DIONNE QUINTUPLETS, the five daughters—Émilie, Yvonne, Cécile, Marie and Annette—born prematurely on May 28, 1934, near Callander, Ont., to Oliva and Elzire Dionne. The parents have had 14 children, 9 by single births. The Dionne quintuplets are remarkable in being the only medically and genetically documented set that has survived; not one member of any other authentic (identical) quintuplet set has lived more than a few days. The Dionne set had a sixth member that aborted during the third month of pregnancy. and this was reported by A. R. Dafoe, the physician who later attended the birth of the quintuplets. Much credit for the survival of the five premature infants is due to the Hospital for Sick Children. Toronto. mhich quickly made available to Dafoe modern incubators, mother's milk and other equipment. The University of Toronto conducted biological, psychological and dental studies of the quintuplets. The biological study established that the set originated from one fertilized egg (an Argentine set, commonly referred to as quintuplets, appears however to have originated from five separate eggs). The Dionne quintuplets arose through repeated twinning of the early single embryo; therefore, five children were produced instead of one child. and each inherited the same potentialities.

Émilie Dionne died suddenly in Aug. 1954.

DIONYSIA, festivals of Dionysus (*q.v.*). They were numerous and widespread, the most famous being those of Attica, which were (1) the Little or Rustic Dionysia, a festival held in various country places in the month Poseideon (December) and characterized by simple, old-fashioned rites; (2) the Lenaea ("festival of Maenads"), in the following month, Gamelion, held at Athens, the chief rites being a festal procession and dramatic performances; (3) the Anthesteria (*q.v.*), in the next month, Anthesterion; (4) the Great or City Dionysia, in Elaphebolion (about the end of March), also accompanied by dramatic performances in the theatre of Dionysus (*see* DRAMA: *Greek Drama: Origins),* and the most famous of all; (5) the Oschophoria ("carrying of grape-clusters"), in Pyanepsion (about the end of October). The times and what is known of the ritual of these festivals show them to have been originally rites of a kind common in the worship of gods of fertility.

See L. *R.* Farnell, ***The*** *Cults of the Greek States,* vol. v, ch. vi (1896–1919); L, Deubner, *Attische Feste* (1956). (X.; H. W. **PA.**)

DIONYSIUS, SAINT (d. 268), pope from 259 to 268. To him fell the task of reorganizing the church after the persecution of Valerian. At the protest of some of the faithful at Alexandria, he demanded from their bishop, Dionysius the Great, explanations touching his doctrine. He died on Dec. 26, 268. and his feast day is Dec. 26.

DIONYSIUS, SAINT, THE GREAT, OF ALEXANDRIA (*c.* 200–c. 265), was converted from paganism at an early age, and studied under Origen. In 231–32 he was elected head of the catechetical school of Alexandria. and in 247–48 elevated to the episcopal throne. Though highly esteemed and often cited by the leading Byzantine theologians, his works are known only from quotations. many of them extensive: preserved by Eusebius (d. c. 339) and other ecclesiastical writers. His feast is celebrated on Nov. 17, and he is commemorated in the canon of the Syrian and Maronite Mass.

Dionysius had a good knowledge of the ancient classics, and wrote a treatise. *On Nature,* against the atomism of Epicurus. But his major interest was theology. He denied that Revelation was written by the author of the Fourth Gospel, and denounced the chiliasts ("millenarians"), who argued, on the basis of a literal reading of Revelation, that after the resurrection the saints would enjoy a thousand years of happiness on earth.

During the Decian persecution (250–251). he was forced to flee. and was exiled again in the persecution under Valerian (257–260). Upon his return to Alexandria in 260 or 262, he favoured the readmission to the church. after repentance, of those who had lapsed under the strain of persecution, in opposition to the rigouristic party that would have excluded them permanently. Taking part in the bitter controversy over baptisms performed by heretics. he himself did not insist on rebaptizing converts who had received heretical baptism, but he recognized the right of communities to rebaptize if they chose to do so.

Dionysius was especially noted for his attacks on the Sabellians, who responded by accusing him of the doctrinal errors of separating the members of the Trinity from each other, denying the eternity of the Son, designating him as a creature (*poiema*) and refusing to describe him as consubstantial (*homoousios*) with the Father. He repudiated these charges, but insisted that the Trinity consisted of three *hypostases* ("persons"). which were not separated from each other. He admitted that he deliberately avoided the word *homoousios* (which in 325 became the touchstone of Trinitarian orthodoxy) because it was unscriptural, but claimed that he accepted the idea that lay behind it. His contemporary Dionysius of Rome objected to "three *hypostases*" as tritheistic, taking the Greek *hypostasis* to be the equivalent of the Latin *substantia,* which referred to the divine essence of the Godhead. But the Alexandrian bishop has been vindicated by the church, which defines the Trinity as consisting of three distinct but not separate *hypostases.*

Charles L. Feltoe. *Tlze Letters and Other Remains of Dionysius of Alexandria* (1904). is the best edition of the Greek text; Feltoe's *St. Dionysius of Alexandria, Letters and Treatises* (1918) is an English translation.

DIONYSIUS, the name of two tyrants of Syracuse.

DIONYSIUS THE ELDER (*c.* 432–367 B.C.), tyrant of Syracuse from 405, by his conquests in Sicily and southern Italy made Syracuse the most powerful among the western Greek cities. After working as a clerk in a public office he distinguished himself fighting in the war with Carthage and took advantage of a crisis in the war in 405 to make himself tyrant by demagogism. The next eight years were spent in strengthening his power. He fortified Epipolae, defeated his political opponents and removed the Greek citizens of Naxos, Catana and Leontini from their cities. settling Sicels and mercenaries there. He relied on large numbers of mercenaries as well as Greeks and Sicels from east Sicily. His first war with Carthage (397–396), during which the. Greeks besieged Motya and the Carthaginians Syracuse, ended with a notable victory, and Carthage's power in Sicily was confined to the northwest. His second war with Carthage in 392 was ended by a treaty greatly in his favour. After 390 he led an expedition against Rhegium and the other Greek cities in southern Italy. Making an alliance with the Lucanians. with their help he devastated the territories of Thurii. Croton and Locri. After a protracted siege he took Rhegium (387) thereby making himself the chief power in Greek Italy; he established contacts also with Illyria, sending colonists there and possibly to northeast Italy as well. At Athens. although Isocrates hailed him as the champion of Hellenism, the brutality of his conquests made him unpopular and his literary pretensions were deplored: when he sent a splendid embassy to the Olympic festival of 384. the Athenian Lysias attacked him in a speech (a portion of which has survived) and the crowd pillaged the tents of his envoys. His third war with Carthage (383–c. 378) proved disastrous; he suffered a crushing defeat and was obliged to pay an indemnity of 1,000 talents and cede to Carthage the territory west of the Halycus river. Nevertheless he was engaged in yet another war against Carthage when he died. His son Dionysius who succeeded him made peace with Carthage on the terms established after the third war. Two Athenian inscriptions of 368 and 36i record respectively friendship and alliance with Dionysius: hence presumably the success of his tragedy at the Dionysia of 367.

An unscrupulous military despot, Dionysius harmed rather than promoted the cause of Hellenism. although he saved Greek Sicily from conquest by Carthage. *See* also SICILY: *History;* SYRACUSE.

See Diodorus Siculus, bk. xiii–xv; N. G. L. Hammond, *A History of Greece,* bk. v, ch. 2 (1959).

DIONYSIUS THE YOUNGER (ruled 367–356 and 354–343 B.C.), son of the above, whom he succeeded in 367. He lacked the vigour to maintain a military autocracy and did not profit by Plato's teaching and become a benevolent despot. In 356 he was driven from the kingdom by Dion and fled to Locri but during the commotions that followed Dion's assassination in 354 he made himself master of Syracuse. On the arrival of Timoleon he was compelled to surrender and retire to Corinth (343).

See Diodorus Siculus, bk. xvi; N. G. L. Hammond, *A History of Greece,* bk. v, ch. 3. (R. ME.)

DIONYSIUS THE AREOPAGITE, converted by St. Paul at Athens, acquired a notable posthumous reputation; in the 2nd century he was held to have been the first bishop of Athens, and in the 9th century he mas identified with St. Denis (*q.v.*) of France. About A.D. 500, probably in Syria, some writings mere forged in his name by a Christian Neoplatonist with moderate monophysite leanings. These writings, whose author is often referred to as Pseudo-Dionysius, became of decisive importance for the theology and spirituality of Eastern Orthodoxy and western Catholicism.

They are first quoted in a fragment from an undated letter written by the great monophysite theologian Severus, patriarch of Antioch (512–518; d. 538), and appeal to their authority was made by Severus' followers at a colloquy with orthodox Chalcedonians at Constantinople in 532. On that occasion their authenticity was denied by the orthodox leader, Bishop Hypatius of Ephesus, on the ground that they were unknown to Cyril of Alexandria. Photius mentions a defense of their genuineness by one Theodore, who attempted to meet the objections that the Dionysian writings are not quoted by earlier writers, in particular by Eusebius of Caesarea; that church customs are of gradual growth and "it is contrary to all probability, or rather wicked forgery, to represent Dionysius as alluding to things that only came to exist by a process of growth long after his death"; and that they quote from a letter of Ignatius of Antioch, martyred under Trajan.

The fact that, despite this strong case against their authenticity, the documents were rapidly accepted by the highest authorities of the Byzantine church from the 6th century onward speaks eloquently of the forger's brilliant success. Within a few years a Syriac translation was made. Maximus Confessor (c. 580–662) wrote a detailed commentary to disclaim the monophysite exegesis of the texts. The writings quickly reached the west; Pope Gregory I's 34th homily has an allusion to them, and at Pope Martin I's

Lateran council of 649 the monothelite appeal to their authority was rejected.

In 858 Erigena made a (very inadequate) Latin version, and commentaries on them were written by Hugh of St. Victor, Robert Grosseteste, Albertus Magnus, Thomas Aquinas and Bonaventura. Late medieval mystics (*e.g.*, Meister Eckhart, Tauler, Rolle of Hampole and the author of *The Cloud of Unknowing*) owe much to Pseudo-Dionysius' inspiration. Even in medieval times, however, occasional doubts were expressed; the authenticity was wholly denied by the Renaissance humanist Lorenzo Valla, by the Reformers and by a few Roman Catholic scholars of the 16th and 17th centuries. A long wrangle ended in the general recognition that the documents are a forgery by a writer intimately dependent on the pagan Neoplatonist Proclus (410–485). Western theologians commonly treat both Pseudo-Dionysius and his "apophatic" (negative) mysticism with reserve; but he remains normative for Eastern Orthodox spirituality.

The corpus consists of ten short letters, addressed to personages of the apostolic and subapostolic age, and four treatises dedicated to Timothy, namely: *Peri theion onomaton* ("Divine Names") discussing the names used of God in Scripture as evidence for the divine being and attributes; *Pcri mystikes theologias* ("Mystical Theology") describing the ascent of the soul to the immediate vision of God in ecstasy; *Peri tes ouranias hierarchias* ("Celestial Hierarchy") describing the chain of angelic beings as divided into three groups each with three subdivisions (Seraphim, Cherubim and Thrones; Dominations, Virtues and Powers; Principalities, Archangels and Angels); *Peri tes ecclesiastikes hierarchias* ("Ecclesiastical Hierarchy") treating the church as the earthly counterpart of the angelic world, likewise containing three holy sacraments (baptism, eucharist, holy chrism), three holy orders (bishop, priest, deacon) and three lower orders (monks, laity, catechumens or penitents). The last-named treatise provides important information for liturgical history (*see* F. E. Brightman (ed.), *Liturgies Eastern and Western,* vol. i, pp. 487–490, 1896).

Pseudo-Dionysius' style is obscure and turgid, abounding in grandiose terminology. The writings give all the appearance of being an artificial construction in content as well as in form; and it is far from certain that the high-flown language about contemplation and ecstasy represents any genuine mystical experience in the writer. He is concerned with the theory rather than the practice, and the more impressive passages turn out to be closely dependent upon Gregory of Nyssa. The chief theme is the ascent of the soul by the negative way, stripping aside first the senses and then all inward thoughts and reasonings until the soul passes into "the darkness of unknowing" wherein it is more and more enlightened by "the ray of divine darkness" which is beyond all light and beyond all being. The writings provide an entire system of the cosmos, and take over the full-blown Neoplatonist notions of the hierarchy of being, and of evil as a privation of good, consequent upon inferiority in the hierarchy.

The actual identity of the author has baffled scholars. E. Honigmann suggested the monophysite Peter the Iberian (411–491).

BIBLIOGRAPHY.—Only the *Celestial Hierarchy* has been critically edited, by G. Heil (1958). B. Corderius' text (1634) is reprinted in J. P. Migne (ed.), *Patrologia graeca,* vol. iii–iv (1857), with the Byzantine commentaries; Erigena's Latin translation is in Migne, *Patrologia latina,* vol. cxxii (1853); Eng. trans. by J. Parker, 2 vol. (1897–99); French trans. by M. de Gandillac (1943). *See* also A. Van den Daele, *Indices Pseudo-Dionysiani* (1941). Full bibliography to 1957 in B. Altaner, *Patrologie,* 5th ed. (1958), and in W. Völker, *Kontemplation und Ekstase bei Ps.-Dionysius Areopagita* (1958). For a positive evaluation from the Russian Orthodox side, *see* V. Lossky, *The Mystical Theology of the Eastern Church,* Eng. trans. (1957). *See* also E. Honigmann, *Pierre l'Ibérien et les écrits du Pseudo-Denys l'Aréopagite* (1952). (HY. C.)

DIONYSIUS THE CARTHUSIAN (DENYS VAN LEEUWEN OR DE LEEUWIS, DENYS VAN RIJKEL) (1402/3–1471), theologian and mystic, in 1424 entered the Carthusian order, where he led a life remarkable for holiness and prodigious literary activity: the modern edition of his works runs to 42 folio volumes. Chiefly a compiler, he came to be known as a master of the spiritual life and was posthumously accorded the title of "Ecstatic Doctor" because of his especial authority in mystical theology. Yet his single properly mystical work, *On Contemplation,* was printed only once previous to the collected edition of his writings published by the Carthusians at the end of the 19th century. He is cited by Ignatius of Loyola, Francis of Sales: Alfonso dei Liguori and others, but solely in confirmation of positions already taken. An anomaly in the history of ideas, over the centuries Dionysius has enjoyed an enormous reputation and, except perhaps in his own order, no influence.

BIBLIOGRAPHY.—There is no completely satisfactory edition of his works. The *Opera omnia* (1896–1935) is little more than a reprint of the *editio princeps* (1530 *et seq.*); the basic life, by Thierry Loer (1500–54), is given in vol. i, pp. xvii–xlviii. *See* also D. *A.* Mougel, *Dionysius der Karthäuser* (1898); D. and G. Mathew, *The Reformation and the Contemplative Life,* especially pp. 151–163 (1934). (E. O'B.)

DIONYSIUS OF HALICARNASSUS (fl. *c.* 20 B.C.), Greek historian and teacher of rhetoric, wrote a history of Rome from the mythical period to the first Punic War. He went to Rome after the end of the civil wars and spent 22 years in studying Latin and preparing materials for his history. The date of his death is unknown. His history, translated as *Roman Antiquities,* was divided into 20 books, of which the first nine remain entire; the tenth and eleventh are nearly complete; and the remainder exist in fragments in the excerpts of Constantine Porphyrogenitus and an epitome discovered by Angelo Mai in a Milan manuscript. The first three books of Appian and Plutarch's *Life of Camillus* also embody much of Dionysius. His chief object was to reconcile the Greeks to the rule of Rome by dilating upon the good qualities of their conquerors. He carefully consulted the best authorities. and his work and that of Livy are the only connected and detailed extant accounts of early Roman history.

Dionysius was also the author of several critical treatises: *The Arrangement of Words; 012 Imitation,* a fragmentary work on the best models in the different kinds of literature; *Commentaries on the Attic Orators,* dealing with Lysias, Isaeus, Isocrates and (possibly by way of supplement) Deinarchus; *On the Style of Demosthenes; On Thucydides,* a detailed but rather unfair criticism of his treatment of subject matter and his style: two *Letters to Ammaeus* dealing with Demosthenes and Thucydides; and the *Letter to Pompeius Geminus,* dealing with Plato.

BIBLIOGRAPHY.—For the full text of the *Roman Antiquities, see* C. Jacoby's edition, 4 vol. (1885–1925); and "Loeb Series" with Eng. trans. by E. Cary, 7 vol. (1937–50). For the lesser works *see* H. Usener and L. Radermacher (eds.), *Dionysii Halicarnasei opuscula,* 2 vol. (1899–1929); and W. Atkins, *Literary Criticism in Antiquity,* vol. ii, ch. 3 (1934); S. F. Bonner, *The Literary Treatises of Dionysius of Halicarnassus* (1939). (K.D.)

DIONYSIUS BAR-SALIBI: *see* BAR-SALIBI, JACOB.

DIONYSIUS EXIGUUS, that is, DENIS THE LITTLE, the surname having been adopted with humility by himself (*c.* 500–560); flourished as a scholar at Rome during the first half of the 6th century. Cassiodorus reports that he was born in Scythia and calls him merely a monk, but he is traditionally referred to as an abbot.

In high repute as a theologian, he was profoundly versed in the Holy Scriptures and in canon law (*q.v.*), and was also an accomplished mathematician and astronomer. To him are owed a collection of 401 ecclesiastical canons, including the apostolic canons and the decrees of the councils of Nicaea, Constantinople, Chalcedon and Sardis, and also a collection of the decretals of the popes from Siricius (384) to Anastasius II (498). Dionysius also translated many Greek works now lost. including *Life of St. Pachomius* and the *Instruction of St. Proclus of Constantinople.* His greatest influence upon posterity. however, was his introduction of the chronology still current. but he wrongly dated the birth of Christ on Dec. 25, 753, according to the Roman system (that is, 753 years after the founding of Rome, which took place in 753 B.C. according to tradition).

For the works of Dionysius, *see* Migne, *Patrol. Lat.,* 67:9–520; for the canons *see* also C. H. Turner, *Eccles. Occid. Mon. Iuris Ant.* (1899 *et seq.*, under each council); O. Bardenhewer, *Geschichte der altkirchlichen Literatur,* vol. v (1932). (G. E. MCC.)

DIONYSIUS TELMAHARENSIS (d. A.D. 845), patriarch of the Syrian Jacobite Church during 818–845, was the author of

an important historical work, *Annals,* covering the years from the accession of the emperor Mauricius (582) to the death of Theophilus (842). His *Annals* have perished except for some passages quoted by Bar-Hebraeus and an extract found by Assemani in *Codex Vaticanus 144* and published by him in the *Bibliotheca orientalis.* He spent his earlier years as a monk at Ken-neshre on the upper Euphrates, and later moved to Kaisum in the district of Samosata. At the death of the Jacobite patriarch Cyriacus in 817, the church was disputing the phrase "heavenly bread" in connection with the Eucharist. An antipatriarch had been appointed in the person of Abraham, a monk from Kartamin, who insisted on the use of the phrase in opposition to the recognized authorities of the church. The council of bishops at Rakka in 818 elected Dionysius to the patriarchal chair, but the ecclesiastical schism continued unhealed during the 30 years of his patriarchate. The details of this contest, of his relations with the caliph Ma'mun and of his many travels—including a journey to Egypt—are to be found in the *Ecclesiastical Chronicle* of Bar-Hebraeus (*q.v.*).

In addition to the *Annals* Dionysius was credited with the authorship of a *Chronicle* narrating the history of the world from the creation to the year A.D. 774–775, later proved to be the work of an earlier writer, a monk of the convent of Zuknin near Amid (Diyarbekir) on the upper Tigris. Though the author had limited intelligence and little historical skill, the last part of his work has considerable value as a contemporary account of events during the middle of the 8th century.

BIBLIOGRAPHY.—W. Wright, *History of Syriac Literature* (1894); Jean Baptiste Chabot's introduction to his translation of pt. iv of the *Chronicle;* A. Baumstark, *Geschichte der syrischen Litteratur,* p. 275 (1922). (W. D. McH.)

DIONYSIUS THRAX (fl. *c.* 120 B.C.) was the author of the first Greek grammar. Apparently called "Thrax" because his father Teres (?) was a Thracian, he himself was a native of Alexandria where he attended the lectures of Aristarchus. Later he taught grammar and rhetoric at Rhodes, where he had the scholar Tyrannio the elder among his pupils. His grammar, which has survived, begins with the definition of grammar and its functions. Dealing next with accents, punctuation marks, letters and syllables, it goes on to the eight parts of speech and their inflections. No rules of syntax are given and nothing is said about style. The authorship of Dionysius was doubted even in antiquity, but such doubt seems unjustified; the great grammarians of imperial times, Apollonius Dyscolus and Aelius Herodianus, knew the work in its present form, though additions and alterations may have been made later. It is essentially an elementary-school grammar and, as such, was used everywhere in the Greek-speaking world till about the 12th century A.D., when it was replaced by catechisms (*erotemata*) based on it. Made known to the Romans, perhaps by Tyrannio, it served as a model for Latin grammars and through them for modern grammars. Dionysius also wrote commentaries on Homer and on Hesiod's *Works and Days* and various other works including an account of Rhodes. His grammar was translated into Syriac and Armenian, and versions in these languages are still extant.

Sandys, *A History of Classical Scholarship,* 3rd ed., vol. i, pp. 138–140 (1921). (E. A. B.)

DIONYSUS (DIONYSOS), in Greek cult and mythology, a nature god of fruitfulness and vegetation, but tending to specialize as a god of wine. The origin of the Greek name is doubtful. The alternative names Bacchus (Bacchos, in use among the Greeks from the 5th century), Sabazius and Bassareus are Thracian.

There seems little doubt that Dionysus is a Thraco-Phrygian deity, introduced into Greece from Thrace or possibly from both Thrace and Phrygia, and, blending with native gods of similar character; *e.g.,* Iacchus at Eleusis. If the solitary occurrence of his name on a Linear B tablet (*see* MINOAN LINEAR SCRIPTS) is correctly deciphered, it was already known in Greece before 1200 B.C. In Homer, notwithstanding the frequent mention of the use of wine, Dionysus is never mentioned as its inventor or introducer, nor does he appear in Olympus; Hesiod is the first who calls wine the gift of Dionysus. On the other hand, he is spoken of in the *Iliad* as "raging," an epithet that indicates that already the orgiastic character of his worship was recognized. In his native country his worhipers sought to become possessed by or assimilated to him by wild dancing and the tearing in pieces and eating of animals; in Greece this was much toned down.

According to the usual tradition, he was born at Thebes and was the son of Zeus and Semele, the daughter of Cadmus. Before the child was mature, Zeus appeared to Semele (whose name is simply the Phrygian for "earth") at her request in his majesty as god of lightning, by which she was killed; but the infant was saved from the flames by Zeus (or Hermes). Zeus took him up, enclosed him within his own thigh until he came to maturity, and then brought him to the light, so that he was twice born; an allusion to this was found in the word *dithyrambos,* actually of unknown origin, but which became both a name of the god and of a hymn in his honour. Dionysus was then conveyed by Hermes to be brought up by the nymphs of Nysa, a purely imaginary spot.

As soon as Dionysus was grown up, he started on a journey through the world, to teach the cultivation of the vine and spread his worship among men. While so engaged he met with opposition, even in his own country, as in the case of Pentheus, king of Thebes, who opposed the orgiastic rites introduced by Dionysus among the women of Thebes, and, having been discovered watching one of these ceremonies, was mistaken for some animal of the chase and slain by his own mother; the story is the subject of Euripides' *Bacchae.* A similar instance is that of Lycurgus, a Thracian king, from whose attack Dionysus saved himself by leaping into the sea, where he was kindly received by Thetis. Lycurgus was blinded by Zeus and soon died, or became frantic and hewed down his own son, mistaking him for a vine. At Orchomenus, the three daughters of Minyas refused to join the other women in their nocturnal orgies, and for this were driven mad, tore in pieces the son of one of them, and were transformed into birds, or bats. These and similar stories may point to the vigorous resistance offered to the introduction of the mystic rites of Dionysus or to some ceremony in which the god, or a priest representing him, was killed and probably brought to life again (*see* below). On the other hand, when the god was received hospitably he repaid the kindness by the gift of the vine, as in the case of Icarius of Attica (*see* ERIGONE).

The worship of Dionysus continued to flourish in Asia Minor, particularly in Phrygia and Lydia. His cult is closely associated with that of numerous Asiatic deities, as Sabazius (*q.v.*), and from the time of Alexander he appears as conqueror of India. The other incidents in which he appears in a purely triumphal character are his transforming into dolphins the Tyrrhenian pirates who attacked him, and his part in the war of the gods against the giants. The adventure with the pirates occurred on his voyage to Naxos, where he found Ariadne abandoned by Theseus. At Naxos Ariadne (probably a Cretan mother goddess) was associated with Dionysus as his wife, and their marriage was annually celebrated by a festival. Having compelled all the world to recognize his divinity, he descended to the underworld to bring up his mother. Like most deities connected with vegetation, Dionysus, at least in Phrygia, died and rose again. This is reflected principally in Orphic mythology, not in normal Greek belief. Zeus had by Persephone a wonderful child, Zagreus. He was brought up secretly, watched over by Curetes; but the jealous Hera discovered where he was, and sent Titans to the spot; they, finding him at play, tore him to pieces, and cooked and ate his limbs, while Athena gave his heart to Zeus. This myth is probably to be connected with the savage rite of *omophagia* (eating of raw flesh) in the worship of Dionysus, in which a victim, perhaps originally human in some cases, incarnating the god, was torn in pieces and sacramentally eaten raw. It is variously reconciled with the tale of Semele. (*See* also TITANS.)

Dionysus further possessed the prophetic gift, and at Delphi was received by the priesthood on almost equal terms with Apollo. His followers included spirits of fertility such as the satyrs, and in his ritual the phallus was prominent. He often takes bestial

shape. and is associated with the bull, the panther, the lion. the snake, the tiger, the ass, the goat and sometimes also the dolphin. His personal attributes are an ivy wreath, the thyrsus (*q.v.*) and the kantharos, a large two-handled goblet. His later representations in art show a youth of soft, nearly feminine form, occasionally an infant; but the earlier type is a bearded man. His title Dendrites ("he of the tree") arises most probably from his functions as a god of the productivity of nature and not of the vine only. For the connection of Dionysus with Greek tragedy see DRAMA: Greek *Dranza:* Origins.

See MYSTERY; see also references under "Dionysus" in the Index volume.

DIOPHANTINE EQUATIONS, or Diophantine analysis, is the name given to a branch of the theory of numbers. It treats the problem of finding the solutions, in whole numbers (integers) or rational fractions, of one or more conditional algebraic equations whose coefficients are rational. For example, the problem of finding the whole numbers x and y satisfying $x^2 - y^3 = 30$ is a Diophantine problem, and this equation is called Diophantine. The name comes from the Greek mathematician Diophantus, who probably flourished about the middle of the 3rd century A.D. He treated a number of problems such as the following: to find three rational numbers such that the product of any two added to the sum of these two gives a square; to find three squares such that their continued product added to any one of them gives a square.

The subject includes much material from a number of topics in the theory of rational integers, usually discussed separately, such as Waring's theorem, the theory of congruences, the theory of quadratic and higher forms (see NUMBERS, THEORY OF). This article is confined to the consideration of the parts of the subject which have not been so definitely classified.

Diophantus solved the problem of finding formulas giving all the right triangles whose sides are integral. To obtain these we may reason as follows: Let the triangle have the sides x, y and z; then we are to find an expression for all the positive integers which satisfy

$$x^2 + y^2 = z^2 \tag{1}$$

It may be shown that the formulas

$$x = 2kmn,\ y = k(m^2 - n^2),\ z = k(m^2 + n^2)$$

where k is an arbitrary positive integer, give all the positive integral solutions of (1).

A generalization of (1), namely the equation

$$x^n + y^n = z^n \tag{2}$$

$n > 2$, has received a great deal of attention (see FERMAT'S LAST THEOREM).

A particular topic in Diophantine analysis, which is now generally referred to as the theory of quadratic forms, treats, by the use of linear transformation, the problem of solving the equation

$$ax^2 + bxy + cy^2 = m \tag{3}$$

in integers x and y for a, b and c given integers. (See NUMBERS, THEORY OF.) An older method involves the use of continued fractions.

Continued-fraction methods are also known for expressing a prime p in the form $x^2 + my^2$, $m > 0$, for various classes of values of p and m. Such a method was first derived by Adrian M. Legendre (1824) for $m = 1$ and $p \equiv 1 \pmod 4$.

We now consider homogeneous quadratic equations. Using Joseph L. Lagrange's results on $x^2 - Dy^2 = n$, Legendre (1798) found the elegant result that if each of the positive integers a, b and c has no square factor, no two have a common factor; and if there exist integers λ, μ, ν such that

$$\frac{aX^2 + b}{c},\ \frac{c\mu^2 - b}{a},\ \frac{c\nu^2 - a}{b}$$

are all integers, then $ax^2 + by^2 = cz^2$ has integral solutions not all zero; and if the three conditions are not all satisfied, then there are no integral solutions. Adolph Mayer (1884) gave a criterion that

$$ax^a + by^2 + cz^2 + du^2 = 0 \tag{4}$$

with a, b, c and d integers none zero, without square factors, and such that no three have a common factor, has solutions in integers. He also arrived at the result that

$$ax^2 + by^2 + cz^2 + du^2 + ev^2 = 0 \tag{5}$$

is solvable in integers not all zero if the coefficients are odd and not all of the same sign. L. E. Dickson (1930) noted that Mayer's arguments concerning (4) and (j) were not complete. Thanks to his contributions (1930, 1939) and those of H. Hasse (1923) and L. J. Mordell (1931), the complete criteria for the solution of (4) for any nonzero integers a, b, c, d were obtained. Also Dickson (1930) gave the first complete proof that (5) is always solvable in integers if not all the nonzero integers a, b, c, d, and e are of like sign. Hasse (1923) obtained a number of elegant results concerning quadratic Diophantine equations by the use of congruences. An example is the theorem that the equation is solvable in integers if and only if

$$\sum_{ij} a_{ij} x_i x_j \equiv 0 \pmod M$$

is properly solvable for all integers M. In this statement the term properly solvable means that $(x_i, M) = 1$ for each i. E. T. Bell (1933) and Morgan Ward (1933) gave, when any exist, all the solutions of

$$A_i x_1^{a_{i1}} x_2^{a_{i2}} \dots x_k^{a_{ik}} = B_i y_1^{b_{i1}} y_2^{b_{i2}} \dots y_e^{b_{ie}}$$

in parametric form.

Thoralf Skolem (1938) gave a number of applications of the theory of algebraic numbers (see NUMBERS, THEORY OF) to Diophantine problems. In this connection he examined the equation

$$N(a_1x_1 + \dots + a_nx_n) = a \tag{6}$$

where the a's are integers in an algebraic field K of degree n, and $N(\omega)$ denotes the norm of ω in K (a being a rational integer), and treats by the use of units in K the problem of finding other sets of solutions of (6), given one set. as well as methods for determining if any set exists.

It is clear that if we have any Diophantine equation and we know all its rational solutions, then these solutions will include all the integral solutions. However, Dickson (1920) pointed out many cases in the literature where formulas had been given for finding all the rational solutions of equations and no method had been supplied for picking out any integral ones. In view of this he considered the problem of finding the integral solutions of

$$ax^2 + bxy + cy^2 = w_1 w_2 \dots w_n \tag{7}$$

in integers x, y, w_1, w_2, . . . , w_n with a, b and c given integers, and gave a complete solution. Generalizations to forms of any degree were obtained by Wahlin (1924) and Skolem (1938). The special case of (7), namely

$$ax^2 + bxy + cy^2 = z^n$$

has been treated by many writers. Lagrange (1769) and Euler (1770) obtained an infinitude of solutions of

$$x^2 - my^n = z^n \tag{8}$$

nith m an integer. Morgan Ward (1935) applied the theory of quadratic algebraic fields to (8) and gave a set of formulas for its complete solution.

Considerable literature has resulted from the examination of equations of the type

$$f(x, y) = c$$

where $f(x,y)$ is a polynomial in x and y with integral coefficients and c is an integer $\neq 0$. These developments seem to have had their beginning in the work of C. Runge (1887), who proved among other results the following one: "Let $f(x,y)$ be a polynomial with integral coefficients irreducible in the rational field, the homogeneous part of j of highest degree not being the power of an irreducible polynomial. Then $f(x,y) = c$ has only a finite number of solutions in rational integers." This was followed by the work of A. Thue (1909), who proved the following celebrated theorem: "If $f(x,y)$ is a homogeneous polynomial with integral coefficients, irreducible in the field of rational numbers and of degree > 2. and c is an integer $\neq 0$, then $f(x,y) = c$ has only a finite number of integral solutions."

In view of the above results we may consider

$$f(x_1, x_2 \ldots x_k) = c$$

where f is a homogeneous polynomial in $x_1, x_2, \ldots x_k$, with integral coefficients, of degree n and irreducible in the rational field, c being an integer. We know from the theory of unita in an algebraic field that for $k = n$ and $c = 1$ there exist equations of this type with an infinity of integral solutions. On the other hand, if $k = 2$, $n > 2$, Thue's theorem states that there cannot be more than a finite number of solutions. An interesting question is. how far must k be increased to obtain equations of this type with an infinity of solutions? If $n = 3$ we have $k = 3$. Related to this is a conjecture which Euler (1772) made, and which amounts to a generalization of Fermat's Last Theorem. He stated that, in his opinion, the equation

$$x_1^n + x_2^n + \ldots + x^n{}_k = y^n \tag{9}$$

has no integral nonzero solutions for $1 < k < n$. The particular case of $n = 4$ has been much studied. For $k = 2$ it is known that there are no such solutions; for $k = 4$ some solutions were found; but for the difficult case $k = 3$ the question of whether or not solutions exist remained a problem for further investigation. Ward (1945) proved that there is no nonzero solution of (9) with $k = 3$, $n = 4$ and $y < 10\,000$.

The problem of finding rational solutions of certain types of equations has been successfully attacked by the use of geometric methods. This is often expressed as the problem of finding the rational points on a curve or surface. The curves

$$f(x,y) = 0 \text{ or } f(x,y,z) = 0$$

in homogeneous co-ordinates. are classified for arithmetical purposes according to their genus (see CURVES), the coefficients of the equations being integral. Two curves are called equivalent when they are connected with each other by a birational transformation with rational coefficients. Thus two curves

$$f_1(x,y) = 0,\ f_2(\xi, \eta) = 0$$

are equivalent if the co-ordinates x,y are rationally expressible with rational coefficients in terms of ξ, η, and conversely. If a curve is of genus zero, it was shown by David Hilbert and A. Hurmitz (1890) and by Jules H. PoincarC (1901) that it is equivalent to a straight line or a conic, from which the theory of the rational points on the original curve is easily derived.

For a curve of genus unity, PoincarC (1901) also proved that if it has a rational point, it is equivalent to a curve of the third degree, and, in particular, the cubic is equivalent to a curve whose equation can be written in the Weierstrass normal form

$$y^2 = 4x^3 - g_2x - g_3 \tag{10}$$

The latter statement was proved by Mordell in 1912.

Poincaré (1901) and A. Hurwitz (1917) noted that the equation (10) could be given in parametric form by the use of Weierstrass' elliptic $\mathbf{p}$ functions (see ELLIPTIC FUNCTIONS) so that

$$x = P(u), Y = \mathbf{p}'(u) \tag{11}$$

It was proved by Mordell (1922) with the use of these ideas that all the rational points on (10) could be found from a finite number of rational points, so that, using (11), if $u_1, u_2 \ldots, u_n$ satisfy (10) then all rational points are given by $m_1u_1 + m_2u_2 \ldots + m_nu_n$, where the m's are integers.

The subject of the rational solutions of cubic ternary equations was extensively investigated and general results obtained by the use of both geometric and algebraic methods. B. Segre (1943) took up this type of problem, using geometric ideas; and proved that if $f(x,y)$ is a given cubic polynomial in x,y with rational coefficients which is not expressible as a polynomial in a single linear function of x and y, the equation

$$z^2 = f(x,y)$$

has an infinity of solutions in x, y and z. From this he showed that an indeterminate ternary cubic equation which cannot be reduced to an equation involving less than three variables has either no rational solution or an infinity of rational solutions, and each case is possible. Mordell (1943) obtained similar results using algebraic methods exclusively.

Although this subject has been attacked by some of the most powerful weapons known to analysis, geometry and abstract algebra. it contains vast domains which have hardly been touched by investigators, and offers great opportunities for a mathematical, pioneer. See also NUMBERS, THEORY OF: Diophantine Approximation.

(H. S. V.)

DIOPHANTUS OF ALEXANDRIA, Greek mathematician, famous for his work in algebra. From a passage of Michael Pselllus it may be assumed that he was not later than Anatolius, bishop of Laodicea from A.D. 270. It has been plausibly argued that Diophantus was contemporary with Hero of Alexandria (1st century A.D.). The Arithmetica, the great treatise on which the fame of Diophantus rests, purports to be in 13 books, but none of the Greek manuscripts which has survived contains more than 6 (though 1 has the same text in 7 books). They contain, however. a fragment of a separate tract on Polygonal *Numbers.* The missing books were apparently lost early, for there is no reason to suppose that the Arabs who translated or commented on Diophantus ever had access to more of the work than we now have. The difference in form and content suggests that the Polygonal *Numbers* was not part of the larger work. On the other hand the Porisms, to which Diophantus makes three references ("we have it in the Porisms that . . ."), were probably not a separate book but were embodied in the Arithmetica itself, whether placed all together or spread over the work in appropriate places. The "porisms" quoted are interesting propositions in the theory of numbers, one of which was clearly that the difference between two cubes can be resolved into the sum of two cubes.

Among the great variety of problems solved are problems leading to determinate equations of the first degree, in one, two. three or four variables, to determinate quadratic equations and to indeterminate equations of the first degree in one or more variables, which are, however, transformed into determinate equations by arbitrarily assuming a value for one of the required numbers, Diophantus being always satisfied with a rational, even if fractional, result, and not requiring a solution in integers. But the bulk of the work consists of problems leading to indeterminate equations of the second degree, and these universally take the form that one or two (and never more) linear or quadratic functions of one variable x are to be made rational square numbers by finding a suitable value for x. A few problems led to indeterminate equations of the third and fourth degrees, an easy indeterminate equation of the sixth degree being also found. The general type of problem is to find two, three or four numbers such that different expressions involving them in the first and second, and sometimes the third, degree are squares, cubes, partly squares and partly cubes, etc., *e.g.*, to find three numbers such that the product of any two added to the sum of those two gives a square (III 15); to find four numbers such that, if we take the square

of their sum + or − any one of them singly. all the resulting numbers are squares (III 19); to find two numbers such that their product + or − their sum gives a cube (IV 28); to find three squares such that their continued product added to any one of them gives a square (V 21). Book VI contains problems of finding rational right-angled triangles such that different functions of the parts (the sides and the area) are squares. A word is necessary on Diophantus' notation. He has only one symbol (written somewhat like a final sigma) for an unknown quantity, which he calls *arithmos* and which characterizes "an undefined number of units"; the symbol may be a contraction of the initial letters ar, as Δ^{Y}, K^{Y}, $\Delta^{Y}\Delta$, etc.. are for the powers of the unknown (square, cube, fourth power, etc.). The only other algebraical symbol is ⋀ for minus (also occurring with Hero), plus being expressed by merely writing terms one after another. With one symbol for an unknown, it will easily be understood what scope there is for adroit assumptions. for the required numbers, of expressions in the one unknown which are at once seen to satisfy some of the conditions, leaving only one or two to be satisfied by the particular value of x to be determined. Often assumptions are made which lead to equations in x which cannot be solved "rationally," *i.e.*, would give negative, surd or imaginary values; Diophantus then traces how each element of the equation arose and formulates the auxiliary problem of determining how the assumptions must be corrected so as to lead to an equation (in place of the "impossible" one) which can be solved rationally. Sometimes his x has to do duty twice, for different unknowns, in one problem. In general his object is to reduce the final equation to a simple one by making such an assumption for the side of the square or cube to which the expression in x is to be equal as will make the necessary number of coefficients vanish. The book is valuable also for the propositions in the theory of numbers, other than the porisms, stated or assumed in it. Thus Diophantus knew that no number of the form $8n+7$ can be the sum of three squares. He also says that, if $2n+1$ is to be the sum of two squares, "n must not be odd" (*i.e.*, no number of the form $4n+3$, or $4n-1$, can be the sum of two squares), and goes on to add, practically, the condition stated by Fermat, "and the double of it increased by one. when divided by the greatest square which measures it, must not be divisible by a prime number of the form $4n-1$," except for the omission of the words "when divided . . . measures it."

In light of the discovery of highly developed algebraic methods in Babylonia (see MATHEMATICS. HISTORY OF). Diophantus' work no longer appears to represent a late and degenerate form of Greek mathematics. On the contrary, there can be no doubt that it was influenced by traditions common to the Hellenistic and Roman world. See also DIOPHANTINE EQUATIONS.

DIOPSIDE: see PYROXENE.

DIOPTER, a unit of measurement used in optics to measure the power of a lens or lens system. The power of a lens is the reciprocal of its focal length, and when the focal length is expressed in metres the power of the lens is in diopters. Thus a lens whose focal length is 1 metre has a power of 1 diopter, a lens of focal length 50 cm. (½ metre) a power of 2 diopters, a lens of focal length 2 metres. ½ diopter and so on. See LENS.

DIOR, CHRISTIAN (1905–1957), Parisian fashion designer who dominated world fashion for a decade after World War II. was born at Granville, France, on Jan. 21, 1905. After a formative period in Paris when he was closely associated with the artistic life of the capital, he opened a picture gallery; but ill health and the financial crisis of the 1930s left him in straitened circumstances. It was at this time (1935) that he first tried his hand at fashion designing. In 1938 he entered the house of Robert Piguet. In 1942 he went to Lucien Lelong. Finally. in 1946. with the backing of textile manufacturer Marcel Boussac, he opened his own house. The overnight success of the "New Look," launched on Feb. 12, 1947, was the prelude to 10 years of outstanding success. Dior was the personality through whom Boussac was able to commercialize Paris fashion on a world-wide basis and on an unprecedented scale. Dior died suddenly at Montecatini. Italy, on Oct. 24, 1957. (P. W. HE.)

DIORAMA, a three-dimensional exhibit or presentation housed in a cubicle to be viewed through an aperture or frame. Its construction is basically dependent upon the laws of linear perspective (see PERSPECTIVE) which were formulated in the 15th and 16th centuries. While in all probability true dioramas — for peep shows, etc.—were constructed earlier, credit for their development is usually given to Louis Jacques Mandé Daguerre (1789–1851), a French scenic painter and physicist who later invented the daguerreotype. In 1822, with a co-worker named Charles Marie Bouton, Daguerre opened in Paris, and later in London, an exhibition he called the Diorama that showed many of these spectacular displays. Daguerre used translucent drops (curtains) and wings which gave the illusion of depth and, with a series of changing, coloured lights, attained artistically dramatic effects. His techniques survive in dioramas, which are widely employed and may be on any subject and of any size, with or without special lighting and with either an opaque or translucent background.

Basically a diorama is an exhibit with a flat or curved back cloth on which there is a scenic painting, photograph or other such illusory effect. In front of the cloths may be placed flat or solid objects to heighten the illusion, while coloured transparent gauze or plastic drop curtains will heighten the three-dimensional effect. Typical diorama effects are of stage settings, room interiors, gardens and other natural scenes. With the addition of stage borders or wings a considerable improvement in the perspective is effected. Usually the immediate foreground material is in the full round but when space limits the depth of an exhibit these objects may be made progressively smaller and lower in relief as they near the background surface. Then similar objects, repeated in the background painting, are also progressively diminished in size to take them into the distance as, for example, the pickets of a fence as it tapers off toward the horizon.

A diorama is not to be confused with a panorama (*q.v.*) or cyclorama. A panorama is a sweeping scene or painting on a flat or curved background which is considerably extended laterally. A cyclorama is a similar exhibit which forms a complete circle and is viewed from a central platform. Both may be with or without foreground objects.

In the theatre a cyclorama is any curved wall on which lights may be projected. (J. L. CK.)

DIORITE is a medium- to coarse-grained plutonic rock with granular texture composed commonly of about two-thirds plagioclase feldspar (*q.v.*) and one-third dark coloured minerals (hornblende, biotite). The presence of soda-rich feldspar (oligoclase or andesine) in contrast to calcium-rich plagioclase (labradorite or bytownite) is the principal distinction between diorite and gabbro (*q.v.*). The volcanic equivalent of diorite is andesite (*q.v.*).

Diorite has about the same structural properties as granite (*q.v.*); but, perhaps due to its darker colour and more limited supply. is rarely used as ornamental and building material. It is one of the dark gray stones that go by the commercial name "black granite" (see also DIABASE). Diorite occurs independently as small bodies (sills, dikes, stocks) or as more irregular masses associated with gabbro, granodiorite, or granite. Diorite may appear marginal to huge bodies (batholiths) of granodiorite and granite.

The plagioclase feldspar in diorite is white or gray and readily identified by fine, parallel striations (twin lines) on the surfaces of broken grains. Under the microscope thin sections of the rock commonly show roughly rectangular grains of plagioclase with zoned structure in which a crystal core appears encased by numerous concentric, rectangular shells of differing composition. Generally cores are calcium-rich and successive shells are progressively more sodium-rich toward the exterior as in diabase (*q.v.*). Dark hornblende as elongate or irregular grains appears green or brown under the microscope. Black biotite, brown under the microscope, may be the sole dark mineral and is generally most abundant in

those diorites carrying considerable quartz. Augite is not common and orthopyroxene, olivine and feldspathoids are rare. Quartz may be present in small amounts and is generally interstitial to plagioclase. With increase in quartz content, diorite passes into quartz diorite (tonalite). Potash feldspar, when present, may be closely associated with or intergrown (as micropegmatite) with quartz. With increase in potash feldspar content, diorite passes into monzonite. With increase in both quartz and potash feldspar content diorite passes into granodiorite. Accessory minerals not readily seen without magnification are magnetite, ilmenite, apatite, sphene and zircon.

Some diorites are truly igneous; they have crystallized from molten material (dioritic magma). Others represent the products of reaction between magma and included fragments of foreign rock. Many have been chemically transformed in the solid state from some older rock such as gabbro by loss of certain constituent atoms and gain of others.

An average analysis (in weight per cent) of diorite is as follows: oxides of silicon (SiO_2), 59.67; aluminum (Al_2O_3), 16.68; ferric iron (Fe_2O_3), 2.93; ferrous iron (FeO), 4.09; magnesium (MgO), 3.62; calcium (CaO), 6.22; sodium (Na_2O), 3.50; potassium (K_2O), 2.13; and titanium (TiO_2), 0.39; and water (H_2O), 0.77. For discussion of processes of crystallization of the igneous rock series extending from gabbro through diorite to granite *see* GEOCHEMISTRY: *Geochemistry of the Lithosphere: Crystallization of Magmas and Its Products.* (C. A. CN.)

DIOSCOREACEAE, the yam family of monocotyledonous herbs or shrubs composed of nine or ten genera, mostly with annual twining stems. Stems in many species arise from tubers of characteristic shape, and often with coloured flesh. They usually have heart shaped leaves, and perfect or unisexual, generally inconspicuous flowers with their parts in threes or multiples of three. Though usually small, the flowers, particularly the staminate, may be borne in great masses. The fruits are usually three-winged capsules and the seeds may be variously winged. The genera are small and of limited geographic distribution with the exception of *Dioscorea,* the genus of true yams, which is composed of about 600 species. The family occurs in the tropics and subtropics, with some members extending into temperate areas.

The economic importance of the family was based solely on a few edible species of *Dioscorea* (such as *D. esculenta, D. alata* and *D. bulbifera*) cultivated for their starchy underground organs, until the discovery about 1940 that the tubers of certain other species of this genus contain steroidal sapogenins, chemical compounds useful in the manufacture of cortisone and sex hormones, a synthesis previously thought to be possible only from compounds of animal origin. In South Africa *D. elephantipes,* the elephant's-foot, possesses these chemical constituents in its often enormous basal organ which develops above ground and has a leathery surface composed of more or less hexagonal platelike sections.

Méx.,* 24, no. 2:279–390, fig. 1–58 (1954). For a résumé of the interesting chemical work involved *see* F. Giral, "Las Dioscoreas en la Industria Farmacéutica," *Rev. Soc. Cubana Bot.,* xiv, no. 1 and 2 (Jan.–June 1957). (B. G. S.)

DIOSCORIDES, PEDANIUS (fl. *c.* A.D. 50), Greek medical man whose *De Materia Medica* was the leading text on pharmacology for 16 centuries, was born in Cilicia and served in the armies of Nero. His treatise details the properties of about 600 medicinal plants and also describes animal products of dietetic and medicinal value. A Greek version of the work was published in 1906–14 and an English translation made by John Goodyer in 1655 was published in 1934.

See F. H. Garrison, *Introduction to the History of Medicine,* pp. 109–110, 4th ed. rev. (1929); Arturo Castiglioni, *A History of Medicine,* pp. 215–217, 2nd ed. rev. (1941).

DIP. In magnetism (*see* GEOMAGNETISM), the angle made by the direction of the earth's magnetic field and the horizontal is the angle of dip, commonly called the dip or inclination. In astronomy and surveying, the dip of the horizon (*q.v.*) is the angular distance between the true horizon and the apparent horizon, due to the observer's elevation. In geology it is the angle which the line of maximum slope of a stratum makes with the horizontal. *See* also FAULT: *Movement Along Faults.*

DIPAVAMSA: *see* PALI LITERATURE.

DIP CIRCLE, an instrument used for measuring the magnetic inclination or dip. It consists essentially of a magnetic needle pivoted at the centre of a graduated metal circle. The circle is mounted with its plane vertical, and the axis about which the needle turns, horizontal. If such an instrument is placed with the plane of the circle in the magnetic meridian, the needle will lie in the direction of the earth's magnetic field. *See* GEOMAGNETISM.

DIPHENYL or BIPHENYL, an aromatic hydrocarbon found in that fraction of the coal-tar distillate boiling between 240°–300° C., from which it may be obtained by warming with sulfuric acid, separating the acid layer and strongly cooling the undissolved oil. It can also be synthesized from simpler aromatic substances. It crystallizes in plates (from alcohol) melting at 70°–71° C., and it boils at 254° C. It has the structure $C_6H_5.C_6H_5$. The principal use of diphenyl itself is as a heat-transfer fluid, either alone or in the form of its eutectic mixture (Dowtherm A) with diphenyl ether $(C_6H_5)_2O$.

DIPHILUS (fl. late 4th century B.C.), one of the principal poets of Athenian New Comedy; he is credited with 100 plays, of which about 60 are known by title. An elder contemporary of Menander (342–291 B.C.), Diphilus came from Sinope on the southern shore of the Black sea; his brother Diodorus is also known as a writer of New Comedy in the early 3rd century. He is said to have died at Smyrna, but was buried in Athens, where he probably spent most of his life. His work survives both in Greek fragments and in Latin adaptations by Plautus (*Casina, Rudens,* probably *Vidularia,* and perhaps other plays) and by Terence (a scene in *Adelphi,* 155 ff.). He seems to have remained more faithful than Menander to the Middle Comedy tradition, and to have excelled in scenes of action and spectacle; his style is marked by its vivid imagery.

DIPHTHERIA is a specific, localized and superficial bacterial infection that is associated with the formation of a characteristic membrane, composed of fibrin and necrotic tissue, and with the production of a powerful toxin. The lesion is normally situated in the upper respiratory tract but is occasionally related to previous wounds or ulcers of the skin.

Although primary localizations of the infection in the nose or nasopharynx and the larynx (voice box) are not uncommon, the tonsils and faucial pillars (folds of mucous membrane at the sides of the passage between the mouth and pharynx) are the sites at which the lesion most often appears. A tough, closely adherent membrane, which leaves a raw surface when torn away, is most characteristic, but there are a number of early or mild cases, especially those in the immunized that present scattered patches of softer, more readily detached membrane. These latter lesions are not easily distinguished from follicular tonsillitis. It is also noteworthy that the severest infections may cause a swelling that is more prominent than membrane formation.

Although there is no absolute relationship between the extent of membrane formation and the severity of the infection, the spread of membrane over the whole tonsil, with progressive involvement of the soft palate, uvula, pharynx and larynx, normally indicates a severe case. In rarer instances extension to the esophagus or to the bronchial tree is observed. Swelling of the lymphatic glands of the neck and edema of the periglandular tissue may be a marked feature; in the worst cases such enlargement is often called "bull neck." Nasal discharge and offensive odour are also common features of the severer cases. The membrane passes through three phases: an early one, not often recognized, in which it resembles raw white of egg; a second one in which it suggests coagulated white of egg; and a final one in which it suggests rubber, with all colour shades from gray to reddish-brown. Rare sites of membrane formation are the eye and vagina.

General Symptoms. — In moderate or severe cases there is usually initial fever, of very short duration, and sore throat; the latter, however, is not a commanding symptom. In the severest cases evidences of profound blood poisoning (toxemia) are discerned: pallor, soft and irregular pulse, general weakness and marked subjective consciousness of illness. Vomiting, a rapid fall in the pulse and hemorrhagic manifestations are all of grave prognostic significance. Evidences of toxic neuritis appear in a variable percentage of cases and are observed between the sixth day and the sixth or seventh week. In order of frequency and time of appearance, paralyses of the palate, eye, pharynx and muscles of the trunk and limbs are observed. The palate lesion is indicated by nasal voice and by regurgitation of fluids through the nose; that of the eye muscles by squint. failure of accommodation and, more rarely, drooping of the upper eyelid (ptosis); and that of the pharynx by difficulty in swallowing.

Causes of Death. — Death may result in four different ways: (1) a primary massive toxemia, which mainly affects the heart, may lead to death within three days; (2) a less profound toxemia may lead to heart failure within the first two weeks; (3) obstruction of breathing caused by membrane formation and edema of the upper respiratory tract; and (4) extensive paralytic manifestations, *e.g.,* diaphragmatic paralysis or inhalation pneumonia, that may be directly or indirectly responsible for many late deaths.

Diagnosis. — Although many well-developed cases of diphtheria can be diagnosed without hesitation by any experienced observer, a proportion of early, mild or unusual cases can only be diagnosed with certainty by bacteriological investigation. Even with a positive bacteriological result, there often remains the question of whether a diphtheria-carrier condition coincides with some other infection that is actually responsible for the clinical symptoms. Bacteriological diagnosis is usually made by combining the observation of morphology of mixed cultures on Loffler's blood serum medium and the appearance of individual colonies on one of the blood tellurite agar media. A rod-shaped form that may show clubbing of its ends and that displays granules or barring when stained with an alkaline solution of methylene blue is considered characteristic.

For fuller identification, resort is made to fermentation of carbohydrates and to virulence tests. Tests of virulence were originally made by inoculation of guinea pigs or rabbits, but have been generally replaced by in vitro determinations of toxigenesis. A positive reaction depends on the detection of lines of precipitation in agar gels, resulting from the meeting of antitoxin (diffusing from reservoirs) with toxin (from bacterial growths).

History, Etiology and Epidemiology. — Diphtheria was first recognized and described as a sharply defined disease by Pierre Bretonneau (1826). Fifty-seven years later (in 1883) E. Klebs demonstrated the presence of bacilli of peculiar morphology in the superficial layers of the false membrane on the throat, and F. Loffler soon afterward (in 1884) succeeded in the cultivation and identification of the bacillus, *Corynebacterium diphtheriae,* long knonn as the Klebs-Loffler bacillus or K.L.B.

The bacteriological diagnosis of diphtheria was carried out by Loffler's original method until the 1930s. The peculiarly severe diphtheria that appeared in Berlin in 1927, and later in other centres, was a stimulus to further investigation. In an outbreak of this kind in Leeds, Yorkshire, Eng., in 1930–34, a difference was observed between a variety of bacillus associated with most of the severe and fatal cases and a second variety that was usually associated with the milder cases.

The extension of this work to many other areas and countries led to the recognition of three main variants of *C. diphtheriae.* C. *diphtheria mitis* is associated more often with mild cases and carriers and is more likely to cause death by excessive membrane production and obstruction of the air passages than by profound toxemia. *C. diphtheria gravis* is associated more often with marked toxemia and with epidemic prevalence of diphtheria. *C. diphtheria intermedius* resembles *gravis* in its pathogenic action but is usually rather less formidable.

The three variants give distinctive colonies on blood tellurite agar. The *gravis* strains are further distinguished by fermentation of starch, and the *intermedius* strains by much restricted growth on most media.

Evidence for the special capacity of the *gravis* strains to cause epidemic diphtheria, even in communities in which prophylaxis has been extensively adopted, is found in the records for Tyneside, Eng. (1939), Halifax, Nova Scotia (1940), Dundee, Scot. (1942–44), and Copenhagen, Den. (1944–45).

The diphtheria of a very severe type observed in Germany about 1927 appeared later in many other countries, and a major epidemic developed that culminated during the latter years of World War II. The figures available do not cover the U.S.S.R., Poland and the Balkans and they are incomplete for Germany, where the incidence of the disease was probably higher than in any other country. The annual incidence of diphtheria in the war period in Europe was estimated at 600,000 cases and the total deaths at 150,000. In most countries the highest epidemic incidence was in 1944 or 1945.

In North America, and especially in the United States, however, the incidence of diphtheria was considerably lower for the five years prior to World War II than it was in most European countries. This lower rate persisted during the war, although the epidemic wave in Europe was reflected by a slightly greater diphtheria mortality in the United States in 1945 than in any year from 1940 to 1960.

The most remarkable feature of the postwar period was the abrupt decline of diphtheria in Europe. This was especially marked in Norway, Finland, Sweden, Denmark and Scotland, where one or more of the years 1952–57 passed without any death from diphtheria being recorded; and in England and Wales, with a much larger population, where both mortality and incidence became negligible. A similar but less marked recession of diphtheria was observed in many other countries during this period. In several areas of South America, however, and in Portugal, Spain, Italy, Yugoslavia, Japan, Egypt and South Africa, diphtheria remained at a much higher level from 1948 to 1958. In a broad way it may be stated that the countries that enjoyed a high immunity in the period 1948–58 were those in which diphtheria was epidemic in a number of the larger cities or greatly increased in the country as a whole in the period of World War II and in which the practice of prophylactic inoculation was followed most thoroughly. There is evidence in Polynesia that wound infection by *C. diphtheriae* is common and sets up an immunity that protects the community from faucial diphtheria.

Diphtheria Toxin and Toxin Production. — Observations following injection of cultures or culture filtrates in experimental animals show that a toxin with lethal, dermonecrotic and neurotoxic properties is the active agent in diphtheria. This was first demonstrated by P. P. E. Roux and A. Yersin (1888). From that time production of toxin for immunization of man and of horses was the subject of a vast amount of investigation, but it was only after 1930 that the underlying principles were so far elucidated that the perplexing irregularities in toxin yield from cultures were largely eliminated. The essentials for proper yield in bacterial cultures appear to be a suitable peptone as a source of nitrogen, combined with fatty acid and carbohydrate, especially maltose, which supply energy in such proportions as to ensure a slow reversal of the reaction, from slight acidification to a p~ of about 8.6. Several days' incubation are necessary, under conditions in which there is a large exposure of surface relative to the volume of culture. The importance of limiting the iron content of the medium, first observed by J. Meuller (1939), came to be generally recognized.

The Park-Williams 8 strain maintained its place for more than 40 years as the most reliable source of toxin, notwithstanding the fact that its virulence on testing in animals was lower than that of many freshly isolated strains. The toxin appears to be a protein that contains sulfur but neither phosphorus nor carbohydrate. A ratio of 1/1,000,000 g. per kilogram of body weight of highly purified toxin will kill a guinea pig. Crystalline preparations of the toxin were obtained in the 1950s by A. M. Pappenheimer in the United States, C. G. Pope in England and M. Raynaud and E. H. Relyveld in France, but there was considerable controversy

about the purity of such preparations. The possibility that secondary toxic elements play a part in the diphtheria caused by *gravis* strains was suggested by R. A. Q. O'Meara (1940), H. Niggemeyer (1955) and Sara E. Branham, C. W. Hiatt, A. D. Cooper and D. B. Riggs (1959).

Treatment.— The existence of curative properties in the serums of animals that had recovered from infections was first observed by Emil von Behring in 1890. The correlation of his work with that of Roux led to the rapid development of antitoxin therapy with the serums of immunized horses. The therapeutic value of such serums was established beyond doubt by the halving of the death rate in the disease in Paris in 1894 (Roux and others) and by the results of treatment of alternate cases with and without antitoxin over a year in the Blegsdam hospital in Copenhagen by J. Fibiger in 1898.

Antitoxin was increasingly used thereafter and emphasis was put on large doses and early treatment. The former were facilitated by new methods of antitoxin purification— partial enzyme digestion followed by differential heat denaturation in acid solution. It is doubtful, however, whether the use of huge doses of concentrated serums give results much superior to those obtained in the early days in which smaller amounts of cruder preparations were employed. There are trustworthy records of death in the hypertoxic cases of diphtheria seen so much in Europe after 1925, notwithstanding intensive serum treatment within 24 hours of onset. Estimations of circulating toxin in such cases on admission may reveal amounts greater than a lethal dose for man. A. Tasman (1958) emphasized afresh the importance of early saturation of the body with antitoxin, the necessity of intravenous administration for this purpose and the precautions required. Variations in the avidity of antiserums for toxins have been recognized and may be related to variations in the globulins of the serum.

Cutting into the windpipe to allow breathing was much more common in the past and this was probably related to the higher incidence of the disease among infants and young children, although changes in the etiological agent may have played a part. The higher relative incidence of diphtheria in adolescents and adults after the end of the first quarter of the 20th century has been the subject of much comment.

Control.— Transmission occurs in several ways: (1) spread of contamination from infected nasal discharges (probably of first importance); (2) the ejection of infected droplets from the throats of cases or carriers; (3) persistence of C. *diphtheriae* in the dust of ward floors; (4) infection of milk or ice cream, to which several well-authenticated minor epidemics have been convincingly traced. The disease has not been effectively checked by the isolation of carriers.

Prophylactic Inoculation.— The basis of prophylactic inoculation was laid by B Schick's demonstration (1913) that persons susceptible to diphtheria could be recognized by their reaction to the intradermal injection of minute amounts of diluted toxin. Immunization was at first attempted with toxin-antitoxin mixtures, but this method was abandoned on account of disasters due to destruction of the antitoxin in such mixtures, and their place was taken by toxoid immunization. Formalin-treated toxin is used as toxoid and is generally referred to as anatoxin in France, where it was specially studied by G. Ramon. In Great Britain most immunization has been done with alum-precipitated toxoid (A.P.T.) in children or, in the case of adults, toxoid antitoxin floccules (T.A.F.), which are less liable to cause severe local reactions. It has been shown that the administration of several doses of suitable preparations at intervals of four to six weeks produces a conversion of Schick positive to Schick negative in over 99% of those inoculated. Special emphasis has been laid on early immunization— at four to six months— and on booster doses where there is a low level of diphtheria in the community and a consequent lack of natural immunization by contact with mild cases or carriers.

It has been claimed that the elimination of diphtheria in many Canadian and C.S. cities and later throughout Great Britain is the result of prophylactic immunization. This may be partly misleading, because other factors such as mass immunization during epidemic periods and changes in the infective agent were also involved. The value of inoculation in saving life, however, was proved beyond any possible doubt.

A perplexing but most interesting series of observations, initiated by V. J. Freeman (1951), revealed some surprising effects of bacterial virus (bacteriophage) preparations on the diphtheria bacillus. It was shown that, under the influence of suitable bacteriophage taken from strains of C. *diphtheriae* or even from certain staphylococci (Hewitt, 1952), a nontoxigenic bacillus may be converted to a toxigenic and lysogenic form. This work obviously may contribute much to the elucidation of changes in the diphtheria bacillus and its pathogenic potentiality.

DIPLODOCUS, a very large amphibious dinosaur found in the Upper Jurassic rocks of the Rocky mountain region: skeletons or replicas are to be seen in many museums. It reached a length of over 80 ft., but was relatively slender in build. See also DINOSAUR. **(A.** S. RR.)

DIPLOMACY is a word often used vaguely with different meanings. Sometimes it is used to express the whole content of international relations (*q.v.*); sometimes to express the manner in which personal affairs are conducted. Sometimes it is used in a derogatory sense; sometimes it is described as a highly commendable activity. Its proper and main meaning is, however, the manner in which international relations are conducted. Numerous definitions of it exist, but perhaps the best is that of the *Oxford English Dictionary:* diplomacy is "the management of international relations by negotiation: the method by which these relations are adjusted and managed by ambassadors and envoys; the business or art of the diplomatist." This definition should not be interpreted to exclude officials of higher rank, for a president, a prime minister or a foreign secretary negotiating in Washington, London or Paris is engaging in diplomacy as much as any ambassador or envoy. It stresses, however, the main point that it is the method, not the object, of the negotiation that is the subject of diplomacy. Bad objects may be sought by good diplomacy and vice versa. Still, diplomacy is in a sense a substitute for force; it is the means of obtaining the maximum national advantage without the use of violence and, perhaps one might add, with the minimum of friction and resentment. It is also true, however, that sometimes it is interspersed with the threat of coercion; and it always depends in some degree on the power, whether military, economic, moral or deriving from association with others, of the state for which the diplomat is acting. Some writers define it as a science, others as an art. It has, indeed, characteristics of both, though it is certainly more an art than a science.

Early History.— The word in the, use defined above is comparatively a newcomer. It is derived through the French from the Greek word *diploma,* meaning a folded paper such as was early used for state papers, charters, etc.; and hence a privilege, licence or degree conferred on a person. Though the word is new, the thing itself has existed since the beginning of civilization— or even earlier. Distrust of foreigners was almost universal in the early ages of society. But if any negotiation were to take place, conventions safeguarding the security of heralds or envoys had to be

observed, and often some form of religious sanction was used for this purpose. When the sovereign states of the Mediterranean area grew in number and, civilization, their contacts multiplied and the necessity for negotiation increased. In the Greek world the system, though intermittent, attracted to it some of the most skillful of Greek statesmen, who cultivated the art of persuasion, and a set of rules for diplomacy began to appear. The Romans took less from the Greeks in this than in some other arts, though they used diplomacy effectively both in their relations with the Greeks themselves and in obtaining the control of Egypt. But when the Roman empire was fully established diplomacy was mainly employed to divide and control the barbarians who surrounded it. In the middle ages diplomats were called by many different names such as legates, nuncios, procurators, agents or ambassadors. In all this development there was no permanent diplomatic machinery, even between states that had frequent relations with one another.

Permanent Missions.—The Italians were the first to establish permanent missions, in the 15th century. It is usual to attribute to this Italian pre-eminence that characteristic of unscrupulous diplomacy to which the term Machiavellian is given because Niccolò Machiavelli described it in remarkable language in his *Principe* and his *Discorsi sopra* la *prima deca di Tito Livio*. But in the age of the Renaissance rulers of other nationalities, Louis XI of France, for example, were no less unscrupulous than the Italians, though the latter produced more subtle and refined personalities. It is not known when the first resident embassy came into existence; the system grew out of the various methods of conducting international relations established during the middle ages among the countries of the Mediterranean area. It was Venice, which had vast connections in the eastern Mediterranean and was threatened by the rising power of the Turk after the fall of Constantinople in 1453, that extended the system into one that became European. When its efforts to lead an alliance of Christian states against the infidel failed, Venice used diplomatic methods at Constantinople itself with considerable success. Meanwhile Venice had begun to establish permanent missions in western Europe.

New types of monarchies were then arising as the power of the pope and of the emperor declined and new methods of organizing the central power of the state came into existence. These monarchies naturally began to negotiate with one another in the new way. For some time they regarded it with great suspicion. Henry VII of England, Ferdinand of Spain and Louis XI of France considered foreign agents as little better than spies.

It is also perhaps significant that permanent embassies arose at the same time as permanent armies. One could be regarded as the antidote of the other. At any rate in the first half of the 16th century, in the age of Thomas Wolsey, of Francis I and of Charles V, the system of permanent diplomatic missions became firmly established among the leading European states, and for reasons both of prestige and security smaller states had necessarily to follow their example. Thus arose in nearly all capitals a diplomatic body that came later to be called the diplomatic corps.

Diplomatic Customs.—Naturally such men could not be subjected to the ordinary laws of the state where they resided; as is described below, a system of special immunities was gradually worked out so that they could go about their business without interference. But they had also to establish their names and titles, their method of communication, ceremonial procedure and conventional language. The rules that were gradually adopted were part of the system later called international law, which grew up in the 17th and 18th centuries *(see* CONFLICT OF LAWS; INTERNATIONAL LAW, PUBLIC).

The term "ambassador" became the designation of the monarch's representative in the 16th century, except the representatives of the pope, who were termed nuncios or legates—though the latter were something more than diplomats. To save expense and for other reasons an inferior and less costly class of agents was instituted, at first called residents or ministers resident, later called envoys. Subsequently a further class, accredited not to the monarch but to his ministers, was used to fill up intervals or when some incident prevented full diplomatic representation; members of this class became known as chargés d'affaires. By the end of the 18th century there were four main classes, which were definitely recognized as such in an annex to the treaty of Vienna of June 9, 1815, and in a protocol of the congress of Aix-la-Chapelle (Nov. 21, 1818): (1) ambassadors, legates and nuncios; (2) envoys extraordinary and ministers plenipotentiary; (3) ministers resident; and (4) charges d'affaires. *(See* AMBASSADOR.)

The language of diplomacy was originally the international language of medieval Europe, Latin. In the 17th century Latin was superseded by French, which remained the principal diplomatic language until the end of the 19th. The use of English had been carefully safeguarded, however, and the right to use English in diplomatic communications insisted upon by the government in Westminster, while other governments made analogous reservations. Not until the Paris conference of 1919 was the perfect equality of English with the French language accepted by other governments, largely because of the influence of the United States.

By the beginning of the 19th century diplomacy had developed in extent and technique. In some states the foundations of departments of foreign affairs had been established, and the ministers were assisted by professional advisers. Instructions to ambassadors were drafted with competent skill; courier services were organized; and ciphers, first used by the Venetians, were employed with imperfect success to guard the secrets of correspondence.

The ambassadors were much preoccupied with the dignity of their office. Not, however, until the above-mentioned agreements of Vienna and of Aix-la-Chapelle was precedence by date of appointment accepted by all states for the classes of diplomats then established. Alphabetical order in the French language was also agreed to in the signature of treaties and similar documents, each state coming first in its own copy. Conventional rules as to the form of correspondence and address had also been established, though each court had its own ceremonial practice for the reception and entertainment of diplomatic agents. As relations between states increased, practical questions occupied the minds of diplomats and etiquette was of less importance.

The 19th Century.—The diplomatic profession, while still largely in its higher ranks in the hands of the nobility, became in many countries a definite career. In the 19th century foreign affairs were dealt with in great departments, as other business of the state. By 1815 in France and in Austria permanent officials already managed much of this business. In Great Britain the foreign ministers for a longer period did most of the important work themselves, aided only by a few clerks. But in London also by the middle of the century the permanent officials had necessarily to do much more as the dispatches multiplied. First the railroad and then, to a much greater extent, the telegraph transformed the tempo of diplomacy.

The position of an ambassador became somewhat different when he could seek instructions from home and receive an answer in a matter of hours instead of days or even weeks. Technical questions, especially those of trade, occupied more of the time and energy of diplomats. Commercial treaties had for a long time been negotiated by special envoys working under the general direction of the ambassador and receiving their instructions from ministers of finance or of commerce. Finally, commercial attachés were appointed. There were also military and naval attaches to report on the ever-growing armies and navies.

In addition, an attempt had been made in 1815 to set up a permanent international organization of the great powers, the European alliance, often called mistakenly the Holy alliance, the latter name being that of the less practical treaty sponsored by Tsar Alexander I. The alliance broke down in 1823; but in 1830 began the system of ambassadorial conferences—mainly of the great powers—which persisted sporadically throughout the century. In 1899 and 1907 two conferences of wider scope met at The Hague to lay down rules for arbitration and revise the rules of war. A number of technical international organizations were also set up with their own conferences and secretariat. Thus originated what was later

called "diplomacy by conference."

Diplomatic Immunities. — As noted above, diplomats could not be governed by the same laws as the people among whom they dwelt, and from an early date it was recognized that they had special privileges. Hugo Grotius gave his great authority to the theory that these immunities were based on the fiction that the diplomat's dwelling was part of the territory of his own country and that he carried its law with him. They are, however, really based on practical convenience. Without them, though not necessarily in their most extreme form, it would be impossible for the diplomatic agent to perform his functions satisfactorily. Diplomatic agents were thus placed outside the criminal and civil law of the land. They could not be arrested on a criminal charge or sued for debt in a civil court.

During the 16th and 17th centuries these immunities were firmly established by numerous precedents. With a few exceptions they were very generally observed in all civilized communities. Perhaps the one most challenged was exemption from prosecution for refusal to pay debts, which was more than once successfully contested. But the immunities were extended to the diplomatic agent's wife and suite and even to his menial servants, since otherwise his freedom of action would be limited by consideration for those who depended on him and on whom he depended for the exercise of his functions. This privilege was in many countries, especially in the orient. often abused in earlier centuries; and even in the 19th century it was sometimes a source of profit to the diplomatic agent. Since a diplomatic agent's house is inviolable, the right of asylum for political refugees was at one time of importance, especially in Latin America, but it was always regarded with jealousy and not held to be good in the case of ordinary criminals, who could be taken by force if not surrendered. He and his suite are exempted from taxation and customs duties. He has naturally also the right of free communication with his own country unless he allows himself to be shut up in a besieged town. On this analogy the diplomatic body in Great Britain was prevented from using cipher dispatches or couriers during the period before the invasion of the European continent in 1944.

In return for these privileges the diplomatic agent had the duty of never creating a breach of the peace or civil disturbance. He was, indeed, expected to avoid all interference in the internal affairs of the host country. If he failed to do so the only remedy was expulsion. It became more usual, however, to ask that the diplomatic agent be recalled by his own government. Such action should not be taken without sufficient cause, though it has been maintained that it is simply sufficient to declare an agent to be *persona* non *grata* as justification for desiring his removal. But if this is done unreasonably, reprisals may follow and a rupture of diplomatic relations take place. *(See* EXTERRITORIALITY; *FOREIGN* SERVICE.)

Early 20th Century. — During the 19th century diplomacy became a highly organized profession, and its practitioners were for the most part chosen for their technical proficiency. In democratic countries the foreign minister was nearly always a politician who might have had no experience at all in diplomacy; he was also a member of a cabinet or under a president who decided policy, subject to certain legislative controls. In the more autocratic countries the foreign minister was often himself a professional diplomat. The old aristocracy still played a notable part in the profession in many countries; and in Great Britain there was an income qualification for the diplomatic service, and its members tended to be chosen exclusively from the upper class. Moreover, of the foreign ministers of Great Britain between 1815 and 1914 all except two (George Canning and Sir Edward Grey) were either peers or the sons of peers. Parliamentary control was also limited by ignorance of many important facts. "It is in the cabinet alone that questions of foreign policy are settled," Lord Palmerston told Richard Cobden. "We never consult parliament until after they are settled." Diplomacy still remained highly secret and, to the man in the street, mysterious. The treaties which bound the states of Europe together in the period before World War I were nearly all unknown to the peoples whose actions they pledged. Even Great Britain had secret discussions with France which, though they left the former free to determine its own course of action, yet were a moral obligation which could not be disregarded. During the war secret treaties were made which became known only when revealed by the Bolsheviks after the Russian Revolution.

The press, it is true, took an increasing interest in foreign affairs. In return, the foreign ministers and diplomats generally took an increasing interest in the press and tried to control it either by bribery or by more subtle methods. Its use became part of the technique of diplomacy. Some journals were controlled by powerful financial and commercial interests, which thus obtained an influence on foreign affairs. Papers such as the *Times* (London), the *Frankfurter Zeitung* or the *Neue Freie Presse* (Vienna) exerted a real effect on public opinion and consequently on legislatures and cabinets. Governments had to defend themselves by publishing correspondence showing the manner in which diplomatic transactions had taken place. But it still remained true that many things, and often the most important, were kept secret. It was natural, therefore, that there should have arisen during World War I an insistent demand in many countries that secret treaties should be abolished and that much more information should be given to the public about foreign affairs. In addition, two other developments in international affairs began after that war to exercise an important effect on diplomatic methods: for the first time in history a world-wide permanent international organization had been set up in the League of Nations. which brought together diplomats from many different countries; and new technological developments, including those which affected communications, made the use of expert knowledge on many different subjects a necessity to the diplomatic profession.

In the western world and in the democracies generally the period between World Wars I and II was marked above all by the growth of popular control over the processes of diplomacy. In the United States, where this control had always been most extensive, all treaties had to be sanctioned by a two-thirds majority of the senate before they could be ratified. This system had resulted in the rejection of many treaties. including the most famous of all, the treaty of Versailles, signed by Pres. Woodrow Wilson in 1919. In Great Britain the executive had the power to ratify treaties, but it was recognized increasingly that it could only do so in important cases if parliament had previously indicated approval. Another step in the direction of democratic control was to make the diplomatic profession more easily accessible to candidates from every class. In Great Britain the income qualification for the diplomatic service was abolished and new methods of appointment and examination introduced — although it took some time for such measures to have any great effect.

As the power of an only partly instructed public opinion over foreign affairs became greater, governments began to use new methods to influence it, not only in their own country but in others. Departments of propaganda were organized which appealed to peoples over the heads of their governments. This practice, first begun by the Soviet government at the end of World War I, was adopted by other authoritarian regimes that appeared elsewhere, the development of radio communication providing them with a new instrument for their purpose.

After the Creation of the United Nations. — With the emergence after World War II of many "new" nations; with the increase in the power of the Soviet Union and the challenge which this presented to the United States and, indeed, to the western world; and with the constitution of the United Nations, a world organization more extensive in scope and in potential importance than the League of Nations, the character of international diplomacy changed. Thus the game of chess which for centuries had been played by the "great powers" of Europe, together with (toward the end of the 19th century) the United States and to some extent Japan, was complicated by the appearance among them on the international stage of such emergent nations as India, Pakistan, China and Indonesia and movements such as Arab and African nationalism.

Similarly the development of the technique of appeal by one nation to another over the heads of established governments by

radio and other mass media, which had begun in the 1920s and 1930s, became more violent in the circumstances of the "cold war," as the rivalry between the United States and the Soviet Union came to be called. A new technique of subversion, sometimes known as indirect aggression, came into being. The object of this new form of diplomacy, if such it could be called, was to gain control of a given country by intrigue conducted from within and fostered from without.

Along with these tendencies was a rather happier development, inevitable with the continued progress in transport and communications, namely diplomacy by conference. As noted above, this device had been initiated in the early 19th century and was employed at intervals up to World War I. It received a great impetus with the foundation of the League of Nations, but it really came into its own with the creation of the United Nations in 1945. That organization was established as a "centre for harmonizing the action of nations in the attainment of (their) common ends" and it was a feature of the whole charter that major international problems could be solved only if the five permanent members of the Security council were in substantial agreement. Unfortunately, the very structure of the Soviet state, together with the westward extension of its power, prevented such harmony save on rare occasions. But the presence of a world organization in which the intermediate and smaller states could play the valuable role of "ball bearings" which could lessen and direct the shock caused by the inevitable rivalries of the great powers seemed right in theory. It is quite true that up till the beginning of the 1960s at least the world forum was often used as a sort of platform in which the ends of the opposing blocs were sought by means of propaganda. It seemed that, in the view of the Soviet Union at any rate, conferences (including, of course, meetings of the Security council and the general assembly of the United Nations) were chiefly desirable as means for dividing its adversaries. When the Soviet Union found it desirable to make a deal the fact was usually made known privately (as happened in 1949 in the case of the Berlin blockade) or action was taken independently and without publicity. But in order to reach this point it might well be necessary to have gone through the processes of diplomacy by propaganda, and to that extent the latter might have served a useful purpose.

The technique of diplomacy by conference has been more profitably employed in the non-Communist world for practical political, economic and social purposes. There advances have been made in the direction of international co-operation. Typical of this kind of co-operation are, for example, the Atlantic council, the Organization of American States and, in eastern Europe, the Council for Mutual Economic Aid, and such United Nations bodies as the Food and Agriculture organization and the World Health organization, where the participating states are represented by their ministers or by career officials in more or less permanent session. It is, as it almays was, for the governments to make the decisions and to lay down the policies, but it must be clear that in doing so they are largely dependent on the trained services they employ. "The Prince" has changed in character since diplomacy began with the European Renaissance but the "negotiator" remains much as he was.

Even the invention of television and its application to diplomacy by conference did not invalidate these conclusions. It is, of course, clear that it is not actual negotiation which is televised. What is televised is the sort of speech which was made in very ancient times when diplomatists were sometimes known as "orators." It is arguable that the "formulator" is better at this kind of thing than the "negotiator," who is more profitably employed behind the scenes; but the experienced negotiator should be capable of making an effective speech and suiting his manner to the occasion.

Finally, it is evident that, apart from diplomacy by conference, there must still be machinery for conducting bilateral relations between nations. In modern conditions such relations are becoming increasingly complicated even if, from the point of view of war and peace, they may be becoming less important. It must also be admitted that the debasing of the coinage as regards embassies (by the early 1960s there were practically no legations left) and the bureaucratic inflation in the centre has resulted in a diminution of the role of the conventional diplomat. For all this, he still has a role to play, together with the consular corps. Into this field comes the increasing work of the press attachés, of the scientific and labour attachés and of national "cultural" agencies such as the U S. Information agency and the British council. With the unification of the world in the realm of manners and ideas that is taking place rapidly in spite of political differences, it is evident that this type of diplomacy serves a real need. Though the qualities required are not necessarily the same as those required for a negotiator, they do for the most part demand expertise and are therefore best left in the hands of professionals.

Qualities of a Diplomat. — No better description of the qualities with which the representatives of independent states ought to be endowed is ever likely to appear than that contained in the work of François de Callihres (one of the chief diplomatic advisers of King Louis XIV of France) entitled *The Art of Negotiating With Sovereign Princes.* It is also true that the qualities are of such a high order that they could hardly ever be embodied in a single person.

To start nith. the negotiator must be an excellent, indeed, an exceptional linguist. Next. he must above all be aware of the state of mind, the neak points and the strong points of those with whom he is negotiating "His aim should be to arouse the minds of his hearers by a sympathetic touch . . . He should therefore at the outset think rather of what is in their minds than of immediately expressing what is in his own . . . The words that I have just used are the beginning and end of all diplomacy." (This point is reinforced by Francesco Guicciardini who, Sir Victor Wellesley informs us, "went so far as to say that an ambassador is at his best when he appears to be so anxious to meet the views of his opponent that he might be suspected of being a traitor to his country.")

He must further possess "an observant mind, a spirit of application nhich refuses to be distracted by pleasures or frivolous amusements and sound judgment which takes the measure of things as they are and goes straight to its goal by the shortest and most natural paths without wandering into useless refinements and subtleties uhich as a rule only succeed in repelling those with whom one is dealing." This in its turn implies "an address always open, genial, civil, agreeable, nith easy and ingratiating manners." Above all he must always act in complete good faith. "It is a capital error. nhich prevails aidely, that a clever negotiator must be a master of the art of deceit. No doubt the art of lying has been practised with success in diplomacy; but . . . a lie always leaves a drop of poison behind," and this may have terrible consequences. (In this respect De Callihres differs from the earlier exponents of the art of diplomacy who based themselves on what was to some extent a misunderstanding of the principles of the great Italian master, Macchiavelli.) Finally, the negotiator must be "a man of peace."

"Neither the soldier nor the courtier can hope to discharge the duties of the diplomatist with success, unless they have taken the pains to instruct themselves." Neither, for that matter, can a lawyer, as a rule. "It is true that sometimes a lawyer diplomatist has made a great success of negotiation, especially in countries where the final responsibility for public policy lay with public assemblies, which could be moved by adroit speech; but in general the training of a lawyer breeds habits of mind which are not favourable to the practice of diplomacy." In any case, incompetence is "the parent of disaster." "It is a crime against the public safety not to uproot incapacity whenever it is discovered." The competent diplomatist, on the other hand, must write candid and crystal-clear reports (which demands long training); and De Callieres reveals an ancient secret of the craft, which is that the diplomatist would do well to insist on the improbability of success "even when he is virtually sure in his own mind that he will succeed."

It is perhaps superfluous to add, after all this, that "the prince should remember that it is within his power to equip the able man with all the necessary means, but that it is not in his power to

endow with intelligence one who does not possess it.!' As a general conclusion we are rightly told that "the most perfect ambassador is valueless unless his advice carries weight with his own sovereign or minister and unless they in their turn disclose to him the full nature of their policies and desires."

Has such a paragon any relevance to the modern age? It is true that circumstances have greatly changed since De Callières laid down the qualifications of the ideal diplomat. Some maintain that modern conditions have reduced the diplomat to the rank of a sort of glorified clerk; whenever anything important is to be transacted in the international field the foreign minister or another minister, occasionally even the head of the government himself, arrives by air to transact it. The ."negotiator" is not therefore (so it is often alleged) the person who actually negotiates. Even the considered telegram often arrives too late; the really important point is usually decided on the open telephone. All this is true. But it is also true that, if the minister arrives, the man on the spot has a welcome opportunity to explain his own views to the fountain of authority. If he is telephoned to he can also telephone back. Even if the considered telegram arrives too late his' reports can at least create the climate in which the crucial decision is eventually taken.

Sir Harold Nicolson in his *Diplomacy* observes that "most ambassadors during the period of slow communications were so terrified of exceeding their instructions . . . that they adopted a purely passive attitude. missed opportunity after opportunity. and spent their time writing brilliant reports on situations which had entirely altered by the time their despatches arrived." He concludes: "I do not agree therefore that improvements in means of communication have essentially disinvested the responsibility of an ambassador or to any important extent altered the nature of his functions." The probability indeed is that the modern ambassador (in which term is included all representatives of their country abroad, whether accredited to nations or to any form of international organization) still has considerable influence if he is efficient. little or none if he is indifferent or had.

Though the one occasionally assumes the functions of the other, a clear distinction should be drawn between the diplomat and the politician. The latter is, inevitably, directly concerned with the great game of power. Whatever the form of the state in which he operates the politician must consider primarily those factors that are likely to preserve him in office or, alternatively, to result in his dismissal or disgrace. If necessary, it is he who must ride the whirlwind. In any case it is he who must assess the risks. The diplomat — the negotiator — is thus necessarily, from the political point of view, a secondary figure. It is for him to offer advice on the best means of attaining the "prince's" ends: it is for him to say frankly whether these ends are attainable, or. alternatively, doomed to frustration. But when his government has finally established the policy there is nothing for it but for him to apply it loyally, whatever his personal doubts may be. Only one exception to this rule is allowed by De Callières, namely, when the negotiator is ordered by his chief to do something "against the laws of God and Justice"; *e.g.,* assassination. This rule clearly holds good even today when there is much less common agreement on what exactly the laws of God and justice are. Should the diplomat feel that he is being instructed to do something that violates his conscience (if he has one) there is certainly no option for him but to resign.

In conclusion. a word may perhaps be said on the confraternity of diplomats. This is not, as is sometimes thought, a sort of social snobbery, a feeling of belonging to a special and privileged class. Class, indeed, is increasingly irrelevant in the modern world. But there is no doubt that long experience of working with negotiators of other countries tends to create among the more intelligent diplomats a sort of freemasonry which sometiines results in a mysterious improvement in an otherwise apparently hopeless situation. People who have known each other for many years and who have constantly worked together. whether in some international organization or in some particular capital (and this naturally includes not only conventional diplomats but international officials as well), are at least predisposed to see each other's point of view and may even get to the point of showing each other, in confidence! their respective instructions. It is just as likely, perhaps, that the foundations of a lasting peace will be built up on this kind of foundation as on speeches delivered primarily for political purposes. Only one thing can interfere with such a beneficent process. Ideological warfare similar to that of the 17th century in Europe or to that of the intensive "cold war" of the era after World War II permits of no diplomacy at all. For, when everything that the one side does is suspect and condemned a priori by the other, international relations are outside the realm of all possible compromise and are continually menaced by total war. In its place is needed a reversion, for negotiating purposes, to the 18th-century assumption of an ideal republic transcending warring nationalities — no longer a "republic of Europe" but a republic of the world.

DIPLOMATIC is the science which has as its object the critical study of the formal sources of history; *i.e.,* of the "records" or archive documents (charters, mandates, deeds of all kinds, judgments, etc.) as opposed to the informal or literary sources such as chronicles. The term "diplomatic" (for which German scholars have substituted the more appropriate one of *Urkundenlehre*) is ill chosen. as the word "diploma," from which it is derived. was never used to designate more than one of the many types of documents which come within the compass of the diplomatic science. Modern terminology, which dates back to the Renaissance, restricts the use of "diploma" in this context to the most solemn acts of kings and princes. The name "diplomatic" was in fact simply taken directly from the title of the first textbook on the subject, *De re diplomatica,* published in 1681 by Jean Mabillon, a Benedictine monk of St. Germain-des-PrCs.

History. — Mabillon's book was called forth by the publication in 1675 of the "Propylaeum antiquarium circa veri ac falsi discrimen in vetustis membranis," a prefatory dissertation by the Bollandist Daniel van Papenbroeck to the second volume for "April" of the *Acta Sanctorum (see* BOLLANDISTS). In this work the author argued against the authenticity of the majority of Merovingian diplomas and other ancient charters which he had come across in monastic archives such as those of the Benedictine abbey of St. Denis, near Paris. Mabillon's refutation of Papenbroeck's criticisms was complete and was accepted by Papenbroeck himself. The *De re diplomatica* established the science on a secure basis; and though its immediate result was a flood of controversy between the Benedictines and the Jesuits, it has been the foundation of all subsequent works on the subject.

Mabillon's lead was soon followed with varying success by other scholars all over Europe. In England. the *Formulare Anglicanum* of Thomas Madox was published in 1702, followed in 1705 by the *Linguarum veterum septentrionalium thesaurus* . . . of George Hickes. Similar works, endorsing the principles laid down by Mabillon, also appeared in Germany, Italy and Spain.

France, however, the cradle of the science, continued to be the home of its development. Mabillon had not taken cognizance of documents later than the 13th century, and a more comprehensive work, the *Nouveau Traité de diplomatique,* 6 vol. (1750–65), was compiled by two later Benedictines, René Prosper Tassin and Charles François Toustain. Like all the other early treatises on diplomatic. the *Nouveau Traité* is an extensive encyclopaedia on the criticism of documents, including, such matters as paleography (*q.v.*) and sigillography (the science of seals), which now fall outside the scope of diplomatic.

As a result of the Revolution, the medieval records of France

lost their legal value as title deeds, but this rather tended to enhance their historical importance. The taste for historical literature revived, fostered by the Académie des Inscriptions. The École des Chartes in Paris, founded in 1821, soon became an active centre for the teaching and encouragement of the study of diplomatic. The same end was achieved in German-speaking countries by the Institut für Oesterreichische Geschichtsforschung, set up in Vienna in 1854–56, with Theodor Sickel as its first director. Great series of critical editions of records were launched both in Germany and in France; *e.g.*, the Monumenta Germaniae Historica (1826–) and Chartes et *diplômes* relatifs à l'histoire de France (1908–). By the end of the 19th century enough groundwork had been done in those countries to make it possible to write new treatises on diplomatic. The first part of Harry Bresslau's great work, Handbuch der Urkundenlehre fur *Deutschland* und *Italien*, was published in 1889 (later completed and revised) and Arthur Giry's Manuel de *diplomatique* in 1894. In England the wealth of record material was such that public and private institutions devoted all their energy to the publication of facsimiles and texts; in the field of public records, this work was undertaken first by the Record commission in 1800 and later taken over by the Public Record office (established in 1838).

Since Mabillon's time diplomatic has made great strides. The method used remains virtually the same: it is still a study of the forms as opposed to the contents of the documents. The objectives of the science, however, are steadily widening: it aims not only at testing the authenticity of records but also at ascertaining their date, their methods of production and the purposes to which particular forms were applied. In many ways the field covered by modern diplomatic borders on administrative history.

Classification of Documents.—Records may be classified according to their provenance: royal documents, issued by kings or on their behalf; and private documents, emanating from private individuals or corporations, ecclesiastical or lay. Each category may again be subdivided according to its formulas, purpose and methods of sealing. In the 13th century, for example, the English royal chancery issued three main types of documents: charters (normally used for grants of land and liberties in perpetuity); letters patent (letters sent "open," used for grants of limited duration, commissions, etc.), in which the seal validated the document without closing it; and letters close (used for news letters, administrative orders, etc.), in which the seal authenticated and closed the document. Some documents are still preserved in the original, others are found only in copies. Of the latter the most important are the contemporary copies made by the authorities who issued the documents; among them the patent, close and charter rolls of the English royal chancery (kept in the Public Record office in London) and the registers of the papal chancery (in the Vatican) are particularly worthy of notice. The copies preserved in monastic and lay cartularies, although not contemporary and compiled by the recipients of the documents, are also valuable, since the originals may no longer exist.

The practice followed by the different chanceries of medieval Europe varied so much that it is impossible to give even a brief account of all of them here. Only some of the results achieved in this field of research can be given.

Papal Chancery.—First and foremost stands the papal chancery, the evolution of which can be traced without interruption from the fall of the Western Roman empire to the present day. At first the papal chancery was organized on the model of the imperial chancery. It grew around the *scrinium* (a word originally meaning "box" and extended first to the records kept in the box and finally to the record office), the centre of the papal archives and secretariat. For the study of papal documents four periods have been defined, each being distinguished by some particular development of forms and procedure.

First Period.—The first period is reckoned from the earliest times to the accession of Leo IX (1049). Down to 788 no original has survived, and it is necessary to rely on copies, sometimes incomplete and untrustworthy, found in transcripts of registers and canonical collections. The earliest original is a fragment of a letter of Adrian I, of 788, written on papyrus. This material was used exclusively until the beginning of the 11th century, when it was gradually replaced by parchment; there is no evidence that papyrus was used after 1057 in the papal chancery. The vast majority of papal documents are in the form of letters, the only notable exceptions being the acts (decreta or *constituta*) of the synods presided over by the pope. There is no clear distinction between the various papal letters until the 10th century, when the privilege, a more solemn type of document used for grants of lasting value. began to be differentiated from the other letters by some special features such as the papal subscription Bene Valete ("Fare well") and a fuller date. All papal documents were authenticated by a leaden impression of the pope's seal, called bulla.

To cope with his huge correspondence, the pope had a secretariat, which until the 10th century was staffed by Roman regional notaries styled notarii sedis apostolicae and also sometimes *scriniarii;* at their head was the *primicerius,* who supervised their work and saw to the dating and probably to the sealing of the documents. Gradually, in the 10th century, the Roman notaries residing in Rome were replaced by papal notaries attached to the pope's person, and the functions of the *primicerius* were taken over by the papal librarian, who finally added to his title of bibliothecarius that of *cancellarius* (chancellor).

Second Period.—The second period, 1049–1198, extends from the accession of Leo IX to that of Innocent III. At the beginning of the period formulas tended to take more definite shape and to become fixed. The distinction between documents of lasting and those of transitory value became more exactly defined, the former class being known as *privilegia* or bullae *majores* (the term bulla or "bull" being extended from the seal to the document in the 13th century), the latter as litterae or bullae *minores*. Among other characteristics distinguishing the privileges were the subscriptions of the pope and cardinals (in the form: Ego . . . . *s[ubscrip]s[i]*) and the two special features called the "rota" and the "monogram"; the rota was a seallike design drawn in ink, and the monogram was made up of the letters of the words Bene Valete, the papal subscription of the earlier period. By the time of the pontificate of Innocent II (1130–43), the subscriptions of cardinals were arranged according to rank, those of the cardinal bishops being placed in the centre under the papal subscription, those of priests on the left and those of deacons on the right.

By degrees the use of ordinary letters increased, superseding the privilege, even for grants of lasting value.

Third Period.—The third period in the history of papal documents, 1198–1417, extends from Innocent III's accession to that of Martin V. The pontificate of Innocent III was a most important epoch in the history of the development of the papal chancery. Formulas became more exactly defined, definitions more precise, the observation of rules and precedents more constant. The staff of the chancery became more specialized and more numerous, and the titular head of the chancery was known, from 1216, as vicecancellarius. It is also with Innocent III that the uninterrupted series of registers of papal documents really begins.

The growing use of ordinary letters for the business of the papal court led to a further development in the 13th century. They were now divided into two classes, letters of grace (litterae gratiosae, or tituli) and letters of justice (litterae executoriae, or litterae de justitia or mandamenta); the former were used for granting favours and generally for decisions of lasting value, the latter for issuing orders, commissions, etc. The letters of grace were written in a more elaborate fashion and sealed on silk cords, like the privileges; the letters of justice were written with less care and sealed on hemp cords, like the letters close which the pope used to convey personal and confidential messages. Letters of grace and letters of justice were sent open; in the case of letters close, the bulla was used not only to validate the document but also to close it.

Fourth Period.—In the fourth period, extending from 1417 to the present time, the letters of grace and letters of justice have continued to be used, but other kinds also have arisen Such are the briefs (brevia), sealed not with a leaden bulla but with a wax impression of the pope's signet ring, the Fisherman's ring (so-called because it represents St. Peter fishing). This type of docu-

ment, which took its origin from some secret letters of the 13th century, came into general use during the pontificate of Martin V or thereabouts. It is written on thin parchment, in the humanistic script, and the name of the pope with his style as papa (in the abridged form *PP*) and his number is written at the head of the sheet: for example EUGENIUS PP III. The address is in the vocative (for example, Dilecte *fili*, "Beloved son") instead of in the dative ("To our beloved son"). Briefs were first used for political and administrative business and were at first always sent close, but from the middle of the 15th century their use became more general. They were then employed even in matters of grace and for the publication of important decisions, such as the promulgation of the Index librorum *prohibitorum* in 1564. In cases of this sort. the brief was sent patent.

Merovingian Chancery.— Of the acts issued by the chancery of the Merovingian kings of France 38 originals have survived: 13 of them, the earliest (625–673), are written on papyrus. the remaining 25 (from 677) on parchment. All these acts, loosely described as diplomas, are technically letters; they are authenticated by the autograph subscriptions of the king (sometimes replaced by a nonautograph monogram when the king was unable to write) and of one of the referendarii (lay chancery officials of the higher. rank) and also by the royal seal applied to the face of the diploma toward the bottom right-hand corner. These diplomas fall into several categories: (1) the capitularies (see CAPITULARY) or legislative documents; (2) the precepts or grants in perpetuity to individuals or communities; **(3)** the mandates or executive documents; (4) the judgments of the royal court. The royal seal was a full-face representation of the king's head.

Carolingian Chancery.— The diplomas of the early Carolingian sovereigns of western Europe differed little from those of their predecessors. The royal subscription was in the form of a sign manual or mark, but Charlemagne elaborated this into a monogram of the letters of his name built up on a cross. Most of his diplomas were authenticated by the subscription of the chancellor and impression of the seal. A novelty in the form of dating was also introduced. two words, datum (for time) and actum (for place), being then employed. The character of the writing of the diplomas, founded on the Roman cursive hand, which had become intricate under the Merovingians, improved under their successors, yet the reform which was introduced into the literary script hardly affected the cursive writing of diplomas until the latter part of Charlemagne's reign. The archaic style was particularly maintained in judgments, which were issued by the private chancery of the palace, a department more conservative in its methods than the imperial chancery. It was in the reign of Louis I the Pious (emperor from 814 to 840) that the Carolingian diploma took its final shape. A variation then appears in the monogram, which is built up not on a cross as previously but on the letter H, the initial of the name Hludovicus (Louis, Ludwig). This served as the pattern for successive monarchs of the name of Louis.

In the Carolingian chancery the staff was exclusively ecclesiastical; at its head was the chancellor, whose title goes back to the *cancellarius* of imperial Rome. His subscription, as keeper of the royal archives, was indispensable for royal acts. The diplomas were drawn up by the notaries, an important body on whom devolved the duty of maintaining the formulas and traditions of the office. In the 9th century the documents were drawn carefully, but in the 10th there was confusion and want of uniformity in diplomas. It was not until 1108, in the reign of the Capetian Louis VI of France, that the formulas were again reduced to rules.

English Royal Chancery.— For the Anglo-Saxon period (up to 1066), English royal documents can be divided into two main types, the diploma and the writ. The diploma, used by Anglo-Saxon kings to convey grants of lands in perpetuity, can be described as a solemn statement, in the king's name, that a grant is made: for example, Ego . . . *concedo* . . . ("I . . . grant . . ."). The document usually begins with a verbal invocation (such as *In* Dei *nomine, amen*) or a chrismon (often Christ's monogram formed from the letters XP), followed by a more or less lengthy harangue quoting a sacred passage on the virtue of charity or similar pious themes. Then come in turn the recital of the grant, the date and a detailed description of the lands granted (the boundary clause). The diploma ends with the subscriptions of the king and of ecclesiastical and lay dignitaries, each of them being often preceded by a cross. The language used in the main part of the document is usually Latin, sometimes Old English, but the boundary clause is always in the vernacular. The subscriptions and crosses were never autograph, nor was any seal ever attached to the document for validation.

The earliest genuine diploma known to have survived in the original belongs to 679, and no trustworthy copy exists of such documents earlier than 670, the year following Archbishop Theodore's arrival in Canterbury. This fact, combined with the appearance in these early documents of features characteristic of the late Roman private deed, led Wilhelm Levison, in his England and the Continent in the *8th* Century (1946), to the conclusion that the royal Anglo-Saxon diploma had an Italian origin. The Anglo-Saxon diploma was still in use in 1066 and some examples are alleged, perhaps rightly, to have been issued even after the Norman Conquest. In the latest examples, the boundary clause is always written in a smaller script than the rest of the document. Although it has been argued that, for part of the period, the diplomas were drafted and written in a royal secretariat, it seems that this task was more often than not left to the care of the beneficiary. This would explain the extreme variety of titles given to the same king in the charters attributed to him. From the second quarter of the 11th century, the diploma decreases in importance as the sealed writ begins to appear.

The Anglo-Saxon writ, unlike the diploma, is always written in the vernacular and in letter form. It begins with the king's style (*e.g.*, "Edward king"), followed by an address to the bishop, earl and thegns of the shire concerned in the text of the grant, and by a greeting. A short statement of the grant often concludes the writ, the whole of the document taking no more than a few lines. The writ is always authenticated with the royal great seal. This type of document may have had administrative antecedents dating back to the reign of King Alfred, but it is doubtful whether it was used for grants of land before King Canute, who is also credited with having imported the royal double-sided great seal into England. The earliest genuine originals of Anglo-Saxon writs and seals to have survived belong to Edward the Confessor's reign.

Before 1066 the writ was unknown to the dukes of Normandy, and there is every reason to believe that they had neither a seal nor a regular secretariat. They conveyed their grants of lands by means of diplomas which were often validated by autograph crosses. After the conquest of England, William the Conqueror had a great seal made, which represented him on one side as king of England. sitting on a throne, and on the other as duke of Normandy. on horseback. During the first years of his reign he continued to issue writs in Anglo-Saxon for his English subjects, just as Edward the Confessor had done; but from c. 1070 the writs began to be couched in Latin. From that time onward royal writs in the vernacular are rare. Gradually the Conqueror and his Anglo-Norman successors improved on the structure of the writ by adding to it some new features which increased its administrative value and gave it a better guarantee of authenticity. At some time between 1070 and 1072, a clause mentioning one or several witnesses began to be inserted at the end of the document. Late in the reign of the Conqueror, this clause was sometimes followed by the mention of the place of issue. Such additional features are not found regularly, however, until the reign of Henry I (1100–35). Exceptionally a date of issue is also given, either by reference to a religious festivity (e g., after Michaelmas) or even by an indication of the year of the incarnation.

For grants to Norman and other continental beneficiaries and also for grants in England, the diploma of Norman type was still used after the Conquest, but it was now sometimes authenticated with the royal seal. By the time of Henry II's accession (1154) it can be safely said that the diploma was dead, being totally replaced by the writ of Anglo-Saxon origin.

When King John succeeded to the throne (1199), the evolution of the writ had been completed. It had developed into three main

types of document easily distinguishable from one another. The most solemn of these was the charter (*carta*), used for grants of lands and liberties in perpetuity. It begins with the king's titles, followed by an address to "all archbishops, bishops, [etc.]." It has two final clauses, a witness clause mentioning a number of ecclesiastical and lay witnesses, and a dating clause introduced by the words "Given by the hand of X, chancellor" and giving a full date by reference to the day of the month and to the king's regnal year. Charters are as a rule authenticated with the great seal in green wax, appended on silk cords.

Next in importance come the letters patent *(littere patentes),* used for acts of transitory value such as grants for a period and commissions to royal officials. They begin with the king's titles, followed by an address to "all those to whom the present letters shall come." There are two final clauses, one indicating that the letters were sent patent; the other reads: "Witness myself at [place of issue] on [day, month and regnal year]." Letters patent are sealed with the great seal in white wax, appended either on a tag (double-queue) or on a tongue (simple-queue).

Letters close *(littere clause)* differ from the other two types of documents in that the seal is used to close the document. They were used to convey information or orders to a single person or to a definite group of people; for that reason, they have a special address. The final clauses are reduced to one, the dating clause, introduced by "Witness myself at . . ." or "Dated at . . . ." Letters close were authenticated and closed by the great seal in white wax, appended on a tongue.

The three types of documents which have been described remained virtually unchanged for the whole of the medieval period. The dating clause of charters was slightly adjusted early in the reign of Henry III to become "Given by our hand . . . ." Also, from the 13th century, Latin was sometimes replaced by French in letters patent and letters close.

The styles used by the English kings from the Conquest to the present time varied much according to fashion and to the political events in which they were involved. It is well known, for example, that Henry III dropped the titles of duke of Normandy and count of Anjou after concluding the treaty of Paris of 1259 with Louis IX of France. Similarly, Edward III assumed or dropped the title of king of France according to circumstances.

The existence of the title of chancellor (*q.v.*) for the head of the royal secretariat can be traced back to the reign of William the Conqueror. He was in charge of the custody of the great seal and also of all the work done in the chancery, although most of the actual work was discharged by less important clerks and scribes whose number increased as time went on.

DIPLOPXA, seeing a single object as double, occurs whenever one of the two eyes leaves the correct position of fixation, *i.e.,* when one eye can not focus on an object simultaneously with the other eye. An object clearly seen by the normal eye gives rise to an image in the deviated eye to one side of the macula and is referred by the mind to a position different from that which it really occupies. Thus, there seem to be two objects. one clearly seen with the normal eye and one indistinctly seen by the deviated eye. Causes of deviation of one eye are (1) disturbances in the motor apparatus of the eye, (2) tumour or abscess in the orbit, (3) limitation of motion of the eyeball from without. Paralysis, or weakness of one or more of the eye muscles, is by far the commonest cause of ocular deviation, and it is in those cases which come on suddenly that diplopia is a striking feature. *See* also EYE, HUMAN; VISION.

DIPNOI (DIPNEUSTI), the true lungfishes, an early order of primitive fleshy-finned fishes having functional lungs. They include forms from Africa, Australia and South America. *See* LUNGFISH; FISHES.

DIPOENUS AND SCYLLIS, early Greek sculptors, who worked together, and are said to have been pupils of Daedalus. Pliny assigns to them the date 580 B.C., and says that they worked at Sicyon, which from their time onward became the site of one of the great schools of sculpture. They also made statues for Cleonae and Argos.

DIPOLE MOMENTS. In common chemical parlance this term refers to an electrical characteristic of a molecule which gives valuable information about the structure thereof. This article will give a simple account of the principles of measurement, and of the main conclusions that have emerged. There is a related magnetic property, commonly called the paramagnetic moment, which also gives valuable information, though of a different kind.

Physical Principles.— A dipole is a system composed of two poles, in the present case electric point charges, of equal magnitude (e) but of opposite sign $(+e, -e)$, fixed a distance *l* apart. The product *el* is commonly denoted μ. Placed in a uniform electric field of strength F, such a system is subject to a twist, or turning moment. which varies from a maximum value of μF when the dipole axis is athwart the field (fig. 1[A]) to a minimum of zero when it is parallel thereto (fig. 1[B]). A field, therefore, tries to align a set of dipoles parallel to each other, and this results in a separation of electric charges in the assembly dipoles which in turn produces surface charges thereon, as shown in fig. 2. This process is called polarization.

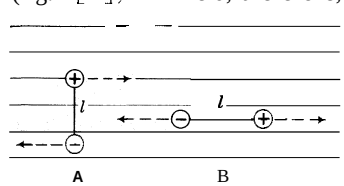

FIG. 1.— DIPOLE SYSTEMS EXHIBITING MAXIMUM (A) AND MINIMUM (B) VALUES OF TURNING MOMENTS

If the original field is produced by opposite electric charges on two parallel conducting plates (an arrangement called a condenser), the effect of introducing a slab of dipole-containing material between these is partly to neutralize it and, therefore, to reduce the electric potential between the two plates although the charges on them remain unaltered (fig. 3). Alternatively, if the potential between the plates is maintained. *e.g.,* by a battery, the charges on them will be correspondingly increased when the slab is inserted.

Such a drop of potential or increase of charge can actually be measured. The ratio, for a given material relative to a vacuum between the plates, is called the dielectric constant of that material, and is written ϵ.

There are other processes of polarization, in addition to that of dipole alignment or orientation, arising from distortion of the molecules by the field which induces dipoles in them; and in order to measure the permanent dipole moment it is necessary to separate the two types of process. Because a field tends to align the dipoles, it tends to produce a higher degree of order in the material than that which obtains in its absence. Thermal agitation of the molecules always tends to produce disorder: it opposes the ordering tendency of the field; and this is more marked as the temperature is higher. Hence, dipole orientation is a temperature-sensitive process; but dipole induction. being a matter of the internal rather than of the external

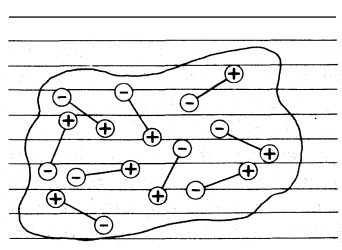

FIG. 2.—POLARIZED DIPOLES. POSITIVE (+) CHARGES TEND TO BE TOWARD THE RIGHT. AND NEGATIVE (—) CHARGES ON THE LEFT

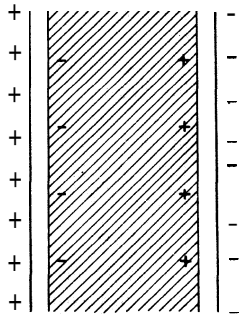

FIG. 3.—A DIPOLE SLAB BETWEEN TWO OPPOSITELY CHARGED PLATES

relations of a molecule, is not.

This relation is shown by the Debye equation:

$$\frac{\epsilon-1}{\epsilon+2}\frac{M}{d}=\frac{4\pi N}{3}\left(\alpha_E+\alpha_A+\frac{\mu^2}{3kT}\right)$$

where M is the molecular weight, d is the density, N the Avogadro number, α_E and α_A are the induction polarizabilities of a molecule due respectively to (1) distortion of electron distributions relative to nuclei and (2) distortion of one partly charged atom relative to another, k is the Boltzmann constant and T the absolute tempcrature. From studies of dielectric constant as a function of temperature, therefore, the electric dipole moment, μ, of the molecules comprising the material can be evaluated.

There is an alternative method. The measurements of ϵ are taken in an alternating field, for practical reasons. Now, while at low field frequencies the dipoles can keep in step with the oscillations. at very high ones they cannot, owing to their inertia or to their friction with each other. Therefore, orientation eventually ceases as field frequency is increased; and the polarization due to it can be derived from the resulting change of ϵ, if measurements are done over a wide enough frequency range.

In order to measure electric dipole moments. it is therefore necessary to study the variation of ϵ with temperature (T) or with field frequency (v). This must be done upon a state of matter in which dipole orientation is possible, *i.e.*, in the gaseous or liquid states or in liquid solutions, but not in the solid, crystalline state wherein the molecules are usually locked rigidly and so cannot orient freely. Measurements in the gas phase are better, because in liquids or in solutions the close approach of molecules causes complications; but measurements in solution are easier. Well over 2,000 substances have been examined in one way or other.

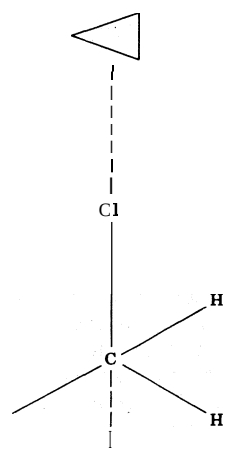

FIG. 4.—METHYL CHLORIDE (CH_3Cl) MOLECULE SHOWING ALONG VERTICAL AXIS OF

An entirely different method of measurement was developed which depends essentially upon the behaviour of single molecules.

Save at low temperatures, the molecules in a gas rotate about various axes of the molecular framework. If they are dipolar, they can absorb electromagnetic radiation, by virtue of their rotation, at certain wave lengths which depend upon the shape and the size of each molecule and on the masses of the atoms composing it; consequently, they show an absorption spectrum which consists of a series of sharp lines. Application of an electric field to the vapour modifies the spectrum. some of the single lines are split into several components by amount uhich depends on the field strength and on the dipole moment of the molecule. This is called the Stark effect. Therefore, if the spectrum be observed with no field and then with a field of known strength, the dipole moment can in principle be calculated.

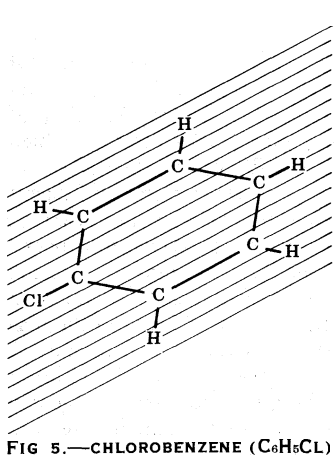

FIG 5.—CHLOROBENZENE (C_6H_5Cl) MOMENT ALONG PLANE OF SYMMETRY

This possibility has been realized in the study of so-called microwave spectra because many rotational spectra fall in the microwave range of wave length of about 0.3—3 cm.; and the development of radar apparatus has led to intensive investigation. Analysis of the Stark effect is an elaborate matter, and as yet not many determinations have been thus made; but comparisons between results from this method and from dielectric constant studies on vapours can be made for about 12 substances. The agreement is gratifyingly good, the average difference being only about 0.02 D (standing for a Debye unit, see below).

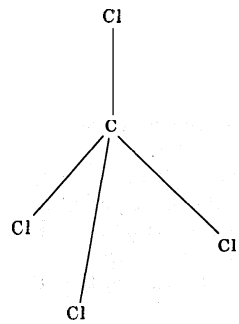

FIG. 6.—NONPOLAR ARRANGEMENT OF CARBON TETRACHLORIDE (CCl_4)

Several other methods of determination exist. The most important of these depends upon the deflections produced in a beam of dipolar molecules by a nonuniform electric field. This is the molecular beam method. (See below.)

Applications.— The electric dipole moment is of chemical interest for two reasons It depends upon the symmetry of the molecule, and also upon the degree of electrical asymmetry within the component parts.

An atom is believed to consist of a very small nucleus, bearing a positive electric charge, around which is a relatively disperse cloud of negative electric charge which is produced by the average distribution of the electrons which neutralize the nuclear charge. It can be shown that this cloud has spherical symmetry about the nucleus, in the absence of an externally imposed electric field; so, in atoms, the centres of action (or centroids) of the positive and of the negative charges coincide, that is to say the distance of separation is zero, and they have no permanent electric dipole moment.

When, however. two atoms combine to form a molecule, there is a profound disturbance of the electron clouds. One or more electrons are redistributed so as to cement the atomic nuclei together. Unless this process results in a symmetrical sharing of electrons between them, there is a permanent preponderance of electrons toward one end or the other of the molecule; the positive and negative centroids no longer coincide; and the system has a permanent dipole moment. In general therefore, unless the two nuclei are identical, as they are in the hydrogen, nitrogen, oxygen or halogen molecules, the molecule should be (di)polar.

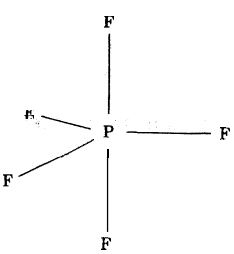

FIG. 7.—NONPOLAR ARRANGEMENT OF PHOSPHORUS PENTAFLUORIDE (PF_5)

This expectation has been verified experimentally. The possible order of magnitude of the dipole moment can be estimated by supposing that an electronic charge is completely transferred from one end of a chemical bond to the other end. These bonds are roughly $1-3\times10^{-8}$ cm. long; so the moment thus created would be $4.8-14.4\times10^{-18}$ e.s.u. (electrostatic units), commonly written 4.8—14.4 D. Actual values are zero for H_2, N_2, O_2, Cl_2, Br_2 and I_2, but 1.18 D'for HCl, 0.10 D for CO and 0.16 *D* for NO. It is therefore clear that when the atoms are unlike, a relatively small but noticeable displacement of charge occurs.

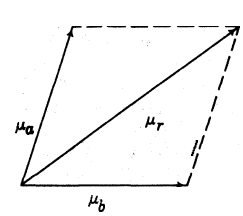

FIG. 8.—ANGLE BETWEEN TWO DIPOLE MOMENTS CALCULATED BY PARALLELOGRAM METHOD USING EQUAL COMPONENT MOMENTS (μ_a AND μ_b) AND RESULTANT MOMENT (μ_r)

In a polyatomic molecule it is generally to be expected that the component bonds will all be polar. Now, a dipole being the product of a charge and of a length, is a vector quantity, which means that, like a force, it has a direction as well as a magnitude, its direction being that of the dipole axis. If in a triatomic molecule, AB_2, the two A-B bonds are antiparallel, B-A-B, then the two

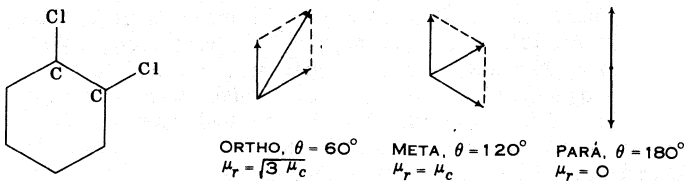

FIG. 9. — THEORETICAL MOMENTS OF CHLOROBENZENE COMPOUNDS

bond dipoles will neutralize each other and the molecule as a whole will be nonpolar; whereas if they are not, *i.e.*, if AB_2 is bent,  , the molecule is polar. It is in fact found that triatomic molecules fall into two such classes. For example, CO_2, CS_2, are nonpolar and therefore straight, while H_2O, H_2S, SO_2, NO_2 and O_3 have moments of 1.84 D, 0.93 D, 1.61 D, 0.3 D and 0.5 D respectively, and are therefore bent. Similarly, it can be seen that because BCl_3 is nonpolar it must be flat. whereas NH_3, NF_3 and PCl_3 having moments of 1.46 D, 0.21 D and 0.9 D respectively must be pyramidal.

More generally, it is reasonably obvious that if a molecule has an axis of symmetry in terms of its atoms, as has methyl chloride, CH_3Cl (fig. 4), with a three-fold axis about the C-CI bond, then the dipole moment of the whole molecule must lie along this axis. Also. if a molecule has a plane of symmetry, as chlorobenzene, C_6H_5Cl, has (fig. 5); then the moment must lie in this plane.

It follows that a molecule which has more than one axis of symmetry must be nonpolar, as must also one which has an axis of symmetry perpendicular to a plane of symmetry. (See STEREOCHEMISTRY: *General* Discussion of *Stereoisomerism.*) Carbon tetrachloride is nonpolar, which supports the hypothesis that the four chlorine atoms are at the corners of a regular tetrahedron with the carbon at the centre, for this arrangement has four three-fold axes, and three two-fold axes (fig. 6).

Phosphorus pentafluoride is also nonpolar. which agrees with the structure shown in fig. 7, for this has one three-fold axis and a plane of symmetry perpendicular to it, and three two-fold ones.

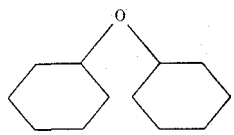

FIG. 10.—ANGLE BETWEEN TWO ARMS OF DIPHENYL ETHER

Just as two forces may be compounded by the parallelogram of forces to give a single resultant which depends upon their magnitudes and upon their mutual direction, so may two dipoles be compounded.

Therefore, if the two component moments are equal, if their magnitude is known, and if their resultant is known, the angle between them may readily be calculated (fig. 8).

(See MECHANICS: *Kinematics.*)

It was therefore hoped that by measuring the moments of chlorobenzene, orthodichlorobenzene, metadichlorobenzene and paradichlorobenzene, the suggested hexagonal structure for the benzene ring could be tested. because the three angles between the C-Cl bonds should be found as 60°, 120° and 180° respectively (fig. 9). The moment of the para compound is certainly zero as expected, that of the meta compound gives $\theta = 121°$, but that of the ortho one gives $\theta = 101°$. It was soon realized, however, that this simple test is not valid, because the permanent dipoles, due to their unequal sharing in the C-Cl bonds, can each affect the other C-Cl bond; *i.e.*, each dipole, by virtue of its electric field, polarizing it. The modifications thus to be expected could produce the observed anomalies; and more precise calculation shows that these could be accounted for satisfactorily. Because of the additional information required in these calculations, and because of the difficulty of getting it with sufficient accuracy, such secondary, induced moments remain a serious difficulty in the quantitative application of this method when the dipoles are close together; *i.e.*, their centres are only 2—3 Å apart (1 Å = 10^{-8} cm.).

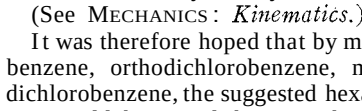

FIG. 11.—BONDS OF A CARBON COMPOUND IN WHICH THE MOMENT IS NEARER TO THE DIFFERENCE OF THE COMPONENTS THAN TO THE SUM

The method can be applied with more confidence when the centres are further apart, and has been used, for example, to measure the angle between the two arms of diphenyl ether (fig. 10) by successive para-substitution in the two rings. By such means, qualitative or roughly quantitative information has been obtained about many substances, particularly organic ones (*e.g.*, cis and trans isomers can often be readily distinguished; ethylene dichloride has been shown not to be rigidly fixed in a trans configuration) and information about the complicated, but important cyclohexane derivatives has been obtained.

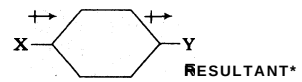

FIG. 12.—BONDS OF A CARBON COMPOUND IN WHICH THE MOMENT IS NEARER TO THE SUM OF THE COMPONENTS THAN TO THE DIFFERENCE

The Magnitudes of Dipole Moments.— The main applications of this quantity to solving chemical problems, aside from those already discussed, comes from the information which it gives about the degree of electrical asymmetry in a molecule. Already it has been shown how, in the case of H_2, Cl_2 and HCl certain simple theoretical predictions have been verified. A more quantitative consideration of magnitudes should indicate general features of electron distribution in chemical bonds.

It is immediately obvious that, in order to begin, we must have a means of finding out whether in A-B the negative pole is toward B or toward A, that is to say the sense of the dipole relative to the two atoms joined by the bond. There is no general, simple way of doing this, but at least the relations between bonds can be shown if one of the atoms is carbon, by taking a compound in which the two bonds (*e.g.*, C-X and C-Y) are in the para position on a benzene ring. Obviously, if the negative pole of C-X is toward X and that of C-Y toward Y. the moment of this compound is nearer to the difference of the magnitudes of the moments of C_6H_5X and C_6H_5Y than to the sum: whereas if in one of the bonds the negative pole is toward the carbon atom and in the other, the positive pole is toward the carbon atom, the moment of the disubstituted compound will be nearer to the sum of the components than to the difference (figs. 11 and 12).

The distinction is easily made. Because of the common occurrence of chlorine as a negative ion in compounds. this element is deemed to be highly electronegative. or electron-seeking, and to be more so than carbon. In the C-Cl bond. therefore, the negative pole is expected to be toward the chlorine end. Assuming this. it may be shown that the same is true for bonds to fluorine, bromine. iodine. oxygen, sulfur. nitrogen and phosphorus.

The emphasis has hitherto been on bonds which are formed by the not-very-unequal sharing of electrons; these are the so-called covalent bonds in which each atom contributes nearly equally to the electrons which form it. In ionic bonds, however, transference of one or more whole electrons from one atom to another is expected, and the moment in such cases should be large. The values for several alkali halides have been measured (by the molecular beam method [see above]) ; and although they are large (KCL, 6.3 D; KI. 6.8 D; and NaI. 4.9 *D*) they would be respectively 12.8 *D*, 15.5 D and 13.9 D if complete electron transfer occurred. The discrepancies show that this does not happen; the field of the cation may be deemed to polarize the anion, and so to reduce the effective degree of transfer (fig. 13). That this mould happen had been anticipated, but the actual degree had not been accurately predicted.

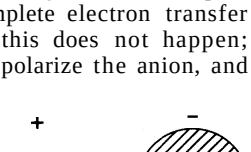

FIG. 13.—REDUCTION OF ELECTRON TRANSFER

A third type of bond, in which electron transfer is followed by electron sharing (*i.e.*, in which one atom provides both of the electrons which form the bond) the so-called dative bond, should also be highly polar. Such a bond should be formed between nitrogen and oxygen when trimethylamine $(CH_3)_3N$, is oxidized to trimethylamine oxide $(CH_3)_3NO$.

The difference of moment between these two compounds is

4.37 *D*, which is 63% of the value for complete transference followed by symmetrical electron pair sharing. The conclusion is that the nitrogen has the larger share of the electron pair. as would indeed be expected because of the positive charge which it acquires. and the negative one which the oxygen acquires, due to the initial electron transfer.

Fig. 14 represents the hypothetical stages in the formation of this bond. Other bonds of this type also are highly polar. However, some which were supposed to be highly polar, according to Lewis's octet theory, proved on careful consideration, not to be sufficiently polar; they are better described as double covalent bonds. Of this type are the PO bonds in phosphorous oxychloride Cl_3PO, and the SO bonds in thionyl chloride (Cl_2SO) and in sulfuryl chloride (Cl_2SO_2).

Attempts have been made to calculate dipole moments of simple molecules purely by theory; but the difficulties have been such that no accurate results have been obtained. The dipole moment is now known to be a complicated function; and a specially important conclusion is that unshared electrons (*e.g.*, those electrons which in water are not used for bonding between the hydrogen atoms and the oxygen atom but which reside on the latter) may be affected by the electron redistribution due to bond formation and may themselves make a large, even a dominant contribution to the total moment of the molecule.

A further application of this quantity with close bearing on quite recent theoretical developments is to show that in some substances, the classical formulation. by one single structure based on the Lewis-Langmuir concepts of covalent, ionic or dative bonds, cannot represent the facts. h'itrous oxide may be represented as $\bar{N}::\overset{+}{N}::O$ or $N:::\overset{+}{N}:\bar{O}$, the plus and minus signs showing the formal charges (which may be somewhat modified) arising from dative bond formation. Either structure would be highly polar: yet in fact nitrous oxide is almost nonpolar ($\mu = 0.17$ D). The organic azides present a similar problem, since they might be formulated: $R:\bar{N}::\overset{+}{N}::N$ or $R:N:::\overset{+}{N}:\bar{N}$ yet phenyl azide has a

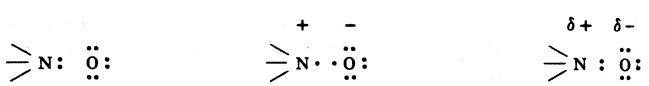

FIG. 14.— HYPOTHETICAL STAGES IN THE FORMATION OF A DATIVE BOND

moment of only 1.55 D instead of the 4–5 D to be expected for either formulation. A mixture of the two forms would be just as polar as either, because the effect of a dipole on dielectric properties is a function of its square. The only conclusion is that neither formulation is correct and that if "mixing" occurs it must do so in much less time than is required for a dipole to orient in a field, and for a gas such as nitrous oxide this is less than 10^{-11}—10^{-12} sec.

According to current theory, when two such representations, differing only in electron distribution, are possible, neither alone can be correct: the simple Len-is-Langmuir formulation is inadequate. This concept, which is variously called "resonance." "mesomerism" or "electron de-localization." is now known to be of wide occurrence and of great importance for explaining not merely the formal representation but the important properties of many compounds. both inorganic and organic. One further example may be quoted. The moments of aliphatic and of aromatic compounds with the same suhstituent group (*e.g.*, methyl chloride and chlorohenzenej are usually somewhat different; and by considering the direction of the differences it is possible to show that the groups which direct further substitution to the ortho and the para positions in the benzene ring produce a drift of electron charge into the ring, whereas those which direct to the meta position produce a drift out of the ring. In this way dipole moment measurements confirm a theory which has been based on a careful analysis of organic reactions.

Other Phenomena. — \Then dipoles are crowded together. as they are in a pure dipolar substance such as liquid nitrobenzene, their fields interact in a very complicated way; so that, as yet, it has not been possible to give an exact, quantitative treatment of the dielectric behaviour of such states. Some interesting points have, however, emerged. It is commonly appreciated that water owes its remarkable solvent power to its high dielectric constant (81); but at first sight the cause of this high value is not apparent, because μ for water is only 1.84 D. The molecules cling to each other. however, to form chains with large moments, and it is thus that the liquid is so polar.

It was stated earlier that if the field frequency is raised sufficiently. dipoles fail to follow it because of their friction with each other. Friction generates heat, and in fact a dielectric can become hot from this cause. The electrical energy which should be stored in the dielectric is in part lost as heat. so this phenomenon is called dielectric loss. It happens in noncrystalline, plastic solids, for although dipoles are not entirely free in these, they usually are not entirely rigid either. Dielectric loss can be useful. as a means of heating a material very uniformly, as is necessary in making certain plastics, but it can be a serious problem, especially in radio and radar equipment, by causing energy loss and, sometimes. overheating of the electrical insulation. "Polythene" (polyethylene) has a low dielectric loss because the molecules in it are virtually nonpolar, so too has "Fluon" (polytetrafluoroethylene). Appreciation of the fundamental theory has been important in improving and controlling the properties of electrical insulators.

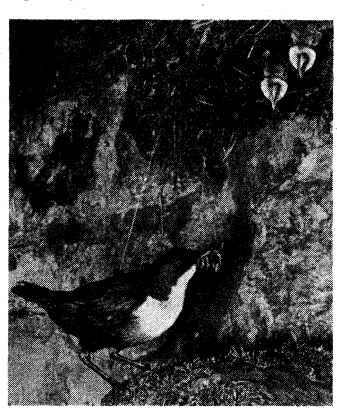
(L. E. SN.)

DIPPER (WATER-OUSEL), a bird about the size of a thrush, squatly built and of an active disposition. The dipper (*Cinclus cinclus*) haunts the swift hill streams of Europe and north Asia. It belongs to a small family of its own, the Cinclidae, and feeds upon small fresh-miter mollusks. crustaceans and insects, which it captures under the water, walking along the bottom of the stream and aiding its progress with its wings. The dipper can also swim on the surface of the water, despite the fact that its feet are not webbed. The plumage is thick and oily. being almost impervious to the icy waters of snow-fed streams. The upper parts are dark and the throat and breast white; the belly has a chestnut band. Its ringing song may be heard even in winter. The white eggs, four to seven in number, are laid in a cup-shaped nest of grass, lined with dead leaves and completely encased and domed with moss, except for a small hole to admit the bird. There are five species in the family, found in the northern hemisphere.



ERIC HOSKING

DIPPER (CINCLUS CINCLUS) BRINGING FOOD TO YOUNG IN NEST

In North America this genus is represented by C. mexicanus in the mountains of the west. The American dipper lacks the white throat of the European bird, which it otherwise resembles. The Costa Rican dipper (C. ardesiacus) of the highlands of Costa Rica and western Panamá is similar, with the general colour a lighter gray.

DIPSACACEAE, a family of dicotyledonous plants, the best-known member of which is the teasel (*q.v.*). The family includes 9–10 genera and about 160 species Several ornamentals also belong to this group; among them are the scabiouses or pincushions (see SCABIOSA).

DIPSOMANIA, a term formerly applied to the attacks of delirium caused by acute alcoholism and sometimes loosely used as equivalent to chronic alcoholism *See* ALCOHOLISM.

DIPTERA, the scientific name. derived from the Greek, for the order of insects that includes all two-winged flies. Most

winged insects possess four wings, but the hind pair in Diptera are reduced to slender stalks bearing apical, knoblike structures termed halteres or balancing organs. A few insects besides the Diptera (*e.g.*, certain small May flies and Homoptera) also have only one pair of wings, but they have no halteres. Several parasitic and a few free-living kinds of flies, rarely seen, are wingless but may be recognized by the presence of halteres.

Diptera are one of the largest and most widespread orders of insects, including approximately 100,000 known species, which vary greatly in size, form and coloration. They abound almost everywhere that insects occur, from subpolar regions to the tropics.

The order has been variously subdivided: one system, based on antennal structure, separates flies having elongate, slender antennae (Nematocera) from those having shortened antennae with fewer segments (Brachycera). Commonly encountered Nematocera include mosquitoes, long-legged crane flies. midges and black flies. Deer flies and horseflies: colourful. wasplike hover flies; the common housefly; bristly blowflies and tachinid flies; and small fruit flies are representative Brachycera.

See FLY; separate articles on various dipterans; *see* also references under "Diptera" in the Index volume. (G. W. Bs.)

DIBTEROCARPACEAE, an economically important family of old world tropical trees; the fruits of most genera are characteristically two to five winged, so as to give them a spiral motion in falling. All of the species are important timber trees, and many of them yield valuable resins. The timber of various Philippine representatives of the genus *Shorea* has been extensively imported into the United States under the trade name Philippine mahogany. Twenty genera are usually recognized, with about 400 known species. The family is a characteristic one of the tropics of the eastern hemisphere; there are two aberrant genera in Africa. The large genera are *Dipterocarpus, Anisoptera, Hopea, Shorea,* and *Vatica.* Sal (*q.v.*) is an important timber tree in India *(Shorea robusta).* Several species of *Shorea* are producers of dammar resin (*see* DAMMAR). (E. D. ML.; X.)

DIPTYCH, two writing tablets hinged or strung together, used in the Roman empire for letters and documents.

Ornamental diptychs of wood, ivory or metal were made for various ceremonial purposes, and especially as tokens of entry upon state offices. Consular diptychs, presented to friends and to persons of importance by a new consul in the later empire, were usually of ivory carved in relief work with portraits and historical or symbolic scenes; surviving examples provide the student of Byzantine art with a useful series of accurately datable objects from 406 to 541. In the middle ages painted or carved diptychs. like similar triptychs and polyptychs, were used as altarpieces or for private devotional purposes.

In the early church the names of persons to be prayed for were inscribed on diptychs and read out during the liturgy. These "diptychs of the living and the dead" included the names of outstanding Christians, especially bishops, of the local church who had died in the faith. With time the lists grew longer and contained not only local names. Only those of blameless orthodoxy were put on the diptychs. so the removal of a name implied an accusation of heresy. Commemoration of certain early saints is still made in the canon of the Mass; the similar list in Orthodox liturgies is still called the diptychs.

DIR, a state included in the Malakand agency of West Pakistan, is named after its capital which lies on the Dir stream, an affluent of the Panjkora. Area (1951) 2,040 sq.mi. Pop. (1961) 385.183. It comprises the country drained by the Panjkora and its affluentsdown to its junction with the Bajaur Rud. The valley of the Dir is also known as Kashkar. The valleys are fertile and produce fruit in abundance. The forests on the mountainsides vield timber in large quantities, the main source of income. After the accession of the state to Pakistan. developments there included a metaled road linking Dir n-ith Malakand and numerous village schools of a religious character.

The rulers of Dir are the Akhund Khel section of the Painda Khel. a sept of the Malizai branch of the Yusufzai Pathans. The founder of the town was Mulla Ilias. known as Akhund Baba, a holy man of the 17th century whose grandson, Ghulam Khan, seems to have acquired temporal power. Mohammed Sharif Khan, the first chief to make treaty agreement with the government of India. succeeded his father Rahmatullah Khan in 1884. The subsequent history of the state was one of rebellion and strife but there was greater peace after accession to Pakistan. Khan Bahadur Sir Mohammed Shah Jehan Khan. the nawab of Dir from 1925, was deposed on Oct. 8, 1960, and was succeeded by his third son, Prince Mohammed Shah Khusro. (K. S. AD.)

DIRAC, PAUL ADRIEN MAURICE (1902-). British mathematical physicist in the field of atomic structure. was born in Bristol. He started as an engineering student at Bristol university. but soon shifted to physics and received his Ph.D. from Cambridge university. His pioneer work in the quantum mechanics of the atom won him the Nobel prize (jointly with Erwin Schrodinger) in 1933, at the age of 31. He was awarded the royal medal of the Royal society in 1939. In 1925, when the true quantum mechanics was first being developed by Werner Heisenberg. Louis Victor de Broglie and Schrodinger, he independently developed an equivalent mathematical form, which involved essentially a noncommutative algebra for calculating atomic properties.

In his book *The Principles of Quantum Mechanics,* Dirac developed the so-called transformation theory of quantum mechanics which furnished a machinery for calculating the statistical distribution of certain variables when others are specified. He was co-discoverer of the Fermi-Dirac statistics and pioneered in developing the quantum theory of radiation. In his *Quantum Theory* of *the Electron* he replaced the conventional single second-order Schrodinger wave equation by four simultaneous first-order equations. When these equations are solved, various properties of the electron, such as its spin and anomalous magnetic moment, make their appearance in an almost miraculous fashion.

For a while, a rather mystifying property of the solutions of these equations was the existence of states of negative energy, which at first did not seem to correspond to physical reality, and hence had to be excluded arbitrarily. However; in a later paper, Dirac suggested that a deficiency of an electron in one of these states would be equivalent to a positively charged particle, of transient life because the state might later become occupied. This concept was confirmed in Carl David Anderson's discovery of the positron.

DIRECTOIRE STYLE, a loose term designating. in architecture, furniture. etc., the transitional work between the restrained classicism of the Louis XVI style *(see* LOUIS STYLES) and the Roman heaviness of the Empire style (*q.v.*); so called from the French Directory which was in power 1795–99. The style is characterized by a gradual loss of the delicacy and grace of Louis XVI forms and a growing enthusiasm for purely Roman motives.

DIRE DAWA, a town of Ethiopia in the northern part of Harar province, lies in the Great Rift valley on either side of the Dachatu river at a height of under 4.000 ft. in a hot, dry region. Pop. (1956 est.) 30.400. It is on the railway from Addis Ababa (296 mi.) to Djibouti, French Somaliland (194 mi.),, and from 1904 until the railway reached Xddis Ababa in 1917 it was the rail terminus and exercised the commercial functions of Harar town. on the plateau to the south, to which it is now connected by a motor road. It was known for several years after its establishment as Addis ("new") Harar. Because sf the railway, the road linking it with Addis Ababa was not maintained. There is little cultivation in the dry environs of Dire Dawa. which means "empty plain" and grain and other produce for rail transit come from the highland area to the south The town has railway workshops, an important cotton-goods factory, and the only cement factory in Ethiopia, which utilizes the exposures of Jurassic limestone at the bdse of the nearby fault scarp. Near the town are some caves decorated with prehistoric paintings. of undeter-

mined age, showing herdsmen, cattle and wild animals.

(G. C. L.)

DIRICHLET, PETER GUSTAV LEJEUNE (1805–1859), German mathematician, nho made valuable contributions in number theory, analysis and mechanics, was born at Duren on Feb. 13, 1805. Educated at Cologne and Paris, he held professorships at Breslau and Berlin. In 1855 he became the successor of Carl Friederich Gauss at Gottingen. Dirichlet worked in many fields of mathematics and in all of them he made notable contributions still associated with his name. (See NUMBERS, THEORY OF: Topics in Analytic *Number* Theory.) In number theory he proved the existence of an infinite number of primes in any arithmetic series $ax + b$ (a and b relatively prime); he developed the general theory of units in algebraic number field. His *Vorlesungen über Zahlentheorie* appeared in 1863, edited by R. Dedekind; it has since seen many editions. In analysis Dirichlet gave general conditions for a function to the expressible by a trigonometric series; he studied the so-called Dirichlet series and definite integrals. In mechanics he investigated the equilibrium of systems and potential theory that led him to the Dirichlet problem concerning harmonic functions with prescribed boundary values. He died at Gottingen on May 5, 1859. His *Gesammelte* Werke was published in two volumes (1889. 1897). (O. OE.)

DIRIGIBLE: see AIRSHIP.

DIRK, a combination dagger and all-purpose knife that rose to popularity in the 17th and 18th centuries, chiefly among working-class people. It had largely disappeared except for ceremonial purposes by 1850. The best known of all the dirk forms were those carried by the Scottish Highlanders and those worn by naval officers and midshipmen with their undress uniforms. The Scottish dirk seems to have derived from the kidney dagger (see DAGGER). It normally had a straight tapering blade and a short wooden hilt carved mith interwoven traceries. As time passed the hilts tended to become longer and after 1800 cairngorms or other

DIRK AND GUARD FORMERLY WORN BY MIDSHIPMEN IN THE ROYAL NAVY

stones were often set in them. The dirk is still worn as part of ceremonial Highland costume.

almost all European navies dirks have been worn at various times. In the British and U.S. navies the practice seems to have developed late in the 18th century, though dirks were not mentioned in regulations until somewhat later. In 1869 the U.S. navy confined the wearing of dirks to midshipmen, and shortly after 1879 the dirk was abandoned completely. At the close of World War II, dirks were still listed in regulations for British midshipmen. Most naval dirks had straight blades, but for a short period, from about 1805 to 1830, sharply curved blades were popular in both Great Britain and the United States.

DISARMAMENT. The word disarmament is used to cover four distinct conceptions: (1) the penal destruction or reduction of the armament of a country defeated in war; (2) bilateral disarmament agreements applying to specific geographic areas; (3) the complete abolition of all armaments; and (4) the reduction and limitation of national armament by general international agreement. Disarmament in the first sense is by no means new. It was enforced in ancient times and as recently as World Wars I and II. Disarmament in the second sense is well represented by the Rush-Bagot agreement between the United States and Great Britain which, since 1817, has kept the Great Lakes and the U.S.-Canadian border disarmed. Disarmament in the third sense has been advocated by utopian thinkers and occasionally by governments. In the fourth sense, disarmament did not come before an international assembly until the Hague conferences (*q.v.*) of 1899 and 1907, which ended in failure.

After the explosion of the first atomic bombs in 1945 and the rapid development of nuclear weapons of mass destruction, such as intercontinental missiles, the problem of disarmament became at once more urgent and more complicated. In consequence, there was talk at many levels of the need for general disarmament. The arguments commonly used in favour of disarmament had always ranged from complete pacifism to economic expediency. After 1945 there was a change: the contention that armaments races inevitably led to war was replaced by the argument that the use of nuclear weapons in quantity threatened civilization itself. Despite this realization, a solution to the problem of disarmament continued to depend on mutual confidence. Before disarmament could relax world tensions, world tensions had to be relaxed to provide a propitious setting for disarmament.

Disarmament and the 1919 Settlement. — It was partly as a reaction against the arms race in Europe that disarmament was stressed in making the Versailles settlement. The fourth of Pres. Woodrow Wilson's fourteen points demanded that national armaments be reduced to the "lowest point consistent mith domestic safety." Art 8 of the covenant of the League of Nations changed the word "domestic" to "national" and added to the point of "national safety" the further phrase, "and the enforcement by common action of international obligations" In this way the disarmament problem was linked more directly nith the problem of security. The Versailles settlement began by applying the principle of disarmament to the defeated countries, Germany and its allies. Germany was required to reduce its army to 100.000 men. and its munitions in proportion. Its naval power was also kept at a minimum, and maintenance of a military air force was prohibited.

(See GERMANY: Defense; STRAITS QUESTION; VERSAILLES. TREATY OF.)

Disarmament and the League of Nations. — The attempt to secure agreement on general disarmament through the League of Nations (*q.v.*) passed through three phases. The first period of committee work lasted from 1920 to 1925 The second period, from 1925 to 1932, was marked by the slow progress of the Preparatory commission for the disarmament conference. The third period, from 1932 to 1934, was that of the disarmament conference itself, which was never formally brought to a close.

At the beginning of the first period a nongovernmental Temporary Mixed commission was set up and, after long deliberations, proceeded in 1923 to draw up a draft treaty of mutual assistance. When this failed to secure adoption, it was replaced by the Geneva protocol of 1924, which set out to offer a threefold guarantee of security—a common definition of aggression, a general system of arbitration and a clarification of the enforcement measures to be taken against aggression — as a necessary preliminary to the calling of a disarmament conference, which, it was suggested, should meet in July 1925. The protocol was warmly welcomed by the assembly in 1924, but failed to secure support from Great Britain to bring it

In Dec. 1925 the council set up a Preparatory commission for the disarmament conference, which met for the first time in May 1926. Germany and the United States became members at once, and the U.S.S R. followed a year later. Progress was slow, but in Dec. 1930 qualified agreement was reached on six main points: budgetary limitation of armament expenditure; limitation of the period of service; the establishment of a Permanent Disarmament commission; the limitation of land, sea and air forces; the naval limitations embodied in the London Naval agreement of 1930; and the renunciation of chemical and bacteriological warfare. But these six points were so subject to reservations that they provided little satisfaction. In Jan. 1931 the council agreed that the disarmament conference should open on Feb. 2, 1932, and in May it appointed Arthur Henderson, then British foreign secretary, as president-elect.

The conference was attended by representatives of 59 states, but there was little unity of purpose. The French emphasis was on international control; on the building of a powerful force to assist the League in its work. The British emphasis was on qualitative limitation; the reduction of armament not by numbers but by categories, offensive armament being distinguished from defensive. It proved impossible to secure a universally accepted distinction between the two types; but more than this, the solution of the problem of disarmament clearly could be found only in the building of an effective international organization.

The most important stages in the history of the conference were the acceptance in July 1932 of a limited agreement (1) that air attack against civilian populations should be absolutely prohibited and the number of aircraft and civil aviation regulated; (a) that heavy artillery and tanks should in principle be limited in size; (3) that chemical warfare should be prohibited. Germany. along with the U.S.S.R.. voted against this agreement and, insisting on equality of status as a condition of continued support, did not attend the second session of the conference, which began in October.

Although Germany was brought back it was difficult to reconcile French demands for security with German demands for equality. In March 1933 the. British prime minister tried a new approach mith the so-called MacDonald plan. a five-year draft convention, which for the first time set out disarmament figures for most European countries. The plan was received with cordiality, but the conference adjourned again in June 1933 without having reached any new understanding.

A French plan, prepared during the recess of 1933, suggested that armament should be stabilized at the existing level for a four- or five-year period. It was accepted by Great Britain and Italy but was strongly opposed by Germany, now under the control of Adolf Hitler. On Oct. 14, 1933, Germany finally left the disarmament conference and the League of Nations.

The conference now came to a standstill for six months, and diplomatic negotiations about disarmament produced no results. The publication of German military estimates in March 1934 diverted attention to the problem of rearmament; and although the conference reassembled in May 1934, it was in an atmosphere of unreality. From 1934 onward there was a return to power politics, the prelude to World War II In March 1935 it was announced openly that a German air force was once more in existence. and a few days later compulsory military service was reintroduced. From this date rearmament rather than disarmament became a leading political issue in all European countries.

Naval Disarmament. — Attempts were made between 1919 and 1930, largely on the initiative of the United States. to secure limited naval disarmament. At the Washington conference (q v) of Nov. *1921,* a hve-power treaty was signed, fixing an arithmetical ratio for large battleships (Great Britain 5,,United States *j,* Japan *3).* It was easier to secure quantitative disarmament in capital ships than in other types of vessels or land armaments (*see* WASHINGTON, TREATIES OF).

In June 1927 Pres Calvin Coolidge called a conference at Geneva. Switz. to consider the limitation of ships not included in the Washington ratios. France and Italy refused to attend, and the United States and Great Britain soon disagreed. The British delegates insisted that mathematical parity with the United States nas not equivalent to practical parity, since British lines of trade and communication were longer, and absolute requirements, particularly in small cruisers, were greater. The conference broke down in August.

The London Naval conference of Jan. 1930 was more successful. The United States. Great Britain and Japan drew up an agreed tonnage table, and together with France and Italy accepted a five-year holiday in the construction of capital ships and a limitation of submarines and aircraft carriers. The international situation after 1931 did not permit any extensive discussion of general naval disarmament. Indeed. the Anglo-German Naval agreement of June 1935 recognized Germany's right to ignore the naval restrictions and prohibitions imposed upon it in 1919. In the meantime, Japan had built up a large navy which. taken in conjunction with its greatly increased army, posed a threat to general peace in the far east.

Disarmament and the United Nations. — The experience of the breakdown of the disarmament negotiations of the interwar years and the parallel breakdown of collective security led to a more realistic approach to disarmament problems during and after World War II. They did not, however, point to a solution, uhich was made more urgent by the invention of atomic weapons, including the hydrogen (fusion) bomb. the atomic submarine and the launching of the first earth satellite in 1957. The eighth point of the Atlantic Charter drawn up by Winston Churchill and Pres. Franklin Delano Roosevelt in 1941 was in line with League of Nations declarations; it stated that all nations "for realistic as well as spiritual reasons" must abandon force and demanded as a first step toward a general system of security the disarmament of aggressor countries. The Moscow declaration of 1943 followed the same lines. The charter of the United Nations reflected the increased emphasis on security. So too did the peace treaties signed on Feb. 10, 1947, with Bulgaria. Finland, Hungary, Italy and Rumania. They all contained stipulations aimed at unilateral disarmament of the defeated countries. Although peace treaties were not signed immediately with Germany, Austria and Japan, each of these countries was occupied and disarmed; in the case of Japan the new postwar constitution (see JAPAN) outlaned war and prohibited the formation of an army or navy. All these arrangements for maintaining security presupposed continued collaboration betneen the Allies of World War II There were hopes of creating new institutions to maintain security. Thus by art. *11* the general assembly of the United Nations was empowered to consider and make recommendations concerning "the general principles . . . of international peace and security. including the principles governing disarmament and the regulation of armaments." and the Security council by art. 26 was made responsible for drawing up specific plans with the assistance of the Military Staff committee created by art. 47 A further step was taken in Jan. *1946.* when as part of a new approach the Atomic Energy commission was set up and given full powers to make plans for controlling not only atomic weapons but also "all other major weapons adaptable to mass destruction."

Despite these provisions, however, the record of achievement in disarmament after 1945 was not impressive. The main differences of opinion betneen the Soviet bloc and the rest of the powers centred on the problem of international control, but they reflected a general lack of mutual confidence and a fear of the supremacy of the U S S R in "conventional weapons." In Dec. *1946* a resolution was passed unanimously by the general assembly recognizing the necessity of "an early general regulation of armaments." A Commission for Conventional Armaments was set up by the Security council in Feb. 1947, but there was early deadlock. In the UN Atomic Energy commission the so-called Baruch proposals, first put forward in June *1946* by the *U* S. representative Bernard Baruch, for setting up an international atomic authority with power to control and inspect were turned down by the Soviet Union, which demanded an immediate banning of atomic weapons. When the project of an international atomic agency, with a system of control, was placed before the general assembly in Nov. *1948* and Nov. 1949, the Soviet Union voted against it on the ground that it failed to prohibit atomic weapons and u-as an infringement of national sovereignty. In Jan. 1950 the Soviet Union withdrew from the Atomic Energy commission.

Meannhile, proposals for an arms census were vetoed by the Soviet Union in the Security council in Oct. 1949, and a statement was issued in the same month by Canada, China, France, the United States and the United Kingdom claiming that there was a "fundamental difference not only in methods but also on aims" between the Soviet bloc and the rest.

In the meantime, divisions among the wartime Allies were so substantial that the immediate postwar aim of forcing unilateral disarmament on the defeated countries was abandoned. Fear of Russian expansion in Europe led to the signing of the Brussels treaty of March *1948* and ultimately to the establishment of the North Atlantic Treaty organization (NATO) in April *1949.* Soon

afterward the question of a "German contribution" to European defense was mooted. Eventually, after complicated discussions. west Germany became a member of NATO in Oct. 1954. In the far east, Japan was permitted and even encouraged to rearm after the outbreak of the Korean War in June 1950. The Russians. too, were arming most of the countries within their sphere of influence. and by the early 1950s only the unilateral disarmament clauses of 1947 concerning Finland were still in force.

At the 1950 session of the general assembly — after the start of the Korean War — there was an attempt to break the deadlock, and Pres. Harry S. Truman suggested that the Atomic Energy and the Conventional Armaments commissions should be merged. A committee of 12 (the Security council members plus Canada) was formed to report on the proposal. While it considered procedural implications, the French, U.S. and U.K. governments studied matters of substance and in Nov. 1951 tabled a draft resolution in the general assembly proposing a merger and the creation of a new Disarmament commission. After long discussions the U.S.S.R. agreed to the proposal, and the commission was set up in Jan. 1952, but there was an open conflict between Soviet and other views. The U.S.S.R. continued to demand an atomic weapons ban and a one-third arms cut before mutual disclosure of information and the introduction of an inspection system. Most of the other powers asked for (1) a sharing of information; (2) an agreement on inspection methods; (3) an international atomic authority; and (4) a system of safeguards "to ensure observance and detect violations" in that order of priority.

The new commission began its work in March 1952 through two committees—the first on reduction and control of armaments) the second on means of verification. The first was handicapped by the Soviet refusal to discuss details before principles and by Soviet rejection of a U.S. statement of "essential principles" in April. The second was the scene of bitter controversy. When in May 1952 the French. U.S. and U.K. representatives submitted detailed proposals for the determination of numerical limitations on existing forces, the Russians replied that the recommendations were merely designed to reduce the Soviet army while increasing the air and naval power of the United States. They rejected the tripartite proposals in August, accused the United States of employing bacteriological methods of warfare in Korea and refused to agree to a proposed impartial commission to inquire into these accusations. So sharp was the disagreement that the commission held only one meeting in 1953.

Increased awareness of the dangers of hydrogen bomb warfare, the knowledge that "both sides" possessed the bomb and the first large-scale production of tactical atomic weapons were more important than strictly political factors in the subsequent period of discussion which began with a speech of Pres. Dwight D. Eisenhower in Dec. 1953. "Elementary prudence" was given as a new reason for disarmament. Eisenhower suggested an international atomic agency to develop peaceful uses of atomic energy and secret diplomatic discussions between the United States and the U.S.S.R.

There was still no real progress, however, and proposals made by both sides were either shelved or rejected at the five meetings of the Disarmament commission between May 1954 and Sept. 1957. In April 1954 the Disarmament commission established a subcommittee of five (Canada. France. Great Britain, the U.S. and the U.S.S.R.). In June 1954 an Anglo-French memorandum was endorsed by all members of the subcommittee except the U.S.S.R. It suggested the preparation of a draft treaty to embody the following points: (1) the total prohibition of the use and manufacture of nuclear weapons and weapons of mass destruction of every type, together with the conversion of existing stocks of nuclear weapons for peaceful purposes; (2) major reductions in all armed forces and conventional armaments; and (3) the establishment of a control organ with rights, powers and functions adequate to guarantee the effective observance of the agreed prohibitions and reductions. In Dec. 1954 the U.S.S.R. representative at last accepted the memorandum as the basis of the commission's future work. and there was a further moment of hope in May 1955 when the U.S.S.R. went on to announce in a draft declaration, supplemented by draft resolutions for the UN general assembly, that it would accept limitation and control, as the western powers had suggested, in the interest of "peaceful coexistence." On paper this mas a notable change of policy, but it did not lead to positive results, for the western powers, placing increasing emphasis on a reliable system of inspection, insisted that the subcommittee should adjourn until Aug. 1955.

In the meantime. at the Geneva "summit" conference of July 1955. President Eisenhower made a new proposal for an exchange of air reconnaissance — the "open-skies plan" — and after Geneva the earlier disarmament proposals of the western powers were withdrawn. The reasons given were twofold: first, that any progress in the reduction of armaments must be dependent on the settlement of outstanding political disputes; and second, that no progress could be made in the most urgently needed form of disarmament, nuclear disarmament. without the inauguration of scientific inspection. The U.S.S.R. restated its proposals of May 1955 and urged that the drafting of a disarmament treaty should begin. There was thus renewed deadlock in 1956, with papers and proposals being produced by both sides.

In March 1956 Britain and France drew up a revised version of their earlier plan of June 1954, while the U.S.S.R. suggested an immediate plan for conventional disarmament only. For the first time, no proposals were made concerning nuclear weapons, except an immediate ban on tests. A month later the United States made suggestions for a first phase of disarmament. Armed forces mould be reduced. information about nuclear materials and weapons would be exchanged, and there would be a limitation and monitoring of nuclear tests under international control. The practical position was stated clearly, however, by the French representative, who remarked that "a limited agreement seems to me today to be as difficult to reach as a general agreement."

In Aug. 1957 the United States. Britain and France prepared a package plan for partial disarmament as a reply to Soviet proposals made in March 1957 for a general "reduction of armaments and armed forces and the prohibition of atomic and hydrogen weapons." Both sets of proposals included a reduction of service manpower by stages and a reduction of conventional armaments under the supervision of an international control organization. While the Russians proposed the total prohibition of the use and manufacture of nuclear weapons and the total abolition under international control of all missiles for warlike purposes. the western governments pressed for a cutoff of new nuclear weapons to begin one month after the international control organization had certified that an effective inspection system had been installed. No detailed proposals were made about the dates or quantities involved in the subsequent transfer of nuclear materials to peaceful purposes. As far as missiles were concerned; the western powers suggested that three months after a disarmament treaty had come into operation a technical committee should be set up to study "the design of an inspection system which would make it possible to assure that the sending of objects through outer space will be exclusively for peaceful and scientific purposes."

The package plan was rejected without hesitation by the C.S.S.R.. which continued to stand by its more comprehensive proposals at the UN general assembly which considered the question in the autumn of 1957. The assembly passed by 56 votes to 9 a resolution urging the Disarmament commission to give priority to reaching a disarmament agreement, which would achieve six of the partial measures, but the U.S.S.R. and other Communist countries were in the minority and refused to give their support to the enlargement of the Disarmament commission to include 14 new members, among which were Czechoslovakia, India, Egypt and Yugoslavia. The U.S.S.R. announced that it would take no further part in the work of the new commission or of the "bankrupt" subcommittee.

In 1958 the U.S.S.R. continued to advocate the total abolition of nuclear weapons and a comprehensive scheme of disarmament. A movement to press for the former objective gained strength in several western countries. No progress was made at the international level, however, until July 1958 when a conference of scientists from eight countries, including the U.S. and the U.S.S.R., met at Geneva "to study the possibility of detecting violations of a

possible agreement on suspension of nuclear tests." In Aug. 1958 it was announced that agreement had been reached that within limits it is possible to detect and identify nuclear explosions. This important statement on the possibility of technical control was followed almost at once by an Anglo-U.S. proposal to suspend nuclear tests for a year by international agreement as a prelude to "measures of real disarmament." No more tests had taken place when Nikita Khrushchev on his visit to the United States in Sept. 1959 appealed to the general assembly to achieve "total disarmament" over a period of four years.

On Nov. 20, 1959, the general assembly unanimously approved a resolution recommending "complete and universal disarmament" and called upon the new 10-nation Disarmament committee to make a "thorough examination" of the whole problem. The committee—composed of the representatives of Canada, France, Great Britain, Italy and the United States on one side and of Bulgaria, Czechoslovakia. Poland, Rumania and the U.S.S.R. on the other—met in Geneva in March 1960 but made no progress. The main points of difference concerned the time schedule for disarmament and provisions for inspection. International tension mounted meanwhile, culminating in the sudden breakup of the summit conference at Geneva during the summer (A. BRI)

In 1958 the United States. the U S S R and Great Britain had each stopped conducting nuclear tests and hopes had risen that a permanent and comprehensive ban on such tests might be agreed upon. But France meanwhile joined the ranks of the nuclear powers by conducting tests in the Sahara desert and there was widespread speculation that the People's Republic of China would also soon possess nuclear weapons. Late in Aug. 1961, at the height of the international tension over Berlin. the U.S S R. announced that it would resume testing of nuclear weapons and immediately set off a series of nuclear explosions in the atmosphere. Before it broke the moratorium on tests the U S S R. had obviously been secretly planning to do so for many months. The U S. government responded by declaring that, in the interest of its own defense, it mould also resume testing. It exploded several small nuclear devices underground during September and October. On April 25, 1962, it set off the first in a series of nuclear test explosions in the atmosphere near Christmas Island in the Pacific ocean.

At the opening of the 16th annual meeting of the UN general assembly in New York in Sept. 1961 the United States and the U.S.S.R. reached agreement on basic principles to guide their disarmament discussions The agreement was general in nature but it nevertheless marked a considerable advance toward bringing the two nations together. When the president of the United States, John F Kennedy, addressed the UN general assembly on Sept. 25 he emphasized the importance of continued disarmament negotiations and challenged the Soviet Union to join in a "peace race" rather than an arms race. Negotiations during the months that followed brought no positive results, though the U.S.S R. and the U S. presented comprehensive plans for general disarmament at the 17-nation disarmament conference that convened in Geneva in March 1962.

DISASTER RELIEF refers to assistance to persons who are deprived of the essential needs of life because of natural disasters resulting from flood, fire, earthquake, hurricane or similar catastrophe. The term also applies to assistance to communities and people suffering from the effects of war or from political oppression or mass prejudice causing physical or economic deprivation. Disaster relief generally is not circumscribed by the laws and regulations that apply to assistance to persons deprived of the means of support through loss of income or illness and old age and known as poor relief or public assistance (*see* SOCIAL WELFARE).

programs.— Before 1900 disaster relief consisted largely of emergency grants of food, clothing and medical care and the provision of mass shelter through hastily organized local committees, often with the aid of voluntary contributions of money or supplies from other communities or countries. In the 20th century disaster relief became one of the chief activities of the International Red Cross, which originally had been organized in the 1860s to aid the victims of war. The American Red Cross, under its revised charter (1905), was given responsibility for establishing a system of disaster relief in the United States. This system included nationwide expansion of disaster preparedness in Red Cross chapters, including the training of volunteers to serve in emergencies and the development of plans and programs to be used in case of either natural disaster or enemy attack. Other voluntary organizations that have been especially active in providing supplies and services for relief in cases of natural disasters have been the Cooperative for American Remittances to Everywhere (CARE), the Salvation Army and church groups.

Modern weapons of war, including chemical, biological and nuclear devices, have aroused nations and communities to establish organizations to plan for prevention and protection against the effects of these weapons. During World War II, a nationwide civil defense program in Great Britain prevented the loss of many lives and helped to reduce some of the suffering following bomb attacks. (*See* CIVIL DEFENSE.) Plans for similar programs were developed in the United States and many other countries to provide for relief in event of catastrophe whether resulting from war or natural causes.

After World War II the Office of Civil and Defense Mobilization, which operates under the executive office of the president, became the official national agency in the Cnited States concerned with disaster relief. This agency prepares plans for mobilization and recommends the adoption of suitable warning devices, protective measures and first-aid facilities. Most cities and states have established some civil defense activities and have prepared inventories of resources available in case of an emergency and of individuals with knowledge of the location of such resources. Locally, the mayor or some designated official is usually the top authority for directing the services when needed. In most instances the major city department involved is the fire department. (This more or less follows the pattern established in Great Britain during World War II.) Other officials generally represented on a disaster relief authority include the commissioners of police and health departments, officials of public and private welfare agencies, hospital authorities, representatives of the local medical society and transportation authorities. In many communities the Red Cross, the Salvation Army and public services are organized to determine the need for food, clothing and shelter in the event, for example, of a large fire. In case of a disaster affecting a large area, transportation facilities—public or commercial—are drawn into service. Emergency medical services and hospital care are important elements in relief after serious fires, floods and windstorms.

Fund Raising.--Many natural disasters occur throughout the world, and aid for the suffering has a special concern for people with ethnic or nationalistic ties. This results in the development of many temporary, short-time services and emergency drives for funds or food and clothing.

With the development of world-wide communication, the knowledge of distress from disasters of all kinds is public information within hours of the occurrence; organizations such as the Red Cross (international and national) quickly provide reliable information on the extent and type of need. CARE, the Red Cross, churches and other groups have trained volunteers who help to interpret the need and assume responsibility for orderly and informed appeals to people who wish to contribute funds or supplies. Within some groups, plans and specific instructions for disaster fund raising are published as guides.

Scores of natural disasters occur annually. Added to these are the periods of distress and suffering imposed on people from political upheavals and minor wars. All of these are given world-wide attention, and appeals for help, usually in funds, are issued. The lack of responsible fund-raising organization has sometimes deterred prospective contributors. As a result, in the Pnited States a few communities offer information and guidance to contributors through such organizations as a local chamber of commerce or a council of social agencies.

Incidence.—The natural disasters that occur in any one year result in the need for local, national arid, often, international disaster relief efforts. In 1960, for example, disaster relief operations were required in at least nine countries: the United States as a result of hurricane "Donna" which caused serious damage in eight states along the eastern coast from Florida to Maine; south central Chile which suffered a series of severe earthquakes. tidal waves and landslides; Iran and Turkey which experienced serious earthquakes; Korea and India which suffered storm damage that required emergency action; northern Italy which was hit by floods resulting in property loss and death; England which also experienced flood damage; and East Pakistan as a result of high winds and a tremendous tidal wave resulting in more than 3,000 deaths and the destruction of 30,000 homes. In the case of East Pakistan, it was a week after the storm before the news of the tragedy reached the rest of the world, but immediately on receipt of information voluntary aid was forthcoming.

War Relief.— During and following World War I and World War II the people of many countries responded to the need for war relief. The World War I relief program administered by Herbert Hoover (*q.v.*) provided funds for the assistance and rehabilitation of people and communities who were in serious need of help. Funds from the United States were also made available to rehabilitate buildings which had been seriously damaged.

After the invasion of north Africa by the Allied armed forces in World War 11, the U.S. state department created the office of foreign relief and rehabilitation under the direction of Herbert Lehman, former governor of New York state. Food and other supplies were shipped to north Africa, together with a small staff responsible for proper distribution of clothing, food and medical supplies.

In 1943 the Allied nations created the United Nations Relief and Rehabilitation administration (*q.v.;* UNRRA), first under the direction of Governor Lehman and later under former New York city Mayor Fiorello La Guardia. Forty-eight nations provided supplies and personnel to countries where the war resulted in personal and community losses. Greece, Belgium, France, Poland and other areas were given food, medical supplies and machinery to be used for relief and rehabilitation.

The displaced persons division of UNRRA, assisted by funds from participating countries and personnel assigned by many of the same countries, carried on services for the people who had been in concentration camps and forced labour groups. The major task, in which the Allied forces and UNRRA participated, was the repatriation of 8,000,000 displaced or homeless persons. and the provision of medical and other needs while the camp residents were being processed for return to their homes or other suitable areas. Approximately 800,000 displaced persons remained in UNRRA's care pending their repatriation or resettlement.

Support for this service, as in north Africa, came in part from voluntary groups and religious organizations — the Roman Catholic Church, the Friends Service committee (Quakers), Jewish organizations, and a host of other nongovernmental groups from the United States and the United Kingdom, including the Red Cross and similar welfare services. Most of the funds and supplies came from the governments associated with UNRRA.

Similar mass operations were undertaken in China, Korea and other countries that were seriously affected by the disaster of war and the confusion that followed it. In the 1960s CARE engaged in self-help projects for refugees in a German camp clearance project through a special grant, as well as similar programs among Tibetan refugees, supplying food and other commodities. CARE also provided self-help programs in addition to relief supplies for refugees in Hong Kong and the Gaza Strip, which involved disaster situations largely of the political type.

Fifteen years after the end of hostilities in World War II refugees throughout the world were still considered a remnant of the disaster resulting from the war. The Cnited Nations designated June 1959 through June 1960 as World Refugee year and committees raised funds to assist in the resettlement of thousands of refugees still in camps. This appeal had only moderate public response, but governments provided official funds to help in the enterprise.

DISCIPLES OF CHRIST (CHRISTIANS), a Protestant denomination characterized by a special concern for Christian unity, found chiefly in the central and western United States. Originating as an informal movement including persons of many denominations, the Disciples of Christ have developed into a typical American denomination of liberal character. By the 1960s there were about 1,600,000 members in the U.S. in about 6,000 congregations; world membership was about 1,800,000.

The principal founders of the denomination were Thomas Campbell, his son Alexander Campbell (*q.v.*) and Barton W. Stone. Stone had been a Presbyterian minister prominent in the Kentucky revival of 1801, but, with others, signed "The Last Will and Testament of the Springfield Presbytery" (1804), giving up that name in order to be called "Christians." Stone advocated as a basis for Christian unity the adoption of New Testament faith and practice without any admixture of human opinions. A similar view was put forward by T. Campbell, a Presbyterian minister of western Pennsylvania, in a "Declaration and Address" (1809), and in the later writings of A. Campbell. The new American nation was looked upon as providing a God-given challenge to a new start in religious organization, and the democratic spirit of the frontier led to a renewed emphasis on the place of the laity in the ministries of the church. The followers of the Cainpbells, known as Reformers or Disciples, were soon out of favour with Presbyterianism. Because they adopted immersion of adult believers as the only form of baptism, they joined the Baptists in 1813, but, differing with the Calvinism of the Baptists, left them to unite with the Christians in 1832. The latter had already been strongly influenced by the teachings of Alexander Campbell, who now emerged as the leader of the new denomination. It grew most rapidly in the states bordering the Ohio river and from there westward. Moving with the frontier, the Disciples of Christ increased most rapidly in the midtvest and southwest and on the west coast.

The Disciples did not suffer schism during the Civil War, but the following years saw controversy over many practical issues. Continuing opposition to instrumental music in worship characterizes a group known as Churches of Christ, first separately listed in the U.S. census in 1906. (See CHRIST, CHURCHES OF.) A minority opposed agencies for intercongregational co-operation as unscriptural, but the majority support of co-operation led the Disciples to take membership in interdenominational local, state, national and world councils of churches.

During the 19th century many periodicals were launched, and leadership in the denomination was exercised primarily by its

great editors: from 1823 to 1860 by A. Campbell through the *Christian Baptist* and the *Millennia1 Harbinger;* from 1866 to 1888 by Isaac Errett through the *Christian Standard;* from 1888 to 1912 by J. H. Garrison through the *Christian Evangelist* (this periodical, renamed the *Christian* in 1960, is an official publication of the denomination). In the early 20th century a Disciples' periodical, the *Christian Century,* emerged as a leading interdenominational journal under the editorship of Charles Clayton Morrison.

Like most U.S. denominations in the 19th century the Disciples founded many colleges, the first successful one being Bethany college, established by A. Campbell at Bethany, W.Va. Most of the surviving schools hold membership in the Board of Higher Education of Disciples of Christ; they include 16 liberal arts colleges and universities. 7 undergraduate Bible colleges and chairs and 11 seminaries or centres of graduate studies. Graduate study for the Disciples' ministry was first established in 1894 through the Disciples Divinity House of The University of Chicago.

Missionary work was initiated by several different organizations, which joined in 1920 to form the United Christian Missionary society, now carrying on missionary work in the major Asian nations, Africa, the Philippines and Central and South America.

The polity of the Disciples of Christ is basically congregational. However. state associations for evangelism began to appear in the 1830s, and a national missionary society and convention was established in 1849. Subsequently, many organizations for missionary work, education, publishing. pensions, benevolence, preservation of history, cultivation of scholarship, etc., have been established. The original convention developed into the International Convention of Christian Churches (Disciples of Christ), serving the U.S. and Canada; to this most of the agencies report and from it they receive advice. After 1950 a Council of Agencies provided general program planning and co-ordinating for all of the agencies of the denomination. A World convention, organized in 1930, includes units from Great Britain, Australasia, South Africa and other nations, some of which originated independently but associate in convention because of similarities of doctrine and practice.

A distinguishing feature of Disciple worship is the celebration of communion every Sunday morning as part of the main service of the day. Disciples believe their service, and its interpretation as a memorial of the life of Jesus Christ, accords with New Testament worship. While an ordained minister usually leads in worship and preaches, the communion normally is administered by elders and deacons appointed by the congregation. Following prayers by the elders and scripture verses, the deacons distribute the bread and wine to the congregation in the pews. Since an ordained minister is not necessary to the service, Disciple congregations maintain their practice of weekly communion even when without a minister.

The Disciples maintain a simple creedal position, accepting faith in Jesus as "the Christ, the Son of the Living God" as an adequate confession for church membership. Infant baptism is opposed, and believer's immersion is usually preached as the adequate form. The New Testament is emphasized as supplanting the covenants of the Old Testament. Though not Unitarian, the Disciples urge the use of a simple New Testament phraseology as to the Godhead. The denomination is rationalistic in temperament, influenced originally by the philosophy of John Locke and "common sense" Scottish philosophy, but its tradition includes a warm evangelical preaching first developed by Walter Scott during his evangelization of the Western Reserve in the late 1820s. At times a minority has placed a legalistic emphasis upon the restoration of New Testament practices as the way to achieve Christian unity; the majority, recognizing the inadequacy of the restorationist idea, have entered fully into the discussions of the 20th-century ecumenical movement.

DISCOUNT. In general business usage, a discount is a deduction from the price of an article offered to the buyer for paying cash, for buying in large quantities or for some other reason. In banking the word denotes the sum of money deducted from a loan to pay the interest in advance. A bank loan of $1,000 discounted at 6% interest for one year, for example, actually yields only $940 ($1.000 less 6%). The rate of interest is thus referred to as the discount rate. In the money market, discount means the rate allowed to the buyer who pays cash for a bill of exchange due at some future date. Discount house is the name applied in the British money market to firms that specialize in the business of buying and selling bills of exchange. *See* MONEY MARKET.

DISCOUNT HOUSE, a term that has different meanings in retail trade and in banking. According to the first meaning. most common in the United States, a discount house is a retail store, or a division thereof, that sells nationally advertised products at prices lower than the prices asked by other stores. Some discount houses sell products specifically labeled for them at what may appear to be very low prices. In banking usage a discount house is an essential part of the money market (*q.v.*) where bills of exchange and short-term government obligations are bought and sold.

Some U.S. discount houses feature wide assortments of durable and semidurable consumers' goods; others specialize in jewelry, phonograph records, radios or electrical appliances. Attempts also have been made to operate food stores on the discount principle. Widely varying practices exist as to the use of membership fees and cards. Some houses offer the barest minimum of services; others offer a wide range.

These establishments originated in the United States after the turn of the 20th century mainly in such cities as Chicago and New York. The pioneers in this field offered for sale only a few types of products. Many furnished business firms with a list of low-priced items suitable for use as gifts. After World War I the number of discount houses increased slightly. The depression of the 1930s gave them a sharp stimulus because so many manufacturers and wholesale middlemen had to liquidate their inventories under the pressure of declining sales.

The post-World War II market furnished the real growth for discount houses. Many reasons can be given for this development: (1) the large pent-up demand for many durable goods that had not been available during the war; (2) increased consumers' incomes; (3) rising luxury and leisure standards; (4) increased emphasis by manufacturers of resale price maintenance (*q.v.*). Successful ventures of book clubs and mail-order record firms spread quickly to other products. The somewhat apathetic views of existing retailers toward discount retailing strengthened the position of discount houses. Finally, the growth of discount houses was stimulated by the abandonment of resale price maintenance by many of its supporters. This led to an increased use of discount selling in competing establishments. By the early 1960s discount houses had become an established part of the retail structure. Depending on what types of goods were included, they accounted for 2% to 5% of the total volume of retail sales. The practice of selling at reduced prices in special shops also grew in Great Britain, particularly after enactment of the Restrictive Trade Practices act of 1956. The word "discount" slowly came into use to describe cut-price trading but it was not so common as in the U.S. (D. A. R.)

DISCOVERIES AND INVENTIONS: *see* INVENTIONS AND DISCOVERIES.

DISCUS THROWING, the art of throwing an implement known as a discus (weighing 4 lb. 6.4 oz.) from a circle 8 ft. 2½ in. in diameter to the greatest distance, so that it falls within a 90° sector marked on the ground. The sport was common in the days of Homer, who mentions it repeatedly. It formed part of the pentathlon, or quintuple games, in the ancient Olympic games and is fully described by Statius. Judging by specimens found by excavators, the ancient discus was a circular plate of stone, later of metal, about 8 in. or 9 in. in digmeter, and weighed from 4 lb. to 5 lb.. although one of bronze, probably a trophy, preserved in the British museum weighs more than *8* lb.

Throning the discus was introduced as an event in modern athletics at the revived Olympic games first held at Athens in 1896,

and in the same year was instituted as a Swedish championship. The first Swedish champion was Helgesson, 97 ft. 53 in. Thereafter throwing the discus became a recognized event in the athletic championship meetings of all nations. The United States adopted the event in 1897, champion C. H. Henneman, 118 ft. 9 in.. and England in 1911, champion W. E. B. Henderson, 106 ft. 11 in. In this era the discus was thrown from a circle 7 ft. in diameter. Martin Sheridan. U.S., improved upon Henneman's record seven times, establishing a mark of 141 ft. $4\frac{3}{8}$ in. in 1911. Thereafter the circle was increased to 8 ft. $2\frac{1}{2}$ in. and James Duncan. U.S., in 1912 threw 136 ft. $1\frac{3}{8}$ in. Less than 20 ft. was added to Duncan's effort in 36 years. After World War II, however, improved techniques led to new achievements. An Olympic games record was established by Alfred Oerter, U.S., when he triumphed in 1960; his mark was 59.18 m. (194 ft. $1\frac{7}{8}$ in.). Oerter became the first man to throw more than 200 ft., establishing a world record of 200 ft. $5\frac{1}{2}$ in. at Los Angeles in 1962.

A great deal of discussion has taken place as to the method of throwing the discus employed by the ancient Greeks. Theories have been based upon the description of the sport as given by Statius and upon a reconstruction of Myron's statue of a discus thrower, "Discobolos," which may be seen in the British museum. This statue portrays the thrower in the act of hurling the missile. F. A. M. Webster contends the reconstruction is substantially correct and the discus thrower correctly posed. (F. A. M. Webster, *Athletics of To-Day,* Frederick Warne & Co., Inc.. 1929.) Norman Gardiner, however, holds that a wrong attitude has been adopted by the restorer. R. Tait McKenzie calls the "Greek style," insisted upon at the first modern Olympic games, "absurd and ridiculous," and says it "could never have been in use among the ancient Greeks." (Robert Tait McKenzie, *Exercise in Education and Medicine,* W. B. Saunders Company. 1923.) Dean B. Cromwell claims the event "was never standardized" in ancient days and that the Myron statue "seems to have been responsible more than anything else" for having "misled us on the interest of the ancient Greeks in the event." (Dean B. Cromwell and A. F. Wesson, *Championship Technique in Track and Field,* Olympic Games edition. McGraw-Hill Book Co., Inc., 1949, p. 276.)

The so-called Greek style of discus throwing was included at the Athenian celebration, 1906 (Jaervinen, Fin., 115 ft. 4 in.), and at the London Olympiad, 1908 (Sheridan, U.S., 124 ft. $7\frac{11}{16}$ in.), but without any great success, so that the event mas abandoned. In the Greek style the thrower stands upon an inclined pedestal, stretches the arms above the head with the discus held between the hands. He then turns the trunk to the right, bends the body at the waist, allows the right hand holding the discus to swing up behind and places the left hand on the right knee, as in Myron's "Discobolos." From this position the thrower straightens out his body, hurls the discus forward and leaves the pedestal in the instant of making the throw.

The modern style, which has entirely superseded the Greek style, provides a more graceful and a more natural series of movements. The essence of this style is that the discus must be slung out and not really thrown at all; the athlete's difficulty lies in controlling an implement which can be retained under and against the hand and wrist only by centrifugal force and such slight pressure as the tips of the fingers are able to exert.

The discus, as used in modern competitions, is composed of a smooth metal rim, permanently attached to a wood body, brass plates set flush into the sides of the wood body, and, in the exact centre of the discus, a means for securing the correct weight, which must be not less than 4 lb. 6.4 oz. The brass plates. circular in form, may not be less than 2 in. nor more than $2\frac{1}{4}$ in. in diameter. The sides taper in a straight line from the beginning of the curve of the rim to a line at a distance of 1 in. from the centre of the discus. The largest dimension comprises a circle not less than $8\frac{5}{8}$ in., the thickness through the centre is not less than $1\frac{3}{4}$ in., and $\frac{1}{4}$ in. from the edge, not less than $\frac{1}{2}$ in.

The discus throw was included when women's track and field was added to the Olympic program in 1928. A slightly smaller although substantially lighter (2 lb. $3\frac{1}{4}$ oz.) implement is thrown. In 1961 at London, Tamara Press, U.S.S.R., created a world record of 55.98 m. (193 ft. 6 in.). *See* OLYMPIC GAMES.

DISMAL SWAMP, sometimes called Great Dismal swamp, is a marshy region located on the Coastal plain of southeast Virginia and northeast North Carolina between Norfolk, Va.. and Elizabeth City, N.C. It covers parts of Norfolk and Nansemond counties in Virginia, and parts of Currituck, Camden, Pasquotank and Gates counties in North Carolina. The swamp is densely forested and contains scattered natural clearings with elevations of 10 to 20 ft above sea level. Along the western margin the Pamlico formation, sometimes knonn locally as the Dismal swamp terrace, rises to 25 ft. and more, forming a natural boundary. In 1763 George Washington, as a member of a surveying and engineering company. surveyed the area with a view to draining and reclaiming the snamp. At that time the swamp was about 40 mi. long and covered about 2.000 sq.mi. In the late 18th century 40.000 ac. were drained. The swamp is now about 37 mi. long north to south, and covers an area of approximately 750 sq mi. The swamp has been lumbered over and much timber has been destroyed by fires set to peat bogs in it. Despite this, the area is still heavily wooded with cypress, black gum, juniper and water ash. and a tangle of honeysuckle and woodbine The swamp is populated with many rare birds, including the ivory-billed woodpecker Water moccasins and other poisonous snakes are numerous. It is noted for fishing and hunting; deer. bear, raccoons and opossum are plentiful, especially in the nearly inaccessible Coldnater ditch area. From 1790 to 1828 the Dismal Swamp canal, sometimes called the Lake Drummond canal, was built. It is a 22 mi.-long north-south intracoastal waterway connecting Chesapeake bay, by way of Deep creek and the southern branch of the Elizabeth river. with Albermarle sound in North Carolina through the Pasquotank river. The canal, which has aided in lumbering and in some clearing for truck farming. forms a link in the 1,700 mi Atlantic Intracoastal waterway (*q* v.). In the midst of the swamp is Lake Drummond, a fresh-water lake connected with the canal by the 3-mi.-long Feeder ditch, and is about 3 mi. in diameter. This lake is the basis of the poem "The Lake of the Dismal Swamp," by the Irish poet Thomas Moore.

(M. C. P.)

DISNEY, WALT (WALTER ELIAS DISNEY) (1901–), U.S. motion-picture and television producer of animated cartoons and other features, the creator of Mickey Mouse and Donald Duck, was born on Dec. 5, 1901, in Chicago, Ill. After driving an ambulance for the Red Cross in France during World War I, he worked as a commercial artist (1919–20) and then as a cartoonist for the Kansas City *Film Advertising* (1920–22). Experimenting with animated cartoons in Hollywood, Calif., he produced the *Alice* comedies with live and animated characters (1923–26) and also created and produced the *Oswald the Rabbit* cartoons (1926–28). Disney produced his first successful sound picture, *Steamboat Willie,* in 1928. His animated cartoon characters, notably Mickey Mouse and Donald Duck, soon became popular throughout the world, and his short *Silly Symphony* cartoons, in colour, also became one of the most popular screen series. *Snow White*

and the Seven Dwarfs (1938), the first full-length animated cartoon feature, was followed by other children's classics such as *Pinocchio, Bambi* and *Dumbo*.

During World War II Disney produced *Victory Through Air Power* (1943), based on the book by Alexander de Seversky, to illustrate the significance of the airplane in modern warfare. He also produced a series of U.S. government films used for training men in the armed forces and in defense plants.

Disney's productions after World War II included *Cinderella* (1950), *Alice in Wonderland* (1951) and *Sleeping Beauty* (1959). Frequently he combined cartoons and live action. He also produced True Adventure Nature films and the live features *20,000 Leagues Under the Sea* (1954), *Davy Crockett* (1955) and *The Littlest Outlaw* (1956). He won many awards. In 1955 he opened Disneyland, a large amusement park at Anaheim, Calif *See* also MOTION PICTURES: *Animated Cartoons.* (M. S. BY.)

DIS PATER, Roman god of the infernal regions, the precise equivalent of the Greek Pluto (q *v.*). Dis ("rich") is a Latin translation of Pluto; Pater is usually added to designate his position as sovereign of the lower world, a rich kingdom in that it is ever increasing and never diminishing. Like Pluto he was never very popular and there is little mythology about him. Proserpina (a Roman corruption of Persephone; q v.) is his wife, although in the late empire she is at times replaced by Aera Cura, of whom little but the name is known. There was an altar of Dis and Proserpina in Rome.

See G. Wissowa, ***Religion und Kultus der Rnmer*** **pp.** 309 ff. (1912).

(R. B. LD.)

DISPENSATION is the term applied to the action of a competent authority in granting relief from the strict application of a law. It may be anticipatory or retrospective. In Greek *ozconomia* means the management of a household or family, and in Latin *dicpensatio* ("stewardship") meant much the same. When, therefore, in Greek, *oiconomia* was used with reference to the management of the household or family of the church, it was naturally translated into Latin by *dispensatio.* The special use of *oiconomia* as a suspension of the strict canon law in cases of urgency in accordance with the dictates of wise stewardship was equally naturally translated into Latin by *dispensatio.* Hence in English the words economy and dispensation are, in this special use. interchangeable.

In Ecclesiastical Law.—Economy is the term normally used in the Eastern Church. The supreme example of economy in its wider sense is the divine economy exhibited in the incarnation whereby in his aisdom God made possible man's salvation. In continuation of the Saviour's work the church strives for the salvation of souls and, when this is more likely to be achieved by a relaxation of a rule rather than by a strict adherence to it. economy permits the relaxation. With typical Orthodox elasticity no canon defines the limits or use of economy, though certain broad principles are discernible. Thus, to run counter to fundamental dogma is an abuse of economy. But the waiving of subsidiary regulations is permissible where this is conducive to the greater good of the church and the salvation of souls. On this principle baptisms and ordinations by heretics may be recognized, and unfermented grape juice may be used in the Eucharist when wine cannot be had.

Lack of precision is also found nith regard to the persons who may exercise economy The most obvious person is the bishop, and all bishops exercise it in their own right and not by delegation; but they should have regard to the views of episcopal synods, which themselves exercise economy, though only after consultation with the bishop of the district within which it is to be exercised. Above both the bishop and the synod is the general council, which can exercise economy of its own mere motion and can reverse the decisions of synods and bishops and is, in fact, supreme. Below the bishop is the priest nho exercises economy in day-to-day matters. such as the relaxation of the rules of fasting and the celebration of the Eucharist in cases of necessity in uncanonical places and at uncanonical times; but, in so acting, the priest is exercising an authority expressly or by implication delegated to him by the bishop.

The Western Church has evolved rules with regard to dispensation with far greater precision and, in the Roman Catholic Church, in some detail. At first it was held that only the common good of the church as a whole justified the granting of a dispensation. It was also generally held that the power to dispense was an adjunct of legislative authority, and that only the person or body which made the laws. whether pope, synod or bishop, could dispense from them. With the development of canon law and the growth of the pouer of the papacy. however, it came to be accepted, at any rate in practice, that the ultimate dispensing power resided in the pope, though it could be delegated by him to subordinate persons and bodies. The field over which dispensation could operate was significantly widened, for, whereas formerly the divine law and the natural law were outside the scope of the dispensing poner. the view was gradually reached that the apostolic jurisdiction of the pope, while unable to abrogate the divine or the natural law, could nevertheless dispense from the obligations imposed by them and from their effects in particular cases, though only where the remote and ultimate object of such laws was not thereby thwarted.

Gradually, moveover, but with increasing frequency. dispensations were granted solely for the benefit of individuals regardless of whether-or not the whole church could be said to-benefit thereby, and the belief that such dispensations were granted too frequently and for financial gain was a factor contributing to the movement which led to the Reformation. Indeed, the Council of Trent (1545–63) was clearly uneasy about what had been happening and tried to guard against abuses. But it left intact the papal authority, and the Roman Catholic system today is essentially the same as that which had developed by the end of the middle ages. While the authority which has the power to legislate in any case may dispense from its own legislation, so also may its superior; and the subordinate authority's power may be limited by superior authority. The ultimate authority resides in the pope which extends over even the divine and the natural law, though. as has been stated. it is conceded that in such extreme "cases the dispensation must not be such as to thwart the ultimate divine intention.

In England the Reformation, inspired at least in part by the pope's refusal to grant Henry VIII a dispensation from his marriage to Catherine of Aragon, put an end to the papal authority in this and all other spheres of its previous jurisdiction. The need for a dispensing authority nas, however, recognized, and the statute (1534) 25 Hen. 8 c. 21, while saving to the archbishop of York and the other bishops the power to dispense "in all cases in which they were wont to dispense by the common law or custom of this realm before the making of this Act," conferred upon the archbishop of Canterbury the power of dispensing formerly exercised by the pope, subject in the more important cases to royal confirmation and "for causes not being contrary or repugnant to the Holy Scriptures and laws of God." These provisions, however, have remained largely a dead letter save for the grant by the archbishop of Canterbury of licences to hold benefices in plurality and in the case of marriages for the grant of special licences by the archbishop of Canterbury, or of common licences by the bishop (both in practice granted under the authority of their respective ecclesiastical judges). The lack of any ordered, practical system of dispensation in the Church of England led to the appointment in 1935 by the archbishop of Canterbury, Cosmo Lang, of a commission which in 1944 produced a report entitled *Dispensation in Practice and Theory,* containing a valuable review of the whole subject.

In English Constitutional Law.—In the realm of constitutional law the problem of dispensation has been important and in England the attempts of James II to dispense with laws contributed largely to his downfall. Though the Bill of Rights (1688 old style; new style. 1689) declared his "pretended power" to be illegal. it is by no means certain that this is a true statement of the law before that date The 17th century was a period when much of English constitutional law took shape; but its form was hammered out in battle. and though the side which ultimately won set the pattern for the future, it does not follow that in points of controversy the losers were always wrong with regard to what the

law then was. The courts had had great difficulty in deciding the limits of the royal power to dispense; but that they had not doubted that in some form it existed is clear from the judgments in *Thomas* v. *Sorrell* (1674) and *Godden* v. *Hales* (1686). Indeed, no one doubts the power of the supreme legislative authority to dispense from its own laws. The struggles of the 17th century have shown that, since then, the crown in parliament is the supreme legislative authority and not the crown alone, and its dispensing powers are exercised, like all its other powers, by acts of parliament. Even so, the crown still possesses powers which, if not strictly powers of dispensation, are very closely allied thereto. The crown, through the attorney general, can enter a *nolle prosequi* in any proceedings on indictment after the indictment has been signed, and this has the effect of staying the proceedings *sine die*. The crown also possesses the prerogative of mercy by which it may modify the sentence of a court and, as part of the prerogative, it may grant a free pardon under the great seal, entirely exonerating an accused person, either before or after conviction. It is possible to distinguish the power of dispensation both from the entering of a *nolle prosequi* and from the exercise of the prerogative of mercy. Dispensation makes lawful that which mould otherwise be unlawful. The *nolle prosequi* and the free pardon relieve from the consequences of an illegality, though, in the case of the free pardon, the circumstances in which it is employed are usually those where subsequently a conviction is shown to have been mistaken and it is thus granted for the very purpose of giving relief from the consequences and (because its purpose is well understood) of clearing the name of the convicted person. But, for practical purposes, the *nolle prosequi* and the prerogative of mercy in fact in large measure preserve the objects of dispensation. The substantial effect of the constitutional struggles of the 17th century has been to transfer power from the crown alone to the crown in parliament. *See* also PARDON.

DISPLACED PERSONS: *see* REFUGEES.

DISPLACEMENT TONNAGE. In shipping, a term used to describe the actual weight of the water displaced by a ship. It is measured by ascertaining the cubic space occupied by that part of the ship which is immersed and dividing this by 35, a ton of sea water measuring 35 cu.ft. The term is used to describe the tonnage of warships. *See* SHIPPING INDUSTRY: *Classification and Tonnage Measurement.*

DISPLAY DESIGN. Display is the art of presenting merchandise attractively for sale.

History.—As regular market gatherings became established in the middle ages, a need was felt for shops (rather than mere spaces or stands) that provided for storage and protection of merchandise when the market was not active. Such shops required display. Their fronts were more or less open to reveal stock inside; counters and tables often were placed at or before the shop front, or were built into it, and these became natural locations for attractive displays. Entire shop fronts sometimes were garlanded or otherwise decked with samples of wares for sale. Under roof. as in bazaars, the tendency was to duplicate the less formal displays of the open market place; sometimes they were no more than an attractive ordering and contrasting of the merchandise at hand, without fixtures, lighting or signs of any kind. In later times galleries, glass-roofed shopping areas similar to the ancient bazaars, became known; in these the tendency was to imitate a shopping street rather than a transient market. The arcaded street, with covered walks on one or both sides, represents a transition between street and gallery.

When glass became available in the later middle ages. shop-front display entered a new phase. The small pieces of glass then in use were assembled into display windows, and wares seen through the mullions acquired new attraction. As technological developments made possible the production of larger sheets of glass: the structural framing was reduced in size, and shop windows more and more became transparent treasure chests, tempting the passer-by to stop, look and investigate.

Comparable changes inside the shop had to await the growth of trade, wealth and population. Until comparatively modern times, most shops were small and had to store a considerable stock; display of stock inside the shop generally was handled as a special ei-ent for an important client and commonly was arranged in a back or upstairs room. Such special display had been arranged since time immemorial in the homes of the wealthy by itinerant hucksters. The idea that important customers might visit a shop was a late development, unusual until the 18th century, the period during which shops began to grow in size and complexity. On large premises, merchandise could be attractively grouped rather than merely shelved; thus interior displays, so important to modern trade, developed.

Display—whether temporary, as at a market stall, or semipermanent. as in a shop. whether in a window or inside the shop on a display stand—is of two main types: (1) assortment display, which shows the quantity and variety of wares for sale, a visual inventory of the stock; and (2) token display, which dramatizes a few selected articles as representative of a larger choice actually available. Generally. assortment displays are associated with inexpensive and nonfragile merchandise, token displays with goods intended for a sophisticated public that is not interested in bargains.

As shops became big stores in the mid-19th century, and as the western standard of living improved, display began to be a recognized asset to trade and a specialty for which training was required. The great mercantile cities of Europe and America exhibited window and interior displays that, toward the turn of the century. under the influence of repeated international world's fairs became more and more elaborate, some of them, indeed. such self-conscious constructions that they made the public more aware of the display designer's art than of the goods exhibited.

After World War I a new style of display was developed that avoided such excesses and that reflected the *avant-garde* fine arts of the time, particularly Cubism. Cubistic display fixtures and even Cubistic arrangements of goods became common. Feature displays for holidays or other special events also became particularly elaborate. At Christmas time, for instance, mechanized troupes of puppets would be set up in show windows portraying fairy tales in motion. The show window as a substitute for popular entertainment was destroyed by the motion picture, by urban traffic and by a competitive commercial system that could not long afford such expensive (in comparison with the return) display. The other aspect of display in the 1920s and '30s (its sense of artistry and its emphasis on up-to-date fixtures and on dummy figures for clothes) has become part of the standard apparatus of modern merchandizing.

Display staffs of large stores came to be organized into departments, with a chief of display in charge, responsible for as many as 80 frequently changed show windows. The increasing importance of lighting as a factor emphasized the resemblance between display design and stage design (*see* STAGE DESIGN). In important shops window display developed into such expert productions that audiences gathered to see the new effects when a bank of windows was changed, as at a first night at the theatre. This flourishing state of display appeared first in Germany, Switzerland and France! but it soon spread to all major cities of Europe and America.

While this growth of dramatic effectiveness was taking place, the cost of display was rising sharply, and commercial managements began to analyze display in a variety of ways. By investigating the behaviour of the purchasing public it was learned that, on the average, people pass a show window in eight seconds; hence it became important to spread display through windows in series. The importance of impulse buying and its correlation with interior displays was demonstrated. Such analyses tended to counterbalance the urge for novelty and for prestige-creating effects, and thus display was turned into something of a science as well as an art.

Contemporary State.—Display is a profession whose efficiently trained members work in every sizable community. Training in art is basic and experience in merchandising and styling indispensable to the display designer. The idea or theme around which a display is developed springs from the merchandise itself—

its use, colour, construction or news value. Pfoperties and background are used to develop the theme, but these, though they may be unusual or striking, rarely are more conspicuous than the merchandise itself. Several types of displays have evolved according to the peculiarities of the goods to be shown; each has its technical problems of support, lighting and presentation. A whole field of related industries has sprung up, supplying mannequins. properties, materials and lighting devices. These display materials are shown at gatherings of designers and manufacturers. which serve as centres for new ideas as well as for nen fixtures; salesmen from display supply houses also travel with samples of their wares. There are, in addition, periodicals devoted to the needs of the display world. (T. B. L.)

DISRAELI, BENJAMIN: *see* BEACONSFIELD, BENJAMIN DISRAELI. EARL OF

D'ISRAELI, ISAAC (1766–1848), English man of letters and literary critic, pioneer of literary research, and also the father of Benjamin Disraeli, 1st earl of Beaconsfield, was born at Enfield, Middlesex, in May 1766. His father, Benjamin D'Israeli. a scion of a Jewish family expelled from Spain by the Inquisition. had migrated to England from Venice in 1748 and made a fortune in commerce. Hopes that his only son would succeed him in his affairs were shattered when, at the age of 14, the boy produced a poem. Sent to Amsterdam to study, Isaac returned four years later a disciple of Rousseau. He then spent a further period in Paris where he moved in literary circles, and on his return he published, in 1789, a poem addressed to Thomas Warton, called "On the Abuse of Satire," attacking the satirist John Wolcot, whose pseudonym nas "Peter Pindar." This poem gained him the friendship of the poet H. J. Pye, and in 1790 he dedicated his verse *Defence of Poetry* to Pye, then poet laureate. The following year D'Israeli published anonymously a collection of *Anecdotes, Clzaracters, Sketches, and Observations, Literary, Critical and Historical,* which became the first volume of *Curiosities of Literature.* A second volume appeared in 1793, and with some reluctance he abandoned his ambition to be a poet and occupied himself aith scholarship. Further volumes of *Curiosities* appeared in 1817, 1823 and 1834, and similar works were *Miscellanies* (1796), *Calantities of Authors* (1812) and *Qzaarrels of Authors* (1814). His *Essay on the Manners and Genius of the Literary Character* (1795) was named by his son "the most perfect of his compositions." These were all intended as chapters of a connected history of English literature; but although in 1841 he published three volumes called *The Amenities of Literature,* he was never able to complete the project. This failure was partly because of the continued success of *Curiosities of Literature,* which was originally a tentative effort "to discover whether a taste for literature could be infused into the multitude." Continued demand suggested a positive ansner, and D'Israeli felt obliged to meet it conscientiously with further volumes. At first the aork was intended only as a collection of excursions into the byways of literature and history, but later volumes contained more criticism, some of which, particularly that concerned with recent writers such as Thomas Gray, showed considerable acumen. However, D'Israeli was accused of exaggerating the importance of the "secret histories," as he called the fruits of his research.

D'Israeli also published some short novels or romances, *Vaurien* (1797), *Mejnoun and Leila,* an oriental tale (1797), *Flim Flams* (1805) and *Despotism, or the Fall of the Jesuits* (1814), but these were not very successful. Purely historical works were *Inquiry Into the Literary and Political Character of James I* (1816), *The Life and Reign of Charles I* (1828–31) and *The Genius of Judaism* (1833).

He married in 1802, and Benjamin Disraeli, later earl of Beaconsfield. was the second of five children. Isaac D'Israeli died at Bradenham. Buckinghamshire, on Jan. 19, 1848.

A memoir by his son was prefaced to the 1849 edition of *Curiosities of Literature. See* also W. F Moneypenny and G. E. Buckle, *The Life* of *Benjamin Disraeli,* vol. i, rev ed. (1929). (P. M. Y.)

