DAISY *TO* EDUCATIONAL PSYCHOLOGY

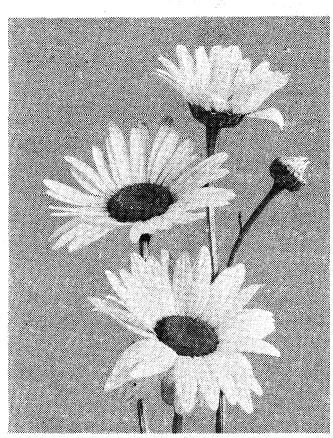
DAISY, the name applied to many species of plants with showy rays, of the family Compositae (*q.v.*). The word is derived from the Anglo-Saxon and means "day's eye." The genus *Bellis* contains ten species found in Europe and the Mediterranean region. The common daisy. *B. perennis,* is much cultivated in the United States as a summer bedding plant, especially in some of its finer forms with pink. white, red or quilled rays. It is the only representative of the genus in the British Isles. It is a perennial, abundant everywhere in pastures, lawns and on banks in Europe, except in the most northerly regions.



J. HORACE MCFARLAND CO.

SHASTA DAISY (CHRYSANTHEMUM MAXIMUM) IN BLOOM

The stem is short; the leaves, which are numerous and form a rosette, are slightly hairy. obovate-spatulate in shape. with rounded teeth on the margin in the upper part, and the rootstock is creeping and of a brownish colour. The flowers are to he found in England from March to November and occasionally in the winter months. The heads of flowers are solitary. the outer or ray florets pink or white, the disk florets bright yellow. The size and luxuriance of the plant are much aifected by the nature of the soil in which it grows, It is often a pest in English lawns. The cultivated varieties bear finely coloured flowers and make very effective borders for walks. What is known as the "hen and chicken" daisy has the main head surrounded by a brood of sometimes as many as 10 or 12 small heads; *i.e.,* proliferous. The ray florets curve inward and "close" the flower head in dull weather arid toward evening.

In French the daisy is termed *la marguerite,* and "herb margaret" is stated to be an old English appellation for it. In Scotland it is popularly called the gowan, and in Yorkshire it is the bairnwort. or "flower beloved by children,"

The Christmas and Michaelmas daisies are species of *Aster;* the oxeye daisy is *Chrysanthemum leucanthemum,* a common weed; the Shasta daisy is *Chrysanthemum maximum;* and the African daisy is either *Arctotis* or *Gazania. B. perennis florepleno,* the double daisy, consists of dwarf showy, three- to four-inch plants. flonering freely in spring if grown in rich light soil.

Among the varieties of B *perennis* in the United States are Double-Quilled, Longfellow and the Bride. all widely planted in city parks. These are not frost hardy over much of North America and are grown as biennials. Seeds sonn the previous year are nintered over in the cold frame and planted out the following spring. They do not tolerate great heat, but under proper conditions they bloom from late spring to frost. (N. TR.; X.)

DAJABÓN, formerly Libertador. a province in northwestern Dominican Republic (area 344 sq mi.), occupies the foothills and part of the Cordillera Central on the Haitian border. Its main products are bananas (along the Massacre river). peanuts, rice, corn (maize) hides and skins. and hardwoods. The region was strongly disputed during the colonial struggles between Spain and France Dajabón city, the capital (pop [1960] 3.230). was founded between 1771 and 1776 but was abandoned during the War of Independence and resettled after the War of Restoration (1865). The province was created in 1938 from Montecristi under plans of development of the frontier regions; the name was changed to Dajabon in 1961. Pop (1960) 40 822. (D. R D.)

DAKAR, the capital of the Republic of Senegal (q v) and one of the chief seaports on the nest African coast, is situated on the southeastern side of the Cape Verde peninsula. the westernmost extension of the African continent. It lies between the Senegal and the Gambia, the tno rivers by way of which the western Sudan was opened to European explorers, and is the ocean terminal of the railroads nhich inherited most of the river-bcrne trade. Its position at a point midway betneen Europe and both South Africa and South America makes it a valuable port of call for ships and airplanes It has one of the best harbours in nest Africa protected by the limestone cliffs of the cape and by a system of breaknaters, and a big airfield at Toff on the opposite side of the peninsula Dakar's strategic position led to its development as a naval and air base It became one of the most important capitals of the French overseas empire and even after the independence

of Senegal in 1960 it remained the financial and commercial centre for much of the west African region.

Because of its position at the end of the peninsula it is cooled by ocean breezes and is one of the most comfortable sites on the coast for Europeans. In appearance and character it is more like a European city than any other in west Africa, and it has the largest European population—30,107 of a total of 230,887 in 1955. Seasonal migration of both Europeans and Africans increases the population during the dry season (November–June).

Dakar was founded in 1857 when the French built a fort on the site of the modern Place de l'Indépendance (formerly Place Protet) (so called after the founder, a naval captain) to safeguard the interests of merchants who had been settling there for 20 years and of residents of Gorée, a waterless island in the lee of the peninsula. By 1862 a short breakwater had been built in the lee of the point and a town laid out on the low limestone platform behind the sandy beach. Another generation elapsed, however, before Dakar gained its supremacy over Gorée (q v.) and Rufisque, a settlement 13 mi. along the peninsula which had become an important export centre for the peanut trade. The decline of Gorée and Rufisque was hastened by the building of the railway line connecting Dakar's superior harbour with the Senegal river in 1885, and by improvements in Dakar's port facilities. In 1887 Dakar was made one of four communes in Senegal. In 1902 it mas designated capital of French West Africa, replacing St. Louis, and by 1908 all government buildings had been concentrated in the peninsula. Further transfer of business houses to Dakar took place after the completion in 1923 of the Dakar-Niger railway line, which, with its later branches, connected Dakar with the upper Niger basin and the heart of the peanut country. Gorée became a suburb of Dakar in 1929. In 1924 Dakar and the neighbouring villages were withdrawn from Senegal and set up as a district (*circonscription*) administered by a governor.

In Sept. 1940. after the fall of France. Dakar's strategic importance caused it to be the object of an attack by a Free French force under Gen. Charles de Gaulle with the support of the British fleet. This failed, but in Nov. 1942. after the invasion of north Africa, all of French West Africa rejoined the Allies.

Dakar was the seat of the executive for French West Africa, of the *grand conseil* set up in 1946 which acted as a local parliament, and of the high court of appeal With the granting of independence to the territories of French West Africa in 1960, Dakar became the capital of the short-lived Federation of Mali and, folloning the collapse of the federation, of the Republic of Senegal. It is the seat of a Roman Catholic archbishop.

The Town.—The business centre of Dakar is attractively laid out and stands about 25 ft. above the harbour on gently undulating ground. Southward the land rises in a long slope and narrows toward Cape Manuel. The centre of this area is the Place de l'Indépendance, where the war memorial stands. The streets radiating from it contain most of the government offices and business houses, including the presidential palace, one of the most conspicuous buildings in the town, on a bluff 100 ft. above the Bight of Gorée Nearby is the imposing domed Roman Catholic cathedral, begun in 1923 and inaugurated in 1929. After 1950 many tall office buildings, up to 15 stories high, were erected, giving the town a very modern appearance.

To the northwest of this business area, which contains many excellent European shops, is Médina, the oldest and nearest of several outlying African settlements. 'Beyond it, toward the airport. and also on the coast, are large, well-planned residential areas known as Grand Dakar. Fann. Point E and Dagoudane Pikine. Between the harbour and Médina is the so-called Syrian quarter containing business houses, some patronized by Africans, run by merchants from Lebanon and Syria In Médina and the outlying African settlements are African open-air markets. To the north is a large industrial area, bordering the port, and containing railway workshops, the naval yards and the power station Manufacturing is confined chiefly to making perishable goods sold locally, although there are cotton, shoe, oil and soap factories. Handicrafts are carried on. chiefly garment making, cabinetwork and the making of jewelry. In the surrounding country most of the arable land is devoted to market gardening At Hann, beyond the dockyards, there is a forest park and zoological garden, founded in 1903. The large sandy beaches at Hann bay and at Ngor on the opposite side of the peninsula are popular resorts during the hot season. Gorée Island with its old houses. museums and historical interest attracts tourists.

In planning Dakar, great attention was paid to health. The marshes round the city were drained for 12 mi. to reduce the danger of disease-carrying mosquitoes, and the water supply is brought from deep wells even farther away. The medical centre, the largest in middle Africa, includes hospitals, an outpatient clinic and a Pasteur institute. There are a university, founded in 1957 at Fann; colleges specializing in administration. the training of teachers and marine engineering; and two *lycées*. The Institut Français d'Afrique Noire promotes scientific research and also runs three museums (historical and marine biological) at Gorée and one at Dakar (ethnological).

Dakar is linked to Paris, Lisbon. Buenos Aires, New York and Johannesburg by air. Dry-season motor roads connect Dakar with several other African capitals. and there is a good tarred road to Ziguinchor through Gambia and others to St. Louis and Touba.

The Port.—Until about 1900 Dakar's chief function was to serve as a port of call for ocean shipping. The first jetty adequate to protect the anchorage from the surf and to aithstand the storms of the rainy season (July–October) was finished in 1866, after which the Messageries Maritimes used Dakar instead of St. Vincent as a port of call for its liners. Between 1898 and 1912 this jetty mas extended to 2.740 ft. Beyond an entrance 820 ft. wide a new breakwater was built to the opposite shore of the bay. The harbour formed by the new breakwater and another on the shoreward half is 555 ac There is also a seaplane base. Before World War II the naval installations consisted of a marine arsenal and repair yard. a dry dock serving ships up to 10.000 tons and a basin for destroyers. Further improvements were begun in the late 1930s and in 1940–43 the region betaeen Dakar and beyond Rufisque was so strongly fortified, to prevent landings and shelter a powerful fleet, that Dakar was nicknamed "the African Gibraltar." These fortifications were abandoned after the mar.

Ships of most lines trading to west Africa call at Dakar, as do many in the South African and South American trade. Services from Yoff international airport (6 mi. N.W.) link west and south Africa with Europe and South America. By volume of traffic it ranked next after Le Havre and Marseilles in the former French Community. but most of this consisted of peanuts and phosphate exports and the importation of petroleum and coal. used mainly for servicing passing ships.

DAKIN'S FLUID (CARREL-DAKIN FLUID) is an antiseptic containing available chlorine and designed for the treatment of infected wounds. First used during World War I, it was the product of long study by Henry Drysdale Dakin and Alexis Carrel in search of the ideal wound antiseptic. The stronger germicidal solutions. such as carbolic acid and iodine, damage living cells, or lose their potency in the presence of blood serum. Dakin's fluid avoids both these defects and in addition has a solvent action on dead tissue which hastens its separation from living tissue. It is prepared from bleaching powder and the carbonate and bicarbonate of soda, and must contain 0 45% to 0.50% of sodium hypochlorite and no free alkali. It is unstable and will not keep more than a few days.

The Carrel-Dakin treatment consists in flooding the entire wound surface every two hours, by means of small tubes connected nith a reservoir. This treatment was replaced eventually by the use of sulfa drugs and antibiotics.

DAKOTA, a tribe. or confederated aggregation of tribes. of Siouan Indians (*q.v.*) in the northern plains of the United States. The name, now applied to two states, means "allies"; the popular designation is Sioux abbreviated from Nadowessioux, from Ojibwa via French.

As the largest tribe in the Siouan family, the Dakota have given their name to this group. In 1950 the Dakota numbered about 40 000, living almost entirely on reservations in North and South Dakota, Montana and Nebraska. There are three main divisions: Santee, Yankton, Teton, calling themselves respectively Dakota, Nakota and Lakota. The Santee comprise the Mdewakanton, Wahpeton, Wahpekute, Sisseton; the Yankton includes the Yankton and the Yanktonai. This makes seven divisions, recognized by the Dakota themselves as "seven council fires"; but the Teton outnumber the other six combined.

First encountered by the whites in Minnesota, the Dakota have drifted westward, under pressure first from the Ojibwa, who were early armed with French guns, and later from the whites. During the latter half of the 18th century the Teton established themselves west of the Missouri river. The Dakota have always been a spirited brave. somewhat turbulent people, upstanding and outright in character. Tall in stature and picturesque in costume, they have in recent generations impressed civilized imagination perhaps more than any other American tribe. All the Teton and part of the other divisions adhered to the Plains Indian type of life: buffalo hunting, tepee dwelling, nomadic. nonagricultural, raiding and proud of their war exploits. Their greatest ceremony was the Sun Dance (*q.v.*). *See* also PLAINS INDIANS. (A. L. K.; X.)

DAKOTA RIVER: *see* JAMES RIVER.

DAL (DALÄLVEN), a river in Sweden, formed by two main tributaries, the Vaster and Österdal, whose headstreams drain Norwegian territory. The total length is 323 mi. Österdal, before meeting the other main stream above Borlange, flows through several lakes of which the largest is Siljan. The Dalarna region centres on the agricultural basin of Siljan. Dissection has given it an attractive hilly appearance and, with lingering local customs, Dalarna is a tourist district. Downstream from Borlange the river flows southeastward with rapids through the mineralized district of Bergslagen. but at Krylbo it turns northeast to Hedesundafjarden and a small estuary. There are many sites for power production and copper, lead, zinc, iron and other ores have made this a great industrial region with such metallurgical centres as Borlange and Krylbo. Skutskar, closed by ice from January to mid-April, has a harbour depth of 18 ft. but most of the Bergslagan traffic goes by rail to Gavle. (A. C. O'D.)

DALADIER, ÉDOUARD (1884–), French statesman, prime minister at the time of the Munich crisis of 1938, was born at Carpentras, Vaucluse, on June 18, 1884. He was a schoolmaster until elected deputy for his native *département* in 1919. Throughout his life a Radical, he took office for the first time as minister of colonies in Édouard Herriot's government of 1924 and held seven other portfolios in different governments before serving as prime minister, Jan.–Oct. 1933. He was his own minister of war and continued to hold this office under the next two governments (Oct. 1933–Jan. 1934). He then resumed the premiership, but only for 11 days, until the violent riots of Feb. 6, 1934. Under his first premiership the Four-Power peace pact among France, Great Britain. Germany and Italy was concluded in June 1933. He led the Radical party into the popular front alliance with Socialists and Communists in 1935 and was minister of national defense in Léon Blum's first government (June 1936–June 1937), Camille Chautemps's (June 1937–March 1938) and Blum's second (March–April 1938). Daladier then resumed the premiership which he retained until March 20, 1940. He signed the Munich agreement on Sept. 29, 1938, declared war on Germany on Sept. 3, 1939, and dissolved the Communist party on Sept. 26, 1939. He continued as minister of war under Paul Reynaud until May 18, 1940, and was minister of foreign affairs till June 16, 1940. He was interned by the Vichy government on Sept. 8, 1940, and sent for trial at Riom in Feb. 1942. The manly tone of his statements at the trial did something to restore his reputation. After the failure of the trial, he remained interned; he a-as handed over to the Germans and deported to Germany in 1943. Liberated in April 1945. Daladier was re-elected deputy in June 1946. He opposed the continuance of the Indochina war and the European Defense Community. (D. R. GE.)

DALAI LAMA, originally the abbot of the 'Bras-spuns (Drepung) monastery on the outskirts of Lhasa, Tibet. These abbots have acted as heads of the dGe-lugs-pa order of Tibetan Buddhism since the first abbot, dGe-'dun-grub-pa (1391–1474), gained this position by his great ability. In accordance with the Buddhist doctrine of rebirth, his successors were conceived of as reincarnating in an identifiable series. They were regarded as recurring manifestations of the saviour sPyan-ras-gzigs (in Sanskrit, Avalokiteivara), and abbots of the important dGe-lugs-pa monastery of bKra-śis-lhun-po (Trashi Lhumpo) were regarded as representing the Buddha 'Od-dpa'-med (in Sanskrit, Amitābha). The members of this second series are known as Pan-c'en Rin-po-c'e (Great and Precious Sage) or, outside Tibet, as the panchen lama. (The nickname tashi lama. coined from the first part of Trashi Lhumpo by early western visitors, lacks all validity.)

The third abbot of 'Bras-spuns revived Buddhism among the Mongols, receiving from their leader the title whose first element has been corrupted into the English word dalai. The Tibetans themselves call the dalai lama rGyal-ba Rin-po-c'e (Precious Con-

queror). The fifth abbot found himself unable to prevail upon the older orders of Tibetan religion and appealed to the Mongols, who, in effect, conquered the country for him in 1642. From then until the 1959 rising against the Chinese Communist occupation forces, the dalai lamas, or more often their active regents. were the effective rulers of Tibet. The 13th (1876–1933) ruled with extraordinary personal authority. The 14th dalai lama was born in Amdo in 1935. *See* also TIBET; TIBETAN BUDDHISM.

BIBLIOGRAPHY.–Sir C. Bell, *The Religion of Tibet* (1931), *Portrait of the Dalai Lama (1946)*; G. Schulemann, *Geschichte der Dalai-Lamas* (1958). (D. L. SN.)

DALARNA (DALECARLIA; "the Dales"), a west midland region of Sweden, extends from the Norwegian frontier mountains to within 25 mi. of Gavle on the Gulf of Bothnia. It forms a transition zone between the barren *fjäll* and the industrial region of Bergslagen. River valleys are deeply cut but generally do not provide through routeways. The region centres on the Silurian outcrop round the lake of Siljan and there the agricultural wealth is greatest with the growing of barley, oats and root crops, whereas transhumance lingers in the uplands. In the south is the industrial area of Falun. The dales region is characterized by its local dialects and colourful costumes, by domestic industries of textiles and woodworking and by local styles of architecture and thus has become a leading tourist region. (A. C. O'D.)

DALAT, a hill station which after partition of Vietnam at the Geneva conference of 1954 was in South Vietnam. It was developed by the French colonial administration in the early 20th century as a health resort and centre for big game hunting for Europeans. At nearly 5,000 ft., the town, elegantly laid out with tourist facilities and fine residences, had a population estimated at 49.518 in 1960 when it still had many Indochinese refugees from the northern zone. Surrounded by heavily forested mountains containing some primitive hill tribes, Dalat has tea, coffee and rubber plantations within a few miles, and temperate-zone vegetables are grown for sale in Saigon to which there are good links by metaled road and by air. Its equable climate is cool yet free from frost, the annual rainfall being 70 in. with July–October as the wet season and December–January as the dry season. (E H. G. D.)

DALBEATTIE, a small burgh of Kirkcudbrightshire, Scot. Pop. (1961) 3,104. It lies on Dalbeattie burn, 13 mi. N.E. of Kirkcudbright. The town, built largely of gray granite, owes its rise to the granite quarries at Craignair and elsewhere in the vicinity, from which came stone used for the Thames embankment, docks at Odessa and Liverpool. Other industries include grain and fertilizer milling, and hosiery and bobbin manufacturing. The wooded estuary of the Urr, known as Rough firth, is navigable by ships of 150 tons, and small vessels can go as far as the mouth of Dalbeattie burn, within a mile of the town. The estuary offers salmon and sea-trout fishing. The Mote or Moat of Urr, about 3 mi. N., the most notable Anglo-Norman earthwork in Scotland. is on a natural circular hillock, cone-shaped with an encircling trench, and is situated at one end of a base court, or bailey. It was once a river island. The former castle at nearby Buittle was the birthplace of John de Baliol (1249–1315). It was there that his mother, Devorguila, is said to have signed the charter for Balliol college, Oxford.

DALBERG, the name of an ancient German noble family, derived from the hamlet and castle (now in ruins) of Dalberg or Dalburg near Kreuznach. In the 14th century, the original house of Dalberg became extinct in the male line, the fiefs passing to Johann Gerhard, chamberlain of the see of Worms, who married the heiress of his cousin, Anton von Dalberg, about 1330. His own family was of great antiquity, his ancestors having been hereditary *ministeriales* of the bishop of Worms since the time of the chamberlain Ekbert, who founded in 1119 the Augustinian monastery of Frankenthal and died in 1132. By the close of the 15th century the Dalberg family was of such importance that, in 1494, the German king Maximilian I granted its members the honour of being the first to receive knighthood at the coronation; this part of the ceremonies being opened by the herald asking "Is no Dalberg present?" (*Ist kein* Dalberg da?). This privilege the family enjoyed till the end of the Holy Roman empire.

The elder line of the family of Dalberg-Dalberg became extinct in 1848, the younger, that of Dalberg-Herrnsheim, in 1833. The male line of the Dalbergs was then represented only by the family of Hessloch, descended from Gerhard von Dalberg (*c.* 1239), which in 1810 succeeded to the title and estates in Moravia and Bohemia of the extinct counts of Ostein.

JOHANN VON DALBERG (1445–1503), bishop of Worms from 1482, was born on Aug. 14, 1445, at Oppenheiin. He studied at Erfurt and in Italy, where he took his degree of doctor of laws at Ferrara but devoted himself especially to the study of Greek. Returning to Germany, he became privy councilor to the elector Philip of the Palatinate, whom he assisted in bringing the University of Heidelberg to the height of its fame, helping to found the first chair of Greek (filled by his friend Rodolphus Agricola) and establishing the library and a college for students of civil law. A humanist, he was president of the Sodalitas Celtica founded by the poet Conradus Celtis and the patron and correspondent of many leading scholars. He died at Heidelberg on July 27, 1503.

KARL THEODOR VON DALBERG (1744–1817) was born at Herrnsheim on Feb. 8, 1744. After studying canon law at Gottingen and Heidelberg he entered the church, becoming administrator of the bishopric of Erfurt in 1772. An advocate of German unity, he supported the league of princes (*Fürstenbund*) formed under Frederick II of Prussia in 1785 and, through Prussian influence, became coadjutor of Mainz and Worms in 1787 and of Constance soon after. In 1802 he became archbishop elector of Mainz and so arch-chancellor of the Holy Roman empire. In 1803 he received the principality of Aschaffenburg and Regensburg, and Regensburg now became the seat of his diocese. Dalberg, in fact, thanks to Prussian influence, was the only ecclesiastical prince to survive the reorganization of the empire effected in 1803, from which he emerged as chancellor of the empire and primate of Germany, with ecclesiastical jurisdiction over Mainz, Cologne and Trier. He hoped to proceed to the establishment of a national German Church, but in 1805 the pope restricted him to the secular administration of his dioceses. Through Napoleon's influence, however, Frankfurt and the countships of Lowenstein-Wertheim and Rieneck were added to Dalberg's territories. He had already turned to Napoleon as the only hope for a unified Germany, and in 1806 he was appointed prince primate of the Confederation of the Rhine. In 1810 Regensburg was ceded to Bavaria, but in compensation Dalberg received the principalities of Fulda and Hanan and the title of grand duke of Frankfurt. He had, however, to accept a French resident, and in 1811 Eugène de Beauharnais was nominated to succeed him as grand duke. On the fall of Napoleon the grand duchy was dismembered at the Congress of Vienna. Dalberg then retained of all his dignities only the archbishopric of Regensburg. He died in Regensburg on Feb. 10, 1817.

WOLFGANG HERIBERT VON DALBERG (1750–1806), Karl Theodor's brother, was born at Herrnsheim on Nov. 18, 1750. As intendant of the theatre at Mannheim (1778–1803), he was the first to stage plays by Friedrich Schiller (*q.v.*), a number of whose letters to him are extant. Dalberg himself also wrote several plays, including adaptations of Shakespeare. He died at Mannheim on Sept. 27, 1806. Another brother, JOHANN FRIEDRICH HUGO VON DALBERG (d. 1812), canon of Trier and Worms, was a composer and musicologist.

EMMERICH JOSEPH VON DALBERG (1773–1833), duc de Dalberg from 1810. Wolfgang Heribert's son, mas born in Mainz on May 30, 1773. As Baden's envoy in Paris from 1803 he became a close friend of Talleyrand. Entering the French service in 1809, he was made a duke and a privy councilor by Napoleon in 1810. A member of Talleyrand's provisional government (1814), he accompanied Talleyrand to the congress of Vienna as minister plenipotentiary. After the second Restoration (1815) he was made a minister and a peer of France by Louis XVIII. In 1816 he was French arnbassador in Turin. He died at Herrnsheim, which he had inherited from his uncle Karl Theodor, on April 27, 1833. Herrnsheim then passed to his daughter MARIE LOUISE PELLINE DE DALBERG (d. 1860), who by her marriage with Sir Ferdinand Richard Edward Xcton (1801–37) became the mother of John Emerich

Edward Dalberg-Acton, the future English historian and 1st Baron Acton (*q.v.*).

DALE, SIR HENRY HALLETT (1875–), British physiologist who, for his work on the chemical transmission of nerve impulses, was awarded the Nobel prize for medicine and physiology together with Otto Loewi in 1936. Dale was born in London on June 9, 1875, and was educated at Cambridge university and at St. Bartholomew's hospital. London. The scientific researches to which he devoted his life had a profound effect not only on the development of physiological theory but also on the progress of practical medicine.

His earliest research, carried out while he was pharmacologist at the Wellcome Physiological Research laboratories, was concerned with the chemical composition and effects of ergot of rye. From this work developed his researches on the action of histamine (one of the constituents of ergot extracts) on surgical shock and on anaphylaxis. In 1914 he was appointed head of the department of biochemistry and pharmacology of the Medical Research council, and from 1928 to 1942 he was director of the National Institute for Medical Research. Among the offices that he held were the presidency of the Royal society, of the British Association for the Advancement of Science and of the Royal Society of Medicine. During World War II he was chairman of the Scientific Advisory committee to the cabinet and a member of the Advisory Committee on Atomic Energy. He was knighted in 1932 and was awarded the Order of Merit in 1944. (W. J. Bp.)

DALE, RICHARD (1756–1826), U.S. naval officer, was born in Norfolk county, Va., Kov. 6, 1756. and went to sea at the age of 12. During the early months of the American Revolution he led a checkered career as a lieutenant in the Virginia provincial navy. a prisoner of war on Gov. John Dunmore's British fleet in the Chesapeake and a mate in a Tory brig. The brig was taken by John Barry on July 27, 1776, and that same day Dale entered on board Barry's Continental brig "Lexington" as a master's mate. He served on the "Lexington" under three captains, and went to Mill prison, Plymouth, Eng., along with the rest of the crew when the brig was taken by the British cutter "Alert" in the English channel on Sept. 19, 1777. Escaping to France more than a year later, Dale entered on board the "Bon Homme Richard." Capt. John Paul Jones commanding. As first lieutenant of that famous ship Dale distinguished himself at the taking of the "Serapis" off Scarborough in Sept. 1779. He followed Jones's fortunes as first lieutenant on the "Alliance" and the "Ariel," and, in Aug. 1781 was on board the "Trumbull" when that frigate was captured by two British ships. After the war, Dale engaged as a shipmaster in the London and East Indies trades until he was appointed fourth ranking captain in the United States navy in 1794. Later, in a dispute over rank, he secured a leave of absence and went back to the merchant marine. In May 1801 he was recalled to duty and appointed to the command of a squadron of observation sent to the Mediterranean. With limited powers and a small force, Dale maintained a successful blockade of Tripoli, and prevented the piratical depredations of the Barbary powers for a period of six months. He returned to the United States in 1802. That same year he refused to take out a second squadron, when the navy department would not allow him a captain for the frigate "President" upon which he was to hoist his broad pennant, and he resigned from the navy on Dec. 17, 1802. Dale lived in retirement in Philadelphia, Pa., until his death on Feb. 26, 1826.

See "Biographical Memoir of Richard Dale," ***The*** *Port Folio* (June *1814)*; *Quasi-War With France and Barbary War Documents,* 11 vol. (1935–42). (W. B. Ck.)

DALE, SIR THOMAS (d. 1619), British naval commander and colonial deputy governor of Virginia. From about 1588 to 1609 he was in the Ketherlands with the English army, originally under Robert Dudley, earl of Leicester, and in 1606 he was knighted by James I. From 1611 to 1616 he was actually, though not always nominally, in chief control of the colony of Virginia. either as deputy governor or as "high marshal," and he is best remembered for the energy and the extreme rigour of his administration there, which established order and in various ways seems to have benefited the colony. Under him began the first real expansion of the colony with the establishment of the settlement of Henrico on and about mhat was later known as Farrar's Island; about 1614 he took the first step toward abolishing the communal system by the introduction of private holdings, and it was during his administration that the first code of laws of Virginia was effectively tested. This code, entitled "Articles, Lames, and Orders—Divine, Politique, and Martiall," but popularly known as Dale's code. was notable for its pitiless severity, and seems to have been prepared in large part by Dale himself. He left Virginia in 1616. Shortly after his return to England he was given command of a fleet sent against the Dutch; he defeated the enemy near Batavia in the East Indies late in the year 1618, arrived at Masulipatam in July 1619, and died there on Aug. g.

DALEN, NILS GUSTAF (1869–1937), Swedish inventor who in 1912 was awarded the Nobel prize in physics, was born at Stenstorp, Nov. 30. 1869. After passing his examination as an engineer at Goteborg in 1896 he completed his studies at Ziirich. On his return home he invented improved hot-air turbines, milking and other machines. In 1906 he became chief engineer to the Gas Accumulator Co., which was exploiting in Sweden the French invention of dissolved acetylene. In 1909 he was appointed managing director of this company and then succeeded in composing a product called "Agamassan" which has the property of absorbing acetylene uithout any danger of explosion. Dalén's cleverest invention was what is called Solventil. which is capable of kindling a flame automatically when twilight sets in and extinguishing it at daybreak; it was particularly useful for automatic lighting in unmanned lighthouses. During an experiment in 1913 he became blind in consequence of an explosion, but nevertheless he continued to conduct his experiments until his death at Stockholm Dec. 9, 1937.

DALGARNO, GEORGE (c. 1626–1687). Scottish author of an early and practical book on education of the deaf and dumb, was born about 1626 in Old Aberdeen. and was a schoolmaster for 30 years. In *Ars Signorum* (1661) he attempted to formulate a universal philosophical language in which ideas were represented by letters. His *Didascalocophus* (1680) contained a manual deaf and dumb alphabet. Dalgarno died at Oxford on Aug. 28, 1687.

DALHOUSIE. FOX MAULE RAMSAY, 11TH EARL OF (1801–1874). English statesman who, as a secretary for war (1855–58). shared the blame for the conduct of the last stage of the Crimean War, was born on April 22, 1801, at Brechin castle in Forfarshire. Educated at Charterhouse, he served as a regular officer for 12 years before retiring from the army in 1832 nith the rank of captain. Maule entered parliament in 1835 as a Liberal member for Perthshire. which he represented until 1837, becoming member for Elgin Burghs in 1838–41. During Lord Melbourne's administration he was undersecretary at the home office and then vice-president of the board of trade; under Lord John Russell he was secretary at war from 1846 to 1852. when he became president of the board of control for India shortly before the ministry's fall. In 1852 Maule. who had sat for Perth betneen 1841 and 1852, succeeded his father as 2nd Baron Panmure. On the formation of Lord Palmerston's first government in 1855, he became secretary of state for war, nhich he remained for three years. In 1860 he succeeded as 11th earl of Dalhousie (taking the Dalhousie surname, Ramsay, in 1861). He died at Brechin castle on July 6. 1874.

Panmure's nickname, "the Bison," reflected his temperament as well as his physique; he was a forceful but often clumsy and insensitive politician and administrator. During the concluding phase of the Crimean War his conduct came under heavy criticism, much of it justified; Palmerston's loyalty protected him until the government's defeat in 1858. but he played no part in politics thereafter. His correspondence, the *Panmure* Papers, published in 1908, forms an important source on the mismanagement of the Crimean War. (A. F. T.)

DALHOUSIE, JAMES ANDREW BROUN RAMSAY, 1ST MARQUESS OF and **10TH EARL OF** (1812–1860), British statesman one of the greatest governors general of India, was born at Dalhousie castle, Scot., on April 22, 1812, the third son of George Ramsay (1770–1838), 9th earl. His father was one of Wellington's

generals and later became governor of Canada and commander in chief in India. James Ramsay, who became 10th earl in 1838, was made vice-president of the board of trade in 1843 and succeeded Gladstone as president in 1845. He therefore had to cope with the railway "mania" of 1845–46. Over the repeal of the corn laws he supported Sir Robert Peel, whose second cabinet he entered in Dec. 1845. He refused Lord John Russell's offers of a cabinet post in 1846, but in 1847, when promised "personal independence with reference to party politics," he accepted the governor generalship of India, assuming office in Jan. 1848.

Territorial Expansion. — Dalhousie found India apparently peaceful, but in April 1848 two British officers sent to install a new Sikh governor in Multan were murdered there. Failure to strike at once permitted Sikh uncertainty and alarm to express itself in wider outbreaks. Full-scale war, half expected, half hoped for by Dalhousie, followed in November. By March 1849 the Sikhs had surrendered and Dalhousie had coerced the boy maharaja and the council of regency into accepting his annexation of the Punjab. For his services Dalhousie was created marquess. In 1352 commercial disputes at Rangoon, badly handled on the spot, led to the second Burmese War. "We can't afford," Dalhousie said, "to be shown to the door anywhere in the East." His care prevented any repetition of the losses of the first Burmese War, and after success had been cheaply achieved within the year, he wisely limited British acquisitions to the province of Pegu. Further acquisitions were peacefully secured. Dalhousie firmly believed in the superiority of western administration and had little hope of Indian self-improvement. He therefore systematically pursued the policy, earlier enunciated though only fitfully applied, of annexing dependent states, by lapse, whenever male heirs failed. Accordingly Satara lapsed in 1848, Jaitpur and Sambalpur in 1849. Baghat in 1850, Udaipur in 1852, Jhansi in 1853 and Nagpur in 1854. The first and last of these additions made British communications between Bombay and Madras and Bombay and Calcutta easier; besides, Dalhousie valued Nagpur as a cotton-growing area.

Two great Indian states. Hyderabad and Oudh, remained outside British rule, but from 1848 Dalhousie was writing about taking over their administration. The nizam of Hyderabad was constantly in arrears with his payments for the Hyderabad contingent. In 1853 he was persuaded to assign to the East India company, in lieu of other payment for the contingent, the revenues — and administration — of Berar. Oudh was more difficult. The king, repeatedly warned, had failed to introduce reforms and repress internal disorders; yet, as Dalhousie said, he mould take any amount of kicking without rebelling. The reports of James Outram, the resident at Lucknow, and Hindu-Muslim riots in Oudh in 1855 provided the occasion for action. Dalhousie proposed British administration in the king's name, but the directors of the company insisted on annexation and in Feb. 1856, when the king refused to abdicate, annexation was proclaimed. In 1855 Dalhousie had signed a short treaty of peace and friendship with the Afghan ruler Dost Mohammed, who was glad to have his part in the Sikh War forgotten. Since the subordinate alliance of the khan of Kalat had the previous year been bought by annual subsidies, the northwest frontier had been secured.

Internal Administration. — By conquest, lapse and annexation Dalhousie had expanded and knit together British territories, drawing the modern map of India. He also began the creation of a modern unitary state. The new acquisitions remained directly under his control, and upon them he imposed an administrative system of Benthamite vigour and directness. "Uniformity of management and unity of authority" were his guides; he therefore placed his districts under a hierarchy of authority and gave to his deputy commissioners the combined function of revenue collector, magistrate and civil judge. Both promptitude of action and real responsibility were thus secured. Besides imposing a rigid system of reports and records — the annual administrative report was his creation — Dalhousie was indefatigable in personal tours and inspections. John Lawrence in the Punjab and Col. Arthur Phayre in Burma were administrators of outstanding ability; nevertheless, by his tours, Dalhousie maintained close personal control of both these provinces. He also invented the all-India department — for public works, the post office, public instruction — each under a single authority; and he swept away such dilatory bodies as the military board, replacing them with new unitary departments. He appointed a lieutenant governor for Bengal, hitherto administered by the governor general, and reorganized the Calcutta secretariat.

Dalhousie also provided the physical instruments for vigorous central control. The road system was rapidly expanded. especially in the Punjab; a half-anna letter post was successfully introduced; cities were closely linked by the telegraph; and the framework of the railway system was designed by his experienced and masterly hand. Improved communications made centralized administration possible and facilitated troop movements and, along with the abolition of hampering duties and customs barriers, stimulated trade. Peace and orderly administration, the execution of the first great irrigation works and Dalhousie's fostering of tea planting encouraged production. Exports and imports doubled during his governor generalship. By entrusting railway construction to private companies he encouraged the first large-scale movement of investment capital into India. Within India, ignoring the court of directors' fears, he began the fruitful process of government borrowing for productive works. Dalhousie also found time to write at length on educational policy and to introduce the reforms prepared by Sir Charles Wood. Fresh emphasis was given to primary education, while grants-in-aid encouraged high schools and colleges. Dalhousie himself paid much attention to expanding the engineering colleges, of whose products he foresaw the coming need.

Only a driving, masterful man could have completed such a program, and Dalhousie, in imposing civilian, central control over army and administration, could be ruthless. Sir Charles Napier, the commander in chief: resigned; Henry Lawrence was pushed aside; picked men like John Jacob, H. B. Edwardes and Phayre suffered for overindependence. His utilitarian contempt for anachronistic princes, sirdars or talukdars could be coarsely brutal. Yet he did much for the peasantry of Oudh and the Punjab, he sought to utilize the experience and intellectual qualities of Indians in the legislative council and from many of his officers he secured devoted service. If his inability to see with other men's eyes and feel with other men's hearts may have played a part in provoking the Indian mutiny, his ability to use other men's hands and brains for broad, creative purposes was certain.

Dalhousie left India in 1856, a very sick man; he died at Dalhousie castle on Dec. 19, 1860. By his marriage (1836) with Lady Susan Hay, daughter of the marquess of Tweeddale, he left two daughters but no sons. The marquessate therefore died with him.

DALHOUSIE, a hill station in Gurdaspur district, Punjab, India, is 52 mi. N.E. of Pathankot at an elevation of 6,678 ft. Pop. (1961) 8,583. Its population fluctuates, there being many summer visitors. The scenic beauty of Dalhousie is typical of the Himalayan summer hill resorts. It is a quiet hill station, where Punjab university maintains a vacation centre for the teachers of the colleges affiliated to it. (O. P. B.)

DALÍ, SALVADOR (1904–), Spanish Surrealist painter, sculptor and illustrator, was born on May 11, 1904, in Figueras, Catalonia. Spain, and studied in Barcelona and Madrid: where he was expelled from the Academy of Fine Arts. He was influenced by Giorgio de Chirico, Yves Tanguy and Max Ernst. *art nouveau* and Dutch painting. The *enfant terrible* of Surrealism, he joined the younger or neo-Surrealist branch of that movement in Paris in 1929 and thereafter was its best-known exponent. With Luis Buñuel he produced two Surrealist films, *Le Chien andalou* ("The Andalusian Dog") (1929) and *L'Age d'Or* ("The Golden Age") (1931), which was closed down by the Paris police. From 1932 his works were shown throughout Europe, in the United States and in the orient, He went to the United States in 1940, gave a retrospective exhibition at the Museum of Modern Art, New York city, in 1941 and published his autobiography, *Secret Life of Salvador Dali,* in 1942. He projected a "psychoanalytical" art

which, in very naturalistic terms, gives symbols from his dream life, hallucinations and fetishes. Dali's work should be contrasted with that of Joan Miró, André Masson and other more abstract Surrealist artists. *See* PAINTING: *Surrealism;* STILL-LIFE PAINTING.

DALIN, **OLOF** VON (1708–1763), leading Swedish writer of the mid-18th century, was born Aug. 29, 1708, in the parish of Vinberg, Halland, where his father was pastor. After studying at the University of Lund he became, in 1727, a tutor in a noble family in Stockholm, where he soon won favour as the witty author of occasional verse, a talent for which he exercised throughout his life. From 1732 to 1734 he published the weekly *Then swänska Argus*, modeled on Joseph Addison's *Spectator*. Dalin's periodical was one of the means by which the ideas of the Enlightenment were introduced into Sweden, but its language and style were of even greater importance than its matter. It is regarded as ushering in the age of modern Swedish prose. Dalin also attempted to create a Swedish drama of the French classical type, but his plays are unreadable.

Dalin lived in a period of political upheaval and often commented on the points at issue. His most famous work, *Sagan om hasten* ("The Story of the Horse." 1740), an allegory in the style of Swift, was a fruitless effort to influence opinion against war with Russia. When the misfortunes of the war accumulated, he wrote his didactic epic *Swenska friheten* ("Swedish Liberty," 1742), in which he saw salvation in the abolition of the party system and in increased royal power.

In 1750 Dalin became tutor to the crown prince, afterward Gustavus III. He held this post until 1756, when, as the queen's favourite, he was exiled from court until 1761, on suspicion of having taken part in the so-called court revolution. Dalin's greatest interest was the study of history; and he wrote three volumes of a lively *Svea rikes historia* ("History of the Swedish Kingdom"; 1747–62). He had early become a civil servant, but royal favour was the real foundation of his social career. Dalin was ennobled in 1751. Before he died (Aug. 12. 1763, at Drottningholm, Stockholm), he had regained his high position at court and in the administration.

BIBLIOGRAPHY.—Dalin's literary works were published in 6 vol., *Vitterhetsarbeten i bunden och obunden skrifart* (1767). *See* also K. Warburg, *Olof Dalin* (1884); *M*. Lamm, *Olof Dalin* (1908); A. DALKEITH, a small burgh of Midlothian, Scot., between the North and South Esk, 7 mi. S.E. of Edinburgh by road. Pop. (1961) 8,864. It is an agricultural centre with one of the largest grain markets in Scotland and the chief milling town for a county famous for its oatmeal. The corn exchange dates from 1854. Other industries are brewing, the making of carpets and brushes, papermaking machines. furniture and brass founding. Near Eskbank, the residential quarter with the railway station, coal mining is carried on and market gardening flourishes. The parish church of St. Nicholas was originally the castle chapel, and was restored in 1852. A park was presented by the duke of Buccleuch in 1909. Melville castle, completed in 1788 to the designs of John Playfair, is now a hotel, though still belonging to the Douglases. Dalkeith palace, rebuilt and redesigned by Sir John Vanbrugh about 1700, was the residence, during visits to Edinburgh, of George IV, Victoria and Edward VII. The picture gallery, gardens and park are famous.

About 1 mi. S. is Newbattle abbey, seat of the marquess of Lothian, on the site of an abbey founded by David I, the ancient crypt being incorporated in the mansion; it is now a residential college for adult education.

Two miles farther south lie Cockpen, immortalized by Baroness Nairne (*q.v.*), and Dalhousie castle. About 6 mi. S.E. of Dalkeith is Borthnick castle where Mary. queen of Scots, spent three weeks after her marriage with Bothwell. The castle was besieged by Cromwell in 1650 and is in ruins.

DALKEY (DEILGINIS), a small port and seaside town of County Dublin, Republic of Ireland, lies 9 mi. S.E. of Dublin by road. Population in 1956 was 5,526. It is situated on and about Sorrento point, the southern horn of Dublin bay. Ruins remain of two of the seven castles which once guarded the town. On Dalkey Island are a Martello tower and the remains of St. Begnet's oratory. The island was noted in the 18th century for the periodical election of the mock "King of Dalkey"; originated by students, this election developed significant political overtones until banned by Lord Clare in 1797. The family of George Bernard Shaw had a cottage (Torca cottage) on Dalkey hill from 1866 to 1874.

DALLAS, ALEXANDER JAMES (1759–1817), U.S. lawyer and financier who served as secretary of the United States treasury during the difficult years 1814–16. He was born of Scottish parents in Jamaica on June 21. 1759, and was educated in Scotland and England. In 1780 he went to Jamaica where he became acquainted with the actor, Lewis Hallam, who induced him to go to Philadelphia. Dallas immediately took up the study of law, and gained admission to practice in 1785. With Hallam he indulged his literary and theatrical inclinations, editing the *Columbian Magazine* from 1787 to 1789 and helping Hallam in the establishment of the theatre in Philadelphia. In 1791 he was appointed secretary of the commonwealth of Pennsylvania, a post he held for the next ten years

In 1795 he gained much influence in the Democratic-Republican party by the publication of an able pamphlet against the Jay treaty; and when Jefferson became president in 1801. Dallas was appointed U.S. attorney for the eastern district of Pennsylvania, a position he held continuously until Madison called him to be secretary of the treasury in 1814. Within two weeks he made recommendations to congress that eventually led to the establishment of the second bank of the United States. Meanwhile, Dallas had made recommendations regarding the tariff and a system of protection which became the basis of the Tariff act of 1816. He left the treasury in March 1816 and died the following year on Jan. 16.

DALLAS, GEORGE MIFFLIN (1792–1864), U.S. vice-president (1845–49) and minister to Great Britain at the outbreak of the American Civil War, was born in Philadelphia on July 10, 1792, the son of Alexander J. Dallas, then a young lawyer, who later became secretary of the treasury. Dallas graduated from Princeton (1810), studied law in his father's office and gained admission to the bar in 1813. He went abroad for a year as private secretary to Albert Gallatin, who was on a diplomatic mission for the United States. He worked with his father in the U.S. treasury department for a short time and then joined the legal staff of the Second Bank of the United States. In the years that followed he became an influential figure in Pennsylvania politics. Dallas filled out an unexpired term as U.S. senator (1831–33), was minister to Russia (1835–39) and U.S. vice-president under James K. Polk. After leaving the senate he aided Robert J. Walker, a former U.S. senator, in promoting in England the financial interests of the Illinois Central railroad. In 1856, when Dallas's political rival. James Buchanan, returned from London to run for the presidency, President Pierce appointed Dallas to be his successor as minister to Great Britain. Buchanan retained Dallas at the London post throughout his term as president. Dallas was an amiable, cultured gentleman and skilful diplomat. He and Lord Clarendon on Oct. 17, 1856, signed a treaty for the settlement of the Central American questions arising from the Clayton-Bulwer treaty (*q.v.*) but it was not ratified.

See G. M. Dallas, *Letters from London (1869)*; *I*. D. Spencer, *Life of Marcy* (1959). (T. P. **MA.**)

DALLAS, principal city of northern Texas, U.S., seat of Dallas county, is an important financial, merchandising and light manufacturing city and one of the control centres of the world's petroleum industry.

Dallas is situated 45 mi. S. of the Oklahoma border and 174 mi. W. of Louisiana. A city largely rebuilt after World War II, its business towers and residential districts occupy about 280 sq.mi. astride the Trinity river near the junction of that river's three forks. It is an area of prairie and gentle hills with low bluffs

along the watercourses. Dallas winters are mild, the January normal temperature being 45.7" F., but the summers are long and hot. As a result, Dallas has become a city almost wholly air-conditioned. Some of its shopping villages have air-conditioned malls connecting the stores.

The population of the city in 1960 was 679,684, and of the standard metropolitan statistical area 1,083.601, according to the federal census. Garland. Grand Prairie, Highland Park, Irving, Mesquite, Richardson and University Park comprise this metropolitan area (for comparative population figures see table in TEXAS: Population).

The city lavishes on dress and fashion the attention that some cities do on fine food. It is one of the largest producers of women's fashions in the United States and one of the largest women's sportswear markets. It is a large insurance centre.

History. — In 1841, John Neely Bryan built the first cabin on the riverbank site. The hamlet which grew up around it took the name of George Mifflin Dallas. then vice-president of the United States. The town profited in 1858 from the failure of the Fourier socialist colony at La Réunion, which had been built three years earlier on the limestone hills west of Dallas. Some of the skilled French and Swiss artisans moved across the river to the rude village. They gave it carriage makers and bakers as well as such frontier naturalists as Julien Reverchon. The town was first shaped toward a commercial destiny, however, by the arrival with the railroads in the 1870s of the "terminal merchants." Some of these men, uho moved their stores on to each new railhead as the railroads lengthened, stayed in Dallas and founded wholesale and retail houses.

From these beginnings grew a $3,000,000,000 wholesale market. Buyers regularly come to the four yearly apparel shows from more than 20 states. Many of the city's retail stores have customers all over the southwest and one, Neiman-Marcus Co., is internationally known.

Cotton fed the town's growth at first, then insurance and oil. Before the Dallas Cotton exchange was organized in 1907, buyers had set up a street market on lower Elm street. In the 1920s, 40% of the nation's cotton crop came from the black clay fields around Dallas, and the city still makes more than half of all the ginning machinery made in the world. For many years it was the world's largest inland cotton market. Memphis, Tenn , had surpassed it by 1960, but oil and insurance had long surpassed cotton as a source of revenue.

Commerce, Industry and Transportation. — Dallas is the leading banking centre of the southwest and the federal reserve bank of the 11th district is there. It was an important financial centre when Texas in 1908 passed the Robertson act requiring insurance companies doing business in the state to headquarter there. The major national companies quit the state, though most returned when the laws were modified many years later. The home-grown insurance companies which sprang up to fill the void tended to concentrate in Dallas. The home offices of about 200 legal reserve life insurance companies, and agencies of 500 more companies are located there.

On Sept. 30, 1930, C. M. ("Dad") Joiner tapped the great east Texas oil field for the first time. Though Dallas had had natural gas and fuel oil since 1915 and Magnolia Petroleum company had set up headquarters there in 1917, the east Texas field made the city an oil centre. Producers and suppliers moved into the city for more than a decade.

The world's three largest oil well supply firms make their headquarters in Dallas, and Dallas geophysical firms operate all over the world. Dallas banks pioneered in financing oil exploration and the large ones have their own staffs of geologists.

The city began a period of spectacular growth in 1946. Its area quintupled. In the post-World War II period, it did a great amount of downtown building and built 147,651 units of housing in one ten-year period. In part, this growth started from the location of two large aircraft firms in the suburbs of Grand Prairie to the west and Garland to the north. Airframes and missiles are produced in the city's plants, but the varied manufactures include auto accessories. cement, food products, clothing, chemicals, fabricated metal products, gun cases and electrical machinery. One electronics firm is one of the world's largest makers of transistors. Another suburb, Richardson. also shares the city's manufacturing plants.

The other two leading fringe suburbs, Mesquite on the east and Irving on the northnest, and the two enclosed suburbs of Highland Park and University Park are mainly residential.

Dallas is served by several railroads. It is headquarters for the Texas and Pacific railroad and regional headquarters for Western Union Telegraph Co. and Southwestern Bell Telephone Co. Most major airlines operate from the city's rebuilt Dallas Love field. Dallas operates Redbird airport for private fliers and leases Hensley field, at Grand Prairie, to the C.S. navy.

Cultural, Educational and Recreational Facilities. — The city supports a symphony orchestra. a civic opera season, a flourishing resident theatre movement and school, several museums of art, history and natural history and a summer-long season of musical shons.

It is the home of Southwestern medical school of the University of Texas and the Baylor dental and nursing colleges. Southern Methodist university, founded in 1911, is in University Park, and the University of Dallas (Catholic) began operations in 1956 in Irving.

Among the many churches, the First Baptist, Highland Park Presbyterian and Highland Park Methodist are the largest.

It has more than 100 parks of about 8.000 ac. They include a zoo and fair park, the site of the state fair of Texas which draws more than 2,500,000 visitors annually. In addition, there are large recreation areas around the three large lakes of Grapevine, Garza-Little Elm and Lavon, north of Dallas, from which the city draws

its water. supply. Dallas has a council-manager form of government established in 1931. (E. P. CR.)

DALLIN, CYRUS EDWIN (1861–1944), U.S. sculptor, best known for his plastic representations of the North American Indian, was born at Springville, Utah, on Nov. 22, 1861. He was a pupil of Truman H. Bartlett in Boston, Mass., of the École des Beaux-Arts, the Académie Julien and the sculptors Henri Chapu and Jean Dampt in Paris, and on his return to America became instructor in modeling in the state normal art school in Boston.

As a boy Dallin had lived among the Indians, and his most notable works are of Indian subjects: "The Signal of Peace" in Lincoln park, Chicago; "The Medicine Man" in Fairmount park, Philadelphia; and "The Appeal to the Great Spirit" in the Museum of Fine Arts, Boston. His statue of the Indian chief Massasoit, at Plymouth, Mass., was completed in 1921.

His later works include "Pioneer Monument," Salt Lake City; "Sir Isaac Newton," Library of Congress; and "Paul Revere," Boston. He won a silver medal at the Paris Exposition, 1900, and in 1906 the first prize in the competition for the soldiers' and sailors' monument at Syracuse, N.Y.

Dallin died in Boston, Nov. 14, 1944.

DALLING AND BULWER, WILLIAM HENRY LYTTON EARLE BULWER, BARON (1801–1872), English diplomat who was highly regarded both by Aberdeen and by Palmerston as a negotiator of exceptional skill. He was born in London on Feb. 13, 1801, and educated at Harrow school and at Trinity and Downing colleges, Cambridge. Leaving the army for the diplomatic service in 1829, Bulwer was sent by Lord Aberdeen as observer during the Belgian revolution of 1830, and received the congratulations of the cabinet on his reports. Entering parliament for Wilton in 1830 as an advanced Liberal, Bulwer sat first for Coventry and then for St. Marylebone between 1831 and 1837, establishing a reputation as a debater and a prolific and versatile writer.

Bulwer returned to diplomacy in 1835 as chargé d'affaires in Brussels. Three years later, while secretary of embassy at Constantinople, he negotiated the Ponsonby treaty with Turkey, which secured important advantages for British trade and was described by the foreign secretary, Lord Palmerston, as "a masterpiece." Chargé d'affaires in Paris during the crisis of 1839–40. Bulwer was appointed ambassador to Spain in 1843. He exercised great influence at Madrid, notably during the Franco-British tension in 1846–47 over the marriage alliances made by the Spanish royal family with that of Louis Philippe of France. Strongly sympathetic to the constitutional cause throughout his embassy, Bulwer was expelled by the dictator Ramón Narváez in 1848; Britain broke off diplomatic relations with Spain, and Bulwer received parliament's thanks for his services. From 1849 to 1852 he acquired considerable popularity as ambassador to the United States, which assisted his conclusion of the Clayton-Bulwer treaty (*q.v.*); and between 1852 and 1855 he acted as minister plenipotentiary to the grand duchy of Tuscany at Florence. After playing a major part in the negotiations at the close of the Crimean War, Bulwer ended his diplomatic career by succeeding Stratford Canning as ambassador in Constantinople from 1858 to 1865. In retirement, he was elected member for Tamworth in 1868. raised to the peerage in 1871 and died at Naples on May 23, 1872.

Brother of the novelist Lord Lytton, whose taste for literary and fashionable society he shared, Bulwer is best remembered as an author for his Life of Viscount Palmerston. (A. F. T.)

DALLMEYER, JOHN HENRY (1830–1883), Anglo-German optician and manufacturer of lenses, was born on Sept. 6, 1830, at Loxten, Westphalia, the son of a landowner. On leaving school at the age of 16, he was apprenticed to an Osnabriick optician. and in 1851 he went to London, where he obtained work with an optician and later with Andrew Ross, a lens and telescope manufacturer. After a year spent in a commercial post, he was reengaged by Ross as scientific adviser. He married Ross's second daughter, Hannah, and inherited, at Ross's death (1859), a third of his employer's large fortune and the telescope-manufacturing portion of the business. Turning to the making of photographic lenses (see PHOTOGRAPHY), he introduced improvements in both portrait and landscape lenses, in object glasses for the microscope and in condensers for the optical lantern. In connection with celestial photography he constructed photoheliographs for the Wilna observatory in 1863. for the Harvard college observatory in 1864, and, in 1873, several for the British government. Dallmeyer's instruments took the highest awards at various international exhibitions, and he received many honours from governments and learned societies. He died on board ship, off the coast of New Zealand, on Dec. 30, 1883.

His second son, THOMAS RUDOLPHUS DALLMEYER (1859–1906), introduced telephotographic lenses into ordinary practice (patented 1891) and wrote a standard book on the subject (Telephotography, 1899).

DALMATIA, a geographical region of the Balkan peninsula, comprising the central stretch of the Yugoslav littoral and a fringe of islands on the eastern coast of the Adriatic. Its greatest breadth, on the mainland, is about 45 mi. and its length, from the Gulf of Kvarner (Quarnero) to the narrows of Kotor (Cattaro) about 233 mi. The major islands are Krk (Veglia), Cres, Rab (Arbe), Pag (Pago), Dugi (Isola Lunga), Brac (Brazza), Hvar (Lesina), Korcula (Curzola), Mljet (Meleda), Vis (Lissa) and Lastovo (Lagosta). Politically, Dalmatia is included in Croatia (*q.v.*) within federal Yugoslavia.

A rugged and barren range of mountains, the Dinaric Alps, divides Dalmatia from Bosnia-Hercegovina. This barrier, with peaks from 3,000 ft. to more than 8,700 ft., offers only two main passes: the Krka river canyon, prolonged on the Bosnian side by the Una river; and the Neretva valley leading to central Bosnia. The coast, both on the mainland and on the islands, has many natural bays and harbours. The climate is mild, with dry summers, abundant rain in autumn and winter and very little snow.

Five-sixths of the population of Dalmatia in the 1960s were Roman Catholic Croats, the remainder Orthodox Serbs, though there was a small Italian minority living mainly in Zadar (Zara). Zadar, Split (Spalato), Sibenik (Sebenico), Dubrovik (Ragusa), Trogir (Trau), Korcula and Kotor (Cattaro) are the principal cities. Zadar is a Roman Catholic archbishopric, and there are Roman Catholic bishoprics at Sibenik, Split, Hvar, Dubrovnik and Kotor. There are also Orthodox bishoprics at Zadar and Kotor.

The soil is not suitable for the cultivation of bread grains but favours olive trees, vegetables and, above all, vines. Dalmatian vineyards supply one-third of the total Yugoslav wine production. There are rich deposits of bauxite, exploited by the aluminium foundry near Sibenik. Abundant reserves of limestone account for the fact more than one-third of Yugoslavia's cement output comes from the neighbourhood of Split. There are also chemical factories as well as food-processing plants. The major shipbuilding yards are at Split. The rivers. except for a few miles on the Krka and on the Neretva, are unsuitable for navigation, but their precipitous fall makes them a natural source of hydro-electric power.

Its picturesque coastline, its romantic islands, its ancient cities with their historic monuments and its delightful climate combine to make Dalmatia one of the most frequented summer tourist areas in Europe,

History.—The first historically recorded inhabitants of Dalmatia were Illyrians, an Indo-European people who overran the northwestern part of the Balkan peninsula (see ILLYRIA). Of this people the Delmatae or Dalmatians were a tribe. The Greeks. however, began to settle in the area from the 4th century B.C., founding a number of colonies on the islands, the most famous of which were Issa (Vis), Pharos (Hvar), Corcyra Melaina (Korcula), and a few towns on the mainland coastline, the most renowned of which were Epidaurum (Cavtat), Iadera (Zadar), Tragurion (Trogir) and Salona (Solin, near the modem Split). Coming into conflict with the Illyrians, the Greek colonists appealed for protection to the Romans, who also had grievances against the Illyrians, and a long series of Roman-Illyrian wars ensued from 229 B.C. onward. The Dalmatians had to acknowledge Roman supremacy in 155 B.C. after the fall of their capital, Delminium, but continued to revolt sporadically until A.D. 9.

Roman occupation introduced classical civilization to Dalmatia. Administration, justice and trade were organized on the Roman

model, and new towns were built in accordance with Roman city planning. At the end of the 3rd century A.D. the emperor Diocletian, himself a native of Dalmatia, divided the country into two provinces: Dalmatia and Praevalitana. On his abdication (305) he went to reside in his new palace near Salona (in modern Split) till his death. The Christian Church, after the bloody persecutions under Diocletian, was reorganized: metropolitan sees at Salona and Iadera were founded.

In the second half of the 5th century Dalmatia became a fighting ground for ambitious generals. In the 460s Marcellinus founded an independent state of Dalmatia. It was in this state that his nephew, the Roman emperor Julius Nepos (*q.v.*) took refuge after being driven from Italy in 475. On the collapse of the Western Roman empire Dalmatia fell under the power of Odoacer in 481 and later under that of Theodoric, to become a battlefield during the wars waged between the Goths and the emperor Justinian.

This period was also one of ever-growing incursions by barbarian tribes — Huns. Bulgars, Avars and Slavs. The Croats, a branch of the Slavs from beyond the Carpathian mountains, invited by the Eastern Roman emperor Heraclius, expelled the Avars and settled down in the old Illyrian province. The cities of Salona, Scardona (Skradin), Iadera, Narona (or the Norin) and Epidaurum were destroyed in the course of fighting. In southern Dalmatia, likewise on the invitation of Heraclius, another tribe of Slavs settled, namely the Serbs. The original inhabitants, however, Romans, romanized Illyrians and Greeks, survived in restricted areas along the coast, mainly in the towns. Former citizens of Epidaurum settled in the newly built Ragusium (Dubrovnik); refugees from Salona found shelter in the abandoned palace of Diocletian. The Slavs formed themselves first into small autonomous units, *zupas,* with a *zupan* as head and then into groups or *banovinas,* administered by a *ban.* Those formations acknowledged, however, the over-all sovereignty of the Byzantine emperor.

In the struggle between Charlemagne and the Byzantines, early in the 9th century, Dalmatia, after a short period under the Franks, returned to Byzantine sovereignty. Then neighbouring Slav peoples began to exercise a more lasting pressure, against which the Byzantine emperor could give Dalmatia no efficient help. Accordingly the Dalmatian towns agreed to pay tribute to the Slav rulers of the interior. Later these rulers assumed the title of kings of Croatia and Dalmatia. (*See* CROATIA.) In fact coastal Dalmatia retained its language, its laws and civil and religious autonomy.

It nas in the dramatic period between the emergence of the Croatian kingdom in Dalmatia and the establishment of permanent Venetian rule that Dalmatia acquired its specific physionomy. During that time it passed through about 30 changes of over-all sovereignty: Byzantine Greeks, French, Croatian and Serbian princes, Venetians. Sicilian Normans, Magyars and Tatars were each masters of Dalmatia for a short period. During the fourth crusade, Zadar was razed to the ground in 1204 by the French and Venetians. Tatars in 1241–42 ravaged some of Dalmatia's towns and laid naste the nearby agricultural land. Underlying all these changes, however, was the permanent struggle between the Slav princes and the Venetian republic. The Croatian kings and the Venetian doges were the only rulers who held power long enough to leave a permanent mark on the Dalmatian character and consciousness. At the end of the Roman period Dalmatia had been divided into two zones, one coastal and prevalently Roman, the other Slav in character, but subsequently the two elements began to interpenetrate one another. For the liturgy of the churches the Glagolitic rite. inherited from Cyril and Methodius, the apostles of the Slavs, made its appearance, and a long struggle ensued between the Latin and the Glagolitic clergy. Roughly at the same time, the Bogomil sect from Bosnia appeared on the scene. To combat it. the Franciscan and Dominicans were sent by Rome to Dalmatia. Their influence, as well as that of the Benedictines, had a great effect on cultural development, to which humanistic schools, various forms of brotherhoods of craftsmen, libraries and archives bear witness. Public notaries began to be appointed and city statutes drawn up in the course of the 12th and 13th centuries. At the beginning of the 15th century the republic of Poljica, in the neighbourhood of Split, was one of the first cities to have its statute in Slavonic. The 15th and 16th centuries also saw the birth of secular literature in Slavonic, as well as a revival of a scientific literature — mostly in Latin and some in Italian.

Venetian rule over Dalmatia (1420–1797) was established when the king of Croatia, Ladislas of Naples, ceded the country to the republic—a period marked by warfare against the Turks. After the fall of Constantinople (1453) Serbia, Bosnia-Hercegovina and Albania fell under Turkish Moslem domination. Dalmatia seemed likely to be the next victim. To face this threat, a Croatian knight, Petar Kruzic formed a corps of guerrillas called *uskoki* at his stronghold of Klis. near Split. The Venetians, meanwhile, created an efficientmilitia out of a mass of Slav refugees in Dalmatia. In the 1460s the first Turkish incursion took place. The environs of Zadar and Sibenik were ravaged, but the citizens of Split and Trogir built a chain of fortifications against the invaders. As long as they attacked the Turks, the *uskoki* were regarded with sympathy by Venice and the Dalmatian cities: the Turks, in fact, accused Venice and Austria of supporting the *uskoki.* In 1536, however, the Turks beat the *uskoki* and took Klis, whereupon the Holy Roman emperor Ferdinand I gave the *uskoki* the city of Senj. The *uskoki* then went on with their exploits and soon became remarkably able mariners, attacking not only the Turks but also the Venetians. In the Venetian wars against the Turks. moreover, from 1515 to 1540, Dalmatia mas left to its own resources. so almost the whole country except the coastal cities fell to the Turks. The cities indeed would probably have suffered the same fate but for the Christian victory in the battle of Lepanto (*q.v.*) in 1571. Subsequently attacks by the *uskoki* on Venetian vessels and cities led to war between Venice and Austria (1615). Under the treaty of Madrid (1617) the question was settled: the *uskoki* were finally removed from Senj, a number of them were hanged and their vessels were burned.

During later wars, from 1645 onward, Dalmatia's frontier with Turkey was changed continually until in 1699, with the peace of Karlonitz, all Dalmatia came under Venice; and the treaty of Passarowitz (1718) confirmed Venetian sovereignty. When the French gave Venice to Austria under the treaty of Campo Formio (1797) Dalmatia became Austrian also, but in 1805, under the treaty of Pressburg. Austria had to cede Dalmatia to Napoleon. By joining Dalmatia, Istria and Slovenia to form the Illyrian provinces of the French empire, Napoleon gave a powerful impulse to the idea of Yugoslav unity. In 1815, after the fall of Napoleon, Dalmatia was assigned to Austria again. It remained an Austrian crownland till 1918.

During World War I, by the secret treaty of London (1915) the Allies had promised large territories, including northern Dalmatia, to the Italians in return for Italian support. This treaty embittered negotiations for a peace settlement. Finally the treaty of Rapallo (Nov. 12, 1920) between Italy and Yugoslavia gave all Dalmatia to the Yugoslavs except Zadar and four islands, which went to Italy. During World War II, when Tugoslavia was partitioned by the Axis powers, Dalmatia was annexed by Italy, but it passed to Yugoslavia in its entirety (*i.e.,* including Zadar and the four islands) in 1945.

DALMATIC, a liturgical vestment, the distinctive garment of deacons of the Roman Catholic, Eastern and Anglican Churches. In the Eastern Churches, the *sakkos* of the bishops is similar in form. *See* VESTMENTS, ECCLESIASTICAL.

DALOU, JULES (1838–1902), French sculptor, noted both for his extravagant, allegorical group compositions and for his unaffected studies of common people, was born in Paris on Dec. 31, 1838. He was a pupil of J. B. Carpeaux and of F. J.

Duret. His earlier reliefs and his large public monuments are in an enlivened classical style learned from Carpeaux rather than the sober academic style taught at the École des Beaux-Arts. But his later smaller sculptures reveal his increasing sympathy with the compassionate attitude to human life and toil found in the paintings of J. F. Millet. His several mother and child groups and the simple realistic figures of workers (terra cottas in the Petit Palais, Paris) for a projected "Monument aux Ouvriers" (*c.* 1889–98) also find parallels in work done by C. Meunier in Belgium and by Dalou's friend A. Legros in England, where Dalou himself took refuge in 1871 following the commune. His most notable Parisian monuments include the allegorical bronze "Triomphe de la République," projected in 1879 and put up in the Place de la Nation in 1899; and the Delacroix memorial in the Jardin du Luxembourg (1890). He died in Paris April 15, 1902.

See H Caillaux, *Aimé-Jules Dalou, 1838–1902* **(1935).**

DALRIADA, the name of a Gaelic kingdom which at least from the 5th century A.D. extended on both sides of the North channel (which divides Ireland from Scotland) and comprised the northern part of the present County Antrim, and part of the Inner Hebrides and Argyll. Tradition and language indicate that in still earlier times Argyll had received extensive immigration from the Irish (known as *Scotti*) of northern Ireland, and had already become an Irish (*i.e.*, "Scottish") area. In the latter half of the 5th century the ruling family of Irish Dalriada, already Christians, crossed into Scottish Dalriada, but continued to rule the kingdom on both sides of the channel. In Scottish Dalriada branches of this dynasty ruled in various districts, the chief strongholds being Dunadd and Dunolly. St. Columba, cousin of the Irish high king, settled on the island of Iona in Scottish Dalriada in the 6th century and converted the northern Picts to Christianity. Irish Dalriada gradually declined, while Scottish Dalriada, under Columba's protégé, King Aidan MacGabrain of Dunadd (d. *c.* 608), and his successors, extended its territory at the expense of the Picts. Early in the 9th century the Viking invasions isolated Irish Dalriada which soon lost its political identity. Despite heavy onslaughts from the Picts, the Dalriada of the Scottish mainland continued to expand. In the mid-9th century its king, Kenneth I MacAlpin (d. 858), brought the Picts permanently under Dalriadic rule. Henceforth the country was known as Scotland and the name Dalriada ceased to be used.

DALRYMPLE, ALEXANDER (1737–1808), Scottish geographer, writer and hydrographer who collected and published a large number of charts for the admiralty, was born on July 24, 1737, at New Hailes, near Edinburgh, Scot., and in 1752 joined the East India company's service at Madras. He spent most of the years from 1757 to 1764 in the East Indies trying to open up trade, with little success; nor did he get support from the company in London in 1765. He returned to Madras as member of council in 1775, but after two years was recalled on a groundless charge of misconduct. In 1779 he became hydrographer to the company, and from 1795 to 1808 was hydrographer to the admiralty. His services were valuable, in spite of his difficult personality. His best work as a scholar was probably his *Historical Collection of the Several Voyages and Discoveries in the South Pacific Ocean,* 2 vol. (1770–71). He died on June 19, 1808, shortly after his retirement. (J. C. BE.)

DALTON, JOHN (1766–1844), English chemist and physicist, best known for his development of the modem atomic theory, was born about Sept. 6, 1766, at Eaglesfield, near Cockermouth in Cumberland. Joseph Dalton, his father, was a weaver who belonged to the Society of Friends and Dalton received his early education from his father and from John Fletcher, teacher of the Quakers' school at Eaglesfield. When Fletcher retired in 1778 young Dalton succeeded him. In 1781 he left his native village to become assistant to his cousin George Bewley, who kept a school at Kendal. He remained at Kendal till, in the spring of 1793, he moved to Manchester, where he spent the rest of his life. Mainly through the influence of John Gough (1757–1825), a classical and mathematical scholar, he was appointed teacher of .mathematics and natural philosophy at the New college in Moseley street (which was in 1889 transferred to Manchester college, Oxford), and that position he retained until the college was moved to York in 1799, when he became a "public and private teacher of mathematics and chemistry."

Encouraged by Gough, Dalton, while he was at Kendal, had contributed solutions of problems and questions on various subjects to the *Gentlemen's* and *Ladies' Diaries,* and in 1787 he began to keep a meteorological diary in which during the succeeding 57 years he entered more than 200,000 observations. He made his own instruments. His first separate publication was *Meteorological Observations and Essays* (1793), which contained the germs of several of his later discoveries; but in spite of the originality of its matter, the book met with only a limited sale. In 1794 he was elected a member of the Manchester Literary and Philosophical society, and a few weeks after election he communicated his first paper on "Extraordinary Facts Relating to the Vision of Colours," in which he gave the earliest account of the optical peculiarity known as Daltonism or colour blindness, and summed up its characteristics as observed in himself and others. In 1803 he published a paper on the "Absorption of Gases by Water and Other Liquids," containing his lam; of partial pressures. *(See* DALTON'S LAW.) Independently of Joseph Louis Gay-Lussac he discovered that all gases have the same coefficient of expansion. *(See* HEAT: *Thermal Properties of Gases.)*

Dalton was a crude experimenter; a good many of his results have since been disproved. None of his investigations compares with those concerned with the atomic theory, with which his name is inseparably associated. For a description of the atomic theory *see* ATOM: *Dalton's Theory;* CHEMISTRY: *The Development of the Theory of Molecular Structure.* It is clear from the notes prepared for his lectures that in his long series of meteorological experiments he was feeling his way toward the atomic theory. A study of these papers by H. E. Roscoe and A. Harden *(A New View of the Origin of Dalton's Atomic Theory,* 1896) shows that the idea of atomic structure arose in his mind as a purely physical conception forced upon him by study of the physical properties of the atmosphere and other gases.

The first published indications of this idea are to be found at the end of his paper on the "Absorption of Gases" (Oct. 21. 1803), published in 1805. There he says: "Why does not water admit its bulk of every kind of gas alike? This question I have duly considered, and though I am not able to satisfy myself completely I am nearly persuaded that the circumstance depends on the weight and number of the ultimate particles of the several gases." He proceeds to give what has been described as his first table of atomic weights, but on page 248 of his laboratory notebooks for 1802–04, under the date Sept. 6, 1803, there is an earlier one in which he sets forth the relative weights of the ultimate atoms of a number of substances, derived from analysis of water, ammonia, carbon dioxide, etc., by chemists of the time. Confronted with the "problem of ascertaining the relative diameter of the particles of which, he was convinced, all gases were made up, he had recourse to the results of chemical analysis. He thus arrived at the idea that chemical combination takes place between particles of different weights, and this differentiated his theory from the historic speculations of the Greeks. The extension of this idea to substances in general necessarily led him to the law of combination in multiple proportions, and the comparison with experiment brilliantly confirmed the truth of his deduction" *(A New View,* etc., pp. 50. 51).

Dalton communicated his atomic theory to Thomas Thomson of Glasgow university, who, with Dalton's permission, included an outline of it in the third edition of his *System of Chemistry* (1807), and Dalton gave a further account of it in the first part of the first volume (1808) of his *New System of Chemical Philosophy.*

In 1804 Dalton gave a course of lectures at the Royal institution, London. where he delivered another course in 1809–10; in 1822 he became a fellow of the Royal society. He was a corresponding member of the French Academy of Sciences and in 1830 was elected one of its eight foreign associates. In 1833 Lord Grey's government conferred on him a pension of £150, which was raised in 1836 to £300.

He lived for more than a quarter of a century with his friend the Rev. W. Johns (1771–1845) in George street, Manchester, where his daily round of laboratory work and teaching was broken only by annual excursions to the Lake district and occasional visits to London. In 1822 he paid a short visit to Paris, where he met many of the distinguished men of science then living in the French capital, and he attended several of the earlier meetings of the British association at York, Oxford, Dublin and Bristol. He rarely went into society and his only amusement was a game of bowls on Thursday afternoons. He died in Manchester on July 27, 1844. where a statue was erected to his memory. Most of the collection of Dalton relics was lost during the air raid on Manchester in World War II.

DALTON'S LAW states that the total pressure of a mixture of gases is equal to the sum of the partial pressures of the individual constituent gases. The partial pressure is the pressure which each gas would exert if it alone occupied the same total volume of the mixture at the same temperature. This law is true only for perfect or ideal gases. *See* KINETIC THEORY OF MATTER; DALTON, JOHN. (J. B. Ps.)

DALY, (JOHN) AUGUSTIN (1838–1899), U.S. playwright and theatrical manager. was born in Plymouth, N.C., July 20, 1838. Although his childhood was spent in amateur performances of the romantic blank-verse drama of the period, it was as a writer of more realistic melodramas that he enjoyed his greatest influence. Beginning in 1859 he was dramatic critic for several New York newspapers. *Leah the Forsaken,* adapted from the German in 1862, was Daly's first success as a playwright. His first important original play, *Under the* Gaslight (1867), was popular for years. In 1869 he formed his own company and later developed such outstanding actors as John Drew, Fanny Davenport, Maude Adams and Anne Gilbert. Daly's best play, *Horizon* (1871), drew heavily upon the western-type characters of Bret Harte and gave important impetus to the slowly developing nationalistic drama. *Divorce* (1871), another of his better plays, ran for 200 nights. After opening Daly's theatre in New Uork in 1879, he confined himself to adaptations and management. He died in Paris, June 7, 1899. (S. W. H)

DALY, MARCUS (1841–1900), U.S. mineowner, developer of copper mining in the western states and one of the founders of the Anaconda company, was born near Ballyjamesduff, County Cavan, Ire., on Dec. 5, 1841. He emigrated to New York in 1856, and moved on to San Francisco in 1858. His mining career took him from California mines to the Comstock in Nevada and to silver mines in Utah.

Later, Walker brothers! bankers and mining financiers of Salt Lake City, sent him to Butte, Mont., in 1876 to investigate silver mines. He purchased the Alice mine for them, operated it successfully and then sold his interest. He acquired an option on the Anaconda claim and enlisted the aid of the California syndicate of J. B. Haggin, Lloyd Tevis and George Hearst. Daly became operating manager and the mine showed good silver ore until 1882, when a large body of chalcocite copper was exposed in the vein. Any attempt to develop the deposit looked like a hopeless economic undertaking; facilities to treat the ore and adequate transportation were lacking. But Daly convinced his associates that there was a vast tonnage of ore available and that the venture would be a success.

From 1882 to 1884 Daly shipped 37,000 tons of ore from Butte to Swansea, Wales, for smelting, to demonstrate that recovery of the copper could be accomplished. Then he selected a site for a smelter near Butte and founded there the town of Anaconda. He built a railroad to haul ore from mines to smelter, acquired fuel and forest lands for his operations, bought mining property and laid the foundations for what was to become the Anaconda company. The company was organized in 1895 and Daly became president in 1899, succeeding J. B. Haggin.

Daly died in New Uork city on Nov. 12, 1900. (W. M. Kk.)

DALY, REGINALD ALDWORTH (1871–1957), one of the leading North American geologists in the first half of the 20th century. was born in Napanee, Ont., on Rlay 19. 1871. He was noted for his research on the shape of igneous bodies and the emplacement, average chemical composition and evolution of igneous rocks. Equally valuable were his investigation of the origin of coral reefs and submarine canyons through the fluctuations of sea level during the waxing and waning of the Pleistocene icecaps, and his studies of isostasy and the interior of the earth.

Daly was geologist for the Canadian International Boundary survey from 1901 to 1907, professor of geology at Massachusetts Institute of Technology, Cambridge, from 1907 to 1912 and Sturgis Hooper professor of geology at Harvard university from 1912 to 1942. He died in Cambridge, Mass., on Sept. 19, 1957. (M. P. B.)

DALY CITY, a residential city of San Mateo county, Calif., U.S., adjoins San Francisco on the south. In the 1850s speculators unsuccessfully struggled to wrest the land from settlers such as dairyman John Daly, after whom the community was named. San Franciscans, who fled from the earthquake in 1906, incorporated the town in 1911. After growing slowly along electric-car lines, the small community of wage earners suddenly expanded after 1945 when immigration into California began on an unprecedented scale. Alongside, rather than within, the older suburb large. privately financed tracts of homes arose for upper middle-class residents. half of them newcomers after 1950. New neighbourhood retail and service centres! churches, public schools. libraries and recreation facilities, as well as a long-established weekly newspaper, *The Record* (1905), met local social needs of the expanded population, while numerous highways carried traffic to and from the metropolitan economic and cultural institutions which gave the major impetus for the city's continued growth. For comparative population figures *see* table in CALIFORNIA: *Population.* (J. H. *St.*)

DAM, (CARL PETER) HENRIK (1895–), Danish biochemist, 1943 Nobel laureate in medicine, jointly with E. A. Doisy (*q.v.*), for his discovery of vitamin K, was born at Copenhagen on Feb. 21, 1895. After graduating from the Copenhagen Polytechnic institute in 1920, he taught in the School of Agriculture and Veterinary Medicine and later in the physiological laboratory of Copenhagen university, where he was appointed associate professor of biochemistry in 1929, holding this post until the outbreak of World War II. From 1940 to 1945 he carried on his research work and lectured in the United States. In his absence, he was in 1941 appointed professor of biochemistry at the Polytechnic institute, Copenhagen. In 1956 he became head of the biological division of the Danish Public Research institute. Between 1929 and 1934 Dam and his associates drew attention to a deficiency disease of chicks characterized by a tendency to bleed and by a greatly retarded clotting time of the blood. Dam ascribed the disease to lack of a particular antihemorrhagic factor in the diet. In 1934–35 he showed that this hitherto unknown factor was a fat-soluble vitamin which he named vitamin K (Koagulations-Vitamin). The isolation of the vitamin in an almost pure state was reported by Dam in 1939 and, independently, by R. W. McKee and his co-workers in the United States (*see* VITAMINS). The discovery and purification of the antihemorrhagic vitamin found important applications in clinical medicine. Dam also contributed to other aspects of vitamin research and to the biochemistry of fats and sterols. (W. J. Bp.)

DAM. A dam is a barrier built across a river or stream to control the flow of water. Such a structure may serve one or more of several functions: diverting the flow into a canal, pipeline or other channel; raising the water level to a height sufficient to produce power or to form a pool for navigation, recreation or the elimination of tidal or seasonal fluctuations; storing water for human consumption or irrigation; or providing a means for flood, erosion and silt control.

From time immemorial dams have been constructed for some

or all of these purposes. There are records of a huge earthen dam on the Tigris and a large masonry dam on the Nile. both built almost in prehistoric times, and the early Romans built numerous massive masonry dams in Italy and northern Africa.

With the advance of the industrial age, dams were required to supply water to operate water wheels. The development of electric power increased the use of dams for this purpose, and the perfection of facilities for the transmission of power over long distances made the construction of dams at remote sites economically attractive.

As property in river valleys increased in value, damage from floods brought about demands for dams to hold back the flood water (see also RIVER AND RIVER ENGINEERING).

With continued economic development it frequently became desirable to utilize single dams for several purposes. By allocating portions of the cost to various uses it was possible to build projects not previously justifiable for single-purpose use. During the first half of the 20th century, in order to expand the economic growth of some less-developed areas, governments throughout the world began investing public funds extensively in large multipurpose dams.

The principal types of dams are earth-fill, rock-fill, solid masonry gravity, solid masonry arch, arch-gravity, structural masonry, and steel or timber. The term masonry is used to designate both stone masonry and concrete. The first three types have been used from antiquity. The others are products of the 19th and 20th centuries.

The type and height of a dam depend upon the geology and configuration of the site, the purpose for which the dam is to be used and its cost as affected by the availability of construction materials and other factors. All types except steel and timber are considered permanent if well constructed, requiring little maintenance.

When a dam is built across a flowing stream. provision must be made for handling floodwaters during construction. For masonry dams on good rock, facilities for this purpose may be required only to protect the works against interruption or minor damage. For fill dams or other types on soft foundations, flood-diversion works may be as important as the final spillway, if failure by overtopping of the partially completed structure could cause a disaster.

Perhaps the most usual type of diversion facility is a tunnel around the end of the dam, the flow being forced into it and kept out of the foundation area by small temporary structures, called cofferdams, upstream and downstream from the site.

For small streams the floods may be handled through pipes, flumes or other such devices. For masonry structures, an opening may be left in the dam to pass floods, to be plugged later at a time of low flow.

The design of bypass facilities is usually a matter of importance. demanding the same careful planning as any other vital parts of the project.

EARTH-FILL DAMS

The early history of earth-fill dam construction is lost in antiquity. The remains of ancient works still existing in India and Ceylon bear evidence that the construction of reservoirs for storing water dates from very remote times. The usual manner of forming these basins, some of which were of vast extent, consisted of closing valleys with dams of earth. Not until comparatively recent times were walls of masonry extensively employed for such purposes.

It is natural that the earliest dams should have been predominantly of earth, the most abundant and easily handled material. However, the ancient dam builders had no scientific knowledge of soil mechanics or flood flows, and hence their construction methods were haphazard and failures were no doubt frequent. Consequently. earth dams fell into a state of disrepute, a state in which they remained for a long period of time.

However, the earth dam has regained a position of importance as a result of several factors: the science of soil mechanics (*q.v.*) has progressed greatly; knowledge of flood flows has advanced; many of the sites suitable for masonry dams have been utilized, leaving for future use sites more suitable for earth structures; and the costs of masonry and concrete construction have risen generally, while improvements in earth-handling equipment have held the costs of earthwork construction relatively constant.

The security of earth dams depends on many factors, among which are the following:

1. Ample spillway capacity for passing floods around the dam is essential because any appreciable amount of water passing over the top of an earth dam will destroy it.

2. The height above the highest water level (freeboard) must be sufficient to prevent overtopping by waves.

3. Leakage through or under the dam must be reduced to an amount that will not move the materials of which the dam and its foundation are composed. If these materials are not inherently watertight, a continuous impervious earth core, or other type of cutoff, extended to an impervious foundation, is required; or as an alternative a stream-bed blanket of impervious materials may be used. Cores of stone masonry, concrete. puddle clay. wood or steel-sheet piling were formerly used. but after about 1920 these were largely abandoned because of cost, difficulty of installation and occasional unsatisfactory performance. Drains under the downstream portion of the dam, consisting of filter blankets or other devices, are frequently used to collect and dispose of leakage harmlessly.

4. The slopes of the dam must be flat enough to prevent sloughing of the fill or overstressing of the foundation. The required degree of slope depends upon the nature of the materials, the degree of compaction and the influence of any water that may seep through or under the dam.

5. The downstream slope must be protected from rainwash and the upstream slope from damage by waves. Grass or other vegetation or gravel may be used on the downstream slope, and a layer of rock fragments (called riprap) or a slab of concrete or asphalt on the upstream slope.

