are so numerous that each organ may be regarded as a sponge full of blood. The skeletal muscles and the muscular walls of the viscera at each contraction express the blood within them and materially influence the circulation. The whole muscular system must therefore be regarded as an accessory pump to

FIG. 3.— DIRECTION OF BLOOD FLOW SHOWN THROUGH HEART CHAMBERS AND VALVES

the vascular system. The veins are of larger calibre than the corresponding arteries and have tough and less extensile walls. The veins are not, as a rule, distended with blood to their full capacity. Their capacity is so great that all the blood of the body can collect within the veins.

The heart and lungs are placed within the thoracic cavity, the floor of which is formed by the muscular diaphragm; the heart is itself enclosed in a tough inextensile bag, the pericardium, the function of which is to check overdilatation of the heart. Below the heart, the pericardium is fixed to the central tendinous part of the diaphragm; above, it is suspended by the mediastinum. Because of this fixed position of the pericardium, the heart is prevented from oscillating.

2. The Valves of the Heart.— As regards the valves of the heart (fig. 3), the tricuspid guards the right atrioventricular opening, and consists of three flaps of fibrous tissue covered, like all the internal surfaces of the heart, with a smooth. shining membrane, the endocardium. The flaps are continuous at their base, forming an annular membrane surrounding the opening. The bicuspid (or mitral) valve consists of two cusps, and it guards the left atrioventricular opening. The undersurface and free edge of each cusp of these valves are attached by chordae tendineae to two papillary muscles; these are pillars of muscle which rise up from the inner surface of the ventricles.

The papillary muscles and chordae tendineae pull down the diaphragm formed by the closed valves (the floor of the auricles), thus expanding the atria and enabling the valvular as well as the muscular parts of the wall of the ventricles to approach together and force out the blood. The ventricles are never completely emptied, for some blood remains in contact with the atrioventricular valves up to the end of systole and ensures their closure. The aortic and pulmonary valves consist of three semilunar, pocket-shaped cusps. A fibrous nodule is placed centrally in the free edge of each cusp, whence numerous tendinous fibres radiate to the attached borders of the cusp. Opposite the aortic cusps are bulging of the walls—the aortic sinuses (of Valsalva). From the anterior one arises the right coronary artery, and from the left posterior arises the left coronary artery; these vessels supply the substance of the heart with blood.

3. Fetal Circulation.— The fetus has no independent respiration or digestion and therefore depends entirely on the oxygen and nutritive substances that diffuse through the placenta from the mother's blood (fig. 4). The purified blood flowing from the placenta through the umbilical vein is partly conveyed to the inferior vena cava by means of the ductus venosus. Even a greater quantity mingles, within the liver, with the portal stream returning blood from the intestine; from the liver it is conveyed to the vena cava by the hepatic veins. The oxygenated blood flowing from the placenta becomes mixed in the vena cava with the venous blood which has returned from the trunk and the lower extremities. In the right atrium it would also become freely mixed with the venous blood returning from the head and upper extremities were it not for a special arrangement which impedes but does not entirely prevent this mixture.

The presence of a special valve of the inferior vena cava (Eustachian valve) directs the upward stream into. the left side of the heart through the foramen ovale—an opening in the interatrial septum—while the venous current from the superior vena cava is directed into the right ventricle. When the ventricles contract, the purer blood contained in the left ventricle is expelled into the ascending aorta and thence to the head and upper extremities, while the venous blood of the right ventricle is expelled into the pulmonary artery and then through the ductus arteriosus (which branches off from the pulmonary artery before it passes into the lungs) into the descending aorta. This separation of the two streams is not perfect, but it is responsible for the fact that the upper parts of the fetus receive blood that contains more oxygen than that received by the lower parts. This is possibly the reason why the head and the arms of the fetus are always considerably more developed than the pelvis and legs. A portion of the blood flowing through the descending aorta enters the two umbilical arteries and is conveyed to the placenta, where it is reoxygenated.

At birth, the course of circulation undergoes changes. As soon as the lungs become distended by the first respiration, a portion of blood is diverted from the pulmonary artery into the lungs. As the pulmonary circulation increases, the ductus arteriosus becomes functionless and slowly turns into a ligament. The foramen ovale between the atria also becomes closed. The circulation, which in the fetus was carried out upon the plan of that of the higher reptiles, becomes that of the warm-blooded animal, and the venous blood becomes separated from the arterial blood. After birth the umbilical arteries and vein shrink, close up and then form the ligaments of the bladder and the ligamentum teres of the liver. The ductus venosus becomes the ligamentum venosum.

4. Physiological Properties of the Heart.— The cardiac muscle must be regarded as endowed with four fundamental properties; viz., rhythmicity, the function of originating its impulse; conductivity, the function of transmitting the impulse; irritability, the function of responding to stimuli; and contractility, the function of developing tension which may be utilized for performing the work of circulating the blood.

Rhythmicity.— The cause of the heart beat has naturally been one of the most continued subjects of inquiry. H. Allen in 1757 was the first to show that the activity of the heart is not dependent on its connections with the nervous system. The heart is controlled and influenced by the nervous system, but this control is not essential for life. The excised heart of a frog continues to beat rhythmically for days, provided that it is supplied with oxygen and prevented from drying. In the case of the warm,-blooded animal, the heart is similarly capable of continuing its rhythmic contractions for some time after excision.

The frog's heart consists of a sinus venosus, which receives the venous blood from the body, two atria, the ventricle and the bulbus

FIG. 4.—HUMAN FETAL CIRCULATION AND PROBABLE COURSE OF BLOOD THROUGH (1) **DUCTUS ARTERIOSUS**; (2) FORAMEN **OVALE**; (3) **DUCTUS VENOSUS**; (4) UMBILICAL VEIN: (5) UMBILICAL ARTERIES

arteriosus, which divides into the two aortas. The frog's heart in the body, or after excision from the body, beats regularly, the contractions starting in the sinus, then traveling to the atria, ventricles and bulbus.

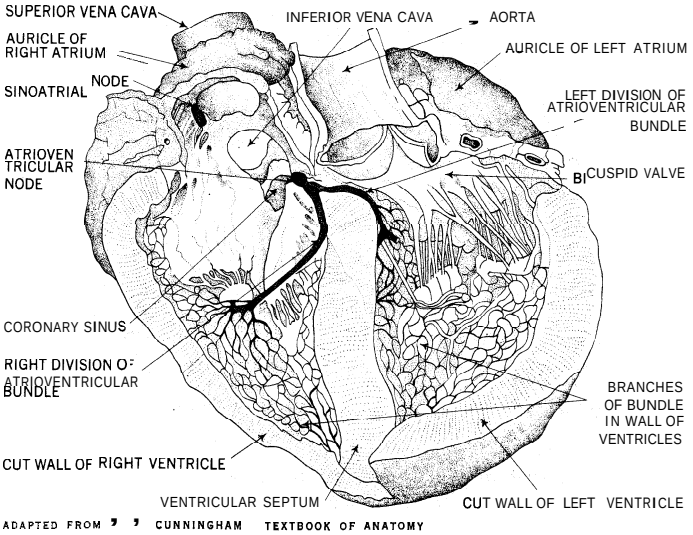
At one time the rhythmic contraction of the heart was attributed to the action of groups of nerve cells in the sinus that mere discovered by Robert Remak in 1848. Some experimental support for this theory, which is known as the neurogenic theory of the heart beat, was given by Stannius, who demonstrated that the atrium and ventricle of the frog's heart cease to beat for some time if the sinus is tied off with a ligature. while the sinus goes on beating regularly. Further experiments have shown, however that the beat of the heart cannot be ascribed to the rhythmic activity of these ganglion cells, for every strip of the heart muscle is capable of rhythmic action. whether it contains nerve cells or not In the developing chick, the heart contracts by the 29th hour of incubation, while the nerves do not grow into the heart before the 6th day. The inherent power of rhythmic contraction belongs to the cardiac muscle itself (the myogenic theory of the heart beat)

Furthermore, the power to contract rhythmically belongs to every part of the heart, but there is a descending scale of this automatic power, from the sinus where it is highest to the lower parts of the ventricle where it is very slight (Gaskell). The normal sequence of contraction of the four parts is determined by the natural rhythm of these parts, but in the whole heart it is impossible for the ventricle to contract at its own rhythm because before it is ready to beat again, after a preceding contraction, it receives an impulse from the atrium. In the same way. the atrium never beats at its own rhythm; it is always subordinated to the faster rate of impulses coming from the sinus. If, however, the ventricle is electrically stimulated at a rate slightly faster than the beat of the sinus, the normal sequence of contractions becomes reversed, the ventricle now contracting first and the sinus last. Experiments tend to confirm the myogenic theory of the heart beat.

The mammalian heart lacks a separate sinus venosus, yet its contractions are as regular and as independent of the nervous system as those of the lower vertebrates. Both in the heart in situ and in the excised heart the two atria contract together, and after a short interval there follows the contraction of the two ventricles

In the mammalian heart. within the region where the superior vena cava opens into the right atrium, there lies a club-shaped formation known as the sinoatrial or S-A node; functionally it is identical with the sinus of the amphibian and reptilian heart The node is composed of slender fusiform cells with little striation It can be considered as definitely proved that. in the normal heart, the sinus serves as the centre in which the stimulus for the cardiac contraction originates The S-A node is however, by no means the only place in which the impulses for the heart can originate The seat of these rhythmically recurring impulses may shift to some other portion of the heart since, as in the frog's heart, the function of rhythmicity is potentially present in every part of the heart, and the S-A node governs the rate of the whole heart only in virtue of its faster rate of discharge of these impulses. On this account the S-A node has often been described as the "pacemaker" of the heart. Other centres in which the impulses sometimes originate, and which in certain cases may gain mastery over the whole heart, are known as ectopic centres.

It has been shown that a very distinctive system of muscle fibres lies enclosed within its own sheath beneath the endocardium. This system is known as the conducting system of the heart. It begins as a few strands of fibres in the region of the coronary sinus; these strands converge in a thickening which is known as the atrioventricular or A-V node; it is composed of the same type of cells as the S-A node. The two nodes are not connected with each other but are divided by the ordinary contractile elements of the auricle. From the A-V node, a thin bundle of tissue passes through the atrioventricular septum toward the ventricle. This bundle was first described by Wilhelm His and is known as the A-V bundle of His. On penetrating the interventricular septum, the bundle divides into two branches, which pass to the right and left ventricle respectively. The two branches divide and subdivide, forming an arborization on the inner surface of the ventricles (fig. 5).



ADAPTED FROM ' ' CUNNINGHAM TEXTBOOK OF ANATOMY

FIG ' —CONDUCTING SYSTEM OF THE HEART, SHOWN ON A SPECIMEN WITH FRONT WALLS REMOVED

Various parts of the conducting system may become centres of ectopic rhythms. If the S-A node is destroyed or injured. or if the irritability of the A-V node is increased, the latter assumes the role of initiating the heart beat. Many nervous and other influences may modify the relative irritability of the two nodes, and a shift of the pacemaker from one to the other may occur temporarily even under normal conditions. Destruction of the A-V bundle is equivalent to a complete functional separation of the ventricles from the atria. The ventricles develop a rhythm of their own, the idioventricular rhythm. Both ventricles, however, continue to contract together, the centre for their activity being localized in the higher part of the bundle. It is probable that still lower centres may assume a rhythmicity, but it is doubtful whether these can ever dominate the rhythm of the whole heart. Their significance consists rather in the fact that they serve to disturb some other dominant rhythm.

Thus, every part of the heart may serve as a centre of origin of an impulse. The natural rate of the discharges of these centres is in the following descending order: the S-A node, the A-V node, the bundle, its branches and muscle. If several centres are active simultaneously, the rate of the heart as a whole will be dominated by that centre which discharges most frequently.

The "normal" heart rate presents considerable variations in different individuals and in different species of animals For man it may be estimated at 68 to 76 beats per minute and for woman 74 to 80; but the normal rate for some individuals may be much lower (50) or much higher (go). Small animals as a rule have a higher heart rate than large animals; *e.g.*, elephant 25–28, horse and ox 36–50, sheep 60–80, dog 100–120, rabbit 150–180, mouse 700. Small birds such as the canary have the extremely high rate of 1,000 beats per minute. Usually in man, under normal conditions, the heart rate declines with age. While at birth it is about 140, it is 100–110 at the age of five; in childhood it is about go and in the adult about 70. In old age it accelerates slightly and becomes about 80.

Conductivity.—The impulses that originate in the S-A node spread along the ordinary muscular tissue to every part of the atria. The rate of conduction in the atrium ranges from 600 to 1,200 mm. per second. In its fanlike spread, the excitation wave reaches the A-V node. There is no indication of a preferential path of conduction between the two nodes, so that the impulse travels at the rate over the atrium and reaches the A-V node about 0.03 second after the origin of the impulse. In the A-V node the rate of conduction is considerably slower, the impulse passing the node at about 150–200 mm, per second. Once it has passed the node, the impulse travels rapidly down the bundle and its ramifications at the rate of about 5,000 mm. per second.

The slow conduction in the A-V node and the rapid conduction in the bundle tissue ensure two important features of cardiac ac-

tivity. Because of the former, atrial contraction is given time to end before the onset of the ventricular contraction, and because of the latter the impulse arrives at every part of the ventricle at approximately the same time. Thus the whole ventricular muscle contracts approximately at the same time, which is a condition necessary for the development of a high pressure in the ventricular cavities.

Irritability.—When a skeletal muscle is stimulated by an increasing strength of electrical stimulus, it responds by an increasing strength of contraction, until a certain maximum is reached. A heart under the same conditions gives a contraction which is maximal for a given condition of the heart in response to the first effective stimulus; further increase in the strength of the stimulus does not lead to an increase in the strength of the response. This difference between the skeletal and the cardiac muscle is not due to fundamentally different properties but depends on the fact that in cardiac muscle the muscle fibrils are in free intercommunication within a syncytium, and in this way a stimulus which originates in one part spreads over the whole of the organ; by contrast, in the skeletal muscle the contractile fibrils are collected into muscle fibres which are separated by the homogeneous coat of the sarcolemma. Since the threshold value of a stimulus which will evoke contraction is different for the different muscle cells, it is only to be expected that a greater number of these cells will contract in the skeletal muscle when the stimulus is strengthened, the result being a stronger total effect of contraction of the muscle. In the heart, when a stimulus evokes a contraction of a few fibres, this contraction will spread over the whole heart, so that with increase in the stimulus there is no further strengthening of the contraction. This behaviour of the heart is known as the All-or-None Law (*q.v.*). It is most evident in the cardiac muscle but is not peculiar to it.

The irritability of the heart undergoes rhythmical variations that are determined by the heart beat itself. Like all excitable tissues. the heart exhibits the phenomenon of the refractory period, which is a period of loss of irritability following each impulse that evokes a contractile response. In the heart this period is extremely prolonged, lasting as long as the contraction of the heart. If a second stimulus is applied to the heart during the contraction evoked as a response to the first stimulus, it is found that it has no effect. In the skeletal muscle, because of the fact that the refractory period is shorter than the time occupied by the contraction, a second stimulus evokes a second contraction, or a summation of the two contractions. The period of complete loss of irritability is followed by gradual recovery, after which there is a phase of supernormal irritability before it returns to the normal.

The length of the refractory period depends in the first place on the strength of the contraction of the heart. Thus drugs and physiological conditions which strengthen the heart beat also increase its refractory period. Of greater significance, however, is the relation of the refractory period to the rate of the heart beat. Thomas Lewis found that the duration of the refractory period of mammalian atrial muscle contracting 100, 130 and 250 times per minute was 0.2, 0.15 and 0.01 seconds, respectively.

It is obvious that as a result of the shortening of the refractory period the heart is able to respond to more rapid rates of excitation than would otherwise be possible. As soon, however, as stimuli occur at intervals which are shorter than the refractory period, alternate stimuli will fail to evoke any response, the heart beating at a half-rhythm or 2:1 response. The change from a 1:1 to a 2:1 response does not occur abruptly. Between these rates there exists a phase in which large and small beats alternate; with further acceleration of the stimulation, some beats are dropped, and with a still further acceleration a regular 2:1 rate sets in. This stage of irregular response is due to the fact that apparently all the parts of the cardiac muscle have not the same minimal refractory period, and consequently at some definite rate of excitation parts of the heart will contract in response to every stimulus while other parts will respond by a 2:1 rate.

Contractility.—The strength of contraction of the heart is independent of the strength of the stimulus. It is, however, highly dependent on the condition of the cardiac muscle. Any interference with the nutrition of the heart, inadequacy of the oxygen supply or accumulation of the products of metabolism such as carbonic acid or lactic acid will lead to a weakening of the contractile response and even to a complete loss of contractility.

There is also a physiological factor of primary importance which modifies the strength of contraction. Briefly it can be stated that, other conditions being equal, the greater the filling of the heart during diastole, the stronger is the following systole. This dependence of strength of contraction is so marked and is of such importance for the whole circulation that E. H. Starling named it the Law of the Heart. It must be remembered, however, that it is not a feature peculiar to the cardiac muscle alone; it belongs to all contractile tissues, whether heart, skeletal muscle or plain muscle, but in the heart it is of a greater immediate vital importance. The practical significance is obvious; it enables the heart to eject the amount of blood which it receives during diastole, whether small or large, and thus enables the heart to adapt its beat to considerable variations of the blood flow without changing its rate. A dog's heart weighing 50 g. can put out 100 or 3,000 c.c. of blood per minute without changes of the heart rate.

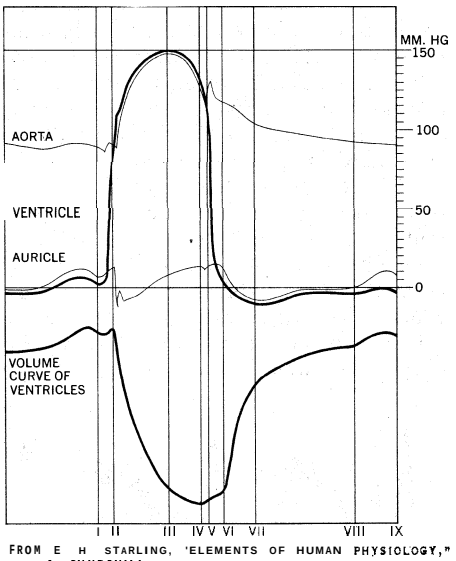
This remarkable adaptation is due to the fact that the larger the output, the more the heart will be filled during each period of relaxation (diastole), and hence its contraction (systole) will be stronger, so that the heart will empty itself of the extra amount of blood. When a heart is in good condition, it performs a given amount of work with a smaller diastolic volume than when the contractility of the heart becomes impaired. The same work may be performed in both cases. but in the second case in order to do the work the heart has to dilate, because at the previous diastolic volume its contractions would be too weak. The dilation of the heart at constant work is thus the first sign of impairment of its functions.

5. Sequence of Events in the Cardiac Cycle.—The time relation between the different events occurring during a cardiac cycle can be most satisfactorily determined by measuring pressure changes in the different cavities of the heart and in the aorta.

The apparatus almost universally used for this purpose is known as the optical manometer. It consists of a small glass or metal tube which can be introduced directly into one of the cavities of the heart. The tube is filled with fluid, and the outside opening is sealed with a thin rubber membrane which carries an excentrally placed small and light splinter of a mirror. A beam of light reflected from the mirror is made to play on a moving photographic plate or film, and thus the minute movements of the membrane, which are of course proportional to the pressure changes, are greatly magnified without the danger of increasing the inertia of the apparatus.

The pressure changes in the heart (fig. 6) were described by Starling as follows (using the old term "auricle" for "atrium"):

The cardiac cycle begins with the contraction of the auricles, which may or may not give rise to a slight rise of pressure in the ventricles. As the auricular contraction dies away, the ventricular contraction begins at I. This causes a very rapid rise of pressure. Almost immediately after the beginning of the rise, the auriculo-ventricular valves close. The pressure then rises rapidly



FROM E H STARLING, 'ELEMENTS OF HUMAN PHYSIOLOGY," J & A CHURCHILL

FIG. 6.—PRESSURE CURVES FROM AORTA, VENTRICLE AND LEFT ATRIUM, TOGETHER WITH VOLUME CURVE OF THE TWO VENTRICLES DURING ONE COMPLETE CARDIAC CYCLE (MODIFIED FROM WIGGERS) (*see* TEXT)

in the ventricular cavity. During this period, the contraction of the ventricular muscle is isometric. It is raising the pressure within the ventricles without causing any change in its contents, or in the length of the muscle fibres. Directly the pressure exceeds that in the aorta, the aortic valves open at the point marked II, and the aortic pressure thereafter rises with the ventricular pressure. During the whole duration of the ventricular contraction, the aortic pressure remains somewhat below the ventricular pressure, showing that the blood is flowing continuously from the ventricle into the aorta. The ejection of blood is at first rapid, so that the pressure in the ventricles continues to rise. As the heart gets smaller, the amount of blood ejected into the aorta becomes less than that flowing out in the unit of time through the peripheral branches, so that the pressure begins to fall in the aorta and ventricle, even though the outflow of blood is still going on. The ejection period may therefore be divided into two phases, that of maximum ejection and that of reduced ejection. The ventricular muscle suddenly relaxes at the point marked IV, causing a sudden fall of pressure in the ventricle and a slight fall in the aorta. The latter is, however, arrested almost at once by the closure of the aortic valves, marked by the sharp depression, the ***dicrotic notch***, in the aortic tracing. The pressure in the ventricle continues to fall until at the point VI it drops below that in the auricle and the auriculo-ventricular valves open, allowing the inflow of blood from the pulmonary veins and auricles. Between V and VI the relaxation is isometric, since all the valves guarding the orifices of the ventricles are closed.

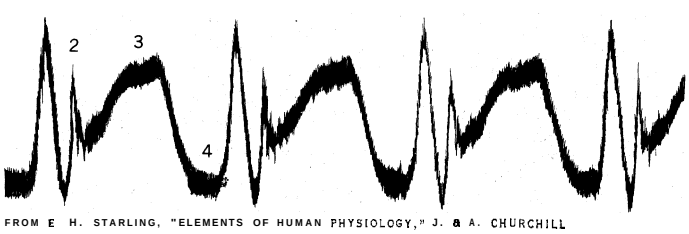
The pressure in the ventricles then continues to fall more slowly until it reaches the line of zero pressure, and remains at or near this line during the greater part of diastole. With a big inflow there may be a slight rise towards the end of diastole, which may be accentuated by the auricular contraction. If the chest is opened the pressure in the ventricle never sinks below zero during any part of diastole. In the closed chest the pressure in the heart cavities during diastole will be neeative. on account of the negative pressure within the thorax.

The duration of the separate phases of the heart beat depends naturally on the rate of the beat. In all cases of change of heart rate, the period of diastole is affected relatively much more than the period of systole. Because of the absence of valves between the atria and the large veins, changes of pressure within the auricle will be transmitted along the veins.

In every case the atrial pressure tracing exhibits the following features (fig. 7): (1) the first positive wave, which occurs during atrial systole; (2) the second positive wave. which is due to the sharp closure of the atrioventricular valves; (3) the third positive wave, which is due to the filling of the atria while the atrioventricular valves are closed; (4) a negative wave, which is due to the rapid emptying of the atrium after the opening of the atrioventricular valves. The chief function of the atrium is not to propel blood into the ventricle by its contraction but to serve together with the big veins as a reservoir for the blood which flows in from the body but which cannot enter the ventricle while the latter is in a state of contraction.

6. The **Apex** Beat. — The pulsation that is felt over the region of the heart is known as the apex beat and was formerly thought to be attributable to the twisting forward of the apex at each systole. Its origin, however, is different. During diastole the ventricles form a flabby flattened cone, lying against the chest wall and slightly depressed by the latter. In systole the ventricles become hard and rigid and assume the form of a rounded cone. This sudden change in shape and hardening of the ventricular wall pushes out that part of the chest wall which is in immediate proximity to the ventricle, giving rise to the apex beat.

7. The Sounds of the Heart. — When the ear is applied to the chest above the cardiac region, two sounds may be heard; the first, which is heard most intensely over the apex, is a duller and longer sound than the second, which is heard best over the base of the heart. The first and second sounds resemble the syllables *lubb dup—lubb dup*. The first sound is of twofold origin. It arises from the sudden closure of the atrioventricular valves and from the contraction of the thick muscular wall of the ventricles. The second sound is due to the sharp closure of the aortic and pulmonary valves.

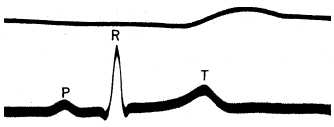


FROM E H. STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY," J. & A. CHURCHILL

FIG. 7.— CURVESOF PRESSURES IN LEFT ATRIUM OF CAT (AFTER STRAUB) (see TEXT)

When fluid escapes through a narrow orifice, vibrations are set up in the fluid giving rise to various sounds. Under normal conditions, when the valves of the heart are closed completely, sounds produced in this way are either absent or negligible; in abnormal conditions (*e.g.*, after disease affecting the orifices of the heart or the valves) these vibrations may become loud enough to be easily heard. These murmurs or bruits, as they are called, are of great importance, for they enable the physician to judge the condition of the valves and to determine which valve is affected.

8. The Electrocardiogram. — The contractions of the different cavities of the heart are accompanied by electrical changes which can be recorded if any two parts of the heart are connected to a sensitive galvanometer. The apparatus which is generally used for this purpose is the string galvanometer, in which a very delicate thread of silvered quartz or of platinum is stretched between the poles of a strong magnet. If the connection is made not with the heart itself but with tissues which are in contact with the heart, the electrical changes at each heart beat can still be obtained. An electrocardiogram so obtained is reproduced in fig. 8.



FROM E H STARLING. 'ELEMENTS OF HUMAN PHYSIOLOGY,' J & A CHURCHILL

FIG. 8.—(BELOW) ELECTROCARDIOGRAM OF MAN, OBTAINED BY LEADING OFF FROM THE TWO HANDS TO A STRING GALVANOMETER: (ABOVE) THE CAROTID (ARTERIAL) PULSE TRACING TAKEN AT THE SAME TIME (*see* TEXT)

The deflection P is due to the atrial contraction, and QRS marks the beginning of the ventricular contraction. Thus the P-R interval represents the period between the atrial and ventricular contractions. The total duration of the excitatory state of the ventricle is measured by the distance between Q and T. A case of A-V block, as for instance in Adams-Stokes's disease, is shown at once on the electrocardiogram by the dissociation of the normal relations between the atrial and ventricular deflections. A delay in conduction of tht excitatory wave is accompanied by a prolongation of the P-R interval, while a beat originating from the A-V node instead of the S-A node is immediately shown by a shortening or even disappearance of the P-R interval. The exact origin of the T wave is not known. The electrocardiogram has become an important aid in the study and diagnosis of abnormal heart activities.

9. The Isolated Mammalian Heart. — The nutrition of the mammalian heart is carried out by means of the coronary arteries, which leave the aorta at the place of its origin. A mammalian heart which has been removed after the death of the animal can easily by revived if the coronary arteries are perfused under pressure with blood or a salt solution which resembles the saline medium of the blood in composition. This procedure was first introduced by K. F. W. Ludwig for the frog's heart and by O. Langendorff for the mammalian heart. Sydney Ringer first determined the exact amount and type of salts necessary for the most successful survival of the frog's heart, and F. S. Locke modified Ringer's solution for the mammalian heart. With the use of such a solution, a mammalian heart can be restored to activity as long as seven days after death. The beat of the isolated heart of a child can be restored 20 hours after death from pneumonia. The excised heart of a cat can be keptbeating for four days. The heart of a monkey was restored after freezing the dead body of the animal.

Conditions Essential for the Heart Beat. — For perfusion experiments, a cannula is tied in the aorta pointing to the heart. The pressure of the column of fluid closes the aortic valves, and the only way of escape is through the coronary arteries; after having passed through the heart muscle, the fluid flows out of the coronary veins. In this manner it is possible to study the influences directly affecting the heart beat and the coronary blood vessels.

The first and most essential condition for reviving a heart is an abundant supply of oxygen; the second is the maintenance of the

perfusion fluid at a reaction similar to that of blood; *i.e.,* slightly on the alkaline side of neutrality (sodium bicarbonate is usually added for this purpose). A third important factor is the maintenance of the temperature within physiological limits. An increase in temperature causes an increase in heart rate, but at about 44°–45° C. the beat ceases entirely. At temperatures ranging from 13° to 19° C. the beat ceases, but on rewarming the co-ordinated contractions are re-established. In all these cases the effect of temperature is primarily on the S-A node, and warming or cooling the node duplicates the effect of warming or cooling the perfusion fluid, except that at some stage the lower rhythm centre of the heart will begin to be dominant, whereas in the cooling of the whole heart the rhythm of all the centres becomes depressed.

The main purpose of the sodium chloride in the fluid is to keep the osmotic pressure of the fluid the same as that of blood. Calcium and potassium, however, have a direct influence on the contractility of the heart. After a short perfusion with a fluid that lacks calcium and potassium, the heart soon stops beating altogether. Addition of calcium salts will immediately evoke contractions, which will grow in force, but the heart will soon fail to relax completely and will gradually stop in systole. On addition of potassium salts, the heart resumes a normal beat. Excess of calcium salts leads to a systolic standstill, and excess of potassium salts leads to a diastolic standstill. The normal activity can proceed only if salts of both calcium and potassium are present in the proper proportions.

The Heart-Lung *Preparation*.—A great advance in the study of the heart was made when Starling succeeded in investigating the heart under conditions like those of the perfused heart but with the great advantage that the heart performed work and pumped blood in exactly the same way as in the whole animal. The arrangement of the method is shown in fig. 9.

Artificial respiration being maintained, the chest is opened under an anesthetic. Cannulae are placed in the brachiocephalic artery and the superior vena cava. All other blood vessels going to and from the heart are tied off. The blood emerging from the heart is made to flow against an artificial variable resistance (R), through a glass spiral immersed in warm water, into a reservoir. From the reservoir the blood flows through the superior vena cava into the heart. The aortic blood pressure can be varied in this preparation by changing the artificial resistance against which the heart is made to aork.

The output of the heart can be measured at any time by opening the tube X, clamping tube Y and allowing the blood to flow into a graduated cylinder. The volume changes of the heart at each beat can be measured by the so-called cardiometric method. A glass cardiometer of the shape shown in fig 10 is fitted over the beating heart. The opened pericardium is tied around the lip of the cardiometer, which is then connected with a tambour with a slack rubber membrane. The movements of this membrane are recorded by a lever on the smoked surface of a revolving drum. The difference between the diastolic and the systolic volume thus recorded is obviously equal to the amount of blood put out by the two ventricles during a single heart beat.

FROM E H STARLING ELEMENTS OF HUMAN PHYSIOLOGY J & A CHURCHILL

FIG 10 — HENDERSON'S GLASS CARDIOMETER, USED IN MEASURING VOLUME CHANGES OF THE HEART (*see* TEXT)

This preparation enabled Starling and his co-workers to study the main features of the physiological activity of the heart. It was found that the heart itself cannot modify the blood flow and that within wide variations of the heart rate and of the arterial resistance against which the heart beats. the output remains constant provided the inflow is not changed. This means that the heart will adapt the strength of its beat within very wide limits and will perform the work required if it is within the functional capacity of the organ. If the inflow into the heart is, say, 1,000 c.c. a minute. this output will be maintained if the heart rate is 100 or 200 beats per minute, or if it has to beat against a pressure of 60 or 160 mm. of mercury. Increase in the heart rate does not modify the output, but it increases the maximum amount of blood which the heart is able to expel, since at the faster heart rates the inflow of blood can be increased without causing overdistension of the ventricles. Another important observation made by Starling was that, in the heart-lung preparation, the heart rate is independent of the pressure against which the heart works and of the output. The heart rate is here determined by the temperature of the S-A node; *i.e.,* by the temperature of the circulating blood. It is clear that the extent of this effect will vary from heart to heart, depending on the natural rhythmicity of the node.

10. The Work of the Heart.— The energy of the contraction of the heart is expended (1) in forcing a certain amount of blood against a certain resistance presented by the arterial pressure and (2) in imparting a certain velocity to the blood. The work done by each ventricle can be calculated from the formula

$$W = Mr + \frac{Mv^2}{2g}$$

where W is the work done, M is the mass of blood expelled at each beat, r is the mean arterial pressure, v is the velocity at the root of the aorta, and g is the factor of acceleration. The work of the right ventricle is approximately one-fifth that of the left. The work of both ventricles in the human heart at rest is about 100 g.-m. per beat, which is equivalent to about 10,000 kg.-m. in 24 hours. During very strenuous muscular exercise, when the output is considerably increased, the work of the heart per beat is about 400 g.-m., or 80.000 kg.-m. in 24 hours. This rate of work could probably be maintained for not more than a few minutes.

The energy required for the cardiac contraction is derived from the oxidation of the deposits of glycogen (possibly also of fats) within the heart itself. It was found by Lovatt Evans that. on increasing the arterial pressure from 80 to 140 mm. of mercury, the oxygen consumption of a heart was increased from 228 to 404 c.c. per hour, and on increasing the output from 9.3 to 92 l. per hour it increased from 155 to 649 c.c. per hour. The maximum efficiency of the heart is of the same order as that found for skeletal muscle, 20%–28%.

11. The **Nervous Regulation** of the Heart Beat.—In the vertebrates the heart is supplied with two sets of nerve fibres: those which pass from the central nervous system in the vagus nerve, and those which pass in the sympathetic nerves (fig. 11). The cardiac fibres of the vagus terminate around nerve cells situated in the heart itself (preganglionic fibres); the ganglionic cells serve as relays from which new fibres (postganglionic fibres) emerge and run directly to the cardiac muscle and to the S-A node. The sympathetic fibres leave the spinal cord by the anterior roots mainly of the second and third thoracic nerves, run in the white rami communicantes to the stellate ganglia nhere they end; from the stellate ganglia, postganglionic fibres begin, which go to the various parts of the cardiac muscle.

The *Vagus Nerve*.—In 1845 the brothers E. H. and E. F. Weber made the important discovery that stimulation of the vagus nerve retards or even arrests the heart beat. The cardio-inhibitory nerves have since been found in all classes of vertebrates and in many invertebrates. During a stimulation of the vagi, the heart

beat is considerably retarded or stops altogether, and as the result of this the arterial blood pressure falls. Blood accumulates on the venous side of the heart and is not forced out in sufficient amount to maintain the blood pressure. If the stimulation of the vagus is prolonged, the heart often begins to beat again with a slow rhythm; this beat is seen to be confined to the ventricles only, the atria still remaining at a standstill. Such a beat is spoken of as an "escape." The ventricle is really beating at its own idioventric rhythm in response to impulses originating with itself.

A detailed study of the effect of vagus stimulation on the heart has shown that it affects all the four fundamental properties of the heart muscle (fig. 12). By inhibiting the S-A node, it depresses the rhythmicity; by affecting the conductive system, it retards the propagation of the impulse in the atrial muscle and in the A-V bundle; by affecting the muscle proper, it diminishes its contractility and each beat becomes weaker, in consequence of which the refractory period of the heart is shortened; and finally it diminishes the irritability of the heart. Whether the vagus has a direct action on the mammalian ventricle is still doubtful.

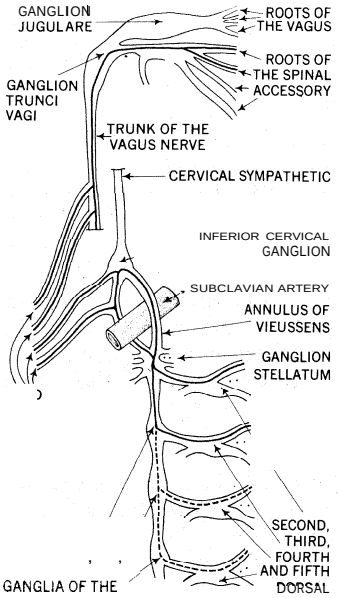

FIG. 11.—CARDIAC INHIBITORY AND ACCELERATOR FIBRES IN THE DOG (FROM FOSTER) (*see* TEXT)

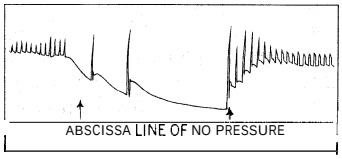
If both vagi are cut, the heart immediately begins to beat faster, showing that under normal conditions a continuous stream of impulses passes down the cardioinhibitory nerves, which do not allow the heart to beat at its full independent rate. For obvious reasons, section of the vagi cannot be performed in man, but there is available a drug that paralyzes the peripheral nerve endings of the postganglionic vagal fibres, namely atropine (*q.v.*), an alkaloid obtained from belladonna.

The question as to what controls the normal tone of the vagi has been the subject of many researches, and at present several factors are known to be concerned. Among them must be mentioned first the blood pressure. E. J. Marey was the first to show that, other conditions being equal, the vagus tone increases with increase in the blood pressure. This effect is probably due not to the direct stimulation of the vagus centre in the medulla but to stimulation by high blood pressure of special sensory endings in the aorta, in the ventricles and in some of the blood vessels going to the brain. The sensory impulses reflexly retard the heart by stimulation of the vagus centre. Changes in the composition of the blood and various drugs may also affect the vagus centre. Asphyxia and the action of morphine may be mentioned as such centrally acting stimuli; they retard the heart, but only if the vagi are intact. Reflexes from various sensory nerves may stimulate or inhibit the vagus centre; for instance, inflation of the lungs diminishes vagus tone (the Hering-Breuer reflex); increase in the output of the heart has the same effect (Bainbridge reflex). Stimulation of the respiratory passages, as in the case of inhalation of an irritant volatile substance, retards the heart, and high intracranial pressure has the same effect. There are also stimuli which may excite the peripheral nerve endings of the vagi in the heart itself; *i.e.*, substances which will act even after section of the vagi but not after injection of atropine—for instance bile salts, which enter the general circulation in the case of jaundice.



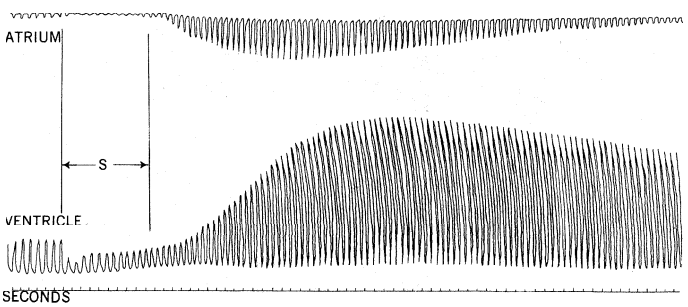
FROM E. H. STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY," J. & A. CHURCHILL

FIG. 12.— BLOOD PRESSURE TRACING FROM CAROTID OF A DOG SHOWLNG EFFECT OF EXCITATION OF VAGUS (BETWEEN ARROWS) (see TEXT)

The intimate mechanism by means of which the vagus produces its effect on the heart has been a field of intense experimentation and theorization. It has been suggested that the vagus impulses produce "interference" waves with the impulses originating in the S-A node; that the vagus is a nerve which abolishes the catabolism or distintegration processes associated with activity and leads to anabolism or reconstruction processes; that because of similarity in the effect of stimulation of the vagus with that of potassium salts, the vagus possibly liberates free potassium from a colloidal combination or from an adsorbed state from the proteins. According to Otto Loewi, the vagus acts by producing some chemical substance (of the choline type) which is the active factor. His experiments support the theory most brilliantly. If a perfused frog's heart is stopped by stimulation of the vagus, and if the perfusion fluid is collected from the heart and transferred to a beating frog's heart, the second heart will show all the effects of vagus stimulation. The chemical substance responsible has been extracted and dried; it is now generally accepted that the effective substance is acetylcholine, which is produced in the near vicinity of the nerve endings.

The Sympathetic Nerve.—Stimulation of the sympathetic cardiac nerve produces effects which are the reverse of the vagus stimulation. It increases the rate by raising the rhythmicity of the heart, augments the contractions, increases the rate of conduction of the impulse and raises the irritability of the heart. Because of the increased strength of contraction, the refractory period becomes somewhat more prolonged than that normally associated with the given heart rate. The sympathetic nerves are much less easily tired than the vagus fibres and have a longer aftereffect. In most animals the inhibitory and the accelerator fibres, which were discovered by Élie de Cyon, become mixed in the cardiac nerves, so that if these are stimulated a double effect is produced on the heart. During the period of stimulation the vagus effect predominates, but after the end of stimulation the sympathetic effect becomes apparent, and the heart accelerates and the beat increases in strength (fig. 13). Stimulation of either set of fibres before they are mixed together produces effects typical of one or the other only. In the dog, whose normal heart rate is about 100 beats per minute, stimulation of the accelerator nerves may increase it to 260 beats, and at the same time the strength of each contraction will be increased. The latter effect is most marked in hearts which have begun to fail and which are therefore dilated.

The question whether, under normal conditions, the accelerator fibres are in a state of tone like that of the inhibitory fibres of the vagus is not definitely settled. It is customary to assume the existence of such a tone but to consider it as less pronounced than that of the vagus. In most experiments, extirpation of the stellate ganglia leads to a retardation of the heart. Many observers have shown that the tonic conditions of the two centres stand in a reciprocal relation to one another. Whenever the tone of the inhibitory fibres is increased, that of the accelerator fibres is diminished; thus the final effect on the heart will be an algebraical summation of the two influences. The tone of the accelerator centre is greatly increased in asphyxia, in cerebral anemia, in the case of



FROM E. H. STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY," J. & A. CHURCHILL

FIG. 13.— TRACING TO SHOW EFFECT OF STIMULATION OF VAGOSYMPATHETIC NERVE ON FROG'S HEART (AFTER GASKELL) (DURING STIMULATION [S] THE HEART IS INHIBITED: AFTER STIMULATION IT ACCELERATES. THEN TENDS TOWARD THE NORMAL)

various sensory stimuli (especially painful stimuli) and probably in the case of muscular exercise. In the first two states, which are pathological, the tone of both nerves is increased simultaneously. Thus, in the absence of the sympathetic nerves, asphyxia produces retardation of the heart by stimulating the vagus, and in the absence of the vagus it produces an acceleration. In the presence of both nerves, it first retards the heart and may even arrest it until the vagi become paralyzed, after which the heart greatly accelerates above the normal, because of the coexistent stimulation of the sympathetic centre.

The *Suprarenal* Gland.—It has already been mentioned that the influence of the vagus can be modified by stimuli affecting the centre, or by substances which stimulate or paralyze the peripheral nerve endings of the vagus within the heart itself. In the case of the sympathetic innervation, the organism normally produces a chemical substance which stimulates all the sympathetic nerve endings.

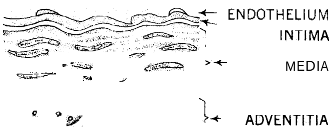
The production of this substance is the function of the suprarenal (or adrenal) gland, and the substance not only has been obtained in a chemically pure state but has also been synthesized. It is known as adrenaline or epinephrine. Adrenaline is active in very small amounts, concentrations of 1 in 100 000,000 producing a strongly exciting effect. Under normal conditions, however, the quantities entering the blood are probably too small to have any physiological effect. The liberation of adrenaline is under the influence of the splanchnic nerves, section of which diminishes the secretion while stimulation greatly increases it. Certain drugs, asphyxia and various emotions such as fear or anger lead to an excessive production of adrenaline. Directly the adrenaline reaches the heart, even when its connections with the nervous system are all severed, the contractions become considerably faster and extremely energetic, and the heart becomes able to cope with a greater strain (either in the shape of arterial resistance or increased venous inflow) than it could do without the stimulus of adrenaline. (*See* also ADRENAL GLANDS; ADRENALINE AND NORADRENALINE; HORMONES.)

To summarize. it may be stated that the heart beat is a property of the heart itself, and as such it is independent of the nervous system. The latter. however, may be said to keep the activity of the heart under constant supervision, moderating its action by means of the vagus and increasing it by means of the sympathetic nerves, thus adapting it to the general requirements of the body. Under conditions of great physical strain, the organism is able to make use of its store of adrenaline, which assists the nervous regulation of the heart beat. Thus, even after complete denervation of the heart, a certain amount of adaptation of its activity is still possible. The total regulatory mechanism is highly efficient.

II. THE BLOOD VESSELS

1. Structure **of the Blood Vessels.**—The hemodynamic conditions in the various parts of the vascular system are very different, and it is not surprising to find that the structure of the various blood vessels is accordingly different. A cross section of a blood vessel shows several coats. The innermost is lined with flat endothelial cells and is common to all vessels. The second coat, the tunica media, varies greatly in thickness; it contains most of the contractile elements of the arterial wall (smooth-muscle fibres) and a variable amount of elastic fibres. Both have in general a regular circular arrangement. At their outer and inner surfaces they form elastic membranes uhich belong to the outer and inner coats. Outside the media lies the third coat, the adventitia, which consists in the arteries almost entirely of connective tissue but in some veins principally of contractile elements. Between the internal elastic membrane and the endothelial layer is a fibrous layer which, together with the endothelial layer and internal elastic membrane, comprises the tunica intima.

2. The Arteries.—In the great arterial trunks such as the aorta, the pulmonary, the carotid and iliac arteries, the tunica media is divided by elastic fibres and membranes into a large number of concentric layers containing (especially in the aorta) only a few muscle fibres. The adventitia of the large arteries is also composed of fibroelastic tissue, but its structure is looser and the fibrous tissue is more abundant. The medium-sized arteries and arterioles differ in structure from the larger ones in that the elastic elements of the media are largely replaced by smooth-muscle fibres (fig. 14). To this type belong the majority of the arterial vessels. Arterioles gradually lose their coats and become precapillaries and capillaries. (*See* also ARTERIES; ARTERIES, DISEASES OF.)



C. C. HUBER, BOHM AND VON DAVIDOFF, TEXTBOOK OF HISTOLOGY, SAUNDERS & CO

FIG 14.—TRANSVERSE SECTION THROUGH ONE OF SMALLER OF MEDIUM-SIZED HUMAN ARTERIES

3. The Capillaries.—These (fig. 15) consist solely of a single layer of endothelial cells. which present little resistance to the passage of substances dissolved in the blood, such as oxygen, carbon dioxide, sugar and salts. The cells forming the wall are not contractile; neither do encircling elements, the so-called Rouget cells, control their calibre. Their filling and emptying are, however, controlled by sphincters on slightly larger vessels (precapillaries).

A capillary segment is 0.4–0.7 mm. long and its lumen will pass red blood corpuscles in single file. In most organs capillaries freely anastomose with each other, forming a loose network.

4. The **Veins.**—Precapillaries, venules and veins drain the capillary bed. They gradually acquire a connective tissue coat, the adventitia (fig. 16), and with increase in size muscle fibres appear in the form of a badly defined media. Some of the larger veins, such as the brachial and subcutaneous veins, have a better-developed muscular layer, while in others (jugular, subclavian, veins of the meninges) muscle is greatly deficient or entirely lacking. Generally speaking, the muscular and elastic elements are much less prominent in the veins than in the arteries, and they contain a preponderance of inelastic connective tissue fibres. In many veins the adventitia shows an inner longitudinal layer of muscle. All subcutaneous veins and some internal veins are supplied with valves which restrict any possible backflow. The valves of the veins are reduplications of the intima, and the greater part of the valvular structure consists of white fibrous connective tissue and elastic fibres. (See also VEINS; VEINS, DISEASES OF.)

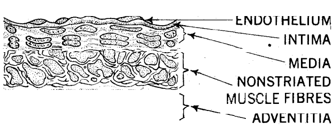
FIG. 15.—PRECAPILLARY AND CAPILLARY BRANCHES OF (A) VENULE AND (B) ARTERIOLE

5. The Blood Pressure.—It has long been known and can easily be demonstrated that the blood is under different pressures in the various parts of the vascular system. When an artery is cut, blood flows out uith great force in a series of jerks which are synchronous with the heart beat. When a large vein is cut, the blood also flous out rapidly, but the stream has very little force.

The first measurement of arterial pressure was made by Stephen Hales (Statical Essays, Containing Haemastaticks, 1733).

After Hales's work, the chief improvements in the method were the application of the mercury manometer by J. M. Poiseuille, the invention of the recording manometer and the kymograph by K. F. W. Ludwig (fig. 17) and the introduction of the more accurate membrane manometer by K. Hurthle and Frank.



C. C. HUBER, BOHM AND VON DAVIDOFF, TEXTBOOK OF HISTOLOGY, SAUNDERS & CO

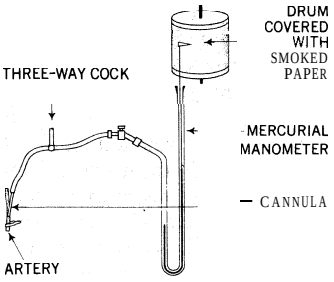
FIG. 16—TRANSVERSE SECTION THROUGH SMALL HUMAN VEIN

The manometer of Ludwig consists of a U-tube which is half-filled with mercury. On the surface of the mercury of one limb

is a float from which a stiff light rod projects, bearing on its upper end a writing point which is made to write on the smoked surface of a revolving drum. The other limb of the manometer is connected by means of a glass or metal cannula to the artery. The tube between the artery and the manometer is filled with a solution of some anticoagulant salt (sodium citrate, magnesium sulfate).

The mercury manometer allows a direct reading of pressure, but because of its inertia it does not accurately record rapid changes in the pressure. The membrane manometer, which is merely a tube filled with fluid and sealed at one end with a stretched rubber membrane, records rapid changes in pressure more accurately, but each membrane requires special calibration if absolute values are desired. The venous pressure is recorded by a similar method but with a water manometer or a manometer with a lightly stretched membrane.

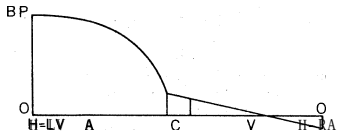
The highest pressure, which occurs while the blood is passing from the heart into the aorta. is called the systolic arterial pressure, and the pressure at the end of diastole is the diastolic pressure, the range between these two extremes is known as the pulse pressure. In the dog, with a mean arterial pressure of about 120 mm. of mercury, the systolic pressure may be as high as 160 mm. and the diastolic pressure as low as 65 mm.; here the pulse pressure would be 95 mm. of mercury. By taking the pressure at different parts of the vascular system, a result is obtained which is diagrammatically represented in fig. 18.



FROM E H STARLING ELEMENTS OF HUMAN PHYSIOLOGY J & A CHURCHILL

FIG 17— APPARATUS FOR TAKING BLOOD PRESSURE TRACING (*see* TEXT)

Close to the heart, the mean arterial pressure is about 100–120 mm. It falls only slomly in the large arteries, but between the smaller arteries and the capillaries there is a very extensive fall of pressure, so that the capillary pressure is only about 10 to 30 mm. of mercury; from the capillaries to the veins the blood pressure falls steadily, until in the large veins near the heart it may be negative



FROM E H STARLING ELEMENTS OF HUMAN PHYSIOLOGY J & A CHURCHILL

FIG. 18.— BLOOD PRESSURES (BP) IN SYSTEMIC CIRCULATION (H-LV) In left ventricle, (A) in arteries, (C) in capillaries, (V) in veins (H-RA) in right atrium; (O-O) zero pressure level (see text)

The arterial blood pressure in man is usually measured by means of the Riva-Rocci sphygmomanometer (fig. 19), which consists of a rubber bag that can be strapped round the upper arm. The bag is connected with a manometer, and the pressure in the bag is raised by pumping air into it. The pressure at which all pulsations disappear in an artery below the place of compression represents the systolic pressure. The diastolic pressure can also be determined by the same apparatus.

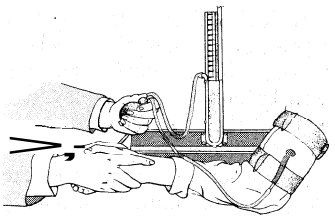
To determine the venous pressure in man, an apparatus is used which is constructed on the same principle as the sphygmomanometer. The skin is greased, and an annular rubber bag is placed over a vein and cemented over with a glass plate (fig. 20). On blowing air into the bag, the pressure can be determined at which the vein collapses.

The blood pressure in the capillaries is usually determined by the Von Kries method. A small glass plate is placed over the skin; attached to this plate is a small scale pan on which weights are placed until the pressure is just sufficient to blanch the underlying skin.

The mean blood pressure in the circulatory system of a young adult man in the horizontal position was found to be as follows:

Large arteries	90 mm. mercury (65-110)
Medium arteries	85 mm.
Capillaries	10–30 mm.
Small veins	9 mm.
Large veins	0–8 mm.

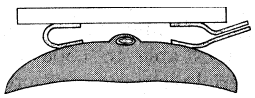
From this it may be seen that the largest drop in pressure occurs between the small arteries and the small veins. This shows that the main resistance of the vascular system is situated in the arterioles. The arterioles are always in a semicontracted state (tone), partly determined by impulses coming from the central nervous system and partly by the properties of the smooth muscles of which they are composed. Since the total vascular bed of the capillaries is very much larger than that of the arterioles, the main drop in the pressure must occur just past the arterioles. The mean arterial pressure depends on two factors: (1) the total resistance to the outflow of blood from the arterial system — *i.e.,* the state of constriction of the arterioles; (2) the output of the heart in a given time, which depends on the inflow of blood. (See also BLOOD PRESSURE.)



FROM E. H. STARLING PRINCIPLES OF HUMAN PHYSIOLOGY HAWKSLEY BROTHERS

FIG. 19.—MEASUREMENT OF BLOOD PRESSURE IN MAN WITH RIVA-ROCCI SPHYGMOMANOMETER

6. The Arterial Pulse. — Because of the elasticity of the arteries, every systolic rise of the blood pressure produces an expansion of their walls, which can be felt by placing a finger on any superficial artery. It is obvious that the nearer the artery is to the heart, the more pronounced will be the pulse. The rate of transmission of this pressure wave will depend on the elasticity of the arteries. If they were rigid, no pulse could be recorded. The more elastic the arteries, the slower will be the transmission of pressure along them. Under normal conditions, the pulse wave in man is transmitted at the rate of about seven meters per second. but if the arteries are initially stretched by high pressure their malls will tend to approximate to rigidity, and therefore the propagation of the pulse wave will be faster. It is important not to confuse the velocity of the pulse wave, which is simply a transmission of pressure along the tubes, with the velocity of the blood flow. The latter is of the order of about 0.5 m. per second in the aorta and considerably less in the smaller blood vessels.



FROM E. H. STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY, J & A CHURCHILL

FIG 20.— APPARATUS FOR DETERMINATION OF VENOUS PRESSURE (see TEXT)

The elasticity of the arterial system determines another important feature of the blood flow; it is the cause of the continuity of the blood flow (except for slight increases during systole and decreases during diastole), in spite of an intermittent ejection of blood by the heart into the aorta. A sufficient amount of blood is accommodated in the arterial system to maintain a flow into the capillaries during the whole period of diastole. In the capillaries the pulse disappears and the blood flow is continuous. Arterial pulse tracings recorded by means of sphygmographs (a system of levers which can be placed on a pulsating artery, the pulsation of which is thus registered on a moving plate with blackened surface) shows various secondary undulations, either in the ascending part of the m-ave (anacrotic pulse) or in the descending (catacrotic pulse). These are due partly to extra vibrations set up in the arterial wall by the inrushing blood and partly to pressure waves reflected from the periphery.

7. Velocity of the Blood Flow. — This depends on the relation between the bore of the blood vessel and the amount of blood passing through it in a unit of time. The total area of the cross sections of the arterial system gradually increases from the aorta to the periphery. The increase in area is especially great when the arteries break up into capillaries, the area of which is probably over 1,000 times larger than that of the cross section of the aorta. The velocity of the blood flow will obviously be proportionately reduced farther toward the periphery, so that while in the aorta the mean velocity under resting conditions may be about 500 mm. per second. in capillaries it is barely 0.5 mm. per second. As the capillaries join to form veins, the area of the vascular bed diminishes and the velocity of the blood flow increases; however,

it never reaches the velocity, which is observed in the aorta, since the cross section of the large veins near to the heart is about double that of the aorta.

8. Intensity of the Circulation.——The amount of blood received by the heart from the veins and passed to the arteries in a unit of time cannot be measured directly. However, a knowledge of the cardiac output is of considerable importance because it controls the amount of oxygen carried to the tissues and the rate of the removal of various products of metabolism from the tissues. The great value of the study of the cardiac output of man and animals has only been realized comparatively recently, and there still remains much to be done; nevertheless, methods of sufficient precision have been worked out, and the main factors governing the cardiac output are gradually being disclosed and the total work done by the heart being determined.

N. Zuntz calculated the output by comparing the difference in the oxygen content of the arterial and venous blood with the amount of oxygen consumed in a given time. For instance, in a horse weighing 360 kg., 2.735 c.c. of oxygen were consumed per minute; the arterial blood contained 10.33% more oxygen than the venous. Since every 100 c.c. of blood that passed through the lungs had taken up 10.33 c.c. of oxygen, 2,733 c.c. of oxygen had been taken up in the course of one minute by $\frac{100 \times 2{,}733}{10.33} = 26{,}457$ c.c. of blood. August Krogh modified this method by making the animal or man breathe a gas which was harmless and easy to detect; viz., nitrous oxide. He knew how much of the gas could be absorbed by one cubic centimetre of blood, and was therefore able to calculate the cardiac output by determining the amount of gas taken in during one minute. Later, other methods were introduced which were claimed to be more exact. In one of them, ethyl iodide is the gas absorbed, and in another the principle of Zuntz is modified and the output is calculated by comparing the carbon dioxide content of the arterial and venous blood with the amount of carbon dioxide given off in a unit of time.

9. Cardiac Output in Man.—In man, under conditions of rest, the cardiac output varies in different individuals between about $3\frac{1}{2}$ and 6 l. of blood per minute; that is, between 60 and about 110 c.c. for each heart beat. The cardiac output (*i.e.*, the inflow of blood into the heart, as in the heart-lung preparation) is within wide limits independent of the heart rate. It primarily depends on (1) how freely the blood passes from the arterial system through the tissues into the venous system—*i.e.*, on the peripheral resistance; (2) the power of the heart to pump the inflowing blood into the arteries; and (3) the capacity of the vascular system relative to the amount of blood. When the arterioles dilate, the blood passes quickly through the organs and, since the capacity of the vascular bed will be changed but little, the blood will reach the heart during the next few beats in a larger amount. The heart will therefore force more blood into the arterial system, and thus within limits prevent a fall of arterial blood pressure, which would have taken place if the arterioles dilated without causing an increase in the blood flow.

Considering the second way in which the output may be increased, namely the strengthening of the heart beat, it is clear that, if the pumping action of the heart becomes inadequate, blood will stagnate on the venous side and the output will diminish. If the heart beat is improved by nervous or pharmacological agencies. there will be better emptying of the venous side and a consequent increase in the circulation rate.

The third factor governing the output is the capacity of the vascular bed relative to the amount of blood. This factor can be appreciated by considering the tremendous capacity of the capillary system. Krogh showed that $\frac{1}{20}$ to $\frac{1}{10}$ of a muscle is made up of capillaries, and in any muscle there is at least one capillary to every muscle fibre. If all these capillaries lost their tone, the animal would literally bleed into them, the arterial and venous system would become empty, and the output of the heart would fall to vanishing point.

The amount of blood in the circulation and the capacity of the vascular bed should not be considered as rigidly fixed for any individual. The vascular system is in a perpetual state of variation because of the continuous changes of the vasomotor tone. It is obvious that unless vasoconstriction is compensated for by a simultaneous vasodilation elsewhere it will lead to a change in the resistance as well as a change of capacity. Arterial vasoconstriction will chiefly affect the resistance, while even small changes in the tone of the enormous capillary bed will mainly affect capacity. Thus because of these changes of capacity more or less blood may be in active circulation and more or less blood may be left behind to fill the vascular bed.

10. Spleen, Lungs and Other Factors.—There are two organs which play a predominant role as reservoirs of blood, namely the spleen and the lungs, the difference being that the spleen seems to change its capacity mainly as the result of active contraction and relaxation, while the lungs play a purely passive role and act only because of the very great elasticity of their blood vessels. With every increase in the pulmonary blood pressure or with a certain decrease in the intrathoracic pressure, the pulmonary blood vessels contain more blood, and therefore less blood is available for the systemic circulation. On the other hand, the capacity of the spleen is to a much greater extent independent of the blood pressure, changes in its vascularity being due to active contractions of its muscles and valves. These contractions seem to be specially adapted to meet the requirements of the whole organism. Whenever, for instance, more blood is needed in circulation, as when the animal loses blood or when blood goes to fill widely dilated vascular areas of other organs, the spleen contracts. This also happens in anoxemia following diminution of the oxygen supply, or during diminution of the oxygen-carrying power of the blood as in the case of carbon monoxide poisoning.

As has been seen, the vascular resistance, the fitness of the heart and the vascular capacity are the three main factors which determine the blood flow in the whole animal. There are, however, accessory factors, the chief of which are the respiratory movements and the contractions of the skeletal muscles. Any increase in respiratory movements leads to a more negative pressure in the thorax and therefore to a better aspiration of blood from the periphery into the large veins and the heart. This is probably the main cause of the so-called respiratory variations of the blood pressure; during inspiration the inflow into the heart is increased, and after a certain lag the output is also increased. The contractions of the skeletal muscles press the blood from the capillaries to the veins, the backflow of blood being prevented by the valves.

11. The Nervous Control of the Blood Vessels.—During increased activity an organ requires more oxygen. Theoretically this could be accomplished by an increased degree of deoxygenation of the blood without a change in the blood flow, or by an increase in the blood supply without any change in the degree of deoxygenation. The organism uses both methods, but the first in preference. In some cases the increase in the blood supply is such as to overcompensate the need, so that, although the oxygen consumption of the organ is increased, the blood supply is so great that each cubic centimetre of blood gives to the tissues less oxygen than usual. Increased blood supply to an active organ is due either to an increase of the general circulation rate, which increases the blood flow through all the organs, or to changes in the distribution of the blood among the various organs, more blood being diverted to the active and less to the resting organs.

Knowledge of the nervous control of the blood vessels dates from Claude Bernard's discovery that in the sympathetic chain run nerve fibres which maintain the vessels in a state of tonic constriction. Section of these nerves leads to a considerable vasodilation and therefore to an increased blood flow; stimulation of them causes vasoconstriction. A few years after this discovery it was found that there are also vasodilator nerve fibres which are antagonistic in function to the vasoconstrictor nerves, and that these nerve fibres also have in many cases a constant influence on the blood vessels; section of them slightly diminishes the blood flow, and stimulation greatly increases it. The blood vessels therefore, like the heart, are under the influence of double innervation. The tonic state of the blood vessels does not itself depend on nervous control, and it does not completely vanish after section

of all the nerves going to an organ. The function of the vasomotor nerves is merely to increase or decrease this tone.

It can easily be shown that the continuous stream of impulses descending to the blood vessels along the vasoconstrictor fibres originates in the central nervous system. If the spinal cord of a dog is divided below the medulla, the blood pressure falls from about 120 mm. of mercury to about 50 mm. Stimulation of the divided spinal cord immediately causes an increase in blood pressure, which may be as high as 280 mm. or more. Section of the central nervous system above the medulla has no lasting effect on the blood pressure. As the result of these experiments it may be said that the vessels of the body are kept in a state of increased tone by impulses arising in the medulla. The portion of the medulla concerned with sending out these impulses is spoken of as the vasomotor centre. The activity of this centre is constantly under the influence of various afferent stimuli originating within the various organs of the body or as the result of excitations of higher or lower parts of the central nervous system

The Vasoconstrictor and Vasodilator Fibres.—The vasoconstrictor fibres leave the spinal cord in the thoracic region. They have a cell station in the ganglia of the sympathetic chain, and are then distributed along various nerves to the organs. The most important vasoconstrictor nerve is the splanchnic nerve, which supplies all the abdominal organs.

The typical vasodilator nerves take their origin from various parts of the central nervous system. Thus the vasodilators to the salivary glands and tongue are distributed with the cranial nerves, and probably originate from the nervus intermedius between the seventh and eighth cranial nerves. The nervi erigentes going to the genitalia leave the lower end of the cord by the anterior roots of the second and third sacral nerves. The vasodilator fibres going to some of the abdominal organs and to the extremities have the same origin and course as the ordinary sensory nerves. Since the vasodilator impulses pass along these nerves in a direction opposite to that taken by the normal sensory impulses, they have been termed antidromic impulses. This appears to be one of the few cases in mammals in which the same nerve fibre performs two different functions.

The vasodilator and vasoconstrictor fibres are generally mixed in common trunks innervating an organ, and it is only by special means that they can be functionally separated.

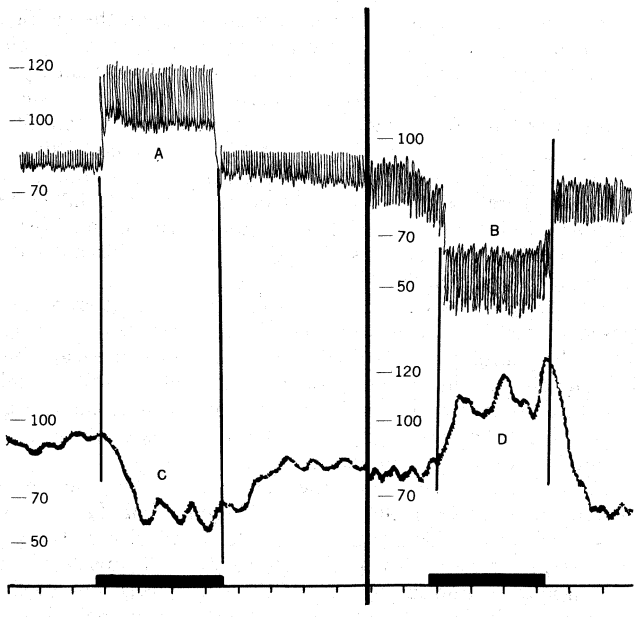
Peripheral Tone of the Blood Vessels.—It has been mentioned above that the function of the vasomotor nerves is only to change the tonic condition of the blood vessels; the tone itself does not disappear, however, even after complete denervation This peripheral tone of the blood vessels is considerably influenced by the composition of the blood, especially the oxygen tension, the degree of alkalinity and the presence of vasoconstrictor substances which are normally secreted by the pituitary and the suprarenal glands. Whether the nerves are intact or severed, the capillaries of the body are never all open at the same time. The capillary bed seems to be, at least in some organs, in a perpetual state of variation. Capillaries constantly close and open so that blood flows through various channels. Whenever the oxygen tension of the blood diminishes, the blood vessels dilate, a large number of capillaries open, and the blood flow through the organ increases; excess of carbon dioxide has the same effect.

On the other hand, an increase of the pituitary secretion or of adrenaline in the blood increases the tone of the blood vessels and capillaries. Some authors regard these two substances as being primarily responsible for the peripheral tone of the blood vessels in general. Superimposed upon these perpetual variations of the peripheral tone is the effect of the vasomotor nerves, and it often happens that agencies which would affect the peripheral tone in some definite direction are prevented from doing so because of antagonistic influences from the vasomotor centre. For instance, in the case of increased carbon dioxide tension of the blood, the carbon dioxide acting peripherally tends to dilate the blood vessels, but it is also a strong stimulus to the vasomotor centre and excites the vasoconstrictor fibres to such an extent that the blood vessels constrict; the blood pressure then rises until the central nervous system succumbs to the toxic effect of the carbonic acid.

The Vasomotor Centre.—Besides being sensitive to carbon dioxide and to the acid products of metabolism which accumulate in consequence of lack of oxygen, the vasomotor centre is constantly influenced by impulses arriving from the sense organs on the surface of the body and from various other organs. Among these, impulses originating in the vascular system are the most important and are practically the only ones which have been studied. The afferent stimuli may be of two kinds. First are those which affect the vasomotor centre in such a way as to cause vasoconstriction either in some definite organ or in many organs; in the latter case the general vascular resistance increases and the arterial pressure rises. These afferent impulses are described as pressor impulses. On the other hand, impulses may reach the vasomotor centre which will lead to vasodilation; this again may be restricted to a small area or may involve sufficient blood vessels to bring about a fall in the arterial blood pressure. These are known as depressor impulses.

Pressor reflexes can be evoked by stimulation of almost any of the sensory nerves of the skin, the digestive tract or other abdominal viscera. The chief depressor nerve originates in the heart and in the first part of the aorta. In the rabbit this nerve runs in a separate and easily accessible trunk. Stimulation of the central end of the depressor produces such a large dilation of most of the blood vessels that the arterial blood pressure falls to a very low level. In the intact animal the physiological stimulus which brings this depressor mechanism into operation is the high blood pressure in the aorta. Distention of the aorta by pressure stimulates the depressor nerve and leads to a compensatory dilation of arterioles and to a fall in pressure. The nerve can be regarded as a safety valve which prevents excessive rises of blood pressure.

It is highly probable that in the case of an excessive fall of pressure another reflex mechanism comes into action, a pressor reflex which also originates in the heart and aorta and which tends to antagonize the fall. It has been amply shown that the carotid artery at the point of its division into the internal and external branches is also sensitive to pressure. Increase of pressure in this part leads to a reflex vasodilation, and fall of pressure leads to a vasoconstriction. Besides these two influences, it seems that the vasomotor centre itself can be excited or inhibited by variation in the blood pressure. Fig. 21 gives an example of the effect on the blood pressure of changes in the pressure of the brain (controlled experimentally by perfusion through the carotid arteries).



FROM E H STARLING, "ELEMENTS OF HUMAN PHYSIOLOGY," J & A CHURCHILL

FIG. 21.— SIMULTANEOUS BLOOD PRESSURE TRACINGS TO SHOW INFLUENCE OF CHANGES IN CIRCULATION THROUGH THE BRAIN ON THE ACTIVITY OF THE VASOMOTOR CENTRE

(A) Rise or (B) fall of pressure in arteries of head brings about, respectively, (C) fall or (D) rise in remaining arteries of body

Thus it is seen that the organism possesses several mechanisms by means of which it can keep the blood pressure constant and counteract any influences which would tend to raise or lower it. In the case of hemorrhage. a considerable amount of blood may be removed from the body, but the blood pressure soon returns to normal. Blood may be withdrawn from the system slowly to the extent of about 4% or rapidly to the extent of about 2% without lowering the arterial pressure, because of the compensatory constriction of the arterioles. Such withdrawal of blood, though it does not affect the blood pressure, will greatly diminish the intensity of the circulation and will reduce the output of the heart. Conversely, injection of salt solution (0.9%) or transfusion of blood will not, within certain limits, affect the arterial blood pressure, because of compensatory vasodilation. Transfusion, however, will increase the circulation of blood and thus lessen the harmful consequences of hemorrhage. Considerable hemorrhages will not be effectively compensated and will therefore lead to fall of blood pressure. and transfusion will be absolutely necessary to save the animal from death.

Since most blood vessels are innervated by vasoconstrictor and vasodilator fibres, it is obvious that a pressor or depressor reflex could be carried out by several means. Vasodilation could for instance be produced by means of a reflex inhibition of the vasoconstrictor tone or by a stimulation of the vasodilator fibres which would depress the tonic state of the blood vessels. What actually happens is that the two sets of fibres in all known cases act in a reciprocal fashion. Thus a depressor reflex involves a simultaneous diminution of the vasoconstrictor influence and increase of the vasodilator influence, and vice versa in the case of a pressor reflex.

12. Chemical Factors. — There has been a considerable accumulation of facts which show that chemical factors affecting the blood vessels. apart from nervous influence. are of great importance for the regulation of circulation, and that these factors can exercise their action on either the arterioles or the capillaries.

It is known for, instance that in many conditions (*e.g.,* pain. asphyxia, the physiological state that accompanies emotion) there is a considerable rise in the production of adrenaline by the suprarenal glands. Adrenaline, as has been mentioned before, stimulates the nerve endings of the sympathetic nervous system, and it therefore also stimulates the nerve endings of the vasoconstrictor nerves. Thus, in all cases associated with increased production of adrenaline, there is widespread vasoconstriction and a rise in the blood pressure; this vasoconstriction is independent of the integrity of the vasomotor nerves. In the case of activity of an organ, vasodilation occurs in most cases not because of concurrent depressor reflexes but because of the production of chemical substances within the organ. These substances mainly affect the tone of the capillaries, and in their presence a great number of previously closed capillaries open or dilate widely. It has been shown that in the case of a contracting muscle the capillaries may be increased from 2% to 15% of the total volume of the muscle.

There is, however, one substance which may possibly be produced in the organism under normal conditions and which is known to have a powerful capillary dilator effect. This substance is histamine, a product of the amino acid histidine, which is a normal constituent of most proteins. It has been suggested that the production of histamine plays an important part in giving rise to the symptoms of surgical shock. In this condition there is a universal dilation of the capillaries, and therefore a fall of blood pressure and a diminution of the amount of blood in circulation which finally leads to death. This condition, which occurs after laceration especially of muscles, can easily be reproduced by injection of large doses of histamine.

The mechanism of adaptation of the circulation in various organs to their needs must at present be regarded as in part dependent on the delicate balance of the nervous vasodilator and vasoconstrictor influences, which modify the tone chiefly of the arterioles, and also on chemical substances produced locally as the result of activity, which modify the tone of the capillaries.

13. The Portal Circulation. — The portal circulation is peculiar in that the blood passes through two sets of capillaries. Arterial blood is conveyed to the capillary networks of the stomach, spleen, pancreas and intestines by branches of the abdominal aorta. The portal vein is formed by the confluence of the mesenteric veins with the splenic vein, which together drain these capillaries. The portal vein breaks up into a second plexus of capillaries within the substance of the liver. The hepatic veins carry the blood from this plexus into the inferior vena cava. The portal circulation is largely maintained by the action of the respiratory pump, the peristaltic movements of the intestine and the rhythmic contractions of the spleen; these agencies help to drive the blood through the second set of capillaries in the liver. Obstruction in the right heart or pulmonary circulation at once affects the circulation in the liver. The increased respiration which results from muscular exercise greatly furthers the hepatic and portal circulation.

14. The Cerebral Circulation. — The circulation of the brain is somewhat peculiar, since this organ is enclosed in a rigid bony covering. The limbs, glands and viscera can expand considerably when the blood pressure rises, but the expansion of the brain is confined. By the expression of venous blood from the veins and sinuses, the brain can receive a larger supply of arterial blood at each pulse. Increase in arterial pressure increases the velocity of flow through the brain, the whole cerebral vascular system behaving like a system of rigid tubes when the limits of expansion have been reached. The pressure of the brain against the skull wall is circulatory in origin; in the infant's fontanelle the brain can be felt to pulse with each heart beat and to expand with expiration. The arterial supply to the brain by the two carotid and two vertebral arteries is so abundant, and so assured by the anastomosis of these vessels in the circle of Willis, that at least two of the arteries can be tied without grave effect. Sudden compression of both carotids may render a man unconscious but will not destroy life, for the centres of respiration, etc., are supplied by the vertebral arteries. The vertebral arteries in their passage to the brain are protected from compression by the cervical vertebrae.

Whether or not the muscular coat of the cerebral arteries is supplied with vasomotor nerves is uncertain.

15. The Coronary Circulation. — Extremely peculiar conditions exist in the coronary circulation; *i.e.,* the blood supply to the heart muscle itself. The coronary arteries originate at the root of the aorta. They turn back into the substance of the cardiac muscle and break up into a rich meshwork of capillaries which convey the blood into the coronary veins, the majority of which collect the blood into the coronary sinus, while some open on the inner surface of the chambers of the heart (Thebesian veins). During systole the heart muscle develops a pressure which must be higher than that in the aorta, as otherwise no ejection of blood from the ventricle into the aorta would be possible. The coronary arteries, which are at any time distended by the pressure prevailing in the aorta, are thus compressed. and during systole the inflow of blood into those of the left ventricle is stopped. The right ventricle by its weak contraction affects the coronary circulation only to a slight extent. While restraining the inflow of blood into the coronary arteries, the contraction of the heart greatly facilitates the outflow from the veins by mechanically expressing their contents. It is interesting to note that adrenaline, which greatly increases the strength of the cardiac beat, also produces a great dilation of the coronary blood vessels, so that a larger amount of blood is provided to meet the increased expenditure of energy. The coronary blood vessels are richly provided with vasodilator and vasoconstrictor nerves; the sympathetic supplies the vasodilator and the vagus the vasoconstrictor fibres.

Since the coronary blood flow is so readily affected by the heart beat, great difficulties are encountered in the study of the regulation of the coronary circulation. **A** knowledge of all the influences affecting it, however, is extremely important because the activity of the heart, and therefore the fate of the organism, ultimately depends on the blood supply to the cardiac muscle. It is known that even temporary occlusion of the coronary blood vessels is fatal. The disease known as angina pectoris, which usually leads to death, is most probably due to such occlusion as the result of arteriosclerosis or thrombosis of the arteries; it is highly probable that in some cases it may also be due to disorders of the nerves which regulate the tone of the coronary blood vessels. In most

cases of weakening of the heart, the coronary flow increases. Lack of oxygen produces an enormous augmentation of the coronary circulation, thus ensuring the survival of the heart so long as there is a trace of oxygen left in the blood.

16. The Influence of Posture on the Circulation. — The circulation remains efficient not only in the horizontal but also in the erect position. Yet in a man standing six feet high the hydrostatic pressure of a column of blood reaching from the vertex to the soles of the feet is equal to 14 cm. of mercury. The blood. because of its weight, continually presses downward, and under the influence of gravity would sink if the veins and capillaries of the lower parts were sufficiently extensile to contain it. During the evolution of man there have been developed special mechanisms by which the determination of the blood to the lower parts is prevented and the assumption of the erect posture rendered possible. The abdominal viscera are slung upward to the spine. while below they are supported by the pelvic basin and the wall of the abdomen, the muscles of which are arranged so as to act as a natural waistband. In tame hutch rabbits, with large patulous abdomens, death may follow in from 15 to 20 minutes if the animals are suspended and immobilized in the erect posture, for the circulation through the brain ceases and the heart soon becomes emptied of blood. If, however, the capacious veins of the abdomen are confined by an abdominal bandage, no such result occurs. Man is naturally provided with an efficient abdominal belt, although this is often rendered toneless by neglect of exercise or gross and indolent living. The splanchnic arterioles are maintained in tonic contraction by the vasomotor centre, and thus the flow of blood to the abdominal viscera is confined within due limits.

The veins of the limbs are broken into short segments by valves, and these support the weight of the blood in the erect posture. Every contraction of the skeletal muscles compresses the veins of the body and limbs, for these are confined beneath the taut and elastic skin. Guided by the valves of the veins, the blood is by such means driven upward into the venae cavae.

17. Circulation During Muscular Exercise. — An attempt to understand the changes in the circulation during muscular exercise can be made only if every part of the complex regulation of the cardiovascular system is kept in mind.

In muscular exercise, every available mechanism concerned in the regulation of the blood flow is brought into operation. everything being centred on the achievement of two objects, (1) to carry the all-important oxygen to the muscles and (2) to remove the excess of waste products as quickly as possible. In violent exercise the common effort of all the cardiovascular mechanisms involved is often inadequate, but fortunately the muscles and other organs do not require an immediate supply of sufficient oxygen to fulfil their needs; fortunately also the muscles can withstand a certain degree of accumulation of waste products without much alteration of the intensity of the activity. In other words the muscles can to some extent run into debt as regards the oxygen supply. But the excess oxygen requirements must at some time be made good, or the activity will have to stop. The complete adaptation of the vascular and respiratory systems, when the oxygen supply and the removal of waste products entirely meets the demand, is achieved comparatively slowly. The first period of severe muscular activity proceeds under somewhat less favourable conditions than hold after complete adjustment. This is probably the explanation of the phenomenon of "second wind." The organism is better adapted to exercise, the more rapidly this state of adjustment is reached.

Since the arterial blood is normally about 95% saturated with oxygen, not much extra oxygen can be obtained by increasing the saturation of the hemoglobin. As already explained, the muscle obtains the required oxygen in two ways: (1) by increased utilization of the oxygen of the blood (*i.e.*, by a greater desaturation of the hemoglobin) and (2) by an increase in the blood flow. The first factor alone would be inadequate even if the muscles were able to remove all the oxygen from the blood. A simple example will serve to illustrate this. If the total blood flow is taken as 4.j 1. per minute, even if the impossible assumption is made that the whole of the blood goes through the muscles, it will mean that the muscles will be supplied with only about 800 c.c. of oxygen per minute. Now the normal oxygen requirements at complete rest are about 300 c.c. per minute. and during severe exercise they may rise to 3.000 c.c. per minute or more. Moreover, the desaturation of hemoglobin is never carried to completion, and even during severe muscular exercise the venous blood still contains some oxygen. Thus the increased oxygen demand can be met to only a limited extent by increasing the coefficient of the oxygen utilization.

The second factor, namely the increase in the output of the heart, is far more important. Among all the factors involved in this increase in the blood flow, the heart will be considered first. This organ plays only a subordinate role. The output of the heart depends on the inflow, and under normal conditions changes in the activity of the heart have little or no effect on blood flow. The main factor in the augmentation of the inflow concerns the peripheral blood vessels. Considerable changes in the heart beat must take place, however, in order to make it possible for the heart to cope uith the larger inflow. The first effect of the larger inflow will be to increase the filling of the heart and therefore the output on account of the stronger beat. This is a purely automatic reaction of the cardiac muscle and is independent of the central nervous system. The adaptation of a denervated heart stops at this point. The limit to this adaptation of the heart muscle is set by the pericardium. The adaptation of the innervated heart does not, however. stop here. The increase in the strength of contraction in this case is out of proportion to the inflow, so that the heart becomes able to give progressively stronger beats. It is not only more filled in diastole but it also empties better during systole. This additional strengthening of contraction depends on the diminution of the influence of the vagus nerve and on the excitation of the augmentor fibres of the sympathetic nerve.

But usually in addition to this increase in strength of the beat there is a quickening of the heart rate. This is also based in the first instance on a diminution of the vagus tone, and probably in most cases on an augmentation of the sympathetic tone. Further increase of the inflow is therefore met by a corresponding quickening of the heart beat. The acceleration of the heart in muscular exercise is a purely reflex phenomenon, based (especially at the beginning of the exercise) partly on impulses descending to the cardiac medullary centres from the cortex of the hemispheres, which are probably conditioned reflexes. In part the acceleration is due to concurrent changes in the respiratory activity and to reflexes originating within the vascular system of the animal itself. It has been seen that each inspiratory phase is accompanied by a diminution of the vagus tone and hence by an acceleration of the heart. Thus if there is a greater number of respirations per minute, the periods of acceleration become more frequent and finally fuse, so that the periods of retardation typical of the expiratory state have no time to develop.

Among the reflexes which affect the cardiac rhythm and which originate within the organs of the body itself, the reflexes from the heart should be considered first. It has been shown repeatedly that increased inflow into the heart brings about reflex acceleration of the heart beat. Changes in the activity of the heart should be regarded not as the cause of increased intensity of circulation but as an adaptation which enables the increase to be performed.

The chief causes of increased total blood flow during muscular exercise can be grouped under the following headings: (1) the increase in the aspiration by the thorax; (2) the pumping action of the contracting muscles; (3) the increase in the amount of circulating blood; (4) the diminution of the total vascular resistance. To these should be added the factors which are not likely to affect the total blood flow but which alter the distribution of the blood among the organs. These are: (1) constriction of the splanchnic area and (2) dilation of the blood vessels of the muscles.

These factors have all been discussed in the preceding pages and need only be mentioned shortly. The increased and more frequent expansion of the chest, which follows the deepening and acceleration of respiration, accentuates the negative pressure in the thorax and tends to diminish the pressure in the large veins. These are therefore more quickly and more completely filled with blood from the periphery. The working muscles, by each contraction, ex-

pel blood from their capillaries to the veins, and thus actively help the propulsion of blood into the heart. The spleen contracts and empties its blood into the vascular system, and an extra amount of blood thus becomes available. The dilation of the blood vessels in the muscles is so intense that the general resistance diminishes and the blood passes from the aorta into the venous system at a considerably faster rate. All these factors are helped by the contraction of the splanchnic vascular area, which diverts the blood to the muscles. The blood vessels in the muscle dilate, and the capillaries open so that the capillary bed in the muscles may increase 40 to 100 times during maximal activity. This dilation is chiefly if not exclusively due to the local production of vasodilator substances. It is not at present known how far the vasomotor innervation participates in this dilation.

Thus it is seen that during muscular exercise the organism meets the demand for an increased oxygen supply to the muscle by an intricate series of correlated mechanisms. The necessary adjustments involve the respiratory system and the whole cardiovascular system, and probably afford one of the finest examples of coordination that has yet been discovered in the realm of physiology.

CIRCULATORY SYSTEM. This article is a general. comparative survey of the features of anatomical circulatory systems. For more detailed treatment of the components and operation of the circulatory system see ARTERIES; BLOOD; CIRCULATION OF BLOOD; HEART, ANATOMY OF; HEART, COMPARATIVE PHYSIOLOGY OF; LYMPH AND LYMPHATIC SYSTEM; VEINS.

The characteristic feature of a typical circulatory system is a set of branching tubes that transport a fluid medium to and from all parts of the body. Important mechanically is a contractile organ, or heart, which beats rhythmically and so propels the fluid in a continuous stream. The vessels that distribute this circulating fluid from the heart to the various organs and parts are arteries, whereas the collecting vessels that return the fluid to the heart are veins.

Interconnecting the terminal arteries and veins are still smaller tubes, the capillaries, which come into intimate relation with all tissues of the organism. In its typical expression the circulating fluid is a coloured blood. But in every instance the fluid acquires oxygen and nutrients from organs specializing in respiration and digestion. These materials are given up to the tissues of the body and from these tissues certain wastes of cellular activity, such as carbon dioxide and urea, are returned to the lungs, gills and kidneys for elimination. The pumping heart and transporting arteries and veins are useful and necessary auxiliaries. But most important functionally are the capillaries, because it is through them that the actual transfers of dissolved gases and solids, outward and inward, are made. Thus the circulating blood serves as a common carrier that makes possible the performance and integration of important vital activities.

It is clear that some multicellular animals have no need of a special distributing apparatus such as the circulatory system provides. Sponges have an intricate set of water canals that penetrate their body mass; even though a sponge may attain large size, all of its cells are in close relation with the water in which it lives. The two-layered coelenterates (hydroids, anemones, corals) have a branching gastrovascular cavity extending into their tentacles and other remote parts; every cell is in direct contact with its watery environment. Although the flatworms have advanced to a three-layered condition, their body mass is provided for by a ramifying alimentary tract and set of excretory tubes. In each of these groups all parts of the organism are brought into intimate relation with mechanisms specializing in nutrition, respiration and excretion.

However, some sort of circulatory system becomes a necessity in animals that reach a size and complexity that place the regions supplying food, oxygen and hormones fairly remote from the muscles, glands and other organs requiring these substances. A further need exists when the excretory organs are concentrated in one locality and hence are far removed from most of the sites where cell wastes are produced. Invertebrates, such as segmented worms and the echinoderms, mollusks and arthropods, have introduced a body cavity between the alimentary canal and the external body wall, and part of this space commonly plays a prominent role in the transport of nutritive, respiratory and excretory fluids. Hearts appear in these groups, and in some representatives there is even a closed system of vessels containing blood.

The circulatory system of invertebrates is organized, for the most part, on an open or lacunar plan (fig., A-C). This term implies that the vessels in some regions lose the character of tubes and continue into blood cavities, or sinuses, which lack special walls and lie between the alimentary tract and other organs; from such a sinus the blood re-enters the heart by passing through slits in its wall. In order that any circulatory system can move its fluid about effectively there must be definite regions that are contractile, and this is made possible by the incorporation of muscular tissue into the wall of the conducting tubes. In the lower animals, large portions of the entire system are contractile, hut in higher forms the circulation is made more regular by the emergence of a definite, propulsive heart.

Opposed to the open, lacunar scheme of circulation is the closed system of a few invertebrates and all vertebrntes (fig., D-I) This term implies the presence of a complete circuit of tubes with their own distinctive walls. With the adoption of a closed system of vessels the body cavity no longer plays a role in the scheme of circulation and, at best, only a temporary role in excretion by the embryo or larva. It is a truism that among the various animal groups the arrangement and structure of the circulatory system have been influenced much more by respiration than by nutrition; always there is a significant correlation in the total expression of respiratory and circulatory organs. In all animals that have developed gills or lungs, two types of capillary beds exist (fig., F, I). One of these occurs throughout the body in general, and its supplying and draining vessels are known as systemic arteries and veins, respectively. The other type of capillary bed, serving only the respiratory organs. is associated with respiratory (branchial or pulmonary) arteries and veins.

Hearts range from the merely thickened wall of an ordinary blood vessel. as in the earthworm, to the highly complicated and efficient double heart of birds and mammals. In order to permit free motion of the heart, it invariably lies either free within the general body cavity or is enclosed within a special sac called the pericardium. Hearts tend to specialize into a receiving portion, the sinus venosus and atrium, and into an expelling portion, the ventricle and conus (or bulbus). Valves also commonly develop to prevent the backflow of blood during periods of relaxation.

The vessels that conduct blood away from the heart toward any capillary bed are called arteries, regardless of whether their blood is pure (*i.e.,* oxygenated) or not. Such vessels are notable for the muscular and elastic components in their walls. The smallest arteries, or arterioles, open into the tiny hairlike tubes called capillaries. These latter consist of only a single layer of thin cells, and this feature enables the oxygen and nutrients (and some of the fluid plasma) to escape into the tissues by diffusion, whereas

carbon dioxide and other wastes are taken up by a transfer in the opposite direction. Although individually tiny. the capillaries are exceedingly numerous and form networks that in the aggregate present an extremely large surface area. Veins are vessels that return blood from the capillary beds to the heart; the smallest of these vessels, draining the capillaries directly, are called venules.

As before, it is the direction of flow with respect to the heart, and not the quality of the contained blood, that is the essential

feature of a vein. Veins are weaker vessels than arteries, and their wall is poorer in muscle and elastic tissue. Since their blood lacks the driving force of a beating heart, veins tend to develop valves which restrict flow to an onward direction.

The circulating fluid of most invertebrates is a colourless plasma that is common with that of the body cavity. When colour is present, as occurs in some invertebrates and all vertebrates, the fluid is called blood. The colouring matter is a respiratory pigment. containing a metallic component concerned with the binding of oxygen. The pigment when present in invertebrates usually resides in the plasma. yet a few types possess coloured corpuscles. In vertebrates the pigment is hemoglobin, carried in red cells named erythrocytes. A general feature of both the invertebrate and vertebrate groups is the amoeboid white cells, or leucocytes; yet even these may be absent in some invertebrates, and the circulating fluid then lacks cellular elements of any kind.

Blood performs a number of functions: it distributes oxygen, nutrients and chemical substances such as hormones; it is an intermediary in the collection and disposal of cell wastes; its leucocytes provide a defense mechanism; it elaborates chemical substances such as fibrinogen and antibodies. Some animals are designated as cold blooded and others as warm blooded. Actually. what is meant is that the first type has variable temperatures through a dependence on the temperature of the immediate environment, whereas the second type maintains a constant temperature through the power of regulating the warmth of its body; this constancy is achieved either by limiting the production of heat or by controlling its loss. (See also ANIMAL HEAT.) The terms arterial blood and venous blood are commonly used to designate the quality of blood with respect to its content of either oxygen or carbon dioxide, but these are inappropriate names. The so-called arterial blood travels in veins when returning from seats of oxygenation such as gills. lungs or the placenta of the fetus. Conversely. the so-called venous blood is transported to these sites in arteries.

The vertebrate plan of circulation bears certain resemblances to the condition in animals as far down in the scale as the segmented worms. Both possess a completely closed system of vessels. Also. as in the worms, there is—in the developmental period if not permanently—a dorsal and a ventral longitudinal vessel interconnected by a series of loops. But a fundamental difference in the vertebrate plan is the interposition of a heart in the ventral vessel rather than in the dorsal one (compare A. D in fig.). A special feature, found only in vertebrates, is the system of lymphatic vessels evolved for the purpose of returning tissue fluids to the great venous trunks.

The concept that blood actually makes a complete circuit within the cardiovascular system. rather than being subject to a mere ebb and flow, came tardily in view of the fact that Galen came close to the truth about A.D. 180 and Vesalius demonstrated the proximity of the minute terminals of arteries and veins in 1543. The pulmonary circulation was described correctly by Michael Servetus in 1553, but the larger credit for the establishment of the concept of the systemic circulation belongs to William Harvey (1628). Marcello Malpighi in 1661 first saw the capillary connections between arteries and veins and thus demonstrated the final link in the set of proofs.

A number of distinct steps were made by the several vertebrate groups toward the perfecting of an increasingly complex and efficient circulatory system. Simplest is the gill plan, especially characteristic of fishes, which contains but a single circuit (fig., D-F). The heart is a flexed tube, receiving impure blood and pumping it to the gills for oxygenation; thence the purified blood flows to the tissues of the body. On the return journey to the heart, some of the impure blood passes through additional capillary beds in the kidneys and liver.

When vertebrates became land inhabiting, lungs replaced gills and a lung plan with a double vascular route was gradually perfected; one is the pulmonary circuit and the other, the general systemic circuit (fig.. G-I). This development necessitated changes in the heart. leading to its subdivision and the production of a twin pumping mechanism that might be considered as two hearts, each with two chambers. Amphibians and reptiles show several stages of advance in this direction. They have separate atria, but the ventricle is incompletely divided and permits some mixing of blood; in a sense. this is one and a half hearts. Birds and mammals attained a completely partitioned double heart (and ventral aorta). The right half contains impure blood and supplies the pulmonary circuit; the left half contains pure blood and supplies the systemic circuit.

With the diminishing importance of a tail and the increased use of the legs in locomotion by land animals, the routing of venous, tail-region blood through the kidneys was discontinued. Thus in mammals there is no renal portal system; by contrast, the hepatic portal system, in which venous blood is interrupted by the sinusoids of the liver, is prominent in all of the vertebrate groups.

CIRCULATORY SYSTEM, DISEASES OF: see ARTERIES, DISEASES OF; VEINS, DISEASES OF; HEART, DISEASES OF THE.

CIRCULUS IN PROBANDO, in logic. a phrase used to describe a form of argument in which the very fact which one seeks to demonstrate is used as a premise; *i.e.,* as part of the evidence on which the conclusion is based. This argument is one form of the fallacy known as *petitio principii*, "begging the question." It is commonest in lengthy arguments, the complicated character of which enables the speaker to make his hearers forget the data from which he began.

The following duologue may serve as a simple illustration of circular argument. "He speaks with angels!" said one of the Master's disciples. "How know you that?" I asked. "He himself admits it," he replied solemnly. "But suppose he lies?" I persisted. "What!" he exclaimed, "a man who speaks with angels capable of telling a lie?"

CIRCUMCISION, the operation of cutting away the whole or part of the foreskin of the penis. The origin of the practice is unknown. The widespread ethnic distribution of circumcision as a ritual, and the quite widely preferred use of a stone knife rather than a metal one, suggest a great antiquity for the operation. Only the Indo-Germanic, the Mongol and the Finno-Ugrian-speaking peoples were unacquainted with the practice. Wherever the operation is performed as a traditional rite it is done either before or at puberty, and sometimes, as among some Arabian peoples, immediately before marriage.

Among the ancient Egyptians, boys were generally circumcised between the ages of 6 and 12 years. Among the Ethiopians, the Jews, the Muslims and a few other peoples. the operation is performed shortly after birth. Among most other peoples who practise it. the operation is performed at puberty. At both age periods the operation is regarded as of the profoundest religious significance. For the Jews it represents the fulfillment of the covenant between God and Abraham (Gen. xvii, 10–14), the first divine command of the Pentateuch, that every male child shall be circumcised. That Christians are not obliged to be circumcised is first recorded in Acts xv. The operation at puberty represents a beginning of the initiation into manhood and the leaving behind of childhood.

At whatever age performed, circumcision usually signifies the formal admission of the individual into his group or to the achievement of a certain status, thus fixing his social position, rights and duties. To this day the operation among many peoples remains a necessary preliminary to the admission of proselytes. It is said that Pythagoras (c. 530 B.C.) had to submit to the operation before he was permitted to study in Egyptian temples. One of the best-known, but not the earliest! representations of circumcision, occurring on the wall of an Egyptian tomb at Saqqara dating to about 2400 B.C.. presents scenes showing a boy whose wrists are being held by a man who stands behind him. while the

priest stoops to perform the operation. Earlier representations and descriptions indicate that the practice mas already well established in Egypt as early as 4000 B.C. and probably earlier. In Egypt it apparently was at first principally performed on the priestly class, being later adopted by the warrior classes, the nobility and royalty.

There are numerous theories concerning the origin of circumcision. The following constitute a representative sample: it represents a blood-offering to the gods. in order to maintain the latter's immortality and also to extend the life of the individual; it is a substitute for sacrifice; it is a dedication; the sacrifice of a part to ensure the welfare of the whole; the cutting off and preservation of part of oneself ensures preservation after death, and reincarnation; it represents the atonement made for incestuous desires entertained in childhood, unconsciously expiated by the fathers through their sons; since the foreskin often exerts a constricting effect it was considered magically to inhibit fertility, hence the necessity of its removal; finally, it has been suggested that it was practised for purely hygienic reasons.

There is probably some truth in some of these conjectures, perhaps in all, but precisely how much or how little it is impossible to say. The origins of the practice are as dark as an Egyptian night. A lucky series of archaeological finds may, however, some day provide a more exact understanding of the origin of the custom.

Female circumcision or excision is widely practised in many parts of the world, such as New Guinea, Australia, the Malay archipelago. Ethiopia. Africa. Egypt. southern Europe. South America and by various Islamic peoples of western Asia and India. The operation consists in cutting away the whole or part of the external genitalia. Strabo, the Greek geographer. in the 1st century A.D. noted female circumcision among the Egyptians. In Egypt the operation appears to have been performed upon females at puberty at least several centuries before Strabo reported it. It is quite possible that female circumcision antedates male circumcision.

From the medical. as distinguished from the ritual, aspect the operation consists in removal of the foreskin to allow its free retraction beyond the glans penis. The foreskin or prepuce consists of a double layer of skin which more or less completely covers the glans penis. Upon the inner layer of foreskin there are situated a number of glands which secrete a cheeselike substance called smegma. Accumulation of smegma beneath the foreskin may result in great physical and psychological discomfort and may serve as the source of a rather penetrating odour. The balanitis or inflammation of the glans penis thus induced. which to some extent is always present in the uncircumcised, is eliminated by circumcision. So, too, is the often associated phimosis or narrowing of the external orifice of the penis relieved. It is noteworthy that in India the Hindus, who do not circumcise ritually, suffer far more frequently from cancer, of the penis than the Muslims who practice ritual circumcision usually at the age of 10 to 12 years. Among the Jews. who perform the operation shortly after birth, cancer of the penis virtually never occurs.

In the western world the operation has been increasingly more widely practised as a hygienic procedure. In many hospitals it is routinely performed upon the newborn unless there is some objection. It has been felt by some authorities that circumcision of the newborn may be a psychologically traumatizing experience to the infant: and that therefore the operation should be delayed until the child is much older. It is, however. a question whether the operation would be less traumatic an experience to the older child. (M. F. A. M.)

CIRCUMSTANTIAL EVIDENCE is a kind of indirect evidence. If something happens in the presence of witnesses who observe it. their evidence is direct evidence of the occurrence. If, however, there is no such direct evidence of the event, then it is necessary to rely on indirect evidence, if any. Such indirect evidence usually consists of certain circumstances surrounding the event or in some way connected with it. By piecing these circumstances together one may obtain an intelligible, coherent account of the whole course of the event or events in question. This piecing together of the data is a kind of hypothesis, and there may be several rival hypotheses to account for the facts. But as in all cases of the use of hypotheses, the hypothesis which gives the most adequate and consistent explanation is usually accepted. Inference from circumstantial evidence resembles ordinary induction to the extent that it involves the use of hypotheses and their verification, but it is unlike ordinary induction inasmuch as it does not aim at a generalization, being concerned only with some particular event. The systematic character of inference is perhaps most obvious in the case of inference from circumstantial evidence, for it manifests most clearly the process of the imaginative construction of a coherent system out of fragmentary evidence. The most familiar occasions for the exercise of inference from circumstantial evidence are criminal cases. Criminals naturally take precautions against the possibility of direct evidence, and are often betrayed by circumstantial evidence. See EVIDENCE: Proof of Facts.

CIRCUS. Although many historians have traced the origin of the modern circus to the circuses of ancient Rome it would seem more logical to assume that the circus, as it is known today, was derived from the Roman amphitheatre. Its shape, if not its size, is similar and the first modern circus was even called an amphitheatre. Both the Roman circuses and amphitheatres, however, were designed for horse racing or spectacles intended to end fatally for either man or beast, the antithesis of the displays of skilful co-operation that were the essence of the circus in the second half of the 20th century.

ROMAN ORIGINS

The Roman Circus.—The Roman circus was built on the model of the Greek hippodrome (*q.v.*). The first and largest was the Circus Maximus in Rome, which was rebuilt in the time of Julius Caesar and held perhaps as many as 13'0.000 seats, situated on three sides of the course. It was enlarged by succeeding emperors and at its greatest, under Constantine, it must have measured about 2,000 by 600 ft.

Although nothing but the site of the Circus Maximus remains, vestiges of the Circus Maxentius (A.D. 309), which followed a similar plan, can still be seen. References to the circuses of Flaminius. Caligulas, Dominitian and Sallust can also be found. although the Sallust, like the Circus Florae, may have been imaginary.

The arena (Lat. arena, "sand," or "beach") was divided longitudinally by a wall (*spina*) decorated with obelisks and shrines and set obliquely to give more room at the beginning of the race. Horses and chariots lined up in the stalls (carceres), which were arranged at a slight angle along one end to ensure a fair start. At the other end, the barrier flanking the track made a semicircular turn, the whole forming a U-shaped course. Chariots were drawn by two, four (occasionally three), and sometimes more, highly trained horses. The drivers, who were often slaves, wore helmets and were wrapped in lengths of reins. They carried knives to cut themselves free if the chariots collided or overturned. The competing teams bore different colours: red and white at first; later green, blue, purple and gold. Four, six, eight or even twelve chariots raced at a time and the course consisted of seven laps, the distance traveled and the progress of the competitors being signaled from each end of the *spina*. Admission was free, though the wine merchants and pastry cooks plied their wares inside the circus while bookmakers and prostitutes solicited custom.

Spectacles other than chariot racing were sometimes produced. During Augustus' reign (27 B.C.–A.D. 14) 3.500 beasts are said to have been killed, and under Nero the torture of Christians was an added attraction at the Circus Caligulas. Most exhibitions of this sort, however! were presented in the amphitheatres.

The Roman Amphitheatre.—Although the circus owes its origin to the Greek hippodrome the amphitheatre is purely Roman. The largest was the Colosseum (*q.v.*), which was dedicated in A.D. 79, and is estimated to have held between 45,000 and 50,000 persons. There the public paid for admission, and, although the arena was sometimes flooded for nautical pageants, the dominant theme was the slaughter of animals and men. Gladiators, who had

first appeared in 264 B.C. and were outlawed in A.D. 404, were among the most popular performers: 2,000 gladiators and about 230 wild animals were billed to die in celebration of Rome's 1,000th anniversary. Until Constantine repealed the law in A.D. 326, a man could be condemned to the wild beasts in the arena. The "hunting" of wild animals in the Colosseum continued until A.D. 523.

Other Roman amphitheatres were built at Pompeii (c. 80 B.C.), Verona (A.D. 290), Pozzuoli, Capua and Pola in Italy; Syracuse in Sicily; at Arles and Nîmes in France; at El Djem, near Carthage in north Africa; and at Dorchester and Caerleon in England. (See also GAMES, CLASSICAL and ROMAN ARCHITECTURE: *Types of Building: Theatres, Amphitheatres, Circuses.)*

THE MODERN CIRCUS

Beginnings in England. — The modern circus came into being in 1768, when Philip Astley (1742–1814), a former sergeant major turned trick rider, found that if he galloped in a circle while standing on his horse's back, centrifugal force helped him to keep his balance. In doing so he traced the first ring.

Circumstances were favourable for the development of the circus. During the second half of the 18th century a number of trick riders were appearing in the pleasure gardens of London and elsewhere. Many of them mere riding masters turned showmen, though, as they were accustomed to the traditional rectangular manège, none thought of riding in a circle until Astley led the way. At this same time the fairs were going into decline. Due partly to rowdyism and partly to the jealousy of the theatre licensees, the run of many of the most famous fairs was curtailed and some of the main attractions were banned. Many showmen, looking for new outlets, found it in the circus, as did ropedancers, acrobats. jugglers and others whose performances were based on dexterity. agility and strength, and who discovered that their performances were better appreciated in the ring, where it could be seen clearly that nothing was faked.

In 1769 Astley moved his ring about a half-mile westward to a site at the Surrey end of Westminster bridge. London. First he fenced the boundary and built a covered stand, then he roofed in the whole establishment and later painted the ceiling above the ring nith foliage, christening the establishment the Royal Grove. The name circus was first used in 1782 when the Royal circus was set up a half-mile to the southeast of Astley's; this was a rival enterprise started by Charles Hughes, one of Astley's horsemen.

Introduction to Continental Europe and America.—In 1772 Astley went to France to present his "daring feats of horsemanship" before the king and the French court. and he found that there, too. many showmen were ready to forsake the fairgrounds. Ten years later he returned to Paris and opened the amphitheatre, which he leased to the Franconis at the outbreak of the Revolution. Antonio Franconi (1738–1836), a member of a noble Venetian family. had been forced into exile after a fatal duel. He became first a showman and later a trick rider, but it was as a director that he excelled. He joined forces with Astley and, in Astley's absence, continued on his own. His sons, Laurent and Henri, continued in his footsteps and the Franconi family became the founders of the French circus. They are reputed to have standardized the diameter of the ring at 13 m. (or 42 ft. approximately in U.S., U.K., and other English-speaking countries), a size that is still recognized.

Astley's journeys did not stop at Paris. In 1782 he traveled as far as Belgrade, visiting Brussels and Vienna on the way, and during his life he built 19 permanent circuses. It was Hughes, however, who first introduced the circus to Russia. He added a company of trick riders to the stud of horses he had been commissioned to deliver to Catherine the Great in 1793 and he was rewarded with a private circus in the royal palace in St. Petersburg. The Russian circus was later developed by a Frenchman, Jacques Tourniaire (1772–1829).

In 1793 John William Ricketts opened circuses in Philadelphia, Pa., and New York city, the first seen in the new world. At the same time Benito Guerre was presenting his feats of horsemanship in Spain, and a cut on a contemporary handbill shows a rider leaping through a paper hoop—a scene that still epitomizes this form of entertainment. By the turn of the century the circus had spread throughout Europe and was firmly established in America. Performances were given mostly in permanent or semipermanent buildings. The greatest hazard was fire, from which Astley and Ricketts suffered particularly: Astley's amphitheatre burned down three times in the first 62 years of its history, and Ricketts lost his circuses in both New York and Philadelphia in the same way.

The traveling showmen of the fairgrounds were quick to adopt this new form of entertainment, first in an open enclosure with canvas walls and later in a tent. Like a number of other innovations in the traveling circus, the tent is said to have been invented in America. The first show to have used a circus tent, or "big top," may have been that of Turner in 1826, though in the same year Quick and Mead had a 50-ft. tent, four wagons, nine horses and a hurdy-gurdy to provide the music. It seems more likely that the tent originated in the European fairgrounds booth.

Theatrical Influence. — Meanwhile, in the permanent circus buildings in Europe, the true circus had become adulterated through a misalliance with the theatre. The tiers of encircling seats were broken to accommodate a proscenium arch and stage behind the ring. Equestrian drama, with plots based on battles and sieges, became the rage. The French public, who had generally shown a deep appreciation of the true circus spectacle, soon tired of the intrusion and applauded horsemanship without histrionics, but in England this hybrid form of entertainment continued. *Richard* III and even *Il Trovatore* were performed on horseback at Astley's, where the theatrical influence could still be seen at the end of the 19th century in the zoological pantomines produced by "Lord" George Sanger. Throughout this period the traditional circus performance was kept alive by the "Scenes in the Circle," which were also included in the bill. Even here, however, the influence of the theatre was apparent in the riding acts. for scenes such as "The Sailor's Return" were enacted on the back of a horse. caparisoned to represent a man-of-war, with gun ports down its flank.

Equestrian Influence. — The greatest exponent of trick riding was an Englishman, Andrew Ducrow (1793–1842), who, after achieving notable success on the Continent, ran Astley's amphitheatre from 1824 until his death. The characters he portrayed, such as the Chinese enchanter, the Tyrolean shepherd and the Indian hunter, could never mask his brilliant riding; and one of his acts, "The Courier of St. Petersburg." was still seen in the circus in the latter half of the 20th century. In this act, a rider straddles two cantering horses while other horses, bearing the flags of those countries that a courier would traverse on his journey to Russia, pass between his legs.

During the first 80 years of its history the circus was dominated by the horse. Many of the proprietors were riders and trainers who founded dynasties. such as Renz in Germany, Salamonsky in the Baltic states. Carré in the Netherlands and Schumann in Scandinavia. Other proprietors who were also famous riders were the Cookes. Clarkes, Fossetts and Ginnetts in England; and the Franconis, Loyals and Rancys in France. A number of the great U.S. riders and trainers, such as Levi North, Charles Fish. James Robinson. Robert Stickney and Spencer Q. Stokes. became proprietors or managers. When Richard Sands' circus visited England in 1842, the "Company of American Horseman" and the "Stud of Highly Trained American Horses" topped the bill.

Equestrian acts of the 20th century could be divided into three main groups: voltige, in mhich a rider vaults on and off a horse's back; trick riding, in which the rider spends more time turning somersaults, pirouettes and balancing on a horse's back; and high school, which is a spectacular form of dressage. The Schumann family, directors of the permanent circus in Copenhagen, are excellent high school riders and in the early 1960s were the greatest horse trainers in the world.

Zoological Influence. — Although horses were the mainstay of the program (and for many years provided the motive power for the traveling shows), there was still room for other acts. One of the most famous U.S. performers, whose fame extended far beyond his own country, was the wild animal tamer Isaac Van Amburgh (1801–65). He first appeared in New York at the Zoological Institute, a name that was the forerunner of the high-sound-

ing American titles of the mid-19th century, for example the Equescurriculum, the Hippolymiad and the Cirqzooladon. Although Van Amburgh is reputed to have been the first man to put his head in a lion's mouth, he was not the first wild animal tamer. Tamers and trainers had been seen on the fairgrounds of Europe for centuries, and the first great tamer to appear in the circus ring was Henri Martin (1793–1882), a Frenchman. Both he and Van Amburgh appeared in theatrical productions, such as *The Lions of Mysore* and *The Brute Tamer of Pompeii,* as well as at the circus.

Menageries were later incorporated into a circus. A program made up of individual specialist acts was expensive and it was a great economy to present animals in the ring which could also be exhibited at an extra charge in the menagerie or sideshow. C. Hagenbeck, an animal dealer in Hamburg, Ger., had pointed the way in his own circus in 1887 and thereafter an increasing number of menagerie proprietors forsook the fairground for the circus: Krone in Germany; Kludsky in Czechoslovakia ; Bouglione, Amar and Spessardy in France; and Chipperfield in England.

Wild animal acts can be divided into two groups: those presented en *douceur* and those presented *en ferocité*. Often it is the less ferocious looking act that is most dangerous. There have been many famous trainers in the history of the circus, including Togare, Kaden, Damoo Dhotre (a pupil of Alfred Court), Gilbert Houcke and Vojtek Trubka.

The Influence of Acrobats. — In 1859 the invention of the flying trapeze by J. Léotard (1838–70) and Charles Blondin's crossings of Niagara falls on a tightrope rekindled the public interest in the work of the aerial gymnast and acrobat. Although the trapeze had never been seen before, ropedancing can be traced back to ancient Greece. By the turn of the century acrobatics had had an extensive influence although they never usurped the supreme position of the horse. About 1900 the Scheffers, Craggs. Hanlon-Voltas, Sandow, Lauck and Fox. Cinquevalli, Caicedo and the Potters were the most prominent European and American acrobats and gymnasts. Later the Concellos and Codonas on the flying trapeze. Con Colleano on the tightwire and Enrico Rastelli, the juggler, captivated audiences with their skill and daring.

Managerial and Technical Developments in the 19th Century. — From 1840 onward, circus combines and amalgamations became widespread in the United States and partnerships were made and broken with bewildering frequency. On several occasions between 1843 and 1856 "General" Rufus Welch (1801–56) joined his company with that of Lewis B. Lent. Welch at one time toured the Mediterranean countries, and Lent had been Sand's partner on his tour of England as well as being associated with the Flatfoots (so named because they put their feet down flatly against competition in what they considered their territory). Van Amburgh. Howes and Barnum. The forming and reforming of such aggregations and combines continued throughout U.S. circus history until 1929, when the Ringling Brothers, who already controlled Barnum and Bailey's "Greatest Show on Earth" and five others, bought out the Circus Corporation of America, bringing a total of 11 major circuses under one direction. This was never the case in Europe, where families tended to split up rather than combine, so that more than one circus may bear the name Pinder, Fossett, Ginnett or Sanger.

The mid-19th century was a period of great technical development in the United States. Spencer Q. Stokes invented the derricklike apparatus for training trick-riders which still goes by the name of the American Riding Machine. At one time his circus traveled by river boat, though he did not give performances on a showboat as did "Dr." Gilbert Spaulding (1811–80). This former chemist from Albany, N.Y., is said to have invented quarter poles (which support the canvas roof of the big top between the central king poles and the side poles) and was also one of the first men to transport his circus by rail. Railroads were more frequently used in the U.S. than in any other country. In Europe this method of transport was never very popular, and, although one or two attempts at traveling by rail were made, it was not until the second quarter of the 20th century that it was regularly used, and then only by Bertram Mills. In Latin America and the far east it was used, when available, after 1900. In 1852 Dan Rice, the famous U.S. clown (1823–1900), tried lighting his circus by electricity but gave up the experiment because of the injurious effect it had upon "persons predisposed to pulmonary complaints" and upon "the tender brain of children." Although P. T. Barnum's name is linked with the circus in the mind of the public, his success was largely due to his partner, James A. Bailey; Barnum's interest was kindled late in life by W. C. Coup (1837–95), who had spent many years with circuses. It was Coup who introduced the end loading of circus trains, bridging the gaps between the flatcars with fishplates. Circus wagons, when traveling by rail, have always been carried on flatcars. The easiest method of loading was, therefore to bridge the gaps between the flatcars and push each wagon down the length of the train. The contributions of the U.S. were not always on the managerial side. "Professor" Risley (1814–74) invented the acrobatic act in which children take part; it is still known as a "Risley act."

During the latter half of the last century the street parade grew in importance. This free attraction was developed by Seth B. Howes, who returned to the United States from England with a number of highly ornate parade wagons. These processions, which wound their way through the town back to the circus field ("lot" in the U.S., "tober" in the U.K.), were a great feature of British tenting circuses, particularly that of "Lord" George Sanger (1827–1911), who also owned Astley's amphitheatre from 1871 until it was demolished in 1893. Once he even tacked his parade on to the end of a military escort accompanying Queen Victoria across London. "Lord" George Sanger took his title because he was so incensed at Buffalo Bill's being referred to as the Honourable William Cody in the course of a law suit, that he said, "If Cody is an Honourable, then I am a Lord!" Queen Victoria later greeted him quizzically as, "*Lord* George Sanger?" to which Sanger replied, "If it so pleases Your Majesty." Astley's, although extremely popular, never became as fashionable as the permanent circuses on the Continent. At the Cirque d'Été the most exclusive club in Paris kept its own private box. and in St. Petersburg the stables were regularly scented for aristocratic visitors. Toward the end of the 19th century the Russian circus was dominated by the Cinisellis, who, like most Italian circus families, made their name outside their own country.

The Circus in the 20th Century. — At the end of the 19th and the beginning of the 20th century the circus was still spreading to many other countries. The British circus family of Harmston settled in the far east, and for years their only rival was the Russian circus, Isako. The Boswells forsook England for South Africa, where, from time to time, they met competition from Pagel, who was of German origin. Frank Brown, whose father had been a clown at Astley's, toured South America for many seasons. In Australia the circus prospered under the Wirths. The Lobes, from Budapest, made Persia their tenting ground and the Sidolis settled in Rumania. Foreign travel was, however, inhibited by the passport formalities, customs duties, quarantine restrictions and currency regulations that followed World War I, and for large companies with much equipment the difficulties were particularly acute. In order to evade inflation and crisis in Germany, Sarassani took his circus to South America in 1923 and 1934, but the last U.S. circus to tour Europe left the United States in 1896, and no British circus has left the British Isles since the early 1920s.

In the 1920s the circus in Britain declined. It was revived by Bertram Mills, a coachbuilder, who introduced the greatest international circus stars to the British public at Olympia, London, and ran the only tenting circus to travel by rail in England. Rastelli the juggler, Colleano the wire walker, the Codonas on the flying trapeze, the Schumanns and their horses and, later, Trubka the trainer of wild animals all appeared at Olympia.

After World War II the circus flourished in Europe. A large number of small family tenting shows sprang up and, in London, Tom Arnold took over the ice hockey rink at Harringay for a number of Christmas seasons, where the circus acts he presented recalled Mills' heyday at Olympia. The shape of the arena, how-

ever, led him to model his show on the American pattern. He surrounded the ring with a hippodrome track and included chariot races, production numbers and aerial ballets in his programs. The Christmas circus is essentially British. Attempts to introduce three rings into European circuses had not succeeded by the early 1960s. In the United States, and to some extent on the continent of Europe, performers who cannot find winter engagements in cabaret or variety retire to winter quarters to rehearse and break in new acts.

In the U.S. the combines and amalgamations led to bigger shows. In order to make these pay, tents that held up to 10,000 spectators would be erected for one day in each town on the circus schedule. The ring, traditionally 42 ft. in diameter, had to be flanked by other rings and intervening stages to suit the new and larger tents. The Ringling Brothers, Barnum and Bailey's "Greatest Show on Earth" at one time had three rings and five stages surrounded by a hippodrome track. This altered the type of show, which could no longer be confined to single acts but had to include spectacular processions and aerial ballets for mass effect. Traveling became more and more difficult and in 1956 increased freight rates and labour problems induced "The Greatest Show on Earth" to give up tenting and appear only in permanent buildings such as exhibition halls. Although about 30 circuses still toured the United States in the early 1960s, they were smaller, and most traveled by road instead of rail.

In the Soviet Union the circus became one of the most popular forms of entertainment and in the early 1960s boasted of more than 100 permanent and tenting shows. Each year approximately 22,000,000 people watched acrobats, riders, trainers and clowns trained in the state circus school. In the 1960s various Soviet circus companies appeared in the European capitals and audiences saw remarkably high standards achieved. The distinguishing features were the originality of the apparatus, the costumes and the presentation. In the high wire act of the Voljanskis, for example, the wire changed from being horizontal to an oblique angle, while the tension was maintained; the Koch sisters performed on a giant semaphore arm that revolved slowly as they balanced on the outside edge. Brilliantly designed circular carpets covered the sawdust, and drapes were used to decorate the ring fence. Safety lunges were used for all acts that involved a risk to human life.

A typical circus program might run as follows: (1) overture; (2) voltige; (3) strong man; (4) trained pigeons; (5) juggling act; (6) liberty horses; (7) clown entrée; (8) springboard act; (9) intermission; (10) wild animal act; (11) aerial act; (12) high school; (13) wire walker; (14) performing elephants; (15) trick riding; and (16) clown entrée. The choice, however. is large; springboard acts, perch performers, hand-to-hand balancers, artists on the rolling globe and many others would fit into the bill equally well.

The advent of television also affected the circus, for while it introduced the skill of the performer to a much larger audience, attendances at the actual performances fell. Circus directors reacted in two very different ways. Some stipulated that artistes should not appear on television for a certain period before and after their engagements, nor would they allow their shows to be televised. Others allowed parts of their programs to be televised, believing that a brief glimpse might whet the public's appetite much as a trailer advertises a film.

In spite of the various phases in its history, the circus remains essentially the same spectacle: a display of human endeavour in which man's agility, strength and ingenuity and his skilful management of animals are contrasted with the comic and sometimes tragic buffoonery of the clowns. Since such a spectacle needs no language to achieve its effect it is at home anywhere, regardless of the audience's race, creed, colour, age, rank, fashion, income and intellect.

CIRENAICA: see CYRENAICA.

CIRENCESTER, a market town and urban district in the Cirencester and Tewkesbury parliamentary division of Gloucestershire, Eng., lies on the Churn river at the edge of the Cotswolds, 17 mi. S.E. of Gloucester by road. Pop. (1961) 11,836. Cirencester is an agricultural and hunting centre with twice-weekly markets and light industrial undertakings. It has many fine gray stone houses built by prosperous wool merchants. The great parish church of St. John Baptist, of Norman origin but mainly Perpendicular, has bells cast in Queen Anne's reign. The grammar school was founded in 1461.

Cirencester occupies the site of the Romano-British Corinium Dobunnorum, at the junction of Fosse way, Ermine street and Akeman street. Tombstones of Roman cavalrymen belong to a Claudio-Neronian fort. The walls enclosed a town of 240 ac., in which remains of a basilica and many well-appointed private houses were discovered. The town was the largest in Roman Britain after London, and probably the capital of Britannia Prima in the 4th century. Westward lay an amphitheatre, and numerous rich villas stood nearby. A fine collection of inscribed and sculptured stones, mosaic pavements and other relics is housed in the Corinium museum. The town was captured by the Saxons in 577. and later became a royal demesne. William the Conqueror granted the manor to William Fitzosbern. earl of Hereford, who built a castle which was later razed to the ground under King Stephen. A college of prebendaries, founded in Egbert's reign, was reconstructed by Henry I in 1117 as an Augustinian foundation. Henry 11 leased the manor to the abbot. In 1215 and 1253 the abbot obtained charters for fairs; the wool trade gave these great importance — William Camden records Cirencester as having "the greatest market for wool in England." In 1403 Henry IV rewarded the citizens for their help against the earls of Kent and Salisbury by granting them a guild merchant, but this was revoked by Henry V. Cirencester became a parliamentary borough in 1572, returning two members until 1885. The abbey was destroyed at the Dissolution. and an Elizabethan mansion (Abbey house) built on the site by Richard Master. the queen's physician. Cirencester house, built at the same time by Sir John Danvers, became in 1690 the home of the Bathurst family, rebuilt by the first Earl Bathurst in 1718. South of the town lies the Royal Agricultural college.

See F. Haverfield, "Roman Cirencester," *Archaeologia,* vol. lxix, pp. 160–209 (1920). (W. E. W. L.; I. A. RD.)

CIRE PERDUE: see SCULPTURE TECHNIQUE.

CIRQUE, a French word used to denote a semicircular amphitheatre, with precipitous walls, at the head of a valley in a glaciated mountain region (Lat. circus, "ring"), generally resulting from basal sapping and erosion beneath the bergschrund of a glacier. The bergschrund is a large crevasse, in the form of a great symmetrical arc, parallel to the head of the névé (see GLACIER) ; it lies at a short distance from the exposed rock surface and separates the stationary from the moving ice, and in early summer, when the glacier commences to move, it opens and exposes the rock at its base to diurnal changes of temperature. Frost action then causes rapid disintegration downward at its base and backward upon such part of the rock surface as is exposed in the bergschrund beneath the stationary ice, thus producing the characteristic form of the cirque. The formation of cirques has played an important part in the development of the scenery of glaciated mountain tracts. Arêtes (sharp ridges) are formed by the intersection of two cirques, and pyramidlike peaks such as the Matterhorn and Snowdon are remnants left by the recession of three or more cirques. Cirques frequently contain lakes, for, as a result of the action of the bergschrund, the floor slopes toward the mountain mass. W. D. Johnston first recognized the processes giving rise to cirque formation by actually descending a bergschrund on the glacier of Mt. Lyell in California. Hollows of similar shape to cirques occur in limestone regions which may

not have been glaciated. These are formed by aqueous solution and are not true cirques.

CIRRIPEDIA, the scientific name for a subclass of Crustacea that comprises the barnacles, marine animals completely sedentary as adults and showing little external resemblance to other crustaceans. Some are parasitic on other marine animals. See BARNACLE; CRUSTACEA.

CISTERCIANS, later known as WHITE MONKS and sometimes as BERNARDINES, took their name from Citeaux (*q.v.*), a locality in Burgundy (Côte d'Or), southwest of Dijon, France. The founding fathers were a group of monks of the Benedictine abbey of Molesme who, according to the traditional account (questioned but possibly correct) were dissatisfied with the relaxed observance of their abbey, and persuaded the abbot, St. Robert, to lead them (1098) to a desert place where they might live a solitary life and observe the rule of St. Benedict "to the letter." When the monks at Molesme demanded Robert's recall, the "new monastery" of Citeaux was confirmed as an abbey under St. Alberic (d. 1109); he was succeeded by another of the original group, St. Stephen Harding, an Englishman from Sherborne (d. 1134). The beginnings were hard, with want and illness reducing the monks almost to despair, but the tide turned with the arrival of St. Bernard in 1112 or 1113.

At some time before 1119, when Urban II gave papal approval, and probably under Abbot Stephen, the outlines of the three essential Cistercian documents took shape: the account of the foundation (Exordium *parvum*), the constitutional summary known as the Carta caritatis ("Charter of Charity") and the regulations (Consuetudines) governing the life. The two former were probably in part at least the work of Stephen, the last was made up of early abbatial decisions augmented by the decrees of subsequent general chapters. There were at the time, and had been before, numerous attempts to remodel the traditional monastic life; the success of the Cistercians was due partly to the determination and logical realism of the group of founders, and partly to the genius of Stephen Harding and others in composing brief but comprehensive constitutional documents. They rejected absolutely all clothing, diet, etc., unauthorized by the rule, emphasized the absolute community of life and cut off every kind of possession that implied contact with the society around them. They reintroduced manual work for monks, making it a principal feature of their life, and they cut out almost all accretions to the office and liturgy and chant save for the daily conventual and private Masses. In order to implement the new venture, they adopted and transformed the practice of using lay assistants for building and farm work, and catered for large numbers of lay brothers or *conversi,* living under a different regime in separate quarters.

When, after a difficult beginning, Citeaux began to flourish and "swarm," the three outstanding constitutional features imposed briefly and firmly by the Carta caritatis were: (1) Uniformity; all monasteries were to observe exactly the same rules and customs, with identical service books and an identical arrangement of buildings (see MONASTERY: Cistercians). (2) General chapter; the abbots of all the houses were to meet in annual general chapter at Cîteaux. (3) Visitation; each daughter house was to be visited yearly by the founding abbot, who should ensure the observance of uniform discipline. The whole body was thus bound together vertically by the close connection from top to bottom of mother and daughter, and horizontally by the legislative and administrative authority of all abbots meeting on an equal footing for the common good. Thus the individual house preserved its internal autonomy, and the individual monk belonged for life to the home of his profession, while the system of visitation and chapter provided external means of maintaining standards and enforcing legislation and sanctions.

The Cistercians might have remained a relatively small family, like the contemporary reforms of Savigny and Tiron, had not the fortunes of the order been changed by St. Bernard, who joined Citeaux as a novice, along with about 30 relatives and friends, in 1112 or 1113. In 1115 he was sent out as founding abbot of Clairvaux, and thenceforward the growth of the order was spectacular. No other religious body before or since has increased so greatly in so brief a space. At St. Bernard's death the total number of Cistercian abbeys was 338, of which 68 were direct foundations from Clairvaux, and the order had spread from Sweden to Portugal and from Scotland to the Levant. The first English houses were at Waverley (Surrey) in 1128 and Rievaulx (Yorkshire) in 1132. In 1147 the Cistercians absorbed the whole family of Savigny in France and England. Nor were the Cistercian communities small, though the founding body normally consisted of 12 monks and 6 lay brothers with an abbot. Citeaux in St. Bernard's later years had a total population of 700; at Rievaulx under St. Aelred there were 140 choir monks and 600 lay brethren. (See also BERNARD, SAINT).

As a result of this expansion and the fame of St. Bernard the spiritual centre of gravity of the church shifted from Cluny to Citeaux-Clairvaux; it was commonly said that the whole world had "gone Cistercian," and for the remainder of the 12th century the White Monks occupied the places that the Cluniacs had held in the previous century in the Roman Curia and as legates and bishops. In a very different sphere, that of economic life, the White Monks made an even greater mark. With compact broad estates and with a large, disciplined, unpaid labour force, the Cistercians were able to develop all branches of farming without the hindrances of manorial customs. In reclaiming marginal land and in increasing production, especially that of wool in the large pastures of Wales and Yorkshire, the Cistercians played a large part in the economic progress of the 12th century and in the development of the techniques of farming and marketing.

The reasons for their unparalleled success were many. Foremost was the appeal made in the virile, expanding Europe by the simple, pioneering, well-balanced life of the early Cistercians, which exactly suited the temper of an age of spiritual endeavour, conditioned to monasticism by the Gregorian reform. More particularly, there were the energy, the charm and the clarion call of St. Bernard, who added to his qualities of leadership and eloquences those of the saint and the mystic, thus attracting the finest spirits of the time. Further, the institution of the lay brotherhood opened the monastic life to a class hitherto neglected, and that in an epoch of rising population. Finally, the foundation of a Cistercian abbey in marginal or waste land, and the preparation of the site and buildings by the lay brethren, made the establishment of new abbeys relatively inexpensive and simple for both landowners and monks.

The Cistercians, in addition to their own expansion, had immediate and lasting influence. Founders such as St. Norbert (Premonstratensians), St. Gilbert of Sempringham (Gilbertines) and the early Knights Templar took counsel and even orders from St. Bernard. The papacy used two of the main instruments of Cistercian government, the general chapter and visitation, as instruments of reform throughout the religious orders. In a less tangible way, St. Bernard and his disciples and imitators opened a new phase of devotion and spiritual teaching, with a more human and personal approach to the Blessed Virgin, the Holy Family, St. Joseph and the guardian angels, and with a more experimental and less formalized description of the higher stages in the spiritual life.

The golden age of the White Monks was the 12th century. Even before its close many abbeys were breaking some of the most essential statutes by accepting churches, villeins and tithes, and by commercial transactions in wool and grain. Moreover the phenomenal expansion of the order put a severe strain upon a constitution framed for a small regional group of abbeys. Thus the annual visit to chapter was a physical and moral impossibility for abbots in Sweden, Scotland and the Levant, and they were allowed exemption. Similarly, the abbot of a mother house with distant foundations — such as the English Kirksted with a daughter house in Norway — could not make the annual visitation or preside at elections. In the 13th century wealth accumulated and discipline declined; the Cistercian pope Benedict XII attempted a moderate reform in 1335 and directed the White Monks to the universities, but the decline continued. Wars and the Great Schism favoured regional independence; economic changes made

the lay brotherhood a liability, and the *conversi* vanished altogether in England and elsewhere. At the Reformation the monks disappeared in northern lands; in France, where the White Monks were most numerous, a movement of reform led to the formation of two groups, those of the strict observance and those of the common observance, which lasted till the Revolution. Besides these there were two important reforms, the Feuillants and the Trappists.

Feuillants. — The Feuillants owed their origin as a separate order to Jean de la Barrière (1544–1600), who began a return to primitive observance in his abbey, Les Feuillans, in the Garonne district of France. The reform spread widely and was approved by Sixtus V in 1589; it became a fully independent congregation in 1592. The Feuillants, who counted among their number the celebrated liturgical scholar Cardinal Giovanni de Bona, disappeared at the French Revolution along with their sister order of nuns.

Trappists. — The Trappists (Ordo Cisterciensium Reformatorum seu Strictioris Observantiae; O.C.R.; O.C.S.O.) were founded by the converted courtier Armand de Rancé (1626–1700), who had held in commendam the Cistercian abbey of La Trappe in France, which he transformed (1662) into a community practising extreme austerity of diet, penitential exercises and absolute silence; he became its regular abbot in 1664. For more than 30 years the abbey, under his forceful sway, was one of the wonders of France; but his rigidity of mind, the physical and psychological demands he made upon his followers and his outspoken criticism of the ways of those less austere than himself provoked many to hostility and led him into a vexatious controversy with Jean Mabillon. Only two Trappist monasteries were founded in the 18th century, both in Italy. In 1792 the monks were ejected from La Trappe and a number of them, led by Dom Augustine de Lestrange, settled at Val-Sainte in Fribourg, Switz., where they adopted an even more rigid life and made several foundations before tlieir expulsion in 1798. Long years of wandering in Russia and Germany were followed in 1814 by a return to La Trappe; they were the first religious order to revive after the Revolution, and at the death of Lestrange in 1827 numbered 700, divided in allegiance between the rule of De Rancé and that of Lestrange. Their increase has never ceased, and by the 1960s there were about 70 abbeys, including several in England, Scotland, Canada, the United States, Australia and South Africa. The three existing congregations of Trappists were united by Pope Leo XIII as the independent Reformed Cistercians of the Strict Observance; they follow the primitive custom of Citeaux with an emphasis on silence and austerity but without the rigid regulations of the early Trappists. After World War II their growth was particularly notable in France and the U.S., where the abbey of Our Lady of Gethsemani (Kentucky), the largest in the whole order. alone comprised eight foundations.

The life of the reformed Cistercians is physically most austere, though its well-balanced regime of prayer, reading and manual work gives it a wider applicability than that of the more solitary and less active Carthusians. The monks sleep, eat and work in common, but in silence unbroken by any set periods of recreation. They practise total abstinence from flesh, fish and eggs, living on bread, vegetables, fruit and a little cheese and milk. Their clothing and bedding are simple and rough; they wear a white tunic and black scapular and hood, with a white cowl. De Rancé and some of his imitators eschewed intellectual work and were inclined to regard ugliness or squalor as a part of poverty. The Trappists have since returned to the beauty of simplicity and have encouraged scholarship in the realms of history and theology; they publish learned periodicals of high reputation, such as the Collectanea and *Analecta* of their order, while the spiritual writings of Dom Vitalis Lehody and Thomas Merton in the 20th century have attained a wide celebrity.

Cistercians of Common Observance. — Meanwhile, the original order, now known as the Cistercians of Common Observance (Sacer Ordo Cisterciensis; S.O. Cist.), has continued with a quiet prosperity to increase, forming eight congregations with about 50 monasteries, chiefly in continental Europe, though with houses in the United States and Canada. Some of these differ little in their practices from the Reformed, and in both orders there has been a notable mid-20th-century revival of literary work, particularly critical historical work of a high quality on topics common to all Cistercians.

Cistercian Nuns. — Communities of nuns adopting the Cistercian customs were found as early as 1120–30, but they were excluded from the order until about 1200 when the nuns began to be directed, spiritually and materially, by the White Monks, though many convents all over Europe transferred their allegiance to and fro between Black and White. Both Benedictines and Cistercians have claimed among their saints the group at the convent of Helfta (founded 1258 in Saxony), which included the two Gertrudes and the two Mechtilds. After the catastrophes of the Reformation many reforms were initiated, among them that of the celebrated abbey of Port-Royal in France and its daughters, which was originally a reform on strict Cistercian lines. There are Cistercian convents mostly in Spain and the German-speaking lands. There are also nuns of the reformed observance, known sometimes as Trappistines; they follow the customs of the monks, and have houses at Stapehill (Dorset), in Ireland, the United States and Canada. See MONASTICISM; ORDERS AND CONGREGATIONS, RELIGIOUS; see also references under "Cistercians" in the Index volume.

BIBLIOGRAPHY.—M. Heimbucher, *Orden* und Kongregationen, vol. 1, p. 330-376 (1933–34); L. J. Lekai, Les Moines Blancs (1957); M. D. Knowles, The Monastic Order in England (1940). (M. D. K.)

CISTUS, the rockrose, a genus of the family Cistaceae, containing about 20 species and many interspecific hybrids. They are low spring-flowering shrubs, mostly from the western Mediterranean, where they grow in full sun, in rocky to chalky soil, and are resistant to prolonged summer drought conditions.

The plants are distinguished by the leaves being in pairs, and the showy flowers in terminal clusters with each flower having five separate, often crinkly, petals. The fruit is a woody capsule. The seeds are many and are borne in five rows on the inside of the capsule wall. They are prized as garden subjects in regions where the ground rarely freezes. The most common are *C. villosus* with rose-purple flowers about $2\frac{1}{2}$ in. across, and C. ladaniferus with white flowers 3–4 in. across. Hybrids are frequently encountered. (G. H. M. L.)

CITADEL: see FORTIFICATION: Permanent Fortifications.

CÎTEAUX (Lat. CISTERCIUM), a famous site in the *département* of Côte-d'Or, Burgundy, France, 16 mi. S.S.E. of Dijon. Its great abbey, mother house of the Cistercian order, was founded in 1098 by St. Robert, abbot of Molesme. In the 12th century, largely due to the activities of St. Bernard of Clairvaux. it became the headquarters of a vast order with, at St. Bernard's death, 338 abbeys scattered all over Europe. The order disappeared during the Revolution. (See also CISTERCIANS.) Of Cîteaux's great past there remains only a part of a Gothic cloister and some 18th-century buildings that were restored and occupied again by the Grand Chapter of the Cistercian order when the abbey was restored to it in 1898. The order's archives, including 12th-century illuminated manuscripts, are kept among the archives of Dijon *département.* (L.-N. L.; L. PE.)

CITHAERON (modern KITHAIRON), a mountain range (4,623 ft.) in Greece, separating Boeotia from Megaris and Attica. Its western end reaches the Corinthian gulf; eastward it is separated from Mt. Parnis by the pass through Panactum and Phyle (modern Kastro). It was famous in Greek mythology. There Actaeon was changed into a stag, Pentheus was torn to pieces by the Bacchantes and the infant Oedipus was exposed. It was the scene of the mystic rites of Dionysus, and the festival of the Daedala in honour of Hera. The road from Athens to Thebes traverses the pass of Dryoscephalae (modern Drios Kefalae, "Oak-heads"), guarded on the Attic side by the ruined fortress of Gyphto Kastro ("Gipsy Castle"). Plataea is situated on the northern slope, and the strategy of the battle of 479 B.C. (see GRECO-PERSIAN WARS) was affected by the necessity for the Greeks to keep open the passes of Dryoscephalae, and the roads farther west from Plataea to Athens and to Megara.

CITHARA, the lyre, principal stringed instrument of the ancient Romans, corresponding to the kithara, the professional lyre of the Greeks (see LYRE). In Latin writings of early Christian Europe, the word denotes the Germanic harp and was variously applied to the early western harp as well as to surviving forms of the lyre. With the decline of the lyre in the middle ages cithara became a term to identify the minstrel's harp and King David was consequently portrayed as a harper, not, more accurately, as a lyre-player. Many common instrument names are ultimately derived from cithara, including guitar and zither.

(A. C. BA.)

CITIUM (Gr. KITION), the principal Phoenician city in Cyprus, situated on the southeast coast at the north end of modern Larnaca (*q.v.*). Converging currents from east and west greatly facilitated ancient trade. To south and west the site is protected by salt lagoons. The earliest remains go back to an Aegean colony of the Mycenaean age (c. 1400–1100 B.C.), but in historic times Citium is the centre of Phoenician influence in Cyprus. The biblical name Kittim, representing Citium, is, in fact, used quite generally for Cyprus as a whole; later also for Greeks and Romans in general. In a list of the allies of Ashurbanipal of Assyria in 668 B.C. a king, Damasu, of Qarthadasht (Phoenician for "Newtown") occurs where Citium would be expected. A Phoenician dedication to "Baal of Lebanon." found at Citium, suggests that it may have belonged to Tyre, and an official monument of Sargon II indicates that Citium was the administrative centre of Cyprus during the Assyrian protectorate (709–c. 668 B.C.). During the Greek revolts of 500, 386 et seq., and 352 B.C., Citium led the side loyal to Persia and was besieged by an Athenian force in 449 B.C. It remained a considerable city even after the Greek cause triumphed with Alexander the Great. It suffered repeatedly from earthquakes, however, and in medieval times its harbour became silted and the population moved to Larnaca, on the open bay. Harbour and citadel have quite disappeared, the latter having been used to fill up the former shortly after the British occupation; some gain to health resulted, but an irreparable loss to science. There are traces of the circuit wall and many tombs. See also CARTHAGE.

CITIZENSHIP is a relationship between an individual and a state originating under terms prescribed by the law of that state and giving rise to certain duties and rights which such law attaches to "citizenship." Citizenship also denotes the individual's status of being thus related to a state, that is, of being its citizen. International law attaches to such status certain rights and obligations of the given state vis-à-vis other states.

The original English meaning of citizen referred to membership of a borough or local municipal corporation, while the word "subject" was used to denote a man's relation to the monarch or the state. Subject is the key word appearing in English common-law usage and nationality legislation. In continental Europe citizenship (droit de citk, *cittadinanza, ciudadanía,* Biirgerrecht) also reflects the historical notion of a relationship to a city, imparting certain liberties. The term came to stand for a status of freedom. In Rousseau's doctrine of social contract, the citoyen ("citizen"), as participant in the formation of the general will, was contrasted with the sujet (the "subject"). In the ideology of the French Revolution citoyen denoted civic freedom and thus figured particularly in the Declaration of the Rights of Man and of the Citizen (1789). The American use of the term citizen is a Gallicism adopted to stress the Americans' republican emancipation from being subjects of the English king

Nationality, though often used interchangeably with citizenship, is a broader term, also comprising relationships to a state which do not confer political rights but imply other privileges, particularly protection abroad. It is the term used in international law, denoting all persons whom a state is entitled to protect, *i.e.,* those enjoying a preferred municipal-law status as well as "United States nationals" who are not citizens, "British protected persons," French ressortissants, etc. Nationality also serves to denote the relationship to a state of entities other than individuals. Thus, corporations, ships and aircraft possess a nationality. Specific terminology varies from one legal system to another.

The basic status of legal affiliation to the United States is generally called citizenship of the United States. The Immigration and Nationality act of June 27, 1952, designates by "national of the United States" both a citizen and a person who, though not a citizen, owes permanent allegiance to the United States. The only remaining noncitizen nationals are the inhabitants of American Samoa, an outlying possession of the United States. They enjoy diplomatic protection and have a right of free entry to the United States but no political rights.

The constitution of the United States also has preserved citizenship in a state of the U.S., acquired by residence in the state (14th amendment, sec. 1). Thus, the privileges and immunities clause of the constitution (art. iv, sec. 2) proscribes discrimination by a state against a citizen of another state. The Judicial code confers upon citizens of a state, including territories, the District of Columbia and the Commonwealth of Puerto Rico, the right to bring certain actions in, or remove such actions from a state court to, a federal court, where the opponent is a citizen of another state or a foreign country ("diversity of citizenship" jurisdiction). For this purpose state-created corporations are treated as having state citizenship.

The British Nationality act, 1948, introduced a concept of citizen having a dual meaning: (1) "British subject" and "commonwealth citizen" are used interchangeably to convey the notion of a comprehensive status which incorporates (2) citizens of member countries of the commonwealth. Any person who, under the provisions of that act, is a citizen of the United Kingdom and colonies (constituting for this purpose one country of the commonwealth) or who, under the law of any other country of the commonwealth, is a citizen of that country, is by virtue of such citizenship a British subject. (See COMMONWEALTH OF NATIONS: Nationality and Citizenship.)

In the Code of French Nationality, 1945, an individual's legal affiliation with the French republic is called *nationalité française, qualité* de *français,* and the bearer of such status is called *Français, Française.* In French terminology, citoyen *français* ("French citizen") denotes a distinctive status in the former French colonies, importing enjoyment of greater rights than those possessed by the "French subject," who was governed by special penal laws and had fewer civil and political rights. French citizenship was granted to all ressortissants of French overseas territories in 1946. The constitution of the fifth republic, 1958, introduced the notion of "citizenship of the community" (comprising the French republic and other member states of the community). The implications of such citizenship are equal protection and certain political rights as regards agencies of the community.

Common principal grounds for acquiring citizenship (apart from international transactions such as transfer of territory or option) are: birth within a certain territory, descent from a citizen parent, marriage and naturalization (regarding the latter, see NATURALIZATION LAWS). There are two systems of attributing citizenship as of the time of birth: *jus* soli, whereby citizenship is acquired by birth within the territory of the state, regardless of parental citizenship; *jus sanguinis,* whereby a person, wherever born, is a citizen of the state if, at the time of his birth, his parent is one The countries of the Commonwealth of Nations and the United States adopt the *jus* soli as basic principle; they also recognize acquisition of nationality by descent but subject it to strict limitations. Other countries generally adopt the *jus sanguinis* as basic principle, supplementing it by provisions for acquisition of citizenship in case of combination of birth and domicile within the country, birth within the country of parents also born there, etc.

Acquisition of citizenship by a woman through marriage to a citizen was the prevailing principle in modern times until the era

following World War I. Under the system of "unity of nationality within the family," the wife and children share the nationality status of the husband and father as head of the family. Modification of this system, where it results in the woman's and child's statelessness, was promoted by the Hague conference of 1930 Under the impact of the idea of equality of men and women. there developed a new system whereby a woman's nationality was not affected by marriage. Resulting mixed-nationality marriages created complications. particularly as regards the nationality status of children, since descent from a citizen mother has also gained recognition as an acquisition ground. Thus, various mixed systems have been devised, all stressing the woman's and child's freedom of choice.

Expatriation provisions, frequently punitive, and the lack of uniformity of rules on citizenship acquisition and loss have produced statelessness. Provisions of nationality laws which overlap oiten result in dual nationality; a person may be a citizen of two countries. which may result in conflicting citizenship duties. Efforts are being made, particularly on an international level, to remedy the incident hardships

Generally, political rights, such as suffrage and the right to hold public office, are predicated upon citizenship. Usual incidents of citizenship are allegiance and military duty. Otherwise, the significance of citizenship varies in accordance with the relevance attributed to it in various countries. Thus, in civil-law countries, issues, such as personal capacity (*e.g.,* capacity to contract marriage, to make a will), legitimate or illegitimate descent family status the civil consequences of marriage, succession to movable property, are governed by the law of the state of which the person concerned is a citizen. In common-law countries such issues are usually determined by the law of the person's domicile. In criminal matters, citizenship plays a nationally varying role. *e.g.,* as regards extradition, penal jurisdiction or treason legislation.

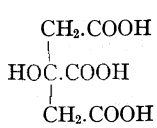
CITOLE: see CITTERN.

CITRANGE, the hybrid tree and its fruit produced by crossing any variety of sweet orange (Citrus sinensis) with the hardy triioliate orange (*Poncirus* trifoliata). From 1892, U.S. scientists endeavoured to produce some form of citrus or a relative which would thrive in a winter temperature subnormal for oranges. Plants raised from cross-fertilized fruits, using these two species as parents, are generally much hardier than oranges. About a dozen varieties have been named—all produce fruit that is highly acid. juicy and of value mainly for flavouring drinks or for culinary use. They are too acid and bitter for eating out of hand. Since they are hardier than oranges, lemons or limes. they are of interest in areas that are somewhat cold for other kinds of citrus.

Some varieties of citrange are used for rootstocks for other kinds of citrus fruits. They are generally vigorous and disease resistant as well as hardy. As rootstocks, they tend to dwarf slightly the grapefruit, orange or lemon tops worked on them.

Citrangequats, trigeneric hybrids made by crossing a kumquat (*Fortunella* rnargarita) with a citrange, are cultivated as novelties in the United States. (J. R. MAG.)

CITRIC ACID, $C_6H_8O_7$, 2-hydroxypropane-1:2:3-tricarboxylic acid, with structural formula:



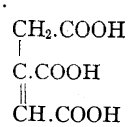
(citric acid)

is one of the commonest plant acids.

Distribution. — The acid was first isolated in a pure form from lemon juice by Karl Wilhelm Scheele in 1784. It occurs as the free acid in many other acid fruits and usually as a salt in most other parts of plants. Almost all plant materials that have been tested with the delicate modern methods have been found to contain some citric acid or citrate, some only a few milligrams per kilogram, others. such as lemons, up to 50 g. per kilogram. It is also a constituent oi many animal tissues and body fluids. Milk contains up to 1.2 g. per litre. bone (wet) and teeth about 3 g. per kilogram, semen about j g. per litre. blood serum about 0.02 j g. per litre, human urine between 0.2 g. and 1.2 g. per litre.

Preparation. — Citric acid has been prepared commercially from the juice of lemons and limes. but this method was largely superseded by the mold fermentation process: C. Wehmer discovered in 1893 that citric acid can be obtained from sugar solutions on which the mold *Citromyces* has been allowed to grow. In 1916 C. Thom and J. N. Currie found that some strains of *Aspergillus* niger produced much more citric acid than Wehmer's organism. This was the starting point of the modern fermentation method. The fermentation is a complex oxidative process; the sugar is probably first broken down to small units such as pyruvic acid, acetaldehyde. acetic acid and carbon dioxide. which recombine to form citric acid. It is usually carried out in shallow vessels which allow free access of air. About ten days after spore inoculation and incubation at 30° to 32° C. the process is completed. Yields as high as 87% of the weight of the sugar used have been reported; usually. however. about 60% can be recovered; sucrose gives the best yields. but cheaper sources like molasses are also satisfactory raw materials. A deep tank fermentation process of the type used in the manufacture of penicillin has been developed in the United States, using *Aspergillus wentii.* The mold fermentation process is used in many countries. Pure citric acid is usually prepared by way of the calcium salt. The crude solution of the acid, after heating and filtration: is neutralized with lime and chalk and boiled. The precipitate of calcium citrate thus obtained is decomposed with dilute suliuric acid; the solution is filtered to remove the calcium sulfate and concentrated in vacuum pans. The acid crystallizes in colourless rhombic prisms of the composition $C_6H_8O_7+H_2O$. The first synthesis of citric acid was accomplished by L. E. Grimaux and P. Adam in 1880.

Properties. — Citric acid dissolves readily in water and is also soluble in ethyl alcohol and in ether. On heating, the crystals soften between 70° and 100° C. and lose water. On further heating the substance again becomes dry and finally melts at 153° C. At about 175° C. it loses a molecule of water and is transformed into (trans)-aconitic acid ($C_6H_6O_6$) or propene-I:2:3:-tricarboxylic acid:

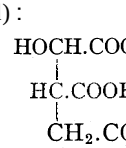


(aconitic acid)

Above 170° C. carbon dioxide and an oily distillate which yields crystals of itaconic acid ($C_5H_6O_4$) are formed. When citric acid is heated in dilute suliuric acid. aconitic acid is formed; fuming sulfuric acid produces acetone dicarboxylic acid ($C_5H_6O_5$), water and carbon monoxide

As a tribasic acid, citric acid forms three series of salts. The salts of the alkaline metals are readily soluble in water. The neutral salts of the alkaline earths are only moderately soluble. Calcium citrate is less soluble in hot water than in cold.

Uses. — Citric acid plays an important part in the metabolism of animals, plants and microorganisms. Most animal tissues, many plants and some microorganisms convert citric acid reversibly into cis-aconitic acid and isocitric acid (1-hydroxypropane-1:2:3:-tricarboxylic acid):



(isocitric acid)

Aconitic acid has been found in the leaves of monkshood (*Aconitum* napellus) and of mare's-tail (Equiseturn), but it is not certain whether the cis- or trans-form is present. Isocitric acid is the

chief acid of the blackberry and occurs in relatively high concentration (up to 12% of the dry matter) in the leaves of various Crassulaceae; *e.g., Bryophyllum, Sedum, Sempervivum.* The dry matter of foxglove leaves contains between 1% and 3% isocitric acid. The reversible interconversion of citric, cis-aconitic and isocitric acids is brought about by the enzyme aconitase. The three acids are assumed to be intermediary stages in the oxidative breakdown of foodstuffs in biological material. By way of a complex series of reactions they can arise from carbohydrate as well as from fat and from protein. They are readily oxidized in the living cells. The significance of the relatively high concentration of citrates in milk. bone, teeth and seminal fluid is not yet clear; since these materials are all relatively rich in calcium. it has been suggested that citrate plays a special role in metabolism of calcium. Citric acid produced commercially is mainly used for medicinal purposes — as a purgative, and in the treatment of gout — and for the manufacture of foods and beverages.

CITROEN, ANDRÉ GUSTAVE (1878–1935), French engineer and industrialist who introduced Henry Ford's methods to the European automobile industry, was born on Feb. 5, 1878, and graduated from the École Polytechnique. At the outbreak of World War I he convinced the French army of the necessity for mass-producing shells. After the war he mass-produced a small car, the Citroen. which won great popularity. Citroen aided in financing the 1932 Georges-Marie Haardt expedition, which traveled by car from Beirut to Peking, and also sponsored the Citroen Central African expedition. Refusing to retrench during the depression. Citroen in 1934 introduced the "Seven" — the only popular front-wheel drive car of its time. La Société André Citroen went into liquidation in Dec. 1934 and was later reorganized. Citroen died in Paris on July 3, 1935. (M. J. BI.)

CITRON, a species of *Citrus* (C. *medica*) belonging to the subfamily Aurantioideae; the same genus furnishes also the orange. lemon. lime. shaddock (pummelo) and grapefruit. The citron is a small evergreen tree or shrub growing to a height of about ten feet; it has irregular, spreading spiny branches; large pale green. broadly oblong, slightly serrate leaves, with wingless petioles, and generally perfect flowers. The acid varieties such as the Diamante have flowers purplish without and white within, while the sweet varieties such as the Corsican have creamy white flowers throughout. The fruit is oval or oblong, protuberant at the tip. from five to six inches long, furrowed; rind adhesive, the inner portion thick. white and fleshy. the outer, thin. greenish-yellow and very fragrant. The pulp is firm. either acid or sweet, and is used only for by-products. The thick peel has an agreeable flavour when candied. There are many ,varieties of citron but the two commonly grown for production of candied peel are Corsican and Diamante. The fruit of the Etrog citron is used only for ceremonial purposes in religious rites of the Hebrew people. It has a pronounced protuberant tip with persistent pistil even on the ripe fruit. Candied citron is highly esteemed as a confection. Supplies come from the Mediterranean countries and Puerto Rico. Citron peel must be cured in brine or sea water prior to being candied.

The citron tree may be grown in the various countries of the world where lemons and limes are grown. as it is only slightly less resistant to frost injury than they are.

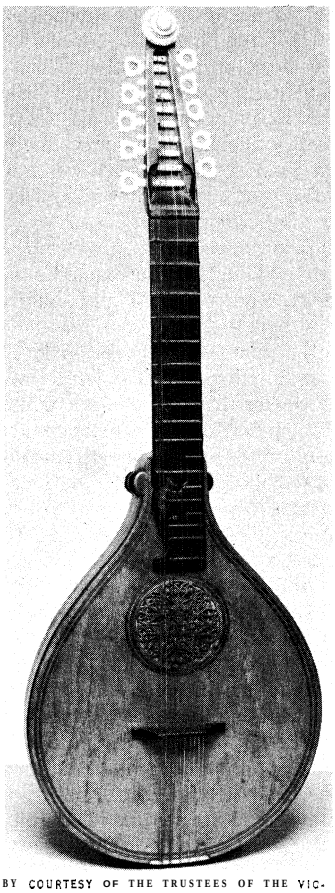
CITTÀ VECCHIA: *see* MDINA.

CITTERN, a small wire-stringed instrument, plucked by a plectrum or by the fingers. which originated in the middle ages but attained its greatest popularity during the 16th and 17th centuries. It had a flat, shallow. pear-shaped body. the depth of which uniquely decreased toward the bottom end. This spatulate form derives from the medieval gittern, one of the earliest of the European types of this family of instruments. Another curious and early feature of the cittern is the assymetric neck, consisting of a semicircular spar and set off-centre to the treble side, but with a wide fingerboard overhanging beneath the lower strings, forming a section resembling the letter P.



BY COURTESY OF THE TRUSTEES OF THE VICTORIA AND ALBERT MUSEUM; PHOTOGRAPH, P. F MACDONALD

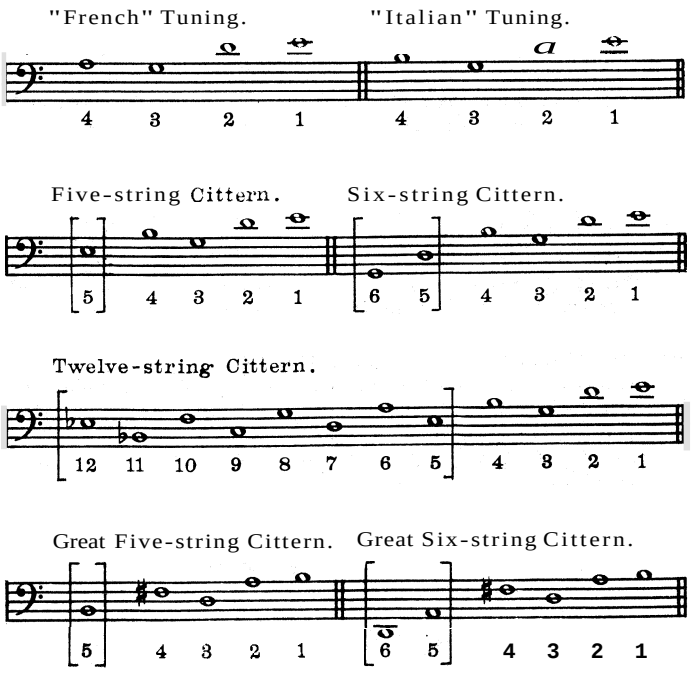
16TH-CENTURY GERMAN CITTERN

The cittern was the first instrument on which fixed metal frets were used. in contrast to the adjustable gut frets of the lute and viol.

The basic arrangement of the strings was four unison pairs. brass for the lower and steel for the upper courses. The instrument was made in two main sizes, tuned a fourth apart in pitch, the lowest notes of which were respectively G and D below middle C. Additional courses of strings were common but were in the nature of diapasons as on the lute and were used for reinforcing the basses of chords *ad libitum.* The strings pass over a pressure or violin-type bridge set fairly high up the belly and are hitched to pins at the lower end. The tuning of the main strings is peculiar (*see* below) and resembles that of the modern ukulele; the tuning arrangement is designed to facilitate the fingering of simple chords. The instrument was played from music noted in tablature. (See **LUTE**).

Cittern Tuning

(after M. Praetorius, *Organographia,* 1619)



The additional strings (diapasons) are shown in brackets.

Early specimens sometimes reveal a high degree of artistic decoration and craftsmanship, suggesting aristocratic patronage.

(E. HA.)

CITY, a name given to certain urban communities in English-speaking countries by virtue of some legal or conventional distinction; it also refers to a particular type of community, the urban community and its generic culture.

In the United States, a city is an urban area incorporated by special or general act of a state legislature. Its charter of incorporation prescribes the extent of municipal powers and the frame of local government, subject to constitutional limitation and amendment. In common usage, however, the name is applied to almost every urban centre, whether legally a city or not, and without much regard to actual size or importance. In Australia and Canada, city is a term applied to the larger units of municipal government under state and provincial authority respectively. New Zealand has followed British precedent since the abolition of the provinces in 1876; the more populous towns are called boroughs under the Municipal Corporations act of 1933 and earlier legislation. In the United Kingdom itself, city is merely an official style accorded towns either in their historical identity as episcopal sees or as the beneficiaries *honoris causa* of a special act of the crown (the first town so distinguished was Birmingham in 1889). Except for the ancient City of London (about 673 ac. under the lord mayor), the title has no significance in local government in the United Kingdom: cities do not enjoy greater corporate powers than those of county boroughs (as defined in the Local Government act of 1888 and Municipal Corporations act of 1882).

City government is almost everywhere the creation of higher political authority, state or national. Indeed, some European countries have adopted general municipal codes which permit centralized administrative control over subordinate areas through a hierarchy of departmental prefects and local mayors. In English-speaking countries, however, devolution of powers occurs through legislative acts which delegate limited self government to local corporations.

As a type of community, the city may be regarded as a relatively permanent concentration of population, together with its diverse habitations, social arrangements and supporting activities, occupying a more or less discrete site, and having a cultural importance which differentiates it from other types of human settlement and association. In its elementary functions and rudimentary characteristics, however, a city is not clearly distinguishable from a town or even a large village. Mere size of population, surface area or density of settlement are not in themselves sufficient criteria of distinction, while many of their social correlates (division of labour, nonagricultural activity, central-place functions and creativity) characterize in varying degree all urban communities from the small country town to the giant metropolis.

While many cities have been deliberate foundations by potentates or colonizers, others have "just grown." During their 7,000-year history, cities have been populated by clans, families and individuals; they have been patterned in rectangular, oval and irregular forms. Cities have variously functioned as temples, fortresses, capitals, markets and factories, and have provided a locus for agricultural, commercial, manufacturing and a host of specialized service activities. As a consequence, city life has given rise to a variety of social structures and personality-types. The changing institutional order of the city has embraced any and all of these social phenomena and has assimilated something from each. The city and its hinterland are usually interdependent: the countryside focuses its life and activity upon that of a central city which, in turn, encompasses the diversity of the hinterland.

Origins of Cities and City Culture.—The early evolution of urban communities occurred between the 6th and 1st millenniums B.C. in widely separated parts of southern Asia. Their origins seem rooted in a Neolithic transformation which resulted in the introduction of cereal agriculture (wheat and millet) some time after 10.000 B C. Dependence on crops required a more orderly and permanent mode of settlement under comparatively restricted conditions of environment. A stable community of stone-using people eating a semicultivated wheat, but without pottery or metallurgy, existed at Jarmo in east-central Mesopotamia about 5000 B.C. A social-architectural prototype with houses and walls was situated at Jericho in Palestine at about the same time. The subsequent transition from agricultural villages to larger cities (as revealed by radiocarbon dating) was quite rapid. By 3000 B.C. urban populations were distinguished by literacy, technological progress (notably in metals), social controls, political organization and emotional focus (formalized in religious-legal codes and symbolized in temples and walls). Such places, dated by historical means, existed on the Sumerian coast at Ur and in the Indus valley at Mohenjo-daro during the 3rd millennium, and before 2000 B.C. had also appeared in the Nile and Wei-ho valleys. Cities proliferated along overland trade routes from Turkestan to the Caspian and then to the Persian gulf and eastern Mediterranean. Their economic base in agriculture (supplemented by trade) and their political-religious institutions had made for an unprecedented degree of occupational specialization and social stratification. From central vantage points, cities already gave some coherence and direction to life and society in their hinterlands.

The growth of cities, however, was by no means the inevitable outcome of a succession from barbarism to civilization. As S. Piggott has pointed out in "Role of the City in Ancient Civilizations" (in *Metropolis in* Modern *Life*, ed. by E. M. Fisher [1955]), an alternative, and in some ways inimical, type of community had arisen in the steppe-lands of Asia based upon animal husbandry: the nomadic encampment. Like their urban contemporaries, the nomads were no longer "primitive" men. In addition to pastoralism, they had developed great oral traditions. abstract art styles, and numerous crafts albeit no formal architecture. Led by warrior chiefs, these self-sustaining migratory peoples encroached upon the settled agricultural-trading areas to the south.

During the 2nd millennium the Indus civilization was engulfed by an onslaught of Aryan nomads, while other peoples, using horses and chariots, penetrated the urban heartland from Mesopotamia to Egypt. In these circumstances of prolonged upheaval, survival required the perfection of warlike arts and predatory supply systems which transformed the urban communities into paramilitary states; *e.g.*, the Hittite, Egyptian and Mycenaean empires. Citizenship, though still a ceremonial service, was increasingly associated with the bearing of arms. After 1200 B.C. even the city-empires (a city-camp hybrid) lapsed into chaos and disorder until the lifting of the Hellenic "dark ages" during the 8th century B.C. and the transplanting of the syncretic city-state beyond the eastern Mediterranean by Phoenicians and Greeks.

Autonomous and Dependent Cities.—The heterogeneous peoples that created the Greco-Roman world inherited a technological and nonmaterial culture from southwestern Asia which helped mollify barbarism and nourish the growth of cities. Their trading colonies, from the Crimea to Cadiz, eventually brought the entire Mediterranean within the orbit of civilization. It was in the Greek city-state (*q.v.*) or *polis*, however, that the city-idea reached its peak. Originally a devout association of patriarchal clans, the *polis* came to be a small self-governing community of citizens in contrast to the Asian empires and nomadic hordes. For citizens, at least, the city and its laws constituted a moral order symbolized in magnificent buildings and public assemblies. It was, in Aristotle's phrase. "a common life for a noble end." When the old exclusive citizenship was relaxed, and as new commercial wealth surpassed that of the older landed citizenry, social strife at home and rivalry abroad gradually weakened the common life of the city-republics. The creativity and variety of the *polis* gave way before the unifying forces of king-worship and empire epitomized by Alexander the Great and his successors. To be sure, many new cities were planted between the Nile and the Indus through which the amenities and forms of city-culture were carried back to the east, but the city itself ceased to be an autonomous body politic and became a dependent member of a larger political-ideological whole.

The Romans, who fell heirs to the Hellenistic world, transplanted the city into the technologically backward areas beyond the Alps inhabited by pastoral-agricultural Celtic and Germanic peoples.

But, if Rome brought order to civilization and carried both to barbarians along the frontier, it made of the city a means to empire (a centre for military pacification and bureaucratic control) rather than an end in itself. The enjoyment of the imperial Roman peace entailed the acceptance of the status of *municipium:* a dignified but subordinate rank. Initiatives passed to the centre and, in the east, the culture of provincial cities became imitative, their politics trivial. They contributed little to the larger economic life beyond the needs of their social elites and the payment of taxes; they tapped the surpluses created by local agriculture and trade in rents and tribute. As Roman citizenship became more universal and formal, the idea of public duty gave way to private ambition. Municipal functions atrophied and, except for their fiscal duties, it was in a passive role that the city survived into the Byzantine era.

Medieval Cities: From Fortress to Emporium. — In Latin Europe neither political nor religious reforms could sustain the Roman regime. The breakdown of public administration and the breach of the frontier led to a revival of parochial outlook and allegiance, but their focus was not upon the city. Community life now centred on the fortress (*burgum*) or castle (*castellum*) and the term city (*civitas*) was attached to the precincts of the episcopal throne, as in Merovingian Gaul.

Early medieval society was a creation of camp and countryside to meet the local imperatives of sustenance and defense. With Germanic variations on late Roman forms, communities were restructured into functional estates each of which owned formal obligations, immunities and jurisdictions. What remained of the city was comprehended in this feudal-manorial order, and the distinction between town and country was largely obscured when secular and ecclesiastical lords ruled over the surrounding counties (*comté,* Grafschaft) as the vassals of mock emperors or barbarian kings. Social ethos and organization enforced submission to the common good of earthly survival and heavenly reward; the true city, civitas Dei, was not of this world. The attenuation of city life in most of northern and western Europe was accompanied by provincial separatism, economic isolation and religious other-worldliness. Not before the cessation of attacks by Magyars. Norsemen and Saracens did urban communities again experience sustained growth.

Recovery after the 10th century was not confined to the city nor to any one part of Europe. The initiatives of monastic orders, seigneurs or lords of the manor, and merchants alike fostered a new era of increased tillage, enlarged manufacture, money economy, the growth of rural population and the founding of "new towns," as distinguished from those "Roman" cities that had survived from the period of Germanic and other encroachments. In almost all the medieval towns the role of the merchant was central: his needs and aspirations had a catalytic effect and, largely as a consequence of mercantile enterprise in the long-distance staple trade, cities were to flourish once more. Under commercial stimulus, feudal obligations were relaxed and European society was made over anew by the city and the market place in pursuit of self-government and economic gain.

Before the year 1000 contacts with rich Byzantine and Islamic areas in the Levant had revitalized the mercantile power of Venice, which commanded the profitable route to the Holy Land during the crusades. Meanwhile, merchant communities had attached themselves to the more accessible castletowns and diocesan centres in northern Italy and on the main traveled routes to the Rhineland and Champagne. They later appeared along the rivers of Flanders and northern France and on the west-east road from Cologne to Magdeburg.

It was no coincidence that the 12th and 13th centuries, which saw the founding of more new towns than any time between the fall of Rome and the Industrial Revolution, also witnessed a singular upsurge toward civic autonomy. Throughout western Europe towns acquired various kinds of municipal institutions loosely grouped together under the designation "commune"; the term, however, encompasses significant regional differences. and for a comprehensive discussion of these institutions see COMMUNE (MEDIEVAL). Broadly speaking, the history of the medieval towns is that of the merchant elites seeking to free their communities from lordly jurisdiction and to secure their government to themselves Wherever monarchical power was strong, they had to be content with a municipal status but elsewhere they created city-states. Taking advantage of renewed conflict between popes and emperors, they allied with local nobility to establish communal self-government in the larger cities of Lombardy, Tuscany and Liguria In Germany the city councils sometimes usurped the rights of higher clergy and nobility; Freiburg im Breisgau obtained its exemplary charter of liberties in 1120. The movement spread to Liibeck and later to the net of Hanse towns on the Baltic and North seas, touching even the Christian "colonial" towns east of the Elbe-Saale rivers. In the 13th century the "Great Towns" of Bruges. Ghent and Ypres, creditors of the counts of Flanders, virtually governed the entire province. In France revolutionary uprisings, directed against nobility and clergy, sometimes established free communes, but most communities were perforce content with a franchise from their sovereign more limited than those enjoyed by English boroughs under the Norman conquest. Finally, the corporate freedom of the towns brought emancipation to individuals. When bishops in the older German cities treated newcomers as serfs, the emperor Henry V affirmed the principle Stadtluft *macht* frei in charters for Speyer (or Spires) and Worms; "new towns" founded on the lands of lay and clerical lords offered freedom and land to settlers who took up residence for more than "a year and a day." In France the *villes neuves* (*e.g.,* Lorris) and *bastides* (*e.g.,* Montauban) likewise conferred rights on servile persons.

In the 14th century, the urban movement subsided as Europe entered on a period of political anarchy and economic decline that did not much abate before the 16th century. At a time when local specialization and interregional exchange required more liberal trade policies, craft protectionism and corporate particularism in the cities tended to hobble the course of economic growth. The artisan and labouring classes, moreover, now challenged the oligarchical rule of the wealthy burghers and gentry disrupted local government and ultimately destroyed the basis for civic autonomy: prolonged social warfare led to "popular" despotisms and fiscal bankruptcy. Visitations of plague, fanatical crusades against heresy, and Turkish encroachments on the routes to Asia worsened conditions in town and country alike. Europe turned inward upon itself and, except for a few large centres, activity in the market place was depressed: the cities surrendered their liberties and their population. These centuries of decline were relieved only by the slow process of individual emancipation and the cultural efflorescence of the Renaissance, which laid the intellectual basis for the great age of geographical and scientific discovery exemplified in the new technologies of gunpowder, mining, printing and navigation. Not before the triumph of princely government, in fact, did political allegiance, economic interests and spiritual authority again become centred in a viable unit of organization, the absolutist nation state.

The City and the Nation State. — The virtue of absolutism in the early modern period lay in its ability to utilize the new technologies. Through the centralization of power, economy and belief it brought order and progress to Europe and provided a framework in which individual energies could once more be channeled to a common end. While the nation stripped the cities of their remaining pretensions to political and economic independence (symbolized in their walls and tariff barriers), it created larger systems of interdependence in which territorial division of labour could operate. Though new mercantilist policies built up national wealth, they did not necessarily foster the growth of cities. All too often the wealth of nations was dissipated in war. Much of the income produced in town and country went to bolster the monarch's power and advertise his fame; the splendour of court life and the baroque glory of palaces and churches were paid for by merchant enterprise and the toil of peasants and craftsmen. Only in colonial areas, notably the Americas, did the age of expansion see the planting of many new cities and it is significant that the capitals and ports of the colonizing nations experienced their most rapid growth during these years. Under absolutist regimes,

a few large political and commercial centres grew at the expense of smaller outlying communities and the rural hinterlands.

By the 18th century, the mercantile classes were increasingly disenchanted with monarchical rule. They resented their lack of political influence and assured prestige. They objected to outmoded regulations which hindered their efforts to link commercial operations with the systematic improvement of production. Eventually, they would unite with other dissident groups to curb the excesses of absolutism, erase tbe vestiges of feudalism and secure a larger voice in the shaping of public policy. In northwestern Europe, where these liberal movements went furthest, the city populations and their bourgeois elites played a critical role out of all proportion to their numbers. Elsewhere, as in Germany, the bourgeois were more reconciled to existing regimes or, as in northern Italy, had assumed a passive if not wholly parasitical role.

With the exceptions of Great Britain and the Netherlands, however, the proportion of national populations resident in urban areas nowhere exceeded 10%. As late as 1800 only 3% of world population lived in towns of more than 5,000 inhabitants. No more than 45 cities had populations over 100,000 and of these less than half were situated in Europe. Asia had almost two-thirds of the world's large-city population and Edo (Tokyo), with 1,400,000 residents, was the largest 18th-century city, larger than ancient Rome or medieval Byzantium at their peaks. Clearly, the mere presence of large cities or merchant elites anywhere in the world did not ensure the development of a dynamic social economy: the decisive factor was industrialism.

Industrial Cities.—Before 1800, innovations in agricultural and manufacturing technique had permitted a singular concentration of productive activity close to the sources of mechanical power—water and coal. A corresponding movement of population was accelerated by the perfection of the steam engine and the superiority of the factory over pre-industrial business organization. From the standpoint of economy, therefore, the localization of differentiated but functionally integrated work processes near sources of fuel was the mainspring of industrial urbanism. Under conditions of belt-and-pulley power transmission, urban concentration was a means of (1) minimizing the costs of overcoming frictions in transport and communications: and (2) maximizing internal economies of scale and external economies of agglomeration. While the intellectual and social prerequisites for industrialization were not uniquely present in any one European nation. an unusual confluence of commercial, geographic and technological factors in Britain led to far-reaching changes in such strategic activities as textiles, transport and iron. Britain became "the workshop of the world" and London its "head office." Differentiation went so far that the cotton, woolen and iron districts became more specialized and productive, each proceeding within its own cycle of technical and organizational change. By the mid-19th century. similar if less comprehensive industrial organization was evident in parts of France, the Low Countries and the northeastern United States.

The concentration of the manufacturing labour force in "mill towns" and "coke towns" gradually undermined traditional social structures and relationships. Age-old problems of public order, health, housing. utilities, education and morals were aggravated by the influx of newcomers from the countryside. High rural birth rates combined with the industrialization of agriculture to release not only the country's foods and fibres but its children as well. Though the lowering of mortality in the 19th century was later offset by declines in fertility, the population of the more industrialized nations boomed into the 20th century and the greater part of the increment migrated to the larger towns. The outcome was rural depopulation and the urbanization of society. Local institutions, often of medieval origin, were unable to cope with conditions that exaggerated poverty, disrupted family life and complicated personal adjustment. Piecemeal reforms did little to improve the new milieu since. in the last analysis. the "city problem" arose not so much from the lack of public authority as from an unwillingness to pay the costs of social planning and improvement. Generations of urbanites experienced a continuing disorganization of their lives and work before the rising productivity of machines and increasing popular pressures on government could arrest the worst effects of this profound transformation. Slowly and painfully, the city's population adapted to its norms and enjoyed its satisfaction. New economic and cultural opportunities in the city evidently compensated for its congestion and strain.

In the century after 1850 world population doubled and the proportion living in cities of more than 5,000 inhabitants rose from under 7% to almost 30%. Between 1900 and 1950 the population living in large cities (100,000 plus) rose by 250%, the rate of increase in Asia being three times that of Europe and the United States. Nevertheless, the pattern of industrial urbanism (an overwhelmingly nonagricultural economy organized in a hierarchical system of different-sized cities ranging from one or more metropolitan centres at the top to a broad base of smaller-sized cities underneath) was still largely confined to the economically advanced areas: Europe, North America and to a lesser extent Australasia. Meanwhile, industrial urbanism had entered on its metropolitan phase. The widespread use of cheap electric power, the advent of rapid transit and communications, new building materials, the automobile and rising levels of per capita personal income had led to some relaxation of urban concentration. City dwellers began moving out from older downtown areas to suburbs and satellite communities where conditions were thought to be less wearing on nerves and bodies. Rising central area land values, traffic congestion, increased taxation and festering slums reinforced the exodus. At the city's core the composition of the resident population came to include growing proportions of the aged, minority groups and the very poor.

In the reshaping of the 20th-century city, advantages for residence and consumption probably played a more decisive role than advantages for production. Thus, while its advantages for manufacturers have diminished somewhat, the city remains the only feasible locus for the mass of specialized service activity which forms so large a part of the modern economy: the city offers maximum access to people. The spread of the city, however, has further weakened the vitality of local government: the difficulty of defining appropriate administrative boundaries has been added to the older problems of powers and finance. The task is to find viable forms of government for vast metropolitan districts, sometimes identified as conurbations, which sprawl across the countryside without unity or identity. See CITY GOVERNMENT; CITY PLANNING; ECOLOGY, HUMAN; URBAN SOCIOLOGY; *see* also references under "City" in the Index volume.

CITY GOVERNMENT. The governments of modern cities bear little resemblance to the governments of ancient or medieval cities. But as the walled medieval town often left its impression at the heart of the modern European metropolis, so too did obsolete governmental patterns linger on to complicate the administration of modern municipal services. This lag was evident in world-wide efforts to cope with the suburban overflow from great metropolitan centres. It also appears in many other ways and suggests the starting point for understanding modern city government; *i* e., the continuing struggle to keep pace with the problems of rapid urbanization.

Early municipal governments evolved to meet the limited demands of small towns serving rural populations. The Industrial Revolution converted the cities into workshops. The accompanying revolution in communications made them the commercial. cultural and intellectual centres of their respective countries. Thus economic drawing power combined with the attractions of a more sophisticated urban culture to bring about a world-wide migration from rural areas into cities.

With the urban migration came a need for new public services. Crime, fire, poverty and pestilence grew in seriousness with the size of the city. Polluted wells yielded to public water supply; open sewers gave way to sanitary waste disposal; contagious diseases came under public health regulations; industrial unemployment required new forms of public assistance; fire and health hazards dictated more stringent building regulations; growing congestion impelled attention to better planning of streets and open spaces. The services provided by city governments became increasingly important to the urban citizen. But each step required new legal powers, more specialists and additional funds. The pressure began to crack the shell of outmoded institutions.

Cities in England.— As the Industrial Revolution spread over England, the European continent, the United States and finally Japan in the 19th century, it brought marked changes in the structure of city government. In England, Elizabethan poor laws collapsed early under the impact of industrial unemployment. The revised Poor law of 1834 set the pattern for early efforts to adjust traditional local institutions to changing needs by creating new governmental areas (poor-law unions). It provided for locally elected governing boards, a paid professional staff and central government supervision of these local authorities. This use of ad *hoc*, or single-purpose, authorities to carry out new municipal functions spread in England until a hopeless confusion of jurisdictions. tax rates and organization forced a series of reforms. Consolidation began as early as 1871, but not until the acts of 1929 and 1933 was a more rational system of local government areas and authorities created.

By mid-20th century most of the larger cities in England, Wales and Northern Ireland operated as county boroughs. These all-purpose authorities are combined city-county governments enjoying the powers of both. The area outside the county boroughs is divided into administrative counties, which are further subdivided into boroughs (called noncounty boroughs), urban districts and rural districts. Most noncounty boroughs and urban districts are cities between 5,000 and 50,000 population, although a few are larger. Whether he lives in a county borough, noncounty borough or urban district, the urban dweller elects a council as his principal governing body. One-third of the members retire each year Both the county borough and noncounty borough councils select aldermen, up to one-third the number of councilors, for six-year terms. The aldermen sit and vote as members of the council. The council also elects the mayor who presides over the council but has no important executive duties. Administration is supervised by council committees appointed for each important department of government. The committee selects the professional head of the service and provides close policy guidance for his activities. There is no single chief executive, although the borough clerk is a connecting link between departments. (See also BOROUGH.)

The Local Government Boundary commission was appointed in 1945 to continue the rationalization of local areas. The Local Government act of 1948 made important changes in the system of government financing and property valuation for tax purposes, in part because the services undertaken by local governments under the National Health Service act of 1946 and the National Assistance act of 1948 outran local tax resources. These acts provided extensive health services and augmented aid to the aged and infirm. The Local Government act of 1948 provided a system of equalization grants from the national government to help underwrite the new functions.

Cities in the United States.— In the United States, both national and state governments were slow to face the emerging urban problems of the 19th century. The cities, reflecting the traditional American suspicion of government, were governed through an ineffectual system of two-chamber city councils, mayors without poner and a multitude of elected officials. The legal status of the city as a corporation, operating within the strict bounds of specified powers delegated from the state governments, was another major handicap Cities often lacked the legal powers needed to exercise necessary controls over private action. Rurally dominated state legislatures uere either indifferent to urban problems or meddled directly in local affairs to get special privileges. When new municipal functions were authorized. state laws usually required that they be administered by semi-independent commissions detached from the administration of the mayor. In the resulting confusion, local officials shielded by dispersed responsibility often took advantage of the opportunities for corruption in awarding franchises for public utilities, enforcing building codes, constructing public works, etc.