DISSOCIATION, a separation or dispersal, the opposite of association but of wider application *(see* ASSOCIATION, CHEMICAL). In chemistry the term is given to chemical reactions in which a substance decomposes reversibly in such a way that, from a single molecule of the original substance, two or more smaller molecules are formed. Often these smaller molecules are of different kinds but sometimes they are of the same kind. Thus the reactions $NH_4Cl \rightleftarrows NH_3 + HCl$ and $PCl_5 \rightleftarrows PCl_3 + Cl_2$ are instances of the first type; $N_2O_4 + 2NO_2$ of the second. When this breakdonn is effected by heating, the process is termed thermal dissociation. Electrolytic or, as it is termed. ionic dissociation is the separation of a substance in solution into ions. *(See* ACIDS AND BASES: *The "Hydrogen-Ion" Theory of Acids;* SOLUTIONS: *Solutions of Nonelectrolytes and Electrolytes: Electrolytic Dissociation and Ionic Association.)*

In psychology dissociation is an abnormal condition of the mind wherein the usual connection between various mental elements is lost. Ordinary lapses of memory represent dissociations, in normal minds. betneen the idea or object which cannot be called to mind and the clue or stimulus idea which formerly sufficed to recall the thing desired. Abrupt changes of mood or change of interest from one subject to another in normal people may represent emotional dissociation. When large, combined groups of ideas and emotions (complexes) become dissociated from other similar groups the resulting condition is known as dissociation of personality.

See also references under "Dissociation" in the Index volume.

DISTEMPER, CANINE, is an acute, highly contagious disease of dogs caused by a virus. Wolves, foxes, mink, raccoons and ferrets are also susceptible, but other common laboratory and farm animals cannot be infected, even by inoculation. The disease is world-wide in distribution, occurring wherever dogs exist. In most areas canine distemper is so ubiquitous that dogs older than six months are often presumed to have been exposed to the disease in some degree and to have developed an immunity. This is more true in urban areas than in rural areas. Although a few cases are mild, and recovery is rapid and complete even without medical treatment, by far the greater number are fatal if treatment is delayed or ignored.

The Virus.—The virus of distemper in dogs is known as the virus of Carré or, more properly, the virus of Laidlaw and Dunkin to distinguish it from other disease-producing organisms of dogs that have complicated the understanding of distemper. H. Carré in France, in 1905, first described a virus from sick dogs. Not until the work of P. P. Laidlaw and G. W. Dunkin (under the auspices of the Field Distemper Research committee in England), uho published their first paper on the disease in 1926, did the true picture of distemper uncomplicated by other conditions become known. Important contributions to knowledge of the diseases associated with distemper were added by R. G. Green and his coworkers at the University of Wisconsin, Madison, and by S. Rubarth in Sneden during the second quarter of the 20th century. J. A. Baker and his co-workers at the Cornell Research Laboratory for Diseases of Dogs, who started their work midway in the 20th century, also contributed greatly to understanding of the disease.

The virus that causes distemper in dogs is ultramicroscopic. It is destroyed in a few minutes by heating to 56° C., but may remain infective under ordinary temperatures for days. If dried in a frozen state it may remain viable for years. Excreta from affected animals, especially from the nostrils, during the first few days of symptoms, are highly infective The organism is spread by feeding and drinking utensils, cleaning brushes, and by contact with contaminated clothing and boots from animal attendants. Also, droplets containing the virus may be distributed through the air on particulate matter and still be infective.

Symptoms and Course of the Disease.—The course of the uncomplicated disease was first described by Laidlaw and Dunkin. After an incubation period of three to five days there is an acute fever (105° to 106° F.) for a few days. After an interval another febrile attack of a few days often takes place. The dog becomes dull and apathetic and refuses food and water, with attendant loss of weight and dehydration. In unusually mild cases the appetite may return after the fever subsides. The uncomplicated disease usually lasts four to eight weeks. For 10 to 15 days after inoculation there is an acute catarrh. The sclera and conjunctiva of the eyes become infected. The entire respiratory tract may be-

come involved in varying degree from simple cough to severe difficulty in breathing (dyspnea), with excessive watery discharge from the nostrils and the eyes. The entire gastrointestinal tract may become involved, with varying degrees of nausea and diarrhea The slimy diarrhea that usually is a concomitant of distemper has a characteristic disagreeable odour A thickening of the pads of the feet is common. (The concept of a separate disease entity, "hard pad disease," that prevailed for a few years after 1945 was shown to be untenable.)

Symptoms involving the nervous system occur in about one-fourth of the cases. These may range from mild involuntary twitchings of a group of muscles (chorea) to posterior paralysis or convulsive seizures.

Clinical cases ,may often be complicated by the existence of concomitant and superimposed infections such as canine viral hepatitis and toxoplasmosis Too, bacteria that are usually present in healthy animals, such as *Bordetella bronchiseptica*, have been incriminated as pathogens in the distemper-weakened dogs, as are organisms of the pleuropneumonia (PPLO) group.

The virus of Laidlaw and Dunkin has a predilection for epithelial cells, those cells that act as the covering or lining of the body, such as the skin, the mucous lining of the mouth, gullet, stomach and intestines. the lining of the ducts of the liver and other glands, the glandular cells themselves, the lining of the genital and urinary tracts and the lining of the entire respiratory tract.

The disease process (pathogenesis) depends upon which of the epithelial cells are attacked most markedly. Congestion and edema of the lungs is present in almost every case that is examined after death inecropsy). Any part of the gastrointestinal tract, including the bile ducts, may show a varying degree of damage (pathological change). The same can be said of the urinary tract. The skin may be involved, especially on the underside of the body.

In the early stages of the disease there is a remarkable depletion of lymphocytes, one of the white cells of the blood. However, at about the fifth week the lymphocyte-forming tissue begins to regenerate cells. The nervous system. too, is affected. Almost all natural cases at necropsy show some inflammation of the brain.

Intracellular particles called inclusion bodies are found in the affected epithelial cells, although they may be difficult to find in the earlier stages of the disease. They are found in that portion of the cell termed the cytoplasm. When found in the epithelial cells of the urinary bladder they are considered to be pathognomonic (diagnostic) of distemper.

Treatment. — Treatment of distemper is a time-consuming procedure requiring patience and sympathy. Free use of serum or the globulin fraction of the serum, if given early enough, is effective. The use of antibiotics to ward off secondary invaders is good therapeutic practice. Nursing should be aimed at restoring appetite. Keeping the nostrils clear is fundamental so that the dog may smell his food and be encouraged to eat. It may be necessary to replenish lost body water and salts with parenteral solutions.

Control. — Laidlaw and Dunkin first formulated a method whereby dogs could be immunized against distemper. They obtained tissues from infected animals, treated the tissue with formalin and gave repeated injections of the treated tissue to young healthy pups to confer an immunity on those pups. The result was a more lasting immunity.

Green. by repeated passage of the Laidlaw-Dunkin virus through ferrets, developed a modified live virus that produced an active immunity in dogs. The dogs had to be healthy. however. If they had worms, or were otherwise debilitated, serious reactions took place. Mid-point in the 20th century an egg-propagated vaccine was developed.

Passive immunity can be conferred by inoculating dogs with serum from other dogs in which an immunity has been developed. Such immunity is effective for about 10 days. Passive immunity can also be transferred from the mother to her pups through the early milk (colostrum), if the mother is immune; this immunity may vary in duration from a few days to a few months.

Active immunity will take place if the dog has recovered from the disease, or if live attenuated virus (vaccine) is inoculated. The effectivenessof the vaccine (duration of protection) is diminished by the presence of immune bodies in the dog. J. A. Baker and his co-workers have shown that the amount of passive immunity transferred by a mother to her pups may be measured. and that the date the vaccine can be given with the assurance that it will become lasting can be calculated.

Active immunity, although more lasting, is variable. It may last eight months or it may last several years. To insure a continuous state of immunity a dog should (1) have its serum tested for immunity each year, and, if the serum is low in immune response be vaccinated again, or (2) be vaccinated each year without testing.

(NA. BR.)

DISTEMPER, WHITEWASH AND CALCIMINE are inexpensive water paints that provide little protection and are used mainly for decorative purposes. All three are composed basically of whiting (calcium carbonate), glue (size) and water. In thick paste or jelly form the paint may be called distemper or whitewash; in dry form it may be called calcimine. The glue acts as a vehicle for suspending the pigment during application and also bonds the pigment to the painted surface. Usually a distemper type of paint contains just enough binder to prevent it from rubbing off a surface, but not enough to make it washable. Consequently, if a coating is to remain durable it must be kept dry. Distemper paints may be improved by adding a little oil or varnish to provide additional bonding, add limited waterproofing and enhance durability. Distemper and similar types of paint cover well and can be applied quickly and easily with large brushes. They are used mainly on ceilings and other interior surfaces when economy is important and washability is not.

Paints made with naturally occurring glues such as water-soluble gums have been known throughout recorded history. Early precursors provided the media for the mud daubings of the cavemen, the distemper wall paintings of the Egyptians, the frescoes of the ancient Romans and medieval Italians, the milk and curd paints of the Hebrews and the whitewash of colonial United States.

A simple distemper can be made as follows: Let 14 lb. of whiting stand overnight in water. Pour off the excess water and thoroughly knead the residue. Disperse 5 Ib. of hot jelly size into the slurry of whiting. Strain and use. The jelly size is made by dissolving 1 lb. of animal glue into 1 gal. of hot water. To improve the whiteness, add a small amount of ultramarine blue to the whiting. Because size is likely to decompose on standing, with consequent loss of binding power, a small amount of preservative is required. In the above example, about 1 oz. of alum, borax, phenol, salicylic acid or other preservative should' suffice. Other proteins (such as gelatin, albumin or casein) or carbohydrates (such as starch, dextrin or vegetable glue) may be used instead of or in conjunction with the conventional animal glue. In recent years water-soluble synthetics such as methyl cellulose, sodium carboxymethylcellulose. polyvinyl alcohol and polyvinyl acetate latices have found favour because they resist mildew and bacterial attack.

Casein distempers, instead of being made with glue, are made with a binder of casein, the insoluble white protein derived from skim milk. Casein must be treated with an alkali such as ammonia, sodium carbonate or borax to make it water soluble. Because casein forms insoluble salts with calcium, casein-based distempers are preferred where limited washability and weather resistance are desired. Immediately after it is applied, a casein distemper film is as sensitive to water as conventional distemper but it hardens with age and develops better water resistance; it

never approaches, however, the durability of oil paints.

A large variety of shades may be obtained by adding coloured pigments to white distemper. Since distemper is usually used on cement and plaster walls that contain free lime and alkali, the tinting pigments must be fast to light and must resist lime and alkali. Ultramarine blue, the various iron oxides, Hansa yellow, carbon black and titanium dioxide are a few of the many pigments that can be used to colour distemper.

Calcimine, or dry distemper, is usually a mixture of whiting with dry slaked lime and finely powdered glue or casein binder. It is manufactured by intimately blending the ingredients in special grinding and sifting machinery. Care must be taken to keep the powders dry at every stage for even a small amount of water could cause the calcimine to cake and become insoluble. Preservatives are also needed. Two formulas for calcimine are as follows: (1) whiting 100 lb., fine-powdered size 8 lb., powdered alum 2 oz.; (2) whiting 100 lb., dry slaked lime 5 lb., sodium carbonate 2 lb., casein 5 lb. Calcimine also may be tinted to any desired shade by using alkali-fast colours.

For many years the term "water paint" referred to the better type of distemper, which, in addition to the usual ingredients, contained a little oil or varnish as well as opaque white pigments such as titanium dioxide, lithopone and zinc oxide. But with the advent of synthetic rubber technology and subsequent development of latex-based water paints, distemper fell into disfavour and the term "water paint" came to be used in reference to latex paints.

(P. HE.)

DISTILLATION, an operation involving the conversion of a substance into vapour which is subsequently condensed to the liquid form. It may also be thought of as a process for separating liquid mixtures which depends on the difference in composition between a liquid and its vapour. The process is exemplified at its simplest when steam from a kettle plays upon a cold surface, producing drops of distilled water. The natural cycle by which the water of the oceans passes into the air and later condenses and falls as rain is an example of distillation. The term, which was originally applied to the separation of alcoholic liquors from fermented materials. now has a far wider application. and distillation is an integral part of many chemical manufacturing processes. It has for its object the separation of liquids from nonvolatile solids, as pure water from the salt in sea water, or the separation of two or more liquids. as gasoline. fuel oil and lubricating oil from crude petroleum.

Simple Distillation. — This term is used to distinguish the simplest distillation operations, as illustrated in fig. 1, from the many possible modifications and elaborations. The basic apparatus consists of three parts: the still or retort in which the liquid is heated; the condenser, to cool the vapours; and the receiver to collect the distillate. On distilling a mixture of substances, the most volatile or lowest boiling distills over first, and the others subsequently or not at all. The simple apparatus described is entirely satisfactory for the purification of a liquid containing nonvolatile material, and reasonably satisfactory for separating liquids of widely divergent boiling points. For laboratory use, the apparatus is commonly made of glass and connected with corks or rubber bungs or ground-glass joints. Simple distillation is also used frequently in technology, and for such purposes larger equipment of metal or ceramic ware is used. (See *Distillation in Industry*, below.)

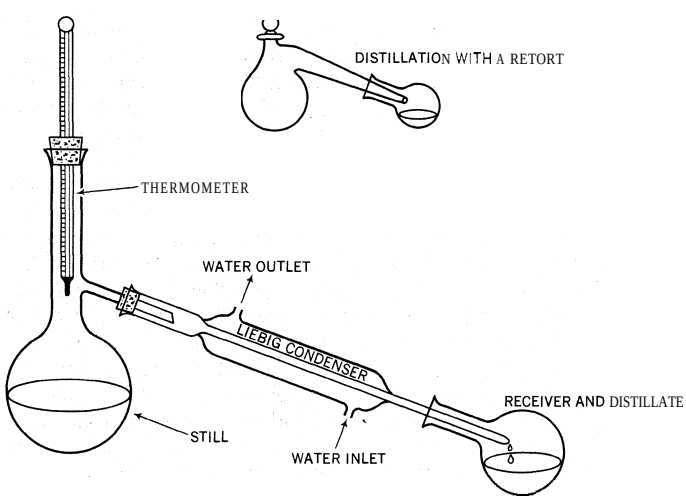

FIG. 1.—TYPICAL LABORATORY DISTILLATION APPARATUS OF SIMPLEST TYPE. THE VAPOUR PASSES FROM THE STILL TO THE LIEBIG CONDENSER. WHERE IT IS CONDENSED BY COLD-WATER CIRCULATION IN THE WATER JACKET. THE DISTILLATE IS COLLECTED IN THE RECEIVER. RETORTS ARE NOW SELDOM USED

A laboratory distilling flask may be heated by direct gas flame or indirectly through a sand tray or wire gauze, or by electrical means. A thermometer is often used to indicate the progress of a distillation. Its bulb is placed just below the side arm where the vapour leaves the still, so that the thermometer reading approximates the temperature of the vapour. Exact boiling points are best determined in a special apparatus.

An air-cooled elongated side tube is adequate as a condenser with substances boiling above 170° C. For lower-boiling substances a Liebig single-surface condenser (fig. 1) is used. Many varieties of glass condensers are available, but the chief differences betneen them are in the ingenuity with which the internal members are designed to give maximum cooling effect.

Historical Note. — Distillation appears to have been used by the earliest experimentalists. Aristotle (384–322 B.C.) mentioned that pure water is made by the evaporation of sea water. Pliny the Elder (A.D. 23–79) described a primitive method of condensation in which the oil obtained by heating rosin is collected on wool placed in the upper part of the still. The Alexandrians added a head or cover to the still and prepared oil of turpentine by distilling pine resin.

The Arabians improved the apparatus by cooling the tube leading from the head, or alembic. with water. They discovered a number of essential oils by distilling plants and plant juices.

The alchemists used such apparatus to prepare hydrochloric, nitric and sulfuric acids in a relatively pure state.

Early in the 1800s, large-scale continuous stills for the recovery of alcoholic liquors were devised by J. B. Cellier-Blumenthal and Louis Charles Derosne in France, and by Aeneas Coffey in Great Britain. Their bubble plate toners are basically identical with many modern industrial stills. Laboratory practice owed much to the introduction, about 1850, of the condenser named (incorrectly) after Justus von Liebig (fig. 1).

In the early 1920s the theory of distillation developed earlier by Ernst Sorel was reduced to engineering terms. This stimulated a series of theoretical and practical investigations resulting in such improvement in the efficiency of both industrial and laboratory distillation that separations formerly considered impractical became commonplace. This made distillation one of the most widely used operations in laboratory research. analysis and chemical engineering.

Fractional Distillation and Rectification. — Fractional distillation was developed because simple distillation is not efficient in the separation of liquids whose boiling points lie close to one another. Originally the term meant the collection of the distillate in successive fractions or cuts. It was also applied to the systematic recombination and redistillation of such cuts in order to improve separation.

In modern usage, fractional distillation represents the whole of any process or method whereby the fractions from a distillation are made as different in properties as possible. Especially important in this connection are still heads, columns and condensers (fig 2) that permit the return of some of the condensed vapours toward the still. The whole aim is to achieve the closest possible contact between rising vapour and descending liquid, and so to allow only the most volatile vapour to proceed to the receiver while returning the less volatile material as liquid toward the still. The purification of the more volatile component by contact between such countercurrent streams of vapour and liquid is referred to as enrichment or rectification. The descending liquid is known as reflux.

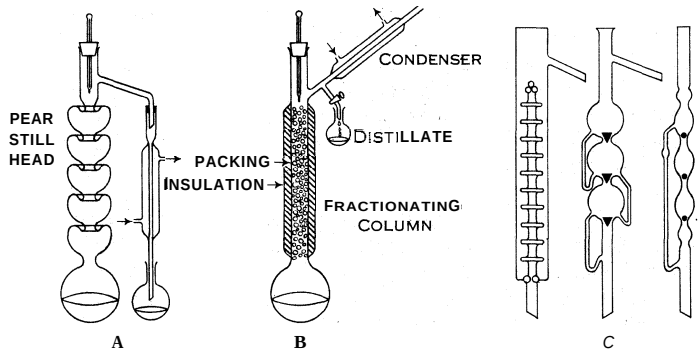

FIG. 2.— FRACTIONAL DISTILLATION. STILL HEADS AND FRACTIONATING COLUMNS. (A) FRACTIONAL DISTILLATION WITH PEAR STILL HEAD; (B) FRACTIONAL DISTILLATION WITH INSULATED COLUMN AND TOTAL CONDENSER; (C) TYPICAL STILL HEADS

In modern apparatus reflux is produced by a condenser at the top of a column (fig. 2) which is preferably insulated or otherwise made nearly adiabatic and filled with packing or plates (fig. 9) or some other device for achieving good contact between vapour and liquid. The most common packings (fig. 3[A] and [B]) are glass beads, metal chain, Lessing and Raschig rings, Berl saddles, Stedman screens and single- and multiple-turn helices of thin wire or glass. A choice among these depends on the diameter of the column and on a balance between cost and efficiency. The Bruun column is an example of a superior laboratory bubble plate column, but this type reached its greatest development in large-scale technological distillation operations. Other devices involve passage of the countercurrent liquid and vapour streams through the narrow annular space between a tube and a rotating cylinder within the tube.

Either partial or total condensers may be used to produce reflux. In the former, which is also called a dephlegmator, the temperature of the condenser is controlled so that only part of the vapour is liquefied and used as reflux, while the remainder passes on to a second condenser and is collected as product. In total condensers, all the vapour is liquefied. Some of the condensate is removed through a side tube just below the condenser (fig. 2) while the remainder supplies reflux. The greater the ratio of reflux liquid to final product (reflux ratio), the better the separation of the various components, but at a corresponding increase in the time and cost of the distillation. Infinite reflux, or total reflux operation. involves no withdrawal of product, and return of all condensate down the column as reflux liquid. Since no distillate is produced, this type of operation is of interest only for testing and for theoretical purposes.

Theory of Distillation.— Every liquid or liquid mixture will evaporate into a closed space until the pressure of the resulting vapour reaches a characteristic or equilibrium value. This vapour pressure is a measure of the volatility of the liquid. It has a fixed value for any one liquid at a particular temperature, but always increases with rising temperature. At any particular pressure, a sample of pure liquid will distill completely at a fixed temperature, but constancy of boiling point does not prove that the material being distilled is a pure substance. Most liquid mixtures distill over a range of temperatures, but certain compositions of particular mixtures (azeotropes) pass over without change in composition or boiling point. These relations are summarized by the boiling-point curves of fig. 4, in which the boiling point of the distillate is plotted against the percentage of the charge that has been distilled. The mixture of liquids with widely divergent boiling points gives a curve with a break at the point where most of the lower-boiling component has distilled over. The sharpness of the break in the distillation curve is determined chiefly by the difference in volatility of the materials being distilled. by the inherent separating power of the column or still head and by the reflux ratio.

The general theory of distillation is quite complex. For the sake of simplicity the succeeding discussion will be confined to mixtures of two components. Three situations can be distinguished according as thecomponents are: (1) quite insoluble in each other—completely immiscible mixtures; (2) soluble only within limits—partly miscible mixtures; (3) soluble in all proportions—completely miscible mixtures.

The first case is illustrated by benzaldehyde and water as discussed under Steam ***Distillation,*** below. Both components distill together at a temperature below the normal boiling point of either, and in constant proportion until one disappears, after which the other distills alone at its normal boiling point. Partly miscible systems behave similarly as long as two immiscible layers are present; but when one disappears, they behave like a completely miscible mixture.

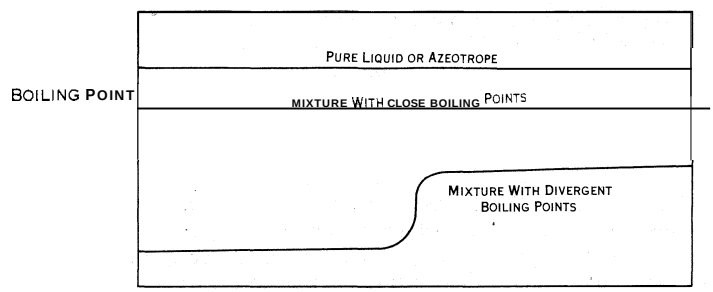

FIG. 4

Boiling-point curves for typical liquids. If pressure is constant, the boiling point rises as the distillation progresses, except when pure liquids or azeotropes are being distilled. If the pressure is increased or decreased, all the boiling points are respectively raised or lowered, and the azeotrope distilling at the new constant temperature will be of different composition

Three varieties of completely miscible mixtures occur. They are (*see* fig. 5): (1) systems in which an azeotrope has a boiling point greater than that of either pure component—maximum boiling-point mixtures; (2) systems in which an azeotrope has a boiling point less than that of either pure component—minimum boiling-point mixtures; (3) systems in which all boiling points are intermediate between those of the pure components. Nitric acid (boiling point [b p.] 86° C.) and water (b.p. 100° C.) provide an example of (1); the maximum boiling point is 120 5° C. for an azeotropic mixture containing 68% of the acid. If a mixture with any other percentage composition is heated. both components pass off in varying amounts until the still contains the azeotropic mixture of maximum boiling point, which then distills unchanged in composition at constant temperature. Propyl alcohol and water furnish an example of (2). On heating this kind of mixture, the azeotrope distills over first, until only one component is left in the still. Thus, as a result of their inherent properties, it is impossible to separate mixtures of (1) and (2) into their pure components by distillation. The difficulties of separating mixtures of (3) are of a different order. Methyl alcohol and water constitute a pertinent example. On distilling any mixture of the two, the distillate always contains a greater proportion of methyl alcohol (the lower-boiling component) than the residue in the still. The completeness of the separation of the methyl alcohol from the water depends only on the number of redistillations and the efficiency of the fractionating column.

Theoretical Plates and Plate Efficiency.— Fractionating columns are rated according to the number of theoretical plates, and, in the case of plate columns, also according to plate efficiency. A theoretical plate may be defined as one that produces the same difference in composition as exists at equilibrium between a liquid mixture and its vapour Thus, for example, any portion of a

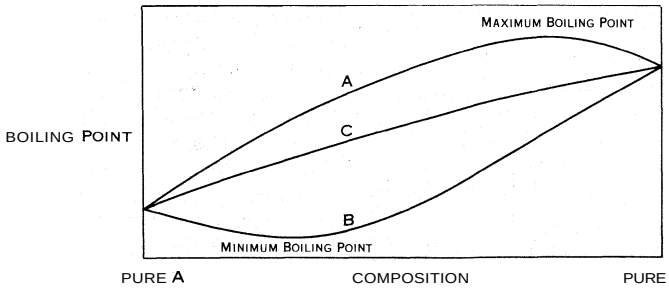

FIG. 5.— THE THREE VARIETIES OF COMPLETELY MISCIBLE BINARY MIXTURES: (A) MAXIMUM BOILING-POINT MIXTURES; (B) MINIMUM BOILING-POINT MIXTURES, (C) MIXTURES IN WHICH ALL COMPOSITIONS HAVE BOILING POINTS INTERMEDIATE BETWEEN THOSE OF THE PURE COMPONENTS

column that produces an improvement in composition from *a* to b or b to c, etc. (see fig. 6), is a theoretical plate. On simple distillation of a liquid of composition *a*, the first drop of distillate should have composition b. This would be a theoretical or perfect simple distillation. These terms are used since this operation is difficult to achieve in practice because of condensation on the upper walls and neck of the distillation flask. Specially designed apparatus is used to obtain the data for constructing vapour liquid equilibrium curves such as that of fig. 6.

The number of theoretical plates is determined from the compositions obtained experimentally at the bottom and top of a column or a section of column. A common example involves operation at total reflux and use of a vapour liquid equilibrium curve, as may be illustrated by reference to fig. 6. Stepwise construction is commenced at the point a corresponding to the composition at the still or bottom of the column and continued (along *h, i, j, k, l, m, n, o, p, q)* to the top or distillate composition (g). The number of steps required in this construction (four and a fraction in this example) is the number of theoretical plates in the column. The height of the column divided by the number of theoretical plates is called the H.E.T.P. or height equivalent to a theoretical plate. The more fundamental H.T.U. (height of a transfer unit) is determined in a somewhat similar fashion Practical applications often involve use of more complex graphical procedures and formulas in order to estimate the type and height of column needed to secure a desired separation or purification.

Plate efficiency may be defined as the ratio (in per cent) of theoretical plates to actual plates. Plate efficiencies vary from 10% to more than 100% but with common mixtures having normal viscosities the value is usually between 50% and 75%.

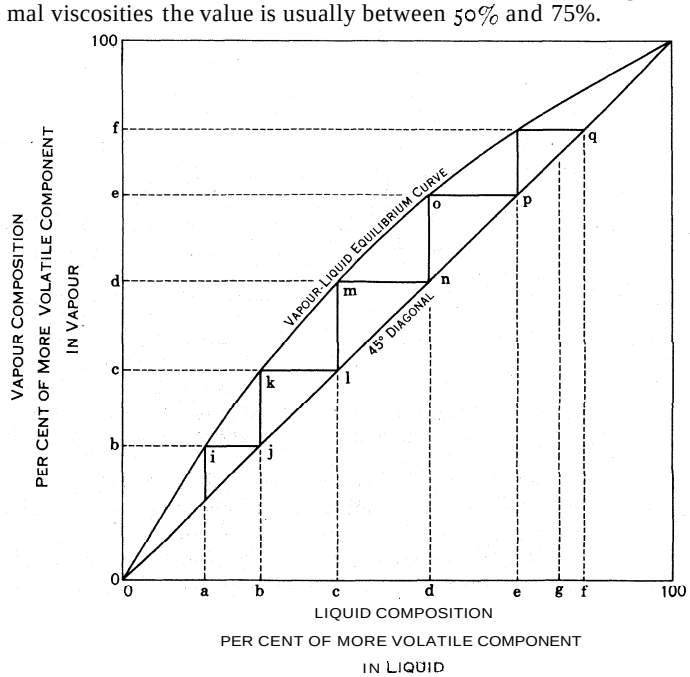

FIG. 6.— VAPOUR LIQUID EQUILIBRIUM DIAGRAM AND THEORETICAL PLATES

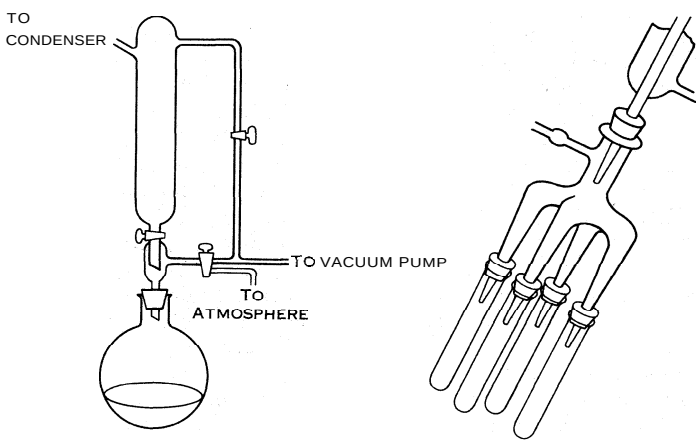
Reduced Pressure or Vacuum Distillation.— Distillation under reduced pressure is adopted when dealing with substances that normally boil at inconveniently high temperatures or that decompose when boiling under atmospheric pressure. Vacuum distillation is also sometimes used because it is more economical. The apparatus differs little from that already described except that the distillate receiver must be connected to a vacuum pump and preferably also to a gauge and automatic pressure regulator.

The collection of fractions under reduced pressure is best managed by an arrangement of stopcocks and connecting tubes or by a specially designed multiple receiver which permits removal of one fraction after another without interrupting the distillation or breaking the vacuum (fig. 7).

The volume of vapour from a given volume of liquid is 760 times as great at one millimetre pressure as at standard atmospheric pressure (Boyle's law). Hence vacuum distillation is



FROM A A MORTON, "LABORATORY TECHNIQUE IN ORGANIC CHEMISTRY," MCGRAW HILL BOOK CO , INC (1938)

FIG. 7.— DEVICES FOR COLLECTING FRACTIONS IN VACUUM DISTILLATION

subject to the disadvantage that reduction of the pressure to ten millimetres or less greatly reduces the distilling capacity because of the resistance offered by ordinary apparatus to the easy flow of the very great volumes of vapour. Distillation at pressures below one millimetre is usually carried out in molecular stills (see *Molecular Distillation,* below).

Steam Distillation.— This is an alternative method of achieving distillation at temperatures lower than the normal boiling point. It is applicable when the material to be distilled is immiscible and chemically nonreactive with water. The usual procedure is to pass steam into the liquid in the still to supply heat and cause evaporation of the liquid. The steam will condense at the start and form a layer of water. In fact, steam distillation is sometimes carried out by simply adding liquid water to the charge and supplying heat in the usual way. For instance, impure benzaldehyde (oil of bitter almonds) may be purified either by adding water and heating. or by passing in steam. As the mixture becomes warm, each liquid vaporizes as if the other were not present. The total pressure of the two vapours is the sum of the individual pressures of the water and benzaldehyde (Dalton's law of partial pressures), as indicated in the accompanying table.

Temperature (°C.)	Vapour pressure (in mm.)			Remarks
	Benzaldehyde	Water	Total	
50	5	92	97	
80	28	355	383	
90	40	526	566	
95	50	634	684	
98	56	707	763	Mixture boils
100	61	700	820	Boiling point of water
140	263			
170	614			
180	790			Approximate boiling point of benzaldehyde

Since any liquid boils when its vapour pressure equals or slightly exceeds the atmospheric pressure (760 mm.), the mixture of water and benzaldehyde will boil slightly below the boiling point of pure

water and far below that of pure benzaldehyde. The volumes of the two vapours in the vapour mixture will be in the proportion of the vapour pressures; *i.e.*, about 56 of benzaldehyde to 707 of water. The relative weights may be found by multiplying the relative volumes by the corresponding molecular weight. Thus, for benzaldehyde, $56 \times 106 = 5.936$, and for water, $707 \times 18 = 12,726$; it follows, therefore, that benzaldehyde will distill with about two times its weight of water.

Distillation with steam is merely a special instance of the distillation of immiscible liquids, as described under Theory of Distillation, above. Accordingly. liquids other than water can be used in analogous operations. Thus impure indigo can be distilled with kerosene to produce a good yield of pure indigo, without loss caused by overheating and decomposition during the distillation.

Steam distillation of mixtures that are partly soluble in water involves entirely different and more complex principles similar to those of extractive distillation (see below). It has proved very useful in separating organic compounds with high and nearly identical boiling points, such as the ortho- and paranitrophenols.

Azeotropic and Extractive Distillations.— When separation by distillation is especially difficult, because the components of a mixture have almost identical volatilities, improvement can often be achieved by addition of a properly chosen new component. In some instances the choice is a substance which is soluble in the mixture to be distilled and which forms a constant boiling or azeotropic mixture with one or more of the original components. If the volatility of the azeotrope formed from the added component and one substance of the mixture is markedly different from the volatility of the other materials present, ordinary distillation will separate the azeotrope from the remaining components. A familiar example is the preparation of pure anhydrous ethyl alcohol by the addition of benzene to ethyl alcohol containing a small proportion of water. On distillation, an azeotropic mixture containing all the benzene and water passes over with a small amount of alcohol and leaves a residue of anhydrous alcohol. Azeotropic distillation is not practical if the component desired enters into the formation of the azeotrope and cannot easily be recovered from it.

Extractive distillation is a somewhat similar method. In this process a liquid which is relatively nonvolatile is added near the top of a fractionating column in order to increase the relative volatility of one of the original components and to allow it to distill in a comparatively pure state. Normal butane may thus be separated from 2-butene by addition of acetone, even though the normal volatilities of the hydrocarbons are nearly the same. This separation is of importance in producing raw materials for synthetic rubber and high-octane gasoline.

Distillation of Gases.—Gaseous mixtures may be distilled after liquefying them through use of high pressures or low temperatures or both. Once liquefaction is accomplished, distillation may be carried out as usual except that the apparatus must be such as to withstand the abnormal temperature or pressure. Oxygen, nitrogen, neon and the other rare gases are separated from air by liquefaction and distillation at low temperatures. Liquefied petroleum gases are separated and purified by distillation under pressure.

Distillation of Solids— Sublimation.— When solid substances are heated to give gaseous or liquid products, the operation is termed dry distillation. If the procedure involves a breakdown of complex materials into simpler substances (elementary or compound), the process is described as destructive distillation. (See COAL TAR; TARS, LOW-TEMPERATURE.) Sublimation is a related process in which a solid distills to give a gas without the intervention of a liquid phase.

Analytical Distillation.— A mixture of substances of the same chemical class is often difficult to analyze by conventional chemical methods. Such a mixture may sometimes be analyzed by distillation. Sharp separation between components is essential. Analytical distillation has been most useful in studying the composition of petroleum.

Batch and Continuous Distillation.— In most of the previously described varieties of distillation, the material to be distilled (the charge) is introduced into the apparatus at one time before the start of the distillation, and distillate is removed at one point only. All such operations are referred to as batch distillations. In continuous distillation, the charge is introduced in a constant stream into the side of the column, where part of it descends with the reflux and the remainder is vaporized by the heated vapours rising from the still (fig. 8). The most volatile product is concentrated in the overhead product that is removed continuously at the top of the column and the least volatile similarly removed from the bottom. Intermediate fractions are sometimes withdrawn from various levels of the column through side streams. Continuous distillation is seldom used on a small scale, but it is of major importance in industrial operations, particularly in the manufacture of alcohols and petroleum products and in the technology of liquid air.

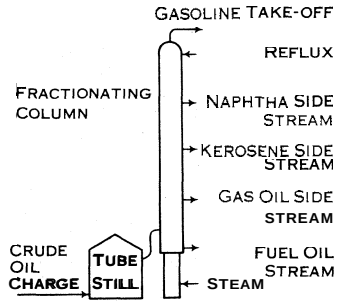


FIG 8.—SIMPLIFIED DIAGRAM OF CONTINUOUS DISTILLATION

The portion of the column above the point at which the charge is introduced is called the enriching section, and the lower portion is the exhausting section

Distillation in Industry.--In addition to the last-mentioned substances. distillation in various forms is used in the processing or production of liquefied fuel gases, coal tar and its products, turpentine, glycerin. fatty acids and a host of other chemical and pharmaceutical products. These range from butadiene and styrene for synthetic rubber manufacture to formaldehyde, phenol, camphor, etc. The type of apparatus used varies with the nature of the mixture to be distilled. the product, the difficulty of the separations involved and the means of heating required or available. Equipment is identical in principle with laboratory equipment already described (see fig. 9). All varieties of construction materials are used, including particularly cast and wrought iron, copper, mild steel, stainless steel. nickel, monel and aluminum. Lead-lined stills, glass-lined stills. fused silica, glass, structural carbon and stoneware are used where special purity or resistance to corrosion is required.

Stills for batch distillation are usually cylindrical shells. In addition to an outlet to carry away vapours. a cylindrical still is often fitted with. (1) a bottom outlet and valve; (2) an agitator for stirring the charge to prevent local overheating: (3) a pressure or vacuum gauge; (4) an inlet and outlet for closed steam coil; (5) a tube reaching to the bottom to introduce live steam; (6) closed tubes to carry thermometers or thermocouples; (7) manholes for

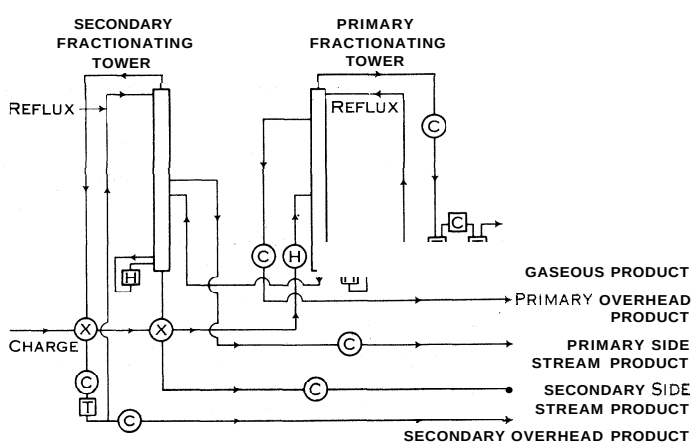

FIG. 9.—FLOW DIAGRAM FOR INDUSTRIAL CONTINUOUS DISTILLATION UNIT. KEY: C, COOLER OR CONDENSER: H, HEATER: X. HEAT EXCHANGER: T, TANK

charging or cleaning; (8) inspection ports; and (9) a safety valve. In many cases the still has a double bottom and double side walls, forming a jacket for circulation of heating fluid. Steam is most frequently used. It may be passed through the jacket or a coil (closed steam) or sent directly into the liquid to be distilled (open steam). The still may also be heated directly by an open fire of coal, coke, oil or gaseous fuel. but such direct methods have a tendency to local overheating and have been largely superseded. Indirect heating with steam is subject to closer control.

In continuous distillation, pipe stills are most used. The material to be heated is pumped rapidly and continuously through coils or pipes that pass through a furnace. The rapid flow inside the pipes allows higher temperatures and more rapid heating without damaging the pipes or decomposing the charge.

Many industrial distillation setups consist only of still. vapour line, condenser and receiver, because the liquid mixtures involved are easily separated. A growing number of installations equipped with fractionating towers have come into use The more efficient towers are either packed or fitted with perforated plates or bubble plate arrangements (fig 10) to give more intimate contact between descending reflux and ascending vapour. Perforated plate towers are particularly useful when the feed material contains solids, as in the distillation of alcohol from fermentation mash. The bubble plate design is by far the most widely used. Another device causes descending liquid to cascade over a weir, while rising vapour forces its way through the cascade.

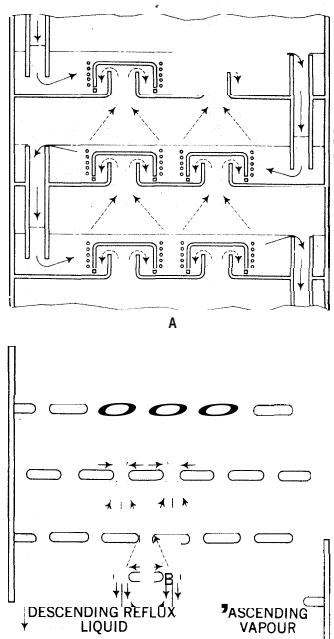

FIG 10.—SECTIONAL DIAGRAMS ILLUSTRATING PLATE CONSTRUCTION AND INTERACTION OF LIQUID AND VAPOUR IN (A) BUBBLE PLATE COLUMN AND (B) PERFORATED PLATE COLUMN

Large industrial columns may have as many as 100 bubble plates, and diameters up to 32 ft. Two towers may be connected in series to obtain the desired number of plates. There is no theoretical limit to the number of plates, but practical difficulties usually restrict the number in any one unit.

Condensers may be open surface, tubular or worm. In the first type, cooling is effected by trickling water over a bank of tubes through which the vapour is passing. A tubular condenser consists of a group of parallel vapour tubes uithin a shell. through which cooling water flows. A worm condenser involves spiral vapour tubes Proper choice and design of condensers depends upon rates of heat transfer from the condensing vapours to the cooling water, as well as knowledge of the probable condenser water temperatures and the quantity and character of the vapour to be liquefied.

The cost of distillation operations lies chiefly in the need for continual heat at the still and cooling at the condenser. The piping arrangements of large continuous units are often quite complex because of the economy of exchanging heat between hot materials leaving the process and cold materials entering it.

Distillation **of** Water.— Water free from dissolved salts is indispensable in many scientific and industrial operations. Laboratory stills consist of a boiler, fed by warm uater from the condenser, and suitable devices for eliminating entrainment. The condenser and all receivers are usually of tin, or at least tin plated. Ordinary glass is not suitable for condensing or storing highest-purity water. Double distillation is frequently used to ensure removal of traces of impurities. The preparation of very pure water is a laboratory operation requiring the greatest care.

The problem of the economic production of potable water from sea water is very old. In 1683 Fitzgerald patented a process for the "sweetening of sea water." S. Hales (1739) gives a history of the earlier attempts in his book *Philosophical* Experiments. The modern plant consists of an evaporator, distiller and condenser. Condenser tubes may be oval, crescent shaped or indented. The latter are self-scaling. For shipboard use, emphasis is on compactness, whereas multiple-effect evaporators of high economy are favoured for use on land.

Compressive **Distillation.**—During World War II pure water was produced by compressive distillation characterized by very high fuel economy (175 lb. distillate per 1 lb. of fuel). The steam from boiling sea water is slightly compressed and circulated through a coil in the still. The compression raises the temperatures of the steam sufficiently to allow it to maintain the charge of sea water at its boiling point. The temperature loss to the still cools the steam and condenses it to distilled water. No separate condenser or cooling water is required. The principle is applicable to distillation of substances other than water. (A. RE.)

MOLECULAR DISTILLATION

When the high-vacuum still is constructed so as to impose no hindrance to the passage of vapour from evaporator to condenser, a device known as the molecular still is achieved. Distillation occurs in this still at the lowest temperatures believed possible. Unstable substances which can be purified by no other means of distillation can often be treated without harm in the molecular still. The apparatus takes many forms but the simplest, which typifies the action of all the others, is little more than a flat vessel, like two saucers sealed together, which is held under high vacuum. The material to be distilled is heated in the lower saucer and the vapour condenses on the upper, cooled saucer. The saucer arrangement and two practical molecular pot stills for laboratory use are shown in fig. 11.

The names of many inventors are associated with the origins of molecular distillation. The first record of a truly molecular apparatus, where the evaporating and condensing surfaces were separated by a distance less than the free path of most of the vaporized molecules, is the mercury still of J. N. Brönsted and G. von Hevesy (Phil. Mag., 1922). The first truly molecular still for the separation of heavy organic substances was described by C. R. Burch (Nature, 1928). Early molecular distillations were performed by H. I. Waterman (1929) in the Netherlands, by E. W. Washburn at the bureau of standards in Washington, D C. (1929), and by K. C. D. Hickman (1929) in Rochester, N.Y. The potentially immense value of molecular distillation in processing of

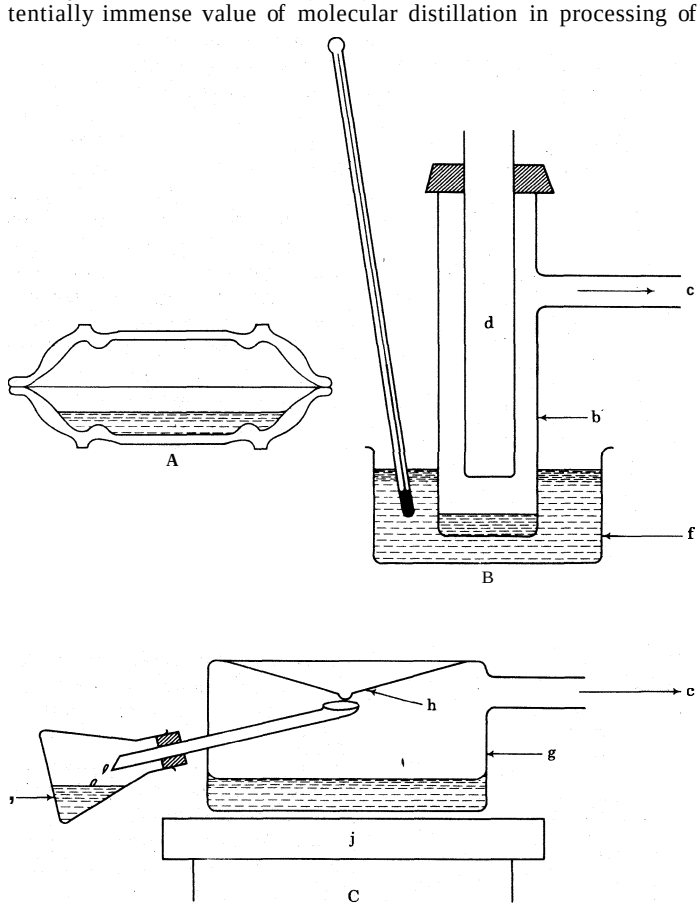

FIG. 11

(A) Pair of saucers, (B) micropot still: (b) body of still, (c) vacuum pump connection, (d) condenser, (f) oil bath; (C) one-piece pot still: (g) body of still, (h) re-entrant surface serving as condenser, (i) distillate receiver, (j) hot plate for heating

natural oils, fats and waxes which could not be distilled by any other known means was pointed out by Burch and was echoed and implemented by other workers. The three categories of distillands (materials to be distilled)—heavy oils, glyceride fats and natural waxes—accommodate production amounting to more than 5,000,000,000 lb. annually in North America, but of this enormous quantity, commercial molecular stills handled only little more than 0.1% in the early 1960s; the capacity, however, was expanding rapidly.

The vacuum required for molecular distillation ranges from one to ten one-millionths of an atmosphere which is equal to a pressure of residual air of .00075–.0075 mm. mercury, or $\frac{3}{4}$ to $7\frac{1}{2}$ microns (one micron = 1μ = .001 mm. mercury). Small laboratory stills operate at pressures as low as one-half micron, but not nearly so low as pressures erroneously recorded in the literature. Commercial stills operate at about three microns, the advantages of lower pressures being offset by the higher cost of pumping.

The time factor is very important in molecular distillation since the degree of destruction of labile substances is proportional to the duration of exposure in the hot still. All kinds of devices have been explored to reduce the time to the minimum. Early stills exposed the distilland in shallow trays. Then came the falling-film still, where the distilland is allowed to tumble down a heated surface contained within an evacuated condenser. The evaporator is generally a vertical polished metal tube heated by electricity; the condenser a large glass tube or bell jar which surrounds and encloses the evaporator.

Individual stills $1\frac{1}{2}$ ft. wide and 6 ft. high have been used in industry. Smaller cyclic batch falling-film stills, constructed chiefly of glass, are in use in research laboratories for the multiple recycling and distillation of natural oils. A diagram is shown in fig. 12.

Industrially, the falling-film still has been superseded by the centrifugal evaporator. The distilland, generally a natural oil, is fed onto the centre of a rapidly rotating metal cone which is warmed on the outside by an electrical radiant heater. The entire assembly is housed within a tank which is maintained under high vacuum by a train of fast pumps (fig. 13). The oil climbs up the inside of the cone under a centrifugal force of 10–100 times gravity and is flung from the upper rim into a stationary gutter whence it flows to a pump which discharges it from the still. The total time of exposure in the hottest zone is about one second. The time of exposure in a high-speed laboratory centrifugal still is about .02 sec. The reduction in both time and temperature of exposure is so drastic in the latter apparatus that the thermal hazard is diminished about 1,000,000,000,000 times from that of an atmospheric distillation lasting an hour. The improvement over the best industrial flash distillation done at 1 mm. mercury is about 1,000,000 times. The improvement factor for the large commercial molecular stills is about 100 times poorer than these figures.

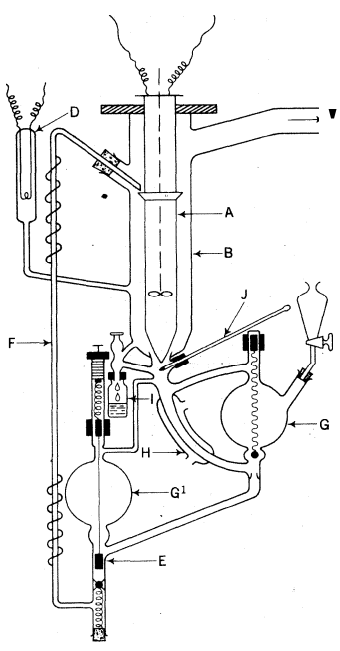

FIG. 12.—CYCLIC BATCH FALLING-FILM STILL

The molecular still requires the service of fast vacuum pumps. Since no economical pump is known that will reduce the pressure a millionfold in one operation, it is necessary to employ a number of different kinds of pumps in series. The fastest pump, operating at the lowest pressure, is always an oil-vapour condensation pump of the type invented by I. Langmuir (1916) and improved by Burch (1928). It may have self-conditioning features introduced by Hickman (1936). The condensation pump pulls residual gases at one to five microns from the still and compresses them 10 to 20 times, discharging them at .075 to .15 mm. into a fore pump which may be, variously, a large oil-sealed mechanical pump or another oil-vapour booster pump. This latter then discharges into a mechanical pump or steam ejectors.

Uses of the Molecular Still.—The falling-film still found commercial use on a small scale in 1935 for the distillation of vitamin A alcohol prepared by the saponification of fish livers The apparatus came into extended use in 1937 for distilling vitamin A esters from dogfish-liver oils and shark-liver oils. Centrifugal stills mere introduced in 1941 and these continued to produce the majority of vitamin A concentrates in North America. The large-scale processing of vegetable oils commenced in 1945. This had the curious effect of displacing the synthetic vitamin E of pharmacy by mixtures of natural tocopherols, chiefly the a and γ homologues.

Mono- and diglycerides of fatty acids distilled from industrial mixtures came into large supply in 1949. They are used extensively in the baking and cosmetic industries.

The application of molecular distillation to heavy chemicals, plasticizers and petroleum residues lagged somewhat. though the use in these fields is extending. The laboratory molecular still has become a routine step in the analysis of natural products for vitamin E, and for the separation of oils, waxes, sterols and hormones. See also references under "Distillation" in the Index volume. (K. C. D. H.)

BIBLIOGRAPHY.—Laboratory distillation is discussed in all books on practical organic chemistry, and its theory in treatises on physical chemistry and chemical engineering. *See* A. A Morton, *Laboratory Technique in Organic Chemistry* (1938); C. C. Ward, "Review of the Literature on the Construction, Testing, and Operation of Laboratory Fractionating Columns," U.S. Bureau of Mines *Technical Paper 600* (1939). C. S. Robinson and E. R. Gilliland, *Elements of Fractional Distillation,* 4th ed. (1950), takes up the application of the principles to the problems of industrial design and operation. The standard older text is S. Young *et* al., *Distillation Principles and Processes* (1922). Section 25 of vol 2, pp 1543–1670, of *The Science* of *Petroleum* (1938) is devoted to a discussion of distillation. Descriptions of industrial procedures and equipment can be found in the technological literature of particular substances.

For further information on molecular stills *see* K. C. *D.* Hickman, "High-Vacuum Short-Path Distillation—A Review," *Chem. Rev.,* 34:51 (1944). (A. RE.)

DISTRESS, at common law, is the process whereby a person, without any prior legal process, seizes and detains from a wrongdoer some chattel or item of personal property as a pledge for the redressing of an injury, the performance of a duty or the satisfaction of a demand. Distress also signifies the property distrained.

England.—The main cases in which distress can be levied are: (1) the nonpayment of rent due under a tenancy or rentcharge; (2) trespass and damage by cattle or other chattels (distress damage feasant); (3) the nonpayment of local rates, taxes or certain fines. Initially the right was a mere passive right to detain the

goods distrained until payment or recompense was made, and this is still the case with distress damage feasant; but in most other cases statute has conferred a power to sell the goods and to pay the sum due and the expenses out of the proceeds of the sale. Distress for rates, taxes and fines is subject in each case to special statutory provisions which make it more akin to the process of execution than to distress for rent.

The law of distress for rent is highly technical, and in practice distress is nearly always levied by certificated bailiffs experienced in this law, acting under a warrant of distress signed by the landlord *Prima* facie, all goods found on the land in question may be distrained, irrespective of ownership, but this is subject to many qualifications. Certain goods are absolutely privileged from distress, such as goods entitled to crown or diplomatic immunity, goods delivered to be repaired or worked on in the way of some public trade, goods in actual use, perishable goods, the apparel and bedding of the tenant and his family and his tools of trade to a total value of £20, and various gas, water and electricity fittings. Other goods are conditionally privileged, so that they may be distrained only if there is no other sufficient distress on the premises. This heading includes beasts of the plow, sheep and tools of a trade or profession. Further, by the Law of Distress Amendment act, 1908, undertenants and lodgers may protect their goods from a distress levied on the tenant by claiming their goods and undertaking to pay their rent to the landlord. In some cases, no distress can be levied without the permission of the court; *e.g.,* where the tenancy is protected by the Rent acts, where the tenant is in the armed forces (in some cases) and where the tenant is a company being wound up by the court.

Distress may be levied as soon as the rent is overdue. It cannot be levied for rent that is more than six years overdue (or one year in the case of an agricultural holding); and, if the tenant is bankrupt, distress is limited to six months' rent accrued prior to his adjudication. No distress may be levied at night or on a Sunday. The premises may be entered in any way short of breaking into them; but. once in, the bailiff may break an inner door in search of distress. Goods are distrained by seizing them, either actually or constructively, and then impounding them for safe custody, usually on the premises. The landlord may not use any goods or cattle impounded, except for their own benefit (as *e.g.,* by milking cows); and he must not only select a suitable pound (as by putting furniture under cover) but also feed and water any cattle impounded. If more goods are seized than are reasonably necessary to satisfy the arrears of rent and costs of distress, an action for damages for excessive distress will lie. However, if the tenant fraudulently or clandestinely removes goods from the premises to avoid distress, he is liable to forfeit to the landlord double the value of such goods, as is any person knowingly aiding him. The landlord can also sue for treble damages if any person is guilty of rescue (*i.e.,* the taking of goods distrained but not impounded) or of pound-breach (*i.e.,* the taking of goods impounded); and pound-breach is a misdemeanour.

No distress can be sold until five days have elapsed after the levy of distress and notice thereof to the tenant; and this may be extended to 15 days if the tenant so requests in writing and gives security for the additional costs. At any time before sale the tenant can replevy the goods; *i.e.,* recover them by paying all that is due. with costs. Subject to this, the goods may be sold for the best price obtainable, usually (though not necessarily) by auction (*q.v.*). Any surplus will be paid to the tenant, but if there is a deficiency the landlord usually cannot levy a second distress unless the deficiency was no fault of his. (R. E. My.)

United States.—In the United States the right of distress, where recognized, includes the power (first conferred in England by statute enacted in 1690) to sell chattels seized in exercise of the right. Because it affords an opportunity for injustice and discriminates in favour of one particular class of creditors, however, this form of self-help has not been favoured in this country. In some states the courts have refused to recognize the remedy of distress as part of the common law of the particular jurisdiction; in other states it has been abolished by statute. Where the remedy remains, it generally has been modified so as to do away with the self-help features by vesting enforcement in a public official, to restrict the right to goods of the tenant himself located on the premises and exempt items which were not exempt at common law, and to limit the length of the period for which a claim for overdue rent may be enforced by this process.

See also LANDLORD AND TENANT. (H. H. Lr.)

DISTRIBUTION. In economics the term distribution generally refers to (1) explanations of how prices for the services of productive resources are determined; (2) how the total product of an economy is divided among the various productive resources (frequently termed functional distribution); or (3) a description of the number of income-receiving units in each of various income classes (usually called personal distribution). Since the term is a generic one, it also has been used to describe the processes by which various commodities are made readily available for purchase by consumers (see MARKETING) as well as the geographic placement of a working force, the occupational distribution of workers according to age and sex and the geographic distribution of capital.

How Resource Prices Are Determined.--Most economists accept the theory that the price for the service of a resource (a particular kind of labour, a given grade of land in a particular location or a capital agent, such as one kind of machine) is determined, as is the price of a commodity, by supply and demand (see SUPPLY AND DEMAND). The quantities of the service of a resource that a user (buyer) will take from the market will be inversely related to the prices that he might pay; the quantities that will be offered to him by sellers will be directly related to the prices at which they might sell. Unless the market "clears" (*i.e.,* unless the quantity demanded by buyers is equal to the quantity that will be provided by sellers) the price will adjust. If buyers and sellers respond to price changes in the manner described above, the price will move upward if demand exceeds supply and downward if supply exceeds demand. The equilibrium price—the price that would prevail unchanged if it were the initial price and there mere no change in the behaviour of buyers and sellers—can be only the price at which the quantity supplied and the quantity demanded are equal. The market price is, on the average, an equilibrium price according to this explanation.

Equilibrium prices for the services of resources are thus explained in the same manner as equilibrium prices for commodities. A single general theory of price is adequate for explaining the equilibrium price of all things entering into exchange, whether they are things used in production or things ultimately purchased by consumers. Any modifications made in this general theory to explain how particular resource prices are determined are the result of demand or supply conditions peculiar to the particular market.

It has long been recognized that the demand for resource services is a derived demand; *i.e.,* that the user desires to purchase these services because they are useful in producing goods and services that he can sell. Consequently the demand for a resource service will reflect the desires of customers for the commodities produced with this service and the physical productivity of the technology employed in transforming these services into final products. Since the physical productivity of a service also may depend upon the amounts of other services employed with it in production, the demand for any resource will be related to the amounts of other resources used and generally mill vary directly with the quantities of these other services. Thus, an increase in the demand for wheat increases the demand for land that can be used in wheat production; improvements in technology that increase the physical productivity of labour increase the demand for labour; and events such as wars. which destroy capital, reduce the demand for labour.

Any buyer of a resource service is assumed to purchase a quantity of that service that is at least as profitable as any other that he might use. It follows from this assumption that an employer will not employ an additional unit of a resource unless the amount added to his gross receipts as a result of such action is expected to equal or exceed the amount added to his total costs. Nor would he reduce the amount of a service employed if he expected this action to reduce his receipts by more than his costs. Thus, for each price of the service of the resource there is a most profitable

amount of this service for each user to purchase. If one were to add together these amounts for all of the users at each price. the resulting relation between the prices and the most profitable quantities mould describe the demand for this service for the economy (the world. the nation. the state or whatever the geographic area for which the users are enumerated).

That this demand for a resource service will be a relation in which the amount demanded varies inversely with the price follows from two considerations. (1) Physical production relationships are assumed to conform to the law of diminishing returns. This implies that the rate of change in physical output with respect to a change in the amount of one resource service employed diminishes as the quantity of this service used is increased, the amounts of the services of other resources used remaining fixed. Economists also term this phenomenon "diminishing marginal physical productivity." With constant product prices, this characteristic would assure that the value added by each successive increment of a resource would diminish and that lower resource prices would be required to make higher levels of employment the most profitable ones. (2) A product price is assumed to decrease as the amount of the product placed upon the market is increased. Even if diminishing marginal productivity was not characteristic of the technology, this product price-quantity relation could result in a resource price-quantity relation of the kind assumed.

Supplies of resource services are determined by the actions of resource owners. Each owner is assumed to sell to the buyers offering him the most attractive terms, including not only money rates of compensation but also such features as working conditions. The larger the quantity of a service that any user wishes to purchase, the higher the price he must pay. This relationship between the price and the quantity supplied to any user follows from two kinds of considerations.

First. if the total quantity of a resource is fixed and there are a number of possible uses for the services of this resource, a user generaliy can increase the amounts that will be made available to him only by bidding the services away from other users. For given market and technological conditions of production, the terms that other users offer increase in attractiveness as the quantities which they use become smaller. This follows from the assumptions of diminishing marginal physical productivity and the inverse relation between product price and quantity offered for sale. The demands of other users determine the supplies available at various terms to a particular user. Imagine, for example, that there were a given number of workers available for employment in two industries, farming and mining. As more and more workers are employed in mining, and thus are removed from farming, labour becomes more valuable in agriculture. Farm managers would find it advantageous to offer higher wages to farm workers. Similarly, a larger number of workers employed in farming (and a smaller number employed in mining) would increase the prices that mine operators would find it profitable to pay for labour.

Second, if the quantity of a service supplied can be altered by resource owners, more favourable terms are required in order to obtain a larger over-all supply. For example. if there were no unemployment, and employers were to induce an expansion in the size of the U.S. labour force! both older and younger workers and additional females in the same age groups as those now employed would have to be drawn into the market. Unless such persons are prevented from entering into employment at existing n-age rates, higher wages mould be required to expand the number of workers supplied.

It should be noted that the supply of labour may not be such as to conform to the kind of relationship between price (wage rate) and quantity described above. The alternative to working for income to exchange for commodities is leisure—including producing for one's own consumption. Because higher wage rates can make workers richer as well as make the price of leisure higher, and more leisure is desired as wealth increases. the result of a wage increase may be less labour supplied Although this possibility appears unlikely, existing empirical studies have not been sufficiently complete to assure that it is not the case.

The division of resource use and the pattern of prices will be altered by such factors as technological change, population change, increased capital and alterations in consumers' preferences for various commodities. For example. it has been estimated that if the future conformed to past experience, technological improvement combined with an increased ratio of capital to labour in the United States would nearly double the real wage rate (before taxes) in a period of about 30 years if the number of workers were to remain unchanged. It would also increase the ratio of wage rates to returns on capital.

An increase in the employed labour force from, say, 65,000,000 to 75,000,000—with no change in the amount of capital or in technology—would cut the real wage rate (before taxes) by about 7% and reduce the ratio of wage rates to returns on capital. Increases in demands for goods requiring relatively large ratios of capital to labour probably would reduce the ratio of wage rates to returns on capital if the total supplies of capital and labour were constants.

The explanation sketched above of how resource prices are determined usually is referred to as the marginal-productivity theory. It is an extension of certain features of the rent theory of David Ricardo (*q.v.*) but was developed independently by English economists of the neoclassical school and by John Bates Clark (*q.v.*), a U.S. economist, during the last part of the 19th century and early part of the 20th. In the early stages of formulation of this theory the demand for resource services was overstressed in explaining resource-price determination; the forces of supply were frequently ignored or the quantity of the resource made available assumed to be fixed. The theory outlined above came to be widely accepted among professional economists because. with the appropriate empirical estimates: it is believed to yield the best predictions and because it is a special case of the general theory of price determination.

However. this theory has been criticized on two counts: (1) its reliance upon the assumption of rationality among resource users and sellers; and (2) its necessity for explaining observed differences in prices for a particular service in different uses as being due to nonobservable factors. Rationality among resource users is incorporated into the theory in the form of the assumption that profit maximization is the determinant of users' actions in deciding how much of a resource to employ at various prices. If users do not make choices in accordance with profitabilities, the magnitudes of changes predicted by the theory would be in error, but the direction of the change could be correct providing that choices are made systematically rather than at random. For example, pricing products so that the price is always a given percentage of cost would not necessarily be pricing in a manner which would be most profitable. But a change in technology, product demands or resource supplies mould still induce producers to alter the direction of resource use in the same manner as if they were choosing in order to maximize profit.

Rationality among resource sellers is defined as choosing to sell where terms are most favourable. Whether this assumption is realistic is extremely difficult to determine.

The theory would explain such phenomena as higher wages for a particular kind of labour employed in one industry or one locality rather than another as being attributable to ditierences in non-wage factors, which are frequently nonobservable. The theory thus may be tautological with respect to explanations of such differences. However, such differences also may be the result of the fact that technological conditions of production permit an indeterminacy of resource prices within certain limits.

Where market or production conditions are such that equilibrium is compatible with a range of different prices. bargaining positions of buyers and sellers have been introduced to explain how a particular price might be established. Economists of the "institutional" school—a group which exerted considerable influence upon economic thought during the first quarter of the 20th century—have been interpreted to argue that these indeterminacies were so important that the bargaining aspects of such problems as wage determination far outweighed those aspects that lent themselves to conventional analysis of supply and demand. Thus it was believed that wage rates could be varied within rather wide limits

without affecting employment and that, since labourers' bargaining positions were inferior to those of employers, strong trade unions were desirable to raise wages without adverse effects upon the allocation of resources.

Bargaining is recognized as a feature of actual price determination under certain conditions. However, general theories of bargaining — including those derived from modern game theory — have not contributed significantly to more accurate predictions of the outcome of most pricing situations.

Functional Distribution of Income. — The functional distribution of income is a description of how the total income of an economy is divided among the various resources; *e.g.,* the amount of total wages, total rent and total interest and profits. Since the total return to any resource is by definition the price paid per unit of service derived from this resource, multiplied by the number of units of such service rendered during any time period, determining the amount of income that will accrue to the owners of any resource requires knowing how much service has been used during a particular time as well as the price. The measurements of the amounts of some resource services employed. particularly those of capital agents, have been relatively crude. Also, considering broad aggregates, such as all labour or all capital, may obscure important differences in the working forces and capital structures among countries at a particular time and within a country over time.

However, estimates of the shares of income distributed to the various classes of resources in the United States and some countries in western Europe during the 20th century indicate that from three-fifths to two-thirds of national income typically goes to labour, the remaining two-fifths to one-third being divided among capital agents, including land. Explaining the shares is an important theoretical problem and also offers opportunities to test theories of how resource prices are determined. Real-wage rates of employed workers normally rise during periods of unemployment. Insofar as unemployment of labour is accompanied by a fall in the labour-capital ratio, this increased real-wage rate is consistent with the general features of the technology and employer behaviour postulated in the theory of resource-price determination described above. However, for the shares of income to be constant within a given economy over time requires that the technology always be such that changing the employment of all resources by a given percentage changes national income by this same percentage. For the shares to be approximately the same in each of several countries requires that the technologies among countries all have this property and differ only by a scale factor; *e.g.,* that both labour and capital in one country be twice as productive or two-thirds as productive as in the other.

Personal Distribution. — The income of any person depends upon quantities of various resources that he owns and the prices paid for the services of these resources. Hence, how resource prices are determined is an integral part of an explanation of how the pattern of individual incomes are determined. Activities directed at changing particular commodity prices — through tariffs, internal excise taxes and government purchase programs, for example — reflect awareness of a relationship between resource prices and product prices of the kind described previously. In addition to the patterns of resource ownership and resource prices, the expenditure and tax patterns of government also must be considered in explaining the distribution of income among persons. The larger the share of national income transferred by or originating in governmental activities, the more important the role of government as a force altering the pattern of income distribution.

Prior to government reliance upon collections from income taxes and widespread social security programs, differences in personal incomes reflected differences in the amounts of various resources owned by different individuals as well as differences in resource prices. There were substantial differences in income among individuals whose primary source was wages (including income from professions). These differences reflected inherent variations in individual skills and variations resulting from differencesin training. Very large nonproperty incomes were received primarily by a few business executives and motion-picture actors, etc. Nearly half the income of those persons in the moderate income brackets was professional income. The percentage of total income made up by income from property (various forms of capital) increased as income increased, although a number of persons in the lowest income brackets received all their income from property.

It is generally believed that a strong relationship exists between the size of nonproperty income and the skill of the income recipient However, chance factors also are of importance. Poor forecasts of future demands for certain skills can make large investments in training result in unusually small returns in income. Discrimination according to race or sex results in some jobs not being effectively open to women or Negroes and to lower incomes than otherwise would be the case for members of these groups with certain skills.

Preferences for employing one's resources in an occupation yielding a lower income than another are important in explaining why some individuals with particular skills receive less income than others with the same skills. Preferences for white-collar jobs have resulted in incomes from such jobs generally ranging belo those in manufacturing. To some extent the relative slowness of migration from agriculture to higher-paying industrial opportunities reflects a preference for agricultural employment. Institutional impediments to entry into particular occupations also result in income differentials among persons with comparable skills.

Chance, together with preferences for taking risks, also plays an important role in determining the distribution of property income. Individuals with identical attitudes toward risk taking, identical initial resource endowments and comparable forecasting abilities may experience different income patterns because of chance factors. Technological discoveries and changes in tastes contain relatively large random components that make choosing an investment activity similar to participating in a fair gambling game. However, differences in attitudes toward risk taking are also of importance. It can be demonstrated that from a given group of individuals with equal initial stakes but different preferences for risk taking, there will emerge a distribution of property (and hence property income) with a greater dispersion among individuals than would be the case if all had identical preferences. A larger percentage of those preferring to assume risks will emerge richer or poorer than those who prefer less risky opportunities.

Inflation (depreciation in the value of money) has been of importance in redistributing wealth and income. Since it reduces the value of cash balances and both the value and burden of commitments made in terms of money. inflation has favoured those persons who held their wealth in forms other than money or claims to it and those who were debtors. Persons who held money or claims that were fixed in money terms have been losers. The wars of the late 19th and 20th centuries together with the expansion in demand for governmental services unaccompanied by an equal expansion in the willingness to pay taxes have been important factors in redistributing income among individuals in a way that probably would not have been sanctioned if its impact were widely understood. In particular, inflation probably has tended to make the poor worse off and the rich somewhat better off insofar as the ability to incur financial liabilities has been directly related to wealth position.

The increased importance of government — particularly the rise of personal-income taxation combined with increased levels of direct governmental payments to individuals and increased governmental services to persons — has diminished the role played by ownership patterns and prices in determining the distribution of income. In the United States the average person with a low income pays a smaller percentage of his income in taxes than does the average person with a high income. although there is considerable variation among individuals within any income-size class. To complete the picture, however, it is necessary to estimate the allocation of the benefits of governmental expenditures among individuals in the various income groups.

An estimate that generally would be considered to be accurate is extremely difficult to make because governmental services are difficult to value and because their distribution among persons would be very costly to determine. In national-income accounting

commodities are valued according to the prices received for them. Thus, if commodity A has a price twice that of commodity B, each unit of commodity A is considered to be worth two units of commodity B. Most governmental services have no prices. They are valued at cost. Consequently, if two units of government are producing identical amounts of a given service and one unit produces at twice the cost of the other, the value of the one's services is said to be twice that of the other's. This convention cannot be accepted in accurately evaluating governmental services.

Even though the value of governmental services could be determined, estimates of the distribution among persons must be somewhat arbitrary. As a first approximation some research workers have attempted to classify governmental services according to whether they were to persons or to property. Services to persons are assumed to be shared equally among the individuals in a particular governmental unit whereas services to property are allocated proportionately to the wealth positions of individuals. Estimates of the benefits from state and local governmental expenditures for a few states and the local governments within them in the U.S. suggest that the ratio of such benefits to income is considerably larger for income-receiving units with low incomes than for those with high ones. However, characteristics such as age and size of family also are important in determining the distribution of benefits so that there is considerable variation among units within any income class. Applying this estimation procedure in allocating the services of the federal government yields less reliable estimates since large elements of federal expenditure, particularly that for defense, cannot readily be divided between persons and property.

Comparisons of the distribution of income at different times in the U.S. generally indicate that it is becoming more equalitarian. In particular the percentage of persons with persistently low incomes has been steadily declining. On the other hand, for the world as a whole, the distribution probably is becoming less equalitarian. National-income growth rates in countries with the highest incomes generally have been exceeding those in countries with the lowest incomes whereas population growth rates among many low-income countries have been exceeding those in high-income countries. Within many of the low-income nations inflation has made for greater inequality than otherwise would exist. *See* also PRICE; SUPPLY AND DEMAND; WEALTH AND INCOME.

DISTRIBUTIVE LAW, in algebra, is the law which asserts that the result of first adding several numbers and then multiplying the sum by another number is the same as the result of first multiplying each of the several numbers separately by the other number and then adding the products. In symbols it is expressed by $a(b + c + d) = ab + ac + ad$, one of two factors (a) being distributed among the parts (b, c and d) of the other factor ($b + c + d$). For example, $2(5 + 3) = 2 \times 8 = 16$; and $2 \times 5 + 2 \times 3 = 10 + 6 = 16$. The law is equally valid for negative, fractional, irrational and complex numbers.

DISTRITO FEDERAL, MÉXICO: *see* MEXICO, FEDERAL DISTRICT OF.

DISTURBING THE PEACE (BREACH OF THE PEACE) is a legal phrase which has three distinct meanings. In its broadest sense, the term is synonymous with crime itself and means any indictable offense. In another and more common sense, however, the phrase includes only those crimes which are punished primarily because of their disrupting effect upon the peace and security of the community. Among these offenses are affray, unlawful assembly, rout and riot, libel, forcible entry and detainer, disturbance of public assemblies, keeping a disorderly house and malicious mischief. In its third and narrowest meaning, the phrase is confined to willful conduct which does not fall within the definition of any other specific crime but which unreasonably disrupts the public tranquillity or has a strong tendency to cause a disturbance thereof. At common law and under many statutes, such a disturbance or breach of the peace is punishable as a misdemeanour. *See* also MISDEMEANOUR.

(C. R. SE.)

DITHMARSCHEN, an area on the west coast of the Jutland peninsula between the Eider and Elbe rivers, now in the Land of Schleswig-Holstein, Federal Republic of Germany, but down to 1866 a semi-independent territory under the king of Denmark. First mentioned in the 9th century in connection with the church at Meldorf, Dithmarschen was then one of the three Saxon Gaue (districts) north of the Elbe. Till 1140 it was a part of the countship of the Lower Elbe and developed a system of parishes. In 1144 the count was killed in a popular rising, and after a dispute between the duke of Saxony and the archbishop of Bremen Dithmarschen passed to the latter. Nevertheless from the mid-13th century onward, the increasingly prosperous peasantry was able to assert its effective independence from Bremen. The archbishop's bailiffs became absorbed into the peasant society and the communities leagued together while the Hanseatic towns, interested in Dithmarschen's harbours and therefore opposed both to the archbishop and to the count of Holstein, assisted the peasants' pretensions. In 1283 the peasants concluded a defensive alliance with the count, even if the aggressor should be the archbishop. In 1319 an attempt of Count Gerhard III of Holstein to conquer Dithmarschen failed, and in 1404 another Holstein attack was repulsed.

Dithmarschen had favourable frontiers: the sea, rivers and marshes. In 1434 the federated parishes created a central judiciary which developed into an administration by 48 regents, and in 1447 the customary laws were codified. In 1473 the Holy Roman emperor Frederick III enfeoffed Christian I of Denmark with Dithmarschen, but the Danish kings' attempts to make good this grant ended in the humiliating defeat of John at Hemmingstedt (Feb. 1500). However, despite increasing prosperity, the province lost political significance, and in June 1559 its forces were defeated near Heide by those of Frederick II of Denmark. In 1580 the province was divided into royal South Dithmarschen and ducal (Gottorp) North Dithmarschen; these districts remained even when in 1773 the whole territory fell to the king of Denmark. In 1867 Dithmarschen. together with Schleswig and Holstein, became Prussian. The district retains political peculiarities in its highly developed parish system and in the relative absence of class divisions.

(A. KA.)

DITHYRAMBIC POETRY, a type of poetry described in the Oxford English dictionary as "resembling a dithyramb in irregularity of style; wild, vehement, boisterous." In the 7th century B.C. the dithyramb (etymology unknown) was an improvised song in honour of the god Dionysus, sung by banqueters under the leadership of a man "wit-stricken by the thunderbolt of wine" (Archilochus); it was contrasted with the more sober paean, sung in honour of Apollo. The dithyramb is said to have attained literary respectability about 600 B.C., when, according to Herodotus, the poet Arion composed works of this type, gave them names and formally "produced" them at Corinth. None of Arion's dithyrambs survives; but they may have been narrative lyric poems similar to those composed by his younger contemporary, Stesichorus of Himera. By the end of the 6th century B.C. the dithyramb was a fully recognized literary genre; its most famous composer was Lasus of Hermione, who is said to have been one of Pindar's teachers. The great age of the dithyramb was also the great age of Greek choral lyric poetry in general; Simonides, Pindar and Bacchylides all composed dithyrambs. Of Simonides' and Pindar's dithyrambs little is known; but two of Bacchylides' are complete (xvii and xviii) and there are considerable fragments of several others. In these there is no suggestion of the origins of the dithyramb (xvii, indeed, should strictly have been classified as a paean); the metrical schemes, language and narrative style are closely comparable with those which are known from other choral lyrics of the great period, and only a casual remark by the comic poet Cratinus, "There is no dithyramb when you drink water," shows that the old-style dithyramb still survived in the 5th century.

Bacchylides xviii is peculiar in that it consists of a dialogue between a chorus and a soloist, and this attempt to increase the dramatic interest of the narrative may help to explain why the classical dithyramb had to give way before the more vivid methods of tragedy. In any case, from about 450 B.C. onward dithyrambic poets employed ever more startling devices of language and music, until for ancient literary critics "dithyrambic" acquired the senses "turgid" and "bombastic." True dithyrambs are rare in modern literature; the resemblance between (for example) Dryden's *Alexander's Feast* and a Bacchylidean dithyramb, or between William McGonagall's compositions and what is known of 4th-century dithyramb, is only coincidence. The nearest modern parallel for the nonliterary dithyramb, such as is referred to by Archilochus and Cratinus, would appear to be the calypso.

DITTERSDORF, KARL DITTERS VON (1739–1799), Austrian violinist and composer of instrumental music and light operas which established the form of the *Singspiel,* was born in Vienna on Nov. 2, 1739. He was a brilliant child violinist, and was engaged at the age of 12 in the orchestra of Prince von Sachsen-Hildburghausen. Later he played in the orchestra of the Vienna opera and became friendly with Gluck, whom he accompanied in 1763 to Bologna; his violin playing brought him considerable celebrity in that city. In 1765 he became director of the orchestra of the bishop of Grosswardein (Oradea) in Hungary. He set up a private stage in the episcopal palace and wrote for it his first opera, *Amore in musica.* His first oratorio, *Isacco,* was also written during this time. Not unexpectedly, performances of light opera by the bishop's company, even on fast days and during Advent, caused a scandal; the empress Maria Theresa censured the bishop, who dismissed his orchestra in 1769.

The following year Ditters was again in the service of an ecclesiastical patron, Count Schaffgotsch, prince-bishop of Breslau, at Johannisberg, Silesia. There he composed 11 comic operas, among them *Il Viaggiatore americano* (1770), and an oratorio, *Davidde penitente* (1770). In 1773, ennobled under the name Ditters von Dittersdorf, he produced the oratorio *Esther* in Vienna. After the peace of Teschen (1779) he again became music director for the prince-bishop of Breslau, who had reconstituted his orchestra. About this time he formed a close friendship with Haydn, who introduced his operas to Esterhazy, and from 1783 he played in string quartets in Vienna with Mozart. From this period onward his output was enormous. He produced the oratorio *Giobbe* (1786) and several operas, three of which, *Doktor und Apotheker* (1786), *Hieronymus Knicker* (1787) and *Das rote Käppchen* (1788), had great success. *Doktor und Apotheker,* in particular, became one of the classic examples of the German *Singspiel.* He also wrote a large quantity of instrumental music. In 1796, following the bishop's death, he was dismissed with a small pension. Poor and broken in health, he accepted a post with Baron Ignaz von Stillfried at Schloss Rothlhotta, Neuhof, Bohemia, where he died on Oct. 24, 1799. On his deathbed he dictated his autobiography which, although naive in concept, is of great interest to students of 18th-century music.

Dittersdorf was one of the earliest composers of the Viennese classical school. His work is uneven but at its best displays true Viennese gaiety. His symphonies, although overshadowed by those of Haydn, are often of great interest, especially those of a programmatic nature, such as the six surviving symphonies on Ovid's *Metamorphoses.* His violin concertos are worthy of study, and several of his string quartets, although lacking the depth of Haydn or the graciousness of Boccherini, have their own personality. His partitas for wind instruments are notable for the formidable nature of the horn parts. As an opera composer Dittersdorf is chiefly remembered for his light-hearted and sometimes sentimental *Singspiele.*

DIU (DIO), an island and town of former Portuguese India, which was taken over by India in Dec. 1961, lies at the southern extremity of the peninsula of Kathiawar. The district (area 14 sq.mi.) included the village of Gogolá on the mainland and the fortress of Simbor (Pani Kota Island) 12 mi. E. The population of the district (1950) was 21,138. The anchorage is protected from the sea, but the depth of water is only about two fathoms. The channel between island and mainland is navigable only by small craft.

The Portuguese, under treaty with Bahadur Shah of Gujarat, built a fort at Diu in 1535, but were besieged in 1538 and 1545. The second siege, the subject of an epic by Jerónimo Côrte-Real (*q.v.*), is one of the most famous events in Indo-Portuguese history. The town is surrounded by a wall with towers at regular intervals. There are remains of several fine ancient buildings. The cathedral of Sé Matriz, dating from 1601, was formerly a Jesuit college. Many of the inhabitants became Banyan merchants of the east coast of Africa and Arabia. Industries which were established include salt processing, fishing, and distillation of spirits from the palm. The trade of the town, however, decayed. Diu was subject to the governor general of Goa as part of the Portuguese overseas province, Estado da India.

See also GOA. (L. D. S.)

DIURETICS are drugs that produce an increased flow of urine. They are used for: (1) the removal of excess water and salt from the bady, thus relieving or preventing edema such as may result from circulatory and nutritional disorders: (2) the hastening of the excretion of ingested poisons; (3) the removal of accumulated metabolic products; and (4) the dilution of urine in order to prevent precipitation of drugs in the kidney tubules *(see* SULFONAMIDES).

In general, diuretics act either by increasing the filtration through the glomeruli of the kidneys or by decreasing the absorption from the tubules *(see* URINARY SYSTEM). The first group includes drugs that alter the osmotic pressure or electrolyte balance of the plasma, such as the saline diuretics, urea and intravenous sucrose, and drugs such as digitalis and strophanthin that improve the circulation by strengthening the heart. Drugs that decrease the tubular reabsorption include the mercurial diuretics such as mersalyl (salyrgan) and merbaphen (novasurol) and probably also the xanthine diuretics (theobromine, theophylline and caffeine). (F. L. A.)

DIURNAL MOTION, the apparent daily motion of the heavens from east to nest which causes the rising and setting of celestial objects and which results from the earth's rotation on its axis from west to east. The axis of this apparent motion is coincident with the axis of rotation of the earth and intersects the celestial sphere at the celestial poles.

The great circle intersection of the plane of the earth's equator with the celestial sphere defines the celestial equator. The apparent daily paths of celestial objects are circles parallel to the celestial equator and are termed diurnal circles. In the northern hemisphere, the diurnal motion causes the stars to appear to describe circles about a point within one degree of the star Polaris. (R. L. DE)

DIVER, a name applied to many aquatic diving birds, but usually applied to the loons, especially in Europe. The loons, constituting the family Gaviidae of the order Gaviiformes, all belong to a single genus, *Gavia. See* LOON.

DIVERTICULITIS AND DIVERTICULOSIS. Diverticulosis generally denotes the presence of one or more diverticula or outpouchings of the colon (large bowel). Diverticulitis means inflammation of these diverticula. In medicine, these two terms usually are applied only to conditions in the colon and are not used to describe diverticula or the corresponding diverticulitis of the following common varieties: pulsion (Zenker's), traction or epiphrenic of the esophagus; duodenal; Meckel's (of the ileum); or the vermiform appendix.

Diverticulosis occurs in about 20% of persons over 40 years of age and is commoner in older people. Its cause is unknown. The diverticula, which are found by X-ray (barium enema) examina-

tion, are confined to a 4- to 8-in. segment of the left colon, especially its sigmoid (lower) portion. In reference to the circumference of the bowel, the diverticula are situated near, but not at, the mesenteric attachment and occur where the small blood vessels penetrate the muscular portion of the colonic wall, creating a weak point. The diverticula tend to become "teardrop" shaped with growth. They do not perforate unless inflamed but may bleed massively into the bowel lumen, serving as a cause, but not a frequent one, of massive bleeding from the rectum. Except when the rare complication of massive bleeding occurs, diverticulosis is symptomless.

Diverticulitis, on the other hand, is usually accompanied by pain. Chills and fever are also common. Because of the pain and the fact that the left colon is involved in 80% of cases, diverticulitis is sometimes referred to as "left-sided appendicitis." Medical treatment is used for mild or uncomplicated cases. while surgery is preferable when complications ensue. Complications include hemorrhage in about 15% of cases. usually milder but more protracted than in simple diverticulosis; perforation, sometimes with a fistula into surrounding organs; obstruction of the sigmoid to the passage of stools, often because of adhesions or local edema; and intractability and chronicity. Quite often the attending physician is unable to differentiate diverticulitis from cancer. The preferred surgical treatment is excision of the involved segment of the colon with end-to-end anastomosis (joining) of the remaining colon, preferably with interrupted sutures.

DIVERTIMENTO, a musical term (from the Italian word meaning a diversion) in fashion in the second half of the 18th century) and given, particularly by Haydn and Mozart, to an instrumental work of a light or entertaining nature that usually consisted of several movements, for strings or wind. with or without harpsichord, or for both of these types of instruments combined. The movements were in sonata form, variation form. or followed the style of dance movements in the suite. Among the numerous divertimenti of Haydn are his sestet, in the form of a double string trio to be played by two groups simultaneously in different rooms, and his "Children's Symphony" for string trio and seven children's instruments. The divertimenti of Mozart resemble his works having the name serenade or cassation. The style of the divertimento was to some extent maintained in the Septet, Op.20, by Beethoven and the Octet, Op.166, by Schubert. Loth for wind and strings. The term was also applied in the 20th century to compositions by Bartok and others.

DIVIDE, in geomorphology, is a height of land from which the natural drainage of an area flows in opposite directions. ***See*** WATERSHED.

DIVIDEND. An ordinary dividend consists of earnings distributed among stockholders of a corporation in proportion to their holdings and as determined by the class of their holdings. Dividends are usually payable in cash, although on occasions distributions are made in the form of additional shares of stocks. The actual payment is made to stockholders of record. The preferred stockholders are entitled to a preferential dividend, usually at a fixed rate, and the common stockholders get a portion of what remains after payment of the dividends on preferred stock. *See* STOCK OR SHARE; *see* also references under "Dividend" in the Index volume.

DIVI-DIVI, the native and commercial name for the astringent pods of *Caesalpinia coriaria,* a leguminous shrub or small tree of the subfamily Caesalpinioideae, growing in open, semiarid regions. especially above tidal flats of the coast from Mexico to northern South America and tht: West Indies. The plant is between 20 and 30 ft. in height and bears white flowers. The pods are flattened and curl up in drying: they are about three-lourths of an inch broad. from two tu three inches long and of a rich brown colour. Divi-divi was nrst taken to Europe from Caracas in 1768. The pods yield a high percentage of tannin (*q.v.*) of exceptional qualities

DIVINATION, the process of obtaining knowledge of secret or future things from contact with superhuman or divine sources. Divination is practised in all grades of culture, the information received being commonly held to come directly or indirectly from superior, nonhuman sources. Divinatory methods may be classified as internal, conditioned by change in the consciousness of the soothsayer; and external.

Internal Methods.— These depend for their results on sensory or motor automatisms or mental impressions. Among sensory automatism~crystal gazing is analogous to dreams, except that the vision is voluntarily initiated, though little, if at all, under the control of the scryer. Shell hearing and similar methods in nhich the information is gained by hearing a voice are less common. The divining rod is the best-known example of motor automatisms. Water divining or dowsing has been uidely used; similarly a sieve held suspended gives indications by turning; and divination by a suspended ring is found from Europe to China and Japan. The ordeal by the Bible and key is equally popular; the book is suspended by a key tied in with its wards between the leaves and supported on two persons' fingers. and the whole turns round when the name of the guilty person is mentioned. Divination by automatic writing is practised in China. Trance speaking may be found in any stage of culture and in many cases the procedure of the magician or shaman induces a state of autohypnosis; at a higher stage these utterances are termed oracles and are believed to be the result of inspiration. ***(See*** also DIVINING ROD; ORACLE.)

Observation shows that by the aid of mental impressions. akin to clairvoyance. fortunes are told successfully by means of palmistry or by laying the cards: for the same "lie" of the cards may be diversely interpreted to meet different cases. In other cases the impression is involuntary or less consciously sought, as in dreams, nhich, honever are sometimes induced for purposes of divination by the process known as incubation or temple sleep. Dreams are sometimes regarded as visits to or from gods or the souls of the dead sometimes as signs to be interpreted symbolically. ***(See*** also PARAPSYCHOLOGY; PALMISTRY)

External Methods.— In external divination the process is by inference from external facts. The methods are very various. The casting of lots, sortilege, was common in classical antiquity. Similarly dice and knuckle bones are thrown for purposes of sortilege In Polynesia the coconut is spun like a teetotum to discover a thief. In ancient times the poets were often consulted, more especially Virgil, just as the Bible is used for drawing texts in modern times.

In haruspication, or the inspection of entrails, in scapulimancy or divination by the spealbone or shoulder blade, in divination by footprints in ashes, the diviner must take active steps to secure the conditions necessary to divination. ***(See*** also HARUSPICES.) In the case of augury and omens. the behaviour and cries of birds. and meeting with ominous animals, etc., may be voluntarily observed ***(see*** AUGUR). Astrology is a divining method of great antiquity ***(see*** ASTROLOGY). ***See*** also references under "Divination" in the Index volume.

DIVINE RIGHT: ***see*** KING.

DIVINE WORD, SOCIETY OF THE (DIVINE WORD MISSIONARIES; SOCIETAS VERBI DIVINI; S.V.D.), a Roman Catholic religious organization, composed of priests and brothers, founded in 1875 in Steyl, Neth., by Arnold Janssen for the propagation of Catholicism among pagan peoples, and approved in 1901. Its members are engaged in all phases of missionary activity. from teaching in universities. colleges and secondary schools to "bush" missionary work among primitive peoples. Over 5.000 members work in 14 European countries, in North and South America. Africa. Australia, Formosa. India. Indonesia. New Guinea. Philippines and Japan. The training of a native clergy has always been a major work of the society in all its missions. It also publishes about 50 periodicals in 14 different languages. The general mother-house is at Rome. Some of its members. particularly Wilhelm Schmidt. have made valuable contributions in the fields of anthropology and ethnology. (N. F. B.)

DIVING: see DIVING APPARATUS; SWIMMING; SKIN DIVING; OLYMPIC GAMES.

DIVING APPARATUS, the equipment designed to permit men to work under water in salvage, commercial (pearl and sponge fishing) and scientific operations. For the techniques and equipment employed in sports. see SKIN DIVING.

This article is divided into the following sections:

I. HISTORY

1. Early Divers.—The earliest reference to the practice of diving occurs in the Iliad, 16, 745–750, where Patroclus compares the fall of Hector's charioteer to the action of a diver diving for oysters. Since remote times swimming and diving have been practised as a special industry among Greeks and Romans and professional divers have recovered pearls, coral, sponges and lost treasures from the sea bed. One diver, Scyllias, contrived the shipwreck of Xerxes' galleys near Mt. Pelion by cutting adrift their moorings during a storm. Thucydides mentions the employment of divers during the siege of Syracuse to saw down the barriers which had been constructed below the surface of the water with the object of obstructing and damaging any Grecian mar vessels which might attempt to enter the harbour. At the siege of Tyre, divers were ordered by Alexander the Great to impede or destroy the submarine defenses of the besieged as they were erected.

2. Early Diving Appliances.— The earliest mention of any appliance for assisting divers is by Aristotle, who says that divers were sometimes provided with instruments for drawing air from above the water and thus they were able to remain a long time under the sea, and also that divers breathed by letting down a metallic vessel which did not get filled with water but retained the air within it. It is also recorded that Alexander the Great made a descent into the sea in a machine called a *colimpha,* which had the power of keeping a man dry and at the same time of admitting light.

Pliny also speaks of divers engaged in the strategy of ancient warfare who drew air through a tube, one end of which they carried in their mouths while the other end was made to float on the surface. It is the same "tube" that enables modern underwater explorers to examine the sea bed while swimming, without having to come to the surface to breathe. Vegetius, a Latin writer of the 4th century A.D., has a drawing representing a diver wearing a tight-fitting helmet to which is attached a long leather pipe leading to the surface where its open end is kept afloat by means of a bladder.

Various writers refer to a passage in Roger Bacon's works in which he alludes to "instruments whereby men can walk on sea or river beds without danger to themselves" (1240). The diving apparatus described by G. A. Borelli in 1679 comprised a leather bottle containing a supply of air which was carried on the diver's back and a piston to regulate his specific gravity, but it could not have proved practicable.

John Lethbridge, a Devonshire man, in 1715 produced a contraption in the form of a leather barrel with two sleeves for the arms and an observation porthole; it could, however, be used only in depths of up to ten feet. It is said that Lethbridge made a considerable fortune by his invention. In 1797 K. H. Klingert of Breslau invented a form of diving gear provided with ingenious devices that opened the way to designers. This consisted of an egg-ended metallic cylinder enveloping the head and the body to the hips. The diver was encased first of all in a leather jacket having tight-fitting arms, and in leather drawers with tight-fitting legs. To these the cylinder was fastened in such a way as to render the whole equipment airtight. The air supply was drawn through a pipe which was connected with the mouth of the diver by an ivory mouthpiece. Klingert perfected his apparatus by adding an air container for breathing.

In 1819 Augustus Siebe invented his open diving dress worked in conjunction with an air force pump. The dress consisted of a metal helmet formed with a shoulder plate attached to a jacket of waterproof leather. The helmet was fitted with an air inlet valve to which one end of a flexible tube was attached, the other end being connected to the air pump. The air. which kept the uater down below the diver's chin, found its outlet at the edge of the jacket, exactly as it does in the case of the diving bell. Excellent work was accomplished with this dress—work which could not have been attempted before its introduction—but it was still far from perfect. It was absolutely necessary for the diver to maintain an upright or but very slightly stooping position while under water; if he stumbled and fell, the water filled his dress, and, unless brought quickly to the surface, he was in danger of being drowned.

To overcome this and other defects, Siebe carried out a great many experiments, which culminated, in the year 1830, in the introduction of his close dress in combination with a helmet fitted with air inlet and regulating outlet valves. Though, of course, many great improvements were introduced after Siebe's death in 1872, his principle remained in universal use. The submarine work which it has been instrumental in accomplishing is incalculable.

FIG. I. — **DIVING HELMET**
(A) Helmet complete with corselet; (B) corselet; (C) interior of helmet showing valves and telephone connections

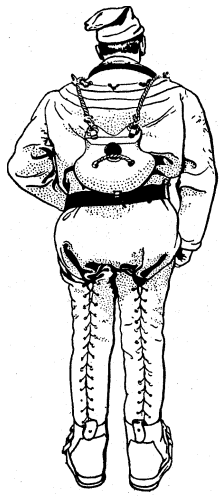
II. MODERN APPARATUS

1. Diving Suit With Helmet.—A set of ordinary modern diving apparatus consists essentially of seven parts: (1) an air pump; (2) an incompressible helmet with breastplate, or corselet; (3) a compressible, or flexible, waterproof diving dress; (4) a length of flexible noncollapsible air tube, with metal couplings joining it to pump and helmet; (5) a pair of weighted hoots; (6) a pair of lead weights for breast and back; and (7) a lifeline. Most apparatus is fitted with a telephone, and submarine lamps are also largely used.

Helmet.—The helmet proper is separate from the corselet, and is secured to the latter by segmental neck rings which are provided on both these parts, enabling them to be connected by one-eighth of a turn, a catch on the back of the helmet preventing any chance of unscrewing. The helmet and corselet are usually made of highly planished tinned copper, the valves and other fittings being of gun metal.

The helmet has a nonreturn air inlet valve to which the air-supply pipe is attached. This valve allows air to pass from the pump to the helmet but not in the reverse direction. A regulating air outlet

valve fitted to the helmet enables the diver to control the amount of air in the dress, and hence his buoyancy. By screwing up the valve, he retains the air in the dress, and so maintains or increases his buoyancy; by unscrewing it he allows the air to escape, thus causing the dress to become deflated, with a consequent loss of buoyancy. On reaching the bottom and starting work. the diver will adjust his valve so as to maintain himself comfortably in equilibrium, altering the adjustment only when he wishes to ascend; that is, of course, assuming, as should be the case, that air is pumped to him at a uniform rate. Thick plate-glass windows are fitted to the helmet. The front window is detachable from the helmet, usually by unscrewing though some helmets are fitted with hinged windows. (See fig. 1.)



BY COURTESY OF SIEBE, GORMA AND CO LTD.

FIG. 2.—DIVING DRESS WITH LACED LEGS

Dress.—The diving dress is a combination suit made of two layers of tanned twill with pure rubber between, and which envelops the whole body from foot to neck, the sleeves being fitted with vulcanized rubber cuffs which make a watertight joint round the diver's wrists. The dress is also fitted with a vulcanized rubber collar which is secured to the corselet or breastplate of the helmet so as to render all watertight. (See fig. 2.)

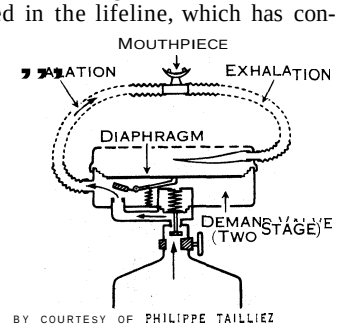
Air Pipe.—The diver's air pipe is flexible and noncollapsible. At the ends are fitted metal couplings for securing the pipe to the pump and helmet respectively.

Boots.—To maintain himself in an upright position under water, the diver wears heavily weighted boots (about 32 lb. the pair).

Weights.—Two lead weights, 40 lb. each. one on the back and one on the chest, ensure the diver's equilibrium under water.

Lifeline.—The diver's lifeline is for use in case of emergency, for hauling the diver to the surface and also for making signals, the diver and his attendant having a prearranged code in which varying numbers of pulls or jerks on the lifeline have definite meanings. When a telephone is provided, the telephone wires are embedded in the lifeline.

Diver's Telephone.—This instrument provides means whereby the attendant at the surface can converse with no. 1 or with no. 2 diver, or with both together. He can also put no. 1 diver into communication with no. 2, himself hearing their conversation. The telephone wires are embedded in the lifeline, which has connections at each end for attaching to helmet and battery box. The diver's receiver is situated generally in the crown of the helmet, and the transmitter between the front glass and one of the side glasses. The diver can ring a bell or buzzer at the surface by pressing with his chin a contact piece situated inside the helmet.



BY COURTESY OF PHILIPPE TAILLIEZ

FIG. 3.—COUSTEAU-GAGNAN COMPRESSED-AIR. OPEN-CIRCUIT BREATHING

Air *Pumps.*—Diver's air pumps are of various patterns, depending principally upon the depth of water in which work is being carried out. since the greater the depth of water the greater the quantity of air required by the diver. The pumps are of the reciprocating type and pressure gauges are provided which indicate the pressure of air which the pump is supplying and the depth at which the diver is working.

Air *Compressors* driven by electric motors or internal-combustion or steam engines are sometimes employed. In these cases the air is delivered into steel reservoirs. the divers' air pipes being connected to an air control panel which receives its air from the reservoir so that in case of a breakdown of the motive power, a reserve of air sufficient to bring the diver safely to the surface is assured.

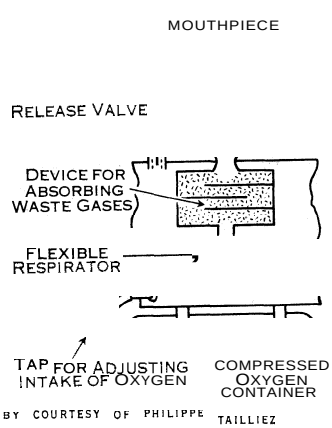
In the pearl and sponge fisheries the small boats from which the divers work are sometimes propelled by internal-combustion engines which also drive the air compressors.

The type of air-pumping apparatus employed varies with the depth of water and the conditions under which the diving operations are conducted.

2. Air Supply.—The diver's air supply must be adequate both in volume and pressure—the volume sufficient to ensure proper ventilation of the helmet, and the pressure fully equal to that which corresponds to the depth of water at which the diver may be working. In fresh air there is only .03% of carbon dioxide, and, at ordinary atmospheric pressure, no ill effects are felt until 3% of the gas is present. As a diver descends, the pressure is increased and the effect of a small percentage of carbon dioxide in his helmet becomes greater.

J. S. Haldane, who conducted deep-diving experiments for the British admiralty in 1906, established that 1.5 cu.ft. of air per minute would be needed to keep the percentage of carbon dioxide at a safe level. This volume of air is required at all depths, so that the actual quantities required at different depths down to 231 ft. are as shown in the table.

3. Self-Contained Diving Apparatus.—The traditional diving suit with helmet described above lost nothing of its value for industrial work. but other forms of apparatus, self-contained and less heavy and cumbersome, assumed increasing importance. They are of two main types: with compressed air and an open circuit—the first industrial application of which was made by the Frenchmen A. Rouguayrot and Denayrouze in 1864; and with oxygen and a closed circuit. The first really practicable example of the latter was designed by H. A. Fleuss.



BY COURTESY OF PHILIPPE TAILLIEZ

FIG. 4.—CLOSED-CIRCUIT APPARATUS

Combined with a diving mask, a weighted belt and means of propulsion, and eventually with a protective covering. these forms of apparatus enabled men to swim and explore under water. Apparatus designed by J. Y. Cousteau and E. Gagnan on the compressed-air 'and open-circuit principle employs from one to three aluminum cylinders. containing air to the pressure of 200 atm., strapped to the diver's back. Inhaling and exhaling breathing tubes connect a mouthpiece to the demand valve (two stage) mounted at the top of the cylinders. The fall in pressure produced by each inhalation displaces the diaphragm of the demand valve and lifts the valve admitting air. At exhalation the air is discharged into the water (fig. 3).

The apparatus using oxygen and a closed circuit supplies a synthetic but breathable atmosphere by means of a watertight chamber containing caustic soda which fixes the carbon dioxide produced in expiration. Fleuss and R. H. Davies were the first to combine the apparatus with the classical diving suit and helmet. During World War II a number of diving devices using oxygen were employed by frogmen, human torpedoes and demolition teams to attack the moorings of enemy ships and destroy coastal defenses.

The practicable limit of self-contained compressed-air appara-

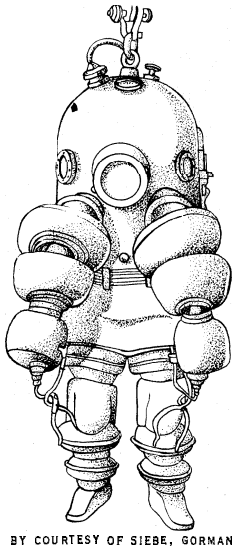
Quantities of Air Required at Vurying Depths

Depth in fathoms	Depth in feet	Pressure per sq.in. above atmospheric pressure (in lb.)	Quantity of air at atmospheric pressure required per minute by the diver (in cu.ft.)
0 . . .	0		1.5
5½ . .	33	14.7	3.0
16½ . .	99	44.0	6.0
33 . . .	198	88.1	10.5
38½ . .	231	102.8	12.0

tus is 130 ft. Oxygen apparatus cannot safely be used below 26 ft., for beyond that depth breathing of pure oxygen under pressure is apt to cause physical disturbances and make drowning more likely.

4. Diving Bells.—When a container is immersed in water, with its opening pointing downward, the volume of air enclosed in it diminishes in proportion to its depth in the water, the air pressure being balanced by that of the water at its own level. Thus at 33 ft., when the pressure of the water is double the atmospheric pressure, the volume of air in the container is reduced by half. If one continues compressing the air in the container at a pressure slightly above the pressure already existing, the level of the water inside can be seen to drop until the air escapes from the rim of the vessel.

Such is the principle of the diving bell. It does not differ from that of the diving suit and helmet, and rudimentary forms of the apparatus have been used since antiquity. From 1671, when letters patent were introduced in England, to the end of the 18th century nearly 30 patents were issued for diving bells and suits.



BY COURTESY OF SIEBE, GORMAN AND CO., LTD.

FIG. 5.—SELF-CONTAINED DIVING DRESS MADE OF CAST-STEEL CYLINDERS. INVENTED BY NEUFELDT-KUHNKE

An important advance in the diving bell was introduced by the English astronomer Sir Edmund Halley in 1690. This consisted of renewing the air of the bell by means of barrels filled with air which were lowered to its level.

Diving bells are used in industry for laying bridge foundations and work in docks and harbours. Several Siebe-Gorman ordinary diving bells, built of steel, were used during the construction of the National harbour at Dover. Each measured 17 ft. long by 10½ ft. wide by 7 ft. high, and weighed 35 tons. They were lighted electrically and fitted with telephonic apparatus which enabled the bell divers to converse with the engineers and crane and compressor attendants at the surface.

Air was supplied to the bell by a steam-driven compressor housed on the gantry which carried the traveling cranes for lowering and raising the bell through the water to a maximum depth of 60 ft. and also for lowering the concrete blocks. The air tube for the compressors was connected to a nonreturn air inlet valve fitted in the crown of the bell, the excess escaping at the lower edge of the latter. The bell divers were employed in leveling the sea bed in readiness to receive the blocks, which weighed 40 tons each. Having leveled one section, the bell was moved to the next. The blocks were then lowered and were placed in position by helmet divers.

The air-lock diving bell comprises a steel working chamber, similar to the ordinary diving bell already described with the addition of a steel shaft attached to the roof. At the upper end of the shaft is an airtight door, and about eight feet below this is another similar door, the space bet een the two forming an air lock. When the men wish to enter the bell, they pass through the first door and close it after them, and then open a valve and let into the lock compressed air from the working chamber till the pressure is equalized; they then open the second door and pass into the main shaft, closing the door after them. Access to the working chamber is by ladder, secured to the side of the shaft. When returning to the surface, they reverse the operation, opening the lower door, entering the lock and closing the door again; then opening a valve to release the air pressure, when the upper door is opened and the men emerge to atmosphere. (Some bells of this type are fitted with two shafts, each with its air lock—one for the passage of the bellmen, the other for materials.)

5. Rigid Diving Apparatus and Observation Chambers.—In contrast with the apparatus already described, in which the diver has, of necessity, to breathe at a pressure equal to that of the water at his level, rigid diving apparatus and observation chambers have an outer cover for resisting the pressure of the water, and the diver himself continues to breathe at a pressure nearly that of the atmosphere; there is a device for absorbing carbon dioxide and regenerating oxygen.

In 1882 the brothers Carmagnolle took out a patent for an armour-plated diving suit. The most satisfactory modern version of this apparatus is the rigid jointed Neufeldt-Kuhnke type, which is lowered and raised by means of a cable and allows the diver to observe and make limited movements. There is a growing tendency for observation chambers to replace rigid diving gear and several types of these are in use. They are equipped with numerous portholes, searchlights and telephones and can reach a depth of 1,625 ft.

6. The First Bathyscaphes.—Credit for the name, the idea and the construction of the first bathyscaphe belongs to Auguste Piccard. It was a transposition into aquatic terms of the free stratospheric balloon with a tightly sealed cabin which had been built by Piccard and which in 1932 reached a height of 55,577 ft. with Piccard himself and Max Cosyns as passengers. Because it nas built with the help of the Fonds National de la Recherche Scientifique Belge (F.N.R.S.) this balloon had been called F.N R S.1.

The construction by Piccard and Cosyns of the first bathyscaphe, also financed by the F.N.R.S. and called F.N.R.S.2, was interrupted by World War II and was not finished until 1948. The sealed steel cabin, equipped with Plexiglas observation portholes, was able to resist a pressure of 5,700 lb. per square inch, which corresponds to the pressure at a depth of 13,000 ft. The weight of the cabin was compensated for by a buoyancy chamber, containing 7.000 gal. of gasoline, a liquid lighter than water. The releasable ballast, controlled from inside the bathyscaphe by an electric circuit, made it possible to brake its descent and to begin the ascent. The bathyscaphe was equipped, among other accessories. with floodlights, twin screws and a guide rope which controlled the rate of descent and held it stable near the bottom.

The trials made in 1948 at the Cape Verde Islands, assisted by the French navy, were a failure because the apparatus was not strong enough to withstand the action of the seas at the surface. However, a descent without passengers to a depth of 3 600 ft. was completed, and it proved at least that the principle of the bathyscaphe was sound and capable of development. A second bathyscaphe, called F.N.R.S.3, was then put into construction at the arsenal at Toulon, making use of the experience gained with F.N.R.S.2. The spherical cabin of F.N.R.S.:! mas the only part to be retained. More robust in construction, the F.N.R.S.3 included notably a shell round the buoyancy chamber making it possible to tow it in high seas, and a flooding chamber facilitating the emergence of the passengers when the bathyscaphe resurfaced. The successful trials of the F.N.R.S.3 ended on Feb 1:. 1954, with a descent into the Atlantic off Dakar to a depth of 13,287 ft. by G. S. Houot, the captain of a corvette, and P. Willm, a naval engineer. After having collaborated with the arsenal at Toulon during part of the construction of F.N.R.S.3, Auguste Piccard built in Italy with the help of the Italian navy a new bathyscaphe of his own. the "Trieste," similar to the F.N.R.S.3 in principle and appearance. After successful trials it was bought by the U.S. navy and on Jan. 23, 1960, Jacques Piccard and Lt. Don Walsh, U.S N., descended in it to the bottom of the Pacific's Mariana trench, a record depth of 35,800 ft.

III. EFFECTS OF AIR PRESSURE ON THE DIVER

When a diver descends into the sea, the extra air pressure to which he is subjected is instantly transmitted to the whole inside of his body. In the lungs the blood is practically in contact with the air, which consists of three important gases—oxygen, nitrogen and carbon dioxide. The oxygen is used up by the tissues. and the breathing prevents the pressure of carbon dioxide from increasing, but the nitrogen is dissolved in the blood in the same way as a gas is absorbed by a liquid on which it has no chemical action in amounts proportional to the pressure of the gas.

Toward the mid-19th century, at the time of the first great practical applications of the Industrial Revolution, work involving compressed-air apparatus (caissons or diving bells) began in

FIG. 6.— BATHYSCAPHE F.N.R.S.3. SELF-CONTAINED AND SELF-PROPELLED OBSERVATION CHAMBER WITH GASOLINE FLOAT AND RELEASABLE WEIGHTS FOR PRESERVING EQUILIBRIUM AND RETURNING TO THE SURFACE

earnest with the sinking of bridge piers and the construction of underwater foundations, etc. Workers employed in these activities would return to atmospheric pressure without taking precautions after long hours spent in pressures sometimes higher than 30 lb. absolute.

After leaving the caisson, or several hours later, disorders occurred, taking many different forms: irritation, depression, extreme fatigue, respiratory troubles and nervous upsets. These aftereffects. sometimes fatal and at times making their victim an incurable invalid, could also pass without leaving a trace.

Divers, naturally tempted to enlarge their field of action—salvaging shipwrecks, fishing for sponges, etc.—prided themselves on descending lower and remaining longer underwater. The same mishaps occurred.

Medical science was powerless to deal with this mysterious "caisson disease" but theories about it and proposed treatments abounded The lowering of air pressure which caused a cooling down of the system was blamed by some and in 1863 a certain Dr. Foley, in a pamphlet called "Work in Compressed Air." went so far as to advise divers to speed up their movements should they find themselves being overcome by a "thick and icy haze." To Paul Bert in Barometric Pressure (1878) goes the credit for showing precisely the cause of such illnesses.

During the descent and period spent at the bottom, the diver breathes air at a pressure higher than atmospheric and at each breath a certain amount of nitrogen is dissolved in the lungs.

The tissues, in their turn fed by the blood, are charged with nitrogen in an amount dependent on the duration of the dive. Admittedly, about six hours would be the minimum time for the whole body to become saturated.

On returning to the surface the process is reversed. The excess nitrogen dissolved in the different tissues is carried by the blood to the lungs and is then eliminated in respiration. If the rise is too rapid, the difference between the pressure of the nitrogen dissolved in the tissues and the hydrostatic pressure is such that bubbles form, as when champagne is poured out quickly. It is these bubbles that cause decompression illnesses. Bert had already recommended a slow and steady rise to avoid the formation of such bubbles. However, even when the return to the surface was prolonged, accidents still sometimes happened.

It was only in 1907, on the publication of findings of the British admiralty's board of deep diving, that rules safeguarding divers' and caisson workers' return to atmospheric pressure were adopted. These rules, which were universally accepted, were the work of Haldane who based his investigations on the fact that when a diver surfaces rapidly from a depth of 45 ft. he does not suffer any trouble however long the duration of his dive has been. At the end of surfacing, the pressure of nitrogen dissolved in the tissues may exceed double the pressure of the surrounding air. The volume of dissolved nitrogen which shows a tendency to escape in the form of bubbles when the pressure is reduced from two to one is the same, whatever the initial pressure. Haldane suggested that it should be possible for the diver to rise without trouble to a first stage where the hydrostatic pressure was half that of the nitrogen dissolved in the most highly charged part of the body.

This hypothesis having been confirmed experimentally, it was then possible to effect the decompression of the diver without risk, provided the speed of his rise was regulated so that the hydrostatic pressure always remained at least equal to half that of the dissolved nitrogen in the most heavily charged part of his body. Surfacing in these conditions involving a variable speed is difficult in practice and Haldane adopted a scheme whereby the diver stops every ten feet for a certain time.

1. Compressed-Air Illness.— Although the rules laid down are calculated to prevent compressed-air illness completely, cases do sometimes occur, as a result of accidents or mistakes, where the diver comes up too quickly from deep water. In such cases, whether the diver has already shown symptoms of compressed-air illness or not, he should be sent down again without delay to the depth at which he has been working and kept there for five minutes, after which he can start to come up again at prescribed rates.

On some deep-diving operations, however, a Siebe-Gorman recompression chamber, as shown in fig. 7. is provided, the use of which is a much better and more comfortable method of treatment than sending the diver into deep water again. This chamber is of steel, provided with a bench on which the diver can sit or lie, electric light, telephone, etc. Windows are provided through which the diver can be watched during the process of decompression; a small hand air lock attached to the chamber allows refreshments, etc., to be passed in to him. It is usually found sufficient to raise the pressure in the chamber to 30 lb., but it should never exceed 45 lb. As soon as the diver is relieved of any symptoms, the pressure is allowed to fall at prescribed minimum rates.

2. Helium and Oxygen for Deep-Sea Diving.— Helium, an inert and light gas (molecular weight 4 as against 28 for nitrogen), was the subject of experiments by the U.S. navy in an attempt to reduce the time taken in surfacing without increasing the risks of accident caused by decompression. These hopes were disappointed, however, for helium is less soluble in the body than

nitrogen and spreads more quickly. Decompression after a dive using helium proved to be a longer and more difficult process than when air mas used. and accidents were much more common. For short dives—the most usual at great depths—the use of air still requires the shortest periods for decompression. It has been established, however, that in dives using a mixture of helium and oxygen the intoxication produced by great depths does not occur at maximum depths reached, *i.e.,* 536 ft.; whereas, using air, it starts at 162½ ft. and prevents descent below 292½ ft. That is why helium is employed for deep diving. U.S. navy regulations provide for its use from 146 ft. In practice it is not used below 211 ft. because of the complexity of the apparatus and, more especially, the difficulties of decompression.

IV. GREATEST DEPTHS FOR USEFUL WORK

The greatest depth at which useful work has been accomplished by divers is 275 ft. This was at the salvage of the G.S. submarine "F4," sunk off Honolulu, by divers of the U.S. navy using the British admiralty decompression system.

The greatest underwater treasure ever recovered was that of the liner "Laurentic." torpedoed in 191; off the coast of Ireland in 114 ft. of water. On board were 40 tons of gold and silver bound for the United States. Work by divers with helmets. under Cmdr. G. C. C. Damant, lasted six years and resulted in the salvaging of about 99% of the total.

The greatest depth from which treasure has been recovered—using an observation chamber—was 475 ft., reached in the case of the "Siagara," sunk by a mine in 1940 off New Zealand. There were eight tons of gold on board. The salvage work. directed by Capt. J. P. Williams, lasted 11 months and recovered about 95%.

The most ancient and important artistic recovery made by divers was the galley of Mahdia, Tunisia, discovered in 1907 by Greek sponge fishers and lying in 120 ft. of water. The cargo was composed of temple columns and capitals. bronze and marble statues and bowls—all dating from the Greek period (1st century B.C.). The finds were placed in Bardo museum. Research begun between 1908 and 1911 was continued by Commanders P. Tailliez and J. Y. Cousteau in 1948 and marked the beginning of underwater archaeology.

See Sir Robert *H.* Davis, *Deep* **Diving** and *Submarine Operations (1936;* 5th ed., 1951); La *Plongée,* diving manual of the French navy (1955). (R. H. D.; P. M. Tz.)

DIVINING ROD. The divining rod has been used for centuries to search for hidden things. According to modern usage it is a Y-shaped forked stick, metal rod or wire. When an operator firmly grasps the branches of the Y, squeezes them together, then walks about, the rod is supposed to indicate by dipping (or rising) that' it is over or near water, precious metals, oil. criminals. buried coins or whatever is being sought.

The ancient Scythians, Medes. Persians, Greeks and Romans used divining rods. Marco Polo found them used for divination (*q.v.*) throughout the orient in the late 13th and early 14th centuries. The best evidence seems to point to Georgius Agricola's De re *metallica* (1556) as the first printed description of the modern rod and its applications. His interest was chiefly in features associated nith mining and the location of minerals. but the technique was identical with that of many searchers for water, sometimes called donsers or water witches. Agricola reported that the consensus among rod users was that the hazel bush was most effective for revealing mineral veins, especially if it grew above a known vein. There were some: however, who recommended a different material for each mineral: hazel for searching for silver: ash twigs for copper, pitch pine for lead and tin and rods of iron and steel for gold.

The divining rod is used primarily in searches for water and it is supposed to locate subterranean springs and streams, two things which in general do not exist. Extensive scientific investigations of the divining rod have proven that it does not react in any way to the underground presence of water. oil, metals or any substance. Springy wood or metal shaped and held as described above will twist vigorously when the squeezing force is relaxed slightly. without any regard whatever for its surroundings. Slight muscular fatigue can lead to such relaxing of pressure without the operator even being aware of it. Sometimes this movement happens at places where water or other substances are later removed from the ground but there is no causal connection between the two.

In spite of this, social scientists who have investigated the phenomenon conclude that use of the divining rod may be expected to continue indefinitely in areas where water and other desired substances are difficult to locate. (L. D. L.)

DIVISION, a general term for the action of breaking up a whole into parts (from Lat. *dividere,* to break up into parts, separate). Thus, in political economy, the phrase "division of labour" implies the assignment to particular workmen of the various portions of a whole piece of work; in the musical terminology of the 17th and 18th centuries, the term was used for rapid passages consisting of a few slow notes amplified into a florid passage; *i.e.,* into a larger number of quick ones. The word is used also in concrete senses for the parts into which a thing is divided; *e.g.,* a division of an army *(see* DIVISION, MILITARY), and an administrative or electoral division. Similarly, a "division" is taken in a legislative body when votes are recorded for and against a proposed measure. (X.)

Mathematics. — In mathematics, division is the process of finding one of two factors when their product and the other factor are given. The given product and factor are called the dividend and divisor respectively. The factor to be determined is called the quotient. In the system of numbers consisting of the integers and fractions there is a uniquely determined quotient for every choice of dividend and divisor except when the latter is zero. In dealing with integers, however, the division is possible only when the dividend is a multiple of the divisor. If the dividend D lies between dq and d(q + 1)—two consecutive multiples of the divisor d—then the integer q is called the quotient and the integer D − dq the remainder; the process of finding the quotient and remainder is referred to as division with remainder. Unique division with remainder is also definable in the division of polynomials in a single variable x by requiring the remainder to be of lower degree in x than the divisor. The details of the division process are given in elementary arithmetic and in high-school algebra textbooks.

A contraction of the usual division process when the dividend is a polynomial in the variable x and the divisor is $x-r$ is known as synthetic division. Thus, if the dividend is ax^3+bx^2+cx+d the synthetic division by $x-r$ is arranged as follows:

a	b	c	d	r
	ar	er	fr	
a	e	f	g	

The numbers e, f, g are the sums of the two numbers directly above each. The remaining numbers are self-explanatory. The quotient and remainder are read from the bottom line; the quotient is ax^2+ex+f and the remainder is g. For instance, the quotient and remainder when $x^4-3x^3+x^2-7$ is divided by $x+1$ are seen to be x^3-4x^2+5x-5 and -2, respectively, from the following calculations:

1	−3	1	0	−7	−1
	−1	4	−5	5	
1	−4	5	−5	−2	

(See ARITHMETIC; NUMBER; POLYNOMIAL.) (G. Y. R.)

Logic.—Logical division is the division in thought of a class into subclasses, resulting in a statement such as this: "Every tree is either evergreen or deciduous." Any subclass can be subdivided in its turn; *e.g.,* "Every evergreen tree has either broad or narrow leaves" A logical division may be constructed for its onn sake, the logician taking a pure aesthetic pleasure in surveying the related classes so exhibited and. generally. in the unified knowledge of the field contained in such a division. It has, however, often been held to be also useful for ulterior purposes among which are the following:

1. The inventor of the concept of logical division, namely Plato, thought of it as a method of reaching definitions (see DEFINITION). Thus, to define the angler we place him in a large class to which

he belongs, say that of technicians. We then divide this class, determine in which of its subclasses the angler falls, divide that again, and so on down to a class equivalent to the angler. The names of the classes we have gone through together constitute the definition of the angler. Plato regarded this as a sure way both of discovering and of proving any desired definition. Aristotle showed, however, that it cannot amount to a proof. In fact, a logical division is not a method of doing anything; it is merely a system of concepts or else our knowledge of that system; and there is no sure method of arriving at such knowledge. The idea that logical division is an intellectual method is an error analogous to the idea that the method of getting to know geometrical truth is the same as the order of exposition in a completed work of geometry.

2. Knowing a logical division of a field may, as Aristotle said, put us in a better position to ask the right questions in that field.

3. A logical division may help us to understand and talk about the individuals belonging to the classes concerned; *e.g.,* about the millions of particular trees.

4. Logical divisions are especially useful for enabling beginners to assign specimens to their species. Divisions for this purpose are often called "keys." The examples given at the beginning of this section are the first two stages of A. F. Blakeslee's key to the trees of northeast America.

There appear to be certain rules for logical divisions, or conditions which we wish them to meet, as follows:

1. A division should always be exclusive, so that no particular specimen belongs to more than one subclass. This rule would be broken if we divided human beings into males, females and children.

2. Similarly, a division should always be exhaustive, so that every particular specimen belongs to some subclass. But here we must distinguish between exhausting all the specimens there are and exhausting all the specimens there might be. A division intended to help people to identify trees need not include all the trees there might be. It need not have a class for trees having seven buds at a node if no such trees are known.

3. Plato held that a division should be dichotomous; *i.e.,* that there should only be two subclasses, or at any rate very few. A division into more than five subclasses is hard to remember or grasp as a whole, but the demand for dichotomy or trichotomy often conflicts with other demands made on division. For example, in a field where specimens vary by very small degrees from one form to a very different form, insistence on dichotomy will result either in inexhaustiveness or in producing subclasses that lack unity.

4. It has been thought that a division should be not merely a dichotomy, but a dichotomy into two contradictories. The chief advantages of this are that such divisions are easier to understand and are automatically exclusive and exhaustive. Contradictories are often and successfully used in botanical keys; *e.g.,* plants are divided into those that are flowering and those that are non-flowering.

5. On the other hand, we often want a division to give us information of what there is in a field, and for this purpose every subclass needs to be positively characterized. "There is no division of negation as such, for not-being cannot have species" (Aristotle).

6. It is often desired that each stage of a division shall arise naturally out of the previous stage. "When the division is carried further than one stage, the same *fundamentum divisionis* should be retained in the later stages which was used in the first" (H. W. B. Joseph). But this seems to be an aesthetic or at least a purely theoretical requirement, and must be sacrificed sometimes when the divider has an ulterior purpose in mind.

7. Plato held that divisions should be "through the middle," and not cut off a small part from a larger; *e.g.,* Greeks from foreigners. Since, however, it is obvious that this particular division of mankind is sometimes good and useful, we have here another purely aesthetic demand.

8. It has been held from Plato on that divisions should give "true species" by "dividing at the joints instead of breaking the bones." But, as Darwin observed, the concept of "true species" is only a confused notion of some particular kind of division which is desired for a particular field. In the realm of organisms what is mainly desired is a division that brings out propinquity of descent.

9. It is sometimes hoped to find divisions sufficient for all purposes; however, this is impossible. For example, it will always be necessary to divide animals for some purposes into wild and tame, and for others into mammals, birds, etc.

10. It has been hoped to construct divisions without experience of uhat there is in nature, or at least to show that they are a priori necessary, but this is possible only in mathematical realms. See also CLASSIFICATION.

DIVISION, MILITARY. In modern armies the division is the smallest formation that comprises a balanced team of all the arms and services needed for the independent conduct of operations. It usually numbers between 12,000 and 20,000 men and is commanded by a major general. In naval usage a division is a group of ships, usually four, forming part of a fleet or naval task force. It also denotes units into which a ship's company is divided for administrative purposes. The term "air division" denotes a tactical command, comparable to an army corps, forming part of an air force. The wing is the air force counterpart of the ground division.

The military strength of an army for the conduct of war may be roughly measured by the number and quality of the divisions it can bring to bear against an enemy. Divisions, together with additional supporting combat and service troops, are formed into corps and field armies for the conduct of military campaigns.

To meet specialized requirements in warfare, divisions have evolved into several types, falling within two general classifications: infantry and armoured. Infantry divisions, known as rifle divisions in the Soviet army, are organized and equipped for combat under all conditions of terrain and weather; they comprise the principal portion of the fighting forces of an army. An infantry division consists chiefly of foot soldiers equipped with light weapons but also includes supporting artillery, armour and engineer units, and has its own communication, supply, maintenance and evacuation services. Divisions of this general type, modified by the introduction of light equipment and given special training, may perform specialized roles. Examples are air-borne (parachute) divisions and mountain (alpine) divisions. Some armies also have formed motorized (U.S. usage, mechanized) divisions by adding truck transport and light armoured vehicles sufficient to mount all the troops of an infantry division. The armoured, or (except in U.S usage) mechanized, division also contains elements of all arms and services, but is comparatively much stronger in tank forces than the infantry division. It makes extensive use of armoured vehicles to increase the mobility and protection from small arms fire of the infantry, engineers and other troops operating in close support of tanks. During World War II the Soviet army organized a large number of artillery divisions, each consisting of from 18 to 24 artillery battalions.

Armoured division operations are characterized by great speed of movement over favourable terrain, heavy firepower and shock effect. Higher commanders often employ them as a mobile reserve and as a striking force against objectives deep in enemy territory when the progress of the battle creates an opportunity for bold maneuver. Infantry divisions have a greater capability for sustained action and their movement is less hindered by terrain obstacles. By replacing battle losses as they occur, infantry divisions may remain continuously in combat for weeks or months at a time. Air-borne divisions pose a strategic threat, since they may be moved by air to any part of a considerable area. To offset their lightness in weapons and austere support, they depend greatly on surprise and rapid execution for success of an air-borne assault.

They are ordinarily committed to battle only for brief periods unless reinforced with additional troops. (See AIR-BORNE TROOPS.)

Historical Background. — The divisional system originated in the long period of French world leadership in military science during the 18th and 19th centuries. Gen. Lazare Nicolas Carnot (*q.v.*) organized the forces of the armies of the Revolution into permanent divisions. Napoleon Bonaparte altered the divisional organization, provided supporting corps artillery and eventually formed separate cavalry divisions. The Prussian army organized divisions in 1813, and other European armies had adopted the divisional system by the end of the 19th century.

At the beginning of World War I, continental European divisions generally were composed of two infantry brigades (each of two regiments), two artillery regiments, a cavalry squadron and engineer medical and administrative units. A typical division had a strength of about 12,000 men and 36 artillery pieces. The British division, organized by Lord Haldane in 1908, was considerably larger; it included three infantry brigades of four battalions each and four artillery regiments. The British army retained essentially the same structure in its infantry divisions through World Wars I and II, although firepower and mobility were greatly increased by the addition of light automatic weapons and motorization. During the American Civil War the United States had used the term "division" for a tactical subdivision of an army corps and later for a geographical area of military command. It experimented with provisional divisions along the Mexican border in 1911–14. Upon its entry into World War I. the U.S. army formed divisions of 27,000 or 28.000 officers and men, twice the size of most European divisions.

By 1928, the U.S. army had organized its peacetime regular and reserve forces into "square" divisions, so-called because their structure included two infantry brigades of two regiments each, with a total strength of nearly 20,000 men. In 1939 it adopted a "triangular" organization that eliminated the brigades and provided three infantry regiments of three battalions each. The divisional artillery regiments were reorganized into three battalions of light howitzers and one medium battalion. The new division, with only 15.000 men. had greater firepower and more flexibility than its predecessor. Conversion to the triangular organization was carried out during the mobilization for World War II, the divisions adding "infantry" to their title to distinguish them from the new armoured divisions organized beginning in 1940.

Following World War II, infantry and air-borne divisions retained the triangular structure, with an increased strength of about 17,000 men to accommodate the addition of organic tank and antiaircraft battalions, through the conflict in Korea (1950–53). In 1957 the U.S. army began tests of a "pentomic" divisional structure to meet the demands of atomic war. It included five battle groups (of about 1,400 officers and men each) in place of the former three infantry regiments. The new division had fewer but more varied artillery pieces, some light aircraft and a more flexible organization of supporting services. The strength of the pentomic infantry division was reduced to less than 14,000, that of the air-borne division to about 11,500.

U.S. armoured divisions originally were similar to the *Panzer* divisions developed by the German army at the start of World War II, and included three armoured regiments as the principal combat units. Following the war, the U.S armoured division consisted of four tank battalions, four armoured infantry battalions, four battalions of self-propelled artillery, one antiaircraft artillery battalion, a reconnaissance battalion, an engineer battalion. signal company and other supporting services. Three combat command headquarters provided an echelon of tactical control of the combat units which could be arranged in various combinations to carry out the division plan of operations. The 1957 reorganization did not greatly alter this armoured division structure.

In 1961 the U.S. army announced plans to discard the pentomic structure and to reorganize its forces into four types of divisions: infantry, mechanized (motorized), armoured and air-borne. Under this reorganization all divisions would have the same type of base. including a divisional headquarters and three brigade headquarters. Other elements of the division base would be an artillery brigade of one missile battalion and four howitzer battalions; reconnaissance, engineer. signal and aviation battalions; and various supporting elements. To this base would be added various combinations of combat maneuver elements — infantry, mechanized, armoured or air-borne battalions — to form one of the four types of divisions. From two to five of these battalions would be under the tactical control of each of the brigade headquarters. By thus tailoring each division to fit its current mission by varying the number and types of combat maneuver elements, the division was made more flexible to cope with every type of warfare — nuclear, conventional or guerrilla,

DIVORCE. Marriage, as distinguished from concubinage or promiscuous sexual intercourse, is a relationship which envisages a lifelong union of the parties. Many legal codes, however, provide for the dissolution of this union, for various reasons, during the lifetime of the parties. Such dissolution is known as divorce.

Primitive Peoples. — Among a few uncivilized peoples marriage is said to be indissoluble or divorce unknown, and among many others divorce is said to be rare or marriage as a rule to last for life; but there are also many tribes in which divorce is reported to be of frequent occurrence or marriage of very short duration. Because of the defective character of the information it is impossible to say anything definite about the comparative prevalence of lifelong unions and of divorce among primitive peoples in general, or about the duration of marriage at the different grades of economic culture. It is interesting, however, to note the universal or almost universal prevalence of lifelong unions among some of the lower hunters and incipient agriculturists, such as the Veddas of Ceylon, the Andamanese, the Orang Mamaq and Orang Akit of Sumatra, and the "pure" tribes of the Malay peninsula. Somewhat more definite than the information available regarding the actual prevalence of divorce among the simpler peoples are the statements about circumstances in which their customs allow it to be practised. Among a large number of tribes the husband is said to be able to dissolve the marriage at will or on the slightest grounds or pretexts, and in the majority of these cases a similar right is granted to the wife. But we are also frequently told that a man must not divorce his wife and a wife not separate from her husband without just or good cause. The most generally recognized ground for divorce is probably adultery on the part of the wife; and among some peoples the wife is said to have a right to divorce an unfaithful husband. A very frequent cause of divorce is barrenness in the wife, while the birth of a child may make marriage indissoluble; and sometimes the wife can effect divorce if the husband proves impotent. Other recognized grounds for divorce are as follows: a man may divorce his wife if she is lazy or neglectful; if she suffers from a foul or incurable disease; if she becomes too old; if all her children die; or, of course, if she deserts him. The wife, again, may dissolve the marriage if the husband neglects or ill-treats her, if he deserts her or if she has a strong repugnance to him. Among some natives of eastern central Africa the wife may divorce a husband who fails to sew her clothes. Among the Shans of Burma, should the husband take to drinking or otherwise misbehave, the wife has the right to turn him adrift and to retain all the goods and money of the partnership. *(See* also **MARRIAGE** : ***Divorce.)***

Semitic Peoples. — Among Semitic peoples the husband has had, or still has, the legal right of repudiating his wife at will. In Babylonia, according to the laws of Hammurabi, however, the wife and even a concubine had certain pecuniary guarantees against arbitrary divorce, and she might also herself in certain circumstances claim a divorce, or at least separation. The right of the husband to repudiate his wife at his pleasure is the central thought in the system of Jewish divorce law: and the rabbis neither did nor could set it aside, although they gradually tempered its severity by numerous restrictive measures. It ceased to exist in practice and was at last, in the earlier part of the 11th century, formally abolished, whereas the husband retained the right to divorce his wife if a good cause could be shown. On the other hand, the wife has no right to divorce her husband. But the

Mishnah allowed her to sue for divorce, and if the court decided that she was entitled to be divorced the husband was forced to give her a bill of divorce, although he was supposed to give it of his own free will and accord. In the modern state of Israel there is no distinction between nullity and divorce, the grounds for divorce being: bigamy; breach of the law of affinity; the wife's adultery or refusal of marital rights; the husband's leprosy, vice, neglect, refusal to maintain the wife, impotence or other bodily defects; and behaviour disturbing to common life. Divorce may also be obtained by mutual consent.

As the ancient Hebrews, so the pagan Arabs let the husband repudiate his wife whenever he pleased, and subsequently this unlimited customary right was crystallized in Mohammed's law; and at Islamic, as at Jewish law, the wife can never divorce her husband, although she may take steps leading to the dissolution of her marriage. When she desires a divorce, she may obtain from him a release from the marriage contract by giving up either her settled dower or some other property; and when the husband is guilty of conduct that makes the matrimonial life intolerable to the wife or when he fails to fulfil his engagements, she has the right of preferring a complaint before the judge and demanding a divorce by authority of justice. But the facility with which Muslim women can effect a dissolution of their marriage is influenced by local custom. So also the frequency of divorce differs considerably in different parts of the Muslim world. In some parts it is practised to an extent that is almost without a parallel; whereas among the Muslims of India the husband seldom exercises his right to divorce his wife without any special reason. This may be due to Hindu influence.

Hindu Practice. — With orthodox Hindus marriage is a religious sacrament which cannot be revoked. A woman convicted of adultery may be deprived of her status and turned out of her caste, but even in this case divorce in the ordinary sense is an impossibility. The law, however, was not always equally stringent. At present the orthodox Hindu law of divorce is more or less disregarded by certain low castes in the north of India and by many castes, both high and low, in the south, among whom usage has superseded texts; according to such usage the granting of a divorce, or the recognition of a divorce as one properly made, is the duty of the caste. (*See* also INDIAN LAW: Marriage.)

Early Greeks and Romans. — Among the Greeks and Romans in the early days, as among the Hindus, marriage evidently was a union of great stability, although in later times, contrary to what was the case among the Aryans of India, divorce became easy and frequent. Among the Greeks of the Homeric age divorce seems to have been almost unknown, but afterward it became an everyday event in Greece. According to Attic law the husband could repudiate his wife whenever he liked and without stating any motives, while the wife could demand a divorce by appealing to the archon and stating the motives for her demand. A Roman marriage was perhaps at no time indissoluble; but the specifically patrician kind of marriage, by a rite called confarreatio, was at any rate very nearly so. The other forms of marriage, not being of the same mystical and sacramental character. could be dissolved without difficulty. The husband's legal authority in regard to the dissolution of a marriage with *manus* (*i.e.*, the legal or customary provision whereby the wife passed into the almost unrestricted power of her husband) was absolute; whereas in the old law a wife in *manu* was as little a free party to the act of divorce as a slave was a free party to that of emancipation. Yet in practice the husband's right was no doubt more or less checked by public opinion and, as it seems, even by the censors; it was said that for 500 years no one took advantage of the liberty of divorce. In regard to a "free" marriage, which implied that the wife did not fall under the menus of her husband, the rule of divorce was very different: the dissolution of such a marriage could be brought about either by mutual agreement between both parties or by the will of one party only. The rules of divorce that were recognized in the case of a free marriage were afterward practically extended to marriages with *manus;* and in the end marriages with *manus* fell into disuse altogether. Toward the close of the republican era and during the empire divorce was very frequent among the upper classes; almost all the well-known ladies of the Ciceronian age were divorced at least once.

Teutonic Peoples. — According to the old customary law of the Teutonic peoples a marriage could be dissolved by agreement between the husband and the woman's kin; and the husband was entitled to repudiate his wife if she was sterile or guilty of conjugal infidelity and perhaps for some other offenses. On the other hand the wife had originally no right to dissolve the marriage.

(E. W.; X.)

Divorce Law. — Divorce is the dissolution, in whole or in part, of the tie of marriage. In the main the practice in the legal systems of the civilized world is derived from the Roman law and the canons of the Christian churches. In countries in which the Roman Catholic creed is supreme, subject to certain exceptions indicated later, complete divorce a *vinculo* matrimonii ("from the bond of marriage") is not legally possible, though the same result may be achieved in rare cases by the ecclesiastical courts declaring that the marriage was a nullity. The partial decree of divorce a *mensa* et thoro ("from bed and board"), which is the practice in the Republic of Ireland and other Roman Catholic countries and is represented in English laws by judicial separation, leaves the parties still married, neither being able to remarry during the lifetime of the other. In the end it was due to the spread of Christianity and the authority of the Church of Rome that marriage came to be regarded not only as a civil contract but also as a sacred bond.

How far the Founder of the Christian religion laid down any moral law in regard to divorce has always been a matter of controversy because of the form of his declaration that has come down to us and the different conceptions then existing of the connubial relations. monogamy, so far as a husband was concerned, had not in his time been established. The rule of the Mosaic law was expressed as follows: "When a man hath taken a wife, and married her, and it come to pass that she find no favour in his eyes, because he hath found some uncleanness in her, then let him write her a bill of divorcement, and give it in her hand, and send her out of his house. And when she is departed out of his house, she may go and be another man's wife" (Deut. xxiv, 1-2).

The Pharisees asked Jesus: "Is it lawful for a man to put away his wife for every cause?" Jesus replied: "What God hath joined together let no man put asunder" and also said: "Moses, because of the hardness of your hearts, suffered you to put away your wives; but from the beginning it was not so." Then came the declaration which is the main basis of the canon law: "Whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery; and whoso marrieth her which is put away doth commit adultery" (Matt. xix, 3–9). Practically the same formula was used in the Sermon on the Mount (Matt. v, 32) and in Luke xvi, 18 and Mark x, 11–12 with the important omission of the exception for fornication; and many modern textual critics have regarded this exception as the interpolation of a scribe.

The Roman Church has always interpreted the exception of fornication as applying only to incontinence by the wife before marriage discovered by the husband after marriage; and has treated it, not as just cause for dissolution of marriage, but as invalidating the marriage itself. It will be observed also that right down to the 20th century incontinence has been regarded as a matrimonial offense only if committed by the wife. In most countries where the civil law allows complete divorce husband and wife are now on an equal footing as to the grounds of divorce.

The Roman Law of Divorce. — The history of divorce took its earliest colour from that conception of the *patria* potestas, or the power of the head of the family over its members, which enters so deeply into the jurisprudence of ancient Rome. The wife was transferred at marriage to the authority of her husband, in *manus*, and consequently became so far subject to him that he could, at his will, renounce his rule over her and terminate his companionship, subject at least to an adjustment of the pecuniary rights which were disturbed by such action. As early, however, as the time of Romulus, it is said that the state asserted its interest

in the permanence of marriage by forbidding the repudiation of wives unless they were guilty of adultery or of drinking wine, on pain of forfeiture of the whole of an offender's property, one-half of which went to the wife, the other to Ceres. But the law of the Twelve Tables allowed freedom of divorce. At last the *lex Julia de adulteriis coercendis* (the Julian law concerning the restraint of adulteries), while recognizing a power oi divorce both in the husband and in the wife, imposed on it. in the public interest. serious restrictions and consequences. It required a written hill of divorce (*libellus repudii)* to be given in the presence oi seven witnesses, who must be Roman citizens of age; and the divorce had to he publicly registered. In this way a wife could divorce a lunatic husband. or the *paterfamilias* (head of the family) of a lunatic wife could divorce her from her husband. The *lex Julia* was followed by a series of acts of legislation extending and modifying its provisions. In A.D. 449 divorce was made easier by Theodosius and Valentinian.

The modification in the civil law of Rome effected by Justinian under the joint influence of the previous law of Rome and that of Christianity was remarkable. Divorce by mutual consent, hitherto, as we have seen, absolutely free, was prohibited except in three cases: (1) when the husband was impotent; (2) when either husband or wife desired to enter a monastery; and (3) when either of them was in captivity for a certain length of time. At a later period Justinian, under the influence of the Christian idea of marriage, placed a further restriction or even prohibition on divorce by consent by enacting that spouses dissolving a marriage by mutual consent should 'iorieit all their property and be confined for life in a monastery (which was to receive one-third of the forfeited property, the remaining two-thirds going to the children of the marriage). The prohibitions of Justinian on divorce by consent were repealed by Justin II, his successor.

Justinian further re-enacted, with some modifications, the power of divorce by a husband or wife against the will of the other. Divorce by a wife was allowed in five cases: (1) the husband's being party or privy to conspiracy against the state; (2) attempting his wife's liie, or failing to disclose to her plots against it; (3) attempting to induce his wife to commit adultery; (4) accusing his wife falsely of adultery; (j) taking a woman to live in the house with his wife, or, after warning, frequenting a house in the same town with any woman other than his wife. A husband was allowed to divorce his wife for any one of seven reasons: (1) failure to disclose to her husband plots against the state; (2) adultery; (3) attempting or failing to disclose plots against her husband's life;. (4) frequenting dinners or balls with other men against her husband's wishes; (5) remaining from home against the wishes of her husband except with her parents; (6) going to the circus, theatre or amphitheatre without the knowledge or despite the prohibition of her husband; (7) procuring abortion.

The Canon Law. — The canon law of Rome was based on two main principles: (1) that there could be no divorce a *vinculo matrimonii,* but only *a mensa et thoro;* i.e., separation; (2) that no divorce could be had at the will of the parties, but only by the sentence of an ecclesiastical court. It is thus apparent that there was no divorce in the sense in which it was defined at the beginning of the article. But the canon law held the marriage to be null and void if (among other things) the parties were within certain prohibited degrees of consanguinity or affinity; and by the middle ages the degrees of consanguinity and affinity which invalidated a marriage were so much extended as to make annulment of marriage possible on the flimsiest of grounds: for example, in the reign of Edward III a marriage was annulled because the husband, before his marriage, had stood godfather to a female cousin of his future wife. (*ST.* H.: C. Mo.; J. E. S. S.)

UNITED STATES

In colonial times the only available method of dissolving a marriage was by act of a legislative assembly, and such power was later exercised by some state legislatures but later was denied by constitutional provisions in all hut a few states. Divorce is to be distinguished: (1) from a decree of annulment of marriage. which is a judicial determination that no legal marriage has ever existed between the parties; and (2) from a decree of separation! which permits or commands the parties to live apart but does not completely and for all purposes sever the marriage tie.

Legal Aspects. — Divorce became available in every state, the District of Columbia. the territories. the insular possessions and the Canal Zone. The grounds for divorce and the procedures through which it may be obtained are determined by the statutes of each political division. Such statutes are derived principally from ecclesiastical law which expresses certain moral concepts. Thus divorce is granted only upon proof that one spouse, and only one. is guilty oi conduct showing moral culpability within one of the categories specified by statute. If both parties are guilty, there can be no divorce; and by the same token, if neither party is guilty of misconduct, no divorce can be granted, even though both may desire it. Moreover, husbands and wives must not collude in the commission of a matrimonial offense or the fabrication of evidence of such an offense for the purpose of obtaining a divorce. Nor will a divorce be granted if the wronged party has condoned or forgiven the matrimonial offense.

In actual practice 85% to 90% of divorce suits in the United States are not contested. The grounds alleged are more often a cloak than a clue to the basic cause of marital discord. Thus desertion. which carries little opprobrium, is the ground charged in about one-third of all divorce suits. Physical cruelty is alleged in another third or more of the cases. with the acceptance in many courts of proof of any sort of physical aggression. even though trivial. as meeting legal requirements. Less than 10% of divorces are granted for adultery, although infidelity is one of the real causes of separation in a majority of instances. Among other grounds for divorce set up in the laws of various states are habitual drunkenness. nonsupport, conviction of ielony, impotency. incurable insanity. communication of venereal disease, habitual indulgence in violent and ungovernable temper and indignities to the person oi an innocent spouse rendering his or her condition intolerable.

The great variation in the legal requirements for divorce in the different states stimulated so-called "migratory divorces." Residents of states where divorce was hard to obtain sought divorce in other states. such as Nevada. where legal grounds and procedures facilitated the severing of marital ties. In the mid-1950s only six weeks' residence was required of an applicant for divorce in Nevada. Idaho and in the Virgin Islands. Florida and Utah required 90 days' residence and Arkansas and Wyoming only 60 days, except that in the latter state a year's residence was necessary if insanity was the ground for divorce. Residence requirements in other states ran much higher, the majority ranging from six months to a year or more.

Conflicts between state laws created great uncertainty as to the validity and scope of out-of-state divorces. Parties to such divorces were sometimes involved in serious legal difficulties. The United States supreme court ruled that the courts of any state have the right to inquire into the jurisdictional facts in connection with divorce decrees granted by other states before recognizing such decrees as valid. The "full faith and credit clause" of the constitution required the recognition only of those out-of-state divorces where jurisdiction is based upon the actual residence of the plaintiff established in good faith and not merely for the purpose of divorce. It thereiore became possible for persons who remarry after obtaining a divorce in one state to be prosecuted and convicted of bigamy in another state. Other complications arose in connection with the effect of out-of-state divorces on property rights. The U.S. supreme court recognized a concept, called by one of the justices "divisible divorce," by which a marriage might be dissolved in one state without barring courts of another state from recognizing property rights arising out of the marriage.

Divorce Rate. — Statistics concerning divorce have been gathered by the U.S. department of labour, the bureau of the census and the national office of vital statistics. The latter agency collated data showing that the ratio of divorces to population rose steadily after 1867 with the exception of temporary dips in the general upward curve after wars and business depressions. The 1867 rate was 0.3 divorces per 1,000 population. By 1887 it was

0.5 and by 1907 it had reached 0.9 per 1,000 population, increasing at an accelerated pace by 1946 to 4.3 per 1,000 population, including the armed forces overseas. The total number of divorces granted in 1946 was estimated at 610.000. The rate declined to 3.4 in 1947 and 2.8 in 1948. By 1954 it had dropped to 2.5 The divorce boom and decline, following World War II, repeated the post-World War I pattern. This phenomenon was attributed to hasty and ill-conceived wartime marriages and to unstable conditions during wartime.

The effects of economic conditions are also reflected in the United States divorce rate. When times are good and income seems likely to be assured, the divorce rate rises. In periods of industrial depression it falls, fluctuating thus in the same way as the marriage rate. For instance. the divorce rate dropped during the depression years commencing with 1929, leveled off during 1932–33 and mounted steadilv thereafter during the industrial recovery.

Government figures also show interesting variations in the divorce rate between different states and different regions of the United States. The rate in Nevada, for instance, for many years ran from 24 to 35 times that for the nation as a whole; and the Florida rate averaged between 2 and 3 times the national rate. These states, and a few others, attracted "divorce business" through the enactment of laws making quick divorce easily available to persons from other states having less liberal divorce laws. With the exception of Florida the divorce rate was generally lowest in the states along the Atlantic seaboard. rising somewhat in the northern Mississippi valley area and climbing still higher in the regions to the south and west. But generalizations as to regional trends were subject to such notable exceptions as Wisconsin, the Dakotas, Iowa, Nebraska and Louisiana, where the divorce rates remained generally lower than the national average.

Two statements often made regarding divorce in the United States are not warranted by the statistics, namely: (1) that the real motive of one or both parties to most divorces is the desire for marriage to a third person; and (2) that a large proportion of divorces are granted to persons who move from one jurisdiction to another in order to avail themselves of lax divorce laws. On the first point U.S. statistics are practically silent since, in issuing a marriage licence to parties one or both of whom have been previously divorced, no record is ordinarily made of the fact. In Connecticut, however, for a number of years this information was required; and, if the statements were trustworthy, the numher of persons remarrying each year was about one-third of the total number of persons divorcing — probably a rate not widely different from that of widows and widowers of the same age. What statistical evidence there was on the subject therefore tended to discredit this popular opinion.

The evidence against the second belief was even more conclusive. About four-fifths of all the divorces granted in the United States were issued to parties who were married in the state in which the decree of divorce was later made; and when we deduct from the remaining one-fifth those divorces in which the parties migrated for other reasons than a desire to obtain an easy divorce, the remainder constituted a small, almost a negligible, fraction of the total number.

Social Considerations. — The frequency of divorce in the United States has been the subject of endless discussion in books and periodicals with general agreement that marital maladjustments and the breaking up of families have grave social consequences, especially through the weakening of parental controls and the inevitable insecurity felt by the children of divorced couples. Certainly the high rate of delinquency among such children may be fairly ascribed to the disorganization of their family life.

It has often been pointed out, however, that divorce is a symptom rather than an evil in itself. The courts merely sever the bonds of matrimony. By the time married couples reach the divorce courts their marriage is already on the rocks and can only be saved by a complete emotional reorientation.

The generally accepted view at mid-20th century was that the cure for divorce lies in better preparation for marriage through training young people in an understanding of the responsibilities as well as the rewards of family living. Efforts were begun in many schools and colleges to furnish such advice through courses on family relations. Similarly, premarital clinics and advisory services were established in many cities in the hope of equipping prospective husbands and wives with a sound attitude toward the marital relationship. It was also recognized that efforts to reduce the frequency of divorce should not stop with premarital advice. The same agencies which offer such service are usually also ready to counsel married couples about their difficulties and problems. Conciliation services have likewise been set up in connection with divorce courts. There was no doubt that such efforts had a substantial effect in adjusting marital discord in many families.

Although the most effective action toward reducing the frequency of divorce must be through preparation for marriage and adjustment after marriage, there was general agreement also that divorce laws throughout the United States needed overhauling. There was less agreement, however, as to the type of legal reform that should be enacted. One view was that divorce should be made slower and more difficult through greater strictness as to residence requirements and the grounds for divorce and by providing "cooling-off" periods and delays before final decrees could be obtained. Opposing this attitude were the proponents of more liberal divorce laws, contending that the only requirement for divorce should be the actual separation of the parties for a period long enough to indicate their intention to live apart permanently. All the old concepts concerning guilt. recrimination, collusion and condonation would be abolished in favour of laws based on an acceptance of divorce as the means by which mismated couples might lawfully free themselves from a bond that no longer has any emotional validity.

Reformers also advocated the establishment of specialized courts with jurisdiction over all family problems such as annulment of marriage, divorce, alimony, adoptions, bastardy, nonsupport and juvenile delinquency. There was growing sentiment in favour of the passage of uniform divorce laws throughout the United States to put an end to the competitive bidding between states for divorce litigation and to make it more difficult for runaway husbands to avoid contributing to the support of dependent wives and children. Some progress had been made at mid-century toward the latter objective through the enactment by a group of states of reciprocal nonsupport laws providing the means for collecting support money in such cases.

BIBLIOGRAPHY.—**Publications** containing divorce statistics include *A Report on Marriage and Divorce in the United States, 1867 to 1886,* published by the U.S. Commissioner of Labor; reports on *Marriage and Divorce, 1867 to 1906, Marriage and Divorce 1916, Marriage and Divorce, Annual Reports, 1922 to 1932, A Review of Marriage and Divorce Statistics, 1887 to 1937,* and the annual *Statistical Abstract of the United States,* all published by the U.S. Bureau of the Census; and the *Statistical Bulletin* published by the Metropolitan Life Insurance company. Legal aspects of divorce are covered by such textbooks as W. T. Nelson, *Divorce and Annulment,* 3 vol. (1945–58), F. V. Harper, *Problems of the Family (1932).* (M. DN.)

ENGLAND AND WALES

Basis of Canon Law. — In England the law of divorce, being based on the canon law of Rome, was practically unchanged until the Matrimonial Causes act, 1857. Only divorce a *mensa et thoro,* a form of judicial separation without a right to remarry thereafter, could be granted. The ecclesiastical courts were invested with this jurisdiction, apart from a break during the commonwealth, until 1857. These were the courts of the various dioceses, including that of the archbishop of Canterbury, the court of arches, and that of the archbishop of York, the consistory court of York. An appeal lay to special delegates appointed by the crown for this specific purpose, until in 1832 the judicial committee of the privy council was given this appellate jurisdiction.

It was for some time supposed after the Reformation that the sentences of divorce pronounced by the ecclesiastical courts acquired the effect of allowing remarriage, and such divorces were in some cases granted. In the marquis of Northampton's case in the reign of Edward VI the delegates, as one of the steps in a series of political maneuvres, pronounced in favour of a second marriage after a divorce *a mensa et thoro.* They did not purport

to dissolve the first marriage, and when Northampton was later convicted of treason his first marriage was restored by act of parliament. It was, however, finally decided in Foljambe's case, in the 44th year of Elizabeth, that a marriage validly contracted could not be dissolved for any cause. In 1670 a private act of parliament was granted in the case of Lord de Roos, and this was followed by another in the case of the duke of Norfolk, submitted in the sessions 1693, 1699 and 1700; meanwhile (1697–98) the earl of Macclesfield had obtained a parliamentary divorce. Such acts were, however. rare until the accession of the house of Hanover, only five acts passing before that period. The jurisdiction thus assumed by parliament to grant absolute divorces was exercised with great care. They were very expensive and, in all. only 229 were successfully promoted. Adultery and cruelty were the main grounds for this sort of divorce allowed by the ecclesiastical courts. and the principles acted upon by those courts are imposed by statute upon the present courts in regard to, among other things, judicial separation, except that desertion was added by the 1857 act as a ground for a decree.

As regards adultery, a mere uncorroborated confession by a spouse of her guilt was not regarded by the canon law as a safe ground for a decree, and in the present practice in English divorce cases a confession has usually to he supported by some sort of circumstantial evidence. In general the principle was and is accepted that if an illicit affection is proved and there are opportunities by association to gratify a guilty passion, then a prima-facie case is made out. justifying a decree if there is no defense. As regards cruelty the definition accepted by the ecclesiastical courts as that of the canon law is the same now. It was accepted by the house of lords in *Russell* v. *Russell* (1897, A.C. 395), in which "legal cruelty" was defined as conduct of such a character as to have caused danger to life, limb or health (bodily or mentalj. or as to give rise to a reasonable apprehension of such danger. There is a classic exposition on the subject in the judgment of Lord Stowell in the case of *Evans* v. *Evans* (1790, **I** Hagg. Con., 3;). Thereafter there were innumerable decisions all showing that the court is not bound by any cast-iron rule in its interpretation of what constitutes cruelty within the range of this definition.

Apart from a bare denial the canon law allowed three grounds of answer: (1) *Compensatio criminis* (setting off of guilt) was the committal by the spouse bringing the charge of the same matrimonial offense. in which case the petitioner could be refused relief. *(2) Condonation* was complete forgiveness of the offending spouse by the other with full knowledge of the facts. Condonation was a bar to relief, and still is. Resumption by a husband of marital relations with his wife when he has full knowledge of her adultery is conclusive proof of condonation under the English divorce law, but resumption by a wife of marital relations with a guilty husband, with full knowledge, is not necessarily conclusive proof of condonation on her part. A matrimonial offense even of a different kind revives the former one, even if condoned. (3) *Connivance:* this also was and is a bar to relief. as it was held that a man could not avail himself of a charge if he did not appear with clean hands. The presumption of law is against connivance, and the intention must be clearly shown for the court to refuse the petitioner relief. The petitioner may be guilty of connivance merely by neglect or indifference, though in that case the modern plea under the English statute law would probably be *conduct conducing,* which is in some cases hardly distinguishable from connivance but which is only a discretionary bar to relief.

Collusion between the parties for the purpose of presenting a false case to the court was and is also a bar to relief, whether it is an agreement to give the appearance of having committed adultery when none had occurred or merely to withhold material facts from the knowledge of the court. The principle, in the words of Lord Stowell, is that there is no real injury "where there is a common agreement between the parties to effect their object by fraud in a court of justice." It applies to any agreement not to defend, even where the agreement is disclosed to the court. Collusion may exist not only when a false case is presented, but also where there is a good case. Thus in one case a divorce petition failed because of an agreement by which the petitioner received a certain sum in advance in respect of damages from the co-respondent. and his second petition on a later charge was dismissed because by taking such sum he had connived at the further adultery of his wife. **A** party may show, however, that the negotiations with a view to a collusive bargain were abortive, or that the collusive agreement had been wholly spent in operation.

The ecclesiastical courts provided for the pecuniary rights of the wife by granting alimony to her during the progress of a suit, and a proper allouance afterward if she was successful. Such payments were dependent on the pecuniary means or faculties of the husband and were subject to subsequent increase or diminution: see *J.* v. *J.* (1955, *P.* 215). The ecclesiastical courts did not deal with the custody of the children of the marriage. but the modern divorce court by statute deals with the custody, maintenance and education of children, legitimate or not, the marriage of whose parents is the subject of proceedings.

Any substantial delay in bringing a suit for divorce might lead to the imputation of acquiescence or even condonation. Desertion by either party to a marriage, except as giving rise to a suit for restitution, was not treated as an offense by canon law in England. It formed no ground for a suit for divorce and constituted no answer to such a suit by way of recrimination, unless it amounted to connivance or culpable neglect.

Conjugal rights are those rights which a husband and wife have to each other's society. When either party continues to refuse to render these rights to the other, they may be enforced by a suit for the restitution of conjugal rights. Until the grounds of complete divorce were equalized in 1923, the procedure of restitution was mainly used by wives to shorten the statutory period of desertion, noncompliance by the husband with a decree being followed by the wife's petition for divorce on the dual grounds of adultery and desertion.

Jactitation of marriage is a persistent claim by a person of a marriage falsely alleged to have taken place between himself or herself and the complainant, who petitions for a decree enjoining perpetual silence on the person alleging such marriage in regard to it. Such a remedy is rarely now required, especially since 1924 when the divorce court was given jurisdiction to make a declaratory order even though no other relief is sought. Jactitation was not an uncommon proceeding when "Fleet" and other irregular marriages were frequent and rights to property were involved. and it might still be useful. The most historic case in which jactitation arose was the duchess of Kingston's case in 1776, reported in the State Trials. The only case to be reported for a quarter of a century was in 1950, when the petition was granted.

Criminal Conversation.—Up to the Matrimonial Causes act, 1857, a husband could bring an action for damages, known as an action for criminal conversation, against his wife's paramour. It was a common-law suit, and the damages were estimated according to the loss he was supposed to have suffered by the seduction and loss of his wife. This procedure was abolished by the 1857 act and engrafted upon the new procedure in divorce, by way of a separate prayer for damages against the co-respondent in a petition for dissolution.

In 1850 a royal commission on divorce law was appointed. **It** reported in 1853.

Legislation Between 1857 and 1907.—The Matrimonial Causes act, 1857, embodied two main principles: (1) the constitution of a lay court to try all matters connected with divorce; *(2)* the transfer to that court, with as little change as possible, of the powers exercised in matrimonial matters by (a) the house of lords; (b) the ecclesiastical courts; *(c)* the courts of common law.

The functions of the new court. termed "the court for divorce and matrimonial causes" (after 1875. the divorce court, part of the probate, divorce and admiralty division of the high court) were practically entrusted to the judge of the court of probate (which was also established in 1857), termed the "judge ordinary." The parties to a suit obtained the right of trial by jury of all disputed questions of fact; and the rules of evidence of the common-law courts were made to apply. An appeal to the full court was given in all matters. which the judge ordinary was otherwise enabled to hear sitting alone.

To this court were transferred all the powers of the ecclesiastical courts with regard to suits for divorce *a mensa et thoro* (thereafter called judicial separation), nullity, restitution of conjugal rights and jactitation of marriage. In all such proceedings it was expressly enacted (s. 22 [comprised in ss. 32 and 103 of the Judicature (Consolidation) act, 1925]) that the court should act on principles and rules as nearly as possible conformable to the principles and rules of the ecclesiastical courts. Judicial separation could be obtained by either husband or wife for adultery or cruelty or desertion continued for two or more years.

There were also transferred to the court powers equivalent to those exercised by the legislature in granting absolute divorce. The husband could obtain a divorce for adultery. the wife could obtain a divorce for adultery coupled with cruelty or desertion for two or more years, and also for incestuous or bigamous adultery or rape or unnatural offenses. As has been explained above, connivance, condonation or collusion continued to be absolute bars to divorce, and the court was given discretion to refuse relief where the petitioner had-been guilty of adultery or conduct conducing to the respondent's adultery or had delayed unreasonably in prosecuting his suit.

The ecclesiastical law regarded desertion only as suggestive of connivance or culpable neglect. But the act of 1857 made it: (1) a ground of judicial separation if continued for two years; (2) a ground in part of dissolution of marriage if continued for the same period; (3) a bar. in the discretion of the court, to a petition for dissolution, though it was not made a bar to a suit for judicial separation.

Section 32 provided, in case of dissolution, for maintenance of the wife by the husband on principles similar to those recognized by the ecclesiastical courts, and s. 45 for the settlement of the property of a guilty wife on her husband or children. By later acts of 1859 and 1878 provision was made for altering settlements made in contemplation or in consequence of a marriage. The act (s. 35) provided also, in all divorce proceedings and in those of nullity, for provision by the court for the custody, maintenance and education of children. It was made obligatory to join an alleged adulterer in the suit; and damages (s. 33) might be claimed against him. and he might be ordered to pay the cost of the proceedings (s. 34).

The act of 1857 also provided (s. 21) that a wife deserted by her husband might apply to a magistrate in petty sessions and obtain an order which had the effect of protecting her earnings and property. The effect of this section appears to have been small; but the Summary Jurisdiction (Married Women) act, 1895, reinforced by the Maintenance Orders act, 1950, afforded a cheap and speedy remedy to all classes. The act of 1857 made no provision as to the name to be borne by the wife after a divorce; in *Cowley* v. *Cowley* (1901, A.C. 450), Lady Cowley was allowed to retain her title, even after remarriage to a commoner.

By the act of 1860, in order to prevent divorces in cases of connivance and collusion or of misconduct of the petitioner, it was provided that a claim of dissolution (a provision afterward extended to decrees of nullity) should in the first instance be a decree ***nisi***, which should not be made absolute until the expiration of a period then fixed at not less than three months, but by subsequent legislation enlarged to not less than six. In 1957, a general court order, as authorized by statute, restored the period, then six weeks, to three months. During the interval which elapsed between the decree ***nisi*** and such decree being made absolute, power was given to any person to intervene in the suit and show cause why the decree should not be made absolute, by reason of its having been obtained by collusion, or by reason of material facts not having been brought before the court. The queen's proctor could also, on suspicion of collusion, intervene before decree absolute, and, by direction of the court. he could intervene during the hearing itself, not only when collusion was in question but in regard to other matters.

By an act of 1866 the court was given power to order a guilty husband to make provision for the maintenance of his former wife on the marriage being dissolved, and by an act of 1907 the court was enabled in suitable cases to order the husband to make similar provision when he was the petitioner and she the guilty spouse. Additional powers to make orders for maintenance were given to the high court by the Law Reform (Miscellaneous Provisions) act, 1949. embodied in s. 23 of the Matrimonial Causes act, 1950, where a husband has been guilty of willful neglect to provide reasonable maintenance for his wife or the infant children of the marriage. From time to time the law of evidence in the divorce court was varied by statute until in 1869 it was enacted that no witness in any proceeding should be asked or be bound to answer any question tending to show that he or she had been guilty of adultery, unless in the same proceeding that witness had given evidence in disproof of the alleged adultery. This was still the law at mid-20th century.

The 1912 Commission Report.—In 1909 Lord Gorell, who had been president of the probate, divorce and admiralty division of the high court, introduced a motion in the house of lords to set up a royal commission, of which he was appointed chairman, on divorce and matrimonial causes. After sitting for three years, it completed its monumental labours in Nov. 1912 and by a majority report recommended important changes in the substantive law of divorce. The more important recommendations of the majority report were as follows: (1) hearing of divorce locally by commissioners of the high court; (2) po ers of magistrates to make orders having the permanent effect of a decree of judicial separation to be abolished and replaced by a simple process in the high court, and husbands to be entitled to separate orders on the grounds of cruelty, habitual drunkenness and willful desertion, equally with wives; (3) amendment of law so as to place the two sexes on an equal footing as regards the grounds for divorce; (4) five new grounds for divorce to be desertion for three years, cruelty, incurable Insanity after five years' confinement, habitual drunkenness found incurable after three years from first order of separation, and imprisonment under commuted death sentence; (5) habitual drunkenness as a ground for judicial separation; (6) provision for overcoming difficulties of jurisdiction as to domicile and residence; (7) unsoundness of mind, actual or incipient, at the time of the marriage, if unknown to the petitioner, and the fact that a spouse was suffering from a venereal disease unknown to the other, or the wife pregnant by another man, both at the time of the marriage, to be grounds for nullity; (8) provision for proceedings in *forma pauperis* (as a poor person); (9) no reports of divorce suits until a case is finished, and divorce judges to forbid or limit reports at their discretion. In their minority report the archbishop of York (Cosmo Gordon Lang), and two other Anglican members, Sir William Anson and Sir Lewis Dibdin, confined their recommendations to placing the sexes on the same basis as to grounds of divorce and to accepting the above recommendations as to the ground for nullity, plus that of willful refusal to consummate the marriage.

Legislation Embodying the 1912 Proposals.—By the Matrimonial Causes act, 1923 (sometimes called the Entwhistle act from the name of its chief sponsor), it was provided that after July 18, 1923, any act of adultery by a husband would entitle his wife to a divorce This act was repealed but re-embodied in the Judicature (Consolidation) act. 1925. Thus the royal commission's proposal in (3) above was carried into effect, and an immense change made in the law of divorce. in keeping with the spirit of the Sex Disqualification (Removal) act, 1919. Thus a woman might now divorce her husband for a single act of infidelity. As a consequence of the alteration in the law the number of wives' petitions increased in a marked degree. Moreover, the procedure of restitution of conjugal rights, mostly utilized up to 1923 for the purpose of shortening the statutory period of two years for desertion, became extremely rare.

By the Administration of Justice act, 1920, provision was made for the local hearing of divorce suits, and this scheme was later extended. Under the Legal Aid and Advice act, 1949, replacing and vastly extending the previous rules relating to poor persons, special provisions were made for persons desirous of petitioning for divorce: solicitors and counsel acting for assisted persons are paid out of a special legal aid fund to which persons aided may be asked, according to their income and assets, to contribute. This

brought divorce within the range of people of small means.

By the majority of three law lords to two, the house of lords in *Russell* v. *Russell* (1924, A.C. 687) effected a retrograde movement in the law of evidence by denying to spouses the right of stating on oath anything as to the possibility of marital access, if such evidence would tend to bastardize a child. The law was altered by statute in 1949, when it was provided that the evidence of a spouse should be admissible.

Notably after World War I the attitude of the court changed in several important respects in the direction of greater humanity. Lord Merrivale in his judgment in *Wilson* v. *Wilson* (1920, P. 20) showed that, in exercising his discretion in favour of a spouse who had himself been guilty of adultery, such action was not inconsistent with the interests of morality at large. In exercising discretion, four points should be considered: (1) the position and interest of any children of the marriage; (2) the possibility of the marriage of the petitioner and the party with whom misconduct had been committed; (3) the prospect of reconciliation of the husband and wife; (4) the interest that the petitioner should be able to marry and live respectably. To these four points Viscount Simon, the lord chancellor, added a fifth in *Blunt* v. *Blunt* (1943, A.C. 417), "namely, the interest of the community at large, to be judged by maintaining a true balance between respect for the binding sanctity of marriage and the social considerations which make it contrary to public policy to insist on the maintenance of a union which has utterly broken down." The old rule that a guilty mother was not entitled to access to her children was overcome by the decision of the court of appeal in B. v. B. (1924, P. 174). On the other hand, one result of equalizing the grounds of divorce was the marked increase in the number of wives' suits in which the charge was based on a solitary incident at a hotel, but this procedure was soon halted.

By the Judicial Proceedings (Regulation of Reports) act, 1926, the reporting of matrimonial causes by newspapers was limited to the names, address and occupations of the parties and witnesses, legal submissions, summings up and judgments and verdicts of juries. Thus the recommendation of the divorce commission, (9) above, was dealt with in more drastic fashion than was proposed.

In 1937 a Matrimonial Causes act was promoted by a private member of parliament, A. P. (later Sir Alan) Herbert, and was finally passed in July 1937. It was largely based upon the recommendations of the royal commission published in 1912. To adultery as grounds for divorce were added desertion for three years, cruelty. and unsoundness of mind regarded, after five years' duration, as incurable. No divorce proceedings could be initiated until three years after the date of marriage; but the courts were given power to reduce this period in cases of exceptional hardship or depravity. The act increased the grounds of annulment of marriage; in one case, at least, a postnuptial matter (willful refusal to consummate) was made a ground of annulment and not dissolution. this being due to the pressure of those who did not wish to see grounds of divorce further increased. A further feature of the act was that it laid no compulsion whatever upon the church in the matter of remarriage of divorced persons, leaving the church free to recognize or not the law of the land. But, as was said in *Weatherley* v. *Weatherley* (1947, A.C. 628) by Lord Jowitt. the lord chancellor: "The marriage which is contemplated in the Book of Common Prayer is a lifelong union which imposes an obligation on the one spouse towards the other 'to love and to cherish till death us do part.' The fact is that the law of the land cannot be co-extensive with the law of morals; nor can the civil consequences of marriage be identical with its religious consequences. What marriage means to different persons will depend upon their upbringing, their outlook and their religious belief." Problems as to what are adequate grounds for divorce are to be solved "on the true construction of the relevant Acts of Parliament."

The Matrimonial Causes act, 1950, among other things, consolidated the law relating to divorce. By s. 1, either spouse might get a decree on the grounds of: (1) adultery; (2) desertion without cause for a period of at least three years immediately preceding the presentation of the petition; (3) cruelty; (4) the respondent's being incurably of unsound mind and having been continuously under care and treatment, as defined in the statute, for at least five years immediately before the petition. In addition, a wife might petition on the ground that her husband had, since the celebration of the marriage. been guilty of rape, sodomy or bestiality. Section 2 forbade presentations of petitions for divorce during the first three years of a marriage, except where, in cases of exceptional hardship or exceptional depravity, a judge, after considering the interests of any children of the marriage and the question of reasonable probability of reconciliation, otherwise allowed. A successful petitioner is first granted a decree *nisi;* once that decree is made absolute and the time for appeal has passed, or the appeal has been dismissed. both the divorced persons may remarry.

The 1956 Commission Report. — In 1951, a private member's bill was introduced by Eirene White, a Labour M.P.. to make seven years' separation a ground of divorce by either spouse in certain cases, but was withdrawn on the establishment of a royal commission to investigate the law of divorce and other matrimonial matters, "having in mind the need to promote and maintain healthy and happy married life and to safeguard the interests and well-being of children." The main issue before the commission was whether divorce should continue to be granted on the basis of certain specified matrimonial offenses, or whether it should be granted on the basis that the marriage had irretrievably broken down. The main recommendations were: (1) by 19 to 1, that the doctrine of the matrimonial offense should be retained; (2) by 9 members. that the principle that a marriage should be dissolved simply because it has irretrievably broken down (*e.g.,* divorce at the option of either spouse after a period of separation) should not be introduced into the law. Nine other members were sympathetic to divorce after seven years' separation; (3) new grounds of divorce should be: willful refusal to consummate (not nullity as heretofore); artificial insemination of a wife by a donor without the husband's consent; where the respondent is an incurable mental defective detained for five years; (4) marriage guidance and conciliation should be promoted by the state; (5) in all suits for divorce, nullity or judicial separation, the court must be satisfied that arrangements proposed for the care and upbringing of any children of the marriage or any other children are the best which can be devised in the circumstances, with the power to withhold relief until the court is so satisfied.

Extent of Jurisdiction in Divorce Petitions. — The act of 1857, which introduced judicial dissolution for the first time, made no specific provision for jurisdiction of the courts of England (and Wales) in divorce suits. For a short time the courts held that they were competent to entertain divorce petitions on the basis of the (British) nationality of the parties. This basis gave way to one in which the residence of the parties was made the decisive factor, this having been the test (by reason of the Statute of Citations, 1531) of jurisdiction in the ecclesiastical courts But in 1895 it was finally established, in *Le Mesurier* v. *Le Mesurier* A C. 517 (a decision of the judicial committee of the privy council which has been accepted as stating also the law of England), that courts have jurisdiction to entertain divorce proceedings only where both the parties are domiciled in England at the commencement of the proceedings, the place of celebration of the marriage not being relevant for this purpose. The rule of English law being that a wife automatically has the domicile of her husband, much injustice resulted: thus, if an English wife were deserted by her husband who had gone abroad and changed his domicile, she would have to go to the courts of that country for her remedy, always supposing that it was a country which acknowledged divorce. In 1937 and in 1944 certain statutory exceptions to this rule were enacted, but the main exception was first introduced in 1949 and then consolidated in the 1950 act. In the case of proceedings, among other things, for divorce, even though the husband is not domiciled in England, the English courts have jurisdiction if the wife is resident in England and has been ordinarily resident there for a period of three years immediately preceding the commencement of the proceedings and the husband is not domiciled in any other part of the United Kingdom or in the Channel Islands or in the Isle of Man. Where the courts take jurisdiction under this new provision, they are ordered to determine the issue in accordance with

the law which would be applicable in a normal case; *i.e.,* where both parties are domiciled in England at the time of proceedings. In such a case, it seems, though it has never been determined in the courts, that an English court will apply only the English domestic law of divorce, disregarding the law of the husband's domicile by which divorce might not be permitted. It was decided by the Court of Appeal in *Travers* v. *Holley* (1953, P. 246) that what entitles the English courts to assume jurisdiction must be equally effective elsewhere, and that where there is in substance reciprocity, it would be contrary to principle and inconsistent with comity if the courts of this country were to refuse to recognize a jurisdiction which *mutatis mutandis* they claim for themselves.

English courts mill only entertain divorce petitions relating to "Christian" marriages. This expression relates not to Christianity as a religion but to the monogamous concept of marriage acknowledged and recognized by that religion, so that non-Christians whose concept of marriage, in the defined aspects, is identical with that of Christians are entitled to have their marriages recognized and adjudicated upon in English courts. Indeed, as Lord Sumner said, the phrase "Christianity is part of the law of England" is "really not law; it is rhetoric." The "Christian" concept asks only that the marriage should be a "voluntary union for life of one man and one woman, to the exclusion of all others." Thus, both Jewish and Japanese marriages, among others, come within this definition; but polygamous marriages cannot be dissolved in England. The mere fact that a marriage may be terminated by unilateral action of a party would not take that marriage, if it were otherwise within the definition, out of the scope of the "Christian" marriage.

Summary Proceedings for Separation.— The legislature sought to extend the relief afforded by the courts in matrimonial causes by a procedure fairly to be considered within the reach of all classes. In 1895 an act was passed which re-enacted in an improved form the provisions of an act of 1878 of similar effect. By the act of 1895 power was given to a married woman whose husband: (1) has been guilty of an aggravated assault upon her within the Offences against the Person act, 1861; or (2) has been convicted on indictment of an assault on her and sentenced to pay a fine of more than £5 or to imprisonment for more than two months; or (3) has deserted her; or (4) has been guilty of persistent cruelty to her or of willful neglect to maintain her or her infant children *and* by *such cruelty or neglect shall have caused her to leave and live apart from him,* to apply to a court of summary jurisdiction (later known as magistrates' courts) and to obtain an order containing all or any of the following provisions: (1) that the applicant be not forced to cohabit with her husband; (2) that the applicant have the custody of any children under 16 years of age; (3) that the husband pay to her an allowance not exceeding £2 (later £5) a week. (The words in italics above were repealed by the Separation and Maintenance act, 1925, with the result that a wife might apply to the magistrates notwithstanding that she had not left her home because of her husband's neglect and cruelty.) The act provided that no married woman guilty of adultery should be granted relief, but with the very important condition, altering the rule of the common law, that the husband should not have condoned or connived at the adultery or conduced to it by willful neglect or by misconduct. An act of 1920, as amended, enables the court to award the wife a sum of up to *30s.* a week for the maintenance of each child of the marriage of whom she has been granted the legal custody. Reforms were made in this branch of the law in 1949 and 1950.

SCOTLAND AND IRELAND

So far as matrimonial laws are concerned, Scotland and Ireland are just as independent of English law as are foreign countries.

In Scotland marriages may be judicially dissolved for two causes, adultery and willful desertion, these being the grounds at common law. Willful desertion for three years was made a statutory ground of divorce in 1938. and four new grounds were added: incurable insanity after care and treatment as an insane person for five years; cruelty; sodomy; and bestiality. Actions for judicial separation also are available. Condonation, connivance and conduct conducing (the latter pleaded as *lenocinium* [pandering]) are bars to relief. A petitioner's adultery is no bar to a divorce but may be set up by the accused spouse by way of counteraction (delay in prosecuting the suit has to be considered by the court but is rarely a bar to relief). The lord advocate has much the same powers as the queen's proctor in England in matters of collusion.

In Ireland, by art. 41 of the constitution of Eire (*i.e.,* the Republic of Ireland) the family is recognized as "the natural primary and fundamental unit group of Society, and as a moral institution possessing inalienable and imprescriptible rights, antecedent and superior to all positive law." The state is thus pledged to guard nith special care the institution of marriage, on which the family is founded, and to protect it against attack. The same article provides that no law shall be enacted providing for the grant of a dissolution of marriage. Further, no person whose marriage has been dissolved under the civil law of any other state, but which is a subsisting valid marriage under the law of the Republic of Ireland, shall be capable of contracting a marriage in Ireland during the lifetime of the other spouse. Thus no divorce may be granted in Ireland, and foreign dissolution decrees will only be recognized where given in the court of the common domicile of the parties. Proceedings for nullity and judicial separation may still be brought.

Divorce in Northern Ireland is controlled by a Matrimonial Causes act of 1939. Either party may petition on the grounds of adultery, desertion for three years, cruelty and insanity after five years' care and treatment; and a wife may petition on grounds of rape, sodomy or bestiality.

COMMONWEALTH OF NATIONS

In Canada, though divorce is a matter exclusively within the control of the dominion parliament, that body did not see fit to pass any general, overriding act, with the result that the divorce laws of the ten provinces, which remain in force until altered or repealed by dominion legislation, vary considerably. The provinces of British Columbia, Alberta, Saskatchewan and Manitoba adopted English law after 1857 (1858 for the first-named, 1870 for the other three), so that their courts have jurisdiction, as was available in England after the Matrimonial Causes act of that year, to grant decrees of divorce. As to Ontario, by a dominion act of 1940, the English law of divorce as in July 1870 was made to apply therein: the idea behind the date chosen in this enactment was to make the law of Ontario uniform with that of Manitoba, Saskatchewan and Alberta. In the case of Nova Scotia, New Brunswick and Prince Edward Island, English law was introduced well before 1557; but, by legislation of the provinces themselves (effected before the dominion was established in 1867), the power to grant divorce was given to the respective provincial courts. The courts of Quebec were not given divorce jurisdiction. "Marriage can only be dissolved by the natural death of one of the parties; while both live, it is indissoluble": the law is the same for Newfoundland, incorporated as a province of the dominion in 1949, but in both these provinces divorce can be obtained by private act of parliament, normally on the ground of adultery. In 1925 the dominion parliament, following the provision of the English act of 1923, enacted that in those provinces possessing divorce jurisdiction a petitioning wife need not prove more than the adultery of her husband.

In Australia the grounds of complete divorce vary according to the state but are generally wider than in England, including conduct which would only justify a judicial separation in England.

In New Zealand the grounds of absolute divorce are: (1) adultery; (2) willful desertion for three years; (3) habitual drunkenness for four years coupled with cruelty or desertion by the husband, or neglect of household duties by the wife; (4) conviction and sentence of imprisonment for seven years or more for attempting to commit the murder of the petitioner, or wounding of the petitioner or a child of the parties; (5) conviction for the murder of a child of the parties; (6) incurable lunacy for at least ten years, including confinement for seven of these years; (7) failure to comply with a decree for restitution of conjugal rights; (8) three years of separation agreed either orally or in writing; (9) a three years' lapse of time after the making of a New Zealand decree of judicial separation; (10) rape, sodomy, bestiality. A mar-

ried woman in New Zealand who, if a feme sole (single woman), would be domiciled there, may present a divorce petition in New Zealand, regardless of her husband's domicile elsewhere, providing that they have been living apart for at least three years.

EUROPE

As regards European countries, there is no complete divorce where the Roman Catholic Church still preserves its ancient powers and influence.

Italy, Spain and Portugal. — In Italy a husband may secure a divorce a mensa et thoro on the ground of his wife's adultery. The wife is entitled to the same decree if her husband keeps a concubine in such a way as to constitute a grave indignity to his wife; or if he voluntarily deserts her or fails to make a home for her, or is guilty of violence. threats or cruelty endangering her safety or health; or if he is sentenced for a grave crime. The Italian courts do not recognize foreign divorces relating to Italian subjects; but if a national of a foreign country celebrates his marriage in Italy and then gets a decree of divorce in another country, this decree, under certain conditions, may be enforceable in Italy through special proceedings (deliberazzone) in a court of appeal. In Spain and Portugal the law is practically the same as in Italy, but Portugal has a comprehensive divorce law relating to non-Catholic marriages.

France. — In France the law of divorce has had a chequered history. Before the Revolution the Roman canon law prevailed, marriage was considered indissoluble and only divorce a mensa et thoro, known as la *séparation* d'habitation, was permitted; though it would appear that in the earliest age of the monarchy divorce a vinculo *matrimonii* was allowed. But the French Revolution swept away marriage among the institutions which it overwhelmed, and by the law of Sept. 20, 1792, so great facility was given for divorce a *vinculo matrimonii* as practically to terminate the obligations of marriage. A reaction came with the Code Napoléon, yet divorce was still fairly easy. On the restoration of the monarchy in 1816 divorce a *vinculo* was abolished.

Divorce uas re-enacted by a law of July 27, 1884, the provisions of uhich were simplified by laws of 1886 and 1907. But a wide departure was made by these laws from the terms of the Code Napoléon. Divorce by consent was not permitted, and the folloning became the causes for which divorce was allowed: (1) adultery by either party to the marriage at the suit of the other, without. in the case of adultery by the husband, the aggravation of introduction of the concubine into the home required by the Code; (2) violence (*excès*) or cruelty (*sévices*); (3) *injures* graves, acts reflecting on honour or reputation and such things as unjustifiable refusal of marital rights or habitual drunkenness; and (4) *peine affictive* et infamante, infliction of a punishment involving corporal confinement and moral degradation

In addition to its recognition of full divorce, the French law recognizes se'paratton de corps. The grounds are the same as those for a divorce; and if a se'paration de *corps* has existed for three years, it may be turned into a divorce upon the application of either party to the court.

On a divorce both parties are at liberty to remarry. The husband could remarry at once; but the wife (art. 296 of the Code) was only allowed to remarry after an interval of ten months. By the act of 1907 this article was abolished, and the wife allowed to remarry as soon as the judgment or decree granting the divorce had been entered, providing 300 days had elapsed. Under the law of March 26. 1924, art. 295 was amended in favour of greater. but not complete, freedom of remarriage of the parties divorced, not still in a state of wedlock. The publication of divorce proceedings in the press is forbidden under heavy penalties. After a divorce the wife may not continue to use the name of her divorced husband. An appeal may be brought against a decree of divorce within two months; and a decree made on appeal is subject to revision by the court of cassation uithin two months. A decree must be transcribed in the register of civil status before it becomes absolute.

Other European Countries. — In Austria the grounds for complete divorce are adultery, conviction for a crime for which the penalty could be five years' imprisonment, malicious desertion, cruelty or conduct endangering life or health. and invincible aversion. A judicial separation is allowed on the same grounds, and also by mutual consent. In Czechoslovakia. Hungary and Poland, the only ground of divorce is the breakdown of the marriage. The interests of the children have to be considered.

Dissolution of marriage by mutual consent is allowed in Belgium, subject to the approval of the court. The other grounds of complete divorce in Belgium include the adultery of the wife, the adultery of the husband only if he has brought a concubine to the home. cruelty and conviction for an infamous offense. Divorce by mutual consent is permitted subject to proceedings which take a year to complete: in these cases. three years must elapse before either party may remarry. In Switzerland divorce by mutual consent was abolished in 1912; grounds for divorce are adultery, cruelty or dishonourable treatment, willful desertion for two and a half years and incurable insanity or mental disease of three years' duration; and in cases of gross antagonism a couple may be granted a trial separation for two years, followed by a divorce if there is no reconciliation. The ground most relied on, however, is that of "conjugal disturbances" under art. 142 of the code.

In Sweden the grounds for divorce are adultery, bigamy, other serious sexual misconduct, conspiring against the petitioner's life, exposure to risk of venereal disease. drunkenness, imprisonment, desertion for two years, one year's separation after court order, three years' separation and three years' insanity. In Norway and Denmark the grounds are very similar, and in the former country a royal decree of divorce may be obtained by mutual request after three years of separation. In the Netherlands judicial separation is allowed, among others, on the usual grounds of the canon law, and complete divorce can be secured for each of the following grounds: adultery, violence against the petitioner, cruelty, four years' imprisonment. five years' desertion or separation after a court order, and by mutual consent where reconciliation is impossible.

The U.S.S.R.—In Soviet Russia, in place of the previous procedure, under which a divorce was registered by either spouse alone without assigning reasons, a decree of 1944 provided for a judicial procedure for divorce, and the only ground is the breakdown of the marriage. The interests of the children have to be considered. In 1947 a decree prohibited marriages between Soviet citizens and foreigners.

See ALIMONY; ANNULMENT; MARRIAGE, LAW OF; see also references under "Divorce" in the Index volume.

(ST. H.; C. MO.; J.E.S.S.; J.J.)

DIWAN (DIVAN), a word of near eastern origin with the Arabicized plural dawawin, primarily meaning a "register," whence "administration" and "finance department"; also a poet's collected verse, arranged according to the last letter, in alphabetical order, of the rhymes. Meaning "register" in a financial context, it appeared under the caliph Omar (A.D. 634–644) as the record of Muslim narriors with their entitlements to spoil. It later acquired the meaning of a register of state financial transactions, and under the Abbasid caliphs (750–1258) it denoted treasury and then the whole civil administration, separate diwans being designated according to function. It lost its bureaucratic connotation in Iran but retained it under the Ottoman sultans in Turkey and the Moguls in India. There it meant in modern times a court of law, but from the time of Xkbar (1556–1605) it was chiefly associated with government finance, the chief finance minister being the diwan nith provincial diwans under him (diwani designating revenue, as opposed to general, administration). Under the Ottomans it meant the imperial chancery headed by the grand vizier. In 1515 a consultative assembly of senior officials summoned by Selim I also was called a diwan. It was early extended to mean the audience chamber of important government officers. These offices were furnished with mattresses and cushions along the walls, and this accounts for the extension of the meaning to "sofa" (see CHAIR AND SOFA) common in Europe and now returned to modern Turkish.

See R. Levy, The *Social Structure of Islam (1957).* (P. W. A.)

DIWANIYAH (AD DIWANIYAH), a town in Iraq, capital of

the *liwa* of the same name. It lies on the Hillah branch of the Euphrates river, approximately 100 mi. S. of Baghdad, to which it is joined by road and rail, and 50 mi. S.S.E. of Hillah. Pop. (1957) 33.204. The town is situated on both sides of the river, nhich is embanked by partly natural and partly artificial levees 12–16 ft. above low-water level and is spanned by a bridge. The greater part of the town is on the left (eastern) bank. Diwaniyah is largely built of brick and sun-dried mud. The chief buildings include the administrative centre (serai), hospital, barracks, schools and commercial buildings with a covered bazaar. Formerly known as Hiska, the town became a centre of government in the 18th century and was later elevated to the capital of an Ottoman sanjak. It has strategic importance, covering approaches to Baghdad from the southwest, and is the centre of a rich though turbulent province.

DIWANIYAH LIWA (area 5.825 sq.mi.; pop. [1957] 507,548) is of considerable agricultural importance, being noted for its cereal production based on intensive irrigation from the Euphrates system. Rice, of which Diwaniyah and Amarah are the two main producing areas in Iraq, is in some years the principal crop, with barley second and wheat a close third. Many water buffalo are kept, an indication of the generally marshy and low-lying terrain, which is on the average less than 100 ft. above sea level.

(W. B. FR.)

DIX, DBROTHEA LYNDE (1802–1887), U.S. social reformer and humanitarian. whose devotion to the welfare of the mentally ill led to widespread reforms in the U.S. and abroad, was born on April 4, 1802. in the frontier town of Hampden, Me. She was a granddaughter of Elijah Dix, a prominent Boston physician. Dorothea's early life was one of poverty and neglect. At the age of 12 she left her parents' home for that of her grandmother in Boston, and finished her schooling with an aunt in Worcester, Mass. In 1821 she opened a school for girls in Boston, where, until 1835, she alternated periods of intensive teaching with bouts of poor health. During illness and convalescence she wrote books for children, traveled abroad and made important contacts as tutor to the children of William Ellery Channing.

Her primary career, however, opened in 1841 when she accepted an invitation to teach a Sunday school class in the East Cambridge (Mass.) jail. There the sight of insane persons thrown into prison with criminals of both sexes stirred her deeply. In the next 18 months she visited every conceivable place in Massachusetts where mentally ill persons mere confined, and revealed the shocking conditions in a report made to the state legislature in 1843. When improvements followed, she turned her attention to neighbouring states and then to the west and south, and saw special hospitals for mental patients built in more than 15 states and in Canada, and improved treatments practised throughout the nation. Her efforts to secure public lands for her cause failed, but she did arouse a new interest in the problems of mental illness both in the United States and Europe.

During the Civil War Miss Dix served as superintendent of women nurses for government hospitals, and at its close returned to her work for the insane. She died on July 17, 1887, in the state hospital in Trenton, N.J., which had been established through her efforts.

DIX, JOHN ADAMS (1798–1879), U.S. political leader and army officer who served in both the War of 1812 and the American Civil War, was born at Boscawen, N.H., July 24, 1798. He attended Phillips Exeter academy and the College of Montreal, and entered the U.S. army at the age of 14. He served during the War of 1812 and remained in the army after the war. Meanwhile he took up the study of law and was admitted to the bar in 1824. From 1828 to 1830 he practised law in Cooperstown, N.Y., where his wife's father owned large areas of land. He was appointed adjutant general of New York in 1830 and became a member of the "Albany regency" (*q.v.*), a politically powerful group of New York Democrats. He rose rapidly in politics, serving as secretary of state and superintendent of public schools (1833–39); as a member of the state assembly (1841); and as United States senator from New York (1845–49). He supported the antislavery wing of the Democratic party. In 1860 he was appointed postmaster of New York city and in 1861 served a short term as secretary of the treasury of the United States. While holding the latter office he issued to a treasury officer in New Orleans the famous order: "If any one attempts to haul down the American flag, shoot him on the spot." He was appointed major general of volunteers (1861) and as commander of various departments he rendered valuable service to the cause of the Union. He was U.S. minister to France (1866–69), and in 1872, although a Democrat, he was elected governor of New York by the Republicans. He died in New York, April 21, 1879.

See D. S. Alexander, *Political History of the State of New York*, vol. ii (1906); Morgan Dix, *Memoirs of John Adanzs Dix* (1883). (R. E. AT.)

DIX, OTTO (1891–), German painter and engraver of socially critical realism, was born on Dec. 2, 1891, at Untermhaus, Thuringia. Trained in Dresden, he was joint founder in 1919 of the "Dresden Secession" and held his first exhibition with the Dresden "1919 group." He executed 50 etchings, "War," in 1923–24 and innumerable portraits in 1923–25. In 1925 he held an exhibition at the National gallery, Berlin, and in 1927 was appointed professor at the Academy of Fine Arts, Dresden, but was later dismissed under the Nazi regime in 1933. Dix was featured in the Nazi exhibition of "Degenerate Art," and his pictures were removed from the museums in 1938. He had settled in 1933 at Randegg in the Hegau, and in 1936 at Hemmenhofen on Lake of Constance. After 1933 he painted symbolic religious paintings and landscapes, tending toward the old German masters. In 1946 his subject matter changed again, tending toward religious pictures and landscapes. Between 1948 and 1956 he made more than 100 lithographs.

Dix's stylistic development has moved away from the prototype of the Italian Renaissance, through surrealism ("The Moon-Woman," 1919), to socially critical realism, which in 1924 became romantic ("Nelly in the Flowers,") and close to the idea-painting of A. Bocklin ("The Temptation of St. Antony," 1936–37). After World War II he modified his painting both in colour and draftsmanship.

DIXIE, a term with two meanings: (1) a popular name generally applied to the southern states of the U.S., particularly those which formed the Confederate States of America, and (2) the title of a song written and set to stirring music in 1859 by Daniel Decatur Emmett, a native Ohioan of Virginia parentage.

Several explanations of the word as applied to the region are current. The most popular is that it had its origin in ten-dollar notes issued before 1860 by the Citizens Bank of New Orleans. Because of the large numbers of French-speaking inhabitants in the area these notes carried the French word *Dix* ("ten") on the reverse side. Thus, Louisiana, and later the entire South, became known as the land of Dixies or Dixie Land. In another story, a kindly, paternalistic New York slaveowner named Dixie moved to the deep south and his slaves called the new home Dixie Land. A variation of this version had Dixie selling his slaves to southern masters when abolitionist sentiment in New York became strong. These slaves, lamenting their new lot, wanted to go back to "Dixie's Land," in this case, New York. How the name was transferred to the South is not explained. There was also an early attempt to connect the term with the Mason and Dixon line.

Emmett, songwriter and performer for Jerry Bryant's minstrel troupe, composed "Dixie" as a "hooray song" or "walk-around" for the company's show. It is said that he got the idea from strolling showmen who, on cold, dreary days in New York, would say, "I wish I was in Dixie Land."

First sung under the title "Dixie's Land" in New York city, "Dixie" received wide acclaim when played by Carlo Patti and sung by Susan Denin at the Variety theatre in New Orleans in Jan. 1861. Played at the inauguration of Confederate President

Jefferson Davis at Montgomery, Ala., on Feb. 18, 1861, "Dixie" soon became what was probably the most popular marching song of the Confederacy and is often regarded as the Confederate national anthem. Albert Pike, poet and general from Arkansas, composed the words for a Confederate version that was published on April 30, 1861, and Mrs. M. B. Moore of North Carolina began in 1863 a *Dixie Series* of Confederate school books that included primers, spellers. readers, histories and arithmetics. Although the word Dixie quickly became synonymous with the South, the North continued to claim the song and there was at least one set of pro-Union lyrics written for it. Speaking to a crowd that had gathered on the White House lawn to celebrate Gen. Lee's surrender, President Lincoln asked the marine band to play "Dixie," jokingly insisting that the Union armies had "fairly conquered it."

Despite the various versions written during the Civil War, Dan Emmett's lyrics were the ones that survived, and, although Dixie, the land, refers only to the South, "Dixie," the song, is beloved by the entire nation. (F. M. *G.*)

DIXON, GEORGE (*c.* 1755–*c.* 1800), English navigator who explored the shores of the present British Columbia. He served under Capt. James Cook in his third expedition (1776–79), and on his return became a captain in the merchant navy. In the autumn of 1j8j he sailed in the "Queen Charlotte," in the service of the King George's Sound company of London to develop the fur trade in what is now British Columbia. His chief discoveries along the coast were those of Queen Charlotte's Islands and sound (the latter only partial), Port Mulgrave, Norfolk bay, and Dixon's Entrance and archipelago. Dixon disposed of his cargo in China and returned in 1788. In 1789 he published *A Voyage Round the World, but More Particularly to the North-West Coast of America,* the bulk of which consists of descriptive letters by William Beresford, his supercargo. Dixon's own contribution to the work included valuable charts and appendixes. He is usually identified with the author of *The Navigator's Assistant* (1791), who was a teacher of navigation at Gosport, Eng.

DIXON, JOSEPH (1799–1869), U.S. inventor and manufacturer who pioneered in the industrial use of graphite, was born in Marblehead. Mass., on Jan. 18, 1799. He received little formal education but had a strong scientific bent and a natural aptitude for mechanics. He became a printer and lithographer and in experiments with type-casting discovered that graphite crucibles withstand high temperatures. He also became familiar with other properties of the mineral and in 1827 began the manufacture of lead pencils, stove polish and lubricants in Salem, Mass. Twenty years later he moved his business to Jersey City, N.J. In 1850 he received patents on graphite crucibles for use in making steel and pottery. He also developed a process for using graphite to grind lenses. He experimented with photography and photolithography and in collaboration with Francis Peabody devised a technique for printing bank notes in colour to prevent counterfeiting. His other inventions included a process for printing calico in fast colours, a wood-planing machine for shaping pencils and a galvanic battery. He died in Jersey City on June 15, 1869.

BIBLIOGRAPHY.—Elbert Hubbard, *Joseph Dixon* (1912); J. W. Oliver, *History of American Technology* (1955); *N. E. Historical and Genealogical Register,* vol. xxxii, p. 477 (1869). (J. B. RA.)

DIXON, ROLAND BURRAGE (1875–1934), U.S. cultural anthropologist and organizer of the valuable anthropological material at the Peabody museum, Cambridge, Mass., was born in Worcester, Mass., on Nov. 6. 18jj. He was educated at Harvard university (A.B.. 1897; A.M., 1898; Ph.D., 1900). His professional career was also entirely at Harvard. where he rose from assistant in anthropology in 1897 to professor in 1915. After assuming chairmanship of the division of anthropology, he built up at Harvard one of the leading schools for the training of profcssional anthropologists. Although his interests were oriented toward the organization and interpretation of anthropological facts rather than field work, Dixon wrote several ethnographies on California Indians. In addition he made notable field studies in Siberia, Mongolia, the Himalayas and Oceania. His work dealt with problems of material culture, mythology, linguistics and primitive religion, and was organized so as to extract historical inferences. Despite the professional tenor of the times, which emphasized culture change resulting from diffusion, Dixon maintained a constructive interest in the importance of ethnic migrations. His system of cross-filing all anthropological articles by area and subject, as well as by author and title, produced one of the most useful and largest libraries in anthropology, at Harvard's Peabody museum. He died Dec. 19, 1934, at Harvard, Mass.