No doubt the earliest earth dams were built of a single class of material, of fine-grained or clay texture, selected for its watertightness. Such dams, known technically as homogeneous dams. are still built, and thousands of structures of this kind are in use. However, homogeneous dams of large size as illustrated in fig. 1 require certain precautions in their construction. After long subjection to water pressure such a structure becomes completely saturated below the seepage line shown in the figure. This saturation and possible outflow of water near the bottom of the fill weaken the structure.

A similar situation can occur on the upstream face, if the water level is suddenly reduced. The supersaturated material may slide out before it has time to drain

Hence, precautions must be taken to ensure safety. The simplest remedy is to flatten the slopes, which decreases the tendency to slough but adds to construction costs. A possible remedy for the downstream slope is illustrated in fig. 2, where a filter-protected gravel drain pulls the seepage line away from the face. If the required materials are readily available at reasonable cost. an ideal solution for both faces is represented by fig. 3. In this section watertightness is provided by the impervious central core and stability by the outer shells of compacted gravel. Slight seepage through the core is harmlessly removed by the pervious downstream shell. When the reservoir level is drann down. the upstream gravel shell drains at once, removing the danger of an upstream slide. The filter layers shown in the figure prevent the fine core material from being washed into the shells.

The details of the section of fig. 3 may be varied according to the abundance and cost of available materials. If gravel is scarce

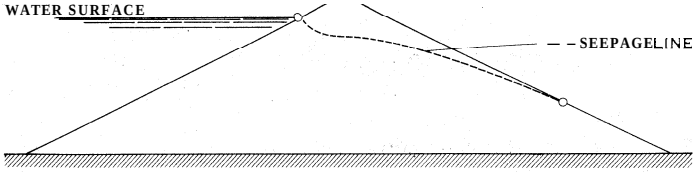

FIG. 1.—HOMOGENEOUS DAM WITH AN IMPERMEABLE FOUNDATION

or expensive, the core may be made thicker and shells thinner, as long as the combination is stable. If available materials are varied it may be desirable to tailor the section to fit, increasing porosity gradually from the core to the outer slopes. An example of such a tailored section is shown in fig. 4, which is a cross section of the Trinity dam. built by the United States bureau of reclamation on the Trinity river in California, and designed as the world's highest of its type. Its crest is 465 ft. above the stream bed and 537 ft. above the lowest point in the foundation.

If free-draining materials are unavailable for either of the types shown in fig. 3 or 4, internal drainage may be employed to take percolating waters away from vital parts of the structure. An elementary drained section is illustrated in fig. 2.

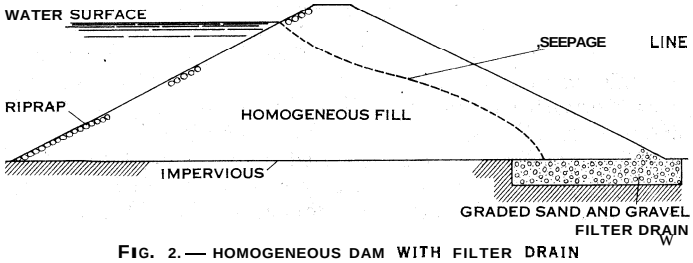

FIG. 2.—HOMOGENEOUS DAM WITH FILTER DRAIN

A more complex example of a drained structure is the Swift dam on the Lewis river in Washington. As designed, this dam was of unprecedented height for an earth-fill structure, reaching more than 400 ft. above the stream bed, 512 ft. above the bottom of the excavated cutoff trench and over 600 ft. above the bottom of a steel cutoff sunk to bedrock. Whether Swift is higher or lower than Trinity depends on the base used for measuring.

Fine-grained local materials suitable for an impervious fill were abundant for construction of the Swift dam, but gravel was scarce and expensive. Because of the necessity for gentle outer slopes, the estimated cost of a homogeneous dam was high. Scarcity and cost of coarse material ruled out types such as those sho n in fig. 3 and 4.

A solution was found in the section illustrated in fig. 5, consisting of a central core backed up by a vertical drainage curtain of processed gravel and a horizontal drainage blanket, both designated in the figure as D. The water-carrying capacity of these drains is far in excess of any possible seepage through the core. This protects the downstream portion of the dam from saturation, assuring its full strength and permitting it to be constructed of random local materials, with reasonable outer slopes. The percolation of fine materials into the drainage system is prevented by graded filters.

The stability of the upstream slope in the event of a sudden lowering of the reservoir level is assured by a free-draining rock fill, fig. 5(E), extending from the top of the dam down to the minimum operating reservoir level. The rock came from adjacent structure excavations. The rock underneath the core was grouted with a cement-water mixture to close any possible paths of leakage under or around the dam. Dams of the types shown in fig. 1 to 5 depend upon the presence of a core or other watertight connection to an impervious foundation. Where the depth of pervious foundation precludes this, underflow can be controlled by an impervious core connected to an impervious blanket.

The extent of the blanket is made sufficient to reduce the underflow to harmless amounts and velocities. Underflow may be further controlled by a downstream filter and porous blanket

Compaction of Earth-Fill Dams.—To ensure stability and watertightness the materials of an earth-fill dam must he adequately compacted. In ancient dams the earth was carried onto the embankment in baskets, and the trampling of the workers' feet provided compaction. Later, animals were used to bring the materials onto the fill, and there was still sufficient trarnpling to assure compaction.

With the introduction of mechanical earth-moving equipment, normal traffic ceased to provide adequate compaction. Consequently, special types of rollers were devised for the purpose. An early and popular form, still in use, is known as the sheep's-foot roller It consists of a hollow steel cylinder fitted with blunt spikes The cylinder is filled with water, sand or concrete to give it weight, and the roller is pulled over the surface by tractors.

Another type more recently developed is the pneumatic or rubber-tired roller, consisting usually of four large pneumatic-tired wheels mounted side by side, each carrying an independent load of about 25.000 lb.

The earth to be rolled is spread in even layers, usually 6 to 12 in. thick, and moistened according to precise laboratory standards before rolling. Moistening may be accomplished on the site, or preferably by irrigation of the "borrow area" before excavation.

Small areas, or areas which cannot be reached by rollers, are compacted by hand or by hand-operated mechanical tampers. The amount of compaction required to give the necessary strength and watertightness is determined by laboratory tests.

Hydraulic Earth-Fill Dams.—A hydraulic fill dam is one in which the earth materials are moved into place by sluicing with water. In the full-hydraulic fill method the materials, preferably a mixture of coarse and fine particles, are excavated by powerful jets from deposits above the dam, and sluiced to the upstream and downstream edges of the fill. The finer particles are then washed toward the centre of the fill, leaving the coarser portions to form the outer pervious slopes. The fine materials settle down in the centre to form an impervious core. Surplus water is drawn off through pipes No compaction is required.

If suitable materials are not available to permit direct sluicing, resort is had to the semihydraulic procedure. The materials are brought to the edges of the fill by conventional means, after which the fines are washed toward the centre.

Several failures of hydraulic earth-fill dams, and the concurrent improvement of rolled fill procedures, reduced the popularity of hydraulic fills. Most failures occurred during construction. The fine materials in the central pool consolidate slowly, particularly if composed largely of clay. As a result, the partially completed dam contains a central core of heavy semifluid material which may cause the fill or the foundation to fail. However, except in cases where some imperfection is known to exist, there is no reason to suspect the stability of hydraulic fill dams that have had ample time for core consolidation.

ROCK-FILL DAMS

Rock-fill dams are embankments composed of rock fragments dumped into place and made watertight by a central impervious zone or a surface blanket or membrane. Perhaps the earliest examples consisted of hand-dumped rock, staunched on the upstream face with earth or sod. With the passage of time, hand placement gave way to mechanical dumping, the use of large, quarry-run rock and more formal provision for watertightness.

The first extensive development of rock-fill dams came about in California, about the time of the gold rush (1849). They were useful in remote locations where equipment and materials for other types were expensive.

Typical sections illustrating the gradual evolution of rock-fill dams with impervious upstream facing are shown in fig. 6. In the earliest examples, both faces consisted of hand-laid dry rubble, the central portion being dumped, as in fig. 6(A). This permitted the use of steep face slopes, and reduced total volume of material. With the gradual increase in the cost of hand labour,

Contents of embankment: (A) selected weathered rock (clay, silt, sand and gravel) compacted by tamping rollers to 6-in. layers; (B) selected weathered rock (silt, sand, gravel and cobbles) compacted by tamping rollers to 12-in. layers; (C) alternating layers of selected dredger tailings (gravel, cobbles and boulders) and selected dredger screeninas and selected undredged sand and gravel (silt, sand, gravel, cobbles and boulders) compacted by crawler-type tractors in 18- and 12-in. layers respectively; (D) rock fill placed in 3-ft. layers

and the improvement of mechanical quarrying and hauling equipment, the over-all section was increased, and the handwork reduced, as in fig. 6(D).

A simple dumped rock fill is subject to appreciable and sometimes irregular settlement which causes the impervious membrane to crack. especially up the sides of the canyon. This can be partially controlled, although not eliminated, by the upstream hand-placed rubble layer, but there is still need for reduction of settlement

Mechanical compaction is impracticable. As an alternative, such fills are now "settled" during construction by sluicing the rock with high-pressure streams of water as it is dumped. This has markedly reduced post-construction settlement and the required amount of hand-placed face rock.

A variety of facings can be used for rock-fill dams, the most common being concrete. Laminated timber facing was widely used on early dams in the western U.S. and is still used in some localities. Steel facings have been used occasionally and asphaltic concrete is also employed.

Watertightness may also be secured by an impervious earth core or facing. A simple type results from the substitution of dumped rock fill for the gravel envelopes shown in fig. 3, with appropriate steepening of the outer slopes. Migration of the fine core material into the rock is prevented by graded filters, as in the case of earth fills.

The earthen core may be moved entirely to the upstream face, where it is referred to as a blanket. When so placed it must meet the stability requirement for the upstream face of an earth dam, and wave protection is required.

The essential stability requirements for a rock-fill dam are as follows: (1) a spillway adequate to prevent overtopping by any possible flood; (2) a sufficient height above highest water level (freeboard) to prevent overtopping by waves; (3) a strong, durable rock in the fill to resist the loads and weathering to which it will be subjected; (4) a thoroughly settled fill, obtained by sluicing during construction; (5) a foundation able to withstand imposed loads without appreciable settlement. and to resist erosion from possible leakage; if upstream facing is used. the foundation must afford adequate tie-in possibilities; (6) sufficient weight and strength of the fill at all levels to resist the lateral force of the water; and (7) stable outer slopes.

SOLID MASONRY GRAVITY DAMS

Solid masonry dams, which resist the forces coming against them primarily by their weight, are generally referred to as gravity dams. The term masonry is used to include both stone masonry and concrete. The forces tending to move the dam include water pressure, silt pressure if any silt accumulates in the reservoir, ice pressure, earthquake forces and the buoyant effect of water seeping through the dam and its foundation.

For stability against overturning or sliding, gravity dams rely on their weight, the vertical component of water and silt pressures on their faces. and the back pressure of water against the downstream face. The strength and roughness of the foundation also have an important influence on stability. The bases of high dams must be spread to keep stress within safe limits in the dam and the foundation.

The earliest masonry dams were no more influenced by scientific considerations than were the early earth fills but, being built of firmer materials, they were more resistant to damage. Their earliest extensive use seems to have occurred about the 16th century in the southern part of Spain, where large reservoirs for irrigation were constructed. Two old Spanish structures are illustrated in fig. 7.

The Almanza dam, fig. 7(A), is reported to be the oldest existing masonry dam, built perhaps in the early 16th century. This slender structure, built of cut-stone facing with rubble masonry interior, has been in service for more than 400 years. The Alicante dam, fig. 7(B), is of more ample proportions. It was built in the late 16th century, and has operated as an overflow .structure for more than 300 years with no evidence of serious damage. A comparison of these two examples with modern dams clearly illustrates the absence of any definite theory of design.

Despite their lack of scientific knowledge, the early Spanish dam builders were far in advance of their contemporaries. The wonder is that, with so little to nork with, they accomplished so much

The foregoing examples show how the art of masonry dam construction started. Once begun, it continued to advance and spread. Both French and Spanish dams early developed a regularity of form and a finished architectural appearance. However, until well into the 19th century there was no indication of any understanding of the underlying engineering principles.

This picture began to change in the latter part of the 19th century when several writers, principally French and English engineers, proposed some basic rules for the design of gravity dams. These rules were neither exhaustive nor in all respects accurate, but they did lay the foundation for the much improved, although still imperfect, procedures of the present day.

Reduced to their simplest essentials the design rules for a gravity dam are as follows:

1. The dam shall be safe from overturning and there shall be no tension in the masonry under any condition of loading, including earthquake effects. This requires that the combined resultant of weight of dam and the water pressure and other forces against and within it shall cut the base at any horizontal section within its middle third. This is the classical "law of the middle third."

2. The dam shall be safe, at any elevation, against sliding; that is, anainst being displaced downstream by water pressure and other forces. This requires that the frictional force holding the dam in place, plus any shearing strength, must exceed the horizontal thrust.

3. The true compressive stress in the masonry must be less than

FIG. 6.—CROSS SECTIONS OF EARLY DAMS SHOWING (A—D) THE GRADUAL EVOLUTION OF ROCK-FILL DAMS

the crushing strength of the masonry by a safe margin, at either face. Above a limited height this supersedes the law of the middle third.

4. The crushing strength of the foundation must exceed the maximum pressures against it by a reasonable margin. Broken areas of otherwise sound rock in the foundation may be consolidated by grouting. Masonry dams are usually founded on solid rock, but low structures, especially diversion dams, are sometimes built on earth or gravel. Adequate provisions are required in such cases to spread the load and to prevent underseepage and downstream scour.

5. A grout curtain, consisting of holes drilled in the foundation at the upstream side of the dam and filled with grout under pressure, is used for high dams to prevent too much leakage through the foundation and to reduce the uplift pressure; drainage holes are then drilled just downstream from the grout curtain.

6. The dam must be provided with a spillway and freeboard.

To reduce the tendency of concrete in large dams to crack because of shrinkage when hardening, modern practice may require any or all of the following: (1) use of the least possible amount of cement in the concrete consistent with required strength and durability; (2) the use of special "low-heat" cement; (3) construction lifts of moderate height; and (4) cooling of the concrete before or after it is placed to reduce the temperature rise during setting.

Sometimes gravity dams are arched upstream in plan in order to fit the contours of the site, but unless the curvature is sharp, very little of the load can be carried by arch action.

An outstanding example of a straight gravity structure is the Grand Coulee dam on the Columbia river in Washington. It has a volume of 10,585,000 cu.yd. and a height of 550 ft. above the lowest point in its foundation. This multiple-purpose dam makes possible the storage of water for the irrigation of new land and the generation of electrical energy. Flood control and navigation benefits are also derived. The dam consists of an overflow spillway section 1,650 ft. long, with adjoining abutment sections giving a total crest length of 4,173 ft. The spillway is capable of passing a flood of 1,000,000 cu.ft. per second.

Spillways **for** Gravity Dams.—Where conditions permit, the simplest means of handling a flood at a solid masonry gravity dam is to pass it directly over all or a portion of the dam, as is done at Grand Coulee dam. This requires that there be room at the base for the flood overflow and for any required powerhouses or other appurtenant facilities. The downstream rock must be sufficiently sound to withstand the impact of the water, or it must be protected by paving or stilling devices, to ensure that the foundations of the dam will not be undermined.

In modern dams the crest is shaped to fit the overpouring stream so as to avoid possible damage to the structure. The flow may be uncontrolled or gated. A curved "bucket" is usually provided at the base of the dam to prevent direct impingement on the foundation, and unless the rock is of excellent quality, a stilling pool or baffles may be required. An uncontrolled example, without a stilling basin, is shown in fig. 11. A stilling basin. with or without baffles, may be added if required. An alternative to the stilling basin is the ski jump, shown in fig. 12. Here the stream leaves the spillway in a slightly upturned direction, above the tail-water level.

The ski-jump spillway is also adaptable to the arch dam, and is widely used in Europe.

Where for any reason direct overflow is not permissible, a more suitable type of spillway must be constructed.

SOLID MASONRY ARCH DAMS

Although the arch was widely used by the ancients for other purposes, there is little evidence of its early use for dams. Arched dams began to appear in number only near the end of the 19th century.

The advantage of an arched dam over a simple gravity structure, when placed on a suitable site, derives from the structural strength of the masonry rather than the sheer weight of the dam.

An explanatory example of a simple arched dam in a hypothetical site is shown in fig. 8. In this hypothetical figure the downstream face is shown vertical at the crown. Many modern arch dams are "overhung" to secure a better fit to the adjacent land masses. Where an otherwise satisfactory arch dam site broadens excessively near the top, artificial abutments for the uppermost arches may be provided by gravity wings, or buttresses.

Originally, for purposes of analysis, arched dams were assumed to be composed of a multiplicity of separate arch slices, stacked one atop another. Each slice was analyzed for stresses as though it were independent of all the others. The total stress in any particular slice, and consequently its required thickness in the direction of the stream, is approximately proportional to its radius. Consequently, it is advantageous to use the shortest practical radius. However, the radius must be great enough so that the arch spans the canyon.

These opposing considerations must be balanced to give the best results for each assumed arch slice.

For a U-shaped canyon a constant radius for each arch slice from top to bottom of the dam may suffice. For a V-shaped

canyon the best solution requires that the radius be constantly decreased from top to bottom to approximate the optimum shape at each level. For very wide canyons, the arch must have a lung radius; however, this necessitates greater wall thickness and thus puts the arch dam at an economic disadvantage.

Early arch-stress computations were based on the theory that each of the assumed individual arch rings performs as a portion of a full cylinder, subject to a uniform radial load equal to the water pressure at its particular depth. This theory makes no allowance for the bending stresses caused by abutment resistance, elastic shortening, temperature changes and other factors; hence its use is permissible only in simple cases, and with conservative factors of safety.

Early attempts to compute more accurately the stresses in the arches of dams followed the procedures available for fixed-end bridge arches. Although valid, these methods require laborious arithmetical integration. In the 1920s William Cain and B. F. Jakobsen developed algebraic approaches to simple cylindrical arches, with restrained abutments, under uniform radial loads. Other writers devised tables and diagrams which further facilitated computation.

Unfortunately, however, a simple cylinder is not the ideal shape for the arch of a dam. Stresses in such an arch are appreciably greater at the abutments than at the crown, so that arches of variable thickness are preferable. This requires a return to the laborious arithmetical integration. Another difficulty is that the assumed arch slices actually are not free to act independently but are restrained by their neighbours as well as by the foundations This causes a redistribution of loads between the arches and vertical and inclined elements, or cantilevers. The loads carried by specific arches are no longer uniform. In very thin dams, this interference may be ignored by allowing an arbitrarily increased safety factor. However, for thick arches, required in nide or deep canyons, these effects need to be considered, and full analysis of the resulting complexities is necessary. There are two methods of analysis in general use. One is a trial-and-error procedure, usually referred to as the trial-load method, which is generally followed in the United States. The other is the modeling method, widely used in Europe. A scale model of the proposed structure is built, loaded proportionally to the full-sized dam, and the deflections and the stresses measured. Both of these procedures are practical. Each requires skilled technicians and considerable labour.

Electronic computers, especially adapted for the task, greatly reduce the labour of the trial-load method.

Few new arch dams are seen in the United States, where the best arch sites have largely been utilized and the cost of concrete construction has risen faster than that of earth fills, but in other parts of the world these factors have less influence and arched

dams are more frequent. **A** notable example is the Tignes on the Isère river in northeastern France. Constructed in 1953, it is among the highest true arch dams in the world (592 ft.).

ARCH-GRAVITY DAMS

If an arch dam is high and the bottom arches are thick, arch action is restricted near the base, and vertical and horizontal beam actions become predominant. The loads near the top are taken largely by the arches, and those near the bottom largely by a combination of gravity and horizontal beam action. Such a structure is called an arch-gravity dam and is analyzed by the trial-load method, or by modeling.

An outstanding example of this type is the Hoover dam on the Colorado river in the southwestern United States. the highest dam in the western hemisphere. The dam, 726 ft. high above the lowest point of its foundation, is a concrete arch-gravity structure in which the reservoir water load is carried both by arch action to the abutments and by the massive weight of the structure on the foundation. A total of 3,250,000 cu.yd. of concrete was used to form the dam, which has a crest length of 1,244 ft. and thickness ranging from 45 ft. at the crest to 660 ft. at the base.

Hoover dam is a multiple-purpose structure. Its services include protection from floods. power generation. and uater conservation for irrigation, recreation and preservation of fish and wildlife. Lake Mead, the reservoir created by Hoover dam, is one of the world's largest, with a total storage capacity of 29,827,000 ac.ft.; its extends 115 mi. upstream from the dam.

Although Hoover dam was not the first arch type to be designed by the trial-load method. it led the way to great advances in the application of the procedure. It is looked upon as the "father" of the present trial-load system of analysis. The stresses were also checked by model.

STRUCTURAL MASONRY DAMS

An appreciable reduction in the volume of masonry in a dam can be effected by using it in its structural forms. Dams of this type are usually composed of multiple concrete or stone masonry buttresses to which the water load is carried by a deck composed of either reinforced-concrete slabs or arches at the upstream face, as shown in fig. 9 The flat-slab type is sometimes called the Ambursen dam and its buttresses are spaced on 18- to 40-ft. centres. On multiple arches the buttress spacing can be increased.

Other types are the round- or polygonal-head buttress dam, with buttresses relatively closely spaced and expanded at the upstream

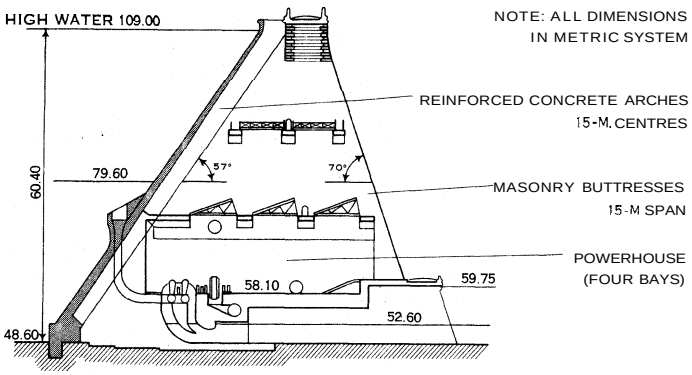

FIG. 10.— CROSS SECTION OF THE TIRSO DAM. SARDINIA

face to provide contact betneen adjacenr units, thus eliminating the deck, and the domed dam, where the canyon is closed by single or multiple domes. For wide-V canyons the domes may be flanked by Ambursen or multiple-arch wings.

When structural dams are designed so that water overflows across the crest, a reinforced-concrete slab is placed also on the downstream face to support the spilling water; otherwise, spillways are provided as for other dams.

Over-all stability depends upon the same factors as those described for solid masonry gravity dams. The upstream face, being inclined usually about 45°, provides a vertical component of water pressure to promote stability, thus reducing the weight of masonry required. However, because structural concrete dams require steel reinforcement, more form work and more skilled labour in their construction, their cost per cubic yard is greater. They have an advantage over solid masonry gravity dams only where the ingredients for concrete are expensive and where lumber for forms and skilled labour are relatively cheap.

The Lake Pleasant dam in Arizona, fig. 9, illustrates the use of the cellular buttress. with double walls, to increase stiffness. Fig. 10 shows a cross section of the Tirso dam in Sardinia, zoo ft. high. Its unique features are stone masonry buttresses and a hydroelectric plant between buttresses.

Structural masonry dams were quite popular in the first quarter of the 20th century, but afterward lost ground to other types on an economic basis. However, the highest of such dams in the United States, the 330-ft. multiple-arch Alder dam in Washington, was completed in 1944.

STEEL AND TIMBER DAMS

The relatively less usual dams of steel and timber must meet all of the stability requirements prescribed for other dams. The steel dam is in general similar to the structural masonry dam, but with a steel-plate deck and steel-frame buttresses. Few steel dams have been built, probably because of cost and lack of confidence in their permanence. Three large steel dams were constructed about 1900, but after one of these failed, although its destruction was attributed to a foundation failure and not in any way to the fact that it was built of steel, it was replaced by a concrete dam.

Small timber dams may consist of framed wooden buttresses with tongue-and-groove wood plank facing, but the most usual type is the rock-filled timber crib, with plank decking. Timber crib dams are numerous, but usually small. Although under favourable conditions they may last more than 50 years. they require considerable maintenance and are seldom tight after a few years of use. They are used frequently as cofferdams in construction work: Their stability requirements are similar to those for gravity dams. Floods are usually allowed to pass over them, but separate spillways may be used.

SPILLWAYS FOR DAMS

With few exceptions, provision must be made for passing excess floodwater over, around or through all dams. The principal exceptions are dams forming regulating basins for artificial channels in which the inflow is subject to complete control, and where natural drainage from uncontrolled areas is not involved; even in these cases it is usual to provide a small safety outlet, to guard against failure to control the inflow properly.

Another exception is the low earth or gravel diversion dam, designed to be wholly or partly carried away in each flood, and subsequently rebuilt.

The required discharge capacity of a spillway is determined from a careful study of discharge records of the stream, and of local flood possibilities. Allowance is made for the modifying effect of available storage. For fill dams the capacity should equal the maximum possible flood, as a single overtopping might cause a disastrous failure. For types of dams and foundations in which occasional limited overtopping will not cause failure, the spillway capacity may be reduced, based on an economical balance between the cost of the spillway and the capitalized cost of possible future repairs.

A preferred type of spillway is a simple uncontrolled chute around the end of the dam. This spillway may be lined with concrete. but if the rock is sufficiently sound and overflows are small or infrequent, the lining may be omitted, except that a leveling sill is usually provided at the top to spread the flow evenly over the width of the chute. The flow over the crest of a chute spillway may be unobstructed or controlled by gates or other devices.

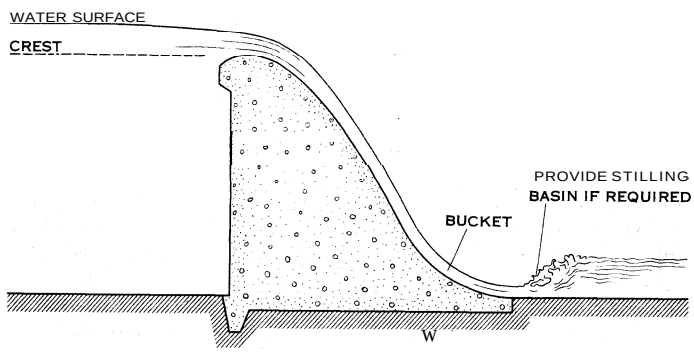

FIG. 11.—OVERFLOW GRAVITY DAM WITHOUT STILLING BASIN OR CONTROL GATES

In the case of an earth- or rock-fill dam the chute must be carried downstream to the point where its discharge will not impinge upon any part of the dam. This may be accomplished by leading the discharge into a natural side canyon or by extending the excavated channel a sufficient distance to clear the structure.

If the rock is of poor quality the chute may require lining all the way to the river bed and in some cases a plunge basin, baffles or other stilling devices may be required to avoid erosion. Otherwise the lining may be terminated, preferably in a "ski jump," at any convenient point where the rock is sound.

Because of its freedom from the risk of failure of automatic devices or human operation, the simple uncontrolled chute is particularly desirable, although not mandatory, for fill dams in remote locations. In an uncontrolled spill ay useful storage behind the dam is limited by the elevation of the spillway crest, but the dam must continue above that elevation to provide the depth required to push the floods into the spillway.

This extra height is expensive and'hence uncontrolled spillways are made as wide and shallow as physical conditions and economics permit.

Where the canyon walls are steep to a considerable height above the top of the dam, a wide shallow chute is not feasible, and a deep narrow chute or a tunnel must be used. The entrance to such a spillway still can be left open, but the necessary increase in the height of the dam greatly increases its cost. As a result, it is necessary to resort to gates, which permit the useful storage to be held above the bottom of the spillway inlet. Gates may also be required, particularly on large rivers and even on wide spillways, when it is necessary to control floodwater levels closely to avoid upstream damage.

In some cases the benefits of a long crest may be secured by extending the intake channel leading to the chute or tunnel a

considerable distance upstream, with the waterside lip at the elevation that would be used for the crest of a wide shallow chute. This is called a side-channel spillway.

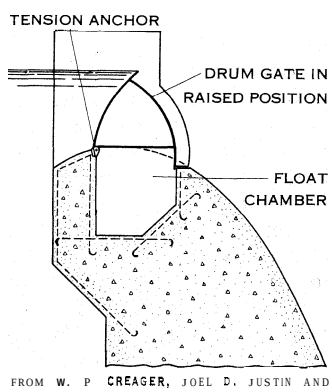
A special type of spillway, known as the "morning glory," consists of a vertical shaft connecting to a horizontal tunnel at the downstream water level. The top of the shaft is belled out to afford a long inflow lip.

The approach flow to the shaft may be uncontrolled, or it may be controlled by one of the devices described below.

Spillway Control Devices.—The simplest floodgates for controlling spillway flows consist of flashboards supported against pins designed to fail at predetermined flood levels. Another form of simple floodgate consists of needles or vertical beams seated on the spillway crest and supported at the top by horizontal beams. Shutters or panels of wood or steel are also used, supported by movable frames, or hinged and supported by collapsible or removable struts. A form of the latter known as the "bear trap" or "roof weir" consists of two panels inclined toward each other and arranged to be raised or lowered by water admitted to or emptied from the space between them. Such gates have been built as high as 17 ft. and for openings up to 120 ft. wide. Hinged panels may also be arranged to be raised or lowered automatically with changes in water level.

Another form of control for wide openings is the drum gate, illustrated in fig. 13. The rigid steel structure is hinged at its upstream corner, and raised or lowered by admitting water under reservoir pressure into the chamber below the gate. In the type shown the top plate is curved to match the shape of the overflow dam when in the lowered position. The perimeters of the lower face of the drum and the ends of the upper face are provided with sealing devices to control leakage.

The gate sometimes is installed in the reverse position, with the hinge at the downstream side.



FROM W. P. CREAGER, JOEL D. JUSTIN AND JULIAN HINDS, "ENGINEERING FOR DAMS" (1945); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. 13—DRUM GATE CONTROL DEVICE

A rolling gate, consisting of a large cylinder resting on the crest of the dam, is also used for wide openings. The gate is raised by rolling the cylinder up inclines on the faces of the piers. Such gates have been built up to 115 ft. long and up to 20 ft. in height.

Large openings may also be provided with vertical sliding or rolling gates. Such gates have been used up to 50 ft. square, power operated. The rollers may "float" between the gate and its frame, attached to neither, or may take the form of wheels fixed to the gate and riding on tracks in the gate groove.

Spillway openings may also be closed by means of radial (Taintor) gates, in which the gate is a segment of a cylinder supported by radial struts hinged at the piers, the gate being lifted clear of the water for passing floods. Sealing devices are required at the ends and bottom of the gate to control leakage. Lifting of the gate involves only its weight, the small drag of the end seals and the bearing friction at the hinge. Operation is accomplished by chains or cables at the face of the gate. These gates are very versatile, and are used in a variety of sizes, from 2 or 3 ft. to over 50 ft. high. Hand-operated hoists may be used for small gates, but larger sizes are power operated. A large gate of this type is illustrated in fig. 12.

Outlets From Reservoirs.—Whatever the purpose of storing water behind a dam, means must be provided for withdrawing it as needed. In masonry dams this is frequently accomplished by pipes imbedded in the concrete, and controlled by valves. Usually two valves are used in tandem on each outlet tube. The downstream one is usually an expensive and somewhat complicated device designed to withstand the damaging effect of operation at partial openings, when close regulation is required. The upstream valve is used only as a safety device and can be of simple design. It may be located near the upstream face, or at least upstream from the watertight element of the dam. The control valve may be placed anywhere downstream from the safety valve. A copious supply of air is required at its downstream face to cushion the damaging effect of turbulence. For fill dams the conduit between the two valves must be watertight under full reservoir pressure.

TABLE 11.—Ten Largest Reservoirs in the U.S.

Name of dam	Name of reservoir	Reservoir capacity (in ac.ft.)
Hoover	Lake Mead	29,827,000
Glen Canyon	Glen Canyon	28,040,000
Oahe	Oahe	23,600,000
Garrison	Garrison	23,000,000
Fort Peck	Fort Peck	19,400,000
Grand Coulee	Franklin D. Roosevelt lake	9,402,000
Rockland	Rockland	6,809,700
Fort Randall	Fort Randall	6,300,000
Wolf Creek	Lake Cumberland	6,089,000
Kentucky	Kentucky	6,002,600

Source: U.S. Bureau of Reclamation.

For fill dams conduits through the fill, especially conduits built along the foundation, may be used, but with extreme care.

A collapse or leak may cause great damage. For such dams, and also for many masonry dams, a preferred outlet conduit is a tunnel through an abutment.

Outlets may be at or near the base of the dam, near the top, or at various intermediate levels in the dam. Their inlets are usually protected by grids of bars. known as trash racks, to exclude troublesome debris. In flood-control dams where the primary purpose is the reduction of flood peaks, some or all of the outlets may be ungated.

DAMAGES, the body of law that governs awards of money as compensation for legal damage. Although it is often difficult to separate the question of whether legal liability exists from the question of how much should be paid as compensation for a particular wrong, the word damages is used in law to designate the

system of rules, standards and formulas which have been developed in relation to questions of the latter type.

Although there was a developed system of money compensation for wrongs in Roman law, and although the remedy appeared early in the development of English lam and became the primary remedy of the common-law courts, the growth of the modern law of damages is a function in large part of the importance of the jury in Anglo-American legal procedure. In the United States particularly, the process of passing on the evidence that may be submitted to juries, of instructing juries on the law they are to apply and of reviewing the amounts awarded by juries for particular wrongs has built up a large body of doctrine. The somewhat narrowed scope of the jury in civil actions in the legal system of England in the 20th century as compared with the vigorous survival of the jury system in the United States has undoubtedly been a factor which has made the law of damages somewhat less complex in England than in the United States.

Basic Concepts. — Terms which frequently occur in discussicns of money awards in the United States are value, certainty and avoidable consequences.

Value. — When an object of property is evaluated for the purpose of compensating its owner for its loss or injury, the usual standard to which reference is made is market value. If the item involved is of a type that has been the object of a great number of commercial transactions, so that evidence of a fairly definite price at the time and place of injury can be produced, the problem presented is relatively simple. If, however, the item to be valued is of a kind which is rarely the subject of sale. the concept of market value is of little value as a standard for determining what the just compensation should be. In such cases the courts often use the term actual value to describe the amount that is to be awarded. Compensation for the loss of a quantity of grain would be discussed in terms of market value, while the loss of an industrial machine would be approached in terms of actual value in the light of such factors as the original cost, the cost of replacement and the depreciation which the machine has been subjected to in use. Again, clothing or furniture acquired for personal use map have an ascertainable market value, but may be worth more in use to the owner than a similar item purchased on the second-hand market. Juries are frequently allowed to consider the value of an item to the owner although they are usually instructed that any sentimental value which an owner attaches to a personal item should not be a part of the compensation awarded. Substantial awards are sometimes approved, however, for lost family portraits and other keepsakes under the value-to-owner formula.

Certainty. — As used in the law of damages, certainty means that there is a sufficient basis in the evidence presented to enable a jury to reach a reasoned conclusion of fact regarding the amount of the loss. The strictness of this standard has varied considerably in its application to different kinds of cases. The idea that certainty is required has had its most frequent application and its strictest formulation in cases involving the recovery of profits lost by virtue of a wrongful act. The frequent use, however, of the idea that it is the fact of loss and not the amount of loss which must be certain has lessened the rigour of the standard of certainty even in this class of cases. The English judges have not developed methods of controlling the award of damages by a jury to the same extent as have judges in the U.S.; and the English cases tend to handle problems, which in the U.S. would fall under the rubric of certainty, in terms of the still less precise idea of remoteness.

Avoidable Consequences. — Many questions which arise concerning amounts to be awarded for particular wrongs can be resolved only with reference to the doctrine of avoidable consequences: the principle that one who is injured by another's wrong cannot passively allow losses to accumulate but must take reasonable steps to protect himself or be denied a recovery for the losses which could have been thus avoided. The damages resulting from a personal injury, for example, cannot be recovered if the person injured will not submit to routine medical treatment when the evidence shows that the injuries would have responded to such treatment. The question of the reasonableness of the injured person's actions will arise as more complicated, dangerous methods of treatment are suggested as possibilities that he should have pursued. A doctrine that is related to the idea of avoidable consequences is the concept that benefits which accrue to the injured party as the result of the particular legal wrong must be credited to the wrongdoer in computing the damages to be awarded. The expense of building materials and labour which a contractor saves because the party for whom he was to work refuses to let him perform would thus be deducted from the contractor's recovery in a suit for breach of contract. The doctrine of avoidable consequences is discussed and applied in England under the somewhat broader concept known as mitigation of damages.

Some Elements of Recovery. — The questions constantly recur whether in particular cases the claimant can recover, in addition to the basic award: interest; the attorney's fees he has had to expend to effect his recovery; and exemplary or punitive damages.

Interest. — The granting of interest as an element of damages is a recognition of the fact that when a sum of money is adjudged to be appropriate compensation as of a particular date, further loss occurs when the amount is not received until a later time. The effective realization of this concept in the law of damages has been slow, perhaps because of the historical policy against the lending of money on interest. The first common-law recognition of the idea of interest as damages came in cases where the obligation asserted the right to the payment of a fixed sum on a given day (*Wood* v. *Robbins,* 11 Mass. 503 [1814]). The requirement that the basic liability be a liquidated sum or a sum which can be computed with the aid of readily ascertainable market values is still an important part of the modern law of interest as damages. Surviving, too, is the attitude that an award of interest should be at the discretion of the court or jury rather than following as a matter of law when the prerequisites are established. These ideas have persisted with more vigour in cases involving recoveries for rongful acts other than breaches of contract; that is, in cases involving torts. In contract cases the idea is being accepted that if it is determined after litigation that a claimant was injured in a pecuniary way at a particular time, then complete compensation should include an award of simple interest on the amount of the basic award from the time of the injury until the date of judgment (*Prager* v. *New Jersey Fidelity & Plate Glass Insurance Co.,* 245 *N.Y.* 1 [1927]). The rate which is utilized in cases where interest is awarded has most often been the "legal rate" fixed by statute, although there is evidence in a few decisions of a judicial willingness to utilize a rate more attuned to the ultimate end of proper compensation in the case at hand. In England, by virtue of s. 3 of the Law Reform (Miscellaneous Provisions) act, 1934, in any proceedings in any court of record for the recovery of any debt or damages, the court may order that there shall be included in the sum for which judgment is given interest at such rate as it thinks fit on the whole or any part of the debt or damages for the whole or any part of the period between the date when the cause of action arose and the date of the judgment.

Attorney's Fees. — A basic difference in English and U.S. law exists on the question of the recovery of attorney's fees by the prevailing party in an action. In U.S. law statutory costs have become a fixed amount which does not include attorney's fees, while in England the costs include such part of the fees which a successful party has had to pay to a solicitor and barrister as the taxing master considers reasonable (*see* Costs). Strong policy arguments can be made for each of these approaches. It is clear that, unless the professional fees which must be incurred if a suit is to have a reasonable chance to succeed can be recovered by the injured party, he is not actually made whole by his recovery of a sum measured only by the injury which is the basis of his action. On the other hand, the possibility of having to pay the fees incurred by one's adversary if a suit is not successful may be a strong deterrent to the bringing of actions which appear to be just. U.S. statutes in some states have made provision for the recovery of attorney's fees in cases such as the suit of a wife for divorce or the foreclosure of a mechanic's lien; further, the case law in the U.S. has developed a rule which allows recovery of attorney's fees in cases where the defendant's conduct has involved the plaintiff in litigation with a third party.

Exemplary or Punitive Damages. — Although most of the law of damages revolves around an attempt to devise a system which will compensate individuals for the harm they have suffered, the concept of punitive or exemplary damages is quite different. Exemplary damages are awarded to the injured person as a means of punishing the wrongdoer. Normally, of course, punishment is the result of the application of the criminal law, and if fines are exacted the proceeds go to the state and not to an individual who happens to have been injured by the criminal act. The use of a private award which is not geared to compensation is, of course, a means of encouraging individuals to sue even when they have not suffered great pecuniary loss if the acts of the wrongdoer have been, as is required for an award of exemplary damages, wanton or malicious. However, it is not ordinarily a defense to a claim for exemplary damages that the wrongdoer has been punished previously in a criminal action. There are other anomalies in the law of exemplary damages. Although, in theory, the size of a punitive award should depend on the nature of the conduct which it is sought to punish without regard to the amount of injury caused by that conduct, some jurisdictions require the size of the exemplary award to bear a reasonable relationship to the compensatory award granted. On the other hand, the punitive function of an exemplary award is recognized in some states by a rule which admits evidence regarding the wealth of the defendant in order that the jury may decide how large an award is necessary for punishment in his case.

The Measure of Damages for Various Legal Wrongs. — The personal-injury action, most often arising out of an automobile accident, has become more prevalent in the courts than any other kind of litigation. The elements of recovery that can be considered in such an action include: the loss of time as a result of the injury, frequently measured by the loss of wages that has occurred; the amount that has been expended for medical services; and a sum designed to compensate the injured person for the pain and suffering that has resulted from the injury. These elements of recovery relate to the past, looking at the situation from the time of the trial. Since only one award is made in the common-law system for an injury resulting from a single wrongful act, it is necessary also to include in this award the damages which will occur in the future as a result of the injury. These future losses are obviously far more speculative in nature than are the losses which have already occurred. They include: the loss of earning capacity; the reasonable cost of the medical services that the injured person will incur; the future pain and suffering that the injured person is reasonably certain to undergo. If the injury is of a disfiguring sort, the recovery may also include a sum to compensate the embarrassment and humiliation of the injured party. The English courts have gone beyond these elements into awards compensating the loss of enjoyment of life brought about by the injury and even into a consideration of the loss of the happiness the injured person would have had in the years of life denied him because of the reduction in his life expectancy. The common law did not recognize a right to recover for death itself, but with the passage in England of Lord Campbell's act in 1846 the concept of such a recovery became a general subject of legislation in the United States. Under most of these statutes the damages are based on the economic benefits that the decedent's family could have expected to receive from him if he had lived.

The theory of an award of damages in a personal-injury or other tort case is that the injured party should be placed in the position he would have been in if the injury had not occurred, so far as this can be done with a money award. The possibility of achieving this goal is obviously far greater where the injury has been to a property interest rather than to the person. Where the legal wrong sued for is the breach of a contract, the theoretical end of the damages remedy is to give the injured contracting party the benefit of his bargain by putting him in the position he would have enjoyed if the contract had been performed. Applied. for example, to a contract to build a house which has been breached by the owner, this formula would give the builder the contract price less what it would cost to finish the job.

Contract recoveries are limited in one respect. by the principle of the landmark case of *Hadley* v. *Baxendale,* 9 Exch 341 (1854), which allowed recovery only for those injuries which were reasonably foreseeable at the time the contract was entered into. This usually means that notice of the possibility of any unusual consequences of failure to fulfill a contractual obligation must be brought to the attention of the contracting party if these unusual consequences are to be the subject of a recovery of damages for breach of contract.

The many complex problems that surround the determination of damages in a lawsuit encourage contracting parties to stipulate at the time of entering into a transaction what the damages shall be for a breach. Such a clause in a contract is known as a liquidated-damages clause. There are safeguards surrounding the enforcement of such clauses designed for the most part to carry out a policy against the use of penalty provisions as a mechanism for the enforcement of obligations. Thus, if the amount stipulated as liquidated damages is unduly large in relation to the injury to be expected from breach, it will be unenforceable and the parties will be relegated to the ordinary process of proving damages.

(R. C. M.)

DAMANHUR, a town of lower Egypt and capital of the delta governorate of Al Buhayrah (Beheira) which supplies cotton and rice, lies 38 mi. E.S.E. of Alexandria. Pop. (1957) 110,521. A triennial fair is the chief event. Damanhur is situated on the ancient site of Time-en-Hor ("city of Horus"), earlier called Behdet, once capital of lower Egypt in predynastic times. Behdet contributed the winged disk of Horus (*q.v.*) to Egyptian symbolism. In Ptolemaic times it was capital of a nome and was known to the Romans as Hermopolis Parva. Little remains of the earlier buildings at this place. (A.B.M.; M. V. S.-W.)

DAMÃO (DAMAN), previously capital of the Damão settlement in former Portuguese India, was taken over by India in Dec. 1961 (see GOA: History). It lies on the east side of the entrance of the Gulf of Cambay within Gujrat state. It has a station on the broad-gauge Western railway. Pop. (1950) 9,027. The settlement had an area of 211 sq mi. and a population of 69,005, and was divided into three parts: Damão proper along the coast, separated from the tiny enclave of Dadrá and the larger one of Nagar Aveli (Nagar Havili) from both of which the Portuguese administrators were ousted in 1954. Damão has a little fishing and shipbuilding but no foreign trade.

Damão town was sacked and burned by the Portuguese in 1531. It was subsequently rebuilt, and in 1558 was again taken by the Portuguese who made it a permanent settlement. The territory of Damão proper was conquered by the Portuguese in 1559; that of Nagar Aveli was ceded to them by the Marathas in 1780 in indemnification for piracy. The settlement was subject to the governor general of Goa as part of the Portuguese overseas province, Estado da India. (L. D. S.)

DAMARALAND, the part of South-West Africa formerly occupied by the Herero (*q.v.*) people who were called by the Nama (Hottentots) the Gomacha (*i.e.,* cattle-breeding) Dama. "Damara" is the feminine plural form which has been used in error to designate the group as a whole. In the Nama language *dama* means "black people," a derogatory name. Many authorities reject the word "Damaraland" in favour of "Hereroland."

The area designated corresponds to no present administrative unit but to the area roamed over by the Herero before the German occupation. Roughly this extends from the Etosha pan (about 19° S.) in the north to the Khomas highlands to the south of Windhoek, and between the Kalahari sand veld in the east and the Namib desert in the west (see SOUTH-WEST AFRICA: Physical Features). Damaraland is %ell-grassed bush country with an annual rainfall of between about 16 and 24 in., constituting the best cattle country in the territory. The area is occupied by whites, the Herero having been allocated reserves mainly on the borders of the Kalahari sand veld. (J. H. WN.)

DAMASCENUS, NICOLAUS: see NICHOLAS OF DAMASCUS.

DAMASCIUS (5th–6th century A.D), Neoplatonist philosopher, the last in the succession of Platonic scholarchs at Athens (see ACADEMY, GREEK), was born about A.D. 480. A pupil and close friend of Isidore of Alexandria (*q.v.*), whose biography he wrote in the customary enthusiastic manner of Athenian Neoplatonism (part of it is preserved in Photius's *Bibliotheca*), he became head of the school himself about 520 and was still in office when Justinian closed the Academy in 529. Damascius. with Simplicius and five other members of the school, went to Persia to the court of Chosroes I. By a clause in the treaty of 533 between Justinian and Chosroes they mere allowed to return and seem to have been glad to do so, as they found the atmosphere of the Persian court uncongenial to philosophy. The date of Damascius' death is not known, but is unlikely to have been much later than the middle of the 6th century.

Damascius' chief surviving work is entitled Problems and *Solutions* About the First *Principles* (ed. by C. A. Ruelle, 1889; Fr. trans. by A. Chaignet, 1898). In this he retains and still further elaborates the whole vast system of Proclus: the hairsplitting logic and theosophical fantasy of Athenian Neoplatonism are still there. But he opens a way to genuine mysticism by his insistence (in the spirit of Plotinus) that our speculation can never attain to the ineffable first principle (which he will not even call "the One") or describe adequately the relation to it of derived reality. This first principle is beyond the reach of human thought and language and utterly outside the hierarchy of reality; and, because it is outside, everything, and, especially. the soul of man can participate in it directly and without intermediary. though in an unspeakably mysterious way. The last of the pagan Greek philosophers points the way forward to the Christian mystics of the "Dionysian" tradition.

DAMASCUS (DIMASHQ), an administrative district (*muhafaza*) of Syria. Pop. (1960) 978,000. Area 7,540 sq.mi. Situated north of the governorates of Dar'a and As Suweida and south of Homs, its western and eastern limits are the borders with Lebanon and Jordan. It includes portions of three geographical regions: (from west to east) the mountains of Hermon (9,232 ft.) and Anti-Lebanon; the fertile plain of the Ghutah; and the Syrian desert. The city of Damascus, situated in the western Ghutah, is administratively separate. There are numerous villages and some small towns in the mountains. Zabadani and Baludan are popular summer resorts. Irrigation from springs and small streams creates oases of fertility in an otherwise barren mountain region. The Ghutah, where 40,000 ac. are irrigated by the waters of the Barada and A'waj (the biblical Abana and Pharpar), is intensively cultivated and produces cotton, wheat, maize and a great variety of vegetables and tree fruits. The local breed of cattle are excellent milk producers. Excess winter floodwater drains into seasonal lakes ('Ateibe and Hij) at the eastern limit of the oasis. The manufacture of cement, glass, textiles, matches and preserved foods is pursued in settlements near Damascus. The small tomns of Al Nabk, Qutayfah. Duma, Qatana and Al Qunaytarah are situated on or near the main north-south road along the desert border. The desert contains no settlements of importance, but its poor winter and spring pasture supports the flocks and herds of nomadic Bedouin tribes.

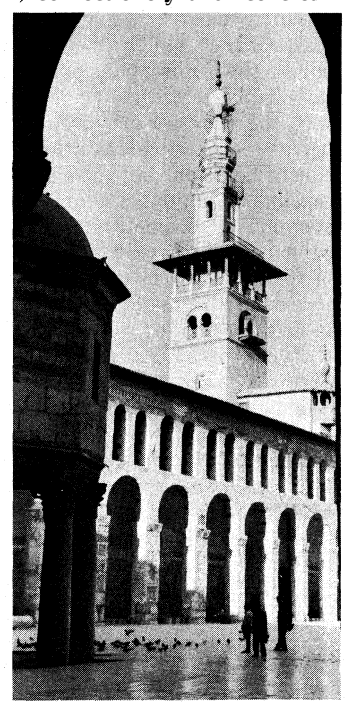
See R. Thoumin, *Géographie Humaine* de la Syrie *centrale* (1936). (C. G. SM.)

DAMASCUS (DIMASHQ), the capital of Syria and of Damascus *muhafaza,* is the country's largest city but not its commercial centre which is Aleppo (*q.v.*). Pop. (1960) 529,579. The majority of the inhabitants are Arabs. coexisting with Druses. Kurds, Turks and Persians. There is a large Christian Maronite minority.

Damascus (Arab. *Dimashq* as *Sham,* meaning Damascus of Syria) has had many other names, including "pearl of the east," "the city of many pillars" and "the gate of Mecca." The city is situated in the Ghutah, a depression and oasis at the foot of Mt. Qasyun, about 2.264 ft. above sea level and 57 mi. S.E. of Beirut It ones its importance and prosperity to its position commanding both the waters of the Barada and A'waj rivers and the transdesert routes and has long been a valuable market for the desert tribes. Formerly it was the starting place for the overland pilgrimage to Mecca; the annual influx of pilgrims added considerably to the wealth of the city. Damascus is connected by all-weather roads with Aleppo and with Beirut. Lebanon; Amman. Jordan; and by desert track to Baghdad, Iraq. There is also a rail service to Beirut. Aleppo, and Dar'a on the Jordan frontier. At Al Mazzah. on the outskirts, there is an airport within 30 minutes' drive from the centre of the city.

The modern town of Damascus is cut in two by the Barada. The old city, partly walled, lies south of the river and contains the principal mosques, khans and markets, the Meidan quarter settled by tribesmen. the Christian quarter to the northeast of the city, and next to this the Druse quarter. North of the river the new town was greatly extended during the years 1940–60, with imposing government buildings including ministries, hospitals, a large general post office, modern hotels and factories. The new northern residential quarters are built largely of stone with shady avenues and gardens and include many large blocks of flats In the western sector is the Syrian university established in 1924 by the French authorities and one of the leading educational establishments in the middle east. Damascus is set among gardens and orchards and is famous for its grapes, melons and apricots. The best view of the city is to be obtained from the Salahayih quarter in the northwest, whence splendid vistas extend to Mt. Hermon. The beauty of the town and its luxuriant setting have led it to be regarded as an earthly paradise, and for the Muslims and Christians especially it is a holy city, the site of the burial of Saladin and of the conversion of St. Paul.

Traditional manufactures include brocades (damask; *q.v.*), carpets, leatherwork, inlaid woodwork in the shape of boxes and furniture. metalwork, including gold and silver filigree and damascene blades (see DAMASK STEEL). Sugar refineries and factories for glass, furniture, matches, textiles, cement and preserves have been established. Rose-petal jam, confectionery and ice cream are long-established manufactures. An important market centre, Damascus exports wheat, tobacco, livestock, hides, dried and fresh fruits. The principal imports are machinery, automobiles, iron and steel, fuel oil and pharmaceutical products.



A SHELL PHOTOGRAPH
COURT OF THE GREAT MOSQUE, JAMI AL UMAWI. 8TH CENTURY, RESTORED 11TH, 15TH AND 19TH CENTURIES, WITH THE MINARET OF JESUS DAMASCUS, SYRIA

Antiquities.— The lines of the old medieval city can be traced from the position of the gates, and it appears to have been divided into several quarters. The most imposing building is the Great Mosque, Jami Al Umawi or Al Aqsa, built within the enclosure wall of the temple to Adad of 1st-century date and replacing the church dedicated to St. John the Baptist built by the emperor Theodosius I in 379. According to Christian tradition, after the Muslim conquest of the city the Christians and Muslims shared the church until 705, when the caliph al-Walid I destroyed the church and rebuilt the mosque. It appears more likely that a mosque and church were both situated nithin the temple temenos. but that in 705 the church nas destroyed and the mosque enlarged

and rebuilt by al-Walid with the aid of Greek architects. The restoration was a splendid building, the walls lined with marble overlaid with golden vines and the wooden roof inlaid with gold tracery, while from the ceiling hung 600 gold lamps. These were later replaced by the caliph Omar II. In 1069 the mosque was destroyed by fire and in 1401 the city was ravaged by Timur. In 1893 it was again damaged by fire, and the existing marble inlay dates from this period. In spite of all these disasters the mosque remains a structure of great beauty.

The citadel, a quadrangular building in the northwest of the old city, may be of Roman date, and was certainly in existence by medieval times as it was rebuilt in 1219. It was frequently restored, notably in 1262 by Sultan Baybars, who liberated Syria from the Latins. The suks (bazaars) are mostly recent, having been largely rebuilt after the revolt of 1925. Of the khans (inns for the exchange of goods) the best known is the Khan Asad, constructed of black and yellow stone with ornamental domes. Of interest is the Azam palace, built in 1749 for the governor of Damascus and converted after 1922 by the French into an institute for the study of Islamic art and architecture. Gutted in the 1925 revolt, it was rebuilt and shows a reconstruction of Arab town life in the 18th century. "The street called Straight" (Acts ix, 11) is usually identified with the Suk al Tawilah ("the long bazaar"), part of which is called Darb al Mustakim ("Straight street"). Investigations suggest that it is above the original street of that name. The Damascus museum, set in riverside gardens beside the beautiful Tagiah mosque in the west of the city, was founded by the French and contains fine collections from various excavations, including material from Mari (mod. Tall Hariri), Ugarit (Ras Shamra), Arpad (Tall Rif'at) and Palmyra. Its collection of Roman glass is one of the finest in the world.

History. — The *Pre-Islamic* Era. — According to Josephus, Damascus was founded by Uz, son of Aram; it was already a city by the time of Abraham. It is known to the Arabs as Al Fayha, "the fragrant." from its many gardens. The ancient name was Dimasqa, which is thought to be non-Semitic.

Traces of the Chalcolithic and Early Bronze Age have been found on the edge of the Ghutah oasis. In the escarpment overlooking the Barada are numerous rock-cut tombs of the 1st millennium B.C. and earlier. By the time of the Amarna letters (see TEL EL-AMARNA) Dimasqa was the capital of the state of Ubi, a vassal of Egypt. Not until the area was overrun by the Aramaeans at the beginning of the 1st millennium B.C. did Damascus acquire political importance. Under Adad-Iri, it headed a league of Syrian states against Shalmaneser III and held out for at least four campaigns between 853 and 841 B C. After Adad-Iri had been assassinated by Hazael, a usurper, Hazael was attacked by Assyria and defeated. but apparently Damascus was not captured. Hazael's son, Bar-Hadad, attacked Hamath (modern Hama) which belonged to the pro-Assyrian party. The sudden death of Bar-Hadad left his son Mari' unprepared for Assyrian retaliation; he allowed Adad-nirari III to enter Damascus unopposed and paid a tribute of 100 talents of gold and 1,000 talents of silver, an indication of the wealth of the city. Under Tiglath-pileser III Assyrian power in Syria was restored after a period of rebellion. Among the states which had revolted was Damascus, and after a siege the city fell in 732 B.C. The king, Rasun or Rezon, paid with his life; his subjects were transported to the borders of Elam and the famous orchards surrounding the city were destroyed. Thus ended Aramaean Damascus, the most powerful and prosperous of the Aramaean states in Syria.

Under the Persian empire Syria (with Palestine and Cyprus) formed the fifth satrapy, and Damascus became a Persian garrison city. On the collapse of the Persian empire after the battle of Issus. Alexander the Great's general Parmenio occupied Damascus without a struggle. but on the death of Alexander his Macedonian empire broke up though Syria did not at first fall to the Seleucids. It was not until 312 B.C. that Ptolemy and Seleucus defeated Antigonus I Cyclops, and the final control of Syria was not established until after 301 B.C. Thereafter the city passed alternately from Egyptian to Seleucid hands, and by 112 B.C. it passed to Antiochus IX. Within the next decade the Nabataeans (*q.v.*) established themselves in Coele-Syria (mod. Beqa') and acquired Damascus. In 64 B C. it was invested by the Romans, and it remained under their rule till A.D. 31, when Aretas, an Arabian ruler, took it on the death of Tiberius; it was under his control at the time of St. Paul's visit.

In 105–106 the Nabataeans were incorporated into the Roman empire as a province of Arabia. Under the Romans Syria recovered rapidly from the economic depression into which it had sunk. Fruit trees from Damascus, such as the damson plum, figs and pistachios, were introduced into Italy by the Romans. Under Roman rule Damascus was overshadowed by Antioch, although under Hadrian it achieved the status of a metropolis and Alexander Severus conferred upon it the rights of a colonia. Diocletian established armament factories at Damascus, which was noted for its manufacture of weapons.

The Damascenes worshiped Adad (*q.v.*), or Hadad-Rimmon, the storm-god. whose name was transformed to that of Jupiter-Damascenus. Christianity throve in Damascus, which became the seat of a bishop and sent delegates to the Council of Nicaea (*q.v.*) in 325. In Sept. 635 Damascus fell before the invading Arab forces. It was temporarily abandoned the following year before the battle of Yarmuk, which finally gave Syria to the Arabs.

(M. V. S-W.)

Islamic *and* Modern. — The first Arab governor, Yazid. belonged to the Omayyad family of Mecca; his successor, Mu'awiya, became caliph of the Islamic empire after the murder in 661 of the fourth caliph. Ali. For almost a century Damascus was the capital of the caliphate (*q.v.*) and the political and cultural centre of Islam. The conversion of the population to Islam began; although Christians, who had been guaranteed possession of their property on payment of taxes, remained important as officials. In 750 the Abbasids destroyed the Omayyad power, Baghdad became the capital and Damascus a provincial centre. As the unity of the caliphate dissolved and local dynasties arose Damascus changed hands often, but for most of the 200 years from the middle of the 9th century it was held by those who ruled Egypt. In 1076 it was occupied by the Seljuk Turks, but in 1154 fell into the hands of Nureddin and then of his successor, Saladin (*q.v.;* Salah al-Din), founder of the Ayyubid dynasty. A period of prosperity, religious culture and fine building continued when, after a brief occupation by the Mongols, Damascus was included in 1260 in the Mameluke state of Egypt and Syria, and became the capital of one of its provinces. In 1401 it was briefly occupied and devastated by Timur.

In 1516 Damascus was captured by the Ottoman sultan Selim I and remained the capital of a Turkish province for 400 years. It was the point of departure of the pilgrim caravan for Mecca, and the governor's main duty was to organize and protect the caravan. Members or dependents of the Azam family ruled the province as Ottoman governors throughout most of the 18th century.

The 19th century saw a new expansion, beginning with the decade 1831–40 when Syria was incorporated in the empire of Mohammed Ali of Egypt. Foreign consuls and merchants settled in Damascus, trade increased, the population grew, schools and a public library were established and railways laid down to Beirut, Haifa and Medina. These changes did not take place without strain: political and economic factors together led to a massacre of Christians by a Muslim mob in 1860, although some Muslim notables tried to prevent it.

In World War I Damascus was the headquarters of the Turkish-German forces which tried to attack the Suez canal and later opposed the British advance in Palestine. In 1918 it was occupied by British and imperial troops and the Arab force which had operated on their eastern flank. The leader of this force, Amir Faisal, became military administrator of Damascus and the interior of Syria, while there was a French military administration on the coast. Two years of tension followed; Faisal's supporters wanted Syria to become an independent Arab state while the French wished it to be placed under their mandate. In March 1920 a Syrian congress meeting in Damascus offered the throne to Faisal, but in July French troops occupied the city after an ultimatum. For the next 25 years Syria and Lebanon were ruled by France

under mandate from the League of Nations. Beirut was the headquarters of the mandatory administration, but Damascus became capital of the Syrian republic, the largest of the regions into which the mandated territory was divided. Under the French there was material progress; new quarters of the city were built. ancient buildings preserved, the museum established and the university created. There was much political unrest, and a revolt in 1925 was not suppressed before the French had twice bombarded the city. In World War II British and Free French forces entered Damascus (June 1941) to oust the Vichy French. After four years of tension over the problem of independence. during which the French once more bombarded the city, agreement was reached on the withdrawal of British and French forces.

From 1946–58 Damascus was the capital of Syria, and prospered despite political unrest: the new quarters expanded, factories and an international airport were built and the university grew. During the union of Syria and Egypt in the United Arab Republic (1958–61), Damascus was administrative centre of the Syrian (Northern) region. but became once more the capital of Syria after the latter's withdrawal from the union.

DAMASK, one of the most popular of patterned textiles. True damask was originally wholly of silk, deriving its name from the fine patterned fabrics produced in Damascus in the middle ages. Gradually the term came to be applied to a certain type of patterned fabric regardless of fibre. Single damask has one set each of warps and wefts and may be woven in one or two colours; compound or double damask has a greater number of wefts. Damask is woven on a Jacquard loom, the satin field being produced by floats of warp that pass over from two to seven and in some instances nine wefts. The design is a plain or taffeta weave, the warp and weft being at right angles that create less lustre than the satin areas.

Crusaders who had passed through Damascus introduced the fabric to Europe in the 11th century, and the weaving of linen damask became established in flax-growing countries—in France, for example, by the mid-13th century. The Flemish city of Courtrai was noted for its table linen in the 15th century, as was Haarlem, The Netherlands. in the 17th and 18th centuries. William III established damask weaving in Ireland in the late 17th century.

Antique damask was 18–25 in. wide. the distance a shuttle carrying the weft threads could be thrown by hand from selvage to selvage through the raised warps. Widths of 50 in. and more date from mechanized weaving. about 1835.

WHILE ON THE REVERSE SIDE THE COLOURS AND THREADS ARE REVERSED

Damask is made in a wide price range and is used for upholstery and draperies, table cloths and napkins. bedspreads, face towels, evening wear and the like. For table damask *see* TEXTILES, HOUSEHOLD: *Table Linen.* (J. K. T.)

DAMASKINOS (1891–1949), archbishop of Athens and regent of Greece during the civil war of 1944–46, was born on March 3, 1891, at Dorbitsia in Aetolia. After attending the university of Athens he served in the army as a private during the Balkan Wars (1912) and was ordained priest in 1917. In 1922 he became bishop of Corinth and in 1938 was elected archbishop of Athens. His election, however, was voided by Premier John Metaxas because of his opposition to the regime, and Bishop Chrysanthos of Trebizond was appointed in his stead. Damaskinos was exiled, but recalled in July 1941 to replace Chrysanthos, who had refused to swear in the proaxis premier, George Tsolakoglu. After much misgiving Damaskinos became archbishop; he was always an opponent of the German occupation policy and urged the concealment of Jews to prevent their falling into Nazi hands.

Damaskinos was appointed regent with the absent king's permission on Dec. 31. 1944, during the civil war initiated by the Communist-controlled guerrilla forces *(see* GREECE: *History).* His integrity and impartiality made him the only person available for this position who was acceptable to all parties. During the next 16 months of political crisis Damaskinos appointed five premiers and in Oct. 1945 himself formed an interim cabinet. He resigned as regent on Sept. 5, 1946, four days after the plebiscite which voted for the restoration of the monarchy. Thereafter he devoted himself solely to his archiepiscopal duties. He suffered from a weak heart, and died in Athens on May 19, 1949.

DAMASK STEEL (DAMASCUS STEEL), a steel with a characteristic watered or streaked appearance, as seen in the blades of fine swords and other weapons of oriental manufacture. This appearance was the result of repeatedly twisting and forge welding together strips of steel of different qualities, the process used also to make Toledo and viking blades. A similar appearance but inferior result may be obtained by etching with acid the surface of a metal, parts of which are protected by some greasy substance in such a way as to give the watered pattern desired. The art of producing damask steel has been generally practised in oriental countries from a remote period, the most famous blades having come from Isfahan. Khurasan and Shiraz in Persia. A similar process in which strips or wires of iron and steel are twisted in a spiral to form a tube has been used to make Damascus barrels for sporting guns. *See* ISLAMIC ART: *Weapons;* IRONWORK: *India and Southeast Asia;* SWORD.

DAMASUS, the name of two popes.

ST. DAMASUS (c. 304–384), pope from 366 to 384, born at Rome of a Spanish family about 304, was a man of great virtue and of cultivated mind. Originally he supported Pope Liberius. whom Emperor Constantius exiled (355); Damasus then acknonledged the antipope, Felix, but finally again recognized Liberius. When the latter 'died, Damasus was elected pope in Oct. 366. Enemies made during this period vexed him for the rest of his life. In two synods (368 and 369) Xpollinarianism and Macedonianism were condemned. Damasus later (381) sent legates to the Council of Constantinople, where these same teachings were again condemned. From a later synod (382) issued the famous "Tome of Damasus," a list of 24 anathemas against Trinitarian and Christological errors. In the east, the pope was unsympathetic in his dealings with St. Basil (*q.v.*), due to a lack of understanding of the Cappadocian's policies. St. Jerome served as private secretary to Damasus, who later gave him the important commission of revising the Latin translations of the Bible; the result, was the Vulgate version. In 380 Theodosius declared that the religion preached by St. Peter, and then headed in Rome by Damasus, mas the religion of the Roman state. Damasus enforced an imperial decree against worldliness among churchmen. He was outstanding in the work of discovering the tombs of martyrs, for which he personally composed epitaphs in verse. The church of S, Lorenzo in Damaso was restored by him. Damasus died on Dec 11 384. and is buried in a small church that he built on the Via Ardeatina. His feast day is Dec. 11. (W. M. K.)

DAMASUS II (Poppo) (d. 1048), pope from July to Aug. 1048, was bishop of Brixen (Bressanone, in Bolzano) when he was nominated in Dec. 1047 by the emperor Henry III to succeed Pope Clement II. It was not until July 17, 1048, however, that Damasus was enthroned, after Henry had peremptorily ordered Boniface of Tuscany to expel Benedict IX. Damasus died Aug. 9, 1048, at Palestrina. (C. P. L.)

DAME, properly a name of respect or a title equivalent to "lady." surviving in English as the legal designation of the wife or widow of a baronet or knight, or of a dame of the order of the British empire; it is prefixed to the Christian name and surname. It has also been used in modern times by certain societies or orders (*e.g.*, the Primrose league) as the name of a certain rank among the lady members, answering to the male rank of knight The ordinary use of the word by itself is for an old woman. As meaning "mistress" (*i.e.*, teacher), "dame" was used of the female keepers of schools for young children which became obsolete after the advance of public elementary education. At Eton college, boardinghouses kept by persons other than members of the teaching staff of the school were known as "dames' houses," though the head might not necessarily be a lady. As a term of address to ladies of all ranks, from the sovereign down, "madam," shortened to "ma'am," represents the French madame, "my lady."

"Damsel," a young girl or maiden, now used only as a literary word, is taken from the Old French *dameisele,* formed from dame, and parallel with the popular dansele or doncele from the Middle Latin domicella or dominicella, diminutive of *domina.* The French *damoiselle* and demoiselle are later formations which developed merely to the title of a young unmarried lady. the mademoiselle of modern usage. the English "miss." At the court of France, after the 17th century, mademoiselle, without the name of the lady, was a courtesy title given to the eldest daughter of the eldest brother of the king, known as *monsieur.* Anne Marie Louise is known to history as La Grande Mademoiselle. The English literary form "damosel" was another importation from France in the 15th century. In the early middle ages damoiseau, Middle Latin *domicellus,* dameicele, damoiselle, domicella, were used as titles of honour for the unmarried sons and daughters of royal persons and lords (seigneurs). Later the damoiseau (in the south donzel, in Béarn domengar) was specifically a young man of gentle birth who aspired to knighthood, equivalent to *écuyer,* "esquire" (*q.v.*), or valet.

DAME'S VIOLET, the common name for *Hesperis matronalis,* a biennial herb belonging to the mustard family (Cruciferae) and closely allied to the wallflower and stock; called also dame's rocket and garden rocket. It has an erect, stout, leafy stem, two to three feet high, with irregularly toothed, short-stalked leaves and white or lilac flowers, three-fourths of an inch across. which give off a scent in the evening. The slender pods are constricted between the seeds. The plant is a native of Europe and temperate Asia, and is found in the eastern U.S. and Canada and in Great Britain as an escape from gardens.

DAMGHAN, chief town of a district in north Iran (in the general governorship of Semnan-Damghan), lies at 3.750 ft. at the southern foot of the Elburz range, on a large and mostly barren gravel plain which slopes down to the *kavir* (salt pan) of Damghan. It is 216 mi. E. of Teheran on the road and railway to Khurasan (Khorasan). Pop. (1956) 8,933; remainder of district 30.298. The oldest mosque in Iran. the Tarik Khaneh (*c.* 775), and four fine towers of the 11th and 12th centuries are still standing. Important archaeological excavations at nearby Tappeh Hesar disclosed cultures ranging from 3500 B.C. to A.D. 500. Damghan was an important town and the chief city of the province of Qumis in the middle ages, but was destroyed by the Afghans in 1723. The town has a trade in pistachios and thin-shelled almonds for which it is noted. (H. Bo.)

DAMIAN, SAINT: see COSMAS AND DAMIAN, SAINTS.

DAMIAN, SAINT PETER (PIETRO DAMIANI) (1007–1072), Italian hermit-monk, cardinal and doctor of the church, was one of the original leaders and most forceful figures of the 11th-century reform movement. A native of Ravenna, having attended schools there, at Faenza and Parma, he abandoned a brief but promising teaching career (1035) to enter the hermitage of Fonte Avellana on Monte Catria, where the Marches border on Umbria. Fully adopting its life of solitary prayer and extreme austerity, he was chosen prior in 1043. Peter's zeal for reform attracted attention beyond monastic circles, however, and he was soon actively engaged in promoting the religious revival that characterized his age. Created cardinal in 1057, with real reluctance, he served the church under three popes. Despite his fiery temperament. he fulfilled five difficult missions as papal legate with remarkable tact. Even in the semiretirement of his last years at his beloved Fonte Avellana (after 1067), he was still active in the cause of reform. He died on Feb 22, 1072, at Faenza, where he is buried, after reconciling his native city with the Roman see. He was declared a doctor of the church in 1828, and his feast (Feb. 23) was extended to the universal church though he was never formally canonized.

An active author for 30 years, Peter was an enlightened spiritual writer, sound theologian, canonist and liturgist, and a fearless critic of the abuses of his coarse times, especially those of the clergy. A conservative in the political and theological controversies of the day, he often used strong language to present his position reminding his contemporaries of the outspoken St Jerome. As an apostle of voluntary poverty, he may be considered a forerunner of the gentler St. Francis of Assisi. His collected works are reprinted in J. P. Migne, *Patrologia* Latina, vol. 144–145 (1853). Selected *Writings* on the Spiritual Life, translated and with an introduction by P. McNulty, was published in 1959.

DAMIEN, FATHER, the name in religion of JOSEPH DE VEUSTER (1840–1889), Belgian missionary, born at Tremeloo, near Louvain, on Jan. 3, 1840. In 1858 he joined the Society of the Sacred Heart of Jesus and Mary (also known as the Picpus Congregation), and while still in minor orders in 1863 went as a missionary to the Sandwich (Hawaiian) Islands, taking the place of his brother, who had been prevented by illness. On reaching Honolulu he was ordained priest in 1864. Struck with the sad condition of the lepers, whom the Hawaiian government deported to Molokai Island, in 1873 he volunteered to take spiritual charge of the settlement. Besides attending to the spiritual needs of the lepers, he managed, by the labour of his own hands and by appeals to the Hawaiian government, to improve the water and food supplies and the housing of the settlement, and after five years received assistance from other resident priests. He died of leprosy on April 15, 1889. Some ill-considered imputations upon Father Damien by a Presbyterian minister produced a memorable tract by Robert Louis Stevenson, An Open Letter to the *Rev.* Dr. Hyde (1890).

BIBLIOGRAPHY.—*Life* and Letters of Fr. Damien, ed. by his brother, Fr. Pamphile (1889); M. Quinlan, Damien of Molokai (1909), which reproduces Stevenson's letter; J. Farrow, *Damien* the Leper (1937).

DAMIENS, ROBERT FRANÇOIS (1715–1757), French fanatic, remembered for his assault on Louis XV and for its atrocious punishment, was born at Tieulloy in Artois on Jan. 4, 1715. Damiens, whose unbalanced mind may have been excited by the polemics between Jesuits and Jansenists and who may have felt that Louis XV's way of life was calling the wrath of God upon France, stabbed the king as he was entering his carriage at Versailles on Jan. 5. 1757, inflicting a slight wound. At first the government believed him to be involved in a widespread conspiracy. Condemned as a regicide, he was publicly tortured and then torn in pieces by horses in the Place de Grève, Paris, on March 28, 1757.

See A. L. Zévaès, Damiens *le* rdgicide (1933).

DAMIETTA (Coptic TAMIATI, Arabic DUMYAT), a town of lower Egypt, 8 mi. from the Mediterranean and 125 mi. N.N.E. of Cairo by rail, and capital of a governorate of the same name. The governorate, a union of adjacent portions of Al Gharbiyah and Al Daqahliyah governorates separated by the Damietta branch of

the Nile, was established in 1955. Area 233 sq.mi. Pop. (1960) 391.000. The town lies on the eastern distributary of the Nile called after it (anciently the Phatnitic branch), between the river and Lake Manzala. Pop. (1957) 66,525. Once the third town in Egypt. it declined after the development of Alexandria and Port Said but there is still some trade with Syria. The town has fine mosques and is an important market centre. Its manufactures include glassware, cotton, silk and rayon goods. It is not clear whether Damietta gave its name to a striped cloth known as dimity (*q.v.*) (Arabic *dumyati* derived through the Persian *dimyati)* for which it was once famous. It is one of the centres for the husking of rice, which is exported along with dates and salted fish from the lake.

Situated 4 mi. nearer the sea than the present town, ancient Damietta fell to the invading Arab forces in A.D. 638. An important medieval commercial centre, it suffered frequent attacks from crusader and other forces. In 1219 it fell to the Latins of the fifth crusade and was not freed until 1221 by al-Kamil after two years of almost continuous fighting. In June 1249 it was captured by King Louis IX of France and his troops of the sixth crusade, but was restored to Muslim hands on his capture the following year. It retained its Coptic character in spite of Muslim domination. Its exposed position led Sultan Baybars (A.D. 1260–77), of the Mameluke or Slave dynasty of Egypt, to block up the mouth of the Damietta branch of the Nile and to move the town to its present position. (A. B M ; M. V. S.-W.)

DAMIRI, AL- (KAMAL AL-DIN MOHAMMED IBN MUSA AL-DAMIRI) (1344–1405), Arab writer noted for his works on canon law and natural history, mas born at Damira near Damietta in Egypt, in which country he spent his life. Of the Shafi'ite school of Muslim law, he became professor of tradition at al-Azhar mosque in Cairo. In the course of his work there he wrote a commentary on the Shafi'ite jurist Nawawi's *Minhaj al-Talibin* ("A Course for Students"). He is, however, better known in the history of literature for his *Hayat al-Hayawan* (Eng. trans. by A. S. G. Jayakar, *A Zoological Lexicon,* 1906–08). which treats in alphabetical order of 931 animals mentioned in the Koran and in the traditions and the poetical and proverbial literature of the Arabs. The use of the animals in medicine, their lawfulness or unlawfulness as food and their position in folklore are the main subjects treated, but occasionally long sections on political history are introduced. Several editions have been made of extracts of this work, among them the poetical edition by the 15th-century encyclopaedist Suyuti, which nas translated into Latin in the 17th century. Samuel Bochart in his *Hierozoicon* (1663) made use of al-Damiri's work.

DAMMAM, AD, a town in Saudi Arabia, which in 1953 replaced Hufuf as capital of the Eastern Province (Al Hasa). It lies on the western coast of the Persian gulf, 8 mi. N. of Dhahran. Pop. (1958 est.) 30.600. There are remains of a castle perched on a coral reef and Ad Dammam is a residential town for the Arab oil-field workers. Its development dates from the 1940s after rich oil deposits were discovered there and later exploration proved the presence of oil fields at Dhahran (*q.v.*). Ad Dammam is the principal port of Saudi Arabia on the Persian gulf and imports heavy machinery and other construction material. In the 1960s there was a major expansion of the port to increase its facilities. The town is the eastern terminus of the railway which extends from Riyadh *via* Hufuf and Dhahran and also operates on its 7 mi long deep-aater port.

DAMMAR (DAMMER), a name often used for a great variety of hard, or varnish, resins obtained from various coniferous trees characteristic of southeastern Asia. In commerce, however, the term is usually applied to those resins obtained from several species of the family Dipterocarpaceae and a few species of the Burseraceae. Probably the most important sources of dammar are *Shorea* species, especially *S. wiesneri.*

The resin oozes in large quantities from the tree in a soft viscous state, being highly aromatic; however, it loses its odour as it hardens by exposure. The resin is much esteemed in oriental communities for incense burning. As found in many foreign markets it is a hard, transparent, brittle, straw-coloured resin, destitute of odour. It is readily soluble in alcohol, ether and chloroform, and with oil of turpentine it forms a fine varnish that dries clear, smooth and hard. The allied kauri gum, kauri copal or dammar of New Zealand (Australian dammar) is produced by the kauri pine (*q.v.*), *Agathis australis.*

Dammar is also a generic Indian name for various other resins that, honever, are little known in western commerce. Of these the principal are black dammar, yielded by *Canarium strictum* (family Burseraceae), and white dammar, Indian copal or piney varnish, the product of *Vateria indica* (family Dipterocarpaceae). Sal dammar is obtained from *Shorea robusta.*

Dammar is exported to many western countries for use in plasters, varnishes and lacquers; a solution of dammar in chloroform or xylene is often used to preserve and mount thin sections of vegetable and animal matter for microscopic examination.

DAMMARTIN, the name of a countship famous in French medieval history. Its seat was at Dammartin-en-Goële, northwest of Meaux (in the modern *département* of Seine-et-Marne), where Hugh, the first recorded count, built a castle in the 10th century. In the 11th and 12th centuries its possessors were strong enough to oppose either the French kings or the counts of Flanders. Raynald (Renaud) I of Dammartin, who was also count of Boulogne, was a member of the great coalition crushed by Philip II Augustus of France at the battle of Bouvines (*q.v.*) in 1214; he killed himself in prison in 1227. Seized by the king, Dammartin then passed to his son Philip Hurepel (d. 1234), who was married in 1216 to Raynald's daughter and heiress Mahaut. On Mahaut's death (1258 or 1259), however, her cousin Mathieu de Trie, son of Raynald I's sister Alix, became count of Dammartin. Subsequently by a series of marriages Dammartin passed from the house of Trie through those of Chbtillon, of Fayel and of Nanteuil to Antoine de Chabannes in 1439. This Antoine de Chabannes (d. 1488), who had already distinguished himself in campaigns with Joan of Arc. later became a leader of the Ecorcheurs and fought against Louis XI in the League of the Public Weal and then for Louis against the Burgundians; it was he who founded the collegiate church at Dammartin. in which his tomb and effigy remain. His great-granddaughter Françoise d'Anjou-Mézières, however, left heirs by both of her marriages, and one family sold Dammartin to the Montmorencys while the other sold it to the Guises. There followed a long lawsuit, which the Montmorencys won. Louis XIII confiscated the countship after the treason of Henry de Montmorency (1632), had the castle dismantled and finally gave the property to the house of Condé.

DAMME, an agricultural polder village of Belgium, lies 5 km. (3 mi.) N E. of Bruges on the Bruges-Sluis canal. Pop. (1955) 1,059. It was founded on the Hontsdam ("Dog's dike") at the extremity of the Zwijn, a navigable channel that ran from the North sea and that was the scene of the defeat of the French fleet by Edward III of England in 1340. Remarkable buildings are reminiscent of its bygone magnificence, particularly the church of Our Lady (1225–1485), partly destroyed by fire (1578) ; the choir alone is used for worship, although the tower also remains. Connected by canals with Bruges and Ghent, Damme served as an outer port for these major cities of Flanders and attracted many merchant guilds. There Jacob van Maerlant (*q.v.*), "father of Flemish poets," was born in 1235, and there too Charles the Bold married Margaret of York on July 2, 1468, in Count Wyt's mansion, now a museum. The flourishing era of Damme lasted only during the 13th and 14th centuries; then sand silted up the Zwijn and landlocked the port. In World War I Damme was in German hands from Aug. 1914 to Oct. 1918 and in World War II from May 1940 to Sept. 1944. (R. M. AN.)

DAMOCLES, one of the courtiers of the elder Dionysius of Syracuse (tyrant 405–367 B.C.). When he spoke in extravagant terms of the happiness of his sovereign, Dionysius is said to have invited him to a sumptuous banquet, at which he found himself seated under a naked sword suspended by a single hair, symbolizing

the precariousness of the tyrant's fortune.

See Cicero, *Tusculanae Disputationes,* v, 61–62.

DAMODAR, a river of India which, with its many tributaries, rises in the Chota Nagpur plateau in the state of Bihar and flows eastward into West Bengal to empty into the Hooghly north of Calcutta after a course of about 368 mi. The valley of the Damodar on the Bihar-West Bengal border includes India's chief coal field and has long been an area of active industrial development, but the upper course of the river and its tributaries lies over the ancient rocks of the Indian plateau. The river derives its water from the summer monsoon and was liable to sudden floods and changes of course, whereas for half the year the broad sandy river beds were almost dry. Inspired by the success of the Tennessee Valley authority project in the United States, India formulated along somewhat similar lines the Damodar valley project. The Damodar Valley authority (D.V.A.) began work in 1948. On the river and its tributaries seven dams have been constructed to form a series of reservoirs (Tilaiya, Balpahari, Maithon, Bokaro, Aiyar, Konar and Panchet Hill) which supply water for irrigation and power—notably to the great Bokaro (Bokharo) power station —while lower down the river the Durgapur barrage affords a long stretch of navigable waterway through the coal field. Among the many new industrial developments associated with the project are the large fertilizer factory at Sindri (Sindhri) and the iron- and steelworks of Durgapur. (L. D. S.)

DAMOH, a town and district of Madhya Pradesh, India. The town (pop. [1961] 46,626), situated approximately 60 mi. N.W. of Jabalpur, is fast increasing in size. It has a municipality, a mission hospital, three oil mills and a college affiliated to Saugar university. It is situated on the Bina-Katni branch line and has road connections with Bhopal and Jabalpur.

DAMOH DISTRICT (area 2,827 sq.mi.; pop. [1961] 439,049) forms the easternmost spur of the Vindhyan plateau culminating in low country with a series of hills and valleys. About 40% of the area is under forest or grassland, and the principal crops are wheat, rice, pulses and oilseeds.

The British took over the Sagar-Damoh region from the Marathas in 1818. It was included in Sagar district from 1934 to 1956. The district abounds in medieval temples and forts, and there are two Vishnuite temples (6th century A.D.) 20 mi. N.E. of Damoh. Singargarh, a hill fort 28 mi. S.E. of Damoh, was the old Gond capital of the region. (S. M. A.)

DAMON AND PHINTIAS (erroneously PYTHIAS), two Pythagoreans, the subject of an anecdote about the elder Dionysius of Syracuse (tyrant 405–367 B.C.) related by Cicero to illustrate the tyrant's lack of true friends. Condemned to death, Phintias begged a respite to arrange his affairs and Damon pledged his life for the return of his friend. When Phintias did return, Dionysius released both and wished to be admitted to their friendship.

See Cicero, *Tusculanae Disputationes,* v, 63.