By the end of the 19th century, municipal corruption had become a national scandal in the United States and several reform movements gathered momentum. Among them were drives for greater home rule for cities, a shorter ballot, more stringent enforcement of tenement-control laws, reform of police systems, city planning and stronger executive control over city government. The National Municipal league, organized in 1894, became the educational centre for changes in the structure of government. It advocated and provided legal guidance for strengthening the position of the mayor, reducing the size of city councils, dispensing with superfluous elected officials and abolishing many independent boards and commissions. With public sentiment for reform growing, many states adopted municipal home-rule laws. These permitted a range of experimentation and local initiative that raised U.S. city government from disrepute to advanced professionalization within a generation.

Three patterns of city government attracted attention in the U.S. during the first half of the 20th century. One—the commission form—is now only a matter of historical interest. It was launched in Galveston, Tex.. in 1901, and later widely imitated. The members (usually five) of a small council served as the administrative heads of a group of services. The mayor was simply the presiding member of the council and had no special powers. With time, the dispersal of responsibility in the scheme revealed serious weaknesses, and the commission form gradually dwindled away. The two forms of government growing in importance by mid-century were the strong-mayor type and the city-manager (*q.v.*) type. Under the strong-mayor form a popularly elected chief executive is given substantial authority to make appointments, initiate the budget, supervise government departments, propose public policy and veto council actions. This became the dominant pattern in the larger cities. Sixteen of the 21 cities with more than 500,000 population in 1960 operated under some form of mayor-council government. Most of these cities had established some kind of general managerial assistance for the mayor in the form of a chief administrative officer. The powers of the mayors varied widely, however, and the trend to centralized administrative authority was restricted by the continuing tendency for state legislatures to place new functions under semi-independent boards. Smaller cities moved more slowly toward a strong executive than did the larger. Many continued at mid-century to operate under strong-council, weak-mayor forms with the council and its committees the dominant element.

The city-manager plan enjoyed startling success after its first introduction at Sumter, S.C., in 1912 and Dayton, O., in 1913. It follows the corporation pattern: the council is essentially an elected board of directors which appoints a professional manager to direct the city's administration. The council is usually small and nonpartisan, with the members elected at large. The manager recommends policy, prepares the budget, makes appointments and exercises direction over the administrative departments. He does not, in contrast with the strong mayor, play an active part in political action designed to get his recommendations adopted. This is left to the council. The system worked well and spread rapidly. At mid-century about half of all cities in the United States with more than 25,000 population had the council-manager form of government. Of towns and cities with more than 5,000 population about one-third operated under the manager plan, about one-half under some form of mayor-council government, about one-eighth under the commission form and the remainder under a form of town meeting.

In the United States, as in England. the growth in governmental services accelerated after 1930. Much of the burden of administering and financing these services fell on local governments. Population shifts during and after World War II meant increased

pressure for utilities, schools, improved streets and related local services. Inadequate local tax sources brought appeals for state assistance. Meanwhile the state and federal governments were looking to local governments to help administer new programs in public health, education, housing, urban redevelopment and other social services. Financial aid to local governments, therefore, expanded and principally took the form of grants subject to state or federal standards of performance and related supervision. The net result was not unlike the pattern that developed in England, although the confusion created by overlapping jurisdictions and special districts was not tackled with comparable vigour. The problem of federal-state-local relations, including the allocation of tax resources, was the subject of many studies by federal and state commissions.

Continental European Patterns of Centralized Control. — While England and the United States were struggling to adapt traditions of local autonomy and limited government to modern urban living, other countries were bringing local governments under strict national supervision. Adequate legal authority was provided by broad grants of power from the central government under general municipal laws. The administration of these powers. however, was held under much tighter central rein than in England or the U.S. France established a pattern of this type which had far-reaching influence in Europe, Latin America and Japan.

In France, the citizens elect a city council, which in turn selects a chief executive, the *maire*. Once selected, the latter becomes in many respects an official of the central government. He exercises extensive police powers independently of the council and is solely responsible for the conduct of city administration. His activities are, however, subject to close national supervision through the prefect of the *département*, or. in small towns, the subprefect of the arrondissement. The prefect may annul acts of a city council that conflict with national laws: he must approve the budget and numerous other kinds of local enactments; he may write into the budget any obligatory items that are omitted; and he may suspend the city council under certain conditions. After World War II the constitution of the fourth republic (1946) and the constitution of the fifth republic (1958) set the stage for greater decentralization of local government in France. The preoccupation of the fourth and fifth republics with national and international problems however, often delaved carrying decentralization plans into effect.

German cities first broke the feudalistic mold with the reforms of Baron vom und zum Stein in 1808. and between 1871 and World War I German municipal administration reached impressive heights of efficiency. Local councils were elected under restricted suffrage which gave one-third of the council seats to a small group of large taxpayers, one-third to a group paying the next-highest taxes and only the remaining third to the mass of voters. This council selected an executive board (*Magistrat*) consisting in part of unpaid citizens, in part of salaried professionals. The chairman of this board was the Biirgermeister, a well-paid professional civil servant enjoying great prestige and authority and, normally, long tenure. This combination set a new standard in effective municipal administration. Although the Biirgermeister was subject to a series of higher authorities ending with the ministry of the interior, he had the authority and administrative competence necessary to good government. The Weimar republic established after World War I democratized the councils but made few basic changes in the structure of municipal government. The Hitler regime, on the other hand, altered the pattern drastically in the 1930s. The *Bürgermeister* and other principal local officials were named by the Nazi party delegate and wielded virtually all the powers of city government. After the Nazi collapse in May 1945. local community elections led the return to self-governing institutions, and city elections were held throughout occupied Germany in 1946 and 1947. Division of the country in the postwar years prevented the emergence of any consistent pattern of local administration.

Municipal government in Italy strongly resembles the French structure. Before the advent of Mussolini in 1922, centrally appointed prefects exercised extensive powers over local affairs in the provinces. The towns and villages (comunes) were governed by a locally elected council and mayor, known as the *sindaco*. Committees of the councils played a somewhat larger part in running local affairs than in France, but the detailed supervision by the prefects was comparable. In Italy, as in Germany, fascism brought extreme centralization under party control. Perhaps as a reaction, the Italian constitution of 1948 decentralized administration. New regional governments, each under a regionally elected council and centrally appointed commissioner, were given extensive powers to legislate for city matters. The principle that regions are normally to exercise their administrative functions by delegating them to the provinces and *comunes* or by using local officials was clearly intended to give municipal governments a new dignity and importance, while continuing to use them to carry out national and regional programs.

In Russia after the Communist Revolution the responsibility for local government became primarily that of the republics and regions. As a result, many different forms developed. The basic pattern, however, vests general authority in a locally elected council (soviet), which in turn administers local affairs through its committees. In the larger cities the soviet selects a committee (presidium) to be the directing and co-ordinating executive. The party and youth organizations are active in selecting candidates, shaping policy and helping to carry out local programs. Popular participation in local government seems to be more active in the U.S.S.R. than it was under the fascist dictatorships of Germany and Italy.

Latin America. — In Latin-American countries local administration has been strongly influenced by continental Europe. Regional administrative areas are commonly designated provinces or departments, and central controls over local affairs are frequently strong, as in France. Constitutional provisions vary widely from extreme centralization to substantial local autonomy. The municipalities (*municipios*) in Latin America are not necessarily cities. They sometimes embrace sizable rural tracts around modest towns. The tendency, in general, is to treat the municipality as an administrative area for the national or regional government, and despite constitutional variations a high degree of centralized control over local affairs predominates.

Japan. — During the late 19th century, and down to the end of World War II, Japan followed the continental system of centralized administration. German advisers after the Meiji restoration of 1868 helped shape the administration of local affairs. although the result was perhaps more French than German. This was encouraged by a basic step in the revolution itself which had replaced provincial feudal lords with centrally appointed governors. The powers of the prefectural governors largely obscured local governmental institutions. The Local Autonomy law of 1947, however, drastically reversed the prewar pattern. Elected prefectural governors and assemblies were provided, while detailed provisions were made for the government of cities, towns and villages. The law provided essentially self-governing status for "special cities" over 500.000, but the opposition of rural prefectures blocked putting this section of the law into effect. The government proceeded, however, with a vigorous program of amalgamating small towns and villages into larger entities capable of assuming important governmental functions. An elected mayor and assembly are the essential organs of local administration, with much of their time devoted to national and prefectural programs.

Major Trends in City Government. — The governments of the cities of the world show certain marked similarities and a number of common problems. A locally elected council is virtually universal. There is usually a single chief executive, and the trend has been to strengthen his administrative position. England and the U.S.S.R. are exceptions, with committees of the council playing a strong role in guiding professional department heads. The appointed professional chief executive, originating first in Germany, assumed major importance in the United States in the modern form of the city manager and city administrative officer. Elsewhere in Europe and in Japan the elected local executive continued to predominate.

Central and state or regional governments came to rely increasingly on local governments for the administration of their

programs. This was a natural development in the centralized continental systems, but it also became evident in Britain and the United States. In both countries financial grants and technical supervision of services by higher authorities emerged as a definite pattern. In both countries, also, expanded services rendered local tax resources insufficient, even for traditional local services. Thus the tendency was to seek further financial aid, and with it to receive closer supervision. Meanwhile France, Italy and Japan were stressing decentralization. The trend, therefore, was toward removing some of the earlier distinctions between the traditional self-government of Anglo-U.S. cities and the more centralized continental systems.

Another distinct trend was the increasing professionalization of municipal services. Cities began to organize into national associations, such as the American Municipal association in the United States, and both national and international conferences of municipal officials became common. Likewise, a growing number of specialists — city managers, finance officers, personnel officials, town planners, etc.—set up national international professional associations.

A final trend to be noted was the growing concern over the problems of metropolitan areas. The great cities of the world do not fit into generalized local governmental patterns. They have spread out to engulf, socially and economically, areas far beyond their political boundaries. Many of them are the metropolitan hubs of their respective countries. These facts have encouraged the consolidation of the larger metropolitan areas under distinctive governmental arrangements. London is governed principally by the London county council, embracing 28 metropolitan boroughs and the city of London within a 117-sq.mi. area. The county has broad powers, which it administers under a county council of more than 100 members and a 21-man board of aldermen chosen by the council. The Metropolitan police district and the ancient City of London (1 sq.mi.) are the principal exceptions to the county jurisdiction. Paris has an over-all municipal council of 90 members, but subdistricts of the city *(arrondissements)* are grouped into nine sectors, each with its own mayor. Metropolitan Tokyo was consolidated into one large governmental district with prefectural powers in 1943. In 1953, Toronto, Ont., and 12 suburban municipalities were consolidated into one metropolitan district with authority to carry on a broad range of common functions.

Metropolitan government remained a major unsolved problem in the United States. Numerous studies of metropolitan regions were undertaken but adoption of adequate programs of reorganization followed at a much slower and more uncertain pace. Among the many attempts to develop remedies for the complex problems of metropolitan government were the Dade county (Miami), Florida, metropolitan government; the city-county consolidations at Baton Rouge, La., and at Atlanta, Ga., and metropolitan special district governments performing limited functions, such as the Seattle, Wash., metropolitan district. In general, however, the central city, its satellite towns, and a variety of special districts remained a chaos of overlapping and competing jurisdictions. There was no metropolitan-wide authority competent to carry on the functions of planning, land-use control, transit, recreation, prevention of water and air pollution, and other activities that demand attention on an area basis. Because local jealousies and rivalries block the consolidation of metropolitan governments, it seemed probable that only new kinds of multipurpose districts, able to carry on area-wide functions while leaving local matters to community determination, were likely to relieve the situation. Certainly the metropolitan region remained a major challenge to students of government throughout the world.

Additional information on city government may be found in the articles dealing with specific countries and some of the large cities. ***See*** also CITY; CITY PLANNING; HOME RULE (MUNICIPAL).

CITY MANAGER. The city manager is the principal executive and administrative officer of a municipality under the council-manager form of local government, which spread widely in the United States and Canada after Dayton, O., became the first large city to adopt it in 1913. Following World War I, some cities and counties in Ireland, Norway and Sweden provided for the appointment of administrators whose duties closely resembled those of the city manager in the United States and Canada. Finland in 1931 required its municipalities to appoint managers, and two states in Germany, North Rhine-Westphalia and Lower Saxony, in 1946 provided for city and county managers.

Under the council-manager plan, the voters elect only the city council, which appoints a city manager to administer municipal affairs under its supervision. The members of the council, usually five to nine in number, may be elected either at large or by wards. The mayor is a member of the council and serves as its presiding officer. He may either be designated to this position by the council or elected as such by the voters. The council acts only collectively, and its individual members, including the mayor, have no administrative functions. The city manager serves at the pleasure of the city council. Subject to its general supervision, he is in full charge of the administration of municipal affairs. He prepares the budget, appoints and dismisses personnel and directs the work of the municipal departments. He attends all council meetings, presents recommendations on municipal business and usually takes an active part in the discussions.

Origin and Spread of Plan. — The council-manager plan was devised and first advocated in the U.S. by the National Short Ballot organization, an association which proposed to improve state and local government by reducing the number of elective offices in order to fix responsibility on a few officials. This organization, of which Woodrow Wilson was president and Richard S. Childs, a young New York advertising man, was the secretary and active promoter, undertook first to support the commission plan of municipal government. Under that plan, all municipal powers were vested in a commission, the members of which collectively served as a legislative body and individually administered the departments.

Since the dispersion of administrative functions proved to be a serious weakness of the commission plan. Childs's attention was attracted by the news that the city council of Staunton, Va.. had appointed a general manager and delegated to him the function of directing the municipal departments. He seized on this idea as a means of overcoming the weakness of the commission plan, and the National Short Ballot organization formulated and began to promote the commission-manager plan. which in all essentials mas the plan later known as the council-manager or city-manager plan.

Sumter, S.C., adopted the plan in 1912. and was followed by several other small cities. The greatest impetus to its spread came with its adoption in 1913 by Dayton. which had suffered a severe flood that required emergency action by its local authorities.

The National Municipal league, the principal organization in the United States for the promotion of municipal reform, had previously concentrated its efforts on strengthening the authority of the mayor and eliminating partisan patronage. After the early success of the council-manager plan, it adopted the plan in 1915 as the basis of its model charter for municipal governments. This charter added to the essential features of the council-manager plan provisions to establish a civil service system, to forbid members of the council to interfere with the city manager's administrative work or appointments and to forbid municipal employees to engage in political activity. (Three-fourths of the cities that have adopted the plan elect their councils at large.)

While it generally proved impractical to write into law a precise definition of the respective functions of the council and the city manager, in view of the fact that the city manager serves at the council's pleasure, the principal objectives of the plan were achieved in most of the cities that adopted it. The plan spread rapidly from 1918 to 1923, as many cities undertook programs of

public works and municipal improvements and realized their need for more efficient administration.

The council-manager plan also continued to grow rapidly in both America and Europe after the end of World War II. In the United States and Canada one-half of all the cities operating with this plan in 1958 had adopted it during the years following that war. At the beginning of 1958 it was in effect in more than 1,550 cities, toans and counties in the United States and Canada Nearly one-half of all the United States cities with populations of more than 25.000 had the council-manager plan.

All cities and towns in Finland as well as one-fifth of the rural municipalities had appointed managers by 1958, and so had all the counties in Ireland. ahile in Sweden all counties and about 10% of the cities and towns had managers. In Norway 85% of all towns had managers. In two states in Germany all cities, towns and counties had managers. Thus by 1958 these five European countries had 1,534 council-manager municipalities, almost as many as the United States and Canada.

Advantages of the council-manager plan are that it provides for a short ballot nith only members of the city council elected by the people; that it unifies authority and political responsibility in the council; and that it centralizes administrative responsibility in an administrator appointed by the council. It is argued by some that a disadvantage of the plan is that the manager generally comes from outside the city and is not familiar with its local problems. Another disadvantage is that too much power is placed in the hands of one man But a good manager must have more than just a knonledge of local affairs A manager has no "power" because the elected council makes all policy decisions and the council can remove the manager at any time.

Legal and Political Basis.—The legal basis of the plan in the United States varies with state law. In states which permitted municipal home rule, cities established the plan by adopting by popular vote charters drafted by local reform groups, often following the model charter or the advice of expert consultants. Some adopted by popular vote an optional council-manager plan provided by state law. Some had their state legislatures enact special council-manager charters for them. And in others the city council adopted the plan by municipal ordinance without submitting it to popular vote.

Characteristics of Managers.— In the United States more city managers have had training or experience as engineers than in any other occupation. But following the end of World War II city councils tended to prefer men with training and experience in public administration rather than men with specialized training. Four-fifths of the managers had attended college and two-thirds of this group completed their college work. One-half of those who obtained bachelors' degrees continued their education for a higher degree, usually a master's degree, and one out of every five managers held a graduate degree.

While city managership had no definite training requirements, a young man who planned a career in this profession usually obtained a master's degree in public administration and served as an intern and as an assistant to a manager for several years before becoming a city manager. Nearly one-half the city managers appointed each year were promoted from one city to another or were former managers who received new appointments. Less than 10% of the managers came from nongovernmental positions.

City managers. with rare exceptions: refrained from taking part, in local political campaigns. even when they were personally attacked by opposition factions. On the other hand, many took the lead in public discussions of municipal policy. Some of the most successful managers were extremely active as public speakers and as public advocates of improving or extending municipal services.

City managers looked on their work as a professional career, but at the same time they never expected to hold their positions except at the pleasure of their city councils.. Their professional society, the International City Managers' association, always took the position that the city manager was subject to dismissal by the council and refused to support proposals that he be removed only by more than a simple majority vote of council members. Similarly, it admitted to membership any city manager duly appointed by a city council and never sought to establish any criteria of its own for recognition or membership in the profession.

The association did a great deal not only to stimulate a professional attitude among its members, but also to advance the general level of municipal administration. It sponsored research in municipal administration; published the ***Municipal Year Book***, an annual encyclopaedia of factual and statistical data on all cities in the United States; and conducted courses of training in various branches of municipal management.

The city-manager movement had effects beyond the sphere of municipal affairs. In the United States. city managers often went from municipal government into state and national administration and did much to help develop administrative systems in which federal, state and local agencies co-operate in the management of national programs See also LOCAL GOVERNMENT.

See International City Managers' Association, ***The Municipal Year Book*** (annually), ***City Managenzent, a Growing Profession*** (1957).

(D. K PE ; C. E RY.; O F. N.)

CITY PLANNING is the guidance of the growth and change of urban areas. As such, it is aimed at fulfilling social and economic objectives which go beyond the physical form and arrangement of buildings, streets, parks, utilities and other parts of the urban environment. City planning takes effect largely through the operations of government and requires the application of specialized techniques of survey, analysis, forecasting and design. Thus city planning may be described as a social movement, as a governmental function, or as a technical profession. Each aspect has its own concepts, history and theories. Together they fuse into the effort of modern society to shape and improve the environment within which increasing proportions of humanity spend their lives: the city.

In many countries, city planning has been broadened to cover larger areas as the need for orderly development of the entire physical environment has been recognized. In some small countries where usable land is scarce, such planning may extend to the whole country. In Great Britain this broader approach is termed "town and country planning"; in the U.S. the usual term is "city and regional planning." (See also REGIONAL PLANNING.)

SOCIAL MOVEMENT

Early History.— There are examples from the earliest times of efforts to plan city development. Evidence of planning appears repeatedly in the ruins of cities in China, India, Egypt, Asia Minor, the Mediterranean world and South and Middle America. There are many signs: orderly street systems, rectangular and sometimes radial; divisions of a city into specialized functional quarters; development of commanding central sites for palaces, temples and what would now be called civic buildings; and advanced systems of fortifications, water supply and drainage. Most of the evidence is in smaller cities, built in comparatively short periods as colonies. Often the central cities of ancient states grew to substantial size before they achieved governments capable of imposing controls. In Rome, for example, the evidence points to no planning prior to late applications of remedial measures.

For several centuries during the middle ages there was little building of cities in Europe. There is conflicting opinion on the quality of the towns that grew up as centres of church or feudal authority, of marketing or trade. They were generally irregular in layout, with low standards of sanitation. Initially, they were probably uncongested, providing ready access to the countryside and having house gardens and open spaces used for markets and fairs or grazing livestock. But as the urban population grew the constriction caused by walls and fortifications led to overcrowding and to the building of houses wherever they could be fitted in. It was customary to allocate certain quarters of the cities to different nationalities, classes or trades, as in cities of the far east at the present day. As these groups expanded, congestion was intensified.

During the Renaissance there were conscious attempts to plan some aspects of city form. Military concerns dictated certain features, such as logistically practical circulation patterns and encircling fortifications, which forced overbuilding as population grew. As late as the 1860s Baron Haussmann's radial boulevards

in Paris had military as well as aesthetic purposes. The grand plan, however, probably had as its prime objective the glorification of a ruler or a state. From the 16th to the end of the 18th century many small cities, and parts of large cities, were laid out and built with monumental splendour. The result may have pleased and inspired the citizens, but it rarely contributed to the health or comfort of their homes or to the efficiency of manufacturing, distribution or marketing.

Early **U.S.** History. — The planning concepts of the European Renaissance were transplanted to the new world; familiar examples are Williamsburg, Va., and Washington, D.C. In particular, Pierre l'Enfant's plan for Washington (1791) illustrated the strength and weakness of these concepts; it was a plan ably designed to achieve monumentality and grandeur in the siting of public buildings, but in no way concerned with the efficiency of residential, commercial or industrial development. More prophetic of the layout of U.S. cities was the rigid gridiron plan of Philadelphia, Pa., by William Penn (1682), with a layout of streets and lots (plots) adaptable to rapid changes in land use, but wasteful of land and inefficient for traffic. The gridiron plan traveled westward with the pioneers, since it was the simplest method of dividing surveyed territory. Its special advantage was that a new city could be planned in the eastern offices of land companies and lots sold without buyer or seller ever seeing the site.

The New England town also influenced later settlement patterns. The central common, initially a cattle pasture safe from marauding Indians, provided a focus of community life and a site for meetinghouse, tavern, smithy and shops. It showed up as the square in county seats from the Alleghenies to the Pacific, still the focus of urban activity. Also from the New England town came the tradition of the freestanding single-family house. Set well back from the street and shaded by trees, it had an ornamental front yard and a working back yard, and became the norm of American residential development. This was in contrast to the European town house, with its party wall and tiny fenced back yard, examples of which are found in some large U.S. cities.

19th Century. — In both Europe and the U.S., the surge of industry during the 19th century was accompanied by rapid population growth, unfettered individual enterprise, great speculative profits and remarkable lapses of community responsibility. During this era sprawling giant metropolitan cities developed, offering wealth and adventure, variety and change. Their slums, congestion, disorder and ugliness provoked the beginnings of the modern housing and city-planning movements. Reacting against the slums of 19th-century industrial cities, housing reform was the first demand. Industrial slums in European and American cities were unbelievably congested, overbuilt, unsanitary and unpleasant. The early regulatory laws enacted against these conditions set standards which improved upon the slums of the time, but seemed a century later to be impossibly low. Progress was very slow, for the rent-paying ability of slum dwellers did not make it profitable to invest in better housing for them. Housing improvement as an objective, however, recurred continually. Early significant improvements in public health resulted from engineering improvements in water supply and sewerage, which were essential to the later great growth of urban populations.

Toward the end of the 19th century, another effort to improve urban environment emerged from the recognition of the need for recreation. Parks were developed to provide visual relief and places for healthful play or relaxation. Later, playgrounds were carved out in congested areas, and facilities for games and sports were established not only for children but also for adults, whose workdays gradually shortened.

Concern for the appearance of the city had long been manifest in Europe, in the imperial tradition of court and palace, the central plazas and great buildings of church and state. The resurgence of this tradition had a counterpart in the "city beautiful" movement in the U.S. following the Chicago world's fair of 1893, as widely expressed in civic centres and boulevards, contrasting with and in protest against the surrounding disorder and ugliness.

In the course of the 19th century, a number of utopian and religious groups contributed ideas for more satisfactory urban forms, though their experimental communities met with indifferent success. The garden-city movement in England developed from the writings of Ebenezer Howard in the 1890s, and was a great and continuing influence on efforts to improve the urban environment.

20th Century. — Early in the 20th century, during the sprawling growth of industrial cities, factories invaded residential areas, tenements crowded in among small houses and the first skyscrapers overshadowed other buildings. To preserve property values and achieve economy and efficiency in the structure and arrangement of the city, the need was felt to sort out incompatible activities, to set some limits upon height and density and to protect established areas from despoilment. Zoning (*q.v.*) was the result.

As transportation evolved from foot and horse to street railway, underground railway or subway, elevated railroad and automobile, the new vehicles made possible tremendous territorial urban expansion. Workers were able to live far from their jobs, and tremendously complex systems of communications developed. The new vehicles also rapidly congested the streets in the older parts of cities. By threatening strangulation, they dramatized the need to establish orderly circulation systems of new kinds.

Metropolitan growth so intensified these and other difficulties that the people living in cities — who for the first time outnumbered the rural population in many countries — began to demand an attack upon all of these problems. In response, city planning by mid-century aimed not at any single problem or reform. but at the improvement of all aspects of the urban environment. An important concept was that all these problems were related, and could not be attacked successfully in isolation. It became apparent that the planning of the urban environment could not be separated from the planning of the whole metropolitan area. This introduced issues of national planning and in many countries brought city planning into the field of planning the nation's economic and social resources as a whole. (See MODERN ARCHITECTURE; APARTMENT HOUSE; REGIONAL PLANNING.)

As it developed, city planning laid stress on those aspects of the urban environment that in the common interest should be improved and that required protection and promotion through government action. Countries varied in the relative importance which they attached to these aims — some stressing the government function in promoting planning, some the role of individual enterprise, with government playing a subsidiary role as the protector of the public from the adverse effects of the actions of others.

Goals of Modern City Planning. — The ultimate goals were social, although the plans themselves related to physical things.. They were deeply involved with intermediate economic objectives. The expression of the goals was, of course, coloured by the culture of the society seeking them. In the U.S. and countries following western European traditions, the ideal urban environment would reconcile the maximum opportunity for individual choice with protection for the individual from the adverse effects of the actions of others. Within this philosophy, city planning would probably seek: (1) the orderly arrangement of parts of the city — residential, business, industrial, etc., so that each part could perform its functions with minimum cost and conflict; (2) an efficient system of circulation within the city and to the outside world, using to the maximum advantage all modes of transportation; **(3)** the development of each part of the city to optimum standards, as of lot size, sunlight and green space in residential areas, and parking and building spacing in business areas; (4) the provision of safe, sanitary and comfortable housing, in a variety of dwelling types to meet the needs of all families; (5) the provision of recreation, schools and other community services, of a high standard of size. location and quality; (6) the provision of adequate and economical water supply, sewerage, utilities and public services.

In any community, these goals might be supplemented by special goals, such as the preservation of a historical area, or the protection of property values, or the efficient conduct of government. On occasion, the goals of some powerful special interests might be inconsistent with those of others; *e.g.*, the preservation of slum property values and the provision of adequate housing. Furthermore, the statement of ideal goals required the use of relative terms, such as "adequate," "high standard," etc., which are relative rather than

absolute, and change from time to time. Therefore inherent in the concept was the recognition that an ideal is not a fixed objective, but itself will change; that the ideal city can be striven toward, but never achieved.

GOVERNMENT FUNCTION

As a normal and identifiable function of government, city planning has been recognized in Europe and the U.S. since the early years of the 20th century. The year 1909 was a milestone. It saw the passage of Britain's first Town Planning act and, in the U.S.. the first national conference on city planning, the publication of the Burnham plan for Chicago and the appointment of Chicago's plan commission (the first official planning agency in the U.S. was in Hartford, Conn.. in 1907). Germany, Sweden and other European countries also developed planning administration and law.

City planning as a government function involves the co-ordination of all governmental activities that bear upon community gron th and change, especially those that influence private development, so that they all work toward comprehensive objectives. In its early form emphasis mas on preparation of a single and authoritative plan. In time, it was realized that the future was not precisely predictable and that the plan must be flexible. More emphasis was placed upon "planning" than "the plan." and upon the administrative arrangements needed to bring study to bear upon each governmental decision. It was also realized that governmental influence on private activities must be primarily negative, and that many of the decisions that resulted in significant growth and change in cities were made by private agencies, such as industries, banks or land developers, especially in the parts of the world that permitted private economic activity. Accordingly, planning was broadened to include the measures needed to foster a realization by business and civic leaders of their stake in city development, and of their opportunities to capitalize on it. In European countries the planning powers of central as well as local government were strengthened in order that the community. through government, might take more positive action to accomplish planning objectives.

The place of the city-planning function in the structure of urhan government has developed in different ways in different countries. On the continent of Europe, where municipal administration was strongly centralized, city planning became the sphere of an executive department with substantial authority. In Great Britain the local planning authority was a local legislative body (the county or county borough in England and Wales. the county or burgh in Scotland). advised by a planning committee of local councilors and with a planning department to act in an executive and advisory capacity. In the U.S., with its tradition of tripartite government, it was recognized that decisions of importance to community development were made both by the executive branch (mayor) and the legislative (council). Rather than impinge on the authority of either, planning was allotted to a separate commission. advisory to both, with no authority beyond the right to be consulted before any action affecting the plan was taken.

After the late 1930s, especially where the city-manager (*q.v*) form of municipal government had been adopted. there was a trend toward making city planning a staff arm of the executive, in line with a general trend toward the strengthening of executive powers, and to channel all advice to the council through his office. There mas also, as municipal government became more complicated, a trend toward formalizing the planning of administrative operations. budgeting and other executive functions, which led to some confusion between this kind of planning and city planning as discussed in this article. (See CITY GOVERNMENT)

Zoning and Subdivision Controls. — The regulation of the use of land and buildings of the density of population and of the height hulk and spacing of structures began long before the development of modern city planning As a tool deliberately used to put into effect a comprehensive scheme for land use, however, it is generally dated from the adoption of New York city's first comprehensive ordinance in 1916. Though zoning was used in Britain and other European countries, it was developed furthest in the U.S. The first ordinances were simple regulations, intended primarily to protect existing property values and preserve light and air. As planning itself broadened its objectives and evolved its techniques during the 1930s, zoning developed into a more precise and sensitive tool. There were successively broader court interpretations of this use of the police power (*i.e.,* the power to regulate private actions in the interest of the public health, safety, morals and general welfare), and zoning was employed more and more to give legal effect to planning policies for land use. The control of land use mas thus related to the development plan, or master plan, prepared by the local planning authority. Such a plan was approved by the central government in Britain where applications for permission to develop land or change its use were considered in relation to the provisions of the plan.

Paralleling the evolution of zoning in the U.S. was the development of subdivision controls: subjecting the initial laying out of vacant land to public regulation. It was realized, after bitter experience with suburban land speculations in the 1920s, that the interest of the owner and developer of raw land is sometimes temporary and purely financial, while the urban community must live with his product for generations after. Subdivision regulations in many U.S. cities specified that new streets conform to the over-all city plan and that new lots be properly laid out for building sites. Some required the developer to give the land needed for streets! playgrounds and school sites, and pay all or most of the cost of development.

Zoning and subdivision control offered adequate controls over the growth of new parts of cities, where they were used by enlightened legislative bodies. (They were also used in some places for such objectives as the exclusion of low-income families or the assignment of special privilege to favoured property owners.) It was realized, however, that they were insufficient to correct past mistakes, and especially to bring about the rebuilding of the obsolete parts of cities. (See ZONING.)

Large-Scale Development. — In order to clear slums and to provide decent housing for slum dwellers unable to afford private standard structures, publicly owned and subsidized housing was developed. (See HOUSING.) It was used first in Europe, especially in the 1920s, and was supplemented by co-operatives and other forms of limited-profit or publicly aided housing, particularly in Scandinavia. Public housing with federal aid became government policy in the U.S. in the 1930s. Most states authorized their cities to condemn and clear slums and build public housing. In Great Britain and Europe in the 1920s and 1930s public housing was also built in suburban vacant areas, in some cases on such a scale as to almost constitute new towns. This was a result of the recognition that all slum dwellers could not be rehoused in the same areas without repeating the slum congestion. Though such action was legal in the U.S. after the 1930s, it was rarely employed.

All over the western world, in the first half of the 20th century, new towns were built, constituting a very small part of the total of urban growth but serving as experiments and as examples of what could be done. This mas largely the product of England's garden-city movement. which proposed preplanned new cities, on land held by the community, limited to 30.000 population. complete with business services and employment centres and surrounded by permanent green belts of rural land. The initial experimental cities were undertaken in England by private initiative, motivated by a spirit of reform: Letchmorth was started in the early 1900s. and Welwyn Garden City in the 1920s.

The concept had substantial influence in the U.S. Kingsport. Tenn.., was a new city built by industrial interests. Some of the design ideas were used in suburban real-estate developments. outstanding being Radburn, N.J., which pioneered the super block scheme as the "town for the motor age." U.S. examples. however. omitted the community-ownership feature. and almost all omitted employment centres, balanced income groups and effective greenbelts. The federal government undertook a few large-scale housing developments for in-migrant industrial workers during World Wars I and II. as make-work projects during the depression of the 1930s and as examples of sound urban design (*e.g.,* the greenbelt towns outside Washington, D.C.. Cincinnati! O., and Milwaukee. R'is.).

Also during the 1930s a number of European countries, especially France, the Netherlands, Germany and the U.S.S R.. undertook the building of new towns as governmental enterprises. Most of them (except in the U.S.S R.) were residential suburbs rather than complete urban units. During the period following World War II many European countries made strides in the regulation of new growth and in planned rebuilding of bomb-torn city centres.

After World War II Great Britain embarked on a bold program. It reorganized the planning districts of the country; it established sweeping new powers over private land use, almost nationalizing the right to develop undeveloped land; and it undertook to build new tonns to receive population and industry from congested great cities, which were planned for rebuilding at lower densities. By 1960, 15 new towns were under way, but the national program had suffered reverses. At first economic exigencies interfered with the relocation of industry suggested by long-range environmental planning, and some of the controls over private land development, which appeared to impede investment and construction. had to be relaxed. Nevertheless most of the new towns had become centres of rapid industrial and population expansion and constituted important new work in city plan effectuation.

In the U S the 1940s saw an increasing concern with planned rebuilding of obsolete areas. This interest was paralleled in countries that had sustained extensive war damage. In the endeavour to rebuild devastated cities several European countries, notably Britain. France and the Netherlands, strengthened public powers to acquire land and redevelop it according to a new layout. Notable examples are Coventry in England and Rotterdam in the Netherlands. Toward the end of the decade many states of the U.S. granted urban redevelopment powers to their cities, which began to clear slums not only for public housing but also for any other public or private re-use that fitted a comprehensive plan. New private uses were made possible by selling or renting the cleared sites at much less than it cost to buy and demolish the slums, the difference being partly paid for with federal aid.

In the U.S. urban redevelopment—*i.e.,* large-scale clearance of completely obsolete areas—was supplemented with federal aid for an attack upon the intermediate areas, obsolescent but not obsolete. The term urban renewal was applied to this concept. Upon all parts of a city, all of the powers of government were brought to bear, under a comprehensive plan including private and civic groups. to rehabilitate run-down areas, to conserve good areas and to check blight as well as correct its results by clearance.

One more device had been developed during the 1930s and 1940s in the U.S., largely by planning agencies. Capital-improvement programing became a normal practice of city government; expenditures for public works were scheduled according to a plan and to priority criteria. Most other effectuation measures had attempted the guidance of private development. Capital-improvement programing and the mandatory reviewing by the planning agency of municipal acts affecting physical environment were devised to guide the complex operations of the municipal government itself.

Planning Jurisdictions.— Where a single municipal government included all of an urban area, tools for planning and effectuation seemed, in the second half of the 20th century, to be approaching adequacy. This condition, however, was exceptional. In Europe and the Americas the metropolitan area was the typical urban form, composed of many independent municipalities, with overlapping jurisdictions of counties, school districts and special authorities.

In the U.S. efforts were made toward metropolitan planning, not to replace city and suburban planning agencies but to supplement them on a broader scale. In the 1920s these efforts were largely voluntary, outstanding being the private Regional Plan Association of New York, whose work had much influence. By the 1940s many public metropolitan planning agencies had been set up; they were, however, purely advisory, with no authority to give effect to their planning recommendations. As late as the early 1960s metropolitan planning efforts in the U.S. were still largely ineffective. Planning agencies had little voice in the decisions of not only the separate cities and suburbs but also larger public agencies, such as state highway departments, sewer and water supply authorities and port and airport authorities. The U.S. planning movement had not yet evolved the governmental machinery for reconciling in a democratic nay the conflicting interests of all of the constituents of a metropolitan area.

During this same period European countries were also groping toward solutions of the metropolitan planning and development problem, with some progress in Great Britain, Scandinavia. Germany (Ruhr) and the Netherlands. In the 1950s a limited metropolitan government was established for Toronto, Ont., with planning as an integral function.

In Asia the emerging industrial economies of the post-World War II period produced cities following many of the patterns of the west. These rapidly developing countries, however, are still preoccupied with political and economic problems and have made little progress in establishing an environmental planning function in city or metropolitan government effective enough to prevent the mistakes made earlier in western cities. There are a few outstanding examples of planned new cities in such widely scattered places as India, Israel and South America. There are also signs of increasing concern in Puerto Rico, India, Indonesia and elsewhere for regional development programs.

Similarly, there was increased emphasis in Europe and America on the role of the city within the larger region, specifically in the Ruhr valley in Germany and with the TVA and other regional planning work in the U.S. during and after the 1930s.

THE PLANNING PROFESSION

As the popular demand for the results of city planning brought increasing official activity and as the city-planning function mas accepted as a government operation, planning developed into a separate profession. Until the 20th century, city planning was done by architects, landscape architects or civil engineers. In Europe city planning is generally considered to be a branch—though a specialized branch—of architecture or engineering. This attitude had been modified to some extent, however, as the relevance of economists, sociologists and geographers to the planning team has come to be accepted.

In the U.S., however, city planning is regarded as a profession in its own right. Architecture, civil and traffic engineering, geography, sociology, economics, law and public administration all contribute to city planning, and city planners are trained to be familiar with the subject matter and techniques of each of these fields. The core of their specialized professional concern, however, is not within the competence of any of the older professions: "the unified development of urban communities and their environs . . . as expressed through determination of the comprehensive arrangement of land uses and land occupancy and the regulation thereof" (from the constitution of the American Institute of Planners, the U.S. society of the profession established in 1917).

The earliest university training for city planners in the U.S. was offered at Harvard in the late 1920s and at the Massachusetts Institute of Technology, Cambridge, in the early 1930s. By the second half of the century more than 20 U.S. schools gave degrees in planning, the master in city planning degree (M.C.P.) being the standard professional degree. The field, however, had far outgrown the number of graduates, and jobs in planning agencies could be filled only by in-service training of personnel from related professions. Special education for planners also developed in other countries, but the total number of schools in the rest of the world was no greater than the number in the U.S. In most other countries, training was offered only to students previously qualified in architecture or engineering, a limitation generally absent in the U.S. However, qualifications for planning courses had undergone modification in some other countries in accordance with a broader conception of the planner's functions.

The fact that U.S. city planners were not necessarily competent in the design of three-dimensional forms gave rise to a new area called urban design. Practitioners of urban design could be considered either as specialized architects or as specialized city planners. They norked on a scale larger than the single building but smaller than the entire urban area (except for very small munici-

palities), and also at a shorter time range than most city planning. An important distinction was that urban design worked toward the completion of three-dimensional projects, whereas city planning, based on a concept of perpetual change, guided change toward desirable objectives (which themselves would also change), rather than toward fulfillment of a specific design. Thus urban design, like architecture and other professional disciplines, was an activity essential to longer-range, larger-scale city planning, but distinct from it. Urban design in European countries received a great stimulus where large-scale development, such as new towns or city centres, was undertaken by public authorities.

City planning, in the second half of the 20th century, was still in flux. It had gradually been equipped with some of the tools of science, drawing heavily upon the social sciences for insights into the social and economic functioning of urban communities, upon technology for solutions to problems such as traffic and transportation and for innovations in housing, industrial or shopping-centre development. However, it was still underequipped with scientific knowledge, and research efforts began on a broad scale during the 1950s in the U.S. and to a much smaller extent elsewhere. It was also underequipped with a knowledge of what people would need and an insight as to what they would want for the future urban environment. Though less subject to research, this was the challenge to city planning and to all related professional disciplines, for as the population of the world was growing annually by greater numbers than ever before, its cities were growing even more rapidly.

(J. T. HD.)

CITY-STATE, the name given to the political form which crystallized during the classical period of Greek civilization. Its ancient name, *polis,* was derived from the citadel (*acropolis*) which marked its administrative centre, and the territory of the *polis* was usually so limited that the citizens (*politai*) were fully acquainted with one another. City-states differed from tribal or national systems in size, exclusiveness, patriotism and passion for independence. The origin of city-states is disputed. It is probable that earlier tribal systems broke up during a period of economic decline and the splintered groups established themselves between 1000 and 800 B.C as independent nuclei of city-states which covered peninsular Greece, the Aegean islands and western Asia Minor. As they grew in population and commercial activity, they sent out bands of emigrants who created similar city-states on the coasts of the Mediterranean sea and the Black sea, mainly between 750 and 550 B.C.

The thousands of city-states that sprang into existence during these centuries were remarkable for their diversity. Every variety of political experiment from monarchy to communism was practised. and the fundamental principles of political life were formulated by their philosophers. The vigour and intensity of the citizens' experience were such that they made unparaileled advances in all fields of human activity, except industry and technology, and laid the basis of Greco-Roman civilization and modern "western" civilization. The particularism of city-states was their glory and their weakness Incapable of forming any permanent union or federation. they fell victim to the Macedonian kingdoms and the Roman empire, under which they lived on as dependent privileged communities (*municipia*). For Rome, which began its republican history as a city-state, shaped its foreign policy to the annihilation of the city-state as a political form in the ancient world.

CIUDAD BOLÍVAR, capital of Bolivar state, Venez.. and an important river town (pop. [1961] 56,032) on the southern bank of the Río Orinoco 260 mi. from the delta. In the past (and to a lesser extent in the late 1950s) it was the commercial centre of the llanos, the huge, sparsely settled grassland region drained by the Orinoco. The limited commerce of this region could at the most be concentrated in a few river ports, and the chief of these was Ciudad Bolívar. The principal exports include gold, diamonds, cattle, horses, hides, skins and some timber. The growth and prosperity of Ciudad Bolivar and the area it serves were expected to be accelerated after the 1950s by the iron ore development in the lower Orinoco valley south from Puerto Ordaz and Palua (see CERRO BOLÍVAR). Its population increased about 25% in the 1940s and was still growing in the early 1960s. The city is situated well above the swamps of the lower Orinoco and despite a tropical location is quite healthful. It is connected by road with Caracas 450 mi. distant.

The town was founded by Moreno de Mendoza in 1764 as San Tomás de la Nueva Guayana, but its location where the Río Orinoco narrows to a width of less than half a mile gave it the popular name Angostura, the Spanish for "narrows." This name was used until 1846, when that of the Venezuelan liberator was bestowed upon it in recognition of the city's close identification with him. In 1819 the town was the meeting place of a congress at which Simón Bolívar (*q.v.*) declared the independence of Gran Colombia from Spain. For a time Ciudad Bolivar served as the headquarters of the revolution during the struggle for independence. It suffered severely during the fighting and the later political disorders. (L. WE.)

CIUDAD JUÁREZ, formerly EL PASO DEL NORTE, a northern frontier town of Mexico, in Chihuahua state, 1,221 mi. by rail and 1,285 mi. by road N.N.W. of Mexico city. Pop. (1958 est.) 220,000; altitude 3,117 ft. It is on the right bank of the Rio Bravo del Norte (Rio Grande), opposite El Paso, Tex., with which it is connected by two bridges. It is a northern terminus of the National Railways of Mexico and has a large transit trade with the United States.

Ciudad Juárez contains the Guadalupe mission, built in 1659, and many modern public buildings Many of the habitations are made of adobe (unburnt sun-dried brick). The town's present importance is due to its border position and its function as the marketing centre for a growing cotton production. The El Chamizal border controversy in the 1860s, created by the meanders of the Rio Bravo at Ciudad Juárez, remains as the last unsettled frontier question between the U.S. and Mexico. It was the headquarters of Benito Juárez in 1865 during his struggle against the French and renamed in 1888 in his honour. (R. B. MCCK.)

CIUDAD REAL, one of the five Spanish provinces formed from the ancient kingdom of New Castile (see CASTILE), of which it is in the southern part. Pop. (1960 est.) 604,264. Area 19,749 sq.km. (7,625 sq.mi.), the third largest province after Badajoz and Cáceres. Mean altitude 2,067 ft. The province is crossed by the railways from Madrid to Badajoz and to Alicante and by that to Andalusia. It is also crossed by roads from Madrid to Cádiz and Ciudad Real; Ciudad Real to Murcia; Córdoba to Tarragona and Valencia to Badajoz, via Almansa. In the east and centre high plains form part of the region known as La Mancha, rising on the southeast to low hills. Apart from the La Mancha region the province is mountainous, having in the north the Montes de Toledo (Sierras de Chorito and Pocito) and in the south the Sierra Morena

(Sierra de la Alhambra). The flat La Mancha area (the country of Don Quixote de la Mancha) extends also into neighbouring provinces, but it is there that it is most extensive. Most of it is a desolate steppe and forms the largest plain in Spain. The region of the Campo de Calatrava is less monotonous. The province has two river systems: that of the Guadiana (the more important) and its tributaries, the Záncara, Gigiiela and Jabalón; and that of the Guadalquivir. In the valley of the upper Guadiana are the famous lakes of Ruidera.

Cereals, vines and olives are cultivated. Wine is the main product of the province, especially that of Valdepefias. The construction of dams such as that at Gasset was undertaken to increase irrigation. For centuries the flocks from Soria, Logroño and Cuenca have grazed in La Mancha. There are mercury mines at Almadén which have been worked since antiquity, and coal mines at Puertollano, near which a modern industrial complex has been formed. Industrial development is slight, however, apart from that based on agriculture. Among popular crafts the lace and needlework of Almagro is well known. The windmills, immortalized by Cervantes, are still silhouetted against the skyline of La Mancha.

Apart from the capital, Ciudad Real, the principal towns are Valdepefias, Tomelloso, Puertollano, Alcázar de San Juan and Manzanares.

CIUDAD REAL, the capital of the province, is situated in a fertile plain watered by the Guadiana and the Jabalón. Pop. (1960 est.) 35,539 (mun.). The city is spread out, with low-built houses. There are many spacious squares and wide streets. Outstanding among the churches are the Gothic Santa Maria, and those of San Pedro and Santiago. The city was formerly walled, but the walls were destroyed by the river. Ciudad Real was founded by Alfonso the Wise, who named it "Villa Real," in 1255. In 1420 John II gave it the status of a city. As a strategic site on the route through La Mancha to Andalusia it has been the scene of many battles throughout history. (M. B. F.)

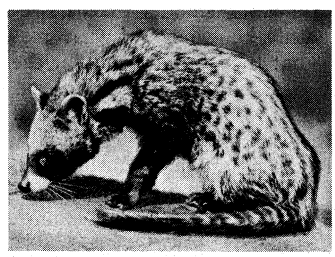
CIUDAD RODRIGO, a city and episcopal see in the province of Salamanca, Spain, lies near the Portuguese border, on the national road from Burgos to Portugal and on the railway from Salamanca to Coimbra. Pop. (1950) 12,455 (mun.). The whole of the urban area within the walls has been declared a historic-artistic monument meriting protection and conservation by the state. Because of its frontier position it has the defensive appearance of a fortress, with walls, towers, gateways and a castle. It is crossed by two principal streets which intersect to form the Plaza Mayor. The streets have a medieval appearance; there are convents and *señorial* houses with heraldic crests. Much is in the plateresque or Spanish Renaissance style. The cathedral dates from the 12th century; it was completed in the 14th century and reconstructed in the 16th. The city was founded in 1150 by Count Rodrigo Fernández, from whom it took its name. Ferdinand II fortified it (c. 1190) and granted the bishopric. It has been the scene of meetings between kings, of the signing of treaties and of royal weddings. In the War of Independence it was taken by the French under Marshal Ney after a hard siege in 1810, but in 1812 Lord Wellington and the guerrilla leader Julián Sánchez retook it after another siege. Wellington was rewarded with the titles of duke of Ciudad Rodrigo and marquess of Torres Vedras in Portugal. (M. B. F.)

CIUDAD TRUJILLO: **see** SANTO DOMINGO.

CIURLIONIS, MIKALOJUS KONSTANTINAS (1875–1911), Lithuanian composer and painter, who, in his representation of the secret of cosmic existence and fate, is considered to have expressed a profound and specifically Lithuanian feeling, was born in Varena on Sept. 10, 1875. He studied music in the school of Duke Oginski in Plunge (1888–93) and in the conservatories of Warsaw and Leipzig. As a painter he was self-taught. His most valuable works were created between 1904 and 1909. He died at the age of 35, on March 28, 1911, in an asylum near Warsaw.

In music Ciurlionis was a mystic, continually searching for an individual form. He composed for piano, orchestra and choir, his best-known works being his symphonic poems "In the Forest" and "The Sea" and his shorter compositions for piano. Not satisfied with music alone for the expression of his fantasy world, he started to "paint music." His best paintings—all tempera—are symbolic and abstract compositions such as "Sonata of the Sea," "Spring Sonata" and "Pyramid Sonata" and his cyclic compositions "Creation of the Universe," "Zodiacal Cycle," etc. Ciurlionis concentrated on the essential and universal; his reality is the everlasting process of life subject to the rhythm of the universe. The portrayed shapes lack material individuality; they are parts of the cosmic harmony, of Ciurlionis' spiritual mirage, of visions of unique beauty. He anticipated the abstract art of Europe, which, when he represented his ideas, had not yet been born. All his paintings are in a gallery in Kaunas, Lithuania. Because of his poverty, Ciurlionis used paints of poor quality and his pictures unfortunately are losing their colours. (MA. G.)

CIVET (CIVET CAT), several species of long-bodied, short-legged carnivores of the family Viverridae, found in Africa and in Asia from India to southern China. The length may be up to 23 to 3 ft., the thickly furred tail being about half as much again. The ground colour is buffish-gray variously spotted and striped with black, with an erectile ridge of dark hair along the back; the ears are small and the snout is pointed. The perineal glands open under the tail into a large pouch in which a greasy, musk-like secretion accumulates. This secretion is used by the animal for marking out its territory and is deposited on tree trunks, stones and other objects; it may also serve to bring the sexes together at the breeding season. Civets kept in captivity provide the secretion, the civet of commerce, which is a valuable material in perfumery.



ZOOLOGICAL SOCIETY OF LONDON

AFRICAN CIVET (CIVETTICTIS CIVETTA)

Civets are usually solitary and live in hollow logs, among rocks and in similar places, coming out to forage by night. They feed on any small animals they can overpower and also eat vegetable matter. They are destructive to domestic poultry and young corn-cobs (maize). The litter consists of two or three young. See also CARNIVORE. (L. H. M.)

CIVICS is the name given, particularly in the United States in the late 19th and early 20th centuries, to the study of citizenship and government in secondary and sometimes in elementary schools. The term also was used for a time to include, in addition to its narrower meaning, curriculum materials derived from sociology, economics, geography, social psychology, international affairs, social ethics and the study of occupations. These areas of study, along with history, came to be known in secondary education as the social studies or the social sciences. Among the social studies still may be found courses devoted specifically to the organization and processes of governments and the rights and duties of citizens. Such courses may be called civics or they may be called government or citizenship or some yet different name. (K. A. B.)

CIVIDALE DEL FRIULI, a town in the Friuli-Venezia Giulia region of Italy, in the province of Udine, lies 16 km. (10 mi.) from the town of Udine by rail. It is 453 ft. above sea level. Pop. (1957 est.) 11,053 (commune). The town is situated where the Natisone river forms a charming-ravine, spanned by the 15th-century Bridge of the Devil. The old Venetian element is still visible. The cathedral (16th century) contains a magnificent wrought-silver altarpiece (12th century) and in its treasury are many precious ornaments dating from the 9th to the 16th centuries. In the museum attached to it are the baptistery of Callixtus, the altar of Ratchis (both 8th century) and other works of early medieval sculpture. The national museum of archaeology contains a *lapidarium* dating from late Roman and early medieval times and a fine collection of Lombard objects and manuscripts. The oratory of Sta. Maria in Valle, also called the Tempietto Longobardo, has decorations in stucco and pictures of the 8th century. Industries include alcohol, paper, cement and furniture manufactures.

The town was founded by Julius Caesar in 52 B.C. and from him

took its name, Forum Julii. It had the same name in 568 when it became the seat of the first Lombard duchy in Italy and gave the name Friuli to the whole region. Under Charlemagne, in 774, it was renamed Civitas Austriae, from which was derived the modern form Cividale. From 735 to 1222 it was also the official seat of the patriarch of Aquileia. The historian Paulus Diaconus was born there in about 720. In 1419 the town voluntarily joined Venice.

CIVIL **DEFENSE,** a term used in the United States and in some European countries to denote all the nonmilitary actions that can be taken to reduce the loss of life and property from enemy action. It embraces defense against all types of attack, including conventional explosive bombs or rockets, nuclear weapons and chemical or biological attacks. During the early 1960s civil defense posed challenging problems for all the major powers living in an atmosphere of cold war. The awesome destructive powers of modern weapons formed one aspect of the problem; the complexities of crowded urban life formed the other. Attitudes toward civil defense ranged from hopeless resignation in the face of the difficulties involved to a crusading zeal for national defense and human survival. Some peace organizations strongly opposed all measures of civil defense on the ground that they were futile and encouraged the acceptance of war as inevitable.

Historical Background. — In the early stages of World War I, Germany used rigid airships to attack England from the air and the Allies launched some counterattacks on Germany. However, it was not until World War II that the threat of aerial attack on cities became sufficiently great to call for organized civil defense planning. While a few special air-raid shelters were built in Great Britain and in Hawaii, civil defense tactics during the interwar years consisted principally of utilizing improvised shelters such as basements and subways. Germany built special bunkers for a small fraction of its population. and these proved to be very effective in saving lives. Other civil defense tactics (in Great Britain and along the coasts of the United States) consisted of blackouts to reduce the night glow from city lights that could have served as guides to enemy pilots. The British government provided gas masks for its people, and practically all the countries involved in the war trained citizens in the elements of fire fighting, rescue and medical first aid.

The major, perhaps critical, difference between the civil defense situation in World War II and that which confronted the world after 1950 was that the relatively small weapons in World War II afforded some "learning time." People could learn by experience that shelters were safer than ordinary buildings, and civil defense volunteers could be recruited and trained after the war had begun. But with weapons that can destroy whole metropolitan areas at one blow, no learning time is afforded; there is no opportunity to learn from repeated attacks because the first attack, in all probability, will accomplish its mission.

Weapon Size. — The increase in explosive power of weapons during the 1940s and 1950s was dramatic. The bomb exploded over Hiroshima in 1945 had about 10,000 times as much power as the largest conventional bombs then in use. Fusion or hydrogen weapons available in the 1960s had increased their destructive power as compared to World War II fission-type nuclear weapons by a factor of hundreds or thousands. These radical increases in the destructive force of weapons caused equally radical changes in civil defense policies. While almost any shelter provided reasonable protection against conventional bombs, nuclear weapons of the size developed in World War II required a policy of locating and marking sites that offered the best possible protection in the area. With the advent of hydrogen weapons, consideration was given to the evacuation of urban centres upon warning of attack. However, with the advent of shorter warning times and with hetter understanding of the radiation hazards of fallout, this policy lost its appeal except as a possible measure to be employed by an aggressor nation to precede its delivery of an opening strike.

Weapon Delivery Systems. — The method of attack affects civil defense primarilv in the amount of warning it affordsfor protective action. During the 1950s it was calculated that piston-engine-driven aircraft afforded some U.S. cities from six to eight hours of warning. Jet-propelled aircraft and cruise-type missiles reduced the warning time to four to six hours. Seaboard cities everywhere could be attacked by ballistic or cruise-type missiles from offshore submarines with virtually no warning at all. Clandestine attack, as from weapons secreted aboard freighters in harbours, affords no warning time.

This situation made mass evacuation completely impractical and even cast doubt upon the possibility of using air-raid shelters, for the time required to empty a large building exceeds the probable warning time. The use of shelters as protection from fallout was still considered feasible because survivors of the initial bomb effects could move to shelters after the weapon had exploded.

Warning Systems. — Air-raid alerting in the U.S. originally was accomplished principally by means of outdoor sirens, but the fact that emergency vehicles also used sirens reduced the effectiveness of sirens for air-raid alerting purposes. Because persons in major cities are indoors most of the time, much effort was devoted to the development of indoor warning devices. One such device, called NEAR (national emergency alarm repeater), consists of an electrical relay that responds to a deviation in the frequency on the electric-power network. On the occasion of an alert, some multiple of the normal 60-cycle-per-second alternating potential would be superimposed nationwide on the utility power networks by means of special generators in the substations; the resulting change in power-line frequency would activate the relay and set off an alarm.

In Great Britain air-raid warning is effected by means of sirens; the siren signal is reserved exclusively for air-raid announcements, while emergency vehicles use bells. In both Nationalist China and Communist China air-raid warning is by means of whistles, and emergency vehicles use sirens. In the U.S.S.R. preliminary air-raid warning is by means of both whistles and sirens. When the initial warning is given in the Soviet Union, all persons are expected to pay continuous heed to the government-controlled radio and loudspeaker network, which serves every area. A follow-up radio notification, plus the ringing of gongs and bells, warns of attack by radiological, chemical or biological means.

Effects of Weapons. — The amount of energy released from a nuclear weapon is expressed in terms of tons of its TNT equivalent. Whereas the strength of the earliest nuclear weapons was measured in kilotons (thousands of tons) later weapon yields ran to megatons (millions of tons). Most of the energy of a nuclear burst occurs in the form of an explosive blast wave; some of the energy is released in the form of heat and light comparable to the radiation of energy from the sun; a small percentage of the energy is given off directly in the form of nuclear radiation; and a fair proportion goes into the production of radioactive fission products, from which in turn emanate beta and gamma radiations over an extended period of time.

The fireball of a megaton-type explosion lasts over ten seconds, and the radiation emanating during at least the first part of this period precedes the blast wave in arrival at any point because the radiation travels with the speed of light — nearly 200,000 mi. per second — while the blast wave travels at a rate of approximately ½ mi. per second, or more than 2.000 m p h.

When a nuclear weapon is detonated well above the earth's surface its fission products are deposited in the stratosphere. The particles may encircle the earth many times before gradually drifting to the ground over periods of months or years. When a nuclear weapon is detonated close to the ground, the heat from the fireball vaporizes a portion of the earth's surface several hundred feet in diameter. These vaporized particles of earth and other debris contain trapped within them much of the released fission material. This mixture of powdered debris and fallout material rises to high altitudes with the heated surrounding air.

The damage effects of nuclear weapons may be considered in terms of effects on man and effects on inanimate objects. The principal blast effects on man are injuries caused by crumbling structures and by flying debris. The direct thermal effects on man are burns resulting from the heat of the fireball. Secondary thermal effects on man arise from fires that are ignited by the radiant heat of the blast, or that originate through such blast effects as over-

turned stoves or shorted electrical circuits. In some cases the fire may be caused by a combination of heat radiation and blast destruction. In general, the initial radiation emanating from the exploding bomb can be neglected because it causes few casualties that are not compounded by blast and thermal effects. However, fallout radiation can contribute a significant danger to man over hundreds of square miles downwind from the bursting point of the bomb and well outside the range of other casualty effects. Even noncombatant countries may be affected by it. The intensity of the fallout radiation decays with time, decreasing to one-tenth its original value in seven hours.

Nuclear radiation has little effect on inanimate objects, although the presence of radiation in the vicinity of a building can render it uninhabitable for some time. On the other hand, buildings are directly vulnerable to blast and to thermal effects. For large nuclear weapons, the area of fire destruction is expected to be several times the area of blast destruction.

With a ten-megaton explosion, wooden frame houses can be expected to suffer severe blast damage up to distances of about 6 or 7 mi. from the detonation point; and, in general, under nuclear-strike conditions (disrupted water mains, unavailability of professional fire-fighting equipment) this type of house can be expected to burn to the ground at any location within a radius of about 15 mi.

From a ten-megaton burst a man could expect to receive second-degree burns at a distance of about ten miles. A ten-megaton weapon with a 15-knot wind could cause sufficient radiation at points as far as 150 mi. downwind to kill half of all exposed persons in the area. Crops and animals would, of course, also be destroyed by nuclear bursts.

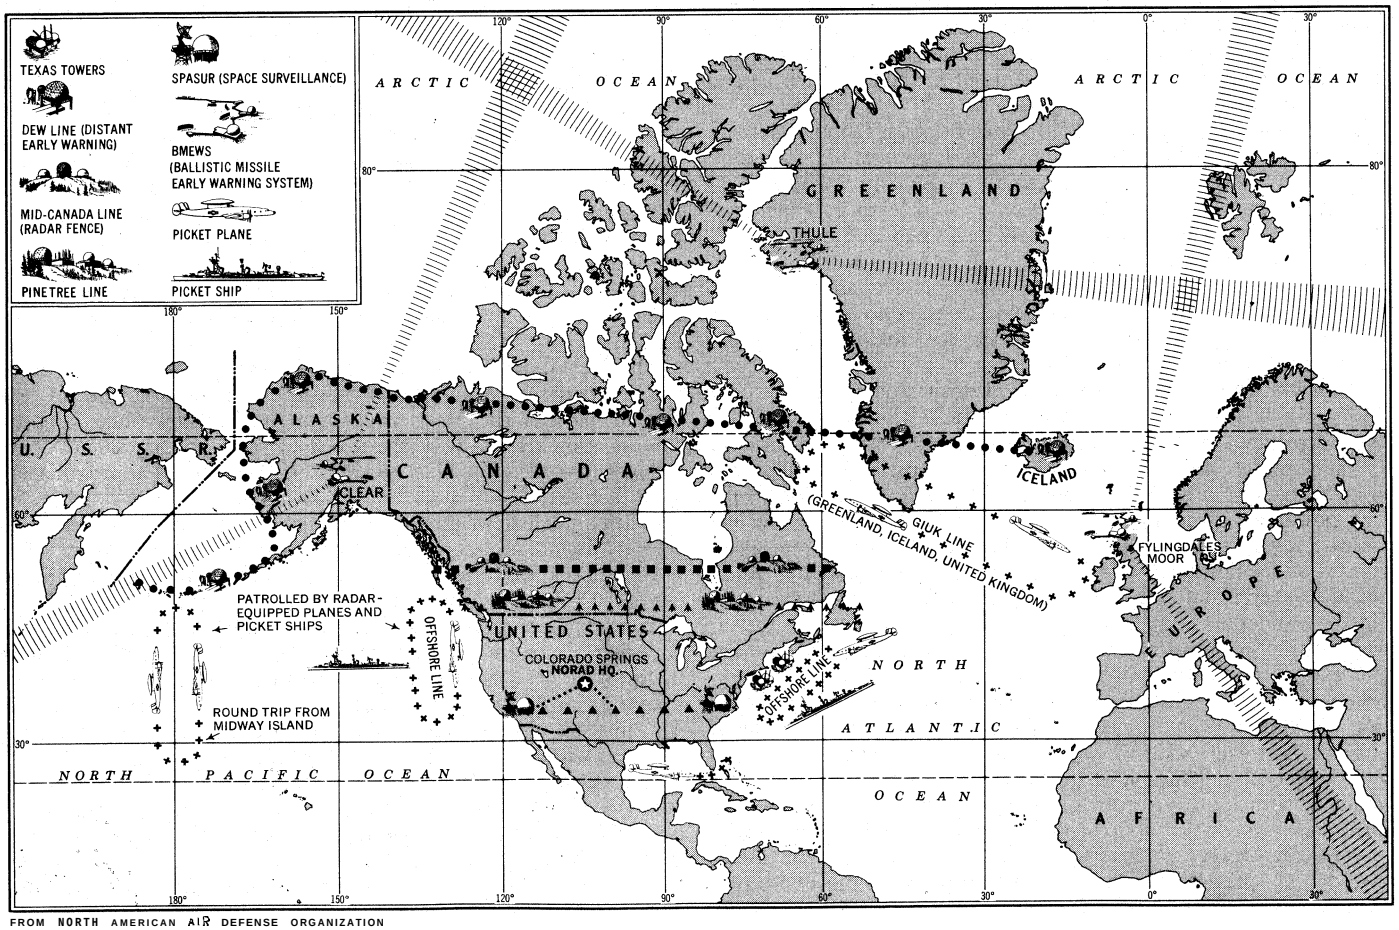
Civil Defense Measures.—The protective measures of civil defense may be considered in four categories: (1) measures taken during peacetime; (2) measures taken just prior to an actual attack; (3) measures taken during an attack; and (4) measures taken following an attack.

In the peacetime category the following are the most important: reinforcement of existing structures and provision of shelters within existing structures; construction of new shelters; construction of underground living and working quarters; reduction of fire hazards by the maintenance of general cleanliness and by the safe enclosure of stored combustibles; dispersal of cities by the removal of major industries to less populous areas; modification of building codes and of general urban planning to incorporate such features as increased structural strengths and fireproofing of buildings, duplicate and emergency public utility services, community shelters, and wide streets and adequate parks to provide firebreaks; stockpiling of first-aid materials and of vital resources; secure storage of important records.

Protection of property from the effects of extreme pressures and the protection of personnel go hand-in-hand, for a building that can withstand such pressures can also protect its occupants. A few specially reinforced windowless structures were built in the U.S. The Baltic countries, especially Sweden, placed a large proportion of their vital industry underground. No adverse effects on production or morale were reported.

Dispersal of facilities by erecting new industries or by moving existing industries a distance from the assumed aiming points has the ultimate effect of also dispersing population. Dispersal is restricted to nations with sufficient land area, such as the U.S. and the Soviet Union.

In the preattack period there are certain governmental measures and certain individual measures that may be taken. Some of the principal governmental measures are the sounding of a widespread alert and the declaration of a state of emergency. During this preattack period the government would continually advise the populace by every available means of communication. In the U.S. a special communications system known as Conelrad (control of electromagnetic radiation) was adopted to shut down all radio and television broadcast stations with the exception of certain AM stations which regulated their operation to deny electromagnetic



FROM NORTH AMERICAN AIR DEFENSE ORGANIZATION

FIG. 1.—NORTH AMERICAN AIR DEFENSE RADAR WARNING SYSTEM

navigational aid to approaching enemy aircraft. To an aircraft navigator the radiation intensity pattern observed from an isolated identified station under normal conditions can be employed as a beacon; however, the pattern observed from the collective Conelrad transmissions is too broad to be useful in the same manner. The scheme could be particularly effective against aircraft carrying kiloton bombs. However, the advent of ballistic missiles, megaton bombs and dependable alternative navigation methods cast doubt upon its value as a passive defense measure, particularly in view of the reduction in coverage of broadcast advice to the public that it entails.

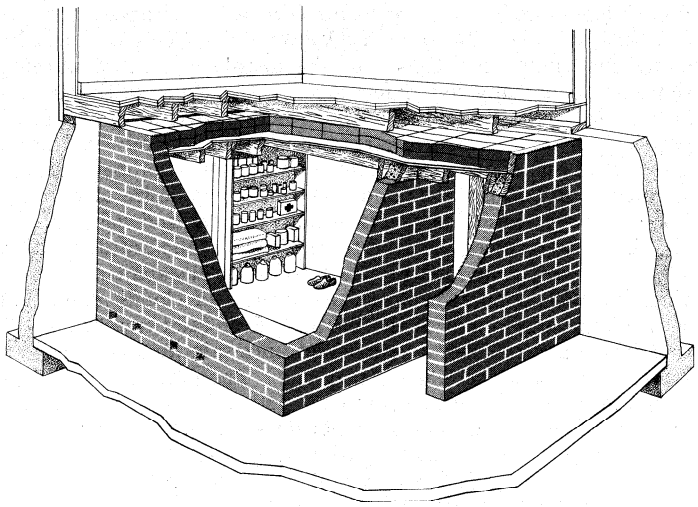
Another passive defense proposal was the employment of oily smoke over cities as a means of attenuating the radiant thermal energy from a nuclear fireball. This technique, called TRAC (thermal radiation attenuating clouds), required a warning period longer than might be available; hence, the concept did not gain wide acceptance.

For the individual, preattack measures include waking any sleeping members of the household; assisting sick and infirm persons; shutting off utilities; moving away from windows and other frangible items; gathering emergency supplies and rushing to the nearest structurally strong shelter; and being attentive to official advice.

During an actual attack, for persons who are fortunate enough to be inside adequate shelters, there is little further protective action that can be taken. It is probable, however, that for some individuals the first warning would be the brilliant light-and-heat flash from the fireball of an exploded weapon. For these persons, depending upon each individual's location at the time, the following alternative actions are available: falling into any convenient ditch or culvert; dropping to the floor of an automobile; or hiding behind anything that could serve as a blast-and-heat barrier. In the absence of any shielding, a prone body in contact with the ground offers less resistance to wind-drag forces than does an upright body; also, the prone body offers a smaller target for debris flying with the blast wave.

Immediately following an attack there are complex restrictions on measures that can be taken effectively. It is important that personnel rescue and first aid be executed as promptly as possible, for in many instances the saving of lives would be dependent upon the speed of action. Ho ever, such work would be hampered by the simultaneous requirement of fighting fires and by the general state of temporary shock induced by the unprecedented sudden destruction. Small blazes, unattended, could grow to continuing fires within about a quarter of an hour, and these, in turn, could merge into conflagrations shortly afterward. After the first hour or so, more than fleeting outdoor exposure to fallout by any living being could be exceedingly dangerous. It could force persons for tens of miles downwind from a ground burst to remain in shelters for days or possibly for weeks. Because of the anticipated high ratio of casualties to trained medical first-aid personnel, it has been proposed that emergency first aid be preceded by a classification of casualties into three groups: (1) too severely injured to be salvaged with existing facilities; (2) capable of survival with assistance from available facilities; or (3) able to bear their injuries without assistance. Treatment would then be confined to those in the second category.

Organization for Civil Defense. — In the U.S. civil defense exists at the national, state and local levels. The Federal Civil Defense act of 1950 created the Federal Civil Defense administration (FCDA). This act gave the FCDA extremely broad powers in time of war, but its peacetime activities were largely restricted to relaying the air-raid warning from the point of detection to the local level; conducting research on matters of interest to civil defense; developing and co-ordinating plans; training civil defense officials and volunteers; stockpiling certain critical equipment, such as medical supplies; and administering the "matching funds" program, whereby state and local civil defense organizations could obtain needed supplies at reduced cost. Seven civil defense regions (their boundaries corresponding roughly to the six U.S. army areas) were established for purposes of co-ordination; however, actual civil defense operations were to be at the state, county and municipal level.



FROM OFFICE OF CIVIL AND DEFENSE MOBILIZATION

FIG. 2. — BASEMENT CONCRETE-BLOCK FALLOUT SHELTER

The Office of Defense Mobilization (ODM) was made responsible for stockpiling critical materials, administering the program for the dispersal of vital industry, assessing potential in supplies and manpower, and applying electronic computers to determine what facilities might survive certain sizes and types of enemy attack. In 1958 the two offices, FCDA and ODM, were combined into the Office of Civil and Defense Mobilization (OCDM). In 1961 the department of defense was assigned responsibility for an expanded program to be carried out through its newly created Office of Civil Defense (OCD). To the OCDM (renamed the Office of Emergency Planning), under the executive office of the president, was assigned over-all co-ordination of the nonmilitary defense program.

In the U.S. the actual civil defense operations (rescue, fire fighting, first aid, radiation monitoring, etc.) are carried out by the normal branches of local government augmented by volunteers. This is also true to some extent in Britain and in Germany. Great Britain's four civil defense organizations, the Civil Defence corps, the Industrial Civil Defence service, the Auxiliary Fire service and the National Hospital Service reserve, enroll part-time, unpaid recruits, both men and women. These services divide among themselves the rescue and care of casualties and the homeless, the protection of offices and factories, fire fighting and nursing. They are supported by the warning and monitory organization, the Women's Voluntary Service for Civil Defence, the police, fire and ambulance services and the armed forces. In Sweden, Denmark, Norway and Switzerland training in civil defense is compulsory. Training in civil defense measures is also compulsory in the U.S.S.R., where the training doctrine is oriented toward chemical and biological as well as toward nuclear attack. In Canada, civil defense planning at the national level is an army responsibility. Operations, as in the U.S., are at the province and local levels. Many major nations (France and Italy, for example) have no civil defense laws or organizations.

Organizations created for ameliorating the effects of enemy action have also proved effective against natural disasters such as tornadoes and floods.

Civil and Active Defense. — Judging on the basis of appropriations of public funds in all countries, there is considerably more public support for active defense than there is for civil defense. One attractive feature of active defense is that while civil defense is aimed principally at saving lives, active defense can prevent losses of property as well. Any known weapons system, however, can be saturated; there is a limit to the number of aircraft that an air defense system can engage in a given period of time. If the number of attacking aircraft exceeds this saturation number, the remainder of the attack force will penetrate to the target city. Furthermore, unless the nuclear bomb is destroyed high in the air along with the aircraft, the explosion of the weapon upon contact with the earth could produce serious results. Most experts agree

that civil defense is a necessary adjunct to active defenses.

Unsolved **Civil** Defense Problems.—Civil defense presents many challenging problems. In the missile era, short warning times preclude many civil defense measures, such as getting people into appropriate air-raid shelters. The behaviour of sheltered populations under extreme stress situations is largely unknown. The cost of an adequate civil defense is enormous, probably in the vicinity of $1,000 per sheltered occupant. The desire of military forces to keep secret the effects of new weapons and the desire of civil defense agencies to make these effects public are in conflict. The fire hazard from nuclear attack is largely unexplored; for example, a nuclear burst between an envelope of clouds above and snow below could increase the thermal effect (and resulting fires) by a large factor. There are inherent uncertainties as to when an attack may begin and when it may end. The detection of a fleet of approaching enemy bombers does not preclude the possibility of a simultaneous missile attack, nor does it preclude the possibility that enemy submarines may be lurking offshore, both alternate possibilities conveying threats with short warning times. Similarly, the explosion of a single nuclear weapon cannot be interpreted as the end of the attack for any specific area. More weapons may be in the offing at the very time that the desire to emerge from shelters to fight fires and attempt rescue work is at its peak. *See* also AIR DEFENSE; ATOMIC ENERGY; BIOLOGICAL WARFARE; CHEMICAL WARFARE; ROCKETS AND MISSILES. (Jo. BA.; T. J. WA.)

CIVILIS, GAIUS JULIUS (1st century A.D.), the Batavian leader of a rebellion on the Rhine frontier of the Roman empire in A.D. 69–70. He commanded a cohort of his own tribe and had been suspected of disloyalty by the party of Aulus Vitellius (*q.v.*) when the latter was acclaimed emperor in Jan. 69. Later that year Antonius Primus, a supporter of Vespasian (*q.v.*), urged Civilis to prevent German reinforcements from reaching Vitellius; Civilis therefore induced the Batavi, followed by German tribes across the Rhine, to attack the Roman legions. He secured control of all the country north of Vetera (near modern Xanten), and in that camp two legions were besieged for several months. Meanwhile Vitellius had died, but the revolt continued against Vespasian. It was joined by certain Gallic tribes, who proclaimed an *imperium Galliarum* under the *praefectus alae* (commander of the auxiliaries) Julius Classicus, a noble of the Treveri, Julius Tutor of the same tribe and Julius Sabinus of the Lingones. Vetera now fell, and was burned along with all Roman camps north of Moguntiacum (Mainz): some legionaries were forced to swear allegiance to the new regime, others were massacred. At this point, however, large Roman reinforcements arrived under Q. Petillius Cerialis who first entered Mainz and then won a decisive battle outside Augusta Treverorum (Trier). Civilis, Classicus and Tutor were gradually pushed northward and made their last stand on the Batavian "island" across the Vahalis (Waal) river. Finally Civilis came to a conference and was given terms apparently favourable to his countrymen; his fate is unknown.

Civilis' story is known only from the vivid account by Tacitus who attributes too much "barbarism" to the fighting methods and general outlook of a rebel who was himself a high Roman officer and was leading auxiliary troops of the Roman army. It is clear, however, that the movement was a result of genuine dissatisfaction with Roman rule.

See Tacitus, *Histories*, books iv and v; H. Nissen, "Der Batavische Krieg," *Bonner Jahrbücher*, vol. 111/112, pp. 60–80 (1904); G. Walser, *Rom, das Reich und die fremden Volker in der Geschichtsschreibung der frühen Kaiserzeit*, p. 86 *et seq.* (1951). (G. E. F. C.)

CIVILIZATION AND CULTURE. The following article by James Harvey Robinson, which first appeared in the 1929 edition of the *Encyclopædia Britannica* under the title "Civilization," has been retained because of its interest as a statement of permanent value. For a discussion by later authors on the concepts of civilization and culture and a summary of modern views, see *Concepts of Civilization and Culture* and *Culture and Humanity* below. (X.)

This encyclopaedia is in itself a description of civilization, for it contains the story of human achievement in all its bewildering developments. It shows what men during hundreds of thousands of years have been learning about themselves, their world and the creatures which share it with them. They have reached out into remote space and studied nebulae whose light reaches them after a million years; they have, on the other hand, dissected atoms and manipulated electrons as they might handle pebbles. In the present magnificent series of volumes man's inventions are reviewed from the rudest chipped flint to the most delicately adjusted microscope; his creation of multiform beauties of design, colour and word, his ways of dealing with his fellows, his co-operations and dissensions; his ideals and lofty aspirations, his inevitable blunders and disappointments; in short, all his gropings, disheartening failures and unbelievable triumphs are recalled.

Several thousand contributors have been brought together to do each his special part in writing millions of words on what mankind has hitherto done and said. It might therefore seem at first sight superfluous, and indeed impossible, to treat civilization itself as a separate topic in a few pages. But there is danger that owing to the overwhelming mass of information given in these volumes certain important underlying considerations may be lost sight of. There are highly significant questions concerning the nature and course of human development, the obstacles which have lain in the way of advance; the sources of success and frustration, which could hardly be brought together in dealing with any of the special aspects of human culture. Accordingly an attempt will be made under this caption to scan civilization as a single, unique and astonishing achievement of the human species.

To begin with, it is a startling fact that civilization, which sets off man in so astounding a manner from all other animals, should only lately have begun to be understood. We are immersed in it from infancy; we take it for granted, and are too near it to see it, except in this detail and that. Even today, with all our recently acquired knowledge, those who strive most valiantly in imagination to get outside civilization so that they may look upon it dispassionately and appraise it as a whole, are bewildered by its mysteries. As for the great mass of intelligent people, they still harbour many ancient illusions and misapprehensions from which they can only be weaned with great reluctance.

The object of the present article is to describe the newer ways of viewing civilization, its general nature, origin, progress, transmission and chiei developments. in the light of information which has been accumulating during the past 50 or 60 years. The study of man himself has been revealing quite as many revolutionary facts and hypotheses during the past half century as the scientific investigation of the world in which he lives. The history of human achievement has been traced back, at least in vague outline, hundreds of thousands of years; man's original uncivilized nature and equipment have been studied and compared with the behaviour of his nearer relatives; new conjectures have emerged in regard to the functioning of speech and the nature and origin of human reasoning; careful investigations of primitive civilizations have cast great light on more complicated ones; the tremendous importance of childhood and its various implications in the development of civilization have been elaborated.

These and many other discoveries conspire to recast our conception of civilization. its past progress and its future possibilities.

It is instructive to note that the word civilization is by no means an old one. Boswell reports that he urged Johnson to insert the term in his dictionary in 1772, but Johnson refused. He preferred the older word "civility." This, like "urbanity," reflects the contempt of the townsman for the rustic or barbarian; it is an invidious term, although in a way justified by the fact that only where cities have grown up have men developed intricate civilizations. The arduous and dispersed tasks of the hunter, shepherd and peasant folk do not afford the leisure, or at least the varied human contacts, essential to the generation of new ideas and discoveries. But modern anthropologists have pointed out that peoples without cities, such as the tribes of Polynesia and the North American Indians, are really highly "civilized," in the sense that upon sympathetic examination. they are found to have subtle languages, ingenious arts, admirably suited to their conditions, developed institutions, social and political; religious practices and confident myths, no better and no worse substantiated than

many that prevail today among the nations of Europe. All these betoken and presuppose a vastly long development. Among English-speaking people the first to point this out clearly was E. B. Tylor, who published his famous *Primitive Culture* in *1871,* the same year in which Darwin's *Descent* of Man appeared. These two books would alone have served, by different approaches, to give the word civilization a far more profound meaning than it had ever had before.

New Conception of Civilization. — There could be no real understanding of the fundamental characteristic of civilization until the fact was well established and digested that could we trace back man's lineage far enough we should find it merging into that of wild animals, without artificial shelters, clothes or speech; dependent for sustenance on the precarious daily search for food. It requires a considerable effort of the imagination to picture the human race without these seeming necessities of even primitive civilization. Without fire and tools men must have existed as did a wild girl discovered near Châlons-sur-Marne, France, in 1731. She possessed a monkeylike agility which enabled her to catch birds and rabbits; these she skinned with her nails and gobbled raw, as would a dog. She delighted to suck the blood from living pigeons, and had no speech except hideous screams and howls.

This conception of man's former animal existence is gradually supplanting the older one, based upon ancient Hebrew tradition, that the first man and first woman were special creations with fully developed minds, speech and reason, which enabled them forthwith to dress the garden in which they found themselves, to name its animal denizens, and to talk with one another, and with God himself in the cool of the evening.

The former assumption was that man was by nature endowed with a mind and with reason. These distinguished him sharply from the animals, which did wondrous things it is true, but not as a result of reason. Their behaviour was guided, it was argued, by instinct. Darwin says that "the very essence of an instinct is that it is followed independently of reason." But if we agree, as manifold evidence seems to force us to do, that long, long ago men behaved and lived like wild animals, are we not forced to ask if they did not live wholly according to what Darwin calls instincts? And if once upon a time our ancestors lived solely by their animal equipment, did they as yet have a mind and reason? May not the human mind be something that has very gradually developed as a result of man's peculiar animal make-up and capacities? May not his reason be but another name for his slowly accumulated knowledge and beliefs and his ways of dealing with them and building upon them? In any case the discovery that our ancestors once lived like wild animals raises entirely new and difficult questions as to the nature, origin and interpretation of those powers of his known as mind and reason, which have enabled him to seek out those inventions and come upon beliefs and practices which have produced in the aggregate civilization.

In short, it seems to be more and more apparent that mind and reason were not part of man's original equipment, as are his arms and legs, his brain and tongue, but have been slowly acquired and painfully built up. They are themselves inventions — things he has come upon. Like other inventions they are part and parcel of civilization — not innate in man but dependent for their perpetuation on education in the widest sense of that term. This is so novel an idea that many readers may find it difficult to grasp, but when grasped it alters one's whole estimate of human progress. We ordinarily think of civilization as made up of mechanical devices, books and pictures, enlightened religious ideas, handsome buildings, polite conduct, scientific and philosophical knowledge, social and political institutions, ingenious methods of transportation and the rest. We think that all these things are due to man's possession of a mind, which no animal has, and as a result of the exercise of reason. In a way this is true enough, only we must reconceive mind and reason and regard them just as truly a part of the gradual elaboration of civilization as a house of commons or a motorcar, and quite as subject to improvement. At the risk of a seemingly irrelevant philosophical digression, which is really essential to a modern understanding of civilization, something may be said of the newer conception of mind and its variant, reason.

The word mind was originally a verb, not a noun; it meant action, not a thing or agent. It was remembering and purposing, and taking note of — as for instance "I minded" — that is, remembered, or paid attention to, or was concerned by. But as time went on philosophers made a noun of the good old verb. It was conceived as that incorporeal substance which was the seat of a person's consciousness, thoughts, feelings, and especially of his reasoning. The body was set over against the mind whose orders it was supposed to execute. The Scottish philosopher of common sense, Thomas Reid, says explicitly that "we do not give the name of mind to thought, reason or desire; but to that power which both perceives and wills." Even John Stuart Mill says in his ***Logic*** that "mind is the mysterious something which feels and thinks."

Recently there has been a tendency to reduce the noun mind once more to a series of verbs — desiring, remembering, feeling, thinking, distinguishing, inferring, planning — and to regard the assumption of "a mysterious something" as unfounded, unnecessary and a serious embarrassment. Relieved of this embarrassment it is possible to begin to bridge the gulf between the original behaviour of the human race and that of mankind today. Descartes and all the older philosophers believed that man had always had a mind as good as theirs. They sought to tell him how to employ it in the pursuit of truth. Mind was to them a sort of divine instrument, conferred solely upon man, that could be sharpened and efficiently used by following the laws of logic; but they could not think of it as something accumulated, so to speak, through the many thousands of years since man made his first contributions to the upbuilding of civilization.

The way is now cleared for a new view of civilization which would not have been possible 50 or 60 years ago. Civilization is no longer contrasted with '*rusticity,""barbarity" or "savagery," but with man's purely animal heritage. Modern men are still animals, they have to eat and sleep. protect themselves from the inclemencies of the weather, and defend themselves from attacks of their fellow creatures and other animals, and to rear a new generation, if the species is to be perpetuated. They closely resemble kindred animals in much of their physical structure, in their important organs, breathing, digestion and the circulation of their blood. All these peculiarities are hereditarily transmitted no matter how much or how little men may be civilized. On the other hand, civilization — language, religion, beliefs, morals, arts and manifestations of the human mind and reason — none of these can be shown to be handed down as biological traits. They can only be transmitted to a new generation by imitation or instruction.

All mankind today has a double heritage. The one comes to us without any effort on our part, as do the spider's peculiar characteristics or those of birds, or of any of our fellow mammals, come to them. It is secure and tends to remain the same for thousands of years. Civilization, on the other hand, is precarious; it must he assimilated anew by each one of us for himself in such a degree as circumstances permit. It can increase indefinitely but it may also fall off tremendously, as the history of man amply testifies. It is a legacy that can be lost as well as kept and increased.

To illustrate: it may be that before human beings had acquired any of this losable thing, civilization, they would pick up a stick to strike an assailant or hurl a stone at him. They might have found themselves riding astride floating tree trunks to cross a stream. Certain persons would occur, let us say. in each generation who would do all these things without ever having seen them done. These acts would be classed in man's animal heritage. But should we find traces of men who chipped a flint nodule into a hatchet head, and hollowed out their log with such a hatchet, or with fire, we should have to class these acts among the arts of civilization since they presuppose so much accumulated experience and ingenuity that they could not be inborn. The art of making a rude boat might consequently be wholly lost, as surely many inventions must have lapsed, if a single generation passed without constructing one.

It seems now an imperative fact that all civilization — the total

social and traditional heritage—would fall away immediately and completely should a thoroughgoing forgetfulness, an overwhelming amnesia and profound oblivion overtake humanity. Only their natural equipment would be left. As Graham Wallas suggests. those least civilized would have a possible chance of surviving. It is only uncivilized man that might go on indefinitely. We are all by nature wild animals plus; and our taming weakens us for the ancient struggle in the forest, naked and barehanded.

Peculiar Items of Man's Bodily Form. — At this juncture the question arises, what was there peculiar in man's physical make-up that enabled him to initiate civilization and build up a mind which he could use to increase his resources so far beyond that of any other animal? Before proceeding we should recollect that the ways of all living creatures are manifold and astonishing. Even a single-celled organism can marvellously adjust itself to altered conditions. It seems to learn by experience, it appears to have a sort of memory, it is modified by happenings which interrupt its comfortable routine. It is ingenious in defending itself, in seeking food and reproducing. It is, in short, purposive in its conduct. The tiger and the frog are able to adjust themselves to very different modes of life, and so are the orioles and cacti. Before man began to accumulate civilization we are forced to assume that he too made terms with the daily need of adjustment which faced him, otherwise we should not he here to write the tale. These are the salient essentials of life, and man is a part of what Julian Huxley calls "the stream of life." All these possibilities lay behind the development of man's intelligence. They are the hinterland from which civilization emerged and to which it ever tends to retreat.

In order to begin and carry on the accumulation of civilization, man had of necessity to be so constructed physically that he could perceive more clearly than his predecessors, make more accurate distinctions and so remember and imagine better; for all these are essential to talking and thinking. The awareness of animals is of a low, vague type, and so must pristine man's have been. The one-celled animals behave in a purposive way, but they have no eyes or ears or noses. They must live in silence and darkness like a human blind deaf-mute. They will nevertheless take in certain food and reject other things. They perceive and act without, so far as we can see, being conscious of their actions. They make the necessary decisions without deciding in a human sense. They have no nervous system, but, as has lately been discovered. the promise of one. The creatures most like ourselves have eyes, ears and noses, and evidently see, hear and smell; and they have an elaborate nervous system. Of these resources they make constant use. But compared with man they are ill-qualified to make careful distinctions and discriminations and remember clearly. They take note of far fewer factors in their situation. They must act somewhat as our digestive system does. It is a sort of animal within us which performs wondrous feats when given food. It works purposively, as do our heart and blood circulation. We can become conscious of these unconscious achievements when we choke, because the switch is not thrown promptly enough to prevent a morsel from going down our windpipe instead of taking the route to the stomach. Palpitation of the heart is a conscious suggestion of the faithful pump, which rarely reminds us of its constant attention to business. Let it neglect two or three beats and we are dead.

The essentials of man's physical equipment for initiating and piling up civilization have been dwelt upon by many writers. He has sensitive hands, and (after he got securely on his hind legs) he could use them far more freely than if he had to employ them as auxiliary feet. His thumb can be readily placed against any one of his fingers. There is no such expert feeler and handler as he to be found among his kindred. He could learn much of shape and form, of softness and hardness, of weight. texture, heat and cold. toughness. rigidity and flexibility, which could be but vaguely sensed with hoof or paw. Had he had ears that he could turn about like a jack rabbit, and a prehensile tail, he might have been able to learn faster. And all these things were the beginning of knowledge. He could not only strike but hurl. His eyes were so placed that he was always looking through a stereoscope, so to speak, and seeing things in the round. His vocal organs promised a great range of delicate discrimination in the sounds he made. Then he was a helpless dependent for many years on his elders so that their acquired ways could become his.

Lastly there is man's brain with its complex cerebral cortex and its association paths, which develop astonishingly as a child grows up. The cortex is the prime correlator of impressions, and is modified through individual experience in a higher degree than any other part of the nervous system. Its functioning is still very mysterious, but no one doubts its essential role in the process of human learning and the increase of intelligence. Its operations are not, however, autonomous but closely associated with the experiences of the whole human organism and dependent on those singular capacities of mankind already mentioned.

So it becomes apparent that after hundreds of millions of years during nhich nature's experiments have been going on in physical structure and function, which have enabled creatures of the most diverse types to meet the absolute requisites of life—growing up and reproducing their species—a kind of animal finally appeared on the earth so constructed that he could become civilized. Man's biological make-up represents a unique combination of physical characteristics. Most of these, as we have seen, occur in other mammals. Even those which seem peculiar to him would not serve, however, as a foundation for the development of civilization except in a highly complex union. Cows might have a human cerebral cortex, foxes apposable thumbs. birds stereoscopic eyes, dogs vocal organs similar to ours, and yet civilization would be far beyond their reach. Man can teach all of them tricks. They themselves can learn something as their life goes on. Chimpanzees may under favourable circumstances make very simple, humanlike inferences; but none of them could initiate and perpetuate the arts and sciences as a heritage of their species.

Progress and Conservatism. — Such then was man's original equipment for getting civilized. He had, obviously, no means of foreseeing the enterprise in which he was engaged. His evolution as a civilized being was no more premeditated than his rise from earlier simian ancestors. There seems to be sufficient evidence that for hundreds of thousands of years changes in his mode of life were so gradual and rare as to pass unperceived. Each generation accepted the conditions in which it was reared without thought of betterment. Our modern hope of "progress"—an indefinite increase of human knowledge and its application to the improvement of man's estate—was practically unknown even to the Greeks and Romans. From the 13th century onward a few writers dwelt upon the promise of the future, but they were outclamoured by those convinced that human noes were attributable to a departure from ancient standards. The humanists strove to re-establish the wisdom of the classical writers, and the Protestants sought to revive the beliefs and practices of the early Christians. Only three centuries ago did Bacon unroll a program of aggressive search for the hitherto unknown, which had any very wide influence. In the 18th century the conception of reform and progress found illustrious spokesmen. and their anticipations of coming changes in the economy of human life were destined, as it proved, to be far outrun by the events of the 19th and early 20th centuries.

We can, however. still note on all hands illustrations of man's confidence in routine sanctified by ancient authorities; his suspicion of innovation in wide realms of belief and practice. This dogged obstinacy in clinging to his habits, and his general suspicion of the unfamiliar. are exactly what might have been anticipated when we consider his animal origin. This trait has served to slow down the process of change, but at the same time has greatly increased the security and permanence of each achievement. Here we find a possible explanation of the great role that the veil of sacredness has played in man's development. He has cast it over beliefs and practices and so hid them from pert scrutiny and criticism. The number of those who can tolerate somewhat critical thinking here and there, has, nevertheless, greatly increased of late. but they are still few indeed. What we call today a conservative or reactionary mood must have been characteristic of mankind from the beginning. It corresponds to animal inclinations.

Among animal proclivities there is, however, from the one-

celled organisms upward, a lifesaving tendency to make random movements, extensions and contractions, to hasten hither and thither. in the pursuit of food and mates. This restlessness and groping are among man's legacies also. They offset his routine and static habits, and lie behind and back of the inventions and discoveries he has made. There is, too, especially obvious among the higher animals, something auguring what in man becomes curiosity. The danger of attack made preliminary scouting a valuable asset in survival. So men were by nature wont to pry and try and fumble, long before they scientifically analyzed and experimented.

There can be no doubt that hundreds of thousands of years were required for man to reach even the lowest degree of culture to be found among the simplest tribes today. The discovery of fossil skulls, teeth and bones at different geological levels shows that more or less apelike men have been on earth for from 500,000 to 1,000,000 years. Several species, such as the Java man, the Heidelberg man and the much later Neanderthal race are now extinct. The only vestiges of their handiwork consist in chipped flint tools. becoming better made and more varied as time went on. There is no way of telling what other arts, beliefs and practices were associated with a particular assortment of flint utensils. William Sollas, in his Ancient Hunters, sought to draw ingenious analogies between these prehistoric weapons and the civilizations of the Tasmanians, Australians, Eskimos, etc.

The so-called Cro-Magnon race had finely developed skulls quite as good as those of today. To them are ascribed the remarkable paintings and drawings found in caves of southern France and northern Spain. They are believed to be from 25,000 to 30.000 years old. Halving this period we come upon traces of ground and polished stone tools, coincident nith the relinquishment of hunting as man's exclusive pursuit and a settling down to sow and reap, spin and weave. Halving it again, we get news of the use of copper, the precursor of the metals on which our civilization largely rests. This can but be a rough chronology subject to much revision as time goes on and the earth is more thoroughly searched for evidences of man's past.

To get the matter clearly before one, let us imagine, as the writer has suggested elsewhere, that 500,000 years of developing culture were compressed into 50 years. On this scale mankind would have required 49 years to learn enough to desert here and there his inveterate hunting habits and settle down in villages. Half through the 50th year writing was discovered and practised within a very limited area, thus supplying one of the chief means for perpetuating and spreading culture. The achievements of the Greeks would be but three months back. the prevailing of Christianity, two; the printing press would be a fortnight old and man would have been using steam for hardly a week. The peculiar conditions under which we live did not come about until Dec. 31 of the 50th year.

There is a school of anthropologists, the diffusionists, who would derive all the higher types of civilization — writing, metallurgy, the construction of imposing stone buildings — from a single region, Egypt. They have collected much evidence to show that through the commerce of the Phoenicians, Egyptian inventions spread eastward into India. China and Japan, then across the Pacific to form the basis of Maya culture in Central America. The merits of the "diffusionist" arguments cannot be considered here. G. Elliot Smith, one of the best known advocates of this theory. dwells on the common lack of inventiveness and the reluctance of mankind to adopt new ideas. his tenacious hold on old ones and "his thick armour of obstinacy." "To obtain recognition of even the most trivial of innovations it is the common experience of almost every pioneer in art, science or invention to have to fight against a solid wall of cultivated prejudice and inherent stupidity."

All anthropologists are well aware of this hostility to change, which we may regard, as shown above, as a natural trait of mankind. They also admit the wide dissemination of inventions through commerce and conquest. Nevertheless many maintain that the same or similar discovery has been made independently in different parts of the earth, as the result of similar needs and conditions. When we have examined the exigencies of successful inventions in the following section we shall see that however commonplace they are now, with the accumulation of the past to build upon and modern facilities to work with, they were beyond measure difficult at the start when mankind still led the life of an animal. When once made and adopted by some tribe it is far easier to think of them as being introduced to other peoples than to assume that their presence represents an independent discovery.

Civilization depends upon the discoveries and inventions man has been able to make, together with the incalculable effects these have had upon his daily conduct, thoughts and feelings. As knowledge and ingenuity increased he departed further and further from his original wild animal life. The manner in which he began to learn is a matter of conjecture, since the manufacture of tools and weapons, the invention of language and artificial ways of producing fire far antedate any written accounts of advances in man's education. The same may be said of the much more recent spinning, weaving and farming. As we have seen, it required hundreds of thousands of years to reach the degree of civilization represented by these achievements. Their importance, however, cannot be overestimated, since they formed the absolutely essential basis of all later developments. We may feel a certain pride in contemporary inventions, but let us remember that we owe to savage hunters and illiterate neolithic farmers the accumulation of knowledge and skill without which none of our modern experimentation would be possible. Where would we be without fire, speech, clothes and bread!

Since invention, discovery and the increase of knowledge are the stuff of uhich civilization is made, it is pertinent to our theme to consider how they occur. There is plenty of evidence available in the reports nhich discoverers now make of the manner in which they reach their conclusions. There is also evidence of how their results are received and acted upon by others. All explorers must be exceptionally curious and at the same time patient gropers. The curiosity observable in most children tends to die away, but survives in one form or another in rare instances through life. These exceptional persons possess a drive alien to their fellows. They may be the handyman of a village or a member of a highly endowed research staff. They avail themselves of what has already been found out; the village mechanical genius does not have to invent a monkey wrench or bit of insulating tape, nor does the biologist need to know much about the optical principles of his lenses, much less invent or manufacture them. The geologist before he makes any discoveries is familiar with hundreds of treatises on his subject. It would be generally conceded by investigators that their discoveries are seemingly accidental. They do not know what they are going to find, and quite commonly find what they were not looking for, even as Saul, chasing lost asses. came upon a kingdom. All this applies to every kind of increase of knowledge, whether it have to do with the operations of so-called nature or with novel suggestions in the realms of philosophy or art. All are the result of curiosity, patient examination and thought. At best they are no more than footnotes and glosses added to existing human knowledge. This is now so varied and voluminous that no single person can compass it except in this detail and that. Should he attempt to do so, all chance of adding to it would be excluded.

But an invention or discovery or the rectification of an ancient error does not become a part of civilization until it has been accepted by the tribe and been added to its habits of action and thought. Plenty of shocking tales could be recalled of professional and popular opposition to innovations on grounds which now seem grotesque. We owe discoveries to individual men and women, but new information and skill can only be propagated and disseminated in a favourable culture medium. Many instances could be cited of promising knowledge which has so far failed to get a footing in civilization.

The influence of particular discoveries and mechanical devices is by no means confined to their more immediate and obvious applications. It is impossible to foresee what wide-ranging effects they may ultimately exert on human life. Fire will cook a meal, harden an earthen bowl, keep a group of naked savages warm,

frighten off prowling animals, soften or melt metals; it may also consume sacrifices to the gods, or form the central interest of a stately temple and be replenished by an order of vestal virgins. It may play its part in the symbolism of the theologian and the poet. The Indians of the North American plains were deeply affected by the introduction of the horse, and African tribes by firearms and whisky. The motorcar and telephone altered social relations. The perfecting of the steam engine revolutionized the transport of men and their wares; it promoted city life; further, it caused Marx to write a big book which became the gospel of a momentous social upheaval. which threatened the peace of mind of all nations.

The invention of clothes—quite material things, whether of linen, wool, silk or cotton—not only created great industries but enabled men by changing their hide artificially to establish social distinctions akin to biological genera and species. Through clothes entered in prudery and the pious horror of bare bodies which has wrought consternation .and disaster among the dark-skinned folk. After World War I women's skirts were gradually shortened. The warmth of houses and vehicles permitted this. One of the conventional distinctions between girls and women was thus obliterated. The unveiling of women's faces in Islamic countries: the breaking down of purdah in India—all these material changes imply modifications of woman's life and of the attitude of the sexes to one another. They forecast further important changes in traditional civilization.

In view of these facts, and indefinitely more that each one can easily add for himself, it would seem that what are esteemed the "nobler" aspirations and creations of mankind, whether in art and literature or the pursuit of truth, are all not only dependent upon "material" inventions but so strangely interwoven with them and their effects that it is no easy thing to separate the higher and the lower, except in imagination. What is sometimes called "the higher life of man" arises from his more humble and practical knowledge and skill; accordingly the old distinction between the material and spiritual seems to be greatly attenuated as they are both seen to merge into the newer conception of civilization as a whole. This will become even more apparent when we come to deal with words.

Role of Childhood.—One of the essential conditions for the perpetuation of civilization is the long period of dependence through which the human child must pass before it gains sufficient bodily strength and intelligence to achieve merely animal self-sufficiency and make its own way. Without the constant and prolonged succour of adults it would speedily perish. This means that the extended period of helpless susceptibility to his surroundings makes it possible vastly to modify a child's original disposition. A mouse is sexually mature in six weeks and fully grown in three months. Calves and colts walk about shortly after birth. The gorilla, on the other hand, has a prolonged childhood, requires 10 or 12 years before it is able to breed, and goes on growing, like man, for a few years after. He lacks, however, in spite of his prolonged childhood, the other essential traits which have enabled mankind to initiate, increase and transmit civilization.

We are all born uncivilized and would remain so through life were we not immersed in civilization. There is a long time in which we may, according to the place where we are born, be moulded into a well authenticated Papuan, Chinese or Parisian. We cannot choose whether we shall find ourselves talking like a Hottentot, a Russian or a German. And we learn to do in all things as those do among whom we are brought up. We cannot but accept their respective customs, scruples, and ideas, for all these are imposed upon us before we have any choice or discretion. We must perforce follow the ways of our elders, who themselves were once children and gained their civilization before any discrimination or comparison with other than the prevailing habits was possible. This is the inexorable rule, and it accounts for many of the striking characteristics of civilization.

If the assimilation of culture is closely associated with the dependence and adaptability of childhood there need be no great surprise that accumulating evidence seems to indicate that when bodily maturity is once reached, the increase of knowledge and intelligence slackens or even almost ceases in many cases. By 13 or 14 the child has acquired an overwhelming part of the knowledge, impressions, cautions and general estimates of his fellow creatures and the world in which he lives, which he continues to harbour with slight modifications during his lifetime. When as a result of the participation of the United States in World War I it became necessary to test the competence of a great number of young men an unforeseen contribution was made to our insight into civilization. Of the 1,700,000 examined, 45% did not show themselves (to quote an eminent authority, Henry H. Goddard) "much above the 12-year-old limit." Those tested, it must be remembered, did not include idiots or "morons." but the average run of youths accepted by their fellows as normal. While tests may be as yet inadequate they but confirm the observable fact that the inculcation of culture is associated with bodily growth and especially with the strange changes in the cells of the forebrain and their intercommunications. These developments are tremendous from infancy to maturity in so-called normal cases.

Only in exceptional instances does mind building continue steadily after childhood and adolescence. We have had time before 13 to take over the standardized sentiments of our elders, to learn all that they know, to accept their views of religion, politics, manners, general proprieties and respectabilities. The common run of mankind can, however, be taught tricks as time goes on and acquire special expertness. But a great part of our childish conceptions retain a permanent hold on us. There is usually little encouragement to alter them. We leave most of them unrevised, though we have to make adjustments as the years elapse. Human beings seem on the whole easily subdued to routine and the routine is established, as it would seem, by the time we are grown up. That the ability to learn, however, falls off very slowly after adulthood was shown by E. L. Thorndike.

The experts in advertising, the publishers of "tabloid" newspapers and the contrivers of moving-picture films seem to conform to the supposition that what appeals to a 12- or 13-year-old child is admirably adapted to the intelligence and tastes of the multitude. This means that the overwhelming majority of men and women assimilate in childhood the common and familiar forms of civilization or culture in the midst of which they find themselves, but hardly outrun them as life goes on. Perhaps one in a hundred may allow his opinions to be altered by assiduous reading, or take pains to cultivate his insight into art and literature and scientific discoveries. But all these and other contributions to one's personal civilization are outside the range of the human animal in general. Indeed the mere upkeep of our present complicated culture must depend upon a very trifling percentage of the population. Were a few thousand carefully selected infants in the various progressive countries of the world to be strangled at birth not only would advances in industry, arts and letters cease but a decline would set in oning to the lack of those to make the essential readjustments in our industries and their financing; to keep up laboratories and books at their present standards. Accordingly the great majority of human beings can barely maintain at best the civilization in which they were reared. Even the innovators considered above are unable to escape from the toils in which they were so easily enmeshed and which they regard not as entanglements and restraints but as comforts and assurances. It would be faithless and disloyal to regard them otherwise. Only peculiar temperaments under highly favourable conditions question what they have been taught. They can do this only on a most modest scale as a result of continued curiosity and study. A physicist may reach a new theory of the constitution of atoms and yet cling stolidly to the notions of religion he had acquired at ten years of age; he may even engage in subtle philosophical speculation and remain a hot defender of the mores of the most commonplace persons 50 years ago.

If these points be well taken the whole contrast between society and the individual which has been played up in various rather futile ways takes on a new aspect. From the standpoint of civilization each individual owes his entire equipment as a civilized being to others. Biologically even, he is vastly modified by his domestication, in habits, impulses and moods. The so-called "instinct of the herd," which William Trotter has made famous, tends to be-

come an unnecessary hypothesis. For every child is made by others in their own image. How gregarious mankind was before the onset of civilization it is impossible to say; but the prolonged infantile weakness implied multiform dependence upon others. Of course there is really no such thing as society in the sense of some powerful and precious personality for whose welfare the so-called individual is invited to make appropriate sacrifices of personal preferences. What we have to do is to make terms with the notions of "the good" and "the bad" which those profess with whom we are thrown. These rules of conduct and sentiment constitute society. They have their heavy sanctions if violated or impeached—disgrace, persecution, imprisonment and even death. The methods of eluding society constitute a highly interesting chapter in the history of civilization. It is not difficult for the shrewd, and seems greatly to enrich life for certain temperaments, whether one be a burglar. a storyteller or a philosopher. Wholesale deceit has established the reputation and fame of many a hero from Jacob and Clysses to those in high places today. Boldness of thought is less likely as yet to arouse primitive enthusiasm.

Words Viewed as Deeds.—One of the most stupendous elements in civilization has hitherto been only casually mentioned—words. Without language civilization could hardly even have begun and certainly could never have attained its higher forms. Speech underlies thinking and conscious planning and research. It does more. It creates a world of ideas which interpenetrates and seems to transcend that of the facts of human experience. What pass for facts are indeed so moulded by our notions of them that recent philosophers are less and less confident in their efforts to separate the functioning of ideas from that of facts. Much has been discovered of late which serves to revolutionize the older theories of language and thinking. and to eliminate some of the agelong quandaries in which philosophers have found themselves involved. These new views can be only briefly suggested here.

The Fourth Gospel opens, "In the beginning was the Word; . . . All things were made by it; . . . In it was life; and the life was the light of men." Goethe declared that in the beginning was the deed. The most recent writers who deal with speech would seek to shed new light on civilization by recognizing that words have always been deeds. They have always been regarded as wonder-working acts; they create things which without them could never exist; they are the chief light of man—and his darkness as well.

Making noises is a conspicuous animal trait. Katydids, frogs, whippoorwills. dogs, and many other creatures exhibit a tireless patience in this matter. Man, too, is a great chatterer. His fellow men may be bored by his talk, but they are likely to be scared by his silence. It is portentous and bodes no good. To keep still is an unfriendly act. So, as Bronislaw Malinowski pointed out, one of the many functions of utterances has been reassurance and the expression of companionability. The cries of animals as related to their needs and behaviour are only just beginning to be carefully studied. Whitman and Craig discovered a marvellous correlation between the ejaculations of pigeons and their ways of life. Others studied our nearer relatives. But all that needs be noted here is that human language must have emerged from the spontaneous sounds made by preman.

Only when men began to make pictures of events and gestures, and painfully developed writing from the pictures, have we the least actual evidence of language. The Egyptian inscriptions illustrate picture writing and its later and most ingenious metamorphosis into sound symbols—an alphabet. This happened 5,000 or 6,000 years ago. But it is clear from the Egyptian language that its surprising complexity and sophistication imply an antecedent development of incalculable length, to judge from the slowness of man's material inventions.

While the beginnings of language are hidden from us by the lapse of hundreds of thousands of unrecorded years, there are several new ways of coming to a far better understanding of them than hitherto. There are historical and contemporaneous sources of information which have been exploited of late and serve to revolutionize the older views. For example, the so-called primitive languages (until recently, never reduced to writing) afford a sufficient proof that words are fundamentally acts! closely related to man's other conduct. Then, watching the way that babies—the Latins aptly called them *infantes,* or speechless creatures—learn to talk greatly re-enforces ,and corroborates the evidence derived from the study of "illiterate" tribes. Lastly, anyone who has learned the trick can substantiate the same thing if he tests the babble always going on around him.

We have already noted one way in which speech is a mode of action, a friendly gesture, not an expression of thought or conveyance of ideas as philosophers have taught us. "How do you do?" is not a question to be answered under usual circumstances. One concurs in the obvious statement, which conveys no fresh information. "Fine day, sir." These are just tail waggings, like taking off one's hat, bowing, smiling and handshaking. We can, however, do far more with language; we at times can strike with a word more safely and more effectively than with our fist; by words we can cower and dodge and elude danger. Those in highest standing in all communities make a living by words, unwritten and written. Whole professions confine their activities to words,—clergymen, teachers (of the older type), lawyers, politicians; brokers deal in alternately saying "buy" or "sell." Doubtless other things lie behind this trafficking, but words are effective acts, or so intimately intertwined with them that it is impossible to say where one sets in and the other ends. Pure talk and written words seem often to do the business without the intervention of so-called things. The magic operations and achievements of words can be observed everywhere and in all ages. Jacob and Esau struggled bitterly to win a blessing from their blind old father. His words were momentous. They might cause unborn generations to bow down before his son's offspring or doom him and his children to perpetual slavery.

As a clergyman of the 18th century remarked. "Words have a certain bewitchery or fascination which makes them operate with a force beyond what we can naturally give account of." Joy and infinite woe follow in their train; from which our wordless ancestors must have been spared. The main emotional structure of civilization—so poignant and so unique an element in human life—is largely reared on words. They serve to establish new orders of sensitiveness and excitability. Words increase the clarity of our memory to a tremendous degree and at the same time they vivify imagination, which could exist on no considerable scale without them. With these word-created adjuncts we can elaborate our hopes. fears, scruples, self-congratulations. jealousies. remorses and aspirations far beyond anything that seems justified to the onlooker; we can project them backward into the past and forward into the future. Words can rear more glorious palaces and dig deeper. darker dungeons than any made with hands.

Talking and Thinking.—What has so far been said of the recent views of language helps to explain the newer interpretation of the old terms mind and reason. These seem to be processes, as we have seen! rather than agents. They are ways of doing things rather than things themselves. John Dewey called his admirable little book on mind, *How We* Think. When older philosophers began to think about thinking, and how by thinking we reached truth, they commonly found themselves writing very long books, very hard to read; and they called their great theme epistemology or the theory of cognition. The effective thinking mhich has built up civilization has not. however, relied upon their treatises; nor has it been influenced by them. Two or three considerations only can be touched upon here which impress recent students in investigating thinking.

Thinking and words go together. For thinking, to be clear. has to rely upon names and their various associations with one another. For instance, grocer's bill, checkbook, fountain pen, envelope. stamp. letter box are names put together in a particular sequence. Of late there has been a good deal of discussion as to whether thinking was not always talking quite noiselessly to ourselves. A child will first utter sounds at random, then begin to find that the sounds he makes bring things: then he gets to naming with vast enthusiasm; then he prattles too freely and inopportunely to please his elders; then he may merely move his lips—as many childish people continue to do—and finally hold his

tongue. It can be shown, however, by appropriate tests that this suppressed talking is accompanied by muscular adjustments of the vocal organs which indicate a silent execution of the words and sentences. We can say openly "That's too bad," or mutter it, or adjust our organs so as to say it if we wished. This suppressed talking seems to be thinking. That all thinking is merely talking to ourselves many will doubt or deny. While some minor reservations are justifiable there is an overwhelming mass of evidence, derived for instance from the study of deaf-mutes, that fortifies the contention stated above—no words, no thinking.

But thinking can easily be seen to be of several varieties. There is the meandering succession of recollections, vague apprehensions, hopes, preferences, disappointments and animosities which has come to be called reverie. It underlies other and more exacting forms of thinking. It is found on inspection to consist of recollections, anticipations, excuses for past or contemplated conduct, reflections on the unfairness of our fello creatures and of the world in general; or assurances that all is well and must in the nature of things remain so. Ordinary daily planning is an essential form of thought—making homely decisions and adjustments. Underneath, we can perceive the reverie flowing as a sort of undercurrent—for thinking is very complicated.

We occasionally turn our thinking to trying to find out something that we do not yet know. This may be the result of mere personal suspicions and vulgar curiosity, or of an honest desire to improve a defective social situation, or learn more of light waves, Chinese paintings, psychoneuroses or investments. In dealing with the workings of the physical universe a special kind of thinking, the mathematical, has produced results that tend to safeguard the investigator from the usual prejudices which beset us in all thinking. It is a peculiar, highly refined language, or way of talking about things, by employing the vocabulary of sines and cosines. logarithms, constants, variables. roots, powers, etc. It has proved to be a wonderfully fruitful way of talking about light, for instance, and the nature of "matter" and "force" and in dealing with engineering problems. Few are addicted to this type or any other variety of scientific thinking. Most practical inventions seem to proceed from our power to experiment by thinking; to fumble and stumble mentally. and sometimes succeed. This mental trying-out is a kind of trial and error. It cannot proceed long without various external acts to check up the guesses and inferences produced by meditation.

One of the most novel and promising methods of learning more about all kinds of thinking is abnormal psychology. Illusional and obsessive thinking which fill the madhouses appear to be only the exaggerations of the thinking of those at large. The psychiatrists hold out hopes of discovering through their special knowledge, and a study of infants and children, ways of eliminating or reducing some of the vices of civilization as it has hitherto developed. To them civilization is in many of its manifestations a species of mild madness; these can only be eliminated by a great change in the way children are brought up, so as to obviate the maladjustments and distress incident to a rapidly altering cultural environment.

Men and women think not only when they are awake but when they are asleep. Their sleeping thoughts and visions and experiences we have learned to set off sharply—far too sharply as it would appear—from waking thought. Primitive man did not do this. He did not deem his dreams mere illusions, comical or distressing, to be banished when he opened his eyes. They were not negligible to him but quite as real and instructive for conduct as what he saw in the daytime. Indeed they had a weight and authority superior to the pronouncements of daily experience; and they served vastly to widen it. What civilization would have been without the manifold influences of dreams it is quite impossible to guess. Had man been dreamless would he have had his religions, his symbolism and his allegories, his poetry and much of his art? This much at least is assured that the beliefs and practices of primitive peoples are in many cases directly attributable to their dreams. Later beliefs and practices of more elaborately civilized peoples can usually be traced back to primitive ideas, which seem to be the soil from which they sprang. So we have to conclude that dreams are one of the most remarkable factors that have entered into the fabrication of civilization as we know it today.

When asleep we find ourselves visiting distant places; for instance when walking the streets of Paris we suddenly wake in New York. How could early men escape the conviction that they had a second self which could wander forth from the body, leaving it behind in the hut, while the "spirit" led for a time an emancipated and adventurous existence freed from the slow and lumpish flesh? Then in dreams the dead appear to us in full life and activity. They may admonish or fortify us; rebuke our departure from the old ways, or fill us with assurance of success. The North American Indians shared the confidence of the ancient Hebrews and Romans in dreams. In India and China the veneration of ancestors forms a highly practical obstacle to the introduction of western institutions. So have we here, without the possibility of much question as to the main issues, a fair explanation of the original belief in the spirit or soul and its survival of death. We have much more. We have the dawn of the gods and the demigods, and the whole foundation of beliefs about supernatural beings and their converse with men; their anger and the possibility of their propitiation by sacrifice.

Looking Forward.—In the preceding sections of this article certain important considerations are enumerated which escaped until recently the attention of students of mankind. They are clear enough when once pointed out. But it has always been a tragic trait of civilization that the obvious has been difficult to perceive, for it is too familiar to catch our attention. It requires a peculiar penetration to discover what in all discussions we are unconsciously taking for granted. And what we are most prone to take for granted are unrevised childish impressions.

There is much complaint of the childishness of mankind, which has become more conspicuous with the democratic assumption that everyone should have his say. John Langdon-Davies' *New Age of Faith* and E. C. Ayres' *Science the False Messiah,* to cite two examples, dwell with some petulance and bitterness on the easy gullibility and obstinate ignorance of humanity. They assume standards of intelligence which obviously do not prevail, as one reads popular newspapers, sermons and political speeches. They are disappointed, but have no reason to be surprised. Why should a former animal not have made grotesque mistakes as he floundered about with words and besetting mysteries and hardened orthodoxies? Then, as we have seen, civilization is mainly acquired in childhood and perforce ever haunted with infantile longings and misapprehensions. When there is an issue between his dreams and visions and his waking experiences why should man not prefer the former? As a matter of fact those reputed as great and deep thinkers have dealt mainly, until very recently, with imaginary beings, with events that never happened; with empty concepts, allegories and symbols and false analogies. John Dewey in his *Reconstruction in Philosophy* deduced philosophy and ethics from savage antecedents and showed how these have interpenetrated later speculations. The hardly to be overcome prejudice which attributes to mind and body separate existence and regards them of diverse substance is the easily explained and inevitable mistake of a savage. The will, the unconscious, the moral sense, regarded as agents, belong to the category of primitive animistic conceptions. Even causation as it used to be conceived is but an expression of the naïve urge to blame or praise some particular person or thing for this or that event. We are now learning to think in terms of situations. For example when Edward Carpenter wrote many years ago on *Civilization, Its Cause and Cure,* he yielded to a venerable usage. It has become apparent enough that civilization has had no one cause but is the result of a situation of cosmic complexity. There can be no one cure for its recognized defects. An Italian writer, Vilfredo Pareto, filled two large volumes with instances of the misapprehensions upon which current sociological treatises are based.

As humanity, or at least their leaders, become more fully aware of the nature and origin of civilization and the manner in which it has hitherto developed they will discover firmer foundations on which to build, more efficient ways of eradicating the inevitable

and congenial errors of the race and of stimulating patient and fruitful reconstruction and reform. So far mankind has stumbled along, enslaved by its past rather than liberated by it for further advances. The reasons for this are beginning to become more apparent than ever before and might as time goes on be made the basis of a type of education, especially in man's early years, which mould greatly forward and direct the progress of civilization rather than retard its development. (J. H. ROB.)

CONCEPTS OF CIVILIZATION AND CULTURE

In anthropological usage, the term "culture" covers the subjects discussed in the foregoing article on civilization, while "civilization" refers to a particular kind of culture. A culture is the way of life of a human group; it includes all the learned and standardized forms of behaviour which one uses and which others in one's group expect and recognize. In a more general sense, culture also refers to those ways of life which characterize all humans and no animals. All humans use language and symbols, have a learned social heritage, operate in societies whose forms of organization are peculiarly and particularly human.

With qualifications that will receive attention later in the discussion, it may be said that civilization is that kind of culture which includes the use of writing, the presence of cities and of wide political organization and the development of occupational specialization. A civilization (as Roman civilization or the civilization of India) is a culture, usually maintained by a large population over a considerable period, which has these elements. The main contrast is with primitive cultures and tribal societies which are. generally speaking, without them.

Both terms, culture and civilization, came into European and English usage with something of their current sense about the 18th century. They have been given varying meanings. Frequently they have been (and still are) used as synonyms, as in the phrase "the civilization of a tribe" in the preceding section. Frequently also they have borne the connotation of refinement, elegance or advancement in style of living. Several German and U.S. scholars have sought to endow the pair with contrastive meanings — civilization to denote technology and that objective information which is socially cumulative; culture to indicate subjective religion, philosophy and art which are nonadditive. But other writers, mainly anthropologists, have found that the two terms are best used neither as synonyms nor as antonyms, but as a class of phenomena, culture, and a subclass of it. civilization.

The development of the word and of the concept. civilization. was well presented by W. R. Dennes and others in a collection of essays entitled *Civilization* and by L. Febvre in an article of another collection, *Civilisation: le ntot et l'idée.* A comprehensive survey and able analysis of both terms was given in *Culture:* a *Critical Review* of *Concepts and Definitions* by A. L. Kroeber and Clyde Kluckhohn. (See *Bibliography* below.)

This concept is given in the article ANTHROPOLOGY and also is discussed briefly in SOCIAL ANTHROPOLOGY. In the latter article. "social structure" denotes the learned, standardized — cultural — aspects of social relations.

All men acquire culture and participate in a culture; not all have been born into civilization or help carry on a civilization. Some of the distinctions which often exist between primitive and civilized societies are given in SOCIAL ANTHROPOLOGY. Primitive societies are generally smaller; in them individuals tend to have fewer and more permanent relations with other individuals. There is less differentiation of roles; established relationships tend to be many stranded; there are few groupings of voluntary membership. Yet these are not absolute criteria; there is such overlapping as is exemplified by the 19th-century Yoruba of west Africa, whose tribe numbered hundreds of thousands. who maintained large cities and specialists. but lacked writing and some other appurtenances, such as large public works, which usually accompany civilization. Then there are peasant and folk communities, as in parts of India, which have been as small, as self-sufficient and as homogeneous as many a tribe. which have had few or no literate members. yet which have come sufficiently under the cultural influence of cities. under the social influence of a state and within the authority of a literate tradition to be counted within the scope of Indic civilization.

The use of writing is a convenient clue for identifying civilization because. in the known cases, the introduction of writing into a culture so improves cultural transmission and so enhances the availability of knowledge as to affect and change all else in the society and culture. Similarly. the maintenance of cities and the specialization of occupation make available to a people more effective energy and wealth than they collectively possessed before.

In cities there are such full-time specialists as blacksmiths, priests. traders and rulers; there must be a technology and economic organization to support them. They cannot well exist without a rural hinterland to feed city dwellers and without transport for food supplies. Once this economic basis is available, the possibility is open, as it is not otherwise, for the development of civilization.

There has been relatively iittle empirical study of the quality, the consequences and the varieties of civilization. Particular aspects of certain civilizations have been well depicted by historians and others, but few scholars have used objective evidence to analyze the nature of civilization or have compared. one with another. the various civilizations which man has developed.

Civilization as a stage in the cultural development of a people has been discussed by some archaeologists. Thus R. J. Braidwood tells that in the near east. particularly in what is now Iraq (Mesopotamia), the hunting-food gathering way of life was quite quickly transformed, about 6000 B.C., into a food-producing way with settled agricultural villages. The manner of living was in turn changed. about 3000 B.C., into a civilized culture with urban centres and a literate tradition. Braidwood noted that the technological advances which made for greater food-producing efficiency were necessary but not sufficient elements in the rise of that civilization. Also necessary was the additional development of social. political, moral and religious patterns which made possible the integration of the increased population into a functioning society and culture.

In a long series of influential books and articles, V. G. Childe showed the significance of the technological-economic advances — the urban revolution. in his terms — as marking the advent of civilization wherever it has appeared on earth. He considered writing as a part of technology, as an intellectual tool used by the first civilized societies in the old and new worlds, a tool which led to such achievements as calendrical astronomy, predictive arithmetic and geometry. Further. Childe noted that the invention of writing apparently coincides with a critical point in the enlargement of local groups and in the accumulation of a social surplus. Childe's use of the term civilization tends more to emphasize this turning point in universal human history than the quality of the culture which subsequently was established. Another turning point seems to have been reached when science and machines powered by inanimate sources of energy became vital elements of civilizations; the quality of every living civilization has been affected by these developments.

The 19th-century social theorist Lewis Henry Morgan formulated a scheme of cultural evolution in seven stages in which civilization was the culminating stage. Later anthropologists demonstrated the failings of Morgan's notions. Yet his approach has not been totally rejected. Leslie White presented the evolution of civilization in terms of the increase of the use of energy and Julian H. Steward tested some evolutionary concepts by using data from primitive and civilized cultures.

There have been only a few main centres in which the shift to civilization was independently accomplished; archaeologists and ethnologists have considered the possible influences of one such centre on the others. Braidwood and Childe tended to the belief that the Egyptian and the Indus valley civilizations, while clearly distinct from that which arose in Mesopotamia before them, were stimulated in origin by it. The earliest civilization to appear in China may have arisen independently, but there is as yet insufficient evidence about it to make a judgment. The Maya, Aztec and Inca civilizations which arose in the new world seem to have developed independently of old world civilizations for the most

part, although some contact between these civilizations and the civilizational centres of Eurasia may well have existed. Although Peruvian Inca culture lacked true writing, it included an elaborate government, complex specialization, great public works and urban settlement, and is generally classed as a civilization.

The whole of European and Asian civilization was viewed by Kroeber as an interconnected whole and as the product of a unitary process. Kroeber saw a single great web of culture growth, reaching from Japan and China to Europe. Within it, such cultural innovations as sculpture, domesticated plants and animals and divine kingship have tended to be transmitted from end to end. Within this range, Kroeber also noted a number of distinctive civilizations and observed that civilizations are delimited from one another by no single criterion, partly by geography, partly by period, by speech. religion and government, less by technology and, most of all probably, by values and style.

A. J. Toynbee's large-scale comparison of civilizations lists more than 20 distinct civilizations. This impressive survey of all civilizations has been vigorously criticized by scholars (especially in the fields of their respective specialties) for mistaken historical reconstruction, for lapses of detail and for untenable theoretical assumptions. Some insisted that no comparison among civilizations is possible. each being a unique ensemble with no relevant similarity to any other. But a good many of the critics agreed that a survey of all civilization and a comparison of particular civilizations should be attempted and that Toynbee's work would stand as an important trial toward that end.

While, as Robert Redfield observed, it is useful to think of civilization as one of a pair of classes, it seemed likely that further analysis would move beyond this dichotomy. As comparative studies of civilization proceed, gradients and continua are seen between primitive and civilized cultures, varieties of civilization are discerned and the concept of civilization is apt to become more useful in terms of a set of processes than as an initial category for sorting out societies and cultures.

The communities of a civilization tend to participate in a dual cultural tradition. One tradition (or in certain cases, several) is embodied in the literature, represents reflection and refinement of thought, relates the community to the wider society and culture and is often exemplified in the behaviour of an elite group. The other is not sanctioned by scripture, focuses on local deities and parochial relations, is carried out by the bulk of the people Redfield suggested several kinds of interaction between the two traditions. Among the Maya, the literary works of the specialists were devoid of story or ethic and had only slight relation with the oral traditions of the people. Chinese literature had ethical content and its specialists influenced the people by precept and example. In India there was more reciprocal influence between literati and common people, between sacred literature and popular tradition.

Such relations and much else about civilization have yet to be explored. But not every writer has been as diffident as this about what it means to be civilized. Many an author, Clive Bell in his *Civilization* (1928) for one. has known just who and what a civilized person is—the best kind of person, the kind which appeals to the author's sense of propriety and good taste. Thus Bell's dictum that those who use authority, like those who create wealth, can be civilized but not perfectly civilized. Intriguing as such cultural ideals can be, necessary as they may be for a particular society, they do not offer suitable answers to the historian's and anthropologist's questions. To these inquirers, civilization appears as the result of a series of widespread processes in human history and as a quality of life whose characteristics and varieties remain to be thoroughly studied. (D. G. M.)

CULTURE AND HUMANITY

In the tradition of the humanities, the term culture assumed its meaning in application to the variety of things that might be "cultivated." The terms culture and cult have the same derivation and were applied by the Romans to the cultivation of the fields (*agri cultura* or *cultus*), the cultivation of the mind (*animi cultura* or *cultus*) and the cultivation of religion and God (*Dei cultus* or *cultura*). Cicero, thus, defined philosophy as the "culture of the mind." and argued that philosophy first educated men to the cult of the gods.

The development of the idea of culture centred about three related problems: the relation of culture to nature; the relation of the cultivation of man to the cultivation of God; and the use of the arts and literature to achieve "humanity," both in the sense of individual perfection and in that of mutual love. As early as the Greek Sophists the distinction was made between man in the state of nature and in various stages of civilization, and the Cynics used the criterion of natural simplicity in opposing culture as a sign of corruption and decadence.

The Roman censor Cato the Elder wrote a treatise on agriculture as well as a handbook for his son warning him against Greek physicians and Greek literature. According to Cicero, on the other hand. the circle gathered about Scipio used culture as a synonym of literature and of humanity or (in modern languages) of the humanities. In the western empire the humanities came to mean erudition in the arts and the cultivation of letters (Aulus Gellius, 14, 6, 1: *litterarum cultus*), while in the eastern empire Themistius argued against the Christians that the love of mankind (*philanthropia*), essential to the training of a statesman, is achieved by the study of literature.

During the Renaissance the term culture was applied to the arts and letters in *cultura bonarum artium* and *cultura litterarum humaniorum,* and the nature of culture was explored in treatises on pedagogy and the arts. Philosophers of the 17th century, on the other hand, sought to apply the methods of science to the study of man and spoke of the culture of the mind or of man. Francis Bacon, having expounded the reasons for the discredit of learning in book i of the *Advancement of Learning,* uses the figure of agriculture and husbandry in book ii to name one part of human philosophy *De cultura animi.* Thomas Hobbes uses the word cultus to signify the labour which a man bestows on anything, and distinguishes two applications: one to things subject to us, as "the labour bestowed on the earth is called *culture,* and the education of children a *culture* of their minds"; the other to God as in *cultus Dei.* John Locke used the analogy of "breeding" in *Some Thoughts Concerning Education,* and gives a subordinate place to learning or the culture of the mind, *ingenii cultus.*

The reaction to this conception of culture as the cultivation of man based on knowledge of his nature took two characteristic forms during the 19th and 20th centuries. German philosophers, taking their start from the study of the "history of culture," investigated the nature of culture and of the spiritual life, and the relation of the sciences of culture, *Kulturwissenschaften,* to the sciences of nature, *Naturwissenschaften.* According to Johann von Herder, in the 18th century, "The culture of a people is the blood of its being," and after him Hegel and the Romantic philosophers Nietzsche, Wilhelm Dilthey, Wilhelm Windelband. Heinrich Rickert and Georg Simmel laid the lines of philosophic and sociological speculation concerning the values embodied in cultural objects, the structure and nature of cultural values and the interplay of subjective and objective in the transformation of cultures. English essayists and reformers, on the other hand, taking their start from problems of politics and religion, investigated the practical uses of culture. Matthew Arnold responded to John Bright's dismissal of culture as "a smattering of the two dead languages of Greek and Latin" in *Culture and Anarchy* (1869), defining culture as a pursuit of our total perfection by means of knowledge of the best which has been thought and said in the world and the development thereby of all sides of our "humanity." Religion is one of the forces by which men perfect themselves, and Hellenism, which is the effort to see things as they are, and Hebraism, which is conduct and obedience, are interacting ways in which they have pursued this aim.

The meanings of culture in contemporary literature continue to reflect the three problems which influenced the first development of the term. John Dewey conceived culture to be the result of interaction between man and his environment, but philosophers of existence emphasize the creative aspects of culture which exceed naturalistic determinations. A large literature has grown up concerning the relation of culture and religion, and writers like T. S.

Eliot, who question Arnold's usage of "culture" as more comprehensive than "religion," make culture the incarnation of the religion of a people. Humanists finally continue to ask how culture, in the sense of the cultivation of the arts and literature, may further the self-realization of individual men and the mutual understanding of peoples. CIVIL LAW, a phrase applied principally to that group of laws which has grown up on the continent of Europe as a combination of Roman and Germanic traditions together with ecclesiastical. feudal and local influences. In this sense,'the civil law constitutes one of the two great families of law of western civilization. the other being the common law (*q.v.*), or Anglo-American law. In ancient Rome. *jus civile* was used to distinguish the proper or ancient law of the city or state of Rome from the jus gentium, or the law thought to be common to all the nations comprising the Roman world, as developed and incorporated with the former through the praetors and jurists (see ROMAN LAW). The phrase has also been used to distinguish private law, or the law governing the relationship between citizens, from public law and criminal law. Again. the national law of a state is sometimes described as civil law, in contrast to international law.

The Civil-Law and Common-Law Nations.—The common law is constituted by the law of England and the laws of those countries in which the law of England has been received or implanted. and, although often transformed in certain respects or supplemented by local or religious traditions, has been preserved in its principal features. Besides England, common-law countries in the strict sense are thus the United States, Canada, Australia, New Zealand. the Republic of Ireland and the West Indies. Common law prevails in India, Pakistan, Burma. Malaya and Singapore, where it is supplemented in matters of personal status by religious laws. as well as in Liberia and most of those parts of Africa and Oceania which were, or still are, British colonies, protectorates or trust territories, and where the common law is supplemented in many respects by native customs.

The civil law has traditionally been the law of most of continental Europe; from there it spread to Latin America and later to those countries of Asia and Africa which found it necessary to westernize their laws; *i.e.,* Japan (1890–98), China (1929–31), Thailand (1925). Turkey (1926) and Ethiopia (1958–60). It also prevails. supplemented by religious laws or native customs, by and large in those regions which were, or still are, colonies, protectorates or trust territories of France (Morocco, Tunisia, Algeria, Guinea, Mali and other territories in Africa, the West Indies and Oceania). Belgium (Congo, Ruanda-Urundi), the Netherlands (Indonesia. Dutch West Indies), Portugal and Italy (Somalia). Civil law, supplemented by Islamic law, has also come to prevail in the countries of the near east. but not in Libya and Iraq, where common law has been influential.

Another group may be said to be constituted by the laws of the Nordic countries (Sweden, Finland, Denmark, Norway and Iceland), which are closer to the civil law, however, than to the common lam. In the Soviet Union it is claimed that the legal system constitutes an entirely new beginning. While the collectivist spirit of Soviet government, economy and society has certainly resulted in many innovations in the law, civil-law traditions have by no means been eradicated from the modes of legal thinking. In the people's republics these traditions have been preserved even more strongly, especially in Poland.

In a few parts of the world, civil law and common law have come to interpenetrate each other, viz., in Scotland, in the Canadian province of Quebec, in the U.S. state of Louisiana, in Puerto Rico, the Philippines, the Republic of South Africa, Southern Rhodesia, Ceylon and on the island of Mauritius. While in most of these regions the common law seemed to be the prevailing influence, an opposite trend set in after the 1920s. so that in most of these areas the private law can be regarded as being of the civil-law variety.

Early Development.—The features characteristic of each of the tno systems have been shaped by history. In the 5th and 6th centuries western and central Europe was dominated by Germanic peoples, especially those who had overrun the Roman empire. Among them were the Anglo-Saxons of England the Franks of western Germany and northern France, the Burgundians, the Visigoths of southern France and Spain and the Lombards (Langobardi) of Italy. Although Roman-lam traditions lingered on for some time, the Germanic customs came to prevail in most regions. In the middle ages these customs underwent vigorous growth to satisfy the complex needs of a society of chivalry and feudalism, growing cities, eastern colonization, increasing trade and a constantly refined culture. Among the many strands that nent into the weaving of the complex pattern of medieval law, the customs of the merchants and the canon law of the church were of special significance. It was mainly through the canon law that entry was found for concepts and ideas that had been elaborated in the law of ancient Rome. As a whole, Roman law had been forgotten. but in the late 11th century it mas rediscovered and made the subject matter of learned study and teaching by scholars of northern Italy, especially at Bologna. With the increasing demand for trained judges and administrators, first by the Italian city republics, then by princes in other localities, students flocked to Bologna from all over Europe, until the learning and teaching was gradually taken over by local universities. As a result of this process, Roman law penetrated into the administration of justice north of the Alps, especially in Germany and the Netherlands, where the Roman-law influence finally became so strong that one came to speak in these countries of a reception of the Roman law.

One of the reasons why Roman law was able to acquire special strength in these Germanic nations of the Holy Roman Empire was because the new emperors cherished the idea of being the direct successors of the Roman Caesars; the Roman law. collected in the Corpus *Juris* by the emperor Justinian I (*q.v.*) between 527 and 565, could be regarded as still being in effect simply because it was the imperial law. Decisive for the reception, however, was the superiority of the specialized training of Roman-law jurists over the empiricist activities of the lay judges and practitioners of the local laws. combined with the superiority of the Roman type of procedure, with its rational rules of evidence. over the forms of local procedure in which proof by nager of law. battle and other irrational methods still prevailed, though they no longer corresponded to the mentality of the Renaissance. Nowhere, however, did the Roman law completely supplant the local laws. So far as the content of the law was concerned, there developed various amalgams. Roman law strongly influenced the law of contracts and torts; canon law achieved supremacy in the field of marriage; and combinations of Germanic. feudal and Roman traditions developed in matters of property and succession. Strongly Roman, in the manner of elaboration of the scholars of the Bologna schools of glossators (12th century) and commentators (13th–15th centuries), were the conceptual formulations in which the norms and principles of the law were expressed. as well as the procedural forms in which justice was administered. The system that thus emerged was called the jus *civile.* In actual practice it varied from place to place, but it was nevertheless a unit that was held together

by a common tradition and a common stock of learning. The lam of the Corpus Juris, especially its main part, the Pandects, was as such in effect nowhere, but constituted the basis of study, training and discourse everywhere. In spite of all variety, the civil-law world experienced a sense of unity which corresponded to the strongly felt unity of European civilization.

Codification. — The undermining of this unity was brought about by the religious split of the Reformation and Counter Reformation and by the rise of nationalism, which accompanied the unification and stabilization of the European nations and their struggle for hegemony. In the field of lam the split found expression in the national codifications, through each of which the law was unified within a particular nation but simultaneously set apart from that of all others. National codification, although not yet in the full sense, was achieved first in Denmark-Norway in 1683–87, then in Sweden in 1734 and in Prussia in 1791–94. In Austria codification began in the 1750s, but was not fully completed until 1811. Because of the personality of their backer and the novel technique applied, the greatest fame and influence were achieved by the Napoleonic codifications of the private and criminal law of France, especially their central piece, the Code Civil (Code Napoléon) of 1804. Napoleon's codes were introduced by the victorious French armies into Belgium, Luxembourg, the parts of Germany on the left bank of the Rhine, and even a small part on the eastern bank. Once introduced, the codes survived the retreat of the French armies. In the 19th century codes were adopted in other parts of Europe. These were either somewhat modified translations of the Code Napoléon, as in the Netherlands (1838) and Italy (1865, replaced by a new code in 1942), or new codes fairly closely following the model of the French, as in Spain (1888), Portugal (1867) and Rumania (1865). Partly direct and partly by way of Spain, the French model of codification found its way into the countries of Latin America. While some of their 19th-century codes branched out in directions of their own, especially the Chilean code of 1855 and the Argentinian code of 1869, Latin-American legal studies have remained firmly linked with France and Spain. (See also CODE NAPOLÉON.)

In Germany codification could not be undertaken until political unification had been achieved in 1871. Unification of the law, *i.e.*, codification of the criminal law and the law of procedure, was achieved shortly thereafter, but the national civil code was not completed until 1896 and did not take effect until Jan. 1, 1900. The German civil code thus came almost 100 years later than the codes of France and Austria, and its draftsmen profited from the intensive efforts at systematization, clarification and modernization of the law that had been carried on by German scholars during that century. As a result, the German code is markedly different from its predecessors. Its arrangement is more orderly, its language more precise and its use more exacting. The Code Napoléon is written in a style that easily induces the reader to believe that he can understand it; the German code is technical. A slightly modified version of the German code was adopted in 1898 in Japan, and from there it was introduced into Korea.

Codification in Germany was followed in 1907–12 by that of Switzerland and, because of the masterly technique of the principal draftsman, Eugen Huber, the code of that country has been copied or has exercised a far-reaching influence in countries as diverse and as distant from each other as Brazil (1916), Turkey (1926) and China (1929–31). The new Greek code of 1940–46, however. was closer to the German than to the Swiss model. (See also GERMAN LAW.)

Comparison of Civil Law and Common Law. — Between the 11th and the 15th centuries the law of England was also strongly influenced by Roman-law learning and, in the 16th century, experts trained in Roman law were welcomed as administrators as much by the kings of England as by continental rulers. However! in contrast to the countries of the continent, where justice was administered locally, it had, as a result of the Norman conquest, been centralized in England. There had grown up at the courts of Westminster a profession of practitioners expert in the law and procedure of the centralized court system, strongly organized and unwilling to yield its position, power and income to a new group of specialists of Romanist learning. In its resistance to royal innovation, the organized bar came to ally itself with the Parliamentary party in the great constitutional struggle of the 17th century. There was thus prevented in England a reception of Roman law of continental style, and there was also established that connection between the principles of constitutionalism and individual freedom on the one side, and the common law on the other, which has created the image of the common law as the legal system of freedom, in contrast to the civil law as the system in which the state is exalted over the individual. This view seems to obtain support from the fact that free political institutions were developed earlier, and have been maintained more firmly, in countries of the common law than in countries of the civil law.

However, political institutions are one thing, and techniques of dealing with civil litigation and criminal prosecution are another. Intimate connections exist, of course, between the two; a society is not free if civil cases are not handled impartially and if persons accused of crime are not safeguarded against injustice. In both these respects, however, neither of the two great legal systems lags behind the other. The ways of argumentation and procedure differ, but in its own way each of the two systems has developed its own guarantees and safeguards and neither can be shown to be superior to the other. The view frequently found in England and the United States, that in civil-law criminal procedure the accused is presumed guilty until he has proved his innocence: is as unfounded as the view widely held on the continent that trial by jury is tantamount to lawless appeal to passion and emotion.

If one compares countries having firmly established institutions of constitutional government, such as, on the one hand, the United Kingdom and the United States and, on the other, Belgium, the Netherlands, Switzerland, the Federal Republic of Germany or France, it appears that in the civil-law countries the protection of the individual against illegal actions by executive agencies is generally about the same: and in some respects such protection is even more elaborate in France than in the United Kingdom. Again, the United States has not yet fully caught up with Germany as regards compensating an individual out of public funds for harm caused to him by wrongful acts of public servants. In general, it may also be said that it is less expensive on the continent for the citizen to seek legal protection of his private rights than it is in the common-law countries.

It is difficult to define what constitutes the real difference between common lam and civil law. It would be erroneous simply to identify civil law with codified or even statutory law, and common law with judge-made or case law. For one thing. the contrasts between the two systems existed long before the civil-law countries began to enact their codes. In addition, large parts of Anglo-American law are also contained in statutes or even codes, while in France, Germany and other civil-law countries large parts of the law have never been reduced to statute at all but have been developed by the courts; and many of the statutes and code provisions have come to be overlaid by judicial glosses to such an extent that, in effect, they are dominated by judge-made law.

No essential difference can be found either in the role of judicial precedent. In theory, it is true, common-law courts are bound by precedent in the sense that once a legal question has been decided a certain way by a court, it must always be decided in the same way by all other courts of inferior or equal rank until the legislature sees fit to change the rule. In civil-law countries, on the other hand, courts are, in official theory, free to consider anew any legal question irrespective of how often it may have been determined before by other courts or even by the one before which it is pending. In practice, however. common-law courts, especially those in the United States, have developed techniques of distinguishing new cases from older ones which have reduced the role of stare *decisis* to a minimum indispensable for maintaining the stability of social life; and civil-law courts. on their part, have been inclined to follow precedent, not only for the sake of continuity and social stability but also in accord with the inclination of courts everynhere to save time and effort by following precedent rather than rethinking every problem each time it arises for judicial determination.

The main difference between the systems consists of the ways in which the norms of the law are articulated and in which new rules are derived from older ones in novel cases. Though law cannot remain static, the change must be orderly and gradual so as not to interrupt the continuity and stability of life. In the common law, this role of adapting the law to changing conditions has traditionally been the task of the judges. In civil-law countries, the task had widely come to be performed by university professors. There, the multiplicity of courts stood in the way of the leading role being assumed by the judges. who could well assume it in England, where the administration of justice was centralized. Judges must proceed from case to case, and cases present themselves in isolation and without prearrangement. Professors deal with hypothetical cases rather than actual ones. They can develop comprehensive ideas and principles, and they are impelled toward systematization and conceptualization by the didactic necessities of instruction. The civil law, as a professorial law, has thus tended to be more systematic and more comprehensive and consistent in its proportions and terminology than the judge-made common law. which may have tended, on its part, to be closer to life and perhaps more detailed.

These traditional differences may diminish, however, for in the civil-law countries judicial power has increased with the national centralization of the administration of justice, while in the common-law part of the world the courts of Westminster have lost their supremacy to the multiplicity of supreme courts in the United States and in the commonwealth. The role of maintaining the unity of the law is thus passing to that group of professionals — the professors — by which it was once exercised in the civil-law world. Gradual assimilation of the techniques of the two great systems of law may thus well be expected.

CIVIL LIBERTIES. Next to the struggle for national independence. the struggle for civil liberties or for the fundamental human freedoms has been one of the major aspects of modern history. and one of the most persistent and pervasive themes in literature. philosophy and religious thought at all times in the history of man. Pres. Franklin D. Roosevelt expressed mankind's intense concern with civil liberties when, in his "Four Freedoms" address (1941), he said that humanity looked forward to a world founded upon four essential freedoms: freedom of speech. freedom of religious worship, freedom from want and freedom from fear. The first two of these four freedoms have been generally thought of as basic civil liberties. Indeed. in modern history, the nationalist's cry of "Give me liberty. or give me death!" (Patrick Henry of Virginia in 177j) has often been linked with the simultaneous demand for civil liberties. Thus, in justifying the American Revolution for national independence, the Declaration of Independence (1776) proclaimed the right of a people to abolish a government that failed to secure the people's "unalienable rights." among which were "Life, Liberty and the pursuit of Happiness." The Declaration in effect stated that the American colonists were seeking not only to throw off a foreign yoke but also to become a free people; *i.e.,* a nation that would enjoy self-rule and the rights or freedoms with which they were endowed by their Creator and that. as such, were inalienable. They made it clear that a denial of these freedoms marked a government (foreign or domestic) as "an absolute Tyranny."

Natural Law Theory. — This assertion of limits on government followed from ihe belief that every man has rights or freedoms that are so intimately connected with his nature as a human being that to take them away would be to deprive him of part of his humanity. They enter into the very nature of man as God or Nature made him. The enumeration of specific civil liberties or basic human freedoms would depend upon the character of the culture, on time and place; *e.g.,* freedom of speech could not seem very significant among ignorant. illiterate peoples, and freedom of the press took on a dimension of importance only after the printing press replaced the scribe. But the root idea of rights or freedoms inherent in a person, and not subject to destruction by the prince or ruler, was found in many and diverse cultures and civilizations. Sometimes this assertion of basic freedoms was expressed briefly as a belief in the dignity of man, or in the biblical idea that every man was made in the image of God. or in the existence of natural law and natural rights. All these beliefs flowed into the position that there were limits on government. or that government is the result of a contract *(see* SOCIAL CONTRACT) in which only certain powers were delegated to the ruler, or that rulership was vested in a government of laws, and not of men, or that the laws of a ruler were subject to judgment under a higher law. *(See* CONSTITUTION ASD CONSTITUTIONAL LAW.)

These conceptions were implicit in the incident of Naboth's vineyard related in the Old Testament. Naboth owned a vineyard that adjoined the property of Ahab. king of Israel in the 9th century B.C. Ahab wanted the vineyard but Naboth refused to sell it, for it was the inheritance of his fathers. Jezebel, the queen. contrived through perjured testimony to have Naboth executed for treason. As Ahab took possession of the vineyard, he was met by Elijah the prophet, who pronounced doom on him and Jezebel and. his house. (I Kings xxi.) God, through the prophet, condemned a ruler who presumed to take property or life under an unjust law or judgment without due process.

When Creon, regent of Thebes, forbade the burial of Polynices, the son of Oedipus. Antigone. the sister of the deceased. attempted to bury the body despite the prohibition. She dared to defy the law, Antigone told Creon, because the king's law contradicted God's law, and the lams of men must give way before the immortal unrecorded laws of God. which exist not only now, but always existed and aln-ays shall be effective, for these laws are beyond man utterly. Her story is told by Sophocles in his *Antigone.*

In time it came to be widely accepted that human authority could not have the last word, and that human beings could, at least morally, appeal to a higher law that comprised the law of nature or the law of God. This right of appeal was recognized by Aristotle and the Greek and Roman Stoics. "The highest law," wrote Cicero in the first century B.c., "was born in all the ages before any law was written or any state was formed." This tradition was transmitted to modern times through St. Thomas Aquinas, the common law of England, Magna Carta. Hugo Grotius and other thinkers and institutions. The struggle between pope and emperor, between church and state (*q.v.*)—a struggle that goes back to the Maccabaean revolt against Syria in the 2nd century B.C. and the Roman persecution of Christians in the first three centuries A.D.—helped keep the tradition alive and significant.

Modern Application of Natural Law Doctrine. — In the 17th and 18th centuries the theory of natural law flowed into the theory of natural rights. The social contract among the members of society and between society and government provided that government had, as one of its chief ends, the protection. as John Locke put it, of the lives. liberties and estates of members of society. Locke added that by property he meant "that property which men have in their persons as well as goods." (Second *Treatise of Government,* 1689.j For the vindication of their "inherent arid inalienable" rights — Jefferson's phrasing of Locke's doctrine. in the original draft of the Declaration of Independence — the people should look to parliament; if this failed, they had the right to resort to revolution.

The English nation kept these alternatives. In the English view, at least from the time of Sir Edward Coke (1552–1634), parliament represents not merely the coercive aspects of the state but also, and more significantly. the free political will of the people, and it is the protector of their liberties no less than of their security. In championing parliament against king, and attacking royal prerogative and law by royal proclamation as contrary to common

law and constitution, Coke enunciated principles of liberty; but while parliament could check the king in the interests of individual liberty, there was no projection of an institutional check on parliament. The common law has its rules and "fundamental points"—what would be called in modern times the basic constitutional principles—and these principles, especially the ones that may be thought of as pertaining to the law of nature, should be respected by parliament; but if it failed to respect them, there was no institutional appeal from the decision of parliament—except, of course, to the electorate. The ultimacy of parliament, however, is not to be denominated as being exclusively, or even distinctively, an expression of legislative sovereignty. There was attached to parliament the character, in some sense, of a court of last resort, as that of the highest court in the land. There was no appeal from its acts because there was no appeal from a court that is supreme. But such a court was bound in conscience to stay within constitutional limits and to observe fundamental or natural law.

This approach was aided by the common view—as it was expressed by Sir William Blackstone in his Commentaries on the Laws of England (1765–69)—that English law was based upon and embodied biblical and natural law, in which were rooted the imprescriptible rights and liberties of Englishmen. In other words, no special bill of rights and liberties was needed, for they were already enshrined in the common law, from which no "high court af parliament" would, in fact, remove them.

Implicit in this view is a philosophy of human nature and politics that reflects biblical and classical influences and that attempts to avoid extreme positions. This view assumes that man is not radically depraved, although he is prone to sin. Society must be protected against man's prideful thrusts and overreaching will. The state, as an instrument of coercion, must contain man within the limits that God and nature and social needs impose upon him. At the same time, since man is not altogether lost, he must be permitted to enjoy his rightful liberties, given to him by the same God and nature that hem him in; and the state is instituted in part to afford protection for these rightful liberties. The power of government is a consequence of human perverseness and also of human dignity and independence. It is instituted to assure both justice and liberty.

Fortunately for the development of civil liberties. these beliefs had a chance to take root and grow in the minds of men in ancient and medieval civilizations before the modern notions of state sovereignty emerged. While Englishmen no longer think of parliament as a high court and are reconciled to the conception of parliamentary sovereignty, they do not fear that parliament will assail the civil liberties of English citizens.

While the English have looked to parliament for vindication of their fundamental liberties, some other nations, notably the United States, have looked chiefly to the courts, to judicial review (*q.v.*), for the protection of their fundamental liberties. The latter alternative became more of a possibility with the development of written constitutions and bills of rights. Into these documents flowed the religious, philosophical and juridical conceptions that had been developed over many centuries, among diverse civilizations, peoples and religions.

Partial precedents for written bills of rights were Magna Carta, the English Bill of Rights (1689) and the Declaration of Independence (*qq.v.*). The Virginia Declaration of Rights (adopted June 12, 1776, and drafted largely by George Mason) was especially notable, since Virginia was the leading colony, and the language of that document was particularly felicitous. It declared that all men are by nature equally free and independent, and that they have certain inherent rights of which they cannot deprive themselves or their posterity; "namely, the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety." Specific civil liberties enumerated included freedom of the press, the free exercise of religion and the fact that no man was to be deprived of his liberty except by the law of the land, or the judgment of his peers.

The constitution of the United States. ratified in 1789, contained some safeguards of personal liberty—a guarantee of the privilege of the writ of habeas corpus, a prohibition on bills of attainder, ex post facto laws and test oaths; but it did not include a bill of rights. The authors of The Federalist Papers, while approving these guarantees, justified the omission of a bill of rights by the argument that since the federal government was to enjoy only delegated powers, there was no need to reserve to the people powers not surrendered by them: "For why declare that things shall not be done which there is no power to do?" (Federalist No. 84.) But the ratifying states demanded a bill of rights, and in 1791 the constitution was duly amended to include the Bill of Rights. (For the text of the Bill of Rights, see UNITED STATES [OF AMERICA]: Administration and Social Conditions.)

Here it should be noted that in the meantime, in 1789, at the beginning of the French Revolution, the National Assembly of France issued the Declaration of the Rights of Man and of the Citizen, which stated that there were certain sacred rights of men and of citizens, among them the following: that men are born, and always continue, free and equal in respect to their rights; that the end of all political associations is the preservation of the natural and imprescriptible rights of man; and these are liberty, property, security and resistance of oppression; that political or civil liberty consists in the power of doing whatever does not injure another; that the law ought to prohibit only actions hurtful to society, and no man should be accused, arrested or held in confinement, except in cases determined by law, and according to the forms which it has prescribed; that no one ought to be punished except under a law promulgated before the offense; that a man is presumed innocent until he has been convicted; that no man ought to be molested because of his opinions, including his religious opinions, as long as their expression does not disturb the public order established by the law; and that every citizen may speak, write and publish freely his thoughts and opinions, provided he is responsible for the abuse of this liberty, in cases determined by the law.

The post-World War II constitutions of the French republic (1946 and 1958) reaffirmed attachment to the rights of man as defined by the declaration of 1789. The 1958 constitution (title vii) provided for a constitutional council of nine members, plus former presidents of the republic, which had authority to decide whether laws were in conformity to the constitution. At the same time the constitution reiterated (title i) the provision of the declaration of 1789 that sovereignty belongs to the people, which exercises it by its representatives, and no section of the people, nor any individual, may attribute to themselves or himself the exercise thereof. This seemed to mean that the whole of sovereignty was vested, by delegation, in the representatives and that no power was retained by individuals. It remained to be seen how this concept of total sovereignty would be squared with the idea that there are natural and imprescriptible rights of man, and that there is in some sense a right to resist oppression.

This idea that sovereignty is in the nation and that no part of sovereignty can be claimed by individuals goes back to Rousseau's general will and even further back to Spinoza's Tractatus theologico-politicus (1670). The impulse of Rousseau's and Spinoza's political theories was democratic and libertarian; they spoke for the liberties of men against the tyrannies of governments, but they found no way of resolving the conflict between majority rule and individual rights. They spoke for the need of strong government; and the constitutions of France also reflect a need of strong government—a government that in fact will govern; but the ambivalence with regard to civil liberties remains unresolved for governments and nations that have been obsessed with the notion of state sovereignty.

In U.S. constitutional development there was no preoccupation with state sovereignty. On the contrary, limit on government was a leading concern. The inalienable liberties of men must be preserved; and since the "natural progress of things is for liberty to yield and government to gain ground" (Jefferson, 1788), everything possible must be done that will protect liberty and restrict government. One significant limit on government may. be a bill of rights.

United States Bill of Rights.—The Bill of Rights of the United States constitution (see BILL OF RIGHTS, UNITED STATES)

was demanded not only by the states, but also by Thomas Jefferson, who perhaps was influenced by the revolutionary atmosphere of France, where he lived from 1784 to 1789. Jefferson was the author of the Virginia bill for the establishment of religious freedom in which was expressed the conviction that the opinions of man cannot be coerced; that measure, with the support of James Madison, was adopted in 1786. Writing to James Madison from Paris in 1787, Jeffersonstated, concerning the constitution of 1787, that "a bill of rights is what the people are entitled to against every government on earth."

Both Jefferson and Madison, however, maintained that a bill of rights alone would be insufficient to assure enjoyment of fundamental freedoms; proper social, economic and political conditions were essential to give reality to'the liberties constitutionally recognized or provided. Thus, Jefferson insisted on the practical necessity for the widest possible distribution of farm ownership, an agricultural and rural economy and society and a work force made up of farmers and craftsmen; for cities, he believed, breed mobs, and mobs add as little to democratic government as sores do to the strength of a man's body. Madison emphasized the conviction that religious freedom was dependent more on the existence of a multiplicity of sects than on a constitutional guarantee. Both were convinced, however, that social, constitutional and governmental institutions must be developed so that every person would be free to use and develop his faculties; that governments were instituted primarily to protect opportunities for the development of a man's faculties or abilities; that the use of opportunities may lead to the acquisition of property; that government is instituted to protect property; that a man has property in his personal safety and personal liberty no less than in his physical possessions; that, as Madison put it, government may not violate, directly or indirectly, "the property which individuals have in their opinions, their religion, their persons and their faculties," so that a wise and just government "will equally respect the rights of property, and the property in rights."

As adopted, the first ten amendments to the United States constitution, generally spoken of as the Bill of Rights, provide that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances" (1st amendment); and that no person shall be "deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation" (5th amendment). These are the most far-reaching guarantees. Other guarantees are the following: security against unreasonable searches and seizures affecting persons, houses, papers and effects; that no warrants shall issue except upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the person or things to be seized; that no person shall be held to answer for a capital or infamous crime except on presentment or indictment by a grand jury; that no person shall be twice put in jeopardy of life or limb for the same offense, or be compelled to be a witness against himself in any criminal case. In criminal cases. the defendant is guaranteed the right to a speedy and public trial by an impartial jury, to be informed of the nature of the accusation against him, to be confronted with witnesses against him, to have compulsory process for obtaining witnesses in his favour, and to have assistance of defense counsel. Excessive bail, excessive fines and cruel and unusual punishments are prohibited.

Since the United States is a federal republic, the courts were faced with the question of whether the Bill of Rights was a limit on only the federal government, or on both the federal government and the government of any state. In 1833, in *Barron* v. *Baltimore,* the supreme court limited the effectiveness of the Bill of Rights to the federal government. Following the Civil War, however, three important amendments were added: The 13th amendment prohibited slavery and involuntary servitude. The 14th amendment provided that all persons born or naturalized in the United States are citizens of the United States and of the states wherein they reside (this meant that Negroes were thereafter to be citizens without regard to their previous condition of servitude). This amendment also provided that "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws." The 15th amendment provided that the right of citizens to vote shall not be denied or abridged by the United States or any state on account of race. colour or previous condition of servitude.

While these Civil War amendments do not expressly make applicable to the states the guarantees of the first ten amendments, the 'supreme court established that the terms "liberty" and "due process of law," as used in the 14th amendment. make available against state action certain fundamental rights guaranteed to accused persons in the original Bill of Rights—those basic rights that are "implicit in the concept of ordered liberty"—for if they were sacrificed, "neither liberty nor justice would exist." (Justice Cardozo, *Palko* v. *Conn., 1937.)* The freedoms of the 1st amendment, for example, have been held protected by the 13th amendment against encroachment by the states (*Gitlow* v. *N.Y.,* 1925). Some members of the supreme court. it may be noted, maintained after World War II that the 14th amendment incorporates all of the freedoms guaranteed by the Bill of Rights, but this was a minority view.

Rights of Women and **Aliens.**—The United States constitution was amended in 1920 to add an additional civil liberty: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex." Agitation for equal women's suffrage started in the United States in the middle of the 19th century, and was successful in ten states, but this progress uas slow, and a movement to amend the constitution in the second decade of the 20th century led to the adoption of the 19th or equal suffrage amendment.

Except for the right of suffrage, civil liberties are not limited to citizens. They are enjoyed by all persons. The civil liberties of aliens are. however, not as secure as are those of citizens. since aliens are subject to deportation under legislative terms. Thus, while a citizen may not be subject to punishment on merely a showing of membership in an organization ostensibly subversive, an alien may be deported for such membership *(Harisiades* v. *Shaughnessy,* [1952]; cf. *Rowoldt* v. *Perfetto,* [1957]). However. as long as he is permitted to remain within the host country, the alien must be permitted to enjoy fundamental substantive freedoms and procedural rights *(Yick* Wo v. *Hopkins,* [1886]; *U.S.* ex rel. *Bilokumsky,* [1923]).

Civil Liberties Distinguished From Civil **Rights.**—Generally, civil liberties are freedoms to do certain things without restraint from the government; but they ordinarily imply no absence of restraint from private individuals or agencies. For example, a person may publish his opinions freely insofar as governmental action is concerned; but this liberty does not imply a duty imposed on a newspaper to publish those opinions. In this regard civil liberties may be distinguished from civil rights. States. in the exercise of their police power, may enact laws to prohibit public officials and private individuals from discriminating against persons because of their race, colour, creed, religion or national origin, in employment opportunities. in offering of accommodations in hotels, restaurants, common carriers and other places of public resort, in educational institutions and in housing (at least nhen supported by public funds). These. known as civil rights acts and fair employment practices acts, have been enacted in many U.S. states and municipalities.

The United States constitution has been interpreted as prohibiting state action (but not individuals acting as private citizens, not under authority of any law) that discriminates against persons by reason of their race or colour. Racial discrimination by states; *e.g.,* segregation in public education, has been held a violation of the equal protection clause of the 14th amendment *(Brown* v. Bd. *of Education of Topeka,* [1954]). Similarly, discrimination by the federal government was held to violate the due process clause of the 5th amendment (*Bolling* v. *Sharpe,* [1954]). These decisions, though they flow from constitutional guarantees and not from legislative enactments. are generally conceived of as involv-

ing civil rights rather than civil liberties.

Civil rights, generally speaking, may be viewed as attempts to give meaning to the ideal of equality. while civil liberties flow from the ideal of freedom. But civil rights and civil liberties are, however, intimately related and are perhaps interdependent. for a person who is denied equality is not likely to find that he enjoys much freedom, and a person who is denied freedom is likely to find that he has lost also his equality.

Other **Countries.**—Following the example of the French Declaration of the Rights of Man and of the Citizen and of the U.S. Declaration of Independence and Bill of Rights, many nations in the 19th and 20th centuries adopted written constitutions with bills of rights. Other countries, influenced in various degrees by the example of Great Britain adopted no written constitutions (*e.g.,* Israel). or written constitutions containing no bills of rights (*e.g*, Australia. Canada. New Zealand). In these countries fundamental rights are nonetheless recognized and guaranteed by common law, court decisions and legislation that reflect deep traditions Some countries also adopted written constitutions including bills of rights, where civil liberties are barely acknoaledged. Such was the case in totalitarian states and in countries nhere a feudal order still prevailed despite some modern trappings It is not possible to summarize here the great diversity of laws and usages relating to human rights in the various member states of the Cnited Nations organization; the interested reader is referred to the *Yearbook on Human Rights for 1946 (US.* [1947]) for a summary of these lans and usages for some 70 countries. and the subsequent issues of this *Yearbook* for supplementary and later data.

UN Universal Declaration of Human Rights.—The interest of the United Nations in civil liberties and civil rights—human rights—reflected a world-wide concern with these subjects. The "Four Freedoms" address of President Roosevelt has a special relevance at this point; for Fascism and Nazism had as their objective the destruction of civil rights. the substitution of police tyranny for due process of law, and the rooting out of the ideals of freedom and equality. In meeting the military challenge of totalitarianism, the leaders of the free nations of the world at the same time promised to meet the ideological challenge of their enemies. The Atlantic Charter (*q.v.*) of 1941 affirmed the objectives of the "Four Freedoms" address.

When the representatives of jo governments at the San Francisco conference in 1945 signed the United Nations charter. they put their signatures to a document that referred to human rights in no less than seven provisions. The charter provides that the peoples of the United Nations established the international organization in order to prevent future wars and in order "to reaffirm faith in fundamental human rights, in the dignity and worth of the human person. in the equal rights of men and women and of nations large and small." The charter states that one of the purposes of the UN is to promote and encourage respect for "human rights and for fundamental freedoms for all without distinction as to race, sex. language or religion." Article 13 of the charter provides that the general assembly shall initiate studies and make recommendations for the purpose of "assisting in the realization of human rights and fundamental freedoms for all without distinction as to race, sex. language or religion." Article 62 imposes upon the Economic and Social council the function and power to make recommendations "for the purpose of promoting respect for. and observance of. human rights and fundamental freedoms." Thus civil liberties and civil rights became an international responsibility.

In furtherance of these purposes. the UN Commission on Human Rights was established in 1946 by the Economic and Social council. The first efforts of the commission were directed toward preparing an international bill of rights. On Dec. 10, 1948. the general assembly of the UN adopted a Universal Declaration of Human Rights, which embodies the 18th-century ideals of fraternity, equality and liberty. The preamble expresses recognition of "the inherent dignity and of the equal and inalienable rights of all members of the human family" and the conviction that these values are "the foundation of freedom, justice and peace in the world." It expressly reaffirms the "Four Freedoms" as "the highest aspiration of the common people." The declaration was proclaimed by the general assembly as "a common standard of achievement for all peoples and all nations" Article 3 states that "everyone has the right to life, liberty and the security of person," and other articles affirm specific civil liberties: slavery should be prohibited; no one shall be subjected to cruel or inhuman punishment; everyone shall be recognized as a person before the law; all are equal before the law and are entitled to equal protection against discrimination; no one shall be subject to arbitrary arrest or detention or exile; everyone is entitled to a fair and public trial, shall be presumed innocent until proved guilty, and shall not be punished under a retroactive penal law. The right of privacy is recognized; also affirmed are freedom of residence and movement within a country, and freedom of exit and asylum; freedom to marry without restriction on account of race, nationality or religion; and the freedom to own property. **A** number of articles provide for freedom of thought, conscience and religion; freedom of opinion, speech and press and other mediums of communication; freedom of assembly and association; and the right to participate in the government of one's country, directly or through freely chosen representatives. There are also provisions that assert social and economic rights.

Following adoption of the Universal Declaration, the Commission on Human Rights turned to consider measures of implementation and to the drafting of a covenant which, when adopted. signed and ratified. would take the form of an international treaty imposing specific legal obligations to observe and protect the freedoms and rights therein provided. In the development of these documents. involving sanctions. progress was slow. Notwithstanding this fact. adoption of the Universal Declaration of Human Rights by the world community was an outstanding achievement as recognition of the central importance of civil liberties and rights for the welfare of peoples and the peace of nations and the world.

Special recognition of the importance of freedom of the press was made manifest by the UN and some of its agencies—notably the Commission on Human Rights and Cnited Nations Educational. Scientific and Cultural organization (UNESCO)—by the work done in drafting international covenants on this subject, by calling international conferences, and by their publication of studies and surveys.

Governmental Practices.—Important as are constitutions, laws and declarations, equally important, if not more so, are the actual practices of governments. Here we find extremes and many shadings between extremes. While the U.S.S.R. constitution guarantees freedom of religious worship, it is only antireligious propaganda that is permitted. and collective religious instruction to children under 18 is prohibited. Freedom of the press is guaranteed, but the government decides who will have a printing press and stocks of paper. Citizens are ensured the right to unite in public organizations. but only the Communist party of the Soviet Cnion is permitted to exist. In Saudi Arabia Islamic religion is the foundation of all rights; the practice of other religions is subject to restrictions. Spain prohibits foreign sects to carry on proselytizing activities. Totalitarian. dictatorial or feudal governments severely restrict religious, political and personal freedoms, so that civil liberties under such rule barely exist. In countries with well-established democratic governments and deeply rooted traditions of freedom, *e.g.,* the United States, Great Britain, France. the Netherlands, Sweden. civil liberties are recognized, respected and protected. Wars or other crises tend to strain fundamental liberties, but they tend to reassert themselves—the restrictions will be limited to what are considered grave emergencies, as; *e.g.,* in the treatment of the Japanese in the United States shortly after Pearl Harbor, or of the Communist party of the U.S. during the cold war.

Because of the great diversity in governmental practices, despite the adoption of the 1948 Universal Declaration of Human Rights, and because only a small fraction of the member states of the UN can be considered democratic, it was impossible in the second half of the 20th century to foresee rapid progress in the spread, implementation or strengthening of civil liberties. There was no universal agreement on what the civil liberties are or ought to be, on

their definitions, or on how they should be achieved or promoted.

European Convention for the Protection of Human Rights.— Where, however, peoples share common traditions and institutions of freedom, they may agree on a program of protection of fundamental liberties. This agreement was achieved through the Council of Europe, set up in 1949 with the participation of Great Britain. France. Italy, the Netherlands, Sweden. Denmark, Norway: Belgium and seven other nations. On Nov. 3 and 4, 1950, the Committee of Ministers of the Council signed the European Convention for,the Protection of Human Rights and Fundamental Freedoms, a document intended to guarantee citizens of council members their basic civil liberties and established a European Commission on Human Rights. In 1952 three additional rights were added to the convention. By the convention, member states agreed to submit to international control their actions affecting basic freedoms.

The European convention, unlike the UN Universal Declaration of Human Rights, provided legal protection for fundamental human rights. Private individuals and associations might file complaints after exhausting domestic or local remedies. The convention substantially duplicated the freedoms enumerated and defined in the UN Universal Declaration of Human Rights, but by providing for their implementation and by recognizing private individuals' complaints, it marked a notable step forward in the struggle for civil liberties in Europe.

Mass Communications and Freedom of Expression.— Formidable obstacles in the way of civil liberties in the second half of the century were held to be certain objective developments that were to be found even in democratic, free societies.

To Thomas Jefferson, if it were a question of having a government without newspapers or newspapers without a government, he would have chosen the latter; for newspapers, he thought. were guardians of all other liberties—without free reporting of events and free discussion of policies democracy could not endure. But in modern society, the mediums of mass communications have been used by totalitarian governments as instruments of control of thought, culture and political institutions.

Concentration of ownership in mass communications industries had in the second half of the 20th century become a prominent fact of modern industrial society. A few chains possessing multiple newspapers dominated in the newspaper field. In the motion-picture industry. competitive restraints in exhibition and distribution of films persisted as challenges to governmental and social policies. Radio networks tended to impose restraints on their member stations, and the common ownership of newspapers and radio or television stations restricted competition in the market place of ideas. Despite increases in population, the number of daily newspapers decreased, so that one-newspaper cities or towns had become an accepted pattern of urban life, and even these newspapers were often not independent but under single control. Thus, with respect to the most important mediums of mass communications, there existed the challenge and problem of monopoly.

These developments imposed strains on democratic theories and practices. Democratic nations are uneasy when they see these mediums become controlled by a few chains or monopolies. This problem was one of the most complex and delicate that free societies faced—societies that still believed, with Jefferson, that "error of opinion may be tolerated where reason is left free to combat it."

These developments affected the formation and direction of public opinion in such ways that the strength and extent of conformity offered threats to civil liberties. Concentration of control in the fields of communication was not the only cause of conformity; industrial. technical civilization, the existence of pressure groups and interests, and the desire for personal and economic security were additional causes in the formation of mass cultures that were inimical to dissent, deviation and nonconformity. Yet open societies, traditionally and historically pluralistic in ideals and institutions. were committed to finding ways to keep themselves open and free, tolerant of diversities and differences, so that majority rule was limited by minority rights, and the imprescriptible freedoms of persons were protected and sustained.

Pragmatic *v.* Natural Rights **Considerations.**—Quite apart from religious convictions and natural law beliefs, which often do not play a controlling role in modern secular societies, the pragmatic basis of civil liberties had by the second half of the 20th century won widespread support. As citizen replaces subject, it is held, self-government and free society can be maintained only if two practical conditions are met; namely, that the enjoyment of human freedoms imposes limits on government, and that there is a free and universal suffrage. The justification and basis for the latter is fqund in the former condition; for self-government can be reasonable only where the citizens are free to develop their intellectual and spiritual powers. For this development they need civil liberties — freedom of speech, press, assembly and association, freedom of religion, freedom to teach and to study, freedom of the person from arbitrary acts of government, the right of privacy and other liberties. Without the enjoyment of these liberties, men cannot qualify for self-government, and without self-government men are subjects and not citizens.

But it is precisely at the point where men chose to be citizens and not subjects that the modern world presented in the second half of the 20th century the greatest threat to civil liberties: men will fight their external enemies in order to preserve themselves from subjection to a foreign power; in this fight they will vigorously seek to uncover agents of the foreign power and will try to control thoughts that may seem suspiciously subversive. They are willing to fight and die for their freedom, yet freedom will be curbed in order to vindicate and win the war. Civil liberties may thus give way to security interests. It, therefore, also becomes apparent that a free society is dependent on peace; and so it becomes a practical issue for free peoples to seek peace among the family of nations. Thus it happens that the organs of international relations, such as the United Nations, are concerned with both freedom and peace—with fundamental human rights and with freedom from fear.

CIVIL LIST, the English term for the account in which are contained all the expenses immediately applicable to the support of the British sovereign's household and the honour and dignity of the crown. An annual sum is settled by the British parliament at the beginning of each reign and is charged on the consolidated fund. It is thus not open to parliamentary criticism, but the account is audited by treasury officials, one of the permanent secretaries of the treasury being appointed auditor of the Civil List.

William and Mary.—The history of the Civil List dates from the reign of William and Mary. Before the revolution no distinction had been made between the expenses of government in time of peace and the expenses relating to the support of the sovereign; the ordinary revenues. derived from the hereditary revenues of the crown and from certain taxes voted for life to the king at the beginning of each reign. were supposed to provide for both. Any saving made by the king in the expenditure on the government of the country or its defense would go to smell his privy purse. But with the revolution a step was taken toward the establishment of the principle that the personal expenses of the sovereign should be separated from the ordinary expenses of the state.

The parliament of William and Mary voted in 1689 an annual sum of £600,000 for the charge of the civil government. This was a mere resolution without statutory effect. In 1697 the first Civil List act was passed. Certain revenues (the hereditary revenues of the crown and a part of the excise duties), estimated to yield £700,000, were assigned to the king to defray the expenses of the civil services and the payment of pensions, as well as the cost of the royal household and the king's own personal expenses or privy purse. The Civil List meant practically all the expenses of government except the debt charge and defense. If the yield of the assigned revenues exceeded £700,000 the surplus was to be disposed of by parliament. This restriction was removed by an act of 1 joo. In the reign of Anne the Civil List consisted of the same assigned revenues (subject to certain deductions). The yield fell short of £700,000, and during the reign debts were incurred amounting to £1,200,000 which were paid off by parliament.

The **Hanoverians.**—For George I additional revenues were assigned, and it was enacted in effect that the Civil List should become independent of the yield of the assigned revenues and should be a fixed sum of £700,000 a year. Any surplus was to be surrendered and any deficiency would be made good. But this was found insufficient, and parliament from time to time made additional grants from the exchequer to pay off debts totaling £1,300,000. In the reign of George II there was again a change of system. The Civil List was composed of the assigned revenues, together with certain fixed grants, and a minimum yield of £800,000 was guaranteed by parliament. Any surplus yield over £800,000 was retained by the king. On the accession of George III the system of a fixed Civil List was resumed. The assigned revenues were no longer paid to the crown but to an aggregate fund as part of the revenues of the exchequer, and the fixed allowance of £800,000 was paid out of the aggregate fund to the king (subject to certain annuities payable to members of the royal family).

During the reign of George III the Civil List played an important part in the king's effort to establish the royal ascendancy. The "king's friends," his supporters in parliament, were lavishly rewarded with places, pensions and even bribes. There was no independent check upon the expenditure of the Civil List. As long as the total was not exceeded, the king, with the co-operation of complacent ministers, was free to spend as he pleased. As it turned out, despite stringent economies in the cost of the household! excesses were incurred. But parliament, already corrupted, was persuaded to provide extra funds to pay off the debts (£513,511 in 1769 and another £618,340 in 1777). In the latter year the Civil List was raised to £900,000.

Edmund Burke had already attacked the extravagance and corruption of the Civil List and in 1780 introduced bills embodying his scheme of economic reform. The scheme could not be passed against Lord North's government, but in 1782 the Rockingham ministry passed a Civil List act which abolished many useless offices; imposed restraints on the issue of secret service money, stopped secret pensions payable during the king's pleasure and provided for a more effectual supervision of the royal expenditure.

The Civil List was divided into classes: but estimates for the several classes were not binding and were in fact soon exceeded. Indebtedness accumulated and had from time to time to be paid off (£3,398,000 in all between 1782 and 1820). The amount of

the Civil List itself was augmented and in 1816 it was fixed at £1,083,727. Meanwhile the principal provision for the civil government had come to be made outside the Civil List. Annual votes of parliament for what were called miscellaneous services had been between £200.000 and £300,000 in the earlier years of George III's reign. By 1820 they amounted regularly to about £2,000,000 a year. George IV on his accession in 1820 received a Civil List of £845,727.

During the reign of William IV, the Civil List was finally freed from all charges for the government service as distinguished from the court and royal family. The expenses left were covered by a Civil List of £510,000, including £75,000 for pensions.

Civil List Pensions.—The pensions were excluded from Queen Victoria's Civil List and a new system was set up. The queen might, on the advice of her ministers, grant pensions up to a limit of £1,200 in any one year, in accordance with a resolution of the house of commons of Feb. 18, 1834, "to such persons as have just claims on the royal beneficence, or who, by their personal services to the crown, by the performance of duties to the public, or by their useful discoveries in science, and attainments in literature or the arts, have merited the gracious consideration of the sovereign and the gratitude of their country." In 1937 the limit of £1,200 was raised to £2,500, and in 1952 it was raised to £5,000.

Queen Victoria to Elizabeth 11.—Queen Victoria's Civil List amounted to £385,000, separate provision of £100,000 being made for Queen Adelaide, who had had a privy purse of £50,000 during her husband's reign. The sums granted after 1901 were as follows:

	Edward VII	George V	Edward VIII	George VI	Elizabeth II
	1901	1910	1936	1937	1952
Privy purse	£110,000	£110,000	£110,000	£110,000	£ 60,000
Salaries and retired allowances of household	125,800	125,800	134,000	134,000	185,000
Expenses of household	193,000	193,000	152,800	152,800	121,800
Works	20,000	20,000	..	..	
Royal bounty, alms and special service	13,200	13,200	13,200	13,200	13,200
Unappropriated	8,000	8,000	..		
Supplementary provision	..				95,000
	£470,000	£470,000	£410,000*	£410,000	£475,000

*Of this amount £40,000 in respect of the king's possible marriage, and £79,000 representing the revenues of the duchy of Cornwall, were undrawn.

In the reigns of Edward VII, George V and George VI £40,000 was earmarked for the queen. In the reign of Elizabeth II £40,000 was paid to her consort, Prince Philip, from the consolidated fund.

The Civil List acts, 1901–37, made provision for an annuity of £70,000 to the widow of a sovereign. Queen Alexandra and Queen Mary drew this allowance and Queen Elizabeth, the Queen Mother, continued to draw it. On the accession of George V in 1910 a slight change of practice was introduced. In 1842 Victoria, though under no legal or constitutional obligation to pay taxes of any kind, undertook voluntarily to pay income tax. Edward VII continued the voluntary payment. George V agreed with the government of the day that it should be discontinued, but in exchange placed on the Civil List the cost of state visits of foreign royalties previously defrayed from public funds. In 1916 the king made a voluntary gift of £100.000 toward the cost of World War I. In the financial crisis of 1931 George V voluntarily offered to make a reduction in the Civil List. It was not until July 1, 1935, that this economy cut was fully testored. In 1948 George VI transferred to the consolidated fund a sum of £100,000 which represented the savings on the Civil List during World War II. The transfer was made so that no additional charge should be imposed for a period of four years for the payments of Princess Elizabeth and the duke of Edinburgh.