Dixon's books included *The Racial History of Man* (1923), *The Northern Maidu* (1905), *The Building of Cultures* (1928), *The Shasta* (1907) and *Oceanic Mythology* (1916).

DIXON, a city on the Rock river, northern Illinois, U.S., seat of Lee county, is 35 mi. S.W. of Rockford and approximately 100 mi. W. of Chicago. John Dixon (1784–1876), for whom the city was named, established a ferry service and tavern there on his mail route between Peoria and Galena. His arrival in 1830 marked the beginning of the first white settlement in the county. The city was chartered in 1859. It is the commercial centre of an agricultural region and its industrial plants manufacture dairy products, cement, shoes, valves, caskets and wire. Dixon State (mental) hospital is located in the vicinity. Distinctive landmarks include the Memorial arch, dedicated to its war dead. and. in a small park which marks the site of Dixon blockhouse, a bronze statue depicting a young Abraham Lincoln as a captain in the militia during the Black Hawk War (1832). At the close of the war Jefferson Davis, Zachary Taylor and Lincoln met in the blockhouse that stood near the northern end of the present bridge across the river. For comparative population figures *see* table in ILLINOIS: *Population.* (E. HG.)

DIYALA (DIALA), a river flowing from Iran into Iraq, and a *liwa* (province) in eastern Iraq bordering Iran. The river, called the Sirvan in Iran, rises in the Kurdistan massifs of the Iranian Zagros and flows south-southwestward toward the Tigris, joining it a few miles south of Baghdad. Its total length is about 240 mi. The upper Diyala drains an extensive mountain area of Iran and Iraq and its course is there marked by defiles and precipices. For 20 mi. it forms the frontier between the two countries. It then emerges first into a rolling plateau country forming part of the region known as Assyria and centred on the oil field area of Khanaqin, then through the Jabal Hamrin (the southwestern boundary of Assyria) into the flat Tigris lowlands. There is a difference in level of about ten feet between the Diyala and the Tigris, hence drainage at floodtime is difficult. At low-water season the entire flow of the Diyala is led off through six major irrigation channels fed by a weir. A large dam, under construction in the early 1960s. at a defile known as Darband-i-Khan, was designed to augment greatly the already considerable irrigation potential of the entire lower basin.

DIYALA PROVINCE consists essentially of the cultivated basin of the lower Diyala, together with portions of higher unused land to the northwest and southeast. Pop. (1957) 329,813. Area 6.224 sq.mi. The main crops are cereals—barley and wheat with rice increasingly important toward the Tigris. The chief town is Baqubah (pop. [1957] 18,547) about 31 mi. N.N.E. of Baghdad on the left bank of the Diyala river. It serves as a market for agricultural commodities and itself produces dates and citrus fruit. Through it runs the main highway from Baghdad to central Iran. (W. B. FR.)

DIYARBAKIR (formerly DIYARBEKIR; from *diar,* "land," and *Bakr; i.e.,* Abu-Bakr, the caliph), chief town of the *il* of the same name in southeast Turkey, stands 110 mi. E.S.E. of Malatya on a basaltic plateau on the right bank of the Tigris, which there flows in a deep open valley. The town is still surrounded by the black basalt walls which gave it the name of Kara or Black Amid; they are imposing on the west, facing the open country, but almost in ruins where they overlook the river. A mass of gardens and orchards covers the southwestern slope. Pop. (1960) 80,645.

The streets are narrow, badly paved and dirty; the houses and shops are low. mostly of stone, sometimes of stone and mud. With the post-World War II increase of population, the city expanded outside the walls, with wide streets and concrete buildings. The bazaar is a good one, and gold and silver filigree work

is made, peculiar in character and design. Fruit is good and abundant, for the rich volcanic soil is well watered from the town springs. The size of the melons is specially famous. To the south the walls are about 40 ft. high, with towers rising to 500 ft. On the north is the Harput gate, on the west the Rum, on the south the Mardin and on the east the Yeni Kapu or New gate. The Great mosque. Ulu Jami, formerly a Christian church, occupies the site of a Sassanid palace and was built with materials from an older palace, probably that of Tigranes II. The churches of greatest interest are those of SS. Cosmas and Damian (Jacobite) and of St. James (Greek).

The summer climate is excessively hot and unhealthful. Winters are frequently short but severe. The town is supplied with water both by springs inside the town and by aqueducts from fountains at Ali Punar and Hamervat. The principal exports are wool, mohair and copper ore. and imports are cotton and woolen goods, indigo. coffee. sugar and petroleum. Cereals. cotton, tobacco, rice and silk are produced. An exceptionally rich copper mine exists at Maden; galena mineral oil and silicious sand are also found. Virulent scorpions abound.

In the 20th century Diyarbakir was one of the most flourishing cities of Asia. It is at the head of navigation of the Tigris, which is traversed downstream by keleks or rafts supported by inflated skins. There are good roads to Aleppo (Syria) and Iskenderun on the Mediterranean and to Samsun on the Black sea by Harput, Malatya and Sivas. There are also routes to Mosul (Iraq) and Bitlis. Railroad service to Diyarbakir from Ankara was inaugurated in 1935.

Diyarbakir became a Roman colony in A.D. 230 under the name of Amida. It was enlarged and strengthened by Constantius II. in whose reign it was taken after a long siege by Shapur (Sapor) II, king of Persia. In the later wars between the Persians and Romans it changed hands frequently. Though ceded by Jovian to the Persians it again became annexed to the Roman empire. and in the reign of Anastasius I (502) was once more taken by the Persians. It was taken in about 638 by the Arabs and afterward passed into the hands of the Seljuks and Persians, from whom it was finally captured by Selim I in 1515. Subsequently it remained under Ottoman rule.

DIYARBAKIR IL is one of the largest provinces in southeastern Anatolia. Pop. (1960) 401,084. Area 5,798 sq.mi. It is located in front of the large curve of the southeastern Taurus mountains and occupies a large part of upper Mesopotamia, being separated from eastern Anatolia by the Taurus mountains in the north and from the Mesopotamian plain by the Mardin hills in the south. Its western frontier is marked by the volcanic cone of Karaca Dag. Thus it forms a large depression crossed by the Tigris river. (N. Tu.; S. ER.; E. Tu.)

DIZZINESS: *see* VERTIGO AND DIZZINESS.

DJAKARTA: see JAKARTA.

DJAMBI: see JAMBI.

DJERBA, an island in the Gulf of Gabbs, Tunisia, lies very close to the mainland. Pop. (1956) 62.445, including about 2,700 Jews living mainly in two villages. Hara-Sghira and Hara-Kebira. Area 197 sq.mi. The island, composed entirely of Quaternary rock, is almost flat and has no surface water. Rainfall is irregular and amounts to about 8 in. a year; it is collected in cisterns for drinking. the water from wells being usually saline. Djerba is joined to the mainland by shoals and by the banks of wadies which dry out at low water, the tides along the Gulf of Gabès having a range of up to 6.5 ft. Olives and palm trees are cultivated extensively and there are some irrigated gardens. The weaving of wool and the manufacture of pottery are in decline, but fishing and diving for sponges flourish. Many single men emigrate temporarily to the mainland. The principal town is Houmt-Souk.

Djerba, the "land of the lotus-eaters" of the ancient geographers, has from Carthaginian times been renowned for its dry cultivation of trees, especially olives, and for its fish. There are remains of four Roman settlements. Djerba was conquered by the Arabs in 655 and became a dependency of Kairouan and Tunis (*q.v.*). It was occupied by the kings of Sicily 1148–60, 1284–1335 and 1383–92, being in the intervals a dependency of Tunis. In 1511 and again in 1560 the Spaniards tried unsuccessfully to take the island. In the 17th century Djerba was finally connected to Tunis but retained a certain autonomy. (J.-J. Ds.)

DJIBOUTI (JIBUTI), the port and capital of French Somaliland, Africa: lies on the southern shore of the Gulf of Tajura, about 150 mi. S.W. of Aden. The population, numbering about 31.000 in 1954, included a variety of ethnic and linguistic groups: Afar (Danakil); Isa, Gadnbursi and Isaaq (Somali); Arabs, Jews and Indians; and French, Greeks and other Europeans (about 4,000). The town is built on level areas, plateaus, linked by jetties: Djibouti plateau, containing Menelik square and the government palace; Serpent plateau; and Marabout plateau. It has a prosperous appearance with its white buildings, old and modern, and its laurel avenues. Adjoining the mainland, the picturesque native quarter. containing the well-known camel market. was being modernized in the mid-20th century. The underground stream of Ambuli supplies the town with water.

The harbour is landlocked and capacious, and the port has been considerably developed since World War II; it covers 160 ac. and has been dredged to a depth of 40–65 ft. There are several berths, with nearly one mile of quays, modern port equipment, a coal depot for 30.000 tons and oil storage. The only significant local industry is the production of salt from the sea. The economic life of the town, and of the territory, depends on the port's use as an entrepbt and as a refueling and supply station for shipping. The number of ships calling at Djibouti has steadily increased with its postwar development. It became a free port in 1949 and since that year its currency has been the Djibouti franc, freely convertible to the U.S. dollar. The Franco-Ethiopian railway. 487 mi. long, opened in 1917 and linking Djibouti and Addis Ababa, carries much of Ethiopia's merchandise. Djibouti owes its creation to Léonce Lagarde, the first governor and founder of the Côte française des Somalis. It became the capital in 1892.

DJOKJAKARTA: see JOGJAKARTA.

D LINES, in spectroscopy (*q.v.*), the pair of lines, characteristic of sodium, in the yellow region of the spectrum. Their separation is too small to be detected with a spectroscope of low resolving power, hence to Joseph von Fraunhofer (*q.v.*) they appeared as a single line. This line was the fourth prominent absorption line in the sun's spectrum, starting from the red end, and he accordingly designated it by the letter D. It was subsequently resolved into two components, D_1 arid D_2, corresponding to wave lengths 3'395.93 and 5395.97 A. (10^{-8} cm.) respectively. An emission line appearing in the chromosphere, D_3 of wave length 5375.62, has since been discovered. This line is caused by helium (*q.v.*).

DLUGOSZ, JAN (JOHANNES LONGINUS) (1415–1480), Polish historian and diplomat, was born at Brzeznica in 1415. After studying at the University of Cracow (1428–31) he entered the service of the bishop of Cracow, Zbigniew Olesnicki, and eventually became the. head of his chancery. Appointed canon of Cracow (1436). Dlugosz proved a capable administrator of the episcopal estates and a trustworthy negotiator. In 1449 he brought back from Rome a cardinal's hat for Olesnicki and was thereafter entrusted with a succession of missions on behalf of church and state. In the conflict over the part to be played by the church in state affairs and, after Olesnicki's death, over the nomination of bishops, Dlugosz upheld his patron's theocratic views and paid for his attitude by a period of disgrace (1461–63). Unlike Olesnicki, however, Dlugosz had from the start supported King Casimir IV in his Prussian policy, assisting him in the negotiations with the Teutonic Order before and during the Thirteen Years' War (1454–66) and at the peace negotiations. His relations with the king having gradually improved, Dlugosz was charged with the education of the royal princes in 1467. The preparation of official dossiers and the impact of humanism awakened his interest in history. His Liber *beneficiorum ecclesiae Cracoviensis* is a primary source for economic history; the monumental *Historia polonica* in 12 volumes. begun c. 1455, completed shortly before his death (in Cracow, May 19, 1480) and first published in full in 1711–12 (2 volumes), though often tendentious, compares favourably with similar contemporary works.

DMOWSKI, ROMAN (1864–1939), Polish statesman who played a major part in his country's resurrection after World War I and whose policy brought him into conflict with Pilsudski on two important issues, was born on Aug. 9, 1864, at Kamionek, near Warsaw! the son of an impoverished country squire. He studied natural sciences at Warsaw university (graduating in 1891), but interested himself in politics and from 1887 was a member of the secret Polish Youth association "Zet," which sought to restore a united, independent Poland. In 1895, with Zygmunt Balicki (1858–1916) and Jan Ludwik Poplawski (1854–1908) he founded in Lwow, in Austrian Poland, the influential *Przeglad Wszechpolski* ("All-Polish Review"). In 1897 the secret National league (founded in 1893), to which Dmowski belonged, became the National Democratic party, which openly opposed both internationalist socialism and loyalist conservatism in all Poland; and Dmowski's ideas, expressed in *Myśli nowoczesnego Polaka* ("Thoughts of a Modern Pole," 1903), were to be its inspiration. In May–July 1904, during the Russo-Japanese War, he visited Tokyo to oppose Jozef Pilsudski's attempt to get Japanese help for an insurrection in Russian Poland. In Nov. 1905 he told Count Witte, the Russian prime minister, that only the establishment of an autonomous state could counteract the revolutionary movement in Poland.

Becoming the leader of the National Democratic party, Dmowski controlled the elections for the three Russian dumas and sat in the second and in the third, in which he held the balance between the Russian parties and tried to interest the government in winning over the Polish nation. In *Niemcy, Rosya i kwestya polska* ("Germany, Russia and the Polish Question," 1908), he defended the thesis that Germany threatened both the Polish and the Russian nations, but that the behaviour of the tsar's government in Russian Poland assisted Germany. Pilsudski, on the other hand, seeing in tsarist Russia the main obstacle to Poland's independence, was prepared to lead a Polish force to fight on Austria-Hungary's side against Russia. As a result of the two splits in the National Democratic party (1908 and 1911). a progressive opposition against its program grew up, and at the elections to the fourth duma (Oct. 1912) Dmowski lost his Warsaw seat.

When World War I broke out Dmowski was visiting Germany. He was interned for two weeks in Stettin (Szczecin) but mas released and returned to Warsaw via Stockholm and St. Petersburg. In May 1915 he was invited by the Russian government to take part in a conference charged to discuss the principles of autonomy for Poland. Dmowski was pressing Russia to proclaim as a war aim the restoration of the Polish state, including the German and Austrian parts of it, to be united with Russia by a common crown, but the Russian ministers would not commit themselves. In summer 1915, however, when German and Austrian armies occupied all Poland, Dmowski concluded that his country's future lay with the western Allies and left for London, whereas Pilsudski continued for a time to co-operate with the Austrians. On Jan. 18, 1916, in Paris, in a memorandum to A. P. Izvolski. the Russian ambassador, Dmowski called for a completely independent and united Poland; in *Problems of Central and Eastern Europe,* privately printed in London in July 1917, he recommended the restoration or formation of national states between Germany and Russia. In autumn 1917 he formed in Paris a Polish National committee. Next autumn, in the U.S., he handed President Wilson a memorandum on the future frontiers of Poland.

In Jan. 1919 the government of restored Poland, with Pilsudski as the head of state, appointed Dmowski first Polish delegate to the Paris peace conference. The struggle for a politically and economically sound Polish-German frontier became his main task and in this he mas opposed by David Lloyd George, the British prime minister, who never found time to talk to him privately. However. Dmowski's hour of triumph came on June 28, 1919, when he signed the treaty of Versailles.

Dmowski returned to Poland in May 1920. Once more he opposed Pilsudski, who was trying to bring into being a federal state combining Poland, Lithuania, Belorussia and Ukraine. Dmowski recommended instead a policy of incorporating only parts of the historic eastern provinces into a unitary Polish state. Dmowski sat in the constituent *sejm* until 1922 and was minister of foreign affairs for a few weeks at the end of 1923, but afterward kept aloof from active politics. He wrote four more political books, of which *Polityka polska i odbudowanie państwa* ("Polish Policy and the Restoration of the State," 2nd ed , 1926) is the most important. He died at Drozdow on Jan. 2, 1939. (K. SM.)

DNEPRODZERZHINSK (formerly KAMENSKOYE). a town of Dnepropetrovsk *oblast* of the Ukrainian Soviet Socialist Republic. U S.S.R.. stands on the high right bank of the Dnieper, about 20 mi above Dnepropetrovsk. Founded as a Cossack settlement about 1750, the town grew from 40.400 in 1913 to 194 000 (1959), a growth based on heavy industry. The large, modern iron and steel plant uses Krivoi Rog ore to produce high-grade steels. There are also rolling-stock works, cement and coke-chemical works and a nitrate fertilizer plant. After 1960 a dam and a powerful hydroelectric station were constructed on the Dnieper there. Most of the population is concentrated in the centre of the city, where the largest factories are located. New development is to the south and southwest. There are a metallurgical institute and a number of technical schools. Railways link Dneprodzerzhinsk to Krivoi Rog and Dnepropetrovsk, and the Dnieper is navigable. The town was occupied by the Germans in World War II from 1941 to 1943. (R. A. F.)

DNEPROPETROVSK, an *oblast* in the east central part of the Ukrainian Soviet Socialist Republic of the U S.S R. It is bisected by the Dnieper river (*q.v.*) and is drained by its tributaries—the eastern part by the Samara and Orel and the western by the Bazavluk and Saksagan. Pop. (1959) 2,704,783. The area (12,278 sq.mi.) consists of rolling plains of loess-covered sedimentary rocks. very much dissected by erosion gullies. In the valleys the underlying ancient crystalline rocks outcrop. The soil is the very fertile black earth, originally in grass-steppe vegetation which has been almost entirely removed by the plow. Only on the Dnieper and Samara flood plains are there forest groves, mainly of oak. The climate is continental. with hot summers and cold winters, the latter modified by incursions of warm air from the Black sea. bringing temporary thaws. Rainfall is fairly low, 15–20 in. a year.

The 1959 census classified 1,906.964 of the population as urban. The largest towns are Dnepropetrovsk (658,000), Krivoi Rog (386,000), Dneprodzerzhinsk (194.000) and Nikopol (81,000).

The *oblast,* formed in 1932, is important for its mineral nealth. Around Krivoi Rog are large deposits of some of the richest iron ores in the world, while the Nikopol-Marganets area has one of the tno largest manganese deposits of the U.S.S.R. In the east, coal is mined These minerals are the basis of large-scale heavy industry in the four largest towns, with iron and steel production and a nide range of heavy engineering. Apart from the navigable Dnieper, there is excellent rail and road communication with Moscow. the Donbass *(see* DONETS BASIN) and the Black sea ports. Agriculture is also very important, with greatest emphasis on grain. especially winter wheat, maize (corn) and spring barley; industrial crops (notably sunflowers), fodder crops and melons are also grown. (R A. F.)

DNEPROPETROVSK, a town and *oblast* centre of the Ukrainian Soviet Socialist Republic of the U.S.S.R , formerly known as Yekaterinoslav and renamed in 1926 for the Ukrainian Bolshevik Petrovski. stands on the high right bank of the Dnieper river (*q v*), almost opposite the confluence with the Samara and at the point nhere the river alters its course from a southeasterly to a southerly direction. The river there has been considerably widened by the construction of the Dnieper barrage (Dneproges) at Zaporozhye, about 50 mi. downstream. Newer suburbs of the city have spread on to the left bank. Pop. (1959) 658.000.

The tonn nas founded in 1787, in the settlement of the newly acquired Right Bank Ukraine under Catherine the Great. From 1796 the town nas known as Novorossiisk until 1802, when its old

name was restored and it became the centre of a government (province). Despite the bridging of the Dnieper in 1796 and the growth of trading functions in the early 19th century, the town remained small (1844, pop. 8,604). In the 1880s railways were built, linking the town to Odessa, the Donbass (see DONETS BASIN) and Moscow, and industrialization commenced (1884, pop. 45,000). Since the Revolution, the town has grown very rapidly into one of the largest industrial cities of the G.S.S.R. With iron ore from nearby Krivoi Rog, Nikopol manganese, Donbass coal and power from Dneproges, a huge iron and steel industry has developed. Castings. plates, sheets, rails, tubes and wire are produced. Large engineering industries are associated with the metallurgy—making electric locomotives, bridge girders, mining and hydro-technological equipment and other heavy machinery. There are large locomotive and rolling-stock repair shops. By the early 1960s the chemical industry had developed. Other important products are cement and reinforced concrete, paper, joinery, clothing, footwear and foodstuffs.

Dnepropetrovsk has a state university and institutes of mining, agriculture, chemical technology, metallurgy, medicine and railway and constructional engineering; there are a Russian and a Ukrainian theatre and a Philharmonic hall. In World War II the town was occupied (1941–43) by the Germans. (R. A. F.)

DNIEPER (DNEPR; ancient BORYSTHENES), the second longest river (1,420 mi.) of the European part of the Union of Soviet Socialist Republics and the third longest in Europe, drains an area of 194.208 sq.mi. It rises in the Valdai hills, at a height of 722 ft., in a peat bog from which also issues a headstream of the Western Dvina The Dnieper first flows southward with a sinuous course, between low, swampy banks, in a valley about a mile vide At Dorogobuzh, the head of navigation, the Dnieper turns sharply westward, past Smolensk to Orsha in the Belorussian Soviet Socialist Republic. In this section it is 45–135 yd. wide, with many sandbanks and with rapids at Kobelyaki. At Orsha, where the river cuts through the Smolensk ridge, it again turns sharply to the south and flows through the very extensive and swampy middle Dnieper lowlands to Kiev in the Ukrainian Soviet Socialist Republic This part of the river is in the highest degree winding. with innumerable divisions, cut-off lakes and sandbanks. Below Kiev the Dnieper swings to the southeast along the northern side of the Dnieper uplands, where there is, characteristically, a high right bank, in places as much as 300 ft. high, with a low, swampy flood plain on the left backed by terraces There the river is 200–1,300 yd wide, again with many sandbanks and islands. At Dnepropetrovsk (q *v.*) the Dnieper turns south and enters the reservoir of the Dnieper barrage (Dneproges) at Zaporozhye, 56 mi. long, which has drowned the cascade of rapids which formerly interrupted navigation there. Immediately below the Zaporozhye dam is the still larger Kakhovka reservoir. 124 mi. long, completed in 1956. Below the Kakhovka dam, the Dnieper flows west-southwest through extensive sand dunes into the long, shallow Dnieper estuary formed by the drowning of the lower reaches.

The average annual discharge is 57,210 cu.ft. per second, with a marked spring maximum following snow-melt. The average fall of the river is slightly less than 1 in 10.000. Freeze-up begins in the second half of November in the upper course and mid-December in the lower, with ice cover firmly established about two weeks later. Thaw starts in early March in the lower course and early April in the upper. The Dnieper has many large tributaries. notably the Berezina (365 mi. long), Pripyat (Pripet) (498 mi.), Teterev (227 mi.) and Ingulets (342 mi.) on the right and the Sozh (403 mi), Desna (738 mi.), Psel (501 mi.), Vorskla (307 mi) and Samara (244 mi.) on the left.

The Dnieper is one of the most famous and important of Russian rivers. On its banks and those of its tributaries stand many of the oldest and historically most important towns—Kiev, the first capital, Smolensk, Mogilev, Chernigov, Turov and Pinsk. The Dnieper was the axis and economic *raison d'être* of Kievan Rus (*see* KIEV); that is, it was the great Baltic-Byzantium trade route "from the Varangians to the Greeks." In the late 18th and early 19th centuries its importance as a routeway was enhanced by canals linking it to rivers flowing to the Baltic—the Berezina, Oginski and Dnieper-Bug canals, the last two using the Pripyat. Of these only the last has been modernized and is still in use. At present the whole system is served by passenger and cargo lines. The Dnieper is of great importance for hydroelectric power. As well as the Zaporozhye and Kakhovka plants, a third has been completed (1959) at Kremenchug. a fourth was constructed after 1960 above Dneprodzerzhinsk and two more were planned at Kanev and Kiev. Power is sent to the Donbass or used in the great industrial areas around Kiev and Dnepropetrovsk. A canal was built in the 1960s to take irrigation water from the Dnieper to the south Ukrainian and north Crimean steppes. (R. A. F.)

DNIESTER (Rus. DNESTR; Pol. DNIESTR; Rum NISTRU), a river of the U.S.S.R., drains a large part of the Moldavian Soviet Socialist Republic and southwestern Ukraine. Its source is on the north side of the Carpathian mountains in Lvov oblast and it drains into the Black sea. Direct distance between source (at 3,000 ft.) and estuary is 410 mi. but because of numerous meanders in the middle and lower courses the river itself is 877 mi. in length. The Dniester and its tributaries drain a long, narrow basin, 27.795 sq.mi. in area but nowhere more than about 60–70 mi. wide. bounded on the north by the Volyno-Podolsk upland, 1,000–1,300 ft. above sea level, and on the south by the Carpathian mountains and Bessarabian upland. There are no long tributaries. In the upper course above Galich, the larger tributaries enter from the Carpathians in the south (Stry, Svicha, Lomnitsa); in the middle course. between Galich and Mogilev-Podolski, they come from the north (Zolotaya Lipa, Seret, Zbruch, Smotrich, Ushitsa); in the lower course they are mainly from the south again (Reut. Byk). In its middle course the river is in a deep valley several hundred feet below the surrounding country in places, in incised meanders. Below Mogilev-Podolski the valley widens to 5–10 mi. and, still meandering, the Dniester flows through an area of lakes and marshes. into the Dnestrovski liman, an inlet about 25 mi. in length and 4–12 mi. wide.

The average discharge is approximately 10.750 cu ft. per second but the flow varies seasonally, the river being fullest following the melting of the ice which normally covers it for two months (November to January) and, later, following the melting of the snow on the Carpathians. The Dniester is navigable for at least part of the year and small vessels can reach Galich, but the continuity of navigation for larger vessels is interrupted by several rapids. The chief river ports are Mogilev-Podolski, Soroki, Bendery and Tiraspol. The main items carried are building materials (granite, limestone), nonmetallic minerals (kaolin, gypsum), cereals and timber. There are no large towns on the Dniester itself. Lvov, Ternopol, Stanislav, Kishinev and other towns in the Dniester basin are on tributaries above the main valley. The hydroelectric power station at Dubossary is the only important attempt to utilize the power resources of the Dniester and its tributaries. Fishing is of little importance except near the coast. The Dniester formed the Rumanian-U.S.S.R. border from 1918 to 1940 but is now entirely within the Soviet Union. (J. P. Co.)

DOAB (Urdu/Hindi **do,** "two"; ab, "rivers"), a name applied, particularly in West Pakistan, to the stretch of country between any two rivers, as the Bari Doab between the Sutlej and the Ravi, the Rechna Doab between the Ravi and the Chenab and the Sind-Sagar Doab between the Jhelum and the Indus. In India it is often used, ordinarily without qualification, as the proper name for the region between the Ganges and its great tributary the Jumna (formerly also called the Great Doab).

DOBBS FERRY, a village of Westchester county. New York, U.S.. located on the eastern shore of the Hudson river opposite the Palisades at the lower end of the Tappan Zee. and about 7 mi. N. of the New York city line. Suburban in character, with many commuters, Dobbs Ferry is known for its fine residential neighbourhoods. (For comparative population figures see table in NEW YORK: Population.) Among the private schools of Dobbs Ferry are the Masters school, founded in 1877, a college preparatory school for girls. and the Children's Village for emotionally disturbed children.

The original site was a Mohican Indian village. The name is derived either from William Dobbs or his son Jeremiah, of English

descent. who operated the ferry to Sneden's Landing across the Hudson in the 18th century. Gen. George Washington established headquarters at the Philip Livingston house, later known as the Peter Van Brugh Livingston mansion, in 1781. There, on July 6, French forces under the comte de Rochambeau rendezvoused with the American Revolutionary army; on Aug. 14, the Torktomn campaign was planned; and, on May 6. 1783, Washington and Gov. George Clinton met with Sir Guy Carleton to arrange for the evacuation of the province by the British. The village was incorporated in 1873 as Greenburgh; in 1882 an act of the state legislature changed the name back to Dobbs Ferry. (RI. D. HH.)

DOBELL, SYDNEY THOMPSON (pseudonym SYDNEY YENDYS) (1824–1874), English poet and critic of the "Spasmodic" school, was born April 5, 1824, at Cranbrook, Kent. He was never sent to school or university, as his parents were of independent views. John Dobell. his father, was the author of a pamphlet on government. Dobell inherited their attitude and interested himself in the liberal movement in Europe. To celebrate the revolutionary year 1848—the year of revolutions—he wrote *The Roman* (1850), a long, formless dramatic poem in broken verse. Hailed by the critics, it secured for him the acquaintance of Carlyle. Ruskin, Tennyson and Browning, as well as that of Mazzini and Kossuth. *Balder* (1853), another long poem. was intended as part of a trilogy on the "Progress of a Human Being from Doubt to Faith. from Chaos to Order." It mas not appreciated. however, and the other parts were never written. *Balder* was burlesqued by W. E. Aytoun in *Firmilian: . . . a Spasmodic Tragedy* in 1854.

The term "Spasmodic," first applied by Carlyle to Byron. was used in 1853 by Charles Kingsley to describe a group of poets including P. J. Bailey (whose *Festus* [1839] was the immediate forerunner of the group), John Stanyan Bigg. Sydney Dobell and Alexander Smith. Their poems were characterized by unrestrained emotions and chaotic imagery. George Gilfillan in *Galleries of Literary Portraits* (1845–54) did much to further their reputation; and Dobell. in a number of essays collected by John Nichol as *Thoughts on Art, Philosophy and Religion* (1876), expressed their vague aesthetic. based on romantic ideas of association and intuition and rejecting the restraint of form.

Besides his long poems. Dobell wrote a number of lyrics and, with Alexander Smith, a sequence of sonnets on the Crimean War (1855). He died at Nailsworth, Gloucestershire. Aug. 22, 1874. *See* Dobell's *Poetical Works,* ed. by J. Nichol (1875). (P. M. Y.)

DÖBELN, a town of Germany which after partition of the nation following World War II became a regional capital in the *Bezirk* of Leipzig of the German Democratic Republic. It is 80 km. (50 mi.) S.E. of Leipzig and 50 km. (31 mi.) W.N.W. of Dresden. Pop. (1959 est.) 29.128. Dobeln is on an island formed by the Freiberger Mulde which divides into two streams on entering the town and joins again upon leaving it. St. Nicholas' church. built in 1485, the town hall dating from the middle ages and an early Benedictine cloister are the main features of interest. Agricultural machinery. metal and tobacco products. soap, sugar. foodstuffs and pharmaceutical supplies are produced in the town. The largest plant is the nationally owned refined-steel works.

DÖBEREINER, JOHANN WOLFGANG (1780–1849), German chemist. played an important part in the development of the periodic system of elements. He was born'at Hof an der Saale. Bavaria. Dec. 13. 1780. Apprenticed to an apothecary and self-taught in agriculture and the textile industry. in 1810 he became chemistry professor at Jena and later was supervisor of science instruction. He was a lifelong friend of Goethe. Dobereiner's examination of the properties and atomic weights of the known elements led to the classification of similar elements into Dohereiner's triads. The mean of the lightest and heaviest atomic weights approximated the atomic weight of the middle element in the triad. These relationships stimulated investigations which culminated in the periodic classification of all elements. (For a description of the development of the periodic system, including the contributions of Döbereiner and other workers in the field, see PERIODIC LAW, THE: *History of the Periodic Lam.)* Dobereiner recommended simple galvanic cells for stoichiometric studies before Faraday. He developed the separation of calcium and magnesium by ammonium oxalate or carbonate in the presence of ammonium chloride. He studied the catalytic action of pyrolusite in the production of oxygen from potassium chlorate; the action of spongy platinum in the ignition of hydrogen and oxygen; and the role of platinum black in the oxidation of alcohol and sulfur dioxide. Döbereiner was made privy councillor and awarded the cross of the white falcon. He died in Jena, March 24. 1849. (V. Bw.)

DÖBLIN, ALFRED (1878–1957), German expressionist novelist, best known for his *Berlin Alexanderplatz* (1929; Eng. trans. 1931), in which he applied the technique developed by James Joyce in *Ulysses* to the life of a Berlin worker. Its realism gives it epic force. Doblin was born in Stettin, Aug. 10, 1878; and after studying medicine in Berlin and Freiburg. practised in Berlin, taking an active interest in the conditions of the poor. He left Germany in 1933, became a French citizen in 1936. went to the United States in 1940 and was later converted to Roman Catholicism. He returned to Germany after World War II and was appointed literary adviser to the French occupation authorities. He died in Emmingden on June 28, 1957. His many novels include *Die drei Sprünge des Wang-Lun* (1915), a novel about China; and *Berge, Meere und Giganten* (1924), a Utopian satire on modern technological society. *Schicksalsreise* (1949) is autobiographical. (H. S. R.)

DOBRICH: *see* TOLBUKHIN.

DOBROVSKY, JOSEF (1753–1829), Czech philologist and antiquary, who was one of the founders of comparative Slavonic linguistics, was born at Gyarmat, Hung., on Aug. 17, 1753. Having intended to go to the east as a Jesuit missionary., Dobrovsky studied theology and oriental languages in Prague. After the dissolution of the Jesuit order in 1773 he devoted the rest of his life to scholarship. enjoying the patronage of enlightened Bohemian noblemen. He was indefatigable in bringing to light and describing ancient Slavonic manuscripts and traveled widely (notably to Sweden and Russia in 1792) in search of them. From textual criticism of the Bible he came to the study of Old Church Slavonic and then to that of the Slavonic languages as a whole. His immense erudition ultimately extended to all fields of Slavonic literature, language, history and antiquities.

In the history of the Czech language Dobrovsky is extremely important. His *Geschichte der böhmischen Sprache und Litteratur* (1792, revised 1818) gave a systematic survey of the earlier monuments of the Czech language, many of which had been neglected or suppressed because of their Protestant religious content during the period of the Counter-Reformation. His grammar of Czech (*Ausführliches Lehrgebäude der böhmischen Sprache,* 1809 and 1819) codified the language and brought order into the usage of the literary language which had come to be neglected in the preceding 150 years. His grammar of Old Church Slavonic (*Institutiones linguae slavicae dialecti veteris,* 1822) laid the foundations of comparative Slavonic philology. He died at Brno. on Jan. 6, 1829. *See* CZECHOSLOVAK LITERATURE. (R. AV.)

DOBRUJA (Rumanian DOBROGEA), a territory of eastern Europe! bounded on the west by the Danube, on the north by the Chilia (Kiliya) arm of the Danube delta, on the east by the Black sea and on the south by a conventional line running from the Danube west of Turtucaia to Ekrene on the Black sea. It is divided politically between Rumania and Bulgaria.

The country consists of low hills, fens and sandy steppes, windswept and drought-ridden. with a fertile corn-growing plateau in the south. Constanta (*q.v.*) is the chief town.

History.— Greek colonies were founded on the Black sea coast of Dobruja in the 6th century B.C., including Istrus, Callatis (Mangalia) and Tomis (Constanţa). In the 5th and 4th centuries B.C. invading Scythians submerged the local Thracian population; hence the names of Scythia Minor and Scythia Pontica. For the Roman occupation of the territory, from 75 B.C., *see* MOESIA. The Romans and their Byzantine successors erected walls for the defense of the area, but it was repeatedly overrun by Goths, Alans and Huns.

In the last quarter of the 7th century the territory, with its mixed population of Slavs and Daco-Romans, was overrun by the

Bulgars. The Byzantines recovered it in 1018, but in 1186 it was incorporated in the second Rumanian-Bulgarian empire. Later it was ravaged by the Pechenegs; and in the 13th century it was frequently raided by the Tatars. The name Dobruja probably comes from that of Dobrotich, a petty chieftain of Walachian origin who established himself for a brief period in the 14th century. After the conquest of Bulgaria by the Turks. Dobruja was temporarily. at the close of the 14th century, acquired by Mircea the Old of Walachia in the course of his campaigns against the Turks; but with his final capitulation in 1417 it came under Turkish domination for nearly 500 years.

The treaty of Berlin (1878) assigned all of northern Dobruja, then one of the Bulgarian lands under Turkish suzerainty, to Rumania, in compensation for Russia's reannexation of southern Bessarabia (*q.v.*). By the treaty of Bucharest (1913) which closed the Balkan wars, Rumania secured from Bulgaria a quadrilateral of 2,905 sq.mi. to the south of the frontier of 1878. During World War I. though Bulgaria. as Germany's ally. sought to secure the whole of Dobruja, the treaty of Bucharest (1918) assigned only the southern quadrilateral to Bulgaria; the north was put under a condominium of the Central Powers, who guaranteed Rumania's commercial outlet to Constanta. The treaty of Neuilly (1919) assigned the entire province to Rumania. The Rumanians settled a number of Vlachs from Macedonia in the province, but at the census of 1930 only 19.1% of the population of southern Dobruja was Rumanian, as against 37.9% Bulgarian; for the north. however, the corresponding figures were 64.9% and 10.2%. The rest of the total of 815,475 was made up of Turks and Tatars, Russians, Germans and a few Jews.

Early in World War II Rumania. while still neutral. was forced by the German-imposed treaty of Craiova (Sept. 7, 1940) to return the quadrilateral (southern Dobruja), with a population of 407,500, to Bulgaria. This territory included the ports of Silistra on the Danube and Balchik on the Black sea. Under this treaty an exchange was arranged of the 106,534 Rumanians of the quadrilateral against the 50,000 Bulgars from the north. All the Germans were repatriated to the *Reich*. After the war. the Paris treaty of 1947 confirmed the frontier established by the treaty of Craiova.

Economy.—The Rumanian Dobruja, with an area of 5,969 sq.mi. and an estimated population of 502,674 in 1960, was absorbed administratively into the regions of Constanţa and Galaţi. Cereals and industrial crops are grown. vineyards cover an important area and the reeds in the Danube delta are used for paper production. Merino sheep are bred, and fishing accounts for about 70% of Rumania's total fish output. There are a few iron and copper mines. Since World War II, moreover, considerable industrialization has taken place. There are shipbuilding yards in Constanţa; metallurgical works at Medgidia and at Cerna-Vodă; a thermal power plant and a cement factory at Ovidiu; and a sulfuric acid as well as a chemical fertilizer plant at Năvodari. There are also summer resorts on the coast (Mamaia, Eforie, Vasile Roaită and Mangalia) and sanatoria for treatment with radioactive mud. (B. Br.)

DOBSINA (Ger. Dobschau), an ancient iron-mining village, is in the upper valley of the Slana river in southeastern Czechoslovakia. 64 km. (40 mi.) W.N.W. of Kosice. Pop. (1960 est.) 5,000. The settlement, founded in 1326 by immigrant German miners, has maintained a tradition of iron mining and timber working. After World War II a large hydroelectric power station was built there.

The famous ice caves of Dobsina lie about 7 mi. from the village. The entrance to them is approximately 3,200 ft. above sea level on a mass of limestone rock and was discovered by some shepherds in 1870. The huge ice chambers, with a total area of nearly 10.780 sq.yd., have an average temperature of 0.28" C. It is thought that the high altitude of the cave mouth prevents any thawing of the cold air that accumulates in the caves and passages. The fine scenery near the caves is famous.

DOBSON, (HENRY) AUSTIN (1840–1921), English poet and man of letters whose love and knowledge of the 18th century gave his own poetry the graceful elegance of pastiche and inspired his critical studies. Born at Plymouth on Jan. 18. 1840, he entered the board of trade in 1856 and from 1884 to 1901. when he retired, was a principal clerk in the marine department. His first collection of poems, *Vignettes in Rhyme* (1873), was followed by *Proverbs in Porcelain* (1877). In these and in *At the Sign of the Lyre* (1885) he showed the polish. wit and restrained pathos which made his verses popular. The ease with which he handled the artificial French forms—the ballade, the triolet and the rondeau—helped to revive their use in English.

After 1885, Austin Dobson was chiefly occupied with biographical and critical works: books on Fielding, Thomas Berwick, Steele, Goldsmith. Horace Walpole, Hogarth, Richardson and Fanny Burney revealed careful research into 18th-century life and a natural sympathy with its more elegant aspects. Three series of *Eighteenth-Century Vignettes* (1892–96) and *A Paladin of Philanthropy* (1899 and 1901) show his prose at its most delicate. He continued to publish essays, introductions to 18th-century studies and editions of works by 18th-century writers until his death in London, Sept. 2, 1921.

See *Collected Poems* (1923); A. T. A. Dobson, *A Bibliography of First Editions of . . . Books and Pamphlets by Austin Dobson* (1925) and *Austin Dobson. Some Notes* (1928); *An Austin Dobson Letter Book* (1935).

DOBSON, FRANK (1888–), a leading British sculptor, was born in London on Nov. 18, 1888. He studied at the City and Guilds school, London, and worked with the Cornish granite cutters. His early work was geometric and abstract. reflecting the influence of cubism. This revealed in him a concern for volume and space and the relationship of mass to mass which was to earmark all his work. This was combined with a sensitivity for design. From his early abstract forms he turned to a classicism in the wake of Aristide Maillol. Dobson's work, however, retained a degree of geometric abstraction beyond that of the French master. His preference in subjects was symbolical or allegorical, interpreted through the nude female figure. His work showed the use of many materials—white marble. Ham hill stone, Portland stone, bronze, faïence, terra cotta, plaster, silver, glass, concrete. This variety would seem to suggest a greater interest in the material, the revelation of its intrinsic qualities and of its volume, than in the subjective meaning of the sculpture. His portraits include those of Osbert Sitwell (polished brass. 1921), Lydia Lopokova (1924) and Tallulah Bankhead (1927). In later years his forms became more abstract. Dobson was president of the London group (1923–27) and professor at the Royal College of Art (1946–53). He was elected member of the Royal Academy in 1953.

Bibliography.—Stanley Casson, *XXth Century Sculptors* (1939); T. W. Earp, *Frank Dobson, Sculptor* (1943); F. G. Mories in *Studio*, 135:186 (1948). (I. S. McN.)

DOBSON, WILLIAM (1610–1646), English portrait painter, one of the first distinguished native English painters, was born in London. According to tradition he became Van Dyck's protégé, but this is disputed. He was probably a pupil of Francis Cleyn, a German artist working in London. Dobson's work also shows Venetian influence, doubtless acquired from study of the paintings in the collection of Charles I, for whom he worked at Oxford between 1642 and 1646, after succeeding Anthony Van Dyck as painter to the court. He was buried on October 28. 1646.

Bibliography.—C. H. Collins Baker, *Lely and the Stuart Portrait Painters* (1912); C. H. C. Baker and W. G. Constable, *English Painting of the Sixteenth and Seventeenth Centuries* (1930); O. Millar, *William Dobson* (1951).

DOBSON FLY. Despite their common name these insects are not true flies (order Diptera). but four-winged, net-winged insects often included in the order Neuroptera but sometimes given separate ordinal rank as the Xlegaloptera. Along with their smaller relatives, the fish flies, they are members of the family Corydalidae. allied to the alder flies (*see* Alder fly), and are found in North and South America, Asia, Australia and Africa. The adults are of medium to large size, some species of the genus *Corydalus*, with a wingspread of about five inches. being among the largest North American insects. The adults are often attracted

to lights. The jaws or mandibles are conspicuously larger in the male than in the female reaching a length of more than an inch in certain species

Up to 2,000–3,000 eggs are laid in whitish clusters on objects near streams, and the young larvae crawl to the water. developing to maturity there in two or three years. The large (up to three inches long). often blackish larvae which lurk under stones in rapidly flowing water, have strong biting mouth parts capable of inflicting painful bites on man; and are ferocious predators on other aquatic insects and small invertebrates. Eventually the larvae migrate to wet soil, moss or decaying vegetation near the water and form a pupal cell. The pupal stage lasts only a few weeks at most; the adults then issue from the cell and climb up any available object to allow the to drv. The larvae are readily eaten-by fish and are used as bait by fishermen. who have applied to them the common name hellgrammite. *See* also NEUROPTERA; INSECT.

DOBSON FLY (CORYDALUS CORNUTUS): (A) HEAD OF MALE: (B) FEMALE

(F. M. CR.)

DOCETISM (from Gr. "to seem"), in the early Christian Church, was a theory that Christ, during his life, had not a real or natural but only an apparent or phantom body. It sprang from the same roots as Gnosticism and was characteristically upheld by the Gnostic writers. The origin of the heresy is to be sought in Greek. Alexandrine and oriental speculations about the imperfection or rather the essential impurity of matter. It differed much in its complexion according to the points of view adopted by the different authors. The more thoroughgoing docetists assumed the position that Christ was born without any participation of matter, and that all the acts and sufferings of his human life, including the crucifixion, were only apparent. Marcion, for example, regarded the body of Christ merely as an "umbra," a "phantasma " They denied. accordingly. the resurrection and the ascent into heaven. The milder docetists (to whom belonged such important thinkers as Valentinus and Bardesanes; *qq.v*) attributed to Christ an ethereal and heavenly instead of a truly human body; they varied in their estimation of the share this body had in the real actions and sufferings of Christ.

Docetism nas attacked by all the early antagonists of Gnosticism, especially St. Ignatius. Several passages in the Epistles of John are quoted against it, especially I John iv, 2–3. "By this you knou the Spirit of God. every spirit which confesses that Jesus Christ has come in the flesh is of God, and every spirit which does not confess Jesus is not of God."

See also GNOSTICISM.

DOCK, the common name for certain herbaceous plants of the genus *Rumex* (subgenus *Lapathum),* the bucknheat family, Polygonaceae (q v.). Docks are characterized by nonacid-tastmg leaves and bisexual floners, in contrast to the sorrels. which also belong to *Rumex* but have acid-tasting leaves and unisexual flowers. male and female on separate plants Docks are cosmopolitan plants but are most numerous in temperate regions About 125 species are knonn. Twenty-eight species, ten of them introduced from the old world, grow in the United States; eighteen are found in Great Britain.

Docks are annual, biennial or perennial plants with leafy stems. In many species the leaves are wavy along the margins, and the lower leaves are larger than the upper ones The small red or green flowers are wind-pollinated and are crowded in clusters that terminate or are scattered along the branches and main stem. Each flower has six sepals, six stamens and an ovary with three styles. The fruiting structures of docks are especially characteristic: the hard. three-angled "seed," an achene, is enclosed by the three inner sepals of the flower that typically enlarge, becoming veiny and winglike as the achene matures, and aid in wind dispersal. A wartlike structure may develop on the midrib of each sepal or of only one or two of them. In certain docks the edges of the sepals bear teeth or bristles. The stem of some species, with its clusters of brown achenes, remains standing throughout the winter.

Giant among the docks is *Rumex costaricensis* of Costa Rica. It may be 20 ft. tall and have a stem 4 in. thick. Some docks are widely distributed weeds, including curly or yellow dock, R. *crispus;* smooth dock, *R. altissimus;* pale dock, *R. mexicanus;* and patience dock. R. *patientia.* The young leaves of several docks. *e.g.,* curly dock and patience dock, may be used for greens. Canaigre or tanner's dock. *R. hymenosepalus,* the most promising tannin-producing plant native to the United States, is found in the southwest. Its tuberous roots contain 25–35% tannin, which, however, is difficult of extraction because of the high percentage of sugar and starch in the roots. Certain cultivated strains of canaigre yield 15–20 tons of roots per acre. Dried roots of R. *crispus* and R. *obtusifolius* constitute the laxative and cathartic drug called rumex. (J. W. TT.)

DOCK, a basinlike enclosure into which vessels are brought for inspection and repair. Originally, docks were used for many purposes: as dry basins, isolated from water by dikes or other means, they served as a place for building and repairing ships; as wet basins, open to water, they provided berthing space for ships in the normal course of traffic and cargo transfer. The latter function was later rendered by another group of structures especially designed for that purpose and given different designations. such as quay wall, pier and wharf. The term dock is still often used in a generic sense to indicate all water front docking facilities, whether they be dry basin or berthing structures.

HISTORY

The origin of docks dates back to the creation of water transport. The first landing facility undoubtedly was natural — some rocks on a river bank or a strip of beach in a harbour or inlet Later, with the advent of water craft as an important means of transport in commerce and warfare. landing facilities evolved into special structures. The date and design of the earliest facilities are unknomn, but it may be assumed that such structures existed as early as 4000 B.C. in Egypt as well as in Mesopotamia. Memphis on the Nile, Babylon on the Euphrates, and Nineveh on the Tigris were prosperous cities of commerce at that time and certainly had docking facilities for their galleys and trading boats.

One of the earliest records of dock construction was found on a tombstone in the Nile valley. This is the tomb of Uni. a high dignitary in the court of the great Egyptian monarch Pepi I. who reigned during the 6th dynasty in 3200 B.C. According to the inscription. Uni. nhose many titles included that of "superintendent of warehouses and registrar of docks," was given the tremendous job of relocating a pyramid. He had to carry the stonework by boats, and it was necessary first to excavate four dock basins in which to build the flat-bottomed, shallow-draft vessels. While no size of the docks is given, some idea may be had from the dimensions of the boats. which were 60 cubits long and 30 cubits wide or roughly 110 by 55 ft.

Another interesting account of an early docking facility is given by the Roman historian Appian. who describes the harbour works at Carthage. Built by the Phoenicians during their golden era of commerce in the 5th and 6th centuries B.C., this installation constitutes a marvelous example of engineering, both in concept and execution. It is comprised of two harbours sheltered from the sea by a long, narrow peninsula. The first of these is a rectangular basin at the entrance of the bay. providing docking facilities for boats in commercial traffic. The second, located above the seaport and connected to it by a canal, is an artificial harbour of circular outline. It is this interior harbour that presents some

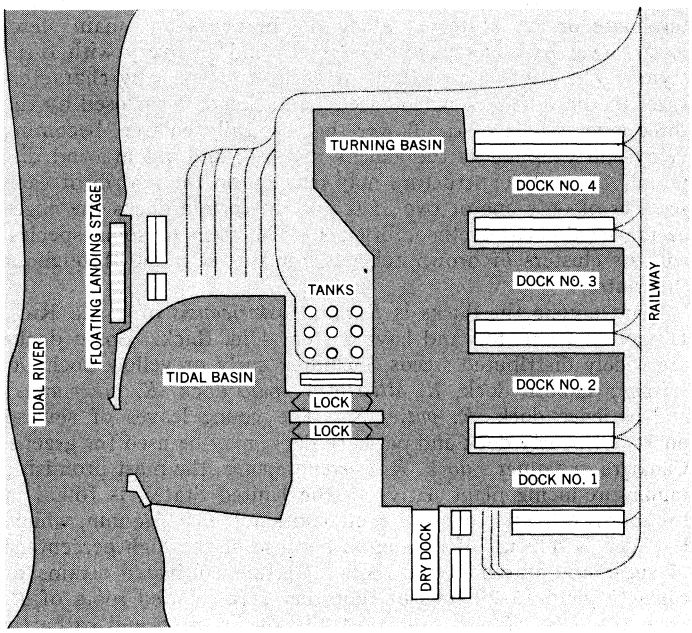

FIG. 1.— HARBOURINSTALLATION ON A TIDAL RIVER. SHOWING DOCK. CARGO HANDLING AND DRY DOCK FACILITIES: WHERE TIDES ARE OF NO CONSEQUENCE. ENTRANCE LOCKS WOULD BE UNNECESSARY

amazingly advanced ideas in both civil and military construction. The saucerlike basin was shaped by digging a circular waterway about 1,000 ft. wide, leaving an island in the centre. A battery of about 220 docks, forming radial niches on both sides of the waterway, provided separate berthing spaces for warships—the multi-tiered rowing galleys of the time. A most impressive feature is the provision of a roof over the docks. This consisted of a masonry vault supported on an ornamental colonnade at the front and by massive fortification walls at the back. The arrangement furnished not only protective concealment for the warships but shelter for the shipyard facilities and operations. Essentially, it may be considered as the prototype of World War II submarine pens built on the northwest coast of Europe.

In general, the structures needed for docking have not materially changed through the ages, although certain supporting facilities have been greatly improved to keep pace with progress in navigation and shipbuilding.

One of the most important factors influencing the dock structure is the depth of the surrounding water. With continually increasing sizes of ships and corresponding increases in their draft, additional water depth has been required at dock sites. In some cases this has been achieved by dredging in front of the dock or the quay wall; in others, the greater depth is obtained by advancing the dock front out from the shore, that is, by building a wharf. In still other cases the structure is projected farther to form a pier. Fig. 1 is the plan of a hypothetical harbour, outlining the general arrangement of docking facilities; the locks shonn at the harbour entrance would be unnecessary in locations where tides were not a factor.

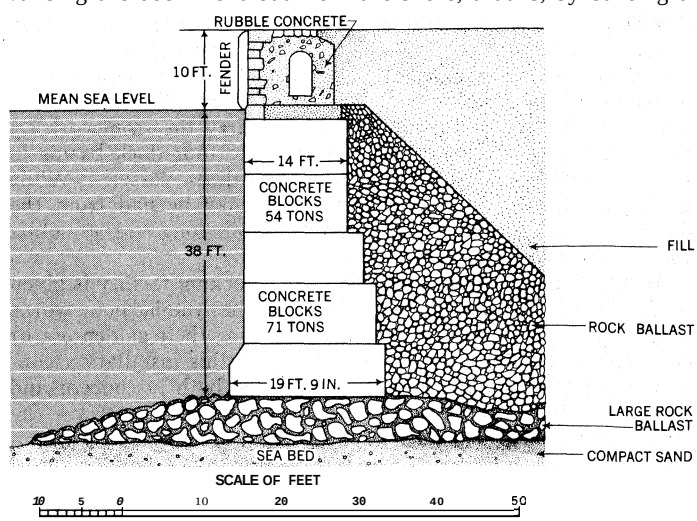

FIG. 2.— QUAY WALLS. VITTORIO EMANUELE III BASIN. GENOA, ITALY

BERTHING STRUCTURES

Quay Walls.— The quay wall is perhaps the oldest and most common type of water front facility for vessels. It is simply a retaining wall along the shore, topped with a deck or platform, serving both as a barrier to protect the shore and as a ship landing and loading facility. In most cases, it is necessary to place a great deal of earth fill behind the wall in order to raise the deck to the needed height above the prevailing high water level. In addition. it may be necessary to do some dredging in front of the wall to obtain the required water depth.

Until the middle of the 19th century, quay walls were built almost exclusively of stone, a material that produced massive sea walls favoured for their durability and simplicity of erection. Honever, with the introduction of portland cement, concrete walls either poured in place or built of precast blocks, came to be used almost universally. The stability of the wall against the lateral force of the retained soil or fill constitutes the main problem in design. In earlier construction, stability was obtained through the sheer weight of the uall itself, and in some cases by an additional weight of rock ballast, such as that shown in fig. 2. In modern construction, lateral stability is achieved with tiebacks and braced trestle frames. The example shown in fig. 3 has the upper part of the wall and the earth-fill deck supported on a timber trestle framework open to the sea; the lower part of the retaining wall consists of timber sheeting driven in back of the platform. Alternatively, the entire system may be built of timber or of concrete framing, with concrete or steel sheet piling used as retaining walls.

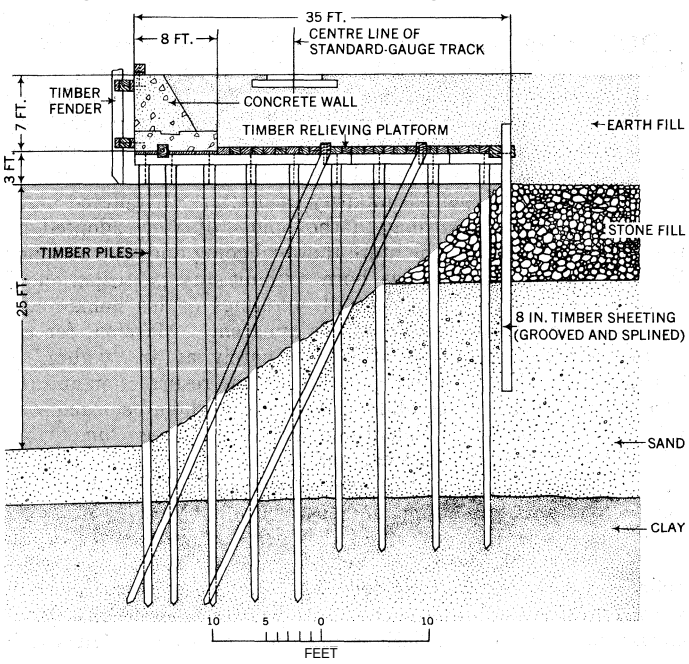

FIG. 3.— QUAY WALL, SAVANNAH, GA.

Wharves.— At certain locations, where the conformation of the shore and depth of water do not favour economical construction of a quay wall, the landing facility is installed at some distance offshore to obtain greater docking depth. A wharf is such a structure. It consists of a trestlemounted rectangular platform, running parallel to the shore line, with a connecting passageway to the shore. Although surrounded by water on all four sides, normally only the front or seaward side of a wharf is used for docking or berthing, since the water depth and accessibility on the other three sides may not be suitable for most vessels.

Wharves generally serve fishing trawlers, pleasure boats and

other small craft. For this purpose a relatively small structure is needed, and hence the landing platform has a rather narrow width and a limited berthing length. The entire framing is usually built of timber.

Piers.—Quay walls provide only a limited docking facility, in respect both to landing area and to berthing length, and because of the valuable water front space that they occupy, docking cost at a quay wall is correspondingly high. A more economical expedient is the pier, which, in its simplest form, is merely a platform extending over the water, usually at right angles to the shore line. Functionally, it serves two main purposes, providing a mooring facility for securing vessels and serving as a transfer platform for cargo and passengers.

A pier is composed of two main parts: the deck and its supporting system. The deck is usually built of reinforced concrete, although timber may also be used. The supporting system is an assembly of beams, girders and bearing piles, framed together to form a series of bents or trestles. The framing material may be wood, concrete, steel or a combination of these. In some piers with concrete framing. the deck and the walls are cast together to form an enclosed cellular structure. The buoyancy of such a structure greatly reduces the load on the foundations and, in addition. the interior space can be utilized for storage.

The over-all dimensions of piers vary widely in accordance with function and location, but the trend in modern times has been toward facilities of ever greater capacity. Two examples, both completed in 1961, are the 35th street pier in Brooklyn, N.Y., 175 ft. wide and 1,740 ft. long. and pier 40 on Manhattan island, N.Y., an enclosed, double-deck, concrete structure, 810 ft. wide and 975 ft. long.

The basinlike space bet een two parallel piers is often referred to by special names. The basin thus formed is called a slip or wet dock, and the quay wall at the shore end is called a bulkhead.

Floating Pontoon Docks.—The so-called floating pontoon docks, of which only a limited number have been built, have the floor pontoon so arranged that it can rise and fall with the water level. The liquid cargo dock of the Allied Chemical & Dye corporation on the Ohio river at Ironton, O., is an example. Completed in 1956, this dock is composed of a bargelike pontoon and two circular walls placed about 110 ft. apart. The walls, formed by steel sheet piling driven to bedrock, serve as an anchorage or mooring device for the pontoon, which floats up and down while engaged to them by means of a sliding arrangement. Access to shore is provided by a trestle hinged at the shore end and resting freely on the pontoon at the other end.

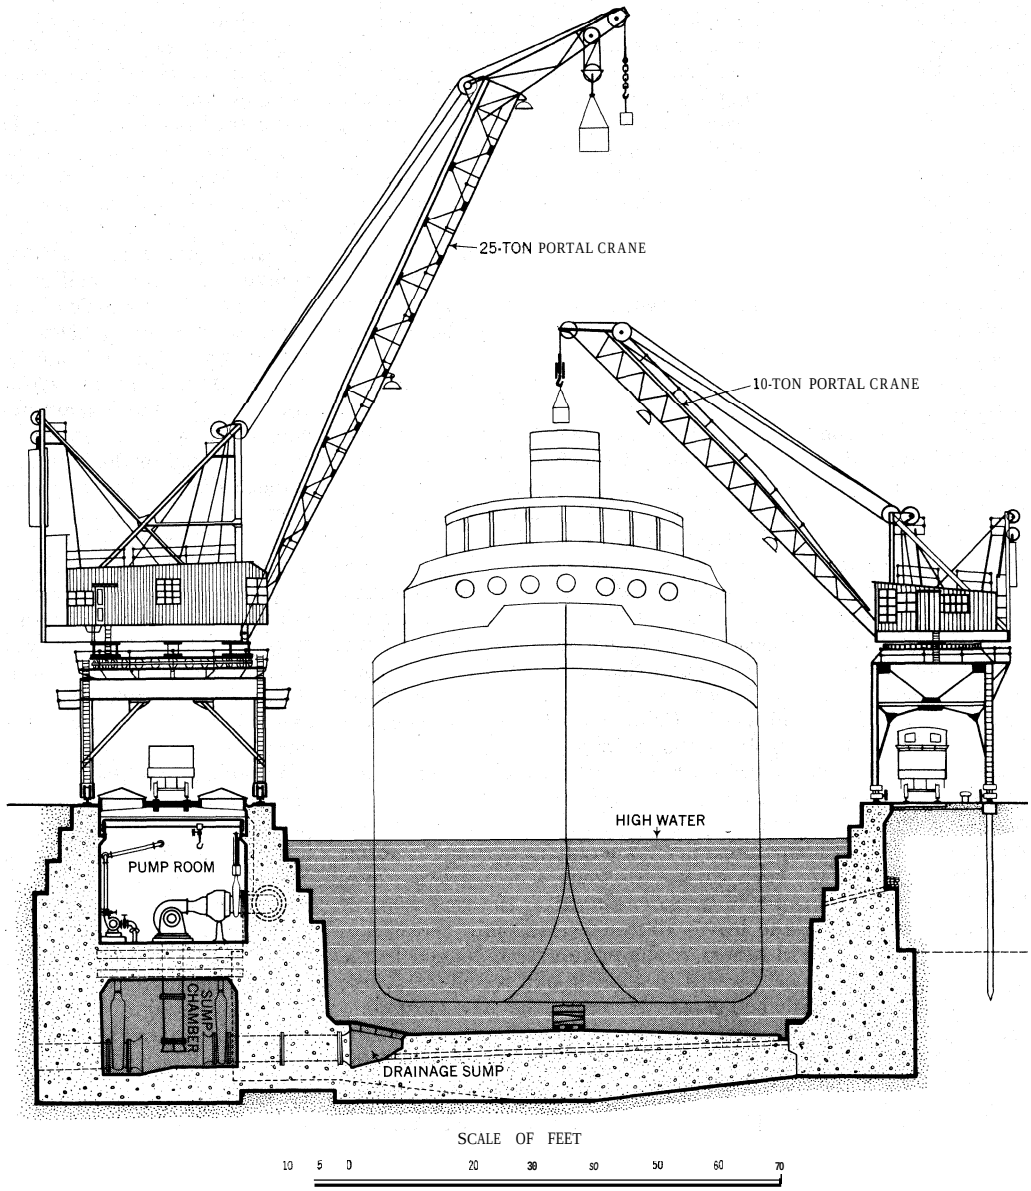

FIG. 4.— CROSS SECTION THROUGH DRY DOCK AT THE KING'S DOCK. SWANSEA, WALES

DRY DOCKS

Although many repairs to vessels can be made while the craft is afloat and tied to a pier or quay wall, dry-docking is necessary for major repairs and overhaul. There are also certain inspection and maintenance tasks, such as cleaning and repainting the bottom plating or repairing a propeller, that can be accomplished only by taking the vessel out of water and placing it in an accessible position. Such operations are performed in a dry dock, generally of the stationary type, uhich is also known as a graving dock.

A dry dock is a rectangular basin dug into the shore and provided with a removable enclosure wall or gate on the side toward the water. Fig. 4 shows the cross-sectional outline of such a dock. The sections of the right wall and the floor slab are typical for the entire dock. The wall section on the left, taken near the dock entrance, contains the pumping equipment. The dock is flooded and drained through a tunnel built in the side wall, uith connections to openings in the floor. In some docks the flooding culverts are located across the floor near the entrance; in others, they are carried through the gate.

The depth of the dock basin is about the same as that of the water outside the entrance. When a ship is to be docked, the dock is flooded and the gate removed. After the vessel is brought in and properly positioned and guyed, the gate is placed in its seat and the dock is pumped dry, bringing the craft gradually to rest on supporting blocks anchored to the floor.

The dry dock floor and walls are subjected to various forces under different conditions of loading, but the critical condition occurs when the basin is empty. The unbalanced ground water

and soil pressures behind the walls and under the floor tend to bend the walls in ard and the floor upward. To sustain these forces, the walls must have sufficient bending strength and, if arranged as simple retaining walls, they must be stable against overturning. The floor, likewise, must have adequate bending strength and, to prevent uplift, the total weight of the dock must be greater than the total forces exerted on its bottom. These requirements generally result in a rather massive framing; deep, wide basins may need a floor slab 20 ft. or more in thickness. In some docks, the ground water pressures in the surrounding soil are reduced, partially or entirely, by lowering the hydrostatic head by means of pumping. In others, some relief against uplift is obtained by using anchorage piles. Piling may also be required where the bearing capacity of the soil is not sufficient to carry the total unrelieved weight of the dock and the load of the ship within.

The construction of a dry dock is a major engineering task. Both the excavation of the basin and the building of the structural lining present difficult problems, arising primarily from severe conditions of underground water. In older installations, in which the basins were relatively small. the dock structure was built mainly of massive stonework or, in a few instances. heavy timber framing, but these materials were displaced by concrete, first in the ordinary mass form and later reinforced with steel. Modern dry docks are considerably larger in size and correspondingly more complex in construction than their earlier prototypes. For example, one of the largest is dry dock no. 6 at the Puget Sound, Wash., naval shipyard. Completed in 1962, this dock is 180 ft. wide, 61 ft. deep and 1,180 ft. long.

Dry Dock Gates.—A dry dock gate is a removable, watertight barrier that serves as the waterside wall of a basin, making it possible to convert a wet dock into a dry dock by excluding outside water after the dock is pumped dry. There have been many forms and arrangements for such gates. In some schemes two leaves have been used to form a mitre-gate, hinged to the side walls of the dock. In others, the leaves roll on a track into recesses in the dock walls. In still others, a one-piece gate is hinged to the bottom sill so it may be lowered to allow a ship to enter. These are all the so-called attached gates. However, the type most commonly used is the floating gate, which is held in its seat when the dock is empty and can be removed simply by floating it out of the way when the dock is flooded with water.

A floating gate is built in the form of a box, and hence such gates are often referred to as caisson gates. Normally they are built of steel and consist of an interior truss work and an exterior shell plate covering. In elevational outline, the gates have a trapezoidal contour, the sloping sides conforming to the inclined faces of the dock walls. The cross-sectional shape of a floating gate is determined by considerations of floatability and stability. It is so devised that the resulting displacement in the prevailing minimum water depths will permit the gate to float. In addition, the gate is ballasted to prevent capsizing. The interior of the gate is subdivided into a series of compartments, some of which serve as water holds. By means of a pumping system and valves. water can be admitted into or ejected from these compartments, and thus the gate can be placed in its seat or removed from it. The interior arrangement and some of the details and equipment of a typical floating caisson gate are shown in fig. 5. Also indicated in the figure are a set of 30-in. culverts that pass through the gate; these serve as auxiliary inlets for flooding the dock.

In some floating gates, compressed air, rather than mechanical pumps. is used to remove the water from the holds. This method of pumping is particularly adaptable to floating gates built of reinforced concrete; with these, because of the greater draft resulting from their heavy weight, it may be necessary to rotate the gate and place it on its face in order to decrease the depth of the draft in the moored position. Compressed air is utilized also in the operation of flap gates hinged to the bottom seat of the dock.

Floating Dry Docks.—While most ship repair work is carried out in stationary dry docks, there are some services that are performed by mobile or floating structures. The principal facility in this category is the floating dry dock.

A floating dry dock is a trough-shaped, cellular structure used to lift ships out of water for inspection and repairs. The docking is carried out by bringing the ship into the channel of the partially submerged dock, which is then raised and drained so that it supports the craft on blocks attached to the dock floor. The raising and lowering of the dock is accomplished by controlling the amount of water ballast within its hollow floor and walls. The sequence of operations is shown in Fig. 6. First, the dock is

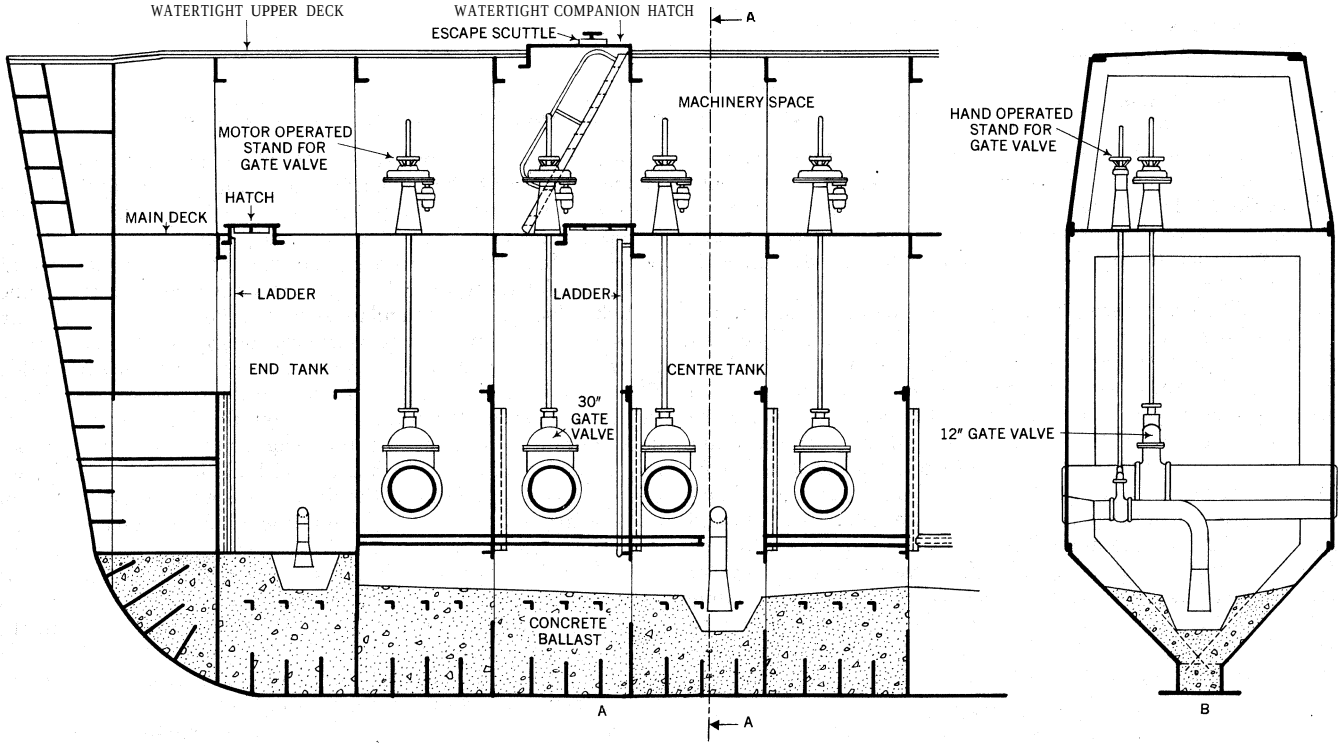

FIG. 5.— SECTIONAL VIEWS OF FLOATING CAISSON GATE STEEL FRAMING SHOWING PIPING AND VALVES: (A) HALF LONGITUDINAL SECTION; (B) TRANSVERSE SECTION THROUGH A–A

FIG. 6.— OPERATION OF A FLOATING DRY DOCK

afloat in its light-draft condition, with little or no water in its ballast tanks. In fig. 6(B) the dock is submerged to its maximum draft by filling the ballast chambers, and a vessel is floating freely in the flooded channel of the dock. The ballast is further reduced, fig. 6(C), the dock floor emerges from the water, and the vessel comes to rest on the support blocking. Finally, in fig. 6(D), all the ballast is pumped out, raising the dock floor completely out of the water and providing a dry working area.

The inner dimensions of the dock channel, that is, the distance between the walls and the height above the floor, are determined by the corresponding dimensions of the largest vessel to be docked. allowing a margin for clearance. The breadth of the walls and the depth of the floor pontoon, as well as the location of safety decks within the walls, are designed to provide the necessary stability in submergence and the required buoyancy for maximum lifting power.

A typical floating dry dock is built of steel: with a framing system similar to that of a ship. However, during periods when a shortage of steel has prevailed, both timber and reinforced concrete have been used. The one-piece floating dock of a simple channel shape (fig. 7[A]) is the most prevalent type. Docks such as this have been constructed in many sizes, varying in lifting capacity from 1,000 to more than 10,000 tons. While the majority are built of steel, some docks of 1,000–2,000-ton capacity have been built of timber, and others, of up to 4,000-ton capacity, have been constructed of reinforced concrete.

Floating dry docks ordinarily are operated in sheltered harbours where wave action presents no problem. Under such conditions the structure is subjected mainly to stresses resulting from the docking of ships. However, during the transfer of docks from one port to another, they also sustain stresses from the sea waves. For docks longer than 400 ft. these are much more critical than the docking stresses and require correspondingly heavier construction. As a compromise, large docks are often built in sectional form, thus making it possible to subdivide the structure into a number of relatively short sections that can be towed separately and then reassembled upon arrival at the destination.

Aside from conditions encountered on a sea voyage, a segmental type of a floating dock map be required for two other reasons. First. it may be necessary to break down the dock into smaller components capable of passing through restricted canals or waterways. Second, for maintenance of the dock itself, it may be desirable to place one section into the remaining sections.

There are several types of floating dry docks in addition to the basic unit type described above. The so-called ship-shaped floating dock, fig. 7(B), of which a great number were built by the U.S. navy during World War II, has a bow like that of a ship at one end and a gate, hinged at the bottom, at the other. Although it is a somewhat more costly structure than the simple channel dock, the ship-shaped dock contains more usable space inside its walls for service facilities, and the shaped bow makes it easier to tow from one location to another.

The sectional version of the simple unit dock consists of a series of short, channel-shaped components, each completely operational by itself, connected to form a dock assembly of the necessary over-all length (fig. 7[C]). The length of each section is such that, when turned sideways, it will fit between the walls of the other sections and thus can be raised from the water for maintenance.

In another type of sectional dock, the floor projects beyond the walls on either side in the form of wide pontoons, thus providing more buoyancy and increasing the lifting capacity of the dock (fig. 7[D]). This type was developed during World War II for servicing capital ships at advanced bases; in versions built for the U.S. navy, the length of the sections was held to 80 ft. so that the sections could be towed sideways through the Panama canal.

The pumping system constitutes the main equipment of a floating dry dock. The type and amount of other equipment installed within the structure are determined by the location in which the dock operates and the types of ships it will service.

MARINE RAILWAYS

A marine railway consists of a cradlelike carriage running on rails that extend from the shore into the water. To dry-dock a ship, the carriage is moved to the end of its inclined course, where it engages the submerged hull of the craft; then, after the ship is secured in the cradle, the loaded carriage is pulled out of water by means of a hauling system. For vessels of small tonnage, marine railways render a quick and economical dry-docking service.

DOCK APPURTENANCES

The basic docking structures are fitted with a variety of supplementary equipment. Fittings include the deck fastenings needed for docking and mooring ships, such as bitts, cleats, chocks and bollards to hold mooring lines and winches and capstans for pulling the hauling lines. For protection against impact and abrasion by ships, the decks are edged with timber fenders and, in some cases,

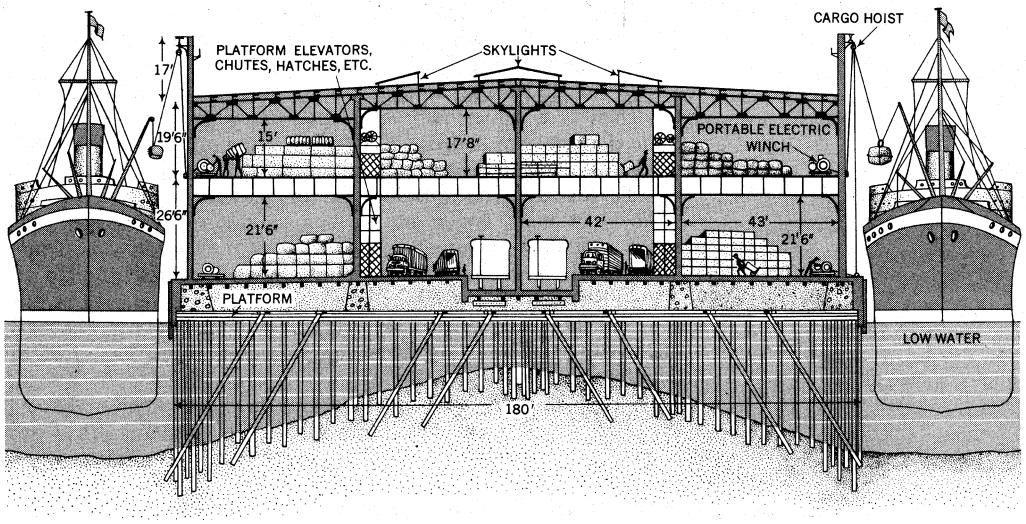

FIG. 8.— SECTION THROUGH CARGO PIER

with chafing plates. For service and repair work, docks may be fitted with connections for such utilities as electricity. fresh and salt water, steam. compressed air and sanitary sewers.

Weight-handling equipment consists mainly of cranes, generally of the portal type. such as those shown in fig. 4. Cargo-handling facilities may differ widely depending upon the nature of the cargo and the type and location of the dock. The equipment may comprise various types of cranes. hoists, fork lifts, chutes. conveyers, elevators, and other special material-handling devices. In addition, some docks also include warehousing and land transport facilities. A cargo pier equipped with such facilities is illustrated in fig. 8.

See also HARBOURS. (AR. A.)

DOCKYARDS AND NAVAL BASES. Every navy requires shore establishments variously known as dockyards, navy yards and naval bases where repairs can be made, ammunition. fuel and stores supplied, and the needs of the personnel provided for. This is true also for the mercantile fleets that are served impartially by the great commercial ports and repair yards of the world. but the term dockyard is usually applied only to the national establishments for the building and upkeep of warships. In its fullest sense a dockyard is an establishment that builds and equips warships and has complete facilities for docking and repairing them. It is equipped for the installation and repair of armaments and provides facilities for storing and fueling of ships. It also offers training. medical and other services. However. only the few large home dockyards in each country are so completely equipped, and even in these only a small proportion of warships is actually built.

Government dockyards are used mainly for refitting and modernizing the ships serving with the fleets and are also the bases from which new ships are commissioned after being built in private shipyards. Other dockyards have no special facilities for building ships but are equipped to repair and refit various classes of ships. Others that have the status of dockyards are capable only of minor repairs and of supplying stores, ammunition and fuel; these smaller establishments are really fortified naval bases or fueling stations. (See BUNKERING, SHIP.)

A naval base is a shore installation that furnishes direct logistic support to ships of the fleet. It normally includes a naval shipyard and supply depots for fuel and ammunition. One of the most important requirements of a naval base is a protected fleet anchorage where the ships can take on fuel, stores and ammunition and give rest and recreation to the crews. Every dockyard or naval base must be defended by sufficient local defenses to protect it from attack by submarines or torpedo craft! from predatory raids by a few cruisers and from air attack. The security of any dockyard or base. however, must depend. ordinarily, upon the ability of the fleet which it serves to maintain the command of the sea.

UNITED STATES

The Continental navy of the American Revolution had no dockyards, and the navy actually went out of existence with the sale of the frigate "Alliance" in 1785. An act of congress of March 27, 1794, provided for six frigates, and these first vessels of the Cnited States navy were built in private shipyards with their future captains superintending construction. The naval committee of the house of representatives recommended acquisition of a navy yard on Jan. 25. 1797. The navy department was established on April 30, 1798; land for six yards was acquired in 1800 and 1801 without express authority of the congress, utilizing part of the funds appropriated for the construction of six 74-gun ships. Feb. 25, 1799; the first direct appropriation, March 3, 1801, was for "completing navy yards." Five additional navy yards were established prior to 1917–18. and all yards added to their facilities at that time. World War II brought extensions and additions to existing yards and establishment of two new ones; it also brought a change in name from "navy yards" to "naval shipyards."

U.S. Naval Shipyards.—*Portsmouth, N.H.*—This yard was established in 1800 and increased in size in 1866 and later years until it reached 243 ac. It has shipways and dry docks and specializes in building and repair of submarines. Although always known as the Portsmouth, N.H., yard, it is actually across the Piscataqua river in Maine.

Boston, Mass.—Established in 1800, this yard lies between the Charles and Mystic rivers. at Charlestomn. on Boston harbour. Area 143 ac. The first dry dock was begun in 1827, completed in 1833. It built many destroyers and escort vessels in World War II. The U.S.S. "Constitution" (*q.v.*) is berthed at the yard. and is open to the public. The South Boston annex. 2 mi. to seaward, was acquired in World War I and increased in area from 106 to 231 ac. in 1942; it has two large dry docks and specializes in cruiser repairs.

New York, N.Y.—Established in 1801 on East river, in Brooklyn, this yard lies between the Manhattan and Williamsburg bridges. Part of the original area was sold to the city of New York in 1890, and the Wallabout market was constructed there. This land was reacquired and additional space was added in 1941–43. There are two large shipways on which battleships have been built, and six dry docks, including two designed for shipbuilding, in which the aircraft carriers "Saratoga" and "Independence" were built. Work was begun in 1941 on a shipyard annex at Bayonne, S.J. in New York harbour. It has a large dry dock and a ship repair wharf, both able to take the largest vessels afloat.

Philadelphia, Pa.—One of the original navy yards was established at Philadelphia, but it was hemmed in and too small by the time of the Civil War. A political fight delayed action but an act of congress of Feb. 18. 1867. authorized acceptance of League Island from the city of Philadelphia, for a new yard. It is on the Delaware river. 100 mi. from the Atlantic, just above the mouth of the Schuylkill river. The old yard was sold at auction Dec. 2, 1875. The shipyard has five dry docks, two marine railways, shipways on which the largest battleships have been built, and modern facilities. The Naval Aircraft factory and testing plants adjoin the yard. Fresh water in the "back channel" provides an excellent mooring space for ships in reserve.

Norfolk, Va.—Established in 1801 at Gosport, in Portsmouth, across the Elizabeth river from Norfolk, this yard occupies a site where the Royal Navy had begun a dockyard before the American Revolution. Always an important navy yard, it was burned on April 20, 1861, in an effort to prevent some of the ships and fa-

cilities from falling into the hands of the Confederates, and burned again by the Confederates when they evacuated the yard on May 11, 1862. Area 665 ac. There are seven dry docks. two of them more than 1.000 ft. in length, one large and other smaller shipways. The St Helena annex of the yard has facilities for the repair of small vessels.

Charleston, S.C.—A navy yard was established in 1901 on the Cooper river, 5 mi. above the junction with the Ashley river. It has dry docks and building ways in its 710 ac., and specializes in repairs to destroyers and mine vessels.

Puget Sound, Wash.—Established in 1891 at Bremerton. across Puget sound from Seattle. It has deep water and is suitable for handling the largest ships. Area 316 ac. It has five dry docks.

Mare Island, Calif. — Established in 1854 across Mare Island strait from Vallejo, Calif., with David Glasgow Farragut as the first commandant. Area 1,500 ac. It has four dry docks and eight shipbuilding ways. It builds and repairs destroyers and submarines.

San Francisco, Calif. — Established in 1940 by the purchase of a private shipyard at Hunter's point, on San Francisco bay, south of the city. It has six dry docks and can handle the largest vessels.

Long Beach, Calif. — Established in 1940, on Terminal Island, San Pedro bay, it has three dry docks and other facilities.

Pearl Harbor, *Hawaii* — Established under authority of an act of March 3. 1901, on the island of Oahu, near Honolulu. Area about 700 ac. It has dry docks and repair facilities.

In addition to the 11 naval shipyards listed above, the navy in the early 1960s had a submarine base at New London. Conn., and a destroyer base at San Diego, Calif., which were capable of all kinds of work except major repairs. The United States coast guard. which operates as a part of the navy in time of war, had a coast guard yard at Curtis bay, Baltimore harbour. Md., which did much repair work for coast guard vessels on the east coast. Other repair nork for coast guard vessels is done in naval shipyards.

One of the six original navy yards was established at Washington, D.C., in 1800, but it specialized in gun design and construction before the Civil War. As the Naval Gun factory it ceased to work on ships, but in the Washington area the name navy yard persisted in general use A navy yard mas established at Pensacola, Fla., in 1826, but it became the navy's first naval air station in 1914.

Fleet Repair Facilities Afloat. — Early in the 20th century ships of the US. navy spent two or three months in navy yards each year for machinery repairs and upkeep Then the navy pioneered in the development of fleet repair ships, destroyer and submarine tenders, all equipped for repair work. Emphasis mas put on repair and upkeep aork by ships' crews themselves. assisted by repair ships and tenders. U.S. destroyers and submarines demonstrated the practical value of this new policy during 1917–18. In World War II, many specialized repair ships were equipped in addition to new repair vessels of the older fleet types. and the results were most satisfactory. Not only were the ships of the fleet kept in operating condition with few visits to naval shipyards, but the presence of these repair ships in the forward areas actually saved many damaged combatant ships from sinking. Some remarkable jobs of "first aid" enabled such vessels to limp back to the floating dry docks nearby or to naval shipyards and to "fight another day." The bureau of yards and docks of the navy designed and built floating dry docks which were employed close to the fighting areas and in remote spots where other dry-docking facilities were nonexistent. (See DOCK.) The U.S. navy had also made great progress in fueling at sea and techniques were developed for transferring ammunition and stores at sea. The consequence of all these activities was that ships of the fleet developed a mobility previously regarded as impossible. The service squadrons which operated in the western Pacific including those which transferred fuel, water, ammunition and stores at sea, added smaller carriers which transferred replacement planes to the fleet carriers.

Construction Battalions and Advanced Bases. — Early in 1942 work was begun on the preparation of advanced bases in the Pacific ocean, at Bora-Bora, Efate and Tongatapu, and the problems encountered resulted in the establishment of the naval construction battalions, nicknamed Seabees (*q.v.*). These organizations had civil engineers and other technicians as officers and were made up of men experienced in or given special training in construction and building work. They erected living quarters and all kinds of other necessary facilities on various Pacific islands, including large repair bases at Espiritu Santo, in the New Hebrides; at Manus, Admiralty Islands; and at Guam.

Naval Air Bases and Stations. — \\'hen the United States declared war in 1917 there was one U.S. naval air station, at Pensacola, Fla. Naval air stations were developed at Norfolk, Va., and San Diego, Calif.. while seaplane patrol bases were established a. seven points on the Atlantic coast. In 1939 there were 11 naval air stations besides 8 air bases for the training of reservists. By 1945 there were about 80 naval air stations, including nearly 40 large stations besides satellite fields. Some of the principal naval air stations in the early 1960s were: Brunswick, Me.; Quonset Point, R.I.; Willow Grove, Pa.; Chincoteague, Va.; Norfolk, Va.; Jacksonville, Fla.; Pensacola, Fla.; Key West, Fla.; Corpus Christi, Tex.; Memphis, Tenn.; Glenview, Ill.; Whidbey Island, Wash.; Xlameda, Calif.; Mojave. Calif.; El Centro, Calif.; and North Island. Calif. (See also FLEET, NAVAL.)

GREAT BRITAIN AND COMMONWEALTH

Until the beginning of the 16th century England had no regular establishment for the navy and possessed neither arsenals nor dockyards. The fleet was composed of a fea- "king's ships" supplemented by ships provided by the seaport towns. These towns were charged with the maintenance of the fighting ships when they were laid up, and there are evidences of dockyards, or of something answering thereto, at the Cinque Ports as early as the 13th century As the fighting ships developed from the galley to the larger sailing ships there appear to have been depots for both ships and stores maintained at Southampton and Portsmouth. and Henry VII built and completed the first dry dock at the latter place in 1496. Henry VIII in 1509 purchased land at Woolwich and Deptford upon which the building of the first royal dockyards was started, and in 1540 the royal dockyard at Portsmouth was founded around the site of the dry dock of Henry VII. Queen Elizabeth I started the dockyards at Chatham and Sheerness. and both were considerably extended by Charles II after the Restoration Plymouth, although its ships played so great a part in Elizabethan times, did not become a royal dockyard until 1689. when William III commenced the Plymouth dock at Devonport. The small dockyard at Pembroke was founded in 1814 and was followed by the establishment at Haulbowline (Cobh. Ire.).

Until 1832 the royal dockyards remained under the control of the navy board, which had been founded in 1546 by King Henry VIII. The admiralty was responsible only for the fleet at sea, and this dual control of the navy led to extravagance and allowed mismanagement and corruption which several times came near to bringing about national disaster. With the Reform bill in 1832, the admiralty and the navy office were amalgamated and the present system of dockyard administration came into being. During the 19th century a gradual change came over the dockyards with the transition from sail to steam, and many additions were made to meet the needs of the modern fleet. The most important improvements at any one period were brought about by the Naval Works act of 1895. Defensive harbours were commenced at Portland. Dover and Gibraltar and also dockyard extensions at Gibraltar. At Devonport dockyard the great Keyham extension was started, and new works were begun at Hong Kong and Simonstown, South Africa. At the same time the building of naval barracks at the three home ports began, together with new hospitals at Chatham, Haslar and Haulbowline and colleges at Dartmouth and Keyham.

The growing German menace in the North sea in the opening

years of the 20th century compelled the admiralty to seek a new base on the east coast, farther north and easier of approach than Chatham. In 1903 the government approved the creation of a new naval dockyard at Rosyth on the Firth of Forth. Though the outbreak of World War I found this base far from complete, it eventually became invaluable as a first-class dockyard with three big graving docks. Between the wars it was reduced to a care and maintenance basis but rapidly expanded again in 1939. When World War II ended, it was kept in active operation.

In addition to Rosyth, the main British naval bases in World War I were the large dockyards at Portsmouth, Plymouth, Chatham and Malta with smaller establishments at Sheerness, Portland, Haulbowline and Pembroke. There were also dockyards at Gibraltar, Hong Kong, Bermuda, Simonstown and Sydney, Austr., and minor bases at Colombo, Cey.; Wei-hai-wei, China; and Bombay and Calcutta, India. The ports of Harwich, Dover and Immingham acted as bases for light forces, and Scapa Flow, as the main operational base for the grand fleet, was equipped for storing and minor repairs, with Cromarty as a second base.

With the outbreak of World War II all these bases, with the exception of Wei-hai and Haulbowline, which had been surrendered to China and Ireland, respectively, were available as was the great new dockyard at Singapore which had been constructed to meet the Japanese threat. During the course of the war new repair bases manned by the admiralty were set up at Lyness in Scapa Flow; Corpach and Dunstaffnage on the west coast of Scotland; Alexandria, Egy., where a large floating dock was moored; Massawa, the old Italian naval base on the Red sea which was equipped by the U.S. in 1942 but manned from England; Kilindini in East Africa; Durban, S.Af., which possessed the only battleship dock in the Indian ocean; Freetown, Sierra Leone, where a floating dock was put into operation in 1943; Trincomalee, Cey.; and Brisbane, Austr. Ten minor bases were established by Canada on the Atlantic and Pacific coasts to supplement the three main bases at Halifax and Sydney, N.S., and Esquimault, B.C. Facilities were also developed in places where they already existed such as Bombay, Calcutta and Vishakhapatnam, India; Cape Town, S.Af.; Diégo-Suarez, Madagascar; etc.

A new development, known as a floating base or fleet train, was used for the war in the Pacific and enabled the fleet to remain at sea for months at a time. It consisted of floating workshops, storeships and carriers of every kind, vessels which could act as floating docks for minor craft, oilers and amenity ships.

At the end of hostilities the majority of these temporary bases were closed down, but, with the growth of commonwealth navies and the necessity for commonwealth bases and repair facilities to be as widely dispersed as possible, certain developments overseas continued. In South Africa, where the British admiralty retained the use of Simonstown, the Union government established a small dockyard and base for its own navy at East London and took over Salisbury Island in Durban bay. Durban and Cape Town, with an even larger graving dock, reverted to commercial use but could readily be adapted as naval bases of first importance.

Though Canada officially closed down its temporary wartime bases in Sept. 1945, the dock at Saint John, N.B., remained available for vessels up to and including aircraft carriers, while the three main Canadian bases continued to be actively employed. The dockyard and naval base at Auckland, N.Z., was developed to refit ships as large as the latest cruisers, and the dockyard at Sydney formed the main base for the Australian squadron. Brisbane remained a minor base without a dockyard, but, on Jan. 1, 1950, Manus in the Admiralty Islands was commissioned as an advanced Royal Australian Navy base. When the Japanese were expelled in 1944, this island was converted into a naval base for the U.S. 7th fleet, and two huge floating docks, warehouses, machine shops and living quarters were set up. The U.S. disposed of this base in 1947. The dockyard at Bermuda which had served the navy for many years was officially closed down as uneconomical on March 31, 1951. Singapore continued to develop after it was freed from the Japanese.

In 1957, because of a further need for economy and to meet the reduced refitting requirements of a smaller number of ships, it was decided to close down the dockyards at Hong Kong, Sheerness and Portland. In addition, Malta dockyard was leased to a private ship-repair firm which was to carry out repairs and refits of H.M. ships stationed in the Mediterranean. The dockyard at Simonstown was vacated by the admiralty and handed over to the South African government in 1957, which continued to use it to maintain its expanding naval forces.

Dockyard Administration. — The system under which British dockyards are administered is uniform for all. The control of all dockyards is vested in the controller of the navy (the third sea lord). At the admiralty, under the controller, are the director of naval construction, by whom all ships are designed, and the engineering, ordnance, torpedo, electrical and other technical departments, each responsible for the design of its own material. The director of dockyards, also working under the controller, is responsible for the general management of H.M. dockyards involving the control of large numbers of skilled and unskilled workers. Instructions emanate from the admiralty, the details are left to the dockyard officials, and in practice there is considerable decentralization.

Each dockyard is under the charge of an admiral, commodore or captain according to its size. His deputy as a rule acts as the sovereign harbour master and is responsible for the berthing and moving of ships in the port. The professional dockyard officers are the managers of the constructive, engineering, electrical and civil engineering departments whose names explain their duties. The civil engineering officer is responsible for all buildings, docks, basins, etc. Other dockyard officers are the naval stores officer, cashier, expense accounts officer and medical officer.

It was decided in 1957 that the administration of the naval dockyards should be reorganized on more modern lines, to enable these establishments to carry out more efficiently the repair and modernization of the more complex ships expected to join the fleets. The duties of the senior officers responsible for the management of the dockyards were functionalized. The control of the productive capacity of the dockyards was made the responsibility of a general manager and the activities formerly carried out by the professional managers were put in the hands of production, planning, services and personnel managers.

(S.T.H. W.; G.M.S.S.; L. KI.)

OTHER COUNTRIES

France. — On the mainland and in Algeria the French coast is divided into four *régions* maritimes with headquarters at the naval ports of Cherbourg, Brest, Toulon and Mers-el-Kebir. The second *région* (Brest) is divided into three arrondissements, Brest, Lorient and Lapalisse. Corsica is a part of the third rkgion (Toulon). Important naval establishments are at Cherbourg, Brest, Lorient, Toulon (building and fitting out yards) and at Mers-el-Kebir (Algeria), Bizerte (Tunisia), Dakar, (West Africa), and Diégo-Suarez (Madagascar). There are minor bases at Aspretto (Corsica), at Algiers, in the West Indies and at Tahiti and New Caledonia.

Each re'gion maritime is placed under the authority of a vice-admiral pre'fet maritime, designated commander in chief in time of war. His authority extends to all territoriai forces but not to organized squadrons. Where there is a dockyard the vice-admiral is assisted by a rear admiral "major general," directly in charge of the dockyard. He is also assisted by the directeurs of all large departments (naval construction, ordnance, works, medical service, justice, finance) and the heads of coastal defenses, land-based naval aviation, reserve fleet and so on.

The main naval aviation bases are situated at Lorient, Les Mureaux (Paris), Cherbourg, Berre, Hyères, St. Raphael, Bizerte, Oran, Dakar and Diégo-Suarez.

Germany. — In the Federal Republic of Germany there were in the early 1960s about 150 shipyards for large ocean-going vessels, as well as yards for smaller ships including five graving and many floating docks. The shipyards at Kiel, Hamburg, Bremen, Bremerhaven, Flensburg and Emden were rebuilt after World War II; the naval shipyards are at Kiel, Flensburg, Wilhelmshaven and Bremerhaven.

In the German Democratic Republic merchant ships are built at Warnemiinde, Rostock and Wismar; the dockyards at Szczecin and Sainemunde are naval bases for Poland and the U.S.S.R.

Netherlands. — The Netherlands can build the largest merchant ships and all types of naval vessels up to about 10.000 tons. The most important of the 20 or so main shipyards are located along the banks of the Rotterdam seaway and at Amsterdam and Flushing. There are small naval bases at Den Helder, Flushing and Waalhaven (Rotterdam).

Sweden. — The Swedish shipbuilding industry is concentrated at a few large yards, mainly in Goteborg, Malmo and Uddevalla. There are other yards of comparatively minor importance at Helsingborg and Landskrona and in the neighbourhood of Stockholm. There are naval bases at Goteborg, Stockholm and Karlskrona.

Norway. — There are in all 25 Norwegian shipyards capable of building modern steel ships, of which the most important are at or near Oslo and Bergen and at Trondheim, Drammen, Fredrikstad and Kristiansand. The main Norwegian naval bases are at Horten, Kristiansand, Bergen, Trondheim and Ramsundet.

Italy. — The principal Italian shipbuilding yards are at Genoa, Riva Trigoso, La Spezia, Leghorn, Naples, Castellammare di Stabia, Palermo, Taranto, Ancona, Venice, Trieste and Monfalcone. The shipyards that were severely damaged in World War II were all rebuilt. The naval dockyards are at the naval bases of La Spezia and Taranto (the principal yards), Venice, Augusta and Messina in Sicily, La Maddalena and Cagliari in Sardinia, and Naples (secondary dockyards and workshops).

Japan. — By the end of World War II there were five naval bases in Japan, each with a dockyard, at Yokosuka, Kure, Sasebo, Maizuru and Ominato. That at Yokosuka (established in 1866) was the oldest and Kure (1886) the biggest. Though Japan's entire fleet was destroyed during the war, damage to shipyards was comparatively light. In the early 1960s these bases belonged to the maritime self-defense force, but Yokosuka was managed by the U.S. navy, Ominato by the ministry of finance, and the others had been transferred to civilian firms.

Spain. — By 1956 the old shipbuilding yards at El Ferrol, Cartagena and Cádiz had been re-equipped with modern installations for the construction and repair of warships. There were smaller naval bases at Port Mahon (Minorca), Sóller (Majorca), Tarifa. Rios near Vigo and Las Palmas (Canary Islands). A new naval air base was constructed at Rota near Cádiz in the late 1950s. Merchant ships are built and repaired in private yards at Barcelona, Bilbao, Valencia, Cadiz, Santander, Vigo and Gijón.

U.S.S.R.—Important shipyards exist at Leningrad and Nikolayev with lesser establishments at Kherson, Archangel, Kronshtadt, Sevastopol, Odessa and Vladivostok. As a result of wartime annexations, medium-sized shipyards were added at Tallinn (Estonia), Liepaja (Latvia), Pillau, renamed Baltisk, and Königsberg, renamed Kaliningrad (former East Prussia). Most of the shipyards suffered extensive damage during World War II but later were extensively modernized. The efficiency of Soviet shipyards after World War II was at a very low level but was raised by replanning and re-equipment. As a result of their occupation of eastern Germany and Poland, the Russians profited from the shipbuilding methods and techniques used by these countries.

(X.; L. KI.)

DOCTOR, the Latin word for "teacher," is the title conferred by the highest university degree. Originally there were three university degrees in European education: bachelor, licentiate (licence to teach) and master or doctor (admission into the teachers' guild). The doctor's degree was first awarded at Bologna in civil law toward the end of the 12th century, then in canon law, medicine, grammar and other fields. In Paris the title master was most common but was interchangeable with the title doctor. English universities adopted the Parisian system but gradually the superior faculties awarded a doctorate while others retained the title master. In Germany master and doctor were at first interchangeable but the term doctor soon came to be applied to advanced degrees in all faculties. It was the German system that was adopted in most of the rest of the world. The original meaning of the doctorate is best preserved when applied to professors, but the title is now conferred in most fields that require lengthy periods of postgraduate study (see UNIVERSITIES; DEGREE. ACADEMIC; MEDICAL EDUCATION).

Doctors of the church are saints whose doctrinal writings have special authority. In the early Christian church there are four Latin or Western doctors — SS. Ambrose, Augustine, Gregory the Great and Jerome — and three Greek or Eastern doctors — SS. John Chrysostom, Basil the Great and Gregory of Nazianzus. To these Eastern doctors Western Christianity adds St. Athanasius the Great. Since the 16th century others have been given the term doctor by proclamation of the Roman Catholic Church. These doctors and the date of their proclamation are: SS. Thomas Aquinas (1567), Bonaventura (1588), Anselm (1720), Isidore of Seville (1722), Peter Chrysologus (1729), Leo I (1754), Peter Damian (1828). Bernard (1830), Hilary of Poitiers (1851), Alfonso Maria dei' Liguori (1871), Francis of Sales (1877). Cyril of Alexandria (1882), Cyril of Jerusalem (1882), John of Damascus (1890), Bede (1899), Ephraem Syrus (1920), Peter Canisius (1925), John of the Cross (1926), Robert Bellarmine and Albertus Magnus (1931), Anthony of Padua (1946) and Lawrence of Brindisi (1959).

(V. L. BH.)

DOCTORS' COMMONS, formerly a self-governing teaching body in London, similar to the Inns of Court (see INNS OF COURT AND CHANCERY), for practitioners of canon and civil law. Its members held degrees either of doctor of civil law at Oxford or doctor of law at Cambridge and were finally admitted as advocates by the dean of the arches, presiding officer of the court of appeal belonging to the archbishop of Canterbury. Members of the governing body, called fellows, were elected from the advocates by existing fellows. The members practised in the ecclesiastical courts, in the court of admiralty — which together included the courts now comprised by the probate, divorce and admiralty division of the high court of justice — and in arbitrations involving questions of international law.

In 1565 the society leased a site in Paternoster row, near St. Paul's, which served as its headquarters until its incorporation as the College of Doctors of Law Exercent in the Ecclesiastical and Admiralty Courts in 1768, and thereafter until its dissolution in 1858. This event was provided for in the Court of Probate act, 1857, and in the Matrimonial Causes act of the same year; these measures were forerunners of the Judicature act of 1873, which established a single supreme court of judicature, inheriting the jurisdiction of the courts of civil law as well as those of common law and equity, and with a single bar practising before it.

DOCTRINAIRES, the name given to a small group of political thinkers, writers or orators, who exercised a considerable influence in France during the Restoration — more, however, on the development of political ideas than on the course of events. Pierre Royer-Collard (*q.v.*), the most typical of them, had been educated in a school run by the Brothers of the Christian Doctrine, nho were colloquially known as "Doctrinaires." This circumstance may have inspired the editor of the *Nain jaune,* who in 1816 was the first to apply the epithet *doctrinaire* to Royer-Collard, but the expression owed its success mainly to the fact that it summed up perfectly the intellectual pride of Royer-Collard and his tendency to present his opinions of the moment as eternal truths. The name was naturally extended to include his friends and disciples, François Guizot, Camille Jordan, Hercule de Sèze, Prosper de Barante, the duc Albert de Broglie, Charles de Rémusat and several others, who had more or less adopted his ideas and his way of expressing himself. The Doctrinaires were never very numerous and a journalist of the period said: "There are four of them, who sometimes boast that there are only three, because it seems to them impossible that there should exist in the world four such powerful intellects, and sometimes claim that there are five of them. but this is when they want to frighten their enemies by their numbers." They at no time formed a political organization or even a school with a well-defined system of thought in common: conscious of being superior minds, they would never have admitted any form of discipline over their political conduct or over their ideas. What they had in common was a certain disdain

for the majority of mankind (according to Rémusat "People are divided into those who understand and those who do not understand") and a way of linking their own political attitudes and certain observed facts to abstract principles (Guizot wrote to a friend: "You have made an admirable choice, like a true Doctrinaire By following a general idea in your approach to an individual problem you have acted both systematically and empirically at the same time."). They were also in agreement in supporting the political philosophy of the so-called Constitutionalist party in the years 1816–20; *i.e.,* a moderate, constitutional government, based on Louis XVIII's charter.

Since the Doctrinaires had provided the Constitutionalist party with its ideological justification, the name Doctrinaires came sometimes to be applied to all supporters of the policy of compromise between the ancien rkgime and the Revolution. In fact, at the end of the Restoration, the Doctrinaires properly so-called were influencing only the small "left centre" group in parliament. By an extension of meaning the word doctrinaire has come to be applied. both in French and in English, to a theoretician cut off from the realities of politics.

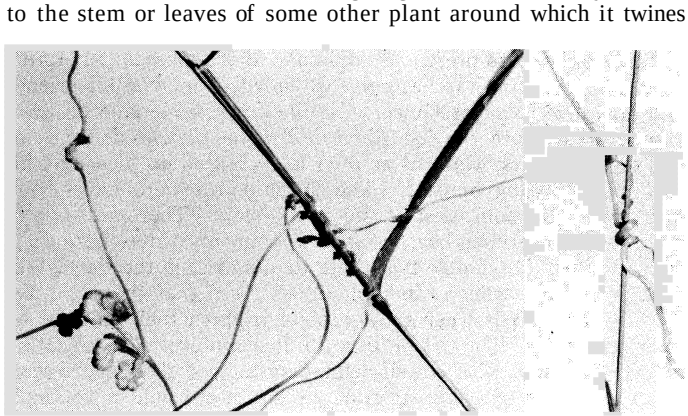
See Charles Pouthas, Guizot pendant la Restauration, ch. 6 (1923); Charles de Rémusat, *Mémoires,* ed. by Charles Pouthas (1958-). (G. DE B. DE S.)

DODD, WILLIAM EDWARD (1869–1940), U.S. historian and ambassador to Germany (1933–37), was born Oct. 21, 1869, in Wake county, N.C. After receiving his B.S. degree in 1895 and his M.S. in 1897 at Virginia Polytechnic institute, he took his Ph.D. in 1900 at the University of Leipzig, where his dissertation was the first of his more than ten books and 100 articles. As professor of history at Randolph-Macon college from 1900 he won national recognition and in 1908 was appointed the nation's first professor of southern history at The University of Chicago. There for a quarter-century his informal lectures and stimulating seminars attracted graduate students from north and south. Alarmed by reactionary and isolationist trends after World War I. he reluctantly turned away from scholarly writing in an attempt, through popular articles and frequent public lectures, to warn the American people of their peril. This led in 1933 to four frustrating years as ambassador to Nazi Germany. Exhausted and ill he returned in 1937 to his farm near Round Hill, Va., where he died on Feb. 9, 1940.

See bibliography of Dodd's publications by Jack K. Williams in North Carolina Historical Review, vol. xxx (Jan. 1953). See also Avery Craven et al., in University of Chicago Magazine (May 1940); Wendell H. Stephenson, The South Lives in History (1955). (W. G.)

DODDER, the popular name of the nonchlorophyll-bearing, rootless, leafless, twining parasitic plants forming the genus *Cuscuta,* formerly regarded 'as representing a distinct family Cuscutaceae but now included in the morning-glory family, Convolvulaceae (*q.v.*). The genus contains over 100 species and is widely distributed in the temperate and warmer parts of the earth. Some species are known as scald in England.

The slender threadlike stem is white, yellow or red in colour, bears no leaves and in the seedling stage attaches itself by suckers to the stem or leaves of some other plant around which it twines and from which it derives its nourishment. It bears clusters of small flowers with a four- or five-toothed calyx, a cup-shaped corolla with four or five stamens inserted on its tube and sometimes a ring of scales below the stamens; the two-celled ovary becomes a capsule when ripe. The seeds are angular and contain a threadlike spirally coiled embryo that bears no cotyledons.

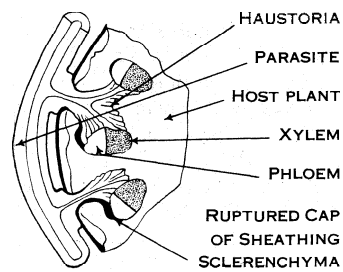


JOHN H GERARD

FIG. 1.—DODDER (CUSCUTA). A PARASITIC PLANT WRAPPED AROUND GRASS

On coming in contact with the living stem of a susceptible plant around which it twines, the seedling dodder throws out suckers that penetrate the host, its tissues establishing organic union (see fig. 1). By this means water is drawn from the wood or xylem and nutriment from the phloem of the host. The dodder then soon ceases to have any connection with the ground. As it grows, it throws out fresh suckers, establishing itself very firmly on the host plant. After making a few turns around one shoot the dodder finds its way to another, and thus it continues twining and branching until it resembles fine, closely tangled, wet catgut.

The injury done to flax, clover, hop and bean crops by species of dodder is often very great. C. europaea, the greater dodder, is parasitic on cultivated and wild hosts in Europe, but is rare in America; C. *epilinum,* on flax, hemp and some other hosts; C. epithymum, on various species of clover, alfalfa and other legumes. *C. trifolii,* the clover dodder, damages clover in England.



BY COURTESY OF MESSRS. GUSTAV FISCHER, FROM STRASBURGER, "LEHRBUCH DER BOTANIK"

FIG. 2.—CROSS SECTION OF A WILLOW TWIG SHOWING THE CONTACT OF THE DODDER WITH THE TISSUES OF THE HOST PLANT, WHICH IT FINALLY DESTROYS

In the United States and Canada about 30 species occur, a few of which have been naturalized from the old world. Among the native species are: the love vine (C. gronovii), common on herbs and low shrubs in the eastern states and adjacent Canada; the glomerate dodder (C. *compacta*), which forms dense ropes of stems on tall herbs in the ceritral states; and the marsh dodder (C. salina), abundant in salt marshes of the Pacific coast, forming golden patches on various saline herbs. All the plants die in autumn but persist by self-sown seeds. (N. TR.; X.)

DODDS, ALFRED AMÉDÉE (1842–1922), French general, uho took a prominent part in the operations that brought the countries of the upper Senegal and upper Niger under French rule. was born at St. Louis, Senegal, Feb. 6, 1842, a mulatto with some English blood on his father's side. On leaving St. Cyr in 1864, he joined the marine infantry as a sublieutenant. He served as a company commander in the Franco-German War, was taken prisoner at Sedan but escaped and took part in the campaigns of the Loire and of the east. In 1872 he was sent to West Africa; and, except when on active service in Cochin-China (1878) and Tongking (1883), he remained on duty in Senegal for nearly 20 years As colonel commanding the troops there, he led expeditions against the local tribes, his methods of campaigning being swift and efficient and his knowledge of the country a great aid to him. Taking command of the expeditionary force in Dahomey in May 1892, he occupied Abomey, the native capital, in November; and in a second campaign (1894) he completed the subjugation of the country. He was then appointed inspector general of the marine infantry and, after a tour of the French colonies, was given the command of the 20th (colonial) army corps, becoming inspector general of colonial troops. From 1904 to 1914 he was a member of the Conseil Supérieur de Guerre. He died in Paris on July 18, 1922.

DODECANESE (modern Gr. DHODHEKANISOS), a group of islands in the Aegean sea, formally annexed to the kingdom of Greece in 1948. Area 1,051 sq.mi.; pop. (1961) 122,346. The group consists of the southern Sporades (*q.v.*), including Rhodes and Karpathos, with Kastellorizon, and constitutes a nomarchy, the southernmost of the five which make up the nomos or department of the Aegean Islands. The city of Rhodes is the administrative centre.

The name Dodecanese means literally "twelve islands" and has

been applied at one time or another to groups differently composed and numbering more than 12 islands. This article is concerned with the general history of the Dodecanese group in the modern sense as indicated above. The islands in question are Karpathos (Ital. Scarpanto), Patmos (Patmo) (*qq.v.*), Kasos (Caso), Astypalaia (Stampalia), Lipsos (Lisso), Leros (Lero), Kalimnos (Calino), Nisiros (Nisito), Tilos (Piscopi), Khalki (Calchi), Syme (Simi), with Ikaria (Icaria) until 1912, Rhodes (Rodi) and Cos or Kos (Coo) from 1912 and the outlying Kastellorizon (Castelrosso) before 1912 and from 1923. The Dodecanese, although picturesque and largely mountainous, except for Rhodes and Cos, suffer from deforestation and poor drainage.

In ancient times these islands formed part of the Greek world. Rhodes and Cos (*qq.v.*) have long histories of their own; details are also given under ASTYPALAIA, KARPATHOS and PATMOS. Neither in the Hellenic period, however, nor under the undivided Roman empire can the islands profitably be considered as a unit. Under the Byzantine empire the "theme (province) of the Dodecanese" included not only these islands but also the Cyclades. In the beginning of the 13th century they were the prey of Venetian and Genoese adventurers. A measure of consolidation was achieved in the 14th and 15th centuries, when the knights of St. John of Jerusalem had their headquarters in Rhodes and controlled Syme and the chain of islands from Khalki northward to Leros. Then, in the 16th century, the islands fell one after another to the Turks.

It is to the system of administration evolved by the Turks that the modern connotation of the name Dodecanese owes its origin: the Turks recognized 12 islands, "the Twelve Sporades," as being entitled to a special regime of their own. Whereas Rhodes and Cos, large and economically valuable territories, were reckoned to have been won by conquest and so to be subject to the ordinary rule of the Ottoman empire, the poorer islands, Ikaria, Patmos, Leros, Kalimnos, Astypalaia, Nisiros, Tilos, Syme, Khalki, Karpathos, Kasos and Kastellorizon, having submitted themselves voluntarily to the sultan, were acknowledged to have privileges, ratified by successive firmans, under which they enjoyed administrative, judicial and fiscal autonomy in consideration of the annual payment of a fixed sum, the *maktou*. These privileges were jealously maintained by the islanders, whose delegates insisted on them when Greco-Turkish affairs were being considered by the Great Powers in conference during the 19th century. In 1869, when the Porte, alarmed by Greek Irredentism, decided to integrate the 12 islands within the *il* of the archipelago ("Islands of the White Sea"), assigning Ikaria, Leros, Patmos and Astypalaia to the *sanjak* of Chios and the remaining eight to the *sanjak* of Rhodes, this was declared to be without prejudice to their rights.

Such was the situation prevailing at the outbreak of the Italo-Turkish War. Then, in April and May 1912, Italian forces seized first Astypalaia and then Rhodes, Cos, Lipsos and the remainder of the Twelve Sporades, except Ikaria (which was occupied by Greek forces in the following November) and Kastellorizon (which remained Turkish).

The Italian commanders promised to secure the islanders' autonomy; but when an insular assembly on Patmos proclaimed "the Autonomous State of the Dodecanese" and expressed a desire for union with Greece, the Italians paid no attention except to impose severe penalties on some of the delegates. In the treaty of Ouchy (first treaty of Lausanne; Oct. 15, 1912), the Italian government undertook to withdraw its forces from the islands when the Turks had carried out their obligations in Tripolitania; but this undertaking was not fulfilled.

In the secret treaty of London (1915) the Allies accorded Italy "full possession" of the Dodecanese as one of the inducements for that country to enter World War I on their side. This agreement, however, became of doubtful validity when the United States entered the war in 1917 on the understanding that secret treaties should not be recognized. On July 29, 1919, an agreement was reached between Eleutherios Venizelos, the Greek prime minister, and the Italian foreign minister Tommaso Tittoni, whereby Italy promised to cede the Dodecanese to Greece with the exception of Rhodes, which was to have "broad local autonomy." By an additional secret accord Italy undertook to permit the inhabitants of Rhodes to decide their own fate in the event of the British government's announcing its willingness to cede Cyprus to Greece, although not until five years should have elapsed. On July 22, 1920, Count Carlo Sforza, Tittoni's successor, denounced this agreement. On Aug. 10, 1920, simultaneously with the abortive treaty of Skvres between the Allies and Turkey, a new Italo-Greek accord was signed, its terms being similar to those of the previous agreement, with the difference that 15 instead of 5 years were to elapse before the Rhodian plebiscite. To enable Italy to transfer to Greece territory that was still Turkish *de jure,* a special article (no. 122) was included in the treaty of Skvres, by which Turkey renounced in favour of Italy all rights and titles upon the Dodecanese and Kastellorizon.

In Oct. 1922 the Italian government unilaterally denounced the accord with Greece, despite the protest of Great Britain; and the treaty of Skvres was never ratified, being overtaken by events, particularly by the Greco-Turkish War in Anatolia. In the treaty of Lausanne (July 24, 1923), which ended this war and superseded the treaty of Skvres, article 122 was embodied as article 15. Thereon rested Italy's claim to sovereignty over the islands. The Greek government, however, before accepting the treaty of Lausanne, expressly reserved in writing its views on the "determination of the future lot" of the Dodecanese.

Italian rule over the Possedimenti Italiani dell' Egeo, "Italian Possessions of the Aegean," which was administered by the ministry of foreign affairs, lasted until the end of World War II. Firm and efficient, it was distasteful to the inhabitants. Italian became the official language, for education as well as administration; freedom of speech and of the press were restricted; the Orthodox religion, though not actively persecuted, was put at a disadvantage in comparison with the Roman Catholic and Uniate Churches, which had hitherto served inconsiderable minorities. The crowning humiliation came in 1925, when the Dodecanesians were obliged to take Italian citizenship. The upshot of all these measures was to increase substantially the scale of emigration from the islands, especially to the United States. The population fell, under Italian rule, by about 15%.

The Dodecanese (particularly Rhodes and Leros) became important to Italy with the outbreak of World War II, as naval and air bases. Repeated plans to capture the islands were made by the Allies and frustrated: Kastellorizon was briefly occupied by the British in 1941 and Leros and other islands in 1943 after the surrender of Italy; but on both occasions the Axis powers recovered them. The islands finally came into Allied hands after the surrender of Germany in 1945, by which date it was taken for granted that they would be ceded to Greece. After a year under British military administration (in which Greeks increasingly participated), it was agreed by the conference of foreign ministers in Paris on June 27, 1946, that the islands should pass under Greek sovereignty. The decision was confirmed in the Italian peace treaty of Feb. 10, 1947, in which the 14 islands were specified by name. A Greek military administration took them over in April.

As in the case of the Ionian Islands in 1864, the cession was not an unmixed blessing for the inhabitants. By material standards, the Greek administration did not prove to be so efficient as the Italian had been; and since the islands remained poor and infertile, there was still a substantial economic deficit, which the Greek state was hard put to meet in the postwar years of suffering and unrest. The crops (fruit, tobacco, olives, wheat) were insufficient for lucrative export, and the principal nonagricultural occupations of the islanders (fishing, shipping, sponge-diving) had not been much developed. But it was not for the sake of material advantage that the Dodecanesians had sought union with Greece; their case was a striking modern example of the predominance of national sentiment over all other considerations.

DBDECAPHONY, a system of musical composition established chiefly by Arnold Schoenberg (*q.v.*) between 1908 and 1920. The system laid down that the melodic and harmonic elements of a work were to be based on a preconceived succession of the 12 notes in the chromatic scale, not on the traditional principles of tonality. From this succession, called the note-row or note-series, both motives and chords were built. In the strictest forms of dodecaphonic music none of the notes in the series was to be repeated before the remainder of the notes in the series had been sounded. The note-row could be used in its basic form, in its inversion, in a retrograde form and a retrograde inversion. (*See* COUNTERPOINT.) These four forms could also be transposed to any of the 12 degrees of the chromatic scale, thus providing 48 versions of a given row. The system is illustrated in Schoenberg's Suite for Piano, Opus 25 (1923), and was adopted by his pupils Alban Berg and Anton Webern (*qq.v.*). After World War II the system was widely used by composers in many countries in Europe and in the United States. A similar system in which the 12 notes of the chromatic scale were divided into two groups called "tropes" was established by Josef Hauer, who also devised a system of notation on a stave consisting of eight instead of five lines.

DODGE, GRENVILLE MELLEN (1831–1916), U.S. civil engineer who was responsible for much of the railroad construction in the western and southwestern states. was born on April 12, 1831, in Danvers, Mass. Educated at Durham (N.H.) academy and Norwich (Vt.) university, where he was graduated from the scientific department, he received a diploma as a military and civil engineer in 1851, at a time when railroad building was commencing in the U.S. on a large scale. He worked first as a surveyor for the Illinois Central railroad and then as head of a survey party in Iowa for the Mississippi and Missouri railroad. He made his home in Council Bluffs, Ia., and at the outbreak of the Civil War he offered his services and those of the Council Bluffs Guards, which he had organized in 1856. He was promoted rapidly to the rank of brigadier general of volunteers and provided valuable service throughout the war in bridge and railroad construction. After the war he served as chief engineer for construction of the Union Pacific railroad, and later held similar posts with the Texas and Pacific railroad and other lines, the facilities completed under his direction totaling thousands of miles. He died Jan. 3, 1916, at Council Bluffs. (W. E. HD.)

DODGE, RAYMOND (1871–1942), U.S. experimental psychologist, one of the most ingenious and productive experimentalists of his generation, was born at Woburn. Mass., Feb. 20, 1871. He received the bachelor's degree at Williams college in 1893 and the degree of doctor of philosophy at the University of Halle in 1896 under Benno Erdmann. After a year as Erdmann's assistant and a year at Ursinus college, Dodge went to Wesleyan university as professor of psychology and then, in 1924, to Yale university and the Yale Institute of Human Relations, retiring in 1936. He died at Tryon, N.C., April 8, 1942.

Dodge is remembered especially for pioneer studies of eye movements in reading and their registration and measurement by photographic methods, and also for having devised during World War I successful methods of selecting and training navy gunners. He experimented also on motor effects of alcohol, vestibular reactions, individual variability and other psychological problems, normal and abnormal. He was editor or associate editor of seven major psychological journals. His writings include *Elementary Conditions of Human Variability* (1926), *Psychological Effects of Alcohol* (with *F. G.* Benedict, 1915) and *The Craving for Superiority* (1931). Dodge was president of the American Psychological association (1916–17), and chairman of the Division of Anthropology and Psychology of the National Research council (1922–23), as well as a member of the National Academy of Sciences.

See C. A. Murchison, *History of Psychology in Autobiography*, vol. i (1930). (F. A. K.)

DODGE CITY, a city of southwestern Kansas, U.S., and seat of Ford county, on the Arkansas river, about 150 mi. W. of Wichita. It has railroad shops and farm implement plants and is the supply centre for an agricultural and stock-raising area. The meridian separating central from mountain time passes through it.

Dodge City was settled about 1872 and incorporated in 1875. It was a famous frontier town on the old Santa Fe trail, the rendezvous of picturesque characters, the centre of important freighting lines and headquarters of the cattle business, At the peak. in 1884. herds aggregating 8.000.000 head of cattle passed through irom Texas. Large herds of buffalo in the vicinity were ruthlessly slaughtered by hunting parties. The town had a transient and diverse population of cattlemen, adventurers, soldiers, buffalo hunters, homesteaders, gamblers, railroad men and outlaws. Lawlessness and gun fights resulted in the establishment of Boot Hill cemetery, and a succession of marshals and sheriffs, whose fame in the annals of the west has been inordinately enhanced by Hollywood and television. Beeson museum, just outside of Dodge City, has one of the largest collections of cowboy and Indian relics in Kansas. On the river 5 mi. E. of the city is old Ft. Dodge (established in 1864 and named for Col. Henry I. Dodge), an important frontier garrison, now a state home for war veterans. For comparative population figures *see* table in KANSAS: *Population.*

See W. S. Campbell, *Dodge City: Queen of Cowtowns* (1955).

DODGSON, CHARLES LUTWIDGE (pseudonym. LEWIS CARROLL) (1832–1898), was an English mathematician and logician who used his specialized knowledge to carry the art of nonsense to a peak, and who at the same time handled a children's story with none of the moralizing and sententiousness of the early 19th century. He was born at Daresbury parsonage. Cheshire. on Jan. 27, 1832. As a child he mas precocious and enterprising, showing a keen interest in the drama. which persisted throughout his life. The first of several manuscript magazines which he wrote and illustrated for his brothers and sisters. *Useful and Instructive Poetry* (1845), contains some curious anticipations of his later work. He spent three years at Rugby school, where he was unhappy, and went to Christ Church, Oxford, in 1851. The death of his mother in the same year profoundly distressed him and may have checked his emotional development. so that his thoughts reverted continually to his happy childhood. He was afflicted with a stammer and was drawn increasingly to the society of children, especially little girls, in whose company he was always at ease. He was nominated to a studentship (or life fellowship) of Christ Church in 1852 and held the mathematical lectureship from 1855 to 1881. Ordained a deacon of the Church of England in 1861, he did not proceed to priest's orders and later considered himself as "practically a layman." He was a painstaking amateur draftsman and became an outstanding photographer of children.

Dodgson's first publication was *A Syllabus of Plane Algebraical Geometry* (1860), and he continued to publish mathematical books, of which *Euclid and His Modern Rivals* (1879–85) and *Curiosa Mathematica* (pt. i, 1888; pt. ii, 1893) may be mentioned. He also wrote anonymously skits on Oxford affairs; *e.g., The Dynamics of a Particle* (1865), *The Deserted Parks* (1867) and *The New Belfry* (1872). But it is on his fanciful works published under the pseudonym "Lewis Carroll"—derived by transposition from his own Christian names—that his reputation rests. Few books have been more often translated than *Alice's Adventures in Wonderland* (1865), which was inspired by his friendship with Alice Liddell, daughter of the dean of Christ Church, and in particular by a trip upriver irom Oxford to Godstow with her and her sisters on July 4, 1862. A suggestion of mild impromptu clings to the opening chapters, describing the fall down the rabbit hole and the little door into the garden. As *Alice's Adventures Under Ground,* the book was first written out by hand as a present for Alice and illustrated by Dodgson himself. The original manuscript consisted of 18,000 words only, but on George MacDonald's recommendation Dodgson revised and enlarged it for publication. John (later Sir John) Tenniel, under Dodgson's supervision, then prepared the famous illustrations. The first version, *Alice's Adventures Under Ground,* was published in facsimile (1886). The final manuscript of *Alice in Wonderland* has never come to light.

A worthy sequel was *Through the Looking-Glass* (1872), a fantasy based on a chess game. There are many allusions in both books to matters known to the young Liddells. The only other of Lewis Carroll's works to attain comparable fame was *The Hunting of the Snnrk* (1876). the longest and best-sustained nonsense poem in the English language. His verse was published in *Phantasmagoria and Other Poems* (1869) and *Rhynze ? and Reason ?* (1883), and subsequently in *Collected Verse* (1932). A master of parody, he comes between Edward Lear and Charles Calverley in the tradition of English light verse. The two volumes of his novel *Sylvie and Bruno* (1889 and 1893) proved elaborate failures, yet they are an interesting experiment in the handling of the supernatural, besides introducing the original form of the verse-epigram sometimes called the "Waterford," and immortalized in "The Mad Gardener's Song." beginning "He thought he saw an Elephant." Dodgson died at Guildford, Surrey, on Jan. 14, 1898.

The *Alice* books belong to the rare company of works written for children that appeal equally to young and old. Their characters have become a part of English folklore; quotations from them are commonplaces of speech; and no definition of English humour since they were written has been able to ignore them.

DODO, the common name for two extinct species of large, clumsy, flightless birds of the genus *Raphus* (or *Didus*). They inhabited the islands of Mauritius and Réunion in the Indian ocean. Together with a smaller bird, the solitaire (*q.v.*), which frequented the nearby island of Rodrigues, they comprise the family Raphidae, believed related to the pigeons (Columbidae). The Raphidae have been extinct since about 1680. The Mauritius dodo (*R. cucullatus*) was much the best known of the two species and several were sent alive to Europe. Some of these were at the time preserved in museums, but no complete specimen now exists, only a foot and leg in Oxford. Numerous bones were found in swamps on Mauritius and skeletons were assembled. Detailed paintings from life give some indication of the dodo's appearance. The huge blackish bill terminated in a large, horny hook; the cheeks were partly bare, and the plumage was whitish on the breast and tail and yellowish-white on the wings. The dodo inhabited the forests and is said to have laid one large white egg on a pile of grass. The chief factor that brought about the dodo's extinction was probably the birds' vulnerability to the early settlers and their imported animals, especially the hogs, which fed upon the dodo's eggs and young.

DODONA, an ancient sanctuary of Zeus in Epirus, contained many remarkable and abnormal features. unlike those of his worship elsewhere. The earliest mention of it is in the *Iliad* (xvi, 234), where its priests are called the Selloi, or, according to a less usual reading of the text, the Helloi. The meaning of the name Selloi or Helloi is unkno n, though a connection between Helloi and Hellenes is conjectured. These priests are described as "of unwashen feet, sleeping on the ground." This does not resemble a description of any normal Greek priesthood, nor does it seem appropriate to the clergy of a sky and weather god; it rather suggests worshipers or servants of an earth goddess or of some chthonian power with whom they kept in continual contact day and night. Homer again (*Odyssey* xiv, 327; xix, 296) has the first mention of the oracle at Dodona; Odysseus is reported (falsely) to have gone there "that he might hear the will of Zeus from the god's oak (*drys)* of lofty leafage." In Hesiod there is mention of another sort of tree, the *phegos,* perhaps to be understood as Valonia oak, in the trunk of which, apparently, some person or persons lived. But the reading is not certain and some uords are lost. It is certain, however, that the tree (more than one, according to Aeschylus) was reputed to give oracles, presumably by interpretation of the rustling of its leaves and other sounds. The occasional references to actual speech, in Aeschylus and in Apollonius Rhodius, can hardly represent contemporary belief.

Herodotus, but no earlier ariter, mentions priestesses. whom he also describes as the actual givers of the oracles, doubtless under some kind of inspiration from the god. Plato classes these uomen with the Delphic prophetesses as prophesying in an ecstasy, or, as he calls it, madness. The legend Herodotus professes to have heard at Dodona, tracing the origin of their office to the shrine of Amun in Egyptian Thebes, may be largely discounted. Of its real origin nothing is known. A further peculiarity of Dodona was the famous "bronze," a large gong set vibrating at every puff of wind by a scourge held in the hand of a figure standing over it; the persistent ringing passed into a proverb. It does not, houever, appear that this had anything to do with the oracle; according to Strabo the gong was an offering from the people of Corcyra.

In Dodona, Zeus had for his consort Dione, not Hera; her name is simply the feminine of his own (stem *Dio-),* and so she may be his original partner, brought with him into Greece. He bore the somewhat puzzling title of Naios, usually connected uith *naein,* "to flow"; hence perhaps "Zeus of the spring." The existence of a sacred spring at the shrine is attested by the elder Pliny and some later authors, and is likely enough in itself. But Naios is equally derivable from *naos,* a "temple." though no temple was built at Dodona until the 5th century B.C. There is always the possibility that, as suggested above, Zeus had taken over an older oracle from some deity of the earth and water; he himself seldom gave oracles directly. although it was the orthodox doctrine that those of Apollo ultimately derived from him.

Thanks to excavations on the spot, several examples of inquiries at the oracle are extant. Consultants wrote their questions on lead tablets in such a form that "yes" or "no" was reply enough. Longer answers were sometimes made by the oracle, however (Demosthenes xxi, 53).

See M. P Nilsson, *Geschichte der griechischen Religion,* 2nd ed., vol i, pp 423–427 (1955). (H. J. R.)

DODSLEY, ROBERT (1703–1764), English author and London bookseller who published most of Dr. Johnson's works, and who edited valuable collections of old plays and of poems, was born in 1703 near Mansfield, Nottinghamshire, where his father was master of the free school. He is said to have been apprenticed to a stocking weaver in Mansfield, from whom he ran away, taking service as a footman. In 1729 Dodsley published his first work, *Servitude,* with a preface and postscript ascribed to Daniel Defoe. A collection of short poems. *The Muse in Livery: or, the Footman's Miscellany,* was published by subscription in 1732 and was followed by a satirical farce. *The Toyshop* (1735). With the help of his friends—Alexander Pope lent him £100—Dodsley set up as a publisher at the "Tully's Head" in Pall Mall, London. in 1735. One of his first publications was Dr. Johnson's poem *London,* for which he gave ten guineas in 1738, and he suggested and helped to finance the *English Dzctzonnry.* Pope also made over to Dodsley his interest in his letters. In 1739 his publication of Paul Whitehead's *Manners,* voted scandalous by the house of lords, led to a short imprisonment. Dodsley also founded several literary periodicals: the *Museum* (1746–47, 3 vol); *The Preceptor: First Principles of Polite Learning* (1748, 2 vol.), with an introduction by Dr. Johnson; the *World* (1753–56, 4 vol.); and the *Annual Register* (1758–), uith Edmund Burke as editor. He is, however, best known as the editor of two collections: *Select Collection of Old Plays* (1744, 12 vol.; ed. by Isaac Reed, 1780, 12 vol.; 4th ed. by W. C. Hazlitt, 1874–76, 15 vol.); and *A Collection of Poems by Several Hands* (1748, 3 vol.), which passed through many editions. A collection of his dramatic works and some poems which

had been issued separately were published in two volumes, *Trifles* (1745–77), and this was followed by other poems and plays. His tragedy *Cleone* (1758) had a long run at Covent Garden and was very popular, 2,000 copies being sold on the day of publication. In 1759 Dodsley retired, leaving the conduct of the business to his brother and partner James (1724–97). Robert Dodsley died at Durham on Sept. 23, 1764.

BIBLIOGRAPHY.—Dodsley's poems are reprinted with a memoir in A. Chalmers' *Works of English Poets From Chaucer to Cowper,* vol. xv (1810). *See* also Charles Knight, *Shadows of the Old Booksellers,* pp. 189–216 (1865); E. Solly, in *The Bibliographer,* vol. v, pp 57–61 (1884); Austin Dobson, "At Tully's Head," in *Eighteenth Century Vignettes,* 2nd series (1894); R. Straus, *Robert Dodsley, Poet, Publisher and Playwright* (1910).

DODSWORTH, ROGER (1585–1654), English antiquary, among the first to realize the historical potentialities of contemporary documents, was born at Oswaldkirk, Yorkshire, in 1585. Publishing nothing himself, he amassed transcriptions toward a baronage and formed a collection of sources on monastic history; this was used by Sir William Dugdale (*q.v.*) in his *Baronage of England* (1675–76) and *Monasticon Anglicanum* (3 vol., 1655–73). This last is known under Dugdale's name, although two-thirds of the work is Dodsworth's. On his death in Aug. 1654, 160 volumes of Dodsworth's manuscripts were placed in the Bodleian library, Oxford. Extracts were published by the Yorkshire Archaeological society as *Dodsworth's Yorkshire Notes* (1884 and 1887–93) and by the Chetham society as *Copies of Lancashire Inquisitions Post-Mortem* (1875–76). (J. M. WI.)

DOG. The dog is the oldest domestic animal. Its remains have been found in Denmark dating from the early part of the Middle Stone Age, in connection with the human culture known as the Azilian. These bones date back to perhaps 6000 to 8000 B.C. Shortly afterward dogs appeared in the Mesopotamian valley and the near east. The evidence is still too incomplete to pinpoint the exact spot where the first dog was domesticated, but it was probably some place in central Europe.

This article is divided into the following sections:

I. ORIGIN AND HISTORY

1. Ancestry.—All dogs belong to a single species, *Canis familiaris.* Other members of the genus *Canis* include the wolves, coyotes and jackals. The coyotes, which live only in North America, can be eliminated as ancestors of the early European dogs on geographical grounds.

Wolf.—The most likely candidate is the gray wolf, *Canis lupus,* which mas originally found over all of Europe, Asia and North America, with a great many highly variable subspecies and local varieties. Wolves are so variable in colour that even individual members of a pack can be easily distinguished; they range from pure black through shades of gray to almost white. The northern wolves are much larger than the southern ones, which makes it probabie that dogs came from a smaller central or southern variety.

Jackal.—The other possible candidate, the jackal, is primarily an African animal, although its range extends into Mesopotamia, southeastern Europe and India. Jackals are less social than dogs; they howl in a manner unlike any domestic dog; and have narrow, foxlike heads—factors that make it unlikely that they are ancestors of the domestic dog.

2. Domestication.—After dogs became domesticated, selection by man for various traits of appearance and behaviour began. One trait that distinguishes dogs from their wild relatives is an upturned tail, ranging from a sickle shape to a tight curl. This characteristic, a mutation that probably goes back to the original stock of domestic dogs, points to a common ancestry for all types of dogs. Another feature that distinguishes most dogs from wolves is the smaller, less powerful teeth. There must have been an early artificial selection for those animals that were smaller, less toothy and also more easily tamed and controlled.

3. Distribution and History.—The domesticated dog apparently spread very rapidly all over the world, through both hemispheres and from tropical to arctic climates. When the white men arrived in North America they brought their own dogs, but every Indian tribe already had them. At that time there were at least 20 distinct breeds in North and South America. Most of these have disappeared except for the Mexican hairless and the Eskimo dogs.

In Australia there is the dingo, a separate species from the domestic dog. The dingo, typically a wild animal, is sometimes found semidomesticated in the camps of the aborigines. Its ancestors must have been brought as domestic dogs to Australia by the first immigrants several thousand years ago and later allowed to run wild.

In historical times dogs were found all over Africa. One of the surviving native breeds is the African basenji, still used by the pygmy tribes in equatorial regions. Similarly, dogs lived all over Asia and on most of the oceanic islands.

Most is known about the history of European dogs. From the earliest times traders and travelers not only took their favourite dogs on long journeys but often returned with new and exotic varieties. Dogs were nowhere more cultivated than in England.

By the time John Caius (founder of Caius college at Cambridge) wrote a description of English dogs for the naturalist Konrad von

Gesner in the 16th century, the English had collected at least six main varieties of dogs — greyhounds, true hounds, bird dogs, terriers, mastiffs and shepherd dogs. The greyhounds, or pursuit dogs, tall, lean and very swift, originally came from Mesopotamia or the near east, where they still survive as the salukis, or gazelle hounds. The true hounds were used for hunting various animals by scent; they had long ears and large baggy lips, as they have today. Caius called them harriers. Modern beagles and foxhounds belong to this group. Bloodhounds were already known in that day. The bird dogs were the water and land spaniels and the related setters. Caius also mentions the "spaniel gentle," probably referring to the ancestors of the modern toy spaniels. Quite different from the above-mentioned dogs were the terriers, which were trained to creep into holes and attack badgers, foxes and other game. Terriers were selected for aggressiveness and were frequently used for dog fights and various sorts of animal baiting. Useful and important dogs in that era were the mastiffs and bandogs, the latter named because they were usually kept on a bond or chain. It is hard to realize that these and most other giant breeds were originally bred for ferocity, being used to protect property and even to fight as war dogs. The shepherd dogs are represented today by the Old English sheep dog and the Scotch collie. Since they were not used by the nobility there are few records concerning them.

A basic group of dogs not mentioned by Caius includes the sled dogs of the Eskimos, found in the arctic in both America and Eurasia. These large curly-tailed dogs, reputedly crossed with wolves, and similar smaller dogs of northern Eurasia are sometimes called the polar or spitz group.

Although the same general types of dogs were found all over the world many less distinct in their physical and behavioural traits have since disappeared. Many ancient breeds have greatly changed or entirely disappeared, but in Iraq are still found two ancient types of dog, the earlier-mentioned saluki and the Kurdish herding dog. The latter is a large breed somewhat resembling the mastiffs and war dogs pictured in Babylonian art in 2200 B.C.

Historical records show that dog breeds have frequently been crossed with each other, so that it is difficult in many cases to determine the ancestors. At any rate, in modern times dogs have become the most variable of domestic animals.

4. Zoological Relationships. — The typical members of the dog family Canidae, order Carnivora, belong to the genus *Canis,* wnich includes the domestic dog, the closely related dingo of Australia, wolves and jackals. The jackals are sometimes put in a separate genus, *Thos.* More distant relatives in the same family are the foxes, belonging to the genera *Vulpes, Urocyon* and *Alopex.* Still more distantly related are the "wild dogs," including *Lycaon,* the African hunting dog; *Icticyon,* the South American bush dog; and *Cuon,* the dhole of India.

All the Canidae have a common ancestor in the Oligocene period. The "wild dogs" were the first to separate from the wolf line; later the foxes split off. In comparatively recent times the wolves gave rise to the coyotes in America and the jackals in Africa and southern Eurasia. Finally a small race of wolves was domesticated to produce the domestic dog, which in turn gave rise to the dingo in Australia. *See* also CARNIVORE: *Survey of the Order: Dog and Dog Allies (Canoidea).*

II. BEHAVIOUR

A. Behaviour Patterns in Dogs and Wolves

Many peculiarities of dog behaviour can be understood only in reference to the lives of their wild ancestors, the wolves. Within recent years the behaviour of wolves in undisturbed wild conditions has been studied scientifically, reducing much of the mythology surrounding them to scientific fact.

1. Territory and Range. — The usual wolf pack has a central headquarters or den The immediate area around this is defended a3 a territory and all trespassers, whether wolves or other carnivores, are driven off. In addition, the pack has a wide hunting range, sometimes as large as 40 mi. in diameter. At various points the wolves commonly pass there are "scent posts" where they stop to urinate and defecate. Males lift the leg to urinate and scratch the ground after defecation. Strange wolves passing by will also mark the place in the same manner. The same habits are seen in dogs allowed to run loose in town or country: the tendency to defend the immediate areas around the houses of their owners, but to wander much more widely, marking certain "scent posts" as they go.

2. Group Activities. — Wolves are highly social animals. Sometimes they live in pairs, but the normal group is a small pack of five or six adult animals, males and females together. The cubs produced each year apparently leave the old pack during the next breeding season to found new packs of their own.

The major activity of wolves is hunting. They will eat anything from mice and birds on up, but their major articles of diet are the large herd animals such as deer, in the woodlands, and caribou, in the arctic. They may also be highly destructive to domestic stock in settled areas. In the usual hunt, the pack sets out together but splits up to find game. If one is successful he howls, bringing the others together, and they join to eat the already downed quarry or to make a combined attack on the struggling prey.

Within the pack, wolves are peaceable and highly co-operative animals. While feeding, the wolves observe a dominance order, with the most dominant animal feeding first. Parts of prey animals are often buried or cached, either at the site of the kill or in the vicinity of the den. This presumably saves the food from scavengers. Domestic dogs show the same habits, even attempting to bury such things as dry dog food.

Wolves show the same general types of sounds and communication as dogs — barking when a strange animal approaches the den, yelping in fear or distress, growling when threatening another animal and howling, either alone or, when the pack is together, in unison.

3. Agonistic or Combative **Behaviour.**—Wolves will attack strange animals unmercifully. Two strange male wolves approach each other stiffly, with tails held erect, and apparently identify each other by sniffing in the tail region. If a fight starts, they rush at each other, snapping and snarling, and the fight lasts until one runs away or submits. The beaten animal will roll on its back, extending its paws, yelping, and protecting its throat by snapping. The winning animal stands over it, growling and threatening If dominance has already been established. one wolf may indicate this by placing his paws on the other's back and growling while the subordinate animal keeps his tail low. Similar patterns of behaviour are seen in domestic dogs.

4. Courtship and Care **of** Young. — In courtship wolves show a characteristic pattern of play. They crouch extending their forepaws and cocking their heads to one side, then they throw their forelegs around each other's necks and wrestle. This is followed by running and chasing and eventually mating. Like domestic dogs, wolves show the peculiarity of the sexual tie: after copulation the two animals remain locked together for many minutes.

For the first three weeks or so young puppies are fed exclusively by nursing, but thereafter they begin to take vomited food. with final weaning at about seven weeks of age. Until four to six months of age the young uolf cubs must be fed by vomited food or other material brought to the den. Feeding the young by vomiting occurs in males as well as females and also in young unmated animals. Domestic dogs show this pattern of behaviour more rarely, but vomit readily and, like wolves, frequently eat the vomitus again.

B. Specialization of Dog Behaviour

The wolf patterns of behaviour present in all domestic dogs have been accentuated or reduced in different breeds by selection for special purposes. Some of the principal specializations of dog behaviour are discussed below.

1. Hunting **Dogs.**—Wolves are generalized hunters, using all possible methods to catch their prey. The hound breeds of dogs have been selected to hunt primarily by scent and are used to find and run down various sorts of land mammals, which leave a continuous trail of scent behind them. Even hounds, however, do not rely entirely on scent but also use their eyes and search the

ground in circles. In most cases the trail followed is quite fresh but the bloodhound breed is remarkable in being able to follow a scent many hours old.

A different type of hunting is found in bird dogs. Flying birds leave no continuous scent, and finding them on the ground is a matter of thoroughly covering a large area. When the bird is finally scented, the dog is trained to stop and wait, as in pointers and setters. Other breeds, such as the spaniels, simply flush the birds so that they can be shot. Another problem in bird hunting is to find the shot and wounded birds and bring them back to the hunter. For this job several special breeds of retrievers have been developed, some of which are used for both finding and retrieving.

The spaniels appear to have been the original bird dogs, and tradition says that they originally came from Spain. They were used and selected for various types of hunting in the middle ages. Some were water spaniels, used for retrieving birds from the water. The land spaniels were used in the sport of falconry, being trained to find and flush birds off the ground so that the falcons could attack them. Others were used in setting birds for the net: on finding the birds the spaniel was trained to lie flat on the ground while the net was thrown over him and the birds. This was the original meaning of "setter." Later, when shotguns were developed for use in bird hunting, this behaviour trait was useless, and the setter breeds were then selected for pointing instead. The original pointers were developed about the same time, probably from a mixture of hound and spaniel breeds.

Hunting game on open plains or deserts is not so much a problem of finding the game as of catching it. The various greyhounds have been selected for great speed and running down game of different sorts by sight.

The final part of hunting is the attack on the prey, and the terrier breeds have been selected as attack dogs. The fox terriers were used to drive foxes out of their dens, and the larger Airedale terriers were, and still are, sometimes used to attack mountain lions and bring them to bay.

Thus starting with wolves, selection for different types of hunting has produced dog breeds that are faster than wolves (greyhounds), more ferocious than wolves (terriers) and better trailers than wolves (hounds). (See HUNTING.)

2. Guard Dogs and Watchdogs. — The tendency of wolves to guard their dens has carried over to dog breeds that guard and protect property. Such dogs have limited uses under modern civilized conditions because the owner is responsible for the damage they do, but almost any breed of dog will still sound the alarm when strangers approach. Breeds such as the German shepherd dog (or Alsatian) and the Doberman pinscher are sometimes used in police work and by night watchmen. Dogs still find certain use in modern warfare, chiefly in night patrols and in scouting and sentry duty.

3. Herding Dogs. — Wolves follow and chase herd animals. In dogs it is a short step from this behaviour to herding. Under primitive conditions herding dogs were used to protect flocks of sheep or goats from predators, and they consequently had to be large and aggressive animals. However, many of the modern shepherd breeds, such as the border collies, are small- or medium-size animals that have been selected for the ability to learn commands and obey them from a distance. Dogs are still sometimes used for herding cattle. Most of the animals in actual use are not registered or show animals.

4. Sled Dogs. — One use of dogs that has no counterpart in the behaviour of wolves is as draft animals. With the domestication of larger animals and with modern systems of transport, this use has largely disappeared in most parts of the world but survives chiefly in the arctic sled dogs. Before the white man brought the horse to North America, Indians used dogs to pull their wheelless vehicles (travois).

5. Companions and Pets. — An important modern use of dogs is as companions and household pets. Almost every breed of dog has been used for this purpose, but for many persons the ideal household pet is small sized and easily controlled. The various toy breeds have been developed especially as pets.

The popularity of dog breeds varies from year to year and mostly reflects the current taste in household pets. The most popular breeds are therefore usually small or medium sized. Within the last haif-century fox terriers, cocker spaniels and beagles have been favourites in the United States, with some of the working and toy breeds such as collies. boxers, Gennan shepherds, Chihuahuas and Pekingese being runners up. Among non-sporting breeds, poodles and Boston terriers have been most popular.

6. Guide Dogs. — Guide dogs for the blind are particularly valuable and devoted companions. Dog and master must go through an intensive period of training in which-the dog learns to avoid overhead obstacles, to stop at curbs and to keep the blind person out of the may of traffic. Several breeds have been used successfully as guide dogs, but the German shepherd dog is employed most commonly. (See also BLIND, TRAINING AND WELFARE OF: Dog Guides for the *Blind.)*

7. Dogs in Research. — The Russian physiologist I. P. Pavlov began to use dogs for his research on conditioned reflexes, laying the foundation for modern theories of learning in animals and man. Dogs show more heritable variability in behaviour than any other domestic animal and thus are ideal subjects for the study of the relationship between heredity and temperament. The close social relationship between dogs and man is in many ways similar to the human parent–child relationship, so that dogs can be used to test various theories of child training.

Dogs also have important uses in medical research, and the resulting discoveries have helped to improve both animal and human health. The use of animals in medical laboratories is regulated both .by codes of professional ethics and by law, in order to prevent needless suffering. In Great Britain such research is strictly regulated by law and performed only by licensed individuals. (See ANIMAL EXPERIMENTATION.)

III. REPRODUCTION

1. Heat or Estrus. — The ancestral wolves do not become sexually mature until nearly two years of age. However, females of most breeds of domestic dogs will show their first heat (or estrus) period before they are a year old and sometimes before six months. There is considerable variation both between breeds and individuals. The African basenji has a seasonal cycle, the females coming into heat in the autumn of each year. A similar cycle is found in the Australian dingo when brought into northern latitudes. Most domestic breeds come into heat at any season of the year, at approximately six-month intervals. The pattern of any individual dog is usually fairly consistent, but longer and shorter cycles are common.

The first sign of estrus in the female is a gradual enlargement of the external genitalia, followed after several days by the discharge of a small amount of blood. At the same time an odorous substance highly exciting to males is secreted in the urine. If the female is not allowed to urinate where males can find it there will be little trouble, but if she is allowed to run freely, males will gather from miles around. Bleeding may continue for a week or more and at its end the female will accept the male. She may be receptive for a few days or as much as two weeks. Ovulation occurs 72 hours before the last point of receptivity. Conception may occur from matings at any time in the cycle, but for maximum fertility the matings should be repeated frequently in order to strike the period of ovulation. Many breeders make a practice of repeating matings every other day throughout the receptive period.

2. Gestation. — The period of gestation is approximately nine weeks counting from the time when the animal is first receptive. The embryos develop quite slowly at first, not becoming implanted until about 21 days after fertilization. The greatest intrauterine growth of the puppies occurs in the last half of pregnancy, during which the female will require an increased and well-balanced diet. Occasionally a female that has not been bred will show a pseudo-pregnancy, nith swelling of the abdomen and enlargement of the mammary glands.

Litter size varies roughly with the size of breed, but there is

great individual variation. Some toy breeds rarely have more than one or two puppies, whereas the setters and larger breeds may have eight to ten, with some record litters going much higher. Four to six is a good average; in very large litters the pups are frequently small and weak.

3. Reproductive Capacity.— The reproductive powers of females diminish after five years of age and reproductive cycles usually cease entirely by the age of eight. Males usually remain capable of breeding to a more advanced age, but a male of six years is entering middle age.

Spaying the female (removing the ovaries) or castrating a male (removing the testes) before maturity affects the normal pattern of growth; such animals usually become taller and more obese than the average. Spaying terminates the sexual cycle in the female, but castration may have little effect on the sexual behaviour of an experienced male.

IV. GENETICS AND BREEDING

As stated earlier, the ancestral wolves are highly variable in size and appearance, and their dog descendants are the most variable of domestic animals. Not only are there wide differences between breeds but there is also great individual variability within each breed. At the present time there is little crossing between any two registered breeds, since this is discouraged by most breeders' clubs, but there are historical records of much cross-breeding in the past, and most of the modern breeds have been developed by such early crosses. It should be remembered that no breed is pure in the genetic sense, but is a variable population kept within certain limits by artificial selection.

1. Colour.—There are certain physical characters the inheritance of which is well known and highly predictable in breeding experiments. Most of these are based on genes affecting colour. Only a few of the major colour-influencing genes are described below.

The basic wolf-gray or wild-type coat consists of long guard hairs, banded with black and red, and a lighter-coloured undercoat, which grows heavily in winter and is shed in summer. The colour is distributed in a basic pattern of "countershading": more black hair on the top of the body and more red underneath, becoming almost white on the belly. Thus there are two basic pigments, black and red, with the absence of pigment producing white.

In domestic dogs the original coat has been modified in length, texture, pattern and colour, in a wide variety of combinations. The major series of genes that modify colour is the *A* series. Given in order of relative dominance, these genes are: A^s, coal black; a^y, red, varying from clear red to red with some dark hair (the so-called sable colouring); a^w, the wild type or wolf gray; and a^t, bicolour (black-and-tan), having a clear black on the upper part of the body and clear red below, with red dots over the eyes.

Other genes may influence the *A* series: the recessive ee changes all black hair to red, and bb changes black hair to brown or liver colour. These pigments may be modified still further by other genes to produce all shades from dark to very light.

Another important series of genes produces various degrees of white spotting, ranging from small spots on the tail, feet and belly, through piebald (heavy mottling over the entire body) to almost completely white animals, as in white bull terriers. Hair length and coat texture are also influenced genetically, but less precisely than coat colour. In general, short hair is dominant over long, coarse over fine, straight over curly, wire coat is incompletely dominant over smooth, sparse over dense. There are an enormous number of possible combinations, each breed having a limited but often confusing number.

2. Shape and Weight.— In body form there is an ancient mutation for the upcurved tail. This is a physiological trait, since the dog can usually straighten his tail; its inheritance is not well known. There is major mutation for short legs, seen in such breeds as dachshunds and basset hounds; the first-generation hybrids of a mating of a short-legged dog with a normal-legged one have legs that are intermediate in length. The bulldog mutation chiefly affects the head, producing a short and flattened snout accompanied by an undershot jaw. Again, the first generation of a cross between a bulldog and a normal-faced dog has an intermediate appearance. Still another inherited trait is ear carriage, varying from lop ears to erect ones.

One of the outstandingly variable characteristics of dogs is body weight, ranging from as little as 2 lb. in dwarf breeds such as the Chihuahua, to 150 lb. in some of the large breeds such as the mastiff and St. Bernard. Offspring from crosses between large and small breeds tend to be intermediate in size, and the trait is affected by large numbers of genes.

3. Behaviour and Temperament.— The inheritance of behavioural and temperamental characteristics is highly complicated. The behaviour characteristic of a particular breed consists of a combination of several independently inherited traits, each of which is affected by one or two major genes and perhaps other minor ones. For example, the tendency to crouch or sit in cocker spaniels depends on two independent traits: the crouching posture itself and the tendency to remain quiet.

It is very likely that more than one combination of genes will produce a desirable trait in a dog; therefore, two excellent dogs bred together may produce somewhat inferior offspring, and vice versa. Consequently, most successful dog breeders experiment with matings till they come upon those matings that give the highest proportion of desirable progeny. Since dogs are long-lived and often fertile animals, this method of progeny testing can be highly successful. At the same time there are in most pure breeds a large number of undesirable recessive traits of form and behaviour that crop out in certain matings. Many of these are preserved and spread throughout a breed if a champion male carrying an undesirable recessive trait is widely bred to numerous females. Furthermore, many of the traits desired by dog fanciers, such as the bulldog head which would be a physical defect in a wild animal and promptly "selected out" in nature, are perpetuated by man through special care and attention.

It should be remembered that no trait is inherited as such. Mendelian inheritance transmits the genetic factors, or genes, but the traits themselves have to be developed in the presence of all sorts of varying environmental factors. Even coat colours can be affected somewhat by the environment, and this is much more true of behavioural traits, which are always modified by training and experience.

V. CARE AND TRAINING OF THE DOG

A. Selecting and Training

1. Selecting a Dog.—Age.—The ideal time to acquire an individual puppy is between six and eight weeks of age, in order to permit normal psychological development (see Development of *Behaviour* below). Since neither physical nor behavioural development is complete at this time, the best guide to the puppy's future is its parents, and the buyer should if possible select a puppy from known breeding stock. The puppy should be normally plump, lively and free from obvious physical defects and extreme timidity. (For establishing a breeding stock, the prospective owner will often do best by acquiring a pregnant female of proven fertility.)

Sex.—Whether the owner chooses a male or female will depend on his personal preference. Males are usually larger than females, more active and tend to wander more as adults.

Being less in demand, females are less expensive. Sexual cycles can be eliminated by spaying, as noted above in the section Reproduction. The most desirable time to spay a female is after the first heat period, as this will assure normal physical development.

Breed.—The choice of breed depends on the use of the dog and, again, on the owner's preference. All dogs require some kind of training and there is no breed that will make a satisfactory animal without it. The hounds and bird dogs are generally quite gentle with children and rarely get into fights with other dogs, but are sometimes a little difficult to housebreak and to prevent from wandering.

Mongrels.—A mongrel, or cur, is a dog of unknown ancestry. First-generation hybrids between two pure breeds show a great

deal of hybrid vigour and are usually more healthy and hardy than either parent breed. Their appearance and behaviour traits may be like one or the other parent, or neither. Some dog breeders regularly produce such hybrids for special purposes when the result can be predicted. Crossbred retrievers, spaniels and setters are hybrid types registered by the Kennel Club of England. Crossing between hybrids themselves produces segregation of parental traits in all sorts of unpredictable combinations. If the owner selects such a hybrid of unknown ancestry, he should remember that appearance is no guide to behaviour, nor even to the breed of the ancestors. Nevertheless, such hybrids frequently make attractive and desirable pets, and sometimes become outstanding working or hunting dogs.

2. Development of **Behaviour.**—The early development of a dog is divided into several distinct periods: (1) neonatal, (2) transition. (3) socialization and (4) juvenile. In the neonatal (newborn) period, the puppy's activity is largely confined to nursing and sleeping. Provided normal maternal care is given by the bitch, little additional care is needed, except to make sure the puppies are kept warm and the mother is well fed. The newborn puppy is blind and deaf and is consequently largely isolated from the external world.

In about 14 days its eyes will open, marking the beginning of the transition period. During the third week the puppy undergoes a rapid change in behaviour and in sensory and motor abilities. Toward the end of the week, when its ears open, the puppy begins to react to sound. At the same time its first teeth appear, and it will attempt to eat solid food if offered.

Meanwhile it has begun to walk instead of crawl and to show social responses to humans and to other dogs. This marks the beginning of the period of socialization. The puppy will now slowly approach a strange person, nosing and wagging its tail. Another social response is playful fighting with its littermates. At any time during this period, which lasts up to ten weeks of age, it is easy to form a close social relationship between a puppy and its owner, the maximum favourable response being obtained between six and eight weeks of age.

By removing a puppy from its litter early in the socialization period all social relationships are transferred to human beings. Emotional disturbance and prolonged yelping is a normal reaction to removal from the litter and can be relieved by fondling and companionship. The puppy soon associates its owner with relief from distress. Adopting a puppy late in the period will throw the balance in the opposite direction, so that the puppy's strongest relationships are with dogs rather than with human beings. In fact, puppies raised in large fields apart from human beings will become almost completely wild by 14 weeks of age. This period is therefore a critical one for determining the nature of social relationships. In addition, the puppy becomes strongly attached to its environment during this period, and it is important that it be introduced into the type of surroundings that will be its future home. Puppies left in a kennel environment much beyond 12 weeks of age are likely to be permanently shy and timid when brought into the outside world. From the viewpoint of the dog trainer best results are obtained if the puppy is introduced to its future activity and environment, at least in a simplified form, sometime between 8 and 12 weeks of age.

Following the period of socialization is the juvenile period, lasting up to sexual maturity, usually sometime after six months of age. During this time the puppy is still physically undeveloped and relatively unskilful, so that complex training should not be attempted.

3. Early Training.— Development of the nervous system is largely completed by eight weeks of age. For the household pet the period between 8 and 12 weeks is the ideal time to begin the basic training in such commands as "come," "sit" and "fetch." It is also the ideal time for housebreaking, based on the natural development of behaviour. The puppy has two basic behaviour patterns that can be used in housebreaking. One is a tendency not to defecate or urinate in a sleeping place, so that if shut up in a fairly small box or kennel for the night the puppy will ordinarily not urinate or defecate until morning. The second is the tendency to urinate and defecate in special spots. This tendency appears at about eight weeks of age. Given frequent access to such spots, either on paper in a house or out-of-doors, the puppy will rapidly form habits of using them. It may also be punished for undesirable habits, but the punishment should be mild and immediately associated with the act itself.

4. Training Methods.— Successful training methods vary with the breed of dog and the type of activity desired. Methods that work well with one breed will work poorly with another. For example, mild punishment can easily inhibit undesirable behaviour in many of the shepherd dogs, whereas similar punishment may only stimulate resistance and fighting in the aggressive terrier breeds.

The basis of most training is reward. The trainer should offer reward for desirable behaviour and withhold reward for undesirable behaviour. To be effective the reward must come immediately after the action, so that the dog can form a connection between the two. Good habits formed in this way also help prevent the formation of bad habits, since one interferes with the other. The rewards used vary with breeds and individuals, and the trainer must study the animal to determine which type of prize is most effective. For the hunting breeds food is usually a very strong reward. Dogs also respond to praise and handling, although some breeds do not enjoy rough petting and restraint. An activity may be rewarding in itself. Hunting breeds such as beagles seem to enjoy hunting for its own sake, irrespective of rewards, and other breeds similarly enjoy other kinds of activity.

Punishment is chiefly useful to inhibit activity and is ineffective otherwise. For example, if an owner repeatedly calls a dog to punish it for misdeeds, the dog will soon learn not to come. A general rule is to use punishment sparingly and only in situations that the dog understands. **At** the same time it is necessary that the trainer be dominant over the dog; the dog must never be allowed to control the master by punishing him. The dominance relationship is easily established over very young puppies, and is best set up by restraint and handling rather than outright punishment.

One chief difficulty in training a dog is getting him to do a required act so that it may be rewarded. In any complicated training it is best to break down the activity into a number of simple steps. Another useful technique is "forced training," in which the animal is compelled to go through a particular activity and so learn what is required. This is particularly useful in leash training, in which it is easy to guide the dog through the proper behaviour, after which he mill usually anticipate the required action without further force being used.

The requirements of city life are such that a dog must be kept under control most of the time. Training of this sort is aimed at preventing the dog from becoming a nuisance to others and at making the dog aware of the dangers of traffic. Obedience training has therefore become highly popular, and special schools for dogs and their owners are found in most cities. The basic training consists of teaching the dog to obey certain elementary commands such as "come," "sit," "stay" and "heel" (to follow closely on the owner's left side). More advanced training includes retrieving. jumping on command and tracking a person.

B. Special Traits

1. Breed **Psychology.**—The psychology of each breed can be best understood in terms of the work for which it has been selected. Hunting breeds such as hounds have been selected to work independently of human handlers and are therefore somewhat difficult to keep under strict control. They have also been selected to work peaceably in packs or groups; consequently, aggressive behaviour is seldom a problem. The shepherd dogs, on the other hand, have been selected for their ability to learn to work under direction and to form firm habits. It is thcrcforc easy to teach them restraint.

As alluded to earlier, a highly important factor in training is the degree of maturity. Young puppies learn very quickly, but have little persistence and power of concentration. In most breeds there is considerable steadying of these qualities at maturity,

sometimes as early as six months but often at a year or more of age. Therefore, it is usually best to attempt complex and difficult training at maturity.

2. Intelligence. — Intelligence can be defined as the ability to solve problems and adapt to new situations. The degree of intelligence shown by any animal depends upon his sensory and motor equipment as well as upon the development of the brain. Dogs have a well-developed cerebral cortex with many convolutions; excellent hearing, being able to distinguish sounds far above the human range, and a highly developed sense of smell. Their vision, however, is considerably inferior to that of human beings, as they lack cclour vision and are relatively poor at discriminating form. A dog may not detect a person standing perfectly still downwind, but notices him only when the person moves.

In their motor abilities dogs are good runners but only fair leapers. They have little power of prehension with their paws, and hence are incapable of solving problems involving complex manipulation. Instead they must use their teeth for manipulating and carrying objects.

Judging how intelligent a dog is, either in comparison to other dogs or to other animals, is very difficult. Obviously a dog will be unable to perform as well as a monkey any problem involving complex manipulation or colour vision. For most dog owners, intelligence is measured by the ease with which a dog can be taught. However, this may depend in a large measure on the degree of motivation rather than on any absolute intellectual power. In general, when individual dogs are sufficiently motivated there appear to be no wide differences in intelligence between breeds.

There are big differences, however, in the ease with which breeds and individual dogs will accept complex training. Certain breeds have a high reputation for intelligence of this sort, particularly the shepherd dogs and poodles. These animals have a high capacity for developing motivation and attention toward their handlers, and a similarly high capacity for accepting inhibitory training. Most of the "wonder dogs" famous for their intelligence belong to these groups. A highly trained dog is capable of mastering hundreds of different commands.

At the same time there are definite limitations on canine intelligence. Like other mammals (excluding man), dogs cannot be taught to talk, and indeed learn to "speak" or bark on command only with great difficulty. There is no evidence that dogs are able to recognize the meaning of words when they are used in new combinations (*i.e.*, to understand new sentences), thus the amount of information that actually can be conveyed to a dog is quite limited. **A** well-trained dog is, however, capable of such attentiveness to his owner's slightest movements and mannerisms that he almost seems to read the owner's mind.

3. Emotions. — Most emotional reactions of dogs are readily understandable to their owners. Growls and snarls are threats, and barking is usually an alarm signal. Rapid horizontal tail wagging indicates a friendly approach and is roughly the social equivalent of the human smile. High-pitched yelping occurs in situations involving pain or terror. The rapid yelps and whines of puppies indicate distress, which may have many causes. Solitary howling usually indicates loneliness or is a reply to another howling dog.

Some other reactions are not so easy to interpret, and can only be understood in terms of the behaviour of dogs toward each other. Jumping up and placing the feet on the master is usually an attempt to initiate the playful fighting so often seen between dogs. A stiff-legged approach with erect and slowly wagging tail indicates aggressiveness and may be followed by an attack. A worried dog holds his ears down, so that his forehead is smooth. An attentive dog often displays a wrinkled forehead, usually the result of the erection of the ears.

The external expression, however, is not always a true guide to internal emotional state. A serious prolonged internal emotional disturbance will often show up in depressed activity and loss of appetite.

4. Abnormal Behaviour; Neuroses. — The owner should be slow to interpret any behaviour of a dog as abnormal, remembering that an animal will adapt to a situation in any way that gives him satisfaction, however bizarre this may appear to the onlooker. Unusual behaviour may also result from organic disease. Any marked changes in behaviour, such as convulsions (often called fits), staggering gait and the like, are usually indications of serious disease and require diagnosis by a veterinarian.

A neurosis may be defined as a kind of behaviour that gives relief from tension without adaptation to the cause of tension. For example, dogs confined to small pens for long periods will often develop the habit of running in circles or jumping from side to side whenever a person approaches. The dog is stimulated to respond to the person, but because of confinement can only make what appear to be useless and inappropriate movements. Likewise, a dog left by itself in a house for long periods will often chew furniture and rugs. This behaviour can be understood as a thwarted attempt to escape.

Neurotic behaviour can be largely prevented by giving the dog an opportunity to satisfy certain basic needs. The two needs most often thwarted are the need for some sort of physical activity (dogs being basically active hunting animals) and the need for social companionship, which can be satisfied by either dogs or people. Dogs adjust fairly well to the absence of opportunity for sexual behaviour, particularly if there is no external stimulation. There is no basic need for aggressive fighting in the absence of external stimulation, and the owner will do well to initiate inhibitory training early in life, remembering that restraint plus rewards are more effective than punishment, which has the effect of actually stimulating fighting.

C. Nutrition and Growth

1. Adult Dogs. — Dogs are basically carnivorous hunting animals, and as such are physiologically adapted for going for long periods without food or water. Many adult dogs can go without eating for a week without serious harm. When food is available, a hungry dog will gulp down large quantities as rapidly as possible.

An adult dog can be fed either once or twice a day. The amount of food needed will depend upon the amount of exercise, but a rough guide is one-half pound of dry dog food or its equivalent for a 20-lb. dog. Smaller breeds generally require more food per pound of body weight than do larger breeds. Pups need more food than mature dogs, especially during the period of rapid growth between six weeks and six months of age. It is easy to overfeed a dog with a good appetite, but this is really a disservice to the animal since, as with man, excessive fat is harmful to health.

Dogs have many individual as well as breed idosyncracies with regard to food. The hunting and working breeds are generally hardy, with good appetites, and do well on almost any balanced diet. In former times they were often fed chiefly on bread and cereal. Some breeds and individuals are much more delicate and require special foods. Professional advice may be needed in some cases. Many dogs will develop special tastes, particularly if they are overfed.

A well-balanced diet for a dog is not too different from that for a human being, except that the dog's intestine is not well equipped for handling roughage, so foods like bran and certain vegetables containing an excess of fibre should be avoided. However, dogs digest bones easily and can live almost exclusively upon fresh ones. Bones sometimes cause trouble though: to be especially avoided are splintery bones, such as those of poultry or chops; large beef bones are safest. Dogs, being able to produce their own vitamin C, have no need for vegetables and fruits, but can eat them if there is nothing else available; they can also readily digest cooked starchy foods. Most dogs, however, prefer meat to any other kind of food.

Most commercial dog foods contain a balanced diet and can be used as a basic element in feeding, supplemented by small amounts of meat and fats. Organ meat (*i.e.*, the liver and other internal organs) is especially nutritious.

2. Puppies. — Puppies naturally have special nutritional requirements. In normal development the young puppy gets all of his food from the mother's milk during the first few weeks of life. The mother then begins to supplement this with vomited food and completely weans the puppies at seven to ten weeks of age. How-

ever, since most mothers cannot feed their puppies adequately by natural means throughout this whole period, food supplementation should begin at about three or four weeks of age, the puppy being fed once or twice a day. The most convenient time for taking a puppy from the mother and one which produces the closest attachment to human beings is, as stated earlier, between six and eight weeks of age, or just before the normal weaning time. Such a puppy can be fed twice a day up to eight weeks and once a day thereafter. More frequent feedings can be given if the owner wishes, but are not necessary.

The best supplement is some sort of mash containing milk and meat. For the best growth of the puppy, the mash should contain large quantities of high-grade protein and also iron, since the mother's milk is deficient in the latter. A puppy's diet should also be supplemented with vitamin D (cod-liver oil is a good source) to prevent rickets. This is particularly important in the large breeds such as the Great Dane. Older puppies can be gradually shifted to the adult diet.

Puppies that must be hand-reared from birth present a different problem. Cow's milk is not a completely satisfactory substitute for bitch's milk, as it contains much less protein and fat and an excessive amount of sugar. The best results are obtained with an artificial bitch's milk. Such puppies need to be fed only three times daily, eight hours apart, up to three weeks of age and twice a day up to eight weeks.

A normal rate of growth is the best indication of good health in a young puppy. For the first three weeks puppies will gain between 50% and 100% of their birth weight each week. Once supplementary feeding is begun they gain weight very rapidly up to four months of age, then more slowly, reaching nearly adult size by six months of age. Thereafter growth is quite slow, the dog reaching full development at approximately two years. The prime of adult life extends through the fifth year; however, many dogs live more than twice this long and some last well into the teens. There are considerable breed and individual differences in longevity.

D. General Care and Hygiene

1. Bathing and Grooming. — A dog may be bathed as often as the owner desires, but it should be remembered that soap removes the natural oil from the hair and skin and may be somewhat irritating to the animal. Thorough rinsing is desirable. The dog itself has no need for bathing and many hunting and working dogs are never bathed. Pregnant females should be bathed prior to parturition in order to remove roundworm eggs from the skin and thus prevent infection of the pups.

The need for grooming varies with the breed. The extremely short-haired breeds never require grooming but most long-haired breeds require brushing to remove loose hair and burrs. Poodles have hair that grows continuously and must be regularly clipped, and wire-haired terriers require special clipping and brushing to keep them in good appearance. A dog that gets little exercise may occasionally need its nails clipped.

2. Exercise and Elimination. — An adult house dog should be let out twice a day, morning and evening, for exercise and elimination. A dog will keep in better health and spirits if given certain regular activity. If the dog cannot be allowed to wander, some task or training should be given for a half-hour or so each day.

3. Symptoms of Ill-Health. — Lassitude and lack of normal appetite are indications of many diseases, and a veterinarian should be consulted in case of any persistent symptoms. A dry nose may indicate a fever, but is not entirely reliable. Temperatures can be checked with a rectal thermometer. A dog's temperature averages higher and is more variable than that of a human being: the range is from 98° to 105° F., but temperatures above 102° F. may indicate fever. A continuous discharge from the eyes or nose is a serious symptom that may indicate distemper. Continuous headshaking or carrying the head to one side may indicate an ear infection. Lameness or limping can occur from a variety of causes, such as cuts or thorns in the foot, sprains, hip displasia and arthritis. "Skidding" in a sitting position indicates some irritation of the anal area and may be caused by an infected anal gland or by parasites. Vomiting is a normal pattern of dog behaviour and is not a serious symptom. Foaming at the mouth and excessive salivation is one symptom of rabies, but also occurs in other conditions. In case of any serious symptoms the owner should consult a veterinarian immediately.

E. Diseases and Parasites

1. Canine Distemper. — One of the most important diseases of domestic dogs is canine distemper. This is an air-borne, highly infectious virus disease that attacks the nervous system, It runs a long course, with a high proportion of fatalities. The disease can be prevented by inoculation with an attenuated virus. This should be given (combined with a similar vaccine against infectious hepatitis) at nine weeks of age and, to maintain protection, yearly thereafter.

Puppies nursing on immune mothers are protected by the antibodies obtained in the mother's milk for a few weeks after birth and can be successfully vaccinated only after these antibodies have disappeared. (See Distemper, Canine.)

2. Infectious Canine Hepatitis. — This disease attacks the liver primarily. The early symptom of high fever resembles that of distemper but the disease, which is often fatal, runs a much shorter course. It is transmitted by contact through urine, hence is less infectious than distemper. However, many dogs are carriers, spreading the disease long after they have recovered. As indicated above, it can be prevented by inoculation. (See Hepatitis, Canine Viral.)

3. Rabies (Hydrophobia). — Rabies is an invariably fatal disease that is highly dangerous because it can be spread to human beings as well as to other dogs and other mammals. The disease attacks the nervous system chiefly, causing animals to become highly irritable. Infected dogs are so fearless that they bite anything they come across, spreading the disease through the saliva entering the wounds. Many wild animals, such as foxes, provide a reservoir for the disease. In parts of the world where rabies occurs. dogs should be inoculated against it. Both temporary and permanent vaccines are available. (See Rabies.)

4. Parasitic Diseases. — Worms. — There are many intestinal worms that attack dogs. The most serious one is a variety of Ascaris, a roundworm that can cause a high percentage of fatalities in young puppies. Most puppies acquire considerable resistance to them after three months of age, but the majority of dogs have at least light infections. Females about to be bred should be wormed, bathed and transferred to thoroughly clean quarters. They can also be wormed as late as seven weeks in pregnancy. If this is not done, the puppies can become infected from the mother, even before birth. Puppies can be given a mild worm expellant (vermifuge) if symptoms develop. Other parasitic roundworms that attack dogs include heartworms, hookworms and whipworms.

With the exception of rabies, most diseases of dogs are not transmissible to human beings. A rare exception is a tapeworm, Echinococcus *granulosus*, normally transmitted from dogs to sheep through fecal matter, but which can accidentally be transmitted to human beings, particularly children. The parasite grows as a cyst and may enter the brain or other vital organs and cause severe symptoms. It is found only where dogs have access to the bodies or entrails of sheep and cattle. Other less harmful varieties of tapeworms occur commonly in dogs and can be treated with appropriate vermifuges. Dogs may become infected with these tapeworms by eating fleas and the uncooked bodies of food animals in which the tapeworms spend part of their life cycle.

Mange.—Mange is caused by two varieties of mites that live in the hair follicles. An afflicted dog loses his hair and the affected area is itchy and inflamed. The mites are difficult to kill and successful treatment must be continued over many weeks. An inexperienced person may confuse mange with wet eczema, a more common and less serious ailment. In wet eczema the skin is itchy and exudes serum; there is usually a loss of hair. It is not infectious apparently, but results from irritation from dust and heat. Serious cases require veterinary treatment.

Lice.—Lice spend their entire life cycle on the dog and are transferred to new hosts by direct contact. Successful treatment usually requires two or more applications of some oily substance that smothers the lice, or of an insecticide. The developing lice (or nits) are highly resistant, but adult lice can be controlled readily, even with soap and water.

Fleas.—Fleas present a different problem, since they leave the dog during part of their life cycle in order to breed. Those on the animal can be easily eliminated with commercial preparations (sprays and powders), but their breeding areas must also be eliminated for successful control. Larval fleas live on filth and commonly breed around barnyards or other places where animals deposit feces.

Ticks—Ticks. which breed in grassy or bushy areas, may attach themselves to a dog as it brushes against the vegetation. Individual ticks can be removed by applying kerosene or some other oily substance to the ticks' bodies.

5. Other Ailments—Finally, dogs are susceptible to many other less common bacterial and parasitic diseases, which vary according to the life of the animal and the climate in which it lives. Dogs are aiso subject to constitutional ailments such as heart disease and cancer. Likewise, congenital defects are common, such as crooked legs and cleft palates. As in other traits. dogs show hereditary differences in their resistance to disease, but this trait is greatly aided by good nutrition and proper exercise.

VI. BREEDERS' ASSOCIATIONS AND DOG SHOWS

1. Development.—In western Europe and North America, dog breeding has been highly developed as a pastime and business. Dog shows and systematic attempts to improve and maintain dog breeds originated in the latter half of the 19th century. According to E. C. Ash, the first recorded dog show was held in Newcastle, England, in 1859, and the first large show was held in Chelsea in 1863. About the same time, the showing of dogs became popular in the United States, and by 1880 the annual bench show in New York included about 29 breeds.

As dog shows grew in number, a need was felt for some kind of regulating body. The Kennel Club of England filled this need in Great Britain; it was founded in 1873 and became the supreme governing body of dog breeders' associations in that country. A few years later, in 1884, the American Kennel club was formed, becoming the ruling body of breeders' associations in the United States. Soon thereafter similar organizations were formed in many other countries.

Dog shows are organized by local or national dog clubs. Some dog clubs are devoted to only one breed, whereas others include any breed. Rules for holding shows in the United States are made by the American Kennel club, and in Britain by the Kennel Club of England. According to U.S. rules, in each breed there are five different classes for each sex. Winners of the classes compete against each other and the final winners receive points toward a championship. Finally, champions may compete in a special class for the best of the breed. A good animal may win the best of breed. win best in its group of breeds and finally be honoured as the best in the show. The competition increases with the number of dogs entered and the highest honour is best in a large show. Two of the largest and best-known U.S. shows are those of the Westminster Kennel club, in New York, and the International Kennel club, in Chicago, in each of which shows 2,000 to 3,000 animals may compete. About a dozen British shons attract double this number of entries each year, Cruft's, at London, being the largest.

Although there is a great deal of correspondence and some interchange of stock between British and American breeders clubs in the different countries set their own standards and rules.

2. Types **of** Shows.--Show dogs are judged on the basis of breed standards, the various physical characters considered desirable and those considered faults in any particular breed. These standards are not directly concerned with health, vigour or ability to reproduce; in fact, the quality of the show breeds sometimes suffers in these respects. A popular feature of many shows is the obedience trial, in which dogs are judged on performance rather than appearance.

Field trials, held for hunting breeds, give an opportunity for dogs to compete against members of their own breeds in the performance of hunting duties such as trailing, pointing and retrieving. There are also standard field trials for shepherd dogs, in which the dog has to herd a small flock of sheep along a prescribed course, cut sheep out of a flock and drive them in a small pen, all without assistance except from signals given by the shepherd.

VII. CLASSIFICATION OF BREEDS

A. English and European

The English classification, revised periodically by the Kennel Club of England, set the standard that other countries have followed, with some modifications. The Kennel club recognizes two major classes of breeds: sporting and nonsporting. Included in the sporting category are hounds, gun dogs and terriers; the nonsporting breeds include working dogs, toys and all other breeds.

Classifications of recognized breeds vary widely in other countries. The French list recognizes, in addition to hunting dogs, watchdogs, running dogs, 17 kinds of shepherd dogs and 24 "ladies' dogs," including toy dogs and lap dogs. The German list emphasizes utility dogs and watchdogs, whereas the Swedish one includes nine different spitz breeds.

B. American

The current American classification, devised by the American Kennel club, is more extensive than the English. It lists six groups of breeds and embraces most of the breeds of other countries. A few breeds on the English list are not recognized in America and vice versa. The American Kennel club provides registry service for the more than 100 breeds listed below, with the number still increasing.

1. Sporting Breeds.—These are primarily bird dogs or gun dogs. The basic breeds were the medieval spaniels, from which the modern setters and pointers were developed—the latter with some admixture of hound ancestry. The pointing griffon is a hunting breed developed in the Netherlands. The Weimaraner, an all-purpose sporting dog developed in Germany, is unusual among the sporting breeds in its aptitude for obedience training. All the retrievers are modern breeds, developed in England and North America within the 20th century from various crosses.

Griffon (wire-haired pointing)
Pointer
Pointer (German short-haired)
Pointer (German wire-haired)
Retriever (Chesapeake Bay)
Retriever (curly-coated)
Retriever (flat-coated)
Retriever (golden)
Retriever (Labrador)
Setter (English)
Setter (Gordon)
Setter (Irish)
Spaniel (American water)
Spaniel (Brittany)
Spaniel (clumber)
Spaniel (cocker)
Spaniel (English cocker)
Spaniel (English springer)
Spaniel (field)
Spaniel (Irish water)
Spaniel (Sussex)
Spaniel (Welsh springer)
Vizla
Weimaraner

2. Hound Breeds.—This group includes two main types: (1) sight hounds and (2) scent hounds. The greyhounds are of the first sbrt, and the closely related saluki and Afghan hound are probably nearest to the original type. Greyhounds and the smaller whippets are now used in dog racing as well as for hunting. The borzoi and Irish wolfhound, as well as the Scottish deerhound, are related animals. The second main type comprises the scent hounds, of which the foxhounds and beagles are excellent examples. The bassett hound, otterhound, bloodhound and harrier are closely related.

Other animals in this group are more miscellaneous. The basenji is an all-purpose hunting dog from Africa, closer to the greyhound type than to any other and now used chiefly as a house pet. The dachshund was originally developed in Germany as a badger hunter. combining the qualities of a hound and terrier; it is now chiefly a house dog. The Norwegian elkhound is an entirely different type of dog from the main types and resembles a small spitz. The Rhodesian ridgeback is a general-purpose hunting dog developed in South Africa and having the peculiarity of permanently erect hair on the shoulders.

Afghan hound
Basenji
Basset hound
Beagle
Bloodhound
Borzoi (or Russian wolfhound)
Coonhound (black-and-tan)
Dachshund
Deerhound (Scottish)
Foxhound (American)
Foxhound (English)
Greyhound
Harrier
Norwegian elkhound
Otterhound
Rhodesian ridgeback
Saluki
Whippet
Wolfhound (Irish)

3. Working Breeds. — The largest number of these breeds are derived from various sorts of herding and farm dogs: the collie, Old English sheep dog. Shetland sheep dog and Welsh corgi (a cattle dog) from the British Isles, and various others named for the country of origin. The German shepherd (or schafer) was the common herding dog in that country; the bouvier des Flandres was a cattle dog; the Briard was a herding dog from Brie in France; and the puli. komondor and Kuvasz came from Hungary. The schnauzer and Rottweiler were originally farm dogs in southern Germany.

The second largest group are the guard dogs, again of miscellaneous origin. The large breeds include the mastiff, Great Dane, Newfoundland, St. Bernard and Great Pyrenees. The boxer and Doberman pinscher are somewhat smaller breeds developed in Germany.

Finally there are the sled dogs from various arctic regions. Alaskan malamute. Eskimo, Samoyed and Siberian husky.

Alaskan malamute
Belgian sheep dog
Bernese mountain dog
Bouvier des Flandres
Boxer
Briard
Bull-mastiff
Collie
Doberman pinscher
Eskimo
German shepherd dog
Great Dane
Great Pyrenees
Komondor
Kuvasz
Mastiff
Newfoundland
Old English sheep dog
Puli
Rottweiler
Samoyed
Schnauzer (giant)
Schnauzer (standard)
Shetland sheep dog
Siberian husky
St. Bernard
Welsh corgi (Cardigan)
Welsh corgi (Pembroke)

4. Terrier Breeds. — These are typically dogs of the British Isles, receiving their original name because they were used to attack vermin living in the *terre* or earth. The only foreign breed is the miniature schnauzer, developed as a rat terrier in Germany.

Airedale terrier
Bedlington terrier
Border terrier
Bull terrier
Cairn terrier
Dandie Dinmont terrier
Fox terrier
Fox terrier (wire-haired)
Irish terrier
Kerry Blue terrier
Lakeland terrier
Manchester terrier
Norwich terrier
Schnauzer (miniature)
Scottish terrier
Sealyham terrier
Skye terrier
Staffordshire terrier
Welsh terrier
West Highland White terrier

5. Toy Breeds. — These are very small dogs of various origins. Some are merely dwarf editions of larger breeds, in fairly normal form and proportion. Others have heads of the bulldog type. with short flat noses. Chihuahuas are the smallest breed.

Affenpinscher
Chihuahua
English toy spaniel
Griffon (Brussels)
Italian greyhound
Japanese spaniel
Maltese
Mexican hairless
Papillon
Pekingese
Pinscher (miniature)
Pomeranian
Poodle (toy)
Pug
Toy Manchester terrier
Yorkshire terrier

6. Nonsporting Breeds. — This is a miscellaneous group used entirely for companions and show dogs. The poodles originally came from water spaniels and have a high reputation for trainability and intelligence. They are bred in three sizes: standard, miniature and toy; the toy competes in the toy class (see above).

Dalmatians were once used as coach dogs and bulldogs for bull baiting. The chowchow, of Chinese origin, is unusual in having a blue tongue. The keeshond and schipperke are small dogs from the Netherlands and Belgium. and the Lhasa Apso came from Tibet. The Boston terrier is a popular American breed developed from a bulldog–terrier cross.

C. Other Varieties

The Kennel Club of England recognizes the following breeds not found in the American classification: Finnish spitz. Australian terrier, bearded collie, shih tzu, Tibetan spaniel, Tibetan terrier and black-and-tan miniature terrier. Many American breeders have not sought recognition for certain purebred varieties that they have developed. Others have registered their distinct breeds in organizations other than the American Kennel club. There are many special strains of hounds, often originating from certain famous packs and some named after their owners. Among American foxhounds, the Walker, Trigg, July. Trumbo and Birdsong strains are well known. and coonhounds include the Bluetick, Redbone. Plotthound and Treeing Walker varieties as well as the Black-and-tan variety recognized by the American Kennel club.

Other breeds found in various parts of the world include the border collie. Australian kelpie, Australian cattle dog, Drahthaar, Drentsche partrijshond, Catalan sheep dog, Istrian pointer, lurcher, Maremma sheep dog, Portuguese pointer, Portuguese water dog. Rumanian sheep dog, Sealydale, soft-coated wheaten terrier, spinone, Svensk vallhund and many more.

See also references' under "Dog" in the Index volume.

BIBLIOGRAPHY.—The rules applying to registration and dog shows, up-to-date lists of registered breeds and information about specialty breeding clubs may be obtained from (in the U.S.) American Kennel club, *221* Fourth avenue, New York, and (in Britain) Kennel club, 84 Picadilly, London.

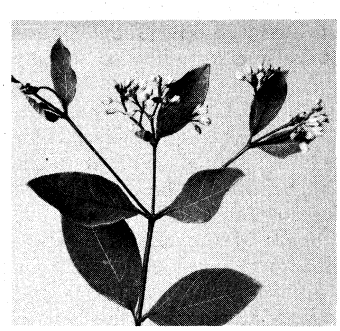
(J. P Sc.)

DOGBANE (Apocynum *androsaemifolium*), a North American herb of the dogbane family (Apocynaceae) whose roots contain a mild poisonous principle that formerly found some use in medicine. Called also spreading dogbane. honeybloom, wild ipecac and American flytrap, the plant is native to fields and thickets from Quebec to British Columbia and southward to Georgia, Missouri, Arizona and California. It is a rather slender perennial, one foot to four feet high, with widely branching stems, opposite, oval, slightly pointed leaves and numerous, small, bell-shaped pink flowers, with darker stripes inside, borne in clusters at the ends of the branches. When in blossom, from late June to August, it is a beautiful wild flower. See also Apocynaceae.



HUGH SPENCER

DOGBANE (APOCYNUM ANDROSAEMIFOLIUM)

DOGE (from Lat. *dux*, "leader" or "duke"), the title of the chief magistrate in the former republics of Venice and Genoa. His authority, considerable at first, was gradually restricted, though the attendant pomp and ceremony increased. The office disappeared in Venice in 1797 and in Genoa in 1805.

DOGFISH, a name properly restricted to several sharks of the family Squalidae. perhaps because of their habit of hunting and pursuing their prey in packs. The group is identified by the presence of a spine that is at the front of each of the tno dorsal fins and by the lack of an anal fin. The common spiny. or piked, dogfish (*Squalus*) is widely distributed on continental shelves and offshore bank areas of all quarters of the earth. It differs from other members of the family in that the teeth of both jaws are alike. Differences between species collected trom different areas are so

slight, if at all perceptible, that some authorities believe that spiny dogfish of all regions belong to a single species, *S. acanthias.* Adults average two to three and one-half feet long and weigh about six to ten pounds; the maximum length is about four feet.

Dogfishes congregate in dense schools according to size. They are exceedingly voracious, preying upon all kinds of fish smaller than themselves, as well as on pelagic and bottom-dwelling invertebrates, and even biting their way through the nets of fishermen to seize their catches. As in all sharks, the eggs are fertilized internally. *Squalus* bears its young alive: the females carry the young 18 to 22 months and produce 2 to 11 in a litter. The black dogfish, *Centroscyllium fabricii,* is a related species of the northern North Atlantic, living in deeper water than *Squalus.*

Dogfishes are sold and eaten in many countries. In the United States more than 1,000,000 lb. are marketed annually, much of it under the name "grayfish." The European small-spotted dogfish (*Scyllium canicula*) and the large-spotted dogfish, or nursehound (S. *catulus*), belong to the cat shark family (Scylliorhinidae). They are oviparous: the eggs, enclosed in semitransparent horny cases, have tendril-like prolongations from each of the four corners by means of which they become attached to seaweeds or other fixed objects.

The bowfin, an unrelated American fresh-water fish, is also sometimes called dogfish. The smooth dogfish, *Mustelus canis,* is a wide-ranging Atlantic shark of the family Carchariidae.

See also CHONDRICHTHYES; SHARK. (L. A. WD.)

DOGGER BANK, an isolated shoal in the North sea, about 60 mi. E. of the coast of northeastern England. It rises 70 ft. higher than the surrounding sea floor; is 160 mi. long and 60 mi. wide at the 20-fathom line; and reaches its highest point at its western end, 50 ft. below the sea surface. The bank is a huge moraine consisting in its upper layers of sand, shells and stones, probably laid down during the last glaciation. It is considered that the bank's abrupt western and northern faces mark the limits of the ice sheets at that time. It is a well-known fishing ground. Large amounts of food are available for various species of fish and as a result good quantities of plaice, cod, haddock, turbot, dabs and herring are caught. The origin of the name is obscure, but the Dutch *dogger,* signifying a trawling vessel, was formerly applied to two-masted ships employed in North sea fishing and, by extension, to their crews (doggermen) and the fish taken (doggerfish). Off the south end of the bank an engagement took place between English and Dutch fleets in 1781. There on Oct. 21, 1904, during the Russo-Japanese War, some British trawlers were fired on by the Russian Baltic fleet. A crisis between Britain and Russia followed and the affair was settled by the Russian government paying compensation after the report of an international commission. A naval action was fought near the bank on Jan. 24, 1915, between British and German forces. *See* WORLD WAR I.

See Sir J. S. Corbett, *History of the Great War: Naval Operations* vol. 2 (1921). (A. J. LE.)

DOGGETT (DOGGET), **THOMAS** (d. 1721), English actor and a first-rate comedian, was born in Dublin. He made his London debut probably about 1690 and had his first successes in comedies by Thomas D'Urfey. His Fondlewife in Congreve's *The Old Bachelor,* his Ben in the same author's *Love for Love,* and his Young Hob in his own *The Country-Wake* established his reputation. Anthony Aston, commenting on his comic technique, wrote: "He was the best face painter and gesticular; and a thorough master of several dialects."

In 1709 Doggett became a joint manager (with Colley Cibber and Robert Wilks) of the Drury Lane theatre, retiring from the stage in 1713. In 1716 he founded a prize ("an Orange coloured Livery with a Badge representing Liberty") for the winner in a boat race of six young Thames watermen; the race, the Doggett Coat and Badge, is still run annually. (A. M. N.)

DOGMA, in Christian theology, is a doctrine set down in the deposit of divine revelation and authoritatively defined by the entire church as a truth to be believed and accepted by all orthodox Christians. From this definition it is evident that the meaning and the status of dogma are dependent upon the prior conviction of Christians that the mystery of God had been definitively revealed in Jesus Christ, and that the church, in its response to and responsibility for this revelation, has both the right and the duty to define "dogma" in the formal and ecclesiastical sense of the word.

In this strict sense, it could be maintained that there are only two truly universal Christian dogmas, the doctrine of the Trinity (*q.v.*) and the doctrine of the person of Jesus Christ (*q.v.*), as these were formulated by the ecumenical councils of the early church. Later dogmas, such as transubstantiation, were defined by the Western Church in separation from the East; and still later ones, particularly the infallibility of the pope and the immaculate conception and bodily assumption of the Virgin Mary, were defined by the Roman Catholic Church in separation both from the East and from Protestantism. The dogmatic status of these pronouncements, then, depends upon the prior definition of the church. For Roman Catholic theology, which identifies the Roman Catholic Church as the true Church of Jesus Christ on earth, such pronouncements are as binding as the decrees of the Councils of Nicaea or Chalcedon concerning the Trinity and the person of Christ; for Eastern Orthodoxy and for Protestantism, although for radically different reasons, they are not as binding.

Theological debate over the place of dogma in Christian theology has concentrated upon two closely related questions: the development of dogma and the authority of dogma. Although a dogma, by definition, must be contained in the deposit of revelation, this does not necessarily mean that it must be explicitly formulated in the Bible. Even orthodox theologians acknowledge, for example, that so basic a Christian dogma as the Trinity is not taught in so many words by any individual passage of the Scriptures but is implied by the thought and language of the Scriptures about the oneness of God and about the Father, the Son and the Holy Spirit. Both the challenge of heresy and the church's own theological thought compelled reflection upon the message of the Bible. From this reflection the dogma of the Trinity emerged. Therefore it did not spring up all at once in the church, but developed over a period of several centuries. The claim of dogma to be biblical must be understood this way. Dogma is the official voice of the church' in its function as the authoritative interpreter of the Bible.

But if dogma claims to be absolutely binding upon all believers, how can it have a history—that is, be part of the flux and evolution of time? The two most influential answers to that question in modern Christian thought are associated with the names of Adolf von Harnack and John Henry Newman.

Describing dogma as "the work of the Hellenic spirit upon the Gospel soil," Harnack's influential work on *The History of Dogma* was intended to show that dogmas were conditioned by the circumstances of their origin and therefore could not claim universal validity or authority. Harnack concluded that the Protestant Reformation, by subjecting dogma to the Bible, ended the development of dogma, at least in principle, although in practice the churches of the Reformation continued to teach a dogmatic Christianity. According to Newman, however, the development of dogma was the most telling refutation of the Protestant idea that the Scriptures are the sole authority in theology. His *Essay on Development* (1845) was in the presses when he made his final decision to leave the Church of England for Roman Catholicism. In this book he sought to prove that Christian dogmas had developed organically, in a way that was simultaneously faithful to the original deposit of the faith and open to the new questions that arose for the faith, both within and without the church.

A closely related problem is the authority of Christian dogma. As has already been indicated, the solution to this problem depends upon one's definition of the church and of its teaching function. Eastern Orthodoxy finds the teaching function of the church embodied in tradition, which is articulated, but by no means exhausted, by the dogmatic decrees of the ecumenical councils; therefore the authority of dogma is divine. Roman Catholicism also affirms the divine authority of dogma on the basis of tradition and the councils, but it locates the pinnacle of dogmatic authority in the pope "when, carrying out his duty as the pastor and teacher of all Christians in accord with his supreme apostolic authority, he explains a doctrine of faith or morals to be held by the universal

Church" (Vatican council of 1870). Protestantism asserts, in the words of the Thirty-Nine Articles of Anglicanism, that "Holy Scripture containeth all things necessary to salvation: so that whatsoever is not read therein, nor may be proved thereby, is not to be required of any man, that it should be believed as an article of the Faith." Therefore dogma has authority in orthodox Protestantism only on the basis of its claim to be biblical, not on the basis of its being the church's official doctrine. Liberal Protestantism has generally followed Harnack's repudiation of dogma as a vestigial remnant of Roman Catholicism, no longer binding upon Protestant theology. During the middle of the 20th century, the most influential Protestant theologian of the time, Karl Barth, composed his magnum opus under the almost forgotten title of "dogmatics," and *Church Dogmatics* at that. Together with the ecumenical movement and the general rediscovery of tradition in Protestantism, this renewed emphasis gave to the question of dogma a prominence it had not had since before the Enlightenment.

BIBLIOGRAPHY.—Adolf von Harnack, *The History of Dogma,* Eng. trans. by Neil Buchanan (republished 1961); John Henry Newman, *An Essay on the Development of Chvistian Doctrine* (1845); Henri Rondet, S.J., *Do Dognzas Change?,* Eng. trans. by Mark Pontifex (1961). (J. J. PN.)

DOGMATISM is the uncritical acceptance and application of any belief, especially of those ultimate or fundamental beliefs known as principles. The term has been applied by Kant (*q.v.*) to most preceding systems of philosophy because of their alleged neglect to examine "critically" the nature and bounds of human knowledge as a preliminary step to their construction.

DOGON, a people of the Republic of Mali well known for their involved system of metaphysics and cosmogony. There is some doubt about the affinities of the Dogon language, which has been placed in the Mandingo, Voltaic and other language groups. Numbering over 200,000, the majority of them live in the mountains and plains of the Bandiagara district. They are mainly an agricultural people, but their few craftsmen, who are metal and leather workers, form distinct castes. They have no centralized system of government but live in villages composed of patrilineal lineages or extended families, whose head is the senior male descendant of the common ancestor. Each large district has a *hogon,* whose authority is chiefly in the religious sphere, and there is one supreme *hogon* for the whole country. In his dress and behaviour the *hogon* symbolizes the Dogon myth of creation, to which they relate much of their present social organization and culture. Their metaphysical system, which categorizes physical objects, personifies good and evil and defines the spiritual principles of the Dogon personality, is more abstract than that of other African tribes. In conjunction with the myth this system provides the unifying principle in their life, although only a small number of men are fully conversant with it.

Dogon society includes a number of Muslims, proselytized mainly by neighbouring Fulani, but Christianity has made little headway and neither has formal schooling. Dogon youths travel long distances to southern towns. There has been expansion of various food crops, notably onions, for export.

See D. Paulme, *Organisation sociale des Dogon* (1940). (I. C.)

DOG RACING. Dog racing is the racing of greyhounds around an enclosed circular or oval track after an electrically controlled and motivated mechanical hare. The successful use of this artificial lure is made possible by the fact that the greyhound chases his prey by sight rather than by smell. This idea of dog racing was tested in 1909 by Oliver P. Smith, a promoter and greyhound fan, at a track he built in conjunction with Tom Keen at Tucson, Ariz. By 1919 Smith had perfected his mechanical hare and successfully demonstrated it at Emeryville, Calif., and in the next few years other tracks were opened, among them those at Tulsa, Okla., East St. Louis and Chicago, Ill., Erlanger, Ky., and Hialeah, Fla. On Jan. 3, 1925, a track was opened at St. Petersburg, Fla.; the earlier tracks eventually went out of existence, and the St. Petersburg track. later to become internationally known as "Derby Lane," became the oldest greyhound racing track in continuous operation in the world. In July 1926 the sport was introduced in England, where it gained greater favour than in the United States. It later spread to many other countries, including Ireland, France, Italy, China, Czechoslovakia, Australia, Mexico and Cuba.

History. — Dog or greyhound racing was an outgrowth of coursing (*q.v.*), the running or hunting of game by fast hounds. The murals of ancient Greece and Egypt include many figures of hunting hounds of the greyhound type *(see* DOG.). In Great Britain the greyhound has been known for many hundreds of years. The origin of the name is a matter of some conjecture, but it is most probable that it is another form of the words "gazehound" or "greecehound." both names being forerunners of the word "greyhound." The 15th-century *Boke of St. Albans* sets out the requirements of a good greyhound from which comes the rhyme:

The head like a snake
The neck like a drake
The foot like a cat
The tail like a rat
The side like a bream
The back like a beam

The greyhound was the badge of King Henry VII and is the badge of the queen's messengers. The coursing of dogs existed in the reign of Queen Elizabeth I, and the National Coursing club was formed in 1858. The Greyhound Stud book was initiated by the club in 1882, a separate Irish Coursing club stud book in 1923, and the National Coursing Association (U.S.) Greyhound Stud book in 1906.