DAMOPHON (fl. 2d century B.C.), a Greek sculptor of Messene, who executed many statues at Messene, Megalopolis, Aegium and other cities of Peloponnesus. Soon after 183 B.C. he repaired the Zeus of Phidias at Olympia which was damaged by an earthquake. Considerable fragments, including three colossal heads from a group by him representing Despoina, Demeter, Artemis and the giant Anytus, were found on the site of Lycosura in Arcadia, where there was a temple of Despoina. The garment of Despoina is decorated with reliefs. A coin shows the statue with two figures standing, two seated.

See Margarete Bieber, *The Sculptures of the Hellenistic Age* (1955). (D. M. R.)

DAMP (MINING): *see* COAL AND COAL MINING: *Hazards of Mining.*

DAMPIER, WILLIAM (1652–1715), who spent most of his life as a buccaneer, is remembered chiefly for his visit to Australia in 1686, for the voyage devoted to exploration of parts of the coasts of Australia, New Guinea and New Britain which followed between 1699 and 1701, and for his account of his voyages. This shows him to have been a careful observer of everything affecting navigation and of the natural history of the lands he visited, with a gift for clear and easy description of what he saw. Dampier was born at East Coker, Somerset, in 1652, possibly in May. By the time he was 16 both parents had died and he joined a ship at Weymouth for a voyage to Newfoundland. Later he made a voyage to the East Indies and in 1674 became undermanager of a Jamaican estate. This post did not hold him long and he engaged first in local trade in the Gulf of Mexico, later in logwood cutting and buccaneering. Between 1678 and 1691 he took part in several piratical voyages, mostly along the west coast of South America and in the Pacific, returning eventually to England. During one of these voyages he visited Australia, probably near Melville Island. He spent just over two months on the coast, but found no water or animals and formed a dislike of the local people and their customs. Of his next few years little is known except that he published his *New Voyage round the World* in 1697, and two years later another volume including "A Discourse of the Winds."

He was appointed by the admiralty to command the "Roebuck" on a voyage of discovery to Australia and sailed from England on Jan. 14, 1699. He called at the Canary Islands, Cape Verde Islands and Bahia in Brazil, sailing thence round the Cape of Good Hope to Australia which he reached at Shark bay on the west coast on July 26. He examined the coast as far as Dampier archipelago but was unable to find a harbour or to obtain water or provisions and went to Timor for supplies and to clean the ship's bottom. Then he sailed for New Guinea which he reached on Dec. 3 and "passing to the northward I ranged along the coast to the easternmost part of New Guinea, which I found does not join to the mainland of New Guinea, but is an island, as I have described it in my map, and called it New Britain." He made a fairly good survey of the northern, eastern and southern coasts of this island, but did not discover that "St. George's bay" is really St. George's channel, nor did he visit the western side of the island or realize its small extent in that direction. By this time his ship was deteriorating rapidly and his crew were discontented, so he called at Batavia for provisions and to carry out repairs and sailed for England on Oct. 17, 1700. By the time he reached Ascension on Feb. 22 the ship had sprung a dangerous leak and had to be abandoned. The crew remained on the island until April 3 when they were picked up by a convoy of homeward-bound warships and East Indiamen. Dampier made two more voyages, as a privateer. The first was unsuccessful, but the second resulted in the capture of booty worth £200,000. He died in London early in March 1715.

See *Dampier's Voyages,* ed. by John Masefield, 2 vol. (1906); C. A. Wilkinson, *William Dampier* (1929). (A. M. F.)

DAMROSCH, WALTER JOHANNES (1862–1950), U.S. conductor and composer whose fruitful activities spanned more than half a century of American musical life, was born in Breslau, Germany, Jan. 30, 1862, the son of Leopold Damrosch (1832–85), German violinist and conductor, who settled in New York city in 1871. Walter Damrosch studied with his father, and upon the latter's death, he assumed the conductorship of the New York Symphony society and the New York Oratorio society founded by his father, and also conducted at the Metropolitan Opera company (1885–91). Later he organized the Damrosch Opera company (1895–1900), specializing in German operas. In 1903 Damrosch reorganized the New York Symphony society and conducted it until 1927, when it was combined with the Philharmonic society.

Like his father, Damrosch was an avowed propagandist of Wagner; as early as March 3, 1886, he gave a concert performance of *Parsifal* in New York. He also presented first American performances of symphonies by Brahms and Tchaikovsky. Although not in sympathy with new music he introduced several works by contemporary European and American composers. He was a pioneer of symphonic broadcasting, and also established a weekly series of radio lectures on music appreciation for schools (1928–42). A competent composer, Damrosch wrote several operas, which, however, lacked distinction: *The Scarlet Letter* (1896), *Cyrano de Bergerac* (1913), *The Man Without a Country* (1937), and *The Opera Cloak* (1942). He also composed incidental music to plays and published an autobiography, *My Musical Life* (1923; 2nd edition, 1930). He died in New York city on Dec. 22, 1950.

His brother Frank Damrosch (1859–1937) was also a conductor.

He led the New York Oratorio society (1898–1912): was the founder of the Institute of Musical Art. New York (1905–26), and published some teaching manuals. (N. SY.)

DAN, one of the 12 tribes of Israel. descended from one of the two sons of Jacob and Bilhah. Rachel's maidservant (Gen. xxx. 4–6), the other being Naphtali. *(See* TWELVE TRIBES OF ISRAEL.)

The tribe originally settled in the region of Zorah and Eshtaol, just west of Jerusalem, but was unable to maintain'itself there under the pressure of the ancient population and of the Philistines (Samson was a Danite from Zorah. Jud. xiii). Part at least of the tribe moved to the extreme northeast of the country, took the Sidonian city of Laish and called it Dan. In the local sanctuary they installed the image of Israel's God which they had stolen from Micah. and made Micah's Levite Jonathan, a descendant of Moses, the officiating priest (Jud. xvii–xviij. After the division of the all-Israelite state, which extended "from Beersheba to Dan" (I Chron. xxi. 2), Jeroboam I chose the old sanctuary of Dan as one of his two national shrines (I Kings xii. 29). The city was for some time dominated by the kings of Damascus (I Kings xv, 20). Its story ended most probably about 734 B.C., when the Assyrians invaded all the north of Israel (II Kings xv, 29). Its remains are at Tall al Qadi *(qadi* means judge. as *dan* does): in northeastern Israel, about 24 mi. N. of the Sea of Galilee.

(L. H. GR.)

DANA, CHARLES ANDERSON (1819–1897), U.S. journalist who became a national figure as editor of the *New York Sun,* was born in Hinsdale, N.H., on Aug. 8, 1819. In 1839 he entered Harvard, hut eye strain and financial stresses forced him to leave college in 1841. From Sept. 1841 until March 1846 he lived at Brook Farm (*q.v.*), where he was made one of the trustees. He had previously written for the *Harbinger,* the Brook Farm organ, and was employed by the *Boston Chronotype* in 1846. The next year he joined the staff of the *New York Tribune,* and in 1848 he wrote letters from Europe on the revolutionary movements of that year. Returning to the *Tribune* in 1849, he became its managing editor, and in this capacity actively promoted the antislavery cause. In 1862 his resignation was asked for, apparently because of wide temperamental differences between him and Horace Greeley, the editor-publisher. Secretary of War Edwin M. Stanton immediately made him a special investigating agent of the war department; in this capacity Dana spent much time at the front. and sent Stanton frequent reports. He went through the Vicksburg campaign and mas at Chickamauga and Chattanooga. and urged the placing of Gen. U. S. Grant in supreme command of all the armies in the field. In 1864–65 Dana was second assistant secretary of war.

Dana became editor and part owner of the *New York Sun* in 1868. and remained in control of it until his death. Under his control the *Sun* opposed the impeachment of Pres. Andrew Johnson: supported Grant for the presidency in 1868; was a sharp critic of Grant as president; and in 1872 took part in the liberal Republican revolt and gave lukewarm suppokt to Greeley's candidacy. In the presidential election of 1876 the *Sun* was a strong Tilden paper. and after Rutherford B. Hayes's inauguration often referred to him by such epithets as "His Fraudulency the President."

For two decades after Dana became editor, the *Sun* was a newspaperman's newspaper; much admired and imitated. It lived up to its claim that its news was "the freshest and sprightliest current," and it specialized in the "human interest story." For such writing Dana hired bright young men, many fresh from college. Editorially the paper was lively but notoriously inconsistent. Dana swung from an early liberalism, evidenced by his Brook Farm connection and his syndicated letters from Europe in 1848, to a later disillusioned conservatism. With George Ripley, Dana edited *The New American Cyclopaedia* (1857–63). He edited one of the most successful of American verse anthologies, *The Household Book of Poetry* (1857), and wrote *Recollections of the Civil War* (1898), *The Art of Newspaper Making* (1895), etc. He died at Glen Cove, N.Y., Oct. 17, 1897.

BIBLIOGRAPHY.—James Harrison Wilson, *The Life of Charles A. Dana* (1907); Candace Stone, *Dana and the Sun* (1938); Charles J. Rosebault, *When Dana Was the Sun* (1931). (F. L. MT.)

DANA, JAMES DWIGHT (1813–1895), U.S. geologist, mineralogist and zoologist, the author of a number of standard works in his field. was born in Utica. N.Y., on Feb. 12, 1813. He early displayed a taste for science and in 1830 entered Yale college in order to study under the elder Benjamin Silliman (*q v*). After two years as teacher of mathematics to midshipmen in the navy, he was assistant to Silliman in the chemical laboratory at Yale in 1836–37 and then for four years acted as mineralogist and geologist for a United States exploring expedition. commanded by Capt Charles Wilkes, in the Pacific ocean. In 1844 he again became a resident of New Haven, Conn , married the daughter of Silliman and, in 1849, on the resignation of the latter, was appointed Silliman professor of natural history and geology in Yale college, a position which he held till 1892. He died April 14, 1895.

A bibliographical list of Dana's writings shows 214 titles of books and papers, beginning in 1835 with a paper on the conditions of Vesuvius in 1834, and ending with the fourth revised edition (finished in Feb. 1895) of his *Manual of Geology.* His reports on *Zoophytes,* on the *Geology of the Pacific Area* and on *Crustacea,* summarizing his nork on the Wilkes expedition, appeared in 1846, 1849 and 1852–54, in quarto volumes. with copiously illustrated atlases; but as these were issued in small numbers, his reputation more largely rests on his *System of Mineralogy* (1837; subsequent ed. rev. by his son, E. S. Dana; 7th ed. rewritten by C. Palache *et al.,* 1944–51); *Manual of Geology* (1862; 4th ed.. 1895); *Manual of Mineralogy* (1848; subsequent ed. rev. by E. S. Dana; 17th ed rev. by C. S. Hurlbut. 1959); and *Corals and Coral Islands* (1872; 2nd ed 1890).

His son. EDWARD SALISBURY DANA, born at New Haven on Nov. 16. 1849. was also a distinguished mineralogist. In addition to his revisions of his father's works he nrote *A Textbook of Mineralogy* (1877; 4th ed.. 1932) and *Minerals and How to Study Them* (1895; 3rd ed. rev by C. S Hurlbut. 1949). From 1879 to 1890 he was professor of natural philosophy at Yale and then was professor of physics until his retirement in 1917. He died June 16, 1935.

See D. C Gilman, *Life* of *Janzes Dwight Dana* (1899).

DANA, RICHARD HENRY (1815–1882), U.S. author and lawyer nhose literary fame rests on a single book, *Two Years Before the Mast,* was born in Cambridge, Mass., Aug. 1, 1815, the son of a prominent poet, also Richard Henry Dana (1787–1879). He withdrew from Harvard when measles weakened his eyesight, and to regain health shipped to California as a sailor in Aug. 1834. After voyaging among California's ports and gathering hides ashore, he rounded Cape Horn, returned home in Sept. 1836, and re-entered Harvard. His experiences cured him physically and engendered sympathy for the oppressed and needy. In 1840, the year of his admission to the bar. he published *Two Years Before the Mast,* a personal narrative presenting "the life of a common sailor at sea as it really is," showing the abuses to which his fellows were subject. Immediately popular, its realistic description made it an American classic. Later and lesser works were *The Seaman's Friend* (1841). a treatise on practical seamanship and the duties of masters and mariners, and *To Cuba and Back* (1859). In the 1840s Dapa entered Free Soil politics. Although vigorously opposed by his own class of Bostonians, he gave free legal aid to Negroes captured under the Fugitive Slave law. As U.S. attorney for the district of Massachusetts (1861–66) he persuaded the U.S. supreme court to uphold the Federal blockade. His scholarly edition of Henry Wheaton's *Elements of International Law* (1866) precipitated an earlier editor's invidious suit. Charges of plagiarism helped defeat him in a congressional election (1868) and caused the senate to refuse confirmation when Pres. Ulysses S. Grant named him minister to England (1876). Hurt by these failures, he went to Rome in 1878 to rest and continue research on international law. There he died on Jan. 6, 1882. Posthumously collected works were *Speeches in Stirring Times* (1910) and *An Autobiographical Sketch* (1953).

DANAË, in Greek legend, daughter of Acrisius, king of Argos. According to the myth, her father, having been warned by an oracle that she would bear a son by whom he would be slain, confined Danaë in a bronze tower. But Zeus descended to her in a shower of gold. and she gave birth to Perseus, whereupon Acrisius placed her and her infant in a wooden box and threw them into the sea. They were finally driven ashore on the island of Seriphus, where they were picked up and brought to Polydectes, king of the island. For her subsequent adventures *see* PERSEUS.

DANAÜS, in Greek legend, son of Belus, king of Egypt, and twin brother of Aegyptus. He was born at Chemmis (Panopolis) in Egypt, but having been driven out by his brother he fled with his 50 daughters to Argos, the home of his ancestress Io. The 50 sons of Aegyptus arrived in Argos, and Danaiis was obliged to consent to their marriage with his daughters. But to each of these he gave a knife with injunctions to slay her husband on the marriage night. They all obeyed except Hypermnestra, who spared Lynceus. She was brought to trial by her father, acquitted and afterward married to her lover. Being unable to find suitors for the other daughters, Danaiis offered them in marriage to the youths of the district who proved themselves victorious in racing contests. According to another story Lynceus slew Danaiis and his daughters and seized the throne of Argos. In the other world the Danaïdes were condemned to the endless task of filling with water a vessel which had no bottom. Crime and punishment alike have been variously explained by mythologists.

DANBURITE, a relatively rare mineral species consisting of calcium and boron orthosilicate, discovered in *1839* at Danbury, Conn., whence its name, where it occurs embedded in dolomite. Danburite crystallizes in the orthorhombic system and crystals are. transparent to translucent. and colourless to pale yellow; they are prismatic in habit, and closely resemble topaz in form and interfacial angles. There is an imperfect cleavage parallel to the basal plane. The formula is $CaB_2(SiO_4)_2$. Hardness is 7 and specific gravity 3.0. Splendid crystals have been found in Japan.

DANBURY, the "Hat city." seat of Fairfield county, in southwestern Connecticut. U.S., lies about *65* mi. S.E. of New York city in rolling foothills of the Berkshires. about *20* mi. N.W. of Bridgeport. Settled permanently in *1685* by eight families. including seven from Norwalk. Danbury was named in *1687.* incorporated in *1702* and became a city in *1889.* It grew steadily until the American Revolution when it was made a depot for military stores. In April 1777 the town was raided by a British expedition under Gen. William Tryon and stores were seized and homes burned. At the approach of the Connecticut militia under Gen. David Wooster. the British retreated. A square, monument and cemetery in Danbury commemorate the bravery of Wooster. who was mortally wounded in the ensuing action at Ridgefield (9 mi. S.).

In *1780* Danhury's hat industry was launched by Zadoc Benedict with a factory making three beaver hats daily. Hatmaking expanded greatly in the 19th and early 20th centuries. Because of the industry's seasonal nature attempts began in *1917* to attract other industries. Although Danbury still has more than 30 hatmaking establishments, they constitute less than one-fourth of the total industrial concerns. Products include precision bearings, heat and power units, electronic testing equipment, magnetic tapes, specialty machinery, paintbrushes. boxes, screw-thread inserts, stainless steel flatware, furniture, aluminum foil, Christmas cards, pencils and surgical sutures. A state teachers college is located there. The Danbury fair, held annually since the early 19th century, is Connecticut's largest.

The Danbury Hatters' case. a suit for damages brought by a manufacturer against *186* hatters of Danbury in *1902.* on the ground that their boycott was a violation of the Sherman Anti-Trust act. is important in the annals of organized labour in the United States. Damages were awarded to the plaintiff and his contention was upheld by the U.S. supreme court in *1908.* For comparative population figures see table in CONNECTICUT: Population. (A. E. V. D.)

DANBY, THOMAS OSBORNE, EARL OF: see LEEDS, THOMAS OSBORNE, 1st Duke of.

DANCE, the name of two English architects of the Georgian period. GEORGE DANCE, the elder (1700–68), architect to the City of London. designed the Mansion house: the churches of St. Botolph. St. Luke's. St. Leonard; the old excise office. Broad street: and other public works of importance.

GEORGE DANCE, the younger (1741–1825), succeeded his father as City surveyor and architect in *1768.* He had already distinguished himself by designs for Blackfriars bridge. His first important public work was the rebuilding of Newgate prison in 1770. He was a foundation member of the Royal Academy and the "revered master" of Sir John Soane.

DANCE. Dance is regarded by some authorities as older than art and as providing the basis of all the arts: from it have sprung drama, décor and music. and it has given expression to religious motives and provided various forms of entertainment and recreation. The different kinds of dance will be considered in the following sections:

I. INTRODUCTION

Dance has been defined as motion that arises from emotion. It is also used metaphorically to describe forms of motion other than human movement; *e.g.,* dancing particles, dancing moonbeams and boats dancing over the waves. Birds, animals and insects are said to dance uhen courting; many young animals dance from the joys of spring; young and growing creatures overflow with an energy that cannot be contained and is expressed in impulses. the repetitive pulsations having the appearance of flow or rhythm. The human body has a natural appetite for rhythm. reflecting the wave characteristics of pulse and propulsion. It is that undulatory response to pulse energy that comprises the act of dance: not only does the body of the dancer vibrate in the dance action but this action, by its rhythmic character, also spurs the watchers to vibrating response.

Such sympathetic vibrating permits the transmission of mood; *i.e.,* of a desire to respond and to mimic the action of the rhythmic mover. This infectious response is part of dance, the two-way process of motion and emotion. A primitive or a child. emotionally aroused, say by the pleasurable foreknowledge of some "good." will break into a dance of glee. The emotion can be recaptured by repeating that particular dance action and thus dance motion and emotion are interchangeable. The capacity for such interchange and build-up of feeling is at the root of hypnotic dances and explains the significance and power of tribal dancing. Since the early tribal chief could induce a mood (*e.g.,* the desire to hunt) in his followers by the rhythmic force of his dance-dramatic .example. they hoped he might also induce some such mood in nature, procuring game, fruits. rain and even help from departed spirits. On cave walls artists of the Old Stone Age drew figures of shamans in dancing attitudes among the animals they magicked within range and then transfixed with painted arrows. This further concept of dance assumes a magical power as applied medicine to be dispensed as a healer or quickener. Thus the dance action of medicine men is in essence life-giving and in ritual and ceremony resurrects a dead or dying world.

The struggle of life to arise out of death in nature, that is, for fertility, is correspondingly expressed in primitive dance and is reflected in folk dance and folk custom. Australian aborigines practise magico-religious dances for food and rain, and North American Indians—especially in Arizona and New Mexico—perform elaborate cycles of dance in order to call down rain. In Europe peasant plowing customs have terminated symbolically with human coupling in the furrowed fields. Fertility is also represented when the Rumanian Calusari dancers, as "medicine men," after dispensing to the sick, draw in the unmarried girls and join with them in a chain dance. "Medicine" dancers, charged by the tribal chiefs with enactments of responsibility, invariably hide their identity behind masks or disguises. They link themselves with animals and vegetables by wearing skins and horns, flowers and greenery. They emphasize their otherworldliness with inside-out apparel and by upside-down behaviour and, in dance customs in many parts of the world, appear as a retinue of "fools."

Out of the *corps d'élite* of "fools" are projected master fools around whom further ritual has evolved. This central figure can be a king, a priest attending the god or even the god itself. A well-known pattern of such ritual takes the form of a dance drama, in which a god or a king is killed and is resurrected in human form or comes to life as green corn or in some other guise. The prehistoric dance dramas that led to classical Greek drama and had a part in Greek religion also led to other religions, fragments of which survive in folk custom in many parts of the world. Some religions, particularly in Asia, Africa and South America, have kept dancing as part of their ritual, although the ritual has through the centuries lost some of its significant content and become decorative and stylized, often barely distinguishable from secular ballet forms.

The orgiastic, frenzied nature of some religious dances such as the Greek Dionysiac rituals has been echoed in the dance crazes that have broken out throughout history, an extreme example being the quasi-religious dance hysterias of the middle ages. Since the living body needs to express organic energy in rhythm, and since civilization and culture tend to bridle such expression, periodically there are outbursts of "primitive" dancing, often touched off by contact with some new dance influence; *e.g.*, the effect on Europe of North American and South American and West Indian dance forms during and after both World Wars I and II. Rhythmic expression seems to be a necessary outlet for healthy organic life.

Dance serves to knit individuals into a unity, or society. It is a function adopted from time immemorial by religious sects like the dancing or whirling dervishes of the middle east, who have sought to induce a state of ecstasy through organized bodily movement in order to achieve union with the divine. Rhythm not only makes the individual whole but also links individual dancers by a common emotion. This linkage is further emphasized when the dancers join hands in a chain or ring: a chain of dancers or a chorus of dancing singers is one of the most ancient dance forms preserved in human record. Some of the earliest chain dances are drawn on rocks in the open near Luxor, Egy., *c.* 4000 B.C.; some are found in ancient Elam east of Babylonia *c.* 3000 B.C. In archaic Greece the chain dance was frequently depicted on vases and modeled in clay in closed ring form; these are claimed as the source of the Provençal farandole, but stylized examples are found on tomb vases of the Early Iron Age in Languedoc, France, and gaily dressed Iberians danced it *c.* 200 B.C. in Spain.

Pair dances are also ancient. On the same rocks near Luxor that immortalize the chain, couples are seen dancing face to face. In folk dance the pair dance is often of erotic intention, notably the saltarello of the Roman Campagna with its apron play. The communal dance by several pairs is designed chiefly for recreation, as in the court dances of the past and modern ballroom dances. As entertainment, dance is as old as the oldest civilizations and, in such circumstances, lends itself readily to commercial exploitation as well as evolution. (D. N. K.)

II. EARLY MEDITERRANEAN CIVILIZATIONS

1. Ancient Egypt.—Throughout the history of ancient Egypt the dance was an important part of religious ceremony, but there appears to have been little secular dancing. Since there is no written description of any dance, the type of step and quality of movement can only be conjectured through painting and sculpture.

Sacred Dances.—Many religious rituals originated in the superstitions of primitive peoples. Seeking kinship with their gods, they evolved dances of imitation, many of which were representations of the cosmic movements: the "dance to the morning star" took place at dawn around the sacrifice of a white camel; the "labyrinth" imitated the passage of the constellations. This led to dancing in circular formation, to rotatory movements and to symbolic gestures.

Dances of adoration and supplication were performed before the effigies of the gods, to the chanting of hymns and prayers. The movements were austere, and each gesture had its special significance. Every temple had its trained dancers and musicians, the instruments used being harps, pipes, castanets and sistra.

Religious festivals began with a procession of priests, dancers and musicians through the streets. Dramatic scenes were enacted, telling stories of the god to whom the festival was dedicated. At the festival of Isis, dancers represented the goddess as the dawn and as the wind of spring and mimed the story of her wanderings in search of Osiris. At the feast of Osiris at Abydos, priests and worshippers enacted the death and resurrection of the god. Hathor, being the goddess of dance and music, was specially honoured at her festivals with these two arts. A festival to the god Ptah took place at harvest in gratitude for the overflowing of the river Nile.

Funeral Rites.—Dances played a part in ceremonies connected with death and burial. These dances, expressing the grief of the mourners, were performed mainly by women. "The feast of Eternity" was a public ceremony in honour of the dead, at which many mourning dances were performed by both men and women.

Secular Dances.—The cultured upper classes of Egypt do not appear to have indulged in any form of social dancing. Some fresco paintings show woman dancers performing at banquets as professional entertainers and a few figures suggest that there was some form of acrobatic dancing.

2. Ancient Greece.—Dancing, since it was universally practised, was a factor in the life and education of ancient Greece throughout its history, each period contributing some dance form of its own.

Temple Dances.—These originated in a primitive form during the Mycenaean era, in the 2nd millennium B.C., but in time developed into temple ceremonies. Great festivals were established in the Dorian age, the most notable being the Panathenaea, the Eleusinian mysteries, the Olympian, Pythian, Isthmian and Delian games. These festivals began with a procession through the city to the temple of the god concerned, where during the religious ceremonies the temple virgins, known as hierodules, performed dances of worship and adoration. Sacred dramas were enacted, the most famous being the one that took place in the temple at Eleusis and told the story of Demeter and Persephone; during the Eleusis festival, tragic dances, torch dances and symbolic dances were performed. At the Pythian games at Delphi a dramatic dance told the story of Apollo's fight with the serpent god Pytho; the priestess of the Delphian oracle gave out her messages while under the influence of a hypnotic dance in which she imitated the movements of a serpent.

Funeral Rites.—During the Minoan and Mycenaean periods, frenzied dances of self-laceration took place around the dead. These orgies continued until the 6th century B.C., when Solon stopped them by law; the gestures then became symbolic and these tragic dances changed to movements of dignity and beauty that came to be accompanied by the music of flutes and harps. They were performed by professional dancers who, at funerals of importance, sometimes mimed an event or incident in the life of the deceased.

The Pyrrhic Dance, a war dance, was perfected by the Spartans about the 7th and 6th centuries B.C. It was danced with the weapons of war and was a mimic battle performed by one, two or more youths. It consisted of the actions of attack and defense and was

also used to express victory. There were masters to teach it. for it was an essential part of military training; the dance was performed to the music of flutes and the singing of war songs.

The Gymnopedic Dances were the outcome of the training of athletes for the games. The actions of javelin and discus throwing were practised to the music of flutes, in order to gain rhythm and grace; these gave rise to dances mimetic of hunting and other sports.

Dionysiac or Bacchic Dances arose from the rustic festivals of the country people. who celebrated the vintage with dances in honour of Dionysus. They trampled the earth into a circular dancing ground and, to the chanting of dithyrambs, executed their dances around an emblem of the god. The death of the god mas celebrated with tragic dances in the winter, and his return to life in the spring was welcomed with wild dances of ecstasy. These country festivals mere the origin of the drama of Greece and of the Great Dionysia of Athens. The dancers were disguised as satyrs. maenads and bacchantes and danced with mine jars, thyrsi. cymbals. castanets and tambours, to the accompaniment of flutes, songs and shouting.

Choric Dances were an important part of the dramatic performances of the Dionysia. There were masters to train the chorus, who expressed in action the words of the poet; these dances were in tragic, ritual. lyric or other form suitable to the verse. In the satyric comedies the dancers were disguised as satyrs or animals and performed movements that were grotesque and frequently obscene. Although the choric dances were accompanied by flute or harp, it was the measure of the verse that set the rhythm of steps and gestures. This link with drama and poetry brought the dance of Greece to its highest intellectual form.

Secular Dances. — *The* dances of the peasantry were mimetic of their occupations and were mainly performed to singing. The "reapers." the "millers" and the "weavers" were danced by men; women danced the "spinners." the "woolworkers" and the "cooks." Games also were played to singing, especially games of ball. Wedding dances were performed to marriage songs; and country dances performed by youths and maidens, holding hands in lines or circles. were a social enjoyment. At banquets and parties professional dancers were hired as entertainers: they were expert in performing complicated steps and turns; used cymbals, tambourines. bones and castanets; and often performed acrobatics. Banquets often ended with the guests dancing the *komos,* an exaggerated version of the Dionysiac dances.

3. Ancient Rome. — Though the Romans developed the art of mime. their contribution to the art of the dance was negligible. In the early days of Rome some agricultural dances. mimetic of the sowing of the seed, were performed in the spring for the fertilizing of the fields, as were others representative of farm activities.

Such religious dances as existed were of an orgiastic type. The priests of Mars danced as warriors with weapons of war and. at the festival known as "the day of blood," the priests of Kybele and Attis performed frienzied dances in which they gashed their bodies with knives and potsherds.

About 200 B.C. a form of secular dancing came into fashion that was entirely drawn from the choreography of the Greeks and Etruscans; but in the hands of the Romans it deteriorated and soon died out. Dancing of all kinds was regarded with disfavour by the cultured and intellectual people of Rome. (R. GI.)

III. THE ORIENT

1. India and Pakistan. — Dance in its several aspects has always been prominent in Indian culture. Until modern times important and impressive tribal dances were very much alive: the horned buffalo dance among the Gonds in central India, the war dances among the Nagas in Assam, the rousing sword dances round the fire among the Pathans, the courting dances of the Santals in Bengal and Bihar and of the Makrans along the Persian gulf. Also popular were the almost ubiquitous community (not tribal) stick and/or handkerchief dances and the hobbyhorses that were often connected with wedding festivities but in the state of Rajasthan (formerly Rajputana) were reminiscent of the wars between the Hindus and the invading Muslims. Strictly ceremonial dances, such as the trance dances of the "Bhutan" priests in south Kanara or the fire-mask dances at the Dharmapuja in Birbhum in west Bengal. were or are definitely magical in purpose.

Constantly influenced by these innumerable folk dances and in turn exercising influence on them are the official classical dancing styles. The principles each follow in their own way were formulated about the beginning of the Christian era in a treatise called *Natya Shastra.* Its mythical author, the sage Bharata. claims to have received his instruction from the supreme god Brahma himself. The *Natya Shastra* is a handbook of dramatic art and deals with all aspects of the theatre, of which dance is an important part; the word *natya,* the name of the highest form of drama, is derived from the root *nat,* which means "to dance." Dance in the stricter sense, however. is called *nrtta* when it is pure dance and *nrtya* when it is meant to convey a certain meaning. for instance illustrating the words of a song by means of stylized hand and foot movements. These movements form a kind of sign language, which. when properly executed, is transformed into a dance of entrancing beauty. The term *mudra,* used to designate these different hand movements. should. properly speaking, be confined to the closely related movements of the priests during T'edic sacrifices. where, however. they are not meant to be a dance at all but are thought to confirm the power of the chanted formulas.

The style as described in the *Natya Shastra* owes a great deal to Vedic ritual, as Bharata acknowledged, but also has a strong element drawn from non-Vedic traditions. There are. as usual, no historical records but. under the cloak of mythological terminology. some historical development can be traced. The strictly Vedic elements are said to have sprung from Brahma, the rest from Siva. With the growing prominence of Siva — especially in his form of Nataraja, the lord of the dance — the importance of the Vedic elements was obscured and can only be traced occasionally in the surviving traditions. Parvati. Siva's spouse. who now is considered at least the equal of Siva as a creative force in dance, is entirely absent in the oldest text.

Four main schools survive in modern times and have found great appreciation in the new India. Perhaps closest to the art as described in the *Natya Shastra* is the style generally called Bharata Natyam (*q.v.*), derived from the dance as performed by the devadasis in the south Indian temples. It is, however. not *natya* ("drama") but *nrtya* ("descriptive dance") mixed with *nrtta* ("pure dance"), mostly to the accompaniment of very intricate drumming. The second school. Kathakali. found along the Malabar coast, is pure theatre. The pieces performed are taken from the rich Hindu mythology, especially from the fairly late *Puranas,* or from the much older epics, the *Mahabharata* and the *Ramayana.* The magnificently dressed and painted actors do not speak but mime the text as it is sung by men in ordinary dress at the back of the stage. The story is often interrupted by pure dance to instrumental accompaniment. mainly on drums. The third school, Kathak, found in north India, has also a sign language. mostly connected with the exploits of the god Krishna and his beloved Radha. Its many centuries of development as entertainment at the courts of Muslim (and also Hindu) princes have given it a special, sometimes decidedly erotic. character. As a marvel of technical perfection it is in no way inferior to either Bharata Natyam or Kathakali. The fourth school, found in the little kingdom of Manipur in Assam, also concerns itself mainly with Krishna legends and uses a sign language akin to that of the Kathak. It was — and perhaps still is — performed by the ladies of the court and thus escaped the stigma once attached to both Kathak and Bharata Natyam. This is why Rabindranath Tagore chose this form of dancing to be taught at the Santiniketan. Bolpur. when he wanted to reintroduce dancing as a form of expression among his pupils. Manipuri in its best form also has great technical refinement and is accompanied by superb drumming.

In the Indian classical theory, dance is considered as one component of a triad expressed by the word *Sangita* (vocal music, instrumental music and dance) and is said to be dependent on the other two components. (AR. A. B.)

2. Indian Influence in Asia. — From India two great religions, Hinduism and Buddhism. spread throughout Asia. Both affected

the philosophies of the areas they touched and determined the character of the dance. Each in its own way and in its particular area remained remarkably steadfast. despite the subsequent arrival of such conflicting influences as Christianity, Islam, colonialism and the psychological and physical encroachment of the west and modern times.

Hinduism is most notably entrenched in the dances of southeast Asia. The historian's designation of these countries (with the exception of the Philippine Islands and Vietnam) as "greater India" suggests the poner of ancient India of the Hindus as do the more colloquial terms "Isles of the Indies," "Indochina" and the like.

From a century before Christ, preachers of the Buddhist faith. local converts and even refugees from Hindu persecution of Buddhists in India brought tales of the Lord Buddha to Ceylon, Burma. central Asia. northeast to China and eventually. by the 8th century, to Japan. In these countries. while it may be said that dances are fewer than in Hindu areas; their playlets and dramas contain more social and even political significance; and an awareness of kings, queens generals and nobles — rather than of gods, goddesses and mythological characters — pervades the national theatre arts. However, in both Buddhist and Hindu countries of Asia. the basic character of Sanskrit theatre is found: the fusion of dance, drama, poetry, music and song.

In general, the dances of Asia fall into one of several different pairs of categories: the simple and the complex; the group and the individual: the primitive and the sophisticated; and. on an economic level, the folk and the palace or, more simply. the amateur and the professional. Underlying each, but applying more specifically to the highly evolved dance forms. the guiding aesthetic principle is an emphasis on tradition or classicism. An Asian artist can spend a lifetime repeating a single set of gestures traditionally handed down from generation to generation, with the result that perfection of known and approved detail assumes greater importance than novel effects to surprise and titillate the spectator. A taste for departures from the familiar only developed in modern times.

Southeast Asia. — Both the dances and dance movements of southeast Asia are especially rich and variegated. The westerner first notices a fundamental difference in the use of the human body as an instrument of artistic expression. Postures are usually asymmetrical and off-centre. in contrast to western ideas of balance and alignment. the back arches sharply. knees splay, elbows break in hyperextension and the torso creates irregular angles of imbalance. Parts of the body are independently articulated: shoulders shudder, fingers tremble like butterfly wings, eyes fly up and down or from side to side in their sockets. the head clicks and swivels from side to side or forward and backward, and even the feet and toes curl and uncurl to beat time.

Using this technique, dance assumes its various forms: dramatized stories from the epics; abstract sequences of no meaning; fragments of moods or suggestions of vague ideas; virtuoso passages to display acrobatics; and individual dances that do little more than exhibit a chain of decorous motions with objects — pieces of cloth, sticks, flowers, fans. fire, water, swords or daggers. While many of the dances have profound religious associations that involve temple preparation. trance, initiations and ceremonies of an elaborate nature, some of them have purely temporal meaning and serve erotic purposes.

Some dances date back as far as the Stone Age, such as those on Nias Island in Indonesia, where, along with other remnants of protohistoric culture. stones are worshipped. Trance dances are also widely practised. These may be induced by autosuggestion or through hypnotic spells cast by priests; they always conclude with superhuman feats such as plunging into waist-high fires. balancing precariously from bamboo poles or on the shoulders of other dancers, or even stabbing daggers into the dancer's own flesh.

Where dance has erotic connections, it may be performed by eunuchs, like the *suwa-suwa* dancing boys of the Sulu islands in the Philippines; by virgins. as in Bali, who offer their purity to the gods; or by prostitutes who earn their living first by dancing to entice and stimulate. One feature of dance in Asia is the frequent performance of men dressed as women and, to a lesser degree, that of women dressed as men.

From an artistic point of view, the highest achievements in southeast Asian dancing are reached at the courts of kings by the palace dancers or, where potentates have been supplanted by democratic institutions, by descendants of these noble performers.

Ceylon — Ceylon is famous for its devil dancing of pre-Buddhist origin and its Kandyan dances of Hindu inspiration. Less known. but of equal importance in dance history, is kolam, dance dramas of kings and queens with frequent intercessions of the Buddha and pointed morals regarding conjugal fidelity and the iniquity of greed.

Devil dancing is exorcistic, usually performed by specially trained troupes when sickness or insanity is discovered in a family. It involves dancing uith fire. prophetic utterances, interspersions of contemporary playlets of excellent mimicry and realism (for the general entertainment of the crowds that gather as soon as the music commences) and a display of horrifying grotesque demons.

Kandyan dances require greater expertise in dance technique. While they are often performed in concert form. they constitute an integral part of the famous *perahera* or procession when a tooth of the Buddha is carried through the streets of Kandy. the old capital of kings of Ceylon. and the dancers are flanked by drummers, elephants and scores of monks.

Burma and Malaya — In Burma. *pwe* means any theatrical show and as in most Asian theatre, no performance is complete nithout a preponderance of dance. Zat *pwe,* the most traditional theatre form, deals with excerpts from the Jataka stories of Buddha's life (occasionally Rama is introduced as a "future" Buddha). Other *pwes* specialize in clowns, puppets and spirits. All are accompanied by orchestral music of extreme beauty and refinement.

Among the Shans. Chins, Kachins and Nagas of upper Burma, the dances are aboriginal in character and consist mostly of pantomimic imitations of various animals and stylized fights with swords or sticks of fire.

Malaya boasts no dances of note, apart from the scant folk dances of its aboriginals and a few social dances, performed in pairs or in groups by its urban populations.

Laos, Cambodia and Thailand. — These countries compose a single dance unit nith folk and social dances common to all three and with their classical dances connected with the courts. The most formal of the classical dances are generically known as khon and are performed with masks by men exclusively. Their themes all derive from the *Ramayana* and are connected by long interludes of pure dancing that indicate obeisances, promenades, embraces, etc. A related dance form, generally known as lakon, is performed by women without masks. It is larger in scope in that it incorporates local mythology and can be adapted to represent any story, provided it is traditional. At the court of the king of Cambodia, the royal Khmer palace dancers exhibit on special occasions and at the invitation of the king the finest examples of this type of dancing. Garbed in costumes of brocade and crowned with tiaras of beaten gold studded with diamonds, the dancers execute their graceful movements describing the glories of Hindu gods with the studied perfection of a classical ensemble trained in a most resplendent tradition.

Indonesia. — The range of dance in Indonesia is bewildering. Each island, each area. each racial minority offers dances that vary in quality from the superb troupe at the palace of the sultan in Jogjakarta in Java and the extraordinary brilliance of the hundreds of professional dancers in Bali to pockets of aboriginal dancers enacting head-hunting dance rites.

The Philippines. — The Philippine Islands are an inseparable part of southeast Asia in geography, but not in the field of dance. This is partly due to their unique position as the only Christian country of Asia and the only one to be colonized by Spain and the United States. Apart from the Muslim islands in the south, where Indian-style dances prevail, most of the folk dances consist of simple movements on unsubtle themes, such as planting rice, gathering the harvest, trick movements with burning candles and glasses filled with water. The majority of the existing folk dances

are comparatively modern and, having been introduced by the Spaniards. are closer to the west than to Asia. In modern times. ballets in western style based on Filipino texts gained popularity and competed with the rumbas and tangos, with which the Filipinos have more affinity.

Tibet. — The people of Buddhist Tibet and Ladakh in central Asia regard dance neither as folk nor professional art but as part of pageants and annual festivities, whose theme must be exclusively religious. The dancers, magnificently attired in huge masks and colourful robes. walk on stilts to gain height and to increase the supernatural qualities of the performance. They enact scenes to prove the triumph of Buddha and his followers over the evil and illusions of this world. The central Asia of Bhutan and Nepal is Hindu and the dances are on the level of village entertainment, being used as a means of courtship or to display movements of an acrobatic nature.

3. China. — Within China and areas influenced by Chinese culture (this includes in a broad sense Vietnam. Okinawa, Formosa, Korea and Japan itself) an enormous aesthetic shift in Asia takes place. Dance is in the main superseded by drama. In China itself there may be lotus dances. stilt dances, butterfly dances, lion dances (inspired by Buddhist stories from the parts of India where lions are known) or Yangko dances from the outer edges of China. but the chief theatrical activity is confined to "operas." From the 8th to the 20th centuries. China has had a flourishing operatic form of theatre that recounts tales of battles, warring kingdoms, domestic troubles and love stories. These transmit the country's history in visual form and perpetuate the moral values of Confucianism as revealed in situations based on filial piety, matrimonial devotion, loyalty, conflict between duty and feeling. and the place of the peasant side by side mith the noble and scholar.

Artistically, the focus was originally on the beauty of arias and the delicacy of dramatic interpretation within roles. This increased over the centuries until dance became a negligible entity within the over-all theatrical framework. Mei Lan Fang (1893–1961). a performer of female roles and the greatest singer-actor-dancer in China's history, was responsible for the reinstatement of dance He not only revived the dance repertoire but also enhanced passages of pantomime until they merged into pure dance.

Opera in China is stylized. exaggeratedly gesticulated and gorgeously costumed; use is made of masklike make-up of fantastic colour combinations and patterns that inform the spectator of the character and motivations of the role-type being portrayed. Acting includes not only singing and, within limits. dancing but also a good measure of acrobatics. As the dramas develop, the movements become vertiginously swift, the music deafening and the tragedies and comedies of the past, describing high and low life, rush to their climaxes.

4. Japan. — Japan has the most all-embracing theatre complex in the world. The country's long isolation from the west and other parts of Asia until the end of the 19th century preserved its arts meticulously and allowed them to evolve more particularly than those of any other country in Asia.

Bugaku dances of the imperial court imported from India and China in the ith century are performed nith traditional exactitude. They are foursquare. with movements stiffly repeated in prescribed patterns, and costumed in the fashions of the period. Patronage by the imperial family guarded them closely, and only after World War **11** were public performances allowed.

Nō drama (*q.v.*), long familiar in the west through translation, is in effect as much dance as drama or poetry. The concluding dance that ends all nō extends each play's theme through pure movement. Nō dates in its present form from the 15th century and presents a spectacle of excessive control and repose. aesthetic qualities that with their understatement contrast strikingly with the bombast and pyrotechnics of their counterparts elsewhere in Asia. A kimono lying on the floor of the stage represents an ailing princess a lift of the mask a smile, a downward glance a frown, a raising of the hand a flood of tears; an entire vocabulary of gesture has been created that communicates to the initiate the deepest feelings.

With Kabuki Japan's popular dramatic form coeval and in many respects similar to Elizabethan drama. dance reaches its most brilliant and cosmopolitan attainments. The themes cover many subjects. from those as simple as a lovelorn village maiden taking a walk. to a series of deceitful ruses employed by a warrior-priest to escape a trap. See KABUKI THEATRE: *Kabuki* Dances.

Japan's puppet theatre, in which the puppets reveal the most intimate aspects of human nature, also includes dances as essential parts of all programs.

Geishas perform. either in the private rooms of restaurants or at public performances in theatres, a vast number of dances peculiar to them. Their gestures illustrate the words of songs based on sentiments appropriate to love, natural beauty or heroes and heroines of history.

Some folk dances are practised in the provinces and remoter areas of Japan and many of them have been enlarged into forms suitable for stage presentation.

Variety or vaudeville troupes, such as the pre-eminent Takarazuka. depend primarily on dance for their success. Some of these are western in style. others incorporate indigenous elements and appeal to an eclectic taste that demands the past and present, the native and imported.

Several Russian ballet schools thrive in Tokyo and guest artists from other countries are invited to perform with the locally trained dancers.

Japan embraces the dance arts of the west with its own in a thoroughgoing manner. Alone among countries Japan seems best able not only to appreciate and import but to support and maintain the dance traditions and inventions of both sides of the world simultaneously within the bounds of its own culture and without detriment to either. (F. Bs.)

IV. EUROPE AND AMERICA

1. Folk Dancing. — The concept of "folk" embodies two ideas: (1) that the form of dance was evolved over great stretches of time by communal practice; and (2) that the process of handing on through successive generations operates within a framework of natural selection.

Ritual-ceremonial folk dances, except in a few instances as in the Balkan peninsula, are performed by men. Derived from ancient religious ceremonial or animal and vegetation fertility rites. they are almost invariably associated with the annual observance of customs linked with the church calendar or solar year. They may consist of some dance action together with ritual drama that often represents a life-and-death conflict. sometimes covering a complete cycle of birth, growing up. marriage. death and rebirth. The dramatic elements are expressed in the antics of "green" men and animal men, in the combats betneen "Moors" and "Christians" in dances of fools and giants with attendant symbols of fertility and magic. Such may be seen in the sword dances of northern England. in the *moriscos* of Spain and Portugal and in the ritual of the Rumanian Calusari.

Social folk dances include all those in which the sex relationship of man and woman is the dominant feature. They may take place as an extension of the ritual dance or be associated nith the seasonal customs as nith the Provençal farandole. the Cornish floral or *furry* dance and the various types of Maypole dancing. But as dances of recreation they are not limited to particular occasions. Chain dances, such as the kolo and *hora* of the Balkans, are a direct survival of the popular dance form of the middle ages, the carole (*q.v.*). Other folk dance forms like the weaving dances of Scandinavia are illustrative of agricultural or domestic activities.

Couple folk dances are also of ancient origin with erotic content. as in the Spanish jota. the Italian saltarello and the acrobatic displays of the man partner in the Basque *aurrescu.* Solo folk dances mostly of ceremonial origin, have survived for exhibition and entertainment purposes Well-known examples are the Highland snord dances and the Russian Cossack dance, certainly not confined to Russia

Folk dances have not remained uninfluenced by other dance forms, and there has been a tno-nay interchange between the nobility and the peasantry, between town and country. Thus the

country dances of England, Ireland and Scotland were peasant dances derived from the long dance processions and May rounds; they attracted the interest of dancing masters and musicians of the 17th and 18th centuries who composed new dances on the old basis. These country dances spread to Europe as *contredanses* and thence to the Americas, returning in their modified form to the countryside. where. when other dance forms replaced them, they were preserved as folk dances. In a similar way the Austrian waltz. the Czech polka. the Mexican tango and other American forms have enriched the dances of the ballroom. See also FOLK DANCE; MORRIS DANCE; COUNTRY DAKCE; COKTREDANSE. (D. N. K.)

2. Social Dancing.—*Medieval.*—Dances of the early medieval period in Europe, as reflected in decorated and illuminated texts. included processions of couples and chains of singing dancers. The latter type, known as the carole, survived in folk custom in several European countries.

The figures and form of some of these dances undoubtedly influenced the trend of the 15th-century *danse* basse, which. from midway through the 14th century, endured in the courts of Europe for about 200 years. The danse basse, although not necessarily a solemn dance, consisted of ceremonial gliding movements. Only a limited number of steps were used, but they could be combined in many ways. Before the 15th century there were no professional teachers; the task of teaching was left to mimes and jugglers, but then the first of the dancing masters appeared in Italy and gradually a technique developed. so that court and folk dances were separated. The dances of the people remained intimate and largely spontaneous. whereas the increasingly voluminous clothes of both the men and women of the nobility restricted movement and frequently caused the dances to become little more than an excuse for the display of finery. Textbooks on the dance of the 16th century describe the danse basse as being slow and stately, with small gliding steps and a graceful rise on to the toes. After about 1550 this dance began to disappear and in his *Orchésographie* (1588) Thoinot Arbeau laments its passing.

The 16th Century, with the growth of a more varied and liberal outlook, found greater scope for self-expression in its festivities and entertainments. The development of the printing of music brought lutes. guitars and organs within earshot of everyone. so that social dancing flourished throughout Europe. Numerous books on the technique and steps of dancing appeared throughout the century. Various forms of galliard (*q.v.*) won high favour and Arbeau devoted 50 pages to descriptions of this dance in all its varieties. In 3/4 time, it was a dance of tremendous zest; consisting of a number of thrusting steps and leaps. At first it contained an element of pantomime: the man first traversed the hall with his partner, then released her and danced before her with a wooing and courtly manner. At this the lady retreated, only to be courted with greater intensity until she relented. Later this element of mime disappeared and the dance grew into a vehicle for the man to display his skill and agility. As the dance developed in complexity the dancer who wished to hold his own had to be able to jump high and perform double turns in the air.

In extreme contrast to the galliard mas the slow and stately pavane (*q.v.*). In 4/4 time. it was known in some regions as the peacock dance. for it was danced "prettily" with a strutting motion. By the end of the century, however, this form had become less strict and little skipping movements gave it a somewhat lighter character.

The *volta* was favoured by the younger people. for in it the dancers, in pairs facing each other, were required to rotate at high speed and at one point the lady was lifted off her feet. For a while the dance was considered impolite but any stigma was removed when Queen Elizabeth I danced it herself at court.

During the last half of the 16th century the couranle (*q.v.*) grew in favour. But whereas the *volta* soon declined, the courante lasted for about 200 years. In its first stage the dance was of a light tripping nature in rapid 3/4 time; then at court it developed a more stately but still not ponderous style.

The *allemande* (*q.v.*) was yet another dance that flourished; processional in form and usually performed to music in common time, this too was at first of a stately nature: although it contained a peculiar step in which the dancers rose on the toes of one foot and threw the other foot forward. pointing the toe.

The *17th Century.*—With the continued increase in skill needed for the execution of the court dances. in France particularly, the social dances gradually left the hall and found their way on to the stage, forming the basis of the technique of ballet. This led. in the 17th century. to a decline in social dancing at court, but as dress became simpler the styles in dance gradually were transformed. The gavotte (*q.v.*), a modified form of an earlier dance style, enjoyed tremendous popularity: it took the form of a square dance in which every couple had a turn to dance on its own.

English country dances were also very popular at this time and John Playford published The English Dancing *Master* in 1651 (see COUNTRY DANCE). Within 80 years this book ran into 18 editions. each one bringing in more dances. Country dances were divided into rounds and rings: in the former, one figure was danced in a circle and in the latter, while still retaining a circular pattern, the dancers also moved inward toward the centre and out again. The Maypole dance is an example of the ring form. The circular patterns were also varied by the formation of squares and lines.

The dance for which this period is chiefly remembered is the minuet; during the 100 years from halfway through the 17th century it was the dance most continuously in favour. In its fully developed form the minuet was executed with small, neat steps and a delicate air. Several great composers wrote music especially for it. and some of this music has become far more familiar than the dance itself. See MINUET.

The *18th* Century. — In the 18th century the spacious houses of the nobility became centres of social activity, including dances, while at fashionable holiday and health resorts assembly rooms and other halls were the centres of frequent balls. Professional dancing masters were now abundant. particularly in England after the French Revolution, and they invented new dances and added to the complexities of the old.

The country dance was introduced into France toward the beginning of the 18th century and was accepted at the court balls. From it was developed the French *contredanse* (*q.v.*), which. with the cotillion, became popular in that country. About the beginning of the 19th century four favourite contredanses were combined to form the quadrille (*q.v.*) which was brought to England about 1815.

The *19th* Century.——Altliough the waltz (*q.v.*) first made its appearance at the Austrian court in the second half of the 17th century. it did not begin to find widespread favour until well into the second half of the 18th century. The age of the minuet (that dance had by now deteriorated into mincing steps and highly artificial behaviour) gave way to the demand for naturalism, satisfied by the uninhibited turning motion and rhythmic lilt of the waltz. At first this dance was regarded as vulgar, but after the waltz had been danced at a ball given in 1816 by George IV when prince regent it was generally, but not completely, accepted. The waltz was probably the first dance in which the closed hold was fully employed.

During the same period set or square dances grew in popularity (see SQUARE DANCE). In 1815 the lancers became the first of a series in which groups of dancers. usually eight, formed into squares, performing a number of different turns. interweaving and linking and changing partners, each couple dancing a short solo in the centre of the square. The waltz turn was featured prominently in the actual dancing in these squares.

About 1840 a great revival of national feeling and culture arose in certain eastern European countries then under foreign dominance, and great sympathy was felt for these countries in western Europe. This may account for the popularity. at about this time. of the polka (*q.v.*), a new turning dance from Bohemia that gained phenomenal success in Vienna. Paris and London. In its train followed the mazurka from Poland, the polka mazurka and other dances that achieved brief marked favour in western Europe.

After this mid-century efflorescence of new dances. Britain and to a great extent France were sterile as regards new dances and the initiative ior the first time passed to New York and the new world. From here in the early 1900s came the military schottische or

barn dance, the cakewalk (*q.v.*), the two-step (*q.v.*), the Boston and the turkey trot.

The 20th Century.—Between 1912 and 1914 Vernon and Irene Castle launched a campaign to refine these various dances. The Castle walk was perhaps the most important outcome of this campaign, for this heralded an entirely new style in which a more or less natural walking step was utilized as the basis of dance movement. Inventions by this same famous couple in the tango (*q.v.*) also aided that dance to become a craze. The early fox trot (*q.v.*), too, evolved through their experiments, and the chassé figure of three steps. one of them bringing the feet together, became an integral part of the figures of most dances of this time.

In the United States during the first part of the 1920s the *paso* doble, peabody and one-step (known as fast fox trot) became established. With the increase in popularity of Dixieland jazz in the mid-1920s, the Charleston (*q.v.*) suddenly engulfed society, reaching its peak about 1925 and petering out. along with the black bottom, in the late 1920s. By 1927 the lindy hop ushered in what was to become known as jitterbug (*q.v.*), a form of dancing that in its early stage consisted of gymnastic feats, breaks and wild footwork.

Good dancers in England adopted the Boston as the English waltz, the American turkey trot became the English one-step and, with the arrival in England of "Alexander's Ragtime Band" in 1912, ragtime became firmly established on both sides of the Atlantic. In that same year the Argentine tango, with its fascinating habanera rhythm, arrived via the French casino towns. Although attacked as an indelicate dance, it soon became exceedingly popular. In 1930 a Cuban dance, known as the rumba, made its appearance; the rhythms of the Cuban music and the rumba movement electrified the public. While interest in the rumba continued to grow, several group dances appeared in the late 1930s. The conga, a "follow the leader" dance consisting of a line. lasted several seasons. Coincident with it came the Lambeth walk, a dance performed in a jaunty, strutting manner, to be followed by boomps-a-daisy. Both these dances, which originated in England, were adopted in the U.S., where they endured into the 1940s. The most popular dance in the U.S. in the late 1930s, however, was the big apple: in it the dancers formed a circle, a leader calling out the various figures, which bore such names as shag. Suzy Q and truckin'. By 1941 the samba became established and the Charleston was revived in 1949.

In England the first *palais* de danse appeared in 1919, to be followed in the 1920s by many similar halls throughout the country. This type of hall, with its cheap prices of admittance, good bands and spacious floors, enabled working people to take up dancing, and large numbers of them became skilled dancers. At the same time dancing in the more expensive resorts and exclusive clubs deteriorated until it became little more than a purposeless shuffle on floors that grew smaller and smaller and more crowded.

The teaching of dancing became a popular profession in England, and schools sprang up all over the country (see DANCE TEACHING). Then, just before the outbreak of World War II in 1939, jitterbug found its way across the Atlantic. having already won tremendous favour in the U.S.; about the same time in the U.S. jitterbug evolved into the quieter swing and jive. By this time, too. competition dancing was popular in England and a list of rules had been laid down by the Official Board of Ballroom Dancing (formed in 1929) to govern amateur status and other matters. Thousands of competitions are held every year, the most important being the British and the International championships. International events also developed rapidly, and in 1950 the International Council of Ballroom Dancing was founded. At that time the title "world championship" was not held in very high esteem, as various private promoters had organized so-called world events that attracted entries from only a few countries and in which leading couples from the most prominent of the "international style" countries did not compete. At first the International council therefore discouraged the organization of world championships, believing that an interval of time was desirable for the title itself to live donn the reputation it had gained. Thus it was not until 1959 that the first world championships in both amateur and professional sections, held in accordance with rules and conditions laid down by the International council, were organized They became yearly events and were contested in the four standard dances (waltz, fox trot, tango and quickstep). Viennese waltz and Latin American dances such as rumba, samba and *paso* doble.

After World War II. the English waltz, the fox trot, the tango, the quickstep and the Viennese waltz remained the principal competitive dances. On the other hand, masses of young people found different, less skilled but more obviously rhythmical forms by which to respond to certain dance music trends of the period. Perhaps the most common of these forms were the mambo (introduced from Latin America about 1947), the calypso and rock 'n' roll. but this style soon shed its initial coarseness for more subtle rhythms and sophisticated movements. In the late 1950s and early 1960s the cha-cha also had a highly popular vogue. The twist, a grotesque dance consisting almost entirely of tnisting movements of the body, with the knees bending and flexing. the partners well apart and without contact, attained international popularity after being introduced in the U.S. in 1961.

In the U.S. social dancing was not standardized so effectively as in England. nor was the technique so fully developed. Teachers differed not only from state to state and from city to city but even in the same city since various teachers used different styles and methods. The United States Ballroom council was working in the early 1960s on a certain amount of standardization, but teachers did not agree that the same kind or degree of standardization 1%-asdesirable as in England, although the English style (known in the U.S. as the international style) was enthusiastically promoted by some U.S. teachers who had studied intensively in England.

3. Theatrical Dancing.—Theatrical dancing is a vague term. Ballet (q v.) itself is of course theatrical dancing of a kind. but theatrical dancing is generally understood to refer only to the dancing employed in musical plays, variety and cabaret. Theatrical dancing varies in many ways, from classical ballet dancing performed by highly trained dancers and arranged by the world's leading choreographers to simple chorus numbers that can be accomplished with little training. The styles, in addition to classical ballet. include tap, acrobatic, sometimes even a highly stylized form of national dancing and yet another style, variously known as modern, contemporary, expressive and central European. See CHOREOGRAPHY.

Musical Comedy.—It is frequently stated that the standard of dancing in musical comedies and variety was extremely low until toward the end of the 1920s, but this is not entirely true. Some of the dancing in the Paris music halls of the 19th century achieved a reasonably high standard, although the skilled performer stood out against a chorus of mediocrity. In the music halls. many individual "acts" produced brilliant acrobatic work and. indeed, Russian ballet dancing of a high standard was introduced to London in such halls. both Tamara Karsavina and Anna Pavlova appeared in this way. Musical comedies of this time and for some years to come, however, usually relied upon a large chorus of girls who executed simple routines, the effect depending upon spectacular costumes together with the group patterns and uniformity of the ensemble rather than any strong originality or brilliance in the dancing itself. Very rarely were the dance routines an integral part of the action of the play; instead they formed an introduction or background for the stars. This kind of work was perhaps best exemplified by the famous totem chorus in Rose *Marie*.

Toward the end of the 1920s, large-scale groups and routines without any real choreographic merit began to give way to a kind of work rather more closely allied to the plot in musical comedies, and in cabaret and variety the dance element became more highly skilled. Perhaps the pioneer in this advance was Albertina Rasch, who trained troupes that became famous throughout the world for their work in films. All the members of these troupes were well trained in classical ballet and, through this training. were able without undue difficulty and in a short time to learn other forms. In the 1930s famous choreographers were engaged to create the dances in many musical plays and films.

By this time some of the pioneers of the modern dance move-

ment. notably Martha Graham, had worked for some time in the United States. Although there was only a small and specialized audience for these styles in their pure form, dancers and choreographers already began to adapt some of the angular, introspective movements into their own vocabulary. This influence reached Britain, and a dance composed on this style that accompanied Sonnie Hale's song "Dance. Little Lady" in C. B. Cochran's review *This* Year *of* Grace proved to be a tremendous success.

Ballet dancing itself, however, remained extremely popular in stage musicals and most members of dance troupes had by now to acquire a good all-round training in the main styles. The tap dance (*q.v.*) too had developed, and complex rhythms were necessary for all except the greatest of the nonchalant stylists such as Fred Astaire and Jack Buchanan.

Stage dance competitions became an important feature of the English dance scene, attracting large entries in all the various styles. At first the winners were usually offered splendid professional opportunities but, even with more competitions and more professional openings. the titles remain highly coveted. Several notable stage personalities gained their first success in these events.

After World War II theatrical dancing made further developments, becoming more and more firmly integrated into the action of the play until, in some productions, it became undoubtedly the most important element. Indeed. dance became so vital an element that in *West* Side Story members of the cast had to be able to dance, sing and act with equal skill. In this musical Jerome Robbins (*q.v*) utilized a kind of modern dance that derived much from both classical ballet and other forms. *West* Szde Story is undoubtedly the outstanding example of the way in which dance achieved equal partnership with the other elements. but earlier productions displayed a marked tendency in this direction. The dance scenes in *Kiss Me,* Kate, for example. were closely allied to the plot and were of an intense, dynamic nature. being devised by Hanya Holm, a choreographer of German origin and a naturalized U.S citizen. In Oklahoma and, later, in Paint Your *Wagon,* Agnes de Mille. who had been trained as a classical ballet dancer and who subsequently studied modern dancing, brought the dance closely into the plot and characterization. It is significant that choreographers such as Robbins. De Mille and Michael Kidd (the choreographer of Finian's Raznbow and Destry Rzdes Again, among many productions) graduated from the role of choreographer to that of producer of the entire production. the dance element became so much a key to the nhole work that in many cases it was essential for the choreographer to have complete charge in order to integrate this element with the others.

In British works dance also occupied a vital place, providing much of the humour in certain productions and possessing high standards both in arrangement and in the skill demanded from the performers. But in Britain modern dance did not exert quite the same influence as in the United States and choreographers were not able to make use of it with the same impact as their North American contemporaries. On the other hand they used period dance, such as the Charleston in *The* Boy Friend, in ways that added much to the over-all effect.

Films and Television.—Theatrical dancing in the early 1960s played a prominent part in both film and television productions. Even in mediocre films the music and dance element was often of a quality far beyond that of the rest of the production. In both media only dancers of a high all-round ability could find regular work. and choreographers became more and more inventive in their constant search for novelty. Indeed, the influence of the modern musical stage production was very strong in both film and television. for almost every kind of variety show possessed well-integrated dance arrangements. Although advanced experiments were being carried out in television with electronics and new types of lens, so that dancers could be apparently multiplied in number, distorted and seemingly robbed of all weight, for the most part the dance element was left to create its own impact without undue interference from producers or technicians. (A. H. F.)

Ballet is an art of the theatre made up of music. dancing, costumes and scenery. It can tell a story, suggest an atmosphere or illustrate the music, the emotions or dramatic situations being conveyed in movement alone. The dancers are taught the technique of ballet that has developed organically like a language; in classical ballet this language is used directly, in modern ballet it may be adapted in such a way that its basic form is no longer immediately recognizable. In whatever way it is used the technique of ballet is an essential discipline for the training of ballet dancers.

The choreographer's function is to orchestrate the movements of the dancers. Though systems of notation are being developed, in practice a particular ballet is handed down from generation to generation through memory and tradition. The changes that inevitably develop have helped to preserve the classical ballet, since, while the essentials remain, details that belong specifically to a period and would seem incongruous at a later date are eliminated.

Ideally music, dance and décor are equal partners in exploiting a theme. An outstanding example of the successful ballet is Petrouchka, in which composer Igor Stravinsky translated popular music in terms of a symphony orchestra; choreographer Michel Fokine translated folk movement for the use of trained ballet dancers; and artist Alexandre Benois adapted popular costume for the stage. These three collaborators co-operated in presenting a dance drama that is readily understandable without the need of program notes.

Ballet must stand on its own without the support of literary explanation. This illustrates both its strength and its weakness. It cannot tell a complex story—how does one convey sister-in-law in action?—nor can it paint subtle characters. On the other hand it can suggest an atmosphere in a way that no other theatre art can. In this same *Petrouchka,* for instance, audiences can either follow a straightforward fairy tale of the loves and jealousies of puppets or. if they are more imaginative, they can read into it the agonizing birth of a soul.

Tamara Karsavina in Le Spectre de la Rose and Galina Ulanova in the first act of Romeo and Juliet revealed the poetry of adolescence in an unforgettable "moment of truth." The role of the poet from Molière to Jean Cocteau has always been a major one in ballet; if the scenario is faulty the ballet is doomed to failure from the start.

The genius of Sergei Diaghilev lay in the skill with which he composed his team of artists, a skill never before matched in the history of ballet. In addition, therefore, to the choreographer, composer, painter and poet, ballet requires an artistic director whose knowledge of the arts must be authoritative and extensive and who must be creative in that his presence inspires creation in others whom he himself has carefully selected.

The role of the dancer varies considerably according to the demands of the choreographer. In some cases the dancer interprets a fully conceived work, while in others it is the personality and physique of the dancer that inspires the choreographer and, in such cases, the dancer collaborates to a greater or lesser degree in the creation.

Under ideal conditions the composer also collaborates closely with the choreographer; *e.g.,* Tchaikovsky and Marius Petipa, Stravinsky and Michel Fokine. Music for ballet is only part of a whole, and good ballet music is not necessarily good music considered in isolation (*e.g.,* **A.** C. Adam's Giselle), though it may be that the music is considered by many to be more successful as a concert suite than on the stage (*e.g.,* Maurice Ravel's *Daphnis and Chloé*). In the case of already composed music, timing is an all-important factor, since the eye takes in a situation with greater rapidity than the ear. Much music is unsuited to ballet not merely because it is absolute in the sense that it is complete in itself but also because it is too long in its development. Few people outside the ballet theatre realize the short duration of even the longest adagios and variations in classical ballet. Because of their brevity, the successful symphonic or concerto ballet is an exception.

Much the same applies to the role of the decorative artist. His shapes and colours are not to be seen in the flat and static form of a fresco composition but in a continually changing and developing picture. Not only must his costumes assist the dancers in

motion they must also reveal the choreographer's intentions at all times. (A. L. Hl.)

Modern Dance. — This form of theatrical dance came into existence in the early years of the 20th century largely through the revolt of certain pioneers against what was regarded as the rigid formality and outmoded conventions of classical ballet. In Germany Mary Wigman (*q.v.*) studied the relationships between music and movement first under Émile Jaques-Dalcroze and later under Rudolf von Laban. With this strong, scientifically inclined background. she began to compose her own works, her first publicly presented creation being *The Seven* Dances of Life, in 1918. Soon she gathered round her a number of enthusiasts and her influence on the development of modern dance was considerable.

This form of dance was fostered in Germany after Mary Wigman's early experiments, but elsewhere in Europe it did not. generally speaking. gain much response. In the United States. however, two pioneers emerged at the end of the 19th century and were followed by a continuous stream of creative artists. Isadora Duncan (*q.v.*), studied ballet as a child but broke away from what she considered its undue restrictions in order to express herself in her own way. Her vaguely formed idea was that dance is the expression of an inner urge or impulse and that the source of this impulse comes, physically, from the solar plexus. In working out her movements she was influenced strongly by the art of ancient Greece, her favourite styie of costume being a flowing tunic. She is generally believed to have been the first western dancer to perform on the stage in bare feet. Soon her work became known in Europe, and she gave successful performances in many European cities. In 1904 she opened her own school in Berlin and, even in those circles that refused to accept her theories, her experiments exerted their influence on various forms of theatrical dance. But her definite avoidance of set movements and figures and her constant improvisations that mere never crystallized into an established technique meant that, notwithstanding her personal influence, no systematized method was left after her death in 1927.

Ruth St. Denis (*q.v.*), who is often referred to as the "first lady of American dance," sought ideas and actual dance forms from the east, producing theatricalized versions of nautch (*q.v.*) and yogi dances. But, different though her style was from that of Duncan. she too sought the same end of releasing dance from what she vowed were the tight and frustrating restrictions of traditional ballet and the virtuosity of *pointe* dancing. Unlike Duncan. however, St. Denis, in collaboration with her husband. Ted Shawn, (*q.v.*), himself a pioneer, was able to develop a technique and training method. Many of her dances were based firmly in religious ideas and she reintroduced dance into certain religious services.

St. Denis' greatest, if most controversial, pupil was Martha Graham (*q.v.*), who studied and worked for seven years at Denishamn, a school and workshop set up by St. Denis and Shawn. Afterward she produced. both by herself and with a small company of votaries whom she trained complex works in which she sought to express deep states of mind and profound emotional relationships. Her images were frequently so personal that their meaning was elusive. Nevertheless, some of her movements had an intense and powerful impact, even when their literary significance could not be understood. While she herself resisted all temptations to give way to popular appeal, she influenced several C.S. choreographers and her work undoubtedly affected the trend of the U.S. musical, with its stress on a variety of dance forms integrated both with themselves and mith the action of the play.

In the U.S. other leaders in modern dance included Doris Humphrey; Hanya Holm, who created dances for several musicals; and Katherine Dunham, who added to the vocabulary of the modern dance form with innovations derived from her studies in ethnological dance.

Gradually more and more teachers and practitioners of modern dance realized that it could no longer remain in isolation from the supreme physical discipline of classical ballet. As a result, in many modern classes exercises derived from those of classical ballet were employed in the basic training.

There were also signs that in turn modern dance was insinuating itself into the vocabulary of classical ballet. (A. H. F.)

V. TECHNIQUE OF MODERN SOCIAL DANCING

1. Six Basic Steps. — All the modem social (ballroom) dances are composed of combinations of the six basic steps. Without a thorough knowledge of these basic steps, one cannot hope to do any of the modern dances really well. With a knowledge of them, there are practically no combinations. done ordinarily in the fox trot and the waltz, at least, that cannot be picked up readily The six basic steps are: the walking steps. the chassé, the waltz. the balance, the pivot and the running steps.

Walking Steps. — Each of the walking steps takes up two beats of the music. On the first beat. the man places the whole foot forward on the floor. toe first, the heel barely touching. The woman reaches backward nith the toe as far as possible On the second beat. both rise slightly on the toes to give spring and pep to the step, and finish.

Step smartly and lightly, shifting the weight from one foot to the other. After taking a step mith one foot always lift the other off the floor. Never drag or slide the feet along.

Practise taking long. slow steps about the room. Women, in their practice. should give especial attention to walking backward. Keep the knees straight and firm and always make. the toes lead. Dance as if you did not have a foot but only a great toe Practise stretching the toes forward, or backward, as far as possible. and always keep them turned out to avoid a pigeon-toed appearance. Always step in a straight line. directly forward. directly back or directly to the side. This is fundamental to a good balance. good appearance and a sense of unity with your partner.

The *Chassé.*—The chassi. is a short, quick step directly to the side — either to the right or to the left. For the left chassé, step directly sidewise to the left and draw the right foot up to the left. For the right chassé, step directly to the right with the right foot and draw the left foot up to the right. Complete the movement mith smartness and precision by bringing the feet together so that they actually touch each time.

The *Waltz.*—The waltz is a combination of a walking step and a chassé (in 3/4 time). In the modern waltz, the accent falls upon the walking step. and all the steps are of the same length and value. Practise the waltz steps to modern waltz music, counting one. two, three with a definite accent each time on the "one." Or. better still. keep time with the words, "step, side. together," the accent falling upon "step."

The waltz may be done forward, backward or used as a turn to left or right. The waltz may also be danced to fox trot music by holding the first step for two beats and giving the second and third steps each one beat.

The Balance. — The balance is a hesitation. Step forward, back or to the side with the whole weight upon one foot. and rise; pointing the free foot forward, back or to the side with the toe just touching the floor. The balance is used in many combinations in both the fox trot and the waltz. When danced to fox trot music, it is given two counts. When danced to waltz music, it is given three. It is a very graceful step. interesting to do, and, moreover, a sure means of developing a good sense of balance.

The Pivot.--This is simply a particularly graceful and effective way of making a quick turn. Always see that one foot is directly in front of the other. Rock forward, on right foot. bringing the entire weight upon the ball of the forward foot, and spin round, making a quarter turn. Rock back on the left foot, and repeat the motion.

The Running Steps. — These are known as syncopated steps because three steps are taken to four beats of the music; take three quick running steps, then pause on the fourth beat. The syncopated steps are helpful to the woman in following because they teach her to step quickly. This is a decided asset to one who must change her step rapidly in order to follow various partners. Although the running steps are faster than walking steps. they are just as long. It is always best to take long steps, whether they be fast or slow. A short step betrays a lack of confidence.

A rnan must train his feet by constant practice to do the various steps and combinations automatically in order to inspire confi-

dence in his partner and to lead with that easy nonchalance that is the mark of an accomplished dancer. It is a mistaken idea that to be a strong leader a man must take a death grip upon his partner and push and pull her with force about the floor. Hold your partner firmly! yes — especially with your right hand — and then go through your steps with certainty and precision. If she knows the steps she will be able to follow. If she does not no amount of forceful guiding upon your part will be of any help to her.

The rumba, a graceful and exciting dance step, is based on the rumba rhythm: one, two, three. pause; one, two, three. pause. Because the knees are actively employed in this step, the dancers stand about eight inches apart. Stand erect, heels together, and relax your weight on the heel of the left foot and at the same time cross your right knee in front of the left. Then shift your weight to the heel of the right foot and cross the left knee in front of the right, Once again shift your weight to the heel of the left foot and cross the right knee in front of the left. Pause after the third count. This is the basic rumba motion, unique for this dance and employed in all rumba steps, whether forward or backward.

2. The Correct Position. — The best position is the easiest and most natural. Stand erect on the balls of your feet, making yourself as tall as possible. Rest the weight upon the foot that you are not going to use first. leaving the other one free for your initial step. Keep the back straight, the shoulders relaxed, the chest out. head up, chin in, eyes directed over your partner's right shoulder, arms high, at about shoulder height. It is very important to keep the arms well up in dancing. Women who unconsciously allow their arms to sag always seem heavy, even though they may be very light on their feet.

The man holds the woman straight in front of him — never to one side — and firmly. just close enough to enable him to guide her easily. His right hand rests in the middle of her back, just below the shoulder blades. His left arm is extended to the side and bent slightly at the elbow, the left hand holding her hand lightly.

The woman rests her left hand lightly upon the back of the man's shoulder. She should never curl her hand under his arm. Trick holds are out of date. Her right arm is extended to the side in an easy, graceful curve with the right hand resting lightly in the man's. Be careful to avoid a spasmodic clutch. It betrays a tension and a lack of confidence that are destructive to your partner's pleasure in dancing with you.

In starting. the man steps forward directly toward his partner, leading with his left foot. The woman steps directly backward, leading with her right foot. Don't be afraid of stepping on your partner's feet. If you start on the proper foot and step in a straight line, directly forward or directly back, you never will get in your partner's way.

There is no fixed sequence for the six basic steps or any of their variations. In modern dancing, the leader may swing into any step at any time. as his fancy may dictate or the music seems to suggest. This is why it is so extremely important that the woman should be thoroughly familiar with the steps her partner may decide to do. The only way to gain confidence and to overcome self-consciousness, awkwardness and stiffnessin dancing is to learn the steps and by constant practice to master them so perfectly that you could almost do them in your sleep.

Self-assurance, ease, grace and relaxation come as a natural consequence of knowing how. Self-consciousness, stiffness, awkwardness will vanish, and you will find yourself dancing with ease and spontaneous enjoyment.

DANCE, PRIMITIVE. Primitive dance, in the sense of elementary or the earliest dance, does not exist today. though Australian and other aborigines trace their rites to an ancestral dream time. But many dances retain all or part of their original character and purpose. They are integrated with activities of daily life and religion and are impelled by a desire to communicate with supernaturals. to control the spirit world and nature by offering, sacrifice and thanksgiving. Such dances survive in all continents, though those in the neighhourhood of industrial centres have suffered more change than those in the wilderness. The term primitive dance will here refer to dance with recognizable retentions of pristine purpose.

Functions. — The earliest dance rituals probably celebrated the crises of life, such as puberty, illness, cure and death. Among dances for economic survival, hunt and animal rites generally preceded agricultural festivals. These types persist, while social, contest and display dances continue to gain in prominence. All contain themes of fertility and physical exuberance.

In Australia, pubescent boys are initiated in groups during the *waiung-arree.* A dream song accompanies the climactic *wallang-arree* dance by the neophyte and attendants. During puberty rites for girls. women of the Wargaitj tribe near Darwin approach the mother of the neophyte in a line dance and enact a symbolic rebirth. In South America the Ona and Yahgan Indians of Tierra del Fuego impersonated demons at a boy's initiation. with terrified women as spectators. The Maipure and Baniba Indians of Venezuela masked as the demon Mauari to initiate boys or girls. The Choroti and Ashluslay women of the Gran Chaco protected a girl in circle dances. Many California tribes celebrated a boy's initiation with masked spirit impersonations and a girl's coming-of-age with circle dances. In the secon'd half of the 20th century, the *gahe* or crown dancers of the Apache Indians were still masking as mountain spirits for a pubescent girl's benefit.

Curative rites are universal. In central Asia they are particularly dramatic. The Siberian and Manchurian curer-seer or shaman possesses beneficial and nefarious powers from an animal spirit or ghost. He works himself into a trance by chanting, stamping, leaping and whirling to the beat of his drum, sometimes with the aid of narcotics. In Eskimo ceremonialism the focal angakok trembles and falls in a trance. Among North American Indians, medicine men still dance and juggle in the elaborate ceremonies of the Algonkin *mide* and the Iroquois yeidos. In South America, individual shamans can cure or lead harvest ceremonies, as does the female *machi* of Chile's Araucanians.

Trance dances take various forms throughout Asia, as in the firewalking of India and the whirling of Turkistan and Afghanistan.

The therapeutic possession dances of Africa have spread to the new world. as in the *candomblé* of Brazil. the *winti* of Surinam (Dutch Guiana) and the *vodun* of Trinidad and Haiti. In these dances an African deity enters a devotee and produces frenzied dancing in the character of the god. Visionary cults are also native to the new world. as the ecstatic peyote leaping of the Huichol and Tarahumara Indians of Mexico and the datura cult of southern California tribes.

Mortuary rites are also ubiquitous. but vary in their emphasis. The California Yuma focus on cremation processions. Women often officiate at wakes and memorial feasts, as among the Iroquois. In Africa. secret societies convene at funerals. The dead may attend in imagination or as masked figures. as on Australia's Melville Island and as in the British Cameroons of Africa.

Animal impersonations serve as cures if a bear. eagle or other spirit must be appeased. They also enter into totemic memorial rites. exemplified by the Kwakiutl raven or wolf-clan emblems, or the Australian emu and kangaroo. But they function primarily in the hunt for food. A hunter or entire tribe addresses the creature's spirit with a placating formula and perhaps a mimetic pre-hunt dance, then with a thanksgiving dance after a successful expedition. The animal varies with the environment: it may be a duck. whale. buffalo. deer, tiger or bear, the latter of which is worshiped from the Carolina Cherokee to the Ainu of Japan. The enactment can be realistic, as in the Plains buffalo dance; semi-stylized, as in the Yaqui (Cahita) and Pueblo deer dances; or stylized. as in the Pueblo buffalo dance.

Food gatherers celebrate the harvests of annual first fruits: maple sugar, berries, wild rice, acorns, algarroba. Agriculturalists address the tutelaries of corn. beans, squash. melons and of the much-needed rain and sun. The natives of the southern United States. the Mexican highlands and the Andes maintain their earlier animal dances along with the maize ceremonies: the rain-bringing *kachina,* the sun-splendid *quetzales,* and the *voladores* for sun and fertility.

Ceremonies developed composite contents as a result of cultural innovations and borrowings from other peoples. Cure. totem and animal dances blended. Sword and stick combats came to bring victory to seasonal new life; among the Oraons of India such combats accompany wedding processions. Ceremonial clowns, usually masked. fuse concepts of death, rebirth, cure. harvest; they enact ancestral or supernatural prototypes. They terrify. censure and chastise as well as amuse, and they can enact social parodies.

The Drama. — The dramatic concepts involved in dance are presented in manifold forms. Sometimes the impersonations enact a myth, such as the wanderings of Australian ancestors or the emergence of the *kachina,* the eponym of the Hopi. The actors vary from a virtuoso soloist to a small trained group or the entire community. War mime may engage a pair of men as in Borneo or a large group as among the Zulu and Afghans. A long list of dramatis personae may add dialogue to movement, as in the Mexican *tlacololeros* combat of farmers and their dog with a destructive tiger.

In their full splendour the dances enhance their potency with other dramatic elements: the setting of an underground shrine, a sacred grove or a plaza; symbolic designs on body, mask and costume; paraphernalia such as evergreens, flowers and rattles in the hand or on parts of the body; instruments such as bullroarers, (*q.v.*) drums and flutes; spirit cries and songs by the dancers or separate musicians.

The enactment may last an hour, as in the Iroquois false-face dance, with the entrance of maskers, curative procedure, paired dance by maskers and sponsoring matrons. and round dance for everyone. After secret preliminaries, the public drama may take several hours. as in the Hopi snake-antelope ceremony. where the priests circuit the plaza four times, stamping on the underworld entrance, then sway in parallel lines, circle four times in groups of threes with the snakes and finally release the reptiles to the four directions in search of rain. The whale cult of the Alaskan Eskimos extends over a week in anticipation of a catch. with a woman as whale, incantations and songs during the catch. dance of rejoicing by the shaman and people, a three-day "mourning" period of placation and a final feast with frenzied dancing. In British Columbia the Kusiut society's mythical dramas may last 27 days.

Patterns. — Not only the larger structure but each dance segment follows traditional patterns. Sometimes the sequence and steps are set. as in the Santa Clara rainbow dance. Sometimes, as in the Pueblo game-animal dances, the composers have considerable leeway within the frame of entrance, slow dance, fast dance and exit. Often the dancers improvise within an established style, as in Afghan and Plains war dances. African animal mime, and antics of sacred clowns.

Techniques vary greatly in different parts of the world. even between adjoining groups and between different dances of one tribe. Some people emphasize footwork; others torso motions; others hand gestures. African and Afro-American dances are often acrobatic and violent. while Mexico's native dances are dignified and measured. In Oklahoma the serpentine stomp dances of the Cherokee and Creek adjoin the lively Kiowa display dances and have been exchanged. From Australia to the North American plains. the women's shuffle serves as foil to the men's leaps and gyrations. Eskimo men jerk, while their women sway with curving arms. Yet the sexes may step in unison, as do the Hopi butterfly dancers.

Basic formations, such as circles and lines, are more universal than physical techniques. However, circles may proceed with or against the sun. among hunters or agriculturalists; they also may open into a meandering line. Two lines may run parallel or cross over. or interweave. Sometimes the four cardinal directions determine the dance orientation and ground plan, as among the Great Lakes tribes and Pueblos.

In functional dances all motions and formations are fraught with symbolism: the phallic stamp. the generative leap and kick. the ecstatic whirl, the vernal arch. the solar or sinister course for power from the sun and sky or from the moon and earth, the serpentine course for fertility. Two factions in opposing lines may compete as good and evil spirits, or the sexes may entice each other. The performers may interlace in circles or in pairs, but in aboriginal dances men and women never dance in a ballroom embrace.

Persistence and Change. — Many of the earliest rituals have persisted. even in the midst of modern civilization. The Rumanian Calushari. the Austrian Perchten and the Portuguese Bugios still enact fierce spirit impersonations. Serbian girls enact the rain-bringing dance of the Dodole supernaturals. In the midst of Catholic ceremonies, the Aymara of Bolivia retain their *choquela* mime of the vicuña hunt; the Quechua of Peru celebrate their *inti raimi* winter solstice; the Aztecs of Mexico perform their sun dances and animal dances. Pueblo and Iroquois conservatives even maintain their ritual organization, including the integration of dance rites with clan and moiety patterns.

Yet changes have been continuous and recently accelerating, due to creative inventions, adaptations to new environments and economic conditions. and borrowings from friends or impositions by conquerors, Often a dance changes meaning, from war to cure. from hunt to weather control, with obsolescence of the original function. Evolution from dance ritual to art theatre has been a frequent event. as in Greece, India, Japan and elsewhere. An equally frequent trend is secularization into folk and social dancing and into displays for tribesmen or tourists.

Aggressive European culture arid religion have exerted a profound and usually destructive influence on native dance traditions in all continents. Not only did pagan dances of Europe change under the sway of medieval Christianity; they have been transported to the new world and have amalgamated with new-world rituals, under names like *moros* y *cristianos* (Moors and Christians'~.*Santiago, matachin* or *conquista.* European steps have blended with native styles and have produced new vocabularies for dance rites as well as secular round and couple dances. New forms have sprung up in Latin America and Oklahoma. Colonial or modern dress. instruments. paraphernalia and backgrounds have been replacing symbolic native costumes and settings. Often the native dances have disintegrated.

The new world has felt an almost equally strong influence from

Africa. through the slaves of European conquerors. African rituals have persisted with colourful variations. even in the urban Holiness churches of the United States. They have mingled with Spanish. French. British and Indian elements on southern plantations and have spread to northern cities as exuberant variants of jazz dance. Thus, while ancient, functional. primitive dances are disappearing, new forms continue to arise from time-honoured patterns.