In addition to the Civil List the sovereign receives the revenues of the duchy of Lancaster. It has also been the practice for provision to be made for the sons and daughters of the sovereign. The heir apparent, if the only or eldest son of the king, is duke of Cornwall and as such possesses the revenues of the duchy. Edward. prince of Wales (later Edward VII), received the revenues of the duchy, then £60,000 a year, with the addition of £40,000 on marriage; the duke of York (later George V) £80,000, with the addition of £20,000; Edward, prince of Wales (later Edward VIII) £80.000. Prince Charles, duke of Cornwall, receives one-ninth of the revenues until he is 18 and then £30,000 a year until he is 21. He would then receive the entire revenue of the duchy.

Annual provision to other members of the royal family was made (in 1958) to: the duke of Gloucester, £35,000; the princess royal £6,000; and Princess Margaret, £6,000. These payments, like those to the queen mother and to the duke of Edinburgh, were paid out of the consolidated fund. The Civil List act 1952 had increased the allowance to Princess Margaret to £15,000 in the event of her marriage (which occurred in 1960). From the supplementary provision of £95,000 in Queen Elizabeth's Civil List, £25,000 was available for other members of the royal family (*e.g.*, the duchess of Kent and the countess of Athlone) who undertook official duties.

CIVIL-MILITARY RELATIONSHIPS. In all societies that have a professional soldiery there is a constant two-way flow of influence between the civilian and military components. This is true both in civilian governments and in military dictatorships. The relationship between the civilian and military groups has commanded the attention of students of military affairs to an increasing degree in the 20th century. The nature of military organizations and their employment and control have become matters of serious concern to civilian and military leaders.

The military organization is always a potential threat, in one way or another, to civilian authority, for the military class holds the double-edged sword of tyranny and national security. Military force has been used throughout history to both limit and advance ideologies, to expand and defend borders and to occupy and administer foreign states. It has at times been an indispensable factor in instituting and protecting civilian authority within the state; at other times it has been instrumental in bringing about the demise of civilian government. In some states the armed services have played a part in the overthrow of monarchies, republics and dictatorships; in others they have helped bring such regimes into existence. On some occasions the military force has been a factor making for change; on others it has created stability.

Tensions between civil and military authorities often arise because of a difference in the emphasis each places on the importance of the military security of the state. The military leaders tend to demand heavy public sacrifice for defense; civilian authority must promote other values as well. As a distinguished civilian statesman, Robert, marquis of Salisbury, once cynically observed. "If you believe the doctors, nothing is wholesome; if you believe the theologians, nothing is innocent; if you believe the soldiers, nothing is safe."

Civilian authority also demands that the armed forces conform to its political policy and social ethic. Sometimes explicitly, sometimes implicitly, the civilian leadership lays down a set of policy limits within which the military organization must plan and operate. In societies that place a high value on a nonmilitary way of life, the civilian authority determines both the goals and the means by which they are to be attained. Rarely have those in the armed services of such states been free to use their best military judgment as to over-all strategy. tactics or even training. Under certain conditions, for example, civilian leadership will not subscribe to the starting of war in the interest of the security of the state no matter how strong the case for it in military logic. On the other hand, the vitality of an ideology may be such that civilian leadership will force the military organization into war long before the military leaders believe war to be feasible. In some circumstances civilian leadership determines the composition and level of military armaments; in others it prevents the use of certain tactics as too costly in human life.

It is precisely this civilian role to which the military authorities object. Certain aspects of civilian control inevitably appear irresponsible and may appear positively dangerous to the military mind. There is a tendency among military men to react as political

idealists who project their own conception of Spartan self-sacrifice into the political affairs of the state.

Civil-military relationships within the great powers of modern times have passed through three general phases as the fundamental concept of war itself has changed. In the first, during the period of royal absolutisms, the nation-state subdued its feudal barons and gained control of the military forces within its borders. In the second, with the rise of popular democracies. the military arm gained control of all the resources of the state for the prosecution of war. In the third phase. with the advent of 20th-century totalitarianism, the historic difference between war and peace, between things civilian and things military, faded. In this last stage virtually every activity of the state came to have some bearing on its military strength.

Roughly speaking. the first phase began in Europe at the end of the middle ages and carried through until the last years of the 18th century. The second began in the late 18th century with the revolutions in the North American colonies and in France and was complete by the end of World War I. The final phase began with the Russian Revolution in 1917 and came to ideological fruition in Nazi Germany in the 1930s and during the Chinese revolution of the second quarter of the 20th century. Each change in civil-military relationships was complemented by new political ideologies —royal absolutism, popular democracy and Fascist and Communist dictatorship. Each shift was buttressed by new economic thinking — mercantilism, laissez-faire capitalism and the garrison economy. The flow of influence between the civilian and military components of the state was affected by new developments in transportation, weapons, communications, mass psychology and the patterns of economic development. In a sense, the main military achievement of the 20th-century dictatorships was their recognition that war is broadly political and that, therefore, old distinctions between war and peace may be made meaningless.

In its simplest form the problem of civil-military relationships is as easy to state as it is difficult to solve: how to provide a strong military organization to protect the state and yet prevent the military class from seizing the reigns of government. For many nations this problem has continued to pose difficult questions throughout the period of modern history. The problem in its modern form was first faced by the European states in the 16th and 17th centuries.

Military Absolutism in the 17th Century. — For both the intellectual and the common man, war in the 17th century was a sordid and continuous affair. It was also something that they took for granted. As commercial competition was directed toward destroying one's competitor, world trade and world peace were considered opposites. War was thought to be an inevitable part of economic competition. Under such circumstances it is understandable that much thought was given to war as a state institution.

The military problem of the 17th-century state was twofold. The first aspect was the supply of war material. Because armies were larger than before, and weapons more expensive, the logistics of war had entered a new phase that demanded new solutions. The second aspect, not so universally troublesome, was that of gaining control of mercenary armies and turning the free-lance soldier into the military bureaucrat. New tactics on the battlefield required greater uniformity of training on the part of both officers and men. War in the 17th century had become a science as well as an art. Officers had to be taught engineering and the common soldier had to learn a new discipline. The solutions to these problems were in a sense complementary, for the organizations created to feed, clothe and arm the soldier were also useful to control his actions. By fulfilling a military need the new bureaucrats were able to achieve political control. By offering schools to the officergroup and putting uniforms on them all, the state was able to enforce a degree of homogeneity on armies that they had never before possessed. The changes took place gradually. and there was no single pattern of development that applied to all states. But finally. with their account books and regulations, the bureaucrats of the 17th century made the state the owner of the tools of war and thus were able to create a dependent military hierarchy.

While the government took away the independence of the officer, it also gave him certain security, awards and privileges which he had not previously enjoyed. In Sweden and Russia, for example, officers were given titles of nobility for their achievements. In France they were made members of the Order of St. Lazare and received financial emoluments accruing therefrom. For the common soldier, whose status was much lowered by these developments, old soldiers' homes were founded or provisions were made whereby the old soldier was not turned out of the barracks. Patient indifference was consciously inculcated into the minds of the soldiery as the height of virtue.

These developments, taken together. meant that at the end of the 17th-century the national government was firmly in control of the army. The military developments of the 18th century gradually made it possible to isolate war from society, at least until new revolutions in North America and France inaugurated new ways of war at the very end of the century.

Civilian-Military Separation, 18th Century. — Frederick the Great of Prussia remarked in his *Political Testament* that the civilian population of a state should not be aware when a state of war existed. And, for all intents and purposes, the civilian population in 18th-century Europe was unaware of military activities in the sense that war seldom touched their homes and persons. As the 17th century had clearly shown, a military force was necessary but nothing was so harmful to the economic well-being of the state as mar. Therefore, the scum of society was swept into the army by such recruiters as those described in Voltaire's *Candide* or into the navy to live the vile life described in Tobias Smollett's *Roderick Random*. The solid strata of the working classes were only slightly touched. Furthermore, the officer class was no greater drain on the more productive elements in society than were the common soldiers. The lower officer ranks seem for the most part to have come from the landed gentry, and the upper ranks were reserved as sinecures for the great families. The usual ravages of war were not apparent in the 18th century, and battles, though bloody when fought, were seldom fought.

Moreover, the absolute monarchy was never able to tap all the resources of the state. The monarch was limited by the interests of his officer nobility, by custom, by the restraints of tradition and precedence, and above all by current economic beliefs. The French monarchy went bankrupt at the end of the 18th century in large part because of military expenditures in connection with financing the revolution in America. But revolutionary France was able to fight all Europe for a quarter of a century immediately thereafter. The difference was that patriotism brought mass participation along with it. Yet. despite or because of isolation from civilians. the aristocratic military class was frequently bitterly criticized by the intellectuals. This was not only true of the philosophers but was part of popular thought as well.

Creation of the Citizen Soldier. — The intellectual background of the two great revolutions that brought the 18th century to an end was antimilitarist. The difference in the attitudes of revolutionaries in France and America lay in the fact that the American colonists tended to be against standing armies per se, as the Declaration of Independence made abundantly clear, whereas the French, as the famous art. i of the decree of the Convention of Aug. 23, 1793. affirmed, simply wanted their army to be a civilian army responsive to the state. The revolutionary saw himself as an antimilitarist, but in the eyes of the rest of 18th-century Europe he had brought a new barbarism to war. The 18th-century absolutist state had tried to separate the civilian from the soldier, whereas the democratic revolutions made a soldier of the citizen.

By the beginning of the 19th century the nature of war had changed; wars had become national. Although the extent of change can be overstated — the revolutionaries both in France and the United States made use of aristocratic officers and old methods of drill — the revolutions did create a new set of civilian values, and these in turn allowed greater scope to military tactics. The virtue of stoicism was replaced by the spirit of patriotism. The soldier as a citizen became a hero. Society put the warrior back on the pedestal of honour.

These changes in civilian values gave the army a sense of dedication and purpose; political revolution had made the army the bearer of political ideology and war itself a crusade. The armies of Napoleon carried the revolutionary ideal across the Alps and over the Rhine. Thereafter, conquering armies throughout the 19th and 20th centuries imposed their ideologies where they planted their flags.

A concomitant of this change was the active intervention of the civilian politician in military affairs. Members of the continental congress gave Gen. George Washington, as well as their naval captains. specific and detailed advice on all manner of military matters, and in France the political representatives on mission to the armies likewise enforced politico-military policy. The activities of both were roughly paralleled by the activities of the political commissar during the Russian Revolution over a century later Civilian control became more directly political, less wholly bureaucratic. To a greater or lesser extent both military tactics and strategy were made responsive to the popular will.

Civilianization of War, **19th** and **20th** Centuries.—The revolutions of the late 18th century, together with the impact of the Napoleonic wars. wiped away the 18th-century distinction between soldier and citizen. Mercenaries continued to be used extensively by Europeans in colonial warfare but the use of mercenaries in Europe became the exception rather than the rule. Yet the 18th-century concept that war and peace were separable conditions, and that civilian affairs and military affairs were likewise largely so, continued as an integral part of the democratic credo.

Nineteenth-century thinking on military forces followed two distinct lines: as a symbol of patriotism the army was a source of national pride; as a symbol of tyranny within the state it was a source of political suspicion. This dual concept continued in the democratic states until World War II and left its imprint on civil-military relationships thereafter. The strength of these conflicting convictions varied in men's minds according to their concept of the extent and source of military danger. From Napoleon's departure for St Helena to the Franco-Prussian War of 1870–71, the possibility of war between the nations appeared remote and armies were not looked upon with great national pride Where the army was used for political repression of democracy, as it was in Turkey and Germany, it was looked upon by the democratic citizenry as a tool of tyranny. But when. in the years following the Franco-Prussian War. the possibility of war between the nations became an accepted part of public opinion then armies became objects of pride and symbols of national security.

Between 1815 and 1870 military thought and economic thought were mutually exclusive. So little did they have in common that it was even considered quite acceptable to deal in the bonds of the enemy state on one's own stock exchange. It was only after 1870 with the advent of national tariff barriers and the complementary new thrust and direction of imperialism, that national economics were once more considered a co-ordinate part of war potential. Between 1815 and 1870 civilian thought on military matters and professional military thinking on these same matters had very little in common. The professional military man tended to think of the good soldier as the old hand to whom the barracks was home and to whom the highest virtue was a sense of duty and a remembrance of discipline. But that professional sense of duty. immortalized in Alfred de Vigny's *Servitude et grandeurs militaires*, was emphatically not that of the liberal. For the 19th-century liberal. the military ideal was the Minute Man, the embattled farmer of the American Revolution, the citizen soldier of the levee en masse. When after 1870, it became generally recognized that infinitely larger masses of men could be successfully employed in war. this separation of thought was modified and the argument between the civilian and the military man became one as to the length of time it took to train a soldier. The farther to the political left. or the farther from the area of possible conflict the civilian happened to be, the greater was his belief in the military virtues of the relatively untrained soldier.

Finally. civilian appreciation of military virtues changed as the concept of war its likelihood and its desirability, changed Only after 1870 was conflict itself considered a virtue. The political philosophers earlier in the century scarcely mentioned war, yet those who wrote in the shadow of World War I, or under the rays of the never-setting sun of imperialism (Rupert Brooke, Nietzsche and others), saw a virtue in struggle. For Mr. Pickwick, Charles Dickens' military enthusiast of the mid-19th century, the soldier was an inspirational ornament. By 1900 the soldier had become a rough, rugged, unappreciated hero, the frontiersman of the thrust of civilization—the hero of Rudyard Kipling's *Soldiers Three*.

The economic developments of the 19th and 20th centuries served to complicate and expand civil-military relations. Civilian transportation facilities such as the railroad and the steamship increased the size of the military mass that could be thrown into battle. The new technology made the inventor and the scientist the indispensable intellectual partners of the military. Civilian technical contributions became greater with time. By the middle of the 20th century, it is no exaggeration to say, the civilian had become a military specialist and the military man a generalist on the military aspects of war. And when during time of peace civilians and military men part company the military tend to become moribund.

The Industrial Revolution made a big business of war. Hence there developed new political interests on the part of civilians in the financial aspects of military contracts. Always a potential source of graft. the military establishment now became a source of legitimate business concern. The converse was also true. As war expanded, governments came to take an increasing interest in industrial and technical progress. By the middle of the 20th century the demands of war were such that in the capitalist countries governments had to go into business themselves to create the weapons of war. Whole sections of the U.S. economy depended during the 1950s on military contracts.

Throughout the 19th and early 20th centuries the distinction between war and peace remained clear in men's minds. Both civilians and military men found it easy, therefore. to admit that there could be an exchange of leadership as peace changed into war. In the years immediately preceding the outbreak of World War I this concept was particularly easy to entertain because of a general belief that in the future, as in the immediate past. wars would be of short duration. Only with the failure of military leadership did civilian decision become dominant once again. As a result, in World War II political leaders such as Winston Churchill and Franklin D. Roosevelt, with the experience of Lloyd George and Woodrow Wilson in World War I in mind. took a direct interest in military affairs, frequently at the expense of what might be more properly considered political affairs.

Civilian authority must be in a position to change the military leadership if necessary. This enormous problem for democratic states could have been more satisfactorily solved had the democracies been willing to make preparations for war in time of peace. The British government. just after the start of the 20th century, did make an attempt to co-ordinate civilian and military organizations for efficiency in time of war when it formed the Committee of Imperial Defence. But in most cases mar was fought with organizations formed at the time for the current emergency. French organization for this sort of emergency remained rudimentary until after World War II, despite much discussion of the problem over a great many years. In the United States an organization for total war did not exist until the creation of the National Security council in 1947. In Germany the general staff prepared no economic plan at all for World War I; Hitler's economic planning for World War II was inadequate. largely because, like Napoleon's, his economic concepts were badly outdated.

In addition to the difficulties that arose between civilian and military leadership because of the distinctions each accepted between the state of war and the condition of peace. the civilian and the military groups in the free societies found themselves in periodic disagreement because of the peculiar position of the army in a free society. In a free society the military establishment is always a state within a state. Freedom to move, to speak, to write, to argue—the basic freedoms in a free society—are subordinated in a military community, which has its own courts,

laws, customs and dress. Insulated from civilian society. it naturally is looked upon with suspicion by civilians. This suspicion has taken a number of different forms, one of which is the belief that the army is a direct threat to the stability of civilian authority. During the first half of the 19th century, for example, there were repeated attempts to destroy the U.S. Military academy at West Point on the grounds that it bred an aristocratic outlook. Or, again, civilian suspicion that military justice is not consonant with the ideals of the state has frequently been a source of conflict between civilian and military interests in the United States. In France the miscarriage of military judgment in the case of Alfred Dreyfus, captain on the general staff, tore the republic into two political factions at the turn of the 20th century.

By far the most serious source of suspicion has been the possibility that the military leaders were playing too large and independent a role in the formulation of national policy in economic and diplomatic terms. This in turn explains the continuous interest by the great democracies in the administrative organization of the armed forces and in the perfection of the mechanisms of civilian control. "Civilian control," however. was never precisely defined. It was simply an expression of democratic faith that armies (always differentiated from navies) are a necessary evil. It follows that at times when armies are considered least necessary they are considered most evil. And when the evil has been thought to outweigh the necessity, there has been greater effort to ensure civilian control.

In great part the interpretation of the meaning of "civilian control" has been the result of historical accident. Those who drew up the U.S. constitution believed, as did their 17th-century English forebears, in strong legislative controls at the same time that they made the president commander in chief, Yet the handling of military budgets is today altogether different in the two countries, and the face-to-face contact with military officers on which the U.S. congress insists is altogether missing in Great Britain where formal parliamentary contact is exclusively with civilian ministers. Both countries. and particularly the United States, have considered civilian ministers or secretaries of military affairs absolutely essential for civilian control. France, on the other hand. has not considered military men in cabinet positions as threats to the state. In Israel. a state that owed its birth to a secret army, there is virtually no concept of control at all. In the Federal Republic of Germany, on the other hand, wherein memory of the destruction of the Weimar republic in the mid-1930s is still bright. control of the military is considered a vital political matter.

Generally speaking, civilian control is exercised through the budget, through legislation affecting military organization and through political control over appointments and dismissals. Civilians have also attempted to set up a force outside the regular army to counterbalance it. The sovereign, for example has his bodyguard; the dictator has his paramilitary secret police; the democracies have their militias, national guards or organized part-time reserve units. one of whose functions was originally thought to be the protection of the state from the regular army.

Civilian control is limited in free democratic societies because of the many avenues open to protest by the military class. Like other elements in society the military may appeal its case. In the United States the military leaders may protest against executive department action to congressional committees or to the press. In Great Britain army officers have on occasions persuaded sympathetic ex-officers in parliament to argue their case publicly and have threatened mass resignation at least twice. Indeed, only when these channels of communication are closed to the military, as in the case of Nazi Germany, has the civilian been able to make his control complete and almost unquestioned.

Although civilian and military affairs tended to fuse in the 19th-century, the image of their separateness lived on in men's minds. Because war and peace were considered separable, war was considered abnormal, a policy mishap rather than a result of policy. And because it was considered an abnormality, and was studied as such in the universities as well as in the foreign offices. military planning and foreign policy planning had remarkably little to do with one another. In the United States there was virtually no contact between the department of state and the military departments until the eve of World War II. In Britain before World Wars I and II the British military establishment and the foreign office had little cross-fertilization' of ideas. In France military planning between the two world wars actually ran counter to foreign policy planning. Hence, because war was not seen in political terms, it was fought as a moral issue, the end result of which was that world wars ended in absolutes — complete victory or complete defeat. And the terms of surrender were considered punishments for crimes committed.

Eclipse of the Distinction Between **War** and Peace. — The basic difference between totalitarian military thought and democratic military thought is that the former makes no distinction in theory between a state of war and a state of peace. The old distinction of nationality disappeared in totalitarian thinking, and with it gradually went the concept of borders, uniforms, the possibility of acceptable codes of war and all the paraphernalia of 19th-century state warfare. Neither Fascism nor Communism has recognized these inherent limitations to war, because both see war as social rather than political. Hence, both believe that war must be fought within the enemy state as well as against it. Thus. the political organizer has become the skirmisher of modern warfare.

Lenin wrote as early as 1906 that Marxism "recognizes the possibility that struggle may assume the most variegated forms." If war and peace are inseparable, and the army only one of the instruments of war policy, of which every activity of the state is a part, then it follows that state and army are one. Mao Tse-Tung, the most prolific and the most sophisticated of the Communist military theorists, once put the idea in this form: ". . . without armed struggle there would be no place for the proletariat, there will be no place for the people, there will be no Communist Party, and there will be no victory in revolution."

Engels. Lenin. Stalin and Mao Tse-Tung were all conscientious students of military affairs. Each considered military affairs as but one aspect of political struggle. As a result each felt that the political leadership should lay down the explicit principles of war for the military organization to follow. Just as other military heads of states — Napoleon, Ludendorff in the last months of World War I, and the Japanese military chiefs during World War 11 — felt no hesitation in directing political affairs as an adjunct to the prosecution of war, so totalitarian leadership did not hesitate to direct the military force as an adjunct to the prosecution of their revolution. Furthermore, the Communist military men understood their relatively subordinate role — better, in fact, than did the German generals. As one of their number, Marshal Shaposhnikov, once remarked, "If war is a continuation of politics only by other means, so also peace is a continuation of conflict only by other means." Thus there has been, on the part of the Communist, conscious realization of the fact that the manipulation of foreign trade, subversion and propaganda are part of an over-all war policy.

This does not mean, of course, that in Communist and Fascist countries there have been no difficulties between the civilian and the military authorities. The purges of military leaders in the 1930s in the U.S.S.R. and the periodic exile of military leaders to distant posts after World War II make the dimensions of the problem quite clear. This struggle has been political. It has had to do with the determination of leadership, as well as basic differences as to what should be spent and how. Military leaders in dictatorships have not always avoided doctrinal conflict with civilian politicians. The military group has argued foreign policy ends with the civilian leadership. The famous July 20th plot of the German army officers to kill Hitler during World War II makes obvious the point that even in a dictatorship there are limits to the military tolerance of civilian dictation.

As war came to permeate every social and economic institution within the state, it was quite natural that the military and the civilian should influence one another to a greater extent than ever before. The "cold war" of the mid-20th century forced the democracies to change their concepts of war and to organize their governments. their minds and their economies for a different kind of struggle, one which was alien to their established system of

values. Their understanding of the new dimensions of struggle evolved slowly. For the Communist the concept of struggle as a complete subordination of means to ends was part of a long tradition, an integral part of a theory of social behaviour and a concept of historical evolution dating from the inception of Marxism.

Technology shrank the world not only in terms of geographical relationships but also in terms of the numbers of powers able to afford the most modern weapons. It also made the great powers less able to use the weapons in their own arsenals, so great had their destructive power become. Technology served to make war a most imprecise and unpredictable servant of policy. And this in turn lessened the relative importance of the military class in the making of war. If war is defined as the manipulation of violence in all of its many forms, then by the mid-20th century the role of the military and the civilian had changed. In a politically bipolar world, in which economic, political and psychological warfare had become the weapons of day-to-day usage. it was the civilian who inevitably played a more vital role in warfare than ever before. Yet this too was a paradox, for in the mid-20th century the military controlled weapons that threatened the destruction of all traditional political institutions. CIVIL SERVICE is the term used to describe servants of the local, state or central government employed as civilians. In the United States the term is often used to describe that part of the government service entered by examination and offering permanent tenure. It does not cover cabinet members or ministers or the judiciary. In other countries it usually does not cover local government employees (see LOCAL GOVERNMENT), nor the staffs of public corporations such as. in the United Kingdom, the National Coal board; but in some countries, where provincial administration forms part of the central government, some provincial staffs are civil servants.

Organized governments have always had civil servants. if not civil services. The civil service in China is undoubtedly the oldest. The able and powerful Roman civil service disappeared in the west when the empire broke up in the 4th and 5th centuries. In the modern world civil services became important with the emergence of national states. notably France and Prussia.

The wide functions carried out by most governments in providing social services (*e.g.,* insurance against unemployment or sickness) or regulating economic life have brought into being large permanent civil services. Many civilians are also employed in support of the fighting services. The growth of these staffs is often described as "bureaucracy." a term connoting regret for the tendency for the state to dominate the life of the individual. As against this. the personnel systems of the big industrial organizations have taken on many of the characteristics of the civil service. while industrial enterprises undertaken by states have increasingly been modeled on the experience of big business. (E. E. Bs.)

THE UNITED STATES

History. — The high standards of integrity, nonpartisanship and permanence of tenure established by George Washington on the whole prevailed in the U.S. national government until 1829, although the states were less fortunate. The Tenure of Office act of 1820 put terms to some positions and under Andrew Jackson (1829–37) rotation in office, partisanship and personal favouritism introduced the spoils system on a national scale. The second period of party patronage and spoils endured, under mounting criticism from such men as Thomas A. Jenckes, George William Curtis, Dorman B. Eaton and Carl Schurz until 1883, the date of enactment of the present national Civil Service (Pendleton) act. After 1883 there was a steady extension and refinement of the merit system, but patronage continued to play an important role in many states, counties and cities.

The character of the U.S. civil service system has been deeply affected by the democratic manners and aspirations of the people. The patronage system was defended because it was believed democratic; on the other hand, a permanent public service smacked of bureaucracy. Jackson spoke against the idea of property in office and of the advantages of wide participation in officeholding. the duties of which, he said. were relatively "plain and simple." Everyone, it is still held, should have an opportunity to compete in examinations. hence age limits were high or nonexistent (and in 1953 were abolished for many classes of federal positions); hence objections to educational prerequisites except for scientific and professional posts. The U.S. has no historic tradition such as that which underlies the civil service institutions of Great Britain and the European continent.

In the national government the principal advances after 1883 were the increasing coverage of the merit system both by legislation and executive order, culminating in the Ramspeck act of 1940; the classification of positions by duties and a systematic pay plan in 1923; a pension act, 1920; the development of progressive personnel practices in the Tennessee Valley authority after 1933; the extension of the merit system by act of congress in 1939 to state services receiving federal grants; further protection against political interference. by the Hatch acts of 1939 and 1940; statutory provision for veterans' preference in 1919 and 1944; and in 1947 an executive order concerning employee loyalty. The centre of interest had shifted from protection against patronage to improved management methods, although the former still remained a principal duty of civil service commissions.

In the early 1960s the merit system included (1) more than 95% of all permanent federal employees. excluding emergency and temporary workers; (2) all state and county personnel receiving federal funds; (3) the state services generally in about 22 states, (4) county services generally in New York and Massachusetts. frequently in New Jersey and occasionally elsewhere. notably in Los Angeles (Calif.) county and Milwaukee (Wis.) county; (5) city services in more than 800 municipalities and the employees of more than 1,000 council-manager cities, most of which had no civil service commissions; (6) police and fire departments generally.

The county services were still predominantly partisan. In some states and some large cities operating standards were low, the merit system being a form rather than a reality. But such cities as Los Angeles, Cincinnati. O., Milwaukee, Wis., and St. Paul, Minn., had admirable records. The U.S. party system was not fully adjusted to a nonpartisan public service and the process offered difficult problems.

The merit system also had to be adjusted to preference for veterans, which antedates civil service legislation. From 1920 to 1940 veterans of World War I received from 20% to 25% of federal positions filled by examination. The Veterans' act of 1944 gave disabled veterans ten points in addition to their earned ratings and a place at the head of each register, five points to all other veterans and various further privileges. With about 15.000.000 veterans of World War II, the proportion of veterans in the federal service by the early 1960s amounted to about 60%. In some states and cities even more impressive benefits were granted; each jurisdiction makes its own rules.

The legal foundation for the national civil service is a considerable body of legislation, a mass of executive orders and commission and departmental rules; in a few states there are constitutional requirements for civil service. State-wide laws govern county and municipal civil services in some cases; in others, cities are left a free hand. In many states there is a considerable body of judicial interpretation, a branch of the law of public officers.

Administration **of** Civil Service Systems. — The typical form of organization for the administration of civil service laws is a commission, usually comprising three persons of whom not

more than two may belong to the same political party. There is a trend. however, toward either a single personnel director or a commissioner with two associate commissioners concerned only with rules and hearings. The U.S. civil service commission is composed of three members. not more than two of whom may be adherents of the same political party. They serve for six-year terms, and since 1949 one member is designated to be the chairman. The U.S. civil service commission is by far the largest of its kind. with a peacetime staff of about 3.000. Its principal divisions are concerned with examination, position classification, investigations, retirement records. loyalty determinations. incentive awards, life insurance, and appeals and review. A large field force is organized in 14 regional offices and many subordinate stations. Since 1938 every federal department and establishment has had a personnel office to deal with its own problems and with the civil service commission. The heads of these offices form the Federal Personnel council, a body re-established in 1938 to facilitate exchange of experience and the formulation of policy. Regional personnel councils exist in the principal centres. In the Tennessee Valley authority personnel work is in charge of a director of personnel; in the council-manager cities the same pattern is cummon. 'There are no special civil service tribunals in the U.S. apart from the loyalty boards, but in the federal departments. since 1940, there are appeal boards (including a representative of the civil service commission) to hear appeals on efficiency ratings.

The examination system developed markedly after 1920. Traditionally examinations were of the essay or problem type or consisted of a demonstration of skill or strength. From the psychological laboratories came tests of "general intelligence" and aptitude which were progressively adapted to large-scale use. Most written examinations now given by the U.S. civil service commission are of the short-answer type. They are scored by an electric scoring machine which has greatly expedited operations and reduced costs. The short-answer form permits the progressive improvement of the reliability and validity of tests, and much experimental work has been done inside and outside of government.

Tests for higher positions usually comprise a rating of education and experience and an oral interview, rather than a written paper. Tests for positions requiring skill or strength are usually demonstrations by actual performance. Grades are recorded numerically and, although they are not infallible, they represent the most scientific standard yet achieved. Certification is normally made by sending the appointing officer three names from which he must select one; the others are returned to the register for future use. Federal examinations are announced in post offices, newspapers and, in case of shortage, by radio and other means. State and municipal examinations are widely publicized.

The classification of positions by duties was initiated in Chicago, Ill., 1910–12, to facilitate equal pay for equal work. The procedure is to develop an accurate, detailed specification of the duties of each class of position, to determine a scale of pay for such positions and then to allocate each job to its proper class. There are hundreds of classes of positions in a given jurisdiction. This systematic description and arrangement of positions by duties has been found fundamental to many personnel operations, especially preparing examinations, certification, efficiency ratings, promotions, transfers and layoffs. The responsibility for classification is usually vested in the civil service commission. Classification plans are frequently published and are usually open to inspection if not published. A lack of co-ordination of the classification plans of different jurisdictions is one (but only one) of the causes for the inadequate personnel statistics of the C.S.

Promotion is by merit, ascertained by frequent examination in the lower grades, and even among division and bureau chiefs. There is considerable movement from cities and states into the federal system. little in the contrary direction. Important career possibilities exist in all the professional and scientific branches and in many of the administrative, specialized and clerical services. The foreign service, put on a career basis in 1924, is independently administered by the state department. More attention was paid during the period 1930–40 to training young persons for public service and to further training of those already employed. Following a national conference at the University of Minnesota, Minneapolis, in 1930 many universities and colleges developed courses in public administration, public finance, psychology and personnel management. The G.S. civil service and the New York city civil service commissions were especially successful in organizing examinations to take advantage of graduates of these courses. State and municipal governments meanwhile had organized training facilities for employees on a part-time after-hours basis, especially for police, fire, utility and inspectional personnel. In 1935 the graduate school of the U.S. department of agriculture expanded its work from the scientific field into the social sciences! including management. Many programs opened up for municipal employees, especially in Los Angeles where the University of Southern California developed a professional interest within the public service.

Legal Rights of Employees. — Less attention has been given in the U.S. civil service to the formal protection of rights of employees, partly because of a patronage background, partly because of the characteristically frequent change of occupation by Americans and partly because of the influence of the business tradition of freedom to hire and fire, as well as public concern over the growth of bureaucracy. Federal law prescribes a written notice and opportunity for reply in case of discharge, but no hearing. In many federal establishments there are administrative provisions for a hearing within the agency; and if an employee can produce proof of discharge for political or religious reasons, he can appeal to the civil service commission. A veteran can appeal to it on wider grounds. In some jurisdictions, such as Chicago, the civil service commission acts as a hearing board. In a few, such as Massachusetts, a discharged employee may secure a full judicial review of the law and the facts.

An executive order of 1947 required a check of the loyalty of all federal employees and future applicants for employment. Agency and regional loyalty boards were established to make initial determinations on all the evidence as to whether there was reasonable ground to doubt the loyalty of employees or applicants, and a Loyalty Review board was set up to entertain appeals. In a service of more than 2,000,000 about 3,000 employees resigned under charges or investigation. About 350 employees and applicants were found upon hearing to be of doubtful loyalty and were refused employment. The 1947 order was supplemented by subsequent legislation and directives. A few analogous loyalty laws in some states and cities discovered few offenders.

The state department, the department of defense, the Atomic Energy commission and other "sensitive" agencies possess by law special authority for summary suspension and removal after hearing of employees deemed to be security risks. Both loyalty and security requirements were induced by fear of sabotage and espionage in the interest of foreign governments.

In 1953 an executive order imposed security requirements over the whole of the federal service. in addition to the prevailing loyalty standards. Several thousand employees were subsequently discharged but there was no disclosure of the particular reasons other than that their continued employment was not clearly consistent with the national interest. During 1953 and 1954 there was bitter conflict between the legislative and executive branches over the handling of loyalty and security cases.

Unionization. — Unions of public employees were first organized in the post officein the 1890s and mere recognized by congress in 1912. Clerical employees formed the National Federation of Federal Employees in 1917 and other groups subsequently. Municipal organizations appeared in the larger cities about 1900; some state employees organized before World War I, but they and county employees remained relatively unorganized. Fire fighters are nationally organized; police are often forbidden to form unions but may organize local social and benevolent associations. Teachers have a national federation.

Such organizations try to secure legislation extending the merit system, better scales of pay and working conditions, protection against arbitrary action and such benefits as group insurance, credit facilities and the like. They are free, as a rule, to affiliate with outside labour organizations but are restrained from taking

an active part in politics. They seek recognition of a right to collective bargaining, written agreements and the majority union as the sole bargaining agent. Except in the Tennessee Valley authority these claims have not been widely granted. Strikes of public employees are rare, one dramatic exception being the Boston police strike of 1919. Police are usually forbidden outside affiliation and the right to strike, a right which is rejected by the overwhelming majority of public employee unions. The Taft-Hartley act (1947) prohibited strikes of federal employees and a number of states subsequently enacted comparable laws.

State and Local Civil Service Systems. — The public services of the states vary extremely in their legal organization and standards of competence. About half have formal merit systems and some of these are indifferently administered. The number of states with merit systems steadily increases, nevertheless, and standards are steadily improving. The older type ot bipartisan civil service commission predominates but Minnesota and other states have abandoned the commission in favour of a director of personnel. Functions are chiefly examination. classification and record keeping. Most states have pension plans for teachers and an increasing number have state-wide pension plans for all employees, on a contributory basis. In New Jersey and Massachusetts the state commissions carry on work for counties. In California there has been notable co-operation between state. county and municipal civil service commissions. There is no coordination betneen state and local agencies and the U.S. civil service commission. State civil service agencies have been handicapped in some instances by political opposition. by lack of funds and by inadequate leadership. During the 1930s substantial progress was made however, both in extending the merit system and in introducing better methods.

Primary and secondary schoolteachers are subject to minimum standards of training fixed by law. They are required to hold a certificate. usually issued by a state examining agency Appointments are made by local school boards without competitive or other formal examinations. After a probationary period, teachers acquire a protected tenure. They are a part of the merit system but not under the jurisdiction of civil service commissions.

In a country nhich has 130 cities nith a population of 100.000 or more (1960 U.S. census), the municipal civil services are of great importance. Until 1900 municipal employees were usually political appointees with low standards of competence and, at times, of integrity. The muckraking era (1900–05) and the ensuing period of municipal reform wrought a great transformation. supported by the increasingly technical nature of municipal functions. Municipal civil service commissions were widely established before 1910; by 1960 there were more than 800 cities under the merit system The introduction of the council-manager plan after 1908 gave a great impetus to the further improvement of municipal standards. although city managers have not favoured the independent, bipartisan civil service commission. Political influence in appointments and promotions has not been eliminated in many of the larger cities, but in the middle-sized and small cities it has lost any major significance. One handicap to the professionalization of the municipal services lies in the preference for local reiidents for appointment — an almost universal requirement for police. fire inspectional and clerical services and a usual requirement even in technical and professional posts. The practice of outside appointments has, honever become well established among city managers. school superintendents, health officers and city engineers

For the purpose of exchanging experience improving procedures and publishing reports, civil service commissions and agencies in 1906 formed the Civil Service Assembly of the United States and Canada. with headquarters in Chicago. This body holds an annual convention, furnishes technical advice carries on research and publishes professional bulletins and the quarterly journal. *Public Personnel Review.* (L. D. W.)

UNITED KINGDOM

History. — The British civil service in its present form dates from reforms between 1855 and 1870 associated with the names of Stafford Northcote and Charles Trevelyan. The civil service commission, an impartial body free from all political influence, was set up in 1855 to examine candidates nominated by departments to ensure that they reached an adequate standard. By 1870 the principle was established that. in place of the system of departmental patronage, posts should be filled by open competitive examination carried out by the commission to ensure the high standard of the British civil service and to bring about a sense of unity, hitherto lacking, between the staffs of different departments.

The British civil service is unlike others in that there is no statute regulating its constitution or organization. Pensions. indeed. are governed by statute. and some conditions of service laid down by orders in council, but the management of the civil service has been accepted as an executive function.

Every department of state has its o n establishment and organization officer responsible for dealing with its personnel problems. But the central responsibility for civil service questions, which developed gradually out of the power of the purse. rests with the treasury. The treasury has direct responsibility for settling salary questions and for the grading and organization of the main classes of civil servants which are common to the service, and for controlling departmental arrangements for the departmental classes.

Until 1943 the United Kingdom had separate diplomatic and consular services which staffed the embassies, legations and consulates while the staff of the foreign office itself formed part of the home civil service. In that year the staffs of the foreign office and its posts abroad were amalgamated into what became known as the foreign service, which is a separate entity from the home civil service, although its staff is recruited by the civil service commission.

The main functions of the United Kingdom civil service are dealt with in the articles ADMIRALTY; FOREIGN SERVICE; GOVERNMENT DEPARTMENTS; WAR OFFICE, BRITISH.

Classification. — The home civil service is organized into a number of classes, themselves divided into grades. On the nonspecialist side there are three main classes. The administrative class (about 2,500 in the early 1960s) is concerned with advice on broad questions of policy and with direction at the highest and most general levels. The executive class (about 70,000) is responsible for the conduct of business within the framework of established policy and for extensive auditing, accounting and fiscal operations. The clerical class (about 190,000) performs the simpler clerical functions.

Entry to established posts is mainly by open competitive examinations (the minimum ages being closely linked nith the educational system). although many have entered since World War II by nay of tests for which only temporary civil servants serving in other classes were eligible The age limits in the case of open competition are: administrative class. 20½–27 years; executive class, 17½–23 years; and clerical officers. 16–59 years. Clerical assistants are recruited either by open competition (age limits 15–19) or by examination after a qualifying period of satisfactory temporary service. There is also a considerable flou of promotion into and betneen these classes. About one-third of those in the administrative class reach it by promotion.

The civil service also contains more than 75.000 professional, scientific and technical specialists organized in classes appropriate to the type of nork to be performed, many of them common to the service. There are. for example. scientists engaged in research and development; lanyers or doctors acting as legal or medical advisers; architects and surveyors engaged in the design and construction of buildings; accountants and actuaries. There is also a large group of more than 105.000 ancillary staff, including typists. machine operators. messengers and cleaners Also there are more than 215 000 manipulative staff in the post office: postmen, telephone operators, sorters, etc.

Finally there is the industrial civil service numbering about 360.000. This comprises skilled and nonskilled manual workers. below the level of foremen or supervisors, employed in government industrial establishments; *e* g., royal dockyards, royal ordnance factories, workshops, depots and stores. Conditions in the indus-

trial civil service are determined largely by reference to the principles of the Fair Wages resolutions of the house of commons. The government accepted an obligation to observe conditions and hours not less favourable than those established for the trade or industry concerned through the recognized negotiating machinery or. where conditions are not so established. by other employers engaged in similar trades and industries. So in several important respects industrial conditions are different from those in the non-industrial civil service.

Suitability Requirements. — No person can be appointed to a permanent post in the civil service until he has satisfied the civil service commission of his suitability. Until World War I it was the practice to rely almost wholly on written examinations of a literary and academic nature. Later, more reliance was placed on interviews at which the interview board had before them full particulars of the candidates' records.

While recruitment is carried out centrally, promotion is for the most part departmental. There are, however. arrangements for the central pooling of a number of vacancies in certain grades so as to reduce disparities in promotion, and interdepartmental transfers are commonly made when new departments are set up or existing departments rapidly expanded. Further, for the top posts in all departments (permanent secretaries and deputy secretaries) the field of selection is the whole civil service While appointments to these posts are made by the minister in charge of the department. the prime minister's assent is required for all promotions to these grades, and to posts of establishment officer and finance officer.

The British civil service prides itself on its impartiality and its capacity to give loyal and devoted service to ministers of nhichever party is in poner For many years no civil servant (other than industrial staff) has been alloued to become a candidate for parliament until he has resigned his civil service post Further no civil servant, save in the subordinate grades. is allowed to take any overt part in party politics. Originally this applied to all civil servants, with the exception of certain industrials, but in 1948 an independent committee set up to examine the limitations on the political activities of civil servants recommended that all minor, manipulative and industrial grades should be free to engage in political activities. This recommendation was accepted

In 1953 it was decided that while the ban on political activities must remain for the middle and higher ranks of the civil service. some measure of freedom (but not including parliamentary candidature) should be allowed to civil servants in the subclerical and clerical classes and in the lower reaches of the scientific and technical classes.

Unions and Grievances — Civil service unions have been recognized by government from 1906 in the post office and from about 1912 in the rest of the civil service. In 1919 Whitley councils were set up to provide machinery for dealing with grievances and to give the staff a greater share in and responsibility for working conditions. There is a National Whitley council for the whole nonindustrial civil service and separate departmental councils for each department. Each council has an official side appointed by the minister and a staff side, representatives of which are appointed by the civil service unions and associations which are recognized as representative of the staff interest concerned. These joint councils are negotiating bodies and can proceed only by agreement.

After World War I a system was set up for compulsory arbitration at the request of the staff or official side about conditions of service. Disputes were to be referred by the ministry of labour to a tribunal consisting of an independent chairman appointed by the minister, one member drawn from the panel of persons appointed by the minister as representing the chancellor of the exchequer and one member drawn from the panel of persons appointed by the minister of labour as representing the staff side of the National Whitley council. This system only applied to the conditions of service of civil servants below managerial level.

A Standing Advisory committee on the pay of the higher civil service was set up in 1957 uhich, at the request of the government or on its own initiative, can carry out reviews of the pay of civil servants above the scope of compulsory arbitration and make recommendations to the prime minister.

The Civil Service Pay Research unit. also set up in 1957. collects information about the pay and other conditions of service of employees outside the civil service whom it regards as comparable with the civil servants in particular grades. This information is made available to the unions and to the official side for use in negotiations.

For the industrial civil service the machinery for negotiation and joint consultation consists of joint councils, representing the departments and trade unions concerned in each of the industrial groups; *e.g.*, engineering, shipbuilding or miscellaneous trades. The government, although a major industrial employer, is not represented on any of the negotiating bodies for outside industry. These councils are represented on a central bodyw known as the Joint Co-ordinating Committee for Government Industrial Establishments. which can deal with matters brought before it by either side or with matters referred to it by the other councils. It does not deal with pay claims. Disputes affecting the industrial civil service that cannot be settled through this machinery are referred for arbitration to the industrial court, set up in 1919. which also deals with disputes in outside industry. (E. B. Bs.; N. Bk.)

COLONIES AND COMMONWEALTH

Colonial Service. — Each British colonial territory has its own civil service, paid from local funds voted by the local legislature. To an increasing extent, colonial civil servants are locally recruited, but many of the administrative and technical posts are filled from her majesty's overseas civil service. Its members are recruited by the secretary of state for the colonies, though they are employed by the government of the colony in which they serve. They are servants of the crown and the secretary of state accepts general responsibility for seeing that their conditions of service are satisfactory. As self-government advances, the secretary of state relinquishes his detailed responsibilities laid down in the Colonial regulations. but in Colonial Office Paper 306, published in 1954, the secretary of state indicated that the U.K. government would ensure, in any transfer of full responsibility to overseas legislatures and governments, that members of her majesty's overseas service who lost their employment would receive adequate compensation and that endeavours would be made to find them alternative employment in another colony.

Commonwealth Countries. — Each common ealth country has a civil service which has developed on the same general lines as that in the U.K. Those with federal governments have state or provincial civil services in addition to the federal civil service. The public service commissions, however, which correspond to the U.K. civil service commission in conducting centralized recruitment on the principle of open competition, are also concerned by statute with promotions and discipline, which in the U.K. are mainly left to the employing department; and in the older commonwealth countries the public service commissions also deal with general matters of civil service control such as structure, complements, grading, salaries, conditions of service and central staff negotiations which in the U.K. are mainly the functions of the treasury. (E. E. Bs.)

Australia.—Each Australian state has its own civil service, based on the same general pattern as the central commonwealth civil service, the organization of which mas provided for by the Public Service act, 1922–54, in conjunction with the Superannuation act, 1922–5j, and the Public Service Arbitration act. Control is in the hands of a board of three members with semijudicial tenure. Appointments are in general competitive, at school-leaving and university standards; preference is given to ex-servicemen; there are no restrictions on interdepartmental or interstate movements.

Canada.—After long experience with patronage, Canada introduced an effective merit system in 1918 when an act strengthened the position of the civil service commission and laid down provisions for recruitment, promotion, dismissal and political rights.

The Canadian system is based on the British pattern in that it is controlled by the treasury and has an administrative class recruited principally from the universities, but it follows the United States in its classification plan. There is a civil service for the federal government as well as one for each province.

Ceylon.—The civil service of Ceylon was founded in 1798 by the first British governor of Ceylon, Sir Frederick North, with the help of 8 officers who went out with him and 24 more who were personally selected by the secretary of state. In 1831 the first step was taken toward native staffing when the Colebrook commission recommended education for the natives in order that they might in time qualify for higher posts in the public service. In 1856 a general competitive examination held in London was substituted for the earlier Haileybury examination, and in 1891 a local division of the public service (known as the lower division) was established. Examination for this was held in Ceylon. After 1924 the competitive examination was held simultaneously in London and Ceylon. and in 1938 it was agreed that no more Europeans should be recruited. In 1931 a public service commission had been set up and in 1947, under the Soulbury constitution, Ceylon was made independent.

India.—The Indian civil service (I.C.S.) owed its early organization to Warren Hastings. dating from 1772. It remained predominately British in composition until 1920. After World War I, recruitment to the I.C.S. was conducted simultaneously in the U.K. by the civil service commissioners and by the public service commission in India which introduced a difficult all-India competitive examination similar to the examination held in London. The Indian element in the service gradually increased in number until about half the officers in the service were Indians at the time of transfer of power in 1947. Thereafter, there was no fresh recruitment to the I.C.S. A new service known as the Indian administrative service was introduced, recruitment to which is through an all-India competitive examination. The new service also provides district officers who may be in charge of all public activities for an area of over 4,000 sq.mi., but unlike the old service it does not provide officers for the judiciary. An Indian foreign service (I.F.S.) was also set up after 1917 and was joined by many officers of the former I.C.S. New entrants to the I.F.S. are also selected by competitive examination. Unlike the I.C.S., the new services are open to women.

New Zealand.—Political control of the public service in New Zealand lasted until 1912, when the Public Service act introduced control by an independent commissioner (replaced in 1946 by a commission not exceeding three) whose functions included recruitment. training, classification and promotion. Recruitment is at two levels, postprimary and university. and promotion is by merit.

Pakistan.—At the time of its establishment in Aug. 1947, Pakistan was faced with the problem of forming and manning its central and provincial governments. It was decided to form a strong, centrally administered service controlled by the government and by a public service commission, with a separate foreign service from which diplomatic and consular posts would be filled. Recruitment was urgent and numbers were made up by transferring officers from the former Indian civil service and from the defense and other services. In 1949, however, the commission started an open central superior service examination for all appointments. The central superior service of Pakistan is a centralized service whose officers have. since 1950, been transferred throughout Pakistan. In addition to the central civil service the provinces have their own civil service under the provincial civil service commission. (X.)

OTHER COUNTRIES

France.—The most prominent characteristics of the French civil service appeared after the Revolution. The revolutionary assemblies destroyed the traditional and complex organization of the old regime and, under the Napoleonic empire, a new framework was set up based upon two main principles: uniform hierarchy and centralization.

Later regimes maintained this new administrative structure but tried to adapt it to democratic evolution. Successive reforms. mainly at the end of the 19th century, developed local government in the communes and the *départements*. Thus the citizens were enabled to take a more active part in the management of public affairs by electing local assemblies. Permanent links were established between central services and local authorities through the mayor, elected by the council of the commune, and the prefect, appointed by the government. The presence of a prefect in every *département* secured a permanent control upon all local decisions.

In the 20th century the civil service was affected by the development of administrative tasks which implied an increase in the number of civil servants. New ministries were created for health, economy, housing, etc. The organization of the French civil service became so intricate that uniform regulation appeared necessary. Some laws and the constructive work of the highest administrative court, the conseil d'dtat, began to establish a general statute which was completed and codified by several acts of 1945 and 1946. The French civil service is divided into classes which correspond, broadly speaking, to the British ones. At the upper level the *administrateurs* civils can be compared to the members of the administrative class. New regulations also established a uniform hierarchy of salaries. Most members of the upper class are selected through the École Nationale d'Administration, the students of which come directly from universities as well as from the lower classes of the civil service. Courses last two years and a half, a first year spent in local services and a year and a half in attending lectures and seminars in Paris. The competitive system is generally used for selection in all classes.

The statute of the French civil servants also determines their rights and duties. In 1946 the right to form syndicats, or unions, was recugnized by the government and joint committees were created to deal with disciplinary questions and technical improvements. The regulation of the French civil service, despite its uniformity, is not as rigid as it may seem. The main exceptions reside in the way in which certain traditions have survived in some parts of the organization. First, in the upper reaches of the civil service, special and important functions are assumed by the main bodies—*les* grands corps—principally by three bodies of control. The conseil d'dtat is both an administrative organ frequently consulted by the government and a tribunal for administrative cases. The *cour des comptes* is a court of financial control over public expenses. The inspection des *finances* is a service which inspects the financial officers. The prestige and tradition of these three bodies constitute one of the most original features of the French civil service. Their members frequently occupy the highest executive functions in most departments.

Secondly, a particular importance has always been given to the good staffing and working of some technical services. Some of the most important specialized schools were created around the beginning of the 19th century, such as the Ecole Polytechnique (1795) for scientific careers and the Ecole Normale Superieure (founded 1794; took its present name, 1845) where many professors of the universities are trained. (P. Vt.)

Germany.—The German civil service emerged out of feudalism under a succession of outstanding Prussian monarchs culminating with Frederick the Great (1740–86). Legally it was based partly on custom, partly on executive acts and partly on statutes. The foundations of the civil service of the German Reich were laid by the Civil Service act of 1873; in addition, the German states had developed civil services of their own.

Up to 1933 the German civil service was characterized by high standards of competence, integrity and impartiality. Its prestige was high and it was closely supported by active citizen advisory groups in municipalities and rural communities. Partisanship was prevented partly by tradition and partly by the fact that conservative groups prevailed under the first Reich. After 1920 the Socialists made some partisan inroads, and after 1933 the Nazis required active party membership from all civil servants. Under the Nazi regime the standard of integrity of the civil service suffered heavily, but its competence and efficiency remained high.

The Civil Service act of 1937 was based on the old German law, hut a number of enactments were introduced by the Nazis with the purpose of strengthening Nazi rule and of eliminating several cate-

gories of "undesirable persons." After Hitler's abolition of the German states the 1937 act mas applied to all civil servants.

In 1950 the German Federal Republic eliminated all National Socialist clauses from the law of 1937. Both the federal civil service and those of the *Lander* returned to the principles contained in the Weimar constitution of 1919 by which entry into the civil service is determined by ability, regardless of race, sex or political or religious ideas. Provision was made for legal protection of civil servants: the state accepts liability for their nrongful acts and freedom of association is allowed. Many of the German states which were re-established after World War II issued new laws for their civil servants.

There are in the German civil service four different classes: the administrative class, requiring a university education; the higher executive class, based on secondary education; and the executive and clerical classes, requiring only a primary education and before 1945 largely reserved for soldiers at the end of their military service. The vast majority of those preparing for the highest grade take a law course, including economics, history and political science. Applicants are then admitted for a training period of several years, during which they work at the courts and in civil administration. They finally take an examination called the *Grosse Stuatsprufung* under the direction of one of the boards set up in every *Land.* Applicants for technical, medical and other careers within the administrative class receive similar, but specialist training.

Republic of Ireland.—Recruitment to the civil service is governed by the Civil Service Regulation acts of 1924 and 1926 which empowered the government to appoint three commissioners. In general no person may be appointed to a permanent situation in the Irish civil service unless a certificate of his qualification for the situation has been issued by the commissioners. Cnder the Civil Service Regulation act, 1924, and the Ministers and Secretaries act, 1924, the control of remuneration and conditions of service generally is vested in the minister for finance.

The local appointments commission. a body parallel to the civil service commission, selects the senior staffs of local authorities. Other staffsare recruited by the county and city managers who discharge the executive functions of the local authorities. In staff matters a manager is not controlled in detail by the elected council. The central government supervises the numbers, pay and qualifications of these staffs. (X.)

AN INTERNATIONAL CIVIL SERVICE

The elements of an international civil service were first found in the Universal Postal union (1874–75). The League of Nations and the International Labour office (ILO) required a staff of about 600 experts and subordinate personnel which took the form of a true international civil service. It drew mainly on British. French and Swiss sources, but more than 40 states contributed members in response to the requirement that the staff should be recruited "on as wide a geographical basis as possible." There mere no formal methods of selection for the higher personnel; the director-general depended on personal acquaintances and trustworthy recommendations. The staff fell into three divisions: administrative, supervisory and clerical, and custodial and manipulative. The main point of interest in an international civil service lies perhaps in the steps it takes to free itself from national loyalties. The League existed during a period of rampant nationalism and irreconcilable conflict, but its experience showed that a broad measure of international loyalty can be achieved, even under difficult conditions. The staff of the League was dispersed after 1939 but that of the ILO was maintained. principally in Canada.

A much larger international civil service was required for the United Nations and the specialized agencies. In the United Nations charter. each member state undertook to respect the international character of the duties of the staff and to refrain from influencing them in their work. International secretariats are also provided for other organizations; *e.g.,* the Organization for Economic Cooperation and Development. Officialsand employees of such organizations are paid from 'the funds of each of these organizations, and are assigned duties by its head. They are subject to its discipline and owe it full responsibility. Valuable experience in international co-operation was obtained during World War II through the various combined boards and through the lend-lease organization. (E. E. Bs.)

CIVIL WAR, ENGLISH, the fighting which took place in England during the years 1642–51 between supporters of the king and parliamentarians. generally called the Civil War or, sometimes. the Great Rebellion. There were three main phases in the conflict: the first civil war. which began in 1642 and ended with Charles I a prisoner of the parliamentarians in Jan. 1647; the second civil war, which began with the Scottish "Engagement" at the very end of 1647 and ended with the king's execution in Jan. 1649; and the third civil war. initiated by the Scottish rising in favour of Charles II in 1650 and ended by the royalist defeat at Worcester in Sept. 1651.

Background to the War.—By 1642 there had been for many years a struggle for power between the English monarchy and parliament. In the middle ages the principal critics of the king had been the nobility who were directly summoned to the house of lords, but from the 16th century their influence declined, partly because so many of them had been killed in the wars of the 15th century. partly because of the repressive policy of the early Tudor rulers and partly because the ecclesiastical baronage had been reduced in size after the Reformation. In the reign of Elizabeth I it was the house of commons which increasingly asserted the right

to criticize the policies of the crown Elizabeth warded off attacks on her personal authority or her "prerogative rights" as best she could, and she was adamant that matters of religion and foreign policy were the sole concern of the monarchy. Nevertheless she was obliged to yield now and again. During her reign much of the procedure and some of the privileges of the commons were firmly established. When she was succeeded by James I, the claims of the lower house to an authoritative voice in public affairs nere emphasized with even more vigour. Members aho to some extent had held their fire out of deference to Elizabeth would not be browbeaten by Stuart claims to high prerogatives which they regarded as contrary to both the laws of nature and the privileges of parliament.

The Stuarts answered the restive attitude of the commons by defending their prerogative powers with every resource at their disposal. Charles I (q v.), "in common with most European sovereigns of the time, wished to strengthen the central government and was impatient of the hindrances put in his way by parliament and by the gentry who exercised local power The gentry, in and out of parliament, resented interference with what they believed to be their liberties and privileges" (C. V. Wedgwood *Truth* and *Opinion,* Macmillan & Co., New York, 1960). When Charles I discovered that he was unable to repulse the attacks on his favourite. the duke of Buckingham *(see* BUCKINGHAM, GEORGE VILLIERS, 1st Duke of), and, after Buckingham had been assassinated. was unable to secure the money to sustain his policies abroad. he decided in 1629 to try to govern the country without a parliament at all and to raise money without the consent of the house of commons.

To the political conflict between Charles I and many of his leading subjects were added serious religious differences The king, a keen supporter of a unified Church of England with a unified ritual, had to contend with the Puritan movement, dating back to the reign of Elizabeth. well represented in the house of commons and strong in many parts of the country, notably in London and the smaller towns. In general. the Puritans wanted to abolish all vestiges of the old Roman Catholic ceremonies and to Increase and spread extempore preaching in the churches. Charles's two archbishops devoted themselves to repressing these tendencies with the full backing of the crown. During the 11 years after parliament ceased to sit in 1629, it was mainly by the Puritan preachers that the flame of discontent with the king's government was kept alive.

The influence of social and economic factors on the course of events leading to the Civil War remains a matter of opinion. It seems likely that the landed gentry, normally represented in the house of commons, had for the most part recently increased their material wealth at the expense not only of the crown and the church but even at that of the nobility. If this were so, it would help to explain the growing political assertiveness of the house of commons in relation to the crown and also in comparison with the house of lords. The gentry and merchants were vexed by various forms of financial exaction imposed by the king. When Charles I came to the throne the commons was reluctant to grant him an indefinite right to impose customs duties (already increased by his father) or to vote him all the subsidies he sought in order to wage foreign wars. Charles's attempts to overcome the effects of this reluctance by the exercise of his prerogative power resulted in economic pinpricks—forced loans, knighthood fines and so on—which angered the well-to-do. Their grievances were further accentuated when in 1635 the king began imposing ship money (*q.v.*) not only upon ports but also upon inland towns.

Finally Charles I's foreign policy was unpopular. The proposal made during his father's reign that Charles should marry a Spanish princess had been much disliked and his actual marriage to a French princess was not much more popular. For two generations Spain had been the traditional foe of England. Yet Charles I, in return for financial aid. assisted the Spaniards in a number of different ways. Consequently there grew up a genuine fear that England was being sold to its ancient enemy.

Immediate Causes.—The two events which most directly led to the Civil War were the king's war with the Scots, known as the Bishops' Wars, and a Roman Catholic rebellion in Ireland (see ENGLISH HISTORY). Charles I, following up his attempt to impose religious uniformity upon England, decided in 1637 to insist. solely on his own authority, that the Scottish church should accept a version of the English Book of Common Prayer. For more than two generations the bulk of the Scottish people had been Presbyterians. and this attempt by the king to force English religious practices upon them met with immediate and widespread resistance. In 1638 the Scottish leaders began collecting signatures for a national covenant—a manifesto promising to defend Presbyterianism to the utmost. In November the general assembly of the Scottish church abolished the episcopacy. Charles refused any compromise and, deciding to enforce his ecclesiastical policy with the sword, not only called out the militia but, following ancient precedents, required the English peers to lead their own troops into the field or compound for money. These demands were resented in England; many felt that the Scots were entitled to practise their own religion. When, in June 1639, after his army had been completely outmaneuvered by the Scots, the king was obliged to agree to a truce at Berwick-upon-Tweed the royal levies melted away. Charles, whose government was already committed to other heavy expenditure abroad, had no money to continue the war and was obliged to summon a parliament, which met in April 1640. The house of commons, which had not met for 11 years and whose leaders wished to concentrate on their accumulated grievances against the king's government. refused all aid and even inclined to favour the Scottish rebels. Thereupon the king dissolved the so-called Short parliament. However, when Charles attempted to resume the war against the Scots, he was even more decisively defeated and had to agree to a humiliating treaty which in effect forced him to call a new parliament.

The so-called Long parliament met on Nov. 3, 1640. Under revolutionary pressure the king agreed to make important concessions but on three points he resisted: the right of parliament to interfere with the organization of the church and. in particular, to abolish the bishops; the right of parliament to nominate ministers and officials; and the right of parliament to control the armed forces. The last question came to a head when a rebellion broke out in Ireland in the autumn of 1641. There then occurred a complete breakdown in trust between parliament and the monarchy. The king naturally wanted to raise troops to repress the rising. The commons feared such troops might also be used against Englishmen.

The house of commons now put forward (Nov. 1641), in a Grand Remonstrance to the king, claims which were far more extensive than those advanced the year before. The narrowness of the majority (159 votes to 148) by which the Grand Remonstrance was passed, however, indicated the growth of a strong royalist party in the commons and encouraged Charles to proceed (Jan. 4, 1642) to his unsuccessful attempt to arrest five members of the commons *(see* ENGLISH HISTORY). A week after the failure of this *coup d'état* the king left London, and though prolonged negotiations took place betneen parliament and the king for a constitutional settlement (as late as June 1642 parliament offered the Nineteen Propositions to the king), both sides now began to prepare for a civil war.

FIRST CIVIL WAR

Resources of the Two Sides.—The first civil war began on Aug. 22, 1612, when Charles I set up his royal standard at Nottingham. Previously the king's headquarters had been in York and his original intention had been to raise the royal standard in Lancashire. for it was hoped to make use of the historic antagonisms between northern and southern England. Not only was much of the north of England, except the towns of the West Riding of Yorkshire. royalist in sympathy, but so too on the whole were the west midlands, virtually all of Wales and a great deal of southwest England. The main strength of the parliamentarian party was concentrated in the City of London and other ports and in the Yorkshire textile towns. Most of East Anglia was parliamentarian, as nere the counties around London. A revolution took place in London on the eve of the Civil War, when a royalist city council

was overthrown and the financial and commercial resources of the capital were put at the disposal of parliament. Apart from Newcastle upon Tyne and Chester, Portsmouth was the only port of any size that at first declared for the king, but Portsmouth surrendered to the parliamentarians early in Sept. 1642. On the other hand, the royalists captured Bristol in July 1643. A line running southnest from Scarborough to Exeter roughly divided the country between the royalists in the north and west and the parliamentarians in the south and east. Many counties. however — notably Cornwall and Torkshire — were deeply divided in their loyalties and some even tried to declare themselves neutral when the war began. No precise class division within the country can be laid down. Many families were divided among themselves, and in the house of commons those who declared themselves parliamentarians and those who fought for the king had no distinctive social or economic characteristics. The parliamentarians were nicknamed Roundheads, after the short-haired, bullet-headed London apprentices, and the royalists were dubbed Cavaliers by their enemies, after the brutal Spanish *cavaliero* or trooper.

The Royal Navy, which inherited traditions dating back to Elizabeth I and her father and had recently been strengthened by the king's expenditure of ship money on it, at once declared itself to be on parliament's side and until 1648 parliament commanded the sea As to the army, there really was none. Each county was supposed to have available militia or trained bands for local defense, but the only trained bands of any real military value were those of the City of London. Armaments had also become antiquated, though both sides at once tried to seize what weapons there were in the county arsenals. The arms factories — for example the iron foundries of Sussex — were mostly at the disposal of parliament and the king had to try to import arms from abroad. Before the war began he sent the queen to the Netherlands to buy munitions.

For cavalry the king was able to call upon the outdoor staffs of the nobility and many of the better-off gentry who rallied to his cause. The parliamentarian cavalry was much more of a scratch force, although the yeomen farmers of east England had experience in riding and shooting. Both sides were able to employ officers who had acquired some knowledge of war in Europe. The king had his two German nephews, Prince Rupert (*q.v.*) and Prince Maurice of the Palatinate, and the parliamentarians had Sir Thomas Fairfax (*see* FAIRFAX OF CAMERON, THOMAS FAIRFAX, 3rd Baron) from the West Riding and Philip Skippon, who commanded the London militia. The cavalry was the cream of the army on both sides and a cavalry charge usually had a decisive effect on the course of a battle. The infantry. armed either with clumsy matchlock muskets or equally clumsy 18-ft. pikes. was most valuable in closed country where the cavalry could not operate. Artillery was somewhat primitive. The big guns were only able to fire a ball every five minutes or so, but they were essential in siege warfare. After the first campaign the parliamentarians were better equipped with guns. For a war chest the king was largely dependent on gifts or loans from his friends and on what he could borrow from abroad. Parliament was soon able to raise new taxes including assessments, a property tax divided between the counties and also an excise levied both on imports and on some home-produced goods.

Campaign of 1642. — At the beginning of the war the armies of both sides, each numbering about 13.000 men, marched westward. The king's army moved from Nottingham to Shrewsbury and thence on to Worcester with the intention of recruiting its strength in Wales. Robert Devereux. 3rd earl of Essex (*q.v.*), commander of the parliamentarian army, left London on Sept. 9 with the object of confronting the king in the midlands. After a preliminary skirmish at Powick Bridge near Worcester (of which Prince Rupert got the better. though he allowed Worcester to be occupied by the earl of Essex) the armies lost each other until, in the second week of October. Essex learned in Worcester that the king was marching through the midlands upon London. The parliamentarian army then marched eastward so as to cut off the king. and the two armies met at Edgehill, near Warwick, where drawn battle was fought on Oct. 23. The royalist cavalry on the wings at first routed its enemy, but the king's soldiers in the centre were beaten. Both sides encamped that night on the battlefield, but the king was able to occupy Banbury and then, on Oct. 29, Oxford. Essex withdrew on London where his army was reinforced by the City's trained bands, while, after setting up his headquarters at Oxford, the king prepared to conquer the capital. Prince Rupert surprised and defeated two parliamentary regiments at Brentford in Middlesex on Nov. 12, but was unable to force the river Thames. After the two armies had confronted each other at Turnham Green the royal force withdrew on Oxford which remained the king's military headquarters for the rest of the war. Meanwhile fighting had also developed in Yorkshire, where the parliamentarians mere based on Hull under the command of Lord Fairfax (see FAIRFAX OF CAMERON, FERDINANDO FAIRFAX, 2nd Baron) and his son Sir Thomas, while the royalists holding York were under William Cavendish, earl (later marquess. then duke) of Newcastle (see NEWCASTLE, DUKES OF), and in the southwest where a royalist army was raised in Cornwall by Sir Ralph Hopton (see HOPTON, RALPH HOPTON, Baron) while Sir William Waller (*q.v.*) recruited a parliamentarian force in Gloucestershire.

Campaign of 1643. — The Fairfaxes in Yorkshire repelled a royalist attempt to expel them from the West Riding early in 1643 and on May 21 captured Wakefield, but Newcastle defeated them at the battle of Adwalton Moor (June 30) and practically the whole of Yorkshire except Hull came under royalist control. Newcastle then entered Lincolnshire. There in east England Oliver Cromwell (q v.), M.P. for Cambridge, had raised a cavalry regiment and was urging an aggressive policy. In May he had won a cavalry skirmish at Grantham in Lincolnshire and in July he repelled an enemy attack on Peterborough, but lack of trained troops prevented him from following up these successes. In the west of England Waller was beaten at Lansdown. near Bath. on July 5 and again at the battle of Roundway Down in Wiltshire on July 13. Hopton had already overrun most of Cornwall, Devon and Somerset. These royalist victories enabled Prince Rupert to march out of Oxford and to obtain the surrender of Bristol on July 26. The royalists then decided to besiege Gloucester so as to clear their lines of communication between Bristol and northwest England and gain full control of the river Severn, but Essex led his army out of London and was able to raise the siege of Gloucester early in September. On his way back to London Essex fought an inconclusive drawn battle with the king's army. which tried to intercept him, at Newbury on Sept. 20. The second year of the Civil War ended without notable results but, on the whole, the royalists had much the better of the fighting. Only in East Anglia, where the parliamentarian counties were bound together in the Eastern association, were the royalists effectively repulsed. On Oct. 11. 1643, Sir Thomas Fairfax and Oliver Cromwell defeated a royalist force at the battle of Winceby. This led to the surrender of Lincoln (Oct. 20). Apart from the London area, eastern England was the only part of the kingdom that was in firm parliamentarian control. The royalists had most of Wales and western England as well as Yorkshire.

The Search **for** Allies. — Both sides began to look for allies. The English parliament began negotiations for a treaty with the Scottish leaders, which was to be known as the Solemn League and Covenant The English sought a military alliance; the Scots a religious guarantee. After long discussions the Scots promised to send an army into England on payment of £30.000 a month, while the English undertook to bring the churches of England, Scotland and Ireland "to the nearest conjunction and uniformity in religion," though not specifically committing themselves to a rigid Scottish Presbyterianism The Solemn League and Covenant was accepted on Sept. 25, 1643, and a Scottish army of about 20.000 men entered England in Jan. 1644. Thenceforward the conduct of the war was placed in the hands of a Committee of Both Kingdoms. Meanwhile Charles I had been negotiating with the Irish. By concluding a truce or "cessation" with the rebels (Sept. 1643) he was able to withdraw royalist soldiers from Ireland to fight for him in England

Campaign of 1644. — The arrival of the Scots in England at once transformed the course of the war. Newcastle marched

north from Yorkshire to try to stop the Scots and in his absence, the Fairfaxes defeated his second-in-command, Sir John (afterward Lord) Bellasis, at the battle of Selby on April 11. This compelled Newcastle to withdraw and shut himself up in York, where he was besieged by the Fairfaxes and the Scottish army. The parliamentarians now had five armies at their disposal. Besides the Scots and the army of the Fairfaxes, an army had been formed in the eastern counties under the command of Edward Montagu, earl of Manchester (see MANCHESTER, EARLS AND DUKES OF). with Oliver Cromwell as his lieutenant general; the main army under Essex was harrassing the king at Oxford; finally. there was Waller's army from the south which on March 29 inflicted a defeat on Hopton's army at Cheriton in Hampshire.

Cnder pressure from his Anglo-Scottish foes the king's strategy had become eclectic. It seems that in 1643 he had envisaged some sort of scheme for a triple attack on London. but now he was content to stay on the defensive, using Prince Rupert to engage in sorties and to relieve threatened positions. On March 21, 1644. Rupert successfully relieved Newark, a key point between the midlands and Yorkshire. which had been besieged by the parliamentarians. Next he was sent to Lancashire to assert royalist control there and clear the way for the expected reinforcements from Ireland He took Stockport and Bolton and cleared the port of Liverpool, although he avoided Manchester. which was parliamentarian. Then he received orders from the king (in a letter dated June 14) to march to the relief of York.

Battle of *Marston* !Moor.—Early in June the earl of Manchester's army from the Eastern association joined the Scots and the army of the Fairfaxes in the siege of York, where the marquess of Newcastle was confronted by a combined force three times the size of his own. He held out for a month. At the end of June. however, Prince Rupert with an army of about 10.000 men crossed into Yorkshire, outmaneuvered his opponents and relieved York. Fearful that Rupert might now try to break through into East Anglia, the three parliamentarian armies decided to bar his advance at Marston moor. 8 mi. W. of York. There. on July 2, 1644, Rupert. outnumbered 27.000 to 17,000 (including Newcastle's men), was defeated because of the bravery and skill of Sir Thomas Fairfax, who commanded the parliamentary right, and of Oliver Cromwell, who commanded the left (see MARSTON MOOR, BATTLE OF) The king's army lost 4,000 men killed and many were taken prisoner. However, the parliamentarians failed to follow up this great victory. The Scots went north to besiege Newcastle upon Tyne; the Fairfaxes turned to clear up royalist pockets of resistance at Pontefract and Scarborough; and Manchester's army from the Eastern association returned to Lincolnshire.

Meanwhile Waller. after his victory at Cheriton, had joined Essex near Oxford. but he and Essex did not get along well together and the king was able to defeat them separately. Waller was checked at Copredy Bridge, near Banbury in Oxfordshire, on June 29 and Essex. who had marched into southern Cornwall and thereby dangerously extended his communications, was cut off and surrounded by a superior army under Charles I at the end of Aug. 1644. At Lostwithiel the whole of the parliamentarian infantry under Colonel Skippon surrendered on Sept. 2, but the cavalry man'aged to cut its way out and Essex himself fled by sea. The king did not, therefore, achieve as complete a success as he might have done. but the surrender at Lostwithiel offset the parliamentarian victory on Marston moor.

The Committee of Both Kingdoms met this disaster by ordering Manchester's army to join the remnants of those of Waller and Essex and try to defeat the king on his return from the southwest to his base at Oxford. Manchester, who was a lethargic general, had already refused to confront Prince Rupert in the northwest but by Oct. 20 he joined the armies of Waller and Essex and reluctantly agreed to attack the king at Newbury. However, the king's army was excellently posted and on Oct. 27 he beat off a two-pronged assault by his enemies at the second battle of Newbury. This virtually ended the campaign of 1644. The parliamentarian leaders were left to contemplate the fact that though they everynhere outnumbered their enemy and had superior resources and allies. two long campaigning seasons had passed without their being any nearer to compelling the king to capitulate to their political demands.

The New Model Army.—The comparative failure of the parliamentarian armies in 1644. except at Marston moor. induced parliament to agree to the formation of a "New Model army" (Feb. 1645) and to pass a Self-Denying ordinance (April 1645) whereby members of both houses were discharged from civil and military offices so as to prevent jealousies and accusations of corruption and to promote professionalism. The nucleus of the New Model army was the Eastern association's cavalry. which had bekn trained largely by Oliver Cromwell. Much of the infantry, however, consisted of new recruits. Sir Thomas Fairfax was created commander in chief, and it was he, not Cromwell, who was mainly responsible for the organization and discipline of this new army of 22,000 men. But it could not be assumed that the New Model army would at once achieve the much-needed victory, and Essex and Manchester. the former commanders, were disgruntled at their exclusion from office.

The king. on the other hand, was resilient and optimistic. He had found a champion in Scotland in James Graham, marquess of Montrose (q v.). a natural-born soldier who, in Aug 1644. had joined up with royalist troops landed from Ireland and was inflicting a series of defeats on the covenanters. In September his men sacked Aberdeen, and the Scottish army in England was compelled to send a detachment to help cope with him. The king rejected in Jan. 1645 the extreme terms offered to him by Anglo-Scottish commissioners, who met his representatives at Uxbridge in Middlesex, and in the spring he was considering leading his army from Oxford either to attack the parliamentarian base in East Anglia or going north to link up with Montrose.

Campaign **of** 1645–46.—Early in 1645 Cromwell, having had his period of command extended despite the Self-Denying ordinance, was sent with a group of cavalry to give encouragement to parliamentarian resistance in the southwest where Col. Robert Blake was desperately holding out in Taunton. Later. with his command again extended, he successfully disrupted royalist movements around Oxford. Fairfax was ordered westward at the beginning of May to blood his New Model army by relieving Taunton, but Cromwell's force was not large enough to contain the king and after three weeks Fairfax was recalled from Taunton and Cromwell retired toward Ely. The royalists decided to relieve the increasing pressure upon Oxford by assaulting Leicester, which they sacked on May 31.

Battle of *Naseby*.—When he learned this news, Fairfax abandoned his preparations for the siege of Oxford and determined to bring the king's army to battle. Cromwell was recalled to take command of the cavalry of the New Model army and a battle took place at Naseby in Northamptonshire on June 14, 1645. Better discipline, a more effective high command and the larger numbers on the parliamentarian side all contributed to its gaining a notable victory. Five thousand prisoners were taken and the royal infantry was almost wiped out (see NASEBY).

Charles I, who had left the battlefield with reluctance retreated into Wales hoping to raise fresh forces there, while Fairfax, after retaking Leicester, moved into the southwest and defeated the one remaining royalist army at Langport in Somerset on July 10. Taunton had at last been relieved and Bridgwater in Somerset was taken. Meanwhile the Scots had cleared the north of England and moved south to Hereford, though they failed to capture it. On Sept. 11, 1645. Prince Rupert surrendered Bristol to Fairfax. for which "mean action" King Charles I dismissed his best general from all his commands. But Rupert had indeed realized that the end of the war was only a question of time. On Sept. 13, 1645. Montrose's long run of successes in Scotland was brought to an end by defeat at the battle of Philiphaugh. In March 1646 Sir Ralph Hopton disbanded the remnants of his Cornish army. Oxford finally surrendered on June 24, 1646. By that time the king himself had fled in disguise from his headquarters and had thrown himself on the mercy of the Scots who were encamped at Newark. Ultimately, having come to terms with the parliamentary leaders in Jan. 1647. the Scottish army left England and handed over the king, a prisoner, to the parliamentarians. Charles was placed in

honourable captivity at Holmby house in Northamptonshire. and the victors considered how to reach a constitutional settlement.

NEGOTIATIONS IN 1647

Attitude of the King. — Though his armies had surrendered and he himself was a captive, Charles I still did not entirely despair. He boasted that the kingdom could not continue without him He still hoped to raise fresh troops from Ireland by coming to an arrangement (which he had no intention of keeping) with the Irish Catholics or to reach an understanding with the Scottish covenanters who favoured their ancient Stuart monarchy provided it nas subjected to a Presbyterian church. Above all, he felt sure that his conquerors would quarrel among themselves. Therefore, when stringent terms were offered to him by parliament, he was careful not to give a downright refusal and later he said that he mas willing to allow Presbyterianism to be established in England for three years and for parliament to control the militia for ten if only he were granted a treaty.

Quarrels Between Parliament and Army. — Parliament had permitted the New Model army to continue in being for a further six months after the end of the war. but early in 1647 it required the soldiers (apart from some garrison troops) either to disband or accept service against the rebels in Ireland. At a meeting held in March at army headquarters at Saffron Walden in Essex, the army's spokesmen demanded to know who was to take command in Ireland, what payments the soldiers would receive there and what would be done about the arrears of pay and indemnity for services already performed in England Not receiving satisfactory answers to these questions, officers and men began to agitate. To grievances over pay and conditions were added religious differences. Many of the soldiers in the New Model army were "Independents" or "sectarians" who believed in the right of congregations to organize their own services and resented being asked to serve not under their former generals but under Presbyterian commanders. So dangerous did the situation become that early in May 1647 parliament invited Cromwell and his son-in-law Henry Ireton (q v), both of whom were members of parliament and were trusted in the army, to try to persuade the soldiers either to volunteer for Ireland or to disband.

By the middle of May it seemed as if Cromwell had managed to induce the leaders of the army to agree to a compromise aith parliament provided that their arrears of pay and an indemnity nere guaranteed. But deep suspicions had been inflamed. A democratic political movement, directed by men nicknamed Levellers, stirred up further trouble, while the City of London, predominantly Presbyterian, began strengthening its militia as a deliberate counterpoise to the New Model army. The king fished successfully in these muddied waters by choosing this time to announce his willingness to accept Presbyterianism in England for three years. The army took alarm and on May 31 a certain Cornet George Joyce was sent into the midlands to make sure that the arsenal and artillery at Oxford were safe and that there was no danger of the king's being taken into the power of the Presbyterian leaders. \\.'hen he reached Holmby house on June 2, Joyce, who had collected a force of 500 soldiers, decided to compel the king to come back with him to the army at Newmarket. Cromwell upheld Joyce's action and himself went to Newmarket. Thus parliament and the army were at loggerheads.

At a meeting of the army council in July. Cromwell and Ireton resisted a demand that the army enter London, disarm the City militia and compel the release of political prisoners, who included the Leveller leader. John Lilburne (*q.v.*). They themselves attempted to come to terms with the king and offered him a constitutional scheme known as the Heads of the Proposals. But the day for compromise had passed. The Presbyterians in London, under pressure from a City mob, forced the Independents out of parliament, collected a defense force and defied the army, and General Fairfax was forced to retort by marching into London (Aug. 6 1647) and restoring order there.

The Scottish Engagement.—Now the situation deteriorated further, for there were disputations within the army betneen those who favoured the Heads of the Proposals on one side and, on the other, the Levellers and their friends who advocated, in the so-called Agreement of the People. a democratic scheme of government without the monarchy or the house of lords. Sensing his opportunity. the king (although he had given his parole) escaped from the army's custody and fled to the Isle of Wight where, though still a prisoner, he was given sufficient freedom to enable him on Dec. 26, 1647, to enter into a secret agreement, known as the Engagement, with a group of Scottish leaders. In return for Charles's firm promise to introduce Presbyterianism into England. to suppress the Independents and to grant favours to the Scots, he was given an undertaking that a Scottish army would invade England to regain his power as king.

SECOND CIVIL WAR

Defeat of the Royalists. — The Scottish Engagement and the profound dissensions between the army and parliament were the signal for widespread royalist risings. Many Presbyterians who had fought against the king in the first civil war now rose for him, and half the fleet mutinied against parliament. The second civil mar began in Wales where in March 1648 the governor of Pembroke declared himself for the king; other big revolts began during May in Kent and in Essex. General Fairfax defeated the Kentish royalists at Maidstone and then besieged those in Essex at Colchester, which held out against him until August. Cromwell had left London for Wales at the beginning of May. He was held up by lack of siege guns, but compelled Pembroke to surrender on July 11. Three days earlier a Scottish army under the duke of Hamilton had crossed the border and found no opposing forces except four regiments and some militia under Maj. Gen. John Lambert (*q.v.*). As Fairfax was still held up in the southeast, Cromwell made a forced march north and joined Lambert in the West Riding in the middle of August. The parliamentarian army mas inferior in numbers to the Scottish Engagers, who were reinforced by northern royalists and Scots from Ireland, but it was far better equipped, disciplined and led. Cromwell crossed the Pennines and struck the enemy army at Preston when it was not concentrated. The northern royalists were destroyed and the Scots were then pursued to Warrington near which a second battle was fought On Aug. 25 Hamilton himself surrendered. Cromwell then turned about and marched to the Scottish frontier, where he came to terms with Archibald Campbell, marquess of Argyll, who was not a party to the Engagement. Argyll promised that the Engagers should be excluded from all power in Scotland and. as a guarantee of his good intentions, surrendered to Cromwell the key towns of Berwick and Carlisle, which had been occupied by royalist supporters. Thus, with Fairfax's victories over the southern royalists and Cromwell's defeat of the Scots in the Preston campaign, the second civil mar came to an end.

Execution of Charles I.—The parliamentary leaders had continued to negotiate with the king in the Isle of Wight even after the Engagement. The army. however. was embittered by the second civil war. Both its northern and southern sections petitioned that the authors of the war be punished, and the Levellers asked that the king be brought to a public trial. What incensed the army was that the king and principal royalists had broken their word not to fight again and that they had engineered a fresh invasion of the north of England by a Scottish force. On Dec. 1, 1648, Fairfax sent officers to fetch the king from the Isle of Wight and, after he had been temporarily lodged at Hurst castle in Hampshire, he was taken to Windsor castle and thence to Whitehall. On Dec. 6 Col. Thomas Pride and a body of musketeers entered the house of commons, expelled all the leading Presbyterians and put some of them under arrest, an incident that came to be called Pride's purge. The remaining Rump parliament of about 60 members agreed, under pressure from the army, to an ordinance of Jan. 1, 1649, establishing a high court of justice to try the king. The remnant of the house of lords refused to accept the ordinance, whereupon the commons assumed the full responsibility and appointed 135 commissioners to act as judges and jury. The court met in Westminster hall on Jan. 20. On Jan. 27 it condemned the king to death as a tyrant, traitor and public enemy. Charles himself refused to recognize the legality of the

court and claimed that he was a martyr of the people. On Jan. 30, 1649. he was executed on a scaffold erected outside his palace of Whitehall.

THIRD CIVIL WAR

Royalist Policy.—Soon after Charles's execution, kingship and the house of lords were abolished and England became a commonwealth. or republic, with the attenuated house of commons, originally elected in 1640, exercising both executive and legislative powers. The royalists, however, regarded Charles II, the 19-year-old eldest surviving son of Charles I, as king. An exile in the Netherlands, Charles II based his immediate hopes of regaining the throne less on the English royalists, who were now entirely crushed, than on support in Scotland. where he was at once recognized as king. and in Ireland where the royalists were still fighting. Most European states preferred to wait and discover the strength of the English republic before committing themselves to war against it. Charles II's first thoughts therefore turned to Ireland, where sympathy might be translated into active assistance.

Rebellion in Ireland.—Charles I's lord lieutenant of Ireland, the earl of Ormonde, at last succeeded, in Jan. 1649, in concluding a treaty at Kilkenny between the Roman Catholic rebels, known as the confederates, and the royalists. In return for a promise of the abolition of the penal laws against them and of an independent parliament, the Irish Catholics undertook to fight for the king; soon almost the whole of the country was in their hands. The English republican parliament decided to counter the threat of a possible Irish invasion by sending Cromwell to Ireland with a well-equipped expeditionary force of 12,000 men. Even before Cromwell arrived, Ormonde was defeated at Rathmines, near Dublin, by a parliamentary army that was there already. In Aug. 1649 Cromwell's army landed at Dublin. where he was also sustained by English sea power. Prince Rupert, who was now distinguishing himself as an admiral in command of a few ships, was soon compelled to leave Irish waters, In a brief, brilliant and ruthless campaign Cromwell cleared most of southern Ireland of his enemies and after fighting through the winter returned home in May 1650, leaving Ireton to carry out mopping-up operations. King Charles II was sadly disappointed by the failure of his friends in Ireland; it had been his expectation that Ireland would become a firm base, that the marquess of Montrose would rally the Scottish royalists to his cause and that with some foreign help he might reconquer England. But an attempted rising by Montrose had already been crushed by the covenanters in April 1650 (and Montrose executed) and now Charles was reluctantly driven to come to terms with the Scottish covenanters who had humiliated and betrayed his father.

Charles II in Scotland.—Though Charles II had been proclaimed king by the Scottish estates after the death of his father, the covenanters; headed by the marquess of Argyll. demanded harsh terms for their military assistance. Sorrowfully Charles promised to uphold the Covenant and, once he was restored, to impose Presbyterianism both on England and Ireland, in an agreement signed on June 11, 1650, while he was on his way to Scotland. The English parliament, however, was determined that this time it would not suffer another invasion of northern England by a Scottish army. Thomas Fairfax, who had now succeeded to his father's title, was therefore ordered to assemble an army and lead it into Scotland. Fairfax. who had not approved of Charles I's execution and had somewhat unwillingly become a member of the republican council of state, refused on the ground that this would be an act of unprovoked aggression. Cromwell was then appointed to lead the expeditionary force and on July 22, 1650, crossed the border with 16,000 men.

The Scottish covenanter army outnumbered the English, was able to operate on inner lines and had a capable general in David Leslie. But Leslie was hamstrung by interference from the church leaders, who criticized his strategy and insisted on purging his army of doubtful elements. Nevertheless Cromwell experienced great difficulties because the country was denuded of supplies; he also found that the fortified line covering Edinburgh could not easily be outflanked. But on Sept. 3, 1650. he won an astonishing victory at Dunbar, 30 mi. E. of Edinburgh, where Leslie's larger army was outmaneuvered and shattered at small cost to the English. Later Cromwell was taken ill and bad weather held up the progress of his campaign. Meanwhile Charles II had not been unduly depressed by the defeat of the covenanters. On Jan. 1, 1651, he was crowned a covenanted king at Scone and placed in nominal command of the remaining Scottish forces, which were concentrated in a strong defensive position near Stirling. protected by the river Forth.

Charles II's Invasion of England.—Charles II's last hope was to lead the Scots into England and there rally the royalists to his cause Cromwell. finding it hard to attack the Scots in their strong position. was willing to give the young king his opportunity. He ordered his son-in-law Charles Fleetwood to raise a fresh army in England and then himself forced his way across the Forth, thus giving the king the chance he wanted to move south across the border Early in Aug. 1651 the king led an army of about 20 000 men through northwest England. hoping to pick up recruits both in Lancashire and in Wales and, having incited a general rising. to advance in triumph on London. But his progress was harrassed by cavalry under Lambert's command and Cromwell, after taking Perth followed Lambert with the bulk of his army. On Aug. 24 Fleetwood joined Cromwell at Warwick and early in September Charles II and his tired troops were surrounded and cut off at Worcester

The young king put up a gallant fight at Worcester on Sept. 3, 1651, but the Scots were demoralized and overwhelmed. Few escaped home For the remainder of the period of republican supremacy Scotland, like Ireland, mas subject to the English Commonwealth. Charles II himself escaped from Worcester and after many adventures arrived safely in France. Some royalist strongholds in Scotland hung out until 1652 and abortive royalist rebellions continued to take place until the Restoration, but the battle of Worcester marked the real end of the English Civil War.

EFFECT OF THE CIVIL WAR

The loss of life, suffering and damage caused by the Civil War were relatively small. On the whole the first civil war was conducted in a humane spirit with courtesies extended across the lines. Bitterness was felt in the second civil war, but episodes such as the sack of Leicester by the royalists in 1645 and the slaughter at Drogheda by the parliamentarians in 1649 were exceptional. Economic losses were heaviest among what may be called the lower middle classes; but considerable unemployment, poverty and hardship were general in the late 1640s and overseas trade was interrupted by an increase in privateering at sea.

On the whole, the war was fought by amateurs and there was no striking evolution in the arts of war. Both Prince Rupert and Oliver Cromwell used the cavalry as a shock weapon, which was sharpened as the war went on. In the infantry, Rupert introduced new formations which he had learned on the continent and which owed their origin to Gustavus II Xdolphus of Sweden Both Fairfax and Cromwell sought to meet their enemies in the field rather than allowing themselves to be bogged down in prolonged sieges, as was customary on the European mainland until the days of Turenne and Marlborough. One consequence of the Civil War was an enduring dislike in England of a standing army.

The Civil War influenced the development of social and economic ideas. The natural leadership of the nobility and established gentry was to some extent temporarily undermined, and on the parliamentarian side men of comparatively humble birth rose to high positions. For a while the whole social and constitutional order was called into question by the democratic Levellers and army "agitators," though the Leveller movement continued for little more than a decade. Above all, the destruction of the church hierarchy and the Puritan victory in the war brought about increasing demands for complete liberty of worship and liberty of conscience among Christians. This independence of outlook. which was particularly marked in the New Model army, survived the Restoration and contributed to the strength of later English Nonconformity See ENGLISH HISTORY: CHARLES I: CROMWELL, OLIVER; see also references under "Civil War, English" in the Index volume.

CIVITA CASTELLANA, a town in the Lazio region of Italy. in the province of Viterbo, is 29 km. (18 mi.) E.S.E. of the town of Viterbo, on the railway from Viterbo to Rome. Pop. (1957 est.) 12.699 (commune). The town is possibly on the site of the 9th-century B.C. Falerii. The cathedral, begun in the 7th century A.D. and destroyed and reconstructed after 1000. is one of the oldest in Italy. The facade and doors are by the Cosmati; the remarkable porch of Jacopo (son of Lorenzo) and his son Cosma inspired Brunelleschi in the design of the front of the Pazzi chapel in the cloister of Sta. Croce at Florence. The apses contain Lombardic elements, also present in the Romanesque church of S. Gregorio. Outside the town is the 12th-century church of Sta. Maria of Falerii. The imposing pentagonal fort was built by command of Pope Alexander VI in 1491 and the octagonal keep by order of Pope Julius II in 1512. The people are mainly occupied in the production of cereals and in viticulture. There is also an important ceramics industry.

Falerii Veteres, the capital of the Falisci, was in existence in the Iron Age. Faliscan vases of local make have been found in its very rich necropolis. It was destroyed in a struggle against Rome in 395 B.C. and again during the Punic Wars (*q.v.*). The inhabitants were moved to the plain where Falerii Novi was built and where ruins of the walls. nearly 2 mi. long, are standing. Falerii became part of the domain of the church and in 998 Pope Gregory V gave it the title of *civitas.* In the 14th century it was given to the princes Savelli. It was raised to an episcopal see in 990 and Orte (1437) and Galese (1805) were later united with it. (M. T. A. N.)

CIVITAVECCHIA, an episcopal town in the Lazio region of Italy, in the province of Roma. 76 km. (45 mi.) W.N.W. of Rome by road, is the principal seaport for Rome and central Italy. It is on the Rome–Pisa railway line. Pop. (1957 est.) 37.543' (commune). Three-fourths of the town was destroyed during World War II, and the subsequent reconstruction was spread over a larger area. The rebuilt civic museum was endowed with the world's largest collection of engravings by Luigi Calamatta, a native of the town. A short distance outside the town, on the road to Tolfa and in the Fioncella area, are imposing ruins of Roman baths. In addition to the maritime traffic. the town's industries include a thermoelectric centre. cement, brick and spirits factories. mechanical laboratories and workshops for the treatment of marble.

The port, on a stretch of coast'already known as Centumcellae. was founded by the emperor Trajan to replace the silting-up harbours on the Tiber. The Porta di Traiano is preserved in the central part of the modern port. Flourishing during the late Roman empire. the town was attacked by Vandals and Saracens and the people fled to the Monti di Allumiere. The settlement there. originally called Cencelle. was renamed Leopoli after Pope Leo IV. who constructed, in 854. a walled town protected by towers. Later the inhabitants returned to the old site. Several popes interested themselves in the protection of the port. The keep, commissioned by Paul III from Michelangelo, was finished in 1537 and the naval arsenal was begun in 1663. By 1870 the town was the most strongly fortified in the states of the church.

CLACKMANNAN, an ancient town of Clackmannanshire, Scot.. formerly the county town but now a civil parish, about 12 mi. W.N.W. of Dunfermline by road. Pop. (1951) 3,024. Clackmannan ton-er (in ruinsj was at one time the seat of the Bruce family and is now an ancient monument under the care of the ministry of works. The Tollbooth and Mercat cross still exists, and with this group stands the stone that gives the town its name (Gaelic, *clach,* "stone"; *Mannan,* the name of the district). In the area are three collieries: the Forth paper mills at Kilbagie and a woolen factory in Clackmannan. (N. A. S.)

CLACKMANNANSHIRE, the smallest county in Scotland. is bounded on the southwest by the river Forth, west by Stirlingshire, north by Perthshire and east by Kinross-shire and Fife. Area 54.5 sq.mi. Pop. (1961) 41.391.

The northern half of the county is the southwestern part of the Ochil hills. a dissected moorland plateau of 1,900–2.000 ft. (Ben Cleuch. 2.363 ft.) planed across andesitic lavas and tuffs of Old Red Sandstone age. with intrusive hypersthene-diorite in Kirk Crags, northeast of Tillicoultry. The Ochils have a spectacular fault-line scarp facing south across the woods: the farm land. the pit heads and small towns of lowland Clackmannanshire. First are the alluvial fans laid down by the Ochils streams; then across a plain the river Devon winds to a low (about 250-ft.) plateau. narrow in the west but broadening toward the east of the county: and then the carse-land fringes the Forth in the south, with a belt of 100-ft. raised beach on the inland side. The lowlands are planed across the outcrops of a south-north trending syncline in Carboniferous rocks: Barren Red Lleasures in the centre. the Coal Measures around these and then the sandstones of Millstone Grit age in belts on either side of the Coal Measures; the synclinal structures are abruptly terminated in the north by the Ochils fault. The rivers of importance are the Devon, noted in its upper reaches for its scenery and trout fishing, and the south or Black Devon. The only loch is Gartmorn dam, which provides the main water supply to Alloa. (A. T. A. L.)

The early inhabitants belonged to the great Celtic tribe known to the Romans as Damnonii. Later the county was part of the district of Mannan, disputed land in central Scotland. About the close of the 7th century St. Serf. who had come to the Fife peninsula to convert the Picts. visited Tullibody, Tillicoultry and Alva; a well at Alva and a bridge over the Devon commemorate his name. The victory of Kenneth MacAlpin, king of the Scots. over the Picts in 844 is said to have taken place near Tullibody, a stone near Baingle brae marking the battlefield. It is said that in 1559 the bridge over the Devon at Tullibody was broken down to impede the passage of French troops in the service of Llary of Lorraine (or Guise): but the French unroofed the church and repaired the bridge. In 1645 the royalist force of the marquis of hlontrose burned Dollar and also Castle Campbell, one of the seats of Montrose's bitter enemy. the marquis of Argyll. By way of reprisal Argyll burned Menstrie house, the seat of the earl of Stirling.

Clackmannan (*q.v.*) was formerly the county town. but the administrative centre is now the small burgh Alloa (*q.v.*). The other small burghs are Alva, Tillicoultry and Dollar (*q.v.*). The county, with part of Stirlingshire, returns one member to parliament. It forms a sheriffdom with Stirlingshire and Dunbartonshire.

The county has a diversity of agricultural holdings, from the sheep farms of the Ochils through the arable and dairy farms in the centre to the carse farms in the south, these last being on land reclaimed from the Forth by the erection of flood banks. Agriculture suffers from land subsidence caused by the extraction of coal which is one of the county's main sources of wealth. In the early

1960s it was estimated that there were unworked reserves in the productive Coal Measures alone to ensure work for 100 years. With the closure of Devon and Meta pits. the surface mines at Forthbank, Zetland and Brucefield and the new mine at Glenochil, northeast of Tullibody, no mine sinkings will be operative; although increasingly coal is being taken from under the county from works near Dollar and at Manor Powis. After World War II miners were transferred from Lanarkshire. and the population of Tullibody has grown. The county's chief manufacturing industries are general engineering, textiles, distilling, brewing, papermaking, printing. woodworking and glass manufacture. (AL. ST.)

CLACTON-ON-SEA, a seaside town and urban district of Essex, Eng.. 15 mi. S.E. of Colchester and 66 mi. E.N.E. of London by road. Pop. (1961) 27,543. Electrification of the London–Clacton railway line was completed in 1962. The urban district comprises Clacton. Great Clacton, Holland-on-Sea and Jaywick and has over $3\frac{1}{2}$ mi. of sandy beaches backed by low cliffs laid out with sea defenses, promenades, chalets, greenswards and gardens. On the pier are a ballroom, theatres, amusement pavilion, open-air swimming pool and lifeboat house. There are four theatres in the town. a pavilion and winter garden and many other amusement and sports centres. In the summer season steamers cruise down the coast and across the English channel to Calais. Great Clacton church is of Norman and later date and St. Osyth priory (4 mi.) is of considerable beauty and historic interest with buildings dating from the 13th century. The chief industries are tourism, printing, light engineering, manufacture of plastic articles and horticulture. (C. B. HE.)

CLAIRAUT (CLAIRAULT), **ALEXIS CLAUDE** (1713–1765), French mathematician, was born on May 7 or 13, 1713, at Paris. Under the tuition of his father, a teacher of mathematics, he made such progress that at 12 years of age he read before the French Academy an account of the properties of four curves that he had discovered. His *Recherches sur les courbes à double courbure* (1731), procured his admission into the Academy of Sciences, although he was still below the legal age. In 1736, with P. L. Maupertuis, he went on an expedition to Lapland, for the purpose of estimating a degree of the meridian; and in 1743 he published his treatise *Théorie de la figure de la terre,* in which he promulgated the theorem known as Clairaut's theorem, which connects the gravity at points on the surface of a rotating ellipsoid with the compression and the centrifugal force at the equator. In 1750 he gained the prize of the St. Petersburg academy for his essay *Théorie de la lune;* and in 1759 he calculated the perihelion of Halley's comet. He also detected singular solutions in differential equations of the first order, and of the second and higher degrees. Clairaut died at Paris on May 17, 1765.

CLAIRON, LA (CLAIRE JOSEPHE HIPPOLYTE LÉRIS) (1723–1803), French actress, was born at Condé-sur-Escaut on Jan. 25, 1723. She began her career as a provincial soubrette, making her début at the Comédie Française on Sept. 19, 1743, in the role of Phèdre. La Clairon's style was that of the declamatory school, and she was best suited for parts that called for nobility of soul and pride coupled with intelligence (Corneille's heroines); in rendering moments of tender sentiment she could not surpass her rival, Marie Françoise Dumesnil. The playwright J. F. Marmontel prevailed upon her to change her acting style and to trim the declamatory display in favour of greater simplicity, the "conversion" taking place in 1753. Soon after, prompted by Diderot, the actress also changed her traditional style of costuming by introducing touches of character and ethnography. In 1766 she retired, though she continued to appear at court and in private theatricals. Her *Mémoires,* which she had written for posthumous release, were published in 1798. She died in Lille, Jan. 29, 1803. (A. M. S.)

CLAIRTON, a city of Allegheny county, Pa., U.S., lies on the Monongahela river, 12 mi. S.E. of Pittsburgh, and is part of the Pittsburgh metropolitan area. Its major industries are steel, coke and benzol plants. The rolling mills at Clairton produce about 130 varieties of construction steel, while the coking plant produces large quantities of smokeless fuel, coke and raw materials used in the chemical industry in manufacturing medicines, plastics, paints and highway-surfacing materials. By-products of the coke plant are further processed by a large industrial chemical plant.

Clairton became a borough in 1903 .and was incorporated as a city in 1922. For comparative population figures *see* table in PENNSYLVANIA: *Population.* (M. R. WO:)

CLAIRVAUX, a village of northeastern France. in the *département* of Aube (*q.v.*) 64 km. (40 mi.) E.S.E. of Troyes by road. is situated in the valley of the Aube on the eastern border of the forest of Clairvaux. Pop. (1954) 533. Its abbey. founded in 1115 by St. Bernard (*q.v.*) of Clairvaux, became the centre of the Cistercian order (*see* CISTERCIANS). The buildings belong for the most part to the 18th century, but there is a large storehouse that dates from the 12th century. In World War II Clairvaux was in German occupation from June 1940 to Aug. 1944. For a description of the abbey, *see* MONASTERY.

CLAIRVOYANCE, a form of extrasensory perception, the ability to discern objects not present to the senses (as distinguished from telepathy, the cognition of the mental activities of another person). *See* PARAPSYCHOLOGY.

CLAM, in its widest usage, is a name applied to about 15.000 species of bivalve or two-shelled mollusks; the term refers to the tightness with which the shell closes. Four-fifths of these species inhabit the sea or brackish waters, the remainder dwelling in fresh water. Within this large group of aquatic animals are found the fresh-water mussels (Unionidae); also readily recognized are

FIG. 1.—FRESH-WATER CLAM (ANODONTA) SHOWING: (A) INTERIOR OF RIGHT VALVE; (B) EXTERIOR OF LEFT VALVE; (C) POSTERIOR

oysters with unequal shells, cockles. scallops with fluted shells and marine mussels with tapering front ends. Clams in the restricted sense include bivalves with smooth, equal shells, closed by two adductor muscles situated at opposite ends of the shell, and possessed of a powerful muscular foot with which they burrow into the bottom. There they lie, from just under the surface to up to two feet for the delicate angel wing, *Barnea costata.* Rarely do they travel over the bottom as is typical of fresh-water mussels.

Most clams inhabit shallow water, where they are protected from wave action by the surrounding bottom. During severe storms. however. tons of surf clams. *Spisula solidissima,* may be deposited on the beach. A species of Abra clam, *Abra profundorum,*

has been taken in the mid-North Pacific at a depth of over three miles.

Water is drawn in and expelled through two tubes. the siphons, impelled by the beating of millions of microscopic whips, called cilia, of the gills. Other cilia strain food from the incurrent water and transport it entangled in mucus to the mouth. Reproduction is usually through a free swimming larva developed after eggs and sperm are shed into the water. In a few species, such as the gem clam. *Gemma*, eggs fertilized by sperm drawn in with incurrent water develop within the mother into young adults that are born alive.

The best known life history of a clam is that of the hard-shell clam or quahog. *Mercenaria (Venus) mercenaria*, of the east coast of North America. Ripe male and female clams, in water approximating 77° F., are stimulated to spawn by addition of fresh clam sperm. Eggs and sperm are extruded from the excurrent siphon. The fertilized egg, developing into a microscopic larva with a bivalve shell, is known as a veliger from its ciliated swimming organ, the velum. The velum also aids in gathering minute plants and bacteria from the water. After approximately one week of this free-living existence the larva drops to the bottom and crawls actively about on its ciliated foot. It then secretes a very thin horny thread the byssus, attaching itself to one or more sand grains or to a shell. After several weeks it releases the byssus thread and burrows into the bottom.

FIG. 3.— LEFT: TRUNCATED MYA (MYA TRUNCATA), RIGHT: QUAHOG (MERCENARIA MERCENARIA)

In size clams range from pinhead-sized gem shells to the giant *Tridacna* of coral reefs of Australia and the East Indies. These latter clams, reaching lengths over 4 ft. and a weight of 500 lb., are unique in that during evolution the soft parts have rotated 180° within the shell, with the foot passing through a separate opening adjacent to the hinge. The upper edges of the mantle, the tissue that secretes the shell, are spread broadly beyond the shell margins in *Tridacna* and are brilliantly coloured, orange to purple, by a host of microscopic algae growing in symbiosis or partnership with the clam. These zooxanthellae as they are called are thought to absorb wastes from the clam and in turn furnish much food to their host.

Among the most widely used clams for human food are the quahog (*Mercenaria mercenaria*). ocean quahog (*Arctica islandica*), soft-shell or long-necked (*Mya arenaria*) and surf (*Spisula solidissima*) clams of eastern North America. On the Pacific coast are found the pismo (*Tivela stultorum*). butter (*Saxidomus nuttalli*). giant razor (*Siliqua patula*), gaper (*Schizotherus nuttalli*) and jackknife or broad razor (*Tagelus californianus*) clams. The largest of the Pacific clams is the geoduck (pronounced gooey-duck) (*Panope generosa*) weighing up to 6½ lb It is delicious eating and is much sought after; in most localities catches are limited to one clam per day.

Clams are less abundant in European waters, but the common razor clam (*Ensis directus*) and a large razor clam (E. *siliqua*), the latter reaching a length of seven inches with breadth of over an inch, are sought for eating. The powerful foot of E. *siliqua*, extended by blood pressure, can pull the clam rapidly down into the sand, aided by water jets from the gill chamber. When expanded against the walls of the burrow. the foot holds so firmly that efforts to dislodge the bivalve will frequently break the clam in two. American jackknife clams. about three inches long, have been observed swimming in rapid spurts by water jets expelled about the foot. *Mya* species hale been introduced to the Pacific coast and to British waters, but thus far they have found little favour with the English people, who prefer the cockle

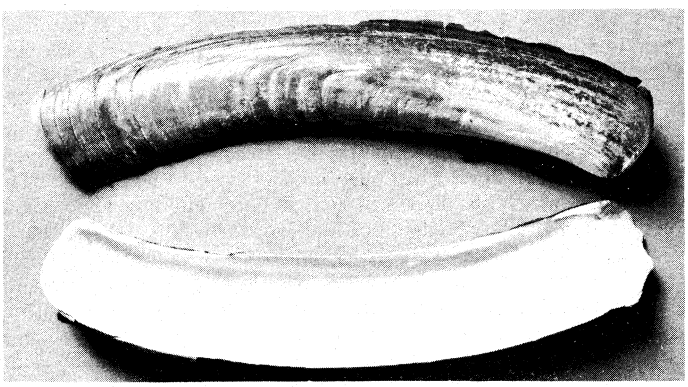
FIG. 4.—ATLANTIC SURF CLAM (SPISULA SOLIDISSIMA) SHELLS OF A YOUNG SPECIMEN AT UPPER RIGHT

Following serious depletion of *Mya* on the New England coast, where it is strongly preferred to the hard clam. large beds were discovered in Chesapeake bay. In New England harvesting is done at low tide on exposed flats. using a clam rake by hand. whereas in Maryland hydraulic dredges are employed in areas never uncovered by the tide.

Mya is much prized in America as steamed clams eaten with melted butter, and for chowder in which the ground clams are combined with salt pork, onion and potato in a rich cream sauce with milk. Manhattan clam chowder consists of the quahog clam. with carrots but without cream sauce and milk. Small quahogs are eaten raw as the so-called cherry stones. These and oysters on the half shell are perhaps the only animals eaten alive by North Americans. A small clam (*Paphia*) of Japan is canned and exported. The large surf clam of the eastern U.S. is canned in large quantities, but substantial numbers are also used for bait. The surf clam and *Mya* have poor keeping qualities, hence they must be promptly consumed or canned. In sharp contrast, the quahog, under refrigeration, will keep for weeks since it can close its shell tightly, thus excluding air Thus sealed the hard clam lives under oxygen-free, or anaerobic, respiration, breaking down its stored glycogen to produce energy. The resulting end product, lactic acid, is neutralized by solution of lime from the inner surface of the shell. *Mya*, with its long siphons, and the surf clam, with heavy mantle borders, are unable to close tightly and are thus exposed to the air.

Numerous animals other than man also enjoy eating clams. Chief among the predators of hard-shell, soft-shell and surf clams are blue crabs (*Callinectes*), green crabs (*Carcinides*), horseshoe "crabs" (*Limulus*), clam borers (*Polynices*), several species of small mud crabs and rays. The crabs either crack the clam shells with their claws or chip away bits from their edges to gain



JOHN H. GERARD FROM THE BARKER COLLECTION

FIG. 5.— COMMONRAZOR CLAM (ENSIS DIRECTUS) OF NORTHERN ATLANTIC SHORES

entrance to the meats. *Limulus* grinds young bivalves between spines. the "chewing" gnathobases, borne on bases of their legs. Clam borers drill a neat hole through the clam shell with their rasping tongue, the radula

The value of annual harvest of hard-shell. soft-shell. surf and razor clams and ocean quahogs in the United States approximates $10.000.000. Several species too small to market are consumed as a broth. Vast numbers of small species and young of larger ones are eaten by bottom-feeding fishes, chief among them the common plaice of Europe. Other small clams include various duck clams such as the dwarf surf clam (*Mulinia lateralis*) Heavy clam shells have been used as shell money by Indians *(see* WAMPUM). Perhaps the greatest value of all bivalve mollusks is in straining microscopic life, plankton, from the water and transforming it into human food either directly. or indirectly through fish.

CLAN, a group of fundamental importance in the social structure of many societies in which membership is socially defined in terms of unilineal descent, either matrilineal or patrilineal. Normally clans are exogamous, *i.e.,* marriage within the clan is forbidden and regarded as incest *(see* EXOGAMY), but the occurrence of unilineal groupings without exogamy, as among the Arab tribes or some of the Polynesians, has led to a broader conception of the clan in recent years.

The terminology employed for the clan has gone through a number of permutations during the past century. During the latter half of the 19th century the term "clan" was employed for a wide variety of groups, some based on unilineal descent but others characterized by totemic beliefs or occupation of a common territory The early cultural evolutionists used the term for both patrilineal and matrilineal groupings and assumed that matrilineal descent nas prior to patrilineal. Growing evidence against this evolutionary sequence and the ethnographic differences between the tno types of descent groups led American ethnologists in the early 20th century to designate the patrilineal clan as a "gens" (pl. gentes). W. H. R. Rivers, in England. proposed the term "sept" in place of clan. since the Scottish clan from which the term derived was neither unilineal nor exogamous. Later, Robert H Lowie suggested the substitution of "sib" for clan and referred to "father-sibs" and "mother-sibs" in an effort to clarify the situation

Soon afterward the conception of a "lineage" as a unilineal group which could trace actual genealogical relationships was developed by E. W. Gifford. A. A. Goldenweiser, Rivers and others, under such terms as the "maternal family," the "joint family," etc. Empirically, subdivisions of clans had been long recognized, but this new distinction was to have considerable theoretical importance, particularly in England, where the term lineage came to be used for unilineal descent groups with genealogical control and corporate functions. in contrast to wider and often dispersed divisions of society in which there is a belief in, but no proof of. common descent and mhich are commonly called clans. In some African societies such as the Tallensi there are lineages of different genealogical depths, for which M. Fortes has proposed the terms maximal, major, minor and minimal lineages.

G. P. Murdock, in a recent attempt to standardize the terminology for social groupings. has proposed the use of lineage and sib for consanguineal kin groups and has utilized the term clan for residential groupings based on unilineal descent and unilocal residence—often called "localized clans" in the literature. This latter usage has not as yet received widespread support, however.

P. Kirchhoff has attempted to make a distinction of a different character. between a unilineal. exogamous clan in which every member is of equal standing and what he calls a "conical" clan, in which nearness of relationship to the founding ancestor is of greatest significance and where no two individuals have the same status. Such "clans" depend on genealogical control but are not necessarily unilateral or exogamous. As such they may lead over to bilateral descent groups which may have some aspects of clan structure and function and which have been recently called "nonunilinear descent groups" by W. H. Goodenough and others.

Despite the variations in terminology. considerable progress has been made in understanding the role of clans in human society. The clan is first of all to be clearly distinguished from the family. Where the clan is exogamous—and this is the case in the great majority of instances—the husband and wife have to come from different clans. The clan or lineage can therefore not stand alone normally, and marriage is one of the major means by which clans are organized into a social structure. Within such families the children belong with the mother and her relatives in matrilineal descent, and with the father and his relatives in patrilineal descent. In a few societies both matrilineal and patrilineal clans coexist, and children belong to their father's patrilineage or clan and their mother's matrilineage or clan *(see* KINSHIP; MATRIARCHY).

Through various rules of residence it is possible to keep certain clan members together in the same household or locality. Thus the Hopi Indians. who are organized into matrilineages and clans. have a general rule that the husband goes to reside in the wife's natal household. The household thus comes to have a lineage segment of women as its core, plus husbands who marry in and minus brothers who marry out. In many African societies, such as the Zulu, the household is patrilineal and patrilocal. the wife or wives coming to live in the kraal of the husband and his sons. Not all societies with patrilineal descent are patrilocal, however. Thus the Omaha Indians of Nebraska, who were organized into patrilineal clans, lived in earth-lodges during the fall and spring in matrilocal fashion but hunted as a group during the summer in tepees with patrilocal residence. And some matrilineal groups such as the Tlingit and Haida Indians of the northwest coast of North America, and certain tribes of central Africa, practised avunculocal residence in which the males go to live with their mother's brothers, either as children or for marriage *(see* AVUNCULATE).

In a few extreme but theoretically interesting cases the clan or lineage is also a residential group. Among the Nayar caste of southern India the matrilineage occupied a household and estate in common and resided together. After ritual marriage and divorce a Nayar woman took lovers from neighbouring Brahman castes or other Nayar lineages, but the father had no rights over his children who belonged to the matrilineage. The Menangkabau of Sumatra had a similar system in mhich marriages took place but the husband remained in his own household and visited his wife at night; otherwise he had little place in his wife's group. In strong patrilineal societies similar results may be accomplished by incorporating the wife into the husband's clan or lineage. often through the exchange of bride wealth. Thus in China a wife became practically a member of her husband's lineage and lost most of her rights in her own clan. Among some of the neighbouring Mongol tribes, such as the Monguor of Kansu province, a wife who was mistreated had only one recourse—suicide. This brought her entire body of clansmen to the husband's camp, where they remained until a large indemnity was paid. But in the majority of cases marriage represents an alliance between clans or lineages, and both maintain an interest in the marriage and the children.

Within the clan the members consider themselves as consanguineal relatives, whether or not they can trace relationship genealogically. This is generally expressed by the use of kinship terms between clansmen, as well as by hospitality and support. In many societies the kinship system is organized in part according to the clan or lineage structure. Thus a Hopi Indian has his closest relations in his own matrilineage and clan but is also considered a "child" of his father's matrilineage and clan. All of his father's clanspeople are "father" and "father's sister." regardless of age or generation; likewise, his mother's father's clanspeople are all "grandfathers" and "grandmothers." Within his own clan a Hopi distinguishes "mother" and "mother's brother," "brother" and "sister," and "son" and "daughter," or "nephew" and "niece." but all who marry into the lineage are generally classed together regardless of generation as "male relative-in-law" or "female relative-in-law." While distinctions are clearly made between close relatives, similar attitudes and behaviour are expected.

Looking at clan societies from without, the clans may be seen as equivalent divisions of society which often have parallel func-

tions as well as special duties. Individual clans may have charge of particular ceremonies or may furnish certain officials, political or religious. The unity of the clan is often expressed in terms of the possession of a common emblem or totem (see TOTEMISM). When totemism occurs, and it is not universal in clan-organized societies. each clan may have a special association with a plant or animal species. or some aspect of nature, and may perform rituals to marntain the species or express respect by not eating it. In some cases there is a belief in descent from the totem animal or in a joint ancestry in some primeval period.

Recent research has also emphasized the significance of the clan or lineage as a corporate group. Sir Henry Maine long ago called attention to the primary attribute of the corporation in terms of perpetuity or self-continuation. and Max Weber expanded this conception to include a locus of authority and rules of membership. Maine's conception was first applied to the analysis of iineage structures by A R. Radcliffe-Brown, in terms of the concept of perpetual corporate succession and the necessity of defining rights over persons and property in unequivocal terms This analysis has had fruitful results in recent social anthropological research on African societies, particularly those with segmentary lineage structures In such societies an individual has status only as a member of a lineage, and the lineage frequently operates as if it nere a single personality. The lineage perpetuates itself from generation to generation, controlling rights over new members and maintaining ties nith past generations through ancestor worship and other rituals. The lineage is often the political unit as well. One aspect of the lineage as a corporate group is seen in blood vengeance. in many cases all members have collective responsibility tor revenge or compensation and each is equivalent as an object of revenge.

The problem of maintaining the lineage structure involves the processes of fission and fusion, as well as continuity. The lineage is dependent on the accidents of birth and death for its perpetuation, and there are fictive devices, such as adoption or replacement by a related lineage. to maintain structures in danger of loss. Where lineages grow too large for their resources they frequently split and form sublineages or separate lineages Or if too small they may merge with another lineage. In such cases the genealogies or traditions are frequently altered to mirror the new situation.

In many African societies the lineages segment at intervals and operate in complementary relationship or in opposition to one another, as described by E. E. Evans-Pritchard for the Nuer. Among some groups the process of segmentation follows relatively regular intervals, and the resulting segments may be organized in hierarchical fashion, as among the Tallensi

The early evolutionists considered clan organization to be characteristic of primitive society. though they set up various hypothetical periods of promiscuity and group marriage for earlier stages. Clan organization, however, is not found among the technologically simplest peoples now existing such as the Pygmies and Negritos, the Great Basin Shoshone, the Bushmen and some of the Siberian peoples. Nor is it characteristic of modern western nations with their highly advanced technologies. Between these is a wide range of societies—from Australian aborigines and many American Indian and African groups to certain peoples of India and China—where unilineal institutions are present or flourish.

Within this wide range of societies a number of explanations have been offered for the development of clan organization Since similar forms occur in widely separated regions, Lomie early rejected diffusion as an adequate explanation and proposed that the transmission of property rights and the mode of residence after marriage were the most important factors for establishing unilateral descent. Murdock has recently further documented their importance. The significance of rights over property and persons has been noted in connection with the discussion of corporate groups and may well be the most important aspect of clan formation In technologically poor groups, small-scale settlements are the rule and bands are often fluid and unstable. Here the tribe as a whole may act as a type of corporate group to maintain nhat continuity and stability there is. Where such groups become attached to particular localities, as in Australia, clan organizations may develop on a considerable scale.

In regions such as central Asia, L. Krader has shown a correlation between the ecology of pastoral life and the type of genealogically controlled lineage structure characteristic of Turkic and Mongol peoples; and E. Bacon has suggested that this type of organization may have been widespread in Eurasia. Practices of preferential marriage between clan groups give rise to special forms of social structure, but the causal significance of preferential marriage for the development of clans is still a moot question.

Clans are often grouped into larger aggregations, usually called phratries, which may also be exogamous. In other instances the clans map be grouped into two major divisions, called moieties; or the whole tribe may be divided into two exogamous halves, with or without further subdivisions. Such moieties frequently have a number of reciprocal functions! in addition to exogamy, and often are associated with a dual organization of the cosmos. Other forms of dual organization exist mith some aspects of exogamous moieties, but they have a different structure and presumably a different origin. *See* DUAL ORGANIZATION.

CLANRICARDE, EARLS OF. The Irish title of earl of Clanricarde was created in 1543 for ULICK DE BURGH (d. 1544), the head of the MacWilliam Uachtar branch of the Burke or De Burgh family (*q.v.*). As head of his clan, he exercised a quasi-royal authority, holding vast estates in County Galway. In 1541 he wrote to Henry VIII, placing himself and his estates in the king's hands. He visited the king at Greenwich in 1543, made full submission, undertook to introduce English manners to Ireland and was made a regrant of most of his old estates with some new ones. On July 1, 1543, he was made earl of Clanricarde and Baron Dunkellin but he did not live to enjoy his new rank long, dying in Ireland on Oct. 19, 1544.

Ulick's son and grandson, succeeding in turn, continued to be loyal to the English, supporting them against the Irish rebels. RICHARD (1572–1635), 4th earl, who succeeded in 1601, fought on the English side in Hugh O'Neill's rebellion and was granted the English earldom of St. Albans in 1628. His son Ulick became marquess of Clanricarde in 1646 (see CLANRICARDE, ULICK DE BURGH, Marquess of), but on his death the marquessate and English titles became extinct. His cousin RICHARD (d. 1666), 6th earl, succeeded to the Irish earldom in 1657. JOHN (1642–1722), 9th earl, fought for James II in Ireland. He was imprisoned in 1691 and attainted. but he conformed to the established church in 1699 and was restored to his titles and estates in 1702. His descendant HENRY (1743–97), 12th earl, was created marquess of Clanricarde in 1789, but died without male issue. The marquessate was revived in 1825 for ULICK JOHN (1802–74), 14th earl, who was ambassador to St. Petersburg (1838–41), postmaster general (1846–52) and, for three weeks in Feb. 1858, lord privy seal. He was also given an English title as Baron Somerhill in 1826. On the death of his son HUBERT GEORGE (1832–1916), 2nd marquess, all the titles became extinct except the earldom of Clanricarde which had been created with special remainder for the 13th earl in 1800. This passed to George Ulick. 6th marquess of Sligo.

CLANRICARDE, ULICK DE BURGH, MARQUESS OF (1604–*c.* 1657), Irish statesman, one of the few influential Roman

Catholics to support the king in the civil war in Ireland, 1641–52, and a courageous opponent of the parliamentarians. He was born in London in 1604, son of Richard, 4th earl of Clanricarde, and Frances, daughter of Sir Francis Walsingham and the widow of Sir Philip Sidney and of Robert Devereux, ear! of Essex. Ulick married Anne Compton in 1622. When his father was created earl of St. Albans in 1628, Ulick became Lord Burgh, and he succeeded to his father's titles in 1635. The new earl strenuously opposed Thomas Wentworth (soon earl of Strafford) in the projected plantation of Connaught, and despite Strafford's objections Clanricarde was confirmed in his huge Connaught estates and privileges in 1640, the plans for plantation being finally abandoned in 1641.

After the outbreak of the civil war in Ulster (1641) Clanricarde succeeded in persuading the Galway gentry to remain neutral, in spite of the provocative policy of the lords justices which had led many Roman Catholics to join the Confederated Catholics at Kilkenny *(see* IRELAND: *History).* When the people of Galway city. resentful of the English garrison's rough tactics, besieged the fort. Clanricarde negotiated the peaceful evacuation of the garrison, and his prestige. enhanced by his protection of English refugees, forced the lords justices to accept the solution. In 1643 Clanricarde was appointed one of the royal commissioners to negotiate with Kilkenny and arranged a truce; he was, however, unable to organize an expedition against the Scots who refused to accept it. In the peace negotiations of 1646 he urged the marquess of Ormonde to accept the demands that Catholics should retain the church lands they had occupied since 1641 and should be exempt from Protestant episcopal jurisdiction. In 1646 he was created marquess of Clanricarde. G. B. Rinuccini. the papal nuncio to Kilkenny. foiled his attempt to arrange an "engagement" between Thomas Preston and Ormonde. In 1648 Clanricarde unsuccessfully urged the nuncio to withdraw his censures on the truce between the confederates and Lord Inchiquin. but he managed to influence many confederates to accept his "declaration" against the parliamentarians. On the subsequent alliance of Kilkenny with Ormonde. Rinuccini aithdrew from Ireland

Ormonde, making no progress against Oliver Cromwell, left Ireland in 1650, appointing Clanricarde his deputy. While Clanricarde was supported by some of the Catholic clergy, he opposed those nho had upheld Rinuccini and. in 1651, abrogated a treaty to confer a hereditary protectorate of Ireland upon Charles, duc de Lorraine. if he helped drive out "the heretics." Though lacking military ability and forces and handicapped by Charles II's disavowal in Scotland of the Ormonde treaty, Clanricarde courageously kept the field in Ireland even after the royalist defeat at Worcester (1651). On the fall of Galway in May 1652 he was forced to capitulate He obtained fairly good terms for his army and was himself allowed to retire to England. where he remained until his death at Somerhill. Kent. in 1657 or 1658. Clanricarde was greatly respected by royalists and moderate Catholics, but not by the separatists or by the ecclesiastics, led by Rinuccini. who equated his diplomacy with treachery. After the Restoration his estates mere restored to his heirs. His *Memoirs* were first published in 1722 with a supplement in 1757. (R. D. Es)

CLANVOWE, SIR THOMAS (fl. 1400), English courtier. probably the author of *The Cuckoo and the Nightingale,* a courtly dialogue poem long attributed to Chaucer. Little is known of Clanvowe. who was at court in Richard II's reign and was a friend of Prince Hal (afterward Henry IV). He is named as one of 20 knights who accompanied John Beaufort to Barbary in 1390. His name is last mentioned in 1404.

The Cuckoo and the Nightingale, called in some manuscripts *The Book of Cupid, God of Love,* was first printed by William Thynne in his edition of Chaucer's works (1532). and continued to be ascribed to Chaucer until W W. Skeat, in editing Chaucer's works for his edition of 1894–97, discovered Clanvone's name on the best of the extant manuscripts and relegated the poem to his supplementary volume of pieces attributed to Chaucer. where he discusses its authorship. The poem is a debate between the cuckoo and the nightingale on the power of love: in treatment traditional. it shows delicacy and sneetness in its descriptions of spring and is of interest also for its prosody, which reveals intelligent study of Chaucer's versification, although not without faults of execution.

BIBLIOGRAPHY.—As well as the edition in Skeat's *Chaucerian and Other Pieces* (1897) based on Thynne's text, there is a critical edition by E. Vollmer, *Das mittelenglische Gedicht "The Boke of Cupid"* (1898). *See* also C. *E.* Ward, "The Authorship of *The Cuckoo and the Nightingale"* in *Mod. Lang. Notes,* xliv (1929).

CLAPHAM SECT, the name, probably coined by their first historian, James Stephen, given to a group of evangelical Christians (all of whom except the Unitarian Sir William Smith were Anglicans) who were prominent in England about 1790–1830. The group—drawn together by the banker Henry Thornton, who in 1792 invited William Wilberforce to share his home in Clapham—included Charles Grant, Edward Eliot, James Stephen, John Venn (rector of Clapham), Lord Teignmouth, Zachary Macaulay and Sir William Smith, as well as Thomas Gisborne, Thomas Babington and Hannah More, who did not live in Clapham Most of them were members of parliament, nicknamed the "Saints," whose great achievement was the abolition of the slave trade and slavery. They also worked for the prevention of cruel sports, the suspension of the game lams and the lottery and better prison conditions. Though mostly conservative in outlook, they were ready to work with radicals and free thinkers such as Jeremy Bentham and James Mackintosh. The Church Missionary society, the British and Foreign Bible society and the Religious Tract society owed much to their initiative and support. The idea of trusteeship for backward peoples was born in the Sierra Leone company, of which Thornton was chairman. Hannah More's schools and her religious and political tracts were largely financed from Clapham pockets, and the group had its own journal, the *Christian Observer,* which Zachary Macaulay edited from 1802 to 1816. They wielded a powerful influence over English society because of their high sense of responsibility to God for their actions. Lord Macaulay. Florence Nightingale, Sir Leslie Stephen, A. V. Dicey and Virginia Woolf were among their descendants.

CLAPPERTON, HUGH (1788–1827), Scottish explorer in west Africa who was the first European to bring back personal observations of the lands which at the beginning of the 19th century had become part of the Fulani empire. He was born at Annan, Dumfriesshire. on May 18, 1788. He served in the navy and then joined Walter Oudney and Dixon Denham (*q.v.*) in a government expedition across the Sahara to Bornu which they reached in Feb. 1823. Clapperton traveled to Kano. Katsina. Sokoto and Zaria and he and Denham returned (Oudney died in Jan. 1824) to England in June 1825. Their records were published in *Narrative of Travels and Discoveries in Northern and Central Africa in the Years 1822–24* (1826). Clapperton almost immediately returned to Africa and on Dec. 7, 1825, left Badagry for the Niger with his servant. Richard Lander (*q.v.*), and two other Europeans. The last two died within a month; Clapperton and Lander crossed the Niger and traveled via Kano to Sokoto, near which Clapperton died on April 27, 1827.

See H. Clapperton, *Journal of* a *Second Expedition Into the Interior of Africa* (1829); *R.* Lander, *Records of Captain Clapperton's Last Expedition to Africa,* 2 vol (1830). (R M P.)

CLAQUE, an organized body of persons who, either for hire or other motives, band together to applaud or deride a performance and thereby attempt to influence the audience.

Historically the claque (Fr. *claquer,* "to clap") is a very old institution, dating back to performances in the theatre of Dionysus at Athens. Menander was frequently defeated by Philemon in the comedy competitions, not by virtue of any superiority in the latter's plays but because Philemon swayed the decision of the judges by infiltrating the audience with claques. Under the Roman empire claques were common in the theatres and law courts, and flatterers and legacy hunters would often serve as *claqueurs* at private performances sponsored by wealthy patrons of the arts. The emperor Nero established a school of applause and was followed on his concert tours by a claque of 5.000 knights and soldiers. In France during the 18th century the chevalier de la Morlibre

and the poetaster Dorat organized claques to support plays by themselves and others.

In the 19th century the claque became a permanent institution; almost every Paris theatre was forced to submit to its services, and the claque leaders, who received monthly payments from the actors and free tickets from the managements, were extremely influential. In addition to the leader, or *chef* de claque, there were the *commissaires,* who memorized the better parts of the play and called their neighbours' attention to them; the *rieurs,* who laughed loudly during comedies; the *chatouilleurs,* who kept the audience in good humor; the *pleureuses,* women who wept during melodramas: and the *bisseurs,* who shouted for encores. Claques have occasionally been employed in England, but never with the elaborate organization of the French claques.

The claque in the early 1960s was restricted largely to opera houses, to political rallies and to radio and television programs. **(A.** H. SA.)

CLARE (CLARA), **SAINT,** OF ASSISI (1194–1253), founder of the order of nuns called after her the Poor Clares, was born in 1194 of a knightly Assisi family. Francis of Assisi so inflamed her with a love for the poor and suffering Christ that she refused to marry as her parents planned but fled by night to the Porziuncola chapel below Assisi, where Francis received her vows. This date (March 18, 1212) marks the beginning of the Second Order of St. Francis. Many joined Clare, including her sister (St.) Agnes and, after her father's death, her mother and another sister. Within a few months the Poor Clares were housed in the church and convent of S. Damiano, near Assisi! where Clare was to remain as abbess until her death on Aug. 11, 1253.

Her great concern was to obtain a rule reflecting the spirit of Francis rather than the Benedictine rule, which Cardinal Ugolino (later Pope Gregory IX) had adapted for her rapidly growing order. Two days before her death Pope Innocent IV approved the definitive rule she had composed. Besides its "privilege of perfect poverty," which forbids the ownership of property even as a community, Clare's order is noted for its apostolic aim in that she considered the penitential prayer life of the Clares to be a spiritually vitalizing force for the church and society at large. This view was shared not only by the popes but by the grateful citizens of Assisi, who credited Clare with twice saving their city from the sword. On the first occasion Clare had the chaplain bring the blessed sacrament to the refectory window and saw the Moorish allies of Frederick II who were storming the walls fall back in consternation. Famed for miracles in life and after death, she was canonized in 1255. Her feast day is Aug. 12. In 1958 Pope Pius XII declared her patroness of television, alluding to an incident during her last illness when she miraculously heard and saw the Christmas midnight Mass in the basilica of S. Francesco on the far side of Assisi. See also FRANCISCANS: Second Order.

CLARE, the name of a famous English family which in the 13th century became the most powerful baronial interest in the kingdom. The founder of the house in England, RICHARD FITZGILBERT (d. *c.* 1090), was descended from Godfrey, count of Brionne, a bastard son of Richard, duke of Normandy. He crossed to England with William the Conqueror in company with his brother, Baldwin of Exeter (d. *c.* 1100), who acquired great estates in the west country. Richard himself was given about 170 lordships in England, of which 95 were in Suffolk, attached to his castle of Clare, whence the family took its name. As chief justiciar in England, Richard played a large part in suppressing the rebellion of 1075. His marriage to Rohese, daughter of Walter Giffard, was to bring many Giffard estates to the Clares a century later.

Richard left several sons, one of whom, ROBERT (d. 1134), founded the baronial house of FitzWalter, extinct in 1432. The English inheritance of the Clares passed to the second son, GILBERT FITZRICHARD (d. c. 1115), who began his family's connection with Wales when Henry I granted him Cardigan. About the same time WALTER DE CLARE (d. 1138), probably his brother, acquired the lordship of Striguil (Chepstow): he was also the founder of Tintern abbey (1131). The Welsh estates of Walter, and most of Gilbert FitzRichard's, passed to the latter's second son, GILBERT FITZGILBERT (d. c. 1148), whom Stephen created earl of Pembroke in 1138, and thence to the earl's son. RICHARD STRONGBOW (*c.* 1130–76), conqueror of Ireland (see PEMBROKE, RICHARD DE CLARE. 2nd earl of). This branch of the Clares became extinct in the male line when Strongbow died in 1176.

The English estates of Gilbert FitzRichard descended to his eldest son, RICHARD (d. 1136), who was himself succeeded in turn by his two sons, GILBERT (d. 1152), created earl of Hertford by Stephen (*c.* 1138) but more commonly known as earl of Clare. and ROGER (d. 1173). who quarreled with Thomas à Becket over Tonbridge castle, the Clare stronghold in Kent. Roger's son. RICHARD (d. 1217), inherited through his great-great-grandmother Rohese a share of the wide Giffard estates. His marriage with Amice, heiress of William, earl of Gloucester, brought him, among other estates, the lordship of Tewkesbury (many of the Clares were buried in the abbey there), wealthy manors in Gloucestershire and the great marcher lordship of Glamorgan. Earl Richard and his son. GILBERT (d. 1230), were prominent among the baronial leaders who forced King John to agree to Magna Carta; it is some indication of the family's influence and connections that no less than 13 of the barons involved in the events of 1215 were kinsmen of the Clares: and that almost all were enemies of the king. Gilbert was recognized, in right of his mother, as earl of Gloucester in 1217; he married Isabel. daughter and coheiress of William Marshal. earl of Pembroke, and in 1215 their son, RICHARD (1222–62), acquired the Kilkenny estates in Ireland and the lordship of Usk and Caerleon in south Wales as Isabel's share of the Marshal inheritance. The English estates of the Clares now extended into more than 20 counties, and the earl of Gloucester was the greatest lord in south \Vales: in Glamorgan especially he was almost an independent prince.

Thus Earl Richard succeeded to a position of immense influence. Matthew Paris described him as "young, graceful, eloquent, careful and well-skilled in the laws" but marred by avarice (Chronica *majora,* under the year 1253). Potentially he held the balance between Henry III and Simon de Montfort, yet in politics he proved vacillating and uncertain. He supported the barons against the king in 1258. but quarreled with Montfort in 1259, only to resume their association as his friendship with the king cooled. His son. GILBERT (1243–95), the "Red Earl," was at first a strong supporter of Montfort; but his desertion of him in 1265 proved a vital factor in the subsequent royalist triumph. In his later years Gilbert was much occupied in the Welsh wars. (See GLOUCESTER, GILBERT DE CLARE, earl of.)

Gilbert had married Edward I's daughter, Joan of Acre. After her death (1307), their son GILBERT (1291–1314) succeeded to the earldom of Gloucester. As nephew of Edward II and brother-in-law of Piers Gaveston, this gallant and generous young man played the part of moderator in the struggles of Edward's early years. He represented the king's party among the ordainers. acted as regent in 1311 and 1313, and helpea to negotiate a settlement after Gaveston's death in 1312. His death without issue at the battle of Bannockburn brought to an end the direct male line of the Clares.

The partition of his estates among his three sisters became a matter of some political importance. Hugh Despenser the younger, husband of the eldest sister, Eleanor, who received Glamorgan and Tewkesbury as her share, tried to deprive his brothers-in-law of all the Clare lands in south Wales, a plan that led to the breakup of the "middle party" and contributed to the outbreak of civil war. The Despenser share later descended to the Beauchamp and Neville earls of Warwick. The youngest sister, Elizabeth, lady of Clare (d. 1360), foundress of Clare college, Cambridge, transmitted her portion to Edward III's son, Lionel, who for this reason mas created duke of Clarence, and thereafter to the Mortimers, earls of March. (C. D. R.)

CLARE, JOHN (1793–1864), one of the best-known poets of the English countryside, was born at Helpstone, a village between Stamford and Peterborough, in Northamptonshire, on July 13, 1793. He was the only son of a farm labourer in times when the English peasantry were under duress through the en-

closure of common land. His grandfather was a wandering fiddler who for a short time was the village schoolmaster. Clare's schooling and access to books were scanty. But he had a prodigious memory; and his poetic gift, which showed itself by the time he was 12, was nourished by his father's and mother's store of folk ballads. The frail, dreamy, shy, brilliant boy determined to be a poet. On his mother's sugar bags and with a ha'p'orth of pencils bought at Stamford or Deeping Fair, he wrote, and re-wrote, verses reminiscent of John Cunningham, Allan Ramsay and James Thomson. In 1817 he tried to get a volume of his poems published by subscription but failed. One of the prospectuses came to the notice of John Taylor, the London publishers of Keats' works; and in 1820 Clare's first book, *Poems Descriptive of Rural Life and Scenery*, was printed. This caused a stir in London literary circles and ran into four editions within a year. Through it and with Taylor's help Clare acquired a small annuity, just over £40 a year. His next volume of poetry, *The Village Minstrel and Other Poems* (1821) sold very few copies; and his third, *The Shepherd's Calendar; with Village Stories, and Other Poems* (1827) though containing better poetry, met the same fate. In 1820 Clare had married Martha Turner, daughter of a neighbouring farmer, the "Patty of the Vale" of his poems. By her he had a family of seven. He was financially responsible for his father, who had become disabled by rheumatism. Clare added to his small annuity by doing field-work and gardening. But poetry, poverty and patronage took their toll of his health. He visited London during the nine days' wonder that his first book occasioned and became the friend and correspondent of Charles Lamb, J. H. Reynolds, Alan Cunningham, George Darley and H. F. Cary. But at Helpstone Clare lived in extreme isolation and spiritual loneliness. Yet by 1824, while seeing clearly the penalty which, under such circumstances as his, a life dedicated to poetry might inflict, he had become a dedicated poet, with a very individual voice.

He made three other visits to London. In 1832 he left the cottage at Helpstone, his "old home of homes," to rent a two-acre piece and a good cottage at Northborough, a village three miles away, in the Fens. He wrote incessantly. Without success he tried, in 1832, to have a fourth volume of poems printed, *The Midsummer Cushion* (a title of his own choice at last). In 1835, his last book, *The Rural Muse*, was published. Though praised by such men as Derwent Coleridge, Henry Nelson Coleridge, Charles Elton and John Wilson of *Blackwood's Magazine*, and full of better poetry than Clare's three preceding volumes, *The Rural Muse* sold scantily.

Years of poor food, poverty and worry could not fail to diminish Clare's tough resilience. He had begun to be beset by terrors and fancies. One of the fancies was that his lost childhood love, Mary Joyce, daughter of a wealthy farmer, had been his first wife; Patty, he thought, was his second. In 1837, again through the agency of his first publisher, John Taylor, Clare was put under the care of Dr. Matthew Allen, at a private asylum at High Beech, Epping. There, under good conditions, the poet stayed four years. But, improved in health and driven by homesickness, he walked the 80 miles to Northborough in July 1841, penniless, eating grass by the roadside to stay his hunger. He has left a moving account in prose of that extraordinary journey, addressed to "Mary Clare, Glinton." He was at home about seven months. At the end of 1841 he was certified insane. He spent the final 23 years of his life at St. Andrew's asylum, Northampton, writing with strangely unquenched lyric impulse. He died there on May 20, 1864.

Clare belongs to that group of poets called the English Romantics. His early work, written between 1814 and 1827, is emotional, intensely detailed, descriptive evocation of the place and time of his boyhood, rural Northamptonshire in the early 19th century. His later work, between 1827 and 1864, consists of singularly pure lyrics, among the chief of which are "Love Lies Beyond The Tomb," "Invite to Eternity," "I Am" and "A Vision." He fulfils the criterion that the whole of a major poet's work has greater significance than the sum of the separate poems. But his reputation has been slow to mature, and the full body of his apprentice work, with some 500 "Ha'penny Ballads" of his St. Andrew's years, remained unpublished in the late 1950s.

(J. W. T.)

CLARE, JOHN FITZGIBBON, 1ST EARL OF (1749–1802), lord chancellor of Ireland, was a powerful supporter of a repressive policy in Ireland and, later, of legislative union with Great Britain. Educated at Trinity college, Dublin, and at Christ Church, Oxford, he was called to the Irish bar in 1772. He entered the Irish house of commons as member for Dublin university in 1778. Fitzgibbon was appointed attorney general in 1783. An able lawyer. he was clear and downright in debate and readily voiced his opinions in unconciliatory terms. He strongly opposed Henry Flood's reform bill introduced in 1783, and from that time forward he was in fact the leading spirit in the Irish government and the stiffest opponent of any concession to popular demands.

In Jan. 1787 Fitzgibbon introduced a stringent bill for repressing the illegal Irish agrarian association known as the Whiteboys. His influence with the majority in the Irish parliament defeated Grattan's proposed reform of the tithe system in Ireland, Fitzgibbon refusing even to grant a committee to investigate the subject. On the regency question of 1789 *(see* PITT. WILLIAM) Fitzgibbon, in opposition to Grattan, supported the doctrine of William Pitt in a series of powerful speeches which proved him a great constitutional lawyer. He intimated that the choice for Ireland might in certain eventualities rest between complete separation from England and legislative union. While he exclaimed as to the latter alternative, "God forbid that I should ever see that day!" he admitted that separation would be the worse evil of the two.

In 1789 Fitzgibbon was appointed lord chancellor in succession to Lord Lifford. being raised to the peerage as Baron Fitzgibbon. His removal to the house of lords greatly increased his power. "He was," wrote William Lecky, "by far the ablest Irishman who had adopted without restriction the doctrine that the Irish legislature must be maintained in a condition of permanent and unvarying subjection to the English executive." Though at the outset of his parliamentary career he had been prepared to agree to a modification of the penal laws he was firmly opposed to allowing the Roman Catholics to have any political power. When the British cabinet forced the Irish executive to accept the Roman Catholic Relief bill of 1793, Fitzgibbon, though he recommended that the house of lords pass the bill, strongly denounced the policy it embodied. Also in 1793, he was responsible for the enactment of the Convention act which severely restricted radical agitation.

When it was decided that Lord Fitzwilliam should be lord lieutenant, Pitt insisted that Fitzgibbon should remain as lord chancellor. Fitzgibbon. who disapproved of Fitzwilliam's Roman Catholic policy, was probably the first to suggest to George III that he would violate his coronation oath if he consented to the admission of Catholics to parliament. When Lord Camden, Fitzwilliam's successor in the viceroyalty, arrived in Dublin on March 31, 1795, Fitzgibbon's carriage was violently assaulted by the mob, he himself was wounded and in the riots that ensued his house was attacked. In June 1795 he was created earl of Clare. On the eve of the rebellion of 1798 he defended the strict measures taken by the government, but he was neither cruel nor immoderate and was inclined to mercy in dealing with individuals. He attempted to save Lord Edward Fitzgerald by promising to facilitate his escape from the country. After the rebellion he threw his great influence on the side of clemency.

In Oct. 1798 Clare, who since 1793 had been convinced of the necessity for a legislative union between Great Britain and Ireland and was equally determined that the union must be unaccompanied by Catholic emancipation, crossed to England and pressed his views on Pitt. On Feb. 10, 1800, Clare in the house of lords moved the resolution approving the union in a long and powerful speech. in which he reviewed the history of Ireland since 1688, attributing the evils of recent years to the independent constitution of 1782 and speaking of Grattan in language of deep personal hatred. He

was not aware of the assurance which Cornwallis had been authorized to convey to the Catholics that the union was to pave the way for emancipation, and when he heard of it after the passing of the act he bitterly complained that he had been deceived. After the union Clare became more violent than ever in his opposition to any policy of concession in Ireland. He died in Dublin on Jan. 28. 1802. (R. B. McD.)

CLARE (CHLÁIR), a county in the province of Munster, Republic of Ireland, is bounded on the north by Galway bay and County Galway, east by Lough Derg, the river Shannon and counties Tipperary and Limerick, south by the estuary of the Shannon and west by the Atlantic ocean. Its land area is 1,231 sq.mi. In 1961 the population of County Clare was 73,710, compared with about 286,000 in 1841. More than two-thirds of the inhabitants live outside villages and towns, of which the largest are Ennis (*q.v.*; 5,678), the county town, and Kilrush (2,861). Administration is by a county manager advised by an elected county council. The cathedral of the Church of Ireland diocese of Killaloe (*q.v.*) is at the town of that name, while the Roman Catholic diocese has its seat at Ennis. County Clare sends four members to *dail* eireann (house of representatives).

The county is divisible into three parts. In the east, hills rising to 1,000–1,750 ft., formed of Silurian shales and slates and Devonian sandstones, include the Slieve Bearnagh, the Cratloe and part of the Slieve Aughty hills. These hills, though covered with peat bogs and almost uninhabited, are penetrated by wide valleys used for roads,

Central Clare is a lowland. Along the Shannon and Fergus estuaries there is a large area of corcasses, originally salt marshes, but now drained and embanked, of which some are used for tillage and some for pasture. The true limestone country of central Clare merges into the central Irish lowland around Galway bay. The scene is varied. Limestones form a number of craggy hills, 150–300 ft. high, of which some are covered by drift and provide good farmlands but others have thin soils and carry scrub woods of oak, ash, hazel and holly.

The drainage reaches the surface in a number of rivers, which appear for a few miles and then disappear, or even emerge for only a few yards in a collapsed cave. There are many "turloughs," or limestone hollows in which water lies for varying periods; some are quite small, but others are as much as a mile across and 30 ft. deep. There are also a number of permanent lakes, some of which fluctuate considerably in size with the changing level of the water table.

West Clare is made up of plateaus and lowlands of Carboniferous rocks. The Burren area, facing Galway bay, consists of slabs of limestone, almost horizontal, with little vegetation except in sheltered places. Along the coast there is a remarkable limestone pavement, with deep cracks harbouring such plants as the maidenhair fern, yews, hawthorns and junipers, and others which rarely show an inch above the surface. Where soil occurs, plants such as the alpine gentian and white-flowered *Dryas* have a luxuriant development. The stony desert appearance of the Burren plateau is seen dramatically in the valley south of Ballyvaughan, which has steep, terraced rock faces above a flat, grassy valley. There are several famous caves around Slieve Elva, including Pollnagollum, more than 4½ mi. long. South of the Burren area, varied shales and sandstones have acid soils with rushy grasslands and there are extensive peat bogs at the higher levels, culminating in Slieve Callan (1,266 ft.). A fine flagstone reaches the sea at various points in cliffs; the Moher cliffs are more than 600 ft. high for several miles.

There are mild winters with mean January temperatures of 42°–43° F. and rainy summers with July means of 58°–59°. The rainfall is everywhere abundant, averaging 40–60 in. a year.

More than two-thirds of the county is in crops and pasture and Clare may therefore be regarded as an extension to the Atlantic of the central Irish lowland rather than as part of the mountainous west with restricted areas of farming. Though by no means rich agriculturally, Clare has not the poverty of Connemara, across Galway bay. The main resources are cattle and sheep, the latter especially on some of the limestone pastures. The farms are mainly medium-sized, averaging 40–50 ac. The chief crops are oats and potatoes.

Ennis has flour milling and other industries. Kilrush is a market centre and was once a busy port, while Ennistimon, with a creamery, is a remote market centre in the west. Most places are trading villages, though at Lisdoonvarna visitors come to drink the spa waters. Iron, copper. lead and silver were once mined east of Ennis, particularly the lead sulfide at Tulla, and also in the Burren district north of Corofin. A thin coal seam in west Clare is not worked, but there are slate quarries at Broadford and elsewhere. The county contains Ireland's first and largest hydroelectric power station at Ardnacrusha on the Shannon (*q.v.*).

Lough Derg is so effective a barrier that most of the road traffic from the east enters the county at Killaloe, O'Briensbridge and near Limerick, while the only rail connection is through Limerick. This railway runs through Ennis northward to Galway. The trans-Atlantic Shannon international airport is on reclaimed land at Rineanna, 12 mi. S.E. of Ennis. (T. W. FR.)

History. — Clare is rich in evidences of prehistoric human occupation, particularly from the Bronze Age, and has many megalithic monuments. About 2,000 fortified enclosures or forts can still be seen in the county. The many early Christian remains include those at Inishcaltra, Kilrush, Dysert, Holy Island and Drumcliff, at all of which there are round towers. Notable among the castles which record the conflicts of later times is mainly 15th-century Bunratty castle. The peninsula of Clare was disputed land between Connaught and Munster, being annexed to Munster (*q.v.*) in the 4th century. It suffered Norse incursions, but no permanent Scandinavian settlement. It took a central place in Irish history when Brian Boru (Boroimhe), king of Munster, with his headquarters at Kincora near Killaloe, became high king of Ireland at the beginning of the 11th century. His family, the O'Briens, remained lords of Thomond, or north Munster, later corresponding roughly to the modern County Clare (see THOMOND, EARL AND MARQUESS OF). Although Thomond was invaded by Anglo-Normans from the 12th century, the O'Briens managed to maintain their position, receiving the title of earl of Thomond from Henry VIII. Clare was made a shire under Elizabeth I and was treated as part of Connaught under Cromwell, later reverting to Munster. Spanish point, on the west coast where ships of the Spanish Armada were wrecked in 1588 derives its name from the many Spaniards buried there. It was in Clare in 1828 that Daniel O'Connell won the critical election victory which led on to Catholic emancipation. East Clare was one of the first constituencies to elect a Sinn Fein candidate, namely Eamon de Valera in 1917. (HU. S.)

See James Frost, *The History and Topography of the County of Clare (1893).*

CLARE ISLAND (CLAIRA), in County Mayo, Republic of Ireland, covers 6.3 sq.mi. and stands at the entrance to Clew bay. Pop. (1956) 239. On the northwest, quartzite hills rise to 1,507 ft. with a fine scarped cliff (Knockmore), and on the east and south there is a limited amount of farm land, divided into holdings of about 7 ac. under a land settlement scheme of the Congested Districts board. Exposure stunts all trees to 6–8 ft. There is motor boat transport from Roonah Point about 3 mi. away which is 20 mi. W. by road of Westport, the nearest town. Gráinne Uaile or ni Mhaille (Grace O'Malley), the 16th-century queen of the island, is buried in the island's Carmelite abbey (founded 1224).

(T. W. FR.)

CLARENCE, DUKES OF. The early history of this English title is identical with that of the family of Clare, earls of Gloucester, who are sometimes called earls of Clare, of which word Clarence is a later form. The first duke of Clarence was Lionel of Antwerp (see below), third son of Edward III, who was created duke in 1362 and whose wife Elizabeth was a direct descendant of the Clares, the honour of Clare being among the lands which she brought to her husband. When Lionel died without sons in 1368 the title became extinct, but in 1412 it was revived in favour of Thomas (*see* below), second son of Henry IV. The third creation took place in 1461, and was in favour of George (see below), brother of Edward IV. When this duke was attainted

in 1478, his title was forfeited. There was no other creation of a duke of Clarence until 1789, when William, third son of George III, was made a peer under this title. Having merged in the crown when William became king in 1830, the title of duke of Clarence was revived in 1890 in favour of Albert Victor (1864–92), elder son of King Edward VII, then prince of Wales, only to become extinct for the fifth time on his death in 1892.

LIONEL OF ANTWERP (1338–68), duke of Clarence, third son of Ed ard III, was born at Antwerp on Nov. 29, 1338. Before he was four years of age he was betrothed to Elizabeth (d. 1363), daughter and heiress of William de Burgh, earl of Ulster (d. 1333), and he entered nominally into possession of her great Irish inheritance. Having been named as his father's representative in England in 1345 and again in 1346, Lionel was created earl of Ulster and joined (in 1355) an expedition into France, but his chief energies were reserved for the affairs of Ireland. Appointed governor of that country. he landed at Dublin in Sept. 1361. In Nov. 1362 he was created duke of Clarence and in the following year his father made an abortive attempt to secure for him the succession to the crown of Scotland. His efforts to secure an effective authority over his Irish lands were only moderately successful, and after holding a parliament at Kilkenny, which passed the celebrated Statute of Kilkenny in 1366, he threw up his task in disgust and returned to England. At Milan, on May 28, 1368. he married Violante. only daughter of Galeazzo Visconti. lord of Pavia, who brought him a rich dowry. Several months were then spent in festivities, during which Lionel was taken ill at Alba. where he died on Oct. 17, 1368. His only child Philippa (1355–81), a daughter by his first wife. married in 1368 Edmund Mortimer (1352–81), 3rd earl of March, and through this union Clarence became the ancestor of Edaard IV.

THOMAS (1389–1421), duke of Clarence, was born on Sept. 29, 1389. He paid two visits to Ireland, where he was nominally lord lieutenant, 1401–13. For a short time, in 1412, he replaced his elder brother, afterward King Henry V, as the chief figure in the government. He favoured an alliance with the Orléanists and led an unsuccessful expedition to France in Aug. 1412. But. after Henry V's accession in 1413, the duke served his brother faithfully and took part in the preparations for the French war. He was at the siege of Harfleur, but was invalided home before Agincourt and acted as regent in 1416. During the invasion of Normandy, in 1417. Clarence led the assault to Caen, and, after Henry V's return to England in 1421, he remained in France as the king's lieutenant. He was killed at Bauge, in Anjou, while rashly attacking the French and their Scottish allies on March 22. 1421. At the time of his death he was heir to the throne. His marriage with Margaret Holland was childless and his titles became extinct.

GEORGE (1449–78), duke of Clarence, younger son of Richard. duke of York, was born in Dublin on Oct. 21, 1449. Soon after his elder brother became king as Edward IV in March 1461, he was created duke of Clarence, and his youth was no bar to his appointment as lord lieutenant of Ireland in 1462. In 1466 Clarence was a suitor for the hand of Mary of Burgundy. Later he came under the influence of Richard Neville, earl of Warwick. and. in defiance of the king. was married to the earl's elder daughter, Isabel, at Calais in July 1469. With his father-in-law he supported the rebels in the north of England. When their treachery mas discovered, Clarence fled to France in March 1470. Returning to England nith Warwick in September, he supported the restoration of Henry VI, and the crown was settled upon himself in case the male line of the Lancastrian dynasty became extinct. But soon after Edward IV returned to England in March 1471, a public reconciliation between the brothers took place, and Clarence then fought for the Yorkists at Barnet and Temkesbury. After Warwick's death in April 1471, Clarence claimed the whole of the vast estates of the earl, and in March 1472 was created by right of his wife earl of Warwick and Salisbury. However, in 1474 Clarence had to accept a partition of the Warwick estates with his younger brother Richard. duke of Gloucester (later Richard **111),** who had married Warwick's younger daughter Anne. Isabel Neville died in Dec. 1476, and Clarence soon sought to marry, as his second wife, Mary of Burgundy, now duchess. To this marriage Edward IV objected. He became convinced that Clarence was aiming at his throne. The duke was thrown into prison, and in Jan. 1478 the king unfolded the charges against his brother to the parliament. He had slandered the king; had received oaths of allegiance to himself and his heirs; had prepared for a new rebellion; and was in short incorrigible. Both houses of parliament passed the bill of attainder, and the sentence of death which followed was carried out secretly in the Tower of London on Feb. 18, 1478. Soon after the event the rumour gained ground that he had been drowned in a butt of malmsey wine. Two of the duke's children survived their father: Margaret. countess of Salisbury (1473–1541), and Edward, earl of Warwick (1475–99), who passed the greater part of his life in prison and was beheaded in Nov. 1499. (T. B. P.)

CLARENDON, EDWARD HYDE, 1ST EARL OF (1609–1674). English statesman and historian, who as Charles II's lord chancellor presided over the Restoration settlement. profoundly influenced the course of English history both as participant and interpreter. His failures and deficiencies in these roles do nothing to diminish his importance.

Edward Hyde was born on Feb. 18, 1609, the eldest son of Henry Hyde of Dinton, Wiltshire, and was educated at Magdalen hall, Oxford, and the Middle Temple. The death in 1631 of his uncle and patron, Sir Nicholas Hyde, justice of the king's bench, did not inhibit him from pursuing his career at the bar, for he had secured many influential friends, among them John Selden and Sir Kenelm Digby. His wide interests and a taste for good living, freely indulged, also brought him in touch with Ben Jonson, Edmund Waller and the literary and philosophical circle at Great Tew in Oxfordshire. In these years many of the characteristic weaknesses which seem typical of his later life were, on his own confession. fully formed. Argumentative, proud, reluctant to suffer fools gladly, he would seem to have nourished a very high opinion of his merits. He married in the winter of *1631/32* Sir George Ayliffe's daughter Anne, who died six months later, and in 1634 Frances, daughter of Sir Thomas Aylesbury, master of requests. This useful second match was soon followed by his appointment as keeper of the writs and rolls of common pleas, and he maintained a profitable practice at the bar.

Early Career.—His bar practice was abandoned not long after his entry into parliament in 1640, first as member for Wootton Bassett in the Short parliament, then for Saltash in the Long parliament. Emerging at once as a critic of ship money and other recent oppressions, he was drawn into the attack upon the jurisdiction of the prerogative courts. He was to the fore in most of the lasting legislation of 1641—the abolition of the courts of wards. Star Chamber and high commission—but he stopped short of any measures which might permanently damage the balanced relationship of king, lords and commons, and in this spirit opposed parliament's efforts to dictate the king's choice of ministers. From the first he was known to be a defender of the Anglican hierarchy and as such was interviewed and commended by Charles I, but it was as a parliamentarian and not a courtier that he opposed the execution of the earl of Strafford and vigorously resisted the Root and Branch bill. The passing of the Grand Remonstrance, a searching indictment of Charles and his father, made any accommodation between king and parliament increasingly difficult, and henceforth Hyde chose to work behind the scenes as an adviser of the crown. In conjunction with his friend Lord Falkland and with Sir John Colepeper, who were made members of the council, he attempted to recommend moderate measures to Charles. Such a course, consistently pursued, might have undermined support for John Pym's radical leadership in the house of commons, but Charles's unsuccessful attempt to seize five members of the commons (Jan. 1642) brought Hyde near to despair, for although war was not yet inevitable, few men could now trust the king's sincerity. In this situation Hyde's efforts to found a settlement upon what had already been achieved were likely to fail, but his constructive moderation. far from being mere compromise. successfully attracted many parliamentarians to the royal camp. Henceforth Hyde's pen was the most influential factor in deferring an appeal to the sword. In drafting royal declarations he presented a strong case founded on respect for those fundamental

laws of the constitution which now seemed most seriously threatened by parliament. His view of the interdependence of king, lords and commons. embodied in the king's answer to the Nineteen Propositions of June 1632, although criticized by some royalists for its weak "spirit of accommodation" which "wounded the regality," gained wide currency on both sides.

Chancellor of the Exchequer.—Hyde joined the king at York in May 1642. He was formally expelled from the house of commons in August and was later excepted from pardon as an evil counselor. He was never a combatant in the ensuing war, and although present at Edgehill remained principally at All Souls college, Oxford. from Oct. 1632 until March 1645. On Feb. 22. 1643, he was made a privy councilor and knighted, arid on March 3 was appointed chancellor of the exchequer. As a member of the council of war he was nominally involved in the direction of the royalist campaign. but he was unable to bring much influence to bear upon the militant enthusiasms of the army leaders. In the privy council, on the other hand, he was a member of the "junto." or secret committee. which considered business before it was laid before the council. To emphasize the legality of royal proceedings and to secure financial grants by constitutional means, he advised the summoning of a parliament at Oxford in Dec. 1643. but its success was limited and by Dec. 1644 he agreed to the recognition of the Westminster body's title to be a true parliament. In Jan. 1645, at Uxbridge, Hyde conducted one last strenuous effort at negotiation, but all his labours could not reduce the parliamentary demands for control of the militia and Presbyterian church government to a form acceptable to the king. The intransigence of parliamentarians and the bitterness of royalists now created a situation in which there was little room left ior the scrupulous constitutionalism of Hyde. and his appointment as guardian to the prince of Wales was a convenient means of disposing of him.

On March 4, 1645, Hyde left the king for Bristol, and after royalist defeats in the west, accompanied Prince Charles to Jersey in April 1646. Retaining his distrust of schemes to draw upon foreign assistance, he also strongly disapproved of the queen's orders for the removal of the prince to France. He thwarted an attempt to sell Jersey to the French but otherwise mas unable to influence events. Instead he began the first draft of his History *of the* Great *Rebellion* in the hope that his interpretation of past errors might serve to instruct the king for the future.

During his sojourn in Jersey, Hyde enjoyed a period of relative tranquillity in the agreeable company of Sir George Carteret, the governor of the island, but on the outbreak of the second phase of the Civil War he began his travels again, leaving Jersey on June 26. 1643 to join the queen and prince at Paris. In attempting to follow Prince Charles on his mission to the fleet in the Thames he and Lord Cottington were seized and plundered by Ostend privateers, and it was not until September that he joined the prince at The Hague. There Hyde, like the rest of the court, was obliged to be an impotent spectator of the king's last efforts to save his throne and his life.

With Charles II in Exile.—Hyde was no less helpless in guiding and counseling the new king. Disapproving strongly of Charles II's desertion of the marquess of Montrose and the subsequent alliance with the covenanting Scots, he was glad to escape from the quarrelsome court by accompanying Lord Cottington on a mission to Spain. But hopes of Spanish assistance in Ireland crumbled with the news of Oliver Cromwell's victory at Dunbar and the appearance of a strong parliamentary fleet in the Mediterranean. and in Dec. 1650 Hyde and Cottington were ordered to leave Madrid. After Charles's escape from Worcester (Sept. 1651), Hyde left his home in Antwerp to join Charles at Paris. Thenceforth he remained close to the king, accompanying him on his successive changes of residence, to Cologne in 1654 and to Brupes in 1656.

Hyde's chief service was to suitain Charles in his adherence to the Anglican Church nnd keep him from any course which might prejudice eventual reconciliation with his subjects. It was principally this hope, rather than plans for an armed reconquest, which directed Hyde's labours during the comfortless years of exile. In 1656 he was prepared to assist the overthrow of Cromwell by intrigue with Edward Sexby and the Levellers, but even in 1659, when the English situation was most discouraging. he held out against those violent schemes of royalist hotheads which would simply reunite the republican factions. His vast correspondence reveals how closely he followed events in England and, when the Presbyterian overtures for a restoration were eventually received. Hyde, appointed lord chancellor in Jan. 1658, was the statesman best fitted to answer them. The Declaration of Breda (April 4, 1660) was his work, embodying his consistent belief that only a free parliament, matching the king's gracious intentions with its own good will, could effect the healing work of reconciliation. In so far as his counsel was willingly accepted by the king the character of the Restoration settlement owed much to Hyde. though he cannot be called its architect. The subsequent course of the settlement diverged from his own plans in several respects.

Lord Chancellor.— Taking his place as lord chancellor in the house of lords on June 1, 1660, Hyde gave some direction to the legislative program of the Convention parliament. He pressed for a generous Act of Oblivion and a speedy provision of royal revenue, hastened the disbanding of the army and strove to create a spirit of accommodation among the religious leaders. To this latter end. Hyde (created Viscount Cornbury and earl of Clarendon on April 20, 1661) was not prepared to sacrifice the Anglican Church, the complete restoration of which was his main objective. In drawing up the royal declaration of Oct. 1660 he had proffered limited episcopacy and a revised prayer book, with the hope of reconciling Presbyterians to conformity with the established church, but the rigid attitude of some of those bishops with whom he had most in common made these efforts appear to be mere temporizing maneuvers. The failure of the Savoy conference between representatives of the Anglican and Presbyterian clergy created further difficulty for Clarendon at a time when he wished to resist the uncompromising Anglicanism of the first Cavalier parliament of 1661. This body was to pass the series of measures against dissenters unjustly known as the Clarendon code: the Corporation act, the Act of Uniformity, the Conventicle act and the Five-Mile act. In fact, Clarendon's attitude was far more friendly to a limited religious toleration than he was later willing to admit. Evidence exists that he was prepared to defend the king's declaration in favour of indulgence (Dec. 26, 1662) during the parliamentary session of spring 1663. The indulgence would have entailed an exercise of the royal prerogative in religious matters in a manner entirely approved of by Clarendon, and would have enabled both king and minister to keep the promise, made at Breda, to relieve tender consciences from the penalties of the law. But Clarendon, like Charles II, bowed to the opposition of parliament.

Clarendon's responsibilities and influence as virtual head of the administration were extensive. He dominated the privy council and its more important committees. He proposed to establish a council at Whitehall to govern Scottish affairs and sought to restore episcopacy in Scotland through the medium of Archbishop James Sharp. In Ireland. on the other hand: while anxious for an establishment upon a solid Protestant basis, he urged "temper and moderation and justice" in securing it. He supported the duke of Ormonde's wise and enlightened administration and earned much unpopularity by opposing the prohibition of the import of Irish cattle into England. He was a member of the council for foreign plantations, and one of the eight lords proprietors of Carolina in 1663. In 1664 he sent a commission to settle disputes in New England. In foreign affairs, however, his influence was more restricted. although he kept up direct contacts with English representatives abroad and supervised such negotiations as the Portuguese marriage treaty, the treaty with the United Provinces and the sale of Dunkirk. This latter episode unjustly earned him the charge of having initiated the scheme for his own profit, and his new house in St. James's was nicknamed "Dunkirk house." By the marriage of his daughter Anne to James. duke of York, in Sept. 1660 he became related to the royal family and was to be grandfather to two English sovereigns. Queen Mary II and Queen Anne, but, anticipating jealousy of this new distinction. he took little pleasure in it. Master of an increasing fortune, he was the principal target of those discontented Cavaliers for whom the

Restoration had offered no relief. Thus the principal charge brought against him in July 1663 by the earl of Bristol, of "having arrogated to himself a superior direction of all his Majesty's affairs," was to be expected. This attempt at impeachment failed, but it foreshadowed the attack of 1667.

Eclipse and Fall From Power.—It was in the emergence of younger politicians such as Sir Henry Bennet and William Coventry that Clarendon perceived the greatest threat to his position. and the appointment of the former as secretary of state in 1662 marked an important phase in his own eclipse. Another critical stage was reached in the parliamentary session at Oxford in Oct. 1665 when Bennet (now Lord Arlington) and Coventry overruled the chancellor in supporting Sir George Downing's scheme for the parliamentary appropriation of supply. Intended as a means of improving the king's capacity to raise loans, it was correctly seen by Clarendon as an infringement of royal freedom to administer finances. Under the stress of the Dutch War, which Clarendon had sought to avoid, it was accepted by Charles as a desperate expedient.

By now Clarendon's influence had waned considerably. The easy intimacy reflected in lighthearted notes exchanged between king and chancellor during privy council meetings had given way to habitual coldness on the part of Charles. Ever since Clarendon had expostulated with the king for resuming relations with Lady Castlemaine soon after his marriage, the temperamental and moral gulf between them had widened Mocked by the king's mistresses and his more accommodating advisers, Clarendon could not fail to appear a censorious busybody. Severe attacks of gout sharpened his temper and incapacitated him for business. The death of his friend the lord treasurer, the earl of Southampton, in May 1667 was yet another serious blow, and by the end of the Dutch War Clarendon stood virtually alone except for the support of his son-in-law, the duke of York.

There were two stages in Clarendon's fall. In Aug. 1667 Coventry and Arlington secured his dismissal from the chancellorship in the interests of administrative efficiency. In October the commons began his impeachment, encouraged by the hostility of Charles to his old adviser and led by the ambitious supporters of the duke of Buckingham—Sir Richard Temple, Sir Robert Howard and Sir Thomas Osborne. The charges, such as having urged government with the help of a standing army, lacked foundation and the house of lords was not prepared to accept them, but by November, under the threat of trial by a special court of the king's selection, Clarendon recognized the hopelessness of his position and fled.

The rest of Clarendon's life was passed in exile in various parts of France, often under conditions of great hardship. At Evreux, on April 23. 1668, he was the victim of a murderous assault by English sailors who attributed to him the nonpayment of their wages. For some time he was not allowed to see any of his children; even correspondence with him was made treasonable by the Act of Banishment. Bearing these troubles with great fortitude, he found consolation in religious duties and daily composition of his *Contemplations on the Psalms.* To the end of his days Clarendon hoped for pardon and permission to return to England, but he died at Rouen on Dec. 9, 1674. He was buried in Westminster abbey a month later. He left two sons. Henry. 2nd earl of Clarendon, and Lawrence, earl of Rochester, and a daughter, Anne, duchess of York. A third son, Edward, predeceased him

Clarendon the Historian.—After his banishment Clarendon began work on his *Life,* writing at first without the aid of any documents. In 1671, however, his son Lawrence was allowed to visit him and brought manuscripts which enabled Clarendon to take up his *History* once again. Into this he inserted some of the recently written autobiographical material. Consequently the accuracy of the finished *History of the Great Rebellion and Civil Wars in England,* edited by *W.* D. Macray, six volumes (1888) varies considerably according to the date and circumstances of its composition. books viii to xv (with the exception of book ix) being particularly weak. The deficiencies of the *History,* and the *Life* which was constructed from the remnants of autobiographical material, do not always derive from lack of documentation. Clarendon, for all his judicious moderation and the magisterial dignity of his prose, occasionally suffered from a conspicuous lack of objectivity. Among the portraits which are the chief ornament of his writings, his accounts of opponents, such as Sir William Coventry, are distorted, and his analyses of the events in which he had been a participant are at variance with the judgments which guided him at the time. Yet such blemishes were natural in a historian who had been deeply involved in a major revolution; conversely, his merits as a statesman were those of a man whose contemplation of the past had sharpened his vision of the future.

CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, 4TH EARL OF (1800–1870). English statesman and a distinguished foreign secretary, notably during the Crimean War, was born in London on Jan. 12,1800. and had—as Charles Greville once said—"the unspeakable advantage of being plain George Villiers and having to fight his own way in the world" as a young man. He was educated at Christ's Hospital and at St. John's college. Cambridge. In 1820 Lord Castlereagh appointed him attaché at St. Petersburg, where he served till 1823; but lack of funds then forced him into becoming a commissioner of customs. in which post he served at Dublin and Paris. Strong intelligence, an agreeable presence and a gift for languages brought him to the attention of those in power. and in 1833 Lord Palmerston made him British ambassador at Madrid.

For six years he wrestled with the intricacies of Spanish politics, while the queen of Spain was a minor. the country torn by civil war and his home government too preoccupied to afford him full support. In 1838 he succeeded an uncle as earl of Clarendon. Early in 1839 he returned to England and married. He refused to go to Canada as governor general, but was persuaded to enter Lord Melbourne's cabinet as lord privy seal, becoming also chancellor of the duchy of Lancaster for the last few months of the government. This spell of office was chiefly notable for a painful opposition to a colleague. since Clarendon thought that Palmerston's policy on the Egyptian question was dangerously hostile to France, and he was delighted when the government resigned in 1841. He took the board of trade when the Whigs resumed office in 1846 and a year later reluctantly accepted the vice-royalty of Ireland, then in the throes of famine. He insisted on being armed with a coercion act, and so was able both to keep the peace and to foster projects for relief. The land legislation he supported only crowded Ireland with selfish speculators, but this result was not apparent till after he had left office in 1852.

Early in 1853 Clarendon succeeded to the one post he coveted and became the only professional diplomat ever to serve as foreign secretary. The foreign office staff took to him at once—he was known there, for many years after his death, as "the great Lord Clarendon"—but he found foreign affairs in confusion. He was never able to get his head clear of the mass of dispatches and could do nothing to stop the country "drifting" (the word was his) into the Crimean War. He was hampered by his own mistrust of Lord Stratford de Redcliffe, the ambassador at Constantinople, and by time-wasting interference from his prime minister, Lord Aberdeen, before the war began. While it went on his talents for conciliation were mainly expended on keeping his colleagues in the cabinet together. He had already secured the friendship of Napoleon III and was able by judicious face-to-face argument to persuade the emperor not to go to the Crimea himself. The French tired of the war before the British, and Clarendon had to use the full range of his diplomatic skill to secure a fair peace at Paris in March 1856. He was offered, but refused, a marquessate on its conclusion.

In 1858 he resigned with Palmerston's cabinet and did not rejoin him in 1859, partly because Lord John Russell insisted on having the foreign office himself and partly because Clarendon disagreed with the Italian policy on which the new government was founded. He spent six years in retirement. advising his friends in office, before becoming chancellor of the duchy of Lancaster

in 1864 and foreign secretary again on Palmerston's death in 1865. The fall of Russell's government released him after a few months, but he returned to the foreign office again, under Gladstone, at the end of 1868. He engaged in a wholly unsuccessful attempt. during the winter of 1869–70, to persuade Bismarck to reduce Prussian armaments, and died, as a result of overwork, in London on June 27, 1870, just when Europe had most need of him, three weeks before the outbreak of the Franco-German War. "If your father had lived," Bismarck said once to Clarendon's daughter Lady Emily Russell, "he would have prevented the war."

See Sir Herbert Maxwell, *Life and Letters of George William Frederick, Fourth Earl of Clarendon,* 2 vol. (1913). (M. R. D. F.)

CLARENDON, CONSTITUTIONS OF, 16 articles defining the relationship between church and state in England which Thomas Becket (*q.v.*), archbishop of Canterbury, Roger, archbishop of York, and 12 bishops promised to observe in Jan. 1164, in the presence of King Henry II and a large number of magnates at Clarendon near Salisbury.

The constitutions were presented as a simple record of some customs of the realm observed under earlier kings, specifically Henry I. This claim may not have been exact, but it accurately reflected Henry II's conservative purpose: to maintain a traditional order that was being threatened, partly by changing clerical opinions about the proper relationship of clergy to laity, partly by attempts to make ecclesiastical justice more effective and partly by the actions of litigants seeking the courts best suited to their immediate purposes. The constitutions defended other interests besides those of the crown, which in a few matters were not directly involved. Further, their object was not merely to defend interests; they were also concerned, *e.g.,* with the proper punishment of crime and the rights of accused persons.

Half of the clauses placed restrictions on the procedures of ecclesiastical judges and on the competence of church courts, limiting the demands such judges might make on excommunicated persons, and restraining them from proceeding against laymen on secret information. They reaffirmed the principle that the king's consent was required for the excommunication of his tenants in chief and officials and for placing their lands under interdict (a lesser restriction applied to royal towns, castles and manors), and they denied to church courts jurisdiction in disputes about advowsons, debts and land held in lay fee. The constitutions on these matters were not merely negative. If no one would come forward to accuse a layman suspected of an offense within the church's jurisdiction, the local bishop could require the sheriff to empanel a jury to declare a verdict. Church courts were assured of jurisdiction in disputes about land given to churches in frankalmoign; if dispute arose between a layman who claimed a property as lay fee and an ecclesiastic who claimed it as frankalmoign, it went to a jury whose verdict would decide whether further pleading should proceed in a lay or in an ecclesiastical court (the assize Utrum).

The judicial provision most vehemently contested at the time (clause 3) would have exposed to secular punishment clerks convicted in church courts of serious criminal offenses like homicide. This repeated a proposal made by Henry II at the council of Westminster in 1163. The object, to which some ecclesiastics were sympathetic, was to ensure, while conceding to clerks immunity from secular trial on these charges, that a clerk notoriously suspect of felony should not be—as some recent cases suggested—scandalously better placed than a layman to escape the consequences of crime. Becket ignored both the object and the form of the proposal. insisting on treating the issue in terms of ecclesiastical privilege and as part of the much wider problem of the standing of ecclesiastics in relation to secular jurisdiction.

Two articles (clauses 4 and 8) specially concerned England's relations with the papacy, prohibiting clergy from leaving the realm without royal permission and requiring royal permission for appeals to a pope in ecclesiastical causes. These customs, inherited from William I, had probably been called into being by the occurrence of papal schism, in which event English kings claimed the right to determine, with proper advice, which of the contending popes should be recognized in England as apostolic. The restrictions had been repeatedly enforced as papal schism recurred, most recently by Henry II in 1159 with the concurrence of Archbishop Theobald, who saw in them a guarantee that papal schism would not have chaotic repercussions in England. They were also a control on recourse to a recognized pope. That Henry II intended in normal circumstances to halt the increasing tendency of litigants to resort to papal authority in a widening range of cases at all stages of litigation is unlikely, but he certainly wanted safeguards for the customs of the realm and probably also some check on vexatious appeals.

Custody of vacant sees and monasteries of which the king was patron was reserved to the king in uncompromising terms (clause 12). The procedure to be followed in filling the vacancies was defined in accordance with the practice of Henry I's later years; it was a compromise between clerical demands for free election and royal desire to retain influence over the electors' choice. Ecclesiastics who held baronies of the king were reminded of the obligations they shared with lay barons (clause 11).

Henry II's attempt to secure at one stroke from prelates and pope overt and definitive assent to numerous debatable propositions failed. He did not, however, have to repudiate explicitly a single clause, though in practice he abandoned the attempt to punish clerks corporally for ordinary criminal offenses.

Saltman, *Theobald, Archbishop of Canterbury* (1956). (ER. S.)

CLARETIAN MISSIONARIES (CONGREGATION OF SONS OF THE IMMACULATE HEART OF MARY; CORDIS MARIAE FILII; C.M.F.), a Roman Catholic religious congregation founded by St. Anthony Claret on July 16, 1849, in Vich, Spain. The Claretian apostolate is all-embracing, but devotion to the Immaculate Heart is an essential element and a distinguishing characteristic. Claretian missionaries, numbering around 4,000, are established throughout the world. The mother house is in Rome. (J. J. O'B.)

CLARI, GIOVANNI CARLO MARIA (1677–1754), Italian composer of vocal music. Born at Pisa, Sept. 27, 1677, he was a pupil of G. P. Colonna, the chapel-master of S. Petronio, Bologna. Between about 1712 and 1736 he was music director at Pistoia, Bologna and Pisa. He was mainly known for his vocal duets and trios with *basso continuo,* first published in Italy in 1720. Later editions were brought out in London between 1740 and 1747 and in 1823 in Paris. They combined graceful melody with contrapuntal learning and were much admired by Charles Avison, Cherubini and Handel, who made considerable use of them although, surprisingly, in view of Clari's popularity in England, this was not fully realized until the 19th century. Clari also composed an opera, *Il savio delirante* (1695), 11 oratorios, mostly for Pistoia. and a large quantity of church music, some of which was reprinted in 19th-century collections. He died at Pisa, May 16, 1754. (Cs. CH.)

CLARINET, a wood-wind instrument regularly employed in the orchestra and in military and dance bands. A distinguished repertory has been written for the clarinet as a solo instrument.