"Coursing by Proxy" was introduced at a meeting held in England at Welsh Harp, near Hendon, Middlesex, in 1876 and described in the *Times* (Sept. 11, 1876). The course was a straight one of 400 yd., and, by means of a windlass, the "hare" was pulled along a rail laid in the ground. Two hand-slipped greyhounds raced at a time. This was the first known occasion on which greyhounds ran after an artificial lure, as previously greyhounds were used exclusively for coursing. Several meetings were held, but because the course was straight the fastest — but not necessarily the cleverest — greyhound always won and the owners lost interest. Fourteen years after the Welsh Harp meeting, a patent for a circular greyhound racing track was taken out in the United States. The idea was not put into actual practice because the inventor could not find anyone to back him financially, but his invention is the basis of the modern sport.

Little further interest was taken until the Emeryville, Calif., track was opened in 1919. The sport became popular there, and other tracks were opened in different parts of the United States. Charles Munn, a U.S. sportsman, went to England and showed pictures of this new sport to Brig. Gen. Alfred C. Critchley, who at once realized the possibilities of such a venture. These two pioneers founded the Greyhound Racing association, built a track at Belle Vue, Manchester, and on July 24, 1926, just 50 years after the Welsh Harp venture, greyhound racing's success story began. The racing of the greyhounds and the opportunities it afforded for betting attracted large numbers of spectators.

Numerous companies were formed in 1927 to promote this sport and on Jan. 1, 1928, the National Greyhound Racing club was formed and all reputable promoters in the country agreed to accept its rules and jurisdiction in the same manner as the Jockey club's rules control horse racing. At the same time, the National Greyhound Racing society was formed from the managements that accepted the supervision of the National Greyhound Racing club.

After those early days the National Greyhound Racing society

BY COURTESY OF THE NATIONAL GREYHOUND RACING SOCIETY OF GREAT BRITAIN

GREYHOUNDS RACING ON A TRACK

became the body officially recognized by the government in all matters affecting greyhound racing. In 1932 the bookmakers objected to pari-mutuel machines or totalizators (see HORSE RACING AND BREEDING) on greyhound racecourses and a court judgment was obtained specifying that totalizators, other than those on horse racecourses, were illegal. The society contended that this was unfair to a rapidly growing greyhound racing public and gave evidence before a royal commission then established. The Betting and Lotteries act of 1934 finally legalized greyhound totalizators and put the sport on a firm and officially recognized basis although confining racing to 104 days a year. These days of racing are not necessarily the same all over the country but are fixed individually by the local licensing authorities; *i.e.,* county and county borough councils.

The total number of persons who attend greyhound racing in Great Britain is estimated to be about 15,000,000 a year.

Method of Racing.— There is a limit of not more than 8 races at each meeting, although on four specially appointed days in the year there can be 16 races. These days must be fixed by the local licensing authority in consultation with the racecourse concerned. In accordance with the rules of the National Greyhound Racing club the races to be run must not be less than 230 yd. or greater than 1,200 yd., and it is usual for flat and hurdle races to be run over varying distances. Not more than six greyhounds run in a race and the owner of the winner is entitled to the prize money, which can be as high as £3,000 for the Greyhound Derby classic race at White City, London. The greyhounds, each wearing a distinctive coat, are placed in separate divisions of the starting box or trap. As the electrically propelled artificial hare, which runs around the inner or outer circumference of the track on a concealed mechanism, flashes past the starting trap, the dogs are released simultaneously by the opening of the front of the trap. To ensure a fair race, control of the speed of the hare is most important. If the leading dog is allowed to gain too much ground to the hare he may run out after it at the bends, allowing the other dogs to come between him and the rail and so gain the advantage. The finish of the race is photographed automatically, and the photograph is used to confirm the judges' placing in the order of finishing. Most races are held at night, under lights. From the form shown by the dogs in trials and races, the racing managers grade their performances and enter the dogs in races with others of equal or comparable merits to ensure as close a race as possible.

Stewards are appointed by the National Greyhound Racing club to supervise all races and trials at all tracks licensed by the club and to maintain the general integrity of greyhound racing. The stewards note the running and times of greyhounds as compared with previous performances. If they are not satisfied with the running of any greyhound they can call for the advice of the veterinary surgeon and, if necessary, hold an inquiry. The result of the inquiry and the stewards' decision is reported to the stewards of the national club. They have power to warn off, suspend or fine any owner or trainer found guilty of any malpractices and, indeed, any other official who deals with racing can be dealt with likewise.

Health.— When the Animal Health trust proposed the formation of a canine division, members of the National Greyhound Racing society guaranteed £70,000 to ensure the establishment of the research centre. The society also makes an annual contribution of £5,000 to the trust.

Veterinary research stamped out distemper and hard pad in greyhounds, invented a special technique to insert a plastic "bone" in the hind leg of a greyhound (which afterward won more races) and devised the "tired heart" operation which foreshadowed similar advances in human surgery. In this field of research Great Britain gave a lead followed by other countries.

There is a veterinary surgeon at every track. No dog is allowed to race unless it has been examined and certified fit; *e.g.,* if its weight varies by more than two pounds from its last trials or racing weight, a greyhound may not race. The veterinary surgeon is there to make quite sure that the entrants for every race are in perfect condition.

Security.— The precautions taken against substitution of one dog for another in a race provide an example of the care taken at tracks licensed by the National Greyhound Racing club to ensure that no loophole is left for criminal ingenuity. Greyhounds running at licensed tracks must be registered with the club. The form of application for registration has to be filled in with an array of measurements. markings and other points which make future identification of the greyhound certain beyond doubt. This information is transferred to the individual greyhound's identity and race record card, familiarly known as its "passport," which must precede the greyhound to every racecourse at which it is running. Every time it runs, the identity of the greyhound is checked against its "passport" to prevent substitution.

OTHER COUNTRIES

United States.— The first greyhounds that provided the nucleus and foundation of the coursing and track stock were brought to North America from England and Ireland by early settlers. Coursing and greyhound racing is confined, in the main, to Florida (which has the most tracks), Massachusetts and the western states.

After the successful demonstration of Smith's mechanical hare in 1919 the sport progressed remarkably, particularly in Florida, Massachusetts, Arizona and Oregon. All major tracks are members of the American Greyhound Track Operators association, and all greyhound racing is held under the supervision of the State Racing commissions, whose representatives supervise the racing, kennels, etc. Practically all track surfaces in the United States are comprised of sand and loam as opposed to the grass surfaces of England and Ireland. The sand and loam are sifted so that the particles are small enough to avoid injury to the greyhounds' feet.

Florida was the first state to legalize greyhound racing, in 1931, after which the state derived considerable income in taxation from it. This income came from a percentage of the "handle" (the money wagered on each race), a percentage of the paid admissions, and occupational licence fees collected from all employees. Florida's experience prompted other states to legalize the sport; these included Arizona, Arkansas, Colorado, Massachusetts, Montana, Oregon and South Dakota. In each of the states in which the sport has been legalized it has become an important source of tax revenue.

The breeding of the greyhounds is extremely important, and there are many full-time breeders who devote their time to ensuring a good blood line for future champions. The registration of greyhounds is with the National Coursing association and the American Kennel club. A dog must be at least 12 months old before his racing career commences as compared with 15 months in Great Britain. A certificate of identification must be granted before the dog can race and this is presented to the racing commission of the state and racecourse concerned before the dog is raced. In addition, the final certificate of identification and "Bertillon" card, which show all the features of the greyhound in the same way as the British identity book, must be produced. The method of racing is very similar to that of Britain, although the number of greyhounds in a race is generally eight and a nightly program or meeting consists of 10 or 11 races. Entries for the various races are determined principally by a grading system that is more or less standardized in the various states, the dogs being classified on the basis of their records in previous races. There are usually six grades, ranging from young greyhounds that are just starting their racing careers and have never won a race. to the outstanding stars of the track. The standard size of the modern track is $\frac{1}{4}$ mi., with the major portion of races run over $\frac{5}{16}$ or $\frac{3}{8}$ mi., the entries passing the grandstand and finish line and then circling the track to complete the distance. Earlier in the history of the sport many of the major races were at $\frac{7}{16}$ and $\frac{1}{2}$ mi. Some feature events are still extended to these distances. The rules under which the dogs race resemble those of the National Greyhound Racing club in Great Britain in principle, although the British rules are more easily enforceable. Betting on races in all the states is by the pari-mutuel (totalizator) system.

Ireland.—Ireland is noted for the breeding and racing of greyhounds and is the main source of supply for other countries, although England and the United States have built up breeding lines.

In the Republic of Ireland a government board was established to control greyhound racing. Northern Ireland racing is held principally at Belfast, which is also noted for its sales of greyhounds.

Australia.— Greyhound racing is legalized in the states of New South Wales and Tasmania with bookmakers and totalizators. In Queensland and Victoria the sport is illegal but coursing is allowed. Control of racing in New South Wales is semiofficially vested in the Greyhound Racing Board of Control of New South Wales Ltd., but its powers are restricted to a general overseeing of greyhound racing. The Australasian and New Zealand Greyhound association controls the racing of greyhounds and issues a yearly stud book.

Continental Europe.—Greyhound racing in Spain is modeled on the British system and the ruling body is the Federación Española Galguerra, which is equivalent to the National Greyhound Racing club and National Coursing club. The meetings are usually of 12 races with five or six dogs competing in each race. Racing also exists in several other European countries, *e.g.*, Belgium, France and the Netherlands, but only in a minor degree.

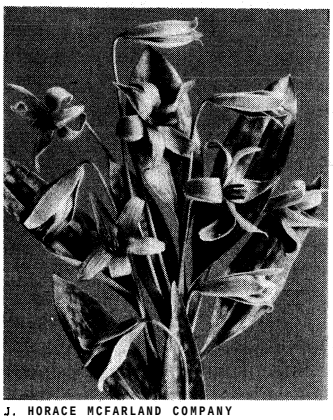
DOGS, ISLE OF, a district of east London, Eng., on the north bank of the Thames. forming the southern extremity of the metropolitan borough of Poplar (*q.v.*). It is enclosed on three sides by a bend of the Thames formed by Limehouse, Greenwich and Blackwall reaches, and includes Millwall (with Millwall dock) on the west and Cubitt Town on the east; the West India docks across its northern end make of it almost an island. Greenwich tunnel (built in 1902) for pedestrians passes under the river there. The whole district is occupied by docks, riverside works and houses for the workers. The origin of the name is not certain; until the 16th century, the area was known as Stepney Marsh; the present name may have originated as a nickname of contempt. It may also be a corruption of the "Isle of Ducks" and there is a story that the royal kennels were once there when the court was at Greenwich.

DOG SLED RACING. Contests of speed between teams of dogs which haul sleds is fairly popular in the snowier regions of North America. Teams are made up from purebred Siberian huskies and Alaskan Malamutes and, when in racing condition, can average 12 to 14 m.p.h. The teams, usually consisting of five, seven or nine dogs, are driven in the "gang hitch,"—a single leader with the rest of the team in pairs. Control of team is by voice, although drivers may carry whips limited to a three-foot length. In open country, point-to-point races are held. In more populated areas, back roads form the locale with races varying in length from 12 to 30 mi. Races are run on a handicap basis, with prizes for the handicap winner and the elapsed time winner. The largest U.S. organization devoted to dog sled racing and the improvement of sled dog breeds is the New England Sled Dog club, organized in 1924. (H. P. D.)

DOG STAR: *see* SIRIUS.

DOG'S-TOOTH VIOLET, any plant of the genus *Erythronium* of the lily family, Liliaceae (*q.v.*), comprising about 20 species, almost all of which are native to North America. They are low herbs with unbranched stems that spring from deep corms and bear near the surface of the ground a pair of unequal leaves, often mottled with dark splotches, and large, nodding, lilylike, mostly solitary flowers on slender stalks.

The best-known representative in eastern North America is the yellow dog's-tooth violet (E. *americanum*), known also as yellow adder's-tongue and trout lily, with yellow flowers, three-fourths inch to one and one-half inches long, on stalks six inches to eight inches high. This handsome spring wild flower is native to moist woods from Nova Scotia to Minnesota and southward to Florida and Arkansas. The similar but smaller white dog's-tooth violet (E. *albidum*), called also fawn lily, with white flowers, occurs in low woodlands from Ontario to Minnesota and southward to Kentucky and Texas. A conspicuous species in the Rocky mountain region, forming an almost continuous cover in many alpine meadows just after the snow is gone, is the large-flowered E. *grandiflorum,* with flower stalks 8 to 16 in. tall, bearing one to five yellow flowers 1 to 2 in. long. E. *montanum,* common in alpine meadows in western North America, is a smaller plant with white flowers. Many species are cultivated in England, where those from western North America do better than in the eastern states of the U.S. All prefer coolness and moisture. E. *americanum* grows well in moist sites in wild gardens. Undisturbed it makes large patches in a few years.



J. HORACE MCFARLAND COMPANY

DOG'S-TOOTH VIOLET (ERYTHRONIUM AMERICANUM)

The European dog's-tooth violet (*E. dens-canis*). a delicate spring-bloomer with rose-purple flowers, is planted in borders and rockeries. (N. TR.; X.)

DOGTOOTH, in architecture, a band decoration of adjoining, projecting triangles, called, from its saw-tooth shape, in French, *dent de scie.* Early examples of this decoration were found in Syria and in the Mesopotamian valley; *e.g.*, in the palace front at Rabbath-Ammon (built either in the last eight years of the Sassanian dynasty or in the early part of the Mohammedan rule), where it was used on arch moldings; and in a highly decorative form. in the palace of Machitta of the 8th century. It was found widely during the Romanesque period throughout Europe, where it is thought to have been introduced by the crusaders from the east. It was particularly common in Norman work in France and England. appearing as the chevron (*q.v.*) and zigzag. It often appears in arch moldings as a series of projecting pyramids, the sides decorated with foliage. To its supposed resemblance, in this form, to a dog's-tooth violet, some people incorrectly attribute the origin of its name.

DOGUBEYAZIT, a border fortress of eastern Turkey, chief town of an *ilce* (district) of the same name, lies 150 mi. E. of Erzurum. close to the frontiers of the U.S.S.R. and Iran. It looks across a marshy plain to the great cone of Ararat at a general altitude of 6,000 ft. Pop. (1960) 6,772. Its site is very old (there are cuneiform inscriptions on neighbouring rocks), being that of the ancient Armenian town of Pakovan. The great trade route from Trabzon through Erzurum into northwest Iran crosses the frontier at Kizildize a few miles to the south. A knoll above the town is occupied by the half-ruined fort or palace of former governors, which was built for Mahmud Pasha by a Persian architect and is one of the most beautiful buildings in Turkey. It contains two churches and a monastery, the Kasa Kilissa, famous for its antiquity and architectural grandeur. The cuneiform inscriptions are on the rock pinnacles above the town, with some rock chambers, indicating a town or fortress of the Vannic period. Destroyed during the 19th-century Turko-Russian campaigns and World War I, Dogubeyazit was restored by the Turks. It is one of the leading trading centres for animal products, which are the chief source of income in the region. (N. TU.; S. ER.; E. TU.)

DOGWOOD, the name applied to about 45 species of shrubs, small trees and a few herbs belonging to the genus *Cornus* of the family Cornaceae (*q.v.*). Except for a single Peruvian form, the group is restricted to the temperate regions of the northern hemisphere. Dogwoods contribute but little to the world's timber supply, but those with crowns of attractive leaf mosaics, showy inflorescences, brightly coloured fruits and twigs of many hues are numbered among the hardiest and most universally used of the woody ornamentals.

Nearly 20 species of *Cornus* are indigenous to North America, six of which occur on the Pacific rim. The most striking are the flowering dogwood (C. *florida*) of eastern United States, and the Pacific dogwood (C. *nuttallii*) of the west coast. Both are small,

shapely trees featuring lustrous green leaves and tiny, four-parted, yellowish flowers borne in heads subtended by four (rarely five) large snowy white bracts with pink or reddish tips followed by clusters of small, brilliant red, fleshy fruits (drupes). The inflorescences. with subtended bracts. appear in great profusion in advance of the leaves and are often two to five inches across.

Horticultural varieties of the flowering dogwood in common use include var. *rubra,* with deep pink floral bracts; var. *xanthocarpa,* with yellow fruits; var. *pendula,* with pendulous branchlets; and var. *pluribracteata,* with eight to ten or more floral bracts. The sapwood of the flowering dogwood *(C. florida)* is very resistant to wear and is used almost exclusively in the production of shuttles and spindles for mills.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

FLOWERING DOGWOOD (CORNUS FLORIDA)

Unlike other species, Pacific dogwood commonly blooms twice during the growing season. The second complement of blossoms appear as the fruits from the first are maturing. During this period the tree is especially attractive with its white flowers and crimson fruits set in a sea of lustrous green foliage. Other noteworthy American dogwoods include the spreading and shrubby red-stemmed dogwood (C. *stolonifera*); pagoda dogwood (C. *alternifolia*), a tree with alternate leaves; and silky dogwood (C. *amomum*), another spreading shrub with purple stems and silky pubescent leaves.

The common European dogwood *(C. sanguinea)* is widely used in decorative plantings. Its principal distinguishing features include small ovate leaves, loose clusters of purplish-black fruits. and dark-red stems. The Cornelian cherry (C. *mas)* of Europe and Asia produces succulent. edible, scarlet fruits which are often made into preserves. Several horticultural varieties of this species together with others of the Asiatic white dogwood (C. *alba)* feature variegated leaves splotched with white. yellow and even pink. Bunchberry (C. *canadensis*), and Lapland cornel (C. *suecica*) are tuo boreal, nearly prostrate. herbaceous species. The former occurs transcontinentally from Newfoundland to Alaska; the latter is a circumpolar form which in some regions extends beyond the Arctic circle

Most dogwoods are prolific annual seeders. Seeds sown in cold frames shortly after their maturation in the fall germinate in the spring in greater numbers than those merely held in cold storage through the winter months. The softwooded species. such as C. *alba* and its allies, are easily propagated from cuttings of mature shoots and by layering. Several horticultural forms and varieties are also perpetuated by twig grafting.

Dogwoods attain maximum development on rich, moist loams, but may be successfully grown in most common garden soils 4 few species thrive better in shade; those with variegated foliage should be planted in the open for best results.

Insect pests of dogwoods include wood borers, cambial miners, twig girdlers, bud and twig gall-forming insects, and sucking insects such as the white fly and San Jose scale. The incidence of attack of some of these is often severe. but rarely do the activities of any one of them result in the total destruction of the host. Those nith sucking mouth parts can usually be controlled by spraying with pyrethrum-soap solutions or oil emulsions. Stems damaged by borers and miners should be removed and burned, preferably before leaf emergence in the spring. Numerous leaf-spotting fungi, some of which cause early defoliation, can be kept under control by spraying with Bordeaux mixture at intervals of two or three weeks soon after the leaves are fully formed.

(E. S. HR)

DOHERTY, CHARLES JOSEPH (1855–1931), Canadian minister of justice from *1911* to *1921,* was born in Montreal. Que., on May *11, 1855,* and educated at St. Mary's college and McGill university. He was called to the bar in *1877,* became a king's counsel in *1887,* taught civil and international law at McGill university for *20* years and was a judge of the superior court of Quebec, *1891–1906.* He was elected to the house of commons in *1908* as Conservative member for St. Anne's-Montreal, and with the Conservative victory of *1911* became minister of justice in the Borden government, a position which he held until he was defeated in the election of *1921.* He was one of the three supporters of the Union government elected in Quebec in *1917.* He accompanied Sir Robert Borden to the meetings of the committee on imperial defense in London in *1912* and to the Paris peace conference of *1919,* and was one of the Canadian representatives at the first assembly of the League of Nations in *1920.* During World War I he was active in the recruitment of the Irish Canadian Rangers. He was appointed to the imperial privy council in *1920.* He died at Westmount, Que., on July *28, 1931.* (M. E. P.)

DOHNÁNYI, ERNŐ (ERNST VON DOHNÁNYI) (*1877–1960),* Hungarian composer, pianist and conductor, principally known for his "Variations on a Nursery Song" for piano and orchestra, was born at Bratislava (Pressburg) on July *27, 1877.* He studied at the Budapest Royal academy under István Thomán for piano and Hans Koessler for composition, and also took some lessons from Eugen d'Albert. His first piano quintet aroused Brahms' admiration in *1895,* and he had further successes with his first symphony *(1897)* and first piano concerto *(1899).* As a pianist he traveled widely and by *1905* mas reckoned one of the first ten pianists in the world. He taught at the Berlin *Hochschule (1905–15)* and gave the first performance of his "Variations on a Nursery Song" *(1914)* in Berlin on Feb. *17, 1916.* He returned to Hungary and became conductor of the Budapest Philharmonic society (1919), professor *(1928)* and director *(1934)* of the Budapest academy and director of the Hungarian radio *(1931).* After 1945 his influence under the prewar regime was held against him, and in *1948* he left as a political exile, his music being banned in Hungary for more than ten years. He taught in Argentina and from *1949* was composer-in-residence at Florida State college, Tallahassee. He mas active as a pianist until the end of his life, but his output after *1930* was only sporadic. The style of his music was late romantic and conservative, and after *1910* he occupied only a minor place among his contemporaries as a composer.

His works include the ballet *Der Schleier der Pierrette* ("The Veil of Pierrette," *1910);* the operas *Tante Simona* (1913), *A Vajda tornya* ("The Tower of the Voivod." *1922)* and *Der Tenor* (1929): three 'string quartets and three symphonies. He died in Sew York city on Feb. *11, 1960.* (Co. MA.)

DOHRN, ANTON (1840–1909), German zoologist and founder of the marine laboratory at Naples, Italy, born at Stettin (Szczecin. Pol.) on Dec. *29. 1840.* studied under E. H. Haeckel at Jena, and made embryological and morphological researches in many animal groups. Working at Messina, Sic., in the 1860s he saw the need for a large international centre for research on marine organisms and realized his ideal in the zoological station at Naples, to found which he gave his own fortune. The first building was opened in 1874 and was further extended in succeeding decades. To help maintain the laboratory he included an aquarium to attract tourists, initiated the system of grants from governments, universities and scientific societies to support research "tables" and promoted the supply of specimens for teaching purposes. During 3j years under Dohrn's direction the zoological station, with its unrivaled library, was visited by leading scientists from all countries and it largely influenced the course of biological research in that era. It became a model for similar laboratories in other countries. Besides the station's *Mitteilungen* and the *Zoologischer Jakresbericht,* Dohrn also started the famous series of monographs on the *Fauna and Flora of the Gulf of Naples.* He died at Munich on Sept. *26.* 1909. (F. S. RL.)

DOISY, EDWARD ADELBERT *(1893–*), U.S. biochemist, was awarded jointly with Henrik Dam of Denmark the Nobel prize in medicine and physiology for 1943 for research into and discovery of vitamin K. Born at Hume. Ill., on Nov. 1 j *1893,* he was educated at the University of Illinois and Harvard uni-

versity, where he received the Ph D. degree in 1920. He served on the faculty of Washington university school of medicine. St. Louis, Mo., 1919–23; during that period he collaborated with Edgar Allen. then embryologist in the department of anatomy, on the refinement of a bio-assay technique to locate and measure the activity of estrogenic hormones That accomplishment paved the nay for notable progress by them and others in the field of sex hormones. Doisy also developed improved methods for isolation and identification of the diabetic hormone, insulin. In 1923 he was appointed professor and in 1924 director of the department of biochemistry of St Louis university. He made important contributions to the knowledge of vitamins and antibiotics, and in 1955 the university's department of biochemistry was renamed the Edward A Doisy department in his honour. He wrote on blood buffer systems, sex hormones, vitamin K and antibiotic compounds in professional journals. He published with Edgar Allen and C. H. Danforth *Sex and Internal Secretions* (1939).

(P. A. SR)

DOLCI, CARLO (CARLINO) (1616–1686). Italian painter, who nas one of the last representatives of the local Florentine school, was born in Florence on biay 25, 1616. He studied with Jacopo Vignali, a folloner of Guercino. At a time when other Florentine painters migrated to Rome. the centre of monumental baroque painting, Dolci remained in Tuscany and developed his manner out of the native traditions of Florence. He rarely left Italy, but in 1672 he went to Austria to paint Princess Claudia Felice, the daughter of Anna dei Medici. The figures in Dolci's dramatically concentrated compositions are typically rendered in half length, and often convey a marked element of sentiment. His easel paintings. especially his madonnas and saints, are his most notable works.

Without possessing much genius or invention. Dolci produced highly wrought pictures extremely attractive to some tastes. Refinement of detail, soft colour and livid shadows often characterize his paintings. Among his students was his daughter, Agnese Dolci, who is supposed to have copied many of his paintings. He died in Florence on Jan. 17, 1686.

DOLDRUMS, an area or belt of calms or very light winds in certain equatorial regions, especially over the oceans. In the days of sailing vessels these areas were avoided, if possible, by mariners lest they find themselves becalmed for days or weeks, feeling uncomfortably warm in the still, humid air, losing time and consuming provisions and water. See WIND; TROPICAL STORM: *Origin.* (H. R. B.)

DOLE, SANFORD BALLARD (1844–1926), president of the Republic of Hawaii (1893–1900) and first governor of the Territory of Hawaii (1900–03), was born in Honolulu on April 23, 1844, the son of American Protestant missionaries. He spent two years in the U.S., from 1866 to 1868, attending Williams college (Williamstown, Mass.) and studying law. He then returned to Hawaii to become one of its leading lawyers, a member of the legislature from 1884 to 1887 and a leader in the reform movement which brought about adoption of the constitution of 1887. Also in 1887 he nas appointed an associate justice of the supreme court of Hawaii, an office he held until the monarchy was overthrown in 1893 by a revolution of which Dole himself was a leader. In 1894 he was elected by the constitutional convention as the first president of the Republic of Hawaii. While accepting leadership in this republican government, he preferred a regency headed by Princess Kaiulani, heir apparent. With firmness and wisdom he guided the republic through a difficult period, suppressing revolutions and stabilizing the governmental machinery. When President Cleveland demanded the restoration of Queen Liliuokalani to the throne Dole refused to yield, claiming that Cleveland was without authority to act. In 1898 he went to Washington in the interests of annexation to the U.S., and when that event took place in 1900 Dole was appointed by President McKinley as the first territorial governor. In 1903 he became U.S. district judge of Hawaii and in 1909 was reappointed to a second term. At its expiration in 1915 he retired to private life in Honolulu, where he died on June 9, 1926. *See* also HAWAII: *History.*

DOLERITE: *see* DIABASE.

DOLET, ÉTIENNE (1509–1546), French humanist, scholar and printer whose *Commentarii linguae Latinae* was a valuable 16th-century contribution to Latin scholarship, nas born at Orléans, Aug. 3, 1509. After studying at Paris. Padua and Venice, he settled in Toulouse. His quarrelsome temperament, unrestrained enthusiasm for Renaissance learning and anticlericalism involved him in personal and public controversies. he mas banished from the university, and moved to Lyons. where for a time he suffered imprisonment for the justifiable homicide of a painter called Compaing, but was released by royal pardon. An ardent Ciceronian. he answered Erasmus' attack on slavish imitations of Cicero's style with a *Dialogus de imitatione Cicerontana* (1535), and in 1536 published the first volume of his *Commentarii;* the second followed in 1538. This work was dedicated to Francis I, who gave him permission to set up as a printer. His first publication. *Cato christianus,* was a profession of his creed as a Christian moralist. It was followed by works which showed the catholicity of his literary appreciation and the unorthodoxy of his attitude to the church: translations and editions of classical authors, of treatises by Erasmus, and of the New Testament and Psalms, as well as norks by Rabelais. He was thrice accused of atheism and imprisoned. in 1542, in 1544 on the double charge of having published Calvinistic works and a dialogue by Plato denying the immortality of the soul, and in 1536 He was finally condemned by the theological faculty of the Sorbonne, and burned at the stake at Paris, Aug. 3, 1546.

Whether Dolet was a Protestant or an anti-Christian rationalist and freethinker is debatable. He was condemned by Calvin as well as by the church. but he published many religious books and repeatedly advocated the reading of the Scriptures in the vernacular. It seems likely that his fate was the result of his capacity to make enemies rather than of his opinions, although he is often described as the "first martyr of the Renaissance."

DOLGELLAU (DOLGELLEY), an urban district and the county town of Merioneth, north Wales. is 10 mi. E. of Barmouth by road. It stands on the south bank of the river Wnion a mile above the estuary head of the Mamddach river and under the shadow of Cader Idris (2,927 ft.). Pop. (1961) 2.267.

The town, a huddle of gray stone buildings, has narrow winding streets radiating from its centre, Eldon square. A seven-arched bridge over the Wnion dates from 1638. The boys' grammar school was founded in 1665 and St. Mary's church was rebuilt in 1716 round the original 13th-century structure. The building comprising the county hall and assize court dates from 1825.

Three important highways meet there: from Cheshire and Merseyside; from the English Midlands and central and south Wales; and from southwest Wales and the Cardigan bay area. Thus Dolgellau is one of the chief gateways of the Snowdonia National park. A branch line links the town with the main railway system.

Merioneth, being mountainous, has the highest proportion of sheep in Wales, and Dolgellau was once noted for the manufacture of a woolen cloth known as "webs." Early in the 19th century this trade declined but Dolgellau remains one of the chief markets for Welsh Mountain sheep. Most of the inhabitants speak both Welsh and English. (A M. RE.)

DOLGORUKI (DOLGORUKOV), a Russian princely family, descended from Rurik. In the 17th century there were four branches of it. Two members of the eldest branch, YAKOV FEDOROVICH (1639–1720) and his brdther GRIGORI (1656–1723), both diplomats. mere personal friends of the emperor Peter I. Yakov's nephew, VASILI LUKICH (1670–1739), also a diplomat and later a member of the supreme privy council, wanted the emperor Peter II to marry his niece EKATERINA ALEKSEEVNA (1712–45). After Peter's sudden death (1730), Vasili produced a letter, purporting to be Peter's last will, appointing Ekaterina his successor. When Vasili had to abandon his scheme, he supported the election of Anna Ivanovna to the throne on "conditions" leaving the real

power to the supreme privy council. Anna subsequently repudiated the conditions and banished Vasili and other members of his family first to Siberia, then to the Solovetski monastery. Finally the charge of forging Peter II's will was revived, and Vasili, with Ekaterina's brother IVAN ALEKSEEVICH (1708–39) and two other Dolgorukis, was beheaded in Novgorod on Nov. 19 (new style; 8, old style), 1739.

Among the members of the third branch the most prominent was VASILI VLADIMIROVICH (1667–1746), a general who plotted against Peter I and also against Anna Ivanovna. He was twice deported and deprived of his titles and twice restored to them. Other members of this branch were: VASILI MIKHAILOVICH (1722–82), the general who conquered Crimea in 1771; PETR PETROVICH (1777–1806), a favourite of the emperor Alexander I and an opponent of Adam Czartoryski; and PETR VLADIMIROVICH (1807–68), who was deported from St. Petersburg to Vyatka for publishing in Brussels, under the pseudonym of Comte Almagro, *Notice sur les principales familles de la Russie* (1843; Eng. trans., *A Handbook of the Principal Families in Russia,* 1858). He left Russia in 1859 and published La *Vérité sur la Russie* in 1860. He died in Bern, Switz.

DOLICHOCEPHALIC, having a relatively long head. In anthropology it denotes a cephalic index of 75 or less *(see* CEPHALIC INDEX; CRANIOMETRY). In obstetrics the term is applied to a head that is temporarily elongated, usually by molding from a long and hard labour. **(F. L. A.)**

DOLL *(cf.* Norse *daul,* Saxon *dol,* old German *doche,* Latin *puppa)* is a child's toy, modeled, however crudely, on the human form, and perhaps the oldest plaything of mankind.

Ancient World and Europe.—No dolls have been found in prehistoric graves, probably because they were made of such perishable materials as wood and fur or cloth. From Babylon there is a fragment of an alabaster doll with movable arms. Dolls dating from 3000–2000 B.C., carved of flat pieces of wood, geometrically painted, with hair made of strings of clay or of wood beads, have been found in Egyptian graves. Ancient Greek clay dolls, meant to be dressed, often have arms and legs secured to the body with metal pins. Other Greek dolls, such as those found at Corinth and dating from about 500 B.C., may have had religious meaning. In ancient Greece and Rome marriageable girls consecrated their discarded dolls to Venus or Diana. Dolls were buried in children's graves in Egypt, Greece and Rome; dolls have even been found in early Christian catacombs, and in southern United States glass doll houses with dolls and toys sometimes are still placed on the graves of children. Ancient rag or stuff dolls also have been found; one Egypto-Roman doll (c. 300 B.C.) is stuffed with papyrus. Dolls crocheted of bright wool, and others, with wool heads, clothed in coloured wool frocks, dating from about A.D. 500, have been found in Egypt. Dolls dating from the middle ages are little known. Clay horses and knights have been found and small figures made of tin and glass. Simple clay dolls with a depression in the breast to hold a christening coin may have been godparents' gifts. Crèches with carefully modeled figures of the Holy Family, the Magi and shepherds were set up in homes and churches. as they are today. Elaborated during the Renaissance, these reached a zenith in the 17th and 18th centuries in southern Europe. Protestant Europe, during the same period, developed very elaborate doll houses. As early as 1413 there were *Dochenmacher* or dollmakers in Nürnberg, which from the 16th to the 18th century was the leading manufacturer of dolls and toys. Paris was another early mass producer of dolls. making chiefly fashion dolls; as early as 1391 the queen of England ordered fashion dolls from France, and Isabella, queen of Spain, received a life-sized fashion doll from Anne of Brittany in 1496.

Doll heads were made of wood, terra cotta, alabaster and wax. the last a technique perfected in England by Augusta Montanari and her son Richard (*c.* 1850–87), who introduced the first infant dolls. About 1820 glazed porcelain (Dresden) doll heads and unglazed bisque heads became popular. A French bisque doll made by the Jumeau family in 1862 had a swivel neck; the body was of kid-covered wood, or kid stuffed with sawdust, a type of manufacture that remained common until it was supplanted by molded plastics. Socket joints, movable eyes, dolls with voices and walking dolls were introduced in the 19th century, as well as paper-doll books and dolls of India rubber or gutta-percha. The period from 1860 to 1890 was the golden age of the elaborately dressed Parisian bisque fashion dolls and the smaller "milliner's models."

America.—The oldest American dolls are possibly those found in Aztec graves, such as those near the pyramids of Teotihuacbn. In the early colonial period stuff or rag dolls predominated. About 1820. china doll heads were imported from Europe; clothes were made from native fabrics. Luduig Griener took out the first American dollmaking patent in 1858; his specialty was finely modeled papier-mâché dolls with glass eyes.

Among American Indian dolls, Kachina dolls, made by the Hopi in Arizona, Zuñi in New Mexico and, in a derived form, by the Pomo of California, are pre-eminent. At annual Kachina ceremonies these small figures are given to children by masked adults, impersonating legendary, supernatural Kachinas, who bring the people's prayers to the gods. The dolls are carved from cottonwood or cactus root, painted in symbolic colours and dressed traditionally. The Hopi recognize over 200 Kachinas, including 30 official, or Mong, Kachinas. The dolls are not toys but sacred objects for the children to study. Dolls of bone, walrus ivory and mammoth teeth are made by Eskimos and northern Indians; dolls of the Keres Indians of Laguna and Cochiti are rounded or flat billets identical in form with the prayer sticks used in ceremonial offerings. The beaded buckskin dolls of the Plains Indians and others probably reflect white influence.

Asia and Africa.—In Japan, dolls are also more often festival figures than playthings. A bride takes her doll collection to her new home. At the girls' festival dolls representing the emperor, empress and their court are displayed; girls from 7 to 17 visit each other's collections and refreshments are offered, first to their majesties, then to the guests. This ritual, over 900 years old. may reflect an early scapegoat rite. A primitive Japanese doll, of shaved willow stick with paper clothes and shavings or strings for hair, no doubt descends from willow sticks set up near streams in annual purification ceremonies. Korean children make similar dolls of bamboo sticks, with long grass hair. A scapegoat doll, treated as if alive, was formerly given to Japanese mothers to ward off evil from their children. Japanese boys have an annual doll festival, from the first May after they are born until they are about 15 years old. Warrior dolls, weapons, banners and legendary figure groups are displayed to encourage chivalrous virtues; and some modern dolls are even attired as football players. In Korea, for the children's festival, a paper image of a xoman is made with a clay base to stand erect. In Japan the corresponding toy, identified as the Buddhist Daruma, is bought by boys at a temple. The face is painted and in place of eyes are white paper disks, upon which black dots are inked if the god answers a prayer. In China, this toy is fashioned to teeter like a drunken actor.

In India elaborately dressed dolls were given to child brides by both Hindu5 and Muslims. In Baghdad dolls are considered unlucky; little girls must improvise their own dolls of pillows and blocks of wood. In Iran they are fashioned of folded cotton. In Syria girls of marriageable age hang dolls in their windows.

In Africa, among the Fingo of the Orange Free State, every grown girl is given a doll to keep for her first child; on its birth, the mother receives a second doll to keep for the second child.

DOLLAR, ROBERT (1844–1932). Scottish-born U.S. lumberman and shipowner, nas born in Falkirk. Scot., on March 20, 1844. In 1856 his family emigrated to Ottawa, Ont.. where he began as a lumber ramp chore buy at the age of 13 and rose to be foreman of a camp at 22. His own first logging venture in 1872 failed during the depression of 1873, but a second in 1876 became

successful. He moved his operations to Marquette, Mich., in 1882. and then in 1888, the year he became a naturalized G.S. citizen, to San Francisco, Calif. Because it was difficult to get shipping, he bought his first steam schooner in 1892, and built up his fleet when the Alaskan gold rush created a demand for charter boats. In 1901 he entered the China and Japan trade. He became an esteemed unofficial adviser to the Chinese. He was in China when the empire fell and the republic was founded in 1911–12. and he recommended U.S. recognition. He gave more than $1.000.000 to build churches, schools and Y.M.C.A. buildings in China. During World War I he secured a U.S. shipbuilding contract for the Chinese government, built the ships and purchased them from the U.S. after the war. He also bought nine troop transports in 1923 and established the first regularly scheduled round-the-world cruise service. He wrote *Memoirs*, 4 vol. (1917–28). and One Hundred and *Thirty* Years of *Steam* Navigation (1931). He died at San Rafael, Calif., on May 16, 1932.

DOLLAR, a small burgh of Clackmannanshire, Scot., lies 13 mi. E.N.E. of Stirling by road at the foot of the Ochil hills. Pop. (1961) 1,955. The fine buildings of the well-known academy founded by John McNabb date from 1818. Castle Campbell. a stronghold of the Argylls from the late 15th century, stands in the romantic Dollar glen. 1 mi. N.

DOLLAR, originally a silver coin that circulated in many European countries. and in the 20th century the standard monetary unit in the United States. Canada and certain other countries. The Spanish peso, or piece of eight. which circulated in the Spanish-American and English colonies, was known as a dollar by the English-speaking peoples, although the term does not seem to have been in use among the Spanish-speaking peoples. Familiarity during colonial times with this coin resulted in the official designation of the United States monetary unit as the dollar. In 1782 Gouverneur Morris (*q.v.*) made a report to this effect to the congress under the Articles of Confederation. The dollar was established as the nation's monetary unit by the Coinage act of April *2*, 1792. Other countries also chose the dollar but their monetary units are not identical with the C.S. dollar. Canada adopted the decimal system of coinage in 1858 with the dollar as the unit of account. As monetary arrangements differ from country to country and change from time to time, "dollar" has a wide range of meanings.

The word itself is a modified form of the Germanic word "thaler," a shortened form of "Joachimst(h)aler," a 16th-century silver coin intended to be the equivalent of the gulden, a gold coin. The Joachimst(h)aler was first struck in 1519 under the direction of the Count of Schlick, who had appropriated a rich silver mine discovered in St. Joachimsthal (Joachim's dale), Bohemia. The coin bore an effigy of St. Joachim. It was also known as the "Schlickenthaler." Many of these coins were struck and they were current in Germany from the 16th century onward. Thaler as a name for a silver coin became general, with various modifications such as daler, dalar, daalder, tallero, etc. Only in 1873 was "thaler" replaced by "mark" as the name of the German monetary unit.

The United States dollar (symbolized $) was defined in the Coinage act of 1792 as either 24.75 gr. (troy) of fine gold or 371.25 gr. (troy) of fine silver. Provision was made for a one dollar silver coin with a bullion content slightly less than that of the Spanish dollar, or peso, as well as for small denomination silver coins and for $2.50, $5.00 and $10.00 gold coins. Thus, from the outset the United States dollar was not simply a silver coin. Rather, the dollar mas the unit of account and was given physical embodiments in both gold and silver coins of various denominations. The first actual coinage occurred in 1794. The silver dollar continued in use, but after 1873, when the United States abandoned biinetallism (*q.v.*) in favour of the gold standard, it had the status of a token coin; *i.e.*, a coin worth more as money than as metal. In 1853 small denomination coins had become tokens.

In the U.S. monetary system "dollar" is used in several senses. By law it is the name of the unit of account. A dollar also is a legally specified weight of gold: from 1934, $15\frac{5}{21}$ gr. (troy), .9 fine. As such, it does not circulate. Day-to-day money payments are made with coins. with various types of paper money and with checks drawn against bank deposits. As a unit of account the dollar provides the means by which values are expressed. It is in dollars that prices are quoted, accounts kept, debts contracted and calculations of incomes and costs performed.

Fundamentally the purpose of connecting the dollar to gold is to assure that the buying power of the dollar relative to that of other currencies will remain reasonably stable. Economic distress results when prices in general rise or fall rapidly, or. in other words, when the value of money decreases or increases. On many occasions money that was not effectively linked to gold depreciated seriously. The United States had such an experience during the American Civil War. Germany in 1923 Hungary in 1945 and China in 1949 provide further examples. However, some nations. notably Sweden in the 1930s. demonstrated that an irredeemable paper currency may retain stability in its value Moreover. when costs are inflexible downward. a nation suffering from pressure on its exchange rate may be able to maintain a higher level of production and employment by way of depreciation of an irredeemable paper currency than by following a policy of monetary contraction with a redeemable currency rigidly tied to gold.

Throughout U S history the dollar has been defined in terms of gold (and silver also prior to 1873). Except during the period from 1861 to 1879, and again from 1933 to 1934, this definition has been meaningful Prior to March 6, 1933, free coinage of gold together with redemption of paper money in gold coin accomplished this. Beginning on Jan. 31. 1934, government purchase and sale of gold in uncoined form at a fixed price served the same purpose. The practical effect of either of these arrangements is that a dollar of circulating money is kept at the same value as the physical quantity of gold specified as constituting a dollar. Of necessity, if circulating money does not itself consist of full weight gold coins, a limit must be placed on the number of circulating dollars nhich may be created. Otherwise, equivalence cannot be maintained. A system of reserve requirements ultimately based on the nation's stock of gold bars serves to fix an upper limit to the circulating medium Purchase and sale of gold connect circulating dollars to the gold dollar.

A relatively small number of gold dollar coins was struck. beginning in 1849, but their minute size made their circulation impractical. This coin contained 25.8 gr. (troy). .9 fine gold, which was the gold dollar's weight from 1837 to 1934. On Jan 31, 1934, the gold in the dollar was reduced to $15\frac{5}{21}$ gr. (troy), .9 fine. In other words, the official price of an ounce of fine gold was increased from $20.66 to $35.00, or. the value of the dollar was reduced from approximately $\frac{1}{21}$ to $\frac{1}{35}$ of an ounce of fine gold. The action was formally taken by means of a presidential executive order issued under terms of the Gold Reserve act of 1934. Until June 30, 1943, further reduction (as well as a slight increase) was permissible, but no further change was made. Also, during 1933–34, gold coins were removed from circulation. title to all monetary gold passed to the government, coins and paper money became full legal tender and gold certificates were called in.

Devaluation (reduction of the gold content of the dollar) was motivated by the desire to raise the price level. which had fallen by March 1933 to approximately half its 1929 level. To the disappointment of those who advocated this step, prices generally did not rise as forecast Ndt until early in World War II was the price level restored to the 1929 level It continued to climb thereafter and at mid-century the U.S. cost of living was roughly twice as high as in 1933.

U.S. experience demonstrated that the gold content of the dollar is not the determining factor governing the purchasing power of the dollar. From 1879 to 1933 prices repeatedly moved upward and downward through a wide range despite constancy in the gold content of the dollar. The rise in prices after 1933 was not simply the resultant of devaluation, but of a host of other factors, many of which outweighed that particular factor.

Many students of money have recommended that the linking of the dollar to gold be retained even if price level stability is not achieved simply and automatically by doing so. They hold that international monetary relationships are more stable nhen currencies have a gold basis and also that it is desirable to impose an upper limit through gold reserve requirements on the volume of

circulating money. They believe, however, that price level stability would be achieved only by skilful central bank management within a broad framework of measures designed to promote economic stability.

Others have recommended elimination of the linking of the dollar to a fixed quantity of gold. Irving Fisher (1867–1947), the leading advocate of dollar stabilization, in 1913 proposed a compensated dollar whose gold content would be varied directly with the price level. Later Fisher advocated credit control measures aimed at maintaining stability in a selected index number of prices. His general proposals for dollar stabilization gained many adherents. although on matters of detail there was substantial controversy. Almost everyone agrees that stability in the dollar's buying pouer, if realized, would contribute greatly to economic stability.

In the 1950s the U.S. dollar became the international currency, for more and more countries increased their holdings of dollars as a form of exchange reserve. This development. coupled with the fact that the U S. balance of payments had turned from surplus to deficit, ushered in a new era. In order to provide essential military and economic assistance, and to maintain effective political and financial leadership in the western world, it became ever more important that the external value of the dollar be held stable and its competitive buying power be maintained. *See* also INTERNATIONAL PAYMENTS. (E. C. Ss.; Jo. M. L.)

DOLLAR AREA, a term applied to the region comprising the United States. Canada and the dollar countries of Latin America. Comparable foreign-exchange areas in other parts of the world are the sterling area, including the Cnited Kingdom and most of the commonwealth countries, and the ruble area. including the Soviet Union, Poland and other communist countries. *See* EXPORTS.

DOLLFUSS, ENGELBERT (1892–1934). Austrian statesman, prime minister from 1932 to 1934, was born at Kirnberg an der Mank in Lower Austria, on Oct. 4, 1892. At Vienna and Berlin in 1919–20 he completed his studies in law and economics. He became secretary of the Peasant federation of Lower Austria and. in 1927, director of the Lower Austrian chamber of agriculture. The Christian Socialist party delegated him to the commission of the Austrian federal railways whose president he was during 1930 From March 1931 he served as minister for agriculture and forests in the cabinets of Otto Ender and Karl Buresch. On May 20. 1932. he became prime minister. His cabinet included Christian Socialists, Land Unionists and members of the Home Bloc; it had a majority in the *Nationalrat* and was in a minority in the *Bundesrat* (the upper chamber). In July 1932 the League of Nations granted Austria a loan of nearly £9,000,000. in consideration of nhich Dollfuss undertook to forgo customs union between Austria and Germany for 20 years. For this the nationalists and Social Democrats unleashed a violent political campaign against him. A formal error in voting procedure in the *Nationalrat* on March 4, 1933, enabled Dollfuss to immobilize his opponents. From then on he became increasingly authoritarian, aiming at domestic peace and freedom from external involvements. In May 1933 he founded the Patriotic Front (*Vaterländische Front)* which, he intended, should gradually replace the political parties. In foreign affairs. Dollfuss enlisted Italy's support against Nazi Germany. At Riccione in Aug. 1933, Mussolini guaranteed Austrian independence, but demanded the abolition of all political parties and a constitutional reform on the Fascist model. In Feb. 1934 fighting broke out in the streets of Vienna between the Socialist and government forces; in the sequel the Social Democratic party was dissolved. On May 1, 1934. Dollfuss proclaimed a new constitution influenced by the papal encyclical *Quadragesimo anno* and based on a system of professional estates The regime became completely authoritarian. From May 1934 not only did domestic conditions worsen but also the pressure from Germany increased. Dollfuss decided to move against the Nazis; terror and counter-terror amounted to near civil war. On July 25, 1934, Dollfuss was shot during a Nazi raid on the chancellery.

Dollfuss' political views were influenced by Christian Socialist theory, especially the work of K. von Vogelsang. It was characteristic that he attempted to realize in practice the ideas of the *Quadragesimo anno;* but he failed to see that one cannot set up Christian estates in the modern state when estates and a Christian outlook are both lacking. Domestic and foreign difficulties made him compromise with political forces which ultimately he could not control. His connection with the *Heimwehr* (merged with the *Vaterländische Front* in 1934) and the demands of Mussolini drove him to policies which ended in dictatorship. Moreover, he never understood that authority needs to be based on legality: in fighting his political opponents he ignored constitutional principles and so destroyed the base for a sound political development.

(H. PF.)

DÖLLINGER, JOHANN JOSEF IGNAZ VON (1799–1890), church historian and one of the leading German Catholic theologians who refused to accept the decree of papal infallibility in 1870 and joined the Old Catholics (*q.v.*), was born at Bamberg, Feb. 28, 1799, and ordained in 1622. After teaching church history at Aschaffenburg, where he published his first work, he became professor of canon law and church history at Munich (1826). As a liberal in politics and theology, he was associated with the French Catholic philosopher Félicité de Lamennais and with Gladstone. From 1835 he was a member of the Bavarian Royal Academy of Sciences (president from 1873). He represented his university in the second chamber of the Bavarian *Landtag* and in the Frankfurt national assembly (1848). Though he lost his professorship in 1847, he was given posts that made him second to the archbishop of Munich in the archdiocese, and he was reappointed professor of church history (1849). His historical researches and his belief in freedom of religion brought him into strong opposition to the policy of Pius IX; he disliked the dogma of the immaculate conception (defined 1854), and some of his ideas were condemned by the *Syllabus errorum* issued by the pope in 1864. His opposition to the Ultramontanes (whom his earlier work, *Kirche und Kirehen,* 1861, had supported), unlike that of the French group led by Bishop Félix Dupanloup. was based on modern historical criticism; he was regarded by his contemporaries as one of the greatest historical scholars in Europe. In 1842 he wrote to E. B. Pusey, sympathizing with the Tractarians. When Pius IX proposed to summon a council to define papal infallibility *(see* COUNCIL; VATICAN COUNCIL), Dollinger became recognized as the leader of the opposition in Germany. In 1869 he wrote a series of articles in the *Augsburger Allgemeine Zeitung,* later enlarged, nith the help of J. N. Huber, and published as *Der Papst und das Concil,* under the pen name Janus (Eng. trans. 1869). This book was called by W. B. Ullathorne "the greatest and severest attack on the Holy See and the Jesuits, and especially on the policy of Rome, for a thousand years," and Dom Cuthbert Butler (in *The Vatican Council,* 1930) thought it perhaps the most damaging onslaught on the popes ever made. In this book Döllinger showed dislike for the Council of Trent and declared that the decrees of a general council are binding only by subsequent consent of the church. It was placed on the Index of Forbidden Books (1869). After the Vatican council and the definition of the dogma of papal infallibility (1870), Dollinger, who seems to have exaggerated the probable effect of the council on civil affairs, wrote (March 29, 1871) to the archbishop of Munich, "As a Christian, as a theologian, as a historian, as a citizen, I cannot accept this doctrine." He was placed under the greater excommunication (which forbade the faithful to have any dealings with him) and remained under it till his death. He mas nevertheless elected rector of Munich university almost unanimously (1871).

The dogmas of the Vatican council, which Dollinger and his friends felt bound to accept, were the infallibility and universal ordinary jurisdiction of the pope; the latter, which is often forgotten, is in practice the more important of the two. These dogmas were to be accepted as having been always the teaching of the church, and the opposition to them was led by professors who had studied the teaching of the church in former ages. Those who were

excommunicated for refusing these dogmas could not be married or buried with the rites of the church, nor could they prevent their children from being taught in school, in Catholic Bavaria, the doctrines which they held to be untrue.

In May 1871 their leaders met at Döllinger's house and decided to organize a congress. Meeting on Sept. 22 in Munich, it was attended by a total of 300 Old Catholics (Altkatholiken) and Eastern Orthodox, Anglican and Lutheran sympathizers. A committee, of which Dollinger was a member, drew up a doctrinal basis and a program for separate organization. Dollinger at first opposed this program, but later associated himself fully with it. That he was definitely an Old Catholic, which has been doubted. is proved by his letter to Pfarrer J. Widmann, Oct. 18, 1874: "I reckon myself as belonging by conviction to the Old Catholic communion, and I believe that it has a higher vocation given to it to fulfil, and that threefold" (protest against the Vatican dogmas, the example of a Catholic church free from error, and the reunion of Christendom). He remained on the list of Old Catholic priests until his death (except between 1878 and 1883, when he removed his name for a time because he did not agree with the permission of clerical marriage). But since the Bavarian government, unlike other German and Swiss governments, did not recognize the Old Catholic confession, he was in a difficult position.

In 1874 Dollinger presided over an international conference of theologians at Bonn, met to discuss reunion between the Old Catholics and the Anglican and Orthodox churches. A basis of agreement between the Anglicans and Old Catholics, on 14 points, very similar to the later Declaration of Utrecht (1889), was carried with but little opposition. Dollinger declared that he and his colleagues did not feel themselves bound by all the decrees of the Council of Trent, and he spoke in defense of Anglican ordinations. He strongly rejected, even as an opinion, the immaculate conception of the Blessed Virgin Mary.

A second conference was held in 1875 at which Döllinger again presided. It was entirely occupied with the *Filioque* clause in the Nicene Creed, and drew up an agreed statement on the subject, which was accepted by both the Orthodox and the Anglicans who were present. In his last years Dollinger and his friend F. H. Reusch collaborated to write *Moralstreitkeiten in der römisch-katholischen Kirche,* 2 vol. (1889), and other works. Dollinger died in Munich on Jan. 10, 1890. after receiving the last sacrament from the Old Catholic priest Johann Friedrich.

DOLLOND, JOHN (1706–1761), English manufacturer of optical equipment, developed achromatic lenses. He was the son of a Huguenot refugee, a silk weaver at Spitalfields, London, where he was born on June 10, 1706. He followed his father's trade. but found time to acquire a knowledge of Latin. Greek. mathematics. physics, anatomy and other subjects. In 1752 he abandoned silk weaving and joined his eldest son. Peter Dollond (1730–1820), who in 1750 had started in business as a maker of optical instruments. His reputation grew rapidly, and in 1761 he was appointed optician to the king. In 1758 he published an "Account of some experiments concerning the different refrangibility of light" *(Phil. Trans.,* 1758), describing the experiments that led him to the discovery of a means of constructing achromatic lenses by the combination of crown and flint glasses. Following the suggestion of Leonhard Euler and the experiments of Samuel Klingenstjerna (1698–1765) Dollond commenced a series of tests on achromatism. Early in 1757 he succeeded in producing refraction without colour by the aid of glass and water lenses: and a few months later he obtained the same result by a combination of glasses of different refrangibilities *(see* TELESCOPE: *Achromatic Telescopes).* Dollond also published two papers on apparatus for measuring small angles *(Phil. Trans.,* 1753, 1754). He was made a fellow of the Royal society early in 1761 and died Nov. 30 of the same year.

DOLMAN, originally a loose outer garment with tight sleeves and open in front, worn by the Turks. The name was also given to the uniform jacket of the Hussars (*q.v.*) which was worn like a cloak with the sleeves hanging. In western European costume the term dolman came to mean a woman's cloak with capelike pieces over the arms instead of sleeves; in modern usage it is applied to a sleeve which is cut to fit a large armhole, so that a dolman sleeve gives the garment a capelike appearance. (M. B, K.)

DOLMEN, the term used for a certain type of prehistoric monument. which usually consists of several great stone slabs set edgewise in the earth to support a flat stone which serves as a roof. The structure n-as designed as a burial chamber and is typical of the Neolithic period in Europe. The word is Celtic in origin but probably is not Breton; the Welsh equivalent of the word is *cromlech.* Dolmens, although found in covered form as far east as Japan are mainly confined to Europe and northern Africa. There are many examples in the British Isles. *See* also BARROW

DOLMETSCH, ARNOLD (1858–1940), French-Swiss musician. subsequently acquiring British nationality, a leading pioneer of the recovery of early instrumental music in modern times, was born at Le Mans. France, on Feb. 24, 1858. Dolmetsch's craftsmanship in restoring and making reproductions of early musical instruments, his insistence on source material coupled with an intuitive understanding gave him a remarkable insight into the problems of presenting the music of Bach's generation and earlier in a style of performance forgotten over the breach of at least a century. Since his principles have been so widely accepted, it is difficult to realize how profoundly musicians are indebted to his single-minded genius for the reforms at which he worked in the face of prolonged indifference and misunderstanding

Dolmetsch studied at the Brussels conservatory and later at the Royal College of Music in London. He was in charge of a department making reproductions of early musical instruments at the Chickering factory in Boston, Mass., from 1905 to 1909 and at the Gaveau factory in Paris from 1911 to 1914. In London he attracted the attention of George Bernard Shaw. who reviewed his concerts with sympathy and enthusiasm. Like Shaw. Dolmetsch was a rebel. a reformer who aroused a response of mingled alarm and fascination. From 1914, however, when he resettled in England. his work met with gradually increasing acceptance; his book, *The Interpretation of the Music of the XVII and XVIII Centuries* (1915 and 1940), confirmed his international reputation. In 1928 the Dolmetsch foundation was organized to support him and to assist in the spread of his ideas. Dolmetsch died in Haslemere, Surrey. Feb. 28, 1940.

See Mabel Dolmetsch, *Personal Recollections of Arnold Dolmetsch (1958); R.* Donington, *The Work and Ideas of Arnold Dolmetsch* (1932). (*R* Do.)

DOLOMIEU, DIEUDONNÉ SYLVAIN GUY TANCRÈDE DE GRATET DE (also known as DÉODAT DOLOMIEU) (1750–1801). French geologist and mineralogist after whom the mineral dolomite was named, was born at Dolomieu, near Tour-du-Pin, Isère, on June 23, 1750, the second son of François de Gratet. marquis de Dolomieu. He was admitted in his infancy a member of the order of Malta. In his 19th year he killed a brother knight in a duel and was condemned to death, but in consideration of his youth was pardoned after nine months' imprisonment, which he spent in the study of natural sciences. He continued his studies and later gave up his commission in the carabineers and visited Spain, Sicily, the Pyrenees and Calabria, the scientific results being given in a series of important works, including *Mémoire sur les tremblemens de terre de la Calkbre pendant l'annke 1783* (1784). In 1789 and 1790 he studied the Alps and described the mineral dolomite in 1791. In 1798 he accompanied Bonaparte's expedition to Egypt. On the way home he was captured and imprisoned at Messina in a pestilential dungeon. Deprived of writing materials, he made a pen from a piece of wood and, with the smoke of a lamp for ink, he wrote his treatise, *Sur la philosophie minkralogique et sur l'espèce minérale* (1801), on the margins of a Bible, the only book he still possessed. Released after the battle of Marengo (1800), he died at Chbteau-Neuf, Saône-et-Loire, on Nov. 26, 1801.

See A. Lacroix (ed.), *Déodat Dolomieu,* 2 vol. *(1921).*

DOLOMITE, a name applied both to a mineral composed of calcium and magnesium carbonate, and to a rock containing the

mineral as principal constituent. The name. originally *dolomie* (N. T. de Saussare. 1792). is in honour of the French geologist D. G. Dolomieu. The rock is known commercially as dolomitic or magnesian limestone and is used as a source of magnesia, as a refractory and as building stone. For discussion of uses *see* LIMESTONE.

The mineral is a rhombohedra1 carbonate with a hardness of 3.5–4, varying with direction. and a specific gravity of 2.85 for the pure compound. The rhombohedron, parallel to the faces of which there are perfect cleavages. is frequently the only form present on dolomite crystals. and these crystals often have curved faces and are saddle-shaped.

The calcium and magnesium ions in dolomite have been shown by X-ray diffraction studies to be segregated into separate planes. This arrangement reduces the symmetry relative to that of calcite. and defines dolomite as a separate compound rather than a magnesian calcite solid solution. There may be extensive substitution of ferrous iron. and to a lesser extent of bivalent manganese, in the magnesium positions. giving rise to a variety called ankerite. The dolomite in sedimentary rocks may contain up to 5 mol. per cent $CaCO_3$ in excess of that required by the formula, $CaMg(CO_3)_2$.

Dolomite is found extensively in marbles as well as in talc schists and other magnesium-rich metamorphic rocks. At least some of this dolomite has been shown by textural studies to have formed on cooling from highly magnesian calcite stable at higher temperatures. In high-grade thermal metamorphism. dolomite may dissociate into a mixture of calcite and periclase. which may later alter to brucite and hydromagnesite. and siliceous dolomitic rocks may yield diopside and other magnesium silicates. Dolomite occurs in hydrothermal veins associated with fluorite. barite. calcite, siderite. quartz and various metallic ores, in cavities in carbonate rocks and less commonly as a cement in various sedimentary rocks.

The most important occurrence of dolomite is as a rock-forming mineral in carbonate rocks. In dolomitized limestones, individual dolomite crystals cut across pre-existing fossil outlines and other textural features. and thus in these rocks the mineral is a secondary replacement, Fossil coral reefs are often replaced in this fashion. The thin beds of dolomite, virtually free of fossil remains, which are found associated with beds of anhydrite and halite have been considered to be chemical precipitates. No organisms are known to secrete dolomite. Ankerite. like siderite (*q.v.*). is common in rocks associated with coal beds and shales containing organic matter.

The exact manner of formation of dolomite in sedimentary rocks has been a puzzle for more than 150 years. because it has not been possible to synthesize the mineral under conditions comparable with those prevailing at the earth's surface. and because no present-day dolomite iormation in nature was known. Finally in 1957 imperfectly crystallized dolomite was observed forming in South Australia. in ephemeral lakes which were from one-tenth to one-half as saline as sea water, in the vicinity of water plants where pH (alkalinity) was higher than elsewhere.

Among the famous occurrences of dolomite crystals are the Binnental near Brieg, Switz.; Joplin. Mo.; Traversella. Piedmont. Italy; Alston, Cumberland. Eng.; Teruel, Spain; and Brumada. Bahia. Braz.

See also references under "Dolomite" in the Index volume.

(D. L. G.)

DOLOMITES (Ital. ALPI DOLOMITICHE), a mountain group lying in the eastern section of the north Italian Alps, bounded by the valleys of the Isarco in the northwest. the Pusteria in the north. the Piave in the east and southeast and the Avisio in the southwest. It comprises a number of impressive peaks. 18 of which rise to over 10.000 ft. The highest point is the Marmolada (10.964 ft.) whose southern face consists of a precipice 2,000 ft. high. Geologically, the mountains are formed of highly jointed, light-coloured dolomitic limestone, principally of Upper Triassic age. In contrast to other parts of the Alps, the Dolomites have been less violently affected by earth movements; thus the structure is simpler and some plateaus of almost horizontal strata occur. Elsewhere, various forms of erosion have carved the limestone into grotesque shapes; the resulting land forms include jagged. saw-edged ridges, rocky pinnacles. deep gorges. screes of limestone debris and numerous steep rock faces at relatively low levels. Much of the peculiar character of the land forms is related to the permeability of the rock and the resultant absence oi surface drainage except in the main valleys. Glaciated features occur at higher levels; 41 glaciers lie in the region. Many of the lower and more gentle scree slopes were once forested: however. only patches of woodland remain, interspersed nith grassy meadows. Most of the main peaks were first climbed in the 1860s and '70s by English mountaineers.

The main valleys provide relatively easy access to most parts of the Dolomites. The three main north-south roads use saddles which represent outcrops of softer rocks—Campolongo (6.151 ft.), Cimabanche 15.065 ft.) and Misurina (5.761 ft.). The east-west roads cross the well-known passes of Pordoi (7.346 ft.), Falzarego (6.913 ft.). Tre Croci (5.932 ft.). Sella (7.264 ft.) and Gardena (6.959 ft.). The principal route and tourist centre is Cortina d'Ampezzo (elevation 3.933 ft.), which lies also on a north-south railway. Other resorts are Auronzo. San Martino di Castrozza and Ortisei with its narrow-gauge railway. On the western and southeastern margins. respectively, are located the larger towns of Bolzano and Belluno.

Less extensive areas of dolomitic limestone are to be found in other parts of the Alps. Dauphiné (the home of the geologist D. G. Dolomieu) contains several such areas southwest of Grenoble. all with the characteristic scenery associated with this type of rock. Similar dolomite groups occur in Switzerland (*e.g.*, southwest of Bergun and north of Splugen). (C. EM.)

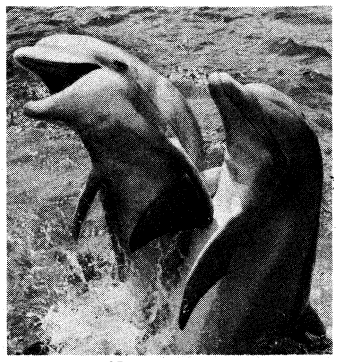
DOLORES, GRITO DE, the "Cry of Dolores" uttered by Father Miguel Hidalgo y Costilla on Sept. 16, 1810. and generally regarded as the beginning of the Mexican independence movement. Hidalgo. the curate of the parish of Dolores in central Mexico. was involved in a conspiracy against the Spanish government and. when the plot nas betrayed. he decided to act immediately. Summoning his parishioners. he cried "Long live America! Long live independence! Death to bad government!" The uprising was premature and Hidalgo was executed but his words lived on. In commemoration. each year on Sept. 16. the president of Mexico shouts them from the balcony of the national palace. *See* also MEXICO: *Colonial Period (1519–1821).* (L. N. McA.)

DOLORES RIVER. Rising in La Plata mountains in southwestern Colorado, the Dolores river flows through deep canyons until it is met by its chief tributary. the San Miguel river, near the Utah border. Then it flows through Paradox valley northwestward to enter the Colorado river above Moab. Utah.

Melting snow causes a flood flow in spring and early summer, but by midsummer the flow is a trickle. The Dolores and its tributaries irrigate about 60.000 ac. The river probably was named Rio de Nuestra Senora de los Dolores by a Spanish trader named Rivera in 1765. (C. N. C.)

DOLPHIN. The name "dolphin" is often confusing, since it is applied to both an aquatic mammal and a fish. Both kinds of dolphin are known in classical literature, appearing as heraldic figures.

The Mammalian Dolphin.— Several species of whale of the family Delphinidae, especially *Delphinus delphis*, are called dolphin. They are among the many types of the smaller toothed whales, suborder Odontoceti. Dolphins are edible; they inhabit seas and large rivers and rarely exceed 11 ft. in length. They feed chiefly on fish and are mostly gregarious. They show great agility and grace in the water, and often play around ships. The common dolphin of the Mediterranean and Atlantic measures about six to eight ieet in length, with a back fin of nine or ten inches. The forehead descends abruptly to the base of the flattened beak, which is about six inches long. The sharp teeth number about 160 to 200 in all. The eyes are of moderate size, the ear aperture is minute and the blowhole crescentic. Dolphins are black above. white below. The female brings forth a single young and is a devoted parent. The bottle-nosed dolphin, *Tursiops* species, has a shorter and more upturned beak.



BY COURTESY OF MIAMI SEAQUARIUM

BOTTLE-NOSED DOLPHINS (TURSIOPS TRUNCATUS) **LEAPING FOR FISH IN AN OUTDOOR AQUARIUM**

The dolphin has been a well-known animal since ancient times to all who know the sea. It has become more widely familiar to the American public through the popular outdoor aquariums of Florida and California, in which dolphins prove to be astonishingly adaptable, remarkably intelligent entertainers. Because of their intelligence and their ability to communicate with one another through a range of distinct sounds (they also produce supersonic pulses), dolphins have become the object of serious scientific experimentation. The term "porpoise" is often mistakenly applied to dolphins, but correctly refers to similar looking whales of a different family, the Phocaenidae, especially to the genus *Phocaena* (*see* PORPOISE). (*See* also WHALE.)

The Fish Dolphin. — This large oceanic fish, called also dorado, is *Coryphaena hippurus.* Along with the very similar pompano dolphin, *C. equiselis,* it constitutes the family Coryphaenidae. *Coryphaena hippurus,* which has a characteristic shape, tapering from the large head to the slender and deeply forked tail, reaches a length of about six feet. This fish is famous for the rapid changes undergone by its brilliant gold and blue coloration as it dies. It is valued for food. *See* also FISH. (K. P. S.; X.)

DOMAGK, GERHARD (1895–), German pathologist and bacteriologist, who was awarded the 1939 Nobel prize for physiology and medicine for his discovery of the antibacterial effects of Prontosil, the first of the sulfonamide drugs. He was born at Lagow, Brandenburg, on Oct. 30, 1895. His studies at the University of Kiel were interrupted by World War I, after which he graduated in medicine in 1921. In 1924 he became a *Pvivatdocent* at the University of Greifswald. In the following year he received an appointment in the Pathological institute at Münster, where in 1928 he was appointed titular professor of general pathology and pathological anatomy. In 1927 he had accepted a research appointment as director of the I. G. Farbenindustrie (Bayer) laboratory for experimental pathology and bacteriology at Wuppertal-Elberfeld. In the course of a systematic search for new dyes undertaken by Domagk's chemical colleagues Fritz Mietzsch and Joseph Klarer, a number of new azo compounds were synthesized, and the therapeutic properties of these were investigated by Domagk. In 1932 Domagk noticed that one of the dyes containing a sulfonamide group exerted a definite effect on infections in the mouse. This dye, known as Prontosil red. was tried out in clinical practice, and it was successfully used by Domagk himself in treating his own daughter, who had acquired a serious streptococcal infection after being pricked by a needle. Domagk's first published report on the drug's extraordinary powers appeared in 1932 and inaugurated the chemotherapeutic era in medicine.

Following Domagk's acknowledgement of the Nobel award in Oct. 1939, a letter reached the Nobel committee in Stockholm, Swed., in which he declined the prize. It was subsequently revealed that he had signed the second letter under duress when he was in the hands of the Gestapo. In 1947 he visited Stockholm, delivered his Nobel lecture and received the gold medal and diploma, but the prize money had by that time reverted to the Nobel foundation. In addition to his work on the treatment of acute infections, Domagk has carried out much research on tuberculosis, and he has, since 1947, been editor of *Zeitschrift für Krebsforschung,* the German journal for cancer research. (W. J. BP.)

DOMBES, a historic region of east-southeastern France, once a sovereign principality, bounded on the southwest by Lyonnais, on the west by the Sabne river (separating it from Beaujolais), on the north by Bresse, on the east by the Ain river (separating it from Bugey) and on the south by the Rhbne (separating it from Dauphiné). It is now included in the *département* of Ain (*q.v.*).

From 1032, when the kingdom of Arles (*q.v.*), of which Dombes was part, passed to the Holy Roman emperor Conrad II, effective authority in the region was exercised by local lords. The seigneurs de Baugé controlled the north, the sires de Villars the south. The north, however, passed to the seigneurs de Beaujeu through the marriage of Marguerite de Baugé and Humbert IV de Beaujeu (1218) and thence to Louis II. duc de Bourbon, when he acquired Beaujeu (1400). Louis then bought the south (1402) from the sires de Thoire, who had succeeded the sires de Villars. While French royal authority over the kingdom of Arles depended only on the imperial vicariate (granted in 1378), the Bourbons were now able to form Dombes into a sovereign principality, with its capital at Trévoux.

Seized by Francis I of France after the treason of the constable Charles. duc de Bourbon. in 1523. the principality was restored to the house of Bourbon-Montpensier in 1561. The last heiress of this house, Anne Marie Louise d'Orléans. duchesse de Montpensier (*q.v.*), ceded the principality in 1681, as part of the price for the release of her beloved Lauzun, to Louis XIV's natural son, Louis Auguste, duc du Maine, whose son Louis Charles, comte d'Eu, transferred it to the French crown in 1762.

The sovereign council for Dombes, established by Francis I at Lyons, became a *parlement.* Transferred to Trévoux by the duc du Maine in 1696, it was finally merged in the *parlement* of Burgundy.

Trappist monks, settled in the region under Napoleon III, were largely responsible for draining the unhealthy marshes on the plateau. after which the population was increased by the overflow from Lyons. The principal industry of the region is dairy-farming.

DOMBROWSKI (DĄBROWSKI), **JAN HENRYK** (1755–1818), Polish general, was born at Pierzchowiec. near Bochnia, on Aug. 29, 1755. After service in the Saxon army (1772–92) he joined the Polish. In 1794 he distinguished himself under Tadeusz Kosciuszko in the defense of Warsaw and then led a separate raid against the Prussians in Poznania. After the third partition of Poland (1795) he left for Paris and obtained from the Directory (Oct. 10, 1796) permission to form a Polish legion in Italy. This was approved on Jan. 9, 1797, by the Cisalpine republic. In command of his legion he played an important part in the war in Italy, entered Rome on May 3, 1798, and distinguished himself at the Trebbia (June 17–19, 1799), where his legion suffered great losses fighting against the Russians (*see* FRENCH REVOLUTIONARY WARS). After the peace of Amiens he passed, as general of division, into the service of the Italian republic. Summoned by Napoleon on Oct. 5, 1806. to promote a rising in Poland. he arrived at Poznan on Nov. 6. By the end of the year he had organized seven Polish units and in 1807 he distinguished himself at Danzig and Friedland. In 1809 he served in the Polish campaign in Galicia and in 1812 he commanded one of the Polish divisions of the Grande Armée for the invasion of Russia, being wounded at the passage of the Berezina. He fought at the battle of Leipzig in 1813 and returned to Poland in 1814. He was one of the generals entrusted by the Russian emperor with the reorganization of the Polish army and, was made in 1815 general of cavalry and senator of the new kingdom of Poland.

Dombrowski died at his seat of Winnogora, in the province of Poznan. on June 6, 1818.

(ST. HE.)

DOME, in architecture. an ovoidal or hemispherical vault; or, a vault of polygonal plan that approaches'the round dome in shape. (*See* ARCH AND VAULT.) The term has been current in this sense since the 18th century. It derived from the Latin *domus,* "revered house" or "sanctuary" (as did the cognate German *Dom* and Italian *duomo,* "cathedral"), and as late as the 17th century it was applied to guild houses, state houses and the like. This change in meaning is significant. reflecting the gradual loss of what was once a very rich symbolism attached to the domical form. Historically. there are two distinct aspects to the development of the dome: the evolution of symbolic ideas associated with its shape, and the progressive solution in different materials of the problems of roofing a large space without inner supports.

DOMICAL SYMBOLISM

In many primitive societies the earliest and most prevalent type of conitructed shelter such as the tent pit house, earth lodge or thatched hut, nas more or less circular in plan and covered with a curved roof of generally domical shape To this round house type there accrued a wide variety of symbolic associations An early one was nith the death-and-reblrth cycle in nature, fertility rites were conducted in or near the round house in which grain was stored As a result of the custom of burying the dead in their own houses and conducting propitiatory rites there, the domical shape became associated nith tombs the underworld and the cult of the dead Very early too it acquired celestial significance, becoming, because of its resemblance to the supposed

FIG. 1.—DOMICAL NEOLITHIC BURIAL MOUND. THE NETHERLANDS

shape of the sky, a symbol of cosmic forces (the "dome of Heaven") and, by extension, of power generally.

As early civilizations developed. many of them perpetuated the revered domical shape in tombs. temples. shrines or palaces long after their ordinary architecture had become rectangular, with flat roofs or gables. From Shang through Han times in China, the usual tomb n-as a circular mound, deliberately made to imitate the matted effect of archaic domed house tents. In India. the domed sepulchral stupa (*q.v.*) was venerated long before it became a sacred form of Buddhist architecture. In late Stone Age Europe. tomb barron-s often contained actual thatched huts. round and domical, as burial chambers. Stonehenge on Salisbury plain has been interpreted as the surviving core of a huge mound which reproduced on great scale and with cosmic references a revered round house type. In Greco-Roman civilization, the dome occurred often as a tomb form; *e.g.*, the Treasury (tomb) of Atreus at Mycenae (c. 1200 B.C.); the tholos (*q.v.*) of Greece, where it symbolized the ideas of death and rebirth in the Greek mystery rites, and the imperial tumuli of Augustus and Hadrian. The dome had celestial significance in round temples, like the Pantheon and the temples of Vesta. and it symbolized the power of the Roman emperors in numerous examples known from literary sources (*e.g.*, the dome over the triclinium in Nero's Golden House).

Diverse and complex traditions of domical ideology developed throughout the ancient world, both east and west. In the late Roman empire domes were used extravagantly to symbolize imperial power and divinity. These connotations were carried. with suitable modifications. into Christian architecture. Examples, especially from the earlier Christian centuries! are innumerable. Over the semicircular apse (*q.v.*) of the basilica (*q.v.*), for instance. there customarily appeared a half dome or conch, which symbolized both celestial power (being very often decorated with an image of Christ in Glory, or Christ Pantocrator) and the tomb of a saint (or many saints) buried under the sanctuary floor below. Most striking of all early Christian domes. perhaps, was that over the church of Holy Wisdom (Hagia Sophia) in Constantinople. As the sermon delivered at the dedication of the rebuilt dome in A.D. j61 explained, this dome symbolized at once the glory of God. the power of Christ, the power of the Byzantine emperor and the tomb of Justinian.

FIG. 2.— CUTAWAY VIEW OF THE TREASURY OF ATREUS AT MYCENAE, LATE BRONZE AGE. SHOWING CORBELING

Later medieval architecture in the west made less use of domical buildings than the Byzantines. But in various ways the celestial. sacred, royal and funereal ideas that clustered about the domical shape aere preserved; *e.g.*, in domed baptistries, to signify spiritual death and rebirth, in Gothic cathedral vaults painted blue with gold stars, in the ciborium and baldachin over tombs and altars. In Renaissance times an interest developed in the dome as a pure visual form in space, but its original significance persisted. The dome of St. Peter's, in Rome, was completed in 1590 nith the intention of symbolizing the glory of God. the power of the Roman pontiff and the tomb of St. Peter below.

Gradually. however, the older symbolic values attached to domes gave nay to an emphasis on their exciting visual effects and a vague association with Roman power. In the 19th and 20th centuries, interest grew in the opportunities the dome offered for experiment in new materials and in the creation of great open expanses of interior space.

DOMICAL CONSTRUCTION

A domical shape develops naturally out of many of the pliable materials used for building in primitive societies such as saplings, grass mud and hides. Conversely. it is an unnatural form in more rigid materials like wood. brick or stone. Yet throughout history domes were built of these materials, often with enormous difficulty. The reason seems to have been that such domes were symbolic; that they resulted less from architectural considerations than from a desire to perpetuate a revered shape in permanent form Many domes were literally carved out of solid rock; *e.g.*, in some of the tomb chambers in Etruria and the Roman catacombs, and most notably, in the Tomb of Theodoric at Ravenna (c. 4 D. 526), which is roofed by a single slab weighing many tons, carved into domical shape and set in place like the lid on a pot.

Exactly when. where and how domical construction originated is much debated; it may well have developed independently in several areas. The technique most commonly found in extant early buildings is corbeling Successive horizontal layers of bricks or stones were built so that each projected slightly beyond the one below. progressively narrowing the interior space until the opening at the top was small enough to be covered by a single slab of stone (*e.g.*, the Treasury of Atreus at Mycenae). It probably developed naturally out of the practice of giving the revered round house a permanent outside envelope of brick or stone. Corbeling was an awkward and none too stable form of construction, however. By comparison, domes in wood had many advantages, and were built much more extensively in early times. Wooden domes were relatively easy to build on a large scale, and when in place, their lightness and interlocked construction exerted little thrust on supporting walls. Although for obvious reasons no ancient wooden domes have survived, there is good evidence that a wooden domical tradition existed in the Roman empire. in India and in Russia, and may have played some part in the development of the Sassanian dome. It was particularly strong in Syria; literary records indicate that large wooden domes were built in that region well into the Christian era—as over the Marneion at Guza (built c. A.D 130 by Hadrian and dedicated to Marnos. a sky god) and the original church of the Holy Sepulchre at Jerusalem (to mark the tomb of the Heavenly Ruler).

Roman.—Gradually, however, both wooden and corbeled domes were superseded by masonry construction, partly because rapid deforestation made wood difficult to obtain, partly because masonry domes were more effective symbols of strength and permanence and partly because the major problems of constructing

large brick and stone vaults were progressively solved during Roman times. This change may be traced in a few examples. In republican times! the Romans were building a kind of square dome, or cloister vault, ovoid in section and rising equally from all four sides, as may be seen in the extant square bays of the Tabularium, Rome (78 B.C.). Two centuries later: the Pantheon (built under Hadrian between A.D. 110 and 125, diameter about 144 ft.) displayed a masterful command of large-scale domical construction in brick, with an intricate system of built-in relieving arches. The construction was heavy, the only opening being a great "eye" at the top. The Romans solved this problem in later buildings; *e.g.*, the temple of Minerva Medica (actually the *nymphaeum* of the Licinian gardens, c. 250), which achieved a daring lightness through use of a structural framework of brick ribs. But they achieved no real solution for the problem of how to make a transition from a square or rectangular ground plan to a circular roof, despite many experiments. An attempt was made in the 3rd century A.D. to put a dome over an octagonal side room in the Baths of Caracalla, by means of corbeling and diagonal arches and niches.

Byzantine.— The next great advance in domical construction was made by Byzantine architects, who developed the pendentive (*q.v.*), and so were able to use the dome over a plan of any shape. The greatest Byzantine dome was that over the basilica-plan church of Holy Wisdom at Constantinople (originally built 532–537 by Anthemius of Tralles and Isidorus of Miletus, restored in 558–562 and later). So skilfully and subtly was the weight of this 100-ft. wide, 180-ft. high dome transferred through pendentives to side walls and buttresses, that on the interior it gave what a contemporary described as the effect of being "suspended on a golden cord from Heaven." Domes became practically standard on Byzantine churches. The only notable further development was to raise the dome on a drum (*e.g.*, the church of St. Theodore, Athens, A.D. 1049). On Byzantine precedent, domed churches were built: in Italy (*e.g.*, St. Mark's, Venice, begun 1063, modeled on the church of the Holy Apostles in Constantinople; S. Antonio in Padua, 13th century); in southern France (cathedral of Angoulême, c. 1128, and St. Front, Périgueux, begun 1120 on the plan of St. Mark's in Venice, remodeled by Abadie in the 19th century); in Armenia; in the Balkans; and in Russia.

Islamic.— Muslim builders were under strong Byzantine influence; they used the dome in a lavish form, but on small scale, in Spain and northern Africa and developed it along Byzantine lines in the later architecture of Egypt, in Persia, in India and especially in Turkey. Smaller Islamic domes and half domes were enriched nith fantastic stalactite ornament. Sometimes elaborate systems of ribs, or transverse and diagonal arches, replaced the pendentive. In certain examples, as the exquisite Taj Mahal at Agra (1632–50), a bulbous or onion type of dome appeared. which perhaps originated in Islamic Persia.

Renaissance.— Renaissance builders introduced a new conception of the dome as a great sculptured form in space. In order to get the exterior visual effect they wanted without unduly raising the interior dome, they often (though not always) constructed their domes with two or more concentric shells. This principle was begun by Brunelleschi in the dome of the Cathedral of Florence (1420–61, including lantern), and followed by Michelangelo in the dome of St. Peter's in Rome; both have shells connected and strengthened by stone ribs. Often, the exterior Renaissance dome was merely a curved timber roof built over an inner dome of masonry, as in the church of Sta. Maria della Salute in Venice (by Baldassare Longhena, begun in 1631), and St. Paul's in London (by Christopher Wren, 1675–1710). St. Paul's has three shells— the outer timber roof, an inner hemisphere and between them a cone-shaped structure carrying the stone lantern.

Modern.— Renaissance dome-building techniques persisted, with refinements. through the 18th century. Typical is Germain Soufflot's dome of the Pantheon in Paris (1757–1812), which has three stone shells, the outer one thinned to only 19 in. at the base. In the course of the 19th century Renaissance principles were gradually abandoned in favour of construction with iron and steel

ribs. These were no longer true vaults, but at first they were treated to look like older forms. The dome of the United States capitol (1851–65, by Thomas U. Walter) has its own ribs covered with a masonry imitation of domes like St. Peter's and St. Paul's. Later in the century, iron ribs were displayed with increasing frankness, in domes like those over the court of the Coal Exchange, lower Thames street, London (by J. B. Bunning, 1846–49), the reading room of the British museum (by Sydney Smirke, 1854–57) and the reading room of the Bibliothèque Nationale in Paris (by Henri Labrouste, 1858–68). The primary function of domes like these was to provide a maximum of open interior space, rather than to perpetuate any particular symbolism. Architects could take full advantage of the new opportunities afforded by iron and glass construction for airy and light effects. The purest example of this new kind of domical construction was the dome planned for the Crystal palace (by Sir Joseph Paxton, to house the great exhibition of 1851 in London); although never built. it set a precedent for domical exhibition buildings that persisted into the 20th century. More significantly, it gave a powerful impetus to the wider use of new materials. As the 20th century progressed, the dome became a favourite form for experiments in new materials and new types of construction. Outstanding among these was the casting of domical shapes in concrete by spraying concrete shells over large inflated balloons. Another remarkable type was the geodesic structure, which consisted of a grid of thin aluminum strips or aircraft tubing, intersecting at the mathematically determined centres of equal stress lines on the spherical surface. It created domical structures combining great span and strength with remarkable lightness. A thin concrete dome, spanning 160 ft., was built at the Massachusetts Institute of Technology, Cambridge, Mass., by Eero Saarinen in 1955.

(AN. *G.*)

DOMENICHINO (DOMENICO ZAMPIERI) (1581–1641), Italian painter and a leading artist of the eclectic school of Rome and Bologna. Born at Bologna in Oct. 1581, he was trained in the academy of Lodovico Carracci, and in 1602 moved to Rome, where he joined the Bolognese artists at work under the direction of Annibale Carracci in the Palazzo Farnese. He was commissioned by Cardinal Agucchi to paint three frescoes in the portico of S. Onofrio. Immediately after he was employed by Cardinal Aldobrandini to decorate a room in the Villa Belvedere at Frascati with mythological frescoes (now in the Lanckoronski collection) and by Cardinal Farnese to paint a chapel in the Badia at Grottaferrata. Both fresco cycles are impregnated with the spirit of Annibale Carracci, though their more classical schemes look forward to the "Scenes from the Life of St. Cecilia" which Domenichino painted in 1615 for S. Luigi dei Francesi. The latter are in some respects his most successful works. In 1614 he executed an altarpiece of the "Last Communion of St. Jerome" (Vatican gallery), based on a painting of the same subject by Agostino Carracci at Bologna; this was looked upon by Nicolas Poussin and later painters as one of the greatest paintings in Rome.

In 1618–19 he executed for Cardinal Borghese the celebrated canvas of "Diana at the Chase" (Borghese gallery, Rome). After the election of the Bolognese Pope Gregory XV (1621), Domenichino was appointed papal architect. Between 1624 and 1628 he was occupied with the frescoed pendentives and apse of S. Andrea della Valle, where the full resources of his mature style are deployed. At this time Domenichino also made studies for the cupola fresco of S. Andrea della Valle, the commission for which was awarded to his rival Lanfranco. Though his work remained in great demand, there was a reaction against the rigid classicism of his style and in the last works which he produced in Rome, four frescoed pendentives in S. Carlo ai Catinari (1628–30) and the "Martyrdom of St. Sebastian" for St. Peter's, now in Sta. Maria degli Angeli, he worked in a broader, less classical style. This closer approximation to the baroque is also apparent in the frescoed "Scenes from the Life of St. Januarius" in the cathedral at Naples, on which Domenichino was engaged from 1631 until his death in April 1641. In Naples his style was less acceptable than it had proved in Rome. and he appears to have been the victim of systematic persecution by local artists, such as Ribera.

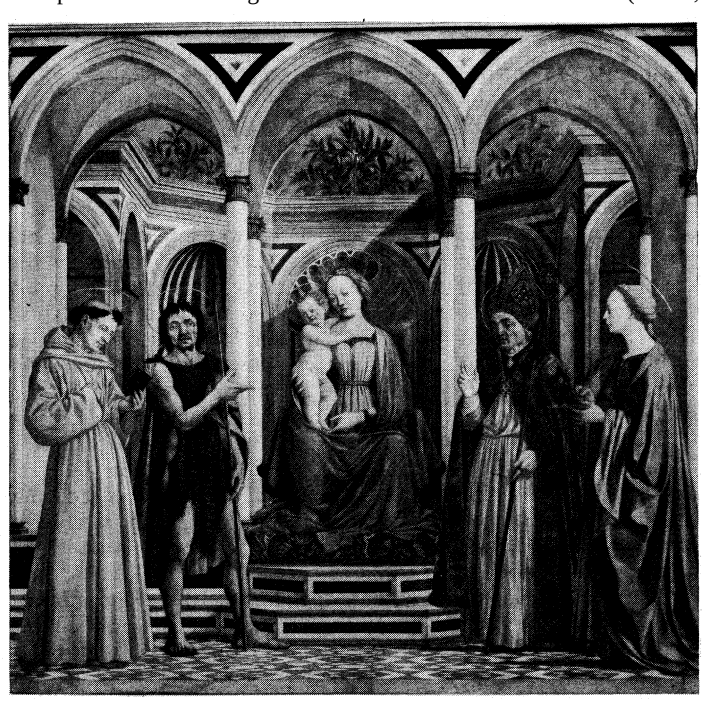
Through the 17th and 18th centuries Domenichino's paintings were regarded as second only to those of Raphael. but in the middle of the 19th century he fell from favour, and the importance of his place in the classical tradition has been recognized only in comparatively recent times. His name is associated with the doctrine of eclecticism, whereby a style derived from Raphael was opposed to the realism of Caravaggio. Domenichino's works reveal him as a fresco painter of great distinction and a draftsman of notable purity and skill. He occupies an important place in the history of landscape painting, and his landscapes (of which the most remarkable is a "Landscape With St. John Baptising" in the Fitzwilliam museum, Cambridge) had a profound influence on the classical landscapes of Nicolas Poussin and Claude Lorrain.

See J. Pope-Hennessp, *The Drawings of Domenichino in the Collection of His Majesty the King at Windsor Castle* (1948).

(J. W. P.-H.)

DOMENICO VENEZIANO (DOMENICO DI BARTOLOMEO DA VENEZIA) (active 1438–1461), Italian painter who. though of Venetian origin, worked mainly in Florence. His name appears for the first time in a letter of April 1, 1438, requesting Piero de' Medici to secure him the commission for a painting. According to Vasari (whose biography of this painter is unreliable). Domenico was engaged in Perugia on work for the Baglioni. His first recorded work, however) is a lost cycle of frescoes painted in 1439–45 for S. Egidio in Florence. In 1454 Domenico was associated with Fra Angelico and Fra Filippo Lippi in an assessment of the frescoes by Bonfigli in the Palazzo dei Priori at Perugia. but in 1455 he was once more in Florence. In 1457 he valued an altarpiece painted by Pesellino and Fra Filippo Lippi for the Compagnia della SS. Trinita at Pistoia (now in the National gallery, London). He died in Florence on May 15, 1461.

Two signed works by Domenico Veneziano survive. The first. a much-damaged fresco of the Virgin and Child enthroned with two damaged heads of saints (Nationa! gallery. London), formed part of the Carnesecchi tabernacle and Is described by Vasari as the first work executed by Domenico in Florence. The second, an altarpiece of the "Virgin and Child with Four Saints" (Uffizi,



ALINARI PHOTO

"VIRGIN AND CHILD WITH FOUR SAINTS." ALTARPIECE BY DOMENICO VENEZIANO FROM STA. LUCIA DEI MAGNOLI. ABOUT 1445. IN THE UFFIZI GALLERY, FLORENCE

Florence), was painted for Sta. Lucia dei Magnoli, probably about 1445. One of the outstanding paintings produced in Florence in the middle of the 15th century, this is remarkable for the soft contours of its figures. its fresh and delicate palette, its mastery of light and its precise and lucid space construction. The predella is now distributed between Berlin. the Fitzwilliam museum, Cambridge, and the National Gallery of Art. Washington. The panels at Cambridge are the most notable surviving examples of the so-called "legitimate construction" described in L. B. Alberti's Della *Pittura,* and the scenes as a whole establish Domenico Veneziano as perhaps the most gifted painter active in Florence at this time. A tondo of the "Adoration of the Magi" in the Kaiser Friedrich museum. Berlin. dates from about 1440. Domenico Veneziano's only surviving portraits are two profile paintings of Matteo and Michele Olivieri (National Gallery of Art. Washington. and Rockefeller collection, New York). The artist's latest work is a fresco of "SS. John the Baptist and Francis" in Sta. Croce. Florence.

DOMESDAY BOOK, or simply Domesday, the original record of William I the Conqueror's survey of England, has proved the most enduring administrative achievement of the middle ages, and is the earliest "public" archive now preserved in the Public Record office, Chancery lane, London, where it is on view to the public. It was undertaken after the king had held "deep speech with his Witan" at his Christmas court in Gloucester in 1085; and was rapidly executed in 1086 by seven or eight panels of commissioners (legati), to each of which was allotted a separate group of counties. Each circuit compiled an elaborate account of the royal estates or manors and of those of the king's tenants-in-chief, which was forwarded to the treasury at Winchester. From these vast documents was made, before the king's death in Sept. 1087, a concise summary which is Domesday Book. By contemporaries the whole operation was known as "the description of England," but we learn from *Dialogus* de *Scaccario* (*Dialogue* of the Exchequer, 1176–79) that the popular name of Domesday — the record from which there is no appeal — mas already then in general use.

Form and Content. — Domesday Book includes all the counties of England, except Northumberland, Durham, Westmorland, Cumberland and the northern parts of Lancashire. which were apparently not surveyed. Though invariably referred to as Domesday Book it consists of two volumes which are very different from each other. Volume I (Great Domesday), written in a single distinctive script, contains the summarized record of all the counties surveyed except Essex, Norfolk and Suffolk. For these counties which formed an eastern circuit, the full, unabbreviated return is preserved in volume II (Little Domesday), which for some reason, perhaps the king's death, was never summarized and added to the larger volume. Because of this accident we are much better informed about the economy of East Anglia than of any other part of England, except the southwestern circuit which included Somerset, Dorset, Wiltshire, Devonshire and Cornwall. These counties are duly summarized in volume I, but an early draft of the circuit return, the Exon Domesday, is preserved in Exeter cathedral. Like Little Domesday, which it resembles, it is written by a number of different scribes, though it describes the material at a slightly earlier stage. It also provides an interesting comparison with the summary contained in volume I, and shows us the principles followed in selecting the basic information preserved in the shorter text. Similar surveys were carried out by later kings, but Domesday is unique in discarding all but the vital facts, and so reducing the final record to manageable proportions. It was not too big to be useful in daily administration, and to this fact, no doubt, it owes its preservation.

Collectively, these three manuscripts demonstrate the complexities and difficulties which faced the commissioners whose circuit returns were sloaly evolved in successive recensions. The fundamental problem was to reconcile the new Norman conception of a feudal society based on the honour or barony — a complex of estates treated as a unit wherever situated — with the age-long division of England into shires and hundreds, which governed both finance and administration. The dilemma was met by treating each county separately, beginning with an account of the chief town, followed by a numbered nominal roll of the holders of land, from the king downward through archbishops, bishops, earls and barons to the humblest tenants who held in chief of the king. The legal assumption was thus made that every acre of land was held either directly by the king, or indirectly by some tenant-in-chief. All the mesne tenants, those below this rank, were ignored except in so far as they appeared under the fief of a tenant-in-chief. These fiefs are described consecutively, following the nominal roll on the first folio of each county, and consist of long lists of manors or estates, giving the name of the manor and of its holder both "now" (1086) and on "the day when King Edward was alive and dead" (*i.e.,* 1066): its measurement in hides (c. 120 ac.): its ploughing capacity: the number of villeins. bordars and cottars, its mills, fishponds, etc., details of subtenures, and lastly its value in pounds. This was considered specially important for it is generally supplied at three different dates — before the Conquest, when the present holder received the manor. and now (1086). No century or country in the middle ages can show any comparable record and contemporary chronicles testify to the resentment which it provoked. For the majority of English villages it is the starting point of their history: also for the towns, for many of which it preserves a record of old customs and services to the crown of immemorial antiquity. Unfortunately it contains no record of London or Winchester (then the capital), though there is some reason to think that they were surveyed.

Method of Compilation. — The serious study of Domesday Book began with the first printing of the text. by royal command in 1783. The work was admirably carried out by Abraham Farley, using special "record" type (which makes it rather difficult to read), and it has never been superseded. There followed in the next generation a volume of indices, a general introduction. and a volume of kindred documents including the *Inquisitio* Eliensis (a private record, compiled by the abbot, of the lands of Ely, all of which lay in the counties of Norfolk, Suffolk, Essex, Cambridge, Hertford and Huntingdonshire) and the Exon Domesday. Finally in 1876 N. E. S. A. Hamilton published the *Inquisitio comitatus* Cantabrigiensis (*The Inquisition* of the *County* of Cambridge), a document of great importance. being a very early draft of the Cambridgeshire material and demonstrating the actual procedure adopted by the commissioners, whose "terms of reference" are preserved in the *Inquisitio Eliensis.* The method was that of the sworn inquest, by which answers were given under oath to a long list of definite questions. Formal sessions were apparently held in the chief county town. and the facts were supplied by the sheriff, the barons and their subtenants, a jury (half English, half French) from each hundred, while from every village there attended the reeve, the priest and six villagers. The procedure was thus strictly geographical — by shires, by hundreds and by villages — and the Cambridge inquisition actually preserved the information so arranged for that county. But however initially recorded (and practice probably varied from circuit to circuit) the facts were finally grouped in the circuit returns under the names of the king and the tenants-in-chief, and in this form returned to Winchester. The task of king's clerks at Winchester was thus simply to summarize in Great Domesday these huge collections of statistics, by omitting nearly three-quarters of the material submitted to them.

Aim of the Survey. — The motives which prompted the making of the survey were, no doubt, mixed; but the form of our three surviving originals — Domesday Book vol. I and II and Exon Domesday — proves that the basic purpose was to ascertain the extent and value, first, of the king's lands, and secondly of those of the holders of land, *i.e.,* the tenants-in-chief. It could hardly be otherwise in that feudal age when the royal revenue was largely drawn from these two sources. As for the land tax or geld, the reassessment of which was once thought to be the sole object of the survey. the records show clearly that the interest of the commissioners lay rather in achieving a more rigorous enforcement of its collection and in discovering concealed hides. Nor must the importance be overlooked of merely getting the facts down in writing in a hitherto largely oral and customary world. The Conquest had resulted in the expropriation of virtually the whole of

the old English upper class, and even the great churches, like Canterbury, Worcester and Ely, had suffered grievous territorial losses at the hands of the new Norman lords. The text of Domesday Book is full of bitter disputes regarding lands unlawfully seized since the Conquest. The survey had thus something of the character of a judicial eyre, though in general the commissioners were more careful to put on record the opposing claims to ownership than to decide between them.

Contemporary and Subsequent Value. — Domesday Book thus gives a detailed, statistical picture of the new aristocratic society. For the king's officers it was a guide to the royal demesne, to the holders of baronies, and to a lesser degree of mesne baronies; while for the ne nobility who had been largely enfeoffed without written evidence *(sine carta)* it filled the place of title deeds. Great landowners secured copies of those pages which concerned them, often inflated by additional local details: and there still survive a number of such Domesday satellites, of which the best known is the *Domesday Monachorum* of Christchurch. Canterbury (ed. by D. C. Douglas, 1944). With the passage of time the importance of Domesday Book grew steadily: it acquired legal authority and was often quoted in the law courts. as indeed it sometimes is today. Rut the details of manorial economy — the amount of plough and meadow land, the numbers of villeins and bordars — went quickly out of date, and this soon led to the compilation, not later than the early 12th century. of a further official abbreviation, the Breviate of Domesday, which omitted these facts. This was sufficiently important to be splendidly recopied in the 13th century, and is now in the Public Record office, London. There is a record of repairs to the binding of the smaller volume in the 14th century; while in 1869 both volumes were rebound and again in 1953.

DOMESTIC APPLIANCES: *see* HOME EQUIPMENT.

DOMESTIC ECONOMY: *see* HOME ECONOMICS.

DOMESTIC RELATIONS. a term used to express the legal relations existing between the various units that compose the family or domestic group. See MARRIAGE, LAW OF; DIVORCE; ANNULMENT; HUSBAND AND WIFE, LAWS CONCERNING; WOMEN, LEGAL POSITION OF; CHILDREN, LAWS CONCERNING.

DOMESTIC SCIENCE: *see* HOME ECONOMICS.

DOMICILE (DOMICIL) **AND RESIDENCE,** terms used in lam to designate a person's dwelling place for purposes of judicial jurisdiction, governmental burdens and benefits. and choice of law. Under all systems of law certain aspects of a person's legal existence do not vary with the state where he happens to be at any given moment but are governed by a personal law that follows him at all times. In Anglo-American countries one's personal law is that of his domicile; elsewhere, it is often that of his nationality.

The state of a man's domicile has judicial jurisdiction over him, *i.e.,* can try a case against him in its courts, even though he happens to be outside its borders at the time he is summoned. So far as governmental burdens and benefits are concerned, only the state of a man's domicile can impose an inheritance tax upon all of his intangibles. This state also permits a man to vote and to hold public office and on occasion will pay him a veteran's bonus. In the field of choice of law, it is the law of a man's domicile that determines the validity of his will with respect to personal property or that decides how such property shall be distributed in the event of an intestacy. The law of a man's domicile also may play a part in determining his legitimacy and the validity of his marriage.

It is a fundamental principle that every person must have a domicile at all times. If this were not so, there would be occasions when a man did not have a personal law. Corollaries to this principle are that a domicile is not lost until another domicile has been acquired and that a person cannot have more than one domicile at a time for the same purpose. The burden of proof is upon him who asserts that there has been a change of domicile.

Types of Domicile. — It is commonly said that there are three kinds of domicile: domicile of origin, domicile of choice and domicile by operation of law.

Domicile of origin is the domicile that a person acquires at birth. Generally, it is the domicile that the father has at that time. If, however, the father is deceased or the child is illegitimate, the domicile is that of the mother. In the United States a domicile of origin can be lost as readily as any other kind of domicile. In England such a domicile enjoys unusual importance. Greater evidence than would be necessary in the case of other kinds of domicile must be submitted to justify a finding that a person has lost his domicile of origin. Also, under a special English rule a person regains his domicile of origin as soon as he leaves a subsequently acquired domicile of choice and is on his way to another.

Domicile of choice is the kind of domicile possessed by most persons. Usually it will be in the state with nhich a person is most closely connected and whose law is therefore best suited to govern the legal matters described above. There are three requirements for the acquisition of such a domicile. First, the person must have the requisite legal capacity. Minors, incompetents and, to a lesser extent, married women lack such capacity. Secondly, there must be physical presence in the place where domicile is claimed. Presence by reason of physical compulsion will not satisfy this requirement. Hence a domicile of choice cannot be acquired in a jail, and it is difficult for a person to acquire such a domicile in a place to which he is sent by military orders. Thirdly, the person must bear the requisite attitude of mind toward the place. This attitude is the present intention to make the place one's home; an intention to make the place one's home at some time in the future will not suffice. To intend to make a place one's home it is necessary that one intends to stay there for an appreciable length of time. The longer one intends to stay in a place, the easier it will be to find that he has the requisite attitude of mind. The rule is stricter in England, where it is held that to acquire a domicile of choice in a place one must intend to remain there permanently. These three requirements must exist at the same time. Provided that they do so even for an instant. a domicile of choice has been acauired. Determination of a man's domicile of choice may present many difficulties in situations where his contacts are more or less equally divided between two or more states.

Domicile by operation of law is a domicile, other than one of origin, that is possessed by persons who lack legal capacity to acquire a domicile of their own. Minors are the prime example. A minor's domicile usually follows that of the father. so that if the father acquires a new domicile after the child's birth, the child will take that domicile also. Where the father is deceased or the child illegitimate, the child's domicile is that of the parent to whose custody he has been anarded. If there has been no custody award, the child's domicile is that of the parent with whom he lives.

Persons who are unable through lack of mental capacity to form an intention to make a place their home cannot acquire a domicile of choice. Provided that they are adults, the domicile of such persons will normally remain that which they possessed at the time when they became incompetent.

The domicile of a married woman follows that of her husband so long as she lives with him. If the spouses live apart or if the husband is deceased. a married woman has as much power as anyone else to acquire a domicile of choice.

Residence and Abode. — Complications are caused by the fact

that statutes rarely use the word domicile but refer to residence instead. Residence, in such a context, usually bears the same meaning as domicile. On occasion it may mean something else than domicile, such as a well-settled physical connection nith the state without bearing toward it the requisite attitude of mind. Sometimes. residence means something more than domicile. namely, domicile in a place plus physical presence there during a specified period of time. Residence when used in a statute means, in any event, a far closer relationship with a state than mere physical presence there. As in the case of domicile, a residence, once it has been acquired, is not lost by a temporary absence from the state. Some statutes use the word abode instead of residence. When so used. abode may bear any of the meanings ascribed to residence. In contrast to domicile, a man may have more than one residence or abode at a time.

DOMINANT: *see* SCALE.

DOMINIC, SAINT (DOMINGO DE GUZMÁN) (1170?–1221), founder of the Order of Preachers. known also as the Dominicans (*q.v.*) or Black Friars. He introduced the idea of an order with a universal mission of preaching, and also certain novel elements of organization and representative government. The order has retained its unity and its framework of law and custom under an unbroken sequence of masters general from St. Dominic to the present day.

Domingo de Guzmán was born at Caleruega in Castile, south of Burgos in northern Spain. perhaps a year or two later than 1170, the traditional date. His father. Felix de Guzmán. was lord of the manor in the village. and his mother. Jane de Aza. was also from the local nobility. He studied at Palencia and then joined the canons of Osma. who had recently become canons regular with the rule of St. Xugustine, and there he gained experience both of monastic life and of the cure of souls. In 1203 the bishop of Osma, Diego de Azevedo, was sent on a royal mission abroad and took Dominic with him. This journey first made Dominic aware of the situation in the south of France with the Albigensian heretics.

The Albigenses (*see* CATHARI) were reviving and developing the Manichaean teaching of two supreme beings. good and evil, dominating spirit and matter respectively, so that all that. concerned the body — eating. drinking, marriage and procreation and the possession of worldly goods—was essentially evil, and the ideal was the renunciation of these things and even of life itself. Thus there arose among them a caste of the "perfect" who led a life of great austerity. while the ordinary people were regarded as reprobates. Thousands were carried away by this false idealism, and a regular Albigensian hierarchy had come into existence. Moreover the local feudal lords, especially the count of Toulouse. were supporting the Albigenses. Pope Innocent III had launched a mission with papal legates and a group of monks commissioned to preach against the heresy.

This was the world in which Dominic and his bishop suddenly found themselves. On their return journey they visited the pope, who refused their request to go and preach to the pagans, indicating more urgent work close at hand. So they returned to France. It was 1206 and the legates and preachers, depressed at the failure of their mission, consulted Diego and Dominic, who saw the reason for it: the heretics would be regained only by an austerity equal to their own; the preachers must abandon their equipages and tramp the roads barefoot and in poverty. This was the birth of Dominic's "evangelical preaching."

The next year Diego returned to Spain, but Dominic remained in France and continued his campaign, an important part of which was the establishment as a convent of nuns at Prouille of a group of women converted from heresy (1207).

In 1208 disaster occurred: the papal legate, Peter Castelnau, was murdered by an emissary of the count of Toulouse. Here was a *casus belli,* and the pope called upon the Christian princes to take up arms. The leader on the papal side was Simon de Montfort. a subject of the king of France and *de jure* earl of Leicester though unable to claim his estates in England through troubles with King John. The Albigensian leader was Count Raymond of Toulouse. an opponent of the king of France and brother-in-la17 of Ring John. lord of neighbouring Aquitaine, who was also at variance with the pope and was excommunicated in 1209. Dominic's work, though confined to the Prouille area. was continuing. and six others eventually joined him. Meanwhile the civil war dragged on until Simon's victory at Muret in 1213. The Catholic party entered Toulouse. and Dominic and his friends were welcomed by the bishop (the attractive former knight and troubadour Foulques) and established as "diocesan preachers" in 1215.

From Foulques's charter in that year Dominic's design for an order devoted to preaching developed rapidly. A characteristic concern was for the theological formation of his men, whom he therefore took to the lectures at Toulouse of the Englishman Alexander Stavensby. Still in 121j. he went to Rome with Foulques (bound for the Lateran council) to lay his plans before the pope, who. however, recommended adoption of one of the existing rules. It was perhaps at this time that Dominic met Francis of Assisi (though the meeting may not have taken place till 1221), and the friendship of the two saints is a strong tradition in both the Franciscan and Dominican orders. In the summer of 1216 Dominic was back at Toulouse conferring with his companions. now 16 in number. This meeting has been called the *capitulum fundationis.* The rule of St. Augustine was adopted, as well as a set of *consuetudines,* partly based on those of the canons regular, concerning the divine office, monastic life and religious poverty. including mendicancy: these are still the core of Dominican legislation. In July Innocent III died! and it was from his successor. Honorius III, that Dominic, once more in Rome, finally received the bull of confirmation of his order on Dec. 22. 1216.

The order was now an established body within the church. and Dominic returned to Toulouse. On Aug. 15, 1217, he made a gesture of confidence in his men: he scattered them to Paris, the centre of learning, and to Spain, leaving two each at Toulouse and Prouille. while he and another went to Bologna and Rome. It was Dominic's special gift to conceive his ideal. form his men to that ideal and then trust them completely. His supreme leadership had great clarity of vision, even to the geographical distribution of his forces and precise details of legislation. firmness of command and certainty of execution. At the same time it was said of him that such was his gentleness that none came to speak to him. even for reproof, but went away happier. and his friend and biographer, Jordan of Saxony, reports that "he loved everyone, so everyone loved him."!

The rest of Dominic's life was spent either in Rome, where he was given the church of S. Sisto, or traveling. In 1218–19 he made his great tour (3.380 m i entirely on foot) from Rome to Toulouse and Spain and back via Paris and Milan, and in 1220 a tour of Lombardy. Everywhere his communities were growing. and he planned many new foundations covering the key points of France and northern Italy. In Rome the pope gave him the delicate task of reforming various groups of nuns. whom he finally gathered at San Sisto in 1221 (this date seems established by M. H. Vicaire), when the brethren moved to Sta. Sabina, which is still the residence of the master general.

At Pentecost in 1220 the first general chapter of the order was held at Bologna. when the present system of representative government was devised. At the second general chapter, held at Pentecost in 1221, also at Bologna, the order was divided geographically into provinces (with England as the eighth. the first brethren being dispatched to England from that chapter) and was established juridically as it is today. This n-as Dominic's last great work. After a visit to Venice he died at Bologna on Xug. 6. 1221.

Dominic was canonized in 1234, and his feast day is Aug. 4. The testimonies of witnesses provide a wealth of details and present him as a man at once inspiring as a leader and legislator and affectionate as a friend and father.

du XIII^e siècle, provides (in French) the documents edited by Vicaire (1955). Many oi the Latin texts and charters mere published as *Monumenta historica S. Dominici* (in the series *Monumenta ordinis fratrum praedicatorum historica,* vol. *15–16,* 1933–35). The best biography in English is B. Jarrett, O.P., *Life ,of Saint Dominic (1924).* (S. BH.)

DOMINICA, an island of the Lesser Antilles in the Caribbean sea. It was formerly a British colony of the Windward Islands and joined the West Indies federation in 1958; the federation was dissolved in 1962. Dominica lies between the French islands of Guadeloupe and Marie Galante to the north and Martinique to the south and about 25 mi. distant from each. Dominica is 31 mi. long. has a maximum breadth of 16 mi. and an area of 305 sq.mi. A range of high forest-clad mountains runs north to south, broken in the centre by a plain drained by the rivers Layou and Quanery, which flow west and east, respectively; the highest points are Morne Diablotin (4.747 ft.) and Morne Trois Pitons (4,672 ft.). The island is of volcanic formation, signs of activity including *solfataras* and hot springs, In the south, Boiling lake lies 2,300 ft. above sea level, and its waters are often forced 3 ft. above normal by pressure of escaping gases.

At sea level the temperature varies between 70° and 90° F., but in the mountains it frequently falls to 60° F. Rainfall varies greatly, from over 200 in. in the highlands to between 60 and 100 in. on the west coast; the island average is 113 in. Dominica has rich soil and is watered by many rivers and torrents, which provide power for lime-crushing mills. The fisheries are productive. Wild bees furnish honey and wax.

The main crops are bananas, citrus fruits, coconuts, cocoa, vanilla and mangoes; the main products are lime juice, lime oil, copra and rum. Chief imports are food, liquor, tobacco, textiles and machinery.

Dominica's system of government is ministerial. The executive council consists of the administrator, one official and five unofficial members. The population in 1960 was 59,916, chiefly Negroes. There is a small white community of French and British descent, and a handful of Caribs. A French patois is the language of the peasantry, but English is generally understood. The capital, Roseau (13,500 [1957 est.]), and Portsmouth (3,000) are on the west coast, and both are ports. Roman Catholicism is the predominant religion. Primary education is compulsory at 47 elementary schools, and there are 4 secondary schools attended by 1,600 children. During the 1950s the island's income more than doubled and this, with other factors, led to a shortage of labour.

Several shipping lines call regularly at Roseau. Before completion, in 1960, of the airfield at Melville Hall, in the northeast, airlines using amphibians or seaplanes provided service to Soufrière bay, in the southwest of the island. Dominica has motor roads.

Christopher Columbus named Dominica in cominemoration of Sunday, Nov. 3, 1493. The first colonists (1632) were French, but in 1748 an agreement between the French and British assigned Dominica to the Caribs. Nevertheless French influence increased, and a French governor ruled. In the wars from 1756 onward Dominica several times changed hands between the British and French, but after 1805 it remained British. At first administered as part of the Leeward Islands. in 1771 Dominica was made a separate colony. It was rejoined administratively to the Leewards in 1832 and remained thus until 1910, when it was transferred to the Windwards as a separate colony.

See *Colonial Office List* (H.M.S.O., annually). (R. To.)

DOMINICAL LETTER or **SUNDAY LETTER:** see CALENDAR.

DOMINICAN REPUBLIC (REPÚBLICA DOMINICANA) shares with Haiti the island of Hispaniola in the Rest Indies. It was the site of the first Spanish settlements in America and formed the Spanish colony of Santo Domingo (*q.v.*) for three centuries after the foundation of Isabela by Christopher Columbus in 1493. As St. Domingue it was ruled by France, and for 22 years by Haiti (*q.v.*) before attaining independence in 1844. Though one of the smallest (18,703 sq.mi.) of the American republics, it has played a relatively important part in international politics because of its location on one of the chief sea routes between Europe and eastern North America on the one hand and the Panama canal on the other. Its people live by agriculture, growing subsistence crops or working on plantations of sugar, cacao and other tropical products raised for export. The production of sugar, now the principal export. has greatly increased.

This article is divided into the following sections:

I. History
II. Population
III. Administration and Social Conditions
IV. The Economy

The geography of the Dominican Republic is treated unitarily with the geography of Haiti in the article HISPANIOLA. Some historical and economic aspects may also be found in the short provincial articles.

I. HISTORY

The Dominican Republic was until mid-20th century one of the poorer and more backward Latin-American states. The country attracted relatively few settlers during the colonial period. and many people of Spanish descent left it during the 19th century. Except for a small, educated upper class, the people are for the most part of Negro or mixed Negro and Spanish ancestry. (See *Population,* below.) Poverty and illiteracy made the establishment of a republican government difficult, and the country was ruled from independence by regimes set up and maintained by military force. Three times between 1822 and 1924 it was occupied by foreign armies. Internal disorder long discouraged the development of agriculture and industry, but in the second quarter of the 20th century, and especially after the inauguration of the Trujillo dictatorship in 1930, the country began to make substantial progress in such matters as agricultural production, road building and education.

Christopher Columbus discovered Hispaniola on his first voyage in 1492 and landed at Môle St. Nicolas. He left a number of his men on shore at La Navidad, in what is now Haiti. These were killed by the Indians, but on his second voyage in 1493 Columbus brought out a large number of new settlers, and in 1496 his brother, Bartholomew, founded the city of Santo Domingo (*q.v.*), as the capital of the first Spanish colony in America. Santo Domingo was the starting point of most of the expeditions that explored and conquered the other West Indian islands and the adjacent mainland. The colony prospered for several years, especially after Columbus was removed as governor in 1500, but its importance declined after the conquest of Mexico and Peru and after the native Indian population was destroyed by mistreatment and disease. So many settlers left that Spain practically abandoned the west end of the island, and in the 17th century the buccaneers from nearby Tortuga Island began to establish plantations there. In 1664 the French Company of the West Indies took possession of the west end, and in 1697 Spain formally ceded the area to France in the treaty of Ryswick. The east end of the island shared relatively little in the prosperity of the west end, French St. Domingue, but its population increased somewhat during the 18th century nith immigration from the Canary Islands and the importation of Negro slaves.

Spain ceded the rest of Santo Domingo to France by the treaty of Basel in 1795, but the European war prevented the actual transfer of possession. In 1801, however, the Negro leader Pierre Dominique Toussaint l'Ouverture (*q.v.*), who had seized power in the French colony, conquered the nhole island. Toussaint was defeated in 1802 by an army sent by Napoleon and French forces held the eastern end of the island until 1809. despite their failure in Haiti. In 1808 a creole revolt, led by Juan Sanchez Ramírez and aided by a British naval squadron, restored Spanish rule. The creoles revolted against Spain in 1821 and attempted to unite Santo Domingo to Bolivar's Republic of Colombia They set up a government headed by José Núñez de Cáceres, but this fell in 1822 when a Haitian army invaded the country. The Spanish end of the island was ruled as a conquered province by the Haitians until they mere expelled by an uprising led by Juan Pablo Duarte (*q.v.*), and Dominican independence was proclaimed in the city of Santo Domingo on Feb. 27, 1844.

The constant fear of a new Haitian invasion and the internal disorder caused by the struggle for power between Pedro Santana and Buenaventura Báez made independence seem a doubtful blessing, and several Dominican leaders advocated placing the country under the protection of some foreign power. The U.S., France and Great Britain interposed to prevent attacks from Haiti, but the earlier projects for a European protectorate were defeated by jealousies among the powers and the lack of real interest in what promised to be a troublesome responsibility. In 1861 Pres. Pedro Santana brought about the reannexation of the country to Spain. but the restoration of the unenlightened centralized colonial government aroused much opposition and the Spanish army. hampered by yellow fever, was unable to maintain order. The Dominicans' resistance, and a realization that the end of the American Civil War would leave the U.S. free to follow up the strong protest that it had made in 1861, led to a final separation from Spain on July 11, 1865. Soon afterward a project for annexation to the U.S. was promoted by two adventurers named William Cazneau and Joseph Fabens. who held several concessions in the Dominican Republic, and gained the support of Báez, the most powerful political leader after the death of Santana in 1864, and of high officials of the U.S. government. A representative of President Grant negotiated treaties for annexation and for a 99-year lease of Samaná bay (see SAMANÁ) in 1869, but opposition in the U.S. senate prevented their ratification.

After Baez fell from power in 1874 there was a period of acute disorder until Ulises Heureaux became president in 1882. Heureaux's regime. a cruel and corrupt despotism, gave the country its first long period of peace. Sugar production, financed partly by North American capital, increased but reckless financial mismanagement paved the way for future trouble. The government repeatedly sold large amounts of bonds in Europe, squandering the proceeds and then refunding and scaling down its debts when it was unable to maintain service on them. After 1892 it carried on these transactions through the San Domingo Improvement Company of New York, which assumed a measure of control over the customs collections and went into partnership with Heureaux in other enterprises, including railroad building and the purchase of the national bank, formerly controlled by French interests.

When Heureaux was killed by political enemies in 1899 there was a period of disorder, with weak governments rising and falling in quick succession. One of these ousted the Improvement company from the customhouses, and the U.S. insisted that the resulting dispute be arbitrated. After a bitter controversy the Dominican government agreed to pay the company $4,500,000 in installments, and an arbitral tribunal ordered that the U.S. should take over certain customhouses if these installments were not met. Meanwhile several European governments pressed claims of their nationals and President Morales asked the U.S. for help. A treaty signed in 1905 provided that the U.S. government should take over the collection of the republic's customs revenues and should endeavour to arrange a general settlement with the country's creditors. This treaty was defeated in the U.S. senate, but a C.S. customs collectorship was nevertheless established under a temporary arrangement. In 1907 another treaty, providing for the collection of the customs by officials appointed by the president of the U.S., to afford security for a loan by U.S. bankers, was signed and ratified. The loan did not materialize but by 1907 a substantial sum was available for debt settlement because 55% of the customs revenues had been set aside for this purpose since 1905, and the creditors were persuaded to accept scaled-down settlements paid partly in cash and partly in bonds secured by the customs collections. This arrangement averted the danger of European intervention and gave the government more money than it had previously had for administration and public works.

The United States' moral support of the constituted authorities and the fact that insurgents could no longer finance their operations by seizing customhouses discouraged revolutions for several years, but new disolders set in when Pres. Ramón Cáceres was assassinated in 1911. When Col. Alfredo Victoria, the military commander of Santo Domingo city. installed his uncle Eladio Victoria as president, the other party leaders revolted. A mission sent by the U.S. government in 1912 persuaded all factions to agree on the election of Adolfo Nouel, the archbishop of Santo Domingo, as provisional president, but Monsignor Nouel resigned early in 1913 because he could not control the military chieftains who were the real rulers in several provinces. The congress then elected José Bordas Valdés for a one-year term, but within a few months a new civil war started. U.S. diplomatic intervention again restored peace, but only for a short time. In Aug. 1914 President Wilson threatened to intervene by force if the factional leaders did not lay down their arms and agree on a provisional president under whom free elections could be held. He promised to assure, fair play in the elections by sending observers. and said the U.S. would itself suppress any revolution against the government that was chosen. The Dominicans agreed to the "Wilson plan," and Juan Isidro Jiménez became constitutional president in Dec. 1914.

It was clear by this time that the customs collectorship alone did not assure the government's solvency. After 1911 military expenditures and the payment of blackmail to potential revolutionists had left little money for other purposes, and a large floating debt had accumulated. The U.S. consequently demanded that Jiménez give a U.S. controller supervision over expenditures. and that the customs service take over the collection of the internal revenues. At the same time it urged the creation of a constabulary under U.S. officers to replace the unreliable and corrupt regular army. Jiménez rejected these proposals and they were not pressed for the time being. In April 1916 Jiménez attempted to free himself from the control of Desiderio Arias, the minister of war. who was the most powerful figure in the government. When Arias defied him! Jiménez resigned, refusing the proffered military aid of U.S. forces. The U.S., which regarded Arias' ambition as the chief obstacle to its efforts to esiablish stable government, at once landed marines at Santo Domingo and other ports and took military control. It demanded that Francisco Henriquez y Carvajal, the new provisional president, accept the financial and military reforms that it had urged on Jiménez. The customs service took over the collection of the internal revenues, so that the Dominican government had no funds, but Henriquez nevertheless refused to accept the proposed reforms and on Nov. 29, 1916, a U.S. military government was proclaimed.

Most of the Dominicans resented this intervention. U.S. marines had to suppress small revolts in 1917 and 1918, and martial law and a strict censorship of the press were continued after order was restored. There was much criticism of the occupation policy, in the republic and abroad. and the discontent increased when the prosperity brought by World War I was followed by an economic collapse. President Wilson announced in Dec. 1920 that the marines would soon be withdrawn, but the Dominican leaders refused to co-operate in establishing a native government because the U.S. still insisted on the reforms proposed in 1915. In 1922. however, the U.S. abandoned this condition and agreed with the Dominican leaders on a plan for the restoration of a free government. The occupation was withdrawn when Gen. Horacio Vázquez was inaugurated as president in 1924.

Economic prosperity and the efficiency of the new army, which had been trained by the U.S. marines, kept the country at peace until Vázquez attempted to bring about his own re-election in 1930. When his opponents revolted, the army offered little resistance, and soon afterward the commander of the army, Gen. Rafael Leónidas Trujillo Molina, was elected president. General Trujillo was the undisputed ruler until he was assassinated in 1961, retaining control through his command of the army during the periods when he permitted a friend or a member of his family to occupy the presidency. When he took office the country was suffering from the effects of low sugar prices, and a hurricane that destroyed most of the capital city in Sept. 1930 made matters worse. Within a few years the country began to make notable economic progress. Exports increased, and the highway system. begun during the U.S. occupation, mas improved and extended. In 1940 a treaty with the U.S. abolished the customs collectorship. which had been in existence since 1905. and in 1947 the foreign debt was paid in full. The long-standing boundary dispute with Haiti was settled by a treaty signed in 1935. Two years later. however, the massacre of

many thousands of Haitians living in the Dominican Republic brought the two countries to the verge of war, and a conflict was averted only by the interposition of the other American republics and the Dominican government's promise to pay a large indemnity. In 1941 the Dominican Republic declared war on Japan and Germany immediately after Pearl Harbor. There were no important internal disturbances between 1930 and the late 1950s, but the dictatorial character of the government and its alleged harsh treatment of political opponents exposed it to much criticism abroad. On May 30, 1961, General Trujillo was assassinated. After a period marked by strikes and some disturbances, the Trujillo family fled the country and Pres. Joaquin Balaguer formed a coalition government. Balaguer, ousted by a two-day seizure of power by a military junta, was succeeded Jan. 18, 1962, by Rafael L. Bonnelly, who became president of the provisional council of state. (D. G. Mo.)

II. POPULATION

Number and Distribution. — The census of 1950 enumerated 2,135,872 persons in the Dominican Republic, or the equivalent of 115 per square mile. By the 1960 census the total had risen to 3,013,525, with a density of 161 per square mile. (See Table.) Santo Domingo, the national capital, had a population of 367.053 in 1960, and the second largest city, Santiago, one of 83,523. The population is mainly rural, the 1960 census listing only 30.5% in places of 2,500 or more.

Composition. — The bulk of the Dominican Republic's people are of mixed white (mainly Spanish) and Negro descent. Thus the proportions classified as mestizo (*i.e.,* mulatto) were 67.5% in 1935 and 60.4% in 1950. Between 1935 and 1950 the percentage classified as white rose from 13.0 to 28.1 and that classified as Negro fell from 19.5 to 11.5. In all probability the proportion of whites actually rose slightly, but it is likely that differences in the criteria used in making the classification were responsible for most of the apparent change. A total of 339 persons classified as Asiatic also was reported in the 1950 census. The aboriginal population of Hispaniola (the Dominican Republic and Haiti) consisted of two main groups, both of which originated in South America: the Arawaks (including the Taino, Ciguayo and Lucavo) and the Caribs. The Indians were village dwellers, cultivating cassava, corn, sweet potatoes, yams, beans and pepper; they were fairly skilled at pottery making, basketry, woodworking and boatbuilding. After European contact the Indians succumbed to massacres and disease, and there is no evidence that they perceptibly influenced the racial mixture found in the Dominican Republic in modern times.

Only 34,654 (1.6%) of the 1950 population were classified as foreign born, and of these, 19,193 were from neighbouring Haiti. The next largest groups came from the following: the British Antilles 2,579; Puerto Rico 2,216; Great Britain 2,066; Spain 1,800; and the U.S. 913.

The sexes are almost equally represented, the number of males per 100 females being 102.0 in 1960. Because of the high birth rate and the relatively high death rate, children of less than 15 years of age constitute a high proportion and persons of 65 and over a low proportion of the total population. Thus in 1950 the percentages of those under 15, between 15 and 64, and 65 or over were 44.5%, 52.6% and 2.9%, respectively.

Spanish, the official language, is spoken by all except the small groups of foreign born. The latter, mostly from Haiti. are usually employed on the sugar-cane plantations and are French speaking.

According to the 1950 census reports, over 98% of the people in the Dominican Republic are Roman Catholics, but the following totals also were reported: Protestants 33.440 (including 2,902 Adventists); no religion 1,845; and other 2,113.

Growth of Population. — The census of 1920 gave a population of 894,665, which by 1935 had increased to 1,479,417 and by 1960 to 3,013,525. During the period 1935 to 1960 the population of the Dominican Republic had increased at the rate of 3% per year, a rate above that for all Latin-American countries except Costa Rica, El Salvador, Guatemala, Honduras and Panamá, and one that is unmatched in practically all other parts of the world. Since the foreign-born population numbered 73,820 in 1935 and only 32,623 in 1950, it appears that the population increase is due to the excess of births over deaths.

After 1950 the reported birth rate averaged about 40 births annually per 1,000 population, but it was likely that the true rate was above 45. Also, it was improbable that it had begun to decline. The reported death rate, about 10 per 1,000 population, seemed to be substantially below the rate actually prevailing in the 1960s, probably between 20 and 25. The death rate. however, almost certainly was falling in the second half of the 20th century, possibly very rapidly, as the impact of modern health and sanitary measures was felt on the island of Hispaniola and in the Caribbean area. (T. L. SH.)

III. ADMINISTRATION AND SOCIAL CONDITIONS

Government. — The Dominican Republic has adopted more than 20 constitutions. New constitutions are drafted when relatively minor modifications are desired. The constitution proclaimed Dec. 1, 1955, is only slightly different from the 1947 constitution, which was similar to the 1942 and 1934 constitutions.

The 1955 constitution established the Dominican Republic as a unitary state with separation of powers (legislative, executive and judicial branches) but with tendencies toward a semiparliamentary system. Thus, the legislature was empowered to force the president's ministers to appear and be subjected to interpellation. The judiciary was given the power to propose laws. All recent constitutions concentrate great powers in the executive, however.

Government is highly centralized and controlled by the president, who has broad authority to legislate by decree. "His Excellency the Generalisimo and Dr. Rafael Leónidas Trujillo, Benefactor of the Fatherland," undoubtedly the most powerful Dominican *caudillo* or leader of the 20th century, dominated government from 1930 until his assassination in 1961. With a single party (the Dominican party) and hand-picked lists of candidates along with straight-ticket voting without provision for blank ballots or write-ins, no organized opposition could exist. The

*Provisional figures. †Created January 1, 1959. ‡Created April 1, 1958.

congress is composed of a senate and a chamber of deputies. The senate has 23 members. elected directly for five years. with one senator from each province and from the District of Santo Domingo. The chamber of deputies of 52 members is elected for five years from the provinces according to the ratio of one representative for each 60.000 population, with each province guaranteed at least two deputies. Every congressman is a member of the Dominican party. Provincial and local governments are controlled by the central government. Gen. Héctor Bienvenido Trujillo Molina, brother of the *generalísimo,* was elected president in a *candidato único* (single-candidate) election in 1952 and re-elected in the same way in 1957.

The Dominican Republic is the only country in Latin America which permits the president to succeed himself. All men and women above 18 years of age (or less, if married) are entitled to vote and are eligible to elective office.

Education and Social Welfare.—Official statistics revealed that in 1950, 56.8% of the population aged ten or older were illiterate. The Education act of 1951 made primary education compulsory between the ages of 7 and 14, and provided free meals for needy children; however, the average length of primary school enrollment in the 1950s was only four or five years. and probably only about one-half of the children of school age were attending school. A determined effort was made after 1955 to eliminate illiteracy among adults. The University of Santo Domingo had an enrollment of about 3.000.

In public health and in social-welfare services. the Dominican Republic is among the most advanced Latin-American countries. The greatest remaining threat to health in the early 1960s probably was malaria, though with United Nations help the problem was being overcome. The social insurance laws go back to 1947. The system. paid for by contributions of employers and employees with some state support, provides medical. maternity and dependents' and cash benefits. There were about 25,000 members of a trade-union movement, which was directed and controlled by the government. (W. S. Ss.)

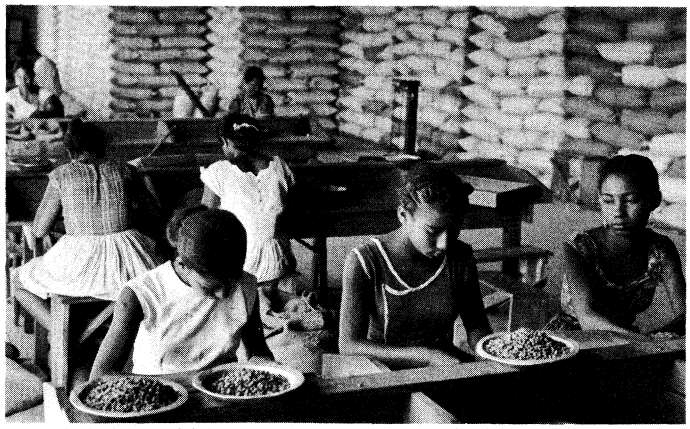
IV. THE ECONOMY

Agriculture.— Much of the population derives its livelihood within a system of subsistence agriculture which emphasizes corn and cassava. Ownership of the land has been, however, in a few hands. and there has been a tendency toward concentration of holdings rather than toward wider distribution. The absolute number of individual holdings declined in the period immediately after World War II.

The economy of the Dominican Republic is basically agricultural, and the country is one of the leading producers of sugar. Sugar cane is grown along the southern coast from Barahona to La Romana and on the northern coast in the province of Puerto Plata. The processing of sugar cane has represented by far the principal industrial activity. In 1955 the sugar industry accounted for 134,000,000 pesos ($134,000,000) of the 201,000,000 pesos invested in industry in the country. There were 15 sugar mills, called *ingenios* or *centrales,* which, in addition to raw sugar. produced molasses and bagasse. A number of them had irrigation systems and all had private railroad facilities; otherwise there was little industry, and much of such enterprise as existed was government owned or Trujillo owned.

Trade and Finance.— Four commodities—sugar (55%) and coffee, cacao and tobacco—accounted for about 85% of the total exports in the latter 1950s. The only nonagricultural export item of importance was iron ore, mined at Hatillo. The U.S. provided more than 60% of Dominican imports and took about 40% of the exports. The major exports to the U.S. are coffee and cacao; Great Britain buys about two-thirds of the nation's sugar exports.

The basic monetary unit is the Dominican peso (RD$) of 100 centavos (officially pegged at a value equal to the U.S. dollar). Prior to Oct. 1947, when the Monetary law was enacted, U.S. money constituted the only circulating paper currency in the country, with Dominican coins serving as subsidiary currency. Although technically the Dominican peso was the sole legal currency in the 1950s, U.S. paper currency still circulated widely. The



STOPELMAN—PIX FROM PUBLIX

DOMINICAN GIRLS SORTING COFFEE BEANS

Central bank was the sole bank of issue and was authorized to perform the usual functions of a central bank.

Transportation.- he only public service railroad in the 1960s was the government-owned and operated United Dominican railways. That line ran from Sánchez, located on the Samaná bay coast in the northeastern sector of the country, up the Yuna river valley. The Dominican Republic had a total of 2,400 mi. of roads, of which about 80 mi. consisted of surfaced highways. Three highways fanning out from Santo Domingo comprised the backbone of the system. There were also about ten active seaports, of which Santo Domingo was the most important, handling about two-thirds of all imports and nearly half of the total exports.

DOMINICANS (ORDO FRATRUM PRAEDICATORUM; O.P.; FRIARS PREACHERS; BLACK FRIARS; ORDER OF PREACHERS), an order of mendicant friars founded by St. Dominic (*q.v.*) in 1216. Dominic became a canon of Osma and accompanied his bishop, Diego de Azevedo, on a tour of preaching among the Albigensian heretics in Languedoc, where he founded a nunnery at Prouille (1207), partly for his converts, served by a community of preachers. From this developed the conception of an institute of preachers to convert the Albigensians, which received provisional approval from Innocent III in 1215. Dominic gave his followers the rule of St. Augustine and made his first settlement at Toulouse; on Dec. 22, 1216, Honorius III issued the formal bulls of approval. The novelty of the institute was the commission to preach Christian doctrine, a task previously regarded as the prerogative and monopoly of bishops and their delegates (the success of the heretical preachers in the south of France revealed the extent to which this task had been neglected); a corollary was the obligation of theological study, and as early as 1218 Dominic sent seven of his followers to Paris university. In 1219 the brethren at Toulouse exchanged the dress of canons for a white woolen tunic, scapular and hood, with a black mantle for formal occasions and travel; and this dress was adopted officially the following year.

Constitution.— The two first general chapters of the order were held at Bologna in 1220 and 1221. From the beginning emphasis was laid on study and preaching as the fundamental purposes of the order, based upon an austere community life learned in the quasi-monastic regime of the friary. The legislation of the order was in two parts or "distinctions," one dealing with the discipline of conventual life, the other with the government of the order. In the first, the sole work of Dominic, the rule of St. Augustine was reinforced by the stricter customs of the Premonstratensians; the diet and fasts were those traditional

to monks, and the divine office was recited in choir, but liturgical service was kept at the minimum and dispensations for study and preaching were explicitly allowed.

In the second distinction. on the government of the order, partly the work of legally trained advisers, Dominic sanctioned a constitution of some complexity but eminently practical. It presented for the first time a fully developed and articulated supranational religious order, in which the principle of election was recognized throughout in the constitution of authority, and in which *ad hoc* commissioners or diffinitors, who were not office-holders, played an important legislative and executive part. The individual convent was the unit within a regional province, and the provinces made up the order. On each of the three levels there was a single permanent executive—the conventual prior, the provincial prior and the master general. On each level also there was an assembly meeting at stated intervals, the conventual, provincial and general chapters, of which the tno last were also legislative bodies. The conventual prior was elected by his community; the provincial prior by the conventual priors and tno delegates from each friary; the master general, who held office for life. by a chapter composed of the provincial priors and two delegates from each province.

The annual general chapter varied in its constitution: for two years the master general sat with two delegates from each province. in the third year with the provincial priors. No legislation could take effect until approved by three successive chapters. The general chapter was at first numerically small, while the provincial chapter might be large, but all business in this latter was conducted by the provincial and four diffinitors (*i.e.*, legislators) elected by the whole body. The weight thus given to the principles of election and delegation was not in intention democratic, but an acknowledgment of the abundance of intellectual and administrative ability in the order. Nevertheless it represented a shift from the patriarchal rule of a single family by a spiritual father to the wise administration of a great body of men by those whom their brethren considered the ablest.

From early days, also, an elaborate scheme of studies was in force. In each friary there was a doctor in charge of primary studies; in each province there was one or more *studium particulare* with a fuller staff to which friars of promise could be sent; finally *studia* generalia were established in university and other important towns (*e.g.*, Paris. 1228; Oxford, Cologne. Montpellier, Bologna, 1248; Cambridge, *c.* 1350) and attended by the cream of the order.

In this way there was established the first fully developed religious order, in which the activity of each part and of each individual was subordinated to the purpose of the institute. This purpose was no longer, as it had been with the monks and canons, the purely spiritual object of the sanctification of the individual and the liturgical service of God; it was the saving of souls within the church or within reach of her missionary activity. In such an institute, the individual belonged to the order. not to the house, and could be sent anywhere at any time about its business. Finally. the order. along with that of the Franciscans, had received its title deeds directly from the papacy and was from the first based upon the curia, obedient to its instructions and regarded as a valuable instrument in the hands of the papacy. Though the Friars Minor (Franciscans) were a numerous body before 1216, the Friars Preachers were the first to receive solemn recognition and the first to set up the machinery of an order, and their constitutions served as a model not only for the other orders of friars but also for other subsequent bodies of religious until the end of the middle ages.

History.—Under the four distinguished masters general who followed Dominic—Blessed Jordan of Saxony (1221–37). St. Raymond of Peñafort (1238–40), John of Germany (1240–52) and Humbert of Romans (1254–63)—the order spread rapidly throughout Europe, and soon became particularly strong in the Rhineland and western Germany. While retaining a spirit all its own, it both influenced and was influenced by its twin brother, the order of Friars hlinor, with whom, as contemporaries observed, it maintained a relationship of uneasy rivalry which the authorities and the better elements in both orders endeavoured to soften by personal and official civilities.

Although the statement that the Franciscans made the Dominicans mendicant friars, while the Dominicans made the Franciscans into a student order. is a serious oversimplification, it indicates well enough the direction of their mutual relations. Dominican writers have resented the opinion of earlier historians that Dominic "cashed in," so to say, on the popular appeal of Franciscan poverty, but though it is certain that from the start the founder regarded strict apostolic poverty as a necessity for his preachers, the Dominicans were not separated from others by a vacuum, and it is difficult to suppose that they would have felt the need to become "mendicants" and "friars" but for the compelling force of the Franciscan ideal. On the other hand. it is even harder to suppose that the Franciscans. had they remained alone. mould have devoted themselves so soon and so eagerly to theological study, and it is certain that the Dominican constitutions had an influence. though not perhaps an overwhelming one, on the evolution of the Franciscan organization between the deposition of Elias of Cortona and St. Bonaventure

The two orders from early times, however, had different attitudes to poverty. To the Franciscans it mas an integral, indeed a principal. part of their imitation of Christ; to the Dominicans it was merely one virtue among others, and they mere insistent that true poverty lay in the lack of desire, rather than in the physical absence of possessions They were therefore able to avoid the distressing controversies which divided the Minors, and ultimately found their vocation better assured by the papal permission (1475) for the corporate possession of property. In the intellectual and theological fields, the latent rivalry took shape in the firm opposition of the Franciscans, under Bonaventure and Archbishop John Pecham. to the adoption of Aristotelian principles of thought by the Dominicans Albertus Magnus and Thomas Aquinas.

On the other hand, the esprit de corps of the two orders gave way to a solidarity against common opponents, and Dominicans and Franciscans presented a common front against the demands of the University of Paris, against the attack on the mendicant ideal by William of St. Amour, and in the later litigation with Oxford and Cambridge on the admission to degrees. They were also in alliance in the most important of all their struggles, that for freedom of action in face of the diocesan bishops. In this and other matters it became habitual for the papacy to load them with privileges of every kind, and to communicate to one order any benefit bestowed upon the other.

Within 40 years of their foundation the talent of the order was concentrated upon the schools at Paris, Bologna, Cologne and Oxford; many eminent masters of the universities took the habit and became in time regents in the friaries, whither they were followed by many of their pupils. Originally students of theology only, and with no distinguishing philosophical opinions, they were led by Albertus Magnus and his pupil Thomas Aquinas to a study of the newly available Aristotle and to the integration of philosophy and theology. After a short initial opposition, the system of St. Thomas mas adopted as official (1278). Meanwhile the Dominicans pursued their vocation by preaching in southern France against the heresies of the Cathari and Albigenses and in Spain and elsewhere against the Moors and Jews. They also evangelized the heathen in northern Europe and the east. The papacy chose numerous bishops from the order, among them in early days Robert Kilnardby. archbishop of Canterbury; Albertus Magnus, bishop of Ratisbon; and Pierre de Tarentaise. archbishop of Lyons and later pope as Innocent V. When the Inquisition was established Dominicans were entrusted with its execution; Pierre Cauchon, who presided over the court that condemned Joan of Arc, and Tomás de Torquemada were Dominicans.

In the Rhineland nhere their school at Cologne was second in importance only to Paris. Albertus had inspired a number of pupils, among them Dietrich of Freiburg and perhaps Meister Eckhart, with a form of Christianized Neoplatonism which, if doubtfully orthodox in Eckhart. helped to create a notable school of mystical theology with Johann Tauler and Heinrich Suso among

its most distinguished writers. Combining elements of the teaching of Dionysius the Areopagite with the system of Aquinas and traditional practice, they built up a scheme of mystical theology which influenced not only Germany, the Low Countries and England but also St. John of the Cross and other Spaniards in the 16th century.

Though the era of the Black Death and the Great Schism was one of general relaxation, Raymund of Capua and Conrad of Prussia initiated reforms that spread throughout the order, and groups of friaries adopted strict regimes; at Florence in particular the convent of S. Marco was the home of Fra Angelico, St. Antoninus and Girolamo Savonarola. On the other hand, many of the Dominican preachers and theologians of the 15th century, in common with those of other orders of friars, were out of touch with the spiritual and intellectual needs and desires of northern Europe, and by their rigid technical approach to all questions and by their preaching in favour of mechanical and often superstitious practices of piety they failed to bridge the gulf between obscurantism and reform. Dominicans were among the *bêtes noires* of Erasmus, and it was Johann Tetzel, a Dominican friar, who by his ill-conceived preaching of indulgences in Germany detonated the Lutheran explosion.

In medieval England the Dominicans had some 53 houses with a population of 1.700 in 1349 and about 700 in 1534, but the province produced few friars of distinction save Kilwardby, Thomas Sutton, Nicholas Trivet (an orthodox Thomist who was also a chronicler and a student of Latin literature) and R. Holcot (a follower of William Ockham). The Dominicans, however, between 1250 and 1400 occupied in England and elsewhere an influential position as court confessors, counselors and diplomats, and no fewer than three English Dominicans became cardinals between 1303 and 1310. After the Black Death, which hit the friars hard, the only memorable name is that of John Bromyard, theologian and popular preacher, who along with his confrères and friars of other orders took a vigorous part in the opposition to John Wycliffe.

The Dominicans were among the first and most energetic missionaries in the "expansion of Europe" under the Spanish and Portuguese explorers and later under the French. In the new world three friars were distinguished among others: Bartolomé de Las Casas. bishop of Chiapas in Mexico, who fought long and nobly against the enslavement and exploitation of the Indians; St. Louis Bertran, the apostle of New Granada and West Indian islands; and Julian Garcés, a follower of Las Casas. In the 16th century also the Dominican theologians of Italy and Spain inaugurated a great revival of Thomism. Francis a Sylvestris and Tommaso de Vio, better known as Cajetan, wrote classical commentaries on the *Summa contra gentiles* and the *Summa Theologica* respectively, while Francis of Vitoria opened a brilliant era at Salamanca. It was an austere and reforming Dominican who, as Pius V, issued the bull *Regnans in excelsis* against Elizabeth I. Among the celebrated theologians of the age at Trent and elsewhere were Melchor Cano; Dominic de Soto; Domingo Bañez, the director of St. Teresa of Ávila and the father of modern Thomism; and John of St. Thomas, a leading mystical theologian. At the turn of the century occurred the celebrated and unresolved controversy between Dominicans and Jesuits on the nature of grace associated with the names of Bañez, Luis de Molina and Robert Bellarmine. In the 17th century missionaries of the order penetrated to China, Japan and the Philippines. In China they were embroiled aith the Jesuits in the vexatious controversy over "accommodation" in doctrine and ritual with the native Chinese, but both there and in Japan they gave numerous martyrs to the faith.

The Dominicans, in common with all other orders. declined under the rationalism and secularization of the 18th century but they gave a fourth pope to the church in Benedict XIII. Later, the persecutions and suppressions of the revolutionary and Napoleonic eras left feu- friars outside the Italian and Iberian peninsulas A revival followed in the mid-19th century, with French influence at its head in particular Henri Lacordaire and A. V. Jandel, for more than 20 years master general, and though harassed in 1880 and expelled for more than 20 years beginning in 1903, the French Dominicans have continued to provide the intellectual leadership of the order. In the first half of the 20th century there was a steady expansion, particularly in the United States, which, after Spain and France, is the nation of greatest influence.

The Dominicans enjoyed an access of prestige when in 1879 Leo XIII recalled Catholic schools to Thomism, and entrusted the Preachers with the production of the great Leonine edition of St. Thomas' works. Since then a succession of great names has given lustre to the order: H. S. Denifle, historian of the medieval universities, of Luther, and of much besides; P. Mandonnet, historian of medieval thought; M. J. Lagrange, orientalist and biblical scholar; and A. Gardeil, a distinguished theologian. Besides their school of philosophy and theology in Rome (the Angelico), the order has at Sta. Sabina historical and liturgical institutes and a publishing centre for learned work. It staffs the biblical school in Jerusalem, founded by Lagrange in 1890; the theological faculty of the University of Fribourg in Switzerland; and the university at Manila. In almost every province journals of religious life and thought are published; among those with world-wide reputation are the *Revue biblique* and the *Revue Thomiste*.

The medieval English province was dissolved in 1538, and though Queen Mary I restored the order for a few years at Smithfield no permanent link was maintained with the past. The founder of the present succession was the English friar Thomas Howard. later the "cardinal of Norfolk," who set up a novitiate for Englishmen at Bornhem in Holland (1657), whence the Englishmen were transferred later to Antwerp and served on the English mission. The order returned to England in the mid-19th century but remained few in number until the 20th century, when a development took place, especially during the provincialate of B. Jarrett, and a large priory was opened at Oxford. The province has charge of the church in Grenada (West Indies) and stations in South Africa. In Ireland Dominicans remained at work throughout the penal times, and in the 19th century T. Burke was widely known as a preacher. In 1960 an Irishman. Michael Browne (created cardinal in 1962), was master general of the order. The friars numbered about 10.000 in the 1960s.

Special Characteristics. — The Dominican order has always been noted for an unswerving orthodoxy. based upon the philosophical and theological teaching of Aquinas, and has steadfastly opposed novelty, opportunism or accommodation in theology. While the close integration of Aristotelian philosophy and traditional theology has given a remarkable strength and cohesion to the Dominican system of teaching, it has led also to a certain rigidity and an absence of clear distinction between what is dogmatically certain and what is deducible with greater or less probability. At the same time there has always been a current of social democracy and liberalism among the friars, appearing in such different personalities as St. Antoninus, Savonarola, Las Casas, Lacordaire, T. Burke and the English friar Vincent McNabb. The Dominicans of the 13th century popularized and appropriated the devotion known as the rosary, and the friars wear the beads at their girdle; they have a rite of Mass and a version of the breviary peculiar to the order.

Second Order. — The Second Order of enclosed nuns (called Preacheresses) sprang from the house at Prouille, whence sisters were taken to the nunnery of Sta. Sabina in Rome (1220). Thereafter numerous foundations were made throughout Europe. In the Rhineland in particular convents were many and communities large, and it was among the nuns of these houses that Tauler and other Dominican preachers spread their doctrine of the ascetical and mystical lives with remarkably fruitful consequences. In England the nunnery at Dartford was one of the largest and most observant in the later middle ages. The nuns of the Second Order are strictly enclosed and contemplative, save where, as in Germany, they devote themselves to teaching.

The Preacheresses' habit, like that of the friars, is black and white: white tunic and scapular, linen wimple and black veil.

Third Order. — The Third Order likewise came into being in Dominic's lifetime for both men and women, and in both cases

the tertiaries tended to adopt a life almost indistinguishable from that of a religious order. There are throughout the world numerous congregations of Dominican nuns, mainly engaged in teaching and nursing, and in some cases resembling very closely the Second Order in their way of life.

In England the first house was founded by Mother Margaret Hallahan id. 1868), and the various branches of the order have been united; foundations have been made in North America and various countries of the Commonwealth of Nations. St. Catherine of Siena, St. Catherine de' Ricci and, among those living in the world, the first saint of America, St. Rose of Lima, were members of the Third Order.

Third Order nuns wear white tunic and hood. leather belt and black cloak.

DOMINION STATUS was an expression often used before 1939 to describe the status of the British countries then known as the dominions, namely Canada, the commonwealth of Australia. New Zealand, the Union of South Africa, Eire and Newfoundland. Though there was no formal definition of dominion status, a pronouncement by the imperial conference of 1926 described Great Britain and the dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations."

The main characteristics of dominion status were regarded as complete legislative authority as provided in the Statute of Westminster. 1931, and. in the executive sphere, the right of dominion ministers to direct access to the sovereign, in contrast to the previous position whereby advice on dominion matters could be tendered only by United Kingdom ministers. Internationally, it connoted the recognition of the dominions (except Newfoundland) as separate states. entitled to have separate representation in the League of Nations and other international bodies, to appoint their own ambassadors and to conclude their own treaties. At the same time the dominions were not considered to stand in the same relation to the United Kingdom or among themselves as foreign countries. After 1947 the use of the expression was abandoned as it was thought in some quarters to imply a form of subordination, and the phrase "members of the commonwealth" came into use to describe the United Kingdom and the dominions enumerated above (except the Republic of Ireland which left the commonwealth in 1949, and Newfoundland, which in 1949 became a province of Canada), as well as India, Pakistan, Ceylon, Ghana and the Federation of Malaya, all of which later attained the same status. (See COMMONWEALTH OF NATIONS.)

The definition of 1926 was modified by a declaration by the commonwealth prime ministers' meeting of 1949. According to this, India, which intended to adopt a republican form of constitution, desired to continue full membership in the commonwealth and accepted the British sovereign as the symbol of the free association of the independent member nations and as such the head of the commonwealth; the other countries of the commonwealth recognized India's continued membership on those terms. A similar declaration relating to Pakistan was issued by the prime ministers' meeting of 1955. In 1961 the Union (Republic) of South Africa withdrew from the commonwealth.

DOMINOES, a game played with rectangular blocks of wood or other material, each identified by the number of dots on its face. Such a block is usually $1\frac{1}{2}$ to 2 in. in length, its width being about half its length and its thickness about one-eighth its length. The blocks are usually called bones, dominoes or pieces, but are sometimes called men, stones or even cards.

The face of each piece is divided, by a line or ridge, into two square ends, and is marked similarly to a pair of dice side by side except that some ends are blank. The usual set comprises 28 pieces, respectively marked 6-6 ("double six," etc.) 6-5, 6-4, 6-3, 6-2, 6-1, 6-0, 5-5, 5-4, 5-3, 5-2, 5-1, 5-0, 4-4, 4-3, 4-2, 4-1, 4-0, 3-3, 3-2, 3-1, 3-0, 2-2, 2-1, 2-0, 1-1, 1-0, 0-0. Any group of pieces having a common end comprise a suit, doublets belonging to one suit each and all other pieces to two suits. Of two bones the one bearing the greater number of dots is called heavier, the other lighter. Some sets run up to 9-9 and others as high as 12-12.

(LEFT) CHINESE DOMINO CARDS WITH CHARACTERS FROM A FABLE; (RIGHT) ESKIMO IVORY DOMINOES

Dominoes in China are as ancient, or almost, as playing cards (see CARDS, PLAYING). They were apparently designed to represent all the possible throws with two dice, for Chinese dominoes (which they call "dotted cards") have no blank faces. It does not necessarily follow, however, that western dominoes were derived from the Chinese. In Europe dominoes are relatively new, there being no record of them before the middle of the 18th century in Italy and France. Apparently they were introduced into England by French prisoners toward the end of the 18th century. The name may have been derived from pieces made of ebony with ivory faces and resembling a black cloak called a domino. The Innuit Eskimos gamble wildly at dominoes. Their game, in which as many as 148 pieces are used, was derived from the European game.

The principle in nearly all modern dominoes games is the matching of one end to another, identically or reciprocally numbered. The principal varieties are:

The Block and Draw Games.—Two play. The dominoes are shuffled face downward on the table. The lead, or set, is usually decided by drawing for the highest bone, but it is sometimes held that any doublet takes precedence. The bones are then reshuffled, and each player draws at random the number of bones required for the particular form of the game, usually seven. The bones left behind are called the boneyard (U.S.), or stock.

The leader plays first, generally playing his highest domino, since at the end the player loses according to the number of pips in the bones he has left in his hand. By some rules, a player after playing a double may play another bone which matches it; *e.g.,* if he plays double-six he may play another bone which has a six at one end. The second player has to match the leader's pose, or play, by putting one of his bones in juxtaposition at one end; *i.e.,* if the leader plays four-five, the second player has to play a bone which contains either a four or a five, the five being applied to the five or the four to the four. Doublets are placed *à cheval* (crosswise). If a player cannot match, he says "go," and his opponent plays, unless the Draw game—the usual game—is being played, in which case the player who cannot match draws from the stock (two bones must always be left in stock) until he finds a bone that matches. If a player succeeds in posing all his bones, he calls "Domino!" and wins the hand, scoring as many points as there are pips on the bones still held by his opponent. If neither player can match, that player wins who has the fewest pips left in his hand and he scores as many points as are left in the two hands combined (sometimes only the excess held by his opponent); but when a player has called "go!" his adversary must match if he can, in which case the other player may be able to match in turn. A game may be 50 or 100 points.

All Fives (or Muggins). — Each player takes five bones. If the leader poses either double-five. six-four, five-blank, or three-two, he scores the number of pips that are on the bone. If in the course of play a player can play such a bone as makes the sum of the end pips 5. 10. 15 or 20. he scores that number; *e.g.*, if to two-four he can play double-four (*à cheval*) he scores 10; if to six-one he plays six-four he scores 5. He must pose if he can match; if he cannot, he draws until he can. Scores are called and taken immediately. At the point of the domino, the winner scores in points the multiple of five which is nearest to the number of pips in his adversary's hand; *e.g.*, he scores 25 if his adversary has 27 pips. 30 if he has 28. If neither hand can match. the lowest number of pips wins, and the score is taken as before, without addition or subtraction, according to the adversary's pips.

All Threes is played in the same manner as Muggins, save that three or some multiple of three is aimed at.

Threes and Fives is similar, but only one point is scored for each five or three made at the two ends, though they can be scored in combination. Thus A plays six-five; B six-one; B scores 2 points for five-one (two threes). A plays one-five; B double-five; B now scores 8 more, 5 for five threes and 3 for three fives.

Sniff, very popular in the U.S.. lends itself to skilful play better than most dominoes games. It is essentially All Fives (described above). Two may play. draning seven bones each; or three or four, drawing five bones each. The first double played is called sniff. The sniff may first be put down endwise (in which case only one of its ends then counts) or sidewise, at the holder's option; thereafter it is permissible to play to this bone both endwise and sidewise, so that there are usually four open ends nith which to reckon. One need not play, although able to, if he wishes instead to draw from the stock; but the last two bones may never be drawn, and since the holding of additional bones may be an advantage it is customary to limit each player to two draws, after which he must play if able and pass if unable to play.

Domino Whist is played by four players. Partners are drawn for as at whist; the player drawing the highest domino leads. Each player takes seven bones. There are no tricks, trumps or honours. The bones are played as in ordinary dominoes, a hand being finished when one of the players plays his last bone, or when both ends are blocked. Pips are then counted. and the holder or holders of the highest number score to their debit the aggregate number of points. The side that is first debited with 100 points loses the game.

Matador. — This is a favourite and is also one of the most scientific forms of the game. It is played on a different principle from the preceding variations, the object being not to match the end number, but to pose such a number as, added to the end, will make seven; *e.g.*, to a five a two must be played, to a three a four, etc. Seven dominoes are drawn and the highest double begins. When a player cannot make a seven on either end he must draw from stock until he secures a bone that will enable him to make seven, two bones remaining in the stock. As Matador is played with dominoes no higher than six, a blank means blocking of that end. In this case no further play can take place at that end excepting by posing a matador, which may be played at any time. There are four matadors, the 6-1, 5-2, 4-3, and double-blank. It is often better to draw one or more fresh bones than to play one's last matador. In posing a double counts as a single number only, but in scoring the full number of pips is counted. When the game has been definitely blocked the player whose pips aggregate the lower number scores the number of the combined hands (sometimes only the excess in his opponent's hand), the game being usually 100. Matador can be played by three persons, in which case the two having the lowest scores usually combine against the threatening winner; and also by four, either each for himself or two on a side. With four players only five bones are drawn by each.

See A. 'H. Morehead *et al.*, ***The New Complete Hoyle,*** rev. ed. (1956).

DOMINUS, the Latin word for master or owner, particularly of slaves. As a title of sovereignty the term under the republic at Rome had the same associations as the Greek *despotes*. Ancient historians such as Tacitus, describing the transition from the republic to the empire. applied the word *dominatio* to the episodes of personal ascendancy such as those of Sulla, Pompey and eventually Caesar, which were steps toward monarchy. The early emperors. for instance Tiberius, were at pains to disclaim the title (see EMPEROR). but Caligula arrogated it and later Domitian insisted on being addressed as "dominus et deus." This finally became an official title of the Roman emperors under Diocletian.

In medieval Latin *dominus* was used to signify the superior in a feudal relationship, the "lord" of a territory or the overlord of a vassal; *e.g.*, the English kings' style of *dominus Hibernie*, lord of Ireland. Equivalent to Eng. "lord," "sir" or "master," Fr. *seigneur, sieur* or sire and Ger. Herr, it came to be used as a prefix of respectful address: Sp. don and Port. *dom* are derived from it. The prefix was also accorded to the clergy (It. don for priests), to religious (especially to Benedictines, still addressed as dom) and to graduates of universities. The English use of "sir" for parsons before the Reformation is a parallel, but it is uncertain whether that of "don" for fellows or tutors of colleges in universities is derived from the academic use of *dominus* or from allusion to Sp. don. The variant "dan" occurs in medieval English and in archaistic contexts later ("Dan Chaucer," etc.).

DOMITIAN (TITUS FLAVIUS DOMITIANUS), Roman emperor AD. 81–96. chiefly remembered for the reign of terror under which prominent members of the senate lived during his last years, was born Oct. 24, 51, the second son of Vespasian (q v) and Flavia Domitilla. During the civil war of 69 he remained unharmed in Rome, but on Dec. 18 he took refuge in the Capitol with his uncle Flavius Sabinus, escaping into hiding when the Capitol nas stormed by supporters of Vitellius (*q.v.*). On the entry of his father's supporters into Rome two days later he was saluted as Caesar, and he became praetor next year. He attempted to turn the repressive campaign of Petillius Cerialis in the Rhineland into a triumphal operation of his own; and for this and other excesses he is said to have required his father's pardon when the latter arrived at Rome in autumn 70. He mas however made *princeps iuventutis* and was consul six times in Vespasian's lifetime; moreover it was recognized that he would eventually succeed his brother Titus (*q.v.*), who had no son and was 11 years Comitian's senior.

On Vespasian's death Domitian expected the same position as Titus had received under Vespasian. in particular tribunicial power and some form of *imperium* (see EMPIRE). These were not granted, and Domitian was evidently antagonistic to his brother; he is alleged to have hastened his death, which occurred on Sept. 13, 81.

As emperor he mas hated by the aristocracy. In the Trajanic writers Tacitus and Pliny (Suetonius is less partisan) it is hard to disentangle stock vituperation from genuine belief, but it seems certain that cruelty and ostentation were the chief grounds of his unpopularity rather than any military or administrative incompetence.

Indeed his strict control over magistrates in Rome and the provinces won Suetonius' praise. In his secretariat he used both freedmen and knights, some of whom retained their posts after his death; and his consilium of close advisers, including senators, involved no departure from precedent. In legislation he was severe, and incurred censure for attempting to curb vices from which he himself was not immune. A fairer criticism might be undue paternalism. An edict ordaining destruction of half the provincial vineyards was typical: it was designed to encourage corn growing and to limit wine imports into Italy (where meanwhile no increased output was permitted), but Domitian was unable to carry the matter through.

His military and foreign policy was not uniformly successful. Both in Britain (see AGRICOLA, GNAEUS JULIUS) and in Germany advances were made early in the reign, and the construction of the Rhine-Danube limes (fortified line) owes more to Domitian than to any other emperor. But consolidation in Scotland was halted by serious wars on the Danube (see DACIA), where Domitian never achieved an entirely satisfactory settlement and,

worse still, lost two legions and many other troops. This. though admitted even by Tacitus to be due to the slackness or rashness of his commanders, was naturally held against him at Rome. But it did not affect his popularity with the army, whose pay he had wisely raised by one-third in 84.

The real issue was his own constitutional and ceremonial position. He continued his father's policy of holding frequent consulates (he was consul *ordinarius* every year from 82 to 88); he became censor for life in 85, with consequent control over senatorial membership and general behaviour; he wore triumphal dress in the senate; and he presided, wearing Greek dress and a golden crown, over four-yearly games on the Greek model, with his fellow-judges wearing crowns bearing his own effigy among effigies of the gods. A grave source of offense was his insistence on being addressed as *dominus et deus* ("master and god").

The execution of his cousin Flavius Sabinus in 84 was an isolated event, but there are hints of more general trouble about 87. The crisis came with the revolt of Antonius Saturninus, governor of Upper Germany, on Jan. 1, 89. This was suppressed by the Lower German army, but a number of executions followed, and the law of *maiestas* ("treason") was later employed freely against senators. The years 93–96 were regarded as a period of terror hitherto unsurpassed.

Among Domitian's opponents was a group of doctrinaire senators, friends of Tacitus and Pliny and headed by the younger Helvidius Priscus whose father of the same name (*q.v.*) had been executed by Vespasian. Their Stoic views were probably the cause of his expulsions of "philosophers" from Rome on two occasions. It is unlikely that he was carrying out any considered policy on the organization of thought, any more than that his condemnation in 95 of his cousin Flavius Clemens for *atheotes* ("irreligion") is part of a deliberate attack on Christianity.

His financial difficulties are a vexed question. Cruelty came earlier in his reign than rapacity, but eventually he regularly confiscated the property of his victims. His building program had been heavy: Rome received a new forum (later called Forum Nervae) and many other works. Then there were Domitian's new house on the Palatine and his vast villa on the Alban mount. Meanahile the increased army pay was a recurrent cost. Probably only his confiscations averted bankruptcy in the last years.

The conspiracy which caused his murder on Sept. 18, 96 was led by the two praetorian prefects, various palace officials, and the emperor's wife Domitia Longina (daughter of Gnaeus Domitius Corbulo, *q.v.*). Nerva (*q.v.*), who took over the government at once, must clearly have been privy. The senate was overjoyed at his death, but the army took it badly; and next year they insisted on punishment of those responsible.

DOMREMY-LA-PUCELLE, a village of eastern France in the *département* of Vosges, is situated on the Meuse, 116 km. (72 mi.) S.E. of Reims by road. Pop. (1954) 173. Part of the village is modern, the rest is medieval. Domrémy was the home of St. Joan of Arc, and her birthplace is now a museum devoted to her memory. In the church close by is the font in which Joan was baptized. and near the bridge is a statue of her by A. Mercié (1902). A mile to the south, on the "Bois-Chenu" hill. is a basilica erected in 1881 in memory of Joan of Arc and all French soldiers. Nearby is the Fontaine des fiévreux where the girl heard some of her voices. *(See* JOAN OF ARC, SAINT.) In World War II Domrémy was in German hands from June 1940 to Sept. 1944. (J. F. L. L.)

DON is the name of several British rivers, of which the two most important are in Xberdeenshire, Scot.. and Yorkshire. Eng.

The Aberdeenshire Don, noted for its salmon and trout. flows generally eastward from its source on the slopes of Meikle Geal Charn till it reaches the North sea at Aberdeen. About 82 mi. in length, it is roughly parallel with the Dee (*q.v.*), but in comparison has more quietly flowing stretches amid green rolling hills or lowland. Rising at about 2,000 ft., in its first 10 mi. it receives many short hill streams on both sides. The main stream swings across a fairly broad glen (it may be a misfit stream, the Avon having captured its former upper course). The place name Strathdon implies a broad valley, and the triangular lowland between gorges north of Coillebhar hill and south of Bennochie is named the Howe (lowland vale) of Alford. From Monymusk the Don swings broadly, flowing east-southeast across an arable and stock-farming lowland, to enter the sea by an artificial course (*c.* 1750) through the north of Aberdeen.

The Yorkshire Don, rising in the Pennines at 1,500 ft., flows east for 5 mi. to Penistone. where it turns southeastward into a deep, narrow valley following the strike of the Lower Coal Measures. In a mainly rural scene are residuals of early iron and woolen industries attracted by water power. ganister and thin coal seams. At Sheffield the Don turns sharply northeastward in a deep, narrow, fault-guided valley cut into a lower plateau in Middle and Upper Coal Measures; this is the heart of the south Yorkshire steel manufacturing area. From Doncaster, an old Roman crossing place and modern mining centre, the valley opens out into the agricultural Vale of York, and the river joins the Ouse at Goole after a course of about 70 mi. Until regulated in the 17th–18th centuries by the Dutch engineer Cornelius Vermuyden and others, the lower Don meandered widely across a heavily drift-covered glacial lake bed. (A. T. A. L.)

DON (ancient TANAIS), one of the great rivers of Europe in the south central European part of the Russian Soviet Federated Socialist Republic of the U.S.S.R., is 1,224 mi. long and drains a basin of 170,849 sq.mi. The Don rises in the Central Russian upland near the town of Novomoskovsk in Moscow *oblast,* southeast of Tula and follows a southerly course to a point about 50 mi. S. of Voronezh, where it swings southeastward and then eastward to within 48 mi. of the Volga. It then takes a great curve to the southwest and finally west-southwest to enter the head of the Taganrog gulf of the sea of Azov. The total fall of the river from source to mouth is only 623 ft., about 1 in 10,000. As a result its course, even in the upper reaches, is extremely winding and its current sluggish. The upper course lies in a fairly narrow valley, widening in the middle reaches to 4–5 mi. and in places up to 20 mi. At this point the width of the river is about 270–400 yd. and there are innumerable sandbanks. At the great bend near the Volga the Don flows into the giant Tsimlyanski reservoir, about 200 mi. long, constructed in 1950–51 in connection with the building of the Volga-Don canal. Below the Tsimlyanski barrage the Don flows in a broad, often swampy flood-plain to its delta, which is gradually filling up the shallow Taganrog gulf. The entire length of the river is characterized by a high, steep right bank, in places up to 200 ft. high or more, which is greatly dissected by ravines. The left bank is a low, broad flood-plain or steppe, backed by a series of terraces.

The average annual flow at the mouth is 31.783 ft. per second, but seasonal variation is considerable. At Kalach a maximum of 508,533 cu.ft. per second has been recorded during the spring snow-melt and a minimum of 2,719 cu.ft. in summer low water. Widespread flooding of the low left bank occurs in spring, but the Tsimlyanski reservoir has allowed more regulated flow in the lower course. The river remains frozen from early November until the second half of March.

The Don has a large number of tributaries, many of which are themselves sizable rivers. The largest are, on the right bank, the Sosna, Tikhaya Sosna, Chir (248 mi, long) and Northern Donets (631 mi.), and on the left bank the Voronezh (229 mi.), Khoper (626 mi.), Medveditsa (475 mi.), Sal and Manych (162 mi.):

The Don is navigable from the mouth to Khlebnoye, about 50 mi. north of Voronezh, but above the Tsimlyanski reservoir sandbanks are a considerable handicap and navigation is of only moderate importance. The reservoir and lower course form a major shipping artery, open to sea-going craft and carrying heavy passenger and goods traffic, with timber, petroleum, coal and grain

the chief freights. This section of the Don, with the Volga-Don canal, forms the outlet for the entire Volga-Kama-Caspian system of waterways. A ship canal, built in 1925. improves navigation through the delta. The Don has been an important line of communication since the period of Kievan Russia *(see* KIEV), when it formed a trade route from the Russians to the Khazars (*q.v.*). Peter the Great, in his campaigns of 1695 and 1696 against the Turkish fortress of Azov at the river mouth. built fleets of ships in oak forests around Voronezh and sailed his armies down the Don. He planned and started work on a canal to link the upper Don to the Oka, but this was abandoned after the failure of his Turkish campaigns. Along the Don settled the most famous of the Cossack hosts, who took their name from the river and who maintained their identity within the former *oblast* of the Don Cossacks (or Don Army) down to the Revolution.

The major cities on-the Don are Voronezh and the port of Rostov-on-Don (*q.v.*), which has usurped the functions of the older Azov. Kalach is an important port near the end of the Volga-Don canal. The Tsimlyanski barrage provides hydroelectric power and also irrigation water for the extensive vineyards and market gardens along the lower Don. The river supports a considerable fishing population who market salmon, herring, salt fish and caviar. (R. A. F.)

DONATELLO (diminutive of DONATO) (*c.* 1386–1466), Italian sculptor, one of the founders of Renaissance art. was the son of Niccolo di Betto Bardi, a member of the Florentine wool carders' guild. Nothing is known about the beginnings of his career, but it seems likely that he learned the craft of stonecarving from one of the group of sculptors working for the Florence cathedral in the years around 1400. Between 1404 and 1407 he was for some time a member of the workshop of Lorenzo Ghiberti. who in 1402 had won the competition for the bronze doors of the baptistery. While his early work betrayed an important artistic debt to Ghiberti, Donatello soon developed a style of such revolutionary boldness that he must be adjudged second only to his friend Filippo Brunelleschi as a founding father of Renaissance art. Whether or not he went to Rome with Brunelleschi as early as 1402 or 1403 (the evidence for this trip is much disputed), he shared the latter's enthusiasm for the art of classical antiquity and was on intimate terms with the humanists, the creators of Renaissance scholarship and philosophy.

In Nov. 1406 Donatello was carving two small marble figures of prophets for the north portal of the Florence cathedral, but he seems to have completed only one of them, since he did not receive payment for the other. Unfortunately. neither statue has survived. Thus his earliest work of which we have certain knoll-Iedge was the marble "David" (Museo Nazionale, Florence) that he did in 1408–09. Originally intended for one of the buttresses of the cathedral, the figure was transferred in 1416 to the Palazzo Vecchio, where it stood for many years as a civic-patriotic monument. Donatello adapted it to its new function by removing a scroll from David's right hand and exposing the left leg which had been hidden, in Gothic fashion. behind a sheath of drapery. Other early norks of the master. still partly Gothic in style, were the impressive seated marble figure of "St. John the Evangelist" (Cathedral museum, Florence) and the wooden crucifix in S. Croce. both of about 1409–11. The latter, according to a persistently repeated anecdote. nas made in friendly competition nith Brunelleschi, but the story is clearly fictitious.

The full power of Donatello's genius was first felt in the two marble statues of "St. Mark" (1411–13) and "St. George" (about 1415–16) for niches on the exterior of Or San Michele. the church of the Florentine guilds (the "St. George" was replaced by a copy; the original is in the Museo Nazionale). Here. for the first time since classical antiquity and in striking contrast to medieval art, the human body was rendered as a self-activating, functional organism, and the human personality was endowed with a confidence in its own individual worth. These figures can stand on their own legs, physically as well as spiritually. The same qualities were increasingly evident in the series of statues that Donatello did for the niches of the campanile, the bell tower of the Florence cathedral. beginning in 1416. All these figures. together with their companions by other and lesser masters, were later removed to the Cathedral museum. where they can be studied at close range. The documents relating to them, although rich in number, presented problems of interpretation and identification that were very difficult to overcome. They indicate that Donatello did five statues altogether: a beardless and a bearded prophet as uell as the group of Abraham and Isaac for the east niches (1416–18, 1418–20 and 1421, respectively) and two figures, the so-called "Zuccone" and the so-called "Jeremiah" (actually a Habakkuk) for the west niches The so-called "St John the Baptist" and the so-called "Poggio Bracciolini"—both misnomers retained non only for the sake of convenience—used to be claimed for Donatello but have turned out to be the work of Nanni di Bartolo (one of the master's assistants) and of Bernardo Ciuffagni, a rather mediocre artist of Donatello's onn generation who also did the "St. Peter" at Or San Michele, another figure previously attributed to Donatello. The "Zuccone" (1423–25) well deserves its reputation as the finest of the campanile statues and one of the artist's masterpieces. Both it and the "Jeremiah" (begun in 1427; delivered in 1435) show highly individual features inspired by Roman portrait busts Their entire appearance, which suggested classical orators of singular expressive force. had so little in common with the traditional image of Old Testament prophets that by the end of the 15th century they could be mistaken for portrait statues pure and simple.

"ZUCCONE" BY DONATELLO, FROM THE CAMPANILE OF THE FLORENCE CATHEDRAL. 1423–25. IN THE CATHEDRAL MUSEUM, FLORENCE

In his relief panels for the north door of the baptistery. Ghiberti had begun to extend the apparent depth of the scene by placing the boldly rounded foreground figures against more delicately modeled settings of landscape or architecture. Taking this pictorial tendency as his point of departure. Donatello in his marble panel of "St. George Killing the Dragon" (1416–17. base of the St. George niche at Or San Michele) invented a bold new mode of relief known as *stiacciato*. Its actual depth of carving was extremely shallow throughout. yet for that verv reason the effect of deep atmospheric space was far more striking than before, since the sculptor no longer modeled his shapes in the usual may but rather seemed to "paint" them with his chisel. Tonal values (or shades) were created through subtle modulations of the relief surface that were meant to control the angle at which the light was reflected by the carved forms. A blind man could read a Ghiberti relief with his fingertips; a *stiacciato* panel, on the contrary, must be seen, for it depends on visual instead of tactile perceptions.

After the pioneer effort of the St. George relief. Donatello continued to explore the possibilities of the new technique in his marble reliefs of the 1420s and early 1430s. They included the "Pazzi Madonna" (about 1422; Staatliche Museen, Berlin), the "Shaw Madonna" (about 1425–28; hfuseum of Fine Arts. Boston), the "Assumption of the Virgin" (1427–28; tomb of Cardinal Brancacci. S. Angelo a Nilo, Naples) and the "Ascension and Delivery of the Keys to St. Peter" (about 1428–30; Victoria and Albert museum: London). His last marble *stiacciati*, so far as is

known. are the "Entombment of Christ" (tabernacle in the Sagrestia dei Beneficiati. St. Peter's. Rome), which he carved during a Roman sojourn in 1432–33, and the "Feast of Herod" (about 1433–35; Musée Wicar. Lille). However. the splendid stucco roundels below the dome of the old sacristy of S. Lorenzo. Florence. still followed the same technique. with the addition of colour for better legibility at a distance (about 1434–37).

In the meantime. Donatello also became a major sculptor in bronze. His earliest work in that material was the overlifesize statue of "St. Louis of Toulouse." executed about 1423 for a niche at Or San Michele (replaced by Verrocchio's group of "Christ and St. Thomas"). Toward 1460 the St. Louis was transferred to S. Croce. where until 1903 it stood in a niche above the main portal. It was then transferred to the museum of S. Croce. A cleaning of the statue restored its original gilt surface and revealed the full beauty of the work. Contrary to the unfavourable opinion of older scholars, the St. Louis was an achievement of the first rank. artistically as well as technically. Even though the garments completely hide the body of the figure, Donatello succeeded in conveying the impression of harmonious organic structure beneath the drapery. Unlike Ghiberti, Donatello never maintained a bronze foundry, but used the casting facilities of others (usually bell founders). This, however. was a matter of convenience. rather than evidence of lack of technical competency, and does not justify the view that the master's bronzes were the result of collaboration with other sculptors better versed in the requirements of the medium. If Donatello needed a collaborator at the time he was engaged on the St. Louis. it was probably a specialist in decorative architecture. since he had been commissioned to do not only the statue but also the niche for it. This niche was the earliest of its kind to display the new architectural style created by Brunelleschi without residual Gothic forms. It could hardly have been designed by Donatello alone: he may have been assisted by Ilichelozzo. with whom he entered a limited partnership one or two years later (in 1424–25). To the joint enterprises of the two masters, Donatello contributed only the sculptural centre — the fine bronze effigy on the tomb of the schismatic pope John XXIII in the baptistery (1425–27), the "Assumption" relief of the Brancacci tomb in Naples and the balustrade reliefs of dancing angels on the outdoor pulpit of Prato cathedral (1433–38). Michelozzo was responsible for the architectural framework and the decorative sculpture. The architecture of these partnership projects. essentially Brunelleschian in character, differed sharply from that of comparable commissions undertaken by Donatello alone in the 1430s (the tabernacle in St. Peter's. Rome; the "Annunciation" tabernacle in S. Croce. Florence; and the singers' pulpit, or *cantoria,* for the Florence cathedral, later placed in the Cathedral museum), all of which showed a very unorthodox ornamental vocabulary drawn from both classical and medieval sources as well as a most un-Brunelleschian tendency to blur the distinction between the sculptural and the architectural elements. The graceful and lyrical figures of the S. Croce "Annunciation" were set against a background of the same ornament that occurred on the tabernacle itself. and the frieze of ecstatically dancing angels on the *cantoria* ran behind. not between, the paired colonnettes of the balustrade.

Even during his partnership with Michelozzo, Donatello carried out a number of independent commissions of a purely sculptural character. including several pieces in bronze for the baptismal font of S. Giovanni in Siena. The earliest, and most important. of these was the "Feast of Herod," an intensely dramatic relief (designed between 1423 and 1425) with an architectural background that displayed for the first time Donatello's command of scientific linear perspective; this mathematically precise system of foreshortening and space projection had been invented only a few years earlier by Brunelleschi. To the Siena font Donatello also contributed two statuettes of virtues ("Faith" and "Hope." about 1428), austerely beautiful female figures whose style pointed toward the S. Croce "Annunciation." and three nude *putti* (child-angels). one of which was stolen and was later acquired by the Berlin museum (1429). These *putti* prepared the way for the bronze "David" (about 1430–32; Museo Nazionale), the first large-scale, free-standing nude statue of the Renaissance. Well proportioned and superbly poised, it was conceived independently of any architectural setting. Its air of harmonious calm made it the most classical of the master's works. The small bronze doors for the old sacristy of S. Lorenzo (about 1440), in contrast. showed paired saints and apostles disputing with each other in extraordinarily vivid and even violent fashion.

In 1443 Donatello was about to start work on a much more ambitious set of bronze doors for the sacristies of the Florence cathedral when he was lured to Padua by the commission for a bronze equestrian statue of the famous Venetian *condottiere* Erasmo da Narni, called Gattamelata. Completed betn-een 1447 and 1450 but not installed on its pedestal in front of the church of S. Antonio until 1453, this overlifesize monument showed the general. in pseudo-classical armour. calmly astride his mount. The head was an idealized portrait instinct with Roman nobility and intellectual power. This statue was the ancestor of all the equestrian monuments erected since the mid-15th century.

While in Padua. Donatello also did a bronze crucifix for S. Antonio (1444–47), a splendidly expressive work that makes an instructive comparison with the master's early crucifix in S. Croce, as well as the high altar of S. Antonio (1447–50), consisting of 7 bronze statues. 21 bronze reliefs and a large panel of the entombment of Christ in limestone. Unfortunately, the architectural framework of the structure was destroyed a century later, and the subsequent arrangement. dating from 1895, was both aesthetically and historically wrong. Among the statues. the majestic Madonna and the delicate, sensitive St. Francis command particular notice; of the reliefs, the finest were the four "Miracles of St. Anthony," wonderfully rhythmic compositions of great narrative power.

The late style of Donatello was seen for the first time in the wooden statue of "St. John the Baptist" in S. Maria dei Frari, Venice, completed shortly before the master's return to Florence in 1453–54. It was marked by a new depth of insight into psychological reality; the powerful bodies found in Donatello's previous work now became withered and spidery, overwhelmed, as it were, by tremendous emotional tensions within. This final expressionist phase of the master also produced the wooden "Jlagdalen" in the baptistery. Florence (about 1455), the marble "Young St. John!' ("Giovannino Martelli") in the Museo Nazionale, the bronze "St. John" in the Siena cathedral (1457) and the bronze group of "Judith and Holofernes" in front of the Palazzo Vecchio in Florence (1457–60). After several years of residence in Siena during the late 1450s, when he was preparing to do a great pair of bronze doors for the Siena cathedral (a commission he suddenly abandoned about 1460). Donatello spent the last years of his life designing two bronze pulpits for S. Lorenzo, the church of his old patrons, the Medici. Covered with reliefs showing the passion of Christ, the pulpits were a work of tremendous spiritual depth and complexity, even though some parts were left unfinished at the master's death (on Dec. 13, 1466) and had to be completed by Bertoldo and other lesser artists. *See* SCULPTURE: *The Renaissance;* RENAISSANCE ART; *see* also references under "Donatello" in the Index volume.

DONATI, GIOVANNI BATTISTA (1826–1873), Italian astronomer chiefly remembered for his work on comets, was born at Pisa on Dec. 16, 1826. In 1854–64 he discovered six comets, one of which. first seen on June 2. 1858, bears his name. These discoveries led to his appointment as professor of astronomy and director of the observatory at Florence in 1864. A pioneer in celestial spectroscopy, he discovered, in Aug. 1864, the gaseous composition of comets, and contributed to early classification systems for stellar spectra. He was supervising the construction of a new observatory at Arcetri when he died in Florence on Sept. 20, 1873. (O. J. E.)

DONATION OF CONSTANTINE (*Constitutum* or *Donatio Constantini*) is the supposed grant by the emperor Constantine the Great to Pope Silvester I (314–335) and his successors of spiritual supremacy over the other great patriarchates and over all matters of faith and worship, and of temporal dominion over Rome, Italy and the entire western world. The gift was claimed to have been motivated by Constantine's supposed gratitude to Silvester for miraculously healing his leprosy and converting him to Christianity. Compounded of various elements (notably the apocryphal Vita *S Silvestri*) and now universally admitted to be a forgery, the Donation was fabricated perhaps at Rome. more probably in the Frankish empire. between the middle and end of the 8th century. In the 9th century it nas included in the collection knonn as the False Dccretals (*see* DECRETALS, FALSE), and tno centuries later was incorporated in Gratian's *Decretum* by one of his pupils. The evidence of its Roman origin is mainly internal; that of its origin in the Frankish dominions is based on the facts that the earliest manuscript (in the Bibliothèque Nationale. Paris) containing it appears to have been nritten there and that the earliest quotations from it are by Ado of Vienne, Hincmar of Reims and Aeneas of Paris, all Frankish authors It was regarded as genuine by both friends and enemies of the papal pretensions throughout the middle ages. though at the close of the 10th century Leo of Vercelli, Otto III's chancellor. proclaimed its true character.

Although the document was in existence before 800, the earliest certain appeal to it by a pope was made only as late as 1054 by Leo IX in a letter to Michael Cerularius, the patriarch of Constantinople. From that time forward it was increasingly employed by popes and canonists in support of the papal claims, and from the 12th century onward it became a weapon of the spiritual against the temporal poners; it is. however, as the church historian Joseph Hergenröther pointed out, possible to exaggerate its importance in this respect. By the partisans of the empire the Donation was looked upon as the origin and source of all evils, and Constantine was regarded as having, in his newborn zeal for the faith, betrayed the imperial trust.

The genuineness of the *Constitutum* was first critically assailed in the Renaissance. In 1440 Lorenzo Valla's De *falso credita* et *ementita Constantini* donatione declarnatio opened a controversy that lasted until the close of the 18th century, when the defense finally was silenced. Though many Roman Catholic scholars of the 15th and 16th centuries felt obliged out of loyalty to the Holy See to defend its authenticity, Nicholas of Cusa and Caesar Baronius rejected it.

Since the last half of the 19th century the controversy has centred about the interpretation of the character of this forgery. its provenance, date and meaning within the framework of papal history There have been three major theories: (1) G. H. Bohmer held that the forgery dates from about 753 and is probably the work of Christophorus, a papal notary, who carried it with him when he went to the court of Pepin in 754 with Stephen II. According to Bohmer, the document was forged with an eye to acquiring the exarchate of Ravenna. (2) E. Mayer denied that the *Constitutum* could have been forged before the news of the iconoclastic decrees of the Council of Constantinople of 754 had reached Rome, pointing out the efforts made by the Byzantines between 756 and 767 to detach Pepin from the cause of Rome and the holy images. The forgery. which occurred about 775, had a double object: as a neapon against Byzantine heresy and as a defense of the papal patrimony. (3) L. Loening held that the *Constitutum* was a pious fraud perpetrated by a cleric of the czrria under Adrian I with the idea of securing a de jure basis for the territorial dominion which the popes had de *facto* established in Italy with the help of Pepin and Charlemagne.

The tendency seems to be to shift the provenance toward the monastery of St. Denis near Paris (where the document first appeared), to date it close to the year 800 and to interpret it as an expression of Frankish independence vis-à-vis Byzantium rather than as a declaration of the temporal and spiritual supremacy of the papacy.

DONATISTS, named after their leader Donatus, were Christians representing a powerful puritan tradition in the north African church who broke nith the Catholics in 312 over the election of Caecilian to the vacant bishopric of Carthage. Despite almost continuous pressure from the successive Roman, Vandal and Byzantine rulers of north Africa, the Donatist church survived until the extinction of Christianity in north Africa in the early middle ages.

The ultimate causes of the schism were both doctrinal and social. Throughout the 3rd century the prevailing tradition in the African church had regarded the church as a body of the elect, vivified by the Holy Spirit in baptism, confronting the assaults of the pagan world, and awaiting the final doom of this world fortified by the hope of a martyr's crown. This view. which was espoused by Cyprian and developed in response to earlier controversy, had as its corollary the belief that the validity of sacerdotal acts depended on the presence of the Holy Spirit in the minister, and that a minister who was not in a state of grace could not administer a valid sacrament. At the same time. riches and sin had tended to become identified; mammon and the Roman world were equally to be shunned.

The increase in the numbers and power of the church during the 3rd century had challenged these ideas. About 220 and about 255–256 Rome and Carthage had clashed over the basic question of the nature of the church. In Africa itself, the puritanical view received reinforcement by the conversion of the native population of Numidia to Christianity in the years 270–300. while the laxer element gradually gained the upper hand in Carthage and the Romanized cities.

The great persecution of 303 produced a crisis. The puritans refused to accept for clerical office the traditores who had surrendered copies of the Scriptures to the authorities. On the death of Mensurius, bishop of Carthage, in 311, there was bitter opposition to the election of Caecilian, who had been his archdeacon but who was accused of cruelty toward imprisoned confessors seven years before and of having allowed himself to be consecrated by a traditor bishop. Felix of Aptunga. The primate of Numidia. Secundus of Tigisis. who had acquired in the previous 40 years the right of consecrating the bishop of Carthage, felt himself slighted. He arrived in Carthage with 70 bishops, and in solemn council declared Caecilian's election invalid. In his stead, the council appointed a reader (lector), Majorinus, the servant of a rich opponent of Caecilian named Lucilla.

These events coincided with Constantine I's defeat of Maxentius at the Milvian bridge on Oct. 28, 312. The new ruler of the west found himself compelled to take sides. because of Africa's importance as a source of wheat and oil supplies for Rome. He granted Caecilian and his supporters financial privileges (winter 312–313) but allowed Caecilian's opponents' claim to arbitration (April 15, 313). A mixed commission of Italian and Gallic bishops under the presidency of Miltiades, bishop of Rome, himself an African, found Caecilian innocent of all charges. on Oct. 2, 313. Meantime, Majorinus had disappeared from the scene and had been replaced as the rival bishop of Carthage by Donatus, a Numidian from Casae Nigrae on the fringes of the Sahara.

Donatus appealed against hliltiades' judgment. and Constantine summoned a council of bishops from the western provinces of the empire at Arles on Aug. 1, 314. Again Caecilian was upheld, and his position was strengthened by a canon that ordination was not invalid merely because it had been performed by a *traditor.* Then, after two inquiries (Aug. 19, 314, and Feb. 15, 315) Felix of Aptunga was declared innocent of the charges brought against him. Despite further appeals by Donatus and his supporters in the summer of 315 and early in 316, Constantine gave a final decision in favour of Caecilian in Nov 316 Four years later, in Dec. 320, the Donatist cause seemed hopelessly prejudiced in its stronghold, Numidia, by a lawsuit brought by a Donatist cleric against his leaders in the court of the governor of the province.

The evidence showed these to be themselves guilty of the crime of *traditio* with which they accused Caecilian.

The schism, however, was not destined to die out. Persecution attempted from 317 to 321 failed, and in May 321 Constantine grudgingly granted toleration to the Donatists. The movement now gained the upper hand throughout north Africa. Only a tactical mistake by Donatus in seeking from Constantine's son Constans recognition as sole bishop of Carthage in 346 enabled the Roman government once more to act against him. In Aug. 347 Donatus with other leaders was exiled to Gaul, where he died *c.* 355, and church unity under Caecilian's successor at Carthage, bishop Gratus, was enforced.

With Julian's accession in Nov. 361, however, a complete change took place. The Donatist exiles returned in triumph, and for 30 years the Caecilianist tradition, though accepted by the Roman world as Catholic, was a minority in Africa. However, internal divisions following the death of Parmenian (391), a Gaul or Spaniard whom Donatus had named as his successor, and ill-judged support of the rebellion of Gildo (398), gave their opponents, now led by St. Augustine, their chance. Donatism was suppressed by a series of imperial decrees in 405. In 411 a conference presided over by Augustine's friend the imperial tribune Marcellinus was held in Carthage to decide the question as to which party. Donatists or their opponents, was to be regarded as the official Catholic Church in Africa. Though the result was a foregone conclusion, the Donatists, numbering 284 bishops to their opponents' 286, defended themselves stubbornly for three days. Marcellinus, however, decided against their doctrinal contention, that "the church of God in the Scriptures should be proclaimed everywhere holy and without spot," in favour of the Catholic view, that the church on earth was a mixed body containing good and evil members, held together by the sacraments; and against the Donatists' historical contention that Caecilian's consecration had been invalid. (See also AUGUSTINE, SAINT.) In 412 and 414 severe laws denied the Donatists civil and ecclesiastical rights. But, expecting hostility from the world as part of the natural order, they survived these blows, and lived on through the Vandal occupation to embarrass Pope Gregory I's representatives in north Africa in the last years of the 6th century.

Historically, the Donatists belong to the tradition of early Christianity that produced the Montanist and Novatianist movements in Asia Minor and the Meletians in Egypt. Their inspiration was Old Testament, and that of the Maccabees in their struggle against the Hellenistic world. However, their opposition to state interference in church affairs (epitomized in Donatus' challenge *quid est imperatori cum ecclesia?*) differed only in degree from the attitude accepted by western leaders, such as Ossius of Córdoba and Ambrose of Milan. To this, however, they added, through the peasant warriors called Circumcellions, a program of social revolution combined with eschatological hopes. Martyrdom, following a life of penance, was the goal of the religiously minded Donatist. In their religious hopes and their fanatical zeal, they illustrate aspects of early Christianity which expressed popular opposition to Roman rule in the 4th and 5th centuries.

DONATUS, AELIUS (fl. mid-4th century A.D.), a famous grammarian and teacher of rhetoric at Rome, one of whose pupils became St. Jerome. He wrote a large and a small school grammar, *Ars maior* and *Ars minor*. The latter, written for young students, gives, by question and answer, elementary instruction in the eight parts of speech. It remained in use throughout the middle ages, and its author's name became a common metonymy in the forms *donat* and *donet* for "grammar" or indeed any kind of "lesson." The larger work, in three parts, deals with the elements of grammar, the eight parts of speech, and errors and beauties of language. It has been argued that Diomedes used Donatus. Others suppose that Donatus used the same sources as Diomedes and Charisius. Certainly Donatus has little claim to originality, but no grammar is cited so often, and many commentaries were written on it.

Donatus also wrote commentaries on Terence and Vergil. The former in its original form is lost and the version which has survived lacks the notes on the *Hautontimorumenos* ("The Self-Tormentor"). Donatus' valuable commentary was based on excellent sources, such as Asper, and on careful study of Terence. It contains interesting notes on scenic representation and comparisons with Greek originals. Of the commentary on Vergil there survive only the preface and dedication, a life of Vergil, the introduction to the *Bucolics*, and quotations.

Aelius Donatus is to be distinguished from Tiberius Claudius Donatus, probably late-4th century A.D., author of the *Interpretationes Vergilianae*, a commentary on the *Aeneid*.

DONCASTER, a county and parliamentary borough in the West Riding of Yorkshire, Eng., 31 mi. S.E. of Leeds by road. Pop. (1961) 86.402. It lies astride the ridge dividing the watershed of the rivers Don and Trent. It is the centre of a large coal-mining area and an important station of the Eastern region of British railways, whose principal locomotive and rolling stock works are there. It also stands on the Great North road, and on the Don river which, with its canal, links the Trent and Humber with the ports of Goole and Hull. The parish church of St. George (architect Sir G. G. Scott) occupies the site of an older structure, destroyed by fire in 1853, and has a central tower 170 ft. high. St. James's church was erected by the same architect and Lord Grimthorpe. Other important buildings are the guildhall, mansion house (1748, one of the three original mansion houses in England), public library, school of art, museum, art gallery, technical college, corn exchange (1873) and market hall. The grammar school, probably founded in the 14th century, was rehoused in the 19th. There are also a girls' high school and a central modern school.

Systems of road transport connect the borough with the coal-mining towns of the district, which lies over a vast area of hidden coal fields dipping eastward toward the Trent. Agricultural trade is extensive and the town has large markets, although coal working is a bigger industry; wire ropes and fencing, brass tubes and fittings, electrical equipment, agricultural machinery, clothing, nylon and confectionery are manufactured.

The Doncaster racecourse lies 1 mi. S.E. of the town and is owned and managed by the corporation. On this course the St. Leger, named after Col. Barry St. Leger, a British officer in the American Revolution who originated the race in 1776 at Cantley common, is run in September, the last classic race of the season. The grandstand was erected in 1777. The airport is next to the racecourse.

Adjoining the borough are the Saxon and Norman ruins of Conisbrough castle and the remains of the Norman Tickhill castle.

History.—A Roman station (Danum) was located there, and numerous remains of the Roman period have been found. In the reign of Edward the Confessor, Doncaster belonged to Tostig, earl of Northumbria; but before 1086 it had been granted to Robert, earl of Mortain, whose successor William was attainted for treason in the reign of Henry I. The overlordship then fell to the crown, and the families of Fossard, Mauley and Salvin successively held the manor as underlords. The first charter of incorporation was that granted by Richard I in 1194; nine succeeding charters were granted by later monarchs. In 1623 Ralph Salvin tried to regain the manor of Doncaster from the mayor and burgesses who, fearing that the case would go against them, agreed to

pay about £3,000, in return for which he gave up his claim. In 1200 a fair on the vigil and day of St. James the Apostle was confirmed. and by the charter of 1194 the burgesses received licence to hold a fair on the vigil, feast and morrow of the Annunciation. These fairs were confirmed by Henry VII in 1505. The fairs and markets are still held under these charters. Doncaster was created a county borough in 1927.

DONDERS, FRANS CORNELIS (1818–1889), Dutch ophthalmologist, perhaps the most notable 19th-century Dutch physician and creator of scientific clinical refraction. was born on May 27, 1818. in Tilburg, and studied at Utrecht. After serving as an army surgeon, he became professor of physiology at Utrecht in 1847. From 1852 onward he specialized in ophthalmology, to which belong his studies of the *muscae volitantes* (1847). the relation betneen convergence of visual axes and accommodation (1848). regeneration of the cornea (1848), hypermetropia (1858), ametropia (1860). and astigmatism (1862). His chief work. *The Anomalies* of *Refraction* and *Accommodation,* was published in England in 1864. With A. von Grafe he founded the *Archiv für Ophthalmologie* in 1854. Donders died in Utrecht on March 24, 1889.

See E. Clarke, *A Brief* ***Review*** *of the Work of Donders (1914).*

DONEGAL (DUN NA NGALL), the most northerly county in the Republic of Ireland, is bounded on the west and north by the Atlantic ocean, on the east by Lough Foyle and the counties of Londonderry and Tyrone and on the south by Counties Fermanagh and Leitrim. It has a land area of 1,865 sq mi.

Physical Features. — The rugged Donegal coast line is heavily indented with inlets. two of the major ones being Lough Swilly and Lough Foyle Between these lies the peninsula of Inishoaen at the tip of which is Malin head, the most northerly point in Ireland The main rivers of the county are the Finn and Erne. The former rises at Lough Finn and flows through the county uniting with the Mourne at Lifford to form the Foyle while the Erne enters the sea at Ballyshannon.

The fundamental mountain ranges, Blue Stack in the south and the Derryveagh in the north, are continuations of the Caledonian system from Scotland. The underlying rocks of the county are predominantly Pre-Cambrian. including the granite of the Derryveagh mountains. The highest mountains. Errigal (2,454 ft.) and Muckish (2.197 ft.), are composed of quartzites. The schists have suffered denudation and often form the floors of valleys. In the eastern and inland parts of the county are extensive Silurian formations. The mountains were a centre of heavy glaciation and the U-shaped valleys. morainic deposits and drumlins found in the county are evidence of this.

The climate is west European with warm summers and mild moist nintrrs. In western Donegal the average January temperatures vary from 40° to 44° F. In northern Donegal the average July temperatures vary from 56° to 58° and in other parts they rise to 60°. For most of the county the rainfall is about 40 in. but in the southwest it exceeds 60 in.