DANCE FORMS IN MUSIC. The essence of dancing is rhythm, and as soon as it became possible to write down music in a reasonably accurate rhythmic form, dance forms appeared in music more and more frequently.

Medieval Forms.— There are two-part dances of the early 13th century in the same manuscript that contains *Sumer is icumen in,* and contemporary European sources include types of dances such as the *ductia, estampie* and *stantipès.* Some of the court dances (*danses royales)* already show a tendency toward pairing movements of contrasting mood and tempo, and although these are generally monophonic it is probable that the instrumentation was extremely varied, for miniatures of the time portray dancers and groups of musicians in various formations. The round-dance, or *carole,* consisting of alternating and repeating sections. influenced the medieval carol. which was frequently constructed in the same may. In Spain. a few pilgrims' dances have been preserved, which doubtless resounded along the route passing through Limoges on the way to Santiago da Compostela. Less joyous bands of religious travelers. the flagellants, are also said to have danced with instrumental accompaniment as they made their way from town to town.

An Italian manuscript of the 14th century has preserved a group of dances that are monophonic like the *danses royales* but considerably varied in mood and style. There are the *istampita,* derived from the *estampie* favoured by troubadours. trouvères and their jongleurs; the *saltarello,* the *trotto* and the *rotta.* The *rotta* was a quick after-dance that followed a slow and solemn initial dance. Repetition of sections is again noticeable in these compositions, a different ending being provided for the first and second statement of each section. Polyphonic dance music came into fashion in the late 14th century; it was usually performed by a trio of wind instruments such as two cornetti and a shawm, the music being for the most part memorized or extemporized. It was some time before attempts were made to write down dance music in accurate fashion. but the 15th century is rich in manuscripts containing the themes of various *basse-danses,* which were played in measured rhythm by the instrument lowest in pitch. while the other two descanted above. Occasionally the three parts are written out in full, as in the *Alta* of the Barbieri Cancionero and the three *basse-danses* (one by an Englishman called Tyling) in the Trent codices. About 1500 a book on dancing by Toulouze printed several *basse-danse* melodies for the first time.

Renaissance Forms.— Dance music flourished with especial vigour during the Renaissance, owing to the growing popularity of the lute (and, later on, of keyboard instruments') as well as the continued development of the small groups, nom extended to include both bowed and plucked stringed instruments. Although much new dance music was specially composed. it was common to take songs and other compositions. arrange them slightly by the addition of ornaments and then perform them as dance pieces. Thus a French chanson for three voices, *Entre Peronne et St. Quentin,* appears in the Glogau Liederbuch as a four-part instrumental composition entitled *Der Pawir Schwantz* ("Peasant's Dance"). In the field of dance music proper, the popular paired dances such as *pavane-gaillarde, passamezzo-saltarello* and *hoftanz-hupfauf* hold the attention of composers until nearly the end of the 16th century, but aiongside these pairs there begins to come into being an extension of the basic idea, with a third dance added to form a choreographic triptych. In France the *basse-danse-recoupe-tourdion* and in Italy the *pavana-saltarello-piva* gradually assisted the dance to gain a stylized detachment, from which eminence it soon gave rise to the suite (*q.v.*), which was to enjoy such a lengthy vogue in instrumental composition during the baroque era.

Understandably, dance compositions for lute or virginals could hardly be used for large groups of dancers, and louder ensembles sometimes up to 10 or 12 in number supplied the necessary background for court balls. This type of dance music was usually in four-part harmony, though five-part settings are not uncommon. as may be seen from the publications of Claude Gervaise and Étienne du Tertre in the mid-16th century. Dance forms became a favourite medium of expression for the English composers for consorts of viols. and though the pavane-galliard pair mas by far the most popular..as indeed it was in the contemporary school of virginalists, there are numerous examples of the *alman, coranto* and *jig.* The slow. stately *sarabande,* mentioned for the first time in printed literature by a Dominican priest resident in Mexico in 1579, gained favour among keyboard players in particular. and it was not long before prototypes of the suite were found. By the middle of the 17th century the four dances, usually known in their French spellings of *allemande, courante, sarabande* and *gigue,* had crystallized into the suite. which was modified and extended throughout the continent without. however, getting rid of the prevailing influence of dance rhythms and tempi.

French and Italian **Forms.**—Newcomers to the ever-growing repertory of dances were the local peasant dances from various parts of France, refined and raised to a degree of courtly beauty by the composers who served under Louis XIII and Louis XIV. From the Auvergne came the sprightly *bourée,* from the Dauphiné the *gavotte* (often followed by a *musette* before the gavotte was repeated) and from Brittany the lively *passepied.* The *rigaudon* probably originated in Provence and the *minuet* in Poitou, while Normandy provided the *loure,* a dance in moderate tempo associated (like the *musette*) with the bagpipe family of instruments. All these dances were used by 18th-century French composers of suites, sonatas and *ordres,* and all were subjected to special refinements of rhythm and tempo that sometimes changed the character of the dance from its original form. It is doubtful whether a Parisian connoisseur of the music of Rameau and Couperin would recognize a dance type immediately if he were to witness a performance in a country village, though in some cases there was an obvious similarity.

Italian composers of the 18th century. whose instrumental music was imitated all over Europe, made extensive use of dances in their *sonate da camera* as well as publishing countless anthologies of dance music without any pretense to greatness. This was utilitarian music for the study or the small ballroom, yet some of the best composers of the age contributed music in this vein. Often there was no attempt to group the pieces into suites or sonatas, and dances of each genre were grouped together under such names as *balletto, giga, sarabanda, corrente* and *allemana.* In the sonatas. thematic links between one dance and another were not unusual. for this treatment had a venerable ancestry going back to the days when composers first discovered that it was possible to produce a group of dances of the utmost variety even though only one melodic idea prevailed.

Later Forms.— The minuet was to the 18th century what the waltz was to the 19th, though the former penetrated the symphonic barrier in a way that no other dance ever has done. Haydn and Mozart wrote dozens of minuets for ballroom use and did not disdain even the humbler *contredanse* (a name very probably derived from the English country dance) and the graceful *ländler.* In sonata: symphony and string quartet the minuet traditionally oc-

cupied third place as a light interlude between slow movement and finale, but in the hands of Beethoven the dance-like character disappeared, giving way to the more rampageous scherzo, whose only link with the dance was its trio section. The waltz has made only very occasional contact with the symphonic repertory, though it frequently appears in operatic scores. Dances such as the Polish *mazurka* and Bohemian *polka* are found first and foremost in their national art-music. while the names of the *polonaise, écossaise* and *malagueña* refer unmistakably to their country of origin. Spanish dances in particular have attracted the attention of non-Spanish composers, mainly in France and Russia, so that the *habanera, jota* and *fandango* have become almost internationally known through orchestral settings. Modern dance forms have made only a very slight impression on the orchestral and chamber music repertory. though there are a few examples of dance suites in a national idiom comparable to the Hungarian and Slavonic dances of the 19th century. In works for the concert hall, composers of the early 1960s seemed to prefer to elaborate upon dances of earlier periods by decking them out with newly devised musical trappings.

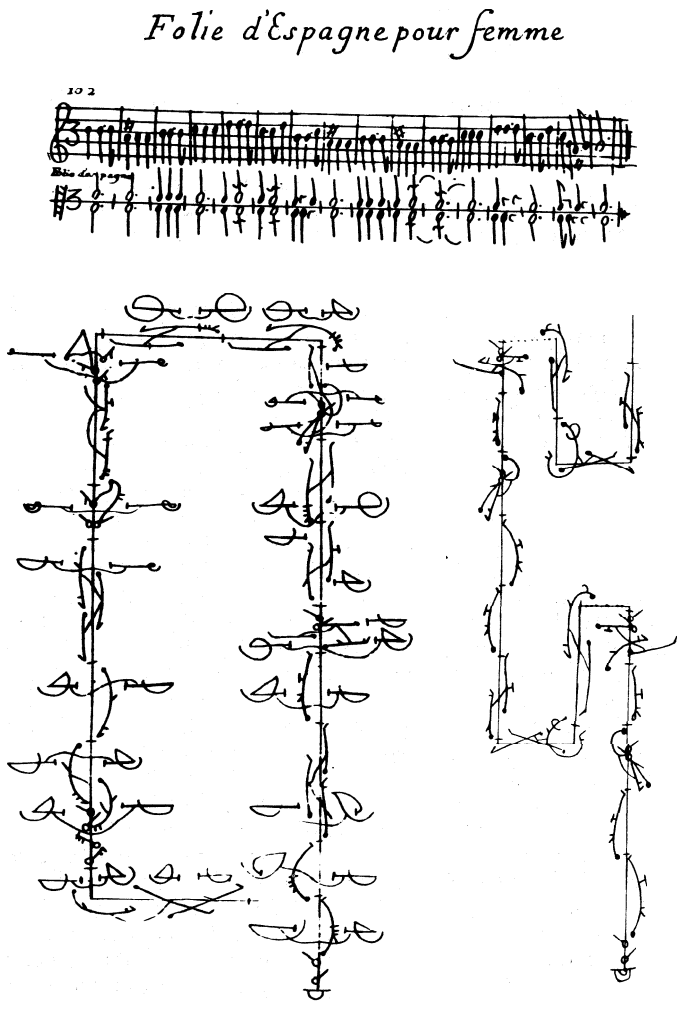
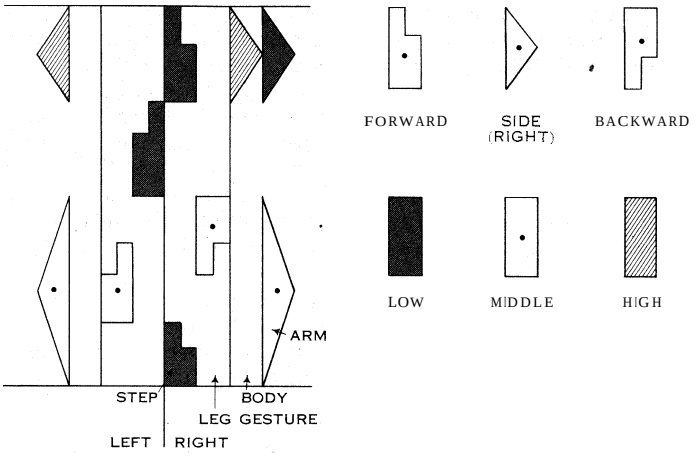
DANCE NOTATION is the recording of dance movement on paper through the use of symbols. Man's effort to make a written record of body movement is not a recent development. It is believed that the ancient Egyptians used hieroglyphs to represent dance movements and that the Romans employed a method of notation for gestures of formal greeting. However, the earliest known manuscript setting forth a dance notation method dates from the late 15th century.

The history of dance notation follows closely the development of dance. As dance became more complex. the first primitive notation devices gradually gave way to progressively more advanced methods until, in the 20th century, dance notation became, in some instances, thoroughly scientific. Many of the older devices continued to appear in modern times, however, particularly in the form of shorthand used for established movement patterns such as in ballet. Systems of movement notation fall into six categories: word abbreviations, track drawings, stick figures, music notes, mathematical forms and abstract symbols.



RAOUL FEUILLET'S SYSTEM OF DANCE NOTATION USED DURING THE 18TH CENTURY



LABANOTATION, THE MOST DIVERSIFIED AND UNIVERSALLY USED SYSTEM

Labanotation is read from the bottom up. The location of a symbol on the staff shows the part of the body to be used. The shape of a symbol indicates direction, its shading shows level and its length controls the time value of the dance movement

In the early Renaissance in France, the *basse* "low" dances were recorded through word abbreviations (R for *révérence, B* for *branle,* etc.) because the steps were simple and well known. The first books employing word abbreviations include *L'Art et instruction de bien danser* (1488) and Thoinot Arbeau's *Orchésographie* (1588). As the patterns of the dancer's path across the floor became more intricate, systems based on track drawings appeared. Indication of the actual steps used on these tracks reached its highest development in Raoul Feuillet's *Chorégraphie ou l'art de décrire la danse* (1700). Through this system, which was widely used in Europe, a record of the dances of that period exists, although many details of performance were not recorded.

During the reign of Louis XIV, professional ballet first became distinguished from social dance, and thereafter notators added to the Feuillet script in order to record the more complex use of the arms and body. This soon proved too cumbersome, and a new approach was tried in showing the various positions by tiny stick figures, usually placed under the music notation to indicate the timing. The first system of this kind, *La Sténochorégraphie,* was introduced in France in 1852 by Arthur Saint-Léon. Later a very similar device appeared in the *Grammatik der Tanzkunst* by Albert Zorn. the German balletmaster in Odessa. These systems received widespread acceptance and were subsequently modified and improved by others.

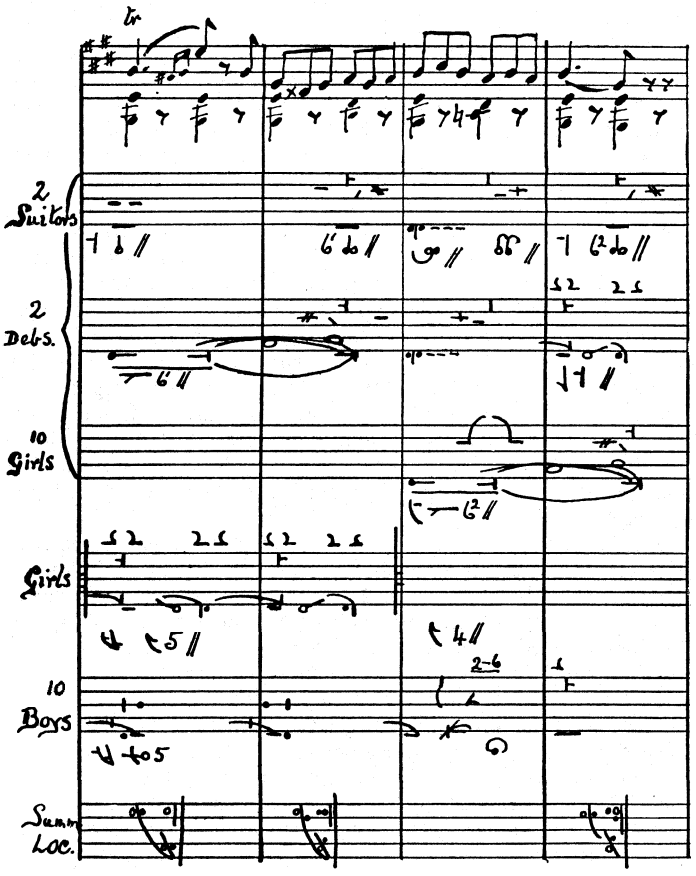
The principal disadvantage of a stick-figure system is the lack of accurate indication of continuity or relationship and flow of movement. Believing that the answer to this problem lay in music notation because of the common element of time, many subsequent notators adapted music notes to record dance. In his *Handbuch der Tanzkunst* (1853), Bernard Klemm used music notes in the description of steps, but the first to produce a full-fledged system of this kind was Vladimir Stepanoff of the Imperial Maryinsky theatre in St. Petersburg. whose book *L'Alphabet des mouvements du corps humain* mas published in Paris in 1891. He aimed to fill the needs of ballet: and though the system was dropped from the St. Petersburg Ballet academy curriculum after a few years, it was the method in which much of the repertoire was recorded.

During the early part of the 20th century. dance developed far greater range of movement and also made use of the floor! as in falls. To record this variety. a system of notation fundamentally

applicable to all movement was needed. In England, Margaret Morris, whose interest in recording movement extended beyond dance into such fields as physical therapy, brought out in 1928 a system based on abstract symbols. In the same year Rudolf von Laban published his *Kinetographie* in Vienna. Laban's interest in movement encompassed dance, theatre, sports, anthropology, physical therapy and industry. His system, known in the United States as Labanotation, employs abstract symbols. Its scientific approach to movement provides for indication of quality, stress and expression, making it applicable to any held in which human movement needs to be recorded.

During the decade between 1946 and 1956. two systems appeared (one by Joseph Schillinger and one by Noa Eshkol) which were based entirely on a scientific analysis of movement, described mathematically in terms of degrees of a circle in a positive or a negative direction. In spite of these advances. notation was still used by comparatively few, and the desire for a quick general description of movement resulted in new systems based predominantly on pictorial stick-figure drawings. Outstanding among these was the system of Joan and Rudolf Benesh brought out in 1955 while Joan Benesh was a member of the Sadler's Wells Ballet in London and used by that company in shorthand form to record its ballets.

The extent to which a system of movement notation can be developed and the range of uses to which it can be put are best seen in the Laban system, which attracted people from many different fields who had a common interest in recording movement. Through diversified applications. the system became highly developed, its universality assured and its practicability tested. Because it stated the basic elements of movement used and indicated the dynamics, timing and sequence. it could record all forms of movement. All styles of dance techniques, ballet, modern, Spanish. Hindu, etc., have been recorded, as well as sports, diving, skating and other activities such as physical therapy and industrial observation of movement. Major works so recorded range from the classic ballets to Kurt Jooss's *The Gveen Table,* George Balanchine's *Agon,* Doris Humphrey's *The Shakers* and Broadway musicals such as *Kiss Me, Kate* and *My Faiv Lady.* Its widespread use resulted in the establishment of several dance notation centres, notably in the United States, England and Germany.



BY COURTESY OF JOHN CRANKO

EXTRACT FROM "LADY AND THE FOOL" ILLUSTRATING THE BENESH SYSTEM OF NOTATION INTRODUCED IN 1955

In New York the Dance Notation Bureau, Inc., founded in 1940 for the advancement of the art of dance through the use of notation, adopted the Laban system as the best, after studying all other available methods. The work of this group produced an advancement in the knowledge and use of dance notation, and Labanotation became established as an aid in teaching dance and in the study and reconstruction of dance works, as well as a means of recording works for copyright registration. (AN. H.)

DANCE OF DEATH, a medieval concept, expressive of the all-conquering power of death, to which the arts of painting. sculpture and music all made their contribution. In painting and sculpture this phrase, often used loosely in the sense of *memento mori* ("effigy of death"), should be restricted to representations of a procession of the living and the dead.

The Dance of Death probably originated in a mimed dance or a morality play. Such a drama existed in France in the late 13th century and probably earlier. The oldest-known musical example is the dance song "Ad mortem festinamus," found in a 14th-century Spanish manuscript preserved at the monastery of Montserrat. The oldest pictorial example was that in the cemetery of Les Innocents in Paris (1424–25), in which the whole hierarchy of church and state, from the pope and the emperor down to the child, the clerk and the hermit. formed a stately dance. the living characters alternating with skeletons or corpses and the dead escorting the living to the grave.

The work was a stern reminder of the inevitability of death and a summons to repentance and amendment of life. The theme of the ultimate equality of all had great satirical potentialities that later were exploited to the full. The Paris *danse macabre* was destroyed in 1669. but a reproduction or free rendering can be seen in the woodcuts of the Paris printer Guyot Marchant (1485), and the explanatory verses have been preserved. All other picture cycles were derived directly or indirectly from that of Les Innocents. The oldest surviving examples in France are those of Kernlaria-an-Isquit in Brittany and La Chaise-Dieu (Haute-Loire), both belonging to the second half of the 15th century. The dependence of the Breton series on Paris is proved by the accompanying verses, apart from pictorial resemblances. The paintings at La Chaise-Dieu, which are more original and artistic, have been discreetly restored. The *danse macabre* lost its grotesque character and its awe-inspiring power at the Renaissance. as can be seen from the carved wooden capitals with Dance of Death motifs in the cemetery of St. Maclou, Rouen.

The oldest example in Germany was that at Liibeck (*c.* 1463). a fine series of mural paintings with the Hansa port as a background; it was destroyed in 1942. The Berlin *Totentanz,* in the Marienkirche. was of about the same date. but inferior in quality. There were also numerous German block books and woodcuts and literary versions of the dance. No European picture cycle was so famous as that (c. 1480) in the Dominican cemetery at Basel, fragments of which can be seen in the historical museum and by which the overwhelming effect created by the whole series can be judged. It must not be confused with the older and less attractive *Totentanz* in the Augustinian convent of Kleinbasel, a northern suburb. It was in Basel. moreover. that Hans Holbein the younger made the celebrated drawings which were engraved by Hans Lützelburger and published at Lyons in 1538 This forms the culminating point in the evolution of the Dance of Death and was one of the outstanding achievements in the art of the woodcut.

Apart from a few interesting but isolated mural paintings in northern Italy, the Dance of Death did not become popular south of the Alps. The "Triumph of Death" in the Campo Santo at Pisa is an art form truly representative of the Italian Renaissance. Spain contributed one masterpiece, the poem "La Danza general de la muerte." which, derived from the verses at Les Innocents, is nevertheless a very original performance.

The Paris Dance of Death was also the inspiration of a cycle of

pictures in Pardon churchyard. near Old St. Paul's, London. The poet John Lydgate translated the French verses into English and they mere inscribed below the pictures. Of the other English examples only mutilated fragments remain: four painted groups at Hexham, Northumberland; one at Newark, Nottinghamshire; three scenes on a carved misericord at St. George's chapel, Windsor; and a stained glass window with one group at St. Andrew's church. Norwich. Scotland has a curious set of eight sculptured figures (*c.* 1450) on the vaulting ribs of the choir of Rosslyn chapel, near Edinburgh. (J. M. CL.)

In music, the Dance of Death frequently has been depicted in compositions associated with death. The theme usually has been stated by quoting the opening notes of the *Dies Irae* (*q.v.*). Compositions portraying the death dance include Saint-Saens' symphonic poem *Danse Macabre*, Liszt's *Totentanz* for piano and orchestra. Mussorgsky's *Songs and Dances of Death* and the "Dance of Death" scherzo movement of Glazunov's The *Middle Ages* suite. (X.)

DANCE TEACHING. In many countries, particularly the United States, Great Britain, the Commonwealth of Nations and Europe. instruction given by well-qualified teachers is readily available in almost every kind of dancing, from social dance to classical ballet, folk dance to acrobatic. Instruction in all forms is mostly obtained from privately operated schools, but a number of general educational establishments on all levels also feature various kinds of dance education either in their normal curriculum or as an extramural subject.

UNITED STATES

Social Dancing. — During America's colonial period, the dancing master taught his charges not only the steps of the popular social dances of the times but also the social graces. To the colonists and, later, to the citizens of the young republic, such instruction was deemed to be of great value in convincing Europeans that Americans were not untutored and uncouth barbarians. The churches, especially during the colonial days and even into the 19th century, occasionally frowned on social dancing (dancing masters were sometimes driven out of town) but social and business leaders, educators and politicians were generally convinced of the importance of dance training for girls and for boys and young men with ambition to advance.

In the 20th century, the social graces are infrequently taught along with the actual dances themselves. In girls' finishing schools and even in certain military academies. etiquette and dance figurations are taught and, of course, even the professional dance studios instruct the student in the proper way to ask someone to dance or to accept the invitation, how to hold a partner and other aspects of ballroom behaviour but, in the main, the professional ballroom dance studios are primarily concerned with teaching individuals how to dance or introducing them to new steps.

In the thousands upon thousands of independent, privately run dance schools that specialize in social dance instruction. millions of pupils learn the patterns of the enduring waltz, the basic fox trot (which came into popularity early in the 20th century), the tango (also a continuously popular Latin form) and those several Latin-American dances. such as the rumba, samba, conga and mambo. which characterized the social dance of the early 1960s.

Pupils, ranging in age from little children to elderly individuals. may take one lesson in a special dance they wish to learn or take a series of lessons or continue studies over the years. Ballroom dance schools range in size from a single studio, with a single teacher and a handful of pupils, to such vast enterprises as the Arthur Murray or Fred Astaire schools with branches throughout the land and even overseas and employing large staffs of instructors.

The calibre of instruction also varies. An ill-equipped or overworked or improperly trained teacher may simply teach steps, often inaccurately. The well-schooled teachers instruct the pupils not only in foot patterns but also in balances, body placements, rhythmic responses. posture. improvisational possibilities and the like. Indeed, the topflight social dance teacher, while not necessarily contending that ballroom dancing is an art form, nevertheless is concerned with communicating to the pupils the joy of movement and presenting the movement disciplines that govern social dancing as methods whereby that joy may be shared with others on the ballroom floor.

Ballet.—The teaching of ballet dancing is a far more complex process than the teaching of social dance, for this form of theatrical dance demands great physical virtuosity. Further, the really skilled teacher of professional and potentially professional dancers must be able to endow them with personal ideas on the interpretation. with adequate and proper feeling, of the many different figures that form the vocabulary of classical ballet.

Since colonial times. ballet has been taught in America, first by visiting ballet artists and ballet masters from France. England or Italy and later by Americans and experts of other nationalities. In the 20th century, the main influence has stemmed from Russia and many of the foremost teachers in the United States during the century have been retired Russian ballerinas (or soloists), leading male dancers. choreographers, *régisseurs* and the like. Their technical and artistic approaches are generally those of the elegant and refined Leningrad school rather than the more spectacular, physically driving and less polished methods associated with the Moscow ballet centres.

Teaching styles vary, of course, with individuals, and such systems as the Cecchetti method (based upon the teaching of the Russian-Italian ballet master long associated with the Diaghilev company) are taught by many instructors. The physical structure of the American and his temperament and his background have also affected the teaching of teachers coming from abroad and have caused them to adapt their styles, if not their fundamental techniques, to the needs of their new charges.

The usual ballet class runs from one hour to one hour and a half and is divided into three sections. It commences with exercise at the *barre*, a rod placed horizontally at varying heights from the floor (depending on the age of the pupil) upon which the dance student may rest his hand and assure balance while he performs exercises in the traditional five positions of the feet, including knee-bends, stretches, extensions, beats, kicks and the like. Following *barre*, the students move to "centre," away from the support of the *barre*, where the problems of balance are mastered as the students work with movements that are more elaborate extensions of exercises learned at *barre*. Some actions are of the sustained or "adagio" type motion while others are "allegro" leaps, jumps, turns and running steps. Combinations or series of movements are next given and the class customarily terminates with the teachers giving special instruction to the girls in *"pointe"* work (they do not wear toe slippers throughout the class) and to the boys in multiple air turns, leg beats and other movements mainly associated with the male dancer.

The majority of expert teachers believe that students should start ballet instruction at the age of eight, although simplified dance movements may be given at an earlier age, and that girls should not wear toe slippers until the age of eleven (variable, depending on the strength and development of the child) and then not until after a minimum of two years' ballet training in soft slippers. Because of ballet's complex technique and the great physical demands it places on the human body, it is essential that the instructor be thoroughly trained himself in the technique of ballet and equally aware of the potentialities and limitations of the body. Because few states have licensing laws, anyone can teach ballet whether he knows anything about ballet or not. Thus, it must be confessed, there are in the United States many teachers of dance ill-equipped to teach ballet. They can and do harm the child student, not only artistically but also physically, through ignorance. Incorrect placement of the body, carelessness in the turnout of the limbs and, especially, too early, too much and improper use of toe slippers can cause harm.

Because of the absence of state licensing or inspection during the major part of the 20th century (and most teachers have objected to politically controlled licensing), organizations of teachers

and dancers were established for the express purpose of attempting to elevate the standards of dance instruction, especially in ballet. Controls, even voluntary, have been difficult to achieve because of the tremendous interest in ballet that developed during and after the 1930s. particularly after television began to feature ballet artists and, most important, ballet "spectaculars" on its programs, for student demand tended to outstrip the availability of trained teachers.

Schools of More Than One Type of Dancing. — Not all of the professional dance studios of the land have been exclusively devoted to ballet instruction. In many communities, including large cities as well as small towns, schools that offer classes in ballet, tap, acrobatics, ballroom and other techniques are common. Indeed, the sign "toe-tap-acrobatic" has been a familiar sign of a dance curriculum over the door of many a studio. The combination of courses has not necessarily meant low standards (although low standards have prevailed in certain of these schools), for some of the large establishments have hired experts in various dance fields to teach, under a single management. ballet. modern dance, tap, jazz dance (in the second half of the 20th century almost a necessity for dancers hoping to work in musical comedy and television). corrective movement and, perhaps, certain ethnic forms. such as Spanish or oriental dance.

Modern Dance. — In modern dance. training methods have been based mainly upon the techniques developed by Martha Graham, Doris Humphrey, Charles Weidman, Hanya Holm (derived from the style evolved in Germany by Mary Wigman), Helen Tamiris and other dance innovators and independents. While ballet training is based upon the teaching of traditional steps and movements of what is generally called the *danse d'ecole* and of character and folk dance steps incorporated into ballet, modern dance training is designed to foster personal creativity. Naturally, basic disciplines have been evolved and these form the exercise base of classroom work. However, improvisation, dance composition and choreography are also fostered, subjects almost entirely (although there are exceptions) removed from the ballet curriculum.

Other aspects of modern dance training that differ from ballet include the following: the use of the floor, rather than the *barre,* for preliminary exercises; instruction in dynamics; studies in the use of space patterns; in the Graham technique. the principle of contraction and release of the muscles; in the Humphrey technique, the principle of fall and recovery as the basic pattern of physically exciting and potentially dramatic action; in the Wigman technique, the principle of tension and relaxation and the degrees of energy that lie between the two extremes. Furthermore, students normally aork barefooted, although soft slippers or half sandals (supporting the arches) may be used.

Schools devoted solely to modern dance instruction are to be found in New York and most other large cities. though outside New Yorkmodern dance may represent one aspect of a large dance curriculum. The vast majority of modern dance teachers include the following: the innovators themselves. their students, company members and newer modern dance performers or individuals trained in colleges and having collegiate dance majors. usually obtained in association with their over-all physical education studies. As in the case of ballet, there are poorly trained or unimaginative instructors.

Tap Dancing. — Tap dance, derived from both the Irish clog and the shuffle dances of the American Negro, has been popular in the U.S. theatre since the minstrel shows of the late 1800s, through vaudeville and into the period of musical comedies and revues. With the years, certain refinements were added and by the second half of the 20th century, many tap dancers incorporated both balletic and modern dance qualities into their basic tapping designs. Because of its lightness of spirit and basic simplicity (although elaborate tap techniques and artistries were evolved by professionals), tap became a popular course of instruction for children across the country. It has been deemed suitable for both boys and girls. it lent itself to community entertainments and it was long considered essential to a career in any phase of show business.

Jazz Dancing. — Jazz dancing emerged in the mid-1950s as one of the most sought after courses of instruction for young professionals wishing to centre their activities in show business as distinct from careers in the ballet or modern dance fields. In many schools, only experienced dancers with previous training in other techniques were eligible (although elementary classes were available), for the materials of the jazz dance form itself called for the precision of ballet, the muscular control and torso fluidity of modern (or primitive) dance and the speed of tap combined with special jazz rhythms and steps extracted from popular dance forms of the day. In terms of movement, jazz dancing's nearest link to a historical dance form would be with some form of primitive dance, generally African. Afro-American or Caribbean (which also possesses African as well as Latin roots).

Folk Dancing. — Folk dance instruction has almost always been combined with the actual folk dance session itself. In a sense, square dance callers are instructors since their calls guide the participants into various formations. Folk dance societies, including square dance groups. American country dance organizations and innumerable national dance associations (nhich carry on old-world dance traditions in America), customarily divide their sessions into periods of instruction, demonstration and participation. The work of callers is augmented by folk dance specialists who give students detailed instruction in steps, patterns. rhythms. styles and etiquette as they vary from region to regicn or nation to nation.

Ethnic Dance. — Ethnic (or ethnologic) dance, which is the art apex of folk dance, is a subject of comparatively limited interest. Ethnologists, students of anthropology and, of course, certain students planning to become professional dancers find this area of study stimulating, informative and enormously valuable in understanding and exploiting art differences. Instruction is frequently supplied by professional dancers who are natives of the lands where the dances originated or by Americans who have conducted lengthy studies of various ethnic forms, either with masters in the U.S or through study and research overseas. Among the ethnic techniques of growing interest to Americans in the second half of the 20th century were the Spanish (an enduring favourite), Hindu (or East Indian). Indonesian. Japanese. Hawaiian and advanced forms of African and West Indian dance.

Public and Private Schools. — In addition to dance training in private dance schools, by societies or by itinerant instructors, the teaching of dance is to be found in both public and private educational institutions. By the early 1950s, the commissioners of education for every state in the union had recommended the inclusion of dance in the curriculums for both elementary and secondary schools. The recommendations were not universally implemented because local decisions are always the determining factor in elective classes. Nevertheless. game dances. certain forms of rhythmic gymnastics (often resembling modern dance), folk dances and some social dances have been introduced into many public schools. Instructors may be general subject teachers who have had some dance materials provided to them in their own normal school or college training. In larger schools, the instructors may be specialists in dancing.

On the college level. surveys have shown that in the 20th century. more and more institutions have offered courses in dance to students. Sometimes these classes are extracurricular: again they may be credit courses; often they are limited to elementary studies in modern dance techniques; with increasing frequency. however, courses have been extended to include scaled classes in modern dance, composition, dance history, music for dance, dance notation and related subjects. In some institutions. it is possible for the student to major in dance. After the 1920s, the prevalent technique nas modern dance. Courses in tap, social dance and folk dance have also been included in the dance curricula of many colleges. By the 1950s, with the tremendous upsning in ballet interest, classes in ballet were made available to college students in a limited number of institutions. College dance instruction usually has been offered under the direction of departments of physical education although independent dance departments exist and sometimes dance is supervised by music or fine arts departments.

College dance instructors generally have been college graduates

trained in the field of education and the students themselves have been given courses that would prepare them for teaching careers either in colleges or in public schools. Some, of course, have gone from college to professional dance studios to prepare themselves for theatrical careers. A unique school, combining the requirements of educational dance with professional theatrical dance training and experience, was established in New York city in the mid-20th century. Here, at the High School of Performing Arts (a metropolitan vocational high school). students in dance, drama and music are selected by audition and placed under the tutelage not of college-trained instructors but of professional performers and choreographers. The goal has been to make them performers, not teachers. The success of the dance wing of the school has been attested by the fact that a tremendous percentage of the graduates moved directly into ballet companies, modern dance troupes, Broadway shows. movies or television.

Dance instruction in the U.S. has also been employed for therapeutic purposes. Expert teachers, with the guidance of doctors. have used dance to correct body flaws, to aid patients to recover from injuries and to assist in the treatment of the mentally ill. Records of achievement in these areas have proved the success of dance as a method of therapy.

Although nothing can adequately replace the "live" teacher, aids in the teaching of dance include books on dance instruction and dance backgrounds, combinations of phonograph records and related manuals, motion pictures and dance notation.

GREAT BRITAIN, EUROPE AND OTHER COUNTRIES

Great Britain. — Dance teaching in Great Britain, as in the United States, includes instruction in ballet, social dancing. folk dancing. free-style dance (forms of modern and revived Greek classical) and popular theatrical techniques (tap, precision, acrobatics. etc.). Independent professional schools may range in size from modest classrooms to large institutions. Unlike the Cnited States, the teaching of dance in higher institutions of learning (universities) is not generally treated as a subject for academic credit or major study. Dance, however, is taught (and increasingly) in many schools (primary. secondary. college) devoted to general education.

Ballet teachers, as in America, may employ any of a number of methods of instruction, for in the independent studios teachers may be of Russian, French. Italian (and other) origin and training. There are also many English teachers of ballet, and through them what has become instantly recognizable as the English ballet style was born. The most celebrated centre of ballet instruction in Great Britain is the Royal Ballet school. the training centre of the Royal ballet (formerly the Sadler's Wells ballet). There. under the direction of a large and distinguished faculty, children are trained and the exceptionally talented ones groomed to take their places in the Royal ballet itself. Students at the Royal Ballet school receive instruction in classical ballet technique. character dancing, mime, dance notation (the Benesh method is employed here) and many related subjects. Several other schools of several years' standing are fully accepted by the educational authorities as boarding establishments with vocational training. There are also countless establishments, specializing only in dance. where excellent teachers provide a grounding before the most promising of their students are taken over by the "professional" schools.

Presiding over the quality of dance teaching in Great Britain (and. indeed. over that in much of the commonwealth) are certain powerful teachers' organizations. These organizations, whose chief functions are the planning. administration and setting of examinations and the development of ever-higher standards of performance and knonledge. constantly prepare and bring up to date syllabuses for the instruction of dance of all kinds, including classical ballet. national, Greek, stage, historical and social. These same organizations provide scholarships ranging from the payment of fees and subsistence at the Royal Ballet school to small awards for dance lessons They also run special courses of study, including annual congresses. which invariably are attended by members from many countries. Although unfortunately no statute has been passed to make some qualification a legal necessity for anyone who wishes to teach dancing. there are but very few teachers who have failed to take advantage of the wonderful facilities offered by these organizations.

A form of modern dance, deriving mainly from the principles and methods established by Rudolf Laban, has been introduced into many of the schools in Great Britain. Both boys and girls receive graded classes in technique and also are led to explore their creative gifts in improvisations and choreography. Folk dancing is also taught, sometimes with emphasis on folk dances common to Great Britain.

Teaching systems that endeavour to combine modern dance with folk dance materials are also to be found. The group of best knon-n leaders included Margaret Morris, founder-director of the Celtic Ballet of Scotland. who evolved her own technique of modern dance. invented a method of notation and exploited, both for theatrical and teaching purposes. Scottish folk dance forms.

The teaching of social dancing flourishes in Great Britain. Every small town possesses a number of dance schools. many of them concentrating solely on the social forms. Every year tens of thousands of pupils take medal tests. organized and administered by the teachers' examining bodies, in bronze, silver and gold standards; a number also take higher awards, such as the gold and diamond star. In addition a few teachers specialize in coaching competitors, the standard of competitive dancing being very high indeed.

Folk dance societies in Great Britain and in other parts of the commonwealth not only foster the continued performing of national and historic dances but also provide instruction.

Of supplemental assistance to the teaching of dancing in all its forms and to the furthering of interest in dance are the books, periodicals, manuals and other printed matter published in Great Britain in quantity and admirable range of subject matter.

Other Countries. — In many other countries, the patterns (if not always the techniques) of dance teaching resemble those familiar to British and Americans. In those countries that support national theatres — Denmark, Sweden, France, the Soviet Union, etc.—the centre of ballet instruction customarily resides within the government-supported institution itself, although in Denmark or France. for example, independent ballet studios exist and function successfully. Some of the most celebrated ballet instructors in the world live and teach in Paris. Folk dance societies. organizations and state-directed schools (such as in the Soviet Union and Yugoslavia) work for the preservation, popularization and even theatrical exploitation of folk dance forms.

In the orient, very young children are often selected for a dance career (many come from dancing families generations old) in a court ballet. national company or independent institution of great age. Thus, the dancers of the Royal Cambodian or Siamese ballets, dancers-actors of Japan's Kabuki theatre or the temple dancers of Bali are invariably trained from childhood for a lifetime of dancing.

Everywhere, however, the popularity of ballroom dancing as produced in Latin America, the United States, Great Britain and in other western cultures has spread to the degree that even those with living folk dance programs and ceremonies study, learn and enjoy the alien steps. (W. Ty.)

DANCOURT, FLORENT CARTON (1661–1725), French actor and playwright, who created the comedy of manners in the French theatre. was born at Fontainebleau on Nov. 1, 1661. He wrote upward of 30 plays, of which more than 20 are in one act. He became expert in the exhibition of current social types, and his plays are a record of many forms of social change, in addition to being amusing and well written.

Dancourt was one of the most popular French dramatists before the Revolution, and the following works were played more than 300 times in Paris: *Le Chevalier à la mode* (1687); *Les Vendanges de Suresnes* (1695); *Les Vacances* (1696); *Le Mari retrouvé* (1698); *La Fête de village* and *Les Trois Cousines* (1698); and *Le Galant Jardinier* (1704). His plays were imitated by Vanbrugh. He died at Courcelles-le-Roi (Loiret), Dec. 7, 1725.

ture in the Seventeenth Century, part iv (1940) and Sunset: a History of Parisian *Drama* in *the* Last Years of Louis *XIV* (1945).
(W. G. ME.)

DANDARAH (DENDERA), a village of upper Egypt on the west bank of the Nile, 417 mi. from Cairo by river. The nearest railway station is Qina, on the opposite bank. The modern village has little of interest, but is built on the site of Ta-ynt-netert ("She of the goddess pillar") or Tentyra. It was the capital of the sixth upper Egyptian nome and was sacred to the cow-goddess Hathor (*q.v.*), a sky and fertility goddess. The temple is one of the best preserved in Egypt. The present building dates to the Ptolemaic period and was completed by Augustus, but rests on the site of a far earlier foundation. References to early structures include one built by Khufu (Cheops) of the 4th dynasty on the site of an even older building probably dating to predynastic times and containing rebuilding and alterations of all the periods between the Old Kingdom and the Ptolemaic.

The temple is of sandstone. built within a large enclosure wall of dried mud brick surrounding an area 900 by 1,000 ft. The temple is approximately 260 ft. long and has an impressive north façade consisting of six gigantic Hathor-headed sistrum columns 50 ft. high and an entablature with a winged disk as chief decoration. These columns have screen walls between them, and between the centre ones project the jambs of the great door which once closed the entrance. All the columns are defaced. The great hypostyle hall is supported by a further 18 Hathor columns, giving a forestlike appearance; the whole hall is elaborately decorated, producing a rich effect, although the details are often crowded and ill-arranged. Few traces remain of the paintings which once covered the interior. The ceiling was adorned with astronomical scenes and the walls with the details of a royal visit. This hall opens into a smaller one with six columns of granite and a series of offering rooms and magazines; here the roof is intact, light and air being admitted through eight openings, and the sculptures represent the foundation of the temple. The small hall opens into two vestibules, the hall of the altars, where sacrifices (mainly vegetable) were made, and the hall of the divine Ennead, where some of the mysteries were celebrated. Opening off was the darkened sanctuary, the dwelling place of the golden one, where the sacred boat was kept containing the most holy image of the goddess. The sanctuary doors were opened only at the main yearly festival. Eleven small sacred chambers opened off the corridor surrounding the shrine, such as the flame room, the birth room, and the throne of Ra; the purpose of many of these is lost, but the flame room is probably that referred to in the 2jth chapter of the Book of the Dead.

The staircases of the temple are decorated with representations of the processions of Hathor. The roof is flat and on two levels, on the lower of which are several chapels dedicated to Osiris. In one of these was the celebrated Zodiac, now in the Bibliothèque Nationale in Paris; it has been replaced by a cast. The sacred lake was situated to the southwest of the temple and was still in use c. A.D. 1200. Among other structures within the enclosure were two "birth houses!' with scenes representing the birth and childhood of Horus, the smaller begun by Nekhtnebf (Nectanebo) I and completed under the Ptolemies, and the larger wholly of Roman date. (M. V. S.-W.)

DANDELION (Taraxacum *officinale*) and related species, perennial herbs belonging to the family Compositae (*q.v.*). The plant has a wide range, being found in Europe and central Asia. Elsewhere it has become a cosmopolitan and pestiferous weed. especially in North America. The leaves form a spreading rosette on the very short stem; they are smooth, of a bright shining green. sessile and tapering downward. The name dandelion is derived from the French dent-de-lion (lion's tooth), an appellation given on account of the toothlike lobes of the leaves. The long taproot makes it somewhat difficult to eradicate. The flower stalks (scapes) are smooth, leafless, hollow and numerous. The flowers bloom nearly throughout the year. The flower heads are golden yellow, and reach one and one-half to two inches in width: the florets are all strap-shaped. The fruits are olive or dull yellow in colour, and are each surmounted by a long beak, on which rests a pappus of delicate white hairs, which occasions the ready dispersal of the fruit by the wind; each fruit contains one seed. The globes formed by the plumed fruits are nearly two inches in diameter. The involucre consists of an outer spreading (or reflexed) and an inner erect row of bracts. In all parts of the plant a milky juice is present. The root externally is brown and wrinkled, internally white, with a yellow centre and concentric paler rings. It is two inches to one foot long, and about one-fourth inch to one-half inch in diameter. The leaves are bitter, but are sometimes eaten as a salad or are cooked for potherbs; they serve as food for silkworms when mulberry leaves are not to be had.

The root is roasted as a substitute for coffee. Several species and varieties of the dandelion are recognized by botanists; they differ in the degree and mode of cutting of the leaf margin and the erect or spreading character of the outer series of bracts.

The red-seeded dandelion (T. *laevigatum*), a native of Europe, very similar to the common species but smaller, with red, shorter beaked fruits and more deeply and finely cut leaves, is somewhat naturalized in the United States and Canada.

Russian dandelion, Kok-saghyz (T. kok-saghyz), was found in 1931 around Tien Shan, Kazakstan, near the China border. It is a perennial with roots about one-half inch in diameter. After 1931 it became a commercial source of rubber in the U.S.S.R. It was introduced into the U.S. in 1942 and experimental plantings were made in several states to determine its possibility as a source of rubber. The results were inconclusive.

The eradication of dandelions is easy if few plants are involved. Digging the roots is the most effective. If infestation is severe a spray of 2,4-D applied in warm sunlight is fatal, but it must cover the foliage.

See also WEED. (W. C. M.; N. TR.)

DANDOLO, an ancient family distinguished in the history of Venice (*q.v.*). Though not listed among the *anteriores* and nobiliores who ruled Venice in the 7th–9th centuries, it rose quickly to prominence when expansion from the lagoons to the mainland began. By the 11th century it was rich, and by the 12th (when the branches of San Luca, San Severo and San Moisè can already be distinguished) it was competing for the highest posts in church and state. In the middle decades of the 12th century, when ENRICO DI DOMENICO DAXDOLO, as patriarch of Grado from 1146 to 1154, strove to defend his prerogatives against Pietro Polani (doge from 1130 to 1148) and the Michiel family, the whole Dandolo family was exiled until, after about ten years. peace was made on the basis of political concessions and matrimonial alliances.

As the power of the Michiel family declined, trouble arose between the restless Dandolo family and the Ziany family headed by the doge Sebastiano, who wanted to impose a policy of peace and internal reform instead of his predecessors' war program. In 1192 the septuagenarian ENRICO DANDOLO (d. 1205), of the branch of San Luca, himself became doge. His rule saw a rapid development of Venetian institutions and the setting of the customary law on a firm juridical basis, but he was chiefly important for his preponderant role in promoting the 4th crusade, which led to the overthrow of the Greek Byzantine empire and the establishment of the Latin empire in its place (see BYZANTINE EMPIRE; CRUSADES; GREECE: History). Refusing the imperial title, Dandolo claimed for Venice dominion over the maritime territories of the empire and styled himself "lord of the fourth part and a half of the empire of Romania." He also reserved a wide field of activity in the east for his own family: MARCO DANDOLO became lord of Andros; and GIOVANNI founded a powerful company that long exploited the colony of Tyre. The Dandolo policy, however, proved an embarrassment to Venice when the colonists tended to secede. In reaction against it, the Ziani and Tiepolo families came to power in Venice for much of the 13th century, so that the Dandolo family had to confine its energies to Crete, to the Negropont (Euboea), to the Aegean islands and to Dalmatia.

Reaction in turn against the Tiepolo family brought GIOVANNI DANDOLO (d. 1289), of the San Severo branch, to the dogeship in 1280, in a period of internal crisis in Venice. At the same time the conflict between Venice and Genoa was on the point of developing

into a general Mediterranean crisis. When this came to a head. involving not only the Italian signorie but also Hungary, the king of Bohemia. the patriarchate of Aquileia and the kingdoms of Xragon and Naples, two more Dandolo doges had to bear the brunt of it: FRANCESCO from 1329 to 1339 and ANDREA from 1343 to 1354. During 20 years of vicissitudes the Venetians required Treviso in their hinterland but faced rebellion, fomented by Genoa and Hungary, in Istria and Dalmatia. Seeking allies near and far. the Dandolo doges resolutely refused compromise and also surmounted the further disasters of earthquake, plague (1348) and financial crisis; but the Venetian victory over the Genoese at Alghero in Sardinia (Aug. 1353) was finally offset by the crushing defeat at Portolongo in the island of Sapienza (Nov. 1354), two months after Andrea's death. The legacy of Dandolo rule was thus an unhappy one for Venice. Andrea in particular. who became doge in his youth, incurred much adverse criticism despite the fact that the conduct of affairs was not in his hands alone but under the concurrent control of the Venetian organs of state.

Whatever his rank as a statesman, Andrea was neither a good jurist nor a great writer. There is little originality in the book that he added to the statutes or in his *Summula* (a collection of administrative regulations); and his two chronicles of Venetian history merely work through earlier sources uncritically, sometimes even distorting the meaning by personal insertions. The collection of documents (Liber *albus*, Libev *blancus*), which he sponsored but did not himself know how to use, is of more value. Later historians up to the time of Marino Sanudo and G. I. Caroldo drew upon the chronicles, but they were excluded from the series of official history and were resurrected only by L. A. Muratori in vol. xii of his *Rerum italicarum* scriptores (1728). The best text of Andrea's works is that in the new edition of the *Rerum italicarum scriptores,* vol. xii, part i, with introduction and notes by E. Pastorello (1938–42). After Andrea no Dandolo was ever doge again. but members of the family still held high offices in the Venetian service till the fall of the republic. (R. CE.)

DANEGELD, a word describing the taxes levied in Anglo-Saxon England to buy off Danish invaders in the reign of Xethelred II (978–1016), and also the recurrent gelds or taxes collected by the Anglo-Xorman kings. The word is not recorded before the Norman Conquest, the usual earlier term being *gafol* (gavel), "tribute." Though the Danes were sometimes bought off in the 9th century. the word danegeld is usually applied to the payments which began in 991. They continued at intervals until 1016. Danegeld is distinct from heregeld. an annual tax levied after 1012, first to pay the Danish crews which had entered Xethelred's service and later to maintain a standing force; this was abolished by Edward the Confessor in 1051, William I is known to have imposed four gelds. Danegeld was last imposed in 1162. The commonest rate was 2s. per hide (*q.v.*), though 4s. and 6s. occur in some years. One purpose served by Domesday Book was to show the liability of estates to the geld. (D. WK.)

DANELAW, the Anglo-Saxon name of the northern, central and eastern parts of England colonized by Danish armies during the Scandinavian invasions of King Alfred's time (late 9th century). In the 11th and 12th centuries, England south of the river Tees was divided into three great regions within each of which a distinctive form of customary law prevailed in the local courts of justice. England south of the Thames, from Kent to Devon inclusive, was the sphere of West Saxon law. Mercian law was in operation in Cheshire, Staffordshire, Warwickshire. Oxfordshire and the country between these shires and the Welsh border. The term Dena *lagu,* generally anglicized as Danelam, was applied to the rest of England from Yorkshire to Essex. The term meant that the law administered in this region was marked by distinctive features felt to be of Danish origin, and the detailed analysis to which it has been subjected by modern scholars has shown that this derivation was correct. The usage does not imply that the whole of this wide country was ever settled intensively by Danish colonists. A Danish aristocracy dominant for a sufficient period in a shire would naturally impress its own ideas on the practice of the local courts, however small the number of its followers might be. But the currency of the term in official circles far into the 12th century illustrates the strength of the Danish influence to which this region had once been subjected.

The conditions under which the term arose were created by the 9th-century Danish settlements in northern, midland and eastern England. A Danish army which had been ranging widely over England divided Yorkshire among its members in 876. Another army divided the eastern half of the Mercian kingdom in 877 and in 880 a third army divided East Anglia. The Danes settled most thickly in Yorkshire and in the country around the Five Boroughs of Lincoln. Nottingham. Derby. Leicester and Stamford. To the south of the river Welland the signs of Danish settlement thin out rapidly, and in East Anglia they are much more evident in Norfolk than in Suffolk. But elsewhere a large number of Danish place names, a strong Danish colouring in dialect and agricultural vocabulary, local divisions of Danish origin such as the three "ridings" of Yorkshire and Lindsey and the survival of many Danish personal names among a medieval peasantry distinguished by a strong tradition of independence prove that a new element had been introduced into the English racial complex.

The annexation of East Anglia and the Danish midlands by the West Saxon monarchy was carried out by King Edward the Elder (899–924). Aethelstan, his successor, was recognized as king beyond the Humber in 926. The situation in Northumbria had recently been complicated by an invasion of Norwegian Vikings from Ireland. Until the mid-10th century English rule in the north was continually threatened from this quarter, and from time to time individual Norse leaders were able to seat themselves precariously as kings in York. But none of these adventurers was supported by the Danish settlers of Northumbria, and on the fall of the Norwegian king Eric Bloodaxe in 954 they came permanently and, it appears. willingly under West Saxon lordship.

The West Saxon kings had no desire to carry out any general assimilation of Danish to English laws and customs. The extent of their kingdom had been vastly increased in the last two generations, and they were anxious to limit rather than increase their responsibilities in government. King Edgar (959–975), the strongest of them, expressly granted autonomy to the men of Danish England in return for the fidelity which they had always shown him.

See F. Liebermann, *Die Gesetze der Angelsachsen* (1903–16), under *Denalagu;* F. M. Stenton, *The Danes in England* (1927), *Anglo-Saxon England,* 2nd ed. (1947). (F. M. S.)

DANGERFIELD, THOMAS (c. 1650–1685). English informer. was one of many rogues who exploited the panic of the "popish'! plot. Born at Waltham, Essex, the son of a farmer, he began his career by robbing his father and, after a wandering life on the continent, took to coining false money, for which offense and others he was many times imprisoned. He was employed in 1679 to assist Roman Catholic suspects by blackening the characters of their accusers. He eventually betrayed his employers, Mrs. Elizabeth Cellier and the countess of Powis, and then claimed that Catholic peers had paid him to assassinate the earl of Shaftesbury and discredit the duke of Monmouth. Although incriminating papers were found at Mrs. Cellier's house in the meal tub where he had planted them, his evidence was so suspect that both she and Lady Powis were acquitted. When examined at the bar of the house of commons Dangerfield made other charges against the duke of York and the earl of Peterborough. but he and Titus Oates failed in an attempt to indict the earl of Castlemaine of treason. He continued to defame the Roman Catholics in a long series of pamphlets. among them *Dangerfield's* Narrative (1679), which led to his trial for libel. On June 29, 1685, he received sentence to stand in the pillory on two consecutive days, be whipped from Aldgate to Newgate and two days later from Newgate to Tyburn. On his way back from Tyburn he was struck in the eye with a cane by a barrister. Robert Frances. and died shortly afterward from the blow. The barrister was tried on July 16. and executed for the murder. (H. G. RO.)

DANGEROUS OCCUPATIONS are those that present hazards to the health or life of workers. The dangers arising from likelihood of accidents are discussed chiefly in the article INDUSTRIAL MEDICINE. This article deals primarily with illnesses

induced in workers by contact with chemicals, dusts and certain physical agents.

There are potential hazards in nearly every enterprise man undertakes. The housewife may suffer skin irritation from detergents or harsh soaps. The college professor doing research work may suffer a fatal anemia from inhalation of certain toxic chemicals. Industries, using a wide variety of toxic chemicals and harmful dusts, have through the years both caused and subsequently prevented a number of man-made diseases. The term "mad as a hatter" reflects general knowledge of a dangerous trade, for this expression arises from Lewis Carroll's knowledge that workers in the felt hat industry absorbed enough mercury to cause great nervousness and marked trembling.

The distribution of occupational hazards in the world varies greatly. Heavily industrialized countries with densely populated urban communities present one extreme, and small agricultural nations the other.

Knowledge of the effects of dangerous occupations is very old. In Roman times, slaves and political prisoners were used to work in deep underground mines with the certain knowledge that the fumes in the mines were lethal. The Italian physician, Bernardino Ramazzini (1633–1714), referred to as the father of industrial medicine, wrote, "Medicine should make a contribution to the well-being of workers and see to it that . . . they exercise their callings without harm." (B. Ramazzini [1713], *Du Morbis Artificum Diatriba;* Geneva, trans. by W. C. Wright, 1940, The University of Chicago Press.)

In the 18th and 19th centuries, the English writers Blake, Lamb and Dickens protested the cruel abuse of little children used as chimney sweeps. The "climbing boys," as these poor children were called! developed malignant diseases of the skin as a result of contact with the chemicals in the chimneys. Alice Hamilton roused interest in occupational disease in the United States early in the 20th century by correlating illness with exposure to toxic materials in industry. On the apathy of physicians in the United States on the subject of dangerous occupations she wrote, "When I talked to my medical friends about the strange silence on the subject in American medical magazines and text books, I gained the impression that here was a subject tainted with socialism or with feminine sentimentality for the poor." (Alice Hamilton, *Exploring the Dangerous Trades,* Little, Brown & Co., 1943.)

There is inadequate knowledge and reporting of man-made disease throughout the world. In the United States each of the states has a different method of tabulating industrial hazards. Swedish, British and pre-World War II German figures on occupational illness are the best available because of well-established systems of government inspection of factories. It is estimated from British records that dangerous occupations cause only 10% of sickness. The National Insurance act in the United Kingdom reported 7,000,000 episodes of sickness in one year (1951), and in the same year there were 720,000 new awards for injuries by accident and only 50,000 for occupational diseases. The much smaller figure for occupational illness has several explanations. Occurrence of job-related illness is less spectacular than, for example, an explosion in a mine causing a number of deaths. It may take a number of years of observation and research to discover that some particular dust, chemical or kind of physical energy is harmful.

In addition, physicians may have difficulty in deciding that an illness is attributable to the job. Many industrial diseases mimic sickness from other causes, and little is known of the ill effects and signs of continued small exposures to toxic chemicals. Another difficulty arises from the fact that although job-related disease may be suspected, doctors often lack tests to identify such disease as specific. As a result, against every diagnosed case of occupational disease there may be many incipient or unrecognized cases from the same causes. Introduction of materials of unknown toxicity, and changes in industrial operations, may create unrecognized problems in preventing harmful effects until after workers have been affected.

With experience and knowledge; dangerous occupations may be made safe. The substitution of a harmless material for a toxic one is the ideal method. If this is not possible, enclosure of the dangerous operation or use of appropriate ventilating devices may ensure a safe working environment. The least desirable method of control, and one to be used only for short periods, is protection of the worker with mask, clothing or glasses. Safe practice through substitution is illustrated in the manufacture of matches. White phosphorus caused destruction of the jawbones, a condition called phossy jaw, in many exposed workers; harmless phosphorus sesquisulfide was substituted for white phosphorus.

Toxic Chemicals. — Certain lead compounds (the oxides. carbonates and tetraethyl lead especially) are directly harmful to the body, producing anemia through red blood cell destruction, and causing paralysis by damage to nerves supplying muscles. Workers engaged in lead smelting, paint manufacture, paint removal, lead soldering, storage battery manufacture, spray painting, ship dismantling and manufacture of antiknock gasoline are exposed to toxic lead compounds. In contrast to the illness produced in children who suallow lead-containing paint, lead poisoning in workers almost always is a result of inhalation of lead fumes. For most jobs proper ventilation can control dangerous amounts of lead in the worker's breathing zone. Because lead exposure may be difficult to control. however, workers are given routine medical examinations, including blood counts and determination of the quantity of lead in body fluids. Many plans of treatment for lead poisoning have been suggested, none completely successful. A drug which complexes the lead and forces it into a harmless compound while it is passing through the body is in use. (*See* also LEAD POISONING.) This discussion of lead toxicity illustrates the knowledge accumulated by experience. Similar knowledge is available for operations using arsenic, mercury, antimony, phosphorus and chromium.

Examples of more recently discovered materials of importance in causing illness are certain beryllium (q v.) compounds. During 1933 to 1942 Russian. Italian and German authors wrote of respiratory disease apparently following beryllium exposure during manufacture of beryllium alloys. U.S. experience accumulated after 1938, when beryllium began to be used in manufacture of fluorescent lamps and neon signs. Because beryllium makes very light alloys which are heat and stress resistant, it is used in manufacture of many items. including airplane structure, fishing rods, furnace bricks and laboratory crucibles. Inhalation of large quantities of toxic beryllium compounds results in acute disease which mimics a pneumonia. After inhalation of smaller amounts, a chronic disease occurs nhich is very like pulmonary tuberculosis This relatively nen hazard made a number of occupations potentially dangerous. A safe substitute made possible the continued world expansion of fluorescent lamp manufacture without the use of beryllium compounds.

Pesticides have caused illness among workers manufacturing these materials. and in a few cases among agricultural workers Many of these are organic compounds of phosphorus; others are complex chemical compounds which act as the organic phosphates do on the nervous system, upsetting essential biological processes. In part, the danger from exposure to these materials arises because they are readily absorbed through the mucous membranes of the nose and through the skin, in addition to the usual hazard from entry into the body by inhalation

Harmful Dusts. — Pneumonoconiosis (*q.v.;* shortened in usage to pneumoconiosis), from the Greek words meaning "dust" and "lung," refers to respiratory disease following long exposure to certain dusts. In order to cause disease, harmful dusts must be inhaled in a finely divided state. Evidence suggests that particles between one-half and five microns in diameter are retained in the lung, and some investigators believe that even smaller-sized particles are potentially hazardous. Larger particles are sifted out by nasal hairs or caught in the mucus secreted in the bronchial tree. The disease silicosis (*q.v.*) is a pneumonoconiosis of worldwide distribution caused by the inhalation of quartz or sand as free silica (SiO_2). For example, it may occur in men long-exposed in such different jobs as underground mining. sandblasting, some foundry operations, granite cutting and certain pottery operations. Silicosis is caused by deposition of harmful amounts of fine silica in the lung, producing an inflammatory reaction that

results in pathologic changes described as silicotic nodules. Complete control of dust can prevent silicosis, but in some operations,. such as deep underground mining, this is nearly impossible.

Certain inert dusts on reaching the lung are simply deposited there, and if the quantity is great they may produce shadows visible in chest X-rays; iron, kaolin, tin and pure carbon are examples of such so-called benign dusts. In cases of extremely intense prolonged exposure to some inert materials, damaging changes in lung structure take place with consequent disability.

Other occupationally hazardous dusts are silicates—that is, naturally occurring materials such as magnesium and aluminum combined uith silica. Asbestos is an example of a silicate (a combination of silicates of magnesium and iron) long used in industry and known to produce pneumonoconiosis. Evidence strongly indicates that there is a significant increase in lung malignancy in men with asbestosis.

Physical Agents.—Many modern occupations involve the risk of exposure to radioactivity, especially because of the development of atomic energy and use of radioactive isotopes by industrial, agricultural and medical research workers.

X-rays are used industrially for radiography and especially fluoroscopy. Necessary strength of fluoroscopic rays varies according to the thickness of the material to be penetrated; soft r e s will show the position of metal plates in rubber heels; hard rays must be used to reveal flaws in castings. Undoubtedly, however, the chief source of X-ray injury is still medical practice. although now that proper measures for protection are known, instances of serious injury are rare. Surgeons are not always alert to the danger of prolonged manipulation of fractures under the fluoroscope, a practice which is dangerous to the patient and the helping attendant as well as to the manipulator. Radiologists doing medical diagnostic nork. if adequate protection has not been provided, are engaged in potentially harmful work as shown by reports of high incidence of leukemia in radiologists. An introduced X-ray hazard to the public and to salesmen is the machine sold to shoe stores to demonstrate that a shoe does or does not fit. These provide risk of X-ray burns to the tissues of the foot and interference with normal bone growth in children. Several states of the U.S. have legislation prohibiting the use of X-ray shoe-fitting equipment.

Several hundred persons were killed by radium exposure prior to 1930. In 1931 cases of necrosis of bone, fatal anemia and bone malignancy were reported among young women workers in the United States engaged in painting self-luminous paint on dials. Such paint contained mesothorium and radium salts. The practice of moistening the tip of the paint-laden brush in the mouth is believed to have been responsible for the fatal cases of radium poisoning; European workers, among whom deaths from radium poisoning were rare, were prevented from such practice. Since that period the number of persons engaged in the industrial handling and application of radium has increased enormously. A modern industrial use of radium is found in the static eliminator; the ionization effect of the alpha particles from decaying radium acts to dissipate static electricity in textile and paper mills.

More serious industrial exposure to radioactive substances occurs in mining radioactive ores, handling and testing the products of the ores and making up radon seeds Carcinoma of the lungs is reported in a significant number of miners of Schneeberg. Ger., where the cobalt arsenide ores are radioactive. Since the 19th century it has been known that a large proportion of the miners died prematurely of lung disease with wasting. The discovery that the disease was pulmonary carcinoma was made in 1878, confirmed in 1913 and again in 1926. The same ore is found on the Bohemian side of the mountain. where pitchblende also is mined. and the Bohemian miners also suffer from pulmonary carcinoma. The hazards of mining radioactive ores are difficult to assess and control.

Equipment that measures various types of radioactivity (dosimeters, film badges, Geiger-Müller counters) is used to record doses of radiation received by workers. It is possible to learn how much radium is in a man's body by measuring the radon gas (a radioactive decay product of radium) in his expired air. Permissible levels of radiation, at which a worker should receive no damage although he worked a lifetime, have been established. Medical examinations—including, *e.g.,* complete blood counts and eye examinations—are given regularly to exposed workers in all well-managed research laboratories, hospitals and industrial establishments where radiation exposure occurs. Shielding, protective clothing, enclosure and ventilation make it possible to carry out potentially dangerous jobs involving exposure to radioactivity.

Radar equipment takes advantage of ultrahigh-frequency waves for detection of solid objects at a distance, and workers and military men are exposed to such energy. High-voltage equipment, called klystrons, necessary for radar detection, generates X-rays. These must be measured to be certain they are at levels considered safe. Present studies suggest that heating is the only result of exposure to waves from radar equipment. Because the energies being used are continually changing, however, experimental work to discover presently unknown harmful biological effects continues.

In exploration of the space above the earth, the effects of gravity are lost and problems of friction to the body and wide temperature changes arise. Knowledge acquired by satellite exploration showed also that there is more radioactivity in the atmosphere surrounding the earth than previously had been realized. (See SPACE EXPLORATION: Space Medicine; RADIATION: BIOLOGICAL EFFECTS; AVIATION MEDICINE.)

The condition called decompression sickness, or caisson disease, which occurs in workers—divers, "sand hogs." etc.—subjected to very high atmospheric pressures, is discussed in the article CAISSON DISEASE.

DANGS, a district in India, was formed after the merger of the Dangs states of the former Gujarat states agency with the province of Bombay. Pop. (1961) 71.589. Area 689 sq mi. From May 1, 1960. the district mas included in the new state of Gujarat. The tract is extremely hilly and broken by deep ravines. Timber, bamboo and minor forest produce are the most important products. *Nagli* or raggee (*Eleusine coracana*), a variety of millet, and inferior rice are the chief crops but other food grains were being introduced in the early 1960s. The principal places are connected by roads suitable for bullock carts. Ahwa, on a plateau about 1,600 ft. above the sea, is the headquarters of the district.

(M. R. P.)

DANIEL (DAKILO ROMAKOVICH; also called DANIEL OF GALICIA) (1202–1264), prince of Halich and Volhynia (in modern Poland and Ukraine), was the son of Prince Roman Mstislavich, who fell in battle against the Poles in 1205, leaving the infant Daniel in his widow's charge. Instantly many pretenders appeared for the vacant throne: the Poles. the king of Hungary. the princes of Chernigov and later Prince Mstislav the Daring of Novgorod. After the latter's death (1228), Daniel finally asserted himself as prince of Halich and Volhynia. He founded new cities—Lviv and Chelm among them—invited foreign traders and craftsmen and moved his capital from Halich to Chelm, which became a strong fortress and a flourishing trading centre.

When the Mongol-Tatar Golden Horde conquered and devastated Kievan Rus in 1237–41, Daniel saw himself compelled to recognize the khan's sovereign power. In 1245, however, he defeated Hungarian and Polish troops at Yaroslav and thus reassured his independence from the west. To find help against Tatar domination, he negotiated with Pope Innocent IV, who planned to rally the Catholic powers of Europe for a crusade against the Golden Horde. The pope sent Daniel regalia of the king's dignity in 1253, and Daniel was cronned king, but no further help came. Daniel died an outwardly obedient but inwardly disillusioned and embittered vassal of the Golden Horde. He is buried at the Chelm Orthodox cathedral.

DANIEL (DANIIL) OF KIEV, the earliest Russian travel writer, who left one of the most important medieval narratives of pilgrimage to the Holy Land, which is of interest also for the study of ritual and of the Russian language. He was the abbot of a Russian monastery, and visited Palestine in the reign of Baldwin I, probably during 1106–07. Daniel's account is fuller and more accurate than that of his predecessor Saewulf and is a valuable record of the condition of the country before the changes effected by the crusaders. Despite his credulity and his errors of topography and measurement, Daniel's work is generally reliable and he has clearly been at pains to check his information wherever possible by his own experience. His narrative begins at Constantinople, whence he traveled along the western and southern coasts of Asia Minor to Cyprus and the Holy Land. He lived over a year in Jerusalem, of which he gives a minute and accurate description, and made three excursions, to the Dead sea, to Hebron and to Damascus. Palestine in this period appears to have been loosely governed and the Saracens much given to lawlessness, but the Latin and Greek Churches were on harmonious terms. The work includes a detailed description of the Easter services in Jerusalem.

BIBLIOGRAPHY.—There are 76 manuscripts of Daniel's Narrative, of which only five are anterior to A.D. 1500; I. P. Sakharov's ed. (1838–39) is perhaps the best known (in *Narratives of the Russian People,* vol. ii, bk. viii, pp. 1–45). *See* also the French version in *Itinéraires russes en Orient,* ed. by Maitre B. de Khitrovo (1889) (*Société de l'Orient latin*); Eng. trans., annotated by C. W. Wilson, in the Library of the Palestine Pilgrims' Text Society, vol. iv (1895); the account of Daniel in C. R. Beazley, *Dawn of Modern Geography,* vol. ii (1901). (WM. C. B.)

DANIEL, ARNAUT: *see* TROUBADOURS.

DANIEL, GABRIEL (1649–1728), French Jesuit historian, known for his pioneer *Histoire de France depuis l'établissement de la monarchie française* (first complete edition, 1713; ed. by P. Griffet, 1755–60). Born at Rouen, Feb. 8, 1649, he entered the Jesuit order in 1667, later becoming librarian of the professed house at Paris, and was appointed historiographer of France by Louis XIV. He died in Paris, June 23, 1728. His writings include *Histoire de la milice française* (1721), *Dissertation sur l'origine du jeu de picquet* (1720), and replies to Pascal in *Entretiens de Cléandre et d'Eudoxe sur les lettres provinciales* (1694) and to Descartes in *Voiage du monde de Descartes* (1691).

See C. Sommervogel, *Bibliotheca Mariana de la compagnie de Jésus,* vol. ii (1885).

DANIEL, SAMUEL (1562?–1619), English poet, was a thoughtful, contemplative writer, praised by later poets for both substance and style. Born about 1562 near Taunton, Somerset, he entered Magdalen hall, Oxford, in 1581. After publishing a translation of Paulus Jovius' book on devices in 1585 for his first patron, Sir Edward Dymoke, he secured a post with the English ambassador at Paris; later he traveled in Italy, visiting the poet Battista Guarini in Padua. After his return, by 1592, he lived at Lincoln in the service of Sir Edward Dymoke, at Wilton as tutor to William Herbert, later earl of Pembroke, and at Skipton castle, Yorkshire, as tutor to Lady Anne Clifford. Soon after the accession of James I, Queen Anne chose him to write a masque in which she danced at Hampton court. She rewarded him with the right to license plays for the boy actors at the Blackfriars theatre and with a well-paid position as a groom, and later gentleman, of her privy chamber. Besides writing "under her roof," he had a garden house in Old street, London, and The Ridge, a farm near Beckington, Somerset, where he died in Oct. 1619 a few months after his wife, Justina. His brother John set two of his sonnets to music in *Songs for the Lute, Viol and Voice* (1606) and edited *The Whole Works of Samuel Daniel Esquire in Poetry* (1623).

Edmund Spenser praised Daniel for his first book of poems, *Delia,* with *The Complaint of Rosamond* (1592). Many of his sonnets had been printed in 1591 without his consent, but in this book Daniel published 50 sonnets with a dedication to Mary, countess of Pembroke, whom he celebrated as Delia. More were added in later editions. Less original than Shakespeare or Sir Philip Sidney, Daniel was strongly influenced by French and Italian sonnets and varied their themes with a quiet music of his own, as in "Care-charmer Sleep" and "When men shall find thy flower, thy glory pass." The passing of youth and beauty into sudden eclipse is the theme of the *Complaint,* a tragic monologue spoken by Fair Rosamond, the mistress of Henry II. In *The Tragedie of Cleopatra* (1594) Daniel wrote a Senecan drama to accompany Lady Pembroke's translation of *Marc Antoine* by Robert Garnier. *The Civile Warres* (1595–1609), a verse history of the Wars of the Roses, had some influence on Shakespeare in *Richard II* and *Henry IV.*

Daniel's finest poem is "Musophilus: Containing a Generall Defence of Learning," dedicated to Fulke Greville. In this dialogue the lover of the world, Philocosmus, argues that poetry is useless, fame an "inheritance of air" and action more important than knowledge. Musophilus, replying that "true knowledge can both speak and do," defends knowledge, "soul of the world"; virtue, "that all-knowing power"; and "blessed letters that combine in one All ages past, and make one live with all." Here the poet rose to the height of his argument. His *Poeticall Essayes* (1599) also include "A Letter from Octavia to Marcus Antonius." His *Defence of Ryme,* answering Thomas Campion's *Observations in the Art of English Poesie,* is a critical essay in prose second only to Sidney's *Apology for Poetry.* Composed as a private letter in 1602, the *Defence* was published in 1603 with "A Panegyrike Congratulatory" to James I and "Epistles" in verse to three lords and three ladies. To Lucy, countess of Bedford, he praised knowledge as the way to true happiness, and to Margaret, countess of Cumberland, he addressed a majestic expression of Christian stoicism. Fame and honour are the subjects of "Ulisses and the Syren" (1605) and of *A Funerall Poeme uppon the Earle of Devonshyre* (1606). Like Ben Jonson with his *Sejanus,* he had had to defend himself against a charge of sympathizing with the earl of Essex, in *The Tragedie of Philotas,* acted in 1604 (publ. 1605), but he explained that the play was purely historical drama. Earlier in 1604, he had pleased Queen Anne with his masque, *The Vision of the Twelve Goddesses,* and in 1610 he wrote another masque for her, *Tethys' Festival,* staged with scenery by Inigo Jones. *The Queenes Arcadia* (publ. 1606), a pastoral tragi-comedy in the Italian fashion, entertained the queen at Oxford in 1605, and a second pastoral, *Hymens Triumph,* celebrated a wedding in 1614. He spent much time in revising his poems and in writing in prose *The Collection of the Historie of England* (1612–18) as far as the reign of Edward III. Wordsworth admired his "Epistles," and Coleridge wrote to Lamb: "Thousands even of educated men would become more sensible, fitter to be members of Parliament or Ministers, by reading Daniel."

BIBLIOGRAPHY.—Daniel's *Complete Works* were ed. by A. B. Grosart, 5 vol. (1885–96), and a selection, *Poems and A Defence of Ryme,* by A. C. Sprague (1930). *The Civil Wars* were ed. by Laurence Michel (1958). There are bibliographies by H. Sellers (1928–30) and S. A. Tannenbaum (1942). *See* also C. S. Lewis, *English Literature in the Sixteenth Century* (1954). (M. Es.)

DANIEL, BOOK OF, a book of the Old Testament. In the Hebrew Bible the Book of Daniel stands between Esther and Ezra-Nehemiah among the Writings, or Hagiographa, the third and latest division of the Palestinian canon; nearly half of it is written in Aramaic.

In the English Bible (following the Alexandrian canon) it is placed among the prophets. Three "additions" which became associated with the canonical text at an early date are found in the Septuagint and Vulgate.

Contents.—The 12 chapters of the canonical book present a collection of popular stories about Daniel, a loyal Jew, and the record of visions granted to him, with the Babylonian exile of the 6th century B.C. as their setting. After an introduction, which explains how Daniel and his three companions came to be living at the Babylonian court and how they remained faithful to the laws of their religion (Dan. i), there are five dramatic episodes calculated to demonstrate the wisdom and might of Israel's God and the unconquerable steadfastness of his loyal people. Thus, through God's gift of wisdom, Daniel outclasses the professional sages of the pagan court by revealing and interpreting Nebuchadrezzar's dream of a great image, made of four metals, which was shattered by a stone cut without human hand (Dan. ii), and then the king's further dream of the tree reduced to a stump, which presaged the punishment of his arrogance by madness (Dan. iv), and, finally, the writing on the wall, which spelt Belshazzar's doom at his sacrilegious feast (Dan. v). By trust in God, Daniel's three

companions, who refused to worship Nebuchadrezzar's golden idol, are miraculously delivered from a fiery furnace (Dan. iii), and Daniel himself, thrown into a den of lions for holding fast to his tradition of prayer, is divinely protected (Dan. vi).

The last six chapters of the book are cast in the form of "visions." In ch. vii, Daniel is granted a vision of four beasts from the abyss, which are brought under divine judgment, and of "one like a son of man" (Dan. vii, 13), who is brought before God to be invested with his universal and everlasting sovereignty. The mythological beasts are interpreted as four empires (Dan. vii, 17) and the manlike figure as Israel, "the people of the saints of the Most High" (vii, 27; *cf.* 18, 22). The vision of the battle between the ram (Medes and Persians) and the goat (the Greek empire) in Dan. viii portrays the iniquities of Antiochus IV Epiphanes, who desecrated the Temple in 167 B.C. (Dan. viii. 9–12), and assures the stricken Jews that the end of their tribulation is near (Dan. viii. 13 ff., 26). The writer's purpose in ch. ix is also to affirm that the time of Israel's suffering is short, and his method is to reinterpret a prophecy of Jeremiah that Jerusalem's desolation would end after 70 years. By making these 70 years mean 70 "weeks of years" (that is, 490 years), the writer is again able to focus attention on the period of Antiochus' persecution in the 2nd century B.C. and the imminence of his determined doom. The remaining chapters (x–xii) provide the third and final commentary on the crisis provoked by the Seleucid tyrant. The greater part of this "vision" is a sketch of such events as affected the Jews from the Persian period to the time of Antiochus Epiphanes (xi. 2–xii, 4), for whose reign of terror (xi, 21–45) all that precedes is mere preparation. After xi, 39, the account of Antiochus' life ceases to correspond with historical fact; the inaccurate prediction of his end in xi. 40–45 is the prelude to the announcement of the end of Israel's tribulation and the inauguration of God's kingdom (xii, 1–4).

The purpose of the whole book, stories and visions alike, is to encourage Israel to endure under the threat of annihilation and to strengthen her faith that "the Most High rules the kingdom of men" (iv, 17, 25) and will in the end give victory to his people and establish his kingdom (ii. 44; vii, 25–27).

Literary History.—The overwhelming majority of scholars have abandoned the belief (already challenged by the Neoplatonist philosopher Porphyry in the 3rd century A.D.) that the book was written, as it purports to be, in the 6th century B.C., and find the occasion for its production in the period upon which the visions are focused; that is, between 167 and 164 B.C. Among the considerations which point to this date in the 2nd century are the folloming:

1. The book is included among the Writings with the latest books of the Hebrew canon.

2. Daniel is not mentioned in Ben Sira's list of the great men of Israel (Ecclus. xliv–1, *c.* 180 B.C.).

3. The prophecy of Jeremiah cited in Dan, ix is regarded as authoritative scripture and interpreted in a manner similar to that found in the literature from Qumran.

4. The four metals of the image in Dan. ii and the four beasts of Dan. vii are generally interpreted as four kingdoms—the Babylonian. "Median." Persian and Greek. The writer's historical knowledge is sketchy and inaccurate for the first three of these kingdoms. Thus. the dating of i. 1 (*cf.* ii, 1) is wrong (cf. II Rings xxiv, 1 ff. and II Chron. xxxvi. 5 ff.). In Dan. v, 11 Belshazzar is represented as the son of Nebuchadrezzar and the last king of Babylon. In fact. Belshazzar was the son of Nabonidus, the last king of Babylon, and although he was invested with certain royal prerogatives he was never actually king. The immediate successor of Nabonidus was Cyrus and not Darius the Mede (v, 31), who is an entirely fictitious character suggested by prophecies of Babylon's overthrow by the Medes (Isa. xiii, 17; Jer. 1, 9, etc.) and named after Darius I. By contrast, Dan. xi is a not inconsiderable historical source for the Greek period and more easily accounted for as prophecy after the event than as prediction made four centuries earlier. The date of this narrative is indicated precisely by the transition from accurate history to inaccurate prediction at xi, 40.

5. The type of Hebrew is late. though the Aramaic is inconclusive for a 2nd-century date.

6. The religious thought and piety of the book belong rather to the 2nd than to the 6th century. Thus, the resurrection of both wicked and righteous individuals is affirmed here for the first time in the Old Testament (Dan. xii. 2); a developed angelology is taken for granted (Dan. viii. 16; x. 13. 21: etc.); vegetarian diet is used to avoid infringing Jewish food laws (i, 8–16): thrice-daily prayer (vi. 10) and fasting with sackcloth and ashes (ix, 3) characterize late Jewish piety; and the "voice from heaven" (iv. 31 [28]; *cf.* Matt. iii, 17) was recognized as a medium of revelation after the decline of prophecy.

Literary Affiliations.—The literary affiliations of the book confirm its 2nd-century dating.

1. The stories of Dan. i–vi are similar in type to the didactic fiction in Tobit. Judith and Esther. Although these three books are products of the 2nd century B.C., their setting in each case is the distant and dimly remembered period of Israel's exile and dispersion and their theme is the success which attends the loyal Jew who resists the temptation to fall in with the way of the gentiles. The history of Susanna and Bel and the Dragon (see below) are completely congruous with this aspect of the tradition to which the book belongs (cf, the tale of the three youths in I Esd. iii–iv and the Aramaic story of Ahikar).

2. The close relationship between the Book of Daniel and the wisdom literature illuminates the didactic use of popular stories (cf. Job, Tobit and see above), the emphatic contrast between human and divine wisdom in Dan, i–vi (especially ii, 20–23; cf. Job xii, 13–25), and the connection with cosmological myths in the vision of the beasts from the abyss (Dan, vii; *cf.* Job iii, 8; Isa. li, 9–10; etc.) and in Xebuchadrezzar's dream of the tree (Dan. iv. 10–17; *cf.* Ezek. xxxi, 1–9). Moreover. if in Dan. xi, 33 and xii. 3 the writer is associating himself with "the wise," that is. the scribes and teachers of the Law, it is reasonable to suppose that he was not far removed from the learned circles in which Ecclesiasticus was written (c. 180 B.C.). The description of the ideal scribe given in Ecclus. xxxix, 1 ff. admirably fits what may be learned of the writer of Daniel from the contents of the book.

3. The writer was clearly a student of the prophetic writings; Dan. ix is a reinterpretation of Jer. xxv, 12 and the book contains many echoes of Ezekiel. It is, however, a curious and significant fact that many of the features which characterize prophetic eschatology and which were elaborated in such later apocalyptic writings as I Enoch, the Sibylline Oracles, the Assumption of Moses and II Esdras are absent from Daniel. Thus the writer neglects the prophets' cosmic imagery, their great eschatological battle scenes. their lurid descriptions of the fate of the gentiles, their highly coloured pictures of the final age and their usual (but not invariable) interest in the messianic leader of the eschatological community. The "anointed one" of Dan. ix. 26 is probably the high priest Onias III (cj. Dan. xi, 22; II Macc. iv. 33–38). The book of Daniel, therefore, cannot easily be placed on any clear line of development between prophecy and apocalyptic and its reputation as the greatest pre-Christian apocalypse rests largely on the fact that it inspired so many apocalyptic writers to imitate certain of its characteristic features. In particular, they adopted the author's method of presentation, whereby divine revelations concerning the future were ascribed to an ancient seer. written don-n by him and sealed in a book until the time to which they referred (Dan. viii. 26; xii, 4, 9: *cf.* Rev. xxii. 10).

Conclusions.—There is a prima facie case for more than one author in that the book is written in two languages, Hebrew (i, 1–ii, 4a and viii–xii) and Aramaic (ii. 4b–vii, 28), and is composed of two diverse elements, anonymous stories (Dan. i–vi) and largely pseudonymous "visions" (Dan. vii–xii). Fragments marking the change in language both at ii. 4b and at viii, 1 have been discovered at Qumran. The hard core of the problem arises from the lack of coincidence between the division of the book suggested by language and that suggested by literary form and. therefore. it is most critical in Dan. vii, which by language belongs to ch. ii–vi but by form to ch. viii–xii. In consequence, some

scholars have divided the book at the end of ch. vi, others at the end of ch. vii. Among the latter group, many take the view that ch. vii though closely related to ch. i–vi was independent in origin and later in date. Chapters viii–xii differ in the following ways from ch. i–vii: they contain references to the desecration of the Temple (*e.g.*, Dan. viii, 11); they are written in Hebrew; the style is tortuous and the symbolism naïve; the eschatological perspective is narrowed from God's inauguration of his kingdom (*e.g.*, Dan. ii, 44–45) to the time of Israel's vindication (*e.g.*, Dan. viii. 13–14); they show interest in developed angelology, theological determinism and individual resurrection.