Construction and Characteristics.— The clarinet is usually made of African blackwood, with a cylindrical bore of approximately 0.6 in. terminating in a flared bell. All-metal instruments are made but are little used in first-class work. The mouthpiece, usually of ebonite, tapers toward the top and has a slotlike opening in one side over which a single reed, made from natural cane, is secured by a screw clip or ligature. In earlier times, the reed was secured by string lapping. as it still often is in Germany. The player grips the mouthpiece, reed downward, with his lips; the lower lip, which is retracted over the teeth, is held against the reed and either the upper lip or upper teeth held against the top surface. The ordinary clarinet is pitched in B flat and is $26\frac{1}{2}$ in. long; its notes, made with the fingerholes and key mechanism, sound a tone (step) lower than written. The "stopped pipe" harmonics produced in an instrument of a cylindrical bore, coupled with a reed mouthpiece, account for (1) the deep-pitched fundamental register, approximately an octave below that oi the flute; (2) the characteristic tone colour. due largely to the virtual ab-

sence of the even-numbered overtones of the harmonic series; and (3) the "overblowing" (effected by opening a thumb key) to an upper register at the 12th (third harmonic) above the fundamentals, instead of at the octave as in other wood-wind instruments. This last fact inevitably complicates the fingering system, though in practice without any adverse effect upon the flexibility of the technique. A high register, using fifth and seventh harmonics, extends the compass to a total span just exceeding three and one-half octaves upward from the D in the bass stave, or staff (written as E below middle C).

Historical Development. — On the authority of a volume of local biographical notices by J. G. Doppelmayr, published in Nürnberg in 1730, the invention of the clarinet is ascribed to J. C. Denner, a well-known flute-maker there at the beginning of the 18th century. Up to that time the single reed had been used only in organs and in folk instruments. though it is likely that an adaptation of a folk instrument, invented as a result of the quest for musical novelties, anticipated the clarinet by a few years; the predecessor was the "mock trumpet" or "chalumeau," which Denner, in the same source: is credited with having improved. The chalumeau was a small instrument played in the fundamental register only. Denner's clarinette was larger, equal in length and similar in build to a treble recorder and was intended for playing mainly in the upper register with the fundamentals as an adjunct, thereby making available a complete "trumpet" (*clarino*) compass, and with steadier clearer notes than those of the chalumeau. The earliest known music for it are tune books published by Estienne Roger in Amsterdam, of which second editions dating from 1716 exist. The instrument was played with the reed uppermost (playing with the reed downward is not described until after 1800, in Germany), had two keys and its lowest note was F below the stave. A short bell was added by 1720, and the important extension of the tube to carry the low E key (providing the upper B formerly imperfectly available) followed at an unknown date, about 1740–50. Early composers for it include Vivaldi (in mixed concertos) and Handel (overture for clarinets and horn). By the late 18th century the clarinet usually had five or six keys. It was built in various pitches to suit different tonalities, the music being transposed to preserve in all cases the same correspondence between the written note and the player's fingering for it. Clarinets were used in most large orchestras from about 1780. while concertos and chamber works. accumulating from the 1760s onward, culminated in the works that Mozart wrote for Anton Stadler. perpetual reminders of the beauties of the instrument at this still early stage.

The modern clarinet was developed between 1800 and 1850. Further keys were first added to improve certain chromatic notes; Heinrich Baermann, for whom Weber wrote his concertos, used 8 keys, and Iwan Müller introduced his 13-keyed system with stuffed pads in about 1810. During the 1820s bores and mouthpieces were enlarged in conformity with general trends toward greater tonal power, and technological advances, including keywork mounted on pillars, T. Boehm's ring keys and A. Buffet's needle springs. led to the appearance of the modern designs in their main essentials during the 1840s. These exist in two main systems: (1) The "simple" or "Albert" system, deriving from the name of the Brussels maker E. J. Albert, represents a modernization of that of Müller. It is now obsolete in America and the Latin countries and has virtually become so in England. In Germany it remains in normal use, with a complex accretion of auxiliary keywork but with conservative features in bore, mouthpiece and reed, the last being smaller and harder than elsewhere, while the deep quality of the German tone is unmistakable. (2) The "Boehm" system patented by H. Klosé and Auguste Buffet in Paris (1844) and so-called because it incorporates much of Boehm's 1832 flute fingering system, bringing many technical advantages. It has remained virtually unchanged and has becbme standard in most countries. (It is quickly distinguished from the other system by the ring at the back for the thumb, and by the four, or occasionally five, keys for the right little finger.) A more elaborate "full Boehm" model is used mainly in Italy, where orchestral players transpose A clarinet parts on the B-flat instrument, instead of possessing also an A clarinet (which sounds a semitone. or half-step, lower), as is customary elsewhere. The vast technical capacity of the Boehm clarinet has been notably exploited in solo works written in the 20th century.

The Clarinet Family. — Clarinets of other sizes than the B flat and its sharp-key equivalent in A (272-in. long) include the following. Octave clarinets in high A flat (14 in.), which are used in large continental bands: sopranino clarinets, a fourth above the ordinary sizes, which began with the F clarinet of the classical period and was replaced in the 19th century by the E-flat clarinet (19½ in.), often used in the orchestra from Berlioz onward and in Germany in conjunction with its sharp-key equivalent, the D clarinet (a popular size in the earliest days). The ordinary or soprano group has also included the C clarinet (23½ in.). for which there are many parts in classical compositions, now normally played on the B-flat clarinet, though a tendency of German orchestration has been to preserve the C clarinet for its bright, incisive quality. Alto (or tenor) clarinets followed the late 18th-century bulb-belled clarinette *d'amour* in A flat, G or F. and the more successful basset horn in F with compass extension down to its low C; the wider-bore alto clarinet, at first in F, now normally in E flat, was introduced in France about 1820 and as today used in many large American and continental bands is made with curved metal socket or "crook" and upturned metal bell.

The bass clarinet, an octave below the ordinary, was built only experimentally in the 18th century, but after 1810 was developed in a multitude of designs in many countries, and was first employed in the orchestra by Meyerbeer. The modern form, with twice-curved crook, owes much to Adolphe Sax's design of 1838, to which the upturned bell was added subsequently. The operas of Wagner perhaps did most to secure its permanent place in the orchestra. Contrabass clarinets are made in E flat or in B flat an octave below the bass clarinet and are increasingly used in special orchestrations.

CLARK, ABRAHAM (1726–1794), American patriot and signer of the Declaration of Independence was born at Elizabethtown, N.J., on Feb. 15, 1726. Benefiting little from formal educa-

tion, he became a surveyor and also managed transfers of property. Clark had a gift for politics and served in many public offices in New Jersey. He championed the cause of the colonies against Great Britain and was elected to the continental congress in June 1776. As a member of that body he voted for separation from Great Britain and signed the Declaration of Independence. He was re-elected to the continental congress several times and was also a delegate to the Annapolis convention (1786). He was chosen to be a member of the Philadelphia convention of 1787 but was unable to attend because of illness. Clark opposed the adoption of the new federal constitution until he was assured that a bill of rights would be added to it. He served in the U.S. house of representatives from 1791 until his death at Elizabethtown on Sept. 15, 1794.

See Dumas Malone, *The Story of the Declaration of Independence (1954).* (J. R. AL.)

CLARK, CHAMP (in full, JAMES BEAUCHAMP) (1850–1921), U.S. politician, speaker of the house of representatives, and unsuccessful candidate for the presidential nomination in 1912, was born in Anderson county, Ky., on March 7, 1850. He was educated at local public schools and at Kentucky university (Lexington) and Bethany college (Bethany, W.Va.) before attending the Cincinnati Law school. He moved to Pike county, Mo., in 1876, and settled permanently at Bowling Green, Mo., in 1880. He followed the pattern for political success in the rural America of his time, serving successively as editor of a country ne spaper, city attorney, county prosecuting attorney and member of the Missouri legislature. He served 13 terms in the U.S. house of representatives (1893–95. 1897–1921) where he attained membership on the committee on ways and means and on the powerful rules committee. As Democratic floor leader for four years he led his party in the March 1910 revolt against Joseph Cannon, speaker of the house, and then served as speaker of the house from 1911 to 1919. He performed effectively as speaker of the house under the revised rules, which materially reduced the speaker's powers.

Clark's opinions and voting record were consistently progressive and represented the views of the south and west on national issues. He was for years a devoted follower of William Jennings Bryan. In 1912, he showed surprising strength in the pre-convention contests for delegates and in the Democratic convention itself. He led in the early balloting but was unable to secure the necessary two-thirds vote. The convention eventually nominated Woodrow Wilson. Clark's failure to receive the nomination, for which he held Bryan responsible. was a bitter and lasting disappointment. He was defeated for re-election to the house in 1920 and died in Washington, D.C., on March 2, 1921.

His son, BENNETT CHAMP CLARK (1890–1954), practised law in St. Louis, Mo., and served as U.S. senator from Missouri (1933–45). (T. S. BY.)

CLARK, FRANCIS EDWARD (1851–1927), U.S. Congregational clergyman and founder of the Christian Endeavor movement, was born at Aylmer, Que., on Sept. 12, 1851. He graduated at Dartmouth college in 1873 and at Andover Theological seminary in 1876, and was pastor successively of the Williston Congregational church in Portland, Me., and of the Phillips Congregational church in South Boston, Mass. In Feb. 1881, at Portland, Clark organized the Young People's Society of Christian Endeavor, which grew rapidly into a world-wide organization. In 1887 he resigned his ministry in South Boston to give his attention to the United Societies of Christian Endeavor, at first as president and later as president emeritus. Ultimately he served as president of the World's Christian Endeavor union and as editor (later honorary editor) of the *Christian Endeavor World*. Clark made several journeys around the world in his promotion of the Christian Endeavor movement. He died at Newton. Mass., on May 26. 1927.

He nas a prolific writer and his many publications are listed in the autobiographical *Memories of Many Men in Many Lands* (1922). They include *The Children and the Church* (1882); *Christ and the Young People* (1916); and *The Gospel Out-of-Doors* (1920). (S. E MD.)

CLARK, GEORGE ROGERS (1752–1818), American frontier military leader, was born in Albemarle county, Va., on Nov. 19, 1752. He received little formal schooling but learned surveying from his grandfather. He participated as a scout in Lord Dunmore's war against the Indians in 1774. Thereafter he resumed his surveying work for various employers along the Ohio river. He became interested in the development of the Kentucky country around Harrodsburg and cast his lot with those who opposed an independent colony of Transylvania and favoured maintaining a connection with Virginia.

When the American Revolution broke out Clark saw the need for an organized militia to operate against the British and Indians along the frontier. Elected by a mass meeting of the pioneers to present their problems before the Virginia government, Clark and John Gabriel Jones went to Williamsburg. Va., in 1776. They persuaded the council and assembly to make Kentucky a separate county and to assume some responsibility for its defense. Clark returned with a supply of powder and assumed chief command of the frontier militia at a critical moment, for the Indians were already making raids against the settlers. Convinced that the Indians were instigated and supported in their raids by British officers stationed at the forts north of the Ohio river. Clark worked out a plan of offensive operations. His plans were approved by Virginia, and he was authorized to enlist troops.

In May 1778 he was at the falls of the Ohio with about 175 men. The expedition proceeded to Ft. Kaskaskia on the Mississippi river, in what is now the state of Illinois. Ft. Kaskaskia and Cahokia, also on the Mississippi, were defended by small British garrisons, which depended on the support of the French inhabitants. The French being willing to accept the authority of Virginia, both settlements were easily taken. Clark gained the friendship of Father Gibault, the priest at Kaskaskia, and through his influence the French at Vincennes on the Wabash were induced to change their allegiance. However, Lieut. Gov. Henry Hamilton, the British commander at Detroit, Mich., recovered Vincennes. After a strenuous march across flooded bottom land in freezing weather, Clark in Feb. 1779 surprised Hamilton and forced him to give up Vincennes. The way was now open to Detroit. British bastion in the west, but it was deemed prudent to wait for reinforcements promised from Virginia. When the reinforcements were delayed Clark withdrew to Ft. Nelson which he had built at the falls of the Ohio. and made that his base for the rest of the war.

In 1780 he helped defeat a British expedition sent against the Spanish settlement at St. Louis; the same year he made a swift campaign against the Shawnee Indians and destroyed their towns, Chillicothe and Piqua. Clark, now appointed brigadier general of the western forces, again planned to move against Detroit and was promised supplies and reinforcements by Virginia for the expedition. Months went by and they did not come, for Virginia was bankrupt. Again in 1782 Clark led an offensive against the Shawnees in the Miami valley, destroying villages and crops.

When peace came in 1783 Clark's conquests doubtless influenced the award to the Cnited States of the country northwest of the Ohio river. His offensive movements had also been of importance in defending the frontier from Indian raids and British expeditions. Clark and his men during all these years received no pay for their services. Furthermore. Clark found himself responsible for debts incurred for supplies, since Virginia, despite its promises, never reimbursed him. The rest of his life was shadowed by the demands of creditors. Clark was appointed an Indian commissioner after the war, and in 1786 he played a leading part in negotiating a treaty with the Shawnees. The same year he led an expedition against the "Wabash confederacy," his last military command. James Wilkinson, a traitor in the pay of Spain (though not so known at that time), coveted Clark's office of Indian commissioner and his military command, set out deliberately to misrepresent him. and was entirely successful. He was appointed Indian commissioner in the place of .Clark, who was discredited and relieved of his command. Thereafter Clark became involved in a scheme to found a Spanish colony west of the Mississippi, and in 1793 he accepted a French major general's commission in the Genêt project *(see* GENÊT. EDMOND CHARLES). In 1798 he chose exile with the Spanish at St. Louis rather than give up the French

commission. In the following year he returned to Louisville, in the vicinity of which he lived in retirement until his death on Feb. 13, 1818. His best biographer suggests that his relations with the Spanish and French "may be fully understood only when they are interpreted as phases of the expansion of the frontier."

BIBLIOGRAPHY.—The definitive biography is James A. James, *The Life of George Rogers Clark* (1928). *See* also John *D.* Barnhart (ed.), *Henry Hamilton and George Rogers Clark* . . . (1950) and T. C. and M. J. Pease, *George Rogers Clark and the Revolution in Illinois, 1763–1787* (1929). (T. A. LN.)

CLARK, JOHN BATES (1847–1938), often called the dean of U.S. economists, was born in Providence, R.I., Jan. 26, 1847. He was educated at Brown university, Amherst college, Heidelberg and Ziirich, and became imbued with the ideas of the German historical school. Returning to the United States. he taught at Carleton. Smith and Amherst colleges. and finally at Columbia university (1895–1923). The first period of his economic thought, influenced by the historical school, culminated in *The Philosophy of Wealth* (1885). In "revolt." as he said, "against the spirit of the old political economy," he rejected competition as the rule of distributive justice. Nevertheless, he outlined independently an "effective utility" theory of competitive value. resembling that of Jevons and the Austrian school somewhat earlier.

A second period culminated in 1899 in his chief work, *The Distribution of Wealth,* marked by the rejection of the old categories of production factors, but ultra classical in accepting competitive price (which he called the specific productivity of agents', as the just rule of distribution. Despite some contemporary protests, Clark's views dominated economic theorizing in the United States ior a generation, and leit lasting effects in clearer conceptions of a universal law of economic variation, of a price system and of the categories of productive agents.

Clark's later work is noteworthy for his original and practicable proposals for the correction of monopolistic abuses. presented in final form in *The Control of Trusts* (1912), but never iully realized in public policy. (F. A. F.)

CLARK, MARK WAYNE (1896–). U.S. soldier. was born at Madison Barracks. N.Y., May 1, 1896. After graduating from the United States Military academy at West Point. N.Y.. in 1917, he served overseas in World War I. Clark first achieved prominence as chief oi staff of the army ground forces early in 1942. Later that year he executed delicate and difficult assignments in connection with the North African invasion, including a dramatic submarine trip to North Africa for a secret meeting with French officers. His stature as a field commander in World War II rested primarily on his leadership of the U.S. 5th army (Jan. 1943–Dec. 1944) during the hard-iought Italian campaign. In the last six months of the war he commanded the 1 jth army group (Dec. 1944–June 1945) and received the surrender of German forces in Italy. After the end of the war in Europe he assumed command of U.S. forces in Austria before returning home to command the 6th army and later the army field forces. In May 1952, during the Korean war, Clark was given command oi all United Nations troops in Korea. holding that post until after an armistice was signed in July 1953. Upon his retirement from military service in Oct. 1953, Clark became president of a military college. the Citadel, in Charleston, S.C. He wrote *Calculated Risk* (1950) and *From the Danube to the Yalu* (1954).

CLARK, WILLIAM (1770–1838), U.S. frontier soldier, explorer. governor and Indian agent. was born in Caroline county, Va., Aug. 1, 1770. The redheaded William was a younger brother of Gen. George Rogers Clark (*q.v.*), conqueror oi British posts in the west during the American Revolution. In keeping with family tradition. William Clark entered military service in 1789 and subsequently participated in several Indian-fighting excursions! including Gen. "Mad Anthony!' Wayne's campaign against the Maumees and the victorious battle of Fallen Timbers in 1794.

Following a period of separation from the army, during which he was associated with "Mulberry Hill." which estate near Louisville, Ky., he inherited from his iather in 1799, Clark received an invitation to share with Meriwether Lewis in the leadership of what was to become known as the Lewis and Clark expedition (*q.v.*). This Jefferson-inspired expedition was organized in 1803 near St. Louis and during the next three years made its way to the Pacific ocean and back via the Missouri and Columbia rivers. The journals kept by Clark and other members of the expedition provided the nation with its first comprehensive description of this region. In the years that followed, Clark served in the Louisiana territory as superintendent of Indian affairs and as governor of Missouri territory with headquarters at St. Louis. There he died Sept. 1, 1838.

BIBLIOGRAPHY.—A monumental source to which Clark made a large and significant contribution is Reuben *G.* Thwaites (ed.), *Original Journals of the Lewis and Clark Expedition,* 1804–1806, *8* vol. (1904–05). The best biographical account is John E. Bakeless, *Lewis & Clark, Partners in Discovery* (1947). (0. 0. W.)

CLARKE, ALEXANDER ROSS (1828–1914), the outstanding British geodesist of the 19th century. was born at Reading on Dec. 16, 1828. Passing out head of his term at the Royal Military academy. Woolwich, he was appointed to the royal engineers in 1847. His mathematical bent led to his being posted to the ordnance survey! Southampton, in 1850 where he remained until he retired in 1881, except for a break between 1851–54. In 1856 he became head of the trigonometrical and leveling department and was responsible for the reduction of the principal triangulation of the British Isles. He did this with extraordinary speed. publishing the results in 1858 in *Ordnance Trigonontetrical Survey of Great Britain and Ireland.* He published in 1861 the reduction of the first geodetic leveling of Great Britain, and in 1863 the account of the triangulation joining England. France and Belgium, part of which he had himself observed. For the measurement oi an international arc oi triangulation stretching irom Ireland to Russia. Clarke was entrusted with the comparison of the standards of length used by the several countries. This he did in a specially designed room at the ordnance survey, publishing his results in 1866. He wrote *Geodesy* (1880), which remained one of the best textbooks on the subject in any language in the second half of the 20th century. He will be best remembered for his determinations of the earth's dimensions in 1858, 1866 and 1880. These three figures oi the earth were taken into use in parts of Africa and in North America.

He was elected fellow of the Royal society in 1862 and received its gold medal in 1887. He was created a companion of the Bath in 1870 and promoted brevet colonel in 1877. On his retirement in 1881 he moved to Reigate, Surrey, where he died on Feb. 11, 1914. (K. M. P.)

CLARKE, CHARLES COWDEN (1787–1877), English editor and critic best known for his work on Shakespeare, was born at Enfield, Middlesex. on Dec. 15, 1787. A friend of Charles Macready, Dickens and Mendelssohn, he became a partner in music publishing with Alfred Novello, whose sister: Mary, he married in 1828. Six years later he began his public lectures on Shakespeare and other dramatists and poets. Those published include: *Shakespeare Characters; Chiefly Those Subordinate* (1863); *Molière Characters* (1865) ; others on *Shakespeare's Contrasted Characters* and *Shakespeare Numskulls;* on the *Poets of the Elizabethan Era;* and on *Four Great European Novelists.* In 1863 he edited George Herbert's poems and in the next 14 years produced new editions of nearly all the English poets. After his wife had compiled her *Shakespeare Concordance* (issued in 18 monthly parts. 1844–45; one vol., 1845), they collaborated in an edition of Shakespeare (issued in weekly parts and completed in 1868) and *The Shakespeare Key: Unlocking the Treasures of His Style* (1879). Clarke was mainly interested in character study, as was his wife. whose *The Girlhood of Shakespeare's Heroines* appeared in 1851–52, and their work takes its place in the main tradition of character analysis from Maurice Morgann through William Hazlitt and Samuel Coleridge to A. C. Bradley. In 1856 the Clarkes leit London for Nice and subsequently Genoa, where Charles died on March 13, 1877, Mary on Jan. 12, 1898. (G. A. O.)

CLARKE, EDWARD DANIEL (1769–1822), English mineralogist and traveler who collected and brought to England valuable statues. manuscripts and minerals, was born at Willingdon, Sussex. on June 5, 1769, and educated at Tonbridge and Jesus college. Cambridge. In 1799–1802 he traveled through Scandina-

via, Finland, Russia, Asia Minor and Egypt. At Alexandria after its surrender he helped to secure for England the collections made by the French savants. He returned home via Greece with large collections of minerals and antiquities. He was ordained in 1805 and became Cambridge university's first professor of mineralogy in 1808 and its librarian in 1817. He was a founder of the Cambridge Philosophical society (1819) and active in the Bible society. He died in London on March 9, 1822.

He gave his Greek marbles (now in the Fitzwilliam museum) to Cambridge university in 1803. The Bodleian library, Oxford, bought his manuscripts in 1808. Richard Payne Knight his coins in 1810 and Cambridge university his minerals after his death. His principal work is *Travels in Various Countries . . .*, six volumes (1810–23).

See W. Otter, *Life and Remains of . . . E. D. Clarke* (1824) and, for a lively character sketch, H. Gunning, *Reminiscences of the University, 2 vol.* (1854). (J. C. T. O.)

CLARKE, JAMES FREEMAN (1810–1888), U.S. Unitarian clergyman, reformer and author, was born at Hanover. N.H., on April 4, 1810. He was graduated from Harvard college in 1829 and from the Harvard divinity school in 1833. His first pastorate was in Louisville, Ky., from 1833 to 1840. In 1841 he returned to Boston to establish the Church of the Disciples, of which he was minister from 1841 to 1850 and from 1854 until his death. Clarke served also as secretary of the American Unitarian association, 1859–61, and as professor of natural religion and Christian doctrine at Harvard, 1867–71. Throughout his career Clarke was closely involved with many of the most significant movements and personages of his day. While at Louisville he edited the *Western Messenger*, a short-lived liberal magazine in which he printed original works of his friends Ralph Waldo Emerson, Oliver Wendell Holmes, Orestes Brownson and Nathaniel Hawthorne. He was a charter member of the Transcendental club, in which his closest associates were Emerson, Margaret Fuller and Theodore Parker. Clarke was a many-sided though mild reformer. He was an anti-slavery advocate and crusader for civil service reform; in the latter role he was influential in securing the presidential election of 1884 for Grover Cleveland. As a theologian Clarke was both Unitarian and reformed Calvinist, and through his many published sermons and his editorship of such magazines as the *Christian World* (1843–48) and the *Monthly Journal of the American Unitarian Association* (1859–61) he did much to popularize these beliefs. Clarke published over 1,000 pieces in periodicals and 32 books, of which the most notable are his *Ten Great Religions*, two volumes (1871-83) and *Memoirs of Margaret Fuller Ossoli* (1852) edited with Ralph Waldo Emerson and W. H. Channing. He died in Jamaica Plain, Mass., on June 8, 1888.

See Clarke's *Autobiography, Diary and Correspondence*, ed. by Edward Everett Hale (1891); Arthur S. Bolster, Jr., *James Freeman Clarke, Disciple to Advancing Truth* (1954). (A. S. BR.)

CLARKE, JEREMIAH (*c.* 1674-1707), English organist and composer of church and sacred music. He became a boy chorister at the Chapel Royal under John Blow, whom he succeeded as master of the choristers at St. Paul's cathedral (1703). In 1700 with William Croft he became a gentleman extraordinary at the Chapel Royal and in 1704 was joint organist there with Croft. On Dec. 1, 1707, Clarke shot himself while mentally deranged.

Clarke's sacred music is sometimes in the dramatic style of Henry Purcell and sometimes in an archaic style. His occasional anthems include "Praise the Lord O Jerusalem," written for the coronation of Queen Anne in 1702, and "The Lord is my strength" for the victory of Ramillies in 1706. His secular odes include the original setting of John Dryden's "Alexander's Feast" (1697). The famous *Trumpet Voluntary*, once wrongly ascribed to Purcell, was originally either a harpsichord piece, *The Prince of Denmark's March*, or an orchestral rondeau, both by Clarke He also wrote incidental music for plays, solo songs and harpsichord music. (C. A. L.)

CLARKE, MARCUS ANDREW HISLOP (1846–1881), Australian author, best known for his novel *For the Term of His Natural Lzfe*, mas born in London on April 24, 1846. On June 7, 1863. he arrived in Australia, where his uncle, James Langton Clarke. was a county court judge. At first a clerk in the Bank of Australasia, he then learned farming on a station near Glenorchy, Victoria, but he was already writing stories for the *Australian Magazine* when in 1867 he joined the staif of the *Melbourne Argus*. He became secretary (1872) to the trustees of the Melbourne public library, and later (1876) assistant librarian. He helped to found the Yorick club in 1868, which soon numbered among its members Adam Lindsay Gordon, Henry Kendall and George Gordon McCrae. He died in Melbourne on Aug. 2, 1881. *For the Term of His Natural Life* (1874), a tale of the convict system, began to appear in serial form in the *Australian Journal* in March 1870.

See H. Mackinnon (ed.), *The Austral Edition of the Selected Works of Marcus Clarke* (1890); *B.* Elliot, *Marcus Clarke* (1958). (C. M. H. C.)

CLARKE, MARY ANNE (*c.* 1776–1852), mistress of Frederick, duke of York. second son of George III, caused a public scandal by her abuse of patronage. She was probably born in London in 1776 and married, before she was 18, a stonemason called Clarke whom she soon left. In 1803 she became the mistress of the duke of York. the commander in chief. The duke's promised allowance was not regularly paid, and to escape from her financial difficulties Mrs. Clarke trafficked in her protector's position, receiving money from promotion seekers, military, civil and even clerical, in return for her promise to secure them the good services of the duke. Her activities caused Colonel Wardle, M.P., to bring in 1809 charges of abuse of military patronage against the duke, which were investigated by the house of commons. The duke was shown to have been aware of what was being done, but to have derived no pecuniary benefit himself. He resigned his appointment as commander in chief (he was reappointed in 1811), and ended his connection with Mrs. Clarke, who subsequently obtained from him a considerable sum in cash and a pension as the price for withholding the publication of his numerous letters to her. She died at Boulogne on June 21, 1852. (A. AL.)

CLARKE, SAMUEL (1675–1729), English theologian, philosopher and exponent of Newtonian physics. regarded by his contemporaries as one of the foremost intellects of his country in his time. was born at Norwich, on Oct. 11, 1675. He was educated at Caius college, Cambridge. After ordination, he became in 1698 chaplain to Bishop John Moore of Norwich and in 1706 a chaplain to Queen Anne. who in 1709 presented him to the rectory of St. James's, Westminster. In 1704–05 he gave two sets of Boyle lectures later published as *A Demonstration of the Being and Attributes of God* (1705) and *A Discourse Concerning the Unchangeable Obligations of Natural Religion* (1706). In the first set he attempts to prove the existence of God by a method "as near mathematical as the nature of such a discourse would allow"; in the second he argues that the principles of morality are as certain as the propositions of mathematics and thus can be known by reason alone. These lectures had a considerable influence on English 18th-century thought. Thus David Hume's criticisms of religion partly resulted from his dissatisfaction with Clarke's attempt to prove God's existence. In moral philosophy the "intellectualist" theory of Clarke found supporters in William Wollaston and Richard Price but its shortcomings were pointed out by Joseph Butler, Francis Hutcheson and Hume, all of whom in part developed their moral theories in reaction against Clarke.

Of Clarke's other theological works, the most important was *The Scripture Doctrine of the Trinity* (1712). This started a violent and prolonged controversy, in which many of his opponents accused him of Arianism. The fact that Clarke never obtained further preferment was almost certainly due to this publication.

Clarke, who had become a friend and disciple of Isaac Newton at Cambridge, did much to help the spread of Newton's views. He made a Latin translation (1697; 4th ed. 1718) of Jacques Rohault's *Traité de physique*, the standard Cartesian textbook, and added to it a large number of footnotes explaining how Newton had improved on Rohault; in 1706 he published a Latin translation of Newton's *Opticks;* and in 1715-16 he acted as Newton's spokesman in an interesting exchange of letters with Leibniz (first published 1717; modern editions 1956 and 1957). Although this

correspondence began with Leibniz's criticisms of certain theological implications which he found in Newton's scientific writings its main importance lies in the discussion of the notions of space and time. Clarke defends Newton's view that space and time have some sort of absolute existence. while Leibniz claims that they are only relations between objects or between events.

Clarke died suddenly at Leicester on May 17, 1729. A collected edition of his *Works,* four volumes, was published in 1738–42.

(H. G. AL.)

CLARKE, THOMAS SHIELDS (1860–1920). U S. painter and sculptor, was born in Pittsburgh, Pa , on April 25. 1860. He studied at Princeton and for a year at the Art Students' league, New Pork, then (1883) went to Paris. where he studied under Gustave Boulanger. Jean Gérôme, Pascal Dagnan-Bouveret and the sculptor Henri M. Chapu.

Among his better-known works are "The Cider Press," a bronze in Golden Gate park, San Francisco. Calif.; four caryatids for the appellate courthouse. New Pork city; and the paintings "Night Market in Morocco" and "A Fool's Fool." He died in New York on Nov. 15, 1920. (D. H. W)

CLARK FORK, a river of the northwestern U.S. is the eastern segment of a system which drains the Clark Fork-Pend Oreille basin of northeastern Washington, northern Idaho, western Montana, and two areas in British Columbia. Can. Rising near Butte. Mont . the Clark Fork flows in an irregular course north and northwest for about 360 mi. before it empties into Pend Oreille lake (*q* v.) in northern Idaho. From this point to the Columbia the stream is called the Pend Oreille river. Principal tributaries are the Blackfoot Bitterroot. St. Regis and Flathead rivers, the latter being the largest and most important. Typically, the river and its tributaries consist of long, narrow scream sections confined by mountainous terrain with cultivable intermontane valleys and prairie sections scattered along their courses. The Bitterroot and Flathead valleys contain extensive irrigated areas.

The river basin is noted for its extensive mineral deposits, forests, attractive lakes and streams. comfortable summer climate and spectacular mountain scenery. Glacier National park. the National Bison range wildlife preserve and a number of national forests are in the Clark Fork-Pend Oreille basin. (G. V. SK.)

CLARKSBURG, a city of West Virginia, U.S., seat of Harrison county, is on the West Fork of the Monongahela river in the north-central part of the state, midway between Cincinnati. O , and Washington, D.C. Located in the midst of a rich farming country, it is also a centre of coal, oil and gas production and has a well-balanced variety of manufacturing plants, including glass, zinc, caskets, brick, chinaware, electrodes, machinery and evaporated milk,

Clarksburg was settled in 1765 and incorporated in 1785. It was named for George Rogers Clark, the noted Virginia soldier and explorer. In 1772 Thomas Nutter, an early settler, built a fort 3 mi. from Clarksburg, around which developed the town of Nutter Fort a suburb of Clarksburg. The towns of Broad Oaks, Stealey Heights, Adamston and North View were consolidated into Clarksburg in 1917 and a new charter was issued by the legislature of West Virginia in 1921.

The city has a council-manager form of government which went into effect at that time.

Clarksburg was the birthplace of Thomas Jonathan "Stonewall" Jackson, the Confederate military leader. John W. Davis, Democratic candidate for president in 1924, and Howard Gore, secretary of agriculture in the cabinet of Calvin Coolidge and governor of West Virginia (1925–29), were also residents of Clarksburg.

For comparative population figures see table in WEST VIRGINIA: Population. (K. K. MCC.)

CLARKSON, THOMAS (1760–1846), English antislavery agitator who was one of the most active leaders of the abolitionist campaign. was born on March 28, 1760. at Wisbech, Cambridgeshire, the son of a schoolmaster. Educated at St. Paul's school and St. John's college. Cambridge, he was ordained a deacon but soon abandoned all idea of exercising his profession. He was first drawn to the subject of slavery in 1785 by the reading he did in preparation for a Latin prize essay (see SLAVERY). The publication of an English translation of this essay brought him in touch with Granville Sharp and others, and with them he formed a society for the abolition of the slave trade and became a member of its committee of 12. Gaining the sympathy of William Wilberforce, William Pitt, Charles James Fox and Edmund Burke, Clarkson spent his days traveling from port to port collecting evidence which was used in his *Summary View* of the *Slave Trade* and the Probable Consequences of its Abolition (1787) and in the parliamentary campaign led by Wilberforce. The abolitionist cause made no parliamentary progress after the beginning of the French war, however, many members feeling that the trade was necessary both as a source of national wealth and as a training ground for the navy.

Clarkson was forced to retire from his exhausting work in 1794 because of ill-health, but from 1804 he was again active and in 1807 a bill for the abolition of the slave trade was passed. Soon afterward Clarkson published his History . . . of the Slave Trade, two volumes (1808). From 1807 he agitated for the enforcement of the act and for international abolition. Finally, in 1815, Lord Castlereagh secured the condemnation of the trade by the other great powers. When the question of practical measures for abolition was unsuccessfully discussed at the congress of Aix-la-Chapelle in 1818, Clarkson personally presented an address to Alexander I of Russia who communicated it to the sovereigns of Austria and Prussia. In 1823 the Anti-Slavery society was formed and Clarkson became a vice-president, but he took little active part in the final victory, the Emancipation act of 1833. Until his death at Ipswich on Sept. 26, 1846, Clarkson continued to publish works attacking slavery. He also wrote Memoirs . . . of *William Penn,* two volumes (1813).

See E. L. Griggs, *Thomas Clarkson* (1936). (A. AL.)

CLASS, SOCIAL, an aggregate of persons, within a society, possessing approximately the same status. The class system, or the system of stratification of a society, is the system of classes in their internal and external relationships. It is the set of relationships constituted by the granting of deference to individuals, roles and institutions in the light of their place in the systems of power, property, occupation, etc. (See also SOCIAL ANTHROPOLOGY: Status and Stratification.)

Deference is an action of respect or honour, associated with the feeling of equality or inferiority. By logical extension, sentiments of disrespect or disesteem, feelings of contempt and superiority, are also comprehended in the conception of deference. Deference is an act of implied judgment of the worth and dignity of a person. office or institution, made in the light of a scale of values. It is simultaneously an act of judgment regarding the person judged and the person judging.

Bases of Class.—The deference which defines class position is granted to persons, offices and institutions in accordance with the deferring person's perception. which may be erroneous and which is almost always fragmentary and vague. of the characteristics of the person, office or institution being judged. A man is judged in accordance with the judging person's perception of his income and wealth, his occupation. his level of achievement within his occupation, his standard of living (including the location of his residence), his ethnic characteristics, his kinship connections, his educational level, his relationships to the main centres of the exercise of power in the society as a whole and in the particular institutions in which he functions, such as business firms, churches, universities, armies, governmental departments, etc., and his associates, formal and informal. (His wife and children are usually granted deference corresponding to his status.) These various characteristics are not always evaluated in the same way in all societies. For example, in the United States the significance of kinship connection is less important than it is in China or Great Britain in affecting a person's social status (*i.e.,* the rank which is accorded to him by the members of the society). Similarly, ethnic characteristics are more important in the United States than they are in France or Brazil, although they are diminishing in their significance in the United States. Education has less significance as a basis of discrimination in the United States than it has in Germany, the Netherlands or Sweden. Occupation is probably

less important as a basis of deference in the United States than it is in Germany, and it continued to decline in the 20th century.

Within each category (*e.g.*, occupation), variations occur in the rankings which result from the feelings and judgments of deference. Scientists, for example, have moved up considerably on the scale in western countries, while the clergy has been undergoing a gradual decline over several hundred years. The military profession rose in the deference hierarchy in the United States after 1940, as it does everywhere when the society is militarily endangered.

The judgment which underlies the act of deference is a synthetic judgment which assesses simultaneously a large number of relevant characteristics. A process similar to that of averaging occurs. Hence, a very wealthy man who keeps low company and whose occupation is disreputable might rank lower in most people's opinion than a less wealthy person whose occupation is most estimable and who is an intimate of the great and worthy. In a society which regards the kinship bond as one of the primary ties, close blood relationship to a great person might compensate for a moderate income and a mediocre professional accomplishment in setting one person above another who is wealthier and more successful but who has no eminent ancestors.

Class System.—The class system is an imperfect equilibrium of innumerable individual acts of deference, both "pure" and "mixed" with elements of the occupational, property and political systems. The class system might be extremely inequalitarian, as in the ante-bellum South, or it might be highly equalitarian. as in modern Norway. The members of the society might classify themselves and each other into a set of status classes which shade off into one another, or the classes might be sharply defined and distinguished from one another.

In an inequalitarian society, the acts of deference will express sentiments of great inferiority or superiority. The deference of the lower classes will be full of self-abasement before the superiors, and the latter will treat the former as barely human. European feudal society was like this. In contrast, there can be societies with a much higher degree of equalitarianism, in which the highest and the lowest both feel themselves to be part of a common community or humanity and in which accordingly there are not such sentiments of profound and far-reaching superiority and inferiority. Few persons in these societies feel themselves to be very much better or worse than anyone else. The modern western countries, and above all those societies which grew up on the frontiers without an inheritance of an elaborate inequalitarian class structure—namely, Canada. the United States, Australia and New Zealand—tend in this direction.

Although logically it is possible for any number of classes to be formed in a given society, once individuals of approximately similar status are grouped into classes, this does not, in fact, happen. There is a tendency for the society or its parts to act as if there were relatively few classes. Such classes as are recognized are not, of course, internally homogeneous. and persons within them make many distinctions which are not seen or acknowledged by those who are not in intimate contact with them. They are moreover practically never defined in the minds of most of those who refer to them. Persons nho are especially "conscious" or sensitive about their own social status will try to define quite precisely the boundaries separating. among the persons with whom they come into face-to-face contact, those with whom they will associate and those with whom they will not associate on the grounds of their class status. Such "status-sensitive" persons are in most societies in varying but almost always small minorities, and even they do not have precise conceptions of the boundaries between classes other than those adjacent to their own class. Most of the class system is rather dimly differentiated in the minds of their members. Thus, the status judgment is not a precise judgment; it is only vague and approximate, in terms of higher and lower.

Boundaries are more precise in societies with an official system of stratification (*i.e.*, a titled nobility, a system of "estates" and a body of sumptuary legislation designed to demarcate class boundaries) and with relatively undeveloped mercantile administrative and professional middle classes (like France in the 17th century or Russia before 1917). Even in such societies, however, the official stratification system covers in a differentiated manner only a small proportion of the social hierarchy. For the rest of the society, although retaining significance, it is too undifferentiated to suffice. In consequence, a further system of stratification of the type discussed in the preceding paragraph emerges spontaneously.

The sharpness of the boundaries of status groups is at its height in a caste system, because endogamy, or intermarriage, is a requirement there to an extent unattained in other types of stratification systems and the inheritance of occupations in a static economic system and the strength of kinship ties add their force to already powerful status sentiments. There is of course a tendency for all status groups to be endogamous, but where personal affection is accorded some sway and where other considerations, such as personal beauty and personal merit, enjoy relative autonomy in competition with status considerations in the selection of marriage partners, this endogamy is always far from complete.

In all large societies, arid particularly in those undergoing a moderate rate of change creating new roles. a considerable amount of upward mobility and some downward mobility is inevitable. It is especially pronounced in societies in which there are special institutional arrangements for training and selection and for the inculcation of standards of judgment which accord a high value to improved class status. This tends to raise problems relating to claims to higher status on the part of the recently ascended and denial of these claims by those with whom the recently risen persons seek to associate as a confirmation of their higher status. The denial of claims to deference of the "parvenu," because he is too new. or too crude, or too rich, or too contaminated with foreign connections or for whatever reasons, is a fertile source of alienation in society and a powerful factor in the promotion of change.

This phenomenon brings to the fore another property of the status system which merits mention. The discussion hitherto has proceeded as if there mere. vagueness notwithstanding, a consensus in every society regarding the criteria for the granting of status as well as consensus in the assignment of the status of particular persons and institutions. This is not so. There is some disagreement and a great deal of sheer unconnectedness in the status judgments of all large societies. The groups which enjoy higher status positions in their own eyes and in the eyes of those adjacent to them will usually have a stronger view of their claims and merits than will those groups that feel themselves to be inferior. The "lower" classes, while acknowledging the superiority of their "betters," do so with reluctance and ambivalence. And in some instances some of the members of these classes deny outrightly that superiority. Ethically radical and politically revolutionary attitudes constitute the extreme form of denial of the claims of the "superior" to their superior status. (See FRIENDS, SOCIETY OF. History.)

The human mind finds inferiority hard to accept in unadulterated doses, and some persons find it harder to take than others. In the loner and middle classes there is often a tendency to deny the validity of the criteria by which the upper classes have enjoyed their superior status. For example, in 18th-century France there was a widespread denial by the mercantile and professional classes of the legitimacy of kinship connections and of heredity as a basis for deference, while they praised the criteria of occupational proficiency and personal merit such as honesty, diligence and intelligence. (This outlook was proclaimed by the constituent assembly of the French Revolution in the Declaration of the Rights of Man and Citizen. which declared "careers open to talent.") Ambivalence and resentment are widespread without, however. going so far as revolution—and even revolutionaries cannot completely expunge from their minds all the status criteria of the society they are revolting against, as is shown by the reestablishment of many of the prerevolutionary status patterns in the Soviet Union Those whom the prevailing system of evaluation relegates to a lower status, even while sharing and acknowledging that status, simultaneously resent and deny it. The proportions of acknowledgment and denial vary among individuals and among societies, but it is safe to assert that it practically never approxi-

mates either extreme in any large society.

The imperfection in the integration of the class system is furthered by the limited range of attention and interest of a large proportion of the population. As a result, they do not participate as much in the larger class system as they do in their local class subsystem, comprising largely the persons with whom they have face-to-face contact.

Status System and Social Organization. — The conflict of classes is a reality of all large societies and cannot be eliminated. It is inevitable for the reasons given in the foregoing section. The lowly status is injurious to the sense of dignity of many persons, especially when it is reinforced by resentment against authority, however legitimate. and the desire for goods and services which cannot be acquired on the basis of income earned through the sale of services or goods in the market. The modern labour unions and employer's associations are responses to these facts. But even in societies in which labour unions are either not allowed or are shorn of the functions which they have developed in free societies, the conflict of classes persists, though it must operate through other institutions or even surreptitiously.

The conflict of classes is not always of constant intensity. It varies among societies and periods. and even at any one time in a given society only an extremely small proportion of the population will be much absorbed by the class conflict in its more active and organized form. (In the Bolshevik Revolution in St. Petersburg, only a few thousand persons were actively engaged.) Much of the population participates by assent, a much smaller number participates by the payment of dues to organizations which promise to bring advantages to the class or some sector of it. and a far smaller number plays an active part in the organization. Thus what the Marxists call "class consciousness," which would be more precisely called "aggressively alienated class identification," is a rather uncommon phenomenon, even in modern industrial societies. Normal class conflict is fully compatible with a high degree of responsible citizenship and a considerable measure of social order.

Tensions and misunderstanding among classes are in some large part linked also to variations in class culture. The fact of differential access to income, personal security and knowledge, which normally are correlated with status, affects the way in which people behave and think at different levels of the stratification system. Thus, in every country for which data exist, the poorer people are, the more likely they are to vote for the more left-wing political party, that group which most favours redistributing the benefits of society, using governmental powers to enhance the position of the lower economic classes. Similarly, groups whose social status is relatively low because of their ethnic or religious background tend to vote disproportionately for the more leftist parties. *(See* also VOTING BEHAVIOUR: *Influence of Social Status.)* Status is also correlated with participation in local political and other community activities. The lower-income and less-educated groups are much less likely to vote in elections or to belong to voluntary associations than are those more privileged along these status-linked lines. Status groups also tend to vary in religious affiliation. In countries with a number of denominations, it is possible to distinguish among them according to the relative social status of their members. Studies of the audience for different mass media indicate that newspapers, magazines, television or radio programs all tend to differ among themselves according to the status of their audience. Investigations of family behaviour patterns, such as the Kinsey studies of sexual behaviour. indicate large variations in type and extent of sexual practices in different classes. in the birth rates (on the whole the more privileged have smaller families though the difference is declining) and in the way in which infants are treated. Studies of mental illness suggest differences in the extent of such morbidities at various levels in the class structure. The lower-status groups have a much higher incidence of schizophrenia than the higher strata. There is no important area of behaviour in which it is not possible to find large statistical differences between levels up or down the class structure.

Class status and the individual's identification of himself in terms of a particular class status clearly play a permeative role in social life. Within the family, they affect parents' hopes for their children's future careers, spouses, friends and associates. They influence the extent to which a parent will exert himself to improve his economic lot so that the family will not only have more conveniences and amenities but so that it can also enjoy a higher status. It influences in large part the mother's decisions in the domestic economy and in the expenditure of income on various types of household articles. It affects the choice of place of residence and the choice of friends and associates. It is seldom the exclusive factor in such choices, but it is also seldom entirely absent. *(See* also STANDARD OF LIVING.)

Face-to-face relationships are of particular significance in the stratification system. It is in such relationships that individuals perceive their own status in the judgments of others. It is in such relationships that they can exhibit their own claims to the deference of others by acting, speaking and dressing in a certain manner. This is the reason why more discriminating and sensitive judgments are rendered about the nearby social environment than about those sectors of the society which are more remote. Yet considerations of class status do not overwhelm all other considerations in face-to-face relationships. The more human beings see of each other, the more they respond to each other as persons. They judge each other as persons worthy of being liked or disliked, of being loved or hated. Relationships which commence with status considerations foremost often develop into relationships in which personal affection or dislike becomes preponderant. Because personal relationships tend to begin in a situation of homogeneity in class status: friendships and marriages tend to fall within narrow ranges in class status. To the extent that they do not. they bring the classes rather closer together.

Face-to-face relationships, whether status or personal elements preponderate. play an important role in the status system as a whole. For those who are in the lower part of the status system, face-to-face relationships, usually with persons of approximately similar status, reduce the danger of denial of their status dignity out of resentment or contempt by those who are respectively lower or higher; while for those at the top of the status hierarchy, the tendency for like to associate with like confirms self-esteem and diminishes the danger of direct denial.

Thus, through the individual's sense of civic membership and his belief in its justice, and through his face-to-face relationships and his limited focus of attention, inequalities in class status, which are an inevitability of large, differentiated societies, are rendered more tolerable to the sense of individual dignity. Society tends to be maintained in a state of equilibrium among the classes although those lower in position always endeavour to improve their lot through individual or collective action. *See* CASTE (INDIAN); COMMUNISM; SOCIALISM; *see* also references under "Class, Social," in the Index volume.

CLASSICAL EDUCATION. The teaching of Latin and Greek to enable pupils to read and use those languages is a discipline that has been handed down from the earliest times. The main justification for this lies in the intrinsic merit of the great humanitarian writers of the classical periods when the civilizations of Greece and Rome were at their peak. That these works have withstood the test of time is felt to be ample testimony to their n-orth. Moreover. as the civilization of western Europe has its roots in Greece and Rome, an understanding of origins is deemed to be a valuable preparation for the proper appreciation of modern problems. Many religious. political and social institutions had their birth in classical times. The ideas associated with their genesis were often presented with such striking clarity that they are eminently suitable for young minds.

But it is not only the literature that has its value. The directness and precision of the Latin and Greek languages, the orderly logic of Latin and the flexible beauty of Greek, impart a training in clear thought and expression that it would be difficult to surpass. The close and concentrated study of words the meaning of which must be clearly understood before they can be translated, where a facile rendering is fraught with danger, whether one is translating into or out of English, gives a constant practice in English comprehension and composition unequaled by similar exercises in modern languages. (T. W. M.)

In the discussion that follows, the subject is treated under the United States, England and Scotland, continental Europe, Latin America and the orient. While in the western world the expression "classical education" pertains to Latin and Greek studies, in the oriental world it is used to refer to the ancient traditions of learning of the various countries being discussed.

IN THE UNITED STATES

Classical education in the United States began with the founding of Harvard (*q.v.*) college and the Boston Latin school in about 1638. Following the English model (probably Cambridge), the only requirement for entrance to Harvard was the ability to read and speak Latin and some knowledge of Greek forms. and this was also the aim of the Latin school. All lectures were in Latin. the curriculum consisted almost wholly of the classics and students were required to speak Latin on the campus. The subsequent progress of classical education has been divided roughly into three periods: the prerevolutionary period, the period to the close of the Civil War and the modern period.

During the first period admission requirements remained much the same as at Harvard; even arithmetic was not required until 1693, and then not universally. In the colleges the classics remained supreme, although arithmetic. geography and anatomy were included in the curriculum of William and Mary in 1693, and physics in that of Yale in 1701. Also, the forerunner of the University of Pennsylvania. under the influence of Benjamin Franklin, made considerable provision for science, and an impressive program in science and history was announced by Columbia in 1754, which, however. was not adhered to.

The middle period was one of great educational expansion. Many new colleges and secondary schools were founded, and the states began to make provision for higher public education in the state universities. Public high schools also began to multiply. The curriculums of the colleges were greatly extended, and the appearance of new subjects in the requirements for entrance involved provision for them in the preparatory courses. At first Greek and Latin, later Latin alone, were obligatory on all candidates for degrees, and while in some academies, notably those for girls. and in the state universities: the tendency was to greater freedom, still the general tone of education was cultural. interpreted as classical. The modern period has been one of revolution. both in ideals and practices. The carrying out of the theory of universal education and the rapid growth of industrialism demanded greater provision for vocational and scientific training. The public high schools still clung closely to the classical tradition but they showed the new influence in the great broadening of their curriculum. Where this was not done, vocational and trade schools discarded the classics for a more immediately practical training. In higher education, either separate scientific and technical schools were established or increased provision was made for science in the colleges and universities. and modern languages and the social sciences vied with the natural sciences in pressing their claims.

Room for the new subjects could be obtained only at the expense of the classics. The first to be seriously affected was Greek. which. though vigorously defended, had by 1928 been eliminated almost entirely from the curriculum of the secondary schools and was studied by very few undergraduates in college. Latin also was severely curtailed and at one time seemed likely to go the way of Greek. Following World War I. however. there took place some reaction in favour of Latin in colleges; it did not continue to hold as large a place in the schools as formerly, although it was still included among the requirements for entrance to college. The number studying Latin dropped from 50% of students enrolled in 1900 to 7% by the 1950s. It is not, however, the Latin of former days. Under the attacks of the new psychology and the advocates of practical studies the teaching of Latin, which formerly had been largely a mechanical preparation for entrance examinations. was adapted rather to the immediate needs of the pupils studying it. In 1920 the General Education board arranged with the American Classical league to conduct an investigation of the classics (chiefly Latini in the secondary schools. In the report, published in 1924, the aims of the teaching of Latin were set forth as follows: to read and understand Latin; to increase the pupil's ability to understand the Latin element in English. and to read, speak and write English; to develop historical and cultural background, correct mental habits and right attitudes toward social situations; to increase the ability to learn foreign languages: and to give an elementary knowledge of the principles of language structure. In the furtherance of these aims extensive recommendations were made as to curriculum and methods of instruction. These were very generally adopted and the textbooks were accordingly reconstructed to carry them out. The rapid increase in enrollments in the high schools in the decades folloning, however, changed their character and the future of Latin seemed precarious (*G.*L.; I. L. K.)

IN ENGLAND AND SCOTLAND

In England a classical education survived from the quadrivium and trivium of the ancient schoolmen *(see* EDUCATION, HISTORY OF: *The Western World: The Renaissance)* with varying continuity. Greek was not always available, and the concentration on Latin grammar in the past might well have put an end to this form of education. In spite, however, of continual attacks from critics, up to the end of the 19th century the classics held pride of place in education. particularly in the public schools (*i.e.*, private schools) where tradition was not easily upset and where an empirical appreciation of their value caused them to be strongly entrenched. In Scotland. too. the classics have traditionally been strong and the study of Greek held in high esteem. Nevertheless as education became increasingly the responsibility of the state and the demand that education should be made to serve the state's economic interests became harder to resist. more time was being devoted to science and technology at the cost of the classics. The independence of the public and direct-grant schools afforded them greater immunity from this pressure than' could be expected in schools maintained by local education authorities. Nevertheless, some enterprising teachers in state schools were striving successfully to keep alive, and even to inaugurate, classical courses.

Moreover, there are a number of bodies interested in keeping the classics alive. The Classical association (founded 1903) is pledged to secure that the classics shall occupy a prominent place in any system of public education. The association and also the Societies for the Promotion of Roman and Hellenic Studies, which cater more for specialists, keep the classics before the public eye. This they do by their journals, *Greece and Rome* (twice yearly, *1931–*), *The Classical Review* (quarterly, 1887–), *The Classical Quarterly* (twice yearly, 1907–) and the *Proceedings* of each of the three societies, as well as by a triennial conference at Oxford or Cambridge at which British and foreign scholars lecture. The Classical association also holds an annual three-day conference at the universities. The Association for the Reform of Latin Teaching is particularly interested in methods of teaching Latin and Greek.

The Orbilian society publishes an interesting Latin newspaper, *Acta Diurna* (1946–), based on the events of 2,000 years ago, as well as charts, maps and other visual aids. The Virgil and Horatian societies exist to foster an interest in the works of those poets.

Organization **of** Classical Teaching. — Latin is begun in grammar schools at the age of 11 or 12 and pursued for a five- or four-year course to the age of 16 when the ordinary level of the

general certificate of education is taken. In the first two years the work consists of the piecemeal mastery of the grammar, accidence and syntax, with exercises illustrating each fresh point in English and "synthetic" Latin. This Latin reading is usually made up to illustrate the life, history or legends of the Greeks and Romans. In the third year pupils are slowly introduced to the easier authors, such as Caesar and Ovid, and the simpler speeches of Cicero. At the ordinary level candidates are expected to show a reasonable proficiency in translating simple Latin into English and straightforward English into Latin. Greek is usually begun two years after Latin by a smaller number of boys. In the sixth form a two-year course leading to an advanced level comprises the reading of authors. translation at sight, prose composition, sometimes verse composition, and ancient history. Latin only may be taken as part of a group of arts subjects, or Latin, Greek and ancient history as the full classical course.

There are three methods of teaching Latin: the traditional, the direct and the Mason Gray method. The direct method relies on constant oral practice to teach constructions, with hardly any translation into English. The Mason Gray method uses extensive reading, ample commentary and, eschewing the slow analytical method of the traditionalists, recommends taking in whole Latin sentences at a time. In the main the traditional method prevails. The whole question of classical teaching was very comprehensively treated in the handbook issued by the Incorporated Association of Assistant Masters, *The Teaching of Classics* (1954). Refresher courses for teachers, at which methods of teaching are demonstrated, are frequently organized by the societies already mentioned. Pronunciation of Latin is a fiercely controversial question, but there is real concern, whatever the pronunciation. that the recitation of Latin and Greek should be encouraged, to which end the Classical association. helped by the Virgil and Horatian societies, organizes reading competitions for school children throughout the country.

Classics at the universities—the number of graduates in classics at Oxford and Cambridge roughly equaled those in the final honour schools of all the other universities—were still fairly strong by the latter half of the 20th century. The honours examinations, "greats" at Oxford and the classical tripos at Cambridge, contributed the largest number of successful candidates in the administrative branch of the civil service. Many business firms were anxious to have as trainees graduates with a good grounding in classics, and this, too, has given support to the teaching of classics.

IN CONTINENTAL EUROPE

It is difficult to generalize about classical education in continental Europe, with its various educational systems. In general the pure classical course had been retained into the second half of the 20th century for those taking Latin and Greek up to university standard, and Latin was still considered important or obligatory where modern languages or other humanities were studied. A universal Latin requirement had, however, given way before the demands of science and other modern subjects.

In France, after the first two years, in which a pupil might or might not take Latin according to his aptitude, a choice of four courses lay open to him, all leading to the *baccalauréat*. Latin was associated with three of these courses: the full classical course; the modern course with Latin and two modern subjects; and the science or mathematical course with Latin. A prognostic year to select pupils for Latin proved unpopular and was dropped. In spite of the encroachments of science, parents were generally ambitious for their children to take Latin.

In Germany schools of the type known as the classical *Gymnasium*, where emphasis is on Latin, Greek and one modern language, were less frequent than formerly. The *Realgymnasium*, however. the commonest form of secondary school, included a course of Latin, and an opportunity for studying Latin was provided in the *Aufbauschule*, schools for country children with no secondary school within reach. Again, it may be said that while classics were not so strong as in the 19th century. ancient languages still represented a considerable element in German education

In the Xetherlands the classics flourished. Latin and Greek were still compulsory at the university for students of law, letters, history and theology. In the *Gymnasium* there was a six-year Latin and five-year Greek course, while in the *Lyceum* Latin and Greek were studied in the last four years. In both types of school there was a bifurcation of pupils into the A-certificate stream with more, or the B-certificate stream with less, classics, the latter being one method of being admitted to a science course at the university The classical course at the *Lyceum*, being shorter, was much more intensive. The position in Belgium was not dissimilar.. Greek and Latin were taught in all secondary schools, but with most emphasis in the *athénées royaux*. Greek and Latin were considered to be the structural element in the *humanités anciennes*, between which two groups a "finishing" student must necessarily choose before embarking on an advanced course.

In Norway and Sweden the classics had lost some ground. Few school children took Greek in Norway, where it was alternative to English. There was one Latin stream in the grammar schools, and no Latin requirement for modern languages or science, although it was compulsory at the university for arts, medical and theological students. Classics in Sweden had not recovered the position they lost after World War I.

In Italy children leaving elementary schools to go to the *scuola media* (*i.e.*, those not going to trade schools) studied Latin for three years. They then proceeded to one of four types of school: the *liceo classico*, where Latin and Greek were studied for five years; the *liceo scientifico*, with Latin for five years; the *istituto magistrale*, for prospective elementary schoolteachers, with four years of Latin; or the *istituti tecnico-commerciale*, without Latin By the mid-20th century it had been suggested that Latin be removed from part of the *scuola media*. Public opinion favoured something more useful; but there was likely to be considerable opposition to the project.

Claisical teaching on the continent tends to be more formal and more regulated than in Great Britain. *Lecture expliquée* seems a favoured method. and translation from the national language into Latin almost completely abandoned. (T. W. M.)

IN LATIN AMERICA

In Latin-American countries less attention is given to the study of classical languages than in other countries whose culture is derived from the classical heritage. In the first place, secondary schools in most Latin-American countries were established at a time of reaction against schools maintained by the teaching orders which had emphasized the classical basis in secondary education. Second, universities have consisted in the main of loosely associated faculties for professional preparation and were only just beginning, at mid-20th century. to permit the study of liberal arts subjects, either in existing faculties of philosophy as in Buenos Aires, or in more recently created faculties elsewhere. In these, provision had been made for the study of Latin and Greek. Third, the secondary-school curriculum had developed by an accretion of subjects and, unlike the European countries and the United States, little provision had been made for options or for differentiated courses. Consequently, when the list of subjects to be carried became too burdensome, a solution was found by dropping those subjects, especially Latin, which the pupils found too difficult and the utility of which was not recognized by the parents.

The situation in general may be illustrated from the practices of some of the leading Spanish American countries. In Argentina a movement to make Latin an optional subject began as early as 1870 and nas realized in 1886; in 1891 proposals began to be made to drop it and by 1901 it disappeared entirely except in three schools that enjoy special privileges of autonomy. Greek had disappeared as early as 1863. In Chile Latin ceased to be required for graduation from a secondary school in 1877 and gradually disappeared. In 1925 an inquiry elicited the opinion that room should be found in certain schools for the study of Latin with or without Greek. It is significant, however, that all students in the Instituto Pedagogico, the institution for training secondary-school teachers, had to take Latin if they wished to become specialists in Spanish or any modern foreign language. In Uruguay Latin grammar was taught in the first two years of the secondary-

school course in 1889 but was dropped in 1909. Latin was required in Mexico for entrance to the law faculty of the university; classical roots replaced Latin in other schools.

In Brazil, Latin, long required for four years, was no longer required of students taking the scientific option, the majority. Greek was studied in a small number of schools where the full classical course was offered.

The secondary-school situation was reflected in the universities, where specialization in classical studies is unusual. But courses were offered in Latin or Greek by a small number of professors at the universities of Buenos Aires and La Plata in Argentina, in the Instituto Pedagogico of the University of Chile and in the University of Concepción in Chile, and in the private Colegio Mayor de Nuestra Seiiora del Rosario in Colombia. Latin, if not Greek, was still cultivated by the ecclesiastical orders and it was under the direction of their members that those interested in the classics could pursue their studies beyond the level of the secondary schools. (I. L. K.)

IN THE ORIENT

India. — In ancient India education was a means to spiritual salvation, and its purpose was both to train one in *dharma* (the principles of moral and ethical living) and to gain intuition of truth and experience of Brahman (reality), thereby attaining *nzoksha* ("spiritual'liberation"). Knowledge of the *Vedas (see* INDIAN PHILOSOPHY) was the basis of the educational system, entailing mastery of pronunciation, metre, grammar, etymology. rituals and astronomy. The student at about the age of 12 years went through a ceremony of initiation and went to live with his teacher. Manual tasks and begging for alms were part of his training, the most important moral factor of which was celibacy. Thus he was prepared for his life as a householder, a retired contemplative and a homeless renouncer of ordinary life. Members of the three higher castes were entitled to study the *Vedas,* though only Brahmins could perform sacrifices. Mere book learning was regarded as a waste of time: the student had to hear the truth as spoken by the teacher, deliberate on it to clear possible doubts and then meditate on it, as a result of which he intuited the truth.

In ages later than those of the *Vedas* and the *Upanishads,* much attention was paid to the training of students in the moral and religious duties of the householder, and the six systems of Hindu philosophy and also literary works were studied. Although modern schools tended to follow western systems, the traditional pattern of education remained current and instruction was oral.

Buddhist Education. — *The* teaching of the Buddha as recorded in the Pali canon was meant for people who renounced the world and ordinary life to seek *nirvana* (the uprooting of desire for existence) The subjects taught at the Buddhist monasteries were *Suttanta, Abhidhamma* and *Vinaya* (texts relating to the doctrines, their philosophical interpretation and the discipline of the monks). As Buddhist philosophy developed, other subjects such as logic and the various systems of Indian philosophy were also included in the curriculum. On attaining moral excellence, purity of intellect and sufficient understanding of the teaching, the monks were instructed in the methods of meditation leading on to the supreme knowledge that nothing had an intrinsic nature of its own and that everything was in ceaseless flux. *(See* BUDDHISM; GAUTAMA BUDDHA.)

Monks also educated the lay followers of the Buddha in the essentials of morality and the way shown by the master; sometimes they instructed the laity in medicine and other professional crafts.

China. — The Confucian teachings were the bases of Chinese classical education, whose aim was not so much the acquisition of knowledge as the formation of the character and virtues of a good citizen, the ideal state being freedom from bigotry and arrogance. The main idea of the Confucian philosophy of government was that each person has an appointed place in the society and .that good government depends on maintaining the right relationships between the people in a community and the universe around them. Since this theory was largely accepted by the rulers, it became necessary for the administrators to study it and its philosophical background, and the emperor Wu began a system of examinations for the selection of administrators who were experts in the famous five (or six) classics *(see* CHINESE CLASSICS; CHINESE LITERATURE). Entry into the civil, service was the way to economic prosperity and social prestige. and all males except the sons of actors, harlots and policemen could compete. There were three examinations, the last of which was so difficult that few passed it, but even those who failed became acquainted with the classics and spread their knowledge among the population. The civil service examinations were terminated in 1905 and, although the classics continued to be studied afterward, they were no longer held in the same respect.

Four other books greatly influenced Chinese education and the formation of the Chinese character: *Ta Hsüeh* ("Great Learning"), *Chung Yung* ("Happy Mean"), the *Lun Yü* ("Analects") and *Meng Tzu* ("Mencius"). It should be noted that the classics of Buddhism, which spread to China early in the Christian era, exerted great influence and, though not part of the state educational system, were assiduously studied by both monks and laymen of culture.

Japan. — Confucianism and Buddhism shaped Japanese culture. Shintoism contributed little, for it developed from a primitive native cult and had no deep metaphysical and ethical background. With the introduction of the "Analects" of Confucius and the *Thousand Clzaracter Classic* from Korea in the 3rd century A.D., Japan began to be civilized and the nobility started to model itself on the Chinese social hierarchy. In the early Heian period, the classics held the chief place in the university curriculum. Between the middle of the 7th century, when attempts were made to organize everything on Chinese lines, and the end of the 13th, civil war between feudal lords and the assumption of power by the military class caused a decline in learning, but the study of classics remained the basis of education. During the Tokugawa period the neo-Confucian philosophy of Chu Hsi and Wang Yang Ming was officially sponsored and very popular, and the 11th shogun founded the Institution of Lectures on the Japanese classics. As a result of widespread educational reforms in 1872, the study of the classics was considered a hindrance to civilization, *i.e.,* western ways of thought and life, but by the turn of the century ideas of filial piety and loyalty, legacies of the Chinese teachings, were again officially declared the cornerstone of Japanese morality and again the classics assumed importance. After World War II, however, this situation changed. *(See* JAPAN : *Education.)*

Buddhism was introduced into Japan in A.D. 552 from Korea and enjoyed the patronage of the imperial family and the military rulers. In the same way many Chinese Buddhist sects spread to Japan and their basic texts were studied by both monks and laymen.

CLASSICAL SCHOLARSHIP, the study, in all its aspects, of the civilization of ancient Greece and Rome. Its province in time is the period about 1500 B.C.–A.D. 500; in space that area covered by the conquests and spheres of influence of Greece and Rome at their widest extent. The following is a historical account of classical scholarship from antiquity to modern times. *See* also biographies of most of the scholars discussed in this article.

Antiquity and The Middle Ages. — Down to the Renaissance, Greek and Latin scholarship tended to pursue independent courses (though the latter was in antiquity heavily influenced by the former) : it is therefore convenient to consider them separately.

Greek Scholarship. — *From* at least as early as the 6th century B.C. the exposition of the poets formed the staple element of Greek education. The sophists of the 5th century were accustomed to explain the poets: some of them took an interest in etymology, phonetics, the correct meaning of words and the classification of the parts of speech. Plato shared their interest in literary criticism and in grammar; but both subjects were more systematically treated by Aristotle. His pupils collected great quantities of information about the early poets, little of which has

survived. During the Hellenistic age scholarship flourished at the two great centres of Alexandria and Pergamum. It was a Peripatetic. Demetrius Phalereus (fl. 300 B.C.), who impelled Ptolemy I to found the great library at Alexandria. The Pergamene school stood in a close relationship to the Stoic philosophy. The grammarians of the school. influenced by the grammatical studies of the Stoics, notably Zeno and Chrysippus, upheld anomaly as the leading principle in grammar against the Alexandrian advocacy of analogy. At Alexandria the chief emphasis was on literary scholarship. From the time of Philetas and his pupil Zenodotus, the first librarian, the Alexandrian scholars concerned themselves with the interpretation (glossae) of the rare words in early poetry. The generation of Zenodotus sorted and classified those authors whose works could be obtained; the poet Callimachus drew up lists of the chief authors, with biographical and bibliographical information, in the 120 volumes of his Pinakes. Zenodotus classified the epic and lyric poets, Lycophron the comedians, and Alexander Aetolus the tragedians. Manuscripts of the poets were collected, and the first critical editions, complete with variant readings and critical signs, were produced; also the first commentaries. Dictionaries were compiled, including special lexicons of particular authors or dialects; and all kinds of information about literature was amassed in a variety of separate treatises, as can be seen, for example, in the work of t o of the librarians, Aristophanes of Byzantium and his pupil Aristarchus of Samothrace. Eratosthenes of Alexandria laid the foundations of ancient chronology, and Apollodorus of Athens carried the work further. During the last century B.C. the learned compiler Didymus Chalcenterus packed the accumulated erudition of his predecessors into immense lexicographical works and extensive commentaries. Dionysius Thrax produced the first Greek grammar, and Tryphon (a younger contemporary) the first vocabulary of the language of prose and the first work on syntax. Tryphon's researches were no doubt prompted by the demand for manuals of correct Attic usage that resulted from the Atticist revival, whose effects can be discerned from the 1st century B.C. on. Apollonius Dyscolus, writing probably under Hadrian, produced a detailed treatment of syntax that acquired great authority, and his son Aelius Herodianus the standard treaties on accentuation. But the age of the Antonines saw the beginning of decline. Scholarship was increasingly dominated by the needs of rhetoric, and more and more of the chief authors dropped out of circulation, surviving only in selections made for use in schools. All over the eastern half of the Roman empire the Greek classics continued to be read; but such scholarly work as was done became increasingly mechanical. During the 7th century the Arab conquest cut off from Greek civilization Syria, Palestine and Egypt; and soon afterward the disastrous effects of the controversy over the use of icons led to the dark age of literature in the Byzantine empire, which lasted until the 9th century.

The 9th century saw a revival of interest in classical literature under the patronage of princes of the church like the patriarch Photius and Arethas, archbishop of Cappadocian Caesarea. These men collected the surviving manuscripts and caused them to be copied in the monasteries; for the purpose of rapid reproduction the Byzantine minuscule script was evolved (see PALAEOGRAPHY), and word division and critical signs were introduced. Anthologies of prose and poetry, and lexicons, etymologies and other learned compilations were produced. In the 11th century Platonism was revived by Michael Psellus, the statesman and scholar, and Aristotle continued to be studied. During the 12th century Eustathius, archbishop of Thessalonica, one of the greatest Greek scholars of the middle ages, produced a commentary on Homer of great learning, and made some excellent conjectures in the text of Athenaeus. The sack of Constantinople during the fourth crusade (1204) brought the first period in the history of classical literature at Byzantium to an end. After the recovery of the empire about the middle of the century, classical studies were carried on no longer by the rich and famous, but by a restricted circle of poor scholars. The monk Maximus Planudes was responsible for many learned compilations, and for a remarkable series of Greek prose translations of Latin writers; Thomas (Magister) and Manuel Moschopoulos about 1300 and Demetrius Triclinius a generation later practised textual criticism on the Greek poets, not without success. During the 15th century learned Greeks like Manuel Chrysoloras and Demetrius Chalcondyles began to make their way to Italy, where they gave instruction in their language; and after the sack of Constantinople in 1453 the number of Greek immigrants increased.

Latin Scholarship. — Roman scholarship from the first imitated Greek: Alexandrian techniques were applied to the editing of Latin texts, and the categories and nomenclature of Latin grammar followed Greek models. Many of its characteristics can be traced back to M. Terentius Varro, the great polymath who left his mark on almost every branch of study. The early empire was the period of the greatest prosperity in scholarship as in other things, the era of commentators such as C. Julius Hyginus, Palatine librarian, and Q. Asconius Pedianus; of editors such as M. Valerius Probus; of grammarians such as M. Verrius Flaccus and C. Suetonius Tranquillus; and of Pliny the Elder, whose encyclopaedic *Naturalis Historia* was a major source book for the middle ages. The 3rd century A.D. was a time of troubles and was unpropitious for learning; and the scholars of the 4th and 5th centuries, such as Nonius Marcellus, Aelius Donatus, Servius and Priscian were a race of epitomators and compilers living on inherited capital. The study of Greek in the west was declining; and the earlier literature of Rome was threatened with extinction. The domination of rhetoric over education and literature (cf. Quintilian's *Institutio* oratoria) favoured a few authors: Virgil, Horace and Terence enjoyed the protection of critics and commentators, while Quintus Ennius and Gaius Lucilius, being left to shift for themselves, disappeared except for the fragments preserved in quotations. During this period the book in the form of the vellum or parchment codex was superseding the papyrus roll, and an author deemed unworthy of the trouble of recopying was doomed to oblivion.

The partition of the western empire into separate kingdoms did not entail a complete breach with the past. The invaders desired civilization on the Roman model, and Latin continued to be the language of literature and the church. Rich and ancient libraries still survived. In the schools, always conservative, the study of pagan literature continued. Enlightened churchmen perceived that through the profane classics lay the only road to higher learning. But interest in classical antiquity for its own sake was no part of the scheme of things; classical texts were copied, directly or indirectly, in the service of the church. In the 6th century Cassiodorus enjoined on his monks the copying of books at Vivarium and laid down strict rules for the conduct of the scriptorium. In the 8th century the emperor Charlemagne, working through men such as Alcuin, instituted a program of church reform which was attended by a revival of interest in classical literature, and during this so-called "Carolingian renaissance" many authors were recopied from manuscripts now Iost in the clear hand from which our Roman type descends. Servatus Lupus is the nearest approach to a humanist scholar that the middle ages can offer. Throughout the medieval period the range of ancient authors generally and closely studied was limited; the chief source books for general knowledge of antiquity, besides Pliny, were compilations like the *Origines* of Isidore of Seville. Some Latin translations of Plato and Aristotle were available, but Greek was for the most part unknown.

The Revival of Learning. — The "revival of learning" which took place in Italy during the 14th and 15th centuries was only one aspect of the complex phenomenon of the Renaissance (*q.v.*). It must be stressed that in its origins the movement was utilitarian: it aimed at exploiting classical antiquity in the service of modern man. The early humanists were not scholars in the strict sense of the word, but literati and educationists. Their interest lay in the glorious past of Rome and Italy and the lessons that it had to offer the present; though Greek manuscripts and Greek professors were entering Italy well before the fall of Constantinople in 1453 — indeed it is probable that by that date all that survived of Greek literature had been saved from the advance of the Turk — the advanced study of Greek made no real headway until the 16th century. In this connection the great plan

of Pope Nicholas V for translating the chief Greek prose writers into Latin is significant. Nor was the invention of printing an effective agent in the revival, for by 1470, when the Latin *editiones principes* were issuing from the press, the Renaissance had spent itself. But the humanists were active in unearthing the buried ore which succeeding centuries were to refine. Sporadic local discoveries of forgotten authors or works had occurred throughout the middle ages; now they were made in scores by Poggio and his contemporaries, and the hundreds of humanistic manuscripts in Italian libraries bear witness to their prompt dissemination. At the same time the material remains of Roman civilization, which appealed directly to Italian sentiment and pride, received attention. Cyriacus of Ancona, "the Schliemann of his time," even traveled to Greece in search of inscriptions, and Flavio Biondo instituted the study of Roman topography. Professional standards of scholarship begin to appear in the work of two men. Lorenzo Valla had the historical sense of the true critic. His exposure of the so-called "donation of Constantine" (*q.v.*) as a forgery marks him as a forerunner of Richard Bentley. A good Latin style was then esteemed as a passport to an official career; but Valla's *De Elegantiis*, on Latin usage, is a book which professional Latinists may still consult with profit. It is a work of scholarship and exact observation, appealing over the head of Priscian to the ancient authors. Politian, contrasted with J. J. Scaliger or Isaac Casaubon, appears a dilettante; nevertheless, though his scholarly production was small he set a hitherto unknown standard of attainment in pure scholarship. He demonstrated the only solid foundation for the critic: a certain feeling for style. based not merely on taste, but on observation and practice in the ancient languages.

The Growth of Scholarship (1500-1800).—By the beginning of the 16th century the "new learning" had been established in the countries north of the Alps by men like Thomas Linacre, William Grocyn, Rodolphus Agricola and Johann Reuchlin, and above all by Erasmus. From about 1500 begins a gradual exploration, growing ever more exact and scientific, of classical antiquity, primarily through the literary sources, but increasingly aided by ancillary disciplines such as archaeology, epigraphy and numismatics. It was now that the printing press came intc its own. Though by 1500 most of the major Latin authors were in print (of Greek, by contrast, a mere handful), the standard of editing did not match the splendour of the typography, and the manuscript still enjoyed a cachet lacking to the printed book. In 1500 Aldus Manutius, the first of the great scholar-printers, changed the face of scholarship and of publishing by the foundation of his "Neacademia," dedicated among other things to the issue of large cheap editions of the Greek and Latin classics. Scholars corrected his proofs; Erasmus himself saw the second edition of his *Adagia* through the press. Aldus was imitated by Johann Froben and Sebastian Gryphius. Successive improvements in the technique of editing and book production during the 16th century converted the printed book from an expensive facsimile of a medieval manuscript to a working tool.

In the 16th century Italy can boast a number of notable antiquaries and one great critic, Pietro Vettori (Petrus Victorius); but though the French conceded Italian supremacy in Latin studies they justly claimed the primacy in Greek. Guillaume Budé, the great jurist, laid the foundations; in the next generation Denis Lambin (Lambinus) did valuable work on Cicero, Lucretius and Horace. Jean Dorat, called Auratus, and Adrien Turnebus did pioneer work in the study of Greek poetry, and inspired such poets of their own time as Pierre de Ronsard and Joachim du Bellay with admiration for Greek literature. The great printer Robert Estienne printed the first critical edition of the Greek New Testament (1550) and many other learned publications; his son Henri excelled him with a whole series of important editions including many *editiones principes* of Greek authors, mostly edited by himself, and a Greek *Thesaurus*, also his own work and not in its original form superseded until the early 19th century. Two men. J. J. Scaliger and Isaac Casaubon, demand especial notice. Scaliger. like Erasmus, saw that classical learning should be a unity. The diversity of his works is not that of the dilettante but of the explorer: each separate edition opened up a new path, that of Festus to old Latin, that of Manilius to ancient astronomy. He assisted Janus Gruter (1560–1627) by compiling the indices to his great *corpus* of inscriptions, *Inscriptiones antiquae totius orbis Romani*, and encouraged the collection of the dispersed fragments of classical literature. His greatest achievement was to bring order into the chaos of ancient chronology in the *De emendatione temporum* and the *Thesaurus temporum*. Contrasted with Scaliger's outstanding historical sense and power of divination is Casaubon's sheer erudition. He too perceived that antiquity must be studied as a whole, also—and this too Erasmus understood—that the study must begin from Greek. His published work, small in proportion to his learning, was soon absorbed into the common stock of knowledge, but his example was instrumental in turning scholarship into a science. "Philology had meant composition and verbal emendation; it now meant the apprehension of the ideas and usages of the ancient world" (Mark Pattison).

Both Scaliger and Casaubon were Huguenots; both ended their days abroad. Scaliger's migration to Leiden in 1593 is symbolic. As scholarship declined in 17th-century France (where the series of the Delphin classics marks the summit of strictly classical achievement), so it flourished in the Netherlands: this was the century of G. J. Vossius, J. G. Graevius, C. Salmasius and Hugo Grotius. The best work was done in Latin: Nicolaus Heinsius possessed a sense of Latin poetic style (based on assiduous composition) which has never been surpassed, and his series of editions, founded on extensive study of the manuscripts, earned him the title of "saviour of the Latin poets." His prose counterpart was J. F. Gronovius. Their letters testify to the same ample conception of classical studies that animated Scaliger and Casaubon; but by the beginning of the 18th century stagnation had set in. Unwieldy variorum editions, uncritically compiled, dominated the scene, and the study of antiquities, divorced from both linguistic scholarship and modern science, degenerated into the mere amassing of facts.

Little had been heard for a century and more of English classical scholarship: once the study of Greek was firmly established there had set in the persistent English preoccupation with education. John Selden, author of *De diis Syris* (1617), is the most notable of a small number of exceptions, and he was not an academic. In 1691 Richard Bentley inaugurated a new era by the publication of his *Epistola ad Millium*. Bentley possessed many of Scaliger's gifts and others besides. As with Scaliger, everything he did showed the way for his successors: his handling of the fragments of Callimachus, his unearthing of literary gold from the dust heaps of antiquity, his discovery of the digamma in Homer—which not even F. A. Wolf credited—his establishment of the metres of Terence, all were seminal and exemplary. The *Dissertation on the Epistles of Phalaris* (2nd ed., 1699) would be a monument of wasted labour if its only effect had been to disprove the authenticity of the letters; as an example of critical method it will be coeval with classical scholarship. Bentley projected far more than he could ever perform, and nobody until K. K. F. W. Lachmann fully appreciated his merits. It is particularly regrettable that his promised edition of the New Testament was abandoned, for though he oversimplified the problems he saw, as no critic for a century was to see, that the so-called "received text" must be jettisoned and the text totally reconstituted from the best authorities. An edition on such lines would have had a startling effect on the criticism of secular texts. Bentley was an isolated phenomenon: he had no disciples and founded no school. After his death the sphere of Greek studies in England contracted: Richard Porson was the best known, if not necessarily the best, of a number of scholars who made the Attic writers their province. Exact observation of usage lay behind his emendations and his few editions; the early *Letters to Archdeacon Travis* (1790), a masterpiece of wit and polemic, are an index of a promise that never fully blossomed in performance. The real strength of English scholarship at this period perhaps lay elsewhere, in the colossal achievement of the historian Edward Gibbon, the originality of Robert Wood, the first (apart perhaps from Giambattista Vico) to realize that there was more to Homer than words on a

printed page; and the beginnings of Greek archaeology in the publications of the Society of Dilettanti (founded 1733), especially James Stuart and Nicholas Revett's Antiquities of *Athens* (1762–1816). In 1786 Sir William Jones began the study of Sanskrit which laid the foundations of comparative philology.

In the Netherlands, where Bentley's merits had received instant recognition, a remarkable series of Leiden professors. T. Hemsterhuis, L. K. Valckenaer, D. Ruhnken, D. A. Wyttenbach and C. G. Cobet, continued to advance the strictly philological side of Greek learning. Everywhere during this period great technical advances were made. J. A. Fabricius laid the foundations of classical bibliography. The great libraries founded by Renaissance potentates formed ever-growing repositories of material, which books such as Bandini's catalogues of the Laurentian manuscripts (1764–78) were now making available to the world. Dictionaries improved: in Greek, revisions of Henri Estienne's Thesaurus graecae linguae held (and hold) the field, but in Latin E. Forcellini's Lexicon (1771) superseded Robert Estienne's *Thesaurus.* Numismatics grew under the hands of Ezechiel Spanheim and J. H. Eckhel. Jean Mabillon, followed by Scipione Maffei, established Latin palaeography as a science; and what they did for Latin, B. de Montfaucon did for Greek. Now at last criteria were available for the accurate dating of manuscripts and systematic recension of classical texts could begin. In archaeology the 18th century saw the beginnings of excavations in the buried cities of Herculaneum and Pompeii, and of the exploration of the remains of Etruscan civilization. In history "source-criticism" (Quellenkritik) begins in the work of B. G. Niebuhr. But technical progress was not enough. A new spirit was needed to arouse classical studies to take their place in the modern world, and it came from Germany.

The so-called "new humanism" that transfigured German intellectual life in the late 18th century was complex, acting through scholarship, education, philosophy and literature. Educationally a leading part was played by the University of Gottingen, where J. M. Gesner, the inventor of the seminar, and C. G. Heyne introduced a new approach, an attempt to understand and enter into the spirit of the past, as displayed not only in its literary but also in its artistic monuments. J. J. Winckelmann first attempted to isolate and describe what was essentially Hellenic in Greek art and to relate the development of art in antiquity to the rest of its culture. Winckelmann's lead was followed by G. E. Lessing, and the new Hellenism spread through such men as J. G. von Herder, Goethe, the von Schlegel brothers and W. von Humboldt. The modern era in scholarship may be taken to begin with the remarkable career of F. A. Wolf, author of the Prolegomena ad *Homerum* (1795) and first founder of a classical journal in the vernacular, who defined the "science of antiquity" (*Altertumswissenschaft*), in terms still valid, as the "knowledge of man in antiquity," and mapped out its constituent disciplines.

The 19th Century. — This was the period during which, in the words of Ulrich von Wilamowitz-Moellendorff, "the scientific conquest of antiquity was completed." New techniques of study were perfected, large new finds of material were made, and above all with the emergence of scientific archaeology began the systematic uncovering and recording of the most important sites and monuments of the ancient world. As classical studies expanded they tended to become "compartmentalized": by the end of the century the traditional "scholar," deeply versed in the polite literature of the ancients but usually in very little else, had been replaced by the figure of the highly (and sometimes narrowly) trained specialist.. Important advances were made, however, as a result of fruitful interaction between separate disciplines within the classical field and between the classics and other branches of study; but the science of antiquity as defined by Wolf, whose conception of classical studies dominates the scene from now on, was too vast a field for an individual to master. Some few men, of whom Wilamowitz was perhaps the greatest, have nevertheless managed to see classical studies as a whole; and this ideal, however impossible of realization, must continue to inspire workers in the field if the subject is to maintain its unity and meaning.

During the 19th and 20th centuries the multitude of active and important classical scholars is so vast that it must suffice to mention only a comparatively few of the more prominent names and trends.

In Greek literary scholarship the greatest figure of the generation after Wolf was G. Hermann, who applied a critical method based on a strict Kantian logic to the study of Homer, Pindar, tragedy and late epic, and laid the foundations of the modern study of Greek metre. In his youth Hermann had crossed swords with Porson; but as he outlived, so he outshone, his English rival, and his pupils included C. A. Lobeck, F. W. Ritschl, T. Bergk and M. Haupt. Hermann's pursuit of verbal criticism and his insistence on the central importance of literary studies brought him into conflict with men more representative of the tendencies of the time and the increasing interest in a historical criticism which embraced mythology and religion, institutions and social studies, art and monuments, as well as literary texts. The most notable representatives of this school were A. Boeckh, who, apart from his important work on poetry, made great contributions to the study of Greek public economy and chronology. and began the systematic collection of Greek inscriptions; K. O. Müller, a pioneer of the study of Greek and Roman origins and mythology, and the author of an important history of Greek literature; and F. G. Welcker, who applied a wide knowledge of Greek art and religion to the interpretation of Greek literature, and did as much as any man to shape the new wide conception of classical scholarship which was maturing at this time. The comparative study of language inaugurated by F. Bopp, though at first regarded with mistrust by scholars like Hermann, gradually revolutionized the philology of the ancient languages. In the realm of Latin literary scholarship the most important name is that of F. W. Ritschl, who laid the foundations of the modern knowledge of early Latin in general and of Plautus in particular, and whose pupils included O. Ribbeck.

Knowledge of ancient literature must always rest on the standard of editing and criticism of the extant Latin and Greek texts, which have come down from antiquity in a corrupt and sometimes mutilated state. In the early years of the century important advances were made in this vital department of classical studies. Cardinal A. Mai published a number of hitherto unknown Latin and Greek texts from newly discovered palimpsests. including a large part of Cicero's De *republica.* The French Revolution and the Napoleonic conquests had resulted in a vast body of formerly unknown or inaccessible manuscript material, particularly Greek, being acquired by public collections in European capitals, especially Paris. These treasures were exploited by Wolf's pupil I. Bekker, an admirable Hellenist, who besides editing many previously unknown Greek texts, was able by the aid of superior and older manuscripts to produce better editions of standard classical authors than those then current: his editions amount to nearly 100 volumes. But the formulation of a technique of systematic recension, *i.e.,* analysis and evaluation of a manuscript tradition, was left to be achieved by the genius of K. Lachmann. whose edition of Lucretius (1850) is still, as Wilamowitz-Moellendorff observed, the critical primer. Lachmann's work was seconded and extended by M. Haupt and by the Danish Latinist and critic J. N. Madvig, whose editions and miscellaneous critical writings are standard works of reference to this day. Unfortunately the methods of these men were taken up and applied with exaggerated and unreflecting rigour by less naturally gifted scholars, with the result that work in this department of scholarship came to be distinguished in certain quarters by a blind confidence in "scientific method" needing no intelligence in its handling. which has proved a will-o'-the-wisp still having power to mislead. Madvig had realized the importance, restressed by enlightened scholarship today. of allowing for inequalities and anomalies in the style of individual authors; but these warnings were lost on those who, in the exuberant confidence of their powers, proceeded to wholesale athetization, such as Ribbeck's condemnation en bloc of the later satires of Juvenal, on a scale unknown since J. Hardouin. It was this rigid insistence on analogical methods of criticism which marred the achievements of the great Dutch critic C. G. Cobet and set a bad example to lesser aspirants.

The second part of the 19th century was a period of great collective and individual enterprises, which have equipped the modern scholar with many of his most essential tools, in the shape of collections of fragments, of inscriptions, of papyri and of works of art; and of reference books such as catalogues of manuscripts, dictionaries, handbooks and encyclopaedias. Among technical advances it is pertinent to mention here the increasing part played by photography, both in making facsimiles of manuscripts and documents available to scholars, and in enabling the accurate publication of monuments and works of art. Individual achievements were the collections of fragments of the Greek comic poets by A. Meineke; of the fragments of the Greek tragic poets by A. Nauck; of the fragments of the Latin dramatists by O. Ribbeck; of the Greek dramatists by K. W. Dindorf, editor of many other important texts; and of the Latin grammarians by H. Keil. Collective projects are the great *Thesaurus linguae* Latinae (1900 *et* seq.), the definitive Latin dictionary; Pauly-Wissowa's monumental *Real-Encyclopädie* (1839–) of the ancient world; Iwan Müller's handbook of antiquity, an indispensable series of histories and monographs; and the great epigraphic collections. Prominent in such enterprises, particularly in the Corpus inscriptionum *Latinarum*, of which he was the begetter, was T. Mommsen, who, starting from the field of Roman private law, made immense contributions to Roman history, literature, epigraphy, and every branch of Roman studies. A position in the world of Greek studies almost comparable to that of Mommsen in Roman studies was achieved by his son-in-law, Wilamowitz, who like him broke down the barriers between the different branches of the subject and made outstanding contributions to all. The narrower tradition of Hermann was maintained by the great grammarian and textual critic F. Blass. The great Greek histories of G. Busolt and K. J. Beloch, and the history of the ancient world of E. Meyer incorporated the results of immense research. E. Zeller and H. Diels did valuable work on Greek philosophy, and the new study of comparative religion had an important effect on Greek studies, as can be seen in the work of H. Usener and E. Rohde. In Latin studies the most notable names during this period are those of J. Vahlen and F Leo; and great advances were made in Latin palaeography and the history of the transmission of Latin texts by L. Traube and his pupils. In the realm of archaeology the most remarkable impetus was given by an amateur, H. Schliemann, who excavated Troy, Mycenae and Tiryns; from about 1880 onward the exploration of important Roman, Greek and near eastern sites was intensified and the chronology of preclassical Greek history and of the earlier neighbouring civilizations of Crete and Mycenae was established. In this process American schools and scholars played a fruitful and increasing part.

A development particularly associated with Germany is the movement toward what may be termed "professionalism" in classical scholarship during the second half of the century. This manifested itself in a number of ways. Though Wolf's example in founding a classical periodical conducted in the' vernacular had been followed elsewhere (*e.g.*, the English Classical Journal, 1810–29), classical journals written primarily by professional scholars for other professional scholars did not begin to proliferate freely until after 1850. Coupled with this were the increased importance of universities, seminars, and academies (with their own published proceedings); and the growing habit of early publication in the shape of the Ph.D. dissertation, the academic "program" and the technical monograph. Increasing specialization was accompanied by a steady rise in technical standards of argument and presentation and a tendency to the employment of a learned jargon intelligible to fellow workers in the field, but barely intelligible to others: a phenomenon by no means confined to classical studies, but particularly noticeable through the contrast with the older scholarly literature. A revolution of questionable value that went hand in hand with this process was the replacement of Latin by vernaculars as a medium of publication (with certain traditional exceptions, such as the preface and apparatus of a critical text), and its virtual disappearance as a vehicle of scholarly intercourse. The consequence has been that since about 1850 a scholar wishing to keep abreast of developments in his subject must be able to read, at least, English, French, German and Italian; and in some fields Russian must now be added to this list. The changes here described had more immediate results on the continent of Europe and in the United States (where the Ph.D. degree was early transplanted); in England their effects were delayed, in part by the regrettable insularity which had characterized English scholarship since the days of Scaliger, in part by the continued concentration of the older universities on teaching and a consequent tutorial distrust of a powerful and effective professoriate and of "research." Only a few men. notably Thomas Arnold, quickly recognized the importance of German historical and critical scholarship. The most noteworthy contribution to ancient historiography in England was made by the banker George Grote, whose great history of Greece brought fresh air and contemporary relevance into the subject. In the latter part of the century, however, English scholarship began to awaken to a sense of its responsibilities: I. Bywater did important work on Aristotle and other Greek philosophers; Sir R. C. Jebb produced a polished commentary on Sophocles; and H. A. J. Munro, an eminent critic of Latin poetry, stood as intermediary between Lachmann, whose work he continued, and Housman.

The 20th Century. — The history of classical scholarship in the first 60 years of the 20th century is that of the 19th century writ large; the amount and complexity of the work done, as well as the nearness of the events and persons concerned, forbids any but a general survey. World War I dealt a severe blow to classical studies, but their recovery was more rapid than might have been expected. World War 11 had a worse effect, especially in Germany, the main home of the classics, whence even before the outbreak of war Nazi tyranny had driven many scholars into exile. especially in England, where they made a notable contribution to a period of great achievement. These setbacks apart, the history of classical studies has continued to be a history of expansion and progress, marred only by what has now become. perhaps, an excessive preoccupation with specialized research for its own sake to the neglect of the needs of the student and the interested layman.

Wilamowitz continued to be active: his last great work. on Greek religion, appeared in the year of his death (1931), and members of his circle did valuable work in the spirit of his comprehensive outlook. Wilhelm Schulze and J. Wackernagel used the methods of comparative linguistics to increase knowledge of Greek and Latin; and they were followed by E. Lofstedt and the Swedish school of Latinists, who, though concentrating for the most part on late Latin, provided by careful and acute linguistic observation a further valuable check on the excesses of the analogical school of textual criticism mentioned above. A. E. Housman had already initiated a reaction away from the conservatism and methodological rigidity of the late 19th century in a series of editions of Latin poets that are standard works of reference; and G. Pasquali, a pupil of Leo and Wackernagel, emphasized the limitations of Lachmannian methods in a seminal book on the tradition of classical texts. Among historians F Jacoby began his vast edition of the fragments of the Greek historians; and M. Rostovtzeff made a great contribution to the social and economic history of the ancient world. A particularly fruitful technique now extensively employed was that of prosopography. The way in which research may and indeed must transcend the conventional limits of individual disciplines may be seen in the history of the so-called "Homeric question" during this period: the combined efforts of scholars in fields as diverse as linguistics, archaeology, Hittite studies, folklore and comparative oral literature have materially advanced the understanding and knowledge of the poems, though an inevitable concomitant of this understanding has been that all prospects of a "solution" to the question have receded indefinitely.

New discoveries have come mostly, where expected. from archaeology and from the study of papyri. The first considerable papyrus finds had been published during the last two decades of the 19th century, adding to the knowledge of ancient literature, administration and law, and altering certain accepted notions about textual criticism. During the 20th century they have ap-

peared in ever-increasing numbers, above all from the hoard found at Oxyrhynchus; in the 1950s the first complete play of Menander, the *Dyscolus,* was discovered. In 1953 Michael Ventris proved to the satisfaction of most people that the language of the Mycenean archives is Greek, a discovery whose implications for early Greek history are not yet fully explored.

Marouzeau, and the surveys of particular fields over defined periods in *Lustrum* (1957–) ed. by H. J. Mette and A. Thierfelder. (H. LL.-J.; E. J. KY.)

CLASSIFICATION is the arrangement of things in classes according to the characteristics that they have in common. Sometimes similar objects are brought together in space, but classification may occur also when the only act of arrangement done by the classifier is the giving of a common name to things of the same kind. In a complex classificatory scheme the *infimae species,* or lowest classes, are subordinated to higher classes, and these again to others still higher until the *summum genus,* or most inclusive category of the system, is reached. It should be noticed, however, that in biology the terms "species" and "genus" are not used, as here, in a relative sense, but indicate classes of two fixed levels; *i.e.,* below orders but above varieties. For a discussion of the classificatory scheme used in biology *see* TAXONOMY.

When, as often, the *summum genus* is given from the beginning, the problem of classification is the same as that of logical division. Exhaustiveness and exclusiveness can be secured at each level by dichotomy; *i.e.,* by dividing each class into two subclasses. one of things that have a certain character and the other of things that do not. This method has advantages for certain purposes such as the construction of a flora, but it does not satisfy the demand that. kinds which are co-ordinate should be placed on the same level in the classificatory scheme. It has often been said that a logical division should proceed throughout according to one principle. and this is true if it is taken to apply to the division of any one genus into species, for otherwise there can he no guarantee that the species will be mutually exclusive. There is no reason, however, why a librarian should not first divide his books into large groups according to size and then subdivide each group according to subject matter. In contexts such as this there may indeed be many different ways of classifying the same things. all in a sense artificial, but all equally correct for their special purposes. The situation is rather different in science, where we assume the existence of natural kinds.

Classification is important for science because it is a prerequisite of all attempts to discover order in the world. (*See* SCIENTIFIC METHOD.) It started already with the beginnings of speech; but the groupings expressed in ordinary language do not go much beyond the practical needs of the men who use it. and scientists must therefore make their own vocabulary, either by adaptation of what they find in ordinary speech or by constructing new words from old roots. The classifications which they produce in this way sometimes surprise the layman, as for example when they distinguish spiders from insects and place them with crabs in the phylum of arthropods. The reason is that they are especially interested in those groupings which help most in the presentation of knowledge as a system. In biology, for example. the modern phylogenetic classification of organisms according to common ancestry is clearly bound up with attempts to systematize and explain the information collected by natural historians. But the notion of natural kinds is to be found already at the very beginning of the study of nature. Men have a use for words such as "lead" only because they find certain recognizable features such as grayness, weight and fusibility occurring frequently together. If there were no such combinations of observable features to attract attention, there could be no natural science. For the laws that are formulated in science are generalizations about the properties of things belonging to such kinds. In short, there is no clear line of demarcation between the work of scientific classification and the practice of induction (*q.v.*).

(W. C. K.)

CLAUBERG, JOHANN (1622–1665), German philosopher and theologian, the leading representative of Cartesianism in his country, was born at Solingen in Westphalia on Feb. 24, 1622. After studies at Bremen he went to Groningen university in Holland. where Tobias Andreae introduced him to the philosophy of René Descartes. Traveling abroad to complete his education. he met Claude Clerselier, Jacques du Roure and Louis de La Forge in Paris (*see* CARTESIANS), attended the lectures of M. Amyraut and L. Cappel at Saumur and paid a visit to England. Back in Holland in 1649, he went to Leiden for several months to hear the Cartesian J. de Raey before taking up the professorship of philosophy and theology at the Calvinist academy of Herborn, in Nassau. At Herborn he distinguished himself as the foremost Cartesian in Germany. but soon met with opposition from his colleagues. especially the professor of rhetoric, C. Lentz (Lentulus). Appointed master of the Duisburg *Gymnasium* in 1651. Clauberg took many of his Herborn pupils with him. His commission to teach philosophy and theology at Duisburg (1653) was followed by the opening of the university there (1655), with him as rector. He taught there till his death. on Jan. 31, 1665.

Clauberg upheld the Cartesian method against Lentz and the Leiden theologian J. Revius in his *Defensio cartesiana* (1652) and against Revius again in his *Initiatio philosophi* (1655). His expositions of the *Meditations* and of the *Principles of Philosophy* of Descartes show him as a lucid though sometimes prolix commentator. In his *Logica vetus et nova* (1654), a work several times reflected in the *Port-Royal Logic,* he "links the ancient with the modern precepts." Moreover. his *Ontologia sive Metaphysica de ente* (1660) is fundamentally the same as his pre-Cartesian *Ontosophia* (1647), only the Aristotelian prolegomena being omitted.

In his *Exercitationes centum de cognitione Dei et nostri* (1656) Clauberg proceeds from the proof of God's existence by the idea of the infinite to an account of being and knowledge that shows a pronounced inclination to Christian Platonism. Platonism likewise inspires his solution, in *Corporis* et *animae in homine conjunctio* (1663), of the specifically Cartesian problem of the union of soul and body: the soul, incapable of movement, cannot create any movement in the world of bodies (in which the quantity of movement remains constant) but can guide such movements according to its will, thus being not their physical but their moral cause; and, conversely the movements of bodies are only "procatarctic" or antecedent causes to the soul, providing the "occasion" for it to call forth some idea. The harmonious functioning of this concourse depends ultimately on God's providence.

Clauberg believed in the excellence of the German language as Descartes had believed in that of French. He published a work on German philology, *Ars etymologica Teutonum* (1663), and wrote one work in German, on the difierence between the old and the new philosophies. A collected edition of his philosophical writings, by J. T. Schalbruch, appeared in 1691,

CLAUDEL, PAUL LOUIS CHARLES MARIE (1868–1955), French poet and playwright, one of the most significant figures in French literature in the first half of the 20th century and the outstanding representative of the Catholic literary revival, was born at Villeneuve-sur-Fkre-en-Tardenois. Aisne. on Aug. 6, 1868. He entered the diplomatic service in 1890. After holding consular posts in the United States, China and Europe. he was appointed minister at Rio de Janeiro (1917) and Copenhagen (1919) and then ambassador at Tokyo (1921). Washington. D.C. (1927), and Brussels (1933). In 1935 he retired and settled in Paris and at his Chbteau de Brangues (Iskre). Throughout a successful diplomatic career he felt no conflict between his prolific writing activity and his official duties, which he regarded as "une

obligation de conscience." The experience he gained in various parts of the world—in the east, for example—was of considerable value to his thought and writing. In 1946 Claudel was elected to the French Academy. He died in Paris on Feb 23, 1955.

Claudel's literary work comprises almost every form except the novel, but drama and lyrical poetry preponderate. He wrote his first play, *L'Endormie,* when he was 14 and completed his last. *Le Soulier de satin,* at 56. His lyrical production covers much the same span, continuing to his 67th year. His articles and essays are innumerable and touch on all kinds of subjects. In addition, he wrote many professional dispatches and reports.

His best-known and most impressive lyrical works are the *Cinq grandes odes* (1910). Later volumes consist of poems written at various times and lack the unity that holds the odes together. He very early adopted the long, unscanned, usually unrhymed line—a strong and supple form well suited to the all-embracing character of his inspiration—which became known as the *verset claudélien* and is his peculiar contribution to French prosody. Its origin is in Rimbaud's *Les Illuminations,* a work which profoundly influenced him from the age of 18.

Claudel is more alive to what strikes the senses than to what appeals to the intellect; lyrically, rather than intellectually, aware of the oneness and manifoldness of nature, he aims at grasping reality in a single instant and in its wholeness. He thus stands in contrast to the tradition of French literature and thought which has always been more concerned with analysis than synthesis, with delineation of detail rather than comprehensive vision. Nevertheless, his personality is too strong for him to overlook the importance of what is individual and his imagination too concrete for him to be concerned only with the universal—witness the firmly drawn characters of his plays. The unifying principle of these opposing tendencies is his Christian faith (he was converted to Roman Catholicism after a religious experience on Christmas day. 1886). He is the most Christocentric great French writer since the 17th century. Whatever his subject, God is felt to be present. His religion, which enables him to apprehend the infinite diversity of creation in an ordered hierarchy and counteracts the expansiveness and luxuriance of his own nature, is for him a way of life which gives meaning to everything. Nostalgia for what is lost, flight from reality, are, thanks to this outlook, sentiments foreign to him.

The outlook is plainly expressed in Claudel's articles and essays, and in his correspondence with Jacques Rivière, Francis Jammes and André Gide; it infuses most of his poetry, implicitly in the odes. explicitly in much of *Corona benignitatis anni Dei* (1914) and *Feuilles de saints* (1925); and it reaches fullest expression in the plays. In the early *Tête d'or* (1889) and *La Ville* (1890) and in the first draft of *La Jertne Fille Violaine* (1892), it is still grasping after intelligible embodiment. It speaks clearly in *Le Repos du septième jour* (1896), is less apparent in the tragic and autobiographical *Partage de midi* (1905), and brings forth its finest fruit with the second *La Jeune Fille Violaine* (1898) and, especially, *L'Annonce faite d Marie* (1910), probably his masterpiece. *L'Annonce* is a drama of renunciation, enacted on two planes—the natural one of everyday life, and the spiritual one of heroic physical suffering, accepted with utter dedication to God—which intersect thanks to the highly individualized characters.

The trilogy concerned with Sygne de Coûfontaine, Turelure and their descendants was for long the best-known part of Claudel's dramatic output. The first of its plays. *L'Otage* (1909), is based on an imaginary episode in Napoleon's conflict with the pope. The third. *Le Père humilié* (1916), has for its setting Rome in the last days of papal temporal power. But after 1943, when a stage version of it was performed. *Le Soulier de satin* (1919–24) attracted most attention. For many of the poet's admirers, it is his greatest play, though its enormous size and piecemeal construction deny it the formal beauty of *L'Annonce.* Set in the late 16th century, it covers many years and is laid in many lands, ranging from Prague to Panamá, as well as on board ship in the Mediterranean and mid-Atlantic. Its diverse episodes are given unity by the hero and heroine, Don Rodrigue and Doña Prouhèze, who scarcely ever meet and whose love will never find fulfilment this side of the grave. The play is both a drama of personal destiny and an evocation of a period in world history, with Spain and Spanish America as focal points. Reduced from its original four *journées* to two long acts, it has been played with increasing success and has come to rival *L'Annonce* in fame and popularity.

Whatever the appeal, or otherwise, of Claudel's philosophical message. his mastery and original use of language, as well as the gravity of his themes, his passionate sincerity and generous encyclopaedic vision, all make him one of the great classics of French and European literature.

BIBLIOGRAPHY.—(The years given, as above, are those of composition.) Claudel's most important works, other than those already mentioned, are the plays *Le Pain dur* (1923–14), *Le Livre de Christophe Colomb* (1927), with music by Darius Milhaud, and *Jeanne au bûcher* (1934), with music by Honegger; the collections of articles *Positions et propositions* (1928), *Figures et paraboles* (1935), *Contacts et circonstances* (1939) and *Visages radieux* (1947); the work of criticism *Art poétique* (1907); and the prose poem *Connaissance de l'Est* (1900). The *Correspondance, 1899–1926,* with André Gide, was published in 1949. Many of Claudel's works have been translated into English. *See* E. Beaumont, *The Theme of Beatrice in the Plays of Claudel* (1954); *W*. Fowlie, *Paul Claude1* (1958). (C. M. G.)

CLAUDE LORRAIN (CLAUDE GELLÉE or GELÉE) (1600–1682), the originator of the romantic tradition in French landscape painting, sometimes called Le Lorrain or simply Claude. He was born at Champagne, near Toul, Lorraine. At about the age of 12 he went to Freiburg im Breisgau and later to Rome to train as a pastry cook, and in this capacity became attached to Agostino Tassi. who had a reputation as a painter of seaports. At an unknown date he had instruction from a Flemish artist. Goffredo Wals. in Naples. In 1625 he made a roundabout journey to Nancy where he was employed for a year as assistant to Claude Deruet, the duke of Lorraine's painter, on work for the ceiling of the Carmelite church (now destroyed). In 1627 he returned to Rome and stayed there till his death on Nov. 23. 1682.

His fame as a landscape painter was established by the end of the 1630s and his numerous patrons, mostly from the Roman church aristocracy, included Pope Urban VIII. It is said that about 1634 Sébastien Bourdon copied one of Claude's landscapes in eight days. To guard against such copying and to record his most famous compositions, Claude made tinted outline drawings of most of his pictures in six paper books which he entitled the *Libro di verità* or *Liber veritatis.* This valuable record is at Chatsworth, Eng.; it was engraved in 1777 by Richard Earlom.

Claude's style is, in a manner of speaking, without history, for once he had found his idiom he did not stray outside it. He painted instinctively, not intellectually as did his contemporary Nicolas Poussin, and chose to paint only that which gave him abiding pleasure, namely the reach of golden sunlight on the country around Rome or on the waters of some mythical seaport.

Claude has been called the meeting point of the northern and southern landscape traditions. The northern tradition, that of Adam Elsheimer and Paul Bril, was the one in which Claude had been trained, for his master Tassi was a pupil of Bril. Entailing a dramatic approach to the subject, it depended on marked contrasts of light and dark, on huge tree masses dominating the scene. The southern tradition, represented by the Carraccis and by Domenichino, consisted of an intellectual approach to nature that was conceived as a matter of orderly recession and balanced masses. Claude began in the northern naturalistic manner, and his early works (*e.g.,* "View of the Campo Vaccino") show a meticulous attention to detail. He gradually emancipated himself from this and moved on to the southern or classical formula. but always kept the northern device of placing a dark tree or building in the foreground to deflect the eye to the source of light on the horizon.

In the 17th century pure landscape did not exist, so that all Claude's landscapes contain a story, either from the Bible, from Greek mythology or the modern romances of Tasso and Ariosto. His subjects have one thing in common: all are treated in an idyllic, as against a dramatic, manner. so that the protagonists do not obtrude themselves. An indifferent figure painter, he often delegated this part of his picture to a minor artist such as Jan Miel or Filippo

Lauri. As he grew older, the purely anecdotal part of his pictures became reduced in scale and in importance. and at the end of his life nature assumed crushing proportions. He abandoned the more conventional seaport scenes for pure landscape, which took on an intense and visionary quality as in "Aeneas Hunting in Libya" (1672. Brussels).

Claude's technique can be studied in any painting of his mature period (c. 1640–60). Structurally he relies on the simple device of a horizon set off by a vertical tree or building in the foreground, all the objects in between being fused by a masterly representation of sun. heat and light. The perspective is established not by compositional lines but by gradations of tone that are themselves governed by light.

Claude rarely painted from nature but he sketched in the open air and worked up the finished pictures in his studio. Perhaps the most precious of his drawings, which display great range and variety, are those rapid and delicate wash sketches that simply establish the relative positions of a tree and a hill. The finished pen drawings are more conventional and northern in style. The British museum contains several volumes of drawings as do the Louvre and the Albertina, Vienna. His etchings also are considered superior (see ETCHING: History). His paintings are to be found in major collections. See PAINTING: *Baroque* Through Impressionist Painting: France; see also references under "Claude Lorrain" in the Index volume.

CLAUDIANUS, CLAUDIUS (CLAUDIAN) (c. 370–C.404), the last important Latin poet of the classical tradition. An Alexandrian, Claudian came to Italy and. abandoning his native Greek, displayed his mastery of Latin in a poem celebrating the consulship of Probinus and Olybrius (395). A civil post which he held was hazarded by an epigram on his fellow-countryman and superior Hadrianus, but his obliging pen won him the protection of Stilicho, minister of the western emperor, Honorius. By assiduously praising Stilicho and denouncing his rivals at the court of Arcadius, the eastern emperor, Claudian gained the position of tribunus et notarius, the rank of vir *clarissimus* and (before 402) the honour of a statue. Serena, the wife of Stilicho, backed Claudian's successful suit to a wealthy African bride, but death evidently intervened while this happiness was fresh, for no composition of his can be assigned to a later date than 404, and Stilicho's victory over Radagaisus (405) has gone unsung. The poems in which Stilicho figures were collected and transmitted independently, and it may be surmised that this collection mas made after Claudian's death in 404 and before Stilicho's downfall in 408.

Claudian's poems fall into three groups, the first (*Claudianus maior*), being the collection of poems just mentioned. together with epistles, idylls and epigrams. The longer poems comprise panegyrics on the consulships of Honorius (396,398,404). Mallius Theodorus (399) and Stilicho in 400 (in two books; a third commemorates Stilicho's entry into Rome); Epithalamium and *Fescennina* for Honorius' marriage with Stilicho's daughter. Maria (398); invectives against Rufinus (396) and Eutropius (399), the ministers of Arcadius; De *bello Gildonico* (398) and De *bello* Gotlzico (402). Among the minor poems may be mentioned the delightful De sene *Veronensi* ("Old Man of Verona"); Deprecatio ad *Hadrianum* (see above); *Epithalamium* Palladii; *Laus Serenae;* Epistola ad *Serenam;* Gigantomachia.

The other two groups are formed by the panegyric already mentioned on Probinus and Olybrius, which is not associated in the manuscripts with the first group until the 12th century. and the mythological epic, De raptu Proserpinae ("the Rape of Proserpine"), on which Claudian's medieval fame largely depended, also transmitted separately (*Claudianus* minor). The second book of the epic is prefaced by an elegiac epistle addressed to Florentinus. from which—if it is really connected mith the poem, for it contains nothing to suggest that it is—it has been inferred that the subject was inspired by the efforts of Florentinus, the city prefect, to meet the shortage of corn created by Gildo's defection in Africa. On this assumption, it can be assigned to 397 and its unfinished state explained by the disgrace of Florentinus.

Though regarded in the middle ages as nearly the peer of the other rhetorical poets. Statius and Lucan, Claudian has not received the approbation of modern critics, partly because of his addiction to inferior themes, partly because of his employment of means too elaborate for such futilities. Yet he is not wholly without value as a historical source, and his mastery of rhetoric and the fertility of his invention compel admiration even in his excesses. His scathing invective is always impressive, and his preoccupation with Rome and its old religion reveals the sincerity of an unabashed pagan at a Christian court. Judged even by golden age standards, his diction and prosody are impeccable, but the smoothness of his verse produces tedium, and his graces generally have an engine-turned quality.

CLAUDIUS, in ancient Rome the name of a famous gens (family). The by-form *Clodius* was regularly used for certain Claudii during the late republic, but otherwise the two forms were used indifferently. The gens Claudia contained patrician and plebeian branches; the chief representatives of the former were those bearing the cognomen (third name) Pulcher, of the latter those with the cognomen Marcellus (see MARCELLUS). The following members deserve particular mention:

APPIUS CLAUDIUS SABINUS INREGILLENSIS, or REGILLENSIS (consul 495 B.C.), so called from his birthplace Regillum (or Regilli) in Sabine territory, founder of the gens. His original name was Attus or Attius Clausus. About 504 B.C. he migrated to Rome, where he received patrician rank; his followers also were granted Roman citizenship and land beyond the Anio (mod. Aniene) river; this formed the centre of the Claudian tribus, one of the rural tribes (a political division) which took their names from old patrician families. His enforcement of the laws of debt while consul provoked the "secession" of the plebeians in 494. (See ROME: Ancient History.)

APPIUS CLAUDIUS CRASSUS (consul in 471 and 451 B.C.), a patrician conspicuous for his aristocratic pride and hatred of the plebeians. In 451 he was made one of the commission of ten (decemviri; *q.v.*) who had been appointed to draw up a code of written laws. By courting the people he secured his re-election as decemvir for 450, and the new decemvirs, under his leadership, began a reign of terror. According to tradition, his treatment of Virginia (*q.v.*) led to an insurrection of the plebeians who seceded to the Sacred Mount. The decemvirs were finally forced to resign (449) and Appius Claudius died in prison, either by his own hand or by that of the executioner.

See T. Mommsen, *History* of *Rome,* vol. i, appendix (Eng. trans. 1911).

APPIUS CLAUDIUS CAECUS (4th century B.C.) was censor in 312 B.C. before he was consul, a reversal of the normal sequence of offices. He retained his censorship beyond the legal limit of 18 months, and filled vacancies in the senate with men of humble birth, including sons of freedmen. He distributed the landless (but not necessarily poor) citizens throughout all the tribes, rural as well as urban, thus increasing the effective voting power of the landless city population. This measure however was cancelled in 304 when the censors again restricted this class to the four urban tribes. He transferred the cult of Hercules in the Forum Boarium from the gens Potitia to public slaves. He gained enduring fame

by the construction of a road from Rome to Capua (312) and an aqueduct; these were called by his name, the Via Appia and the Aqua Appia, an honour without precedent. The exclusive rights of the patricians were invaded in 304 when his secretary Gnaeus Flavius (q *v*) published the *legis* actiones (methods of legal practice) and the list of dies *fasti* (days on which legal business could be transacted). He was consul for the first time in 307, interrex (see INTERREGNUM) in 298, consul again in 296 when he led an army into Etruria. praetor in 295, and once dictator. He opposed the admission of plebeians to priestly offices (300). Despite blindness and old age he dissuaded the senate from considering the eloquent appeal of Cineas the envoy of Pyrrhus (q *v.*), king of Epirus, to make peace (c. 280). Tradition regarded his blindness. nhich might have been invented merely to explain his cognomen Caecus, as punishment for his transference of the cult of Hercules from the Potitii. Various opinions have been held about him: as a reactionary patrician who fought against the newer plebeian aristocracy, as a demagogue and would-be tyrant, as a politician seeking ascendance (but not tyranny) for himself and his supporters, or as a champion of the industrial and commercial classes At least it is clear that he advanced the interests of the urban elements in both the senate and assemblies.

His speech against peace with Pyrrhus was the first that was handed down in writing. and laid the foundation for prose composition. He published aphorisms in verse and a legal nork De *Usurpationibus,* and he may have been concerned in drawing up the *legis actiones* published by Flavius. He was also interested in grammatical questions, being responsible for introducing the distinction in Roman nriting of the two sounds R and S, and the abolition of the letter Z.

See A. Garzetti, *Athenaeum,* vol. xxv (1947); E. S. Staveley, *Historia, Zeitschrift für Alte Geschichte,* vol. viii (1959).

PUBLIUS CLAUDIUS PULCHER (d. before 246), son of the above. As consul in 249 B.C. he attacked the Carthaginian fleet in the harbour of Drepanum (Trapani) in Sicily and was completely defeated. This was the only serious Roman naval defeat in the First Punic War, and it was commonly attributed to Claudius' treatment of the sacred chickens, which refused to eat before the battle. With the words, "Let them drink then." he had them thrown into the sea. Accused of treason and heavily fined, he died before 246.

APPIUS CLAUDIUS PULCHER (d. 130 B.C.), consul in 143 B.C., was later censor (136) and *princeps senatus* (senior statesman). He supported the program of his son-in-law Tiberius Sempronius Gracchus (*q.v.*) and served on the agrarian commission from 133 until his death in 130.

APPIUS CLAUDIUS PCLCHER (d. 49–48 B.C.), served under his brother-in-law Licinius Lucullus in Asia in 72 B.C. In 57 he was praetor, in 56 propraetor in Sardinia, and in 54 consul with L. Domitius Ahenobarbus. Pompey reconciled him to Cicero whose return from exile he had opposed. While governor of Cilicia (53–51) he corresponded with Cicero but he resented the appointment of Cicero as his successor and avoided meeting him. When impeached by P. Cornelius Dolabella on a charge of treason, Claudius had to approach Cicero in order to obtain witnesses in his favour from his old province. He was acquitted on this charge and also on a charge of bribery. In 50 he was censor and expelled many senators. When Caesar crossed the Rubicon (49) he fled from Italy. He was appointed by Pompey to the command in Greece, but died before the battle of Pharsalus (48). He wrote a work on augury, the first book of which he dedicated to Cicero.

See Cicero, *Letters, Ad Familiares,* iii (ed. *R.* Y. Tyrrell and L. C. Purser 1899–1918); L. *A.* Constans, *Un Correspondant de Cicéron, Ap. Claudius Pulcher* (1921). *A* full account of all the Claudii mill be found in Pauly-Wissowa, *Real-Encyclopadie der classischen Altertumswissenschaft,* iii, *2* (1899). (H. H. SD.)

CLAUDIUS I (TIBERICS CLAUDIUS NERO GERMANICUS) (10 B.C.–A.D. 54), Roman emperor A.D. 41–54. **A** member of the patrician branch of the gens Claudia, he was born at Lugdunum (Lyons) on Aug. 1, 10 B.C. He was the son of Nero Claudius Drusus and the younger Antonia, the brother of Germanicus Caesar, a nephew of the emperor Tiberius and a grandson of Livia Drusilla, the wife of the emperor Augustus. Ill-health, unattractive appearance, clumsiness of manner and coarseness of taste did not recommend him for a public life. The imperial family seems to have considered him something of an embarrassment. He was long left to his own private studies and amusements. It was Livy who recognized and encouraged his inclination for historical studies. Claudius defended Cicero in a pamphlet and, having discovered that it was difficult to speak freely on the civil wars. he began a history of Rome with the principate of Augustus. He composed 20 books of Etruscan and 8 books of Carthaginian history, all in Greek, an autobiography and a historical treatise on the Roman alphabet with suggestions for orthographical reform—which as emperor he later tried not very successfully to implement. He also wrote on dice playing, of which he mas fond. All his works are lost and their importance cannot be measured. The Etruscan history may have had original material: his first wife. Plautia Urgulanilla. had Etruscan blood and her family was probably able to put Claudius in touch with authentic Etruscan traditions. After divorcing Urgulanilla, he married in turn Aelia Paetina. Valeria Messallina, who was his wife at his accession, and finally Agrippina the younger. He had two children. Drusus and Claudia, by Urgulanilla; one daughter, Claudia Antonia (A D 27–66). by Paetina; and two children, Octavia and Britannicus Caesar. by Messallina. Drusus and Claudia died before he became emperor. As a young man Claudius was made a member of various religious colleges. but he became consul only under the reign of his nephew Gaius (Caligula; *q.v.*) in 37. There was, however, little cordiality between Claudius and Gaius.

Power came to Claudius unexpectedly after Gaius' murder on Jan. 24. 41, when he was discovered trembling in the palace by a soldier. The praetorian guards made him emperor on Jan. 25. and his Jewish friend Herod Agrippa I helped him in his first difficult dealings with the senate. By family tradition and antiquarian inclinations Claudius mas in sympathy with the senatorial aristocracy. but soldiers and courtiers were his real supporters. while freedmen and foreigners had been his friends in the days of disgrace. Initially the attitude of the senate had at least been ambiguous In 42 many senators supported the ill-fated rebellion of the governor of Dalmatia, Furius Camillus Scribonianus. Even later several attempts on Claudius' life involved senators and knights. Though paying homage to the dignity of the senate (to whose administration he returned the provinces of Macedonia and Achaea) and giving new opportunities to the equestrian class, Claudius was ruthless and occasionally cruel in his dealings with individual members of both orders. From the very beginning he emphasized his friendship with the army and paid cash for his proclamation as emperor.

Claudius' decision to invade Britain (43) and his personal appearance at the climax of the expedition, the crossing of the Thames, and capture of Camulodunum (Colchester) were prompted by his need of popularity and glory. But concern with the anti-Roman influence of Druidism. which he tried to suppress in Gaul. and a general inclination toward expanding the frontiers mere other reasons (see BRITAIN). Claudius planted a colony of veterans at Camulodunum and established client-kingdoms to protect the frontiers of the province; these were afterward a source of trouble such as the revolt in 47 of Prasutagus, client king of the Iceni, and later the general revolt instigated by his wife Boadicea (*q.v.*). He also annexed Mauretania (41–43), of which he made two provinces (Caesariensis in the east and Tingitana in the west). Lycia (43) and Thrace (46). Though he enlarged the kingdom of Herod Agrippa I, he later made Judaea a province on Agrippa's death in 44. In 49 he annexed Ituraea (northeastern Palestine) to the province of Syria. He mas careful not to involve the empire in major wars with the Germans and the Parthians. Claudius supported Roman control of Armenia. but in 52 preferred the collapse of the philo-Roman government of Mithradates to a war with Parthia, when Vologaeses installed his brother Tiridates as ruler; Claudius left a difficult situation to his successor.

In the civil administration, many measures demonstrate Claudius' enlightened policy. He improved in detail the judicial system and in his dealings with the provinces he favoured a moderate extension of Roman citizenship by individual and collective grants:

in Noricum, for instance, five *civitates* became Roman *municipia* (*see* MUNICIPIUM). He encouraged urbanization and planted several colonies, for example at Camulodunum and at Colonia Agrippinensis (mod. Cologne) in Germany in 51. In his religious policy Claudius respected tradition; he revived old religious ceremonies, celebrated the secular games (47), made himself a censor together with L. Vitellius in 47, and extended in 49 the *pomerium* of Rome (the boundary of the area in which only Roman gods could be worshiped and civil magistrates rule). He protected the *haruspices* ("diviners") and probably romanized the cult of Attis. According to Suetonius in *Claudius* (25) on the occasion of troubles Claudius expelled the Jews from Rome for a short time: Christians may have been involved. Elsewhere he confirmed existing Jewish rights and privileges, and in Alexandria tried to protect the Jews without provoking Egyptian nationalism. A letter addressed to the city of Alexandria survives in which Claudius asked Jews and non-Jews "to stop this destructive and obstinate mutual enmity." Personally disinclined to accept divine honours. he did not seriously oppose the current trend and had a temple erected to himself in Camulodunum. His public works include the reorganization of the corn supply of Rome and a new harbour at Ostia which was later improved by the emperor Trajan.

Claudius' general policy increased the control of the emperor over the *aerarium* (q v.) and the provincial administration, and apparently gave jurisdiction in fiscal matters to his own procurators in the senatorial provinces. He created a kind of cabinet of freedmen to superintend various branches of the administration, which included Narcissus, Callistus, Pallas and Polybius, on whom he bestowed honours. An impressive series of documents. such as the speech for the admission of Gauls to the senate recorded on a partly defective inscription at Lugdunum, the edict for the Anauni (an Alpine population who had usurped the rights of Roman citizenship and whom Claudius now confirmed in these rights) and the above-mentioned letter to the city of Alexandria (41 AD.), survive as evidence of his personal style of government: pedantic, uninhibited. alternately humane and wrathful, and ultimately despotic. The inscription from Lugdunum is interesting by comparison with Tacitus, *Annals*, xi, 24 which gives an account of the same speech of which the inscription records the text. The speech as recorded in the inscription, in spite of irrelevance, inconsequence and fondness for digression (much of which is absent in the version of Tacitus) shows that he knew what he wanted and that he appreciated the latent forces of Roman tradition.

His marriage with Messallina ended mysteriously in 47 when she apparently conspired against him and married Gaius Silius. Messallina and Silius were killed, and Claudius married his niece Agrippina. an act contrary to Roman law, which he therefore changed. To satisfy Agrippina's lust for power Claudius had to adopt her son L. Domitius Ahenobarbus (later the emperor Nero) to the disadvantage of his own son Britannicus. The new commander of the guards Afranius Burrus was protected by Agrippina. Roman tradition is unanimous in stating that Claudius was poisoned by Agrippina on Oct. 13. 54, though the details differ. The version of poisoning by mushrooms prevailed. L. Annaeus Seneca, who had been recalled from exile to educate Nero, derided the dead emperor and his apotheosis (duly decreed by the senate) in the satire *Apocolocyntosis Divi Claudii* ("The Pumpkinification of Claudius the God": the title and its exact meaning are both subject to discussion).

The picture of Claudius that appears in this work has much in common with that of later Roman historians who give details of the unpopular side of Claudius' administration. The *Apocolocyntosis* ridicules his uncouth physical appearance and attacks his habit of giving legal judgments without a hearing. and the executions of relatives, senators and knights. Tacitus, Suetonius and Dio Cassius attribute Claudius' mistakes to infirmity of character and the influence of his wives and freedmen. They echo the hostility of the upper classes of Rome against an emperor who, in spite of his own words, had been unfavourable to them. That this tradition is one-sided is shown by the surviving documents of the reign and the energy with which Claudius carried out the practical affairs of government.

CLAUDIUS II GOTHICUS (MARCUS AURELIUS CLAUDIUS) (214–270), Roman emperor 268–270, born in Dardania. part of Moesia Superior, in May 214, was an army officer under Gallienus (260–268) when barbarian raids devastated most of the Roman empire. By the end of the reign he was commander of Gallienus' newly formed cavalry, and on Gallienus' murder in 268, in the course of suppressing the rebellion of Aureolus. Claudius succeeded him. It is quite uncertain whether he had anything to do with the death of Gallienus or not. Claudius speedily suppressed Xureolus and drove from Italy the Alamanni (*q.v.*) summoned by the usurper.

Claudius' authority was recognized only in the central territories of the empire; he made an unsuccessful attempt to recapture the allegiance of the western provinces who obeyed the emperors of the Rhine, and in the middle of 269 the princes of Palmyra assumed the style of emperor. But in his own area he destroyed near Naissus (Nish) in Moesia a vast Gothic migration. Much of the credit went to his cavalry commander Aurelian who succeeded him. He died of the plague early in 270, preparing a campaign against the Vandals.

In the next century, Constantine I claimed that his grandmother was niece or daughter of Claudius; it is not clear whether historical tradition glorifies Claudius because he was claimed as Constantine's relative, or whether Constantine made the claim because Claudius' reputation was already glorious.

CLAUDIUS, MATTHIAS (1740–1815), German poet, the author of lyrics of direct simplicity, deep feeling and piety. "Der Mond ist aufgegangen." the best known of his poems, well deserves its place in the anthologies. Claudius was born on Aug. 15, 1740, at Reinfeld, Holstein. He studied at Jena but subsequently kept no fixed occupation for long until, in 1788, he acquired a sinecure post in the Schleswig-Holstein bank.

From 1771 to 1775 he edited a newspaper, the *Wandsbecker Bote*, in which, under the name "Asmus," he published many of his essays and poems. Claudius formed one of a group (including J. G Herder and others) who fought against the rationalistic and classical spirit of the day and sought to preserve in literature a Christian and a natural—almost a folk—atmosphere. He died on Jan. 21, 1815, in Hamburg.

See U. Roedl, *Matthias Claudius*, 2nd ed. (1950). (M. KL.)

CLAUSEWITZ, KARL VON (1780–1831), Prussian general, military historian and foremost modern theorist on land warfare, was born at Burg, near Magdeburg, Ger., on June 1, 1780, of a poor middle-class family with professional background. Entering the Prussian army in 1792, Clausewitz mas commissioned during the Rhine campaign of 1793–94 and spent the next years, while on garrison duty, in educating himself, an effort that enabled him to gain admission to the War college in Berlin in 1801.

During his formative years in Berlin, Clausewitz learned military science under the guidance of his teacher, Gerhard von Scharnhorst (*q.v.*), studied philosophy and literature, and developed his basic strategic concepts. Scharnhorst introduced him at court, where he met his future wife, the Countess Marie von Bruhl, and obtained for him an appointment as aide to Prince August. He served in this capacity in the campaign of Jena (1806), was captured at Prenzlau and returned to Prussia when released in 1508. Clausewitz became one of the leaders of the Prussian army reform under Scharnhorst. but resigned his commission on the eve of Napoleon's invasion of Russia (1812) and, like other German patriots, entered Russian service.

In the campaign of 1812 Clausewitz distinguished himself as a Russian staff officer. He was partially responsible for the successful strategic retreat and for negotiating the convention of Tauroggen. which marked the beginning of Prussia's abandonment of the French cause. After having served in various capacities during the campaigns of 1813–14, Clausewitz returned to Prussian service and served as chief of staff of an army corps during the Waterloo campaign. In 1818 he became a general and was appointed administrative head of the War college.

During the next 12 years he used much of the leisure that this position provided in writing his historical studies and his major work on strategy, *On War* (Vom *Kriege).* Before completing this manuscript. he was transferred to Breslau and then assigned to Prussian forces deployed to observe the Polish revolution of 1830. He contracted cholera and died shortly after his return to Breslau on Nov. 16, 1831. His papers were edited and published by his devoted widow.

Clausewitz's personality reflected not only his relatively humble origins, but also the strong influence of contemporary German literature and philosophy. Shy and sensitive by nature, he often kept his ideas to himself. He never had a command of his own but served mostly in a staff capacity, distinguishing himself through his sound advice and bravery in combat. His background and career identified him more closely with the broader movements for national German revival than with the aristocratic Prussian military tradition.

Clausewitz's fame rests on his military studies. While his extensive histories of the various Napoleonic campaigns are only of technical interest, his work *On War* has made a profound impact on modern strategic concepts. Drawing on the experiences of Frederick the Great and Napoleon, Clausewitz tried to analyze the workings of military genius by isolating the factors that decide success in war. His conclusions have remained generally applicable, and since his work contains a minimum of technical discussion, it has retained a wide appeal. Clausewitz produced no system of strategy, thus breaking with the more rigid and mechanistic concepts of his predecessors. Instead, he emphasized the importance of psychological and accidental factors that elude exact calculation and the necessity of a critical approach to strategic problems. By a lengthy discussion of a variety of situations likely to confront the military leader Clausewitz tried to develop in his reader a theoretically founded military judgment, capable of weighing all pertinent factors in a given situation. He stated that strategy should aim at three main targets, the enemy's forces, his resources and his will to fight.

His most significant single contribution is the doctrine of political direction in military matters. In maintaining that "war is nothing but a continuation of political intercourse with the admixture of different means," he denied that war is an end in itself. His emphasis on defensive warfare was based on the argument that it is both the militarily and politically stronger position.

Clausewitz was studied closely by his countrymen and left his imprint on German military thought, but his influence on German over-all strategy has been overrated. The military specialists considered him outmoded, and the general staff rejected his doctrine of political direction of warfare. Beginning with the 1853 edition of *On War* the crucial passage calling for cabinet control of strategy was altered to prescribe the reverse. German military planning became increasingly devoid of political purpose, leading to the rigid and aggressive mobilization concepts of 1914 and to Ludendorff's virtual dictatorship in 1916. There was a considerable revival of interest in Clausewitz during the interwar period. and his political doctrines influenced the military officers who tried to assassinate Hitler on July 20, 1944.

Clausewitz was read extensively outside of Germany. Swedish, Dutch, Swiss and Austrian officers took an early interest in his doctrines and most of his works were translated into French. An English translation of *On War* appeared in 1873, and other editions exist in Russian, Italian, Hebrew, Hungarian. Serbian and Spanish. By 1900 his doctrines were known in the United States and Japan. The first American translations appeared during World War II. Marx and Engels discussed Clausewitz's work and Lenin studied his political doctrines during exile in Switzerland. Communist theory on the nature of war, including such concepts as that of the "imperialistic war," was largely derived from Clausewitz, whose authority has been recognized behind the "iron curtain." By the middle of the 20th century. when new long-range weapons systems appeared, the significance of Clausewitz's strategic concepts which are derived exclusively from land warfare has declined, although many of his basic ideas are as valid as ever. *See* also STRATEGY.

CLAUSIUS, RUDOLF JULIUS EMANUEL (1822–1888), German physicist, made important contributions to molecular physics. He was born at Koslin, in Pomerania. In 1848 he took his degree at Halle, and in 1850 was appointed professor of physics in the royal artillery and engineering school at Berlin and *Privatdocent* in the university. In 1855 he became an ordinary professor at Zurich Polytechnic and professor in the University of Zurich. Clausius moved to Würzburg in 1867 as professor of physics, and two years later was appointed to the same chair at Bonn. a position which he held until his death.

The work of Clausius, who was a mathematical rather than an experimental physicist, was concerned with many of the most abstruse problems of molecular physics. By his restatement of Carnot's principle he put the theory of heat on a truer and sounder basis, and he deserves the credit of having made thermodynamics a science; he enunciated the second law, in a paper contributed to the Berlin Academy in 1850, in the well-known form, "Heat cannot of itself pass from a colder to a hotter body." He applied his results to an exhaustive development of the theory of the steam engine, laying stress in particular on the conception of entropy.

The kinetic theory of gases owes much to his researches. He raised it, on the basis of the dynamical theory of heat, to the level of a theory, and he carried out many numerical determinations in connection with it; *e.g.,* of the mean free path of a molecule. Clausius also made an important advance in the theory of electrolysis, suggesting that molecules in electrolytes are continually interchanging atoms, the electric force not causing but merely directing the interchange. This view found little favour until 1887, when it was taken up by S. A. Arrhenius, who made it the basis of the theory of electrolytic dissociation.

CLAUZEL, BERTRAND, COMTE (1772–1843), marshal of France. governor of Algeria from 1835 to 1837, was born on Dec. 12, 1772, at Mirepoix in Languedoc. He joined the national guard there on the outbreak of the Revolution in 1789 but resigned his commission in 1792 to volunteer for the army of the Pyrenees. After service in the eastern Pyrenees, northwestern France and Italy, he had risen to be general of division in 1802. In that year he accompanied the expedition to San Domingo, where he married a planter's daughter. After serving further in Dalmatia, he was present at the battle of Wagram (1809) and was then sent to Spain, where at Salamanca (1812) he saved the army when Marshal Marmont was wounded. He was general in chief of the northern army in 1813. Having crushed the Bordeaux royalists during the Hundred Days, he was made a peer of France by Napoleon (1815) but had to flee to America in 1816 to escape prosecution under the Restoration. Returning to France under the 1820 amnesty, he was elected deputy for Ariège in 1827. After the July revolution of 1830 he was sent for a short time to replace Marshal Bourmont in command in Algeria. On his recall he was elected deputy for Ardennes (Oct. 1830) and made marshal of France (Feb. 1831).

Thenceforth Clauzel devoted himself to propaganda for the colonization of Algeria, where he himself acquired large estates. Convinced of Algeria's possibilities, he proposed that settlers be brought there from all countries, that cotton be grown there and that the Mitidja be drained and protected by a network of block-

houses. Presenting himself as the only man capable of establishing and extending the French colony there and undertaking to make enough profit by the end of seven years to cover the occupation costs, he secured appointment as governor in succession to J. B. Drouet d'Erlon in July 1835. The French cabinet, however, would nat authorize his forward policy. and he was soon in conflict with it. He captured Mascara but then gave it up, launched the Tlemcen expedition despite the cabinet and then began preparing to attack Constantine. Alarmed at ministerial changes in Paris (Sept. 1836), he advanced hastily against Constantine with inadequate forces and suffered a reverse, which he minimized as being due to bad weather. Summoned to Paris to account for his conduct, he was amazed to learn, in Feb. 1837, that Gen. C. M. D. Damrémont had been appointed to succeed him. He then retired to the village of Secourrieux (Haute-Garonne), where he died on April 21, 1843.

His Algerian correspondence was edited by G. Esquer, as volume v of the series *Correspondance générale* in the *Collection de documents inédits sur l'histoire de l'Algérie* (1948). (L. G.)

CLAVECIN, the French for harpsichord (*q.v.*). The word is derived from the Latin *clavisimbalum,* a stringed instrument of the dulcimer type with an added keyboard mechanism. *See* CEMBALO.

CLAVICHORD, a stringed keyboard instrument in use at the beginning of the 15th century and obsolescent by about 1800. The 20th century saw a revival of interest in the clavichord, which in the early 1960s was being built in a number of small workshops.

By the 16th century the words clavichord, monochord, virginal and clavicymbalum were freely used to describe any of the forerunners of the pianoforte; but a more precise use of these words was adopted in the second half of the following century. In Germany, however, the word clavier became generic and was applied to any domestic keyboard instrument, including the pianoforte. This untidy nomenclature makes it difficult and often impossible to identify the particular instrument, clavichord or harpsichord, when reading the directions of early composers or historians.

The clavichord usually has a compass of from three and one-half to five octaves. The right-hand or treble part of the instrument, which is oblong in shape. contains the soundboard, the bridge and the wrest or tuning pins. The strings run horizontally from the tuning pins over the bridge and are secured to the hitch pins in the left-hand or bass part of the instrument, where strips of felt are woven through the strings to act as dampers. A small blade of brass, the tangent, stands on each key just below the string which that key controls. When the key is depressed the tangent rises and strikes the string, dividing it into two parts. The right-hand part, between the tangent and the bridge, vibrates and produces the appropriate note; the left-hand part between the tangent and the hitch pin is damped by the felt and is silent. The tangent has done two things: it has determined the vibrating length of the string, as does the finger of a string player; and it has caused the string to sound, as does a pianoforte's hammer. When the key is released the tangent falls away from the string, which is immediately silenced by the felt dampers. The clavichord is usually built with two strings for a note, but it does not always have an independent pair of strings for each key on the keyboard. Thus the tangents of two or three adjacent keys, involving notes that are unlikely to be required together, are sometimes made to share a single pair of strings. each tangent marking the proper speaking length for the note in question. Such clavichords are fretted or. in German. *gebunden,* while those with independent strings for each key are unfretted or *bundfrei;* the nomenclature is reminiscent of the fretted finger boards of lutes and viols.

The tone of a clavichord is very soft, and the instrument is essentially suited to domestic use It possesses two musical qualities that are unique among the forerunners of the pianoforte: first, a capacity for dynamic variation including piano, forte. crescendo and diminuendo. all of which are obtained by touch alone; and second, the ability to vary a note that is sounding with a vibrato or *Bebung,* the rapid sequence of a normal and a slightly sharpened pitch obtained by a corresponding variation of finger pressure on the key and thus of the tension of the string—a technique familiar to all string players.

Music expressly written for the clavichord is not easily identified with certainty; the simultaneous presence of three or four types of domestic keyboard instruments resulted in the use of whichever instrument was at hand, a practice that is therefore sound today. Some idea of the type of music that will sound well on the clavichord can, however, be obtained by considering some of the works for which J. S. Bach particularly specified the harpsichord. and not the clavichord: his *Italian Concerto,* the *Partita in B minor, Goldberg Varzations,* the *Chromatic Fantasy and Fugue* and the *Toccata in* D *major*

Thus it can be seen that the clavichord is not the best medium for brilliant or virtuoso music. extended works or compositions calling for two manuals. The instrument is best suited to contrapuntal music in two or three parts, and to other works of the smaller and more intimate sort that are contained within a four-octave compass. such as the six sonatas (1753) of C. P. E. Bach. (R. A. RU.)

CLAVIJO Y FAJARDO, JOSÉ (1730–1806), Spanish man of letters, remembered for his campaign against public performance of the Corpus Christi *autos sacramentales* which led to their being banned in 1765, and for his love affair with Beaumarchais's sister Louise, immortalized in Goethe's tragic drama *Clavigo* Born in Lanzarote in the Canary Islands, he was educated in France. acquiring the respect for the French classical ideal which led him to criticize the peculiarly Spanish *auto sacramental* for its nonconformity to rule. Settling in Madrid, he edited a periodical influenced by Joseph Addison's *Spectator,* and translated plays by Racine and Voltaire and critical works by Buffon. He died in Madrid in 1806.

CLAY, CASSIUS MARCELLUS (1810–1903), U.S. antislavery leader. was born in Madison county, Ky., Oct. 19, 1810. He was the son of Green Clay (1757–1826), a Kentucky soldier in the War of 1812 and a relative of the noted congressman Henry Clay. Prior to graduation from Yale in 1832, he attended lectures by William Lloyd Garrison, then a reforming editor. and became a confirmed abolitionist. Clay was elected to the Kentucky legislature in 1835, 1837 and 1840, but was defeated in 1841 on the slavery issue. He established an antislavery publication, the *True American,* in Lexington, Ky., in 1845, turning his offices into a virtual arsenal to repel proslavery raiders. In spite of this, the newspaper was sacked during his absence and he was forced to move it t Cincinnati and then to Louisville.

Clay was one of tl founders of the Republican ty in 1854. He served as U.S. minister t Russia in 1862, and again between 1863 and 1869. He temporarily left Republican ranks to support Horace Greeley in the presidential election of 1872, but e: to he ɔ rty and supported James G Blaine in 1884. He lived his last days in Kentucky and was adjuɨ ɨ insane shortly befor his death, July 22, 1903.

(J. M. Wo.)

CLAY, HENRY (1777–1852), U.S. political leader, known as the "great compromiser" in the era preceding the American Civil War, was born in Hanover county. Va., on April 12, 1777. His parents, John and Elizabeth Clay. came of English stock and were moderately well-to-do. Henry was the seventh of a family of nine children. He had little formal schooling. but he early displayed great ambition. Given an opportunity to act as amanuensis for Chancellor George Wythe, one of Virginia's most distinguished lawyers, he turned easily to the law as a profession. He studied under Wythe and another famous Virginia lawyer, Robert Brooke, and in Nov. 1797 was admitted to the bar. Then, attracted to Kentucky, to which his mother had moved and which drew many lawyers because of innumerable suits over land claims, he left the strenuous competition of the Richmond bar for the opportunities of the frontier.

Clay went to Lexington, Ky., which was then the centre of frontier culture and refinement. There his star swiftly rose. Shread, facile in argument, naturally eloquent, he had no equal in the state as a criminal lawyer, and had numerous clients in civil as well as criminal cases. His position was further established by his marriage in 1799 to Lucretia Hart, daughter of Thomas Hart, a wealthy Lexington businessman. By 1800 Clay was one of Kentucky's outstanding lawyers.

Clay had begun political activities a few months after his arrival in Lexington. A Jeffersonian Republican. he urged liberalization of the state constitution. This, together with an eloquent speech against the alien and sedition laws of 1798, made him popular with Republican voters, and in 1803 he mas elected to the Kentucky legislature. In 1806 he acted as counsel for Aaron Burr, who was under grand jury investigation in Kentucky because of his designs in the southnest When Burr was freed, Kentucky Republicans believed that he had been the victim of a Federalist conspiracy. Clay's reputation did not suffer when his client's designs were later exposed.

Shortly after his defense of Burr, Clay, not yet 30 years of age, was appointed to fill an unexpired term in the U S senate, where he advocated a broad construction of the constitution that would permit use of federal funds for roads, canals and other internal improvements Already he was a "fusionist," ready to accept Federalist doctrines where they promoted western and national economic development.

From 1807 to 1809 he served in the Kentucky legislature. uhere he defended President Jefferson's embargo and urged the development of home manufactures. In Jan. 1809 he fought a duel with Humphrey Marshall, a Federalist; both men were wounded. Later that year Kentucky again sent Clay to the U.S. senate. There he supported home manufactures and President Madison's seizure of West Florida. He also helped defeat the proposal to recharter the Bank of the United States, which he regarded as an unconstitutional and dangerous money power.

Clay thought of himself as a defender of the people's interests and as such gladly exchanged his seat in the senate for one in the house of representatives in the 12th congress. On Nov. 4. 1811, he was elected speaker of the house, an office he filled with distinction many times in subsequent years. An ardent expansionist, a champion of western economic interests that had been hard hit by the British and French treatment of neutrals, and a nationalist outraged by British contempt for American rights on the high seas, he headed the congressional group known as the "War Hawks" that steadily pushed Madison toward the War of 1812 (*q.v.*). He supported the war vigorously when it came. Then in 1814, as a member of the U S. peace commission, he took an active part in negotiating the peace treaty. During the negotiations at Ghent he vigorously and successfully opposed giving Great Britain the right to navigate the Mississippi river.

By 1815 Clay was recognized as one of America's leading younger statesmen. He was the spokesman for Kentucky and now sought to consolidate his position as a national leader. In congress he urged limited measures of preparedness, internal improvementi at national expense and the protective tariff of 1816. Reversing himself on the bank issue, he successfully championed with Calhoun the incorporation of the second Bank of the United States. Clay also urged that aid be given to the Latin-American patriots who were struggling for independence from Spain. an attitude that made him very popular in South America. He hoped to become secretary of state, as a step toward the presidency, but President Monroe gave the appointment to John Quincy Adams. This so embittered Clay that he became a needling critic of Monroe's administration. In 1819 he also attacked Andrew Jackson for his invasion of Florida, thus earning that doughty general's lasting enmity.

In 1820 Clay became prominent in a role for which he was to become famous: that of compromiser. The dispute over the admission of Missouri to the union as a slave state rocked the nation. Clay, a slaveholder, disliked slavery but saw no way, other than by colonization in Africa. to end the institution. He believed that the Missourians should be free to have slavery, and backed the compromise admitting Maine as a free and Missouri as a slave state, with the rest of the Louisiana purchase above latitude 36° 30' N. to be forever free. He also pushed through a plan that enabled hlissouri to gain admission with a state constitution that excluded free Negroes and mulattoes from admission to the state. His tactfulness in handling the disputes over Missouri won general acclaim, and his admirers called him "the great pacificator."

Clay left congress in 1821 and for the next two years devoted himself to his private affairs, but his political ambition was undiminished He was easily elected to the 18th congress (1823–1825) and again became speaker of the house. He approved Monroe's famous message of 1823, but criticized the president for his opposition to internal improvements at national expense. He defended the protective tariff of 1824 in a brilliant speech that demanded an "American system" of tariff protection to build up national industry and wealth. In a broader sense. the "American system" that became identified with Clay's name also included the Bank of the United States as a guarantee of a stable currency, internal improvements and distribution to the state governments of revenue from the sale of public lands. It was essentially a nationalistic program.

Clay was a candidate for the presidency in 1824 but ran fourth and last in the election. This excluded him from consideration when the contest was decided in the house of representatives. There the leading contestants were Andrew Jackson and John Quincy Adams. The Kentucky legislature instructed Clay to vote for Jackson, but he refused to do so. He threw his support to Adams, who was elected. Adams then made Clay his secretary of state. Jackson was furious, and he and his followers raised the cry of "bargain and sale." Clay marshaled impressive evidence to show that he had decided to vote for Adams before coming to Washington. The charges of corruption mould not down, however, and were periodically resurrected with damaging effect to Clay throughout the rest of his life.

As secretary of state, Clay was loyal to Adams, but he found the department of state dull. He concluded a number of minor commercial treaties but failed to reach an accord with Great Britain on West Indian trade, and British West Indian ports were closed to U.S. shipping. He sought close relations with the South American states, but his effort to send delegates to a Pan-American congress at Panamá was thwarted by his political opponents in congress. In 1826 Clay challenged John Randolph to a duel because of charges of corruption made by the eccentric Virginian, but neither man suffered harm. Political rivalry thereafter became increasingly bitter, the followers of Jackson, Calhoun and William H. Crawford of Georgia combining against the Adams administration and the National Republican party. Out of this conflict grew the Jacksonian Democratic party that defeated the National Republicans in 1828 and put Jackson in the White House

After March 4, 1829, Clay retired to his estate, Ashland. at Lexington, but he kept in close touch with the national political situation. He attacked Jacksonian policies in regard to the Indians, the use of the veto power and political discrimination in appointments to federal offices. **A** National Republican conven-

tion in Dec. 1831 nominated him for the presidency. That same year he re-entered the senate. where he headed the opposition to the Jacksonian Democrats. He supported a protective tariff and the use of public land revenues for internal improvements. He also championed the recharter of the second Bank of the United States and went down to disastrous defeat before Jackson on that issue in the presidential campaign of 1832. In the following year, however. he successfully piloted the compromise tariff of 1833 through congress, in this way ending the nullification crisis with its menace to the union.

During the remainder of Jackson's second term, Clay continued to challenge Jackson and his cohorts. Now in alliance with Calhoun. Clay prevented confirmation of Martin Van Buren as U.S. minister to England, and pushed through the senate resolutions censuring the president for removing the government deposits from the Bank of the United States. He opposed Jackson's handling of the French debt question, and in so doing helped to restore good relations with France. But his course of action produced few positive results. The deposits were removed from the bank; the censure resolutions were expunged in 1837; Clay's policy of keeping up the price of public land and distributing the proceeds to the states failed to pass congress. His gloom increased as Jackson's term of office drew to its close. He declined to run for the Whig nomination in 1836, and it was only with a heavy heart that he accepted re-election to the senate in 1837.

Van Buren, Jackson's chief lieutenant and designated successor, was elected president in 1836. The charter of the Bank of the United States expired in that year and the new president came out for an independent federal treasury which would keep its money in its own vaults instead of depositing it in a national bank or in the so-called "pet" state banks. Clay fought this proposal, but the Independent Treasury bill became law in 1840. The struggle over this issue separated Clay and Calhoun, the latter now rejoining the Democratic party.

The panic of 1837 and the subsequent depression killed Van Buren's chance of re-election, and Clay confidently expected the Whig nomination in 1840. But Whig party leaders, especially Thurlow Weed of New York, judged it better to find a candidate not so closely associated with the bank issue and turned to Gen. William Henry Harrison, the victor in the battle of Tippecanoe in the War of 1812. John Tyler of Virginia, one of Clay's supporters, received the vice-presidential nomination as a sop to the Clay group.

Harrison and Tyler won handily in 1840 but Harrison died one month after his inauguration and Tyler became president. Clay had already proposed in the senate a party program which consisted of repeal of the Independent Treasury act, re-establishment of a Bank of the United States, distribution among the states of the proceeds of public land sales and a higher tariff. The Independent Treasury act was repealed, but Tyler vetoed two bank bills in the summer of 1841, and Clay's plans for the tariff and distribution were frustrated by opposition from both the legislative and executive branches. In 1842, he resigned from the senate.

Tyler could not qualify as leader of the Whigs. The party rallied around Clay and it speedily became evident that he would be the Whig choice for president in 1844. But a new issue now appeared, one fraught with great peril for the Kentucky statesman. This was the annexation of Texas. Clay and Van Buren (nho seemed destined for the Democratic nomination) apparently agreed to oppose immediate annexation. Clay was nominated by the Whigs. but Van Buren lost the Democratic nomination to James K. Polk of Tennessee, an ardent expansionist. In the campaign Clay tried by his "Alabama letters" to convince southern voters that he favoured the annexation of Texas at the earliest possible moment. This helped him in the south, but cost him votes in the north. Thousands of New York abolitionists deserted him; he lost that state and uith it the election. Bitterly disappointed, the "sage of Ashland" now devoted himself for a time to the pleasures of country life and the repair of his depleted fortunes, but his political ambition burned as brightly as ever. He opposed war with Mexico before it came, but supported the prosecution of the struggle once it began. He hoped for the Whig nomination in 1848 but he was then 71 years old; this, together with the fact that he was a thrice-defeated candidate worked against him and his own state refused to support him. The Whigs turned to the victorious Mexican War general. Zachary Taylor, and once again Clay's hope for the presidency vanished in frustration.

There remained for the disappointed leader one last great act of national service. Strife was growing between the north and south over the extension of slavery, particularly in the territories gained by the Mexican War, and Clay came back to the senate in 1849 resolved to meet the growing threat of disunion. He proposed a series of resolutions in the senate: California was to be admitted as a free state; the rest of the territory acquired from Mexico would be organized without reference to slavery; there would be a more effective fugitive slave law. These and a number of other provisions were designed to quell the growing tumult. Clay fought hard for this Compromise of 1850 (*q.v.*) and its main proposals were finally enacted into lam, largely through Democratic support. Tension between the sections eased and the Civil War was delayed for a decade. Had it come in 1350, the south might have won, for the disparity of strength between north and south was nowhere near as great then as it was ten years later.

Clay's health began to break in 1850 and was only temporarily improved by a vacation trip to Cuba in 1851. He spoke on every appropriate occasion on behalf of the union, but his day of leadership nas over. He returned to Washington in the fall of 1851. but could take little part in the proceedings of the senate. Hungary, then oppressed by Austria, was pleading for U S. intervention, but Clay told the Hungarian patriot Kossuth, in Jan. 1852. that the greatest service the United States could render his suffering land would be to continue setting an example of the results of liberty. During the ensuing months the Kentuckian's health gradually ebbed He died of tuberculosis in the National hotel at Washington, June 29. 1852. He was buried in the cemetery at Lexington as the nation mourned.

Ardent. impulsive, fearless, Clay was one of the outstanding leaders of the middle period in American history. He sought to make the United States great and powerful by joining the industrial east and the agrarian west in a political alliance under the banner of his "American system." With equal ardour he sought the presidency. But the "American system" and Clay's presidential ambitions alike nent down to defeat. Mistakes in judgment, such as accepting the post of secretary of state and campaigning on the bank issue, together with his fundamentally conservative position on tariff, monetary and public land policies, laid him open to damaging attacks by the Jacksonian Democrats. Loved and honoured though he mas by many thousands of American citizens. the country would not follow his lead on the great economic questions of the day, nor would it put him in the White House. He was, nevertheless, a national patriot, devoted to public service. At times arrogant and overbearing in his leadership. he yet commanded the loyalty of his followers to an unusual degree. He loved Ashland, with its 600 ac , its stately mansion and its 50 slaves; he nas fond of cards, horse racing and good liquor. He and his wife Lucretia had 11 children, 6 daughters and 5 sons. Of these, only four sons outlived him His direct line ended with the death of his son John M. Clay in 1887.

CLAY, LUCIUS DUBIGNON (1897–), U.S. army officer of World War II. was born in Marietta. Ga., on April 23, 1597, of a prominent old Georgia family. He graduated from the U.S. Military academy at West Point. N.Y., in 1918. served in various army engineer assignments and during 1940–41 directed the first national civil airport program. Clay was assigned to Washington, D.C., in March 1942, and for the next two and one-half years was in charge of the army procurement program. After brief assignments as base section commander in Normandy and as deputy for war mobilization and reconversion, Clay went to Germany in the spring of 1945 as deputy military governor. In 1947 he became

commander in chief, U.S. forces in Europe, and military governor of the U.S. zone of Germany. His administration was marked by the dramatically successful Allied air lift of food and supplies into Berlin during the Soviet land blockade of that city in 1948–49. Following his retirement from the army in May 1949, with the rank of general and numerous decorations, Clay entered private business. He was a prominent supporter and adviser of Dwight D. Eisenhower in the electoral campaign of 1952 and subsequently. Late in Aug. 1961, Pres. John F. Kennedy appointed Clay as his personal representative in Berlin, with the rank of ambassador. to help deal with the critical situation that had developed during the year as to the future status of that city. (R. M. LN.)

CLAY AND CLAY MINERALS. The term clay has been used in several senses: (1) to designate particle size, about minus 0.004 mm.; (2) as a rock composed essentially of clay materials; and (3) as a name for a group of minerals—the clay minerals. As a rock name it comprises soils, ceramic clays. clay shales, mudstones, glacial clays—including great volumes of detrital and transported clays—and the oceanic clays, red clay, blue clay and blue mud. These are all characterized by one or more of the clay minerals together aith varying amounts of organic and detrital materials, among uhich quartz is dominant.

Clay materials are plastic when met, water retentive, and coherent when dry. Most clays are the result of weathering, but some are formed by hydrothermal processes. They are one of the major mineral products, being used in a wide variety of industries; and they provide the mechanical and chemical environment for almost all plant growth, and hence for nearly all the life on the earth's surface.

The Clay Minerals.—Clay minerals, which are hydrous aluminum silicates, are divided into three main groups, all being characterized by a sheetlike crystal structure:

Kaolinite group	kaolinite, dickite, nacrite halloysite;
Montmorillonite group	montmorillonite aluminian montmorillonite (beidellite) nontronite, saponite, hectorite sauconite;
Potash clay or hydrous mica group	hydromica, hydrous mica, illite, glimmerton (German) bravaisite.

Knolinite *Group.*—Kaolinite, dickite, halloysite and nacrite have the same chemical composition ($Al_2O_3.2SiO_2.2H_2O$) and differ only in their crystal structure. The related mineral endellite contains twice as much water and loses half of it at 60° C., changing to halloysite. Allophane, a material without crystal structure (amorphous) and with variable chemical composition, occurs widely as a product of weathering that is not assignable to any mineral group.

Montmorillonite Group.—The montmorillonite group can be represented by means of ion substitutions in the chemical formula of the related mineral, pyrophyllite [$Al_2Si_4O_{10}(OH)_2$]. In typical montmorillonite about one-sixth of the aluminum is proxied by magnesium, and such exchangeable ions as calcium, sodium, potassium, hydrogen and some magnesium are held between the sheets of the crystal lattice (the so-called exchangeable bases). Variable amounts of loosely held water occupy a position between the crystal sheets. Various ions may proxy aluminum in the crystal structure. If this is iron, the mineral is nontronite; if magnesium, it is saponite or hectorite; and if zinc, it is sauconite. A limited proportion of aluminum may proxy silicon. In the crystal structure approximately three bivalent ions (magnesium, zinc) may proxy trivalent ions (aluminum, iron): which occupy only two of three potential octahedral positions in the crystal structure.

Potash Clay or *Hydrous Mica* Group.—The hydrous mica group has not been adequately studied. It seems to range in chemical composition from potash-bearing montmorillonite on the one hand to micas on the other. A material with about half the potassium oxide of mica (about 6%) occurs widely. Preliminary studies suggest that the group includes potash-bearing montmorillonite, mixed layers of more than one of the various sheet materials and materials closely related to muscovite mica.

Uses.—No other earth material has so wide an importance or such extended uses as do clays. Their properties as soils are dependent on their providing the physical environment for plant growth; that is, porosity, aeration and water retention. Clays are the storehouse of chemical fertility, base exchange being a fundamental property. Ion exchange in clays plays a major role in plant growth, being a reservoir of potassium oxide, calcium oxide and even nitrogen. It also is a factor in industry in water softeners and oil clarification, with or without acid treatment. Montmorillonites have a high ion exchange capacity (60 to 100 milliequivalents per 100 gram); potash clays have roughly half as much, but in the kaolinite group it is slight.

The purest available source of montmorillonite is bentonite (q v.), a clay resulting from the alteration of volcanic ash. With calcium as the exchangeable ion it is treated with acid and used in petroleum refining. With sodium it is highly dispersable (colloidal) and has wide use as an absorbent.

The use of clay in pottery making antedates recorded human history, and pottery remains are a major record of past civilizations. In western Asia the hieroglyphics inscribed on tiles played a major role in ancient culture. As building materials, bricks (baked and as adobe) have been used in construction since earliest time. Brick, tile and the cruder types of pottery have used impure clays but even the early potters learned to add ground rock or previously baked clay (grout) and even volcanic ash. The finer grades of ceramic materials have made use of white clay or kaolin (q v), in which kaolinite is the characteristic clay mineral To this are usually added ground quartz (or flint), ground feldspar and ball clay (a commercial grade containing more organic matter and ion compounds than kaolin) to increase plasticity. Refractory materials, including fire brick, chemical ware and melting pots for glass, make use of kaolin together with other materials which increase resistance to heat. Certain clays known as iuller's earth (*q.v.*) have long been used in wool scouring. A large use of clays (bentonite, halloysite and altapulgite) is in the refining of both organic and mineral oils, commonly after activation by means of acid treatment.

A major use of white clays is as paper coatings and fillers; they give the paper a gloss and increase opacity and printability.

In rubber compounding, the addition of clay increases resistance to wear and aids in the elimination of molding troubles.

The essential raw materials of portland cement are limestone and clays (commonly impure ones). These are ground together, sintered and then ground to a fine powder. On the addition of water, the calcium, aluminum and silicon combine into crystals of hydrous alumina silicates, and the material sets.

Clay materials have a widé variety of uses in engineering. Earth dams are made impermeable to water by adding suitable clay materials to porous soil materials; commonly this is an impermeable core. Water loss in canals may be reduced by adding clay materials. Clays, after acid treatment, have been used as water softeners. The base exchange property permits the clay to remove calcium from solution and substitutes sodium. A major use of bentonitic clay is as drilling muds. These prevent flocculation and their circulation removes the drill cuttings of the rotary drill. A heavy material (barite is commonly used) may be added to the mud. and the hydrostatic head thus developed prevents escape of gas.

CLAYS, PAUL JEAN (1819–1900), Belgian marine painter, famous for his pictures of fishing boats in the estuaries and harbours of Holland and his native Belgium. was born at Bruges on Nov. 27, 1819. As a boy Clays ran away to sea. and kept his passion for the sea all his life. He studied in Paris under the French marine painter Théodore Gudin (1802–80) and on his return to Belgium worked mainly in Brussels where he died on Feb. 9, 1900. He began as a follower of C. J. Vernet and Gudin. but after about 1850, under the influence of Gustave Courbet, his paintings became naturalistic in feeling and approach, less composed. and bolder in colour and execution, often aith heavy impasto. (A. Bs.)

CLAYTON, JOHN MIDDLETON (1796–1856), U.S politician, best known for his part in negotiating the Clayton-Bulwer treaty (*q.v.*), was born in Dagsboro, Del., on July 24, 1796. He graduated from Yale in 1815, studied law and was admitted to the bar in 1819. He then entered politics, became a member of the Delaware house of representatives in 1824, and from 1826–28 was secretary of state for Delaware. In 1829 he was elected to the U.S. senate by anti-Jackson forces, was re-elected in 1835 as a Whig but resigned the next year. He mas elected chief justice of Delaware in 1837 and in 1845 re-entered the U.S. senate, where he opposed the annexation of Texas and the war with Mexico. In 'larch 1849 he became secretary of state under Pres. Zachary Taylor. His brief secretaryship, which ended on July 22, 1850, was notable for his negotiation of a treaty dealing with canal rights in Central America with Sir Henry Lytton Bulwer, the British minister in Washington, D.C. This treaty, although the crowning achievement of his political career, was probably the most persistently unpopular American treaty. In March 1853 Clayton again entered the senate and served until his death in Dover, Del., on Nov. 9, 1856. (A. DE C.)

CLAYTON-BULWER TREATY, one of the most discussed and difficult treaties in the history of Anglo-American relations, was signed April 19, 1850, and later ratified by both the United States and Great Britain. To quote from its official title, the treaty was a "convention for facilitating and protecting the construction of a ship canal between the Atlantic and Pacific Oceans, and for other purposes." It was the joint product of Sir Henry Lytton Bulwer, British minister in Washington, D.C., and John M. Clayton, U.S. secretary of state.

The negotiators hoped that the treaty would relieve certain tensions that had developed between the two nations over Central America and would make it possible for private enterprise to construct and operate a canal. U.S. interest in such a project had been stimulated by the discovery of gold in California in 1848. The two governments agreed that Central America should be neutralized—*i.e.*, neither government would erect or maintain fortifications or occupy, colonize, assume or exercise any dominion over any part of Central America; make use of any protection or alliance that either had or might have with any state or people in Central America; take advantage of any intimacy, or use any alliance, connection or influence that either might possess with any state or government through whose territory the canal might pass.

These provisions were followed by seven articles. One guaranteed freedom of passage at all times, in war as well as in peace, to the ships of either nation. Another assured protection against local violence to any persons who undertook to build the canal. The signers pledged mutual co-operation in inducing states or governments through whose territory the canal would pass to give the project their support. They also engaged that, once the canal was completed, they would protect it and see that it was operated on the principle of fair and equal treatment of the commerce of both nations. They promised that other interested states would be invited to make similar agreements and that they (Great Britain and the United States) would on their part enter into treaty stipulations with the Central American states concerned so that the canal would be maintained "for the benefit of mankind, on equal terms to all." The signatories declared they would support and encourage such persons or company as should first offer to commence construction with the necessary capital. Finally, they agreed to extend their joint protection under the same conditions to any other system of trans-isthmian communication, whether by canal or railway, that might be built by way of Tehuantepec or Panamá.

During the years immediately following ratification of the treaty private capitalists, notably Cornelius Vanderbilt, considered, but decided against, investment in a canal. On the other hand, means of transit across the isthmus were provided to meet the flow of immigrants to the west coast. Vanderbilt opened a combined river and wagon road route across Nicaragua: the same that the proposed canal was expected to traverse; and a rival concern built the Panama railroad, opened for business in 1855. Neither of these enterprises could be said, however, to owe anything to the Clayton-Bulwer treaty, whose elaborate provisions respecting an international waterway remained inoperative.

The historical significance of the Clayton-Bulwer treaty rests, not so much on its safeguards respecting an isthmian canal that was never built under its auspices, as on the international tensions and power rivalries that the treaty was expected to alleviate. Far from accomplishing this object, the treaty entered a stormy period of 10 years, the Gnited States arguing that it required renunciation on Britain's part of certain established interests. viz., a protectorate over the hlosquito Coast, a settlement in British Honduras, and a community of settlers. mostly Negro, living on the Bay Islands, nho asked for and received from the colonial office recognition in 1852 as a colony. Britain's counter position on these matters was that the treaty recognized the status *quo*. This argument ended in certain adjustments being made in 1859–60; but in 1881 James G. Blaine, U.S. secretary of state, demanded that the treaty be abrogated, his argument being that the Cnited States was now the paramount power in the Americas and could not permit its hands to be tied by the treaty. This argument, rejected by the Gladstone ministry at the time, gained acceptance in 1901 witn the conclusion of the second Hay-Pauncefote treaty. This treaty abrogated the Clayton-Bulwer treaty and authorized the United States to construct and control the canal. See also PANAMA CANAL.

CLAZOMENAE, an ancient city of Ionia, about 20 mi. W. of Izmir (Smyrna) on the south side of the Gulf of Izmir in the Izmir *il* of Turkey. It was a member of the Ionian Dodecapolis (confederation of twelve cities). Its founders are said to have come from Cleonae and Phlius and to have settled at Clazomenae only after unsuccessful attempts elsewhere. The city stood originally on the mainland near the base of the Erythraean peninsula; but the inhabitants, alarmed by the encroachments of the Persians, moved to an island 400 yd. from the coast, and there established their city. This island was connected with the mainland by Alexander the Great by means of a pier, some traces of which are still visible. During the 5th century B.C. it was subject to Athens but in 412 B.C. it revolted and after a period of bitter party strife became subject to Persia in 387 B.C. Under the Romans Clazomenae was included in the province of Asia and enjoyed immunity from taxation. It was the birthplace of the philosopher Anaxagoras and of Pericles' siege engineer, Artemon. It is famous for its painted terra-cotta sarcophagi which are notable monuments of Ionian painting in the late 6th century B.C. (E. GR.; Jo. M. Co.)

CLEANTHES (c. 301–232 or 252 B.C.). Stoic philosopher, was born at Assos in the Troad. He came to Athens, where he listened first to the lectures of Crates of Thebes and then to those of Zeno the Stoic, supporting himself meanwhile by working all night as water carrier to a gardener (hence his nickname, "one who draws from a well"). On the death of Zeno he became the leader of the school. Among his pupils were his successor, Chrysippus, and Xntigonus II Gonatas, king of Macedonia.

Cleanthes produced little that was original, though he wrote about 50 works, of which fragments have survived. The principal is the large portion of the *Hymn to* Zeus, which was preserved in Stobaeus. He regarded the sun as the abode of God, the intelligent providence, or (in accordance with Stoic materialism) the vivifying fire or ether of the universe. Virtue, he taught, is life according to nature; but pleasure is not according to nature. The principal fragments of Cleanthes' works are contained in Diogenes Laërtius and Stobaeus; some may be found in Cicero and Seneca. See STOICS.

muth, *Commentationes de Zenone Citiensi et Cleanthe Assio* (1874–75); R. Hirzel, *Untersuchungen zu Ciceros philosophischen Schriften,* ii (1882), containing a vindication of the originality of Cleanthes.

CLEARINGHOUSE. When business firms engaged in the same kind of activity have extensive dealings with each other, it is an obvious convenience and economy to establish an institution to enable them to offset one transaction with another, thus limiting payment settlements to net balances. Such mutual institutions are called clearinghouses and they may be established in many branches of industry.

Clearinghouses have been set up for the purpose of settling interbank check clearings in financial centres throughout the world; clearinghouses also play an important role in settling transactions related to railroads, stock and commodity exchanges and international payments.

Bank clearinghouses generally are voluntary associations of local banks set up for the purpose of simplifying and facilitating the exchange of such items as checks, drafts, bills and notes, and to facilitate the settlement of balances among the banks. *(See* BANKING.) In addition, bank clearinghouses may serve as the medium through which participating banks may discuss matters of mutual interest and perform such functions as fixing service charges, exchanging credit information, gathering credit data and regulating advertising. Before the formation of the federal reserve system, bank clearinghouses in the United States, on occasions, performed additional functions such as fixing interest rates on deposits and extending loans to the government and to member banks.

The first modern bank clearinghouse was established in London in 1773, although the clearinghouse idea had been applied to various forms of trade in such places as Tokyo, Japan, Florence, Italy, and Lyons, France. many centuries earlier. It was not until 1853 that the New York clearinghouse, the first bank clearinghouse in the United States, was established. By the early 1960s there were more than 300 bank clearinghouses in the United States; they varied greatly in volume of clearings and physical facilities. In smaller tonns. for example, the clearinghouse might be only a single room within one of the member banks.

A large share of all bank clearings in the United States is effected through the New York clearinghouse. Settlements among the member banks are effected through the deposit account that each holds at the Federal Reserve bank of New York Other banks in the New York metropolitan area and throughout the country indirectly effect many of their check clearings via the New York clearinghouse either through the Federal Reserve bank of New York or through correspondent relations with New York clearinghouse members. Daily check clearings at the New York clearinghouse frequently exceed $2,000,000,000, but over 80% of settlements generally are effected through exchange of clearing items.

CLEAVAGE, in geology, refers to parallel surfaces of secondary origin along which rocks tend to break into thin sheets one millimetre or so thick. Ordinary roofing slate (*q.v.*) is an excellent example of a rock possessing good cleavage. Cleavage is more restrictive in its meaning than foliation, which refers to any parallel surfaces, regardless of whether they are primary or secondary, along which the rock tends to break into thin sheets. The tendency of many sedimentary rocks to break into slabs parallel to the bedding is primary, that is, it is the result of properties inherent in the rock from the time of deposition. Schistosity is that variety of cleavage found in the more coarsely crystalline metamorphic rocks, notably schists (*q.v.*).

Cleavage, the result of deforming forces acting on the rock, is sometimes referred to as rock cleavage to distinguish it from mineral cleavage, which is due to the parallel arrangement of the layers of atoms of which the mineral is composed *(see* MICA: *Mineralogical Properties).*

See also FAULT; FOLD; METAMORPHISM.

CLEAVERS, commonly called goose grass, *Galium aparine* (family Rubiaceae). is a common plant in hedges and waste places. It has a long, weak, straggling, four-sided, green stem, bearing whorls of six to eight narrow leaves, one-half to two inches long and, like the angles of the stem, rough from the presence of short, stiff. downwardly pointing, hooked hairs.

The small, white, regular flowers are borne, a few together, in axillary clusters, and are followed by the small, bristly, two-celled fruit which, like the rest of the plant, readily clings to a rough surface, whence the common name. The plant has a wide distribution throughout the north temperate zone, and is also found in temperate South America.

CLEETHORPES, a municipal borough (1936) in the Louth parliamentary division of the Parts of Lindsey, Lincolnshire, Eng., adjoining Great Grimsby to the southeast, 36 mi. S S.E. of Lincoln by road. Pop (1961) 32,705. Its gently shelving shore of fine sand, affording safe bathing. is part of the Humber estuary. The sea wall and continuation embankment form the three-mile Kingsway promenade. The church of the Holy Trinity and St. Mary is principally Norman, but pre-Conquest work appears in the tower.

Cleethorpes, facing eastward to the North sea, is a health and seaside resort for the midlands, Lancashire and Yorkshire. There are parks, pleasure grounds and a pier.

CLEF: *see* MUSICAL NOTATION.

CLEFT PALATE, a congenital cleavage in the roof of the mouth, due to faulty embryologic development. *See* SPEECH DISORDERS.

CLEISTHENES, the name of two ancient Greek statesmen, one Sicyonian, the other Athenian.

CLEISTHENES OF SICYON, tyrant of Sicyon, from about 600 to 570 B.C.. belonged to the non-Dorian family of Orthagoras. who had established the tyranny in Sicyon with the support of the Ionian section of the inhabitants. Cleisthenes emphasized the destruction of Dorian predominance by giving ridiculous epithets to their tribal units, which from Hylleis, Dymanes and Pamphyli become Hyatae ("Swine-men"). Choireatae ("Pig-men") and Oneatae ("Ass-men"). He also attacked Dorian Argos and suppressed the Homeric rhapsodists who sang the exploits of Dorian heroes. He championed the cause of the Delphic oracle against the town of Crisa in the Sacred War of c. 590 B.C. Crisa was destroyed, and Delphi became one of the meeting places of the Delphic amphictyony (*see* AMPHICTYONY). The Pythian games were re-established with new magnificence. and Cleisthenes won the first chariot race in 582. He founded Pythian games at Sicyon and built a new Sicyonian treasury at Delphi. His power was so great that when he offered his daughter Agariste in marriage. some of the most prominent Greeks sought the honour, which fell upon Megacles, the Alcmaeonid. The story of the rival suitors is told by Herodotus.

CLEISTHENES OF ATHENS (late 6th century B.C.), the Athenian statesman. was the son of Megacles, the Alcmaeonid, and Xgariste, daughter of Cleisthenes of Sicyon. The Xlcmaeonidne (*q.v.*) had been in exile during the last period of Pisistratus' tyranny, but Cleisthenes had been allowed to return by 525. when he was archon (Pisistratus' son Hippias, after his father's death, may perhaps have been trying to reconcile the opposition). He was, however, soon in exile again. Then. after an unsuccessful attempt to return by force. he used his influence at Delphi to secure the intervention of Sparta. Cleomenes I. the Spartan king, at the Delphic oracle's bidding (and because he was concerned at Pisistratid friendship with Argos) expelled the Pisistratidae from Athens in 510. Returning to Athens. Cleisthenes realized that the Athenians would not tolerate a new tyranny, and the other nobles were unwilling to accept him as leader of an oligarchy. Defeated in the struggle of aristocratic factions. he "took the people into partnership," in Herodotus' words. The crisis came in 508 when his main rival, Isagoras, was archon. Cleisthenes' democratic program was accepted by the assembly, but Isagoras appealed to Sparta. Cleisthenes and his supporters went into exile when the Spartans revived the old question of the Alcmaeonid bloodguilt, but when Cleomenes tried to set up an oligarchy in Athens the democrats

rose and. after securing the withdrawal of Cleomenes and Isagoras, recalled Cleisthenes and his supporters from exile. Cleisthenes' reforms could now be carried through.

Cleisthenes saw that the existing system of tribes, with their constituent units of phratries (brotherhoods) and clans, militated against the effective working of democracy. This was so because the divisions of phratry and clan, having not only racial and religious associations but also associations of property (since they were more or less parallel with geographical divisions), caused local and family interests to predominate in the four tribes and enabled noble families to exert undue influence in politics. He accordingly abolished the four tribes and created ten new ones on an entirely different basis. He divided Attica into three districts, urban (including suburban), inland and maritime. each of which was subdivided into ten trittyes (a purely artificial geographical unit). He created a tribe by taking one trittys from each of the three districts, so that each of the ten new tribes so constituted included people from all parts of Attica. Each trittys comprised one or more demes or to nships, and the deme now became the political subdivision of the tribe and the basic electoral unit.. Electoral divisions thus ceased to be identical with those of clan and property. This new organization was for political purposes only. For religious purposes the clans and phratries retained their old signification.

The names of the new tribes were taken from legendary heroes and therefore contributed to the idea of a national unity. Each tribe had its shrine and its particular hero cult, which, however, was free from local association and the dominance of particular families. This national idea Cleisthenes further emphasized by setting up in the market place at Athens a statue of each tribal hero

The number of members of a deme varied greatly, though, at first, the division was local (*i.e.,* a deme consisted of its residents); the qualification became hereditary, a man belonging to his father's deme wherever he lived. Hence there arose a distinction between resident demesmen and residents belonging to another deme. The main purpose of the reform was to do away with the religious qualification of connection with clan or phratry and so facilitate the enfranchisement of new citizens. The demes were not invented by Cleisthenes. They were primitive divisions of Attica which were now given definition as political divisions. But the formation of demes in the city itself was new; there were six, in five different tribes, and the other five tribes were represented in the suburbs and the Piraeus. In the Cleisthenean system there was one great source of danger, namely that the residents in and about Athens must always have had more weight in elections than those in distant demes. Moreover, a special class, the new commercial element in the citizenship devised by Solon and fostered by Cleisthenes, soon came to have a preponderating influence in the city and suburbs.

Cleisthenes also carried out a franchise reform. According to Aristotle he created new citizens by enrolling in the tribes "many resident aliens and emancipated slaves." Metics (resident aliens) had been encouraged to settle in Athens by Solon and the grant of citizenship had been made to many skilled in trades and handicrafts. The Pisistratidae had favoured this commercial class as a support against the aristocrats, but after their expulsion a revision of the citizen roll had removed many or all of these as "not of pure descent." Cleisthenes restored these and opened the way to citizenship to all satisfactory resident aliens, so strengthening the position of the democracy.

The boule (*q.v.*) was reorganized to suit the new tribal arrangement and was known henceforward as the Council of the Five Hundred, with 50 members from each tribe, each 50 acting as an executive committee (prytaneis) for one month. Later, in the fully developed democracy, the president of the boule and ecclesia was chosen by lot each day from the tribe which was providing the *prytaneis* that month, but in the time of Cleisthenes it is more probable that the archon continued to preside. The new tribal system was also applied to the boards of magistrates, which henceforward had each ten members, and the apodektai (receivers) may have been introduced to assist the kolakretai (treasurers), since state finance was becoming more complex. A further change which followed from the new tribal system was the reconstitution of the army under ten tribal commanders; this, however, probably took place about 501 B.C. and cannot be attributed directly to Cleisthenes. For most purposes the deme replaced the naucraria as a local administrative unit, but the naucrariae still supplied the fleet, and were increased from 48 to 50.

Cleisthenes is also said to have introduced ostracism (*q.v.*) to enable the democracy to remove potential tyrants without violence. The device was not used until 487, some time after the battle of Marathon, and it has been thought that it must have been instituted immediately before its first use; but this inference is not necessary and is against the best evidence.

We hear nothing of Cleisthenes after his reforms except for a late story, probably false, that he was himself ostracized. He may have been discredited as a result of Athens' approaches to Persia when the new democracy was threatened by Sparta, Boeotia and Chalcis (506). There are indeed indications that some of the Alcmaeonidae may have favoured Persia in the period 507–490, but the evidence is not decisive.