History. — The name Donegal is from Dun *na nGall,* "the fort of the strangers," and was extended from the tomn to the whole county which was "shired" in 1585. The ancient name was Tirconaill (Tyrconnell; q v.), meaning the "land of Conall." Conall was one of the sons of Niall of the Nine Hostages who ruled at Tara from A.D. 380 to 405. Niall's sons, Eoghan and Conall, conquered northwest Ulster about 400, founding the kingdom of Aileach. Its capital or headquarters was at the still extant Grianan of Aileach. a great concentric stone fortress on a hill 802 ft high at the narrowest part of the peninsula between Loughs Snilly and Foyle. 5 mi. W across the frontier from Londonderry city. Eoghan (Omen). the older brother, took for his share Tir Eoghain (Tyrone, the land of Eoghan) and Inis Eoghain (Inishowen, the island or peninsula of Eoghan); his descendants. the O'Neills. ruled central Ulster until 1603. Conall, the younger brother, took the western part, Tir Conaill, and his descendants, the O'Donnells, ruled that area, often the rivals and sometimes the allies of the O'Neills. until the two great families came to final defeat in 1603.

The remote position of Tirconaill enabled it to escape serious interference by Anglo-Norman invaders and, although the O'Neills several times did homage to one of the earls of Ulster, no O'Donnell ever did so. The O'Donnells were also able to defeat a northward thrust from the Anglo-Norman conquerors of Connaught in the 13th century. They also introduced the custom of importing "Galloglasses," fighting men from Scotland. Although they held their own, the O'Donnells had a stormy history all through the middle ages. Among changes within their sphere of interest was the emergence in the 14th century of the O'Dohertys as lords of Inishowen, and an extension of O'Donnell influence over the Maguires of Fermanagh and the O'Connors of Sligo. Manus O'Donnell in 1541 gave undertakings of loyalty to the government of Henry VIII. Led by Hugh Roe O'Donnell (Red Hugh), the O'Donnells were the stanch allies of Hugh O'Neill in the great Ulster war at the close of Elizabeth I's reign. After the final defeat of the Irish cause in 1603, Hugh O'Neill and Rory O'Donnell were kindly received in London by James I, and Rory was created 1st earl of Tyrconnell. Feeling their position impossible, however, O'Neill and O'Donnell took flight secretly for the continent in 1607—the "Flight of the Earls." (See O'DONNELL; O'NEILL.) The county of Donegal was included in the scheme for the Plantation of Ulster immediately afterward, and its story becomes merged in the general history of Ireland. In the Franciscan abbey in Donegal town, however, was Michael O'Clery (*q.v.*) who, with three other men of learning, felt concern at the obliteration of the Gaelic past, and compiled the *Annals* of the *Four Masters,* a chronicle of Irish history up to 1616. The ruins of the Church of the Four Masters are in Donegal town. St. Columba (*q.v.*) was born in the county, at Gartan, in 521. A very early legend tells of St. Patrick's sojourn on an island in Lough Derg, in the south of the county. and for hundreds of years an annual pilgrimage to St Patrick's Purgatory has taken place (see DERG, LOUGH).

Population and Administration. — The population is mainly concentrated on the shoreland and the river valleys with remarkable densities on the west and south coasts. However, the greatest area of population is in the combined valleys of the Finn and Foyle. while the lowlands round Lough Swilly are also well populated. The main towns (1961 pop.) of the county are Donegal tonn, Buncrana (3,165), Ballyshannon (*qq.v.*) and Letterkenny (4,329). The total population in 1961 was 113,815.

Donegal contains 50 parishes, 149 electoral divisions and 2.648 townlands. Lifford, although only a small village, is the administrative centre. The Donegal County council, consisting of 28 elected members, acts as the local authority for the administrative area of Donegal, with an urban council in each of the towns of Letterkenny, Buncrana and Bundoran while Ballyshannon is administered by town commissioners. There is a county manager.

The Economy. — In the Foyle and Finn basins lie the most fertile areas and they are intensely cultivated, while the rugged western seaboard is unsuitable for tillage. Only about one-third of the county is suitable for cultivation. Afforestation of nonproductive land is progressing. Agriculture, the main industry, consists of tillage and rearing of cattle, sheep and poultry, mainly for domestic needs. The two chief crops are oats and potatoes. Donegal is one of the largest potato growing counties in the Irish republic and much of the crop is exported.

Fishing is the second most important industry. Killybegs on the west coast. with a large plant for the curing and freezing of fish for export and a fish meal factory to consume any surplus, is the main centre. Kelp, a source of iodine, is also made from seaweed. Salmon fishing is carried on in the rivers Finn, Foyle, Erne and Gweebarra.

The tourist industry is third in importance. Peopie visit Donegal for its rugged scenery, its many beautiful beaches, its shooting and fishing, and its golf courses at Rosapenna, Lisfannon and Bundoran. Large numbers of students visit Donegal to extend their knowledge of Gaelic.

A hydroelectric station at Ballyshannon, together with the turf-fired generating station at Gweedore, provides most of the county's electric power. Another hydroelectric power plant was constructed on the river Clady in the west.

In west Donegal the manufacture of handmade woolen garments

and "Aran" sweaters is of importance, while from the toy factory at Crolly, in the Gaeltacht (Irish language speaking area), come the "Crolly dollies." At Mountcharles the hand embroidery industry has been preserved and employs large numbers of "outdoor" workers, and at Convoy the world-famous Donegal tweeds are woven. There are small skirt factories at Carndonagh, Lifford, Buncrana, Castlefinn and Ballybofey.

The main roads in Donegal provide the coinmunication between the towns. After 1959 the old County Donegal railway (the last narrow-gauge railway in the British Isles) closed down and was replaced by buses. (T. J. McM.; Hu. S.)

DONEGAL (DUN NA NGALL, "fort of the strangers"), a small seaport and market town on the river Eske, at the head of Donegal bay. County Donegal, Republic of Ireland, lies 131 mi. W. of Belfast by road. Pop. (1956) 1.413. It is famed for its historic associations and its picturesque environment. Just south of the town. on the shore of the bay. stand the ruins — broken walls and a splendidly proportioned Gothic arch — of Donegal abbey, founded in 1474 by the O'Donnells for the Franciscan order. In the abbey the important Irish chronicles, *The Annals of the Four Masters* (*see* IRISH LITERATURE), were compiled between 1632 and 1636. The Franciscans, re-established at Rossnowlagh (6 mi. S.S.W.), have opened a county museum with specimens of ancient craftsmanship and literature. Donegal castle, a stronghold of the O'Donnells, was rebuilt by Sir Basil Brooke in 1610.

(T. J. McM.)

DONELAITIS, KRISTIJONAS (in German CHRISTIAN DONALITIUS) (1714–1780), the first Lithuanian poet whose work was appreciated outside Lithuania. Born at Lasdinehlen, near Gumbinnen (now Gusev), East Prussia, Jan. 1, 1714, he studied Lutheran theology and classical languages at Konigsberg university (1736–40) and in 1743 became pastor of the village of Tolmingkehmen (Tolminkiemis) where he remained until his death, Feb. 18, 1780. Donelaitis lived in a district of East Prussia where Lithuanian was still spoken: he spoke German and Lithuanian equally well, writing fables and idylls in Lithuanian and short didactic works in German, but they remained unpublished in his lifetime. His main work. *Metai* ("The Seasons"). written in hexameters (never before used in Lithuanian), echoes classical literature in describing the four seasons but depicts the countryside and the life of the serfs of 18th-century Lithuania. In 1818 L. J. Rehsa of Konigsberg published *Metai* as *Das Jahr* in *vier Gesangen,* with a German translation: it was later translated into other languages. His works also include *Aisópas arba pásakos,* a book of fables published and edited by Rehsa (1824), the themes of which are frequently taken from folklore or classical literature.

BIBLIOGRAPHY.—His poems, ed. by G. H. F. Nesselmann (1869), include a Ger. trans. Another Ger, trans., by L. Passarge, appeared in 1894 and his collected works in Rus. trans. in 1951. *See* also M. Biržiškos, *Duonelaitio gyvenimas ir raštai su kalbos paaiškinimais* (1927); V. Mykolaitis, "Donelaičio 'Metai'," *Lietuviu literatüros instituto Darbai,* vol. i (1947). (J. A.)

DONELSON, FORT, an entrenched camp at Dover, Tenn., erected by the Confederates in the American Civil War (*see* AMERICAN CIVIL WAR) to guard the lower Cumberland river in Tennessee and the approach to Nashville by river. In mid-Feb. 1862, Gen. U. S. Grant applied the combined army and navy tactics that had resulted in his capture of Ft. Henry on the Tennessee river on Feb. 6. 1862, in a move on Ft. Donelson. On the 12th he moved overland the less than ten intervening miles and took up an unintrenched position on ridges overlooking Ft. Donelson. There he waited in cold and rainy weather for the naval flotilla to run down the Tennessee to the Ohio and up the Cumberland. The Union gunboat attack on the water batteries of the fort on the 14th failed. Commodore A. H. Foote was wounded and two of his strongest gunboats disabled. The next day the Confederates attempted to cut their way through the Union right and failed. Grant quickly launched an attack on the opposite end of the Confederate line and by nightfall occupied the outer line of rifle pits. The Confederates meanwhile elected to give up the defense. and during the night the senior generals, J. B. Floyd and G. J. Pillow, went up the river by steamer with about 2.000 men. and Col. N. B. Forrest with 1,000 cavalry escaped by road. On the 16th, Gen. S. B. Buckner surrendered unconditionally with 15,000 men. The fall of Ft. Henry and Ft. Donelson broke the Confederate line from Columbus to Bowling Green, opened the way by river into Tennessee, and forced the evacuation of such strongholds as Columbus and Nashville.

See C. C. Buel and R. U. Johnson (eds.), *Battles and Leaders of the Civil War* (1884–87), *Personal Memoirs* of *U. S. Grant,* vol. 1 (1909). (C. W. TE.)

DONETS BASIN (DONETSKI BASSEIN or DONBASS), the largest coal field of the Union of Soviet Socialist Republics with its associated heavy industrial area, lies in the steppes of the eastern Ukraine and adjoining parts of the Russian Soviet Federated Socialist Republic. Administratively the Donbass falls within Lugansk and Donetsk (*q.v.;* formerly Stalino) *oblasts* of the Ukrainian S.S.R. and Rostov *oblast* of the Russian S.F.S.R. From 1954 to 1957 the Donbass portion of Rostov *oblast* formed the separate Kamensk *oblast* (now abolished). The northern limit of the coal field is marked by the Northern Donets river, from which it derives its name, while through the centre of the field run the hills of the Donets ridge, rising to 1.204 ft. The exploited coal field covers nearly 9,000 sq.mi., but deposits have been established extending as far west along the middle Dnieper as the Pripyat. This "Greater Donbass" covers more than 23,000 sq.mi., but by the early 1960s the western extension was exploited only locally on a small scale.

The Donbass possesses vast reserves of coal, including much of high quality. Proved reserves total 50,290,000,000 tons, with a further 63,490,000,000 tons probable reserves and 76,200,000,000 tons possible reserves. Of the proved reserves 23% are anthracite. 9.4% semianthracite, 20.7% coking coals, 38.8% bituminous and 8.1% subbituminous. All the coal is in the Carboniferous strata (88% in the middle Carboniferous) and preserved in a deep trench in the underlying crystalline foundation of the Russian platform. The thickness of the strata is considerable and there are 260 coal-bearing seams, of which about 40 are worked, all over $1\frac{1}{2}$ ft thick. The average thickness of seam is just under 3 ft. and seams only rarely exceed 5 ft. Along both the northern and southnestern margins of the field there has been considerable faulting of the seams. The mines are not generally deep, although most of the seams nearest the surface have been worked out. Of more than 530 pits operating in the 1960s only six exceeded 700 m. (2 296 ft.). There is no open-cast mining.

The Donbass was the first coal field of the U S.S.R. to be exploited. Coal was discovered there in 1721 and mining first started at the beginning of the 19th century. The Crimean War. which cut off English imported coal, gave a stimulus, but large-scale production began only after the coming of the railways in the 1870s The metallurgical industry began to expand after the building in 1886 of a railway to the iron ore mines of Krivoi Rog (q v.) The last two decades of the 19th century saw rapid development and the creation of a "Black Country" in the Donbass. By 1913 the area was producing 87% of the coal and 74% of the pig iron in Russia. After the Revolution rapid expansion of the Donbass continued and despite the grave setback caused by heavy damage during World War II a hen the region was occupied by the Germans, the region remains the largest coal producer, although the growth of new industrial areas in the Urals, Siberia and elsewhere has reduced the proportion of the Donbass in total U.S.S R production. In the early 1960s the Donbass averaged about 190,-000.000 tons of coal annually or approximately 36% of the national total and well over twice as much as the Kuzbass (Kuznetsk basin). the next largest producer. Production of anthracite exceeded 57,000,000 tons and coking coals 45,000,000 tons. The main mining centres are Donetsk (*q.v.*), Makeyevka, Gorlovka, Kadiyevka, Shakhty, Novoshakhtinsk, Chistyakovo. Krasny Luch and Krasnodon.

Donbass coal is the basis for large-scale heavy industry in the area. Fire clays and limestone are also obtained locally. Iron ores are brought by rail from Krivoi Rog, west of the Dnieper or by ship from Kerch in the Crimea Around Nikopol on the lower Dnieper manganese is mined. Petroleum and natural gas are brought by pipeline from the north Caucasus. Hydroelectric

power is available from the large stations on the Volga at Kuibyshev and Volgograd, and on the Dnieper at Zaporozhye and Kakhovka. Complete integrated iron and steel plants with coke ovens, blast furnaces, steel furnaces and rolling mills have been developed at Donetsk, Makeyevka. Yenakiyevo. Konstantinovka, Kramatorsk and Kommunarsk (formerly Voroshilovsk). Other centres. such as Lugansk (formerly Voroshilovgrad) and Lisichansk have smaller plants. Much of the steel produced is used in the heavy engineering and machine building industries of the Donbass, notably at Lugansk (especially locomotives), Kramatorsk (heavy machinery), Donetsk and Kadiyevka The chemical industry. has developed rapidly, especially at Slavyansk and Artemovsk (*q.v.*), using coking by-products and the rock salt mined near Artemovsk. Mercury is also mined in the Donbass and cement making is important. In Soviet times a wide range of light consumer industries has been introduced to support the heavy industries and expanding population. In all branches of industry the great devastation of World War II accelerated the re-equipment of factories and mines with modern machinery, while concentration into larger units during reconstruction has made economies of scale possible.

The total population of the three oblasts which cover the Donbass was 10,025,967 (1959), of whom 7,566,992 were urban. The largest town is Donetsk, with 701.000 inhabitants.

The Northern Donets is a tributary of the Don, 631 mi. long and draining a basin of 38,439 sq.mi. It rises in the central Russian upland near the village of Kholodnoye and flows southward past Belgorod and a little to the east of Kharkov. In this upper course it is a small stream only 30 ft. wide. South of Kharkov the river curves to the southeast and follows a highly sinuous course to the north of the Donbass to join the Don just below Konstantinovski, 115 mi. from its mouth. The lower course is up to 300 ft. wide with many sandbanks. The average annual flow is 5,650 cu ft. per second, with a maximum of nearly 100.000 cu.ft. in the spring floods. Freeze-up lasts from early December to late March. A series of six weirs makes navigation possible as far upstream as Donetsk (formerly Gundorovka in Rostov oblast). (R. A. F.)

DONETSK, oblast (formerly Stalino oblast) of the Ukrainian Soviet Socialist Republic in the U S S R., lies in the eastern Ukraine, covering an area of 10.232 sq.mi. It stretches from the Donets ridge in the north, across the low, gently rolling Azov uplands and the level coastal plain to the sea of Xzov. The north is drained by the Northern Donets and its tributaries, the west by the Volchya and the south by several small rivers flowing to the Azov sea, but there is little surface water and many of the streams dry out in summer. The whole area is in steppe. on fertile chernozem (black earth) soils, and the greater part is under the plow.

The oblast, which was formed in 1938, had a population of 4,262,048 (1959). It includes the western half of the Donets basin (*q.v.*) industrial area and this is reflected in the exceptionally high proportion (more than 80%) of urban dwellers. The largest of the 39 towns and 138 urban districts are Donetsk, the oblast centre (701,000), Makeyevka (358,000), Gorlovka (293,000), Zhdanov (284,000) and Kramatorsk (115,000). Despite the overwhelming predominance of coal mining, iron and steel manufacture. heavy engineering and chemicals in the economy, the oblast is important agriculturally, chiefly for winter wheat, maize (corn), sunflowers and market gardening. (R. A. F.)

DONETSK (renamed from Stalino in Nov. 1961 and formerly Yuzovka), a town and oblast centre of the Ukrainian Soviet Socialist Republic in the U.S S.R , and the largest city of the Donets basin (*q.v.*) industrial area. Pop. (1959) 701,000. The town stands on the headwaters of the Kalmius river In 1872 an ironworks was founded there by a Welshman, John Hughes (from whom the pre-Revolutionary name Yuzovka, *i* e., Hughesovka, was derived). to produce iron rails for the growing railway network of Russia. Later steel rails were made The plant used coal from the immediate vicinity and both coal mining and steel making advanced rapidly. By 1914 there mere four metallurgical plants. ten pits and a population of about 50 000. The giant integrated coking-iron smelting-steelmaking plant now makes Donetsk one of the largest metallurgical centres of the U.S.S.R. The great destruction of World War II during the German occupation led to the rebuilding of its factories and their re-equipment with modern machinery. There are a number of heavy engineering plants, producing especially mining equipment. In addition there are food processing and other light industries. Donetsk has industrial, medical and pedagogic institutes, several technical schools and research institutes for coal, pit planning and the physiology of work. (R. A. F.)

DONGA, a Bantu word for a narrow watercourse or eroded gully. Adopted by Europeans in South Africa from the Kaffirs, it was applied to similar ravines or watercourses elsewhere. It is almost equivalent to the Arabic *khor,* which also means the "dry bed of a stream," and to the Indian *nullah* (properly "a watercourse").

DONGAN, THOMAS: see **LIMERICK,** THOMAS DONGAN.

DONGOLA, a subdistrict and a town in the Northern province of the Republic of the Sudan The subdistrict extends along both banks of the Nile and forms the northern part of Merowe-Dongola district. between the Third and Fourth cataracts. Pop. (1956) 151,736. Area 27.520 sq.mi. Dongola reach is a plain of desert erosion where Nubian sandstone overlies the basic complex, with granitic and volcanic rocks sparsely distributed in the desert. It has a continental desert-type climate and rainfall is very slight. The common feature of the region is barren desert, but thorny drought-resisting vegetation is found in wadis. Grazing allowed by nomad tribes (Hawawir, Ababda, Bisharin, Kababish and Gar-rarish) and the felling of trees for fuel have reduced the vegetation cover. Near the Nile, plants are more plentiful and there are abundant date palms. Doom trees (*Hyphaene thebaica*) also are common.

The area of fertile soil is mainly ,confined to the lands watered by the river and varies from a few feet in width in some places to two or three miles in others. It is classed as alluvial riverain soil composed almost entirely of recent silts deposited from the floodwaters of the Nile, and is intensively cultivated.

The principal market towns are Argo, Dongola and Kerma. There is a regular Nile steamer service between Kareima, in the northern subdistrict of Merowe, and Kerma in Dongola subdistrict. Motor transport is common and the small airport at Dongola town is not often used. The population of Dongola consists mainly of Danagla (the indigenous people after whom Dongola is named), some Arabs and small groups of nonindigenous peoples. The Danagla influence extends from Kerma in the north to Debba and Gushabi in Merowe district to the south. Characteristics derived from Nubian ancestors have survived. Farming is the main livelihood of the Danagla. They are good agriculturalists and use different types of lift irrigation such as saquias, shadoofs and pumps. The chief crops grown are cereals (wheat, durra); pulses (chick-peas, horse beans); and vegetables. Of the cash crops the most important are dates and citrus fruit.

DONGOLA TOWN is the main centre in the subdistrict of Dongola, a small mud-built market town on the west bank of the Nile about 836 mi. N. of Khartoum. Pop. (1956) 3,350. Founded about 1812 by the Mamelukes who fled from Egypt to Nubia, it is referred to as Dongola al-Urdi (Dongola Camp) to distinguish it from Dongola al-Aguz (Old Dongola) which it supplanted.

At the beginning of the Anglo-Egyptian condominium rule, Dongola was chosen as the provincial headquarters. Further administrative reorganization reduced it to a district headquarters and later, when Merowe and Dongola reaches were amalgamated to form one district, the former became the district headquarters and Dongola town lost much of its administrative functions. After this centralization local administration, headed by a nazir (chief), was established in Dongola to deal with certain local affairs.

The fate of Dongola al-Aguz was even more decisive. From a large city and the seat of the Christian kingdom of Dongola it was reduced to ruins and its large 14th-century church converted into a mosque. (A E -S. O)

History.—Dongola once the fertile land of Cush, was visited by Old Kingdom Egyptian traders. There was an Egyptian trad-

ing post at Kerma, the capital of Cush c. 2000 B.C. Military expeditions included Dongola in the Egypt of the New Kingdom, *c.* 1528 B.C. Gem-aten at Kawa was founded by Amenhotep III *c.* 1380 B.C., and a temple built by Tutankhamen survives there. Jabal Barkal became a centre of the worship of Amon (Amen-Ra), with several temples. After the collapse of the New Kingdom, the Egyptianized descendants of the kings of Cush invaded Egypt c. 725 B.C. and established the 25th dynasty. Their capital was Napata near Jabal Barkal, and they were buried under pyramids at Kuru nearby. The temples at Barkal and Kawa were then enlarged, for much wealth came to Napata as capital of a powerful state Taharqa (Tirhakah) and his successor Tanutarnon (Tanwetamani) were both expelled from Egypt by the Assyrians, but after 660 B C. the kings of Cush, still powerful, continued to threaten Egypt until, about 590 B C.. Psamtik II forestalled them by sending an army, which sacked Napata. Meroë near Shendi then became the capital of Cush, while Napata remained until about 300 B C. the religious capital, the kings being buried there under pyramids. In 23 B.C. Dongola was invaded by the Roman Petronius to recover the statue of Augustus stolen from Aswan. He met the queen at Napata. but refusing to wait for the statue, which was at Meroë, razed Napata. Early in the Christian era the great temple there mas restored by King Natakamani. who also set up two colossal statues of himself before a temple on Argo Island. In the 4th century Dongola was the home of the Xobatae. The large mound graves of their kings are at Zuma and Tangasi near Napata. They were presumably the Red Noba whose frontier was reached by the Aksumite army after sacking Meroë about A.D. 350. The Nobatae were converted to Monophysite Christianity in 543 during the reign of Justinian. In 569 Mukurra, approximately coterminous with Dongola and the central of three Nubian kingdoms, was converted to Orthodox Christianity. Its capital was at Old Dongola. It had absorbed the northern kingdom by 652, nhen it was invaded by Muslims from Egypt. A treaty, which lasted for 600 years, was made, by which in return for a tribute of 400 slaves. a gift in kind was received from Egypt.

By 985 some Muslims were settled in Lower Nubia. the frontier of Dongola was at the Second cataract, the trade was by barter, the exports being slaves. camels, cattle, iron and corn. In 1173 an ambassador sent by Saladin reported that Dongola was a poor country. the king rode bareback and knew no Arabic, and his palace was the only house riot built of grass. In 1240 Kanem had a post nest of Dongola al-Urdi. to secure its trade with Egypt; and from 1275 Dongola was repeatedly invaded from Mameluke Egypt. To this period belong the stone forts copying contemporary European castles (at Sai I, Khandaq, Bakhit and Old Merawi), with which Dongola attempted to protect itself; also the tiny churches on islands, whither many inhabitants fled. David, king of Dongola, took refuge in the northern district of Alwa, but the ruler sent him to Sultan Baybars. During the next generation Egypt repeatedly interfered by force in the affairs of Dongola until in 1315 a Muslim was made king and the tribute abolished. In the confused events nhich followed, Arabs from Lower Nubia took an ever greater part in events in Nubia, and by the end of the 14th century, hordes of Arabs were pouring through Dongola into the Sudan, happy to escape the Mamelukes.

By 1517 the Turk Selim I was ruler of Egypt and, invading the Sudan, was surprised to find that it was ruled by Muslims (the Fung), who held his forces near the 'Third cataract. During the reign of the Fung sultan Badi Abu Dign (1645–80), the Shaigia of Dongola revolted, securing the independence of the area betneen Deiga and the Fourth cataract. There, centres such as Kajebi, Merawi East and Amri were ruled by petty chiefs who lived in fortified houses of stone. The Shaigia were famous for their schools and brigandage. Their revolt cut the Fung off from Dongola, their chief source of horses, and rendered the route to Egypt dangerous.

After Mohammed Ali had overcome the Mamelukes, his son Ismail Pasha in 1820 invaded the Sudan, capturing Dongola and crushing the Shaigia, who resisted bravely. Thus Dongola became a province of Egypt.

Following the failure of the British relief expedition of 1884–85 and the mahdist capture of Khartoum it was decided to withdraw to the region of the Second cataract, and the Dongola province was evacuated. The British vanguard left Dongola town in June 1885 and the mahdists occupied it at the end of August. They held the province for 11 years, during which its northern villages were depopulated and their riverside lands laid waste. It was reoccupied by forces under the command of Maj. Gen. Sir H. (later Lord) Kitchener in 1896, Dongola being recaptured on Sept. 23. It remained a province of the Anglo-Egyptian Sudan until 1936 when it was incorporated as a district in the Northern province. *See* also SUDAN.

DÖNITZ, KARL (1891–), German naval officer, was born in Gruneau. near Berlin, Sept. 16. 1891, and entered the navy on April 1, 1910. He was promoted through the various ranks, becoming a rear admiral on Oct. 1, 1939, vice-admiral in 1940 and admiral in 1942. Dönitz commanded the German submarine force until Jan 30. 1943, when he was promoted to the rank of grand admiral and became commander in chief of the navy, retaining this position until the end of the war. After the defeat of Germany in 1945 the inter-Allied tribunal at Nürnberg sentenced him to imprisonment, from which he was released in 1956. (J. B. HN.)

DONIZETTI, (DOMENICO) GAETANO MARIA (1797–1848), Italian opera composer, was born on Nov. 29, 1797, at Bergamo. He began his musical studies with Simon Mayr, nho was organist of Bergamo cathedral and a successful composer of operas. and completed them at the Liceo Filarmonico at Bologna under Stanislao Mattei. Donizetti's father intended him to become a church musician, but the young man's tastes lay in the theatre. He scored his first success at one of the Venetian opera houses in 1818 and during the next 12 years composed no fewer than 31 operas. most of them produced in Naples and now forgotten. In 1830 his *Anna Bolena,* produced in Milan. carried his fame abroad to all the European capitals and across the Atlantic. Two years later he scored another lasting success mith *L'Elisir d'amore,* a comedy full of charm and character with a text by Felice Romani. *Lucrezia Borgia,* also nith a libretto by Romani, achieved considerable success in 1833 at La Scala. Milan. and elsewhere. Like Rossini and Bellini. before him, Donizetti now gravitated to Paris. His *Marino Faliero,* produced in Paris, suffered from comparison with Bellini's **I** *Puritani,* and he returned to Naples for the production of his tragic masterpiece. *Lucia di Lammermoor,* in 1835. He continued working in Naples (where his young wife died in 1837) until in 1838 the censorship refused to allow the production of *Poliuto* on religious grounds. He returned to Paris nhere the field had been cleared for him by the death of Bellini and Rossini's retirement. There he revived some of his best operas, including *Lucrezia Borgia,* which, however, had to be withdrann because of the opposition of Victor Hugo, on whose drama the libretto was based. *Poliuto* was produced as *Les Martyrs* in 1840, preceded a few months earlier by the *opéra comique, La Fille du régiment,* nhich gained enormous popularity through the performances of Jenny Lind, Adelina Patti, Emma Albani and others throughout the 19th century. Later in the same year the Paris Opéra produced *La Favorite,* Donizetti's first essay in French grand opera. for which he himself wrote the text of the last (and best) act. The piano arrangement of the score was made by the as yet unknown Richard Wagner, who was in Paris at the time. Apart from *Linda di Chamounix,* produced in Vienna in 1842. the only other work of note is the *opera buffa, Don Pasquale,* produced at the Théâtre Italien in Paris in 1843. For this delightful and witty farce. Donizetti wrote his own text. *Dom Sébastien,* his second work for the Opéra, was a complete failure. Melancholia, presaging the final stages of general paralysis, had already begun to quench the spirit of the gay and debonair composer. The remaining years are a sad story of degeneration to helpless insanity, first in an asylum near Paris and then at his native Bergamo, where he died on April 8, 1848.

As the list of his numerous operas shows, Donizetti was a most

facile composer. He acquired from his masters, Mayr and Mattei, just the right amount of technical proficiency to serve his purpose and no more. His theatrical flair enabled him to give musical emphasis to the dramatic situations on the stage without probing deeply below their surface, while his abundant fund of melodic invention never failed to provide lyrical expression to the emotions of the characters. Historically his tragic operas, of which *Lucia* and *La Favorite* are the best. represent a transitional stage between Rossini's and Verdi's. His comedies have a wit and gaiety entirely their own. Apart from opera, he composed string quartets and other chamber works and also sacred music.

See G Barhlan, *L'opere di Donizetti nell' età romantica* (1948); *A.* Fraccaroli, *Donizetti* (1944). (DY H.)

DON JUAN, a fictitious character, confusedly derived from folklore and given literary personality in the tragic drama *El Burlador de Sevilla* ("The Rake of Seville," attributed to Tirso de Molina and published in 1630), and generally regarded as a symbol of libertinism. The story in which he usually figures tells how. at the height of his licentious career, he dishonoured a girl of noble family and killed her father who tried to avenge het; how, later, seeing a commemorative effigy on the father's tomb, he flippantly invited it to dine with him; and how the stone ghost duly arrived for dinner as the harbinger of death. Don Juan is at his artistic best in the original Spanish tragedy where his attractive qualities—his nervous vitality, his arrogant courage and his sense of humour—heighten the dramatic value of the catastrophe The power of this drama derives from its rapid pace, the impression it gives of cumulative tension as Don Juan's enemies gradually hound him to destruction, and the electrifying fact that he is nervously goaded by excess to defy, beyond redeemable limits, even the ghostly forces of the unknown. Refusing to repent he crashes to eternal damnation. Through Tirso's tragedy he has become a universal character comparable nith Don Quixote, Hamlet and Faust, and expresses, psychologically, man's challenge to the world of his limitations.

Later Spanish versions retain Don Juan's likable qualities and avoid the calculated cynicism of certain foreign ones; but they tend to reduce the shock of the Tirsian catastrophe. A milder arrangement by Antonio de Zamora, called *El convidado de piedra* ("The Stone Guest"), was popular in the 18th century; José de Espronceda's poem. *El estudiante de Salanzanca* (1839), where a Don Juan with a different name and under romantic auspices takes part in a mysterious dance of death, is more picturesque than dynamic. But by the 19th century many foreign versions of the Don Juan legend had become influential, and the highly popular *Don Juan Tenorio* (1844) of José Zorrilla, still performed in Spain at All Souls' tide. borrowed lavishly from French sources. Zorrilla's play sentimentalizes the legend by furnishing a pious heroine and a serious love interest, perhaps indirectly inspired by the Faust theme. and by procuring Don Juan's repentance and salvation. Spanish-Italian relations in the 17th century facilitated literary exchanges, so that the Don Juan story soon became known to strolling Italian players some of whom traveled to France with this theme in their repertoire of pantomime.

Famous among non-Spanish literary versions are Molière's *Le Festin de Pierre* ("The Stone Banquet"; 1665), based on earlier French arrangements; Prosper Mérimée's novel *Les Âmes du Purgatoire;* and the drama *Don Juan de Marana* by the elder Dumas. Early English arrangements—T. Shadwell's *The Libertine* (1676), for example—are uninspired, but later the libertine reappears with new personality and purpose in Byron's *Don Juan* and Shaw's *Man and Superman.* The theme readily lent itself to opera and was used with greatest distinction by Mozart in *Don Giovanni.*

See A. Farinelli, *Don Giovanni* (1946); *J.* Casalduero, *Contribución al estudio del tema de Don Juan en el teatro español* (1938); *G.* Marañón, *Don Juan* (1940). (I. L. McC.)

DONKEY: *see* **Ass.**

DONNAY, CHARLES MAURICE (1859–194j), French dramatist, illustrating early 20th-century tendencies, was born in Paris, Oct. 12, 1859, and began his career as the poet of the literary cabaret, *Le Chat Nozr.* He made his name in the theatre nith *Amants* (189j), which marked an important date in the evolution of the French drama between the Théâtre Libre and World War I. It also inaugurated his *théâtre d'amour,* which included *La Douloureuse* (1897) and *L'Affranchie* (1898). 4 second cycle of plays, including *Le Retour de Jérusalem* (1903) and *Les Eclaireuses* (1913), dealt with current social problems, and *La Chasse à l'homme* (1919) and *La Reprise* (1924) were comedies of manners depicting the new postwar France. Donnay died in Paris, March 31, 1945.

See H. Duvernois, *Maurice Donnay* (1928); *P.* Bathille, *Maurice Donnay* (1931); *M.* Donnay, *Mon Journal, 1919–39* (1953). (D. Ks.)

DONNE, JOHN (1572–1631), English poet and priest, was spoken of by his contemporary, Ben Jonson, as "the first poet in the world in some things." When he died, as dean of St. Paul's, he had earned another reputation as the greatest preacher of his age. Both as poet and priest he sank in reputation after the Restoration; but in the 20th century he rose. as a poet, to a fame as great as he had enjoyed when living, or even greater; and interest in his poetry brought a revival of interest in his sermons. As master of the so-called "metaphysical school" of poets he became the idol of critics in England and the United States, and the influence of his highly individual style can be seen widely in poetry written between World Wars I and II.

Donne was born some time in the first half of 1572 in the City of London. His father, also John Donne, was a prosperous merchant of Welsh ancestry, who rose to be warden of the Ironmongers' company in 1574. Two years later he died. Donne's mother was Elizabeth Heywood, daughter of John Heywood, epigrammatist and playwright, whose wife was the daughter of Sir Thomas Afore's sister. Both Donne's parents were Roman Catholics, and through his mother he came of a family remarkable for its loyalty to the Roman Church as well as for literary activity. His mother's brothers, Ellis Heywood and Jasper, the translator of Seneca's plays. were both Jesuits who died in exile. His younger brother, Henry, died at the age of 19 in 1593, having caught fever in the prison to which he had been committed for sheltering a priest.

In 1584 Donne matriculated at Hart hall, Oxford. As it was impossible for a Roman Catholic to take the oath of supremacy required at graduation he left without taking a degree. No records confirm Izaak Walton's statement that he went to Cambridge on leaving Oxford. He entered as a law student at Thavies Inn, London. in 1591, and transferred to Lincoln's Inn in 1592. Sir Richard Baker remembered him as living there "not dissolute. but very neat, a great visiter of Ladies, a great frequenter of Playes, a great writer of conceited Verses." The Lincoln's Inn records will not allow for any prolonged absence from London between 1592 and 1596, so that if, as Walton says, Donne traveled extensively in his youth, it must have been in the period between leaving Oxford and entering the Inns of Court. Walton's picture of Donne at Lincoln's Inn differs from Baker's. He says that he would rise at four and work in his chamber until ten and that "about the nineteenth year of his age, he, being unresolv'd what Religion to adhere to" put aside other studies "to survey and consider the Body of Divinity. as it was then controverted betwixt the *Reformed* and the *Roman Church.*" But the dandy and wit, and the serious student. are both reflected in the poems Donne wrote at this time: the sensual, witty *Elegies* and the mordant *Satires.* In the latter, particularly in the noble satire "Of Religion." his moral gravity finds expression.

Donne went on the earl of Essex's Cadiz expedition of 1596 and on the Islands voyage in 1597. "The Storm" and "The Calm," brilliant examples of poetical journalism, describe this second expedition. On his return he became secretary to Sir Thomas Egerton. the lord keeper (afterward Lord Chancellor Ellesmere). He had. by this time. conformed to the Church of England. What seemed a promising start to a diplomatic career was made abortive by his secret marriage in Dec. 1601 to Ann More. the young niece of his employer's wife. Donne was imprisoned for the offense of marrying a minor without her guardians' consent, and the girl's father, Sir George More, secured his dismissal from Egerton. On his release. he found himself without employment and his wife

without a dowry. He had spent his patrimony as a young man about town and the next years were years of poverty and humiliating dependence. Donne's marriage. the great error of his life from the worldly point of view. was its true turning point. There is no evidence for any period of religious crisis in his life. and. if the term "conversion" is to be used in discussing the change from "Jack Donne" to "Dr. Donne." it must be taken to mean a gradual process by which a wilful. passionate and ambitious temperament was schooled by harsh circumstances and natural responsibilities. The ruin of his career was the beginning of the process, and love for his wife, which he said, after her death, had led him to seek God. a main means in achieving it.

The finest of Donne's poems, the *Songs and Sonnets,* cannot be dated with any certainty; but some were certainly written after his marriage. since they assume a king upon the throne. and it is impossible not to wish to connect the more serious and impassioned of them with Ann More. The same kind of probability would lead to the dating of the more cynical and outrageous in the Lincoln's Inn period, at the same time as the Ovidian *Elegies* and the prose *Paradoxes and Problems.* These last. however, are a warning of the uncertainty of such a conjecture, since Donne was capable of amusing himself with this kind of witty trifling as late as 1607. Donne did not write for publication. He was a "poet on the by.'! writing to please himself and his friends. Original as the *Songs and Sonnets* are, many are brilliant variations on stock themes. It is Donne's artistry which makes them seem so direct and personal. The impulse behind any one of them may well have been an artistic pleasure in making something new out of an old topic rather than a wish to express personal feeling,

From 1602 to 1613 Donne struggled to find ways to support himself and his growing family. Ann Donne bore him 12 children, seven of whom survived her, before her early death in 1617. At first he depended on charity, but after a few years he found a use for his extensive learning in helping Thomas Morton (afterward bishop of Durham) in his controversies with Roman Catholics. As early as 1607. according to Walton. Morton, on becoming dean of Gloucester. urged Donne to take orders, so that he might offer him preferment. Walton, who almost certainly had the story from Morton, says that Donne refused on grounds of personal unworthiness. He was probably also reluctant to abandon all hope of a secular career, and about this time his prospects brightened. Sir George More relented over the dowry, and Donne became a client of Lucy. countess of Bedford, and through her had contact with influential persons. His first published work. *Pseudo-Martyr,* written to persuade Roman Catholics to take the oath of allegiance, appeared in 1610. It earned Donne an honorary M.A. at Oxford and the notice of the king. This weighty work was followed by *Ignatius his Conclave* (1611), a brilliant and bitter little squib against the Jesuits, and a little earlier Donne wrote, but did not publish. *Biathanatos,* a learned casuistical treatise on the possible lawfulness of suicide. In 1610 Donne found a new patron in Sir Robert Drury, who took him abroad from Nov. 1611 to Aug. 1612; and on his return he courted the king's powerful favourite, Viscount Rochester. later earl of Somerset. He wrote to Rochester expressing an intention to take orders; but a later letter to a friend, asking him to use his influence with Rochester to secure a diplomatic post, shows him vacillating and in Xpril 1614 he was elected to parliament. There is no doubt of Donne's reluctance to take orders, or of the fact that he finally gave way in obedience to King James's direct pressure. He was ordained on Jan. 23, 1615, and at the age of 43 began a new life.

During these middle years Donne wrote two poems for publication, the *Anniversaries* of 1611 and 1612 in commemoration of the death of the 15-year-old daughter of his patron. Elizabeth Drury. He also composed funeral pieces, complimentary epistles, and two epithalamiums: one for the wedding of Princess Elizabeth and the other for the wedding of Somerset and the countess of Essex. (The old notion that Donne was concerned with the scandal of the countess' divorce arose from a confusion between him and Sir Daniel Dunne.) Most of his *Divine Poems* belong to this period also. notably "A Litany" and two sets of sonnets: "La Corona." a linked sequence on the mysteries of the Christian religion, and the greater part of the "Holy Sonnets," in which with intense feeling and great force of language he treats the age-old themes of meditation: sin, death and judgment. After his ordination Donne wrote very little poetry. His creative impulse found a new outlet in preaching.

Donne felt a deep satisfaction in the exercise of his ministry, and was assiduous in performing his duties. Like all distinguished churchmen of his day, he was a pluralist, holding country livings as a nonresident and the city living of St. Dunstan-in-the-\Vest. Walton's parish. from 1624. In 1616 he was appointed reader in divinity to the benchers of Lincoln's Inn; in 1619 he went abroad as chaplain to Viscount Doncaster (later earl of Carlisle) on his mission to the German princes in an effort to avert the outbreak of the Thirty Years' War; and in 1621 he was made dean of St. Paul's. There was a proposal to make him a bishop in the autumn of 1630; but Donne was by then a very sick man. He died in London on March 31, 1631. and was buried in St. Paul's, where his monument. the only monument to survive the fire of 1666, still stands. There are many tributes to Donne's impressiveness in the pulpit. He was a favourite preacher at court, and much approved by that learned theologian, King James. James's more devout, if less learned. son, Charles I. chose Donne to preach the first sermon of his reign. But Donne's finest sermons were preached in St. Paul's on the great feasts. They are splendid examples of the formal sermon. preached under heads given by the dividing of the text and buttressed with massive scriptural and patristic quotations, full of flashes of poetic imagination, and displaying a profound knowledge of the human heart as well as a firm grasp on the central doctrines of Christianity. A few sermons were printed in Donne's lifetime. His only other publication after his ordination was *Devotions upon Emergent Occasions* (1624), the fruit of a serious illness in the winter of 1623. During this illness, an attack of spotted fever, Donne wrote the "Hymn to God the Father" and probably also the "Hymn to God my God in my sickness." although Walton says that he wrote this last poem on his deathbed.

Walton's account of Donne's last days is not wholly reliable. He drew heavily on Donne's own account of the pious death of Magdalen, the mother of Edward and George Herbert, whose funeral sermon Donne had "preached weeping." Donne was too ill to preach at Christmas 1630, but he was able to preach before the king on Feb. 12, 1631; the first Friday in Lent. his "old constant day." His appearance. as an obviously dying man, made a deep impression and many said that "Dr. Donne had *preach't his own Funeral Sermon.*" This last sermon, under the title *Death's Duel,* was published shortly after his death. Between preaching this sermon and his death, Donne had his picture painted in his shroud and composed his epitaph. The picture was the original of the engraved portrait prefixed to *Death's Duel,* and from it Nicholas Stone carved the monument in St. Paul's, where Donne stands in his shroud upon an urn. "looking towards Him whose name is the Rising." Since the folds of the shroud are plainly not carved from a standing figure. Walton's story of Donne's standing for it on an urn. wrapped in his shroud, in his study can be regarded with some skepticism.

Eighty sermons, which Donne had written out in full as a legacy to his son. were published by him in 1640. with the first version of Walton's *Life* of *Donne* prefixed. A further 10 appeared in 1649, and the younger Donne scraped the bottom of that barrel with the *XXVI Sermons* of 1661. He also published *Essays in Divinity* and *Letters to Several Persons of Honour* in 1651, and made public some works which his father would have preferred to remain unprinted. the *Juvenilia* (1633) and the sombre *Biathanatos* (entered on the Stationers' Register. 1646: publ., undated. 1647). The *Poems,* which had circulated widely in manuscript copies, appeared in 1633. and an enlarged edition in 1635. It is not known who mas responsible for these editions. There were further editions in 1639. 1649. 1650, 1654 and 1669. Between the last of these and the appearance of Donne in John Bell's *Poets of Great Britain* (1779), there is only Jacob Tonson's edition of 1719.

Walton revised his *Life of Donne* (1640) in 1658 and again in 1670 and 1675. His declared purpose. to show the world "the best

plain picture of the Authors Life that my artless Pensil. guided by the hand of truth. could present." underrates the extent of his art, and the degree to which he was actuated by the desire to present his hero in the most edifying light. Sir Edmund Gosse's *Life und Letters of John Donne* (1899) remains the only full biography. It is extremely unreliable. All students of Donne need to be on their guard against Walton's gift for charming and probable anecdote. and Gosse's habitual inaccuracy and constitutional inability to distinguish between fact and surmise.

In his own day Donne's poetry mas praised for its wit. The 20th century, although acknowledging the brilliance of his use of unexpected and recondite images, pedantically precise hyperboles and daring paradoxes, values him more for his power to catch in verse the ring of passion and to render the accents of a "naked, thinking heart." It was the blend of passion and ratiocination, or the illusion which his poetry gives that thought and argument are arising immediately out of passionate feeling, which made him the master of both the later W. B. Yeats and of the young T. S. Eliot, who were reacting against the meditative lyricism of the romantic tradition in its decline. Combined with this play of intellect and scorn of conventionally poetic imagery goes a refusal of poetic diction and a handling of metrical effects which makes Donne's poetry hover between the singing voice of passion and the speaking voice of argument and expostulation. This dramatic realism of style and versification made Donne the idol of the first half of the 20th century. He was perhaps over-praised: hut at his best he gives, as almost no other poet does, the illusion that we are listening to the very accent of passion become conscious of its power.

BIBLIOGRAPHY.—There is no full modern biography to replace Edmund Gosse. *Life and Letters of John Donne,* 2 vol. (1899). A brief life, correcting Gosse's errors, can be found in Evelyn M. Simpson, *A Study of thr Prose Works of John Donne,* 2nd ed. (1948). Standard editions are: *Poems,* ed. by H. J. C. Grierson, 2 vol. (1912); *Divine Poems,* ed. by Helen Gardner (1952); *Sermons,* ed. by G. R. Potter and Evelyn M. Simpson, 10 vol. (1953); *Devotions,* ed. by John Sparrow (1923); *Essays in Divinity,* ed. by Evelyn M. Simpson (1952). Sir Geoffrey Keynes's *Bibliography,* 3rd ed. (1958) contains, in addition to a full bibliography, a list of hooks known to have been in Donne's library, a list of early references to his work and a select list of books and articles on him. There is a *Concordance* to the poems by H. C. Comhs and Z. R. Sullens (1940). Among innumerable critical studies, P. Legouis, *Donne the Craftsman* (1928) and J. B. Leishman, *The Monarch of Wit* (1951) are outstanding. T. S. Eliot's essay "The Metaphysical Poets," in the *Times Lit. Supp.* (1921), reprinted in *Selected Essays* (1932) was the test for much subsequent criticism. (HN. *G.*)

DONNER, GEORG RAPHAEL (1693–1741), Austrian sculptor, whose works are representative of the transition from the baroque to the neoclassical style, was born on May 24, 1693, at Esslingen in Lower Austria. He went to Heiligenkreutz intending to take holy orders, but he was there encouraged to follow his artistic bent by the sculptor Giuliano, and, after working in his studio. entered the Vienna Academy. His fine work brought him to the notice of the court and he found employment in Salzburg for some years, afterward returning to Vienna, where he died on Feb. 15, 1741. His masterpiece is the fountain on the Neumarkt in Vienna, which he executed in the years 1738 and 1739. The figures originally cast in lead, a technique favoured by the artist, were replaced by exact copies in bronze in 1873. Other works are the fountain with Perseus and Andromeda in the courtyard of the Vienna Rathaus and a statue of Charles VI in the Belvedere, Vienna. Donner's refined plastic form and clear outline contrasted with the art of his contemporaries and predecessors, who tended toward exaggerating the restlessness of Bernini's baroque style, and influenced his followers to adopt a more classic conception of form.

DONO, PAOLO DI: *see* UCCELLO, PAOLO.

DONORA, a borough of Washington county, Pa., U.S., lies along the Monongahela river. 30 mi. S.E. of Pittsburgh. Located in the soft coal region of western Pennsylvania, Donora is one of the many industrial towns of that area. The economic life of the community is largely dependent upon a plant which manufactures wire and steel products including barbed wire, woven fence, welded concrete reinforcing wire. nails; welding rods and stranded cable. A zinc plant was dismantled and moved in 1958 because of excessive cost of producing zinc in that area. In 1918 Donora was the scene of a smog disaster resulting in 20 deaths *(see* DUST: *Concentration;* SMOKE AND SMOKE PREVENTION: *U.S. Practice).*

Donora was incorporated as a borough in 1901. For comparative population figures *see* table in PENNSYLVANIA: *Population.*

(M. R. Wo.)

DONOSO CORTÉS, JUAN, MARQUIS DE VALDEGAMAS (1809–1853), Spanish author and diplomatist famous for his political writings, was born at Valle de Serena, near Badajoz, May 6, 1809. He entered politics as an advanced liberal, but made a complete reversal after 1848, and in his *Ensayo sobre el catolicismo, el liberalismo, y el socialismo* (1851), denounced reason as the enemy of truth and liberalism as leading to social ruin. With all its rhetorical excesses, the *Ensayo* remains one of the finest specimens of impassioned Spanish prose during the 19th century. Among his oratorical pieces stands out his *Discurso sobre la Biblia,* delivered on his election to the Royal Spanish Academy (1848). He died in Paris. March 3, 1853

DONUS (DOMNUS) (d. 678), pope from 676 to 678. was elected to succeed Adeodatus (II) in August and consecratkd on Nov. 2. 676. He was buried on April 11, 678.

DOOLEY, THOMAS ANTHONY (1927–1961), "jungle doctor," author and lecturer! was born in St. Louis, Mo., on Jan. 17. 1927. After a year of premedical training at the University of Notre Dame he served for two years (1944–46) as a navy corpsman (medical aide) attached to the U.S. marine corps. He graduated from the St. Louis university school of medicine in 1953.

While serving his internship in the navy, he was assigned in May 1954 as medical officer at a Haiphong evacuee staging area for refugees fleeing from Communist-controlled North Vietnam following the Indochinese war. The misery and disease he saw among an estimated 600.000 refugees processed there started him on a career of providing medical aid in underdeveloped countries. After being discharged from the navy in 1956, he used the proceeds of a best-seller book. *Deliver Us From Evil,* which described his Haiphong experience, to establish a small hospital in the Laotian village of Nam Tha. After turning that hospital over to the Laotian government in late 1957, he returned to the United States and became cofounder. with Peter D. Comanduras, of Medico, Inc.. international medical aid organization. He started its first hospital at Muong Sing, Laos, and his books (others were *The* Edge *of Tomorrow* and *The Night They Burned the Mountain)* and lecture tours provided much of the financing for its overseas operations in the next three years.

Recurrence of cancer, which began in the summer of 1959, caused his death in New York city on Jan. 18, 1961.

(R. H. ST.)

DOOLITTLE, JAMES HAROLD (1896–), one of the most versatile figures in U.S. aeronautics, was born on Dec. 14, 1896, at Alameda, Calif. He was educated at the University of California and Massachusetts Institute of Technology (Sc.D., 1925). After receiving pilot training during World War I, he remained in the U.S. army air corps until 1930, when he entered private business. During the 1920s and 1930s he was an outstanding racing pilot, and he led in the introduction of such developments as "blind" flight (flying only by instruments). Back on duty with the army air corps after 1910, Doolittle's aggressive spirit won him selection as leader of the raid against Tokyo on April 18. 1942, for which he mas awarded the medal of honor. During World War II Doolittle commanded in succession the 12th air force in North Africa and two strategic air forces in Europe—the 15th, operating from Italy, and the 8th, flying from England. He was the only nonregular air force officer to command a major combat air force. as a lieutenant general, during the war. In 1946 Doolittle returned to private business, continuing, however, to serve on advisory boards and commissions concerned with aviation problems. (A. GG.)

DOOM, originally a law or enactment, the legal decision of a judge, and particularly an adverse sentence on a criminal (O.E. *dóm,* a word common to Teutonic languages for that which is "set up" or "ordered"). The word is thus applicable to the adverse

decrees of fate, and particularly to the day of judgment. The verb "deem," to deliver a judgment, is seen in "deemster," the name of the two judges of the Isle of Man (*q.v.*). See also ENGLISH LAW.

DOON DE MAYENCE, one of the hero barons of the chansons de geste (*q.v.*).

DOOR is a screen, usually of wood, metal, glass or a combination of materials, installed to swing, fold, slide or roll in order to close an opening to a room or building. Doorway is the entrance (including a doorframe), usually constructed of masonry, wood or metal and consisting of jambs and a lintel, or arch, often including panels of glass or other materials, sometimes surrounded by architectural and sculptural elements.

Doorways.—Originating as a crude opening in primitive building, the doorway, or portal, has been an important architectural element since the emergence of monumental building (c. 3000 B.C.). The typical Egyptian doorway was a large rectangular opening (42 ft. high in the great temple at Karnak) cut through sloping stone walls and crowned with a cavetto cornice. In Mesopotamia the doorway was characteristically arched. constructed of brick and often faced with glazed tiles. The Greek doorway was perfected in the Erechtheum (5th century B.C.) at Athens, where the opening (17 ft. high) is narrower at top than bottom. Constructed entirely of marble, the jambs and lintel consist of flat moldings, studded with rosettes? surmounted by a cyma *reversa* (see CYMA) carved with anthemia (see ANTHEMION) and supported by consoles. The Roman doorway is typified in the Pantheon (2nd century A.D.) at Rome, where the rectangular enframement (46 ft. high) consists of flat moldings and entablature, enclosing a bronze-grilled transom supported by brazen Doric pilasters.

The Roman type persisted into Byzantine and Romanesque architecture. Romanesque design. however. dramatized the Roinan arch, as in the portal of S. Michele at Pavia, where diminishing arches form a deep splay in thick stone walls. Columns and archivolts mere usually carved with stylized animal or vegetable forms; the tympanum was sculptured in religious inconography. With the new use of the pointed arch, the Romanesque portal was gradually transformed into Gothic, culminating in France in the cathedral at Amiens (13th century), where deeply splayed portals consist of slender columns with attached elongated statues of biblical personages, and archivolts carved as a heavenly host enclose a sculptured tympanum. A terrifying Last Judgment usually mas preferred for the central portal, with a statue of the Virgin or Saviour on the median jamb. Smaller Gothic doors usually were framed with continuous moldings forming a pointed arch.

The Roman portal was revived in the Italian Renaissance; *e.g.,* the doors added by Lorenzo Ghiberti to the baptistery at Florence. Such doorways sometimes were elaborated by the addition of a carved arch above the entablature. In the 16th–18th centuries doorways usually were composed in the orders of architecture (*i.e.,* with pedestals, columns or pilasters, entablatures, and pediments or arches) in a variety of usage. often including sculpture, achieving rich, original effects in the baroque period. Stricter classical usage returned in the 18th century, as in the Georgian architecture of Great Britain and its American colonial version, in which wooden orders generally were substituted for stone. A Georgian innovation was the semicircular fanlight, widely used c. 1750–80. By the end of the century side lights had been added and the fan correspondingly enlarged, producing the fashionable Venetian door.

The eclecticism of the 19th century produced revivals of historical styles and inventive combinations of them. Side lights and transoms were variously used, glass becoming more and more prominent after 1850. The organic designs of the art *nouveau* and the increasing importance of commercial building led to the virtual disappearance of the monumental portal in 20th-century architecture, in which the doorway has been generally reduced to a simple structural frame (usually metal), often repeating the modular system of the building's enclosure and being an integral part of it.

Door.——Early Types.—The first doors were merely hides or textiles. In Egyptian wall painting of the fifth dynasty are representations of doorways equipped with matting that could be rolled up and lowered. Doubtless common in antiquity, this usage has persisted in Mediterranean countries, where flaps of leather (or strings of beads) are used as secondary doors. However, doors of rigid, permanent materials appeared simultaneously with monumental architecture. The most important doors were often stone or bronze; the most numerous were wooden.

Stone.—Stone doors often were used on tombs. A marble, paneled Roman example. probably from the time of Augustus, was found in Pompeii; a similar Greek door (c. A.D. 200) from a tomb at Langaza has been preserved in the Istanbul museum. This Hellenistic type persisted in the distinctively lithic architecture of Syria of the 4th–6th centuries.

Bronze.—The use of monumental bronze doors, a tradition that has persisted into the 20th century, was derived from the technique of casting bronze hollow (usually by the cire-perdue, or "lost wax," process), which was perfected in Greek sculpture of the 5th century B.C. The portals of Greek temples were often fitted with cast bronze grilles; the Romans applied the technique to the production of solid doors. They were characteristically double doors; *i.e.,* consisting of two leaves. or valves. each hung at one side of the doorway, closing together nithout a median jamb or mullion. They were mounted as crapaudine doors; *i* e., supported by pivots fitted into sockets in threshold and lintel. The earliest large examples are the double doors of the Roman Pantheon, each valve (24 ft. high) consisting of flat panels originally gilded. Late imperial examples in Rome (all 4th century) have survived in the Baths of Caracalla, the Temple of Romulus (vestibule to the church of SS. Cosmas and Damian) and Constantine's church of St John Lateran, the latter pair enriched with four gilded Corinthian columns. The Roman paneled design and mounting technique continued in Byzantine and Romanesque architecture.

The art of casting was preserved in the eastern empire for centuries after the decline of the west, the most notable Byzantine examples being the double doors (dated 838) in Justinian's great church of Hagia Sophia at Constantinople In the 11th century bronze castings from Constantinople were imported into southern Italy Bronze plates (cast c. 1066) were attached to the wood-framed doors of the church at Monte Cassino Hollon-cast double doors were brought to the cathedrals of Salerno (1099) and Amalfi, to St. Mark's, Venice, and elsewhere. In these instances, the classical flat panels were ornamented with silver-damascened figures.

Bronze doors were introduced into northern Europe when Charlemagne brought a Byzantine pair (cast *c.* 804) to the cathedral at Xachen. The first bronze doors to be cast in one piece in northern Europe were produced (c. 1015) in the famous foundry sponsored by Bishop Bernaard of Hildesheim for the cathedral there. A technical and artistic marvel of the age, these double doors were designed with a series of historiated panels in relief, establishing a sculptural tradition that distinguishes Romanesque and later bronze doors from the flat-paneled Roman and Byzantine style. Others folloned (11th century) at Augsburg and Mainz; and Germanic influence, being felt as far as northern Italy, accounted for the series of 48 hammered bronze panels of biblical scenes attached to the wood-framed doors of S. Zeno Maggiore in Verona.

Hollow casting with panels in relief was revived in the 12th century in southern Italy, notably by Barisanus of Trani (cathedral doors. 1175). and carried northward by artists such as Bonanno of Pisa doors by whom have survived in the cathedrals at Monreale and Pisa. The Italian development was given impetus by the rising artistic activity of the 14th century in Tuscany, where the principal examples are the pairs of sculptured, paneled bronze doors on the Florentine baptistery: the Gothic south doors (1330–36), by Andrea Pisano. and the north doors (1403–24), by Lorenzo Ghiberti which initiated the Renaissance Ghiberti's east doors (1425–52), sculptured with Old Testament scenes and gilded, have become known as the *Porta* del Paradiso, according to a description attributed to Michelangelo. After the model of

Florence, double bronze doors with panels in relief, by Antonio Filarete, were cast for St. Peter's, Rome, and many others subsequently were designed by the major sculptors of the Italian Renaissance. Bronze doors were not generally used in northwestern Europe until the 18th and 19th centuries. important French examples being the double doors of the Panthéon (finished 1790) and of the Madeleine (finished 1842) in Paris. The first monumental bronze doors in the United States were erected in 1863 in the capitol at Washington. Designed by Randolph Rogers, they consist of two valves of four panels each, under a semicircular tympanum, portraying the life of Columbus.

Wooden: Ancient and Oriental.—The wooden door was doubtless the oldest and commonest type in antiquity. Archaeological and literary evidence indicate its prevalence in Egypt and Mesopotamia, the forests of Lebanon being an important source of materials. Apparently large doors were constructed of heavy vertical planks held together by dowels or metal bands or sheathed in hammered metal. Fragments from the Assyrian palace at Balawat (9th century B.C.), preserved in the British museum, indicate that the palace had double wooden doors, each valve over 8 ft. wide and 27 ft. high, bound with ten-inch bronze bands depicting religious and military scenes. Solonion's temple (c. 900 B.C.) is reputed to have had folding doors of cypress (or fir) and of olive, constructed without metal but carved and overlaid with pure gold (I Kings vi, 31–35).

According to Pompeiian murals and surviving fragments, doors in the houses of prosperous Greeks and Rofnans looked much like modern wood-paneled doors, being constructed of stiles and rails (vertical and horizontal members) framed together to support panels and equipped with locks, keys and occasionally hinges. The classical wood-framed, paneled type persisted into the Christian epoch, richly carved double doors of the 5th century surviving in Sta. Sabina, Rome, and S. Ambrogio, Milan. The Roman door was adopted in Islamic countries, where a tradition of highly skilled carpentry modified the rectangular panels into elaborate polygonal and stellar patterns, often forming intricate grilles ornamented with metal mountings. This technique was perpetuated in Indian and in Turkish architecture of the 16th century and afterward, as in the mosque of Rustem Pasha, Istanbul. The technique was similar in China and Japan, where the prevalent wooden door usually consisted of two panels: the lower solid, the upper a delicate wooden lattice backed with paper.

Wooden: Traditional Types.—The traditional types of wooden door descend directly from the middle ages and the Renaissance. The typical medieval door was constructed of vertical planks backed with horizontals (battens or ledges) on the inside, or in simpler form with diagonal braces. The batten door and braced door have persisted in remote districts into the 20th century. The vertical joints were covered with thin fillets, and the door was strengthened by long iron hinges (commonly used from the 12th century onward) and wrought nails in decorative patterns. In large churches where the principal doors were opened only occasionally, there was for daily use a small wicket, or framed door, set within the larger door.

The paneled door was reinvented in the 15th century in France and in the 16th in England, door design repeating the wall paneling thenceforth through the stylistic sequence to the end of the 18th century. For symmetry a door was sometimes made to appear as part of the wall (jib door), or a single door was made to look like double doors (double-margin door). Double doors were everywhere used in important portals, assuming monumental proportions in France—*e.g.*, the wooden doors (c. 1680) of St. Gervais, Paris—and striking richness in Spanish architecture, a resurgence of Moorish feeling producing numerous small panels in a variety of intricate geometrical designs.

In domestic architecture, interior double doors of wood appeared in Italy in the 15th century, France in the 16th. England in the 17th and in the American colonies in the 18th. Their design was derived from the Roman paneled type. which was revived in the Italian Renaissance, a pair (c. 1480) with rich inlaid woods existing in the Palazzo Ducale, Urbino. In the 16th–17th centuries panels became more elaborate, often arched, carved, painted and gilded; the classically rectangular flat panel becoming standard again in the 18th century. In France the sequence through the styles Louis XIV, XV and XVI has been preserved in the interiors at Versailles. A characteristic Anglo-American type mas the Georgian door of three or six flat panels. This and other historical types, and a variety of 19th-century flat-paneled doors, have persisted as standard manufactured items into the 20th century. Gradually simplified to one large panel. the wood-framed door has been largely superseded by the flush-panel door. constructed with a hollow or solid core smoothly covered with wood veneer or plastic laminate.

Special Types *and* Modern Doors.—A number of special types have become standard manufactured doors. The louvered door (or blind door), with fixed or movable slats, was evolved in the 18th century by enlarging the Venetian-style window blind recently made fashionable in English Georgian architecture. It has been most used in the United States. The screen door was an American innovation of the late 19th century. when wire mesh was mass-produced. The storm door (or weather door) also became common in the 19th century. The dutch door (batten or paneled), an outside door cut in two near the middle, allowing the upper half to be opened while the lower remains closed (originally to exclude barnyard creatures), descends from a traditional Flemish-Dutch type introduced into the American colonies in the 17th century. The half door (paneled or louvered), being approximately half height but hung near the centre of the doorway, allowing an opening above and below, was common in the 19th century (U.S.).

Glazed doors date from the 17th century, first appearing in the houses (begun 1605) in the Place des Vosges, Paris, as window casements extended to the floor. Widely used as double doors in France (17th–19th centuries), the French door was incorporated into English architecture late in the 17th century, appearing in America in the 18th. An 18th-century modification was the sash door. paneled in the lower half and glazed in the upper. The mirror door was a 17th-century French invention. The rising production of glass in the 19th century made increasingly larger panes economically possible, and by 1900 the door with one large panel of plate glass was common. The perfection of safety glass produced the door of a solid glass slab ½ or # in. thick. Tinted glass and units composed of two large glass sheets sealing a vacuum have been developed for climate control. The nood frame supporting large glass panels has been generally superseded. in commercial and public buildings, by extruded frames of metal: bronze, stainless steel, aluminum.

Metal doors of bronze, steel or aluminum have been increasingly made, in the form of hollow flush-panel doors or reproductions of historical types. Metal-clad doors were developed (early 19th century) principally as fire doors, being constructed of a solid wooden core covered with tin or galvanized steel drawn through steel dies, as the kalamein door. Other, later types have been made with a core of polystyrene covered with anodized aluminum, stainless steel or porcelain. The heaviest industrial type has been the nuclear-shielding door of lead, steel or concrete. a large example consisting of a steel shell filled with concrete 24 ft. thick and weighing 20 tons.

From mid-19th century onward there have been increasing technical developments, such as automatic door closers and openers —hydraulically, pneumatically or electrically activated—and innovations in hanging doors: pivoted. folding. sliding, rolling. The commonest pivoted type is the swinging door. operated equally in either direction. The revolving door was developed c. 1900 in the United States. consisting of four valves (glass) mounted at right angles and revolving about a central pivot in a circular vestibule, thus forming a perpetual air lock. The folding door became common in the 19th century as a series of wooden leaves hinged together to fold to one side of the opening. The 20th-century type has generally been made to resemble a curtain, being carried on an overhead track with a pantographic frame supporting a light, pliable material, such as veneer strips, textile, rubber, leather or plastic. The sliding door (wood paneled) appeared in the 19th century, characteristically carried by rollers on a metal

track disappearing into the wall. The sliding door (flush panel or glass) has been further developed and refined since 1900 after the inspiration of sliding wall panels in Japanese houses. Large wooden sliding doors have been common in barns, metal clad in factories; and the metal-frame type has been widely applied in large structures; *e g.,* aircraft-hangar doors 75 ft. wide and 46 ft high. The rolling door (developed 19th century), constructed of tubular astragals of aluminum or steel (galvanized or stainless) rolling up on an overhead track. has become common in industrial installations and as large as 48 ft. wide and 39 ft. high in gantry cranes on the St. Lawrence seaway. This type has also been made to roll up as a window shade or side-coiling. Other industrial types include the canopy door, constructed to swing out as an awning. in sizes as large as 60 ft. wide and 20 ft. high, or in units bifolding or telescoping when raised.

(E. A. C.)

DOPPLER, CHRISTIAN JOHANN (1803–1853), Austrian physicist, discoverer of the effect known by his name. He was born at Salzburg on Nov. 29, 1803. Educated at Salzburg and Vienna, he became, in 1850, director of the Physical institute and professor of experimental physics at Vienna. Doppler's earliest writings were on mathematics, but his name is associated with his work in physics. In 1842 he published a paper "Über das farbige Licht der Doppelsterne." which contained what is now known as the Doppler effect (*q.v.*). *(See* LIGHT: *Waves and* In*terference.)* He drew the analogy between the sound coming from a moving source and the light coming from a moving star; as the pitch of sound from a moving source varies, so Doppler thought the cclour of the light from a star would be altered.

The principle was verified experimentally for sound by C. H. D. Buys Ballot in 1845, but the correct explanation in the optical case was given by Armand Fizeau in 1848. Doppler's principle is applied to the motion of stars in the line of sight, and is used for the discovery of double stars.

Doppler died at Venice on March 17, 1853.

DOPPLER EFFECT, the change in the observed frequency of a vibration because of relative motion between the observer and the source of, the vibration. In sound (*q.v.*) this effect is an everyday experience; *e.g.,* when a blowing horn is passed at any speed above 10 m.p.h. the pitch of the note becomes increasingly lower. The Doppler effect for light waves is evident in spectroscopy (*q.v.*). *See* LIGHT: *Waves and Interference; see* also references under "Doppler Effect" in the Index volume.

DOR, an ancient Canaanite seaport on the Mediterranean, the site of the modern agricultural settlement of Nasholim, 15 mi. S. of Haifa in northwestern Israel. During the first Israelite conquest Joshua defeated its king, but Israel did not expel the Canaanites. In the early 11th century B.C. Wen-amun. an Egyptian temple official who was sent to Byblos to procure lumber, was robbed at Dor, and was pursued by the men of Dor to Byblos. Dor was the centre of one of Solomon's administrative districts (I Kings iv, 11), and it remained in Israel after the division of the kingdom. After 722 B.C. it became headquarters for the Assyrian province of Dor. It underwent other sieges, and with the building of Caesarea nearby by Herod the Great it declined permanently.

(E. D. GR.)

DORAT (DAURAT), **JEAN** (Lat. AURATUS) (1508–1588), French humanist and one of the seven poets of the Pléiade, was born at Limoges in 1508. He belonged to a noble family, and, after studying at the College of Limoges, went to Paris to be presented to Francis I, who made him tutor to his pages. He was also chosen as tutor to his son. Jean Antoine, by Lazare de Baïf, after whose death in 1547 he became the director of the Collège de Coqueret. where. besides Baïf, he had among his pupils Ronsard, Rémy Belleau and Pontus de Tyard. Joachim du Bellay was added by Ronsard to this group and these five young poets. under the direction of Dorat, formed a society for the reformation of French language and literature. They increased their number to seven by the initiation of the dramatist Étienne Jodelle and thereupon they named themselves La Pléiade, in emulation of the seven Greek poets of Alexandria. The election of Dorat as their president proved the ueight of his personal influence and the value which his pupils set on the learning to nhich he introduced them. but as a writer of French verse he is the least important of the seven.

Meanwhile he collected around him a sort of academy and stimulated the students on all sides to a passionate study of Greek and Latin poetry, nhile he himself wrote incessantly in both those languages His influence extended beyond the bounds of his own country and he was famous as a scholar in England, Italy and Germany In 1556 he was appointed professor of Greek at the Collège Royal, a post uhich he continued to hold until, in 1567, he resigned it in favour of his nephew, Nicolas Goulu. Charles IS gave Dorat the title of *poeta regius,* one which he had justly earned by his numerous compositions for court ceremonies. His flow of language was the wonder of his time; he is said to have composed more than 15.000 Greek and Latin verses. The best of these he published at Paris in 1586 as J. *Aurati Lemovicis poetae et interbretis regii poemata.* He died in Paris on Nov. 1, 1588, having survived all his illustrious pupils of the Pléiade, except Pontus de Tyard. He was a little, restless man, of untiring energy, rustic in manner and appearance. His unequaled personal influence over the poets of his age gives him an importance for which his own writings do not fully account.

His *Oeuvres poétiques* were edited by C. Marty-Laveaux in his *Pléiade française (1875).*

DORCHESTER, DUDLEY CARLETON, VISCOUNT (1573–1632), English diplomat who conducted important negotiations on behalf of James I and Charles I, was born in Oxfordshire on March 10, 1573. Educated at Westminster school and at Christ Church, Oxford, he then spent several years on the continent. acquiring a good command of foreign languages. before accompanying a diplomatic mission to France in 1602. Later he became secretary to the earl of Northumberland, but this appointment impeded his rise in the diplomatic service, for when Northumberland was implicated in the Gunpowder plot, Carleton also fell under suspicion. He was soon able to clear himself. but it mas not until 1610.that he was given another diplomatic post. That year he was knighted and sent as ambassador to Venice, where he remained for five years and accomplished the difficult task of negotiating peace (treaty of Asti) between Spain and Savoy. From 1616 to 1625 he was ambassador to the Netherlands. There, in 1621. he acted as host to the elector palatine, Frederick V, and his wife when they were obliged to take refuge at The Hague. Their visit came at a time when Carleton was encountering great difficulty in receiving prompt payments of his salary and allowances; by 1622 his salary was £2.895 in arrears.

Carleton was finally given adequate reward for his long service to the crown in 1625 when, having won the favour of the duke of Buckingham. he returned to England and was appointed vice-chamberlain of the royal household and a member of the privy council. He was created Baron Carleton of Imbercourt in 1626 and Viscount Dorchester in 1628. His work was confined mostly to special diplomatic missions until he was appointed principal secretary of state in 1628. He died on Feb. 15, 1632.

In the opinion of the earl of Clarendon, Carleton "understood all that related to foreign employment, and the condition of other princes and nations, very well: but he was utterly unacquainted with the government, laws. and customs of his own country, and the nature of the people." Modern historians generally share this opinion and distinguish between his work as ambassador and his achievements as secretary of state. (R. C. Jo.)

DORCHESTER, GUY CARLETON, 1ST BARON (1724–1808), soldier and governor of Quebec whose wise policy toward French Canada had far-reaching effects, was born in County Tyrone, Ireland, of Anglo-Irish parentage, Sept. 3, 1724. After serving with distinction on the Continent under the duke of Cumberland, he participated in the attack on Quebec with James Wolfe (*q.v.*). Wounded in this engagement, he left Canada shortly thereafter. After taking part in various other campaigns (Belle Isle, Port Andro, Havana), he returned lo Canada in 1766 to rule as lieutenant governor of Quebec in the absence of the governor, whom he succeeded officially in 1768.

With statesmanlike vision Carleton insisted that the only way to keep the colony mas to give it a constitution fitted to its French character. He was instrumental in the passage of the Quebec act (*q.v.*), 1774, by which French Canadians got Catholic emancipation half a century before their coreligionists in England. As a consequence of this wise and tolerant measure, most French Canadians remained neutral when American forces invaded Canada, by Dec. 1775 overrunning it. Carleton was forced to flee from Montreal and make his headquarters in Quebec, where he was besieged until spring, when the Americans fled before the arrival of a strong British army. Knighted in July for having saved Quebec, Carleton disappointed the home government by not using this army to strike south and cut the old colonies in two. Denied command of the expedition to the south in 1777, he resigned his office and in 1778 he departed.

Returning to America in 1782 at the close of the American Revolution as commander in chief, he dealt skillfully with the difficult problem created by the thousands of Loyalists huddled in New York, finding a refuge for them in the maritime provinces. Back in England by late 1783, he advised the government on the affairs of British North America, aspiring vainly to become its governor general. In 1786 he was raised to the peerage, commissioned governor in chief of each colony except Newfoundland, and sent back to Quebec, where he was expected to work out a new system of government for the old Canada (the province of Quebec). In this he failed, and he opposed its division in 1791 into Cpper and Lower Canada. In 1794 he committed two grave indiscretions that threatened the peace with the United States and brought a stern rebuke from London Again, unable to admit that he had done wrong, he resigned. He finally departed in 1796, an embittered old man. He died on Nov. 10, 1808, at Stubbings, near Maidenhead.

See extended treatment of Dorchester in A. L. Burt, *The Old Province of Quebec* (1933) and *The United States, Great Britain and British North America* (1940), which has been summarized in *Guy Carleton, Lord Dorchester 1724–1808, Revised Version by* the same author (1955). (A L Bu.)

DORCHESTER, a market town and municipal borough and the county town of Dorset, Eng., in the West Dorset parliamentary division, 8 mi. N. of Weymouth by road. Pop. (1961) 12.266. It stands on an eminence on the right bank of the river Frome, 6 mi. N. of the English channel. St. Peter's church is a Perpendicular building with a fine tower. All Saints and Holy Trinity churches were rebuilt in the 19th century, but St. George's, Fordington, retains Norman and Transitional details. Of public buildings the principal are: the town hall, market house and corn exchange, shire hall. the county museum and the county hospital. The oldest secular building in the town is Naper's (or Napier's) Mite, formerly an almshouse (1615), but restored and reopened in 1955 as shops for selected trades. The grammar school, founded in 1569, is in modern buildings. A statue to Thomas Hardy, the poet and novelist, was unveiled in 1931. Hardy was born near Dorchester, the "Casterbridge" of his Wessex novels. A room containing part of his study and other memorabilia was opened in the museum in 1939. There is also a statue to William Barnes, the Dorsetshire poet (1801–86). The town has been noted for its ale since the 17th century. The cloth industry flourished during the 16th century, and serge was manufactured in the 17th. Dorchester is a place of considerable agricultural trade, and large sheep and lamb fairs are held in May. Agricultural machinery, printing and leatherworking are local specialties.

Durnovaria. at the intersection of a number of Roman roads, was a Romano-British country town of considerable size, probably successor to a tribal centre of the Durotriges. The walls can be traced in part, and many mosaics, remains of houses, etc., have been found. Running northwestward was an aqueduct and to the north are traces of the so-called Celtic fields as well as remnants of farms and similar sites. Remains of an "amphitheatre," which dates to pre-Roman times, are at Maumbury Rings in the south of the town. Maiden Castle, on a hill 2 mi. S.W., is a vast earthwork encircled by gigantic entrenchments and ramparts, occupying 120 ac. Excavations in 1934–38 indicated that the hill was the site of an important settlement which began in the Neolithic period and grew with subsequent fortifications to its present size in Iron Age times. In the early 1st century A.D. the Belgae came into control of it, but after A.D. 43 it was taken by the troops of the future emperor Vespasian. Though the site declined, in the 4th century a Romano-Celtic temple was built on the hill. Another smaller encampment is at Poundbury, to the northwest, and barrows and numerous other remains have been found in the vicinity.

Little mention of Dorchester (Dornceaster, Dorcestre) occurs in Saxon annals, but a charter from Aethelstan to Milton abbey in 939 is dated at villa *regalis quae dicitur* Doracestria, and at that period it possessed a mint. According to the Domesday survey it was a royal borough, and mention is made of a castle at Dorchester in records of the 12th and 13th centuries. The Franciscan priory, founded before 1331, is thought to have been constructed out of its ruins. Edward II granted the borough to the bailiffs and burgesses at a fee-farm rent of £20 for five years. The first charter of incorporation was granted by James I in 1610. Dorchester returned two members to parliament from 1295 until the Representation of the People act, 1868, when the number was reduced to one; in 1885 the representation was merged in the county. Edward III granted to the burgesses the perquisites from three fairs and three weekly markets. Elizabeth I granted an additional three days' fair at Candlemas. Dorchester was the scene of the "bloody assizes" of Judge Jeffreys in 1685 after the battle of Sedgemoor. In 1834 the six "Tolpuddle martyrs" were sentenced in the town for administering illegal oaths concerning trade-union activities. The old crown court where they were tried was in use as a court up to 1955. In 1956 the Trades Union congress took over its ownership as a memorial to the martyrs.

DORCHESTER, a residential district, with some light manufacturing. located in the southern section of Boston (*q.v.*), Mass., U.S. It was founded in 1630 by a group of colonists from Dorsetshire, Eng., who had previously been gathered together under the leadership of the Rev. John White. In 1633 a town-meeting form of government was set up, reportedly the first in the colonies. The Dorchester Historical society has preserved several houses from this period and the Dorchester burying ground contains some of the oldest marked graves in the United States. The colonial town figured significantly in history when, on the night of March 4–5, 1776, the fortification of Dorchester Heights, under orders from Gen. George Washington, forced the British to evacuate Boston. In 1868 Dorchester was incorporated into Boston.

Modern Dorchester is bounded on the west by the Midland branch of the New Haven railroad and on the east by the Old Colony railroad and stretches from Boston's south end to the Neponset river. The area is an ethnically heterogeneous one; housing units are primarily three-storied, wooden-frame structures. Most of the residents of the area earn their livelihood in central Boston. The Boston sanatorium is in the southern section of Dorchester. Public transportation is provided by the Ashmont extension of the subway and by many bus lines. (R. C. Wo.)

DORCHESTER-ON-THAMES, a large village of Oxfordshire, Eng., lies 9 mi. S.S.E. of Oxford by road on the west bank of the river Thame, just above its junction with the Thames. Pop. (1961) 1,877. Facing the ancient Dyke hills, there rises across the Thames the double isolated mound known as Wittenham Clumps (historically Sinodun). an early Iron Age earthwork. Dorchester (Dorocina, Dorcic, Dorceastre, Dorchestre), built where a Roman road crossed the river, became a walled town containing the station of a Roman official. In 634 it was made the seat of a bishopric by Birinus, apostle of the West Saxons, who baptized King Cynegils there. The witan of Wessex was held at Dorchester three times in the 9th century, and in 958 Aethelstan held a council there. In the 11th century the town is described as small but remarkable for the majesty of its churches. In 1092 the bishopric was finally moved to Lincoln by Remigius, the 17th bishop, where it is recorded in Domesday Book. About 1140 Alexander, bishop of Lincoln, founded an Augustinian abbey at Dorchester, of which the church and guest house remain. The town declined in importance, but in 1939 it was made a see suffragan to Oxford.

The abbey church of SS. Peter and Paul and Birinus has a nave

of great length, primarily of the Transitional Norman period; a choir with fine Decorated arcades; north choir aisle of the late 13th century, south choir aisle (*c.* 1300) and south nave aisle (*c.* 1320). The massive western tower was rebuilt in 1602. The eastern bay of the choir is considered to have been added as a Lady chapel, and the north window is a magnificent example of a "Jesse window," in which the tracery represents the genealogical tree of Jesus, the complete execution of the design being carried out in glass. The ancient sedilia and piscina are very fine. Behind the sedilia are four late 12th-century glass roundels. The font is Norman carved lead. The Decorated windows on the south side of the church contain the finest collection of early armorial glass in Great Britain (*c.* 1300); there are monuments and brasses of great interest. (W. O. H.)

DORDOGNE, an inland *département* of southwestern France, comprises nearly the whole of ancient Périgord (*q.v.*), together with parts of Agenais and smaller portions of Limousin and Angoumois. Pop. (1954) 377,870. Area 3,561 sq.mi. It is bounded north by Haute-Vienne, west by Charente, Charente-Maritime and Gironde, south by Lot-et-Garonne and east by Lot and Corréze. From the western part of the crystalline plateaus of Limousin, the *département* slopes west and southwest to the lowlands of Aquitaine. It is crossed in its southern portion by the Dordogne and farther north by that river's right-bank tributaries the Vézère, Isle and Dronne. These rivers traverse the limestone platforms that occupy much of the *département* and are known as the Causses de Périgord, or Petits Causses, to distinguish them from the higher Grands Causses of Aveyron. Along the contact of crystalline and limestone rocks, in the east of the *département,* the softer intervening marls have been etched out into fertile depressions with rather clayey soils. Crossing the Causses, however, the rivers are deeply entrenched, and the valley sides often present glistening walls of white rock. The intervening plateau surfaces are dry and stony but are much lower than in the Grands Causses and have a milder climate. They are also less denuded of woodland, and, associated with their oak woods, pig rearing is important and truffles are a well-known product. Raising of a variety of livestock—cattle, sheep, pigs and poultry—is especially important. *Pâté de foie gras* is a famous product of Périgord. In the sheltered valleys and basins maize as well as wheat is grown, and fruit orchards are especially extensive. The flat valley floors are occupied by irrigated meadows. Vineyards were formerly widespread, but since the *Phylloxera* plague of the late 19th century they have been largely replaced by fruit trees. In the market towns food-canning and preserving industries are prominent and there are many local brick- and tileworks, but manufacturing is generally little developed.

The towns of Périgueux (*q.v.;* the capital), Bergerac, Montron and Sarlat give their names to the four constituent *arrondissements* of the *département,* which for ecclesiastical, educational and judicial administration comes under the jurisdiction of Bordeaux.

The *département* is rich in remains of prehistoric man, and the caves of Lascaux in the valley of the Vézère near Montignac, which were discovered in 1940, in particular provide remarkable wall paintings and other evidence of prehistoric cultures. Those of the Beune valley have been known longer, and Les Eyzies, at the confluence of the Beune and Vézère, is the tourist centre for archaeologists and has the National Prehistoric museum. There are several fine medieval castles, notably at Bourdeilles, Biron and Jumilhac-le-Grand, and examples of medieval town planning in the form of *bastides,* such as Monpazier, built for the resettlement of the area after the devastations of medieval warfare. The remains of the Cistercian abbey at Cadouin include a fine Romanesque church and flamboyant cloister. (Ar. E. S.)

DORDOGNE RIVER, a river of central and southwestern France, rises at a height of 5,640 ft. on the Puy de Sancy in the Massif Central and flows to the Garonne, with which it unites at Bec d'Ambès to form the Gironde estuary. It has a length of 472 km. (293 mi.) and the area of its basin is 23,870 sq.km. (9,216 sq.mi.). In its course it cuts across a large number of geologic formations, as do its two major right-bank tributaries, the Vézère and the Isle. The Dordogne descends rapidly from its source and enters deep gorges as it flows through the crystalline plateau country, rich in granites, until it reaches Beaulieu (*département* of Corrèze) where it enters a wide fertile valley and is joined by the Cère. Entering the *département* of Lot it turns west and flows through limestone country, often in gorges with the Causses (*q.v.*) above on both sides. It traverses the *département* of Dordogne, where it receives the Vézère. The lower course of the latter is through limestone, and its many caves have made it classic ground for the study of Paleolithic man. Below the town of Bergerac, the Dordogne enters the *département* of Gironde and is joined by the Isle at Libourne. The river is about 3,300 yd. wide at its union with the Garonne, 45 mi. from the sea. There are important bridges at Cubzac-les-Ponts. There is much river traffic after the confluence with the Vézère over the last 112 mi. of its course. The estuary of the Gironde is one of the most conspicuous features of the western coast of France and the highest tides ascend the Dordogne as far as Pessac, a distance of approximately 100 mi. from the ocean. (Ar. E. S.)

DORDRECHT, a town in the province of South Holland, Neth., is situated 12.5 mi. S.E. of Rotterdam by rail at the confluence of four large rivers: Merwede, Noord, Oude Maas and Dordtse Kil. Pop. (1957 est.) 77,624 (mun.). The part of Dordrecht on the riverside has maintained its picturesque medieval character with many courtyards, gates (*e.g.,* Groothoofdspoort) and old buildings, busy quays and numerous canals, quaint streets and curiously gabled houses. The great church with a massive tower dates from the 14th century and its beautiful interior has finely carved stalls and a notable pulpit. Large modern housing estates are spaciously laid out and there are three public parks. The town is a centre for aquatic sports. The town museums have an interesting collection of paintings, including pictures by some of the old masters, and a collection of antiquities belonging to old Dordrecht.

Roads and railways connect the town with all parts of the country. There are waterways to the Rhine, Antwerp, Rotterdam and, via Oude Maas, to the North sea. Dordrecht's many industries include shipbuilding and metallurgical, wood and chemical works. A great deal of trade is carried on from the harbour, where ore, coal, wood and oil are imported.

Dordrecht was founded by Count Dirk III in 1008, becoming a town about 1200. In 1572 it was the meeting place of the deputies who asserted the independence of the United Provinces. In 1618 and 1619 it was the seat of the important Synod of Dort (*q.v.*).

DORÉ, (PAUL) GUSTAVE (1832–1883), French artist, one of the most prolific and successful book illustrators of the late 19th century, was born at Strasbourg on Jan. 6, 1832. In 1847 he went to Paris and from 1848 to 1851 produced weekly lithographic caricatures for the *Journal pour rire,* as well as several albums of lithographs (1847–54). His later fame rested on his wood engraved book illustrations. Among his finest were an edition of the works of Rabelais (1854), *Contes drolatiques* of Balzac (1855), the large folio Bible (1866) and the *Inferno* of Dante (1861). Employing more than 40 woodcutters, he produced over 90 illustrated books. He also painted many large compositions of a religious or historical character, and had some success as a sculptor. He died in Paris on Jan. 23, 1883.

See W. B. Jerrold, *Life of Gustave Doré* (1891); H. Lehmann-Haupt, *The Terrible Gustave Doré* (1943).

DORGAN, THOMAS ALOYSIUS (pseudonym Tad), (1877–1929), U.S. journalist, boxing authority and cartoonist, was born in San Francisco, Calif., on April 29, 1877. At an early age he joined the art department of the *San Francisco Bulletin,* where he worked as a cartoonist and comic artist. In 1902 he was employed by William Randolph Hearst, becoming a political cartoonist of the *New York Journal.* Dorgan did not continue as a political cartoonist, however, but began to concentrate his interests on sports, particularly boxing. His sketches of fighters and commentaries were widely syndicated throughout the country, his pen name Tad (the initials of his name) becoming well known.

Dorgan also developed comic-strip characters, such as "Silk Hat Harry" and "Judge Rummy," which he used in his daily cartoons. He was responsible for the wide currency of many slang expressions, among them "The first hundred years are the hardest," "As

busy as a one-armed paper hanger with the hives," "23, skidoo" and "Yes, we have no bananas."

He died at Great Neck, L.I., on May 2, 1929.

DORIA, ANDREA (1466–1560). Genoese condottiere and statesman who was also the greatest admiral of his time, was born at Oneglia on Nov. 30, 1466, the son of Ceva Doria, of an ancient family which had given Genoa many political leaders and the fleet's commander in four major victories (Oberto at Meloria, 1284; Lamba at Curzola, 1298; Pagano at Portolongo. 1354; Luciano at Pola, 1379). Orphaned at an early age, he became a soldier of fortune and served first in the papal guard and then under various Italian princes before being appointed captain-general of the Genoese galleys in his 40s. As such he scoured the Mediterranean fighting the Turks and the Barbary pirates. After the Holy Roman emperor Charles V's forces had taken Genoa (1522) and deposed the pro-French faction there, Doria took service under the French king Francis I. Appointed admiral of the French Mediterranean fleet, he made the emperor's army raise the siege of Marseilles in 1524. When Charles took Francis prisoner at the battle of Pavia (1525), Doria went to serve Pope Clement VII. He returned to the French service in 1527 (when Francis had been set free) and helped to restore the pro-French faction in Genoa. Francis, however, not only failed to restore Savona to the Genoese but unwisely began to take measures against Doria's own security. Doria thereupon retired to Lerici, transferred his services to Charles V, recalled his cousin Filippino from collaboration with the French in the blockade of Naples with the Genoese fleet, took Genoa in Sept. 1528 and restored the republic there under imperial protection. Charles gave him the title of prince of Melfi.

Doria gave the Genoese constitution a new aristocratic bias and stopped the factions which divided the city. He refused the lordship of Genoa and even the dogeship, but exercised predominant influence in the councils of the republic until his death. He was given two palaces, many privileges and the title of liberator et *pater patriae.* As imperial admiral he commanded several expeditions against the Turks. taking Coron and Patras and helping the emperor to capture Tunis (1535). Charles found him an invaluable ally in the wars with Francis and used his services to extend his domination over the whole of Italy. Doria is said to have let the Turks defeat him at Preveza in 1538 on purpose to spite the Venetians, whom he detested. He accompanied Charles on the ill-fated Algerian expedition of 1541, of which he disapproved: he just managed to save the force from complete disaster. For the next five years there was hardly an important event in Europe in which he had not some share.

After the peace of Crépy between Francis and Charles in 1544 he hoped to end his days in peace. But he had many enemies, and in 1547 Giovanni Luigi Fiesco (*q.v.*) plotted to upset the power of his house. Doria's nephew Giannettino was murdered, but the conspirators were defeated. and Andrea punished them with great vindictiveness. He was implicated in the murder of Pierluigi Farnese, duke of Parma (see FARNESE), who had helped Fiesco. Other conspiracies followed, most important that of Giulio Cybb (1548), but all failed. Charles repeatedly tried to saddle Genoa with a citadel to be manned by Spaniards, but Doria resisted all attempts to win his approval. Nor did age lessen his energy: in 1550. at 84, he put to sea again to punish the raids of the Barbary pirates, but without much success. When war between France and the empire broke out again. the French seized Corsica, then administered by the Genoese Bank of San Giorgio. Doria then spent two years (1553–55) in the island, fighting the French with varying fortune. He returned to Genoa for good in 1555 and gave the command of the galleys to his great-nephew Giovanni Andrea Doria.

Andrea Doria died on Nov. 25, 1560, leaving his estates to Giovanni Andrea. One of the last great condottieri, he had many of the faults of his profession: he was greedy, conceited, vindictive, unscrupulous and authoritarian. Yet he was also fearless. untiring and endowed with outstanding tactical and strategic talents. He loved his native city, enriched it with works of art and gave it as good a government and as much independence as circumstances allowed.

See E. Petit, Andre' *Doria* (1887) ; I. Luzzatti, Andrea *Doria* (1943).
(R. S. L.)

DORIANS, an important section of the classical Greek people, distinguished by their subdivision, within all their communities, into the tribes (phylai) of Hylleis, Pamphyloi and Dymanes, and by a well-marked dialect.

Dorians in historic times occupied the southern and eastern Peloponnese and the isthmus region, including Sparta. capital of Laconia and of conquered Messenia, Argos. Phlius. Epidaurus, Sicyon, Corinth and Megara; the southern Aegean islands. including Crete, Melos and Thera and the Dodecanese. where the three cities of Rhodes. with Cos and the mainland cities of Cnidus and Halicarnassus. formed the *hexapolis* ("six cities") of Asian Doris, with meetings for common worship at the Triopian promontory near Cnidus. Colonization brought Dorians from Corinth to Corcyra (Kerkyra, Corfu) and Syracuse; from Sparta to Taras (Latin *Tarentum,* modern Taranto); from Rhodes and Crete to Gela and Acragas (Agrigento); from Thera to Cyrene and from Megara to Megara Hyblaea and Selinus in Sicily, and to Byzantium and Chalcedon. Heraclea Pontica (Eregli). Chersonesus near modern Sevastopol in the Crimea, and other cities in the Black sea area (see articles on individual cities).

The distribution of Greek dialects in historic times confirms the Greek tradition that Dorians came into the south Aegean area at the end of the Bronze Age, when it was already occupied by other Greeks; for in inland Arcadia (*q.v.*). unconquered by Dorians. there survived a Greek dialect whose only close relations are with that of Cyprus. This Arcado-Cypriot dialect, therefore, was presumably the speech of the seafarers who brought Mycenaean culture to Cyprus about 1400 B.C., before Dorians overran the nearer southern islands and cut off Arcadia from the sea (see GREECE: History). The Doric dialect preserved the broad *ā* sound, as in Gr. *mātēr,* "mother." modified into long *ē* (our a in "mate") in Attic-Ionic, and other characteristics. such as the terminations of the verb in -ti for the 3rd person and in *-mes* for the 1st person plural, wherein comparison with other Indo-European languages shows that it, among Greek dialects. best preserved primitive forms. Kindred dialects were spoken in northwestern Greece.

Greek legend related that the Heraclidae or children of Heracles, persecuted after his death by his cousin and enemy, Eurystheus of Mycenae, took refuge in Thessaly with an old ally of their father, Aegimius, king of the Dorians, descended from the eponymous hero Doros, son of Hellen; and Aegimius adopted Hyllus, son of Heracles, as a brother to his own sons, Pamphylus and Dyman. Thence. after three generations ("80 years after the Trojan War" according to Thucydides) the Heraclid brothers Temenus. Aristodemus and Cresphontes. great-grandsons of Hyllus, set out with a Dorian host to recover their heritage. ..\voiding the isthmus. where Hyllus had fallen in an earlier attempt. they built ships at Naupactus (the "place of shipbuilding") and invaded the Peloponnese from the northwest. Elis fell to the lot of their Aetolian allies; Messenia to Cresphontes; the Argolid, after a victory over Tisamenus, son of Orestes, to Temenus, and Sparta to Eurysthenes and Procles, the twin sons of Aristodemus, who died during the conquest. (Hence, according to Spartan official genealogy, the Spartan dual monarchy.) Southern Laconia was only "Dorized" after a struggle of several generations, in which the people of Helos. on the coast, who resisted desperately, were made serfs. giving their name to the helot class. The small district of Doris (*q.v.*) between Mts. Oeta and Parnassus was said to have its name from Dorians who stayed behind. and thus to be the mother-country of the southern Dorians, a claim recognized by Sparta for political reasons in the 5th century; while the coming of the Spartans from "windy Erineos" (one of the four towns of Doris) is mentioned by the 7th-century Spartan poet Tyrtaeus. From the Peloponnese, finally, the Dorians turned against Attica, conquering the northern part of the isthmus and founding Megara ("the halls"; one of the few old Greek cities to have a Greek name); but Athens survived. to preserve some elements of civilization and to organize refugee-settlements of the displaced populations in Ionia.

However much of romance may be included in this legend of the *Dorica*, it is noteworthy that the name of the Dymanes is of a northnestern type (cf. Acarnanes. Athamanes, etc.), while the Pamphyloi ("all tribes") may represent a "mixed multitude" organized into a war-band. The tradition of descent from Heracles will originally have been confined to the Hylleis, but the existence of the three tribes in all Dorian cities suggests that the Dorians entered the south either as an organized mar-band, or already a nation.

In some cities additional tribes are found, *e.g.*, the Hyrnathioi at Argos, the Aigialeis ("coast dwellers"?) at Sicyon, said to be named after a son of the pre-Dorian king Adrastus; these may represent an incorporation of pre-conquest elements into a Dorian body-politic. At Corinth. as reorganized after the fall of the tyranny in the 6th century B C. there were eight tribes; whether the Dorian three were among them is unknown. But in early historic times government in the Dorian states was everywhere in the hands of a Heraclid aristocracy, ahich had either abolished the monarchy as at Corinth or curtailed its powers as at Sparta. The tradition of the conquest added racial feeling to economic tensions; and nhen, in the coastal cities, "tyrants" arose to overthrow the aristocracies, this feeling was exploited. Cypselus of Corinth is said to have been a Heraclid through his mother, but to have claimed older pre-Dorian nobility on his father's side; Cleisthenes of Sicyon is said to have renamed his own non-Dorian tribe Xrchelaoi ("rulers") and given abusive names to the three Dorian tribes. An element of racialism was introduced into Greek political controversy. From a temple in Ionic Paros, somewhat later, there is an inscription: "Slaves and Dorians not admitted." The ethnological theory summarized by Herodotus (i, 56 *et* scq.), no pan-Dorian fanatic rightly distinguishes tno main racial factors in Greece, one immigrant and one aboriginal, and associates the introduction of the Greek language with the former; but he nrongly associates this Hellenic element exclusively with the Dorians, and confuses the speakers of other Greek dialects—brought into Greece, it is clear. by earlier migrations, of which all memory had been lost—with the non-Greek-speaking "Pelasgians" (q *v.*), a name which Greek theorists used as a general term for "aborigines."

The question remains whether there was a well-marked Dorian character and way of life to be distinguished in Greek history. Some 5th-century Greeks clearly thought that there was: a character marked by greater discipline and sobriety and higher military qualities than that of the Ionians. who had emerged from Persian lordship only to fall under that of Athens. Herodotus reflects this view: Thucydides more than once quotes Dorians as holding it. Some modern writers, influenced by the 19th-century "Aryan" theory of the inherent superiority of certain races and especially by the famous book of the youthful K. O. Miiller, *Die Dorier* (1824), have accepted it. More recent views have become more skeptical. Corinth and Rhodes were as commercial-minded, Syracuse and Taras as democratic (and as unstable) in their heyday. Argos and Corcyra as bloody in their revolutions, as any Greek states. That Ionia felt the full influence of the Orientalizing movement in art (as did Rhodes and Corinth) and life and that Ionia fell before eastern conquerors may be more plausibly ascribed to geography; that the Peloponnese escaped Persian invasion was due largely to the length of the Persian line of communications and to the victory at Salamis of the Athenian fleet. The fact is that for a strongly differentiated Dorian constitution. we have to look to just two quarters: to Crete and to Sparta. in both of which (and in Sparta hardly before 600. though some scholars would prefer an earlier date in the 7th century) Dorian aristocracies deliberately "froze" an archaic form of society. sacrificing their early artistic promise in the process, in order to secure their position against a larger population of serfs. The dominating factor is not racial, but social. In Sparta, indeed, at the very time when it was perfecting its "Spartan" may of life, there was even a movement to "play down" pan-Dorianism. The "bones of Orestes" the Achaean, stolen from Tegea. mere re-buried with honour in Sparta; and the brilliant and unorthodox king Cleomenes I, when the priestess of Athena at Athens barred his entry into the temple with the words, in the manner of the Parian inscription, "It is not permitted for Dorians to enter here," replied "Madam. but I am not a Dorian, but an Achaean" (507 B.C.). It is fair to add that his more orthodox brother was named Dorieus.

Dorians contributed not a little to the culture of Greece: in choral poetry, the germ of drama; in early vase-painting, especially Corinthian and Laconian; in Doric architecture; in sculpture in Crete and at Xrgos. But the extravagances of the "Dorian theory" date from a time when Dorian upper classes were struggling to maintain their position; especially when, in the 5th century, while proud of their repulse of Xerxes during the Greco-Persian wars, they were also nervous at the concentration of the resources of the eastern Greek world, and the encouragement of democracy there, under the overlordship of Athens. See IONIANS; SPARTA; see also references under "Dorians" in the Index volume.

DORIC ORDER: *see* ORDER.

DORION, SIR ANTOINE AIMÉ (1816–1891), Canadian statesman and judge, joint premier of United Canada for four days in 1858 and in 1863–64, was born of an old Liberal family at Ste. Anne de la Pérade, Lower Canada (Quebec), on Jan. 17, 1816. He went to Nicolet college and later studied law under M. Côme-Séraphin Cherrier, an eminent Montreal lawyer. Admitted to the bar in 1842, he became Cherrier's associate, and in 1863 was made a queen's counsel. He entered politics in 1854 as member of the legislative assembly for Montreal. At once he became the leader of a group of audacious and talented young men known as the *Rouges*, who were really the Canada East (Lower Canada) wing of the Liberal party. They were compromised in the eyes of the French-Canadian electorate by their association with anticlericalism and with the Liberals of Canada West who were often belligerent Protestants. It was evidence of Dorion's abilities that he succeeded at all.

He had a trenchant mind and an acid tongue to express it. He had little use for political traditions unless intrinsically valuable, and he disliked the casual conservatism represented by G. E. Cartier and J. **A.** Macdonald, who, he suspected, were quite capable of manipulating friends or funds in order to stay in office. He believed that the solution of the political difficulties of the province of Canada lay in a federation of the two sections, which in fact he proposed in 1856. Probably some similar solution was the basis of the Brown-Dorion administration of August 2–5, 1858. This unfortunate coalition weakened him with the French-Canadian voter; he was more successful in 1862 when, united with a Roman Catholic Scot from Canada West, he helped form the John Sandfield Macdonald-Sicotte government and, later, the Dorion-Macdonald administration, 1863–64.

He was a stern critic and opposed confederation with every power at his command, believing it dangerous for the liberties of French Canadians. But he accepted the *fait accompli* of 1867. He became minister of justice in the Liberal government of Alexander Mackenzie in 1873 and was appointed chief justice of Quebec in 1874 and knighted in 1878. Dorion's talents were effectively utilized on the bench. His penetrating and shrewd intelligence made him as effective a judge as he had been powerful an advocate, and his integrity was the guarantor of his impartiality. He died at Montreal, Que., on May 31, 1891, just a week before his old archenemy, J. A. Macdonald. (P. B. W.)

DORIS, a small district in central Greece, between Mts. Oeta (modern Oiti) and Parnassus, containing the headwaters of the Cephissus (modern Kifisos) river. This narrow valley, which nowhere exceeds 4 mi. in breadth and has only four small townships, owed its importance partly to its command over the road from Heraclea in Trachis to Amphissa, but chiefly to its prestige as the alleged mother country of the Dorian conquerors of the Peloponnese (see DORIANS). Its history is mainly made up of petty wars with Oetaeans and Phocians. In 457, the Spartans, admitting the claim of Doris to be the Dorian metropolis, sent an

army to help it against the Phocians, and again against the Oetaeans in 426. Except for mention of its cantonal league in 196, Doris passed early out of history.

DORISLAUS, ISAAC (1595–1649), Anglo-Dutch lawyer and diplomatist, assassinated for his part in preparing the trial of Charles I, was born at Alkmaar, Neth., the son of a minister of the Dutch Reformed Church. He was educated at Leiden, removed to England about 1627, and was appointed to a lectureship in history at Cambridge, where his attempt to justify the Dutch revolt against Spain led to his early retirement. In 1629 he was admitted a commoner of the College of Advocates. He made his peace at court in 1632. On two occasions he acted as judge advocate—in the Bishops' War of 1640 and in the army commanded by the earl of Essex in 1642. In 1648 he became one of the judges of the admiralty court, and was sent on a diplomatic errand to the states general of Holland. He assisted in preparing the charges against Charles I and in managing the king's trial. Re went to The Hague in May 1649 to help in negotiations for an alliance between the Commonwealth and the Dutch republic, and was murdered there by royalist refugees on May 12.

DORKING, a market ton-n and urban district of Surrey, Eng., lies 12 mi. E. of Guildford by road. Pop. (1961) 22,594. It is at the edge of the North downs in the sheltered wooded valley of the river Mole and is noted for the beauty of its countryside. Holmwood common (630 ac.) at the southern end and Box hill (1,429 ac.) in the northeast of the district belong to the National trust. Dorking is the centre of an extensive agricultural and residential area. It gives its name to a well-known breed of fowl distinguished by having five toes.

Several fine mansions are in the vicinity of the town, notably those of Leith Hill place (southwest), Polesden Lacey (3 mi. N.W.), which contains the Greville collection of works of art, and Deepdene, once a famous mansion, where Disraeli wrote most of *Coningsby*. Leith Hill place and Polesden Lacey belong to the National trust. The district has literary associations with George Meredith, who lived and is buried there, Fanny Burney (Frances D'Arblay) and T. R. Malthus, as well as Disraeli and others. Dorking has four railway stations, including Box hill station.

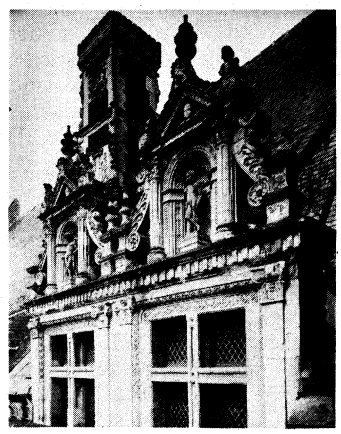
DORMAN, THOMAS id. 1577?), English Roman Catholic theologian, was born at Berkhampstead, Hertfordshire, and studied at the Berkhampstead free school, at Winchester and at New college, Oxford, where he was elected a probationer fellow. He became a fellow of All Souls' college in 1554, during the Catholic revival under Mary, and was awarded the degree of bachelor of civil law in 1558.

Opposing the religious changes made after the accession of Queen Elizabeth I in 1558, Dorman left England. He became a student of theology in Louvain, Belg., and in 1565 was graduated as bachelor of divinity from the University of Douai. in France, which later also awarded him the doctorate. Dorman assisted in the establishment of the English college at Douai, founded in 1568 by William Allen.

In 1572 or 1577 Dorman died at Tournai, Belg.

DORMER, in architecture, **a** projection from a sloping roof, containing a window. Dormers may occur either on the face of the wall or high upon the roof; their roofs may be gabled, hipped, flat or with one slope. Wherever steep, high roofs occur, dormers are common, in order to light the space within.

Simple dormers, frequently in several rows, characterize the steep roofs of Teutonic countries, but in the late Gothic and early Renaissance periods certain dormers, whose fronts were on the wall line of the building. were built in masonry and richly decorated.



GIRAUDON

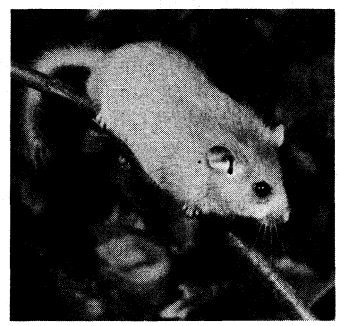
RENAISSANCE DORMER OF THE CHÂTEAU OF BLOIS, FRANCE. EARLY 16TH CENTURY

Similar elaborate dormers, usually with gabled roofs, were characteristic of the French chhteaux from the time of Louis XII to that of Louis XIV, and of Tudor work in England and Scotland.

Examples of dormers, ornamented with pinnacles, tracery and buttresses. occur in the Palais de Justice at Rouen (end of the 15th century). Heidelberg castle (1556) and the chbteaux of Blois and Chambord (time of Francis I) show characteristic Renaissance enrichment.

The term "dormer" arose from the windows' being those of sleeping rooms. The phrase "dormer beam" is the equivalent of the modern sleeper. *See* ROOF.

DORMOUSE, any of certain small rodents of the families Gliridae (often, Muscardinidae) and Platacanthomyidae, which contain a number of old world species. In their appearance and habits—arboreal life and the habit of sitting up on their hind legs with their food grasped in the forepaws—dormice are like squirrels, from which they differ in being completely nocturnal; some of their most distinctive rodent features are internal. They live (average span three years) among bushes or in trees, and make a neat nest for the reception of their young, generally four in number, produced twice a year (spring and fall). They are born blind, but in a very short period are able to care for themselves; their hibernation begins later in the season than that of the adults. The common name refers to their proverbial somnolence. The species inhabiting cold climates construct a winter nest in which they hibernate (often for six months), waking up at times to feed on an accumulated store of nuts and other foods. They become very fat prior to hibernation, and at such times the edible dormouse was considered a favourite article of food on the continent.



JOHN MARKHAM

COMMON DORMOUSE (MUSCARDINUS AVELLANARIUS)

In the more. typical rnembers of the Gliridae, forming the subfamily Glirinae, there are four pairs of cheek teeth, which are rooted and have transverse enamel folds. The typical genus *Glis* is represented by the European edible dormouse, *G. glis,* a gray species with black markings and about 8 in. long; the genus ranges from continental Europe to Japan. The common dormouse *Muscardinus avellanarius,* ranging from England to Russia and Asia, is of the size of a mouse. The fine, silky fur is tawny above and paler beneath, with a white patch on the throat. The third genus is represented by the continental lerot, or garden dormouse, *Eliomys quercinus*, which is a large chestnut coloured species with black cheeks.' There are several local forms or races. **A** large number of African species belong to the genus *Graphiurus.*

The family Platacanthomyidae, spiny dormice, are represented by the Indian *Platacanthomys* and the Chinese *Typhlomys,* in which there are only three pairs of cheek teeth. (J. E. HL.; X.)

DORNER, ISAAC AUGUST (1809–1884), German Lutheran theologian. was born at Neuhausen, Wurttemberg, on June 20, 1809. After studying at Tiibingen, he traveled in England and Holland. He was professor of theology successively at Tubingen (1837), Kiel (1839), Konigsberg (1843), Bonn (1847). Gottingen (1853) and finally Berlin (1862). Dorner's best-knomn work is his treatise on the history of the doctrine of the Person of Christ (1835–39; Eng. trans., 5 vol., 1861–66). Others are Das *Princip unserer Kirche nach dem innern Verhältniss seiner zwei Seiten betrachtet* (1841) and *Geschichte der protestantischen Theologie* (186;; Eng. trans.. 1871). His ultimate position as one of the "mediating" theologians is best seen in his *Christliche Glaubenslehre* (1879–81). The companion work *System der christlichen Sittenlehre* was published in 1886. Dorner founded and for many years edited the *Jahrbücher fur deutsche Theologie.* He

died at Wiesbaden, July 8, 1884.

DBRNOCH, the only royal and small burgh and the county tonn of Sutherlandshire, Scot. Pop. (1961) 933. It lies on the north shore of Dornoch firth. 62 mi. N.F.E. of Inverness by road. Its dry climate. sandy beaches and splendid golf links have made it a residential and resort town. The cathedral, built by Bishop Gilbert de Moravia (Moray) (d. 1245), was damaged by fire in 1570, during a raid, and neglected till 1835–37, when it was restored by William Burns. A further restoration took place in 1924. The one remaining tower of the bishop's palace, later called Dornoch castle, was rebuilt and is now a hotel. It was the scene of the last execution for witchcraft in Scotland (1722). The town received its charter from Charles I in 1628.

DOROTHEUS, a professor of jurisprudence in the Roman law school of Berytus (Beirut) in Syria. and one of the three commissioners appointed by the emperor Justinian to draw up a book of Institutes to serve as an introduction to the Digest, part of the Corpus *juris civilis*, already completed. His colleagues were Tribonian and Theophilus, and their work was accomplished in 533. Dorotheus later wrote a commentary on the Digest, which is called the Index and was published by him in 542. Fragments of this commentary have been preserved in the *Scholia* appended to the Basilica, from which it seems probable that the commentary of Dorotheus contained the substance of a course of lectures on the Digest delivered by him in the law school of Berytus.

DORSET, EARLS, MARQUESSES AND DUKES OF, English titles formerly borne by the families of Beaufort. Grey and Sackville. Osmund (d. 1099). bishop of Salisbury, an alleged son of Henry, count of Seéz, by a sister of William I, is said to have been created earl of Dorset about 1070, but the authority is a very late one and probably inaccurate. William de Mohun (fl. 1141) earl of Somerset, was sometimes also called earl of Dorset, since the two shires were once united under a single sheriff.

JOHN BEAUFORT (*c.* 1371–1410) earl of Somerset. the eldest son of John of Gaunt, duke of Lancaster, and of Catherine Swynford. was created marquess of Dorset in 1397. but he was reduced to his former rank of earl two years later. His brother THOMAS (d. 1426). afterward duke of Exeter. was created earl of Dorset in 1411 and John's son EDMUND (1406–1455), afterward earl of Somerset, obtained the same dignity in 1441, becoming marquess of Dorset two years later. Edmund's titles were inherited by his son HENRY (1436–64), but became extinct on Henry's execution in 1464 (see BEAUFORT).

THOMAS GREY (1451–1501) was created marquess of Dorset in 1475. He was the eldest son of Sir John Grey. Lord Ferrers of Groby (1432–61), by his wife Elizabeth Woodville, afterward queen of Edward IV. Thomas received the earldom of Huntingdon in 1471. but renounced it shortly afterward. He fought for Edward IV at Tewkesbury, and after Edward's death he and his brother Richard Grey supported their half-brother the young Edward V. thus incurring the enmity of Richard, duke of Gloucester (later Richard III). Richard Grey was arrested and beheaded at Pontefract in June 1483, ahile the marquess saved his life by flight. Dorset was one of the leaders of the duke of Buckingham's insurrection. and when this failed he joined Henry, earl of Richmond (afterward Henry VII), in Brittany, but he was left in Paris when the future king crossed to England in 1485. After Henry's victory at Bosworth the marquess returned to England and his attainder was reversed. He was suspected and imprisoned when Lambert Simnel revolted (1487) but he was soon restored to favour, took part in the French expedition of 1492 and helped suppress the Cornish rising in 1497. He died on Sept 20, 1501.

THOMAS GREY (1477–1530), 2nd marquess of Dorset. the eldest son of the 1st marquess. fled to Brittany with his father in 1484. He spent several years in prison under Henry VII but was highly favoured by Henry VIII, who gave him command in France in 1512 and made him warden of the Scottish marches in 1523. He was famous for his skill in the tournament and was one of the eight challengers at the Field of Cloth of Gold. He died on Oct. 10, 1530. His eldest son, HENRY GREY (1517–54) 3rd marquess of Dorset, was in 1551 created duke of Suffolk (see SUFFOLK, EARLS AND DUKES OF). A younger son, Lord Thomas Grey, was beheaded in 1554 for sharing in the rebellion of Sir Thomas Wyat; another son, Lord John Grey (d. 1569) was also sentenced to death for his share in this rising, but his life was spared by the efforts of his wife, Mary, daughter of Sir Anthony Browne. Under Elizabeth I, Lord John, a strong Protestant, was restored to the royal favour.

In 1604 THOMAS SACKVILLE (*q.v.*) was created earl of Dorset. He was succeeded by his son ROBERT (1561–1609). 2nd earl. and his grandsons RICHARD (1590–1624), 3rd earl, and EDWARD (1591–1652), 4th earl. Edward had attained much notoriety by killing Edward Bruce, 2nd Lord Kinloss. in a duel in 1613 and he fought for James I's son-in-law, Frederick V, elector palatine, in 1620. In the house of commons. where he represented Sussex in 1621–22, Sackville defended Francis Bacon and advocated an aggressive policy for the recovery of the Palatinate; twice he was ambassador to France (1621 and 1623). and he was interested in Virginia and the Bermuda Islands. Under Charles I he was a privy councilor and lord chamberlain to Henrietta Maria. At the outbreak of the Civil War, he joined the king at York, but he endeavoured to secure peace. At Oxford he was lord chamberlain to the king and lord president of his council (1644), but Charles did not altogether approve of his pacific attitude. He died on July 17, 1652. His wife Mary (d. 1645), daughter of Sir George Curzon, was governess to the sons of Charles I, the future Charles II and James II.

CHARLES SACKVILLE (1643–1706), 6th earl of Dorset, was the eldest son of RICHARD (1622–77), 5th earl, and of Frances, daughter of Lionel Cranfield, earl of Middlesex. He was born on Jan. 24, 1643. probably at Copt hall, Essex. He inherited in 1674 the vast estates of his maternal grandfather. whose title of earl of Middlesex was conferred on him in 1675, and succeeded to his father's title in 1677. He was educated at Westminster school and traveled on the continent from 1658 till 1660. After the Restoration he became member of parliament for East Grinstead, and was a prominent member of the famous circle of court wits. He was one of the group which produced a translation of Pierre Corneille's *Pompée* in 1663 and he took part with Sir Charles Sedley and Sir Thomas Ogle in a notorious drunken frolic at Oxford Kate's tavern in Covent Garden in June 1663. Like other young courtiers he served as a volunteer in the Dutch War in 1664. Nell Gwyn was his mistress before she bestowed her favours on Charles II, and, according to Samuel Pepys, he was living with her at a house at Epsom in July 1667. He was a gentleman of the bedchamber to Charles II but he opposed the policy of James II, and in 1688 supported William of Orange (afterward William 111), who made him lord chamberlain in 1689. He died at Bath on Jan. 29, 1706.

The 6th earl was a munificent patron to many men of letters, including Dryden, Etherege, Butler, Shadwell and Prior. Dryden valued his friendship highly and dedicated to him the Essay of *Dramatic* Poesy, in which Dorset appears under the name of Eugenius. He was celebrated for his indolence, his mordant wit and his good nature. Rochester called him "The best good Man, with the worst natur'd Muse." He only left a small sheaf of poems but they have an individual quality. The most famous is the lively. sparkling ballad said to have been "Written at Sea, in the first Dutch War, 1665" beginning:

To all you ladies now at land
We men at sea indite.

His little satiric poems on Katherine Sedley are a piquant combination of the lyric and the satiric epigram and two of his satires in heroic couplets on Edward Howard anticipate to a remarkable degree the manner of Pope, who greatly admired Dorset's poetry and ones a considerable debt to it.

BIBLIOGRAPHY.—Brice Harris, *Charles Sackville, Sixth Earl of Dorset: Patron and Poet of the Restoration* (1940); V. de S. Pinto, *Restoration Carnival* (1954). For a collection (not exhaustive) of Dorset's poems, see *The Works of the Most Celebrated Minor Poets*, vol. i (1749) and the undated supplement to that miscellany. (V DE S P.)

The 6th earl's son LIONEL CRANFIELD SACKVILLE (1688–1765), 7th earl, was created duke of Dorset in 1720. He was twice lord steward of the household, tnice lord lieutenant of Ireland and was lord president of the council from 1745 to 1751. His second vice-

royalty of Ireland (1750–55) was stormy and ended in dismissal. He died on Oct. 10, 1765, leaving three sons: Charles. the 2nd duke; John Philip (d. 1765); and George (see SACKVILLE, GEORGE, 1st Viscount).

CHARLES SACKVILLE (1711–69), 2nd duke, an associate of Frederick, prince of Wales, was a member of parliament for many years and a lord of the treasury under Henry Pelham; he died on Jan. 5, 1769. His nephew JOHN FREDERICK (1745–99). 3rd duke, was ambassador in Paris from 1783 to 1789 and lord steward of the household from 1789 to 1799; he died on July 19. 1799. and was succeeded by his only son GEORGE JOHN FREDERICK (1793–1815), 4th duke. When the 4th duke died unmarried in Feb 1815, the titles passed to his kinsman, CHARLES SACKVILLE-GERMAIN (1767–1843), 5th duke, son and heir of the 1st Viscount Sackville. When he died on July 29, 1843, the titles became extinct. (X.)

DORSET, a southwestern county of England, bounded northeast by Wiltshire, east by Hampshire, south by the English channel, west by Devon and northwest by Somerset. Area 974.9 sq.mi.

Physical Features.— In the centre of the county the chalk hills of the western downs sweep southwest from Cranborne Chase through Blandford Forum, Milton Abbas and Frampton to Dorchester. There the chalk outcrop narrows and turns southeastward by Portisham and Bincombe to West Lulworth. whence it is continued eastward as the Purbeck hills, Within this run of chalk is a fringe of Reading Beds and London Clay which may be traced from Cranborne through Wimborne Minster, near Bere Regis and Puddletown, then southwest through West Knighton, Winfrith and Lulworth, and along the north side of the Purbeck hills to Studland. Bounded by this and occupying the eastern portion of the county is a low-lying region of sands. gravel and clay, probably an extension of the Hampshire basin. Denudation has revealed the Wealden Beds in the vale between Lulworth and Swanage, and also near East Chaldon. The town of Shaftesbury stands upon a hill of greensand, while the Upper Greensand also forms the high ground above Lyme Regis, Golden Cap and Pilsdon and Lewesdon Pens. It is thought that a stream following the syncline of the Frome valley, the Solent and the Spithead was at one time the chief feature of the drainage. Subsidence. however, resulted in the tributaries of this stream now finding their way independently to the sea. The Stour rises in Wiltshire and flows with a general southeasterly course to join the Hampshire Avon near its mouth at Christchurch in Hampshire. It receives the Cale and Lidden, which drain the Vale of Blackmore, in its upper course, and breaches the western downs in its middle course between Sturminster Newton and Blandford. The small river Piddle or Trent and the Frome flow across the eastern plain and reach Poole harbour within a few hundred yards of each other. In the northwest, the Yeo flows northward to join the Parret and so sends its waters to the Bristol channel. The Char, the Brit and the Bride drain the southwest. Lulworth cove is an excellent example of differential marine erosion. Chesil bank (*q.v.*), a unique shingle beach whose origin is the subject of conflicting arguments, connects the Isle of Portland (see PORTLAND, ISLE OF) with the mainland. The Dorset landscape, its downs, heaths and coastline, is of outstanding beauty.

The climate is mild, and in some sheltered spots, such as Abbotsbury, semitropical plants flourish.

The National trust's 326 ac. (1961) includes the Cerne giant, the figure of a man 180 ft. high holding a huge club, cut in the chalk above Cerne Abbas in Romano-British times; the cottage near Dorchester where Thomas Hardy (*q.v.*) was born; Clouds Hill, 9 mi. E. of Dorchester, where Thomas Edward Lawrence (*q.v.*), Lawrence of Arabia, lived on retiring from the Royal Air Force; the Hardy monument put up in memory of Vice-Admiral Sir Thomas Masterman Hardy (*q.v.*) by the road from Martinstown to Portisham where it commands a fine view over Weymouth bay: and several other small properties. (C. P. BN.)

Archaeology and **History.**—Acheulean tools have been found at Broom, Moreton and Corfe Mullen, and Mesolithic squatting sites are known in Purbeck and Iwerne Minster, but Dorset does not figure significantly in the archaeological record until the arrival of Neolithic peasants from northern France sometime before 2000 B.C. The existence of easy landfalls between Weymouth and Christchurch giving directly upon the chalk downs, or indirectly via the Frome, Piddle and Stour, made Dorset a gateway for continental immigrants seeking the lightly forested and well-drained calcareous soils of Wessex, which offered fewest obstacles to prehistoric agriculture. The county's geographical situation ensured that these movements would most often derive from Normandy and Brittany, while its accessibility by the western sea routes encouraged trade with Cornwall, Wales, Ireland and even Mediterranean lands. Overland its natural ridgeways ran directly to the great focus of prehistoric trade arid pilgrimage upon Salisbury plain, whence contact was maintained with the Thames valley and East Anglia.

Characteristic Neolithic "causewayed camps" have been identified at Maiden Castle and Hambledon hill. Megalithic tombs occur as far east as Bere Regis, but collective burials in earthen long barrows are normal in the chalklands. The ritual circle of Maumbury (later an amphitheatre) probably belonged to Secondary Xeolithic people of native stock; similar henges. as at Knowlton, may prove to belong to the partly contemporary Beaker folk, whose earliest groups (with bell-beakers) will have reached Dorset c. 1800 B.C. The patriarchal society of the copper and bronze-using pastoral communities of the ensuing centuries is characterized by single burials in round barrows, of which the Oakley down and Winterborne Abbas groups are outstanding. The splendours and the trade contacts of the chieftains of the Wessex Culture (c. 1600–1350 B.C.) are exemplified by the gold and amber objects of the Ridgeway no. 7 and Clandon barrows, and by beads of Mediterranean origin from Frampton.

Succeeding centuries saw a more even distribution of wealth, domestic objects as well as weapons being made of bronze. The Deverel-Rimbury Culture. named after two Dorset sites. probably began c. 1150 B.C., incorporating important indigenous elements as well as features brought by settlers from western France. Its major contribution, perhaps, was the extension of downland tillage by the use of the ox-plow. Deverel-Rimbury traditions were absorbed rather than extinguished by Celtic peoples with iron equipment who came from much the same region. Dorset may have been penetrated from Wiltshire by Iron Age A folk with characteristic haematite pottery, but at least one foreign group fortified Bindon hill as a beach head before 400 B.C. Abundant remains imply an increased population, living in family groups in hamlets or hutted farmsteads near their fields, but occasionally acting tribally to build single-ramparted hill-forts as refuges during intertribal war, as upon the eastern knoll of Maiden Castle. This farming economy persisted into late Roman times, but in the last two centuries B.C. there were important developments, the precise chronology and direction of which are still uncertain, but in which a historical tribe, the Durotriges, can be recognized. Characteristics were the use of slings in warfare, the development of multiple ramparts such as those of the enlarged Maiden Castle, a silver coinage, and various technical improvements in milling and potting, resulting from trade contacts and perhaps immigration from northwestern Gaul, and stimulated by parallel developments in the Belgic areas of southeastern Britain. The tribal territory evidently lay between the Hampshire Avon and the Axe, with a less definable northern frontier excluding Salisbury but including Ham hill and Ilchester.

This became the Roman canton, when the brief military phase was over after A.D. 43, administered perhaps partly from Durnovaria (Dorchester) and partly from Lendiniae (Ilchester). The former replaced Maiden Castle as the chief town; the latter presumably grew as a centre for the rich area of villa estates which had no prehistoric roots and no counterpart in the chalklands, where native-style farming persisted even though the farmstead itself might then be Romanized. Important harbours at Hamworthy and Radipole were linked by branch roads to the trunk road through Dorset, and local industries exploited Portland stone, Purbeck marble and shale. and the clays of the Poole basin. Excavation has suggested that the two chief tonns were prosperous in the 4th century. The conversion of Bokerley dike, possibly

the boundary of an imperial cattle ranch in Cranborne chase, into a barrier against attack from the east, seems however to have been a reaction to the combined barbarian raid of 367–368, and before 400 the arterial road through the dike from London was blocked and never reopened.

Practically- nothing is known of events between the withdrawal of imperial authority in the early 5th century and the incorporation of the region in the West Saxon kingdom after Penselwood (658), except that it remained British. Nor was ultimate absorption accompanied by wholesale slaughter or dispersal. The creation (705) of the diocese of Sherborne. doubtless followed by the institution of a parochial system. marked the consolidation of Dorset. Somerset and Devon. Probably early in this century Wessex was divided into shires, which already must have been subdivided for administration. presumably into hundreds *(see* HUNDRED). This newer part of Wessex, behind the barrier of Selwood, became the core of resistance to the Danes in the 9th century. Domesday Book (1086) shows that by late Saxon times the prehistoric pattern of upland settlement gave place to an essentially modern one upon the richer soils of the vales. A two-field system was normal in the chalklands and recent research into manorial boundaries suggests that at least some groups of manors were carefully planned in relation to the needs of agricultural communities, at a very early phase of the settlement.

A. F. KERSTING

RUINS OF CORFE CASTLE. DATING MAINLY FROM THE 13TH CENTURY, ON THE ISLE OF PURBECK, DORSET. ENG.

The name Dorset denotes "the settlers by Dorchester," which suggests the priority of the future county town, although Shaftesbury and Wareham (*qq.v.*) were larger, and the latter the residence of the sheriff, in 1086. The county has not often figured decisively in national history since the Conquest, but its ports guaranteed it a certain strategic importance, especially during Stephen's reign and the Civil War, when Corfe castle (*q.v.*), Sherborne and Wareham (in the 12th century) were locally prominent. Wareham was surpassed as a port by Weymouth and Melcombe and subsequently eclipsed by Poole. which supplanted Melcombe as the wool staple in 1433. As ships grew larger the Dorset port declined, despite lucrative privateering and channel piracy, but in the 16th and 17th centuries trade with the Newfoundland fishing settlements brought renewed prosperity to Poole, Lyme and the united borough of Weymouth and Melcombe.

Industries have generally been of local importance, although the netting and cordage of Bridport and the extraction of Purbeck marble. Portland stone and china clay deserve mention.

Farming has been the principal activity. Some enclosure of commons had occurred by Elizabeth I's day. but open arable fields survived in many places well into the 19th century and are still cultivated in Portland, where grass balks divide the arable strips. In the middle ages Dorset's wool was not specially esteemed, but by the 17th century its sheep and dairying were famous. The flocks had dwindled toward extinction by mid-20th century. The hardships culminating in the suppressed protests of the labourers in 1833 and the Tolpuddle case in 1834 have passed into national history. but government planning helped to avoid agricultural depressions such as followed the Napoleonic Wars and World War I, as well as the bad harvests of the 1870s. (R. A. H. F.)

Population and Administration.— The population of the administrative county was (1961) 309,176, an increase of approximately 6% over the 1951 figure. The county contains eight municipal boroughs, the chief of which are Dorchester, the county town (pop. [1961] 12,266), Poole, a county and borough (88,088), Weymouth and Melcombe Regis (40,962) and Bridport (6.517). There are four urban districts and nine rural districts. Dorset and Poole each have a court of quarter sessions and there are nine petty sessional divisions. Dorset is divided for parliamentary purposes into three county divisions and the Poole parliamentary division, each returning one member. The dialect of the county, distinguishable from those of Wiltshire and Somerset, yet bearing many marks of Saxon origin, is admirably illustrated in the poems of William Barnes (*q.v.*). Many towns, villages and localities are readily recognized from their descriptions in the "Wessex" novels of Thomas Hardy.

Agriculture, Industries and **Communications.**—Fine timber grows in the richer soils, in some of the sheltered valleys of the chalk district and more especially upon the greensand, but many woods have been cleared. State forests in the early 1960s covered more than 15.700 ac. The chief crops are barley, oats and wheat, but mixed corn, beans, peas and mangels are widely grown. Cattle, sheep, pigs and poultry are reared.

A variegated coastline and the unspoiled scenic qualities of the countryside have attracted a tourist industry second in importance only to agriculture. Poole, Smanage, Weymouth, Bridport and Lyme Regis are the principal coastal resorts. Poole, the county's largest seaside town, manufactures pottery, bricks, tiles and chemicals. Shipbuilding and marine and general engineering are important at both Poole and Weymouth. Other Dorset manufactures are rope, twine and net at Bridport, silk at Sherborne. paper at Witchampton and gloves in several towns and villages in the north. The aircraft industry is represented at Blandford. Food processing and brewing are carried out throughout the county. Two minerals found in Dorset are of national importance. namely ball clay and firestone. Ball clay is both mined and worked open cast in Purbeck and east Dorset, much of the product being exported to the potteries of Staffordshire. The auarries of the Isle of Portland supply a much used white freestbne while Purbeck marble was used for many of the most famous Gothic churches in England. Other minerals worked are sand, gravel, brick and pipe clay, chalk and shale oil.

Poole, Weymouth and Bridport are the chief ports. Portland harbour, under the admiralty, is a naval base used for training purposes. There is a large atomic energy research establishment at Winfrith.

Gillingham and Sherborne, in the north of the county, stand on the Southern region's Waterloo (London) to Exeter main railway line. and Lyme Regis is served by a branch of this system from Axminster. The Southern region's Waterloo to Weymouth main line serves Poole, Wareham and Dorchester, with branches serving Wimborne, Blandford and Swanage Dorchester is also on the Western region's Paddington to Weymouth main line, branches of which serve Bridport and, for freight only. Portland. A number of intercounty omnihus companies provide a road transport link with neighbouring counties. (C. P. BN.)

DORSEY, JAMES **OWEN** (1848–1895), American ethnologist and linguist known especially for his work on the Siouan Indians. was born in Baltimore. Md., on Oct. 31, 1848. After studying at the Theological Seminary of Virginia, he was ordained a deacon of the Protestant Episcopal Church in 1871 and began work that same year as a missionary among the Ponca in Dakota territory. Already adept in classical linguistics, he quickly learned the Ponca language.

Having returned to Maryland because of illness, he became acquainted with Maj. J. W. Powell, director of the U.S. Geological survey, who, in recognition of his linguistic talent, sent him to Nebraska to make linguistic and ethnological studies of the Omaha Indians. When Major Powell created the Bureau of American Ethnology in 1879, he chose Dorsey as one of the first members of the staff. Dorsey remained in this capacity until his death and, despite continued ill-health, was a prolific worker. The bulk of his research was among tribes of the Siouan stock, such as the Ponca. Omaha. Osage, Kansa and Dakota. He also studied the Athapascan, Takelman, Kusan and Yakonan stocks of Oregon. He edited the *Dakota-English Dictionary* and *Dakota Grammar, Texts, and Ethnography,* prepared by S. R. Riggs, which have remained classics in their field.

Dorsey made many important contributions to American Indian ethnology and to linguistic theory. Among his memoirs published by the Bureau of American Ethnology in its *Annual Reports* are *Omaha Sociology* (1884), *Osage Traditions* (1888), *A Study of Siouan Cults* (1894) and *Siouan Sociology* (1897). Because of his untimely death in Washington on Feb. 4, 1895, many of his papers were unfinished and remain in the archives of the Bureau of American Ethnology. (M. W. ST.)

DORSTEN, a town of Germany which after partition of the nation following World War II was included in the *Land* (state) of Norrh Rhine-Westphalia, Federal Republic of Germany. It is situated on the Lippe river and the Wesel-Datteln canal, 30 km. (18.6 mi.) N. of Essen by road. Pop. (1959 est.) 35,611. Dorsten is the northernmost town of the Ruhr and was badly damaged by bombing in World War II. A Franciscan monastery (1488), the old town hall (1567; now a local museum), a boys' school (1642) and an Ursuline nunnery with girls' school (1642) survived and the town was later rebuilt. There are collieries, coal-gas works, an iron foundry, quartz works, factories making wire and furniture, and coco weaving. Dorsten, a village in Roman times, was granted civic rights by the archbishop of Cologne in 1251 and mas fortified in the 14th century. As a monastic centre it was a stronghold of the bishops. In 1815 it became part of Prussia. Its industrial importance dates from the coming of the railway in 1899 and the first coal mine was opened in 1911.

DORT, SYNOD OF, an assembly of the Reformed Church of the Netherlands called at Dordrecht (Dort) in 1618–19 to settle theological dispute between the supporters of Jacobus Arminius and the supporters of the Bezan form of Calvinism, led by Franciscus Gomarus. The Arminian merchant oligarchy, largely indifferent to theological dogmas and interested in a speedy settlement with Spain, was also opposed politically to the Calvinistic clergy and middle class, who wished to move more vigorously against Spain. The Synod of Dort was originally intended to bring agreement on the doctrine of predestination among all the Reformed Churches, but in practice this Dutch synod, because of the political forces at work, was mainly concerned with problems facing the Reformed Church of the Netherlands.

The theological antecedents of the synod — the conflict between the Arminian Remonstrants (so called because their theological views were contained in the Remonstrance, presented to the states-general in 1610) and the Gomarist Counter-Remonstrants concerning the ground, extent and consequences of the doctrine of predestination — are described elsewhere (*see* ARMINIANISM). The grand pensionary, Johann van Oldenbarnevelt (who had arranged the truce with Spain in 1609), urged the toleration of both parties, but the Dutch clergy, largely Calvinistic: opposed his religious and political aims and were supported by the head of the army, Prince Maurice of Nassau. When these political and theological passions had coincided, the states-general rejected Oldenbarnevelt's policy of toleration and called the Synod of Dort. whose many sessions lasted from Nov. 13, 1618, until May 9, 1619.

The delegates to the synod were all Gomarists: there were 37 ministers, 19 lay elders and 5 university professors (including Gomarus), together with 18 commissioners for the states-general. In response to the Dutch invitations 26 theologians came from most of the Reformed Churches of Germany and Switzerland and also from England. Brandenburg declined to send delegates, and those appointed by the Reformed Church of France were prevented by Louis XIII from attending. A clergyman associated with Prince Maurice, J. Bogerman, was appointed president of the synod.

The opening sessions dealt with a new Dutch translation of the Bible, a catechism and the censorship of books. Thereafter, Simon Episcopius, leader of the Arminian or Remonstrant party, and 12 other Remonstrants were cited to attend. After arriving they refused to recognize the authority of the synod as binding on their consciences and protested against not being allowed to criticize either the Calvinistic Belgic Confession or the teaching of the Gomarists. Eventually the Arminians were expelled from the synod and the Remonstrant theology was declared to be contrary to Scripture. The political as well as theological tensions of the synod can be seen in the Remonstrants' being accused not only of bad theology but of being "disturbers of their country."

The synod finally produced 93 canons which expounded in detail the errors rejected as well as the doctrines affirmed in the Five Articles dealing with the field of controversy. The doctrines affirmed were predestination not conditional on belief; Christ not dying for all; total depravity; irresistibie grace; the impossibility of falling from grace. The foreign delegates left on May 9, 1619, after signing the canons, and in its closing sessions the synod dealt with matters of discipline in the Dutch Church. These canons of Dort remained for 200 years as the theological basis of the Reformed Church of the Netherlands, alongside the Belgic Confession and the Heidelberg Catechism, and represent the extreme form of Bezan Calvinism.

DORTMUND, a city of Germany which after partition of the nation following World War II was in the *Land* (state) of North Rhine-Westphalia, Federal Republic of Germany. Located at the head of the Dortrnund-Ems canal, 32 km. (20 mi.) E. of Essen, it is the largest town in the *Land* and a major industrial centre of the Ruhr. Pop. (1959 est.) 637,105.

The town centre. more than 90% of which was destroyed during World War II, has been reconstructed on new lines with two broad arteries running north–south and east–west. Other new roads were cut, the old rampart streets widened and a new civic centre was built. The Reinoldikirche and the Marienkirche, both 13th-century buildings, the latter containing an altarpiece by Konrad von Soest, the Propsteikirche and the Petrikirche were restored. The city owns four moated castles. The synagogue (1956) is architecturally interesting. Dortmund's Westfalenhalle (1952) is one of Europe's largest halls and is used for congresses, exhibitions, tournaments, sporting events and similar affairs. There are many learned institutions, including the Max Planck institute for industrial physiology and for the physiology of nutrition, the institute for spectrochemistry and spectroanalysis, Münster university's department of social studies and an academy of social studies. an institute for journalistic research. a mountaineering school and a teachers' training college. Fritz-Henzler-Haus combines under one roof the people's college for adult education and the many-sided "house of youth." There are several museums.

Dortmund lies practically on three *Autobahnen:* Cologne-Hanover; Ruhrschnellweg; and Cologne-Leverkusen-Kamen. Fast trains in the Ruhr area are electrified and trans-European expresses connect Dortmund with Ostend and Paris. There is also a helicopter service to Paris via Brussels. The Dortmund-Ems canal is a vital artery of Dortmund's economy. Steel, coal and beer are Dortmund's principal products. In the early 1960s it produced about 20% of the Federal Republic's output of crude steel and 25% of the Ruhr production of crude iron. Seven of the 24 large breweries in west Germany are in Dortmund. There is a large wholesale fruit and vegetable market. Dortrnund is also the headquarters of bridge-building firms employed all over the world.

Dortmund is mentioned first as Throtmannia, about 885, when

it was already of some importance because of its position on the *Hellweg.* It achieved prosperity as a result of joining the Hanseatic league in the 13th century. It had trade connections as far as England, Scandinavia, Poland and Russia and in the 14th century its merchants were so wealthy that the English crown was several times in pledge to them. Its prosperity declined, however, and by 1803, when it lost its rights as a free city. it was a little agricultural town of 4,000 persons. With 19th-century industrial advances it rose rapidly, as population figures show: 1871, 44,420; 1910, 214,226; 1939, 542,000. This rise was halted only by World War **11.** (B. A H.-F.)

DOSITHEOS (1641–1707), patriarch of Jerusalem, an important church politician and theologian of the modern Greek church, was born on May 31, 1641, in Arachoba near Corinth. From the beginning of his career attached to the patriarchal throne of Jerusalem. he became metropolitan of Caesarea in 1660 and patriarch of Jerusalem in 1669. He died on Feb. 8. 1707, in Constantinople.

Dositheos understood his office as patriarch to mean responsibility for the whole Orthodox church. By correspondence and by extensive journeys he concerned himself with the state of the church in the Balkans, Georgia and the Ukraine. His relations with the tsar Peter the Great (to whom he wrote many letters) were strained because of Peter's church reforms, and his attempts to make Peter intercede for the churches of the east in connection with the peace treaty with Turkey in 1702 were fruitless. Dositheos strove to raise the standards of monasticism in Palestine. In 1680 he founded a Greek printing press in Jassy, Rumania, to encourage the study of theology. His extensive writings, largely compilations from the Greek Fathers, were directed against the Roman Catholic Church and the church union of Brest-Litovsk (1596; *see* ROMAN CATHOLIC CHURCH: *The Uniate Rites: The Byzantine).* In 1672 he called the synod of Jerusalem, which supported his "confession of faith" against the Calvinism of Cyril Lucaris *(see* JERUSALEM. SYNOD OF). Twentieth-century Greek theologians consider Dositheos' work to be in part too much of its time and to be lacking in original theological thought.

DOS PASSOS, JOHN RODERIGO (1896–), U.S. novelist, author of the trilogy *U.S.A.,* was born in Chicago, Ill., on Jan. 14. 1896. His mother's family was from Maryland and Virginia. His father, a lawyer, was the son of a Portuguese immigrant. and from this source came some of Dos Passos' early radical sympathies and his involvement with the Sacco-Vanzetti case. After graduating from Harvard in 1916, he visited Europe and traveled in Spain. During World War I he successively enlisted for volunteer ambulance service in the French army. joined the Red Cross in Italy and entered the medical corps of the U.S. army as a private. His early novels, *One Man's Initiation* (1917) and *Three Soldiers* (1921), dealt with this experience. His next important book was *Manhattan Transfer* (1925). This was a panoramic view of New York city life, highly experimental in technique, while *The 42nd Parallel* (1930). the first volume of *U.S.A.,* carried forward the experimental technique and the panoramic vision to a major chronicle of the American nation from 1900 to the 1930s. The second volume of the trilogy, *Nineteen-Nineteen* (1932). was the story of the war years. *The Big Money* (1936), the last and perhaps best volume of the three, dealt with the frenzied finance of the post-World War I period. His later works include other novels, another but less successful fictional trilogy. *District of Columbia* (1939–1949), and a series of travel books. historical studies and documentaries, but critical opinion is agreed that Dos Passos' major contribution to American literature is *U.S.A.* (M. GE.)

DOSSERET, in architecture, an impost block; the block of stone sometimes used in the Byzantine style above the capital *(q.v.)* of a column. It has the form of a truncated pyramid. with the large side up. and therefore furnishes ample bearing for carrying the arches and vaults above it.

DOSSO DOSSI (GIOVANNI DE LUTERO or LUTERI) (d. 1542), Italian painter, the leader of the Ferrarese school in the 16th century. There is doubt over the date of his birth, which has been put as early as 1479 and as late as 1490; he is first recorded in 1512, in Mantua, but by then he must have been in Venice and absorbed the art of Giorgione (d. 1510) and also have seen some of the early works of Titian. His style was founded on the romantic approach to landscape which reached its highest expression in Giorgione's "Tempest" (Accademia, Venice), but Dosso added something of Titian's richness and a personal quality of fantasy which was partly his birthright as a Ferrarese of the generation following Cosimo Tura, Francesco del Cossa and Ercole de' Roberti. He settled in Ferrara in 1517 and he must have come once more under the influence of Titian, whose early mythologies were painted for Dosso's own patron Alfonso I of Ferrara. There is no evidence that Dosso ever went to Rome but he was certainly acquainted with Raphael's work by 1520, and the tension of Raphael's later style was the final influence on Dosso. In his later works there is an unearthly light falling on melancholy figures arranged in a romantic dreamland. Dosso was the friend of the great Ferrarese poet Ariosto, who celebrated him as one of the nine greatest living painters, along with Raphael, Titian, Michelangelo and others *(Orlando Furioso,* canto xxxiii, stanza 2); and Dosso's most famous work, the "Circe" (Borghese gallery. Rome), has been seen as almost an illustration to Ariosto. There are the remains of some frescoes in the Castello at Trent, and representative paintings at Hampton Court. Middlesex, at the National gallery, London. at Dresden and elsewhere His brother Battista (d. 1548) was also a painter and occasionally worked with him. Dosso died in the summer of 1542, in all probability in Ferrara.

DOST MOHAMMED KHAN (1789–1863) was the founder of the Mohammedzai (Barakzai) dynasty of Afghanistan. The 20th of the 21 sons of Sardar Payenda Khan, chief of the Barakzai clan, he passed his childhood, after Payenda Khan's execution, first with his Kizilbash mother's relatives and later with his eldest brother Fath Khan. He rose to prominence in 1809 when Fath Khan was appointed vizier to Mahmud Shah. In 1816 the two brothers were sent to defend Herat against an invading Persian army and there Dost Mohammed was said to have insulted one of the royal princesses by robbing her of her jewels. Mahmud's eldest son Kamran. who was jealous of the vizier, thereupon hastened to Herat, seized Fath Khan and blinded him. Dost Mohammed escaped to Kashmir.

On hearing this news the remaining Barakzai brothers rose in arms against the shah and when Fath Khan was tortured to death Dost Mohammed invaded Afghanistan from Kashmir (1818). He seized Peshawar and Kabul and drove Mahmud and Kamran to a last stronghold in Herat. The Barakzai brothers then divided the greater part of Afghanistan among themselves. At the formal partition of 1826 Dost Mohammed received Kabul, Ghazni and Jalalabad and thus became the most powerful of the brothers.

In the meantime, in the confusion of civil war, the amir of Bukhara had occupied the northern Afghan provinces and the Sikhs had seized the trans-Indus districts, including Peshawar. Having consolidated his position in Kabul Dost Mohammed was determined to recover this territory from the Sikhs and to this end declared a *jehad* (crusade) in 1836. Assuming the title of Amirud Mumini (the leader of the faithful) he advanced on Peshawar but was defeated by the cunning of the Sikh ruler, Ranjit Singh, who undermined the loyalty of his army by intrigue.

After his return from Peshawar Dost Mohammed formally assumed the title of amir and in 1837 received the British delegation led by Capt. (later Sir Alexander) Burnes which came to seek his help against the threat of Russian penetration. Failing to receive from the British the help he had hoped for against the Sikhs Dost Mohammed received the Russian envoy Capt. P. Vitkevitch

This led to the recall of the British mission and the first mar between the British and the Afghans. Dost Mohammed escaped

in 1839 first to Balkh and then to Bukhara where for a time he was imprisoned. Thence he escaped in 1830, raised an army arid attacked the British at Parwandara. Although he had the upper hand in this battle he astonished the Afghans by surrendering the next day to the British authorities in Kabul. For the remainder of the war he was detained as a prisoner in Calcutta.

Restored to the throne in 1843 Dost Mohammed sent aid to the Sikhs in the second Sikh War (1848–49) but after the battle of Gujrat (*q.v.*) determined to concentrate on the consolidation of his own kingdom. He signed treaties of friendship with the British in 1855 and 1857 and remained neutral during the Indian mutiny. In the meantime he incorporated Kandahar in his kingdom, recovered the lost provinces in the north and in 1863 recaptured Herat which was held by Sultan Ahmed. his son-in-law. He died in Herat in June a few days after this event

Dost Mohammed was a strong ruler and was greatly admired by his own people. He had come to power at a critical period in Afghan history and it was largely due to his wisdom and energy that the country emerged from its difficulties strong and united. *See* also AFGHANISTAN: *History.* (MD. A.)

DOSTOEVSKI, FËDOR MIKHAILOVICH (1821–1881), Russian novelist of international reputation who is generally acknowledged to be one of the profoundest creative artists of the 19th century His father. the son of a priest in a small Ukrainian town, had been destined for the church but ran away from home, studied medicine in Moscow, took part in the Franco-Russian campaign of 1812 as an army doctor and later became a staff doctor at the Mariinskaya hospital for the poor in Moscow. He married a Moscow merchant's daughter, Marya Nechaeva, in 1819. Fëdor Dostoevski, his second son, was born in Moscow on Nov. 11 (new style; old style, Oct. 30), 1821. He went to a Moscow boarding school and after his mother's death in 1837 was taken with his elder brother Mikhail to St. Petersburg to enter the army engineering college. On the way he came for the first time face to face with the grim realities of Russian life when, during one of their stops at a posting station. he watched a government courier belabour his coachman with his fists to make him drive faster. "This revolting scene," Dostoevski wrote in 1876, "remained in my memory for the rest of my life," and indeed it provided the impetus for his revolutionary activities ten years later. Another encounter which left its mark on his writings took place immediately on his arrival in St. Petersburg, when he met the romantic poet Ivan Shidlovski, an idealist torn between the promptings of the flesh and the spirit. who was to appear in different guises in his stories and novels, particularly as Mitya Karamazov (in *The Brothers Karamazov).*

Dostoevski spent three unhappy years at the college, devoting most of his free time to reading Russian and foreign writers, including E. T. A. Hoffman, Schiller, Goethe, Shakespeare, Balzac, Victor Hugo, the French classical dramatists and George Sand and Dickens. In June 1839 his father, who had retired in 1837 to his small estate near Moscow, was murdered by his peasants, whom he had treated with great brutality. Dostoevski never referred to his father's murder but there can be no doubt that it greatly influenced his attitude toward the problem of serfdom and, subsequently, his idea of the Russian peasant as the sole repository of all Christian virtues.

Dostoevski's first literary work, a free translation of Honoré de Balzac's *Eugénie Grandet,* was published in a St. Petersburg periodical in the summer of 1844. In Oct. 1844 Dostoevski resigned his army commission. He was working on his first novel, *Bednye lyudi* (Eng. trans. *Poor Folk,* 1915 and 1956), which, after several revisions, he completed in April 1845. The novel brought him instantaneous success, being acclaimed by Vissarion Belinski (*q.v.*), the most influential critic of the day. as a literary masterpiece that showed "a profound understanding and an artistic recreation of the tragic aspect of life." It was, indeed, this tragic aspect of life, particularly of the poor and downtrodden low-civil servant. which became in one form or another the theme of the stories written in the first period of his literary career. Some of his heroes, like those of "Dvoinik" (1846; Eng trans. "The Double"), "Gospodin Prokharchin" (1846; Eng. trans. "Mr. Prokharchin") and "Slaboe serdtse" (1848; Eng. trans. "A Weak Heart") were driven to despair and madness, while others, like those of his only supernatural story *Khozyaika* (1847; Eng. trans. "The Landlady") and *Belye nochi* (1848; Eng. trans. "White Nights"—all published in *Otechestvennye zapiski,* "Home Annals") took refuge in a life of futile day-dreaming and soul-destroying self-absorption and inactivity. What made these stories so different from many of the type that became fashionable after the publication of Nikolai Gogol's *Shinel* (1842; Eng. trans. *The Overcoat)* was Dostoevski's uncanny insight into the darkest nooks and crannies of man's heart and mind.

The Revolutionary.—Belinski's enthusiastic praise of his first novel, which as he acknowledged a few years before his death had given him "one of the most enthralling moments" of his life, made Dostoevski an intimate of the critic's circle of friends and, though he had been brought up in a conservative and deeply religious environment, a convert to their radical and atheistic ideas. Belinski's cold and even hostile reception of Dostoevski's subsequent stories brought about a breach between them. It did not, however make Dostoevski give up the ideas he owed to Belinski. On the contrary, having parted from Belinski and his followers, including the young Ivan Turgenev, whose teasing he particularly resented, he joined first the more radical circle of utopian socialists led by Mikhail Petrashevski, and in Nov. 1848. a yet more revolutionary group which went so far as to acquire a printing press to publish illegal literature. As this time Dostoevski was in financial straits, being obliged to exist on meagre advances from his publisher, for he had renounced his claim to his father's estate for a lump sum that he spent as soon as he received it.

He was also suffering from violent nervous attacks, the first symptoms of epilepsy, though his epileptic fits only began two years later, and was writing his uncompleted novel "Netochka Nezvanova," the first two parts of which were published in *Otechestvennye zapiski* in Jan. and Feb. 1849. But all this did not stop his political activities. On April 1, 1849, he made a long speech at one of Petrashevski's Friday "at homes" demanding freedom from censorship, the abolition of serfdom and reform of the law-courts. On April 15 he read Belinski's posthumously circulated "Letter to Gogol," which the government had banned as "pernicious." On April 23, at 5 A.M. he was arrested and incarcerated in the Aleksis Ravelin of the Peter and Paul fortress, where, incidentally, he wrote "Malenki geroi" ("A Little Hero"), an amazingly serene story, considering the circumstances, and unpublished until 1857.

At his interrogation Dostoevski conducted himself with singular courage, trying to exonerate the other members of the Petrashevski group and reaffirming his own views on the need to free the serfs, abolish the censorship and relax the laws governing the free discussion of political events. In fact he showed no signs of believing in meek submission to the will of the authorities, the principle he propagated with such militant fervour toward the end of his life.

The Convict.—The trial of the Petrashevski group began on Sept. 30, 1849, and ended on Nov. 16. Dostoevski, whom the authorities considered "the most important" of the accused, was found guilty by the military court and sentenced to death. The death sentence, however, was reduced by the prosecutor-general to eight years' hard labour and by the emperor himself to four years' hard labour to be followed by service in the army as a private. Neither Dostoevski nor his fellow-prisoners were informed of their reprieve. On the morning of Dec. 22, 1849, they were taken to their place of execution, the Semenovski parade-ground, and only after all the preliminaries of the execution had been carried out was their reprieve read out to them. Twenty-four years later, after Dostoevski had become one of the most fanatic supporters of the autocratic regime of the tsar, he recalled with pride the scene on the Semenovski parade-ground. "We members of the Petrashevski group," he wrote, "stood on the scaffold and listened to our death-sentences without any feeling of repentance. The majority of us would at that moment have deemed it dishonourable to renounce our convictions . . . for we

considered the cause for which we had been sentenced, the ideas which had held sway over our minds, not only as requiring no repentance but . . . as a martyrdom for which a lot would be forgiven us."

On the night of Dec. 24, 1849, Dostoevski, with two other condemned men, was put in chains and sent off to Siberia. He arrived at the Omsk convict prison on Jan. 23, 1850. He was transferred on March 2, 1854, to Semipalatinsk, where he was to serve as a private in the 7th Siberian line regiment. In Semipalatinsk he was permitted to live in his own rooms and it was there that he was befriended by Baron Wrangel, a young official who was the local public prosecutor. It was in Semipalatinsk, too, that Dostoevski met and fell violently in love with Marya Dmitrievna Isaeva, wife of a low-grade civil servant and mother of a boy of nine. After her husband's death, Marya, who was herself in love with a young impecunious schoolmaster, at last agreed to marry Dostoevski for her son's sake. Their marriage (a disastrous mistake, as was to be expected) took place on Feb. 6, 1857. By that time Dostoevski had regained commissioned rank and a year later he resigned from the army on a plea of illness, his epileptic attacks making it impossible for him to carry out his duties. He had resumed his literary work as soon as he left prison and by the time he left Siberia on July 2, 1858, he had written two stories: *Dyadyuslzkin son* (Eng. trans. *Uncle's Dream,* 1958) and *Selo Stepanichkovo i ego obitateli* (Eng. trans. *The Friend of the Family,* 1887), the first an innocuous farce describing the goings-on in a Siberian provincial town with just a reminiscence of his unhappy heroes of the past in the person of a poor consumptive schoolmaster in love with a beautiful society girl and the second a much more virile satire on a sanctimonious rogue lording it over the household of a weak-willed, though morally and spiritually admirable landowner, Dostoevski's first sketch of "the perfect man" that was ten years later to be more satisfactorily embodied in Prince Myshkin, the hero of *The Idiot.*

Return to St. Petersburg. Major Works.--On his return to St. Petersburg in Dec. 1859, Dostoevski was no longer a believer in the ideas of his Petrashevski period, but neither had he become the violent militant reactionary of the 1870s. In the statement outlining the policy of the monthly periodical *Vremya* ("Time"), which he published with the help of his brother Mikhail in 1861, he merely pointed out that "being an entirely separate national entity." the aims of the Russians should be "to create a new form [of political life] . . . deriving from the Russian soil and the spirit of the Russian people." "The Russian idea," he declared, anticipating some of his later beliefs, "might in time become the synthesis of all the ideas Europe has been developing with such courage and pertinacity among her different nationalities." Nor had his religious ideas as yet taken the extreme form that provoked Turgenev to declare that Dostoevski was "the most malignant Christian" he had ever met. On the contrary, writing from Semipalatinsk in 1854 to a woman correspondent, he confessed that he was "a child of my age, a child of unbelief and doubt. and I remain to this very day and [I know that] I shall remain so to my very grave." -"You cannot imagine," he went on, "the terrible torment the desire to believe has caused and still causes me, for it is a desire that grows all the stronger in my heart the more arguments I have against it." He still harped on his religious doubts ten years later. "The main question that will be dealt with in all the parts [of the proposed novel 'Zhitie velikogo greshnika'—'The Life of a Great Sinner']," he wrote to the poet Appolon Maikov, "will be the same as those which consciously and unconsciously tormented me all my life—the existence of God." It is a question that also torments the heroes of his great novels who, like himself, have the worm of doubt buried in their breasts.

In the 20 years between his return to St. Petersburg and his death in 1881 Dostoevski wrote six long novels: *Unizhennye i oskorblënnye* (1861; Eng. trans. *The Insulted and the Injured), Prestuplenie i nakazanie* (1866; Eng. trans. *Crime and Punishment,* 1911, also 1951), *Idiot* (1868–69; Eng. trans. *The Idiot,* 1914 and 1953, also 1955), *Besy* (1871–72; Eng. trans. *The Possessed,* 1931, and *The Devils,* 1953), *Podrostok* (1874–75; Eng. trans. *A Raw Youth)* and *Bratya Karamazovy* (1879–80; Eng. trans. *The Brothers Karamazov).* Of these *The Insulted and the Injured* belongs to his minor creations, but is full of interesting autobiographical features, such as his own unhappy love for his first wife, Marya, his ambivalent attitude toward his rival, his first literary triumphs and failures and his dislike of the nobility, which had become sharpened by his experiences in prison where he had first realized how deep was the hatred of the common people for the nobleman. *Crime and Punishment* put him in the forefront of Russian writers. It is his first great novel on the theme of redemption through suffering. *The Idiot,* one of his most powerful and perceptive novels, was on its publication practically ignored by the Russian critics, chiefly, no doubt, because at that time of political ferment it dealt with a subject of universal rather than topical significance—the place of the righteous man in society. *The Devils,* on the other hand, provoked a storm of comment just because it was a political pamphlet in the shape of a novel that dealt with a political murder that had taken place a short while before and with the political ideas that were convulsing Russian public opinion. *A Raw Youth* also got a cool reception. It is, in fact, the least successful of Dostoevski's long novels, perhaps because he felt a little constrained in writing it, since he intended it as a peace offering to the poet and publisher Nikolai Nekrasov, an old "enemy" from the days of Belinski. in whose radical monthly *Sovremennik* ("The Contemporary") it was published. Quite different was the reception of *The Brothers Karamazov,* undoubtedly his greatest novel, in which he achieves a profundity of thought that surpasses anything written in his or, indeed, any time since. Published at a time when Dostoevski's fame had reached its zenith in Russia, it was recognized at once as the greatest achievement of his genius.

Other Works.--Of Dostoevski's other novels *Zapiski iz podpolya* (1864; Eng. trans. *Letters From the Underworld,* 1913 and 1953) was written after his first journey abroad, which had brought him face to face with the less pleasing aspects of the industrial revolution in London and of the bourgeois régime of Napoleon III in Paris, aspects which he analyzed with a brilliance that proved him to be one of the most profound thinkers of his age. His second short novel, *Igrok* (1866; Eng. trans. *The Gambler,* 1915 and 1956), was finished in one month so as to frustrate the plot of a dishonest publisher to possess himself of the copyright of all his works unless he submitted a new novel by a certain date. Though for that reason alone one of his weakest novels, it contains highly revealing autobiographical matter, such as his passion for gambling and his even greater passion for Polina Suslova, the young student who became his mistress in 1862 but threw him over for a young Spaniard in Paris and who was the prototype of his proud and independent heroines, particularly Nastasya Filippovna in *The Idiot.* Of a much more subtle autobiographical significance is Dostoevski's third short novel, *Vechny muzh* (1870; Eng. trans. *The Eternal Husband,* 1888), a study of jealousy and masochism in which he again returns to one of the main themes of *The Idiot,* namely the impossibility of finding an adequate solution of the "eternal" problems of human relationships, since they do not conform to the established laws and conventions of social behaviour but depend on psychological factors beyond the control of reason. This also forms the main theme of Dostoevski's most powerful short stories, "Krotkaya" (1876; Eng. trans. *A Gentle Creature,* 1950), a penetrating study of the suicide of a young married woman, and "Son smeshnogo cheloveka" (1877; Eng. trans. "The Dream of a Ridiculous Man," 1945, 1950), a space-fiction story of the inhabitants of some remote planet beyond the solar system who are corrupted by a man who arrives from the earth and in whose heart the seeds of evil are too deeply sown for him to be converted by a society that lives in the golden age and knows no evil. Mention should also be made of two important nonfictional works Dostoevski wrote in 1862 and 1863: *Zapiski iz mertvogo doma* (Eng. trans. *The House of the Dead,* 1911), his remarkable reminiscences of prison life, and *Zimnie zametki o letnikh vpechatleniyakh* (Eng. trans. *Summer Impressions,* 1955), which describes his first journey abroad.

That Dostoevski was, of course, a fully "committed" writer,

is best proved by his work for the three monthly periodicals he wrote for and edited: *Vremya* (1861–63), banned by the authorities because of a rather lukewarm article on Russo-Polish relations published during the Polish insurrection, *Epokha* ("Epoch," 1864–65), which foundered on the death of his elder brother Mikhail, who looked after the circulation and the financial side of the paper, and finally *Dnecnik pisatelya* (1876–80; Eng. trans. *The Diary of a Writer,* 1949), in which Dostoevski recorded his own thoughts and ideas on current affairs and conducted political warfare against the Russian liberals and revolutionaries and in which he also occasionally published his short stories.

Second Marriage. Last Years.—Three years after the death of his first wife (in 1864) Dostoevski married (on Feb. 15, 1867) Anna Snitkina, the young stenographer he had engaged when he had to write *The Gambler.* Soon after he was forced to flee from his creditors and he and his wife stayed in Germany, Switzerland and Italy (from April 1867 to July 1871). During this time two daughters were born: Sofya in March 1868 (she died two months later) and Lyubov in Sept. 1869. It was due to his wife's good management that on their return his financial affairs improved, his debts were settled and he was even able to buy a house in the watering place of Staraya Russa. where his family spent the summers. Because of his deteriorating health, he himself spent most of the summers be'tween 1874 and 1880 at the German spa of Ems. In Russia two more children were born: his first son Fëdor in July 1871 and his second, Aleksei, in Aug. 1875. Aleksei, of whom Dostoevski was deeply fond, died at the age of three of an epileptic fit.

The last years of Dostoevski's life were years of growing revolutionary agitation in Russia, culminating in two attempts on the life of Alexander II, numerous attempts on the lives of high officials of state and the murder of a student in Moscow by the young terrorist Nechaev, which formed the main subject of *The Devils.* It was not till 1872, however, that Dostoevski went over openly to the conservative camp by accepting the editorship of the reactionary weekly *Grazhdanin* ("The Citizen"). In his own monthly *Dnevnik pisatelya,* four years later, his conservative views took a definite chauvinistic tinge with his passionate advocacy of the belief that it was the destiny of Russia "to reconcile the European contradictions" by uniting the European nations under her aegis. This belief he reaffirmed in his famous speech on June 8, 1880, on the occasion of the unveiling of the Pushkin memorial in Moscow. In his view Russia and the Orthodox Church were alone destined to lead the nations of Europe and, indeed, the world, into the paths of righteousness. As for the problem of evil in general, "It is clear," he wrote in *Dnevnik pisatelya,* "that evil is buried more deeply in humanity than the cure-all socialists think, that evil cannot be avoided in any organization of society, that a man's soul will remain the same, that it is from a man's soul alone that abnormality and sin arise, and that, finally, the laws that govern man's spirit are still so unknown, so uncertain and so mysterious that there are not and cannot be any physicians or even judges to give a definitive cure or decision, but that there is only He who says, Vengeance is mine, I will repay." This, in fact, is the creed that inspired all Dostoevski's great novels.

Dostoevski died in St. Petersburg on Feb. 9, (N.S.; O.S. Jan. 28), 1881.

BIBLIOGRAPHY.—There are many editions of Dostoevski's collected works in Russian, including one in 10 vol. *(1956–58).*

Nearly all the novels and stories were translated into English, notably by Constance Garnett (*The Novels of Fyodor Dostoevsky,* 12 vol., *1912–20)* and by David Magarshack (various translations mentioned in the article above and dated after 1950). Two works not mentioned are *Pages From the Journal of an Author (i.e., Dnevnik pisatelva),* trans. by S. S. Koteliansky and J. Middleton Murry (1916) and *Stavrogin's Confession,* trans. by S. S. Koteliansky and Virginia Woolf *(1922,* re-issued with a study of Dostoevski by Sigmund Freud, *1949). See* also *Letters of Fyodor M. Dostoevsky to His Family and Friends,* trans. by E. C. Mayne *(1914,* 2nd ed. *1917); Dostoevsky: Letters and Renziniscences,* trans. by *S.* S. Koteliansky and J. Middleton Murry *(1923);* A. G. Dostoevskaya, *Dostoyevsky Portrayed by His Wife,* trans. by S. S. DOTHAN, a city in the extreme southeastern part of Alabama, U.S., seat of Houston county, is about 95 mi. S.E. of Montgomery. It is primarily a farm trade centre of the wire-grass region, with small diversified industries producing cigars, toys, hosiery, garments, farm implements, fertilizers, lumber products and oils from cottonseed and peanuts. During the mid-19th century longleaf pine timber attracted settlers to the region and they soon discovered the excellence of the soil for diversified agriculture.

Originally settled as Poplar Head, the name was changed to Dothen and renamed Dothan for the place quoted in the Bible (Gen. xxxvii, 17) at the suggestion of a Methodist preacher, J. Z. S. Connelly. Incorporated in 1885 with a population under 200, it grew steadily after the coming of the first railroad in 1889. A branch of the University of Alabama is located there and a trade school is operated at nearby Napier field.

For comparative population figures *see* table in ALABAMA: *Population.* (H. WE.)

DOU, GERARD (GERRIT DOW or DOUW) (1613–1675), Dutch painter, who was a pupil of Rembrandt and later headed the school of Leiden, was born at Leiden on April 7, 1613 His first training was in the workshop of his father, a glazier, and subsequently with the engraver Bartholomeus Dolendo and the glass-painter Pieter Couwenhorn. He studied with Rembrandt from Feb. 1628 until 1631, and in his early style the influence of Rembrandt is everywhere apparent—in the thick impasto, the draftsmanship, the subject matter and the treatment of light and shadow. After Rembrandt left Leiden for Amsterdam in 1631, his influence on Dou gradually weakened, and Dou began to evolve a personal manner. He continued to paint on wood, and on a small scale, but the portraits and studies of heads of his Rembrandtesque phase gave way to a predominance of domestic genre subjects, rich in accessory details. His technique became at once freer and smoother, with an enamellike surface that is comparable. among his contemporaries, only to certain of the painters of still life. Still life, indeed, plays an important role in Dou's work: for example his kitchen scenes are often crowded with vegetables, poultry and utensils. His most characteristic device is the painted "frame within the frame"—the grayish stone window which enhances the jewellike effect of the scene it contains. After 1650 he painted many candlelight subjects. Among the most accomplished works in this genre, they belong to the widespread type that included, earlier in the century, the work of the Utrecht school and of Georges de la Tour. Dou's laborious and glossy style becomes, in the hands of his numerous followers, an empty and tedious accomplishment, but in his own best works there is evidence of taste and character which assures him a place among the Dutch masters. He was buried in Leiden on Feb. 9, 1675. Among his most important pupils was Frans van Mieris the elder.

(R. E. W. J.; X.)

DOUAI, a town of northern France in the *département* of Nord. is situated in flat country on the Scarpe river, which flows north through the centre of the town, 38 km. (24 mi.) by road south of Lille. Pop. (1954) 41,649. Although severely damaged in World Wars I and II and largely rebuilt, Douai still has many buildings dating from the 16th–18th centuries. Boulevards and gardens mark the site of the old fortifications, but the Porte de Valenciennes, the Porte d'Arras, and the Tour des Dames (14th and 15th centuries) survive. There are many wide boulevards flanked by high buildings—in strong contrast to the surviving medieval streets. The Hôtel de Ville (partly 15th century), east of the river, has a lofty belfry with a new carillon of 49 bells. Farther east is the church of Notre Dame (12th and 14th centuries and badly damaged in 1944). Its splendid early 16th-century altarpiece of wooden panels painted by Jean Bellegambe (1470–1534) of Douai is now with the rest of the polyptych of Anchim abbey in the museum. There, too, are Gallo-Roman artifacts,

Flemish and Dutch pictures and other works of art. After 1958 the museum was housed in a Carthusian monastery of the 16th and 18th centuries. The Palais de Justice on the river bank was formerly the town house of the abbey of Marchiennes. In July a procession takes place in which the images of the legendary giant Gayant, his wife and children are borne through the town. Douai is the coal mining centre of the north of France; chemical products. railway equipment. springs: mining equipment, glass. wire and electricity are made; there are iron and engineering works and cotton spinning. Cereals, potatoes, and sugar beet are the chief agricultural products of the region.

Douai, the site of which was occupied by a castle (Castrum Duacense) as early as the 7th century, belonged in the middle ages to the counts of Flanders, passed by marriage to the dukes of Burgundy in 1384, to Austria in 1477 and to Spain on the accession of Philip II in 1556. Captured by Louis XIV of France in 1667, it was ceded to France by the treaty of Aix-la-Chapelle the following year. Douai was important as the centre of the political and religious propaganda of exiled English Roman Catholics. In 1562 Philip II of Spain founded a university there in which several English scholars were given chairs, and in connection with this William Allen (*q.v.*), in 1568, founded the celebrated English college, where the Douai Bible was prepared. The college moved to Rheims in 1578 and returned to Douai in 1593; it had trained more than 300 priests before the end of the 16th century. There were also an Irish and a Scots college, and houses of English Benedictines and Franciscans. All these survived until 1793 when the university was suppressed. In 1819 the English Benedictine college was reestablished and survived until 1905. The modern university was moved to Lille in 1887. In World War I Douai was in German hands from Oct. 1914 to Oct. 1918, and in World War II from May 1940 to Sept. 1944.

DOUBLEDAY, FRANK NELSON (1862–1934), U.S. publisher, was born at Brooklyn, N.Y., on Jan. 8, 1862. He was educated at the Polytechnic Institute of Brooklyn and at the age of 15 was employed by Charles Scribner's Sons. He became manager of *Scribner's Magazine* when it was started in 1886. In 1897, with S. S. McClure, he formed a new publishing business, which later became Doubleday, Page & Co. when Walter Hines Page joined it in 1900. Doubleday built Country Life Press at Garden City. N.Y., in 1910 and established a chain of more than 30 book shops. In 1927, Doubleday, Page & Co. absorbed George H. Doran Company and was known as Doubleday, Doran until 1946, and thereafter as Doubleday & Co. Rudyard Kipling gave Doubleday the nickname of "Effendi." Other Doubleday authors were Conrad, O. Henry, Tarkington. Ferber, Selma Lagerlöf and William McFee. Under the pseudonym Charles T. Whitefield, Doubleday wrote *A Plain American in England* (1910). He died at Coconut Grove. Fla.. on Jan. 30. 1934. (A. M. RU.)

DOUBLE ENTRY: *see* BOOKKEEPING.

DOUBLE JEOPARDY, a common law and constitutional protection against the use, by the state, of certain multiple forms of prosecution. The term applies to a number of significantly different situations. It prevents the state from convicting a person twice for the same crime based upon the same conduct. If a person robs a bank, he cannot twice be convicted of robbery for the same offense. Nor can he be convicted of two different crimes based upon the same conduct unless the two crimes are defined so as to prohibit conduct of significantly different kinds. Thus a person cannot be convicted of both murder and manslaughter for the same killing, but he can be convicted of both murder and robbery if the killing arose out of the robbery.

The defense of double jeopardy also prevents the state from subjecting a person to a second trial for the same crime after that person has been acquitted of that crime. Nor can the state voluntarily dismiss a case after trial has begun in order to start over again.

There is variation in the law relating to whether a conviction, acquittal or prior trial in one state bars a subsequent prosecution in another state. But it would appear that prior trial in a state or federal court mill not limit the power of the other to try the defendant for the same offense.

See CRIMINAL LAW: *Criminal Procedure: Double Jeopardy.*
(F. J. R.)

DOUBLE LIABILITY: *see* LIABILITY.

DOUBLE STAR: *see* BINARY SYSTEM; STAR.

DOUBLE-STOPPING, the playing of two or more notes simultaneously on a string instrument of the violin family. When the notes are "stopped" by the left hand on two adjacent strings, only a single movement of the bow is necessary, but if more than two notes are "stopped," the player is often obliged to "spread" the notes, producing an arpeggio effect. Double-stopping was notably used in J. S. Bach's unaccompanied violin sonatas and in the 19th-century virtuoso violin music of Niccolo Paganini.

DOUBS, a frontier *département* of eastern France, formed in 1790 from part of Franche-Comté and the principality of Montbéliard (*qq.v.*). It is bounded east and southeast by Switzerland. north by Belfort and Haute-Saône, west and southwest by Jura. Pop. (1954) 327,157. Area 3,269 sq.km. (2,031 sq.mi.). The northwest of the *département* is part of the fertile lowland corridor that leads from the Rhône-Saône valley to the Rhine through the Gate of Burgundy. It is drained southwest to the Saône river by the Doubs and Ognon, following parallel courses. To the southeast the scarp edge of the Jura plateau rises sharply from this plain to occupy the southeastern part of the *département* to the Swiss frontier, where the Mont d'Or reaches 4,806 ft. It is deeply trenched by the Doubs river and its tributaries. with zigzagging courses and picturesque gorges and waterfalls. The scenery in the upper valley of the Doubs is especially fine. The convent of Notre Dame de la Consolation has a magnificent site. and farther upstream Morteau is a summer resort near a fine gorge section with a 90 ft. waterfall (Saute de Doubs).

Much of the drainage of the porous limestone plateau is underground, and the peculiar features of limestone scenery. such as swallow holes and intermittent streams. are in evidence. A once-heavy cover of forest has been extensively cleared for farmland. The winters on the plateau are long and severe and the precipitation is heavy. The emphasis is upon pastoral farming, especially dairying, and large quantities of Gruyère cheese are made at co-operative dairies (*fruitières*). Survivals of old metalworking industries are found in some of the valley market towns and watchmaking, introduced from Switzerland in the 18th century, employs large numbers in the *département*. Besançon is the chief centre of this widespread activity and also has important rayon manufactures. Montbéliard and the industrial town of Audincourt nearby have become great engineering centres, with the Peugeot works, and Montbéliard also has textile factories. The Rhône-Rhine canal, following the Doubs valley, traverses the *département* for 135 km. (84 mi.) of its length. Apart from the important route approaching Belfort and the Rhineland by way of Besançon and Montbéliard in the Doubs valley, the railway from Dijon to Neuchâtel in Switzerland crosses the south of the *département* by Pontarlier, which commands the gap by which the Doubs emerges from the high Jura mountains onto the plateau. It is a tourist and winter sports centre. Nearby are the remains of the Augustine abbey of Montbenoît.

Besançon (*q.v.*), former capital of Franche-Comté, is the prefecture of the *département*. It is a cathedral and university city, the headquarters of an archbishopric and an *académie* (educational division) and has a court of appeal. The *département* is divided into three *arrondissements,* centred upon Besançon, Montbéliard and Pontarlier. (AR. E. S.)

DOUBS RIVER, in eastern France, rises in the Jura at the foot of the Noirmont ridge, at a height of over 3,000 ft., and flows into the Saône. It is 267 mi. long, but, because it doubles back upon itself, the distance from source to mouth in a direct line is only 56 mi. Its basin has an area, of 3,022 sq.mi. The river begins by flowing northeast. traversing the Lake of St. Point and passing Pontarlier. Thenceforth its course lies chiefly through wooded

limestone gorges of great grandeur. After skirting the town of Morteau, below which it expands into the Lake of Chaillexon and descends over the Fall of the Doubs (88 ft.), the river for about 28 mi. forms the frontier between France and Switzerland. It flows in the latter country for some distance and then turns abruptly westward. Thus far the Doubs has been flowing between the ranges of the Jura, but when it comes against the shattered southern face of the old block of the Vosges its course is rapidly altered. After turning westward it finds its way through this complicated country by turning north, and finally, at Voujeaucourt, southwest. Below that town the river is joined by the canal from the Rhône to the Rhine, to accommodate which its course was canalized as far as Dôle. The Doubs passes Clerval and Baume-les-Dames to Besançon. The lower section of its course is in the great structural depression between the Côte d'Or and the Jura. After passing Dôle it leaves the high ground and enters the plain of the Saône. There it receives the waters of the Loue, which also has a complicated course, finding its way, like the Doubs, between the outer folds of the Jura—sometimes parallel with them and sometimes cutting across them, and finally falling into the great structural depression with the lower Doubs and Saône. The Doubs reaches the Saône at Verdun-sur-le-Doubs. The river is navigable for only about 8 mi. above its mouth.

(AR. E. S.; X.)

DOUGHBOY, in the 17th century, signified "dumpling." During the American Civil War it was applied to the brass buttons on uniforms and thence to infantrymen. At a period not exactly ascertained, the word was supposed to come from the doughlike appearance of a uniform soiled by moistened pipe clay. Again, infantrymen were said to march in "dough" during wet weather. "Adobe" furnishes a similar derivation, although it may be a popular etymology or wholesale transference of a foreign word to an English meaning and spelling. "Doughboys" was a favourite designation for United States soldiers during World War I.

DOUGHERTY, PAUL (1877–1947), U.S. painter of marine subjects, was born at Brooklyn, N.Y., on Sept. 6, 1877. He studied law, but upon graduating in 1898 went to Europe for five years to study art.

He won many prizes. and among his more important pictures are "October Seas." "The Road to Cayey" and "Lake Louise." in the Metropolitan museum. New York city; "The Land and the Sea," in the Corcoran gallery, Washington, D.C.; and "Sun and Storm." in the National gallery. Washington. He died on Jan. 9, 1947, at Palm Springs, Calif. He was a brother of the actor Walter Hampden. (D. H. W.)

DOUGHTY, CHARLES MONTAGU (1843–1926), English writer and the greatest of all Arabian travelers, was the younger son of the Rev. C. M. Doughty of Theberton hall, Suffolk. He was born on Aug. 19, 1843, and was educated at London and Cambridge universities. He indulged his taste for scholarly pursuits while traveling widely in Europe and the Levant. From Damascus in 1876 he began the wanderings in Arabia that made him famous. Marching with the Mecca pilgrims in the *hajj* caravan *(see* MECCA) as far as Madâin Sâlih, where he studied its Nabatean monuments and inscriptions which he later published, he spent two years in Arabia. He visited Khaibar, Taima, Hail, Buraida and Anaiza, whence he traveled with the butter caravan of 1878 to Taif and Jidda. His *Travels in Arabia Deserta* appeared in 1888, but won little recognition at the time, though it came to be regarded as one of the great literary epics of travel. Concerned more with producing, out of his unique experience, a monument of what he considered pure English prose than with recording information, Doughty attempted direct Elizabethan style and rejected all later growths in syntax and vocabulary. Although irksome to some, his majestic style conveys the feeling of his remote and lonely adventuring. Doughty himself attached more importance to his epic poetry, to which he devoted the rest of his life. In general it is too rough, but it contains passages of sublime poetic inspiration. His epics and poetic dramas included *The Dawn in Britain,* 6 vol. (1906), *Adam Cast Forth* (1908), *The Cliffs* (1909), *The Clouds* (1912), *The Titans* (1916) and *Mansoul* (1920). Doughty died at Sissinghurst, Kent, on Jan. 20, 1926.

See D. G. Hogarth, *The Life* of *Charles M. Doughty (1929).*

(H. ST. J. B. P.)

DOUGLAS, the name of a Scottish noble family, of which the duke of Hamilton, marquess of Douglas, is now heir male, while the unentailed estates have passed to the earls of Home (Douglas-Home), and of which the other two most notable bearers are the marquesses of Queensberry and the earls of Morton. The marquessate of Douglas and the earldom of Angus, the historic titles held by the two chief branches of the family, the Black and the Red Douglas, are merged in the Hamilton dignities. The name (Gaelic *dubh glas,* "dark water") comes from Douglasdale, the home of the family in Lanarkshire, still in the possession of the earls of Home. The first chief of whom anything certain is known was WILLIAM DE DOUGLAS or Dufglas (d. c. 1214), whose name frequently appears on charters from 1173. His elder son ARCHIBALD (d. c. 1240) inherited his estates, while the second son BRICE (d. 1222) became bishop of Moray.

Archibald's son was WILLIAM (*c.* 1200–C. 1272), called "Long Leg." His son SIR WILLIAM (d. *c.* 1298), called "le Hardi," was the first member of the family formally to assume the title of lord of Douglas. He did homage to the English king Edward I (1291) but when John Balliol rebelled (1295) Sir William held Berwick castle against the English, surrendering it when they sacked the town (1296). After a short imprisonment he was restored to his Scottish but not to his English estates. He joined William Wallace's rising (1297) but submitted to the English almost immediately, and died in the Tower of London c. 1298.

His son, "the Good" SIR JAMES (c. 1286–1330), was educated in Paris and returned home to find an Englishman, Robert de Clifford, in possession of his estates. He joined Robert the Bruce, attending his coronation at Scone (March 1306) and sharing his wanderings in the Highlands after their defeat at the battle of Methven (June 1306). The following year they separated, Sir James returning to the south of Scotland, when he three times attacked his own castle at Douglas, finally destroying it. His assault made on Palm Sunday, March 19, 1307, is known as the "Douglas Larder." His many successful raids on the English won him the dreaded name of the "Black Douglas." Through the capture of Roxburgh castle (1313) by the stratagem of disguising his men as black oxen, he secured Teviotdale; and at the battle of Bannockburn (June 1314) he commanded the left wing with Walter the Steward. He invaded Yorkshire (1319) with Thomas Randolph, earl of Moray, defeating an army assembled by William de Melton, archbishop of York, at Myton-upon-Swale. Bruce rewarded him for his capture (1322) of the pass of Byland, Yorkshire, with the "Emerald Charter"; by this he and his heirs were granted "high justice" throughout the family estates, and were freed of all feudal dues except military service. Shortly before peace was finally concluded, he nearly captured Edward III in a daring night attack on the English camp in Weardale (Aug. 1327). Before his death (1329) Bruce asked Sir James to carry his heart to the Holy Land in redemption of his unfulfilled crusading vow; Sir James set out (1330), bearing the embalmed heart in a silver casket, but he fell fighting against the Moors in Spain on Aug. 25, 1330. The Douglases have since borne a human heart in their coat of arms. SIR ARCHIBALD (*c.* 1297–1333), half-brother of Sir James, was appointed regent of Scotland (April 1333) and, with SIR WILLIAM (d. 1333), son of Sir James, was killed at the battle of Halidon Hill on July 19, 1333. The inheritance then passed to his brother HUGH (1294–c. 1347), a churchman, called "the Dull," who resigned his lands (1342) to David II for regrant to a series of named heirs.

WILLIAM (c. 1327–84), 1st earl of Douglas, the second but first surviving son of Sir Archibald, was educated in France and returned to Scotland in 1348. He killed his kinsman and godfather, SIR WILLIAM (*c.* 1300–53), the knight of Liddesdale, in Ettrick forest (1353) and acquired part of Liddesdale. His marriage (1357) with Margaret, sister and heiress of Thomas, 9th earl of Mar, brought him the estates and earldom of Mar (1374), and he was created earl of Douglas in Jan. 1358. He joined David II in proposing a treaty (1363–64) with England, which would substitute for Robert the Stewart (afterward Robert II) an English

prince as heir to the Scottish throne; David was seeking a remission of his ransom, William the return of his family's English estates. On the accession (1371) of Robert II he was nevertheless reconciled and was appointed warden of the marches. He died at Douglas in May 1384. By his wife's sister-in-law, blargaret Stewart, countess of Angus in her own right and widow of the 9th earl of Mar. he had a son, GEORGE (c. 1378–c. 1402), afterward 1st earl of Angus.

JAMES (c. 1358–1388), 2nd earl of Douglas and Mar, son of the 1st earl, married (1371 or 1373) Isabel, daughter of Robert II. He invaded England (1388), besieged Newcastle for three days, and captured the pennon of Sir Henry Percy (Hotspur) in single combat. Percy sought revenge in the battle of Otterburn (Aug. 1388), celebrated in English ballad as "Chevy Chase." The Scots were victorious, and Percy and his brother were captured; but James was killed. He left no legitimate male issue, but his natural sons WILLIAM (d. c. 1421) and ARCHIBALD (c. 1297–1333) founded the families of Douglas of Drumlanrig (see QUEENSBERRY. EARLS, MARQUESSES AND DUKES OF) and Douglas of Cavers. His sister Isabel (d. 1408) became countess of Mar, inheriting the lands of Mar and his unentailed estates.

The earldom and entailed estates of Douglas reverted by the patent of May 1342 to ARCHIBALD (c. 1325–*c.* 1400) 3rd earl of Douglas, called "the Grim," an illegitimate son of the "Good" Sir James. He became warden of the west marches (1368) and lord of Galloway (1369), and increased his estates by marriage (1362) with Joan. widow of Sir Thomas Moray, lord of Bothwell, and by purchasing the earldom of Wigtown (1372). He was twice sent on missions to the French court (1369, 1371). His daughter MARJORY (d. c. 1420) married (Feb. 1400) David, duke of Rothesay (d. 1402), Ring Robert III's son and heir, while his illegitimate son, SIR WILLIAM DOUGLAS of Nithisdale (d. 1392) married (c. 1387) Egidia, daughter of Robert II. Archibald died at Threave, near Douglas, probably on Christmas eve, 1400.

Xrchibald the Grim was succeeded by his eldest son, ARCHIBALD (c. 1370–1424), the 4th earl, who married (1390) blargaret, eldest daughter of John, earl of Carrick (afterward King Robert III). As master of Douglas (1400) he defeated, near Preston, Percy and George Dunbar, earl of March, who had joined the English, disappointed at his failure to marry his daughter to the duke of Rothesay. Douglas acquired the lands which March thus forfeited; when the rest were restored (1409) he retained the lordship of Annandale. Archibald was, with the regent, Robert, duke of Albany, suspected of compassing Rothesay's death (March 1402) while he was in their custody at Falkland; but both were declared guiltless by parliament. In a raid upon England Archibald was captured by Percy at the battle of Hamildon Hill (Sept. 1402); he fought with his captors against Henry IV at the battle of Shrewsbury (1403) and was taken prisoner by the king. He was allowed to visit Scotland several times after 1405, negotiating between the Scots and English for the release of the Scots king James I, who had been captured by the English (1406) while sailing to France. Archibald was finally freed in 1413. He commanded a contingent of 10,000 Scots sent to help the French king Charles VII against the English; he was made lieutenant-general of the French army and received the peerage-duchy of Touraine with remainder to his heirs male. He was killed fighting against John, duke of Bedford, at the battle of Verneuil on Aug. 17, 1424, and was buried in Tours cathedral.

ARCHIBALD (c. 1390–1439), 5th earl of Douglas, succeeded to his father's honours but never got the revenues of Touraine. He fought against the English in France, taking part in their defeat at the battle of Bauge (March 1421), and shortly afterward mas created comte de Longueville by Charles VII. He was a regent (1437) for the young king James II, and as lieutenant-genera1 of Scotland summoned a parliament (1438). He died of fever at Restalrig on June 26, 1439. The lordship of Bothwell, acquired by Xrchibald, the 3rd earl, was settled on his widow Eupheme, countess of Stratherne in her own right; at her death (1468) it reverted to the crown.

Archibald's two sons, WILLIAM (c. 1424–1440), the 6th earl, and DAVID, though little more than boys, defied the government, were tried for high treason and beheaded in Edinburgh castle in the young king's presence, on Nov. 24, 1440. This judicial murder broke up the dangerous power wielded by the Douglases. The lordship of Annandale fell to the crown and Galloway to their sister MARGARET, the "Fair Maid of Galloway." Despite the attainder, the Douglas lands passed to their great-uncle. JAMES (1371–1443), 7th earl of Douglas. called "the Gross," of Balveny, who was the 2nd son of Archibald, the 3rd earl. Lord of Abercorn and Aberdour, he was created earl of Avondale (1437). He made no attempt to avenge his kinsmen and died in March 1443.

His son WILLIAM (c. 1425–1452), 8th earl, restored the power of the Black Douglases. By his marriage with his cousin, the Fair Maid of Galloway (1444) he regained Galloway and Wigtown, and was granted Bothwell by James II with whom he at first stood in high favour. But c. 1450 he joined Alexander Lindsay, earl of Cram-ford: in an alliance against the court party. He was summoned to Stirling castle and, in breach of safe conduct, was stabbed to death by the king himself on Feb. 22. 1452.

JAMES (1426–1491), the 9th and last earl, at first attempted to avenge his brother's murder but, deserted by his allies, mas obliged to submit to the king (Aug. 1452). To keep the family estates together, he obtained a dispensation to marry his brother's widow. He openly accused the king of the murder (1454) and led 40.000 men against him. Meanwhile another branch of the family, known as the Red Douglas, had risen to importance (see ANGUS, EARLS OF), and GEORGE (d. c. 1462), great-grandson of the 1st earl of Douglas, supported the king against his chief. James, again deserted by his allies, fled to England; he was attainted (June 1455) and his wife divorced him: The lordship of Douglas was granted to the earl of Angus. James. who had long intrigued with the Yorkist faction in England, was favoured by Edward IV who sent him (1461) to make a treaty with John, earl of Ross and lord of the Isles. against the Scottish king who had given asylum to the fugitive English king Henry VI. He was captured while raiding southern Scotland (1484) and relegated to Lindores abbey, Fife, where he died in May 1491.

Other sons of the 7th earl were ARCHIBALD (d. 1455), who became earl of Moray through his marriage with Elizabeth Dunbar, coheiress of James, earl of Moray (d. 1429), HUGH (d. 1455), created earl of Ormond (1445), JOHN (d. 1463) lord of Balveny and HENRY who took orders. Moray. Ormond and Balveny were defeated by the earl of Angus at Arkinholm on the river Esk (1455); Moray was killed, Ormond captured and executed: while Balveny fled to England, whence he returned to capture and execution c. July 1463.

WILLIAM (1589–1660), 11th earl of Angus, was created marquess of Douglas by Charles I (1633). In the Civil War he joined (1644) James Graham, marquess of Montrose, and although he escaped after the battle of Philiphaugh (Sept. 1645), he was captured soon afterward and imprisoned in Edinburgh castle (1646–47). He died on Feb. 19, 1660. His eldest son ARCHIBALD (c. 1609–55) predeceased him; another son. WILLIAM (1634–94), created earl of Selkirk (1646) married (1656) Anne (*c.* 1632–1716) duchess of Hamilton, and was created 3rd duke of Hamilton (1660). By failure of the elder branch (1761) the dukes of Hamilton (*q.v.*) became heirs male of the house of Douglas. GEORGE (c. 1636–1692), 5th son of the 1st marquess was created earl of Dumbarton (1675).

JAMES (1646–1700), 2nd marquess of Douglas, succeeded his grandfather. His eldest son, JAMES (1671–92), earl of Angus, raised the Angus regiment, known later as the Cameronians or 26th Foot, and was killed at its head in the battle of Steinkirk (Xug. 3, 1692). The younger son, ARCHIBALD (1694–1761), 3rd marquess, was created duke of Douglas (1703). He supported the government in the rising of 1715, fighting against James Edward, the Old Pretender, at the battle of Sheriffmuir (Nov. 13). When he died on July 21, 1761 the dukedom became extinct. The heir presumptive to the Douglas estates was his sister, LADY JANE DOUGLAS (1698–1753), who secretly married (1746) Colonel, afterward Sir John Stewart of Grandtully, by whom she had twin sons, alleged to be spurious, born in Paris in July 1748. When Lady Jane died, the duke refused to acknowledge the elder boy as his nephew; but

he revoked (1760) a will devising the estates to the Hamiltons. Thus this nephew, ARCHIBALD JAMES EDWARD DOUGLAS OF DOUGLAS (1748–1827), obtained the estates, after a house of lords decision against the Hamilton claim (1769); he was armorially invested as chief of the name (1771) and was created 1st baron Douglas of Douglas (July 1790). Archibald was succeeded as Baron Douglas by three of his sons; but as they left no male issue the Douglas estates passed (1857) to the earls of Home, Cospatrick Alexander. 11th earl of Home, having married (1832) a granddaughter of Archibald, 1st baron Douglas, Lucy Elizabeth, at whose death (1877) the Douglas chiefship became dormant.

BIBLIOGRAPHY.—D. Hume of Godscroft, *History of the Houses of Douglas and Angus*, legendary in some respects, 4th ed. (1748); Sir W. Fraser, *The Douglas Book (1885)*; Sir H. Maxwell, *History of the House of Douglas (1902)*. (T. I.)

DOUGLAS, DAVID (1798–1834), Scottish botanist, for whom the Douglas fir is named, was born at Scone, Perthshire. After being a gardener at the botanical gardens of Glasgow, he went to Oregon in 1823 as a collector to the Royal Horticultural society. In 1825 he went to British Columbia where he discovered many new plants, trees and birds, and in 1827 reached Hudson bay. From 1830 to 1834 he explored California and the Fraser river region. He died in the Sandwich Islands July 12, 1834. He introduced into Britain many trees. shrubs and plants.

DOUGLAS, GAVIN (1475?–1522), Scottish poet and bishop, the first British translator of the *Aeneid*, who also played a part in political events at a troubled period of Scottish history. Born *c.* 1475, he was the third son of Archibald "Bell-the-Cat," 5th earl of Angus. He studied at St. Andrews university and possibly in Paris. In 1496 he obtained a grant of the teinds (tithes) of Monymusk, Aberdeenshire, and two years later James IV promised him the parsonage of Glenquhom when it should fall vacant. He also obtained the parsonage of Lynton and the rectory of Haugh (Prestonkirk), East Lothian; and *c.* 1501 he became provost of the collegiate church of St. Giles, Edinburgh. The records testify to his energy and influence in ecclesiastical affairs, and the period of his provostship was also that of his literary activity.

The battle of Flodden (Sept. 1513) proved fatal to Douglas' career and reputation. In Aug. 1514 Margaret Tudor, James IV's queen widowed at Flodden. married Archibald, 6th earl of Angus, and Gavin Douglas' nephew. This marriage, regarded as in itself reprehensible, invested the powerful house of Douglas with almost royal dignity and identified it with the Anglophile party in Scotland. Gavin Douglas, who was close to the queen at least from the time of the disaster at Flodden, presumably favoured the match. Margaret, writing to Pope Leo X in June 1514 in the name of her infant son, nominated Douglas abbot of Aberbrothock as a man worthy of "the highest ecclesiastical authority, even the primacy," and "foremost in rank among the nobles of this kingdom, second to none in literature and morals." After her marriage she nominated him archbishop of St. Xndrews, but the archbishopric went to Andrew Forman, bishop of Moray and the pope's nominee, and Douglas lost more than he gained by the queen's favour.

The lords of the council deprived Margaret of the regency in Sept. 1514, summoned Angus before them on constitutional charges, and invited the duke of Albany, cousin of James IV, to return from France as governor of Scotland. In the eight months before Albany's return, a state of anarchy developed. The queen withdrew from Edinburgh to Stirling. Angus seized James Beaton, archbishop of Glasgow and chancellor, an opponent of the Douglas marriage, and set the great seal in the hands of Gavin Douglas. Henry VIII, whose overtures as protector and governor of Scotland were resisted by the lords of the council, tried secretly to persuade Margaret to take refuge in England with her children. Douglas played a part in these negotiations, with the promise of ecclesiastical advancement as a reward. The queen wrote to Adam Williamson, a Scottish priest acting in the English interest from London, that "there is nane that I may trust bot my husband and his uncle quhilk ar rycht glad thereto yf it mycht be."

In Jan. 1515 the queen nominated Douglas to the vacant see of Dunkeld, and the pope confirmed this in the following month, in the face of opposition from the earl of Athole, who had installed his brother Andrew Stewart in the bishop's palace. But before Douglas' consecration took place, Albany arrived in Scotland and assumed the regency. Douglas' use of foreign influence to obtain preferment aroused suspicion, and the interception of correspondence relating to the affair brought him to disaster. Albany laid the letters before the lords of the council, and Douglas was imprisoned in the castles of Edinburgh and later St. Andrews. The queen meanwhile retired to England. The pope intervened on Douglas' behalf; he was released in 1516 and ultimately consecrated bishop.

Douglas made his peace with Albany, and in May 1517 accompanied him to France on an embassy which brought about the treaty of Rouen. Albany stayed on in France, and the strife among the Scottish nobles rose to boiling point in a plot of the Hamiltons to seize the earl of Angus. Gavin Douglas unsuccessfully mediated between the two factions. Armed conflict broke out in the streets of Edinburgh in 1520—the celebrated brawl known as "Cleanse-the-Causeway"—and the Douglases triumphed. Gavin distinguished himself briefly by saving the life of the captured Archbishop Beaton, who was prominent in the Hamilton cause. Thereafter the behaviour of Angus, whose indifference and scandalous amours had estranged the queen, became more and more outrageous. Albany, with the encouragement of Margaret and supported by a strong French force, returned to Scotland in Nov. 1521; and Angus, with Gavin Douglas and others, was forced to flee into England. Douglas was deprived of his bishopric, and remained in exile in England until his death in the London plague in Sept. 1522. His closing years were lightened by the friendship of Polydore Vergil.

Douglas' literary activity belongs to the peaceful years 1501–13. In the *Testament and Complaynt of the Papyngo* (1530), David Lindsay refers to Douglas as author "abufe vulgare Poeitis prerogatyve" of "worthy workis in nowmer mo than fyve." He is credited with *aureas narrationes* by John Bale in his *Illustrium Majoris Britanniae Scriptorum Summarium* (1548), and with *De Rebus Scoticis, Comoedias aliquot* and a translation of Ovid's *Remedium Amoris* by Thomas Tanner *(Bibliotheca Britannico-Hibernica*, 1748). But only four works survive that are certainly or probably his: the poem *Conscience*, a punning conceit written in four seven-lined stanzas, The *Palice of Honour*, *King Hart* and the *Eneados*.

The Palice of Honour, to which Douglas refers at the end of his *Eneados*, was written in 1501. It is a dream allegory of more than 2,000 lines in a difficult nine-lined stanza with a ballade. On the theme "where does true honour lie," it is appropriately dedicated to James IV and reflects a higher theoretical virtue than Douglas was to exemplify in his career. The poet's dream describes the diverse ways to honour, in a series of processions and progresses—Sapience, Minerva, Diana, Venus and others, with their trains—and the palace of honour itself, founded on moral virtue. The appeal of the poem lies in harmonious rhetoric, rich imagery and description both of beauty and of horror. Its weaknesses are those of overabundant detail and an excess of fine language. This is the earliest Scottish poem to bear the marks of the new learning: the ancient world is seen not through medieval fable but through the eyes of the Greek and Latin authors.