A possible solution of the problem is the following: the book in its present form was produced between 167 B.C., when Antiochus Epiphanes desecrated the Temple, and 164 B.C., when the Temple was rededicated. Chapters i–vii were written after Antiochus Epiphanes plundered the Temple in 169 B.C. but before he desecrated it in 167 B.C. This author incorporated traditional stories into his first six chapters and wrote chapter vii. The remainder of the book was written between 167 and 164 B.C. by a scribe who translated Dan. i–ii, 4a into Hebrew, presumably to improve the book's reception among the *Hasidim* ("Hasidaeans") who resisted the Hellenizing Jews during the Maccabaean persecution.

The date of the traditional stories (Dan. i–vi) and the background of their hero, Daniel, are difficult to determine. A character named Dan'el (another form of Daniel) is mentioned as one of Israel's legendary saints together with Noah and Job in Ezek. xiv, 14, 20, as the wise man par excellence from whom "no secret is hidden" in the mythological content of Ezek. xxviii, 3, and as a righteous man in the tale of Aqhat among the Ras Shamra texts. It is not certain whether Daniel should be identified with this Dan'el or not. The stories in which he figured were found useful by the author of Dan. i–vi because they exposed the ludicrous pretensions of gentile kings and depicted the victories of true religion. The 2nd-century writer made his own contribution by unifying the stories about Daniel and integrating with them the independent tale about Shadrach, Meshach and Abednego (cf. Dan. i, 7) in the furnace (Dan. iii), by developing the theological reference of the stories and, above all, by crowning the book with a profound eschatological interpretation (Dan. vii).

Interpretation. — To recognize that the antedating of the visions is a literary device is to be delivered from the traditional assumption that the book contains predictions of the remote future and, in consequence, from all the sterile and fantastic speculations about their fulfillment. The stories are addressed to the immediate crisis and the visions refer to the immediate future. Their dominant theme is the sovereignty of the living God, now opposed by pagan arrogance but upheld by the fidelity of his people and shortly to be manifested fully and finally in the judgment of the kingdoms of the world and the inauguration of the Kingdom of God. The eschatological pattern and imagery of the book profoundly influenced the writers of the New Testament no less than Jewish apocalyptic writers. In particular, the corporate term "Son of Man" (Dan. vii, 13; cf. Mark xiii. 26) became on the lips of Jesus and in martyr contexts of the New Testament the perfect symbol for expressing the conviction that God is sovereign in human history and will assuredly vindicate his humiliated and suffering servants. (ER. W. H.)

Additions to Daniel. — Three short pieces not in the Hebrew Bible, Susanna and the Elders, Bel and the Dragon and The Song of the Three Holy Children, are appended to the Book of Daniel in the Septuagint and Theodotion's version, from the latter of which they passed to the Vulgate. They are rejected from Protestant Bibles and form part of the Apocrypha (*q.v.*). It is uncertain whether Hebrew, Aramaic or Greek was their original language, and they cannot be dated more precisely than to the 2nd century B.C. after the Book of Daniel or to the 1st century B.C.

Susanna and *the* Elders. — This further story illustrating the wisdom of Daniel forms the 13th chapter of the book of Daniel in the Vulgate. The Greek version by Theodotion is fuller than that of the Septuagint. It relates how during the captivity of the Jews in Babylon a devout and beautiful woman named Susanna was spied on by two elders as she prepared to bathe in her husband's garden. Her virtue, however. was impervious to their adulterous advances, though they threatened to accuse her publicly of an adultery of which they would claim to be witnesses. In the event, their word was believed rather than hers, but as she was led out to die Daniel appeared in her defense. His cross-examination of the two elders separately showed that they were lying, and Susanna was thus proved innocent.

Bel and the Dragon. — Two stories about Daniel as an attacker of pagan gods are told under this heading. In the Vulgate they form the 14th chapter of Daniel. Daniel proved to Cyrus, king of Persia. that the Babylonian god Bel (Marduk) was a lifeless idol by scattering dust around it so that those who came secretly by night to consume the quantities of food offered to it left clear traces of their activities. The living serpent or dragon, another object of worship, was also proved ineffectual as a deity by Daniel. who caused its death by feeding it with a mixture of pitch, fat and hair. Infuriated by their loss the people threw Daniel into the lions' den. where he remained unharmed and was fed by the prophet Habakkuk brought miraculously to Babylon by an angel for the purpose. On the seventh day Cyrus released Daniel and acknowledged the greatness of God.

The Song of the Three Holy Children. — The three holy children Shadrach, Meshach and Abednego, also known as Hananiah, Mishael and Azariah, were thrown by Nebuchadrezzar into a fiery furnace for refusing to worship a golden image (Dan. iii). This addition (inserted in the Septuagint and Theodotion's version. followed by the Vulgate, between Dan. iii, 23 and 24) consists of a prayer by Azariah (1–22), a narrative account of how an angel kept the fire from harming them (23–28) and a series of blessings of God uttered by all three "as with one mouth" (28–68). At the end there is a reference to the furnace (66), but apart from this the prayer and the blessings have no particular connection with their supposed occasion. Both are included among the canticles (*q.v.*) of the Orthodox Church, and the Benedicife, which is the greater part of the blessings. is said at lauds in the Roman Catholic Church and included in the Book of Common Prayer.

DANIELL, the name of a number of English late 18th- and early 19th-century topographical painters and engravers. THOMAS DANIELL (1749–1840) was best known for his work with his nephew William on Oriental Scenery, drawn in India in 1784–93 and published in six aquatinted volumes in 1808. WILLIAM DANIELL (1769–1837) was also noted for his Madras panoramas, for his aquatinted Picturesque Voyage to India (1810) and for *A* Voyage Round Great Britain (4 vol., 1814–25). He made soft-ground etchings (1808–14) of G. Dance's portraits of John Flaxman. Benjamin West, etc. Thomas and William were under the general influence of P. Sandby. William's brother SAMUEL DANIELL (1775–1811) traveled into Bechuanaland in 1801, one result being his aquatinted African Scenery and Anzmals (2 parts. 1804–05). Settling in Ceylon in 1806 he published in 1808 Picturesque *Illustrations* . . . of Ceylon.

Of Daniells unrelated to the above the most notable was EDWARD THOMAS DANIELL (1804–43), a Norwich clergyman, amateur landscape etcher, dry point engraver and water colourist.

Others included ABRAHAM (d. 1803), miniaturist of Bath; JAMES (fl. c. 1800), etcher; and JOSEPH (fl. *c.* 1810), etcher.

See Thomas Sutton, *The Daniells: Artists and Travellers* (1954).

DANIELL, JOHN FREDERIC (1790–1845), English chemist and meteorologist, best known for his invention of the Daniell cell *(see* BATTERY). He was born in London on March 12, 1790, and in 1831 became the first professor of chemistry at the newly founded King's college. London. He also invented the dew-point hygrometer known by his name *(Quar. Journ. Sci.,* 1820), and a register pyrometer *(Phil. Trans.,* 1830); in 1830 he erected in the hall of the Royal society a water barometer with which he carried out a large number of observations *(Phil. Trans.,* 1833). A process devised by him for the manufacture of illuminating gas from turpentine and resin was in use in New York for a time. His publications include *Meteorological Essays* (1823), an *Essay on Artificial Climate Considered in Its Applications to Horticulture* (1824). which showed the necessity of a humid atmosphere in hothouses devoted to tropical plants. and an *Introduction to the Study of Chemical Philosophy* (1839). He died on March 13, 1845, in London.

DANIELS, JOSEPHUS (1862–1948), U.S. editor. secretary of the Navy during World War I and diplomat. was born at Washington. N.C., on May 18, 1862. Educated briefly at the University of North Carolina, he was publisher, and intermittently editor, of the Raleigh, N.C., newspapers, the *State Chronicle* from 1885 to 1904 and the *News and Observer* from 1904 to 1948. He was a leader in movements for railroad and utility regulation, prohibition, labour legislation and women's suffrage. A lifelong Democrat, he became one of the original supporters of William Jennings Bryan (*q.v.*) in 1896 and was close to Bryan in his three campaigns for the presidency. In 1911 Daniels turned to Woodrow Wilson for leadership of the Democratic party and helped nominate him for the presidency in 1912. Appointed secretary of the navy in 1913 by Wilson, Daniels helped bring the navy to high efficiency during World War I. He named Franklin D. Roosevelt as assistant secretary of the navy. In 1933 when Roosevelt became president he appointed Daniels ambassador to Mexico. In that country Daniels won Mexican friendship and helped prevent expropriation of U.S. oil properties from disrupting Mexican-U.S. relations. His five-volume autobiography (1939–47) was an important contribution to American historical literature. He died on Jan. 15, 1948, at Raleigh, N.C. **(A.** S. LK.; Jo. D.)

DANIELSSON, OLOF AUGUST (1852–1933), Swedish classical scholar and comparative philologist, especially noted for his work on Etruscan epigraphic remains, was professor of Greek at Uppsala university from 1890 to 1917. Danielsson's formative period, comprising years of study in Germany, coincided with the emergence of the "neogrammarian" school of Indo-European comparative philology, which emphasized the stringent regularity of sound laws governing linguistic change. Danielsson was one of the young scholars who introduced the new doctrines in Sweden. His own contributions to scholarship comprise numerous monographs and articles on the historical and comparative grammar of Greek and Italic languages and dialects. more strictly philological contributions on the exegesis of ancient authors, on Venetic. Lepontic and Lydian inscriptions, and above all the great enterprise of the *Corpus Inscriptionum Etruscarum,* begun by *C.* Pauli with Danielsson's collaboration in the 1880s. The first volume was published shortly after Pauli's death in 1901; Danielsson carried on the work, assisted by B. Nogara, G. Herbig and E. Sittig. Different fascicles of the second volume appeared during the ensuing decennia, but the gigantic undertaking remained unfinished at Danielsson's death; posthumous materials and remaining installments were published by the surviving collaborators.

DANILEVSKI, NIKOLAI YAKOVLEVICH (1822–1885), Russian naturalist and historical philosopher, the author of *Rossiya i Evropa* (1869; Ger. trans. *Russland und Europa,* 1920), was born in Oberets (Orel), Dec. 10 (new style; old style, Nov. 28), 1822. He was the first to propound the philosophy of history as a series of distinct civilizations. According to him, Russia and the Slavs should remain indifferent to the west and concentrate on the development of political absolutism, their own special cultural heritage—not necessarily better than but different from that of the west. Danilevski was said to have "given Russian nationalism a biological foundation." His ideas influenced Konstantin Leontiev among Russian thinkers and, among western philosophers. Oswald Spengler (*q.v.*). He died in Tiflis, Nov. 19 (N.S.; 7, O.S.), 1885.

See his *Darvinizm,* 2 vol. (1885–89); also K. Pfalzgraf, *Die Politisierung und Radikalisierung des Problems Russland und Europa bei N. J. Danilevskij* (1954). (R. **F.** HI.)

DANILOVA, ALEXANDRA (1904–), Russian-American ballerina, was born in Petergof, Russia. She attended the Russian Imperial and (later) the Soviet State Ballet schools in Leningrad. where she studied under Agrippina Vaganova, and became soloist at the Maryinsky theatre. In 1924 she visited western Europe with a small ballet ensemble headed by George Balanchine. The entire group joined the Diaghilev Ballet and never returned to Russia. Danilova soon rose to prominence in the Diaghilev company, creating leading roles in *Apollo, La Pastorale* and *The Triumph of Neptune.* After Diaghilev's death in 1929, she joined the Ballet Russe de Monte Carlo, making her American debut as its prima ballerina in 1933. While touring extensively throughout the United States! she achieved tremendous personal popularity through the warmth and individuality of her characterizations. Especially memorable were her brilliant performances as the street dancer in *Le Beau Danube,* the glove seller in *Gaîté Parisienne,* Odette in *Swan Lake* and Swanilda in *Coppélia.*

Danilova appeared as guest artist with Sadler's Wells Ballet, London, and with her own company danced in Japan and South Africa. She also appeared in musical comedy and in 1959 made a lecture tour.

See A. E. Twysden, *Alexandra Danilova* (1945). **(LN. ME.)**

DANISH LANGUAGE, one of the Scandinavian group of the Germanic languages, has about 5,000.000 speakers. It is closely related to Swedish, Norwegian and Icelandic, which are all derived from a common Scandinavian language; the separation of the four languages began at about A.D. 1000. The primeval Nordic language *(c.* A.D. 250–800) is known from relatively few runic inscriptions, among which is the famous Danish *Gold Horn Inscription (c.* 400). In the period of so-called runic Danish (800–1100) remarkable changes took place, mainly through fracture, i-mutation, *u*-mutation and assimilation, and through the disappearance of unstressed short vowels. While these and other phenomena apply to all the Scandinavian languages, other changes, such as the monophthongization of *ei* into *e, au* into *ø* and *ey* into *ø,* and the disappearance of *h* in front of *l, n* and *r,* are characteristic only of the east-Scandinavian languages (Swedish and Danish). The period of Middle Danish (1100–1500) is characterized by a weakening of the vowels *a* and *i* into *e,* in an unstressed position, and by a change of the plosives *p, t* and *k* into b, *d* and *g,* after a vowel sound. Other characteristic changes are from ja into *jæ,* from *ju* into jy, from a long *a* into the 6-sound, and from the unvoiced th-sound (written *þ*) into *t*. A general simplification of declension and grammar took place at the same time, more slowly in the eastern Danish provinces of Scania, Halland and Blekinge, most radically in the western dialects of Jutland.

Already in the viking period a number of loan words of Latin and Greek origin penetrated into the Danish language; this tendency was continued in the middle ages, when there was also a great influx of Low German words, prefixes and suffixes, because of the influence of Hanseatic merchants.

Modern Danish may be divided into two periods, before and after 1700. While the general simplification of the language continued steadily, many new words came into the language, mainly from High German arid French but also from a variety of other languages. Several of these loan words disappeared again, to some extent the result of the deliberate efforts of language purists; but many came to stay. An influx of English loan words is noticeable from about 1870.

A characteristic phenomenon of the modern spoken language is the glottal stop (*Stød*), derived from an original tonal accent.

The grammatical structure of modern Danish is nearly as simplified as that of modern English; there are only two cases (nominative and genitive) and two genders (common gender and neuter). In addition to the letters of the English alphabet, Danish has the three letters *æ ø* and *å*. A spelling reform of 1948 abolished the previous general use of capital letters for nouns and replaced the letter aa by *å*.

DANISH LITERATURE. Denmark's first literature is found in the runic inscriptions scratched on stone or carved on metal, mainly epitaphs of warriors, kings and priests, occasionally with short. unrhymed alliterative verses reflecting the viking spirit. Runic inscriptions were used in Denmark from about A.D. 250, but most of those preserved date from 800–1100.

Middle Ages.—With the introduction of Christianity Latin became the predominant language. Anders Sunesøn (c. 1167–1228) wrote *Hexaëmeron,* a long Latin poem describing the creation and the ecclesiastical dogmas. This poem, the poetry of Morten Børup (c. 1446–1526) and two poems of mourning and despair of unknown origin are Denmark's most important contributions to medieval Latin poetry. A number of legends and biographies of saints date from the early middle ages, notably one about Canute the Holy, by Aelnoth, an English monk; various annals of monasteries, as well as historical chronicles, have also survived. Sven Aggesøn's brief outline of Danish history before 1185. *Historia regum* Daniae *compendiosa,* was shortly followed by the Gesta *Danorum* by Saxo Grammaticus (*q.v.*), Denmark's first important contribution to world literature. Of its 16 books, written between 1185 and 1222, the first 9 cover prehistoric Danish antiquity, based on pagan legends and heroic poems passed down by word of mouth from generation to generation.

Danish medieval literature also includes a number of edifying books, hymns and various provincial laws for Scania, Zealand and Jutland; the Jutland laws were accepted by the rulers of the kingdom in 1241. Other important treasures are Peder Laale's Ordsprog ("Proverbs"; 14th century), some medical books by Henrik Harpestraeng (13th century), *Lucidarius* ("The Enlightener." a medieval "encyclopaedia") and *Rimkrøniken,* a versified Danish history, incidentally the first Danish book to be printed (1495). In a class by themselves are the medieval ballads, of which no country possesses a finer treasure; 539 are known in more than 3,000 versions, but nearly all were written down after the end of the middle ages. The first printed edition appeared in 1591. (See BALLAD.)

The Reformation and the Renaissance.—In 1536 the Reformation came to Denmark and this marked the end of the middle ages. The beginning of the 16th century was characterized by its many religious polemic pamphlets for or against the Roman Catholic Church. This inaugurated a new literature in the mother tongue. European humanism and the Renaissance made their influence felt also in Denmark, where Christiern Pedersen (*q.v.;* d. 1554) ranks as the most prominent of the humanists who supported the Reformation. He edited the first printed edition of Saxo's Gesta *Danorum* (Paris, 1514) and Laale's *Ordsprog,* translated the New Testament and adapted Martin Luther's pamphlets into Danish. Of supreme importance is his participation in the translation of the Bible (1550). Poul Helgesen (c. 1485–c. 1535) was the most gifted opponent of the Lutheran reformation (also the author of the *Skibykrønike*) and Hans Tausen (*q.v.;* 1494–1561) its most talented spokesman. The *Visitatsbog* of the Lutheran bishop Peder Palladius (1503–60) is a charming literary document.

The bulk of 16th-century Danish poetry was either religious or polemical, the main lyrical contributions being some fine love poetry and some hymns. Hans Thomissøn made the first important collection of hymns (1569) and Hans Christensen Sthen (1544–1610) was the first notable hymnist.

The earliest plays—mysteries, miracles, moralities, farces and school plays—date from the beginning of the 16th century, but many of them have been lost. *Ludus* de Sancto Canuto ("Saint Canute's Play"), a miracle play, dates from about 1530. The most important playwright of the period was Hieronymus Justesen Ranch (1539–1607) and the farce Karrig Nidding ("The Miserly Rascal") his best play.

Anders Sørensen Vedel (1542–1616) translated Saxo's work into Danish and edited the first collection of ballads; Peder Claussøn Friis (1545–1614), a Norwegian, translated Snorri's Heimskringla; and Arild Huitfeldt (1546–1609) wrote Danmarckis *Rigis Krønnicke* ("Chronicle of the Danish Realm") in ten volumes.

In the 17th century the literary renaissance reached Denmark, and led to a strict adherence to classical patterns. It was in Denmark an age of orthodoxy and blind belief in authority in political, religious and literary matters. Niels Hemmingsen (1513–1600), a theologian of European reputation, had fallen a victim to the heresy hunt in the previous century; and in religious literature Latin dogmatics, edifying leaflets and a host of pamphlets reflecting the superstitions of the century were dominant.

It was. however, a great era of science and scholarship. Ole Worm (1588–1654), a physician and antiquarian. is famous for his book on the runic inscriptions, the *Monumenta* Danica (1633). Thormod Torfaeus (1636–1719) and Arni Magnússon (*q.v.;* 1663–1730) introduced the scholarly study of Old Norse literature and Peder Hansen Resen (1625–88), who wrote a description of Denmark. Atlas Danicus, edited and translated some of the poetry of the Edda; Erik Pontoppidan (1616–78), with his Grammatica *Danica* (1668), and Peder Syv (1631–1702), with Af *Nogle betenkninger om* det *cymbriske sprog* ("Reflections on the Cimbrian Language," 1663) and Den Danske *Sprog-Kunst* ("Mastery of the Danish Language," 1685), introduced the linguistic study of Danish.

The most important Danish prose work of the 17th century is *Jammers-Minde,* the memoirs of Leonora Christina (1621–98), the daughter of Christian IV, a fascinating human document about her 20 years' imprisonment in the Blue Tower of Copenhagen. The manuscript was first discovered and published in 1869.

Danish poetry in the 17th century tended to follow the classics slavishly, and the favourite forms were the hexameter, the Alexandrine and the sonnet. Simplicity is deliberately avoided; the style is precious; allegories, euphemisms and metaphors abound. Anders Arrebo (1587–1637) translated the Psalms and wrote Hexaemeron (1661), a Danish version of Guillaume Du Bartas' La *Divine Sepmaine.* The century was rich in occasional poetry celebrating weddings and birthdays or mourning for a deceased paragon of virtue; didactic and pastoral poems were also frequent. Anders Bording (1619–77), an interesting exponent of Danish baroque poetry, was also the founder of the first Danish newspaper, *Den* Danske Mercurius (from 1666), in which the news appeared in rhymed Alexandrines. The only truly great poet was Thomas Kingo (*q.v.;* 1634–1703), a supreme master in almost every kind of poetry. His hymns reflect a violent, passionate character, worldly and yet deeply religious. Among the few playwrights Mogens Skeel (1650–94) deserves mention.

The 18th Century.—Ludvig Holberg (*q.v.;* 1684–1754), a Norwegian by birth and upbringing, is the great name of Danish literature in the first half of the 18th century. His most important contribution is his 32 comedies written for the Danish theatre, which opened in 1722. His first 15 plays are comedies of character, 11 (nritten 1723–27) are comedies of manner and a final group, mainly written in his old age, are moral allegories. His aim was to create a modern Danish literature on European lines and to entertain by making people laugh at their own follies. He wrote also satires, *e.g.,* Peder Paars (1719–20), a mock-heroic poem, and *Niels* Klim's Subterranean Travels (in Latin; 1741). His Moralske *Tanker* ("Moral Thoughts," 1744) and his nearly 500 Epistler (1748–54) are the finest examples of a Danish political essay form. He also contributed a number of valuable histori-

cal works. Influenced by English and (mainly) French thinking, he was a sober rationalist, led by reason in all matters, who always preferred to follow a middle course.

Among Holberg's contemporaries the greatest lyrical poets are H. A. Brorson (*q.v.;* 1694–1764), a religious mystic whose Pietist hymns have often a background of personal sorrow or agony, and Ambrosius Stub (1705–58), whose poems are mainly religious and moralizing arias or occasional pieces, witty improvised epigrams or drinking songs. The satirist Christian Falster (1690–1752) was a conservative counterpart to Holberg; Friedrich Eilschov (1725–50) and Jens Schelderup Sneedorff (1724–64), the latter of whom edited *Den* patriotiske *Tilskuer* ("The Patriotic Spectator"), a Danish Spectator, were both rationalist disciples of Holberg. Notable historians were Hans Gram (1685–1748), Jacob Langebek (1710–75) and Erik Pontoppidan the Younger (1698–1764).

A significant revival of Danish literature took place toward the end of the century. The Norwegian Johan Herman Wessel (*q.v.;* 1742–85), one of the greatest humorists to use the Danish language. immortalized his name when, in 1772, he wrote *Kierlighed* uden *Strømper* ("Love Without Stockings"), a parody directed against the Danish imitations of Italian operas and French tragedies that had superseded Holberg's comedies on the Danish stage, especially those of Niels Krog Bredal (1732–78) and Johan Nordal Brun (1745–1816). His light humorous poems and versified narratives are still very popular. (See also NORWEGIAN LITERATURE: Det Norske Selskab.)

At the same time a revival of emotional poetry was taking place, influenced partly by German literature (Goethe, Schiller and Klopstock). partly by English literature (Shakespeare, Milton, James Macpherson, Thomas Percy, Edward Young and Thomas Gray). Johannes Ewald (*q.v.;* 1743–81), by many regarded as Denmark's greatest lyrical poet, was the first poet to delve into Scandinavian antiquity and discover the poetic wealth in the myths, in Saxo, in the sagas and in the ballads. Rolf Krage (1770) and Balders *Død* (1774–75; Eng. trans.. *The* Death of Balder) are his best tragedies; Fiskerne ("The Fishermen," 1780) was the first serious Danish drama in which ordinary people were treated heroically. His lyrical poetry varies from the solemn and majestic to the simple and subdued expression of feelings. His memoirs, *Levnet* og *Meninger* ("Life and Opinions"), were influenced by Laurence Sterne and Jean Jacques Rousseau. Jens Baggesen (*q.v.;* 1764–1826) at first imitated the satires of Holberg and Wessel but gradually developed a style of his own. He is a poet of distinction, although the quality of his poetry varies much. In Labyrznten ("The Labyrinth," 1792–93), a charming arabesque, impressionistic in style, he described his travels in Europe in the manner of Sterne.

The end of the 18th century is marked by much literary dilettantism. P. A. Heiberg (1758–1841) is an interesting exponent of a militant radicalism, influenced by the ideas of the French Revolution. His plays (*e.g.,* De Vonner og de Vanner, "The Yon's and the Van's"), his satirical prose and his poems caused him to be expelled from Denmark and he spent his last 40 years in France as a political refugee. Malthe Conrad Bruun (see MALTE-BRUN, CONRAD, 1775–1826), the author of Aristokraternes *Catekismus* ("The Aristocrats' Catechism"), had a similar fate. This was the age of social clubs, and drinking songs abounded. Knud Lyne Kahbek (1760–1830), who founded and edited the periodicals *Minerva* and Den dnnske *Tilskuer,* was a versatile song writer. Among the plays of the period it will suffice to mention the charming comedy *Gulddaasen* ("The Gold Box") by Christian Olufsen (1763–1827), the idyllic and patriotic plays of Thomas Thaarup (1749–1821) and the historical tragedy Dyveke by Ole Samsøe (1759–96).

Among the several historical and critical writers of this period special mention should be made of Rasmus Nyerup (1759–1829), a scholarly philologist, and Werner Abrahamson (1744–1812). aesthete and critic. The popular historical essays. Store og gode Handlinger af *Danske,* Norske og *Holstenere* (1777; Eng. trans., Great and Good Deeds of *Danes,* Norwegians, and Holsteinians, 1807), by Ove Malling (1747–1829), exercised a great influence, as did the historical works of P. F. Suhm (1728–98).

The Romantic Period. — The romantic movement came to Denmark from Germany, inspired partly by the German Jena romantics, partly by the classicism of Goethe and Schiller. F. W. Schelling's philosophy was interpreted in Denmark by the Norwegian Henrik Steffens (*q.v.;* 1773–1845) but the leading Danish romantics gave it a form very different from the original. A. W. Schack von Staffeldt (1769–1826) was hardly recognized in his lifetime, and his metaphysical poetry lacked popular appeal.

Adam Oehlenschläger (*q.v.;* 1779–1850) became the leader of the movement in Denmark, and his versatile writings, especially between 1802 and 1807, were inspired by a youthful ecstasy. In poetry, drama and prose he gave evidence of poetic genius which has no parallel in Danish literature. St. *Hansaften-Spil* ("Play for Midsummer Eve") and Aladdin are among his most important early plays, both embodying the main ideas of Danish romanticism. *Hakon Jarl* ("Earl Håkon") is the best of his many northern tragedies, and among later works his cycle of dramatic poems. Helge (1814), is outstanding. N. F. S. Grundtvig (*q.v.;* 1783–1872) is a gigantic figure, not only in Danish literature, but also as an educationalist, a historian, a philological scholar and a politician. His popular and historical songs, his many hymns and his personal poetry give him a lasting place in literature. He shared the romantic enthusiasm for the antiquities of Scandinavia, interpreting the Scandinavian myths as poetic visions; he retranslated both Saxo and Snorri and translated Beowulf into Danish before it had even appeared in English. His *Haandbog i Verdens*-Historien ("Handbook of World History") is, like his other historical works, a strange mixture of scholarship, prophetic visions and insanity. B. S. Ingemann (*q.v.;* 1789–1862) inspired contemporary thought with the romantic ideas of chivalry and national pride through his historical novels (1824–36) and through his poetic cycle about Holger Danske ("Holger the Dane"). Of more lasting value, however, are his simple and unsophisticated Morgen og Aftensange ("Morning and Evening Songs"). Carsten Hauch (*q.v.;* 1790–1872) wrote dramas which are often sinister, tragic and philosophic. frequently in a historical setting; his historical novels reflect his philosophy of resignation. He ranks highest as a contemplative, lyrical poet.

Romantic Realism. — During the first quarter of the 19th century the early romantic movement mas unchallenged. Then appeared t\ \ men who brought a new element of reason and realism into Danish literature. Poul Møller (*q.v.;* 1794–1838) mas the author of the first novel in Danish dealing with contemporary events, En dansk Students Eventyr ("Adventures of a Danish Student," 1824), a charming book, full of gay humour. Some of his poems are in the form of dramatic scenes, others in the form of fables, often reflecting personal disillusionment. His brilliant aphorisms also deserve mention. Steen Steensen Blicher (*q.v.;* 1782–1848), an impoverished Jutland parson, was in his early life strongly influenced by Ossian; he translated Macpherson, Pope, Goldsmith and some of Percy's ballads. In *Trækfuglene* ("Birds of Passage," 1838) he interprets human nature with sad resignation; some of his best poems are in the Jutland dialect. His many *noveller,* beginning in 1824 with the masterly Brudstykker af en Landsbydegns Dagbog ("The Journal of a Parish Clerk"). strike notes varying from sorrow and resignation to humour and irony.

Minor writers of the same period are Thomasine Gyllembourg-Ehrensvard (1773–1856), whose novel En Hverdagshistorie ("A Story of Everyday Life," 1828) was much admired; A. de Saint Aubain (1798–1865), who wrote novels under the nom de plume of Carl Bernhard; and Carl Bagger (1807–46), whose novel *Min* Broders *Levnet* ("My Brother's Life," 1835) shocked the literary world by its bold realism.

Poetic Realism. — About 1830 the early romanticism gave way to a poetic realism, less naive, more contemplative and more concerned with form than with content. The leader of this movement, Johan Ludvig Heiberg (*q.v.;* 1791–1860), was at his zenith the dictator of literary taste in Copenhagen. As a dramatist he attempted to revivify Danish drama by importing French vaudeville (*q.v.*) and in his serious romantic plays, *e.g., Elverhøj* ("The Fairy

Hill") and Syvsoverdag ("Day of the Seven Sleepers"), there is an interplay between the worlds of poetic and pedestrian reality. His finest achievement is the verse comedy En *Sjæl efter Døden* ("A Soul After Death," 1841). He was a literary critic of high distinction, strongly influenced by the philosophy of Hegel. Henrik Hertz (*q.v.;* 1797?–1870) also regarded perfection of form as more important than content, as is clearly expressed in his Gjenganger-Breve ("Letters of a Ghost:" 1830). As a poet he was a clever imitator of style; as a playwright he wrote both light comedies and serious romantic plays, *e.g.,* Svend Dyrings Huus ("Svend Dyring's House") and Kong *Renés* Datter (1845; Eng. trans.. King *René's* Daughter, 1850).

A revival of lyrical poetry took place in the 1830s and 1840s, led by Christian Winther (1796–1876), Ludvig Adolf Bødtcher (1793–1874) and Emil Aarestrup (1800–56). They are mainly concerned with love and nature, treated in a purely aesthetic manner. Winther was a Zealand poet, who sang the praises of his native island and of woman. His long verse novel *Hjortens Flugt* ("The Flight of the Stag," 1855) is his main work. Bødtcher wrote only a handful of poems, several of which were inspired by the Italian scene; his poetry is delicate, sensitive and artistically sober. Aarestrup. Gallic in his taste, was an epicurean, a lover and connoisseur of beauty; he is Denmark's erotic poet par excellence. Frederik Paludan-Müller (*q.v.;* 1809–76), originally a light and frivolous disciple of Byron. became eventually an uncompromising moralist, condemning the world and the flesh. His main work, *Adam Homo* (1841–48), a poetic epic in 12 cantos, is a bitter contemporary satire. The subjects of his poems are often mythological or biblical; *e.g., Venus, Kalanus* and Kain.

Hans Christian Xndersen (*q.v.;* 1805–75) wrote novels. *e.g., Improvisatoren* (1835; Eng. trans., The *Improvisatore*), poems, plays and travel sketches; but of lasting value are only his fairy tales and stories, 164 in all, the first 4 published in 1835. Some are based on Danish folk tales, some on historical incidents; the plots of others are from foreign sources; but most of them are his own invention, often springing from some personal event. They were told for children, but their ideas are often better understood by adults. His own story is told in *Mit* Livs Eventyr (1855; Eng. trans., The Story *of My Life,* 1871).

Søren Aabye Kierkegaard (*q.v.;* 1813–55) holds an entirely isolated position in Danish literature, unattached to any group of writers and with hardly any followers in his lifetime. His religious philosophy is expressed in such works as *Enten-Eller* (1843; Eng. trans., Either-Or, 1944) and Stadier paa Livets *Vej* (1845; Eng. trans., *Stages on Life's Way,* 1940). He spent his last years in a violent and passionate attack on "official Christianity."

M. A. Goldschmidt (*q.v.;* 1819–87), a Danish Jew, was the editor of a rebellious, antiroyalist weekly, Corsaren ("The Corsair," 1840–46). Many of his novels are concerned with Jewish life in the Danish community; *e.g.,* En Jpde (1845). The 1850s and 1860s produced hardly any new Danish writers of importance. The poetry of Carl Ploug (1813–94) has little inspiration, and the Grundtvigian songs and light comedies of Jens Christian Hostrup (1818–92) have more popular than literary value. Christian Richardt (1831–92) and H. V. Kaalund (1818–85) did little more than rehash the better-known romantic themes. Edvard Lembcke (1815–97) should be mentioned for his translations of Shakespeare and Byron. The novels of Vilhelm Bergsøe (1835–1911), *e.g.,* Fra Piazza del Popolo ("From the Piazza del Popolo," 1866), Carl Brosbøll (1816–1900), who wrote under the nom de plume of Carit Etlar, and H. F. Ewald (1821–1908) are mainly entertaining. The most original novelist of the period was Hans Egede Schack (1820–59), whose novel *Phantasterne* ("The Day Dreamers," 1857) reveals great psychological gifts. Philosophers of some distinction are Frederik Christian Sibbern (1785–1872), Rasmus Nielsen (1809–84) and Hans Brøchner (1820–75).

Radical **Realism.**—*Det moderne gennembrud* is the Danish term used to describe the new movement beginning about 1870 in which a modern (*i.e.,* naturalistic or realistic) literature emerged—a movement of which Georg Brandes (*q.v.;* 1842–1927) was the spiritual leader. Originally influenced by H. A. Taine, C. A. Sainte-Beuve and John Stuart Mill, he felt it his mission as a critic to awaken the Danes and bring Denmark out of its backwater and isolation. His *Hovedstrømninger* i det *19de Aarhundredes* Litteratur (1872–90; Eng. trans., *Main Currents* in 19th *Century Literature,* 1901–05) caused a great sensation, and his demands that literature should concern itself with life and reality, not with dreams and fantasy, and that it should work in the service of progress, not in the service of reaction, provoked much discussion and influenced, outside Denmark, both Henrik Ibsen and August Strindberg. Among his many critical and scholarly books his various biographies of great men (*e.g.,* Shakespeare, Goethe. Voltaire) should be mentioned; these mere to some extent written under the influence of F. W. Nietzsche. whose "aristocratic radicalism" he came to share. J. P. Jacobsen (*q.v.;* 1847–85) was among the first Danish writers to be influenced by Brandes; his novel *Niels* Lyhne and his short stories deal with the problem of dreams versus reality. In *Marie Grubbe* he introduced the naturalism of Gustave Flaubert. Holger Drachmann (*q.v.;* 1846–1908). the greatest lyrical poet of the period, began his career as a staunch supporter of Brandes, against whom he reacted strongly later on. Passionate. impulsive and capricious, he is the author of many fine love poems; much of his poetry and prose is concerned with the sea and with the lives of sailors and fishermen. The novels and peasant stories of Sophus Schandorff (1836–1901) show prose realism of less artistic value. Vilhelm Topsøe (1840–81) depicted contemporary life with subtle irony in his prose works. Edvard Brandes (1847–1931), Georg's brother, discussed topical problems in his plays.

Henrik Pontoppidan (*q.v.;* 1857–1943) holds rank as one of Denmark's greatest novelists. His early stories reveal social injustices; and in several of his short novels he discusses the political, moral and religious problems of his day. But his greatest work is his three long novel cycles. Det *forjættede* Land (1891–95; Eng. trans., The Promised Land, 1896), Lykke-Per ("Lucky Peter," 1898–1904) and De *Dødes* Rige ("The Kingdom of the Dead," 1912–16). They are all concerned with contemporary Denmark and are most penetrating and convincing, though little flattering, analyses of Danish national character. Herman Bang (1857–1912) was another novelist who cultivated the small things: insignificant people! the gray and lonely and miserable men and women who are normally overlooked because nothing ever seems to happen in their undramatic lives. In his best novels, *e.g.,* Ved *Vejen* ("By the Way-side," 1886) and *Tine* (1889), and in Det *hvide Hus* ("The White House," 1898), a nostalgic recollection of childhood, he displays the virtuosity of his impressionistic technique. Karl Gjellerup (*q.v.;* 1857–1919) began as a disciple of Brandes, whom he later opposed. There is a fine poetic beauty in his best novels, *e.g., Minna* and *Møllen* ("The Mill"), but the metaphysical idealism of his later novels has made them unreadable.

Other notable prose writers toward the end of the century were Gustav Wied (1858–1914), a novelist and playwright, whose wit is cynical and bitter; his "satyr-plays" and his novels *Livsens* Ondskab ("Life's Wickedness") and Knagsted are full of malicious humour; Peter Nansen (1861–1918), whose stories are in the style of Maupassant; Carl Ewald (1856–1908), whose nature stories are based on Darwinian philosophy; Otto Benzon (1856–1927) and Gustav Esmann (1860–1904), playwrights; and Karl Larsen (1860–1931), who caught the atmosphere of Copenhagen and drew a picture of Danish "cockneys" with fine linguistic precision. Sven Lange (1868–1930), Einar Christiansen (1861–1939) and Henri Nathansen (1868–1944) are three notable playwrights.

Poetic Revival. — In the 1890s a neoromantic poetic revival took place. Emotions and fantasy were reinstated. The lyric poets of the period called themselves "symbolists," as their object was "to express the inexpressible in symbolic form." Their poems often describe mental processes and religious and mystic experiences. Johannes Jørgensen (1866–1956) was their leader; he became a convert to Roman Catholicism, and many of his prose books are also widely read; *e.g.,* his Lignelser ("Parables"), his books of travel, his biographies of saints (*e.g.,* of St. Francis and of St. Catherine of Siena) and his autobiography, Mit Livs *Legende* (1916–28). Viggo Stuckenberg (1863–1905) was a poet

who gave tender expressions of sad resignation. Sophus Claussen (1865–1931) was a lustful and sensual lover of female beauty, a pantheistic lover of nature and a sophisticated and capricious aesthete. whose poems are often obscure riddles. Helge Rode (1870–1937) was a religious mystic; as well as poetry he also wrote plays and critical works attacking modern intellectualism. Ludvig Holstein (1864–1943) nas more akin to Goethe and Oehlenschlager than to his own generation of symbolists. Other notable neoromantic poets of the same period were Sophus Michaelis (1865–1932), Thor Lange (1851–1915) and Niels Møller (1859–1941).

Several women made important contributions to Danish literature toward the end of the century and after. Gyrithe Lemche (1866–1945) is well known for her novel cycle *Edwardsgave.* Agnes Henningsen (1868–) is a brilliant prose writer, whose novels are often concerned with the erotic experiences of the emancipated woman. Karin Michaelis (1872–1950) was a fine psychologist; among her many novels *Den farlige Alder* (1910; Eng. trans.. *The Dangerous Age,* 1911) is best known.

The 20th Century.— The two greatest Danish novelists of the beginning of the 20th century were Martin Andersen Nexø (*q.v.;* 1869–1954) and Johannes V. Jensen (*q.v.;* 1873–1950). Andersen Nexø's fame is based almost entirely on his two great epics of proletarian life, *Pelle Erobreren* (1906–10; Eng. trans.. *Pelle the Conqueror,* 1913–16) and *Ditte Menneskebarn* (1917–21; Eng. trans.. *Daughter of Man,* 1920–23). All his novels and short stories are concerned with the lives of poor people. His four volumes of reminiscences (1932–39) rank among the finest in Danish literature. Jensen, a north Jutlander, expressed his Darwinian philosophy in his long novel cycle *Den lange Rejse* (1908–22; Eng. trans.. *The Long Journey,* 3 vol., 1922–24), an ambitious epic of man from the baboon stage to modern times. His *Himmerlands Historier* contain forceful descriptions of the people and scenery of northern Jutland, and his novel *Kongens Fald* (1901; Eng. trans., *The Fall of the King,* 1933) ranks high; his nine volumes of *Myter* ("Myths") are a happy mixture of fiction and essay. He was also a great and original lyric poet and a prolific essayist.

Another Jutlander was Jeppe Aakjær (1866–1930), whose novels of social criticism are less important than his poetry, which has a wide popular appeal. Two other notable Jutland poets were Johan Skjoldborg (1861–1936) and Thøger Larsen (1875–1928).

Jakob Knudsen (1858–1917) was the Carlyle of Denmark, one who believed in the inequality of man and in the necessity of authority and obedience; he discusses Christian and moral problems in his novels. *e.g., Den gamle Præst* ("The Old Priest") and *Lærer Urup* ("Schoolmaster Urup"). The novels of Marie Bregendahl (1867–1940), Harry Søiberg (1880–1954) and Thomas Olesen Løkken (1877–1955) all contain faithful descriptions of Jutland.

Harald Kidde (1878–1918) is a solitary, introspective and melancholy novelist, preaching a gospel of renunciation and humility, as, for example. in *Aage og Else* and *Helten* ("The Hero"). Knud Hjortø (1869–1931) is a keen and intelligent observer, whose novels are mainly psychological. Provincial life is described in a baroque and fanciful manner in the novels of Johannes Buchholtz (1882–1940); *e.g., Egholms Gud* (1915; Eng. trans., *Egholm and His God,* 1921) and *Clara van Haags Mirakler* (1916; Eng. trans., *The Miracles of Clara van Haag,* 1922). Other noteworthy novelists are Hans Povlsen (1886–), Otto Rung (1874–1945), Poul Levin (1869–1929), J. Anker Larsen (1874–1957), Thit Jensen (1876–1957) and Astrid Ehrencron Kidde (1874–1960).

Two important lyrical poets were Valdemar Rprdam (1872–1946) and Kai Hoffmann (1874–1949).

After World War I.—The most significant poets of the 1920s were Tom Kristensen (1893–), whose novels—*e.g., Lzvets Arabesk* ("Life's Arabesque," 1921) and *Hærværk* ("Havoc," 1930)—are also important, Otto Gelsted (1888–), Emil Bønnelycke (1893–1953), Hans Hartvig Seedorff (1892–), Harald Bergstedt (1877–) and Per Lange (1901–). Jacob Paludan (1896–) is an important novelist, whose main works are *Fugle omkring Fyret* (1925; Eng. trans., *Birds Around the Light,* 1928) and Jørgen Stein (1937). The novels of Hans Kirk (1898–), especially *Fiskerne* ("The Fishermen," 1928), represent social realism at its best. Harald Herdal (1900–) is a disciple of Andersen Nexø; his proletarian novels reveal the rottenness and hypocrisy of modern society. Mogens Klitgaard (1906–45) and Leck Fischer (1904–56) have both been concerned with the loner middle classes in their novels and short stories.

The novels of Jørgen Nielsen (1902–45) are set among Jutland peasants. and their themes are suppressed feelings: hatred. sin and fear. Similar problems, but in a different milieu, are treated in the novels of Michael Tejn (1911–). Aage Dons (1903–) concentrates on feeling and penetrating analyses of the depths and conflicts of the human soul. H C. Branner (1903–) is an important novelist and playwright, who in *Rytteren* (1949; Eng trans.. *The Riding Master,* 1951) and *Ingen kender Natten* (1955; Eng trans., *No Man Knows the Night,* 1958) deals with the loneliness of men, the dangers of fear and of power; he is a superb short-story writer, of outstanding psychological penetration. Martin A. Hansen (1909–55) recalled Johannes V. Jensen in his early novels but later works, *e.g., Lpgneren* (1950; Eng. trans. *The Liar,* 1954), showed a tendency toward an anti-intellectual mysticism, related to that of the youngest generation of post-World War II poets. Knud Sønderby (1909–) is a novelist, short-story writer and playwright with a brilliant style and a deep psychological understanding. Hans Scherfig (1905–) writes novels usually disguised as detective stories, full of acid satire. Other noteworthy prose writers are Karl Bjarnhof (1898–), Erik Aalbæk Jensen (1923–) and Hans Lyngby Jepsen (1920–).

Nis Petersen (1897–1943) held a high position as a poet and was also a distinguished novelist. His *Sandalmagernes Gade* (1931; Eng. trans., *The Street* of *the Sandalmakers,* 1933) is set in ancient Rome and *Spildt Mælk* (1934; Eng. trans.. *Spilt Milk,* 1935) in Ireland at the time of the rebellion. Karen Blixen (1885–), whose first book, *Seven Gothic Tales,* was first published in English under the nom de plume of Isak Dinesen in 1934, is a refined, aristocratic writer, with a subtle irony, and with an unusual elegance and sensitivity. Her books *Out of Africa* (1937), *Winter's Tales* (1942) and *Last Tales* (1957) published simultaneously in English and Danish. should also be mentioned. Two Faroese novelists have also made important contributions to contemporary Danish literature: Jprgen-Frantz Jacobsen (1900–38), whose novel *Barbara* was published in 1939 (Eng. trans. 1948), and William Heinesen (1900–).

Sven Clausen (1893–1961) and Svend Borberg (1888–1947) represent the post-World War I generation of Danish playwrights, influenced by German expressionism, by symbolism, by Luigi Pirandello and by Sigmund Freud. Kaj Munk (*q.v.;* 1898–1944), a dramatist of unusual qualities, revived the "heroic" Shakespearean and Schillerian drama. Among his best plays are *En Idealist* (1928; Eng. trans., *Herod the King,* 1955) and *Ordet* (1932; Eng. trans., *The Word).* He was a religious agitator who used the stage as a pulpit and all his dramas are concerned with the problems of God and man. Kjeld Abell (1901–61) was an iconoclast in both form and content. His first plays mark a complete break with naturalistic drama, and there is always a deep and radical perspective underlying his remarkably witty and sparkling dialogue. His most important plays are *Melodien, der blev væk* (Eng. trans., *The Melody That Got Lost,* 1937), *Anna Sophie Hedvig* (1939) and *Dage paa en Sky* ("Days on a Cloud," 1947). C. E. Soya (1896–) is yet another brilliant playwright as well as a short-story writer and a novelist.

Kai Friis Møller (1888–1960) was a distinguished poet and critic, also a fine translator of French and English poetry. Paul la Cour (1902–56), a lyrical poet. was influenced by the modern French intellectual school. Other poets with established names are Hulda Liitken (1896–1946), Jens August Schade (1903–), Alex Garff (1904–), Tove Ditlevsen (1918–), also a fine novelist and short-story writer, and Morten Nielsen (1922–44). The most interesting younger lyrical poets of the mid-20th century were Ole Sarvig. Ove Abildgaard, Ole Wivel. Halfdan Rasmussen, Frank Jæger, Thorkild Bjørnvig, Erik Knudsen, Jørgen Nash, Grethe Heltberg and Grethe Risbjerg Thomsen. The leading lit-

erary scholars and critics of the century were Axel Olrik (1864–1917), Vilhelm Andersen (1864–1953), Valdemar Vedel (1865–1942). Hans Brix (1870–1960), Vilhelm Grønbech (1873–1948), Paul V. Ruhow (1896–) and Sven Møller Kristensen (1909–).

DANNECKER, JOHANN HEINRICH VON (1758–1841), German neoclassical sculptor, in whose works the influence of Canova and the study of the antique are apparent, was born at Stuttgart, on Oct. 15, 1758. His father was employed in the stables of the duke of Wurttemberg. Dannecker studied under local late-rococo masters and in 1780 was made sculptor to the ducal palace.

In 1783 Dannecker left for Paris, and placed himself under Augustin Pajou; in 1785 he went to Rome, where he worked for five years. Goethe and Herder were then in Rome, and they, as well as Canova, who was the hero of the day, became his friends. Subsequently he returned to Stuttgart, where he lived for the remainder of his life.

The Ariadne (1806, Bethmann museum, Frankfurt), was the most popular of his works. Many illustrious persons were modeled by him, including Friedrich Schiller, of whom he did three portrait busts.

Dannecker was director of the Gallery of Stuttgart, and received many academic and other distinctions. He died in Stuttgart on Dec. 8, 1841.

D'ANNUNZIO, GABRIELE (1863–1938), Italian poet. celebrated not only for his poems, novels and dramas but also for his two important interventions in political affairs, was born in Pescara, Abruzzi, on March 12. 1863. In 18'79, while still at school, he published a collection of poems, *Primo vere.* This was followed by new poems and short stories'in 1882 and then by the long series of lyrics, stories and novels (the last-named including *Il piacere,* 1889, Eng trans., *The Child of Pleasure,* 1898; *L'innocente,* 1892, Eng. trans., *The Intruder,* 1898, new ed. 1919; and *Il trionfo della morte,* 1894, Eng. trans., *The Triumph of Death,* 1896, new ed. 1923) which established his literary reputation. At this time he lived mainly in Rome, where he also proved himself brilliant as a journalist.

In 1896, when he was beginning to urite for the stage, D'Annunzio made the acquaintance of the actress Eleonora Duse (*q.v.*), whose lover he soon became. Duse took the leading role in the Parisian production of D'Annunzio's drama *Sogno d'un mattino dz primavera* (1897; Eng. trans., *The Dream of a Spring Morning,* 1902) and—after he had preferred Sarah Bernhardt for the Parisian production of his tragedy *La città morta* (in a French version; 1898; Eng. trans., *The Dead City,* 1902)—in the Italian productions of his next two tragedies, *La Gioconda* (1899; Eng. trans., *Gzoconda,* 1901, new ed. 1921) and *Francesca da Rimini* (1901; Eng. trans., 1902), as well as in the Italian production of *La cittd morta* Another actress, however, was given the leading role in *La figlia di Iorio* (1904; Eng. trans., *The Daughter of Jorio,* 1907), which is D'Annunzio's greatest tragedy; and thereafter his association with Duse, the earlier part of which he had already portrayed in his novel *Il fuoco* (1900; Eng. trans.: *The Flame of Life,* 1900, new ed. 1932), moved steadily toward a close.

Meanwhile D'Annunzio, after serving for a time as a deputy in the Italian parliament (1897–1900), had settled in Tuscany. From there, in a revival of his poetic inspiration, he published three books, *Maia* (1903), *Elettra* and *Alcyone* (both 1904), in the lyrical series *Laudi del cielo, del mare, della terra e degli eroi* (1903–12). New plays and a new novel followed; but these failed to bring him the money required for his extravagant may of life. and in 1910 he was obliged to leave Italy in order to escape from his creditors. Settling in France. he wrote some plays in French; and for one of these, *Le martyre de Saint Sébastien* (1911), Debussy provided an important score of incidental music.

On the outbreak of World War **I,** D'Annunzio came forward as an advocate of Italian intervention on the side of the Allies; and in May 1915 the Italian government, being already resolved on such intervention, facilitated his return to Italy to prepare public opinion. D'Annunzio's influence, enhanced as it was by his earlier patriotic poems *Odi navali* (1892–93) and *Canzoni della gesta d'oltremare* (1912), was effective. When war was declared, he served with distinction in the army and then in the air force.

After the Armistice of 1918 the national hero came forward as a nationalist leader. On Sept. 12, 1919, with fewer than 300 volunteers, he occupied Fiume (Rijeka), which the Italian government and its Allies at the peace conference. having taken it from Austria-Hungary, were proposing to incorporate in the newly formed Yugoslav state. Enthusiastically received by the Italian population, he maintained himself there as "commandant" and. in defiance of the powers, proclaimed on Sept. 8, 1920, "the Italian regency of the Carnaro." On Christmas day 1920, however, Italian government forces bombarded his headquarters; and three days later he abdicated his authority. Even so, his action had established the Italian interest in the city.

Despite the impetus given to Fascism by the Fiume episode *(see* ITALY: *History),* D'Annunzio exercised no influence on Italian politics after 1922. The last years of his life were spent in princely retirement at Gardone, on Lake Garda, where he died on March 1. 1938.

D'Annunzio's adventurous and successful career, the scandal of his amours, his daring in wartime, his eloquence and his political leadership in two national crises, all contributed to make him one of the most striking personalities of his day. The faults of his moral character and the sequels to his political activity. which made even his less good plays excessively popular and caused the occasional redundance of his style to be overlooked, have affected his literary reputation adversely'. Yet he was a poet, and at times a very good one.

Apart from certain books autobiographical in character. such as *Notturno* (1921) and *Le faville del maglio* (1924–28), there is not much in D'Annunzio's vast output of prose that can be read without tedium: he was too receptive of the various currents of contemporary thought and style, so that his work is liable to reflect indiscriminately the influences of other writers—from Dostoevski to Nietzsche; from Maeterlinck to Maurice Barrès. The same can be said of most of his plays. One of them, however, *La figlia* di *Iorio,* is a great work of poetry, a powerful peasant tragedy of the Abruzzi mountains, rooted in the primitive fears, passions and superstitions of D'Annunzio's own countrymen.

As a poet D'Annunzio clearly derives his powers from his great emotional susceptibility. Already in *Primo vere* and *Canto novo,* when his technique was still modeled on Carducci's classical prosody, he had shown an astonishing gift in rendering with precision and power the healthy exuberance and youthful intensity of a boy in love with nature and with women. Though he turned to morbid and decadent themes in *La chimera* (1890) and in *Poema paradisiac~*(1893), he recovered the vitality of his inspiration and found a new musical, modern form for its expression in the great work of his maturity, the *Laudi,* especially in its third book. Alcyone. Some of the poems in this book, in which D'Annunzio proclaims his sensuous, joyful feeling of communion and even identification with nature ("La pioggia nel pineto," "Meriggio")

are among the masterpieces of modern Italian poetry and have had great influence on later poets. On the whole Alcyone may be called the best Italian book of poems since Leopardi's *Canti*.

For D'Annunzio's complete works see the "national edition" by A. Sodini, 48 volumes with one volume supplement (1927–36).

DAN TAKUMA (1858–1932), a Japanese engineer and businessman of the samurai class, one of the most powerful members of Japan's so-called "unseen government" during the 1920s. In 1871 he went to the United States where he studied mining engineering, returning to Japan in 1878. For a short time he taught at Tokyo university but later he was employed successively in the bureau of industry and by the House of Mitsui when it acquired, in 1888, the government mine at which he was working. From themanagement of the mine, which he turned into a rich source of profit for the Mitsui family, he joined the Mitsui Trading company when it was founded in 1909. As manager of that company he became the guiding genius of the Mitsui empire. He was assassinated on March 5, 1932, by nationalists who regarded him as a symbol of the evil power of high finance in government. (T. C. SH.)

DANTE (full name DANTE or DURANTE ALIGHIERI) (1265–1321), the greatest poet of Italy, if not of medieval and modern times, and author of the greatest Christian poem, the Divina *Commedia* or Divine Comedy. The loftiness of his art is revealed by the immense variety of his literary output and by the exceptional breadth and depth of his interests. The *Divina Commedia* is in itself an epitome of medieval civilization, though in certain respects it also belongs, with the works of Petrarch and Boccaccio, to that profound cultural renewal which established the new humanism and opened the way to modern civilization.

The son of Alighiero di Bellincione and his wife Bella, Dante was born in Florence under the zodiacal constellation of the Twins (see Paradiso, canto xxiii, lines 112–17), *i.e.*, between May 15 and June 15, 1265. The sources of our information about Dante's ancestry are his own lines in Paradiso (xv–xvi) and a few legal documents which have survived. His great-great-grandfather, Cacciaguida, died in Conrad II's service in the Holy Land during the Second Crusade (1147) and Dante traced his ancestry farther back, giving it a legendary connection with the Roman origins of Florence (Inferno, xv, 73–78). His family were ancient city nobility, not wealthy country landowners but part of the economic life of the commercial and industrial commune. Dante's grandfather, Bellincione, was a moneylender in Florence and Prato, and his father Alighiero carried on the same business until his death (before 1283). These activities were nothing to be proud of, which explains why the poet seldom refers to his nearest kin. The family's importance in the political life of Guelph Florence is proved—at least in the case of Dante's father and grandfather—to have been negligible by their not being exiled after the defeat of the Guelphs at Montaperti (Oct. 1260).

At the time of Dante's birth the Florentines were devoting all their energies to territorial and economic expansion, which in later years the poet justly condemned (Paradiso, xvi, 49–78) as the basic cause of the internal conflicts lacerating the life of the city. These conflicts were chiefly between the Guelph and the Ghibelline factions, which were, broadly speaking, the party of the pope and the party of the emperor respectively: Florence was dominated by the Guelphs in 1266 and was to remain so well into the 14th century.

Boyhood and Early **Studies.**—Dante's mother died when he was a small child: his father remarried later and the poet's childhood was enlivened only by the company of an elder sister, who soon married, and of Francesco and Tana (Gaetana), his half-brother and half-sister by his father's second marriage. Dante's study of grammar and rhetoric began early and his natural bent for poetry was fostered by the contacts he made as a boy in cultured Florentine society. The most important of these was with Brunetto Latini (*q.v.*), who returned to Florence from exile in 1266 and died there in 1294, having held several important public appointments. Even if Brunetto Latini was not in the strictest sense Dante's teacher, he taught him, at any rate, on the poet's own admission, "how man makes himself eternal" (Inferno, xv, 85)—*i.e.*, how a man may make a lasting mark for himself by means of his works. Detto *d'Amore* and Fiore, two bold and assured versions of the Roman de la Rose in Italian verse, written at no great distance in time from each other, might be evidence of such an apprenticeship in the arts of rhetoric and poetry. Both show the influence of Latini's verbal technique and of the popularizing style so dear to him, and if they were written by Dante, reveal the effect of his teaching on the young poet.

Another literary influence was that of the Florentine poets who wrote in the wake of the Sicilian school and of Guittone d' Arezzo (*q.v.*), a circle whose poems are in the 13th-century Vatican Codex 3793; their compositions are certainly related, even intimately so, to the verse which the young poetry-reader Dante wrote before he adopted the stil novo ("new style"; see ITALIAN LITERATURE: The Tuscan Dialect). But the most important influence on the actual development of Dante's art was the poetry and the friendship of Guido Cavalcanti (*q.v.*), to whom Dante sent the sonnet "A ciascun' alma presa e gentil core." Dante married shortly afterward—probably about 1285—Gemma Donati (assigned to be his bride as early as 1277). Almost ten years later the sonnet appeared at the beginning of the Vita *Nuova*, which is dedicated to Cavalcanti. Thus Dante's poetic experiments developed first along the lines of the poetry of the Sicilian school and of Guittone (as in his correspondence with Dante da Maiano) and then, suddenly, under the influence of Cavalcanti (and in the light, graceful lines of some of the *ballate* there can be heard in the notes of acute distress and tormented love the stirrings of new elements of style); but the poet acquired his own marked character later when, with the so-called "rhymes of praise" for Beatrice he freed himself from the patterns of traditional love poetry, and, developing to the full the lesson of Guido Guinizelli (ever after recognized as his master, Purgatorio, xvi, 97–98), emerged from the "vulgar crowd" (Inferno, ii, 105) with the canzone "Donne ch'avete intelletto d'amore," distinguishing himself from the other vernacular poets by the nobility of his inspiration and his mastery of style.

The "Vita **Nuova**" (The New Life).—The theme of Dante's first work of importance was his love for Beatrice (Folco Portinari's daughter, later the wife of Simone de' Bardi: she died on June 8, 1290). Written about 1293 and conceived within a purely literary framework as a *prosimetrum* (*i.e.*, work partly in prose and partly in verse), modeled on Boethius' *De* consolatione *philosophiae*, it brought together in the framework of a commentary and narrative in prose 31 compositions written between 1283 and 1291, arranged in an imaginative and conceptual order arising from his memories and his reflections on the events and the fundamental stages of that love, from the first meeting with Beatrice, which occurred when he was nine years old, to the second, nine years later, when a greeting from the "wonderful lady" left the young poet "as if intoxicated."

Love now completely dominated Dante and almost destroyed his vital powers. Anxious, however, to conceal from the world the true object of his love, he composed "certain trifles in verse" for two other ladies. As a result, people passed comments, Beatrice refused her salutation and the poet, thus deprived of that "which was the goal of all his desires" (Vita *Nuova*, xviii, 4), discovered after a period of deep discouragement his only happiness (which no one could take away from him) in the disinterested praise of his lady, expressed poetically in the series of compositions which begin with "Donne ch'avete."

On Beatrice's death in 1290 the poet almost went out of his mind, but found solace briefly with a gentle and compassionate young woman. But the memory of Beatrice overcame him again; and he directed all his thoughts to her in heaven. After a "wonderful vision" (probably foreshadowing the glorification of Beatrice "on the throne that her merits assigned to her," Paradiso, xxxi, 69), Dante decided to write no more about her until he was able to do so in a more worthy manner and to say of her "What hath

not before been written of any woman."

The *Vita Nuova* is not only rich in undoubtedly autobiographical detail but also displays much variety of literary style, including features of the stil *novo* and some deriving from Provencal culture, and in the prose section shows signs of the influence of philosophical thinking — apparently evidence of Dante's new interests (he had begun the philosophical studies of which he speaks in *Convivio,* II, xii, 1–5). The work is important both for its poetic value and also as part of the tradition of Italian literary prose; but above all it throws light on the artistic and conceptual influences and the historio-biographical elements which, 20 years later, were to give life to the figure of Beatrice, one of the essential personages of the *Divina Commedia.* In fact in the Vita *Nuova* she already appears as the first of the great inspiring Muses of modern poetry, comparable in importance to Laura, the inspiration of Petrarch.

After the "Vita **Nuova";** Political Life up to the Time of Dante's Exile. — The death of Beatrice was followed by a period of hard study. This was the basis of Dante's whole theoretical outlook and of his practical activities: side by side with the poet there appeared the robust, if not perhaps original, thinker of the more complex works of his maturity. Boethius and Cicero opened a new world to him; he frequented "the schools of the religious and the disputations of the philosophers" (*Convivio,* II, xii, 7) in Franciscan and Dominican establishments. His thought was enriched and his knowledge of the classical and medieval texts and authors fundamental to his development (Virgil, Lucan, Horace, Ovid; the *Ethics* of Aristotle in the commentary of St. Thomas Aquinas; Albertus Magnus, Bonaventura and Aquinas himself) gave rise to the allegorical poems conceived in praise of philosophy as scientia ("Voi che'ntendendo il terzo ciel movete" and "Amor che ne la mente mi ragiona"), and those which are doctrinal, celebrating two moral virtues — nobility and grace.

The new themes of the latter ("Le dolci rime" and "Poscia ch'amor") reflect not only, like their predecessors, the broadening of his culture and of his range of enquiry; their clear-cut criticisms of current ideas and ways of life also arise from daily experience of the class jealousies underlying the violence of the aristocracy.

The Guelph nobility provided much of the manpower in the successful military enterprises undertaken by Florence against the Ghibellines of Pisa and Arezzo (Dante himself took part in the battle of Campaldino against the Aretines — June 11, 1289 — and witnessed two years later the surrender of the Pisan infantry at Caprona — see *Inferno,* xxi, 95. xxii, 4–6; *Purgatorio,* v, 92), which put fresh heart into the aristocracy. They had lost power through the establishment of the constitution of the *secondo popolo* and the nomination of six *priori* of the guilds (see FLORENCE: History) and wished to regain their former positions of supremacy. The *Ordinamenti* di *Giustizia* (Jan. 1293) were enforced to lessen their influence, but in 1295 a new law passed by the signoria which expelled the originator of the Ordznamenti, Giano della Bella, allowed the nobles to take office provided they had joined, even only nominally, one of the guilds, and were not knights. It was at this period that Dante entered political life, enrolling in the guild of physicians and apothecaries (probably chosen because of his philosophical studies). As a member of the special council of the captain of the people, for the six-month period from Nov. 1295 to April 1296 (his first experience of public life) he was not very active: he never made a speech. At that time he had purely literary preoccupations.

The first of his four *"rime petrose"* ("Io son venuto al punto della rota") nritten for a lady "Pietra," nho harshly rejected his love, were written in Dec. 1296; they are no longer considered evidence of an ardent sensual passion, but the beginning of a more mature period of experiments in metre and style (in which he modeled himself on one of the Provencal troubadours, Arnaut Daniel — a difficult task for a Tuscan poet), far removed from the youthful poetry of the stil *novo,* and pointing, in their energetic use of language and their inventiveness, toward the stylistic virtuosity of his major work — an outstanding example, in short, of Dante's linguistic ability, which before his maturity had helped him to write (besides the poems of the Vita Nzrova) the humorous, realistic sonnets of the *Tenzone* (correspondence) with Forese Donati, and nhich was to be established later in the stylistic complexity of the *Commedia.*

After 1295 (when Boniface VIII was elected to the papacy) events forced Dante into the midst of the city's affairs and he became an important and responsible figure in Florentine politics. The Guelph nobility had split into two factions, the Whites (led by the Cerchi family) and the Blacks (led by the Donati): the new pope apparently attempted to reconcile them, but made a secret agreement with the Blacks. who were hoping to destroy the popular commune, to settle the argument in their favour and to further his own plans for territorial aggrandizement in Tuscany. By early 1300 the Florentines had clear evidence of these intrigues and the signoria (White in sympathy) struck sharply against the traitors, despite the fierce opposition of the pope. Dante's position we are better able to guess than to establish by evidence, lacking the minutes of the council's deliberations between July 1298 and Feb. 1301. Thereafter he upheld a policy of independence and autonomy. On May 7, 1300, he was sent as ambassador to San Gimignano to consolidate the Guelph league in the war supporting the pope against the Aldobrandeschi of Santa Fiora, but also to strengthen the ties uniting the members of the league against the pope's attempts to become the dominant partner in the league. He was then nominated as priore for the period from June 15 until Aug. 14, 1300, nhich was a recognition of his acute political vision. On June 23 the consuls of the guilds were attacked by the Black nobles. The *priori,* to ensure peace, banished equal numbers of leaders of both parties, including Cavalcanti, the poet's "first friend," who was exiled. Meanwhile, on June 27 Cardinal d'Aquasparta, who had been sent as pacifier by Boniface with the secret purpose of aiding the Donati, arrived in Florence. When his mission failed, the pope decided to ensure the triumph of the Blacks and requested Charles of Valois, brother of Philip the Fair of France, to invade Tuscany. Dante, realizing that conflict was imminent, endeavoured in the council meetings between April and Sept. 1301. to secure the recall of the troops sent against the Aldobrandeschi. After his election as priore he was the leader of those Whites most resolute in opposing the pope and the Angevins; but his proposals did not please the majority, who still hoped for a compromise. Even when Charles was at the gates and on Oct. 4, 1301, mas joined by the banished Blacks. the signoria chose to send ambassadors to Boniface. Dante was among them. despite his having proposed a quite different policy. He departed in late October and was never again to re-enter his beloved Florence.

On Nov. 1 Charles of Valois entered the city and gradually the Blacks returned. Private vendettas broke out: murder, arson, rapine and forced marriages followed. The pope's full authority over the commune was recognized and the Whites were tried and accused of Ghibellinism and barratry (*i.e.,* fraud in administering public affairs). On Jan. 27, 1302, Cante Gabrielli da Gubbio, nominated *podestà* by the Blacks, condemned Dante (guilty only of opposing the aims of the pope) to pay 5,000 florins and to remain outside Tuscany for two years; on March 10, as he had not presented himself to pay, he was condemned to death.

Writings and Life in Exile. — At the time of his condemnation Dante was returning from Rome. He joined the other exiles (Whites and Ghibellines) who had been sheltered by the Ghibelline Ubaldini and were preparing to re-enter Florence by force. On June 8. 1302, at San Godenzo, with 16 other Florentines, he signed an undertaking to set to rights the losses caused by the war. But the failure of the exiles' first attempt to regain Florence made new military preparations and political arrangements necessary. Dante went as ambassador to the Ordelaffi at Forli and to Bartolomeo dalla Scala at Verona (1303). The death of Boniface VIII in October aroused new hope in the hearts of the exiles (now gathered in the Aretino), especially because the new pope, Benedict XI, sent Cardinal Niccolò da Prato to Florence to compose the differences in March 1304. Negotiations followed (documented by Letter I which Dante sent to the cardinal on behalf of the Whites), but they broke down because of the intransigent attitude of the Blacks. The cardinal was received with scorn and left the city. The Whites

and the Ghibellines moved against Florence. Their disunity resulted in defeat at La Lastra above Florence (July 20, 1304) and their hopes of speedy victory collapsed. By this time Dante had already "niade a party for himself" (*Paradiso,* xvii, 69), after serious disagreements with the other Whites on the policy to adopt. Patriotism was stronger in him than partisanship. Such is the feeling of the great canzone of his exile "Tre donne intorno al cor mi son venute" (1304). wholly inspired by love of justice and a desire for reconciliation, a feeling which also animated the poetry of the episode of Farinata degli Uberti (*Inferno,* x). With his separation from the "wild party" Dante's true exile begins. He was forced to travel. poor and alone, through almost the whole of Italy (Convivio, I, iii). There is little reliable evidence of his wanderings. Between 1304 and 1306 he mas in Bologna, a city favourable to study. Here two works rich in passages expounding his teachings, the *Convivio* (in Italian) and the De vulgari *eloquentia* (in Latin). which reveal his ardent return to philosophical and rhetorical studies, were probably planned and composed. Dante nished to establish his reputation as a scholar with these works and also to obtain the revocation of his condemnation. Both books are permeated by a deep nostalgia for his distant native city and his hopes of returning there.

The Convivio ("The Banquet," c. 1304–07). planned as a banquet of knowledge in 15 books, in the form of a commentary on 14 allegorical and ethical canzoni, did not get beyond the fourth book; but it offers to the reader a clear view of the problems which absorbed Dante, and of his spiritual and cultural maturity. He demonstrates his love for the Italian vernacular in the introduction, affirming in moving tones its aptness for the expression of the loftiest thoughts. In the second book he refers again to the episode of the "Donna gentile" (cf. Vita *Nuova*) and interprets it (when commenting allegorically on the canzone "Voi che'ntendendo") as a conflict between his love of Beatrice and his love of philosophy. And it is precisely to this glorification of philosophy that the third book. which comments on the canzone "Amore che nella mente mi ragiona," is dedicated. Regarded as "a loving use of wisdom" which proceeds directly from God and reflects His perfections, philosophy is defined in its essence and analyzed in its effects on man's conduct. Finally. the fourth book expounds the canzone "Le Dolci rime," the central theme of which is the nobility of man. which is not tied to hereditary privilege or to wealth but to goodness of nature and to possession of the moral and intellectual virtues by the individual. The judgment of men and events according to a fundamentally ethical standard was central to Dante's thought as the *Commedia* was to show. Difficult to read on account of the loftiness of its themes and its lengthy philosophical digression. the Convzvio was conceived as an encyclopaedia of the knowledge of the time, modeled on Latini's *Tresor.* The work contains themes and conclusions which were later developed more fully. *e.g.,* the digressions on the four levels of significance in writing (II, i) and on the authority of the emperor and the necessity of the empire for the well-being of humanity (IV, iv–ix).

The **"De vulgari eloquentia."**—The nice problem of how to raise the status of the Italian vernacular to that of a literary language like Latin, is the theme of De vulgari *eloquentia,* which mas intended to be in four books but broke off in the middle of the second. Dante opposes to locutio *vulgaris* (language as means of communication, variable in time and space), granzatica (literary language, stable in being fixed by rules). When the three Romance languages (Provençal, French and Italian) have been examined, attention is concentrated on the last, to select one of its many dialects for elevation to the status of a literary language. Having examined them all, Dante finds evidence of this language (defined as the "illustrious vulgar tongue") only in examples of the work of those poets (*e.g.,* the Sicilians, the Bolognese school and the Florentines of the *stil* novo) who could detach themselves from their local manner of speech. The illustrious vernacular is therefore the language of high culture, or rather of elevated lyric, employed by Dante himself in the philosophical and ethical canzoni which followed the *Vita Nuova.* The highest of the styles recognized by the rhetoricians—the tragic, with its elevated themes of arms, love and virtue—is appropriate to this vulgar tongue. The treatise breaks off with an examination of the canzone. It was intended by Dante as a theoretical and practical justification of his own literary language. The concept of the continuous evolution of languages (in book i). and the idea, which is the foundation of book ii, that poetry is the ideal imitation of the great Latin classics and a fiction which beneath formal beauty offers to the reader a hidden content of thought, are particularly to be noted.

The Convivio and *De vulgari eloquentia* remained unfinished. On Oct. 2, 1306, the commune of Bologna expelled the Florentine exiles, a measure which was not unexpected. Dante, for his part, had already left the city. On Oct. 6, 1306, he concluded peace at Sarzana between Marchese Franceschino Malaspina and the bishop of Luni. Reliable evidence for his subsequent movements is wanting. (It can no longer be held that he went to Paris, still less to Oxford.) Strong indication of a stay at Lucca is to be found in a legal document of 1308, in nhich Dante's eldest son Giovanni, who with Pietro and jacopo had followed their father into exile at the age of 15, is named as a witness. But Dante's reference to Gentucca (*Purgatorio,* xxiv), a girl of Lucca, is better evidence. Having returned to the Casentino, he sent shortly afterward to Moroello Malaspina the canzone "Amore da che convien," with an explanatory letter (IV). He was probably in the Casentino when he learned of the election of Henry of Luxemburg as German king (1308). After being exiled he had long meditated over the events which had overtaken him. He had soon become convinced (by the time he nas writing the *Convivio*) that those events and the disorder connected with them had occurred only because the political guide willed by providence "for the perfection of human life" (Convivio, IV, ix) was lacking. since there was no emperor Such an "imperial majesty," "possessing everything and no longer being able to desire anything" (IV, iv) would have imposed a rule of justice on mankind, curbing its passions and above all its cupidity. It mould have limited the aims of the church of Rome in the temporal field and would have thus brought back to the earth the peace which was the bequest of Christ and which alone permits men to realize their potentialities on a social and collective basis, and thence to attain happiness on this earth. The emperor's mission is one willed directly by God; it is therefore sacred even if in its means and end it is distinct from that of the pope, the guide in spiritual matters. The heart of the exile exults, therefore. while the deliverer prepares to come to Italy. And when Clement V agrees to crown the new emperor in Rome, the poet makes himself the mouthpiece of the general expectation and delight in Letter V ("Universis et singulis," 1310), urging the princes and peoples of Italy to rejoice at the coming of the Rex *pacificus.* Only Florence, allied to Robert of Naples, opposes the emperor; and the poet throbs with indignation in Letter VI (March 31, 1311) against the "most nicked Florentines" and then turns at once to Henry, to whom homage had already been paid in Milan: he should crush the head of the viper which attempts to bite its mother (Letter, April, 131) For this reason Dante was excluded from the amnesty conceded by Florence on Sept. 2, 1311, when Henry was approaching the city to besiege it. But from reverence for his native city, which had indeed been a stepmother to him, he did not appear among the exiles who encamped with the imperial troops on the plain of San Salvi. and his name is missing from the list of the condemned published by the commune in March 1313.

The "Monarchia" and Later Minor Works.—The Latin treatise *Monarchia*—in which, in three well-reasoned books, Dante expounded the theories and conclusions he had reached during his years of meditation on the destiny of man and on man's temporal and spiritual goals—is connected with Henry's invasion of Italy. Books I and II. taking up again what had been foreshadowed in the Convivio (IV), show the necessity of monarchy for the well-being of the world and prove that the Roman people acquired the empire with good title and by the divine will. Book III investigates whether the imperial authority depends directly on God or whether on a minister or vicar of his. Declaring (as do the *Constitutiones* published at that time by Henry), that the imperial authority proceeds immediately from God, the treatise concludes by affirming that God has ordained the whole of humanity for two

ends, one of which is attainable in time, the other in eternity, with the aid of two guides: the emperor (guide to temporal felicity, figured imaginatively by the terrestrial paradise) and the pope, who alone can open to men the gates of that paradise which is eternal happiness (III, xvi).

The rift which soon opened between Henry and Clement V and the sudden death of the emperor at Buonconvento (Aug. 24, 1313), while on the march toward Naples against the Angevins, abruptly dashed the hopes of the poet, who, after staying from some time in Tuscany (perhaps with Uguccione della Faggiuola, lord of Lucca), returned about 1316 to Verona where Cangrande della Scala (the imperial vicar nominated by Henry VII in 1312) was laying the foundations of a powerful Ghibelline state in northern Italy. To these years belong the last three letters known to us: Letters XI (June 1314, to the Italian cardinals in conclave after the death of Clement V, urging them to elect an Italian pope who would bring the seat of the papacy back from Avignon to Rome), XII (May 1315, to a Florentine friend: Dante refuses an amnesty because its conditions are regarded as humiliating) and XIII (c. 1316, in which he dedicates to Cangrande the Paradiso, which he had just begun, and gives the beginning of a commentary on it, together with the general framework of the *Commedia*). This is the final stage in the life of Dante: he left Verona about 1318 and went to Ravenna as guest of Guido da Polenta. In the peace of Ravenna his surviving children gathered round him: Pietro, Jacopo and Antonia (who after the death of her father was to become a nun, taking the name of Sister Beatrice). He composed two Latin eclogues there in reply to Giovanni del Virgilio, who had urged him to write a poem in Latin verse on a historical theme and had invited him to Bologna, promising him the poetic laurel. There is evidence of a brief stay at Verona in the Quaestio de aqua et terra (Jan. 1320), debated and decided in the church of Sant' Elena, in which Dante grapples with a favourite scholastic problem (whether water could in some places be higher than the dry land), showing the impossibility of the hypothesis. On his return from Venice, where he had been sent as ambassador by Guido da Polenta (on the occasion of a dangerous dispute with this neighbouring power) the poet, who had only very recently finished the Paradiso, was struck down by malaria and died during the night of Sept. 13–14, 1321. But he left to Italy and to the world the "Comedy" which posterity judged to be divine.

The **"Commedia."**—Dante worked on this from the time when he broke off writing the *Convivio* and De *vulgari* eloquentia, as if on a vast fresco depicting his sorrows and hopes, his fierce hatreds and his cherished beliefs in poetic terms which would reaffirm clearly and effectively his ethical and political conception of the world, of the ends and duties of man within the twofold order of Nature and Grace. A poet above all, he felt that only in poetry, which goes beyond the closed abstractness of a scientific treatise, would he be able to express fully his dream—resulting from deep experience and suffering—of a spiritual and civil renewal of the whole of humanity. This complex work, which was begun about 1307, is a poem unique of its kind (although within the tradition of the great medieval allegorical poems by Martianus Capella, Bernard Silvestris, Allan of Lille and above all of Virgil's Aeneid, which was considered allegorical in the middle ages. Divided into three *cantiche* (the first composed by 1310, the second by 1314, the third between 1315 and 1321), it is written in the vernacular language and is very long: 14,233 hendecasyllables in *terza rima* (*q.v.*; a rhyme scheme connected with the popular *serventese:* ABA, BCB, CDC, etc.), arranged in 100 cantos (one being a prologue to the entire work, and each *cantica* having 33 cantos). The title, in accordance with medieval vocabulary, is *Commedia* (Inferno xvi, 128; xxi, 2; Letter XIII, 10), because the subject, horrible in the Inferno, becomes desirable and pleasing in the other two cantiche, the Purgatorio and the Paradiso. The literal subject of the work is the journey Dante makes through the world beyond the grave, repeating by divine grace the experience of Aeneas in his descent to Avernus (cf. Aeneid, vi) and also undergoing an experience analogous to that of the apostle Paul, who ascended to the third heaven (Inferno, ii, 13–30). At the age of 35 years, on the evening of Good Friday 1300, the poet finds himself wandering astray in a dark wood. After a night of anguish, he sets out in the morning toward a hill illuminated by the sun, but three wild beasts (a leopard, a lion and a wolf) bar his path and force him back toward the darkness of the wood. Virgil, however, appears to aid him, having been sent by three "blessed ladies" (the Virgin Mary, St. Lucy, Beatrice), and Virgil leads Dante to salvation, guiding him through the infernal realm and the mountain of Purgatory, at the summit of which the Roman poet is replaced by Beatrice, who then conducts Dante (raising him from heaven to heaven by the brilliant and loving power of her glance which is that of a blessed soul who contemplates God) as far as the Empyrean, where the poet enjoys for a brief moment the supreme vision of the divinity.

The Inferno, a dark and deep chasm, is subdivided into nine circles descending to the centre of the earth and gradually becoming smaller. Enclosed within it are mythical and historical personages of all times from classical and biblical antiquity to 1300; poets and philosophers, heroes, emperors, popes, politicians and ecclesiastics, queens and famous women, and Florentine citizens of the two factions. Their punishments are inspired by the Aristotelian classification of vices according to three kinds of evil disposition (incontinence, malice, bestiality—cf. Inferno, xi, 22–90), and they are placed in accordance with the gravity of the offense and of the punishment (which is greater the lower one descends). At the bottom of the Inferno and therefore farthest from God is Lucifer who, when he fell from heaven, originated the infernal chasm. He is visualized as having three faces and six wings (a deformed trinity of evil opposed to the divine Trinity). He munches with his three mouths Judas, betrayer of Christ, and Brutus and Cassius, betrayers of Caesar.

Purgatory, a mountain surrounded by the waters of the southern hemisphere, rises toward heaven, above the four elements. Divided into an ante-purgatory and seven terraces or ledges (on each of which, in order of decreasing gravity, souls expiate one of the seven deadly sins, from pride to lust), the mountain is crowned at its summit by the "divine, thick and living forest" of the Terrestrial Paradise (the counterpart of the "wild wood"). Here Dante meets Beatrice. who has descended from heaven; and here is fulfilled the rite of confession and purification of the poet who thereby becomes "pure and worthy to ascend to the stars" (Purgatorio, xxxiii, 145). In the Ptolemaic conception of the universe, Paradise is subdivided into nine concentric heavens (Moon, Mercury, Venus, Sun, Mars, Jupiter, Saturn, Fixed Stars, Primum Mobile) which rotate around the earth. In the tenth heaven or Empyrean, which embraces them all, the blessed reside in a "mystical rose" enjoying in proportion to their merits the vision of God; and thence they descend to appear to the poet in the various heavens (corresponding to grades of spiritual perfection) in order that he may the better understand, in this metaphorical way, the gradations of their beatitude. Having reached the Empyrean, Dante sees Beatrice return to the seat of glory (it is the glorification of her promised in the Vita *Nuova*); she is succeeded by St. Bernard, who obtains for Dante (by the intercession of the Virgin Mary) the possibility of intuiting the principal mysteries of the Christian faith, contemplating them directly for a brief moment in God: the unity and trinity of God and the incarnation of Christ—an exalted experience which makes the poet feel later the inadequacy of the imagination to describe his own supreme vision. The "sacred poem" concludes on this note, in the name of "the Love that moves the sun and the other stars."

The Commedia is a sublime work of poetry. For greatness of conception and construction, for concrete invention, prismatically reflected (within the framework of the imaginary journey) in every episode and character of the poem and sustained by the perfect and sensitive adaptation of the style to the subject, it has shown no signs of the wear and tear of time after many centuries and for artistic mastery and impassioned moral power even today it is only equaled by the great poems of classical antiquity and in the sublime poetry of the Bible. This is fully realized by anyone who closely studies the book and is moved by the sentiments which inspired Dante to compose immortal episodes, lyrically attuned to the changing moods of his soul, the imaginative power of which infuses life into the various characters and expresses in them, in

many varied ways, his own inner life. But Dante also intended the poem to have a precise allegorical significance which is not superimposed on the poetry from outside, but is rather the conceptual nucleus around which the poetic images flower in all their beauty.

To understand its range (and together with it the value of the message entrusted by Dante to the *Commedia*) it suffices to re-read the last chapter of the *Monarchia* (III, xvi) which expounds the basic symbolism of the poem. Ordained by God for two ends. natural and supernatural, man can attain happiness on this earth (figured by the Terrestrial Paradise) provided he lives in accordance with the moral and intellectual virtues. The second goal (blessedness not on earth but in eternity, which consists in the vision of God in Paradise) is acquired, on the other hand, by living in this life on the plane of grace, according to the three theological virtues. It is the task of the emperor to guide the human race to happiness on this earth; it is the duty of the pope, who has been entrusted with the revelation of God's word, to lead mankind to the blessedness of Paradise. The perfect harmony between the symbols of the Terrestrial and of the Celestial Paradise explained in the *Monarchia* and the images which mark the fundamental stages of the poem show how the imaginative representation of Dante's journey—on the allegorical plane—is no other than the poet's conscious grasp of a concrete, existential reality: that of our life here and now, of human nature with its passions, contradictions and conflicts: poetic knowledge of man and his purposes which is expressed in Dante's own no less real spiritual experience. The tragic obscurity of the "dark wood" (symbol of the uncultivated life, life without reason and virtue), dominated by the "three wild beasts" (the three radical passions of human nature subsequent to the original sin—lust, pride, avarice) is abandoned by Dante under the guidance of Virgil (the poet of the Roman empire who sang in the *Aeneid* of the fulfilment of an ideal of piety and natural justice, and in the fourth eclogue foretold—it was believed in the middle ages—the advent of Christ) in order to regain that state of natural perfection (Terrestrial Paradise) which is proper to one who lives according to reason and virtue, but which at the same time disposes the Christian soul, illuminated and sanctified by the theological virtues, actually to live the life of grace and contemplation (Paradise). The poetic experience of the *Commedia* on the allegorical plane is therefore the history of Dante's own soul: of his finding in himself, in his noble conscience and his deeply spiritual nature, the solution of the grave political, moral and religious problems which tormented him after his exile. The two guides willed by providence are, it is true, missing through lack of an emperor and of adequate spiritual guidance by the pope who by his confusion of the two offices has violated the providential order, so that the chair of Peter is vacant in the sight of God (*Paradiso,* xxvii, 254); but man can still by his unaided powers, if he meditates on his own duties and destiny as an immortal soul, rediscover the "straight way" of a moral life which leads him to perfection. In short, readers of the *Commedia* were to discover in the poem, as in a great, sacred allegory, an *exemplum* which should lead them to meditate on the evil of the tragedy of the contemporary scene and should at the same time indicate the solutions: the empire as the sole remedy and bridle for human avarice; the necessity of a return on the part of the church to purity and evangelical poverty. In this sense, taken with Letter XIII, to Cangrande, the purpose of the *Commedia* can be said to be to "remove those living in this life from the state of misery and lead them to the state of felicity" (li. 15). because Dante's exceptional poetical experience could be repeated at the level of ordinary life, by anyone who wished to move with equal resolve toward the same spiritual goal.