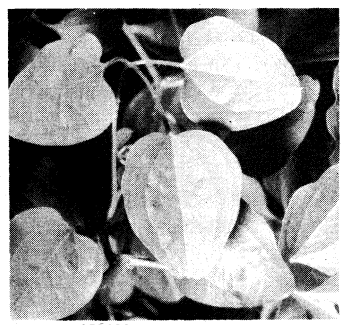
CLEITHRAL, an architectural term applied to a Greek temple whose roof completely covered it; in contradistinction to hypaethral. applied to one partly or wholly open to the sky. See GREEK ARCHITECTURE; TEMPLE ARCHITECTURE.

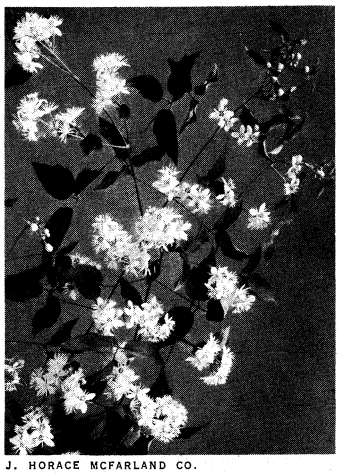
CLEITOMACHUS (CLITOMACHUS, originally named HASDRUBAL) (187/186–110/109 B.C.), from Carthage, head of the Academy in Athens from 127/126 B.C. (see ACADEMY, GREEK), was the pupil and the main literary exponent of Carneades. His works, all of which are lost, filled 400 volumes and included On the *Withholding of* Assent; two popular introductions to the Academic philosophy: and a consolatory letter to his compatriots on the fall of Carthage. How much can. in addition to quotations. be traced to him in Cicero. in Sextus Empiricus and in other writers is controversial. Contradicting some philosophers. he maintained that Carneades never disclosed preference for any philosophical doctrine. True to antidogmatism, he expected the ideal wise man never to assent to anything (to practice *epochê*), but permitted him to admit or to deny verisimilitude, according to circumstances. (PP. M.)

CLEMATIS, a genus of vines and herbs of the crowfoot family (Ranunculaceae; *q.v.*), containing approximately 200 species and widely distributed but most abundant in temperate regions. The plants are semiwoody climbers with generally compound, opposite leaves. the stalk of which is sensitive to contact like a tendril, becoming twisted round suitable objects and thereby giving support to the plant. The flowers are arranged in axillary or terminal clusters; they have no petals. but white or coloured, often large sepals, and an indefinite number of stamens and carpels. They contain no honey, but are visited by insects for the pollen which is plentiful. The fruit is a head of achenes, each bearing the long-bearded, persistent style, suggesting the popular name of old-man's-beard. This feathery style is an important agent in the distribution of the seed by means of the wind. Inclusive of the sections *Viorna* and *Atragene,* which some botanists regard as separate genera, there are about 27 species of Clematis native to North America. Of these, the following representatives are more or less cultivated: the virgin's-bon er (C. virginiana), found from Nova Scotia to Manitoba and southward to Georgia and Louisiana; the western *C. ligusticifolia,* growing from North Dakota and



JOHN H. GERARD

FIG. I.—LEAVES OF OLD-MAN'S-BEARD. OR TRAVELER'S-JOY (C. VITALBA)



J. HORACE MCFARLAND CO.

FIG. 2.—VIRGIN'S-BOWER (CLEMATIS VIRGINIANA)

Missouri westward to British Columbia and California ; the purple virgin's-bower (C. verticillaris), found from Hudson bay to Minnesota and southeastward to Connecticut and Virginia; the scarlet virgin's-bower (C. texensis), native to Texas; and the pipestem virgin's-bower (C. lasiantha) of California and Oregon.

Clematis is represented in England by Clematis vitalba, old-man's-beard or traveler's joy, a common plant on chalky or light soil.

Several of the species, especially the large-flowered ones, are favourite garden plants, well adapted for covering trellises or walls or trailing over the ground. Of these over 30 are grown in U.S. gardens. and about 40 in England. They grow best in a rich, loamy soil with a fair supply of well-rotted manure thoroughly distributed in it.

Far finer than the species are the garden hybrids, mostly derived from crosses betneen C. *jackmanii* (itself a hybrid) and several other species. Some of these have flowers four to six inches wide and are extremely handsome vines A selection from over 60 of these hybrids might include: Gipsy Queen (purple), Ramona (blue) Lady Caroline Neville (mauve, with dark bars), Sir Garnet Wolseley (bronzy blue), William Kennett (lavender), Lord Neville (dark plum), Henryi (white), Belle of Woking (azure blue). Crimson King (red) and Duchess of Albany (scarlet).

CLEMENCEAU, GEORGES (1841–1929), French statesman nhose determination and perseverance urged his country on to victory in World War I, was born at Mouilleron-en-Pareds, Vendée, on Sept. 28, 1841. He took up his father's profession of medicine and studied at Nantes and Paris. Attracted by inclination and family tradition to the republican opposition to Napoleon III, he began to take an interest in British and U.S. affairs. At the end of 1865 he embarked for the United States, taking with him Mill's Auguste *Comte* and Positivism to translate into French. He remained in New England for three years, writing descriptions of American post-Civil War conditions to the Paris Temps and teaching French in a girls' school at Stamford. Conn. He married one of his pupils, Mary Plummer, but they separated after seven years.

In 1869 Clemenceau returned to Paris. After the revolution of 1870 he was nominated mayor of the 18th *arrondissement* of Paris (Montmartre). On Feb. 8, 1871. he mas elected as a Radical to represent the Seine *département* in the national assembly at Bordeaux. where he voted against the preliminaries of the peace with Germany. In Paris, the execution of Generals C. M. Lecomte and Clément Thomas by their mutinous soldiers on March 18, which he tried to prevent, brought him into collision with the central committee of the National Guard, then the illegal government of Paris. It ordered his arrest. but he escaped; he was accused, honever, by various witnesses, at the subsequent trial of the murderers (Nov. 29), of not having intervened uhen he might have. and though he was cleared of this charge it led to a duel, for his share in which he was prosecuted and sentenced to a fine and a fortnight's imprisonment.

Meanwhile, on March 20, 1871, Clemenceau had introduced in the national assembly at Versailles, on behalf of his Radical colleagues, the bill establishing a Paris municipal council of 80 members, but he was not himself elected to it. He tried with the other Paris mayors to mediate betneen Versailles and the central committee, but failed. He accordingly resigned his mayoralty and his seat in the assembly and temporarily gave up politics; but he mas elected to the Paris municipal council on July 23, 1871, for the Clignancourt quartier and retained his seat till 1876, passing through the offices of secretary and vice-president and becoming president in 1875. In 1876 he stood again for the chamber of deputies and was elected for the 18th arrondissement. He joined the extreme left, and his energy and mordant eloquence speedily made him the leader of the Radical section.

In 1877, after the Seize mai (see FRANCE. History), Clemenceau took a leading part in resisting the anti-republican policy of which the Seize mai incident was a symptom, and in 1879 he demanded the indictment of the duc de Broglie's ministry. In 1880 he started his newspaper, La Justice, which became the principal organ of the Radicals in Paris; and from this time onward throughout Jules Grévy's presidency he rapidly built up his reputation as a political critic and as a destroyer of ministries who yet would not take office himself. He led the extreme left in the chamber. He was an active opponent of Jules Ferry's colonial policy and of the Opportunist party, and in 1885 his use of the Tongking disaster principally determined the fall of the Ferry cabinet. At the elections of 1885 he was returned both for his old seat in Paris and for the Var, selecting the latter. Refusing to form a ministry because he could not command a majority in the senate to replace the one that he had overthrown, he supported the right in keeping Charles de Freycinet in power in 1886 and was responsible for the inclusion of Gen. Georges Boulanger (*q.v.*) in the Freycinet cabinet as war minister. When Boulanger showed his real colours, Clemenceau became a vigorous opponent of the Boulangist movement and helped to found the League of the Rights of Man to press for radical reforms

By his share in the exposure of Daniel Wilson, President Grévy's son-in-law, for trafficking in honours, Clemenceau caused the resignation of the prime minister Maurice Rouvier (*q.v.*). Having refused Grévy's request to form a ministry, he also contributed to Grévy's resignation (Nov. 1887) and nas primarily responsible, by advising his followers to support neither Charles Floquet, Ferry nor Freycinet, for the election of an .'outsider" as president in Sadi Carnot. Clemenceau's relationship with Cornelius Hertz inevitably threw suspicion upon him when the Panamá scandal was exposed (1892) and the Boulangists took revenge upon him for repudiating the general. Although their attack failed it involved him in a duel with Paul Déroulède and cost him his seat in the elections of 1893.

For the next nine years Clemenceau confined his political activities to journalism, his career being further clouded by the Dreyfus case (see DREYFUS, ALFRED). In this he was an active supporter of Zola (whose exposé of the affair appeared in *L'Aurore,* founded by Clemenceau in 1897) and an opponent of the anti-Semitic and nationalist campaign. In 1900 he withdrew from La *Justice* to found a weekly review, Le Bloc, which lasted until March 1902. On April 6. 1902. he was elected senator for the Var, although he had previously demanded the suppression of the senate. He sat nith the Radicals and vigorously supported the ministry of Émile Combes. In June 1903 he undertook the direction of *L'Aurore* In it he led the campaign for the revision of the verdict on Dreyfus, and for the separation of church and state.

In March 1906 the fall of the Rouvier ministry, because of riots provoked by the inventories of church property, at last brought Clemenceau to power as minister of the interior in Ferdinand Sarrien's cabinet. When a strike of miners in the Pas-de-Calais after a disaster at Courrières led to the threat of disorder on May 1, 1906. he resolved to employ the military; and his attitude in the matter alienated the Socialist party, from ahich he definitely broke in his notable reply in the chainber to Jean Jaurès in June 1906. This speech marked him out as the "strong man" of the day in French politics; and when the Sarrien ministry resigned in October he became premier. During 1907 and 1908 the new entente with England was cemented, and France played a great part in European politics, in spite of difficulties with Germany and attacks by the Socialist party in connection with Morocco. On July 20 1909, Clemenceau was defeated in a discussion in the chamber on the state of the navy. He was succeeded as premier by

Aristide Briand, with a reconstructed cabinet.

Two years later Clemenceau entered the senate again and became a member of its commissions for foreign affairs and the army. He could have had no better position for surveying European fluctuations and German activities or for inquiring into the real condition of French armaments. about uhich he was most concerned. Convinced that Germany meant war. he was haunted by the fear that again France might be caught unprepared. In order to make better known his views on armaments, he founded in May 1913, a new daily paper, *L'Homme Libre,* with himself as editor. He could thus wage daily battle for security against the German menace.

In the spring of 1913 the question of restoring the three years' term of conscript service suddenly arose. Clemenceau took an impassioned part in the debates on armaments. In Aug. 1914 World War I started. *L'Homme Libre* suffered at the hands of the censor for Clemenceau's plain speaking. He wanted the whole youth of France to be mobilized; he denounced the shirkers, demanded technical efficiency and attacked red tape, inadequate munition factories and badly run hospitals. He made war upon all who failed to realize that this was a conflict of supplies and organization, and upon every kind of apathy and feebleness. In Sept. 1914 *L'Homme Libre* was suppressed. Two days later, however. it reappeared as *L'Homme Enchaîné,* but wore its fetters lightly. For three months there nas a daily struggle with the censor. For some time not a week passed without articles' being mutilated, but Clemenceau won and excisions became rare. Meanwhile. in the senate. Clemenceau agitated for more and more guns. munitions and soldiers, for judicious use of the available manpower and for a better-equipped and better-organized medical service.

Above all. Clemenceau strove to create an indomitable "will to victory." As the war dragged on, weariness. slackness and pacifism began to appear. Clemenceau was the first to draw public attention to that growing peril, and it was at a public debate in the senate on July 22. 1917, that he made his famous attack on Louis Malvy, who had been minister of the interior since 1914. Clemenceau declared that Malvy had not treated revolutionaries nith a firm enough hand. Malvy's justification mas that he desired to "gain the confidence of the working-man"; but Clemenceau retorted that there was no comparison betneen those workingmen aho were loyally doing their duty to their country and a number of abject "defeatists."

In Nov. 1917 the president of the republic, Raymond Poincaré, asked Clemenceau to form a government. Clemenceau knew that his task meant victory or death: morale at the front was bad, and at home even worse; resources were nearly at an end. and no solution whatever could be discerned. Though he was 76 years of age, he formed his cabinet on Nov. 16, 1917, with himself as minister of war as well as premier. Thenceforward till Nov. 11. 1918. he concentrated on war only. He made it clear that France was bent on absolute victory and would accept no half-measures. Those who spoke of wavering or yielding were immediately silenced; anyone nho obstructed the path to victory was ruthlessly removed. By these means Clemenceau restored the nation's self-confidence. When the Germans launched their great assault on the Anglo-French line in March 1918, Clemenceau joined in organizing the unity of command nith Ferdinand Foch'at the head. In May came the disaster of the Chemin-des-Dames, and the French troops mere driven back on the Marne. The commander in chief was severely criticized, but three months later Clemenceau made him marshal of France. During 1918 Clemenceau's resolution remained unshaken, and on Nov. 11 the Germans signed the Armistice.

From Nov. 11, 1918 to June 28, 1919, Clemenceau devoted himself to the international settlement. The peace of Vérsaílles was in preparation. and this necessitated strenuous days of work and delicate negotiations. Clemenceau made it his task as president of the conference of Paris to reconcile the interests of France with those of Great Britain and the United States. He defended the French cause with enthusiasm and conviction. forcing his view alternately on David Lloyd George and Woodrow Wilson. Meanwhile he took care to see that Germany disarmed. Yet the French parliament began to grow restless, for it saw itself put to one side in the peace negotiations. It no longer regarded Clemenceau as indispensable. The great patriot, anxious to finish the work that he had begun, did his best to smooth matters over. Demobilization had to be faced, a general election was looming ahead, and the questions of Alsace-Lorraine and the liquidation of war stocks had to be settled. Clemenceau decided to deal simultaneously with these questions as of equal importance.

Peace was signed on June 28, 1919, and on Nov. 11 the new chamber was elected. Clemenceau counted on its support, for he believed that its members, many of them ex-soldiers, would have profited by the lesson of the war. Yet though Clemenceau had saved his country, the parliamentarians could not forgive. the fact that he had excluded them from the final work for victory. During the war he had undoubtedly worked alone, as he felt that large assemblies mere not made for action, but he might have admitted the commissions to the deliberations on the treaty of Versailles if diplomatic obstacles had not precluded it. He had also to face the hostility, not only of the clerical party of the right who suspected him of indifference to the Vatican, but also that of the extreme left, who were alienated by what they considered to be his militarism. He thus met the fate which overtook other war ministers, and on Jan. 20, 1920, his cabinet fell, Alexandre Millerand being summoned to office. Clemenceau had earned the gratitude of his country and could now have sought repose; instead he sailed for India.

When it appeared that the United States was seeking to dissociate itself from European affairs, Clemenceau, 81 years old, sailed at once for the United States at the end of 1922. From town to town he carried the message of France to the citizens of the U.S. He had no official mission; for he had neither asked anything nor received anything from the French government. His progress was nonetheless triumphant. Once more he returned to Paris, but not to rest. By the end of 1925 he was already writing two books: one on philosophy. *Au soir* de la *pensée,* two volumes (1927; Eng. trans., In the ***Evening*** of *My Thought,* two volumes, 1929), and the other on Demosthenes, *Demosthène* (1926; Eng. trans. by C. M. Thompson, 1926). He was at work upon his memoirs, *Grandeurs* et *misères d'une* victoire (1930), when he died in Paris on Nov. 24, 1929.

CLEMENS (NON PAPA), **JACOBUS** (c. 1510–c. 1558), Flemish composer famous for his sacred music. Born in Ypres, about 1510, from 1546 he called himself "Clemens non Papa" to avoid confusion with a priest and poet of the same name there. In 1544 he was in Bruges as probationary choirmaster of St. Donatien, leaving before 1545, and in 1550 he was a singer and composer at 's Hertogenbosch. His outstanding *Souter* Liedekens (1556), an almost complete series of Flemish metrical psalms, were probably interrupted by illness or death; an elegy of 1558 suggests that he died violently. His works include 15 Masses (10 published 1557–59); many motets (6 published 1546; 11, 1556; 92, 1559); and 90 chansons. He composed in all the current styles, using simple, impressive themes, melodious lines and dextrous imitation foreshadowing Lassus.

BIBLIOGRAPHY.—A good selection of his works is in F. Commer (ed.), *Collectio operum musicorum Batavorum* . . . (1844–58) vol. I, III, V, X–XII; complete ed. by K. P. B. Kempers (1951 *et seq.*). *See* also *K. P.* B. Kempers, "Zur Biographie Clemens non Papa's," in *Zeitschrift fur Musikwissenschaft,* IX (1927). (B. L. TR.)

CLEMENS, SAMUEL LANGHORNE: see **TWAIN,** MARK.

CLEMENT, the name of 14 popes and 3 antipopes.

ST. CLEMENT I (St. Clement of Rome), pope from 88 to 97 or from 92 to 101, according to Tertullian was consecrated by St. Peter. Irenaeus lists him as third successor of Peter, contemporary of the apostles and witness of their preaching. Eusebius' Ecclesiastical History dates his pontificate from the 12th year of Domitian to the third year of Trajan (A.D. 92 to 101). Origen, Epiphanius, Eusebius and Jerome identify him with the Clement of Philippians iv, 3. Though the important Epistle to the Church of Corinth, called I Clement, does not bear Clement's name, the tradition

which ascribes it to him is early and universal. References to the persecution by Domitian and the testimony of Hegesippus (quoted by Eusebius in his Ecclesiastical *History*) indicate that it was written around A.D. 96. The unmistakably authoritative tone of the letter addressed to a church in Greece makes the author more than merely a peacemaker. Clement regards the ejection of several presbyters as a highhanded and unjustifiable procedure on the grounds that the hierarchical principle of the Christian ministry, the apostolic succession, precludes such action by the Corinthians. The long invocation toward the end of the letter is probably the contemporary Roman liturgical prayer in the Eucharist. Extensive use of the Greek version of the Old Testament (Septuagint) points to a Judaeo-Hellenistic background. Christian antiquity, especially in Syria and Egypt, read the letter avidly, almost equating it with the New Testament. Numerous so-called Clementine writings (see CLEMENTINE LITERATURE) witness the high regard for Clement in the early church. His feast day is Nov. 23.

(J. M. F. M.)

CLEMENT II (Suidger), pope from 1046 to 1047, a worthy man of nohle Saxon birth and formerly bishop of Bamberg, was elevated Dec. 24, 1046, by Henry III. His short pontificate saw the beginning of a period of reform, and in 1047 he convoked the council of Rome which passed decrees against simony. Clement died Oct. 9, 1047. (C. P. L.)

CLEMENT III (Guibert. or Wibert, of Parma), antipope from 1080 to 1100. the talented son of an imperialist family, served at the German court, becoming imperial chancellor for Italy (1058–63). Confirmed as archbishop of Ravenna by Alexander II (1073), he fell out with Gregory 1-11 and became Italian leader of the imperialist faction. Already excommunicated, he was elected on June 25, 1080, by a synod convoked by Henry IV at Brixen, which declared Gregory deposed. He was enthroned when Henry finally took Rome (March 24. 1084), and kept power there until the 1090s. He died Sept. 8, 1100. (J. J. RY.)

CLEMENT III (Paolo Scolari), pope from 1187 to 1191, a Roman and cardinal bishop of Palestrina. was elected pope on Dec. 19, 1187. In October Jerusalem had fallen to Saladin, and Clement urged the princes of the west to undertake the third crusade. Apart from the capture of Acre the results were disappointing. In Italy the marriage of King Henry of the Romans with Constance of Sicily threatened to unite south Italy to the German crown. This Clement tried to avert by enfeoffing Count Tancred of Lecce with Sicily. but he died before the results of his policy became apparent. One of his permanent acts was the removal of the Scottish church from the jurisdiction of York (1188) and it became dependent directly on Rome. Clement III died March 20. 1191.

(C. H. LE.)

CLEMENT IV (Guido Fulcodi or Faucoi), pope from 1265 to 1268, mas born at St. Gilles, near Nîmes. An eminent jurist serving Louis IX, he had become priest when widowed, then bishop of Le Puy (1257), archbishop of Narbonne (1259) and cardinal bishop of Sabina (1261). He was elected pope on Feb. 5, 1265. Executing Urban IV's plan, Clement invested Charles of Xnjou with the Sicilian kingdom (1266) and financed the costly invasion. But the Hohenstaufen defeat brought peace neither to Rome nor to Italy; the Angevins were a new threat to the papacy's independence and a heavy drain on its material and moral resources. Clement died Nov. 29. 1268. at Viterbo. (J. J. RY.)

CLEMENT V (Bertrand de Got) (1264–1314), pope from 1305 to 1314, the first of the Avignon popes. He created a majority of French cardinals and assured a line of French popes. Blackmailed by King Philip IV of France. the chronically sick pope acquiesced to Philip's demands for the suppression of the Knights Templars. A scholar himself, he founded chairs of oriental languages at Paris. Bologna. Oxford and Salamanca and made important additions to canon law. He died April 20. 1314.

CLEMENT VI (Pierre Roger) (1291–1352), pope from 1342 to 1352, was a French Benedictine abbot, archbishop and cardinal before his election. He purchased Avignon, enlarged the papal palace there and patronized artists and scholars. During the Black Death he welcomed Jews to Avignon when they were accused of starting the plague. He died at Avignon on Dec. 6, 1352.

CLEMENT VII (Robert of Geneva), antipope from 1378 to 1394, was one of the leaders of the cardinals who declared the election of Urban VI invalid. He settled at Avignon, thus precipitating the schism nhich lasted until 1417.

CLEMENT VII (Giulio de' Medici) (1478–1534), pope from 1523 to 1534, was born at Florence on May 26. 1478. A weak, vacillating pope in the political rivalries of Francis I of France and the emperor Charles V he supported first one and then the other under the pressure of events. In 1527 he had to ransom himself after the sack of Rome by Charles V and promise to call a general council to deal with Lutheranism. Clement delayed in handling the plea of Henry VIII of England for the annulment of his marriage with Catherine of Aragon until, losing patience, the king led the English church into heresy. Clement died Sept. 25, 1534. (J. A. CT.)

CLEMENT VIII (Gil Sánchez Muñoz), antipope from 1423 to 1429, was the creature of Xfonso V of Aragon. After his abdication he became bishop of Majorca and died in 1446.

CLEMENT VIII (Ippolito Aldobrandini) (1536–1605). pope from 1592 to 1605. was born at Fano on Feb. 24. 1536. Cardinal in 1585, he was elected pope on Jan. 30, 1592. Clement. who was concerned principally with his spiritual functions, encouraged the labour of St. Francis de Sales and relied on St. Philip Neri. His absolution of Henri IV of France has been praised for freeing the papacy from Spanish domination and criticized as the replacement of one master by another. The dispute between the Dominicans and the Jesuits on grace and free will was given an airing in Rome from 1594 on. Clement died on March 5, 1605.

CLEMENT IX (Giulio Rospigliosi) (1600–1669). pope from 1667 to 1669. was born at Pistoia on Jan. 28. 1600. Cardinal and secretary of state under Alexander VII. he nas elected pope on June 20, 1667. The Gallican principles of Louis XIV troubled his pontificate. Clement's policy of appeasement of the Jansenists brought peace for a time. He died on Dec. 9, 1669.

CLEMENT X (Emilio Altieri) (1590–1676), pope from 1670 to 1676. was born in Rome on July 12. 1590. Cardinal in 1669, he was elected pope on April 29. 1670. In spite of his advanced age, Clement showed himself surprisingly firm in the face of French arrogance. He died on July 22, 1676.

CLEMENT XI (Giovanni Francesco Xlbani) (1649–1721), pope from 1700 to 1721, was born at Urbino on July 23. 1649 He was made cardinal in 1690 and elected pope on Nov. 23, 1700 He espoused the losing cause in the War of the Spanish Succession and was ignored in the peace of Utrecht (1713). Jansenism again convulsed France and Clement's measures proved unacceptable to some Catholics He condemned the Chinese rites in 1703 and made the feast of the Immaculate Conception of the Virgin Mary a holy day of obligation in 1708 He died on March 19, 1721.

CLEMENT XII (Lorenzo Corsini) (1652–1740), pope from 1730 to 1740 was born in Florence on April 7 1652. Cardinal in 1706, he was elected pope on July 12, 1730. Clement tried, despite ill health, to halt the decline in the influence of the papacy He defended the rights of the church threatened by the encroachments of the Catholic powers. He died on Feb. 6, 1740, having been totally blind since 1732.

CLEMENT XIII (Carlo della Torre Rezzonico) (1693–1769), pope from 1758 to 1769 was born at Venice on March 7. 1693. Made cardinal in 1737, he was elected pope on July 6. 1758. The question of the suppression of the Jesuits dominated his pontificate as it did that of his successor, Clement XIV. Clement XIII could not prevent their brutal suppression in Portugal, France, Spain, Naples and Parma He died on Feb 2. 1769.

CLEMENT XIV (Giovanni Vincenzo Antonio Ganganelli) (1705–1774), pope from 1769 to 1774. was born near Rimini on Oct. 31, 1705. He joined the Order of Friars Minor Conventuals in 1723, taking the name of Lorenzo Becorning cardinal in 1759. he was elected pope on May 18. 1769. Clement endeavoured to conciliate the Catholic poners by decreeing the suppression of the Jesuits (Aug. 16, 1773). He died on Sept. 22, 1774. (E. A R.)

(J. M. F. M.; J. J. Ry.; E. A. R.)

CLEMENT OF ALEXANDRIA (TITUS FLAVIUS CLEMENS) (*c.* 150–c. 215), Christian presbyter, whose writings mark an epoch in early Christian intellectual development, was born of pagan parents probably at Athens. He became an independent Christian teacher in Alexandria and died probably before 215, possibly in Asia Minor.

The pagan intelligentsia of the 2nd century. including such a person as Celsus, dismissed the Christians as vulgar upstarts who violently rejected the hallowed religious traditions of Greek and Roman society and wanted to set aside the noble literary heritage of the past in favour of the seemingly unimpressive and obscure Jewish writings which they called the Scriptures. Though Celsus admits that not all Christians of his time are so foolish. he consoles himself with the reflection that the educated minority are knaves who can reconcile their faith and their philosophy only by sophistry and forced exegesis of the Scriptures. Against this background Clement appears not as a Christian whose relation to education and culture is that of a disappointed lover but as one who is an accepted member of cultivated society and who surveys the world from within the Christian society as one who has found there the best that life has to offer.

The most important of his writings is a trilogy: "Exhortation to the Greeks" (*Protrepticus*), the "Tutor" (*Paedagogus*) and the "Miscellanies" (*Stromateis*). These are extant virtually complete; the first page of the *Stromateis* is lost. and Clement does not seem to have continued after the 7th book; the 8th, which may have been appended posthumously from his papers, consists of desultory notes. He also wrote an almost complete tract on the right use of wealth (*Quis* dives salvetur?); a short moral exhortation "To the Newly Baptized"; a collection of summary notes on the doctrines of the Valentinian Gnostic Theodotus (*Excerpta ex* Theodoto); some disconnected notes. partly exegetical, entitled "Prophetic Selections" (Eclogae *propheticae*); "Outlines" (*Adumbrationes* or Hypotyposes) briefly explaining Genesis. Exodus, Psalms. Ecclesiastes, the Pauline and Catholic Epistles (of the last, except for fragments, only an epitome of the section on the Catholic Epistles. purged of some risky opinions, is extant in a Latin version by Cassiodorus); fragments of works on the Easter season, against the Judaizers (dedicated to Alexander. bishop of Jerusalem) and on providence; and letters. Treatises on fasting, on malicious gossip and on the prophet Amos have been lost.

After passing through the lecture rooms of a number of Christian teachers. Clement found his ideal in Pantaenus of Alexandria, a philosophically minded Christian whom he praises above all for his fidelity to the apostolic tradition. This insistence on orthodoxy is significant. In 2nd-century Alexandria there were many adherents of Gnosticism, and the dividing line between orthodoxy and heresy was still in process of being drawn. Clement's writings are a contribution to the drawing of that line. He believes that his faith could be reconciled with reason and philosophy, and that he must refuse the choice between an obscurantist adherence to orthodoxy on the one hand and an intelligent but heretical reinterpretation of the faith on the other. As a Christian thinker he must steer a middle course between, on the one hand, Gnosticism, which freely interpreted. the apostolic tradition in a syncretistic hotchpotch of theosophical ideas. and. on the other, an anti-intellectual faith that regarded philosophy as the mother of all heresy. Clement is therefore both an apologist and a defender of the faith against heretical adulteration. He sets a high value upon the Hellenic literary and philosophical tradition· it is relative truth pointing forward to the revelation of God in Christ. Philosophy is to the Greeks what the Old Testament is to the Jews—a tutor to bring them to Christ. Hebrew history is therefore profoundly significant in the story of God's self-disclosure, but not unique or exclusive Providence is at work everywhere. educating all men to the right worship of God. Pagan cults, with their immoral myths and phallic crudities, Clement condemns as diabolical, making only the concession that God may have allowed the heathen to worship sun and moon to raise their eyes from earthly materialism. Sharply negative toward heathen religion, Clement is generously positive toward philosophy, especially toward Plato and the Stoics. Platonic metaphysics and Stoic ethics play a large part in his thought. All wisdom is one, all truth is of God. This positive evaluation of Greek philosophy derives either from the conventional argument of Hellenistic Judaism (Clement owed much to Philo and the Jewish Wisdom literature) that the Greek philosophers had plagiarized Moses or from the theological affirmation of an identity between the divine Logos and human reason.

Clement is especially sensitive to the accusation that Christianity is a revolutionary innovation, an abandonment of ancestral customs of immemorial antiquity. He therefore insists on the timeless character of the divine wisdom discerned alike by Hebrew sages and Greek philosophers. That truth is found everywhere is a consequence of God's implanting his image in all men at the Creation. The very miracle of the incarnation is a focus and climax of the divine immanence in all the world. Thus Christ is God and ideal Man, the divine Son is God in his immanent relation to the world, while the Father is transcendent and ineffable. The Son became flesh to help man to be free of sin and to give a pattern of moral and spiritual perfection. The ground of redemption is creation: nevertheless. the image of God does not eliminate the discontinuity between God and man which results from finitude and sinfulness. Salvation is therefore dependent on the divine initiative and grace. With this grace man must cooperate in reciprocal love. The ideal is "likeness to God as far as possible," and the summit is adoption into sonship, "deification" or sanctification, especially through the sacramental life of the church and the indwelling power of the Word himself in the sanctuary of the soul. The saint who attains this is "the true Gnostic." Clement's description of the true Gnostic (Sfromateis, bk. vii) deeply influenced later ascetical theology; and although he attacks Gnostic hostility to marriage and wine and holds that Christ condemned not wealth but the wrong use of wealth, his final recommendations for Christian practice are stern and rigid He must be reckoned one of the fathers of monastic spirituality.

Some of his most original thinking concerns the nature of faith discussed at length in *Stromateis,* bk. ii The problem mas imposed on him from more than one quarter. The pagan critic ridiculed faith as unreasoning prejudice. Gnostics disparaged the mere faith of ordinary church folk in comparison with that higher esoteric insight and innate mystical knowledge which they offered their adherents. Anti-intellectual Christians asserted the all-sufficiency of the act of faith and rejected all claims to provide a reasoned understanding of it Clement vindicates faith partly as a deliberately chosen hypothesis which is subsequently verified by experience. justified on the principle that a preliminary directing of the will is a precondition of all knowledge, and partly as obedient assent to Authority which, inasmuch as it is divine. is fully reasonable.

Though an independent teacher, he accepted the authority of the orthodox church tradition, and was eventually ordained presbyter. In the eyes of posterity, however, his will to be orthodox was not equaled by deed. His writings were criticized as tainted with the heresies associated with Origen. Some of his speculative passages and his belief in the purely remedial character of divine punishment explain the charge. Photius is particularly severe on the Hypotyposes. Clement does not seem to have been widely read in medieval times. Except for the *Adumbrationes* nothing was translated into Latin. The survival of the *Protrepticus* and *Paedagogus* is solely due to the interest of the Byzantine humanist

Arethas, archbishop of Caesarea in Cappadocia. whose beautiful copy. written by his scribe Baanes in 914, is now at Paris. Likewise the *Stromateis* depend on a single manuscript of the 11th century at Florence. In the west, however, he was long reckoned among the saints and commemorated on Dec. 4. On the advice of C. Baronius his name was deleted from the Roman martyrology issued in 1586 by Pope Sixtus V; the omission provoked protests but was defended by Benedict XIV in *Litterae apostolicae de nova martyrologii Romani editione* (1748) chiefly on the ground of Clement's uncertain orthodoxy.

CLEMENTI, MUZIO (1752–1832), Italian pianist and composer whose studies and sonatas developed the techniques of the early pianoforte. Born in Rome on Jan. 24, 1752, he was a youthful prodigy; he was appointed an organist at 9, and at 12 had composed an oratorio. In 1766 Peter Beckford. cousin of William Beckford, the author of *Vathek,* prevailed upon Clementi's father to allow him to take the boy to England, where he lived quietly in Wiltshire pursuing a rigid course of studies until 1773. when he went to London and met with immediate and lasting success as both composer and pianist. The pianoforte had become more popular in England than anywhere else, and Clementi, in studying its special features, made brilliant use of the new instrument and its capabilities. From 1777 to 1780 he was employed as harpsichordist at the Italian Opera in London. In 1780 he went on tour to Paris, Strasbourg. Munich and Vienna and in the last city became engaged in a friendly musical duel with Mozart at the instigation of the emperor, Joseph II.

In May 1782 Clementi returned to London, where for the next 20 years he continued his lucrative occupations of fashionable teacher, composer and performer. He took shares in the music publishing firm of Longman and Broderip and lost a good deal of money when they went bankrupt, but he was a shrewd businessman and in 1799 in partnership with Longman founded a firm for both music publishing and the manufacture of pianos that was very successful. Among his numerous pupils were J. B. Cramer. G. Meyerbeer and John Field. Clementi visited the continent again in 1820 and 1821. In his later years he devoted himself to composition, and to this period belonged several symphonies, the scores of which were either lost or incomplete. Two of them were reconstructed from sketches by Alfredo Casella (*q.v.*). During the later part of his life he had a country residence at Evesham in Worcestershire, where he died on March 10, 1832. He was buried in Westminster abbey.

Clementi's chief claims to fame are his long series of pianoforte sonatas, many of which are remarkably fine and unduly neglected, and his celebrated studies for piano, the *Gradus ad Parnassum* (1817). His own contributions to the development of pianoforte technique coincided with the period of the new instrument's first popularity and did much to establish the lines on which piano playing was to develop.

See G. C. Paribeni, M. *Clementi nella vita e nell'arte* (1922); *G.* de Saint-Foix, "Muzio Clementi" in *The Musical Quarterly* (1923).
(CS. CH.)

CLEMENTIA, the Roman personification of mercy and clemency. Her worship begins with her deification as the celebrated virtue of Julius Caesar. The senate in 44 B.C. decreed a temple to Caesar and Clementia in which the cult statue represented them clasping hands. The location of this temple. however, is unknown. Tiberius was honoured with an altar to his *clementia,* the clemency of Caligula received yearly sacrifices, and the Arval brothers record a-sacrifice in Nero's time. On coins she is typically a standing goddess with patera (a dish used in sacrifices) in one hand and sceptre in the other.

See G. Wissowa, *Religion und Kultus* (1912). (R. B. LD.)

CLEMENTINE LITERATURE, a title that covers a diversified group of writings that at various times were added to the one genuine epistle (for which, *see* CLEMENT) remaining from Clement. bishop of Rome toward the end of the 1st century These include (1) the so-called Second Epistle. a homily probably written at Rome about 140: (2) two "epistles" *On Virginity,* perhaps the work of Athanasius in the 4th century: (3) the *Homilies* and *Recognitions,* along with an introductory letter supposed to have been written by Clement to James; (4) the Apostolic Constitutions, also from the 4th century; and (5) five letters that are part of the forged Decretals (for the last two, *see* CONSTITUTIONS, APOSTOLIC; DECRETALS, FALSE).

Second Epistle of Clement.—11 Clement is not an epistle but a sermon; it lays emphasis on a high Christology and the importance of preserving the seal of baptism by maintaining the purity of the flesh for the resurrection. Its use of uncanonical writings and the silence of earlier writers caused it to be questioned by Eusebius (*c.* 315), the first writer who mentions it. as well as by Photius (*c.* 854), who criticizes it but regards it as genuine. In the interval it was occasionally cited by both Monophysite and orthodox authors. but it was never popular, even though in the Codex Alexandrinus of the Bible (5th century) and in the later Syrian church it was regarded as canonical.

On Virginity.—The two "epistles" (actually treatises) *On Virginity* are preserved in a Syriac manuscript of the year 1470 and one of them in Coptic fragments, though they were originally written in Greek; extracts from the original are preserved in the homilies of the Palestinian monk Xntiochus (*c.* 620). They are first mentioned by Epiphanius (*c.* 375) and were used in Egypt in the 4th and 5th centuries. Their basic purpose is to denounce the abuses of "spiritual marriage" and of the "kiss of peace," and violations of asceticism in general. The Coptic version ascribes them to Athanasius, and the time, if not the person, is surely correct.

Homilies and Recognitions.—The *Homilies* (preserved in the Greek original) and the *Recognitions* (translated into Latin by Rufinus and into Syriac by an anonymous translator, both about 400) contain a great deal of common material, though Rufinus evidently tried to remove unorthodox ideas from the *Recognitions.* The *Homilies* clearly reproduce more accurately peculiar Jewish-Christian notions about the perpetuity of the Mosaic Law, about the importance of daily baptisms and of abstinence from meat, and about Jesus as "the true prophet" (*cf.* Deut. xviii, 15) who showed his disciples how to detect interpolations in the Old Testament. There are also many Gnostic notes in the book, which has a framework based on Clement's travels with Peter and finally his recognition of his long-lost father, mother and brothers. Both *Homilies* and *Recognitions,* composed in the last quarter of the 4th century in an attempt to exalt the position of the oriental churches in relation to Rome, are based on an earlier work, the *Circuits of Peter,* attested by Epiphanius and probably mentioned by Eusebius and by Origen (early 3rd century). It is even possible that this source. or another prior to it and known as the *Preachings of Peter,* goes back into the 2nd century, for (1) Irenaeus (*c.* 180) mentions contendings of the apostles with Simon Magus, and they are reflected in our documents; and (2) the Gospel quotations in the *Homilies* and *Recognitions* sometimes seem to represent a stage in the transmission of the Gospels before the text reached its present. relatively fixed state. Some of the ideas set forth, especially in the *Homilies,* may well represent the thought of various kinds of Jewish Christianity as early as the 2nd century, though it is extremely doubtful that they reflect 1st-century conceptions, at least in what was to be the main stream of Christianity.

Influence.—In later times these Clementine documents were remarkably influential. The medieval story of Faust is based on the portrait of Simon Magus in the *Recognitions,* while the letter of Clement to James served as the starting point for the Pseudo-Isidorian *Decretals.* Another forged Clementine letter was used by Anabaptists to justify the community of women. And in the 19th century the Tübingen school of New Testament critics claimed that the *Homilies* and *Recognitions* represented the

Petrine thesis as against the Pauline antithesis; out of thesis and antithesis came the (Hegelian) Catholic synthesis. Unfortunately for this theory. it is based not on chronology but on philosophy. The importance of the Clementines lies in the light the *Homilies* cast on Jewish-Christian heresy in the early centuries of the church, while the *Recognitions* show how, in an expurgated form, such literature could provide entertainment along with edification. It may be that these documents mill still yield information about early stages of the New Testament text (the Gnostic Gospel of Thomas seems to be related to them), but it is unlikely that they reflect a truly primitive form of Christianity.

CLEOBIS AND BITON were two brothers of the city of Argos, noted for their strength. During an Argive festival honouring Hera, they took up the yoke of a wagon and themselves drew their mother to the temple. She begged the goddess to grant them, as a reward for their piety, whatever was best for men, whereupon they fell asleep and died (Herodotus).

The story was famous in antiquity and apparently had some historical foundation. Pausanias saw a relief of the brothers at Argos; Herodotus says that the Argives dedicated statues of the two at Delphi, where in fact they were found by French excavators in *1893.* The statues date from the early 6th century B.C.

(T. V. B.)

CLEOBULUS (? 6th century B.C.), Rhodian statesman, is listed by Plato as the fifth of the Seven Wise Men of ancient Greece. According to the "life" by Diogenes Laertius (i, *89–93),* he was the son of a certain Evagoras and became tyrant of Lindus in Rhodes, where he invited Solon (*q.v.*) to take refuge from Pisistratus. He is also said to have been strong and handsome and to have written *3.000* lines of verse, many of them riddles. Cleobuline, his daughter, also composed riddles in hexameters. Among the sayings attributed to him is: "Neither quarrel with your wife nor indulge her in the presence of others."

For lists of the sayings *see* F. W. Mullach (ed.), *Fragmenta philosophorum Graecorum,* vol. i, book 2 (1860); and Diels-Kranz, *Fragmente der Vorsokratiker,* vol. ii, 7th ed. (1954).

CLEOMENES, the name of three Spartan kings of the Agiad house.

CLEOMENES I (king after 520–*c. 490* B.C.), son of Anaxandridas, succeeded him not long after 520 B.C., in preference to his half-brother Dorieus. who then led a colony abroad and was killed in Sicily in 510. Early in his reign Cleomenes advised the expulsion from Sparta of Maeandrius of Samos, who wanted help against Persia. About *513* a Scythian proposal to attack Darius I, king of Persia. was also rejected. In *510* he led an army to Athens to expel the tyrant Hippias. In *507* he came again with a small force to support Isagoras against Cleisthenes, but he had to withdraw. He next collected a large Peloponnesian army against Athens. but at Eleusis the Corinthians mutinied and the other king. Demaratus, supported them. Later the Spartans proposed to their allies to reinstate Hippias at Athens, but the Corinthians defeated the project.

Herodotus' account suggests that Cleomenes' influence in the Peloponnese was very great from at least 507. and when Aristagoras of Miletus in 499 appealed for help for the Ionian revolt from Persia, the king's personal refusal was treated as decisive. Cleomenes' failure to dominate Athens may have damaged Spartan prestige, but this was restored in *494* when he inflicted a heavy defeat on Xrgos at Sepeia near Tiryns. In *491* he intervened at the request of the Athenians at Xegina, which had given tokens of submission to Darius, but Demaratus thwarted him. He got the latter deposed by bribing the Delphic oracle. but the bribery was discovered and he had to flee to Thessaly. Returning to Xrcadia he recruited an army there. and the Spartans reinstared him, but soon afterward he went mad and committed suicide.

A powerful ruler. he consolidated Sparta's leadership in Greece, later the kernel of resistance to Persia. His refusal to commit Spartan forces overseas may have been military calculation rather than indifference to the Persian danger. Because of his interference at Athens, Herodotus' informants were generally less than fair to him.

CLEOMENES II (king *370–309* B.C.), son of Cleombrotus, succeeded his brother Agesipolis II in *370.* His long reign was an eventful period, but no action of his is recorded.

CLEOMENES III (king *235–222* B.C.), son of Leonidas II. who married him young to Agiatis, widow of Agis IV. From *229* onward he was at war with the Achaean league (*q.v.*) under Aratus of Sicyon. Xratus declined battle at Pallantion in *228,* but was defeated in *227* at Lycaeum, though he contrived to seize Mantinea. Cleomenes now recalled from exile Agis' brother Archidamus V, but he was murdered soon after, possibly with Cleomenes' connivance. Later in the year he defeated the Achaeans at Ladoceia near Megalopolis, and conducted further operations in Arcadia.

Late in *227* he left the citizen troops in camp and hurried back to Sparta to enforce reform on the lines attempted earlier by Agis IV (*q.v.*). Four of the five ephors were executed and *80* citizens were exiled. Debts were canceled, land redivided to provide *4.000* new citizen holdings and the old Spartan training was restored. His brother Euclidas became king in Archidamus' place, the ephorate was abolished, the powers of the council were probably curtailed and he is said to have instituted the board of six elders called *patronomoi* which existed later. The army was trained in the use of a longer pike. *(See* SPARTA.*)*

In *226* he retook Mantinea and heavily defeated the Achaeans at Hecatombaeum near Dyme. The league began to disintegrate and Cleomenes hoped to become its leader, but negotiations broke down in *225.* He took Pellene. Phlius. Argos and other cities. and was invited to Corinth. Aratus now called in the Macedonian king Antigonus Doson. He failed to pierce Cleomenes' lines near Corinth in *224,* but trouble broke out at Argos from disappointment that Cleomenes had not carried out social revolution. He had to retire, and in spite of bold strokes like his surprise capture of Megalopolis, Antigonus finally defeated him in *222* at Sellasia north of Sparta. Sparta fell into Antigonus' hands, and Cleomenes fled to Ptolemy Euergetes in Egypt. Imprisoned by his successor Ptolemy Philopator, he broke out in *219* and. having failed to raise a revolt in Alexandria, took his own life.

Cleomenes' Spartan reform was designed to re-create a society of aristocrats, and neglected *perioeci* and helots; the hope of social revolution which it aroused elsewhere could not be fulfilled. and gained him only momentary support. But Sparta alone had not the resources to back his military ambition, for all his ability and force of character.

(A. As)

CLEON (d. *422* B.C.), the first prominent representative of the comineercial class in Athenian politics, was the son of Cleaenetus. from whom he inherited a tannery. He came to notice first as an opponent of Pericles (*q.v.*) during the Peloponnesian War, and as such found himself acting in concert with the aristocrats, who equally hated and feared Pericles. In *430,* when Athens was devastated by the plague, Cleon headed the opposition to the Periclean regime. Pericles was accused of maladministration of public money and was actually found guilty though he was re-elected *strategos* in *429.* The death of Pericles *(429)* left the field clear for Cleon. Hitherto he had only been a vigorous opposition speaker, a critic and accuser of state officials. He now came forward as the champion and leader of the democracy and was for some years undoubtedly the foremost man in Athens. He was gifted with natural eloquence and a powerful voice. and knew how to work upon the feelings of the people. He became the leader of the war party in opposition to Nicias and the moderates, who favoured a cautious strategy and an early peace. He probably advocated a vigorous offensive in the war and may have been responsible for the introduction of a capital

levy (*eisphora*) in 428, when the Athenian reserves were running low.

When Mytilene, which had revolted against Athens, fell in 427. Cleon proposed that all its citizens should be put to death, and the women and children enslaved. His policy was to hold down the empire, which, according to Thucydides, he regarded as a "tyranny," by naked force. His decree was passed, but rescinded next day. in time to save Mytilene.

In 425 when the Spartans were blockaded in Sphacteria, an island off the peninsula of Pylos, Cleon caused the Athenians to reject the terms offered by Sparta, in the hope of securing a peace which would restore Athens' land empire. He then reached the summit of his fame by capturing the Spartans on the island. Much of the credit for this success, the most notable which the Athenians won during the Archidamian War, was due to the military skill of his colleague Demosthenes; but it was due to Cleon's determination that the *ecclesia* (assembly) sent out the additional force that was needed. About this time Cleon doubled the tribute payable by the allies and raised the pay of the Athenian jurors from two to three obols. He attempted, unsuccessfully, to bring over Argos to the Athenian side and was elected *strategos* in 424. The Athenian failures in Megara and Boeotia were not Cleon's fault. but they strengthened the peace party and in 423 a year's armistice was agreed. In 422. after the close of the armistice, Cleon, who was eager to continue the war, went to recover Thrace from Brasidas, but, after capturing several cities, was taken by surprise at Amphipolis, defeated and killed. With his death, the peace party at Athens gained power, and the peace of Nicias was concluded. *(See* PELOPONNESIAN WAR.)

Cleon is represented by Aristophanes and Thucydides in an extremely unfavourable light, but neither can be considered an unprejudiced witness. Aristophanes was opposed to Cleon's political program and also bore him a personal grudge, having been prosecuted by him after the production of his *Babylonians*. Thucydides had been exiled after the loss of Amphipolis and Cleon may have been responsible.

CLEOPATRA, the name of the sister of Alexander the Great of Macedonia; of a daughter of the Seleucid king Antiochus III who was married to Ptolemy V, king of Egypt, in 193 B.C.; and, after that time, the name of several queens and princesses of the Ptolemaic dynasty *(see* PTOLEMIES).

CLEOPATRA VII (69–30 B.C.), by far the most famous bearer of the name. was the daughter of Ptolemy XII Auletes and became queen on his death (51 B.C.), ruling successively with her two brothers Ptolemy XIII (51–47) and Ptolemy XIV (47–44) and her son Ptolemy XV Caesar (44–30), until her death in 30 B.C. During this period she participated in the struggles that attended the replacement of republican by autocratic government at Rome. not so much by reason of the resources of her kingdom, though these were considerable, as through her personal attachment to, and influence over, two of the chief Roman statesmen of the time —Julius Caesar and Mark Antony *(see* CAESAR, GAIUS JULIUS; ANTONIUS).

Born in 69. Cleopatra was of Greek and Macedonian stock in roughly equal proportions, with a very small admixture of Iranian blood. Although not beautiful. she had in full measure the gift of exciting men's senses. She was highly educated, with a knowledge of several languages (including Egyptian, which none of her ancestors had studied). To the native Egyptians she showed herself sympathetic, and, whether from policy or conviction, she identified herself with many of their religious beliefs and rituals. She was without scruples, yet in those whom she chose as friends she inspired devotion. Possessing great energy, courage, charm and intelligence, she gave first place in her life to the realization of two ambitions: to consolidate her dynastic heritage in Egypt and to share in the central power at Rome. The second of these ambitions was impossibly daring in a foreign woman; but it is a convincing proof of her greatness that her Roman enemies came eventually to fear as well as hate her.

Three years after succeeding her father Cleopatra became involved in a conflict with her brother consort and his guardians. At that point Julius Caesar, who was then engaged upon securing the eastern Roman provinces in his war against the followers of Gnaeus Pompeius. arrived in Alexandria. With good judgment Cleopatra threw in her lot with him, becoming his mistress. In the so-called Alexandrine War (winter 48–47) he crushed her enemies and eliminated her brother the king. Early in 47 he departed. From the autumn of 46 Cleopatra resided at Rome in a villa set aside for her by Caesar. The full significance of her presence at Rome cannot be determined. Either in 47 or 44 she bore a son whom she claimed to be Caesar's child and who was given the name Ptolemy Caesar (Caesarion or "little Caesar" was his Alexandrian nickname); but the available evidence is insufficient to confirm the truth of this claim. however probable it may appear in some ways. Caesar continued to show Cleopatra much favour. and. according to one view ,of his ultimate aims, it is conceivable that marriage to her and adoption of his child by her was envisaged by Caesar as part of a design of becoming a divine ruler of the Hellenistic type, and that Cleopatra encouraged him in these thoughts.

Upon the murder of Caesar (March 44) Cleopatra returned to Egypt. In 41 the triumvir Mark Antony summoned her to Tarsus in Cilicia to give an account of her actions in the recent war between the Caesarians and the forces of Brutus and Cassius. By a lavish display of wealth she ensnared Antony and made him her lover. They spent the winter of that year in Alexandria in the pursuit of pleasure. At that time no important political advantage accrued to Cleopatra from the liaison. After Antony's departure she gave birth to twins, Alexander Helios and Cleopatra Selene. Not until 37 was she reunited with Antony (at Antioch in Syria) and thereby given a fresh opportunity of intervening in world affairs. Their reunion was a spontaneous act on his part, and, although in character and resolution she was the stronger partner. she remained entirely dependent upon his good will. It is true that she disposed of a substantial asset in the royal treasure which she had inherited, but this meant nothing apart from her personal hold over Antony. The lovers now married (and were recognized in the east as legal partners in spite of Antony's Roman marriage to Octavia). and Antony acknowledged as his the twins born in 40, giving them the symbolic names mentioned above. Moreover, he bestowed upon Cleopatra large gifts of territory in Judaea. Arabia, Phoenicia, Cilicia and Crete, besides restoring to Egypt Cyrene (bequeathed to Rome 96 B.C.) and Cyprus (annexed in 58). Later, in 34. at a ceremony in Alexandria he proclaimed the setting up of an eastern empire in which Cleopatra's children should be the rulers of various territories, with the queen herself supreme above them all as "queen of kings" (the so-called donations of Alexandria).

When in 33 Antony, at her prompting, at last began to prepare for the inevitable war with Octavian *(see* AUGUSTUS), Cleopatra accompanied him at his successive headquarters. Her material contributions to the campaign were important, but her presence in camp increased the effectiveness among Antony's followers of the enemy propaganda which had made her its chief target. Together she and Antony escaped in Sept. 31 from the lost battle of Actium (*q.v.*). When Octavian finally occupied Alexandria in August of the next year, they committed suicide, Antony first, Cleopatra a few days later. Shortly before her death she had met Octavian privately, probably with the object of securing the safety of her children rather than in any hope of being permitted to continue as a client-queen. She deliberately chose death by snake-bite for the sake of the significance which such a death would have in the eyes of her Egyptian subjects because of the ancient belief that the snake was the minister of Amon-Ra, the sun-god of the country's religion.

CLEOPATRA'S NEEDLES, the name popularly given to the two Egyptian obelisks presented to the British and American people respectively, and now standing on the Thames Embankment in London and in Central Park in New York city. Originally set up by Thutmose III at Heliopolis about 1500 B C., they were removed by Caesar Augustus to adorn the Caesareum at Alexandria about 14 B.C. and there remained until removed (in each case by private munificence) to their present positions in 1878 and 1880. Both are of rose-red Syene granite. covered with hieroglyphical inscriptions, and are estimated to weigh some 200 tons. *See* OBELISK.

CLEOPHON (d. 404 B.C.), Athenian statesman, an opponent of the oligarchs and of the peace party in the later phases of the Peloponnesian War, was the son of Cleippides (recorded as *strategos* in 428 B.C.). He inherited the radical policies and the following of Cleon (*q.v.*) and Hyperbolus. His power, like Cleon's. rested on his control of the *ecclesia* (assembly) and on his activity in the courts. He was violent in his style of oratory. but probably patriotic and honest. Like Hyperbolus, he was a bitter enemy of Alcibiades (*q.v.*), and in Thucydides' view the feud between the radical leaders and Alcibiades was the main cause of Athens' defeat in the Peloponnesian War. Cleophon came to power on the collapse of the oligarchic reaction in 410 and was one of the dominant figures in Athenian politics until the end of the war. He led the people to reject Spartan peace offers after the Athenian victory at Cyzicus (410) and again after Arginusae (406), as Cleon had rejected similar peace offers in 425. He encouraged the prosecution of members of the oligarchy of 411 and, by the distribution of poor relief, helped to sustain morale among the common people at a time when the Spartan control of most of Attica caused serious destitution in the city. Even after the decisive defeat of the Athenians at Aegospotami, when the Spartans were blockading Athens, Cleophon continued to urge resistance, but as the situation became desperate the oligarchs gained control of the *boule,* and Cleophon was arrested and condemned to death in 404. (R. ME.)

CLEPSYDRA, a chronometer that measures time by the gradual flow of water. Simple water clocks were used in Egypt and examples from *c.* 1400 B.C. survive. These were bucket-shaped vessels from which water was allowed to escape by a small hole at the base. Uniform scales of time, one for each month to allow for the different seasonal lengths of Egyptian hours, were marked on the inside. By the end of the first hour water filled to the brim would have fallen to the first mark of the scale of the month in question. The difficulty of regulating the pressure of outflow of these clocks, only partly achieved by the sloping sides of the vessel, and the differential viscosity of water according to temperature, rendered them inaccurate.

From Egypt, water clocks were introduced into the classical world and called *clepsydrae* (Gr. *kleptein,* "to steal," *hydor,* "water"). By adjusting the outflow Greeks and Romans were able to make such clocks record regular temporal hours. The Roman clepsydra took the form of a cylinder into which water dripped from a reservoir. Readings were taken against a scale with a float in the cylinder. With a full reservoir irregularity of flow was minimized. Vitruvius describes a water clock with a wheel and ratchet mechanism. A shaft attached to the float had teeth that engaged a cog wheel fixed to a pointer moving over a dial. Such dial clocks were perfected by the Chinese and Arabs and used in Europe until the 16th century.

CLÉRAMBAULT, LOUIS NICHOLAS (1676–1749). French composer and organist whose secular cantatas. his most important works, show both grace and feeling. was born in Paris. Dec. 19. 1676. He was organist at several Paris churches. and at St. Cyr; he also held the post of *surintendant* de *la musique* to Mme de Maintenon, and, perhaps through her and his position at St. Cyr. wrote the music for the wedding of the Dauphin with the Infanta of Spain in 1745.

His church music includes a large *Te Deum,* and he also composed a book of organ music and one of pieces for the harpsichord. His cantatas mere published in five volumes (1710 ff.). The recitatives are in French style but the arias are fluent and strong, in the prevailing Italian tradition. In *Orphée, Héro et Lkandre* and *Pigmalion,* which are characterized by refinement of workmanship, the instrumental introductions or *simphonies* show a mastery of the concerto style. One of his best works is Le *soleil vainqueur des nuages,* a thanksgiving for Louis XV's recovery from illness (1721). Clérambault died in Paris. Oct. 26, 1749. (B. P.)

CLERESTORY (CLERESTOREY or CLEARSTORY), in architecture, any wall of a room carried higher than the surrounding roofs so that windows can be pierced in it to light the room. In a large building, where interior walls are far from the outside of the

G E KIDDER SMITH

CLERESTORIES LIGHTING THE INTERIOR OF ST. PAUL S OUTSIDE THE WALLS, ROME. REBUILT IN 1823

building, some such method of lighting the central part becomes necessary, and the use of the clerestory appeared as early, at least, as the 19th dynasty in Egypt, under which the great hypostyle hall of the temple at Karnak was built. This had a central range of columns, higher than those on either side, to allow clerestories to be built of pierced stone slabs. In Roman architecture many great halls were thus lighted, usually groined vaults over the central hall allowed large semicircular windows to be built above the side roofs; *e.g.,* Sta. Maria degli Angeli (the tepidarium of the Baths of Diocletian) and the basilica of Constantine, both at Rome. Similarly the walls under the side arches of Hagia Sophia at Istanbul are clerestory walls. It was however in the Romanesque and Gothic churches of the middle ages that the clerestory idea received its most adequate expression. *See* GOTHIC ARCHITECTURE.

CLERFAYT (CLAIRFAIT) **CHARLES JOSEPH DE CROIX,** GRAF VON (1733–1798) Austrian field marshal, was born at Bruille in Hainaut on Oct 14. 1733. He entered the Austrian army in 1753, distinguished himself during the Seven Years' War (1756–63) and also took part in the Turkish War of 1787. In 1792 he was given command of the Austrian contingent in the duke of Brunsnick's army His corps was conspicuously successful at Croix-sous-Bois and inflicted a heavy defeat on the French.

In the Netherlands in 1793 he had initial successes at Aldenhoven and at the siege of Maestricht and a decisive victory at Neerwinden (March 18 1793) After that his fortunes changed: he was defeated at Wattignies and his campaign in West Flanders in the folloning year was also unsuccessful. Clerfayt succeeded the duke of Saxe-Coburg as commander in chief. but his troops were outclassed by the French and withdrew east of the Rhine.

By 1795 he had become a field marshal and was commanding on the middle Rhine against Jourdan, whom he defeated at Höchst (Oct. 11. 1795) and Mainz The armistice terms which he concluded were badly received in Vienna and he resigned. thereupon

he became a member of the Aulic council. He died in Vienna on July 19, 1798. (C. N. B.)

CLERGY, a term used to describe clerks (Lat. *clerici*) in holy orders. In the Roman Catholic Church the term "clergy" includes all orders from the episcopate down to the minor orders; more freely, it includes also members of religious orders. In the Church of England "clergy" strictly speaking includes all orders but modern definition tends to separate by distinguishing offices; *i.e.,* bishop, dean, archdeacon (*qq.v.*). This usage, which is anomalous, has probably arisen from the increasing disuse of the term "inferior clergy" for all orders below the dignity of bishop. By 20th-century usage the term "clergy" is used to describe ordained ministers of all Christian churches.

The 2nd century of the Christian church witnessed the emergence of a distinction between clergy and laity (Gr. *laos,* "people"). This distinction received form and recognition by the privileges and immunities granted to the clergy by Constantine I, which were later extended and codified in the 16th book of the Theodosian code. In certain circumstances the clergy were exempted from the jurisdiction of civil courts. In the first regularly constituted English parliament in 1295 the clergy formed a part together with the baronage and commonalty. The arrogation of power by the clergy from the 13th century down to the Reformation mas based upon the claim of Pope Innocent III that the clergy as rulers over spiritual things were as much superior to temporal rulers as the soul over the body. Progressive legislation has removed the privileges and immunities of the clergy, but vestiges of these may still be seen, as in England in their exemption from jury service and from candidature for election to the house of commons. *See* HOLY ORDERS; MINISTRY. CHRISTIAX; *see* also references under "Clergy" in the Index volume. (J. W. L.)

CLERGY, BENEFIT OF, often called "clergy," was once a useful device for substituting a lesser punishment than death in English and American criminal law. In England, in the late 12th century, the church succeeded in compelling King Henry II and the royal courts to grant to every *clericus* accused of a capital offense immunity from trial or punishment in those courts. On producing letters of ordination the accused *clericus* was turned over to the local bishop for trial in the bishop's court, which never inflicted the death penalty and frequently acquitted the *clericus.* In the 14th century the royal judges gradually turned this clerical immunity into a discretionary device for mitigating the harsh criminal law by holding that a layman, convicted of a capital offense, might be deemed a *clericus* and obtain clerical immunity if he passed a reading test. For this purpose verse 1 of Psalm li came to be frequently used and was known as the "neck verse." Later it was held that a layman could claim his "clergy" only once. and in 1490 parliament enacted a law that all such laymen should be branded on the thumb for identification.

The practice of handing convicted clerics or laymen over to the bishop mas abolished in 1576 and imprisonment for one year substituted instead. In 1692 the layman's "clergy" was extended to women and in 1707 to all persons whether they could read or not. From the 16th century on. however, a long series of statutes made certain crimes punishable by death "without benefit of clergy." Its importance was further diminished by the 18th-century practice of transporting persons convicted of capital crimes to the colonies: whether they were entitled to "clergy" or not. and in 1827 it was abolished. Benefit of clergy was adopted in most of the American colonies by judicial practice. Though generally abolished soon after the American Revolution, it persisted in the Carolinas until the mid-19th century.

See F. Pollock and F. W. Maitland, *History of English* **Law,** 2nd ed., vol. i, pp. 424–440 (1898); G. W. Dalzell, Benefit of Clergy *in America (19.55).* (Mo. H.)

CLERGY RESERVES. By the act of 1791, establishing the provinces of Upper and Lower Canada, the British government set apart one-eighth of all the crown lands in Canada for the support of "a Protestant clergy." These reservations, after being for many years a stumbling block to the economic development of the province and the cause of much bitter political and ecclesiastical controversy, were secularized by the Canadian parliament in 1854 and the proceeds applied to other purposes, chiefly educational. Because of the wording of the imperial act, the amount set apart is often stated as one-seventh, and was sometimes claimed as such by the clergy.

CLERIHEW, a form of brief biography invented by Edmund Clerihew Bentley (1875–1956) and introduced in his *Biography for Beginners* (1905). It is written as a four-line verse of two rhyming couplets, the first line almost invariably ending with the name of the subject, as in the following from Bentley's first collection:

> After dinner, Erasmus
> Told Colet not to be "blas'mous"
> Which Colet, with some heat
> Requested him to repeat.

The number of accents in the line is irregular. and one line is usually extended to tease the ear, as in the last of these anonymous lines on two famous Victorian murderers:

> It is unfair
> To be too hard on Hare.
> Early anatomical work
> Owes much to men like him and Burke.

Another requisite of the successful clerihew is an awkward rhyme, as in Bentley's "Aeschylus":

> "Steady the Greeks!" shouted Aeschylus.
> "We won't let such dogs as these kill us!"
> Nothing, he thought, could be bizarrer than
> The Persians winning at Marathon.

Some of the best clerihews were written during the 1920s by Sir Francis Meynell, Edmond Kapp and the ever-active Anon. (Jo. M. C.)

CLERK, SIR DUGALD (1854–1932), Scottish engineer. pioneer in the development of internal-combustion engines whose researches on the explosive pressure and specific heat of gases advanced the science of thermodynamics and brought him international fame. was born in Glasgow on March 31, 1854. and studied science at Andersonian college, Glasgow, and Yorkshire college, Leeds. Having built his first gas engine in 1876, he concentrated for 12 years on research on gas engines. In 1881 he patented and exhibited his two-stroke gas engine working with compression on the Clerk cycle. with an explosion once in every two strokes of the piston in contrast to the Otto four-stroke cycle (*see* INTERNAL-COMBUSTION ENGINE). In 1888 Clerk and Sir G. C. (later Lord) Marks became life partners as consulting engineers and patent agents. Clerk, a director of the National Gas Engine company. was appointed director of engineering research at the admiralty in 1916 and knighted in 1917. He mas elected a fellow of the Royal society in 1908. His researches were published in his scientific papers and in his book *The Gas, Petrol, and* **Oil** *Engine* (new ed., vol. i. 1909; vol. ii. 1913). He was elected president of the Institution of Civil Engineers in 1932, but died at Ewhurst. Surrey, on Nov. 12 of that year. (AR. S.)

CLERKENWELL, the western part of the metropolitan borough of Finsbury (*q.v.*), London. Eng., consisted formerly of the parishes of St. James and St. John, which grew up about the ancient nunnery of St. Mary and the priory of St. John of Jerusalem, both founded in the 12th century by Jordan de Briset. The name Clerkenwell is derived from the "clerks' well" which adjoined the nunnery. and there the parish clerks of London used to meet to perform miracle plays. The well was lost for many years until rediscovered in Farringdon road in 1924. The church of St. James. Clerkenwell Green. built in 1792, replaced the old nunnery church. The priory was the headquarters in England of the Knights of the Order of the Hospital of St. John of Jerusalem from the 1140s until 1559. Prior Docwra's gatehouse (1504). after being put to many uses! has since 1874 been associated with this order. The 18th-century parish church of St. John was conveyed to the order in 1930. It mas bombed in 1941. only the 12th-century crypt remaining. but it was rebuilt and in 1958 it was rededicated. Clerkenwell has been famous for clock- and watchmaking from the 18th crntury, and although the actual manufacture has almost disappeared. it is the centre of the repairing trade. It is also known

as a quarter for jewelers and opticians. (M. McD.)

CLERKS REGULAR, in the Roman Catholic Church. are bodies of men who live in community under religious vows but engage actively in pastoral work. Best known of the clerks regular are the members of the Society of Jesus (*q.v.*); others are the Theatines. Barnabites. Caracciolines. Piarists, Somaschi. Clerks Regular of the Mother of God and Ministers of the Sick. *See* also ORDERS AND CONGREGATIONS, RELIGIOUS.

CLERMONT (CLERMONT-EN-BEAUVAISIS), a small town of northern France on the Brèche river, in the *département* of Oise. Pop. (1954) 4.583'.

Probably founded as a military post during the Norman invasions. Clermont became the seat of a countship, the lords of which were already powerful in the 11th century. Raoul de Clermont, who rose to be constable of France. died at Acre in Palestine in 1191. His daughter Catherine brought Clermont to her husband, Louis I, count of Blois and Chartres, but their son Thibaut VI of Blois died childless in 1218. Philip II Augustus of France then obtained Clermont from Thibaut's collateral heirs and gave it to his son Philip Hurepel, from whom it passed to his daughter Jeanne (d. 1251). Louis IX of France recovered it for the crown in 123'8, then gave it in 1269 to his son Robert? ancestor of the royal house of Bourbon (*q.v.*). Thus the eldest son and heir of the ducs de Bourbon was styled comte de Clermont until the end of the senior male line. During the Hundred Years' War the town was several times taken and retaken by the English and the French before the French finally recovered it in 1451.

After the treason of the constable Charles, duc de Bourbon, in 1523, Francis I of France confiscated the countship. Granted to the queen mother Louise of Savoy in 1527, to Charles, duc d'Orléans. in 1540 and to Catherine de Médicis in 1562, it was pledged in 1569 to Eric, duke of Brunswick-Calenberg, in payment for supplying mercenaries. His widow transferred it in 1599 to her brother, Charles III of Lorraine, whose third son, François, comte de Vaudémont, sold it in 1610 to Henry II de Bourbon, prince de Condé. Condé ceded the domain in 1615 to his aunt Anne de Montafié, comtesse de Soissons, whose grandson Emmanuel Philibert Amédée, prince de Carignan, sold it in 1702 to Françoise de Brancas, princesse d'Harcourt (d. 1715). The title, however, was meanwhile still used occasionally to designate younger sons of the house of Condé, and the duc de Bourbon, Louis Henri de Condé, bought the domain back in 1719. The property was confiscated from the house of Condé in 1792. Under the Restoration, the countship passed with the rest of the Condé inheritance to Henri d'Orléans, duc d'Aumale, son of Louis Philippe. Henri d'Orléans, eldest son of Henri, comte de Paris, was given the title comte de Clermont on his marriage in 1957.

CLERMQNT-FERRAND, an industrial city of south central France. capital of the *département* of Puy-de-Dôme (*q v.*), was formed in 1731 by the union of Clermont and Montferrand. It is situated on the small Tiretaine river, 181 km. (112 mi) W. of Lyons Pop (1954) 133,391. Hills surround it to the north, nest and south, and beyond are mountains, with the Puy de Dôme dominating. Boulevards encircle the old part of Clermont. where the buildings are commonly of dark volcanic rock from nearby quarries. The 13th-century Gothic cathedral, built of the same dark stone, stands on the summit of a small hill on the site of an earlier church. The church of Notre Dame du Port (12th century) is a fine example of Auvergnat Romanesque, with its four radiating chapels and its transept surmounted by an octagonal tower. There are many houses from the 16th, 17th and 18th centuries. The Amboise fountain dates from the Renaissance, and the nearby Lecoq garden, laid out in the 19th century, is one of the finest in France. The buildings of the university (faculties of letters, medicine, pharmacy and law) adjoin the garden. The city also has colleges of music and drama and of fine arts, a library, and three museums (natural history, arts and local history and regional ethnography). Montferrand has Gothic and Renaissance houses, in excellent state of preservation Royat, 5 km (3 mi) W of the city centre is famous as a spa Clermont-Ferrand is on the main railway line from Paris and Nevers to Nîmes and the south coast of France. From the nearby Aulnat airport air service is available to Algiers. Paris and Nîmes. The chief industries of Clerinont-Ferrand are the manufacture of rubber tires and other heavy rubber equipment. Metalwork. chemical and pharmaceutical goods and clothing also are made, preserved fruit, apples and cheese are marketed. The town also is the centre of the Auvergne tourist trade.

Clermont, the Augustonemetum of the Romans, replaced Gergovia as the centre of the Auvergne after the Roman conquest of Gaul. It was evangelized about the 3rd or 4th century by St Austremonius (Stremoine), the "apostle of Auvergne" and first bishop of Clermont. The town was devastated in turn by the Visigoths and Normans. Its bishopric and tno large monasteries gave it great ecclesiastical importance during the middle ages, and several councils took place there. At one of them. in 1095, the first crusade was inaugurated. Struggles with Riom and Montferrand to obtain the supremacy of the province were the chief events in Clermont's history in the 12th and 13th centuries; the Hundred Years' War and religious wars did not affect the city. It became capital of the duchy of Auvergne in the 16th century. and was the birthplace of Blaise Pascal (1623). Clermont was developed in the 18th century nhen the boulevards and squares were built. In 1731 Clermont was united with Montferrand, taking its present name. The Revolution hardly touched the town. and it was not until the 19th century that it grew into a large manufacturing centre. In World War II it was occupied by the Germans from Nov. 1942 to Aug. 1944. *See* also AUVERGNE.

(A. Mo.)

CLERMONT-GANNEAU, CHARLES (1846–1923), French archaeologist with unusual knowledge of the languages of ancient western Asia and close firsthand acquaintance with the middle east, who contributed much to biblical studies. He was born at Paris on Feb. 19, 1846. and after studying oriental languages entered the diplomatic service. While holding various posts in the near east he carried on archaeological research. As early as 1869 he recovered at Dibon (modern Dhiban, Jordan) the celebrated Moabite stele of King Mesha (9th century B C.), bearing directly on the Old Testament; and in 1873–74 he identified the site of the ancient town of Gezer, Judaea, a great event in biblical research. From 1880 he directed expeditions to Syria (1881), to the Red sea (1886), to Cyrenaica and Crete (1895) and to the island of Elephantine (Aswan Jazirat), Egypt (1906–08).

In 1885 Clermont-Ganneau became a member of the Académie des Inscriptions et Belles Lettres and in 1890 professor of archaeology and oriental epigraphy at the Collkge de France. He improved the translations of important Phoenician, Aramaic, Nabataean, Neo-Punic and Palmyrene texts. He also exposed various archaeological forgeries, among them the collection of "Moabite" pottery in the Berlin museums (1874), the "biblical manuscript" acquired by the British museum (1883) and the golden "tiara or King Saitapharnks" in the Louvre, Paris (1903). Clermont-Ganneau died at Paris on Feb. 15, 1923.

His chief publications were *Etudes d'archtologie orientale,* two volumes (1880–97), *Recueil d'archéologie orientale,* eight volumes (1885–1924). *Les Fraudes archéologiques en Palestine* (1885).

For a more complete bibliography, *see* R. Dussaud, "Les Travaux et les découvertes archéol. de C. C.-G.," *Syria,* vol. iv, pp. 140–173 (1923).

(J. P.)

CLERUCHY, the name given in the ancient Greek world to a body of citizens holding allotments of land in a dependent country. The earliest example of a cleruchy was in Salamis where Megara and Athens in .turn planted their citizens on Salaminian land in the 6th century B.C. A fragmentary inscription gives the conditions under which the Athenian citizens held such allotments: the cleruch was forbidden to lease the allotment which he owned in perpetuity; provision was made for him to act as a soldier, and disputes with the native Salaminians were regulated by a resident Athenian official. A cleruchy of 4,000 Athenian citizens was planted on the best land of Chalcis in Euboea about 505 B.C.

When the Confederacy of Delos and the Second Athenian Confederacy were established in the 5th and 4th centuries B.C., the cleruchy became a regular weapon of Athenian imperialism. The cleruchs retained full Athenian citizenship—voting, paying taxes and serving in the forces—and governed their internal affairs with magistrates and assembly on the Athenian model. They were thus extensions of the Athenian state, separate in prestige and privilege from the native peoples among whom they were placed.

The object of each cleruchy was to cripple the dependent state, which lost its best territory, and to garrison it for the future. The network of cleruchies which the Athenians planted had an important strategic value, for they were placed on main lines of communication, for instance on the islands of Andros. Naxos and Samos and at Sestos on the Hellespont and they provided permanent bases for the Athenian fleets which policed the empire. At the same time the financial advantage of being a cleruch encouraged thousands of Athenian citizens to settle overseas; the pressure of population in Athens was thereby relieved, and the financial and military strength of the state increased. The dependent "allies" of Athens detested the system of cleruchies which ended all hope of co-operation in an equal alliance, and the vested interest of Athenian democrats in the cleruchies made the Athenians cling desperately to their imperial possessions.

BIBLIOGRAPHY.—H. Nesselhauf in *Klio,* Beiheft 30 (1933); F. H. Marshall, *The Second Athenian Confederacy* (1905); A. W. Gomme, *A Historical Conznzentary on Thucydides,* vol. i, pp. 346 and 373 where further references are given (1945). (N. G. L. H.)

CLETHRA, a genus of shrubs or small trees, commonly known as white alder, belonging to the Clethraceae or pepper-bush family and found largely in the tropics and subtropics of the eastern hemisphere with some occurring in Asia and Madeira. They have alternate; simple. toothed. persistent or deciduous leaves and fragrant white or pinkish flowers in terminal racemes or panicles in summer. They are allied to the heath family and grow best in lime-free soils.

C. alnifolia, the sweet pepper bush, is found from Maine to Florida. C. *acuminata* from Virginia to Alabama and C. *tomentosa* from North Carolina to Florida. (J. M. BL.)

CLETUS, SAINT: see ANACLETUS, SAINT.

CLEVE (CLEEF). **JOOS VAN** (JOOS VAN DER BEKE) (*c.* 1480–1540), Flemish religious and portrait painter, is now commonly accepted as the painter of the pictures formerly grouped under the name of the "Master of the Death of the Virgin," and it is suggested that he was the pupil of Jan Joest van Calcar. The earliest work ascribed to Joos. the two wings with Adam and Eve, dated 1507, in the Louvre, shows marked affinities with Calcar's style. Joos is first mentioned in 1511, when he entered the Antwerp guild as a master painter. He soon received commissions from Cologne. The date 1515 is on one of the two well-known triptychs which he painted for the Hackeney family of Cologne, representing the "Death of the Virgin" on the central panel and the portraits of the male and female members of the family grouped on the wings. The larger picture is in the Munich Pinakothek, and the smaller is in the Cologne museum. These two pictures, which gave the artist the provisional name of "the Master of the Death of the Virgin," brought the Flemish tradition to Cologne, and exercised a far-reaching influence on the local school. Another picture painted for Cologne is the "Pietà" at Frankfurt (1524), for the church of St. Maria in Lyskirchen.

In 1520 Joos was appointed dean of his guild in Antwerp. In that year Albrecht Diirer visited the city, and Joos must have admired his work for he copied the German master's "St. Jerome." It seems to have been his custom to copy other masters. The "Madonna and Child" (New York) recalls Jan Van Eyck; "The Deposition" (Philadelphia) is founded on Rogier van der Weyden; the Saviour in the Louvre on Quentin Massys; the "Two Children Embracing," of which there are many replicas, on Leonardo da Vinci. He must have felt drawn to the great Italian by his delight in delicate modeling, and he may have seen some of Leonardo's work in France; it is known on the authority of Francesco Guicciardini that when Francis I of France sent to Flanders for a good portrait painter. Joos van Cleve was chosen among others; he was rightly described as a good colourist. The originals of the portraits which he painted of the king and of his wife. Eleanor of Austria, are apparently no longer extant, but it is thought that the portraits of the king at Hampton court and at Philadelphia, and of the queen at the Vienna museum. are replicas of his work, if not the originals. An attractive portrait by his hand. of Henry VIII when young, at Hampton court. suggests that the artist visited England. He also painted the emperor Maximilian (Paris). In the Louvre is a large altarpiece with a "Pietà" in the central panel. a "St. Francis" in the lunette and a "Last Supper" on the predella. which came from a church in Genoa. The "Last Supper" is founded on the famous fresco of Leonardo da Vinci at Milan. Three more altarpieces were painted by Joos for Genoa; one of these is still in the church of San Donato; another is the triptych of the "Crucifixion" in the Metropolitan museum, New York; the third is the larger of two versions of the "Adoration of the Magi," by the master, at Dresden. Thus he probably visited Italy some time after 1530. He died at Antwerp in 1540.

The following may also be noted: "The Crucifixion" (Boston); "The Crucifixion" in the Naples museum; "The Holy Family" (Chicago); and "The Annunciation" (New York). At his best when painting the Virgin and Child, Joos's fame rests on "The Madonna" at Ince hall and on "The Madonna" at the Vienna museum. The heads are delicately modeled, with pretty complexions and sweet expressions. Characteristic of his work are the accessories he introduced in the foreground, such as a bowl of fruit, a knife. a lily in a glass. an open manuscript carefully finished—as in "The Madonna" (Cambridge) and one in Paris, and as in the "Virgin and Child and St. Anne" at Modena. The landscape backgrounds often recall the style of Joachim Patinir, who settled at Antwerp in 1515. The landscape in "St. John at Patmos" (New York) seems certainly to be by Patinir. Joos van Cleve is sometimes called "the Elder" to distinguish him from his son, Cornelis van Cleve (1520–67), a distinguished portrait painter commonly known as Sotte Cleve because he lost his reason.

CLEVELAND, BARBARA VILLIERS, DUCHESS OF (1641–1709), mistress of the English king Charles II, was born at Westminster in the autumn of 1641, the daughter of William Villiers. 2nd Viscount Grandison (d. 1613). Her intimacy with Charles II began soon after her marriage, in 1659, to Roger Palmer, who was created earl of Castlemaine two years later. The king was probably the father of her first child, Anne, born in Feb. 1661, although the paternity was also attributed to one of her earliest lovers, the earl of Chesterfield. There is a legend that the restored king spent his first night at his palace at Whitehall with her. Certainly she dominated the early years after the Restoration, and her house became the rendezvous for opponents of Lord Chancellor Clarendon. Her delight at his fall in 1667 was conspicuous. But although her favour had become an avenue to political advancement, her most famous protégé being Henry Bennet, earl of Arlington, her influence was essentially negative and her hold on the king was precarious. He had forced the queen to accept her as one of the ladies of the bedchamber in 1662. and she retained her status for several years. She had become a Roman Catholic in 1663 and for a while the French ambassador was instructed to seek her favour. But the king paid less attention to her demands after 1670. and by 1674 she was entirely supplanted by Louise de Keroualle, duchess of Portsmouth.

Barbara Villiers had become countess of Southampton and duchess of Cleveland in 1670. with remainder to her first and third sons. Charles and George, the king at this' time not admitting the paternity of her second son, Henry. She consoled herself with other lovers, among them John Churchill, afterward duke of Marlborough, and William Wycherley. In 1677 she settled in Paris, where she formed an intrigue with the English ambassador, Ralph Montagu, who lost his position through some revelations which she made to the king. His revenge, the exposure of secret Anglo-French intrigues, had serious repercussions.

She returned to England just before Charles died in Feb. 1685. In July 1705 her husband. the earl of Castlemaine. whom she had left in 1662, died. and in the same year the duchess was married to Robert (Beau) Feilding (d. 1712). a union which was declared void in 1707. She died at Chiswick on Oct. 9, 1709.

Her eldest son, CHARLES FITZROY (1662–1730), was created in 1675 earl of Chichester and duke of Southampton. and became duke of Cleveland and earl of Southampton on his mother's death Her other sons. HENRY and GEORGE, were also given dukedoms (see GRAFTON, DUKES OF; NORTHUMBERLAND. EARLS AND DUKES OF). (H. G. Ro)

CLEVELAND, (STEPHEN) GROVER (1837–1908), president of the United States from 1885 to 1889 and again from 1893 to 1897 was born, the fifth of nine children. in Caldwell. Essex county, N.J., on March 18, 1837. His father, Richard Falley Cleveland, a Presbyterian clergyman and a graduate of Yale college and of the theological seminary at Princeton, was a descendant of Moses Cleveland, who came to Massachusetts from England in 1635. His mother, Ann Neal, of Baltimore, Md., met and married Richard Cleveland in 1829 while he was employed as a tutor in that city. In 1841 the family moved to Fayetteville, N.Y., and in 1850 went to Clinton, N.Y., where Grover attended the town academy. He intended to enter Hamilton college, but at the death of his father in 1853 he abandoned his college plans to aid in supporting his mother and her five dependent children. He had worked in a general store in Fayetteville and now took a teaching position at the New York Institution for the Blind at New York city.

In 1855 Grover Cleveland became a clerk in the Buffalo law office of Rogers, Bowen and Rogers and in 1859 was admitted to the bar. He joined the Democratic party along with his law associates and quickly assumed an active role in the local organization. When the American Civil War began, Grover, who had no urge to become a soldier, did not enlist. as did tuo of his brothers. When drafted in 1863 he took advantage of the commutation provision of the law and hired a substitute. He continued, meanwhile, to support his mother and to assist two teen-age sisters.

His practice of law grew as did his reputation in the party. In 1862 he won his first elective office as ward supervisor. The following year the district attorney of Erie county appointed Cleveland his assistant and two years later (1865) the Democrats chose him as their candidate for district attorney. Defeated in the contest, Cleveland returned more actively to his law practice in the ensuing years and devoted his great energy and unflagging industry to a growing number of cases that came to his office. In 1870 he was elected sheriff of Erie county, and discharged the duties of the office with honesty and vigour. He devoted the years immediately succeeding his retirement from the office of sheriff to his law practice and came to be recognized as one of the leaders of the bar in western New York.

During these years of early manhood, Cleveland revealed a personality of contrasting characteristics. An indefatigable worker, he appeared as a stern, stolid and dignified citizen before the public. He sought relaxation, on the other hand. with a small circle of friends drinking, singing, roistering and indulging in carefree banter in the cafés, saloons and beer gardens of Buffalo. This dual aspect of his character persisted throughout his life.

Mayor of Buffalo.—The Democrats nominated the 44-year-old bachelor lawyer for mayor of Buffalo in 1881. The city government had been marred by extravagance and maladministration, and the voters, revolting against the Republican incumbent, elected Cleveland. Chosen to reform the city administration, he thoroughly reorganized the various departments of the government and introduced businesslike methods in the conduct of the public's affairs. He attracted widespread attention by his independence and his generous use of the veto and by 1882 state party leaders groomed him for a larger field. The Republicans in New York, weakened by scandals and intraparty strife, nominated Charles J. Folger (1818–1884), then U.S. secretary of the treasury, for governor. The Democrats chose Cleveland, who was little known outside of Erie county and was dissociated from the inner ring of state politicians. Supported by many thousands of disaffected Republican voters, Cleveland received an unprecedented plurality of 192,854 votes; he became governor of New York on Jan. 3, 1883.

Governor of New **York.**—As governor, Cleveland displayed the same stern and independent qualities that had marked his other public positions. He refused to play the game of partisan politics with its dreary round of patronage, spoils and party regularity. He subordinated the demands of party leaders to the general interest, thereby earning the plaudits of the public and the ill will of the political bosses. He backed a strong civil service law, vetoed a popular bill that would have lowered the fares on New York city's elevated lines in violation of a contract with the companies, worked for municipal reform legislation for New York city and fought Tammany Hall over appointments and legislation. The governor laboriously scrutinized all bills passed by the legislature and wielded the veto power without fear or favour.

President of the United States, **1885–89.**—In 1884 the Democratic party had been out of power in national affairs for 23 years. The Republican party, in control at Washington since 1861, was now split into two factions—the Halfbreeds and the Stalwarts—which weakened its organization and sapped its effectiveness. The situation afforded the Democrats an unusual opportunity. The Democratic national convention adopted a platform calling for liberal reforms in the administrative departments, the civil service and the national finances and, despite the opposition of Tammany Hall, nominated Cleveland for president. The Republicans, after a contest involving violent personal animosities, nominated James G. Blaine (*q.v.*) of Maine, a brilliant man whose sense of honesty had been dulled by protracted associations with speculative promoters.

The ensuing campaign, one of the bitterest in U.S history, was noted chiefly for its mudslinging. Partisans accused Cleveland of pro-Southern sentiments because he had avoided war service during the Civil War and exposed an unsavoury incident from his private life involving an illegitimate child. On the other side, campaigners unraveled a sordid story of Blaine's part in a series of political and financial scandals. Despite the closeness of the popular vote (4,874,986 to 4,851,981) Cleveland won the election by an electoral college vote of 219 to 182 (see also UNITED STATES [OF AMERICA] : History).

Cleveland's first term, while uneventful, was characterized by firmness, justice and a steady adherence to the principles which he deemed best for the nation. He staunchly backed the "Pendleton bill" (1883), designed to develop a nonpartisan civil service by making entrance and promotion dependent upon competitive examinations. Cleveland added 11,757 jobs to the classified service during his first term. Continuing an earlier practice, Cleveland made extensive use of the veto power, vetoing or pocket vetoing 413 bills (over two-thirds of which were private pension bills) passed by the congress. The president, in a politically explosive move, vetoed the Dependent Pension bill, a bold raid upon the federal treasury calculated to increase political support for its backers. Cleveland further alienated the bigwigs of his party by moving against the tariff.

In 1887 there was a large and growing surplus in the treasury which, because of the prevailing fiscal legislation of the country, acted to restrict the amount of currency available for business. About two-thirds of the public revenue came from tariff duties levied on imports from foreign countries. The Republican party, during its period of ascendancy at Washington, had fostered high tariffs to protect native American industry. Cleveland vigorously attacked the tariff legislation of the country, devoting his entire annual message of 1887 to the problem. He did not propose free trade. but he condemned the tariff laws as "vicious, inequitable and illogical." The administration tariff measure, the Mills bill, passed the Democratic house but was withdrawn owing to amendments in the Republican senate.

The presidential campaign of 1888 opened while the debate on the Mills bill raged. Although disgruntled party bosses fretted, the Democrats renominated Cleveland. The Republicans passed over the onetime loser, Blaine, and nominated Benjamin Harrison (*q.v.*) of Indiana. The politicians could raise little enthusiasm for the colourless Harrison and the stolid Cleveland as they de-

voted their major attention to the tariff issue. Although Cleveland received a popular vote of 5,540,309 to Harrison's 5,439,853, the electoral college gave Harrison the presidency by a vote of 233 to 168. Cleveland, weary of the White House, happily returned to private life and the practice of law in New York city after Harrison's inauguration in 1889.

President of the United States, 1893–97.—The Democrats, in 1892, despite the bitter protests of Tammany Hall, nominated Cleveland for president a third time. The Republicans renominated Harrison. The campaign was a quiet one despite the underlying tension abroad in the nation. The People's party, essentially agrarian in nature, had emerged after 1890 to offer a liberal challenge to the two conservative parties. The Populists, under the leadership of James B. Weaver of Iowa, boldly championed "free coinage of silver" as well as other reforms while Cleveland and Harrison emphasized the tariff in their appeals for votes. Cleveland won the election with a popular vote of 5,556,918 to Harrison's 5,176,108 and Weaver's 1,027,000. Although Cleveland gained less than a majority of the total popular vote, he received 277 electoral votes to Harrison's 145 and Weaver's 22.

Cleveland's second administration proved to be a stormy one. Shortly after his inauguration a financial panic struck the country leaving in its wake one of the most serious depressions suffered by the United States. The uncritical public, its temper on edge, blamed Cleveland and the Democrats for the disaster. To compound his difficulties the president found his party drifting away from his leadership.

His first major fight involved the repeal of the Sherman Silver Purchase act of 1890. The government had kept $346,000,000 "greenbacks" (inherited from Civil War days) as legal tender in circulation and had issued, under the terms of silver purchase acts, nearly $600,000,000 in silver coin and certificates. The treasury had accumulated over the years a gold reserve of more than $100,000,000 to protect its currency, but in April 1893 drains on the treasury reduced the reserve below the $100,000,000 mark. The president, alarmed at the threat of inflation, called the congress into a special session to repeal the Sherman act. The house promptly passed the repealing act but the senate proved obdurate. Although the Democrats controlled the senate, the prosilver Democrats refused to budge. During this period Cleveland underwent an operation for cancer but news of his illness was kept from the public.

Post-Civil War deflation had worked a severe hardship upon many agrarian sections of the country, a hardship intensified by the depression. Farmers clamoured not for less silver in the currency but more as a means of raising badly depressed prices for their crops. The president whipped his party into line and with the help of the Republican minority forced the passage of the repealing bill (Oct. 30).

Repeal of the silver act failed to cure the depression. The federal deficit bequeathed by the Republican administration made it necessary to dip into the gold reserve to meet current expenses. Holders of legal tender notes, fearing depreciation, presented them for redemption in gold. To replenish the gold supply Cleveland authorized the purchase of 3,500,000 oz. of gold from J. P. Morgan and August Belmont at an estimated profit to the financiers of $7,000,000 on a $62,000,000 loan. The business world, despite these efforts to bolster it, remained in a state of constant agitation. Bankruptcies were rife, trade was sluggish, wages were reduced and unemployment mounted. A bitter labour war broke out at the Pullman Palace Car works near Chicago from whence spread a railroad strike that tied up every midwestern railroad and caused riots and bloodshed at many centres. Gov. John P. Altgeld (*q.v.*) of Illinois, lacking sympathy for the railroads, refused to intervene in the strike. Cleveland, acting upon the appeal of the railroad association and over the protest of Governor Altgeld. dispatched federal troops on July 6, 1894, to safeguard the mails, clear the way for interstate commerce and restore peace. The troops dispersed the workers and broke the strike within one week. The president, while he received the plaudits of the business community, earned the suspicious distrust of organized labour.

Cleveland further weakened his party in dealing with the tariff issue. He believed that he held a mandate from the electorate to effect a downward revision of the tariff. With this in mind, William Lyne Wilson of West Virginia introduced a reform tariff bill in the house. The senate, under the leadership of Sen. Arthur Pue Gorman of Maryland and a group of high-tariff antiadministration Democrats, so amended the bill upward that it became a mockery of tariff reform. Unwilling to veto the measure and risk losing badly needed revenues, the president signified his dissatisfaction with its high rates by allowing it to become law without his signature.

In foreign affairs Cleveland began his administration by withdrawing a treaty for Hawaiian annexation negotiated by Harrison's administration. The American colony at Honolulu had engineered a revolution against the reactionary policies of Queen Liliuokalani, established a republic and sought admission to the United States. Cleveland, who opposed expansion and thought that the queen had been wronged, refused to support annexation and urged the revolutionaries to restore the dethroned queen. The president of the new republic politely informed Cleveland that Hawaii would brook no interference with its internal affairs. Cleveland also faced problems growing out of a new revolutionary outbreak in Cuba (1895) caused partly by the Wilson tariff, which had raised the duties on Cuban sugar and demoralized the industry. Cleveland stoutly refused to encourage the expansionists within the nation by interfering in Cuba.

On the other hand, the president did not hesitate to speak out boldly when he sensed an impending violation of the Monroe Doctrine (*q.v.*). Great Britain and Venezuela had for long disputed a boundary line between British Guiana and Venezuela. The Venezuelans had insisted on arbitration and London had resisted. Following a well-planned Venezuelan-inspired publicity campaign in this country, sentiment favouring Venezuelan claims developed rapidly and congress in 1895 adopted a resolution urging arbitration. Cleveland, unable to ignore the domestic political implications of the situation, on July 20, 1895, sent an intemperate note prepared by his secretary of state, Richard Olney, pointing out that England was violating the Monroe Doctrine and asking that her majesty's government arbitrate the boundary. After several months' delay Britain returned a reply which made Cleveland "mad clear through." On Dec. 17, 1895, the president sent a ringing message to congress calling attention to Britain's action and recommending an appropriation to finance an investigating commission to report on the disputed boundary. The United States, he insisted, "must resist by every means" an extension of British jurisdiction over what "we have determined of right belongs to Venezuela." The president implied that the United States should define the boundary and be prepared to fight, if necessary, to compel acceptance. The congress unanimously appropriated the necessary funds without delay.

Fortunately, after the jingoes on both sides of the Atlantic had had their field day, more sober counsels prevailed and tempers cooled. Britain agreed to arbitrate, as did Venezuela, and the commission awarded what Britain had on several occasions offered to Venezuela. Cleveland and the United States emerged from the dispute with enhanced prestige and England henceforth sought to eliminate sources of friction and bring the United States into closer relations with Great Britain.

Despite widespread support in the Venezuela affair, Cleveland, by the end of his second administration, had lost touch with the dominant forces of his party and unintentionally antagonized several important groups of voters. When the Democrats met in convention at Chicago in 1896 the antiadministration wing gained control and refused the customary endorsement of the administration. The inflationists proceeded to adopt a platform promising the free and unlimited coinage of silver as well as sweeping economic and political reforms. The convention, after listening to the impassioned "Cross of Gold" speech of William Jennings Bryan of Nebraska, nominated him for president. The gold Democrats thereupon bolted the convention and nominated their onn candidates under the banner of the National Democratic party. Cleveland supported the "sound money" nominees.

Retirement. — When Cleveland's second term ended on March 4, 1897, he retired to a home in the quiet university town of Princeton. N.J., where he maintained his residence until his death. Partisan animosities gradually lost their intensity and Cleveland regained his reputation as a sincere, independent, disinterested defender of honest government. Princeton university made him a trustee and Stafford Little lecturer on public affairs. Democrats in 1904 talked of renominating Cleveland for a third term, which he doubtless would have declined. In 1905 Cleveland accepted an invitation to serve on a board of three trustees of the Equitable Life Assurance society to reorganize the company. Subsequently he acted as rebate referee for the Equitable, the Mutual of New York and the New York Life insurance companies. In the meantime he published several magazine articles on political and other subjects and found time to bring out *Presidential Problems* (1904) and *Fishing and Hunting Sketches* (1906).

Cleveland in 1886 at the White House had married Frances Folsom (1864–1947). The Clevelands enjoyed a happy family life despite the disparity in their ages. Four of their five children survived him. While Cleveland was not a rich man, he had carefully husbanded and invested his resources and was able to live comfortably and leave money for the generous support of his family. After several months of illness Cleveland died at his home on June 24, 1908.

There was an outpouring of expressions of esteem on the occasion of his death. The American people saw in Cleveland a staunch defender of many of their ideals and time-honoured virtues. He was a typical 19th century liberal whose views had altered little while all about him had changed. Cleveland had stood for honesty and probity in the public service, had fought against special privilege, had advocated as large a measure of freedom in economic life as was consistent with public order, had sought to lower tariff walls in the interest of the consuming public and had reasserted the nation's role in foreign affairs without embarking upon expansionist programs which might prove embarrassing to support.

CLEVELAND, JOHN (1613–1658), English royalist poet, originator of a native type of political satire, was born in June 1613 at Loughborough, Leicestershire, and educated at Christ's college, Cambridge. In 1634 he was made fellow of St. John's. Soon after June 1642, at the outbreak of the Civil War, he left Cambridge for Oxford and began to employ his pen in the service of the king. He was judge advocate in the garrison at Newark from May 1645 until its surrender in May 1646. After this nothing is certainly known about him until his arrest at Norwich in Nov. 1655, although it is possible that he was in London in 1647–49, and probable that he was at the house of Stephen Anderson in Manby, Lincolnshire, in 1651.

His arrest led to a three-month imprisonment in Yarmouth jail, from which he was released as a result of his "Petition to the Protector." He found his way to Gray's Inn, London, where he died on April 29, 1658.

Cleveland was the most popular poet of his age. Over 30 editions of his poems appeared between 1647 and 1700, whereas the same period saw only two editions of Milton's Poems (1645). His verse carries "metaphysical" obscurity and conceit to their limits, and many of his occasional poems are merely brilliant intellectual gymnastics ("'Fuscara," "The Antiplatonick" and "The Senses Festival"), But his real achievement is in his political poems, and he is very nearly a great political satirist. His control of the heroic couplet in "Rupertismus," "The Rebel Scot" and "The King's Disguise" foreshadowed the method of Dryden and inaugurated the sophisticated form of satire. His metrical experiments in "Mark Anthony," "The Author's Mock Song to Mark Anthony" and "Square-Cap" — fine poems in their own right — provide further evidence of his technical inventiveness. Cleveland attracted a host of imitators, and his later editions contain many spurious poems. As a satirist he deserves more lasting fame than he has found.

BIBLIOGRAPHY.—The best text is in G. Saintsbury, *Minor Poets of the Caroline Period,* vol. iii (3 vol., 1905–21). For Cleveland's life see *The Poems,* ed. by J. M. Berdan (1911); S. V. Gapp, "Notes on John Cleveland," *Publications of the Modern Language Association of America,* xlvi, 4 (1931); G. Thorn-Drury, *A Little Ark* (1921). The bibliographical problems are considerable, and both Saintsbury and Berdan contain many inaccuracies. (B. R. M.)

CLEVELAND, a city of Ohio, U.S., and seat of Cuyahoga county, is the chief St. Lawrence seaway port on Lake Erie and port of entry for Ohio. Centrally located on Ohio's lake shore at the mouth of the Cuyahoga river, the city is 481 mi. W. of New York and 340 mi. E. of Chicago by highway. To the southwest are Columbus (141 mi.) and Cincinnati (239 mi.). Pop. (1960), city 876.03'0; standard metropolitan statistical area, which includes both Cuyahoga and Lake counties: 1,796,595. Largest of the bordering suburbs are Lakewood, Parma, Garfield Heights, Shaker Heights, Cleveland Heights, East. Cleveland and Euclid (*qq.v.*). (For comparative population figures for Cleveland and its suburbs *see* table in OHIO: *Population.*)

History. — Cleveland is the product of enterprising men who made use of every advantage of its site and hinterland. Located at the mouth of the second largest river in the Erie watershed and at the western end of the only lowland corridor between the Atlantic at New York city and the central plains, the site is a natural transshipment centre. The first to recognize its value were the ancient mound builders who built fortifications within the present city limits. Indian and French trading posts were established in the lower Cuyahoga before the coming of the English. About 60 Indian families were residing on the west side of the river when Cleveland was founded and three important Indian trails became the chief highways of the settlers. The Lake trail between Buffalo and Detroit became the principal thoroughfare in Cleveland utilizing a glacial lake beach. The Muskingum trail led southward along the Cuyahoga over Portage path in Akron into the Muskingum valley of the Ohio watershed. The Mahoning trail was the most important one used by settlers between Pittsburgh and Cleveland.

When the Ohio country was opened to settlement after the American Revolution, Connecticut, in ceding its western lands to the federal union in 1786, reserved a 3,500,000-ac. tract (known as the Western Reserve) in northeastern Ohio. To expedite the sale of land, the Connecticut Land company sent Moses Cleaveland to lead the first surveying party of 46 into "New Connecticut"; they arrived at the mouth of the Cuyahoga on July 22, 1796. Surveying of the Western Reserve began immediately and two months later the plan for the town of Cleaveland was completed. The 4-ac. public square was surrounded by 220 lots of 2 ac. each to the east of the Cuyahoga gorge and due south of the lake, with 99-ft. streets, with the exception of Superior avenue (132 ft.). The downtown portion of Cleveland conforms in large measure to the original plan, including the pattern of thoroughfares radiating from the square. (The "a" in Cleaveland was dropped in 1832 to shorten a newspaper's masthead.)

From the nucleus of the original settlement the city spread first eastward on the 2–4 mi. wide lake plain between the lake and the glaciated portion of the Appalachian plateau, whose 200-ft. escarpment divides the narrow lowland from the rolling "heights." As the narrow plain was developed for commercial, residential and industrial land use, the Cuyahoga valley "flats" became the site where bulky raw materials could be shipped by water and rail for heavy industries. The heights remained a partially cleared farming area throughout the 19th century. The most notable farming community was that of the Shakers, a communal religious sect, supplying the city with high-quality farm produce.

Manufacturing had an early start in the usual pioneer industries, including flour milling with local sandstone for the grindstones. The convergence of river, lake and Indian trails did not, however, immediately bring prominence to Cleveland. As late as 1820 the population was only 606. Phenomenal growth and prosperity of the community began with the era of canal building. The completion of New York's Erie canal provided an all-water route

between Lake Erie and the Atlantic. In 1825 Ohio began construction of its first canal. to connect Lake Erie and the Ohio river. The Cleveland-Akron portion was opened in 1827; five years later the canal was completed.

A decade later railroads increased the commercial and industrial activity of the city. When the Soo canal was opened in 1855, Cleveland became Lake Erie's transshipment centre for lumber, copper and iron ore and for rail shipments of coal and farm produce from the hinterland. Soon thereafter the American Civil War supplied the impetus for the initial growth in iron and steel processing, the fabrication of metals, oil refining and chemical manufacturing.

At the close of the 19th century a new means of transportation enhanced the position of Cleveland and initiated rapid suburban growth. A mushroomirig development of electric interurban trains carried not only rural and intercity passengers but also large tonnages of perishable farm products, mail, express and packaged freight at more frequent intervals than the railroads. They offered Cleveland an efficient network of interstate services. In the 20th century, auto, bus and truck transportation became increasingly important.

Early in the 20th century Cleveland began a program of urban renewal to eliminate slums and revitalize the downtown area. The "group plan" committee in 1902 executed the plan for the construction of public buildings surrounding a mall near the public square and consisting of the courthouse, city hall, federal building, public library, public auditorium. board of education building and the stadium. Privately financed buildings were also erected after the state legislature in 1915 granted authority for steam and electric railroads to build a union station at the southwest corner of the public square. In addition to the Union Terminal building, other large multistory buildings included a hotel, a department store. large office buildings and the main post office. By the mid-1930s Cleveland had the appearance of a modern metropolis in a New England colonial setting of the public square.

Since 1950 urban renewal has prompted the removal of blighted buildings for modern office buildings. newspaper publishing. banks and civic centres. Along Euclid avenue between East 22nd and 40th streets, once the site of palatial homes of Cleveland's millionaires, are regional offices of national companies.

Government. — Cleveland is divided into wards, each represented by a councilman elected for two years. The mayor's cabinet and the council budget the city expenditures for safety and welfare, utilities and salaries, health and sanitation, properties and parks, port control, aviation and traffic, housing, urban renewal and planning. Civil and criminal cases are handled by the municipal court. The responsibilities for supporting several institutions offering county-wide benefits are assumed by the county commissioners. The Cleveland metropolitan services commission is designed to reduce many of the duplications of services in the more than 60 cities, villages and townships of the county.

Commerce and Transportation.--No natural factor of location was more impelling in the growth of Cleveland than its advantages for transportation. In the development of Cleveland lies the glacial history of the region, notably in the lower half of the Cuyahoga course. Its source is only 15 mi. S. of Lake Erie and 35 mi. E. of Cleveland. After flowing southwestward, at Cuyahoga falls on the northern limit of Akron, the river drops into a large and deep preglacial valley and, flowing northward, reaches the lake plain about 6 mi. from its mouth. There it is entrenched as a meandering stream in a gorge 60–125 ft. deep and near the lake is less than $\frac{3}{4}$ mi. wide. The Indian name, Cuyahoga, meaning "crooked," reaches the full sense of the word for it has 855° of curvature in the last 2 mi. of its course. The sharpest meanders have been widened so that lake freighters can reach the head of navigation about 5 mi. from the mouth. To straighten the river valuable river frontage would have been sacrificed. The original mouth lay more than 1 mi. west of the present outlet. To overcome constant silting at the last meander, the new river outlet was cut directly to the lake and the old mouth closed. The land between the old and new mouths, known as Whisky Island, is the city's most important bulk storage portion of the inner harbour.

Along the entire northern border of metropolitan Cleveland lies 40 mi of lake shore. but the commercial and industrial dock activities are confined within the 5-mi. breakwater extending both east and west of the river mouth and along the Cuyahoga. General cargo facilities in the outer harbour include private piers able to accommodate ocean and lake vessels of 500-ft. length. including a 500-ft. pier specializing in Canadian newsprint. Also located in the outer harbour is the U.S. coast guard station. Reclamation along the lake front has added considerable acreage for warehouse facilities, railroad sidings. the municipal stadium, Burke Lakefront airport, pleasure craft moorings, parks, municipal parking lots and the highway east of the river.

In the inner harbour of the flats are found heavy industry, railroad yards, bulk storage space and $13\frac{1}{2}$ mi, of navigable river frontage for privately owned bulk cargo docks handling iron ore, limestone, coal and chemicals.

As for land transportation, the terminals of five major trunk railways radiate from the right bank of the lower Cuyahoga. Three local railroads serve principally the steel industry.

Federal and state highways radiate from the public square. Seven bridges in the flats and four high-level structures cross the gorge to link the east, west and south sides of the city. Limited access multilane highways from the commercial core of the city expedite commuter traffic and in turn connect with several limited access federal highways constructed through metropolitan Cleveland.

To improve the public services for handling daily commuters, the municipally owned Cleveland Transit system operates a modern high-speed electric railway along the Nickel Plate and New York Central rights-of-way, 7.7 mi. due east and 7.2 mi to the southwest of the Union terminal. Shaker Rapid Transit is a 10-mi. electric railway between the Cleveland terminal and the city limits of Shaker Heights in the southeast.

Ten miles southwest of the public square is the municipally owned Cleveland-Hopkins airport Located in the terminal is one of the nation's major weather stations. Nearby is the federally owned Flight Propulsion laboratory and the National Administration for Space Aeronautics.

Industry. — The basic prosperity of metropolitan Cleveland rests upon heavy industry. Of the total industrial labour force, about three-fourths finds employment in the manufacturing of primary steel, the fabrication of steel and aluminum products, hardware and enamelware, machine tools, appliances, tractor and motor vehicles, airplane parts, electrical machinery, electronic equipment and hundreds of other metal products. In addition, the making of wool clothing is an important industry.

Much of Ohio's oil refining, basic chemicals, paint manufacturing and plastics industries are concentrated in the lower Cuyahoga valley and along the lake shore to the northeast. Long a centre for aeronautical, electrical and other industrial research, metropolitan Cleveland has about 400 research laboratories. During and after World War II manufacturing expanded into the sparsely populated suburban communities of Euclid, Parma, Brooklyn and Garfield Heights, where much level land was available for industrial sites.

Throughout the history of Cleveland, glacial deposits in the Cuyahoga valley fostered the building trades. The manufacture of brick and other clay products has declined, partially due to the change in land use, and most of the extensive glacial gravels and sands are exhausted. The chief sandstone formation, Berea Grit, outcropping southwest of Cleveland, supplied the world with high-quality grindstones and sandstone for Cleveland's older public buildings and palatial homes. In no other metropolitan area is there a greater mileage of sandstone sidewalks. In 1890 vast salt beds about 1,800–2,000 ft. below the surface of Cleveland's lake plain were discovered, and salt provides a valuable raw material for the chemical industry.

In Cuyahoga valley about 5 mi. south of the square is located a highly specialized vegetable greenhouse industry. Unlike most farming communities located near large cities where the growth of suburbs has forced a retreat of agriculture, the vegetable greenhouse acreage has increased. Three-fourths of the vegetables produced annually are shipped outside the Greater Cleveland market

from the Atlantic to the Mississippi and as far south as Baltimore, Md., St. Louis, Mo., and Louisville, Ky.

Cleveland has an unlimited supply of medium soft water from Lake Erie. The first public waterworks system was put into use in 1856 by pumping water from the lake; the city has since multiplied and modernized its water facilities for distribution to most of the county. Abundant and dependable electricity is supplied by both public and private steam-generating plants.

The development and growth of manufacturing in Cleveland was made possible in large measure by immigration of skilled and unskilled labour from the British Isles, Germany and Scandinavian countries, and later from eastern and southern Europe. During and after World War II the southern labour force made possible continuing industrial growth.

Education and Cultural Institutions.—The largest of Cleveland's notable educational institutions is Western Reserve university, a private university founded in 1826; it consists of Adelbert college for men, Flora Stone Mather college for women, Cleveland college for continuing adult education, a graduate school and schools of law, medicine, dentistry, library science, nursing, business and applied social sciences. In 1958 a 20-year master plan was organized under the University Circle Development foundation to preserve and enlarge the facilities of the 28 cultural and religious institutions in close proximity to Western Reserve university.

Other educational institutions are Case Institute of Technology, a private technical college founded in 1880; John Carroll university, a Roman Catholic university for men, founded in 1886; Baldwin-Wallace college, Methodist, founded in 1845; Cleveland Institute of Art, private, 1882; Cleveland Institute of Music, private, 1920; Cleveland-Marshall Law school, private, 1897; Fenn college, private, 1923; Ursuline, founded in 1871, and Notre Dame, founded in 1923, both Roman Catholic colleges for women. Private schools include Laurel and Hathaway Brown, for girls, University and Hawken, for boys, and, in nearby Hudson, Western Reserve academy for boys. Within the Roman Catholic diocese are many high schools. There are two Lutheran high schools.

The Museum of Art, Western Reserve Historical society, Museum of Natural History, Health museum, Allen Memorial Medical library, Garden centre, Fine Arts gardens and the Cleveland Symphony orchestra housed in Severance hall are all located within ½ mi. of Western Reserve university and Case Institute of Technology. The Cleveland public library is one of the nation's great research libraries and the first to establish the open-shelf system.

In the field of drama, the needs of both professional and amateur players are met by year-round playhouses, the most famous being Karamu house.

Parks.—The natural beauty of several gorges is preserved in the metropolitan park system, notably in Chagrin, Rocky, Bedford and Euclid reservations. Big Creek is the site of the Cleveland zoological gardens and Doan Brook contains the formal cultural gardens established by various groups to commemorate international heroes and creators of art, music and literature. More than 500 neighbourhood playgrounds provide recreation for young and adult Clevelanders.

Health and Welfare.—Well-known for work in social welfare, Cleveland sponsors many settlement houses and civic centres for preserving old-world cultures and for the Americanization of foreigners. The community chest, which originated in Cleveland in 1913, finances many agencies within the metropolitan area. The highly endowed Cleveland foundation contributes annually large funds to charitable and cultural institutions.

Metropolitan Cleveland has about 60 hospitals. Those with graduate training programs are Cleveland clinic, Metropolitan General, Deaconess, Doctor's, Euclid-Glenville, Fairview Park, Huron Road, Lakewood, Lutheran, Marymount, Mt. Sinai, St. Alexis, St. John's, St. Luke's, St. Vincent's and University. There are also two veterans' hospitals, three state hospitals for the mentally ill and two county hospitals for the physically handicapped and tubercular. Cleveland and Cuyahoga county support six corrective institutions for juvenile offenders and three for adults.

CLEVELAND HEIGHTS, a residential suburb 8 mi. E. of Cleveland (*q.v.*) in Cuyahoga county, Ohio, U.S., and a part of the Cleveland metropolitan area, lies on the northern portion of the Appalachian plateau about 440 ft. above Lake Erie. It has no railroads or industry and is noted primarily for its many imposing homes. It was incorporated as a village in 1903. The region remained largely a wooded tract until it was incorporated as a city in 1921. The council-manager plan of city government went into effect at that time. The city has an excellent public school system and libraries. Its municipal park system includes Cain park, nationally known as an outdoor summer theatre in a natural amphitheatre setting. Cleveland Heights shares with Shaker Heights the scenic Shaker lakes in the valley of Doan Brook. In 1938 it received 70 ac. of Forest Hills, the summer residence of John D. Rockefeller, from which was created Forest Hills park, offering both winter and summer recreation facilities. The population in 1960 was 61,813. For comparative population figures see table in OHIO: *Population.* (M. M. WA.)

CLEVES (German KLEVE; Dutch KLEEF or CLEVE), a town on the western edge of Germany, which after partition of the nation following World War II was included in the *Land* (state) of North Rhine-Westphalia in the German Federal Republic. It is situated on three hills rising from a flat countryside. 65 km. (40 mi.) N. of Krefeld by road and 15 km. (9 mi.) S. of the Dutch frontier. Pop. (1959 est.) 21,342. Cleves is on the main railway from Cologne to Amsterdam. The Spoy Canal connects it with the Rhine.

The town is built on two levels. The Schwanenburg or "swan's castle," associated with the legend of Lohengrin, is used as a law court. Its two towers, the Spiegelturm and Schwanenturm, date from 1429 and 1440 respectively. The Collegiate church (1341–1402) and the Minorite church (1427) are also interesting. There are two parks, the Forstgarten, redesigned by the landscape architect Maximillian Weyhe, and Prinz Moritz park, the grounds of the former residence of the electors. The town's mineral wells and its proximity to large areas of heath and woodland attract a large tourist trade. Agriculture is the basis of the district's economic life; shoes, margarine, biscuits, cocoa, tobacco, leather goods and chemicals are manufactured.

The town was the seat of the counts of Cleves as early as the 11th century, but it did not receive municipal rights until 1242. The county, which lay on both banks of the Rhine, passed in 1368 to the counts of La Marck and was made a duchy in 1417. It was united to the neighbouring duchies of Jülich and Berg (*qq.v.*) in 1521. Anne of Cleves (*q.v.*), daughter of Duke John, was the fourth wife of Henry VIII of England. By the treaty of Xanten in 1614, Cleves passed to the elector of Brandenburg. It was ceded to France during the Revolutionary and Napoleonic Wars, restored to Prussia in 1815 except for some small portions given to the Netherlands, and became part of the German empire in 1871. Cleves was severely damaged in World War II before its capture by the Allies on Feb. 11, 1945.

CLICHY (CLICHY-LA-GARENNE), a northern suburb of Paris, is a commune and canton of Seine *département.* Pop. (1954) 55,578. The main features are the church, dedicated to St. Vincent de Paul, who was the village priest at Clichy (1612–25), and

Beaujon hospital. The station, shared with the neighbouring commune of Levallois-Perret, is on the main line from Paris to Rouen and Le Havre. The chief industry is the manufacture of automobiles; electrical equipment, machinery, plastics, chemicals, foodstuffs and pencils are also produced, and printing is done. Clichy (Lat. *Clippiacum*) was a residence of the Merovingian kings. On March 30, 1814, at the gate of Clichy, the Russians attacked the French in the battle of Paris. In World War II the town was occupied by the Germans from June 1940 to Aug. 1944. (A. DL.)

CLICKS, in linguistics, are peculiar sounds of unknown origin found in many languages. The German term *Schnalze* and the Afrikaans *klukken* are both attempts to give a descriptive name, but the English word "click" is as onomatopoeic as any. The outstanding examples of click speech are the Hottentot languages (Nama, !Kora, Griqua, etc.) with four or five different clicks and those of the Bushmen of South Africa (*e.g.*, !Kung, Kham. !Ai) with as many as nine different clicks.

From contiguity with the Hottentots and Bushmen several Bantu stocks have acquired clicks, which are alien to Bantu speech systems. Such stocks are the Zulus and Kaffirs, while the Damaras (originally Bantu) have dropped their language entirely and speak only Hottentot. In the interior, even Afrikaans (Cape Dutch) has acquired clicks.

It seems fairly well established that clicks are not confined to South African tongues. There are cases of their presence in the Melanesian languages of the eastern Pacific, the Q recorded by R. H. Codrington and Bishop J. C. Patteson representing a click sound. Clicks never appear very far north of the equator and historically, at least, a definite "click zone" can be found girdling the earth at, and south of, the equator. A study of the Quichua language of the Incas of Peru showed the existence of click sounds, later changed to simple gutturals, in the ancient tongue. The Aztec or Nahuatl tongue also had clicks and in the surviving Aztec spoken by Mexicans in the hills of the interior, the *tl,* final and initial, sounds exactly like a Hottentot dental click.

In the Nama speech (standard Hottentot), there are four clicks, represented thus:

	Tindall	German system	International Phonetic Association
Dental	c	/	ǀ
Cerebral	q	!	ǃ
Palatal	v	≠	ǂ
Lateral	x	//	ǁ

In the Bushman languages other clicks exist having such signs as:

Guttural ⌐ Semi-labial ◻ Labial ⊙

The sounds must be heard; no description can do more than convey a general idea of their nature. The dental click, for example, is pronounced by pressing the flattened tip of the tongue against the front teeth at the gums and quickly withdrawing it. Early attempts to define and describe these sounds will be found in the works mentioned below.

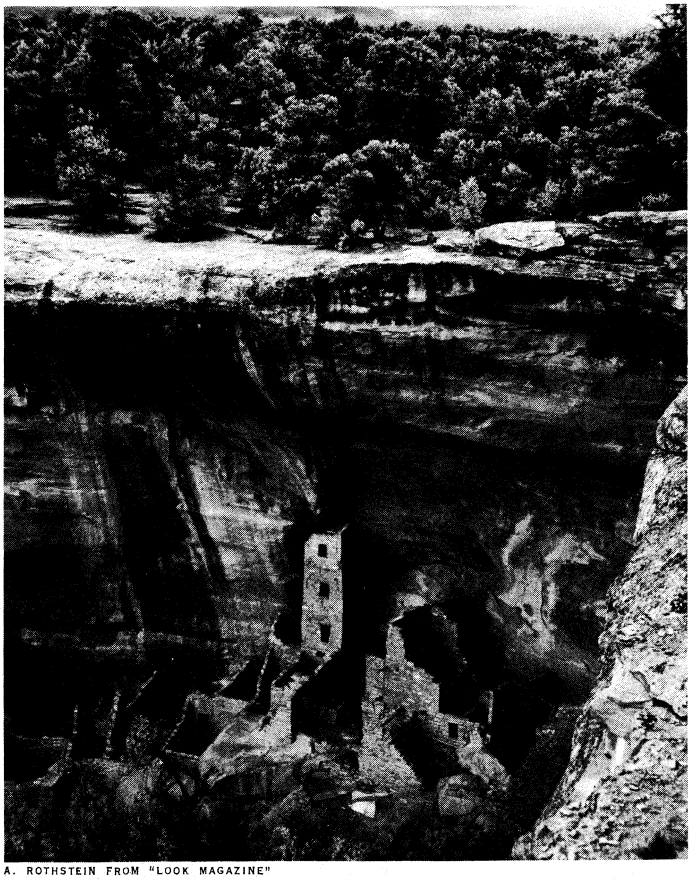
See H. Tindall, *A Grammar of the Namaqua-Hottentot Language;* J. *L.* Dohne, *Zulu-Kafir Dictionary* (1857); Meinhof, *Lehrbuch der Namasprache* (1909); Leonhard, *Aus Namaland und Kalahari* (1905); *N.* Whymant, *The Zone of Clicks* (1923). (A. N. J. W.; L. G. J.)

CLIFF DWELLERS is the popular name for the prehistoric American Indians belonging to the Anasazi (*q.v.*) culture in what is now the southwestern United States; their 20th-century descendents are the Pueblo Indians. About A.D. 1050 to 1300 the Anasazi characteristically built their homes and granaries on cliff ledges, probably as a protection against invaders. The most impressive site from that period is at Mesa Verde, Colorado (see CLIFF DWELLINGS). *See* also NORTH AMERICA: *Prehistory and Archaeology: Southwestern Village Farmers;* INDIAN, NORTH AMERICAN: *Culture Provinces: The Southwest.*

CLIFF DWELLINGS is the term usually applied to houses and villages built in natural caves and sheltered recesses in the faces of cliffs by the prehistoric Indians of the southwestern United States and northwestern Mexico. Except for such modifications made necessary by construction within the limited confines of a cave. they differed little from other masonry or adobe houses and villages (or pueblos) built by the same groups on the mesa tops or in the valley bottoms. Cliff dwellings should be distinguished from cave dwellings and rock shelters which with little or no modification have been used since earliest times in many parts of the world. Many of the southwestern caves which contain cliff dwellings were first utilized for burial, storage or habitation by the Basket Makers and similar people who were ancestors of the cliff dwellers (*q* v) and the modern Pueblo Indians (*q.v.*).

When cliff dwellings first came to attention many early visitors mistakenly attributed them to a "lost race" of pygmies Beginning nith the first scientific excavations by Gustav Nordenskiold in 1891, however, it soon became apparent that the cliff houses were made by the same Indians who built houses in the open.

Like contemporaneous surface houses the cliff pueblos were communal dwellings. Although most mere small, containing from 1 to 10 or 15 domestic rooms and 1 or 2 ceremonial rooms or kivas, a few were very large with more than 100 rooms and numerous kivas. Many dwellings consisted of two, three, or even four stories, often built in stepped-back fashion so that the roofs of the loner rooms served as porches for the rooms above. Some houses abutted the cave wall while others were free-standing. The loner. inner chambers were used primarily for the storage of maize (Indian corn), beans, squash and various wild foods such as pinyon and yucca seeds. and of basketry, pottery, agricultural implements and other objects The upper rooms served for corn grinding, sleeping and living and were reached by ladders or, rarely, by stairways. Small doors helped to conserve heat in the houses. Cooking and most other domestic chores were carried on outside the houses, on the roofs or in the plaza areas between blocks of rooms. Towers, which often commanded the approaches to the caves, were presumably for defensive purposes but may have had ritual functions as well. Kivas were usually constructed as underground



A. ROTHSTEIN FROM "LOOK MAGAZINE"

SECTION OF SQUARE TOWER HOUSE, MESA VERDE NATIONAL PARK. COLORADO

chambers in the plaza areas and served both for ceremonies and as clubhouses for the men of the villages. Houses were built of stone masonry with mud mortar or of adobe mud and frequently were plastered. Rooms and kivas often were whitewashed and occasionally had painted decorations.

Most of the cliff dwellings in the high, arid mesa and canyon country of the adjacent portions of Colorado. Utah. Arizona and New Mexico drained by the San Juan river have been dated by dendrochronology from the 11th to the 13th centuries, but some may date as early as the 9th century. Farther south, most of the cliff dwellings of central Arizona and southern New Mexico appear to have been built in the 14th century. Recent evidence suggests that some cliff dwellings in northwestern Mexico may date near A.D. 1000.

While defense may often have been a major reason for the selection of caves as village sites, protection from the elements and the warmth of the south-facing caves during winter were other considerations in the choice.

The best-preserved cliff dwellings are those in Mesa Verde National park (*q.v.*) in Colorado and in various national monuments in Arizona. Cliff palace in Mesa Verde, which occupies the entire floor of a cave approximately 300 ft. long. contains about 200 secular rooms and towers and 23 kivas. Spruce Tree house, Balcony house, Long house, Mug house, Square Tower house and Step house are other important cliff dwellings in Mesa Verde National park. White house and Mummy cave in Canyon de Chelly National monument and Xeet Seel and Betatakin in Navajo National monument are also notable. Good examples of the smaller, later, southern type may be seen at Montezuma Castle and Tonto National monuments in central Arizona.

Cavate lodges are sometimes considered as cliff dwellings. These consist of groups of rooms excavated in relatively soft stone cliff faces. In front of these, flat-roofed pueblos were constructed, often as a series of terraces following the slope of the talus. Cavate lodges were built in the valleys of the Verde river in Arizona, the San Juan river in Colorado and especially in the upper Rio Grande valley in New Mexico. This type of village may be seen at Puye and in Bandelier National monument (Rito de los Frijoles) near Santa Fe, N. M.

CLIFFORD, the name of a famous English family and barony taken from the village of Clifford in Herefordshire.

ROGER DE CLIFFORD (d. *c.* 1285) played an important part in the Barons' War in the reign of Henry III. He supported Simon de Montfort in 1263, but fought for the king at the battles of Lewes (1264) and Evesham (1265), and was granted estates in Westmorland. His grandson ROBERT (1274–1314), the 1st baron, served in the Scottish wars of Edward I and Edward II. He was one of the lords ordainers (1310) and an opponent of Piers Caveston. He was killed at the battle of Bannockburn on June 24, 1314. His son ROGER (1300–22) joined in the rebellion of Thomas, earl of Lancaster, was captured at the battle of Boroughbridge and hanged at York on March 23, 1322. JOHN (1435–61), the 9th baron, earned the nickname of the "butcher" in the Wars of the Roses, in which he fought for Henry VI. He was killed by a chance arrow at Ferrybridge, Yorkshire, on March 28, 1461, and was attainted later that year. For this reason his son HENRY CLIFFORD (*c.* 1454–1523) was brought up in obscurity and is sometimes called "the shepherd lord." But after the accession of Henry VII the attainder was reversed (1485). Henry fought at the battle of Flodden (1513) and died on April 23, 1523. His son HENRY (1493–1542) was created earl of Cumberland (*q.v.*) in 1525, and the main line of the Cliffords was associated with this earldom until the title became extinct in 1643.

On the death of GEORGE (1558–1605), 3rd earl of Cumberland, the barony of Clifford, separated from the earldom, was claimed by his daughter ANNE (1590–1676), later countess of Dorset, Pembroke and Montgomery. After Anne's death the claim passed to her daughter MARGARET (d. 1676), wife of John Tufton, 2nd earl of Thanet, and to her descendants. The barony was later held with intervening abeyances by the Southwells and the Russells, to which latter family the present Lord de Clifford belongs.

In 1628 a new barony of Clifford was created in favour of HENRY (1592–1643). afterward 5th and last earl of Cumberland, passing on his death to his daughter ELIZABETH (1613–91), wife of Richard Boyle, 2nd earl of Cork. From the Boyles it passed to the Cavendishes, falling into abeyance in 1858.

The barony of Clifford of Lanesborough was held by the Boyles from 1644 to 1753. The Devonshire branch of the family is descended from ROGER (1333–89), 5th Lord Clifford. Its most famous member, THOMAS CLIFFORD (*q.v.*), a member of the cabal ministry under Charles II, was created 1st Baron Clifford of Chudleigh in 1672. The family of Clifford of Flaxbourne, N. Z., is descended from HUGH (1700–32), 3rd Lord Clifford of Chudleigh. CHARLES (1813–93), his great-grandson, speaker of the house of representatives in New Zealand from 1853 to 1860, mas created a baronet in 1887.

CLIFFORD, JOHN (1836–1923), British Nonconformist minister and social reformer, was born on Oct. 16, 1836, at Sawley, Derbyshire. His father had Chartist sympathies. At the age of ten Clifford began work in a lace factory, but on his deciding to become a Baptist preacher he was sent in 1855 to the General Baptist academy in Leicester. In 1859 he became minister of Praed street chapel, Paddington. and continued his studies at London university, where he took degrees in arts, science and law.

A new chapel at Westbourne Park was opened in 1877 for his growing congregation. Clifford became president of the Baptist union in 1888 and was prominently involved in the "downgrade" controversy resulting from charges of heresy brought against the union by one of its most influential preachers, C. H. Spurgeon (*q.v.*). The uniting of the General Baptists of the New Connexion with the Baptist union in 1891 owed much to Clifford's leadership. In 1898 he became president of the National Free Church council.

His keen social sympathies led to his close association with the radical wing of the Liberal party and with a number of early Labour leaders, including James Keir Hardie. Clifford became a national figure as a result of his ardent advocacy of "passive resistance" to the Education act of 1902 by nonpayment of rates as a protest against the use of public funds to support denominational schools. His goods and those of other Nonconformists were several times confiscated. The failure of the Liberal government of 1906 to end the dual system was a great disappointment to Clifford. In 1899 he was again president of the Baptist union and from 1905 to 1911 served as the first president of the Baptist World alliance. The world alliance for promoting international friendship through the churches had his active support, but he was hesitant in his reaction to the Lambeth Quadrilateral of 1920 (*see* ENGLAND, CHURCH OF: *20th Century History and Development: Relations with other Churches*). At the end of his long life his main emphasis was upon personal evangelism. His chief writings were *The English Baptists* (1881), *The Christian Certainties* (1893) and *The Ultimate Problems of Christianity* (1906). He died in London on Nov. 20, 1923.

See *Dr. John Clifford, C.H.: Life and Letters*, ed. by Sir James Marchant (1924).

(E. A. PA.)

CLIFFORD, WILLIAM KINGDON (1845–1879), English mathematician and philosopher, was born on May 4, 1845, at Exeter. He was educated at King's college, London, and at Trinity college, Cambridge, where he was elected fellow in 1868. He was appointed professor of mathematics at University college, London, in 1871 and was elected a fellow of the Royal society in 1874. In 1875 he married Lucy, daughter of John Lane of Barbados, who beoame well known under her married name as a novelist, her

most successful story being *Mrs. Keith's Crime* (1885). Clifford died of pulmonary tuberculosis at Madeira on March 3, 1879, leaving his widow with two daughters.

Clifford impressed all his contemporaries as a man of originality; he had a lucid style. wit, poetic fancy and social warmth. Contrary to the analytic tendency of the Cambridge mathematicians, he was "above all and before all a geometer." He developed the theory of biquaternions as a generalization of W. R. Hamilton's quaternions and linked them with the general idea of a linear associative algebra. He recognized the serious difficulties created for Kant's theory of a priori synthetic propositions by the non-Euclidean geometries of Nikolai Lobachevski and Georg Riemann (*qq.v.*). He showed that spaces of constant curvature could have several different topological structures in the large and proved the topological equivalence of a Riemann surface to a box with holes in it.

His suggestion (1870) that matter is a type of curvature of space foreshadowed Einstein's general theory of relativity. Other important papers of his dealt with Abelian functions, algebraic forms and projective and algebraic geometry.

Karl Pearson further developed Clifford's views on the philosophy of science, which were related to those of H. von Helmholtz and Ernst Mach. In philosophy. Clifford's name is chiefly associated with two phrases of his coining. "mind-stuff" and "the tribal self." The latter gives the key to his ethical view. which explains conscience and the moral law by the development in each individual of a "self" that prescribes conduct conducive to the welfare of the "tribe."

His works included: *Elements* of *Dynamic* (1879–87); *Seeing and Thinking* (1879); *Lectures and Essays* (1879); *Mathematical Papers*, ed. by *R.* Tucker (1882); and *The Common Sense* of *the Exact Sciences*, completed by Karl Pearson (1885).

CLIFFORD OF CHUDLEIGH, THOMAS CLIFFORD, 1ST BARON (1630–1673). English statesman, lord treasurer in Charles II's Cabal ministry, was one of the king's most inept advisers, although he mas a man of undoubted personal sincerity. Born Aug. 1, 1630, at Ughrooke near Exeter. he matriculated at Exeter college, Oxford, in 1647 and entered the Middle Temple in 1648. He represented Totnes in the Convention parliament of 1660 and in the parliament of 1661. and became a steady supporter of Henry Bennett (who became Lord Arlington in 1665) in opposition to the chancellor, the earl of Clarendon. On the outbreak of the second Dutch War in 1664 Clifford was appointed commissioner for the care of the sick and of prisoners. Afterward knighted and appointed ambassador to Denmark and Sweden, he served with the fleet in 1665 and 1666, and in Oct. 1667 was one of those selected by the commons to prepare papers concerning the naval operations. In 1666 he mas made controller of the household and a privy councilor, in 1667 a commissioner for the treasury and in 1668 treasurer of the household.

As one of the Cabal ministry, Clifford co-operated zealously with the king in breaking through the triple alliance with the United Provinces and Sweden and in effecting an understanding with France. He was the only minister. besides Arlington, entrusted with the secret treaty of Dover of 1670; he signed it as well as the ostensible treaty shown to all the members of the Cabal. In 1672. during the absence abroad of Arlington and Coventry, Clifford acted as principal secretary of state. He was chiefly responsible for the "stop of the exchequer" (which, through the suspension of all payments for 12 months, gave Charles the use of all revenue) and probably also for the attack upon the Dutch Smyrna fleet. In the same year he was appointed a commissioner to inquire into the settlement of Ireland. On April 22. 1672. he was raised to the peerage, and on Nov. 28. by the duke of York's interest, was made lord treasurer. This excited the jealousy of Arlington, who had always aspired to that office. It was, however, the Test act of 1673 which brought about Clifford's downfall. On the passing of the bill Clifford followed the duke of Tork into retirement. He had, it would seem, been gradually moving toward Roman Catholicism and probably the Test act precipitated his conversion to the Roman faith. His resignation caused astonishment. since he had never publicly professed his religion and in 1671 had even built a new Protestant chapel at his home at Ugbrooke. According to John Evelyn, however, his conduct mas governed by a promise previously given to James. He gave up the treasurership and his seat in the privy council in June. On July 3, 1673, he received a general pardon from the king as a safeguard against a possible impeachment by the commons. In August he said a last farewell to Evelyn, and died at Ugbrooke on Oct. 17. In Evelyn's opinion the cause of death was suicide. but this seems very unlikely. The evidence is not strong nor was such an action in keeping with his character. Evelyn declares him "a valiant, uncorrupt gentleman; ambitious, not covetous; generous, passionate, a most constant, sincere friend." He was succeeded by Hugh, his fifth but eldest surviving son.

See C. H. Hartmann, *Clifford of the Cabal* (1937). (H. G. Ro.)

CLIFTON, a city of Passaic county, in northeastern New Jersey, U.S., on the Passaic river. 8 mi. N. of Newark and 12 mi. N.W. of New York city, between Passaic and Paterson cities. Founded in 1685, it was part of the Acquackanock tract bought by the Dutch from the Lenni Lenape Indians of the Algonkin tribe, an area which early became a major fur trading centre. The settlement was renamed Passaic in 1854 and in 1917 Clifton was detached from Passaic (*q.v.*). It has a council-manager form of government, in effect since 1934. Principal manufactures are steel, chemicals, textiles, electrical equipment, electronics. machinery and paperboard. It is the site of the U.S. department of agriculture animal quarantine station for the eastern United States. Clifton expanded rapidly after World War II. Pop. (1960) 82.084: for comparative population figures see table in NEW JERSEY: *Population.* (D. N. A.; M. P. M.)

CLIMACTERIC, a critical period in human life. In a medical sense, the period known as the "change of life," marked in women by the menopause (*q.v.*). The word is also used to describe any turning point in the history of a nation, a career, etc. See also ENDOCRINOLOGY: *Ovaries.*

CLIMATE AND CLIMATOLOGY. Climate is the average condition of the atmosphere at a locality or over an area. Climatology is the science dealing with climate; it is a subfield of meteorology (*q.v.*). Climate is determined by the daily weather events and their seasonal patterns. It is usually described in terms of a variety of climatic elements. In common practice these include temperature, humidity, amounts of rain and snow, duration of sunshine, cloud amounts, wind direction and speed, weather phenomena such as fog, frost, rain and thunderstorms.

In this article the subject is dealt with under the following main headings:

I. OBSERVATIONS AND CONTROLS

Strictly speaking all atmospheric characteristics are involved. in line with the broad definition given by Alexander von Humboldt in 1845. He refers to climate as "designating in its general sense all changes in the atmosphere which sensibly affect our organs: the temperature, the humidity. the changes in barometric pressure, the calms or the effect of the different winds. the electrical field,

the purity of the atmosphere or its contamination with more or less gaseous exhalations; finally the degree of the usual transparence and clearness of the sky which is not only important for the increased heat radiation of the soil but also for the well-being and moods of humans." Humboldt's all-inclusive definition postulates as important climatic elements several that are eveh now not always observed: barometric pressure, radiation intensity, visibility, evaporation, state of soil, atmospheric ionization and atmospheric pollution.

Observations of the climatic elements should cover several decades in order to describe the climate adequately. From these observations the frequency of various weather events and the range and frequency distribution of measured quantities can be obtained. The arithmetic means of the observed values of various elements have often been used exclusively as a basis for describing and comparing climates. This approach has considerable limitations because it conveys essentially only a static picture of the atmospheric surroundings. These. as evervone knows, belong to the most fickle environmental factors in human life. The mean is mainly useful because it is a statistic readily derived from large numbers of observations. However, the mean is not necessarily the most often observed value (mode) nor does it always split the observations in half (median). All mean values given or depicted in this article should be viewed with this reservation in mind.

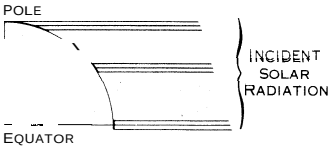

FIG 1.— ANGLE OF SOLAR INCIDENCE ON HORIZONTAL PLANES IN VARIOUS LATITUDES OF THE EARTH

1. Climatic Observations.— The climatic elements are observed at many places on earth. Part of these observations serve primarily the purposes of weather forecasting (*q.v.*), but they constitute a most valuable source of climatic information. It is estimated that complete surface and upper air weather observations are made at about 2,500 weather stations. These are usually manned by full-time. trained meteorological personnel. In addition, there are many observing posts which are primarily devoted to climatology. Most of these take instrumental readings only once or twice a day; often interested laymen act as volunteer observers at these posts. There are about 40,000 such auxiliary stations in the world. Temperature and precipitation are the main elements observed; humidity and sunshine duration are also often recorded., Because rainfall is of such great importance for agriculture and water-supply problems there are about 100,000 supplemental stations, which are only equipped with rain gauges. Solar radiation intensity is recorded at probably not more than 500 stations and even fewer measure atmospheric electricity and air pollution.

Although the networks for observations in many parts of the earth and for many elements are still sparse, the total number of observations is staggering. Some estimate it at 20,000,000 per year. It requires the use of tabulating machines to digest this material to any appreciable degree. In this scheme the observations are punched into a card, the holes in the card corresponding to the observed values. The U.S. hydrographic office first considered the use of punched cards for summarization of marine climatological data in 1895. Actually. the first moderate start with this scheme was made in 1920 and it became the standard processing medium. The punched cards with weather observations have collected at a rate of more than 10.000.000 per year since that time and in the archives of the National Weather Records centre of the U.S. weather bureau constitute a valuable source of raw material for climatological studies. Modern electronic processing machines permit compilations of various statistics from these data at high speed.

2. Climatic Controls.— The climate of a locality is basically governed by solar radiation. This was apparently known to the Greek scholars of the classical period. It was probably Eratosthenes (c. 276–192 B.C.) who recognized that the angle the sun's rays make with horizontal plane is of importance. The inclination (Gr., *klima*) of this plane at a given latitude to the horizontal at the equator governs the average incidence of solar radiation (fig. 1). Ptolemy in the 2nd century A.D., possibly following leads given by Hipparchus (*fl.* 146–127 B.C.), divided the earth into "climates" (klimata) or zones with a change of angle of incidence of solar radiation.

From this the notion of climatic zones developed that were labeled as follows: torrid belt around the equator where the sun is usually close to vertically overhead; two temperate zones, north and south, with intermediate angles of incidence; two frigid zones around the poles where the rays of the sun always have a low slant or are even absent part of the year. It is quite clear that the ancients centred their notions of climate around temperatures as induced in the atmosphere by solar radiation. Long afterward and into the early 19th century the idea prevailed that latitudinal differences alone could account for the varying climates of the earth. Only after actual meteorological observations from all over the globe began to accumulate did the great complexity of climate become evident.

There are four major controlling factors of climate: (1) Intensity of the primary solar radiation at the upper boundary of the atmosphere. (2) Reflection of the radiation (albedo) from clouds, snow, soil and water surfaces. The last two are small, the first two large; fresh snow may reflect as much as 90% of the incoming radiation, but a black soil may absorb over 90%. (3) Distribution of continent and oceans. On land the distance from and direction to the ocean is an important climatic control. (4) Topography, which includes the elevation; the distance to major mountain ranges and the exposure on peak, ridge, plateau. slope or valley. The climate produced by these major controls is technically called macroclimate and it usually characterizes a whole region. In addition, there are a number of smaller local influences. They include the local land forms; the character of vegetation, if any; effects of lakes. ponds, swamps; and effects of human activity, such as the cultivation of soil, city and factory influences. The small-scale variations of climate are designated as microclimate.

II. SOLAR RADIATION

There exists, as yet, relatively little direct information on the

extraterrestrial solar radiation. Rocket flights, starting in the mid-19405, and earth satellites, starting in the late 1950s, have been able to collect measurements in the high atmosphere. (See also INTERNATIONAL GEOPHYSICAL YEAR.)

All available evidence points to a value of solar radiation of about two langleys per minute, received on a surface normal to the radiation at the mean solar distance. One langley (ly.) is equivalent to one gram calorie per square centimetre. This value (2.00 gm. cal./cm.^{2}/min.) is called the solar constant. For the cross section of the earth this amounts to the stupendous energy of $5\frac{1}{2}\times10^{21}$ kw. per year. According to the measurements the solar constant (despite the term) shows some small fluctuations, probably less than 2%. There has been speculation that in the course of the millenniums it might fluctuate over wider limits and cause appreciable climatic changes. Astrophysical views on this point diverge widely.

TABLE 11.—Average Precipitable Water Contents in the Atmosphere
(In inches)

Part of globe	January	July
Northern hemisphere	0.8	1.4
Southern hemisphere	1.0	0.8
h o e earth	0.9	1.1

The distribution with latitude of the solar radiation received on a horizontal surface per day, throughout the year. is shown in fig. 2. The relative steadiness of this factor near the equator and the extreme variations near the poles (from zero in winter to quite substantial amounts in summer) is obvious from the diagram. Thus, if the earth had no atmosphere there would be considerable contrasts between poles and equator through the course of the seasons. In such a hypothetical case daytime temperatures near the equator would reach several hundred degrees and in the winter night at the poles temperatures close to the absolute zero (−459° F.) of space would prevail. The presence of the atmosphere and one of its variable constituents, water vapour, prevents these extremes. Part of the energy received from the sun goes directly back to space by scattering from atmospheric molecules or particles, or reflection from cloud tops and other surfaces. The energy directly lost by reflection amounts for the earth as a whole, on an average, to about one-half of the energy received from the sun. The remainder is absorbed and transformed into other forms of energy. Only very little of it is stored through photosynthesis. Atmospheric processes dissipate most of the energy. It vapourizes water from soil, lakes and the sea. This water vapour condenses again, forms clouds and ultimately is precipitated back to earth. Most of the heat becomes kinetic energy. The balance sheet of these processes is shown in Table I.

III. HYDROLOGIC CYCLE

Considerable transport and transformation of energy take place because of the hydrologic cycle, the change of water to water vapour and back to water. The amount of water stored in the atmosphere is quite substantial. The total amount held at any one time is a function of the mean atmospheric temperature. This amount is called precipitable water. It is larger in the hemisphere in which summer prevails and so the northern hemisphere, which because of its larger land surface has colder winters and warmer summers than the southern hemisphere, also shows a wider range of precipitable water. Likewise, the earth's atmosphere as a whole shows a higher water vapour content during the northern summer season. Table II shows the estimated amounts. In the transition seasons there is some interhemispheric transport of water vapour. Most of the excess in the northern hemisphere between summer and winter must be deposited or precipitated. Autumnal hurricane rains. frost and early winter snow deposits account for most of it. In the heat balance sheet of the earth condensation and evaporation processes contribute probably less than 10%.

IV. ENERGY TRANSFORMATIONS

1. Wind Currents. — The major energy transformations within the atmosphere find expression in the general circulation. This is an equalizing and dissipating mechanism. Cold air is transported from the poles toward the equator, warm air from the equator toward the poles. It maintains the large wind systems which. in turn, are the main motive power of the ocean currents. Through these flows of air and water there is a continuous transport of heat energy from one place of the earth to another. This flow does not take place in smooth currents. but forms a system of rather turbulent streams. Embedded in meandering broad air currents are eddies in the form of low-pressure systems called cyclones (*q.v.*). Guided by longer waves in the currents, these pass in unending sequence over various localities on the earth. They bring alternately cooler or warmer, drier or moister air masses. The relative frequency of each of these determines the climatic character of a place. Although the position of the large air currents is not fixed by firm banks as water in a river, the general location is governed by the sources and sinks of heat, the distribution of land and water and the mountain barriers. Therefore each region bears the stamp of a specific climate even though many areas show frequent day to day or marked seasonal changes of weather.

The hubs of these atmospheric currents are a series of semipermanent high-pressure areas (anticyclones). which in some regions are more or less fixed features even though the absolute pressure values vary seasonally. These anticyclones exist as a result of combinations of dynamic forces and thermal conditions. Other anticyclones, strictly seasonal in character, form in higher latitudes over the continents during winter. Air from these reservoirs is fed to the areas with lower pressure. Fig. 3 and 4 show the mean pressure distribution over the globe for the mid-months of the extreme seasons, January and July, and the semipermanent high-pressure cells in the subtropical latitudes, 20° to 35°. These anticyclones are particularly pronounced as an almost continuous belt on the southern hemisphere at the height of the southern winter (July). In the northern hemisphere they are best noticed in the western quadrant. Toward the equator the circulation is fairly simple. The surface air flows there from both subtropical high-pressure belts. with northeasterly winds on the northern hemisphere and southeasterly winds on the southern hemisphere. Over the oceans these winds are so steady that they earned the name trade ("steady on course"!) from the mariners of the sailing ship era. Near the equator the trade winds slacken and converge into a general, weak easterly drift. At the origin of these winds, the outflow area,

FIG. 3.— WORLD DISTRIBUTION OF MEAN ATMOSPHERIC PRESSURE AT SEA LEVEL IN JANUARY (H=HIGH; L=LOW; PRESSURES IN MILLIBARS)

there is generally subsidence in the atmosphere. Few if any clouds form in the descending air, there is a scarcity of rain and the sun often blazes mercilessly for days or even months on end (see fig. 5).

Where the trade winds converge, ascending, occasionally colliding, air currents become prevalent; clouds and heavy showers are frequent. (See fig. 6.) The position of the convergence zone shifts through the year from about lat. 10° N. to 10° S. The continents somewhat disrupt the latitudinal regularity of these zones, but even over land the effect is well pronounced in the occurrence of the rainy seasons. Some localities which are passed twice when the conflicting currents cross the equator from one hemisphere to the other have a characteristically double-peaked rain regime during the year. Table III shows two examples: one represents a continental case from equatorial Africa where the peaks of rainfall about coincide with the equinoctial zenith of the sun; the other is from an equatorial island in the Pacific where the rainfall peaks occur after solstice. This probably corresponds to the maximums of development of the moisture-bearing trade winds.

Poleward of the semipermanent high-pressure systems are the realms of the westerly winds. On the southern hemisphere these westerlies are again a well-pronounced belt between about 40° and 60° latitude. There is almost no land to introduce complications into the circulation pattern. Into an endless procession of low-pressure systems, embedded in the broad westerly current, flow the warm air of the subtropics and the cold air from the Antarctic.

Since the cold air masses are warming in the process and the warm air is cooling, they compensate the inequalities introduced by the primary radiative processes and dissipate the energy imparted by the sun.

The described mean pattern of circulation represents primarily the conditions in the lower layers of the atmosphere. At higher levels quite different conditions exist. Aloft the winds are usually moving with much higher speeds than near the surface. In the middle latitudes the dynamics of the system produce currents of

FIG. 5.—WORLD DISTRIBUTION OF MEAN ANNUAL HOURS OF SUNSHINE

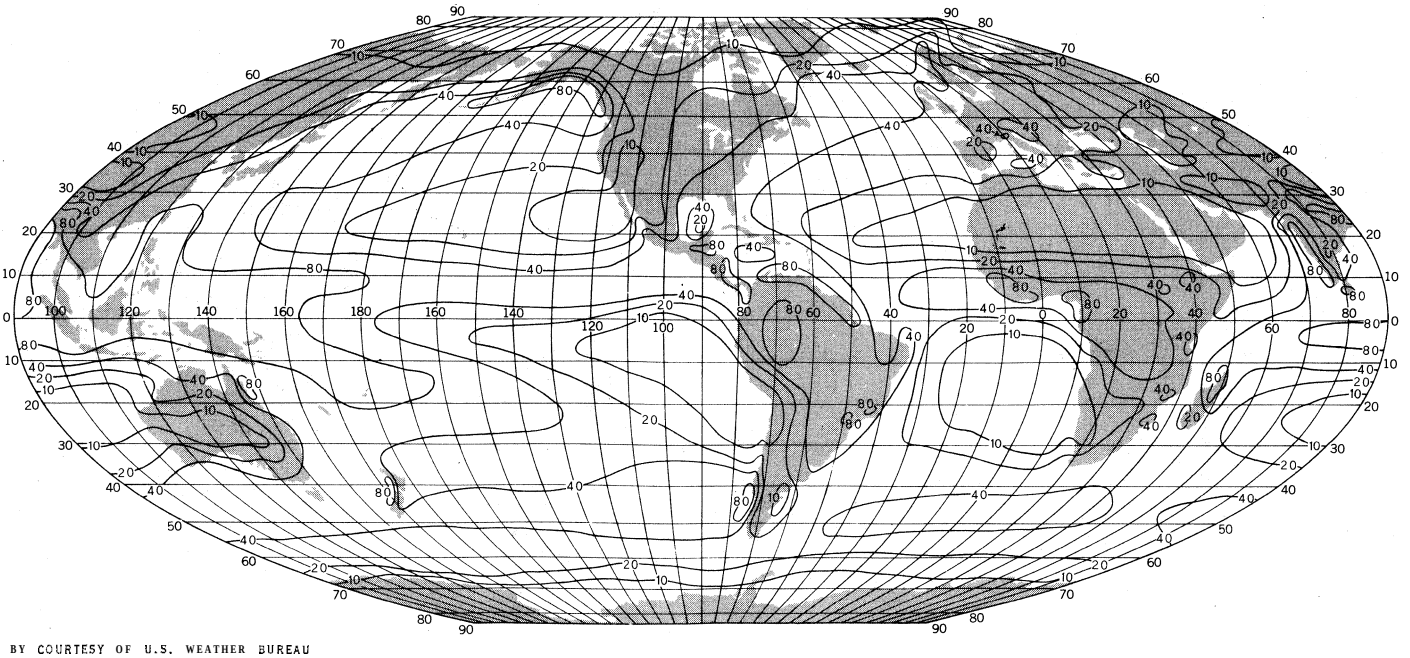
extraordinary velocities. called the jet stream. Speeds in excess of 200 m.p.h. are occasionally observed and, in the cold season, mean speeds of 100 m.p.h. are prevalent. The core of these jet streams is located just below the tropopause, which is the boundary between the troposphere and the stratosphere. The whole upper air motion, up to the stratosphere in nearly all latitudes—except for the zone nearest the equator—is westerly.

An idealized picture of the velocity vectors at 30,000 ft. can be seen from fig. 7. Sear the equator easterlies still prevail even at that height.

In the northern hemisphere the alternation of continents and oceans produces major modifications of the simple planetary circulation, which would be present in the atmosphere of a rotating planet with a uniform surface. This can readily be seen from fig. 3 and 4 which show the mean conditions. In January (winter) high pressure has been built up over the continents by radiative cooling and lack of heat reserves, such as are available in the ocean. through heat capacity. convection and currents. Over the oceans, therefore, relatively low air pressures prevail on an average.

In summer the opposite pattern prevails; the continents in moderate and high latitudes show lower air pressure, mainly caused by quick radiative heating. than the slowly warming oceanic water masses. Hence north of the subtropical high-pressure belt the zone of the prevalent westerly winds in the northern hemisphere becomes a complicated battlefield of air masses. In winter the dominant flow is from the northwest. Winds come from the cold high-pressure cells which form over the continents. This may lead to pronounced seasonal winds (monsoons). which in winter blow from land to sea, such as the well-marked east Asiatic land monsoon.

The cold. dry air transported by these winds interacts with



BY COURTESY OF U.S. WEATHER BUREAU

FIG. 6.—WORLD DISTRIBUTION OF MEAN ANNUAL RAINFALL (IN INCHES)

warmer, moister maritime air masses from the ocean. Along the interface, or front: of the continental polar and the maritime air masses snow or. in lower latitudes, rain ensues. Eddies often form along this polar front. These circle the middle latitudes as migrating low-pressure systems.

In summer over the northern hemisphere continents warm and dry continental air masses form. 'Against these, cool maritime air advances from the ocean. In some areas these excursions of moist oceanic air are relatively regular and lead to the summer monsoons which are coupled with copious rainfall. These are particularly pronounced along the southeastern shores of Asia but similar tendencies. if not quite as steady and regular, are noted from the other continents.

In the late summer other climatically important weather formations occur. Waves form in the outflowing easterlies from the poleward-displaced subtropical high-pressure cells over the oceans. These may be provoked by high-level invasions of polar air into lover latitudes. These waves often curl into tropical cyclones. They affect the east coast of Sorth America, the Caribbean, east Asia, the Bay of Bengal, Madagascar and the South Pacific islands. Their climatic significance. aside from the destructive winds. is the abundant rains precipitated from the extremely unstable. moist, maritime tropical air masses.

FIG. 7.—SCHEMATIC DIAGRAM OF UPPER WESTERLY WIND AT 30,000 FT. ON THE NORTHERN HEMISPHERE

The circulation and climate of the two polar regions, too, are primarily governed by the geographical features and the great yearly swing from dark to light There are still large gaps in our knonledge because of the paucity of observations from these areas. In the arctic basin there are frequent migratory pressure systems. These are more prevalent in summer than in winter. In winter the contrasts to the surrounding continents is not too pronounced. If anything. the high-pressure centres with outfloning air and the poles of surface cold are well to the south of the geographical north pole. In general. a light easterly circulation is prevalent near the surface. In summer moving Ion-pressure areas, reminiscent of but usually a little weaker than in the zone of westerlies. govern the exchange of air masses.

In the antarctic a rather different pattern prevails. The highland terrain of the continent surrounding the south pole nith its permanent ice cover strongly tends to be a source of outfloning cold air. To the north is only ocean territory. governed by an intense zonal low-pressure trough nith its roaring westerly ninds The antarctic air feeds into the eddies of the nesterly current. but there is less influence of these eddies upon the polar zone than in the arctic. The cold pole and the geographical pole coincide closely.

Table IV gives the general features of the climate of the earth, as related to the latitude.

2. Air Mass Climate. — The general circulation, in part provoked and modified by the continents, oceans. mountains and ice fields, transports a variety of air masses hither and yon. The high-pressure cells become the source regions of air masses. The semi-permanent high-pressure areas of the subtropics over the ocean are the breeding grounds of narm-moist tropical maritime air; when located over land they furnish hot-dry continental air. The winter high-pressure areas of the polar latitudes produce cold polar continental or arctic air masses. Their usually less stable counterparts over the oceans in higher latitudes during summer are the sources of cool-moist maritime polar air.

Every locality derives its climatic character from the air masses which pass over. The frequency of various types usually changes with the seasons. In some locations circulation and geographic position cause few changes, consequently the climate is very monotonous. Examples are tropical islands in the trade wind zone where even temperature. high humidity, variable cloudiness. frequent rainfall and steady wind cover the same range day after day and often month after month. In some of the low-latitude deserts similar monotony prevails. There, of course, humidity is low and rainfall nearly absent. In fact, in some of these places the diurnal (daily) variation of temperature is greater than the annual swing. It is not uncommon to have daily maximums and minimums 40° F. apart with a difference of only 10° F. of the mean temperatures of the warmest and coldest months.

In contrast to these monotonous climates, we find many places, especially in the belts of westerlies, which are subjected to rapid. and occasionally violent, changes of air masses. The borders of the continents in latitudes 40° to 60° are particularly affected. Continental and maritime. tropical and polar air clash frequently: bright sunshine alternates with overcast. shon-ers n-ith steady rain. calm with brisk winds turning through all points of the compass. Rarely does the same air mass prevail for more than a couple of days.

The changeability of weather in Scotland and New England is proverbial and typical of this kind of climate. In these regions there are wide swings from day to day in all climatic elements but the difference between the extreme months may not be so great. The seasonal amplitudes of climatic elements are largest in the interior of the continents. especially in the higher latitudes, where they come about in a less turbulent fashion. A weather type once established is apt to last for days or even weeks.

3. Continental and Oceanic Climatic Types. — The contrast of the seasons can be described by the annual range of temperature. This range is defined as the difference of the means of the months having the largest and the smallest value. The widest swings are found in mid-continental areas: this condition contrasts with small ones in mid-ocean areas. (*See* fig. 8.) The annual temperature range can be used to distinguish between maritime and continental climatic types. In the most extreme case of continentality, in north-central Asia. the range is about 120° F. On the North American continent the largest annual ranges approach go" F. In the southern hemisphere where the continental expanses are much smaller than in the northern hemisphere the annual ranges, even inland. rarely exceed 30° F. In typically oceanic climates the annual ranges stay below 20° F.; exceptions exist only in the polar oceanic regions where permanent or seasonal ice produces the same effects as a land surface. Ice surfaces lose heat rapidly by radiation and the winters become very cold. In the warmer season until the ice disappears the temperatures stay. of course, close to the freezing point.

Aside from the great range, another characteristic of continental climate is the rapid transition from warm to cold in autumn. The lag of the temperature extremes behind solstice is usually quite short. In the northern hemisphere January is the coldest month and July the warmest. Spring in some subpolar localities is retarded because solar energy is first used in melting snow and ice. Typically continental climates are apt to have their precipitation maximum in summer, often in the form of showers.

In oceanic climates there is commonly more time lag of the thermal extremes behind the solstices. In the oceans of the northern hemisphere August is often the warmest month. The shore

FIG. 8—WORLD DISTRIBUTION OF MEAN ANNUAL TEMPERATURE RANGE (IN DEGREES F.)

areas benefit from the oceanic effect. In regions where onshore winds prevail. warm temperatures may persist long into autumn. Likewise; extreme summer heat rarely occurs because of transport of cool maritime air ashore. The influence of ocean currents and prevailing winds on the shore areas is quite marked. In the zones of the westerlies this leads to considerable contrast in climate of the west coasts and east coasts in the same latitudes. For example; in western Europe the onshore winds carry the maritime influence hundreds of miles inland; this' results in mild winters, cool summers, considerable cloudiness and even precipitation throughout the year. In the same latitude ih east Asia cold. dry winters and hot, wet summers are the normal rule. On the west coast of the Americas the maritime influence does not carry far inland because of the north-south mountain chains rising close to the shore lines.

Maritime climates, in general, have ample precipitation. There is, however, no uniformity in the course of the year. It depends on the circulation belt in which an area is located. Some have pronounced rainy and dry seasons, particularly in the tropical and subtropical areas where the belt is tied to the shifting trade and monsoon winds. In the zones of the westerlies the distribution of precipitation is more even. The same holds for the variability of rainfall from year to year.

The maritime climates of the moderate latitudes show the greatest reliability of rainfall. The highest variability is encountered in some of the subtropical areas under the influence of the semipermanent high-pressure cells, including some islands which have otherwise a typically maritime climate. However. the shift of ocean currents following changes in the wind patterns may bring about very dry years followed by extremely wet years. An example is Malden Island (4" S., 155° W.). During a 30-year period the mean annual rainfall there was 28 5 in.; the lowest annual value was 3.9 in.. the highest 93.3 in. This example not only shows the extreme local variability, but also illustrates the care needed in the proper interpretation of mean values. Standing alone they do not reflect the changeability of the atmosphere from year to year; a measure of the range or dispersion of events and values is usually needed as corollary information. World maximum and minimum temperature extremes are given in Table V and maximum and minimum rainfall extremes in Table VI.

The contrast of continental and oceanic climates extends to all climatic elements. including temperature and precipitation. The average difference between the highest and lowest temperature of a day in mid-ocean usually does not exceed 3° F. On small islands and right at the coast this daily range generally remains under 10° F., while a few hundred miles inland it normally exceeds 15° F. Similarly. in maritime climates, the temperature variations from day to day are smoothed; in continental climates the interdiurnal contrasts increase. In the zone of the westerlies the day to day temperature changes on the west coasts of North America and Europe average only about 3° F. and in the mid-continent of North America and Eurasia they average about 6° F. On the east coast of the two continents where the continental influences predominate over the maritime effects, the interdiurnal change is still 5° F.

There is usually a decrease of humidity from the shores toward inland, as well as a decrease of mean cloudiness and wind speed, but an increase in sunshine.

The interactions of atmosphere and ocean have many profound influences on climate besides the broad contrasts between land and water and the effect of distance from shore. The major wind systems and ocean currents are closely linked but the oceanic drifts are, in part, governed by the configurations of the ocean basins. In addition, onshore winds on some coasts cause the upwelling of cold water from the deeper oceanic layers. Wherever this occurs a profound effect on the coastal climate results.

INSTRUMENTS FOR DETERMINING CONDITIONS OF THE WEATHER

1. Mercurial barometer, invented by Torricelli in 1643. Each tube holds a column of mercury, which rises and falls according to pressure of surrounding air. 2. Anemometer, for measuring velocity of wind. Three cups attached to horizontal arms revolve at speed varying according to Wind velocity. 3. Windvane or anemoscope, indicates direction of the Wind. This 4-ft. vane may be connected with the recording instrument (fig. 4). 4. Weather recording register equipped to record changes at one-minute intervals. Instrument registers the velocity and direction of wind, rainfall in hundredths inches and the duration of sunshine. 5. Tipping bucket rain gauge, in parts. 6. Standard barograph or recording aneroid barometer, with cover removed. 7. Intermediate range thermograph which traces a continuous record of the temperature on a revolving drum. 8. Thermal sunshine recorder, electrically connected with recording instrument (fig. 4), determines duration of sunshine

As a broad picture we find on the east coast of continents warm currents existing between latitudes of 0° to 40° and cold currents in the higher latitudes. On the west coasts there are moderately warm currents between 0° and 20° latitude. In the moderate latitudes, 20° to 40°, the west coasts have cold offshorewaters and above 40° are heated by warm drifts.

One of the remarkable effects of these currents is the distortion of the latitudinal belts of temperature at sea level elevation. For example, places on the west coast of Europe have the same mean annual temperature value as localities 10° farther south on the east coast of North America.

The littorals with cool upwelling waters, as the north Chilean and southwest African coasts, are characterized by a climate with little precipitation but frequent fog or low stratus clouds. Similar conditions occur seasonally along the coast of California in summer.

4. Mountain Influence on Climate.— Equal in magnitude to the effects of ocean currents on shore climates are those produced inland by mountains. The extremely high ranges, such as the Andes. Rockies. Alps and Himalayas, exercise strong modifying influence upon the general circulation. Their effect is by no means restricted to the immediate mountain zone, but reaches somewhat upstream and farther downstream. The extensive upper air data available show that in the case of the Rocky mountains the direct influence extends nearly 1,000 mi. to the east. In all mountains the effects on the upper air currents can generally be detected up to heights of twice the mean elevation of the ranges. In most instances mountains become sharp boundaries between various climates, quite aside from the special climates prevailing in the mountainous areas.

A most noteworthy effect is the decrease of temperature with elevation. This occurs also in the free atmosphere. In mountains it is complicated by diurnal changes in convective and gravity flow of air. During the day, with warming slopes, there is a general tendency for upslope motions; at night, with cooling on the slopes, there is a downward directed wind flow. The flows are most pronounced in clear weather with weak general winds. The regular winds. changing from day to night, are often referred to as mountain and valley breeze, and in some places they are distinct features of climate.

A further effect upon the temperature change is produced by condensation in ascending air currents. In upslope motion air expands according to the decrease in pressure and consequently cools. If it is cooled below its dew point the water vapour condenses and liberates the heat of condensation. Thus, while dry air cools at a rate of 5.5° F. per 1,000 ft.. it is considerably less in moist air .after condensation sets in. For this reason we find that in the tropics. in the lower layers, the temperatures on the windward slopes decrease about 3.6° F. per 1,000 ft. of elevation. About the same temperature lapse rate prevails in the moderate latitudes in summer. There, in winter, the lower layers and valleys are often filled with dense, heavy, cold air. Then the temperature in lower elevations may be less than on the higher slopes. This is called a temperature inversion, which is often a peculiarly characteristic climatic condition of valley and basin locations in mountainous country. Temperature inversions are most common during clear, calm periods. When fresh winds prevail the normal decrease of temperature with height is re-established.

The mean decrease in the moderate latitudes during winter is only 2.2° F. per 1,000 ft. The above rates of decrease are generally valid t~ about 12,000 ft. elevation.

On the windward sides the lapse rate is usually less because of condensation processes. The upslope motion of air crossing mountains causes increased cloudiness, greater humidity and more rainfall, level for level, on the windward side than to the lee. The daily, annual and absolute ranges of temperature are small on the windward side and large on the lee. Usually the wind speed is also higher on the wind exposed slope.

The crests of extended mountain chains. especially if they are at right angle to the prevailing winds, form the boundaries between climatic provinces. In many instances they are climatically a more pronounced demarcation line than coasts. A few examples will illustrate this: In North America the west slopes of the coastal ranges, the Cascades, the Sierra Nevada and (to some extentj the Rocky mountains are cool, wind-swept, rainy and cloudy. The basins east of these chains are sunny, dry, and approach desert conditions. The southern Andes in the west wind zone of South America exhibit the same characteristics. In Europe the Alps block many of the cold maritime polar air mass invasions from the North Atlantic areas. Thus we find the winter contrast of the cloudy, snowy northern slopes in Switzerland, Germany and Austria to the sunny and warm area in Italy on the southern side.

Such dissimilarities in climate are, of course, also found north and south of the Himalaya massif. Not only are most of the cold winter air masses blocked from entry into India but the same range has extraordinary rainfalls on the south slopes in summer from the sea monsoons in contrast to the arid regions to the north.

One of the features of mountainous regions are the descending air currents on the lee sides. They bear the technical name katabatic winds. As a direct consequence of the fact that the air masses in crossing the mountains have lost their moisture on the windward slope, they are usually warm and dry. As they cross the crests and descend they are compressed and heated at the rate of 5.5° F. per 1,000 ft.

In many regions these winds bear special names; in North America the best known is the chinook of the Rocky mountains; in Europe the foehn. a south wind crossing the Alps, is most famous. In winter these winds cause rapid melting of snow. In other seasons, the extreme dryness introduces exceptional fire hazards in the forests, especially if the winds are sustained or recur often. Some have ascribed particular effects on human health to the winds. They are alleged to cause irritability, headaches and to induce asthmatic attacks. The reasons for these effects are obscure. The frequency of the katabatic winds is one of the elements which is used to describe the climatic conditions of a mountain area.

The different prevalent combinations of precipitation, temperature, humidity. sunshine and katabatic winds on the various slopes of mountains determine the height of the snow line. In the high mountains differences of 1,000 to 2.000 ft. between windward and lee sides are quite normal. (For the general latitudinal variation of sea-level elevation of permanent snow see Table IV.)

The heavier precipitation on the windward slope plays an important role in the alimentation of glaciers. These, in turn, promote cold mountain winds which descend into the valleys. This exercises an important local climatic influence in the mountains of higher latitudes where glaciers occupy the higher valley areas.

A special type of katabatic wind is caused when cold air masses are forced by pressure differences to descend from cold, sometimes frozen. highlands to a warm sea. Even after their descent and

warming by compression they still are colder than the warmed sea air they replace. These cold downdrafts are often called bora after the name they bear locally on the east coast of the Adriatic sea. They are well known on the shores of Greenland and the Antarctic continent.

High, extended mountain ranges show all of the various climatic influences just outlined, but even smaller ranges produce considerable effects locally. If exposed to moist air masses they wrest more water from them than lowlands, thus influencing water supplies and flood hazards in the region. The most important climatic influences of smaller ranges are the cold nighttime slope flows and the formation of cold air pools in topographic depressions and valleys. The temperature inversion with cold bottoms and warm crests leads to more frequent ground fog formation. In the cool regions this inversion is the cause of increased frost frequency. Wherever human activity leads to ,air pollution the contaminating products will accumulate under such conditions. In the cold season the inversion may continue through the day and, with stagnating weather, even persist for prolonged periods, leading to an obnoxious and irritating combination of smoke and fog, popularly named smog. Industrialization and urbanization have brought about this new climatic element. Mountainous topography favours high smog frequencies. (See also WIND.)

5. Mesoclimate and Microclimate. — Smaller features of terrain and landscape have a locally significant effect on climate. If the influence extends horizontally over several miles and vertically a few hundred feet it creates a mesoclimate, as distinct from the regional or macroclimate. If the effect exists only on a small scale from feet to a mile horizontally and up to tree or house height it creates a microclimate.

The mesoclimate is governed primarily by smaller ranges of hills, lakes, rivers and individual glaciers. The influence of hills is different from that of mountains only in the degree to which it becomes measurable. The differences of precipitation between windward and lee sides are usually overshadowed by the effects of hills on wind speeds and temperature.

In winter, particularly. the inversion conditions become most obvious, and the effects of larger lakes are definitely pronounced. In spring they develop notable lake breezes which exercise a cooling effect on the shore areas. In winter. if not frozen, they furnish heat and moisture to cooler air masses which cross them and this leads to additional precipitation and higher mean temperatures on the lee shores. Lakes which freeze tend to depress the temperatures of their shores in spring until they thaw and become warm. These same lakes cause autumn to linger a little longer in the vicinity until the ice cover forms. The effects of glaciers have already been discussed.

In the microclimatic realm the horizontal and vertical scales of the phenomena are even smaller; nonetheless, the climatic effects remain pronounced. In fact, microclimates are often more readily accessible to differentiation by measurements than mesoclimates. Vegetation, soil conditions. small-scale topography and man's structures and activities cause the microclimatic differences. Trees. hedges, furrows, grassland; houses, asphalt and concrete surfaces, concave and convex land forms are the governing elements of microclimate. Radiation exchange greatly influences the layer of air near the surface. Therefore sizable differences in short distances develop on clear days and nights; on cloudy days the differences are less.

Wind is next in importance. On calm days the microclimatic differences have the best opportunity to develop. Strong winds tend to minimize and equalize the spot differences. The water balance, precipitation and evaporation, are markedly affectedby soil type. soil condition and vegetation. Their rapid variation within small areas will cause additional, though secondary, gradations of the microclimate.

The temperatures of air and soil are the most readily available indicators of microclimatic differences. Although the temperature changes in the course of a year penetrate 30 to 50 ft. into the ground. depending on soil type, the diurnal variations stay mainly within the first two feet.

In the air the major microclimatic differences are often found below the normal j- to 6-ft. height of thermometer shelters. The typical conditions on a soil with short grass for a dry, sunny day are exemplified by the difference between the highest and lowest temperature:

Item	Air above soil					Soil below surface				
Inches. . .	60	36	20	4	2	0	2	4	20	36
Daily range, °F.	28	30	32	34	38	43	18	12	2	0

Thus the diurnal temperature variation vanishes within the first three feet of soil and is greatest right at the surface. In the case shown the soil surface was 5° F. colder than the air at 5 ft. at the time of the daily minimum in the early morning, while at the time of the afternoon maximum the surface was 10° F. warmer than the j-ft. air temperature. The soil condition exercises a profound influence on the soil temperature. On the same day the range just below the surface with short lawn was 20° F. but in a patch of bare ground it was 60° F.

In bright sunshine exposed surfaces such as roofs: pavements, parked cars or aircraft can show extremely high temperatures. The rise above the air temperature in the shade depends upon the reflection characteristics of the surface — a black surface will become hotter than a white or shiny one. Temperature measurements on surfaces show common increases for various surfaces in sunshine: concrete road 10° F.; asphalt drives, asphalt shingles 30° F.; car roofs. rails 40° F. Similarly, a black soil will show a higher daytime temperature than a light sand. In nature snow and ice surfaces show particularly high reflectivity. Hence little heat is accumulated in daytime. and nighttime radiation from these surfaces will tend to accentuate low winter temperatures in the blanketed areas.

Plant cover materially alters the microclimate. The tops of plants, whether crowns of trees or tips of crop plants, in a dense stand form a new effective surface. The extreme temperature range otherwise observed at the soil surface may become transferred to this level. Inside the forest or crop stand the temperature variations will be much more moderate. This is shown by the following representative vertical temperature distribution in a dense pine forest in the early afternoon of a clear day and the temperature range between the highest and lowest value during the day:

Forest levels	2 P.M., ° F.	Daily range, ° F.
Forest soil surface . .	66	10
Six feet above ground . .	67	11
Half-height of trees . . .	68	12
Tree tops . . .	73	19
Air above tree tops . . .	71	16

The plant cover also has a profound effect on the water cycle. It contributes to the water consumption by metabolism and transpiration, but it also conserves water by preventing direct evaporation and runoff which is rapid on bare soil. The well-known farm practice of mulching is directly designed to change microclimate by reducing evaporation and lowering soil temperature extremes. Widespread removal of plant cover causes greater local extremes of temperature. It also results in desiccation of soil and dust blowing. Conversely, a permanent plant cover will decrease local temperature extremes, increase the humidity of the air and prevent dust storms. There is some evidence that forestation on a large scale results in moderate rainfall increases. It also considerably retards melting of snow in spring, thus reducing flood hazards in mountainous areas. If the slopes become denuded. spring runoff from melting snow occurs with such rapidity over still-frozen soil that the flood danger is greatly increased.

Wind conditions are markedly affected by surface character. For this reason the wind measurements used in meteorology for forecasting purposes are made well above the ground, usually at least 30 ft. high. The low-level wind conditions in the microclimatic zone are governed by the terrain roughness. In the lowest layer of air above a smooth surface, such as a runway,

the wind speed increases with height according to a logarithmic law—as height increases by factors of 10, the wind speed doubles. Thus if a wind of 5 m.p.h. is noted at 1-ft. height, it will be 10 m.p.h. at 10 ft.. and 15 m.p.h. at 100 ft. Over rough surfaces the wind usually becomes turbulent, particularly in midday when the vertical temperature distribution causes unstable conditions.

Inside of plant growth. whether crops or trees, the wind speed is much reduced, being usually less than half that measured just above the tops of the plants. Close to the ground the frequency of calms increases markedly, which is one of the reasons for the reduced evaporation with plant cover because less water vapour is carried away. In many instances, however, increased transpiration by plants more than compensates for this conservation. Even so. the microclimatic effectiveness of hedges and shelter belts for crop protection is beyond doubt. The decrease of speed downwind in percent at distances of various height-multiples of the shelter is: 65% for 3 heights. 50% at 10 heights. 35% at 20 heights. If the wind in front of a hedge 10 ft. high is 10 m.p.h. it will be: 3.5 m.p.h. 50 ft. downwind, 5 m.p.h. 100 ft. downwind and 6.5 m.p.h. 200 ft. downwind.

6. City Climate. — A specialized case of microclimatic influence is represented by human settlements. Considerable alterations of the natural climate are caused when fields and forests are replaced by homes and factories, by steel and stone. The change in surface conditions from the spongelike structure of the natural soil cover to the well-drained asphalt, concrete and roof area creates an effect approaching desert conditions. As cities grow. domestic and industrial furnaces as well as large numbers of vehicles add heat and combustion products to the air, and these also change the climate.

All climatic elements except atmospheric pressure are appreciably changed in towns. Metropolitan areas, with cities surrounded for many miles by satellite towns and industrial fringes, have a distinct climate of their own.

The most striking change from natural surroundings occurs in the composition of the air as many gaseous and solid suspensions are added. Some of these are noxious in themselves, others become so through photochemical reactions under the influence of sunlight. Whenever natural circumstances are unfavourahle, irritating smogs form. The principal conditions are light general winds. clear sky and subsequent development of temperature inversions at or near the surface. In this stable air stratification. pollution products keep accumulating until stronger winds with turbulence, intense surface heating or rainfall permit convective dissipation. dilution or precipitation of the concentrated smoke elements. The buildings of a city cause a decrease of wind speed at street level. comparable with the changes observed inside a forest or to the lee of a shelter belt. The effective surface for radiative processes in the densely built-up areas will be located at roof level. These conditions retard the self-cleansing processes in the atmosphere. The magnitude of the pollution influence can be gauged by the fact that in the major industrial cities several hundred tons of dust settle on each square mile of land per year.

In city areas the visibility decreases and the number of fogs increases markedly, because many of the fume particles act as centres for condensation of water vapour. sometimes even before saturation is reached. Actually, much steam is also added by some industrial processes. which leads to the remarkable apparent paradox that although the average humidity in cities is from 4% to 8% lower than rural areas, cities have ten times as many fog days. In reality. the lower humidity figures apply mostly to the warmer season; the higher fog frequency to the colder part of the year. The contamination of the air also decreases the solar radiation intensities received in cities by 15% to 20% and especially reduces the amount of ultraviolet radiation received, particularly when the sun is low above the horizon.

Most obvious from the climatic records is the temperature increase in urban areas. most pronounced in the nightly minimum. These are, on an average, 2° to 3° F. higher than in the open country; however, on clear calm nights the city may show as much as 8° or 10° higher night temperatures than the rural areas. The annual mean temperature in most cities of the temperate zone shows about 1° to 2° **F.** excess which has to be attributed to urbanization. It has been noted that for the nonworking days this excess is cut in half.

In the built-up areas wind speed is considerably reduced even at roof height. This amounts to about 25% less than at the same height in the natural surroundings Yet turbulence and convection on windy and sunny days is increased over the city; on sunny summer days the city air becomes a region of updrafts, often noticed by the formation of cumulus clouds. In low-level flying it is felt as "bumpiness" of the air. In some localities this tendency may even lead to showers. In winter the pollution products introduced into passing cloud layers may, under suitable conditions, act as freezing nuclei. which in heavily industrialized areas leads to added precipitation in the form of drizzle and snow flurries. These regions experience about 10% more days with precipitation of less than .2 in. Although it is an extremely variable factor, added nuclei and water vapour, coupled with the convection have caused rainfall increases from 5% to 15% over some of the industrial conurbations.

7. **Bioclimate.**—Life processes and climate are intimately related. The atmospheric conditions are perhaps the most powerful environmental factor in plant and animal life. *(See* ECOLOGY, ANIMAL: *Principle of Succession;* PLANTS AND PLANT SCIENCE: Plant *Ecology.)* There is certainly no doubt that climate determines the indigenous plant cover. **A** plant has to be adapted to the climate in order to survive. In many areas it must be able to withstand the wide swings that are quite common. It cannot migrate as can animals or man. Hence, if a plant, such as a tree, can stand and prosper for years or even centuries in one locality it must certainly be adapted to the prevalent climatic regime. Few species are ubiquitous. Most plants and. even more so. plant associations are quite characteristic of the climatic conditions. This fact has even led ecologists to designate climates by the primary plants which dominate an area in its natural state.

Crop plants are equally dependent upon climate. although modern plant breeding has permitted some leeway by producing varieties which are hardier or mature in shorter time intervals. Technological advances. such as irrigation procedures or orchard heating, have permitted temporary or permanent corrections of climatic deficiencies. Microclimatic ameliorations by mulching. shelter belt planting and combination of greenhouse and free land cultivation have expanded the natural habitats of the more expensive crop plants. Yet, by and large. nature still controls what farmers can grow.