King Hart was ascribed to Douglas in a later hand in the Maitland Folio manuscript (1580; in the Pepysian library, Cambridge). The poem is an allegory of over 900 lines in eight-lined stanzas, describing vigorously and graphically the youth of Hart (the human soul) in his "cumlie castell," his thralldom to Lady Plesaunce, the ultimate assaults of age, conscience and reason, and the death of King Hart. The morality is familiar enough; but it is set out in freshly imaginative detail and with a controlled power absent from *The Palice of Honour*. If it is not Douglas' work, there is no other Scottish poet of the period to whom it may reasonably be ascribed.

The XIII Bukes of the Eneados, Douglas' longest and last work, was the first direct translation of the whole *Aeneid* made in Britain. It includes a version of the 13th book added to Vergil by the 15th-century humanist Maffeo Vegio. and an original prologue

to each book. Douglas undertook his translation at the request of the sailor Henry, Lord Sinclair, "fader of bukes, protectour to sciens and lair," and in revulsion from "ane buke of Inglys gross" —the translation (1490) from French by William Caxton, who "knew never thre wordis at all quhat Virgill ment." Despite the contentions of earlier critics. Douglas' approach to Vergil was not humanistic. He recognizes his greatness as a poet, and he represents as much of that greatness as he can "in the langage of Scottish natioun," "kepand na sudroun [English] bot our awin langage." His respect for his original, his concern with the technique of translation and his sensitiveness to linguistic differences, give him superficially a closer resemblance to a neoclassical translator such as Dryden than to medieval paraphrasers of Vergil. But he is medieval in the casual freedom with which he brings his original up to date, in his sense of kinship with the Latin poet and in the absence of both humanistic "classical" diction and renaissance gravity of tone. He "shocks us by being closer to Vergil than we . . . . To the present day a reading of his version is the best possible preparation for a re-reading of the Latin" (C. S. Lewis, *English Literature in the 16th Century*, Clarendon Press. Oxford, 1954). But the *Eneados* is important in other respects. Douglas' prologues are notable pieces of original writing, containing vigorous discussion of Vergil's poetic merits in the tradition of medieval criticism (i, v, vi, ix), moralizing with personal undertones that move and endear, and three splendid season poems (vii, xii, xiii)— almost the first and certainly the best examples of that poetry of the "good old Bards" whose "Images are native, and Landskips . . . domestick" *(Miscellaneous Works of that celebrated Scotch Poet Allan Ramsay,* 1724).

BIBLIOGRAPHY.—No manuscript of *The Palice of Honour* survives. The earliest editions were printed in Edinburgh *c.* 1540 and in London *c.* 1553. It was edited by J. G. Kinnear for the Bannatyne club (1827). The *Eneados* survives in five manuscripts: the Cambridge manuscript *(c.* 1525; Trinity college), the Elphynstoun manuscript *(c.* 1525) and the Ruthven manuscript *(c.* 1535) in Edinburgh University library, and the manuscripts in Lambeth palace and the library of the marquis of Bath at Longleat. The first (and corrupted) printed edition was published in London in 1553. It was edited from the Cambridge manuscript by G. Dundas, 2 vol., for the Bannatyne club (1839). New collected edition by D. F. C. Coldwell *et al.,* Scottish Text Society (1957–).

For criticism of Douglas, *see* C. S. Lewis, *English Literature in the Sixteenth Century* (1954); Agnes Mure Mackenzie in J. Kinsley (ed.), *Scottish Poetry: A Critical Survey* (1955); and J. M. Ross, *Scottish History and Literature* (1884). Douglas' indebtedness to Chaucer is discussed in P. Lange. *Chaucers Einfluss auf die Originaldichtungen des Schotten Gavin Douglas* (1882). *See* also J. A. W. Bennett, "The early fame of Gavin Douglas's 'Eneados,'" *Modern Language Notes,* lxi (1946); W. Beattie, "Gavin Douglas's 'Palice of Honour,'" *Times Literary Supplement* (Feb. 23, 1946); B. Dearing, "Gavin Douglas's 'Eneados,'" *Publications of the Modern Language Association of America,* lxvii (1952). (J. Ky.)

DOUGLAS, SIR JAMES (1803–1877), governor of Vancouver Island, 1851–64, of British Columbia, 1858–64. and known as "the father of British Columbia," was born in Demerara, British Guiana, on Aug. 15, 1803. He received his schooling in Lanark, Scot.. and entered the service of the North West company, arriving in Canada in 1820. His career as Hudson's Bay company fur trader commenced in 1821. He rose from clerk to chief trader in 1834 and chief factor in 1839. As John McLoughlin's chief assistant at Ft. Vancouver, he carried out important trading missions in the Alaskan panhandle and in California. On McLoughlin's retirement in 1845 he became senior member of the board managing the company's operations west of the Rocky mountains. In 1843 he started construction of Ft. Victoria near the southern end of Vancouver Island and in 1849. after the extension of the international boundary line to the Pacific and the British withdrawal from Oregon. moved the company's western headquarters there from Ft. Vancouver.

At first passed over for the position of governor when a British colony was established on Vancouver Island under the auspices of the Hudson's Bay company in 1849, he received the appointment in 1851.

In the spring of 1858, faced with a rush of 10,000 miners to gold fields on the Fraser river and the prospect of American settlement being followed by territorial claim, he extended his authority to the mainland as imperial officer in order to maintain a British foothold on the Pacific. The British government approved his action, created a second colony, British Columbia, and offered him the governorship on condition that he sever his connection with the Hudson's Bay company. Against overwhelming odds, and with the aid only of a small force of Royal Engineers, a few Royal Navy ships, a judge and some magistrates, he maintained British rule and British law. *(See* BRITISH COLUMBIA: *History.)* He was knighted in 1863 and retired in 1864. He died in Victoria on Aug. 2, 1877.

See Margaret A. Ormsby, *British Columbia: a History* (1958); E. E. Rich (ed.), *The Letters of John McLoughlin,* vol. 3 (1944). (M. A. O.)

DOUGLAS, JAMES (1837–1918), Canadian mining engineer, industrialist and philanthropist who contributed greatly to the industrial growth and welfare of Arizona and the U.S. southwest, was born Nov. 4, 1837, at Quebec, Que. He was educated in Canada at Queen's university, Kingston, Ont., where he was later chancellor, and in Scotland, studying theology and medicine.

With T. Sterry Hnnt, he invented the Hunt-Douglas process for treatment of copper materials. In 1873 he became superintendent of the Chemical Copper company. Phoenixville, Pa.. where he installed the first commercial copper electrolytic refining plant. Six years later he was employed by Phelps. Dodge and Company of New York to examine copper mines in Arizona. leading at that time to the acquisition of mines at Bisbee and Morenci and, afterward, of other mines and also the El Paso and Southwestern railroad. He was made a Phelps, Dodge partner and later president when the firm was incorporated in 1908, and from 1916 was chairman until his death, in New York, on June 25, 1918. He encouraged the mining of radium ores. and presented more than three grams of radium to General Memorial hospital, New York, stimulating later cancer research by that institution.

Douglas mas the author of many technical papers and of several historical books on Canada. (C. E. D.)

DOUGLAS, (GEORGE) NORMAN (1868–1952), British writer, especially read for his evocation of southern Italy, where he lived for many years, latterly on the island of Capri. He was born at Tilquhillie, Aberdeenshire, on Dec. 8, 1868, the son of an old family of Deeside lairds, which had intermarried with German aristocrats. The most important part of his schooling was at the *Gymnasium* at Karlsruhe, where he showed a precocious gift both for languages and natural science. He entered the foreign office in 1893 but spent only about three years on diplomatic service in Russia, after which he traveled widely, in India, Italy and north Africa. He died on Capri on Feb. 11, 1952.

Douglas was for a time assistant editor of the *English Review.* His first notable book was *Siren Land* (1911) and his first popular success the satirical novel, set in Capri, *South Wind* (1917). The charm of all his books. whether fiction, topography, essays or autobiography, lies in their uninhibited expression of a personality at once bohemian and aristocratic, a mind stored with odd learning yet easy and gay, an attitude to life cantankerous and amoral, yet with an odd sturdiness and simplicity about it. His prose is somewhat near the perfection of the conversational style. Perhaps the richest of his books is *Old Calabria* (1915), the most self-revealing his informal autobiography *Looking Back* (1933). (G. S. F.)

DOUGLAS, STEPHEN ARNOLD (1813–1861), U.S. political leader who debated the slavery issue with Abraham Lincoln in 1858 and ran against him for president in 1860. He was born in Brandon, Vt., on April 23, 1813 Left in infancy to the care of a widowed mother and a bachelor uncle, he became a cabinetmaker's apprentice in Middlebury and Brandon. He attended schools at Brandon and in Canandaigua, N.Y., and began the study of law. In 1833 he went west and finally settled in Jacksonville, Ill., where he was admitted to the bar in March 1834. Early in his career he took an active interest in politics and his rise was remarkably rapid. He affiliated with the party of Andrew Jackson and soon became a leader in the Illinois Democratic party. In Feb. 1835 he was elected public prosecutor of the first judicial circuit, in Dec. 1836 he became a member of the state legislature.

In 1837 he was appointed by Pres. Martin Van Buren registrar of the land office at Springfield, which had just become the state capital. In the 1840 election he did much to carry the state for Van Buren; and for a few months he was secretary of state of Illinois. He served as a judge of the supreme court of Illinois from 1841 to 1843. In 1843 he was elected to the national house of representatives.

In congress, though one of the youngest members, he at once sprang into prominence by his clever defense of Andrew Jackson for alleged contempt of court in New Orleans. He was soon recognized as one of the ablest and most energetic of the Democratic leaders. An enthusiastic believer in the manifest destiny of his country, he remained throughout his career a devoted advocate of western development. He was a thoroughgoing expansionist, heartily favouring the measures that resulted in the annexation of Texas and the Mexican War. Taking an active share in the Oregon controversy, he opposed yielding "one inch" of the territory to Great Britain. He early proposed the extension to the west of United States settlements under military protection. He advocated the construction, by the aid of government land grants, of a transcontinental railway and was the chief promoter (1850) of the Illinois Central railway. In the 1850s he argued on behalf of a free homestead policy for western settlers. As chairman of the committee on territories, at first in the house and then in the senate, to which he was elected in 1847, he introduced the bills for admitting Texas, Florida, Iowa, Wisconsin, California, Minnesota and Oregon into the Union, and for organizing the territories of Oregon, Minnesota, New Mexico, Utah, Washington, Kansas and Nebraska.

In the bitter debates concerning the keenly disputed question of slavery in the territories, Douglas was particularly prominent. Closely related to his belief in national expansion and his support of western development was his doctrine of "popular sovereignty" —the idea that the people of the territories should decide the question of slavery for themselves. Against slavery itself he never publicly expressed any moral antipathy; his first wife and children were by inheritance the owners of slaves, although he himself never was. He did more, probably, than any other man to secure the adoption of the Compromise of 1850. The organization of the Utah and New Mexico territories with popular sovereignty was a victory for Douglas' position. Nevertheless his bill for organizing the territories of Kansas and Nebraska, reported in Jan. 1854, and which in amended form was signed by the president on May 30, reopened the whole slavery dispute—wantonly, his enemies charged, for the purpose of securing southern support to his presidential ambitions—and caused great popular excitement. It repealed the Missouri Compromise, and declared the people of the territories "free to form and regulate their domestic institutions in their own way, subject only to the Constitution of the United States." The passage of his Kansas-Nebraska act, one of the most momentous in its consequences ever passed by the federal congress, was largely a personal triumph for Douglas, who showed marvelous energy, adroitness and resourcefulness and genius for leadership. He was, however, bitterly condemned and vilified by many anti-slavery people. His hostility to the Know-Nothing party and his plea for religious toleration also caused him trouble. In 1852 and again in 1856 he was a strong candidate for the presidential nomination in the Democratic national convention.

In 1857 the decision of the U.S. supreme court in the Dred Scott case indirectly struck at Douglas' popular sovereignty principle by declaring that congress had no power to prohibit slavery in the territories and that the territories were open to slavery. Douglas, however, denied any contradiction and continued to argue the validity of his principle. The same year he broke with Pres. James Buchanan and the "administration" Democrats and lost much of his prestige in the South, but partially restored himself to favour in the North by his vigorous opposition to the method of voting on the Kansas Lecompton constitution and the admission of Kansas into the Union as a slave state. (See KANSAS: History.) Shortly afterward he engaged in Illinois in a close contest for the senatorship with Abraham Lincoln, the Republican candidate, whom he met in a series of debates. Although his followers did not poll as large a vote as Lincoln's, Douglas won re-election by a vote in the legislature of 54 to 46. In one of the debates, at Freeport, Ill., he expressed his famous "Freeport Doctrine," that the territories could still determine the existence of slavery through unfriendly legislation and the police power, in spite of the supreme court decision. As a result, southern opposition to Douglas became more intense and he was not reappointed chairman of the committee on territories.

In 1860 in the Democratic national convention in Charleston, S.C., the adoption of Douglas' "popular sovereignty" platform brought about the withdrawal of several southern states from the convention. The convention adjourned to Baltimore, Md., where additional southern delegations withdrew and where Douglas was nominated for the presidency by the northern Democrats. He campaigned vigorously but hopelessly, boldly attacking disunion and advocating "popular sovereignty" as the only measure that could save the Union, but in the election he received an electoral vote of only 12, against Lincoln's 180, although his popular vote was 1,375,157.

Douglas urged the South to acquiesce in Lincoln's election. and he and his second wife, Adèle Cutts, were among the foremost to welcome the Lincolns to Washington. On the outbreak of the American Civil War he denounced secession as criminal. and was one of the strongest advocates of maintaining the integrity of the Union at all hazards. At Lincoln's request he undertook a mission to the border states and to the northwest to rouse the spirit of unionism; he spoke in western Virginia, and in Ohio and Illinois. Partly as a result of his exertions on behalf of the Union, he died on June 3, 1861, at Chicago, where he had made his home since his election to the senate. He was buried on the shore of Lake Michigan.

In person Douglas was conspicuously small, being hardly five feet in height, but his large head and massive chest and shoulders gave him the popular sobriquet "The Little Giant." As a resourceful political leader, and an adroit, ready, skilful tactician in debate, he has had few equals in American history. His generosity in defeat. his courage and his capacity for inspiring warm personal friendships were among his most attractive qualities. It was regretted that his death came just when a new and great era of usefulness seemed opening before him.

DOUGLAS, a municipal borough (1895), seaport and capital of the Isle of Man since 1869, lies on a picturesque sandy bay on the eastern side of the island, 80 mi. N.W. of Liverpool and 90 mi. N.E. of Dublin. Pop. (1961) 18,837. Low hills encircle the town, penetrated by the valley of the combined Dhoo and Glass rivers, from which the town takes its name. The narrow, twisting streets of Old Douglas have nearly all vanished and the town has spread toward the west and north. Among notable buildings are the Tower of Refuge, built (1832) on the dangerous Conister or St. Mary's rock in Douglas bay by Sir William Hillary, founder of the Royal National Lifeboat institution, Castle Mona (1804), the legislative buildings (1894), the Manx National museum and Noble's hospital (1912). Popular attractions include theatres, dance halls, gardens, golf links, sports grounds and an athletics stadium. The Tourist Trophy motorcycle races and international cycle races are held in June and the Manx Grand Prix race in September.

Immediately below and to the north of Douglas head, at the mouth of the rivers, is the harbour, which can be entered by vessels drawing 15 ft. at spring tides, and 7 mi. S.W. of the town is a civil aerodrome. There is daily communication by sea with Liverpool and by air with London, Liverpool, Manchester and Blackpool, and there are services to other towns in the summer. An electric railway connects Douglas with Ramsey and with the summit of Snaefell (2,034 ft.), and a narrow-gauge steam railway

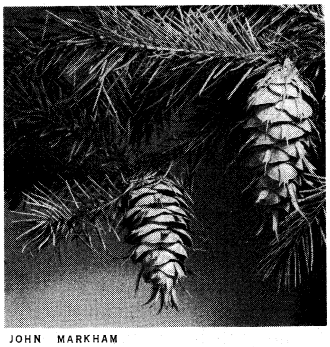
runs to Peel, Ramsey and Port Erin.

A small fishing village in the 16th century, Douglas grew rapidly in the 18th century as a result of the smuggling trade. By 1850 the town was becoming an increasingly popular watering place, this development being encouraged by the creation of the Isle of Man Steam Packet company. The town's primary occupation is the tourist industry, which caters for more than 500.000 visitors a year, but there are also light precision engineering works, knitting and carpet-weaving factories, breweries and mineral water works.

(E. F. Ls.)

DOUGLAS, a civil parish in Lanarkshire, Scot. Pop. (1951) 3,832. It is on Douglas water, 9 mi. S.S.W. of Lanark by road. and it is the original home of the Douglas (*q.v.*) family. Of the old castle, Sir Walter Scott's *Castle Dangerous,* only a tower exists; the working of collieries nearby led to its demolition in 1933–48. The modern castle is the seat of the earl of Home. Only choir and spire remain of the 12th-century church of St. Bride, patron saint of the Douglases. which has old French stained glass. The vault beneath the choir was, until 1761, the burial place of the family, and it contains a silver case said to hold the ashes of the heart of the "good Sir James" (1286–1330). In 1879 the choir was restored and the tombs (including that of Sir James Douglas) repaired. On the hill of Auchensaugh, 2½ mi. S.E., the Cameronians assembled in 1712 to renew the Solemn League and Covenant. James, earl of Angus, raised the Cameronian (26th) regiment at Douglas in 1689, and there is a monument commemorating this event.

DOUGLAS FIR (*Pseudotsuga taxifolia* or *menziesii*), one of the most important timber trees in North America, is in the pine family (Pinaceae) and is also called red fir, yellow fir, Douglas spruce, Oregon, red and Puget Sound pine, and false hemlock. It resembles the firs and hemlocks. but is more closely related to the spruces It ranges from central British Columbia to Montana, southern California: western Texas and northern Mexico. with isolated stands in South Dakota. The species attains maximum development in western Washington and Oregon. where it grows in pure stands or mixed with other conifers. Trees in Washington, Oregon and California are commonly 6 ft. in diameter and 200 ft. tall. but rarely exceed half that size in the Rockies. Douglas fir has displaced southern yellow pine as first place producer of lumber in North America. It constitutes a high percentage of the standing saw timber in the United States, and its cut represents a good portion of the total annual lumber production of the country. The symmetrical young trees constitute a portion of the Christmas tree trade in the U.S.



JOHN MARKHAM

BRANCH OF DOUGLAS FIR (PSEUDOTSUGA MENZIESII) WITH CONES

Douglas fir cones are pendent, two to four inches long, and fall intact. A three-toothed bract subtends, and extends to one-half inch beyond, each cone-scale. The related big-cone spruce (*P. macrocarpa*) of southern California has cones to seven inches long, but is of little commercial value. Three other species occur in China, Japan and Taiwan. *See* also CONIFERS.

See W. A. Eliot, *Forest Trees of the Pacific Coast (1938).*

(I. L. W.)

DOUGLASS, FREDERICK (original name. FREDERICK AUGUSTUS WASHINGTON BAILEY) (1817–1895), U.S. journalist, one of the most distinguished of American Negro orators. and anti-slavery leader. was born in Tuckahoe, Md., probably in Feb. 1817. His mother was a Negro slave of exceptional intelligence, and his father was a n-hite man. At the age of eight he left his grandmother's care and spent a year on the plantation of Col. Edward Lloyd, of which his master. Capt. Aaron Anthony. was manager. He then was sent to Baltimore to the family of Hugh Auld n-here blrs. Auld befriended him and secretly taught him to read; he soon learned to write free passes for runaway slaves. Upon Captain Anthony's death in 1833 he was returned to the plantation to serve Thomas Auld. Anthony's son-in-law. After being hired out for a year to Edward Covey. he was sent to William Freeland of St. Michael's. Md. Although treated kindly, he attempted an escape in 1836. and was subsequently returned to Hugh Auld, who apprenticed him as a ship caulker. He learned his trade and in Sept. 1538, masquerading as a sailor, escaped by rail to New Tork city. In the interests of safety, he soon moved to New Bedford. Mass.. changed his name from Frederick Augustus Washington Bailey to Frederick Douglass, and for three years worked as a day labourer.

An extemporaneous speech before an antislavery meeting in Nantucket. Mass., in Aug. 1841 led to his appointment as an agent of the Massachusetts Anti-Slavery society, and for the next four years he delivered antislavery addresses in New England and the middle states. To quiet the suspicion that he was an imposter, he published the *Narrative of the Life of Frederick Douglass, an American Slave* in 1845. To avoid recapture he went abroad; his lectures in 1845–47 did much to enlist British sympathy for the abolitionist cause. In the interim a sum of £150 was raised by subscription to secure his legal manumission. From 1847 to 1860 he continued lecturing and conducted an antislavery weekly at Rochester, N.Y., known as *The North Star,* later *Frederick Douglass's Paper.* A follower of Garrison at first, he allied himself after 1851 with the more conservative Constitutional abolitionists led by James G. Birney. He disapproved of John Brown's attack upon Harpers Ferry in 1859, and declined to take any part in it. During the Civil War he was an early advocate of the use of Negro troops by the Union army. In 1871 President Grant appointed him assistant secretary of the Santo Domingo commission. Subsequently he was marshal of the District of Columbia (1877–81), recorder of deeds for the district (1881–86), and American minister and consul general in Haiti (1889–1891).

Douglass was widely known for his eloquence, and was one of the most effective orators whom the Negro race has produced in America. He died in Anacostia Heights. D.C., on Feb. 20. 1895. His autobiography, *The Life and Times of Frederick Douglass,* appeared in 1882.

BIBLIOGRAPHY.—F. M. Holland, *Frederick Douglass, the Colored Orator* (1891); C. W. Chesnutt, *Frederick Douglass* (1899); Booker T. Washington, *Frederick Douglass* (1907), in the series of American Crisis biographies; and *Life and Writings,* ed. *by P.* S. Foner (1950–52).

DOUHET, GIULIO (1869–1930), Italian army officer and pioneer exponent of strategic air power, sometimes called "the Mahan of air power!" was born at Caserta on May 30. 1869. Douhet was trained as an artillery officer but served from 1912 to 1915 as commander of Italy's first aviation unit, and then with an infantry division. For his severe criticism of the conduct of the war he was court-martialed, imprisoned and put on the retired list. The Italian defeat at Caporetto in 1917 tragically justified Douhet's criticisms. Recalled to active service as head of the aviation service. by 1921 he had attained the rank of major-general.

Douhet wrote a number of books: of which the most widely known, *Command of the* **Air,** was published in 1921. He contended that an enemy's war effort could be completely disorganized by strategic bombing. His theories implied creation of an independent air force, progressive diminution of other arms, and unification of the armed forces. Douhet's advocacy of such ideas created controversy throughout the world. He died in Rome on Feb. 15, 1930. too early to see his theories put to the test in World War II. See STRATEGY: *Development of Strategy.*

See Louis A. Sigaud, *Douhet and Aerial Warfare* **(1941).** (D. **CR.**)

DOUMER, PAUL (1857–1932), French statesman and 13th president of the third republic, was born at Aurillac on March 22, 1857. In 1888 he entered the chamber of deputies, where he sat among the Radicals. As minister of finance in Léon Bourgeois' cabinet (1895–96) he vainly tried to introduce income tax. In Jan. 1897 he was appointed governor of Indochina. an office he filled with great distinction. In 1902 he returned to France, refused to support the ministry of Émile Combes and formed a Radical dissident group. He was elected president of the chamber in Jan. 1905 and unsuccessfully stood for the presidency of the republic in 1906. During World War I, in which four of his sons were

killed, he played an important part in the senate committee on military affairs. He again was minister of finance in 1921–22 and 1925–26. In Jan. 1927 he was elected president of the senate. In May 1931 he was elected president of the republic, taking office on June 13. He was assassinated by a Russian fanatic, Pavel Gorgulov. on May 6, 1932. Doumer left the reputation of a strong patriot and of a man of high moral integrity. He wrote *L'Indochine française* (1903) and *Le Livre de mes fils* (1905).

See A. Dansette, *Histoire des présidents de la République (1953).*

(J. C. DE C.)

DOUMERGUE, GASTON (1863–1937), French statesman, the 12th president of the third republic, was born at Aigues-Vives, Gard, on April 1. 1863. He studied law and, after holding minor judicial offices in Indochina and Algeria, was elected deputy for Nîmes in 1893. In the chamber he sat among the Radicals. Having been minister for the colonies under Émile Combes (1902–05), he became minister of commerce in Ferdinand Sarrien's cabinet (1906), retained this portfolio in Georges Clemenceau's government and nas subsequently minister of education (1908–10). In 1910 he entered the senate.

On the fall of Louis Barthou's administration in Dec. 1913, Doumergue formed a cabinet, in which he took charge of foreign affairs, but after the general elections of Nay 1914, xhich resulted in a majority opposed to the three-year military service law, he had to resign. On the outbreak of World War I, however, he became minister for the colonies again in René Viviani's government of national defense, and he retained this portfolio in hristide Briand s government (Oct. 1915–March 1917). In Jan. 1917 he was sent on a mission of inquiry about conditions in Russia. In Feb. i923 he was raised to the presidency of the senate. As such he supported the Ruhr policy of Raymond Poincaré.

On June 13. 1924, Doumergue was elected president of the republic against Paul Painlevé, candidate of the *cartel des gauches.* He remained in office until 1931, when he retired to his country place. In Feb. 1934, under very difficult internal circumstances, he agreed to form a coalition government, but he failed to achieve the constitutional reform that he had planned and resigned in the following November.

Doumergue died at Aigues-Vives on June 18, 1937.

See P. Lafue, *Gaston Doumergue, sa vie et son destin (1933).*

(J. C. DE C.)

DOUNE, a small burgh in Perthshire, Scot., $8\frac{3}{4}$ mi. N.W. of Stirling and 4 mi. W. of Dunblane by road. Pop. (1961) 775. It is on the left bank of the Teith, crossed there by the bridge built in 1535 by Robert Spittal, tailor to James IV. The town was once famous for pistols and sporrans. Doune castle, now ruined, is believed to have been built by Robert Stewart, 1st duke of Albany (d. 1420) and his son, Murdoch (d. 1425). Macgregor of Glengyle, a nephew of Rob Roy, held it for Prince Charlie and it figures in Sir Walter Scott's *Waverley.* It belongs to the earl of Moray (Murray). The braes of Doune lie to the northwest of the town and extend toward Uam Var (1,600 ft.). Deanston, 1 mi. S.W. of Doune, has cotton mills and was the scene of James Smith's (1789–1850) experiments in deep plowing, field drainage and the design of agricultural and other machinery. Smith also invented the salmon ladder for weirs.

DOURA-EUROPUS (DURA-EUROPUS), a ruined city of Syria, in the Syrian desert on the right bank of the Euphrates, about 50 mi. below the modern town of Deir-ez-Zor. It was laid out on a rectangular plan on the rocky plateau now called Salihiye. Apart from a few brief references in classical literature, nothing was known of the city until it was excavated first under the direction of F. Cumont (1922–23) and later of M. Rostovtzev (1928–37). Even its location was unknown until the investigations that followed the accidental discovery of wall paintings there by a British officer in 1921.

Of the old Babylonian town of Doura on this site virtually no trace remains. It was rebuilt about 300 B.C. by the Seleucids and given the alternative name of Europus after the native city in Macedonia of its reputed founder, Seleucus Nicator. For two centuries it served as a military colony on the main road between Antioch and Seleucia on the Tigris. About 100 B.C. it fell to the Parthians, under whose control it throve as a caravan city on the trade route from the Persian gulf through Palmyra to the Mediterranean. Being a commercial city, it was usually regarded as neutral by the Romans on the nearby imperial boundary. In A.D. 165, however, it was annexed to the Roman empire, and used for nearly a century as a cantonment and frontier fortress. Shortly after A.D. 256 it was overrun and destroyed by the Sasanians. A century later Ammianus described it as a ruined site over which herds of deer were hunted.

By virtue of the richness and variety of its remains and the detailed picture they give of the everyday life of the place, Doura-Europus may be compared with Pompeii. Both cities were overwhelmed by a sudden catastrophe, and the dry sands at the one site like the volcanic ash at the other ensured the remarkable preservation of what was buried—even wood, leather and papyrus. The inscriptions, reliefs and architecture provide abundant evidence about the fusion of Greek and Semitic culture. The temple of Zeus Theos stood at the same time as those of Adonis and Atargatis; further, a synagogue and a church, both of the 3rd century, were found buried under the final, hastily constructed reinforcements of the city wall. These last two buildings. both of which contain extensive wall paintings, are of the highest importance for the study of Jewish and early Christian art and architecture. (WM. C. B.)

DOURO (Sp. DUERO; Port. DOURO; ancient DURIUS), the third longest river (478 mi.) of the Iberian peninsula, draining the largest catchment area (30,539 sq.mi.). The Douro rises in the Urbión mountains (7,310 ft.) in Spain and crosses the Numantian plateau in a pronounced curve. As far as Aranda it is narrowly confined by its banks; then it widens out across the broad monotonous Tertiary plains of Old Castile. Beyond Zamora the river narrows as it cuts through the hard slates and quartzites of the western Meseta. Along the international frontier it plunges about 1,250 ft. within 30 mi. in a series of gorges and rapids. The remaining 124 mi., from the Portuguese frontier at Barca d'Alva to the sea, are navigated by small boats. Although a series of rapids above Ferradosa were blasted away in 1820 to permit navigation, this section is used only by very small craft. Between Pêso da Régua and Oporto there is a considerable barge trade (the *barco rabelo*) taking the mine from the vineyards of the port wine district to Vila Nova de Gaia; from Pedorido to Oporto there is also some coal traffic. The mouth of the river is partially blocked by a sand bar, which explains the growth of the artificial port of Leixões to the north of the estuary. Navigation on the Portuguese stretch is complicated by rocks, shifting channel beds and winter floods during which the river may rise suddenly 10 or 20 ft. above its normal level.

After 1930 the Spanish basin was developed for irrigation and hydroelectric power. By the mid-1950s, 14 new dams had been built capable of storing 1,978,500,000 cu.m., producing 597,000,000 kw.hr. and irrigating 97.000 ac. The largest dam is the Ricobayo on the Esla. . The major tributaries, the Esla and Pisuerga, come from the northern zone of higher rainfall; the southern tributaries such as the Adaja and Tormes, coming from the drier Cordillera Central, are less important. Whereas irrigation is the most important asset of the Spanish section, in Portugal the Douro has very high hydroelectric-power potentials which in the 1960s were being developed to a limited extent. (J. M. Ho.)

DOURO LITORAL, a province of northern Portugal, coincides roughly with the administrative district of Oporto. Pop. (1950) 1,237,170. Area 1,269 sq.mi. It comprises a narrow coastal plain 1–2 mi. wide, stretching about 20 mi. from the Ave valley to south of the Douro river. Inland it rises to a low undulating plateau with a complex series of erosion surfaces carved out of the granitic rocks. Silurian slates outcrop in a northwesterly-southeasterly belt from near Arouca to the Vallongo hills (1,000–1,250 ft.), forming a more sparsely populated and forested tract. Farther inland the northwest-southeast valleys, notably the Tâmega, break up the higher granitic massifs, some of them fractured as horsts, others with dissected erosional forms. 'These high plateaus culminate in the eastern mountains of Montemuro (4,534 ft.), south of the Douro, and Marão (4,642 ft.) on the borders of

Tras-0s-Montes e Alto Douro. The Douro and its tributary the Tâmega are the chief rivers.

The mild and moist climate with a mean annual rainfall of about 40–60 in., together with the generally fertile gray podsol soils over the deeply weathered granites, have encouraged an intensive use of land. Mixed farming with a rapid succession of winter and summer cereals, vegetables and tree crops permits large peasant families to live on holdings of even less than one acre, fragmented into tiny parcels.

Population densities average 400 per square mile, although around Oporto they rise to 1,000 or more in street villages strung along the roads and even more thickly dispersed among the fields. Timber and its associated resin industry is, with the production of *vinho verde* (an acid, green wine), often the only source of a cash income for the peasants in the remoter valleys.

Oporto (*q.v.;* pop. [1960] 310,474), the second city of Portugal, dominates commercially the whole of the north and as far south as the Mondego valley. Situated on a series of granitic hills on the lower north bank of the Douro, it originated, like most of the old nucleated settlements of the region, on an Iron Age *castro.* "Portucale." from which Portugal was later derived, was first used in the district. A cathedral and university town, Oporto grew rapidly in the 19th century with new industries, chiefly textile mills.

Although Oporto is the commercial capital of the famous port wine trade, the bonded warehouses are actually situated on the south bank at Vila Nova de Gaia (pop. 159,590 [mun]). A sand bar at the mouth of the Douro restricts navigation to smaller craft, so that Oporto's port of Leixões (erected 1890 and further developed in 1916) handles the bulk of the coastal traffic. Adjoining it is Matozinhos (91,909 [mun.]), one of the chief sardine-packing centres of the country. Foz do Douro is a coastal suburb of the city and Espinho farther south is a seaside resort. (J. M. Ho.)

DOVE, ARTHUR GARFIELD (1880–1946). C.S. painter, one of the earliest nonobjective artists, was born at Canandaigua, N.Y., on Aug. 2, 1880. He began his career as a magazine illustrator, but after meeting Alfred Stieglitz he gave up conventional painting and turned to abstract art. In 1910 he had his first exhibition with Stieglitz in New York. His art employed soft masses of an organic character, muted in colour, similar to the amorphous shapes of Kandinsky. Despite their nonobjective character, his paintings often suggest the cursive qualities of landscape and the forms of nature. In explanation of his art, Dove said that he would like to take wind and water and sand and work with them, but. failing that, he used colour and force lines and substance, as music uses sound. Dove also created many fine collages, incorporating fragments of commonplace subjects in a symbolic expression combining homely sentiment with touches of irony. He died in Huntingdon, N.Y., on Nov. 23, 1946.

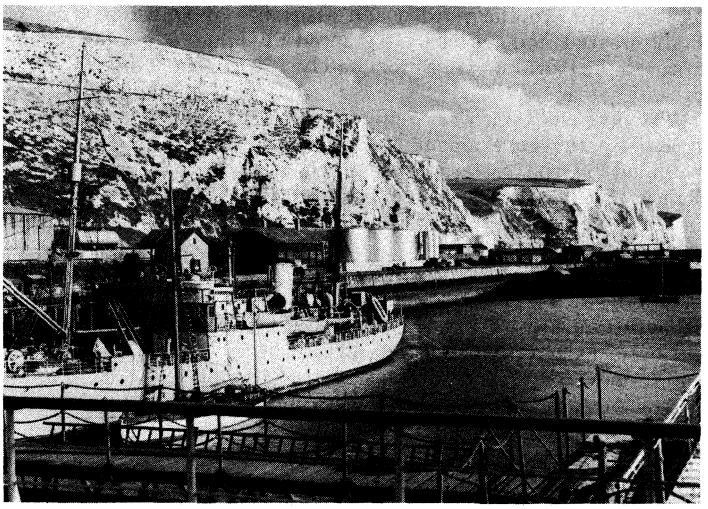
See F. S. Wight, ***Arthur** G. Dove (1958).* (S. Hu.)

DOVE: *see* PIGEON.

DOVEKIE (DOVEKEY), the common name in North America for the little auk (Plautus alle), 8 in. long, breeding on rocky coasts and islands of the North Atlantic. *(See* AUK.) The name also is applied by sailors to the black guillemot. *See* GUILLEMOT.

DOVER, a seaport, municipal and parliamentary borough of Kent. Eng., and one of the Cinque Ports (*q.v.*), is 72 mi. E.S.E. of London by road. It is situated on the Straits of Dover, the neck of water 18 to 25 mi. wide between England and France. Pop. (1961) 35,248.

The only one of the Cinque Ports which is still a great port, Dover is the nearest English port to the European continent. The town lies in a valley of a dissected chalk upland whose main axis is from northwest to southeast, breaching the high chalk cliffs that fringe the coast on either side. Through the valley runs the river Dour. The pronounced physical relief of the district has imposed on Dover the pattern of its development. In the 4th century it was guarded by a fort sited near the harbour and forming part of the defenses of the Saxon shore (Litus Saxonicum). The dominant building is the castle on the eastern height, 375 ft. above sea level. Within its precincts are a Roman pharos or lighthouse, the ancient fortress church (St. Mary in Castro), some



J. ALLAN CASH

THE HARBOUR AND CHALK CLIFFS AT DOVER. ENG.

remains of the Saxon stronghold and the massive keep and subsidiary defenses (such as the Constable's, Avranche's and other towers) of the Norman building. The constableship is held jointly with the lord wardenship of the Cinque Ports.

Remains were discovered in 1854 of a round church of the Templars (Holy Sepulchre), 32 ft. in diameter, which was restored. The remains of the foundation of St. Martin's priory, of the 12th century, include the great gate, the house refectory with campanile and the spacious strangers' refectory. These are all incorporated in Dover college. a boys' public school which was instituted in 1871. In High street may be seen the noble hall and truncated fabric of the Maison Dieu, founded by Hubert de Burgh in the 13th century for the reception of pilgrims of all nations. From the time of Henry VIII until 1830 it was used as a crown victualing office, but was subsequently purchased by the corporation and adapted as part of a town hall, a new part being added and opened in 1883. In 1949 a small portion of the latter was converted into a museum to replace the war-damaged former premises in Market square. Next to the Maison Dieu stands Maison Dieu house, which was built in 1665 as the residence of the agent victualer to the king's navy. It was bought by the corporation in 1904 and used as offices until 1949, when it was evacuated in order that it might be restored and adapted for use as a public library, the original premises of which had been destroyed during World War II. It was opened for this purpose in 1952.

The popularity of sea bathing in the 19th century developed Dover as a seaside resort. At the end of the century some labour was also supplied for the exploitation of the Kent coal field. Since World War II new housing estates have been provided and the sea-front area has been redeveloped, an imposing feature being The Gateway, a large block of municipal flats.

Dover claims to be a Saxon borough "by prescription" in that the burgesses acted in a corporate capacity without any formal charter of incorporation. Its privileges of independent jurisdiction and free courts were granted in return for ship service rendered to the king by the burgesses at this important point on the neck of the narrow seas. These privileges are set forth on the first page of the Kentish section of Domesday Book: "The burgesses gave to the king twenty ships once a year for fifteen days and in each ship were twenty men. This they did in return for his having endowed them with sac and soc." *(See* J. B. Jones, Annals of *Dover,* 2nd ed. [1938].)

Dover is a bishopric suffragan in the diocese of Canterbury and also a garrison town. (B. A. C.)

The Port.—Dover is the premier passenger port in Great Britain and the principal cross-channel port operating regular passenger-accompanied car and cargo services to and from Boulogne, Calais, Dunkerque and Ostend. General foreign and coastal trade is also handled at the port. The port authority is the Dover Harbour board, an autonomous public trust constituted in 1861

as successors to the warden and assistants of Dover harbour, a body created under a charter granted by James I in 1606. The area of the harbour is approximately 850 ac., including a water area of 650 ac.

The outer harbour was completed in 1909 and in 1923 was transferred by the government to the Dover Harbour board. It is bounded by the eastern arm, the southern breakwater and the Prince of Wales pier. The eastern arm is 2,800 ft. in length and provides berths with 27 ft. depth of water at low water, ordinary spring tides (L.W.O.S.T.). The southern breakwater is a protective mole 4,270 ft. in length. The Prince of Wales pier is 3.000 ft. in length, with about 1,600 ft. of berthing accommodation for vessels up to 25-ft. draft at L.W.O.S.T. There are two entrances to the outer harbour — the eastern, 670 ft. in width, and the western. 740 ft. in width.

The western docks comprise the Admiralty pier, the train ferry dock, tidal basin, Granville and Wellington docks. The Admiralty pier, originally constructed in 1871, was extended in 1897–1900 and widened at the shoreward end in 1909–13. This pier. 4,140 ft. in length, provides berths with up to 26 ft. depth of uater at L.W.O.S.T. Immediately adjacent to the pier are the Dover marine passenger and freight train ferry services betneen Dover and the continent. The tidal basin forms the entrance to the Granville and Wellington docks. The Wellington dock consists of eight acres of water. The Granville dock has a water area of 4½ ac., with depths of 23 ft. at spring tides and 17 ft. at neap tides. Both docks have modern cargo-handling equipment and transit accommodation.

The eastern docks comprise the Camber and the land area between the cliffs and the sea-retaining wall, running from the entrance to the shoreward end of the eastern arm. The Camber, a tidal basin, has an area of 25½ ac. affording berthing accommodation up to 21 ft. at L.W.O.S.T. The land area of these docks. about 21 ac., is devoted to industrial purposes At the Camber, the Dover harbour board's car ferry terminal, completed in 1953, enables the motorist to drive straight on or off the cross-channel vessels operating regular services to the continent. Bunkering facilities are available. Within the harbour area there is an industrial dockside estate. (J. W. Sn.)

Besides the mail service and harbour trade, Dover has a trade in ship supplying together with timber importing. Industries include metal foundries, cardboard-box, fountain-pen. mineral-water, paper, toy and tar-macadam manufacturing, as well as several flour mills. In 1949 a program uas approved by the South Eastern gas board making the Dover gasworks the central manufacturing station for a considerable portion of east Kent.

History.—Before the Roman invasion a permanent settlement existed on the site of Dover. Caesar regarded it as sufficiently important to make it his first point of attack in Aug. 55 B.C. Although the landing was successful the expedition as such failed. He returned in May 54 B.C. and, by effecting a landing farther to the east between Deal and Sandwich, began the period, which lasted nearly 100 years, during which Britain was in a tributary state to Rome. Among relics of Roman occupation are the pharos and *bredenstone* and, until the 18th century, a Roman bath. Watling street started from the town. Dover (Dubris) was one of the ports for continental traffic in Roman times. By the time of William I it had considerably increased in size and importance, ranking among the principal towns of England. It became the main link between the English and continental possessions of the Conqueror and during his reign was defended with a wall, gates and towers.

An important naval victory was won off Dover by the ships of the Cinque Ports against the French in 1217.

Dover harbour provided the headquarters of the Dover patrol during World War I. The functions of the patrol were, primarily, to keep the narrows of the English channel open to traffic and also to hunt submarines. At the beginning of the war the Dover patrol force operated with the army in checking the German advance through Belgium by their gunfire, and vessels at Dover were also called on to undertake bombardments of the dockyard at Ostend and the submarine base at Zeebrugge. Blocking operations were carried out during 1918 when Zeebrugge was attacked, hut a similar attempt on Ostend failed. The air service at Dunkerque was also one of the arms of the patrol and was invaluable both on the coast and in assisting the army. Without the breakwater and harbour facilities at Dover, the protection of the straits would have been impossible and the evacuation of the wounded most difficult.

During World War II Dover suffered from constant hit-and-run air raiding, but most of the damage sustained was the result of enemy shelling from Cape Gris Nez. A great deal of reconstruction has taken place since the war.

DOVER, a town in Delaware, U.S., is on St. Jones creek (also known as Dover river), in the geographical centre of the state. It is the seat of Kent county and has been the capital of the state since 1777. It had its origin in an order of William Penn (1683) to lay out "the town of Dover, in the county of Kent" and erect a courthouse and jail for the county. The town was laid out in 1717 around an open square (the green) bisected by the King's road running north and south through the town. This is now State street, lined with pleasantly shaded 19th-century residences. The old state house on the green was erected in 1792 to accommodate the legislature and state as well as county offices. The green was the centre of the political and public life of the county and (from 1777) of the state until 1933, when a new group of red brick Georgian colonial buildings was started to the east to house the legislature, the archives and other departments of the state government.

Dover is the trade centre for the surrounding agricultural area of Kent county. Its industries are almost all small or local, an exception being a company established in 1855 which was a pioneer in the canning industry and whose specialities, boned chicken and plum pudding) became nationally known. In 1929 Dover adopted a modified form of council-manager government. It operates its own electric generating plant. Wesley junior college on State street was founded in 1874 as the Wilmington Conference academy (Methodist). The hall of records. repository of official state records and other historical material, has on display William Penn's title deeds to Delaware, granted to him by James, duke of York, in 1682. The Delaware state museum on Governor's avenue, opened in 1950, occupies the old Presbyterian church, erected in 1790. Early in World War II a military air base was established east of the town and hundreds of pilots were trained there during the war. Inactivated in 1946, the base was taken over by the Military Air Transport service in 1952 and became an air cargo terminal. For comparative population figures *see* table in DELAWARE: *Population.* (H. C. Re.)

DOVER, a city of southeastern New Hampshire, U.S., the seat of Strafford county, is located 10 mi. N.W. of Portsmouth. The Cocheco river, with a 33-ft. fall providing abundant water power, passes through the town and empties into the nearby Piscataqua river. The original settlement, once called Bristol, was established in 1623 by Edward and William Hilton and Thomas Roberts at Dover point, 5 mi. S.E. of the present city. A second settlement was made by Thomas Wiggin at Dover neck in 1633. Life originally centred around the point and its shipbuilding interests, but during the 18th and 19th centuries, as manufacturing grew, the city developed about its present site. Modern industries include textiles, shoes, printing, chemicals, plastics, electronic products, lumber and cement blocks. The town existed as an independent entity for a brief period before 1642 when it voluntarily submitted to the jurisdiction of Massachusetts. During the 50-year period following 1675 the settlement was jeopardized by Indian attacks, the worst of which came on June 28, 1689. Dover was chartered as a city in 1855. The University of New Hampshire is located at Durham, 5 mi. S.W. For comparative population figures *see* table in NEW HAMPSHIRE: *Population.* (R. C. Gi.)

DOVER, TREATY OF. There were two Anglo-French

treaties of Dover in 1670, and they were concerned with two different projects: the one, which was secret, with the conversion of England to the Roman Catholic faith, which was favoured by Charles II; and the other, which was formal, with an Anglo-French military and naval alliance designed to subjugate the United Provinces of the Netherlands, which was desired by Louis XIV. The secret treaty, in the negotiation of which Charles's sister Henrietta Anna, duchesse d'Orléans (*q.v.*), was deeply involved, was concluded on June 1 (new style; May 22, old style). By it, Charles II was to receive £200,000 in money and the support of 6,000 French troops, if needed, so that he might declare himself a Roman Catholic, and a further £300,000 a year to enable him to join a war against the Dutch. Among other clauses it was stipulated that England would support any claims that Louis might get to the Spanish succession. To allay suspicion, the formal treaty was concluded through the ordinary diplomatic channels on Dec. 31 (N.S.; Dec. 21, O.S.), omitting all mention of religion. The conversion clause never came into effect, for Louis XIV was really interested only in war, and Charles II's ambition was not so much the restoration of the Catholic religion as the establishment of monarchical power which he thought it would secure and which he came to promote instead by a policy of religious toleration. *See* CHARLES II; DUTCH WARS. (I. F. B.)

DOVE RIVER, England, is for most of its 40-mi. course the boundary between Derbyshire and Staffordshire. It rises about 1,800 ft. above sea level in the rugged gritstone moorlands around Axe Edge near Buxton. It flows southward through hilly pastoral country with drier limestone hills on the east or Derbyshire side. South of Hartington these form a scarp through which the river cuts a picturesque gorge. The valley has several local names. Beresford dale, by Hartington, is associated with Izaac Walton and Charles Cotton, whose fishing house stands near Pike pool. Dovedale, the five-mile stretch above the confluence with the Manifold near Ilam, is an especially fine wooded limestone gorge with caves and swallow holes, and is mostly National trust property. South of Ilam the country opens out into the midland plain, there floored by Triassic marls and smeared with glacial deposits. At Rocester it is joined by another right-bank tributary, the Churnet, and from there flows east through wide alluvial meadowlands to its junction with the Trent 150 ft. above sea level at Newton Solney near Derby. (JN. P.)

DOW, CHARLES HENRY (1851–1902). U.S. newspaperman and stockbroker who became the founder and first editor of the *Wall Street Journal.* He is best remembered for the Dow-Jones stock averages *(see* PRICES, STATISTICS OF: *United States)* and for the Dow theory of investments, a complex system for analyzing the stock market which other writers developed after his death from the "folksy" and common sense columns and editorials he wrote.

Little is known of Dow's early life. He was born on a Connecticut farm on Nov. 6, 1851; his father died when young Charles was six years old; he was mainly self-educated. At the age of 20 or 21 he became a reporter on the *Springfield* (Mass.) *Republican;* a few years later he worked on the *Providence* (R.I.) *Journal.* A trip to Colorado in 1879 to write about the silver boom led to Dow's meeting a group of New York financiers who encouraged him to move to New York. This he did in 1880, working first on a newspaper and later for a news service specializing in financial news. In 1882 he and Edward D. Jones formed their own company; they collected news during market hours and Charles M. Bergstresser, later a partner, wrote the bulletins which were distributed by messenger boys in the financial district. The *Wall Street Journal* was founded in 1889.

Dow was a general partner in the brokerage firm of Goodbody, Glyn and Dow from 1885 to 1891, and was a member of the New York Stock exchange. He died in Brooklyn, N.Y., on Dec. 6, 1902. (K. L. T.)

DOW, HERBERT HENRY (1866–1930), U.S. chemist, was a pioneer in the chemical manufacturing industry. Born on Feb. 26, 1866. in Belleville. Ont., in Canada, where his family had moved from New England, he grew up in the U.S., his family having returned there soon after his birth. He received his B.S. degree from the Case School of Applied Science in 1888.

From the time he wrote his thesis on Ohio brines, Dow concentrated on deriving the maximum value from brines. In preparing to present his thesis to a scientific society, he studied brines in Michigan, Ohio, Pennsylvania and West Virginia, and discovered that the brines of Canton, O., and Midland, Mich., were heavy in bromine. While professor of chemistry and toxicology at the Homeopathic Hospital college, Cleveland (1888–89), he patented a method for extracting bromine from brine, and in 1889 organized a company to use the method at Canton. Improvement in methods followed the failure of this company, and the Midland Chemical company was formed in 1890. His processes allowed the removal of bromine from the brine by electrolysis without evaporation. The company was the first to make successful use of the newly devised direct-current generator in the chemical industry. A chlorine extracting company, formed in 1895 at Navarre, O., was moved to Midland in 1896 and absorbed in the Dow Chemical company, founded in 1897; in 1900 he bought the Midland Chemical company.

Dow moved from one field to another in his concentration on brine, making insecticides and pharmaceuticals. Studies of alloys of magnesium produced Dowmetal. His process for producing magnesium sulfate (Epsom salts) introduced the automatic handling of ocean brines. Dow produced the first synthetic indigo in the U.S. and was the first important producer of iodine, initially from Louisiana brine and later from California petroleum brine. Dow eventually was granted more than 100 patents as his company became one of the important chemical manufacturers. He died at Rochester, Minn., on Oct. 15, 1930.

DOWDEN, EDWARD (1843–1913), Irish critic, biographer and poet, outstanding for his work on Shakespeare, was born on May 3, 1843, at Cork. Educated at Queen's college, Cork. and Trinity college. Dublin, he became professor of English literature at the latter in 1867, and lectured at Oxford (1890–93) and Cambridge (1893–96). His *Shakespere: His Mind and Art* (18; 5) was the first book in English to attempt a unified and rounded picture of the whole work of Shakespeare. As in the interpretations of the German critics Hermann Ulrici and Georg Gervinus, to whom Dowden acknowledges a debt. Shakespeare is studied in terms of successive periods. The works are seen as an expression of a single character and temperament subject to a dominant law in the writer's mind. Dowden's interests are therefore psychological and ethical, but like many of his contemporaries he sentimentalized the poet, particularly the Shakespeare of the final romances. Primers. introductions to Shakespeare and works on the poems followed; and he edited some of the first Arden texts: *Hamlet* (1899), *Romeo and Juliet* (1900) and *Cymbeline* (1903). Dowden is also of interest for his *Poems* (1876), his *Studies in Literature* (1878) and other biographies, especially his *Life of Shelley* (1886). He edited Shelley's works in 1900. He was among the first to appreciate the U.S poet Walt Whitman. He died in Dublin on April 4, 1913. (G. A. O)

DOWDING, HUGH CASWALL TREMENHEERE DOWDING, 1ST BARON (1882–), British air marshal who directed the fighter command in the battle of Britain (1940), was born at Moffat, Dumfries, on April 24, 1882. He was educated at Winchester and at the Royal Military academy. During World War I he commanded squadrons in France and was made companion of the order of Bath and companion of the order of St. Michael and St. George.

In 1919 Dowding was appointed to a permanent commission in the Royal Air Force as a group captain. He first commanded various groups at home, and between 1922 and 1926 served as chief staff officer of inland area and of the Iraq command. During 1926–29 he was director of training at the air ministry. then air officer commanding in Transjordan and Palestine. He commanded fighting area in the air defense of Great Britain (1929–30) before he was appointed member of the Air Council, Research and Development (1930–36). During this period many new types of aircraft were evolved or introduced.

Dowding then held the important post of air officer commanding in chief, fighter command; he was still in command at the begin-

ning of World War II and during the battle of Britain. It can safely be said that it was largely due to his great skill and resolution as a commander, strategist and tactician that this outstanding victory against great odds was won. He then went to the U.S on a mission for two years, retiring from the R.A.F. in 1942. A barony was conferred on him in 1943. (E. B. BN.)

DOWER, at common law, was the life interest of a widow in one-third of the legal estates in real property owned by her husband at any time during the marriage. Originally there were varieties such as dower *ad ostium ecclesiae* ("at the church door") and dower *ex assensu patris* (by the heir with his father's consent), where immediately before the marriage the wife was endowed of specified lands; and sometimes land held in knight service was exonerated from dower by the widow's taking dower *de la pluis beale* ("of the most fair") of her husband's socage land. But by the 16th century these forms were of little importance compared with dower at common law. or subject to local customs under which dower might extend to a quarter, a half or even the whole of the land. Except where the wife had been endowed of specific lands, she was entitled to have her land assigned "by metes and bounds" by the heir within her quarantine; *i.e.,* the 40 days during which Magna Carta (1215) permitted her to remain in her husband's house after his death The right to dower might be barred by the aife before marriage accepting a jointure (a life estate in specified lands) in lieu of dower, or by the complicated uses to bar dower invented in the 18th century. By the Dower act. 1833, dower in Great Britain was restricted to realty still owned by the husband at his death and not devised by his will; and it could also be barred by a declaration in his will or by deed. Dower thus ceased to be a nuisance to conveyancers. As a small measure of compensation to widows, the act extended dower to equitable interests. The Administration of Estates act, 1925, abolished dower.

Dower at common law continues in a number of common-law jurisdictions, often in a modified form. The modern tendency, however, is either to abolish it or to replace it by other less arbitrary means of providing for widows. (R. E. MY.)

United States.—In the United States. in such states as did not enact statutes to the contrary, dower continues as at common law. Some statutes are in efiect which declare the principles of the common law. In most states. however. the common-law doctrines of dower were greatly modified by statute In some states dower either was abolished or a different right or interest was substituted Even where it has been abolished, the term is often popularly used. Where dower is abolished. the interest substituted may be in one oi several forms, perhaps a certain portion of the husband's property, or of the community property of both or of a life estate in a portion of his realty. *See* also HUSBAND AND WIFE; MARRIAGE, LAW OF.

DOWIE, JOHN ALEXANDER (1847–1907), U.S evangelist and faith healer. founder of the Christian Catholic Church, was born in Edinburgh, Scot.. May 25, 1847, but moved with his family to Australia as a boy. He returned to study theology in Edinburgh before entering the Congregational ministry in Australia in 1872. A remarkable healing experience led to his developing a deep interest in spiritual healing and eventually to his founding the International Divine Healing association; indeed, healing characterized his entire subsequent ministry. In 1888 he went to the United States, settling eventually in Chicago, where he had notable success as evangelist and healer. opened various "Divine Healing Homes" and began the publication of *Leaves of Healing.* Finally, in 1896. he founded the Christian Catholic Church, which, sate for its healing emphasis and practice of triune baptism, differed little from the more millennial-minded orthodox Protestant churches. In 1901 he established Zion City, about half-way between Chicago and Milwaukee, Wis., on the shore of Lake Michigan, with about 5,000 of his followers, and there introduced various industries and ruled the community as a theocracy. In the same year he proclaimed himself as Elijah the Restorer, and later as First Apostle of the church. But unwise expenditures put a heavy strain on the finances of the. movement, and Dowie's health began to fail. He appointed Wilbur Voliva as temporary head; later Dowie was removed and Voliva elected overseer. Dowie died on March 9, 1907.

The Christian Catholic Church survived the debacle, and most of the church properties were saved, but control of the community and its industries was lost. The annual Passion Play is the church's most outstanding activity, though work is actively carried on in other cities of the U.S. and in a dozen countries around the world. (C. S. B.)

DOWLAND, JOHN (1563–1626), English composer and lute virtuoso, enjoyed a great reputation in Europe in his own lifetime. Nothing is known of his early life or training and there is little evidence to substantiate the theory that he was born in Ireland. From 1580 to 1584 he was in Paris in the service of two successive English ambassadors there and. according to his own account, it was at this time that he first came under the influence of various exiled Catholics. Soon after, he returned to England and married, and in 1588 received the degree of bachelor of music at Oxford. Disappointed in his hopes of obtaining a place among Queen Elizabeth I's musicians (he attributed this to his religious beliefs, which seems strange when one considers that William Byrd and other Catholics were high in royal favour), he set out in 1594 on a long European journey that took him through Germany to Venice and Florence. He appears to have met uith great success at all the courts he visited and to have made the acquaintance of several distinguished musicians. Though he did not reach Rome, where he had intended to study with Luca Marenzio, he claimed to have been offered a "large pension of the Pope" but to have become alarmed at finding himself among enemies of his country. Whether or not this was true (he may merely have been concerned to forestall any reports of the treasonable company he had been keeping), he returned to England for a short period. In 1595 he was appointed lutenist to Christian IV of Denmark at a salary rivaling those of the highest officers of state. In spite of this and additional munificent gifts. Dowland managed to get into financial difficulties and also overstayed his leaves of absence in England. In 1606 he was finally dismissed from the Danish service and settled in London where, in 1612, he was appointed one of King James's "musicians for the lutes"—a post he retained until his death.

Although Dowland's contemporary reputation rested very largely on his powers as an executant (the poet Barnfield wrote of "Dowland . . . whose heav'nly touch upon the lute doth ravish human sense"), his compositions have secured him his place in musical history. Of these, his songs with lute accompaniment have hitherto attracted most attention; 85 are contained in his four "books of ayres" (1597, 1600, 1603 and 1612) and three more in *A Musicall Banquet* (1610), compiled by his son Robert. They confirm Dowland as the greatest, as well as the earliest, of the English school that produced such a wealth of lute songs in the first quarter of the 17th century. Others were to rival him in the brisk, light vein, but no one equaled the intensity of his more serious songs. which reflect a deep personal melancholy. His *Lachrimae* (1605) bear witness to the same temperament, being a collection of "seaven passionate pavans" for five viols and lute. The first of these *(Lachrimae Antiquae)* is a reworking of a pavan that had also appeared as ***Flow*** *my tears* in the second book of ayres; the remaining six are thematically related to it, and the collection also contains 14 further dances. Of Dowland's solo lute music between 70 and 80 pieces have been preserved in English and continental sources—an output as remarkable for quality as for quantity.

See P. Warlock, *The English Ayre (1926);* complete songs in *The English School of Lutenist Song Writers, ed.* by *E.* H. Fellowes (1920–32). (J. J. N.)

DOWLAS, a plain cloth, similar to sheeting but usually coarser. In the 16th and 17th centuries dowlas was a linen fabric, made in England, Scotland and France, and used for rough towels, workmen's shirts and the like. It now refers to a coarse cotton fabric with a glazed finish, made in imitation of linen dowlas and used for some household and apparel purposes. It has largely been replaced by calico (*q.v.*).

DOWN, a maritime county of Northern Ireland, occupying

the most easterly part of the island, is bounded on the north by Belfast lough, east by the Irish sea, south by Carlingford lough, west by County Armagh and northwest by County Antrim. Its area is 952 sq.mi.

Physical Features. — The county is generally undulating with three areas of high ground: the Mourne mountains (Slieve Donard. 2.796 ft.) in the south; the Ballynahinch mountains (Slieve Croob, 1,755 ft.) in the centre; and the lo er Castlereagh and Holywood hills in the north. To the northwest of Slieve Croob lies the valley of the Lagan, which rises in these mountains. To the west the land falls to the Newry basin and the river Bann, and eastward it slopes gently down to the low-lying Ards peninsula, which encloses Strangford lough, a large tidal inlet noted for the number of its islands, its beauty and its bird life. Besides Strangford and Carlingford Ioughs and other glacial effects, the last great Ice Age left a belt of low whale-backed hills known as drumlins, extending westward from central Down; these give variety and richness to the landscape.

The foundation of the county is Silurian rock throughout, with much slate and sandstone; it is a continuation of the southern uplands of Scotland. The Caledonian granite which appears in southern Armagh continues northeastward to Slieve Croob, furnishing excellent building stone. South of it, the Eocene granite of the Mourne mountains forms a group of rocky summits divided by valleys, of which the Silent valley is one of the main sources of Belfast's water supply. Basalt dikes abound in the lower parts of the county. At the head of Strangford lough basalt has protected Triassic sandstone, and basalt, protecting chalk and Triassic formations, also extends through the northnestern part of Down.

The climate is temperate, equable. humid and rather cloudy with plentiful, though often localized, rainfall varying from 65 in, in the Mournes to less than 35 in. a year in the east and north. Although the soil on the southern slopes of the hills in the north is very fertile, producing two or even three crops a year, the predominating soil is a shallow loam mixed, particularly in hill areas, with stones, nhich are used for the characteristic field boundary walls. Clay is mostly confined to the east coast and the northern parts of Castlereagh rural district, and sandy soil is found mainly around Dundrum bay. Moorlands are confined to the lower mountain slopes.

History. — Down contains many relics of ancient man, particularly megalithic monuments. In the Giant's Ring, south of Belfast, a cromlech stands enclosed by a broad rampart 12 ft. high and more than 600 ft. in diameter. and near Newcastle there is a well-preserved souterrain. There are also early Christian remains, for it was at Saul near Downpatrick that St. Patrick began his mission in Ireland in 432, and at Bangor a great monastic school flourished from the 6th century. The saint's drinking well and bath houses are preserved at Struell in the vicinity of Downpatrick, and a boulder marks his reputed grave in the grounds of Downpatrick cathedral *(see* DOWNPATRICK). Dromore *(q.v.)* is the ancient ecclesiastical capital of Down. In the late 12th century Down was invaded by John de Courci, who made a considerable area subject to his control; the mounds which formed the bases for his forts can still be seen in many places. Sumerous castles fringe the eastern part of Down, the best examples being the ruined Norman castle of Dundrum and Jordan's castle in the village of Ardglass, built in the late 14th century and virtually intact. Although English influence shrank in the later middle ages, it never lost its hold upon the peninsula of Lecale between Dundrum and Downpatrick. In later Tudor times parts of Down were colonized by English and Scottish adventurers; and, though the county did not form part of the scheme for the plantation of Glster in the reign of James I. there was a big influx of colonial population at this time.

Population and Administration. — County Down had a population of 267.013 in 1961. Downpatrick (4,219) is the county town, but Bangor (23,865) is the largest town and one of the two municipal boroughs, the other being Newtownards (13,090). The city of Belfast overflows its boundaries into the northwestern part of the county. At Hillsborough is the official residence of the governor of Northern Ireland, and the parliament house is also within the county at Stormont. County Down returns eight members to the parliament of Northern Ireland and two to the United Kingdom parliament.

Agriculture and Industry. — Down is a predominantly agricultural county, the chief crops being oats, flax, potatoes and seed hay, with some vegetables for the Belfast market. Beef and dairy cattle, sheep and pigs are raised and there is extensive dairy and poultry farming. **A** large quantity of white fish is landed at Portavogie. Kilkeel and Annalong, and a considerable herring fleet operates from Ardglass.

By 1962 the forestry division of the ministry of agriculture had acquired 9,171 ac. of which about 7,000 ac. have been planted with trees. Because of the climate, these afforestation schemes were expected to reach maturity in 20% less time than in most parts of Great Britain. Tollymore park (c. 1.200 ac.), at the foot of the Mourne mountains. became the first forest park in Northern Ireland in 1955. Near Annalong and in other parts Mournes granite is extensively quarried.

There is industrial activity in many towns. In Newry there are spinning and weaving of both linen and cotton, the manufacture of waterproofs and other clothing, and the processing of food products such as dehydrated potatoes. At Banbridge there are spinning, weaving, bleaching and finishing of linen and the manufacture of footwear. Newtownards, much industrialized, carries on rayon weaving, fabric printing, and the manufacture of hosiery, aircraft components, draftsman's instruments and sheet metal work. Card and fibre boxes are made at Warrenpoint, electrical goods at Newcastle (q *v.*), and leather is tanned at Killyleagh. At Castlereagh, which is within easy reach of Belfast, there is a modern industrial estate whose products include computers, industrial driers and welding equipment.

There is an active tourist industry in the county, particularly at coastal toans such as Bangor, Donaghadee. Newcastle, Kilkeel and Warrenpoint, and at the seaside resorts of the Ards peninsula. The only railways are from Belfast to Bangor and from Newry to Warrenpoint. There are about 1,150 mi. of trunk and classified roads in the county.

See A. Knox, *A History of County Down (1875)*; J. Stevenson, *Two Centuries of* **Lzfe** *in Down, 1600–1800 (1920).* (HU. S.; J. H. **HA.**)

DOWNERS GROVE, a residential city in Du Page county, Ill., U.S., 21 mi. S.W. of Chicago. Pierce Downer settled there in 1832 and soon thereafter a tavern was erected at the site, in a hardwood grove surrounded by prairies, to facilitate stagecoach traffic along the modern U.S. highway 34 route. With the construction of the nearby Illinois-Michigan canal more settlers arrived, and after 1864, when the Chicago, Burlington and Quincy railway extended its road to Aurora, Downers Grove became a prosperous suburb of Chicago. Residents commute between Downers Grove and Chicago, the Argonne National laboratory for atomic-energy research near Lemont. Ill., and other areas. Industries within Downers Grove include the manufacture of plastics, roller bearings and power transmission equipment. For comparative population figures *see* table in ILLINOIS. Population.

(H. L. SM.)

DOWNING, SIR GEORGE *(c.* 1624–1684), English diplomat and public servant, made vigorous contributions to his country's prosperity as a financial and commercial administrator. He is also remembered as one of Harvard's first graduates and as "godfather" of Downing street. He was born in Dublin of Puritan stock, the son of Emmanuel Downing. barrister, and Lucy, sister of Gov. John Winthrop. In 1638 his family joined Winthrop in Massachusetts and George entered the newly founded Harvard college. By 1646. however, he was back in England serving in the parliamentarian army; he rose to be chief of intelligence to the forces in Scotland. He sat in the parliaments of 1654, 1656 and 1659. He was sent to France in 1655 to remonstrate on the massacre of the Protestant Vaudois apd was appointed resident at The Hague in 1657 nith instructions to effect a union of Protestant powers. to protect English commercial interests and to spy on the activities of exiled royalists.

By late 1659 Downing was ready to assist a restoration of the

monarchy. Charles II appraised his abilities, giving him a knighthood in 1660 and a baronetcy in 1663. In parliament Downing gave expression to his determination to build up English commercial prosperity at the expense of the Dutch in the Navigation act of 1660 and other protective economic legislation. Eventually his pugnacity as the king's envoy at The Hague fostered the outbreak of the first Dutch War. During the conflict he facilitated government borrowing by introducing a strictly regulated system of repayments based on the appropriation of parliamentary supplies. His appointment as secretary to the new treasury commission in May 1667 enabled him to realize his plans for the efficient management of public finances. In Sept. 1671 he left this post to become head of the customs commission, and was sent again to The Hague, avowedly to incite another war. His rapid success obliged him to flee prematurely in fear of his life; he was disgraced for disobeying orders and spent several weeks in the Tower of London. After his release he continued to serve the crown as a customs and exchequer official until his death in Cambridgeshire in July 1684.

Downing left a lasting mark on treasury methods of business and on English mercantile law, but his assiduity won him few friends. He was arrogant and mean and he has generally been stigmatized as treacherous for his zeal in seizing for execution in 1662 three fugitive regicides, one of whom had been his patron. Samuel Pepys, once his clerk, gave grudging admiration to a man not only as painstaking as himself but more successful in amassing a great fortune. Reputed one of the richest men in England, Downing acquired large estates in Cambridgeshire as well as the property in London which bears his name. In 1764 this wealth went toward the foundation of Downing college, Cambridge, according to the will of the 3rd and last baronet. Downing had married a sister of Charles Howard, afterward earl of Carlisle, in 1654, and William of Orange (later William III) was godfather to some of his children.

See J. Beresford, *The Godfather of Downing Street* (1925); C. Wilson, *Profit and Power: a Study of England and the Dutch Wars* (1957). (H. G. Ro.)

DOWNING, **MAJOR JACK:** see SMITH, SEBA.

DOWNPATRICK, an urban district, market and county town of County Down, N.Ire., lies 22 mi. S.S.E. of Belfast by road, where the Quoile river broadens into its estuary in Strangford lough. Pop. (1961) 4,219. The Dunum of Ptolemy and the Dun-de-lath-glas (fortress of the two broken fetters) of Irish chronicles, it takes its name from dun (fortress) and from its association with St. Patrick. Formerly a MacDunleavy stronghold, it was seized in 1177 by the Anglo-Norman adventurer John de Courci (*q.v.*) and served as his headquarters until 1203. The adjacent barony of Lecale, forming a peninsula between Strangford lough and Dundrum bay, has relics of many castles of this period and remained in English occupation during later centuries when English rule lapsed in most other parts of Ireland. At Saul, 2 mi. from Downpatrick, St. Patrick (*q.v.*) began his mission in Ireland in A.D. 432. De Courci used the cult of St. Patrick to the utmost to placate the native Irish; but his claim that he laid the remains of SS. Patrick, Bridget and Columba in one grave in Downpatrick is not taken seriously by any competent authority. This grave, which is in the grounds of the present Church of Ireland cathedral, is marked by a rough granite monolith. The cathedral was built in 1790 but incorporates the chancel of an older building. The 1500th anniversary of St. Patrick's landing was commemorated by the erection in 1932 of a small (Church of Ireland) church of Mourne granite at Saul and a large statue under Roman Catholic auspices on an adjacent hill. Downpatrick is a market town containing the county administrative offices, a hospital and some pleasant Georgian buildings. The remains of the Cistercian Inch abbey, founded by De Courci in 1180 are 2 mi. N. (Hu. S.)

DOWNS, the name given in the south of England to rounded and grass-covered hills. The most characteristic "downs" are built of chalk, but in the west (Somerset and Devon) the name is applied also to hills composed of other geological formations, although of similar appearance and history. In contrast, chalk hills of similar type are termed "wolds" in Lincolnshire and Yorkshire.

The main area of chalk downland lies in Berkshire, Wiltshire and northern Hampshire, centring around Salisbury plain. From this an offset runs southwest, turning abruptly and terminating in the Isle of Wight. Three main spurs run east. The South downs follow the seacoast through Sussex, reaching their highest point in Butser hill (889 ft.) and terminating in the cliffs of Beachy head. The North downs follow the southern boundary of the Thames valley, reach a maximum height of 868 ft. and bend southeast to finish in the "white cliffs of Dover." The largest and northernmost spur runs northeast as far as East Anglia. It is breached by the Thames at Goring, then becomes the dissected and wooded country of the Chilterns and only regains the character and name of downland east of Tring, in the vicinity of Dunstable. The region lying between the North and South downs is known as the Weald (*q.v.*).

Because of the porous nature of the chalk, the summits of the chalk downs are dry in summer. The only surface water available is usually in "dew ponds" where the winter rains are stored on a clay foundation. Under these dry conditions tree growth would normally be slow even if undisturbed. It has been prevented by sheep and rabbit grazing which destroys any isolated seedlings. Lower, on the flanks of the downs, there are often woodlands, sometimes in the form of beech "hangers," especially common (*e.g.*, in the Chilterns) where furniture making has remained a local industry. Other noticeable woodland features are the local abundance of yew, juniper and box (*e.g.*, at Box hill). The yew wood at Kingley vale, a national nature reserve, has been described as the finest in Europe. There is reason to believe that the downs were formerly well wooded and that the chief trees were oak and ash, beech having spread after the original woods were cleared. Yew, a shade-tolerant tree, is believed to have established itself in the shade of the beeches.

The downs are also especially noteworthy for the numerous remains of ancient man they bear. The best known perhaps are the figures such as white horses cut out of the turf, the oldest of these being relics of pre-Conquest times when Anglian and Danish settlers worshiped Odin, whose white steed is thus represented. Other frequent prehistoric remains show that Neolithic men settled on the hilltops, which were then either open woodland or easily cleared, avoiding the denser woodlands in the swampy clayey valleys below. The pathways thus ran along the ridges and led to Salisbury plain, which became a natural centre of the early civilizations. The great megalithic monuments at Avebury and Stonehenge show that these early settlements were powerful and their populations numerous. Later monuments include Celtic linchets as well as the great ring encampments, many of which had been several times improved and strengthened so that, like Maiden Castle, the most famous, they were in use even at the time of the Roman invasions. The use of the downs for grazing and agriculture is thus probably very ancient.

After this the gradual and continued clearing of lowland forests led to the development of new routes running toward the north and south rather than east and west. Thus in medieval times, the gaps through the downs, mostly cut by rivers, became more important than the ancient ridgeways. They were marked by a series of medieval fortresses and towns, now usually nodal points in the railway system; *e.g.*, Winchester, Lewes, Rochester, Guildford, Arundel. But although the general use of the downs as ridgeways decreased, their pastoral use increased with the introduction of rabbits and the spread of sheep grazing after the 12th century. Much of the wealth of rural England came to be associated with the wool so nurtured.

The characteristic bare and rounded summits of the downs with their springy turf are thus very old and there has been time enough for them to develop an individual vegetation, including rare orchids, as well as a distinctive animal life, with many snails and insects which are almost restricted to this dry and lime-rich habitat. These features are rapidly disappearing. The coming of mechanized plows made it possible to cultivate all but the steepest slopes, and the original turf is everywhere being replaced by arable crops or by manured leas using improved grasses of high yield (*e.g.*, cocksfoot) and clover. Thus it is possible to maintain and fatten

cattle where formerly sheep or rabbits ruled. Further, the tractor meant the disappearance of the traditional downland flocks and their shepherds as well as the turf on which they grazed.

THE DOWNS is also the name of a roadstead in the English channel off Deal between the North and the South Foreland. It forms a favourite anchorage during heavy weather, protected, except during severe southerly gales, by the Goodwin sands. It has depths of 12 fathoms.

DOWNSIDE, a modern Benedictine abbey with its associated independent Roman Catholic boarding school for boys. is situated near the village of Stratton-on-the-Fosse, Bath, Somerset, Eng.

The direct descendant of the English Roman Catholic foundation in 1605 at Douai, France, the community was transferred during the French Revolution first to Acton Burnell, near Shrewsbury, and finally in 1814 to Downside. The monastery, the abbey church—of cathedral splendour—and the school have been developed into striking examples of modern architecture.

The school, whose housemasters are members of the community, is a public school. Cardinal Gasquet *(see* GASQUET, FRANCIS NEIL) was educated there. (T. J. HT.)

DOWRY is a term denoting the property, whether realty or personalty, that a wife brings to her husband on marriage. It is not a word that has all the technical connotations and implications of the French *dot* because of the different roots from which English and French law respectively have sprung. In English law, until the enactment of the Married Women's Property act, 1870, the wife's property passed, in law, absolutely to the husband: the rigour of this rule was modified by the application of the rules of equity to the provisions of settlements, with the result that property was brought into the marriage settlement by the husband or by the wife, or by both, or by persons (such as the parents of either) interested in their welfare, and while the legal estate was vested in the trustees of the settlement, the beneficial interest in the property included in the settlement vested as provided by the terms of the deed. Thus, while in law a married woman could own no property, the position in equity was quite different. With the passage into law of the Married Women's Property act marriage settlements were no longer necessary for preserving the wife's title to her own property, although of course the purpose of creating a fund for the benefit of the spouses and their children still remained.

In countries, such as France, where Roman law remained the basis of the law of the country and was received as such, the husband's rights in relation to the *dot* were never unlimited, and certain rights remained to the wife to take legal steps to protect the property which she had brought into the community of goods.

In many primitive societies husbands make a payment to their fathers-in-law, and the wife is often, in effect, bought from her father *(see* BRIDEWEALTH). The idea of the dowry is fundamentally different, namely that the bride or her father makes a payment to her husband to help him to discharge the responsibilities he assumes on marriage. But the institution of the dowry, performing these simple and elemental functions in relation to ordinary marriages, has played an important part in building the power and wealth of great families and even in determining the frontiers and the policies of states. The importance of the dowry in the framing of dynastic policies is epitomized by the epigram *Alli bella gerunt: tu, felix Austria, nube* ("Others wage wars: you, happy Austria, get married"); and the practice of preferring marriage to wars of conquest was not confined to Austria. *See* also HUSBAND AND WIFE, LAWS CONCERNING. (W. T. Ws.)

DOWSING: *see* DIVINING ROD.

DOWSON. ERNEST CHRISTOPHER (1867–1900), English poet representative of the "decadent" writing of the 1890s, was born at Lee, Kent, on April 2. 1867, the son of the proprietor of a London dry dock who suffered from tuberculosis. Having passed much of his childhood abroad, Dowson was at Queen's college, Oxford, from 1886 to 1888 and then began work in his father's office. He spent his evenings in Soho cafés and in taverns round the Strand with young writers and artists (including Arthur Symons. Lionel Johnson, W. B. Yeats and Aubrey Beardsley), with whom he became a member of the Rhymers' club. In 1891 he met the 12-year-old Adelaide Foltinowicz, a Polish café-owner's daughter, with whom he fell in love. In 1895, however, Dowson's father died and his mother killed herself; and his depression was deepened by Adelaide's marriage (1897).

Going to France for the last time in 1897, he lived a lonely life in poverty and illness, consoled by alcohol and sustained by his earnings as a translator for a disreputable publisher, Leonard Smithers. He returned to London in 1899 and died at Catford on Feb. 23, 1900.

Dowson published some prose fiction and a verse drama, ***The Pierrot of the Minute*** (1897), but is chiefly remembered for his few poems *(Verses,* 1896, dedicated to Adelaide Foltinowicz; *Decorations,* 1899; *Poems,* ed. by Arthur Symons, 1905; *Poetical Works,* ed. by Desmond Flower, 1934 and 1950). These poems show the influence of Latin writers in their contemplation of mortality; of Swinburne in their metrical structure, in their alliteration and in their vocabulary; and of Verlaine in their broken rhythms and in their tone of disillusionment with the contemporary world to which the poet ironically belongs.

Dowson expressed, with exquisite grace and in verses of great technical accomplishment, a mood of lassitude and a sense of fragility characteristic of his period but still meaningful as reflections of genuine experience. His stanzas with the refrain "I have been faithful to thee Cynara, in my fashion," his sonnet "To One in Bedlam" and his quatrains "Impenitentia Ultima" may be cited as typical.

See M. Longaker, *Ernest Dowson* (1944).

DOXOLOGY, an ascription of praise to God. In Christian worship there are three common doxologies:

1. The Greater Doxology or *Gloria in excelsis,* used in the Roman Catholic Mass. the Orthodox liturgies and many Anglican, Lutheran and Protestant orders:

Glory be to God on high, and on earth peace to men of good will. We praise thee, we bless thee, we worship thee, we glorify thee, we give thanks to thee for thy great glory, O Lord God, heavenly King, God the Father Almighty. O Lord, the only-begotten Son, Jesus Christ; O Lord God, Lamb of God, Son of the Father, that takest away the sins of the world, have mercy upon us Thou that takest away the sins of the world, receive our prayer. Thou that sittest at the right hand of God the Father, have mercy upon us. For thou only art holy; thou only art the Lord; thou only, O Christ, with the Holy Ghost, art most high in the glory of God the Father. Amen.

2. The Lesser Doxology or *Gloria Patri,* used in most Christian traditions at the close of the psalmody:

Glory be to the Father, and to the Son, and to the Holy Ghost, as it was in the beginning, is now, and ever shall be, world without end. Amen.

3. Metrical doxologies, usually variations upon the *Gloria Patri.* The most familiar in English is that of Thomas Ken:

Praise God, from whom all blessings flow;
Praise him, all creatures here below;
Praise him above, ye heavenly host;
Praise Father, Son, and Holy Ghost. Amen.

(J. J. PN.)

DOYLE, SIR ARTHUR CONAN (1859–1930), English novelist and historian best-known as the creator of the modern detective story and of the character of Sherlock Holmes, was born in Edinburgh, May 22, 1859. Educated at Edinburgh university, he practised medicine until 1891, when he published *The White Company, a* historical novel to which *Sir Nigel* (1906) was a worthy successor. His interest in the Napoleonic Wars inspired two short novels, a play and the sympathetic character of Brigadier Gerard, a creation on which rests his reputation as a humorist.

Rut it was through his cycle of Sherlock Holmes stories—the first of which appeared in 1887—that he attained universal recognition. His dexterous handling of the plots, and the crisp quality of the narrative, set a new tone in the technique of short-story writing, while the ingenious methods suggested for the detection of crime eventually furthered the advance of criminology.

Admired and respected by his fellow authors, Conan Doyle felt it a duty to give a lead in national affairs. In 1902 a knighthood acknowledged his work with the Langman field hospital in Bloemfontein, a history of the Boer War (1900) and a pamphlet vindicating the British army (1902). His interest in military matters, his activities with the Congo Reform association, his inquiries into two notable miscarriages of justice, the question of tariff reform and other public affairs took up much time. His *The British Campaigns in Europe* (definitive edition 1928) is a monument of scholarship. In 1917, Sir Arthur declared himself a spiritualist and the rest of his life was dedicated to the propagation of his faith. He died in Crowborough, Sussex, July 7, 1930.

DOYLE, RICHARD (1824–1883), Anglo-Irish caricaturist, painter and illustrator who, together with his father, John Doyle, introduced into British caricature a moderate satiric tone, opposed to the savagery and unruliness of Gillray and Rowlandson. He was born in London in Sept. 1824, and studied with his father. From 1843 he regularly contributed decorations, theatre sketches and political caricatures to *Punch,* whose familiar cover he designed. But in 1850 he resigned because of *Punch's* anti-Catholic statements, and devoted himself to painting fanciful water colours which he often exhibited at the Royal Academy, and to book illustration (Thackeray, *The Newcomes,* 1854–55; Dickens' Christmas books; etc.). He died in London, Dec. 11, 1883.

JOHN DOYLE (1797–1868), who was also known by the pseudonym "HB" from cypher of his initials, HB, was the father and teacher of Richard Doyle. He was born in 1797 in Dublin where he studied under G. Gabrielli and J. Comerford. He settled in London in 1821, and after an unsuccessful spell at portraiture he turned in 1829 to political caricatures. Immensely popular, they were praised by Macaulay and Wordsworth and collected in their entirety by Prince Metternich. Doyle made 917 plates, about 600 designs for which are in the British museum. He retired in 1851 and died in London, Jan. 2, 1868.

DÓZSA, GYÖRGY (1475–1514), leader of the Hungarian revolution of 1514, was a Szekler nobleman and soldier of fortune who had won such a reputation for valour in the Turkish wars that in 1514 he was appointed to organize and direct a new crusade against the Muslims. In a few weeks he recruited from among peasants thousands of volunteers, who, assembled in their counties, soon began to voice the grievances of their class. The situation worsened because no food or clothing had been provided for them, and when at harvest time the landlords ordered them to return to reap the fields, they refused. The landlords retaliated by maltreating the wives and families of the volunteers and setting armed retainers on the half-starved peasants. The movement was changed into a war of extermination against the landlords, and Dózsa lost control of the rabble. The rebels burned hundreds of manor houses and castles and killed thousands of the nobility. As the rising became a full-fledged revolution, the feudal levies of the kingdom were called out and mercenaries were hired from abroad. At first it seemed that the government was incapable of coping with Dózsa and his bands: the fortresses of Arad, Lippa and Világos fell, and Buda itself was threatened. At last, however, the rebels were destroyed. Dózsa was routed in Temesvár by the combined forces of János Zápolya and István Báthory (father of the future Stephen of Poland), taken prisoner and executed.

See D. *G.* Kosary, *A History of Hungary* (1941), with bibliography; S. Marki, *Dózsa Gyorgy* (1913), *in* Hungarian. (GE. GR.)

DOZY, REINHART PIETER ANNE (1820–1883), Dutch Arabic scholar of French (Huguenot) origin, is best remembered for his monumental *Histoire des musulmans d'Espagne, jusqu'à la conquête de l'Andalousie par les Almoravides, 711–1110* (1861). Dozy was born in Leiden in 1820 and died there in May 1883, having been professor of history at the university for 33 years. His history, a graphically written account of Moorish dominion in Spain which shed new light on many obscure points, long remained the standard work on the subject. His *Recherches sur l'histoire politique et littéraire de l'Espagne pendant le moyen âge* (2 vol., 1849; recast in 1860 and 1881) forms a trenchant addition to the *Histoire.* His *Supplément aux dictionnaires arabes* and the *Glossaire des mots espagnols et portugais* (ed. with *W.* H. Engelmann of Leipzig) are works full of research and learning and storehouses of Arabic lore. Dozy also edited many Arabic texts. *Het Islamisme* (1863), a popular exposition of Mohammedanism, is more controversial, and *De Israeliten te Mekka* raised criticism on religious grounds in Jewish circles.

See M. *J.* de Goeje, *Biographie de Reinhart Dozy (1883);* and biographical introduction to *Spanish Islam* (1913), F. *G.* Stokes's translation of Dozy's *Histoire des musulmans d'Espagne.*

DRACAENA, the common and generic name of certain shrubs or trees of the family Liliaceae (*q.v.*), containing about 50 species in the warmer parts of the old world. They have long, generally narrow leaves, panicles of small whitish flowers and berried fruit. The most remarkable species is *Dracaena draco,* the dragon tree of the Canary Isles, which reaches a great size and age. The famous specimen in Teneriffe, which was blown down

EDGAR AUBERT DE LA RUE

DRAGON TREE (DRACAENA) OF FRENCH SOMALILAND

by a hurricane in 1868, was 70 ft. high with a circumference of 45 ft. several feet above the ground and was supposed to be 6,000 years old. A reddish resin exuding from the trunk is known as dragon's blood (*q.v.*). D. *fragrans* and *D. goldieana* are common greenhouse plants.

Some of the cultivated dracaenas of the florist belong to the closely allied genus *Cordyline.* They are grown for the beauty of form, colour and variegation of their foliage and are extremely useful as decorative house or greenhouse plants and for table decoration. A large number of the garden species of dracaena are varieties of *Cordyline terminalis* of eastern Asia.

DRACHMA, a silver coin of ancient Greece and the monetary unit of modern Greece. Its name was derived from the Greek verb "to grasp," and its original value was equivalent to that of a handful of arrows. The drachma had different weights in different regions. From the 5th century B.C., Athens gained commercial pre-eminence and the Athenian drachma became the foremost currency. The silver coin weighed 4.367 g. One drachma equaled 6 oboli, 100 drachmas 1 mine and 60 mine 1 Attic talent.

As a result of the conquests of Alexander the Great, the Athenian drachma came to be the monetary unit of the Hellenistic world. In time, silver coins of one drachma and its multiples were debased and progressively higher proportions of copper were admixed. The

drachma also became the prototype of an Islamic coin—the dirhem.

When Greece attained its independence from Turkey in 1828, the phoenix was introduced as the monetary unit, but it was replaced in 1831 by the drachma. In 1875 Greece joined the Latin Monetary union and the value of the drachma was set equal to that of the franc. Only paper money circulated in Greece, however, and before World War I the drachma was quoted at a discount to gold. During the war its value was maintained by virtue of the demand for Greek money by Allied forces stationed in Salonika. The outbreak of war with Turkey in 1919 caused serious inflation in Greece. By the end of 1920 the drachma had fallen from a par of 19.295 U.S. cents to 7.56 U S. cents. Defeat by Turkey depressed the drachma still further Even though exchange controls were introduced in 1931, the value of the drachma could not be maintained, and in 1936 there was a new effort at stabilization which linked the drachma to the pound sterling. The new exchange rate was fixed at between dr. 540 and dr. 550 to the pound.

BY COURTESY OF ROYAL GREEK EMBASSY

DRACHMA ISSUED DURING THE REIGN OF KING GEORGE I OF GREECE

From 1940 to 1944 Greece was under German occupation and its currency was subject to rigorous German regulation. Following the liberation of 1945, Greece entered a period of staggering inflation. With the assistance of the United States the economy gradually recovered and the inflationary forces were brought under control. In May 1954, a new official rate of dr. 30 per dollar or dr. 84 per pound was introduced; the official buying and selling rates for the U.S. dollar were set at dr. 29 85 and 30.15 respectively. (B. F. H.; Jo. M. L.)

DRACHMANN, HOLGER HENRIK HERHOLDT (1846–1908), Danish writer, most famous for his lyrical poetry, was born in Copenhagen, where his father was a physician on Oct 9, 1846. After leaving school he studied painting, exhibiting for the first time in 1869. At the same time he began to nrite, for which a journey in 1867 to Scotland, Spain and Italy supplied material. A visit to London in 1871 awakened an interest in social problems and after his return he joined the new radical movement of which Georg Brandes was the central figure. In 1872 he published his first work, *Digte,* a collection including both lyrics and poems expressing his theories.

During the following years he established his position as the greatest poet of the modern movement in Danish literature with collections such as *Dæmpede Melodier* ("Muted Melodies," 1875), *Sange ved Havet* ("Songs by the Sea") and *Venezia* (both 1877) and *Ranker og Roser* ("Weeds and Roses," 1879). The prose *Derovre fra Grænsen* ("From Over the Border," 1877), containing descriptions of the war against Austria and Prussia in 1864, and the verse fairy tale *Prinsessen og det halve Kongerige* ("The Princess and Half the Kingdom," 1878), showed a patriotic and romantic trend which brought him into conflict aith the Brandes group, and about 1880 he took up a bourgeois-conservative standpoint opposed to naturalism. This phase was most clearly expressed in the travel book *Skyggebilleder* ("Shadows," 1883). Toward the end of the 1880s he returned to an individualist radicalism and a challenging, antibourgeois cult of freedom and beauty.

Drachmann was emotional by nature, and had much of the romantic bohemian in his make-up. Recurrent figures in his writings are the minstrel and the knight-errant. At the same time he was hard-working and very prolific. His output was of great variety, including verse, short stories, novels and plays. His lyric verse is the most important of the period. He forsook classical prosody for a freer metre and a lively rhythm. reflecting the cadences of natural speech. His imagery, which is often dreamlike and visionary, generally reflects his inner emotional world. Apart from his love poetry, his favourite subjects are the sea and life by and on it. The best later collections are *Gamle Guder og Nye* ("Old and New Gods." 1881). *Sangenes Bog* ("The Rook of Songs," 1889) and *Den hellige* Ild ("The Holy Flame," 1899). Many of his stories describe fishermen and sailors. as in Paa *Sømands Tro og Love* ("Sailor's Honour," 1878) and *Lars Kruse* (1879), which reveal his sympathy with simple folk. His novels are often partly autobiographical, the characters being artists or writers, as in the most important, *Forskrevet* ("Pledged," 1890), in which his own personality is seen split into its bourgeois and bohemian components. Drachmann was not pre-eminently a novelist or a writer of epics, though he was a great stylist. Neither can his plays be counted among his best work, though the fantasy, *Der var engang* ("Once upon a Time," 1885) remains a favourite, chiefly because of Peter Lange-Müller's music. The melodramas *Vølund Smed* ("Volund the Smith," 1894) and *Renæssance* (1894) also enjoyed success. Drachmann died at Hornbaek on Jan. 14, 1908.

BIBLIOGRAPHY.—Drachmann's poems were published in 12 volumes (1906–09). *See* also *G* Brandes, in *Samlede Skrifter* (1899–1910), vol *3;* V. Vedel, H. *Drachrnann* (1909); Paul V. Rubow, *H. Drachmann, 3* vol. (1940–50). (S. M. K.)

DRACO (DRAKON), the name of an Athenian lawgiver of the 7th century B.C. His code is generally dated to 621; Aristotle says, in the archonship of Aristaechmus. which shows that unlike Solon, Draco was not himself made archon to perform his task.

The six junior archons *(thesmothetae)* are said by Aristotle to have been instituted, after 683. to record the laws. If this is correct, Draco's code was not the first reduction of Athenian law to writing, but it may have been the first comprehensive code, or a revision prompted by some particular crisis. The code was later regarded as intolerably harsh, punishing trivial crimes with death; it was probably unsatisfactory to contemporaries, since Solon not many years later repealed all but the laws dealing with murder and issued a new code. A decree of 4091408 B.C. orders the public inscription of this murder law, which is partly extant. Later authors refer to other laws of Draco, which may be genuine; but the constitution ascribed to Draco in ch. 4 of the *Constitution of Athens (q.v.)* by Aristotle is certainly a later fabrication.

Tod, *Greek Historical Inscriptions,* vol. *I,* no. 87 (2nd ed. 1946); Pollux, ix, 61. *See* also *G.* Busolt and H. Swoboda, *Griechisches Staatsrecht,* ii, 803–817 (1926); C. Hignett, *History* of *the Athenian Constitution,* pp. 305–311 *(1952).* **(A. As.)**

DRACO (the Dragon), in astronomy, a constellation of the northern hemisphere. The Greeks had many fables concerning this constellation; one is that when Hercules killed the dragon guarding the Hesperian fruit, Hera transferred the creature to heaven as a reward for its services. It stands between the bears, Ursa Major and Ursa Minor, keeping them apart. The star γ Draconis has acquired historic interest because, from his observations of it, James Bradley discovered the phenomenon of aberration of light *(see* ABERRATION [OF *LIGHT]).* It enjoyed this distinction because it is the brightest star that passes close to the zenith of Greenwich. so that errors of observation arising from refraction are minimized. *See* CONSTELLATION.

DRACONTIUS, BLOSSIUS AEMILIUS (5th century A.D.), the foremost Christian Latin poet of Africa, flourished at the time of the literary revival which took place under Vandal rule in the latter part of the 5th century. At Carthage Dracontius received the traditional rhetorical education under the grammarian Felicianus, and practised as a lawyer. Though his family was initially favoured by the Vandals, he eventually suffered imprisonment and confiscation of his property, on account of a poem in which he praised the emperor rather than the Vandal king Gunthamund (484–496). On his release it is suggested he migrated to Italy.

Dracontius' earlier verse is represented by the *Romulea,* a collection (prefaced by a trochaic dedication to Felicianus) of nine pieces in hexameters principally on mythological themes which form the basis for philosophical argument: one piece (v) is a versified *controwersia.* The highly rhetorical flavour of these poems reappears in his elegiac *Satisfactio,* a plea for pardon addressed to Gunthamund during his imprisonment: a *controwersia* is embodied in the *Orestis tragoedia* whose attribution to Dracon-

tius, though long in doubt, now seems certain; and even his most religious poem, De laudibus dei, shows the characteristic multiplication of exempla. This last poem, his most important work, comprises 2327 hexameters in three books: book i describes the Creation and Fall. and the evidence for immortality; book ii treats the benevolence of God as shown by the preservation and redemption of the world; and book iii is concerned with the dealings of God with man. The account of the Creation (= book i, except the first 117 lines) was separately circulated in the middle ages under the title *Hexaemeron*, and was revised and augmented in the 7th century by Eugenius III, bishop of Toledo. Dracontius shows wide familiarity with pagan Latin literature and with the Bible. His syntax and prosody reflect contemporary usage, and there is some harshness and obscurity of language.

Sattsfactio, ed by Sister M. St. Margaret (1936) and De laudibus Dei, book i, ed. by J. F. Irwin (1942), both containing bibliography. *Orestis* tragoedia, ed. by E. Rapisarda (1951). See also F. Chatillon, "Dracontia," Revue du moyen *âge latin*, vol. 8, pp. 177–212 (1952). (D. R. BR.)

DRAFTED MASONRY, in architecture, masonry formed of large stones dressed or cut round the edge to a single plane, with the face between left as it came from the quarry. Many notable Roman examples exist, such as that of the Porta Maggiore at Rome (period of the emperor Claudius, *c.* A.D. 50). It was also particularly common in the near east, being found from the time of Cyrus, in the platform at Pasargadae (c. 530 B.C.), up to the time of the castles built by the crusaders. In the Renaissance drafted masonry was used occasionally for decorative purposes, as in the Riccardi palace at Florence by Michelozzi (c. 1430). When so used it is sometimes loosely termed "rustication."

DRAGO, LUIS MARÍA (1859–1921), Argentine statesman and author of the Drago doctrine (*q.v.*) opposing the forcible collection of debts through military intervention, was born May 6, 1859, at Buenos Aires. A member of a distinguished Argentine family, at an early age he became chief editor of El Diario in Buenos Aires. He later served as financial officer of the government, then minister of foreign affairs (1902) during the period of the intervention of the three European powers in Venezuela seeking the forcible collection of the public debt of that country. It was on this occasion that he wrote a historical letter to the Argentine minister in Washington setting forth the so-called Drago doctrine. Drago represented his country at the Hague peace conference of 1907. Two years later he served as a member of the tribunal of arbitration created by the United States and Great Britain to decide the North Atlantic fisheries controversy. He died on June g, 1921, shortly after he had been invited by the council of the League of Nations to draft the statute of the Permanent Court of International Justice. See DRAGO DOCTRINE. (C. *G.* FK.)

DRAGO DOCTRINE. The government of every state, declared Lord Palmerston in 1848, is entitled by diplomatic methods to take up the complaint of any of its subjects against the government of another state and, if well founded, to demand redress. Palmerston added that in certain circumstances the government might be prepared to go to the length of using force. To this statement Lord Salisbury subsequently gave his assent in 1880. In 1902 Venezuela, having failed to comply with the demands made by Great Britain, Germany and Italy to make good its default in respect of its external loans, was called upon by these powers to honour its obligations. Failing to obtain satisfaction, a blockade of certain Venezuelan ports was instituted. This led to dispatch of a note from Luis M. Drago (*q.v.*), foreign minister of the Argentine republic, to the Argentine minister at Washington declaring that the principle should be accepted that for the common safety of the South American republics, just as the Monroe Doctrine is a principle enforced by the United States for the preservation of the territorial status quo throughout the American continent against European aggression, the collection of pecuniary claims of citizens of any country against the government of any South American republic should not be effected by armed force. This proposal, however, did not find general acceptance, but by the Hague convention (1907) the contracting powers agreed not to have recourse to armed force for the recovery of contract debts claimed from the government of one state by the government of another state as due to its nationals. This agreement, however, did not apply if the debtor state refused or neglected to accept an offer of arbitration, or after accepting the offer prevented any compromise being reached, or after an award failed to carry it out.

See Sir T. Barclay, Problems of International *Law* and Diplomacy (1907); Robert J. Phillimore, International Law, vol. ii (1854–61). (H. H. L. B.; X.)

DRAGOMAN is a comprehensive term applied to anyone serving as an intermediary between Europeans and orientals, whether as a hotel tout or travelers' guide, or as the chief dragoman of a foreign embassy, whose functions at one time included the conduct of important political negotiations (Arabic tarjuman, "interpreter"; cf. Hebrew *targum*). In the latter sense the dragoman has, essentially, ceased to exist, especially since the passing of the Ottoman empire from the stage of history (c. 1919–23) in the near and middle east, although in the second half of the 20th century many embassies in the Arab world still employed a *k'vass*, largely for ceremonial purposes, and there were still oriental secretaries.

The original employment of dragomans in the Ottoman government arose from religious scruples against the use of the language of a non-Moslem people. Ottoman political relations compelled the sultan's ministers to use interpreters, who rapidly acquired a very considerable political influence. The first chief dragoman of the Sublime Porte was Panayotis Nikousia (1665–73). Alexander Mavrocordato (*q.v.*), later *exaporritos* ("secretary of state"), who succeeded Nikousia, negotiated the treaty of Karlowitz (1699) for the Ottoman empire, and became very prominent in the development of Ottoman policy. From the end of the 17th century until the Greek national revolt in 1821–29, Greeks (Phanariotes; *q.v.*) practically monopolized the conduct of Ottoman foreign relations, and soon established the system under which the chief dragoman, as a matter of course, was elevated to the dignity of hospodar (*q.v.*) of one of the Danubian principalities (Rumania).

Similarly, foreign emissaries accredited to the Sublime Porte, in the absence of duly qualified linguists, found it necessary to employ Greeks, Armenians or Levantines with the appropriate knowledge of language, laws, customs and administration of the country. They became the confidential intermediaries between the missions and the Sublime Porte. But the disadvantages of this system were soon patent, and as early as 1699 the French government decided to establish a school for French dragomans at Constantinople, for which the École des Langues Orientales in Paris was substituted in later years. In 1877 Great Britain inaugurated a system for the selection and training of British-born dragomans, and most of the European great powers eventually took similar steps. The United States, a latecomer to the scene, did not.

The functions of the first dragoman were essentially political in character. The subordinate dragomans transacted less important business, including, generally, all matters in which the interests of foreign citizens were involved. The high esteem in which the dragomans were held by most foreign powers was demonstrated by the fact that they were often elevated to the most important diplomatic posts.

In the Russian, Austrian and German foreign services a number began careers as a junior dragoman, and the French chief dragoman usually attained the rank of minister plenipotentiary. The more important consulates in the Ottoman provinces were also provided with dragomans, whose duties were of a similar if less important nature. Banks, railway companies and financial institutions employed dragomans to facilitate their business relations with Ottoman officials. (H. N. H.)

DRAGOMIROV, MIKHAIL IVANOVICH (1830–1905), Russian general, knonn principally for his writings on military tactics, was born on Nov. 8 (new style; Oct. 27, old style), 1830. He entered the guards in 1849 and in the following decade began his study of military education. He helped to reorganize the Russian army's educational system and taught members of the

imperial family. He took part in suppressing the Polish insurrection of 1863 and was attached to the Prussian army during the Austro-Prussian War of 1866. In the Russo-Turkish War of 1877–78 he commanded the 14th infantry division, which led in the crossing of the Danube. After the defeat at Plevna, he strenuously opposed suggestions that the Russian army retreat back to Rumania. Wounded at Shipka pass, he had to leave active service and for the next 11 years was director of the Nicholas Military academy. Collating Europe's best military literature, he introduced it into the Russian army training schools. He improved the morale and technical efficiency of the officer corps, especially on the staff. In 1889 he became commander of the Kiev military district and governor general of the three southwestern Ukrainian provinces, retaining this post until 1903. General Dragomirov's larger military works—among others, his *Uchebnik* taktiki ("Course of Tactics," 1879)—have been translated into French and German. In formal tactics he was the head of the "orthodox school," advocating the offensive at all costs, and the combination of crushing short-range fire with the bayonet charge. He followed Suvorov's ideas to the limit, and many felt that he pressed them beyond the attainable. He died at Konotop, Chernigov province, on Oct. 28 (N.S.; Oct. 15, O.S.), 1905. (B. J.)

DRAGON, a fabulous monster, usually conceived as a huge, bat-winged, fire-breathing, scaly lizard or snake, with a barbed tail. The belief in dragons seems to have arisen without the slightest knowledge on the part of the ancients of the gigantic and astonishingly dragonlike extinct reptiles of past ages. The word is derived through the French and Latin from the Greek drakon, connected with derkomai, "see," and interpreted as "sharp-sighted." The equivalent English word "drake" or "fire-drake" is derived from Anglo-Saxon draca. In Greece the word drakon was used originally of any large serpent, and the dragon of mythology, whatever shape it may have assumed, remains essentially a snake.

In general, in the near eastern world, where snakes are large and deadly (Chaldaea, Assyria, Phoenicia, and to a lesser degree in Egypt), the serpent or dragon was symbolic of the principle of evil. Thus Apophis, in the Egyptian religion, was the great serpent of the world of darkness vanquished by Ra, while in Chaldaea the goddess Tiamat, the female principle of primeval Chaos. took the form of a dragon. Thus, too, in the Hebrew sacred books the serpent or dragon is the source of death and sin, a conception which was adopted in the New Testament and so passed into Christian mythology. In Greece and Rome, on the other hand, while the oriental idea of the serpent as an evil power found an entrance and gave birth to a plentiful brood of terrors (the serpents of the Gorgons, Hydra, Chimaera and the like), the dracontes were also at times conceived as beneficent powers—sharp-eyed dwellers in the inner parts of the earth, wise to discover its secrets and utter them in oracles, or powerful to invoke as guardian genii.

In general, however, the evil reputation of dragons was the stronger, and in Europe it outlived the other. Christianity, of course, confused the benevolent and malevolent serpent deities of the ancient cults in a common condemnation. The very "wisdom of the serpent" made him suspect; "the devil," said St. Augustine, "is a lion and a dragon; a lion because of his rage and a dragon because of his wiles." In Christian art, the dragon came to be symbolic of sin and paganism, and as such was depicted prostrate beneath the heels of saints and martyrs. The dragon myths of the pagan east took new shapes in the legends of the victories of St. Michael and St. George; and the kindly snakes of the "good goddess" (see BONA DEA) lived on in the immanissimus draco whose baneful activity in a cave of the Capitol was cut short by the intervention of the saintly pope Silvester I. In this respect indeed Christian mythology agreed with that of the pagan north. The similarity of the northern and oriental snake myths seems to point to a common origin in remote antiquity. Whatever the origin of the northern dragon, the myths, when they first appear, show him to be in all essentials the same as that of the south and east. He is a power of evil, guardian of hoards, the greedy withholder of good things from men; and the slaying of a dragon is the crowning achievement of heroes—of Siegmund, of Beowulf, of Sigurd, of Arthur, of Tristram—even of Lancelot, the beau ideal of medieval chivalry.

CHINESE DRAGON FROM "NINE DRAGON SCROLL" BY CH'EN JUNG, MID-13TH CENTURY. SUNG DYNASTY. IN THE MUSEUM OF FINE ARTS, BOSTON

As to the dragons' form, this varied from the beginning. The Chaldaean dragon Tiamat had four legs, a scaly body and wings. The Egyptian Apophis was a monstrous snake, as were also, originally at least, the Greek dracontes. The Persian dragon was noteworthy for its cloven hoofs. The dragon of the Apocalypse (Rev. xii, 3), "the old serpent," is many-headed, like the Greek Hydra. The dragon slain by Beowulf is a snake (worm), for it "buckles like a bow"; but the dragon done to death by Sigurd, though its motions are heavy and snakelike, has legs, for Sigurd wounds it "behind the shoulder." On the other hand, the dragon seen by King Arthur in his dreams is, according to Malory, winged and active, for it "swoughs" down from the sky.

The qualities of dragons being protective and terror-inspiring, and their effigies decorative, they were early used as warlike emblems. Thus, in the Iliad, Agamemnon has on his shield, besides the Gorgon's head, a blue three-headed snake, just as ages afterward the Norse warriors painted dragons on their shields and carved dragons' heads on the prows of their ships. From the conquered Dacians, the Romans in Trajan's time borrowed the dragon ensign which became the standard of the cohort as the eagle was that of the legion. Under the later eastern Roman emperors the purple dragon ensign became the ceremonial standard of the emperors, under the name of the drakonteion.

In England before the Conquest the dragon was chief among the royal ensigns in war. Its origin, according to the legend preserved in the Flores historiarum, was as follows: Uther Pendragon, father of King Arthur, had a vision of a flaming dragon in the sky, which his seers interpreted as meaning that he should come to the kingdom. When this happened, after the death of his brother Aurelius, "he ordered two golden dragons to be fashioned, like to those he had seen in the circle of the star, one of which he dedicated in the cathedral of Winchester, the other he kept by him to be carried into battle."

From Uther Dragonhead, as the English called him, the Anglo-Saxon kings borrowed the ensign, their custom being, according to the *Flores*, to stand in battle "between the dragon and the standard." The dragon ensign which was borne before Richard I in 1191, when on crusade, "to the terror of the heathen beyond the sea," was that of the dukes of Normandy; but even after the loss of Normandy the dragon was the battle standard of English kings, and was displayed, for example, by Henry III in 1245 when he went to war against the Welsh. Not till the 20th century was the dragon officially restored as proper only to the British race of Uther Pendragon, by its incorporation in the armorial bearings of the prince of Wales. Thus the dragon and wivern (*i.e.*, a two-legged snake; M.E. *wivere*, "viper") took their place as heraldic symbols (see HERALDRY).

In the far east the dragon has managed to retain its prestige and is known as a beneficent creature. In China, it appears as the national symbol and was the badge of the royal family. In Chinese art, the imperial dragon can be identified by its five claws; the ordinary Chinese dragon has only four. The Japanese dragon,

known as *tatsu,* is identifiable by its three claws, and is capable of changing size at will, even to the point of becoming invisible. Both Chinese and Japanese dragons, though regarded as powers of the air, are wingless. They are among the deified forces of nature of the Taoist religion, and the shrines of the dragon-kings, who dwell partly in water and partly on land, are set along the banks of rivers. (W.A.P.; T. A. SB.; X.)

Zoology.—The term "dragon" has no zoological meaning, but it has been applied in the Latin generic name *Draco* to a number of species of small lizards found in the Indo-Malayan region and characterized by the possession of winglike folds of skin projecting from the sides of the body and supported by the greatly elongated ribs. These structures do not involve the legs and cannot be used as actual wings for flight; they serve merely as gliding planes which extend the distance over which the animal can leap from one to another of the trees in which it lives. The largest form is only about ten inches long.

Another lizard to which the name is popularly applied is the giant monitor, *Varanus komodoensis,* discovered in Komodo, an island of the Lesser Sundas, in Indonesia. It is a heavily built lizard that reaches a length of at least ten feet, thus greatly exceeding all other living lizards, although the extinct *Varanus priscus* of Australia attained perhaps twice the length. *V. komodoensis,* which is almost at the point of extinction because of the interest of collectors, is now protected.

Military.—In military use the name dragon was applied to the musket—ornamented with the head of a dragon—from which the dragoons (*q.v.*) derive their name; later it was applied to a tractor for drawing guns, propelled by an internal-combustion engine and running on caterpillar tracks. See also DRACO.

DRAGONET, a name applied to perchlike, often brightly coloured fishes of the family Callionymidae. The common dragonet, *Callionymus lyra,* which inhabits the coasts of Europe, has a slender naked body and large eyes close together on top of the flattish, triangular head. The male is larger and more ornamental than the female. After active courtship, the male and female swim side by side toward the surface, at which time the floating eggs are extruded and fertilized. (C. Hu.)

DRAGONFLY, the common name applied to insects of the order Odonata. Dragonflies are swift-flying, graceful insects which patrol the edges of ponds and streams. In the hand they are harmless and can be recognized by the great jeweled eyes; the two pairs of similar, narrow, transparent wings; the long, usually slender abdomen or "tail"; and the forward position of the six similar legs. Many are conspicuously marked with bright colours on a dark background; others are dark with a metallic iridescence.

FIG. 1.—DRAGONFLY LARVA, WITH LABIUM EXTENDED, SEIZING ITS PREY

The larvae live in water until the last stage of development is reached

Habits and Structure.—Dragonflies are more perfectly attuned to life on the wing than any other group of insects. Some species seldom alight from dawn to dusk during warm, sunny weather, but others are so sensitive to changes in light that they immediately seek shelter when the sun is overcast. A few species sleep around the clock except for short flights at dawn and dusk. Dragonflies hunt only during flight; the six feet, placed far forward below the mouth, form a spiny basket in which flying insects are caught.

The dragonfly's life is encompassed and guided by vision. It is, however, a mosaic vision: the sum of images received by 1,000 or more individual "cameras" that make up the two compound eyes. These eyes, occupying over half the head surface, are acutely sensitive to moving objects. The antennae, the main organs of smell in insects, are reduced in dragonflies to little more than bristles with probably little use. The two pairs of jaws are well armed with crushing and piercing teeth.

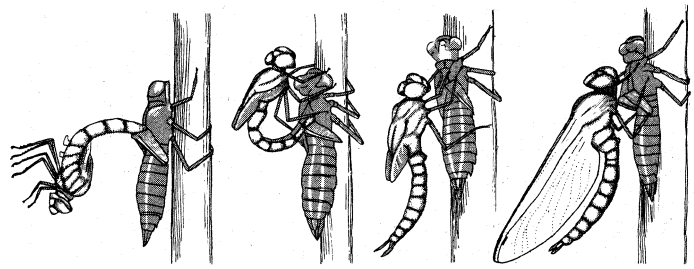

FIG. 2.—METAMORPHOSIS FROM LARVA TO DRAGONFLY

On leaving the water, the final change takes place. The front part of the dragonfly (A) is liberated through the larval cuticle followed by the tail (B) and the whole body (C). Metamorphosis is nearly complete (D) when the wings have acauired their full dimensions and the abdomen is not yet fully extended

The wings are thin, tough membranes stretched on an elaborate frame of veins, the arrangement of which reveals a basic plan throughout the order; variations occurring in the families are associated with particular flight habits. These differences in venation, being well preserved in fossil dragonflies, have furnished the most useful characters for a natural classification of the dragonfly order.

Of the three thoracic segments, the first, bearing the forelegs, is free and necklike, whereas the other two segments are united into one large fixed region, the pterothorax, bearing the wings as well as the middle and hind legs. This stoutest part of the body, owing to the skewness of its development, displaces the legs forward and the wings backward. The forward position of the legs gives the dragonfly great freedom in perching or hanging from branches or other supports.

The last segment of the ten-segmented abdomen of the male is equipped with three or four terminal holding devices or claspers. On the second and third segments is a complex copulatory organ to which he transfers sperm from the genital opening near the end of the abdomen. The act of mating is peculiar. The male grasps the head or thorax of the female from above with his claspers and. while thus joined in tandem, either during flight or at rest, the female loops her body forward and places its tip next to the male organ. The male may release the female after insemination or he may hold her in tandem while she lays her eggs. No other insects have a similarly complex mating, this one being adapted to fast flight. The females of those species with an ovipositor place their eggs in plant tissues, whereas species without an ovipositor scatter eggs over the water's surface during flight.

Development.—The larva, unlike the aerial adult dragonfly, is aquatic throughout its period of growth. Most species develop in fresh water, some tolerate brackish water and a few are mud dwellers. None are truly marine. The larva can walk or climb, and swims efficiently by a sort of jet propulsion: water is drawn into the rectum and then forcibly ejected. Descended from air-breathing land insects, the larva has a complete tracheal or air-tube system, which carries oxygen to all parts. In the water the tracheal openings (spiracles) are closed and oxygen is absorbed into the tracheal system directly from the water; osmosis takes place through the walls of the gills and of the rectum, which areas are supplied with microscopic branches (tracheoles). In the Anisoptera, the tracheolar gills are in the rectum and are folds of the rectal walls. They are aerated by water drawn through the anus into the rectum. When the insect emerges from the water the spiracles of both nymph and adult admit oxygen directly from the atmosphere.

The larva captures its prey by means of a prehensile lower lip or labium, which is folded under the head when not in use, but can be suddenly extended to seize prey by a pair of terminal hooks (fig. 1). Larvae of most species wait until the prey comes within reach

of the hooks, but the more aggressive species stalk the prey until it is within striking distance.

The period of development varies from one to four years or longer, and there are about 10 to 15 larval stages. The insect hatches as a transient stage, the pronymph, followed by the first true larval stage, a minute creature similar to the later stages, but without traces of wings until after the third or fourth molt. The first food taken consists of microscopic organisms, such as large protozoans. Later small Crustacea (Cyclops, Daphnia) or small worms (Oligochaeta) are eaten, and finally larger Crustacea and insect larvae, including midges, mosquitoes and May flies, form the diet for this carnivorous insect.

During the larval period the wings continue to develop until the last stage is reached. Then for a week or so the larva lies sluggishly and ceases to feed, while the internal larval organs are replaced by those of the adult. Wings are now closely folded within the larval wing sheaths. Eventually the urge toward light and air becomes prominent and the insect crawls up an emergent plant stem, stump or rock. When the cuticle is dry enough it splits along the back, and the pale, soft creature slowly withdraws its head, legs, wings and lastly its abdomen (fig. 2). After emergence the teneral (newly exposed adult) dragonfly must wait another half hour or so until its wings and appendages have acquired their final form. Even more time is required before the colour pattern has reached its full depth and brilliance (fig. 3). This is a critical period, since swallows and other birds rear their young largely on soft, emerging dragonflies. Many species, however. avoid this danger by emerging at night, and are already on the wing when the birds first awake.

Geographic Distribution. — The Odonata are a small order of insects (about 4,870 species) as compared with the larger orders Coleoptera, Diptera and Hymenoptera (over 85,000 species each). Because they are adapted to sunshine they are most abundant in the tropics, with 500 species in India, 450 in North America and 100 in Europe. One species, *Pantala flavescens,* is circumtropical, being found in all the continents except Europe. Many genera with few species are circumpolar.

Geological History. — Dragonflylike fossils appear in the Paleozoic (about 260,000,000 years ago), occurring in the Carboniferous strata at Commentry, France. and later in the Permian of Kansas. These were of the order Protodonata; many were large, some two feet across the wings. In the Mesozoic great size is lost and early modern forms appear, *i.e.,* the suborders Anisozygoptera, Zygoptera and Anisoptera in the Bavarian slates (Jurassic). Cenozoic dragonflies, early modern, occur in the U.S. Green River beds of the Eocene, and in Miocene beds in Colorado and at Oensingen, Switz. In the latter appear libellulid larvae, the most modern type.

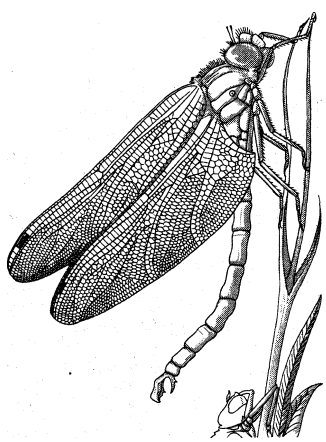

FIG. 3.—THE PERFECT DRAGONFLY, METAMORPHOSIS HAVING BEEN COMPLETED. RESTING TO DRY ITSELF BEFORE EXTENDING ITS WINGS HORIZONTALLY

Economic Importance. — Since dragonflies feed on small insects captured during flight, many species are useful in the natural control of mosquitoes and black flies.

The larvae of some genera, such as Lestes and *Sympetrum,* feed extensively on mosquito larvae and pupae. The larvae of other dragonflies inhabiting lakes and streams provide food for fish. On the other hand young fish with the yolk sac still attached are often preyed upon by dragonfly larvae.

CLASSIFICATION

Dragonflies chiefly fall into two suborders, the Anisoptera and the Zygoptera; only two species remain of the order Anisozygoptera.

Anisoptera. — The Anisoptera are generally larger and more robust, with hind wings broader at the base than are the fore wings. When at rest the wings are laterally extended. The eyes may be separated or may meet for a short distance along the middle line of the head. These dragonflies are swift and agile in flight and are skilful dodgers. Many practise that most difficult maneuver of hovering, a flight skill possessed by few insects. About eight families are recognized in this suborder. Widespread northern genera are Aeshna, *Gomphus,* Cordulegaster, *Libellula* and *Sympetrum.*

Zygoptera.—The Zygoptera, often called damsel-flies, are typically smaller and more fragile. Their wings are paddle-shaped and their flight is relatively feeble. When at rest the wings are generally folded over the back The head is hammer-shaped and the eyes are widely separated though prominent. There are 11 or 12 families. Common northern genera are Calopteryx, *Enallagma, Ischnura,* Agrion and Lestes.

Anisozygoptera.—In Japan and India live two species of *Epiophlebia,* of an otherwise extinct suborder, the Anisozygoptera.

DRAGONHEAD, the common name, from the appearance of the flower, for plants of the genus Dracocephalum, comprising about 40 species of annual and perennial herbs of the mint family (Labiatae). They have blue, purple or white flowers crowded in dense heads in the leaf axils or in terminal spikes. Although a few species are grown in the garden, they are of secondary importance. False dragonhead or obedient plant (*q.v.*) is the name given to species of the genus Physostegia of the same family.

(J. M. BL.)

DRAGON'S BLOOD, a red-coloured resin obtained from several species of plants. *Daemonorops* draco, one of the rattan palms, which produces much of the dragon's blood of commerce, is a native of the Indonesian area. The fruit is round, pointed, scaly and the size of a large cherry; when ripe it is coated with the resinous exudation known as dragon's blood. The substance in commerce is dark red-brown, nearly opaque and brittle; it contains small shell-like flakes and gives, when ground, a fine red powder which is soluble in alcohol, ether, and fixed and volatile oils. If heated it gives off benzoic acid. In Europe it was once valued as a medicine because of its astringent properties and is now used for colouring varnishes and lacquers and in photo-engraving; in China, where it is mostly consumed, it is employed to give a red facing to writing paper.

The drop dragon's blood of commerce is still one of the products of Socotra island (off the coast of Somaliland), and is obtained from Dracaena cinnabari. The dragon's blood of the Canary Islands is a resin procured from the surface of the leaves and from cracks in the trunk of Dracaena draco. The hardened juice of a euphorbiaceous tree, Croton draco, is the dragon's blood of the Mexicans, used by them to heal wounds and as an astringent. *See* DRACAENA.

DRAGOON, originally a mounted soldier trained to fight on foot only. (See CAVALRY and INFANTRY.) This mounted infantryman of the late 16th and early 17th centuries, like his comrades of the infantry who were styled "pike" and "shot," took his name from his weapon, a species of carbine or short musket called the dragon. Dragoons were organized not in squadrons but in companies, like the foot, and their officers and noncommissioned officers bore infantry titles. The invariable tendency of the old-fashioned dragoon, who was always at a disadvantage when engaged against true cavalry, was to improve his horsemanship and armament to the cavalry standard. Thus dragoon came to mean medium cavalry, and this significance the word has normally retained since the early wars of Frederick the Great. The light cavalry of the British army in the 18th and

early 19th centuries was for the most part called light dragoons. The phrases "to dragoon" and "dragonnade" bear witness to the mounted infantry period, this arm being the most efficient and economical form of cavalry for police work and guerrilla warfare. The "Dragonnades," properly so called, were the operations of the troops (chiefly mounted) engaged in enforcing Louis XIV's decrees against Protestants after the revocation of the Edict of Nantes.

DRAGUIGNAN, a town of southeast France, capital of the *département* of Var, is situated on the left bank of the Nartuby river, 80 km. (49.7 mi.) N.E. of Toulon by road. Pop. (1954) 10,249. The town is 679 ft. above sea level at the southern foot of the wooded heights of Malmont. Two gateways remain of the 13th-century walls and in the Rue de la Juiverie is a synagogue with a 13th-century façade. The museum is housed in the 18th-century summer palace of the bishops of Fréjus. There is a bust of Georges Clemenceau by Auguste Rodin and, outside the town, a large United States military cemetery. There are manufactures of leather, soap and spirits and trade in olive oil and grapes. The town was in German hands during World War II from Nov. 1942 to Aug. 1944.

DRAINAGE BASIN, an area of land from which the natural drainage flows into a single stream, See WATERSHED.

DRAINAGE OF LAND: see LAND RECLAMATION.

DRAKE, SIR FRANCIS (*c.* 1543–1596), English admiral, the greatest and most famous of Elizabethan seamen, was born near Tavistock of Devon yeoman stock. The date of his birth is uncertain, and nothing definite is known about his early years beyond the fact that his father became a preacher at Chatham dockyard and that Francis was apprenticed to the coasting trade. From his father Drake inherited an ardent Protestantism. He sailed with John Lovell on a slaving voyage from Guinea to South America in 1566 and commanded the "Judith" (50 tons) on the third slaving voyage of his kinsman Sir John Hawkins of Plymouth in 1567–68. From this voyage only Drake's own ship and that of Hawkins escaped from a disastrous encounter with the Spaniards at San Juan de Ulua. For the next few years he was the most successful of the many corsairs raiding the Spanish main, his most daring exploit being an attack on Nombre de Dios in 1572, on which expedition he first saw the Pacific and vowed "to sail an English ship in those seas."

Between 1577 and 1580 Drake performed the first circumnavigation of the world undertaken by an Englishman. The objects of the voyage are obscure because there were at least two plans: a public plan promoted by Sir Francis Walsingham and other notables for the discovery of trading bases in the legendary Terra Australis and the Moluccas; and a secret plan supported by the queen for a raid on the west coast of South America, to which was added the suggestion that Drake should search for the western exit of the northwest passage. The discrepancy between the two plans may explain his quarrel with Thomas Doughty (whom he executed at San Julián on the excuse that he was a "conjurer") and the return of William Winter (Wynter) with one of the ships. Drake sailed on Dec. 13, 1577, in command of the "Pelican" (renamed "Golden Hind," 100 tons) and four smaller ships with about 160 men. Off Cape Verde he captured a Portuguese vessel from which he took the pilot, Nuno da Silva, whom he later put ashore at Guatulco. He then sailed down the east coast of South America to San Julián and through the Strait of Magellan, from which he emerged on Sept. 6, 1578. A storm separated him from Winter's ship and drove him south to about 57°. It is doubtful if he thereby discovered Cape Horn, but he certainly proved that Tierra del Fuego was an island by realizing the existence of the strait which now bears his name. Sailing alone up the coasts of Chile and Peru, he sacked towns and plundered shipping, notably the "Cacafuego" treasure ship. It is not known how far north he went (some accounts say 48°), but bad weather forced him south again to land at an unidentified spot in latitude 38° which he named New Albion. The authenticity of a brass plate discovered near San Francisco, Calif., in 1937 remains doubtful. He crossed the Pacific to the Moluccas, where he loaded six tons of cloves, most of which were jettisoned when the ship ran on a reef. It was there that he "excommunicated" his chaplain, Francis Fletcher, who wrote an account of the voyage. He returned to Plymouth on Sept. 26, 1580, the profits of the voyage amounting to about £500,000. With his share he purchased Buckland abbey, South Devon, which became the home of his descendants and which contains a Drake museum. The queen knighted him at Deptford on board his ship, of whose timbers there remain a chair at Oxford and a table in the Middle Temple hall.

Drake married a second time in 1585, his first wife having died in 1583. He then embarked on the first act of open war with Spain as commander of a fleet of 29 ships to attack Spanish possessions in the Caribbean. He sacked San Domingo, Cartegena and St. Augustine in Florida and took off the first Virginian colonists before his return in 1586. Since the Spanish Armada (*q.v.*) was now preparing, he sailed in 1587 to attack it in Cádiz harbour, a brilliant exploit popularly known as "singeing the king of Spain's beard." He also captured the "San Felipe" carrack valued at more than £100,000 in English currency. In 1588 he was appointed vice-admiral under Lord Charles Howard of Effingham at Plymouth. His offensive plans to attack the Armada before it left Spain were not approved until it was too late. News reached Plymouth that the Armada was in the channel on Friday, July 19 (old style; July 29, new style); according to a story first printed in 1624, the commanders were playing bowls on the Hoe, but Drake's remark "there's time for that and to beat the Spaniards after" only appears in 1736. The night after the British fleet put to sea in chase of the Armada Drake, in his flagship, "Revenge," captured the "Rosario" galleon. He may have suggested the fireship attack on the Spanish fleet at Calais and he certainly played the leading part in the attack off Gravelines on July 29 (O.S.; Aug. 8, N.S.) which finally shattered the Armada.

Drake commanded the naval force when Sir John Norreys commanded the land force in an attack on Lisbon in 1589. Delays, bad victualing and disagreements between the commanders led to the failure of the expedition, after which Drake was not employed again for five years. In 1595 he and Hawkins sailed in command of an expedition of 27 ships in which it was hoped to repeat the success of 1585, but the Spanish defenses proved too strong. Hawkins died off Puerto Rico and Drake off Porto Bello, in the night of Jan. 27, 1596. He was buried at sea.

Drake is described by a Spaniard as being "of medium stature, blonde, rather heavy than slender, merry, careful. He commands and governs imperiously. Sharp, ruthless, well-spoken, inclined to liberality and to ambition, boastful, not very cruel." His tactical genius and powers of leadership were of the highest order. As the embodiment of Elizabethan maritime enterprise, he may be said to have founded the British naval tradition. See also references under "Drake, Sir Francis" in the Index volume.

DRAKENSBERG MOUNTAINS (Afrikaans DRAKENSBERGE; Sesuto QUATHLAMBA) is the name given to two distinct parts of the South African Great Escarpment, or plateau edge (see SOUTH AFRICA, REPUBLIC OF). Originally the name appears to have derived from the peak known as the Drakens (*i.e.,* Dragon's) Mountain, or Dragon's rock (8,944 ft.) to the west of Matatiele. The name has become general for the whole "High Berg," forming for the greater part of its course the eastern border of Basutoland, and the "Low Berg" which forms the boundary between the Orange Free state and Natal.

The highest part of the escarpment is formed by a thick covering of Karroo (Stormberg) lava overlying Stormberg sandstones, extending from Xalanga peak in the south (about 25 mi. E. of Dordrecht) to the Sentinel peak at the Mont-aux-Sources (10,822 ft.) in the north (where it forms the highest part of the main watershed of the Republic of South Africa), a distance of about 280

mi. In this stretch are many outstanding peaks, the highest being Thabana-Ntlenyana (Thadentsonyane), 11,425 ft. From the Mont-aux-Sources to Laing's Nek, south of Charlestown, the Low Berg has no covering of lava, its highest points being formed by Stormberg ("Cave") sandstone, such as the Binghamsberg (6.859 ft.) and Rensburgskop (7,500 ft.). South of Laing's Nek, Majuba and Mount Prospect there are peaks which are now detached from the escarpment by headstream erosion. In the Transvaal the plateau edge between Carolina in the south and Haenertsburg in the north is an extremely bold, cliff-like feature formed mainly by the resistant Black Reef quartzite of the Transvaal system. This feature is known generally as the Transvaal Drakensberg, its highest point on the quartzite being Marieps mountain (6,382 ft.) and, a little to the west of the quartzite, the andesite peak Mt. Anderson (7,498 ft.). (J. H. WN.)

DRAM or DRACHM, a weight approximately equal to that of the ancient Greek coin, the drachma; in apothecaries' weight one-eighth of an ounce, or 60 gr. (3.888 g.); in avoirdupois weight one-sixteenth of an ounce, or 27.34375 gr. (1.772 g.). For short the term is used for a fluid dram (drachm), a measure of capacity equal to one-eighth of a fluid ounce, The U.S. Pharmacopoeia differs in usage from the British. The former uses apothecaries' weights, the latter the avoirdupois.

DRAMA, a town and nomos (prefecture) in the region of Macedonia, northern Greece. The town (pop. [1961] 32,328) lies at a height of 344 ft. at the northern edge of the broad, artificially drained plain of Drama, which was formerly a lake basin, and at the foot of the Falakron mountains, where the limestone yields copious springs. An irregular mountain torrent, the Drama, flows through the market place. The town replaced Philippi as the chief centre of the plain in the 18th century, but it remained a small, congested town of Turkish style until after World War I. With the departure of its Turkish inhabitants and the influx of Greek refugees in 1922 and subsequent years, its population was almost doubled and new suburbs on the grid plan were added. The town is a military and administrative centre and a tobacco market. It has rail links with Salonika and Istanbul, and is connected by road to the port of Kavalla. The nomos of Drama has a population (1961) of 120,936 and contains some of the finest tobacco-growing land in Europe. (WM. C. B.)

DRAMA (ARTICLES ON): see THEATRE (ARTICLES ON).

DRAMA. After an introductory discussion on the nature of drama, this article deals with its development, primarily as a literary form, in the western world: its origins in ancient Greece; its development there and in Rome into the classical drama which became at the Renaissance the model for modern drama; its revival, after the decline of tlie dark ages, out of the liturgy of the medieval church and its survival as folk drama during its second decline at the end of the middle ages; and, finally, its revival again at the Renaissance, when classical drama was rediscovered, and its history in Europe and, later, the United States, from then until the mid-20th century. For other aspects of drama, and for drama in the east, the reader should consult the articles THEATRE; THEATRES (STRUCTURES); and the articles on the literature and music of particular countries—*e.g.*, CHINESE MUSIC; CHINESE LITERATURE; JAPANESE MUSIC; NO DRAMA; INDIAN LITERATURE; SANSKRIT LITERATURE; HINDI LITERATURE; BENGALI LITERATURE; AUSTRALIAN LITERATURE; CANADIAN LITERATURE; etc. For further information on drama in ancient and modern Greece, Rome, Great Britain, the United States, Latin America, France, Germany, Italy, Spain, Portugal, Hungary, Poland, Yugoslavia, etc., see also the articles on the literature of the countries concerned and the biographies of dramatists. and writers on drama, *e.g.*, ARISTOTLE. See also COMEDY; VAUDEVILLE; MUSICAL COMEDY; MUSIC HALL AND VARIETY; PANTOMIME; etc.; for further information on dramatic forms, see CRITICISM and DRAMATIC CRITICISM.

This article is divided into the following main sections:

I. THE NATURE OF DRAMA

Drama is a form of art in which the artist imagines a story concerning persons and incidents, without himself describing, narrating or explaining what is happening. In practice a story can be presented in this way entirely in dumb show with no speaking, and it must be recognized that this, too, is drama. But as it has normally been understood and practised by dramatists the art is one in which words are used to express the thoughts, emotions and desires of personages imagined as having these when interacting in a relationship with one another. More than speech is implied by what the characters say; nevertheless, it is by using words alone that the dramatist creates his imagined characters, the incidents in which they are involved in a shaped and purposeful plot and the background of place and time in which everything is imagined as occurring. Dramatic speech not only expresses what is going on within the characters, it also makes clear what action they are taking outwardly in a nexus of relationship to one another and the situations in which they are involved in the imagined world of the drama. Basically the dramatic relationship is one of conflict, not only between individuals and one another but also between individuals and spiritual or supernatural forces.

Drama is certainly literature from one point of view, inasmuch as it is composed in words; but as it is written for theatrical performance the literary art is subject to influences exerted by the kind of theatrical presentation in terms of which it is created. From another point of view, therefore, it is possible to see the art as existing fully only in performance; in this view the medium of the art is no longer one of words alone, but of words to which are added the material conditions of performance. The literary text is regarded by those who hold this view as a kind of blueprint, the potential of which cannot become actual until the characters are created in the imitative art of the actor, with the incidents

enacted and the location presented physically on a stage with the required scenery, properties, lighting and sound effects.

Theoretically it must be conceded that a person whose understanding of humanity was adequate and whose imagination was powerful and creative enough would be able to experience a play as completely when reading it as when responding to a performance. Nevertheless, in practice it is an undisputed fact that customarily a dramatist assumes that his audience will respond to his writing and imagine his play in the most complete and pleasurable experience as the result of watching a performance rather than by reading it. As with radio drama, the performance may be one which can only be heard and not seen; but even then the actors create the characters and enact the incidents by expressing vocally the full significance of the words. And in radio drama as in that of the theatre or of television, the way in which the artist writes—the length of his work and its shaping—is influenced by the needs of performance. This is the great difference between drama of the theatre. radio and television on the one hand, and what is called closet drama on the other. Closet drama, as the name suggests, is written for private reading and not in relation to performance of any sort. Such are the plays of Sir Henry Taylor (1800–86), Charles Whitehead (1804–62) and Robert W. Buchanan (1841–1901) and Tennyson's Harold. *A Drama* (1876). Closet drama usually lacks a true dramatic structure and can be longer than plays for performance: it tends to resemble a narrative written in dialogue, is written in verse which allows the author to poeticize and generalize pseudo-philosophically and is a symptom of a culture whose theatre is dominated by prose drama. It is possible to deny this form the title of drama proper; but theoretically it can be classed as a dramatic form, if a poor one, on the ground that the artist expresses himself by imagining characters involved in incidents without describing, narrating or explaining in his own person.

Strictly speaking then, drama proper is restricted to what is written designedly for performance in a theatre or in front of an audience. It may be noted in this connection, that a drama can be performable without being performed. This was the case, for example, with Milton's *Samson Agonistes;* his rejection of contemporary performance was an attack on the stage of his day and its patrons, and his play has been performed successfully in the 20th century.

1. Text and Performance. — The relationship between a dramatic text and its performance before an audience has given rise to a great deal of comment and theorizing. Some critics and dramatists have asserted that the full effect of a play comes from performance only and have then gone on to insist that the rapport between the periormers and their audience constitutes an essential element of the drama itself, without which no play can be completely experienced. There is no doubt that in fact the response of the audience has a reaction upon the quality of the performance; and to that extent it is true that a sufficiently large and responsive audience will result in a performance which enables them to imagine the play more completely; or in other words, the attitude of the audience can help or obstruct the performers in their task of representing the characters in action and all that they have meant for the author in his work of art. But there is no certainty that the audience is essential, and perhaps the only statement that can be justified is that the audience's presence makes the task of the performers less difficult; for in the case of radio drama the absence of an audience means that no such rapport is possible as in a theatre, and yet performances create the work of art in the listeners' minds.

2. Drama as a Literary Kind. — For the ancient world and in more recent times up to the beginnings of naturalistic theory in the 16th century, it was normal to regard drama as a kind of literature written in one of the three possible modes or manners. The first of these, the mode or manner of narration, is that in which the poet speaks to his reader or public in his own person, in narration, description, explanation or comment. In the second mode, that of drama. the poet does not speak in his own person in the narrative manner, but through his imagined persons and their actions: this mode is also called the mode of dramatic presentation, of dialogue and of conversation. The third mode is a mixture of the first two, with the poet speaking sometimes in his own person in the manner of narration and sometimes through his imagined persons in the manner of dramatic presentation. According to this classification, poems that mould now be called narrative — such as epic — would be regarded as in the mixed manner, as would Milton's sonnet on his blindness. For people thinking in terms of these three modes. the mere fact that a piece of writing was in dialogue meant that it should be classified as in the manner of drama; and to speak of nondramatic dialogue was a contradiction in terms. The difference between a philosophic dialogue and a tragedy written for performance was as clearly understood, however, as if the former were not included in the category of the dramatic. And in this respect it is worth noting that even though a philosophic dialogue is not dramatic in the modern sense of the word, it is an exposition of a conflict of ideas without the writer's speaking in his own person.

3. The Origins of Drama. — That drama as an art has arisen to a large extent out of the natural human instinct for imitation is a point — made first apparently by Aristotle — on which there is general agreement. There is also general agreement that in all likelihood the art gradually developed out of mimetic song and dance associated with ritual. There is not really enough detailed evidence available to prove that in fact this is what has happened; nevertheless, none of the existing evidence suggests any other kind of origin. Two types of theory have been elaborated as to the kind and purpose of the ritual in which were involved song and dance and the wearing of masks, the elements out of which drama has developed; and each type of theory seems to be supported by what is known of the part played by imitation and disguise in such ritual in primitive societies still existing in the modern world. One type of theory finds the beginnings of drama in ritual celebrating the victory of the force of life over that of death as seen in the alternation of the seasons; in the mimetic act of worship the New Year triumphs over the Old Year, as life fights out its battle nith death in the folklore of many peoples all over the world. Such rites are traced in the dialogue and impersonations of European folk festivals and in the sword dances and mummers' plays of England and northwest Europe and in the mid-20th century still existed in practice among American Indians and in Africa, Australia, the South Seas and New Guinea. The other type of theory sees drama as originating in a tomb ritual, by means of which the dead were honoured, so that in attaining immortality they might continue to guide and protect the living. otherwise deprived of their strength and wisdom. And here again support is found in the practices of primitive tribes who in the 20th century in Africa practised a type of dramatic ritual in which the exploits of dead kings were re-enacted. It seems possible that each kind of theory is valid, that drama in fact owes its origin to more than one kind of rite, to that celebrating life's victory over death, to fertility ritual and to the rites of the tomb.

A survey of the early phases in the development of drama in different parts of the world shows it associated with liturgy in fact. There is not complete agreement that liturgical drama existed in Egypt as early as between 3.000 and 4,000 years B.C., a suggestion which has been made on the evidence of what are known as the Pyramid texts. These have been interpreted by some authorities as showing that priests, in animal masks to represent the deities, gave performances in tombs and buildings attached to pyramids. There is more agreement that in the 2nd or 3rd millennium B.C. the Abydos passion play really was performed; though this also may be regarded as expanded ritual rather than drama. The subject was the death and dismemberment of Osiris, with the reassembling of his limbs by Isis and Horus. No text survives, but there is an account given by Ikhernofret, who treated older material, of the presentation for which he was responsible between 1887 and 1849 B C. In other parts of the world religion is similarly associated with the comparatively early stages of dramatic development. In Arabia. Turkey and Persia soon after the deaths of Mohammed and his children a tradition of passion plays arose dealing with the sufferings of Hassan and Fatima. In China at an early date mimetic song and dance were part of harvest celebrations. Drama proper has been shown to have developed there independently much later, but a very early ritual drama associated with ancestor

worship involved the singing and dancing of priests. Tibet, Korea, the East Indies and Japan—the last-named in its *Nō*-plays—show ritual and drama similarly intermingled. In India. too, there are very strong grounds for relating the development of drama at some stage with the festivals of the Krishna cult. That the drama of western Europe also developed from ritual, first in Greece and then in its revival in the middle ages, will be seen below.

4. Drama as an Imitation of Life.—In all these forms of drama, although human behaviour is imitated, the dramatist and the performance are not aiming at evoking a response from the audience by creating a deceptive illusion that art is not art. Human emotions have to be true to life, but the way in which they are expressed does not have to be a realistic imitation of what would be seen and heard in life outside art. As a result technique is sometimes realistic and sometimes not, as the evocation of an imaginative response and not deception is the object. Nevertheless, for an understanding of the art of drama as it exists today, consideration must be given to the concept of it which occurs in what is known as consistent naturalism. This was first put forward with what seems superficially like logical consistency in Lodovico Castelvetro's commentary on Aristotle's *Poetics* in 1570, *La Poetica di Aristotile volgarizzata.* All poetry, it is claimed, being an imitation of life, that is best which is most verisimilar or true to life. It follows that poets who use only words cannot give a verisimilar imitation of both words and things; but the dramatic poet can deceive his audience into accepting his poem as not an imitation, a work of art, at all. To do this he uses words and things to imitate words and things, respectively, with consistent verisimilitude to obtain illusion. It follows from this fundamental conception that dramatic speech must be, or seem to be, exactly what the speaker would use if he were to come to life miraculously outside the theatre in the given situation. It should be noted that despite the fact that naturalism assumes that the audience can be deceived, what happens in fact is that the dramatist restricts himself to imagining only what might happen, occurring in the way in which it really would happen; and as a result members of the audience respond to a performance by which they are induced also to imagine only what might happen occurring as it would happen, for that is all that they see and hear. Naturalistic and unnaturalistic drama differ only in theory; what actually takes place in each art is fundamentally the same. In each, words are used to create characters thinking, feeling and wanting or willing as real human beings would in the imagined situations. In drama written according to naturalistic theory, however, the dramatist must make them express what they have within them in words which will be accepted by the audience as those which they really would use. In drama not written according to naturalistic theory, on the other hand, the actual words themselves do not have to be, or to seem to be, those which really would be used if the character were to come to life: instead the artist can use literary techniques to create the inner life of the imagined character, and it is the inner life that must be truthfully imagined in terms of human nature as it exists.

5. Drama as Entertainment.— A distinction is sometimes made between drama for sheer entertainment and drama which expresses insights into life and its problems at the same time: the drama of entertainment is related to the art of the mime in earlier times devoted only to entertainment, but drama with a serious purpose is envisaged as having developed not from such miming but from the tradition in which mime and song were a part of ritual. There is also a suggestion sometimes that this latter is to be considered as more representative of real drama. It seems, however, that although serious drama is more impressive to an adult civilized mind, the drama of entertainment is no less properly dramatic. It is not safe, moreover, to assume that the drama of entertainment derives from one kind of mime only, while more serious drama has developed from religious practices; it is more likely that all have been influenced by one another throughout history. Certainly Aristophanic comedy involves the mime of burlesque which is essentially entertainment. As for the element of entertainment, it exists in even the most serious drama, which is well described as both teaching and delighting, with the delight arising in part from the quality of what is being said as well as the way in which it is said. *See* also BURLESQUE; *MIME.* (B. L. J.)

II. GREEK DRAMA

A. ORIGINS

In many parts of the world at many periods there have existed rituals out of which drama could have developed. The widespread use of masks in religious ceremonies implies the idea of impersonation, whether of a worshiper merging himself with his god or of a magician possessing himself of powers not naturally his. In fact few cultures have independently produced a drama, and it is not possible to give a clear account of the impulse which has led to the transformation or of the process by which it has been effected. In the first flush of anthropological discovery numerous attempts were made to uncover the ritual forms latent in Greek tragedy and comedy, and so to account for their origins. None of them has won wide acceptance, and the all but unique transformation of Greek ritual into Greek drama remains unexplained. But that Greek drama emerged from ritual, and ritual of a primitive character, is not to be doubted.

Dionysus was the deity with whom, for the most part, was connected the ritual from which drama arose. Dionysus was among other things an embodiment of the forces of nature manifest in the growth of vegetation, especially the vine, and in the animal world, where he was associated especially with the bull and the goat. Unlike the Olympian deities, who were often remote and unapproachable, he entered into possession of his worshipers, whose frenzied excitement, leading sometimes to a bloody climax, is unforgettably described in Euripides' *Bacchae.* Dionysus had also divine counterparts to his ecstatic human worshipers, mischievous and licentious spirits of forest and mountain. satyrs, silenuses and nymphs, whose wild revelry is frequently represented on Attic vases. As will be seen, these satyrs gave their name to a peculiar form of drama.

Dionysus is scarcely mentioned in the Homeric poems. which means not that he was unknown in Greece (the name occurs on a tablet from Pylos) but that his cult had no place in the society which is there represented. Dionysus was largely the god of the poor and oppressed, to whom he gave relief in temporary forgetfulness from the harshness of life. His turbulent worship was for long excluded from the public cults of Greek cities, and it is significant that both in Athens and in Sicyon it was tyrants, anxious to secure popular support against the aristocrats they had deprived of power, who instituted public festivals of Dionysus.

At the Great Dionysia at Athens, where tragedy, if not comedy, first achieved maturity, Dionysus was honoured with four separate types of performance, dithyramb, tragedy, satyr-play and comedy. The dithyramb was a hymn to Dionysus sung and danced by a choir of 50; each of the ten tribes into which the citizen body was divided competed with a choir; this form alone of the four was not dramatic. In the tragic competition each of the three tragic poets chosen to compete produced three tragedies followed by a satyr-play; this last treated some heroic legend in a burlesque spirit, and its chorus consisted of satyrs, beings represented in human form with animal attributes, usually a horse's tail. In comedy five poets competed for the prize, each with one play. It is noteworthy that the satyr-play was always the work of a tragic poet and that the same poet never wrote both tragedies and comedies. Tragedy was introduced when Peisistratus founded, or rather refounded, the festival between 534 and 531 B.C., comedy not till 486. Plays were later introduced into the minor festival of Dionysus, the Lenaea, comedy about 440 and tragedy ten years later.

1. Comedy.—Although the establishment of comedy was subsequent to that of tragedy, and although the oldest surviving comedy, Aristophanes' *Acharnians* (425 B.C.), is some half a century later than the oldest extant tragedy, comedy preserves more obvious traces of its origin from ritual. Most of the earlier plays of Aristophanes can be roughly divided into four parts: an introduction, mainly in iambics, in which the basic fantasy is explained and developed; the parabasis, in which the chorus (sometimes represented as animals) interrupt the action in order to come forward and address the audience on topics of the day; the contest or agon,

a set debate, the most famous example of which is the one between the Just and the Unjust Argument in the *Clouds;* and finally a series of scenes, again in iambics, in which the hero, his project now achieved, gives short shrift to a number of characters who seek favours from him. The play ends with a banquet or a wedding. Aristotle states in the *Poetics* that Crates, about 450, was the first comic poet to give his play a plot, and that he did this under the influence of the Dorian comedy which had developed at Syracuse; previously Attic comedy had been satirical and abusive. having arisen from the improvisations, spoken or shouted rather than sung, of the leaders *(exarchontes)* of the phallic songs such as were still customary in his day at certain cities. Leaving for the moment the question of the iambic parts of comedy on which the plot mainly depends, it is easy to see a possible connection between the parabasis, with its attacks on individuals, and the more primitive ribaldry of the Dionysiac *komos* ("revel") from which comedy gets its name, "the song of the *komos";* an alternative derivation from *kome* ("village") is mentioned by Aristotle but not approved by him. It is not quite clear from what kind of *komos* he supposed comedy to have been derived, but celebrations of the sort were common in Greece, loosely organized processions in which the phallus, the emblem of male fertility, was conspicuous, and in which those who took part were exhilarated by holy drunkenness, sang traditional songs with occasional inspired improvisations, and exchanged highly obscene badinage with the passers-by. The original function of the obscenity, though this was doubtless forgotten in historic times, was by spoken reference to the organs and actions of procreation to increase the fertility, both vegetable and animal, of the community; in addition, perhaps, by attributing to each other afflictions and infirmities which they had not got, they hoped to deceive the evil spirits who distribute such things and cause them to go elsewhere. A comic version of a *komos* is represented in the *Acharnians* 238–279.

It is easy to believe that the outspoken comments of the comic chorus developed from those of the *komos*. The connection between *komos* and the debate or agon is less obvious though not intrinsically unlikely; further, the agon shares with the parabasis the so-called epirrhematic structure, a roughly symmetrical arrangement of lyric stanzas and passages in "long" metres from which the iambic trimeter, the characteristic metre of dramatic dialogue, is virtually excluded. Without the agon there would be little need for actors at all, and comedy would not have reached the dramatic stage. But it is a plausible hypothesis that in the first 30 years after the introduction of comedy at the Dionysia it consisted mainly of an entry by the chorus leading up to parabasis and agon, and that the iambic prologue and the short iambic scenes at the end were added as the use of plot developed after about 450.

The precise form of *komos* from which Attic comedy arose is not known, but it may be significant, in view of the frequent occurrence in comedy of animal choruses, that men masquerading as animals and accompanied by a flute player are found on a number of Attic vases dating from about the end of the 6th century. Aristotle mentions also the existence of comedy at Megara at the time of the democracy in the 6th century, with which the shadowy figure of Susarion is sometimes associated, and "Megarian jokes" are mentioned with some contempt by Athenian comic poets. Athenaeus tells of a *komos* of potentially comic character at other places in Dorian Greece, notably the *phallophoroi* ("phallus bearers") at Sicyon. Figures, some with phallus, wearing heavily padded stomachs and buttocks similar to representations of Athenian comic actors are found on Corinthian vases of the late 7th century B.C. Incidentally, these are supposed by some to be satyrs of an original Peloponnesian type. They are certainly connected with Dionysus.

Whatever may be the truth about the influence of Dorian ritual on the choric parts of Attic comedy, there is some evidence of a Dorian origin for the more dramatic element. Athenaeus also mentions certain *deikelistai* who at an unspecified date performed at Sparta realistic scenes from low life with a number of stock characters like the quack doctor and the thief. In 1906 excavations in the sanctuary of Artemis Orthia at Sparta revealed a quantity of clay models of masks dating from the 6th century and resembling those used later in Attic comedy. Further, the *kordax,* the obscene dance of Attic comedy, is known to have been associated with Artemis. A possible channel for the transmission of this dramatic form to Athens is through Megara and the poet Epicharmus, who had a connection with the Megarian colony of Megara Hyblaea in Sicily. Epicharmus produced his comedies at Syracuse, probably at the festival of Artemis, during the first half of the 5th century. His plays had normally no chorus, and it is possible that his actors wore no phallus. His plots were sometimes realistic, and led eventually to the mime as found in the urban mimes of Theocritus, sometimes burlesque heroic; his characters were carefully differentiated studies in conventional types more like those of the Attic New Comedy than of the Old.

On the subject of the origins of comedy there is little that can be stated with confidence, but the theory of Attic comedy as a union between a native choric element connected with the cult of Dionysus and a Dorian drama which reached its full development in Sicily at least does not conflict with the evidence, internal or external.

2. Tragedy. — The only extant Greek tragedies are the 35 plays of Aeschylus. Sophocles and Euripides, written probably between 472 and 405. They contain no survivals comparable to those of comedy, though if ordinary Greek ritual forms were extant no doubt much in the hymns and dirges of tragedy would be found to resemble them. The point that emerges clearly when the plays are arranged as far as is possible in chronological order is that the chorus is increasingly predominant in the older plays, though there is now reason to think that the play with the greatest proportion of choral ode, the *Supplices* of Aeschylus, is not in fact the oldest. The conclusion that tragedy arose from a type of performance which was purely choral, though not necessarily correct, is supported by the celebrated fourth chapter of Aristotle's *Poetics,* which is the natural starting point for further inquiry.

The salient points in Aristotle's account are the following: tragedy began from the improvisations, presumably spoken, of the leaders *(exarchontes)* of the dithyramb; in the early stages the plays, if they can be so called, were short, the diction ludicrous, and the general character akin to that of the satyr-play; only at a late stage did the plays acquire size and dignity, and the metre of dialogue changed from the gay trochaic tetrameter to the iambic trimeter; Aeschylus added the second actor and made dialogue dominant over choral lyric; Sophocles added the third actor. This may be supplemented from the 26th oration of Themistius, who quotes Aristotle to the effect that Thespis introduced prologue and speech. which is to say that he was the first actor. It seems to have been the general belief that Thespis made this innovation and that tragedy became an accepted form when. probably toward the end of Thespis' life, Peisistratus made it part of the Dionysia about 534.

This tantalizingly brief account can be explained and expanded a little from other sources. "I know how to lead off *(exarchein)* the dithyramb, the song of the lord Dionysus, when my wits are thunderstruck with wine"; so wrote Archilochus, incidentally in trochaic tetrameters, in the 7th century B.C. The basic idea seems to be of the poet performer who improvises to a chorus which sings a traditional song in reply. Possibly this led the chorus to dramatize the subject of which they were singing instead of using lyric narrative. Otherwise this does not provide any obvious entry into drama, any more than the responses of two semichoruses, in which some scholars have supposed the origin of drama to lie. According to Herodotus the dithyramb itself was developed into a regular poetic form by Arion in Dorian Corinth about 600, but the statement in the Suda lexicon that Arion introduced speaking satyrs cannot be true if prologue and speeches were invented by Thespis, who was still alive *c.* 534. The statement in the same source that Arion invented the tragic method *(tropos)* means only that he used the musical "mode" afterward associated with tragedy.

The next step was the introduction of the actor, hardly before about 560; in other words, the *exarchon* became an actor who spoke a prologue and made speeches between choral songs; presumably his speech announcing events which had taken place off stage gave the motive for the next song. The form into which the

actdr was introduced can scarcely have been the dithyramb, which continued as narrative lyric down to a late period. Presumably it was a kind of choral lyric in honour of Dionysus which had split off at an earlier date and was already called tragedy. Further, it is said to have been of satyric character, and nothing in the dithyramb suggests a connection with satyrs (except for dubious evidence from vases which may show a chorus of satyrs). Aristotle does not say that tragedy developed from the satyr-play; perhaps he accepted the tradition recorded in the Suda lexicon that the satyr-play proper was introduced by Pratinas from Phlius in the Peloponnese between 500 and 490; but he must mean that it was a largely humorous performance with a chorus of beings partly animal in form. Finally this changed to the more dignified tragic form using iambic metre. As Aeschylus was regarded in the late 5th century as the second founder of tragedy, Aristotle may have thought of the change as taking place soon after 499, when Aeschylus began to produce, though the time between Thespis and Aeschylus is short for such a change. Certainly the *Capture of Miletus* by Phrynichus, which in 494 reduced the theatre to tears, was no humorous work. The use of a second actor increased dramatic possibilities enormously, since dialogue was no longer restricted to one actor and the half-impersonal leader of the chorus.

So long as it was believed that satyrs were goat-men and that, just as comedy was the song of the *komos*, tragedy was the song of goats, this account seemed to have some measure of confirmation. But it has long been clear that at Athens in the 5th century no distinction was made between satyr and silenus and that both were a mixture of man and horse, although the shaggy skins worn by dancers in earlier representations may be meant to suggest goats. But to Plato, for instance, satyr-play and silenus-play were alternative expressions. Attempts to show that the chorus of satyrs was sometimes addressed as goats have failed, though both in the *Ichneutae* of Sophocles and in the *Cyclops* of Euripides they are called "beasts" (Gr. *theres*). And the word tragedy can be explained alternatively as song for a goat as prize, or song connected with the sacrifice of a goat. Doubts of the reliability of Aristotle's account are increased by the difficulty of combining with it the only other solid piece of early evidence. Herodotus relates that about 590 B.C. Cleisthenes, the anti-Dorian tyrant of Sicyon, in an effort to get rid of the Dorian hero Adrastus, disestablished his cult, taking away from him the "tragic choruses" which had celebrated his sufferings and giving them to Dionysus. The importance of this is that it suggests that the subject matter of tragedy is essentially the sufferings of heroes, not the story of Dionysus, so much so that in antiquity there was a saying "nothing to do with Dionysus," which may have arisen from the paradoxical absence of his story from the forms intended to do him honour. This passage was the main support for Sir William Ridgeway's theory in *The Origin of Tragedy* (1910) that tragedy was derived from lamentations at the tombs of heroes. Incidentally, it is unlikely that the chorus which lamented Adrastus was composed of satyrs. In regard to the reliability of Aristotle's account, therefore, two alternatives suggest themselves:

1. Aristotle, though writing nearly 200 years after the time when records began to be kept, none the less possessed reliable information which showed the progression dithyramb — satyr-type play — serious tragedy. He does indeed claim in the *Poetics* to have fuller knowledge of the history of tragedy than of comedy, though on the most natural reading of the words he refers not to origins but to later developments. It is a striking fact that from at least the early years of the 5th century tragedy and satyr-play were closely associated, written by the same poets and performed by the same chorus; it is hard to see why this should have happened unless there were strong historical reasons for it. Further, if Aristotle wrote from conjecture rather than knowledge, it is unlikely that he would have produced a theory so strikingly at variance with his own scheme of literary development, according to which the serious-minded on the one hand advanced from hymn and encomium through epic to tragedy, and on the other the frivolous passed from invective through lampoon to comedy. Presumably he would not have intruded the ludicrous satyr-play into the sequence of serious developments unless he had had good grounds for thinking that it belonged there.

2. On the other hand, it is quite possible that Aristotle possessed no reliable information about the period before Thespis or even Aeschylus. Observing the four literary forms, all connected with Dionysus, and the peculiarly close connection between tragedy and satyr-play, he may have suggested *a priori* that both of them were derived from the dithyramb, thus reducing the four to dithyramb and comedy as the basic pair, even though the difficulty of fitting the satyr-type play into the development of tragedy between Thespis and Aeschylus was considerable. The notices in later writings which seem to support the theory may be derived in the last resort from Aristotle and his school and so lack independent authority.

On the question of whether Aristotle had access to reliable information about the early history of tragedy modern opinion is very evenly divided. It is possible that tragedy, like comedy, arose out of a combination of Peloponnesian with local Attic ritual. There is evidence not to be dismissed lightly for tragic choruses connected with hero-worship at Sicyon and a tragic style of music, perhaps arising out of the dithyramb, at Corinth. A kind of Doric was used for the lyrics of Attic tragedy. It would be idle to pretend that there was positive evidence for rustic drama in Attica which might lie behind Thespis' innovation, but there seems to have been some primitive mumming at Eleutherae whence Dionysus came to Athens, and there was a Dionysiac legend attached to Icaria, the birthplace of Thespis. (D. W. Ls.)

B. History

1. Tragedy. — The history of tragedy between the institution of the contest (534/531 B.C.; *see* above) and the time of Aeschylus (first competed 499, first victory 484) is wholly obscure. Since even the mature drama of Aeschylus consists to a surprising extent of scenes between the chorus and a single actor, most conspicuously in the *Supplices* which many scholars now date to 463, it is likely that the earliest tragedy was very largely lyric. Aeschylus appears 11th on the list of those who won tragic victories, a small number for the 50 years down to 484 if the records are complete. Of his predecessors apart from Thespis only Choerilus, Pratinas and Phrynichus are known by name.

Phrynichus (first victory 511 B.C.; another 476, with Themistocles as choregus) claimed to have invented as many dance movements "as waves on a stormy sea" and wrote lyrics beloved by Aristophanes long afterward. Many of his plays started a tradition in tragedy; *e.g.*, *Alcestis* (*cf.* Euripides), *Danaides* together with *Aegyptii* (*cf.* Aeschylus) and *Phoenissae* (celebrating the victory of Salamis, like Aeschylus' *Persae*). His *Capture* of *Miletus*, however, celebrating a disaster with political bearings, incurred a fine and was never imitated.

In early times each tragic dance probably concentrated on one situation, so that the three made up a loosely connected story, like some of the recorded trilogies of Aeschylus. His *Oresteia*, however, the only surviving trilogy, was written toward the end of his life and is a magnificent unity. The element of epic story as opposed to Bacchic dance steadily increased. Aeschylus drew "slices from the great banquet of Homer" (not the *Iliad* and *Odyssey*, which belonged to the Panathenaea, but the rest of the epic tradition); and Sophocles was named "most Homeric." Sophocles particularly developed the "plot"; *i.e.*, the art of telling a story not by narrative but by action. Only one trilogy is credited to him, and he made each play an independent whole. The third actor, introduced by him (*see* above), led the way to complex dramatic effects: as when a messenger brings the news of Orestes' death at the same time to Clytemnestra and Electra, throwing one into exultation, the other into despair, while the news itself is a lie. No such effect could be produced with the two actors of Aeschylus, whose genius liked to concentrate on one great situation, like the age-long martyrdom of Prometheus, or one problem, like the crime that can only be avenged by more crime (*Oresteia*). Sophocles made his diction more natural, his character drawing more subtle and varied and his verse more fluent, often ending a line with no pause, and sometimes even with an elision. One may

say he created the "well-made play" admired by Aristotle.

Greek opinion, however, demanded, as may be seen from the Frogs and from Plato, that a poet should be *sophos* ("wise" or "enlightened") and Euripides particularly responded to the demand. In some ways he returned to Aeschylus in his grand choral effects,his religious problems, even his revival of the obsolete long-trochaic metre; but in thought he belongs to the Sophistic age, being a friend of Anaxagoras and Protagoras and particularly admired by Socrates. He subjected to criticism both the traditions about the gods and the Socratic theory that virtue is knowledge. He was also an adept in *rhetorike,* not "rhetoric" in its English sense but the new "art of speech," aiming at order and lucidity. His plays generally start with a prologue, often spoken by a supernatural being, explaining the subject, and end with a divine judgment or prophecy. This produces both a ritual form and an artistic pattern: calm—passion and crisis—calm. The variety of his themes is remarkable; he has dramas of love (*Hippolytus,* Medea), of mystery (Bacchae) and realism (Electra), of adventure (Helena), of epic fullness (Phoenissae) and of static Aeschylean tragedy (Troades).

Tragedies continued to be written and performed in large numbers during the 4th century B.C., and there was for a time in the 3rd century a school of tragic poets at Alexandria. At Athens the tragic festivals seem to have continued as late as the 2nd century A.D., but from all this activity only a number of names and a few fragments survive. The works of the three great poets and of several others were preserved practically complete in the great library at Alexandria, but later they ceased to be widely read or acted, and a small selection was made primarily for reading in schools about A.D. 200; these are the plays still extant, together with nine others of Euripides which chance has preserved.

2. Old Comedy.—This is known only by 11 plays of Aristophanes, though other writers, such as Cratinus, Eupolis, Crates, Pherecrates and Magnes, are known by name and by numerous fragments. A substantial portion of the Demes of Eupolis was recovered early in the 20th century. The subjects discussed are public and topical, whether political (Acharnians, Knights, Lysistrata), philosophical (Clouds) or literary (Frogs, *Thesmophoriazusae*), and seem to be addressed to a very well-read audience. As remains of the popular fertility revel the following may be noted: the frequently indecent language; the constant suggestion in the background of a better world to be attained in some new age; and the personal abuse of politicians, as in the cartoons in modern newspapers. These attacks were often violent, especially against the ultrademocratic war party, and were forbidden by law (414 B.C. and later) when that party was chiefly in power.

In the later plays of Aristophanes the choral lyric is sometimes omitted, its place being taken by the stage direction "chorus," as in Menander. Indeed his last plays, except for some burlesques of tragedy, form a transition to Middle Comedy, of which no fully developed play survives. The most important writers of Middle Comedy were Alexis and Antiphanes.

3. New Comedy.—This was a comedy of manners with no coarseness of dress or language and no mixture of the supernatural or heroic. "O Menander and life. which of you imitated the other?" asks one ancient critic. The characteristic plot is an inheritance from the adventure plays of Euripides, such as the *Ion,* in which a baby who has been exposed at birth is "recognized" and restored to the appropriate station in life; a frequent consequence in New Comedy is that it makes possible a desired marriage. The chief writers of New Comedy were Menander, Philemon and Diphilus. Only fragments of the two last-named survive. Menander also was known only by numerous quotations (including St. Paul's "evil communications corrupt good manners." I Cor. xv, 33) and Terence's Latin imitations until the discovery in 1905 of a papyrus containing a great part of three plays.. In 1958 a complete play, the *Dyskolus,* was published, a somewhat surprising work by reason of the simplicity of its plot. The remains confirm the ancient praises of Menander's quietly witty style and delicate character draning, but it is a little strange that his rather slight work should have enjoyed so extraordinary a reputation in the last centuries of the ancient world.

4. Production.—The typical Greek play of the late 5th century B.C. was performed in a large open-air theatre by three actors, who might take some ten parts between them, and a chorus of 15 (24 in comedy). In the absence of most theatrical devices the spectacle depended mainly on the richness of the actors' dress, which was often in striking contrast to the normal simplicity of Greek clothing. Masks were worn by all and tragic actors had leather boots (cothurni), which might have thick soles to increase the wearer's stature, though this was probably not customary until later than the 5th century. The crane (*mechane*) could be used to introduce deities traveling through the air (hence the expression deus ex *machina,* "god from the machine"), and a movable platform (enkyklema) to suggest an indoor setting. On the stage actors did little but talk. Violent action was described, often very vividly, in set speeches by messengers.

The plays, which were about half the length of an Elizabethan drama, were lightly divided into scenes by songs, accompanied by dancing, from the chorus; there were often four such songs in a play. During these songs a longer time might be supposed to elapse than the actual time taken by the performance, but, since an actor often remained present while the chorus sang, the break was less violent than when the curtain falls on the modern stage. At moments of high emotion spoken dialogue could be replaced by song, and Euripides often gave his characters long solos. The whole structure was remarkably varied and flexible.

Although a tradition of acting Latin comedies grew up in the Renaissance, Greek drama was not attempted on the stage until the late 19th century. Since then there have been numerous and successful performances both in the original Greek and in translation. The regular productions which take place in Greece itself are particularly celebrated. The two great difficulties to be surmounted are the absence of a familiar convention which might mitigate the strangeness of the chorus, and the general ignorance of the myths and legends of the Greeks from which the ancient dramatists took their themes. developing them in accordance with their own ideas in the assurance that the audience would see the significance of every variation from the tradition. It is striking that, whereas at the time when the universal use of the classics for education made these myths well known they were little used in the theatre apart from opera, dramatists of the 20th century have frequently sought to exploit the meaning and the emotion latent in such stories as those of Oedipus and Agamemnon.

(G.G.A.M.; D. W. Ls.)

III. ROMAN DRAMA

1. Early Dramatists.—The Romans claimed small originality for their drama, which derived mainly from Greece, but a native germ may have existed in the "Fescennine verses," rude exchanges of ribaldry in improvised rhythm at harvest homes and other occasions of merriment. Livy, in his summary of Roman dramatic origins, says that in 364 B.C., at a time of pestilence, Etruscan ludiones were summoned to Rome to avert by their dancing the wrath of the gods. This tradition of early Etruscan influence is supported by Livy's statement that the Etruscan word for "player" was *ister* (Lat. *histrio*) and by the probable connection of persona, "player's mask," with phersu, the name of the masked gladiator seen in some Etruscan tomb paintings.

From an early period Rome had been in contact with the Italian Greeks, and must have been aware of their dramatic exhibitions (illustrated, presumably, in the so-called phlyax vase paintings). Further, the Oscan inhabitants of Campania had long possessed a rude masked performance, afterward developed at Rome into a distinctive form under the title fabula *Atellana* (Atella was a town in Campania). From the combination of the Etruscan dance to music and the Fescennine verse there grew what Livy calls a "medley" (satura), which apparently had no plot, but consisted of jest, horseplay and songs composed for accompaniment by the pipes. However artificial and at times absurd Livy's account may be, it seems to contain elements of truth.

In 240 B.C., the year after the close of the First Punic War, Livius Andronicus, a Greek (probably from Tarentum) who made a living as a teacher and literary man at Rome, translated

a Greek play for production at the Roman games. The titles of eight (?) tragedies and thre'e comedies of his survive. Their. literary merit was probably slight; his achievement is to have been a pioneer (though the degree of skill with which Greek metres are handled in the extant dramatic fragments may suggest some doubt as to whether he really was a pioneer in adapting Greek verse to the Latin language). The native Italian genius of Gnaeus Naevius (first production in 235 B.C.) shone most brightly in comedy; titles of 34 of his comedies (translated, of course, from the Greek) are known, as against 7 tragedies. The fragments of the comedies are infused with a flavour of common and indeed low life, Italian in spite of the Greek framework. One of his most famous plays was the Tarentilla, which vividly portrayed one of those Greek courtesans with whom Roman soldiers must have become familiar in the war. The plot turned upon the adventures of two young men detected by their fathers living with two girls in Tarentum and haled back to respectability. Naevius' creation of the Roman historical play (fabula praetextata), dealing with heroes of Roman legend or contemporary history, is still more striking evidence of his originality. His outspoken attacks (presumably from the stage) on the nobility are said to have been punished with imprisonment or exile.

In tragedy Naevius was followed by the great poet Quintus Ennius, who was born in Calabria in 239 and died in 169 B.C. In comedy he seems to have been a failure (two comedies only are known by name), but there are titles and fragments of about 20 tragedies and perhaps 2 praetextatae. He is said to have been especially attracted by Euripides; his translation of the Medea was famous, and his Andromacha was well known as late as the time of Cicero, who loved to read and quote him.

2. Plautus and Terence. — After Ennius no one attempted both tragedy and comedy. Indeed Titus Maccius Plautus (c. 250–184 B.C.), a native of Sarsina in Umbria, had already confined himself to comedy. He is the great representative of the *fabula* palliata, translated from Greek New (some would add Middle) Comedy; 20 of his plays are extant. He introduced quite freely allusions to Roman legal procedure, manners and customs, Italian place names and Latin puns. Of large-scale alteration the only specific evidence is Terence's statement that he omitted a scene through "carelessness," but his boisterous humour turns his "translations" into original Italian comedies. One of the greatest masters of the Latin language, Plautus riots and gambols in dialogue in which everything is sacrificed to the desire to raise a laugh, but the nimbleness and suppleness of his diction are extraordinary. His high spirits and his mastery of dialogue and metre were never again equaled in Roman comedy.

Statius Caecilius (d. 168 B.C.) was regarded by some later critics as the chief of Roman writers of comedy. He was famed for his argumenta ("plots," or perhaps "exposition of the plot"), moral force and emotional power. His chief model was Menander, to whom he owed 16 of his 42 named comedies; the fragments, while free from allusions to Italian topics, show that he could on occasion alter and coarsen the style of his original.

Terence (c. 185?–*c.* 159 B.C.) traditionally came from Carthage to Rome as a slave, and became a literary friend of "noblemen" (later identified with Scipio and his circle). His literary methods incurred the jealous hostility of a rival dramatist, Luscius Lanuvinus. Of Terence's six plays it is generally held that the first was the *Andria,* produced in 166. and the last the *Adelphi,* produced in 160 B.C. His prologues deal sharply with the attacks of his critics and the fickleness of the public. Terence lacks the boisterous mirth, rich vocabulary and metrical mastery of Plautus; his style is graceful and correct without formality; he is free from the discrepancies of Plautus; his main interest is in the portrayal of character; his deliberate departures (attested by Donatus) from his models were criticized by his enemies as contaminatio, "spoiling," but the only alterations which he admits are occasional borrowings from a second Greek source.

The only other writer of *palliatae* who is more than a name is Sextus Turpilius (d. 103 B.C.). He seems to have kept close to his Greek originals; his Leucadia (from Menander) had an unusually interesting plot; his *Demiurgus* was revived in Cicero's day. Turpilius is the last known writer of comedy, but old *palliatae* continued to be produced until the end of the republic and perhaps later.

3. Later Developments. — Roman tragedy after Ennius was continued by his nephew, Marcus Pacuvius (c. 220–*c.* 130 B.C.), born at Brundisium, a painter as well as a poet. Titles and fragments of 12 tragedies and one praetextata still remain. He was regarded by later critics as the chief Roman writer of tragedy, or second only to Accius; his plays contained famous pathetic scenes; he was celebrated for his "learning," and seems to have paid particular attention to sound effects. Many of his plays continued to be performed down to the end of the republic; a canticum from his *Armorum Iudicium* was declaimed at the funeral of Julius Caesar. Later generations seem to have wearied of his harsh, strained style, his weird compounds and his pedantry.

In strong contrast was the spirited and lofty genius of L. Accius (170–*c.* 85 B.C.), a man of immense energy, who has left the titles of over 40 tragedies and of two praetextatae. He liked violent plots, flamboyant character drawing and forceful rhetoric; his *Atreus* contained the famous retort oderint *dum* metuant! ("let them hate provided that they fear"). In him republican tragedy is at its climax and already approaching the excessively rhetorical style of Seneca. Perhaps Accius was the last writer of tragedies intended for the stage.

The native Latin comedy, fabula togata, may have come into being about the end of the 2nd century B.C. It seems to have avoided dangerously political topics by keeping to the life of obscure folk and of the country towns. Its chief writers were Titinius (of unknown date), T. Quinctius Atta (d. 77 B.C.) and Lucius Afranius, who lived later than Terence (whom he praises) and who seems to have brought the togata to its highest point; his *Simulans* was performed in Cicero's day, his *Incendium* during Nero's principate. Nothing is known of the plots of the togatae, or of the rustic Atellanae which had a vogue in the last century B.C. These farces had originally dealt with stock characters (Maccus, the clown; Pappus, the old fellow; Manducus, "Champjaws," the ogre; Dossennus, usually explained as the "hunchback," from *dorsum*). Pomponius and Novius gave the Atellana literary form.

About this time, too, the maskless mime came into fashion; Cicero seems to say that by his day mimes had ousted the Atellanae from public favour. The principal writers of these often immoral playlets were Decimus Laberius (c. 105–43 B.C.) and Publilius Syrus, a former slave from Syria, who successfully challenged the sexagenarian Laberius to a dramatic contest at the ludi *Caesaris* in 46 or 45. There is a large collection of sententiae or pithy sayings attributed to Syrus.

During the last century of the republic the tragedies of the earlier masters were frequently produced. The Augustan age gave birth to two new plays (now lost), Varius' Thyestes and Ovid's Medea. The writing of tragedies for "recitation" (reading aloud to an invited audience) now became a fashion; this is perhaps the origin of the nine tragedies attributed to the younger Seneca. In these plot and character are subordinated to extravagantly rhetorical effects and display of ingenuity and erudition; artificial as they appear today, they exercised great influence at the time of the Renaissance. The only extant praetextata, the Octavia, must have been written after the death of Nero.

4. Production of Plays. — Performances of plays were part of the free public entertainment offered at the great festivals (ludi *Romani, Megalesia,* etc.) or at funerals, triumphs and the dedication of temples. The earliest scene buildings were no doubt simple structures of wood, put up for the occasion. Seats for spectators are mentioned in the plays and prologues of Plautus; in 194 B.C., according to Livy, special seats were assigned to the senators. An attempt in 155 B.C. to build a stone theatre was prevented by the consul Publius Cornelius Scipio Nasica; Pompey's stone theatre was built in 55 B.C.

The scene building formed the permanent background to the performance; changeable scenery was unknown. The actors declaimed to music provided by the piper (tibicen). At first authors acted in their own plays; but later a manager (such as Ambivius Turpio, who produced for Caecilius and Terence) with a troupe

of actors (grex) brought out the play, engaging their services to the magistrate who had charge of the festival. The actors may have been slaves (though the Atellan farces, according to Livy, were produced by freeborn citizens down to his own day); in the course of time. however, great actors such as Clodius Aesopus in tragedy and Quintus Roscius in comedy are said to have achieved not only fame and fortune but a certain position in society. At the bottom of the social scale came the mime.

5. Downfall of the Classical Drama.— The great theatres of the empire seem to have been intended chiefly for trivial or degrading performances. There were dramatic cantica; thus Nero "sang" such parts as Orestes the matricide. Far more important was the *pantomimus,* the masked dancer, who performed scenes in dumb show, supported by a chorus. This "Italian dance" was introduced in 22 B.C. by Pylades and Bathyllus. The themes were mostly taken from mythology; the librettos sung by the chorus for these ballets (fabulae salticae) were sometimes written by such eminent poets as Lucan and Statius. Purely literary plays of every type continued to be written, but not, apparently, for the stage. A comoedus was now a slave who read extracts from comedy at a banquet; on the stage comedy gave place to farce, chiefly the mime, which survived all other kinds of comic performances, perhaps because of its more audacious immorality and open obscenity. Women as well as men took part in these performances; in the 6th century the mime actress Theodora captivated Justinian himself and became his empress. Long before this the mime had come into open and bitter conflict with the Christian church, which, without usually caring to distinguish between the nobler and the looser elements in the drama, involved all its manifestations in a consistent condemnation (as in Tertullian's De spectaculis).

At Rome the last mention of *spectacula* as still in existence seems to date from the earlier half of the 6th century. In the capital and provinces of the eastern empire the decline and fall of the stage cannot be similarly traced. Perhaps the mimes, as they lost all footing in the centres of civic life, became a wandering fraternity, who appeared at festivals when their presence was required, and vanished again into the depths of the obscurity which has ever covered the strolling player's life. These strange intermediaries carried into succeeding ages such traditions as survived of the acting drama of pagan antiquity. (WM. BE.)

IV. MEDIEVAL DRAMA

1. Forms and Content.— The traditional concept of medieval drama is so inclusive that it takes in many spectacular activities that are not in the true sense drama at all. May games, sword dances, processions and dumb shows in honour of royal and noble persons entering or passing through cities, and pageants in general, lack one or more of the three essentials of true drama— impersonation, dialogue and action. This is not true of the three principal kinds of medieval drama, mystery plays, miracle plays and morality plays, all of which make use of all three elements of drama. It can also be seen that the middle ages invented, somewhat sporadically, the farce and the *pastourelle.*

The first and most important of these forms is the mystery play, derived, like the French *mystère,* from the Latin *ministerium* ("service"), for the mystery play grew out of the liturgy and was controlled by it from beginning to end. The word "mystery" here carries no suggestion of the unknown and the unknowable. The mystery play originated in the Quem quaeritis trope, a musical addition to the liturgy of the 9th century, and grew gradually greater for about six centuries by the addition of scenes and themes into perhaps the most extensive dramatic series that has ever appeared in the world.

In the presence of this wide inclusiveness and this manifestation of such deep human interest it is necessary to ask where the events originated and how they were used in drama. The source is obviously the Bible, but not by free choice of subject; during the earlier centuries of the Christian church a process of selection of biblical topics manifested itself for purposes of instruction and commemoration, the main points being man's creation, fall and redemption.

The word "liturgy" in its stricter sense refers to the manner of the celebration of the Eucharist or Lord's Supper, a daily service of prayer whose guide is the missal or prayer book. This does not normally include historical or instructional features except in matters of daily conduct. In a more general sense, "liturgy" means all the services of the church, thus including the service of the divine office. The latter is concerned with the vast number of special services observed throughout the year, with which the development of religious houses, or monasteries, was closely related. Houses of monks and nuns, by their specialization, could carry through day by day and hour by hour the full commemorative and instructional requirements of the church; cathedrals, priories, collegiate churches and perhaps some amplified parish churches could also meet the full requirement. They did this according to a division of the day into set periods, called hours (see HOURS, CANONICAL). Of these so-called hours. matins, the night office, is of particular interest to the student of drama. It was a long period of relative leisure devoted mainly to worship and to readings from the Scriptures and the Church Fathers, and it seems to have been the time when religious plays were written and revised.

Instruction took the form of lections, selections from the Bible, not chosen according to individual motive but prescribed (see LECTIONARY). The year itself was divided into seasons, each with its special significance in the telling of the great story. The year began with Advent, starting the Sunday nearest to Nov. 30, which was a time for the contemplation of ultimate things. From Advent came the plays of the Last Judgment and of Antichrist. Christmastide and Epiphany, a period of 13 days, told the stories of the nativity, the shepherds and the magi. The days after Epiphany were devoted to the creation and the lives and deeds of the patriarchs. Lent and Eastertide dealt with the passion and the resurrection (see CHURCH YEAR).

By the 11th century the number of service books necessary to perform the service of the hours (or divine office) had become great, and a condensation known as the breviary was made. It was divided into two parts: the Temporale, devoted to events recorded in the Bible, and the Sanctorale, containing services in commemoration of saints and martyrs (see BREVIARY: Contents). It may be said that mystery plays belong with the Temporale and miracle plays with the Sanctorale.

Miracle plays originated in the liturgy as did the mystery plays and like them increased greatly in size and number until miracle plays became of almost equal importance with mystery plays. Most saints' plays in English were destroyed during the Reformation, but great numbers have been preserved in France.

The third great kind of medieval drama is the morality play. It was the last invented (by about 1400) and possibly reached its finest form in English. It is discussed at some length below, and in these introductory remarks it is necessary only to insist on a clear understanding as to what a morality play is. It is basically a dramatized allegory. The mere appearance of allegory in plays does not make them morality plays, since in the middle ages allegory was apt to appear anywhere and everywhere.

In the mid-20th century there have been many revivals of mystery plays. The Chester cycle has been successfully performed in a simple manner. The York plays have been produced triennially. This was a more difficult undertaking and the cycle was more modernized. There has also been on the stage a popular condensation and modernization of the Wakefield cycle. Various single mystery plays have also been put on the stage, mainly by amateurs. Possibly the most detailed and accurate of the revivals is that of the Beauvais Daniel from ms. Egerton 2615 in the British museum, London, with full choral and liturgical accompaniment. There are also many places in France, Germany, the Netherlands and Austria where mystery plays have continued to be performed by the people or have been revived for particular reasons. The most famous is Oberammergau (*q.v.*).

2. The Revival of Drama: The Mystery Play.— During the Carolingian renaissance of the 9th century there was a new impulse in the field of church music, and simple attempts were made to beautify the Gregorian chant (see PLAINSONG: The Gregorian

Music), mainly by variation of final syllables in such words as hallelujah. These additions were recorded in an imperfect system of musical notation known as *neumae* (see NEUMES). There was no staff, and it has been suggested that, since tunes are best remembered when coupled with words, these variations were associated with appropriate language and that these words came to be tropes. They were chosen from passages associated with the context and became, as time went on, very abundant, and indeed occupied whole volumes called Troperia. One of these was widely accepted and began to operate as a living drama. In the course of a century or so this trope took on the form of a fully developed play of the resurrection.

The earliest example appears in a 10th-century manuscript from the monastery of St. Gall in Switzerland. It was sung in connection with the Mass of Easter as an addition to the service and is known as the Quem quaeritis:

Item de Resurrectione *Domini*

Interrogatio:

Quem quaeritis in sepulchro Christicolae? ("Whom seek ye in the sepulchre, Christian women?")

Responsio:

Iesum *Nazarenum crucifixum*, o caelicolae. ("Jesus of Nazareth the crucified one, O dwellers in heaven.")

Non est *hic*, surrexit *sicut* praedixerat; ite, *nunciate* quia surrexit de sepulchro. ("He is not here, he has arisen as it has been prophesied; go ye and announce that he has arisen from the tomb.")

Resurrexi.

The last word—"I have arisen"—belongs to the next feature of the service of the Mass. The scene is at the tomb of Jesus, and the first interrogation is that of the angel of the tomb. The first response is that of the three Marys whose mission is to anoint the body of the Lord (Luke xxiii, 55–56). The phraseology is not, however, from the Gospel of St. Luke but is repeated from various parts of the service of the Easter Mass. The words "Go and announce that he has arisen from the tomb" are themselves an invitation to further development and the trope grew by incremental additions.

An idea of the early stages of growth can be derived from the service as described in the Regularis Concordia of St. Ethelwold, a document for the direction of Benedictine monasteries prepared at Winchester between A.D. 965 and 975. This stage of development is shown also in the Winchester *Troper*, a Bodleian manuscript (No. 775) dating from A.D. 979. Indeed, there are many manuscripts from continental countries, published or described by Karl Young (see Bibliography), which show the Quem quaeritis in an early stage such as that of Regularis *Concordia* or in various more advanced conditions. The next earliest version from England, however, is a 14th-century version considerably extended. It belonged to the Sarum service and is preserved in ms. 15,540 in the Bodleian library at Oxford, but was formerly in possession of the Church of St. John the Evangelist in Dublin. It begins with a series of laments of the three Marys on their way to the tomb, always a lyrical feature of the play; then comes the Quem quaeritis trope; then the episode of the visit of the disciples Peter and John in response to the report of the Marys; then a lyrical sequence, *Victimae paschali* laudes, of importance in the further development of the play; then a dialogue between the Marys and the disciples (apparently represented by the choir), who sing a song of glorification. After that the service of matins is ended with the singing of Te Deum. All this is still within the limits of the original scene, but another closely related event appears in many early manuscripts. It is, as recorded in St. John's Gospel, Christ's appearance to Mary Magdalen in the garden.

The next important addition, in the 12th century, is the *Peregrini*, a play based on the story of the walk to Emmaus, as recorded in Luke xxiv, 13–35, which later had added to it the appearance of Christ to the disciples in the upper chamber. This almost completes the story of the development of the resurrection plays proper. The Harrowing of Hell, based on the apocryphal Gospel of Nicodemus, which seems to have had an independent origin, was intruded into the resurrection play, and, with the same desire for completeness, there was prefixed a scene showing the Setting of the Watch to prevent the friends of Jesus from removing the body from the sepulchre. In it appears Pilate, the first hostile character to appear in the plays.

Passion Plays.—Plays of the resurrection group, although important theologically, proved after the performance of mystery plays came into secular hands (see below) to be less popular than plays of the passion, and the question is whether or not passion plays originated within the church. The evidence is scanty but it is clear that such plays did belong to the Latin and not the vernacular drama. Only two dramatic texts have been preserved. Both are in the 13th-century German Benediktbeueren manuscript. The first, the *Ludus* breviter de Passione, is clearly marked as a prologue or first part of a resurrection play; indeed, it gives at the end the first line of such a play. This is the way in which one might expect that scenes of the passion would be developed within the drama of the church. The other text, longer and fuller, suggests a different origin. It begins with the calling of Peter and Andrew (Matt. iv, 18–20) and proceeds through the plays of the ministry of Jesus, the betrayal, capture, trials, crucifixion, death and burial, which seem to be taken with little modification from New Testament readings. But these parts seem to be an amplification of an independent play on the worldly life of St. Mary Magdalen and the raising of Lazarus, like those that appear in independent liturgical *ordines* on these subjects. At any rate, it can definitely be stated that the play of the passion in Latin was late in developing.

Pastores and Magi.—The second great unit of the medieval mystery play is made up of plays that arose contemporaneously with the Easter plays at Christmas and the Epiphany. Development follows the same route in these plays as that followed in the Easter group. For the play of the shepherds (pastores) there is actually a trope imitative of the Easter Quem quaeritis. It is of the 11th century from Limoges, and we have Quem quaeritis in *praesepe*, pastores, dicite? ("Whom seek ye in the crib, shepherds, speak?") The question is asked by the midwives, and the shepherds say they have been led to the crib of Jesus by the prophecy of Isaiah (Isa. vii, 14). To this was soon added an episode of the announcement of the birth of the Saviour to the shepherds as they were tending their flocks in the field (Luke ii, 10–11). With slight additions the popular play of the shepherds was complete. Meantime, there arose at the Epiphany (Jan. 6) a tiny play of the magi or wise men of the east (Matt. ii, 1–16), and the *pastores* and the magi were united and amplified by the activities of the great villain Herod, who attempts to destroy the magi and in his rage at their escape, orders the killing of the children, or the slaughter of the innocents. This in turn brings into existence the play of the flight into Egypt, and to that in some plays were added the traditional episodes of the fruit-laden cherry tree and the falling of the Egyptian idols.

The Christmas cycle is not complete, however, without the play of the prophets (prophetae), a most interesting development. A sermon wrongly attributed to St. Augustine, and read as a lesson at matins on the night before Christmas, developed as a sort of processional play that was used as prologue to the Christmas group. The sermon, which is highly rhetorical, was designed to convert Jews, pagans and Arians. It was the part directed at the Jews that grew into a play. It is a principle of Jewish Law, the preacher says, that the testimony of two witnesses is adequate for the establishment of truth. He will bring forward many witnesses, and he proceeds to recite messianic prophecies from Isaiah, Jeremiah, Daniel, Moses, David and Habakkuk. He goes further and quotes Simeon, Zacharias, Elizabeth and John the Baptist; even cities three witnesses from the pagans themselves: Virgil, Nebuchadrezzar and the Erythrean Sybil (who prophesied the Trojan War). In a very simple play from Limoges (11th century) the prophets in costume recite their prophesies, St. Augustine being the precentor. Another prophetae from Laon goes further in development, as does a play from Rouen, with many more prophets and greater scenic growth. With the addition of the annunciation and the visit to Elizabeth the structure of the Christmas cycle, a play that in one form or another lasted for centuries, and still survives in the modern nativity play, was complete.

Old Testament Plays and Others.—On the three Sundays and ferial days of the weeks preceding Lent the readings at the serv-

ices of the hours were from Genesis and Exodus, with some other small parts from the Pentateuch, and thus provided the materials for Old Testament plays. There exist a fragmentary play of Joseph from Laon (13th century) and one from Vorau of Isaac and Rebecca and their sons, dated by Karl Young at the end of the 12th century (see *Bibliography*). It is clear that both of these were performed inside the church as part of the service. Also, some testimony comes from the famous 12th-century play of the temptation and fall of man, the *Ordo Adae*. It is in Anglo-Norman, and, although carefully scriptural, is highly developed. Stage directions and quotations from the liturgy are still in Latin, and there can be little doubt that it originated in the church service. This is only part of the well-known list of popular Old Testament plays in the vernacular. A play of the fall of Lucifer is known to be of later origin than are the main body of Old Testament plays: the creation, the fall, Cain and Abel, Noah, Abraham and Isaac, Jacob, Joseph and Moses and the exodus, with other occasional plays — the death of Cain, Seth in Paradise — and at least two plays that seem to have originated from the *prophetae* — *Balaam,* and Moses and the tables of the Law.

The other important group of plays necessary to present the whole story of mankind in relation to God are plays of the last judgment, the *Judicium.* They are normally only two and these may have originated together as parts of one theme — Antichrist and doomsday. *Antichristus* was a traditional devil mentioned in II Thess. ii, 3–11 and elsewhere in the New Testament, and was well known. A drama on the subject appears in a highly advanced stage with political bearings in the Tegernsee manuscript of the 12th century, and it has been thought that that play is the original rather than an amplification, but this is now seen to be a mistake. The play appears in a much simpler form, as if from the liturgy, in an Italian version, along with the *Judicium.* This other Advent theme of the last judgment, which became a necessary part of full-scope mystery plays, rests on Matt. xxv, 31-46 and was a regular feature of the liturgy of Advent. Another play of considerable interest is the *Sponsus* or play of the wise and the foolish virgins (Matt. xxv, 1–13). This led an independent existence of some scope.

Period of Transition. — *By* the early 14th century the religious drama had in most places passed from the hands of the clergy into the hands of the laity. The process was a long one, no doubt varied from place to place, and was never complete. It is thought that trade guilds, which were also religious guilds, were the principal avenue of transition. At least it may be said that, after the transfer was complete, trade guilds were in many places in charge. Also, mainly in France, guilds of minstrels or musicians called *puys* were in charge of religious plays. The move was also in most places made from indoors to outdoors. It is clear that the *Ordo Adae* was acted at the church door, partly inside and partly outside a church, and there is an interesting record from Beverley, Yorkshire, from *c.* 1220, of *a* play of the resurrection that was then being performed between the buttresses on the north side of the Church of St. John of Beverley.

The transition from Latin to the vernacular was a still more gradual process. In any purely liturgical plays short phrases in the vernacular appeared either by way of paraphrase or as lyrical forms. The development was always toward making the plays intelligible to the uneducated audience. This concession to those who did not understand Latin appears first in dialogue, and in many instances the vernacular took possession of the dialogue while Latin remained in stage directions, quotations from the service and in those parts of a play that were to be spoken or sung by groups of characters.

Corpus Christi Plays and Passion Plays. — *A* turning point came. particularly in England, with the feast of Corpus Christi, which was established by the Council of Vienna in 1311. The feast is in honour of the Eucharist and is observed on the Thursday after Trinity Sunday. Its observance spread rapidly over Europe and it was celebrated at Canterbury in 1318 and at London in 1347. Some remarkable changes took place in the religious drama in some places in England, Germany, Spain and possibly France as the new feast became a centre of dramatic activity. The region affected in England was mainly the northern and midland counties.

It is possible that the pattern of the Corpus Christi play came from Chester, where a full-scope play, from the creation to the last judgment, seems to have been borrowed from France and translated into English. The traditional date, which has been questioned, however, is 1328. This French play has been identified with the famous *Le Mystère du Viel Testament,* but it cannot of course have been that play in the form in which it now exists in a printed version of 1501. In the 175 years between the early 14th and the beginning of the 16th century the French religious drama underwent enormous changes and amplifications, and the original form of the play is unknown.

There are unmistakable records of Corpus Christi plays in about 20 places in England, and there may have been more. Texts of such plays have been preserved from Chester, York. Wakefield (usually called the Towneley plays from the owner of the manuscript) and another cycle known erroneously as *Ludus Coventriae* or Hegge plays, which may possibly be the lost Lincoln plays. The conjecture that this cycle represents the lost Lincoln plays rests on various circumstantial considerations: similarity in dialect, since it may at least be said that there are no dialectal obstacles in the way; evidence of theological culture in the cycle, since Lincoln was outstanding in the middle ages as a seat of learning; but mainly a set of agreements between Lincoln records as to the special features of the Lincoln cycle and the obvious contents and forms of *Ludus Coventriae.* One of these is the union of a St. Anne's day play with a Corpus Christi play appearing in both the manuscript and the Lincoln records. The idea is presented only as an attractive probability and for further detail the reader is referred to Hardin Craig's *English Religious Drama of the Middle Ages (1955).*

Besides these full cycles, there are preserved two single plays or pageants from Coventry, one from Norwich and one from Newcastle upon Tyne. There are also two plays of Abraham and Isaac whose cyclic connection is not known although their form indicates that they are part of a Corpus Christi play. Besides these, the Digby tnanuscript (in the Bodleian library, Oxford; a collection of plays from different sources and dates) contains three plays that seem to be independent. There is the conversion of St. Paul, always an independent play and acted in some unknown small town; a play of St. Mary Magdalen with the raising of Lazarus and a play of the slaughter of the innocents, which is one annual part of a play performed on St. Anne's day (July 26). Another Bodleian manuscript contains a burial and resurrection, which seems to be a play on those subjects never joined with a cycle.

While the plays were still performed in the church, certain places called *loca* or *sedes* were fixed upon, and much of the action took place in the space between these stations. This is the basis of the multiple stage of the medieval drama, for when the plays were taken out of doors the same system was followed. Stations were grouped together, and spectators occupied the area around the group of *loca* or *sedes,* which had now become decorated platforms called "mansions," each one representing a particular locality. The action was largely in the *platea,* the space between and in front of the platforms. Many of these areas must have been circular. When, however, the plays again went indoors, into a hall, the various stations were arranged side by side on a platform, distance still being imaginary. The feast of Corpus Christi had a procession about the city, and in some places the procession was made up of individual scenes. The stations necessary for such processional plays were loaded on wagons called pageants and drawn to selected, open places, where the plays, in chronological order, pageant after pageant, were enacted. Some of these pageants showed more than one locality, so that distance was still disregarded. The classical idea of unity of place was not introduced into the drama until the Renaissance.

The English Corpus Christi plays happen to be better preserved, both as regards texts and records, than any other, so that there is a general impression that all medieval religious drama took their form, although, in point of fact, Corpus Christi plays were

not even dominant in England, being confined to a relatively few northern and midland cities. The Corpus Christi plays were also exceptional on the continent of Europe, and even in London and the southern counties, from which no texts and few records have been preserved, the large-scale mystery plays were passion plays. The main difference between these and the Corpus Christi cycles is that the passion plays had no plays of the nativity. There is a great stock of such passion plays in French and German, and a few in Low German and Spanish. No doubt they were once plentiful in Italy, although none has been preserved.

There are simple passion plays in the vernacular, not far removed from the strictly liturgical plays of the church, from Trier and Wolfenbiittel in Germany, and a fragmentary early play from Kloster Muri in Switzerland. Later and fuller plays in German come from Redentin, Vienna and Erlau. St. Gall in Switzerland supplied two most interesting early plays, one of the passion, the other of the nativity. In fact, most stages of development are represented in the plays in German, culminating in a host of long later passion plays—those from Alsfeld, Frankfurt, Heidelberg in Germany and the Tirol in Austria. In France the drama has not been studied from the point of view of development, and what we have are great passion plays from Semur, Arras and Angers, and the vastly expanded works attributed to Arnoul Greban and Jean Michel. Little is known about these two great 15th-century figures in the history of les *mystères* in France. Greban, poet and musician, was born at Le Mans and died there about the year 1471. Michel, who was younger than Greban and made use of his work, is known only as a dramatist and man of culture. They are thought of by some scholars as independent dramatists, but they are merely the last of a long series of redactors. Both wrote long plays on the passion, which when combined and acted in 1507 ran to 65,000 lines and occupied six days in the performance.

Cyclic Plays in England.—Much remains of the English cyclic plays, however much the losses may be regretted. Each of the four extant cycles—York, Wakefield, Towneley and the so-called Ludus Coventriae—has its own greatness as a picture of the spiritual life of the middle ages. Each is a version of the great story of the fall and redemption of man which reveals the goodness and wisdom of God. If the fitting of symbols to events, ideas and emotions may be rightly taken as the basis of the growth of the mind, how could a long period of slow human development have had a better subject for contemplation? The Chester plays, which are rich in content, underwent the least change in spirit and style. They tell the great story in adequate yet simple form. The local and municipal pride of the prosperous city of Chester is the most probable reason for this truly medieval adequacy of the Chester plays.

York was also a long-established centre of medieval culture, and the York plays show careful preservation of early style in a different yet characteristic way. York was for centuries powerful politically and religiously and was industrially prosperous. Trade guilds in York were numerous and anxious to participate in the fashionable Corpus Christi play. It was managed by the municipality itself and in consequence the number of plays was greatly increased both by the division of existing plays and the creation of new ones. In this amplification use was made of a narrative poem originating from Northumbria, The Northern Passion, and later of the vernacular Gospel of Nicodemus; still later, with further use of the New Testament Apocrypha, there was a great redaction of the plays into alliterative verse. It affects about 14 plays and this last great redactor or reviser of the York plays was a dramatic genius of excellent quality.

The Wakefield plays, preserved in the slightly imperfect Towneley manuscript, now in the Huntington library in California, were originally identical with the York plays. At some time, probably in the later 14th century, the York plays were transferred bodily to Wakefield and established there as a Corpus Christi cycle. After the transfer each cycle went its own way. Six plays within the cycles remain practically unchanged and there are identical speeches here and there in other plays. Twelve plays have been revised in York and not in Wakefield; five in Wakefield and not in York. There are also 12 plays that seem to have undergone independent revisions in both cycles. Finally, there are some plays in one cycle that do not appear in the other. This is in large part due to defects or omissions in one manuscript and not in the other, although, at least in the York cycle, there may be plays composed after the separation. The best-known feature of the Towneley cycle is the work of a talented redactor, described by C. M. as "the Wakefield Master" in his article on him (International Quarterly, 1905). Brilliant in metre, language and rhyme, particularly in the management of stanza forms, witty and satirical, his work is easily recognizable.

The fourth of the great cycles is sometimes called the Hegge (pronounced "hedge") plays, again from an early owner of the manuscript. Its old name is Ludus Coventriae because it was thought to come from Coventry. Early in the 19th century, however, it was seen that these plays could not be the Coventry cycle, because some parts of the true Coventry were known, and they were very different plays. The Hegge plays as a whole are distinguished for dignity and theological learning.