BIBLIOGRAPHY.—Two excellent introductions to the whole subject are U. Cosmo. *Guida a Dante* (1947: Eng. trans. *A Handbook to Dante Studies,* 1950) and *M.* Barbi, *Dante: Vita, opere e fortuna* (1933; Eng. trans *Life of Dante,* 1954).

Life: The documents appear in R. Piattoli, *Codice diplomatico dantesco* (1950); a good general survey is U. Cosmo, *Vita di Dante* (1930; 2nd ed., 1949).

Works and Concordances: Complete critical ed., *Le Opere di Dante. Testo critico della Società Dantesca italiana,* ed. by *M.* Barbi, etc. (1921, reprinted 1960); the Oxford Dante, *Le Opere di Dante,* ed. by E. Moore (4th ed. rev. by P. Toynbee, 1924) is also complete. Toynbee's *concise Dictionary of Proper Names and Notable Matters in the Works of Dante* (1914) is invaluable; though based on editions earlier than the critical text, there are useful *Concordances* to the *Commedia* (by E. A. Fay, 1888), to the minor Italian works (by E. S. Sheldon and A. C. White, 1905, and by L. H. Gordon—*A Supplementary Concordance,* 1936) and to the Latin works (by E. K. Rand and E. H. Wilkins, 1912). The American Dante society prepared new concordances (based on the 1921 text) for the septcentenary of 1965.

Individual Minor Works: Il Fiore e il Detto d'amore, critical ed. by E. G. Parodi (1921). *Rime* (*i.e.,* the *Canzoniere*), ed. by G. Contini (2nd ed., 1946), which has an admirable commentary; *see* also *Le Rime della "Vita Nuova" e della giovinezza,* ed. by M. Barbi and F. Maggini (1956). *Vita Nuova:* first ed., 1576; critical ed. by M. Barbi (1932). *Convivio:* first ed., 1490; *Il Convivio ridotto a miglior lezione,* ed. by G. Busnelli and G. Vandelli, with commentary (1954). *De vulgari eloquentia:* first ed., by J. Corbinelli, 1577; first Italian trans. by G. G. Trissino, 1529; critical ed. by P. Rajna (1896) and L. Bertalot (1920); ed. with commentary and trans. by A. Marigo (1937). *Monarchia:* first ed., 1559 (placed on Index of prohibited books until 1881 because of its anti-papal polemics); critical ed. by L. Bertalot (1920); ed. with commentary by G. Vinay (1950). *Epistolae* (letters); *The Letters of Dante,* an excellent ed. with Eng. trans. by P. Toynbee (1920). *Eclogae* (eclogues): *Dante and Giovanni del Virgilio,* ed. with Eng. trans. by P. H. Wicksteed and E. G. Gardner (1902) is of fundamental importance. *Quaestio de aqua et terra* (as no manuscript exists, its genuineness has been doubted): first ed. (1508) was reproduced with a commentary, by G. Boffito (1905); definitive proofs of its authenticity appear in *Studi danteschi,* vol. xxxiv, pp. 163–204 (1957).

The "Commedia": the first 4 ed. (1472, 1477) were reprinted by Lord Vernon and A. Panizzi (1858); the first Venetian ed. appeared in 1477, the first Milanese (ed. by M. P. Nidobeatus) in 1478, the first Florentine in 1481; Aldus produced the first pocket-edition in his new "italic" type in 1502; the existence of more than 600 mss. and the size of the work made the preparation of a critical text difficult, but following the preparatory researches of Carl Witte (for the 1862 ed.), E. Moore's *Contributions to the Textual Criticism of the Divina Commedia* (1889) was important; the critical text was ed. by G. Vandelli (1921); the ed. by M. Casella (1923; London, 1928) is excellent.

Early Commentaries on the "Commedia": the first (on the *Inferno* only) was by Jacopo Alighieri (1322), the next by Graziolo de' Bambaglioli (1324); the first commentary on all three *cantiche* of the *Commedia* was by Jacopo della Lana (1324–28); the first Florentine commentary (called the *Ottimo*) was by Andrea Lancia (3 ed., *c.* 1333–40); Pietro Alighieri's commentary (3 ed., *c.* 1340–60) is profound; the Carmelite Guido da Pisa's commentary (*c.* 1350) remains unpublished: see *Studi danteschi,* vol. xxxv, pp. 29–128 (1958); in the second half of the 14th century appeared the *Letture* ("readings") of Giovanni Boccaccio (1373), Benvenuto da Imola (1375–80) and Francesco da Buti (*c.* 1390); extracts from early commentaries and a bibliography of modern eds. are given in G. Biagi, G. L. Passerini, E. Rostagno and U. Cosmo, *La Divina Commedia nella figurazione artistica e nel secolare commento* (1921–40), which also includes passages from later commentaries by Cristoforo Landino (1481), Alessandro Vellutello (1544), Bernardino Daniello (1568) and Lodovico Castelvetro (unpublished until 1888) and from 18th- and 19th-century commentaries. Modern commentaries: those by F. Torraca (1905), T. Casini and S. A. Barbi (1922) and I. del Lungo (1926) are still useful; those by G. Vandelli (1928), C. Grabher (1934–36), A. Momigliano (1951) and M. Porena (1946–47) are more up to date; N. Sapegno's commentary (1957) is essential; for English readers, the 3 vol. "Temple Classics" with text, Eng. trans. and commentaries by H. Oelsner, T. Okey and P. H. Wicksteed (1899–1900: reprinted 1946–52) are very useful, as are W. W. Vernon's *Readings* on *inferno* (1894), *Purgatorio* (1889) and *Paradiso* (1900).

Translations of Minor Works: Eng. trans of *Vita Nuova* by *T.* Okey (1906), of the *Canzoniere* (1906), *Convivio* (1903), *De monarchia, Epistolae, Eclogae* and *Quaestio de aqua et terra* (all 1904) by P H. Wicksteed and of *De vulgari eloquentia* (1890) by A. G. F. Howell appear in the "Temple Classics" with full explanatory notes; *see* also Eng trans. of the *Canzoniere* by C. Lyell (1840) and by L. de' Lucchi (in *The Minor Poems of Dante,* 1926); *Vita Nuova,* in the classic trans. by D. G. Rossetti 11898. 1906) and those by C. E. Norton (1867. reprinted 1893, 1902) and C. S. Boswell (1895)—the earliest-known Eng. trans. was by Emerson (unpublished until ed. by J. C. Matthews, 1960); *Convivio,* trans. by W. W. Jackson (1909); *Monarchia,* trans. by *D.* Kicholl and C. Hardie as *Monarchy, and Three Political Letters* (1954); *Epistolae,* trans. by P. H. Toynbee (1920); *Quaestio de aqua et terra,* trans. by C. H. Bromby (1897) and C. L. Shadwell (1909).

Translations of the "Commedia": first Eng. trans. of the entire work by Henry Boyd '(1802); the admirable blank-verse rendering by H. F. Cary (*The Vision,* 1814; 2nd ed. 1819) is the standard trans.; numerous later translations include those by Longfellow (1867), J. A. Carlyle (*Inferno* only, 1849), C. E. Korton (1893, 1922; reprinted in the *Encyclopaedia Britannica* "Great Books of the Western World" series) and the prose trans. by H. F. Tozer (1904); G. Musgrave's *Inferno* in Spenserian stanzas (1893, 1933); C. L. Shadwell's *Purgatorio* and

Paradiso in the metre of Andrew Marvell's "Ode to Cromwell" (1892, 1899 and 1915); versions of the *Commedia* in *terza rima* by F. K. H. Haselfoot (1887, 2nd ed. 1899), M. B. Anderson (1921, 1933) and G. L. Bickersteth (1955); D. L. Sayers translated *Inferno* and *Purgatorio* and *Paradiso* in *terza rima* in the "Penguin Classics" series (1949, 1955 and 1961); other verse translations by D. J. Mackenzie (1927) and J. H. Fletcher (1931, 1951); prose trans. with the Italian text opposite by J. D. Sinclair (1939).

Aids and Studies: It is only possible to list a few general works useful to English readers—E. Moore, *Studies in Dante* (4 series, 1896–1917); P. Toynbee, *Dante Studies and Researches* (1902), *Dante Studies* (1921); P. H. Wicksteed, *From Vita Nuova to Paradiso* (1922); the Dante studies of F. D'Ovidio reprinted in his *Opere,* vol. i–ii and iv–v (1926, 1931, 1932); F. Torraca, *Studi danteschi* (1912), *Nuovi studi dantesclzi* (1921); E. G. Parodi, *Poesia e storia nella Divina Commedia* (1921), *Lingua e letteratura* (1957); B. Croce, *La poesia di Dante* (1921; Eng. trans. *The Poetry of Dante,* 1922); T. S. Eliot, "Dante" (1929; reprinted in *Selected Essays,* 1932); C. Foligno, *Dante* (1921; Eng. trans. 1929); C. H. Herford, *The Significance of Dante for the Modern World* (1933); F. Olivero, *The Representation of the Image in Dante* (1936); M. Barbi, *Problemi di critica dantesca* (2 series, 1934, 1941); L. Pietrobono, *Saggi danteschi* (1936), *Nuovi saggi danteschi* (1956); B. Nardi, *Dal "Convivio" alla "Commedia"* (1960).

On the "Vita Nuova": M. Kavanagh (M. J. Spain), *Dante's Mystic Love* (1936); J. E. Shaw, *Essays on the "Vita Nuova"* (1929); C. S. Singleton, *An Essay on the Vita Nuova* (1949). On Dante's philosophical thought: P. H. Wicksteed, *Dante and Aquinas* (1913); E. G. Gardner, *Dante and the Mystics* (1913); E. Gilson, *Dante et la philosophie* (1939; Eng. trans. *Dante the Philosopher,* 1948); B. Nardi, *Saggi di filosofia dantesca* (1930), *Nel mondo di Dante* (1944). On Dante's political thought: F. Ercole, *Il pensiero politico di Dante,* 2 vol. (1927–28); A. Passerin d'Entrèves, *Dante as a Political Thinker* (1952); N. Lenkeith, *Dante and the Legend of Rome* (1952); E. Lewis, *Medieval Political Ideas* (1954); C. T. Davis, *Dante and the Idea of Rome* (1957); *see* also introduction and notes to D. Nicholl's Eng. trans. of *Monarchia (Monarchy, and Three Political Letters,* 1954).

On the "Commedia": W. H. V. Reade, *The Moral System of Dante's Inferno* (1909), *Dante's Preparation for the Divine Comedy* (1937); H. Peri, *The Original Plan of the Divina Commedia* (1955); J. B. Fletcher, *Symbolism of the Divina Commedia* (1921); K. Vossler, *Die gottliche Komodie* (1907–11; Eng. trans. *Medieval Culture. An Introduction to Dante and his Times,* 2 vol., 1929, reprinted 1958); J. H. Whitfield, *Dante and Virgil* (1949); Charles Williams, *The Figure of Beatrice* (1943); E. R. Curtius, *Europaische Literatur und lateinisches Mittelalter* (1948; Eng. trans. *European Literature in the Latin Middle Ages,* 1953); C. S. Singleton, *Dante Studies, I: Commedia. Elements of Structure* (1954), *Dante Studies, 2: Journey to Beatrice* (1958); M. Barbi, *Con Dante e i suoi interpreti* (1941) and *Problemi fondamentali per un nuovo commento della Divina Commedia* (1956); D. L. Sayers, *Introductory Papers on Dante* (1954), *Further Papers on Dante* (1957); K. Foster, *God's Tree* (1957); B. Stambler, *Dante's Other World* (1957); J. A. Mazzeo, *Structure and Thought in the Paradiso* (1958) and *Medieval Cultural Tradition in Dante's Comedy* (1960); S. Ralphs, *Etterno Spiro. A Study in the Nature of Dante's Paradiso* (1959).

On Dante's Reputation: W. P. Friederich, *Dante's Fame Abroad,* 1350–1850 (1950); P. Toynbee, *Dante in English Literature from Chaucer to Cary* (1909), *Britain's Tribute to Dante in Literature and Art . . . c.* 1380–1920 (1921); F. P. Wilson, "A Supplement to Toynbee's Dante in English Literature," *Italian Studies,* vol. iii, pp. 50–64 (1947).

Periodicals: The most important for Dante studies are the *Bullettino della Società Dantesca Italiana* (1893–1921), *Giornale dantesco* (1894–1940) and *Studi danteschi* (1920-), founded by Michele Barbi and later edited by G. Contini. *See* also the *Deutsches Dante-Jahrbuch* (1867–).

Portraits of Dante: The repainted figure in a fresco of the podestà's chapel in the Bargello, Florence, is probably authentic and was probably executed by Giotto from a sketch made early in the poet's life. The Torrigiani mask now in the same chapel is probably a 15th-century work derived from a high relief on the tomb (removed during the 16th century). *See* further R. T. Holbrook, *Portraits of Dante from Giotto to Raffael* (1911); R. hltrocchi, "The Present State of Dante's Iconography," *Italica,* vol. xii (1935); W. Goetz, *Das Dantebildnis* (1937); P. L. Rambaldi, "Dante e Giotto nella letteratura artistica sino al Vasari," *Miscellenea d'arte* (special Giotto sexcentenary no., 1938).

(FR. M.)

DANTON, GEORGES JACQUES (1759–1794), one of the most complex and controversial statesmen of the French Revolution, was born at Arcis-sur-Aube, in Champagne, on Oct. 26, 1759, the son of Jacques Danton (d. 1762), an attorney of the *bailliage,* and of Marie Madeleine Camus, his second wife. Educated by the Oratorians at Troyes (from 1773), he went in 1780 to read law in Paris, becoming a clerk to an attorney in the *parlement.* After obtaining his degrees at Reims, he returned to Paris to practise. In March 1787, he bought the office of advocate in the *conseil du roi,* having borrowed half of the money to pay for it. He then married Antoinette Charpentier.

At the outbreak of the Revolution, Danton enrolled in the civic guard of the Cordeliers district (July 1789) and was elected president of the district (October). In Jan. 1790, when the arrest of J. P. Marat was ordered for an offense against the press laws, Danton roused his district to defend him. After the suppression of the districts and the creation of the *sections,* Danton, who had been a member of the provisional commune of Paris, was excluded from the commune in its final form (Sept. 1790). It was during this time that he became prominent in the club of the Cordeliers (*q.v.*). On Jan. 31, 1791, he was elected administrator of the *département* of Paris, but he rarely attended this assembly and had no influence in it. From this time, however, he began speaking in the Jacobin club. On June 21, 1791, he accused La Fayette of complicity in Louis XVI's flight to Varennes and called on him to resign the command of the national guard in Paris. Though Danton's signature does not appear on the famous petition of the Cordeliers which resulted in the massacre on the Champs-de-Mars (July 17, 1791), his arrest was ordered on Aug. 4, for reasons still obscure, but he escaped first to Arcis, then to Troyes and finally to London.

Appointed elector for the Théâtre Français section, Danton returned from England for the elections to the Legislative Assembly. In Dec. 1791, he was chosen as second assistant to the *procureur* of the Paris commune. In the great controversy between Brissot and Robespierre, Danton at first supported Robespierre and the cause of peace as against war, but soon fell silent, leaving Robespierre to face the Girondins alone. In the commune he supported the mayor J. Pétion de Villeneuve and the *procureur* L. P. Manuel in their campaign against La Fayette and the Feuillants. On June 18, 1792, after Louis XVI had dismissed the Girondin ministry, Danton demanded that La Fayette be called to account for himself before the assembly, but he took no part in the manifestation on the Tuileries on June 20. What he did to organize the movement against the monarchy which culminated in the insurrection of Aug. 10 remains very obscure, though he later claimed to have prepared it himself. In any case, the Girondins took him next day into the provisional executive council, which shows that they credited him largely with the success of the insurrection.

Minister of Justice.—In the provisional executive council Danton was minister of justice. His revolutionary past and his personal character now made him the dominating figure in the new government. As the Prussians advanced toward Paris, it was Danton who expressed the will to fight and to win. When, on Aug. 28, 1792, J. M. Roland proposed the withdrawal of the government to the Loire, Danton opposed him, as retreat would have meant the moral collapse of France. On that day he proved his unshakable powers of leadership. The legend that Danton was personally responsible for the September massacres (when the populace, on the news of the siege of Verdun, broke into the prisons), is an invention of the Gironde: like all the terrified Girondins, Danton simply let them happen. "No human power," he later said, "could have prevented the overflowing of the national vengeance."

Danton and the **Girondins.**—On Sept. 6, 1792, Danton was elected to the Convention as deputy for Paris by 638 votes out of 700. He then left the executive council and resigned his ministry. Inclined to conciliation, he did not share Robespierre's invincible hatred of the Girondins, to whom indeed he offered his support. At heart a man of the centre, he wanted the Convention to abandon extreme measures. While he opposed the federalists, he also denounced the tendency toward dictatorship, and in October he promised Théodore Lameth that he would try to save Louis XVI (in order to ensure peace). The Girondins, however, rejected his overtures. Madame Roland envied his ascendancy and, with her intransigent faction (Charles Barbaroux, François Buzot, J. B. Louvet and others), sought to crush opposition. By demanding from Danton an account of his secret expenses as minister, which he was not able to give, and by accusing him of robbing the *garde-meuble* (the repository of the crown's valuables), the Girondins and Madame Roland launched a persecution that finally drove him toward the Mountain.

Sent on a mission (Nov. 30, 1792) to Gen. C. F. Dumouriez (*q.v.*) in Belgium, Danton took no part in the opening of Louis XVI's trial. He was present, however, on Jan. 15, 1793, and voted for death without reprieve. He had already said to Lameth in October: "Can a king be saved once he has been brought to trial? He is dead when he appears before his judges."

On Jan. 31, 1793, Danton declared himself for the annexation of Belgium, formulating the doctrine which the Convention was thenceforth to adopt: that the republic should spread to the frontiers "demarcated by nature." That day he was sent again to Belgium, but his wife's death within a fortnight brought him back to Paris until the end of February. When the Austrian successes against Dumouriez began, Danton hurried back to Paris to raise the alarm. To save Belgium, he appealed, as in 1792. for a new effort by the patriots of Paris. When they declined to leave the capital exposed to treachery, he opposed the creation of a special tribunal to ensure security—the future Revolutionary tribunal (*q.v.*). This was set up (March 10), but his next proposal (March 11), for a committee invested with executive power, was rejected by the Convention when the Girondins accused him of aiming at dictatorship. When Dumouriez sent a threatening letter to the Convention (March 12), Danton went again to Belgium to remonstrate with him. On his return to Paris he gave no warning of the intentions of Dumouriez. The general's final defeat and treason in April added bitterness to the conflict between the Gironde and the Mountain.

As long as he could, Danton had tried to reunite the republican parties, but his interviews with Dumouriez laid him open to suspicion. The Girondins not only questioned these, but continued clamouring for his accounts. On April 1, 1793, when David Lasource raised the matter again with especial vehemence, Danton finally declared his break with the party that had wanted to save Louis XVI and ranged himself on the side of the Mountain.

Danton's Committee of Public Safety.—On April 6, 1793, the Convention set up the committee of public safety, which Danton had demanded. In this committee (with men like Bertrand Barère and Pierre Joseph Cambon, more or less Montagnards), Danton was the dominant member, with almost ministerial powers. Regardless of his speech of April 1, he tried still to conciliate the Girondins and the Mountain, but his hestitation only postponed the crisis. On May 27, however, he persuaded the Convention to suppress the commission of twelve that the Girondins had instituted to counteract the Paris commune. Finally came the events of May 31–June 2, the rising of the Paris sections and the overthrow of the Girondins in Paris. If he did nothing to instigate the rising, at least Danton declared his approval of it: "But for the cannons of May 31, but for the insurrection, the plotters would have triumphed" (June 13).

Despite the danger of foreign invasion and the spread of civil war in France, after June 2, 1793, Danton and the committee of public safety hesitated to take extraordinary measures. On June 6, he even suggested suppressing the committees of surveillance. Moreover, since his return to power, he had been making overtures for peace to Lord Grenville, the British foreign secretary. These, however, were scornfully rejected. His negotiations, in fact, could have made sense only if France had either won a victory or been prepared to capitulate under a show of reaching a compromise, and some of the Montagnards thought that he was planning to surrender Marie Antoinette and her children or even to restore the monarchy. As the crisis grew worse, his critics lost patience, and on July 10, when the committee of public safety's term expired, the Convention elected a new committee without Danton.

The Terror and the **Indulgents.**—In the summer of 1793, while the popular movement was giving strength to the Revolutionary government and as the Terror was beginning, Danton still raised his voice occasionally. It was he who proposed the decree of Aug. 12 for the internment of suspected persons. On Sept. 5, however, he dismayed the popular militants by having the meetings of the hitherto permanent sectional assemblies reduced to two per week. On Oct. 12, however, he withdrew to Arcis.

On his return to the Convention (Nov. 21), Danton found the anti-Christian movement in full swing. Against this, he was at one with Robespierre and the extremists were confounded when the Convention disavowed the movement by decreeing that freedom of worship remained (Dec. 6). Danton and his friends now took the offensive with Camille Desmoulins (*q.v.*), in Le *Vieux* Cordelier, as their spokesman. In fact they were challenging not only Hébert and the anti-Christian faction but the whole government policy and the regime of the Terror: in Danton's view the Revolution, no longer in danger, could now afford clemency.

Danton probably did not mean to set himself up as the leader of a faction, but the tactics and the aims of the "Indulgents," as those who shared his desire for clemency were called, were in conformity with his past policy and conciliatory opportunism. The Indulgents, moreover, attracted a number of questionable adherents whose main concern for clemency was in order to escape the scaffold themselves. Also, the fact that Danton was suspected of corruption brought the whole group into suspicion. When Danton claimed that his friend Fabre d'Églantine and the other deputies arrested for complicity in the fraud over the liquidation of the Compagnie des Indes should be given a hearing, Billaud-Varenne clearly threatened Danton himself in his reply (Jan. 13, 1794).

The Fall of **Danton.**—For two months the feud between the Indulgents and the Exagérés or Hébertists went on. Then the committee of public safety resolved to put a stop to it. The first to fall were the Hébertists (March 17–24, 1794). Then Billaud-Varenne and Collot d'Herbois persuaded Robespierre to strike the opposite faction likewise. Danton and his friends were arrested in the night of March 29–30, and Saint-Just read to the Convention the report that Robespierre had helped him to draw up against them. An imaginary plot to rescue them was alleged in order to silence Danton's defense. Condemned to death, Danton and the others were guillotined on 16 Germinal year II (April 5, 1794). To the executioner he said: "Show my head to the people, it is worth the trouble." The people, however, were almost unmoved.

Conclusions.—The question whether Danton took money corruptly cannot be passed over. Historians now agree that evidence from Mirabeau and Antoine Talon proves beyond doubt that he did so, and the further evidence from Brissot, Bertrand de Molleville and La Fayette can be accepted on essential points. In the case of Louis XVI's trial, Danton's corruption seems most probable.

Danton's character was complex: his self-interested flexibility, his caution and his venality cannot be doubted but he also possessed a statesman's realism. His wild enthusiasms, his carelessness and his sudden changes of plan show a violent temperament without intellectual or moral discipline. His sudden gestures of generosity and of compassion may perhaps be linked with a pleasure-loving disposition that could not long sustain distrust or hatred.

If any judgment can be given on Danton's politics, his real attachment to the nation and to the revolutionary cause cannot be denied: he served the Revolution well during the crisis of Aug.–Sept. 1792. His policy in the following months, when he worked for a general peace, is understandable but highly controversial. The same may be said of his direction of the committee of public safety, though his indecision in the spring of 1793 only exacerbated the conflict between the Gironde and the Mountain. In the last part of his life his policy of moderation served only to weaken the efforts at general mobilization, and his opposition to the committee of public safety precipitated the crisis in which he himself was destroyed. It can be argued that his trial was right and necessary. Even so, it dealt a fatal blow to the Mountain and opened the way to the fall of the Revolutionary government.

BIBLIOGRAPHY.—There are two different opinions of Danton. According to one, he was a sincere democrat, a sound patriot and a great statesman. For this view *see* J. F. *E.* Robinet, *Danton, homme d'ktat* (1889) ; *A.* Aulard, *Les Orateurs de la Législative et de la Convention,* 2nd ed., vol. ii (1906), and *Études et leçons sur l'histoire de la Révolution française,* i, ii, iv, v and ix (1893–1924). According to the other opinion Danton was an unscrupulbus politician capable of betraying the Revolution and of selling himself to the court. This view is adopted by A. Mathiez, *Danton et la paix* (1919), *Autour de Danton* (1926) and "Danton, l'histoire et la légende," *Annales historiques de la Révolution française* (1927). For a middle position *see* L. Madelin, *Danton*

(1914); G. Lefebvre, "Sur Danton," *Annales historiques de la Révolution française* (1932). (A. So.)

DANUBE (Ger. DONAU; Slovak DUNAJ; Hung. DUNA; Bulg. and Serbo-Croat DUNAV; Rum. DUNĂREA; Russ. DUNAY; Lat. DANUBIUS and in the lower part of its course ISTER), is the most important river of central and southeastern Europe.

It rises in the Black Forest mountains of Germany and empties into the Black sea, receiving tributaries on the right bank from the eastern Alps, the Dinaric Alps and the Balkan mountains and on the left bank from the Franconian Jura, Bohemian Forest (Bohmer Wald or Cesky Les), the Czech-Moravian plateau, the Carpathians and the Transylvanian Alps. It is 1,776 mi. long, drains an area of 315,444 sq.mi. and is the most important river of Europe as regards the volume of its outflow although it is inferior to the Volga in length and drainage area. The river is first called the Danube at Donaueschingen in the Black Forest, where the Brigach, the Breg and a smaller stream meet at an altitude of 2,187 ft. It is navigable for special river craft below Ulm (1,505 ft. above sea level), and is fed by at least 300 tributaries, many of which are large rivers.

The river can be divided into three sections: the upper course, above Bratislava, Czech.; the middle course, between Bratislava and the Iron Gate in Rumania; and the lower course, below the Iron Gate.

The Upper Course.—The direction of the river in its upper course is determined by the structure of the Alpine foreland. Rising in the crystalline rocks of the Black Forest, it flows eastward across a narrow belt of Jurassic rocks to Sigmaringen and then to Regensburg, its bed being in the soft Molasse (Upper Oligocene and Miocene rocks). Below Regensburg the river flows southeastward along the southern flanks of the Bohemian massif and flows in part upon the crystalline rocks of the latter and in part upon the Molasse, but at Krems, Aus., it turns eastward across the Molasse and after passing Vienna it flows through the gap which separates the eastern Alps from the Carpathians.

The valley of the Danube above Sigmaringen is narrow, the scenery being wild and beautiful, especially above Tuttlingen, where castles crown every possible summit on the neighbouring hills. Below Immendingen much water escapes by subterranean fissures into the Aach river, a tributary of the Rhine. After it is joined at Ulm on the right bank by the Iller, which rises in the Allgäuer Alpen, the Danube attains a width of 78 yd. and an average depth of 3 ft. 6 in. and becomes navigable downstream for specially constructed craft of 100 tons. Near Donauwörth (1,330 ft.) it receives on the right bank the Lech, while at Regensburg (949 ft.) it is joined on the left bank by the Naab. Below Regensburg at Deggendorf it is joined by the Isar, on the banks of which stands Munich. At Passau, Ger. (800 ft.), it enters Austria and is joined on the right bank by the Inn. Both the Isar and the Inn drain a large portion of the eastern Alps.

From Passau to Linz the Danube is hemmed in by mountains, but its valley becomes wider below Linz where the river subdivides into several arms which unite again at the once-famous whirlpool near Grein. Below Grein, the river flows through another narrow defile as far as Krems but once more subdivides as it passes toward Vienna. The district between Linz and Vienna is renowned for its beauty and for the numerous places of historical and archaeological interest along the banks. At Vienna the river is 316 yd. wide, and 429 ft. above sea level. Below the town is the district of Marchfeld, a low-lying country across which the Danube frequently subdivides to form numerous islands. It is joined by a left-bank tributary, the March (Morava), which drains Moravia. Before reaching Bratislava, the Danube passes through the narrow gap between the lower spurs of the Alps and the Carpathians and enters upon the middle section of the river. At this gap the river also flows out of Austria and for a few miles is entirely in Czechoslovakia, but it soon becomes the boundary between that country and Hungary.

The Middle Course.—The Danube flows for the first 100 mi. of its middle course upon alluvial and Quaternary deposits of the Little Hungarian Plain which is separated from the Great Hungarian Plain by the Bakony Hegyseg ridge, the innermost arc of the Carpathian mountain system. The Danube breaks through the ridge east of Esztergom, Hung. After leaving Bratislava, it divides into three channels forming two main islands, the northern and larger (Velky Ostrov Zitny, Great Schiitt) being Czechoslovak, the smaller (Szigetkoz, Little Schiitt), Hungarian. The northern branch is joined at Komarano by the Slovak tributary the Vah, which rises in the Carpathians. Higher upstream at Gyor (Raab), Hung., the southern branch of the divided Danube is joined by the Raab (Rába) river which rises in the Styrian Alps. The three channels join again at Komarno, Czech., and farther down the Danube receives two more Slovak tributaries, the Hron, whose confluence is opposite Esztergom, and the Ipel (Ipoly), whose lower part marks the Czechoslovak-Hungarian frontier. Between Esztergom and Vác the valley becomes narrow until at Vác the river turns to flow southward for 230 mi. across the Great Hungarian Plain, meandering in the wide alluvium-filled valley and frequently dividing into two or more streams. Passing Budapest, Sztalinvaros, Baja and Mohács, the river leaves Hungary and enters Yugoslavia.

About 8 mi. E. of Osijek, the Danube is joined by the right-bank tributary, the Drava (Drau), which rises in Italian Tirol and drains a large portion of the eastern Alps. The Danube again flows eastward at Vukovar, along the northern edge of the Fruska Gora. Between Novi Sad and Belgrade it receives the left-bank affluent, the Tisa, which, rising in the Carpathians, drains the greater part of the western slopes of the mountains, as well as the Great Hungarian Plain. At Belgrade, the Danube is joined by the right-bank affluent, the Sava, which, rising in the Julian Alps, flows eastward and drains Slovenia, Croatia and part of Bosnia. Serbia is drained by the Morava, which joins the Danube east of Smederevo, also on its right bank.

The character of the valley changes suddenly at Bazias, where the Danube meets the Rumanian frontier. Between Bazias and Turnu Severin the river has worn a channel through the mountain ridge which joins the Carpathian arc with the Balkan mountains. Until comparatively recent geological times, the Great Hungarian Plain formed an inland sea, whose effluent followed the present course of the Danube through the Cazane (Kazan) defile and the Iron Gate. By the lowering of its channel through the gap (the level at Orsova is 42 ft. above sea level) this sea was drained. Hemmed in by precipitous rocks, the river passes through the stupendous Cazane defile (162 yd. wide), then widens out to nearly a mile at Orsova, becoming narrower again at the Iron Gate. The river has been cleared of numerous obstructions to make navigation possible along this stretch.

The Lower Course.—The lower course of the Danube stretches from the Iron Gate to the Black sea. From Ram to the junction with the small right-bank tributary, the Timok, the Danube forms the boundary between Yugoslavia and Rumania. From the Timok to Silistra, Bulg., it forms the boundary between Rumania and Bulgaria, then flows through Rumanian territory. East of Galati, Rum., the river forms the boundary between Rumania and the U.S.S.R. (Ukraine).

Along its lower course, the Danube flows over Quaternary deposits covered by river sands and gravels. Its north bank is low, flat and marshy with numerous small lakes, but its south bank is crowned by low heights which make excellent townsites; *e.g.*, Vidin, Lom, Nikopol, Svishtov, Ruse and Silistra (all in Bulgaria). Between Giurgiu in Rumania and Ruse a double-deck railway and road bridge, of 37 spans and a total length of 7,400 ft., was inaugurated in June 1954.

The river receives many tributaries along this stretch. On its left bank the Jiu, the Olt and Dâmbovita are the most important, draining the Transylvanian Alps, and on its right bank the Iskur and the Yantra, draining the northern ridges of the Balkan mountains. At Cernavodă, Rum., the river is crossed by the railway from Bucharest to Constanta, the Black sea port. Turning, the Danube flows northward flanked by the Dobruja hills, which form an isolated remnant of the Hercynian foreland of Europe.

Through Rumania as far as Brăila, the river subdivides into several channels, and spreads out over the surrounding country to form numerous lakes. The river changes its direction again at

Galati, the chief port on the delta of the Danube, and flows eastward toward its mouths. Seagoing vessels having a register less than 4,000 tons can ascend the river as far as Brăila, but those of less than 600 tons can sail as far as Turnu Severin. Two left-bank affluents, the Siret and the Prut, which drain the eastern side of the Carpathian mountains, enter the river near Galati. For 30 mi. in an easterly direction from Galati, the Danube flows in a single channel until it breaks into the several branches of its delta. Along the northern shore of the river from Galati to the sea there are many shallow lakes, indicating the poor drainage of the region. The most important mouths of the river from north to south are Kiliya, Sulina and St. George. The amount of silt brought down to the delta each year is estimated at 108,000,000 tons. As the currents of the Black sea along the delta coast flow from north to south, silt from the Kiliya tends to block the mouths of the other channels.

The delta of the Danube, which is about 1,000 sq.mi. in area, is a wilderness of swamps and marshes covered by tall reeds, through which the silt-laden distributaries of the river slowly meander. The monotony of the wasteland is relieved by isolated elevations covered by oak, beech and willow, many of them marking ancient coast lines. The most important towns in the delta region are Izmail and Kiliya on the Soviet bank of the Kiliya branch, Sulina Rum., at the mouth of the Sulina branch and Tulcea, Rum., on the St. George branch. The Kiliya branch breaks up into a wide delta which is continually advancing seaward and it is estimated that its various mouths pour 3,000 cu.ft. of sediment per minute into the sea. The Sulina branch breaks off from the St. George branch 7 mi. below Tulcea. The St. George branch again subdivides before entering the sea.

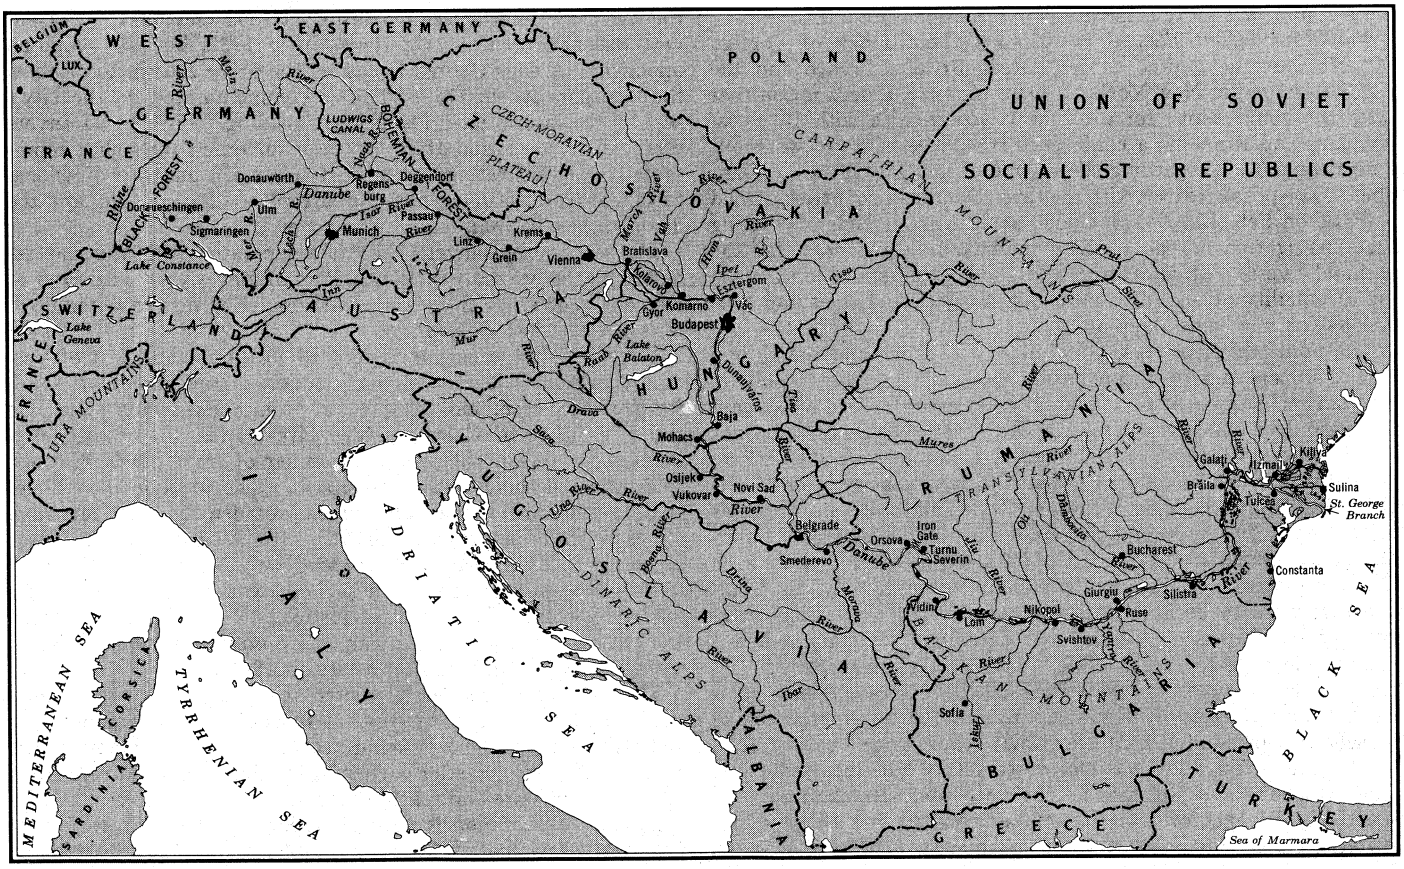
At one time ships drawing only eight feet of water experienced great difficult? in entering, as the depth of water in the channels rarely exceeded eight feet and the numerous sand banks and bars added to the difficulty of shipping. However, engineering works were undertaken to make the channels navigable by larger craft.

International Regulation.— The European Commission.— Before World War II the administration of the Danube was controlled by the single European Commission of the Danube, an institution set up with a provisional character by the treaty of Paris in 1856. Its headquarters were at Galati, and it administered the Danubian delta only, eight interested nations being represented on it. In the treaty of Bucharest (May 1918) the Central Powers reduced membership to "states situated on the Danube or the European coasts of the Black sea."

The treaty of Versailles (June 1919) reinstated the commission in "the powers it possessed before the war." It went on that "as a provisional measure, only representatives of Great Britain, France, Italy and Rumania shall constitute this commission." The commission acquired definite character when the Danube statute was signed in Paris on July 23, 1921. In the future, subject to the unanimous consent of the states represented on the commission, any European state which was able to prove its possession of sufficient maritime commercial and European interests at the mouths of the Danube could be represented on it although, in actual fact, the representation was not increased.

The International Commission.—The treaty of Versailles, art. 347, provided that "from the point where the competence of the European commission ceases," *i.e.*, from above Brăila, "the Danube system referred to in art. 331," *i.e.*, as far as the highest navigable point at Ulm. "shall be placed under the administration of an international commission." This was to include two representatives of German riparian states, one representative of each other riparian state and one representative of each nonriparian state represented in the future on the European Commission of the Danube. From 1920–39 the "nonriparian states" were France, Italy and Britain.

On July 23, 1921, the statute was signed. Many of its provisos simply followed the lines of the "convention on the regime of navigable waterways of international concern" concluded at Barcelona, Spain, on April 20, 1921. Art. i declared navigation on the Danube system to be unrestricted and open to all flags, on a footing of complete equality, from Ulm to the Black sea, and the internationalized portions of the Danube tributaries were defined. The International commission had to see that art. i was not infringed by any riparian state or states, to draw up a program of



COURSE OF THE DANUBE RIVER AND TRIBUTARIES, SHOWING ITS RELATIVE IMPORTANCE TO THE WHOLE OF EUROPE

public works for the improvement of the waterway on the basis of proposals submitted by the riparians, controlling and if necessary modifying the annual programs of the riparian states for current works of maintenance. The cost of such works was to be borne by the riparian state concerned, assisted, if the commission so decided. by other states interested.

Improvement costs might be covered by navigation dues, to be imposed (with the commission's authorization) by the riparian state which had executed the works, or by the commission itself, if it had executed them itself. The principle of equality for all flags was to be upheld regarding the levying of dues and customs duties. Goods and passenger traffic either in transit or between ports of the same riparian state were to be unrestricted. Uniform police regulations were to be drawn up and applied by each riparian on its own territory. A special approved joint service of Rumania and Yugoslavia was to take over the maintenance and improvement of the Iron Gate section, with headquarters at Orsova.

The commission was to determine its own procedure and administer its own budget, the presidency being held for six months by each delegation in turn. Its seat was to be at Bratislava for the first five years, and thereafter it might be established at other towns on the Danube, selected at its discretion, for five-year periods in rotation. Its property and members were to enjoy diplomatic privileges and it was to fly its own flag. Every effort was made to ensure uniformity between the workings of the International and the European commissions, and between different signatory states.

The convention came into force on June 30, 1922. Economic depression and international friction during the years between World Wars I and II seriously limited many planned improvements. The old Ludwigskanal was enlarged, however, to form the Rhine-Main-Danube canal; this made navigation possible from the Atlantic ocean to the Black sea through the European continent.

By 1940, Germany had gained control of the whole of the Danube. In September of the same year the two Danube commissions were declared dissolved and for the rest of World War II river administration was solely in the hands of the riparian states under German presidency. With the defeat of Germany, the question of the Danube once more came up for international review.

The Soviet-Controlled Commission.—The Council of Foreign Ministers of the United States, Great Britain, France and the U.S.S.R. issued in New York, on Dec. 16, 1946, a declaration that after the coming into force of the peace treaties with Bulgaria, Hungary and Rumania a conference should be held "to work out a new convention regarding the regime of navigation on the Danube." The peace treaties with the three Danubian countries, signed in Paris on Feb. 10, 1947, included an identical article stipulating that "navigation on the Danube shall be free and open for the nationals, vessels of commerce, and goods of all states, on a footing of equality in regard to port and navigation charges and conditions for merchant shipping."

The nonriparian powers, Great Britain, France and the United States, upheld the 1921 convention, but their attempt to obtain riparian recognition of this view failed at a conference which met in Belgrade from July 30 to Aug. 18, 1948. Germany was not represented because it was without a government and Austrian delegates were there only in a consultative capacity. Thus, the U.S.S.R., having become a riparian state, and with its satellites in the majority, on Aug. 2 proposed the establishment of a new Danube commission, composed of one representative from each Danubian state. Staffed by Danubian nationals only, its headquarters were to be at Galati. Expenses were to be shared by the riparian states. A Russian was appointed secretary and was responsible only to the U.S.S.R. The 1921 convention was declared null and void, its assets were taken over by the new commission and the use of Danubian waters for nonriparian naval vessels was prohibited. At the Galati conference held on Dec. 9–17, 1953, a Yugoslav was elected secretary and representatives from Hungary and Bulgaria as chairman and vice-chairman, respectively. Henceforth, each member country was to be represented on the body of elected offices at least once in nine years. The commission's headquarters were moved to Budapest.

After May 1954, Austria was able to conclude navigation agreements with countries downstream, and by the Austrian state treaty, signed in Vienna on May 15, 1955, its assets in the Danube Shipping company were restored. Austria joined the commission in Jan. 1960, and in the same year a passenger service was inaugurated between Vienna and Izmail. Navigation on the Danube is nominally free for commercial vessels and goods of all states on a footing of equality.

Traffic.—Brăila and Galati have been the usual points for transshipment between seagoing vessels and barges. From those ports much traffic moves inland by rail. Danube traffic had never equaled that on the Rhine. Besides economic and political problems, there were many natural physical obstacles to overcome. Channel silting on the delta, swift currents and dangerous reefs at the Iron Gate, a long winter freeze-up, low water in late summer and the recurring danger of floods on the upper course of the river in spring and early summer all impeded development.

Following World War II, with the entry of the U.S.S.R. into the Danubian trading sphere, together with the effect of increased industrialization in the Soviet-controlled states, the character of river trade changed. Grain and Rumanian oil, once the chief commodities carried, were replaced by ores, especially bauxite from Hungary to the U.S.S.R. and iron ore from the U.S.S.R. to Hungary and Czechoslovakia. The over-all volume of trade decreased, however, compared with pre-1939 figures. See also references under "Danube" in the Index volume.

DANVERS, a town of Essex county, Mass., U.S., 17 mi. N.E. of Boston, of which it is a residential suburb. Manufacturing industries include shoes, leather and metal products. A state hospital for the insane and a county agricultural school are located there. The town originated from a grant to Gov. John Endecott and Rev. Samuel Skelton of the Salem church in 1632, and was named a separate district in 1752 from part of Salem known as the "Village and Middle parishes." Salem village was the centre of the witchcraft delusion in 1692 (see SALEM). Danvers was incorporated as a township in 1757, but the supposed opposition of King George II caused the privy council to disallow the incorporation in 1759. This is commemorated on the city's seal by the inscription "The King Unwilling." In 1775 Danvers was made a town, and after 1950 was governed through a representative town meeting, a board of selectmen and a professional town manager. Danvers was the birthplace of Israel Putnam, the distinguished Revolutionary War general.

In 1855 South Danvers became a separate town, and was renamed Peabody (*q.v.*) in 1868. Part of Beverly was annexed to Danvers in 1857. For comparative population figures see table in MASSACHUSETTS: Population. (J. F. Co.)

DANVILLE, a city of eastern Illinois, U.S., and seat of Vermilion county, is located at the junction of the north and south forks of the Vermilion river, 4 mi. from the Indiana state line and 124 mi. S. of Chicago. The city stands on the site of a Piankashaw Indian village and a number of trails passed through or terminated there in the early days. The location of salt deposits a few miles west of the village provided the chief incentive for early white settlement. Shortly after Vermilion county was organized in 1826 Dan Beckwith and Guy W. Smith, two early settlers who were interested in the salt works, offered to donate the land necessary for a "seat of justice." The offer was accepted and the new county seat was named Danville in honour of Beckwith. It was incorporated as a city in 1869.

The city is the commercial centre of a prosperous agricultural, mining and manufacturing region. In addition to farm products and strip mining of coal, manufactures include automotive and electrical supplies, castings, chemicals, clothing, fireworks, food products, hardware and machine tools. Points of interest nearby include Lake Vermilion and Kickapoo State park (4 mi. W.). For comparative population figures see table in ILLINOIS: Population. (R. M. Su.)

DANVILLE, a city in Virginia, U.S., is on the southern border of the piedmont area of the state; it lies in, but is politically independent of, Pittsylvania county. It gained importance as the centre of a bright-leaf tobacco area and of cheap hydroelectric power, created by harnessing the falls (pinnacles) of the Dan river, on whose banks the' city stands. Its site was discovered by William Byrd II in 1728 and the first settlement clustered around a general store and ordinary (tavern) that attracted persons passing between the tidewater region of Virginia and the North Carolina towns. It was chartered as a town in 1793 and incorporated as a city in 1870. In 1950 it adopted the council-manager form of local government.

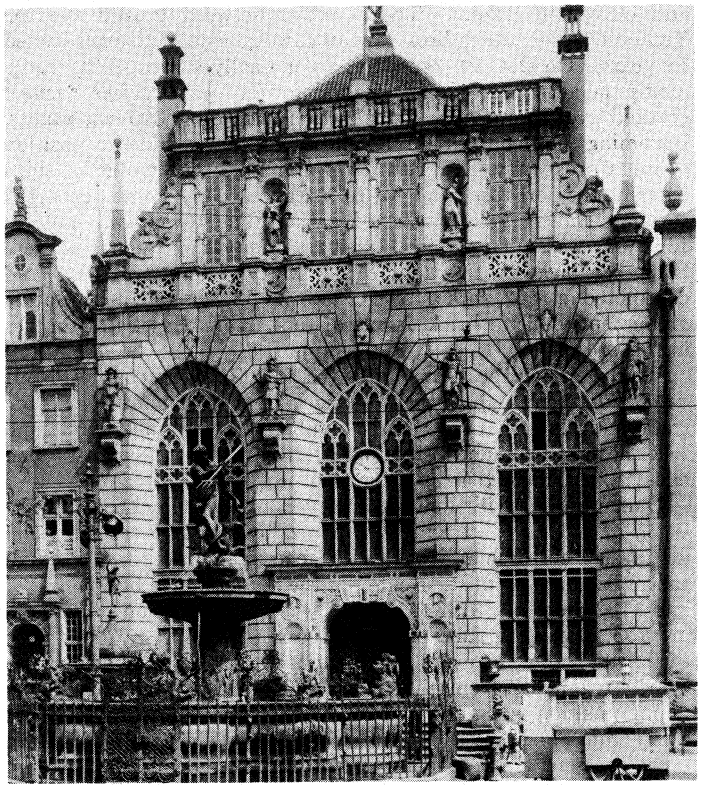
Danville became a terminal point for river navigation early in the 19th century, and the Richmond-Danville railroad, opened in 1848, was extended during the Civil War to link with a railroad reaching into the lower south. Its flue-cured tobacco market, established in 1869, became the largest establishment of its kind in the world. Two major cotton mills, established in 1882, grew into the largest single-unit textile factory in the world. Municipal ownership since 1875 of gas, water and electric utilities provided the city with a great financial asset of lo service charges and solvency. The town made a mark in history when Jefferson Davis and his cabinet made it the Confederate capital for seven days after their flight from Richmond on April 2–3, 1865. Stratford and Averett junior colleges, Danville Technical institute and Virginia Polytechnic institute extension are located there. Industries extend from the manufacture of high-quality cloth and tobacco to millwork, mattresses and sausages. For comparative population figures *see* table in VIRGINIA: *Population.* (F. B. S.)

DANZIG (GDANSK), a major Polish town on the Bay of Gdansk at the Vistula mouth on the Baltic sea, is the capital of the province (*wojewodztwo*) of Gdansk and a see of a Roman Catholic bishop. Pop. (1960 census) 286.500. Area 155 sq.km. (60 sq.mi.).

Danzig lies on the border of three physiographic types of landscape: a morainous elevation which is part of the Pomeranian lakelands, the Vistula delta and dunes of the Vistula sandy spit (*mierzeja* or *Nehrung*). The oldest part of the town came into being on the Vistula delta, at the foot of the morainous elevation, and thus used the drier terrain provided by the alluvial fan of the Motlawa and Radunia rivers, which flow into the Leniwka or Martwa (Dead) Vistula (a branch of the Vistula proper) in the modern town. The old city constitutes the central part of Danzig and contains many architectural monuments which were carefully rebuilt after war damage. The old port of Danzig arose on the Martwa Vistula, about 5 km. (2 mi.) from the coast. As a result of much obstruction in the Leniwka river, the port was moved to the river mouth itself in the 17th century and was known as Nowy Port (New Port). Later urban areas were developed on the morainous elevation, where the subsoil is healthier and more suited for building. In its expansion. the town incorporated several separate settlements along the edge of the elevation. This orographic line, consisting of almost uninterrupted settlements, marks the main communications axis of the Danzig, Sopot and Gdynia conurbation. The part of Danzig which contains most of its seats of learning (Wrzeszcz) is situated there; it has a medical school, the school of engineering, a higher school of fine arts. a higher pedagogical institute and the maritime institute, as well as the residential sector of Oliwa, with its famous cathedral and fine botanical garden. Oliwa, Jelitkowo and Brzezno are also popular holiday resorts. Danzig has four theatres, a concert hall and an opera house.

Danzig is an important industrial centre comprising shipbuilding, metallurgical, chemical, timber and food-processing plants. Pride of place is taken by the shipyards. In 1948 the first ocean-going ship was launched there, the first ship of this kind built in Poland. In March 1961 the 308th ship was launched, rounding off 1,000,000 tons of shipping built in Danzig.

Between World Wars I and II Danzig was mainly a port for bulk cargoes (coal, iron ore, timber), but after World War II it developed into a port for mixed cargoes. Between 1946 and 1960 its cargo turnover rose from 3,994,000 to 5,914,000 metric tons.



JAMES SAWDERS

ARTUS HALL AT DANZIG DATING FROM THE 15TH CENTURY

The number of ships entering the port more than doubled during the same period.

History.—Danzig's history, more than that of any other city of eastern Europe, reflects the 1,000-year-old Polish resistance to the German *Drang nach Osten* ("thrust toward the east"). As the capital of eastern Pomorze (Pomerania), a Polish principality, Gdansk was conquered by the Teutonic Order in 1308; 146 years later it became part of Poland and so remained for 339 years. Between 1793 and 1807 it was part of Prussia. Then for seven years it was a free city linked with the duchy of Warsaw, returning to Prussia in 1814; 105 years later it was again a free city linked with Poland. In 1939 it was annexed by Germany but in 1945 it was unconditionally restored to Poland.

Gdansk is first mentioned as *urbs Gyddanyzc* in 997 and was then part of Poland. In 1148, under the bull of Pope Eugenius III, in which it is called *castrum Kdanzc,* the city, together with eastern Pomorze, was included in the Polish diocese of Wloclamek. Sometime earlier, Subislaw, a local ruler. built a castle there. In 1185 the first parish church, St. Catherine's. was founded. With the eastward extension of the shipping and trade of Lubeck, a market of German merchants developed and in 1227 Duke Swientopelk founded a Dominican abbey and the church of St. Nicolas. About 1260 Swientopelk granted Danzig its municipal autonomy. In 1294 Msciwoj (or Mestwin) II, son of Swientopelk, died without issue, having bequeathed his duchy in 1282 to his cousin Przemyslaw II, duke of Great (or western) Poland.

By the late 13th century Danzig was an important link in the chain of Hanseatic towns which carried on trade between eastern and western Europe. As such. it was coveted by the Teutonic Order, already established east of the lower Vistula. In 1308 the knights invaded Pomorze and on Nov. 14 they seized Danzig and put its Polish inhabitants to the sword. The kings of Poland, however, never renounced their rights to Pomorze. Wladyslaw Jagiello, calling himself *Pomoraniae dominus et haeres,* defeated the Teutonic Knights at Grunwald in 1410 but failed to secure Pomorze and Danzig. In 1454 the nobility and towns of Pomorze appealed to Poland for help against the Teutonic Knights and offered their submission to the Polish crown. King Casimir IV Jagiello, on March 6, proclaimed the incorporation of Pomorze

and Danzig in Poland. The new war between Poland and the Teutonic Order, which broke out in consequence of this act, lasted 13 years. On Oct. 19, 1466, the order finally surrendered, recognizing the act of 1454. As a reward for its loyal services Casimir granted local autonomy to Danzig, then a city of 30,000 inhabitants. Becoming the main port of Poland, it rapidly attained a position of great prosperity. Between 1474 and 1490 the number of ships entering the port rose from 405 to 720 and in 1492 Poland exported through Danzig 25,600 tons of grain. The town hall, built in 1357–82, was enlarged in 1486–92. Many new churches were built, the biggest being that of St. Mary, founded in 1343 and completed in 1502, with a tower 259 ft. high. This Flemish-Gothic monument, built of brick, is one of the largest Christian churches in the world.

In 1541 grain exports amounted to 150,000 tons and only Amsterdam could then compare with Danzig as an emporium of world-wide trade in grain. In 1754 Danzig numbered 77,000 inhabitants and was the most populous city in eastern Europe; its annual grain exports were more than 200,000 tons.

Danzig's links with Poland, however, were cut by the first partition of 1772. It became surrounded by Prussian territory and a Prussian customhouse was established in the mouth of the Vistula. The number of ships entering the port dropped between 1770 and 1782 from 1,988 to 145. At the second partition of Poland, in 1793, Danzig became part of Prussia. In 1807, by the treaty of Tilsit, Napoleon made Danzig a free city, garrisoned by two Polish regiments from the duchy of Warsaw. The city's economic position was not satisfactory, for it was territorially separated from Poland by a Prussian "corridor." The senate of Danzig therefore sent a delegation to Paris and London in 1813 and to Vienna in 1814 to ask that "Danzig be again territorially united with Poland." But the Congress of Vienna ended by partitioning Poland once more among Russia, Prussia and Austria, and Danzig became the chief town of the province of West Prussia. Cut off from its natural hinterland, Danzig ceased to be the great centre of the Baltic trade, the relative importance of which also declined sharply. Some industrialization, especially shipbuilding, provided a measure of compensation for lost greatness.

The Free City, 1919–39.—The treaty of Versailles restored eastern Pomorze to Poland. Danzig was made a free city under the protection of the League of Nations, with a territory of 731 sq.mi. and a population (1929 census) of 407,500. including 15,890 Poles. The free city was included within the Polish customs frontiers. Poland was granted the free use of all waterways and of all railways of Danzig, and authority to conduct the city's foreign relations. The democratic constitution was approved and guaranteed by the League, represented in Danzig by a high commissioner. There was a Volkstag (legislative assembly) elected by universal franchise; responsible to it was a city government or senate headed by a president.

This complicated regime never worked satisfactorily because the free city's German government adhered to the general line of German policy toward Poland, seeking through permanent conflict to bring about a revision of the territorial settlement of Versailles. Unable, therefore, to rely on any good will from Danzig, the Poles decided to build a port of their own at Gdynia (*q.v.*), 10 mi. to the north, on Polish territory. Although Gdynia's trade developed quickly, Danzig continued to prosper economically. In 1913 the ships entering the port of Danzig totaled 924,837 net registered tons; by 1938 this figure had risen to 4,796,000. The annual amount of imports and exports rose between 1913 and 1938 from 2,112,100 to 7,127,000 metric tons. These figures were the more remarkable when compared with the traffic of Gdynia where the goods turnover rose from 10,167 tons in 1924 to 9,173,000 tons in 1938.

The prosperity of Danzig did not make the political conflict less bitter. This conflict was exacerbated by the rise of the German National Socialist party. On May 28, 1933, the Nazis gained 38 out of 72 seats in the Volkstag and accordingly formed the new city government. Hermann Rauschning, a Conservative, the new president of the senate, attempted to reach a direct understanding with Poland. He resisted the pressure of Albert Forster, the Nazi gauleiter, who wanted a nazification of the free city's political regime. On Nov. 23, 1934, Rauschning was forced to resign and was succeeded by Arthur Greiser, Forster's subordinate. New elections to the Volkstag were held on April 7, 1935, and this time the Nazis obtained 43 seats. On Oct. 24, 1938, Hitler considered the time ripe for demanding the return of Danzig to Germany. Poland refused and this led to mounting Polish-German tension. On Sept. 1, 1939, Germany attacked Poland and on the same day Hitler proclaimed the reincorporation of Danzig in his greater German Reich.

Restoration to Poland.—In March 1945 Danzig was a theatre of heavy fighting between the German and Soviet armies, and about half its houses were either destroyed or rendered uninhabitable. The picturesque medieval centre of the city with its narrow streets and gabled houses suffered greatly. In addition, industrial plants were dismantled by the Soviet authorities. When, in Aug. 1945, Danzig was returned to Poland, the city was in ruins. Rebuilding soon started and by the later 1950s was nearly completed. Care was taken to restore all historic monuments to their former condition. Among the buildings restored were the town hall, Artus hall (1477–81) and St. Mary's church, which was returned to the Roman Catholics.

DAPHNAE, the Greek name of an ancient fortress town called Tahpanhes in the Bible (modern Tall al Dafana), situated 10 mi. W. of Qantara in northeastern Egypt. It was excavated by Sir Flinders Petrie in 1886. There, in the 7th century B.C., on earlier ruins of the Ramesside period, Psamtik I built a massive fort and enclosure surrounded by a wall 40 ft. thick and in it established a garrison of mercenaries, mostly Carians and Ionian Greeks. After the destruction of Jerusalem (587 B.C.) many Jewish fugitives, including Jeremiah, came to Tahpanhes (Jer. xliii). Its decline started when Ahmose II, in the 6th century B.C., gave Naukratis the monopoly of Greek trade.

BIBLIOGRAPHY.—W. M. F. Petrie, *Tanis II* (1888); D. Mallet, *Les Premiers Établissements des grecs en Egypte* (1893); *R*. M. Cook, "Amasis and the Greeks in Egypt," *Journal of Hellenic Studies* (1937). (M. S. DR.)

DAPHNE, in Greek mythology, personification of the laurel, a tree whose leaves, formed into garlands, were peculiarly associated with Apollo. The myth explains the laurel's special position by supposing that once Apollo loved a beautiful girl, Daphne. Daphne, daughter of a river god, lives a pastoral existence in Thessaly, the Peloponnese or Syria, rejecting every lover, even Apollo.

When the god pursues her, Daphne prays to Earth or her father to rescue her, whereupon she is transformed into a laurel. Apollo appropriates the laurel for poets and, in Rome, for triumphs (Ovid, *Metamorphoses* i, 452 ff.). Daphne was also loved by Leucippus who, disguised as a woman, was through Apollo's jealousy exposed and killed. (WM. S. A.)

DAPHNE, a genus of much cultivated, showy and sometimes evergreen Eurasian shrubs belonging to the family Thymelaeaceae and containing about 50 species. D. laureola, spurge laurel, a small, widely cultivated shrub, with green flowers in the leaf axils towards the ends of the branches and ovoid black, poisonous berries, is found in the British Isles and in southern Europe. D. *mezereum*, mezereon, a rather larger shrub, 2 to 4 ft. high, has deciduous leaves, and bears fragrant pink flowers in clusters in the axils of last season's leaves, in early spring before the foliage. The bright red ovoid berries are cathartic; the whole plant is acrid and poisonous. It is a native of Europe and north Asia and is found apparently wild in copses and woods in Britain.

These and several other species of the genus are cultivated in the open air and as greenhouse plants. D. cneorum, garland flower, is a hardy evergreen trailing shrub, with pink sweet-scented flowers. D. *odora* (China and Japan) is a hardy evergreen with showy, rosy-purple, fragrant flowers. D. indica (China), with red blos-

soms, and *D. japonica* (Japan), with white or pinkish-purple flowers, are grown as greenhouse evergreens.

DAPHNEPHORIA, a festival held every ninth year at Thebes in Boeotia in honour of Apollo Ismenius or Chalazius. It consisted of a procession in which the chief figure was a boy, of good family and noble appearance, whose father and mother must be alive. Immediately in front of the boy walked one of his nearest relatives, carrying an olive branch hung with laurel and flowers and having on the upper end a bronze ball from which hung several smaller balls. Another smaller ball was placed on the middle of the branch or pole, which was then twined round with ribbons. Then followed the *Daphnephoros* ("laurel bearer"); *i.e.*, the young priest of Apollo Ismenius. There is little doubt that the branch was a kind of Maypole. Then followed a chorus of maidens carrying supplient branches and singing a hymn to the god. The *Daphnephoros* dedicated a bronze tripod in the temple of Apollo.

DAPHNIS, the legendary hero of the shepherds of Sicily, and reputed inventor of bucolic poetry. According to his countryman Diodorus, and Aelian in his *Varia Historia,* Daphnis was the son of Hermes and a Sicilian nymph and was found by shepherds in a grove of laurels (whence his name). He won the affection of a nymph, who made him promise to love none but her, threatening that if he proved unfaithful he would lose his eyesight. He failed to keep his promise and was smitten with blindness. Daphnis, who endeavoured to console himself by playing the flute and singing shepherds' songs, soon afterward died, or was taken up to heaven by his father Hermes, who caused a spring of water to gush out from the spot where his son had been carried off. Ever afterward, the Sicilians offered sacrifices at this spring. In Theocritus, Daphnis apparently has offended Eros and Aphrodite, and in return has been smitten with unrequited love; he dies, although Aphrodite, moved by compassion, endeavours, but too late, to save him.

It is erroneous to suppose that every shepherd called Daphnis in pastoral poetry is this particular Daphnis.

DAQAHLIYAH, AD, an Egyptian *muhafazat* (governorate) in the Nile delta reaching the Mediterranean sea in the northeast, is bounded by the Damietta branch of the Nile to the west and Ash Sharqiyah governorate to the east and south. Area 1,336 sq.mi. Pop. (1960) 2,016,000. The capital is Al Mansurah (*see* MANSURAH, AL). The governorate takes in part of the very fertile middle delta land but in the north it includes the greater part of Lake Manzala (Buhayrat al Manzilah) and the contiguous saline marshes. Reclamation of these marshes and the lagoon area was proceeding slowly in the 1960s, with rice as the main crop of the reclaimed farmland. Ad Daqahliyah is Egypt's second principal rice-growing governorate but cotton becomes the most important crop in the centre and south of the governorate, accounting for 25% of the cultivated land. Other major crops include corn (maize), wheat and clover. About 60% of the occupied population is engaged in agriculture. The principal waters for irrigation are obtained from the Mansuriyah (paralleling the Nile) and Buhiyah canals. Much of the drainage of the irrigated land is pumped northward into Lake Manzala where fishing is an important occupation. The principal industries are related to the agricultural resources, namely cotton ginning, flour and rice milling, oil pressing, textile manufactures. Rice mills are established at Al Mansurah, Dikirnis, Al Manzalah and Fariskur, and there are textile mills at Mit Ghamr. There are no mineral resources. The principal towns are Al Mansurah, Al Matariyah, Mit Ghamr and As Sinbillawayn. (A. B. M.)

DAQUIN, LOUIS CLAUDE (1694–1772), French harpsichordist, organist and composer of keyboard music, some of which remains popular.

He was born in Paris, July 4, 1694, and was a godson of the famous composer Elisabeth Jacquet de La Guerre, whose husband probably taught him to play the organ. The boy was a prodigy, playing before Louis XIV at the age of six. At 12 he was a professional organist and his life story is a record of successive appointments, culminating in that of organist to the chapel royal in 1739. He had already published (1735) his *Premier Livre de pièces pour le clavecin,* which contains his one really famous piece, "Le Coucou." He also published the successful *Noëls pour l'orgue et le clavecin.*

He lived all his life in or near Paris, and died there, June 15, 1772. His playing is said to have been remarkable for neatness and precision and though his music lacks breadth and vision, some of it has gentle charm.

See A. Pirro, *Les Clavecinistes* (1924). (Cs. CH.)

DAR'A (DER'A; anc. EDREI), a small town in Syria and administrative centre of the governorate (*muhafaza*) of the same name, lies on the Jordan frontier. It is situated at a height of 1,742 ft. above sea level, on the Wadi Jride, south of the Yarmuk. The town, 61 mi. N.E. of Amman, the capital of Jordan, is a focal point for road and rail communications between Amman, Jerusalem and Damascus. Population (1960) of the governate was 168,000. The railway station is to the north of the wadi and the town south of it. There are no local industries, but Dar'a serves as a market for the surrounding district and as a garrison centre. The country is open and cultivated, growing mainly barley. The area to the east is largely desert country occupied by the Beni Sakr, one of the major Jordanian tribes.

The decisive battle of Yarmuk was fought in 636 near Dar'a at the junction of the Yarmuk and its tributary Al Ruqqad. This led to the annihilation of the Byzantine forces under Theodorus and the capture of Syria by the Arabs. During World War I Dar'a junction was the scene of fierce fighting and was eventually captured by irregular Arab forces. (M. V. S.-W.)

DARAB, chief town of a district in Fars, Iran, is situated 4,000 ft. above sea level in a well-watered intramontane basin at the southern foot of high ranges. Pop. (1956) 9,101. The climate is mild in winter and allows the cultivation of citrus fruits and date palms besides other fruits, wheat and barley, rice, cotton and fine quality tobacco, all irrigated. Large stretches of the lower lands, however, are still used for winter pastures by the Baharlu tribe. The salt mines have been important for centuries. Once on the main highway from Shiraz to Hormuz, Darab is a short distance from the motor road to Bandar Abbas.

Modern Darab lies 5 mi. N.E. of the ruins of the ancient city of Darabgird, the chief place of the southeastern quarter of Fars which included Fasa, Neyriz, Furg, Tarom and Lar. Its layout was circular, a mile in diameter, with a citadel (or fire temple) crowning a rock in the centre, and four gates. Persian legend recounts that it was founded by Darab, father of Darius III Codomannus (336–330 B.C.). (H. Bo.)

D'ARANYI, JELLY (1895–), British, originally Hungarian, violinist, a grandniece of Joseph Joachim (*q.v.*), known for her performances of modern music, was born at Budapest on May 30, 1895. She was a pupil of Jenő Hubay and first appeared in Vienna in 1909. Béla Bartók's two sonatas for violin and piano were written for her, and Maurice Ravel dedicated to her his *Tzigane* for violin and orchestra. Her playing was fiery and temperamental. She settled in London in 1913.

With her sister, Adila Fachiri (b. 1889), she was known for performances of J. S. Bach's double concertos. They also gave the first performance of Gustav Holst's concerto for two violins.

DARBHANGA, a town and district in Bihar state, India. The town, headquarters of the district, is an elongated place, 6 mi. long and covering 7 sq.mi., on the left bank of the Little Baghmati river. Pop. (1961) 103,106. It is surrounded by mango groves and large artificial tanks and is an important agricultural market. The only notable building is the residence of the local maharaja in extensive grounds (55 ac.). The town has three colleges affiliated to Bihar university, including a medical college. Although only about 60 mi. N.E. of Patna, it can only be reached from there after crossing the Ganges river by ferry.

DARBHANGA DISTRICT extends from the Nepal frontier to the Ganges. Area 3,345 sq.mi. Pop. (1961) 4,422,363. The district consists of a moist alluvial plain with the Ganges, Burhi Gandak, Baghmati, Little Baghmati, Balan, Little Balan and Tiljuga as the principal rivers. It has suffered from destructive floods for many years as a result of the constant migration of the Kosi river. Rice is the staple crop; other important crops are wheat, barley, maize, gram, oilseeds, sugar cane, tobacco and good mangoes. The dis-

trict is served by the North Eastern railway. Roads are poor. The township of Pusa (*q.v.*) in western Darbhanga has an agricultural research institute specializing in mycology and pestology. It was formerly the seat of the Indian Agricultural Research institute which was moved to New Delhi after the Bihar earthquake of 1934.

The Darbhanga raj, a hereditary and extensive estate since the 16th century, was acquired by the government after India became independent in 1947. (E. AH.)

D'ARBLAY, FRANCES: *see* BURNEY, FANNY.

DARBOUX, (JEAN) GASTON (1842–1917), French mathematician who made contributions to geometry, was born at Nimes on Aug. 13, 1842. His father died in 1849, and under the guidance of his mother, and with her encouragement, he was educated at the École Normale, Paris.

Pasteur became interested in Darboux and created a teaching post for him at the École Normale. After acting as assistant to Joseph Bertrand in the chair of mathematical physics at the Collège de France (1866–67), he taught at the *lycée* Louis le Grand (1867–72), at the École Normale (1872–73) and at the Sorbonne (1873–90). Darboux, besides being an excellent teacher and a notable mathematician, was a very capable administrator. He died in Paris on Feb. 25, 1917.

Practically all his mathematical work was in geometry. His early papers (1864 and 1866) were on orthogonal surfaces; these were followed by a memoir on partial differential equations of the second order (1870), which embodied a new method of integration. In his treatise *Sur une classe remarquable de courbes et de surfaces alge'briques* (1873) Darboux developed the theory of the class of surfaces called cyclides. *Leçons sur la théorie générale des surfaces et les applications géométriques du calcul infinitésimal* (4 vol., 1887–96) is one of Darboux's most important works; dealing with infinitesimal geometry, it embodies most of his previous research work. In 1898 the publication of *Leçons sur les systèmes orthogonaux et les coordonne'es curvilignes* was begun. He was the author of a number of papers and memoirs on the approximation to functions of very large numbers, on discontinuous functions and on other subjects.

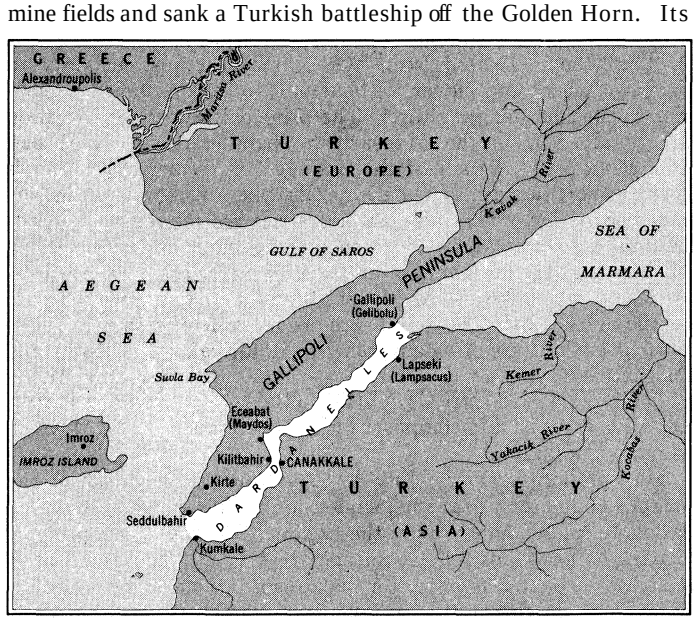
DARBOY, GEORGES (1813–1871), French prelate, the third archbishop of Paris to be killed between 1848 and 1871 (*see* AFFRE, DENIS AUGUSTE), was born at Fayl-Billot, Haute-Marne, on Jan. 16, 1813. He was appointed bishop of Nancy in 1859 and archbishop of Paris in Jan. 1863. Appointed chief almoner to Napoleon III in 1864, he became a senator and a member of both the privy council and the council of regency. A strenuous upholder of episcopal independence in the Gallican tradition, Darboy sought to establish control over the Jesuits and other religious orders within his diocese. This led to friction with Pope Pius IX, which was further embittered when, at the Vatican council of 1870, Darboy strongly opposed the dogma of papal infallibility as inopportune, though in the end he accepted it. During the Franco-German War he organized relief for the wounded, remaining at his post during the siege of Paris and the Commune. On April 4, 1871, he was arrested as a hostage by the Communards and imprisoned. When Adolphe Thiers refused to exchange him for Auguste Blanqui, Darboy was shot in the prison of La Roquette together with four priests on May 24. He died blessing his executioners and uttering words of forgiveness.

See *J. A.* Foulon, *Histoire de la vie et des oeuvres de Mgr. Darboy (1889).*

DARCY, THOMAS DARCY, BARON (*c.* 1467–1537), English soldier and one of the most powerful noblemen on the Scottish border, became implicated in the 1536 rebellion against Henry VIII's ecclesiastical policy. A son of Sir William Darcy (d. 1488), he was summoned to parliament as a baron probably in 1504, certainly in 1509, and was made warden of the east marches toward Scotland in 1505. Darcy led troops to Spain to help Ferdinand and Isabella against the Moors in 1511; he took part in the siege of Thérouanne during Henry VIII's French campaign (1513). He was also a member of the royal council, dividing his time between London and the north. He brought accusations against his former friend, Cardinal Wolsey, in 1529, but after Wolsey's fall he himself came under suspicion. Disliking the separation from Rome, Darcy asserted that matrimonial cases should be determined by spiritual authority (1532) and he corresponded (1535) with Eustace Chapuys, ambassador of the emperor Charles V, about a possible Catholic invasion of England. Detained in London by the king, he was not allowed to return to Yorkshire until late in 1535; the northern rising known as the Pilgrimage of Grace broke out about a year later. Darcy held Pontefract castle against the rebels for a short while only; he surrendered it to them sooner than its strength warranted, and went with them to Doncaster, where he was regarded as one of the rebel leaders. Darcy may have helped to suppress a renewal of the rising under Sir Francis Bigod early in 1537, but the king believed, probably with good reason. that he was guilty of fresh treasons, and he was seized and hurried to London. Tried by his peers, he was found guilty of treason and beheaded on June 30, 1537. (G. R. E.)

DARCY'S LAW: *see* PERMEABILITY (FLUID).

DARDANELLES (Turk. CANAKKALE BOGAZI), the strait (anciently called the Hellespont) that unites the Sea of Marmara with the Aegean. The city of Dardanus in the Troad, where Mithradates VI and Sulla signed a treaty in 85 B.C., gave the strait its name. The shores are formed by the peninsula of Gallipoli in Europe on the northwest and by Asia Minor on the southeast; it extends for a distance of about 38 mi. with a breadth of from $\frac{3}{4}$ to 4 mi. and has an average depth of 30 fathoms and a maximum depth of 50 fathoms in the narrowest central section. There is a rapid surface current from the Sea of Marmara to the Aegean and a compensatory undercurrent below a certain depth. The waters of the Dardanelles are rich in various kinds of fish, and the fishes caught are used in the canning industry, which is mainly located in Canakkale and Gallipoli (Gelibolu). At the Aegean extremity stand the castles of the Seddulbahir and Kumkale. respectively in Europe and Asia; and near the Marmara extremity are the towns of Gallipoli on the northern shore and Lapseki (Lampsacus) on the southern. The most famous castles of the Dardanelles are Canakkale, Sultankalesi, or the Old Castle of Anatolia, and Kilitbahir, or the Old Castle of Rumelia. The strait has long been famous in history since the passage of Xerxes' army by a bridge of boats. It is the scene of the story of Hero and Leander and of Byron's successful attempt to rival Leander. The strategic importance of the strait has always been very great, since it is the gateway to Istanbul and the Black sea from the Mediterranean. Although easily capable of defense, the strait was forced by the English admiral Sir J. T. Duckworth in 1807; and during World War I a British submarine under the command of Lieutenant Commander Stoker penetrated through the Turkish mine fields and sank a Turkish battleship off the Golden Horn. Its



STRAIT OF THE DARDANELLES BETWEEN THE SEA OF MARMARA AND THE AEGEAN

strategic importance has given to it an international political importance that has found expression in what is known as the Straits (Dardanelles and Bosporus) question (*q.v.*). *See* also DARDANELLES CAMPAIGN; and references under "Dardanelles" in the Index volume. (N. Tu.; S. ER.; E. TU.)

DARDANELLES CAMPAIGN, in World War I, an Anglo-French operation against Turkey in 1915, intended to force the 38-mile-long Dardanelles channel and to occupy Constantinople. Plans for such a venture were considered by the British authorities between 1904 and 1911, but both military and naval opinion was against it. When war between the Allies and Turkey began early in Nov. 1914 the matter was re-examined and classed as a hazardous, but possible, operation.

On Jan. 2, 1915, in response to an appeal by the grand duke Nicholas, commanding the Russian armies, the British government agreed to stage a demonstration against Turkey to relieve pressure on the Russians on the Caucasus front. The Dardanelles were selected as the place, a combined naval and military operation being strongly supported by the then first lord of the admiralty, Winston Churchill. On Jan. 28 the Dardanelles committee decided on an attempt to force the straits by naval action alone, using mostly obsolete warships too old for fleet action. On Feb. 16 this decision was modified, as it was agreed that the shores of the Dardanelles would have to be held if the fleet passed through. For this purpose, a large military force under Gen. Sir Ian Hamilton was assembled in Egypt, the French authorities also providing a small contingent. The naval bombardment began on Feb. 16, but was halted by bad weather and not resumed until Feb. 25. Demolition parties of marines landed almost unopposed, but bad weather again intervened. On March 18 the bombardment was continued; but, after three battleships had been sunk and three others damaged, the navy abandoned its attack. concluding that the fleet could not succeed without military help.

Troop transports assembled off the island of Lemnos, and landings began on the Gallipoli peninsula at two places early on April 25, 1915, at Cape Helles (29th British and Royal Naval divisions) and at "Anzac" beaches (Australian and New Zealand troops). A French brigade landed on the Anatolian coast opposite, at Kum Kale, but was later withdra n. Small beachheads were secured with difficulty, the troops at "Anzac" being held up by Turkish reinforcements under the redoubtable Mustafa Kemal, later to become famous as Atatiirk. Large British and Dominion reinforcements followed, but little progress was made. On Aug. 6, another landing on the west coast, at Suvla bay, took place, but after good initial progress the assault was halted.

In May 1915 the first sea lord, Admiral Lord Fisher (*q.v.*), had resigned because of differences of opinion over the operation. By Sept. 1915 it was clear that without further large reinforcements there was no hope of decisive results, and the authorities at home decided to recall Hamilton to replace him by Lieut. Gen. Sir Charles Monro. The latter recommended the withdrawal of the military forces and abandonment of the enterprise, advice which was confirmed in November by the secretary of state for war, Lord Kitchener, when he visited the peninsula. This difficult operation was carried out by stages and successfully completed early on Jan. 9, 1916.

Altogether the equivalent of some 16 British, Australian, New Zealand. Indian and French divisions took part in the campaign. British Commonaealth casualties, apart from heavy losses among old naval ships, were 213.980. The campaign was a success only in so far as it attracted large Turkish forces away from the Russians. The plan as such was a good one: it failed to produce decisive results because of poor military leadership in some cases, faulty tactics including complete lack of surprise, the inexperience of the troops, inadequate equipment and an acute shortage of shells.

The campaign had serious political repercussions. It gave the impression throughout the world that the Allies were militarily inept. Before the evacuation had been decided Henry Asquith's Liberal administration was superseded by his coalition government. Winston Churchill, the chief protagonist of the venture, resigned from the government and went to command an infantry battalion in France. In the end the campaign hastened Asquith's resignation, and his replacement as prime minister by David Lloyd George, in Dec. 1916.

DARDANUS, in Greek legend, son of Zeus and the Pleiad Electra, mythical founder of Dardania on the Hellespont and ancestor of the Dardans of the Troad and, through Aeneas, of the Romans. His original home was supposed to have been Arcadia. Having slain his brother Iasius or Iasion (according to some legends, Iasius was struck by lightning), Dardanus fled across the sea. He first stopped at Samothrace and, when the island was visited by a flood, crossed over to the Troad. Being hospitably received by Teucer, he married his daughter Batea and became the founder of the royal house of Troy.

DARDIC LANGUAGES, the name assigned to languages spoken immediately to the south of the Hindu Kush mountains, include the Kafir languages spoken in Kafiristan, Afg.; Khowar, spoken in the Chitral country in Pakistan, and the Shina languages, which include the Shina of Gilgit, India; Kohistani, spoken in the Kohistan of the Indus and Swat rivers; and Kashmiri. Of all these Kashmiri is the only one which has received any literary cultivation. The Dardic languages (also known as the Piśāca or Pisacha languages) are Indo-European by origin, but are neither Iranian nor Indo-Aryan. They have developed phonetic peculiarities and possess. almost unaltered and in common use, words which in India are seldom found except in Vedic Sanskrit. In each there is a small element of Burushaski. *See* also BURUSHASKI LANGUAGE; INDO-ARYAN LANGUAGES; KASHMIRI LANGUAGE.

BIBLIOGRAPHY.—For the general question of the Dardic languages, *see* G. A. Grierson's *The Piśāca Languages of North-western India* (1906); *Linguistic Survey of India,* vol viii, pt. ii. For the different languages of this group *see* G. W Leitner, *Dardistan* (1877); *J.* Biddulph, *Tribes of the Hindoo Koosh* (1880); *D.* J. O'Brien, *Grammar and Vocabulary of the Khowār Dialect* (189;); *J.* Davidson, *Notes on the Bashgali (Kāfir) Language* (1901); *T* G. Bailey, *Grammar of the Shina Language* (1924); G. Morgenstierne, *Report on a Linguistic Mission to Afghanistan* (1926), *Notes on Phalūra, an Unknown Dardic Language of Chitral* (1941). (ET. B.)

DARDISTAN, a conventional name for the region inhabited by the so-called Dard races in the north of West Pakistan and northern Kashmir. It includes Chitral, Yasin, Panyal, the Gilgit valley, Hunza and Nagar. the Astor valley, the Indus valley from Bunji to Batera, the Kohistan-i-Malizai, *i.e.*, the upper reaches of the Panjkora river, and the Kohistan (highland) of Swat. The Dard races are referred to by Pliny and Ptolemy and are supposed to be people of Aryan origin who ascended the Indus valley from the Punjab plains, reaching as far north as Chitral, where they dispossessed the Khos. They have left traces in the different dialects, Khowar, Burushaski and Shina, spoken in Gilgit.