Most animals likewise are bound to climatic zones, with some species of course being adaptable to a relatively wide variety of climatic conditions. They can develop subspecies, varieties or races which may be found in many places. In the domesticated animals man has succeeded in breeding characteristics which make successful survival in nearly all climatic zones possible. In nature many species, commonly among the birds. have developed migratory habits. which permit avoidance of seasonally unfavourable climatic conditions. Even so. the animal associations found are dependent on the food supply. which in turn in herbivorous species is climate bound. This dependency also keeps the range of predators close to a specific climatic region.

Even in the oceans, climatic conditions closely govern many classes and species. Some types with shells are so sensitive to temperature changes that they can be used as index animals; *i.e.,* if their shells are iound in geological deposits a direct inference can be drawn about the ocean temperature extant at the time the deposit was formed. This property. mostly encountered among some one-cell *foraminifera,* has been used to deduce paleoclimatic conditions. Actually. fossil evidence of both animal and plant remains has been the principal tool for investigations of the climates of the prehistoric and geological past.

Most marine animals, whether sessile or mobile. are to some extent sensitive to climate directly or to conditions affected by climate. such as salinity. In case of ground-bound species the effect is usually direct. In the mobile species it is more related to the relative abundance of food supplies. particularly plankton which is subjected to climatically controlled elements of drift,

temperature and, in coastal waters, precipitation! which affects salinity.

Thus, the natural vegetation and associated fauna are on a broad scale adapted to average temperature and precipitation conditions. Crop plants, although often pushed by cultivation practices to the margins, flourish in specific optimal climates. There is no important vegetation possible in areas where the mean temperature of the warmest month stays below 42° F., nor is there any appreciable vegetation in lands where the mean annual rainfall stays below 10 in. As temperatures and precipitation increase above these limits various characteristic plant associations appear.

The subpolar regions. where the warmest month has at least a mean temperature between 42° and 50° F., is the realm of the tundra, where mosses, lichens, a few flowering plants and low bushes prevail. During the short frost-free season the topsoil is moist, and even though little precipitation falls, evaporation is also minimal. In the short summer mosquitoes are all-pervasive. Caribou, musk ox, reindeer. lemmings and polar bears manage to eke out an existence. In the subpolar seas. however, close to the limits of permanent ice, wildlife is abundant during the summer months, with seal, walrus and whale among the seasonal visitors.

The taiga is found in the subpolar areas where at least one to three months have mean temperatures above 50° F., with usually six months below the freezing point and precipitation between 10 and 20 in. annually. This is forest land composed of conifers—spruce, fir, larch, pine and hemlock. Much economically important lumber is harvested there, and in cleared spaces some marginal agriculture is possible where the freeze-free season lasts from 70 to 90 days. Barley, rye. potatoes and berries are among the possible crops. The long daylight hours of the subpolar regions are important to the ripening process. The forests are the habitat of some of the best fur-bearing animals such as the bear, beaver, ermine, fox! lynx and pine marten.

In the middle latitudes a great variety of climates exists. In the northern hemisphere the cool continental type is quite widespread. About half of the months each year have mean temperatures over 50° F.; in from one to four months the mean stays below 32° F.; snow cover in winter is common, with summer rainfall also adequate. It is the area of deciduous trees: beech, birch, chestnut, elm, maple, oak and poplar predominate. Fruit trees are cultivated and yield commercially important crops of apple, cherry, pear and plum. The growing season lasts from 100 to 140 days. Important cereal crops of spring wheat, rye. oats, barley and buckwheat are grown; also potatoes, flax, soybeans and grass for hay production prosper.

The dense settlement of these areas has left little of the original wildlife. but among it may be counted bear, deer, elk, moose and squirrel, as well as a wide variety of migratory birds. In the freshwater streams and lakes of this zone bass, trout, pike and pickerel abound. In the shore waters of the bordering oceans are some of the most important commercial fishing grounds for cod, herring and salmon.

In the temperate zone, with growing seasons of from 140 to 220 days and 20 to 30 in. annual precipitation with a summer maximum, falls the corn (maize) and winter wheat belt. Where the precipitation approaches 40 in. tobacco will prosper, and where the freeze-free season exceeds 200 days cotton becomes an important crop plant. Among the natural vegetation of these regions are bamboo. cedar, chestnut and magnolia, with the grape, apricot and peach the climatically favoured fruits.

Where freezing temperatures become infrequent and the mean values of the warmest months exceed 68° F. and of the coldest month 43" F., with annual precipitation of 20 to 30 in. falling mostly in the cold season, the climate is often called mediterranean after its famous old-world prototype. Similar conditions prevail also in parts of California. Florida. New Zealand. Chile. South Africa and southern Australia. These are the regions of citrus and fig groves and the olive tree.

Drier areas with annual precipitation of less than 20 in. in the moderate latitudes have wide expanses of grassland, which are called steppe in Asia, prairie in North America. pampas in South America. veld in South Africa and downs in Australia. This is the habitat of such diverse long-legged animals as the horse. deer, ostrich and kangaroo. Toward the rainier margins of these areas the quest for arable land has led to plowing in a gamble to raise winter wheat and sorghum. In dry years. however, the harvest has been dust storms instead.

Where annual rainfall in these latitudes falls below 10 in. only a few grass tufts, sagebrush, thorny bushes, some acacias and, in frost-free areas, cacti may survive in the transition zone to the complete desert. At the other end of the scale, in the areas of abundant rainfalls (more than 40 in.) where the mean temperature of the coldest month is above 43° F., cultivation of rice, sugar cane, pineapple and some citrus fruit is practised. Broad-leaved evergreens and palms are among the indigenous species of these subtropical areas.

Typically tropical conditions prevail where the mean temperatures of all months exceed 64° F., and if rainfall is ample, dense forests of giant trees with ebony, mahogany and teak. or jungles with lianas, mangrove and tree moss develop. The rain forests are the home of elephants, monkeys, leopards, tigers. alligators and giant turtles; many species of bright-coloured birds are also among the natural inhabitants. Plantations of coffee, tea, cacao, bananas, rubber, coconut palms, jute, sugar cane and rice flourish in these climates. In regions where a dry season alternates with wet months, the tropical grassland savanna will develop. There tall elephant grass thrives and a few baobab trees are scattered around. Savannas form the landscape in which antelopes, giraffes, gnus. zebras and their predators — lions, leopards and hyenas — struggle for survival.

V. CLIMATE AND MAN

1. Climate and Race. — Many of the higher animals, although they have general climatic preferences, show a fairly wide range of adaptation to environmental conditions. In this process they often develop regionally distinct varieties or races. The differences are often typified by size, shape and colour. in some instances the specialization leading to distinct subspecies. Under the same climates many different animal classes develop similar characteristics: *i.e.,* the white furs of unrelated inhabitants of the polar regions.

Carleton Coon has proposed that climate is also the basic reason for the original racial differentiation in man ("Climate and Race," Smithsonian Institution. *Annual* Report *1953*). Man has settled in all climatic zones, having been aided by hunting ability, shelter and fire. Trade and transport have made it possible to secure food in areas where little can be obtained locally. However. only in the 20th century has man had all the facilities to become essentially independent of climate. But in his million-year history certain adaptations to climatic factors became embedded in his genetical heritage, as in lower animals, applying to properties of skin, size and shape.

There are essentially three skin types: (1) The pinkish-white, which burns when exposed to certain short-wave lengths in the solar and sky radiation. It is found among the descendants of tribes from northwestern Europe where clouds are prevalent and sunshine is rare. (2) The second type is chocolate brown or black, which is completely unaffected by solar radiation. Presumably this pigmentation was originally acquired at the tropical margins of the deserts and in the savannas. (3) The third skin type is changeable, taking different shades in individuals. variously described as creamy white, olive. yellow, red or brown. The primary distinction is that it can pale when covered and darken or tan when exposed to the sun. an adaptation to the widespread climatic type where seasons alternate between cloudy rain periods and bright sky.

Another climatically induced characteristic in man and other warm-blooded animals, is that individuals tend to be larger in colder sections and smaller in the warmer sections of their range. Coon cites the following weight contrasts between north and south: In northwest Europe the average weight of the Irish is 157 lb. compared with the 124 lb. of the Algerian Berbers. In Asia the north Chinese weight average is 142 lb.; the southern Annamites. only 112 lb. In America the Aleuts have average weights of 150 lb. compared with a 119-lb. average for the Mayas of Central America.

This difference is in agreement with the fact that it is easier to keep warm if the ratio of skin surface to bulk is small. Such adaptation to environment can be changed within a generation if migration from one climate to another takes place. Basal metabolism also is clearly related to size. If one sets the metabolic rates found among peoples in the northeastern United States and in Europe as 100, it is found that the Eskimos exceed this by 10% to 30%. In contrast a rate 10% lower is found among the inhabitants of the hot parts of India, Australia and Brazil.

The heat produced by metabolism is lost through the skin, usually by radiation or convection. If the air temperature exceeds 83° F. these processes are insufficient: in which case perspiration starts and cooling by evaporation takes place. At high temperatures and moderate or low humidities man loses large quantities of water. Aside from the problem of replacement, this is also a great strain on the circulatory mechanism. Hence, the wisdom of the environment-adapted peoples of the desert and other hot areas, who avoid exertion in midday, becomes obvious; they hunt or work in the early morning or evening hours and have long siestas between times. In the desert, travel at night is also common. The physiological adaptation to desert conditions is accomplished by large skin surface per unit weight. Coon points out that in this adaptation the size and shape of hands, forearms and foreheads play an important role because these parts have large concentrations of sweat glands. Consequently the desert-adapted tribes show long skinny types with narrow heads, long forearms, large hands and long slender fingers.

In the cold regions protection from heat loss is of primary importance. This requires a large body mass, short extremities and adequate fat deposits in areas where heat loss is apt to be rapid. Protruding body parts are endangered by frostbite; as a result one finds in the cold-adapted Mongolian and Eskimo types short, stocky individuals with small ears and noses.

Humans have also achieved a successful adaptation to high altitude climates where temperature and radiation factors are secondary to the bioclimatically dominating effect of the partial pressure of oxygen in the air—an unimportant factor in altitudes below 7,000 ft. In the highland groups in Tibet and the high Andes one encounters persons with larger lung capacity and higher concentrations of red blood corpuscles than in the low altitudes. This adaptation to smaller oxygen supply is apparently readily acquired or lost from generation to generation, according to the domicile.

2. Climatic Comfort Conditions. — Man has learned to live with the climate. Food habits, clothing and housing are geared to the environmental factors, especially among the so-called primitive societies. From the dawn of mankind secluded spaces, such as caves, lean-tos, tents and igloos have been used, which have a cryptoclimate (hidden climate) apart from, if not independent of, the surrounding atmospheric conditions. Modern man has conquered all climates by mechanical devices. Heaters. air conditioners! fans, filters, humidifiers and dehumidifiers, designed to bring about optimal atmospheric comfort conditions, have enabled him to create completely separate artificial climates in enclosed spaces.

TABLE VII.—*Chill Factor* of *the* ***Atmosphere***

Chill factor (Kcal./m.²hr.)	Sensation	Skin temperature ° F.	Air temperature, wind at 5 m.p.h. ° F.
100	Warm	96 8	84
200	Pleasant	*92.7*	76
400	Cool	*87.8*	60
600	Very cool	*82.4*	45
800	Cold	—	29
1,000	Very cold	—	13
2,000	Bitter cold	—	— 2

The concepts of hot. sultry, cool, chilly and cold show the long preoccupation of mankind with climatic conditions. Physiologically speaking, these terms are vague; in part this is caused by the wide differences between individuals. Their reactions depend on age. sex, state of health and nutrition; however. some closer specifications can be given. The comfort sensations are primarily related to the process of heat loss from the body. If the removal of heat is in equilibrium with the production, which depends on level of activity. the person feels comfortable. If it is less the body heats up; if it is more the body cools. The skin temperature is a good indicator of these uncomfortable conditions; it rises when the environment does not permit adequate heat loss and falls if cooling exceeds the metabolic rate. Below 83" F., when evaporative cooling plays little or no role, the heat loss depends on temperature and wind speed. At the higher temperatures cooling by evaporation becomes dominant and this is governed by humidity in addition to the other two factors. Many attempts have been made to express the comfort sensations in terms of the physical factors of the environment. Several indexes have been developed, variously named as chill factor or cooling power of the atmosphere; they are usually expressed in terms of heat loss in kilo calories per square metre per hour (Kcal./m.² hr.). Table VII shows this measure together with the subjective sensation experienced by a majority of healthy individuals. and indicates the approximate corresponding skin temperature for the higher values of the chill factor, where this temperature has a meaning. At lower chill factors the body has to be properly clothed, otherwise it freezes rapidly. Also shown is the corresponding air temperature at which a wind of 5 m.p.h. produces the particular chill factor. At the hot end of the scale the oppressive sensation of sultriness appears. With light wind speeds humans find it sultry when the humidity exceeds 75% at 80° F., 40% at 86° F., 25% at 95° F. Again, clothing and state of acclimatization play a considerable role in individual reactions.

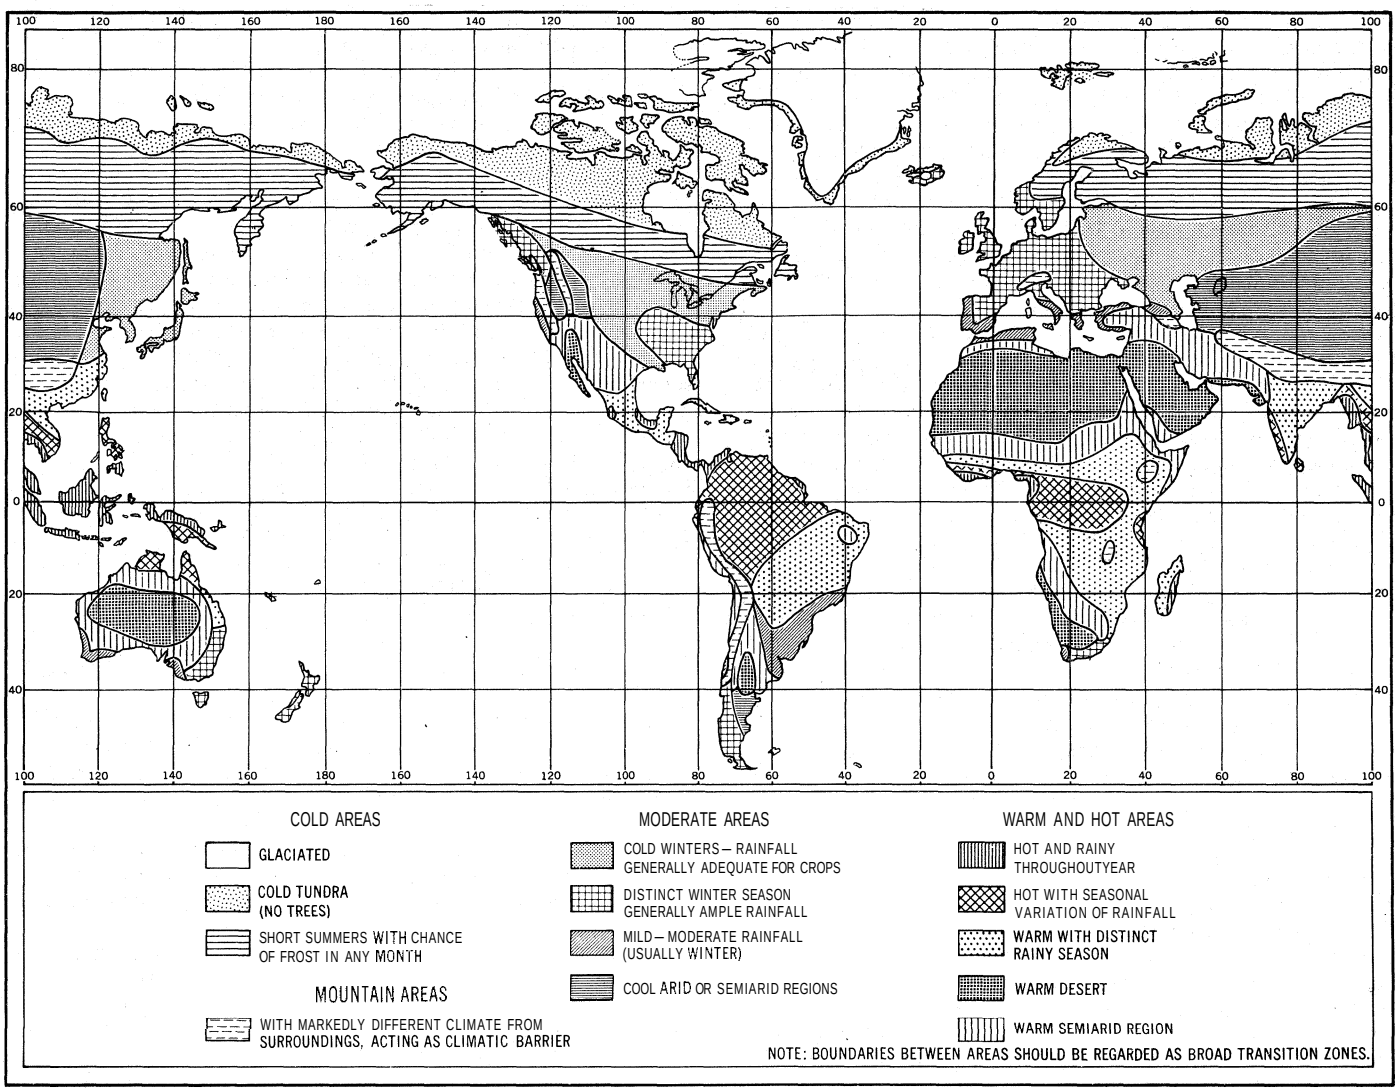
The U.S. weather bureau in 1959 included a temperature-humidity index (originally called a discomfort index) developed by Earl C. Thom, in its summer weather reports. The index is determined by multiplying the sum of the wet bulb and dry bulb temperatures by 0.4 and adding 15: with an index reading of 70, 10% of the people in a given area will be uncomfortable, with a reading of 75, 50% and with a reading of 80, 100%. At index readings of 85 or more precautions should be taken against heat exhaustion and heat stroke.

There have been many claims that certain climates are particularly conducive to health, others stimulating to mental activity, still others particularly suitable for the healing or alleviation of certain diseases. It is difficult to prove any of these claims objectively because climate is generally only one of many factors which act simultaneously on human beings. A few relationships mill be listed as indicative of a school of thought represented by E. Huntington and others. (E. Huntington. *Civilisation and* ***Climate;*** S. F. Markham, Climate *and the Energy of Nations*). According to their theories the climate of areas in the world in the moderately cool zone with frequent cyclonic activity and rapid changes of weather are apt to stimulate individuals to mental activity and propel nations to leadership. Sorthwestern Europe, New England and Japan have been cited as such regions. Mysticism and religious activity are supposed, under these hypotheses, to thrive in the semiarid regions at the edge of the tropics. In the regions of extreme cold the struggle for survival is assumed to dominate the psychology of peoples. In the tropical areas, in contrast, extreme lassitude is presumed to pervade the population. Obviously, all these statements depend on judgments rendered in the light of a specific subjective scale of values.

Objectively, beneficial results of climate have been determined for sufferers of chronic respiratory ailments in the dry, sunny plateaus. Equally, persons with circulatory ailments often find a favourable environment in the subtropical climates of even temperature with little day to day change and the lack of seasonal extremes.

3. Climatic Changes. — Climate is not an invariable quantity with time. Aside from the wide variations possible from year to year there are slow trends in climatic conditions, sometimes noticeable even in a single life span. There have been many attempts to attribute these trends to cyclical phenomena. Various climatic cycles have been proposed, foremost among them the so-called sunspot cycle.

Many analyses have been made but the recorded data show that, whatever cycles may be present, their amplitude is small



BY COURTESY OF H. E. LANDSBERG

FIG. 9. —THE WORLD'S MAJOR CLIMATIC ZONES

and their period variable. This may be a consequence of the fact that the inciting phenomena themselves are not strictly cyclical. Even the sunspot cycle is only a general rhythm; while it has a mean duration of 11 years, the time interval between extremes of the same sign has varied between 7 and 18 years in length, according to existing records.

Often shorter and longer cycles and trends have been surmised in the climatic events. These exist over long periods of time. of course. especially if one reckons with a geological time scale. *(See Climatic Change,* below.) In historical times. temperature changes of a few degrees per century and a few per cent of precipitation have been found.

4. Comparative **Climatology.**—Many systems have been proposed for the purpose of comparing the various surface climates of the globe. These climatic classifications have no universal application. but are limited to specific purposes, some applying to plants, others to human comfort conditions. Still other classifications have been used for specific operational purposes: such as flying conditions, factory locations or construction practices.

There are similarities in climates of localities, even in different regions, provided the major controls of circulation and exposure are similar. These similarities are, however, only a first approximation; the variabilities of the atmosphere in time and space create so many nuances that one cannot carry the comparisons very far. These reservations should be kept in mind. when looking at charts showing climatic types for the world. (See fig. 9.)

(H. E. LG.)

VI. CLIMATIC CHANGE

Geological history is divided into four main periods, Pre-Csmbrian (Archeozoic and Proterozoic). Paleozoic, Mesozoic and Cenozoic (Tertiary and Quaternary). There is evidence of many changes of climate, but this article is mainly limited to those which occurred after the appearance of man. roughly a million years ago, at the beginning of the Quaternary (*q.v.*). The Tertiary is divided into Eocene and Paleocene, Oligocene, Miocene and Pliocene; the Pleistocene is in the Quaternary. The Tertiary began about 70,000,000 years ago. with, warm climates and this period was one of gradual cooling which became rapid toward the end. The uppermost beds of the Pliocene contain large numbers of Arctic species, and appear to be contemporaneous with the first glaciations of Scandinavia and the Alps.

The latest bed in England which was formerly attributed to the Pliocene, the Cromer Forest bed, indicates a return of somewhat warmer conditions and is now placed in the first interglacial period. It is succeeded by boulder clays and other deposits of land ice. indicating the oncoming of glacial conditions in England itself.

1. Quaternary Ice Age.—The Quaternary (Pleistocene) Ice Age was characterized by the advance of great glaciers or ice sheets from a number of centres. of which the most important were Scandinavia and the Alps in Europe and the Cordilleras and various other centres in North America. Minor centres of glaciation were located in Spitsbergen, Iceland, Ireland, Scotland and northern England, the Pyrenees, the Caucasus range, the Himalayas, the mountain ranges of central Asia, Alaska and the whole chain of the

Rockies and Andes, the highest mountains of equatorial Africa, New Guinea; southeastern Australia and New Zealand.

The ice sheets of Greenland and Antarctica are remnants of the Quaternary glaciation, and illustrate the character of the great inland ice sheets of northern Europe and North America.

The maximum area occupied by land ice was about 13,000,000 sq.mi., including 5,000,000 sq.mi. in the Antarctic, 4,500,000 sq.mi. in North America, 1,250,000 sq.mi. in Europe and at least as much in Asia, and over 800,000 sq.mi. in Greenland. The present area is about 6,000,000 sq.mi. In addition. there was a great extension of floating ice in the oceans, especially in the North Atlantic and Antarctic. Altogether. nearly one-tenth of the earth's surface must have been ice covered. The ice did not reach its maximum thickness and extension simultaneously; it' it had. the amount of water withdrawn from the oceans would have lowered the sea level by almost 400 ft. The actual lowering however exceeded 260 ft., which is sufficient to show that the major ice sheets were all in existence at the same time. (See also PLEISTOCENE EPOCH.)

2. Pluvial Periods. — In tropical and subtropical land areas the rainfall during the glacial periods was almost everywhere greater than during the interglacial periods. In North America the lakes of the Great Basin spread out to form large inland seas, the best known of which are Lahontan and Bonneville. In east Xfrica a whole series of lakes has been found and correlated with the Alpine sequence: Kafuan with the Günz and Mindel; Kamasian (Great Pluvial) with the Riss; and Gamblian, consisting of four successive lakes. the first three representing the three maximums of the Würm. The pluvial periods were separated by interpluvials, during which the lakes dried up more or less completely.

3. Postglacial Period. — The postglacial period was marked by alternations of rainy and dry climates. These are clearly shon-n in peat bog sections by the alternation of rapid growth and drying up. often with tree growth. The succession was first investigated and the periods named by the Norwegian Axel Blytt: in later years G. Erdtman and (in Britain) H. Godwin carried the study into great detail. The rainy Atlantic period was followed by the Subboreal. This was on the whole cooler and drier, with long droughts in which the surface of the peat dried up, followed by returns to more rainy conditions.

The main dry periods were about 2200–1900, 1200–1000 and 700–500 B.C. The latter (Grenzhorizont), was the best developed; it has been described as a dry heat a-ave lasting for perhaps 200 years. Lakes decreased in area and in a few places trees grew on their floors below the level of the outlet. From four such lakes in Ireland, Germany and Austria it is estimated that the rainfall was only about half that of recent centuries. The drought was not intense enough to interrupt the steady development of the forests. but it caused extensive migrations of peoples from drier to wetter sites. At the end of this dry period. about joo B.C., there was a rapid deterioration of favourable climate, marked by renewed growth of sphagnum bogs and flooding of lake settlements; this brought in the Sub-Atlantic period.

4. Climatic Changes During the Christian **Era.**—Increasingly detailed and accurately dated knowledge of climatic changes began n-ith the Christian era. In Europe this depends on peat bogs, lake levels. advances and retreats of glaciers, location of settlements and, later, literary records and old weather journals. In Asia the prime source is the level of the Caspian sea; Chinese annals are also helpful. In northeast Xfrica there are the levels of the Nile and the history of oases. In the west of North America the rainfall is recorded with surprising accuracy by the widths of the annual tree rings. These varied lines of evidence from the north temperate zone are in general agreement, with some differences of detail.

At the beginning of the Christian era the climate was much as it is at present, or possibly a little rainier, especially in northeast Africa. About A.D. 400 a period of relative warmth and dryness set in, the Caspian sea being below its present level. This dry period reached its greatest intensity about A.D. 700. when there was much traffic over the Alpine passes. There was extensive sea traffic off western Europe. and the civilization of Ireland reached a high level (Irish learning being greatly esteemed in Europe). There were many droughts in China. low Nile levels and a great decline in the prosperity of the north African oases. Ellsworth Huntington's curve of tree growth in western America fell to a very low level: this dry period in America is supported by some evidence of lake levels.

After about A.D. 800 the climate of the temperate belt became rainier, but remained mild. Greenland was explored and colonized in the 10th century under conditions far more favourable than those of the 20th century.

Western Europe became stormy after 1200, and there were many inundations of the North sea coasts of England and the Netherlands, culminating in the destruction of Winchelsea and the coastal defenses of the Setherlands and Frisia. In Greenland, where the Sorse colonies had prospered in the 11th and 12th centuries. rapid deterioration set in. The ground became permanently frozen about 1400 and the colonies disappeared.

The next centuries were generally rainy, but were chiefly remarkable for a readvance of glaciers all over the world; this period becoming known as the Little Ice Age. The glaciers began to expand during the 13th century. Their advance was slow at first and probably stopped completely during the second half of the 16th century. but it became very rapid from about 1600 to 1650. In Sweden the latter date marks one of the two points of greatest extension and was followed by a slight retreat, but in the Alps and Iceland it was little more than a temporary halt. The second maximum occurred at or a little before 1750, when the glaciers reached an extension greater than at any other time since the end of the Quaternary Ice Age. Since then there has been a general retreat. slow at first and broken by a halt or readvance about 18 jo, but again becoming rapid during the 20th century.

Instrumental observations began in England in 1677, when there was a period of dry continental climate. About 1; jo this changed to a more oceanic climate. with mild winters and cool rainy summers. There was a brief return of the continental type from 1794 to 1810, with prevailing easterly winds and a notable period of severe winters. After 1850 winters became progressively warmer in nearly all polar and temperate regions, but the colder winters beginning about mid-20th century may indicate a reversal of this tendency.

The broad pattern of climatic change since the end of the Ice Age is consistent with the hypothesis of an alternate weakening and strengthening of the planetary atmospheric circulation. associated with alternate poleward and equatorward shifts of the wind zones. At times of minimum circulation the circumpolar belt of west winds contracts and anticyclones are frequent in middle latitudes. Winds are variable, rainfall is small and the climate continental. with cold winters and hot summers. When the circulation is stronger. westerly winds predominate, storms are more frequent and penetrate into lower latitudes, the rainfall is heavier and climate more oceanic. This. with a few short interludes. was the general condition during the Sub-Atlantic and after about A.D. 1200.

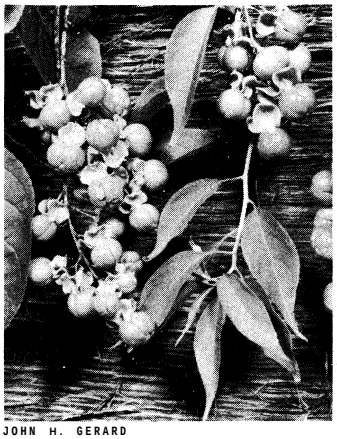
CLIMBING BITTERSWEET (*Celastrus scandens*), a North American climbing shrub of the staff-tree family (Celas-



JOHN H. GERARD

CLIMBING BITTERSWEET (CELASTRUS SCANDENS)

traceae), called also false bittersweet and waxwork. It grows mostly in rich soil. from Quebec to Manitoba and southward to North Carolina and New Mexico, usually trailing on banks or small shrubs but sometimes climbing to a height of 25 ft. on trees. It has smooth. pointed leaves and small greenish flowers and matures in autumn with showy clusters of orange-yellow. berrylike capsules, which split open after frost, disclosing the crimson coverings (arils) enclosing the seeds. The handsome, persistent fruit is often used in winter for indoor decoration.

The true bittersweet or woody nightshade belongs to another family, the Solanaceae (see NIGHTSHADE).

CLIMBING FERN, the botanical genus Lygodium, with 40 species, found chiefly in the warmer parts of the old world. The plants have a creeping stem. on the upper face of which is borne a row of leaves. Each leaf has a slender. stemlike axis. which twines round a support and bears leaflets at intervals; it goes on growing indefinitely.

Several species are favourite greenhouse plants. The American climbing fern (L. *palmatum*), called also Hartford fern and Windsor fern, one of the most beautiful ferns native to the United States. grows in open woods from New Hampshire to Pennsylvania and Ohio south to Florida and Tennessee.

CLINIC, an organized medical service offering diagnostic, therapeutic or preventive treatment to ambulatory patients. The original meaning was a bedside demonstration of a sick patient before a group of physicians or medical students. In medical education clinic is still so used but may also mean a particular lecture: classroom or outpatient examination where several medical men discuss their views. Often in Europe and occasionally in the U.S. the term covers the entire teaching centre. including the hospital and ambulatory-patient facilities. The usual meaning, however, has come to indicate any organized medical service for ambulatory patients. Such service may or may not be connected with a hospital. In addition, clinic is used to designate the entire activities of a general clinic or may be used to designate only a particular division of the work; *e.g.,* the psychiatric clinic, the neurology clinic, the surgery clinic, etc. Usually, the entire activity when connected with a hospital is called the outpatient department, and the subdivisions are referred to as clinics.

The first clinic in the English-speaking world, the London dispensary. was founded in 1696 as a central means of dispensing medicines to the sick poor whom the physicians were treating in the patients' homes. The New York, Philadelphia and Boston dispensaries, founded in 1771, 1786 and 1796, respectively. had the same object in view. Later, for the sake of convenience, physicians began to treat their free patients at the dispensary. The number of such clinics did not increase rapidly, and as late as 1890 only 132 were operating in the United States. The impetus for the mushroomlike growth that has occurred since that time came with the rapid growth of hospitals and also from the public health movement.

During the late 1800s the modern hospital as a complex of skilled technical personnel ,and extensive diagnostic equipment began to take shape. During this period some of the hospitals connected with medical schools inaugurated outpatient departments for teaching, as well as for charitable purposes. The Johns Hopkins and Massachusetts General hospitals are believed to be the American pioneers in the form of medical education. The advantages of providing ambulatory care close to the facilities of a hospital became apparent, and such hospital clinics multiplied rapidly.

About 2.550 hospitals in the United States have organized clinic services. The number of different patients treated in them exceed 13,000,000 and patient visits total about 53,000,000 annually.

A hospital clinic in general follows the same pattern of medical organization as the particular hospital has developed for its inpatient work. Hospital clinics are mostly concerned with acute diseases and the physicians in the clinics are usually the same physicians who treat bed patients in the hospital. Many hospitals that operate charity clinics follow the practice of requiring recent appointees to the medical staff to serve a period in the clinics as a step to senior staff membership. Such physicians ordinarily nork no more than one-half day each week in the clinics and usually receive no compensation for this work.

In many hospital clinics care is made available only to the medically indigent. and no professional fee is charged. Practically all such clinics. honever. charge a small registration fee if the patient is financially able to pay; income from such fees helps pay operating costs. In later vears a number of successful attempts have been made to extend hospital clinic care to paying patients. Most of this effort has been in the area of the lower income groups although in a few hospitals no limit is placed on income in determining eligibility for care. The hospitals of The University of Chicago, for example, began operating a clinic on such a basis in 1928.

The public health movement has been mainly concerned with preventive medicine, child and maternal health and other medical problems affecting broad segments of the population. The first public health clinics were established in the late 19th century. In 1890 A. Pinard set up a maternal dispensary or antenatal clinic at the Maternité Baudelocque in Paris. Milk distribution centres were set up in France by J. Comby (1890) and in Britain by F. D. Harris (1899). Infant welfare clinics were established in Barcelona. Spain (1890), and clinics for older children in St. Pancras, London, by J. F. J. Sykes (1907). Between 1900 and 1960 more than 6.000 public health clinics were established in the U.S. Unlike the hospital clinics. which have had their greatest growth in the metropolitan areas, the public health clinics are located chiefly in smaller towns and villages. In the U.S. the first great movement in creating public health clinics resulted in the founding of the National Association for the Study and Prevention of Tuberculosis in 1904. It was the association's goal to study and prevent tuberculosis by making clinic facilities available for free examination and treatment in every city and county. Other nationwide, private health agencies in specialized medical fields quickly adopted this method to improve the quality and extend the quantity of medical service in their fields. Local governmental health units operate similar clinics in the medical specialties related to the prevention of' communicable disease and long-term illness. Such clinics are generally concerned with one particular medical interest, usually one of the following: tuberculosis, venereal disease, prenatal care, well-baby care. teeth, tonsils, eyes, crippled children and mental hygiene. There was a tendency in the early 1960s toward the establishment of traveling clinics, such as dental clinics for school children and tuberculosis case-finding clinics in industrial plants. Usually no charge is made for service in public health clinics, and for many medical conditions no income restrictions are imposed. A few are operated in connection with hospitals, but most such clinics use public buildings or space furnished by welfare and other social agencies. Financial support is received mostly from the same sources.

The advantages of group medical service, with facilities and technical personnel beyond the means of an individual practitioner plus the added benefits of group consultation, have encouraged the establishment of a rapidly increasing number of pay or private clinics. This type of clinic is essentially a voluntary association of physicians engaged in the practice of medicine on an organized group basis. Common administration and facilities are used, and the resulting expense and income are shared according to a predetermined plan. To be classified as a group clinic the relationship between each physician and the organization must be defined in a legal agreement. The relationship usually takes the form of a partnership. Several of these, such as the Mayo clinic, in Rochester, Minn., have achieved a national reoutation

and attract patients from a wide geographical area. A survey in 1959 by the American Medical association reported 1.100 organized group clinics, with 11,100 member physicians. The majority of these groups were general clinics; *i.e.,* they had several of the different medical specialties represented on their staffs. A number of private clinics, however, limit their work to one medical specialty. The American Association of Medical Clinics, a national organization of organized group clinics, restricts its membership to clinics with five or more doctors and covering at least three medical specialties.

Usually the group is organized independently of any hospital or other agency, but in some instances such clinics own and operate their own hospital facilities. In other instances the clinic is a part of a prepaid health service plan. This latter pattern has received impetus in recent years as labour unions have set up medical clinics supported by welfare benefits contributed by employers. The United Mine Workers union, for example, has established a system of such clinics in hospitals constructed by the union in the coal mining areas of Virginia and West Virginia.

In 1920 in Britain a consultative council on medical and allied services (Daason committee) described a health centre as an institution wherein are brought together various medical services, preventive and curative. Under section 21 of the National Health Service act, 1946. local health authorities provide, equip, maintain and staff health centres to offer facilities for all or any of the following services — general medical and dental; pharmaceutical; hospital outpatient and health education; care of expectant and nursing mothers. The ante- and postnatal clinics include periodical medical and dental examinations. classes in parentcraft and relaxation, and the supply of welfare foods. Activities in child welfare clinics comprise education in all aspects of mothercraft; periodic medical and dental examinations; advice on mental health problems; immunization and vaccination; and distribution of welfare foods.

In the U.S.S.R., the polyclinic is designed to combine the function of a hospital outpatient department with that of a general practitioner health centre. (R. E. BN.; J. F. SK.)

CLINICAL PSYCHOLOGY: *see* PSYCHOLOGY, APPLIED: *Psychology in Treatment.*

CLINTON, DE WITT (1769–1828), U.S. political leader and chief sponsor of the project to build the Erie canal, was born March 2, 1769. in Little Britain, N.Y. He graduated from Columbia college. New York city, in 1786 and the next year wrote a series of articles signed "A Countryman" opposing the ratification of the proposed constitution of the United States. He began to practise law in 1790 and served until 1795 as secretary to his uncle, George Clinton, governor of New York. At the age of 28 he entered the state senate, serving from 1798 to 1802 and again from 1806 to 1811. As a member of the council of appointments he sought to fill the more important offices with Republicans and to divide the minor offices between the political parties according to their strength. Because in the process many Federalists were removed and many Republicans were appointed, De Witt Clinton was charged with being the originator of the "spoils system" (*q.v.*) in New York.

In 1802 Clinton entered the U.S. senate but resigned the next year upon his appointment as mayor of New York city, an office he held for ten of the years between 1803 and 1815. While mayor he also served as state senator (1806–11) and as lieutenant governor (1811–13). As mayor of New York, Clinton advocated free and widespread education and with the aid of public and private funds succeeded in opening Public School No. 1. After a congressional caucus in 1812 had nominated Pres. James Madison for a second term, Republican leaders of New York, desiring to break up the so-called "Virginia dynasty," met and by legislative caucus nominated Clinton for the presidency. In the election Madison received 128 electoral votes, Clinton 89.

For many years Clinton had been interested in a proposal to build a canal from the Hudson river to Lake Erie and in 1811 he introduced a bill in the state senate to appoint a commission to explore the route suggested. He and Gouverneur Morris mere sent to Washington to secure federal aid for the project but were unsuccessful. After the War of 1812 the canal project was revived and Clinton became chairman of the new commission. He was elected governor of New York for two terms (1817–1823), and work on the canal began during his first year in office.

While governor, Clinton advocated the gradual abolition of slavery in New York, sought to improve the condition of the poor, and urged training for teachers in state normal schools. As bitter opposition to his administration developed under the leadership of Martin Van Buren and Tammany Hall, Clinton refused to run for a third term in 1822. His dismissal as canal commissioner in 1824 caused such indignation throughout the state that he was saept into the governorship the next year and served until his death In Oct. 1825 he took part in the formal opening of "Clinton's Ditch," later to be known as the Erie canal (*q.v.*). He died in Albany on Feb. 11, 1828.

In addition to his interest in politics and public improvements, Clinton had devoted much time to the study of the natural sciences. Among his published works were *Memoir on the Antiquities of Western New York* (1818) and *Letters* on *the Natural History and Internal Resources of New York* (1822).

BIBLIOGRAPHY.—J. Renwick, *Life of De Witt Clinton* (1845); W. W. Campbell, *Life and Writings of De Witt Clinton* (1849); E. A. Fitzpatrick, *The Educational Views and Influence of* De *Witt Clinton* 1911); and Dorothie Bobbé, *De Witt Clinton* (1933). (R E AT.)

CLINTON, GEORGE (1739–1812), U.S. soldier, state governor and vice-president of the U.S., was born at Little Britain, N.Y., on July 26, 1739, the son of Charles Clinton (1690–1773), who had migrated from Ireland to America in 1729. George went to sea at the age of 18. Within a year he returned home where in 1759 he received a clerkship in his home county of Ulster. He was commissioned a lieutenant in the company of his brother (Capt. James Clinton) and served under Lord Jeffrey Amherst in the campaign of 1i60 that captured Montreal from the French. After the French and Indian War he studied law, was commissioned attorney at law, and in 1764 surveyed the disputed New York-New Jersey boundary line. He was a member of the New York general assembly from 1768 to 1775 and in the latter year became a member of the continental congress. In December of that year he was commissioned a brigadier general of militia by the New York provincial congress. The following summer, while still a member of the continental congress, he was ordered by Gen. George Washington to assist in the defense of New York and left Philadelphia before he could sign the Declaration of Independence, which he had supported in debate.

Clinton was charged with the defense of the highlands of the Hudson river and, although offering stiff resistance, he was unable to check the advance of the British under Sir Henry Clinton. In March 177i he was appointed brigadier general by congress, thus holding two military commissions since New York refused to accept his resignation as brigadier in the militia. So great was his popularity with the people of New York at that time that he was elected both governor and lieutenant governor in the first election under the new state constitution. He declined the lieutenant governorship and on July 30,1777, entered upon his duties as governor. He served 18 consecutive years as governor (1777–95) and later served an additional three-year term (1801–04). As governor he was a forceful leader, an able administrator and a man greatly admired for his integrity and his forthright democratic principles.

During the struggle in New York over the adoption of the federal constitution he was one of the leaders of the opposition because he feared that the constitution would lead to the destruction of the states and the setting up of a consolidated federal government. In the state convention of 1788. over which he presided, his party was defeated and the constitution was ratified. In national politics Clinton was a follower of Thomas Jefferson; in state politics he led the long-dominant faction known as the "Clintonians."

In 1804 he was elected vice-president of the United States. In 1808 he sought the nomination for the presidency and was much disappointed when James Madison was chosen. However, Clinton accepted the nomination for the vice-presidency and was again elected. In 1811 he cast the deciding vote in the senate that defeated the bill for the renewal of the charter of the Bank of the

United States, thus showing his opposition to strong central authority in finance and banking. He died in Washington, D.C., April 20. 1812, before the expiration of his second term as vice-president.

See *The Public Papers of George Clinton*, 6 vol. (1899–1902), published by the state of New York; E. W. Spaulding, His Excellency George Clinton (1938). (R. E. Ar.)

CLINTON, SIR HENRY (1738–1795), British general, who was commander in chief in America during the American Revolution (*q.v.*), was born in Newfoundland, where his father was governor. He joined the army in 1757, served in the final three campaigns of the Seven Years' War, and was promoted colonel in 1762. In 1772 he was made a general. He went to America in 1775 as second-in-command to Sir William Howe, fought with distinction at Bunker Hill and Long Island, and was left in command in New York when the main army went south to Pennsylvania. On Howe's retirement (1778), Clinton succeeded to the supreme command. He conducted various minor expeditions in the New York area, but disagreed with Lord Cornwallis, his second-in-command, over the possibility of more decisive operations with the limited forces available. He led his main army in an offensive in the Carolinas in 1780, but after the siege and fall of Charleston he returned to New York, leaving Cornwallis in charge of the subsequent operations which led to the capitulation at Yorktown and the peace treaty recognizing American independence. Clinton resigned his command in 1781, and returned to England. His *Narrative of the Campaign of 1781 in North America* (1783; new ed. by W. B. Wilcox, 1954) provoked an angry reply from Cornwallis. Clinton was appointed governor of Gibraltar in 1794 and died there on Dec. 23, 1795.

His two sons also rose to be generals. The younger, SIR HENRY CLINTON (1771–1829), saw varied service, and won a good reputation, especially during the Peninsular War. His division held a vital portion of the British line at Waterloo (1815). He died in Hampshire on Dec. 11, 1829. (E. W. SH.)

CLINTON, HENRY FYNES (1781–1852), British classical scholar and chronologist, was the author of the Fasti *Hellenici* and the Fasti Romani, which set classical chronology on a scientific basis. Born at Gamston, Nottinghamshire, on Jan. 14, 1781, he was educated at Westminster school and at Christ Church, Oxford, and from 1806 to 1826 was M.P. for Aldborough, Yorkshire. He died at Welwyn. Hertfordshire, on Oct. 24, 1852. The value of his Fasti can scarcely be overestimated, even though later research corrected some of his conclusions. His chief works include Fasti Hellenici, the Civil and Literary Chronology *of* Greece From the *Earliest* Accounts to the Death of *Augustus*, including dissertations on points of Greek history and scriptural chronology, three volumes (1824–51); and Fasti Romani, the *Civil and Literary* Chronology of Rome and *Constantinople: From the Death of Augustus* to the Death of Justin *II*, two volumes (1845–50). Epitomes of these works were published in 1851 and 1853.

See C. J. F. Clinton (ed.), The Literary Remains of *H*. F. Clinton, including an autobiography (1854).

CLINTON, a city of Iowa, U.S., on the Mississippi river, is the seat of Clinton county and the easternmost city in Iowa

The original settler, Joseph M. Bartlett, opened a trading store for Indians in the area in the 1830s and named his proposed town New York. The real development of the town was delayed. however, until 1855, when the Iowa Land company purchased the townsite and renamed the town for De Witt Clinton (*q.v.*). It was incorporated in 1859 and reincorporated in 1881. Formerly the largest sawmill centre in the middle west. Clinton was forced by a diminishing lumber supply to turn to such other indusfries as railroading and the manufacturing of corn products, cellophane, and steel and wire specialties. The city's public education system includes Clinton junior college. Clinton has a number of public parks, among them Eagle Point park, which provides an excellent view of the Mississippi. For comparative population figures see table in IOWA: Population. (J. F WA)

CLINTON, a village in the town of Kirkland in Oneida county. N.Y., U.S., on Oriskany creek, 9 mi. S.W. of Utica. Founded in 1786 by New England pioneers, it was named for George Clinton. a general in the American Revolution and first governor of the state. It was incorporated in 1843. The village is a residence for professional and businessmen from Utica and Rome. It is the site of Hamilton college, founded in 1793 as an Indian academy by the pioneer missionary Samuel Kirkland and first called the Hamilton Oneida academy, after Alexander Hamilton and the Oneida Indians. In 1812 it was chartered as a college for men and became one of the most distinguished liberal arts colleges in the U.S. Among its many famous alumni are Elihu Root (1845–1937), Henry Wheeler Shaw ("Josh Billings") (1818–1885) and Samuel Hopkins Adams (1871–1958). Early iron mines in the area had mostly closed by the second half of the 20th century. The surrounding farms specialize in the production of vegetables. The population of the village in the 20th century was less than 2,000. (V. C. C.)

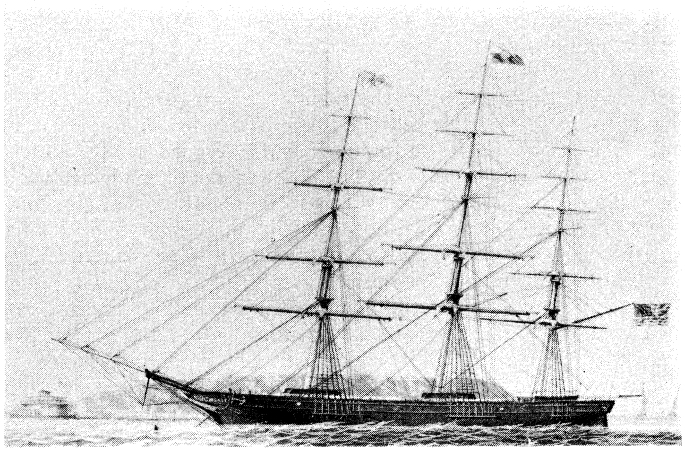
CLINTONIA, a genus of beautiful herbs of the lily family (Liliaceae; *q.v.*), named in honour of De Witt Clinton (1769–1828), governor of the state of New York. There are six species, four North American and two Asian, all stemless perennials, with a few broad leaves rising from a slender rootstock, and lilylike flowers, usually borne in clusters (umbels) at the top of the flower stock (scape). The yellow clintonia (C. borealis) is found in woods from Newfoundland to Manitoba and southward to North Carolina and Wisconsin; the white clintonia (C. *umbellulata*) occurs in woods from New York and New Jersey to Tennessee and Georgia; the mountain clintonia (C. *uniflora*), with a single white flower, grows from Montana and California northward to Alaska; the western clintonia (C. *andrewsiana*) is found near the Pacific coast in central California.

CLINTONITE: see OTTREEITE.

CLIPPER SHIPS, exceptionally fast sailing vessels developed primarily in the United States between 1830 and 1860. The term clipper was probably derived either from "clipping time from previous records" or "going at a good clip." These ships were celebrated for their fast passages between important ports of call.

A ship with a reputation for speed brought large profits to its owners during the period of mass emigration to America, the rush for gold in California and Australia and the expanding trade in tea and wheat. Repeal of British navigation acts in 1849 ended the monopoly of the China trade that had been long held by British vessels and opened it to adventurous American shippers. Their experience in building fast ships to cope with maritime difficulties with France, Tripoli and England during the late 18th and early 19th centuries enabled American designers and shipbuilders to produce the fastest commercial craft that ever sailed. But the successful clipper ship required more than just a good design and good workmanship; it also required a good crew. The true clipper had the following characteristics: a hull that was sharp—with length five or six times its beam—designed for high speed rather than great cargo capacity; a heavy and lofty square rig, usually three masts with spars capable of spreading far more canvas than ships of comparable size; and a captain with a mania for speed who could drive his craft and crew to the limit of their strength.

The origin of this class of ships is not clearly understood. Some historians believe that the French frigate of the late 18th century was the inspiration for the Yankee clipper, while others point to the early Baltimore clippers as the forerunner of the type. Very probably the extreme clipper was evolved by numerous designers using their combined experience gained over a long period of time. It is interesting to note, however, that the French frigate had a rounded bow, a large dead rise (slope of the bottom above the horizontal), greatest breadth forward of amidships, and greatest depth of the hull at the stern. In contrast, the clipper, in its most efficient form as built in the early 1850s, had a long sharp bow with a flare, a comparatively small dead rise, greatest breadth at or just aft of amidships, and a depth of hull slightly greater at the bow than at the stern. That there was a gradual evolution in the development of the clipper is illustrated by the hull lines of the 500-ton Baltimore clipper "Ann McKim" (built in 1833 by the Baltimore merchant Isaac



BY COURTESY OF SMITHSONIAN INSTITUTION

CLIPPER SHIP "NIGHTINGALE" (FROM A LITHOGRAPH)

McKim and considered by some historians to be the first clipper), which have some of the features of both the types compared above. Even among the later clippers the hull lines varied from ship to ship, and tonnage ranged from 470 to 4,500. Some designers produced ships that were fast in rough weather—excellent craft for the roaring forties of south latitude—while other designers built vessels that made comparatively better speed in moderate or light winds.

Among the most famous builders of clipper ships was Donald McKay (*q.v.*), of Boston, who launched the "Sovereign of the Seas," of 2.421 tons register, in 1852. Described by one historian as being "stately as a cathedral, beautiful as a terraced cloud," this clipper achieved a speed of 411 nautical miles in one day. But it was the "Lightning," another McKay ship, that established on its maiden voyage the best record for a single day's run—436 mi.—a record that was not surpassed by a steamship for many years For sustained speeds on long runs in all kinds of weather the honours probably go to two of the last British tea clippers, the "Thermopylae" and the "Cutty Sark" of 1868–69. The "Cutty Sark," fully rigged and equipped. is preserved in a permanent dry dock at Greenwich, Eng.

Construction of the extreme clipper, capable of making up to 18 knots, stopped generally after 1854 because of a financial slump. With resumption of ship construction, builders in both the United States and Europe favoured a modified form in both hull and rig, one that would carry more cargo and be less costly to build and maintain. This type of ship, built during and after the American Civil War, was termed a medium clipper or a modified clipper.

Some of the famous clippers and their records are: "Nightingale," Shanghai to London, 91 days; "Sea Witch," Canton to New York, 81 days, and New York to Valparaiso, Chile, 59 days; "Challenge," Hong Kong to San Francisco, Calif., 33 days; "Flying Cloud," New York to San Francisco, 89 days; and "Andrew Jackson," Liverpool to New York, 15 days.

CLISSON, OLIVIER DE (1336–1407). French magnate and military commander who served England, France and Brittany one after the other and ultimately did much to keep Brittany within the French sphere of influence. Born in Brittany. he was brought up in England and learned from the English tactical methods that he was later to use against them. In the War of the Breton Succession (see BRITTANY), he fought on the English side for John IV (John of Montfort) against the French-supported Charles of Blois and won the battle of Auray (1364), in which Charles was killed and Bertrand du Guesclin taken prisoner. In 1365, however, he left John IV (who would not reward his services adequately) and induced the Black Prince (Edward of England) to release Du Guesclin. Clisson then went over to the French. Appointed lieutenant of Guienne by Charles V in 1369, he conducted a fierce struggle against the English there and became notorious for cruelty. After serving as lieutenant general in Brittany (1374). he succeeded Du Guesclin as constable of France in 1380. In 1382 he defeated the Flemings at the battle of Roosebeke. In 1392 Pierre de Craon, at John IV's instigation, made an attempt on his life in Paris. This provoked a French expedition against Brittany that was cut short by Charles VI's attack of madness. The new French government deprived Clisson of his office as constable, whereupon he withdrew to Brittany and, in 1395, became reconciled with John IV. On his deathbed (1399) John appointed him guardian of his children and protector of Brittany. Clisson died at the castle of Josselin on April 23, 1407. Eager for gain and for glory, at once warlike and pious, he was the typical feudal lord.

CLITHEROE, a municipal borough of Lancashire, Eng., 26 mi. S.E. of Lancaster by road. Pop. (1961) 12,147. It stands on a limestone ridge between the river Ribble and the foot of Pendle hill (1,831 ft.), described by William Harrison Ainsworth as a haunt of the "Lancashire Witches" in his novel of that name.

The honor of Clitheroe was first held by Roger de Poictou, almost certainly the builder of the castle. From 1310 it was part of the duchy of Lancaster until Charles II bestowed it on Gen. George Monck. It is now held by Baron Clitheroe of Domnham. The first charter was granted in 1147 by Henry de Lacy, the privileges being confirmed and enlarged by a second charter granted about 1283 (confirmed by Edward III, Henry V, Henry VIII and James I). The remains of the Norman castle (the keep and parts of the wall) stand overlooking the town and valley at the southwestern end of the limestone ridge on which the town was anciently located. It is surrounded by a municipal park acquired in 1919 as a war memorial. A grammar school founded in 1554 is still in existence. The church of St. Mary Magdalene is a comparatively modern structure on ancient foundations. Stonyhurst college, the Roman Catholic public school, lies 5 mi. S.W. of Clitheroe.

Clitheroe's principal industries are cotton processing. limestone quarrying, the manufacture of clothing and agricultural appliances and light engineering. A large cement works and a chemical works are also located there. The Ribble and Hodder provide trout and salmon fishing.

CLITUNNO (anc. CLITUMNUS), a river in Umbria, Italy, rising from an abundant spring by the road between Spoleto and Trevi. 12.9 km. (8 mi.) from the former, 6 km. 14 mi.) from the latter. After a short course through the territory of Trevi it joins the Timia, a tributary of the Tiber. Pliny described and the emperors Caligula and Honorius visited the lake, a clear pool surrounded by poplars and weeping willows. The stream was personified as a god, whose ancient temple lay near the spring; close by were other smaller shrines, and it occurs under the name Sacraria ("Shrines") as a Roman post station.

The building, generally known as the Tempio di Clitunno, close to the spring is an ancient Christian chapel, its decorative sculptures being contemporary with those of S. Salvatore at Spoleto (4th century). (G. KH.)

CLIVE, KITTY (CATHERINE RAFTOR) (1711–1785), British actress, who became one of David Garrick's most famous leading ladies, was born in London. the daughter of William Raftor, an Irishman of good but impoverished family. About 1728 she began to play at Drury Lane under Colley Cibber and soon became a favourite. She married George Clive. a barrister, but they separated by mutual consent. Her first great, success was as a comedienne and singer in *The Devil to* Pay. Almost her whole career belonged to Drury Lane. where in 1747 she joined Garrick, with whom she remained for 22 years. always playing comedy roles. She also sang in some of the oratorios of Handel, whose friend she was. In 1769 she left the stage and retired to a villa (the gift of Horace Walpole) at Twickenham. where she lived for 16 years and where she died on Dec. 6. 1785.

Kitty Clive had no beauty but possessed considerable fascination and was certainly the best comedy actress of her day. However, she was temperamental and led Garrick (who was afraid of her) a troubled life. Her private life was above suspicion and she supported her father and many friends. Horace Walpole, a great admirer of her art, placed an urn to her memory in his garden. On it was inscribed:

The comic muse with her retired
And shed a tear when she expired.

See P. Fitzgerald, *Life of Mrs. Catherine Clive Together With Her Correspondence (1888).* (*W. J.* M.-P.)

CLIVE, ROBERT CLIVE, BARON (1725–1774), British soldier and statesman who mas one of the creators of British power in India, was born on Sept. 29, 1725, at Styche, the family estate, in the parish of Moreton Say, near Market Drayton, Shropshire. The Clives were one of the oldest families in the county, having held the manor of Styche in the reign of Henry II. One Clive had been chancellor of the Irish exchequer under Henry VIII; another had been a member of the Long parliament; Robert's father for many years represented Montgomeryshire in parliament. Young Clive was a difficult boy of high and unruly spirits and was sent to several schools. including the Merchant Taylors' school in London, without much visible profit. But he mas able to read Horace in later life and to write and speak in vigorous English. In 1743, aged 18, he was sent to Madras as a "writer" in the English East India company's service — something of a last resort at that time since the prospects were limited.

First Years in India. — At Madras he was moody and quarrelsome, twice attempted suicide and once fought a duel; he found solace in the governor's library where he virtually educated himself. The outbreak of hostilities between the French and British in south India gave Clive the chance to reveal his latent talents as a man of action. He was taken prisoner at the capitulation of Madras in 1746 but escaped to Ft. St. David where he served as a volunteer and the governor gave him the rank of ensign (1747). The peace of Aix-la-Chapelle in 1748 seemed to end Clive's military career, but the renewed hostilities between the English and French East India companies and their support of rival Indian princes drew him back into military service. In 1751 the French candidate for the Carnatic nawabship. Chanda Sahib, was besieging the British candidate, Mohammed Ali, in the fortress of Trichinopoly. Clive offeredto lead a diversion against Arcot, the capital city and Chanda's base. With 200 Europeans and 300 Indians he seized Arcot on Sept. 12 (new style; Aug. 31, old style) and then successfully withstood a 53-day siege (Oct. 4–Nov. 25) by Chanda's brother. This feat proved to be the turning point in the contest with the French commander, Joseph Dupleix (*q.v.*). In the next months Clive established himself as a brilliant exponent of guerrilla tactics. In March 1753 he returned to England with something of a fortune, having been appointed in 1749 a commissary for the supply of provisions to the troops. Before leaving he married Margaret Maskeleyne.

The "Heaven-Born General." — In 1755, after unsuccessfully standing for parliament, he was sent out again to India as governor of Ft. St. David with the reversion to the governorship at Madras and a lieutenant colonel's commission in the royal army. With him went troops intended to dislodge the French from the Deccan in view of the imminence of a European mar. On the way, at the request of the Bombay government, he stormed the pirate stronghold at Gheriah on the western coast.

Clive reached Madras in June 1756. He immediately became involved in the affairs of Bengal, with which, henceforward, his fate was to be linked. Hitherto Bengal had been ruled by the Mogul viceroys, progressively more independent of Delhi. and under their protection the English East India company carried on its trade. The principal city, Calcutta, had come to rival Madras as a trading centre and its commerce was the most valuable in India, In 1756 a dispute with the British about fortifying the city caused the new nawab of Bengal, Siraj-ud-Daula, to attack and capture the fort there (see CALCUTTA: History). It was this situation which Clive was now called upon to remedy.

News of the fall of Calcutta reached Madras in Aug. 1756. After some delay Clive was given command of the relief expedition and set out on Oct. 16,1756, with 900 Europeans and 1,500 Indians conveyed by Adm. Charles Watson's fleet. He was supremely self-confident; "it is by far the grandest of my undertakings," he wrote to his father. He felt the touch of destiny and he was not mistaken. The Calcutta fugitives were rescued in December. Calcutta itself taken on Jan. 2, 1757, and peace made with the nawab on Feb. 9, 1757. There was to be restoration of the company's privileges, compensation for losses and permission to fortify Calcutta. the original bone of contention. In so acting, Clive recognized the difficulty of his position, with the French in danger of becoming Bengali allies, the company demanding peace and cooperation with Admiral Watson a matter of some delicacy. Clive refused to return to Madras and used the time thus gained to eliminate the French settlement of Chandernagore. Siraj-ud-Daula stood by for fear of the Afghans who had just sacked Delhi. Clive then determined to take advantage of discontent with the nawab's regime, follow the French precedent in the Deccan and sponsor a new ruler in order to ensure conditions agreeable to the company's trade. Clive's candidate was Mir Jafar, an elderly general secretly hostile to Siraj-ud-Daula. At the last moment one of the conspirators, Omichund (Amin Chand), threatened to divulge the secret and was silenced by explicit promises of reward in a doctored copy of the secret agreement mith Mir Jafar. Clive then broke with Siraj-ud-Daula and overthrew him on June 23 at the battle of Plassey. The night before the battle was the only time he showed any signs of indecision. The conflict was more of a cannonade than a battle; only 23 of Clive's men were killed, and Mir Jafar held aloof until treachery had decided the issue. It was a trial of nerves rather than of arms. Nevertheless. the issue was decisive. Clive was now the virtual master of Bengal.

Clive's first government lasted until Feb. 1760. He was confirmed as governor by the company and went about his business with explosive energy. His first task was to buttress Mir Jafar's authority. The rumoured treasure of £40,000,000 turned out to be no more than £1,500,000 and the nawab, finding difficulty in fulfilling his financial obligations, looked to the treasuries of his Hindu officers to fill the gap. The Hindu-Muslim conspiratorial alliance was thus strained and Clive had to protect the Hindu officers from Mir Jafar and Mir Jafar from further intrigues. Another source of danger came from the Mogul crown prince, but he aas repulsed from Patna in 1759. The Dutch, who sought to play on the nawab's discontent, sent a force to their settlement at Chinsura. but through a series of adroit moves Clive destroyed this force even though England was at peace with the Netherlands. By 1760 Mir Jafar's authority was unchallenged throughout Bengal and Bihar, and his subservience to the company was complete. In addition, by the dispatch of a force under Col. Francis Forde in 1758, Clive secured the Northern Circars from the French garrison left by Charles de Bussy.

Clive's second task was to settle the company's affairs. In this he was less fortunate. First, he accepted not only full compensation for loss to the East India company and the Calcutta citizens, but also large payments to himself and the council. He himself received in all £234,000 in cash, a Mogul title of nobility and an estate or jagir with an annual rental of about £30,000. It was a venal age, but this example opened a flood of corruption which nearly ruined both Bengal and the company, and which Clive himself later struggled manfully to control. Second, he obtained from the nawab the practical exemption from internal duties, not only of the company's goods. but also of the private trade of the company's servants as well. Since the company possessed paramount force and its servants believed "in doing themselves justice," this had a most harmful effect on the economy of Bengal.

Though stained by corruption and duplicity, Clive's first government was a tour de force of generalship and statecraft. He had snatched the richest province of India over the heads of his political superiors and with the authority of the Mogul regime. The more sinister fruits were yet to appear. Returning to England in Feb. 1760, he nas given an Irish peerage as Baron Clive of Plassey in 1762 and knighted in 1764. He was described by William Pitt (afterward earl of Chatham) as "a heaven-born general."

He became member of parliament for Shrewsbury, purchased an estate and cultivated a parliamentary interest. It would seem that he hoped to use his Indian wealth to carve out an English political career. But he had to reckon with the current jealousy toward any upstart, however brilliant. the unpopularity of returned Indian "nabobs" and suspicions within the East India company resulting from his suggestion to Pitt that the state should take over its territories. He had an Achilles heel in his jagir, because its income. necessary to further Clive's political ambitions, depended on the good will of the East India company. His critics, led by his former friend Lawrence Sulivan. chairman of the company since 1738, succeeded in limiting its tenure to ten years. They failed to ruin Clive, but they prevented him from becoming a national statesman. His energy and money were wasted in buying votes in the company's court of proprietors to influence the annual elections of the directors.

Second Government in Bengal.—In 1764 opinion within the company turned in Clive's favour because of the news from India. Clive's protégé Mir Jafar had been deposed in favour of Mir Kasim who in turn had been deposed in 1763. Shah Alam, the Mogul emperor, attacked again and the company seemed to be on the brink of disaster. Clive was appointed governor and commander in chief of Bengal with power to override the council. He arrived in Calcutta for the second time on May 3, 1765. He found that the decisive battle of Buxar (Baksar) had already been won; Shuja-ud-Daula, the nawab of Oudh, was in flight and the emperor had joined the British camp. However, there mas a political and military vacuum between Bengal and Delhi and the whole Bengal administration was in confusion.

Clive's chief claim to fame as a statesman rests upon the achievements of his second governorship. His work falls into three parts: external policy, the settlement of Bengal and the reform of the company's service. In his external policy Clive had to face one of the most difficult tests of statesmanship: that of knowing where to stop. There was nothing to prevent him from restoring Shah Alam to Delhi and ruling north India in his name as the Marathas did later, but he wisely decided to limit the company's commitments to Bengal and Bihar. Oudh was returned to Shuja-ud-Dauia as a buffer state between Bengal and the turbulent northwest. The emperor was solaced with Allahabad and Korah and an annual tribute; in return he conferred the revenue administration or dewanee of Bengal on the East India company. This grant formed the key to Clive's second achievement, the settlement of Bengal. It gave legal authority to the company to collect the revenues of Bengal and Bihar, sending only an annual tribute to the emperor. The administration of the dewanee was organized through a deputy nawab appointed by the company. The police and magisterial power was still exercised by the nawab of Bengal as the emperor's deputy, but he in turn nominated the company's deputy to act for him. This was Clive's famous "dual system" which made the company the virtual ruler of India's two richest provinces. It was the real beginning of the British empire in India.

Clive's third task was the reform of the company's service. Within two days of landing he superseded the Calcutta council. which had defied his predecessor. Henry Vansittart, and had gone to war over his head. He re-established discipline by accepting all resignations, enforcing others and bringing replacements from Madras. All company servants were required to sign covenants not to receive presents worth more than Rs. 1,000 (about £100) without the consent of the governor. Private trade. abuses of which had caused the war, was forbidden. This was the least successful measure because the company's officials were not adequately paid and had no other means of livelihood. Clive tried to meet the difficulty by forming a Society of Trade which administered the salt monopoly and in which the servants received shares according to their rank. These two measures were only partially successful, but they marked the end of nearly ten years' reckless plunder in Bengal. Finally Clive dealt with the army with equal rigour. He cut down swollen allowances and faced with dauntless courage the "White mutiny" of discontented officers, when for a time he stood almost alone in Bengal.

Attacks in England.— Clive left Calcutta in Feb. 1767. His second government was his crowning achievement, but it was deeply resented by those who regarded him as a poacher turned gamekeeper. His enemies had friends in the court of directors and awaited their opportunity. At first he mas welcomed and was voted an extension of his jagir for another ten years. But there grew an active group, supported by Lord Chatham himself, who feared the corrupting influence of Indian wealth on English public life. This group joined with Clive's enemies when in 1772 the company appealed to the government to save it from bankruptcy. It appeared now that Clive's system of government in Bengal had not been as successful as had been hoped. Two parliamentary committees uncovered the facts of corruption among the company's servants, and this set off an attack on Clive as the instigator of the whole process. He defended himself in parliament (1772) with characteristic vigour and conviction, complaining of being treated like a sheep stealer and declaring "I stand astonished at my own moderation." After an all-night debate it was declared that he "had rendered great and meritorious services to his country." This triumph was his last. With his already shaken health. the strain on his melancholic temperament was too great: on Nov. 22, 1774. he died by his own hand at his house in London.

Clive suffered from reaching the top too soon. The faults of his first years in Bengal were those common in his day, magnified out of proportion. rather than heinous offenses. When maturity came he found himself enmeshed in the consequences of his early mistakes. His talents were outstanding, his character no more unscrupulous than that of many men of his day. He must equally receive the credit for the acquisition of Bengal and bear the blame for the temporary ruin of the province.

Clive's son and successor Edward (1754–1839) was created earl of Powis in 1804.

CLOACA, the Latin term for a drain or sewer. The most famous is the Cloaca Maxima at Rome. built to drain the marsh where the Forum Romanum was situated. The Cloaca Maxima was constructed originally in the late 6th century B.C. as an open stone-lined channel; some side channels were vaulted in the 5th century; the main channel was vaulted in the 3rd century and later with a stone barrel vault.

Cloaca is also the name given to the joint opening of the urinogenital and alimentary systems characteristic of all the vertebrates except the mammals, among which it is retained only in the monotremes.

CLOCK, a machine designed to record or indicate the time of day. The way to construct such a machine is to link a device that performs regular movements in equal intervals of time to a counting mechanism that will record the number of these movements. All clocks. of whatever form. are made on this principle.

An ordinary clock consists of a series of todthed wheels and pinions (small toothed wheels) driven by a weight or spring and linked by an escapement *(see* below) to a pendulum or, alternatively. to a balance and hairspring, which has the property of even, isochronous motion. Such a machine, though popularly called a clock. is strictly a timepiece, the term clock being properly applied only to a timekeeper which, by an additional mechanism, strikes the hours on a bell or gong.

The earliest known timekeepers are the sundials (*q.v.*) and water clocks (*see* CLEPSYDRA) of ancient Egypt, and devices of the same type were in use throughout the periods of the Greek and Roman empires. whence they passed to medieval Europe. A parallel development of water clocks on somewhat different lines took place in China between about A.D. 100 and 1100. The origin of the all-mechanical escapement clock is still unknown; there are various references to public striking clocks in Europe from about 1290 onward, perhaps the first definite one being in Milan in 1335.

The oldest surviving clock in England is that at Salisbury cathedral, which dates from 1386. A clock erected at Rouen, France,

in 1389 is still extant and one built for Wells cathedral in 1392 is now in the Science museum, London. The Salisbury clock strikes the hours and those of Rouen and Wells also have quarter chiming mechanisms. Other clocks of somewhat later date are at Cotehele house. Cornwall and Rye church. Sussex. These clocks were large iron-framed structures. They were operated by means of a mechanism known as a verge, or crown wheel, escapement controlled by an oscillating weighted bar, a device which preceded the pendulum by more than 300 years (see fig. 1).

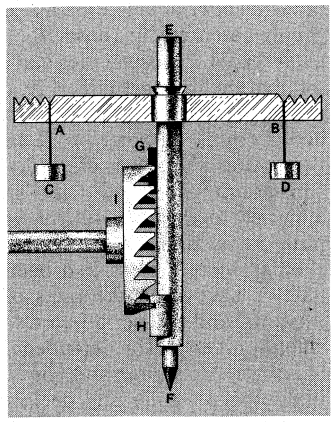

FIG. 1.—FOLIOT BALANCE CONTROL MECHANISM (*See* TEXT)

A crossbar, or foliot, AB carries two regulating weights CD and is mounted on a vertical spindle E F carrying two projections or pallets, GH. As the foliot swings to and fro, the teeth of the escape wheel I are released one by one. As each tooth is released it gives an impulse to the pallet and thus keeps the foliot swinging. The time of a swing depends on the driving weight and even on the shape of the individual teeth of the wheel. so that the accuracy of foliot clocks was low and their errors must have been as large as half an hour per day.

The first domestic clocks were smaller versions of these large public clocks. They appeared late in the 14th century and few examples have survived, most of them extremely austere in design. Domestic clocks of a much more pleasing appearance were made in the 15th century, and spring drive first appeared toward the end of that century. While this made clocks portable, it brought its own mechanical problems: the driving force of a weight remains constant but that of a spring is greater when it is fully wound than when nearly run down. Methods of compensating for this varying force were at once devised; the one usually employed was the "fusee," which gave an almost perfect compensation (see WATCH: The *Mainspring*).

The surviving spring-driven clocks of the early 16th century are in the form of flat metal drums or square boxes with the dial on the upper face, but about the middle of the century the vertical type, n·ith the dial on one of the side faces of the case, came into use. Although a few wooden-cased clocks were made on the European continent from the late 16th century onward, wooden cases were the exception rather than the rule until after the invention and application of the pendulum.

The Pendulum.— .%bout 1582 Galileo (1564–1642) noticed the characteristic timekeeping property of the pendulum and later attempted to apply it to clock mechanism. It was, however, the Dutch astronomer and physicist Christiaan Huygens (1629–95) who was responsible for its general application as a time controller in clocks from 1656 onward.

The great virtue of the pendulum as a time measurer lies in the fact that, for small arcs of swing. its period of swing depends only on the length of the pendulum and is almost independent of the extent of the arc. The length of a pendulum beating seconds with a fairly heavy bob and a light rod is about 39 in., and an increase in length of ,001 in. will make the clock lose about one second per day. Altering the length of a pendulum is therefore a sensitive means of regulation. The alteration is usually carried out by allowing the bob to rest upon a nut which can be screwed up or down the pendulum rod.

Any expansion or contraction of the rod caused by changes of temperature will affect the timekeeping of a pendulum; *e.g.*, a pendulum clock with a steel rod will lose one second per day for a rise in temperature of 4° F., and will gain one second per day for a similar fall in temperature. If accurate timekeeping is required, the pendulum must be compensated by some device which will keep its length as constant as possible. This may be done in several ways, some of which use the differing coefficients of expansion of different metals to obtain a cancelling-out effect. The most usual forms of this type of compensation are the mercurial, in which the bob consists of a glass or metal jar containing a suitable amount of mercury; the gridiron, in which brass and steel rods are employed; and the zinc-iron tube, in which the pendulum rod is made up of concentric tubes of zinc and iron. A better method, however. is to make the pendulum rod from a special alloy called Invar. This material has such a small coefficient of expansion that small changes of temperature have a negligible effect.

The escapement of a pendulum clock usually consists of two parts: an escape wheel of special shape geared to the clock's main train of wheels. and an oscillating system linked with the pendulum and carrying two projections or pallets which engage alternately with the teeth of the escape wheel. The wheel is allowed to escape through the pitch of one tooth for each double swing of the pendulum, and in escaping it transmits an impulse through the pallets to the pendulum to keep it swinging and make up losses of energy due to friction. An ideal escapement would perform both functions without interfering with the free swing; the more closely an actual escapement approaches this standard, the better it is.

When first introduced. the pendulum was used with the verge escapement like that shown in fig. 1, but adapted to pendulum control. In a short time the verge was replaced by the anchor or recoil escapement, which was a great improvement and is still used for many domestic clocks (fig. 2).

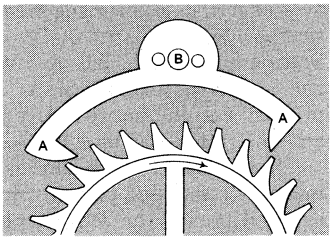

FIG. 2.—RECOIL ESCAPEMENT (*See* TEXT)

The recoil escapement has two pallets A mounted on the ends of a curved bar or yoke B that spans a part of the circumference of the escape wheel. At a point approximately equidistant from both pallets, the yoke is attached to a pivoted spindle linked to the pendulum by a light bar, or crutch. As the pendulum swings it causes the pallet spindle to oscillate, and this in turn engages and disengages the pallets with the teeth of the escape wheel. so permitting the wheel to advance in a step-by-step motion. The inclined acting faces of the pallets not only arrest and release the teeth of the escape wheel but also transmit to the pendulum in the form of impulses some of the energy used to drive the clock. Because of the construction of the pallets, however. any additional swing made by the pendulum after a tooth has engaged with them causes the escape wheel to recoil. This defect was modified by a device known as the deadbeat escapement (fig. 3) invented in 1715 by George Graham (1673–1751), who also devised mercurial compensation for pendulums.

In the deadbeat escapement the acting surfaces of the pallets have two distinct parts, known as the dead and impulse faces. The teeth of the escape wheel fall first upon the dead faces (GF and BD) and rest upon them before the movement of the pallets allows them to reach the impulse faces (AF and BE) and finally to escape.

The dead faces of the pallets are made in the shape of arcs of a circle whose centre is the pivot point C. so that as the pallet system moves with an escape wheel tooth resting upon a dead face. the escape wheel remains at rest. The wheel is then neither pushing the pallet nor recoiling from it, the only interaction being a slight friction. To minimize interference still further by reducing friction, the pallets of very precise clocks have pieces of jewel inserted in their acting faces.

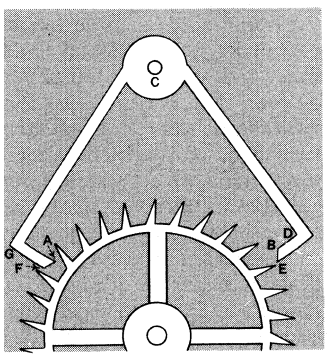

FIG. 3.—DEADBEAT ESCAPEMENT (*See* TEXT)

One of the defects of both the recoil and deadbeat escapements is that the impulse they transmit to the pendulum can vary because

of variations in the power transmitted by the wheelwork. Such changes arise from thickening of the oil, from dust, wear or, in the case of tower clocks, wind pressure and snow or ice on the hands. To overcome this, a number of inventors designed escapements in which weighted arms were raised by the escape wheel and then delivered the impulse of the pendulum as they descended to their original position. The first really successful escapement of this kind was invented about 1853 by J. M. Bloxam, a barrister. A much better form, the double three-legged gravity escapement, was invented by E. B. Denison, afterward Lord Grimthorpe (1816–1905), and used by him for the great clock at Westminster, now generally known as Big Ben, which was installed in 1859. It has since become standard for all really accurate tower clocks.

Many domestic clocks are fitted with escapements embodying a balance and hairspring as the timekeeping element instead of a pendulum, thus making them more easily portable. The escapements used are the cylinder, lever and, in some cases, the chronometer detent. Their construction is identical with that of similar escapements used in watches and their general layout is that of a large watch. (See WATCH: *Escapements.*)

Clock Wheelwork: the Train.—With all but the gravity escapement, it is most important that the energy transmitted by the wheelwork should be as constant as possible and, even with a gravity escapement, a consistent supply of power is an advantage. The wheels and pinions must be made accurately and the tooth form designed so that the transference of power takes place as steadily as possible. Advances in gear design and manufacture have made present-day clocks far better than older ones in this respect.

In a weight-driven or spring-driven clock, the power of the weight or spring is first transmitted by the great or main wheel. This engages with the first pinion, whose spindle is attached to the second wheel which, in its turn, engages with the second pinion, and so on, down through the train to the escapement. The gear ratios are such that one spindle, usually the second or third, rotates once an hour and can be used to carry the minute hand. A simple 12-to-1 gearing, known as the motion work, gives the necessary step-down ratio to drive the hour hand. The spring or weight is fitted with some form of ratchet mechanism so it can be rewound when necessary, and the spindle carrying the minute hand is provided with a simple slipping clutch which allows the hands to be set to time.

Construction.—The timekeeping part of all clocks, including large tower clocks, is substantially the same. Figure 4 shows the side view of a simple weight-driven timepiece with a pendulum. The frame is made up of two plates which carry the pivots of the various wheels and other moving parts and are united and spaced by four pillars (Pi). The driving weight (W) hangs from a line coiled around the barrel (B) and is wound by means of the winding square K, slippage occurring (during winding) at the ratchet wheel (R). The main wheel (G) engages with the centre pinion (c) on the spindle of which is also mounted the centre wheel (C). The front pivot of this wheel and pinion is lengthened to the left of the illustration, and carries the minute hand and part of the gearing necessary to drive the hour hand.

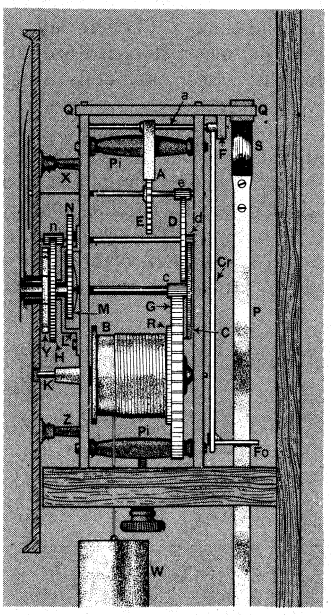

FIG. 4.—WEIGHT-DRIVEN CLOCK (*See* TEXT)

The centre wheel (C) engages with the pinion of the third wheel (d) and on that same spindle is mounted the third wheel (D) which in its turn engages with the escape wheel pinion (e). The escape wheel (E) engages with the pallets (A), which are fixed to the spindle (a) and pivot between the front plate and the pendulum suspension cock (F). Also fixed to the pallet spindle is the crutch (Cr), which terminates at its lower end in a fork (Fo) which embraces the pendulum rod (P). This pendulum, of which only the upper part is shown, is suspended by a thin flat suspension spring (S) from the cock (F), which is reinforced to obtain the utmost possible rigidity by a bar (QQ) spanning the top of the frame plates.

The motion work used for driving the hands at their relative speeds is mounted between the dial and the front plate of the frame. The wheel (M), which rotates once an hour and is known as the cannon pinion, is coupled to the centre spindle by a flat spring which acts as a clutch and permits the hands to be set. The cannon pinion (M) engages with a wheel of similar size (N) called the minute wheel, and the small pinion (n) attached to this wheel engages with the hour wheel (H) that pivots on a small supporting bar, or bridge, (L). The winding square (K) is shown behind a hole in the dial plate, and the attachments of the dial plate to the mechanism are at X and Z. The wheel (Y) is connected with the striking mechanism, which consists of a hammer-lifting mechanism, equipped with a counting device, which strikes the hours on a bell or gong. It is released through a train of wheels by the action of the timekeeping part and is usually mounted in the same frame.

Tower Clocks.—In former times the frames of large timekeepers were made up of an assembly of bars fastened together in a sort of cage. For this reason they were known as birdcage-frame clocks. The standard frame now in use is the flat bed, in which the main part is a massive casting resembling a table or platform. The bearings of the various wheels are bolted in such a way that almost every part can be dismantled separately. The adoption of this improved design was largely due to Lord Grimthorpe, who used it for the great Westminster clock (see above). The timekeeping and striking parts of a tower clock do not differ very much from those of smaller clocks in basic design.

Hand-wound tower clocks are invariably driven by weights which are usually wound up to the full height of the tower. By the 1960s automatically wound clocks, in which a light weight is hung from an endless length of roller chain and rewound by an electric motor, had become almost standard. In most cases the striking and chiming mechanisms are driven directly by electric motors, which raise their hammers by cams that are rotated by the final spindle of an enclosed reduction gearing.

Sometimes the timepiece has no pendulum and escapement of its own but is released in half-minute steps by a trigger release device controlled by an electromagnet which is in turn connected to a precision master clock. This arrangement enables large dials to be driven accurately and is remarkably simple in construction. A good example is the great Shell-Mex clock on the Embankment, London, where two 25-ft. dials are operated.

Some tower clocks are driven by synchronous electric motors operated from commercial alternating current supplies and are similar to the synchronous clocks described below.

Electric Clocks.—Electric currents are used in two different ways—to replace the weight or spring as a source of power and as a means of signaling time indications from a central master clock to a wide range of distant indicating dials.

Although electric power is used to rewind the weights of a tower clock, it can be more readily applied to give direct impulses to the pendulum or to lift a lever after it has imparted an impulse to the pendulum. In various modern master clocks the pendulum operates a light count wheel, which turns through the pitch of one tooth every double swing and is arranged to release a lever every half-minute. This lever gives an impulse to the pendulum and is then restored to its original position by an electromagnet. The pulse of current which operates the electromagnet can also be transmitted to a series of distant dials, advancing the hands of each through the space of a half-minute. Thus a master clock can control scores of dials in a large group of buildings, as well as such other apparatus as time recorders and sirens.

Electrical master clocks of this type are good timekeepers, since the impulse can be given symmetrically as the pendulum passes through its middle position and the frictional interference with

its motion is small. The most accurate mechanical timekeeper is the Shortt pendulum clock, which makes use of a movement of this type. It consists, in fact, of two separate clocks, one of which synchronizes the other. The timekeeping element is a pendulum which swings entirely freely except that once every half-minute it receives an impulse from a gently falling lever. This lever is released by an electromagnetic signal transmitted from its slave clock and, after the impulse has been given. a synchronizing signal is transmitted back to the slave clock which ensures that the impulse to the free pendulum will be released exactly a half-minute later than the previous impulse. The pendulum swings in a sealed box in which the air is kept at a constant, low pressure. Shortt clocks in observatories are kept in a room, usually a basement, where the temperature remains as constant as possible, and under these conditions their errors amount to only a few thousandths of a second per day.

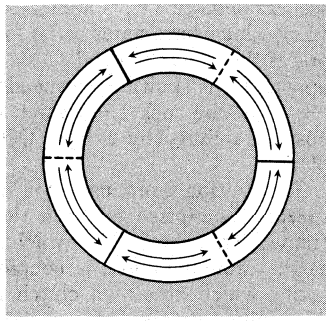

FIG. 5.—QUARTZ RING (*See* TEXT)

Synchronous Electric Clocks.—A clock of this type consists of a small electric motor coupled to a reduction gearing which drives the clock hands. The motor runs in step with the frequency of the alternating current, and so the hands move round at the correct rate. The frequency of commercial alternating current is so carefully controlled that the time shown is normally correct to within a few seconds.

Quartz Crystal Clocks.—In the clocks so far described the timekeeping element has been a pendulum or balance wheel which repeats a purely mechanical motion. Two other types of motion, whose regularity is even greater than that of the best pendulum or balance wheel. have been utilized to produce "quartz crystal" and "atomic" clocks.

The mechanical vibrations of quartz are accompanied by small electrical effects which can be amplified by electron tubes and transistors. A small amount of the amplified power is fed back to the crystal to keep it oscillating and make up for very small losses in internal friction. The timekeeping element of a quartz clock consists of a ring of quartz about $2\frac{1}{2}$ in. in diameter which is suspended by six threads and is enclosed in a heat-insulated chamber. Electrodes are attached to the surfaces of the ring and connected to an electrical circuit whose oscillations are tuned to those of the ring. The vibrations form a stationary wave pattern around the circumference of the ring as shown in fig. 5. The frequencies of vibration are very high, of the order of hundreds of thousands per second. and are reduced by a frequency divider and applied to a synchronous motor connected to a clock dial through mechanical gearing.

If the crystal makes 100,000 vibrations per second and the combined electrical and mechanical gearing gives a reduction of 1 to 6,000,000, then the second hand of the synchronous clock will make exactly one rotation in 60 seconds. The vibrations are so regular that the error of an observatory quartz-crystal clock is only a few ten-thousandths of a second per day, equivalent to an error of one second every 10 years. Small portable clocks can be made accurate to about 1/30th of a second per day.

Atomic Clocks.—Accuracy exceeding even that of quartz crystal clocks can be attained by so-called atomic clocks. which utilize oscillations taking place in individual atoms These small electrical and magnetic vibrations are almost wholly independent of normal external conditions and, as their frequencies are a property of the atoms themselves, they are identical for all atoms of the same kind.

In one of the most commonly used types of atomic clocks, the atoms used are those of cesium In a magnetic field each cesium atom behaves like a small magnet the magnetic moment of its nucleus setting itself parallel or antiparallel to the field. The polarization of the atoms can be made to change direction if they are placed in an alternating magnetic field where the frequency of the alternations is equal to the natural frequency of the cesium atoms.

Figure 6 shows the basic technique used in a cesium atomic clock. A beam of cesium atoms emerges from the oven A, passes down the evacuated chamber and is deflected by a fixed magnet B to pass through the rapidly alternating magnetic field. If this field has the correct frequency, the polarization of the atoms will change direction and the atoms will then be deflected in the opposite direction by the second fixed magnet C which will focus them on a detector D. If the alternating field is not of the correct frequency, the atoms will be deflected in the wrong direction at C. In practice. the frequency of the alternating field is varied slowly until the maximum response is obtained at the detector. and the frequency is then known to be exactly equal to that of the cesium atoms The tuning is so precise that the frequency can be measured to 1 part in 30,000,000,000—equivalent to a discrepancy of one second in 1.000 years. This is the accuracy of the second cesium atomic clock installed at the National Physical laboratory at Teddington. near London. (*See* also TIME MEASUREMENT)

THE CLOCK IN DECORATION

Judged by modern standards, very early timekeepers seem crude; nevertheless they were serious contributions to the scientific life and thought of their day, and in consequence the best endeavours of the craftsmen were lavished upon them. The result mas in most cases not merely a utilitarian piece of mechanism but a work of art.

Before the introduction of the pendulum. both the mechanism and the case were usually made of metal, most commonly brass and steel. However simple or elaborate the clock was, it was well finished. but many had fine engraving or overlaid ornament and much of it was gilt. The steel work came in for particular attention and many items were elaborately pierced or wrought, polished and blued. It is true that the earliest-known clocks would not have been so well finished, for they were constructed oi wrought iron throughout and were entirely uncased. They persisted for many years in central Europe and are usually referred to as Gothic clocks The family of Leichti of Winterthur, Switz., made a large number between 1550 and 1650. Gothic clocks may well have been the forerunners of the popular English lantern clocks, which they resemble. and which were made in considerable numbers

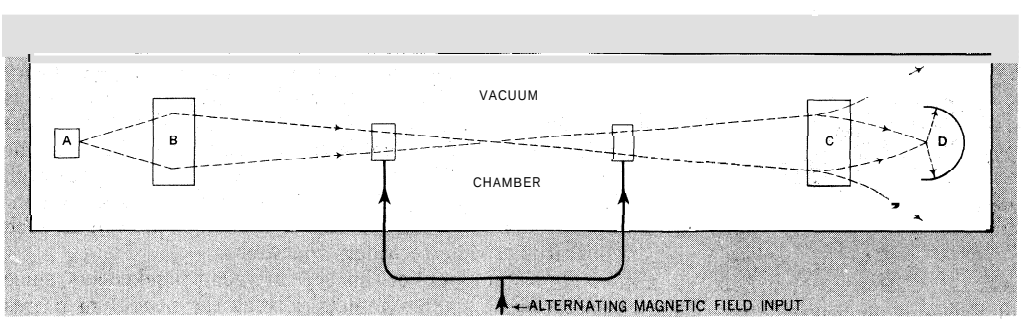

FIG. 6.— CESIUMATOMIC CLOCK (*See* TEXT)

throughout the 17th and 18th centuries. However, these were constructed almost entirely of brass.

The general adoption of wooden cases for clocks dates from the introduction of the pendulum in 1657. (*See* above.) This invention originated in Holland, where the first clockcases were little more than rectangular boxes hung on the wall. Makers such as Ahasuerus Fromanteel and Edward East, who developed the new mechanism in England, greatly improved the appearance of the clockcase by adding architectural detail and finely finished mouldings. The more highly developed designs were completely architectural and were enriched with gilt metal mounts. It was these early makers who started the tradition for artistic clockcase design that many generations of English clockmakers followed. The cases were constructed of oak and veneered with ebony. Although the anchor escapement using the long pendulum was not introduced until about 1670, weight-driven long-case clocks were made before that date having a verge escapement and short pendulum. These early long-cases were extremely slender.

In the 1670s, ebony was used less frequently as a veneer for long-cases. and olivewood, usually used in conjunction with inlaid box and ebony or small panels of simple marquetry, became popular. The dial was normally of brass and was ten inches square. The chapter ring (the circle containing the numerals) was silvered; the corners enclosed between the outside of the circle and the frame, known as spandrels. had gilt cupid-head mounts. Walnut soon superseded olivewood in popularity and was used with and without marquetry panels. As the 17th century drew to a close the marquetry panels tended to cover larger areas and the detail became more elaborate. At the end of the century the standard long-case dial was 12 in. square.

During the same period (1670–1700) most spring-driven clocks were veneered with ebony. The architectural basis of design was discarded and the small, dome-topped case with a carrying handle took its place, a style characteristic of the clocks of Thomas Tompion. Toward the end of the century these cases were often lavishly ornamented with gilt mounts, the entire dome sometimes being of *repoussé* brass.

Early in the 18th century the break-arch dial (in which the square dial has a semicircular addition at the top) was introduced and the spring clock became taller in proportion. Decorative woods gradually replaced a black finish for spring clocks but it was not until the second half of the century that mahogany was used in any quantity. Late in the 18th century a much greater variety of designs was used, influenced in part by the belated general introduction of the anchor escapement into spring-driven clocks.

Decorative woods, at first walnut and later mahogany, were used throughout the century for long-case clocks, while there was a short vogue for floral, arabesque and seaweed marquetry and for Chinese lacquer.

A number of attractive small mantel clocks, which utilized 30-hour watch movements, were made in the late 18th and early 19th centuries, but during the 19th century they were superseded by small eight-day pendulum and lever clock movements.

English provincial clock design has, in the main, followed the London fashions, with local variations of detail. The vast majority of oak long-case clocks are of provincial origin, the most prolific period being 1750–1850. The dials of these clocks are often enameled with painted decoration ranging from floral subjects to rural scenes.

In the early days of pendulum clocks, French design was very similar to the Dutch. The French flair for decoration, however, soon created distinctive styles. The use of boulle work was one of the first departures from the soberness of Dutch design, while in the 18th century ormolu was increasingly used.

American design stems from the English and frequently bears a relation to the London designs similar to that of the English provincial work. However, early in the 19th century really distinctive designs emerged with the Banjo clock of Simon Willard and the shelf clock of Eli Terry.

CLODION (CLAUDE **MICHEL**) (1738–1814), French sculptor, very prominent in the rococo movement, was born on Dec. 20, 1738. in Nancy. In 1755 he went to Paris and entered the workshop of Lambert Sigisbert Adam, his uncle, and on his death became a pupil of J. B. Pigalle. In 1759 he obtained the grand prize for sculpture at the Académie Royale de Peinture et de Sculpture; and in 1762 he went to Rome. Catherine II was eager to secure his presence in St. Petersburg. but he returned to Paris in 1771. There he had a success and frequently exhibited at the Salon. D'Angiviller, Louis XVI's architectural director, ordered a statue of Montesquieu from him (now in the Institut), intended to be one of a series of great Frenchmen.

Clodion worked mostly in terra cotta, his preferred subject matter being nymphs and satyrs, bacchantes, Nereids, etc. He was also (with his brothers) a decorator of objects such as candelabra, clocks and vases. Perhaps because of his apparent unwillingness to be seriously monumental he was never admitted to the Académie Royale. Nevertheless, after the Revolution had driven him in 1792 to Nancy (where he lived until 1798), he was flexible enough to adapt himself to the new neoclassic tendency. The relief on the Arc de Triomphe du Carrousel, representing the entry of the French into Munich, is an example of this. Among his many patrons were the chapter of Rouen, the states of Languedoc and the Direction *générale.* One of his last groups represented Homer as a beggar being driven away by fishermen (1810).

Clodion died in Paris on March 29, 1814. (A. K. McC.)

CLODIUS, PUBLIUS (surnamed PULCHER) (*c.* 93–52 B.C.), a disruptive politician and gangster in late republican Rome. Sprung from two distinguished families, the Appii Claudii and the Caecilii Metelli, he adopted the spelling ***Clodius*** instead of *Claudius,* and his three sisters, one of whom was the Lesbia of Catullus' poems, did likewise. Serving under his brother-in-law L. Lucullus against Mithradates, he instigated the troops to mutiny in winter 68–67. In Dec. 62, when the winter ceremony of the Bona Dea, from which men were excluded, was celebrated in the house of Julius Caesar, a man was discovered in the house disguised as a female harpist. The senate instituted a trial for *incestum* (on the ground that the offense was akin to misconduct with a Vestal Virgin). and in 61 Clodius, then quaestor, was prosecuted and acquitted, whether because the jury had been bribed. or because they were unconvinced by the evidence of Caesar's mother. Clodius claimed to have been at Interamna, 90 mi. from Rome. Cicero, who abused Clodius intemperately and gave evidence to break his alibi, was ultimately the chief sufferer from the case, for Clodius set out to prosecute him on a capital charge for the execution in Dec. 63 of the associates of Catiline (*q.v.*). Clodius was adopted into a plebeian family in 59, and elected tribune for

58. Of his tribunicial legislation, the abolition of payment for the monthly corn ration at Rome was a vote-catching measure, but other bills were defensible, such as that which put an end to such unprincipled obstruction of public business on religious grounds as Bibulus (*q.v.*) had practised in 59. In March he re-enacted a series of laws forbidding execution of a Roman citizen without trial, after which, Cicero having fled from Rome, he passed a second law declaring Cicero an exile.

In the following two years Clodius worked for Caesar, then in Gaul, to ensure that Pompey did not abandon his political alliance with Caesar in favour of the *optimates* (see CAESAR, GAIUS JULIUS); this he did by repeatedly frightening Pompey into the belief that his life was in danger.

A tribune of 57. T. Annius Milo. who did much to secure Cicero's recall from exile in that year, organized gangs to counter those of Clodius. As aedile in 56. Clodius made an abortive attempt to prosecute Milo for disorderly conduct. In Jan. 52 he was killed in a running fight on the Appian way at Bovillae. His body was cremated in the senate house. nhich was burned to the ground. Milo was prosecuted, defended unsuccessfully by Cicero, and went into exile.

CLODOMIR (495–524), one of the Merovingian kings in France. was the eldest son of Clovis and Clotilda. In the division of territory that followed the death of Clovis in 511, he obtained the Loire valley from Orleans to Tours and the cities of Chartres. Sens, Auxerre and Poitiers. In an attack on the Burgundians in 523, he captured and murdered their king Sigismund, but he was himself killed in the battle of Vezeronce, near Vienne. on June 25, 524 To secure his inheritance his brothers Childebert I and Clotaire I then murdered all his young children save one, Clodoald, who escaped to become a monk and was the founder, at Nogent-sur-Seine, of the monastery later named after him. St. Cloud. (JE. H.)

CLOG DANCE, a type of solo step dance performed in clogs in which the dancer marks the rhythm by tapping with the toes and heels. The clogs used are a light form of the w-ooden-soled clogs once common in industrial areas of northern England. southwest Scotland and south Wales. Clog dances were performed in all these regions by men and girls from at least 1870. but since about 1930 they have survived only in Northumberland and Durham. Clog dancing probably originated in Lancashire. for the two most widely distributed clog dances are the Lancashire and Liverpool Hornpipes. Clog dancing, after being introduced into the U.S., became one of the basic elements in the development of tap dancing. *See* TAP DANCE. (T. M. FL.)

CLOGHER (CLOCHAR MAC NDAIMHÍN), a village in the Clogher valley. County Tyrone. N.Ire. Pop. (1961) 197. It gives its name to the dioceses of the Church of Ireland and the Roman Catholic Church, the Protestant cathedral being dedicated to St. Macartin, an associate of St. Patrick. Myler Magrath, the pluralist. was the first Protestant bishop in Elizabethan times. Clogher was a parliamentary borough under the old Irish parliament. The name may be derived from clochoir, a "stone of gold," as there is a tradition of a local stone cult until the 15th century; or simply *clochar*, a "stony place." The novelist William Carleton (*q.v.*) was born at nearby Prillisk in 1794. (HU. S.)

CLOISTER, most commonly an enclosure surrounded by covered ambulatories. usually attached to conventual and cathedral churches and sometimes to colleges. The term is also used in a narrow sense of the ambulatories themselves, in a general sense of monasteries as a whole, and in a generic sense to denote places of retreat for religious purposes (in contrast to convent, which emphasizes more the idea of community life).

Generally speaking. a cloister is the quadrilateral area in a monastery around which the principal buildings are ranged. and which is usually provided with a covered may or ambulatory running all around and affording a means of communication between various centres of the ecclesiastical establishment. In developed medieval practice, cloisters usually followed either a Benedictine or a Cistercian arrangement.

ALINARI

CLOISTER OF ST. PAUL'S OUTSIDE THE WALLS, ROME. DESIGNED BY GIOVANNI COSMATI IN THE 13TH CENTURY

According to the Benedictine arrangement. which from its suitability to the requirements of monastic life was generally adopted in the west, one side of the cloister was formed by the church, the refectory occupying the side opposite to it, so that the worshipers might have the least annoyance from noise or smell. On the eastern side the chapter house was placed, with other apartments adjacent to it, belonging to the common life of the brethren, and. as a rule, the dormitory occupied the whole upper story. On the opposite or western side were generally the cellarer's lodgings with the cellars and storehouses in which the necessary provisions were housed.

In Cistercian monasteries the western side was usually occupied by the *domus conversorum* or lodgings of the lay brethren, with their day rooms and workshops below the dormitory above. The cloister. with its surrounding buildings. generally stood on the south side of the church, to secure as much sunshine as possible, although local requirements occasionally caused it to be placed on the north.

The cloister of a religious house was the scene of a large part of the life of its inmates. It was the place of education for the younger members and of study for the elders. A canon of the Roman council of 826 enjoined the erection of a cloister as an essential portion of an ecclesiastical establishment for the better discipline and instruction of the clerks. Peter of Blois described schools for the novices as being in the west walk, moral lectures being delivered in that next the church; stone benches running along the side provided places for auditors to sit. At Canterbury the monks' school was in the western ambulatory, and it was there that the novices were taught at Durham. The other alleys, especially that next to the church. were devoted to the studies of the elder monks. For this purpose small studies (known as "Carols" or "Carrels") were often found in the recesses of the windows. and in the cloister, too, supplies of books were kept. Particularly in rainy weather. the cloister served for exercise and general recreation. And in its central area and alleys were the customary places of burial.

Larger monastic establishments commonly had more than one cloister; there was usually a second connected with the infirmary, of which there are examples at Westminster abbey and at Canterbury, and sometimes one giving access to the kitchen and other domestic offices. The cloister was not an appendage of monastic houses exclusively. It was also attached to colleges of secular canons, as at the cathedrals of Lincoln. Salisbury and Wells, and

a cloister forms an essential part of the colleges of Eton and Winchester, and of New College and Magdalen at Oxford.

Historically, the earliest cloisters consisted of open arcades, usually with sloping wooden roofs. This earliest form of cloister was generally superseded in England by a range of windows, usually unglazed but sometimes, as at Gloucester, provided with glass, lighting a vaulted ambulatory, of which the cloisters of Westminster abbey, Salisbury and Norwich are typical examples. In southern climates, the open-arcaded cloister remained standard; of this type are the cloisters at Le Puy-en-Velay and Arles in southern France (the columns of which are among the finest pieces of Romanesque sculpture), and Laach in Germany.

It was in Italy, however, that the open cloister attained fullest development. Fine examples are the cloisters of St. John Lateran and St. Paul's Outside the Walls at Rome. where the coupled shafts and arches are richiy ornamented with ribbons of mosaic. Perhaps the finest example of all was the Campo Santo at Pisa, which consisted of four ambulatories as wide and lofty as the nave of a church, with inner walls covered with important eariy Renaissance frescoes; it was damaged beyond full repair during World War II.

Of Renaissance cloisters, the most significant was perhaps the one Donato Bramante designed for the church of Sta. Maria della Pace at Rome in 1504. Later Renaissance cloisters tended more and more to become duplicates of palace courtyards. See also MONASTERY. (AN. G.)

CLONAKILTY (CLANNA CHAOILTE), an urban district of County Cork, Republic of Ireland, at the head of Clonakilty bay, 33 mi. S.W. of Cork by rail. Pop. (1961) 2,417. There are megaliths in the neighbourhood. Richard Boyle, first earl of Cork, granted it a charter in 1613, and in 1641 the town was almost destroyed in a fight between the English and Irish. Sam's Cross, about 3 mi. W. of Clonakilty, was the birthplace of Michael Collins (*q.v.*), the Irish politician and general.

There are castles at Galley head, Dunnycove and Dunowen. The linen industry was important in the 18th and 19th centuries but trade is now in agricultural produce. The harbour is obstructed but there is a pier for large vessels at Ring, 1 mi. below the town.

CLONMACNOISE (CLUAIN MIC NOIS. "the meadow of the son of Nos"), a famous early Christian centre on the left bank of the Shannon, County Offaly, Republic of Ireland, 9 mi. S. of Athlone by river. After the foundation of an abbey by St. Ciaran (or Kieran) in 548, Clonmacnoise became the most famous of the Irish monastic cities, and by the 9th century it was a great centre of learning. Several books of annals, the oldest being those of Abbot Tigernach O'Braein (d. 1088), were compiled there. Lebor *na* Huidre or the Book of *the* Dun Cow (partly compiled there by Maelmiure about 1100) is a copy of an older collection of romances said to have been taken down by St. Ciaran on parchment made from the skin of his favourite cow.

The remains of the ecclesiastical foundation, called the Seven Churches of Clonmacnoise, still survive. The cathedral or Great Stone church (Daimhliag Mhor) was founded in 904 and rebuilt in the 14th century by Tomultach MacDermot; the other churches (teampulls) are those of Finian (or Finghin), Conor, St. Ciaran, Kelly, Ri (or Righ) and Dowling (named after Bishop Edmund Dowling). There are two round towers, O'Rourke's (62 ft. high) and MacCarthy's (56 ft.). The latter, the belfry of Finian church, has a doorway at ground level, an unusual feature. Of the three high crosses, the Cross of the Scriptures (13 ft. high) faces the door of the Great church. Many inscribed stones and elaborate sculptures of the 6th and 7th centuries and later are preserved in the churches. In 1957 these monastic ruins were transferred to the Irish government as a national monument. Clonmacnoise became a bishopric and there are remains of a castle (1214) and bishop's palace (13th century) which were destroyed by Oliver Cromwell's soldiery; in 1568 the diocese was merged with that of Meath. There is an annual pilgrimage to Clonmacnoise on Sept. 9, the feast of St. Ciaran.

CLONMEL (CLUAIN MEALA. "meadow of honey"), a municipal borough and the county town of County Tipperary. Republic of Ireland. 105 mi. S.W. of Dublin by road, standing on both banks of the Suir. Pop. (1961) 10,617. A noted fishing and sporting centre (hunting, horse racing, coursing), it has fine scenery in its vicinity, with the Comeragh mountains on the south and Slievenamon close by. Clonmel, an ancient town chartered during the reign of Edward I, was besieged for two months by Oliver Cromwell in 1650.

Laurence Sterne (*q.v.*), the English humorist, was born in the town in 1713; George Borrow, the English traveler and author, attended the old grammar school. The town was the scene of the trial and execution of Father Nicholas Sheehy in 1766 and in 1815 Charles Bianconi made it the centre for a one-horse, two-wheeler passenger-car service in the south of Ireland.

Clonmel's industries include meat processing and the making of enamelware, tubular steel goods, perambulators, shoes and cider.

CLOOTS, JEAN BAPTISTE DU VAL-DE-GRÂCE, BARON DE (ANACHARSIS CLOOTS) (1755–1794). revolutionary fanatic, was born near Cleves at the castie of Gnadenthal, on June 24, 1755, of a noble Prussian family of Dutch origin. His father placed him in the military academy at Berlin, but he left and went to Paris in 1776, where he took part in the ccmpilation of the *Encyclopkdie*. He left in 1784, traveled widely in Europe and returned to Paris at the outbreak of the Revolution. He then joined the Jacobin club and later became one of the founders of the cult of reason. On June 19, 1790, he presented himself to the constituent assembly at the head of 36 foreigners and, in the name of this "embassy of the human race," declared that the world adhered to the "Declaration of the Rights of Man and of the Citizen." After this he was known as "the orator of the human race," by which title be called himself, dropping that of baron and substituting for his baptismal names the pseudonym of Anacharsis, from the abbé J. J. Barthélemy's philosophical romance. In 1792 he placed 12,000 livres at the disposal of the republic "for the arming of 40 or 50 fighters in the sacred cause of man against tyrants."

In Sept. 1792 Cloots was elected to the convention. He voted for Louis XVI's death in the name of the human race. He was guillotined as an Hébertist on March 24. 1794.

See G **Avenel,** *Anacharsis Cloots, orateur du genre humain (1865).*

CLOSE, MAXWELL HENRY (1822–1903), Irish geologist who devoted himself especially to the glacial geology of Ireland, was born in Dublin, Oct. 23, 1822. He was educated at Weymouth and at Trinity college, Dublin, took holy orders and held various charges in England, and in 1861 returned to Dublin. His paper, read before the Geological Society of Ireland in 1866, on the "General Glaciation of Ireland" is a masterly description of the effects of glaciation and of the evidence in favour of the action of land ice. Later he'discussed the origin of the elevated shell-bearing gravels near Dublin, and expressed the view that they were accumulated by floating ice when the land had undergone submergence.

Close died in Dublin on Sept. 12, 1903.

CLOSED SHOP. The closed shop, in union-management relations, is an arrangement whereby the management employs, and retains in employment. only persons who are members in good standing of a specified labour (trade) union (*q.v.*). It is the most extreme variant of a series of arrangements for the protection of labour organizations, collectively known as "union security." Less extreme than the closed shop is the union shop, in which the employer may hire a nonmember of a union provided the new employee joins the union within a specified time. Another form of union security is known as preferential hiring. Under this arrangement the employer agrees to hire union members if they are available but, if qualified union members cannot be found, he may hire nonunion workers. Agreements for maintenance of membership provide that all persons in the employ of a company on a specified date who are then members of a union and who do not resign their membership within an "escape period" must remain members of the union for the duration of the agreement, under pain of dismissal from their jobs. These are the basic forms of union security, but in practice there are many detailed variations.

In the United Kingdom, and to a lesser extent in all other industrial nations, a closed-shop provision is seldom found in a writ-

ten contract, but it is understood in some industries that union members will walk off the job before they will work with nonunionists. This is so commonly assumed among printers, dockers and miners in England that employers rarely attempt to employ nonunion workers. Throughout the nations of northern Europe, labour-management agreements are usually between large industrial segments and a number of unions. In England the closed shop has not been an issue for controversy to the same extent as in the U.S. since union membership of workers is taken for granted. This is assumed even by government boards and commissions, which expect unions to represent all employees in an industry.

Early History.— The closed shop is not a development of modern industry. Medieval British guilds prevented nonmembers from working and whenever possible. the 18th-century trade clubs did the same. Some of the guild regulations of the 16th and 17th centuries decreed that no guild journeyman was to work with a nonmember. These tactics were continued by British trade unions and were conveyed to America. The Cordwainers' society of the city of New York in 1804, the New York Typographical society in 1809 and, subsequently, other unions adopted bylaws forbidding members to work for employers hiring men who did not belong to their organizations or who worked for wages lower than the union scale. The chief weapons used by employers to combat unions until 1836 were old laws that declared combinations of workmen and strikes to be criminal conspiracies. By about 1840 the closed-shop rule had been adopted by the majority of U.S. trade unions. With the repeal or nullification of conspiracy statutes, employers formed local associations to resist the closed-shop movement.

After 1870 local trade unions in the United States gradually merged into national unions, the majority of which made the maintenance of the closed shop a vital rule. During the same period, especially in the last decade of the 19th century, employers formed national associations! one of the purposes of which was to maintain the open shop. Large factories locked out union men for demanding the closed shop. The American Federation of Labor declared in 1890 that the working of union with nonunion men was inconsistent, especially when nonunion men displaced unionists locked out or engaged in strikes. From 1850 to 1898 the major part of more than a dozen court decisions held that strikes for the closed shop were criminal or tortious. In spite of these decisions the unions continued to insist upon the closed shop.

Developments of the 20th Century.— The struggle over the closed-shop question reached an intense stage about 1901 when the unions insisted that employers sign written agreements conceding the closed shop. Previously the granting of the closed shop had been based upon custom or oral negotiation. Declaring that they would not accept "union dictation in the management of business," the large employers' associations aggressively campaigned to destroy the closed-shop system.

The award of the anthracite coal strike commission in the great coal strike of 1902 was of great moral assistance to manufacturers' associations; the commission granted practically every demand of the union except that for the closed shop. Encouraged by this stand, the National Association of Manufacturers in 1902 began a vigorous movement for the open shop. The American Federation of Labor reiterated that the trade-union movement stood for the union shop. Union after union endorsed the closed-shop principle. The proportion of strikes for recognition of trade unions and union rules more than trebled in succeeding years. By reducing employment, the panic of 1907 weakened the trade unions and gave corresponding advantage to employers. The campaigns carried on by the manufacturers' associations also caused a decided shift in. public sentiment in favour of the open shop. By 1910 this was established in many industries, notably those which had been consolidated into powerful corporations. The open shop prevailed in the south.

There were several periods of ebb and flow in unionism during the four decades after the United States entered World War I in 1917. Certain main tendencies persisted, however. Union membership increased greatly, from 2,750,000 in 1916 to more than 17,000,000 in 1960. Collective bargaining was established in many industries that had previously been nonunion or open shop. There was widespread improvement of industrial relations as union and management became accommodated to each other and gained experience in collective bargaining. The scope of collective agreements expanded steadily to include not only wage rates and hours of work but also seniority provisions. paid vacations and holidays, retirement plans, and health and accident insurance. Despite these changes, the union security issue remained an active one and occasioned considerable industrial conflict.

"Union security" was probably the most frequent problem faced by the U.S. government in handling unresolved labour disputes during World War II. The National War Labor board (1942–45) developed the maintenance-of-membership formula as a compromise measure. and utilized the formula in thousands of disputes. By the end of the war almost 30% of the workers under union agreements were covered by maintenance-of-membership clauses. Some 45% were employed in closed or union shops, and 3% under preferential hiring arrangements. The remaining morkers were in establishments where the union was recognized as the exclusive bargaining agent but did not enjoy formal union security protection.

In the Taft-Hartley act of 1947 the U.S. congress undertook for the first time to regulate union security agreements in private industry. The closed shop was declared illegal. Labour organizations were prohibited from negotiating union shop agreements unless authorized. in a secret ballot, by a majority of morkers in the bargaining units. These restrictions. designed to guarantee the right to work and to protect rank-and-file employees from the unions, did not have the intended effect. During the first four years of the Taft-Hartley act, 97.1% of all union shop elections were won by the unions; 84.8% of eligible employees voted, and 91 4% of all voters cast affirmative ballots. Moreover, the proscription of closed shops nas widely circumvented by various methods, particularly in the building construction. printing and maritime industries. By 1950, the proportion of unionized employees in closed, union or preferential shops had risen to 58%; and in 1951–52 union shop provisions were adopted in the rubber and steel industries and part of the railroad industry. The Taft-Hartley act was amended in 1951 to permit union shop contracts without first polling the workers.

Meanwhile, leaders of various industries and industrial associations organized a campaign for what they called "right-to-work" laws. Such laws declared the union shop to be illegal. Their proponents argued that a worker who did not choose to join a union should have the right to work wherever an employer might choose to hire him. Labour leaders countered with the argument that, where a union represents the employees in a shop, it is only fair that all of the employees share in the cost of being represented, that majority rule is an accepted practice in the American system, and that right-to-work laws were designed to injure unions rather than to protect the rights of workers. Since the campaign was designed to enact legislation, the issue quickly became embroiled in partisan politics. Right-to-work bills were introduced in legislatures throughout the United States and were enacted by 19 nonindustrial states. Elsewhere the proposed statutes were defeated and, by 1960, the campaign appeared to have lost its momentum.

In large segments of the U.S. economy, the legal prohibition of closed or union shops had lost much of its significance by the beginning of the 1960s. In most of the nation, in the larger industries (as, for example, building construction and the railroads), the closed shop had come to exist in practice even though forbidden by law to exist in a signed agreement. Many employers unquestioningly recruited their labour from union offices. In many cases no nonunion workers were available. In large areas, building trades workers refused to work with nonunionists, and the employer made no attempt to hire the latter. Union security agreements are much more general in the U.S. than in the United Kingdom and northern Europe where union membership is rarely enforced by specific agreement. In this sense, in spite of the illegality of the closed shop, trade union membership is made a condition of employment on a much broader scale in the U S. than in Britain or Europe.

CLOSURE: see PARLIAMENT: Parliamentary Procedure.

CLOTAIRE, the name of four Frankish kings of the Merovingian dynasty.

CLOTAIRE I (c. 497–561) was the youngest son of Clovis and Clotilda. At his father's death (511) he received Soissons (which he made his capital), Laon, Noyon, Arras, Cambrai, Tournai, Maastricht and the lower Meuse basin. After the death of his brother Clodomir (524) and the murder of Clodomir's children, Clotaire acquired Tours and Poitiers. He took part in the wars against the Burgundians (523–534), capturing Autun, and in the eventual division of Burgundy received Grenoble, Die and adjacent territories. When the Ostrogoths ceded Provence to the Franks in 537, he acquired Carpentras, Gap and Orange. Prominent in the hostilities within the Merovingian family, he narrowly escaped murder by his brother Theuderic (Thierry) I in 531, attacked Theuderic's son Theudibert (Thibert) I in 534 and, when Theudibert allied himself with Childebert I against him c. 540, was only saved by Clotilda's intervention. Nevertheless he marched with Childebert against the Visigoths in 541. Clotaire fought constantly to defend his eastern border. He crushed the Thuringians near the Unstrut in 531 and captured and married their princess Radegunda; he reduced the Saxons to tributary status (555–556); and even the Bavarians may have acknowledged his overlordship. The death of Theudibert I's son Theudibald (Thibaut) in 555, followed by that of Childebert I in 558, left him sole master of the Frankish kingdom. His last years, however, were disturbed by the revolt of his son Chram, but he destroyed Chram's adherents in Brittany in 560 and had Chram and his family burned to death. Clotaire died at Compiègne late in 561 and was buried at Soissons.

CLOTAIRE II (d. 629) was the son of Chilperic I and Fredegund. An infant when his father mas assassinated (584), he was nevertheless assured of the succession by his mother's power and the protection of his uncle Guntram, king of Burgundy. After Fredegund's death (597), his cousins Theudibert II, king of Austrasia, and Theuderic II, king of Burgundy, soon allied themselves against him; they destroyed his army at Dormelles, near Montereau (599 or 600) and took most of his kingdom. In 613, however, when Theudibert and Theuderic were dead, Clotaire drove deep into Burgundy, put their grandmother Brunhilda to death and finally established himself as ruler of the whole Frankish kingdom. At a council of bishops and magnates held at Paris he issued a notable edict (Oct. 18, 614). By this he extended the jurisdiction of ecclesiastical courts; promised specific administrative and fiscal reforms; confirmed the grants of land that he had made to the magnates; and agreed to select his counts from the districts that they would administer. Clotaire recognized the heterogeneity of Neustria, Austrasia and Burgundy, setting a mayor of the palace over each. He assigned much of Austrasia to his young son Dagobert as a separate kingdom in 623 and was obliged at Dagobert's majority to add to it the traditional Austrasian territories immediately west of the Vosges and the Ardennes, which, with Aquitaine, he had wanted to retain. The Burgundian magnates forced him to dismiss their mayor of the palace in 627. He died on Jan. 4, 629, and was buried in the monastery of St. Vincent in Paris.

In the chronicle of the Pseudo-Fredegarius, Clotaire is described as well-informed, devout, upright and a benefactor of the church, but immoderately fond of hunting and unduly susceptible to feminine wiles.

CLOTAIRE III (d. 673) succeeded his father Clovis II as king of Neustria in 659. At his majority (664) he was released from the tutelage of his mother Bathilda and of one mayor of the palace, Erchinoald, only to fall completely under the influence of the new mayor, Ebroin (*q.v.*). He died on March 10 or 11, 673.

CLOTAIRE IV (d. 719), of uncertain parentage, was perhaps a son of Theuderic III. He was placed on the Austrasian throne early in 718 by Charles Martel, mayor of the palace, in order to check the pretensions of Chilperic II, king of Neustria.

See F. Lot *et al., Les Destinies de l'Empire en Occident de 395 à 888* (1928), vol. i of *Histoire du moyen âge.* (JE. H.)

CLOTH, any material woven of wool or hair, cotton, flax, vegetable, animal or man-made fibre. In commercial usage, the word has been particularly applied to a fabric made of wool. The word is Teutonic, though it does not appear in all the branches of the language. The ultimate origin is unknown. The regular plural of "cloth" was originally "clothes," now confined in meaning to articles of clothing, garments, in which sense the singular "cloth" is obsolete. "Cloths" as the plural form of the word in its modern sense of material dates from the beginning of the 17th century, but the distinction in meaning between "cloths" and "clothes" is a 19th-century one.

See WEAVING; for the different kinds of cloth see COTTON MANUFACTURE; SILK MANUFACTURE; SYKTHETIC FIBRE; WOOL; WOOLEN MANUFACTURE; etc. See also references under "Cloth" in the Index volume.

CLOTHING MANUFACTURE, the process of making garments from cloth or other materials. In the Paleolithic Age, in northern Europe, garments were made of skins sewn together with leather thongs. Holes were made in the skin and then a thong was drawn through them with an instrument curved like a crochet hook. In southern Europe fine bone needles of the same period have been found. These must have been made for use with fibre or thread, indicating that woven garments were already worn. Later, although weaving and embroidery were highly developed in the ancient civilizations and the middle east, the equipment used in the construction of clothes remained simple and has, in fact, always lagged behind the development of techniques for spinning and weaving. The next important advance took place in the middle ages, when iron needles were introduced. These are thought to have reached England by the early 16th century. All operations continued to be performed by hand until factory production was made possible by the invention of new machinery for spinning and weaving in the 18th century, and the subsequent appearance of the sewing machine.

Mechanization **of** the Industry. — Attempts to design a sewing machine began in the 18th century but the first man to use his invention commercially was Barthélemy Thimmonier, a Frenchman who made military uniforms in Paris. The experiment failed when all the machines were destroyed by a mob of persons who feared that the machines would make the unemployment situation more acute. The next important advance came when an American, Elias Howe, invented a lock stitch machine which used two threads, a needle and a shuttle. It was patented but was not accepted in America; Howe then took it to England and sold part of his patent rights. The objections of the American tailors and seamstresses were finally overcome by a machine designed in 1851 by Isaac M. Singer of Pittstown, N.Y. (See SEWING MACHINES)

For many years the seaing machine was the only mechanical tool possessed by the clothing industry, and so the operator of the sewing machine had to wait on the cutter. The next major development was the introduction in 1860 of the band knife machine which cut several thicknesses of cloth at one time. It was introduced by John Barran of Leeds, the founder of the Leeds clothing industry, who substituted a knife edge for the saw edge of a veneer-cutting machine. Many of the subsequent improvements were American. The Reece Machinery company of the United States pioneered buttonhole machines at the end of the 18th century and later the Singer company developed buttonhole machines and machines for sewing on buttons. The introduction of the Hoffman press enabled pressing to be done more quickly than by hand (although hand pressing is still used at various stages for high-grade garments). All of these developments have made factory production of clothing efficient in industrialized countries. The first manufactured garments were of the shoddiest quality both as regards make and materials but they were welcomed by the poorer people, who had previously had to rely on making their own. As the trade developed it improved the quality of production and materials and catered more and more to the well-to-do.

SOCIAL AND HISTORICAL ASPECTS

Hand Tailoring. — In the middle ages in Great Britain the custom-made, or bespoke, hand-tailoring industry catered solely to wealthy male patrons, a situation that remained unchanged for many centuries both in Britain and later in America. The ladies' custom tailoring industry did not exist as an industry until the early and middle 19th century, when Scandinavian and German tailors migrated to London and New York and brought new skills with them. Although wealthy and fashionable women previously had employed seamstresses or dressmakers to make all their garments. they then turned to the ladies' tailors for their finest suits and coats.

Until the mid-17th century most tailors were skilled both in the cutting and in the sewing of garments, but the master tailors' practice of allocating only the sewing to apprentices and journeymen created a class of mere sewers. By the 18th centuty the master tailors tended to be recruited from those journeymen who possessed special cutting skills and business acumen. This tendency, plus the high cost of starting a business in the better quarters of the cities. gave rise to a permanent group of wage earners whose skill declined at the end of the 19th century when competition from the ready-made clothing industry led to the division of labour among hand tailors. Production was cheapened further when it became the practice to make portions of custom-made garments by machine.

The journeymen hand tailors were among the first craftsmen to form trade unions in Great Britain and in the United States. In 1720 the London master tailors complained to parliament that their journeymen had combined to demand higher wages and shorter hours. In 1795 journeymen in Baltimore struck for higher wages. From these dates local trade unions spread in both countries. Nevertheless the earliest attempts to amalgamate the local societies into a national union failed. The First Grand Lodge of Operative Tailors, formed by the London journeymen in 1833, joined Robert Owen's Grand National Consolidated Trades' union, led a strike that depleted the Grand National's funds and collapsed within a year. Similarly, the Journeymen Tailors' union, formed in 1865 in the United States, disintegrated in 1876 when an officer embezzled its funds.

Later efforts to form national unions were more successful. The Journeymen Tailors' union of America was reorganized in 1883 and existed until 1936, when it merged into the Amalgamated Clothing Workers' union of America. In Great Britain the Amalgamated Society of Tailors was formed in 1866 and lasted until it united with the National Union of Tailors and Garment Workers in 1932. The hand tailors in both countries sought to regulate the working conditions and number of apprentices and to maintain craft standards; but when handicraft standards fell, the journeymens' unions merged into the ready-made clothing workers' unions.

The Homework System and "Sweating." — The homework system existed on a small scale before the industrial revolution, for the lady of the manor sometimes employed a seamstress who worked in her own home rather than in the manor house. The system spread at the turn of the 18th century when more journeymen tailors started to work at home and to hire female homeworkers to do part of the sewing during busy seasons. "Sweating," the term used to describe Iow wages, excessively long hours of work and substandard working conditions, became more prevalent as this practice increased. Later when the ready-made clothing industry developed, the homework system became a serious social problem since clothing manufacturers employed large numbers of female homeworkers to sew garments that had been cut by the manufacturer.

Immigrant women in New York and wives and daughters of dockers (longshoremen) in London, whose labour was cheapened by the need to supplement their families' low and irregular incomes, provided the industry with a large and inelastic labour supply that was not driven away by exceedingly low wages. In Leeds where there was no inelastic supply of cheap female labour, the development of the self-contained factory was not impeded. However, the existence of this cheap labour supply in London and in New York meant that manufacturers could avoid the overhead costs of large premises and could dispense with the supervision of their labourers. Thus homework and "sweating" multiplied in London and New York.

After 1875, and after the Russian pogroms of the 1880s and 1890s, Jewish immigrants flocked mainly to New York, but also to London. Finding German-Jewish manufacturers who would give homework. the immigrants took the work home, set up a workshop in a spare room or parlour, employed other male immigrants to work for them, and devised methods of rationalizing their labour to increase production. The immigrants' completely nonindustrial, middleman background from the Russian and Polish ghettos inspired them to emerge from the position of wage earners to that of employers and the number of small subcontractors' workshops multiplied. The "subdivisional" or "sectional" system of production became the exclusive province of the Jewish subcontractor who combined a high degree of division of labour with relatively high wages. The Jewish tailor worked exceedingly long hours in overcrowded, unsanitary and unventilated premises but, with the exception of the first period of his working life when he was learning his specialized section of the trade, his wages were not "sweated" as compared with the wages of the female homeworker.

In Great Britain the immigrants branched out from the small workshops into factory production. In the United States virtually the whole clothing industry came to be regarded as Jewish However, in both countries the descendants of these immigrants were tending in the second half of the 20th century to shun the industry. Some of their jobs in London were being filled by West Indians, Cypriots and Irish women. In New York the Jens and large numbers of Italian immigrants who had also entered the industry were being succeeded by Negroes and by new waves of immigrants from Puerto Rico and Mexico.

Trade Unions and the Fight Against "Sweating." — With the exception of the retail custom tailoring trade, where collective agreements existed prior to the 20th century, trade unions were weak and there was no adequate machinery for the effective regulation of wages in the clothing industry in Great Britain before 1909. Therefore the fight against "sweating" was undertaken by social reformers who tried to awaken the conscience of parliament. The Trade Boards act, adopted in 1909, provided for the establishment of legal minimum rates of wages by boards composed of equal numbers of employer and worker representatives. Among the first four trades to which the act applied were the "Ready-made and the Wholesale Bespoke Tailoring trades."

The Trade Boards act not only raised the wages of the female homeworkers but also provided an impetus for the employers to form associations and for the competing clothing unions to amalgamate. In 1915 a small industrial union, a cutters' union and two small Jewish unions merged to form the United Garment Workers' Trade union (known in the early 1960s as the National Union of Tailors and Garment Workers). In 1919 this union signed its first national agreement with the Wholesale Clothing Manufacturers' association, and the negotiated rates were jointly submitted to the trade boards. When wages councils replaced the trade boards negotiated rates continued to be submitted in the same way. Negotiated minimum rates are applicable as basic rates and as legally enforceable minimum rates throughout the clothing industry. Piece rates negotiated in individual shops must be set at a level that enables a worker to earn at least the minimum rate. The union is continually engaged in bargaining with individual firms to raise the wages of workers above the minima.

In the United States the fight against "sweating" was won by the trade unions. The Amalgamated Clothing Workers' union was formed in 1914 when a group of Jewish and Italian tailors withdrew from the United Garment Workers' Union of America. In the early 1960s the parent union, which was formed in 1891, was mainly composed of shirt workers; the breakaway union, however, catered to all workers in the men's clothing industry. The International Ladies' Garment Workers' union, formed in 1900, served all the workers in the ladies' clothing industry.

The U.S. clothing unions fought "sweating" in three ways: they made the manufacturer responsible for the wages and the working conditions not only of his own employees but also of his subcon-

STEPS IN THE HAND-TAILORING OF MEN'S CLOTHING

1. Cutting the cloth by hand, one garment at a time, along lines marked with chalk
2. Stitching the padding of a coat front
3. Basting a sack coat. So many thicknesses of material go into a garment of this type that careful basting is necessary to assure that the final stitching anchors each piece firmly in its proper place
4. Hand-stitching the interlining of a coat lapel
5. Making a buttonhole by hand
6. A partly finished sack coat

tractors' employees; they made the subcontractor put up a bond guaranteeing that he would live up to the provisions of the agreement; and they devised elaborate agreements that contained detailed time and piecework scales and also included. by descriptive enumeration, every type of work or pattern for which a distinct rate was paid. In the early 1960s collective agreements covered many items other than rates and hours of work; *e.g.*, pension schemes. sick and death benefit funds, retirement and unemployment funds. The U.S. clothing workers' unions also have pioneered in all sorts of social experiments for the benefit of their members: *e.g.*, co-operative housing projects, credit unions and co-operative banks, rest homes, sanitariums and holiday camps.

(S. W. L.)

THE MODERN INDUSTRY

Machinery. — It is impossible to describe in detail the hundreds of machines in use in the early 1960s. The lock stitch machine could not perform some of the hand stitching operations although much progress had been made during the 20th century. At the turn of the century a blind stitch machine for felling hems was invented by Charles Dearborn in the U.S.A. By the early 1960s a machine designed for specific tasks was capable of 5,000 to 6,000 stitches a minute. The needles of high-speed machines require cooling to avoid overheating and the melting or fusing of man-made materials. Accordingly, self-lubricating and cooling systems were incorporated into the machines; some machines included a mechanism designed to eliminate vibration at high speed. Embroidery machines could be set to produce a design simultaneously on eight different pieces of material. One machine had 21 built-in patterns that could be selected by turning a dial.

In 1959 a machine that automatically makes buttonholes in a shirt front was introduced. A lock stitch machine sews the seam and also pinks the edges of the material mechanically; the latter operation previously had been done by hand and took as long as the stitching itself since pinking shears were used to produce a zigzag edge on the free material beyond the seam; the free material mas then pressed back onto the body of the garment to prevent fraying. The band knife machine of Barran was still being used in the early 1960s although many new forms of mechanical cutter had been introduced; the Eastman cutter, invented in the 1900s, had been adapted and improved for various uses.

The difficulties encountered in working with man-made fibres have been turned to great advantage in the development of heat sealing. Plastic raincoats, which used to be sewn (quite unsatisfactorily), came to be put together by means of a heat-sealing machine. By 1959 electronic machines were capable of sealing seams, facings and buttonholes so quickly that a raincoat factory in the United States was producing 4.000 plastic garments a day with machines tended by four men only. Heat sealing may take the place of stitching if nonthermoplastic material can be appropriately treated but its application to the highest grade of clothes is problematical.

The technique of cutting material in predetermined shapes is used extensively for small items such as collars and cuffs, pockets and basic linings. Since a press cutting machine must be specially designed for each new shape it is not practicable where new designs and new patterns are required in large numbers at the start of every manufacturing season.

An interesting aid to manufacture is the hem leveler, which either measures and cuts the skirt as it revolves on a stand or puffs out a jet of powdered chalk to guide the worker who then cuts the hem along the chalk line. The material is pressed during and after the sewing operations with electric steam irons, which have superseded gas irons and pressing cloths.

One of the most important operations is that of cutting many thicknesses of material, and its success depends on the accuracy with which each piece of material is laid on top of the one underneath. Selvages must be laid together exactly and in the case of patterned materials each part of the design must be immediately above the same part in the cloth beneath. A laying-up machine runs back and forth along a railway on either side of the cutting table and spreads the cloth from end to end. Between 50 and 100 thicknesses may be cut at a time. The cloth is clamped at each end and at intervals along the selvaged edge. The patterns of the various parts of the garments are arranged on the top of the pile to give what is known as the lay. and from this arrangement a marker is produced that is placed on the pile to guide the cutting machine operator. The plan of the cutting lay is most important since it must ensure the most economical use of the cloth. A machine developed in the late 1950s and called a photo marker reproduces the master marker by photography. Sometimes the lay is set from miniature copies on a small drawing board and enlarged to the actual size. The lay is marked by various methods. including chalking by hand or by spraying so that an outline is left for the cutting operator to follow.

An original set of patterns has to be graded to produce similar patterns for perhaps six or more sizes. At one time the skilled pattern grader had to prepare these with a ruler and drawing board but later a grading machine was developed that enabled the operation to be carried out more accurately and swiftly.

Division of Labour. — The principle of allocating one operation to one employee and generally dividing the work so as to achieve greater efficiency was adopted from the start in the ready-made clothing industry, although in higher grade work the dressmaker has continued to "make through"; *i.e.*, virtually all operations are carried out by the same person. In the case of tailoring, the practice of putting vests (waistcoats) and trousers out to specialists while the tailor makes the jacket or overcoat himself has existed for a long time but in mass production tailoring the division goes very much further. Each operation is centrally planned and is allocated to one or more employees. The problem of reducing the time between sewing operations has become a managerial one. After the designer and the cutters have completed their part of the job the cut fabric is made into bundles. each containing the component parts of the garment. These pass through the factory from machine to machine and each operation is carried out in sequence. The bundle system is often varied to achieve greater efficiency and to ensure the least possible handling. Sometimes only the pieces that have to be machined are given out and as each operation is performed the necessary additional pieces are introduced into the production line. Conveyor belts were used after World War I but were generally abandoned on the ground that production was slowed down to the speed of the slowest worker.

Between 1950 and 1960 conveyors were reintroduced and arranged so that a supervisor at a central point can send work to each employee as it is required. Thus the objections raised by the use of the early inflexible conveyors have been overcome and the time of the more efficient worker is not being wasted.

After the operations of main sewing have been completed there still remain the jobs of finishing. Hems have to be basted, buttons, hooks and eyes have to be sewn on, and trimmings including detachable collars and cuffs added. The final operation is pressing, which may be done entirely with a hand iron or by using mechanical presses for the main pressing work and a hand iron for the rest.

Production in the 20th Century. — At first the most important clothing manufacturing countries were the United States and the United Kingdom. In the first six decades of the 20th century the U.S. contributed many of the technical improvements and innovations, while the U.K. concentrated on quality goods. After World War II the U.K. faced fierce competition from the U.S., especially in South Africa, Australia and New Zealand, where American styles had much influence.

The ready-made dress industry was given a tremendous impetus soon after World War I when new methods of production and organization were introduced and women began to wear less complicated clothing. Many countries, notably Denmark, Norway, Sweden, the Netherlands, Belgium, Canada, South Africa, Australia and New Zealand, renewed their efforts to develop their own ready-made clothing industries. This drive became more pronounced after the end of World War II when communications improved and knowledge of up-to-date machinery and techniques became available to all.

Outstanding developments at the beginning of the second half of the 20th century were the rapid advance of Italian knitwear and the remarkable achievements of the Hong Kong textile and clothing industries. Both the Italian and Hong Kong developments started afresh after World War II with completely modern equipment. Hong Kong was helped considerably by the influx of Chinese from the mainland; factories and housing were built rapidly. Germany also had to rebuild its industry and @ 1960 its clothing industry was the biggest in Europe after that of Great Britain. In France and Italy the retail distributive system was less well developed than in such countries as Britain, the Netherlands, Belgium and Switzerland, partly because the people of France have been unreceptive to both domestic and imported ready-made clothing. The state of the industry in the Soviet Union and its eastern European neighbours was unknown in the early 1960s, though it was fairly certain that western techniques were being used in the German Democratic Republic and in the Soviet Union and if the latter lagged behind it could only have been because of concentration on other industries.

Home dressmaking has had a revival in the United States and the United Kingdom although dressmakers have been less in demand. *(See* SEWING, HOME.) Made-to-measure clothes for men are now manufactured almost entirely by huge multiple tailoring concerns that have developed as vertical organizations controlling the production of cloth and the manufacture and distribution of garments to chains of shops throughout the country. In some cases, the retail outlets also are owned or controlled. Qualified staff members take the measurements of the customers and send them back to the great factories. This is also true to some extent in continental Europe.

Expenditure. — Clothing purchases in the U.K. have accounted for about 10% of total yearly expenditure for many years but the figure in the early 1960s was somewhat below this. Of the £1,350,000,000 spent annually on clothing in the U.K., about £900 000,000 represents purchases of women's, girls' and infants' wear. In the U.S., with a population roughly three-and-a-half times that of the U.K., the total yearly expenditure was about $20,500,000,000.

Materials. — Even after man-made fibres were introduced, cotton and wool continued to be the principal materials used to manufacture clothing. In the early 1960s cotton accounted for more than two-thirds of the world consumption of fabrics and wool for about 11%. The viscose process was invented in 1892 and after the mid-1920s rayon became increasingly important and in the early 1960s accounted for about 16% of the consumption of textile fibres. The polyamides, polyesters and acrylics were given considerable publicity and indeed, many of these newer fibres may have an important future though their production was still, in the early 1960s, very much behind viscose rayon and acetate. The polyamides are more popularly known under other names, such as nylon, while Terylene and Dacron are the British and U.S. trade names for polyester fibre. Courtelle, Orlon and Acrilan are trade names for acrylics. *See* COTTON MANUFACTURE; SYNTHETIC FIBRE; WOOLEN MANUFACTURE; *see* also references under "Clothing Manufacture" in the Index volume. (A. CLQTILDA, SAINT (CHROTECHILDIS) (d. 545), queen consort of Clovis (*q.v.*), king of the Franks, in whose momentous conversion to Catholic Christianity she played a notable part. She was the granddaughter of Gundioc, king of Burgundy (436–*c.* 473), who was related to the Visigothic kings and shared their Arian faith. At Gundioc's death his kingdom was divided between his four sons, Gundobad, Godegesil, Chilperic and Gundomar. Clotilda's father Chilperic and her mother (who may have been a Catholic but is not to be identified as the queen Caretena who died at Lyons in 506) were murdered by Gundobad. Clotilda and her sister Chrona, who were zealous Catholics, took refuge with Godegesil in Geneva. The Salian Franks and the Burgundians were then exchanging embassies frequently, and Clovis, hearing good reports of Clotilda, obtained Gundobad's permission for their marriage. Clotilda was tireless in urging her husband to renounce his idols and acknowledge the true God; his final decision (496 or 506) was made to honour a vow taken during a battle against the Alamanni. After Clovis' death (511) Clotilda, who greatly venerated the tomb of St. Martin, made her residence at Tours. Though she was still active in politics, she became famed for sanctity and almsgiving. She died at Tours on June 3, 545 (her feast is celebrated on the anniversary) and was buried in Paris in the church that she and Clovis had built. Of the many other churches alleged to have been founded by her, bnly that of St. Germanus at Auxerre can be certainly attributed to her patronage:

CLOTURE (CLOSURE), the closing of debate in a parliamentary body by a vote of the members. In the C.S. senate, by a revision of the rules adopted in 1959, cloture might be invoked by a two-thirds vote of all senators voting. *See* FILIBUSTER; for closure in the British parliament. *see* PARLIAMENT: *Parliamentary Procedure.*

CLOUD, a visible aggregation of minute water droplets and/or ice particles in the air, usually above the general ground level.

CLASSIFICATION

Although the shapes and general appearance of clouds must have been a matter of interest and speculation from earliest times! no lasting contribution to the development of a scientific cloud classification was made until 1803, when Luke Howard published his classical paper entitled "On the Modifications of Clouds." The Latin terms which Howard adopted were applied with such excellent judgment that his system later became the basis of the internationally accepted cloud classification.

For more than 50 years following the appearance of Howard's treatise little progress in the study of clouds was achieved. It was not until 1874, the year of the first International Meteorological congress, that important new efforts were initiated in this field. During the succeeding 20 years constructive proposals were advanced in many countries by a large number of workers whose combined efforts led in 1896 to publication of the *International Cloud Atlas.*

During the period of World War I and the years immediately following, interest in cloud forms and their prognostic significance was stimulated by the development of aviation, and the preparation of a new and much more extensive cloud atlas was undertaken. The result was the *International Atlas of Clouds and States of the Sky,* with editions in 1932 and 1939.

The exhaustion of the 1939 edition, modifications in cloud codes and new cloud knowledge prompted the World Meteorological organization to prepare a carefully documented new *International Cloud Atlas* (1956) in two volumes (vol. i, text; vol. ii, 224 plates of which 101 were in colour). The World Meteorological organization also prepared an abridged atlas of the two volumes combined and an *International Cloud Album for Observers in Aircraft.* The new unabridged atlas describes the 10 main cloud genera (families), which are subdivided into 14 species based on their shape and structure and 9 general varieties based on their transparency and geometrical arrangement. The genera can be listed according to their heights as follows:

A. High (mean heights 5 to 13 km. [16,500 to 45,000 ft.])
   1. Cirrus
   2. Cirro-cumulus
   3. Cirro-stratus
B. Middle (mean heights 2 to 7 km. [6,500 to 23,000 ft.])
   4. Alto-cumulus
   5. Alto-stratus
   6. Nimbo-stratus
C. Low (mean heights 0 to 2 km. [0 to 6,500 ft.])
   7. Strata-cumulus
   8. Stratus
   9. Cumulus
   10. Cumulo-nimbus

CLOUD FORMS

Top ***left:*** Cirrus fibratus, nearly straight or more or less irregularly curved white filaments which are always fine and do not terminate in hooks or tufts. The filaments are, for the most part, distinct from one another

Top right: Cirrus uncinus, detached clouds of white delicate filaments often shaped like a comma, terminating at the top in a hook or a tuft

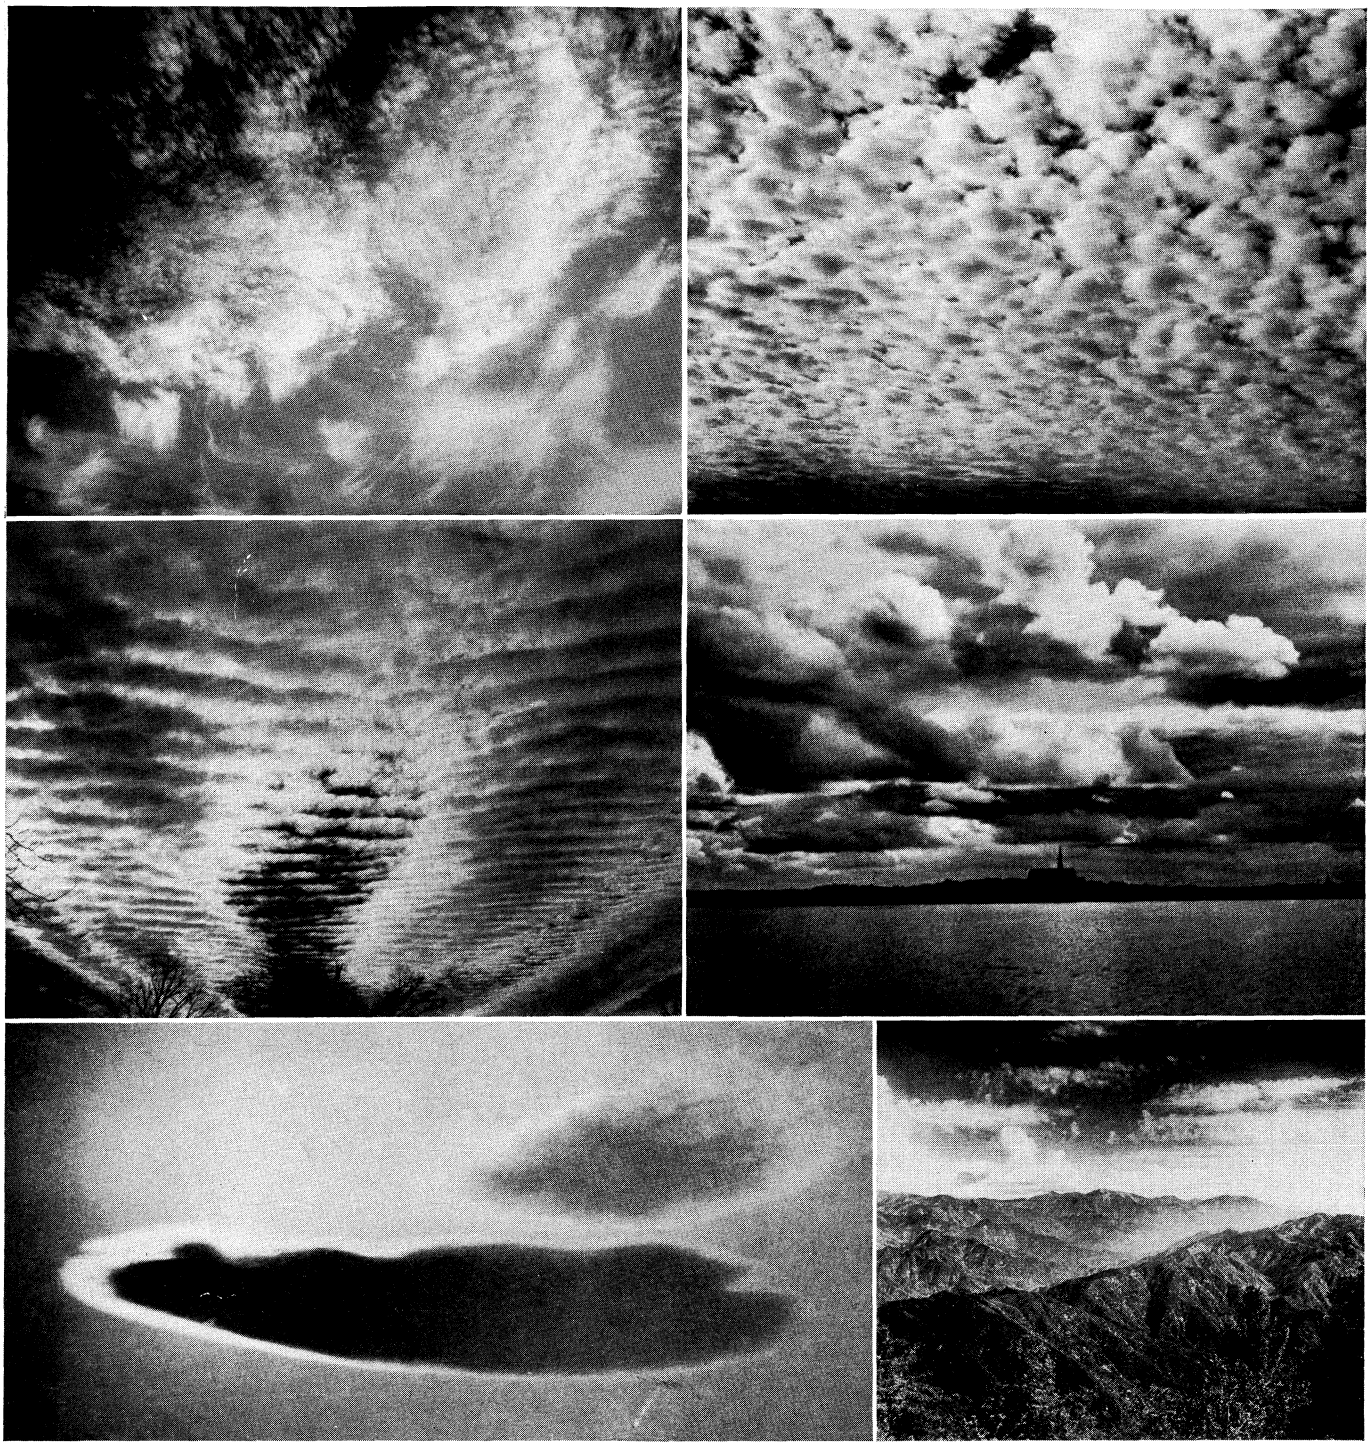
Centre left: Cirrus spissatus, detached clouds of fibrous appearance with sufficient optical thickness to appear grayish when viewed toward the sun

Centre right: Cirrus cumulonimbogenitus, detached but optically thick clouds of fibrous appearance, originating from the upper part of a cumulonimbus cloud

Bottom left: Cirrostratus nebulosus, a transparent whitish veil of smooth appearance, showing no distinct details, totally or partly covering the sky and generally producing halo phenomena

Bottom right: Cirrostratus fibratus, a thin whitish veil of nearly straight filaments

CLOUD



BY COURTESY OF (TOP TO BOTTOM) THE UNITED STATES WEATHER BUREAU: PHOTOGRAPH (CENTRE LEFT) A. C. LAPSLEY

CLOUD FORMS

Top left: Cirrocumulus, a thin white patch of cloud without shading, composed of very small elements in the form of grains, ripples, etc., which are here arranged in groups and associated with tufted cirrus

Top right: Altocumulus translucidus, a white and gray layer of cloud composed of rounded masses, the greater part of which is sufficiently translucent to reveal the position of the sun or moon

Centre left: Altocumulus undulatus, a white and gray sheet of cloud, with shading, composed of regularly arranged roils

Centre right: Altocumulus cumulogenitus, a gray layer of cloud with shading formed by the spreading of the tops of cumulus clouds

Bottom left: Altocumulus lenticularis, gray patches of cloud having the shape of lenses or almonds, often very elongated and usually with well-defined outlines. They occasionally show irisation

Bottom right: Altocumulus castellanus, white patches, partly fibrous, which present, in at least some portion of their upper part, cumuliform protuberances in the form of turrets which generally give the clouds a crenelated appearance

BY COURTESY OF THE UNITED STATES WEATHER BUREAU

CLOUD FORMS

Top left: Altostratus translucidus, a grayish or bluish cloud sheet of striated or fibrous appearance having parts thin enough to reveal the sun as through ground glass. Altostratus does not show halo phenomena

Top right: Altostratus opacus, an extensive grayish or bluish cloud sheet of striated or uniform appearance, the greater part of which is sufficiently opaque to mask completely the sun or moon

Centre left: Stratocumulus perlucidus, a gray and whitish layer which has dark parts composed of tessellations which are nonfibrous. The cloud layer has distinct but sometimes very small spaces between the elements

Centre right: Stratocumulus opacus, an extensive gray cloud sheet with rounded masses which are nonfibrous, the greater part of which is sufficiently opaque to mask completely the sun or moon

Bottom left: Stratocurnulus curnulogenitus, a gray layer of cloud with dark parts composed of elongated masses which are nonfibrous. The clouds represent the last stage of daytime development of cumulus

Bottom right: Stratocumulus undulatus, a layer composed of fairly large and often gray elements, arranged in a system of nearly parallel lines. Transverse lines crossing the main system are sometimes visible

CLOUD

BY COURTESY OF THE UNITED STATES WEATHER BUREAU

CLOUD FORMS

Top left: Stratocumulus mamma, a gray or whitish sheet of cloud with dark parts which are nonfibrous and which has hanging protuberances like udders on the under surface

Top right: Stratus, a generally gray cloud layer with a fairly uniform base which may give drizzle, ice prisms or snow grains

Centre left: Cumulus humilis, detached clouds, generally dense and with sharp outlines, characterized by only a small vertical extent and appearing generally as if flattened

Centre right: Cumulus congestus, detached clouds generally dense with sharp outlines and often great vertical extent. The bulging upper part of the cloud frequently resembles a cauliflower

Bottom left: Cumulonimbus capillatus, a heavy and dense cloud with a considerable vertical extent in the form of an anvil. The upper portion of the cloud has distinct cirriform parts of clearly fibrous or striated structure. This cloud is usually accompanied by a shower or thunderstorm, often with squalls and sometimes hail

Bottom right: Cumulonimbus calvus, a heavy and dense cloud with a considerable vertical extent in which at least some protuberances of the upper Part are beginning to lose their cumuliform outlines but in which no cirriform parts can be distinguished

Usually alto-stratus, nimbo-stratus, cumulus and cumulo-nimbus clouds and sometimes other clouds extend outside these height ranges, which are only approximate for temperate regions. Clouds of a given genus are generally lower in polar regions and higher in the tropics.

The definitions and descriptions of the cloud genera given in the *International Cloud Atlas* are as follows:

1. Cirrus **(Ci).**—Detached clouds in the form of white, delicate filaments, or white, or mostly white patches or narrow bands. These clouds have a fibrous (hairlike) appearance, or a silky sheen, or both.

2. Cirro-cumulus (Cc).—Thin, white patch, sheet or layer of cloud without shading, composed of very small elements in the form of grains. ripples, etc., merged or separate, and more or less regularly arranged; most of the elements have an apparent width of less than 1°.

3. Cirro-stratus **(Cs).**—Transparent, whitish cloud veil of fibrous or smooth appearance, totally or partly covering the sky, and generally producing halo phenomena.

4. Alto-cumulus **(Ac).**—White or gray, or both white and gray, patch, sheet or layer of cloud, generally with shading, composed of laminae, rounded masses, rolls, etc., which are sometimes partly fibrous or diffuse and which may or may not be merged; most of the regularly arranged small elements usually have an a p parent width of between 1° and 5°.

5. Alto-stratus **(As).**—Grayish or bluish cloud sheet or layer of striated, fibrous or uniform appearance, totally or partly covering the sky, and having parts thin enough to reveal the sun at least vaguely, as through ground glass. Alto-stratus does not show halo phenomena.

6. Nimbo-stratus (Ns).—Gray cloud layer, often dark, the appearance of which is rendered diffuse by more or less continuously falling rain or snow, which in most cases reaches the ground. It is thick enough throughout to blot out the sun.

Low, ragged clouds frequently occur below the layer, with which they may or may not merge.

7. Strato-cumulus (Sc).—Gray or whitish, or both gray and whitish, patch, sheet or layer of cloud which almost always has dark parts, composed of tessellations (checkerboard patterns), rounded masses, rolls, etc., which are nonfibrous (except for virga [precipitation trails]) and which may or may not be merged; most of the regularly arranged small elements have an apparent width of more than 5°.

8. Stratus (St).—Generally gray cloud layer with a fairly uniform base, which may give drizzle, ice prisms or snow grains. When the sun is visible through the cloud, its outline is clearly discernible. Stratus does not produce halo phenomena except, possibly, at very low temperatures.

Sometimes stratus appears in the form of ragged patches.

9. Cumulus **(Cu).**—Detached clouds, generally dense and with sharp outlines, developing vertically in the form of rising mounds, domes or towers, of which the bulging upper part often resembles a cauliflower. The sunlit parts of these clouds are brilliant white; their base is relatively dark and nearly horizontal.

Sometimes cumulus is ragged.

10. Cumulo-nimbus **(Cb).**—Heavy and dense cloud, with a considerable vertical extent, in the form of a mountain or huge towers. At least part of its upper portion is usually smooth, or fibrous or striated, and nearly always flattened; this part often spreads out in the shape of an anvil or vast plume.

Under the base of this cloud uhich is often dark, there are frequently low, ragged clouds either merged with it or not, and precipitation sometimes in the form of virga.

In addition to the cloud classification, there is a classification of 30 code numbers for the state of the sky in the three height groups (see A, B. C above). The latter classification, coded as one of ten numbers (0 to 9) for each height group, is based on combinations of cloud formations in that height group observed simultaneously. The three selected code numbers (called C_L, C_M and C_H, corresponding to low, middle and high cloud formations) are transmitted as part of every international surface weather report. Also included in this report are the amount of cloud cover at the different levels, the direction of motion of the clouds and the heights of their bases. In the United States and Canada the term ceiling is used to denote the height of the base of the lowest clouds present in quantity on any occasion. Ceiling zero is reported when the ceiling is 50 ft. or less; ceiling unlimited is reported when either no broken or overcast layer is observed, or the base of the lowest reported broken or overcast layer is higher than 9,750 ft. above the ground. (G. Es; E. M. Bs.)

WEATHER ASSOCIATED WITH CLOUDS

Precipitation in significant amounts usually falls only from a few cloud genera: alto-stratus, nimbo-stratus and cumulo-nimbus; the word nimbus meaning rain cloud. Precipitation may fall from alto-cumulus, strato-cumulus, stratus or cumulus, but amounts are small except under special circumstances. Cirrus, cirro-stratus and cirro-cumulus, high clouds composed exclusively of ice crystals, may produce snow, but the snow generally evaporates before reaching the ground if there are no lower clouds present. On the other hand, when thick clouds of waterdrops are present at lower levels, the snow from above may get heavier and reach the ground as snow or rain, depending on the temperature. Stratus clouds may produce drizzle, whereas cumulus clouds sometimes yield showers, especially in the tropics. Cumulo-nimbus clouds are usually accompanied by showers of rain, snow or hail, often with a thunderstorm or even a tornado. Steady rain lasting all day is produced usually by alto-stratus or nimbo-stratus.

Clouds are valuable aids in forecasting the weather. If the sky is becoming overcast with cirrus and cirro-stratus clouds, thickening and lowering to alto-stratus clouds, precipitation is imminent, probably from an approaching warm front in temperate latitudes or perhaps a hurricane in the tropics. However, in temperate latitudes in summer or in the tropics, isolated masses of thick cirrus which are not increasing are normally followed by fair weather because these clouds are often remnants of old thunderstorms which have already dissipated. New active thunderstorms are indicated by cumulus growing rapidly into cumulo-nimbus on a humid day, even though the sun may be shining brightly between the clouds. A line of cumulo-nimbus cloud tops appearing in the northwest may indicate thunderstorms with an approaching squall line or cold front, followed by drier weather. An alto-cumulus cloud sheet, which may result from the degeneration of alto-stratus, often indicates a layer of stable air or a weak front aloft, which generally does not produce precipitation.

The presence of cloudiness indicates smaller diurnal temperature variations. In the evening a low overcast acts like a blanket,, preventing the temperature from dropping much at night; whereas, a clear evening sky indicates rapid cooling leading to dew, frost or even fog the following morning. Stratus or fog with calm conditions, probably associated with warm air aloft, in the morning indicates that the clouds will evaporate and the sun will cause a rapid heating at the ground. However, a deck of strato-cumulus and strong winds in the morning indicate a cloudy day with only a small temperature rise as the colder air aloft mixes with the surface air. (E. M. Bs.)

MEASUREMENTS OF CLOUDS

As an aid to forecasting. the cloud observer should measure the wind at each cloud level. This can be done in the case of an overcast by sending up a free balloon of known rate of ascent and measuring its angular position each minute with a theodolite until it disappears into the cloud deck. Another method is to measure the apparent speed and direction of a selected portion of a cloud by following its reflection for one minute in a nephoscope, an instrument consisting essentially of a heavily silvered horizontal mirror with a scale of 360° of azimuth around its circumference, and a fixed eyepiece. To find the wind velocity from the nephoscope measurement by similar triangles. it is necessary to have the height of the cloud base. Although this height can often be estimated from the type of cloud formation itself, measurement is preferable.

Modern techniques for measuring cloud heights employ such devices as ceiling balloons, ceiling light projectors, ceilometers and

very short-wave length (1 cm.) radar. In addition, cloud heights have been estimated by triangulation methods, by optical range finders, by intersections of clouds with hills or mountains, or by application of the dew point formula. (*See* HUMIDITY, ATMOSPHERIC.) In the latter method, when the air is thoroughly mixed as far as the base of the cloud, the height of the base of a cumulus cloud may be calculated from the surface temperature T and the dew point temperature T_d, both in degrees Fahrenheit, by the formula

$$\text{height of base (in ft.)} = 225\ (T - T_d)$$

An accurate and convenient method, available for ceiling measurements during the hours of darkness, is the use of the ceiling light. In this device a small searchlight projects a narrow beam of light, of less than 3° spread, vertically upward to the base of the Eloud. An observer, located 500 to 1,000 ft. from the projection, sights on the spot of light on the lower surface of the cloud and measures the vertical angle, *h*, to the spot. If L is the base-line distance from observer to projector, then the height of the cloud base is L tangent h. The accuracy of this method is adequate for airways purposes, being limited chiefly by the uniformity of the underside of the cloud and by the accuracy with which the vertical angle can be measured. With a 500-ft. base line, an uncertainty of 2° in angle will give an error of 300 ft. for a cloud height of 2,000 ft. Under ideal conditions, cloud heights up to 15,000 ft. have been determined to an accuracy of about 2,500 ft.

In daylight the spot from the ceiling light projector is, of course, invisible, since the sky may be 1,000,000 times as bright as the spot. The difficulty has been resolved by using a light modulated to a known frequency, and observing the spot by means of a special telescope which has a photoelectric cell at the focus of a large lens. Electrical filters used in conjunction with the photoelectric cell reject all signals except those of the modulating frequency. These electric signals are then amplified sufficiently to operate a standard electrical meter. This device, known as the ceilometer, can measure cloud heights up to 10,000 ft. during the daytime and about 20,000 ft. at night. It is widely employed not only at civilian air terminals but by various military services.

A knowledge of the vertical extent and structure of clouds is of great importance. Radar equipment has been developed that not only measures the base of selected clouds but also permits detailed study of the vertical structure of clouds. The development, in the early 1950s, of the radar cloud-base and cloud-top indicator represents one of the most significant advances in meteorological instrumentation. It has been shown both theoretically and experimentally that microwaves of approximately 1 cm. wave length are scattered by cloud water droplets of radii between 10 and 30 μ. Short microwave pulses of a few microseconds duration are radiated vertically upward toward the cloud from a parabolic mirror six feet in diameter. These pulses are then scattered back toward the antenna from the top and bottom of each successive layer of clouds. From the time interval between the transmission of the pulse and the returned cloud echo, the height of the echoing surface above the radar set can be computed.

Radar sets operating at these short-wave lengths have detected clouds to heights in excess of 45,000 ft. It has also been possible to locate clouds through several thousand feet of light rain. However, the minimum cloud altitude that can be measured is about 800 ft., this limitation being due to the recovery time of the radar receiver.

CLOUDBERRY (*Rubus* chamaemorus), a low-growing creeping herbaceous plant of the rose family (Rosaceae), with simple obtusely lobed leaves and solitary white flowers, resembling those of the blackberry, but larger—one inch across—and with stamens and pistils on different plants. The orange-yellow fruit is about half an inch long and has a pleasant flavour. The plant is widely distributed through the more northerly portions of both hemispheres.

In North America it grows in peat bogs and on mountains from Maine and New Hampshire to arctic America and westward to Alaska and British Columbia. In Great Britain it grows in mountainous areas. In Norway and Sweden the fruit is gathered in large quantities and sold in the markets.

CLOUDBURST, a sudden, very heavy rainfall. usually local in nature and of brief duration. Most so-called cloudbursts occur in connection with thunderstorms. In these storms there are violent uprushes of air, which at times prevent the condensing raindrops from falling to the ground. A large amount of water may thus accumulate at high levels, and if the upward currents are weakened the whole of this water falls at one time. Cloudbursts are especially common in mountainous districts. This is probably because the warm air currents of a thunderstorm tend to follow the upward slope of a mountain. The effects of heavy rain are especially striking on mountain slopes because the falling water is concentrated in valleys and gulleys. Mountain cloudbursts cause sudden and destructive floods. The intensity of rainfall in the most severe cloudbursts can only be conjectured. A rainfall of 2.47 in. in 3 min. was registered by an automatic rain gauge at Porto Bello, Pan., on Nov. 29, 1911, and one of 1.02 in. in 1 min. was registered by two automatic gauges, placed side by side, at Opid's camp, on the west front of the San Gabriel range, Calif., on April 5, 1926. There have been cases, however, in which the excavations made in the ground by the falling water of a cloudburst appear to indicate an even greater intensity of rainfall.

CLOUD CHAMBERS, apparatus in which the passage of high-speed ionizing particles produces vapour trails of minute droplets which are visible to the eye and can be photographed. The two basic types are the Wilson cloud chamber and the diffusion cloud chamber. When high-speed electrically charged particles such as electrons or atomic nuclei pass through any gas they remove some of the negative electrons from the atoms of the gas, leaving the ionized atoms positively charged and the electrons free of the atoms. These negative and positive free charges then form centres of condensation upon which droplets form if the gas is supersaturated with a vapour. Cloud chambers have been powerful tools in the study of radioactivity, X-rays, cosmic rays and nuclear phenomena (see RADIOACTIVITY, NATURAL; X-RAYS; COSMIC RAYS; NUCLEUS; PARTICLES, ELEMENTARY). The positron, meson, neutral V particle and charged V particle were discovered with this device. The bubble chamber (*q.v.*) is similar in function to the cloud chamber. For a general article on radiation-measuring devices *see* NUCLEAR INSTRUMENTS.

The Condensation of Supersaturated **Vapours.**—Water in a closed container filled with air evaporates until the air becomes saturated with water vapour. If the water-saturated air is cooled, the air becomes supersaturated. Droplets will form on any dust particles left in the air, and as the drops fall out the dust is carried to the bottom of the container. When all the dust has been removed and supersaturation has reached a value of 4.2, droplets will form on electrons and charged ions left behind by the passage of an atom through the container. In 1896 C. T. R. Wilson, working at the Cavendish laboratory, Cambridge, Eng., found that ions produced by X-rays could produce droplets in supersaturated gases. A little later he showed that rays from radioactive substances, ultraviolet light and other agencies which produce ions led to the same effect. That the condensation was actually due to ions, and not to some other action of the rays, was proved by applying an electric field before the gas was supersaturated by cooling; this removed the ions, and at the same time stopped the formation of a cloud of droplets.

The first method used to cool the gas was by expanding it, approximately adiabatically, so rapidly that the cooled gas was not appreciably warmed by the walls of the container. The closed tube in which the condensation was to take place was fitted with a glass plunger. Proper cooling resulted from the sudden withdrawal of the plunger through a controlled distance. Wilson found that, once dust particles had been removed by repeatedly expanding, and the drops were allowed to settle. no condensation could be produced unless the ratio of expansion v_2/v_1 (where v_2 is the final, v_1 the initial volume) exceeded a certain threshold value, namely 1 25. This corresponds to a supersaturation of about 4.2,

the supersaturation S, defined as the ratio of the amount of water vapour present to that required to produce saturation at the prevailing temperature, being given by the formula

$$S=\frac{\pi_1 v_1 T_2}{\pi_2 v_2 T_1}$$

where T_1 and T_2 are the temperatures before and just after expansion, and π_1 and π_2 are the vapour pressure of water at those temperatures; by a familiar expression $T_1/T_2=(v_2/v_1)^{\gamma-1}$ where γ is the ratio of the specific heat at constant pressure to the specific heat at constant volume, for air. With an expansion ratio exceeding 1.25, a few drops are produced in dust-free air; with an expansion ratio exceeding 1.38, a dense cloudy condensation is produced, but in this case the supersaturation is about 8. The essential observation made by Wilson was that when ions were produced in air with an expansion ratio 1.25, by the action of X-rays or any other agent, a fog was formed instead of the few drops formed by residual ions when there was no radiation. The density of the cloud depends upon the strength of the radiation, but no cloud at all is formed unless the expansion equals or exceeds 1.25. Wilson showed that positive and negative ions are not equally effective as condensation nuclei in the presence of water vapour, negative ions being effective at an expansion ratio of 1.25 and positive ions at 1.31.

The efficacy of charged ions as nuclei of condensation is bound up with the question of the evaporation of drops of different sizes in a saturated atmosphere, for a droplet can form only if there is a tendency for liquid to deposit on it from the vapour state rather than for its liquid to pass into vapour. It was shown by Lord Kelvin that the vapour pressure p at a surface of radius of curvature r differs from the vapour pressure P at a plane surface according to the equation

$$\sigma RT\log\frac{p}{P}=\frac{2\alpha}{r}$$

where a is the density of the liquid, R the gas constant for unit mass of vapour. and α the surface tension. The vapour pressure at the surface of a spherical drop being greater than that at a plane surface the drop will tend to evaporate, in an atmosphere of saturated vapour, which is in equilibrium with a plane surface, and it will only be stable, or tend to grow, if there is a supersaturation equal to or greater than p/P which by the above formula depends on r. The effect of charging the droplet electrically is to reduce the tendency to evaporate. This can be seen by considering that the electrical capacity of a sphere is proportional to the radius, and hence the electrical energy, with a given charge, varies inversely as the radius. This means that the diminution in size and eventual evaporation of a charged drop requires a supply of energy, and will not take place under conditions in which an uncharged drop of the same size will evaporate. J. J. Thomson worked out the theory in detail, and showed, by thermodynamic reasoning, that the above formula becomes, for a drop carrying a charge e,

$$\sigma RT\log\frac{p}{P}=\frac{2\alpha}{r}-\frac{e^2}{8\pi r^4}$$

While for uncharged drops the supersaturation required to produce condensation on a droplet increases steadily as r is diminished, for a charged drop, as shown by this formula, $S=p/P$ has a maximum at a radius approximately 6×10^{-8} cm.. and then decreases. A droplet of radius 4×10^{-8} cm. is in equilibrium with saturated vapour above a plane surface. and so droplets of any smaller size grow automatically to this size without supersaturation. The maximum value of S, at $r=6\times10^{-8}$ cm.. works out to be about 4.2, so that for this supersaturation, or any greater value, a droplet once begun will grow large. This agrees excellently with the value found by Wilson for condensation on negative ions: the different value found for positive ions requires subsidiary explanatory hypotheses, which are not altogether satisfactory. All of the above numerical values are for the case of water vapour. Experiments have been carried out with other vapours, and the values obtained for the limiting expansion agree well on the whole, with Thomson's theory. An indication of the difficulties in giving a complete explanation is found in the fact that the relative efficiency of positive and negative ions is reversed, as compared with water vapour, for the vapours of the organic liquids tested.

Apparatus for Obtaining Cloud Tracks.—Wilson Cloud Chamber.—For the successful application of the method it is necessary, first, to produce the expansion in such a way as to avoid stirring up the gas, as this would distort the trails of waterdrops which record the paths of the particles. and, second, to ensure that before the passage of the particle no ions or other condensation nuclei are present. In the first form of the cloud chamber used by Wilson, the apparatus was in the form of a circular glass cylinder with the axis vertical. The chamber was closed on top with a glass plate through which observations were made. In later experiments by other workers the axis has frequently been horizontal. and this has required much more careful control of the temperature to prevent turbulence. When the space under the cylinder is connected to an evacuated vessel, the pressure of the air under the piston is suddenly lowered, causing the piston to drop. The extent of its movement is controlled by contact with the floor of the chamber. The chamber used by. Wilson in the period between 1911 and 1929 had a diameter of 16.5 cm. with the depth about 3 cm. The apparatus has been variously modified by other workers since: for instance, T. Shimizu, who used a chamber only 6 cm. in diameter, found that perfect tracks could be obtained when the piston was given a reciprocating motion by a simple mechanical device. The frequency of the motion may be as high as 3 oscillations a second, which permits a large number of photographs to be taken rapidly. This form of apparatus was used by P. M. S. Blackett.

A simpler form of cloud chamber was developed by Wilson in 1933 in which the moving piston was replaced by a flexible rubber diaphragm. This diaphragm was separated from the front part of the chamber by a series of wire gauzes that ensured a uniform expansion of the gas in the chamber. The size of the chambers has varied from 2 in. to 4 ft. in diameter, and rectangular chambers have been built as large as 5 by 8 by 4 ft. deep. Chambers mounted in large electromagnets have been of major importance in studies of cosmic rays and high-energy nuclear physics.

An ingenious modification for this purpose was described by Wilson in 1935. In this chamber the gas was expanded radially. Flat glass plates at the front and back of the chamber permitted observation of the condensed drops by illumination which was only slightly displaced from the line of sight. The intensity of light scattered by small droplets increases considerably as the direction of the line of sight approaches the direction of illumination. This chamber also was used in an arrangement in which the chamber was initially between the poles of a magnet, and was dropped immediately after expansion. The tracks were photographed after it had fallen from between the poles of the magnet and was still in free flight. Under these conditions there is no circulating turbulence in the chamber due to thermal effects as the gas in the chamber experiences no gravitational field while falling freely.

For special applications the character of the gas in the chamber has been varied. The noble gases, helium, neon, argon, krypton and xenon. are desirable because of their inert character and because as monatomic gases the expansion ratio required to produce supersaturation is appreciably less than for diatomic and polytomic gases. The condensation vapour has been varied to include many organic and inorganic substances. The use of mixtures of water and ethyl alcohol produced good drops at an expansion ratio appreciably below that required for either alcohol or water alone.

In the study of very low-energy particles, the pressure of gas in the chamber has been reduced to such a point that only the vapour of the condensing substance is present. For high-energy particles the pressure of the gas has been increased to as high as 80 atmospheres pressure. To withstand pressures of this magnitude, strong windows are required. When it is desired to determine the direction of tracks in the cloud chamber, it is, in general, necessary to take simultaneous pictures in more than one direction

so that the direction of motion in space can be determined. From such photographs it is a matter of simple geometry to obtain the true angles between the different branches in the case of a forked track.

To remove the background of stray ions that are formed between expansions it is necessary to have an electrical clearing field in the chamber. This field must either be weak enough not to disturb the tracks after expansion, or it must be removed at the time of expansion. Uncharged condensation nuclei can be removed by a series of slow expansions which do not produce appreciable condensation on ions but will produce condensation on dust particles. When sharp tracks are desired, the expansion of the cloud chamber should precede the admission of the ionizing particles or radiation by a few hundredths of a second. The flash of light with which the photographs are taken should be delayed about a tenth of a second in order to permit the drops to grow to a size that will scatter sufficient light for photography. Where it is desired to count the individual drops, the expansion should follow the passage of the ionizing particle so as to permit the ions along the track to diffuse sufficiently so that the individual drops can later be resolved. Continuance of the clearing field during this time is desirable, as this separates the positive ions from the negative ions and simplifies the counting procedure.

Diffusion Cloud Chamber.—In 1950 E. W. Cowan, T. S. Needels and C. E. Nielsen invented a continuously sensitive cloud chamber which superseded one developed by A. Langsdorf. Called a diffusion cloud chamber, it has become a major research tool, particularly in the study of particles from the high-energy accelerators. It is extremely simple to make and to operate. and its use has led to many important discoveries. Cowan's first chamber consisted of an air-filled glass cylinder 12 in. in diameter and 7 in, deep, sitting in a pan of methyl alcohol which was cooled by dry ice. Warm methyl alcohol in a tray near the top of the chamber evaporates and the vapour diffuses downward toward the cooled pan at the bottom. Cloud tracks appear to a height of from 2 to 4 in. from the bottom of the chamber. The cylinder was covered by a glass plate through which the tracks could be observed when illuminated from the sides. A hydrogen-filled diffusion cloud chamber of this type, 19 in. in diameter, and operating at a pressure of 35 atm. in a vertical magnetic field of *22,000* gauss was built in 1954. In the same year a large continuous chamber measuring 4 by 8 ft. was used in the study of cosmic ray showers. At any one instant 1,100 cosmic rays could be seen traversing the chamber.

Applications of the **Cloud** Chamber.— The importance and usefulness of the cloud chamber lies in the possibility of following in detail the path of a single elementary particle. This apparatus has been used to study the dynamics of the collisions of single particles with atoms and electrons. In the first photographs published by Wilson in 1912, the Rutherford theory of single scattering of alpha-particles by nuclei was clearly verified (see NUCLEUS: Description and History). When the mass of the penetrating particle exceeds the mass of the particle that is struck, as in the collisions between alpha-particles and protons, the recoiling proton may have a range that is considerably longer than that of the initiating alpha-particles. An example of this is shown in a picture by L. Meitner. Half of the bundle of alpha-particles shown in this picture have passed through a thin film of wax. Wax. being a hydrocarbon, contains large quantities of hydrogen. A recoiling proton with a long range can be seen coming from the group of alpha-particles that have passed through the wax film. A detailed examination of the track due to alpha-particles and other heavy nuclei indicates that the loss of energy along the path is almost entirely due to the ionization produced in the gas. The distance which a high-energy particle will travel is, therefore, proportional to the energy of the particle.

Pictures by J. Chadwick and K. G. Emeleus show the track of alpha-particles from thorium C and thorium C'. Thorium C disintegrates by the emission of a short-range alpha-particle, followed by a beta-particle to form lead, the end of the thorium radioactive series.

In 1923 Wilson used his apparatus to study the ionization produced by X-ray photons in passing through gases. The tracks of electrons that were ejected by the photoelectric absorption of the X-ray quanta were observed. .In addition to these long tracks due to high-energy electrons, many short tracks called fish tracks were observed, which were later interpreted as being due to the recoil of electrons that had suffered elastic collisions with photons. The conservation of momentum and energy in such an elastic collision requires that the gain in energy by the electron be compensated by a loss in energy by the photon. This loss in energy by photons results in a reduction of the frequency of the radiation carried by the photon. This phenomenon, known as the Compton effect, was first reported by A. H. Compton in 1921 (see COMPTON EFFECT). The importance of Wilson's observations and the apparatus with which they were made was recognized in the awarding jointly to Compton and Wilson of the Nobel prize in physics for 1927.

The Wilson cloud chamber has been an unusually powerful and useful tool in the study of cosmic rays. It is possible with a cloud chamber in a strong magnetic field to determine the momentum of a particle and the magnitude and sign of the electric charge carried by it. In 1932 Carl D. Anderson discovered the positron in cloud chamber pictures of cosmic rays. The positron is a particle identical with an electron but with a positive instead of negative sign. Anderson was awarded the Nobel prize in 1936 for this discovery.

In 1937 S. H. Neddermeyer, Anderson, J. C. Street and L. Fussell presented evidence for the existence in the cosmic radiation of another particle of mass intermediate between that of an electron and a proton. Measurements made in 1946 indicate that the mass of the particle called a meson is very close to 200 times the mass of an electron. It has been observed with both positive and negative charges. From other observations on the properties of these mesons, they are known to disintegrate after a short time, about 2μ sec., releasing an electron with considerable energy. Some cloud chamber pictures have been taken that show the meson disintegrating into an electron. To conserve momentum and energy in these disintegrations it has been necessary to propose the existence of a nonionizing particle that shares in the energy and momentum of the disintegration. This particle is called a neutrino.

Cosmic-ray showers have been shown to contain cascade production of pairs of positive and negative electrons. Mesons are produced in these showers also.

The cloud chamber has been an important instrument in the discovery and identification of new particles. From ionization chamber measurements, Chadwick, in 1932, discovered a neutral particle with a mass nearly identical with that of a proton. This particle is called a neutron. Wilson cloud chamber pictures have given direct and convincing evidence for the existence of this particle. The recoil of protons from hydrogen gas in the chamber due to the neutrons gives information about the energy and abundance of these particles.

The bombardment of normally stable nuclei by high-energy particles with resulting disintegration of the nucleus was first shown in the cloud chamber pictures taken by Blackett of the bombardment of nitrogen by alpha-rays, in which the proton ejected from the nitrogen nucleus was shown. In this nuclear reaction a helium nucleus with 2 positive charges and a mass of 4 unites with a nitrogen nucleus with 7 positive charges and a mass of 14 to form an unstable fluorine atom with 9 positive charges and a mass of 18. This unstable fluorine atom disintegrates with the ejection of a proton with 1 positive charge and unit mass, leaving an oxygen atom with 8 positive charges and a mass of 17. The production of high-energy protons by the bombardment of nitrogen with alpha-particles was observed first by E. Rutherford in 1919, and he is therefore credited with having performed the first man-made nuclear reaction, but the clear interpretation of this observation was due to the cloud chamber measurements of Blackett. The disintegration of lithium produced by bombardment with protons was first observed by J. D. Cockcroft and E. T. S. Walton in 1932. In 1947 G. D. Rochester and C. C. Butler discovered heavy mesons (K mesons) produced in cosmic rays. Cloud chamber observations of these phenomena and many other reactions have been

MAKING VISIBLE THE EFFECTS OF NEUTRONS AND X-RAYS AND THE PATHS OF PROTONS AND MESONS CREATING V PARTICLES AND OTHER MESONS

Top left: A 42 mev (million electron volt) X-ray coming in from the left creates an electron and a positron in argon gas filling a Wilson cloud chamber. A magnetic field of 12,000 gauss makes the particles curva. The positron and electron tracks start at the tip of the arrow. The positron curves clockwise and forms the long spiral. The electron curves upward in a counter-clockwise direction and leaves the picture at the upper right hand corner. Electrons and positrons can be seen starting in pairs from the left side of the chamber at points marked A.