A Cornish mystery play, which appears in three great groups—creation, passion and resurrection—is in early and simple form, with, however, a different basis from the English plays. They are evidently like the plays acted in Brittany and are distinguished by the introduction of a wide variety of subjects. Little is known about the mystery plays of London except that they were of enormous extent. They were of early origin, and a great play at Skinners Well, near Clerkenwell, in 1409, lasted for five days. It included the creation and apparently the passion and must have been acted on a stationary stage like the passion plays of the continent. It may be inferred that the lost plays of southern England were also of the continental type. Nativity plays were probably acted separately, and this may also have been true at Aberdeen. The Creed play, dating from the early 15th century and performed at York every tenth year instead of the Corpus Christi cycle, not on Corpus Christi but on Aug. 1, the feast of St. Peter ad Vincula. seems to have been on the popular French theme of the Apostles' Creed—to which, it was thought, each of the apostles had contributed a clause—illustrated by incidents from their lives.

Mystery plays, which were as a whole simple and devotional and not theological or controversial, were partly suppressed during the Reformation and partly merely neglected in the revival of classical learning at the Renaissance. There is evidence that their loss was lamented by simple citizens.

3. The Miracle Play.—Miracle plays, or plays presenting the lives and martyrdoms of the saints, originated in the liturgy in the same way as the mystery plays. This is clear from a single example. There exist four liturgical plays in Latin drawn from the legend of St. Nicholas, mainly, perhaps all, derived from the service of St. Nicholas' day (Dec. 6). There may have been other saints' plays in Latin, but none has been discovered. There are early records of a play of St. Catherine at Dunstable, c. 1100, and an early play of St. Dorothea located by W. Creizenach (see Bibliography) in Upper Saxony. Plays of St. Agnes and St. George are probably of early origin. Miracle plays of the Virgin Mary as well as of the saints were numerous in Germany, indeed all over Europe, and grew to great proportions in France, as witnessed by the 14th-century collection, Les Miracles de *Nostre* Dame. They were also numerous in England and Scotland, but the zeal of the reformers has destroyed the texts. There were plays of St. Catherine, St. George, St. John the Baptist, St. Nicholas and many others, but all that are left in English are the Croxton Play of the Sacrament in east midland dialect, probably dating from the 15th century, which describes a miracle said to have taken place in 1461; and the possibility that the manuscript called Dux *Moraud*, which appears to have been written down in the 14th century and was found on the margin of an assize roll, is a single player's part of a miracle play. There is also a miracle play in ancient Cornish on the life of St. Meriasek from Cambourne in Cornwall.

The lost Paternoster plays of York, Beverley and Lincoln seem to have been made up of a group of saints' legends. This is

a matter of some interest, since it has long been believed that the Paternoster play mas the first recorded morality. But there are serious objections to this conclusion. It is known from an allusion by Wyclyf in 1378 that the play had to do with the Lord's Prayer and from records at York and Beverley that it had seven parts, each called by the name of one of the seven deadly sins. There is no immediate knowledge of the contents of the plays themselves, but there is a traditional belief that each of the seven petitions of the Paternoster was regarded as a defense against one of the sins. Moreover, certain saints were distinguished by their successful resistance to some one of them. At Lincoln, particularly, and at other places where there were Paternoster plays, there are mentions of at least five of these sin-resisting saints, and it becomes a plausible conjecture that the Paternoster play presented the lives of these saints. If so, it follows that the Paternoster play was not a morality but was a series of miracle plays.

4. The Morality Play.—A morality play is a dramatized allegory, and its characters are abstractions. The hero is Mankind or *Humanum Genus*, and the theme is man's response to the temptations and moral forces of life and his possible salvation through the mercy of God at the moment of inevitable death. These forces for good or evil including Death itself are personified abstractions. The morality was a late arrival on the medieval stage, for no examples seem to be earlier than the beginning of the 15th century. Possibly the earliest is a fragmentary play, *The Pride of Life*. The prologue is complete and it is possible to see what the story was. The King of Life, accompanied by Fortitude and Sanitas, challenges all comers including Death. He fights with Death and is overcome. The theme in general is the same as that of *Everyman*, which, however, although possibly much older, did not appear in England until it was printed by Richard Pynson early in the 16th century.

Three plays of general significance appear in one manuscript, the *Macro Morals*, now in the Folger Shakespeare library, Washington, D.C. The manuscript was so called after Cox Macro, a former owner, and the three morality plays it contains are on different paper and in different handwritings. The plays, which have been bound up into one volume, seem to have no connection with one another. All seem to belong to the 15th century, and W. K. Smart makes a fair case for dating *The Castle of Perseverance c.* 1405. The other two have been thought to have been written later in the century. *The Castle of Perseverance* introduces most of the customary themes: the Good and the Bad Angel, the World, the Flesh and the Devil, the Seven Deadly Sins, the siege of a castle and the Dance of Death. Confession, Shrift and Penitence appear and salvation is determined after a debate of the so-called Four Daughters of God (Ps. lxxxv, 10). *Mankynd*, in the same manuscript, a play badly degenerated by use by traveling players, is also on the theme of salvation. The third, *Mind, Will and Understanding*, is more psychological, more satirical and more learned. Anima and Universal Wisdom appear in the play.

Other moralities that may be considered as belonging in some sense to the simple medieval and general group are *Magnificence* (printed 1529) by John Skelton; the *Satire of the Three Estates* (1540) by Sir David Lyndsay; and *Mundus et Infans* (1522). In Tudor times the morality play became much more elaborate and had a great effect on later dramatists. It lasted and exercised an influence on the Elizabethan drama in such plays as Marlowe's *Doctor Faustus* (1592) and Thomas Dekker's *Old Fortunatus* (1599). *(See* below and also ENGLISH LITERATURE: *Elizabethan and Jacobean Drama.)*

5. Folk Drama.—There is little that is actual drama in the extensive medieval activities spoken of as folk drama, which is what is now thought of as vaudeville, not, however, as pseudo-dramatic entertainment in theatres, but largely in folk festivals and customs. The subject is interesting and has had much attention paid to it by scholars. In festivals such semidramatic entertainment mainly belongs to folklore, but there was also a miscellaneous element made up of clownage, jugglery, song. dance, mimicry (of animals as well as human beings), burlesque, monologue and the merely peculiar or grotesque. Now and then in its varied activity impersonation, dialogue and action came together, and actual drama resulted. The noted example is that *c.* 1470 in France there appeared *Pierre Pathelin,* the first farce, probably the dramatization of a *fabliau* (*q.v.*).

Another very clear case of a drama developed from a folk festival is connected with the annual May game. It is thought that toward the end of the 13th century a minstrel, Adam de le Hale of Arras, wrote an actual drama for such a festival in the form of a *pastourelle, Le Jeu de Robin et Marion.* In it Marion, a village maid, is tempted to forsake her local sweetheart in favour of a charmer from the city, but she remains steadfast in her affections. It was introduced, it is not known how, into England and became associated with the peasant hero Robin Hood (*q.v.*). In some ballads and ballads in the form of dialogue Robin becomes Robin Hood and Marion becomes Maid Marian. The little play remains in primitive form.

The whole group of so-called mummers' plays *(see* MUMMERS) common in England, Scandinavian countries and other parts of Europe, lived on until the 20th century. At their basis, it is thought, there lay long-forgotten heathen rites carried out to secure the favour of spirits in the revival of spring and the growing of crops. In the mummers' plays are a group of oddly named characters who make traditions1 speeches, which, like the speakers themselves, are merely vague echoes from the past—the Fool, Pickle Herring, Blue Breeches, Pepper Breeches, Ginger Breeches, the Doctor, Mr. Allspice and Cicely. These are mainly from the Revesby Sword Play, written down in the 18th century. This and the Shetland Sword-Dance are apparently fullest of ancient superstition and indeed are thought to suggest human sacrifice *(see* also FOLKLORE).

6. Medieval Knowledge **of** Classical Drama.—In the long period of the middle ages before 1400 almost nothing was known about classical drama, not even that it had been acted by actors on a stage. Terence was a school author much admired and very influential, but chiefly revered as a philosopher, and this did not lead to the writing of plays imitating his comedies. There is a fragment 65 lines long of a dialogue called *Terentius et Delusor* that may have been the prologue of a comedy. Of immediate imitations the one case was that of Hrosvitha, a nun of Gandesheim, living in the later part of the 10th century. who wrote six obvious imitations of Terence. They were discovered and printed by Conrad Celtes in 1501. This pious lady, shocked no doubt at the pagan realism of Terence, wrote comedies in which she substituted for Terence's courtesans, tricky slaves, bawds and greedy old men, chaste Christian women, honest men and the sufferings and constancy of martyrs. She does not altogether lose the wit and skill of her model and is interesting for herself, but she had no influence.

There is also a group of survivals known as elegiac comedy, which are at least semidramatic. They have been organized into groups by scholars but can hardly be said to have been connected and can have had little influence and currency. There is *Querolus,* a sort of sequel to the *Aulularia* of Plautus, and *Geta,* an imitation of his *Amphitruo.* There are a score or more of these imitations of Latin comedy. They seem to be the work of individual scholars or small groups of scholars or of schools, and their interest lies in their anticipation of the Renaissance; but they are not in the main current of medieval drama. (H. CG.)

V. MODERN DRAMA

Drama developed in modern Europe as the result of the new kind of interest being taken in the classical world by Italians as early as the beginning of the 14th century. Nicholas Trevet *(c.* 1258–c. 1328), the Englishman, who was an acquaintance of Dante's, wrote a commentary on Seneca *(c.* 1306?), pronouncing him a truly tragic writer because not only were his themes tragic but his manner was that of drama as opposed to narration. As the various countries of western Europe responded to an increasing experience of classical drama, however imperfect or distorted, the same sorts of reactions took place in general. although they did not necessarily occur in the same sequence in every country and the process started later in some countries than in others.

Everywhere there already existed some type of liturgical drama and some native form such as farce which could react to, if it was not utterly suppressed by, the new enthusiasm for the classics. Everywhere modern drama emerged as the result of a study of the Latin and later of the Greek dramatists, which involved experiment in performing them, in translating them and in imitating them, both in Latin and in the vernacular. In theory and in practice an influence was exerted by Aristotle's *Poetics*, which was almost unknown in medieval Europe, after its rediscovery some time in the 15th century. with the subsequent outburst of commentary, interpretation and misinterpretation. As drama was performed and analyzed with varying thoroughness in the schools the pronouncements and dogmas of the major critics gradually filtered down to the schoolboy and so contributed to the creation both of new playwrights and their audiences.

1. The Influence of Humanism. — The results of studying the Romans as living drama showed themselves early in the 14th century in Italy with the Senecan inspiration of Albertino Mussato's Latin tragedy, *Ecerinis* (1315). Terence was studied and acted at Vittorino da Feltre's school set up in Mantua in 1428; and Plautus was the model for a number of Latin plays written at Ferrara by Tito Livio dei Fruvelosi (1432–34). Another early Latin play, *Philogenia*, was written by Ugolino Pisani at Parma in 1430. The study, writing and performing of drama increased with the growth of the academies, particularly those of Rome and Ferrara. Roman comedy. especially Plautus, was performed at Rome with farces in the Atellan fashion; and by the end of the century Plautus and Terence were being acted in many places in accordance with the notions of humanist scholars who were misreading Horace and Vitruvius and who completely despised the native farce of their own land. One new form, the pastoral, developed out of the blending of classicism with a genuinely Italian spirit. At first even some element of the existing *sacra rappresentazione* was involved in the *Favola di Cefalo* (1487) written by Niccolb da Correggio, treating material from book vii of Ovid's *Metamorphoses*. In another direction the pastoral, in the form of eclogues recited by actors in masks as *intermezzi* between the acts of regular tragedy, led to the development of the masque (*q.v.*). But a pastoral form developed separately as a mingling of comic and tragic elements in an idyllic and idealized pastoral setting: such are *Egle* (1545) by G. B. Grimaldi and *Sacrifizio* (1554) by Agostino Beccari. The outstanding example of the pastoral proper is *Aminta* (1573) by Torquato Tasso; as well known, but not so exquisitely written, is *Il Pastor fido* (1590) by Giovanni Battista Guarini. Italian influence showed itself in Spain in the pastoral dialogues, called *representaciones*, in which Juan del Encina celebrated the history of the Alba family and of the royal house. Pastoral in England is seen in masques and in Italian-inspired works such as Abraham Fraunce's translation of Tasso's *Amintas* (1587), Samuel Daniel's *The Queenes Arcadia* (1606) and John Fletcher's adaptation of *Pastor fido* as *The Faithful Shepherdess* (?1609). (*See* also PASTORAL.)

The first important comedy written in Italian was *Calandria*, a free adaptation of Plautus' *Menaechmi* by Bernardo Dovizi (1470–1520; known as "Il Bibhiena"), performed in 1513. After translating Latin comedies for performance Ludovico Ariosto wrote his own well-constructed comedies, with conventionally paired characters, both male and female; *I Suppositi* (1509) and *Negromante* (1520), on which he worked for ten years, are his best plays. Ariosto tended to satire, an element which was even more pronounced in *La Mandragola* (*c.* 1513–20), the most important of the comedies of Niccolb Machiavelli, author of *Il Principe*. The conventions of Latin comedy laid down by the scholars were opposed by Pietro Aretino in his vivid, fast-moving if rather shallow comedies which include *La Cortigiana, Il Marescalco, Talanta, L'Ipocrito* and *Il Filosofo*. In Portugal Bibbiena and Ariosto served as models for Francisco de Sá de Miranda. Luis Vaz de Camões preferred to go directly to Plautus for his *Auto dos Enfatriões* (1587).

In France as in Italy the humanists despised the existing vernacular comedy, in this case the form of farce which had developed with such vigour throughout the 15th century. There was a careful study of Plautus and Terence and by 1500 Plautus' *Amphitruo* had been translated. In 1534 Terence's *Andria* was translated and in 1539 a collection of translations by different hands appeared as *Le Grant Térence tant en rime qu'en prose*. In the middle of the century the group of writers known as the Pléiade (*q.v.*) turned to the reform of comedy. Pierre Ronsard translated Aristophanes' *Plutus* (1548) and *Eugène* (1552) by Étienne Jodelle forced the subject of a satirical medieval farce into the regularity of the *commedia erudita*. In 1554 Bibbiena's *La Calandria* was played at Lyons before Henry II. Jacques Grévin wrote *Maubertine, ou la tresorière* (1558) and *Les Esbahis* (1560) in an effort to reform comedy; Jean de la Taille actually wrote *Les Corrivaux* (1562) in prose, and in 1567 Jean Antoine le Baïf published *Le Brave*, modeled mainly on Plautus' *Miles gloriosus*. Pierre Larivey, of Italian birth, translated 12 Italian comedies into lively French. These, in his versions, were more genuinely comically dramatic than anything earlier and established a foundation on which Molière was able to work later. Italian comedy is even more gallicized in *Les Contens* (?1580) by Odet de Turnèbe (1553–81).

In Italy humanist influence was so strong that native comedy was quite displaced apart from the *commedza dell' arte* (*q.v.*). In France there was a wide rift between educated comedy and what was enjoyed by the populace; but in England native forms of farce and interlude did not suffer. Before Erasmus and his English admirers virtually founded the grammar school system there existed a vigorous drama which was by no means unsophisticated, represented by plays such as *Fulgens and Lucrece* (*c.* 1497; only discovered in 1919). This was written by Henry Medwall, chaplain to John Cardinal Morton, and has for its theme the conflict between the patrician's love of pleasure and the high principle of the commoner. He shows the same skill in *Nature* (?1530), which is more of a morality play. John Rastell, the printer of *Fulgens and Lucrece*, himself wrote two didactic plays, which are not theatrical. *A New Interlude and a Mery of the Nature of the Four Elements* (1519) and *Of Gentylnes and Nobylyte* (*c.* 1527). Rastell's son-in-law. John Heywood, wrote the interludes *Wytty and Wytless, A Play of Love* (1533), the *Play of the Wether* (1533) and *The Four PP*. (1543–47). Two others have been conjecturally ascribed to him, *Johan Johan* (1533) and *The Pardoner and the Frere* (1533). These are all unaffected structurally by humanist theory.

As humanist education was established in England stress was laid not only on the reading and analysis but on the performance of Plautus and Terence and of neo-Latin drama. This was the work of the continental playwrights, John Ravisius Textor (1478–1524), Georgius Macropedius (Georg van Langveldt, 1475–1558) and others. The Latin plays of the Dutch writer Gulielmus Fullonius or Gnaphaeus (Willem van Volder, 1493–1568), on the theme of the prodigal son, were popular, especially *Acolastus* (1539), translated with a commentary by John Palsgrave (1540). Such theoretical and practical work, probably strengthened by the sound critical principles of Erasmus, led to plays such as *Ralph Roister Doister* (?1553) by Nicholas Udall, headmaster of Eton and then of Westminster; this is the first English play in acts on the classical model and blends neoclassical with English elements, its characters being types from Plautus' *Miles gloriosus* anglicized. *It* is thought that Udall's biblical play *Ezechias* (played before Queen Elizabeth I in Cambridge, 1564) was an early work and that he may be the author of *Thersytes* (*c.* 1537), a skilful adaptation of the dialogue by Textor; *Jacob and Esau* (1568) is also conjecturally ascribed to Udall. A Textor dialogue was the basis of Thomas Ingelend's *The Disobedient Child* (1570?). The two latter, with the anonymous *Misogonus* (written 1577) and George Gascoigne's *The Glasse of Government* (1575), are of the prodigal son type. Nine years earlier Gascoigne had translated Ariosto's I *Suppositi* into prose as *Supposes* for performance at Gray's Inn. There were numerous other translations from Italian, now lost, as well as the anonymous *The Bugbears* and John Phillip's *Pacient Grissill* (1565); so far as is known, all, like these two, were in rhyming verse. One group of plays on English themes from this period includes *Tom Tyler and*

His Wife and the Cambridge farcical comedy Gammer *Gurton's* Needle (1575). Romantic subjects, occasionally with allegorical elements, were treated in plays such as Common Conditions (printed 1576), The Rare Triumphs of Love and *Fortune* (printed 1589) and Sir Clyomon and Sir Clamydes (printed 1599).

In Germany, Latin drama was similarly cultivated by humanists of whom the most famous were Jakob Wimpheling (1450–1528) and Johann Reuchlin (1455–1522). But the secular German drama supported by the civic guilds did not suffer from humanism and flourished, particularly as written in the 16th century by Hans Sachs, not only in the form of Fastnachtspiele (Shrovetide plays) but also in the form of tragedies and comedies. In the Low Countries, moralities continued, thanks to the support of the civic guilds, organized as *Rederijkers Kamers* or chambers of rhetoric (see DUTCH LITERATURE); the famous Elckerlijc (printed 1495; in English Everyman) won first prize in a civic contest at Antwerp (1485). The *Rederijkers* developed colourful tableaux vivants, which could be used allegorically.

2. Jesuit School-Drama.— Tableaux vivants were adapted to the purposes of the Counter-Reformation in due course by the Society of Jesus (first organized in 1534), whose first college for outside pupils was established in 1548, the year after the banning of the performance of religious drama in France. Jesuit education was hardly less important an element in the development of European drama than that provided by the grammar schools of England. The first mention of a Jesuit play occurs in 1551 and by 1600 there were 250 schools and 90 seminaries throughout Europe where drama was performed according to the regulations in Ratio atque *institutio* studiorum (1577, revised several times by 1599). Plays were to be in Latin, performances — only at the beginning or end of the school year — were not to be staged elaborately, and there were to be no interludes between the acts. The subjects were religious, usually involved martyrdom, and were designed to evoke pity and terror and to inspire a reverence for, and even a capability to endure, a noble death. No feminine character or costume was permitted. Eventually the vernacular was allowed to some extent for lay audiences. Although there was opposition to worldliness in the staging of Jesuit plays, the tendency was to become more elaborate in the 17th century, absorbing elements from the tableaux vivants of the Low Countries, from ballet and opera in other parts of Europe and from the secular drama of Spain; even fireworks and special theatrical effects were introduced.

Thousands of plays were written by teachers and pupils and performances involved great scholarship as well as theatrical values. The Jesuits were acknowledged masters of the art of "Pronunciation" or rhetorical delivery, which is fundamentally akin to acting, making many of the same technical and imaginative demands. Their authority was recognized in this field even in England. Jakob Bidermann (1578–1639) and Nicolaus von Avincini (1612–86) were two of the prominent personages in Germany, where in the 17th century in Jesuit schools alone was there a living dramatic tradition preserved in the Catholic provinces; and Protestant schools elsewhere responded by developing their own drama. In Poland, Jesuit theatrical activity likewise stimulated rivalry from the Orthodox Church, whose members adapted their adversaries' plays into Russian. Simeon Polotski (1629–80), tutor to the sons of Tsar Alexis, was involved in this school drama, the only drama in Russia of that time.

There are obvious links between Jesuit drama and the religious drama of the middle ages; but the later form was much more varied and colourful in its theatrical techniques and the borrowing from the Dutch tableaux vivants of a series of curtained archways within a facade had repercussions on the structure of baroque theatre in Europe. The influence of the genre can only be estimated accurately by remembering that in his youth Voltaire took part in plays at the Collège Louis-le-Grand.

3. Neoclassic Imitation.— Tragedy as well as comedy started in Italy with Latin imitations, at first of Seneca. As Italian neoclassic criticism began to develop the notion of a "regular" drama, Italian Senecan plays displaced those in Latin. Giorgio Valla's Latin edition of Aristotle's Poetics (1498) preceded by ten years the famous edition of the Aldine press. Giovanni Rucellai's Rosamunda (1515) is a typical expression of the conception of tragedy which emerged from the blending of what was derived from Horace, postclassical Roman theory, Seneca and the study of Aristotle. Critical study continued: Lodovico Dolce translated Horace into Italian (1535); Alessandro de' Pazzi produced a Greek text of Aristotle with a parallel Latin translation (1536); and Bernardino Daniello's *Poetica* (1536) shows in its references to tragedy and comedy a debt to both Horace and Aristotle. In 1548 came the first complete commentary on the Poetics, Francesco Robertello's In *librum* Aristotelis de arte *poetica* explica*tiones*. The effect of such theorizing in other countries as well was felt in imitations of Seneca and the Greeks, in attempts to develop regular neoclassical drama and in the influences exerted by such attempts on the development of the dominant forms in Spain, France and England.

In Italy the first notable imitation of Greek tragedy was Gian Giorgio Trissino's Sofonisba (written in 1515 but performed in 1556); typical imitations of Seneca are Sperone Speroni's *Canace* (1543) and G. B. Giraldi Cinzio's Orbecche (1541). A similar sequence occurred in France: Seneca, printed in 1485, was followed in 1506 by Erasmus' Latin translations of two Euripidean plays, Hecuba and *Iphigenia,* with French translations appearing later. The Senecan model for regular tragedy was established by Jodelle with *Cléopâtre* captive (1552). There followed equally dull plays expressing the Senecan spirit as then understood: *Médée* (1555) by Jean Bastier de la Péruse, Jacques Grévin's Julius *César* (1561), La Soltane (printed 1561) by Gabriel Bounin and André de Rivaudeau's *Aman* (1561). Contemporaries regarded Robert Garnier as the genius who outstripped the rest; among his plays are Porcie, Hippolite, Cornelie, Bradamanthe and Les Juifves. In its day the attraction of this sort of drama seems to have been partly in the gravity of spirit and partly in what it offered to minds educated in the tradition of rhetorical delivery which could enliven in performance, or imagined performance, what is now so dead in the text. Passionate and intricately or formally constructed speeches could be enjoyed in their own right. Similar circumstances had produced the second vernacular tragedy in Europe, Castro (*c.* 1558), by the Portuguese poet Antonio Ferreira.

England had some attempts at regular "Senecan" tragedy, for the most part the work of the circle associated with Mary Sidney (1561–1621), who became countess of Pembroke and who translated Garnier's Marc-Antoine (1578) as Antonie (1592). Samuel Brandon's The Vertuous Octavia (1598), Thomas Kyd's *Cornelia* (1594, from Garnier, 1574), and Daniel's Cleopatra (1594, from Marc-Antoine) and *Philotas* (1605) complete this group of plays, which had little practical influence. Neoclassicism made its effect felt on English drama in another way; translation of Seneca played its part, however, in developing the spirit rather than the form of popular English drama. In 1558 a number of university men started individual translations which were collected and published by one of their number, Thomas Newton, as Ten Tragedies of Seneca (1581; ed. by T. S. Eliot, 2 vol., 1927).

The first tragedy on a Senecan model in English, Gorboduc (or Ferrex and Porrex) by Thomas Norton and Thomas Sackville was acted by members of the Inner Temple before Queen Elizabeth on Jan. 18, 1562. It is a blend of English and classical elements, ignoring the unities of time and place, employing classic formalities such as chorus and messenger, but adding unclassical dumb shows before each act; it is the first English play in blank verse. Four years later (1566) Gray's Inn performed *Jocasta* by George Gascoigne, Francis Kinwelmersh and Sir Christopher Yelverton, little more than a translation of Dolce's Giocasta. Classical plays in Latin and English were being written in the universities, including Nicholas Grimald's Christus Redivivus (1543) and *Archi*propheta (printed 1548) and plays in Latin by William Gager (fl. 1580–1609) at Oxford. At Cambridge, where Thomas Watson (1513–84) and John Christopherson (d. 1558) treated biblical and national history, the best known is Thomas Legge's tragedy, Ricardus III (1579). Neoclassical influence did not freeze inspiration in such English tragedies as John Pickering's Horestes

(1567), R. Bower's *Apius and Virginia* (printed 1575) and Thomas Preston's *Cambises* (*c.* 1569). Among plays of this sort written about this time are *Gismond of Salerne* (1568) and two tragicomedies, *Damon and Pithias* (1564–65) by Richard Edwards and *Promos and Cassandra* (printed 1578) by George Whetstone.

Although neoclassicism and humanist education produced academic and untheatrical drama in Italy and France in the 16th century, in England the same influence led to an articulate and theatrical body of plays. Humanism in England in this period seems to have provided the audience as well as the writers; popular demand was satisfied by dramatists who had learned to construct, to write speeches, even to command verse and prose in grammar school and university. It is usual to trace the progress of Elizabethan drama as rising from these beginnings to a culmination in Shakespeare, after whose time there is a gradual deterioration into a decadence in which sensation arises from skilful but superficial contriving of plots, halfheartedly pretending to deal with themes which are not really of importance to the writers. It is true that the later writers have a more obvious and more sophisticated technical virtuosity; but it may be questioned whether at any time there was much Elizabethan drama that survives careful scrutiny, except for the plays of Shakespeare and Ben Jonson.

4. England: Elizabethan and Jacobean Drama.—An early arrival was the chronicle play, foreshadowed by *Gorboduc*, Thomas Hughes's *The Misfortunes of Arthur* (1587) and the experiments usually ascribed to John Bale in *Kynge Johan* (1548). The chronicle play differs from these in that it is a dramatization of an existing historical chronicle. *The Famous Victories of Henry the Fifth* (acted before 1588) belongs to this genre; so do the two parts of *The Troublesome Raigne of John King of England* (1591) and *The True Chronicle History of King Leir* (first acted *c.* 1593–94), which was used by Shakespeare for his tragedy. Out of the school drama developed the plays of John Lyly with their fairy lore, mythology, classical and romantic legend, and their allegory. He started for English prose dialogue a development like that which began for blank verse with Christopher Marlowe, assuming that Marlowe preceded Kyd. The pre-Shakespearean scene has much life and variety in the work of George Peele, Robert Greene, Thomas Kyd and Christopher Marlowe, to name a few. Peele's *David and Bethsabe* (printed 1599) and Greene's *James IV* (printed 1598) and *Frier Bacon and Frier Bongay* (printed 1594) have fresh vigour and signs of a command of language which are associated traditionally with pre-Shakespearean drama. Other important writers of this period are Thomas Lodge, Thomas Nashe, Henry Chettle and Anthony Munday.

In all these may be seen the fruits of a classical education that strengthened rather than suppressed what the writer derived from his native culture. Marlowe in particular drew vigour from the elements of classicism that cramped French and Italian writers. His blank verse is classical in its fundamental structure, and had he paid more attention to what could be learned from academic theory in the matter of integrating plot, character and theme, his weaknesses might have been fewer. Kyd, too, shows the besetting failure of popular Elizabethan dramatists, both before and after Shakespeare, to make character and incident elucidate theme, to relate linguistic virtuosity to dramatic imagining, to shape plot out of a consistent chain of cause and effect. Only Ben Jonson shows an imaginative intelligence and a discipline which can be compared with Shakespeare's, and then primarily in comedy. Although George Chapman was ostensibly engaged with a theme—the nature of heroic man and of his conflict with fate—too much of his work is sensational, superficial and contrived. With John Marston, Francis Beaumont and John Fletcher, John Webster, Cyril Tourneur, Thomas Middleton, John Ford and Philip Massinger tragedy and tragicomedy alike do not derive from an organically developing and fully imagined action of character and incident: opportunities are contrived for special effects, and irrelevant satire and inconsistencies of plot and character detract from the work of all. Domestic tragedy of the nature of *Arden of Feversham* (printed 1592), *A Yorkshire Tragedy* (printed 1608) and Thomas Heywood's *A Woman Killed With Kindness* (printed 1607) share the virtues and defects of the other kinds. Comedy tends to support criticism more satisfactorily, possibly because it admitted to less pretentiousness in the matter of heroics, poeticizing and sententious comment. Jonson was followed in this kind by Thomas Dekker, John Marston and George Chapman and by Richard Brome, who wrote in Jonson's shadow. Other writers of comedy were Fletcher, Middleton and Nathan Field, and in the time of Charles I, aristocratic manners and interests were treated by James Shirley in a way that anticipates some of the qualities of the Restoration drama.

It is quite possible that criticism of these dramatists has been misled by the quality which exists in Shakespeare to ascribe merit unjustifiably to his fellow playwrights. When we measure him against them we become aware of the possibilities of Elizabethan drama as a genre: he developed his blank verse, his rhyme and his prose from the same common stock, but he commands his medium where they too often are the prisoners of theirs. He constructs and shapes his plots more competently, and tends to be turned aside by far fewer irrelevancies. His choice of word is more precise; his use of figure, whether of words, such as climax and antithesis, or of thought, such as metaphor, is at once more varied, richer and less complicated than theirs; and his imagery not only develops coherently in relation to his themes but expresses the psychological needs of his characters. Plot, character and theme all go together. And basically the equipment with which he did all this was derived from the kind of learning taught in the grammar school. which he shared with them and which allowed him to develop in a native way while using a fundamentally classical tradition. It is certain, however, that his gift of imagining character was his own. even though it was put into practice in words the mastery of which he owed to the opportunities given him by humanist teachers.

Popular as the art of the Elizabethan dramatists undoubtedly was, it did not differ from neoclassicism in the way in which German romanticism differs from the classicism of Corneille or Racine. The Elizabethan ignored the unitfes, the chorus, the purity of style of the neoclassicist; but he made use of neoclassic teachings on plot structure, on writing itself, on the use of rhyme, on the need to relate the particular incident to what was felt to be true about life in general.

5. Spain: Drama Before and During the Golden Age.— Spain, like England, was not dominated by neoclassicism; its religious drama survived and profoundly influenced the writers of the Golden Age, who were even less inclined than the English to conform to Italian views on decorum and the unities. Lucas Fernández ignored the academic humanist teaching enough to write an Easter play, the *Auto de la Pasión* (printed 1514), performed by the clergy in Salamanca cathedral. But Bartolomé de Torres Naharro, influenced by Italy, wrote a sort of comedy of manners and romantic plays, in the latter anticipating the conflict of love and honour in Lope de Vega. Gil Vicente, a Portuguese who wrote in Portuguese and Spanish, has comic scenes and combines satire, secular accounts of Spanish history and allegorical treatment of religious issues in his *Trilogís das Barcas* (discovered and printed 1784); most of his pieces are *autos* (short dramas originally in a biblical setting). Lope de Rueda (1510–65) was the first professional actor-manager in Spain and developed a form, the *paso,* a short comic sketch; he also wrote *autos*. Gradually a national drama was developing, especially after the opening of the public theatres, the *corrales.* Heroic subjects from Spanish history were treated by Juan de la Cueva. A popular Spanish legend was treated by Micer Andrés Rey de Artieda (1549–1613), as *Los Amantes de Teruel* (1581). *Autos* and *entremeses,* these latter much like medieval farces, were written by Cervantes, whose *Numancia* (printed 1616) has much of the morality in it. Cervantes borders on the Golden Age, which really begins with Lope de Vega, who not only wrote a tremendous number of popular works but established traditions in the Spanish theatre so far as concerned the *comedia de capa* y *espada* (cloak-and-sword comedy); he wrote a heroic drama in which historical persons of noble and royal rank are involved, notwithstanding which there is a humorous underplot, and left models for domes-

tic drama in which the principals are characters low in the social scale. His styles, subjects and kinds of drama are too varied and mixed to be classified. His *Fuente-Ovejuna* (11613) has often been regarded as an anticipation of "proletarian theatre."

This was the great age of Spanish drama, with a number of very competent writers, even apart from Lope and Calderón. Gabriel Téllez ("Tirso de Molina," *q.v.*), a Mercenary friar, is best known for his female characters and for characterization in general, especially in *El Burlador de Sevilla* (on Don Juan, printed 1630), *El Condenado por desconfiado* (1635) and *La Prudencia en la mujer* (1634). Francisco de Rojas Zorrilla wrote comedies of intrigue and of character, and in *Del Rey abajo, ninguno* (printed 1650) has a power treatment of conflict between the yeoman class and the aristocracy. Juan Ruiz de Alarcón y Mendoza wrote more systematically worked-out intrigues; in both his early and late work there is a more disciplined structure than in that of his fellows. His *La Verdad sospechosa* (printed 1634) was the model for Pierre Corneille's *Le Menteur* (1643). Another member of the group, Guillén de Castro y Bellvís (1569–1631), wrote *Mocedades del Cid* (1618), which served Corneille for his *Cid* (1637).

The outstanding figure of the second phase of the Golden Age — the baroque period — is Pedro Calderón de la Barca, whose huge output not unnaturally shows some superficiality but is based on fine craftsmanship and inventiveness and expresses a fundamentally philosophic and mature attitude. He treats honour rather than love in cloak-and-sword plays which tend unfortunately to be limited in their range by his acceptance of the rigid code of Spanish social life. Calderón's essential profundity and rich splendour are best seen in the religious and philosophic *autos* such as *El gran teatro del mundo, La Vida es sueño, El Principe constante, La Devocidn de la Cruz;* his treatment of sainthood is most impressive in *El Mágico prodigioso.* The only dramatist whose quality approaches Calderon's is Agustin Moreto y Cabaña, who treats farcical situations with freshness of wit and charm: *El Lindo Don Diego* (printed 1662) and *El Desdén con el desdén* (printed 1654) show the liveliness of his comedies of manners. No writer of consequence survived Calderón.

6. France: The 17th Century. — In France the public had not been interested in the academic regular plays already discussed, but still valued their farces above such grave tragedies as Antoine de Monchrestien's *L'Écossaise* (1601) on Mary, Queen of Scots. Much more popular was the body of tragedy and tragicomedy provided by Alexandre Hardy for the actors at the Hôtel de Bourgogne. Hardy kept the five-act division but moved from scene to scene with the freedom of the Spanish and English. In 40 years he wrote between 600 and 700 plays, the best known being *Mariamne* (1610). Hardy had the action, subjects and themes of popular drama; had he been a greater writer he might have fostered in France a drama nearer to those of contemporary Spain and England. In his tradition were Georges de Scudéry and his sister Madeleine, who both wrote the tragicomedy *Ligdamon et Lidias* (1629). The pastoral *Les Bergeries (c.* 1619) by Honorat de Bueil, seigneur de Rancan, and the tragedy *Pyrame et Thisbé* (1621) by Théophile de Viau are in the unclassical group. So is the work of Jean Rotrou, who refused to accept the insistence of the Académie Française that the unities must be maintained; he wrote *La Bague de l'oubli* (1628), a comedy, and the naive and profound tragedy *Saint-Genest* (1646), which in some ways anticipates the quality of Hugo's romanticism two centuries later.

But the drama actually in existence in France at the time of the critical controversy — about the unities, decorum and the nature of the tragic hero — which developed in the late 1620s had really very little to commend it: this means that the neoclassical reformers were not trying to oust a dominant form of which they disapproved, nor were they trying to revive the academic classicism of the last century. The rules which mere being established. supposedly in accordance with Aristotle's *Poetics,* were sincerely envisaged to some extent as a guide to the production of a civilized drama which could be accepted as a not unworthy modern equivalent of the classics. Jean Mairet's *Sophonisbe* (1634) was interpreted as establishing the dominance of the new regular tragedy, soon showing itself in his *Marc-Antoine, ou la Cléopâtre (c.* 1635), in *Médée* (1635) by Pierre Corneille and in Georges de Scudéry's *Le Mort de César* (1635). When Corneille's *Cid* (11637) appeared as a heroic tragicomedy, there was an underlying justification for the ensuing controversy in the fact that this really seemed a retrograde step; and some of the objections of Jean Chapelain and others in the *Sentiments de l'Académie Française sur la tragi-comédie du Cid* (1637) are valid as literary criticism in themselves, although they are not necessarily to be taken as demonstrating the weakness of the tragicomic genre. The concentration and drive of Corneille's succeeding tragedies may well be ascribed to what he learned from neoclassical criticism.

In the middle of the century, however, tragicomedy tinged with the spirit of the new romances became popular again. In part the abbé d'Aubignac's *Pratique du théâtre* (1657), with its discussion of characterization and simplicity, made possible the atmosphere in which Jean Racine developed tragedy past the point to which Corneille had taken it. Racine's verse had more delicacy and precision. At first he followed Corneille in treating grandeur and heroism rather than love; but from *Andromaque* (1667) onward he concentrates on the passion of love, especially in his heroines, who have little choice and are caught up in an action which expresses an inevitability of fate. *Phèdre* (1677) was his last play for the public theatre, although he wrote *Esther* (1689) and *Athalie* (1691) in a different spirit, one of piety.

French comedy was now flowering in the work of Molikre, after the fashion earlier in the century for a kind of comedy of manners and intrigue deriving from Spanish examples. Corneille had written a regular comedy, *Le Menteur* (1643), with witty, polished dialogue but not much laughter. Paul Scarron wrote plays of the Spanish type and created a superb comic character, the valet Crispin in *L'Écolier de Salamanque* (1654). Thomas Corneille, the great Corneille's brother, also wrote comedies of intrigue from Spanish sources. This was the situation to be transformed by Molikre. He absorbed into his work elements which came from farce and *commedia dell' arte* but makes something of his own out of them, thanks to his dialogue, his characterization, his wit and his ability to achieve a consistent development of incidents and persons interacting on one another. His satire succeeds because he treats permanent human traits, obsessions and pretensions with a mastery springing from keen and true understanding of human motivation and behaviour. **A** fundamental tolerance of human frailty prevents his sense of the ridiculous ever becoming the bitterness of disgust or hatred in his plays, of which the best known are *Les Précieuses ridicules* (1659), *Tartuffe* (1667), *Don Juan* (1665), *Le Misanthrope* (1666), *L'Avare* (1668), *Le Bourgeois Gentilhomme* (1670) and *Le Malade imaginaire* (1673).

7. Germany and Elsewhere. — Northern Europe in the 17th century produced little drama. Sweden had no professional theatre, although in 1609 there was an amateur performance of *Magnus Asterophus* by Johannes Messenius (1579–1636), a writer of formless didactic drama. Georg Stjernhielm wrote masques. In the preceding century comic interludes and farces and romantic comedies in the style of Lope de Vega were written in the Netherlands by Gerbrand Adriaanszoon van Bredero. Pieter Corneliszoon Hooft wrote his *Achilles Polyxena* (printed 1598) on the model of Seneca. Joost van den Vondel was the only playwright of international stature; he translated and imitated Plautus and Terence. *Lucifer* (1654), which was known to Milton, is the finest of his plays on biblical subjects.

Germany also produced very little after the farces of Jakob Ayrer except for the crude, sensational plays of Heinrich Julius, duke of Brunswick, in the same tradition also influenced by the drama of the English comedians. Martin Opitz von Boberfeld, an advocate of classicism, produced lifeless alexandrine translations of Seneca. Andreas Gryphius made similar translations, but improved on these in his original work thanks to English and Dutch influence and particularly to that of the Jesuit drama, which he attempted to rival in his Protestant school drama. *Herr Peter Squentz* (1663) is a satire on the lower middle class, based on the Bottom scenes in Shakespeare's *Midsummer Night's Dream,* and *Horrbilicribrifax* (1663) caricatures the boasting soldiery of

the Thirty Years' War. *Die geliebte Dornrose* (1660) is a comedy in dialect. By the end of the century Germany was dominated by plays called *Haupt- und Staatsaktionen*, involving improvisation as in *commedia dell' arte*, but dealing with incidents in high places (hence their name) and allowing opportunities for the popular fooling of the clown "Hanswurst."

8. England: Restoration Drama.— The success of Corneille, Racine and Molikre, together with the prestige of France as a European power and the dominating influence of classicism in art and literature as a whole, meant that at least lip service was paid to the principles of neoclassicism in drama all over Europe. In England the native traditions were too strong to allow of anything as completely classical as in France or as colourlessly classical as in other lznds; but even there, partly as a result of the court's exile and partly as a natural development out of classical elements in pre-Restoration drama and in English literature in general, some attempt was made at a valid English classicism in drama.

The genre known as rhymed heroic drama certainly derived from an attempt by Roger Boyle, first earl of Orrery, and John Dryden to answer Charles II's query as to whether it would be possible to provide an English equivalent of the French play in classical alexandrines. Nevertheless, the English heroic play as written by Dryden, Sir Robert Howard and Nathaniel Lee was quite unclassical in its bombast and general lack of restraint, concentrating upon expressing the marvelous as well as exaggerating the passions quite unnaturally.

In the English dramatic conflict of love and honour little was truthfully felt or completely imagined. The atmosphere was false and there was uncertainty as to the target at which the dramatist aimed. Dryden's *Tyrannick Love* (1669), *The Conquest of Granada* (1670–71) and *Aureng-Zebe* (1675) and Lee's *The Rival Queens* (1677) have all the characteristics of the genre, to which belongs work by John Banks, Samuel Pordage, Elkanah Settle and even the critic Thomas Rymer. A less bombastic kind of tragedy shows itself in Dryden's blank verse *All for Love* (1677), whose classicism is more assured than that attempted by John Crowne. Thomas Otway failed to reproduce the qualities of Racine in *Alcibiades* (1675) and *Don Carlos* (1676), but found his true romantic and emotional tragic style in *The Orphan* (1680) and *Venice Preserv'd* (1682). Similar tragedy was written by Thomas Southerne, whose *Oroonoko* (1696) and *The Fatal Marriage* (1694; later adapted by David Garrick) were favourites until the 19th century. One famous tragedy, *The Mourning Bride* (1697), came from William Congreve. At the beginning of the 18th century, Nicholas Rowe produced popular tragedies which avoided the excesses of the heroic play; audiences throughout the century responded with satisfaction to *The Ambitious Stepmother* (1700), *Tamerlane* (1702), *The Fair Penitent* (1704) and *Jane Shore* (1714).

The only play which can be claimed to be thoroughly classical is Addison's *Cato* (1713). Although its first success was due to a political crisis (it was interpreted as upholding the Whigs against the Tories in a conflict over the Act of Settlement), it certainly held the stage and was regarded as providing a first-class acting role for a century.

During the same period English comedy combined much that had existed in Jonson and Fletcher with imitations of the Spanish and French, especially of Molière. Thomas Shadwell claimed to be wearing the mantle of Jonson, whose precision and wealth of inspiration and talent he lacked; Aphra Behn and John Crowne produced comedy of intrigue. But the characteristic Restoration form is the comedy of manners, which can be found even in the uncertainties of Dryden's early comedy and tragicomedy. *The Mulberry Garden* (1668), by Sir Charles Sedley, has the witty pair of lovers, the elegant dialogue, the cynical atmosphere of refinement, with a comparatively unimportant plot, which are more pronounced in the comedies of Sir George Etherege, in which the form is established. It throve for some decades in the hands of William Wycherley, Congreve, Sir John Vanbrugh and George Farquhar, in whose *Recruiting Officer* (1706) and *The Beaux' Stratagem* (1707) there is much the same spirit but with a more extended range of characters and scenes of action.

9. Decay of the Neoclassic Drama in the **18th** Century.— In France itself after the great period of Corneille, Racine and Molikre the second- and third-rate writers fell back on the conventional formulas. For the most part tragedy concentrated on love themes, with plots arranged to show tragic dilemmas arising from conflicting claims of loyalties, political interests and love, all deployed to exhibit the tragic personages wavering, and their respective fates changing from act to act. In some plays, such as those of Prosper Jolyot de Crébillon, situations alter to maintain excitement, atrocities give excuse for sentimentality, and sensation is combined with a superficial formal classical coldness. The aim was to move the audience to pity and terror, but to maintain refinement, while in the plot parents and their children became unwittingly involved in the killing of one another.

This state of drama was reflected in other countries. In Italy nothing of note was produced, though there was lifeless imitation, until Francesco Scipione di Maffei's *Merope* (1713), which was to be an inspiration for Voltaire; otherwise, until the appearance of Alfieri, Italian classicism is well represented by dull work such as that of Antonio Conti (1677–1749). In Spain Molikre's influence is to be traced in the successful neoclassic comedies of Leandro Fernández de Moratin later in the 18th century, but otherwise the drama was dull in its subservience to an influence that did not really suit the Spanish genius. This is true of Portugal, too, where there was, however, a little more to show. Antonio José da Silva produced uninspired, cold classical work; but a tragedy, *Ines de Castro*, by Domingos dos Reis Quita (1728–70), led to a much better *Nova Castro* (printed 1803) by João Baptista Gomes. There was also an anonymous tragedy, *Osmia* (1788), in which classicism did not mean lifelessness. Portuguese classicism led to the not unsuccessful *Merope* (printed 1841) and *Catão* (1821) with which visconde de Almeida-Garrett started his play writing.

In Germany, which, because of the effects of the Thirty Years' War, lacked a regular drama of its own, Johann Christoph Gottsched set out deliberately to try to create one on the model of French classicism at the beginning of the 18th century. He translated French playwrights, among them Racine, whom he tried to imitate in the formal and uninspired *Der sterbende Cato* (1732). His German alexandrine couplets had neither the dignity nor the expressiveness of the French in his own work or in his translations of Corneille's *Le Cid* and Racine's *Iphigénie*. In Holland after Vondel classicism produced little except the valueless imitations of the French by *Dichtgenootschappen*, the societies of poets *(see* DUTCH LITERATURE); there was, however, the more successful Pieter Langendijk (1683–1756), who imitated Molière.

Molibre, again, was the inspiration of Denmark's Ludvig Holberg, whose comedies (written 1722–27) show great ability, even if they are not in the same class as their models. Nevertheless, he naturalized his borrowings into his own age and country; his weakness derives from an uncertainty of intention beyond that of developing a Danish comedy. Sweden in the first half of the 18th century was dominated by classical tragedy as performed by visiting actors. The only Swedish work of any note is a not very competent attempt in the manner of Racine, *Brynhilda* (1738) by Olof von Dalin.

10. The Late 18th Century: Voltaire and Others.— A second period of classicism developed largely because two outstanding playwrights of different temperaments, but of not entirely differing ideals — Voltaire in France and Alfieri in Italy — found themselves able to express adequately what they needed to in the classical manner. Voltaire dominated the European scene for the whole of his adult life. Throughout his career he looked to Racine and the Greeks as his masters, and it is only natural to find him reacting deliberately against Crébillon at the outset. He took a wider range of subjects and themes than that of his immediate predecessors; where they were restricted almost to love, he brought in other topics of importance to the Europe of the Enlightenment. His greatest dramatic weakness, which makes his tragedies fail in the last resort, derives from his need to expound ideas, as a result of which his characters, while skilfully motivated, tend to be so chiefly in respect of his external principles. He invests his whole

structure of surprises and pathetic utterances with an essentially sophisticated elegance. In this and in extending his range to bring in besides the figures of classical antiquity such personages as Mahomet, Alzire, Zulima. Tancred and the Orphan of China he met to some extent demands that were answered later by romantic dramatists.

Voltaire seems to be responsible for a stronger flicker of classicism in the English theatre in plays which were obviously good vehicles for the tragic actors and actresses throughout the country. Such were Aaron Hill's *Zara* and *Alzira* (both 1736). English versions of other plays by Voltaire, including Arthur Murphy's *The Orphan of China* (1756), held the stage throughout Garrick's lifetime. Meanwhile England continued to produce its own brand of tragedy, well represented by the plays of James Thomson, the author of *Sophonisba* (1730). Thomson's *Edward and Eleanora* (1739) inspired Lessing's *Nathan der Weise* (1779) to some extent.

Voltaire's influence was felt in Sweden in the work of Johann Kellgren, Carl Gustaf af Leopold and Gudmund Adlerbeth. Leopold's *Virginia* (1802) and *Oden eller Asarne Invandring* (1790) are pseudo-classical tragedies, the latter of which won its author the laurel wreath from Virgil's grave, the gift of Gustavus III. Voltaire's influence extended to Russia, where the first tragedy in the French style was written by Aleksandr Sumarokov (1718–77), the self-styled "Racine of the North," who in fact imitated Corneille, Racine and Voltaire and claimed to be imitating Molière in his comedies. Yakov Borisovich Knyazhnin likewise imitated French and also Italian models; his *Dido* (1769) imitated Metastasio and his *Rosslav* (1784) and *Vadim* (1789) were neoclassic. French classicism also dominated the little Polish drama that there was; *Le Cid* had been translated into Polish by Andrzej Morsztyn (c. 1613–95) and performed in 1661.

One of the greatest of the classical writers of this age was Vittorio Amedeo Alfieri, the success of whose blank-verse tragedy *Cleopatra* (1775) led him to immerse himself in study of Italian writers of the past and in painstaking reading of the ancient dramatists. His theme was predominantly the overthrow of tyranny, with heroic personages from the ancient world, from the Bible and from European history. But he did not take the romantic way of treating these; his plays were more severe than his models in dispensing with all but the most essential characters and incidents. His blank verse has none of the traditional neoclassic smoothness and elegance, but it is concentrated and expressive. *Saul* (1782) and *Mirra* (1784–86) are considered his best work.

11. A New Development: The Evolution of Middle-Class Drama.— Although neoclassic tragedy still held sway after the period of Corneille and Racine, changing social conditions and a new intellectual atmosphere in Europe associated with the emergence of sentimentalism led to the development of a new type of drama which took contemporary middle-class life and problems as seriously as those of the aristocracy had been treated by traditional tragedy. To some extent the new type of drama had been anticipated in Guarini's defense of his *Pastor fido*. His attackers had used the traditional argument that persons of high and low rank, that a high and a low style of writing, that comic and tragic incidents should not be mixed in one play. His reply was that he had not produced a mixture of the classically comic with the classically tragic, but a new compound in which the spirit of each was blended to produce a genre which was still classic. By allowing the action to lead to reconciliation the satiric sting is taken from comedy and the depth of tragic melancholy from the tragic part. He added that where tragedy and comedy were each restricted to one section of society, tragicomedy, by mixing the high and the low, was able to give a truer picture of the world as it exists, which is the purpose of drama. Guarini's play does not justify his argument; it does not do these things. But something much like them was done by the new middle-class drama which appeared in Europe in the course of the 18th century and which can be seen developing in both tragedy and comedy simultaneously.

The new form has been traced first in certain developments visible in English comedy at about the time of the attack made by Jeremy Collier on the excesses of Restoration drama (1698), a time when there was in any case a change in the moral tone and spirit of English comedy as the result of the middle classes' gain in importance. The new element has been held to be present already in the fact that the wronged wife remains faithful to her husband, not in ignorance of his misdemeanours but in loving forgiveness, in Sir John Vanbrugh's *The Provok'd Wife* (1697). The fact that Susannah Centlivre (1667–1723) took to reclaiming her offenders in her last acts has been likewise ascribed to the new tone, which certainly tinges Richard Steele's *The Funeral* (1701) and *The Lying Lover* (1703, founded on Corneille's *Le Menteur*). Colley Cibber's *The Careless Husband* (1704) is the first definite example of a comedy in which the action treats the implications of a moral sentiment with pathos. Steele followed this beginning with *The Tender Husband* (1705); in this and in *The Conscious Lovers* (1722) social problems rather than wit and intrigue constitute the centre of interest and there is much moralizing, while scenes of pathos lead to a happy ending and express the sentimental spirit of the age. It has been pointed out by historians of English drama that early in the 18th century a tendency toward the treatment of domestic themes already existed in the tragedy of Nicholas Rowe and Thomas Southerne. This tendency is developed fully by Colley Cibber and Steele to produce an artificial weak pathos and tearfulness with no real comic attitude. With Steele the purpose was sincerely moral if artistically inept.

The new form of comedy soon affected France, where Molière had left no real successor. Although Jean François Regnard was not a sentimental writer, he has been considered to have affinities with what was soon to come in England in the style and theme of *Le Joueur* (1696); there is a similar quality in his much livelier and more competent *Le Légataire universe1* (1708). Pierre Carlet de Chamblain de Marivaux helped toward the development of sentimental comedy in France, or—to give it its French name—*comédie larmoyante*. He has been compared to a comic equivalent of Racine, for like Racine he polishes his style in a refinement of dialogue; but instead of treating tragic passions, Marivaux deals no less subtly with the development of love in a manner that has charm and sympathy and is amusing but not bitter or satiric. His style is delicate and his plays artificial and fantastic, but their mood is one of happy comedy and their sentiment very near to the sentimentalism of the new form. This form already shows itself in the dullness of the moral sentiments which Philippe Néricault Destouches aimed to express in *Le Glorieux* (1727) and *Le Philosophe marié* (1727); the latter had a great effect when translated into English by John Kelly as *The Married Philosopher* (1732). The best early representative of the new genre is Pierre Claude Nivelle de la Chaussée, often regarded as its father on the grounds that he partook of the qualities of both tragedy and comedy, without creating either in *La Fausse Antipathie* (1733), *Le Pre'juge à la mode* (1735) and *L'Homme de fortune* (1751). But before *comédie larmoyante* could develop into the middle-class serious play known as *drame* it was necessary for yet another breach of classical tradition in England to make its effect felt beyond the channel.

In 1731 George Lillo deliberately extended the range of tragedy to bring in persons of the middle class in his *The London Merchant, or The History of George Barnwell* (1731). In his preface he argued that this was not an offense against the dignity of tragedy and that plays "founded on moral tales of private life" were as tragic as those dealing with persons "of superior rank." Whether classical or not, England had adhered to the tradition which could not conceive of tragedy as affecting such a person as a London apprentice and his master. It is true that something approaching this may be discerned in Elizabethan domestic drama; but there it was merely that the characters were not aristocratic; they were treated in the same spirit as if they were, and in much the same style. Lillo knew he was breaking with the traditionally tragic; and Edward Moore, helped by Garrick, followed him in *The Gamester* (1753). Even before *George Barnwell* affected French practice, it was a source of inspiration to Gotthold Ephraim Lessing for his *bürgerliche Trauerspiel* (middle-class tragedy), *Miss Sarah Sampson* (1755).

Two years later came *Le Fils naturel*, written by Denis Diderot,

though it was not acted until 1771. From this and from Diderot's *Le Pkre de famille* (written 1758, performed 1761), the whole of the genre of *drame* took its tone and colouring in France. Plays were written to enunciate moral truths, to preach the crimes of civilization and conventional society, to advocate the strength and purity of the natural virtues, to express pity for the oppressed and admiration for the solid, serious, virtuous middle-class merchant. To such belong Michel Jean Sedaine's *Le Philosophe sans le savoir* (1765) and Louis Sebastien Mercier's *Jenneval, ou le Barnevelt français* (printed 1769) and *Le Juge* (1774). The link between Lillo and Mercier is obvious. Diderot followed his writing of serious comedy itself with a defense of the genre in his essay *De la poksie dramatique, à Monsieur Grimm* (1758). He finds classical precedent in Terence. whose comedies he insists are not aimed primarily at provoking laughter but at touching the sentiments in scenes which are natural and in tune with the customs of the age in which they were written. The new form was defended also by Pierre Augustin Caron de Beaumarchais, the author of *Le Mariage de Figaro* (1784), in his *Essai sur le genre dramatique sérieux*, which he published with an example, *Eugénie* (1767). He pointed out that while witty lines and stage tricks can blind the audience to the reality of vice and while the sufferings of the traditional tragic heroes have little relation to the facts of living in 18th-century France. the sentimental drama could move by truth and nature and by undisguised moralizing; the very element of emotionalism to which exception is taken today and to which it was taken by some, notably Voltaire, in his own age, is what stems so necessary to Beaumarchais in order that virtue shall be strengthened in the fight against vice.

Serious middle-class drama was not confined to England and France. Lessing followed *Miss Sarah Sampson* with a retelling of the Virginius story, *Emilia Galotti* (1772), and another play of this kind is Schiller's *Kabale und Liebe* (1784). In Russia the influence of Marivaux, Diderot and Beaumarchais led Vladimir Ignatevich Lukin (1737–94) to make an attempt to introduce bourgeois comedy there; it could hardly be expected. however, to live, much less thrive, in a country almost without a bourgeoisie. In Holland the new form took; French examples were translated and imitated. In Italy, despite Goldoni and his followers, the sentimental drama conquered. Typical are *Il delatore* (1800) by Camillo Federici and *La Dama di spirito* (*c.* 1790) by Francesco Cerlone. Even Spain has such works as El *Delincuente honrado* (1774) by Gaspar Melchor de Jovellanos and plays by Nicolas Fernández de Moratin such as *El Viejo y la niña* (1790) and *El Sí de las niñas* (1806).

12. England and Italy: 18th-Century Sentiment and Comedy.—Although England had been a strong influence in the development of the sentimental play, it had opponents there; but the objections were not on classical or aesthetic grounds, but simply against the sentimental spirit itself. Oliver Goldsmith tried to provide an alternative in the shape of *The Good-natured Man* (1768) as an example of what he called "Laughing Comedy" in his "Essay on the Theatre" (1773). Goldsmith's other comedy, *She Stoops* to *Conquer,* designed to provoke laughter, not pathos or sentimentality. appeared in 1773, the same year as Samuel Foote, "the English Aristophanes," amused his Hayrnarket audience with *The Handsome Housemaid; or Piety in Pattens* (1773), a satire of the spirit of sentimental drama. The art of Richard Brinsley Sheridan was fundamentally opposed to the atmosphere of lachrymose comedy, whose devotees are ridiculed to some extent in the person of Lydia Languish in *The Rivals* (1775). Sheridan avoided the mixed form himself, preferring to translate the wit and gaiety of Restoration comic dialogue out of its cynicism into something more suited to a society accustomed to genteel comedy.

Plays with a mixture of the laughably comic and the sentimental continued to be written and were popular to the end of the century. Among them are *The Way to Keep Him* (1760) and *Tlze School for Guardians* (1767) by Arthur Murphy and *The Jealous Wife* (1761) by George Colman the Elder, who collaborated with David Garrick in *Tlze Clandestine Marriage* (1766). Another example which held the stage successfully was Thomas Morton's *Speed the Plough* (1700), in which the character "Mrs. Grundy"—later to become symbolic of a type of moral outlook—was introduced to the British public. Hugh Kelly's *False Delicacy* (1768) and Richard Cumberland's *The West Indian* (1771) delighted their time; and the same sentimental spirit dominates Thomas Holcroft's *The Road to Ruin* (1792) and much of the work of Elizabeth Inchbald, particularly *Such Things Are* (1787) and *Lovers' Vows* (1798) derived from *Das Kind der Liebe* (1790) by August von Kotzebue. Toward the end of the century, even George Colman the Younger, who was regarded as the successor to Sheridan in comedy, was providing for his public sentiment rather than wit.

To some extent the sentimental *drame* of the 18th century was more realistic than classical tragedy; it created a tradition of treating middle-class, rather than aristocratic, matters seriously; it showed to the public persons and scenes which could be recognized as part of contemporary life; and it began the process of development toward the prose dialogue of later ages.

Eighteenth-century Italy saw the flowering of more traditional comedy in Gozzi and Goldoni. Count Carlo Gozzi took advantage of the existing *commedia dell' arte* to write fairy tales—*fiabe*—with a satirical purpose, in a strong reaction against the lachrymose spirit of the age. Where Gozzi was an aristocrat who delighted in using the extravagances of the *comedia dell' arte* method, Carlo Goldoni was a bourgeois. dedicated to reform the stage with a regular written comedy. He is credited with more than 300 plays, in many of which he writes his own comedy of manners. observing the ridiculous but not satirizing deeply; although he writes witty dialogue he can also perpetrate the dullest of moralizings. He castigates the aristocrats and approves of middle-class virtues; his men are not so interestingly and completely imagined as his women.

13. Romanticism in Germany and Scandinavia.—As the 18th century progressed, English influence on the drama was felt not only in the form of sentimental comedy but as an alternative to classicism, especially as this was associated with France. It was logical that in Germany politial opposition should combine with an awareness of the difference between the genius of the French and that of the German language to strike at Gottsched's attempt to found a German classical drama on the French model. The rising middle classes of Germany could find much to appeal to them not only in the middle-class sentiment of 18th-century English drama but also in the freedom of earlier playwrights from what were to Germany the fetters and artificialities of neoclassicism.

Shakespeare in France did not arouse a wave of enthusiasm until the early 19th century; but as he became known to the Germans from the time of Lessing onward, if not earlier, it seemed that here was an example of untrammeled genius, showing Germans the way. In 1762 Christoph Martin Wieland started a prose translation which was finished by Johann Joachim Eschenburg in 1782. Shakespearean energy and "nature" proved an inspiration to the movement known as *Sturm und Drang,* which was the title of a play in the new style by Friedrich Maximilian von Klinger. This play, which appeared in 1776, dealt enthusiastically with the American Revolution; in the same year Klinger wrote his most impressive play, *Die Zwillinger,* with fratricide as its subject. Five years earlier, Goethe, who had still to develop into the classicist. had been influenced by Shakespeare's unclassical writing to produce an imitation, *Goetz von Berlichingen* (performed 1773), in which he expressed with energy a nationalist delight in the German middle ages, alternating comic and tragic scenes in the Shakespearean. not the classical manner. *Alarcos* (1802) by Friedrich von Schlegel is so absurd as to be virtually a parody of the genre, and in this respect it is equaled by Clemens Brentano's *Die Gründung Prags* (1814).

But not all the romantics were so absurd or sensational. Heinrich von Kleist, author of the very amusing *Der zerbrochene Krug,* wrote tragedies dealing with the intensity and complexity of passion: *Die Familie Schroffenstein* (1803), *Penthesilea* (1808) and *Das Käthchen von Heilbronn* (1810); in *Der Prinz von Homburg* (1811) he goes much deeper into human psychology. Another outstanding romantic is Franz Grillparzer, an Austrian, whose *Ahnfrau* (1817) is based on a theme in itself absurd. His later

plays are poetic rather than theatrical with the exception. possibly. of *Der Traum ein Leben* (1834). The German romantics tended to ignore the material conditions of the contemporary stage and thus created gigantic poetic plays which in some ways anticipate the writings of the 20th century: such are *Napoleon oder die hundert Tage* (1831). by Christian Dietrich Grabbe, and *Dantons Tod* (1835) and *Woyzeck* (1836), both by Georg Bdchner.

Nevertheless it was a lesser dramatist, August von Kotzebue, whose plays were first imitated outside Germany; in the 1790s he reduced Schiller's style of poetry in drama to a form in which it was appreciated by popular audiences. His works can more accurately be called melodramatic in their sensationalism and sentimental philosophizing. His scenes ranged even further than those of Voltaire, of whom in some ways he is the melodramatic equivalent, although the Frenchman firmly believed in the views which he advocated, whereas the German made use of any scrap of enlightened, romantic or humanitarian thinking that would serve his purpose. Of Kotzebue's plays, 36 were translated into English and 20 of these performed. The most popular were *Pizarro* (1799), which Sheridan adapted from *Die Spanier in Peru* (1796), and *The Stranger* (1788; from *Menschen hass und Reue,* 1788), in which John Philip Kemble and Sarah Siddons delighted their devotees as the Stranger and Mrs. Haller.

Romanticism influenced Scandinavian drama earlier than that of most other countries. As early as 1770 in Denmark Johannes Ewald based his prose tragedy *Rolf Krage* on the chronicles of Saxo Grammaticus; four years later his *Balders Dod* (1774), from the same source, was the first Danish play to be written in iambic pentameters. His most famous play is *Fiskerne* (1778), treating the life of a fishing village. Ewald and Adam Gottlob Öhlenschlager were both influenced by Goethe and Schiller. Öhlenschlager wrote two historical tragedies, some plays with love themes and an idyllic pastoral, *Den lille Hyrdedreng* (1818). Johannes Carsten Hauch wrote historical plays which were studies of character. Romantic plays, including *Kong Rene's Datter* (1845; Eng. trans. *King Rene's Daughter,* 1850) were written by Henrik Hertz (1798–1870). Sweden reacted to romanticism as early as Bengt Lidner's *Grefvinnan Spastaras dod* (1783). In the next century came Erik Johan Stagnelius with *Martyrerna* (1821) and *Bacchanterna* (1822). These, like the work of P. D. A. Atterbom and Carl J. L. Almquist, were not theatrical enough for performance. The first romantic plays in Swedish suitable for performance were those of Baron Bernard von Beskow (1796–1868), historical plays strongly imitative of Schiller. The historical plays of Frans Hedberg were often acted. as was the musical play *Värmlännigarne* (1846) by Fredrik Dahlgren.

14. France: Melodrama and Romantic Drama. — In France pure romantic drama did not develop until comparatively late. It was preceded, however, by the equivalent of the melodrama of Kotzebue in the work of Guilbert de Pixérécourt (1773–1844), ahose *Sélico* (1793) represents adequately his sensational plots, full of tension and theatrical climaxes, adapting themes and subjects of popular novels and with the scene set in France, Scotland, Mexico or Poland. It is considered that the work of Pixérécourt and Kotzebue led to both the kind of play developed by Eugène Scribe and the romantic yet realistic melodrama of 19th-century England. Romanticism proper in the French theatre was released by the impact of Shakespeare, as in Germany. What the art of Racine had degenerated into was avidly replaced by the imitation of Shakespeare, who became a symbol of the freedom of the poetic imagination. The French romantic dramatists did not appreciate the real Shakespearean method, which they mistook for a kind of melodrama to some extent, but with tremendous natural energy and poetic strength such as melodrama could not attain. Romantic drama itself tended to be lyrical and undramatic in the theatrical sense as there was little or no dramatic conflict either between individuals or within them.

In 1821 a French edition of Shakespeare was published; interest was deepened with François Guizot's writings on him, to he increased even more as the result of Stendhal's *Racine et Shakespeare* (1824). Then in the season of 1827–28 Paris was visited by Charles Kemble's company. Victor Hugo had already written his romantic *Oliver Cromwell* in 1824; three years later he issued it with a preface claiming pre-eminence for Shakespeare. Hugo himself wrote a comparatively realistic historical play in 1829, *Un duel sous Richelieu;* in 1830 came the sensation of *Hernani,* in which a combination of sensational incident and fiery sweeping verse expresses the essence of drama in French romantic terms. The furore caused by its performance was less the result of any striking novelty than due to the fact that, as this took place in the Comédie Française, it was regarded by the supporters of classicism as a challenge to be rebutted and by the supporters of romanticism as one to be supported no less vociferously. Hugo's *Ruy Blas* (1838) and *Les Burgraves* (1843) have the same tremendous vitality, mixing the sensation and to some extent the spirit of melodrama with a quality which comes from a poetic capability in the author and which far outstrips that of the writers of melodrama, even though their knowledge of theatrical practicalities may have been greater.

Alfred de Vigny was more sentimentally Byronic. Having translated *Othello* (1829) he tried in his *Chatterton* (1835) to show the action going on morally within the individual, thus anticipating to a certain degree the later impressionist drama. The English players of Shakespeare also made a great impression on Alexandre Dumas *père,* who did not try to establish a poetic theatre so much as to use the means provided by melodrama to develop a more realistic romantic type of historical play with a well-knit plot, as represented by his *Henri* IN *et sa cour* (1829). His *Antony* (1831) is a link in the development of 19th-century realistic drama out of the *drame* of the previous century; this is a play of typically romantic and violent passions but takes place in a middle-class milieu. A contemporary, Alfred de Musset, having failed with his *La Nuit vénitienne* (1830), went on to develop his own unclassical version of the kind of play written by Marivaux, with a touch of the quality of Beaumarchais and of Shakespeare's true sentiment in comedy as opposed to sentimentality.

Romantic experiment stopped with the failure of Hugo's *Les Burgraves.* The romantic play's development into the realistic play of the middle of the century, which in translation and imitation provided vehicles for the English actor-managers, is heralded as early as 1832 by Casimir Delavigne's *Louis* XI, in which he tries to blend romantic novelty of theme and treatment of character with a more conservative spirit nearer classicism.

15. The **18th** and Early **19th** Centuries: Neoclassic and Romantic Drama. — The prevailing tone in France is shown in the fact that after a failure mith *Lucrèce* (1843), an attempt at classical tragedy, François Ponsard was more successful with the more romantic *Agnès de Méranie* (1846) and the historical *Charlotte Corday* (1850). It was this sort of play that was partly the inspiration for such writers in Holland as Hendrik Jan Schimmel, whose *Twee Tudors* (1847) and patriotic dramas achieved some popularity.

In Spain and Portugal the spread of romanticism in drama was delayed by political considerations. Neoclassicism dominated the 18th century, but in its second half theorists had come forward with justifications of the unclassical drama of the Golden Age. These are to be found in the writings of Tomás de Erauso y Zavaleta (1750). Juan Cristóbal Romea y Tapia (1763) and Francisco Nieto de Molina (1768). Calderón, Rojas Zorilla and Moreto were defended by Leandro Fernández de Moratín in *La Comedia nueva* (1792). Although the writers of the Golden Age a-ere being published and performed more, it was not until the end of the reactionary reign of Ferdinand VII (1814–33) that the new romantic drama appeared in Spain. Many translations from Hugo, Dumas and much less competent French romantic dramatists were performed; but the new Spanish plays in this genre were not very successful. Moratin and Manuel Bretón de los Herreros —a neoclassical writer — were at least as well received as Francisco de Paula Martinez de la Rosa's *La Conjuracion de Venecia* (1834), Angel, duque de Riva's *Don Alvaro* (1835) and *Los Amantes* de *Teruel* (1837) by Juan Eugenio Hartzenbusch. Spanish romantic drama did not entirely displace the neoclassical; later 19th-century Spanish writers tended to draw what they needed from either school, looking for their real inspiration to the playwrights of the

Golden Age of two centuries earlier. Two outstanding romantics were José Zorrilla y Moral, with a very popular new treatment of an old story, *Don Juan Tenorio* (1844), and José Echegaray y Eizaguirre. In the work of Manuel Tamayo y Baus can be seen the alternation of the classical with the romantic typical of his time, with a very able combination of the two in *Un Drama nuevo* (1867).

Portugal produced its first romantic playwright of stature even later than Spain. After the neoclassical attempts already noted João Baptista da Silva Leitão, visconde de Almeida-Garrett, treated patriotic subjects powerfully and skilfully—in prose dialogue, moreover: such are *Um Auto de Gil Vicente* (1838), *Dona Filipa de Vilhena* (1840), *O Alfageme de Santarém* (1841) and *Frei Luis de Sousa* (1844), of which the last is best.

Italy, like the other Latin countries of the south, did not easily succumb to romanticism in its drama, possibly owing to the influence of Alfieri as well as to the fact that a classical way of writing had been traditional there for if anything longer than an unclassical one had been taken for normal in England. Giovanni Pindemonte shows some reaction to the romantic spirit and method in his *Ginevra di Scozia* (1795) and *Lucio Quinzio Cincinnato* (1800), but he is fundamentally a classicist. Romantic theories of historical drama, in which the influence of Schiller in particular lived, were the inspiration of the greatest of the Italian romantic tragic writers, Alessandro Manzoni in his *Il Conte di Carmagnola* (1820) and *Adelchi* (1822). Giovanni Battista Niccolini, another patriot, who had failed with his classical *Polissena* (1810) to rouse his countrymen to adopt pure Greek rather than neoclassic models, now followed Manzoni's lead with the romantic *Antonio Foscarini* (1827). *Giovanni da Procida* (1830) and *Arnaldo da Brescia* (1843), all patriotically political; of these the last is best. Linked with the Risorgimento were also the undistinguished plays of Silvio Pellico, Carlo Marenco and Carlo Tebaldi Fores.

Romanticism came in Russian drama as the result of melodrama in practice norked upon by the influence of Shakespeare. and the German romanticists and Byron. After Vasili Andreevich Zhukovski and Ivan Andreevich Krylov came the much greater Aleksandr Sergeevich Pushkin, whose *Boris Godonov* (1825) is a romantic Russian version of the Shakespearean verse history play. Schiller is the dominant influence on Pushkin's contemporary Mikhail Yurevich Lermontov in his *Ispantsi* (written 1830), and Shakespeare provides the model for *Maskerad* (written 1835, but not performed until 1852). Other minor authors attempted romantic drama for patriotic purposes, among them the philosopher Aleksei Stepanovich Khomyakov in *Ermak* (1827) and *Dmitri samozvanets* (1832). Patriotism expresses itself in Polish romanticism also, with Alojzy Felinski's *Barbara Radziwillowna* (1811) and with Julius Slowacki, who was inspired by Shakespeare in style and technique in his *Mindowe* (1833), *Balladyna* (1839) and *Mazeppa* (1840). In Hungary, Shakespeare had a similar effect on *Bdnk Bdn* (written 1815, first performed 1833) by József Katona. Another Hungarian romantic was Károly Kisfaludy, who wrote *Irene* (1821).

16. The 19th Century: The Development of Realistic Drama.—In Europe and drama as a whole the transition from romanticism into realism took place quite logically. Although the tno are really fundamentally different in spirit, romanticism was opposed to the old traditions associated with both classicism and the *ancien régime;* it mas in some ways an exaggeration of sentimentalism' and like the writers of *drame,* of middle-class tragedy and sentimental comedy. the romantic dramatists reacted against the sharp neoclassic division of subject and style into tragic and comic. In addition, however poetic the new movement might be in its dialogue, it had no dogmatic objection to the use of realistic theatrical techniques in performance. As a result, the first wave of realism in 19th-century Europe was not inspired by a consistent program of theatrical and social reform so much as it was a reaction against romantic excesses, mingled with an awareness of much that was wrong with contemporary manners and conventions Comedy has always been more realistic than tragedy; it tends to show people as they only too ridiculously are, whereas tragedy's tendency is to concentrate on the ideal, on people as they ought to be. In France the new realism was felt in comedy at first, derived partly from the methods of the mixed form *comédie-vaudeville,* and can be seen in the work of Charles Guillaume Btienne (1777–1845) and Louis Benoît Picard (1769–1828). Alexis Jacques Wafflard (1787–1824) is more realistic in his *Un Moment d'imprudence* (1819), and even more vivid with ingenuity of incident is Delavigne's *La Comédie des corne'diens* (1820).

In this situation it was possible for Eugène Scribe to develop systematically a practice of constructing efficient working plots for historical dramas, melodramas. tragedies and comedies of intrigue, with the aid of a number of collaborators. The term "the well-made play" given to these productions is enough to indicate their nature. Scribe himself had no feeling for character, but he demonstrated how to make a plot develop; and in some of his work, notably *Un Verre d'eau* (1842), he expressed that element of the realism of the age which aimed at deflating false pretentiousness. Honor6 de Balzac, starting with romantic tendencies, eventually showed himself the realist in *Pamela Giraud* (1843), *La Marâtre* (1848) and *Mercadet* (performed 1851; originally *Le Faiseur,* 1830); this last entered the repertoire of the Comédie Française (1869).

Realism developed further in Alexandre Dumas *fils,* who learned from Scribe and yet understood his weaknesses. Dumas took up ideas and developed them skilfully in terms of theatre, manipulating characters and plot, but showing people as created by their environment and with no control over their fate. Gradually moving away from the colourful to the sordid he impressed his contemporaries with what they accepted as powerful treatments of life as it existed. The strength of his dialogue and characterization derive partly from his careful study of Corneille. His range includes *La Danze aux camélias* (1852), *Le Demi-monde* (1855) and *Francillon* (1887), but he steps beyond it with the attempt in *Le Fils naturel* (1858) to write a thesis play for which he had no real profundity. Émile Augier moved to realism by way of romanticism and melodrama, developing the new dramatic style under the influence of Scribe's methods. Augier wrote at first in verse, which he left in his treatment of the clash of ideals in *Le Gendre de M. Poirier* (1854). He had ideas on the state of society, and by means of lifelike pictures of that society he expressed them theatrically in such plays as *Le Mariage d'Olympe* (1855). Here was the combination of brilliance in plotting and characterization and the working out of a thesis that was to develop into later naturalism. The weakness of both Dumas *fils* and Augier lies in their superficiality, however exact their observation of the surface may have been.

In Russia realism also developed by way of melodrama and satiric comedy. There is an element of satiric realism in the comic sketches written by the empress Catherine II the Great in the 1770s. which had been preceded by a similar quality in Denis Ivanovich Fonvizin's *Brigadir* (1780; "The Brigadier-General") and also occurs in Mikhail Matinski's *Sankt-Peterburgski gostiny dvor* (1781; "The St. Petersburg Arcade") and Vasili Vasilevich Kapnist's *Yabeda* (1793–94; "Chicanery"). In 1821 Aleksandr Sergeevich Griboedov started writing his *Gore ot uma* (1831; "Wit From Woe") in which the verse dialogue did not detract from the fundamental realism of the character portrayal. Although this was more a series of comic scenes than a play, it contributed to the atmosphere out of which emerged the skilfully plotted, fully theatrical satiric realism of *Revizor* (1836; Eng. trans. *The Government Inspector)* by Nikolai Gogol. The tradition was continued by Aleksandr Sukhovo-Kobylin (1817–1903). In the middle of the century Russia was not dominated by the methods of Scribe, largely, it is considered, owing to the more powerful influence of Aleksandr Nikolaevich Ostrovski. who developed the realism of his predecessors by concentrating on character rather than plot. The seeming formlessness of his series of scenes appears to be like that aimed at by those who later talked of drama as a slice of life. But there is no logical exposition of "the theme underneath" as in Zola's conception. Ostrovski had the ability to satirize and sympathize as he attacked middle-class dullness and many aspects of Moscow society; his

best plays are *Groza* (1860; "The Storm") and *Les* (1871; "The Forest").

Although Scribe did not affect Russia, his influence helped to give structural strength in almost every other country. It appears in Spain in the Argentinian Ventura de la Vega's *El hombre del mundo* (1845) and in *Nos más mostrador* (1831) by Mariano José de Larra. In Italy with a comic tradition stemming from Goldoni there aas no need of aid from Scribe in play-making, yet he contributed an element to the style of Riccardo Castelvecchio's *La donna romantica e il medico omeoputico* (1858). Poland made something of its own out of what Scribe offered in such writings as *Matzenstwo Apfel* (1887; "The Apfel Marriage") by Count Kazimierz Zalewski. Similarly the Czech dramatist Emanuel Bozdech gave an individual tnist to his *Zkozcska statinkova* (1874; "The Politician's Trial"). Scribe's effect was felt and absorbed into something fundamentally native in Austria and Hungary. That he had something valid to offerwhich did not dominate those who made use of his model can be seen in the case of August Blanche's Swedish play *Ett resande teatersällskap* (1842). This is constructed according to the Frenchman's method, yet its atmosphere and personages are utterly Swedish.

German realists, however, hammered out their own drama in the first half of the century, as their social thinking and materialist philosophy began to take effect. There the line of development was through romanticism and melodrama, but not by way of comedy. The movement known as *Junges Deutschland* ("Young Germany") had as one of its aims a truly national and democratic theatre; and Karl Gutzkow with *Uriel Acosta* (1847) and Heinrich Laube tried to provide what they demanded In the meantime Friedrich Hebbel influenced by Hegelian thinking. was unsparingly labouring at the development of his talent, concentrating on psychological motivation. His *Judith* (written 1839. acted 1840) and *Genoveva* (1840–41) were still partly in the romantic tradition, but what has been called the first play of German naturalism came in his *Maria Magdalena* (1843). which has a sordid working-class environment and is the expression of a conception of tragedy as caused by the conflict between the individual and society. This conception inspired his medieval German history plays, among which is *Agnes Bernauer* (1855) Where Hebbel's thought was expressed by genuine dramatic ability, Otto Ludwig failed in his *Erbfouster* (1850) because of his anxiety to expound his thesis, which prevented him imagining his story in terms of it. In the second half of the century, German realism was affected by the theories ahich Gustav Freytag, himself a moderately gifted dramatist, put forth in *Die Technik des Dramas* (1863). In it he expounded his theory of structure ("Freytag's Pyramid") and rejected the theory of dramatic conflict held by Ferdinand Brunetière. An Austrian writer of this time of importance to the later development ot realistic drama in Germany was Ludwig Anzengruber, nhose peasant plays contain dialogue in uhich he aimed at reproducing the quality of colloquial, even dialect. speech, yet giving something which was more than a mere faithful transcript.

As the century progressed, realism in France developed its next phase, at first in the work of Victorien Sardou, nho adapted the methods of Scribe to the demands of a time more accustomed to at least a superficial realism of technique and to a drama which dealt aith views then regarded as advanced. Whether the subject was historical or modern, dealing with the strange and bizarre or the contemporary social scene, Sardou welded together the thesis play and the kind of intrigue in which character took second place to action and sensation. Whereas Sardou can be regarded as the heir to Scribe, Henri Becque took over those elements of realistic drama which had been developed by Augier and Dumas *fils*. Becque's drama of ideas tended to be without obtrusive structure; he concentrated upon well-thought-out characterization, in which motivation and actions appeared probable and consistent with one another. These qualities in *Les Corbeaux* (1882) are typical of the comparatively brutal realism of what was called the *comédie uosse*.

But the comedy of intrigue and the *pièce à thèse* were invalidated in one blow by the theorizing of Émile Zola, who insisted that true realism—in his terminology, naturalism—should give as perfect an imitation of life as possible, striving to avoid any sign of artificial structure: of planned intrigue or contrivance, so that the incidents seemed to arise of their own accord as the result of the coming to life in the story of the characters as if they had not been created by an author. His *Thérèse Raquin* (1873) has been called the first tragedy of the French naturalist theatre. Without arranging his facts to fit the needs of a thesis, but by imagining a world in which things happen in accordance with it, which is what he thought of the real world, too. Zola called for a drama that was absolutely true to the facts of existence and which could permit his own time to see itself on the stage.

17. Ibsen: The **Play of** Ideas.—The most fruitful of the treatises written on the art of drama and the contemporary world in the 19th century may well have been *Das moderne Drama* (1852) by Hermann Hettner, who considered that his friend Hebbel had pointed in the right direction, and that by concentrating on psychological truth and the interplay of social forces it would be possible for dramatists to produce a really significant drama showing the situation of modern man in the modern world. This treatise reinforced in Henrik Ibsen the understanding of the art of drama which he had acquired from the study of Shakespeare, Holberg and Scribe during many years as *Dramaturg* and director of the Bergen theatre, and from his own writings before he developed his naturalistic drama himself.

In *De Unges Forbund* (1869; Eng. trans. *The League of Youfh)* and *Samfundets Støtter* (1877; Eng. trans. *Pillars of Society)* he had mastered the art of realistic prose dialogue: but the method was still fundamentally that of Scribe in plot structure, while the tone was comically satirical of social conventions. In *Et Dukkehjem* (1879; Eng. trans. *The Doll's House*) and the plays that followed, the 19th-century ideal of the realistic play embodied itself. Conventional attitudes to matters of importance to society are tested, individuals are shown in organic relationship to their environment and one another, the exposition is not obvious, character and incident seem to grow necessarily intertwined, the convention of five acts is ignored while that of unity of place tends to be observed; and stage directions are important because the whole environment has been imagined as of significance in the fates of the individuals dealt with.

Another Norwegian realist was Bjørnstjerne Bjørnson, lesser than Ibsen yet outstanding in his own right, who wrote realistic plays in the early 1870s when Ibsen's characteristic art had riot been developed. With these two there appeared the realistic Swedish dramatist August Strindberg, whose first work was romantically Byronic, but who developed a powerful realism in the 1880s in plays such as *Fadren* (1887; Eng. trans. *The Father*). By the time of *Fröken Julie* (1888; Eng. trans. *Miss Julie*), however, Strindberg was finding the need to extend beyond the range of naturalism; although in this play he manages to imagine a situation in which no exception can be taken on naturalist grounds to the use of music, dancing, and of poetic atmosphere. A much lesser figure was the Norwegian Gunnar Heiberg, whose dialogue was effective! but only *Balkonen* (1894) and *Kjaerlighedens Tragedie* (1904; "Love's Tragedy") show anything like great talent.

The model provided by Ibsen led to a spate of "plays of ideas" by French naturalistic writers, many of whom were associated with André Antoine, whose enthusiasm for the new drama led to the founding of the Théâtre Libre in Paris in 1387. During its seven years of life, foreign naturalist plays, especially those of Ibsen. were given in translation and new French playwrights were encouraged. This group included George de Porto-Riche. François de Curel, Henri Lavedan and Paul Hervieu. The most controversial of these writers was Eugène Brieux, who had the technique and imaginative strength to present problems dramatically in what mas the final development of the play of ideas. Contemporaries were startled or stimulated by the boldness with which he dealt with issues that to other writers of the time seemed to be too advanced for theatrical presentation. Although he was potent in stimulating discussion of problems that might otherwise have been ignored by large sections of the public. his thinking was fundamentally commonplace, his methods often too sensational.

The examples of Ibsen and the French dramatists stimulated existing German realism to fresh efforts. On Sept. *29, 1889,* Otto Brahm combined with Theodor Wolff and Maximilian Harden to found the Freie Buhne, a theatre on the model of Antoine's in Paris. Brahm admired the art of Anzengruber, Ibsen and Bjørnson and encouraged German writers to treat similarly such topics as abnormalities of conduct, crime, disease and the lives of the proletariat, aiming at natural dialogue and the careful integration of character, incident and environment. Arno Holz and Johannes Schlaf collaborated on *Die Familie Selicke (1890);* and Schlaf alone in *Meister Ölze (1890)* treated the psychological motivation and behaviour of a criminal in a way that offered another subject and model for his fellow writers.

To this group of realistic plays belong the early works of Gerhard Hauptmann, whose *Vor Sonnenaufgang* was played at the Freie Bühne in *1889.* At this period he was influenced by Anzengruber and Ibsen; Anzengruber's influence is seen in *Die Weber* (1892), Ibsen's in *Einsame Menschen (1891)* and in stage directions that set a scene necessary for the depiction of the interaction between environment and character. His bourgeois tragedy aimed at treating social problems by an objective depiction of life. Hermann Sudermann, a lesser playwright, tended to treat a lower-middle-class milieu: his *Ehre (1889)* is best known. Succumbing to the influence of Augier and Dumas *fils* as much as that of Ibsen, he falsified situations and sacrificed integrity of imagining for theatrical effect. Moral and social issues mere handled in the naturalist manner by Max Halbe (1865–1944), Georg Hirschfeld *(1873–1939)* and O. E. Hartleben (1864–1905).

In Russia in the second half of the century, realism developed as elsewhere, but in a way that was uniquely Russian. As early as *1850* Ivan Turgenev anticipated the manner of Chekhov in *Mesyats v derevne* (performed *1872;* Eng. trans. *A Month in the Country)* in which realistic technique analyzed sentiment, and by means of apparent irrelevance created an imaginative impression of reality. Like Ostrovski's, this is not photographic realism, nor does it wrestle po erfully with violent states of mind, but induces a poetic mood. Lev Tolstoi was nearer to the manner of Hauptmann but with a Christian rather than a pessimistic spirit, if no less brutal, in *Vlast tmy (1899;* "Power of Darkness") and *Plody prosveshcheniya (1891;* "The Fruits of Enlightenment"). But in Anton Chekhov, author of *Vishnevy sad (1904;* Eng. trans. *The Cherry Orchard),* realism deserted the precise certain pronouncements of problems and denunciations of evils for a no less realistic but much more devious inner treatment of character and milieux, producing a seeming formlessness externally. His five great plays and his one-acters show equally a capacity for laughter, which is based on penetration into human foibles but which is tolerant. His achievement is to have been able to write and imagine with superb fidelity to nature, while avoiding the strident, and to have expressed the ideal in a meticulous representation of the real.

18. England in the 19th Century: From Melodrama to Realism. — The development of realism in England has to be seen in relation to what was happening in Europe from the beginning of the century. There was the same development through romanticism and melodrama to a kind of romantic realism; but England produced few playwrights of any worth and the stage depended mainly on translations and imitations, particularly from the French. Apart from Byron, the English romantic writers made no contribution to the theatre; and his *Manfred* (first performed *1834,* by Charles Kean) was treated as exalted melodrama by actors later, notably Macready, who found it a useful vehicle. *Sardanapalus* (first performed *1834)* was used for their own purposes by this actor and by Charles and Ellen Kean, who made a great spectacle out of it. Byron's *Werner* (first performed *1830)* also provided a favourite role well into the century.

For more than three decades the English theatre maintained in its repertoire many of the popular acting roles from the preceding century and in this way provided audiences with poetry despite the fact that contemporary writers were producing little of any worth. Among these the most successful were James Sheridan Knowles with *Caius Gracchus* (1815), *William Tell* (1825), *Virginius* (1820), *The Hunchback (1832)* and *The Wife (1833).* Even in these plays the change in attitude associated with the rise of an industrialist and mercantile society can be seen; in many ways the spirit of middle-class drama inhabits them despite their classical or medieval subjects. Another purveyor of a semblance of poetic drama was Richard Lalor Shiel, whose *Evadne, or The Statue (1819)* held its place in the repertoire for about half a century. To some extent the results of changes taking place on the continent filtered through to England in the work of Edward Bulwer-Lytton, later Lord Lytton: *The Lady of Lyons* (1838), the most popular romantically realistic play of the century in England; *Richelieu* (1839), which was almost as popular; and *Money (1840)* catered to the prevailing taste for sentiment, colour, sensation, realistic staging and powerfully realistic romantic acting. William Charles Macready was genuinely anxious to foster contemporary poetic drama. His association with Robert Browning led to nothing more successful than *A Blot on the Scutcheon (1843)* and *Strafford (1837);* but *Ion* (1836), by Sir Thomas Noon Talfourd, found its way into the repertoire for a number of years.

A landmark in the development of realism in England was provided by Macready's production of *The Patrician's Daughter (1842)* by John 'Westland Marston. This was an attempt at treating changes in contemporary society in a blank-verse play and the staging was realistic enough to dismay at least one of the performers, Mrs. Warner, when she found herself obliged to carry a parasol just as if she were not taking part in a play. Although it was a popular success, critics objected to the uneasy yoking together of realism and tragedy; obviously, Marston had not thought out his play in terms of contemporary life. Ten years later he provided *Anne Blake,* again a contemporary play, for Charles Kean, who staged this realistically as he had staged *The Wife's Secret (1846)* by G. W. Lovell. By the middle of the century, melodrama was becoming much more realistic in milieu and staging, especially in such plays as *The Octoroon* (1859), *The Colleen Bawn (1860)* and *The Trial of Effie Deans (1860,* from Scott's *Heart of Midlothian*) by Dion Boucicault.

Although the work of Tom Taylor, such as *Still Waters Run Deep (1855)* and *The Ticket-of-Leave Man* (1863), and that of Charles Reade in *Masks and Faces* (with Taylor, *1852)* is superficial and sentimental, contriving to present theatrical entertainment rather than expressing powerful convictions, they were preparing the way for T. W. Robertson, who, partly as the result of working with Charles Kean, came to have an organic understanding of a realistic play as something more than a pretext for superficial stage realism. Fortunate enough to find in the management of Sir Squire and Lady Bancroft both practical and theoretical agreement, he came nearer than anyone before him in England to reflect ordinary everyday life. In *Society* (1865), *Ours* (1866), *Caste (1867)* and *School (1869)* he developed an English equivalent of the work of Augier and Dumas *fils.*

Drama in England, however, was not responsive to the influence of realism abroad except in the form of adaptation, translation and in acting and staging. This may well have been due as much as anything to the fact that audiences which were too sophisticated for "transpontine" melodrama were nevertheless quite satisfied with what could be made of mediocre and bad plays by the genius of such actors as Charles Kean and Henry Irving, who managed to convey the sense of reality by the truthful intensity of their acting in such romantic and sentimental, when not sensational, stage pieces as Dion Boucicault's adaptions (1855) of Delavigne's *Louis XI, The Corsican Brothers (1852;* from a novel by Dumas *père*) and Leopold Lewis' *The Bells (1871).* To be sure, Irving was glad of verse plays if he could find them; but Tennyson's *Queen Mary (1876)* and *Becket* (1893), like *Charles I (1872)* by W. G. Wills, look backward and not to the future, or even to contemporary England. In *1879,* the year of *The Doll's House,* with a ferment of developments in European drama, it was possible for Matthew Arnold to lament with justification that in England "we have no drama at all."

But in the next *20* years, with the stimulus of foreign models, as the result of the theoretical and critical writings of William

Archer, Sir Edmund Gosse and later George Bernard Shaw and Sir Henry Arthur Jones and with the examples of foreign models to inspire them, a school of realistic dramatists began to develop. It is not unnatural that in a theatre accustomed to melodrama and the refinements on it provided by translations of Sardou, Jones in collaboration with Henry Herman tried to preach a sermon, however sentimentally, with the essentially melodramatic *The Silver King* (1882). Jones responded to the influence of Ibsen two years later with an adaptation of *The Doll's House* entitled *Breaking a Butterfly* (1884). He gradually developed his art along traditional realistic lines in accordance with his conviction that the theatre should be re-formed to become a real force for social reform (a view elaborated in his *Renascence of the English Theatre,* 1895). In plays such as *The Middleman* (1889), *Wealth* (1889), *Michael and His Lost Angel* (1896) and *Mrs. Dane's Defence* (1900) he treated, if sentimentally and superficially, themes and problems of importance to contemporary England. His sense of what was wrong with that society was more completely and truthfully expressed, however, in the comedies *The Masqueraders* (1894) and *The Liars* (1897).

During the 1890s, the problem play developed in England, especially after the founding in 1891 of the Independent Theatre by J. T. Grein (1862–1935) to provide an opportunity for the performance of Ibsen and other realistic playwrights and to encourage new English dramatists. Sir Arthur Wing Pinero. who had mastered the art of the well-made play, now turned to the new field with *The Second Mrs. Tanqueray* (1893), which shows his strength as a competent playnright and his essential weakness in that he had really nothing to say which demanded expression, but had merely exploited an effective technique and a new fashion. In the same decade the first rush of plays of ideas, superficially naturalistic in technique, began to pour from George Bernard Shaw, who, like Brieux, saw the drama as a vehicle for discussing and preaching. but who, unlike Brieux. was vitally involved in the transmission of his ideas. Naturalism in England developed more fully in the next two decades in the nork of Harley Granville-Barker as a producer and as the writer of *The Voysey Inheritance* (1905) and *The Madras House* (1910). Among such writers as Alfred Sutro. Stanley Houghton and Harold Brighouse, John Galsmorthy stands out. In his unsensational realism he strives by means of what seems a truthful picture of life to involve the emotions and intellect of his audience simultaneously in the perfect dramatic expression of humanitarian liberalism. Sir James Barrie made skilful use of realistic techniques, but for his own purposes, which were more sentimental and fantastical than those of the true naturalist such as Galsworthy.

19. Realistic Drama in Southern and Northern Europe.— The 19th century saw the spread of realism in other countries of Europe. Although the method and style were fundamentally alien to some aspects of Italian culture, Italy had its own blend of the art of Scribe and of romantic melodrama from which evolved plays *a tesi* in which the style was that of *verismo.* Vincenzo Martini wrote plays in which there is some attempt to consider serious social themes: *Una donna di quarant' anni* (1853), *Il cavaliere d'industria* (1854) and *Il marito e l'amante* (1855), treating adultery in an "advanced" way. Scribe gradually overcame Goldoni in the work of Tommaso Gherardi del Testa. **I** *mariti* (1867) by Achille Torelli belongs to the new genre, which was also tried by Leo di Catelnuovo and Paolo Ferrari in the 1860s and 1870s. In the next two decades realism was adopted by Giuseppe Giacosa, Girolamo Rovetta and Roberto Bracco. **I** *parasiti* (1899) by Camillo Antona-Traversi bears comparison with realistic drama of other lands.

Spain gave much the same kind of response. From the late 1870s onward José Echegaray y Elizaguirre, who was really by nature a romantic, made attempts at the realistic method. He wrote a number of thesis plays on the model of Dumas *fils;* only in *El Gran galeoto* (1881) and *El Hijo de Don Juan* (1892) does he produce anything like the art of Ibsen, whom he admired. Between 1892 and 1920 a number of thesis plays were written by the novelist Benito Pérez Galdós, of which *Electra* (1901), *Mariucha* (1903), *Barbara* (1905), *Pedro Minio* (1908), *Casandra* (1910) and *Alcestis* (1910) are considered the best. Frederich Soler is memorable for organizing a group, the *Teatra Catalá,* to write Catalan drama. Among them Ignasi Iglesias treated working-class characters seriously. Ángel Guimera wrote tragedies of love among the peasants and fishermen and later, influenced by Hauptmann and Sudermann and the Scandinavians, tried psychological naturalistic drama, not unsuccessfully.

Northern Europe took more naturally to the new drama, even where nothing outstanding was written. In Holland, Herman Heijermans showed an understanding of the techniques of stagecraft and characterization and in *Ahasverus* (1893), *De Meid* (1900) and *Op Hoop van Zegen* (1900) treated social and working-class problems. Belgium had Gustave Vanzype, Paul Spaak and a number of lesser writers. Not unexpectedly, Denmark showed a fierce reaction against romanticism toward the end of the century in the work of Gustav Wied, who wrote *Dansemus* (190.5). Other naturalist plays of this period are *En Martyr* (1896) by Sven Lange and *Karen Bornemann* (1907) by Hjalmar Bergstrøm.

20. Drama and Verisimilitude.— Looking back from the state of drama in Europe at the beginning of the 20th century it is possible to see a straight line of development technically as the logical consequence of the conception of the art put forward by Lodovico Castelvetro in *La Poetica di Aristotile vulgarizzata* in 1570. From the fundamental assumption that the business of a poet is to imitate life in his medium, Castelvetro pointed out that the nondramatic poet has only words with which to imitate both words and things. His imitation of words could be verisimilar but not his imitation of things. But the dramatic poet could use words to imitate words and things to imitate things For Castelvetro the unities were needed in order to aid the dramatist's deception of the audience. He himself was able to defend the use of verse in drama on the ground that it did not destroy illusion. In the theatre it is necessary for the actors to speak more loudly and with larger gestures than in common life; but in common life in that age it was usual to speak verse in much that manner. As a result, Castelvetro argued, verse in drama would sound quite natural. Part of the controversy between Dryden and Sir Robert Howard over the use of rhyme arose as a result of the acceptance of Castelvetro's thesis by Howard. Where Dryden insisted that natural nriting meant good writing by literary standards, Howard took it to mean writing which simulated unpremeditated colloquial speech.

As the conception of realism slowly developed, critics began to examine dialogue by the standards of colloquial speech as well as those of good verse and to demand that so far as was possible, motivation and outward behaviour should be more like those of ordinary life. Soliloquy mas accepted as a conventional representation of silent thought, but the thought itself must be such as the person concerned might have in the circumstances. So long as it did not seem possible to create naturalistic illusion on the stage in practice, critical pronouncements did not change very much in the actual drama, a point which Samuel Johnson understood when he said that in truth the audience always knew that it was in the theatre. But with technical and scientific advances in the 19th century, it began to seem possible really to put theory into practice and create a consistently naturalistic imitation on the stage. At the same time changes of thinking and of society led to the attitudes of mind that saw in the new techniques the truly dramatic may of showing the age to itself. Now it seemed that the true dramatic way was to give a realistic imitation of life as it is seen and heard outside the theatre, with human beings motivated in the way in which, according to contemporary thinking, human behaviour is motivated, in a world operating according to the laws which such writers as Zola were convinced were the controlling forces in the real world. In this drama there was no room for verse, soliloquy, aside, or obviously theatrical acting or playwriting. Instead of concerning itself in tragedy mith the heroes of the past it treated ordinary men and women, mostly of the middle classes, but in some cases belonging to the workers and the outcasts from society.

21. The Reaction to Realistic Drama: 19th **and** 20th **Cen-**

turies.—During the 19th century it had seemed impossible for dramatists to treat problems and themes of any real significance to their contemporaries except by increasingly realistic means, until by the 1890s with the culmination of this movement in naturalism verse drama had been discredited. Nevertheless, verse dramatists soon learned that "poetry" was no excuse for slovenliness, triviality or a nostalgic attempt to evade issues of importance in their own time. In the 20th century there have been three main trends: first the immediate poetic reaction, next the kind of unnaturalistic drama associated with Expressionism; and all the time many dramatists continued writing naturalistically and successfully. The avowed rejection of naturalism as sordid and unpoetic was seen in Germany in Hugo von Hoffmansthal's *Gestern* (1891) followed by his verse plays on classical themes. Ludwig Fulda with *Der Talisman* (1893), Wilhelm von Scholz, Karl Gustav Vollmoeller, Edward Stucken and Paul Ernst took part in this reaction, which also affected Hauptmann *(Hanneles Himmelfahrt,* 1893; *Die versunkene Glocke,* 1897; *Der arme Heinrich,* 1902) and Hermann Siidermann *(Die drei Reiherfedern,* 1899). Symbolism, unnaturalistic prose and verse were used for medieval and religious themes elsewhere by the Belgian Maurice Maeterlinck, in France by Paul Claudel and Henri Ghéon, with Villiers de l'Isle-Adam's *Axel* (written 1874, produced 1894). The romantic verse dramas of Edmond Rostand reacted from naturalism, too.

In Russia the reaction came in the symbolism of Leonid Andreev and of Fedor Sologub and the poetic drama of Aleksandr Blok. In Spain the plays of Federico Garcia Lorca have a fierce poetic strength. Jacinte Benavente refused to conform to naturalism, as did the Italians Giovanni Verga, Girolamo Rovetta, Giuseppe Giacosa, Sem Benelli, E. L. Morselli and, towering above them, Gabriel d'Annunzio. In England attempts to create a living poetic drama in verse were made by Stephen Philips, Lascelles Abercrombie, John Drinkwater and, later, by Stephen Spender, W. H. Auden and Christopher Isherwood, Christopher Fry and T. S. Eliot. In Ireland J. M. Synge seemed to be finding a way with more success than W. B. Yeats in reaching a large audience. Maxwell Anderson and Archibald MacLeish have written verse drama in the United States. One element in the turning from naturalism is shown in a willingness to imitate medieval and early Renaissance forms, by Hoffmansthal in *Jedermann* (1911, from *Everyman)* and by Eliot in *Murder in the Cathedral* (1935). Yeats and Gordon Bottomley similarly experimented on the model of the Japanese Nō-plays.

Expressionism, the other kind of reaction away from naturalism. is foreshadowed in the plays which Strindberg wrote after 1399 and in the work of Frank Wedekind, Naturalism was related to the conception of reality derived from 19th-century scientific thought. Expressionism and allied kinds derive from the more complex conception which developed with further scientific development, in which new studies of the mind played a great part. The Expressionists proper scorned consistent naturalism and its attempt at illusion: instead, outer form was subordinated to expressing inner reality by the German writers Karl Sternheim, Georg Kaiser, Ernst Toller, Reinhard Sorge, Walter Hasenclever, Reinhard Goering and Fritz von Unruh. To this drama is related the "epic theatre" of Bertolt Brecht, who also used Chinese and Japanese techniques. Expressionism showed itself in the Czech writer Karel Čapek, in Russia in Vladimir Mayakovski and the directors Vsevolod Meyerhold and Aleksandr Tairov, as in the German Erwin Piscator. In the United States it affected Elmer Rice, Thornton Wilder and Tennessee Williams, who have a vitality and talent which are never negligible and often impressive. In England it was seen to some extent in Stephen Spender, Auden and Isherwood, Anne Ridler and Ronald Duncan and in Eliot's *Murder in the Cathedral;* it also tinged the later work of Sean O'Casey. Similar to Expressionism in superficial techniques were French Surrealists and the Italian Grotteschi.

There have been a number of dramatists in the 20th century who without being restricted to any "movement" make use of any techniques which achieve the most complete imaginative expression of their individual aims. Such in France are Henri Lavedan, Jean Giraudoux, Jean Cocteau, Jean Paul Sartre, André Obey; in Switzerland Friedrich Diirrenmatt; in the United States Eugene O'Neill and Arthur Miller; in Italy Luigi Pirandello and Ugo Betti; and in Britain James Bridie and J. B. Priestley.

Naturalism has persisted throughout the 20th century, notably in Maksim Gorki, whose *Na dne* (1902; Eng. trans. *The Lower Depths)* anticipated in theme and technique much written in the 1950s and 1960s by dramatists such as Samuel Beckett, Eugène Ionesco and the English writers of the "kitchen-sink" school (*e.g.,* Arnold Wesker), whose themes and techniques especially resemble those of the German naturalists. In the U.S. little of worth was written until the early 20th century, when European naturalism dominated such writers as W. V. Moody and E. Sheldon. More specifically American and individual is the realism of Sydney Howard and Robert E. Sherwood. It is responsible for the methods of the comedies of manners of Somerset Maugham in England, for the satire and realistic intensity of Carl Zuckmayer in Germany, for the political and religious appeals of Kaj Munk in Denmark. In Ireland it helped to produce the group of dramatists associated with the Abbey theatre, in particular determining the style and aim of the early work of O'Casey. Nevertheless, the Irish dramatic movement was not only nationalistic, it was also a reaction against naturalism in theme and technique. Dominated by W. B. Yeats and Lady Gregory, these dramatists aimed at a serious and valid contemplation of life beyond the themes and techniques of the naturalists, concentrating on form and attempting to vary technique to suit the needs of the individual theme. Here, perhaps, is the fundamental explanation for O'Casey's later styles.

DRAMATIC CRITICISM extends from dramatic theory on the one hand to reviews of theatrical performances on the other; however, certain periodical essayists and journalists have written descriptions and discussions of the drama of their day which are of lasting interest and have strongly influenced dramatic theorists and even dramatists. By the 20th century a "drama critic" meant in normal speech a journalist on the staff of a periodical who wrote reviews of stage plays and whose views might or might not be worth noting. Some of these critics merely evaluated a play and a performance in general or possibly in "box-office" terms for the guidance of their readers, while others tried to go further and judged the work and the production by the highest standards.

The earliest theorist of the drama was Aristotle (*q.v.*), whose *Poetics* (*c.* 325 B.C.) laid down, miraculously for its time, the basis of all dramatic theory. His definition of tragedy as "an imitation of an action that is serious: complete and of a certain magnitude . . . in the form of action, not of narrative; through pity and fear affecting the proper purgation (*katharsis*) of these emotions" lies behind all subsequent discussions. The *Tractatus Coislinianus,* a 10th-century manuscript conjecturally related to Aristotle and first printed in 1839 (*see* Lane Cooper, *An Aristotelian Theory of Comedy,* 1924), gives an analysis of comedy that can be supported from Aristophanes, Shakespeare and Molikre. Ancient dramatic criticism in action may be seen at its most amusing in *The Frogs* by Aristophanes (*q.v.*). Roman theory is represented by the *Ars poetica* (*c.* 10 B.C.) of Horace (*q.v.*), a clever and superficial work suggesting that "good sense," entertainment combined with instruction and a five-act division were the road to success. In the middle ages theory was concerned mainly with the still popular formal distinction between tragedy with its unhappy ending and comedy with its happy ending. Dante calls his poem *a Comedy* because "in its beginning it is horrible and foul, because it is Hell; in its ending, fortunate, desirable and joyful, because it is Paradise."

First Horace and then—when his work became accessible—Aristotle formed the basis of Renaissance criticism and ultimately of modern theory. The rediscovery of Aristotle's *Poetics* gave a new and fierce life to the discussion of dramatic theory and practice. A Latin translation by Giorgio Valla appeared in 1498, the Aldine *editio princeps* of the Greek text in 1508, Francesco Robertelli's critical edition in 1548 and an Italian translation (the first in any modern tongue) in 1549. Aristotle's cryptic lecture notes needed clarifying and most commentators loyally interpreted, altered and expanded in accordance with contemporary theatrical conditions. Plays were composed on Aristotelian principles. Ludovico Castelvetro (1505–71) was the powerful and individual founder of the Renaissance neoclassical doctrine, which survived until the romantic movements of the mid-18th century. In his commentary *La Poetica di Aristotile vulgarizzata* (1570) he insisted that plays must be acted and not read; that tragedy is concerned with kings and public characters and comedy with low and private people; that tragedy might have either a happy or miserable end, as well as comedy; and in so doing he looked back, unwittingly, to Plato's concluding comment in his *Symposium* "that the genius of comedy was the same with that of tragedy." His farthest-reaching contribution was the formulation of the doctrine of the three unities. Aristotle has only the unity of action and a part of that of time. Castelvetro gave definite shape to the unities of action, time and place.

The Age of Shakespeare.—On the threshold of the great national dramas of England and Spain, Renaissance theory was epitomized in Sir Philip Sidney's *Defence of Poesie* (1595) and in part 1, ch. xlviii of Cervantes' *Don Quixote* (1605). But the world of practice became insistent and Shakespeare's point of view in England was matched by Lope de Vega's *El Arte Nuevo de hacer comédias* ("The New Art of Writing Plays," 1609), in which, on the experience gained from writing 483 plays, he put forward the first classic of box-office criticism; "Since the crowd pays for the comedies, it is fitting to talk foolishly to it to satisfy its taste; give plenty of variety, let women wear men's costumes, keep up the suspense and mystery to the last scene and don't bore your audience with pregnant silences." There is surprisingly little new criticism in the Elizabethans. Ben Jonson's (in *The Discoveries,* 1640) is largely secondhand and Shakespeare's advice on acting (see *Hamlet,* Act III, scene ii), bold and vivid as it is, has Italian forerunners.

The 17th Century.— With the 17th century, the age of criticism. important changes occurred. In France, Jean Chapelain, the abbé D'Aubignac, Jean Racine and above all Pierre Corneille (*qq.v.*) contributed to serious theory. Corneille, in his *Discours* and *Examens* of 1660, for which he claimed "50 years of practical experience of the theatre," took up the problems of decorum, verisimilitude and the three unities, which had already occupied Castelvetro, and gave them new and live interpretation. It was Corneille's alertness of mind, and not his point of view, that dramatists should try to please according to the rules, that stimulated John Dryden (*q.v.*) to write his essay Of *Dramatick Poesie* (1668) and his prefaces modeled after Corneille's *Examens.* Dryden, as befits an individual Englishman, was torn between the formalist or "good sense" view continued by Boileau and René Rapin in France and by Milton and Thomas Rymer (*qq.v.*) in England, and the saner view based on practice, of which he was perhaps the only representative. His views on tragicomedy and on character drawing: by giving chapter and verse, laid the foundation of modern criticism in England, and his definition of action foreshadowed something of Ibsen's attitude. For comedy, Molikre in his scanty utterances and William Congreve in his letter *Concerning Humour in Comedy* (1696) express urbanely what can be more robustly gathered from their works.

The 18th **and** 19th Centuries.— With the decline of drama, adjacent criticism, largely of morals and of theatrical art, became more insistent. Jeremy Collier's *Immorality and Profaneness of the Englislz Stage* (1698) is an important landmark, and Colley Cibber's *Apology* (1740) contains some of the earliest and finest

descriptions of acting. The 17th century was the age of fashionable baroque theatre, the 18th the age of great or much-applauded actors. Diderot's Paradoxe sur le *comédien* (1773–78; publ. 1830) and G. C. I'chtenberg's descriptions of David Garrick in his accounts of visits to England (see Lichtenberg's Visits to England, ed. by M. L. Mare and W. H. Quarrell. 1938) not only exemplify the interest in acting, but, together with G. E. Lessing's *Hamburgische* Dramaturgie (1767–68), give proof of the growing international interest already shown by Saint-'Ovremond and Voltaire. The chief contributions of the 18th century are the flood of Shakespearean criticism and the spread of the theatrical periodical. In Germany alone 133 periodicals have been traced between the Hamburgische Dramaturgie and the end of the 18th century. Lessing, leaning heavily on English example, did much to overthrow French post-Cartesian standards in favour of Shakespearean grandeur and liberty.

The romantic rejection of neoclassical dogma in favour of a misty and grandiose Nature and a grotesque medievalism gave a new dignity to the emotions and their representation. Lessing, Diderot and A. W. and F. von Schlegel (*qq.v.*) on the continent and in England Samuel Johnson (in one outburst against the unities), Lamb, Hazlitt and above all Coleridge (*qq.v.*) expressed, more or less ripely, the doctrines of the individual, and from their utterances emerged principles which unfortunately were not exemplified in the new drama. The chief result of this activity was the new conception of Hamlet as an amalgam of Byron, Prometheus and Werther. In France alone, with the theory and practice of Victor Hugo (prefaces to Cromwell, 1827, and *Hernani,* 1830), was there a satisfactory romantic drama.

The 19th century was dominated by the "well-made play" of Eugène Scribe and Victorien Sardou (*qq.v.*), and Francisque Sarcey was its critical prophet. His Essai d'une *esthétique* de *théâtre* (1876) discusses the principles by which, for the average audience, reality is replaced by illusion. The newer schools of naturalism and realism endeavoured to restore reality to the theatre. and criticism followed in their wake. Émile Zola wrote much on the theatre and wished his characters to live rather than perform. Ferdinand Brunetière's La Loi du *théâtre* (1894) introduced a new topic of discussion: "In drama or farce what we ask of the theatre is the spectacle of a will striving towards a goal and conscious of the means which it employs."

In Germany Friedrich Hebbel and Gustav Freytag (*qq.v.*) contributed to non-European movements. Ibsen's practice rendered theory unnecessary. The best comments for English readers can be found in C. E. Montague's Dramatic Values (1911) and the prefaces and other writings of Bernard Shaw. Expressionism had yet to find its critic. Its theory may be sought in Nietzsche's Die Geburt der Tragodie (1872; Eng. trans. The Birth of Tragedy, 1909) and in the writings of August Strindberg and Frank Wedekind (*qq.v.*).

The 20th Century.—A remarkable contribution of the early 20th century was the advance in Shakespearean criticism. The pioneer in the 19th century was Coleridge, but nothing really important followed until A. C. Bradley's Shakespearean Tragedy (1904), a penetrating analysis of character and its dramatic significance. It held the field until the emergence of the new criticism based on practical knowledge of the theatre, with its insistence on the function and importance of the "producer," a concept which crystallized about 1889. The pioneer productions of William Poel in the Elizabethan manner influenced the practice of Harley Granville-Barker (*q.v.*) at the Savoy theatre (1912–14), and from their practice emerged Granville-Barker's brilliant series of Prefaces to Shakespeare (1927–47). (See also SHAKESPEARE, WILLIAM: Literary Criticism). Gordon Craig's *The* Art of the Theatre (1905) and Towards a New Theatre (1913) directly affected Max Rheinhardt's Deutsches Theater in Germany, Konstantin Stanislavski's Moscow Art Theatre (*q.v.*) in the U.S.S.R. and Jacques Copeau's Vieux Colombier in France, and influenced the English theatre through the work of Copeau's pupil, Michel St. Denis, for the Compagnie des Quinze and the Old Vic. From the U.S.S.R. the psychological theories of acting and production held by Stanislavski (*q.v.*) radiated throughout the world and particularly influenced the serious theatre of the U.S. (see ACTING, DIRECTION AND PRODUCTION). The directors Vsevolod Meyerhold (*q.v.*), who had been a pupil of Stanislavski, and Aleksandr Taïrov (1885–), of the Moscow Kamerny theatre, did not adhere to the principle of "inner realism" taught by Stanislavski and both worked for a nonrealistic theatre, advocating in writings and through productions a highly stylized kind of drama (see THEATRE).

In the 1920s the German Communist playwright Bertolt Brecht (*q.v.*), an admirer of Meyerhold, evolved a non-Aristotelian theory of drama. Drama, as he saw it, "epic drama," should appeal "less to the feelings than to the spectator's reason. . . Instead of sharing an experience the spectator comes to grips with things. At the same time it would be quite wrong to try and deny emotion to this kind of theatre" (translated from a newspaper article by Brecht, 1927, in J. Willett's The Theatre of Bertolt Brecht, Methuen, 1959). Brecht developed the idea of "epic" as opposed to "dramatic" theatre. particularly emphasizing the importance of "distancing" the audience from the play and preventing them from identifying themselves with the characters on the stage, in his critical writings (especially "Kleines Organon für das Theater" from *Schriften* zum Theater, 1957), in his own plays and through his work as director of the Berliner Ensemble (1949–56), a company who acted in the German Democratic Republic and in the 1960s, led by Brecht's widow, Helene Weigel, continued to work on the lines he had laid down.

A new element in criticism emerged from the French theatre in the plays and theories of Jean Cocteau, J. P. Sartre and Albert Camus, a new concept of dramatic myth embodied in prose recreations of Greek drama. The re-emergence of poetic drama also produced searching explorations of the fundamentals of poetic drama in the writings of T. S. Eliot, culminating in his Poetry and Drama (1951). and in Francis Fergusson's comprehensive and profound The Idea of a Theater (1949). Allied to this movement was the critical approach to Shakespeare which laid special emphasis on the dramatic function of poetic imagery, leading to W. H. Clemen's Shakespeare's *Bilder* (1936; rev. and trans. as The Development of Shakespeare's *Imagery,* 1951) and Caroline Spurgeon's Shakespeare's Imagery (1935).

A new dimension was added to dramatic criticism by the advance in the art of the cinema, and, particularly in the U.S.S.R., the critical writings of S. M. Eisenstein (*q.v.*), translated into English as The Film Sense (1948) and Film Form (1951), deepened and enriched the criticism of the theatre.

In the U.S. and Great Britain the drama critics working for daily newspapers and weekly magazines became increasingly important in the early 20th century. Among those who helped to familiarize the public with the new dramatists of the period were Brooks Atkinson, John Mason Brown, George Jean Nathan and Alexander Woollcott in the U.S., and in Britain James Agate. T. C. Worsley, Ivor Brown, Harold Hobson, Desmond MacCarthy, Laurence Kitchin and Kenneth Tynan. Many of them also wrote books and published collections of critical essays, but their most important work was done in their daily or weekly commentaries on the plays of the day and in their attempts to evaluate them in the light of their own conception of what was most lasting in the dramatic critical theory of both past and present.

DRAMMEN, a town in the county of Buskerud, southern Norway! is situated 32 km. (20 mi.) S.W. of Oslo at the junction of the Dramselv with the Drammen fjord. the western branch of the Oslo fjord. Pop. (1959 est.) 30,657. The town is divided by the river into two sections, Bragernes on the north side and Stromso and Tangen on the south. In Bragernes is the market place with the town hall, fire station and church. The Drammen museum is in Stromso. Drammen is an important road and railway junction and centre for one of the richest forest districts of Norway. Along the banks of the Dramselv are many buildings of the Norwegian wood pulp, cellulose and paper industries, whose products comprise the town's leading exports. The town also has several engineering works. Bragernes and Stromso were given common town privileges in 1715. In 1811 they were united into a municipal town called Drammen. During World War II Drammen was in German hands from April 1940 until May 1945. (J. SD.)

DRAMMEN RIVER (DRAMSELV), a river in Norway, rises in the Hallingskarv mountains as Hallingdal river and empties into Drammen fjord at the town of Drammen southwest of Oslo 192 mi. from its source. The name Drammen river refers only to the lowest 5 mi. of the river, but is also used about the whole river system draining into this. Its catchment area of 6,603 sq.mi. extends to the central mountain region of the country and contains wide forested districts with the lakes Randsfjord, Sperillen, Tyrifjord and Krøderen. During the last 25 pears of the 19th century the water power of these rivers below the lakes was exploited for manufacturing industry along the river banks. After World War II, large hydroelectric power plants were installed in the upper parts of the river basin, especially in Hallingdal and Valdres. (L. H. HG.)

DRANCY, a town of Seine *département*, France, lying 6 mi. N.E. by rail of Paris (Gare du Nord). Pop. (1954) 50,599.

It is a dormitory town for Paris and its growth dates from about 1920–21 when, to relieve congestion, intense efforts were made to persuade Parisians to build for themselves in the suburbs. Most of the houses are detached, but the five 14-story blocks of flats built before 1954 are some of the earliest examples in France of vertical development. Since then blocks of 4 to 12 stories have been erected on the few remaining open spaces. There are infant and primary schools, and a *lycée* opened in 1958. Drancy has no significant industries. It is served by road and rail (two stations) and Le Bourget airport is less than $2\frac{1}{2}$ mi. from its centre. The church mas rebuilt after the war of 1870 and a castle, destroyed later, has been reconstructed.

DRAPER, HENRY (1837–1882), U.S. physician and amateur astronomer, who obtained, in 1872, the first stellar spectrogram and, Sept. 30, 1880, the first photograph of a nebula! the Orion. He was born in Prince Edward county, Va., on March 7, 1837. Educated at the Gniversity of the City of New York (later New York university), he was appointed to the medical staff of Bellevue hospital, New York, in 1859 and became dean of the medical faculty of his university in 1866. He was elected a member of the National Academy of Sciences and of the American Philosophical society in 1877, and of the American Academy of Arts and Sciences in 1881. Draper's father, John William Draper, had obtained the first successful photograph of the moon, and the son also made many contributions to the early history of celestial photography. He introduced the silver-on-glass reflector into the United States and was the first to exploit its photographic possibilities. He died in New York, Kov. 20, 1882. (O. J. E.)

DRAPER, LYMAN COPELAND (1815–1891), founder and corresponding secretary (1854–86) of the State Historical Society of Wisconsin; he made the first significant collection of personal, nonofficial historical manuscripts in America. He was born in New York state on Sept. 4, 1815. After studying at Granville (O.) college, Draper began collecting materials, intending to write a book on the pioneers of the old west—the Allegheny region—primarily in the 18th century. He traveled, afoot and on horseback, over Kentucky, Tennessee, Virginia and Missouri, and among his collections were the papers of Daniel Boone and George Rogers Clark. In 1852 he moved to Wisconsin, where he founded the State Historical Society and became its head. Beginning with 50 books. he built a library that contained 110,000 volumes at the time of his retirement in 1886, and the society which he directed became the model for other state societies throughout the country. He collected and edited ten volumes of *Collections* of Wisconsin history, and continued to add to his personal collection, which passed into the hands of the society after his death, Aug. 26, 1891. He served one term (1857–59) as superintendent of public instruction of Wisconsin. In 1881 he published *King's Mountain* and *Its Heroes.*

See W. B. Hesseltine, *Pioneer's Mission: The Story of Lyman Copeland Draper (1954).* (W. B. HE.)

DRAPER, RUTH (1884–1956), U.S. monologist and monodramatist, mas born in New York city Dec. 2, 1884, of a socially prominent family. She began her career by writing sketches about people she knew or had observed and then performing them at parties given in her own home and those of friends. Her only appearance in a full-length play was as the maid in *A Lady's Name* at the Maxine Elliott theatre, New York, May 1, 1916. She made her New York debut as a monologist at the Comedy theatre on Feb. 6, 1917, in a bill of one-acters, one of which, *The Actress,* she herself wrote. Her critical reception was dismal; she received praise only for her own sketch, which confirmed her in the choice of her métier. Her London professional debut in her sketches was made at Aeolian hall, Jan. 29, 1920. From then on she triumphed everywhere in the world until her final performance at the Playhouse in New York city on Dec. 26, 1956. She died in New York city on Dec. 30, 1956. (GE. F.)

DRAUGHTS: *see* CHECKERS.

DRAVA (DRAVE; Ger. DRAU), one of the principal right-bank affluents of the Danube. It rises below the Innichner Eck in the Tirol at an altitude of over 4,000 ft., runs eastward and forms the longest longitudinal valley of the Alps, the Drau Thal. The Drava is 447 mi. long. Near Zákány, Hung., it is joined by the Mura (Mur). The valley of the Drava was the chief road through which the invading peoples of the east such as the Huns and the Slavs penetrated the Alpine countries. The middle Drava flows through Carinthia and Slovenia and in this section there are a number of hydroelectric power stations. At its mouth the Drava attains a breadth of 1,055 ft. and a depth of 20 ft. It is navigable for rafts only from Villach, Aus., and for river steamers from Barcs, Hung., a distance of 65 mi. The principal towns on the Drava and its affluents are Klagenfurt and Graz in Austria and Maribor and Osijek in Yugoslavia. See DANUBE. (H. R. WI.)

DRAVIDIAN, the name applied to the peoples of south and middle India and of those parts of Ceylon where a Dravidian language is spoken. The term is a purely linguistic one, since Dravidian-speaking peoples are of many different racial types. Their origin and early history are obscure, and no specific racial element or prehistoric civilization can be associated with their first appearance in India. The once widely current theory that, previous to the Aryan invasion in the 2nd millennium B.C., Dravidian-speaking peoples also extended over most of northern India and that the indigenous populations mentioned in the Vedic hymns were Dravidians is no longer generally accepted.

As the Dravidian peoples include some of the most highly civilized populations as well as some of the most primitive forest tribes, it is as inappropriate to speak of a specifically Dravidian culture pattern as it is misleading to speak of a Dravidian racial type. Yet, since India's attainment of independence in 1947, a strong feeling of Dravidian nationalism has developed in southern India, and particularly among the Tamils (*q.v.*) of Madras. This has led to an agitation against the introduction of Hindi as the All-India official language, and in its extreme forms even against Vedic Hinduism, which is considered a product of Aryan civilization. The reorganization of political units according to linguistic principles has resulted in the establishment of four predominantly Dravidian-speaking states: Madras, Andhra Pradesh, Mysore and Kerala.

There is no uniform Dravidian religion. Most of the preliterate

Dravidian tribes profess tribal religions centred in the cult of clan ancestors. local deities and such universal goddesses as mother-earth. whereas the higher castes follow the pattern of Brahmanical Hinduism. A characteristic phenomenon is the dichotomy between the cults of the vegetarian Brahmanical gods of northern origin and the indigenous meat-eating deities, who are propitiated with animal sacrifices. The former gods are believed to have consorts. whereas the latter, and particularly the female divinities, are thought to stand alone. Priests of different castes and status minister to these two types of deities, but both are comprised in a universal pantheon, and the two cults are complementary and not antagonistic.

In 1961 the distinction between Dravidian and Aryan languages was a political issue also in Ceylon. where Tamils settled as early as the 11th century A.D. About 000,000 indigenous Tamil-speakers inhabit the northeastern provinces, and nearly 1,000,000, who immigrated more recently from India, provide most of the plantation labour of the hill regions. Small numbers of Dravidian-speaking Indians have settled also in Malaya, east Africa and other overseas territories.

(C. **v.** F.-H.)

DRAVIDIAN LANGUAGES is the name given to a family of about 20 languages, comprising all those spoken in southern India and others in central and north India. It has been estimated that at mid-20th century there were about 90,000,000 speakers. The territory in which they are spoken includes the northern half of Ceylon and extends northward to an irregular line drawn from a point on the Arabian sea about 100 miles below Goa along the Western Ghats as far as Kolhapur, then northeast through Hyderabad, and farther eastward to the Bay of Bengal. Farther to the north, Dravidian languages are spoken by small tribes in hladhya Pradesh and Orissa, and up to the banks of the Ganges in the Rajmahal hills. A Dravidian language is also spoken by the Brahuis of Baluchistan in West Pakistan. *See* also INDIAN LANGUAGES.

Classification. — The Tamil (*q.v.*) language, which has about 28,000,000 speakers, and Malayalam, which has about 14,000,000 speakers, are two dialects of the same language, which is closely related to Kanarese (about 15,000,000 speakers). Toda and Kota lie geographically between these; Toda is closely related to Tamil, and Kota may be also. Kodagu, lying between Malayalam and Kanarese, is an independent language intermediate between them. Tulu (about 800,000 speakers) and Telugu (about 33,000,000 speakers) diverge from the other South Dravidian languages. Five of the small central languages form a closely related group—Kolami, Naiki, Parji, Ollari and Poya Gadaba. The many Gondi dialects and Konda are closely related, and the latter is also related to Kui and the Kuwi dialects. Kui has some features which relate it closely to Telugu, but in other respects it is one of the most archaic languages of the family. Kurukh and hlalto are closely related to each other, and Brahui shows some features relating it to these. The position of Brahui, however, is difficult to determine accurately since its vocabulary has been swamped by Iranian loanwords from Baluchi and even Persian.

The Dravidian languages form an isolated group, and no connection with any other family of languages has been established. Such attempts have been made especially with the Ural-Altaic languages, but the arguments adduced have not proved convincing.

Literature. — Tamil, Malayalam, Kanarese and Telugu are the four literary languages. Tamil literature begins at least as early as the beginning of the Christian era; the others are somewhat later. Even the oldest Dravidian literature is largely indebted to Sanskrit models. The oldest datable specimens of a Dravidian language are the Tamil inscriptions scratched on shards found at Arikamedu near Pondicherry and belonging to the second quarter of the 1st century A.D. These languages are written in alphabets that are ultimately derived from those used in north India, such as Devanagari. They have, however; been much modified and are not now recognizable as related to the northern alphabets. There are three chief alphabets now used: one for Tamil, one for Malayalam and one, with two slightly different variants, for Telugu and Kanarese. Early documents show an even greater number of distinct forms. A Dravidian language may have been spoken by the people of the prehistoric Indus valley culture, but this is no more than a guess.

The Dravidian languages are gradually losing ground in the center and north, where they meet with Indo-Aryan dialects. This process has been going on for millenniums, and all the Dravidian languages in fact have borrowed many Indo-Aryan words. It is possible, however, also to trace a Dravidian element in the Indo-Aryan languages of north India, even as early as Sanskrit.

Main Features. — The Dravidian languages in general are distinguished from those of most other families by the large number of sounds formed in the front of the mouth. All of them have dentals (*e.g.,* *t* and *d*), formed by the tip of the tongue against the back of the upper teeth, contrasting with retroflexes (*e.g.,* *ṭ* and *ḍ*), formed by the tip of the tongue curled back against the centre of the hard palate. The southernmost languages also have alveolars (*e.g.,* *t̲* and *d̲* which are made like English *t* and d with the tip of the tongue against the upper gums. These distinctions extend to nasals. liquids and trills. The threefold contrast was found in proto-Dravidian. and most of the languages of the family have identifiable descendants of the contrasting sounds.

In the literary languages the structure of syllables is very simple. Few groups of consonants are found; these are of a limited number of types, and in some of the languages no consonants ever come at the ends of words. Typical is Tamil *avan* "he." which in Kanarese is *avanu;* in Telugu an originally longer form *avantu,* because of metathesis of the initial vowel and consonant, became *vāṇḍu.* (Dravidian words in this article have been transcribed in letters of the English alphabet supplemented by additional characters of the International Phonetic alphabet.) This simple structure seems to have been typical of proto-Dravidian. In most of the languages. however. many of the vowels in all but initial syllables have been lost, and long consonant clusters result. Thus Tamil *avan* is represented in Kota by *avn,* and the longer form *avantu* became in Naiki *avnd,* whence Kolami amd and Parji *ōd;* Tamil *avanukku* "to him" is represented in Kota by *avnk* and in Parji by *ōnug.* Extreme examples appear in Kota and Toda; *e.g.,* Toda *wïθfyk* "for aid" is derived from an earlier *utavikku.* It would not, however. be difficult to find parallels in colloquial Tamil.

All the languages have a considerable inflectional and derivational apparatus consisting of suffixes. Nouns (including pronouns), adjectives and verbs are well differentiated by both their sets of suffixes and their syntax. There is also a highly developed fourth word class which may be called onomatopoeic. It frequently involves complete reduplication, and it has a peculiar syntax; *e.g.,* Telugu *pakapaka* "suddenly bursting out laughing," *garagara* "clean, neat, nice."

Nouns have cases and two numbers, singular and plural; *e.g.,* Tamil *maram* "tree." *marattukku* "to a tree," *marangaḷ* "trees." *marangaḷukku* "to trees." The genitive case, which precedes the governing noun, sometimes is formed by a suffix, but sometimes is merely the stem; *e.g.,* Tamil *mara-ppaṭṭai* "bark of a tree." The last type of construction is the basis of innumerable compounds.

In some of the languages, *e.g.,* classical Tamil and Kanarese and modern Telugu, nouns combine with personal inflections that are identical with or like those found in the verbs, and thereby form sentences; *e.g.,* Kui *ānu kũentenu* "I am a Kui," *āmu kũinganamu* "we are Kuis."

Persona! pronouns are similar to nouns in their inflection, but show much irregularity; *e.g.,* Toda *On* "I." *enk* "to me." The plural of the first person usually has one form including and another form excluding the person addressed; *e.g.,* Toda *om* "we (including you):" *em* "we (not including you)."

Demonstrative and interrogative pronouns in most of the languages have a gender system. This is generally based on a distinction between male persons, female persons and everything else (nonpersons). The languages differ in the combinations between

these and the two numbers. Tamil, Malayalam, Kanarese and Tulu have forms for a male person, a female person, a nonperson, persons and nonpersons; *e.g.*, Tamil *avaṉ* "that man," *avaḷ* "that woman," *atu* "that animal or thing," *avar* "those persons." *avai* "those animals or things." In Gondi, Kui and the group that includes Kolami, there are forms for a male person, male persons, a singular denoting anything but a male person and a plural denoting anything but male persons. In Telugu and Kurukh there is a skew type of system in which the forms denote a male person, a female person or a nonperson, persons and nonpersons. Toda and Brahui have lost all gender distinctions and have only a singular and a plural form in these pronouns. Verbs very commonly have third person forms agreeing in gender and number with the pronouns.

Verbs show agreement in person and number with the subject, whether it is a noun or pronoun. They are marked by a rather simple system of combined tenses and modalities. In addition, there are negative paradigms. The languages differ considerably in their systems of simple paradigms. Kota has past indicative: nonpast indicative, potential ("I may go"), irrealis ("I would have gone"), future, argumentative ("he went. as I must remind you"). voluntative ("I want to go," "I want you to go"). negative indicative, imperative, prohibitive. Negatives corresponding to the other Kota modes. and many other forms, both positive and negative, are periphrastic syntactic phrases.

All the languages have voice systems in the derivation of verb stems. The commonest type is a system with intransitive versus transitive. and a causative for each of these; *e.g.*, "it broke," "I broke it," "I caused it to or let it break," "I caused someone else to break it."

Kui has a more complicated verb structure than any other language in the family. Derivational suffixes are found in the verb when it has a first or second personal pronoun as direct or indirect object; *e.g.*, *sī-mu* "give (it to him)!," *sī-a-mu* "give (it to me)!" A complex set of derivational suffixes denotes plural action; *i.e.*, action on a number of things or on one thing many times. There are indications that these two features belonged to proto-Dravidian.

In most of the languages, each of the tense-modalities of the verb has beside it an adjective form. The verb form generally ends the sentence or predication: when a predication ends in an adjectival form of a verb. it precedes a noun and qualifies it like a simple adjective. Thus in Telugu *mīru nāku iccina pustakamu* "the book that you gave to me," the first three words are "you to-me gave" and *iccina* "gave" is in an adjectival form, the whole phrase qualifying *pustakamu* "book." This construction translates English clauses with relative pronouns.

The Dravidian languages have many roots which when provided with one set of inflectional suffixes are nouns, with another set verbs; *e.g.*, Tamil *keṭu* with intransitive voice conjugation is "to perish." with transitive voice conjugation "to destroy," with noun inflection "peril." Derivational forms added to these make a very complex picture; *e.g.*, Tamil *peru* "great" or "to grow great or numerous." *peru-ku* "to be increased, multiply, prosper," *peru-kku* "to make to increase." *peru-kk-am* "abundance, prosperity," *peru-pp-am* 'bigness," *peru-pp-i* "to magnify."

DRAWING (TECHNIQUES OF). Drawing is the presentation by chiefly linear means of an object, person, landscape, symbol, emotion. idea or scheme. A drawing is often preparatory to further work on a larger scale, but may exist for its own sake. One may draw with a stylus, pen, pencil, brush. crayon, needle, chisel or almost any line-producing object on paper. cloth. ?archment, wood, stone, metal or pottery; making lines with a stick on a sandy beach, incising with an awl in walrus ivory or scratching with a diamond on window glass is drawing in a broad sense. The lines may have colour and other colours may be accessory to drawing in the form of wash or pastel, but mainly drawing is thought of as being done with writing materials and being akin to writing; in its coloured varieties it approaches painting. from which it differs most in not covering the support or ground completely; in its three-dimensional varieties, such as engraving, it approaches sculpture.

HISTORY

Artists. and laymen with a temporary artistic or expository intention, have been drawing in some form since the dawn of man; if potmaking is the oldest and most widespread useful art, drawing is its "nonuseful" coeval. Drawing's image-making function as an instrument of magic-religion made it efficacious to primitive man: the cave paintings of France and Spain are largely drawing, and so are more recent Bushman and American Indian rock pictographs. In the orient where, until 19th- and 20th-century westernization. almost all writing was done with a brush, drawing merged into painting. and both were a form of calligraphy. Almost the only oriental examples of drawing in the western sense (as different from painting) were preparations for woodcuts or perhaps for decoration of ceramics.

Western drawing rose when paper began to be fairly common early in the 15th century. Before that. both writing and drawing were "drafted" on wax tablets, chalked boards or other erasable surfaces; manuscript illuminations were prepared by drawing on the spot. and the preliminary drawing was usually completely hidden under colour and gold; a few manuscripts were illustrated with uncoloured drawings.

Cheaper paper made it possible to work out designs in many trial forms for comparison before deciding permanent execution. It was not at first realized that rag paper was almost as stable a material as parchment; and many artists who used paper for trial work might keep a permanent stock book on parchment; but one of the surviving pattern books of Jacopo Bellini (Venetian, *c.* 1400–*c.* 1470) is on parchment, the other on paper. Such *simile* (semipermanent pattern) sheets were a pre-Renaissance studio property.

With the Renaissance grew a more individualistic but widely accepted practice of preparing almost all artistic commissions by stages of drawing as follows: (1) sketches, normally made with the pen, for a whole composition; (2) studies of detail, normally drawn with such a broad medium as black chalk, figures being frequently studied as nudes. and costume studied on further sheets of paper; (3) a definitive scale plan called a *modello* which was a part of the contract between artist and buyer. as a blueprint is part of the contract between builder and householder; (4) a full-sized pattern or cartoon, to be transferred to the panel. canvas or wall by various means, most of which resulted in the cartoon being torn to bits when it was removed.

To these must be added the notebook of private observations, which in the 15th century and occasionally thereafter was drawn with silverpoint on leaves prepared with a (sometimes tinted) ground; the copy. usually in pen and often reversed, by which a print maker prepared to reproduce a painting or sculpture; the portrait or landscape made for its own sake and for sale, often in mixed technique; exercises such as life-class nudes which were means to an unspecified end; and architects' designs and drawings for photomechanical reproduction. Print makers' drawings may sometimes be recognized by left-handed action; studies often are found squared for enlargement.

From about 1500 wash was more and more used with pen and ink; while red chalk and blue paper, together with the white high lights which had already been used with silverpoint on tinted grounds, brought in a range of colour as well as strong suggestions of relief or depth. The workshop practice mentioned above broke down in the 19th century; the 20th has seen a growth of drawing independent of painting or sculpture, and of novel techniques.

Of artists whose drawings are numerous enough to allow just appraisal. Antonio Pisanello (c. 1395–*c.* 1455) was one of the first, a laborious observer, with pen and silverpoint. of men and animals. Leonardo da Vinci explored landscape. floral and human

SKELETON DRAWN AND ENGRAVED BY JAN WANDELAAR IN 1747 FOR TABULA SCELETI ET MUSCULORUM CORPORIS HUMANI BY B. S. ALBINUS

anatomy and meteorology in drawings more numerous than his designs for pictures or his diagramed inventions. Also in the 15th and 16th centuries, Albrecht Diirer, first northerner to fuse his native art with that of Italy, was one of the most prolific and most purely graphic of artists. The younger Hans Holbein left a body of portraits. many drawn with the help of a glass plate and net, which influenced the Clouets in France among others.

In the 16th century Pieter Brueghel, sensitive landscapist, earthy observer of earthy people, underlay Flemish genre drawing. In the 15th and 16th centuries, Raphael, cool and decorous in drawing as he was noble in painting, diifered vastly from Michelangelo, whose uneasy temper shows in his tortured monumental figure drawings. In the 16th century Tintoretto and his family circle left quantities of rapid-fire figures in chalk—muscular, almost weightless. In the 16th and 17th centuries Peter Paul Rubens, drawing often with the brush (sometimes in oil colour on panel), also made searching chalk studies, while Sir Anthony van Dyck in the 17th century made northern baroque splendour sensitive with his pen compositions. Their Dutch neighbour Rembrandt was grand in conception, intimate and human in execution. his abrupt pen simplifications warmed by the brush and wash. Nicolas Poussin (1594–166j), an adult Raphael, drew monumentally but hastily for his own use only. while Claude Lorrain (1600–82) created thousands of tender or majestic landscapes, some for immediate sale. Antoine Watteau (1684–1721), starting from a Rubenslike base, led off the French 18th century with his bittersweet, flickering figures in red, black and white chalk, often on blue or tan paper. Giovanni Battista Tiepolo (1692–1769) lighted his soaring compositions and godlike beings with sunlit nash, and this luminosity was taken from Venice to France by Jean Honoré Fragonard (1732–1806) for his genre and landscape Francesco Guardi (1712–93) was enough younger to profit in his nervous urban seascapes by knowledge of both Watteau and Tiepolo. Canaletto (1697–1768) made endless half-fantastic Venetian views in brown pen lines and cool wash, often for direct sale.

In the 18th and 19th centuries Francisco Goya (1746–1828) used the etching needle as his chief drawing instrument but his brush dranings were stenographically tremendous. Thomas Rowlandson (1756–1827), great comic journalist, was prolific in coloured pen line and water colour. In the 19th century J. A D. Ingres (1780–1867), classicist and classic of pencil draftsmen, became in his late years almost as romantic as Eugène Delacroix (1798–1863), whose volatile line served a strong and colourful inventive faculty. Honoré Daumier (1808–79), in stature closer to Rembrandt than to Rowlandson, put solid bones under his apparently unmethodical niggles. Sir John Everett Millais (1829–96), though his own best time was short, was a Pisano with social opinions, and representative of a great school of illustrators. Edgar Degas (1834–1917) was so knowing of structure that when he was old and nearly blind, having to draw with charcoal and pastel in lines a quarter of an inch broad. he could still articulate a figure to perfection and make his "ugly" subjects elegant. Thomas Eakins (1844–1916) used scientific means in the service of an analytical art. and line in neo-Ingres style Vincent van Gogh (1853–go), using a broad reed pen, overpowered nature. Georges Pierre Seurat (1859–91) made shadows and totems with nonlinear tones and textures. Pablo Picasso (1881–) was the most fertile inventor of his generation in classic pen outline or cubist mass and tone. Paul Klee (1879–1940) was the witty conductor of a "line out for a walk" and maker of new graphic textures. Henry Moore (1898–) used complex almost corrupt, techniques. to draw figures of eternal weight Ben Shahn (1898–) could dran a brick wall emotionally or a dead child without comment, though often with oriental suggestions The lines of Henri Matisse (1869–1954) could be delicate and colour-suggesting or sculptural and sensuous.

(W. A.)

ELEMENTS OF DRAWING

Consideration of drawing here will be confined to the traditional method of drawing which has arisen in western civilization and which has to do with the creation of the illusion of reality. Though the basic elements of this method are simple, it is difficult to communicate them to others by words alone. The principles of drawing cannot be fully grasped until they are experienced through long practice in drawing itself.

Drawing as a Language. — A characteristic of realistic drawing is that ideas are communicated by symbols that give the illusion of three-dimensional form. But doing this is not a simple process. In order to draw a form the artist must be aware that it exists, he must come to an exact conclusion as to its shape, he must come to a decision as to its position in space, he must light it in such a way that it is recognized for what he has in mind. And he must have the skill of hand to render the shape and values he has decided upon.

Before long the beginner will be able to present the conventional symbols for the cube, the cylinder and the sphere. He will soon learn he can give the illusion of any complex form by combining together the simple forms, or parts of the simple forms, of which the complex form is composed.

Context and Juxtaposition. — As soon as the student is able to produce the simple forms he will realize that he has learned the initial words of the visual language. Given the proper context. his simple symbols will express an amazing number of ideas. If he draws a spoon near his cube, the cube will become a lump of sugar; placed on top of a house. the cube becomes a chimney. A wisp of smoke, and his cylinder becomes a cigarette; placed beneath a head it becomes a neck. As for the sphere — a stem and a leaf, and it becomes an apple; placed in the hand of Aphrodite it becomes a golden apple of the Hesperides.

Light. — The artist understands that since light is the creator and destroyer of form, he must be the creator and destroyer of light. He is aware of the sources of light that fall upon a form, of their colour, size and intensity. He is able to regulate these sources, to quench them if he wishes. or to create ne ones. He decides upon the number of lights he will throw upon the form; he is apprehensive if he throws three or more. He places high lights upon the form not nhere he sees them but where he wishes; he does the same with the progression of values that move from these high lights. He knows the difference between colour, shade and cast shadows and knows that cast shadows destroy the form on which they fall.

Line. — By drawing a cube the student may understand some of the significance of line in the creation of the illusion of reality. He will realize then that a line is a symbol for the outer edge of an object, the meeting of planes and the abrupt change of values where planes meet. Line is further used to indicate the abrupt meeting of different colours and to explain the shape of the form over which it moves. **A** line of varying strength will suggest the changing values that lie upon a form. And of course a line is used to symbolize a line. Often a line fulfills a number of the above conditions at once.

Planes. — It is a convenience to the artist to visualize two-dimensional planes on form for the accentuation of values, the creation or alteration of line and the clarification of thrust or direction. As planes can always be thought of as the surface of masses, their functions may be further clarified by a consideration of the artist's conception of mass.

Mass. — An artist is skilled in visualizing complex forms in terms of simple mass. In drawing the figure the student should practice breaking the body down into simple masses — the head as a box, for instance; the neck as a cylinder; the rib cage as an egg; the fingers as cylinders or long boxes. Such a visualization will solve many problems of proportion because proportion is largely a matter of the relationship of masses each to each in a manner suitable to the artist concerned. Further, the thrust or direction of complex forms may thus be more readily felt. It is easy to ascertain the exact position of a head if the details — eyes, mouth, ears, etc. — are forgotten and the head thought of as a simple block.

Most important, values of light and shade conceived to be lying on the masses may be visualized and transferred to the drawing For example, in drawing a straight finger, the artist may conceive the finger as a long box, in his mind throw light and reflected light upon it, visualize the resulting values and transfer these values to his drawing of the finger, thus rejecting the values he may actually see upon the finger itself. Lines, too, are frequently drawn as if over a mass conception rather than over the complex form itself. The line of a ribbon around the complex neck may be but a circle around a cylinder.

Thrust or Direction. — In drawing it is necessary to decide on the exact position of forms in space. For instance; if a form is in motion, since it cannot be drawn in two or more places at once, the artist must decide and seize upon a single phase of the motion. Luckily most action has a repetitive quality with a phase of rest at the beginning and end of the action. The woodsman may be rendered with his ax raised or buried in the wood. In continuous action a random phase is seized, accompanied by such obvious symbols as wind-borne drapery or trailing hair. In figure drawing beginners complain about movement of the model; advanced students have already come to decisions as to the directions of the forms involved.

If lights are fixed, values upon a form will vary as the direction of the form changes. If a door is closed, it will retain the values of the mall upon which it is hinged; if opened, it will become lighter or darker than the wall. If the model is posed with one leg forward and one leg back, the front of the forward leg may well be of lighter value than the other. This circumstance may explain the different values to be placed on bodily forms as these forms change direction each to each.

If it is accepted that a line cannot be drawn until the form over which it is to move has been conceived by the artist, then the line cannot be drawn until the artist has decided upon the direction of the form. For as the direction of the form varies. so will the line vary. At times. in order to present the illusion of the true shape of a form, its direction must be altered; a cube rendered head on gives the illusion of a square plane. In regard to drapery, changing thrusts of shoulders, arms and legs and other parts of the body strongly affect the folds. (R. B. HE.)

Anatomical Drawing. — For the student of anatomy as applied to art the simple drawing is the most effective in learning to construct the human figure. The eye must follow a line or a plane or a mass, which in construction becomes a moving line, a moving plane. a moving mass. But the mental construction must precede the physical, and in this the concept of mass must come first, that of the plane second, that of line last.

Certain laws enter into the functioning of the various organs of the'body, just as pronounced as they are in controlling any other machinery. To the bones, for example, which make up the pressure system, belong the laws of architecture, as in the dome of the head, the arches of the foot, the pillars of the legs, etc.; also the laws of mechanics, such as the hinges of the elbows, the levers of the limbs, etc. Ligaments constitute the retaining or tension system, and express other laws of mechanics. Muscles produce action by their contraction or shortening and are expressed in the laws of dynamics and power, as well as the laws of leverage.

Hand. — In drawing the hand the artist must realize that there is an action and inaction side. When the thumb side is the action side the little finger is the inaction side. The inaction construction line runs straight down the arm to the base of the little finger. The action construction line runs down the arm to the base of the thumb at the wrist; from there out to the middle of the joint, at the widest part of the hand; thence to the knuckle of the first finger: then to that of the second finger. and then joins the inaction line at the little finger. However. with the hand still prone, when it is drawn *from* the body the thumb side becomes the inaction side and is straight with the arm, while the little finger, corresponding previously to the thumb, is at almost right angles with it. The inaction construction line now runs straight to the middle joint of the thumb, while the action line runs to the wrist on the little finger side, thence to the first joint.

Each of the four fingers has three bones. The middle finger is the longest and largest, because in the clasped hand it is opposite the thumb and with it bears the chief burden. The little finger is the smallest and shortest and most freely movable for the opposite reason. The middle joint of each finger is the largest, and, like all the bones of the body, the bones of the finger are narrower in the shaft than at the ends. In the clenched fist it is the end of the bone of the hand that is exposed to make the knuckle. Each of the three joints moves about one right angle except the last, which moves slightly less. The movements of the joints are also limited to one plane, except the lower one, which has also a slight lateral movement, as shown when the fingers are spread.

The centre of all the activities of the fingers, the hand and the forearm is the thumb. The fingers, gathered together, form a corona around its tip. Spread out, they radiate from a common centre at its base; and a line connecting their tips forms a curve whose centre is the same point. This is true of the rows of joints also. The thumb has three joints, and its bones are heavier and its joints more rugged than those of the fingers. It is pyramidal at the base, narrow in the middle, pear-shaped at the end. The ball faces to the front more than sideways. The thumb reaches to the middle joint of the first finger. The last segment bends sharply back, its joint having about one right angle of movement. and only in one plane. The middle segment is square with rounded edges. smaller than the other two, with a small pad. Its joint is also limited to one plane. The basal segment is rounded and bulged on all sides. The joint of its base is a saddle joint, with the free and easy movement of one in a saddle.

Arm. — The forearm has two bones, lying side by side. One. the radius, is large at the wrist and the other, the ulna, is large at the elbow. Diagonally opposite the thumb, on the ulna, is a bump of bone which is the pivot for both the radius and also

the thumb. Muscles must lie above the joint they move, so the muscles that bulge the forearm are mainly the flexors and extensors of the wrist and hand. The flexors and pronators form the inner mass at the elbow, the extensors and supinators form the outer mass.

Both the above masses arise from the condyles of the humerus, which is the bone of the upper arm. The part of the humerus near the shoulder is rounded and enlarged, where it joins the shoulder blade. The lower end is flattened out sideways to give attachment to the ulna and radius, forming the condyles. The shaft itself is straight and nearly round and is entirely covered with muscles except at the condyles.

Shoulder.—The deltoid muscle, triangular in shape, gives form to the shoulder. Just below the base is a ripple which marks the head of the armbone. The masses of the shoulder, arm, forearm and hand do not join directly end to end with each other, but overlap and lie at various angles. They are joined by wedges and wedging movements. Constructing these masses first as blocks, we will have the mass of the shoulder, or deltoid muscle, with its long diameter sloping down and out, leveled off at the end; its broad side facing up and out; its narrow edge straight forward. The mass of the forearm overlaps the end of the arm on the outside by a wedge that rises a third of the way up the arm, reaches a broad apex at the broadest part of the forearm and tapers to the wrist, pointing always to the thumb; and on the inside by a wedge that rises back of the arm and points to the little finger. In the lower half of the forearm, the thin edge of the mass, toward the thumb, is made by a continuation of this wedge from the outside. In the back view of the arm, the mass of the shoulder sits across its top as in the front view.

Neck.—Curving slightly forward, the neck rises from the sloping platform of the shoulders. The strength of the neck is at the back of the head, this portion being somewhat flat and overhung by the base of the skull. The sternomastoid muscles descend from the bony prominences back of the ears to meet almost at the root of the neck, forming a triangle whose base is the canopy of the chin. In this triangle below is the thyroid gland, larger in women, and above it the angular cartilage of the larynx, or Adam's apple, larger in men.

Head.—Both the oval and the cube have been used by artists as a basis for drawing the head, but the cube seems preferable in that the oval is too indefinite and offers no points for comparison, no basis for measurement, and the eye does not fix on any point in a curved line. The block not only carries the sense of mass but provides a ground plan on which any form may be built, as well as its perspective and foreshortening. The element of bilateral symmetry enters the drawing of the head. A vertical line in the centre divides the head or the trunk into parts equal, opposite and complemental. The right eye is the counterpart of the left; the two halves of the nose are symmetrical; the limbs, except for changes of position, are nearly exact though reversed duplicates of each other.

The cranium, the skeleton of the face, and the jaw constitute the masses of the head. Into the rounded mass of the cranium sets the narrower mass of the forehead bounded by the temples at the sides and by the brows below. From the lower outer corners of the forehead the wedge of the cheekbones begins, moves outward and down ard until it just passes the curve of the cranium, then down and in, in a long sweep, to the corner of the chin. The two cheekbones together form the central mass of the face, in the middle of which rises the nose.

The planes of the head are those of the forehead, sloping upward and backward to become the cranium. The sides turn sharply to the plane of the temples. The plane of the face, divided by the nose, is broken on each side by a line from the outer corner of the cheekbone to the centre of the upper lip, making two smaller planes. The outer of these tends to become the plane of the jaw, which is again divided, etc. The relations of these masses and planes is to the molding of a head what architecture is to a house. They vary in proportion with each individual and now must be carefully compared with a mental standard.

Eye.—Below the eyebrow, on the lid, are three planes, wedging into each other at different angles. The first is from the bridge of the nose to the eye. The second is from the brow to the cheekbone. which is again divided into two smaller planes, one sloping toward the root of the nose, the other directed toward and joining with the cheekbone. The lower lid is stable; it is the upper lid that moves. It may be wrinkled and slightly lifted inward, bulging below the inner end of the lid. The cornea is always curtained by the upper lid, in part. The immovable masses of the forehead, nose and cheekbones form a strong setting for the most variant and expressive of the features.

Nose.—The bony part of the nose is a very clear wedge. its ridge only half the length of the nose. The cartilaginous portion is quite flexible, the wings being raised in laughter, dilated in heavy breathing, ndrrowed in distaste, and wings and tips are raised in scorn, wrinkling the skin over the nose.

The ears, the mouth, the lips and the chin, all offer variations in construction, and it is through comparison with others that the art of drawing them can best be acquired.

Trunk.—The upper part of the body is built around a bony cage called the thorax, conical in shape, and flattened in front. The walls of this cage are the ribs, twelve on each side, fastening to the spine behind and to the sternum or breastbone in front. The first seven are called true ribs, the next three false. and the last two floating ribs. The masses of the torso are the chest, the abdomen or pelvis, and between them the epigastrum. the first two comparatively stable, the middle one quite movable. The shoulders are also movable, changing the lines of the first mass and bulging the pectoral muscles, but the mass itself changes little except the slight change in respiration. The mass of the abdomen is even more unchanging.

Torso.—In profile the torso presents three masses: the chest, the waist and the abdomen. The mass of the chest is bounded above by the line of the collarbones; below, by a line following the cartilages of the ribs. This mass is widened by the expansion of the chest in breathing, and the shoulder moves freely over it, carrying the shoulder blade, collarbone and muscles. The back view of the torso presents numerous depressions and prominences, due to its bony structure and the crossing and recrossing of a number of thin layers of muscles. The outside layers manifest themselves only when in action, and for this reason the spine, the shoulder blade, and the hipbone are the landmarks of this region.

Lower Limbs.—The thigh, the leg and the foot constitute the lower limb. The thighbone is the longest and strongest bone of the body, and the mass of the thigh is inclined inward from hip to knee, and is slightly beveled toward the knee from front, back and outside. Below the knee is the shinbone, the ridge of which descends straight down the front of the leg, a sharp edge toward the outside, a flat surface toward the inside, which at the ankle bends in to become the inner anklebone. The outer bone of the foreleg soon overlaid by a gracefully bulging muscular mass, emerges again to become the outer anklebone. Two large muscles form the mass on the back of the leg.

Foot.—In action, the foot comes almost into straight line with the leg, but when settling upon the ground it bends to keep flat with the ground. A series of arches form the symmetry of the foot, the function of these arches being that of weight-bearing. The five arches of the foot converge on the heel, the toes being flying buttresses to them. The balls of the foot form a transverse arch. The inner arches of the foot are successively higher, forming half of a transverse arch whose completion is in the opposite foot. (E. C. BR.; G. B. BR.)

DRAWING, ENGINEERING, is the means of communicating the ideas of the engineer, designer or architect to the workmen who must produce a machine part, for example. or to a builder who erects a structure. With the increasing complexity of modern mechanical equipment and structures! it is necessary that the engineer. architect and draftsman have a thorough understanding of the geometric principles of orthographic projection upon which engineering drawing is based. The teaching of technical drawing in schools and colleges has tended strongly, therefore. to rigorous instruction in projection theory *(see* DESCRIPTIVE GEOMETRY).

Classification of Drawings.— The term "graphics" often is used in place of "drawing" because the subject matter has come to include a wide range of material.

Projection drawings are thdse based upon the geometric principles of projection theory. such as orthographic. axonometric. oblique, or perspective projection, all of which are discussed below. From the viewpoint of usage, these types of drawings may be classified into professional categories. such as machine, structural, map, ship, architectural, aeronautical, piping or electrical drawings. In all of these types the fundamental principles of orthographic projection apply, but the symbols used and the methods of indicating dimensions vary for each class.

Engineers and businessmen use other types of drawings, commonly called charts, graphs or diagrams. which do not involve projection theory. These usually show facts rather than objects. Thus, the familiar bar chart may be used to show comparative production figures! or a curve may be plotted to show data obtained from a tensile test of mild steel. Computation charts, such as nomographs, vector diagrams and network charts, often are used by engineers to simplify calculations (*see* NOMOGRAPHY; VECTOR ANALYSIS).

Instrument drawings are any of the foregoing types made with instruments such as the T square, triangles and compass; these are sometimes called mechanical drawings. Any drawings made by the unaided hand are referred to as freehand drawings.

Selection **of** Scale.— Since objects are rarely of a size that will permit them to be revresented on a drawing at their actual dimensions, it is necessary for the draftsman to reduce, or sometimes enlarge, the size in some definite proportion. When the drawing is the actual size of the object, the scale is said to be "full size" or 1" = 1″. When the dimensions are reduced one-half; or $\frac{1}{2}'' = 1''$, the scale is sometimes called "one-half size." Other scales such as $\frac{3}{4}'' = 1''$, $\frac{1}{4}'' = 1''$, and $\frac{1}{8}'' = 1''$ often are used.

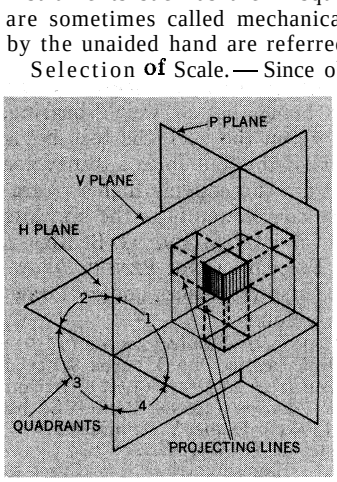

FIG. 1.— PRINCIPAL PLANES OF PROJECTION AND QUADRANTS USED FOR ORTHOGRAPHIC PROJECTION

In architecture and civil engineering. the subject matter of drawings requires even further reductions, and scales such as $\frac{1}{8}'' = 1'$ and $\frac{1}{4}'' = 1'$ are common. The civil engineer also uses scales with proportions of 20 parts to the inch, and scales for 30, 40, 50 and 60 parts to the inch also are available. These are useful in map drawing and in graphical computation. Decimal scales for $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$ and full size drawings also are employed.

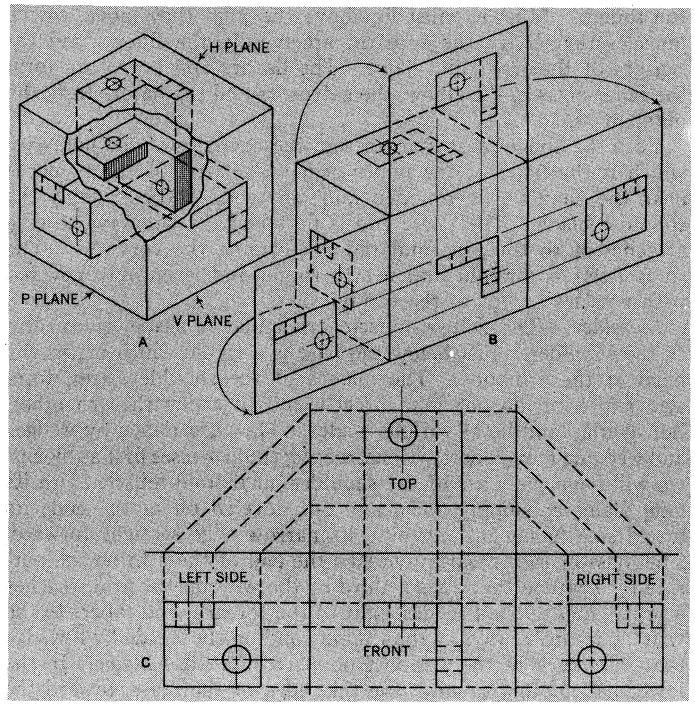

FIG. 2.— REVOLUTION OF PLANES OF PROJECTION FOR THIRD-QUADRANT PROJECTION

Orthographic **Projection.**—An orthographic projection is a drawing made by projecting lines from the object perpendicular to the plane of projection, as shown in fig. 1. One. two, three or more planes may be used as needed. The three planes of projection most frequently used are called the principal planes of projection and are at right angles to one another. The horizontal plane (the H plane) and the vertical plane (the V plane) divide space into four quadrants. The third or profile plane (P plane) may be at either side; its position does not affect numbering of the quadrants.

In order to get the views into the single plane represented by the sheet of drawing paper, the H plane and P plane are imagined as being revolved away from the object into coincidence with the V plane, as shown in fig. 2(A). The resulting arrangement of views is then as shown in fig. 2(B). For most work only one of the side views needs to be shown. This arrangement, for third-quadrant projection, has come to be standard practice in the United States, Canada and the military services of Great Britain. The first-quadrant arrangement of views shown in fig. 3 is used in continental Europe and for ordinary industrial drawings in Great Britain.

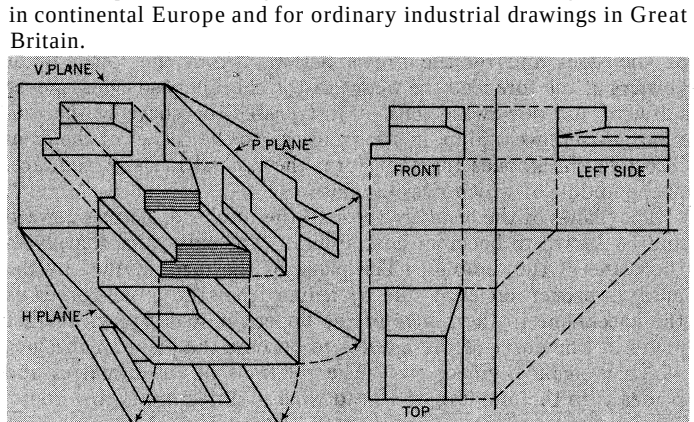

FIG. 3.— REVOLUTION OF PLANES OF PROJECTION FOR FIRST-QUADRANT PROJECTION

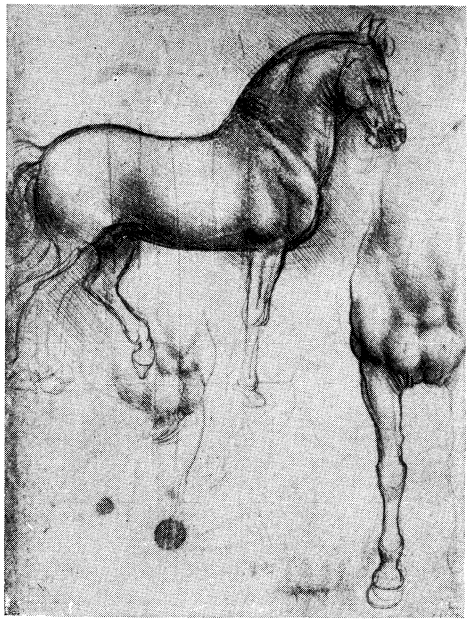
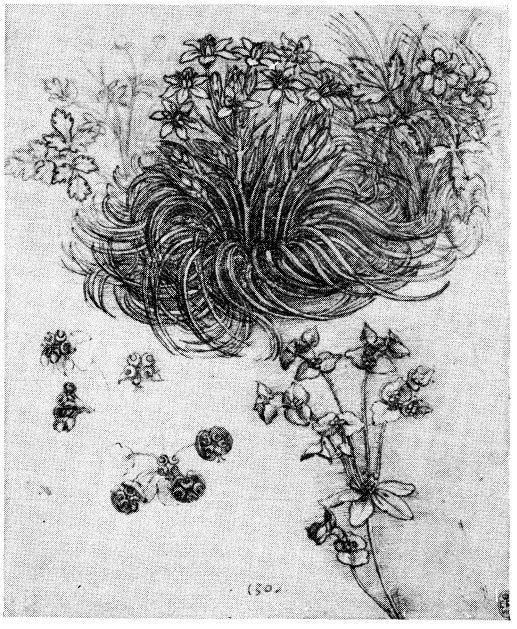
Right: Egyptian ostrakon (pottery fragment) showing two bulls fighting. From Thebes, period of the New Kingdom, 1567–1085 B.C. In the Metropolitan Museum of Art, New York. A preparatory or at least a trial drawing, comparable to Egyptian sculptors' trial pieces

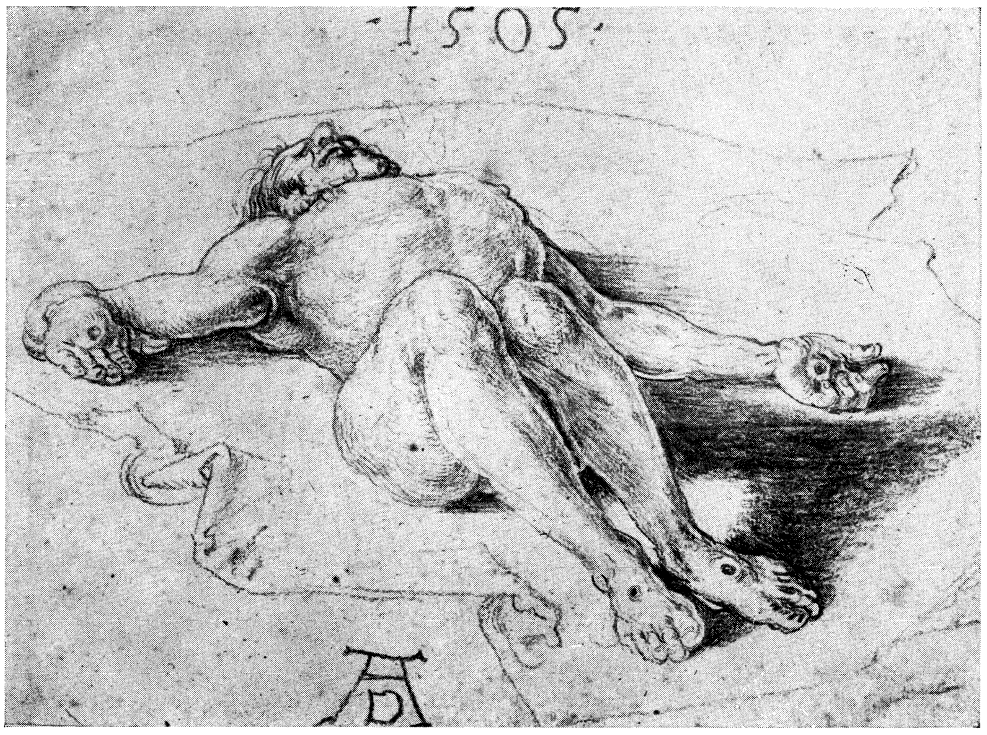
Below: A section from the panoramic Rotulus (roll) of Joshua, *c.* A.D. 700. In the Pierpont Morgan library, New York. The open manner of drawing accords well with the cursive text; a manuscript illuminated in colour would have had more formal lettering



Left and right: Two drawings by Leonardo da Vinci (1452–1519), Italian. In the Royal library, Windsor castle. *Left:* Silverpoint on blue ground; graphic strength with delicate modeling. *Right:* Pen and ink over red chalk notation; note the "rightness" in placement on the page of apparently random details of the Star-of-Bethlehem and other plants

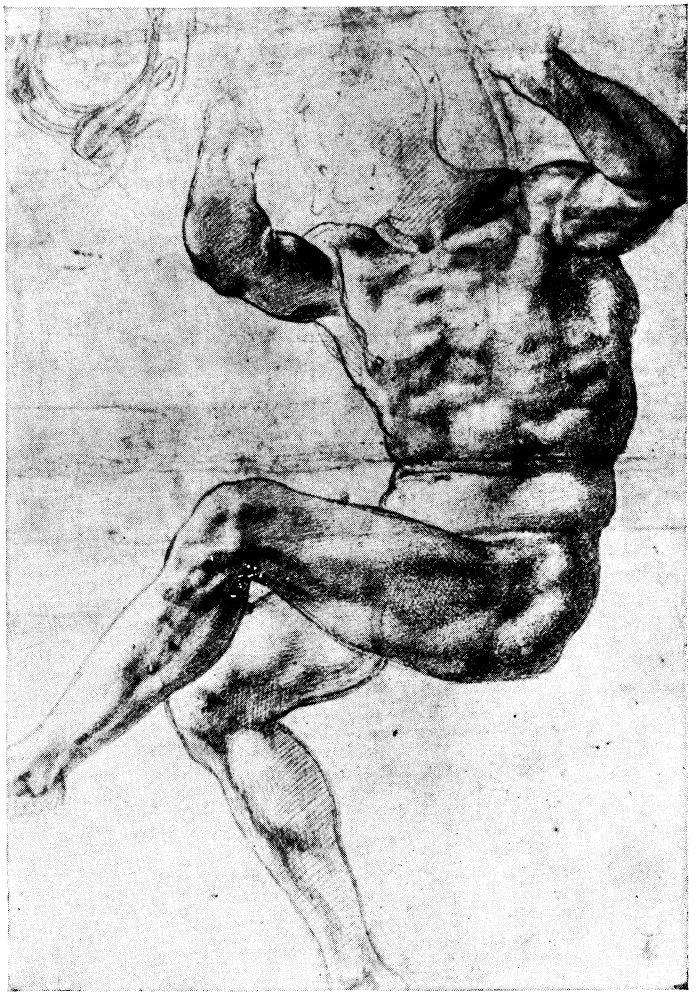


DRAWING (TECHNIQUES OF)



"The Dead Christ Lying on a Pall" by Albrecht Durer (1471–1528), German. In the Cleveland Museum of Art. Charcoa', probably done in Venice under some influence of Mantegna (foreshortening). An early example of signing and dating a drawing, evidence of the rising status of the artist

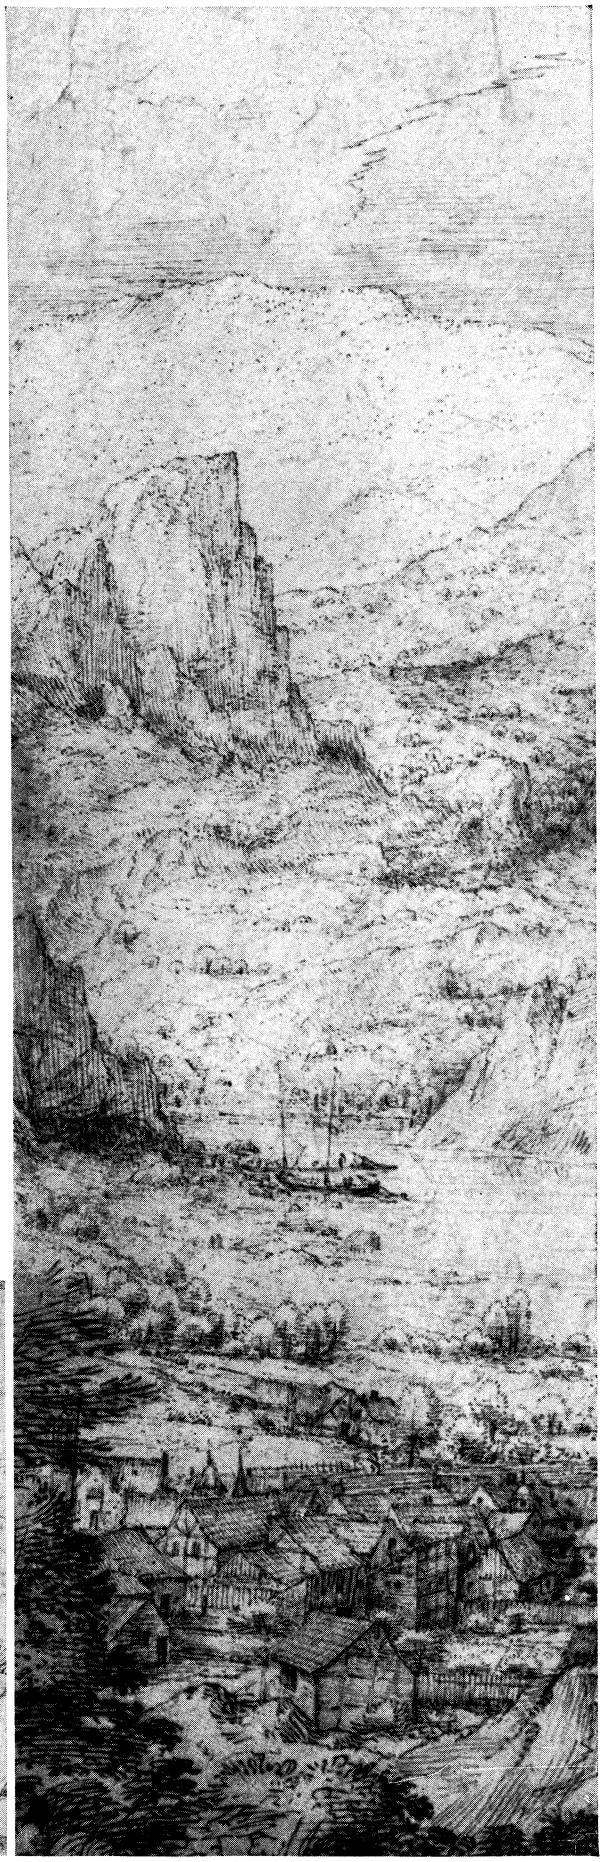
"Head of the Virgin" by Raphael Sanzio (1483–1520), Italian. In the Uffizi gallery. Black chalk. Part of a cartoon for a small painting, heightened with white for pictorial effect and pierced along the chief lines for transfer



Study for the nude above the prophet Daniel in the ceiling fresco of the Sistine chapel, by Michelangelo Buonarroti (1475–1564), Italian. In the Cleveland Museum of Art. Red chalk. The cross-hatching, partly for shade and partly for description of detail, is rubbed in some places to enrich plasticity

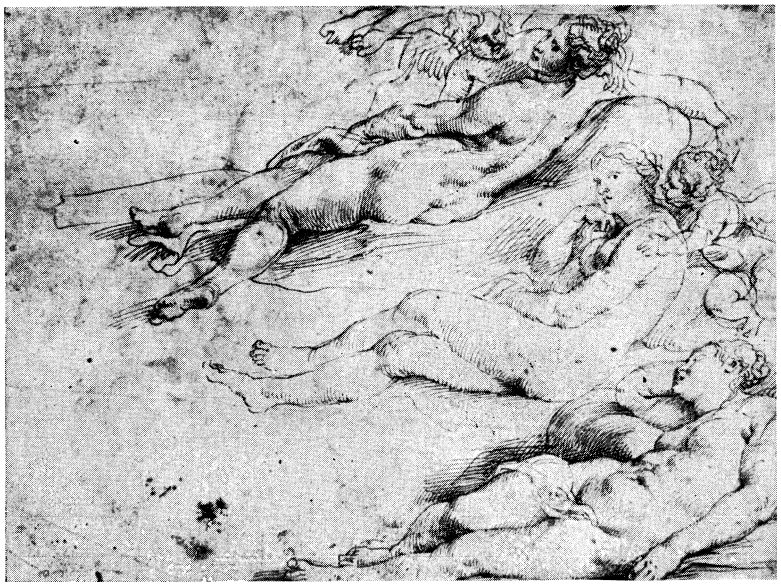
BY COURTESY OF (TOP AND RIGHT) THE CLEVELAND MUSEUM OF ART. (TOP, GIFT OF HANNA FUND 1952; RIGHT, HENRY G. DALTON MEMORIAL, 1940); PHOTOGRAPH, (LEFT) W. GERNSHEIM, LONDON

Portrait, probably of a member of the Fugger family, by Hans Holbein the Elder (*c.* 1465–1524), German. In the William Rockhill Nelson Gallery of Art, Kansas City, Mo. Silverpoint. The subtlety of modeling is achieved through blending of fine lines; no correction or erasure is possible in this medium



Detail of a landscape by Pieter Brueghel the Elder (*c.* 1525–69), Flemish. In the Pierpont Morgan library, New York. Pen and ink. Use of the pen in graded weight (the ink also seeming less diluted) from background to foreground

Triple study for a painting of Venus by Peter Paul Rubens (1577–1640), Flemish. In the Frick collection, New York. Pen and ink. Modeling lines of parallel hatching supplement the contours; rhythmic repetition with variants makes a handsome *mise-en-page* (page composition)



BY COURTESY OF (TOP LEFT) WILLIAM ROCKHILL NELSON GALLERY OF ART, KANSAS CITY, (RIGHT) THE PIERPONT MORGAN LIBRARY, N Y.; PHOTOGRAPH, (BOTTOM LEFT) W GERNSHEIM, LONDON

DRAWING (TECHNIQUES OF)

"Houtewall near Amsterdam" by Rembrandt van Rijn (1606–69), Dutch. In the Boymans museum, Rotterdam. Pen and bistre wash. An eloquent "scribble" in which the whole is greater than the sum of its parts. The wash, which may be in part an addition, is subordinate to the line

"Cassandra Dragged from the Temple of Pallas" by Anthony Van Dyck (1599–1641), Flemish. In the British museum. Pen and brush. The use of wash is given equal importance to the use of line

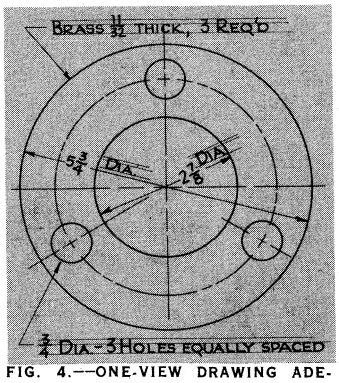

FIG. 4.—ONE-VIEW DRAWING ADEQUATELY DEPICTS A FLAT GASKET

With the standard arrangement of views shown in figs. 2 and 3 it can be seen that (1) the front and top views are always in vertical alignment and the front and side views are always in horizontal alignment; (2) for third-quadrant projections (fig. 3) the plane of projection is always between the observer and the object, while for first-quadrant projections the object is between the observer and the plane; (3) in both cases the planes are revolved away from the object into coincidence with the V plane.

Selection of *Views.*—The purpose of all projective drawings is to represent accurately the shape of an object. For a simple object such as a gasket, one view may be enough. In fig. 4 one view shows the shape of the part; the thickness is given by a note and thus all the necessary information is provided. Even somewhat more complex objects frequently can be described by only two views, as in fig. 5. In industry it is always desirable to keep drafting costs as low as possible; and hence unnecessary views should not be made. The engineer, however, must be certain that his drawings describe the shape of the object in such a way that it cannot be misunderstood. In the drawing reproduced in fig. 6, for example, it might be assumed that the front and top views describe a cube; however, it is apparent that these views could equally well describe any of the five shapes shown in the side views. It is obvious that the objects shown in figs. 2, 3, and 7 require three views.

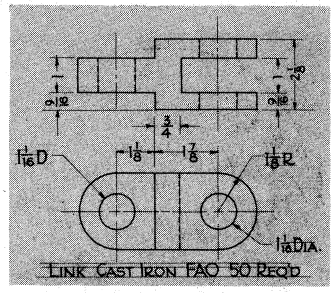

FIG. 5.—FRONT AND TOP VIEWS ADEQUATELY DEPICT LINK; SIDE VIEW IS UNNECESSARY

On many objects there are lines or edges that cannot be seen but must nevertheless be shown to give a complete description of the object. These are represented by dashed lines. as shown in fig. 5 and 7. When choosing the views of an object it is best to select the ones having the least number of hidden lines; thus, in fig. 2 the left side view would be selected rather than the right.

Auxiliary Views.—Many objects have oblique faces that will not show their true shapes in any of the three principal views. In such cases an auxiliary or helping plane may be set up to obtain the true shape.

For an auxiliary view to be effective, the plane upon which the face is projected must fulfill two conditions: (1) it must be perpendicular to one of the planes already in use, and (2) it must have a definite relationship to the object; *i.e.*, if the true shape is desired, the plane must be parallel to the face while also fulfilling condition (1).

In fig. 8 it is obvious that neither the top nor side views shows the true shape of the face MNOP. However, that face does show edgeways in the front view, and thus it can be projected onto a parallel auxiliary plane, represented edgeways by the line V–1, placed at any convenient distance. Projections are made

FIG. 6— AMBIGUOUS FRONT AND TOP VIEWS: SIDE VIEW COULD BE ANY OF THOSE SHOWN AT RIGHT

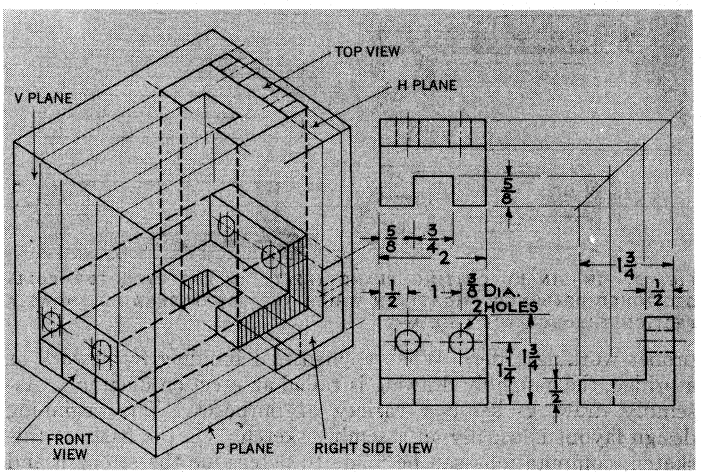

FIG. 7.— THEORETICAL METHOD (LEFT) OF PROJECTING A THIRD-QUADRANT, THREE-VIEW DRAWING AND (RIGHT) COMPLETED DRAWING WITH UNIDIRECTIONAL DIMENSIONING

from the front view and the measurements a and b are obtained from either the top or side view since they are the same in either case.

Sectional Views.—An object that has open spaces within it sometimes presents such a maze of hidden lines that the drawing is difficult to understand. When this occurs it is customary to make a sectional view, *i.e.*, a view in which a part of the object is removed so that the interior can be seen. For a full-sectioned view, the cutting plane is imagined as passing through the centre of the object, the front half of which is removed, as shown in fig. 9. Where material is cut the area is crosshatched by light lines sloping at 45°. When the section is made through an assembly drawing, the crosshatching is sloped in different directions for each separate part cut, but always in the same direction for different areas of the same part. Solid shafts, bolts and screws are not sectioned, even though the cutting plane passes through them.

In fig. 10 the left quarter of the front of the object has been removed, giving a front view that shows the left half in section and the right half as an outside view. Such a drawing is said to be a half-sectioned view. In the top view of fig. 10 the front portion of the object has been broken off to conserve space; this is a common practice for symmetrical objects. The entire top view could be shown if desired.

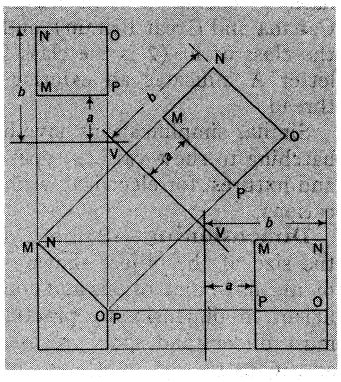

FIG. 8.—USE OF AUXILIARY PROJECTION TO OBTAIN TRUE SHAPE OF FACE MNOP

When it is necessary to show the shape of a member, a cutting plane is passed through the member at right angles to its length and the plane is then revolved 90°, as shown for the spoke in fig. 11. However, instead of revolving the section in place, the location of the cutting plane may be shown on the view and the cross section then may be drawn at a convenient place elsewhere on the sheet, as shown for the rim of the wheel in fig. 11. The section may be made at the same scale or larger if desired. If it is made larger, the new scale should be noted on the drawing.

When important details cannot be shown by passing a plane straight through the object, the plane may be offset at right angles, as in fig. 12, or it may be bent or turned so that it passes through important features. One part of the plane is always parallel to one of the principal planes. The bent portion is then imagined as being rotated so that it is parallel to the same plane, as in fig. 13. The location of the cutting plane must be shown on the adjacent view by heavy dash lines.

Assembly Drawing.— As its name implies, an assembly drawing shows the parts of a machine or structure put together in their

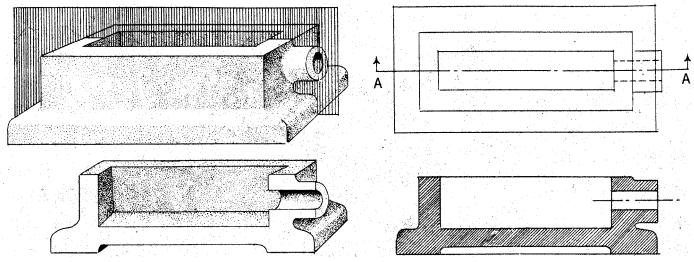

FIG. 9.— IMAGINARY CUTTING PLANE (LEFT) IS EMPLOYED FOR FULL-SECTIONED DRAWINGS (RIGHT), IN WHICH THE LOWER DRAWING SHOWS A SECTION THROUGH THE LINE A–A

proper working order. When applied to a building framework or a bridge, the assembly drawing is called an erection diagram. Assembly drawings serve a variety of purposes. The beginning design layout is usually an assembly sketch. On the basis of this sketch, computations can be made to determine the strength and stability of parts. The parts are then drawn and dimensioned in detail, and finally an assembly drawing is prepared. This drawing, with all parts numbered, is used to assemble the machine. On such a drawing there may also be a bill of materials, listing such standard items as bolts, screws, washers and pins, for which separate drawings are not made.

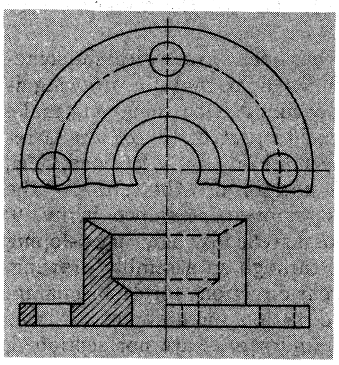

FIG. 10.— HALF-SECTIONEDVIEW; TO CONSERVE SPACE, DRAFTSMAN SHOWS ONLY REAR PORTION OF SYMMETRICAL OBJECT

Symbols.— In order to save drafting time many standard parts are represented by symbols, such as those for screw threads shown in fig. 14. In the schematic representation the helical curve of the screw is represented by a straight line, for both the crest and root of the thread, at right angles to the length of the bolt or nut.

The type of thread and the class of fit are indicated by a note on the drawing. The first number of the note gives the outside diameter of the thread, and the second gives the number of threads per inch. The letters UNC mean that the thread is of the unified national coarse form (a standard accepted in the United States, Canada and Great Britain), and the last number and letter specify the class of fit (2 is the class for ordinary machine work). The letter A indicates an exterior thread and B means an interior thread.

Similar simplifications have been made for gear teeth, for crosshatching to show various types of materials, for plumbing fittings and fixtures, for electrical wiring diagrams, and many other applications.

Dimensioning.— Before a drawing can serve a useful purpose, the size of the object shown and all of its parts must be given by means of dimensions and notes. The draftsman, to become proficient in dimensioning practice, must understand shop processes and construction methods, but certain dimensioning practices have been standardized throughout the United States, Great Britain and Canada. These can be found in the publications of the American Standards association (see *Bibliography*).

Two methods of placing dimensions on a drawing are in use. In the aligned system the dimensions are lettered in the same direction as the dimension line (fig. 4 and 5). Horizontal dimensions read from the bottom of the sheet, and vertical dimensions read from the right side of the drawing. Inclined dimensions must also be aligned with their dimension lines. In the undirectional system, which is simpler to make and to read, all numerals read from the bottom of the sheet, as shown in fig. 7. For either system, the following rules should be observed.

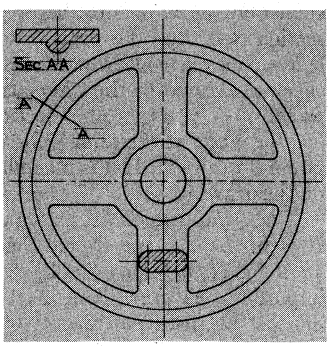

FIG. 11.— REVOLVED SECTION (LOWER SPOKE) AND REMOVED SECTION (THROUGH WHEEL RIM AT A–A); REMOVED SECTION IS DRAWN TO LARGER SCALE

(1) Extension lines, dimension lines and leaders should be light, solid lines (fig. 15). (2) Extension lines should begin about $\frac{1}{16}$ in. from the view and end about $\frac{1}{8}$ in. bevond the dimension line.

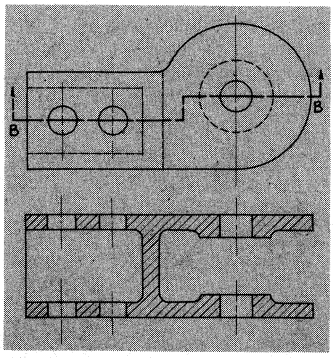

FIG. 12.— OFFSET SECTION TAKEN THROUGH LINE B–B

(3) Dimension lines in machine drawing are broken near the midpoint and the numerals inserted in the space. In structural and architectural drawing it is the usual practice to draw a continuous dimension line and place the numerals above the line. (4) In architectural and structural work, feet and inches are indicated thus: 5′ 2″. If the dimension is in even feet, it is written 6′ 0″. If desired, the inch symbol (″) may be omitted. (5) In machine drawing, dimensions are usually all in inches, and so the inch symbol is not used. (6) When fractions are used, the bar is always aligned with the dimension line, never slanted or omitted. (7) In machine drawing there is a strong trend toward the exclusive use of decimal fractions. (8) Arrowheads are placed at the end of dimension lines to show the extent of the dimension. They are small, black and about one-third as wide as long. (9) Leaders from a dimension or note should be made as in fig. 15. When leaders refer to holes, they should touch the circle and point in a radical direction toward the centre.

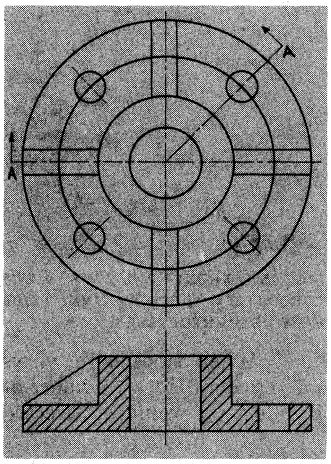

FIG. 13.— ALIGNED SECTION THROUGH A–A

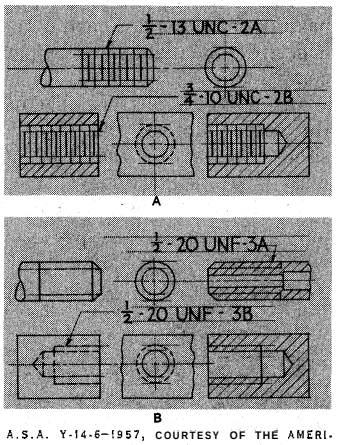
Positioning of Dimensions.— There are six important rules for the placing of dimensions on a drawing. (1) As far as possible, dimensions should be placed outside the views. They may be placed within a view only if greater clearness results. (2) Dimensions should be placed between views. (3) The first dimension line should be placed $\frac{3}{8}$ to $\frac{3}{4}$ in. from the view to which it applies. (4) Successive dimension lines should not be closer than $\frac{1}{4}$ in. to each other. (5) Dimensions should never be put along centre lines. (6) Hidden lines should not be dimensioned, if it can be avoided. The centre line of a hidden hole is regarded as a hidden line.

Selecting *Dimensions*.—Two factors are involved in the dimensioning of an object: the size of its parts and the location of the parts relative to one another. (1) Circles are specified by diameters. cylindrical shafts or holes by diameters and lengths. (2) Sizes of circles such as rounded corners or fillets are specified by giving the radius followed by the abbreviation R or Rad. (3) Compound curves composed of a series of circular arcs are dimensioned by giving the radius of



A.S.A. Y-14-6–1957, COURTESY OF THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS

FIG. 14.—STANDARD THREAD SYMBOLS: (A) SCHEMATIC; (B) SIMPLIFIED REPRESENTATIONS

each arc and the location of its centre in two directions, usually at right angles to each other. (4) Noncircular curves are dimensioned by co-ordinates to points along the curve. (5) Angles may be dimensioned in several ways, as shown in fig. 16.

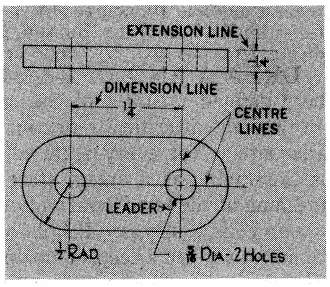


FIG. 15.— DEFINITIONS OF TERMS USED IN DIMENSIONING DRAWINGS

Toleranced Dimensions.-In the manufacturing process it is impossible to make large numbers of parts to an exact dimension. It is therefore necessary, in the mass production industries, to allow some leeway in producing a part, such as a cylindrical wrist pin to attach a piston to its connecting rod in an automobile engine. To permit interchangeable assembly. any wrist pin must fit the holes in any piston, as well as the hole in any connecting rod. The problem of making parts fit together involves tolerances. allowances and limits, which are defined as follows: (1) tolerance is the amount of variation permitted in the size of a part; (2) allowance is the intentional difference in the size of two mating parts; it may be either positive, providing a clearance fit, or negative, producing an interference fit; (3) limits are the extreme permissible dimensions of a part; two limits are always involved, an upper and a lower, and the difference between them is the tolerance.

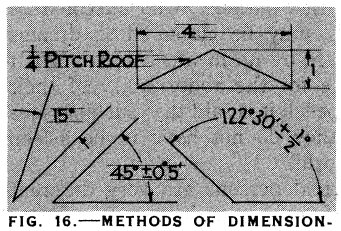

FIG. 16.—METHODS OF DIMENSIONING ANGLES

There are three systems of specifying tolerances on drawings. The bilateral system, in which the deviation on both sides of the basic dimension is shown (fig. 17[A]), is most often used for location dimensions. The unilateral system, in which the allowable deviation is indicated from one side of the basic dimension (fig. 17[B]), is frequently used for close-fitting shafts and holes. The limit system, in which the limits of deviation are given, rather than the basic dimension, is shown in fig. 17(C).

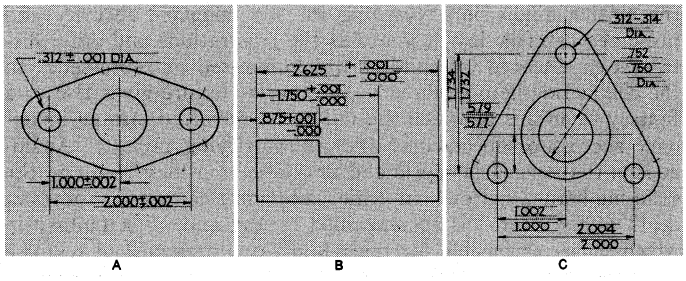

FIG. 17.— THREE METHODS OF INDICATING TOLERANCES: (A) BILATERAL DIMENSIONING: (B) UNILATERAL DIMENSIONING: (C) LIMIT SYSTEM

Pictorial Drawing.— Although most engineering drawings are made in multiview orthographic projection, the engineer finds pictorial drawing useful for a number of purposes, For those who cannot understand the two- and three-view drawings that show only one face of an object at a time, the pictorial forms are very helpful.

There are three types of pictorial drawings: perspective, used mainly by architects, which is described and illustrated in the articles PERSPECTIVE and ARCHITECTURAL RENDERING; axonometric projection, which is a one-plane orthographic projection; and oblique projection, in which the projecting lines are at an angle (other than 90") to the plane of projection.

Axonometric Projection.— If a plane is imagined as being set up obliquely to the three principal planes of projection (fig. 18) and the object is projected upon this plane at right angles, an axonometric projection results. The axonometric projection may be of three types: isometric, dimetric or trimetric.

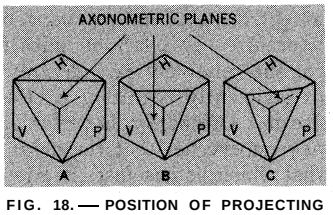

FIG. 18.— POSITION OF PROJECTING PLANE FOR THREE TYPES OF AXONOMETRIC PROJECTION: (A) ISOMETRIC: (B) DIMETRIC; (C) TRIMETRIC

When the axonometric plane makes equal angles with the three principal planes (fig. 18[A]), an isometric projection is obtained. From a study of this projection, rules have been established for making isometric drawings, as of the cube in fig. 19(A). The three edges of the cube are all the same length: conseauentlv. an obiect like that in fig. 20 can be drawn bv making measurements along or parallel to the three axes. using the same scale in all of them.

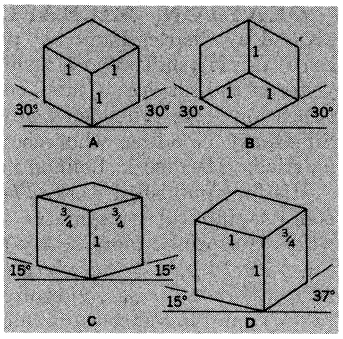

FIG. 19.— AXES AND SCALES FOR ISOMETRIC AND DIMETRIC PROJECTION (A) ISOMETRIC PROJECTION OF CUBE. (B) SAME PROJECTION WITH AXES REVERSED, (C) AND (D) DIMETRIC PROJECTIONS WITH DIFFERENT SCALES ON AXES

If the axonometric plane is tilted so that it makes equal angles with any two of the principal planes and a different angle with the third (fig. 18[B]), a dimetric projection is obtained. Dimetric drawings are made in the same manner as isometrics except that different scales must be used on the axes, as shown in fig. 19(C) and 19(D). These drawings are usually more realistic than isometrics. When the axonometric plane is unequally inclined to each of the three principal planes (fig. 18[C]), a trimetric projection results. This type requires a different scale on each axis and is more tedious to draw; hence, trimetric drawings are not often used.