See G. *W.* Leitner, *The Races and Languages of Dardistan,* 2nd ed. (1877).

DARES PHRYGIUS, in the *Iliad* a Trojan priest of Hephaestus, is the reputed author of a pre-Homeric account of the Trojan war. Of this account the Latin *Daretis Phrygii de excidio Troiae historia* (probably 5th century A.D.; language and style contradict the indication of the preface that Cornelius Nepos [Ist century B.C.] was the translator) purports to be a version: whether it is indeed translation or original work is uncertain. The work aims at authenticity and excludes supernatural agencies. Its supposed origin won for this account wide acceptance in the middle ages, and in some quarters up to the 17th century: together with the work of Dictys Cretensis (*q.v.*) it was the main source of medieval handlings of the Trojan story, being rivaled (in the 12th and 13th centuries) only by the *Excidium Troiae* whose anonymity led to its disregard.

See edition by *F.* Meister in the Teubner series (1873). (D. R. BR.)

DAR ES SALAAM, a seaport on the Indian ocean and the capital of Tanganyika, Africa, lies 48 mi. S. of Zanzibar. Pop. (1957) 128,742 (93,363 Africans, 27,441 Indians, 4,479 Europeans, 3,459 others). The climate varies with two rainy seasons—March to May and October to December. The best and coolest months are June to September.

Extensive commercial, industrial and residential development took place after World War II and most of the old Arab and German buildings have been replaced with modern multistory buildings. Azania front and Main avenue, containing the town hall, government offices and the law courts, the main post office, the Roman Catholic cathedral and the Lutheran church, face the harbour. Behind these is the commercial area, with the main shopping centres, banks, shipping offices, motion-picture theatres, hotels and the railway station. Government house is on Ocean road, overlooking the Indian ocean, and residential estates have been developed beyond the commercial area. Notable new buildings include a group hospital, technical institute and the high court. The botanical gardens, which surround a museum and a public assembly hall, contain specimens of tropical trees.

A modern airport, opened in 1954, is 8 mi. from the town centre. Dar es Salaam is the coastal terminus of the Central railway which runs approximately 780 mi. to Kigoma on the eastern shore of Lake Tanganyika. The port area contains three deep-water berths, railway sidings, warehouses and factories. The average monthly tonnage handled by the port in the early 1960s was: imports (including bulk oil) 54.000, exports 30,000. The port is the outlet for most of the produce of Tanganyika, including tobacco, tea, coffee. hides and skins, minerals. wattle bark, pyrethrum. peanuts and sisal. It also handles transit traffic to and from the Republic of the Congo. Local industries include vegetable oil and flour milling: soap, paint, metal box, cigarette and shoe manufacture; and meat canning.

The town dates from about 1862, when the sultan of Zanzibar developed the fishing village of Mzizima and the neighbouring inland creek as a safe port and trading centre, and as a site for a summer palace. The Arabs gave it the name of Dar es Salaam, "house or haven of peace." The German East Africa company was allowed by the sultan to use the port as a trading base. and in 1889 the imperial German government garrisoned the town. In 1891 the German imperial commissioner transferred the seat of his government from Bagamoyo to Dar es Salaam, and from then until 1914 there was slow but steady development of town and railway. The town was captured by the British in 1916 and became a base for the conquest of the rest of Tanganyika. The British civil administration assumed responsibility in 1919. In Dec. 1961 it became the capital of the independent sovereign state of Tanganyika (*q.v.*). (P. E.)

DARESTE DE LA CHAVANNE, ANTOINE ELISABETH CLÉOPHAS (1820–1882), French historian, whose reputation rests on his authoritative *Histoire* de France (9 vol., 1865–79), was born in Paris, Oct. 28, 1820. Educated at the École des Chartes, he became professor of history at Grenoble in 1847, and at Lyons in 1849, remaining there for many years. and eventually becoming rector. His other works include *Histoire* de *l'administration* en France (2 vol., 1848), *Histoire* des classes agricoles en France (1854) and *Histoire* de la Restauration (2 vol., 1879). His general history was considered the best of its kind before Ernest Lavisse's *Histoire générale du IV^e siècle jusqu'à* nos jours (1893–1901). He died at Lucenay-16s-Air (Nièvre), Aug. 6, 1882.

DARFUR, the westernmost province in the Republic of the Sudan, extends from latitude 9° to 20° N. and from longitude 21° 50' to 27° 50' E. It has an area of 191,648 sq.mi.

It is formed of Archean crystalline rocks in the west and Nubian sandstone in the north. To the east and southeast are extensive superficial deposits of sand, and in the extreme southeast and south are alluvial clays. In the centre are outcrops of recent volcanic rocks. A plateau 2,000 to 3,000 ft. above sea level, Darfur is almost featureless in the east and southeast. To the west and north are low, irregular hills and in the centre bold, rugged volcanic uplands such as Jabal Marra (10,134 ft.) and Jabal Meidob (3,500 ft.).

A tropical continental climate prevails. Rains (between May and October) diminish from a total of about 35 in. along the southern border to nothing at latitude 20° N. Altitude tempers the heat: at Al Fasher (2,395 ft.) the mean temperature for January is 69.5" F. and for June, 87" F. The highest part of Jabal Marra has a montane climate. There are no permanent rivers except some short streams on the southwestern flank of Jabal Marra, but large watercourses radiating from the central volcanic uplands, *e.g.,* the Wadi Azum, the Wadi al Ku and the Wadi Nyala, drain westward and southward and are in flood after heavy rains.

The vegetation is broadly that of tropical savanna. In the south moderately tall grasses accompany thickets of deciduous and semideciduous trees, and in some watercourses there are evergreen trees such as mahogany. In the central zone shorter grass accompanies various species of Acacia and the plant mantle thins until at 17° 30' N. the desert appears. Jabal Marra has a distinctive montane flora. Clay and silt soils occur along the Bahr al Arab in the south, on terraces fringing some of the larger western watercourses and locally at the foot of Jabal Marra. Elsewhere are sandy soils, deep to the southeast but otherwise generally thin except locally in the northern centre. In the far north are desert sand dunes not fixed by vegetation.

In 1956 the population was 1,328,765. The chief tribal groups are those of western Darfur (of which the Fur form a majority), numbering 758,000, and the Baggara, numbering 268,000. Arabic was spoken by about half the population and western Darfur languages (among the Fur and in Dar Masalit) by 554,000 persons. The Negroid Fur, from whom the province is named, occupy the centre. To the east are the Berti and Bergid; to the west are the Masalit and in the north the Zaghawa and Meidob or Midohi, Negro-brown and of mixed origin, akin to the Tebu of Tibesti. The larger Arabic-speaking tribes are partly or wholly nomadic and include camel-owning tribes in the north and Baggara (cattle owning) in the south, the latter mainly Negroid. The chief areas of settled population are in the west, close to the main watercourses, and in the central uplands and piedmont zones as far north as latitude 14" 30' N. The northern desert fringe, the southeast and the south are used only by nomadic peoples. Al Fasher, the province's capital, had a population of 26,161 in 1956.

The province is divided into five administrative districts: Central (administered from Al Fasher), Southern (Nyala), Western (Zalingei), Northern (Kutum) and Dar Masalit (Geneina, also the seat of the sultan of Dar Masalit).

Agriculture is based upon two species of millet, sesame, peanuts, maize (corn), various vegetables, fruits and cotton. Wheat is grown at higher altitudes on Jabal Marra. The pastoral tribes own great numbers of camels, sheep and goats (in the north) and cattle and horses (in the south). They travel far during their migrations.

Economic development has been retarded by lack of communications. Trucks spend four days on journeys between Nyala or Al Fasher and El Obeid, bearing quantities of tobacco, gum arabic, peanuts. ostrich feathers, *semn* (clarified butter), hides and skins for export. Camels, sheep and cattle are also driven eastward along routes provided with watering points. The extension of the railway to Nyala, completed in March 1959, will stimulate both agricultural and pastoral production. Air services connect Geneina, Nyala and Al Fasher with El Obeid and Khartoum. (J. H. G. L.)

History. — In prehistoric times the extreme north, then not so desiccated as now, was sparsely inhabited by people related to and culturally connected with the predynastic inhabitants of the Nile valley. Darfur was probably within the sphere of the Egyptian caravans which traded from Aswan about 2500 B.C., and although the people who now call themselves Daju or Dagu in Darfur and Kordofan (*q.v.*) are Negroid, it is probable that the Daju who were the first traditional ruler's of Darfur were in some ways connected with ancient Egypt. Pottery and stone axes related to those of the Nile valley in 2000 B.C. have been found in the Wadi Howar in the extreme north. Slaves, ostrich feathers, ivory and ebony no doubt found their way to Egypt during the New Kingdom and to Napata and Meroe during the time of the kingdom of Cush.

On the fall of Meroe in about A.D. 350 the royal family of Cush probably fled west and may have given a dynasty to Darfur, for the pattern of divine kingship found there when history begins may derive originally from Egypt — probably via Cush. Meroe was succeeded on the Nile by the Christian kingdoms of Nubia (*q.v.*), and

evidence indicates that the red-brick ruins at Ain Farah in northern Darfur were those of a Christian monastery, which no doubt imported from Nubia the fine date palms that still grow in the vicinity. Thus the Tungur, traditionally once rulers of Darfur who succeeded the Daju and came from the Nile, are seen to have been missionaries or colonizers from Nubia. An early form of the name Tungur was probably Tumagera, which may mean "the great ones of Tibesti (Tu)," where there are still Tumagera. This suggests that Christianity reached Darfur via Tibesti and Ennedi rather than across the plains from the east, and certainly accords with the tradition that the inhabitants of Ain Farah eventually fled to Ennedi. Abu Sofian and Zankor, in northern Kordofan, where there are also red-brick remains, must have been links between Christian Darfur and the Nile. The most likely date for the Christian period in Darfur is from A.D. 900 to 1200. It was no doubt the eastward advance of Islam from Kanem that brought an end to Christianity in Darfur. By 1240 the king of Kanem was claiming control of his trade route with Egypt as far as Sai on the Nile; this is, therefore, the most probable date for the beginning of the influence of Kanem-Bornu, which is evident in the titles and form of administration of the historical Keira sultanate of Darfur (although Kuru, its legendary founder, claimed descent from the Tungur). Indeed it is by no means impossible that Darfur was a province of either Kanem or Bornu (*q.v.*) at one or more of their great periods.

There are stone ruins in Turra on Jabal Marra that are the traditional palaces of Kuru, of Suleiman Solong (*c.* 1640–70) and of his son Musa (c. 1670–82). The first historic mention of the name Fur occurs in 1664 in the account by J. M. Vansleb of a visit to Egypt. Fur appears to be the name given by the Keira sultans to the Negroid inhabitants who accepted Islam and their rule. As the dynasty became more and more Negroid through intermarriage with concubines, its members became known as Fur. After Musa, each sultan had his capital or *fasher* in a different place, until Abdal-Rahman al-Rashid (1787–1802) chose the present site of Al Fasher. Sultan Ahmed Bukr (1682–1722) spread Islam by building mosques, conquered the Gimr and defeated a Wadai army at Kebkebia. His brother and successor, Abulgasim, was defeated in battle with Wadai. Another brother, Mohammed Teirab (1752–57), died on a campaign in which he reached the Nile near Shendi. He was succeeded by his brother Abdal-Rahman al-Rashid, who in 1799 wrote to congratulate Napoleon on his defeat of the Mamelukes in Egypt and was asked by Napoleon to send 2,000 black slave recruits for his army. Mohammed al-Fadhl, his son, whose reign lasted until 1839, devoted himself largely to the subjection of the semi-independent Arab tribes who lived in the country. In 1821 he lost the province of Kordofan to the Egyptians. Of his 40 sons, the third, Mohammed Husain, was appointed his successor. In the later part of his reign Husain became involved in trouble with the Arab slave raiders who had seized the Bahr el Ghazal, looked upon by the Fur sultans as their especial "slave preserve." The Negroes of Bahr el Ghazal paid tribute of ivory and slaves to Darfur, and these were sold by the Darfurians to the Egyptian traders along the Arbain road to Asyut. Husain died in 1873 and the succession passed to his youngest son, Ibrahim, who soon found himself engaged in a conflict with Zubayr, the chief of the Bahr el Ghazal slave traders, and with an Egyptian force from Khartoum. Ibrahim was slain in battle in the autumn of 1874.

Under Egyptian rule, various revolts were suppressed, and in 1881 Slatin Bey (Sir Rudolf von Slatin) was made governor of the province. Slatin defended the province against the forces of the mahdi but was obliged to surrender (Dec. 1883), and Darfur was incorporated in the mahdi's dominions. Following the overthrow of the khalifa at Omdurman in 1898 the new (Anglo-Egyptian) Sudan government recognized (1899) Ali Dinar, a grandson of Mohammed al-Fadhl, as sultan of Darfur. A rising attempted by Ali Dinar in 1915 brought about a punitive expedition in which he was killed (Nov. 1916), and Darfur then became a province of the Sudan. Into it was incorporated in 1922 the small, hitherto independent state of Dar Masalit, which continued to enjoy a measure of self-government under a sultan.

The first European traveler known to have visited Darfur was W. G. Browne, who spent two years (1793–95) at Kobbe. Gustav Nachtigal in 1873 spent several months in Darfur.

DARGOMYZHSKI, ALEKSANDR SERGEEVICH (1813–1869), Russian composer of songs and declamatory opera, was born Feb. 14 (new style; 2, old style), 1813, in a village near Tula. He grew up in St. Petersburg as a talented amateur musician, playing the violin and piano and dabbling in composition. Acquaintance with Glinka (1833) turned his thoughts more seriously toward composition and in 1839 he completed his first opera, *Esmeralda* (after Victor Hugo), though it had to wait eight years for performance. The next, *The Triumph of Bacchus*, was not performed till 1867, but his third opera, *Rusalka* (after Pushkin), was successfully produced in 1856. Some of Dargomyzhski's best songs date from the late 1850s; in these he developed an individual vein of humour and satire. A little later came three orchestral pieces notable for their harmonic experiments. After 1866 Dargomyzhski was occupied with a more striking experiment: a setting of Pushkin's play *The Stone Guest*, just as it stood, to a species of declamatory musical prose, with entire passages composed in the whole-tone mode. This work aroused the interest of Balakirev and his circle, particularly Mussorgsky, who was deeply impressed by Dargomyzhski's slogan of "the note as the direct expression of the word"; when Dargomyzhski died (in St. Petersburg, Jan. 17 [N.S., 5, O.S.], 1869) the score was completed by Cui and orchestrated by Rimski-Korsakov. *The Stone Guest* is no more than an important historical landmark, a stimulating experiment, but some of Dargomyzhski's songs are of lasting value.

DARIÉN, the name traditionally given the area comprising the easternmost part of the Isthmus of Panamá. It lies chiefly within the republic of Panamá (*q.v.*) but also includes the region of Urabá gulf in the departments of Antioquia and Chocó (*qq.v.*) of Colombia. This hot, humid, forested area has always been sparsely populated. In the Colombian section the largest settlement is the small port of Turbo, which is connected with the interior by a motor road.

The area was first reached by Rodrigo de Bastidas in 1501 and was seen by Columbus on his last voyage two years later. The first European settlement of South America, Santa Maria de la Antigua del Darién, was attempted on the western side of Urabá gulf. It was founded in 1510 by the expedition of Alonso de Ojeda, who had previously attempted to form a settlement at Cartagena bay. It was from this failing colony that Vasco Núñez de Balboa (*q.v.*) made his famous march westward in 1513, reaching the Pacific ocean at San Miguel gulf. A few years later some members of the colony moved far to the west on the Pacific side, where in 1519 they founded the city of Panama (*q.v.*). The Darién colony then gradually declined and was subsequently abandoned. The end of the 17th century witnessed a Scottish attempt at colonization. A trading company under William Paterson founded a settlement in this area about half way between the Spanish strongholds of Porto Bello and Cartagena (*qq.v.*). This colony too was short-lived. (T. E. N.)

Darién gulf is the southernmost extension of the Caribbean sea, between Panamá and Colombia. Urabá gulf, the inner section of the Darién gulf between Punta Caribana and Cabo Tiburón, Colombia, is a shallow, mangrove-lined arm of the sea 20 mi. wide and 50 mi. long into which protrudes the delta of the Atrato river. (Js. J. P.)

DARÍO, RUBÉN (1867–1916), pen name of FÉLIX RUBÉN GARCÍA-SARMIENTO, who was the leader of the important Spanish American literary movement known as Modernism. He was born in Metapa, Nic., Jan. 18, 1867, and died at León, in the same coun-

try, Feb. 1916. Most of his life was spent in other countries of Spanish America and in Europe, on diplomatic missions and as a newspaper correspondent.

He was the author of many volumes of excellent journalistic prose, originally published as articles in *La Nación* of Buenos Aires and many other periodicals; of approximately 100 short stories and tales, of artistic types largely original with him; several volumes of penetrating literary criticism; and much verse of varying quality. His chief fame, however, rests upon three great collections, chiefly of verse, in which he gave expression to his literary theories.

The first of these, *Azul,* consisting of short stories, descriptive sketches and verse! was first published in Chile in 1858. The author had only recently become acquainted with the Parnassian movement (*q.v.*) in French literature, and the volume represents to a considerable degree his attempt to apply to Spanish the tenets of that group. In the prose portions he discards the traditional long Spanish sentence, of complicated grammatical structure. in favour of short and simple sentences. Both prose and poetry are largely concerned with objective description, based upon the principles of graphic and plastic art, and both deal largely with the exotic, the chief interests being classical mythology, France and the orient. All in all, the volume is purely concerned with art for art's sake. An enthusiastic review of it by the great Spanish critic Juan Valera helped to assure its favourable reception on both sides of the Atlantic, and it was soon recognized as the herald of a new era in Spanish American literature. In a second edition, in 1890, he added several short stories and a number of sonnets of sensationally new types, particularly notable being the use. in most of them, of the alexandrine line, as in French, instead of the traditional Spanish hendecasyllable.

Dario's second great collection, *Prosas profanas* (1896), consisted entirely of verse. It follows to some extent the Parnassian trend established by *Azul,* but places its chief emphasis upon the type of Symbolism *(see* SYMBOLISTS, THE) newly developed in France. The subject matter is still largely exotic, but the scenes and personages treated often have a symbolic rather than an objective significance. Like *Azul,* the volume is concerned with art strictly for its own sake. with little relation to everyday life.

By 1905, the date of publication of *Cantos* de *vida y esperanza,* world events and his own advancing age had brought about a profound change in Dario's outlook on life. Technically and artistically, the book maintains and even surpasses the standard of excellence set by *Prosas pi-ofanas.* Now, however, the poet was vitally concerned with things outside the realm of art: the supposed threat of North American imperialism after the defeat of Spain in 1898; the solidarity of Spanish-speaking peoples; the future prosperity of Spanish America; the age-old problems of human existence as such.

Throughout most of his career Dario experimented boldly with many forms of verse, and probably introduced more innovations in metre than any other Spanish-speaking poet. Many of his metrical novelties were wholly Spanish in origin; others were adaptations from the French. From the standpoint of artistic resourcefulness and technical perfection, Dario is considered by many to be the greatest poet who ever wrote in Spanish. By any standard he must be considered as one of the great figures of universal literature.

DARIUS (Old Persian *Darayavaush),* the name of three kings of the Achaemenid dynasty of Persia.

DARIUS I the Great, who reigned from 522 to 486 B.C., was the son of Hystaspes (*q.v.*), the satrap of Parthia. The principal contemporary sources for his history are his own inscriptions. especially the great inscription of Bisitun (*q.v.*), in which he tells how he gained the throne. The accounts of his accession given by Herodotus and Ctesias are in many points evidently derived from this official version but are interwoven with legends; *e.g.,* that Darius and his fellow conspirators left the question as to which of them should become king to the decision of their horses and that Darius won the crown by a trick of his groom.

According to Herodotus, Darius when a youth was suspected by Cyrus the Great of plotting against the throne. Later he mas in Egypt with Cambyses as a member of the royal bodyguard. After the death of Cambyses in the summer of 522 B.C., Darius hastened to Media where, in September, with the help of six Persian nobles, he killed Bardiya (Smerdis; *q.v.*), who had usurped the throne the previous March. In the Bisitun inscription Darius defended this deed and his own assumption of kingship on the grounds that the usurper was Gaumata, a Magian, who had impersonated Bardiya: a son of Cyrus the Great, after Bardiya had been secretly murdered by Cambyses. Darius therefore claimed that he was restoring the kingship to the Achaemenid house. He himself, however. belonged to a collateral branch of the royal family, descended from Teispes, and as his father and grandfather were alive at his accession it is unlikely that he was next in line to the throne. Certain modern scholars consider that he invented the story of Gaumata in order to justify his actions and that the murdered king was indeed the son of Cyrus.

Darius did not at first gain general recognition but had to impose his rule by force. His assassination of Bardiya was followed, particularly in the eastern provinces, by widespread revolts, which threatened to disrupt the empire. In Susiana, Babylonia, Media, Sagartia and Margiana independent governments were set up, most of them by men who claimed to belong to the former ruling families. Babylonia rebelled twice and Susiana three times. In Persia itself a certain Vahyazdata. who pretended to be Bardiya. the son of Cyrus, gained considerable support. These risings, however, were spontaneous and unco-ordinated, and notwithstanding the small size of his army, Darius and his generals were able to suppress them one by one. In the Bisitun inscription he records that in 19 battles he defeated nine rebel leaders, who appear as his captives on the accompanying relief. By 519 B.C., when the third rising in Susiana was put down, he had established his authority in the east. In 518 Darius visited Egypt, which he lists as a rebel country, perhaps because of the insubordination of its satrap, Aryandes, whom he put to death. He also removed Oroetes, the disloyal satrap of Sardis.

Having restored internal order in the empire, Darius undertook a number of campaigns for the purpose of strengthening his frontiers and checking the incursions of nomadic tribes. In 519 B.C. he attacked the Scythians east of the Caspian sea and a few years later conquered the Indus valley. In 513. after subduing eastern Thrace and the Getae. he crossed the Danube into European Scythia, but the Scythian nomads retired before him, devastating the country, and he was forced by failure of supplies to abandon the campaign. The satraps of Asia Minor completed the subjugation of Thrace, secured the submission of Macedonia and captured Lemnos and Imbros. The approaches to Greece were thus in Persian hands as was control of the Black sea grain trade through the straits, of major importance for Greek economy. The conquest of Greece was a logical step to protect Persian rule over the Asiatic Greeks from interference by their European kinsmen. According to Herodotus, Darius, before the Scythian campaign, had sent ships to explore the Greek coasts, but he took no military action until 499 B.C., when Athens and Eretria supported an Ionian revolt against Persian rule. After the suppression of this rebellion. Mardonius, Darius' son-in-law, was charged with an expedition against 'Athens and Eretria, but the loss of his fleet in a storm off Mt. Athos (492 B.C.) forced him to abandon the operation. In 490 B.C. another force under Datis, a Mede, destroyed Eretria and enslaved its inhabitants but was defeated by the Athenians at Marathon (*q.v.*). Preparations for a third expedition were delayed by an insurrection in Egypt and Darius died in 486 B.C. before they were completed.

Although Darius consolidated and added to the conquests of his predecessors, it was as an administrator that he made his greatest contribution to Persian history. He completed the organization of the empire into satrapies. initiated by Cyrus the Great, and fixed the annual tribute due from each province (see SATRAP). During his reign ambitious and far-sighted projects were undertaken to

promote imperial trade and commerce. Coinage and weights and measures were standardized and land and sea routes developed. An expedition led by the Carian captain Scylax of Caryanda sailed down the Indus river and explored the sea route from its mouth to Egypt, and a canal from the Nile to the Red sea, probably begun by Necho, was repaired and completed.

While measures mere thus taken to unite the diverse peoples of the empire by a uniform administration, Darius followed the example of Cyrus in respecting native religious institutions. In Egypt he assumed an Egyptian titulary and gave active support to the cult. He built a temple to Amon in the Kharga oasis, endowed the temple at Edfu and carried out restoration work in other sanctuaries. He empowered the Egyptian Udjahorresne, who had served under Cambyses, to re-establish the medical school of the temple of Sais, and he ordered his satrap to codify the Egyptian laws in consultation with the native priests. In the Egyptian traditions he was considered as one of the great lawgivers and benefactors of the country. In 519 B.C. he authorized the Jews to rebuild the temple at Jerusalem, in accordance with the earlier decree of Cyrus. He also continued the privileges granted by Cyrus to the Greek sanctuaries: a Persian official was reprimanded for exacting tribute and forced labour from the priests of the temple of Apollo near Magnesia on the Maeander. In the opinion of some authorities the religious beliefs of Darius himself, as reflected in his inscriptions, show the influence of the teachings of Zoroaster, and the introduction of Zoroastrianism as the state religion of Persia is probably to be attributed to him.

Darius was the greatest royal architect of his dynasty, and during his reign Persian architecture assumed a style that remained unchanged until the end of the empire. In 521 B.C. he made Susa his administrative capital, and there he restored the fortifications and built an audience hall (apadana) and a residential palace. The foundation inscription of his palace describes how he brought materials and craftsmen for the work from all quarters of the empire. At Persepolis, in his native country of Fars (Persis), he founded a new royal residence to replace Pasargadae. The fortifications, apadana, council hall, treasury and a residential palace are to be attributed to him. although not completed in his lifetime. He also built at Ecbatana and Babylon.

DARIUS II Ochus reigned from 423 B.C. until his death at Babylon in 404 B.C. The son of Artaxerxes I by a Babylonian concubine, he seized the throne from his half-brother, Secydianus (or Sogdianus), who had murdered Xerxes II, the son and successor of Artaxerxes. He executed Secydianus and also his own full brother, Arsites, who rebelled against him. Ochus, who had previously been satrap of Hyrcania. adopted the name of Darius on his accession; he was also known as Nothos ("the bastard").

Darius was dominated by eunuchs and by his half-sister and wife, Parysatis, a cruel and ambitious woman who exercised an evil influence on the conduct of government. During his reign intrigue and corruption were rife at the Persian court, and revolts by the satrap of Hyrcania and in Media. although quickly suppressed, were symptomatic of the discontent caused by his rule. After the Athenian disaster at Syracuse in 413 B C., Darius judged the moment opportune to recover the Greek coastal cities of Asia Minor, which had been under Athenian control since 448 B.C. The satraps of Asia Minor, Tissaphernes and Pharnabazus, were ordered to collect arrears of tribute, and an alliance against Athens was formed with Sparta, nhich recognized Persian sovereignty over the Greek communities in Asia. In the ensuing war the greater part of Ionia was recovered, but elsewhere the allies had less success. partly due to the policy of Tissaphernes, who, foreseeing that a victorious Sparta might be as dangerous to Persian interests as Athens had been, gave its forces only limited support. In 407 B C., however, after the victories of Alcibiades, Darius decided to put all his resources behind Sparta. He appointed his son, Cyrus the Younger (*q.v.*), as commander in chief of Asia Minor in place of Tissaphernes and gave him funds to recreate the Spartan fleet. As a result Lysander in 405 B.C. broke the Athenian power at Aegospotami.

DARIUS III Codommanus. who reigned from 336/335 to 330 B.C., was the last king of the Achaemenid dynasty. He belonged to a collateral branch of the royal family, his father being Arsames, son of Ostanes, a brother of Artaxerxes II. He was placed on the throne by the eunuch Ragoas (*q.v.*), who had poisoned Artaxerxes III in 338/337 and Arses in 336/335 B.C. When Darius asserted his independence, Bagoas also attempted his murder but was forced by the king to drink the poison himself. Darius had earlier distinguished himself in single combat against a Cadusian rebel, for which he had been rewarded with the satrapy of Armenia.

In 338 Philip of Macedon had formed the League of Corinth for the purpose of liberating the Greek cities under Persian rule, and early in 336 had sent an advance force into Asia Minor. In July, however, he mas assassinated, according to Alexander at the instigation of Darius. In the spring of 334 B.C. Alexander crossed the Hellespont. Darius, although he had sent subsidies to the Greek states in an attempt to raise them against Alexander, had made no serious military preparations to resist the invasion. Alexander defeated a Persian army at the Granicus and by the following year had won most of Asia Minor and reached Cilicia. Darius advanced against him but was defeated at Issus in the autumn of 333 B.C. and fled from the field, abandoning his mother, wife and children.

While Alexander was at Marathus, Darius sent him a letter requesting the return of his family and offering friendship and alliance. Alexander rejected the overture and demanded that Darius recognize him as overlord. Later Darius wrote again, offering a large ransom for his family, cession of all the Persian empire west of the Euphrates and the hand of his daughter in return for an alliance. Alexander again refused. In 331, having completed the conquest of Syria, Phoenicia, Palestine and Egypt, Alexander marched into Mesopotamia. Darius made no attempt to resist his crossing of the Euphrates and Tigris but offered battle at Gaugamela, east of Mosul. On Oct. 1, 331 B.C., he was decisively defeated and, as at Issus, turned his chariot and fled, although his subordinates fought on (see GAUGAMELA, BATTLE OF). He escaped to Ecbatana and then, on the approach of Alexander, retired toward Bactria, but was deposed and killed by Bessus, the satrap of Bactria, in July 330 B.C.

The name Darius was also borne by many later dynasts of Persian origin, among them kings of Persis; Darius of Media Atropatene, who was defeated by Pompey the Great; and Darius, appointed king of Pontus by Mark Antony in 40 B.C.

(J. M. M.-R.)

DARJEELING, a town and district of West Bengal, India. The town lies 305 mi. N. of Calcutta and is connected with that city by road, rail and air. Pop. (1961 est) 40.405. Darjeeling is a hill station and vacation resort to ahich the West Bengal governor and ministry move for a short while in summer. It is situated on a long asymmetrical mountain ridge of the Sikkim Himalayas which runs northward from Tiger hill, with its almost flat top at an average elevation of 7,500 ft., and bifurcates into Lebong spur and

R. J. CHINWALLER FROM BLACK STAR

HILL STATION OF DARJEELING, WEST BENGAL, INDIA. AT AN ELEVATION OF 7,500 FT. IN THE SIKKIM HIMALAYAS

Birch Hill spur before descending into the Rangit valley (3,000 ft.). A magnificent view of snow-clad Kangchenjunga (28,146 ft.) can be had from Darjeeling on a clear day, and from the top of Tiger hill, or from Jalapahar, Mt. Everest (29,028 ft.) can just be seen. Darjeeling has a moderately cool but rainy summer, a fine autumn and a dry winter with occasional snowfall. Chaurasta (the Mall), on the ridge (7,002 ft.), is the main shopping centre and the most attractive promenade. A little higher up. on the east, is Observatory hill (7,139 ft.), which commands a good view. Birch hill with its natural park is a beauty spot which contains the Institute of Mountaineering. Lloyd Botanic gardens were laid out in 1865. There are three colleges, affiliated to Calcutta university, and a natural history museum.

DARJEELING DISTRICT embraces 1.160 sq.mi. and had a population of 624.879 in 1961. It has two contrasting types of landscape: mountain ranges rising northward almost vertically from plains to over 10,000 ft. (Sandakphu, 11,911 ft.), and the gravelly plains of the Terai on the south between 250 and 1,000 ft., cut into flat-topped terraces by innumerable hill streams. Narrow belts of flat alluvial plains and low foothills of Tertiary sandstone and coal-bearing Gondwana rocks are also included within the district. The mountains are principally composed of hard rocks, gneisses and schists of Archean age, and the deep Tista valley has been carved out of softer rocks, slates and phyllites. The chief rivers from west to east are the Mechi, Balasan, Mahanadi, Great Rangit and Tista. Darjeeling district has a wide range of climate, from tropical to subalpine, which is reflected in its natural vegetation. Rainfall is excessive, over 100 in. a year, and hence wherever the surface is exposed on the south conifers are replaced by evergreen oaks. Forests yield valuable timber. The economy of the district is based mainly on tea, which is grown as a plantation crop from the Terai plains right up to the altitude of Darjeeling railway station (6.700 ft.). There are also plantations of cinchona trees and a quinine factory at Mungpo, 10 mi. S.W. of Kalimpong. Cardamom is another cash crop, which is grown at altitudes from 1,000 to 5,000 ft. Rice is the main food crop of the plains and hills up to 5,000 ft.

Siliguri (pop. [1951] 32,480) on the Terai is the largest market town. and has a flourishing timber industry. It is served by the Assam link of the North East Frontier railway, and is also the terminus of the Darjeeling Himalayan railway. Kalimpong (*q.v.*; pop. [1951] 16,677), on the main trade route between India and Tibet through Sikkim, is 25 mi. E. of Darjeeling town by road. Kurseong (pop. [1951] 11,719) is another hill station (4,680 ft.). Baghdogra is the terminus of the airline between Calcutta and Darjeeling. (S. P. C.)

DARK AGES, a term formerly used to cover the whole period between the end of classical civilization and the revival of learning in the 1 jth century. The use of the term implied an exclusive respect for classical standards in literature and art and a corresponding disparagement of all that was achieved between the decline of ancient culture and the work of Renaissance scholars, writers and artists. With the progress of medieval studies in the 19th century it became impossible for historians to dismiss one of the great constructive periods in human activity with an epithet implying contempt for its achievements, and the phrase became obsolete. It remains, nevertheless, the fact that the six centuries following the collapse of the Roman empire are in a special sense dark through the insufficiency of historical evidence. Even so, it is necessary to remember that intellectual work of the highest quality was done by exceptional individuals in ages when life was insecure and its environment discouraging to thought. The ages which form the prelude to medieval history are dark when compared with the time which followed, but the foundations of medieval civilization were laid in these obscure centuries. *See* MIDDLE AGES, THE. (F. M. S.)

DARLAN, JEAN LOUIS XAVIER FRANÇOIS (1881–1942), French-naval officer, was born at Nérac, Lot-et-Garonne, Aug. 7. 1881. He entered the French naval school in 1899 and advanced through the various ranks, becoming a rear admiral in 1929, vice-admiral, admiral and on June 24, 1939, admiral of the fleet He nas chief of staff of the navy from Dec. 31, 1936, and commander in chief of the French navy from Aug. 28, 1939. After the German attack on France in 1940, additional duties were given him, and from Feb. 1941 he was vice-president of the council of ministers and minister of foreign affairs. He gave up his ministerial duties to become commander in chief of all French military forces in 1942. In November of that year he was assigned the post of high commissioner in Africa, where he ended French opposition to the U.S. and British invasion forces in Algeria and Morocco. Darlan was an officer of character and ability who received much undeserved abuse in the British and United States press. He was slain in Algiers on Dec. 24, 1942. (J. B. HN.)

DARLEY, GEORGE (1795–1846), Irish poet, only slightly esteemed by his contemporaries but praised by 20th-century writers for his power to evoke, in his unfinished lyrical epic, *Nepenthe*, a symbolic dream-world of unusual intensity. Born in Dublin, and educated at Trinity college, he was prevented from academic and social success by an incurable stammer. which, growing worse as he grew older, sapped his self-confidence, destroyed his pleasure in society and confirmed his tendency to ineffectual despondency. In 1822 he settled in London, and published his first book: poems, entitled *The Errors of Ecsfasie and other Pieces.* Through the *London Magazine,* to which he contributed criticism, verse and short stories, he became intimate with leading writers, especially Lamb and Henry Cary. A volume of short stories and verses (1826) and the verse drama, *Sylvia* (1827), described by Lamb as "a very poetical poem," met with little success, and Darley, discouraged, turned to the writing of mathematical textbooks which achieved the fame denied to his poetry, and also wrote on art and drama for the *Athenaeum.* In 1835 the first two cantos of *Nepenthe* were privately printed: Mary Russell Mitford voiced the general impression when she said, "there is no reading the whole . . . there is an intoxication about it which turns the brain" Yet it is this unfinished work which ensures Darley's fame, for modern poets find its dream imagery, recalling Coleridge in its cloudy fire, its tumultuous, yet skilfully contrived. metrical effects and its symbolic self-revelation interesting as examples of late romanticism and as foreshadowings of 20th-century tendencies. It marked the peak of Darley's achievement: two tedious verse dramas *Thomas à Becket* (1840) and *Ethelstan* (1841) and an edition of Beaumont and Fletcher (1840) completed his output, and he died in London, Nov. 23, 1846.

BIBLIOGRAPHY.—*Complete Poetical Works,* ed. by R. Colles (1908); C. C. Abbott, *Life and Letters of George Darley* (1928) ; J. Heath Stubbs in *The Darkling Plain* (1950).

DARLING, CHARLES JOHN, 1ST BARON (1849–1936), English judge with unusual insight into human nature, was born at Colchester. Essex, on Dec. 6, 1849. Called to the bar by the Inner Temple in 1874, he became a queen's counsel in 1885 and sat in parliament as Conservative member for Deptford from 1888 until appointed a queen's bench judge in 1897, when he was knighted. His appointment was much criticized, but he later justified it. On the bench he too often strove after humour, with indifferent success. He retired in 1923, becoming a peer in 1924. Darling died at Lymington, Hampshire, on May 29, 1936.

His published works include *Scintillae Juris* (1877), *Seria ludo* (1903), *On the Oxford Circuit* (1909), *Crime and Insanity, Murder and Its Punishment, Musings on Murder* (1925).

BIBLIOGRAPHY.—*E.* Graham, *Lord Darling and His Famous Trials* (1929) ; *D.* Barker, *Lord Darling's Famous Cases* (1936) ; *D.* Walker-Smith, *Life of Lord Darling* (1938). (R. E. MY.)

DARLING, GRACE HORSLEY (1815–1842). British heroine, famous for her courageous rescue of survivors from the wrecked "Forfarshire," was born at Bamburgh, Northumberland, on Nov. 24, 1815, daughter of William Darling who became keeper of the Longstone (Farne islands) lighthouse. On the morning of Sept. 7, 1838, the luxury steamship "Forfarshire" struck on the rocks near the Longstone. Seeing a few survivors, and considering the seas too treacherous for the mainland lifeboat, Grace and her father managed to row the mile from the lighthouse in their coble, and by a combination of daring, strength and skill to rescue four men and a woman. Darling then returned with two of the men to take off the remaining four survivors. Grace won nationwide fame; she and her father were given the gold medal of the Humane society

and large subscriptions were collected for them. But she remained at the lighthouse, and died of tuberculosis at Bamburgh on Oct. 20, 1842.

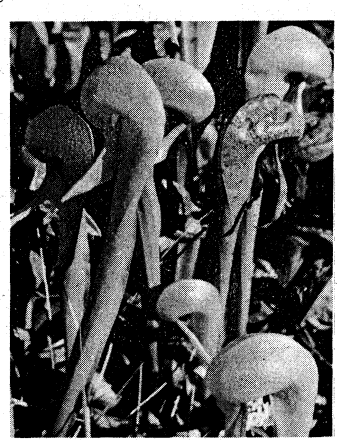
DARLING RIVER, Australia, the longest tributary of the Murray, rises in the Eastern highlands (*q.v.*) near the New South Wales-Queensland border. The river was named after the governor of New South Wales, Sir Ralph Darling (1775–1858). It has a total length of 1,702 mi. Though most of it usually remains a normally flowing river, only its upper reaches are really perennial. In the latter part of the 19th century the Darling was of importance to navigation, but this traffic has long been superseded by the railway. West of the river increasingly poor pastoral country extends into the "far west" of New South Wales. The 2.000 acre-feet storage scheme at Menindee lakes will improve local stock and domestic supplies (including that of Broken Hill) and by regulating the flow in the lower Murray will give a more assured irrigation supply to South Australia. (O. H. K. S.)

DARLINGTON, a market town and a county and parliamentary borough in Durham county, Eng., 18 mi. S. of Durham by road. Pop. (1961) 84,162. It lies on the Great North road and on the river Skerne, a tributary of the Tees, not far from the main river. Its appearance is almost wholly modern, but there is a fine 12th-century parish church dedicated to St. Cuthbert.

There was a Saxon settlement on the site of the town and in Norman times it was in the Durham palatinate. Before the 19th century Darlington was noted for the manufacture of linen (flax was first spun by machinery there), carpets and worsted; the latter is still carried on, but Darlington owes its modern importance to the opening of the railway between Darlington and Stockton on Sept. 27, 1825. "Locomotive No. 1," the first engine that ever ran on a public railway, stands in Bank Top station. The fairs and markets were in existence as early as the 11th century and were purchased by the local authority in 1854. The town was incorporated in 1867 and became a county borough in 1915. There are an Elizabethan grammar school and a college for further education. The chief industries are spinning, bridge building. heating and ventilating engineering, foundry work, joinery and the manufacture of paint, decorative panels and insulation products. The large locomotive works of the former London and North Eastern railway which were removed to Darlington from Gateshead in 1900 now belong to British railways.

Five miles north of the town is the Aycliffe trading estate near which a New Town (*q.v.*), Aycliffe, with a projected population of 20,000, was initiated in 1947.

DARLINGTONIA, the California pitcher plant, a carnivorous plant belonging to the family Sarraceniaceae. It was named after William Darlington, a U.S. botanist. There is only one species. D. *californica.* It grows in sphagnum swamps and springy hillsides in southwestern Oregon and northwestern California from near sea level to an altitude of 6,000 ft. in the Sierra Nevada mountains. The tall tubular leaves grow in a cluster arising from a stout horizontal stolon and have two forms. The juvenile leaf has the open top overhung by a tapering lidlike appendage. Such leaves are found in seedlings and variously on small shoots. The leaf of maturity may reach a height of three feet, gradually expanding its diameter until at the top it expands suddenly into a bknt-over hood ending in a downward hanging appendage of the shape of a fishtail. Beneath the hood is a rounded opening, the entrance, guarded on the inside by a low, inturned flange having many nectar glands, which are common also to the fishtail appendage, and to the interior surface of the hood. The roof of the hood is tessellated by white translucent patches, "windows" mullioned by green, eventually red bands of chlorophyll-bearing tissues.



W. H. HODGE

CALIFORNIA PITCHER PLANT (DARLINGTONIA CALIFORNICA)

To an insect approaching the entrance, attracted by the nectar on the fishtail or elsewhere beneath the hood, the windows doubtless suggest a way of exit. When once inside, the insect feeds on the abundant nectar and gradually, impelled by downward pointing hairs, falls into the hollow tubular leaf. Since digestive glands are absent, the decay of the captured insects take place through the agency of bacteria, the products of this sort of digestion being absorbed by the walls of the tube. So abundant is the dead prey that the odour of decay has often been remarked.

An interesting matter is the invariable presence of often plentiful living insect larvae in the wet mass of decaying insects found in the pitcher; a few of these are obligate commensals, not occurring elsewhere.

See also CARNIVOROUS PLANTS; PITCHER PLANTS.

(F. E. L.)

DARMESTETER, ARSÈNE (1846–1888), elder brother of James Darmesteter (*q.v.*), and a distinguished philologist and man of letters noted for his contributions to the history of the French language, was born at Château-Salins, Moselle, France. on Jan. 5, 1846. He studied under Gaston Paris at the École des Hautes Études, and became professor of old French language and literature at the Sorbonne. He collaborated with Adolphe Hatzfeld in a *Dictionnaire général de la langue française* (2 vol., 1895–1900). Among his most important work was the elucidation of old French by means of the many glosses in the medieval writings of Rashi and other French Jews. Darmesteter died Nov. 16, 1888, at Paris. His scattered papers on romance and Jewish philology were collected by James Darmesteter as *Arsène Darmesteter, reliques scientifiques* (2 vol., 1890). His *Cours de grammaire historique de la langue française* was edited after his death by E. Muret and L. Sudre (1891–95; English ed., 1902).

DARMESTETER, JAMES (1849–1894), French orientalist known for his studies of ancient Iranian, was born of Jewish parents at Château-Salins, Moselle, on March 28, 1849. The family name had originated in their earlier home in Darmstadt, Ger. He studied in Paris under Michel Bréal and Abel Bergaigne. In 1875 he published a thesis on the mythology of the *Zend-Avesta,* and in 1877 became teacher of Zend at the École des Hautes Études. He followed up his researches with his *Études iraniennes* (1883), and ten years later published a complete translation of the *Zend-Avesta,* with historical and philological commentary (3 vol., 1892–93), in the *Annales* du *musée Guimet.* He also edited the *Zend-Avesta* for Max Müller's *Sacred Books of the East.* Darmesteter regarded the extant texts as far more recent than was commonly believed, placing the earliest in the 1st century B.C., and the bulk in the 3rd century A.D. In 1885 he was appointed professor in the Collège de France, and was sent to India in 1886 on a mission to collect the popular songs of the Afghans, a translation of which, with a valuable essay on the Afghan language and literature, he published on his return. His impressions of English dominion in India were conveyed in *Lettres sur l'Inde* (1888). He married A. Mary F. Robinson. Darmesteter died at Maisons-Lafitte, a suburb of Paris, on Oct. 19, 1894.

DARMSTADT, a city of Germany, former capital of the grand duchy of Hesse-Darmstadt and after the partition of the nation following World War II the administrative centre of Darmstadt *Regierungs-Bezirk* of the *Land* of Hesse in the Federal Republic of Germany. It lies on a plain gently sloping from the Odenwald to the Rhine, 33 km. (20.5 mi.) S.E. of Mainz by road and 28 km. (17.4 mi.) S. of Frankfurt am Main.

Darmstadt is an industrial centre and was heavily damaged by bombing in World War II. It formerly consisted of an old and a new town but after the war it was rebuilt, though many of the old buildings have survived. In the stately Luisenplatz, with its two fountains, stands a statue of Ludwig X, the first grand duke. The ducal castle, to the east, was badly damaged, but most of the library was saved. In the Landesmuseum are collections of art and of natural history, and behind the museum are the castle gardens. There are a technical high school. schools of art and engineering and the *Land* school of music. There is an annual music festival.

To the east of the town lies the Mathildenhohe, formerly a park and converted into villa residences. There are the artists' colony, created in 1889 by the grand duke Ernst Ludwig, and the Russian church. built (1898–99) by the emperor Nicholas II of Russia in memory of his Hessian wife. Nearby is the Kranichstein hunting lodge, now a hunting museum, and game park. West of Darmstadt is Kuhkopf Island in the Rhine, a large nature reserve with rare waterfowl, especially herons and kites.

The industries are extremely varied and include the manufacture of chemicals, radios and kitchen ranges.

Darmstadt is mentioned in the 11th century, but in the 14th century it was still a village, held by the counts of Katzenelnbogen. It came by marriage into the possession of the house of Hesse in 1479, the male line of the house of Katzenelnbogen having in that year become extinct. The imperial army took it in the Schmalkaldic War and destroyed the old castle. In 1567, after the death of Philip the Magnanimous, his youngest son Georg received Darmstadt and chose it as his residence. He was the founder of the line of Hesse-Darmstadt. Its most brilliant days were those of the reign of Ludwig X (1790–1830), the first grand duke, under whom the new town was built. The chemist Justus von Liebig (*q.v.*) was born in Darmstadt in 1803. The city was captured by the U.S. 3rd army on March 25, 1945.

DARNEL (*Lolium* temulentum), a member of the grass family known also as poison rye grass, tare and ivray. Darnel is an annual noxious weed of grain fields and is poisonous when eaten by livestock. Because the seed is often fungus-infected, its poisonous properties may be due both to the alkaloid, temuline, and to a waste product of the fungus. Persons have been poisoned by eating bread made from grains contaminated with appreciable quantities of darnel seed. It has been a pest of considerable significance through the centuries, more so in Elizabethan times than in modern times because winnowing processes of earlier eras were unable to separate grains of darnel from those of rye.

The genus Lolium includes all rye grasses—a group of about 12 species, distinguished by the spikelets solitary and situated edgewise in alternate concavities along a continuous rachis or stalk. The perennial kinds are important as the principal ingredient of inexpensive lawn-grass mixtures, especially perennial rye grass (L. *perenne*) and Italian rye grass (L. *multiflorum*). They have the merit of germinating quickly and producing a soil-holding sod, but the foliage is coarse and a short-lived turf of poor quality results.

See also RYE GRASS. (G. H. M. L.)

DARNEL'S CASE (known also as the FIVE KNIGHTS' CASE) is a leading case in the history of the liberty of the subject in England, and contributed to the enactment of the Petition of Right. The case was designed to test the legality of imprisonment for refusing to contribute to forced loans. Sir Thomas Darnel, who had for this reason been committed to the Fleet prison in March 1627, together with four other knights—Sir John Corbet, Sir Walter Earl, Sir Edmund Hampden and Sir John Heveningham—applied for a writ of habeas corpus. Their jailor's return to the writ stated simply that the knights had been committed "by the special command of his majesty." At this stage Darnel withdrew from the action, but the other four defendants decided to challenge the sufficiency of this return before the king's bench judges (Nov 1627). Counsel for the knights relied on both medieval and modern precedents, including clause 39 of Magna Carta (that no man should lose his liberty without due process of law). They ignored, however, the fact that the Tudors had assumed a large discretionary power of imprisonment, and their argument that public policy demanded the release of the knights was met by pointing out that even more dire consequences would ensue in time of national danger if this prerogative power of arrest was not recognized. The judges ordered that the knights must remain remanded, and refused hail, but they did not decide that the crown could always commit without cause. Whether prisoners should be released or not was a matter of judicial discretion; "upon such a return" the king should be "first consulted with."

The judges showed no partiality, and the precedents were nicely balanced. Nevertheless it was assumed that the decision was in favour of the crown. After the release of the knights in 1628 the debate continued in parliament. Charles I's agreement not to imprison subjects who refused to pay forced loans did not mollify the house of commons which sought to impose on a reluctant monarch its own interpretation of Magna Carta. From this impasse was born the Petition of Right (1628).

See William Cobbett, *State Trials,* vol. iii (1809). (G. H. J.)

DARNLEY, HENRY STEWART (STUART), LORD (1545–1567), second husband of Mary (*q.v.,* Stuart), queen of Scots, was the son of Matthew, earl of Lennox (d. 1571). He was born at Temple Newsam, Yorkshire, on Dec. 7, 1545, and educated in England. His father had pretensions to the Scottish crown, based on the alleged illegitimacy of James Hamilton, earl of Arran (d. 1575), and his mother, formerly Margaret Douglas (d. 1578), had a claim to the throne of England as granddaughter of Henry VII. She planned to strengthen her son's hopes of succession by his marriage with the rival claimant, Mary.

With the permission of Queen Elizabeth I, Darnley went to Scotland in Feb. 1565. Soon after his arrival there, rumours circulated that he would marry Mary, whom he had already met while on a visit to France shortly after the death of her first husband, the French king Francis II. She created him earl of Ross on May 15, and duke of Albany on July 20, 1565. The marriage was celebrated according to Catholic rites at Holyrood on July 29, 1565. Elizabeth had already shown her displeasure by sending the countess of Lennox to the Tower. Her dislike of the marriage was shared by James Stuart, earl of Moray, Mary's half-brother, whose influence was at an end; by the Hamiltons, whose hopes of the Scottish crown were destroyed; and by John Knox and the Protestant ministers, who saw it as a victory for Catholicism. Opposition soon collapsed, however, and Mary's enemies fled to England.

Despite its dynastic advantages and Mary's early infatuation, the marriage soon showed signs of breaking up, for not satisfied with the title of king conferred upon him at time of the wedding, Darnley coveted the crown matrimonial, by which he could reign in his own right after his wife's death. Nevertheless, he was weak, vicious and pleasure-seeking and unwilling to share in the labours of government. Resentful of the confidence which Mary gave to her secretary, David Rizzio, he intrigued with others who desired Rizzio's removal. But after the murder of Rizzio (March 9, 1566) Darnley betrayed his accomplices and enabled Mary to escape. Nevertheless they convinced her that he had been the instigator of the crime and his brief reconciliation with her did not long outlast the birth (June 19, 1566) of their son James, whose baptism at Stirling in Dec. 1566, he refused to attend.

Despised by his wife, hated by those whom he had betrayed and detested by most of the nobility for his pride and arrogance, Darnley became aware of plots against him. He took refuge with his father in Glasgow, where a sudden illness incapacitated him. After visiting him there, Mary, again apparently reconciled, persuaded him to accompany her to Edinburgh, where they lodged in the lonely house of Kirk o'Field, adjoining the city walls. On the night of Feb. 9–10, 1567, while Mary was absent at a servant's wedding festivities, the house was blown up. The body of Darnley, who had apparently been strangled, was found in the garden, some distance away. Soon afterward his widow married James Hepburn, earl of Bothwell, reputed author of the murder plot. Mary's complicity in the murder has never been proved, although Darnley's father collected a mass of evidence against her, some of which was published, in a highly coloured form, by the historian, George Buchanan.

Darnley is the direct ancestor of all British sovereigns since James I (James VI of Scotland).

(A. L. Mu.)

DARQUIER DE PELLEPOIX, LOUIS (1897–), French politician notorious as an anti-Semite and collaborator with Nazi Germany, was born at Cahors (Lot) on Dec 13, 1897; his family was an old one of some distinction. After studying science at Toulouse university, he had a checkered career as a business administrator. As a right-wing demonstrator he was wounded in

the riots of Feb. 6, 1934. He became a member of the Paris municipal council, organized the Anti-Jewish Rally of France and established a virulent journal: *La France enchaînée,* which was subsidized by the German-based International Anti-Semitic organization and which was suppressed at the start of World War II. In 1939 he was twice sentenced to imprisonment for anti-Semitic propaganda. He served with distinction in the army and was captured but swiftly released. Appointed commissioner of Jewish questions in the Vichy government in May 1942, he promoted the Nazi policy for the extermination of the Jews; Marshal Philippe Pétain, disgusted, addressed him as "Monsieur le tortionnaire" (Mr. Torturer). In Jan. 1944, however, Darquier was arrested on a charge of misusing confiscated goods and had to resign. At the liberation he was reported to have been captured. tried and executed, but later he was rumoured to be alive in Spain. In Dec. 1947 he was tried *in absentia* and sentenced to death.

(P. W. C.)

DARRANG, a district of Assam, India, lies between the Bhutan and Dafla hills and the Brahmaputra and includes many islands in the river. Area 3,369 sq.mi. Pop. (1961) 1,289,650. The administrative headquarters are at Tezpur (pop. [1951] 18,880), on the right bank of the Brahmaputra, 90 mi. K.E. of Shillong. At Tezpur are Darrang college, connected with the University of Gauhati, and a government industrial and technical school which trains carpenters, smiths, wheelwrights, weavers and other craftsmen. Seven miles from Tezpur is Salani airport, and the town is served by the Korth Eastern railway via Rangapara. Darrang is for the most part a level plain watered by many tributaries of the Brahmaputra. The district contains the two subdivisions of Tezpur and Mangaldai, tea being the principal crop cultivated in the valley of Tezpur and rice in Mangaldai. Mustard seed and jute are also grown. In Tezpur the population density increased more than sevenfold in the first 30 years of the 20th century because large areas of wasteland were brought under cultivation. There are reserved forests in the district, mostly at the foot of the hills along the northern boundary.

DARROW, CLARENCE SEWARD (18j7–1938), U.S. lawyer. famous as defense counsel in notable criminal trials, was born near Kinsman. O., April 18, 1857. He attended law school for only one year before he was called to the bar of Ohio. in 1878, He achieved recognition as a lawyer only when he moved to Chicago. where, through the friendship of John P. Xltgeld (*q.v.*), who later became his partner. he was appointed city corporation counsel and then general attorney of the Chicago and North Western railway. He resigned from the latter position to defend Eugene V. Debs, president of the American Railway union, and other union officials in the Pullman strike difficulties of 1895. This case gave him national fame in labour and criminal matters. He became a legend in his lifetime. Among the celebrated cases in which he appeared were the anthracite coal strike arbitration (1903); the William D. Haywood-Charles H. Moyer-George Pettibone and Steve Adams cases. involving the 1905 bomb murder of former Gov. Frank Steunenberg of Idaho (1907); the *Los Angeles Times* dynamite case (1911); the Communist case, involving a 1919 Illinois sedition act (1920); the trial of Richard Loeb and Nathan Leopold for the murder of a 14-year-old boy (1924); the Scopes trial (*q.v.*), in which Darrow defended a Tennessee schoolteacher accused of illegally teaching the Darwinian theory of evolution (1925); the Sweet case. involving violence in a Negro segregation dispute in Detroit, Mich. (19263; and the Thomas H. Massie trial, involving the revenge murder of an alleged rapist (1932). His cases. scattered throughout the nation, were the topics of daily conversation everywhere.

Darrow was at one time the law partner of Edgar Lee Masters, the *Spoon River* poet. His writings included *Crime, Its Cause and Treatment* (1925), *Farmington* (1905), *A Persian Pearl and Other Essays* (1899), *An Eye for an Eye* (1905), The *Prohibition Mania,* with Victor S. Yarros (1927), *The Story of My Life* (1932) and many other books and pamphlets on social. literary and economic questions. His courtroom pleas were filled with allusions based on his n-ide reading. For many years he was a well-known platform speaker and debater, distinguished for his freedom from dogma and his skepticism about human nature and institutions. He died on March 13, 1938, in Chicago.

His centennial commemoration in 1957 and the parole of Nathan Leopold in 1958 aroused renewed interest in Darrow and he became the subject of plays and books and appeared to have become a part of American folklore.

See an anthology ***of*** his speeches, ***Attorney for the Damned, ed. by*** Arthur Weinberg (1957); Irving Stone, ***Clarence Darrow for the Defense*** (1941). ***(E. Gz.)***

DARTER, the common name applied to a water-dwelling bird, the anhinga or snakebird, capable of lightning-fast lunges of its head and bill, and to many small, active, bottom-dwelling fishes of the perch family, especially *Etheostoma* species, of North America. *See* SNAKEBIRD.

DARTFORD, a municipal borough (1933) in the Dartford parliamentary division of Kent. Eng., 17 mi. E.S.E. of London by road. It lies near the confluence of the Thames and its tributary, the Darent, which is crossed there by the Roman Watling street from Canterbury to London, thus giving the town its Domesday name of Tarentford. Pop. (1961) 45,643. It is an ancient market town and former coaching station, and also an industrial centre. The parish church has a Korman tower and contains a medieval (*c.* 1450) fresco and several interesting brasses. The Bull is an old coaching inn with a galleried courtyard. The grammar school dates from 1576

Because of its situation on the main route between London and the continent, Dartford has been associated with many historic events. It was there in 1235 that Isabella, sister of Henry III, mas married, by proxy, to the emperor Frederick II. In 1331 a famous tournament was held in the place by Edward III who also established a Dominican nunnery on West hill in 1355, of which, honever, little remains. After the Dissolution it was used as a private residence by Henry VIII, Anne of Cleves and Elizabeth I. The town was closely connected with the Wat Tyler revolt in 1381 (*see* TYLER, WAT). One of the first attempts to manufacture paper in England was made there by the German, Sir John Spielman id. 1607). jeweler to Elizabeth I. Papermaking is still important there as well as chemical manufactures, light engineering and flour milling. In the neighbourhood are large quarries supplying chalk for making lime and cement. There are several big hospitals in and near the toun and a museum with Roman and other antiquities.

DARTMOOR, a wild moorland plateau in southwest Devon, Eng.. from 1951 a national park. It measures 23 mi. from north to south, 20 mi. from east to west and is 365 sq.mi. in area, with a mean altitude of 1,700 ft. The uplands are unfenced and bleak, with heather moors and peat bogs. Isolated headlands called tors, capped with wind-worn granite rocks, arise in rugged grandeur; the highest of these are Yes Tor and High Willhays (2,028 and 2.039 ft.). Only two good roads, one from Exeter to Plymouth and the other from Ashburton to Tavistock. cross the moor, intersecting at Two Bridges. Most of the moor is uninhabited.

Dartmoor gives rise to eight main rivers but much water is impounded in reservoirs to supply the towns of Devon. Grazing is Dartmoor's other main resource; it supports hardy wild Dartmoor ponies, sheep and some cattle. Granite and china clay are quarried. There are extensive oak and spruce woods on the fringes.

Dartmoor nas a royal forest in Saxon times, and from 1337 the central portion has been owned by the royal duchy of Cornwall. The surrounding districts are called venville districts. and their farmers have valuable pasturage rights over Dartmoor. The main centres for local trade and tourists are Okehampton. Chagford, Moreton Hampstead, Ashburton and Tavistock, all lying off the moor itself.

Princetonn, near the heart of the moor, 1,400 ft. above sea level, was founded in 1806 to serve Dartmoor prison, which was built to hold French prisoners from the Napoleonic Wars. During 1813–15 it held U.S. sailors captured in the War of 1812, who helped build Princetown parish church A memorial window and gate ay presented by U.S. women commemorate 218 captives who died there. From 1850 Dartmoor has been England's main prison for long-term convicts. (H. L. EN.)

DARTMOUTH, BARON AND EARLS OF. The title Baron Dartmouth was bestowed upon GEORGE LEGGE (1647–91) in 1682. His father, William Legge (*c.* 1609–70) was a staunch royalist during the English Civil War and assisted in the Restoration. George served as a volunteer in the navy during the Dutch War of 1665–67. He was a member of the household of the duke of York, afterward James II, was governor of Portsmouth and master general of the army. He commanded as colonel the troop at Nieuport in 1678. In 1683 as "admiral of a fleet" he sailed to Tangier, dismantled the fortifications and brought back the English troops. Under James II Dartmouth was master of the horse and governor of the Tower of London; and in 1688 when William of Orange was expected, James II made him commander in chief of his fleet. Although he was himself loyal to James, the same cannot be said of many of his officers, and an engagement with the Dutch fleet was purposely avoided. Dartmouth, however, refused to assist in getting James Edward, prince of Wales, out of the country, and even reproved the king for attempting this proceeding. He then left the fleet and took the oath of allegiance to William and Mary, but in July 1691 he was arrested for treason, and was charged with offering to hand over Portsmouth to France and to command a French fleet. Dartmouth protested his innocence. He died in the Tower of London on Oct. 25, 1691, before the question was investigated.

The 1st Baron's only son WILLIAM (1672–1750), 1st earl of Dartmouth, succeeded to his father's barony. He became secretary of state for the southern department and joint keeper of the signet for Scotland in 1710. In 1711 he was created Viscount Lewisham and earl of Dartmouth; in 1713 he exchanged his offices for that of lord keeper of the privy seal, which he held until the end of 1714. He retired on the accession of George I and died at Blackheath on Dec. 15, 1750.

WILLIAM (1731–1801), 2nd earl, grandson of the 1st earl, was lord privy seal at the beginning of the American Revolution. He advised the colonies in 1775 to accept the conciliatory proposals put forward by Lord North, but he opposed similar proposals in 1776 and advocated the employment of force. He resigned his office in March 1782 and became lord steward of the household in 1783; he died on July 15, 1801. Dartmouth's piety and his intimacy with the early Methodists won for him the epithet of the "Psalm Singer." Dartmouth college in New Hampshire was named after him. Among his papers preserved at Patshull house, Wolverhampton, are many letters from America relating to the struggle for independence.

The titles have descended directly to HUMPHRY (1888–) 8th earl, who succeeded his brother in 1958.

DARTMOUTH, a city in Halifax county, Nova Scotia, Can., on the eastern side of Halifax harbour, opposite the city of Halifax, to which it is connected by the mile-long Angus L. Macdonald suspension bridge, opened in 1955. A large oil refinery at Imperoyal, near the mouth of the harbour, employs many residents, and other oil companies maintain docking and distribution facilities. Other industries are shipbuilding, molasses production and the manufacture of aircraft parts and electric components. The Royal Canadian Navy has a seaplane base at Shearwater and a research establishment. The Bedford Institute of Oceanography, situated on Bedford basin, the northern end of the harbour, was established to obtain information about Atlantic and sub-arctic coasts.

Named after the town in Devonshire, Eng., Dartmouth was founded in 1750 by 353 English settlers who had arrived on the ship "Alderney." It expanded during the building (1826–61) of the Shubenacadie canal connecting the Bay of Fundy with the Atlantic ocean, and during World Wars I and II, although partly destroyed by the Halifax explosion of December 6, 1917. Incorporated as a town in 1873, it became a city in 1961 after eight communities had been amalgamated. Pop. (1961) 46,966.

(P. R. BL.)

DARTMOUTH, a seaport and municipal borough of Devon, Eng., lies on the west bank of the Dart estuary, 30 mi. E. of Plymouth by road. Pop. (1961) 5,757. It is connected by ferry steamer with Kingswear on the opposite shore. The castle, built in the 15th century in Edward IV's reign, stands above the estuary; its wooded estate was bought by the corporation in 1904. The ancient manors of Clifton and Hardness, together with Dartmouth, give the borough its official name (under a charter of Henry II) of Clifton Dartmouth Hardness. The Butterwalk, beneath timbered houses resting on 11 granite pillars, dates from about 1635. The town is a yachting centre with shipbuilding, light engineering and pottery industries. River steamers ply to Totnes, 10 mi. up the Dart. From Dartmouth, William II embarked in 1099 for the relief of Le Mans, and in 1190 the crusader squadron of Richard I set sail for the Holy Land. Manorial markets, granted in 1231 and 1301, were important, for as early as 1225 the fleet was provisioned there. In 1341 the town was incorporated by a charter frequently confirmed by later sovereigns. The "Speedwell" and the "Mayflower" lay off Bayards cove for a week in 1620 before sailing for America. Dartmouth played an important part in World War II, and from there U.S. troops embarked for Normandy.

The Britannia Royal Naval College. — From 1863 until 1905 naval cadets were trained for 16 months to two years in H.M.S. "Britannia" berthed in the river. In 1905, when the New Britannia Royal Naval college was opened (still known as H.M.S. "Britannia"), the Selborne scheme, introducing a common entry for all officers of the executive and engineering branches and of the Royal Marines. was put into practice. Cadets spent their first two years at the Royal Naval college, Osborne (opened in 1903), and the last two at Dartmouth, after which they went to sea as midshipmen. Following the introduction of the special entry scheme in 1911, Dartmouth mainly provided officers for the Royal Marines. From 1921, when Osborne was closed down and Dartmouth enlarged: all cadets (about 550) were trained at Dartmouth until 1942, when the college was bombed. Cadets then moved to Eaton hall, Chester, until their return in 1946. (For current conditions of entry and training, see MILITARY. NAVAL AND AIR ACADEMIES.) The naming of the royal yacht H.M. Yacht "Britannia," in 1953, caused the name of the college to be changed to the Britannia Royal Naval college. Dartmouth.

DARTMOUTH COLLEGE, a privately operated nonsectarian institution of higher learning for men, chartered in 1769 and located at Hanover, N.H. See HANOVER.

DARTS, a predominantly British game played by throwing darts at a circular numbered board. The board, usually of cork, bristle or elm, is divided by thin mires into 20 sectors, valued at points ranging from 1 to 20. A narrow outer ring running through all sectors doubles the value of the sector for the dart thrown into that part of the sector and a narrow inner ring trebles it, while the bull's-eye itself has a small outer ring worth 25. the inner circle being worth 50 points (see figure). Throwing is free style from 8 to 9 ft. away, with the centre of the board 5 ft. 8 in. from the ground. Each player has three darts! generally about 6 in. long. weighted and feathered. The usual game is to start with any double score (dart thrown into the double ring) and then

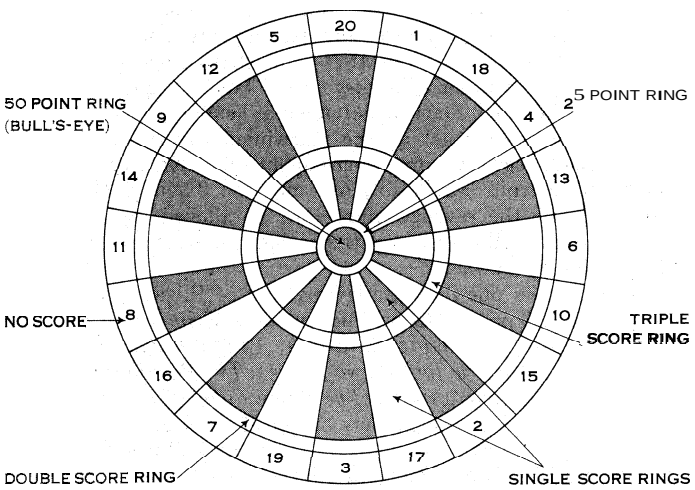

DIAGRAM OF A DART BOARD

subtract this and subsequent scores from 301. The winner must reach exactly zero with a final double. Variations of the game are limited only by the player's imagination.

In the 16th century there were reports of "darts" being thrown at a marked quintain, a tournament practice target, as a game. Darts is recorded as a pastime of the Pilgrim Fathers on board the "Mayflower" in 1620. In its modern form the game is played in the public house (tavern) or club, rather than the home. At the beginning of the 1960s there were estimated to be about 6,000,000 players in the British Isles, of whom 1,000,000 were registered players, organized into 7.000 clubs affiliated with the National Darts association. Two national Sunday newspapers organize annual championships; the *People* runs a team championship for the Lonsdale trophy and the *News of the World* runs the individual championship.

See R Croft-Cooke, *Darts* (1936). (N D. M)

DARU, PIERRE ANTOINE, COMTE (1767–1829), French military administrator whose conscientiousness and capability won him Napoleon's complete confidence, was born at Montpellier on Jan. 12, 1767. He entered the military administration in 1784. After serving as chief commissary of Masséna's army in Switzerland (1799), he became secretary-general of the ministry of war (1801) and a member of the tribunate (1802). In July 1805 he became councilor of state and intendant-general of the emperor Napoleon's household. In addition he played the principal role in the administration of the Grande Armée (as intendant-general from Oct. 1806) during the campaigns of 1805, 1806, 1807 and 1809; he supervised the French administration of the Prussian and Austrian territories under military occupation and the execution of the financial side of the treaty of Tilsit by Prussia. Daru was nominated secretary of state on April 17, 1811. He followed Napoleon with the army in 1812 and 1813. then became minister for the administration of war in Nov. 1813. On the first Restoration he retired in April 1814. but he was nominated intendant-general of the army in December. However, during the Hundred Days (1815) he was minister of state. attached to Napoleon's ministry of war. Even so, under the second Restoration he was admitted to the Chamber of Peers in 1819, where he resisted the ultra-royalist policy. He died at Meulan on Sept. 5. 1829.

Daru uas also a man of letters. Among his works are: *Histoire de la république de Venise,* 7 vol. (1819); *Histoire de la Bretagne,* 3 vol. (1826); a poetical translation of Horace, 4 vol. (1804–05); *Discours en vers sur les facultés de l'homme* (1825) and *Astronomie,* a didactic poem in six cantos (1830).

See C. A. Sainte-Beuve, *Causeries du lundi,* vol. ix *(1878)*; also the composite work *L'Intendant général Comte Daru* (1933), which includes a reprint of the "Notice" on Daru by his younger contemporary M. Viennet (1833). (C. E. Du.)

DARWEN, a municipal borough (1878) in the Darwen parliamentary division of Lancashire, Eng., is situated 4 mi. S. of Blackburn on the Darwen river. Pop. (1961) 29,452. **A** prehistoric tract and a Roman road run through the borough, which was the site of early settlement where many Bronze Age and Roman remains have been found. Darwen manufactures include cotton goods (since 1820), paper, paint, plastics, textile machinery, pipes, and chemicals. It has three richly flowered and well laid out public parks and the use of 30 mi. of pathways over the surrounding moors.

DARWIN, CHARLES ROBERT (1809–1882), English naturalist, who first soundly established the theory of organic evolution in his monumental work, *Origin of Species,* was born at Shrewsbury, Shropshire, on Feb. 12, 1809, the grandson of Erasmus Darwin (*q.v.*). His mother, a daughter of Josiah Wedgnood (*q.v.*), died in 1817. Darwin was educated at Shrensbury school under Samuel Butler (1774–1839), and in 1825 uent to Edinburgh university to prepare for the medical profession, for which he was unfitted. In 1828 he went to Christ's college, Cambridge. with the idea that he should become a clergyman. He took his degree in 1831, tenth in the list of those who do not seek honours. The chief advantage which he gained at Edinburgh and Cambridge was the friendship of scientific men such as Robert Edmond Grant and William MacGillivray at the former, John Stevens Henslow and Adam Sedgwick at the latter.

Early Observations and Origin of Species.—From Dec. 1831 to Oct. 1836, Darwin sailed in H.M.S. "Beagle" as naturalist for the surveying expedition which visited Cape Verde and other Atlantic islands, the South American coasts and the Galapagos Islands, Tahiti, New Zealand, Australia, Tasmania, Keeling Island, Maldives, Mauritius, St. Helena, Ascension and Brazil. His work on the geology of those lands became the subject of volumes which he published after his return, including his *Journal of Researches* (1839) and *The Structure and Distribution of Coral Reefs* (1842); in the latter he advanced a theory of reef formation that is still generally held.

The voyage was the real preparation for his lifework. His observations on the relationships between geographically separated animals (forms on the islands and the contiguous mainland) and time-separated animals (living and recently extinct forms, related to but not the same as the extant animals) led him to reflect upon the prevailing view of the fixity of species. He had also been much impressed by "the manner in which closely allied animals replace one another in proceeding southwards" in South America. His journal for 1837 contains the words: "In July opened first note-book on Transmutation of Species. Had been greatly struck from about the month of previous March on character of South American fossils, and species on Galapagos Archipelago. These facts (especially latter) origin of all my views." While he was secretary of the Geological society from 1838 to 1841, he saw a great deal of Sir Charles Lyell (*q.v.*), whose principle of uniformity, contained in his *The Principles of Geology* had impressed him greatly. In Jan. 1839 he married his cousin, Emma Wedgwood. They lived in London until 1842, when they moved to Down, near Beckenham, Kent, which was Darwin's home for the rest of his life. From 1846 to 1854 he was chiefly engaged upon monographs on the recent and fossil cirripede Crustacea *(Ray Soc.,* 1851 and 1854; *Palaeontograph. Soc.,* 1851 and 1854).

Soon after beginning his notebook in 1837 he began to collect facts bearing upon the formation of the breeds of domestic animals and plants, and quickly saw "that selection was the keystone of man's success. . . . But how selection could be applied to organisms living in a state of nature remained for some time a mystery to me." Upon reading in Oct. 1838, T. R. Malthus' *Essay on the Principle of Population,* his own observations having long since convinced him of the struggle for existence, it at once struck Darwin "that under these circumstances favourable variations would tend to be preserved, and unfavourable ones to be destroyed. The result of this would be the formation of new species. Here, then, I had . . . a theory by which to work." It was because Darwin provided a scientific explanation of how evolution occurred, free from miraculous intervention or unfounded fancy, that he succeeded where Lamarck had failed in making the fact of evolution acceptable. *(See* EVOLUTION, **ORGANIC; LAMARCKISM.)**

In 1856 Darwin started to write a large treatise on his views, and had completed about half of it, when, in June 1858, he received a manuscript from Alfred Russel Wallace (*q.v.*), who was then at Ternate in the Moluccas, in which Darwin was startled to find a complete abstract of his own theory of natural selection. He placed himself in the hands of Lyell and Sir Joseph Dalton Hooker (q *v.)* who decided to send Wallace's essay to the Linnean society, together nith an abstract of Darwin's work which they asked him to prepare, the joint essay being accompanied by an explanatory letter to the secretary. The title of the joint communication was "On the Tendency of Species to Form Varieties; and on the Perpetuation of Varieties and Species by Natural Means of Selection." It was read on July 1, 1858, and published in the *Journal of the Linnean Society* (Zoology) for that year.

On Nov. 24, 1859, Darwin published his great work, *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life.* The whole edition of 1,250 copies was sold out on the day of issue. The first four chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence. The fifth chapter deals with the laws of variation and causes of modification other than natural selection. The five

succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection. The three remaining chapters (omitting the final recapitulation) deal with the evidence for evolution provided by paleontology. geographical distribution, comparative anatomy. embryology and vestigial organs. The theory which suggested a cause of evolution is thus given the foremost place and the evidence for the fact of evolution considered last. Although others before Darwin had conceived the idea of evolution, none had thought out and marshaled the evidence in a manner which bears any comparison with his. A storm of controversy arose over the book, reaching its height at the British association meeting at Oxford in 1860, when the celebrated disputation between T. H. Huxley (*q.v.*) and Bishop Samuel Wilberforce took place. Throughout these struggles Huxley was the foremost champion for evolution.

In Darwin's day nothing was known about heredity. There was a vague belief in blending inheritance and in the inheritance of acquired characters. Darwin's great difficulty was to account for a sufficient supply of variation, which is why he relied more and more on the supposed inheritance of acquired characters. Gregor Johann Mendel's discovery of genes that are particulate, remain uncontaminated, conserve past variance and change occasionally by mutation provided exactly the mechanism required by Darwin and removed his difficulty. The integration of Darwinian selection and Mendelian genetics and the proof that variation in organisms is not directed but fortuitous, demonstrated in 1930 by Sir Ronald Fisher, are now generally accepted as the explanation of evolution. (*See* DARWINISM.)

Reactions to Darwin's Views.—Darwin's character was marked by great tenderness and kindness to his family, friends and fellow scientists. After returning from the voyage of the "Beagle," he was almost continually in poor health; he suffered extreme fatigue and was often disinclined to meet company, with the result that he led the life of a semi-invalid recluse under the constant care of his wife. When he was not well, his daily routine involved no more than four hours' work, the remainder of his time being taken up by walks, rests and reading novels.

About his works he was always modest, although he realized that they inaugurated a new era of thought. His retiring disposition prevented him from ever taking part in the violent controversies over his demonstration of evolution by natural selection, and he was content to let his views be defended by others, in particular Huxley. At the same time. his sensitive nature was deeply pained by unfair criticism. Even when subjected to formidable attacks, as by Fleeming Jenkin on the swamping of new variations, or Lord Kelvin on the reduced estimate of the age of earth, Darwin never lost faith in the validity of his demonstration of natural selection, and modern knowledge has justified him completely.

One of the most important results of Darwin's work has been the demonstration that the evolution of plants and animals, and of the adaptations which they show, provides no evidence of divine or providential guidance or purposive design, because natural selection of fortuitous variations gives a scientifically satisfactory explanation of evolution without any necessity for miraculous interposition or supernatural interference with the ordinary laws of nature. This fact led to a conflict between the upholders of orthodox revealed religion and the scientists. Darwin himself was well aware of the significance of this conflict. "My theology is a simple muddle," he wrote in 1870; "I cannot look at the universe as the result of blind chance, yet I can see no evidence of beneficent design, or indeed of design of any kind, in the details." In 1856 he had written "What a book a devil's chaplain might write on the clumsy, wasteful, blundering, low, and horribly cruel works of nature." Darwin believed that all morality was the result of evolution and that in man it had been produced not by natural selection working on the individual, but by the improvement of social standards conferring survival value on the social units whose members show them. It was therefore not surprising that as he grew older Darwin abandoned the views of an orthodox member of the Church of England and became an agnostic.

Later Works.—*The Variation of Animals and Plants under Domestication* was published by Darwin in 1868, and may be looked upon as a complete account of the material condensed in the first chapter of the *Origin of Species.* It contains his now abandoned theory of "pangenesis" (*see* LAMARCKISM).

The Descent of Man, and Selection in Relation to Sex (1871) was the natural sequel to the *Origin* of *Species* and amplified his statement there that "light will be thrown on the origin of man and his history." Research has confirmed Darwin's conclusions. The book also contains the evidence in support of his hypothesis of sexual selection which, with modifications, is still accepted. *The Expression of the Emotions in Man and Animals* (1872) offered a natural explanation of phenomena which appeared to be a difficultyin the way of the acceptance of evolution. Of Darwin's numerous other works his *On the Various Contrivances by Which British and Foreign Orchids are Fertilised by Insects* appeared in 1862. *The Effects of Cross and Self-Fertilisation in the Vegetable Kingdom* (1876) proved that the offspring of cross-fertilized individuals are more vigorous and more numerous than those produced by a self-fertilized parent. *The Different Forms of Flowers on Plants of the Same Species* (1877) demonstrates that each different form, although possessing both kinds of sexual organs, is specially adapted to be fertilized by the pollen of another form, and that when artificially fertilized by pollen from a plant of its own form, less vigorous offspring are produced. *On the Movements and Habits of Climbing Plants* and *Insectivorous Plants* were published in 1865 and 1875 respectively. *The Power of Movement in Plants,* assisted by Francis Darwin, appeared in 1880, and *The Formation of Vegetable Mould, Through the Action of Worms,* in 1881.

Darwin died on April 19, 1882, and was buried in Westminster abbey. Four of his sons became prominent scientists: Sir George Howard (1845–1912), professor of astronomy and experimental philosophy at Cambridge; Sir Francis (1848–1925), botanist; Leonard (1850–1943), a major in the royal engineers, and afterward well known as an economist and eugenist; and Sir Horace (1851–1928). civil engineer.

DARWIN, ERASMUS (1731–1802), English scientist and poet, was generally considered one of the foremost physicians of his day. The grandfather of the biologists Charles Darwin and Francis Galton, he was born at Elton, Nottinghamshire, of a Lincolnshire family notable for its members' originality of mind and character. He was educated at St. John's college, Cambridge, and received medical training at the universities of Edinburgh and Cambridge. In 1756 he set up medical practice at Nottingham but was unsuccessful and soon moved to Lichfield. In 1781 he moved to Derby where he died on April 18, 1802. He corresponded with such eminent men as Priestley and Rousseau. He was also an accomplished writer of light occasional verse, and the author of several religious poems which were included in popular hymnals.

His more ambitious works include: *The Botanic Garden* (1792) and *The Temple of Nature or the Origin of Society* (1803) in verse; and *Zoonomia* (1794–96), *Female Education in Boarding Schools* (1797) and *Phytologia, or the Philosophy of Agriculture and Gardening* (1799) in prose. Most of Darwin's verse, with its stilted. pedantic heroic couplets and constant use of allegory, is long since forgotten. However, it is not without passages of vigour and even of grandeur. His prose, on the other hand, is clear and readable even by modern standards.

Darwin was a child of the 18th century and a convinced deist. As a young man he wrote to a friend on the occasion of his (Darwin's) father's death: "That there exists a superior *Ens Entium,* which forms these wonderful creatures, is a mathematical demonstration. That He influences things by a particular providence, is not so evident. The probability, according to my notion, is against it, since general laws seem sufficient for that end." In his ideas of aesthetics and psychology he followed in the tradition of

English materialism established by Locke, Hume, Berkeley and David Hartley. Zoonomia, particularly, is interesting for its apparent anticipation of the later theories of Lamarck, Charles Darwin, Pavlov and others, and also for its emphasis on the physical basis of thought and emotion.

Briefly, it is as a transitional figure that Erasmus Darwin is chiefly important. He stands at the threshold of a new era. taking most of his basic assumptions from 18th-century materialism; but also prefiguring the more sophisticated approach of scientists like Charles Darwin and T. H. Huxley.

Darwin's Botanic Garden" in *Wiener Beiträge zur englischen philologie* (1909); James V. Logan, "The Poetry and Aesthetics of Erasmus Darwin" in *Princeton Studies in English (1936).* (L. C. D.; S. P. D.)

DARWIN, SIR GEORGE HOWARD (1845–1912), British astronomer and pioneer in applying detailed dynamical analysis to cosmogonical and geological problems, was born at Down. Kent, on July 9, 1845. The second son of Charles Darwin, he was educated at Trinity college, Cambridge (second wrangler and Smith's prizeman), was elected fellow in 1868 and became Plumian professor of astronomy and experimental philosophy in 1883. His work on the harmonic analysis of tidal observations. based on methods developed by P. S. Laplace and Kelvin, is monumental. He discussed the effects of tidal friction on the evolution of binary systems with special reference to the moon, coming to hold that the moon might have originated from the disruption of a parent earth by resonant solar tides. He examined the possibility of geological changes causing large alterations in the inclination of the earth's axis to its orbital plane, but came to a negative conclusion. He also made extensive studies of periodic orbits in the problem of three bodies, and particularly of the figures of equilibrium of rotating masses of fluid, with the difficult problem of their stability; but his conclusion that the pear-shaped figure is stable, contrary to A. M. Liapunov's result and Sir James Jeans's later work, is considered incorrect. He became president of the Royal Astronomical society in 1899 and of the British association in 1905. Darwin received many honours and was made knight commander of the Bath in 1905. He died at Cambridge on Dec. 7, 1912.

Among Darwin's works are *The Tides and Kindred Phenomena in the Solar System* (1898), based on popular lectures at Boston, Mass., in 1897; and *Scientific Papers*, vol. i–v (1907–16), vol. v of which contains a biographical memoir by his brother Sir Francis Darwin. (R. A. L.)

DARWIN, a town in the centre of the northern coast of Australia, named for Sir Charles Darwin. It lies on the eastern side of a spacious natural harbour and is the administrative centre and chief port of the Xorthern Territory. Pop. (1954 census) 8,071. Area 27 sq.mi. Founded in 1869 and known as Palmerston until 1911, Darwin was largely rebuilt after World War II. The population consists mainly of public servants; the pastoral, mining and rice-growing industries of the hinterland depend upon the port facilities of Darwin. The town has an international airport and is the terminal of the east and west coast shipping routes, of the railway to Birdum (317 mi. S.E.), of the Stuart highway (1942) to Alice Springs (954 mi. S.S.E.) and of the 1,973-mi. overland telegraph line (1872) to Adelaide, South Australia. (N. S. B.)