Top right: Invisible 90 mev neutrons break up three oxygen atoms into four fragments each. The long spiral is a 1.8 mev proton. The neutrons are going in the direction of the arrow and do not leave tracks

Bottom left: 5.3 bev (billion electron volt) protons traverse a 35 atmosphere diffusion chamber filled with hydrogen gas. The centre proton, entering at A, hits a hydrogen atom and produces two V particles, one just below the collision point, and one to the right. The magnetic field is 22,000 gauss. The small spirals are electrons, the horizontal lines are olearing field wires. The broad tracks are old tracks from cosmic rays

Bottom right: 4.7 bev negative a mesons traverse the 35 atmosphere diffusion chamber. One of them, entering at A, strikes a hydrogen atom and creates four new a mesons

used extensively in the field of nuclear disintegration and fission.

CLOUDED TIGER (CLOUDED LEOPARD), a large arboreal cat *Panthera (Neofelis) nebulosa,* found in southeast Asia, Sumatra, Java, Borneo and Formosa. The coat of this beautifully marked cat—grayish-brown spotted with dark patches edged with black—resembles that of the marbled cat (*Felis marmorata*), with which it is not related, however. It has an elongated head, a body and tail each about three feet long and rather short limbs. The upper canine teeth are proportionately longer than in other members of the cat family, enabling it to kill large game, although it usually preys on small mammals and birds. (J. E. HL.)

CLOUET, FRANÇOIS (*c.* 1515/20–1572), French painter of portraits and genre subjects, who immortalized in his portraits the society of the Valois court, was born at Tours. The son of Jean Clouet, he was known under his father's surname, Janet, a fact which created a persistent confusion between the works of these two painters. François worked with Jean possibly as early as 1536 and replaced him in 1540 as official painter to the king Francis I. He continued in this office, serving under Henry II, Francis II and Charles IX. He directed a large workshop in which miniaturists, enamel designers and decorators carried out his projects. In addition to portraits he painted genre subjects including nude figures, *e.g.*, "Lady in Her Bath" (Washington), and theatrical scenes attested by an engraving and by a picture representing a "Scene of the Commedia dell' Arte" (Thyssen Coll., Lugano); he also supervised the funeral ceremonies and the triumphal entries of the kings. It has been possible to identify his work on the basis of two signed pictures, "Lady in Her Bath" and the "Portrait of Pierre Quthe" (1562, Paris), and of another one bearing a 16th-century ascription to him, "Portrait of Charles IX, Full-Length" (probably 1569, Vienna). Around the preparatory drawing for the last picture may be assembled about 50 portrait drawings (Chantilly, Paris and Leningrad, etc.) and several painted portraits, the best of which are: "Francis I on Horseback" (about 1545, Florence); "Odet de Coligny" (1548, Chantilly); "Elizabeth of Valois" (about 1558, Toledo, O.); "Henry II, Full-Length" (1559, Florence); "Charles IX as a Boy" (1561, Vienna); and "Elizabeth of .Austria" (about 1571, Paris).

In comparison with his father, François Clouet shows a much greater variety both in subject and in style. He seems to have had three different manners. One appears in his court portraits in which he follows the conception of his father; another in his less formal yet monumental portrait of Quthe, influenced by the Italians (such as Giambattista Moroni or Cecco di Salviati, who worked in France); the third manner combines the Netherlandish tradition of genre painting with the stylization of the school of Fontainebleau and bears some analogy to the art of some Italianate Flemings, such as Jan van Hemessen and Jan Massys. On the whole, François's range as an artist is much wider than that of Jean Clouet. He is a typical Renaissance painter, closely related to the humanistic circles and praised by many poets of his day, including Pierre de Ronsard and Joachim du Bellay. As a portrait painter he is less profound than Jean, although he is able to render a more vivid, more fleeting expression of the face. His drawings show an almost dry precision, an elegant stylization and a clear-cut plasticity—features that are typically French. He is in fact the most representative painter of the French Renaissance.

For bibliographical references *see* CLOUET. IEAN. (C. SG.)

CLOUET, JEAN (*c.* 1485–1540), known also as JANET or GENET, French painter of royal portraits and religious subjects, celebrated for the depth and delicacy of his characterization. Records show that he was not French by origin and never naturalized; that he had already come to France during Louis XII's reign (1498–1515); was official painter of Francis I as early as 1516; and was appointed groom of the chamber from 1533, thus enjoying the salary and social position granted to the most prominent poets and scholars of the time. In the early 1520s he lived in Tours, and from 1529, in Paris. He painted chiefly portraits but, at least in the earlier part of his career, he also produced religious subjects (a "St. Jerome" in 1522; designs for the "Four Evangelists," 1523). He died in 1540.

Until recently Clouet's work was known only on the strength of an assumption. It consisted of a group of about 130 preparatory drawings representing members of the French court between 1520 and 1540 (most of them in the Musée Condé. Chantilly, and in the Bibliothèque Nationale, Paris) and in a small group of miniatures and oil paintings, the drawings for which can be found among those of the first group. None of these is signed or documented as the work of Jean Clouet. But the discovery and the cleaning of the portrait of Guillaume Budé, now at the Metropolitan Museum of Art, New York city, changed the assumption into a certainty. Indeed, Budé himself stated about 1536 that Jean Clouet had painted a portrait of him and the cleaning revealed in the New York picture a bright blue background like that in the miniature portraits. Since the preparatory drawing for this picture exists in Chantilly and is obviously by the same hand as the other drawings, the attribution to Jean Clouet of all the above-mentioned works ceased to be merely hypothetical. The extant oil paintings by Jean Clouet are: "Dauphin Francis as a Child" (about 1522, Antwerp), "Charlotte de France as a Child" (about 1523, Chicago), "Claude de Guise" (about 1525, Florence), the large "Portrait of Francis I" (workshop of Clouet, about 1525, Paris), "Louis de Nevers" (about 1525–30, Bergamo), "Unknown Humanist With a Volume of Petrarch" (about 1535, Hampton Court) and "Guillaume Budé" (about 1535, New York city). To these should be probably added the "Portrait of a Banker" (1522, Museum of St. Louis. Mo., there attributed to Jan Mostaert), the "Portrait of Madame de Canaples" (about 1523, Edinburgh) and the "Portrait of an Unknown Humanist Holding a Book" (Poznań), which, although a copy, provides information about an important lost original (about 1535–40). In all these portraits the hands differ considerably, and were probably executed by apprentices in Clouet's workshop. This body of works shows Clouet as one of the best 16th-century portrait painters, both incisive and delicate in the psychological characterization of sitters. His drawings are simple, broad and subtle; his paintings are fresh in colour, mellow in modeling and minute in execution. His technique seems fundamentally Flemish (he came probably either from Brussels or from the old Franco-Flemish region of Valenciennes)., but his supple drawing: his calm plasticity and his acute analysis of the individual are typically French. In his youth he could have been influenced by the already ancient French tradition of portrait drawing. On the other hand, his monumental composition is influenced by the Italian Renaissance portraiture introduced into France by Andrea Solario. Some of Clouet's portraits show also similarities with those by Holbein, who in his turn borrowed the technique of portrait drawing in coloured chalks during one of his trips to France. The manner of Clouet became the source of continuous tradition of portraiture in France, until the appearance of Degas.

CLOUGH, ANNE JEMIMA (1820–1892), promoter of the higher education of women and first principal of Newnham college, Cambridge, was born at Liverpool, Lancashire, on Jan. 20, 1820, a

sister of the poet Arthur Hugh Clough (*q.v.*). When two years old she was taken to the U.S., returning to Liverpool in 1836. She opened a school there after her father's business failure in 1841. In 1849 she studied in London, teaching at the Borough road and the Home and Colonial schools, and in 1852 she opened a school at Ambleside. Westmorland. A strong supporter of the movement for the higher education of women, she uorked with Emily Davies. Frances Mary Buss, Henry Sidgwick and others. She played a prominent part in founding the North of England Council for the Higher Education of Women and was its secretary (1867–70) and president (1873–74). She persuaded James Stuart, the founder of university extension. to give lecture courses in the north. and this led to the admission of women to the colleges at Manchester and Newcastle. When Henry Sidgwick planned a house for women students at Cambridge. Miss Clough was selected as principal. It opened in 1871 uith five students; its success led to the building of Newnham hall (1875) and the foundation of Newnham college (1880). Miss Clough died at Cambridge on Feb. 27, 1892.

See Blanche Athena Clough, *Memoir of Anne Jeminza Clough,* 2nd ed. (1903); Mary Agnes Hamilton, *Newnham, An Informal Biography* (1936). (S. J. C.)

CLOUGH, ARTHUR HUGH (1819–1861), English poet, is best known as the author of "Say not, the struggle nought availeth," and for his friendships with Matthew Arnold. who commemorated him in *Thyrsis,* and with Florence Nightingale, whose cousin, Blanche Smith, he married.

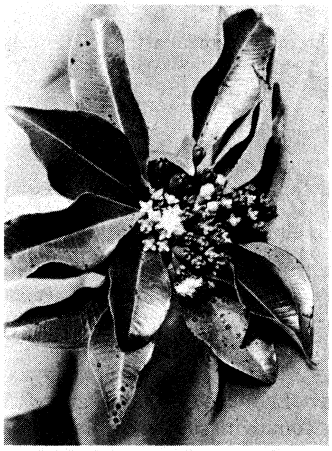
Clough was born in Liverpool on Jan. 1, 1819, and was educated at Rugby. where he was one of Thomas Arnold's most brilliant and devoted pupils, and at Oxford, where he was a scholar of Balliol and fellow of Oriel. He went up to the university intending to become a clergyman, but could not bind himself to the dogmas of the Church of England and resigned his fellowship in 1848. After three years in London as principal of a students' hostel. followed by eight months in Massachusetts, where he was treated with great kindness by Emerson, Lowell and other admirers, he obtained a post as examiner in the London education office. In 1859 his health began to fail, and he died in Florence on Nov. 13, 1861.

Clough was a clever, kindly, thoughtful man of almost passionate intellectual sincerity, who stood firmly by his disbeliefs, but without arrogance or intolerance. Some of his poetry is mild and flat, and little of it is musical; it is curious that. in an age that admired Tennyson. Arnold and Swinburne, his *Poems* (1862) should have been so popular that they were reprinted 16 times within 40 years of his death. But his best verse has a rare flavour, quite unlike that of any other Victorian. much closer indeed to the taste and temper of the 20th century. Unfortunately for his reputation, two of his chief works are in English hexameters: a metre which he handled with exuberant dexterity, but which is strange to ears unused to classical prosody. *The Bothie of Toberna-Vuolich,* "A Long-Vacation Pastoral" (1848), describes an Oxford reading party in Scotland. "Amours de Voyage," also in hexameters, is based on Clough's visit to Italy in 1849, and contains a brilliant assortment of reflections and descriptions, including an eyewitness account of the siege of Rome. Clough's sharpest shafts against Victorian humbug are in "The Latest Decalogue":

> Thou shalt not kill, but need'st not strive
> Officiously to keep alive.

BIBLIOGRAPHY.—H. F. Lowry, F. L. Mulhauser and A. L. P. Norrington (eds.), *Poems* (1951); F. L. Mulhauser (ed.), *Correspondence* (1957). There are memoirs by S. Waddington (1883), J. I. Osborne (1920) and G. Levy (1938). (A. L. P. N.)

CLOVE, the small, unopened flower bud of the tropical *Eugenia caryophyllata* tree, Myrtaceae (*q.v.*) family, was a major item in the earliest spice trade. Centuries before Christ, envoys from Java to the Han court of China brought cloves, customarily held in the mouth to perfume the breath during audiences with the emperor. Southern Arabian peoples plied the Indian ocean coasts before recorded history to bring spices from the East Indies to the Persian gulf, and from there by caravan to Alexandria or other eastern Mediterranean ports. Empires grew from the spice trade. Venice, dominating the Mediterranean, controlled and taxed Arabian trade destined for Europe. Venice fell when Portuguese navigators, learning to circumnavigate the Horn, founded an empire in the far east, only to be ousted a century later by the Dutch.



BRITISH CROWN COPYRIGHT

CLOVES (EUGENIA CARYOPHYLLATA) IN VARIOUS STAGES OF RIPENING

During the late middle ages all Europe depended upon the orient for spices, cloves finding use as food preservative, flavouring and garnish. Clove-growing was confined almost entirely to Indonesia. In the early 17th century the Dutch issued a directive for eradication of cloves on all islands except Amboina and Ternate, to create scarcity and sustain high prices.

In the latter half of the 18th century the French succeeded in smuggling cloves from the East Indies to Indian ocean islands and to the new world. Dutch monopoly was broken. never again to threaten abundant supplies. In 1768 when a Dutch resolution forbade clove tree propagation, there were 1,500 tons of cloves in Batavian warehouses. and enough in Holland to supply European needs for ten years Cloves still come from Indonesia, but the greatest production is in Zanzibar and Madagascar

The clove tree seldom reaches 50 ft. The gland-dotted leaves are small, simple and opposite Trees are usually propagated from seeds, planted in beds having protective shading A single tree may yield up to jj lb. of dried buds. Flowering begins about the fifth year, with harvest in late summer and again in winter. Buds are picked by hand as they redden, then are sun-dried. In the dried cloves, the characteristic four sepals can be noted at the base of the bulbous bud.

Cloves are strongly pungent due to the aromatic oil eugenol, extracted by distillation to yield oil of cloves; it is used in clearing microscope slides, germicides, mouthuashes. as a local anesthetic for toothaches, in the synthesis of vanillin and in perfumes as a sneetener or intensifier. (R. W. Sy.)

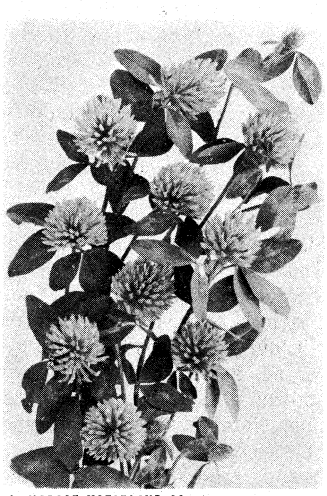
CLOVELLY, a quaint fishing village, popular with tourists and artists, on Barnstaple bay, north Devon, Eng., 43 mi. NW. of Exeter by road. Pop. (1951) 533. Its main street is cobbled and descends 400 ft. in wide steps and stages, which are too steep for wheeled traffic. At the bottom is a small cove with a pier and a pebble beach, and down either side cluster little old houses, whitewashed and gaily painted. The village is built in a rocky cleft with thick woods sheltering it on three sides so that the climate is mild. Clovelly is described by Charles Dickens in *A Message* From *the Sea (1860).*

CLOVEN-FOOTED ANIMAL, the popular designation for any member of the order Artiodactyla (*q.v.*), which includes sheep, cattle. deer, antelopes, goats and swine (*qq.v.*).

CLOVER, the name for plants belonging to the genus *Trifolium,* so-called from the leaf, which has three leaflets (trifoliolate). Clover is a member of the family Leguminosae and contains about 250 species. Many other plants also are called clover, but most of these belong to different genera of the legume family. Species are found on every continent, and in all except Australia certain ones form a part of the native flora. Species of agricultural importance appear to have originated in southeastern Europe and southern Asia Minor. The plants are small, annual or perennial herbs with trifoliolate leaves (rarely nith five or seven leaflets) with stipules adnate to the leafstalk, and heads of small red. purple. white or yellow flowers or shades thereof; the small one- to few-seeded pods are enclosed in the calyx Clovers are best adapted to cool. humid climates. either the summer months in the temperate zones or the winter months in countries that do not have severe cold. The perennials may behave as annuals. depending upon the severity of unfavourable climate, diseases or insect pests.

Many species are extensively cultivated in all countries, while others form an important part of the native vegetation.

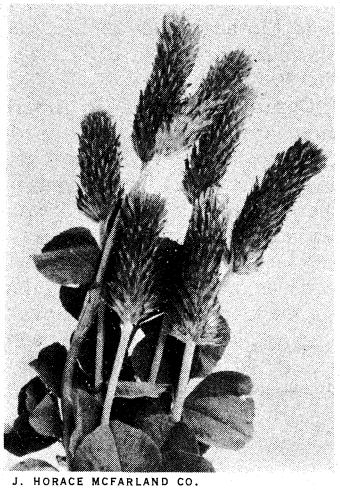
Agricultural Species.—The most important agricultural species are red clover (T. *pratense*) (fig. 1). with round, light to dark purplish-red clover heads, the most widely cultivated species from Siberia to Chile, botanically a perennial but agriculturally more of a biennial; white clover (T. *repens*), a stem-creeping, node-rooting perennial, abundant in good pastures. meadows and lawns, the most widely naturalized species, with flowers borne on small round heads, white to pinkish, becoming brown and reflexing as the seed matures; alsike clover (T. *hybridum*), common in meadows and moist habitats, botanically a perennial but agriculturally mostly a biennial, with flower heads resembling those of white clover; crimson clover (T. *incarnatum*), with pointed heads of bright crimson flowers (fig. 2), a winter annual in climates where winters are not severe. or a restricted summer annual in high latitudes; large hop clover, T. *campestre* (T. *procumbens*) mostly a winter annual widely naturalized in pastures and along roadsides, with small round heads of bright yellow flowers; small hop clover, T. *dubium*, in Europe synonymous with T. *minus* and commonly called shamrock, similar in all respects to large hop clover but with smaller and fewer flowers per head; sub clover (T. *subterraneum*), a winter annual with decumbent stems: and heads of few. cream-coloured flowers borne inconspicuously under the foliage (after fertilization the flomers reflex and bury the developing seed under the surface of the soil); Persian clover (T. *resupinatum*), mostly a winter annual, having small flat heads of lavender flowers with calyx inflating as maturing; strawberry clover (T. *fragiferum*), a creeping. node-rooting perennial with round, slightly pointed heads, with pinkish flowers, calyx inflating as maturing, tolerant to soil salinity, preferring moist habitats; berseem clover (T. *alexandrinum*), a winter annual having spikelike heads of white to cream flowers, not tolerant to heavy frosts;. cluster clover (T. *glomeratum*), a winter annual with small round heads of dull rose-coloured inconspicuous flowers, the heads borne on short stems in leaf axils. rough and spinelike upon maturity; rose clover (T. *hirtum*), a winter annual with heads similar to red clover, rose nonshowy flowers, leaves and stems densely hairy; and ball clover (T. *nigrescensj*, a winter annual: having round small heads, similar in colour to white clover. More than 50 native species of clover occur on the Pacific coast and in the Rocky mountain region, but east of the Mississippi river only 4 native species occur.



J. HORACE MCFARLAND CO.

FIG. 1.—RED CLOVER (TRIFOLIUM PRATENSE)

Cultivation and Uses.—Clover was cultivated in the Netherlands about the mid-16th century and possibly by the Letts 1,000 years earlier. Sir Richard Weston originally introduced clover from Flanders into England as a field crop about the mid-17th century. He was the first to introduce into England the rotation of crops, using clover as a soil-improving crop. Clovers are grown alone or in mixtures with other legumes and different grasses. They thrive in soils having a high phosphorus, calcium and potassium content either natural or supplied by fertilizers. The forage is highly palatable to livestock and is high in protein and in phosphorus and calcium, thus making valuable livestock feed in either the green or the dry stage. In addition to their principal value as animal feed in the form of hay, pasture and silage, the clovers are valuable soil-improving and conserving plants. Depending on the thickness of stands, degree of inoculation and amount of growth when plowed under, clover adds 50 to 150 lb, per acre of nitrogen to the soil and increases availability of other nutritive elements for crops that follow. Diseases and insects are important in the production of clovers, affecting the length of life of the plant and its reproduction; many diseases and insects are worldwide wherever clovers occur; others are limited to specific countries. The length of the photoperiod where the strain or variety originates also is important to its adaptation in different locations.



J. HORACE MCFARLAND CO.

FIG. 2.—CRIMSON CLOVER (TRIFOLIUM INCARNATUM)

Varieties and Strains.—Many varieties and strains of each species occur: representing forms best adapted to the environments, developed both by natural selection and by plant breeders. The basic chromosome numbers of the genus appear to be six, seven and eight. Of the species studied, the somatic numbers of chromosomes range from 12 to about 130. Many important species, such as red clover. white clover and alsike clover, are principally self-sterile. Cross-pollination resulting in seed setting is brought about by insects, principally bees! which visit the flowers for nectar and pollen. Other species, such as the hop clovers and Persian clover, are self-fertile and self-pollinating; still others, such as crimson clover, are self-fertile but not self-pollinating.

Distribution.—All the above-mentioned clovers are grown in the U.S. Berseem clover is grown only in limited areas in southern Arizona and California; cluster clover in southern Mississippi; sub clover in the coastal section of the Pacific states and limited areas of the southern states; rose clover on the coastal ranges of California; and ball clover in limited areas of the southern states bordering the Gulf of Mexico. Other more widely grown species are Persian, grown on the heavy Ion--lying soils of the southern states; the hop clovers from Kentucky southward and the Pacific northwest; strawberry clover throughout the irrigated lands of the western states; crimson clover from Sew Jersey and Kentucky southward as a winter annual and in northern Maine as a summer annual; white clover in all states where there is sufficient moisture and required plant foods; Ladino clover, a large-growing variety of white clover of major importance, in improved humid and irrigated pastures throughout the U.S. and Canada. The principal red clover belt is east of 98° longitude and north of 35° latitude, in the Pacific northwest and irrigated lands of the western states: but its planting was increasing in the southern states in the second half of the 20th century. The planting of alsike clover was decreasing. being replaced by Ladino white clover and red clover. Red clover. white clover. alsike clover and the hop clovers were widely grown in the British Isles; sub clover was the basis of an extensive sheep and cattle industry in Australia; while white clover was the legume of the New Zealand dairy pastures.

Seeding and Growth.—Red clover. alsike clover and Ladino white clover may be seeded with companion grain crops. alone and in mixtures with grasses and other legumes. Chances of obtaining thick legume and grass stands are increased if the green grain crop is grazed off or cut in the dough stage for silage. If .there is adequate moisture after the grain is harvested, light grazing or a small hay crop may be produced the first year. Weeds are controlled by clipping once or twice during the seeding year and using specific weed killers. The heavy crop occurs from the second year's growth. If clover is seeded with grass, the stands are usually left through the third year: otherwise, the aftermath is plowed under for cultivated row crops in the fall of the second year or the next spring. Failure to establish and maintain stands may be due to improper seedbed preparation, heavy seedings of rank, late-maturing grain crops. deficiencies of plant foods (phosphorus, potassium and calcium), diseases and insects, the use of unadapted varieties and strains and thick weed infestation. Most other clovers are used principally for pastures and soil improvement and are seeded on turf or with grasses. When the clover is seeded on

turf, the grass must be either closely grazed or clipped, or thick sods thoroughly disked or plowed, and adequate quantities of phosphate and potash fertilizers and limestone applied to obtain successful seedings.

Common Types.—In America there are two recognized common types of red clover, medium and mammoth, better called double- and single-cut, which are comparable with but not the same as the English double-cut and single-cut clovers. To conditions in the U.S., none of the European clovers are adapted, and their use leads to poor stands and low yields; likewise, strains adapted to one section of the red clover belt do poorly in another. Improved varieties are developed by state and provincial agricultural experiment stations and the United States and Canadian departments of agriculture. Kenland, Pennscott, and Dollard in the United States; LaSalle and Altaswede in Canada; Montgomery late and Aberystwyth S.123 in England represent improved red clover varieties. White clover varieties differ widely, varying from Ladino and Pilgrim of the large type, Louisiana S.1, Aberystwyth S.100 and New Zealand of the intermediate type to English wild white and Aberystwyth S.184 of the' low-growing type. Dixie, Auburn, Autauga, Chief and Talladega are crimson clover varieties of the reseeding type. With their development, the acreage of crimson clover increased many times in the southern states. The Mt. Barker, Tallarook and Nangeela (Australian) varieties of sub clover are widely grown in the coastal section of the western states, while in Australia there are more than 10 extensively used varieties.

Seed Production.— The seed of most clovers, except that of Ladino white clover, is generally produced where the plants are extensively grown for livestock feed and soil improvement; after 1948, more seed of red clover varieties was produced under irrigation in the western states. Weather conditions and other factors in the western states, generally more favourable than in the humid east, are more conducive to the production of large quantities of high-quality seed. The winter annual species produce seed in the spring and are perpetuated by the seed that volunteers in the fall.

CLOVIO, GIORGIO GIULIO (1498–1578), Italian miniature painter and priest, by birth a Croat, was said to have studied at Rome under Giulio Romano and at Verona under Girolamo de' Libri. His book of 26 pictures representing the procession of Corpus Domini, in Rome, was the work of nine years, and the covers were executed by Cellini. The British museum has his 12 miniatures of the victories of the emperor Charles V. A manuscript life of Frederick, duke of Urbino, is superbly illustrated by Clovio (Vatican library), and many other works are doubtfully attributed to him. He sometimes exceeded the limitations of his medium in attempts to sustain the art of illumination.

CLOVIS (CHLODOVECCHUS) (c. 466–511), king of the Franks, the founder of the Merovingian power in western Europe. was only 15 years old when, in 481 or 482, he succeeded his father Childeric I as king of the Salian Franks. Childeric, who was in treaty relations (foederatus) with the Roman empire, had established his power in part of the old Roman province of Belgica Secunda, making his capital at Tournai. The exact stages by which, in the course of 30 years, Clovis extended his power from this little kingdom till he was ruling over a domain almost as great as modern France are still a matter of much controversy. Evidence is scarce, and Gregory of Tours, whose *Historia Francorum* is the main source for the career of Clovis, wrote so long after his reign that in his account legend and reality are inextricably mingled.

Clovis' first aim was to conquer the district between the Somme and the Loire, controlled by Syagrius (*q.v.*) the last representative of Roman rule in western Europe. With the assistance of other Frankish tribes under their chieftains Chararic and Ragnachar to whom he was related, Clovis invaded the territory and defeated the army of Syagrius outside Soissons. Syagrius fled to Toulouse, but the Visigothic king Alaric II, fearful of offending the victor of Soissons, sent him captive back to Clovis, who had him put to death (486). In the following years, by means of war. intrigue and murder, Clovis increased his power at the expense of other Frankish tribes: in the words of Gregory of Tours, "he killed many other kings and several of his close kinsmen, fearful lest they should supplant him or diminish his authority."

Clovis married a Burgundian princess, Clotilda (*q.v.*), niece of King Gundobad; she was an ardent Catholic, and at once set about winning Clovis to her faith. Gregory of Tours gives a detailed account of his conversion, which followed a memorable victory over the Alamanni. The Alamanni, who were reputed to be the most formidable of the barbarian invaders of Gaul, were occupying the area between the Vosges, the Rhine and Lake Constance. Prevented by the armies of Theodoric, king of the Ostrogoths, from expanding toward Italy, they turned instead toward the northern lands settled by the Franks. First they attacked the Ripuarian Franks, penetrating deeply into their country until they were repulsed in a battle at Ziilpich, southwest of Cologne. The Alamanni then attacked the Salian Franks. It is not clear where the battle took place, but Clovis routed them. According to Gregory, this victory determined him finally to acknowledge Clotilda's God, whose aid he had solicited during the battle. He was baptized, with more than 3,000 of his warriors, by St. Remi, bishop of Reims. According to Gregory of Tours, the conversion of Clovis took place in 496; but his chronology is not necessarily accurate, and A. Van der Vyver has ascribed these events to the year 506.

Clovis had vanquished Syagrius and the Alamanni: there remained, in southern Gaul, the Burgundians to the east and the Visigoths to the west. These two races had been Christian for a century, but adhered to the Arian heresy. The Gallo-Roman population and clergy under their oppressive rule naturally looked for liberation to the victorious and Catholic Salian Franks. Clovis turned his attention first to the Burgundians. Having allied himself secretly with Godegesil, the Catholic king of Geneva, he attacked the Arian Gundobad, whose capital was Lyons, and defeated his army near Dijon. Gundobad fled to Avignon; Clovis followed and besieged him until Gundobad promised to pay him tribute.

Several years later Clovis won a much more decisive victory over the Visigoths who occupied southwestern Gaul. At the battle of Vouillé (507), near Poitiers, their king Alaric II was killed and his army routed. The Franks then took possession of his capital, Toulouse. Despite help from the Ostrogothic king Theodoric, the Visigoths lost to Clovis all their land in Gaul except Septimania, a strip bordering the Mediterranean.

Clovis, victor of Vouillé, returned to Paris in 508, breaking his journey at Tours to offer gifts in the church of St. Martin. Here, according to Gregory, he received an embassy from Constantinople and was given the diploma and invested with the insignia of a Roman consul. This story, once questioned by historians, has been corroborated to some extent by later research.

Fearless in battle, astute and ruthless in eliminating his rivals, Clovis also showed qualities of more considerable statesmanship. The Lex *Salica*, a Latin redaction of the penal law of the Salian Franks, was drawn up on his orders (see SALIC LAW). He moreover convened, at Orléans, in July 511, the first church council held in Gaul which can be described as national rather than provincial. Clovis died in Paris, which he had made "the seat of the kingdom" (*cathedra* regni) and his normal place of residence, on Nov. 27, 511. He was buried in the church of the Holy Apostles SS. Peter and Paul (later known as the church of Ste. Geneviève) which he and Clotilda had built on the hill on the south bank of the Seine overlooking the island where his palace stood.

CLOVIS, a city of eastern New Mexico, U.S.; seat of Curry county. In 1907 the Santa Fe railroad set aside a half section

of land for a townsite on its new route across New Mexico and Alice Ripley, daughter of the president of the railroad, who was studying the reign of King Clovis, suggested the town name. The chant of the cattle auctioneer is a familiar sound, for Clovis is a major livestock centre. Flour and feed milling, wheat raising, irrigation farming, trade and transportation activities and the Cannon air force base contribute to a prosperous economy. Eastern New Mexico university is 19 mi. distant at Portales. For comparative population figures *see* table in New MEXICO: Population. (G. M. FI.)

CLOWN, a familiar comic typed character of pantomime and circus (*qq.v.*) with recognizable dress and make-up whose aim is to induce hearty laughter. He usually follows a permanent routine which most commonly is to fail miserably in all that he does.

Early ancestors of the clown were the bald-headed, padded, stupid fools in Greek and Roman mimes. They persisted through the middle ages in secular farces and as court fools. In the Commedia dell'arte (*q.v.*), comic types appeared with mountebanks in theatres and fairs and Zanni, Arlecchino and Pierrot (*q.v.*) improvised dialogue and developed professional routines. Elizabethan clowns were called merry-andrews. In the 18th century, Harlequin (*q.v.*) and companions appeared in pantomimes with harlequinade and transformation scenes. Joseph ("Joey") Grimaldi (*q.v.*) displaced Harlequin as a clown and set the whiteface tradition. "Joey" influenced the circus clown, who first appeared at Philip Astley's riding school (afterward Astley's amphitheatre), as a comic on horseback and a talking clown.

In the 1860s a low-comedy buffoon appeared under the name of Auguste, who had a big nose, baggy clothes, large shoes and untidy manners. He worked with a whiteface clown, and always spoiled the latter's trick by appearing at the wrong time to mess things up. In Germany and Austria a stock figure, Hanswurst (*q.v*), appeared in the 16th century and was popular through the 19th century. Other buffoons included the grimacing, musical, singing, rubber and vanishing clowns. With the three French Fratellini brothers, the Auguste-clown act became an art: François was the whiteface Pierrot (similar to Jean-Baptiste Gaspard Deburau, pantomimist, creator of lovesick, pale Pierrot) and Paul and Albert were the buffoons.

Grock (*q.v.*) (Adrien Wettach), the whiteface pantomimist, failed in everything he did. When he sat on a chair to play a concertina. the chair would collapse. He carried a tiny violin in a huge portmanteau. When a stool was too far from a piano, he shoved the piano to the stool. His sadness is comparable with that of Emmett Kelly, the U.S. vagabond clown. See also FOOL (JESTER).

CLOYNE (CLUAIN-UAMHA), a small market town of County Cork, Republic of Ireland, about 18 mi. E.S.E. of Cork by road. Pop. (1956) 607. Its Gaelic name signifies "the meadow of the cave," from the limestone caves of the vicinity. An ecclesiastical foundation of the 6th century, it has an ancient oratory and a cathedral (mainly 14th century) dedicated to St. Colman, disciple of St. Finbar of Cork. Opposite the cathedral is a fine round tower 100 ft. high. The town suffered from Scandinavian raids in the 9th century and was laid waste by Dermot O'Brian in 1071 and burned in 1137. In 1430 the bishopric was united to that of Cork, in 1638 it became independent, and in 1660 it was again united to Cork and Ross. It became independent once more in 1678 and so continued until its reunion with Cork in 1835. The Pipe Roll of Cloyne compiled by Bishop Swaffham in 1364 is a valuable record of medieval land tenure. It is now in the record office, Dublin, and was edited in 1859. The cathedral contains a memorial to Bishop George Berkeley (*q.v.*), the philosopher, who became bishop of Cloyne in 1734. The town gives its name to a Roman Catholic diocese with a cathedral at Cobh.

CLUB. The ancient Greek hetaeria and the Roman *sodalitas* may be regarded as early ancestors of the modern club, although they were in fact loose associations of like-minded companions rather than true clubs in the modern sense of that term. Among the Greeks, religious organizations that worshiped esoteric deities not recognized by the state religion were the most important, but political, commercial and athletic associations also flourished, together with dining clubs whose members met to eat together and exchange ideas.

In Rome, religious and trade clubs were common but, like their Greek predecessors, they were nearer to sects or trade guilds. The Roman political clubs were more like modern clubs in aim and organization but they tended to degenerate into unruly cabals and were suppressed by Julius Caesar as dangerous to public order. Burial clubs existed among poorer people to help them provide their dead with the expensive funeral rites then considered necessary. Cicero in De Senectute mentions symposia which, he says, he enjoyed as much for the conversation as for the well-cooked meals. Though some of these early societies elected committees and drew up definite rules, they had little in common with the modern club. Probably the true club spirit was most often found in the unorganized but more or less regular gatherings of friends at the Roman public baths.

BRITISH CLUBS

The Rise of English Clubs.—The earliest English club of which we have certain knowledge was Le Court de Bone Compagnie, described in a poem, La Male Rkgle, by Thomas Hoccleve, who was a member. It flourished in Henry IV's reign and was evidently a dining club, meeting in a house near the Middle Temple, London. The Elizabethan Friday Street, or Bread Street, club was also a dining association; it met in the famous Mermaid tavern, and is said to have been founded by Sir Walter Raleigh. About 1616 Ben Jonson founded the Apollo club in the Devil tavern by Temple Bar. Its many distinguished members included Lucius Cary, Sir John Suckling, Robert Herrick and Lord Herbert of Cherbury. Though purely masculine in membership, it adopted the modern-seeming practice of admitting ladies on special nights.

With the rise of coffeehouses in the mid-17th century, clubs acquired more or less settled homes and began to take on distinctive characters. The landlord of a coffeehouse usually allotted a special room to the club's use. For this he made no charge, relying for his profit on the food and drink consumed by the members and the distinction conferred upon his house by the presence of notable men. At this period the term "club," in its modem sense, first came into common use. "We now," says John Aubrey, "use the word clubbe for a sodality in a taverne." In 1660 Samuel Pepys mentions Woods' tavern in Pall Mall where he and his friends went "for clubbing."

Among the most notable political clubs of the 17th century was the Rota, founded by James Harrington in 1659. It was strongly republican in sentiment and included among its members Lord Algernon Sidney and Lord William Russell (both of whom were subsequently executed for their supposed parts in the Rye House plot), Sir William Petty and Andrew Marvell, the poet. Pepys calls it the Coffee club, perhaps because it met in Miles' coffeehouse in Westminster. The Sealed Knot was a royalist association, while the Green Ribbon club (sometimes called the King's Head club from the Chancery lane tavern in which it met) was an organization of influential malcontents under the leadership of Lord Shaftesbury. In 1693, White's, which in the 18th century was to become a prominent Tory stronghold, began its long career in the chocolate house owned by Francis White. In its beginnings it was social rather than political and derived its clublike characteristics from White's determination to keep his clientele select and from the strict rules he enforced. The original chocolate house stood in St. James's street, on the present site of Boodle's. In 1697 the business was transferred to the opposite side of the road where it was later carried on by John Arthur, the founder in 1765 of the club known as Arthur's. In 1736 White's became a private club, and 19 years later it moved to its present site in St. James's street.

Of nonpolitical Stuart clubs, two of the best known are the Royal Navy (1674), prototype of the 19th-century service clubs, and the Wednesday, founded by William Paterson in the Dog and Whistle tavern, Friday street. Paterson was the financial genius

of his era and at his weekly meetings the project that resulted in the creation of the Bank of England was first evolved.

The 18th-Century Clubs.—The number and variety of clubs increased very rapidly. Many were comparatively short-lived associations. reflecting the more violent phases of contemporary political feeling, or the extravagant and often lawless fancies of idle young men. Among these was the Calves Head club (established shortly after the execution of Charles I) whose chief meeting was held on the anniversary of the execution, when the dishes served included a calf's head, representing the defeated king. and a pike, representing tyranny. Others were the various Mug House clubs, most of which were eventually suppressed for their disorderly conduct; the notorious Hell Fire club at Medmenham; and the Mohocks', whose unruly members terrorized law-abiding Londoners. Other societies with odd, and sometimes unedifying, aims are mentioned in the pages of the *Spectator*, and in Ned Ward's two books on club life (see *Bibliography)*.

Of the more serious clubs, many were political, or partly so. The October was founded in 1710 or 1711 by a band of Tories dissatisfied with Robert Harley's administration. The Cocoa Tree began as a Jacobite association and became a private club in 1746. Jonathan Swift was a leading member of both and also of the Saturday (founded by Henry St. John in 1711), the Brothers, and the Jacobite Mourning Bush, afterward called the Fountain. Other clubs that were mainly political were the Hanover, for the more ardent supporters of the new dynasty; the Rumpsteak or Liberty (1734); the Board, mentioned by Horace Walpole in a letter dated 1743; White's, which became definitely Tory under William Pitt's influence in 1783; and its Whig opposite number, Brooks's. The last-named was founded in 1764 as a social and gaming establishment by William Macall, who bought a house in Pall Mall and, transposing the letters of his name, called it Almack's. This club (not to be confused with the more famous Almack's assembly rooms in King street, also run by Macall) was bought by Brooks in 1774. Four years later it was transferred to the present clubhouse in St. James's street and thereafter was always known as Brooks's. Renowned for its high stakes in play and its social brilliance, it was also famous as a leading Whig stronghold and the favourite haunt of Charles James Fox and his associates.

Important and influential as the political clubs were, the literary, artistic and social associations were most characteristic of the period. Many clubs combined these attributes. The members of Brooks's assumed the role of arbiters of literary taste; those of the Blue-stocking moved with equal ease in the learned and aristocratic worlds. The Scriblerus club, founded by Swift in 1714, included men of fashion like the earl of Oxford and Viscount Bolingbroke, and poets like Alexander Pope and John Gay. The Society of Dilettanti (1743) was a gathering of amateur art collectors, whose fine collection of pictures by Sir Joshua Reynolds and Francis Knapton is housed in the St. James's club, Piccadilly, where the Dilettanti hold their dinners. The famous Kit-Cat club, founded at the beginning of the century by Joseph Jacob Tonson, a bookseller, began as a literary association but soon became renowned for its distinguished membership, its toasts and the portraits of members by Sir Godfrey Kneller. The name was derived from Christopher Cat, in whose eating house the first literary reunions were held. In 1749 Dr. Johnson who, like Swift, was an ardent clubman, founded the Ivy Lane club at the King's Head tavern. Fifteen years later he and Sir Joshua Reynolds organized the more celebrated Literary club, usually known simply as "The Club." The original membership was limited to 12 and gradually increased to 40, after which a resolution was passed in 1780 that it should never exceed that number. Oliver Goldsmith, Edmund Burke, David Garrick, James Boswell and Sir John Hawkins were among the earliest members and during the next two centuries many outstanding men joined it. In 1783, not long before his death, Johnson founded yet another club. called the Essex Head, after the tavern near the Strand in which it met.

Boodle's (1763) which, like White's and Brooks's, still occupies its 18th-century home, was one of the more famous social institutions. Originally called the Sçavoir Vivre, it was later named for William Boodle, who became its manager about 1774. This club was renowned for its cuisine. Its beautiful clubhouse in St. James's street is said to have been designed by the Adam brothers. Another fine building is Coventry house. Piccadilly, once the home of the Coventry House club which settled there in 1769. and later occupied by the social and diplomatic St. James's club (1857).

During the 18th century, clubs of the English pattern sprang up in French and German taverns. In 1749, literary Monday club was founded in Berlin and the first purely social club in Germany was inaugurated in 1752. It was followed by a variety of political clubs, many of which were suppressed in 1848 during the revolutionary disturbances. In France small political coteries abounded in the years immediately preceding the French Revolution and contributed largely to the unrest of the time.

Clubs of the **19th** and 20th Centuries.—In the 19th century many clubs began to follow the lead of White's and Brooks's in acquiring permanent headquarters, often in the form of imposing houses built for them by well-known architects. They also tended to become more specialized and clubs for those of different professions and interests became usual. This differentiation first appeared in the service clubs. Many officers returning to London at the end of the Napoleonic Wars needed meeting places where they could share meals and reminiscences. The Guards Club was formed in 1813, the United Service in 1815. In 1827 the Junior United Service was founded and, ten years later, the Army and Navy club. These pioneers were followed by the Naval and Military (1862), the Cavalry club (1890), the Junior Army and Navy (1911) and the Royal Air Force (1917). The soldiers and officials of the East India company congregated chiefly at the Oriental (1824) and the East India United Service (1850).

Among civilian specialized clubs, the City of London (1832) and Gresham's (1843) were, and remained, mainly for merchants and bankers as the Farmers' club (1842) was for agriculturists. Membership of the City Livery (1914) is confined to Liverymen of the City. The Garrick (1831) was one of the earlier theatrical foundations. A still earlier example was the Thespian, which flourished in the second half of the 18th century. It was followed by the Green Room (1877), the Rehearsal (1892), the O-P club (1900) and the Vaudeville (1901), to name only a few. Other specialized clubs are the Caledonian (1898) whose members must be of Scottish birth or be regular officers in a Scottish regiment; the Royal Societies (1894), a social club for members of learned societies; and the Travellers' (1819) which is restricted to those who have traveled outside the British Isles for a distance of 500 mi. in a direct line from London.

Of the many literary and artistic clubs founded in the 19th century, the most important was the Athenaeum, inaugurated in 1823 by John Wilson Croker at John Murray's house in Albemarle street. This famous club, to which Sir Walter Scott, Tom Moore and most of the leading writers of that and later days belonged, was first known as the Society. In 1830 it moved to the present clubhouse in Pall Mall, designed for it by Decimus Burton.

Almost as well known are the Savile (1868), once called the New club and generally regarded as a waiting place for the Athenaeum, and the Savage (1857), noted for its early bohemianism. The Arts club came into being in 1863, the Authors' in 1891 and the original centre of the P.E.N. club, an international association of writers and editors, in 1921. The principal university clubs were also formed during the 19th century, the United University and the New University in 1822, the Oxford and Cambridge in 1830, the New Oxford and Cambridge in 1883 and the City University in 1885.

The two outstanding political clubs founded in the 19th century are the Carlton club (Conservative, 1831) and the Reform club (Liberal, 1834). Both occupy houses of considerable architectural importance, that of the Reform club being usually considered the most impressive of its kind in London. They were followed by numerous others: the Conservative (1840); the Junior Carlton (1864); the Cobden (1866); St. Stephen's (1870); the Eighty (1880); the National Liberal (1882); the Constitutional (1883); and the United (1890). These were all West End clubs, the City having its own political organizations, such as the

City Carlton (1868), the City Liberal and various others.

The passion for gambling that marked the latter half of the 18th century continued during the first years of the 19th in most of the older social clubs and in some new ones. In 1806 Watier's club was founded in Bolton street and rapidly became the foremost gambling club in London. "Beau Brummell" (George Bryan Brummell), was one of its prominent members. After a feverish existence of little more than 12 years it perished and what remained of it was then acquired by William Crockford who, in 1828, opened the gambling club named after him. Crockford's was housed in a magnificent building in St. James's street, designed by James Wyatt, which became the home of the Devonshire club (1875) Hazard, whist and card games of all sorts were its principal attractions, but it was also renowned for its excellent meals and for cockfights held in a small cockpit in the basement. Like Watier's, it was short-lived and broke up soon after its founder's death in 1844.

Besides the clubs that had their own premises, there were various dining clubs to do honour to some great man, such as Dr. Johnson, Pepys, Samuel Butler or Charles Dickens, or to provide regular meetings for collectors or persons interested in particular ideas. Grillion's, to which so many illustrious men belonged, was founded in 1813 by Sir Thomas Acland as a centre for men of all shades of political feeling and the Cosmopolitan (1852) and the Breakfast club (1866) were similar nonparty institutions. There were also the Boz, the Erewhon and the Titmarsh for Dickens, Butler and Thackeray enthusiasts; the Roxburghe, the First Edition and the Sette of Odde Volumes for book collectors; the Hardwicke with legal interests, the Urban and many others.

Women's Clubs.—The last years of the Victorian era also saw the rise of women's clubs. An organization known as the Ladies club and referred to by Walpole as "the female Almack's" existed in the 18th century. There were also associations of working women at this period, such as the Mantua-makers' club in St. Martin's lane. and the Milliners' club near the Royal Exchange. In general however. clubs were exclusively masculine institutions until 1883, when the Alexandria was founded. No man was allowed to enter its premises; on one occasion even the prince of Wales (afterward Edward VII) was refused admittance when he called for the princess. The University Women's club was formed in 1887, the Pioneer in 1892. Three years later the American Women's club for Americans visiting London came into being, and in 1897 the Empress was founded.

Once the idea of such associations was accepted, women's clubs developed with great rapidity. The Ladies' Empire was established in 1902, the London Lyceum in 1904, the Ladies' Carlton in 1906. Thereafter every sort of social, literary, artistic, sporting and political interest had its women's clubs in London and the provinces. There are also many institutions. like the Pilot club (1949), the Lansdowne (1935) and the International Sportsmen's (1929) and others, with both male and female members, and some that admit women as associate members.

Sports clubs have been in existence since the days of the Tudors. uhen young men gathered in companies with such grandiloquent titles as Prince Arthur's Knights. Among 18th-century clubs of this type may be mentioned the Sons of the Tharnes, predecessor of the Thames Rowing club (1860) and the London Rowing club (1856): the Royal Thames Yacht club, founded in 1775; the Royal Toxophilite (1781) which has been open to women as well as men since 1920; the Four-in-Hand coaching club; and the famous Hambledon club, started about the middle of the century. whose members laid the foundations of modern cricket. The last-named was dissolved in 1791 but its place was taken by the Marylebone Cricket club (1787), the famous "M.C.C."

About 1750 a number of men Interested in horse racing began meeting at the Star and Garter coffeehouse in Pall Mall and there founded the Jockey club to regulate racing and eliminate abuses at Newmarket. The influence of this club soon spread from Newmarket to other courses, and it became the ruling authority in English racing throughout the country. Other clubs connected with the same sport are the Turf, which developed from the Arlington in 1868, the Victoria (Wellington st.) in 1860 and various other clubs connected with particular racecourses.

As well as general clubs like the Sports club (1893), the United Sports (1903) and the Bath club, specialized clubs representing every branch of sport have been established in London and the provinces since the beginning of the 19th century Some of the more famous specialized clubs are the National Sporting club, devoted to boxing; the hunting clubs, Badminton and Beaufort; the Golfers' and the Lady Golfers'; the Flyfishers' (1884): the London Fencing club (1848) and the Sword (1905); the Alpine (1857), the Ladies' Alpine (1907) and the Ski Club of Great Britain (1903); and the Kennel club (1873). Yachting organizations range from the Royal Yacht squadron at Cowes (1815) and the Royal Ocean Racing club (1925), to the model yacht racing clubs associated with the Round pond in Kensington Gardens. The newer forms of sport are represented by such clubs as the Royal Automobile (1897) and the Royal Aero club, established in 1901.

Rural Clubs.—Rural benefit clubs formed an important part of village life from the late 18th century until the introduction of national insurance in 1912. The members paid a monthly contribution of 2*s.* or more, received sickness and unemployment benefit and a fixed sum, varying in the different clubs. paid to the survivor on the death of a member or his wife. Meetings were held in a room set apart in the local inn and each summer there was a club day with processions, a service in the parish church, sports, dancing and a dinner at the inn. In some parishes there were more than one benefit club, and in some there was also a female club which had its own funds and was quite independent of that of the men. In their early days these rural clubs were purely local institutions but with the growth of the great friendly societies (*q.v.*) they often became branches of such societies, while still retaining their local character. When national insurance was introduced, most village clubs were given up, but a few continued to flourish and to carry on their work. The Greyhound club at Marsh Gibbon, founded in 1788, is one that still pays benefits to its members. Another of the women's clubs which has long outlived its male counterpart is at Much Marcle in Herefordshire

Club Organization.—Theinternal economy of clubs varies as much as do their aims or the architecture of their clubhouses. In some the committee has the power of electing or refusing members; in others this is done by a ballot of members. Some, like the Athenaeum, have the right to elect annually a certain number of members on account of their eminence, services to the state, literature, art, science and so forth. The committee is, of course, the responsible body, but in most cases the actual running of the club is largely in the hands of the secretary, control by members being exercised through th annual general meeting.

Clubs are also subject to certain legal restrictions and duties. Since the Licensing act of 1902 (passed primarily to prevent the. formation of clubs for the sale of liquor), every club has to provide the clerk to the justices of the petty sessions area in which it is situated with yearly infonnation concerning its membership, subscription and general conduct. The details of the laws covering club management may be studied in *Daly's Club* Law edited by C. J. Collinge (5th ed., 1954) and *Wertheimer's* ***Law*** *Relating to Clubs* edited by A. W. Chester (4th ed., 1935). See also WORKING MEN'S CLUBS.

UNITED STATES

The number and variety of clubs in the United States demonstrate the prevalence of "joining" among the American people. As distinguished from many other expressions of this voluntary associationalism. clubs usually place greater stress upon sociability and are more apt to be local in nathre than chapters of national organizations.

Although U.S. clubs derived from English prototypes of the late 17th and early 18th centuries, their appearance was understandably belated. The colonial period lacked both the city life and the leisure necessary for their development Nevertheless, as early as the mid-18th century the success of Benjamin Franklin's Junto in Philadelphia, Pa., and the spread of Masonic lodges suggested that associational activity nould presently become a prominent part of American life. Urban growth in the late 19th century not only made clubs possible by assembling groups large enough for specialized interests of nearly every sort but also made clubs essential to provide adequate social outlets in the impersonal metropolis.

The most direct imitations of English clubs (see ***British*** *Clubs* above) are the socially exclusive gentlemen's clubs existing in most large cities, such as the Somerset club of Boston. Mass.. and the Pacific Union club of San Francisco. Calif. Admitting only those of high social and financial standing, they usually have fine buildings with eating. drinking, reading and athletic facilities. Other clubs. while highly selective, make some form of literary, artistic or intellectual interest the basis for affiliation rather than wealth or social background. In differing ways the Lambs and Players clubs of New York city, the Cosmos club of Washington, D.C., and the Bohemian club of San Francisco could be placed in this category. Slightly different are the large number of luncheon and dinner clubs, usually composed of business and professional men. which may or may not have their own buildings. Although the social element also predominates in these, they are often basically discussion groups which do little more than meet periodically for that purpose.

1\11 the clubs mentioned tend to be highly restrictive in membership. but there are also many organizations open to all individuals sharing a mutual interest. Ever since the rise of "Democratic societies" among the opponents of the Federalist administration in the 1790s, political clubs have been prominent examples of this type. A vast network of such groups now forms the basis of U.S. political parties, at the same time affording considerable social opportunities for their members. In the late 19th century. when ward clubs in large cities became identified in some minds with corrupt political machines, good government advocates began founding the modern city clubs and commonwealth clubs, which are largely devoted to the study of public affairs and the improvement of government. In addition to these groups, which also often have their own buildings, innumerable less pretentious civic clubs developed in smaller communities or even neighbourhoods throughout the country. The average businessman, however, has preferred to join one of the service clubs such as the Rotary, Exchange, Kiwanis or Lions clubs. Good fellowship is one of their main attractions, and they sponsor many worthwhile programs to serve community welfare.

With the steady decline of working hours in the 20th century, came the existence and even the problem of far more leisure time for large numbers of people. Not surprisingly organizations have appeared catering to recreational interests of almost every description. In particular. because of the restrictions of urban life, a wide variety of athletic clubs arose. Golf clubs, for example. appeared in or near every metropolitan area. In the form of elaborate country clubs, many furnished additional facilities that enabled them to serve the entire family unit. With their restaurants, bars and Saturday night dances, they increasingly became the social centres for well-to-do suburban residents; thus the term "country club set" became part of the American vocabulary.

In addition to clubs in which the emphasis is on social exclusiveness, civic activity or avocational interests, many neighbourhood clubs have been formed along national or religious lines. There are still many survivals of the social clubs formed by various immigrant groups. and nearly every large American religious denomination has affiliated clubs that are important in the social as well as religious lives of their adherents.

The form of club life most characteristic of the United States, however, is the women's club. a striking demonstration of the leisure that has become available, at least to the urban middle-class woman. Organizations like the Chilton club. in Boston, the Colony club in New York city, and the Acorn club in Philadelphia parallel the exclusive men's groups, but far more significant are the numerous women's clubs of general membership which, beginning with the New England Women's club of Boston and the Sorosis of New York (both founded in 1868), spread so rapidly that by 1889 the General Federation of Women's Clubs was formed *(see* WOMEN'S CLUBS. GENERAL FEDERATION OF). At first concentrating on subjects such as literature, art and gardening, they extended their interests to include social problems and public affairs until the American clubwoman became a far more representative figure than the clubman.

There are, of course. numerous organized clubs for children in the United States. such as the Boy Scouts, Girl Scouts and, in rural areas. the 4-H clubs (*qq.v.*). (WE. E. D.)

CLUBFOOT, the popular name for a medical condition characterized by abnormal position and shape of the foot and caused by a congenital deformity of the foot and ankle. In the more severe examples three distinct components of the deformity may be recognized, but in milder cases one or another of these may be lacking. The most constant component is plantar flexion of the foot at the ankle so that the foot points downward. Next most common is inversion of the foot, which is a rolling in of the sole of the foot so that the soles of the feet face each other. The third component is adduction of the forefoot, which is an extreme pigeon-toe deformity. All of these deformities are rigidly maintained so that the foot may not be returned to normal position. Each of the deformities may be present in varying degrees from mild to severe. At an early age these deformities result from abnormal pull of tendons and contracture of the ligaments, but over a period of years and particularly after weight bearing, bony deformity may appear and prevent correction of the deformities. In approximately half of the patients, both feet are involved.

The cause of clubfoot is essentially unknown. Many theories have been advocated, but none has been proved. The most popular theories involve pressure or faulty position in the uterus and hereditary influences. None of these theories has any foundation in experimental evidence. In observations on animals, typical clubfoot deformities in the offspring have been produced by excessive exposure to X-rays of a pregnant animal or by vitamin-deficient diets given a pregnant animal.

Treatment of the clubfoot depends upon the severity and multiplicity of the deformities. The treatment should begin early in infancy when the tissues are more pliable than later in life and before bony deformity occurs. In the extremely mild deformity, whether of plantar flexion, inversion or adduction of the forefoot, simple manipulation by the physician or the parent may suffice. In the more severe deformities, splints, plaster of Paris casts or special shoes may be necessary. Numerous methods for applying the splints and casts have been devised, but all depend upon the reversal of the deformities at an early age so that the muscles, tendons and bones may grow normally.

More severe or untreated deformities may require surgery upon tendons or bones or both. Treatment must be continued until all component deformities are corrected. Following adequate and complete correction, observation of the person must be continued until growth ceases. This is necessary because of the tendency toward recurrence of these deformities when the child is passing through a period of rapid growth. If adequate treatment is started

early in infancy, the patient should be able to lead a normal life with normal activity. Frequently, similar deformities of the feet follow poliomyelitis or other diseases. In these instances, braces and surgery may be required because of muscle weakness or fixed deformity.

Abnormalities opposite to those of clubfoot frequently occur. These include increased dorsiflexion of the foot so that the foot points upward rather than downward, and eversion of the foot so that the sole faces outward. These deformities are usually more flexible than those of clubfoot and are more amenable to simple methods of treatment.

CLUB MOSS, the common name for plants of the genus *Lycopodium* (*q.v.*), but often extended to cover all the Lycopodiales, an order of the class Lycopsida, which includes chiefly extinct relatives of club mosses. *See* PALAEOBOTANY.

CLUBROOT (FINGER-AND-TOE or ANBURY), a destructive plant disease caused by a relatively simple fungus parasite—one of the phylum Myxomycophyta (*q.v.*)—known as *Plasmodiophora brassicae*, which attacks cabbages, turnips, radishes and other cultivated and wild members of the mustard family (Cruciferae; *q.v.*). The disease is recognizable by the presence of nodules or warty outgrowths on the roots, which usually become greatly swollen and ultimately rot, emitting unpleasant odours. The disease is contracted from minute round spores present in the soil which germinate in the spring, forming motile biflagellate cells which infect the young roots of the host plant. The parasite develops within the living cells of the plant, forming more motile cells in sporangia (spore sacs) and finally a mass of living material known as the plasmodium, the shape of which alters from time to time. The infected cells are stimulated to enlarge enormously in size (hypertrophy), and the parasite spreads from cell to cell. Ultimately the plasmodium cleaves into numerous minute spores which are set free in the soil as the host roots decay. The disease is more frequent in acid soils, and lime in various forms is used to control it. A dressing of 1,500–2,000 lb. per acre of hydrated lime will give fair commercial control. Diseased plants should be either burned or thoroughly boiled before feeding to animals in order to prevent transmission of the living parasite into the manure. More details on control practices are found in J. S. Karling's *The Plasmodiophorales*, pp. 104–120 (1942). (J. S. KG.)

YOUNG CABBAGE PLANT INFECTED WITH CLUBROOT

CLUJ (Ger. KLAUSENBURG; Hung. KOLOZSVÁR), a town of Rumania, the historic capital of Transylvania (*q.v.*), is located 322 km. (200 mi.) N.W. of Bucharest in the Somegul-Mic river valley. Pop. (1960 est.) 161,931. It is the administrative centre of the Cluj region and the second largest town in Rumania. Cluj stands on the site of an ancient Dacian settlement which under the Romans became the Napoca municipium and an important military post. In the middle ages it was a thriving commercial and cultural centre, and in 1405 Sigismund of Luxembourg, king of Hungary, declared it a free town. Among its historic monuments are the house in which Matthias I Corvinus, king of Hungary, was born (1440); the ruins of the Mînăştur church, built in 1061; the ruins of the walls of the Cluj citadel; and the Gothic church of St. Michael, begun in 1321 and completed in 1444.

Cluj is important industrially, with machine-building, metalworking, chemical, textile, clothing, leather and footwear, timber, glass, ceramics and food-processing plants. Among its cultural institutions are a branch of the Academy of the Rumanian People's Republic, the Bolyai university, the Ion Andreescu Institute of Fine Arts, a polytechnic institute, a school of music and a number of research institutes. The Ethnographical Museum of Transylvania has a section on the world's primitive peoples. The Cluj botanical gardens are the richest in Rumania.

CLUJ ADMINISTRATIVE AND ECONOMIC REGION is situated in the northwestern part of Rumania. Area 16,820 sq.km. (6,494 sq.mi.). Pop. (1960 est.) 1,199,842. It is divided into 14 administrative districts. The relief is hilly and the region is surrounded by high mountains. The climate is continental and temperate. Chief rivers are the Somegul-Mare, Someşul-Mic, Almag, Mureş, Crişul-Repede and the Arieg.

The mineral resources of Cluj include methane gas deposits, salt, brown coal, silver, gold, copper, limestone, clay, gypsum, dolomite and building stone. There are mineral springs at Singeorz. The region's important metallurgical industry developed on the basis of its mineral wealth. In addition to the many industries in the town of Cluj. there are chemical plants at Ocna-Muregului and Turda, building materials, glass and ceramics factories at Turda, leatherwork at Bistriţa and Turda and food-processing plants at Bistrifa, Dej and Cherla. Agricultural products include grains (maize, wheat, barley and rye), potatoes, sunflower, hemp, colza, fruits and grapes for wine. Animal husbandry is practised.

CLUNY, a town of east central France, in the *département* of Saône-et-Loire, on the left bank of the Grosne, 14 mi. N.W. of Mbcon. Pop. (1954) 3,570. The interest of the town lies in the association with it of the monastic order of Cluny, a body of Benedictines (*q.v.*), and in its specimens of medieval architecture, which include, besides the celebrated abbey, the Gothic church of Nôtre-Dame, the church of St. Marcel with its Romanesque spire, portions of the ancient fortifications and a number of old houses. Cluny gradually increased in importance with the founding of the abbey (910) and the development of the religious fraternity, and in 1090 received a communal charter from the abbot St. Hugh. In 1471 the town was taken by the troops of Louis XI. In 1529 the abbey was given *in commendam* (in trust) to the family of Guise. The town and abbey suffered during the religious wars of the 16th century, and the abbey was closed in 1790.

The chief remains of the abbey are the ruins of the basilica of St. Peter and the abbot's palace. The church, built between 1090 and 1131, was a Romanesque building, and until the erection of St. Peter's at Rome was the largest in the world. It was in great part demolished under the first empire, but the south transept, a high octagonal tower, the chapel of Bourbon (15th century) and the ruins of the apse remain. The abbot's palace (15th century) serves as *hôtel de ville* (town hall), library and museum, containing fine sculptures from the church and paintings by Pierre Paul Prud'hon, a native of Cluny. There are local quarries of limestone. (AR. E. S.)

CLUSIUM (modern CHIUSI in the *regione* of Tuscany, Italy), the Roman name for an ancient Etruscan town, founded in the 8th century **B.C.**, on the site of a prehistoric Umbrian town. The Etruscan form of the name was perhaps Clevsia; its pre-Etruscan name was Camars and the early inhabitants might have been connected with the Umbrian tribe of Camertes. In Roman times however its inhabitants belonged to the tribe Arnenses. In the early 6th century B.C. it entered in alliance with Arretium (Arezzo), Volaterrae, Rusellae and Vetulonia against Tarquinius Priscus of Rome. At the end of the 6th century it featured under the leadership of Lars Porsena in an attempt to restore the power of the Tarquins in Rome. By 391 B.C. it was allied with Rome against the invading Gauls and in 205 supplied the Roman army which was fighting Hannibal. Under Sulla it was refounded as a military colony. In imperial times it seems to have been rather isolated although according to Columella its agricultural land was highly productive.

Excavation of the cemeteries of Clusium, from the early 19th century onward, has shown it as an important centre of Etruscan art as well as importation of Greek pottery. The cemeteries are on a series of hills around Chiusi: Poggio Renzo and Poggio Gaiella to the north and northeast, Dolciano, Chianciano and Montepulciano to the northwest, and at Città della Pieve and Sarteano to the southeast and southwest. Material from these tombs is housed in the museums of Chiusi, Florence, Palermo (Cassuccini collection) and Rome (Villa Giulia).

Long after the coastal towns of Etruria had adopted inhumation, the inhabitants of Clusium retained the practice of cremation, begun in their early Villanovan culture, down to Roman times (see ETRUSCANS). Characteristic of the earliest cremations was the placing of the ashes in earthenware jars whose large "canopic" lids (see CANOPUS) were molded in the form of human heads. These and the series of pottery human figures, many with distinctive traits of portraiture, were placed in pit tombs dated by the presence of proto-Corinthian and locally copied pottery to the late 8th and 7th centuries B.C. From these anthropomorphic jars and effigies, often placed in the tombs on elaborate thrones, the later custom of portraying the deceased on sarcophagi may have evolved: they certainly had a formative effect on early Etruscan sculptures. In the 6th and 5th centuries, the figures, often of man and wife, are reclined upon the lid of the funerary box or sarcophagus. The sides of these boxes are often adorned with scenes in low relief of dances and funeral games and, from the 5th century, mythological scenes. In addition to their artistic merits, these sarcophagi are a major source of inscriptions in the Etruscan language. The sarcophagi were themselves placed in large chambered tombs, some of which, the Tomba della Scimmia, del Colle, del Granduca, di Tassinaia, have important painted frescoes. One such built chambered tomb, crowned with pyramids and bells, was famous in antiquity and is described by Pliny the Elder as the tomb of Lars Porsena. It is perhaps to be identified with a tomb on the Poggio Gaiella.

There are also remains at Clusium of catacombs of the Christian era and it was the seat of a bishopric in the 4th century A.D.

CLUTCH, a coupling by means of which rotating parts may be connected or disconnected. A clutch may be used to connect two shafts end to end, or to connect a free-riding hub to the shaft on which it rotates. Clutches may be designed for automatic application, one-way drive, controlled slip to vary the relative speeds of the driving and driven members, and for slippage at predetermined torque.

Positive-drive clutches consist of cylinders with mating jaws attached to each rotating member; the jaws are engaged at low relative speeds. The jaws may consist of sections such as those in fig. 1, or teeth on the periphery of the cylinders, as in gear clutches. For heavy loads the jaw clutch may have two or three teeth, but for quicker engagement considerably more teeth must be used. To facilitate engagement, light spring-loaded cone clutches (fig. 2) may be used to bring the speed of the slower member up to that of the faster one. as is done in selective geared (synchromesh) automobile transmissions.

Clutches built into internal-combustion engines to permit load engagement after operating speed is obtained are known as power take-offs; clutches used to couple a driving motor to a shaft are known as cutoff couplings. Friction in some form is used to absorb energy by slippage during engagement and is sufficient to maintain constant speed during normal operating conditions.

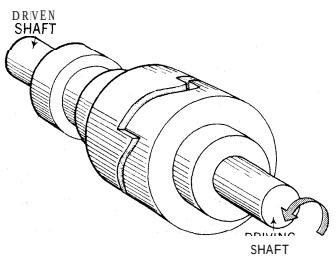

FIG. 1.—SPIRAL CLAW. OR RATCHET. CLUTCH (See TEXT)

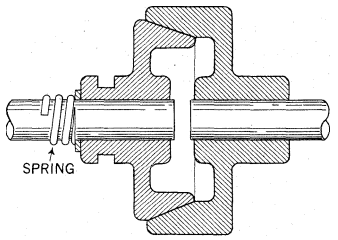


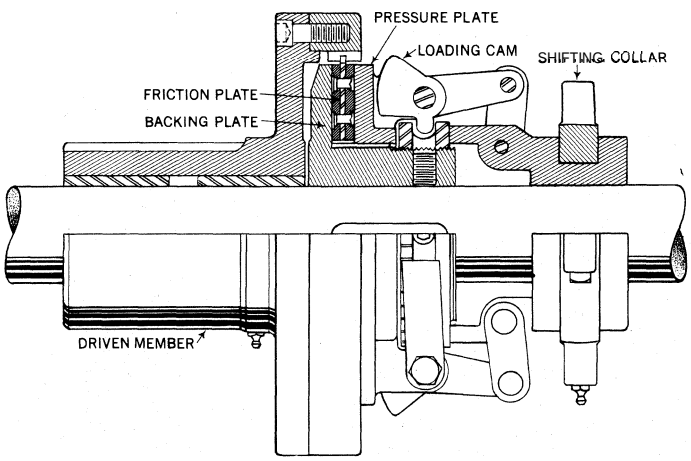
ADAPTED FROM V. M. FAIRES, "DESIGN OF MACHINE ELEMENTS," 3RD ED., REPRODUCED BY PERMISSION OF THE MACMILLAN COMPANY

FIG. 2.— SPRING-LOADED CONE CLUTCH

Contact may be made on the faces of disks, the inside or outside peripheries of drums, the surfaces of cones or wedge-shaped grooves, or combinations of these.

Axial-Force Clutches.—The cone clutch (fig. 2) has had extensive use because the normal force between the contact surfaces is much greater than the axial force needed to engage the two cones. The contact may be metal-to-metal, or a lining of leather, cork or special friction fabric may be attached to the male cone. The female cone ordinarily is unlined, contact being made on the finished surface of the cast iron. The torque transmitted is equal to the product of the normal force, the coefficient of friction, and the mean radius of the cone.

The cone clutch is relatively heavy and it is often limited in capacity because suitably large cone diameters cannot be accommodated in restricted machine spaces; therefore, it becomes unsuitable if large torques must be transmitted at high speeds. Also, the inertia of the heavy cone causes it to continue rotating for a time after disengagement, a feature that may be undesirable.



BY COURTESY OF LINK-BELT COMPANY

FIG. 3.— INDUSTRIAL DISK CLUTCH

The disk clutch is a compact type of clutch actuated by axial force. The industrial clutch coupling shown in fig. 3 illustrates such an application for controlling the rotation of a driven shaft The sleeve to which that shaft is attached rides freely on a bearing. An extension of the hub carries the friction plate, restraining it from relative rotation but allowing axial movement. The friction plate is between a backing plate and a pressure plate connected to the hub and keyed to the driving shaft. When the shifting collar is moved to the left, the linkage forces the pressure plate against the friction plate, which is stopped by the backing plate. Both surfaces of the friction plate are subjected to the full axial force and resist slippage. The friction plate is made of flexible steel covered with a friction material and runs dry (without lubricant). When gradual engagement is desired, as in power take-off clutches, the iriction plate may be divided into sectors by radial cuts and warped slightly. Upon engagement the edges contact first and deflect gradually until the whole plate is in contact. The same effect may be achieved by putting springy spots on the surface of the plate.

It can be seen that a series of plates, alternately connected to the driving and driven hubs, would increase the clutch capacity in direct proportion to the number of pairs of contacting surfaces. This type of clutch is called a multiple-disk clutch. A multiple-disk magnetic clutch is shown in fig. 4.

Multiple-disk clutches with plates alternately of bronze and steel operating in oil are used extensively on machine tools. Two

clutches arranged back to back and operated by a single shift collar permit quick reversal of a shaft. Such clutches are called duplex-disk clutches and can be engaged and disengaged in fractions of a second.

Power take-off clutches are held in engagement by springs, except when disengaged by overcoming the force of the pressure springs. Single disks, faced with woven or molded asbestos surfaces and operated dry, are satisfactory for automobile use. Heavier vehicles use multiple-disk clutches, usually dry.

FIG. 4.— MULTIPLE-DISK MAGNETIC CLUTCH (*See* TEXT)

Rim-force clutches utilize the force applied to either the inside or outside circumference of a drum by wooden blocks, lined shoes, an expanding internal ring, a contracting external band or combinations of these. Many variations of the rim clutch have been devised. Great force may be exerted against an internal rim by blocks forced outward by toggle action. Wedges are also used to expand the blocks radially. Split-ring clutches may be operated by cams that force apart the split ends of the ring.

In external-band clutches the band is fixed at one end and a force is applied at the other end to wrap the band around the drum.

Coil clutches utilize a coil spring of rectangular cross section. One end of the spring is fastened to the driving plate and the other end can be actuated, through a leverage system, to force the spring to wrap snugly around a drum fastened to the driven shaft. Coil clutches may be designed for high-capacity applications.

Air Clutches.— Clutches may be classified also according to the means used to actuate them. Instead of being controlled by mechanical linkages, which in large sizes may be sluggish to operate, the clutch action may be controlled by the pressure of air or of a hydraulic fluid. Here the use of a piston, valve and tubing simplifies the clutch but requires an external source of pressure.

An air clutch consists of a tube, similar to an automobile pneumatic tire, that can be expanded by air under pressure, forcing the outer surface of the tube, covered with a friction material, against the inner surface of a drum. This clutch may be used for heavy-duty applications as a power take-off, clutch coupling or slip clutch.

Magnetic Clutches.— Magnetic clutches are friction-disk clutches engaged by energizing a magnet coil which attracts a steel disk with the necessary axial force to resist slipping. When the energizing current is discontinued the plates are free to turn separately.

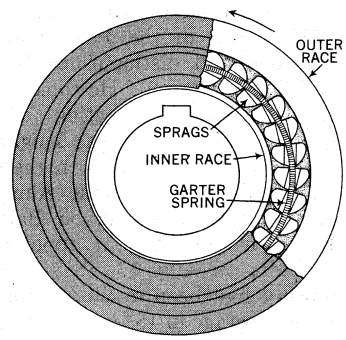
The magnetic fluid clutch uses a mixture of magnetic particles (powdered iron) in oil within the annular space between concentric drums, either of which may contain an electromagnetic coil. As the coil is energized, the magnetic particles form chains, and the viscosity of the mixture increases practically to that of a solid when the coil is fully energized. Controlled by a small current, the load may be engaged smoothly, without the "chatter" or wear typical of mechanical clutches. There is no slippage when the magnetic fluid clutch is transmitting the torque for which it is designed.

Automatic Clutches.— Automatic clutches are designed to allow the driving shaft to attain a preselected speed before engagement takes place. Such action is desirable where motors are used to drive equipment which has high inertia and friction when starting. Rim friction clutches are modified so that the shoes or bands are applied by the centrifugal force of a weight in the rotating system or by the weight of the shoes themselves. Another design consists of paddles on a hub which rotate inside a drum. The inner surface of the drum is serrated, and the enclosed space is partially filled with steel shot which is thrown outward by the paddles as they accelerate. At a certain speed the shot accumulates on the rim ahead of the paddles and transmits the force necessary to drive the drum. A similar clutch uses the centrifugal force of a heavy fluid, such as mercury, to create the force necessary to engage friction surfaces. The fluid is confined in a flexible container.

Single-revolution clutches, used on punch presses, make one revolution after engagement and are then released automatically by a tripping mechanism. One-direction, or free-wheeling, clutches are designed to drive in one direction only and permit free movement when the speed of the driven element exceeds that of the driver. A positive-drive ratchet engaging a toothed wheel will drive in one direction only. Similar effects can be obtained by rollers moving outward along ramps on a member rotating inside a drum. Force is transmitted by the jamming action of the rollers against the drum. Rotation in the opposite sense causes the rollers to move to the bottom of the ramp, out of contact with the drum. A comparable effect may be obtained with negligible backlash by inclined blocks, or sprags, tilted between the surfaces of concentric drums.

Fig. 5 shows rounded blocks retained in position by garter spring.

Coupling-Type Clutches.— Electric or magnetic couplings are frequently classified as clutches, although there is a slip of about 3% between driving member and driven member at full load. The magnetic type has an outer member with a laminated core and squirrel-cage winding and an inner member with a field pole construction like that in a synchronous motor, but without the damping winding. When direct current flows through the field coils, there is generated in the squirrel-cage winding a current that transmits torque in proportion to the field excitation.



FROM "INDUSTRIAL POWER CLUTCHES" (FEB 1948); REPRODUCED BY PERMISSION OF "POWER" MAGAZINE

FIG. 5.— FREE-WHEELING CLUTCH (*See* TEXT)

The eddy-current clutch uses an eddy-current ring instead of the laminated core and squirrel-cage winding, and a single-coil magnet. The ring is made of special magnetic steel and its periphery is slotted to carry the flux across the ring face and also to radiate the heat generated. In the larger eddy-current clutches, water cooling is necessary.

Hydraulic couplings have found extensive application as power take-offs for internal-combustion engines. The hydraulic unit consists of a vaned impeller attached to the driver, which faces a similarly vaned runner attached to the driven shaft, both enclosed in a casing with oil. At rest the oil is in the bottom of the casing, and thus the impeller starts with very small resistance. As the speed of the impeller increases, the oil is propelled to the vanes at the outer periphery and the oil drives the runner with increasing speed. When the impeller circuit is completely filled with oil, the speed of the runner is about 3% less than that of the impeller. The speed ratio may be controlled by limiting the quantity of oil in circulation. Various elaborations of design result in an effective torque converter.

Having no mechanical connections, the electric and hydraulic couplings do not transmit shock; they will slip when overloaded, and hence will not stall the driving engine.

See also AUTOMOBILE; POWER TRANSMISSION. (E. S. A.)

CLÜVER (CLUWER, CLUVERIUS), **PHILIPP** (1580–1622), German geographer, the founder of historical geography, was born at Danzig. He was sent to study law at Leiden, but turned to ancient history and geography. After a period as a soldier and of traveling in most of Europe, he settled in Leiden in 1615, where in 1616 he was appointed *geographus academicus*, with an annual stipend. He died prematurely and in poverty on Dec. 31, 1622. His principal works are *Germaniae antiquae libri III* (1616, 1631, 1663), *Sicilia antiqua cum . . . Sardinia et Corsica* (1619, 1624, 1659), *Italia antique*, two volumes (1624), his main work, posthumously published and *Introductionis in universam geographiam*

. . . *libri VI* (1624, 1652; in French, 1639; in German, 1678).

See J. Partsch, ('Philip Clüver der Begriinder der historischen Länderkunde," *Geogr.* ***Abh.,*** v (1891). (K. A. S.)

CLWYD, the principal river of northeast Wales, draining parts of Denbighshire and Flintshire. It rises at a height of 1,200 ft., about 7 mi. S.W. of Ruthin, its total length is 35 mi. and it reaches the sea by the town of Rhyl. In parts of its upper course the river flows in a deeply cut valley, but 2 mi. S. of Ruthin it breaks through a ridge of limestone to enter the Vale of Clmyd. This is a broad lowland floored with relatively soft Triassic sandstone, and flanked by the Clwydian hills on the east and the Denbighshire uplands on the west. From these uplands, the Clwyd receives the Wheeler on the right bank and the Clywedog, Ystrad and Elwy on the left. The chief settlements of the Vale of Clwyd are Ruthin, Denbigh, St. Asaph and Rhyl (*qq.v.*). (C. EM.)

CLYDE, COLIN CAMPBELL, BARON (1792–1863), British soldier who was commander in chief in India during the Indian mutiny (*q.v.*), was born in Glasgow on Oct. 20, 1792, and entered the army in 1807. He lacked social influence and his promotion was slow; he took 30 years to rise from captain to colonel and 40 to get clear of debt. He served in the Walcheren expedition (1809) and in the Peninsular campaigns, when he was twice wounded and distinguished by his gallantry (at San Sebastián and the Bidassoa). He took part in the War of 1812, in quelling the Demerara insurrection (1823) and in the Opium War with China in 1842. He was knighted for his notable service in the Sikh War of 1848–49. In the Crimean War he commanded the Highland brigade at the Alma and won fame for the repulse of the Russian attack on Balaklava. On the outbreak of the Indian mutiny he was appointed commander in chief, arriving in India on Aug. 13, 1857, and controlling operations until the mutiny had been quelled. For these last services he was raised to the peerage in 1858 as Baron Clyde, was thanked by both houses of parliament and was granted a pension of £2,000 a year—a splendid, prosperous end to the career of a self-styled "soldier of fortune." He died at Chatham, Kent, on Aug. 14. 1863.

Nicknamed "Old Khabardar" (Old Careful) in India, his care was for his men, not for himself. He paid great attention to the troops' health, fighting drunkenness, providing shelter in the Crimea, sun helmets in India. He believed in field exercises, the use of ground and open formations, and in the sappers and artillery rather than the bayonet. He expected his officers to set an example of sober economy in the mess and to share in the duties of their men. He was ready to pass over senior officers sent out from England when he felt that their juniors with Indian experience were fitter for command. Though criticized for overcaution during the mutiny, notably at Lucknow, his successes were very cheaply won and his campaigns thorough.

See Sir Owen Tudor Burne, *Clyde and Strathnairn* (1891); *L.* Shadwell, ***Life*** of *Colin Campbell, Lord Clyde* (1881). (J. B. HA.)

CLYDE, the most important of Scottish rivers (the Clota of Tacitus and Ptolemy), also the name of the estuary which forms the largest firth on the west coast of Scotland.

The River.—The Clyde has a total length of about 106 mi. from its source, perhaps best taken as lying on the north side of Queensberry hill (2,286 ft.) in Dumfriesshire. to "Tail o' the Bank" opposite Greenock where the firth begins. Its catchment area is estimated at 1,481 sq.mi. Its main headstreams are the Daer water and Potrail water which unite 3½ mi. S. of Elvanfoot.

From this point the name Clyde is given to the river, though a minor right-bank tributary entering below the junction is known as the Little Clyde burn. The river follows a generally northward course for 30 mi. to the neighbourhood of Biggar. Throughout this section it occupies a well-developed mature valley bordered by gravel terraces. At Coulter station the river abandons this valley and turns abruptly northwestward, though the wide valley continues eastward where it is drained by the insignificant Biggar water to the Tweed. It is clear that the upper Clyde was, at one period, tributary to the Tweed.

In the second section of its course, as far as its junction with the Douglas water, the Clyde is a winding stream flowing over deposits of glacial drift and falling less than 100 ft. in 15 mi. South of Carstairs it turns southwestward and then, about 4 mi. from Lanark, northwestward, a direction it maintains for the rest of its way to the sea. In a stretch just exceeding 4 mi, occur the Falls of Clyde where the river level drops nearly 250 ft. over the Bonnington, Corra, Dundaff and Stonebyres linns as it cuts its way through a red sandstone gorge. Water power from these falls was used by the cotton mills of New Lanark in the early days of factory industry. Hydroelectric power stations at Bonnington (10,000 kw.) and Stonebyres (5,680 kw.) were constructed after World War I, but their output is variable as well as low by modern standards.

The valley widens as the river emerges from the gorge near Crossford, though its bounding slopes remain steep until Glasgow is approached. Its flat alluvial floor is liable to flood. As far as Hamilton the Vale of Clyde or Clydesdale is intensively farmed, with orchards on the slopes and strawberry fields and extensive greenhouses on the lower ground. Comparable conditions occur nowhere else in Scotland. It is noted for a leading draft breed of horse, the Clydesdale (***see*** HORSE). Coal mining and heavy industry crowd in on the river from Hamilton to the heart of Glasgow.

As late as the mid-18th century the river was fordable at several places to 12 mi. below Glasgow bridge. Whiteinch road tunnel under the river was completed in 1962. A channel giving a depth of 26 ft. at low tide was dredged and blasted in the mainly glacial clay deposits of the river bed from the city to the entrance from the firth. Clydeside shipyards, long among the best equipped in the world, border the river for 20 mi. below Glasgow. Hills close in upon the river as it nears its mouth, and the towns on its banks (*e.g.,* Dumbarton on the north bank and Greenock on the south) are crowded on narrow raised beaches. The Forth and Clyde canal (completed 1790) links Bowling on the Clyde with Kirkintilloch, Falkirk and Grangemouth on the Forth, a distance of about 40 mi., but now carries little traffic.

The Firth.—From Dumbarton, where the firth is commonly considered to begin, to Ailsa Craig, where it ends, the fairway measures 64 mi. Its width varies from 1 mi, at Dumbarton to 37 mi. from Girvan to the Mull of Kintyre. Depths of more than 600 ft. are found in a narrow trench reaching up Bute sound into Loch Fyne and in Kilbrennan sound; over a submerged ridge from Kintyre through Ailsa Craig to Girvan they are less than 150 ft. The Cumbraes, Bute and Arran (*qq.v.*) are the principal islands in its waters. The sea lochs comprise Gare loch, Loch Long, Loch Goil, Holy loch, Loch Striven, Loch Riddon and Loch Fyne.

The only rivers of any importance entering the firth are the Ayrshire streams, of which the chief are the Garnock, Irvine, Ayr, Doon and Girvan. The chief ports are Glasgow, Port Glasgow, Greenock, Ardrossan, Irvine, Troon, Ayr and Campbeltown (*qq.v.*). There are lighthouses on Ailsa Craig, Sanda, Davaar, Pladda, Holy Island and Little Cumbrae, and at Turnberry point, Cloch point and Toward point. There is a network of passenger steamer services, curtailed in winter, connecting the various piers. (T. HER.; A. T. A. L.)

CLYDEBANK, a large burgh of Dunbartonshire, Scot., on the right bank of the Clyde, 6 mi. N.W. of Glasgow. Pop. (1961) 49,654. In the 1870s the district was almost entirely rural, but many industries have since been established, including the manufacture of sewing machines and asbestos cement. Most important are the shipyards, where the "Queen Mary" and the "Queen Elizabeth" were built.

Large areas of Clydebank were severely damaged by air raids in 1941, and the local authority had to replan the whole town. Many new districts were added after World War II. The Clydebank Burgh Order Confirmation act of 1949 extended the boundaries of the burgh for housing and other purposes.

CLYNES, JOHN ROBERT (1869–1949), British statesman, was a member of the original parliamentary Labour party, served in the first two Labour governments and became one of the party's most respected leaders. He was born at Oldham, Lancashire, on March 27, 1869, the son of an Irish labourer, and himself worked in a cotton mill from the age of ten until he became a full-

time trades union official in 1889. He always maintained a close trades union connection and was later president of the National Union of General and Municipal Workers (1912–37): widening his activities. he entered parliament in 1906 as Labour member for Manchester Northeast. With a break from 1931 to 1935, he sat for the same constituency (renamed the Platting division in 1918) until 1945. During World War I he gave his support to the Lloyd George coalition and was parliamentary secretary to the ministry of food in 1917–18, becoming minister for a short time in 1918. Clynes became deputy leader of the Labour party in 1919 and leader in 1921. After the 1922 election, however, James Ramsay MacDonald returned to parliament and took over the leadership, and Clynes again became deputy. He was lord privy seal and deputy leader of the house of commons in the first Labour government (1924), and home secretary in the second Labour government (1929–31). When MacDonald formed his National government in 1931 Clynes unhesitatingly went into opposition with the majority of the Labour party. He was never again in office and he died in London on Oct. 23, 1949. He was a loyal, moderate, self-effacing man who made few enemies but whose career was often overshadowed by more flamboyant and less predictable colleagues. His *Memoirs*, two volumes, were published in 1937. (R. J.)

CNIDUS, an ancient Greek city on the Carian coast. the site of which is on the Resadiye peninsula in the Mugla *il*, at the southwestern extremity of Turkey. Recent research has shown that the early site was on the south coast of the peninsula near Resadiye (Datca) (nearly 20 mi. E. of Cape Krio). About 330 B.C. the city was transferred to Cape Krio, where a small island was joined up (probably artificially) to the mainland and thus provided shelter for two harbours (joined by a canal). The harbour on the northwest of the isthmus was for warships, the other gave ample accommodation for merchant ships. The new city at Cape Krio was chiefly on the mainland, but continued over to the former island; and the whole was enclosed in a fortified circuit which is still well preserved.

The ancient city was nearly a mile in length. Extensive excavations were carried out by C. T. Newton aided by British sailors during 1857–59. and the axial plan of the city appears clearly, with a large theatre on the slope, an odeum, a number of temples and other public buildings. The world-famous "Aphrodite" of Praxiteles (a statue rejected by the people of Cos on account of its nudity. and purchased by the Cnidians) has perished and is known only from later copies; but in a sanctuary on the south slope of the city Newton found a fine marble statue of the seated Demeter (perhaps by the sculptor Leochares), which now adorns the British museum.

The Cnidians claimed to be of Spartan origin. In conjunction with Halicarnassus, Cos and the cities of Rhodes, Cnidus celebrated regular festivals with games at Triopion (perhaps the modern Kumyer, 6 mi. E. of Cape Krio). It planted colonies on Lipari and at Black Corcyra (Curzola) in the Adriatic, and settled the adjacent Carian Chersonese. After a vain attempt to separate their peninsula from Asia by a canal the Cnidians submitted to the Persians (soon after 546 B.C.); they joined the Delian league after the battle of Mycale (479 B.C.) and revolted from Athens in 412. In the 4th century B.C. the narrow and despotic oligarchical government was replaced by a democracy. In the 3rd century B.C. Cnidus was under Ptolemaic control (and perhaps was subsequently subject for a short time to Rhodes). In the Roman province of Asia it ranked as a free city. The site at Cape Krio seems to have become desolate in early Byzantine times, perhaps as a result of Arab sea raids.

The new city at the cape was an important commercial station. It exported the full-bodied wine of the peninsula in great quantity and was reputed for the production of canes, onions, and medicinal herbs and seeds. Cnidus had a famous school of medicine. Among its illustrious citizens were Ctesias and Eudoxus (*qq.v.*) and Sostratus who built the Pharos lighthouse at Alexandria.

COACH: *see* CARRIAGE.

COAHUILA, a northern frontier state of Mexico, bounded north and northeast by Texas, east by Nuevo León, south by San Luis Potosi and Zacatecas. and west by Durango and Chihuahua. Pop. (1960) 896,509; area 58,067 sq.mi. Its surface is a roughly broken plateau, traversed by several ranges of mountains. The western part of the state was barren desert until irrigation projects made the soil productive. In general the rainfall is light and the rivers are small. The climate is hot and dry, and generally healthful. Stock raising was for a time the principal industry, but agriculture has been developed in several localities. The chief products are cotton, Indian corn, wheat, beans, sugar and grapes. The Parras district in the southern part of the state has long been celebrated for its wines and brandies. The mineral products include silver. lead, coal, copper and iron. The mining operations are chiefly centred in the Sierra Mojada, Sierra del Carmen and in the Santa Rosa valley. The modern industrial development of the state is due to the railway communications developed during the last quarter of the 19th century, and to the investment of foreign capital in local enterprises. The first Spanish settlement in the region was at Saltillo in 1575, when it formed part of the province of Nueva Viscaya. Coahuila and Texas formed a single state in 1824. The dissatisfied American settlers in Texas declared their independence in 1836.

In 1857 Coahuila was combined with Nuevo León, but in 1868 it became a separate state. The capital of the state is Saltillo (*q.v.*). Among the more important towns are Parras (pop. [1950] 18,546), 98 mi. N.W. of Saltillo, one of the largest railway centres in the country, and Piedras Negras (*q.v.*), formerly Ciudad Porfirio Díaz, on the Rio Grande. Torreón (pop. [1950] 128,976); founded in 1887. is one of Mexico's most modern cities. The state has excellent air and rail connections, and a superhighway between Piedras Negras and Mexico City. (J. A. Cw.)

COAL AND COAL MINING. Coal mining is one of the world's basic industries and also one of the most complex. Like other enterprises engaged in the extraction of mineral products, it differs from manufacturing industries in that an increased mine capacity must inevitably result in a shortened mine life: doubling the output must halve the life, whether it be that of a single mine or of a national industry. The immense expansion of industry that began in the 18th century and transformed the western world was initiated by the development by the two Abraham Darbys and others of methods of using coal (coke) instead of charcoal in blast furnaces and forges by the coal-burning steam engine developed by James Watt. Ample workable deposits of coal became the growth of the industrial strength of Europe and the United States *(see* INDUSTRIAL REVOLUTION, THE). By the start of the 20th century the United States had displaced Great Britain as the world's major coal producer and, because of its favourable mining conditions, developed complex machinery which raised coal mining from a pick-and-shovel technique to an assembly-line operation by the second half of the 20th century.

In the following pages, the discussion of coal and coal mining will be divided as follows:

I. ORIGIN OF COAL

Coals are not true minerals, but are organic compounds of many types formed from the remains of living trees, shrubs and plants that flourished millions of years ago during periods of uniformly mild and moist climate. Coal is a fossilized plant material whose exact nature is dependent upon that of the original plant debris, upon the decay and weathering which this undergoes prior to its burial and consolidation (diagenesis) and upon the effects of pressure. temperature, time and other subsequent geological conditions. Although coal is not a true mineral, its formation processes are similar to those of sedimentary rocks. Various coal seams can be studied and related geologically to the sedimentary rocks with which they are associated.

Coal consists of varying amounts of carbon and volatile material and of impurities such as sulfur, phosphorus, incombustible rock materials and moisture. The carbon in the plants which later became coal was manufactured in the cells through the action of the colouring material (chlorophyll) of their leaves. This carbon originated in the carbon dioxide and water content of the air, and the energy necessary for the transformation originated in the sun.

Although some coals were deposited 400,000,000 years ago during the Silurian period, most were formed during the Mississippian and Pennsylvanian geological epochs (Lower and Upper Carboniferous) about 250,000,000 years ago. A warm and humid climate favoured the growth of huge tropical seed ferns (Pteridospermae) and giant nonflowering trees, and created the vast swamp areas which comprise the coal beds of today. (See also CARBONIFEROUS SYSTEM AND PERIOD.)

As the plants died and fell into the boggy waters, which excluded oxygen and killed bacteria, they partially decomposed, but did not rot away. The vegetation mas changed into a slimy material called peat. Some peat was brown and spongy. some black and compact, depending on the degree of decomposition.

The sea advanced over such deposits and new sediments were laid down. Under pressure the peat dried and hardened to become low-grade coal or lignite. Further pressure and time created bituminous coal, a thickness of about 20 ft. of the original plant material compressing to I ft. of coal. Even more extreme pressures. from the folding of the earth's surface into great mountain ranges, produced the highest-grade coal, anthracite.

II. TYPES OF COAL

The degree of coalification (rank) of coals is determined by chemical methods called proximate analysis (see FUELS: Coal *and* Related Fuels). Proximate analysis determines how much moisture, volatile matter (material turned into gases as a result of heat) and fixed carbon the coal contains. Heating value. caking and weathering properties classify the lower ranking coals, Coal rank increases with the amount of fixed carbon and decreases with moisture and volatile-matter content (see Table I).

Lignite.—This is a low-rank, brown-to-black coal containing 30% to 40% of moisture. It disintegrates rapidly in air and is liable to spontaneous combustion. Although there are thousands of square miles of lignite deposits in the United States, little is mined because of these facts and because of its relatively small heat value.

Subbituminous Coal is black and contains from 15% to 30% moisture when mined. It weathers and is subject to spontaneous combustion to a lesser degree than lignite. It is mined commercially for local use in some areas.

Bituminous Coal is the most abundant variety, varying from medium to high rank. It is a black, usually banded coal. It weathers only slightly and may be kept in open piles with little danger of spontaneous combustion if properly stored. Medium- to 101%--volatilebituminous coals may be of coking quality. This property is independent of rank classification and depends on the ability of the coal to produce a coke when heated in a coke oven.

A coking. or caking, coal softens, swells and runs together when heated almost to its burning temperature. When it is further heated in a closed oven, either without oxygen or with only a little. the volatile matter is driven off in the form of gas, water vapour, light oil and tar. The gray porous matter remaining consists largely of fixed carbon and is called coke. Coke is used extensively in blast furnaces for the smelting of iron ore.

Noncoking coals resemble the coking types in appearance, but burn freely without pronounced swelling. Residue from combustion is a char or powder rather than coke. Such coals are preferred for the manufacture of cement because of their high-volatile content.

Anthracite, or "hard" coal, has a brilliant lustre. It can be rubbed without leaving a stain on the finger. It can even be polished and made into costume jewelry. Anthracite burns slowly with a pale blue flame and requires a minimum of attention. It is used primarily as a domestic fuel, although it can sometimes be blended with bituminous grades of coal to produce a mixture with improved coking qualities.

TABLE I.—*Classification of Coals by Rank**

Class	Group	Limits of fixed carbon or B.T.U., mineral-matter-free basis	Requisite physical
Anthracitic	1. Meta-anthracite	Dry F.C., 98% or more (dry V.M., 2% or less)	
	2. Anthracite	Dry F.C., 92% or more and less than 98% (dry V.M. 8% or less and more than 2%)	
	3. Semianthracite	Dry F.C., 86% or more and less than 92% (dry V.M., more than 8% and less than 14%)	Nonagglomerating†
Bituminous§	1. Low-volatile bituminous coal	Dry F.C., 78% or more and less than 86% (dry V.M., 22% or less and more than 14%)	
	2. Medium-volatile bituminous coal	Dry F.c., 69% or more and less than 78% (dry V.M., 31% or less and more than 22%)	
	3. High-volatile A bituminous coal	Dry F.C., less than 69% (dry V.M., more than 31%); and moist‡ B.T.U., 14,000 or more	
	4. High-volatile B bituminous coal	Moist‡ B.T.U., 13,000 or more and less than 14,000‖	
	5. High-volatile C bituminous coal	Moist B.T.U., 11,000 or more and less than 13,000‖	Either agglomerating or nonweathering¶
Subbituminous	1. Subbituminous A coal	Moist B.T.U. 11,000 or mord and less than 13,000‖	Both weathering and nonagglomerating
	2. Subbituminous B coal	Moist B.T.U., 9 500 or more and ldss than 11,000‖	
	3. Subbituminous C coal	Moist B.T.U., 8 300 or more and ldss than 9,500‖	
Lignitic	1. Lignite	Moist B.T.U., less than 8,300	Consolidated
	2. Brown coal	Moist B.T.U., less than 8,300	Unconsolidated

(F.C.=fixed carbon; V.M.=volatile matter; B.T.U.=British thermal units)
This classification does not include a few coals that have unusual physical and chemical properties and that come within the limits of fixed carbon or B.T.U. of the high-volatile bituminous and subbituminous ranks. All these coals either contain less than 48% dry, mineral-matter-free fixed carbon or have more than 15,500 moist, mineral-matter-free B.T.U.
†If agglomerating, classify in low-volatile group of the bituminous class.
‡Moist B.T.U. refers to coal containing its natural bed moisture but not including visible water on the surface of the coal.
§It is recognized that there may be noncaking varieties in each group of the bituminous class.
‖Coals having 69% or more fixed carbon on the dry, mineral-matter-free basis shall be classified according to fixed carbon, regardless of B.T.U.
¶There are three varieties of coal in the high-volatile C bituminous coal group: variety 1, agglomerating and nonweathering; variety 2, agglomerating and weathering; variety 3, nonagglomerating and nonweathering.

4. Motorman of a coal train emerging from a low-seam mine
5. Coal train outside the mine
6. Loading coal into railroad cars

but there is no concrete evidence that other ancient peoples were aware of the properties of this fuel. Marco Polo, in his wanderings through Cathay toward the end of the 13th century A.D., recorded the long-established practice of the natives, who dug out of the mountain a black stone which they burned for fuel. There was a widespread belief that coal was used on a small scale in the Greco-Roman world. This belief was largely based on the writings of Theophrastus, the Greek philosopher and disciple of Aristotle who, in his "Treatise on Stones," made reference to a black stone which smiths occasionally burned instead of charcoal. Theophrastus said that this fuel originated in Liguria in northern Italy and the province of Elis in Greece.

Further evidence in support of the theory that the Romans used coal was given by archaeological excavations in England. which revealed the presence of coal ashes amid Roman remains. There are many legends suggesting that coal was worked on the continent of Europe in Roman times, but scholars have failed to find any foundation for them in fact.

The first documented proof that coal was mined in Europe occurs in the chronicle of the monk Reinier, of the priory of St. Jacques at Liège, who wrote of "black earth very similar to charcoal" in use by metalworkers. This chronicle was written about the year 1200, and provides the first authentic documented proof of European coal mining as such. It is, however, known that even by this time *charbon de roche,* or sea coal, was being exported from England to Bruges in appreciable quantities.

But the gathering of sea coal cannot be considered as truly representative of actual mining operations. and it is not until the first decades of the 13th century that definite references to coal mining are to be widely found. Scores of authentic records show that in this century coal was being worked in many of the coal fields of England and Scotland and in a number of fields on the European continent. The pits were generally very shallow excavations widening out at the base and resembling in shape a bell or inverted funnel; each employed at the most a dozen workmen.

Early prejudice against coal as a fuel was caused by its inefficient use. It emitted noxious fumes, which so aggravated the populace that it is recorded that during the reign of Edward I (1239–1307) the death penalty was imposed on those found guilty of burning coal. With abundant supplies of timber available in Europe and discriminations against the use of coal, it is not surprising that this fuel was not recognized as an important national asset until the 16th century.

Although by this time coal mining operations were in evidence in many European countries, the industry mas of no great consequence to national life or economy. Except in isolated cases. coal was produced by small groups of men for use largely within the immediate vicinity of the mine. However, the increased use of coal-fired brick kilns in the 15th and 16th centuries led to a wider demand for coal. Not only was coal required for the firing of the kilns themselves, but the bricks made could be used to build improved domestic fireplaces and chimneys, and thus coal could be burned on the hearth without the inconvenience formerly experienced. By the mid-16th century the estimated annual coal production of the principal mining districts in Britain was almost 220,000 tons. This period marked the start of large-scale mining activity, and thus the effective birth of the industry.

During the 17th century the ironmaster Dud Dudley (1599–1684) established in Staffordshire iron smelting works, and early in the 18th century innovations by the Darbys and others opened up a vast potentia! market for coal, so that the foundations for widespread industrial expansion were laid and assured markets for British coal were provided. Successive metallurgical and engineering developments engendered a well-nigh insatiable demand for coal. Although coal production on the European continent also significantly increased, Britain had, by the beginning of the 18th century, established a commanding supremacy as the world's greatest coal producer.

It was just at this period (1701) that the earliest recorded coal mining operations in the United States were commenced, in Virginia, on the James river near Richmond; but it was not until 1745 that coal was mined on a commercial scale. Coal was discovered in Ohio in 1755, and in 1770 George Washington commented on a coal mine he had seen near the Ohio riverbank.

Deposits of anthracite were known to have existed near the headwaters of the Schuylkill river and Swatara creek in Pennsylvania as early as 1770. Up to the time of the American Revolution, however, most coal used in the American colonies came from England or Nova Scotia. Spurred on by wartime shortages, the indigenous infant industry expanded considerably, particularly to serve the needs of the munitions manutacturers. The government requisirioned coal in amounts of from 6 to 1000 bu. from Philadelphia citizens for use in "casting cannon." The state of Maryland authorized the purchase of 6,000 bu. to help the war effort, guaranteeing to pay for boat and cargo if captured by the enemy. After the American Revolution, coal came to be used more and more in the United States and countless small companies were organized to mine it.

In 1742 nhen Peter Salley named the Coal river in western Virginia (later West Virginia) he had no idea how correct the name would be. It is recorded that in 1852 private owners built a canal system of eight locks and dams extending 35 mi. up Big Coal river to ship coal from the region. The American Civil War interrupted this little-known operation, and high waters destroyed the system. No more coal was shipped from the area until 1910 when the railroad arrived.

The first exploitation of the famous Appalachian bituminous coal field, the largest in the U.S. with a length of more than 900 mi. and an area of almost 63,000 sq.mi., is indicated on the Fry and Jefferson map of Virginia (1751). There the words "Coal Mine" appear near the site of Georges creek in Maryland. During the ensuing three decades little reference to coal in this region can be found, but it can be assumed that outcropping seams were mined for local use. In 1810 an unusually violent freshet unearthed a large area of a huge seam — probably the Pittsburgh — near Barton. The discovery caused great excitement and people came for miles to see it. The coal was hauled by wagon as far east as Romney and even Winchester, where it was used for smithing Later it mas hauled to Westernport and floated to Washington on flatboats and rafts. The United States geological survey records that coal was first discovered near Frostburg. Md.. in 1534 Coal from the Sheetz mine was hauled to Cumberland. where it is known to have been used for the manufacture of glass as early as 1816. In 1814. during construction of the turnpike from Cumberland to Wheeling, coal aas found at Eckhart Mines, in the general vicinity of the Sheetz mine, and hauled by wagon to Cumberland and Baltimore. During 1842, 1,708 gross tons are known to have been produced by the Cumberland region

In 1852 or 1853, the first commercial shipments of coal were made from a mine operating in the Pittsburgh seam and located near the centre of the present city of Fairmont. One of the first known commercial operations in the great low-volatile Pocahontas field was opened by a blacksmith named Jordan Nelson shortly before the year 1870. This mine was located near Pocahontas. Va , and operated in the Pocahontas no. 3 seam. which was 13 ft. in height in rhe immediate area. Nelson sold his coal for a penny a bushel, and mountaineers carried it home on muleback. Blacksmith Nelson's mine, abandoned in 1955 after the removal of more than 44,000,000 tons of coal, was a direct cause of the westward expansion of the Norfolk and Western railway.

By the early 1830s many small mining companies were in existence along the Ohio. Illinois and Mississippi rivers and in the Appalachian regions. In the 1840s the U.S. coal industry mined its first 1,000,000 tons. and from then on growth was steady.

As in European countries, the advent of the steam locomotive gave a tremendous impetus to the coal industry: the problein of land transportation was solved and immense new markets opened. The 40-year period 1863 to 1905 showed an increase in total world production trom 182,000.000 tons to 928.000.000 tons. representing a rise in output of rather more than 500%. Despite continued increases in world production after that time. this accelerated rise in output nas not maintained. and by 1935 world output stood at 1,181.OC0.000 tons; it remained at about that level until the second hali of the 20th century when marked increases in pre-

viously underdeveloped areas, especially the U.S.S.R. and China, pushed world production to more than 2,500,000,000 tons.

IV. MINING AND MINERS

To appreciate the rise of the coal miner from his former position at the very foot of the social scale to his status as one of the highest-paid industrial workers, it is advantageous to consider the history of working conditions in the industry. Much of this early history was enacted in Great Britain, as, until the 20th century, the United Kingdom was the world's leading coal producer.

A. Early History of Working Conditions

When mining was nothing more than an indiscriminate nibbling at coal deposits, operations were more or less wholly dependent upon the will of the reigning monarch or of the owner of the land beneath which the coal was found, who promulgated such rules and regulations as he thought fit. These formed the basis of a primitive mining code, much akin to other customs regulating human vassalage. Even until well into the 19th century it was common for European miners to be bound in law to work continuously at one particular colliery for a specified period—usually 12 months.

By its very nature, work in coal mines involved hard manual labour performed under conditions of great personal risk and discomfort. These features fostered a spirit of comradeship and interdependence among miners and there are many records of the banding together of coal miners of the 17th and 18th centuries in an effort to ameliorate their conditions. In Britain, as long ago as 1662, 2,000 miners of the northern coal field put their marks to a petition to the king, Charles II, praying for redress of their grievances, chief among which was the danger to which they were exposed by inadequate ventilation. As with many other appeals, there was no response from the state. Following the adaptation of the steam engine to operate mine pumps in the early 1700s, pits became deeper and workings much more extensive, and the toll of human life and suffering increased proportionately. Isolated rebellions and strikes broke out throughout Britain as the miners were provoked beyond endurance. Such expressions of disquiet did not have the sympathy of the general public, and in the absence of an effective organization these localized strikes were totally ineffective.

Until after the repeal of the Combination law (*q.v.*) in 1824, the men held together without any formal constitution, which, under these laws, would have exposed them to prosecution and imprisonment.

As the Industrial Revolution gathered impetus the condition of the miners deteriorated and, even judging by the poor over-ail standard of living of industrial workers of the period, the lot of the coal miner was unenviable. As degradation breeds decadence it is not surprising that the miners sank lower and lower and that they entered the 19th century virtually as outcasts. By this time Britain had reached unquestioned industrial supremacy, built upon the annual 10,000,000 tons of coal won at a cost of great human suffering. Working conditions were appalling and exploitation of child and female labour was rampant. Such was the condition of the industry that an eminent judge was moved publicly to criticize, in 1815, the then practice of dispensing with a coroner's inquest if the corpse "was only that of a collier."

Into such a community there came between 1820 and 1850 two inspiring influences, religion and trade unionism. Religion was carried into the mining villages by unschooled, poverty-stricken men, themselves earning a precarious living as manual workers, yet finding time and means to preach the gospel of salvation of the Methodist Church. It would be difficult to overestimate the profoundly beneficial effect of these "ranters" on the lives of miners of the period, many of whom completely changed their mode of living. The early trade unions, which were soon to follow this religious crusade, benefited considerably in that an astonishingly large proportion of their leaders was recruited from the ranks of the converts.

B. Miners' Unions

Almost immediately after the repeal of the Combination act in 1824, local unions came into being in many of the coal fields. However, lack of funds and experience and determined opposition from the coal owners resulted in the premature collapse of most of them. Not until 1841 did Martin Jude succeed in forming the Miners' Association of Great Britain, which quickly gathered 100,000 members. Although this union also eventually succumbed, it is to this national association that the miners owe the first enunciation of what afterward became their characteristic policy. This was, broadly, not to rely mainly on strikes but to secure as many as possible of their demands by act of parliament, and to insist on continuous negotiation with the employers, preferably on a national basis. Although the mining trade union movement suffered many vicissitudes before emerging as a definite force in the industry, a start had been made. The influence of these primitive organizations, even though unimpressive by current standards, nonetheless made itself felt both in collective bargaining with employers and in the activities of national governments. The early mining associations were in part responsible for state intervention in the regulation of working conditions, prohibition of child and female labour underground, enforcement of safety regulations, etc. Indeed, the histories of safety legislation and of miners' unions are so interwoven the world over that it would be difficult to consider them separately.

Meanwhile, during the embryonic struggles of the early unions in Britain, public opinion had been aroused by a series of colliery disasters. Successive commissions set up in the second and third decades of the 19th century had revealed a state of affairs which profoundly shocked the nonmining community. Probably the most significant of these investigations was that carried out by the royal commission of 1840 which, two years after its appointment, reported to parliament on the employment of children and women underground. Their report revealed that children of both sexes—some as young as five and six years of age—were habitually employed in the mines. Girls of 16 and 17 were working at the coal face with naked colliers; children were kept underground for as much as 16 hours a day dragging loaded tubs along roadways 30 in. in height.

Public conscience was finally stirred, and in Aug. 1842 an act was passed—albeit against opposition in the house of lords—prohibiting the employment underground of females of all ages and of boys under ten. This act also provided for the appointment of mines inspectors, although it was not until 1850 that statutory legislation demanded the appointment of expert mining engineers as government inspectors of mines and compulsory notification to the state of all fatal mining accidents.

Despite being the world's greatest producer, Britain had lagged behind other European coal countries in appreciation by the government of the moral and social responsibilities of the state toward the mining community. France, Germany and Belgium had all instituted a system of mine inspection before 1850, although adult female labour was still employed underground in Belgium until toward the end of the 19th century. Illogically, the prohibition of women underground had almost invariably met with opposition from the miners themselves. This proved as true in India, when the government banned underground female labour in 1937, as in Europe a century before.

In the United States, the latter half of the 19th century was a period of tremendous activity in the industry, and output of coal and anthracite rose from just over 1,000,000 tons in the fourth decade to almost 250,000,000 tons by the turn of the century. Not unnaturally such a phenomenal development was accompanied by severe growing pains. There was considerable labour unrest, chiefly manifested in spontaneous localized strikes. As many of the workers came from established European coal fields, they brought with them a miscellany of traditions and usages Small local unions were soon in existence, but there was no significant workers' association until the late 1890s, when an organization came into being which embraced the entire state of Illinois *(see* STRIKES AND LOCKOUTS: United *States)*. Within a few years, an effective labour organization was functioning in Indiana, Ohio, Michigan and parts of Pennsylvania. The southern sector of the Appalachian region remained largely nonunion until 1933, but since

that time, with few exceptions, all the mineworkers in the United States have been members of a common organization, the United Mine Workers of America.

Mining legislation in the United States was introduced on a state basis rather than on a national basis as in Europe. In 1870, Pennsylvania became the first state to institute compulsory inspection of mines. Since that time, every state in which coal is mined has promulgated mining laws and instituted an inspection department. Research was instituted by the federal government following a succession of disastrous mine explosions in 1907 causing the deaths of 1,148 miners. In 1910 this work was transferred to the newly created bureau of mines. Despite the strenuous efforts of this organization, the first four decades of the 20th century gave the U.S. an unenviable record for mine safety. Standards in some mines were woefully low and state safety laws varied widely in scope and adequacy.

Alarmed at the rising toll of dead and injured, the 77th congress enacted the Federal Coal Mine Inspection act in May 1941, By this legislation the secretary of the interior, acting through the federal bureau of mines, was empowered to make inspections and investigations of health and safety conditions. Somewhat illogically, no authority was given to enforce the recommendations of the federal inspectors until 1946, when a federal mine safety code was issued after consultation between representatives of the U.S. bureau of mines, the United Mine Workers and mine operators. Since then an intensive safety drive has been maintained, with considerable success.

Complementary to the various national organizations already discussed, there are several international bodies concerned with the well-being of the coal miner. Even during the 19th century there had been a growing feeling that something should be done on an international basis to protect industrial workers in general. In 1919 the International Labour organization came into being with, at first, 41 member countries pledged to improve working and living standards within their boundaries. In 1945 a Coal Mining Industrial committee was inaugurated within the I.L.O.; on this were represented workers, employers and governments of all the major coal producing countries. This committee dealt with such topics as safety in mines, hours of work, labour problems, wages and productivity, etc. Although purely advisory, the work of this and similar organizations contributed materially to the rise in the working and living standards of coal miners in many parts of the world. Thus mining has become possibly the most closely controlled and organized of the major industries. Although the miner's social status and working conditions have changed tremendously over the years, he has Still much in common with his predecessors. Most miners still live in the relatively compact communities well away from the cities, with the mine the hub around which life revolves. Workers in these closely knit communities, sharing common heritage, hazards and interests, display a solidarity seldom evinced elsewhere, a solidarity fostered by the father-to-son tradition still strong in mining. Men raised in such an environment rapidly develop strong convictions, and the coal fields have produced many strong, even turbulent, characters who have achieved eminence in other walks of life.

V. TYPES AND METHODS OF MINING

Coal mining operations can be considered under three main headings:

Underground, or Deep Mining.—Coal is extracted from the seam without removal of overlying strata.

Strip, or Opencast Mining.—The strata overlying the coal seam (overburden) are removed and coal is extracted from the exposed seam.

Auger Mining.—Coal is extracted by means of large diameter augers boring horizontally into the outcropping seam.

The type of mining employed depends upon the area of coal available, the thickness and inclination of the seam and overlying strata, the value of surface land and other economic factors. In the United States approximately 70% of the bituminous coal output is mined by underground methods, almost 30% by strip mining and about 1% by augering.

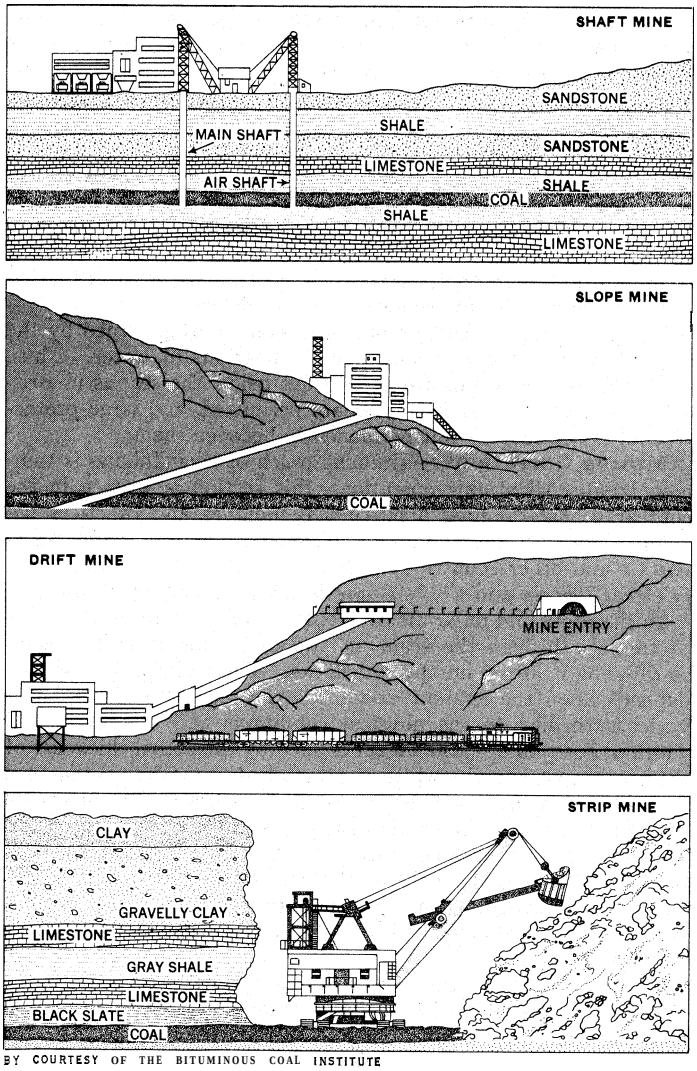
A. Underground Mining

Access to underground mines is by shaft, slope or drift openings (see fig. 1). Many mines employ a combination of these, and all mines have a minimum of two access openings to facilitate circulation of air through the mine and to provide alternative means of escape in case of emergency.

A shaft is a vertical opening driven through the rock from the surface to the coal seam. It is the shortest and frequently the most economical method of reaching the coal. However, coal from shaft mines must be hoisted to the surface in buckets, cages or skips. Complex machinery and controls and skilled labour are required, and less coal or machinery and fewer men can be transported.

In a slope mine, coal is removed through an opening driven from the surface through the rock to the coal level at an angle of between 15° and 25° from the horizontal. Such slopes vary in length from a few hundred feet to more than one mile, depending on the depth of the seam and on the inclination of the tunnel. Their advantage lies in the ease and economy with which the coal can be brought to the surface on conveyers and in the fact that men and machines can be taken in and out of the mine with greater ease than through a vertical opening.

A drift mine is one from which the coal is removed through a horizontal opening driven from the surface directly into the coal seam. This method is only possible where the coal seam is exposed at surface elevation (outcrop) or has been exposed by stripping away the rock above the coal. In such mines coal may be brought out of the mine on belt conveyers or in cars pulled by locomotives or winches.



BY COURTESY OF THE BITUMINOUS COAL INSTITUTE

FIG. 1.—TYPES OF COAL MINES

The type of access opening is not dependent on the physical size or production capacity of the mine. Any of the three types may cover a land area equivalent to an entire county. Daily production depends upon the thickness of the seam, the mining conditions and the type and size of equipment employed.

The thickness and quality of coal seams vary greatly. China is said to have the world's thickest coal bed—400 ft. in thickness. Two seams in Wyoming measure 90 ft. or more in thickness. The average thickness of coal seams in the United States suitable for mining—because of their quality, proximity to the surface and the ease with which the coal can be extracted—is from 2 to 10 ft.

The anthracite beds in Pennsylvania are more variable in thickness and have been subjected to greater geological upheavals than the bituminous ones, and whereas the latter are often relatively level, anthracite frequently must be mined from measures lying more than 80° from the horizontal. A single minable anthracite seam can vary in depth from surface outcrop to almost two miles beneath the surface of the earth.

Underground Mining Methods.—Room and pillar mining is the most usual method adopted in U.S. mines. Rooms are large tunnels driven in the solid coal and the intervening pillars of coal may be either permanently left or extracted later. The percentage of coal recovered from a minable seam depends on several factors. In the United States, where coal reserves are very large, the percentage to be extracted is primarily decided by consideration of the number and size of protective pillars of coal thought necessary to support the roof safely. In general, the less coal is extracted the less is the need for costly roof supports. The necessity to protect valuable surface land also has a bearing on the amount of coal mined. In some sections of West Virginia and other states, where the surface land is owned by the coal producer, almost 100% of the available coal can be mined. In such states as Illinois, however, where farm and industrial land is extremely valuable, only about 50% of the coal is mined to prevent surface damage from subsidence.

In certain heavily industrialized areas in Great Britain and in western Europe the need to mine every possible ton of coal overrides consideration for the surface. In such cases special methods of working the deposits are employed and every care is taken to minimize damage to the surface. Nevertheless, total extraction inevitably gives rise to some surface subsidence.

The percentage of coal extracted is sometimes governed by the need to protect the workings from inundations of water. Thus, when mining operations are carried out below the sea, as in Britain, only narrow working places are permitted, and large protective pillars of coal are left permanently between them.

Mining Operations.—Although much of what follows is common to all coal mining operations, this section is written in the context of U.S. mining practice. Techniques and practices developed to meet the special mining conditions and problems in Britain and other countries are discussed below (see Coal Mining in Great Britain and Coal *Mining* in Other Countries, below).

In the room and pillar method, coal is mined by driving a series of tunnels through the seam in two directions at right angles, so dividing it into a number of blocks. The daily output of coal depends upon the amount extracted from each tunnel, and this varies according to the physical conditions and the height and width of the tunnel. The height is fixed by the actual thickness of the coal seam, and the width is normally the maximum that can be removed without collapsing the rock overhead. Contrary to popular belief, no attempt is made to support the entire weight of overlying rock material. Mines are designed to leave sufficient blocks of coal to support the total weight of overlying rock. Roof support underground is only for the purpose of supporting the few vertical feet of immediate rock left unsupported by the driving of tunnels.

After the tunnels have been driven through the coal to the limit of the area planned for mining, pillars between adjacent tunnels may be removed. After removal of such blocks of coal, the rock strata above generally collapse and the earth gradually settles, creating cracks and breaks in the surface land. Removal of coal from blocks and pillars is known as retreat mining. Underground areas in which final or retreat mining has been done are known as gob areas and thereafter are impossible, or at least unsafe, to enter. The width of the original tunnels driven largely depends on the cost of supporting the rock strata immediately overhead (see Hazards of Mining, below). In general the larger the cross sectional area of the tunnel the lower is the cost of mining per ton.

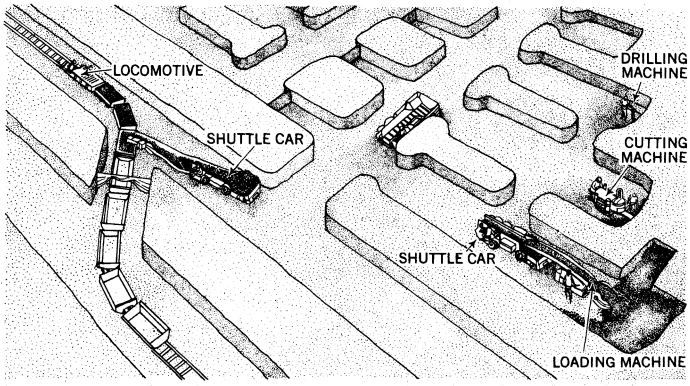


FIG. 2.—ROOM AND PILLAR MINING (CYCLIC)

Mechanization.—Two principal methods of underground mechanized mining are employed in the United States. They are known as "conventional" or "cyclic" mining and "continuous" mining. Conventional mechanized mining involves the following sequence of operations: supporting the roof, cutting, drilling, blasting and loading (see fig. 2). After the roof above the seam has been made safe by timbering or rock bolting, one or more slots—a few inches wide and extending for several feet into the solid coal—are cut along the length of the coal face by a large, mobile cutting machine. (This is essentially a multiton version of the portable power saw used to fell trees.) The cut, or slot, provides a free face and facilitates the breaking up of the coal subsequently blasted by explosives from the seam. The holes in which the explosive charges are placed are drilled by power drills. Special explosives are used to break down the coal. These are known as "permissible" explosives and when detonated liberate less heat and unpleasant fumes than ordinary high explosives (see EXPLOSIVES).

Other methods of breaking down the coal consist of placing in the blast holes steel cartridges several feet in length, filled with air compressed to pressures as great as 20,000 lb. per square inch, or with liquid carbon dioxide. The gases, when suddenly released in the small hole, expand and break the coal with an effect similar to that of explosives. (See also BLASTING.) After breakage, the coal is loaded directly into track-mounted mine cars or into rubber-tired electric trucks known as shuttle cars. Sometimes it is loaded directly onto chain or belt conveyers. The self-propelled loading machines are mounted on tracks, crawlers or rubber tires and are capable of loading up to 20 tons of coal a minute.

The operations of supporting the roof, cutting, drilling, blasting, loading and moving the coal out of the working place are performed by a group of from 10 to 20 men, known as a section crew. An experienced crew may mine more than 1,000 tons of coal in a single seven-hour shift.

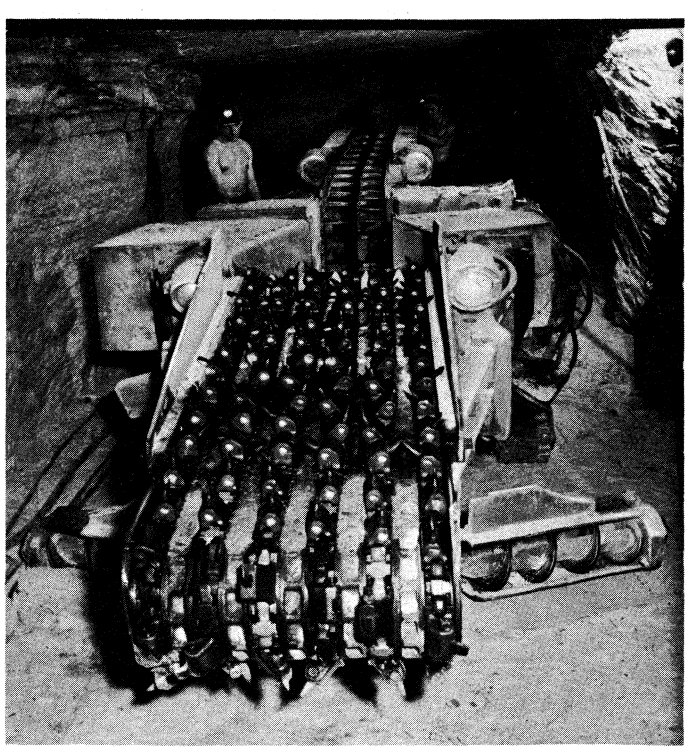
Continuous Mining.—This is a method introduced during the late 1940s, which began to replace the sequential and cyclic operations of cutting, drilling, blasting and loading coal. A single machine, the continuous miner, was developed to break off the coal from the seam and to transfer it back to the haulage system (see fig. 3). Many such machines were installed underground, some having a productive capacity in excess of 5 tons per minute. Their use eliminated cyclic operations and reduced the number of men required in a section crew. Secondary advantages lay in the elimination of explosive costs and of machines for cutting and drilling the coal. The weak link in the chain of operations extending from the coal face back to the main haulage system was often the secondary transport system immediately behind the continuous miner. Such was the high rate of advance and loading of the continuous

miner that normal secondary haulage systems were inadequate, so that mobile extensible belt conveyers were introduced. These high-capacity conveyers have self-propelled drive and tail sections and sufficient belt storage to permit advances of up to 100 ft. without stopping the conveyer. Cornering devices were also developed to carry coal around a series of right angle turns without its having to be transferred to another conveyer.

Underground Haulage. — After the coal is loaded into shuttle cars or conveyers in the production area, it is transferred to the main haulage system. In the United States more than 500 mi. of belt conveyers are used, most of them automatically controlled so as to stop the flow of coal in the event of any unforeseen condition. Many of these belts are adapted to carry men and equipment in and out of the mine. Approximately 4,000 mi. of railroad were in use in underground coal mines in the second half of the 20th century, with track equal in quality to that of many surface railroads. Trains carrying up to 25 tons of coal in each car were hauled by 35- to 50-ton locomotives, either completely out of the mine or as far as the shaft or slope foot where the coal was transferred to the shaft hoist or slope conveyer. It was estimated that 8,000 underground locomotives were in use.

B. Surface or Strip Mining

Coal was first discovered on the surface of the earth in exposed ledges or outcroppings. In time this supply was exhausted and man scratched back the earth to lay bare the coal seams. That was the way in which strip, opencut, or surface mining began. It became increasingly difficult, however, to remove the masses of overlying earth and rocks, and eventually mining operations went underground. The early miners rapidly realized that coal lying too close to the surface could not be safely mined underground. Unless there was a solid roof above them which could be propped up, the tops of the shallow tunnels would collapse. Large reserves of coal were therefore left, too deeply buried to be exploited by the primitive equipment then available and yet too shallow to be safely won from underground workings. As improved earth-moving equipment became available, strip or opencut mining developed. It consists of the removal of the soil and rock (overburden) above a coal seam and subsequent loading of the exposed coal. The method is used to best advantage where the seam outcrops or is not deeply buried, although many modern strip mines employ equipment capable of removing overburden more than 200 ft. in thickness. Power shovels used for this purpose in the second half of the 20th century were as tall as 12-story buildings and could remove up to 115 cu.yd. of earth in a single bite; wheel excavators rated up to 3,500 cu.yd. per hour were of virtually equivalent capacity.



BY COURTESY OF JOY-SULLIVAN LTD

FIG. 3.—CONTINUOUS MINING MACHINE

By the second half of the 20th century more than one-fourth of all bituminous coal production and one-third of anthracite production in the United States came from surface mines. In Europe the large brown coal deposits were extensively worked by this means, and about 5% of British coal production was by opencast methods.

Strip Mining Method. — Although certain coal deposits can be strip mined without the use of explosives, usually some means of breaking the overburden is required. Large drills place either vertical or horizontal blast holes up to 14 in. in diameter in the overburden, and explosive charges are detonated to break the rock into fragments for easy loading. A power shovel or dragline then removes the broken rock overlying the coal and piles it in an area from which the coal has already been removed. Power shovels are located at the coal level, while draglines operate at the earth's surface level adjacent to the pit. The almost vertical solid rock wall above the coal seam that faces the direction of mining advance is called the high wall. The pile of broken rock moved to the opposite side of the pit is known as "spoil." Many states require that the spoil piles left following strip mining be leveled and restored to conditions of future productivity.

The horizontal surface of the coal seam is cleaned of small remaining amounts of dirt and rock with bulldozers or self-propelled power brooms. Smaller power shovels then load the coal into trucks or large semitrailers which move it to a preparation plant for washing and sizing.

C. Auger Mining

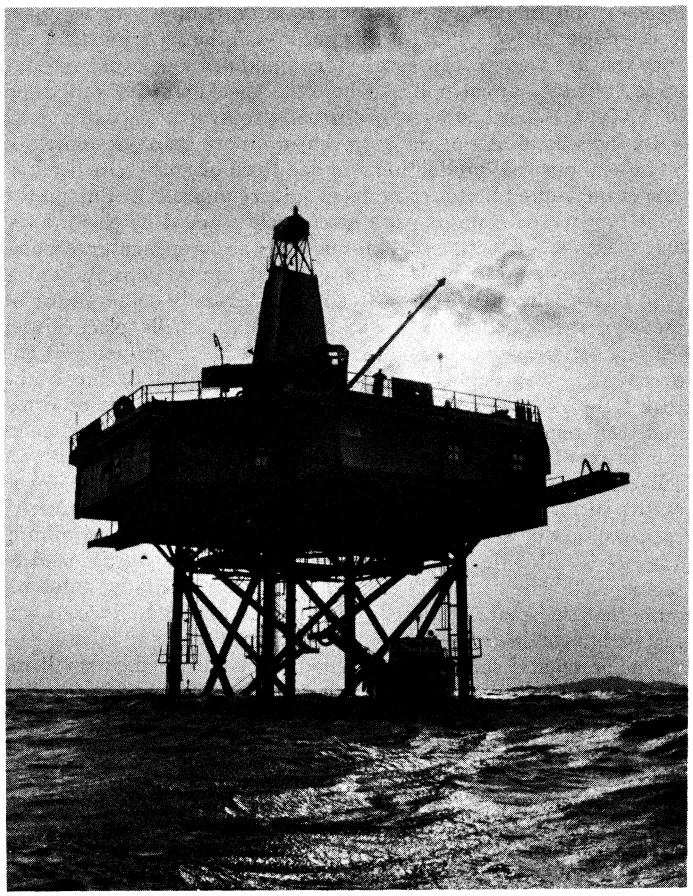
Auger mining as a method of recovering coal developed in the period following World War II. Because of the low initial cost of equipment and economy in mining. the growth of this method has been rapid in areas where it can be used. Auger mining consists of boring a series of parallel horizontal holes into the coal seam which has been exposed by outcropping or by strip-mining methods. Augering is frequently used in open-pit mines where the thickness of overburden over the coal at the high wall has become too great for further economic strip mining.

The augering machines. powered bv diesel or gasoline engines, drill holes between 2 ft. and 5 ft. in diameter to depths of up to 300 ft. in the coal seam. The coal so removed is discharged to an elevating conveyer and loaded into waiting trucks. No drilling to place charges of explosives, blasting, roof support or overburden removal is required. With a production crew of three men. an auger mine is capable of producing up to 100,000 tons of coal annually, although additional men and equipment are required to transport the coal and prepare it for market. Augers have been adapted for use in underground mines.

D. Coal Mining in Great Britain

Large-scale coal mining operations have been carried on in Great Britain for many centuries, and most of the easily accessible and high-quality seams have been depleted; reserves of certain particularly high-grade coal are almost completely exhausted. Seams of such low thickness are worked at such great depths as would be considered impracticable and uneconomical in the United States. In Durham a seam has been worked which is frequently only 12 in. thick, and some collieries in Lancashire and Staffordshire are mining more than 4.000 ft. below the surface. The average depth of British mines is about 1,100 ft.

Workable seams in Britain range in thickness from 1 ft. to 40 ft., although the average thickness of seams being mined in 1960 was approximately 4 ft. The coal measures of England are fairly flat and relatively free from major geological disturbances but in certain areas of Scotland and south Wales the seams are highly inclined and faulted. Appreciable deposits of coal have been proved to underlie the sea bed off the northeast and northwest coasts; and many mines are working a mile or more out to sea. In the 1950s exploratory borings were made from offshore drilling towers



BRIAN SEED

FIG. 4.— OFFSHOREDRILLING TOWER. FIRTH OF FORTH. SCOTLAND

(fig. 4) to locate seams that could be mined through tunnels from the shore under the sea. In most British coal fields seam density is high. This is the ratio of cumulative coal seam thickness to over-all coal measure strata thickness, and a high density indicates seams in close proximity. Special techniques have been evolved to allow full extraction of seams adjacent to one another. Many British coal fields are situated in heavily industrialized areas, and it is often necessary to "solid stow"; *i.e.*, to fill completely with rubble the void created by the extraction of the coal. Power stowing machines have been developed which throw debris into the void at a rate of 30 to 40 cu.yd. per hour. Although solid stowing minimizes surface subsidence, the extraction of many seams in close proximity inevitably gives rise to damage. Provision for payment of compensation to owners of property damaged by subsidence amounted to approximately between £3,000,000 and £6,500,000 annually after World War II. Mining conditions are generally more difficult in Britain than in the United States, and although several Britieh coal mines use U.S. mining equipment and the techniques associated with it, natural conditions militate against large-scale application of room and pillar mining as practised in North America Room and pillar mining (variously known in Britain as bord and pillar, pillar and stall, stoop and room) accounts for less than one-tenth of output. It finds its widest application in the working of seams where safety considerations preclude the adoption of the much more favoured longwall system of mining.

Advancing Longwall Mining Methods.— This is by far the most important method of mining coal in Britain and accounts for about 92% of total annual production. With this system the whole of the seam within a specified area (panel) is extracted in one continuous operation by taking successive slices over the entire length of a long working face. The length of this face is normally between 80 yd and 150 yd. In the simplest case a modern longwall face is developed and worked as follows (see fig 5):

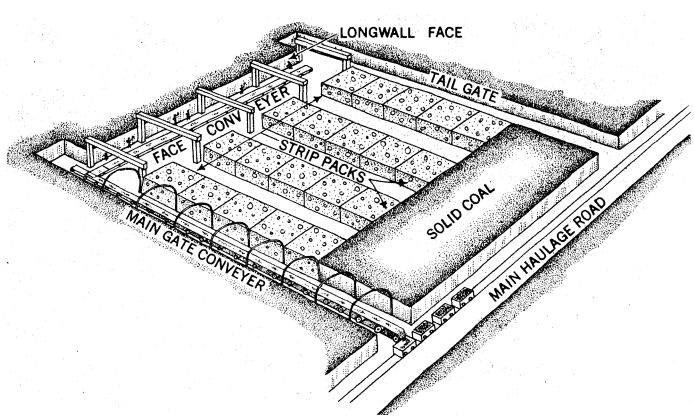
Assuming that consideration of required daily output has shown that a 100-yd. longwall face is necessary, two parallel tunnels are driven, starting from the main haulage road, at points 100 yd. apart. These parallel tunnels are termed gate roads and they are often at right angles to the main haulage road. As they are ultimately intended for use as transport roads for men, mineral and supplies, they are made fairly large. In the case of thin seams, part of the roof has to be blasted down in order to provide headroom. After some distance has been advanced, a longwall face is opened up by driving a further tunnel, the height of the seam, between the remote ends of the gate roads. The roof along this 100-yd. longwall face is then supported. In conventional longwall mining the coal face is usually undercut by a specially developed cutting machine which makes a slot about five inches wide and five feet deep into the seam. Blast holes are then drilled into the coal face and explosives are used to bring down the coal for hand shoveling onto a conveyer belt which runs the length of the face. This belt carries the coal to a gate road. Installed in this road—called the mother gate or main gate—is a second conveyer which delivers the coal to the principal transport system in the main haulage road.

After the entire slice of coal has been removed, the face conveyer and the face supports are moved forward a distance equal to the depth of the undercut. Then the mother-gate conveyer is extended by a like amount and permanent supports are erected in the now lengthened gate roads. The full cycle is now complete and begins again. Normally the three principal operations, cutting, filling and advancing equipment, are carried out in consecutive shifts, so giving a 24-hour production cycle. As one cubic yard of coal weighs about 0.95 long tons it can readily be calculated that in a 4-ft.-thick seam, a 100-yd. longwall face having a 5-ft. undercut will produce 210 tons of coal each day. Many British coal mines have a dozen or more such production areas, each requiring a total of about 60 miners to complete the whole cycle.

The waste area (known also as gob or goaf) left behind as the longwall face advances can be partially or wholly filled (solid stowed) with rock. The former process is known as strip packing, and involves the building of wide rock walls at intervals along the face. These walls or packs run parallel to the gate roads. Choice of method depends on the competence of the strata adjacent to the seam and the urgency of the need to reduce surface subsidence. On many longwall faces the roof behind the face is induced to break up and cave into the goaf. This is termed longwall caving, and with this system the only supports left in the waste area are protective stone packs which are built alongside the gate road and are continually extended as the face advances.

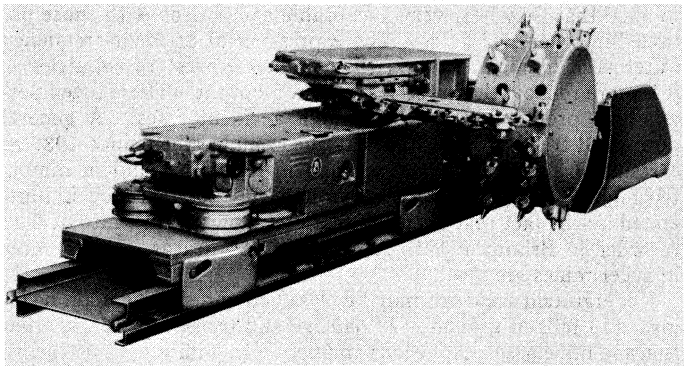
On occasion the longwall method is adapted to retreat mining. In such cases the gate roads leading from the main haulage road are driven to the boundary of the panel of coal to be extracted. At the boundary, a longwall face is developed as before, and is then worked back toward the main haulage road in the same general manner as previously described.

Both longwall systems can be successfully used in a wide variety of mining conditions. In Britain, seams varying in thickness between 1 ft. and 40 ft. have been mined by longwall methods and the system has been adapted to use in seams having inclinations



A GRIERSON

FIG. 5 — MINING AT ADVANCING LONGWALL FACE WITH ROOF SUPPORT BY STRIP PACKS (*See* TEXT)



ANDERSON, BOYES & CO., LTD.

FIG. 6.— LONGWALL CUTTER AND LOADING MACHINE

in excess of 45°. Another important feature is that longwall mining can be carried out at depths so great that pillars might break under the weight of the overburden if the room and pillar system were used. It is because of this versatility in application and the high percentage extraction which it permits that longwall mining has found universal favour in Britain.

Mechanized Mining. — The necessity for close support systems on longwall faces is an impediment to mechanization, and progress in developing power-loading machinery has been limited by the extreme variations in mining conditions. Such variations militate against standardization, and many machines have been designed for a specific set of operating conditions. Power-loading machinery in Britain can be divided broadly into two main groups: those machines which mechanically load coal that has previously been blasted, and cutter-loading machines which eliminate the need for any prior preparation of the coal *(see* fig. 6). Many of these machines utilize high speed revolving chains fitted with hard metal teeth which tear the coal from the face. Although the machines are capable of producing many hundreds of tons of coal each shift, the severe working action of some of them so degrades the coal that its selling value is often reduced. With the end of the 1950s came a slackening in the demand for coal and a corresponding greater discrimination in the choice of mechanized mining equipment.

Nationalization. — As in most European countries, the coal industry in Britain is under state control. Public ownership of the coal industry was initiated by the Coal act of 1938, whereby the state acquired all the unworked coal then privately owned at a cost of £66,450,000. This act was followed in 1946 by the Coal Industry Nationalization act, which brought the entire industry under public control at a further cost to the state of £164,600,000.

In accordance with the provisions of this act the responsibility of running the industry was transferred on Jan. 1, 1947, to the national coal board, whose members are appointed by the minister of power. Since the inception of nationalization various changes have been made in the structure of the board and in the organization of the industry. In 1959 Britain was divided into nine major producing zones or divisions, each having a divisional coal board with considerable autonomy. These divisions were in turn subdivided into a total of 51 areas, each controlled by a general manager responsible for about 15 to 20 coal mines. Although each higher management level has considerable independence there is a clearly defined line of command, and all major capital expenditure must be sanctioned by the national board. The national coal board itself is subject to directions of a general character from the minister of power, on matters which affect the national interest.

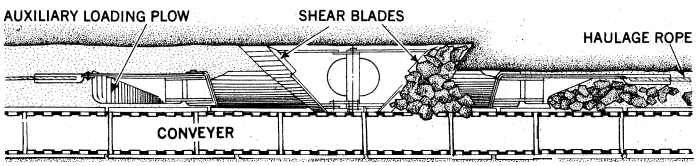
E. Coal Mining in Other Countries

Western Europe. — In Europe the coal seams are generally numerous, highly inclined and at appreciable depth. These geological features have led to the widespread use of a special mining technique known as "horizon mining." This is analogous in concept to metalliferous mining practice in that the main haulage and ventilation tunnels are not driven in the seam or mineral vein being worked but in the adjacent strata. Thus the principal tunnels are not constrained to follow the undulations and vagaries of the coal seams but can instead be driven in a predetermined direction at an arbitrary uniform inclination. In Europe it is usual for horizon roads to be driven at an inclination of about 1:500, as this gradient is ideally suited to locomotive haulage. The various seams are reached via small shafts driven upward from the horizon roads, and the actual mining of the coal is usually by one or other of the longwall mining methods. The coal is generally less hard than in Britain and the United States and, in consequence, much of the output is won by pneumatic picks. The use of compressed-air picks eliminates the need for machine undercutting and explosives. In an endeavour to increase productivity, special machinery and techniques have been developed for use in these soft coal seams. Much of western Europe's power-loaded output is won with the use of coal plows *(see* fig. 7). In their simplest form these are hardened steel or alloy blades, fitted to a plow frame, which shear off a strip of coal a few inches thick as the plow is slowly hauled across a longnall face by means of a wire rope coiling onto a powerful winch in the gate road. The coal sheared from the face is deflected by a ramp onto a specially designed armoured chain conveyer. The plow is capable of shearing coal in both directions, and auxiliary plows at each end of the machine clear in advance any loose coal lying in its track. The armoured conveyer has articulated joints and is capable of being continuously snaked forward toward the solid coal face. Specially developed support systems complete the face mechanization equipment and permit full continuous mining to be done. Power-activated plow blades have been developed for use with harder coals.

Eastern Europe. — Many of the eastern European countries are major coal producers, and in every country the coal industry has been highly developed since the end of World War II. In no country has more progress been made than in the U.S.S.R., and output of coal and lignite increased from an estimated 161,000,000 tons in 1946 to about 500,000,000 by 1960. The U.S.S.R. has huge reserves of coal at less than 1,200 ft. depth and much of the annual output is mined from shallow seams. In the interests of rapid expansion in output numerous slope mines have been developed, many with daily outputs of less than 500 tons. Longwall mining is the most common method of working and accounts for about three-quarters of total output, including coal which has been strip mined. The U S.S.R. has developed a wide range of power-loading equipment, and in the flatter seams about one-half of the output is loaded by mechanical means. In such widely scattered coal fields as in the U.S.S.R. a great variation in mining conditions is inevitable, and in the Kuzbas field (Kuznetsk basin) alone the thickness of seams worked varies between 2 ft. 6 in. and 50 ft., the average being 6 ft. 9 in. Almost one-third of deep-mined output comes from seams inclined at more than 25° to the horizontal.

Hydraulic mining has been introduced at several slope mines. This system involves the removal of coal from the face by high-pressure water jets and its transportation entirely by hydraulic means to the surface. The water pressure in the hydraulic nozzle ranges from 300–1,000 lb. per square inch. depending on whether the coal is first loosened by a special blasting technique or is sliced off the solid coal face. It is claimed that the productivity in hydromines is about $2\frac{1}{2}$ times that in comparable mines worked by conventional methods.

Asia. — The Chinese coal industry is undergoing a period of intensive expansion, and one of the most important developments has been the large-scale introduction of hydraulic mining. Immense coal reserves are available under conditions which vary widely. The availability of ample manpower has in the past militated against intensive mechanization although it is probable that the



A GRIERSON

FIG. 7.— TOP VIEW OF SIMPLE COAL PLOW

phenomenal rise in production recorded after the mid-1950s must in substantial part be due to machine mining.

India has appreciable reserves, but if over-all industrial development in the second half of the 20th century were not to be retarded, it would be necessary to reorganize almost the entire coal industry. Seams of 40 to 50 ft. in thickness are worked by bord and pillar mining, with very little mechanization. One of the principal problems facing the industry in India is that of maintaining an adequate labour force: many miners are also farmers, and this results in high seasonal absenteeism.

Australasia. — Coal mining is one of Australia's oldest industries. Most of the bituminous coal output comes from New South Wales, where mechanized mining methods have been widely introduced. This field has an area of about 5,000 sq.mi. and by the early 1960s over 80% of underground production was mechanfcally cut and loaded. The brown coal deposits in Victoria are of extraordinary thickness — there are single seams up to 265 ft. thick — and are worked by opencast mining methods. Small amounts of coal are mined in Queensland, New Zealand and Tasmania.

F. Automation in Mining

The remote or automatic control of mining operations, which comprises a large number of small, scattered working units, poses a very different problem from that existing in a compact manufacturing plant where both the product and the processes have reasonable uniformity. This diversification has militated against its widespread application to mining machines and niethods. Although mechanization underground has contributed significantly to the increased efficiency of mining operations, automatic control has been first applied to straightforward materials handling operations such as haulage and hoisting. Here progress has been fairly rapid. Many mines have automatic hoisting equipment, sometimes supplemented with closed circuit television, which loads the mineral into the shaft conveyances, operates the hoist and discharges the mineral at the surface without requiring the attention of the miner. Automatic traffic direction units, complemented by computers, have been installed underground to control intricate locomotive haulage systems and automatic control of conveyer systems has long been standard practice. Many of the processes within the surface plant lend themselves to automation.

The extension of control to operations on the coal face was being actively considered In Britain. hydraulic-powered roof supports, which only require manual operation of a control valve to carry out the operations of release of support, advance and reset of support for the roof. are extensively used. Research was undertaken to operate these powered supports remotely and monitor their performance. Successful experiments have been made underground using a nucleonic probe to give an indication of the thickness of coal beneath the cutter-loading machine to the miner controlling it by hand, thus facilitating coal mining within the seam without excursions into roof or floor. Work was under way to make this operation fully automatic. Similar work was proceeding in the U.S.S.R. The carbide miner, a combination of carbide-tipped, multiple rotating cutters with a unitized conveying system, operated by remote control from an outcrop portal, has been in use in the United States for several years.

VI. HAZARDS OF MINING

Although comprehensive mining legislation, improved mining techniques and intensive safety propaganda directed at the workers have considerably reduced accidents in coal mines throughout the world, mining remains an inherently dangerous occupation. For example, the death rates per 100,000 underground man shifts in western European and United States coal mines for the ten-year period following World War II ranged, in Great Britain, from a high of 0.44 in 1947 to a low of 0.24 in 1954; in Belgium from 0.66 (1953) to 0.32 (1955); in the Netherlands from 0.53 (1946) to 0.15 (1955); in France from 0.48 (1948) to 0.34 (1955); in the Federal Republic of Germany from 0.77 (1948) to 0.61 (1955); and in the United States, for anthracite, from 1.54 (1955) to 0.75 (1950), and for bituminous from 1.22 (1947) to 0.84 (1952). When considering the significance of these figures it must be borne in mind that they bear very favourable comparison with those obtained in other coal fields. The expression of accident frequency in terms of man shifts worked is common in western countries as it is more reliable than systems based on output. These often permit high productivity to mask high accident rates. A general downward trend, by and large, has been maintained since 1935 as a result of successive improvements in legislation and in mining techniques. That there are no grounds for complacency is illustrated by the fact that even the reiatively low fatality rate of 0.22 recorded in Britain in 1956 represented 289 deaths. Death rates in auger mines are low.

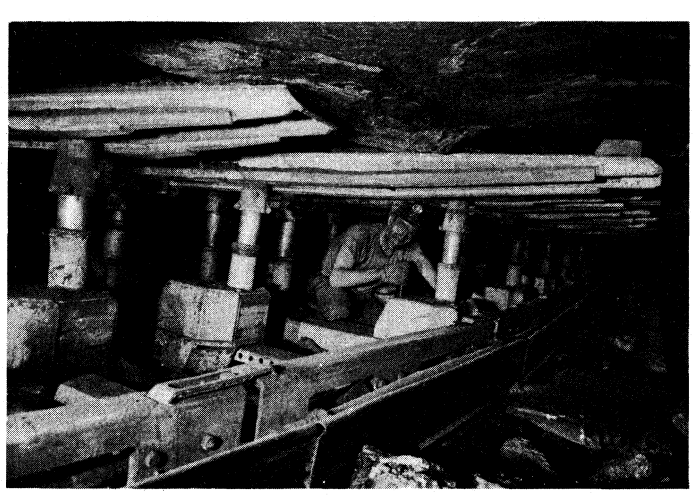
Underground accidents may be classified under three main headings: (1) falls of ground; (2) haulage and transport; (3) ventilation and mine gases, explosions and fires. In addition, other health hazards must be noted. A study of accident statistics reveals a fundamental similarity in the general percentage classification of casualties in the major coal-producing countries. Falls of ground account for just over half the total kilied or seriously injured each year in coal mines. A further 20% of the annual casualties are attributable to haulage and transport accidents, and the remainder are accounted for by gases, explosions and fires, and by electrical mishaps and the like. Major disasters such as mine fires and explosions — grievous though these may be in local effect — do not account for the greatest number of underground deaths and injuries.

A. Falls of Ground

Accidents caused by falls of the mine roof and sides do not usually involve more than one or two men, although on occasion single incidents result in many deaths. This is particularly the case in mines liable to rock bursts. In certain circumstances the sudden release of elastic strain energy in stressed strata results in violent disintegration of the rock itself. Such rock bursts can be on a very large scale and accompanied by air-pressure waves of sufficient violence to disrupt the mine ventilation circuit. Although much has been learned of this phenomenon, and safety measures have been introduced, rock bursts still constitute a major hazard in many coal fields, particularly in North America.

The relatively small falis of rock, however, account for most deaths, occurring as they do with terrible regularity. Prevention of this type of accident depends upon adequate support of the roof and sides of the mine. Normal support systems may be supplemented by protective pillars of coal which are left unmined. Since 1945 a technique known as rock bolting has been widely employed, particularly in United States coal mines. This involves drilling holes in the strata and inserting steel rods which are subsequently anchored in position. These rods, several feet in length and an inch or so in diameter, either bolt the immediate roof or sidewall to a stronger stratum or, alternatively, bolt together several individually weak layers to form in effect one thick, compound beam.

In Europe, hydraulically powered supports have been extensively used to give improved roof conditions and to reduce the



BY COURTESY OF DOWTY MINING EQUIPMENT LIMITED

FIG. 8.— SELF-ADVANCING HYDRAULIC SUPPORTS ON A LONGWALL FACE

number of men employed on the coal face on support operations (see fig. 8).

B. Haulage and Transport

Mine haulage systems are often large even by surface standards, and it is not unusual for a coal mine to require large numbers of haulage workers. Haulage accidents, like falls of ground, tend to be limited in individual effect but to be all too frequent in occurrence. Apart from the obvious dangers associated with the large-scale movement of men and material, mine haulage is made more dangerous by lack of working space and by a standard of lighting much below that on the surface.

C. Mine Ventilation and Gases, Explosions and Fires

Ventilation. — Provision of adequate ventilation is one of the most essential safety features of underground coal mining. In Europe, the average weight of air passing daily through the coal mines is about six times the total daily weight of coal produced, and many mines require the circulation of more than 500,000 cu.ft. of air per minute. Obviously not all of this vast quantity of air is required to enable the miners to work in comfort. Most of it is necessary in order adequately to dilute the harmful gases produced during mining operations. Such gases are frequently termed "damps," (from the Middle German *dampf,* literal meaning, "vapour").

Firedamp. — The gas which occurs naturally in the coal measures is nearly always methane, CH_4. This gas is highly inflammable and explosive when present in the air in a proportion of 5% to 14%. Several gas explosions are recorded each year in the United States. In Great Britain methane is frequently called marsh gas or firedamp, although more correctly the latter term should be confined to an inflammable mixture of methane and air. Methane is occluded in the coal and the associated strata and is liberated when these are disturbed, although the amount generated in some mines is insignificant. It is usually given off gradually, and in the course of mining some seams yield up to 5,000 cu.ft. of methane for each ton of coal. In order to render this gas harmless it is necessary to circulate large volumes of air to reduce the percentage of methane to below a prescribed figure. (The permissible maximum methane content varies from country to country but is of the order of 1% or 2%.) Methane may also be given off in the form of outbursts. These are sudden, violent discharges of short duration, usually accompanied by the displacement of large quantities of broken strata and dust. In the earlier years of the 20th century, at Morissey colliery in British Columbia, about 2,000 tons of coal were displaced during an outburst of an estimated 3,000,000 cu.ft. of methane. Although such serious outbursts are fortunately rare, firedamp, however formed, is a major hazard and, despite improvements in detection and ventilation techniques, dangerous accumulations still occur. In a five-year period in the 1950s, 157 ignitions of firedamp occurred in Britain alone, causing 69 deaths and 214 injuries.

To reduce the danger from inflammable gas underground, long boreholes may be drilled in the strata ahead of the working face and the methane drawn out of the workings and piped to the surface. This technique is known as methane drainage and is common in Europe. The extracted gas is frequently utilized on the surface, pure methane having a calorific value of 1,012 B.T.U. per cu.ft. Although many instruments have been specifically designed to detect the presence of firedamp underground, the principles of the flame safety lamp (*q.v.*) devised by Sir Humphry Davy in 1815 still form the basis of many detectors.

Methane air mixtures can be ignited by a naked flame or by frictional sparking, which has accounted for many serious underground explosions, and it has been found that firedamp can be readily ignited by electrical energies in the region of one millijoule. Accordingly, only specially designed electrical equipment may be used in mines where methane constitutes a possible hazard. In some mines only compressed-air-powered machinery is permitted.

Whitedamp: CO.—Carbon monoxide is a particularly harmful gas, and as little as 1% in the air inhaled very rapidly causes death. It is the product of the incomplete combustion of carbon and is formed in coal mines chiefly by oxidation of coal, particularly in those mines where spontaneous combustion occurs. It is often found after explosions and it occurs in the gases evolved by explosives. The exhaust gases of diesel engines used underground also contain up to 0.05% carbon monoxide by volume, and this emission may necessitate the circulation underground of up to 200 cu.ft. per minute of diluting air for every brake horsepower (b.h.p.) of the engine. The term "whitedamp" is obsolescent.

Blackdamp. — This is an atmosphere in which a flame lamp will not burn, usually because of an excess of carbon dioxide in the air or because of a deficiency of oxygen. Blackdamp, chokedamp or stythe as it is variously called, is found chiefly in old workings or badly ventilated headings. The actual percentage composition of blackdamp depends upon its source, and its physiological effect on the miner varies with its composition. Many countries prescribe the minimum oxygen content and the maximum carbon dioxide content permissible in the atmosphere in which miners are to work. However, numerous fatalities have resulted from men's inadvertent entering of old or badly ventilated workings.

Stinkdamp: H_2S.—This is the name given by the miner to hydrogen sulfide, because of its characteristic smell of rotten eggs. It is one of the first gases to be expelled when coal is heated out of contact with air; hence it is frequently found in the gases resulting from gob or goaf fires. It occasionally occurs in small quantities along with the methane given off by outbursts and is sometimes present in the fumes resulting from blasting. Stinkdamp is an extremely poisonous gas and concentrations in excess of 0.1% can cause serious disability or death.

Afterdamp. — This is the term applied to the mixture of gases found in a mine after an explosion or fire. Its actual composition varies with the nature and amount of the materials consumed by the fire or with the extent to which firedamp or coal was involved in the explosion. Afterdamp is very deficient in oxygen and among other dangerous characteristics has a high carbon monoxide content. By far the greater proportion of deaths in coal mine explosions and fires are due to the effects of afterdamp.

Explosions and Fires. — The menace of firedamp explosions in coal mines was widely recognized early in the 19th century and appropriate steps were taken to prevent them. The danger of coal dust in mines was not, however, appreciated until the 20th century. Few people heeded Michael Faraday's thesis in 1845 that the ignition and explosion of firedamp would raise and then kindle coal dust. Eventually it was realized that coal dust presents a far greater danger than methane, in that coal dust explosions are far more violent in character and widespread in effect than simple firedamp explosions. These latter are usually fairly localized in their effect and their principal danger lies in the fact that a relatively minor firedamp explosion may initiate a far more serious coal dust explosion. Some of the worst disasters of the 20th century, all coal dust explosions, are shown in Table II. Precautions taken against the occurrence of coal dust explosions include the deposition of incombustible rock dust in the mine roadways to suppress propagation of the explosion.

Fires are particularly dangerous in coal mines as, apart from the fact that a naked flame may initiate an explosion, there is the added complication that the coal itself provides a virtually inexhaustible supply of fuel. Much of the equipment used underground is capable of initiating or sustaining a fire. Inflammable conveyer belting was responsible for the death of 80 miners at Creswell colliery in England in 1950. To prevent a repetition of this disaster the British national coal board replaced all underground rubber belting by noninflammable polyvinyl chloride belting.

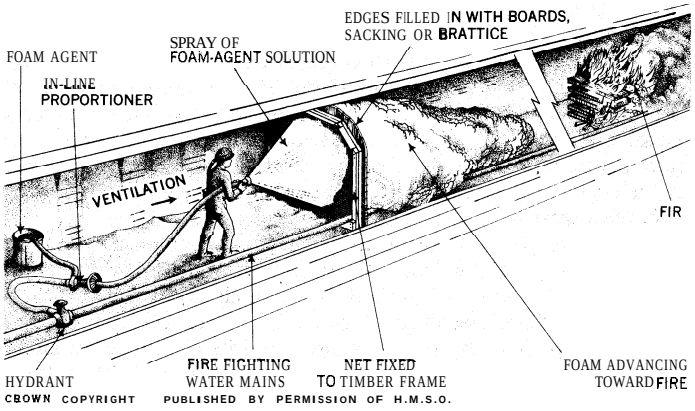

FIG. 9.— FIGHTINGA MINE FIRE BY THE FOAM-PLUG METHOD (*See* TEXT)

A development in the field of underground fire fighting is the "foam plug" technique. Tens of thousands of cubic feet per minute of air-water foam are generated on the upwind side of the fire. This foam completely fills the roadway and is pushed by the normal air stream into the fire zone, and so blankets the fire (see fig. 9). Large-scale trials of this technique have taken place in Great Britain, the United States, Poland and the U.S.S.R.

D. Other Hazards

It is now universally recognized that continued inhalation of certain dusts is detrimental to health and may lead to reticulation of the lungs and eventually to fatal diseases included under the general term pneumoconiosis. Coal and silica dusts are particularly harmful when the particle size is below five microns and, unfortunately, much of the dust produced during mining operations is below this size. Methods adopted to combat the dust hazard include the infusion of water under pressure into the coal before it is broken down; the spraying of water at all points where dust is likely to be formed; the installation of dust extraction units at strategic points; and the wearing of masks by miners operating drilling, cutting and loading machinery. Despite these precautions, in Great Britain almost 3,000 men per year are certified as having contracted lung diseases.

Miners' Nystagmus.—This is an occupational disease which usually manifests itself after 20 or 30 years' work in coal mines. Initially it is a defect of vision, but if it is not checked nervous disorders may develop culminating in total disability. The concensus is that the primary cause of miners' nystagmus is to be found in the low brightness levels characteristic of working faces in coal mines. Illumination underground has improved considerably during the 20th century and the replacement of oil-flame safety lamps by more efficient sources of lighting has resulted in a significant drop in the incidence of this disease. In the mines of the United States, where electric cap lamps have long been used in preference to other forms of portable lamps, the disease became virtually unknown. In Europe, the change-over to electric lamps came about later and, as the disease takes very many years to develop, some cases of miners' nystagmus were still being diagnosed in the 1960s.

VII. PREPARATION AND USES OF COAL

A. Preparing Coal for the Market

Coal preparation embraces all the handling and treatment of the coal from the time that it reaches the mine outlet until it is finally taken over by the surface haulage system for dispatch to the market.

In earlier days, coal was dispatched from the mine and sold much as it came from the ground. Some effort was made to remove rock and impurities when the coal was loaded into the mine car underground, because payment to the miner was generally withheld if his cars contained visual impurities. When coal was hewn and loaded by hand, the miner could sort out much of the large-sized dirt and leave it in the waste area. At the beginning of the 20th century small coal was not easy to sell, as the principal consumers, power stations and the coking and gas industries, were very small by modern standards. In the absence of a market for a small-sized product, coal was often loaded underground with a fork rather than with a shovel. This left behind the small coal, which tended also to be the dirtiest. This primitive form of selective mining disappeared early in'the century, and gradually rudimentary coal-sorting plants came into general use. In the United States. bituminous mines these were called tipples, after the tippling operation which transferred the coal from the mine cars onto picking or sorting screens and belts. Here a group of men picked out the visible impurities. Tipples also segregated the run-of-mine coal into size groups, and as the larger sizes could be more carefully hand-cleaned and were burned with greater ease and cleanliness in fireplaces and hand-stoked furnaces, size became associated with quality in the public mind.

With the onset of mechanical mining, and in some countries the economic necessity to mine dirtier seams, run-of-mine coal became smaller and dirtier. In many mines more than a quarter of the coal brought to the surface was rejected as waste, and thus grew the mountainous heaps of rock which disfigure coal mining areas. With improved efficiency in the many coal-cleaning processes used, the tonnage of rejected waste material increased yearly. In several countries — particularly in Europe — much of this rock was taken back underground and used as stowing material. Attempts were made to improve the unsightly appearance of waste heaps by seeding them with special grasses and by planting shrubs.

Coal-Cleaning Processes. — Methods employed for the removal of impurities from coal depend upon the physical differences between the impurity and the coal; particularly the differences in their specific gravities. The specific gravity of coal depends in some degree upon its intrinsic impurities, and ranges between 1.2 and 1.5, a generally accepted average value being about 1.25. Most of the extraneous impurities mined with coal are much heavier than the coal itself, and separation can be effected by immersing the run-of-mine coal in a fluid having a specific gravity greater than that of the coal but less than that of the impurity. This allows the pure coal to float and the heavy waste material to sink, and arrangements are made to collect the two products separately. There are, however, all kinds of associations of coal and rock ranging in an unbroken series from pure coal through coal with an increasingly higher proportion of inorganic impurities, continuing through rocks having a more or less carbonaceous content and finishing with pure rock. Accordingly, the specific gravities of these bodies form an unbroken series between the two extremes represented by pure coal and pure rock. Thus in practice the problem is often to separate impure coal from more or less carbonaceous rock, and the arbitrary demarcation line is frequently dependent on economic considerations; *i.e.*, the balance of the cost of improved cleaning of the coal against the increase in sales resulting from such improvement.

One of the most widely adopted heavy-medium cleaning proc-

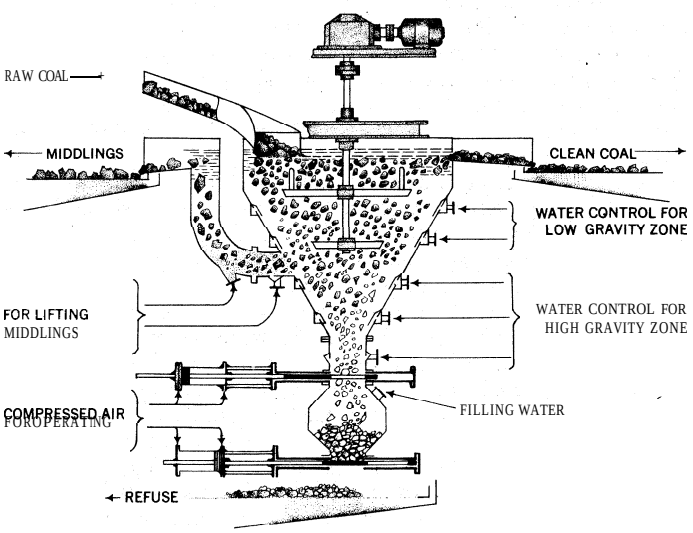

FIG. 10.— CHANCE SAND-FLOTATION PROCESS

esses is illustrated in fig. 10. The plant consists of a large inverted conical vessel in which sand is maintained in suspension in an upward current of water. The density of the fluid can be varied by increasing or decreasing the amount of sand held in suspension. The process can be arranged so as to give an intermediate product between the pure coal and the pure rock. This is achieved by adjusting the speed of the upward water current through control of the volumes of water admitted at the several levels. Some heavy-medium flotation plants use finely crushed barium sulfate or magnetite in suspension in water. In some processes, termed dry, or pneumatic, cleaning, air is used as the separating medium. This system originated in the United States and is considered cheaper than wet washing, but it is less catholic in application.

Very small sizes of run-of-mine coal can be cleaned by froth flotation methods. Coals to which much dirt adheres may be crushed to less than $\frac{1}{50}$ in. in size and fed into a bath containing an oil and water emulsion through which air is bubbled. The oil spreads as a film over the surface of the coal particles, which then attach themselves to the entrained air bubbles and are carried to the surface of the bath. The rock particles, however, are preferentially wetted by water and not by oil and so sink to the bottom of the bath. The froth on the surface of the bath is then removed and broken down to release the clean coal.

Occasionally, especially for the anthracite market, coal must be broken to smaller sizes before sale. Coal preparation plants in the anthracite fields of the United States are therefore commonly known as "breakers." Even when dealing with the softer bituminous coals it is becoming a general practice to crush all coal above 6–8 in. in size. Thus hand-sorting confined to the larger-size ranges will eventually disappear. By mid-20th century, more than half of the coal mined in industrialized countries was mechanically cleaned and sorted.

B. Transportation and Marketing

Almost three-fourths of the coal mined in western countries is transported to market by railroad, the remainder being shipped or trucked to its destination or used at the mine. There are many occasions when coal is transported by road, rail and water in its journey from mine to market. In the United States, tonnage handled on the inland waterway system increased significantly in the second half of the 20th century as waterways were improved and extended to serve more coal mining areas. By this time almost 200,000,000 tons of coal were moved each year by water—much of it in barges. In Europe, too, considerable tonnages were moved by water. Special 50-ton-capacity amphibious vehicles came into use in the 1950s to carry coal from the Ruhr to lower Saxony. The coal was loaded into the vehicles at the mine and these were then hauled by locomotives to the waterway, where the containers were transferred bodily from the railroad track to the water. This system reduced the cost of transferring the mineral from one transport medium to another.

In some mining areas near the coast the coal was taken by conveyers directly from the mine to the holds of large coastal vessels. In Britain, much of the coal from the northern coal fields is taken to London and the south in coastal cargo vessels called colliers. Almost 17% of British output was moved by sea in 1958. However, this was less than one-fourth of the tonnage moved by rail.

In both the United States and Britain, the coal industry and the railroads are closely linked historically and economically. Each was largely responsible for the development of the other, and traditionally they were each other's best customer. However, particularly in the United States, the balance of this reciprocal benefit has been upset by the rapidity of the change-over from coal-fired locomotives to diesel or electrically-powered ones. In the United States, class I railroads decreased their use of bituminous coal from a peak of 132,000,000 tons in 1944 to about 2,000,000 tons by 1960. In Britain the fall in demand was much less abrupt, and in the 1960s the railroads still provided a market for about 5% of total output. On the other hand coal traffic provided the nationalized British railways with 40% of the total freight receipts.

The late 1950s saw the introduction of higher-capacity road-haulage trucks than were formerly considered practicable. Large-scale truck haulage of coal is normally only economic over relatively short distances, but increased size of pay load makes for a wider field of application. In some strip mines giant trucks were introduced carrying up to 80 tons or more.

Another development was the erection of large chemical, industrial and power plants close to the mines to reduce fuel-haulage costs. The coal was carried directly to the plant or factory on conveyers. Electrical utilities were built fairly adjacent to mines, for it was much cheaper to transmit electrical power over long distances than to move the equivalent tonnage of coal. In 1957 a co-operative producer-consumer project was inaugurated using a coal pipeline 108 mi. long to carry a mixture of coal and water from a mine near Cadiz, O., to a power plant at Cleveland where the coal was separated from the water and fed into the boilers. Although this system of coal transportation was not new, it represented a major step forward in the field of long-distance hydraulic transport. Further installations were put into operation in Britain and elsewhere. It was held that pipeline transmission of coal was economic between the areas in which a large supply of coal was available and those specific markets where large tonnages of coal were used at a fairly uniform rate. Where consistently high tonnages were required, belt conveyers were widely used for medium-distance hauls. With the development of stronger belting and the introduction of conveyers in which the stress was taken by external steel cables, many of the former limitations of belt conveying were removed. Single flights up to many miles in length were installed, handling many hundreds of tons of coal an hour.

Great Britain and the United States differ considerably in their patterns of coal consumption, independently of the size of their respective coal industries. This is explained by the serious encroachment of oil and natural gas onto U.S. coal markets. Since the end of World War II, the contribution of bituminous coal to U.S. energy requirements in those spheres where coal can be used had fallen from 60% to less than half this figure by the 1960s. The market for domestic coal, traditionally a very profitable one, had, for example, plunged from 99,000.000 tons in 1947 to 33,000,000 tons by 1958. This drop was offset exactly by a corresponding rise in the electrical utilities market during this period and although, on balance, the amount of coal produced had not materially altered, the actual consumption pattern had been greatly changed. As Great Britain has no significant natural gas deposits, the demand for manufactured gas there provided a market for 25,000,000 tons in 1958, almost one-eighth of total inland consumption.

C. By-products of Coal

Although most of the coal mined throughout the world is burned in its natural state, a significant proportion is used to produce various processed fuels and coal chemicals. Of paramount importance is the manufacture of coke for the steel and kindred industries and, indeed, many coal chemicals are obtained as by-products from coal which in the first place has been carbonized to manufacture coke. (*See* also Carbonization, Low-Temperature; Coke, Coking and High-Temperature Carbonization.)

In the basic coke manufacturing process, one short ton of coal produces about 1,500 lb. of coke, 11,000 cu.ft. of manufactured gas, 10 gal. of coal tar, 3.5 gal. of light oil and 28 lb. of chemicals. There are many processes in which the aim is to gasify the coal completely. The resultant gas may be used directly as a fuel or be further treated to produce fuel oils and various chemicals. as at Sasolburg in South Africa, where eight Lurgi pressure gasifiers each completely gasify 400 tons of coal per day, producing about 20,000,000 cu.ft. of raw gas. This gas is further treated to produce vast quantities of oils and related chemicals. The coal used in this plant comes from a nearby colliery, where mine production costs per ton are considered to be the lowest in the world. Coal is used in the manufacture of such common products as fertilizers, insecticides and disinfectants, food dyes, synthetic rubber, nylon and numerous plastics used in everyday life. The refrigerants in many refrigerators, *i.e.*, carbon dioxide and ammonia, are frequently coal derivatives. Tar and pitch for highways and roofs are important by-products of coal. Photographic sensitizing dyes are a few among the many thousands of dyes derived from coal.

VIII. WORLD PRODUCTION AND RESOURCES

Industrial production and living standards depend decisively upon fuel and power, and although over-all dependence on coal as a primary source of energy has been proportionately reduced during the 20th century coal still supplies much of the world's energy needs. Fig. 11 shows the trends in the United States in the energy supplied by mineral fuels, water power and atomic energy in the 20th century.

A. World Production

Discounting occasional downward trends of short duration, world demand for coal has risen steadily during the 20th century despite the extremely rapid increase in the use of alternative fuels. For the most part this rise in demand has been attributable to a tremendous increase in industrial activity in the western world and, although this stimulus remains, it seems probable that further significant increases in coal production are coupled to the rising needs of the hitherto underdeveloped areas. Improved living standards for the vast populations in these areas require massive increases in indigenous coal production on a scale comparable with that evidenced in Europe and North America during the western Industrial Revolution. In China, for example, official coal production statistics suggest that output was more than doubled in a single 12-month period, rising from 130,730,000 tons in 1957 to 270,000,000 tons the following year. Fig. 12 shows total world production of coal and lignite from the beginning of the 20th century and indicates the falling off in the proportion contributed by the United States and Great Britain. This falling off was not due solely to increased activity in other coal mining countries—although this was the dominant factor—but also, in the case of the United States, to deliberate restriction of coal production to meet a falling domestic demand. More there than in any other major producing country, the coal industry suffered from loss of markets to competitive fuels. Fig. 13 shows the percentage contribution of the various mineral-energy fuels to U.S. energy requirements during the first half of the 20th century.

Following World War II a chronic fuel shortage in Europe temporarily cushioned the impact of competitive fuels on the U.S. coal industry, and exports of American coal increased to a maximum of 80,000,000 tons in 1957. Since that time a reduced European demand has been reflected in a substantial drop in U.S. exports of coal.

World coal production increased markedly after about 1950, reaching more than 2,500,000,000 metric tons by 1960. Most significant was the record production of more than 420,000,000 tons by mainland China in 1960. The U.S.S.R. increased its production by 166,000,000 tons from 1954 to 1960 to replace the United States as the world's leading producer in the latter year, with a total of 513,000.000 tons. It is noted, however, that over 30% of U S.S.R. production was lignite, as compared with less than 1% lignite for the U.S. U.S. production (480,000.000 metric tons in 1956) totaled less than 400,000,000 in 1960, Canada's production was about 10,000,000 and the production of the United Kingdom was down to less than 200,000,000. Production of the Federal Republic of Germany had reached 240.000.000 metric tons; that of the German Democratic Republic 228,000,000. Other important world producers in 1960 included Poland (114,000,000 metric tons), Czechoslovakia (86,000,000) and Hungary (26,000,000) in eastern Europe; France (58,000,000), Belgium (22,000,000) and the Netherlands (12,000,000) in western Europe; Spain (16,000,000); and Yugoslavia (23,000,000). Production in India reached 53,000,000 tons, a figure almost matched by Japan, and both South Africa and Australia produced about 38,000,000 tons. (See also World Coal *Reserves*, below, and articles on individual countries.)

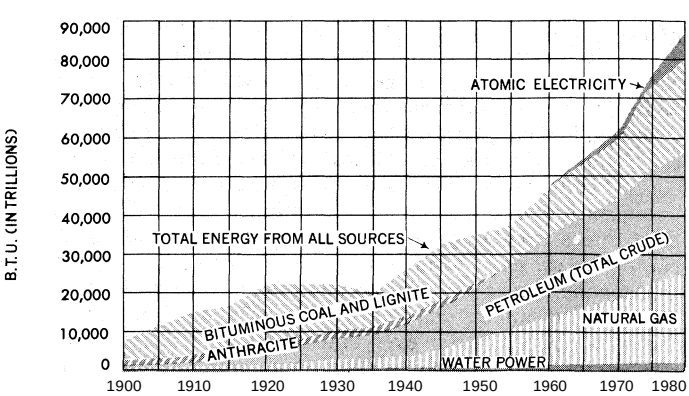

FIG. 11.— ENERGY SUPPLIED BY MINERAL FUELS, WATER POWER AND ATOMIC ELECTRICITY IN THE UNITED STATES, PROJECTED THROUGH THE 1970S.

B. Productivity and Labour

The particular and rather complicated character of coal mining has led to a diversity of conditions of employment probably without parallel in any other major industry. This diversity is due primarily to the fact that mining is dependent on natural conditions to a far greater extent than are manufacturing industries. These conditions vary widely from coal field to coal field and even from colliery to colliery within the same field. Coal seams vary widely in thickness, cleavage, inclination and faulting. They are encountered at differing depths; the roofs and floors vary in competence and dryness; the working places vary in size, layout and distance from the mine outlet. Nor are such features the only causes of variety. The use of machinery, the method of ownership, the scope of mining legislation and finally the accessibility and conditions of the ultimate market all influence in some degree the technical and economic conditions under which the mines are worked. In consequence, the productivity of the individual miner is capable of almost infinite variation from country to country.

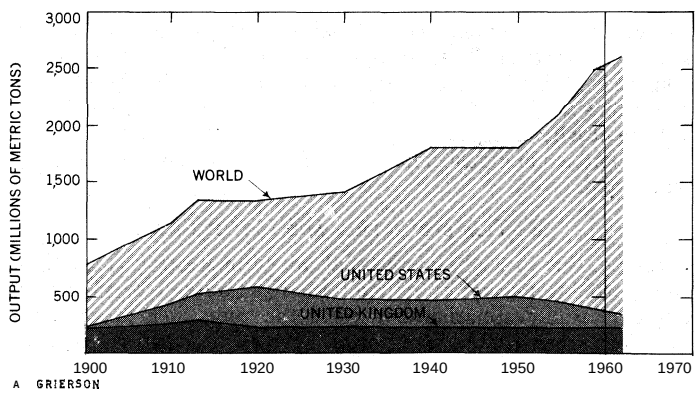

FIG. 12.— WORLD PRODUCTION OF COAL AND LIGNITE

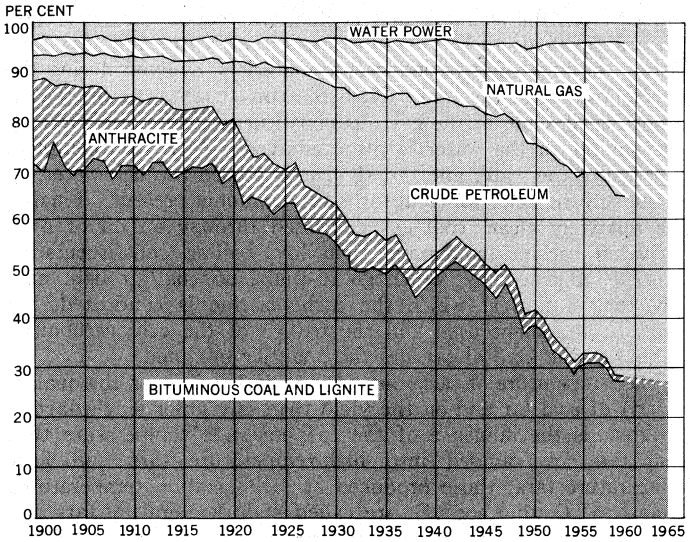
An example of this extreme variation is afforded by a comparison of productivity in United States and Indian coal mines. During one year studied (1958) an average of 360.000 miners were employed in India to produce about 46,000,000 tons of coal. With a labour force of little more than half that of India, the U.S. coal industry produced 392,000,000 tons in the same period.

The extraordinary rise in output of the U.S. coal miner has been due to large-scale introduction of loading machinery underground. By 1960, of the coal won from the underground bituminous mines, more than four-fifths was mechanically loaded; the comparable fraction in Indian mines was less than one-twentieth. In 20 years (1940–60) the productivity of U.S. miners more than doubled and employment declined more than 70%. The rising productivity per miner per day, together with a generally declining market, aggravated employment and other economic problems in coal producing communities, as, for example. in West Virginia.

In Europe, where mining conditions are less favourable than in the U.S., productivity is proportionately less. Although the rise in output per man shift in European coal mines has not been so marked as in North America, steady progress has been maintained chiefly because of increased use of power-loading machinery.