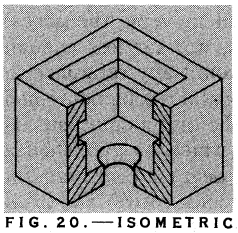

FIG. 20.—ISOMETRIC HALF-SECTION

Oblique Projection.— If an object, in its usual position for orthographic projection upon the three principal planes, is viewed at an angle oblique to the vertical plane, three faces of the object can be projected or can be seen in one view. If the angle of viewing is at 45° to the vertical plane, the front face of the object projects in its true shape. since it is parallel to the plane of projection. The third axis, which is perpendicular to the plane, also projects in its true as in fig. 21. Hence, equal measurements can be made on all three as in isometric projection. Two of the axes are always at right angles to each other. An oblique projection of this type is called a cavalier projection or drawing. This type of drawing is sometimes unpleasing because the thickness seems to be exaggerated. The visual effect can be reduced somewhat by employing another type of oblique projection in which the scale on the receding axis is just one-half that on the front face. This is called a cabinet drawing. Scales such as ⅝ or ¾ can be used on the receding axis to give a more pleasing effect. The receding axis may be at any angle with the horizontal, but 30° and 45° are most often used.

DRAWING AND QUARTERING, part of the penalty anciently ordained in England for treason. Until 1870 the full punishment for the crime was that the culprit be dragged on a hnrdle to the place of execution; that he be hanged by the neck but not till he was dead; that he should be disemboweled or drawn and his entrails burned before his eyes; that his head be cut off and his body divided into four parts or quartered.

This brutal penalty was first inflicted in 1283 on the Welsh prince David. and in 1305 on Sir William Wallace. Edward Marcus Despard and his six accomplices were in 1803 hanged, drawn and quartered for conspiring to assassinate George III. The sentence was last passed (though not carried out) upon the Fenians Burke and O'Brien in 1867.

DRAYTON, MICHAEL (1563–1631), English poet described by Charles Lamb as "panegyrist of my native earth," was born at Hartshill, Warwickshire, in 1563 He spent his early years in the service of the Goodere family, to whom he owed his education. He remained a lifelong friend of Anne, daughter of Sir Henry Goodere, whom he celebrated as *Idea*, but he never married. He died in London in 1631.

His first published work, *The Harmony of the Church* (1591), contains biblical paraphrases in an antiquated style. His next works conformed more nearly to contemporary fashion: in pastoral, with *Idea, The Shepherd's Garland* (1593); in sonnet, with *Idea's Mirror* (1594); in erotic idyll, with *Endymion and Phoebe* (1595); and in historical heroic poem, with *Robert, Duke of Normandy* (1596) and *Mortimeriados* (1596). The last, originally written in rhyme royal, was recast in ottava rima and renamed *The Barons' Wars* (1603). Drayton gave this characteristically professional reason for the revision: "The often harmony (of the seven-line stanza) softened the verse more than the majesty of the subject would permit. Therefore I chose Ariosto's stanza, of all other the most complete and best proportioned."

Drayton's most original poems of this period are *England's Heroical Epistles* (1597), a series of pairs of letters exchanged between famous lovers, which remained the most popular of his poems throughout the 17th century.

Drayton, like most other poets, acclaimed in verse the accession of King James I but, unlike all others, was tactless enough in *To the Majesty of King James* (1603) to omit any reference to Queen Elizabeth I. For this he "instantly saw all his long nourished hopes even buried alive before his face." The disappointment affected his poetry of the next few years, in which he published a deliberately obscure satire, *The Owl* (1604); degraded the graceful *Endymion and Phoebe* into an even more difficult satire, *The Man in the Moon* (1606); and contrived a portentous heroic poem, *Moses in a Map of His Miracles* (1604). He recovered himself with his first collected *Poems* (1605), and in *Poems Lyric and Pastoral* (1606) he introduced a new mode into English poetry with the "odes," modeled on Horace. The most famous, "The Ballad of Agincourt," shows Drayton's gift for pure narrative. Unfortunately, when he attempted the complexity of epic, he did not combine this gift successfully with the insight into character shown in the *Heroical Epistles*.

Further collected editions culminated in his most important book, *Poems* (1619). Here Drayton reprinted most of what he chose to preserve from his earlier poems, often much revised; and added many fine new poems and sonnets. He had also meanwhile published the first part of his most ambitious work, *Polyolbion* (1612), in which he intended to record that Elizabethan discovery of England, of the beauty of the countryside, the romantic fascination of ruined abbeys and spoiled forests, its history and legend and active present life. But he was too eager to cram everything in, so that the poem tends to run aground on the shoals of detail to which his alexandrines are too accommodating.

Drayton was not exhausted by this "Herculean toil"; he produced a second part in 1622, and in his old age wrote some of his most delightful poetry, especially the fairy poem *Nymphidia* (1627), with its mock-heroic undertones, and the charming *The Muses Elizium* (1630), where he is at last content with the cool, sequestered world of his imagination. The admirable *Elegies Upon Sundry Occasions* (1627), addressed to his friends, often suggest, with their easy, polished couplets, the manner of the Augustans.

Drayton's best poetry is, in the fullest sense, patriotic: the poetry of a man who is continually discovering new enchantments in the English scene or in English history; whose patriotism is a matter more of pleasure than of pride. His sonnets owe less to continental models than do those of most of his contemporaries; his pastorals, "bold upon a new strain," are set in no fancied Arcadia; his Ovidian epistles are written by men and women famous in the history of England. This discovery of an independent English tradition is among the most important for Drayton's generation; to its celebration no man more consistently devoted greater gifts than Drayton.

See *Complete Works*, ed. by J. W. Hebel, 5 vol. (1931–41); *Poems* (selection) ed. by John Buxton, Muses' Library (1953); B. H. Newdigate, *Drayton and His Circle* (1941). (E. J. M. Bn.)

DREAM AND DREAMING. Traditionally, dreams have been defined as states of consciousness taking place during sleep. In the light of critical reflection, however, this definition is hardly adequate. Not every state of awareness occurring during sleep is classifiable as a dream state; nor is sleep in the conventional meaning of the term invariably necessary for the production of the dream consciousness. People often hear a telephone ringing even though they are asleep or dozing. Upon being fully roused, they find that nhat they heard in the sleep or quasi-sleep state corresponds with external reality, since the telephone is still ringing. Such correct apprehension of a genuine event is obviously not to be classified as a dream even though sleep and the apprehension were concomitant.

An essential characteristic of the dream is thus a manifest discrepancy between dream images and external reality. In other words, dreams are illusory or hallucinatory experiences and just because such experiences can take place in the absence of ordinary sleep, the adequacy of the traditional definition is to be questioned. The experiences of some mentally sick patients, who misconstrue their hallucinations as real events, may be classified as dreams despite the fact that the patients are by no means asleep. Their hallucinations are often responsible for the abnormality of their speech and conduct. In common speech it is said that such persons are living in a dreamworld, and they do not have to be asleep in order to live in such a dreamworld.

The ordinary daydreams of normal persons are very different from the hallucinated fantasies of mental patients. The latter act as if the fantasies are genuine occurrences taking place in the immediate present. The fantasied events of the daydream, on the other hand, are not confused with reality. They are experienced as what might once have taken place or what might yet still take place. In contrast to night dreams, daydreams thus are either relegated to the past or projected into the future; their temporal locus is rarely the present. Like night dreams, however, daydreams are products of different instigating wishes, concerns, interests and kindred dynamic factors. Some daydreams, for example, centre around the theme of the "good old days"; here the motive might be a yearning for the imagined security and presumed carefree joy of youth as the frustrations and other distresses experienced by children are minimized or repressed. In the conquering-hero daydream the sting of failure gives rise to a fantasy by means of which the failure is converted into an imaginary success of spectacular and self-glorifying import. Analogously, the sting of a reprimand or a rejection may result in the suffering-hero daydream in which the imagined agony or even death of the "hero" is accompanied by the gratifying fantasy in which those responsible for the rebuff express anguished remorse and plead for forgiveness. A third type of common daydream is what might be termed the debating-hero daydream, also prompted often by the sting of failure or reproof or disparaging criticism; in fantasy the aggrieved person anticipates the supposititious argument in which he will become embroiled should he undertake his own defense, the fantasy often following the pattern of "if he says, then I'll say." in which the "hero" imagines himself formulating brilliantly effective and even crushing rejoinders.

In the light of the foregoing considerations it is possible to formulate a more exact definition of the concept of dreaming. A dream is to be regarded as an illusory or hallucinatory experience the temporal locus of which is the present and which is usually accepted as real or as having genuinely existential status at the time it occurs. This last qualification is necessary in order to allow for the relatively rare dreams in which the dreamer is actually or incipiently cognizant of the fact that he might be having a dream. Ordinarily. however. it is not until fully alert consciousness supervenes that the dreamer recognizes the unreal status of that which he has just experienced in his dream.

(This unreality of dream events is also suggested by the derivation of the word dream, which is traced through the Anglo-Saxon to the root meaning of the modern German word *Traum;* this is in

turn related to the German verb *trügen,* which means "to deceive." By stressing the role of illusory and hallucinatory factors in the dream experience the definition formulated above tends to preserve the idea of deception implicit in the root meaning of the word.)

PSYCHOLOGICAL INVESTIGATION

Interest in the nature and significance of dreaming dates from antiquity. Divination by means of dreams, a recognized art in ancient times, was called oneiromancy (from the Greek *oneiron,* "dream"), and for the unsophisticated in all ages dreams have possessed significance of a sort that enabled the oneiromancer to have his art taken seriously. Even today so-called dream books are purchased by the credulous for the purpose of ascertaining the presumed prophetic meaning of given dream symbols.

Scientific study of dream phenomena was initiated in 1861 with the publication of A. Maury's study of sleep and dreams. Later investigators devoted themselves to similar application of scientific method to problems of dream psychology. For the most part these problems have had little in common with the beliefs which the credulous of all ages have tended to associate with dreams. Instead they have had to do with questions so framed as to be amenable to study by the methods of science. The following are examples:

1. What are the roles of internal and external stimuli in the production of dreams?
2. Is dream imagery different in kind from that of imaginative productions in daydreams and creative thinking?
3. What is the relationship between depth of sleep and incidence of dreams?
4. How long do dreams last?
5. Are dreams revelatory of conscious and unconscious desires and personal conflicts?
6. Can dream symbols be interpreted in dependable fashion?
7. Are dreams produced during hypnotic sleep different from those occurring normally?
8. Do the dreams of the blind and deaf differ from those of persons with normal vision and hearing?
9. Do the frequency and nature of dreaming vary with age?
10. Does dreaming serve any useful function?

In order to find the answers to questions of the foregoing sort, students of dream psychology have had recourse to varying techniques of investigation. Some have endeavoured to influence the dream consciousness by pinching the sleeping subject or bringing odoriferous substances close to his nostrils. The experimenter would then either arouse the subject for the purpose of securing an Immediate report on his dream life or else wait until he awakened spontaneously to furnish such a report. Some experimenters applied stimuli to themselves prior to falling asleep. For example, one investigator would knot a string around his finger or keep a metronome ticking and prepare himself to observe the possible influence of such tactual and auditory disturbances on his dreams. (Self-observation of this kind is rendered more reliable if the experimenter keeps a pencil and notebook handy so that he can write down his observations immediately upon awakening; for dreams are fleeting, and delay in recording may render it impossible to remember more than a few fragments of what had been a relatively complex dream.)

A few psychologists have used a method of experimental induction of dreams during hypnosis. In this technique hypnosis (*q.v.*) is induced by any one of the traditional routine procedures, and then the hypnotized subject is told that he will soon find himself experiencing a dream. A suggestion of this kind arouses a definite set to dream. Once this set is aroused the experimenter introduces various disturbances calculated to induce a dream. He may sound a buzzer, call out a person's name, hold a bottle of perfume near the subject's nostrils, stroke the skin surface with a tuft of cotton, change the position of the subject's arm or leg or introduce any other kind of disturbance. Some psychologists have awakened the hypnotized subject in order to get his dream report. This is not necessary in most instances since the hypnotized subject may be made to respond to the suggestion that he supply an account of each dream as soon as he has experienced it. A co-operative subject does this without awakening from the hypnotic state. In this way a whole series of dreams may be collected during a single experimental session. By means of this technique it is also possible to get an approximate measure of the duration of a dream. All that is required is to set a stop match in motion when the dream stimulus is applied and to stop the watch as soon as the subject starts his account. Using this method it was found by one investigator that the hypnotic dream averages about 30 seconds. The hypnotic technique also has been used to influence the course of ordinary night dreams. This is accomplished by giving the subject a posthypnotic suggestion to dream about some specific theme on a particular night and to report the resulting dream to the investigator.

During the 1950s Nathaniel Kleitman and his collaborators developed an objective method for the study of dreaming. This involved obtaining records of the eye movements of sleeping subjects along with simultaneously recorded brain waves. In the course of numerous experimental sessions, it became clear that sleep was characterized by periods of rapid eye movements (REM's) at approximately regular intervals. Each such period was followed by one of no rapid eye movements (NREM's). Moreover, the brain wave pattern for the REM period differed from the NRERI period, the latter pattern being more characteristic of deep sleep and the former of lighter sleep. When subjects were awakened in conjunction with these periods and instructed to record their dreams, it was found that dreaming was definitely more frequent during the REM periods than during the NREM periods. For example, in one series of studies using nine subjects, a total of 152 dreams was recalled in association with REM periods, and only 39 such periods were devoid of dream recall. In contrast to this, the same group of subjects had no recall of dreams for 149 NREM periods, and only 11 instances of dreaming were reported for these periods.

Dreaming, known to be characterized by predominant visual imagery, thus can be presumed to be taking place when the two sets of recording instruments show rapid eye movements and the kind of brain waves indicative of light sleep. In the absence of rapid eye movements, along with increasing depth of sleep, there is less likelihood of activation of the dream process.

Kleitman's introduction of objective procedures prepared the way for further experimental studies of dream phenomena. It was no longer necessary to rely on the delayed reports of subjects describing dreams of the previous night; by the Kleitman method the sleeper is awakened according to the REM pattern, and his description of dream events is automatically recorded. Since this occurs in a laboratory setting, it is possible to control environmental variables affecting the sleeper, and to study the effects of drugs, stress, personal conflict and other conditions on dream content.

NATURE OF DREAMS

Content. — It is a commonplace observation that the sequence of events in a dream episode is more bizarre than that characteristic of waking consciousness. The dreamer's control of attention, judgment, imagery and other mental functions is much reduced or altogether absent. The dream is something that happens to him as opposed to something that he does for himself or to himself. To a large extent he is a passive observer of events sweeping over him. These events are presented in the form of a phantasmagoric play of images. This should not be construed to mean that the images are exclusively visual, for psychological studies have demonstrated the variegated nature of dream imagery. Although visual and auditory imagery seems to predominate, as it does in waking life. any other kind of imagery may be woven into the fabric of the dream. In only one respect does dream imagery seem to differ significantly from the spontaneous utilization of imagery in waking life: coloured or chromatic images are not common in dreams. Events in the dream are more likely to appear in gray pictures rather than in colours. Occasionally it has been implied that the perception of coloured images is altogether absent from the dream process, but this is not in accord with fact. Coloured images do occur, but they are far less common than the ubiquity of colour in waking experience would lead one to expect. The reason for this is unknown.

In general, whatever form of imagery is experienced during waking life can also be experienced during sleep. This means

that persons suffering from congenital absence of a given sense modality can never experience the sensations and images characteristic of that modality. Because of this the congenitally deaf never have auditory imagery in their dream patterns. Similarly, the dreams of the congenitally blind are devoid of visual imagery. However, such imagery is present if the loss of vision took place after several years of visual experience. The first five to seven years seem to be critical in this respect; blindness occurring after the seventh year does not result in loss of capacity to experience visual images. In cases of early loss of both vision and hearing, dream imagery is restricted to the unimpaired sense modalities. Helen Keller in writing about her own dreams in ***The*** World **I *Live*** In gave a classic account of the dream life of one so handicapped:

> I smell and taste much as in my waking hours, but the sense of touch plays a less important part. In sleep I almost never grope. No one guides me. Even in a crowded street I am self-sufficient, and I enjoy an independence quite foreign to my physical life.

That kinesthetic and tactual imagery did nevertheless constitute active dream processes for Miss Keller is exemplified by the following passage:

> Once in a dream I held in my hands a pearl. I have no memory-vision of a real pearl. The one I saw in my dream must, therefore, have been a creation of my imagination. It was a *smooth,* exquisitely *molded* crystal . . . My pearl was *dew* and fire, the *velvety* green of moss, the *soft* whiteness of lilies . . . (Italics added.)

This passage is of special psychological interest because it indicates the way in which her use of the vocabulary of colour is seemingly an outgrowth of the tactual characteristics of objects. The velvety feel suggests green, softness suggests white.

Dream content, of course, is not static but dynamic, akin to living a story or experiencing an event. Material for the dream story comes from stimuli impinging on the dreamer at the moment as well as from his store of past experiences and contemporary interests and urges. Often events from the dreamer's remote past may be reactivated in the dream and play a vivid role. Sometimes such reactivated experience parallels the original one without much distortion. At other times the dream experience may involve a transposition of earlier and more recent images into a novel and unique pattern of happenings.

In either case, dream content is a product of the dreamer's recent or remoter past and not a foreshadowing of events to come. This is brought out by comparing the dreams of children with those of adults; very young children, for example, are likely to dream of wizards and fairies, and the older child of school examinations and athletic heroes. Children of the destitute are likely to dream of wonderful toys, hungry persons of food, homesick soldiers of their families and prisoners of freedom. The wish is father to the dream as well as to the thought. Desires, worries and tensions may also have a direct bearing on the kind of dream content experienced.

It seems safe to assert that the language of the dream is more pictorial than linguistic. Verbal images do not occur frequently or prominently in the course of dream content. The paucity of verbal content means, of course, that critical analysis or subtle reasoning is not likely to occur in dreams. Language seems to be an almost indispensable tool for such refined mental operations. Because of the restricted role of language in the dream, the thinking of the dreamer is largely limited to that which can be symbolized by nonverbal means.

Structure. — An ordinary daydream is often regarded as a matter of idle association or reverie. The sight of a box of candy, for example, induces one to think of eating between meals, and this recalls visions of parental scoldings for raiding the icebox and this, in turn, reminds one that electrical refrigeration is an improvement over the old-fashioned box, etc. In schematic terms this amounts to saying that the structure of making association of a random sort follows the pattern of item A arousing B, B eliciting C, C provoking D, etc. Is this type of structure also the structure of the dream pattern? Is the dream merely a sequence of idle associations instigated in a sleeping person by a chance stimulus such as a clanging ambulance bell or a clogged nostril? To find the answer, the pattern of such free association must be compared with those dream patterns resulting from known forms of experimentally controlled stimulation. Examination of hypnotic dreams aroused by simple stimuli demonstrates that dreaming is not merely a matter of free association. Although such stimuli provoke the dream pattern, the relationship between the instigating factors and the resulting pattern of response is not a simple A-B-C-D sequence.

In the dream the instigating stimulus becomes a constituent feature of the pattern, though it is buried within the pattern in such fashion that knowledge of the dream alone is not sufficient to make it possible to identify the antecedent stimulus. It is as if a cause were to be engulfed by its effect. An example of what this means is supplied by the hypnotic dream of one subject who dreamed that he was in a hospital and was visited by his sweetheart who sat down next to his bed and stroked his hand. This particular dream had been touched off when the experimenter stroked the back of the subject's hand with a tuft of absorbent cotton. Here the cotton as cause was experienced toward the end rather than at the beginning of the dream. Another hypnotized subject dreamed that he was dressed in his track suit and running for exercise when he chanced to see a dead horse by the side of the road. In this instance two stimuli had been applied simultaneously: pressure on the sole of the hypnotized subject's shoe along with a whiff of asafetida. The former stimulus was responsible for the idea of running and the latter for that of the dead horse; but both ideas were woven into the pattern of the dream, and even though their provocative stimuli had been presented concurrently the resulting images were not concurrent until the close of the dream.

Dreams as Trial Percepts. — The fact that dreams seem to be characterized by a type of structure in which the consequences of the provocative stimuli come to be constituent features of a larger dream context is of considerable theoretic importance. It suggests that some dreams are to be explained as attempts by the dreamer to account for an ambiguous or dimly apprehended stimulus pattern in terms of whatever backgrounds of experience happen to be touched off by the stimuli in question. This phase of the dream process is analogous to the common, waking experience of being startled by a strange sound while absorbed in a novel. A what-can-that-be attitude, as opposed to the attitude of free association, comes to dominate consciousness. For the time being the novel is relegated to a subordinate position. As the strange sound is repeated, various possibilities suggest themselves: an intruder in the attic, somebody tinkering with a car outdoors, a rattling venetian blind, etc. These possibilities are rejected almost as soon as they occur because the troublesome noise fails to accord with these possibilities. Then the startled reader recalls having set a trap in the attic a few days earlier. The curious noise is now recognized as that of a rat dragging a trap across the attic floor. This interpretation agrees with the unique characteristics of the startling noise and the problem is regarded as solved. It is solved by means of a series of trial percepts brought to bear on the situation.

This utilization of trial percepts may help to account for many dreams. In sleep many stimuli that would evoke immediate recognition on the part of a waking person are blurred or ambiguous because so much relevant sensory material is excluded by the heightened sensory thresholds characteristic of sleep. Only fragments of a given total stimulus pattern are experienced by the sleeper. The what-can-that-be mental set is aroused because of the strangeness of such fractured stimulation. It is like trying to read a book printed with broken type. Imaginative guesswork has to replace clear-cut, facile perception. The dreamer. in other words, being cut off from the world of reality by heightened sensory thresholds, accepts those few sensory fragments that break through to awareness as being the core of genuine happenings interpreted in the light of whatever trial percepts are brought into play. But such interpretation differs from the same process carried out by a fully alert person; for the dreamer fails to recognize the trial or hypothetical character of the series of interpretations. What the alert person knows to be merely a suggestion or a possibility is accepted as actual fact by the dissociated consciousness of the dreamer.

THEORIES OF DREAMS

Dream consciousness, to employ a grammatical metaphor, tends to be in the present indicative. The past, the future, the perfect and the subjunctive are not utilized. For the dreamer the cognitive equivalents of "it might be," "it's as if" or "maybe this is" are largely nonexistent. The dream world is a world of the present in which what happens takes place here and now and in which all hypotheses are facts and all imaginative guesses genuine realities. This also suggests one other respect in which dream consciousness differs from waking consciousness: the optative or wishing mood may play a more exclusive role in the perceptual life of the dreamer. This is to say that often what the dreamer perceives as fact is a product of what he wishes were a fact, or fears might be a fact.

Freud. — Discovery of these optative factors and analysis of their implications can be regarded as the heart of Sigmund Freud's contribution to the psychology of dreaming. His viens on the subject were expounded originally in The *Interpretation* of *Dveams,* first published in 1900. Many critics regard this as Freud's outstanding work, and Freud himself once expressed the opinion that "the most valuable" of his discoveries are to be found in it. An enormous literature grew up in connection with Freud's brilliant approach to the dream problem. (See also PSYCHOANALYSIS.)

Freud was primarily interested in the dream as an expression of dynamic trends in the life of the dreamer. It was as though he had asked, "What can this dream mean in terms of this patient's longings, desires, wishes or urges?" An approach of this kind tends to view dreams as products of the optative mood. It is concerned with the assumption that dreams are to be regarded as expressions of balked wishes or frustrated yearnings. Freud regarded the dream as supplying a "royal road" to the realm of unconscious motivation. For him dreams were either actual or attempted wish fulfillments. He conceived of the sleeping person as largely cut off from external stimulation, mith the critical functions of waking consciousness also excluded for the most part. so that internal tensions, the repressed but regnant strivings of the unconscious, could find vicarious expression in the symbolism of the dream. A vicarious outlet of this kind, he held, makes its appearance in sleep because the mind's forces of inhibition are also dozing. Illicit impulses consequently would be expected to meet with less resistance from such a somnolent conscience.

In terms of later Freudian theory, this policing function of conscience was attributed to the superego and the source of the illicit unconscious impulses was the id. In brief, because sleep deactivates superego functions, frustrated id impulses have a better chance of expressing themselves in the drama of the dream.

To understand the drama of the dream. as Freud saw it, it is necessary to become familiar with certain distinctions he introduced. The story of a dream as it is told by the dreamer upon awakening is not the whole story nor the real story. Such a story supplies what Freud called the manifest content of the dream. He contrasted this with the latent content of the dream. Freudian dream interpretation thus calls for penetration of the disguise of the manifest content of dream imagery in order to get to the core of latent dream motivation.

Freudian theory attributes certain characteristic dodges to the strategy of id impulses. One of these is condensation or the process of giving expression to more than one impulse by means of a single dream image or symbol. This process is akin to what psychoanalysts sometimes call overdetermination, meaning that a multiplicity of motives may be responsible for a single act or a given symptom. Another of these dodges or dynamisms is that of displacement or the shift of emphasis from a revealing symbol or figure to a neutral one. For a woman to report experiencing a patriotic thrill as she perceived the British flag in her dream might serve as an example of this provided that in the course of her free associations to the idea of this flag she comes to confess a secret love for a Londoner named John. The flag, the Union Jack, would then be interpreted as a disguised expression of her unconscious longing for closer ties with John. What mas experienced as a patriotic thrill in the manifest content had been a more personalized, libidinous thrill in the latent stage of its origin. Instead of expressing this erotic longing directly by means of a dream image of John, the impulse was displaced from John to the seemingly harmless image of the British flag. In actual dream interpretation the Freudian analyst thus has to work back from the symbolism of the manifest content to the motivational sources in the latent content.

In doing this he must not only guard against being misled by the distortions resulting from condensation and displacement but also against those caused by what Freud called secondary elaboration. This refers to inaccuracies in the report of the dream as made by the dreamer in order to make the account more coherent or more plausible. In other words. even the manifest content is apt to be distorted in the process of telling about the dream. Significant items may be left out and new ones may be added quite unconsciously as the narrator strives to make his story more dramatic or more plausible. Such secondary elaborations must be recognized and stripped away before the analyst can probe into the unconscious determinants of the dream.

This probing is accomplished by having the patient react to specific items in the manifest dream content with whatever ideas such items chance to arouse. According to Freudian teaching, the resulting train of free associations will expose a track leading to the unconscious tension responsible both for some of the patient's neurotic symptoms and for some of the vagaries of his dream life. Furthermore, as a result of analyzing a tremendous number of dreams, Freud found what he took to be a fairly stereotyped relationship between certain dream symbols and certain unconscious wishes. He then felt justified in speeding up the process of dream interpretation whenever such fixed symbols occurred by decoding them immediately without having recourse to the often tediously circuitous free-association route. The vast majority of these standardized symbols were taken to be expressions of infantile or childish notions of sexuality. Notions of this kind are especially subject to repression because their early manifestation tends to provoke the shocked or horrified disapproval of parents. It does not take the young child long to learn of the strength and sternness of society's code of sex taboos. What he does not dare express simply has to be repressed. It is consequently easy to understand, say the Freudians, why so much of the dynamics of unconscious motivation has to do with impulses harking back to the dawn of sex curiosity. And it is precisely such impulses which Freud regarded as playing such an important role not only in neurotic behaviour but also in dream symbolism.

Critique of Freud's Theory. — There can be no question about the brilliance, boldness and originality of Freud's contribution to the psychology of dreaming. Even though adumbrations of parts of his theory can be found in earlier writers, especially Plato, no previous worker dealt with dream phenomena with such profundity of psychological insight and with such speculative daring. No serious student of such phenomena can afford to neglect these insights and speculations. Almost all modern studies are grounded in them, even those of students who have repudiated or modified the Freudian theory.

Only a bare outline of the more salient points of dream theory controversy can be introduced here. One of these has to do nith Freud's idea of stereotyped dream symbols, which is rejected by most competent students. For example, the Freudian idea of the inevitable and certain phallic import of a snake symbol is no longer endorsed. Sometimes, of course, such a symbol may have such import in a particular dream of a particular individual; but not every manifestation of this symbol in the case of any individual's dream is to be linked with phallic implications as a routine interpretation. After all. a snake may be symbolic of deception or of undulation or of the phylum of Reptilia or of the Garden of Eden or a host of other notions, so that to restrict its symbolic significance to representation of the male sex organ exclusively is hardly warranted. Criticism of this sort can be applied to all other allegedly fixed dream symbols.

Freud's technique of getting at motivational determinants by means of free association has also been exposed to criticism. Some critics have called attention to the difficulty of finding out when

to call a halt in the onward flow of the patient's associations. How is one to recognize the terminus of latent content? Others have maintained that even if latent content is reached by such a train of associations, it would not follow that dream formation had taken the same associative pathway in the reverse direction. For example, a woman may dream of a game of cards in which she holds four aces. By means of free association the latter item may induce her to think in successive fashion of the Four Horsemen of the Apocalypse, a eucalyptus tree, a shoe tree, a shoe salesman and, finally, the owner of a shoe store whom she met at a dance some months previously. Let it be further assumed that she admits having found him a very attractive person. Does it follow, the critics of this point ask, that her supposititious desire to "win the hand" of this attractive man expressed itself in the dream by the reverse sequence of associations going from the unconscious desire for the man, to a shoe salesman, to a shoe tree, to a eucalyptus tree, to the Four Horsemen of the Apocalypse and ending with the thrill of holding a hand with four aces? Evidence justifying an affirmative answer to this question has not been supplied to the satisfaction of these critics.

An additional phase of Freud's theory to which many critics objected was his emphasis on unconscious, infantile sexuality as a preponderant source of potent dream instigation. These critics regard such emphasis as decidedly exaggerated. They would enlarge the scope of potential dream motivation to include all of man's lusts, aspirations, ambitions, fears, cravings and strivings. The life of conation, both conscious and unconscious, is not to be compressed within the narrow confines of a child's frustrated sex curiosity.

Freud himself was not unmindful of some of these objections and sought to answer them. His followers no longer accept the early formulation of the theory in its orthodox form. Few, if any, for instance, endorse the doctrine of fixed dream symbolism.

The attack on Freud's theory has been severe, but certain basic features of his formulation seem to have survived adverse criticism. These include Freud's emphasis on the need for a distinction between manifest and latent content; the role of such dynamisms as displacement and condensation; and what may possibly constitute his most penetrating insight: recognition of dreaming as a dramatic projection and distorted expression of underlying personal conflicts. By thus envisaging the dream as a product of motivational tensions Freud paved the way for the development of numerous other so-called projective techniques for studying the complexities of human motivation. These are methods calculated to induce people to reveal their inner preoccupations and personal conflicts by the kinds of stories they invent to account for the meaning of pictures shown to them, by the figures they project into meaningless graphic representations of clouds or ink blots, by what they choose to draw or model when supplied with crayons or clay, or by the way in which children "play house" when manipulating dolls symbolic of a family group. All such methods may be regarded as outgrowths of Freud's teaching regarding the psychological significance of the dream fantasy.

A Bipartite Theory. — It would be misleading to think of every dream as a projection of unconscious personality conflicts. A satisfactory theory of dreams must account for all dream phenomena. As a consequence, the Freudian view requires supplementation.

Dreams may be regarded as products of two sets of factors: (1) the stream of impulses reaching the sensory areas of the brain that chance to spill over the heightened sensory thresholds of the sleeping person; and (2) motivational tensions which, figuratively speaking, are clamouring for expression. By taking account of these two sets of factors it ought to be possible to explain the nature of all dreaming at least in terms of a first approximation to probable scientific fact.

Understanding of this bipartite approach to dream phenomena is facilitated by consideration of one of the above-mentioned projective techniques. When a person is confronted with an ink blot on a sheet of paper and asked what the blot might be or what it makes him think of, two kinds of replies might be forthcoming. By noting the outline of the blot he might find enough resemblance to the coast line of Australia to venture the guess that the blot can be taken to be a map of that continent. Such a response is not so much a projection of his personal troubles as it is a product of his general intellectual background. It is a product of the what-can-this-be type of mental set induced by strange or ambiguous stimulus patterns. It is more or less implicit in every act of difficult perception such as trying to recall what friend a stranger seen on the train resembles or what a strange noise coming from the attic might mean. What a person does under such circumstances is to try out various possible suggestions supplied by his background of relevant experience until he stumbles on something that fits the perplexing pattern. The motivation back of such effort is often little more than intellectual curiosity of the kind involved in solving crossword puzzles, watching a steam shovel operate or reading the headlines of a newspaper. No crucial personality conflicts are revealed by perceptual acts of this sort.

Many dreams can be regarded as products of this kind of perceptual effort induced by the ambiguous nature of sensory patterns experienced by the sleeper. More ambiguity occurs in sleeping than in waking because so much of the total perceptual field is cut off. This truncated stimulus pattern is not easily recognizable precisely because it is a distortion of the familiar whole of waking perception. It is this novel stimulus pattern to which the dreamer responds with the what-can-it-be attitude. The consequent dream formation may be regarded as a series of trial percepts — many of them bizarre — brought to bear on what amounts to a bizarre problem.

The motivational tensions that the bipartite theory would utilize in accounting for dreams may also be exemplified by means of the ink-blot technique. If a dark smudge on the blot were to remind a subject of black despair or of sudden death or of the dark forces of evil or of conspirators whispering in the night, then a different set of psychological factors would be involved. In such a case the subject would be projecting his own worries on to the blot material. Projection of this kind would constitute a species of tension-release for him. What he attributes to the blot would be more a sign of what is going on within him than a description or an explanation of the blot as a visual object.

Under the circumstances it should be clear why trial percepts are closer to perceptual reality than are processes of tension-release. The tenuous nexus between provocative stimulus and tension-release may account for the bizarre character of many dreams. It is akin to the incongruity observable in connection with many everyday emotional outbursts in which worried or irritable people give vent to pent-up feelings which are touched off by annoyances disproportionately trivial as compared with the magnitude of the resulting emotional upheaval.

In the light of the bipartite theory dreams are products of tension-release and of trial perception. Sometimes one set of factors may be responsible for a given dream, sometimes another set, and often both sets of factors may be operating conjointly. These possibilities may be illustrated by the dream of the chemist F. A. KekulC whose theory of the benzene ring was a product of what KekulC observed in a dream at a time when he was working on his textbook of chemistry. The writing, he reported,

> did not go well . . . I turned the chair to the fireplace and sank into a half sleep. The atoms flitted before my eyes . . . wriggling and turning like snakes. And see, what was that? One of the snakes seized its own tail and the image whirled scornfully before my eyes. As though from a flash of lightning I awoke. I occupied the rest of the night in working out the consequence of the hypothesis.

The dream had supplied KekulC with a picture of the benzene ring. It may be presumed that preoccupation with a difficult chemical problem had resulted in the kind of tension that goes with personally significant unsolved problems. It may also be presumed that flickering flames from the fireplace touched off vague visual impressions that gave rise to a trial percept congruent with the dozing chemist's tension. Flickering lights were perceived as dancing atoms. This trial percept was governed by the "wish" to overcome an impasse in his writing. Both motivational and perceptual factors thus can be seen as operative in this dream.

There is no way of telling from direct scrutiny of a given dream whether it was the consequence of a trial percept or a function of

tension-release or whether both factors were involved. To settle questions of this sort the investigator must know more about the inner life of the dreamer than bare knowledge of a single dream can supply.

DREDGES AND DREDGING. The word dredge is derived from a form of the word draw, which refers to the pulling of devices over underwater areas to be excavated. Dredging has four principal objectives: (1) to develop and maintain greater water depths than exist naturally, chiefly for canals. rivers and harbours; (2) to raise the level of lowlands and thus create new land areas and improve drainage and sanitation; (3) to construct dams, dikes and other control works for streams and seashore; and (4) to recover subaqueous deposits or marine life having commercial value, such as precious metals and minerals, shellfish for food and pearls, coral and sponges, sand and gravel, and fertilizer.

The noun dredge (British, dredger) refers herein only to large floating contrivances utilized in underwater excavation engineering; the term dredging is restricted to the procedures used to excavate relatively large quantities of subaqueous materials. Other concepts, including land dredges and special equipment utilized in oceanography, are not treated here.

Dredging is an ancient art. The Assyrians and Chinese used spoon-and-bag devices to clear waterways thousands of years ago. In Italy Leonardo da Vinci devised ways to drain marshes and improve harbours; in Holland large areas have for centuries been wrested from the sea by dredging processes. Henry Emile Bazin of France invented a hydraulic pump in 1836, and in 1867 employed centrifugal dredge pumps in excavating the Suez canal. A suction dredge was built in England in 1861, and a self-propelled hydraulic seagoing hopper dredge was employed in the United States for dredging at Charleston, S.C., in 1855.

Dredge designs have improved along with advances in general technology and have also been promoted by demands of shippers and others interested in improved waterways and water fronts. Early devices were for relatively shallow depths and of small capacity and were operated by the muscle power of men and horses. Devices in one country have often been improved in another, largely because of the characteristics of materials encountered.

Dredges are classed as mechanical and hydraulic. Many special types in both classes, and ingenious combinations of the two, have been devised. A great variety of auxiliary devices (rotating cutters, teeth, scrapers. water jets and disks) have been devised to increase dredge efficiency. Likewise, numerous arrangements have been resorted to for holding dredges in a horizontal position and on an even keel.

Mechanical power for dredges has covered a wide range: boilers (low and high pressure; wood. coal and oil burning), steam engines (reciprocating and turbine), internal-combustion engines (diesel. gasoline and naphtha), hydraulic and pneumatic pressure systems, and electric power from shore. Applications of mechanical energy have generally conformed to existing marine practices. All types of dredges may have living quarters aboard.

BASIC TYPES OF DREDGES

Though dredges have been constructed to remove many kinds of deposits, the bulk of material removed has consisted of sand and mud. Production rates of all types of dredges are governed by the character and depth of bed materials, quality and design of machinery, type and amount of power, distance and elevation of discharge point, operator skill, percentage of solids in mixtures and weather and water conditions. Basic types of dredges are generally recognizable from the nomenclature applied to them, such as dipper, grab, ladder, scraper and hydraulic. There are classes within types, and adaptations and combinations of different basic types. Sizes are usually designated as follows: for dipper, grab and scraper dredges, the volume of excavating container; for ladder dredges, the number and volume of individual buckets; for pipeline dredges, diameter of pump discharge; for hopper dredges, total load-carrying volume of hoppers in cubic yards or tons.

Selection of the proper dredging plant for efficient and economical production under a great variety of conditions requires experience and sound judgment. The dipper dredge is capable of excavating practically all classes of material, except hard rock, at 50-ft. depths. The grab dredge, by virtue of its construction, can dredge at great depths. The bucket ladder dredge is favourably adapted for work within the limit of its ladder length for nearly all materials, and for preparing a level bottom. It is popular in Europe and Asia. Dredges of this design have excavated at depths exceeding 100 ft. The scraper dredge is most useful on projects where a long outreach is needed. When the discharge point is reasonably close to the excavation point, and materials are dredgeable hydraulically, the suction-type dredge is usually selected. Whether of pipeline or hopper arrangement, this type of dredge is superior in performance and unit operating cost when large quantities of soft material are involved. Seagoing hopper dredges of the hydraulic class are most efficient for work in exposed or rough sea locations.

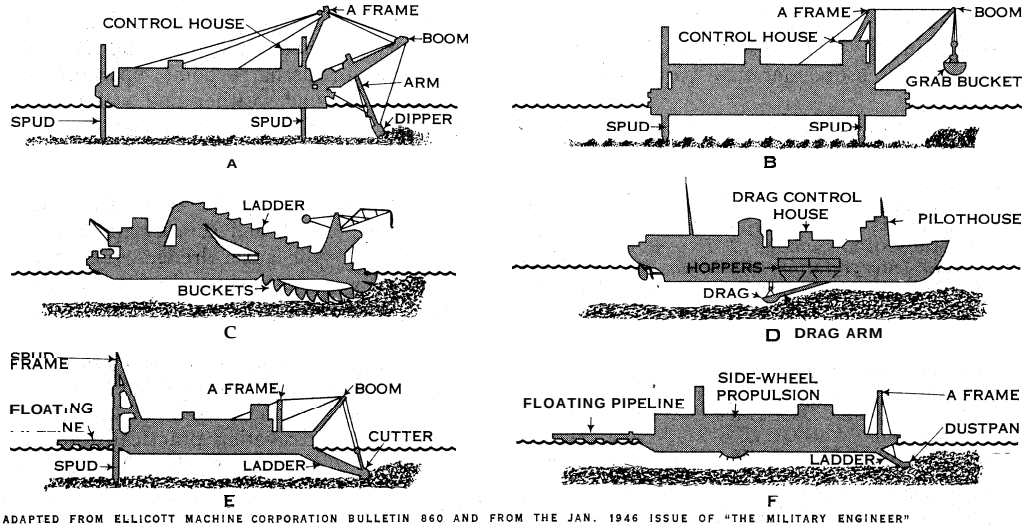
Dipper Dredge.—This dredge is essentially a power shovel mounted on a barge for marine use. Its origin is credited to William S. Otis in 1837. Distinctive features are the bucket and its arm. the boom which supports and guides the arm and is mounted to work around a wide arc and the mechanism that gives excavating movement to the bucket. In operation the dipper is "crowded" into material to be excavated; normally, spoil is dumped into scows for towing to disposal sites. The bucket has a hinged bottom or trap door. which is released to dump a load. To counteract digging reaction, the dredge is usually pinioned to the bottom by large stakes called spuds, and may be only partially water-borne. The dipper dredge will excavate almost any material except solid rock, but is limited in depth by the lengths of boom and dippper arm. Dipper teeth may be added for disintegrated rock and conglomerate masses. The entire dredge must be ruggedly built to withstand severe operating stresses.

Grab Dredge.—This type is also called a grapple, clamshell, orange peel or bucket. It lowers, closes and raises a single bucket by means of flexible cables. It is, in essence, a barge-mounted derrick. In operation the bucket is dropped to the bottom in opened position and bites because of its weight and the action of the bucket-closing mechanism. Some have one line while others operate with two (one each for closing and hoisting). Dredgings are discharged by releasing the bucket-closing line. When constructed in two halves, the bucket is called a clamshell; when consisting of more than two parts, it is referred to as an orange peel; when tongs are used, it is called a grapple. The greatest advantage of the dredge is that the depth to which it can work is practically unlimited. It can also operate in restricted areas. The chief disadvantages are that it leaves an irregular bottom, and the bucket may spin, thereby fouling the lines. Boulders weighing up to 70 tons were excavated by grab dredge at Hell Gate, N.Y.

Ladder Dredge.—The characteristic feature of this type of dredge, also called an elevator, is a continuous chain of buckets rotating around a rigid adjustable frame called the ladder. When the ladder is lowered into operating position the buckets descend empty along the underside of the ladder: at the bottom position the bucket lips dig into material as the chain turns. and the loaded buckets ascend along the upper side of the ladder. As each bucket turns at the uppermost position preparatory to descending,

it spills its contents by gravity into a chute (British, shoot), which, in turn, may be used to direct disposal of the spoil. It may be directed into the vessel's own hopper for transport to the dump area, and the vessel is then known as a seagoing hopper dredge in regions where operated. It may be directed into a barge or scow located alongside, to be towed away or pumped through a pipeline leading to the disposal area. Revolving members at the ends of the ladder are called tumblers; normally, the top tumbler, through gearing, drives the chain of buckets. The conventional ladder is hinged at the top of a high structure and extends downward through a well in the dredge hull at an angle of about 45°.

The lower end of the ladder is supported by cables that serve to adjust dredging or to elevate the ladder above the water surface.



ADAPTED FROM ELLICOTT MACHINE CORPORATION BULLETIN 860 AND FROM THE JAN. 1946 ISSUE OF "THE MILITARY ENGINEER"

DRAWING OF DREDGES IN WORKING POSITIONS

(A) Dipper dredge with spuds lowered and dipper in excavating position; (B) grab dredge with spuds lowered and bucket in raised position; (C) bucket-ladder dredge in dredging position; (D) suction-type seagoing hopper dredge with drag lowered to dredging depth; (E) cutterhead hydraulic dredge with spud lowered and ladder in position for excavation, showing floating pipeline through which mixture of material is discharged by means of large centrifugal pump; (F) shallow-draft dustpan hydraulic dredge in operating position, showing floating pipeline which enables vessel to discharge hydraulic mixture to distant point

Many European bucket ladder dredges are of seagoing type and are used for work in exposed locations. In the United States this type of dredge is used principally for mining and for the recovery of sand and gravel for construction purposes; in the latter case, screening and cleaning equipment is located on the vessel, while unwanted materials pass overboard. Experimental gold dredges of the ladder type introduced into Australia and New Zealand in the 1860s were improved for similar use in California and Alaska. Mining dredges initially worked in river bottoms but they may operate away from streams, carrying ponds or lagoons along as they advance. Rubber conveyer belts are used with mining dredges for stacking rock tailings. The efficiency of the ladder dredge depends on the capacity and number of buckets, the speed of the buckets over the tumblers and the dredging depth, in addition to factors inherent in the machinery design and type of prime mover and the efficacy of disposal methods. A disadvantage is that loose material tends to wash out of the moving buckets.

Scraper Dredge.—The scraper dredge, also called a dragline, handles material with a scoop suspended from a swinging boom. The scoop is drawn forward by a line attached to the front, while a second line attached at the rear holds the scoop at the proper angle to slice the earth away as the device is pulled along. When filled! the scoop is lifted to the peak with both lines taut. After being swung around to a desired position, the scoop dumps automatically when the drag or hauling line is released.

Hydraulic Dredge.—A dredge of this type, also called a suction dredge, makes use of airtight suction piping and a centrifugal pump. In the pump casing an impeller, by its action, draws from the bottom and expels by centrifugal action a mixture composed of solids, water and gases. As a partial vacuum is created within the pump, atmospheric pressure on the outside water surface acts to force water through the only available route, the suction pipe. As the water rushes through the mouth of the drag, it carries in quantities of solid particles. Single or multiple pump installations are in use. Hydraulic dredges have successfully handled solids up to 20% concentration, depending upon the "voids ratio" of materials. In Europe. where loose material is encountered and ground profile is not important, a cutterhead may not be needed; in the United States cutters are required for the bulk of new-work hydraulic dredging because of soil characteristics. Several forms of suction dredges have been developed, but all utilize the hydraulic principle, namely a centrifugal pump, the inlet to which is at the centre of rotation and the discharge of which is at the casing periphery. The basic form, with plain or slightly modified drag opening, is used throughout the world, but three distinct varieties have been evolved in the United States—the cutterhead, the dustpan and the seagoing hopper dredge.

The cutterhead dredge has a rotating cutter installed at the outer end of a movable frame called the ladder. The cutter is actuated by a shaft that runs the length of the ladder. Also installed on the ladder is a suction pipe which leads from just behind the cutter to a centrifugal dredging pump inside the hull. Compacted material released by cutter action forms a mixture with surrounding water, and is then handled hydraulically through a pipeline leading to the disposal area. Control of the dredge is by lever, push button or switch from a central vantage point. Some dredges of this type are self-propelled; small ones are portable. Monthly production rates range from about 20,000 cu.yd. of solids for a 6-in. dredge to over 200,000 cu.yd. for a 16-in. dredge working 24 hours a day. Pipelines may vary in length from a few hundred feet with a 6-in. dredge for handling heavy material to several miles with a 30-in. dredge handling lighter material. A cutterhead dredge operating in the Panama canal lifted material a height of 137 ft. with the aid of booster stations.

The dustpan dredge was developed under the auspices of the Mississippi River commission during the period of 1891–96 for quick removal of large deposits of alluvium, principally where sand bars accumulate at crossings (where the natural channel shifts from near one bank to the other). The typical dustpan dredge is self-propelled for rapid transfer between work sites, but having once been placed in dredging position, it operates much the same as other stationary dredges. The suction opening at the lower end of the ladder is greatly expanded horizontally to form a dustpan that may be up to 36 ft. in width by 1 ft. in height. Hydraulic features are quite large (up to 34 in. in diameter) in order to move large quantities of material quickly. Multiple high-velocity water jets located in the suction head loosen material being attacked. Otherwise, except that floating discharge line only is used, the functioning is similar to that of a cutterhead-type hydraulic dredge. Spoil is deposited in shallow areas at considerable distances (up to 1,000 ft.) from the dredging site to minimize the drifting back of the material into the marked navigation channel. The dustpan ladder extends forward during dredging. As a rule, dustpan dredging is done on falling river stages, where low water depths are expected to be deficient. Some are radial feeding; others have swinging ladders.

The seagoing hopper dredge of the hydraulic type has been developed almost exclusively by the U.S. army corps of engineers. Normally it operates within navigable rivers and harbours, and

goes to sea only for dumping purposes or to navigate between ports. It has the molded hull and lines of a self-propelled ocean vessel and is equipped with special apparatus and machinery for removing material from a channel bottom or ocean bed and carrying it in compartments called hoppers to another location for disposal. Hinged-leaf. conical and cylindrical hopper doors or opening devices are power operated. Hopper dredges of American design raise spoil by large centrifugal pumps, by which bed material is mixed with water and drawn upward through large tubular drag arms, while the drags maintain contact with the bottom. The mixture is discharged into hoppers where the solids settle and excess water passes overboard via troughs. After a load is obtained, the drag arms are raised and the vessel proceeds at a relatively high speed to a disposal site where, usually, the spoil material is released through bottom-dump doors. After the hoppers are emptied and the bottom doors closed, the ship is returned to the dredging area to repeat the cycle of operation.

Material is usually deposited into deep water to ensure permanent removal, although some dredges of this type are equipped for repumping material, either directly or through a separate rehandler into which the hopper dredge first disgorges its load. Hopper dredges built in the United States have trailing drag arms (over the stern. at ship's side or through a centre well) and move ahead at an average dredging speed of from two to three miles an hour. Also, they have pilothouse control and twin screws and rudders, and are cut away aft to improve maneuverability. The advantages of this style of dredge are: (1) it can work effectively, safely and economically in waters exposed to the open sea; (2) it can transfer quickly, at low cost, to other dredging sites; (3) it does not interfere with or obstruct navigation; (4) it quickly improves the entire dredging area because of removal of successive layers from shoal; (5) it is independent of delays from inoperable attendant plant; (6) it can usually make a central cut to induce natural scour; (7) it discourages spot shoaling by making a series of long shallow cuts; (8) it can be used for agitation dredging, with or without filling hopper, if material is slow settling; (9) it requires no expensive upland spoil-discharge area. A disadvantage is that the actual dredging is interrupted to go to the disposal area. Hopper dredge operations have been greatly improved by such steps as the unwatering of the hoppers (to minimize dilution), installation of gas ejectors (to prevent choking of the pump because of excessive quantities of entrained gas) and determining the most economic loading time. Economic loading of hopper dredges is based on the determination of that pumping time which. in each case. results in removal of the maximum amount of spoil material in a given time. Involved are times for loading. turning, traveling to and from the disposal area and dumping. Proper selection of drag from several available designs (fixed, adjustable and self-adjusting) contributes toward more effective results. The combined area of drag opening is about four times the cross-section area of suction pipe.

AUXILIARY APPLIANCES AND ATTENDANT PLANT

Dredging operations often require the employment of attendant plant, such as tugboats for maneuvering nonself-propelled dredges and the spoil containers, and rehandlers or boosters in pipelines. Nonself-propelled dredging equipment requires a power vessel to get into and from dredging sites.

Supplementary items that may be required in connection with operating dredges (except those of hydraulic seagoing hopper type) are scows or barges (towed or self-propelled; self-dumping or clammed out), pontoon-mounted sections of discharge pipeline, anchor barges, elbow barges, end barges, quarter boats (if no crew accommodation exists otherwise), fuel and water barges, supply tenders, personnel launches and sounding equipment. Several kinds of built-in spuds (bank, digging, walking) are used to hold stationary dredges in place while working; in addition, anchors, piling and winches are extensively utilized to swing or position dredging plant. Pipeline sections are joined by rigid flanges, flexible rubber sleeves or steel ball joints. In dealing with removal of underwater hard rock, British engineers employ rock breakers (heavy pointed bars or chisels for dropping until shattering occurs); U.S. engineers almost always use drill boat and blasting charges for this work.

SURVEYS AND SUPPLEMENTARY ENGINEERING

Surveys are an integral part of dredging. They include the making of hydrographic surveys to determine water depths at precise locations, gauging tidal heights and velocities, sampling of material in channel beds and positioning buoys to mark a dredging area. Topographic survey work involves sextant targets, shore-based ranges and shore-line features. Disposal areas may be designated in deep or shallow water or ashore, depending upon the type of dredge, availability of space, economy considerations and permanence of retention. Structures such as dikes (including sheet piling. for retaining solids), sluiceways (for runoff of excess liquid) and trestles (if required) are constructed as adjuncts to disposal ashore by pipeline dredge. The foregoing data are shown on maps and described in specifications prepared for proposed work. After the site has been explored and the work laid out, plant is assembled and the actual dredging begins. It is desirable to place a resident inspector on the job to ensure compliance with dredging specifications, for numerous details, aside from operating dredging machinery, require attention (sampling, testing, soils data, dredging aids, measurements, computations, reports, supply and personnel problems, and related items). When solids are stirred up intentionally, or are pumped overboard after economic loads have been obtained, and these solids drift away through current or tidal action to be deposited outside the channel in quantities that are beneficial, the operation is called agitation dredging. Influencing factors are the settling rates of solid particles, velocity and direction of current, stage and set of tide and littoral drift. Agitation dredging should not be performed if conditions would cause stirred-up material to return to the project area or to where future excavation is planned.

DETERMINATION OF WORK *DONE*

Surveys showing conditions before and after dredging are used to compute place measure of the work performed. Modern depth sounding and computations of quantities of material may be accomplished electronically. Material moved may also be measured "in the loose" by determining the amount of solids actually issuing from the dredge, either from known capacities of floating containers or by surveying the spoil deposited. Various rules of thumb have been employed to learn the performance of a dredge at any given moment, such as watching the rate at which buckets travel over a ladder, counting the dips or grabs per hour or estimating the velocity and concentration of solids flowing from a pipeline. Compacted in *situ* material may expand 50% in handling. An instrument known as a yardage meter, based on displacement changes, gives instantaneous readings of loading on American hopper dredges.

DRED SCOTT DECISION, a decision by the U.S. supreme court announced on March 6, 1857, that added fuel to the bitter sectional controversy over slavery and pushed the nation further along the road to civil war. The opinions of a majority of the justices covered three main points: (1) Negroes were not citizens and therefore could not sue in the federal courts; (2) a slave's residence in a free state did not make him a free man; (3) the Missouri Compromise of 1820, which had forbidden slavery in that part of the Louisiana Purchase (except Missouri) lying north of latitude 36° 30′, was an unconstitutional exercise of congressional power.

The decision concerned the status of an illiterate Negro slave, Dred Scott, who was purchased in 1833 by a U.S. army surgeon, John Emerson. In 1834 he was taken by his master from Missouri, a slave state, to Illinois, a free state. He was later taken to Ft. Snelling in the northern part of the Louisiana Purchase. Emerson returned to St. Louis with Dred Scott in 1838. In 1846, with the help of antislavery lawyers. Scott sued for his own and

his family's freedom in the Missouri state courts on the ground that his residence in a free state and a free territory had made him a free man. The Missouri supreme court ruled against Scott and the case was eventually taken into the federal courts. Scott's owner by this time, Emerson having died, was a citizen of another state. John F. A. Sanford of New York. (Sanford's name was incorrectly spelled in the official record as "Sandford" and the case is usually cited as *Dred Scott* v. *Sandford.*) Scott claimed that as a citizen of Missouri he was entitled to sue a citizen of another state in the federal courts.

Each member of the supreme court wrote a separate opinion. Most agreed wholly or in part with the opinion written by the chief justice, Roger B. Taney, and his opinion is usually referred to as the opinion of the court. Taney declared that Dred Scott was not entitled to sue in the federal courts because he was not a citizen as that term was understood at the time the constitution was adopted. The case might have been dismissed on this narrow ground but Taney went on to make certain further observations (*obiter dicta)* about the case. He asserted that Dred Scott had not become a free man by virtue of his residence in territory declared free by the Missouri Compromise because in passing that legislation congress had exceeded its constitutional powers. (The Missouri Compromise was no longer on the statute books as it had been repealed by the Kansas-Nebraska act of 1854.) According to Taney, congress had no power to forbid slavery in the territories because slaves were property and property rights were protected by the constitution. This was the first time since *Marbury* v. *Madison* (1803) that the supreme court had declared an act of congress unconstitutional. Taney's opinion stated that Dred Scott was still a slave because the courts of Missouri, where he lived, had so ruled.

The Dred Scott decision dealt a serious blow to the antislavery forces that had hoped to keep slavery out of the territories, and particularly to Sen. Stephen A. Douglas' doctrine of "popular sovereignty" by which the residents of a territory were to be free to decide for or against slavery. Republican newspapers denounced the decision and spoke of the mounting danger of the slaveholding interest, while Democratic papers generally defended the decision. Though Chief Justice Taney and his colleagues had hoped by their decision to put the slavery issue to rest. they actually fanned the flames of sectional conflict. As for Dred Scott, the pawn in the case, he was freed by his owner soon after the decision and earned his living as a hotel porter in St. Louis until his death on Sept. 17, 1858. After the American Civil War ended, the questions at issue in the Dred Scott case were settled by the 13th amendment to the federal constitution that freed the slaves and the 14th amendment that made them citizens.

DREES, WILLEM (1886–), Dutch statesman and Socialist leader, prime minister from 1948 to 1958, was born in Amsterdam on July 5, 1886. Educated at a commercial school. he was appointed stenographer to the Netherlands ,states-general (parliament) in 1907. He entered politics by joining the Labour (Social Democratic) party and was elected member of The Hague municipal council in 1913 and of the lower chamber in 1933. From 1939 he was chairman of the Labour group in the lower chamber. When the Germans occupied his country in World War II, he contacted other leaders of the forbidden political parties to organize resistance, but was soon arrested and sent to the Buchenwald concentration camp. Released in 1941, he rejoined the resistance and presided over the Vaderlandsche Comité which had to prepare the first governmental measures after liberation. After the German capitulation in 1945 Drees served as minister of social affairs in the governments of Willem Schermerhorn (1945–46) and Louis Beel (1946–48). In 1946, meanwhile, he and Schermerhorn, a left-wing Liberal, had combined to form a new Socialist party, the Party of Labour. On this party and on the Catholic People's party his successive governments from Aug. 6, 1948, to Dec. 12, 1958, mainly relied. As minister of social affairs in his first government he promulgated a series of laws and regulations on labour conditions and social insurance. As prime minister he was chairman of the Round Table conference which granted independence to Indonesia in 1949. At home his aim was to build a welfare state; in foreign affairs he firmly adhered to the Atlantic alliance. In a debate over new tax proposals the Catholic People's party broke the coalition in 1958 and this ended the political activity of Drees. (F. DE J.)

DREISER, THEODORE (1871–1945), U.S. author distinguished for his realistic novels of tragic lives, was born at Terre Haute, Ind., on Aug. 27, 1871. The son of a German immigrant who after an initial success in the new world had failed in business, Dreiser was reared in poverty. His later fascination with fine clothes and other success symbols, as well as the dread of hunger and cold that pervades all his writings, have their roots deep in his childhood experience. Because his father was an ardent Catholic, Dreiser was sent to parochial schools until he was 14. A brief attendance at public schools in Warsaw; Ind., and a year (1889–90) at the University of Indiana concluded his formal schooling. For a dozen years Dreiser was a newspaperman in Chicago, St. Louis, Pittsburgh and New York, and a free-lance magazine writer of sufficient renown to be included in the first edition of *Who's Who in America* in 1899. Through the influence of his brother, Paul Dresser *(sic),* the composer of many popular songs of the day, including "My Gal Sal" and "On the Banks of the Wabash," Dreiser also served for a time as editor of the magazine *Ev'ry Month,* put out by a sheet music publisher.

In 1900, on the recommendation of Frank Norris, the publishing firm of Doubleday contracted to bring out Dreiser's first novel, *Sister Carrie.* For some reason—probably the horror of Mrs. Doubleday—the publisher changed his mind about the book, printed only 1,000 copies and made no effort to promote it in any way. The psychological effect of this disappointment drove Dreiser into a nervous breakdown and the contemplation of suicide. When he regained his health, he went back to magazine work, becoming by 1910 the $10,000-a-year editor of the Butterick "Trio" of women's magazines. But with the publication of his second novel, *Jennie Gerhardt,* in 1911, Dreiser decided to devote himself entirely to writing. In 1912 he brought out *The Financier,* first of a trilogy of novels about a business superman whose career in many respects resembled that of Charles T. Yerkes, the street-car magnate. The second of the series, *The Titan,* followed two years later. In 1915 came *The "Genius,"* a novel which reflects both autobiography and an unguarded enthusiasm for Nietzsche. It aroused a tremendous critical controversy, culminating with an effort by the New York Society for the Prevention of Vice to intimidate the publisher into withdrawing the book. H. L. Mencken, despite his dissatisfaction with the novel, rallied to Dreiser's defense and circulated a petition of protest that was signed by such writers as Willa Cather, Robert Frost, Ezra Pound and Edwin Arlington Robinson. *A Traveler at Forty* and *A Hoosier Holiday,* long volumes of travel description, philosophical reflection and nostalgic memory, were also results of Dreiser's amazing productivity during this period. With *The Hand of the Potter* (1918) he ventured into playwriting, but could not find a producer; and a 1921 production by the Provincetown Players was not a success. *Free, and Other Stories* (1918), his first collection of short stories, included two of his finest, "The Lost Phoebe" and "The Second Choice." In the years 1919–29 he continued to write in the variety of forms with which he had previously experimented: travel book, autobiography, philosophical essay, short story and novel. *Twelve Men* (1919), a collection of vigorous sketches of men whom Dreiser had known, is perhaps his most interesting venture into autobiography and deserves to be better known. *An American Tragedy* (1925), based on the Grace Brown murder case, brought Dreiser wider recognition as a novelist than he had ever before known. Dramatized by Patrick Kearney, the novel became a Broadway hit, and Hollywood twice made a film of the book. Between *Tragic America* (1932), a social commentary, and *America Is Worth Saving* (1941), a plea for isolationism, no book came from Dreiser's pen. Two posthumous novels, *The Bulwark* (1946) and *The Stoic* (1947), the third of the businessman trilogy, were Dreiser's final literary testaments.

In 1917, Mencken said of Dreiser's writing that it "often takes

on the character of an actual siege operation, with tunnelings, drumfire, assaults in close order, and hand-to-hand fighting." Dreiser was, said Mencken, "the Hindenburg of the novel." (A Book of Prefaces, New York. Alfred A. Knopf, Inc.) But if Dreiser's style was massively clumsy and his diction often trite, he understood supremely well the psychology of the outsider in the rising American cities, his loneliness, his desires, and the cost exacted of him for the realization of his dreams.

BIBLIOGRAPHY —The best biography of Dreiser is Robert H Elias, *Theodore Dreiser: Apostle of Nature* (1949). Other studies of a more critical nature as F. O. Matthiessen, *Theodore Dreiser* (1951); Alfred Kazin and Charles Shapiro (eds.), *The Stature* of *Theodore Dreiser* (1955); Kenneth S Lynn, *The Dream* of *Success* (1955).

(K. S. LN.)

DRENTHE, a province of the northeastern Netherlands, is bordered northwest by Friesland, south and southwest by Overijssel, southeast by Germany, north and northeast by Gronigen. Area 1,011 sq.mi. Pop. (1957 est.) 301,814, mostly rural.

In contrast with the marshlands farther north, the province forms a low plateau, mostly between 30 and 60 ft. high but reaching nearly 100 ft. in the ridge of the Hondsrug in the east. The plateau surface is ground moraine and fluvioglacial deposits, mostly coarse sands; alluvium covers the valley floors and raised bogs occupy large areas in the south. The streams are short and flow in shallow valleys; much of the drainage, even outside the peat, is canalized. The southern streams are all collected at two points on the southern borders—Meppel and Coevorden—whence they communicate with the Zwarte Water and the Vecht respectively by means of the Meppeler Diep and the Coevorden canal. The Steenwijker Aa, however, enters the Ijsselmeer independently. The northern rivers all flow into Groningen.

Prehistoric settlement on the plateau began early. Mesolithic occupation sites existed at Anlo, Diever and Oosterwolde. Neolithic colonists brought agriculture to the area and erected at least 54 megalithic structures (hunebedden); they also planned many tracknays and built wooden causeways over boggy areas. Agriculturalists of this and later periods cut much of the existing open woodland and thus extended the area of heathland. Agricultural activity continued in the succeeding Bronze and Iron Ages, though the climate nas drier and settlement probably less dense. Some Iron Age (La Tène) fields still remain.

Saxon invasions came in the 5th and 6th centuries A.D., and the area was later governed by counts under the Frankish and German kings. Betneen 1046 and 1522 the countship was part of the bishopric of Utrecht, but in 1536 it was incorporated in the Habsburg dominions. Although it took part in the revolt of the Netherlands, Drenthe was not separately represented in the states-general until 1796. The province was under French rule between 1795 and 1813 and was occupied by the Germans between 1940 and 1945.

During the middle ages population on the heathlands remained low and settlement scattered. Wolves and other wild beasts were not eliminated until 1800. Rye was the chief grain crop, but potatoes mere of increasing importance from the 18th century. Cattle and horses were kept in limited numbers on the valley pastures and flocks of poor-grade sheep grazed the heathlands. In the 19th century systematic attempts to convert heathlands to agricultural use increased, using heavy dressings of urban compost. Three new settlements were established for paupers, the largest being Frederiksoord, and four for criminals; *e.g.,* Aardsche Veld. Reclamation continued irregularly from that time; in 1926 the Zwindersche Veld between Coevorden and Hoogeveen was enclosed.

The flocks of sheep have disappeared, and cattle and swine are the chief livestock. Mixed farming, with rye as the principal grain, remains general. Milk products are important and dairy factories have been established in many villages. One-sixth of the area, chiefly lowland, is in market gardens or orchards. Much of the heathland reclaimed after the end of the 19th century has been laid to grass. Nearly one-third of the surface of the province is still *Calluna* heathland. covering large areas with little interruption, as in the Ellertsveld. Some heath is in reservations, near Dwingelo, some in military training grounds. Afforestation, begun privately before 1800. and after 1905 under provincial control, has been considerable.

Raised bogs (*hoogveenen*) cover substantial areas of Drenthe, though less than in Groningen to the east. Turfs were being cut for sale by monastic houses as early as 1193, but medieval interest in the bogs was confined to unregularized peat cutting for fuel. Attempts to cut all the peat from an area and convert it to agricultural use began later—at Ruinerwold and Hoogeveen in the 17th century, Smilde and Hijkershulde in the 18th and at least nine different districts in the 19th. The 19th-century pauper colonies reclaimed bog at Veenhuizen, the convict settlers at Vledderveen. Whereas on the southern border of the province the former peat bogs (veenkolonien) have been converted into grassland. those on the eastern and western sides of the plateau are arable land, with rye, oats and potatoes as the principal crops. Only in the extreme southeastern corner of Drenthe is the digging of peat carried on.

Drenthe has a long tradition of cottage industry; *e.g.,* spinning, weaving and ropemaking. Processing agricultural products was by 1960 the chief ,industry and was widely distributed; potato flour and strawboard are two important products Meppel, the port of Drenthe. has shipbuilding and pharmaceutical chemicals, Hoogeveen aluminum products and ceramics. Assen clothing and printing. Emmen is being developed as a "new town" with nylon, chemical and timber industries. Oil deposits, found near Oud Schoonebeek in 1944, produce more than 1,000,000 metric tons annually. (J. T. C.)

DRESDEN, a city of Germany which after partition of the nation following World War II became capital of Dresden *Bezirk* in the German Democratic Republic. Prior to 1952, it was capital of the former *Land* of Saxony. It lies in the broad basin of the Elbe river between Meissen and Pirna, 111 mi. S. of Berlin by rail. The estimated population in 1959 was 493.515.

Dresden was once called .'Florence on the Elbe" before the widespread destruction sustained during the war and was numbered among the most beautiful cities in the world, noted for its architecture and great art treasures. On Feb. 13, 1945, the city was devastated by phosphorus and high-explosive bombs. Since then it has been to a great extent reconstructed, with modern buildings, broad streets, squares and green open spaces, while as far as possible the character of the old town has been preserved. This baroque city is spread along the Elbe valley, to the north of which are the Lossnitz ridges, the woods of the Dresdener Heide and the steep slopes of the Lausitz (Lusatia) granite plateau, while to the south are the foothills of the Erzgebirge. The sheltering hills contribute to the mild climate; the average annual temperature is 50° F. North of the river, on the right bank, is Neustadt (so-called "new town" but really the older part), and to the south is Altstadt ("old town") with old and new suburbs. Four road bridges and a railway bridge connect the two parts of the town. The central bridge was the Augustusbriicke, originally built in 1727–31 but now superseded by a wider one called the Dimitroff bridge. The centre of the old town is still the Altmarkt, which retains the characteristic silhouette of its towers, and the Postplatz, Pirnaische Platz, Pragerstrasse, Wiener Platz, the Neumarkt, Theaterplatz, Neustadter Markt and the Strasse der Befreiung (formerly Haupstrasse of Neustadt) remain important points in the city's layout.

Dresden's churches suffered severely during World War II. The Frauenkirche (1726–43) with its cupola, built by George Bahr, was almost totally destroyed but has been included in the plan for Dresden's reconstruction. Many notable churches have been restored. These include the rococo Hofkirche with its slender tower nearly 300 ft. high (built by C. Chiaveri 1739–51), the twin-towered Sophienkirche on the Postplatz, the baroque Dreikonigskirche in the new town and the Kreuzkirche on the Altmarkt where, besides regular church services, the concerts of the famous Dresden Kreuzchor take place.

Many historic secular buildings were also damaged. Among these was the Georgenschloss, the former royal palace in the Altstadt, built in 1530–35 by Duke George the Bearded and thoroughly restored between 1890 and 1902 in German Renaissance style. The George gate (Georgentor), also damaged, was

widened to allow vehicular traffic to pass through it and beneath the royal apartments from the centre of the town to the Augustus-briicke. The whole is surmounted by a lofty tower (387 ft.), the highest in the city.

Dresden has several world-famous museums and galleries. The Zwinger, originally planned by M. D. Poppelmann as forecourt for a castle, houses a number of valuable collections including pewter and porcelain. There are zoological and mineralogical museums and a room containing instruments used in mathematical and physical science. In the open space north of the Zwinger a Renaissance style building was erected in 1846, the exterior of which is adorned by statues sculptured by E. Rietschel and E. J. Hahnel of Michelangelo, Raphael. Giotto, Dante, Goethe and other famous artists and poets. This building, the Semper gallery, was destroyed in 1945 and reopened in 1960, the 400th anniversary of the foundation of the Dresden art collections. It contains Dresden's famous pictures, among which are many great paintings of the Italian, Dutch and Flemish schools. The gem of the collection is Raphael's "Madonna di San Sisto" for which a room is set apart. This and other art treasures, taken by the Russians in 1945. were returned ten years later. There are famous paintings by Correggio, Titian, Paolo Veronese, Andrea del Sarto, Rubens, Van Dyck and Rembrandt as well as those of many modern painters. The chapel of the Georgenschloss contains pictures by Rembrandt, Nicolas Poussin, Guido Reni and Annibale Carracci. The Japanese palace, overlooking the river from the north bank, formerly housed a library of 3,000 manuscripts and 20.000 maps. It now houses collections of coins and porcelain, including pieces from the far east, Sèvres and Meissen.

Dresden is also a city of music with a great operatic tradition. Both Weber and Wagner conducted there where operas by Richard Strauss and others had their first performances. The opera house was completed in 1878 in the Renaissance style according to G. Semper's design. It stands on the western side of the Theaterplatz overlooking the river.

The city has a long tradition of learning, particularly in the scientific and technical fields. The technical college, destroyed in World War II, has been rebuilt and much expanded. Other colleges in the city are for the study of music, medicine, plastic arts and transport. There are a teachers' training college and a celebrated academy of painting. The Central Institute for Nuclear Physics is not far from the town. The Deutsche Hygiene museum has an international reputation, particularly for its manufacture of transparent plastic anatomical models, which are exported all over the world.

Parkland. wooded on the northern bank, and many public and private gardens contribute to the city's beauty. There are also several historic parks, notably the Grosser Garten. southeast of Altstadt In this park. which was laid out in 1676 by John George II, are the botanical and zoological gardens, and in the centre of it stands the Lustschloss built in 1670–80. The Freilicht-theater ("open-air theatre"), completed in 1956, is also there. The hunting lodge Moritzburg lies 8 mi. N.W. of Dresden, surrounded by small lakes. The city has sports grounds and swimming pools.

Industry and Communications. — The city's industry developed only in the middle of the 19th century but expanded greatly after World War II. There is no heavy industry but a wide variety of goods are manufactured, including precision tools and optical instruments. radio and electrical equipment, electrical transformers and X-ray apparatus, sewing and adding machines, typewriters. cigarettes. cardboard and foodstuffs. There is extensive market gardening, and camellias, azaleas, rhododendrons and roses are cultivated for export. The industry with which Dresden's name is primarily connected, however, is the manufacture of china, especially figurines. Known as Dresden or Meissen china, the industry originated in Dresden but was removed to Meissen, 15 mi. N.W., in 1710. (See POTTERY AND PORCELAIN.)

Dresden lies at the centre of an extensive railway system. which places it in communication with the chief cities of northern and central Germany as well as with the southeast. It is a junction on the grand trunk lines Berlin-Vienna and Wroclaw (Breslau)-Gorlitz-Dresden to Karl-Marx-Stadt. The Elbe connects directly with the inland waterway system as far as Hamburg and into Czechoslovakia. The Ndrnberg-Hof Autobahn divides, north of Dresden, into two branches leading to Gorlitz and Berlin. Services of the German Democratic Republic's *Lufthansa* operate from the airport. Dresden-Klotzsche.

HISTORY

The Dresden area was once a settlement of Slav villages, one of which, on the right bank of the Elbe, was called Dresdany, meaning "forest dwellers on the plain." The town on the left bank was founded by Margrave Dietrich as a German colonial town. Although, in fact. of earlier origin, the Slav village came to be known as Neustadt, and the later Germanic settlement as Altstadt. The first authentic mention of the town Dresden is in 1216. Decisive factors in the choice of position for the settlement were the ford over the Elbe. which was part of a trading road, the flood-free situation. the natural protection afforded by lakes and ponds and the development of trade and mining in the Erzgebirge. There is no reliable reference to a bridge over the river, however, until 1287. It became the capital of Henry the Illustrious, margrave of Meissen, in 1270, but for some time after his death belonged first to Wenceslaus I, king of Bohemia, and next to the margrave of Brandenburg. Early in the 14th century it was restored to the margrave of Meissen. On the division of Saxony in 1485 it fell to the Albertine line. Having been burned almost to the ground in 1491, it was rebuilt, and in the 16th century it became a capital town and the fortifications were begun. Dresden accepted the Reformation in 1539. The fusion of old and new Dresden took place between 1680 and 1700. In the 17th century John George II greatly improved the town; it took on its baroque character in the first half of the 18th century, when Augustus I and Augustus II, kings of Poland as well as electors of Saxony, modernized it. The Neustadt. which had been burned down in 1685, was founded again by Augustus I on a plan designed by Wolf Kaspar Klengel. He also founded Friedrichstadt on the broad promontory to the northwest of the Altstadt. The treaty of Dresden, signed on Dec. 25, 1745, between Prussia, Saxony and Austria, ended the second Silesian War and confirmed Silesia as Prussian.

Under bombardment during the Seven Years' War. two-thirds of Dresden was destroyed. In 1813 Napoleon made the town a centre of military operations and there, on Aug. 26 and 27, he won his last great battle. The dismantling of the medieval fortifications. begun by the French in 1810. was completed by 1830, and gardens and promenades were made. Many buildings were completed or founded by King Anthony (1755–1836), from whom Antonstadt on the north bank derives its name. Dresden again suffered severely during the revolution of 1849, and in 1866 it was occupied by the Prussians, who did not finally evacuate it until the spring of the following year. (See GERMANY: *History*) The city's prosperity grew rapidly during the 19th century, accelerated

by the completion of railways connecting it with Berlin and Leipzig. The same century saw the growth of industrial suburbs, mostly on the left bank.

World War I brought street fighting in 1919. During air and artillery bombardment of Dresden in World War II extensive destruction was wrought in the city and over 35,000 people were killed. Dresden was occupied by Soviet troops on May 8, 1945. Since 1945 a great deal of rebuilding has taken place. (Js. B.)

Battle of Dresden. — The battle of Dresden, the last of the great Napoleonic victories, was fought on Aug. 26 and 27, 1813. The intervention of Austria in the War of Liberation and the consequent advance of the allies under the Austrian field marshal Prince Karl Philipp Schwarzenberg from Prague upon Dresden recalled Napoleon from Silesia, where he was engaged against the Prussians and Russians under Gebhard Lebrecht von Bliicher. Only by a narrow margin of time was he able to bring back sufficient troops for the first day's battle. He detached a column under Dominique René Vandamme to the mountains to interpose between Schwarzenberg and Prague (see NAPOLEONIC WARS); the rest of the army pressed on by forced marches for Dresden, around which a position for the whole army had been chosen and fortified, though at the moment it was held by fewer than 20,000 men under Laurent de Gouvion Saint-Cyr, who retired there from the mountains, leaving a garrison in Konigstein, and had repeatedly sent reports to the emperor about the allied masses gathering to the south.

The battle began late in the afternoon, for Schwarzenberg waited as long as possible for the corps of Klenau, which formed his extreme left wing on the Freiberg road. At last, about 6 P.M., he decided to wait no longer and six heavy columns of attack advanced against the suburbs defended by Saint-Cyr and now also by the leading troops of the main army. Three hundred guns covered the assault, and Dresden was set on fire in places by the cannonade, while the French columns marched unceasingly over the bridges and through the Altstadt. On the right the Russians under Ludwig Adolf Peter Wittgenstein advanced from Striesen, the Prussians under Friedrich Kleist von Nollendorf through the Grosser Garten, while Prussians under Prince Augustus and Xustrians under Hieronymus, Count von Colloredo-Mansfeld, moved upon the Moczinski redoubt, which was the scene of the most desperate fighting and repeatedly changed hands. The attack to the west was carried out by the other Austrian corps; Klenau, however, mas still far distant. In the end, the French defenses remained unshaken. Michel Key led a counterattack against the allies' left, the Moczinski redoubt was definitely recaptured from Colloredo-Mansfeld and the Prussians were driven out of the Grosser Garten. The coup of the allies had failed, for every hour saw the arrival of fresh Napoleonic forces, and the Austrian leader withdrew to the heights again. He was prepared to fight another battle — indeed he could scarcely have avoided it had he wished to do so, for behind him lay the mountain defiles, toward which Vandamme was marching with all speed.

Napoleon's plan for the 27th was, as usual, simple in its outline. As at Friedland, a ravine separated a part of the hostile line of battle from the rest. The villages west of the Plauen ravine and even Lobda were occupied in the early morning by General Metzko with the leading division of Klenau's corps from Freiberg, and upon Metzko Napoleon intended first to throw the weight of his attack. giving to Claude Victor's infantry and the cavalry of Joachim Murat the task of overwhelming the isolated Austrians. The centre, aided by the defenses of the Dresden suburbs, could hold its oun, as the events of the 26th had shown; the left, now under Ney, with whom served François Kellermann's cavalry and the Young Guard, was to attack Wittgenstein's Russians on the Pirna road. Thus, for once. Napoleon decided to attack both flanks of the enemy. His motives in so doing have been much discussed by the critics; Vandamme's movements, it may be suggested, contributed to the French emperor's plan, which if carried out would open the Pirna road. Still, the left attack may have had a purely tactical object, for in that quarter was the main body of the Prussians and Russians, and Napoleon's method was always to concentrate the fury of the attack on the heaviest masses of the enemy; *i.e.*, the best target for his own artillery. A heavy rainstorm during the night seriously affected troop movements on the following day. but to Kapoleon's advantage, for his more mobile artillery, reinforced by every horse available in and about Dresden, was still able to move where the allied guns sank in mud. Further. if the cavalry had to walk, or at most trot through the fields the opposing infantry were almost always unable to fire their muskets. "You cannot fire; surrender," said Murat to an Austrian battalion in the battle. "Never," they replied; "you cannot charge us." On the appearance of Murat's horse artillery, however, they surrendered. Under such conditions, Metzko, unsupported either by Klenau or the main army beyond the ravine, was an easy victim. Victor from Lobda drove in the advanced posts and assaulted the line of villages Wolfnitz-Toltschen; Metzko had to retire to the higher ground southwest of the first line, and Murat, with an overwhelming cavalry force from Cotta and Burgstadl, outflanked his left, broke up whole battalions and finally, in conjunction with the renewed frontal attack of Victor's infantry, annihilated the division. The Austrian corps of Ignace Gyulai arrived too late to save it.

Meanwhile Ney on the other flank, with his left on the Pillnitz road and his right on the Grosser Garten, had opened his attack. The Russians offered a strenuous resistance defending Seidnitz, Gross Dobritz and Reick, and Ney was so far advanced that several generals at the allied headquarters suggested a counterattack of the centre by way of Strehlen so as to cut off the French left from Dresden. This plan was adopted, but failed because of various misunderstandings. Thus the allied centre remained inactive all day, cannonaded by the Dresden redoubts. One significant incident took place there. Tsar Alexander I, the king of Prussia, Schwarzenberg and a large headquarter staff watched the fighting from a hill near Racknitz and offered an easy mark to the French guns.

In default of formed bodies to fire at, the latter had for a moment ceased fire; Napoleon, riding by, half carelessly told them to reopen. and one of their first shots, directed at 2,000 yd. range against the mass of officers on the sky line, mortally wounded Gen. Jean Victor Moreau. who was standing by Alexander. A council of war followed. The tsar was for continuing the fight; Schwarzenberg, however, knowing the exhaustion of his troops, decided to retreat. As at Bautzen, the French cavalry was unable to make any effective pursuit.

See also references under "Dresden" in the Index volume.

DRESS and its numerous synonyms — clothes, garments, apparel, attire, etc.—refers to the covering used for the human body. The varieties of dress (from the French dresser, "to set out," "to arrange") worn by human beings, now and in the past, are so numerous that it is not possible to deal with all of them. Thus, this article does not consider the national or regional costumes of the various peasant peoples of Europe or other parts of the world, or the garb of modern primitive peoples of Africa. the Americas and Asia. It deals chiefly with three main aspects of the subject of dress: (1) that of the ancient Mediterranean world; (2) that of western Europe (chiefly England and France), considered as standard for Europe and America, from the middle ages to contemporary times; and (3) that of the far east. The article is outlined as follows:

I. ORIGINS

1. Motivation. — Modern anthropologists have exploded the idea long held by westerners that the wearing of clothes originated solely in an impulse of modesty. Indeed, notions of modesty vary so widely over time and place that it is very difficult to regard them as anything more than arbitrary conventions. An Arab woman caught without her veil will lift her skirt (thereby exposing her body) in order to cover her face. The Chinese long regarded the exposure of the feet as indecent. Even as late as the early 20th century a European woman who revealed a considerable portion of her bosom in evening dress was embarrassed if she was thought to be showing an ankle.

Those who discard the modesty theory of the origin of clothing are likely to accept the idea that clothes were invented for protection against the elements. But as the earliest civilizations developed for the most part in warm climates, this, too, is unlikely. Protection against insect bites seems a more probable motive. Furthermore, early hunters must have found it convenient to tie weapons, game, etc., to the body rather than to carry them. A bag or pouch hung from a waistband thus was a real advance; it lasted in male attire until the invention of pockets in the 17th century, and survives today in the Scotsman's sporran.

Another motive for dress was vanity. It is probably safe to say that among the acts that distinguish man from the animals one is the adornment of the body: staining or scarification of the skin, putting feathers in the hair or hanging an ornament in the pierced lobe of an ear. All such actions spring from a psychological need that animals do not experience, and clothes, even in their most primitive form, are essentially a reaction to it.

Clothes are pride-enhancing. The man who has "a feather in his cap" (or in his hair) has both increased his apparent height and augmented his self-confidence. But if a man sticks too many feathers in his hair he is likely to arouse the jealousy of other men. He has to fight to defend his right to wear them, and very soon only the successful fighters are allowed to wear feathers in any number. Even today it seems reasonable that the admiral should have more gold braid round his sleeve than the lieutenant does. Men's clothes throughout history and prehistory are founded on this hierarchical principle, which explains their seemingly inevitable tendency to formalize, even to fossilize, as emblems of rank.

Women's clothes, in general, have followed a different principle, one of seduction. To the modern mind the taking off of clothes has an erotic significance; the primitive mind thinks just the opposite. A psychologist of dress, John Fliigel, has sought to explain the perpetual changes of female fashion by what he calls the shifting erogenous zone. According to his theory the whole of the female body (in contradistinction to the male body) is "eroticized"; that is to say, any portion of it is attractive to the opposite sex. But it is impossible for the mind to grasp an "eroticization" that extends over the whole body, and so attention is directed to various regions in turn. A hidden charm acquires erotic capital during the period of its eclipse, and this can be exploited, when the time arrives, by uncovering it. or by draping clothes tightly over it, or by drawing attention to it in one of the many ways that dress designers perfectly well understand. This exploiting of the shifting erogenous zone is what is known as fashion.

2. Fashion. — It is plain, however, that fashion, in the modern sense, has not been operative always or everywhere. In peasant communities, although sexual attractiveness plays some part in the selection of a wife, other motives commonly outweigh it: strength to work and bear children, and a good dowry. Female peasant dress therefore is only partly founded on seduction. Where women are secluded in harems or covered with veils in public, the seduction principle again cannot operate. Fashion is essentially competitive. Even in as advanced a civilization as that of ancient Greece there was no fashion among respectable married women; it could flourish only among the hetaerae. Its final emergence as a historical phenomenon took place about the middle of the 14th century, in the luxurious courts of France and Burgundy, where women competed for the attention of the ruler by inventing, or having invented for them, the three most potent weapons in the armoury of fashion: tight lacing, décolletage and striking headdresses. These were naturally denounced by the clergy, and indeed fashion has been looked at askance by moralists of all ages, who see in it an encouragement of the lust of the eye and the pride of life. This point of view is perfectly correct: those are the purposes of fashion.

Pride of life (the hierarchical principle), the lust of the eye (the seduction principle), with the utility principle as counterpoise, regulate all the phenomena of fashion. Men's clothes, in general. are governed by the hierarchical principle, slightly modified by utility; women's clothes are governed by the seduction principle slightly modified by utility. In practice, however, class distinction has never been entirely absent from women's clothes, and the erotic element took a long time to disappear from men's clothes; even today, when it seems almost entirely submerged, it can be noted occasionally in, for example, the criminal fringes of society.

Another factor to be considered in fashion is that of national costumes. The Renaissance was essentially a "triumph of time" (to use Petrarch's phrase) over place. In the middle ages a man's or a woman's costume hardly changed in a lifetime; but to travel to the next village, still more to a neighbouring country, was to find everything different. Then, with increasing ease of communication, costume tended increasingly to be the same at any moment over the whole of western Europe but to change rapidly in time.

The prestige of Louis XIV ensured that fashionable clothes were the same everywhere in his day. To be in the mode was to dress like the courtiers of Versailles, to change as they changed. This French domination over the dress of both men and women lasted for about a century. Women's clothes continue to be inspired by France, but the inspiration of men's clothes passed to England about the time of the French Revolution. The clothes of every westernized man today are derived from the sporting costume of the English country gentleman of about 1780. Full evening dress for men is a fossilized version of the late 18th-century hunting coat; the top hat was originally a crash helmet. Men's clothes, being essentially class conscious, are deliberately made unsuitable for any active pursuit, and the usual way to alter them is to allow a new sports costume to become formal in its turn. This process continues today.

Women's clothes were class conscious until the end of the 18th century, but decreasingly so as the seduction principle became accepted. Some curious compromises occurred on the way. The Elizabethan ruff, for example. is essentially "hierarchical." being so uncomfortable and easily soiled that it could be worn only by the upper classes. But the erotic element forced its way through, and while Elizabethan male courtiers wore ruffs all the way round their necks, the queen herself wore a divided ruff to permit exposure of the bosom. With the invention of the fashion plate in the late 18th century, fashion spread throughout society ever more

rapidly, until in contemporary times the only advantage a rich woman can have over her poorer sisters is slightly better materials and about a month's start. The erogenous zone has shifted wildly. In the Edwardian period emphasis was on the bosom; in the 1920s bosoms were abolished (even to the point of wearing .'flatteners") and legs became the focus of interest. In the 1930s women's clothes seemed designed to be seen from the back; after World War II the bosom—or rather the breasts—once more was accentuated. However. many women began to wear trousers for work or for shopping, and it seems possible that in the future women's clothes may be divided into practical work garments and frankly erotic leisure-time garments In men's clothes, the erotic element, absent for so long, may also tend to return.

3. Primitive Man.—Most of the motives toward clothing described above continue to operate. We still seek to increase our self-confidence, soothe our vanity, improve our shape, attract the opposite sex, demonstrate our membership of a caste. One primitive motive, however, is so remote from our conceptions that a considerable effort of the imagination is needed in order to understand it at all. This is the motive of protection against magic.

Primitive people mere dominated by fears, and in particular by fear of that form of malevolent magic known as the evil eye. A mere look from an evilly disposed person might strike a man with disease or weakness or. worst of all. sterility. This danger could be averted by the use of amulets, objects selected for the most part for supposed resemblance to the sexual parts. Most important of these nas the cowrie shell, which mas thought to resemble the external female genitalia. the portal by nhich a child entered the norld—that is, the giver of life. Such shells have been found among the prized possessions of primitive people all over the world. even in places far distant from their sources of origin. The cowrie shell being so potent a protection against sterility. was naturally hung as near as possible to the organs of reproduction, and girdles and aprons of these shells were worn before the idea of clothing, as such, had arisen at all. With the advent of clothes, amulets shrank to the position of decoration; *i.e.*, jewelry.

The impulse of decoration mas, of course, always present. even before clothes were invented. It had a life-enhancing value, and it is often difficult to distinguish motives of vanity from those of protection magic. A necklace of the teeth of tigers or other strong beasts. for example. was both an amulet and an ornament. As Hilaire Hiler has observed:

> Suppose a bear's tooth to be worn by an individual as an indication of his prowess as a hunter, purely from the standpoint of trophyism; this would automatically suggest his ability as a food provider and thus indirectly at least would prove attractive sexually, but a bear's tooth is not without aesthetic allure from the standpoint of colour and lustre. Furthermore, it is an article which is sufficiently difficult of possession to recommend display from the point of view of its rarity. Its association with the bear, a powerful animal and worthy adversary, might imply that some quality, as strength, inherent in the bear, should persist in the tooth—fetishism and magic. If a man owned a great number of these teeth it might be assumed that he possessed one or all of these qualities to a superior degree, thus giving signification to ornament as a mark of caste. By the same token, being powerful, it mould be a protector of superior quality (*From* Nudity *to Raiment;* London, W. & G. Foyle Ltd., 1929).

Clothes and fire presumably were discovered in Paleolithic times, and both were important in extending the range of human habitation. It is possible only to guess at the nature of clothes worn at a time so remote. Some authorities believe that Heidelberg man may have used his powerful jaws for chewing leather as the Eskimo does today, and so have made it pliable enough for use as clothing: Neanderthal man certainly had tools, some of them strongly suggesting the instruments used by tanners; Neanderthal woman stayed at home while the man went hunting. and it is thought that it nas at this time that a differentiation arose between male and female dress. In a cave of Cro-Magnon time. at Cavillon in France, a hairpin was found in such a position near a body as to leave no doubt as to its use; other objects resembled toggles or double buttons, and there were also bracelets and leg ornaments. Caverns in the Dordogne have yielded bone pendants and collars of ivory, shells, stags' teeth and fish vertebrae. Mural paintings in the rock shelter at Cogul, Lérida, Spain, show people clothed in what seem to be skin garments somewhat resembling those of the modern Eskimo. Skin garments cannot be made without needles. and specimens of these have been found in large numbers in Magdalenian burials.

Hiler remarks:

> There are strong reasons for believing that the use of fundamental garment forms of a rudimentary perfection dates from the Magdalenian. A simple tunic, the ancestor of a long line of similar pieces, the skirt and kilt (or divided coverings for the legs), the mantle or cape (precursor of the coat) as well as moccasins or boots are among the probabilities.

If this is the case, the fundamental forms of European clothing were established at this remote period and hardly changed in essentials until the middle of the 14th century A.D.

Neolithic man made use of wool and flax fibres for clothing manufacture. Decorated spindle whorls found, for example, in the Grotte du Pontal, Hérault, indicate that the vital discovery of thread had been made, and fragments of both plaited and woven cloth have been found at Robenhausen in Switzerland, and elsewhere. Dyes were used, the colours being the primaries—red (obtained from hematite). yellow (from the yellow weed Reseda *luteola*) and blue (from danewort). This raises the question whether primitive people merely preferred these colours or whether they were able, in fact. to distinguish any others. Experiments conducted with surviving primitives and with children indicate that colour sensibility is much less marked among them than among civilized adults. Red is the first colour noticed, then yellow, with blue a long way after; intermediate tints are ignored altogether. Of course the colours used in primitive dyeing were not bright, hence, perhaps, the enormous prestige of the so-called purple (really purplish-red) dye obtained from the murex in later times. Red also is the colour of blood. and "the blood is the life," but the aesthetic effect of red is enough to explain its popularity without any magical or religious hypotheses.

Primitive man not only dyed his few clothes but also painted his body. and body markings, by painting, tattooing or scarification, served to promote vanity, denote prestige. attract the opposite sex, indicate membership of a clan and frighten the enemy and were probably not differentiated in his mind from garments.

4. Skirts and Trousers.—Much ingenuity has been exercised by anthropologists and historians of costume in explaining what seems to us the fundamental difference between skirts and trousers. The difference lay, originally, merely in the way in which a piece of cloth was draped round the body. If it was allowed to hang free from the hips it nas the ancestor of the skirt; if any portion of it was passed between the legs it was the ancestor of trousers. C. H. Stratz proposed a distinction between arctic clothes (trousers) and tropical clothes (skirts). This certainly holds good in historical times, people of both sexes in northern latitudes wearing trousers, people in southern latitudes wearing skirts. while in the regions between, trousers (or other bifurcated garments) are worn by men and skirts by women. The ancient Greeks wore skirts and regarded trousers as the mark of the barbarian. The Romans had the same opinion of the trousered Germanic tribes: nonetheless, the Roman troops came back from service in Germany wearing tight breeches under the Roman kilt.

Trousers are, in general, warmer and more practical for active pursuits than skirts, and the persistence of skirts for women has been thought to be due to the less active and exposed life they have generally been called upon to live. On the other hand. Turkish women, whose lives were extremely sheltered and inactive, generally wore trousers, and skirts (or kilts) have been worn by hardy mountain people like the Scots and the Greeks. Climate indeed has never been the dominating factor, as can be seen in the ample clothes of the Arabs. who live in a hot climate, and the scanty coverings of the Fuegians of the bitterly cold region near Cape Horn. Clothes in short. in primitive as in modern times, are not merely the covering of the body, but the vesture of the soul. (J. LR.)

II. MEDITERRANEAN WORLD

A. NEAR EAST

1. Ancient Egypt.—Modern knowledge of ancient Egyptian

dress derives for the most part from ancient paintings and sculptures, since very few garments have been preserved. It is necessary, therefore, to remember that artists were very much bound by tradition and, further. that modes of representation lagged behind actual changes of fashion. As is usually the case, new fashions originated among the rich; the general tendency was toward greater and greater elaboration in both costume and accessories. Practically the only fabric that has been preserved is linen, found in graves of the Neolithic period, long before the dynastic age. The Egyptians themselves realized that flax culture mas very old and believed that the gods were clothed in linen before they made their first appearance on earth. Wool seems scarcely ever to have been used, and silk and cotton were unknown. The first clothing worn by men was a narrow band around the waist to which pendants were attached, the whole arrangement being both amuletic and decorative. The loincloth and kilt were later developments of this. The earliest representations of women show them either nude or clad in tightly fitting white linen skirts down to the ankles.

Men.—The characteristic masculine garment throughout the dynastic period was the white linen kilt: a rectangular piece of cloth wrapped around the body and tied in front. The length, fullness and method of adjustment varied with the date and the social position of the wearer. In the earlier Old Kingdom the kilt was usually short and draped smoothly around the hips. Often one or both of its lower corners were rounded; sometimes it was pleated or partially pleated, and later it might be stiffened to project in front. In the Middle Kingdom there was a fashion for long kilts, sometimes reaching from waist to ankles, sometimes hanging from the armpits. with no belt or other interruption at the waist. In the late 18th dynasty the double kilt appeared, long and full, with the upper one doubled and gathered in front. Fullness was always concentrated in front. and all garments—both men's and women's—were adjusted so as to fit the figure smoothly behind. A triangular loincloth sometimes, perhaps usually, was worn under the kilt.

Shirts, though worn at all periods, are first represented in the 18th dynasty; the upper part of the body, however, was often left bare or covered with a shawl. The shirt, like the kilt, was made of a rectangular piece of linen, the material being folded and sewn up the sides, openings being left for the arms and a hole cut at the fold for the head. Several shirts have been preserved with long, tight sleeves sewn into the armholes. The richly furnished intact tomb of the architect Kha of the 18th dynasty, the contents of which are in Turin. contained a pile of about 50 loincloths, many kilts 20 to 23 in. wide and about 67 in. long, seven sets of loincloths and kilts tied up together and a pile of shirts of both light and heavy, winter weight.

Women.—The characteristic woman's garment in the Old Kingdom was a long. tight slip held up by suspenders over the shoulders. During the Middle Kingdom and early 18th dynasty artists copied the Old Kingdom representations closely, and it is not possible to ascertain when the draped robe, which first appears in pictures after the first half of the 18th dynasty! actually came into fashion. These robes were unshaped: each consisting of a length of material wound around the body, brought up over one or both shoulders and tied at the breast. There were numerous ways of arranging the drapery; most commonly the right arm mas left free. Some pictorial representations seem to indicate a tight garment under the robe, but probably the artist was only trying to represent the first twist of the cloth, strained over the body so that folds or pleats were smoothed out. Men are also represented wearing the draped robe in the later New Kingdom.

Women, like men, wore heavy mantles for warmth. Examples survive of materials with a self-pattern on the right side which appears on the reverse as a thick, warm tufting. In the privacy of their homes most women may have gone about without clothing, as did their maids, who are often so represented.

Children.--Children are invariably shown naked, their heads shaven except for the "lock of youth" that hangs down one side. However, a few children's shirts and sandals—smaller models of their parents'—have been preserved.

Fabrics and Ornament.—The Egyptians had not learned to use the mordants required to dye linen successfully, and as their clothing was frequently washed only white was really practical. Nonetheless, yellow. blue, green and red garments were worn on occasion. Costumes made of materials with coloured patterns are represented. but whether the material was linen, and if so how these patterns were applied and how often such garments actually appeared in real life, is uncertain. Tapestry weaving mas known but was extremely rare, tapestries and embroideries apparently occurring only in garments belonging to the king and members of his family and, indeed, being treated as heirlooms. To make up for the lack of colour the material of the dress might be elaborately pleated or arranged in a mass of fine folds, bright ribbons might be tied around the waist and hair, and those who could afford to do so wore brilliantly coloured jewelry. often combined with garlands and wreaths of flowers.

Heavy wigs or a padding of false hair. worn by both men and women, are known from an early period. They served not only as an adornment but also to protect the wearer's head from the burning rays of the sun, thus in a way acting as hats. Semicircular kerchiefs, tied by the corners at the nape of the neck under the hair. were sometimes worn to protect the wig on a dusty day. Wigs were dressed in many different ways, each characteristic of a given period; generally speaking the hair became longer and the arrangement of curls and braids—set with beeswax—more complicated as time went on.

Cosmetics, like wigs, served a practical as well as an ornamental purpose. Even during the predynastic period men as well as women applied a line of green paint around the eyes. which helped to absorb some of the sun's glare. In dynastic times the paint used was a dark gray. Red ochre seems to have been used to colour the cheeks, and henna the palms, nails and, in the late period at least, the hair.

Sandals of woven rushes or of leather were worn on occasion by men, women and children (artists represented them as being worn only by men and members of the royal family), but the Egyptians probably usually went barefoot, as, indeed, they still do in rural districts.

The clothing described above was for the most part that of the official class. The king himself is shown either in the severely simple short kilt of the Old Kingdom or in contemporary costume, nith decorations peculiar to himself—an elaborately worked jacket. a jeneled belt and apron. and a variety of crowns or royal headdresses At the other end of the social scale mere the labourers and workers in the fields, who went nude or perhaps wore a belt or loincloth of linen or leather. (*See* also EGYPT: *History:* Ancient *Civilization and Culture.*) (N. E. Sc.)

2. Ancient Mesopotamia.—Simplicity characterized Mesopotamian clothing in the periods of that civilization's greatest flowering. Garments typically consisted of a rectangular piece of loosely woven wool, bleached or dyed red or blue. Linen was employed to a lesser extent, its use increasing in the 1st millennium B.C. The warp formed a straight fringe along the short sides, sometimes knotted into tassels. The weft could be made to stick out in loops, forming a wavy fringe on the long sides. Red and blue garments had nhite fringes and white garments often had coloured fringes. As Mesopotamian art suppresses most folds. the rendering of the borders is the best clue to the draping of the garment. Men normally draped their clothes counterclocknise, women clockaise. Since manual labour and warfare require freedom of movement, the wearing of long garments denotes leisure and peaceful pursuits. In the earliest periods, clothes were discarded during the performance of feats of strength or service in the temple.

Protoliterate Period.—During this period (*c.* 3500–3000 B.C.) men of rank wore an ankle-length skirt, the rectangular cloth being nrapped so that the visible short side was in front.

Early Dynastic *Period.*—During the Early Dynastic period (*c.* 3000–2340 B.C.) the cloth was wrapped as before, but the short side was behind the left hip. where the ends of the belt or the cloth itself were knotted. A fringe of long weft loops encircled the skirt below. In the later part of the period. a luxury version had rows of loops all over. This fabric represents the origin of the divine garments of later periods.

Women wore a similar but larger cloth. With one short side it was placed over the left shoulder, then it was passed under the right armpit and again over the left shoulder, from where the other side hung down to the ankles, covering the left arm except for the hand. A hidden pin or stitching may have held the two layers of material together on the left breast.

Akkad, *Neo-Sumerian* and Old Babylonian Periods.--Men of rank now also wore a full-size cloth (at least 3 by 1½ yd), placed with the centre of one short side on the left loner arm (which had to be kept horizontal), wrapped around the back, under the right armpit and over the left arm and shoulder, thus giving freedom of movement to the legs and right arm. The other short side curved up the back. One corner was either tucked under the right armpit or brought forward over the right shoulder. When the cloth grew even longer, it was wrapped around twice, ending over the left arm. Exceptionally, the cloth might be wound clockwise, the first turn forming a skirt and the second brought over the left shoulder with the same result of disengaging the right arm while enveloping the left.

The beret, worn by rulers in the north in the Early Dynastic period. was current in the Akkad period. Thereafter a turban, sometimes covered with curls as if made of fur, was the royal headgear.

For women an arrangement covering both shoulders. not unknown before. now became common. The centre of one long side was placed across the bosom. Both short sides were passed under the armpits, crossed in the back and brought forward over the shoulders and upper arms, so that two points hung down in front. The hair might be enveloped in a cloth held in place by a headband.

Kassite Period.—The mountaineers from the border of Iran who ruled Babylonia during this time (c. 1600–1100 B.C.) introduced heavy. richly decorated clothes and soft shoes.

1st *Millennium B.C.*—The basic garment of the Assyrians was the rectangular tunic. The slits for neck and arms often had embroidered borders and tassels sometimes appeared around the bottom. Depending on the freedom of movement desired, tunics were ankle length or knee length, girt with a cummerbund over which a narron belt might be worn. Sandals were the common footgear.

Over the tunic the king threw a long shawl, draped like the traditional garment. but. being narrower than the latter, covering the right side only from the waist down. For the lesser members of the court the width of the shawl decreased. becoming a mere sash. The king also wore a headband with rosettes, either separately or over a pointed cap similar to a fez.

Assyrian women more a sleeved tunic and a large shawl, wrapped so as to cover both shoulders.

The Babylonians also more sleeved and belted tunics, drawn smooth in front so that the folds were concentrated in the back. Diagonal shoulder bands may denote rank. The royal headdress (generalized in Persian times) took the shape of a pointed cap with a streamer. (M. v. L.)

3. Persian, Arab and Ottoman Empires (to Modern Times).—The primitive costume of the Persians was made of animal skins. wool being little known before the time of Cyrus and cotton and silk not known at all. The costume was in the form of a coat and breeches. and this, with minor modifications has lasted until modern times. With growing prosperity the Persians began to make both coat and trousers of coloured cloth. They wore at first a conical leather hat, which was exchanged for a time for the Phrygian cornet. The conical cap was sometimes circled by bands of cloth. in which perhaps may be seen one of the origins of the turban. A relief found in the ruins of the palace of Persepolis shows various figures bringing presents and clad in a mixture of Persian and Hebrew modes (the Hebrew dress was longer than the Persian and, in the Semitic tradition. without trousers) There is hardly any trace in ancient Persian monuments of the dress of women.

Scythians and Parthians wore trousers with coats open at the front and crossed with a belt to keep them in place. The coats of the women were longer but otherwise similar, except that the belt was sometimes replaced by a long piece of cloth wound round the hips and knotted in front.

The Arab conquest in the 7th century A.D. brought modifications. Arab costume itself has been singularly unchanging, as can be seen from occasional representations in the monuments of ancient Assyria and Egypt. The Arabs' earliest garments seem to have been a piece of cloth wrapped round the body below the armpits and a long, full shirt with or without sleeves. The descendant of this latter garment is the garb of many modern Egyptians. The Arabs wore over it a mantle of coarse wool or camel hair in the shape of a sack open at the bottom and with holes for arms and head. This is the aba mentioned in the Bible as the costume of prophets. It was usually cream coloured with wide vertical stripes of black, white, brown and blue. The headdress was a small piece of cloth wound round the head or folded in a triangle and kept in place by a ribbon tied in a knot at the front or a cord, plain or ornamented. encircling the crown. This is the haik, the characteristic Arab headdress even of the 20th century. Under it is worn a felt cap (or several felt caps one over the other) coloured red. white or brown.

No representation is known of the early dress of Arab women, but it probably resembled closely the dress of men, and has continued to do so. The shirt, or chemise, reaching to the ground and very wide, was open over the chest but buttoned at the neck A scarf was worn round the waist. The mantle consisted of a large rectangle of woolen cloth. black or blue with yellow or red stripes. It was sometimes worn over the head on top of the small fichu wound round the crown. The usual veil is a band of black crepe or white muslin, sometimes long enough to reach the feet, kept in place by two ribbons attached to a circlet round the head and often ornamented with pearls or coins.

The great Turkish migration of the 11th century brought some changes to both Arab and Persian costume. The Persian costume at this time consisted of a shirt, a caftan (a Turkish word describing a kind of long coat open at the front, with short sleeves, and sometimes edged with fur) and a cloak. The cap of lambskin in the form of a truncated cone, introduced by the Turks, is still worn in Persia. A cap of similar form but red in colour and made of felt. the fez, became the characteristic headgear of Turks until abolished by Kemal Ataturk in 1925.

Characteristically the Persian trousers were baggy and gathered in at the ankles. Slippers were made of leather with turned-up points. Kurds, Afghans, Georgians and Armenians long preserved these modes. which are by no means extinct.

Documentation increases during the 16th century when Europe became conscious of the Turkish threat, and there was a growing interest in exotic dress. The costume worn by Persian women—and still surviving—consisted of a white cotton chemise mith long sleeves, long woolen stockings. woolen embroidered slippers, wide trousers of dyed cotton, tied round the ankles and hanging in folds. an underwaistcoat with long sleeves open to the elbow and a short-sleeved overwaistcoat, a small cap and a shawl tied round the waist. A veil of white muslin was either wound round the head or suspended just below the eyes. Out of doors women threw over their shoulders a piece of cloth that covered them completely.

Men's dress at this period, at least among the upper classes, consisted of trousers at first extremely ample (still worn among the Kurds) but gradually growing tighter. The camise, or shirt. often striped and patterned, worn outside the trousers and falling sometimes to the knees and sometimes to half-calf. was provided with long sleeves. The caftan was buttoned across the chest and closed by means of a scarf. Its long skirts were sometimes turned back and attached to the belt. An outer garment as long as the caftan and always more ample was of a different colour. In the 20th century the overmantle was provided with long wide sleeves, sometimes slit. A very ancient garment, long retained, was the abayah. a kind of long cloak. originally made of camel hide, thrown over the shoulders. Sometimes it had a single wide sleeve. a peculiarity preserved by the modern Kurds.

The waistcoat. dating from the end of the 16th century was generally of red or blue cloth with braid of a contrasting colour and adorned with small buttons sewn very close together Over this was sometimes worn a short coat. rather like an Eton jacket. similarly ornamented. Red leather slippers were worn except by

clergy and magistrates, who wore blue.

The original headgear of the Turks was probably the round Tatar cap edged with fur, but after the capture of Constantinople the sultan imitated the Prophet Mohammed by surrounding his cap with a large amount of white muslin wound round and round. It was at this period that the turban became usual among the Turks. Functionaries were compelled to wear it in a form determined by their rank. The costume of the lower classes consisted simply of trousers and a cloak of hide or cloth.

Women's costume was hardly to be distinguished from that of men except that the trousers continued to be more ample. The chemise, made of white muslin and falling to mid-thigh, was décolleté and had no sleeves or very short ones. The dress was open in front and reached the ground. Veils of black horsehair or white muslin were attached to the headdress, a small cap often ornamented with precious stones. The hair was worn either loose and flowing or in plaits encased in a kind of cloth tube.

In the second half of the 20th century the visitor to near eastern countries finds little enough of the traditional costumes described. After the foundation of the Turkish republic there was a progressive invasion of European influences, particularly in Turkey itself. Men largely adopted some form of European dress, the women less so, except in Egypt. Wealthy Egyptian women obtain their clothes from the best couture houses of Paris and even peasant women, if they have not abandoned the veil, wear one of net which hardly conceals the features. On the other hand, the black horsehair veil still worn by the women of Damascus and Baghdad makes it difficult for an observer to decide whether the wearer is coming or going.

The typical Turkish fez is still worn by men in Egypt, the rest of the costume being altogether European. This was the rule among the Turks in the days of the last sultans, who themselves wore frock coats with Turkish headgear. Indeed the process of europeanizing had begun in the middle of the 19th century. In 1873 the Imperial Ottoman Commission for the Universal Exhibition of Vienna sponsored an elaborate work containing photographs of men and women in all parts of the Turkish empire, and the pages of this volume reveal clearly not only the variety of costume in the different regions but also the layers of influence out of which they had been built up. In what was then the vilayet of Baghdad men are shown dressed in the pure Arab mode while the woman wears a recognizably Persian costume. The peasant of the neighbourhood of Jerusalem wears a long white cotton shirt with a broad leather belt, and over it a garment resembling a western academic gown, with broad black and white stripes; his fez is wound round with white muslin. A Christian artisan in the region east of the Jordan river wears over his long open shirt the jubbah, a long, sleeved garment resembling a western mackintosh. A peasant woman of Damascus is seen covered with jewelry "like an Assyrian idol of which her costume conserves the archaic form." A peasant woman of Lebanon, on the other hand, wears garments of biblical simplicity. The clothes of a Christian woman of Beirut are plainly *à* la *française* but about ten years behind the western mode. A Kurdish soldier has a turban like that of the Afghans. In Istanbul the same bewildering variety is apparent. The old-fashioned bourgeois was still clad in the costume of his ancestors; the young government employee wore black trousers and a frock coat — there was nothing oriental about his garb except the fez. Between these two extremes could be found every combination and permutation possible. Especially after World War II the process of europeanization was greatly speeded up. (J. Lr.)

B. The Aegean

Clothing worn by the Cretans in the 3rd and 2nd millenniums B.C., and that of the Mycenaeans in the second half of the 2nd millennium, was very different from oriental as well as from later Greek costume. Early in the 3rd millennium in Crete men wore a short loincloth attached to a tight, broad belt. A relief vase from the early 2nd millennium shows a prince wearing long hair, uncovered, and an officer wearing a helmet. From late Minoan times a life-size stucco relief showing a king and a wall painting showing young men carrying precious gifts indicate that elaborate loincloths, with woven patterns and embroidered borders and adorned in front with tassels, were morn. Similar are the costumes of envoys from Crete pictured in Egyptian tombs.

On the mainland, in Mycenae, Tiryns and Sparta, where the Cretan civilization was accepted and imitated in the second half of the 2nd millennium. men wore short tunics with long sleeves for war and the hunt, a helmet with boars' teeth; high sandals: and leggings. A musician on the sarcophagus of Ayia Triada in Crete (c. 1400 B.c.) shows that this tunic was adopted there from the Mycenaeans; the lyre player wears a long tunic without sleeves and with a decorative border and a stripe around the shoulders and continuing down to the border. The priests who bring offerings wear fur skirts.

The costume of Cretan noblewomen is much more complicated, reflecting the luxurious living and gay spirit of court life. A lady of the 3rd millennium wore a bell-skirted dress, the sleeveless bodice of which exposed the breasts and stood away from the nape of the neck. Her cap mas high and turbanlike. In the middle and late Minoan periods this dress became a tailored, well-fitted, elegant robe. The temple repository in Knossos shows priestesses with bell-shaped skirts made of small strips sewn horizontally together or of different-coloured flounces falling one over another. An apron, similar to the loincloth of the men, hangs from a broad, tight belt. The jacket is open in front, but the breasts are covered by a diaphanous vest. Narrow sleeves cover the upper arms. The headdress is a high turban or a crown.

When Cretan civilization was taken over by the mainland, women accepted this rich dress and made it even richer. The best example is provided by the figures of women from a fresco at Tiryns; their dress exhibits flounces, some smooth, others with scale and half-moon patterns in different colours; the jacket has borders of flower petals. The hair is elaborately bound up with ribbons and rings, with rows of small curls before and behind the headband, a chignon on the crown of the head from which a pony tail falls, and four long strands falling down the back. When women went to the hunt, as shown in another fresco from Tiryns, they wore a simple tunic like that of the men, with short sleeves but no belt. In the bull games women wore the apronlike loincloth and high shoes of the men. On the late Minoan sarcophagus of Ayia Triada. the priestess, like the priest, wears a skirt made of fur

In the shaft tombs of Mycenae many golden diadems, breastplates and buttons have been found, the last used perhaps as jewelry or sewn on dresses as ornaments.

C. Greece

The clothing of the Greeks. like their civilization, changed with the three periods of their history: the Archaic (c. 1000–500 B.c.), the Classical (c. 500–330 B.c.) and the Hellenistic (c. 330–30 B.c.). In the Archaic period the dress was influenced by the orient; in the Classical period it was original and harmonious; in the Hellenistic period it was luxurious.

1. Chiton. — The main dress of Greek men and women in all periods was a linen (later sometimes woolen) shirt, the chiton. Homer mentions the garment often, terming it radiant white and long. Ionian men wore it with a train, and a long chiton was worn by all men in the Archaic period, later only by elderly men, priests and charioteers. After the Persian war young men wore a short, narrow version. In its simplest form, the chiton mas made of two panels of linen cloth seamed up the sides and across the top. with openings left for the head and arms. Actors and priests (for example, the priest of Athena on the central slab of the east frieze of the Parthenon) wore sleeved chitons.

The chiton worn by women was much wider than that of men (sometimes as wide as the woman's measurement from finger tip to finger tip, with the arms outstretched). Hence the openings for the arms were left at the top, rather than on the sides; in adjusting the garment the wearer brought the two edges together at the shoulder and fastened them with a brooch or brooches along the upper arms. The naist mas gathered in with a girdle. the extra length (the garment was about a foot longer than the wearer was tall) making a *kolpos,* or pouch, well illustrated by the caryatids of the Erechtheum.

Artisans, warriors and slaves wore a short chiton, often with the right shoulder left free.

2. Peplos.—The main dress of women in the Early Archaic and later again in the Classical period was the peplos, a large rectangular piece of wool folded vertically (*i.e.*, just the opposite of the chiton) and worn with an overfold at the top in several different ways. Every four years the young girls of the best families of Athens, under the guidance of the priestess, wove a new peplos for the cult statue of Athena Polias, the city goddess.

Athletic Spartan girls, and other young girls, wore the peplos without a belt and with one side left open so that the leg showed. In most cases, however, a belt was worn, either around the waist or, in the Hellenistic period, much higher, just below the bust. If the overfold of material at the top was long, the belt was laid over it, and it is seen thus in many statues of Athena. If the overfold was short, the belt was placed below it and a pouch made of the excess length. For young girls both overfold and pouch were long, so that the dress could easily be lengthened for the growing girl by shortening overfold or pouch or both. When peplos and chiton were worn together the peplos served as the overdress.

The peplos and the chiton became more and more similar in form with the passage of time. Sometimes the peplos was worn without an overfold, sometimes the chiton was worn with one; an example is that worn by the caryatids of the Erechtheum. In the Hellenistic period very costly materials—cotton and silk, in addition to thin linen and wool—were used. A heavy woolen chiton mas fixed on the shoulders with clasps (*perone*), and named from them a *peronatris*.

3. Himation and **Chlamys.**—The peplos, being merely a rectangular piece of material, could also be used as a mantle (himation). As such, in the Archaic period, it was laid symmetrically over both shoulders and the ends were allowed to hang down in front. In the Classical period it was commonly draped in such a way that a long end hung down from the left shoulder in front; the himation then was carried back over the left shoulder, across the back, across the right shoulder or hip to the front. across the body and again thrown back over the left shoulder, arm or hip. Women draped the himation over their heads when walking outside the house, as did both men and women in mourning. The many possibilities for style of draping were used by sculptors to reflect the character of the wearer of the himation.

A smaller mantle, the chlamys, worn by men only, was draped around the upper body and fastened with a brooch on the right shoulder, leaving the right arm free. The four corners hung freely on the right side. The two lower ones were rounded during the Hellenistic period.

4. Patterns and **Colours.**—In the Archaic period over-all patterns, as well as figured representations, ornamented fabrics. In the Classical period patterns were restricted to borders and central stripes. Priestesses wore only white, but other women used many different colours. In the Hellenistic period these became more brilliant. and many mixed colours, particularly violet, were used. Servants and artisans wore dark dresses.

5. Hair.—In the Archaic period men wore beards and long hair. but after the Persian wars they cut their hair short and in the Hellenistic period shaved their beards. Women often wore their hair parted in the centre and bound up in various ways with ribbons, diadems and scarves; chignons and loose back hair were common. Little girls wore braids and twisted locks. In the Hellenistic period the so-called melon coiffure, with many partings like the rind of a melon, was preferred by women and children.

***6.* Shoes.**—Men and women generally wore sandals. The soles were fastened by leather thongs crossed in various ways and bound above the ankle. Men also on occasion wore high leather boots. Women sometimes wore soft closed shoes. Women's shoes became very luxurious in the Hellenistic period. White and red were preferred colours.

D. Rome

After the Tarquinii were driven out and the Etruscans defeated and brought under the supremacy of Rome in the 4th century B.C., the Romans kept the Etruscan dress, at least for their priests. After the conquest of Magna Graecia, however, in the 3rd century, Roman women adopted the chiton (Latin tunica) with a high belt and the himation (palla). Men also began to wear the himation (pallium). Nevertheless the Romans had a number of original forms of dress. The most characteristic feature of Roman dress is its sharp differentiation by social and professional classes.

1. Tunic.—The tunic, a shirt corresponding to the Greek chiton. was introduced to Italy by the Etruscans. It consisted of two pieces of linen sewn up the side and across the top, with holes left for the head and arms. Plebeians, herdsmen and slaves wore narrow tunics of coarse linen in dark colours; patricians wore fine white wool. For children the tunic was made wide, with large sleeves. The *tunica* angzrsticlavia, the tunic with narrow stripes. was worn by children of patricians until their 16th year, when they received the pure white tunic (tunica *pura*). Magistrates and knights wore the tunica angusticlavia, senators and other high officers the *tunica* laticlavia (with broad stripes). Women's tunics had a broad central stripe down the front. At funerals and other rites, and by brides, the tunic was worn ungirt (tunica recta).

In later times the sleeves were woven in one piece with the body of the tunic, and the decoration became variegated, particularly for children. In the 2nd century B.C. the sleeves became very wide, the stripes often being repeated on them; this garment was the dalmatica, fabricated of nhite Dalmatian wool. It mas later taken over as a Christian liturgical vestment (see Vestments, Ecclesiastical: *The* Dalmatic).

2. Toga.—The distinctive Roman mantle, the toga, originally Etruscan, was worn during the early period by both men and women of all classes. Gradually it was abandoned by women, then by labouring people. then by the main body of the patricians. Throughout the history of the empire, however, it remained the state dress, the garment of the emperor and high officials of the state. Colour and purple border were rigidly prescribed for most wearers. and the style of draping became extremely complicated—so complicated that rich men had special slaves whose chief duty was handling the toga. For triumphs and. in the later period. for consuls the toga was heavily embroidered (toga *picta*). Candidates for office wore the all-white toga *candida*.

3. Hair.—In the 1st centuries B.C. and A.D. men were clean-shaven; before and after that period they wore beards. The hairdress of Roman women changed with each generation. Particularly high coiffures, often made with false hair, were worn in the periods of the Flavians, down to the Antonines.

4. Shoes.—Footwear was differentiated according to classes. Women wore closed shoes in white, red, green or yellow. Men wore sandals, those of the patricians being red with a moon-shaped ornament on the back. Senators wore brown shoes with four black leather straps nound around the leg up to the middle of the calf and tied in two knots. Consuls wore white shoes. Soldiers wore heavy boots with toes free. (Me. Br.)

III. FAR EAST

Western-style clothes, which many persons prefer to wear during business hours, are now a common sight in all the large cities of the far east, but they do not dominate the scene and are usually exchanged for traditional dress when the day's work is done. In Japan and Korea (more especially in Japan) traditional styles of dress reflect marked Chinese influence, though both countries developed characteristic styles of their own. In like manner, modes of dress in India have been a source of inspiration to some of the countries of southeast Asia and of the East Indian archipelago.

A. China

More than 2,000 years before the beginning of the Christian era the Chinese discovered the marvelous properties of silk and shortly thereafter invented looms equipped with devices that enabled them to weave patterned silks rapidly enough to satisfy the demand for them by luxury-loving Chinese society. Thus centuries before Chinese silks began to be shipped westward and still more centuries before the west learned the secret of sericulture, the people of China had already established ultrarefined standards of elegance in matters of dress.

The earliest period of Chinese history for which reliable visual evidence of clothing styles is obtainable is the Han dynasty (202 B.C.–A.D. 221). Han bas-reliefs and scenes painted in colour on tiles and lacquers show men and women dressed in vide-sleeved kimono-style garments which, girdled at the waist, fall in voluminous folds around their feet. This p'ao-style robe continued to be morn in China until the end of the Ming dynasty (1644). The graceful dignity of post-Han p'ao is revealed in Chinese figural paintings of the 8th to 12th centuries and also in the modern kimono of Japanese women, for this Chinese style, introduced into Japan in the 8th century, has been little changed in the country of its adoption during the intervening centuries.

Chinese records indicate that at least as early as the T'ang period (618–906) certain designs, colours and accessories were used to distinguish the ranks of imperial, noble and official families. but the earliest visual evidence of these emblematic distinctions in dress is to be found in Ming portraits. In some of these, emperors are portrayed in voluminous dark-coloured p'ao on which the 12 imperial symbols. which from time immemorial had been designated as imperial insignia, are displayed. Other Ming portraits show officials clothed in red p'ao that have large bird or animal squares (the so-called "mandarin squares" or p'u-fang) on the breast, specific bird and animal emblems to designate each of the nine ranks of civil and military officials having been adopted by the Ming in 1391.

When the Manchus overthrew the Ming in 1644 and established the Ch'ing dynasty, it was decreed that new styles of dress should replace the voluminous p'ao costume. The most formal of the robes introduced by the Manchus was the *ch'ao-fu*, designed to be worn only at great state sacrifices and at the most important court functions. Men's *ch'ao-fu* had a kimono-style upper body with long close-fitting sleeves that terminated in the "horse hoof" cuff introduced by the Manchus and a closely fitted neckband over which was worn a detached collar distinguished by winglike tips that extended over the shoulders. Below, attached to a set-in waistband, was a full pleated or gathered skirt. Precisely stipulated colours and pattern arrangements of five-clawed dragons and of clouds, waves and mountains were specified for the ch'ao-fu of emperors, princes, nobles and officials; the bright yellow of the emperor's robe and the 12 imperial symbols emblazoned on it clearly establishing his lofty rank. All other ranks wore "stone blue" ch'ao-fu decorated in accordance with prescribed rules about the number, type and arrangement of the dragon motifs.

Among women, only those of very high rank were permitted to wear ch'ao-fu Women's robes were less commodious than the men's and were cut in long straight lines with no break at the waist. The narrow sleeves with "horse hoof" cuffs of these *ch'ao-fu* robes and the arrangement of their dragon, cloud, mountain and wave patterns were essentially the same as those of the so-called dragon robes discussed below. They were clearly differentiated from the dragon robes. however, by their capelike collars and by flaring set-on epaulets which, gradually narrowed, were carried donn under the arms. Stolelike vests, always worn over women's ch'uo-fu, were also a distinguishing feature of this costume. The colour of the empress's *ch'ao-fu* was bright yellow, related shades being worn by princesses and wives of princes.

Chi-fu, or "dragon robes" (lung-p'ao) as they were usually called, were designed for regular court near by men and women of imperial, noble and official rank. The chi-fu was a straight kimono-sleeved robe with a closely fitted neckband that continued across the breast and down to the underarm closing on the right side. the long tubular sleeves terminating in "horse hoof" cuffs. The skirt of the *chi-fu* cleared the ground to permit easy walking and in men's garments was slit front and back as well as at the sides to facilitate riding, these extra slits being the only feature which distinguished the chi-fu of men below the rank of emperor from those of their wives. All chi-fu were elaborately patterned with specified arrangements of dragons, clouds, mountains and naves, to which were added auspicious and Euddhist or Taoist motifs. Distinctions in rank were indicated by the colours of the robes and by slight variations in the basic patterns, but because of the large number of personages who wore chi-fu these distinctions were not always easily recognizable. Emperors' chi-fu, either yellow or blue, were always distinguished by the 12 imperial symbols, but these have also been found on a number of empresses' robes (which have identifying dragon sleeve bands), even though the Ch'ing regulations did not prescribe them for mear by the empress. A large number of *chi-fu*, including those worn by emperors and empresses, were acquired by western museums after 1912 when the overthrow of the Manchu regime and the establishment of the Chinese republic did away mith the official hierarchies of imperial China; these provide a rich but complicated field of study.

The *p'u-fu*, a three-quarter-length coat worn by men and women over their ch'ao-fu and chi-fu, became an important adjunct of Ch'ing dynasty dress because it proclaimed the wearer's exact rank at a glance, being made of plain purplish-black silk on which his insigne was emblazoned in bright colours and gold. The specially designated *kun-fu* of the emperor and the *p'u-fu* of his family were distinguished by specific numbers and arrangement of five-clawed dragon medallions; the p'u-fu of nobles had squares enclosing four-clawed dragons or other mythical beasts; and the p'u-fu of civil and military officials each had their appropriate p'u-fang or mandarin squares.

The informal Manchu ch'ang-fu, a plain long robe, was worn by all classes from the emperor down, although Chinese women also continued to wear their Ming-style costumes consisting of a three-quarter-length jacket and pleated skirt. Men's ch'ang-fu, cut in the style of the *chi-fu*, usually were made of monochrome patterned damask or gauze; women's ch'ang-fu had wide loose sleeves finished off with specially designed sleevebands and gay woven or embroidered patterns. Modern Chinese dress developed directly out of these ck'ang-fu styles. Men's robes underwent very little change. Women first narrowed the ch'ang-fu, then cut the sleeves offat the shoulders, and finally shortened the skirt and slit it up the sides to form the present sheath style.

B. Japan

The earliest representations of dress styles in Japan are to be found in 3rd- to 5th-century clay grave figures (*haniwa*), a few of which show men and women wearing meticulously detailed two-piece costumes consisting of crossed-front jackets that flare out over the hips, the men's worn over full trousers. which, banded above the knees, hang straight and loose beneath; women's jackets were worn over pleated skirts.

Two-piece costumes appear to have been worn regularly during the 7th and 8th centuries, the jackets of this period being called *kinu*, the men's trousers *hakama* and the women's skirts *mo*. It is known, however, that during the Nara period (710–784) Japanese court circles adopted Chinese court dress, the most characteristic feature of which was the long kimono-style p'ao garment, so it must be supposed that the *kinu*, *hakama* and *mo* were the accoutrements of middle- and lower-class society, though these garments may also have been adapted for mear under the p'ao. Very little specific information about Chinese court dress of this period seems to have been recorded in either China or Japan, but it is clear that emblematic colours and patterns as well as the p'ao style were borrowed from China because modern court dress in Japan, which has been little changed since the 12th century, has many purely Chinese characteristics.

The most important court costumes of Japan are the sokutai of the emperor and the *junihitoe* of the empress, which are worn only at coronations and at very important ceremonial functions. (Similar costumes are worn by the crown prince, by princes and princesses of the blood, by high officials and by ladies in waiting.) The most interesting features of the emperor's sokutai may be summed up as follows: the voluminous outer robe (ho) is cut in the style of the Chinese p'ao but is given a distinctively Japanese look by being tucked up at the waist so that the skirt ends midway between the knees and the floor. This ho robe is yellow (the colour worn only by emperors and their families in China), and it is patterned nith *ho-o* birds and *kilin* (japanized versions of the mythical Chinese *feng-huang* and *ch'i-lin*). The outer and most important of three kimonos worn under the ho is the *shitagasane*, which has an elongated back panel that forms a 12-ft. train. The

shitagasane is made of white damask, as are the baggy white trousers (*ueno-hakama*) that are a characteristic feature of the sokzitai costume. Both these garments and the cap-shaped headdress (*kammuri*) of black lacquered silk with its upright pennon decorated with the imperial chrysanthemum crest are purely Japanese in style, but the ivory tablet (shaku) carried by the emperor when wearing the sokutai was undoubtedly inspired by the tablets of jade which Chinese emperors carried as symbols of their imperial power.

The outermost garment sf the empress's *junihitoe* costume is a wide-sleeved jacket (karaginu) which reaches only to the waist. This has a pattern of ho-o bird medallions brocaded in colours of the empress's choice. Attached to the waist at the back of the karaginu is a long pleated train (mo) of sheer white silk decorated with a painted design. The outer kimono (*uwagi*) is very large to accommodate the many layers of kimono worn under it, the abnormally long skirt swirling out fannise around the wearer's feet. This too is made of rich brocade, its design and colours being a matter of personal taste. Under the *uwagi* the empress nears a plain purple kimono, and under that the robe known as *itsutsuginu,* which has multiple bands of coloured silks (usually five) attached at the edges of the sleeves, at the neckline and at the hem, giving the appearance of several robes worn one over another. No special interest attaches to the *hitoe* kimono worn under the *itsutsuginu* or to the kosode worn next to the body, but the divided skirt (*naga-bakama*) which completes the costume is an extremely picturesque garment. Made of stiff red cloth and fastened high up under the breasts, the naga-bakama covers the feet in front and is carried out in a train in back. An elaborate coiffure known as *suberakashi* and special hair ornaments affixed directly over the forehead are worn with the *junihitoe,* the empress's ornaments being a lacquered, gold-sprinkled comb surmounted by a gold lacquered chrysanthemum crest.

Other types of dress formalized in the 12th century were the *noshi* (courtiers' everyday costumes) and the *kariginu,* worn for hunting. Both these garments were voluminous hip-length jackets worn with baggy trousers tied at the ankles. At this time also it became necessary to devise special costumes for the newly formed samurai caste. The hitatare, the formal court robe of samurai, and the *suo,* a crested linen robe designed for everyday wear, though more closely related in style to the Chinese p'ao than the *noshi* and *kariginu,* were characterized by V-shaped necklines accentuated by inner-robe neckbands of white. Several centuries later the samurai adopted the *kamishimo,* a striking jumperlike garment with extended shoulders and pleated skirt-trousers that was worn over the hitatare. This costume probably inspired the later fashion of wearing skirt-trousers (hakama) over a full-length black kimono which, together with the short black haori coat, is today the approved formal attire for Japanese men.

The basic kimono style that was adopted by Japantse women during the Nara period has remained amazingly close to that of the p'ao robes worn by the women of T'ang China. The kimono is usually thought of as a Japanese invention, and it was in fact the master designers and dyers of Japan who, in the 17th and 18th centuries, evolved styles of decoration that have made it the most beautiful garment in the world. The practice of wearing short-sleeved kimono (kosode) as outer garments and belting them in with narrow sashes (obi) originated during the Muromachi period (Ashikaga shogunate; 1392–1573) when samurai women began to wear a voluminous outer kimono (uchikake) as a kind of mantle. Eventually, the kosode came to be worn only by married women, the long-sleeved *furisode* being reserved for young unmarried girls. The wide obi, which is today the most elegant feature of the Japanese costume, nas not adopted until the early 18th century, and it mas at this time also that women first began to wear the short haori coat which has come to be an important feature of Japanese women's dress.

Yukata, which are worn by both men and women, are cot'ton kimono with stencil-dyed patterns (usually done in shades of indigo) that were originally designed for wear in the home after a bath. Because it has become accepted practice to wear *yukata* on the street on warm summer evenings, the cottons designed for them have become increasingly handsome.

C. Korea

Some of the basic elements of modern dress in Korea, the chogori (jacket), paji (trousers) and *turumagi* (overcoat), were probably worn at a very early date, but the characteristic two-piece costume of today did not begin to evolve until the period of the Three Kingdoms (57 B.C.–A.D. 688). During the early part of this period both men and women wore tight waist-length jackets and short tight trousers, and it is believed that the Koreans' traditional fondness for white clothing dates from this period.

Korean records state that special costumes for court wear modeled after those of T'ang China were adopted during the reign of Kim Ch'unch'u (654–660), but Chinese influence on Korean dress at this period is verifiable only in changes that occurred in the everyday costumes of the nobility. Noblewomen formerly had worn tight trousers and jackets (which continued to be worn by the poorer classes); now they began to appear in wide-sleeved hip-length jackets belted at the waist and in full-length skirt-trousers. The corresponding dress for noblemen was a narrower tunic-style jacket, cuffed at the wrists, belted and worn with roomy trousers bound in at the ankles. The most striking evidence of Chinese influence at this time is to be seen in the style of the *turumagi* overcoat worn by noblemen, pictured in fresco paintings as a voluminous full-length garment made almost exactly like the p'ao robe of T'ang China. One-piece robes were never worn in Korea until the late 13th century when the court was forced to adopt Mongol dress; after Mongol domination ended in 1364, Koreans wore the one-piece robe only at wedding ceremonies.

In the 15th century Korean women began to wear pleated skirts (*ch'ima*) and longer *chogori,* a style undoubtedly introduced from China. Noblewomen wore full-length ch'inta to indicate their social standing, and began gradually to shorten the chogori until eventually it attained its present length, just covering the breast. This style made it necessary to reduce the fullness of the skirt somewhat in order to make it possible to wear it raised up almost to the armpits, which remains the fashion.

The adoption of Chinese-style *p'u-fang* (mandarin squares) as emblems of rank for civil and military officials (who wore them on their turumagi) appears to have been the only notable example of Chinese influence on men's dress at this period. Otherwise few changes were made until 1894, when class distinctions were relaxed by government decree. It was at this time that the turumagi was shortened and narrowed to its present form.

The most picturesque costume of modern Korea is that of men of leisure. yangban, who are past 60 years of age. The yangban wear white almost exclusively, their costumes consisting of full trousers tied at the ankles with ribbons, over which is worn a short *chogori* and a fitted vest and, over all, the loose *turumagi,* which falls just below the knees and is tied at the breast. The patriarchal appearance of the yangban (who is usually bearded) is accentuated by the black horsehair hat he affects, its flat brim and high crown giving him somewhat the appearance of one of the Pilgrim Fathers. Younger men wear a similar costume (though not the hat) in gray, light blue or light brown.

Women's costumes feature the bolero-style white chogori finished off at the neck by a figured band or ribbon that ties from left to right, and high-waisted *ch'ima* which in formal costumes is a full billowing garment made of beautifully patterned silk.

D. India and Pakistan

The Hindu population of India comprises about 2.000 castes, the members of which wear clothes and ornaments that clearly indicate their caste. The subject of dress in India, therefore, cannot be dealt with satisfactorily in a few paragraphs. Some of the principal features of upper-class Hindu and Muslim dress and the history of their development can, however. be sketched briefly.

The ancient origin of two of the most characteristic garments of modern India, the dhoti worn by men and the sari worn by women, is verifiable in sculptured reliefs dating back as far as the 2nd century B.C. In these and in slightly later reliefs both men and women are pictured wearing a long piece of cloth wrapped around

the hips and drawn between the legs in such a fashion that it forms a series of folds down the front. The upper bodies of both men and women were unclothed, though women wore a narrow cloth girdle. Men are pictured wearing large turbans, women head scarves that fell to the hips. Women also wore a great amount of jewelry—bracelets, anklets, jeweled necklaces and girdles—men's ornaments consisting solely of bracelets.

No major change in costume appears to have been made until the 12th century, when the Muslims conquered north and central India. In this part of the subcontinent radical new dress styles were adopted to conform with Muslim practice. which required that the body be covered as completely as possible. Men's costumes thereafter consisted of the jama, a long-sleeved coat that reached to the knees or below and was belted in with a sash, and wide trousers known as isar. These garments and the *farji*, a long gownlike coat with short sleeves that was worn by priests, scholars and high officials, were made of cotton or wool, silk being forbidden to men by the Koran. Somewhat modified, these traditional styles continue to be worn by upper-class men of Pakistan.

Women's garments dictated by the Muslim conquerors consisted of wide-topped trousers snugly fitted around the calves of the legs, a long shirtlike garment and a short fitted outer jacket. Silk was not forbidden to women, and highborn women. forced to spend their lives in seclusion, devoted a great deal of time and money to their costumes. The Mogul emperor Akbar's Rajput wives, inspired by the profusion of luxurious fabrics available in India, designed a graceful new style of dress which Muslim women adopted forthwith. This costume consisted of an open-front pleated skirt, (ghagra) worn with a long apronlike panel over the front opening, and a short-sleeved breast-length jacket (choli). The ghagra and choli continue to be basic elements of Muslim women's dress, the loose front panel having been replaced by the traditional sari. which is worn as an overgarment, one end being draped around the hips, the other carried up over the shoulder or head.

Dress in southern India was little affected by Muslim rule in the north. The dhoti continued to be worn by most Hindu men (it is forbidden to some castes) and the sari by women. Some additions to these traditional costumes have been adopted. On formal and semiformal occasions many Hindu men wear a long. full-skirted white cotton coat, which reaches to the knees and buttons down the front from top to bottom, over jodhpur-style white trousers; and most Hindu women wear a short choli-style jacket under their sari or a loose waist-length bodice. (PA. S.)

IV. WESTERN WORLD

A. EUROPE THROUGH THE 18TH CENTURY

1. Middle Ages.—In the early middle ages the clothes of both men and women in western Europe showed very little change from those of five centuries before. when Gaulish and Germanic costume had been assimilated to that of Rome, toga abandoned and trousers, usually loose and cross-gartered, added. Short tunics, sometimes two at once, often made of undyed woolen cloth, were worn almost universally. Shoes were simple moccasins, often made of untanned leather. An ample cloak completed the outfit. Such a costume remained that of men of the lower classes for many centuries. Women wore a rather long, shapeless dress concealing the lines of the figure. The sleeves were long and wide and beneath them could be seen the tight-fitting sleeves of the underbodice. There was very little decoration, and colours were simple, mainly earth colours and vegetable dyes. The hair was entirely concealed by a veil.

The feudal lords returning from the crusades introduced oriental luxuries such as silks and damasks. Trousers were replaced by close-fitting hose, revealed by a tunic that at first reached to the knees and later to the ankles. The long, full gown had tight, embroidered or bejeweled sleeves, and round the hips was worn a decorated belt from which hung the pouch. sword and dagger. There was also a straight overmantle fastened round the neck by a cord. chain or jeweled clasp. Improvements in weaving and dyeing made possible a wider range of colours. and the garments of both sexes began to be trimmed with fur. The typical male headgear consisted of a hood framing the face and forming part of a short cape over the shoulders. The hood was sometimes lengthened at the back to form a point or even a long tail known as a liripipe.

The shaping of garments to the body, for both men and women, began at the end of the 13th century, and by the middle of the 14th something that can be recognized as "fashion" appeared. Men wore a gipon, a kind of short tunic, tight-fitting and buttoned down the front; the sleeves were very tight and long enough to cover the knuckles, the neck was round and low. When the gipon was worn without the overgarment called a cote-hardie (a close-fitting, long-sleeved tunic long enough to cover the buttocks), it was belted round the hips. The tight hose were revealed, the two legs often of different colours. The upper garments were sometimes similarly of divided colour and adorned with heraldic emblems; at this period both men and women often wore their coats of arms on their own persons. Shoes, long and pointed, were known as crackowes after the Polish city of Cracow; it is thought that the marriage of Richard II of England to Anne of Bohemia (Poland at that time being part of the kingdom of Bohemia) was responsible for this fashion. Gloves, at first worn by kings and bishops as a status symbol, were worn universally among the upper classes in the 14th century.

A characteristic overgarment from 1380 to 1450 was the houppelande. later called the gown. It fitted the upper part of the body but fell below the waist in folds. The neck had a high, upright collar the edge of which was often "dagged," or cut in fancy shapes. The hood also was dagged and, between 1390 and 1410, the peculiar mode arose of inserting the head into the face opening, winding the folds round like a turban and binding them in place with the liripipe. The dagged edge thus formed a kind of cockscomb. Hats were also worn with a plume attached by means of a jeweled brooch.

Women continued to wear the kirtle or gown, but, like men's clothes, more closely fitted, and now décolleté. Sleeves were extremely tight with many buttons. The cote-hardie had long sleeves sometimes reaching to the ground. Over it, for more than a century, women wore a sideless surcoat consisting of a front and back descending to below the waist. In headdresses there was increasing elaboration. Older women continued to wear the veil and the wimple, a piece of cloth covering the chin, but the court ladies adopted a kind of circular arch of goffered linen. Another fashion was to frame the face by means of two pillar-shaped structures of net enclosing the side hair.

After 1400 men were clean-shaven; were, indeed, almost compelled to be so because of the introduction of a helmet with a chinpiece instead of the cowl of mail usual in the preceding century. They also cut their hair short. and after 1410 the "bowl crop," which looked as if the hair had been shaved round a bowl, was usual.

About 1420 the gipon, now called a doublet, began to develop a collar. The cote-hardie worn over it was very short at the beginning of the century, but knee-length from about 1410 to 1450. The houppelande or gown showed considerable variation in the shape of the sleeves. The belt mas now usually worn at the waist instead of round the hips. Materials were richer, and there was an increasing use of fur trimming. Hose now began to be joined together like modern theatrical tights and were attached to the lower edge of the doublet by "points" or strings. The hood became rare except among the peasantry, the usual form of headgear being the chaperon, a kind of ready-made turban. There was an increasing use of hats, some of them resembling the top hats of a later age. Women's headgear assumed fantastic shapes, and the hennin, or steeple headdress, was fashionable in France and Flanders between 1460 and 1480, though it never became popular in England. There were also a turban for women and the so-called "butterfly headdress" of transparent gauze raised above the head by means of long pins.

In the second half of the 15th century men wore. under the very short doublet, a kind of padded waistcoat, known confusingly as a petticoat. The shoulders of the doublet mere puffed and padded. A tall brimless hat, like a Turkish fez, was worn. For women the

sideless surcoat was replaced by the gown, often with a very deep decolletage. Skirts were very long, often with a train.

2. 16th Century. — The characteristic English fashions of the 16th century were beginning to appear at the time of the accession of Henry VII in 1485. For women the butterfly headdress was replaced by a low hood lined with fabric of a contrasting colour and turned back in a broad fold. When this was stiffened in the shape of a flat arch it developed into the "Tudor" headdress. The hair was completely concealed.

Men were still clean-shaven but wore their hair long. Hats were sometimes adorned with large feathers. Long, pointed shoes gave place to extremely broad shoes. Sleeves, sometimes detachable, also became noticeably wider. They were nearly always puffed and slashed. a curious fashion supposed to have been derived from the costume of German mercenaries. The doublet was longer, reaching almost to the knees, but parted in the front to reveal that astonishing item, the codpiece. Under the doublet men wore a waistcoat, over it a jerkin or jacket and over that a sleeveless and heavily furred gown. All prosperous men wore a gold chain, and this, together with the sleeveless furred gown, has survived as the traditional dress of English mayors. The hat was generally small and worn over one ear. After 1530 it was the fashion to cut the hair short and wear a full beard.

Women wore the kirtle, a bodice and skirt sewn together, and over it the gown, tight-fitting to the waist and falling in ample folds to the ground. Toward the end of Henry VIII's reign it was given a curious bell-shaped sleeve, narrow at the shoulder and opening out to an enormous fur cuff. Trains became shorter after 1530 and ten years later disappeared entirely. The neck of the gown was cut low and square, revealing the neck of the kirtle and, below that, the top of the chemise. The English hood, or Tudor arch headdress, was gradually replaced by the French hood, which was smaller and worn farther back on the head, exposing the hair above the forehead.

The German influence that had been dominant in the first half of the century gave place about 1550 to Spanish. The new effect was narrower, tighter and more formal. The doublet had a narrower sleeve and its skirts shrank almost to the waist. Puffed trunk hose, frequently slashed in contrasting colours, covered the hips and thighs. The characteristic cloak was short, reaching only to the hips. and, about 1560, it was the fashion to wear it attached to one shoulder only.

The most striking characteristic of both men's and women's costume in the second half of the 16th century was the ruff. a frill of folded linen, worn round the neck, that gradually grew larger and larger. It was at first supported by wires, but the invention of starching made these unnecessary. Women's ruffs were worn above or divided in front to show the decolletage. With the ruff was sometimes worn the rebato, a mired collar edged with lace and standing up behind the head in the shape of wings. This is the style familiar from portraits of Queen Elizabeth I. Much jewelry was worn by men, chiefly in the form of gems sewn onto the doublet. Women's stomachers were similarly adorned, and women in addition wore necklaces and ropes of pearls.

Women's skirts grew wider and wider and were kept distended by a roll farthingale. a padded roll worn round the hips, or by a wheel farthingale, which made its wearer look as if she were standing in a large drum. The dresses, however, were sometimes sufficiently short to show the clocked and molded stockings made possible by the invention of the stocking frame. In the last quarter of the century, women wore their hair turned back from the forehead over a pad or a wire frame known as a *palisado.* Men generally wore their hair short. and beards were almost universal: pointed, forked or spade shaped, sometimes even dyed crimson. Many men adopted the curious fashion of wearing an earring in one ear. The flat caps that had been worn in the first half of the century were replaced among the fashionable by hats of various kinds. Apprentices and others of low degree were ordered to wear woolen caps, but the law was ineffective and was repealed in 1597. Women wore hats only for riding or traveling.

3. 17th Century. — The modes of the 16th century continued almost unchanged until after the death of Queen Elizabeth I and even during the early years of the reign of James I. The change came about 1610 with the disappearance of trunk hose and the vogue for longer and tighter breeches. Tall hats ornamented with feathers gave place to low-crowned, wide-brimmed hats. Instead of shoes are found wide boots reaching to the knee and turned down, or half-length boots with wide tops. Ruffs were replaced by wide collars falling over the shoulders and edged with lace. This became the characteristic Van Dyck collar of the Cavaliers; in a plainer form it was worn by the Roundheads also. Women's neckwear showed the same transition, although sometimes the ruff and falling collar were worn together. On their heads women began to wear a square piece of material pinned round the back of the head and known as a head roll. The bodice was now short-waisted. with a round instead of a square décolletage, often laced up the front with a ribbon. The sleeves were wide and sometimes puffed and slashed. The skirt. instead of being distended over a farthingale, mas now bunched up to reveal a petticoat. Among the men long hair showed Royalist and short hair Puritan sympathies.

The Puritans' costume was similar to that worn by their Dutch contemporaries; the Cavalier costume mas essentially French. The Restoration of Charles II was a real victory for French over English fashion. The doublet had become so short that the shirt was revealed between it and the breeches, and its sleeves also were very short, reaching just to the elbow. The breeches, loose at the knee like very wide shorts, were called Rhinegraves. Every item of clothing was lavishly decorated with ribbons. The falling collar had become a kind of bib edged with lace.

Then, in 1666. there was a complete revolution in masculine attire. The diarist Samuel Pepys records: "This day the King begins to put on his vest . . . being a long cassock close to the body of black cloth . . . and a coat over it." The other great diarist of the period. John Evelyn, calls it "a comely dress after the Persian mode." The new costume, which by 1670 mas firmly established in both England and France, consisted of a long coat with wide turned-back sleeves and a row of buttons down the front. Some of these were left unbuttoned to reveal a garment almost identical but without sleeves. Neither coat nor waistcoat (as the undergarment begun to be called) was provided with collar or revers, but a cravat of lace or muslin, sometimes with a bow. was worn. Breeches were tight-fitting. and the stockings, gartered below the knee, were pulled up over them. The outfit was completed by the wig and a hat which had already begun to be cocked but had not yet become a tricorn, or three-cornered hat. There was not much change in women's dress during the first 20 years of the reign of Charles II, though women's garments gradually became stiffer and more formal. They aimed at an effect of height, and this tendency culminated in the last decade of the 17th century in the fontange or topknot, a high lace cap supported on a wire frame.

4. 18th Century. — Men's dress remained static for almost the whole of the 18th century, the typical costume consisting of a long square-tailed coat, embroidered waistcoat, tight knee breeches and clump-heeled square-toed shoes. The three-cornered hat was universal As the century progressed, the waistcoat grew gradually smaller until it assumed something like its 20th-century form. The nig and hat grew smaller also. The fashion of powdering the hair gave a touch of artificiality and served to distinguish the upper from the lower classes. There was no real change in essentials until the eve of the French Revolution.

Women's dress was not so constant. Shortly after the death of Queen Anne the farthingale returned under another name and in a rather different form, known at first as the hoop skirt and later under the French name of punier, or pannier. By 1730 it had become a general European fashion. Panniers were structures of osier reeds or whalebone. rather like a country woman's basket, worn on the hips so that the skirt mas extended sideways and not all the way round. The extreme width even had an effect on the architecture of the period, and the curved balusters of the staircases, specially constructed to allow for the passage of women's voluminous skirts, may still be seen. The hair, however, was now dressed close to the head, the towering fontange having been completely abandoned.

A charming fashion of the first quarter of the century was the so-called "Watteau gown," a loose gown, worn over a tight bodice. with long, vertical pleats falling from the shoulders to the ground.. At first it was a *négligé,* but by the 1730s it had become the accepted *robe à la française,* or French dress. As dresses grew less formal the materials of which they were made became lighter; heavy brocades gave place to flowered taffetas and damasks and even to delicate lawns and dimities. Men's coats. plain and dun coloured at the beginning of the century, began to be embroidered all over or made of patterned velvet. The shirt ended in a frill of lace at wrist and throat. The silk stockings, now usually white, ceased to be rolled over the knees. The three-cornered hat became much smaller, and was sometimes carried under the arm so as not to disturb the wig.

In women's dress, in 1750, there was a striking decrease in the size of hoops. The triangular-shaped bodice, long and with a tight waist. was cut very low in a square décolletage. The bodice mas sometimes laced across the front with ribbons, the corset thus not being a separate garment but forming part of the dress. In cold weather small capes and even large cloaks were norn. Muffs were popular with both men and women. some of them large enough to hold a small lap dog.

In the 1770s women's hair began to rise from the head and the general effect was once more of height rather than width. The shape of dresses began to be modified, the side panniers being replaced by a pad worn at the back, giving the appearance of a bustle.

The1790s saw a fundamental change in both men's and women's costume, essentially a change from court modes to country modes. Instead of the tricorn men began to wear a hat which, with its narrow brim and high crown. is the obvious ancestor of the top hat. Embroidery disappeared from men's coats, and the skirts were cut away in front. What resulted was a hunting or riding costume. Boots were substituted for pumps, and swords ceased to be carried. Men began to wear their own hair instead of wigs. and toward the end of the century they gave up the use of powder.

Women's clothes showed a new simplicity based upon what were supposed to be classical modes. About 1795 the waist became extremely high and remained so for a quarter of a century. The materials used were very plain and thin: in France transparent fabrics were occasionally worn. High-heeled shoes mere replaced by heelless slippers, and caps were discarded in favour of bandeaux. From 1794 to 1797 there mas a fashion for wearing two or three large ostrich plumes in the hair, and this fashion, slightly modified, persisted in court dress into the 20th century. Dresses were so scanty that cashmere shawls and wraps of various kinds came into fashionwas well as the spencer, a short tailless coat with tight-fitting sleeves.

These modes, both masculine and feminine, had been anticipated by children's clothes a generation before. It was not until the middle of the 18th century that there were any special clothes for children. who were dressed as replicas of their elders except that boys wore their o n hair instead of wigs. Like adults they had full-skirted coats, tricorn hats and lace ruffles; little girls wore long dresses and mere tightly laced even from infancy. Jean Jacques Rousseau's theories of education induced many upper-class parents to clothe their children in more sensible garments. By the 1770s boys were wearing soft shirts and comfortable trousers and girls loose white dresses with a hint of the high waist. (J. Lr.)

B. Colonial America

1. Early Period.— The settlers of the new world brought with them habits of and ideas concerning dress that were characteristic of their places of origin. Basically, however, the dress of the American colonists was completely under English influence. Historical events of the 17th century in England had their influence on costume, and plain dress and rich dress became, in effect, the respective symbols of Puritan and Cavalier. Many Virginia colonists leaned toward the Cavaliers; Puritan ideas prevailed in Massachusetts. Virginia dress, though it differed little in design from that of New England, was in general more costly. The Puritans omitted such extravagances as fine brocades, rich laces. ribbons and feathers; the change to simpler dress that had begun before their departure for America continued.

Probably the greatest change in clothing, in America as opposed to Europe, took place in everyday working costume, the Americans wearing heavier and warmer clothing made of stronger and stouter materials. The distinguishing characteristic of all clothes listed in the inventories of the colonization companies is their wearing quality, and the terms "heavy cloth" and "strong durable stuff" are often encountered. Men, boys and workmen wore comfortable. durable jackets and breeches made from deer and buckskin tanned to the consistency of fine chamois with the use of animal brains, a process the colonists learned from the Indians. Courts of both Virginia and New England forbade the use of rich dress and ornaments by persons of small means, although there is no record of fines imposed for this offense in Virginia. The Dutch were not restricted in their dress, which was sometimes more colourful and exhibited more lace.

Men wore breeches full at the waist and knee; the mandilion, a loose cloak. often lined with fabric of a different colour; doublet and jerkin, somewhat similar garments resembling a jacket, often sleeveless when designed to be worn over another garment; the cassock. similar to doublet and jerkin but longer; and the buffcoat, a strong coat of buff leather, with or without sleeves, tied by a wide sash around the waist. The doublet was especially important, morn by both men and women and by children. its high. tight collar often surmounted by a stiff linen collar or band. It mas made of two thicknesses of cloth and welted at the armhole. the welt or wing being a piece of cloth set over the armhole where body and sleeves met. The everyday dress of women was a short gown of durable material, with a full skirt over a homespun petticoat, covered by a long apron of white linen. The more stylish dress was longer and made of finer material. It often had the virago sleeve. full at elbow and shoulder and drawn in at intervals by strings of narrow ribbon, which appears in most 17th-century portraits of American women and children.

Slashed clothing was fashionable, as in England: in the openings made by the slashes could be seen rich materials. In 1634, however, the general court of Massachusetts forbade men and women to make or buy clothes with more than one slash in each sleeve and another in the back. The starched ruff of the early 17th century gave nay to the falling band, the common form of which was a broad, plain linen collar. Both men and women wore this collar and plain linen turn-back cuffs.

Stockings were either knitted or cut from woven cloth and sewn to fit the leg. They were attached to men's breeches by points, which were also used to secure other garments; later, sashlike garters replaced points. Both men and women wore stout leather shoes with medium heels. Men also wore French falls. a buff leather boot with a high top wide enough to crush down. After 1660 the jack boot, a shiny black leather boot large enough to pull over shoe or slipper, replaced the French falls; oxfords of black leather were worn by school children.

Both men and women wore the steeple hat of felt or the more expensive beaver. Men also wore the *montero* cap, which had a flap that could be turned down. and the Monmouth cap, a kind of stocking cap. Women of all ages wore the French hood, especially in winter, when it was made of heavy cloth or fur-lined; this hood, tied loosely under the chin, is seen in many portraits of the time. Sometimes the steeple hat was worn on top of the hood.

About 1660, as in France and England, the doublet. jerkin and cassock were gradually transformed into the coat, which became the general style of man's attire. The vest, cravat, sash garters, buckled shoes and wigs all came in about the same period. By 1690 breeches were cut to fit the leg.

As colonial wealth increased, so did refinements in clothing. Many portraits of American women in the last half of the 17th century show costume as stylish as that morn in England. The skirt of the woman's gown was gathered to the bodice and hung full to the floor or was open in front to show the petticoat; sometimes the sides were caught together in the back. This increasing back fullness developed into the bustle, which lasted until about 1711 when the hoop came in. Small, elegant aprons became fashionable.

It was in the last quarter of the 17th century, too, that the characteristic men's clothing of the 18th took shape: the periwig, the tricorn hat, the ruffle of lace or sheer linen at throat and wrists, the long waistcoat, the skirted coat with wide, turn-back cuffs, tight breeches, stockings and buckled shoes.

2. 18th Century.— Fashion was a noticeable element in the first half of the 18th century in America. No laws restricted fine dress in this prosperous period, and merchant ships brought to all the seaport towns elegant fabrics as well as other luxuries. Dresses and suits of homespun, stout shoes and durable cloaks were worn as before, but those who could afford to do so had stylish dress. There was no waste of fabric, however. The cherished brocade dress. the fine suit and embroidered waistcoat were often bequeathed by will to the second and even the third generation. There were no fashion plates. but jointed dolls dressed in the latest styles mere sent at regular intervals from London to the American colonies.

The most fashionable women's dress during most of the 18th century was the sacque, or "Watteau gown" (see above), whose ample folds displayed to full advantage the costly material of which it was often made. The commonest woman's dress, however. one worn nith variations both before and after the sacque. was a dress nith a long-waisted, pointed bodice. a full skirt, a rather low, rounded or square neck and a close-fitting sleeve nith a ruffle at the elbow. Stays, or corsets, were a necessary article of dress.

The woman's dress shoe was a brocade slipper with a French heel and usually a buckle. Often the patten, or overshoe, worn to shield the slipper, was made of the same material. As in the 17th century, cloaks were worn extensively, called by such names as pompadours, roquelaures, capuchins and cardinals. The cardinal, a hooded scarlet cloak. was worn during the entire century.

Hoods, which previously had been made ordinarily of black silk or heavy cloth. now came in fine fabrics and gay colours. The calash, a great bonnet that resembled the extension top of a *calèche,* or French carriage, was worn with the high, pompadour style of hairdress. This head covering. usually of thin silk. nith whalebone or rattan run at two- or three-inch intervals through shirrings. could he pulled over the face or pushed back. The mobcap. a huge nhite lace or lawn cap nith deep-hanging frills, was also worn Gypsy hats and the skimming-dish hat, or skimmer, both of leghorn straw, were worn after 1750.

From 1770 to 1780 the polonaise gown was popular. The bodice was fitted as before. but the full skirt was curved away from the front and caught up on either side at the back so that it fell in three large loops, showing the elaborately quilted or embroidered petticoat. A long apron of sheer, embroidered linen was worn with the open-front gowns of this period. Gold beads and fans for women and the snuffbox for men were important accessories.

Little had happened to the man's costume described at the close of the 17th century save a shortening of the waistcoat, a decrease in the size of the turn-back cuffs and the wig, and the replacement of the cravat by the stock, which fastened at the back so that the frilled edge of the shirt could be seen at the open front of the waistcoat. After 1760 breeches were fastened at the knee with buttons and a small buckle, and the front of the coat. which was developing a collar. mas cut away at the sides. Unpowdered, natural hair became popular for both men and women. (A. W. Mu)

C. Europe and America, 19th–20th Centuries

1. Regency.— The dress of the Regency dandy was a smartened version of the country clothes described above. Beau Brummell. whose clothes were copied by the prince regent himself. was so concerned with fit that he had his coat made by one tailor, his waistcoat by another and his breeches by a third. The top hat became almost universal. The neckcloth mas so elaborate and voluminous that Brummell's valet sometimes spent a whole morning getting it to sit properly. It was at this period that English modes for men became everywhere accepted as correct, even in Napoleonic France.

France continued, however, to dictate women's fashions, except for an interlude between 1802 and 1814 when communication was difficult and English dresses diverged noticeably from those worn in Paris. However, after the abdication of Napoleon in 1814, English women's clothing immediately reverted to Parisian styles. The French waist was still high but the skirt had become wider at the hem and was rather heavily decorated at the lower edge to make it stand out. The invention of the fashion plate meant that fashions now filtered down the social scale more quickly. The only real change in men's dress after 1814 was that trousers began increasingly to replace breeches; in summer they were usually made of white duck.

In 1820 women's waistlines resumed their normal position, becoming steadily tighter and tighter. Skirts continued to expand. being sometimes weighted at the lower edge with a band of fur. Colour came back again after a long eclipse and there was a vogue for tartans. resulting no doubt from the popularity of the novels of Sir Walter Scott. The little puffed and sometimes slashed sleeve, another product of the romantic movement, began about 1825 to be worn with another transparent sleeve over it. When this was made opaque, the sleeve assumed the leg-of-mutton shape so characteristic of the period. After 1830, while skirts grew shorter. sleeves became enormous. Hats were also extremely large and ornamented with flowers and ribbons.

2. Victorian Age.—With the accession of Queen Victoria in 1837 these romantic modes began to be modified. The wide sleeves disappeared, or rather the bulge was placed farther down the arm. Large hats, indeed hats of any kind except turbans. were abandoned in favour of the poke bonnet. Shawls were universally worn. The general effect was subdued and modest. On the other hand evening dresses developed a wide décolletage that exposed the shoulders; this early Victorian style, which would have been thought extremely improper in the 18th century, was accepted without question.

The increasing amplitude of skirts in the early 1850s caused a revival of the 18th-century hoop in an improved form. the crinoline, a stiff fabric made of horsehair and linen thrend. This was soon replaced by a series of flexible steel hoops, sometimes forming a separate structure and sometimes sewn into the petticoat.

Men's clothes at this period had a somewhat sombre look. The top hat had become the shiny silk hat, usually black. The clothes, except for a surviving fancy waistcoat, were also black, although shepherd's plaid trousers were occasionally worn The cutaway coat was now worn as evening dress only. High neckcloths had been abandoned for collars and ties not very different from those worn in the 20th century.

The crinoline reached its largest dimensions about 1860. After that it began to slip to the back and was indeed no more than a half crinoline. Then. about 1869. it was replaced by the bustle, although hoops were sometimes still employed. Hats replaced bonnets, being worn tilted over the forehead. In men's clothes there was a steady evolution toward less formal modes. a short black coat sometimes replacing the frock coat or morning coat. The bowler hat, invented in the 1850s for country wear, began to be worn in town. The suit, aith coat and trousers made of the same material, was worn by younger men.

As the 1870s progressed the bustle gradually slipped down until it was no more than a fullness at the bottom of the skirt. Almost all dresses had long trains. even the street dresses of fashionable women. In 1880 the fullness of the skirt disappeared for a brief period; dresses were not only smooth over the hips but fairly narrow round the hem. The waist was very tight and the general effect was of a corset worn outside the dress. The bodice was high-necked and very closely fitting. However. by 1884 the bustle was back again in a slightly different form, stretching straight out at the back like a shelf. Hats were small, perched squarely on top of the head.

Not all the women of the 1880s, however, wore these fashionable clothes. Followers of the aesthetic movement wore looser garments. though the waists were still tight, with enormous sleeves, supposed to resemble those worn by women in early Florentine paintings The humorous journals of the period made great play with the contrast between fashionable and aesthetic modes.

For men the 1880s provided a certain relief from formality by the invention of various kinds of sports clothes. Men took to knickerbockers and tweed jackets, straw hats and "deerstalkers" like that immortalized by Sherlock Holmes. Women also wore straw hats and bodices of naval cut to match the double-breasted "reefers" of the men. In the 1890s women began to wear knickerbockers for cycling, a real revolution in female attire. They also thought it necessary for this purpose to adopt men's stiff collars and trilby hats.

In 1890 sleeves rose to a point on the shoulders. and this feature expanded until it produced the characteristic balloon sleeves of the middle of the decade, familiar from the drawings of Aubrey Beardsley and the posters of Toulouse-Lautrec. Muffs. almost universally worn, were so small that they could be carried on one forearm, the other hand being perpetually occupied in lifting the dress In evening dress, décolletage, which had been modest in the 1870s and 1880s. became more daring.

Children's clothes were less sensible and comfortable than they had been 50 to 60 years before. What had started in the 1820s as rational dress for boys had been formalized into the rigid discomfort of the Eton suit with its stiff uhite collar. Fortunate boys nere dressed in sailor suits and unfortunate ones as "Little Lord Fauntleroy." in velvet suits with lace collars and cuffs and mith the hair dressed long in curls. Little girls mere dressed in elaborate and easily soiled garments with much lace. Their skirts were shorter than those of adult women, but the waists nere nearly as tight.

As the century drew to a close the wide sleeve slipped and became a bulge over the forearm, facilitating the wearing of the short capes then fashionable. A prodigious quantity of lace was worn, at the wrists or in the form of a frilled shirt front attached to the corsage. For informal near blouses had become popular, these too adorned with frills of lace

Men's clothes had divided into formal and informal wear. Formal near consisted of a long frock coat nith silk lapels, nhite or gray waistcoat. striped trousers an all-the-way-round stiff white collar and a silk (top', hat. Informal wear consisted of a check suit or knickerbockers and a Norfolk jacket, and a straw hat. Cloth caps also were worn. Even nith this costume, however, it was usual to wear a stiff collar. Men's evening dress had also divided into the formal tail coat and the informal dinner jacket, a stiff shirt being norn with both.

3. Early 20th Century.— The first decade of the 20th century showed comparatively little change in the essential lines of feminine costume. The mature type of woman was admired: tall. small-naisted, heavy-bosomed and with a peculiar stance, the S-shaped look. resulting from what was strangely known as the "health" corset, a corset boned in such a way as to throw the hips back and the bosom forward. The effect was accentuated by the Russian blouse and cascades of lace descending from the bust. Never since the days of William III had so much lace been worn. Lace collars and collarettes, lace sleeves, lace plastrons, lace overbodices and lace petticoats, only to be glimpsed occasionally. but requiring the finest workmanship — there was hardly any part of women's dress that was not adorned with this expensive form of decoration. Real lace in such quantities being unobtainable and machine-made lace somewhat despised. a compromise was discovered in Irish crochet, for which there mas a considerable vogue, especially in 1907. Skirts nere long and sweeping, with a curious resemblance to the dominant line of *art nouveau* furniture. The hair was built high on the head and the flat pancake hats projected forward as if to balance the trailing skirts.

4 revolution in nightwear took place in the early years of the century. For 300 years or more women had worn in bed a long smock and men a longer version of the day shirt. Pajamas now began to take their place. They are thought to have originated in India (Hindu *pajama,* "drawers") and, once introduced into the nest, became steadily more popular not only for men but also for women.

In 1908 a slight modification began to be discernible in women's clothes. The bust was no longer thrust quite so far forward as before; the exaggerated overlap of the blouse was abandoned and skirts became a little narrower at the hem, although they still trailed on the ground and required to be gathered up in the hand when crossing a wet or muddy street. The change resulted, in part. from the coming of what was called the empire gown. although it did not resemble very closely the high-waisted dress of a century before. Its effect was to straighten the figure. and by 1910 the process was complete. At the same time hats became extremely wide and the wide skirt was replaced by a very narrow one.

The hobble skirt of 1911, one of the strangest garments ever worn by women, shackled the legs so completely that walking was almost impossible. The feminine silhouette, as so often. resembled a triangle, but a triangle standing on its apex. With the enormous hats went very large muffs, and the handbag reappeared, since it was impossible for such narrow skirts to contain pockets. In the draped effect of evening dresses there is a curious orientalism due in part to Paul Poiret. the most fashionable dressmaker of the period, and in part to the immense success of the Russian ballet, particularly in the pieces staged by Léon Bakst For day wear the tailor-made was very popular. The fashionable trimming consisted of buttons sewn in the most unlikely places all over the costume.

A kind of tunic overskirt made its appearance in 1912, and by early 1914 had become the feature of dress upon which the attention of designers was concentrated and which was to provide the jumping-off stage for the development of the next mode. There mas a fundamental change in the neckline, the new fashion being known as the V-neck and considered by many to be dangerous to both health and morals. Men's clothes remained extremely formal.

The outbreak of World War I in 1914 did not bring about any immediate change in women's dress, but about the middle of 1915 the narrow underskirt was abandoned and the lampshade tunic became the whole dress. This skirt reached to mid-calf, revealing high laced boots. Hats mere now small, usually trimmed mith a vertical feather The shortish skirts and high boots lasted with little modification until the end of 1918.

4. Post-World War I.—By 1921 the skirt fullness of the war period had disappeared, and waists had disappeared with it. The general effect was tubular, the corset having been completely abandoned Hair mas bobbed, but the close-fitting cloche had not yet appeared and the extremely low waist was indicated only by the loner edge of the now inevitable jumper. Panniers made a brief appearance in 1923 but did not long affect the prevailing trend. It was not until 1925 that the extremely short skirt made its appearance. With it were worn silk stockings in various shades of flesh pink, a startling innovation.

Skirts reached their extreme of shortness in 1927, when it was impossible for a woman to sit down nithout showing her knees. The short skirt lasted for day wear until 1930, but evening dresses, by careful degrees — tails, trains, sidepieces and transparent hems — became long again. In 1930 day skirts suddenly lengthened to mid-calf or lower and the waistline moved back to its normal position. There was a temporary vogue for large sleeves, not, as in 1830 and 1895, to decrease the apparent size of the waist. but to make the hips look smaller. The emphasis throughout the 1930s was on slim hips and backless dresses, and sometimes the whole outfit looked as if it had been designed to be seen from the rear. The shoulders mere heavily padded to make them look square. The long reign of the cloche hat came to an end, to be replaced by a variety of very small hats perched forward over one eye.

Men's clothes showed a steady progress away from formality. The frock coat disappeared altogether and the morning coat and silk hat were worn only on ceremonial occasions. The wide trousers known as Oxford bags came in in 1924 and trousers remained wide until the end of the 1930s. Soft collars replaced the stiff white linen variety, and for golf and other sports men wore the baggy knickerbockers known as knickers or plus fours. often with a gaily coloured sweater. Women's sports clothes became more and more scanty, and it became usual to play tennis

in shorts or very short skirts, without stockings. Swim suits were extremely exiguous.

Two marked general tendencies may be noted: the disappearance of class distinction in women's day clothes. and the marked divergence between day clothes and evening clothes. Many women were now engaged in some kind of work away from home during the day and there was evolved for this purpose a kind of working uniform. consisting of the tailor-made, or suit. Trousers, in the form of slacks, were increasingly worn for sports but not yet for shopping. On the other hand, even girls in the lower-income groups assumed for evening some kind of "glamour" dress. a dress based ultimately on what had been seen in motion pictures. This influence tended to inhibit change over the years, since as much as two years may elapse betneen the shooting of a film and its general release. The "glamour" toilettes of the 1930s are therefore curiously static and tend to have the appearance of fancy dress. With regard to foundation garments, C. Willett Cunnington notes:

> A technical invention of some importance in this period was the belt [in the United States, girdle], made of elastic material, which gripped the abdomen and buttocks so as to produce flattening of those regions. Some were of woven textile with a two-way stretch, and were put on by being unrolled from below upward; others were of india-rubber composition, and pulled up. The garment iurnished with suspenders, was often worn next to the skin, and supplied a sculptured foundation on which the tight-fitting dress appeared moulded *(English Women's Clothing in the Present Century,* 1952).

With this was worn the brassière, now a separate garment rather than a part of the corset or girdle.

5. World War II Period.—Just before World War II there was a definite attempt on the part of dress designers to bring back the boned corset. Fashion commentators spoke of "the figure of eight which the new clothes demand; so get it, by hook, by crook, or by corset." Apart from this trend there was a wild variety of styles, especially in evening dress. There were hooped skirts, hobble skirts and even harem skirts, a kind of thronback to the fashions immediately preceding World War I. But these developments were cut short by the war.

By the summer of 1939 day skirts were almost as short as they had been in the late 1920s. Shoes were very square-toed with low heels. When war came the little hats that had served for a decade were often replaced by head scarves and, in net weather, by plastic hoods. Housewives as well as factory workers took to slacks, thereby making stockings unnecessary. Even with skirts many women began to go about with bare legs, on which stockings were sometimes painted with a line drawn down the back to simulate the still obligatory seam. Clothes rationing was introduced in Britain in June 1941, and for the rest of the war fashion may be said to have ceased to exist in that country. In the United States, rationing of clothing worked little hardship, but restrictions on uses of fabrics (leading to the virtual disappearance of silk and nylon) affected clothing. The daytime silhouette for women continued to be broad-shouldered and short-skirted. The short dress for evening reappeared. The hair was worn "upswept" in the back, with a high "pompadour" in front, or else hanging loosely to the shoulders or below.

6. After World War II.—When communication with France was restored in 1945, there was a cry that '.fashion is going feminine," but in fact there was at first very little change. Day dresses had more rounded shoulders and a slightly smaller waist; evening dresses sought to revive the modes of 1939. Then in the spring of 1947 Christian Dior launched the "new look" from Paris. The shoulders were narrow, there was a new emphasis on the bust and the skirt was much lengthened and had a wide, billowing hem. Hats, after their wartime eclipse, returned to popularity, with much experiment in form and colour. Brims, in general, were large and flaring, or small and turned back against the crown.

A popular development in postwar fashions was the late-afternoon cocktail dress, which by means of a minor adjustment, such as discarding a bolero, could be made to serve as an evening dress also. There was a certain revival of such Victorian modes as the crinoline for formal occasions. It was as if women were unconsciously striving to return to a more settled age. There was a marked emphasis on the bosom, the desired effect being sometimes obtained by means of a padded or inflated brassibre. Soon. however, the "new look" gave place to what seemed like a revival of the modes of the 1920s, with the straight lines and displaced waists of typical postcrisis periods. Dior brought out his H-line and then his A-line, and it seemed as if the designers were unable to decide whether to echo the fashions of 1800 or those of 1925. By the early 1960s they appeared to have made up their minds, fashionable dress resembling very closely that of the '20s, with a lowered waist and very high hemline. Shoes were excessively pointed, with stiletto heels. In the servantless postwar world women wore slacks for housework and shopping; in some communities long shorts (Bermudas or Jamaicas) replaced slacks, and culottes, or divided skirts, reappeared.

Men's clothes after the war showed a curious reaction! not to Victorian but to Edwardian modes: tighter trousers, coats buttoned higher and the revived bowler hat. There was a passing craze for fancy waistcoats. Slacks, sport shirt (worn without a tie) and a jacket resembling battle dress, together with a variety of sweaters, became ordinary wear for many young men. In the evening the tail coat almost entirely disappeared but the dinner jacket maintained its popularity. See also references under "Dress" in the Index volume. (J. LR.)

DRESSER, CHRISTOPHER (1834–1904), British designer, one of the first professional industrial designers of the 19th century, was born in Glasgow on July 4, 1834. After two years' training at the School of Design at Somerset house, he first taught botany, published *Unity in Variety* (1859) and became a fellow of the Linnaean society. In 1862 he published *The Art of Decorative Design* and soon afterward took up his career as a designer. His work was influenced by a scientific outlook nhich led to overtheorization and elaboration of the principles of design, reducing the aesthetic interest of his work, particularly his flat patterns, which often were heavy and pedantic. But he showed a genuine understanding of the use of materials, especially metals and glass. He was one of the leaders of the Japanese vogue and visited Japan in 1876 as a representative of the British government.

Dresser died at Mulhouse, Alsace, on Nov. 24, 1904.

Dresser's works include *The Development of Ornamental Art in the International Exhibition* (1862) and *Japan, its Architecture, Art and Art Manufactures* (1882). *See* also DESIGN, 19TH-CENTURY: *Idealism and Innovation.*

DRESSLER, MARIE (LEILA KOERBER) (1869–1934) U S actress, remembered for her portrayals of robust, humorous old women. was born in Cobourg, Ont., on Nov 9, 1869 After appearing with a roving light opera troupe she eventually became a featured actress with Weber and Fields, and played the lead in *Tillie's Nightmare* (1910). Her first film was *Tillie's Punctured Romance* (1915), in which Charlie Chaplin also appeared. Following World War I Miss Dressler was almost lost sight of as an actress, but she was re-established in motion pictures in 1927, meeting with great success as Marthy in *Anna Ckrzstie* (1930). The character of Marthy typified the roles she generally played thereafter in many pictures, some of which uere *Politzcs* (1931), *Prosperity* (1933), *Dinner at Ezght* (1933) and *Tugboat Annze* (1933). The Academy of Motion Picture Arts and Sciences voted her the best actress of 1930–31 for her performance in *Min and Bzll* She died in Santa Barbara, Calif., July 28, 1934. (M. S. BY.)

DRESSMAKING: *see* SEWING, HOME.

DREW, the name of a family of U.S. actors.

1. JOHN DREW (1827–62) was born in Dublin, Ire., Sept. 3, 1827. After a brief career as a seaman, he turned to the stage as an actor of Irish and light comedy roles, making his first New York appearance in 1842. In 1843, with William Wheatley, he leased the Arch Street theatre in Philadelphia. In 1859 he toured Australia and England, leaving his wife as manager of the theatre. He died in Philadelphia, May 21, 1862.

2. His wife, LOUISA LANE DREW (1820–97), was the daughter of a British acting couple. She began her career as a child actress in roles such as Little Pickle in *Tlze Spoiled Child*. As was the custom in her time, Louisa played Romeo, Mark Antony and other male parts, and at various times in her career she acted with W. C. Macready and Joseph Jefferson. She married John Drew in 1850, and between 1861 and 1892 managed the Arch Street theatre. Mrs. Drew had four children, John, Louisa, Sidney (adopted) and Georgiana, the last of whom married Maurice Barrymore and became the mother of Lionel, Ethel and John Barrymore, all actors.

3. The eldest son, JOHN DREW (1853–1927), was born Nov. 13, 1853, in Philadelphia. He did not begin acting until 1873, when he appeared under his mother's management in *Cool as a Cucumber*. In 1875 he made his first New York appearance in Augustin Daly's *The Big Bonanza*. Beginning in 1879, he spent 14 years as an actor with Daly's troupe, leaving it to join Charles Frohman's company at Palmer's theatre in 1892. During the next 20 years. under Frohman's personal direction. Drew established his name as one of the greatest actors of the United States in such plays as *A Marriage of Convenience, One Summer Day, Richard Carvel, Much Ado About Nothing, The Will, The Circle, School for Scandal* and *Trelawney of tlze Wells*.

When Frohman died in the "Lusitania" disaster in 1915, Drew's career began to ebb. He died in San Francisco, July 9, 1927. So esteemed was John Drew by his fellow actors that he was chosen lifetime president of the Players' club, an honour previously shared only by Edwin Booth, founder of the club, and Joseph Jefferson. In 1922 he published a volume of reminiscences, *My Years on the Stage*.

See also BARRYMORE (family). (S. W. H.)

DREW, DANIEL (1797–1879), U.S. steamboat pioneer and railroad financier, was born in Carmel, N.P., July 29. 1797. He spent his early life on a farm and attended a country school. After achieving success in cattle trading he bought an interest in a New York-to-Peekskill steamboat in 1834. Six years later he established the People's Line, a steamship company, and the Stonington Line in 1847. He became a Wall Street broker in 1844, took an interest in railroads and in 1850 purchased a small road with Cornelius Vanderbilt. He established a stockbroking and banking firm (Drew, Robinson and Co.) that became one of the principal traders in railroad stocks in the United States. He was also a director and large stockholder of the Erie railroad. Drew founded a ladies' seminary and a theological seminary. In later life he suffered financial losses that resulted in his bankruptcy. He died in New York city on Sept. 19, 1879. (H. J. SG.)

DREXEL, ANTHONY JOSEPH (1826–1893), U.S. banker and philanthropist, was born in Philadelphia, Pa., Sept. 13, 1826. His father, Francis Martin Drexel (1792–1863), had founded the banking house of Drexel and Co. in Philadelphia. When Anthony and his brothers succeeded to the business, they transformed it into an investment banking house. In 1871 they organized Drexel, Morgan and Co. of New York city, and Drexel, Harjes and Co. in Paris. Anthony Drexel participated in flotation of government bonds, organization of railroads, developing mining properties and urban real estate. From 1864 he was co-owner with George W. Childs (*q.v.*) of the *Philadelphia Public Ledger*. He contributed generously to hospitals, churches and charities, and founded Drexel Institute of Technology with an endowment of $3,000,000. He died June 30, 1893, at Carlsbad, Bohemia.

(J. R. LT.)

DREYER, JOHN LOUIS (or JOHAN LUDWIG) **EMIL** (1852–1926), Danish astronomer whose *New General Catalogue of Nebulae and Clusters of Stars*, published in the *Memoirs* of the Royal Astronomical society in 1888, with supplements in 1895 and 1908, was still a standard work in the late 1950s, was born in Copenhagen on Feb. 13. 1852. In 1874 he was appointed astronomer at the earl of Rosse's observatory at Birr castle. in Ireland. In 1878 he went to Dunsink, near Dublin, to be assistant at the observatory of Trinity college. He became director of the observatory at Armagh in 1882, retiring from this post in 1916. Dreyer's interest in the history of astronomy led him to undertake the preparation of a complete edition of Tycho Brahe's works. The first ten volumes of *Tychonis Brahe Opera Omnia* appeared at Copenhagen during 1913–26, the remaining four being complete in manuscript at the time of his death. He also edited the *Scientific Papers of Sir William Herschel* (1912). He was awarded the gold medal of the Royal Astronomical society in 1916 and served as president of the society in 1923–24. He died at Oxford on Sept. 14, 1926. (O. J. E.)

DREYFUS, ALFRED (1859–1935), French army officer whose trial for treason began a 12-year controversy that deeply marked the political and social history of the third republic, was born at Mulhouse (Mülhausen) in Alsace, on Oct. 19, 1859, the son of a wealthy Jewish textile manufacturer. In 1882 he went to the École Polytechnique and entered on a military career, attaining captain's rank by 1889. In 1890 he married Lucie Hadamard, daughter of a diamond merchant of Paris. They had two children.

Sent in 1893 as a staff learner to the ministry of war, he fell under suspicion of being the author of a letter which reached the statistical section of the ministry on Sept. 26, 1894. This document, known as the *bordereau*, contained evidence of the betrayal of military information to Germany. On Oct. 15 Dreyfus was arrested by the military authorities and accused of high treason.

The court martial which heard the case in camera in Dec. 1894 found him guilty, on meagre evidence, and condemned him to degradation and to deportation for life. He was sent to Devil's Island, Guiana, where he was to spend nearly five years. Although he denied his guilt and although his family consistently supported his plea of innocence, public opinion and the French press as a whole, led by its virulently anti-Semitic section, welcomed the verdict and the sentence. French opinion had already been deeply disturbed by the crisis of Boulangism (see BOULANGER, GEORGES ERNEST JEAN MARIE) and by the Panamá scandal, with their implications of corruption in high places. It was excited and belligerent and in no mood to commiserate with convicted traitors.

Doubts. however, began to grow, first in the minds of Gen. R. F. C. Le Mouton de Boisdeffre, chief of staff, and Lieut. Col. Georges Picquart, now head of the statistical section. Picquart found evidence that Maj. C. F. (Walsin-)Esterhazy, formerly of his section, was engaged in espionage, and that his handwriting was that of the bordereau. When Picquart was removed from his post, it was believed that his discovery was too inconvenient for his superiors. Meanwhile Dreyfus' family and friends agitated for reconsideration of the case, and some papers aired doubts of the verdict. Bitterly resisted by the anti-Semitic press, this agitation began to attract wider attention. The veteran politician Auguste Scheurer-Kestner, vice-president of the senate, became convinced of Dreyfus' innocence and persuaded Georges Clemenceau (*q.v.*) to denounce the irregularity of the court martial. The "Dreyfus case" began to rank as a major political issue, a development which the weak premier, Félix Jules Méline, tried in vain to prevent.

The affair was made absurdly complicated by the activities of Esterhazy in inventing evidence and spreading rumours. and of Maj. Hubert Joseph Henry, discoverer of the bordereau, in forging new documents and suppressing others. When Esterhazy was brought before a court martial he was acquitted, and Picquart was arrested. This precipitated an event that was to crystallize the whole movement for revision of Dreyfus' trial. In Jan. 1898 the novelist Émile Zola (*q.v.*) wrote an open letter to Félix Faure, president of the republic. It was published on Jan. 13, on the front page of *Aurore,* Clemenceau's paper, under the headline "J'Accuse." By the evening of that day 200,000 copies had been sold Zola accused the first court martial of violating the rights of the defense and the second of acquitting Esterhazy on the orders of the ministry of war. He challenged the authorities to prosecute him.

Amid uproar in parliament, the government, pressed by the nationalists to bring Zola to justice, while the anti-Semites began a series of riots in the provinces, found itself caught between two fires. A petition demanding revision of the Dreyfus trial was signed by some 3,000 persons, including Anatole France, Marcel Proust and a host of intellectuals, men of letters and of art. The trial of Zola, which the government could not now refuse, would focus the whole agitation. It began on Feb. 7 and became a parade of all the many *dramatis* personae now involved, save Dreyfus himself. Zola was found guilty and sentenced to a year's imprisonment and a fine of 3,000 francs, but the revisionist movement had gained its purpose: grave doubts had been cast on the legality of Dreyfus' trial.

Revision would still have been difficult to pursue, however, but for one fortuitous event. Major Henry committed suicide at the end of Aug. 1898, after confessing his forgeries. Boisdeffre resigned as chief of staff. Picquart, now dismissed from the army, was free to join forces with the revisionists. Esterhazy, in panic, fled to Belgium and London. The confession of Henry opened a new phase in the affair, for it ensured that the appeal of the Dreyfus family for a retrial would now be irresistible. A new ministry under Henri Brisson agreed to allow the appeal. In Sept. 1898 the court of criminal appeal decided to proceed with a further investigation of the case. Meanwhile the Brisson ministry, never robust, resigned and mas succeeded by a reshuffled ministry led by Charles Alexandre Dupuy (*q.v.*). Already it was four years and five ministries ago since Dreyfus had been condemned; but the Dreyfus affair, already a cause of violent controversy and protracted disorders, was to drag on for eight more years.

By now the issues were regarded as far exceeding the personal matter of the guilt or innocence of Dreyfus. Inflamed by extremist agitation on both sides. in which old issues such as anticlericalism became intertwined, the case of the revisionists had become a cause. the cause of republican civilian authority against a military body claiming to be autonomous within the state, of individual rights against all public authority, of the nation against occult usurping power. On the right, nationalist and authoritarian by tradition, it seemed equally a cause: of national security against international socialism and Jewry, of France against Germany. After Zola's trial, there was formed the League for the Defense of the Rights of Man and the Citizen; after the agreement to hold a retrial, Charles Maurras (*q.v.*) founded the Ligue de la Patrie Française.

Faure died and was succeeded in Feb. 1899 by Émile Loubet, known to favour revision. A new ministry, led by René Waldeck-Rousseau (*q.v.*), took office in June resolved to bring the affair to an end at last. Dreyfus, brought back from Devil's Island for retrial. appeared before a court martial in Rennes (Aug. 7–Sept 9, 1899). It pronounced him guilty, but in extenuating circumstances. and sentenced him, by five votes against two. to ten years' detention. Loubet, however, remitted the balance of the sentence and canceled the order for degradation. Dreyfus accepted the act of clemency, but reserved the right to do all in his power to establish his innocence.

His efforts, supported by those of his brother Mathieu, continued until. in 1903. he succeeded in adducing enough fresh evidence in his favour to have the verdict of Rennes submitted to the court of criminal appeal. In March 1904 the court decided for full revision. Once again all the witnesses still alive were summoned and examined In July 1906 the united appeal courts delivered judgment: they annulled the verdict of Rennes. Parliament passed a bill reinstating Dreyfus. On July 22 he was formally reinstated and decorated with the Legion of Honour. After further short service in the army, in which he attained the rank of major, Dreyfus went on to the reserve. He was recalled to active service during World War I and, as a lieutenant colonel, commanded an ammunition column. He died in obscurity in Paris on July 12, 1935.

The Dreyfus case—or *l'Affaire* as it came to be called—was an important landmark in the history of the third republic and indeed of modern France. From the turmoil of which it was the centre emerged a sharper alignment of political and social forces, leading to such drastic anticlerical measures as the separation of church and state in 1905 and to a cleavage between right-wing nationalists and left-wing antimilitarists that haunted French life until 1914 and even later. On each side were mobilized France's most eminent literary men, and the violent controversy destroyed the cohesion of French life for more than a generation after. A conjunction of mistaken loyalties, repeated stupidities, base forgeries and excited extremisms inflamed the situation into a national crisis. At best it evoked a passionate repudiation of anti-Semitism which did France honour; at worst, it revealed and intensified a chronic internal division which was to be a major source of national weakness. See also references under "Dreyfus. Alfred" in the Index volume.

(D. TN.)

DRIESCH, HANS ADOLF EDUARD (1867–1941), German biologist and philosopher, was an exponent of vitalism (*q.v.;* the theory that life cannot be explained as physical or chemical phenomena). He was born on Oct. 28. 1867. at Kreuznach. After studying at Hamburg, Freiburg, Munich and Jena, he traveled in the far east. and from 1891 to 1900 worked in the zoological station of Naples. He then settled in Heidelberg where in 1909 he became Privatdocent and in 1911 professor of philosophy. In 1920 he was made professor at Cologne and in 1921 at Leipzig. Driesch began as a disciple of Haeckel but through the influence of G. Wolff and W. Roux came to support a dynamic vitalism.

His doctrine that the functions of protoplasm cannot be ex-

plained mechanically was the outcome of experiments on the blastula of the sea urchin, which showed that any fragment cut at random always gave a complete embryo, and on the restitution of animal parts.

He died in Leipzig in April 1941.

DRILL, a large, short-tailed baboon, *Papio* (*Mandrillus*) *leucophaeus,* from the Cameroons, resembling the mandrill (*q.v.*), but distinguished from it by being smaller and having a black face. The lower lip is bright crimson and the hairs around the face are yellowish-white as is a tuft behind the ears. The rest of the animal is olive brown.

See also BABOON: PRIMATES. (J. E. HL.)

DRILL, MILITARY, is the preparation of soldiers for performance of their duties in peace and war by practice and rehearsal of prescribed movements. In a practical sense, drill consolidates soldiers into battle formations and familiarizes them with their weapons. Psychologically, it develops a sense of teamwork, discipline and self-control; it promotes automatic performance of duties under disturbing circumstances and instinctive response to the control and stimulus of leaders. Modern drill is essentially of two types: close-order and extended-order or combat drill. Close-order drill comprises the formal movements and formations used in marching, parades and ceremonies. Combat drill trains a small unit in the looser, extended formations and movements of battle.

Rudimentary drill appeared in ancient Egypt with the dawn of formal warfare because of the need to move and assemble large numbers of men for battle. Drill in the modern sense was introduced by the Greeks, who engaged in tireless practice in the precise evolutions of the phalanx. Philip II of Macedonia and Alexander the Great further improved the phalanx and its drill. (See MACEDONIAN ARMY.) Excellence in military drill contributed to Rome's success in dominating the Mediterranean world for five centuries. (See ROMAN ARMY.) After Rome's fall, drill almost disappeared as skill in warfare degenerated during the middle ages. Two notable exceptions were the well-trained Byzantine armies, and Genghis Khan's precisely drilled *toumans.*

Gustavus II Adolphus of Sweden accelerated a gradual revival of skill in European warfare early in the 17th century. His introduction of simplified drill techniques for the use of improved weapons was copied by all Europe. By the end of the 17th century France led in the development of modern standing armies, largely because of a drill system devised by Louis XIV's inspector general of infantry, Jean Martinet, whose name became a synonym for drillmaster. (See MARTINET.) To'make effective use of inaccurate muskets, concentrated volleys had to be delivered at short range. Troops advanced in rigidly maintained battle lines, all firing simultaneously on command. Through ceaseless drill, the Prussian army of Frederick the Great achieved a mechanical perfection in these tactics. At Valley Forge during the American Revolution, Baron von Steuben (*q.v.*) adapted Prussian techniques into a less rigid drill system fitted to the American character and to conditions of warfare in the new world.

Exact parade ground maneuvers on the battlefield disappeared in the 19th century because of improvements in the range and accuracy of weapons. This trend began during the American Civil War when soldiers had to be trained to spread out, take cover and dig entrenchments. It was hastened later by the introduction of the machine gun and quick-firing artillery. Close-order drill, however, mas retained not only because it had value for ceremonies and for moving large bodies of men on foot, but also because it provided a psychological foundation of teamwork and discipline without which combat drill is impossible.

In the U.S. army the details of close-order drill and the basic elements of infantry combat drill are included in a field manual, FM 22–5, "Drill and Ceremonies." Additional manuals deal with evolutions of armoured and other motorized units, and with gun drill for crew-served automatic and artillery weapons. Similar drill manuals exist for the British army.

For purposes of peacetime exhibitions and competition, many military and semimilitary units maintain special drill teams, adept in normal close-order drill movements. and in other fancy and complex evolutions requiring precision and skill in marching and in the handling of weapons. (T. N. D.)

DRILLING MACHINERY. Drilling of holes of various diameters in rock is employed for (1) prospecting for mineral deposits; (2) ascertaining the depth below the surface to a bedrock or other firm or massive substratum, together with the character of the overlying soil, preparatory to mining or other civil-engineering operations; (3) geological, geophysical or other scientific explorations; (4) drainage of gas or water in mining operations; (5) injection of cement into highly fissured or water-bearing rocks prior to excavation; (6) sinking petroleum. natural gas, water or salt wells; and (7) deep blasting in quarries and open-pit mines and blasting in underground workings.

The most successful application of drilling to prospecting is the placing of holes through horizontal or nearly horizontal strata containing seams, for example, of coal. iron, lead or salt. A reasonably accurate map of the location, depth and thickness of such a deposit may subsequently be drawn and the true dip of the strata ascertained from the depths to the deposit of three holes drilled at the corners of a suitable triangle. Deep drilling is often necessary to determine the true depths of deposits whose continuity is disturbed by geological faulting. The data obtained from drilling for prospecting purposes permit cost estimates to be made for the sinking of shafts and the driving of tunnels for exploitation purposes. (For discussion of drilling and drill cores in relation to prospecting and to geologic exploration see FOSSIL: Fossil Study; SEDIMENTARY ROCKS: Exploration *for* Oil *and* Gas.)

In sinking petroleum wells, drilling serves both for discovering the oil-bearing strata and for extracting the oil. After about 1918 a number of the deepest borings in the world were made for oil or natural gas; for example, several in the United States were drilled to more than 20.000 ft. Rock-salt deposits are sometimes worked through boreholes by introducing water and pumping out the brine for further treatment (e g , in Cheshire, Eng.).

There are two principal methods of drilling — percussive and rotary. The former operates by intermittent chipping by impact, whereas the latter is continuous. The rate of penetration of percussive tools depends on the intensity of blow, the number of blows per full revolution of the bit and the frequency of blow. It is necessary, therefore, to adjust these variables to give a satisfactory penetration rate with minimum or acceptable degree of bit wear. Fine-grained hard rocks require high frequency rates, high intensities of blow and the maximum number of blows 'per revolution. Large-grained heterogeneous rocks are more conducive to the chipping action and fewer blows per revolution are required to effect breakage.

Rotary tools operate by a cutting and sometimes a grinding action. The rotary bit wear problem is more important than in

the percussive system and is dependent on the depth drilled per revolution. the thrust exerted on the tool and the amount of flushing water used.

A modern method of drilling is with a rotary-percussive drill, whose chief application is in Shot-hole drilling in mines and on public-works contracts in very hard rocks. It differs from percussive drilling insofar as the rotary action is continuous instead of intermittent. Conversely, it is rotary drilling with a continuously applied percussive action. The chief advantage is that the percussive action need only be introduced when the hardness of the strata results in uneconomic bit wear and slow drilling rates.

Types **of** Drill Bits.—There are four chief designs of rotary bit: the untipped drag bit, the tipped drag bit, the roller bit and the diamond bit. These bits have very different characteristics, are suitable for different conditions of drilling and so require varying rates of rotation, flushing-water quantities, etc. In general, the rate of penetration with a suitable type of bit is dependent on the compressive strength and shear strength of the rock. Drag bits cut the rock, roller bits operate with a crushing and wedging action and diamond bits grind away the rock.

Drag bits (fig. 1, left) $4\frac{1}{4}$ to 25 in. in diameter are mostly used in soft rocks and may have two, three or four wings. For harder rocks the roller bit (fig. 1, right) gives a satisfactory drilling rate and is preferred to a coring diamond bit when accurate samples are not required. The roller bit shown consists of three rollers mounted on ball bearings and equipped with wedge-shaped teeth. These bits are made in sizes from $3\frac{7}{8}$ to 26 in. in diameter. Modern drag bits are often tipped or dressed with tungsten carbide, and roller bits have tungsten carbide facings to reduce wear and prolong life. Most forms of rotary drilling demand the use of hollow rods of steel to provide circulation of cooling water or other liquid, and these must be robust enough to withstand the heavy feed thrusts necessary to maintain high drilling speeds. Additions of water in quantities of 76 to 350 gal. per hour may be required for rotary drilling in varying strata, dependent on size and depth of hole. For mud flushing, quantities of 1,200 gal. per minute have been used. (See Hole *Maintenance,* below.)

FIG. 2.—END VIEW OF DIAMOND BIT FOR CUTTING CORES

Diamond bits may be of the noncoring or coring types. The former, which may be up to $7\frac{3}{8}$ in. in diameter, are used when no accurate sampling is required, in which case the whole section is actually drilled. The coring method makes an annular hole, the core of which furnishes a practically complete cross section of the strata penetrated; the thickness and character of each stratum are revealed, with its depth below the surface. Thus the diamond drill can be used for very accurate prospecting of deposits. The bit, an example of which is shown in fig. 2, is of cast steel, set with a number of diamonds according to the diameter, which may be from $1\frac{9}{16}$ to $3\frac{1}{2}$ in. yielding cores 1 to $2\frac{9}{16}$ in. in diameter. The diamonds require careful setting in the bit and may project but slightly from its surface. Two kinds of diamond are used, "carbons" and borts. The former are a kind of black diamond or amorphous form of pure carbon, are opaque and, as they are tougher than the brilliant and have no cleavage planes, are more suitable for hard rock. Borts are imperfect brilliants and are best used for softer rocks.

Percussive Drilling.— Percussive drilling is the slower of the two methods, but still has many applications. chiefly for shallow holes. The principle consists of applying blows successively to a tool attached to rods or a cable, and rotating the tool between blows so that a new portion of the face of the hole is attacked at each blow. The usual cutting tool or bit is shown in fig. 3(B). The rod is from one to two inches square in long lengths with screw joints. For holes of less than 50 ft. the work may be done by hand, one or two crossbars being clamped to the rod. The men alternately raise and drop the drill while walking round and round to rotate the bit and so keep the hole true. The cuttings are cleaned out by attaching a bailer consisting of a pipe with a foot valve on the rods in place of the bit. However, the trend has been to use compressed-air jackhammers to provide the percussion; mobile drills, capable of drilling down to zoo ft., are known as wagon drills.