C. World Coal Reserves

Economic and political considerations together with differences in reporting criteria militate against reliable estimations of world



BY COURTESY OF BUREAU OF MINES, U S. DEPARTMENT OF THE INTERIOR, "MINERALS YEARBOOK," VOL II (1960)

FIG. 13.— PERCENTAGE OF TOTAL PRODUCTION OF BRITISH THERMAL UNITS (B.T.U.) EQUIVALENT OF MINERAL-ENERGY FUELS AND ENERGY FROM WATER POWER IN CONTINENTAL UNITED STATES

coal reserves. Even if official national figures purporting to give coal reserves could always be accepted as correct, the situation is often obscured by lack of relevant data. There is, for example, a significant difference between probable and proved total reserves. Again, all proved reserves cannot be considered recoverable. The total coal reserves of the United States are estimated at 1,660,000,000,000 short tons of which half are estimated to be recoverable.

In addition to these massive United States deposits, there are immense coal reserves in Canada, ranging in rank from anthracite to lignite. Total Canadian recoverable reserves are estimated at more than 40,000,000,000 metric tons.

Estimated recoverable bituminous and anthracite coal reserves in the United Kingdom total 48,700,000,000 metric tons. Estimated reserves on the European continent include, in France, 5,700,000,000 metric tons of bituminous and anthracite and 300,000,000 metric tons of other coals (lignites and higher grade lignites); Belgium, 2,800,000,000 tons of bituminous and anthracite; the Netherlands, 5,000,000,000 tons; and Italy, 500,000,000 tons and 800,000,000 tons of other coals. Austria's reserves are estimated at 200,000,000 tons of lignite and higher grade lignite. Turkey's reserves include 1,000,000,000 tons of bituminous and anthracite and 300,000,000 tons of other coals. Norway's bituminous and anthracite reserves amount to 2,500,000,000 tons and Sweden's to 100,000,000. Reserves of the Federal Republic of Germany amount to 70,000,000,000 metric tons of bituminous and anthracite and 63,000,000,000 of other coals, and those of the German Democratic Republic to 200,000,000 and 28,600,000,000 respectively. Yugoslavia has reserves of 12,100,000,000 tons of which 100,000,000 are bituminous and anthracite. Hungary has 1,600,000,000 tons of lignites and higher grade lignites; Rumania, 1,700,000,000 tons of bituminous and anthracite and 1,100,000,000 of other coals; Bulgaria, 100,000,000 and 1,400,000,000; Poland, 71,000,000,000 and 1,000,000,000; and Czechoslovakia, 100,000,000 and 12,000,000,000. The estimated reserves of the U.S.S.R., including all types, are 425,600,000,000 metric tons.

Other major coal deposits occur in Asia and Australasia, particularly in the former. The original estimate of the 12th International Geologic congress in 1913, estimating China's coal reserves at 995,587,000,000 tons, was challenged by geologists as an overestimate, and in 1926 the Chinese geological survey offered a conservative estimate of 217,626,000,000 tons. However, since the Communist regime, upward revisions have been made which suggest that Chinese coal resources are not far short of the figure given in the 12th International Geologic congress. Whatever the true figure, the fact remains that China must be considered as possessing a large fraction of the world's coal reserves. Other major Asiatic deposits are found in Japan, and are estimated to total 7,869,000,000 metric tons.

Although when the world's total coal reserves are considered as a whole it is seen that they are sufficient to maintain current output for very many centuries, distribution is nevertheless so inequable that already some major producing countries are experiencing a shortage of certain coals—particularly coals suitable for the manufacture of high-grade coke. *See* FUELS; *see* also references under "Coal and Coal Mining" in the Index volume.

COALFISH *(Pollachius virens),* a fish of the cod family (Gadidae), with three dorsal and two anal fins, distinguished from the cods (*Gadus* species) by its blackish colour, prominent lower jaw and very small barbel. It ranges from the Arctic ocean to the Bay of Biscay and Chesapeake bay, and grows to a length of about three feet. It is sometimes called pollock. (C. Hu.)

COAL GAS: *see* FUELS; GAS INDUSTRY.

COALITION, a combination of bodies or parts into one body or whole, from the Latin word *coalitio,* from *coalescere,* "to grow together" The word is used, especially in a political sense, of an alliance (*q.v.*) or temporary union for joint action of various powers or states, such as the coalition of the European powers against France during the wars of the French Revolution *(see* FRENCH REVOLUTIONARY WARS) and Napoleonic empire *(see* NAPOLEONIC CAMPAIGNS); the word is also used to describe the union in a single government of distinct parties or members of distinct parties.

Modern war demands that allies engage in a joint effort far more intimate than was called for by treaties of alliance in an earlier day. Anglo-French relations during World War I, strained by the difficulties of reaching agreement on a military strategy, a unified command or an equitable sharing of sacrifice, illustrate the problems of integrating the war effort of allies. Anglo-American relations during World War II were not uniformly smooth; but a series of conferences between Prime Minister Winston Churchill and Pres. Franklin D. Roosevelt *(see* WORLD WAR II CONFERENCES, ALLIED); the erection of a number of "combined" agencies for military and economic planning, and the appointment of inter-allied supreme commanders for each major theatre of the war made the coalition effort relatively harmonious.

In the second half of the 20th century, strategists believed that war could be fought successfully only if everything were in readiness on the first day of the war. Greater importance was attached in the era of thermonuclear weapons to a strategy of deterrence. It was felt that coalition diplomacy and coalition military planning must, therefore, as in the North Atlantic Treaty organization (*q.v.*), precede rather than follow the outbreak of war. In domestic politics, coalitions are normal in countries with multiparty political systems. In countries with two-party systems, coalitions are characteristic only of war or other grave emergency. See also WARSAW TREATY ORGANIZATION; AMERICAN STATES, ORGANIZATION OF; PAN-AMERICAN CONFERENCES.

(W. T. R. F.)

COAL TAR is the primary condensation product resulting from the carbonization of coal; *i.e.,* the heating of coal in the absence of air, at temperatures ranging from about 900° C. to about 1,200° C. It is a black, viscous, sticky fluid whose density is greater than that of water. A vast number of chemical compounds, many of which are of commercial importance, have been derived from coal tar.

History.—J. J. Becher, a German professor of medicine, is credited with having discovered coal tar sometime prior to 1665. When the supply of American wood tar, used for treating ships' bottoms, was cut off during the Revolutionary War, coal tar was manufactured for this purpose in England.

The introduction of coal-gas lighting in England in 1792 created a large supply of coal tar as a by-product. Up to the middle of the 19th century the commercial applications of coal tar were few and on a small scale; and it became common practice to dump this "waste material" into streams in the neighbourhood of the gas works. The first of a series of minor industrial uses for coal-tar distillates was developed in 1820, when Charles Mackintosh used naphtha derived from them to produce a solution of rubber for waterproofing cloth. About five years later, coal-tar distillates were used as a preservative for railroad ties. (See CREOSOTE.) In 1842 coal-tar pitch was used for briquetting coal.

In 1843 A. W. von Hofmann, a professor at the Royal College of Chemistry in London, discovered that aniline was present in coal tar; in 1845 he succeeded in extracting benzene from coal-tar distillates. In 1856 W. H. Perkin—a former pupil of Hofmann and at the age of 18 his laboratory assistant—extracted the first coal-tar dye, mauve, from aniline. In 1868 two German chemists, Carl Graebe and Carl Liebermann, experimenting with coal-tar anthracene, synthesized alizarin, or turkey red, a widely used dye that previously had been obtained only from the roots of the madder plant. Coal tar, once a public nuisance, rapidly assumed an important place in world economy; 50,000 ac. in France, and at least five times that number in the rest of Europe and in Asia Minor that had been devoted to producing madder, were released for cultivation of food. In 1897 a synthetic indigo derived from coal tar was placed on the market in Germany, eventually releasing an additional 1,000,000 ac.

In its medical history, coal tar has played a double role. The discovery of the antiseptic properties of carbolic acid (phenol) by Sir Joseph Lister in 1865 was the forerunner of many pharmaceutical uses for coal-tar derivatives. On the other hand, some coal-tar products are believed to contribute to cancer. (See CARCINOGENIC CHEMICALS; CANCER RESEARCH.)

Coal tar was first used to surface roads in 1901. The new industrial field of coal-tar plastics was opened in 1907 when Leo Baekeland discovered the bakelite resins; these are made from phenols and formaldehyde. Another major industry was created with the synthesizing of nylon and other artificial yarns from coal-tar constituents.

PRODUCTION PROCESS

The manufacture of coal tar and related products starts with the placing of coal in a chamber, and the heating of it out of contact with air. The coal is thereby decomposed into volatile products and into a nonvolatile residue, coke. The volatile products are composed of condensable materials and noncondensable gases. As the volatile products are formed they are removed from the chamber and cooled, whereupon the water and tar are liquefied; these two substances (*i.e.,* water and tar) constitute the bulk of the condensable materials evolved during the decomposition of the coal. With the condensation of the water, a portion of some of the gaseous constituents which are more or less soluble in the water is also removed. After the complete removal of the water and tar, the gas is passed through water, or dilute sulfuric acid, which absorbs the ammonia present. Finally, the relatively clean, cool gas is passed through an oil or over activated carbon to remove such low boiling constituents as benzene, toluene, etc., which go to make up coal-tar light oils. The temperature at which the carbonization is conducted, the type of equipment used and the nature of the coal carbonized determine the kind of tar and the quantity obtained.

The temperature of carbonization has more effect on the quality (kind) of coal tar and on the yield than any other single factor. So great is the influence of the carbonization temperature that coal tars are divided into high-temperature tars and low-temperature tars; those produced at carbonization temperatures from 900° C. to 1,200° C. are called high-temperature tars and those produced at carbonization temperatures from 450° C. to 700° C. are called low-temperature tars (see TARS, LOW-TEMPERATURE).

Low-Temperature **Carbonization.**—When coal is heated, in the absence of air, to a temperature of about 450° C., the coal begins to decompose and an evolution of gaseous products occurs., As these gases are liberated from the coal mass they come in contact with the walls of the carbonizing chamber before they escape and are condensed. If the walls of the carbonization chamber are at about 450° C., the gaseous products are not changed by coming in contact with them and the tar recovered from the gases is a true low-temperature tar, called a primary tar. If, however, as is the case in the commercial production of coal tar, the walls of the chamber are at a higher temperature, the gases evolved from the coal at 450° C. are altered when they come in contact with the hotter walls. The type of change which occurs at these hot walls, as well as the portion of the gases that undergoes change, depends upon the temperature of the walls and the length of time the gases are in contact with the hot walls.

Although it is customary to say that the coal is carbonized at a low temperature or at a high temperature, this is not strictly correct. The coal is not carbonized *at* a temperature but to a temperature. The initial decomposition of the coal takes place at about 450° C. As the carbonization progresses, the temperature of the decomposing coal rises. If the carbonization process is discontinued when the temperature of the decomposing coal mass reaches about 700° C., and if the gases do not come in contact with walls which are at a temperature above about 700° C.. the tar recovered is a low-temperature tar. If the decomposing coal is heated to a higher temperature, 900° C.–1,200° C., further decomposition of the coal mass takes place; the gaseous products evolved at these higher temperatures are of a different nature from those evolved at the lower temperature.

High-Temperature Carbonization.— In commercial carbonization of coal, the heat needed is usually supplied through the walls of the retort. In high-temperature carbonization processes the temperature of the retort walls varies from about 900° C. to about 1,200° C. In such retorts the coal close to the hot walls is quickly heated to the temperature of the walls, and the gaseous products evolved come in contact with the hot walls before they escape; the tar thus produced is truly a product of high-temperature carbonization. However, the coal farther removed from the walls is heated more slowly, the gases are first evolved at low temperatures, and if all of these gases could be condensed without coming in contact with the hot walls (900° C.–1,200° C.) a low-temperature tar would be obtained, but most of these gases do come in contact with the hot walls and are thereby altered. As the carbonization proceeds the temperature toward the centre of the charge increases and slowly approaches that of the walls. The higher temperature causes further decomposition of the coal. The type of products obtained by this later decomposition is different from that first obtained.

The tar recovered from commercial high-temperature carbonization is a mixture of products resulting from the high-temperature decomposition of the coal and of the products formed by the thermal decomposition of the low-temperature and intermediate-temperature tars evolved from the coal.

Chambers. — Two general classes of chambers are used for the production of coal tar: (1) gas retorts, which are relatively small chambers; and (2) by-product coke ovens, which are much larger. Most gas retorts are either horizontal or vertical. Horizontal retorts, the oldest form of gas retorts, vary from about 8 ft. to about 20 ft. in length; they have a shape which is approximately that of a half cylinder with the flat portion forming the floor of the retort. A group of these retorts is built up into banks or "benches"; around the outside of the retorts and through the benches there is a system of flues through which flow the hot gases which thus heat the walls of the retort. Horizontal retorts are heated to about 1,000° C. to 1,100° C. throughout their entire length. The tar liberated from the coal during carbonization in a horizontal retort is in contact with the hot retort walls for a long time before it escapes to the condensing equipment. This prolonged exposure to the high temperature alters a large portion of the tar. Although the walls of horizontal retorts are not much hotter than those of the by-product coke ovens, the ratio of wall surface to coal charge is high and therefore the tars obtained from horizontal retorts have undergone considerable decomposition after their liberation from the coal. Horizontal retort tars are high-temperature tars; they have high specific gravities, are viscous, have only a small amount of tar acids and are high in naphthalene content.

The vertical retorts are the most popular gas retorts in England. These retorts are vertical tubes having an elliptical or rectangular cross section. They are usually about 20–25 ft. long and measure 5 ft.–10 ft. by 8–18 in. in cross section. The retorts are grouped in settings. They are heated by means of hot gases passed through flues arranged between individual retorts. Vertical retorts are either of the intermittent or continuous type. In the operation of vertical retorts, coal is charged in at the top and the coke is discharged at the bottom. In the continuous vertical retort, as the coal moves downward it slowly passes through zones of increasing temperatures. The decomposition of the coal starts in the cooler upper regions of the retort and the tars formed there escape from the retort without much change; some of the tar formed in the lower portions of the retort is decomposed by coming in contact with the hot retort walls, but most of this tar passes up through the coal bed and escapes without being thermally decomposed. Hence, the tar which emerges from the vertical retort is a combination of tars, most of which have been subjected to only low-temperature conditions, some that have been exposed to medium-temperatures and a small portion that has been exposed to high-temperatures. Although vertical retorts are considered to be a type of high-temperature carbonizing equipment, the tars produced in these retorts have characteristics intermediate between those of low-temperature and high-temperature tars.

As was mentioned above, the other general type of equipment used to produce tar is the by-product coke oven. More than three-fourths of the tar produced in the United States is by-product coke-oven tar. The modern by-product coke oven is rectangular in shape, about 40 ft. long, 14 ft. high and 16 in. wide. The ovens are built in long rows, called "batteries." The two long walls of the oven are heated by flues in which gas is burned to furnish the heat. These ovens are operated in an intermittent manner. Coal is charged into the ovens through removable doors in the top. After the carbonization is complete, doors at both ends of the oven are opened and the red-hot coke is pushed out by means of a long steel ram. Then another charge of coal is introduced and the process repeated. Some of the gaseous products evolved from the coal during carbonization pass upward along the hot walls of the oven, some of them pass through the uncoked centre of the coal charge. but some of them pass through the coked and partly coked region of the charge; these gases are largely decomposed as they pass through the heated zones so that a high-temperature tar is formed.

Coal. — Commercially, coal tar is produced by the carbonization of bituminous coal of the common banded variety. The yield of tar obtained is dependent upon the amount of volatile matter in the coal. When coal is carbonized at high temperatures there seems to be little relationship between the properties of the tar produced and the nature of volatile matter originally present in the coal; the thermal decomposition of the primary tars equalizes their properties.

DISTILLATION OF COAL TAR

The raw tar is processed in various ways to produce a variety of products. The processing is carried out either at the plant which produced the tar or at conveniently located tar processing plants. The processor of coal tar has long been known as a tar distiller.

Usually the first step in processing coal tar is to give it a primary distillation to produce a number of fractions or cuts. The number of cuts made and the nature of the cuts vary somewhat at the different plants. In general, at least three cuts are made. These are frequently referred to as light oil, middle oil and heavy oil; the middle oil is also known as tar-acid oil and as crude naphthalene oil; the heavy oil is sometimes called anthracene oil. The material remaining after the removal of the oil distillates is usually either a pitch or a refined road tar base; occasionally, the distillation is carried on until the residue is pitch coke.

The primary distillation is made either in batch stills or in continuous stills. In the United States the commonly used batch still is a horizontal, cylindrical steel vessel; in England it usually is a vertical cylindrical vessel, known as a "pot still." Capacity of the batch stills varies from about 3,000 to about 8,000 gal..

In the continuous distillation of coal tar the most generally used equipment is a tube still, also called a pipe still. Essentially, the tube still consists of a furnace containing a tube several hundred feet long. The tube is either in the form of a spiral or more commonly in straight lengths connected in a continuous manner by means of return bends. The diameter of the tube varies in the different plants but is usually between one inch and five inches.

When tar is processed in a continuous manner in a tube still, it is pumped through the hot tube whereby it is heated to a predetermined temperature. After passing through the tube the hot tar is released either into one tall fractionating column or into several shorter columns which are connected in series. In the fractionating equipment the tar is separated into oil vapours and either a pitch or an intermediate product, as desired. The oil vapours are collected into such cuts as are wanted; the pitch is pumped to storage.

How far the tar is distilled depends upon the products to be manufactured. If the plant is interested primarily in the distillate oils, the tar is distilled to either a hard fuel pitch or even to pitch coke. On the other hand, if the plant is to make specific residual products, such as road tar, electrode pitch, briquetting pitch or roofing pitch, the distillation is stopped at an appropriate intermediate point. In some of the smaller tar distilling plants, the oils obtained by the distillation of coal tar are mereiy mixed together to make creosote oil. In the larger refineries various chemical compounds are removed from the distillate oils prior to blending them to produce creosote oil.

The coal-tar distillate oils are complex mixtures of hundreds of chemical compounds. Most of these compounds fall into one of three groups: hydrocarbons, acids and bases. Mainly, the hydrocarbons present in coal-tar distillates belong to the aromatic series; typical coal-tar hydrocarbons are benzene (*q.v.*), naphthalene (*q.v.*) and anthracene (*q.v.*).

The acidic compounds occurring in coal-tar oils are chiefly phenolic compounds, such as phenol (*q.v.*), cresols (*q.v.*), xylenols (dimethylphenols) and naphthols (see NAPHTHALENE). Coal-tar bases are cyclic nitrogen compounds; they have the nitrogen either attached to the ring as in aniline (*q.v.*) or forming a member of the ring as in pyridine (*q.v.*); in addition to aniline and pyridine, the picolines (see PYRIDINE), quinoline (*q.v.*) and acridine are typical coal-tar bases. Besides hydrocarbons, acids and bases. the coal-tar oils contain: nonacidic oxygen compounds,

such as coumarone and diphenylene oxide; nonbasic nitrogen compounds of which carbazole is the most important and organic sulfur compounds; *e.g.*, the mercaptans and thiophenols. Appended to this article is a list of compounds that have been identified in coal-tar oils.

Tar Acids.—After the tar has been distilled and the desired cuts obtained, the next processing step in a coal-tar chemical plant is the extraction of the tar acids. These phenolic compounds react with caustic soda to form water-soluble salts. By means of this ability to form water-soluble salts they are separated from the other compounds present in the coal-tar distillates. The process used for the recovery of tar acids is essentially the same in all plants. The light-oil and the middle-oil fractions are washed separately with a dilute aqueous caustic soda solution by thoroughly mixing the two liquids. The mixture is then allowed to settle, whereupon it stratifies into two layers. The lower layer is the caustic soda solution of the tar acids, which solution is called "carbolate"; the upper layer consists of the oils which are not soluble in the caustic soda. The caustic soda solution is separated from the oil layer. Usually, the carbolates from the light-oil fraction and from the middle-oil fraction are combined for further purification; such purification comprises the removal of noncaustic soluble oils that were entrained in the carbolate and is usually accomplished by steaming. The tar acids are liberated or "sprung" from the purified carbolate by treating it with sulphuric acid or with carbon dioxide. The crude mixture of phenols thus obtained is subjected to fractional distillation, usually under vacuum, to obtain a number of products: phenol, orthocresol, cresylic acid and mixed xylenols; cresylic acid is a mixture of tar acids consisting largely of the three cresols (*o*-cresol, m-cresol and *p*-cresol) but also containing appreciable amounts of phenol and of the various xylenols.

By special processing, largely in the United States, the cresylic acid and the mixed xylenols are separated into the individual cresols and the individual xylenols. The individual tar acids which are commercially available are shown in italics in the list at the end of this article. The tar acids present in the heavy-oil fraction are also recovered in some plants. These high-boiling tar acids are seldom fractionally distilled; they are usually used in the form of crude mixtures in the preparation of disinfectants possessing exceptionally high germicidal properties.

Tar Bases.—The more progressive coal-tar refineries recover the basic constituents present in the distillate oils. After the tar acids have been removed, the distillate oils are thoroughly mixed with a dilute aqueous solution of sulfuric acid. The sulfuric acid reacts with the coal-tar bases present to form nater-soluble sulfates. Upon standing, the mixture stratifies into two layers: a lower aqueous sulfuric-acid layer containing the coal-tar base sulfates and an upper layer of neutral oil. The base sulfate solution, after being separated from the neutral oil, is purified to remove any entrained neutral oil. Then the bases are sprung by treating the solution with an excess of caustic soda or with a lime slurry. The crude mixture of bases is then subjected to fractional distillation to obtain various ihdividual bases. The bases recovered from the light-oil fraction are pyridine, the picolines, the lutidines and some aniline bases. Frequently, a mixture of light bases is sold as "denaturing pyridine"; such mixtures were added to grain alcohol to make it unfit for human consumption; as the chemical uses for pyridine bases developed, the amount of bases sold as denaturing pyridine became small. From the middle-oil fraction are recovered quinoline, isoquinoline, methylquinolines and acridine.

Beta-picoline, gamma-picoline and 2,6-lutidine all boil at about 144° C. Because the boiling points of these three constituents of the light coal tar bases are so close together it is not possible to separate them from each other by ordinary fractional distillation.

In 1941 U.S. chemists found that these three bases could be separated readily from each other by the simple expedient of steam distillation through an efficient fractionating column. This discovery of a means of separating pure beta-picoline from coal-tar bases was an important and timely one, for just then there arose a demand for beta-picoline in the manufacture of nicotinic acid, the pellagra preventive factor of the vitamin B complex. The simplest and the most direct way of preparing nicotinic acid is by the oxidation of beta-picoline. Another commercial method for preparing nicotinic acid involves the oxidation of quinoline to quinolinic acid and then decomposing the quinolinic acid to nicotinic acid. In a few plants the tar bases present in the heavy-oil fraction are recovered. The mixture of bases thus obtained is a valuable inhibitor in the pickling of steel; it prevents the acid from attacking the steel but does not interfere with the action of the acid in dissolving the scale that is to be removed.

Naphthalene.—After the tar acids and the tar bases have been extracted from the middle oil, the "washed" oil is fractionally distilled to produce a heavy coal-tar solvent naphtha and a naphthalene fraction. The naphthalene fraction, while it is hot, is run into shallow pans; there it cools and crystallizes. The solidified mass is broken into large pieces, which are transferred to a crusher. By being crushed into fairly small pieces the solid chunks are transformed into a thick slurry of crystalline naphthalene suspended in an oil. The naphthalene is separated from the oil either by means of a centrifuge or a hydraulic press. The resulting crude naphthalene is used without further purification for many purposes. For other uses a pure naphthalene is needed. The crude naphthalene is refined by first treating it with either sulfuric acid or metallic sodium, and then distilling it. The distilled liquid naphthalene is usually passed over water-cooled steel rolls whereby it is solidified in thin layers which are then scraped to give "chipped naphthalene"; sometimes the naphthalene is allowed to solidify in pans and then is crushed to give "crystalline naphthalene"; the purest naphthalene is made by sublimation.

Higher Coal-Tar Hydrocarbons.—For the recovery of such higher boiling coal-tar hydrocarbons as acenaphthene, fluorene, phenanthrene (*q.v.*), anthracene (*q.v.*), pyrene and chrysene, the heavy-oil cut is distilled to obtain fractions rich in the particular compound desired. Such fractions are then chilled to cause the compounds to crystallize. The crystalline substances are separated from the oil and are then purified, usually by recrystallization from solvents.

Light Oil.—The first fraction obtained in the distillation of coal tar is "light oil." It contains the lower boiling constituents of coal tar; *i.e.*, benzene (*q.v.*), toluene (*q.v.*) and the xylenes (*q.v.*). Because of the low boiling point of these compounds only a small portion of them is condensed with the tar; most of them are recovered from the coke-oven gases in a separate step after the tar has been condensed. Because the quantity of light oil recovered from the coke-oven gases is so much greater than that recoverable at the tar distillation plant, it is seldom profitable to refine light oil at a tar refinery. Practically all the processing of light oil is carried out at the tar producing plants.

After the tar and water have been condensed, and usually after the ammonia has been removed, the coke-oven gases are treated to recover the light oil. It is recovered from the gases by scrubbing them with high-boiling coal-tar or petroleum oils, or by absorption on activated carbon. In the oil-washing process the coke-oven gases are passed through a suitable high-boiling tar oil or petroleum oil, which dissolves the light-oil components. The light oil is recovered from the wash by steam distillation in a stripping column; the wash oil is used again to scrub more coke-oven gases. In the activated carbon process the coke-oven gases are passed through a bed of activated carbon which absorbs the light oil. The latter is recovered from the carbon by steaming it; the carbon is re-used.

The refining of coal-tar light oils is essentially a combination of fractional distillation and sulfuric-acid washing. A common practice is first to fractionate the light oil to obtain several crude cuts: forerunnings (the most volatile fraction), benzene, toluene, light-solvent naphtha and heavy-solvent naphtha. The further processing of the crude benzene depends upon the use to which it will be put; if it is to be used as a motor fuel, its further processing consists in the addition of an antioxidant; if. however, the benzene is to be used as a chemical or for industrial solvent purposes, it is washed with sulfuric acid and then distilled. The process for refining the crude toluene fraction and the crude light-solvent naphtha fraction is the same as that for the crude benzene.

The crude heavy-solvent naphtha is the main source of the coumarone-indene resins. In order to produce these resins the naphtha is subjected to a special processing. First it is washed with dilute sulfuric acid to remove the bases. Then the resin-forming constituents, the coumarones and the indenes, are polymerized (resinified) by vigorously agitating the washed naphtha with small quantities of concentrated sulfuric acid. The polymerized product is separated from the unreacted oils, dried and polymerized further by heating.

Light **Pyridine** Bases.—Because of their widely different boiling points, and because of their solubility in water and in oils, the pyridine bases formed by the carbonization of coal are divided between the tar and the gases remaining after the tar has been condensed. In 1937 the demand for pyridine made it desirable to recover more bases from the coke-oven gas. As described above, after the water and the tar have been removed, the remaining gas is passed through dilute sulfuric acid to absorb the ammonia present; the sulfuric acid at the same time absorbs the pyridine bases. The separation of the pyridine bases from the ammonia liquor is accomplished in many ways, usually by neutralization and distillation

Most of the pyridine, picolines and lutidines of commerce are produced from the light pyridine bases recovered from the coke-oven gases.

Road Tar.—In the manufacture of road tar, the crude tar is distilled to obtain a "road tar base." which is a soft pitch. The road tar base is then cut back or thinned by the addition of a suitable flux oil; the flux oils most commonly used are water-gas tar distillates, coal-tar oils or a light water-gas tar. The extent to which the base is thinned is governed by the particular requirements in each case.

CONSTITUENTS

The chemical constituents identified in coal tar are listed below. The compounds are grouped by their chemical nature. In the various groups. they are listed in the order of increasing boiling points. Those hydrocarbons phenols and bases which are printed in italics have been produced commercially.

Hydrocarbons.—n-pentane. isobutylacetylene, pentene-1, cyclopentadiene 41° C, 1,1-dimethylallene, valylene (1,4-pentadiene), 1-methylbutadiene. propylacetylene methylethylacetylene, n-hexane, hexene. 2,3-dimethylbutadiene, diethylacetylene, butylacetylene, *benzene* 80° C.. cyclohexane (hexahydrobenzene), cyclohexene (tetrahydrobenzene), dihydrobenzene, methylpropylacetylene (4-hexyne), heptene, *n*-heptane, *toluene* 110 8° C., n-octane, ethylbenzene. *m-xylene* 139.3° C.. *p-xylene* 138.4° C., 1,2;4-trimethylcyclohexane, *o-xylene* 144° C., styrene, cumene (isopropylbenzene), decane, n-propylbenzene, *m*-ethyltoluene, *p*-ethyltoluene, mesitylene (1.3.5-trimethylbenzene). *o*-ethyltoluene, pseudocumene (1,2,4-trimethylbenzene), *dicyclopentadiene* 170° C.. hemimellitene (1,2,3-trimethylbenzene), cymene (*p*-methylisopropylbenzene), hydrindene, *indene* 182° C., 1-ethyl-3,4-dimethylbenzene, *n*-undecane, durene (1,2,4,5-tetramethylbenzene), isodurene (1 2,3,5-tetramethylbenzene), 4-methylindene, *tetrahydro*naphthalene, naphthalene 218° C., dimethylindene, *2-methyl*naphthalene 241.1° C., *1-methylnaphthalene* 244.8° C., 1-ethylnaphthalene, 1-ethylnaphthalene, *diphenyl* 255.2° C.. 2.6-dimethylnaphthalene, 2.7-dimethylnaphthalene 1,7-dimethylnaphthalene. 1,6-dimethylnaphthalene, 1.5-dimethylnaphthalene 2,3-dimethylnaphthalene. 1,2-dimethylnaphthalene, 3-methyldiphenyl, 4-methyldiphenyl, 1,3,7-trimethylnaphthalene, *acenaphthene* 280.7° C . 2,3,5-trimethylnaphthalene, 2,3,6-trimethylnaphthalene, 3,4′-dimethyldiphenyl, 4 4′-dimethyldiphenyl, γ-diphenylenemethane, 4,5-benzondane (1,2-cyclopentanonaphthalene), *fluorene* 298" C., paraffin (octadecane), heneicosane. 2-methylfluorene, 3-methylfluorene, tricosane. tetracosane. pentacosane. docosane, nonadecane, hexacosane. heptacosane, octacosane, *phenanthrene* 340° C.. anthracene 342 3° C., 3-methylphenanthrene, 4,5-phenanthrylenemethane, 9-methylphenanthrene, 1-methylphenanthrene, 2-phenylnaphthalene, naphthacene, 2-methylanthracene, 2,7-dimethylanthracene, 1,2,3,4-tetrahydrofluoranthene, truxene, *fluoranthene* 384° C, *pyrene* 393° C., retene (8-methyl-2-isopropylphenanthrene), 1,2-benzofluorene (naphthofluorene), 2,3-benzofluorene (isonaphthofluorene), naphtho-2′,3′-1,2-anthracene, 1,2-benzonaphthacene. chrysene 448.5° C., triphenylene, crackene, benzerythrene, 1,2-benzanthracene, perylene. 4,5-benzopyrene, 1,2-benzopyrene, 3,4-benzopyrene, picene, 1,12-benzoperylene.

Phenols.—phenol 183° C., o-cresol 191° C . *p-cresol* 201° C., *m-cresol* 202° C , *1,3,4-xylenol* (2,4-dimethylphenol) 211° C., 1,3,2-xylenol (2.6-dimethylphenol), *1,4,2-xylenol* (2,s-dimethylphenol) 211.3° C.. m-ethylphenol 219° C., *p-ethylphenol* 218° C., 1,2,3-xylenol (2,3-dimethylphenol), *1,3,5-xylenol* 220° C., *1,2,4-xylenol* (3,4-dimethylphenol) 226° C., pseudocumenol (2,4,5-trimethylphenol), *1,3,5-methylethylphenol* 236° C., isopseudocumenol (2,3,5-trimethylphenol), 7-hydroxycoumarone, 4-hydroxyhydrindene, 3.4,j-trimethylphenol, durenol (2,3,5,6-tetramethylphenol), 5-hydroxyhydrindene, o-phenylphenol 27j° C., *α-naphthol* 280° C., *β-naphthol* 286° C., p-phenylphenol 319° C., tetramethylbiphenol. 2-hydroxydiphenyleneoxide, 2-hydroxyfluorene, hydroxyanthracene, 2-hydroxyphenanthrene (2-phenanthrol).

Nitrogen **Bases.**—*pyridine* 115° C., *α-picoline* (2-methylpyridine) 129° C., *β-picoline* (3-methylpyridine) 144° C., *2,6-lutidzne* (2,6-dimethylpyridine) 143.8° C., *γ-picoline* (4-methylpyridine) 145.4° C., *2,4-lutidine* 157° C., *2,5-lutidine* 156° C , 2,3-lutidine, 3 4-lutidine, 4-ethylpyridine, 2.4.j-trimethylpyridine, 2,3,4-trimethylpyridine, 3,5-lutidine, symmetrical collidine (2,4,6-trimethylpyridine), 2,3,6-trimethylpyridine, *aniline* 184° C., *p-toluidine*, 200 4° C. *o-toluidine* 200 7° C., *m-toluidine* 203 3° C., 2,4-xylidine, 2,5-xylidine, 3,5-xylidine, 2,3-xylidine, 2,3,4,5-tetramethylpyridine, quinoline 238" C., *isoquinoline* 243.2" C., *quinaldine* (2-methylquinoline) 247.6' C., 8-methylquinoline, 3-methyl-*isoquinoline* 252.2° C., *1-methylisoquinoline* 2j5.2° C., 2,8-dimethylquinoline. 7-methylquinoline, 6-methylquinoline, 3-methylquinoline, j-methylquinoline, *lepidine* (4-methylquinoline) 264.2° C., 5,8-dimethylquinoline, 2,4,6-trimethylquinoline, hydroacridine, *α-naphthylamine* 301° C.. *β-naphthylamine* 306° C., *acridine* 346° C., phenanthridine, phenanthridone.

Sulfur **Compounds.**—ethylmercaptan, dimethylsulfide, carbon disulfide, ammonium sulfide, thiophene, diethylsulfide, 2-methylthiophene, 3-methylthiophene trimethylthiophene, thiophenol, ammonium thiocyanate. *o*-thiocresol, thionaphthene, methylthionaphthene. diphenylene sulfide, dibenzothionaphthene.

Nonphenolic Oxygen Compounds.—acetone, ethyl alcohol, methylethylketone acetic acid, propionic acid, coumarone. 6-methylcoumarone, 3- or j-methylcoumarone, 4-methylcoumarone, acetophenone. 3,6-dimethylcoumarone, 4,5-dimethylcoumarone, 4,6-dimethylcoumarone, benzoic acid. α-naphthofurane, β-naphthoiurane. *diphenylene* oxide, 1-methyldiphenyleneoxide. 2-methyldiphenyleneoxide, 2,3,5,6-dibenzocoumarone, 1,9-benzoxanthene.

Nonbasic Nitrogen **Compounds.**—methylisocyanide, *acetonitrile* (methyl cyanide). pyrrole, benzonitrile, indole, 3-methylindole (skatole). 7-methylindole, 4-methylindole, j-methylindole, 2-methylindole, 1-naphthonitrile (1-cyanonaphthalene). 2-naphthonitrile *carbazole,* 2-methylcarbazole, 3-methylcarbazole, 2,3-benzocarbazole.

COAL-TAR DYESTUFFS: see **Dyes.**

COALVILLE, an urban district in the Bosworth parliamentary division of Leicestershire, Eng., about 12 mi N W. of Leicester by road. Pop (1961) 26.159. It is a town of modern growth, a centre of the coal-mining district of Leicestershire. Bricks and tiles are also made there.

To the north is Whitwick, with Castle hill, formerly the site of a Norman castle, and beyond are the remains of the nunnery of Gracedieu, founded in the 13th century. In Charnwood forest is the Cistercian abbey of Mount St. Bernard.

COAST, that part of the land that borders the sea. The term is also applied to the shores of large lakes. It is also used to designate certain coastal areas such as the Gulf coast and the Malabar coast. The problem of classification of the world's coasts is difficult. Since the peak of the last glacial period all the coasts of the norld have been subjected to a 200 ft. or greater rise of sea level; but during this period some coasts have been rising, some

sinking and some remaining stationary.

Mountainous coasts commonly have even, smooth, regular outlines with few indentations or bays. The coast of California is one example of this type, as is much of the west coast of South America. These are rocky coasts. Another relatively smooth shore line is formed by the coastal edge of level plains. The Gulf coast of southern United States is an example. It is low, made up of unconsolidated material and marked by numerous long offshore bars. Such coasts are difficult for ships to approach, because the only access is provided by narrow channels through the offshore bars. When rougher plains are inundated by the sea a more irregular coastal outline is formed with numerous wide-mouthed bays and estuaries. Much of the northeast coast of the United States and many coastal strips in western Europe are of this type. Ria coasts are the seaward margins of hilly lands and are even more intricately and deeply indented because the lower ends of the inundated river valleys are deeper and more numerous. The classic example is the northwest coast of Spain.

Probably the most deeply and intricately indented of all coasts are the fiord (*q.v.*) coasts of Alaska, Norway, Chile and the South Island of New Zealand. Such coasts have a bewildering array of long, deep, narrow bays, islands and inner passages. (W. C. C.)

COAST DEFENSE. Throughout history military and naval forces have looked upon protection of their country's coast against attack and invasion as one of their most important missions, but only in modern times have they constructed elaborate coast defense works for the purpose. The military history of ancient Greece and Rome records countless raids on enemy coasts and actual invasions or attempted invasions by sea-borne forces, but it tells us little about fixed coast defenses. The Persian host that invaded Greece in 490 B C. landed unopposed on a small plain at Marathon. The Greeks won the historic battle that ensued without benefit of coastal fortifications. The Romans showed a genius for constructing inland fortifications but made little effort to fortify their seacoasts. Caesar encountered no coast defense works when he invaded Britain nor did William the Conqueror more than a thousand years later.

In later years, when England had become a great seafaring nation, it placed primary reliance for coast defense on its naval power, though Henry VIII took the precaution of building a series of forts, sometimes called castles, along the southern coast. The defeat of the Spanish Armada in 1588 was brought about by British ships meeting the enemy in the channel, not by land fortifications. Other seafaring nations followed England's example for centuries. but with the development of powerful long-range naval guns the need for fixed coast defenses to protect harbours, cities and other strategic points became apparent. Such defenses relieved the navy of purely defensive functions and gave it greater freedom for maneuver and aggressive action.

During the 19th and early 20th centuries nations with exposed coastlines developed elaborate coastal fortifications, organized specially trained troops to man them and adopted ingenious techniques for dealing with naval attacks. They attempted to arm these land fortifications with guns at least equal to those of any potential enemy naval force. They stretched chains and nets across channels to block the entry of enemy ships or submarines. Mines mere placed where they could be controlled and covered by artillery fire to obstruct ships. Fixed torpedo launchers and motor torpedo boats were used to augment the firepower of the main artillery.

The broad mission of the coast defense organization was to prevent the enemy from attacking vital areas or landing on the coast and to destroy or repel any successful landing before the enemy could establish a secure beachhead and push inland. The specific objectives of seacoast fortifications were to support the navy by protecting ports, supply bases and shipbuilding facilities; to protect commercial shipping from seizure or destruction; to prevent blockade of ports and coastal shipping; to protect valuable property and populated areas; and to prevent enemy forces from establishing positions along the coast for land or naval action.

Up to and including World War I this concept of coast defense was found to be effective against direct naval attack, provided the armament was protected by properly constructed concrete and sand emplacements and was manned by well-trained and determined crews. This fact was demonstrated when the Turks' repulsed the Allied fleet in its attack on the Dardanelles in 1915. A much earlier example, during the 18th century, was probably the longest and most successful coast defense operation in history. The British defended Gibraltar from June 1779 to the signing of the treaty that ended the American Revolution in Feb. 1783. On the other side of the Atlantic. however, during the same period and also during the War of 1812, the lack of adequate American coast defenses permitted the British to occupy strategic coastal centres.

In 1793 George Washington advised congress that the vulnerable portion of the U.S. coastline should be fortified. His advice went unheeded for a year, but in 1794 Secretary of War Henry Knox, who had been Washington's wartime chief of artillery, drew up plans for harbour defense works for which a small amount of money had been provided. These works got little beyond the planning stage for the next 20 years. After the experience of the War of 1812, construction of defensive works was begun, and during the next 45 years most of the important harbours on the Atlantic and Gulf coasts were protected by a series of closed masonry forts. During the American Civil War many of these forts gave excellent accounts of themselves and capitulated to greatly superior forces only after extensive siege operations. After the Civil War coast defense languished for 20 years, but it received renewed attention in 1886. In the succeeding two decades defensive works designed solely to repulse attack by naval gunfire were constructed at all important harbours in the continental United States.

Sometimes coast defenses performed their function of protecting harbours, ports and naval bases merely by virtue of their existence. During World War I, for example, a superior British navy made very few attempts to destroy the artillery-protected German bases from which submarines were operating successfully against Allied shipping. Examples can be cited, of course, in which coast defenses were ineffective because their armament was inadequate or the commanders and crews failed to take aggressive action. In the battle of Manila bay during the Spanish-American War (1898) the U.S. naval force entered the bay past a strongly fortified Corregidor without a shot being fired.

Coast defenses were so expensive to build and required so many troops to man them that no country with a long coastline could afford to build and maintain a continuous system of mutually supporting forts capable of repulsing an enemy landing at any and all points. The accepted tactic for reducing a specific coastal fort was to land troops at an adjacent unprotected point and attack the fort from its vulnerable rear. To meet such tactics coast defenses had to be supported by highly mobile ground forces. Generally, because of limited troop resources, the coast defense garrison itself was trained to issue from the fort and form or become part of such a mobile force. The defenders might then defeat the landing party on the beach before it could organize and attack the fort or other vital areas.

After World War I and in the early stages of World War II all first-class military powers greatly improved their coast defenses by installing guns of larger calibre and greater effectiveness. They provided protection for more points along their coasts and improved their fire control systems. The Japanese greatly expanded their coast defenses, which they called "fortress commands," and extended them to include the Ryukyu Islands and Formosa. The United States, with extensive unprotected coasts, placed powerful guns at strategic points. It also mounted heavy seacoast artillery on railway cars so they could be moved quickly to counter an attack at any point. Mobile field guns were added to the weapons employed by coast artillery troops. Antiaircraft guns protected both the defenses and the defended areas from enemy aerial attack and observation. Sound ranging equipment, underwater listening devices and powerful searchlights helped to prevent surprise and to cover mine fields at night.

The military thinking of the period between World Wars I and II was influenced unduly by the supposed superiority of the de-

fense. Great effort went into the construction of fortifications against land as well as sea-borne attack. Military leaders were willing to sacrifice mobility for the security which, it was alleged, fortifications provided. While the memory of many disastrous attacks of World War I was still fresh, the concept that only the offensive can win wars was subordinated.

World War 11.—World War II proved that fixed defenses, whether coastal or inland, were not impregnable. They could be destroyed. isolated or bypassed. Fortified positions still were considered useful and necessary, but their most important functions were to delay enemy action and channel the attack to the advantage of the holding troops. New tactics and techniques radically changed the concept of coast defense. The factors that contributed most to this change were the extensive use of military aircraft, both land-based and carrier-based, for direct attack on fortified positions; employment of air-borne troops to outflank fortified positions and isolate or attack them from the rear; and development of amphibious landing techniques and landing craft capable of delivering troops and heavy equipment over the beaches.

The successful Japanese attack on Pearl Harbor and the conquest of the Philippines occurred despite strong U.S. coast defenses at both places. A short time later the powerful British naval base at Singapore fell to a Japanese attack from the land side. When U.S. forces took the offensive in 1942 and later years they were able to effect successful landings at selected points in the Pacific despite well-prepared Japanese fixed defenses. The Allies landed successfully on the French coast in 1944 against the most formidable barrier ever encountered by an amphibious assault. This particular area had been strongly fortified by the Germans with bunkers and trenches of concrete and steel. Heavy guns with overlapping fields of fire were sited to rake the beaches. The coast was protected by underwater obstacles, and mines were placed on the obstacles, both under water and on the beaches. The defense was supported in considerable depth by mobile forces. The German air force, however, had been so depleted that Allied bombing and naval shelling of the beaches were not effectively opposed.

World War II proved that existing coast defenses were not worth their cost. All military powers abandoned them within a few years except where the armament was mobile and could be used in a dual role for antiaircraft and coast defense. It would have been unprofitable to design and construct improved coast defenses because of tremendous postwar advances in weapons. With the advent of nuclear bombs, long-range aircraft and intercontinental missiles it was apparent that the defense of a coastline was no longer a separate coast defense problem but part of the total defense of a nation.

Postwar Developments.— The best defense against attack and invasion is, of course, the ability to attack the aggressor's homeland and invasion bases with such destructive force that the intended attack or invasion cannot be launched, or carried out if launched. Guided missiles and aircraft normally will accomplish this mission. But even though a country possesses the ability to counterattack, it cannot dispense with strictly defensive measures. It must be prepared to ward off the initial attack and to defend itself against invasion should retaliation not be effective. This is particularly true for the nation that concedes the first blow to the aggressor. Regardless of the tremendous destructive power of nuclear weapons, it was widely agreed following World War II that a war is won only when military forces have established themselves within a country for the purpose of strangling the economy and political power of the enemy. A sea-borne invasion can be carried out for this purpose only after the defenders have been sufficiently weakened.

It is unlikely that a sea-borne or air-borne invasion would be attempted against a nation known to be able to retaliate with atomic weapons until the intended victim had been defeated or rendered impotent by air or guided missile attack. All means of employing atomic weapons must be demolished because the leaders of a nation struggling for survival could be expected to utilize all methods available, regardless of any previous reluctance to use atomic weapons. An invasion force is particularly vulnerable to atomic attack during landing operations and immediately after establishing a beachhead. Targets of primary importance to the invader during preinvasion attack would include airfields, air defense installation~supply depots, communications centres, naval forces and troop concentrations in the broad area of the contemplated invasion. Roads and railroads would be strafed and bridges destroyed in an attempt to isolate the invasion area. Feints in sufficient strength would be carried out against adjacent areas to confuse the defenders. These attacks would extend to a depth far beyond that usually thought of as the coast. Protection from aerial attack requires an elaborate air defense system covering large areas. In the age of nuclear weapons, total defense becomes the objective because even a few atomic bombs delivered to the vital areas of a country could result in disaster.

The most likely invasion that a nation must be prepared to repel would be air-borne in its initial phase. In the modern era of long-range flying, an air armada of transports could take off at any time from widely separated bases or from carriers at sea and strike for an invasion point of its own choosing. Air-borne troops. however, even though successfully landed and accompanied by air-transported artillery, tanks and other vehicles, must be quickly reinforced. The invader can therefore be expected to immediately attempt a sea-borne landing to link up his main forces with the air-borne troops ashore, while they attack the coast defenses from the rear and disrupt communications. Coast defense strategy must therefore recognize the possibility of sea-borne invasion, be prepared to defend against it, but still take cognizance of the greater threat of an initial air-borne landing. A successful invasion by either method or in combination requires air superiority in the invasion area.

Coast defense by mid-20th century had become that portion of the total defense which happened to face the sea. It was no longer a separate problem for special troops with no other mission but was of concern to all the military forces of a nation. Air defense, with its radar warning and control nets, antiaircraft guns and guided missiles, and interceptor planes, was an important part. Naval forces protecting ports and harbours and patrolling the sea frontier were also a part of the defense. They included antisubmarine patrols employing sonar and other means of detecting underwater vessels, air surveillance by radar-equipped aircraft and surface vessels, and underwater mines and submarine nets.

Troop organization for coast defense was essentially the same as for other land combat. The defense was usually organized in great depth with highly mobile reserves. If the attacker had an atomic capability, troops and equipment were dispersed so that they did not present a profitable atomic target. The function formerly performed by heavy coast artillery had been taken over by guided missiles and aircraft. Airfields and missile launching sites were found within supporting distance of the coast, particularly in vital areas. Construction of bunkers and strong points all along the coast was considered wasteful because it did not provide sufficient strength to be effective at any point where an aggressor might choose to make an invasion. Nations with relatively short coasts found it profitable to distribute underwater obstacles and to mine beaches and underwater approaches if sea-borne invasion appeared imminent. Otherwise. sufficient quantities of these items were kept on hand for emplacement after the enemy had revealed his intentions or committed his forces.

A typical coast defense pattern was made up of many types of military units, operating as a single command, organized in great depth, comprising the following elements in order of their appearance from front to rear: (1) distant naval and air reconnaissance and radar to detect enemy preparations for attack or overseas movement; (2) naval and air action to counter such effort before it gets under way; **(3)** naval and air action to meet such effort at sea and defeat it; (4) naval and air offshore patrolling to give early warning of the approach of hostile forces and counter the threat of submarine-launched missiles; *(5)* naval and air inshore patrolling to cover mine fields and fixed underwater obstacles; (6) air defense systems consisting of antiaircraft weapons and interceptors; (7) ground forces of all arms, deployed at points of expected attack; (8) mobile army reserves of all arms, strate-

gically located and capable of rapid movement to meet and destroy an enemy when he had committed his forces. *See* AIR DEFENSE; AMPHIBIOUS WARFARE; ARTILLERY: *Coastal Artzllery;* CIVIL DEFENSE, FORTIFICATION.

COAST GUARD, a force, usually naval in character. maintained in some countries for the suppression of smuggling. for the enforcement of the maritime laws and for the assistance of vessels wrecked or in distress on or near the coasts. The coast guard forces of Great Britain and the United States had a similar origin in that both were first formed to prevent infraction of the rights of the revenue. At first they developed along similar lines. but whereas the United States coast guard may now be described as the national maritime law enforcement agency. the coast guard in Great Britain has become primarily a marine lifesaving service.

UNITED STATES

Origin.— The United States coast guard traces its origin to the ten small armed boats authorized by the first congress on Aug. 4, 1790. to guard the nation's coast against smuggling from the sea and to enforce customs laws. Known first as the revenue marine and later as the revenue cutter service, it became officially the U.S. coast guard when it was combined with the lifesaving service on Jan. 28, 1915. The lighthouse service: which had come under federal control on Aug. 7, 1789, was consolidated with the coast guard in 1939, and the bureau of marine inspection and navigation was transferred from the department of commerce to the coast guard in 1942. (The latter transfer became permanent in 1946.) Thus the principal maritime agencies were organized as one united service.

Duties and Organization.— The functions of the U.S. coast guard embrace, in general terms, maritime law enforcement, saving and protecting life and property, providing navigational aids to maritime commerce and to transoceanic air commerce, promoting the efficiency and safety of the U.S. merchant marine and readiness for military operations. The primary purpose of most of these duties is to prevent avoidable loss of life and property resulting from illegal or unsafe activities. In actual practice, however, the maintenance of safety and order in maritime navigation is not limited to the strict enforcement of laws. It also encompasses a continuing program of education among ship operators and boatmen and the enlistment of their co-operation and self-regulation in the prevention of marine disasters.

The organic act of 1915, as revised, provided that the coast guard ". . . shall be a military service and a branch of the armed forces of the United States at all times." It further provided that "the Coast Guard shall be a service in the Treasury Department, except when operating as a service in the Navy." Such service in the navy takes place upon the declaration of war or when the president directs. The coast guard's peacetime organization: regulations, training and customs parallel those of the navy insofar as operations will permit. Personnel receive the same pay and allowances as prescribed for corresponding ranks, grades and ratings in the navy, and uniforms are identical except for the coast guard's shield insignia.

The coast guard, as the principal maritime law enforcement agency of the federal government, enforces or assists in the enforcement of all applicable federal laws upon the high seas and waters subject to the jurisdiction of the United States. It administers laws and promulgates and enforces regulations for the promotion of safety of life and property, covering all matters not specifically delegated by law to some other executive department. Among the more important are enforcement of the navigation and inspection laws and assistance in the enforcement of the Oil Pollution act, and of laws relating to internal revenue, customs, immigration, neutrality, and conservation and protection of fisheries and wildlife. It enforces rules governing the security of ports, anchorage and movement of vessels in territorial waters. By the early 1960s the coast guard had developed and operated nearly 40.000 aids to maritime navigation, such as lighthouses, lightships, lights, radio beacons, radio-direction-finder stations, buoys and unlighted beacons, as required to serve the needs of commerce and the armed forces.

In the promotion of safety of life and property. coast guard duties include the inspection of vessels and their equipment; investigation of marine casualties; regulation of the outfitting and operation of motorboats, of the transportation of dangerous cargoes of vessels, and of the construction and repair of vessels; enforcement of manning, citizenship, mustering, drilling of cre and load-line requirements; protection of merchant seamen; and licensing of officers, pilots, seamen and motorboat operators.

The coast guard maintains an established organization of inshore and offshore rescue surface vessels, aircraft, lifeboat stations and radio stations, together with rescue co-ordination centres in each district. It extends medical aid to crews of U.S. vessels transports shipwrecked and destitute persons in Alaska and elsewhere and engages in flood relief work. It operates ocean stations in both the North Atlantic and North Pacific to provide search and rescue, communication and air navigation facilities in areas traversed by US. aircraft. Another duty is to conduct the annual International Ice patrol in the North Altantic to protect shipping from icebergs. The administrative head of the coast guard is the commandant, with headquarters in Washington, D C. In most instances activities are directed by 12 district commanders and performed by individual operating units such as ships. aircraft and marine inspection offices.

History.— The early revenue marine soon found itself charged with many other duties in addition to the enforcement of customs laws. These activities included distinguished service in every conflict in which the United States engaged. with the exception only of the war with Tripoli. A revenue cutter, "Harriet Lane," is credited with firing the first shot in the Civil War, on the eve of the bombardment of Ft. Sumter, S C. The cutter fleet of 28 vessels helped enforce the blockade and lent support to the army and navy striking into the south.

On April 6, 1917, when the Cnited States declared war on Germany, the navy was augmented by 15 cruising cutters, about 200 officers, and 5,000 warrant officers and enlisted men of the coast guard. They were entrusted uith the hunting of submarines and raiders and with guarding the transport of troops. A squadron of coast guard cutters, based at Gibraltar, performed escort duty between that port and the British Isles. While on this duty the cutter "Tampa" disappeared on the night of Sept. 26, 1918, with a loss of 111 coastguardmen and 4 navy men. It is believed that the "Tampa" was torpedoed. In proportion to its strength, the coast guard suffered the highest losses of any of the armed services in World War I.

The coast guard reached its peak strength in World War II. It had 802 vessels (more than 65 ft.) of its own and, in addition, manned 351 navy and 288 army craft. By June 30, 1945, its personnel numbered 171.168. Of these, 572 were killed in action. Coast guard surface craft destroyed 11 U-boats and aircraft sank another. More than 4,000 survivors of torpedoings and other enemy action were rescued from the Atlantic and Mediterranean. Another spectacular war duty was the manning of assault craft in landings in North Africa, Europe and in the Pacific. The coast guard's years of experience in operating small boats through the surf made it the logical organization to train and supply crews for landing craft from the smallest barge to the giant LST (landing ship, tank). Coast guard crews also served on many of the large assault transports which carried the barges and troops within striking distance of the beachheads. On D-day in Normandy 83-ft. coast guard cutters were given special lifesaving duties. Under fire from German guns, they rescued 1,468 men from sunken landing barges.

Military personnel on active duty in the early 1960s numbered about 30,000; reserve strength was more than 31,000 officers and enlisted men.

The motto of the coast guard is *Semper Paratus* ("Always Prepared").

GREAT BRITAIN

In Britain, the original antismuggling force was in 1856 placed under the admiralty in order to make better provision for coastal defense, to provide a reserve for the navy in case of war and to protect the revenue. In the first half of the 19th century a number of private lifesaving companies had been formed on the coast, and, when these were taken over by the board of trade in 1854, the coast guard helped in the training of their members and assisted in dealing with wrecks. (See LIFEBOAT AND LIFESAVING.)

In 1923, the coast guard itself was transferred to the board of trade and became a civilian force. It is administered, primarily as a lifesaving service, by the ministry of transport and civil aviation, though it still retains the title of H.M. coast guard. Its chief function is to assist in saving lives in cases of shipwreck and distress at sea. For this purpose it has not only to maintain an extensive visual watch but also to initiate and to keep in touch with all search and rescue measures for ships in distress off the coasts of the United Kingdom.

The visual watch is maintained from about 315 lookout huts, usually sited on headlands or other vantage points overlooking dangerous waters. The distance between lookout huts is about five miles over stretches of coast where small-ship traffic is heavy and runs close inshore, but elsewhere distances are greater. The normal type of watch is a bad weather and thick weather watch and, although the coast is scanned at frequent intervals during daylight, constant watch is kept only at points where there is a large volume of small coastal and fishing-boat traffic and where the navigational hazards are such that immediate action is necessary, even in fine weather, to save lives if a casualty should occur. A night watch is kept in fine weather at a sufficient number of stations to ensure that it is set at all other stations affected on the approach of bad weather.

Search and rescue measures for vessels in distress off the coast can be undertaken and assisted by several differentagencies. One of the first duties of the coast guard is to ensure that these agencies are informed of a casualty, and to keep in touch with them during the whole of the search and rescue operations.

The coast radio station of the general post office, from which a constant listening watch on the maritime distress frequencies is kept, is in direct telephonic communication with its nearest coast guard station. By this means the coast guard is kept informed of all marine distress messages and of the steps taken by other ships to go to the help of a distressed vessel.

Should the coast guard stations observe or have brought to their notice a marine casualty they at once inform the nearest lifeboat station of the Royal National Life-boat institution. This latter is a purely voluntary service, financed wholly by voluntary contributions, and it maintains a fleet of more than 150 modern motor lifeboats. These are all fitted with radios and can communicate with vessels by radio telephone on the marine distress frequencies, and also with search and rescue aircraft and helicopters by very high frequency (VHF) radio telephone.

The ever-increasing use of aircraft and helicopters in search and rescue work has had the effect of extending considerably the sea area within which a distressed vessel may expect to get shore-based aid. Consequently the coast guard has to work closely in conjunction with the Royal Air Force rescue co-ordinating centres. The coast guard stations are kept informed of all marine casualties known to be within 750 mi. of the coasts of the United Kingdom, and if they consider that aircraft would be of assistance to a casualty, either by searching for it or by dropping survival equipment, they at once inform the appropriate R.A.F. rescue co-ordinating centre.

The staff at coast guard stations is usually recruited from among pensioners of the Royal Navy and from men of the merchant navy and fishing fleets with equivalent sea service. The lifesaving equipment is kept ready for instant use at all regular and auxiliary stations and generally consists of a line-throwing projector together with rocket, whip, hawser and breeches buoy. A modern, cordite-propelled rocket will carry a 1-in. line more than 450 yd. The lifesaving equipment is worked by teams of local men formed into companies of the Coast Life-Saving corps. This corps, which has a voluntary basis, was formed in 1932 to assist the regular coast guard. Besides constituting the lifesaving companies, the members of the corps keep visual watch in bad weather from auxiliary stations and do relief work at regular stations.

Other work of a miscellaneous character is undertaken by the coast guard. This includes patrolling of the coastline for the purpose of finding and safeguarding wrecked property, the general supervision of the foreshore to prevent encroachment on land below the high water mark and the reporting of any oil pollution on the beaches.

The coast guard also carries out commercial maritime signaling and reporting at six special stations on behalf of the corporation of Lloyds. Meteorological instruments are installed at certain stations; full observations and readings are taken throughout each day and reported by telephone to a designated centre.

COAST PROTECTION: see BREAKWATER.

COAST PROVINCE, KENYA, one of the six provinces of this east African territory, has an area of 25,928 sq.mi. Its frontage is on the Indian ocean in a restricted coastal plain which widens considerably north of the Sabaki-Galana river. The plain is of Tertiary sands and clays and Pleistocene corals. Inland a discontinuous chain of hills reaches about 1,000 ft. behind which the extensive Nyika peneplain rises westward, covered with Paleozoic and Mesozoic sediments in the east and exposing Pre-Cambrian crystalline rocks in the west, In the northeast is the Tana river (*q.v.*). The moderate rainfall (about 40 in. a year), high relative humidity and high, equable temperatures of the coast give way inland to semiarid conditions with unreliable rainfall averaging less than 20 in. a year, although the Teita hills (7,051 ft.) stand out as a better-watered area. The vegetation sequence is from high grass bush with relict areas of coastal forest to the desert grass bush of the Nyika from which the Teita hills with their richer scattered tree-grassland emerge as a distinctive landscape. The Tsavo Royal national park (1948), 8,046 sq.mi. in extent, lies astride the boundary between the Coast and Southern provinces. (See also KENYA.)

The character of the Kenya coastlands is markedly influenced by their historical contacts and there are architectural remains of earlier Arab civilizations and of the Portuguese intervention. About 10 mi. S.W. of Malindi the remains of the walled city of Gedi, occupied from the 13th to the 16th centuries and containing mosques, a palace and dwellings. are of great archaeological interest. As a testimony to the former Arab control the ten-mile coastal strip which comprises the protectorate as distinct from the colony of Kenya is held on lease from the sultan of Zanzibar; but the boundaries of the administrative districts—Kwale, Mombasa, Kilifi, Lamu-Tana river and Teita—ignore this distinction. In 1948, out of a total population of 501,121, the province contained 52,863 non-Africans, including 25,894 Indians, 21,505 Arabs, 2,659 Europeans, 1,839 Goans and 966 others. Four-fifths of the non-European population was concentrated in the cosmopolitan town and seaport of Mombasa (*q.v.*), the headquarters of the province. Lamu and Malindi, the latter a fishing port which also developed as a holiday resort, are small towns with predominantly Arab populations. The main tribal groups of the province are Digo, Duruma, Giryama, Pokomo and Teita, but many of the coast Africans are detribalized Swahili-speakers.

Maize, cassava, coconuts and fruits are grown for local use; market gardening has developed around Mombasa. The main export crops are cotton, coconuts and cashew nuts. Fifty miles in-

land from the coast, agriculture gives way to the largely unproductive and tsetse-infested Nyika, where the wilderness is relieved only in the upland island of the Teita hills and along the Tana river. Coastal fisheries yield about 4,000 tons a year. Apart from a little mining in Teita district all industrial development is concentrated at Mombasa.

Mombasa has an airport and is the terminus of the Kenya-Uganda railway line, a branch of which runs from Voi to Kahe (91 mi.) in Tanganyika, thus linking it with the Tanga line. Main roads in the province follow the rail routes; in addition a coast road links Mombasa with Malindi and with Tanga. (S. J. K. B.)

COAST RANGES, mountains fringing the western coast of North America from near Santa Barbara, Calif., to the Kenai peninsula, Alaska. Eastward, the Great valley of California and the Willamette valley of Oregon border the ranges; in northern California the Klamath mountains join them to the Cascade range. Off the coast of Canada, the range submerges, becoming a chain of rugged islands, and the term "Coast range" is transferred to the northern extension of the Cascade range. In southern Alaska, the "true" Coast range is resumed in the St. Elias mountains, including Mt. Logan, 19.850 ft. (See ALASKA: Physical Geography.)

In California, the mountains are linear, separated by long alluvium-filled valleys; summit elevations average 3,000 ft. south of San Francisco; 6,000 to 8.000 ft. in northern California and 3,000 ft. in Oregon. From Washington's 8,000-ft. Olympics northward, Pleistocene glaciers carved steep-sided valleys, since drowned to make magnificent fiords. In Alaska, some glaciers still reach the sea.

Cattle graze the chaparral and oak-grass woodlands of the range in California, and the valleys support rich and varied commercial agriculture. From northern California to British Columbia, coniferous forests yield much lumber, and dairying and mixed agriculture prevail. Mining is important in the Alaskan panhandle.

See Roderick Peattie, *The Pacific Coast Ranges (1946).*

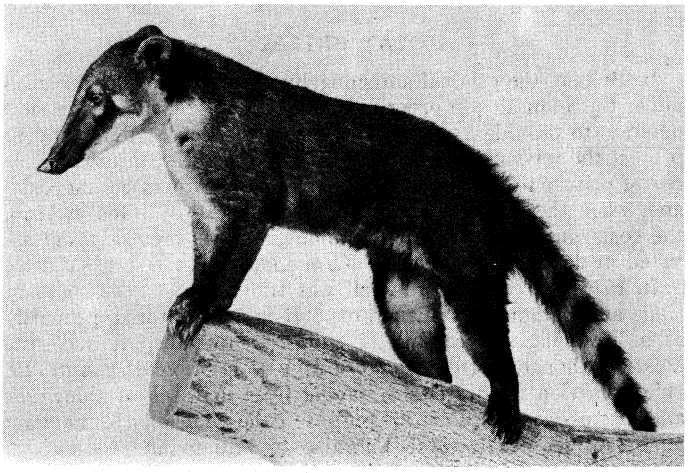
(R. F. LN.)

COATBRIDGE, a large burgh, having the privileges of a royal burgh, of Lanarkshire, Scot., 12½ mi. E. of Glasgow by road and on the Monkland canal. Pop. (1961) 53,946. In 1931 a prehistoric crannog (an artificial island dwelling) was found in Drumpellier park during the drainage of Lochend loch.

The industrial development of the town began in 1820 when "black band" coal was discovered locally. The iron industry now centred on Coatbridge was first developed by the ironmaster James Baird, and later by Andrew and James Stewart. The town has a technical and mining college and produces malleable iron, tubes, wire and wire ropes, tin plate, chilled grain (cast iron) and steel rolls, heavy castings, prefabricated houses, knitwear and quinine. Coatbridge became a burgh in 1885.

COATES, JOSEPH GORDON (1878–1943), New Zealand statesman, was prime minister from 1925 to 1928, but is chiefly remembered for his economic policies during the 1930s. He was born at Pahi, on Feb. 3, 1878. He became a farmer, like his father, and in 1911 entered parliament for Kaipara. He was appointed minister of justice and postmaster general in 1919 and went on to become minister of public works (1920–26), railways (1923–28) and native affairs (1921–28). On W. F. Massey's death (May 1925) he became prime minister. Coates encouraged practical development in all his departments, established good relations with the Maoris through their leader, Sir Apirana Ngata, and won the approval of the British at the 1926 Imperial conference, becoming a privy councilor. His government was defeated in 1928, but in Sept. 1931 he joined the coalition formed to face the crisis of the depression. As minister of public works (1931–33) he combated unemployment, and as minister of finance (1933–35) he depreciated the exchange rate of the New Zealand pound, established a powerful, partially state-controlled Reserve bank, and forced down rates of interest. He also encouraged trade within the British empire, taking a leading part at the Ottawa conference of 1932. Labour won the 1935 and 1938 elections, but in 1940 Coates shelved party differences to assist in wartime administration, working in a two-party cabinet under Peter Fraser until his death in Wellington on May 27, 1943.

COATI (COATI-MUNDI), the name of raccoonlike mammals of the South and Central American genus Nasua, of the family Procponidae. They are recognized by their long body and tail, and elongated, somewhat flexible snout. The tail is often promi-



BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY

DUSKY COATI (NASUA NASUA SOLITARIA)

nently banded.

Coatis are gregarious and arboreal in habit, and feed on fruit, seeds, birds, eggs, lizards and insects. They are often tamed as pets.

See CARNIVORE.

COATS, JAMES (1774–1857), Scottish founder of the world's largest thread company, later known as J. and P. Coats, Ltd.. was born at Paisley, Scot. When only 17, he rode to London to join the army; rejected for medical reasons, he walked home 400 mi. and worked again at the loom till Napoleon's invasion threats and his own sense of adventure drove him into the Ayrshire Fencible cavalry.

In 1800 Coats became a yarn spinner in a Paisley mill. Next, he started to make muslins and crepe shawls on his own with such skill that by 1826 he had amassed sufficient resources to build the first of the famous Ferguslie cotton thread mills. In 1830, with himself continuing as adviser, he handed it over as J. and P. Coats to his sons James and Peter, later joined by Thomas and Andrew. By 1857, when James Coats died, the business had already achieved ascendancy in the thread trade.

(D. E. K.)

COBALT, a chemical element long known in the form of impure compounds as a source of beautiful blue colours, has recently acquired importance in many branches of science and industry. Classified in Group VIII of the periodic table between iron and nickel, cobalt closely resembles these metals in both its pure and combined states.

This article is divided into sections dealing with the history of cobalt, its use. occurrence, metallurgy and properties, including chemical properties, physical and mechanical properties and analysis.

HISTORY

Ores containing cobalt have been used since antiquity as pigments! but without knowledge of the source of the colour. In China, cobalt ores were used to produce the blue colours of the porcelains of the Ming dynasty. In central Europe during the 16th century the term kobold, meaning mischievous spirit, was applied by the miners of the Harz mountains to certain ores that had been roasted for their supposed copper content. Not only did these ores fail to produce copper, but on roasting they emitted dangerous fumes. It was found that the ores, after elimination of sulfur and arsenic by roasting, could be fused with sand to produce a blue glass called smalt. In 1742 G. Brandt showed that the blue colour was due to a previously unidentified metal, cobalt.

The derivation of the term seemed prophetic after the development of the nuclear bomb, when radioactive cobalt-60 (Co^{60}) was

found to be formed from ordinary cobalt-59 by neutron bombardment. Cobalt-60 emits β-rays and becomes nickel-60, an emitter of energetic y-rays. The term "cobalt bomb" is used somewhat ambiguously to mean either an assemblage of X-ray sources for deep therapy employing multiple samples of radioactive cobalt, or a weapon in which Co^{60} might be deliberately formed by a nuclear explosion as a potentially lethal substance. The world-wide diffusion of radioactive cobalt from many such bombs would be dangerous to the race. The radioisotope Co^{60} has become a cheap and useful tool in medicine, plant physiology and industry. Its half life of 5.3 years is, however, low compared with the 30-year half life of caesium-137 which is replacing it for many purposes. (See Uses: Cobalt-60, below.)

The small European deposits of cobalt were surpassed after 1874 by the oxidized cobalt ores of New Caledonia. The latter were outranked after 1905 by the cobalt-silver ores of Ontario. Around 1920, extraction of cobalt from the copper-cobalt deposits of Katanga province in the Republic of the Congo (former Belgian Congo) was commenced by Union Minière du Haut Katanga, which became the dominant world producer.

With the development of the copper properties in Northern Rhodesia after 1930, the small quantity of cobalt occurring in the copper ores of Rhokana Corporation, Ltd., enabled that country to attain one of the leading positions in cobalt output. After 1933 French Morocco (after 1956 a part of the kingdom of Morocco) made varying but important contributions to the world supply. Other principal producers are Canada, the United States and Finland, with several other countries reporting small and spasmodic outputs. Statistics are lacking for production in the Soviet Union. (See also NATURAL RESOURCES: Minerals: Iron and the *Ferro*-alloys.)

Prior to World War I, most of the world's cobalt went to the ceramic and glass industries in the form of oxide to serve as colouring agent. After this period, increasing proportions were used in the metallurgical field for tool steel, magnets, cemented carbides and high temperature alloys and about 80% of the output is employed in the metallic state.

USES

Ferrous Alloys.—Tool Steels.—Cobalt is one of the principal constituents of an important group of tool steels. The addition of 5%–12% cobalt to the basic 18:4:1 tungsten-chromium-vanadium high-speed steel (*q.v.*) markedly improves cutting efficiency at elevated temperatures. Such steels are recommended for heavy cuts and feeds at high speeds on hard, gritty or scaly metals, as well as machining of material like austenitic stainless steels which work harden under any form of stress.

Permanent Magnets.—The remarkable magnetic properties of steels containing high proportions of cobalt were discovered in 1916. The best permanent magnet steel in commercial use is the 35% cobalt steel, a complex alloy which also contains tungsten and chromium. After 1930 another valuable series of permanent magnet alloys was developed, known as the Alnico type. The composition of these alloys is usually: nickel 14%–30%, aluminum 6%–12%, cobalt 5%–35%, with the balance iron. They cannot be worked or machined, and must be produced by casting or powder metallurgy.

Glass-to-Metal *Seals.*—Special seals which have the same coefficient of expansion as glass are made with metals which contain approximately 18% cobalt, 28% nickel and 54% iron.

Other Alloys.—Cobalt is employed in alloys possessing practically zero coefficient of expansion such as stainless invar (*q.v.*), iron 36.5%, chromium 9.5% and cobalt 54%.

Nonferrous Alloys.—Cobalt will alloy with many metals such as aluminum, beryllium, chromium, copper, manganese, molybdenum, nickel, tin, titanium, tungsten and vanadium.

A useful series of cobalt-chromium-tungsten alloys, termed Stellites, are very hard and corrosion resistant. They contain roughly cobalt 42%–65%, chromium 25%–35%, tungsten 5%–19%, iron 1%–2%, carbon 1%–2%, silicon 1%–2%, and are used for cutting tools and hard-facing. A dental and surgical alloy known as Vitallium, containing essentially 65% cobalt, 30% chromium and 5% molybdenum or tungsten, is not attacked by body liquids, does not give rise to any irritation to tissues, and is electrically neutral in the body.

High temperature, high strength alloys for various components of jet aircraft and gas turbines have become of great importance. Nearly all contain from 20% to 65% cobalt, together with nickel, chromium, molybdenum, tungsten and minor quantities of other elements.

Cemented Carbides.—Tungsten carbide, one of the hardest man-made substances, is extremely valuable for machine tools, drill bits, dies and saws. In its production, a briquetted mixture of powdered tungsten carbide and cobalt is sintered at a temperature above the melting point of the latter. The cobalt melts and serves as a bond holding the hard carbides, and adding the toughness and resistance to shock needed to make these carbides of practical value. Cobalt is the most satisfactory matrix or binder for this purpose, and may be present in amounts from 3% to 20% by weight. (See also CARBIDES.)

Electroplating.—Although cobalt plating itself has not attained any commercial importance, cobalt is sometimes added to nickel baths to give a deposit ranging from 1% to 18% cobalt, producing smooth, bright films which are hard but yet relatively ductile.

Glasses.—Cobalt is added to impart a blue colour to structural glass, pharmaceutical, perfume and decorative bottles, and optical filter glasses. Cobalt additions of from 5 oz. to 10 lb. per ton of glass are employed.

To neutralize in plate and window glass the yellow tint of iron, small quantities of cobalt, 1 to 45 gm. per ton of glass, are required.

Ceramics.—Body Stain.—In the ceramic industry cobalt is used to neutralize the yellow colour of iron in pottery clays. Cobalt oxide is added in the proportion of about 1 lb. per ton of dry pottery clay. In larger quantities, cobalt will colour bodies various shades of blue.

Glaze Stain.—A rich blue colour may be obtained by adding 5% cobalt oxide to a glaze of high lead content.

Underglaze or On-glaze Stain.—For this purpose the usual stains are smalt or Thenard's blue. The latter gives a turquoise blue characteristic of cobalt aluminate, whereas smalt gives the typical violet blue of cobalt silicate.

Enamels.—Cobalt oxide is used in the production of white enamels to neutralize any yellow caused by iron. Smalt is employed to colour enamels blue, and cobalt oxide added to some mixtures gives an excellent black.

Cobalt oxide in quantities of 0.2% to 2% is used in enamel coats on steel to increase the adherence of the enamel to the metal. Cobalt is the most satisfactory substance for this purpose.

Catalysis.—Cobalt exhibits many catalytic reactions of economic importance or scientific interest.

A number of cobalt salts, particularly organic compounds, are excellent driers of paints and varnishes. Cobalt linolates, resinates and naphthenates, containing 4%–12% cobalt, are preferred.

Cobalt, usually in the form of a cobalt-thoria-kieselguhr catalyst, is used in the Fischer-Tropsch synthesis of liquid hydrocarbons from carbon monoxide and hydrogen (see CATALYSIS: Practical Uses).

Cobalt catalysts are used, or have been patented, for other reactions such as ammination of ethylene and propylene, desulfurization of crude oil, hydrogenation processes, oxidation of ammonia, carbon monoxide and hydrogen cyanide, decomposition of ethylene and acetylene and preparation of iso-octaldehyde from a heptene olefin.

Trace Element: Biological and Biochemical Relationships.—For a very long period it has been a puzzling fact that many pasture lands in various countries were unsuitable for continuous grazing by cattle and sheep. The poor condition of these animals was ascribed to mineral deficiencies, poisons in herbage or soil or to parasites, but finally around 1935 the cause was traced by workers in Australia and New Zealand to a deficiency of cobalt. Since that time, similar diseases caused by cobalt deficiency have been verified in many parts of the world, and in such areas the

addition of a small quantity of a cobalt compound to the ration, water, salt lick, fertilizer or pasture amendment has become a well-established practice. In general, a content of less than 0.08 parts per million (p.p.m.) cobalt in the forage may produce deficiency diseases in cattle and sheep. The minimum level of cobalt required in the soil to yield this concentration in herbage is dependent on a number of factors of soil and climate. As a rough guide, cobalt in the soil should generally be above 5 p.p.m. for the maintenance of health in ruminants.

Physicochemical studies have shown that vitamin B_{12} contains cobalt, and it is the only vitamin known to contain a heavy metal. Pernicious anemia has been virtually eliminated in many countries by vitamin B_{12} therapy, and while the biological function of B_{12} is still unknown it may be linked in some way with the oxidation-reduction reactions of cobalt cyanides.

A number of nutritionists have suggested that cobalt should be considered a human dietary essential, ,but there is no indication of the quantity required. Low cobalt foods, less than 0.05 p.p.m., include apricots, carrots, cherries, corn, oats, peas, potatoes, rice and wheat.

High cobalt foods, over 0.2 p.p.m., embrace beet greens, buckwheat, cabbage, figs, lettuce, spinach and water cress.

Cobalt-60.—A radioisotope Co^{60}, prepared by exposing cobalt to the radiations of an atomic pile, is useful in industry, medicine and science. Co^{60} is used in place of X-rays or radium in the inspection of materials to reveal internal structure, flaws or foreign objects. Its advantages over radium lie in lower cost, more homogeneous y-radiation and softer β-radiation which can be easily filtered out, no radioactive contamination from radon gas and ability to be machined or shaped in any form before irradiation to fit special requirements.

Co^{60} is used in cancer therapy, and extensively as a radioactive tracer in biology and industry. Its half-life of 5.3 years eliminates the need to consider changes in source strength and provides a tracer at moderate cost.

OCCURRENCE

Cobalt is widely diffused but is not one of the abundant elements, being usually considered to make up about 0.001% of the igneous rocks of the earth's crust, compared with 0.020% nickel and 5% iron. The element is found in meteorites, the sun and stellar atmospheres, sea and mineral waters, soils and living organisms both plant and animal. Traces of cobalt have been reported in many ores of iron, nickel, copper, silver, manganese and zinc.

The important cobalt minerals are sulfides, arsenides and oxidized compounds. In combination with sulfur it occurs as linnaeites in many localities such as the Mississippi lead-zinc deposits and the copper mines of Northern Rhodesia and Katanga. Cobalt substitutes for nickel in many of the minerals of the Sudbury, Ont., and similar copper-nickel sulfide ore bodies.

Cobalt arsenides, such as smaltite (*q.v.*), safflorite and skutterudite, are found in Canada, Morocco and other countries. The sulfarsenide cobaltite (*q.v.*) is frequently associated with arsenides.

Oxidized cobalt minerals are an important source of this element. Asbolite, an impure mixture of manganese and cobalt oxides, is the principal cobalt mineral of New Caledonia and is also found in small quantities in Northern Rhodesia. Heterogenite, a hydrated cobalt oxide, is one of the chief minerals of the Katanga deposits.

The carbonate sphaerocobaltite is found in Katanga and to a small extent in Northern Rhodesia. Erythrite (*q.v.*), an oxidation product of cobalt arsenide minerals, is found in Canada and Morocco.

METALLURGY

Depending upon the form of cobalt in the ore, a wide variety of recovery processes may be employed to yield the refined metal.

Arsenides, sulfarsenides and mixed oxide-arsenide ores of Canada, Morocco and other countries are concentrated by hand sorting, gravity separation by jigs or tables, or by froth flotation. The concentrate is charged to a blast furnace with coke and limestone, and smelted to a speiss, or impure mixture. The latter is ground, roasted with common salt and leached with water. The insoluble chlorides are ground with sulfuric acid, washed and filtered and the combined solution after oxidation is neutralized with lime. The precipitate of basic ferric arsenate is filtered off, giving a solution containing only cobalt and nickel. Fractional additions of sodium hydroxide and sodium hypochlorite precipitate cobalt as cobaltic hydroxide, $CO(OH)_3$, at first pure and afterward as a mixed hydroxide of cobalt and nickel. The latter is recirculated to obtain pure cobaltic hydroxide.

The principle of this separation depends on the fact that in neutral solutions cobalt is more readily oxidized than nickel. The oxidized cobalt compound hydrolyzes and precipitates, leaving nickel in solution. The acid liberated by the hydrolysis must be neutralized to carry the reaction to completion.

The cobalt precipitate is dried, ground and made into thick disks or rondels, in a pelletizing machine. The rondels are dried, reduced with charcoal to cobalt metal, cooled, magnetically separated and screened for market.

From Katanga and Northern Rhodesia, where cobalt is essentially a by-product of copper production, various cobaltiferous materials are processed in electric furnaces to yield a copper-cobalt-iron alloy which is sent overseas for refining. In Katanga high-grade cobalt ores, concentrates and slags are charged to electric furnaces with coke and limestone. A crude cobalt alloy containing about 15% copper, 42% cobalt and 40% iron is produced. At Rhokana Corporation, Ltd., in Northern Rhodesia, where the sulfide ore contains about 3% copper and 0.13% cobalt, two flotation concentrates are produced. A copper concentrate containing a high copper and low cobalt content is removed first, using a minimum quantity of reagents, and then by the addition of more reagents and recirculation of various flotation pulps a cobalt concentrate, having less copper and more cobalt, is produced. These concentrates are treated separately in reverberatory furnaces and converters. The converter slags are high in cobalt and are charged, with coke, and silica if necessary, to electric furnaces. A crude cobalt' alloy containing 15% copper, 40% cobalt and 45% iron is produced.

In European refineries these alloys are dissolved with hot 20% sulfuric acid, copper remaining insoluble. The solution is treated with sodium chlorate and soda ash, and the iron precipitate removed. Final precipitation of cobalt is done with sodium hypochlorite to give cobalt hydrate, which is purified in the manner described for arsenical ores.

Electrolytic cobalt has been produced in increasing quantities from Katanga and Northern Rhodesia. In Katanga the slime residues from the copper leaching plant are dissolved, the solution passed to electrolytic cells for decopperizing and the remaining copper removed by cementation on cobalt shot. Cobalt is precipitated by lime, filtered, dissolved in sulfuric acid and electrolyzed on steel cathodes using lead anodes.

In Northern Rhodesia the cobalt concentrate, obtained as outlined earlier, is roasted under controlled conditions to transform the cobalt to the sulfate and leave most of the copper and iron in water-insoluble forms. The roasted concentrate is leached with hot water and the acidity adjusted with lime to precipitate most of the copper and all the iron. The solution is passed over cobalt granules to cement out the residual copper.

Cobalt is precipitated with lime, dissolved in H_2SO_4, and electrolyzed.

An important source of cobalt is the nickel industry, where recovery may take several forms: (1) At International Nickel Company of Canada, Ltd., Port Colborne, Ont., cobalt is precipitated from the impure anolyte (the solution surrounding the anode) by chlorine and basic nickel carbonate as a cobalt-nickel-copper-iron slime. This is dissolved in H_2SO_4, the copper and iron removed, and cobalt is separated from nickel with sodium hypochlorite. (2) Cobalt is recovered at the refinery of the Mond Nickel Co., Ltd., at Clydach, Wales, where the carbonyl process is employed to produce pure nickel from Canadian nickel oxide. Residues from the carbonyl treatment are roasted, leached, copper

and iron removed, and cobalt is precipitated as a crude cobaltic hydroxide, refined to high-grade black and gray cobalt oxides. (3) When lateritic nickel ores are reduced and leached with ammonium carbonate any cobalt present is largely precipitated with the basic nickel carbonate. (4) The techniques of pressure leaching of nickel sulfide concentrates in acid or ammoniacal solutions, followed by precipitation of nickel and cobalt as metals with hydrogen, furnish another source of cobalt.

PROPERTIES

Chemical Properties.— The symbol of cobalt is Co; atomic weight, 58.9332; atomic number, 27; melting point, 1.495° C.; boiling point, 2.900° C.; valence. 2 or 3. Cobalt is not attacked by air or water at ordinary temperatures. The metal is rapidly attacked by sulfuric. hydrochloric and nitric acids, but slouly by hydrofluoric acid, ammonia and sodium hydroxide.

Principal cobalt compounds are:

1. Carbides of cobalt are important in the Fischer-Tropsch synthesis of hydrocarbons (see *Uses: Catalysis,* above).

2. Cobaltous carbonate is formed when soda ash or limestone is added to a cobalt solution.

3. Cobalt carbonyl, unlike the corresponding nickel compound, is not formed when CO is passed over reduced cobalt powder at atmospheric pressure. Pressures in the region of 100 atm. and 200° C. are required for an appreciable yield of cobalt carbonyl.

4. Among the halides, cobaltous chloride is an important salt of cobalt, and cobalt fluorides are employed in the synthesis of fluorocarbons.

5. Cobaltous hydroxide, formed when an alkali hydroxide is added to a cobalt solution, is slowly oxidized by air to cobaltic hydroxide.

6. Cobaltous nitrate is produced when nitric acid is added to cobalt metal, oxide, hydroxide or carbonate.

7. Cobalt. like iron, has three common oxides:

a Cobaltous oxide, CoO, varies in colour depending on the grain size, but is usually dark gray and is the principal constituent of the gray cobalt oxide of commerce.

b. Cobaltic oxide, Co_2O_3, is formed when cobalt compounds are heated at a low temperature in an excess of air. On prolonged heating it goes to Co_3O_4.

c. Cobaltosic oxide, Co_3O_4, is the stable black oxide resulting when cobalt salts are heated at temperatures not exceeding 850° C. It is the chief component of commercial black cobalt oxide

8. Cobalt silicates are found in glazes and slags.

9. Cobaltous sulfate is prepared by the action of sulfuric acid on cobalt compounds.

10. Cobaltous sulfide is the black powder formed when H_2S is passed into an alkaline cobalt solution.

The higher valence states of many cobalt compounds are unknown. or prepared only with difficulty. In co-ordination complexes, however, cobalt prefers the trivalent state, and numerous ammonium compounds with cobalt have been described.

Physical and Mechanical Properties.—Cobalt when polished is silver-white with a faint bluish tinge. At ordinary temperature the stable form is the close-packed hexagonal a-cobalt, while above 400° C. the stable form is face-centred cubic β-cobalt. The metal has a specific gravity of 8.9, is ferromagnetic, and possesses in hardness, tensile strength and machinability similar properties to nickel and iron.

Analysis.—The need to determine cobalt in large numbers of samples, ranging from traces in herbage to 65% or more in alloys, has resulted in the development of many analytical methods. For small quantities, colourimetric procedures employing nitroso-R-salt or ammonium thiocyanate are recommended, or the element may be determined in certain cases polarographically or spectrographically. For large quantities of cobalt the electrolytic method is the most satisfactory. In the intermediate ranges, the gravimetric method of weighing as Co_3O_4 after separation of cobalt with a-nitroso β-naphthol—or the potentiometric procedure depending on oxidation of cobalt in ammoniacal solution by potassium ferricyanide — are reliable.

BIBLIOGRAPHY.—J. W Mellor, *A Comprehensive Treatise on Inorganic and Theoretical Chemistry,* vol. xiv (1935); U S Bureau of Mines, *Mineral Yearbook* (annual); Roland S. Young, *Cobalt* (1948).

(R. S. Y.)

COBALTITE, a mineral composed of cobalt sulfarsenide, is found as granular to compact masses, and frequently as beautifully developed crystals. Brilliant crystals of cobaltite from Tunaberg in Sodermanland, Swed., and from Skutterud near Drammen in Norway are well known in mineral collections. Crystals have also been found at Cobalt. Ont.. and at Khetri in Rajasthan, India, and under the name *sehta* the mineral is used by Indian jewelers for producing a blue enamel on gold and silver ornaments. Cobaltite crystals have the same symmetry as the isomorphous mineral pyrite, being cubic with parallel hemihedrism. The usual form is a pentagonal dodecahedron with faces of the cube and octahedron. The colour is silver-white with a reddish tinge, and the lustre brilliant and metallic, hence the old name cobalt-glance. The formula is CoAsS or $CoS_2.CoAs_2$.

See COBALT.

COBB, HOWELL (1815–1868), **U.S.** congressman, cabinet member and Confederate general during the American Civil War, was born at Cherry Hill. Ga., on Sept. 7, 1815. His father was a well-to-do planter who moved the family to Athens, Ga., seat of the state university. Cobb graduated from the university in 1834 and two years later was admitted to the bar. From 1837 to 1840 he was solicitor-general for the western circuit of his state. During these years he agreed with the Jacksonian view on the question of nullification He later supported Pres. James K. Polk during the Mexican War and became an ardent advocate of the extension of slavery into the territories. But when the Compromise of 1850 (*q.v.*) had been agreed upon he became its stanch supporter as a Union Democrat and on that issue was elected governor of Georgia by a large majority.

From 1843 to 1851 and again from 1855 to 1857 he was a member of the U.S. house of representatives, becoming Democratic leader in that body in 1847 and serving as speaker in 1849–51. From 1851 to 1853 he was governor of his state and from 1857 to 1860 was secretary of the treasury in Pres. James Buchanan's cabinet. In 1860, upon the election of Abraham Lincoln, he ceased to be a Unionist and became a leader of the secession movement. The following year he was appointed colonel of a regiment and two years later was made a major general in the Confederate army He died in New York city on Oct. 9, 1868.

COBB, IRVIN SHREWSBURY (1876–1944), **U.S.** journalist and humorist, was best known for his colloquial handling of familiar situations with ironical, penetrating humour. Born on June 23, 1876, in Paducah, Ky., the setting of his most popular stories, he left school early to work for local newspapers. At the age of 19 he became managing editor of the *Paducnh Daily News.* In 1904 he went to New York city, and became a staff writer for the *Evening World* and *Sunday World.* First through syndicated newspaper features and later in magazines, he became widely known for such articles as "Speaking of Operations," which in book form sold over 500,000 copies, and for short stories, of which he wrote over 300. His stories about a shrewd and kindly Kentucky judge, Judge Priest, first brought him fame. In them he aimed to give a faithful picture of a southern community; some of these were collected in *Back Home* (1912) and *Old Judge Priest* (1916). A prolific writer, he published more than 60 books and traveled throughout the country as a lecturer and after-dinner speaker. He also wrote plays and scenarios and acted in motion pictures. He died on March 10, 1944.

See Fred G. Neumann's *Irvin Shrewsbury Cobb: His Life and Letters* (1938), Cobb's autobiography *Exit Laughing* (1941) and reminiscences by his daughter, Elisabeth Cobb, *My Wayward Parent* (1945).

COBB, JOHN (d. 1778), English cabinetmaker and upholsterer. was partner with William Vile from about 1750 to 1765 in an important London cabinetmaker's business. Vile retired in 1765 and Cobb continued alone until his death in 1778. Up to 1765 the firm supplied furniture to George III, but after Vile's retirement Cobb apparently ceased work for royalty. Records are rare; a ledger from Edgcote house, Northamptonshire, records payment of over £1,000 in 1758, and Cobb supplied furniture to Horace Walpole in 1770. Work known to be Cobb's is neoclassical in

style. A bill dated 1772 shows that Cobb supplied the marquetried commode and pair of vasestands at Corsham court, Wiltshire'; two similar commodes, in the Victoria and Albert museum, London, and in Holland house, may also be his.

COBB, TY (TYRUS RAYMOND COBB) (1886–1961), one of the greatest of U.S. baseball players, won more titles (58) for offensive play than any player in major league history. He was born Dec. 18, 1886, at Narrows, Banks county, Ga., the son of a noted educator and Georgia senator. He became a major league player with the Detroit Tigers in 1905, when he was 18. Nicknamed the "Georgia Peach," Cobb, a left-handed batter and right-handed thrower, stood 6 ft. ¾ in. tall and weighed 175 lb. He spent 22 seasons as an outfielder with the Detroit Tigers of the American league and managed them in 1921–26. He was 42 years old and a member of the Philadelphia Athletics when he retired from the game in 1928. Cobb died at Atlanta, Ga.. on July 17, 1961.

Cobb played in more games (3,033), scored more runs (2,244), made more hits (4,191), stole more bases (892) and finished with a higher lifetime batting average (.367) than any other major leaguer. He led the American League in batting 12 times—nine times in a row. Three times he hit .400 or better and hit ,300 or more for 23 straight years. But the Cobb record that baseball historians talk most about was the 96 bases he stole in 1915, the all-time high. In the first election to the baseball Hall of Fame at Cooperstown, N.Y., in 1936, he received the most votes.

(J. D. McC.)

COBBE, FRANCES POWER (1822–1904), British philanthropist and writer on religious and social subjects, and prominent antivivisectionist, was born in Dublin on Dec. 4, 1822. In 1858 she began social work among the girls and boys of Bristol. She carried out various special investigations on vivisection, on destitution and on separation orders and divorce. She was a strong suffragist. From time to time she conducted services in Unitarian chapels. She died at Hengwrt, near Dolgelley, Merionethshire, Wales, on April 5, 1904. She published about 30 separate works, among which may be mentioned: *Essay on Intuitive Morals,* published anonymously (1855), *Pursuits of Women* (1863). *Dawning Lights* (1868), *Darwinism in Morals* (1872), *The Hopes of the Human Race* (1874), *The Duties of Women* (1881), her own *Life* (2 volumes, 1894) and *The Scientific Spirit of the Age* (1888).

COBBETT, WILLIAM (1763–1835), English author, journalist and radical, is one of the most representative figures in English literature, and his life and writings embody the history of the common people between the revolutions of the 18th century and the dawn of the Victorian era. He was born at Farnham, Surrey. on March 9. 1763 (not 1766, as he himself wrongly stated). His father was a small farmer and his grandfather had been a day labourer. As a boy he worked in the fields, but at 14 he began his adventures by running away to work in Kew gardens. He returned home after a while; then, at 19, again left Farnham and found employment as a solicitor's clerk in London. Soon sickening of this occupation, he joined the army. After a year at a training base, during which he read hard and discursively and taught himself grammar and writing, he was drafted, first to Nova Scotia, then to Fredericton, N.B., where he remained till 1791, rising to the rank of regimental sergeant major. Conscious of the systematic fraud and peculation that went on in the regiment (as indeed throughout the service), he began collecting evidence against the principal offenders. In 1791, when his regiment was ordered home, Cobbett at once procured his discharge and demanded a court-martial of the officers involved. This was at length granted, but Cobbett, in despair of getting the case fairly heard, failed to appear at the court-martial and fled to France (March 1792). The same year he took ship for America, where, first at Wilmington, Del., and later at Philadelphia, Pa., he supported himself by teaching English to the French *émigrés*.

So far Cobbett had written little, but in 1794 an incident occurred which embarked him on his long career as a political writer. Joseph Priestley, the great Unitarian radical, came in that year to settle in the United States, and numerous addresses of welcome were presented to him by American radical societies. These aroused Cobbett's strong pugnacious instincts and he entered the lists as a pamphleteer with his *Observations on Priestley's Emigration* (1794). From that date until his return to England in 1800, he was the most vehement and violent writer on the British side in the United States, producing a series of tirades against the French Revolution and all its works and against all Americans who ventured to give it. or any sort of radicalism, even the mildest support. *A Bone to Gnaw for the Democrats, A Kick for a Bite, The Scarecrow, The Cannibal's Progress,* a scurrilous *Life of Tom Paine* and the autobiographical *Life and Adventures of Peter Porcupine* are among these early pamphlets. They are all unmeasured in violence, often outrageous but always lively, readable and written in virile and forthright English. Cobbett's style was almost as good in his first unpractised writings as in the best of his more famous later work.

Cobbett was soon in trouble with the law. He libeled Benjamin Rush, doctor and well-known Democratic politician, accusing him of killing George Washington with his special "bleeding treatment." This brought a heavy fine. He then wrote scurrilous pamphlets about Thomas McKean, the judge who had tried the case and was Rush's political ally. Before long he was no longer welcome in the U.S. and in 1800 he gave up the contest and returned to England, where his writings, regularly republished, had already made him well known. He was greeted with enthusiasm as a powerful recruit to jingo journalism. He met Pitt at dinner, and was offered the editorship and ownership of one of the leading government newspapers. He refused the offer, as he had already refused government payment for his services in America, and attempted instead to start a daily newspaper of his own, *The Porcupine.* This speedily failed; but in 1802, with help from William Windham, who was for several years his chief political supporter, he started the weekly *Political Register,* which he thereafter edited, and for the most part wrote, regularly until his death in 1835.

The *Political Register,* with which Cobbett's name was from 1802 chiefly associated, began its career as an extreme anti-Jacobin journal. It strongly opposed the peace of Amiens and called for a renewal of the war with France. However, after Pitt's return to power and the renewal of the war, Cobbett slipped gradually into opposition and found himself in alliance with Windham and with Fox, the latter of whom he had hitherto vehemently denounced. In 1806, in the "ministry of all the talents," his friends came to power, but Cobbett soon fell into opposition to them also. He was by this time denouncing the "Pitt system" as the root of all evil, and attacking in particular the methods of pursuing the war, the multiplication of pensions and sinecures and the dangerous growth of the national debt. When the ministry of all the talents broke up in 1807, he was already a radical, at war equally with Whig and Tory and beginning to cry out for peace and parliamentary reform as well as for "economical reform."

So far, Cobbett was merely an outstanding political journalist, whose writings, however trenchant, had given little indication of his peculiar quality as a democratic leader. But from about 1805 a new tone began to appear in his work. That year he bought a substantial farm at Botley, near Southampton, and thereafter spent most of his time in the country. The change opened his eyes to the great contrast between the countryside as he remembered it in his boyhood and as it had become under stress of wartime prices and enclosure. He realized for the first time the misery of the labouring classes; it roused his indignation and completed his conversion to radicalism. The one articulate-voice among the suffering people of the countryside, he brought a new note into radical agitation. At once he became a power, but his power brought penalties. In 1809 there was a minor mutiny among the soldiers at Ely over unfair deductions from pay. The mutiny mas suppressed and the ringleaders were flogged under the eyes of German mercenaries. Cobbett wrote, denouncing the floggings. and was prosecuted for sedition. A fine of £1.000, two years in Newgate jail, bail of £3,000 and the finding of two sureties at £1,000 each, were his punishment.

From Newgate, under the lax prison discipline of the time, Cobbett continued to edit the *Register* and wrote his famous *Paper Against Gold*, in which he denounced the wartime inflation of the currency and the financial policy of Pitt and his successors. His imprisonment, however, brought him financial ruin. He went bankrupt. His farm at Botley was sold and most of his valuable properties passed out of his hands. The *Register* he barely saved. Three great publishing enterprises on which he was engaged had to be sold—the *State Trials* (known as Howell's, from the editor whom Cobbett employed), the *Parliamentary History of England* and the *Parliamentary Debates*, which were bought by his printer, Hansard, and thereafter bore the latter's name. All these were originated by Cobbett, though the actual editorship, under his control, had been mainly left to others.

When Cobbett emerged from prison in 1812 he appeared to be ruined, but he had still the *Register*, and the ending of the war, in 1815, brought him his chance. Prices fell, indeed; but the cessation of war demand and the prostration of Europe after the long struggle led to widespread unemployment and distress. Unrest grew in the industrial districts; and the farmers, pressed down by high taxation, were also in a condition of active discontent. The government had no plans for dealing with the crisis; and Cobbett, with his demands for parliamentary reform and a reduction of the heavy interest on the national debt, became the central figure in a nationwide agitation. In 1816 he began the issue of a cheap unstamped *Register* (denounced as Cobbett's "two-penny trash") addressed particularly to the journeymen and labourers of the northern and midland counties. He became suddenly the most influential leader of the working classes. By this time, however, the government was embarking on a campaign of repression, and Cobbett, in order to avoid arrest, fled in 1817 to the United States.

Settling down on a hired farm at North Hempstead, Long Island, N.Y., Cobbett set himself to write. He sent the copy regularly for the *Political Register*, which continued to be published by his agents in England. He also embarked on other literary work. To the respite which exile gave him from daily political preoccupations is owed the beginning of his great literary period. Hitherto he had written much excellent journalism but no important book. Between 1817 and 1819 he produced not only his *Journal of a Year's Residence in the United States of America* but also his famous *Grammar of the English Language*, which, despite its faults of scholsrship, is still probably the best introduction to correct virile English for the working-class student. In America, too, he projected several of his other important books.

Although the repression was not over, Cobbett went back to England late in 1819 and assumed his place as an outstanding leader of working-class agitation. From 1819 to 1832 his history is, in one aspect, the history of the agitation for parliamentary reform. In addition, he found scope for other activities, above all for his *Rural Rides* through the southern half of England. His accounts of these appeared in the *Register* between 1820 and 1830, when they were first published in book form.

Rural Rides, certainly Cobbett's most widely read works except for the *Grammar*, are difficult to describe. They are, in part, a plain account of what he saw in the English countryside—of good farming and of bad, of rotten boroughs and the country houses of bankers, stockjobbers and successful army contractors, and above all of the misery and starvation of the common people. But they are far more than this. They abound in digressions, in racy snatches of autobiography, in topical political tirades and everywhere in abundant outflowings of Cobbett's own forceful and appealing personality. Though they were composed in haste and sent off to the *Register* without chance of revision, they were astonishingly well written. *Rural Rides* are Cobbett at his best, showing more sides of the man than appeared in any of his other works.

Rural Rides and the ceaseless "rustic harangues" which accompanied them did not, even with the added burden of conducting the *Register* and actively guiding a large section of the reform movement. at all exhaust Cobbett's energies. Books, for the most part good books, flowed from *him—Cobbett's Cottage Economy* and the *Sermons* in 1822, *The History of the Protestant Reformation in England and Ireland* (questionable history this, but vigorous writing) in 1824–27, *The Woodlands* in 1825, *Advice to Young Men* (next to *Rural Rides* his'best book) and *The English Gardener* in 1829 and a host of others. Moreover, in 1820–21 he wholeheartedly espoused the cause of Queen Caroline against the king, acted as one of her regular advisers during the divorce proceedings and wrote ceaselessly on her behalf. He even composed a number of her own letters and messages concerned with the case. In his hands the defense of the queen became also a means of rallying the forces of the reformers.

Meanwhile, in 1820, he had rid himself by bankruptcy of some of his financial worries and had settled down to rebuild his shattered fortunes by means of his pen. Botley had been given up and for a while he had no land. Soon. however, he developed a flourishing seed farm in Kensington and began to deal also in American trees and in a variety of imported seeds and plants. He especially urged the cultivation of maize ("Cobbett's corn"), of the locust tree and of Swedish turnips, as well as the introduction of straw-plait manufacture from home-grown grasses. His seed farm and his agricultural writings brought him a large following among the farming classes.

In 1830, with the fall of Wellington and the end of the long period of Tory ascendancy, the reform agitation came to a head. The Whigs, under Lord Grey, assumed office, and reform became the one political question of the day. Immediately upon this change followed the hunger movement of the rural labourers in the southern and eastern counties. The opponents of the movement sought to trace these troubles to Cobbett's influence and the Whig government, anxious to prove its respect for property and to reassure the propertied classes on the subject of reform, prosecuted him. Refusing to employ counsel, Cobbett defended himself in a masterly speech which thoroughly turned the tables on his opponents. The jury disagreed, and no further attempt was made to molest him. The revolt, however, was savagely repressed.

At length, in 1832, the Reform act became law. Cobbett, though he had no love for the Whigs, had urged the workers to support it on the ground that no more liberal measure stood any chance of immediate success. At the election which followed he was elected M.P. for Oldham as the colleague of John Fielden, the radical and manufacturer. He had stood at Manchester also, but withdrew on learning of his success at Oldham.

This was not Cobbett's first parliamentary contest. He had stood unsuccessfully for Coventry in 1820 and for Preston in 1826. Indeed, for many years he had been seeking to force his way into parliament. At 68 years of age, he found himself a member, as strongly in opposition to the reformed parliament of 1832 as he could have been to the unreformed parliaments of earlier years. He passed his two and a half years of parliamentary life as the leader of a tiny group of extreme radicals, supported sometimes by O'Connell and his Irish, but always fighting for forlorn hopes. Especially, he put up an unavailing struggle against the "new poor law" of 1834, and his last weeks of life were spent in the endeavour to run a campaign against the act when it had been passed into law.

It is usually said that Cobbett was not a success as a parliamentarian. He could hardly have been so, for he accepted none of the rules of the game. He remained to the end the leader of an essentially extraparliamentary crusade. Furthermore, his health was failing. He had been always an indefatigable worker, rising very early and doing a good part of a day's labour before other men were astir. Now, although severe colds and coughs began to trouble him, he insisted on adding assiduous attention to his parliamentary duties to his other activities. In 1835 his health gave way under the strain and on June 18 he died of an attack of influenza. His sons attempted for a few months to carry on the *Register*, but it was nothing without his vigorous editorials and was speedily discontinued.

Cobbett's character has been variously estimated. He was always extremely pugnacious and made many enemies; he also made many firm friends. His pugnacity, which led him to quarrel almost

as much with allies as with opponents, was purely political. Carlyle called him "the pattern John Bull of his century"; his fellow M.P.. Silk Buckingham, said he had "a ruddy contenance, a small laughing eye, and the figure of a respectable English farmer." Hazlitt, who liked his books, also said he looked like a farmer. Cobbett was, indeed, despite his appeal to the workers of the factory districts, always at heart a countryman, with an unconquerable instinct for the land and the men of the land. He was intensely English and, in his way, intensely patriotic; it was this patriotism that roused him to the defense of his fellow countrymen, trodden under by the oppressions of war and the twin revolutions in agriculture and industry whose devastating social effects he watched from phase to phase. He was that rarest of literary phenomena—an articulate peasant. His prose is astonishingly quick in its movement and yet solid as a lump of earth. He had a marvelous facility for nicknames and for the ridicule that hurts. Above all his prose depends for its success on the personal quality that pervades it. It is spoken rather than written down, and in it the man lives. Cobbett has often been called an egoist, and he was; but his egoism—his capacity to make himself express the aspirations of a whole suffering class—is at the very root of his appeal.

(G. D. H. C.)

COBDEN, RICHARD (1804–1865), English political economist, and the greatest apostle of free trade in early Victorian England, was born on June 3, 1804, at Dunford farm, near Midhurst, Sussex. He was the fourth of 11 children who, because of their parents' poverty, were cared for by relatives. Richard, after attending a wretched private boarding school in Yorkshire, entered his uncle's warehouse in London. In 1828 he and two other young men set up a calico-merchanting business on their own account, and three years later, after the heavy duties on calico were removed, began to do their own calico printing at Sabden in Lancashire. At this time Cobden was dominated by a "Buonapartian feeling," and "ambitious hopes and schemes almost boundless": as the ambitions took form, they led him increasingly from business into politics.

He remedied his early lack of education by reading and travel. Between 1833 and 1839 he visited France, Switzerland, the United States, the middle east and Germany. The influence of both reading and his travels can be traced in two significant pamphlets which he wrote at this time—England, Ireland *and* America (1835) and Russia (1836). They pointed to salient facts in the international situation that many Englishmen ignored: to the rise of the United States and its vast economic resources, to the artificiality of most current assessments of "the balance of power," particularly pro-Turk and anti-Russian biases, and to the need for Great Britain to expand its foreign trade. Such expansion was dependent on free trade, not on military power and the "false tenets of glory": "cheapness, and not the cannon and the sword, is the weapon through which alone we possess and can hope to defend or extend our commerce." Furthermore. Great Britain's interests as a trading power could point the way to a new international order, based on the increase in wealth and the free movement of resources.

Struggle for the Repeal of the Corn Laws.—Cobden was to take up the main theme of these pamphlets on many later occasions, but from 1838 to 1846 he was engaged on a practical task, which demanded the whole of his energies—the fight for the repeal of the corn laws. In Oct. 1838 the Anti-Corn Law association was founded by seven Manchester men; by March 1839 it had transformed itself into a national organization. the Anti-Corn Law league; by the end of 1840 it had become the most powerful pressure group in British politics, and Cobden had established himself as its leading personality. For Cobden and his supporters the corn law "took from the poorest of the poor to add to the richest of the rich." It was morally wrong as well as economically inexpedient. The sole class nhich benefited by it was the class of the landowners: it enriched them at the expense of the community. There was little original in Cobden's economic arguments: what was new was the relentless drive and tactical skill with which they were pressed on the platform, first in the manufacturing cities, then in London and the countryside. Along with men like John Bright (*q.v.*), who in 1841 pledged himself never to rest "till the corn law is repealed," Cobden carried on a perpetual agitation, linking national free-trade policy, wherever he could, to the dream of international solidarity, based on full liberty of commerce.

At the general election of 1841 Cobden became member of parliament for Stockport, and made his first speech on the corn laws during the debate on an amendment to the address. The mounting pressure of political activities compelled him to neglect his business interests, and from 1841 onward he always put politics first and business second. He soon became renowned in the house of commons as the main critic of Sir Robert Peel, countering the views of Peel and his Conservative supporters not by rhetoric but by plainness and persuasiveness. In the country he was prepared to take up more dramatic tactics, and the methods of the Anti-Corn Law league were frequently open to criticism. After he had told Peel in Feb. 1843 that he held him individually responsible for the distress in the country, there was a sharp clash between the two men, which created much argument outside Westminster. Nonetheless Peel found it increasingly difficult to counter Cobden's arguments and in March 1845, after Cobden had recapitulated the league's arguments in the commons, Peel crumpled up his notes and said to Sidney Herbert, "You may answer this, for I cannot."

Some politicians had already prophesied that Peel would crown the fiscal reforms of his 1841 ministry with the repeal of the corn laws and some members of his government had realized at the time of Peel's first budget in 1842 that the next change in the corn laws would be their total repeal. In the autumn of 1845 Peel was wavering and the prospect of famine in Ireland as a result of the failure of the potato crop hastened his conversion. The cabinet was divided, and on Dec. 5, 1845, the prime minister resigned. Lord John Russell, invited to take office, asked Cobden to join his ministry, but he refused on the ground that his mission lay outside the house of commons on the public platform. Lord John Russell failed to form a ministry and on Dec. 20 Peel resumed office. Abandoned by many of his supporters and supported by many of his opponents, he carried the repeal of the'corn laws, but was immediately defeated on a different issue and resigned on June 29, 1846, paying a warm tribute to Cobden in his final speech: "The name which ought to be, and will be associated with the success of these measures is not mine . . . but one who acting I believe from pure and disinterested motives, has with untiring energy, made appeals to our reason and has enforced those appeals with an eloquence the more to be admired because it was unaffected and unadorned: the name . . . of Richard Cobden."

The seven years' struggle for repeal left Cobden a ruined man. He had made a large fortune before he devoted his time to the league, but it had disappeared, and a public subscription was raised for him in 1847 to enable him to meet his obligations. With part of the amount collected he bought his birthplace, the farmhouse of Dunford, which was henceforward to be his home. He had married a Welsh girl, Catherine Anne Williams, in 1840, and all visitors to Dunford spoke of her beauty and charm. Their only son, Richard Brooke Cobden, died suddenly in 1856 at the age of 15; they also had five daughters, one of whom, Ellen Millicent, was a novelist.

Advocate of Free Trade and Peace.—Cobden did not retire into private life. however. in 1847. He chose travel as his means of recuperation after the long repeal struggle and visited Spain and Italy in 1846 and Russia in 1847. At the general election in 1847 he was elected a member of parliament for the West Riding of Yorkshire which he continued to represent until 1857. His main preoccupations during these ten years were with the international implications of his trade policy. He considered the reduction of armaments as the logical complement of free trade, and in advocating nonintervention in Europe, opposition to the expansion of the British empire and friendship with Russia, he

found himself in sharp opposition to Lord Palmerston, who after the death of Peel in 1850 became the dominant figure in British politics. In 1849 Cobden moved a commons resolution in favour of international arbitration and in 1851, the year of the great exhibition, when his ideas seemed to have converted a large section of the community, a resolution in favour of the mutual reduction of armaments. He associated himself also with the international peace movement, which organized a series of international congresses between 1848 and 1851. The mood of 1851 soon changed, and Cobden's advocacy of a cheap and passive foreign policy and an active trade policy became very unpopular in 1853 and 1854. This did not daunt him. and one of his most powerful pamphlets, *1793* and *1853* in Three Letters (1853) was a plea to learn from the "errors of the past" and to avoid war with France. After the Crimean War had broken out he courageously restated in What Next—And Next? (1856) his youthful views on the Russian question. He held that the interests of trade and humanity alike pointed to friendship with Russia and not with Turkey and, like Bright, he deplored not only the loss of money and blood but also the climate of war hysteria which influenced many of his fellow countrymen. Cobden suffered directly as a result of the war. Although in 1857 he was successful in carrying a motion in parliament to condemn Palmerston's foreign policy in relation to China, he lost his seat at the subsequent election. Bright too was defeated, and the ideas for which they had both stood seemed in eclipse.

Anglo-French Commercial Treaty.—After another visit to the United States, Cobden was returned unopposed to the 1859 parliament by the electors of Rochdale and on this occasion his old enemy Palmerston asked him to serve in the new broad-based Liberal cabinet as president of the board of trade. Cobden declined, but soon afterward (Oct. 1859) embarked upon laborious and at first unofficial negotiations for a new commercial treaty with France, based on tariff reduction and the expansion of trade. Backed by W. E. Gladstone, who differed with him on several points, he was successful, and a treaty was signed in 1860, which was designed to serve as a model for other commercial negotiations. Each of the two powers, in addition to making specific concessions, engaged not to enforce against the other any prohibition on imports or exports which was not applicable at the same time against other nations. This, the "most-favoured-nation clause." was copied in many other treaties. Although the free-trade mood was to be dissipated again in the 1870s and 1880s, Cobden in 1860 made a genuine and substantial contribution to international understanding.

The last great issue of policy with which he was concerned was the American Civil War. After some initial hesitation, Cobden declared for the North, and his correspondence with Charles Sumner. to whom he had been writing since 1851, was an important unofficial contact between Great Britain and the United States. The strain of the Anglo-French negotiations and the anxiety of living through a cold and foggy winter in Paris undermined Cobden's health, and for the last five years of his life he was extremely unwell. On a visit to London to attend parliament, he made a last endeavour to get from his bed to vote against expenditure on fortifications, but the effort was too much and he died on April 2, 1865.

Character and Influence.—Cobden's career clearly illustrates the development of middle-class radical politics in the 19th century. He was a child of the Industrial Revolution. and he believed that the removal of restrictions on the free play of self interest would eventually be in the interests of all. He opposed factory legislation for most of his life, although he was prepared to support state intervention in education. He disliked trade unions, which in 1842 he claimed were "founded upon principles of brutal tyranny and monopoly," and he never fully shared Bright's enthusiasm for a wider franchise or for the political sense of the working classes. Unhappy during the political lull of the early 1860s. he went so far as to ask in 1861. "Have they [the working class] no Spartacus among them to lead a revolt of the slave class against their political tormentors?", but the question reflected his mood rather than his ideology. He was indeed essentially a middle-class spokesman, who did much to forge middle-class consciousness in English politics. He himself called the Anti-Corn Law league "a middle-class agitation" and admitted that "we have carried it on by those means by which the middle-class usually carried on its movements." As late as 1862, somewhat disillusioned by middle-class support of Palmerston, he commented that "with many faults and shortcomings, our mercantile and manufacturing classes as represented in the chambers of commerce are after all the only power in the state possessed of wealth and political influence sufficient in part to counteract in some degree the feudal governing class of the country." His greatness was that he translated the language of interests into the language of moral principles, and tried to teach the English middle classes, whom he felt that he represented, to relate their immediate operations to the whole chain of international economic activities, which he considered to be the practical foundations of world peace.

COBDEN-SANDERSON, THOMAS JAMES (1840–1922). English book designer and binder, who contributed much to the success of the arts and crafts movement, was born on Dec. 2, 1840, at Alnwick, Northumberland. He was called to the bar but in 1883, strongly encouraged by his wife, Annie, fourth daughter of Richard Cobden, he turned to bookbinding, in which, despite technical imperfections, he rapidly won distinction. He established the Doves bindery at Hammersmith (1893), confining himself thereafter to designing, and in 1900 he founded with Emery Walker the Doves press, the restrained splendour of whose books is unsurpassed. The partnership ended in 1908, and Cobden-Sanderson ensured that no one should use its special type after the press closed in 1916; regardless of his undertaking that Walker should have it after his death, he flung it in the river Thames. All reference to Walker was excluded from his Cosmic Vision (1922) and *Journals 1879–1922* (2 vol., 1926). He died at Hammersmith on Sept. 7, 1922.

COBENZL, PHILIPP (1741–1810), and **LUDWIG** (1753–1809), GRAFEN VON, Austrian statesmen, were cousins.

PHILIPP VON COBENZL was born at Laibach (Ljubljana), on May 28, 1741. From 1759 he was employed in the fiscal administration of the Austrian Netherlands. When only 26, he became a councilor of state in Vienna. In 1777 he traveled to France in the personal entourage of the emperor Joseph II. He also enjoyed the patronage of the chancellor, Prince Kaunitz. After the successful conclusion of the peace of Teschen (1779), Kaunitz nominated Cobenzl as vice-chancellor and his personal representative. In 1787 Cobenzl was sent to the Austrian Netherlands to pacify the troubles provoked there by Joseph II's reforms; peace was restored only by abandoning the imperial policy. Unlike Kaunitz, Cobenzl shared the emperor Leopold II's approval of a policy of compromise with Prussia. Leopold made him a conference minister, but he gained the commanding voice in affairs only when the emperor Francis II appointed him chancellor in succession to Kaunitz (1792). Cobenzl wished to overcome the objections of Prussia to the long-proposed exchange of the Austrian Netherlands for Bavaria. By making no protest against Prussia's annexation of Brandenburg-Ansbach-Bayreuth (1791) and countenancing Prussian designs on Poland, he thought he would gain Prussian approval for the exchange. When, however, in Jan. 1793, Prussia and Russia made the second partition of Poland without any reference to Austria, Cobenzl's policy was demolished and in March he was dismissed. From 1801 to 1805 Cobenzl served as Austrian minister in Paris but he failed to regain his position in the state. The last member of his family, Cobenzl died at Vienna on Aug. 30, 1810.

LUDWIG VON COBENZL was born at Brussels on Nov. 21, 1753.

After serving in the administration of Galicia, Cobenzl was appointed Austrian minister in Berlin in 1774 and was sent as minister to St. Petersburg in 1779. Intelligent and charming, he established excellent connections at the Russian court, receiving the special favour of the empress Catherine II. In 1795 he was able, by the third partition treaty, to get compensation for Austria's exclusion from the second partition of Poland. After this, he was called in to represent Austria at the negotiations with France, both at Campo Formio (1797) and at the congress of Rastatt (1797–99). In both cases. however, although appearing to win territorial gains for Austria, he was in fact outwitted by Napoleon, who wished, by concessions, to overcome Austrian opposition to his plans for the dismemberment of the Holy Roman empire. In 1800 Cobenzl became foreign minister and was largely responsible for the terms of the treaty of Lunéville between Austria and France (Feb. 1801), which confirmed the unfavourable terms of Campo Formio and Rastatt, effecting a total German withdrawal from the left bank of the Rhine. Cobenzl's effort to find a *modus* vivendi with France led him, in 1804, to recognize Napoleon's imperial title, but he followed this by rashly leading his country, still militarily unprepared, into the third coalition against France, The coalition was defeated at the battle of Austerlitz on Dec. 2, 1805, and Cobenzl was dismissed on Dec. 25. He died at Vienna on Feb. 22, 1809.

COBERGHER (COEBERGER), **WENCESLAS** (WENSEL) (1557/61–1634), Flemish painter, engraver and architect who was a leader in the development of the Flemish baroque style of architecture, was born in Antwerp. He received his education as a painter in the workshop of Maarten de Vos and by studying works of art, in Paris, Rome and Naples (1583–1604). From 1605 until his death Cobergher was painter, architect and engineer to the archduke Albert and the infanta Isabella, governors of the Spanish Netherlands. He painted altarpieces for churches in Italy and in Belgium, but his pictures are far less important than his few surviving buildings. Of these the most famous is the church of Notre Dame de Montaigu near Antwerp which is an imitation of St. Peter's in Rome. He wrote also on archaeology. Cobergher died in Brussels on Nov. 24, 1634. (A. NH.; X.)

COBH (CÓBH pronounced "Cove"), a seaport and naval station of County Cork, Republic of Ireland, on the south side of Great Island, rising on a terraced hill above Cork (*q.v.*) harbour. Pop. (1961) 5,266. Cove of Cork, as it was formerly called, was a small fishing village until the end of the 18th century. In honour of Queen Victoria, who landed there on her first visit to Ireland in 1849, it was renamed Queenstown and it retained this name until 1922. The great Gothic-style cathedral of St. Colman. begun in 1868 and consecrated in 1919, crowns the hill and is the seat of the Roman Catholic Cloyne bishopric. Cobh became a military and naval centre and port of embarkation for troops and is the chief Irish port of call for transatlantic liners. The depth at the harbour entrance is 41 ft. (low water) while in the river it is 29 ft. at high tides and 26 ft. at low tides. There is a dockyard at Cobh and steelworks at Haulbowline Island, which is also the Irish naval base.

COBIA (CRABEATER, SERGEANT FISH), a strong, swift, voracious game fish (*Rachycentron* canadus), cosmopolitan in warm seas, the only genus of the family Rachycentridae, which, according to G. A. Boulenger, is allied with the mackerellike fishes. The fish is slender and somewhat pikelike. reaching a length of five feet. The head is flattened and the lower jaw projecting. The tail is strong and forked, the upper lobe slightly the longer. In advance of the long, low, soft dorsal fin are about eight low, isolated spines constituting the spinous dorsal. The anal fin is almost as long as the dorsal. The cobia is dark olive green above, shading into lighter brownish-green and silvery. On the sides two distinct dark stripes parallel each other, one from the tip of the upper jaw to tail, the other starting at the origin of the pectoral fin.

See also FISHES.

COBLENZ (KOBLENZ) is a town of Germany, located after the partition of the nation following World War II in the Land (state) of Rhineland-Palatinate, Federal Republic of Germany. It lies at the junction of the Moselle and the Rhine (hence its old name of Confluentes), 88 km. (55 mi.) S.S.E. of Cologne by road, on the main railway from Basel, Frankfurt and Mainz to Cologne and the Ruhr. Pop. (1959 est.) 97,242. Spurs from the Hunsriick, Eifel, Westerwald and Taunus mountains surround the town. The Lohrstrasse runs from the main railway station to the old town, on the highest point of which is the Liebfrauenkirche (Church of Our Lady), a Gothic basilica standing partly on Roman walls. Its vicarage was the royal court of justice and residence of the archbishop in the days of the Frankish kings. Close by is Metternich house in which the Austrian chancellor Prince Metternich (1773–1859) was born. Eastward is the Jesuit church (1613–17) with a fine late Renaissance entrance and, connected to it the former Jesuit college (1690–1700), now the town hall. The Florins market is dominated by the basilica. A castle formerly belonging to the electorate of Trier (1273), on the bapks of the Moselle to the northwest, holds the municipal library, founded in 1827. The adjacent Baldwin bridge (built by the elector Baldwin, 1343) crosses the Moselle on 14 arches. The Deutsches Eck, a point of land at the junction of the Rhine and Moselle, was set aside after 1953 as a place of dedication to German reunification. Nearby are the rebuilt Deutschherrenhaus (1216) and the Gothic Castor church (836). A few hundred metres farther east are Clemens square and the new town, containing an early classic municipal theatre (1786) and a palace, built during the reign of the elector Clement Wenceslaus (1768–1812) and rebuilt after damage in World War II. Below it, on the bank of the Rhine, is the "wine village," a centre for the promotion of the German wine trade. A memorial to Joseph von Gorres (1776–1848), Catholic politician and writer and a native of the town, stands on the riverside promenade. The development of the Rhine is shown in the Rhine museum.

Ehrenbreitstein, a fortress and suburb incorporated into Coblenz in 1937, stands across the Rhine from the confluence with the Moselle on a precipitous rock 118 m. high. The winding path up the south side is heavily guarded and the citadel is flanked by a double line of fortifications. A castle was first built on the site in the 11th century by a noble named Erembert (or Erembrecht). From the 12th century it belonged to the archbishops of Trier. The fortress was blown up by the French in 1801 after a four-year siege and between 1816 and 1832 it was rebuilt into one of the strongest in Europe. The buildings survived World Wars I and II without being seriously damaged. A chair lift brings visitors to the fortress, which offers a panoramic view. The Mid-Rhine museum, with documents relating to the history of Coblenz and a valuable collection of paintings, is located there.

Coblenz has 41 schools, among them 5 Gymnasiums for boys and girls, a *Realschule,* a trade and technical school, the combined technical institutes, a teacher-training college and a Volkshochschule, The surrounding countryside is rich in woods and lakes and in the summer Coblenz is the centre of Rhine and Moselle river traffic and a popular goal for campers and tourists. The position of Coblenz made it an important commercial centre from early times. Large industrial concerns manufacture furniture, clothes, chemical articles and equipment and other industries are located on the town's outskirts. The Coblenz-Rauental harbour on the Moselle was rebuilt with numerous oil storage depots, making Coblenz one of the larger mid-Rhine petroleum ports.

One of the oldest towns in Germany, Coblenz was known to the Romans as Castellum as early as 9 B.C. In the 6th century it was a royal seat of the Franks, and in 1018 it was given to the archbishopric of Trier by the emperor Henry II. After World War I it was the headquarters of the Joint Allied Commission for the Rhineland (1919–29). During World War II it was captured by the Allies (March 1945). About 85% of the buildings were de-

stroyed. Reconstruction gave the town a spacious modern appearance. (A. RI.)

COBRA, the name applied to certain extremely poisonous snakes, related to the new world coral snakes and mambas, of the family Elapidae. Cobras have a more or less laterally expansible neck region, and include the genera Naja, *Ophiophagus, Hemachatus,* Pseudohaje and Boulengerina. The dilation of the neck to form a broad disk or hood is brought about by the raising and pushing forward of the long anterior ribs, the elastic skin being stretched taut over this framework. This type of hood is in marked contrast to the vertical expansion of the neck of many snakes (*e.g.,* boomslang and mamba), which is caused by the inflation of the windpipe. In all species, however, erection of the hood only occurs when the animal is annoyed or disturbed.

The genus Naja — the cobras proper, containing about ten species — ranges from the Cape of Good Hope throughout Africa, Arabia and India to southern China. the Philippine Islands and the Malay archipelago; *Hemachatus,* the "spuy slang" (spitting snake) of the Boers, with a single species, is confined to South Africa; Ophiophagus, the king cobra, ranges from Burma through the East Indies. *Pseudohaje,* the black cobra and Gold's cobra, are found in the western rain forests of central Africa; Boulengerina, fish-eating water cobras, inhabit the large central African lakes. These snakes are proteroglyphous, *i.e.,* with fixed poison fangs on the front of the upper jaw, and the bite of all the species is extremely dangerous. Accurate statistics of snake-bite mortality cannot be obtained, but it seems fairly certain that the common Indian cobra (Naja naja) is responsible for several thousand deaths annually.

As in all proteroglyphous snakes, the venom acts directly on the nervous system (neurotoxic) and so is much more rapid in its action than that (hemotoxic) of the solenoglyphic (vipers and rattlesnakes) and opisthoglyphous snakes (boomslang, mangrove snake, etc.), the toxicity of which is chiefly due to its power of destroying the blood corpuscles. In the past, despite a multitude of so-called cures and a widespread belief in the efficacy of "snake stones," no really effective treatment was available except immediate excision of the site of the bite and application of mild. even suction in order to drain off the venom; now efficient antivenins are produced from the blood sera of animals that have been immunized by regulated doses of venom. These antivenins, however, must be administered hypodermically (see also VENOM). The dose is large and, to be effective for the bites of proteroglyphous snakes. must be given immediately, conditions not easily obtained in most of the regions which cobras inhabit. Danger to man is further enhanced by the fact that the prevalence of rats and mice frequently attracts cobras to the vicinity of villages and houses where they are more likely to come into contact with man. In India also, cobras are often regarded with so much superstitious reverence that no attempt is made to kill them.

The best-known species is the common Indian cobra, which may reach a length of about 5½ ft. and which exhibits great variation in colour; typically it is yellowish to dark brown with a black-and-white spectacle-shaped marking on the hood, but all gradations between this form and specimens without any trace of such a mark are known. The king cobra or hamadryad (Ophiophagus hannah) is another oriental species; it is rarer than the common cobra, larger, reaching a length of 12 ft. or more, and feeds chiefly on other snakes. Like all the cobras it lays eggs. It exercises some parental care; a definite nest of dried leaves is made, and the parents remain in the vicinity of the nest until the eggs are hatched. There may be some care of the nest in the common cobra.

JOHN MARKHAM

INDIAN COBRA (NAJA NAJA)

In Africa there are several species, the hooded or Egyptian cobra (*Naja haje*) and the black-necked cobra (Naja nigricollis) being the most widely distributed. The latter species is able to spit its venom, like the spitting cobra (Hemachatus haemachatus), which is closely allied to the true cobras, and is notorious for its habit of spitting venom when annoyed; by muscular compression of the poison glands the venom is forced out through the fangs to a distance of several feet, and if it strikes an enemy in the eyes, intense irritation is set up that results in temporary, and sometimes permanent, blindness unless the area is promptly washed. In the accomplished venom spitters, the opening near the end of the fang faces directly forward, while in the cobras that spit only occasionally, like the common cobra, the fang openings are directed downward. (D. M. S. W.; X.)

COBURG is a town of Germany, located after the partition of the nation following World War II in the Land (state) of Bavaria, Federal Republic of Germany. It is on the left bank of the Itz, 110 km. (68 mi.) N. of Niirnberg by road, and on the railway from Niirnberg to Meiningen. Pop. (1961) 10,646. The duke's residence, the Ehrenburg, was converted by Duke Johann Ernst in 1547 from a religious house proscribed during the Reformation. After the abdication of the last duke in 1918, it housed the library of the Land and the Coburg branch of the Bavarian state archives. On the market place are the medieval *Rathaus* and the town hall, a fine example of German Renaissance style. There is a Gymnasium, founded in 1605. Between 1909 and 1924 the Veste or castle above the town, one of the finest castles in Germany, was completely renovated. It contains art collections founded by the dukes. From 1914 the science museum, notable for its collection of birds of the world, had its own building in the castle grounds. Industries include breweries, manufacture of meat products, machinery, light bulbs, dolls, toys, basketwork, china, glasswork and glass jars.

Coburg was a possession of the emperor Otto II (d. 983) and was first mentioned in a record of 1056. It was of considerable importance in the 15th and 16th centuries, largely because of its strongly fortified castle situated on the busy trade route from Augsburg and Niirnberg to Hamburg. In 1248 Coburg was inherited by the dukes of Henneberg, who gave it civic status. From 1343 to 1918 Coburg was in the possession of the margraves of Meissen, members of the Wettin family, who after 1826 took the title of dukes of Saxe-Coburg-Gotha (see WETTIN; SAXE-COBURG-GOTHA). The castle was strong enough to withstand successfully a siege by Wallenstein in 1632. In World War II Coburg was captured by the Allies in April 1945. (R. O. B.)

COCA (CUCA) (Erythroxylum coca), a plant of the family Erythroxylaceae (*q.v.*), the leaves of which are used as a stimulant in western South America. It grows to a height of 8 feet. The branches are straight and the lively green leaves are thin, opaque, oval and more or less tapering at the extremities. A marked characteristic of the leaf is an areolated portion bounded by two longitudinal curved lines one on each side of the midrib, and more conspicuous on the under face of the leaf. The flowers are small, and disposed in little clusters on short stalks; the corolla is composed of five yellowish-white petals, the anthers are heart-shaped, and the pistil consists of three carpels united to form a three-chambered ovary. The flowers are succeeded by red berries.

The plants thrive best in hot, damp situations, such as the clearings of forests: but the leaves most preferred are obtained in drier localities, on the sides of hills. The leaves are considered ready

for plucking when they break on being bent. The green leaves (matu) are spread in thin layers on coarse woolen cloths and dried in the sun; they are then packed in sacks, which, in order to preserve the quality must be kept from damp.

The composition of different specimens of coca leaves is very inconstant. Good samples of the dried leaves are uncurled, deep green on the upper surface, gray-green on the lower, and have a strong tealike odour; when chewed they produce a sense of warmth in the mouth, and have a pleasant, pungent taste. Besides the important alkaloid cocaine (*q.v.*) there are several other alkaloids. Coca leaves and preparations of them have no external action. Internally their action is similar to that of opium, though less narcotic.

COCAINE is a white, crystalline alkaloid used for local anesthesia. It is a potent, dangerous and habit-forming drug causing serious social problems.

The only medical use of cocaine is based on its ability to interrupt conduction in nerves, thus producing local anesthesia, especially of the mucous membranes of the eye, nose and throat. The discovery of its local anesthetic action was made in Vienna in 1884 and is ascribed to Carl Koller. Cocaine represents the first step in a long series of local anesthetic drugs.

Cocaine is obtained from the leaves of Erythroxylon (or *Erythroxylum*) cocae (or coca), a bush commonly found wild in Peru and Bolivia and cultivated in many other countries, including Indonesia. For centuries the Indians of Peru and Bolivia have chewed coca leaves, often mixed with ashes of plants and with limestone, for pleasure and to enable them to withstand strenuous work, walking, hunger and thirst. When taken by mouth it produces local anesthesia of the stomach, so that hunger and thirst are not felt. It is readily absorbed from the mucous membranes and has a pronounced, highly toxic action upon the central nervous system, a stimulation followed by a depression. The cortex of the brain is first stimulated, mental power is increased, and the sensation of fatigue disappears. It causes euphoria and pleasant hallucinations. Following larger doses the spinal cord also is stimulated, and convulsions may result. The stimulation is often followed by a depression of the entire nervous system, and death may result from respiratory failure.

The greatest hazard in the use of cocaine is addiction, which may develop after a very short time, even weeks. Cocaine is called "snow," because it is a fine white powder, and it is often sniffed and absorbed from the nasal mucosa. Because of its irritating and vasoconstricting characteristics it frequently causes ulcerations in the nasal cavity. Addiction is commonest in unstable and psychopathic persons and is particularly deleterious because the addicts prefer company and try to induce their friends to share their pleasures. Gradually and increasingly a paranoiac psychosis develops. Cocaine addicts are often fearful and may suffer from the paranoiac belief of being threatened; they are dangerous and commonly carry weapons, which they are likely to use.

The hallucinations can be auditory, visual or tactual; imaginary insects are seen and felt crawling over the skin. Psychic dependence on cocaine develops, sleeplessness is common, loss of appetite, nausea and digestive disorders lead to emaciation, and convulsions are often seen. Mental deterioration takes place, and most addicts end up as pitifully reduced, grumbling and irritating inmates in mental institutions.

See also ALKALOIDS; COCA; DRUG ADDICTION; NOVOCAINE.

(E. T. M.)

COCAMA, a tribe of South American Indians which at the time of the Spanish conquest occupied the lower reaches of the Ucayali and Huallaga rivers in what is now northeastern Peru The westernmost representatives of the widespread Tupi-Guarani linguistic family (see TUPIAN), the Cocama were a warlike people who took the heads of their enemies as trophies but did not practise cannibalism. In most respects their culture resembled that of other peoples of the tropical forest, but the wearing of woven garments suggests some influence from the Andean civilizations. Subsistence was derived from agriculture and from the rivers, with turtles and turtle eggs being especially important. Villages, ahich were largely independent of one another, were composed of several large thatched houses, each containing several families. Chiefs had little authority. Religious practises centred around the treatment of disease, which was thought to be caused by a variety of spirits inhabiting the rivers and forests.

The modern Cocama number about 10,000. Most work as peons and maintain many of the old customs.

See Alfred Métraux, "Tribes of the Middle and Upper Amazon River" in *Handbook of South American Indians,* ed. by Julian H. Steward, Bureau of American Ethnology Bulletin 143, vol. 3, pp 687–712 (1948). (SE L.)

COCCEIUS, JOHANNES (JOHANNES KOCH or COCH) (1603–1669), German Protestant exegete and theologian, a leading exponent of federal (foedus) or covenant theology, was born in Bremen on Aug. 9, 1603. Educated at Hamburg and Franeker (Netherlands), he was later professor at Bremen, Franeker and finally at Leiden until his death on Nov. 5, 1669.

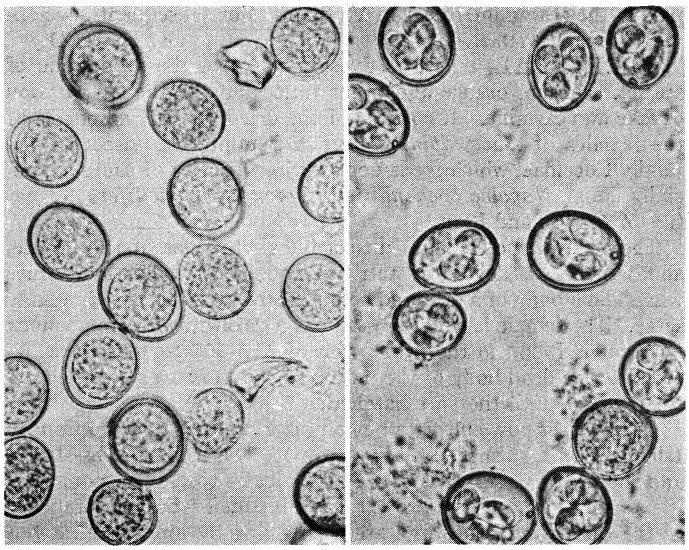
The bulk of Cocceius' massive works is biblical interpretation, which was also the point of departure in his systematic thought In his Summa doctrinae de foedere et testamento Dei (1648) the basic conception is that before the Fall, as well as after it, the relation between God and man was a covenant. In paradise there was a covenant of works (*i.e.,* salvation was promised on condition of perfect obedience) which, after sin made obedience impossible, was "abrogated" by the covenant of grace (salvation as a free gift of God). The gracious covenant originated in an inner-Trinitarian "pact" between the Father and the Son (Cocceius' version of predestination) and is realized in a succession or "economy" of historical steps culminating in the eternal Kingdom of God. Thus Cocceius was able to strengthen biblical piety and introduce the idea of the history of salvation, including an uncharacteristic millenarianism, within scholastic Reformed theology. The covenant of works reflected in the conscience of all mankind provided a broad base for theological treatment of social and political life; the gracious covenant, first stated in Gen. iii, 15, allowed the interpretation of much of the Old Testament as types or symbols of Christ.

BIBLIOGRAPHY.—Cocceius' *Opera Omnia* were published in 12 vol., folio (1673–75). *See* analysis and bibliography in G. Schrenk, *Gottesreich und Bund, . . . vornehmlich bei Johannes Coccejus* (1923); P. Jacobs in *Religion in Geschichte und Gegenwart,* 3rd ed., vol. i, pp. 1518–20, 1814 (1957). (E. A. DY.)

COCCIDIOSIS, in the generalized sense, is infection of an animal (the host) with one of the parasitic microbial animals collectively known as coccidia. There are at least as many kinds of coccidiosis as there are species of coccidia. The parasites infect farm animals and occasionally man.

The life cycles of certain species of coccidia span two kinds of hosts; *e.g.,* Hepatozoon *muris* passes part of one life cycle in a mammal, the common rat, and the rest of it in its transmitter, a mite that sucks the blood of its host. The coccidia of major economic importance are of the one-host, filth-borne sort, whose survival depends on the production and mechanical spread of their infective stages.

Life Cycle of One-Host **Coccidia.**—The basic life cycle is ordinarily divisible into two successively recurring phases: endogeny, which is the total development that ordinarily takes place within the body of the host; and exogeny, which occurs in the environment outside the bodies of animals but inside the walls of the oocysts, the terminal stages produced during endogenous development. Oocysts are shed from infected tissues such as the lining of the intestine and reach the outer world in the feces. As viewed through the microscope at about 400 magnifications, one oocyst consists of a roundish or oval parasite containing a nucleus and enveloped by a more or less firm wall. At ordinary temperatures and in the presence of air and moisture, the parasite forms one, two or more thin-walled lemon-shaped spores; from the content of each of these in turn are developed two or more naked, banana-shaped sporozoites, each containing a nucleus. It requires a minimum of one to six days for the completion of the exogenous phase, depending on the species concerned. The sporozoites are the infective stages; they are capable of living for weeks, months, or even one or two years under favourable conditions of temperature and moisture, because of the protection afforded them by the walls of



ELERY R. BECKER

OÖCYSTS OF EIMERIA BRUNETTI FROM CHICKENS

(Left) freshly discharged oocysts; (right) oocysts at completion of exogenous development

oocyst and sporocyst, but most eventually perish from aging or weathering.

When the environment is sufficiently contaminated. sodner or later a susceptible animal will swallow some of the infective stages with its food or drink, or while licking or preening itself or others. In the digestive tract the sporozoites become active, escape from their enveloping malls and invade the epithelial (lining) cells or the deeper layers of the intestinal wall. Some species enter minute blood vessels to be carried to such sites as liver or kidney. Once the sporozoite is within its preferred type of cell, it starts its endogenous development and is henceforth known as a schizont. It grows, and its nucleus undergoes a series of divisions. at the completion of which the schizont divides into as many merozoites as there are nuclei; this completes one round of a process known as schizogony. The merozoites enter other suitable cells and grow into either second-generation schizonts or gametocytes, depending on the species. In certain species schizogony occurs only once, in others twice, in still others three times.

Some or all of the merozoites produced from one of the last schizont generations enter suitable host cells and grow into immature sexual forms known as gametocytes. The macrogametocyte (female) matures into a nonmotile. walled macrogamete (egg) with one nucleus, while from the microgametocyte (male) are created a swarm of extremely small: comma-shaped microgametes (sperms) capable of movement with the aid of their flagella. The macrogamete becomes fertilized when a microgamete enters it at one end through a minute opening in the wall; it is thereafter called an oocyst.

Kinds of **Coccidia.**—The sporulated oocysts of the genus *Eimeria* possess four spores, each holding two sporozoites, while those of *Isospora* have two spores, each with four sporozoites. A number of other genera are also recognized, but the species of greatest economic importance in livestock and man belong to these genera. Wildlife such as bony fishes, amphibia, reptiles. birds and mammals also harbour these and other genera. Each category of livestock—chickens, cattle, sheep, etc.—has its own coccidian parasites not shared with others, a fact that simplifies tracing outbreaks to their source.

Eimerias of Economic Importance.— These occur in chickens, turkeys, geese, rabbits, pigs, cattle. sheep and goats. The greatest losses from coccidial disease occur among chickens, cattle, sheep and rabbits. Young chickens are frequently victims of caecal coccidiosis, caused by *Eimeria tenella.* The disease is characterized by bleeding into the caeca and bloody droppings. Chickens are also severely attacked under certain circumstances by three other species of *Eimeria,* as well as by several others whose effects are less severe. Seven species are known to infect turkeys. but only two of them cause severe symptoms or death. The tame rabbit is the host for possibly a dozen species of *Eimeria,* all inhabiting the digestive tract except *E. stiedae,* which grows in the liver. The latter species is especially deadly in heavy infections. Feeder sheep and lambs in confinement are subject to serious disease and death from infection with one or more of three intestinal species. Cattle harbour about 11 species in their digestive tracts, of which 3 are notable as causes of serious losses among dairy calves in moderate climates; E. *zurnii* does the most damage because it produces red diarrhea, so-called because of the bloody liquid feces. Serious outbreaks of coccidiosis can occur among feeder cattle, confined in lots, a few weeks after they have been brought in from the range.

Isosporas of Economic Importance.— Economically important species of *Isospora* are found in man! cats, dogs and certain fur-bearing carnivores. Two species occur in man, though rarely. The commoner of the two, *I. belli,* is believed to undergo endogeny in the epithelium of the small intestine. Symptoms in the severe form of the disease are diarrhea, diarrhea alternating with constipation, abdominal pain, fever, nausea, headache, loss of appetite and loss of weight. The other species, *I. hominis,* is similar to *I. bigemina* and may he identical with it. The latter species is parasitic within the intestinal villi of dogs and cats, and its oöcysts undergo exogeny before they are shed. Either the sporulated oocysts or the spores are discharged with the feces. Two other species, *I. felis* and *I. rivolta,* whose oocysts are not sporulated when passed, also occur in dogs and cats. It is only when dogs and cats are kept under extremely unsanitary conditions that coccidial infections become serious.

Control.—Coccidiosis is not a serious problem in livestock under good management with sanitary conditions and adequate diet, though there are exceptions to this rule. Certain sulfonamides, arsenicals, antibiotics and other drugs can be used as additives to feed or drinking water to supplement environmental control or for treatment.

COCCUS, a bacterium of spherical shape. See BACTERIOLOGY.

COCHABAMBA, a department in central Bolivia bounded north by El Beni, south by Chuquisaca and Potosi. east by Santa Cruz and west by La Paz and Oruro Pop (1959 est) 554,967; area 21.479 sq mi. It is located in a region half temperate and half semitropical nith a wide range of elevations; the average elevation is about 8,000 ft. It consists in large part of immense plains and great valleys. open to the south and starting from the Cordillera Real. with an abundance of streams. The foremost concentration of settlement in Bolivia is found in the Cochabamba basin, an area about 15 mi. long by 6 mi. uide, where the rural population density exceeds 300 per sq mi.

The department is commonly referred to as "the granary of Bolivia," for it is highly productive of farm commodities and livestock. Agricultural products include wheat, maize, barley, quinoa, potatoes and coffee in the more elevated regions, and sugar cane, coca, cacao, tobacco, citrus and other fruits from the lowlands. The forests supply lumber, dyewood and rubber. Mineral resources worked comprise tin, gold, silver, tungsten, wolfram and copper. The Cochabamba department was established in 1826 and is made up of the following provinces: Cercado, Arque, Quillacollo, Tapacari, Capinota, Ayopaya, Chaparé, Germán Jordán, Esteban Arce (Tarata), Punata, Arani, Carrasco, Mizque and Campero. The completion of a pipeline from the Camiri oil field to the refinery in Cochabamba city, in 1954, further enhanced the economic status of the department. Rivers of consequence include the Mamoré, Chimoré. Ichilo, Rocha, Chaparé and Isiboro.

The department is linked to the lowlands by the Cochabamba-Santa Cruz highway, with Oruro by railroad and with La Paz by highway. (J. L. TK.)

COCHABAMBA, a city of Bolivia, capital of Cochabamba department and of the province of Cercado. The population,

which is largely Indian and mestizo, was estimated at 99.099 in 1959. The city, founded by Sebastián Barba de Padilla with the name of Villa de Oropeza in 1574, was named Villa de Cochabamba in 1786. It lies at an elevation of 8,392 ft. and the climate is mild, 57° F. being the average of its coldest month, and 63.1" F. the annual average temperature. The rainfall averages about 18 in. annually. A diversity of crops including barley, maize, wheat and fruit are cultivated in the surrounding rural district.

Cochabamba is the cultural as well as politico-economic centre of the department and contains a number of fine buildings including the University of San Simón, the museum, the municipal library, the cathedral and the government palace. The Plaza 14 de Septiembre, located in the centre of the city, commemorates the date on which the local patriots took up arms in the War of Independence. Important satellite towns are Vinto, Quillacollo, Sipesipe and Sacaba.

Industries in the city are varied and small, mainly supplying the local market and provinces. The economic position of the city has been greatly enhanced by the completion of the Cochabamba-Santa Cruz highway and the construction of a pipeline into the department from the Camiri oil field. Cochabamba is connected by rail with Oruro (131 mi.) and by highway with La Paz (285 mi.). It is on the established air routes. (J. L. TR.)

COCHIN (KOCHCHIBAND), a port on the southwestern or Malabar coast of India, lies 580 mi. S. of Bombay and about 130 mi. N. of Cape Comorin. Formerly the capital of a princely state of the same name, it is now in the state of Kerala (*q.v.*). Pop. (1951) 29,881. The contiguous and larger town of Mattancherri is also in Kerala. Pop. (1951) 73,904.

The princely state had an area 1,493 sq.mi. and a population of over 1,400,000 at the time of India's independence in 1947. It was then united with Travancore (*q.v.*) as Travancore-Cochin until 1956, when the boundaries were enlarged and the state of Kerala was formed.

Cochin town is situated on the northern tip of a narrow tongue of land barely a mile wide which separates the deep Arabian sea from one of the shallow lagoons typical of this coast. These lagoons are often connected with the sea by shallow channels. In the case of Cochin the channel (though blocked by a sand bar) was sufficiently deep to allow the passage of fishing and coastal vessels. The British Indian government in consultation with the Raja of Cochin began the construction of the modern port in 1920 by dredging the entrance to the lagoon. The first ocean-going steamer entered the harbour in June 1928. In 1936 the port administration was taken over by the Indian government and Cochin was declared a major harbour. It is now open for deep-water traffic even in the worst of the monsoon. Cochin is an ideal distributing and collecting centre for Kerala (formerly dependent on the long rail haul to Madras). Facilities include the Cochin harbour railway linked with the broad-gauge Southern railway, coaling berths, ship repair yards and hotels. Ernakulam on the mainland shore of the lagoon is a considerable trading centre.

Cochin was the earliest European settlement in India, the first occupants being the Portuguese. Vasco da Gama founded a factory in 1502 and Affonso de Albuquerque built the fort (the first European one in India) in 1503. The British made a settlement in 1634 but retired when the Dutch captured the town in 1663. Under the Dutch the town became a great trading centre. In 1795 Cochin was captured again by the British and in 1806 the fortifications and many buildings were destroyed. (L. D. S.)

COCHIN CHINA, a colony of French Indochina between 1862 and 1948, now that part of South Vietnam which lies south of Phan Thiet. Before the French period, no one native state covered exactly the area that became Cochin China, but part had been included in Champa, a kingdom of the Hindu colonial period; part was the kingdom of Nguyen phua Anh, who entered into first treaty relations with the French in 1787. Cochin China included the fertile outer delta of the Mekong river, together with contiguous deltas farther north, and was largely opened to immigrant rice farmers during the French period, when Saigon became the capital and a major international port. The National Assembly of Cochin China voted in 1949 that Cochin China should become part of the new unified state of Vietnam. For subsequent developments, see VIETNAM. (E. H. G. D.)

COCHINEAL, a natural dyestuff used for the production of scarlet, crimson, orange and other tints, and for the preparation of lake and carmine. It consists of the dried, pulverized bodies of the females of Dactylopius *coccus,* a hemipterous insect of the family Coccidae, which feeds upon various species of cactus, especially nopal, *Nopalea cochenillifer* (*Opuntia coccinellifera*), a native of Mexico and Peru.

The male of the cochineal insect is half the size of the female, and, unlike it, is devoid of nutritive apparatus; it has long white wings and a body of a deep red colour, terminated by two diverging setae. The female is wingless, and has a dark-brown plano-convex body; it is found in the proportion of 150–200 to 1 of the male insect. The dead body of the mother insect serves as a protection for the eggs until they are hatched.

Cochineal is now cultivated chiefly in Honduras and the Canary Islands, but is furnished also by Mexico, Peru, northern Algeria and southern Spain. It is collected thrice in the seven months of the season. The insects are carefully brushed from the branches of the cactus into bags, and are then killed by immersion in hot water or by exposure to the sun, steam or the heat of an oven—much of the variety of appearance in the commercial article being caused by the mode of treatment.

The dried insect has the form of irregular, fluted and concave grains, of which about 70,000 go to a pound. The best crop is the first of the season, which consists of the unimpregnated females; the later crops include an admixture of young insects and skins, which contain proportionally little colouring matter. Its tinctorial power is attributed to the presence of a substance termed cochinealin or carminic acid, $C_{22}H_{20}O_{13}$ (the formula shown by Dimeoth in 1920), which may be prepared from the aqueous decoction of cochineal.

Cochineal also contains a fat and wax; cochineal wax or coccerin, $C_{30}H_{60}(C_{31}H_{61}O_3)_2$, may be extracted by using benzene; the fat is a glyceryl myristate, $C_3H_5(C_{14}H_{27}O_2)_3$.

The dye was introduced into Europe from Mexico, where it had been used long before the entrance of the Spaniards. Cochineal has almost entirely been replaced by aniline dyes, but it is still used principally as a colouring agent for cosmetics, beverages, etc.

CQCHLAEUS, JOHANNES (JOHANN DOBENEK or DOBNECK) (1479–1552), German humanist and a leading Roman Catholic opponent of Martin Luther (*q.v.*), was born of peasant stock at Wendelstein, near Niirnberg. University studies in humanism and theology at Cologne (1504–10) were followed by five years as head of a boys' school at Niirnberg. While there he published several highly esteemed textbooks, which notably improved instructional methods in Latin grammar, geography, history and music. In Italy he studied humanism and law at Bologna (1515–17), gained a doctorate in theology at Ferrara (1517) and was ordained priest while in Rome (1517–19). On his return to Germany he held ecclesiastical benefices as dean at Frankfurt Am Main, canon at Mainz, court chaplain to Duke George of Saxony and canon at Breslau.

Cochlaeus' early sympathy with Luther changed about 1520 into unremitting criticism. As adviser to papal nuncios and other ecclesiastical and secular dignitaries, he was prominent at important gatherings striving to mend the religious split—at the diet of Worms; at *Reichstags* in Niirnberg, Ratisbon and Speyer; at the diet of Augsburg (1530), where he was one of the theologians selected to draw up a refutation of the Lutheran Augsburg Confession; and at the famous if indecisive conferences at Hagenau, Worms and Ratisbon. More influential, however, were his numerous writings in Latin and German, predominantly concerned with religious controversy.

Noteworthy among his historical productions were the History of the *Hussites* (1549) and Acts and Writings of Luther (1549), his best-known book. This partisan biography coloured Roman Catholic portrayals of Luther into the 19th century. Not an outstanding theologian nor profoundly learned, Cochlaeus displayed nonetheless extensive knowledge, and ranked among the most capable contemporary authors. In external labours he was zealous,

self-sacrificing and completely dedicated to his cause.

Cochlaeus died at Breslau on Jan. 10, 1552.

See K. Schottenloher, *Bibliographie zur Deutschen Geschichte im Zeitalter der Glaubensspaltung, 1517–1585,* vol. i (1933) and vol. v (1939), the fullest bibliography of the period; J. Janssen, *History of the German People at the Close of the Middle Ages,* 17 vol. (1896–1925). (JN. F. B.)

COCHRAN, SIR CHARLES BLAKE (1872–1951), English theatrical manager and impresario, the first nights of whose productions were great social events, was born at Lindfield, Sussex, on Sept. 25, 1872. After a period on the stage in the U.S. during the 1890s, he set up as a theatrical agent in London, where he presented a wide variety of entertainments ranging from boxing to Max Rheinhardt's *The* Miracle and the Diaghilev ballet. Among the personalities he brought to London were Mistinguett, Houdini. Sarah Bernhardt, Eleonora Duse, Fyodor Chaliapin and the Guitrys. He became best known as a producer of reviews and musical plays, including a number of which Noel Coward was author and composer, such as *This Year of Grace* (1928), *Bitter Sweet* (1929), *Cochran's 1931 Revue* and *Cavalcade* (1931). Other successes were *Nymph Errant* (1933) and *Bless the Bride* (1947). Cochran was knighted in 1948 and died in London on Jan. 31, 1951.

COCHRANE, ELIZABETH: *see* BLY, NELLY.

COCKADE (Fr. *cocarde,* with allusion to a cock's comb), a bow or knot of ribbons worn in the hat. Cockades from being simply ornamental early came to be used as party badges. Before the introduction of uniforms (*q.v.*) however, a ribbon or a sprig of foliage was on occasions worn in soldiers' hats to distinguish members of opposite forces. Before the brim of the soldiers' felt hat was looped up, it was sometimes ornamented with a band and knot of ribbon; when the brim came to be cocked up on three sides, a bow of black ribbon was fastened on the left side with a button and loop. At first this bow had no national significance, and the idea that it was introduced into the British army by the Hanoverians is disproved by paintings and the murals made for the great duke of Marlborough, which show his troops all wearing black cockades in their hats. Moreover, in 1763, many of the regiments of the French army, including the *gardes Françaises,* wore black cockades. With the outbreak of the French Revolution. Camille Desmoulins is said to have proposed a green cockade for partisans of the new order, but the blue, white and red cockade which was finally adopted simply took the colours of the royal livery (blue coats, faced red, and ornamented with a white lace with a red chain pattern). Later, French *émigrés* fighting against the Revolution assumed a white cockade if they were serving in the army of the prince de Condé (Louis Joseph de Bourbon) or in the British army, an orange cockade if they were serving in the Dutch forces, and a black and yellow cockade if they were serving in the Austrian.

In the armed forces cockades went out of use when the army and navy ceased to wear cocked hats. A leather cockade! however, still survives in the headgear of the liveried coachmen and chauffeurs of high officials. (C. C. P. L.)

COCKAIGNE (COCKAYNE), **LAND OF,** the name of an imaginary country, a medieval Utopia where life was a round of luxurious idleness. The origin of the word has been much disputed; the most usually accepted derivation is from the Latin *coquere* ("to cook") and the German *kuchen* ("cake"). the literal sense thus being "The Land of Cakes:" In Cockaigne the rivers were of wine, the houses were built of cake and barley sugar, the streets n-ere paved with pastry and the shops supplied goods for nothing. Roast geese and fowls wandered about inviting folks to eat them, and buttered larks fell from the skies like manna. There is a 13th-century French *fabliau, Cocuigne,* which was possibly intended to ridicule the idea of the mythical Avalon, "the Island of the Blest." The 13th-century English poem *The Land of Cockaygne* is a satire on monastic life. The name has been humorously applied to London and was so used by Sir Edward Elgar as the title for his *Cockaigne* overture. It has been confused with Cockney (*q.v.*).

COCKATOO: *see* PARROT.

COCKATRICE (BASILISK), in Hellenistic and Roman times, was a small serpent, possibly the Egyptian cobra, known as a *basilikos* ("kinglet") and credited with powers of destroying all animal and vegetable life (except the weasel, which secreted a venom deadly to the snake) by its mere look or breath. By the time of the 17th-century naturalist Ulisse Aldrovandi, more marvels had been added. The snake (called a cockatrice in English, apparently a corruption of Latin *calcatrix,* "treader," through French *cocatris,* and popularly associated with "cock") was said to be generated from an egg laid by a cock and hatched by a serpent. The weasel, which was still its enemy, was fortified by rue before and after attacking it. Another enemy was the cock: if the basilisk heard a cock crow, it would shortly die; hence travelers in regions infested by the basilisk took cocks with them. A kind of early cannon was called a basilisk. Cockatrice on occasion means a spiteful and dangerous person. (H. J. R.)

COCKBURN, SIR ALEXANDER JAMES EDMUND, 10TH BARONET (1802–1880), lord chief justice of England from 1859 to 1880, was born on Dec. 24, 1802. Scion of a distinguished Scotch family, his immediate predecessors in title were his uncle James, a major general, undersecretary for war and governor of the Bermudas; his uncle George, an admiral and co-commander of the British forces which advanced on Washington, D.C., in 1814 and burned the U.S. capitol; and his uncle William, dean of York. Alexander's father, a younger son of the 6th baronet, had been ambassador to Colombia; his mother was the daughter of the Vicomte de Vignier.

Cockburn was privately educated in Britain and on the continent. where he became fluent in French. German, Spanish and Italian. He was a first class scholar at Trinity college, Cambridge, where he took a degree of bachelor of civil laws and was elected to a fellowship. He entered the Middle Temple in 1825 and was called to the bar in 1829. Initially, he achieved greater success at the sessions than in London, but in 1832 he brought out a volume of reports on election cases that led to a great demand for his services in this form of parliamentary practice. His circuit practice was also flourishing and he became recorder for Southampton. In 1841 he became queen's counsel. Cockburn was an admirable trial lawyer and gained great repute for his successful defense, on grounds of insanity, of Daniel McNaghten, who had killed Sir Robert Peel's secretary The resulting "McNaghten rules" have controlled the law of insanity as a defense in most Anglo-U S. jurisdictions ever since. Cockburn represented his uncle in a suit against the archbishop of York, in which he vanquished John Campbell. the attorney general, Thomas Wilde, the solicitor general, Dundas and Phillimore.

In 1847 he was elected to the house of commons from Southampton as a liberal reformer. When, in 1850, the house of lords voted a censure of Lord John Russell's government for Palmerston's handling of the "Don Pacifico" dispute with Greece. it fell to Cockburn to defend the government against Gladstone's attack. His speech to the commons helped prevent the fall of the Russell cabinet, and he was rewarded with the post of solicitor general. When Sir John Romilly was made master of the rolls, Cockburn became attorney general. Meanwhile his practice was abundant, for at that time the law officers of the crown were permitted to engage in private practice. His most famous cases were the defense of John Henry Newman on a charge of criminal libel leveled by the recusant Dominican monk Achilli and his successful prosecution of William Palmer for the poisoning at Rugeley of John Parson's cook. The Palmer case turned entirely on circumstantial evidence, and the success of the prosecution was due wholly to Cockburn's magnificent advocacy, which in turn depended, as all great legal advocacy must, on thorough preparation. In 1854 Cockburn became recorder for Bristol. He was truly the leader of the bar when he was appointed chief justice of the common pleas in 1856. When Palmerston returned to power in 1859, Cockburn hoped for the great seal, but Campbell was made lord chancellor and Cockburn succeeded him as lord chief justice.

Throughout his judicial career Cockburn was a better nisi prius judge than he was an appellate judge. He presided at the famed Tichborne trial, involving a contested inheritance, which took 188 days (*see* TICHBORNE CLAIMANT). Cockburn's charge to the jury

took 18 days and won from Disraeli the statement in commons that Cockburn was "a man of transcendent abilities." His most important extrajudicial role was that of arbitrator in the "Alabama" claims (see "ALABAMA" ARBITRATION), though he dissented from the majority decision. Cockburn's leisure was spent in hunting, yachting, music and literature; he never married. He was a person of wide intellectual attainment and excellent disposition. He died in London on Nov. 21. 1880. (P. B. K.)

COCKBURN, ALICIA (also called ALISON) (1713–1794), Scottish author of the first version of the ballad "Flowers of the Forest" and famous for her wit and brilliance as a hostess, was born on Oct. 8, 1713. Her lines beginning "I've seen the smiling of Fortune beguiling," set to the old air of "Flowers of the Forest," were probably written before 1731, and were occasioned by the failure of seven Selkirkshire lairds in their financial speculations. Her version, which is the one usually sung, was not published until 1765 in The Lark, and was unknown to Jane Elliot (*q.v.*). After her marriage to Patrick Cockburn of Ormiston, Alicia was hostess to many literary and political celebrities, among them David Hume and Lord Monboddo, and she was also a close friend of Sir Walter Scott. Her other writings, including parodies, toasts and character sketches, are of little merit. She died in Edinburgh on Nov. 22, 1794.

COCKBURN, SIR GEORGE, BART. (1772–1853), British admiral, entered the navy at the age of nine, though he did not go to sea until 1786. After serving on the home station and in the East Indies and the Mediterranean, he assisted, as captain of the "Minerve," at the blockade of Leghorn in 1796, and fought a gallant action with the Spanish frigate "Sabina," which he took. He was present at the battle of Cape St. Vincent. In 1809, in command of the naval force on shore, he contributed greatly to the reduction of Martinique, and signed the capitulation by which that island was handed over to Great Britain.

After service in the Scheldt and at the defense of Cadiz he was sent in 1811 on an unsuccessful mission for the reconciliation of Spain and its American colonies. In 1813–14, as second in command to Sir J. B. Warren, he took part in the War of 1812, especially in the capture of Washington. In the autumn of 1815 he carried out, in the "Northumberland," the sentence of deportation to St. Helena which had been passed upon Bonaparte. He was promoted admiral in 1837; he became senior naval lord in 1841, and held office in that capacity till 1846. In 1851 he was made admiral of the fleet. Cockburn died on Aug. 19, 1853.

COCKCHAFER (Melolontha melolontha), a common European beetle whose larva is destructive to the roots of crops. The white grub spends several years in the soil before emerging as a large beetle that feeds on the leaves of trees and that may often be seen flying in large numbers at dusk.

See CHAFER; BEETLE.

COCKCROFT, SIR JOHN DOUGLAS (1897–), British physicist and co-winner, with E. T. S. Walton, of the Nobel prize for physics in 1951. At a meeting of the Royal society on April 28, 1932, Lord Rutherford announced that two of his workers at the Cavendish laboratory, Cambridge — Cockcroft and Walton — "had successfully disintegrated the nuclei of lithium and other light elements by protons entirely artificially generated by high energy potentials." On Nov. 15, 1951, the Royal Swedish Academy of Sciences announced the award of the Nobel prize for physics jointly to Cockcroft and Walton for "their pioneer work on the transmutation of atomic nuclei by artificially accelerated atomic particles."

Born in Todmorden, Yorkshire, Eng., on May 27, 1897, he was educated at Todmorden Secondary school, at Manchester university and at St. John's college, Cambridge, of which he was a fellow from 1928 to 1946 and an honorary fellow from 1947.

Cockcroft was Jacksonian professor of natural philosophy in Cambridge university, 1939–46; from 1941 to 1944, however, he served as chief superintendent, air defense research and development establishment, ministry of supply, and from 1944 to 1946 he was director of the atomic energy division, National Research council of Canada. In 1946 he became director of the atomic energy research establishment, ministry of supply, at Harwell, Eng. He was also chairman of the defense research policy committee and scientific adviser, ministry of defense, from 1952 to 1954, and served as a member of the British Broadcasting corporation's Scientific Advisory committee, 1948–52. Cockcroft was elected a fellow of the Royal society in 1936, was knighted in 1948 and created knight commander of the Bath in 1953.

PRINTED IN THE U. S. A. BY R. R. DONNELLEY & SONS CO.

plants and secondary steel processing plants have been established in an industrial suburb on the western outskirts of the old city. (J. E. SR.)

CH'ENG-TE (formerly JEHOL), a city of China and capital of the former Jehol province, lies about 130 mi. N.E. of Peking on a tributary of the Luan river at 40° 59′ N., 117° 52′ E. within a plain enclosed by scarps which separate the Mongolian plateau from the north China plain. Pop. (1953) 92,900. The city was the summer residence of the Manchu rulers, being used mainly in autumn as a base for the imperial hunting parties in the great forests. After 1911 Chinese farmers mqved in. cleared timber from the rugged hills, and so began the soil erosion that kept them in poverty thereafter. At one time a railway from Peking ran through Ch'eng-te to Chin-chou on the Peking-Mukden line, but a less difficult route was established 20 mi. E. In 1955 Jehol province, formed from an administrative area in 1929, was abolished, with Ch'eng-te and other parts of southern Jehol being joined to Hopeh province. (TE. H.)

CH'ENG-TU, capital of Szechwan province, China (pop. [1953] 856.700) lies in the centre of the fertile Ch'eng-tu plain, in the northwest corner of the Szechwan basin. The plain (area 2,800 sq.mi.) is the alluvial fan of the Min river spilling south from the Great Snow mountains (Ta-hsdeh shan). By a unique irrigation system begun by Li Ping in the 3rd century B.C. and rigorously maintained ever since, the river waters are led off by countless channels for irrigation. At the lower end of the plain, the channels meet and flow eventually into the Yangtze as the Min and T'o rivers. The plain is well sheltered from winter cold by lofty mountains and with much fertilizer gives heavy yields of rice. sugar, citrus fruits silk, wheat and tung oil. Ch'eng-tu has long been known as a centre of regional administration, wealth and scholarly achievement. One of its most famous residents was the great T'ang dynasty poet, Tu Fu, whose home is a provincial museum. Because of its location, the city is the focal point for the trade of the western Szechwan basin, and the pastoral mountain country of the upper Min which produces wool, hides, furs and medicines for the Ch'eng-tu market.

Ch'eng-tu is the seat of Szechwan university, and during World War II several universities were moved there temporarily from Japanese-held areas. There are also institutes of technology, geological prospecting and telecommunications and a medical college. Under the Chinese People's Republic, the city is changing greatly. Many of the old streets have been widened for bus services. while sanitation has been improved by building underground sewers. Industrial expansion on the north side includes a new steam-power plant, railway repair shops and freight yards, machine tools and brick and tile factories. The Ch'eng-tu—Chunking railway, completed 1952, extends for 300 mi., and meets in Ch'eng-tu the 400-mi. railway built across the 10,000-ft high Tsinling mountains north to Pao-chi in southnest Shensi province; construction of the line south to R'un-ming is in progress. Two important new highways link Ch'eng-tu with the high Tibetan plateau: one. 310-mi. long, leads northwest to Ahpa, 9 800 ft. above sea level; the second bends southwest via Ya-an, Kan-tzu and Lhasa to Shigatse, 1,700 mi. away in south-central Tibet, permitting trucks and animal caravans to transport goods over some of the world's most rugged high-level mountain and gorge country. This is in keeping with increased control of Tibet by the People's Republic. and also with the establishment in Ch'eng-tu of one of eight institutes for national minorities to educate young Tibetans and other non-Han peoples of China. (TE. H.)

CHÉNIER, ANDRÉ MARIE DE (1762–1794), French poet who was, after Racine, one of the greatest writers in French classical verse. Born at the end of Oct. 1762 in Constantinople, where his father was French consul general, he returned to France with his parents in 1765 and though his father later went to Morocco as consul general; the rest of the family did not follow him. André was educated at the Collège de Navarre and in 1782 entered the army at Strasbourg, but he asked to be released after serving for only six months and returned to Paris where he mixed with the writers and artists who frequented his mother's salon. A journey to Switzerland and Italy in 1783 and 1784, besides improving his delicate health, made a deep impression on his mind and strengthened his passion for the antique. In 1787, partly because of his father's worsening financial situation, he took a post in London as secretary to the French ambassador, who was a relative, and stayed there for three years. London, however, displeased him and he returned to France in 1790 and plunged into political writing.

He was mainly concerned with condemning the authors of disorder and, in particular, the *club des Jacobins*. Three works were especially noteworthy, *Avis au peuple français sur ses véritables ennemis, Le Jeu de Paume à David peintre* and *Hymne aux Suisses de Châteauvieux,* the first in prose, published in the *Mémoires de la Société de 1789* and the others, in verse, printed over his name in the *Journal de Paris*. He escaped the massacres of Sept. 1792 by fleeing to Normandy, but he returned at the end of the year and wrote in defense of Louis XVI. After the king's execution he was obliged to go into hiding at Versailles, but was arrested on March 7, 1794. His imprisonment lasted 141 days. Despite the efforts of his brother, Marie Joseph, who was a member of the Convention, to save him, he was executed on July 25, 1794.

Among his best and most famous works are *La Jeune Tarentine,* written after his return from Italy; the *Ode à Charlotte Corday* and *Ode à Versailles,* which date irom the months after Jan. 1793 when he was in hiding; and *Jeune Captive* and *Iambes* which belong to the period of his imprisonment.

During his lifetime he was known only by the *Jeu de Paume* and the *Hymne aux Suisses* and the circumstances of his death explain how it was that an interval of 20 years passed before there was the merest recognition of his genius. The *Jeune Captive* and *La Jeune Tarentine* were published in 1795 and 1801, but there was no attempt to collect the body of his work before 1819. Since that date there has been unanimous acknowledgment of his genius, but the critics have been divided as to whether he should be classed, as Sainte-Beuve classed him, as the forerunner of Victor Hugo and the romanticists. or, as Anatole France would have it, as the last exponent of the art of the 18th century. Perhaps his influence was greatest on the classicists who led the reaction against the romanticists at the end of the 19th century, on Leconte de Lisle and Hérédia.

BIBLIOGRAPHY.—*Oeuvres complètes, ed. by* G. Walter (1950); G. Walter, *Andre' Chénier, son milieu et son temps* (1947); P. Dimoff, *La Vie et l'oeuvre d'André Chénier avant la Révolution française* (1936).

CHÉNIER, MARIE JOSEPH BLAISE DE (1764–1811), French dramatist. poet and politician. whose work achieved success by its expression of popular republicanism and anticlericalism, was born at Constantinople, Feb. 11, 1764. He spent two years in the army before beginning a literary career in Paris. His first success. *Charles IX* (written in 1788 but produced after censorship in Nov. 1789) set the pattern for his later tragedies — conventional imitations of the Voltairian model. using subjects from classical or modern history as a vehicle for political ideas. He supported the first stages of the Revolution. and was a member of the Convention and of the committees of general security and public safety, but his disapproval of the violence of the Terror reflected in the plays *Caius Gracchus, Fénelon* and *Timoléon* led to their being censored.

Unjustly suspected of having connived at the death of his brother André, Chiinier might himself have been a victim of the Terror had it not ended. His poem *Sur la Calomnie* is a reply to royalist journalists who compared him with the fratricide Timoleon in his tragedy.

He remained politically active until 1802 and from 1803 to 1806 was inspector of education. His last tragedy, *Cyrus* (1804), was in honour of Napoleon. He was also the author of patriotic hymns —of which *Le Chant du départ* was the most famous—conventional odes. elegies and epigrams, and translations. He died in Paris. Jan. 10, 1811.

BIBLIOGRAPHY.—His *Oeuvres complètes* were published in 8 vol. (1824–26); *see* also A. Liéby, *Étude sur le théâtre de M.-J. Chenier,* (1901); A. J. Bingham, *M.-J. Chenier, Early Political Life and Ideas* (1939). (W. D. HH.)

CHENILLE, a cotton, wool, silk, acetate, rayon or nylon yarn that has a pile protruding all around at right angles so that it simulates a caterpillar. (Chenzlle is the French word for "caterpillar.) The yarn is used as filling (weft) for heavy draperies, curtains and carpets. embroidery and fringes.

It is woven in gauze or leno weave with cotton or linen warp and silk, wool, acetate or cotton filling. The warp threads are taped in groups and the filling is beaten into fabric very compactly. After the fabric is woven it is cut between the groups of warp ends. and the latter is twisted, thereby forming the chenille effect. (G. E. L.)

CHENNAULT, CLAIRE LEE (1890–1958). U.S. air commander in China during World War II, was born in Commerce, Tex., on Sept. 6, 1890. After almost 20 years of service with the U.S. army air corps, Chennault was retired for physical disability in 1937 and became adviser on aeronautical affairs to the Chinese Nationalist government. A zealous believer in the importance of fighter aviation. Chennault acquired a reputation as a daring pilot and a serious student of air tactics. In 1941 he organized and trained the famous "Flying Tigers." a group of U S pilots recruited to fight for the Chinese, especially in defense of the Burma road.

In April 1942 Chennault returned to active duty with the U.S. army air forces as a brigadier general and until the end of the war commanded units in China which were organized in 1943 as the 14th air force.

Chennault's brilliant leadership and superior tactics helped greatly to overcome the inferiority of his airmen in numbers and equipment. He was promoted to major general in 1943 and retired in 1945. He died in New Orleans, La., on June 27, 1958.

See his autobiography Way of a *Fighter* (1949). (A. GG.)

CHENONCEAUX, a village of central France. in the *département* of Indre-et-Loire (*q.v.*), is on the right bank of the Cher. 34 km. (21 mi.) S.S.E. of Tours by road. Pop. (1954) 172. Chenonceaux owes its interest to its château, which bridges the Cher. "Son et *Lumière"* is presented at the château. The village is on a secondary railway from Tours to Bourges.

The château represents a type of architecture transitional between Gothic and Renaissance. Founded in 1515 by Thomas Bohier, it was confiscated by Francis I in 1535. An isolated tower flanking a drawbridge is part of an earlier building of the 15th century. Henry II presented it to Diane de Poitiers, who on his death was forced by Catherine de Medicis to exchange it for Chaumont-sur-Loire. Catherine built the gallery that leads to the left bank of the Cher.

Chenonceaux passed thereafter through several hands. and in the 19th century it was extensively restored. The village was occupied by the Germans during World War II from June 1940 to Aug 1945.

CHENOPODIUM (GOOSEFOOT), a genus of erect or sometimes prostrate herbs of the family Chenopodiaceae. comprising about 60 species. natives of temperate regions, some of which have cosmopolitan distribution as weeds. Inclusive of those introduced from the old world. about 25 species occur in North America. A well-known representative is the common goosefoot (C. *album*), called also lamb's quarters and pigweed. It is native to Europe and Asia. is found in Great Britain, and is widely prevalent in North America as a naturalized weed. The green angular stem is often striped with white or red, and, like the leaves. often more or less covered with mealy particles. The leaves are entire. lobed or toothed and often more or less triangular in shape. The minute flowers are borne in dense axillary or terminal clusters. The fruit, usually enclosed by the persistent calyx is a membranous utricle covering a small, black, often glossy seed.

Among native North American species are the red goosefoot (C. *rubrum*), growing on saline soils on seacoasts and in the interior. and found also in Europe; the strawberry blite (C. *capitatum*), with fleshy red fruit clusters somewhat resembling strawberries, native to dry soil from Nova Scotia to Alaska southward to New Jersey and California, and also in Europe; and the California goosefoot or soap plant (C. californicum), found in the foothills of the Sierra Nevada and coast ranges, the grated roots of which are used as soap by the Indians.

Among other goosefoots found in Great Britain and also naturalized in North America are the maple-leaved goosefoot (C. hybridum), the nettle-leaved goosefoot or sowbane (C. *murale*), the oak-leaved goosefoot (C glaucum), the many-seeded goosefoot (C. *polyspermum*), the city goosefoot (C. *urbicum*), and good-King-Henry (C. *Bonus-Henricus*). Other old-world species naturalized in North America are the Jerusalem oak (C. Botrys), the Mexican tea (C. ambroszoides) and the wormseed (C. *anthelminticum*).

Quinoa (C. Quinoa), native to the Andean region, is cultivated in South America for its seeds, used as food. The wormseed (*q.v.*) yields an oil used in the U.S. as a remedy for the round and hookworms.

CHEPHREN: see KHAFRE.

CHEPSTOW, a market town, urban district and river port in the Monmouth parliamentary division of Monmouthshire. Eng., on the western bank of the Wye near its confluence with the Severn. 16 mi. S.S.E. of Monmouth by road. Pop. (1961) 6.041. As the key to the passage of the Wye. Chepstow (Estrighoiel, Striguil) was the site of prehistoric. Roman and Saxon fortifications. The Norman castle was built on a rocky ledge by William Fitz-Osbern to defend the Roman road into south Wales. Founded in the 11th and rebuilt in the 13th century, it was granted by Henry I to the Clare family; after its reversion to the crown, Edward II granted it to Thomas de Brotherton. It passed to the dukes of Norfolk from whom. after again reverting to the crown, it passed to the earls of Worcester. It was confiscated by parliament but restored to the earls in 1660. Parts of the town wall can still be seen and in the Old Town gate (formerly the only entrance to the town except by the bridge) is a small museum. The present bridge, replacing at least two former ones, was built to the design of John Rennie in 1816. The Tubular bridge (1852) was designed by I. K. Brunel. The church of St. Mary. which originally belonged to a Benedictine priory, has some old features but was restored in 1841. The borough grew up around the castle between the 14th and 15th centuries and in 1524 the earl of Worcester granted it a charter of incorporation. A port since early times. when the lord took dues of ships going up to the Forest of Dean, Chepstow had no ancient market and no manufactures except that of glass. which was carried on for a short time within the ruins of the castle. A local trade during the 19th century was handicapped by the narrowness and depth of the channel and the consequent tidal bore. Mainly agricultural. Chepstow has several industries, among them engineering, brushmaking and asphalt processing. There is a racecourse in Piercefield park. Tintern abbey (*q.v.*), the picturesque Cistercian ruin. is 4 mi. N.

CHEQUERS. Chequers court, near Wendover, Buckinghamshire. Eng.. 30 mi. N.W. of London, became the official country residence of British prime ministers in 1921 through the generosity of its owners, Lord and Lady Lee of Fareham. The estate is about 1,500 ac. in extent. (See LEE OF FAREHAM, ARTHUR HAMILTON LEE, 1st Viscount.)

On Bulpit hill, about ¾ mi. to the southwest. are traces of what was possibly a small Iron Age settlement. "Radulphus," clerk to the exchequer, was owner of the manor under Henry II. and the place appears to have taken its name from his office. In 1565, his descendant, William Hawtrey, remodeled the house and gave it much of its present character and appearance. In the 18th century a unique collection (which still remains) of Cromnell portraits and other relics was brought by the Russells who were descended from one of the Protector's daughters The Russells maintained the Elizabethan house with little alteration, but Robert Greenhill, who inherited from them early in the 19th century, plastered the whole of the outside and redecorated the interior in Strawberry Hill . Gothick' fashion

When the Lees entered on a long tenancy in 1909 they sought to reveal all the remaining ancient features, and to Introduce others characteristic of the days of the Hawtreys and the Russells. In