DARWIN GLASS: see TEKTITE.

DARWINISM. The word Darwinism was originally coined to denote that type of evolutionary mechanism propounded by Charles Robert Darwin (*q.v.*) as an explanation of organic change. Darwinism must not be taken as synonymous with the word evolution itself (see EVOLUTION, ORGANIC). Rather, it denotes Darwin's specific view of how the process comes about. Even here the word is open to a certain ambiguity because Darwin actually introduced more than one partial explanation of evolution into his great book, The Origin of Species. As the years passed, however, the natural selection hypothesis took on favour with biologists and Darivinism. by degrees, shed some of the minor supporting hypotheses which Darwin originally brought forward to sustain his thesis of natural selection. Modern neo-Darninism (see below) for this reason must not be taken as precisely similar to Darwinism. On the basis of newer knowledge, some ideas have been dropped and new views substituted. If Darwin were living today he would recognize his theory but would be unfamiliar with much that has been incorporated within it. At the core of modern evolutionary theory is still to be found, however, the pure Darwinian conception of a selective death rate, which, on the whole, favours the population most successfully adapted to a given environment.

History of Natural Selection.—The biological theory which we loosely call Darwinism and which was first brought to widespread public attention by the publication in 1859 of Darwin's Origin, has a much older history, which was, for a time, obscured by the revolution in biological thought which occurred in the latter part of the 19th century as a consequence of that book.

Accumulation of Facts.—Although fragments of the theory of evolution may be found in the writings of the early Greek philosophers, centuries elapsed before any convincing scientific statements appeared. Like most noteworthy contributions to science the leading idea of Darwin's argument was anticipated by a few writers as the slow accumulation of pertinent facts began to transform the western world's view of life. The truly fruitful harvesting of facts began in the 16th century. Briefly, the events of this period ahich stimulated thought about evolution can be outlined as follows:

1. The great exploratory voyages of the 16th and 17th centuries had a profound impact upon European scholars. The voyages made Europe aware of a diversity of animals. men and plants of which it had been previously unaware. A new effort, therefore, was required to fit this larger world into the framework of Christian philosophy. Men began to pay more attention to the Deity's second book of revelation: nature. In England, for example, there arose a line of parson naturalists, theologically oriented men who made observations upon local natural history. John Ray (*q.v.*), a model for many later writers, is an exemplar of this class of observers.

2. So long as the notion that the world was only about 6,000 years old obtained, as it did, in orthodox Christian circles, no really strong evolutionary conceptions were possible. Some belief in the ability of plants or animals to alter, existed before the 18th century, but it was certainly different from modern ideas of progressive evolution. Thus before the evolution of life on a grand scale could be taken seriously, two things had to be accomplished: the full depth of geologic time had to be explored, and the nature of past life on earth revealed in all its amazing diversity.

3. Even after the succession of life forms in the rocks had been demonstrated, it would still be necessary to show that the life of one age was genetically related to the life of a later and succeeding age. To do this would demand full recognition of the continuity of geologic ages, an extensive development of comparative anatomy as a science and. finally, a plausible scientific theory as to how organic change in plants and animals might come about. It was this final point which Darwin was to provide in his Origin.

Supporting Views in Geology.—By 1785 James Hutton, the Scots geologist, had expressed at considerable length his belief in the great antiquity of the earth and the fact that the face of the planet was still undergoing alteration as it had throughout the great vistas of past time. Although his work suffered temporary eclipse, it was supported ably by his friend and follower, John Playfair.

In the 1830s Charles Lyell (*q.v.*) advocated and readvanced a naturalistic interpretation of geologic processes. His work, The *Principles of* Geology, had a profound effect upon young Darwin. He read the first two volumes during the course of his service as naturalist aboard H.M.S. "Beagle" (see below). By the time Darwin began his work upon the species question, the depth of geologic time to the order of millions of years was quite well accepted.

Fossil Record.—The work of Baron Cuvier, Richard Owen, William Smith and others had similarly begun to reveal the richness of the fossil record as well as the basic anatomical relations between extinct forms of life and those of the present.

Idea of *Evolution.*—A few men, notably P. L. M. de Mauper-

tuis, Buffon, Erasmus Darwin and J. B. Lamarck, had already postulated some kind of evolutionary succession. Darwin, therefore, did not originate the idea of evolution. Instead, he organized the first great body of proofs that showed the process to be a reality and, in addition, supplied the first adequate mechanism to account for it; namely, the theory of natural selection. (See SELECTION.)

Struggle for Existence. — The struggle for existence, upon which Darwin's theory was based, was, like so much else in the theory, known long before Darwin. Population pressure (the effect of a surplus of organisms) against food resources had been observed among both men and animals in the 18th century by John Bruckner (1768) and Thomas Malthus (*q.v.;* 1798). It had been remarked that this pressure exercises a pruning effect upon life; *i.e.,* it results in a struggle for existence, an active or passive competition among organisms for the available food and space. Those individuals better equipped for the struggle tend to survive and reproduce themselves; those ill-equipped often perish.

In the 18th and early 19th centuries what today is called natural selection was thought to be simply a kind of divine government maintaining natural forms in their proper proportions. It was thus seen by John Hunter, William Paley and others who repeated these ideas. Hunter termed the process "natural government." Science, in other words, had recognized before Darwin the negative aspects of selection — its role in extinction (Lyell) and its part in keeping species up to par by eliminating the weak or aberrant individuals. What was not glimpsed, except by two or three persons before Darwin, was the fact that selection might be creative — that new forms might be introduced slowly and imperceptibly by degrees.

A strong theological bias on the part of both scientists and the public led to a vague feeling that evolution was atheistic. The fact that it had been propounded by Frenchmen at about the time of the Revolution and directly after made the idea doubly suspect in conservative England. Although antievolutionist sentiment has largely subsided, it is still formally espoused by a few religious groups. (See FUNDAMENTALISM; SCOPES TRIAL.)

Darwin's Discovery. — In 1831 Darwin, as a young man of 22, set forth on the famous voyage of the "Beagle" which was to occupy him for five years. In the course of his wanderings he saw and learned much of the geology and animal life of South America and the neighbouring Galapagos Islands. He observed that species vary on opposite sides of mountain barriers and upon the separate islands of archipelagoes. While Darwin was absent on his voyage, two naturalists, Patrick Matthew (1831) and Edward Blyth (1835), had caught shadowy glimpses of the possibilities which lay in natural selection, but their briefly voiced ideas passed unheeded. In 1836 Darwin returned to England and settled down to a quiet life of meditation and study which was to culminate in his great work of 1859. Darwin, in his later years, attributed his inspiration to Malthus, but research suggests that he was also acquainted with the work of Blyth, who, though remaining within the old conservative framework, had hinted (1835–37) that his "localizing principle," as he termed natural selection, might suggest the descent of species from a common parentage.

Beginning in 1837 Darwin proceeded to work on the now well-understood concept that evolution is essentially brought about by the interplay of three principles: (1) variation — a liberalizing factor, which Darwin did not attempt to explain, present in all forms of life; (2) heredity — the conservative force which transmits similar organic form from one generation to another; (3) the struggle for existence — which determines which variations will survive in a given environment, thus altering life through a selective death rate. Add the long course of geologic time, contended Darwin, and life will be as slowly and inexorably altered as the unseen passage of an hour hand around a clock. Men's lives are so fleeting that they are not conscious of organic change until they learn to read the record of past epochs in the rocks of the earth.

This is the bare outline of the philosophy which was independently propounded by Alfred Russel Wallace (*q.v.*) in 1858, and which hastened the publication of Darwin's long-laboured-upon Origin in 1859. Darwin still made use of such ancillary hypotheses as the inheritance of acquired habits and. as criticism grew in his declining years, he tended to fall back upon similar Lamarckian arguments which were less prominently utilized in the first edition of the Origin. For a discussion of the reaction to Darwin's views see DARWIN. CHARLES ROBERT.

Neo-Darwinism. — Darwin and his contemporaries had none of the cytological and genetic information which became available later. Gregor Mendel (*q.v.*) — Darwin's contemporary — the founder of scientific genetics, was unknown, and the significance of his work was not recognized until 1900. As a consequence, Darwin was forced into unnecessary retreats and ambiguities in the later editions of his book.

The neo-Darwinian school — exemplified by, among many others, such outstanding scholars as Sewall Wright, T. Dobzhansky, G. L. Stebbins, Ernst Mayr and Julian Huxley — embraces a great body of experimental data which has removed many of the discrepancies of Darwinism. Modern neo-Darwinism has been purged of Darwin's lingering attachment to the Lamarckian inheritance of acquired characters. Present knowledge of the mechanisms of inheritance are such that modern scholars can distinguish more satisfactorily than Darwin between noninheritable bodily variation and variation of a genuinely inheritable kind.

The specific determiners of heredity (*q.v.;* genes) and the intricate mechanics of the chromosomes during cell division are factors which have been discovered since Darwin's time. Scientists have learned to produce mutations artificially through radiation and chemicals. Studies are being made on the chemical composition of the hereditary substance itself. Mathematical formulas elaborated by such scientists as Ronald Fisher. Wright and others have been introduced to handle the theoretical genetics of entire populations. These increases in perspective have placed scientists in a position to account for variation to a degree unrealized by Darwin.

The modern conception of evolutionary theory would be seen by Darwin as more intricate and complex than he had imagined, a matter of gene pools rather than individuals, but the essence of his theory remains. In this sense Darwin's work has withstood a century of criticism. He will always be hailed along with Wallace as the man uho took a new look at an old idea and in doing so rejuvenated what had been regarded as an exploded and fallacious notion of organic descent held by a few solitary philosophers before his time. Darwin's achievement is unique even if not so completely original as is ordinarily assumed. Only a man of persuasive and powerful intellect and an enormous capacity for labour could have so drastically affected the thinking of his time. See LAMARCKISM; GENETICS; VARIATION; see also references under "Darwinism" in the Index volume.

DAS, CHITTA RANJAN (1870–1925), Indian politician and leader of the Swaraj ("Independence") party in Bengal, was born at Calcutta on Nov. 5, 1870. of a high-caste Vaidya family of substantial means. After failing the competitive entrance examination for the Indian civil service he was called to the bar. He defended many accused of political offenses and took an active part in nationalistic journalism. Bitterly opposing British rule and rejecting all idea of the political or economic development of India along western lines. he idealized the life of the ancient Indian village and saw a golden age in ancient Indian history. He supported the nonco-operation movement launched by M. K. Gandhi and in 1921 was imprisoned for six months as a political offender. In 1522 he presided over the session of the Indian National Congress at Gaya and subsequently persuaded the members to adopt his policy of standing for election to the provincial legis-

lative councils and obstructing their business from inside instead of entirely boycotting the elections. Later, when the Swarajists were returned as the largest party in Bengal, Das declined the post of chief minister, stating that his aim was to wreck the system of dyarchy under which some provincial departments were headed by ministers responsible to the governor and others by ministers responsible to the legislature. In 1924 he mas elected mayor of Calcutta but was criticized for paying more attention to party management than to administrative efficiency. In the following year he began to make hints of a willingness to co-operate with the government, but before anything could come of them he died at Darjeeling on June 16, 1925.

See P. C. Ray, *Life and Times of C. R. Das* (1927). (KE. A. B.)

DASE (DESSIE), the capital of Wallo province of Ethiopia and the third largest town in that country, stands at a height of over 8,000 ft. on the edge of the escarpment between the cool, wet highlands of the western part of the province and the hot, dry lowlands of the Danakil plain to the east. Dase is 250 mi. N. of Addis Ababa. 438 mi. S. of Asmara and 16 mi. N.W. by road from Combulchia, which lies 2.000 ft. below Dase and is the junction of the roads to Asmara, Addis Ababa and Assab. Pop. (1956 est.) 53,500.

The town is the residence of the governor general of Wallo province and has a secondary school, a hospital and flour mills. At the beginning of the 20th century it was the capital of the Galla chieftain Ras Mikael, and it is a long-established and important market for grains. oilseeds and hides and skins and a distributing centre for imported goods. It has a subsidiary market at Batie, 40 mi. to the east on the Assab road and on the edge of the Danakil desert. Combulchia is the airport for Dase. (G. C. L.)

DASHKOVA, EKATERINA ROMANOVNA VORONTSOVA, PRINCESS (1744–1810), Russian literary figure of the Enlightenment, was born in St. Petersburg on March 28 (new style; 17, old style), 1744, the third daughter of Count Roman Illarionovich Vorontsov. (For the family. *see* VORONTSOV.) She became one of the leaders of the party that attached itself to the grand duchess (afterward empress) Catherine. In May 1759 she married Prince Mikhail Ivanovich Dashkov and went to reside nith him at Moscow. In 1762 she was in St. Petersburg and took a leading part in the *coup d'état* by which Catherine was raised to the throne. But for this, Princess Dashkova's elder sister Elizaveta, mistress of the emperor Peter III, might have risen to power, as Peter had declared that he would depose Catherine in her favour. Still, the princess' relations with the new empress were not cordial and she set out in Dec. 1769 on an extended tour through Europe, which lasted three years. In Paris she gained the friendship and admiration of Diderot and Voltaire. In 1775 she went again abroad and spent the years 1776–79 in Scotland. In 1782 she returned to the Russian capital. in Jan. 1783 was appointed *directrice* of the Academy of Arts and Sciences and in September first president of the Russian Academy founded at her suggestion. She projected the Russian dictionary of the academy, arranged its plan and executed a part of the work herself. She edited a monthly magazine. the *Sobesednik,* and wrote dramatic works. Shortly before Catherine's death Princess Dashkova retired from court. On the accession of the emperor Paul in 1796 she was deprived of all her offices and ordered to retire to a village in the government of Novgorod, "to meditate on the events of 1762." But she passed the closing years of her life on her estate near Moscow. where she died on Jan. 16 (N.S., 4. O.S.), 1810.

The *Memoirs of the Princess Dashkaw Written by Herself* were composed in French. but first published in English in London, 2 vol. (1540). They were edited by Mrs. W. Bradford.

See A. A. Suvorin, *Knyaginya Katerina Romanovna Dashkova* (1888); G. Schlegelberger, Die *Fürstin Daschkowa* (1935).

DASS, PETTER (1647–1707), Norwegian poet whose place in his country's 17th-century literary revival and in the affections of his compatriots rests mainly on his descriptive poem. *Nordlands Trompet.* The son of a Scottish merchant who had settled in Bergen, he was born on the island of Nord Herö, off the north coast of Norway, studied at Copenhagen and was ordained in 1677. In 1689 he received the living of Alstahsug in northern Norway, where for the rest of his life he exercised jurisdiction over a large and scattered parish, exhorting and comforting his congregation of fishermen, shepherds and farmers and sharing their love for their homeland. His poems were passed in manuscript from hand to hand, and learned by heart by his parishioners: the only work published in his lifetime was *Den norske dalevise* ("The Norwegian Song of the Valley," 1683). His sacred poems, revealing personal faith and piety, were collected after his death as *Aandelig Tidsfordriv* ("Spiritual Pastime"). Many were written with a didactic intention and are easily memorable versions and expansions of biblical texts and parts of the catechism.

Nordlands Trompet (Eng. trans. *The Trumpet of Nordland,* 1955) was first published in 1739. A rhyming description of the province of Nordland, it depicts with loving accuracy, homely humour and quaint learning its natural features, people and occupations. It is written in an easy, swinging metre, as lively and energetic as its writer, and has remained popular with the "men who inhabit the North," "the master who guides and the servant at work." and "all men who wear homespun" to whom it is addressed.

See H. Midbøe, *Petter Dass* (1947).

DASYURE, a name for the marsupial cats or tiger cats of the genus *Dasyurus,* found in New Guinea and Tasmania, as well as on the Australian continent. These are weasellike, carnivorous mammals about the size of a small cat, rusty or olive brown in general coloration, spotted with white. Females have a well-developed pouch in which four to six young may be suckled and supported. However, as many as 24 young may be born at a time, the greater portion of them dying soon after birth. Dasyures hide themselves in the daytime in holes among rocks or in hollow trees, but prowl about at night in search of the small mammals and birds, which constitute their prey. In arboreal species there are transversely striated pads on the feet; these are absent in terrestrial forms such as the common dasyure *(D. viverrinus).* *See* also MARSUPIALIA: *The Australian Dasyuroids.*

DASZYNSKI, IGNACY (1866–1936), Polish Socialist leader and patriot, the most eloquent Polish public speaker of his time, was born at Zbaraz, near Tarnopol, in eastern Galicia, on Oct. 26, 1866, the son of a modest civil servant. He studied at the universities of Cracow and Zürich. In Oct. 1892 he was one of the organizers of the Polish Social Democratic party in Galicia. Elected to the Austrian *Reichsrat* in 1897, he sat in it till 1918. From 1903 he took part in many congresses of the Socialist International, always insisting that the independence and the reunification of all Polish lands were an integral part of the Polish Socialist program. From 1912 he collaborated to this and with Jozef Pilsudski (*q.v.*), whom he then admired. In 1912 also he became editor-in-chief of the Polish Socialist daily newspaper *Naprzod* ("Forward") in Cracow. Daszynski was the head of the first and short-lived provisional government of restored Poland formed at Lublin on Nov. 7, 1918. Elected on Jan. 26, 1919, to the first Polish *sejm,* he was re-elected in 1922, 1928 and 1930. From July 21. 1920, to Jan. 4, 1921, he was deputy premier in the government of national unity presided over by Wincenty Witos. From 1928 to 1930 he was marshal (speaker) of the *sejm* and, as such, firmly defended the parliamentary prerogatives against Pilsudski's authoritarianism. The two leaders were friends no more and in 1930 Daszynski had to surrender his passport. He became ill in 1931 and retired from public life. He died on Oct. 31, 1936. at Wisla, near Cieszyn. His memoirs (two volumes) had appeared in 1925–26.

See A. Próchnik, *Ignacy Daszyński* (1946). (K. SM.)

DATE LINE, a north-south line through the Pacific ocean where, by common usage, the date changes. East of the line it is one day earlier than it is to the west. The line is necessary because the earth is divided into 24 one-hour time zones (of 15° longitude each) which make one full day on the earth. Since the earth rotates toward the east a given clock time progresses westward around the world. Thus noon arrives at London (0° longitude) five hours before it does in Washington (75° west of London), eight hours before it does in San Francisco (120° west of London), and twelve hours before it does at 180° west of London. At that longitude it would be midnight when it was noon in

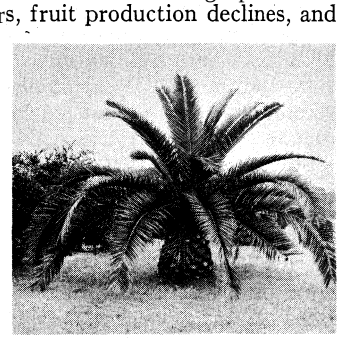
London. However, if longitude and time were counted east from London's noon, though midnight would be approached again, time would be later in the day, one hour for each 15°, rather than earlier. This situation would place the same day on both sides of 180". This cannot be, for the new day that starts westward from the 180th meridian must have a date one day later than the day which has just arrived. there from the east. The anomaly is solved by arbitrarily designating where a new day begins. On both sides of the line the time of day is the same but the name of the day, and hence its date are changed — forward if going west, backward if going east.

The line which has been arbitrarily designated as the date line (usually international date line) is the 180th meridian, with variations to the east or west for the convenience of certain land areas and islands. The line bulges eastward through Bering strait to accommodate eastern Siberia and then westward to include the Aleutian Islands with Alaska. South of the equator another eastward deviation allows certain island groups to have the same day as New Zealand. (J. W. RH.)

DATE PALM. The dates of commerce are the fruit of the date palm, *Phoenix dactylifera,* a tree which ranges from the Canary Islands through northern Africa and from the southwest of Asia to Pakistan and India. The tree has been cultivated and much prized, for its fruits have been the staple food and chief source of wealth in the irrigable desert portions of most of these regions from the remotest antiquity. It was carried to the new world by Spanish missionaries in the 18th and early 19th centuries and a few seedling plantings of date palms in the dry districts of Mexico date back to that period.

Plant Characteristics. — The date palm is a beautiful tree, growing to a height of from 60 to 80 ft. and its stem, which is strongly marked with the pruned stubs of old leaf bases, terminates in a crown of graceful, shining, pinnate leaves, 10 to 20 ft. long. The flowers are of separate sexes borne on different palms in branching spadices from the axils of leaves which emerged the previous year. Under cultivation it is necessary to pollinate the female flowers by artificial means. The fruit is a one-seeded berry, usually more or less oblong, but varying much in shape, size, colour, quality and consistency of flesh according to variety and cultural conditions. A single large bunch may carry more than 1,000 fruits weighing 20 lb. or more. The dried fruit so widely exported owes more than half its weight to sugar and about 2% each to protein, fat and mineral matter. Propagation is either from seeds or from suckers or offshoots which arise chiefly near the base of the stem in the early years of the palm's life. Palms grown from seed are a source of new varieties but extremely variable and about equally divided as to number of males and females.

Offshoots reproduce the sex and character of the parent palm and are used for commercial plantings. When offshoots are three to six years old and have formed roots of their own they are removed and planted. Palms are spaced about 30 by 30 ft.; they begin to bear in 4 or 5 years and reach full bearing at 10 to 15 years, yielding 100 to 200 lb. or more each. Although palms are known to live as long as 150 years, fruit production declines, and in commercial culture palms are replaced at a much earlier age.



J. HORACE MCFARLAND

YOUNG DATE PALM (**PHOENIX** DACTYLIFERA)

Varieties. — Early in the 20th century some of the better varieties of the old world were introduced into the southwestern United States and were being cultivated on a commercial scale chiefly in the Coachella valley of southern California, 140 mi. S.E. of Los Angeles. Leading varieties grown in the U.S. are Deglet Noor from Algeria, Medjool from Morocco, and Khadrawy, Zahidi and Halawy from Iraq.

Economic Value. — All parts of the date palm yield products of economic value to the old-world areas where it is grown. Its trunk furnishes timber for housebuilding; the midribs of the leaves supply material for crates and furniture; the leaflets for basketry; the leaf bases for fuel; the fruit stalks for rope and fuel; the fibre for cordage and packing material; the seeds are sometimes ground and used for stock feed. Sirup, a strong liquor, alcohol and vinegar are derived from the fruit. The sap is used as a beverage, either fresh or fermented, but the method of extraction causes serious injury to the palm so only those of little value for fruit production are used for this purpose. When a palm is cut down the tender terminal bud is eaten as a vegetable or salad.

Date sugar, a commercial product of India, is obtained from the sap of *Phoenix sylvestris,* another species very closely related to the date palm.

Production. — Iraq is the leading date-growing country in the world and supplies most of the fruit exported to other countries. Fruit from Algeria and Tunisia, much of it packaged in Marseilles, France, is also well known in Europe Although high summer temperatures and low humidity during the ripening season are required for successful fruit production, the palm itself will grow in any tropical or subtropical region where prolonged temperatures below 20° F. are not of frequent occurrence. Along the Mediterranean shores of Europe the date palm is grown as an ornamental and used to supply leaves for the festival of Palm Sunday among Christians, and for the celebration of the Feast of Tabernacles by Jews.

See PALM; FRUIT FARMING; *see* also references under "Date Palm" in the Index volume.

(R. W. N.; X.)

DATIA, a town and district in the Bundelkhand division of Madhya Pradesh, India. The town (pop [1961] 29,441) is 45 mi. S.S.E. of Gwalior on the Delhi-Bombay main line of the Central railway. It is surrounded by a stone wall enclosing handsome palaces and gardens. The 17th-century palace of Bir Singh Deo is a fine example of Hindu domestic architecture; it is untenanted.

DATIA DISTRICT (area 782 sq mi.; pop. [1961] 200.502) lies in the level but poor country between the Sind and Pahuj rivers, and is largely covered by scrub jungle and grasses. It comprises the former princely state of Datia which came under British control after the treaty of Bassein in 1802, was settled upon a cadet branch of the Bundela Rajput ruling family of Orchha state by treaties of 1804 and 1818 and was part of the Bundelkhand subagency of Central India. It was merged with Vindhya Pradesh on April 4, 1548. and nith it became part of Madhya Pradesh on Nov. 1, 1956. There is an inscription of the emperor Asoka (q *v.*) at Gujarra, 7 mi. N. of Datia town. and a group of Jain temples are nearby at Sonagir. (S. M. A.)

DATING, METHODS OF. The various methods of dating the earth and its inhabitants are discussed in GEOCHRONOLOGY and ARCHAEOLOGY: *The Materials of Archaeology.* Particular methods are treated in the articles DENDROCHRONOLOGY; POLLEN ANALYSIS; RADIOCARBON DATING; TYPOLOGY; VARVE ANALYSIS.

DATO IRADIER, EDUARDO (1856–1921), Spanish statesman, who was leader of the Conservative party 1913–21, was born at Corunna on Aug 12. 1856. As undersecretary at the home office in 1892, and minister in 1859, he sponsored workers' compensation acts and bills to regulate female employment. He mas minister of justice in 1902, mayor of Madrid in 1907, when he interested himself in municipal health reform, and then president of congress. Like his friend and chief, Francisco Silvela, he belonged to the moderate ning of the Conservative party. When Antonio Maura, the Conservative leader, refused in 1913 to form a government in place of the conde de Romanones, Dato took over the leadership of the party and became head of the government until 1915. As such he established the *mancomunitat* of Catalonia and was instrumental in keeping Spain neutral at the outbreak of World War I. He was in office again from June to Oct. 1917, when he was obliged to suspend constitutional guarantees and freedom of the press in order to put down unrest in Barcelona, strikes in Valencia and near-revolution in other parts of the country. He became prime minister again in 1920 and tried to heal the division in the Conservative party and to calm social upheavals in Catalonia.

He was assassinated by anarchists near his home in Madrid on March 8, 1921. (J. C. J. M.)

DATOLITE, a relatively uncommon mineral consisting of calcium and boron hydrous silicate, $CaBSiO_4(OH)$. It occurs in colourless to white, well-developed monoclinic crystals and in fine-grained granular masses. Some notable localities nhere it is found are Westfield. Mass.; Bergen Hill, N.J.; and the Lake Superior copper district.

Datolite is commonly difficult to recognize by simple examination and is easily mistaken for quartz. It may be distinguished by its easy fusibility in a Bunsen burner flame and by the characteristic green flame coloration given by the boron contained in it. It occurs most characteristically as cavity linings in igneous rocks such as basalt and diabase. It is commonly associated with quartz, calcite, prehnite, zeolites, apophyllite and pectolite.

(D. M. H.)

DATURA, a genus of shrubby herbaceous plants several species of which, especially *D. stramonium,* the jimson weed or thorn apple, are poisonous. Native to tropical Africa and Asia, these members of the nightshade family (Solanaceae) are naturalized throughout the temperate northern hemisphere chiefly as weeds. *See* SOLANACEAE; WEED.

DAUBENTON (D'AUBENTON), **LOUIS JEAN MARIE** (1716–1800), French naturalist. well known for his studies in comparative anatomy, was born, like Buffon, at Montbard (Côte d'Or). In 1741 he graduated in medicine at Reims, and returned to his native town with the intention of practising. In 1744, however, Bernard de Jussieu's post as keeper of the cabinet of natural history in Paris having become vacant: Daubenton was persuaded by Buffon to accept this position. Buffon also invited him to provide the anatomical descriptions for the *Histoire naturelle;* and Daubenton's details of the dissection of 182 species of quadrupeds in that work brought him great reputation. But the two men were very different in outlook and style. Buffon had a gift for synthesis. while Daubenton's mind was more analytical. and he never used his imagination. Buffon therefore dispensed with Daubenton's services in the remainder of the *Histoire naturelle,* and from 1767 they worked independently of each other, although remaining friends. Daubenton now occupied himself with zoological descriptions and dissections, the comparative anatomy of recent and fossil animals, vegetable physiology. mineralogy, experiments in agriculture and the introduction of the merino sheep into France. From 1775 he lectured on natural history in the college of medicine, and in 1783 on rural economy at the Alfort school. On the enlargement of the Jardin du Roi under the Convention and its change of name to the Muséum, Daubenton was elected its first director (1793–94) from among the 12 professors appointed to it, and enjoyed a second term of office from 1796 to 1797. In Dec. 1799 he was made a member of the senate. He died in Paris on Jan. 1, 1800.

DAUBIGNY, CHARLES FRANÇOIS (1817–1878), French landscape painter and engraver whose discoveries in the values of light influenced the Impressionist movement, was born in Paris on Feb. 1j, 1817, of a minor bourgeois family. After visiting Italy in 183j he returned to Paris in 1836, attempted historical painting and exhibited a "St. Jerome" in the Paris Salon of 1840. He was compelled also in youth to illustrate books, among them E. Sue's *Les Mystères de Paris;* but his true leanings were toward the more tranquil art of landscape as practised by the first painters of the school of Barbizon. themselves largely of the same urban extraction as himself. Like J. B. C. Corot he painted in the Morvan, and in 1852, after the two had met, his work began to depend on a strict observation of tonal values fortified by a concealed but indispensable minimum of composed structure. Such works, though calm and unspectacular. soon gained success, one of them being bought by the emperor in 1853. Later in the 1850s Daubigny's manner; though still restrained, began to express a more personal lyricism, and he increasingly employed the phenomenon of graduated light reflections from surfaces to give effects of space; such methods moreover were directed at conveying a momentary impression of the landscape. Daubigny was never strictly a member of the school of Barbizon. and. painting in the manner described in the region of Auvers-sur-Oise and on the Seine in the boat studio (which he launched in 1857), he is best seen as a link between the more classically organized naturalism of Corot and the undiscriminating visual receptiveness of his young friends Claude Monet and Alfred Sisley — the most striking difference lying betweei the grays, greens and ochres of Daubigny and the polychromy of the younger men. His glass prints were among the best ever executed. Daubigny died in Paris on Feb. 19, 1878.

See E. Moreau-Nélaton, *Daubigny raconté par lui-mème* (1925).

(D. C. T. **T.; X.)**

DÄUBLER, THEODOR (1876–1934), German writer, was one of the leaders of the Expressionist movement. He was born Aug. 17, 1876, at Trieste. and his birthplace made him free of both German and Romance civilizations. He lived a wandering life in Italy, Germany. France, the Balkans and the middle east, nithout settled occupation or income. His poetry was slow to nin appreciation but he made a deep impression on those nho met him, with his huge person. flowing beard and the vast appetite which seemed an aspect of his immense vitality. Daubler published novels (*L'Africana,* 1928; *Die Göttin mit der Fackel,* 1931); writings on art *(Der neue Standpunkt,* 1911); essays and other prose (*Mit silberner Sichel,* 1916; *Griechenland,* 1947); and poetical works *(Der Sternhelle Weg,* 1915; *Das Sternenkind,* 1916; *Dte Treppe zum Nordlicht,* 1920; *Attische Sonette,* 1924). His chief nork was his long lyrical cycle "Das Nordlicht" (1910), in nhich, with cosmic imagery, he expresses his visionary ideas. The sun was for Daubler the symbol of the spirit and in seeking to reconcile Christian and pagan conceptions he saw in Apollo the link between the two. He died at St. Blasien, in the Black Forest, June 14, 1934. (M. KL.)

DAUBRÉE, GABRIEL AUGUSTE (1814–1896), French geochemist and a pioneer in the application of experimental methods to the study of diverse geological phenomena. was born in Metz, on June 25. 1814. He was educated at the École Polytechnique and the École des Mines, following which he toured Germany England and Scotland for one year and then was sent to Algiers as a member of a commission to undertake studies in mining In 1838 he became regional mining engineer for the province of Haut-Rhin and professor of the akademie at Strasbourg. In 1861 he became professor of geology at the Musée des Sciences Naturelles, and next year professor at the École Imperiale des Mines. In 1867 he nas appointed inspector general of mines. retiring from this position in 1886 after nhich he remained honorary director of the office until his death in Paris on May 29. 1896. In 1869 he was elected commander of the Legion of Honour.

Daubrée's earliest works dealt with the synthesis of minerals and the study of the formation of minerals in some of the hot springs of France, and the application of these data to the origin of mineral deposits. He also carried on experimental studies on the mechanical formation of pebbles sands and muds; on the fracturing of rocks with especial regard to the formation of joints and geological faults; and on the metamorphism and the development of schistocity in rocks. Many of his researches mere devoted to the subject of meteorites, including their constitution and relations to terrestrial rocks and the modification of their, shapes during their flight through the atmosphere He also proposed a classification of meteorites. These researches were summarized in his principal work entitled *Etudes synthétiques de géologie expérimentale* (1879). His last important nork related to the role of underground naters. in which he discussed the changes that water produces nithin the crust of the earth. These studies mere published in his *Les Eaux souterraines* (1887).

The minerals daubréeite (an oxychloride of bismuth) and daubreelite (a meteoric mineral) were named in his honour.

(W. F. FG.)

DAUDET, ALPHONSE (1840–1897), French novelist, author of short stories and dramatist usually classed nith the "naturalist" school of writers but distinguished from other members of it by his more sensitive approach and by his constant readiness to commit himself in his subject. was born at Nîmes on May 13, 1840, the son of a silk manufacturer In 1849 his father

was obliged to sell his factory and to move to Lyons. where Alphonse was at first repelled by the damp-laden atmosphere but soon found compensations in escapades and in the life of the Rhône. He wrote his first poems and his first novel at the age of 14. In 1857 his parents lost all their money, and Daudet had to give up his hopes of matriculating. Taking work as an usher at a school at Alais. he led a double life there for six unhappy months which culminated in his dismissal but which later furnished the theme. with embellishments and omissions, for his novel *Le Petit Chose* (1868). At the end of the year he went to join his elder brother Ernest in Paris.

Daudet now threw himself into writing and began to frequent literary circles, both bohemian and fashionable. A handsome young man, he was able to form a liaison with a model, Marie Rieu, to whom he dedicated his only book of poems, *Les Amoureuses* (1858; new ed., 1863). His long and troubled relationship with her was to be reflected, much later, in his novel *Sapho* (1884). He also contributed articles to the newspapers, in particular to *Figaro.* In 1860 he met Frédéric Mistral: who awakened his enthusiasm for the passionate life of the south of France; and in the same year he obtained a secretarial post under the duc de Morny.

His health undermined by poverty and by the venereal disease which eventually cost him his life, Daudet spent the winter of 1861–62 in Algeria. One of the fruits of this visit was *Chapatin le tueur de lions* (1863), the hero of which can be seen as the first sketch of the author's future Tartarin. Daudet's first play, *La Dernière Idole,* made a great impact when it was produced at the Théâtre de l'Odéon in Paris in 1862. His winter in Corsica at the end of 1862 is recalled in passages of his *Lettres de mon moulin* (1869). His full social life over the years 1863–65 (till Morny's death) provided him with the material that he analyzed mercilessly in *Le Nabab* (1877). In Jan. 1867 he married Julia Allard, herself a writer of talent, with whom he was deeply in love and who gave him great help in his subsequent work. They had two sons. Léon and Lucien, and a daughter, Edmée.

In the Franco-German War, which had a profound effect on his writing (as can be judged from *Les Contes du lundi,* 1873). Daudet enlisted in the army; but he fled from Paris during the commune of 1871. His *Tartarin de Tarascon* (1872) was not well received, though its hero is now celebrated as the type of naïveté and boastfulness combined. His play *L'Arlésienne* was also a failure. His next novel. however, *Fromont jeune et Risler aîné* (1874), which won an award from the Académie Française, was a success, and for a few years Daudet enjoyed prosperity and fame—not without some hostile criticism.

In his last years Daudet suffered from agonizing disease of the spinal cord. *La Doulou* (not published till 1931) represents his attempt to alleviate his pain by investigating it. With admirable self-control he continued to write books of all sorts and to entertain Parisian literary and musical society. He was a kindly patron of younger writers, for instance of Marcel Proust. In 1895 he visited London and Venice. He died suddenly on Dec. 16, 1897, while speaking oi interplanetary travel.

Psychologically, Daudet represents a synthesis of conflicting elements, and his actual experience of life at every social level and in the course of travels helped to develop his natural gifts. A true southerner, he combined an understanding of passion with a view of the world illuminated by Mediterranean sunlight and could allow himself unfettered flights of the imagination without ever relaxing his attention to the detail of human behaviour. All his life he used to record his observations of other people in little notebooks, which he used as a reservoir of inspiration: a novel, he held, should be "the history of people who will never have any history." Yet there was nothing unfeeling in his approach (he has even been accused of sentimentality), and he was free from preconceived ideas: unlike the naturalists, he believed that the world in its diversity was misrepresented by novelists who concentrated only on its uglier aspects.

At the same time his objective interest in external detail went hand in hand with the expression of an extraordinarily compassionate personality and a reverence for the mystery of things and of individuals. Everything in his world had an inner reality. which he reproduced no less faithfully than the material phenomena. Finally, he saw passion as endowed uith something like the force of destiny; and this conception, which bore fruit in many of his writings, tempers his satire with pity and so brings him into kinship with Dickens as well as with Maupassant.

In Daudet's work as a whole we can discern not so much a continuous evolution as an episodic process in which various literary tendencies found expression successively. Even so, the anti-romantic irony of *Tartarin de Tarascon* gave place to a realism akin to that of the pointillist and impressionist painters in *Lettres de mon moulin,* which was followed by the tragic tone of *L'Arlésienne* as a corrective to his earlier mockery of southern characteristics; also there is more sympathy and anxiety than irony in *Le Petit Chose* and *Contes du lundi.* As he grew older Daudet became more and more preoccupied with the great conflicts in human relationship: *Jack* (1876) presents a woman torn between physical and maternal love; *Numa Roumestan* (1881), the antagonism between the northern and the southern character in man and woman; *L'Évangéliste* (1883), filial affection struggling against religious fanaticism; and *La Petite Paroisse* (1895), the contrarieties of jealousy. In *Sapho* (1884), underlying the moral issue, there is Daudet's evaluation of a whole generation of young men, together with a statement of the age-old dilemma of the lover who must choose between freedom and the claims of pity. *Le Trésor d'Arlatan* (1895), *Notes sur la vie* and *Nouvelles notes* show Daudet as a bold psychologist anticipating Freud in his analysis of complexes. Truth and fantasy, merciless delineation and poetry, clear-sighted seriousness and a sense of humour, irony and compassion, all the contrasting elements of which man's dignity is made up are to be found harmonized in Daudet's best work. He could find poetry where no one else would have looked for it, as chemists can extract from coal scents more potent than those of the floners which they call to mind.

BIBLIOGRAPHY.—For Daudet's own reminiscences, see *Trente ans de Paris* (1888) and *Souvenirs d'un homnze de lettres* (1888). (Js. H. Be.)

DAUDET, **LÉON** (1867–1942), prolific French writer and the most virulent and courageous polemicist of his generation in France. whose literary reputation rests largely upon his memoirs. The son of Alphonse Daudet. he was born in Paris. Nov. 16. 1867, and died in St. Rémy-de-Provence, July 1. 1942. His major journalistic achievement mas, from March 1908, in collaboration with Charles Maurras, refashioning *Action Française* into a daily paper of avowedly reactionary, nationalist and royalist opinion and contributing to it in characteristically satirical and Rabelaisian vein. His most important books, *Souvenirs des milieux litéraires, politiques, artistiques et médicaux* (1914–21), are informative, vivid and partisan. Among many novels. *Le Voyage de Shakespeare* (1896) is more successful than most. His books on psychology and medicine, such as *Le Monde des images* (1919), are stubbornly anti-Freudian; his political writings, as in *L'Avant-Guerre* (1913), show prescience as well as conservatism. *Le Stupide XIX^e Siècle* (1922) violently condemns the false gods worshiped in France after 1789.

See P Dresse, *Léon Daudet vivant* (1948).

DAUGAVPILS (Russ. DVINSK, Ger. DÜNABURG), a town of southeast Latvia (now the Latvian Soviet Socialist Republic of the U.S.S.R.), is situated on the Daugava river (Western Dvina) 219 km. (136 mi.) E. of Riga. Pop. (1959) 65,000. The first to n. built 1274 by the German Livonian order, was destroyed by Ivan IV called "the Terrible." Daugavpils was rebuilt 1582 by Stephen Báthory, king of Poland, and became an important fortress and administrative centre. It passed to Russia at the first partition

of Poland 1772, and to the French for a short while in 1812. In both World Wars I and II it was the scene of heavy fighting. In Jan. 1920 Latvian and Polish forces expelled the Russians and it became a district town of Latvia. Occupied, with the rest of Latvia, by the Russians in June 1940. it was in German hands from July 1941 until July 24, 1944, when it was recaptured by Soviet forces.

In the 1860s Daugavpils became an important centre of trade and communications when the St. Petersburg-Warsaw and Riga-Orel railways were built. Besides railway workshops there are food, textile, and building works. (J. A. Bo.)

DAUGHTERS OF THE AMERICAN REVOLUTION, a national patriotic society organized Oct. 11, 1890, and chartered by congress Dec. 2, 1895. Membership is limited to direct lineal descendants of soldiers or others of the Revolutionary period who aided the cause of independence; applicants must have reached 18 years of age and must be "personally acceptable" to the society. By the early 1960s the society's membership totaled approximately 187,000. There were more than 2,800 local chapters situated throughout the United States and in several other countries.

The DAR, as the society is generally known, carries on a threefold program through the divisions of its national office. The historical division stresses the study of U.S. history, preservation of Americana, marking of historic sites and maintenance of a museum. library and genealogical record centre. The educational division provides scholarships and loans, helps to support schools for underprivileged youth and for Americanization training, sponsors various prizes and publishes appropriate manuals. The patriotic division alerts the nation to potential dangers through the *Daughters of the American Revolution Magazine, The National Defense News,* and a wide range of resolutions adopted at the annual continental congress held at the society's headquarters in Washington, D.C. *Ser* also PATRIOTIC SOCIETIES. (J. P. N.)

DAULATABAD, formerly a hill fortress and town, now a village in the Aurangabad district of Maharashtra, India. Pop. (1951) 827. Daulatabad owed its position as one of the strongest fortresses in medieval India "to its geological formation, a conical hill of rock rising abruptly from the plain to about 600 feet and situated by the ancient 'ghat' or roadway which runs past Ellora. . . . The fortifications constitute three concentric lines of defence culminating in the citadel with its rock-cut defences. . . . Throughout, the defensive system consists of a wall with bastions standing on the inner edge of a rock-cut ditch and having formidable gateways with elaborated local defences." (Stuart Piggott, *Some Ancient Cities of India,* Oxford University Press, London, 1945.) The citadel is wholly scarped to a vertical rock-cut face, 150–200 ft. high and surrounded by a water-filled moat, dug into solid rock. The only access to it is by a narrow bridge and subterranean galleries culminating in a steep staircase covered by a grating intended to form the hearth of a huge fire maintained by the garrison above.

Daulatabad was probably founded (as Deogiri) about A.D. 1187 by the Yadava Bhillama I. The town was captured by 'Ala ud-din Khalji in 1296 and the Yadavas were forced to pay tribute. It was again occupied by the Delhi forces in 1307 and 1313. The last raja, Harpal, was killed by Sultan Mubarak Shah Khalji of Delhi in 1318.

In 1327, Mohammed Tughluq made Daulatabad his second capital, transferring numbers of the Muslim aristocracy there two years later. The outer defenses probably belong to his reign. In 1346 his military chiefs in the Deccan revolted and Daulatabad was taken by Zafar Khan, governor of Gulbarga. After 1347 it was a headquarters of the Bahmani (*q.v.*) sultanate. Ahmad Nizam Shah captured Daulatabad in 1500 and it remained under Ahmednagar (*q.v.*) until 1633, when it was taken by the Mogul general hlahabat Khan. Its importance declined when Aurangzeb established the Mogul seat of government in the Deccan at Aurangabad. In 1760 Daulatabad passed from the possession of the nizam of Hyderabad to the Marathas.

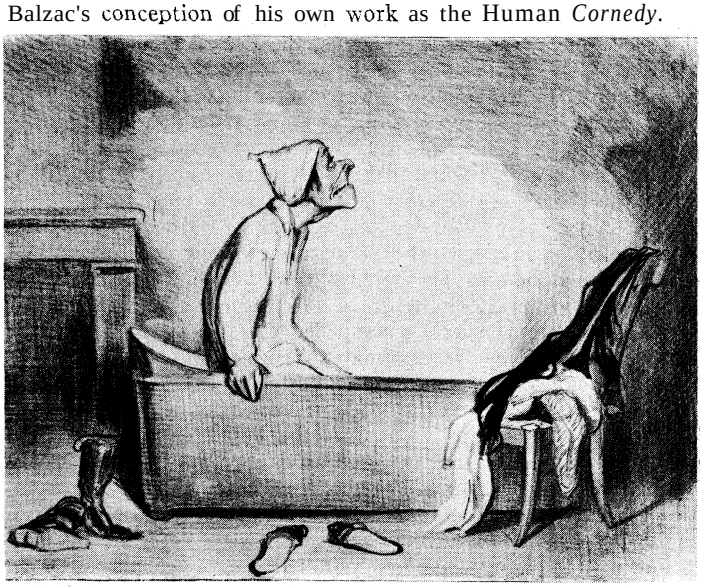
See Sir W. Hunter, *Imperial Gazetteer of India, s.v.* Daulatabad, vol. xi (1918); S. Toy, *The Strongholds of India* (1957). (P. H.)

DAUMET, PIERRE JÉRÔME HONORÉ (1826–1911), French architect who rebuilt the Palais de Justice, Paris, was born on Oct. 23, 1826, in Paris. He entered the École des Beaux-Arts in 1846, and in 1855 was awarded the Prix de Rome. In 1861 he went on an archaeological expedition to Macedonia, and published, in collaboration with Léon Henzey, an important work on their research in Thessaly, Thrace and Illyria. He was entrusted with the restoration of many monuments of French architecture, including the castle of Chantilly, the Palais de Justice. Paris, and the theatre at Orange. In 1884 Daumet undertook the construction of the Eglise du Sacré-Coeur on Montmartre. which had already been begun by the architect Abbadie; but the following year he abandoned the task, after a dispute with the ecclesiastical authorities. He died in Paris on Dec. 1 j, 1911.

DAUMIER, HONORÉ (1808–1879), French caricaturist and painter whose lithographs are an unforgettable record of the ironies of human behaviour and whose paintings are an important link in the development of modern art, was born at Marseilles on Feb. 20 or 26, 1808. The family moved to Paris during Daumier's childhood and thus he grew up in the city with which he is as completely identified as Charles Dickens is with London. He served in such varied capacities as bookseller's assistant and messenger in the law courts. An association with the director of the Musée des Monuments de France gave him an interest in sculpture which was to have a profound effect on his whole career.

After mastering the craft of lithography, Daumier did anonymous work for publishers until, in 1830, his gift for political cartooning caught the attention of Charles Philipon, a liberal journalist who had founded *La Caricature.* Daumier's connection with Philipon and his journals lasted 40 years, though with interruptions. The first of these was caused by the publication of his lithograph of Louis Philippe as "Gargantua" (1832): he was imprisoned for six months and soon afterward *La Caricature* was forced to discontinue. But Philipon provided a new field for Daumier's activity when he founded *Le Charivari* with the intent of holding up to good-natured ridicule the foibles of society.

Daumier's style in lithography underwent a marked change after the 1830s. Drawing by sharp outlines changed to line conceived as a web of sculptural contours, and detailed modeling gave way to ever increasing selectivity of detail. The development may be traced from "Le Ventre Législatif" (1832) and "La Rue Transnonain" (1834), to the Robert Macaire series of the later 1830s (100 lithographs about the adventures of the hero of a then popular melodrama); to the many series of the 1840s and 1850s ridiculing, among other things, decaying classical lore and the evils of the law courts. The total number comes to nearly 4,000 (each in a large edition) and together they form a visual parallel to Balzac's conception of his own work as the Human *Cornedy.*



COURTESY OF THE MINNEAPOLIS INSTITUTE OF ARTS

"THE TOO HOT BATH," LITHOGRAPH BY HONORÉ DAUMIER, 1839, FIRST APPEARED IN LE CHARIVARI THE SAME YEAR

Balzac was one of the first to recognize Daumier's genius, as against his mere ability to entertain. He once remarked. "There is something of Michelangelo in that fellow." The point was well taken, for it suggested his dramatic power, his emphatic scale and his concern for the great passions even when the theme chosen might seem trivial. Daumier's interest in sculptural form was another link to Michelangelo, not only in his draftsmanship but in his practice of making small clay reliefs and busts to help him visualize the three-dimensional shape. Cast into bronze after his death, these sculptures became highly prized by collectors.

It is ironic that Balzac did not know Daumier as a painter, for here his reference to hlichelangelo would have been especially appropriate. Daumier did not begin to paint until 1848; there were few oils by 1850, when Balzac died, and none of these can be called characteristic. Most of his painting was done between about 1855 and 1870. when his connection with *Le Charivari* mas interrupted for long intervals. None of his oil paintings, so far as is known, was done on commission. In 1872 he began to lose his eyesight and by 1878 he was a pauper, totally blind. An exhibition organized in that year by the dealer Durand-Ruel and by such painter friends as Corot and Charles Daubigny had little effect because the public was not prepared to find in a caricaturist the equal of a Molière or of a Cervantes—writers whose themes and characters increasingly absorbed Daumier as a painter. He died in Valmondois on Feb. 10 or 11, 1879.

After his death. however, the demand for Daumier's paintings soon exceeded the limited supply. This stimulated the activity of many forgers, some of them able. The first major one-man exhibition of Daumier's work in America (1937) was accompanied by scientific examination through such techniques as infrared and X-ray photography and a basis was established for identifying paintings and drawings for which he was not responsible.

Among Daumier's masterpieces in oil, "Crispin and Scapin" (Paris), "The Melodrama" (Munich), "Don Quixote and Sancho Panza" (Berlin) and "Third Class Railway Carriage" (New York) may be cited.

DAUN (DHAUN), **LEOPOLD JOSEPH,** GRAF VON (1705–1766), Austrian field marshal and commander in chief during the Seven Years' War (1756–1763), was born in Vienna on Sept. 24. 1705. He was the son of Wierich Philipp, Graf von Daun. an officer of the Austriap army. As a young and middle-aged man he saw service in many campaigns under a variety of conditions—in Sicily (1718), in Italy during the War of the Polish Succession (1734–35), in the Turkish campaigns of 1737–39 and in the War of the Austrian Succession both against the Prussians in central Europe (1740–42) and against the French in the Netherlands (1746–48). This wide experience of war made him well qualified to reorganize and modernize the imperial army, as he did, before being promoted to field marshal in 1754.

Daun greatly distinguished himself in the Seven Years' War. After the defeat of the Austrians under Graf von Browne near Prague in June 1757, he was instrumental in retrieving the situation by driving Frederick the Great toward Kolin and forcing him to evacuate Bohemia. On Oct. 14, 1758. he won another success over Frederick at Hochkirch. In 1759 he achieved yet another victory, at Maxen, when he compelled the Prussian general Fink and some 11,000 men to capitulate. Daun's run of successes was now at an end. In 1760 he was heavily defeated by the Prussians and severely wounded at the battle of Torgau.

In 1762 he was made president of the Austrian war council and once again used his almost unique experience and talent to carry out various army reforms. At this time he devoted much attention to improving the military academy and to the training of potential officers.

Few men in history have had more battle experience than Daun. From 1734 to 1760 he was almost continuously on active service. He has been described as an adept at making the best of the resources at his disposal and seizing a fleeting opportunity to snatch a victory. He died on Feb. 5. 1766. (C. N. B.)

DAUNOU, PIERRE CLAUDE FRANÇOIS (1761–1840), French statesman, theorist of liberalism and historian, was born at Boulogne on Aug. 18 1761. Educated at the local school of the Oratorians. he became an Oratorian himself in 1777, taught in Oratorian convents from 1780 and was ordained priest in 1787. In the opening stages of the French Revolution he defended the Civil Constitution of the Clergy, took the oath and mas made vicar metropolitan of Paris. Elected to the Convention by Pas-de-Calais, he strongly opposed the king's trial, protested against the proscription of the Girondins, was imprisoned in Oct. 1793 but returned to the Convention in Dec. 1794. He was the chief author of the constitution of 1795 and founder of the Institut National, which replaced the academies suppressed in 1793. Deputy in the chamber of the 500 from 1795 to 1797 and from 1798 to 1799, he was sent in the interval to organize the Roman republic.

The *coup d'état* of 18 Brumaire (Nov. 9, 1799) was prepared chiefly by Emmanuel Siéyès, and it is uncertain whether Daunou had any part in organizing it, though he was certainly a sympathizer. On 19 Brumaire he was elected to the commission of 25, which was to replace the 500. He then became a member of its constitution section, which joined with the corresponding section of the commission of the *anciens* and with the three provisional consuls to produce a draft constitution on the lines envisaged by Siéyès; A. H. Taillandier later published this draft as being Daunou's work entirely, but it was not, though it owed much to him. Subsequently the two commissions and the consuls together produced the constitution of the year VIII (Dec. 1799), to which Daunou subscribed with the rest of the commissioners.

Having entered the *tribunat,* Daunou favoured the administrative reforms of Feb. 18, 1800, but opposed the establishment of special tribunals without juries to deal with crimes of brigandage (armed insurrection) in 1801 and was excluded from the *tribunat* in 1802. His history is that of many discontented *Brumairiens* who became the adversaries of a regime they had unwittingly helped to set up.

Daunou had directed the Panthéon library (now the Bibliothèque Ste. Genevikve) since 1797 and was director of the national archives from 1804 to 1815. During this period he published his *Essai historique sur la puissance temporelle des papes* (1810), in support of Napoleon against Pius VII. Under the Restoration he became director of the *Journal des savants* (1816), professor of history and ethics at the Collège de France (1819), deputy (1819–23 and 1828–34) and director of the archives again (1830–40). He was made a peer of France in 1839. He died in Paris on June 20, 1840. Having no religious beliefs, he was buried at his own wish without any religious ceremony.

Daunou's *Essai sur les garantzes individuelles* (1818) deserves to he included among the great books of liberalism. In it he contends that the criterion of a government's goodness or badness is the presence or absence of certain guarantees of individual liberty: namely, security of the person, with juries drawn from a wide range of classes and no secret police; no excessive taxes on property; no corporations to hamper industry; liberty of opinion and of the press; and liberty of conscience in religion. He also wrote numerous articles for the *Histoire littéraire de la France,* vol. xiii–xxi, on 12th- and 13th-century writers. His lectures at the Collkge de France were published after his death as *Cours d'études historiques,* 20 vol. (1842–46).

DAUPHIN, the title of the heir apparent to the French crown from 1350 to 1830, was acquired by the royal house of France through the future Charles V's purchase of Dauphin6 (*q.v.*) in 1349. (For the dauphins of Auvergne *see* below.)

The title dauphin was derived from the personal name Dauphin, which occurs in western Europe in various forms (Dalphinus, Delfinus, Dolfin, etc.) from the end of the 4th century A.D. The first ruler of Viennois to bear this name was Guigues IV Dauphin (12th century). An unusual name, it was borne so regularly by his

successors that it came to be taken for a title peculiar to rulers of Viennois: a formula such as *Dalphinus Viennensis* et *Albonensis comes* could easily be understood as meaning "dauphin of Viennois and count of Albon" instead of "Dauphin, count of Viennois and of Albon." By the end of the 13th century the titular use of the word was established, and the aggregate of fiefs held by the dauphins was called the delphinate or Dauphin6 (Dalphinatus). Charles of France, having become dauphin of Viennois in 1349, became heir apparent to the French crown on his father John II's accession to it in 1350. King of France himself in 1364, Charles granted Dauphiné to his son, the future Charles VI, in 1368 and so established the precedent whereby the French king's eldest son became dauphin.

In Auvergne, the count Guilhem VII the Young, son-in-law of Guigues IV Dauphin of Viennois, gave the name Dauphin to his own son. This Dauphin in 1169 secured his succession to the little territory that his father had been able to keep from Guilhem VIII (see AUVERGNE). As in the case of Viennois, so here this territory came in the 13th century to be called the delphinate or Dauphin6 d'Auvergne. Through the marriage (1428) of the dauphine Jeanne, it passed in 1436 to the house of Bourbon-Montpensier. Seized by Francis I of France in 1523 but restored to the Montpensiers in 1561, it finally passed to the French crown in 1693.

From 1436 to 1693, to distinguish them, the dauphin heir to the French crown was occasionally called le *roi* dauphin (king dauphin) and the dauphin of Auvergne le prince dauphin, as the Montpensiers were French princes of the blood.

DAUPHINÉ, an old province of France, bounded on the west by the Rhbne, on the extreme northwest by Lyonnais, on the north by Dombes and by Bugey, on the northeast by Savoy, on the east by the Alps and on the south by Provence and by the Comtat-Venaissin; and corresponding to the modern *départements* of Isère, Drbme and Hautes-Alpes.

The nucleus of the province was the countship of Viennois, the country round Vienne on the left bank of the Rhbne. In 1029 or 1030 the southern part of this countship was enfiefed to Guigues de Vion, count of Albon, who is reckoned as Guigues I of Viennois. Profiting from the loose control exercised by the Holy Roman emperors over the kingdom of Arles (*q.v.*), Guigues I extended his domain to include first Briançonnais (Briançon and its hinterland) *c.* 1040, then Grésivaudan (the country round Grenoble) by 1050. His great-grandson Guigues IV Dauphin, count from 1133 to 1142, the first to bear the name that was to distinguish his successors (see DAUPHIN), was killed early in the first major war between Viennois and Savoy. The last of the male line of Albon, Guigues V, was succeeded in 1162 by his son-in-law Hugh of Burgundy. Hugh's son André Dauphin (d. 1236), otherwise called Guigues VI, acquired Embrunais and Gapençais (round Gap) by marriage in 1202. Guigues VII (d. 1270) likewise acquired Faucigny, but this lay far to the northeast beyond the territories of the counts of Savoy, with whom a series of wars about it naturally ensued. Jean I, last of the Burgundian line, was succeeded in 1282 by his brother-in-law, Humbert I, of the house of La Tour du Pin. By the end of the 13th century the name Dauphin, now traditional in the ruling house of Viennois, had been transformed into a title, dauphin, and the aggregate of fiefs held by them was being called Dauphiné.

The dauphins of the house of La Tour du Pin extended their lordship in the west along the Isère river and in the southwest to Nyons and Le Buis. They also developed governmental and judiciary institutions, but the Savoyard wars and the lavish expenditure of Hurnbert II, dauphin from 1333, exhausted their financial resources. Finally, in 1349, Humbert II (d. 1355) effected the so-called "transport," in fact the sale. of Dauphin6 to the future Charles V of France. In 1355 the treaty of Paris settled the principal dispute with Savoy by the exchange of remote Faucigny for various Savoyard enclaves in Viennois.

Charles of France was the first to convene the provincial estates of Dauphin6 (1357). He also began the practice whereby the kings of France ceded Dauphin6 to their heir apparent. In 1378, moreover, the Holy Roman emperor Charles IV granted to the dauphin the imperial vicariate over the kingdom of Arles. This act enhanced French authority in the area, but left open the question whether Dauphin6 was to be part of the French kingdom or a distinct territory.

The acquisition of Valentinois and Diois from the house of Poitiers-Saint-Vallier by legacy (1419–26) and of certain papal rights over Montélimar by exchange (1447), followed by the exaction of homage for the town of Vienne itself from the archbishop (1450), gave Dauphin6 at last a continuous frontier along the Rhbne from north to south.

The dauphin Louis II. later Louis XI (*q.v.*) of France, established the *parlement* of Dauphin6 (1453) in the place of the delphinal council. He tried, homever, to exploit his territory's quasi-independent status in his quarrels with Charles VII of France, who had finally to annex Dauphin6 to France in 1457.

In the 16th century Guillaume Farel spread Protestantism in Dauphiné, and the baron des Adrets (François de Beaumont) made himself notorious for his atrocities in the civil nars, first on the Protestant side, then on the Catholic. François de Bonne, duc de Lesdiguières (*q.v.*), a partisan of Henry IV, was governor from 1591 to 1626.

The estates of Dauphin6 were suspended by the French government in 1628. A meeting at Grenoble in June 1788, followed by the unauthorized assembly of the estates at Vizille on July 21, was one of the immediate causes of the convocation of the estates-general, which led to the French Revolution of 1789.

See F. Vernay, *Nouvelle histoire* du *Dauphiné* (1933); G. Le Tonnelier, *Histoire* du *Dauphiné,* 2nd ed. (1958), with bibliography.

DAVAO, the second largest of the Philippine provinces. Area, 7,529 sq.mi.; pop. (1960) 903 224. The Spanish were never able to pacify the Moro and pagan tribes of the area. and development began after 1914 with the influx of settlers from the central islands. In the late 1950s more than half the population were Cebuano speaking. Japanese development of abaci (Manila hemp) plantations began during World War I, reaching a peak in 1939 when over 15.000 Japanese resided in the province. In 1945 the Japanese plantations were confiscated and distributed to Filipino smallholders who replaced much of the abaci with food crops. but the province remains by far the leading abacá producer of the Philippines. A new highway to the north coast of Mindanao was completed in 1957, opening up the interior for settlement by Visayan islanders.

DAVAO, the provincial capital, is located in S.E. Mindanao Island. near the head of Davao gulf. The city was chartered in 1936, with an area of 748.4 sq.mi., in order to include a population large enough to warrant a charter, and in 1958 comprised one urban and ten rural districts. Pop. (1948) 111.263; (1960) 231,833. Almost completely destroyed during World War II. the rebuilt Davao is an attractive city, an important port for inter-island shipping. and a lesser foreign trade port. It ships abaci both to Manila and abroad, has considerable passenger traffic, and ships copra. maize and rice to Cebu. (J. E. SR.)

DAVENANT (D'AVENANT or D'AVENANT), **SIR WILLIAM** (1606–1668). English poet laureate. playwright and theatre manager who presented the first English opera. He was baptized on March 3, 1606 (new style; 1605. old style), at Oxford. William Shakespeare was apparently his godfather. and gossip suggested that Davenant was actually Shakespeare's son, a story which in 1913 caused Arthur Acheson to identify his vivacious mother, Jane, as the "dark lady" of the Sonnets.

After a smattering of an education under tutors connected with Balliol and Lincoln colleges. in 1622 Davenant became a page in London, first to the widowed duchess of Richmond and then to the famous literary courtier Fulke Greville, Baron Brooke. In Brooke's household he wrote his first plays: tragedies of revenge such as *Albovine* and *The Cruel* Brother and tragicomedies such as The Colonel and *The Just* Italian. After experience in the continental mars, his engaging and reckless personality and his plays and occasional verses attracted the attention of Queen Henrietta Maria herself. By 1630 he was signing himself "Servant to Her Majesty." Acquiring other famous patrons, as well as a wife and debts. he became a candidate for the office of poet laureate on the death of Ben Jonson in 1637, but in spite of the success of his

popular comedy, *The Wits* (licensed 1634), of the tragicomedy, *Love and Honour* (1634), of masques such as *The Temple of Love, Britannia Triumphans* and *Luminalia,* and of his little volume of poems, *Madagascar* (1638), the king delayed his appointment until late in 1638. Before that Davenant, as a result of a brawl arising from insults about the disfigurement of his nose (a result of syphilis), had killed a tavern servant and had been briefly exiled to the continent.

His success as a writer and his royal patent to erect a new theatre based on continental models were interrupted by the outbreak of the Bishops Wars, in which he risked his life in the bungled army plot of 1641. When the Civil War broke out in 1642, he was rewarded by being appointed lieutenant general of the ordnance under the duke of Newcastle. In 1643, in recognition of his adventures running supplies and munitions across the channel, he was knighted near Gloucester. After the parliamentary victory Davenant joined the exiled court in Paris. There he began his uncompleted romantic epic, *Gondibert* (1651), with its important critical preface. After the execution of Charles I, the queen resolved to send Davenant to aid the royalist cause in America, as lieutenant governor of Maryland. Davenant's ship was captured, however, and he was imprisoned in the Tower until 1654.

As soon as he was able to settle his affairs in France, Davenant turned to his old love, the theatre. In May 1656 he presented in the hall of his home, Rutland house, Aldersgate, London, The *First Day's Entertainment,* the first real attempt to bring back the drama banned under Cromwell's regime. This successful disguise of the drama as "Declamations and Musick" encouraged him later in the same year to offer publicly the first opera in England, *The* Siege *of Rkodes. Made a Representation by the Art of Prospective* [sic] *in Scenes and the Story Sung in Recitative Musick.* In it he introduced three important innovations to the English public stage: an opera, painted stage sets and a female actor-singer.

Before the Restoration Davenant presented other operas under similar circumstances; after it, late in 1660, he and his rival, Thomas Killigrew, were granted royal monopolistic patents to establish new acting companies. including women as well as men. Davenant's theatre, finally settling in its new building in Lincoln's Inn Fields, was called the Duke of York's playhouse. As manager, director and playwright. Davenant continued to produce his own plays, his operas, his adaptations of Shakespeare and works by new authors until his death in London, April 7, 1668.

DAVENPORT, CHARLES BENEDICT (1866–1944), American zoologist, made valuable investigations in the breeding of animals and in the heredity of eye, hair and skin colour and temperament, stature and build in man. He was born at Stamford, Conn., on June 1, 1866. He was educated at Brooklyn Polytechnic institute and at Harvard. After serving as assistant and instructor in zoology at Harvard in 1888–99, he was assistant and associate professor of zoology and embryology at The University of Chicago from 1899 to 1904. He was then made director of the station (at Cold Spring Harbor, L.I., N.Y.) for experimental evolution of the Carnegie Institution of Washington, in which he became the director of the eugenics record office and of the department of genetics (1904–34).

Davenport was the author of a number of works on biology and genetics. He died Feb. 18, 1944, at Huntington, L.I.

DAVENPORT, EDWARD LOOMIS (1815–1877), U.S. actor, born in Boston. Mass., on Nov. 15, 1815, made his first appearance on the stage in 1837 at Providence, R.I., in support of Junius Brutus Booth. Afterward he went to England, where he supported Anna Cora Mowatt (Ritchie) (1819–70). William Macready and others. In 1854 he was again in the United States, appearing in Shakespearean plays and in dramatizations of Dickens' novels. As the thief Bill Sikes in *Oliver Tzaist* he was especially successful and his Sir Giles Overreach, the villain in Philip Massinger's *A New Way to Pay Old Debts,* and Brutus were also greatly admired. He died at Canton. Pa., on Sept. 1, 1877. In 1849 he had married Fanny Vining (Mrs. Charles Gill) (d. 1891), an English actress also in Mrs. Mowatt's company.

Their daughter FANNY (LILY GYPSY) DAVENPORT (1850–98) appeared in New York city at the age of 12 as the king of Spain in *Faint Heart Never Won Fair Lady.* Later (1869) she was a member of Augustin Daly's company in New York. and afterward, with a company of her own, acted with success in Victorien Sardou's *Fhdora* (1883), *Cleopatra* (1890) and similar plays. She died at South Duxbury. Mass., on Sept. 26, 1898.

DAVENPORT, a city of Iowa, U.S., and seat of Scott county, is on the Mississippi river opposite Rock Island and Moline (*qq.v.*), Ill. Situated on the slope of a bluff, it commands an extensive view of the river. The region first attracted white settlers in 1808. Credit Island, now a park, was a battlefield in the War of 1812. Fort Armstrong was established on Rock Island in 1816. Antoine LeClaire, an army interpreter of French-Indian ancestry, acquired the site of Davenport after the Black Hawk treaty of 1832. He in turn sold it to a fur company headed by an Englishman, Col. George Davenport, who had settled in the area. The land was surveyed privately in 1835–36; the town was incorporated in 1839 and was chartered in 1843 and again in 1851. The strategic location of the city, together with the development of both river and rail transportation, assured its economic growth. The first railroad bridge to span the Mississippi river was opened to traffic there in 1856. The Rock Island arsenal, one of the world's largest, was established on the island in 1861. Products manufactured, some in the industrial suburb of Bettendorf, include: agricultural implements, aluminum sheets and plates, cement, gas and diesel engines, lumber and timber products, processed foods, washing machines and pumps.

St. Ambrose college for men (founded 1882) and its co-ordinate, Marycrest college for women (founded 1939), are maintained by the Roman Catholic Church. St. Katherine's, a preparatory school for girls, is supported by the Protestant Episcopal Church. There are 1,155 ac. of parks, including Antoine LeClaire park and Fejervary park, and playgrounds.

Mid-19th century immigration was mainly German, and from 1900 to 1950 the population more than doubled, reaching 74,549. The population in 1960 was 88,981 by federal census. Population of the Davenport-Rock Island-Moline standard metropolitan statistical area, including Scott county, Iowa, and Rock Island county in Illinois, was 270,058 in 1960. (P. W. GL.)

DAVENTRY, a market town and municipal borough of Northamptonshire, Eng., lies 12 mi. W. of Northampton by road. Pop. (1961) 5,846. An agricultural centre, Daventry is situated on a sloping site in rich undulating country. Borough hill, adjoining it to the east, is the site of a vast ancient earthwork, and other remains have been found in the vicinity at Burnt Walls. Daventry grammar school was founded in 1576; the parish church of Holy Cross was rebuilt in 1752.

The chief industries of the town are the manufacture of boots and shoes, light engineering and the making of roller bearings. Daventry became an important radio centre after 1925, when the British Broadcasting corporation set up a high-power long-wave station on Borough hill. In 1927 a second, medium-wave station was built for the Midland Regional program. These stations were superseded in 1934 by transmitters at Droitwich. By 1932 the BBC had begun regular services to the commonwealth using short-wave transmitters at Daventry. Overseas broadcasting increased after World War II and by 1956 there were ten transmitters serving all parts of the world.

Nothing is known of Daventry itself until the time of the Domesday survey, when the manor consisting of eight hides was held by the countess Judith, the Conqueror's niece, as the widow of Waltheof, the last native earl of Northumbria, who at the Conquest held the great midland earldom of Huntingdonshire and Northamptonshire. Before the end of the century it had passed to Simon de St. Liz, whose grandson Walter Fitz-Robert held it "of the fee of the king of Scotland," then possessed of the earldom of Huntingdon (*see* HUNTINGDONSHIRE; NORTHAMPTONSHIRE). Daventry was created a borough by King John, who granted to Simon, son of Walter, a market on Wednesday and a fair on St.

Augustine's day, which is still held in October. There is no extant charter before that of Elizabeth I in 1576, by which the town was incorporated under the name of the bailiff, burgesses and commonalty of the borough of Daventry. James I confirmed this charter in 1606, and Charles II in 1674 granted a new charter. During the Civil War Daventry was the headquarters of Charles I immediately before the battle of Naseby. The last remains of the Cluniac priory endowed by Simon de St. Liz were removed during the 19th century.

The pronunciation of Daventry as "Dane-tree," sanctioned by ancient local usage (cf. Shakespeare's "Daintry," Henry VI, part iii, act v), is referred by tradition to the building of the town by the Danes. Though the written element affords no definite proof of early pronunciation, the spelling "Daventrei" in Domesday is explicit, and in the legend of a seal of the Prior Nicholas (1231–64) "Davintre" is given (Victoria County History, Nor*thampton*, vol. ii, 1906).

DAVID (DEWI), SAINT (d. *c.* 600), the patron saint of Wales. Little is known of his life. According to the genealogists he was the son of Sant, a prince of the line of Cunedda, his mother being St. Non. He seems to have taken a prominent part in the celebrated synod of Llanddewi-Brefi and to have presided at the so-called Synod of Victory held later at Caerleon-on-Usk. Legend asserts that he moved the seat of ecclesiastical government from Caerleon to the remote headland of Mynyw or Menevia, which is still, under the name of St. David's (Ty-Dewi), the cathedral city of the western see. St. David founded numerous churches throughout south Wales (more than 50 still recall his name), but apparently he never penetrated farther north than the region of Powys, although he seems to have visited Cornwall. His shrine at St. David's became a notable place of pilgrimage. His formal canonization by Calixtus II about 1120 is not proved. His feast day is March 1.

See ***Butler's Lives of the*** Saints, ed. ***by*** H. Thurston and D. Attwater, vol. i, pp. 449–451 (1956). (X.; PL. GN.)

DAVID, founder and first ruler of the united kingdom of Israel and Judah, was a native of Bethlehem. a town in the territory of Judah. He was the youngest son (I Sam. xvi. 11; xvii, 12–16) of Jesse, who is described as an "Ephrathite," probably referring to the region of Judah bordering on Benjamin, including Bethlehem. During his reign, which began about 1000 B.C. and lasted approximately 40 years, David not only united the land and people of Israel under a single crown but also created an empire extending far beyond its borders. Though the empire was short-lived, David and his lineal heirs ruled in Jerusalem for over 400 years, until Nebuchadrezzar destroyed the city, and his name and throne became symbols of Israel's messianic hope. David's career coincided with a creative period in Israel's cultural development. well illustrated by the beginning of history writing. I Sam. xvi–II Sam. v, which relate the story of David's rise to power, contain many early narratives; and in II Sam. ix–xx and I Kings i–ii is found an account of the family history of David and of Solomon's succession that is nearly contemporary with the events it reports.

In Saul's Service.—The excavations at Mari (Tell el Hariri, on the Euphrates) show that the term *davidum* served as a title for a military marshal. It has been suggested that David's original name was something else, perhaps Elhanan (II Sam. xxi, 19), and that he is known to history only by his title as military leader.

David began his career as an aide at Saul's court. Whether he was brought to Gibeah for his gifts as a musician, as one tradition reports (I Sam. xvi), or whether he won his place, including the promise of marriage to a royal princess, by his victory over Goliath (I Sam. xvii), it was his prowess as a warrior that caused his advancement and also his conflict with Saul. The king was faltering as a leader and the Philistines were soon to overrun all Israel west of the Jordan; the story of David is simultaneously the story of the extinction of the rule of Saul's house and of the decline of the Philistines. Saul's son Jonathan freely abdicated his royal and military prerogatives and facilitated David's appointment as head of the royal guard (I Sam. xviii, 1–5). Saul, like Jonathan, also sensed that David would succeed him, and, despite his genuine affection for David, this prospect and David's popular success provoked in Saul an envy and hatred that caused him to plot the death of the young hero. Forewarned by Jonathan, David fled Saul's court.

Outlaw and Adventurer.—David is a classic example of the public figure who combines adherence to principle and basic aims mith flexible and practical political action. The accounts of his slaying of Goliath nith a sling and of his doubling the bride price for Michal (I Sam. xviii. 20–27) show that from the very first he was endowed with political shrewdness and with a capacity for public drama. His years as an outlaw in the Judean desert and as a refugee at the court of Achish of Gath stimulated the development and ripening of these gifts. He was nithout legal protection, and his physical safety often depended on his use of his wits. To become a political and military force David had to win the loyalty of clan heads and towns that owed nominal allegiance to Saul but that were proudly independent and properly concerned with their own interests and welfare.

The arid ranges and steppes of Judah formed a frontier region, a no-man's land where Saul's authority mas ineffective. In his flight southward David stopped at the priestly shrine of Nob, probably located northeast of Jerusalem on what is now known as Mt. Scopus. Implying that he was on a mission for Saul, he obtained food and the sword of Goliath from Ahimelech the priest. But the priest's hospitality was reported, and the king commanded the massacre of the entire priestly community; only Abiathar was able to escape and join David in the wilderness, thus beginning a service that endured as long as David lived.

David first sought refuge in the Philistine city of Gath, but since he was not welcome (I Sam. xxi, 10–15) he returned to the Judean wilderness, with his first headquarters in the cave of Adullam. There he launched his own political movement. "And every one who was in distress, and every one who was in debt, and every one who was discontented. gathered to him: and he became captain over them" (I Sam. xxii, 2); that is, he was the chieftain of refugees and outlaws like himself. To keep together this band of adventurers. numbering from 400 to 600 men. David became a sort of Robin Hood, offering help to the injured and protection to the wealthy. hoping thus to provide for his men and win a following. But in this role he was often rebuffed. Having gone to relieve the town of Keilah from the raiding Philistines. and having succeeded, he was nevertheless warned that the town would turn him over to Saul (I Sam. xxiii. 1–14). In the desert of Paran. David sent a deputation to Nabal, a wealthy herdsman, to ask that his men be allowed to share the food and drink of the sheepshearing feast, inasmuch as they had respected the property of Nabal (I Sam. xxv). Nabal interpreted the request as blackmail and rejected it; but his wife Abigail, recognizing that her husband had delivered an insult that would lead to bloodshed, offered hospitality for David's band. David interpreted the sudden death of Nabal as a sign of divine vengeance; and his marriage to Abigail marked a first step in the knitting together of the southern clans under his banner.

His position, however, remained insecure, as is indicated by the fact that he again sought, and this time received, the protection of Achish of Gath. though the Philistine nobles, mindful of his record as their enemy, vetoed their king's plan to use David as his bodyguard in his campaign against Saul (I Sam. xxix. 1–5). Probably much relieved, David returned to his Philistine residence of Ziklag to discover that it had been looted by the Amalekites, against whom he had himself raided periodically. He now pursued and overcame them, restoring all persons and property taken from Ziklag and taking great loot in addition. This he distributed judiciously among "the elders of Judah" in "all the places where David and his men had roamed" (I Sam. xxx. 26–31), thus quietly advancing his plans in the very days of Saul's last, fatal battle.

King and Emperor.—David's success as a builder of political power rested on his political realism and foresight. He could bear temporary hardships, setbacks and even insults for the sake of long-range objectives. He knew how to put all sorts of groups in his debt. Training himself in patience, he attempted at all

costs to avoid shedding the blood of any Israelites, knowing it would hurt his program of unification. He used his sincere convictions to obtain political results, yet without becoming cynical. Thus he dramatized his belief in the sacredness of the royal person to impress the following of Saul (I Sam. xxiv, 6; xxvi. 9 ff.). His deeply moving elegy (II Sam. i. 19–27) not only voiced his grief but also served to conciliate the tribes bound to the house of Saul. And his message of gratitude to Jabesh-gilead for the burial of the royal dead was at the same time an advertisement of his own rule, newly established at Hebron (II Sam. ii, 5–7). He was able to dramatize his hatred of treachery so well that the treacherous slaying of Abner by David's commander Joab did not fatally damage the successful outcome of the long and delicate negotiations leading to the union of north and south (II Sam. iii, 22–39). The character traits and the methods of practical action which years as a fugitive had perfected in David guided him consistently in all his years as a ruler.

When the Philistines slew Saul on Gilboa they almost extinguished the political power of his house. They overran all territory uest of the Jordan, and Israel's government, now in the weak hands of Ishbosheth, Saul's son. supported by Abner, was established at Mahanaim. David's first aim was to unite all Israel under his rule. Judah, whose leaders he had so carefully cultivated, proclaimed him king; and Hebron became his capital for about seven years. During this period David bided his time while the dissolution of the house of Saul proceeded. Abner had slain Asahel, brother of Joab, thus creating a feud between the two military leaders. But Abner nevertheless made overtures to David for a "covenant" (II Sam. iii, 12) under which he would deliver the northern tribes to David. Joab's murder of Abner jeopardized the agreement. David publicly condemned Joab's deed, and waited. Sedition in Mahanaim cost Ishbosheth his life. leaving the northern tribes without alternative. They came to Hebron where David was anointed king over all Israel (II Sam. v, 3).

Having been proclaimed king, David had to rid the land of the Philistine menace. The decisive campaigns were fought west of Jerusalem, "from Geba to Gezer" (II Sam. v, 25), in the region that separated Judah from the northern tribes.

These victories over the Philistines apparently followed immediately after his conquest of the citadel of the Jebusites, the walled city of Jerusalem. This constituted a barrier between the south and the north, and it was David's plan to make this neutral location, the "city of David," the capital of the united kingdom he had founded. The citadel occupied an almost impregnable position. but David circumvented this difficulty by having his men enter the city through a water tunnel, which began outside the walls and connected with a vertical shaft inside the city (II Sam. v, 6–10). This stratagem apparently came as a complete surprise to the Jebusites, and the city was surrendered without a battle. David took wives and concubines from the conquered city (II Sam. v, 13), thus confirming his rule over it. With the aid of Hiram of Tyre he built a palace.

David recognized that to make Jerusalem the real centre of loyalty for all Israel it mas necessary to make it a symbol of religious significance as well. This presented serious difficulties for, while there were many sacred sites in the land made venerable by Israel's worship of the Lord, the newly conquered site of Jerusalem held no sacred associations of any sort. To meet this problem David brought the ark to Jerusalem.

The ark was a very ancient symbol of the presence of God in the midst of the community of Israel, probably dating back to the nomadic era. Israel believed that by means of it God led her in the wilderness (Num. x, 35 ff.) and fought in her behalf in battle (I Sam. iv, 1–9). It had stood in the shrine at Shiloh, but when the Philistines destroyed Shiloh they took the ark as loot. After its return it had stood in Kiriath-jearim, in a shrine provided by Abinadab (I Sam. vii, 1–2). In bringing it from there to Jerusalem, Uzzah, a son of Abinadab, suffered sudden death, which was interpreted as punishment for his having stretched out unhallowed hands to touch the sacred object. For a time David was overcome uith awe and afraid to proceed with his plan. The ark was placed in the house of Obed-edom. After three months David heard that the presence of the ark had brought blessings to Obed-edom, and. with sacrifices and formal acts of reverence, the ark was brought up Mt. Zion and installed in the tent. In these ceremonies David himself offered the sacrifices, led the sacred dance and blessed the people. David was clearly the leading spirit in the establishment of the Jerusalem cultus. As such he quite naturally served as the patron of psalmists in the centuries that followed. There is, moreover, no reason to doubt that he was himself an author of psalms used in worship (see PSALMS).

David made very practical political use of the ark and of the worship connected with it. But this is not to impugn either his deep reverence for it or the sincerity of his personal faith in the God of Israel. The episode simply illustrates that the characteristic qualities of his personality, already noted in connection with his political activity, are also reflected in his religious life. David believed that God had made a "covenant" with him; that is, that in the person of David, as king, God acted to mediate his power and blessing to fulfill the destiny of Israel, and that this covenant included all David's royal heirs to come until God's promise to Israel was realized. At the same time, as the conclusion of the story of his affair with Bathsheba illustrates (II Sam. xii). he was keenly aware that he was responsible for his own deeds and that these mere subject to the judgment of God.

Having unified Israel, overcome the Philistines and established a political and religious capital, David proceeded to build an empire. He conquered and occupied the kingdoms of Edom and Moab, east of the Jordan. Farther north in Syria, he installed garrisons at strategic points, notably in Damascus, and created a series of tributary states. It has been estimated that his non-Israelite subjects were more numerous than the Israelites and that his territory extended from the upper Euphrates to the Gulf of Aqaba. David's was the only empire ever to rise in Palestine, a geographical region not intended as a centre of empire but rather as a bridge between empires. The fact that it did not long outlast David offers additional tribute to the skill of its builder.

Domestic Problems. — David's great success as warrior and empire builder was marred by family dissensions and political revolts. The two were interrelated in many ways and both were in large measure the result of the social and cultural transition exhibited and furthered by the establishment of a central political monarchy in Israel.

To tie together the heterogeneous elements of his kingdom, David took wives from them and created a harem. David's family represents an extreme departure from the family in the consanguineal context of a clan structure. In such a society the rights and status of the members of a given family were determined by the unchanging traditions of the clan life and by the place of a given family in the hierarchy of the clan. Moreover, even if a man had several wives, these normally came out of a common context in clan or tribe. David's wives, on the other hand, were mostly completely alien to one another, and his children were without the directing support of established social patterns that provided precedents for the resolution of conflict. The point is often made that in family quarrels, such as that between Ammon and Absalom, David was indecisive or "indulgent." But considering the policy of watchful waiting that governed his political program, it may be suggested that David lived by the same qualities and principles in relation to his family, although the results were not so salutary as they were in the arena of statecraft. For example, the problem of the succession did not take care of itself as helpfully as had the problem of the throne of Saul.

The revolts, first of Absalom and then of Sheba, also imply a rapid social and cultural transition that was beginning to meet resistance. To further his conspiracy, Absalom sought direct personal contact with the heads of clans (II Sam. xv, 1–6), reviving a royal practice of David's earlier years that had fallen into disuse with the establishment of a state bureaucracy. The revolt of Sheba (II Sam. xx) contained elements of northern, especially Benjaminite, resistance to the rule of David; it anticipated the breakup that was to come at the end of the reign of Solomon, David's son and successor.

Messianic Symbol. — Under David, Israel enjoyed military and

political achievement greater than in any subsequent era. As king, David was "Messiah" ("anointed"), the vicegerent of God through whom God mediated his salvation and blessing to Israel. Israel lived by the "promise" of God to Abraham. This promise was variously defined in detail but was always summed up by the word "peace"; and this included the most complete material and spiritual well-being for Israel. The full realization of the promise would be the arrival of the Kingdom of God on earth. Israel's prophets used the great era of David as an illustration of the time of fulfillment for which they waited and prayed. Often their expectation included the coming of a Messiah (*q.v.*), a lineal "son of David" by means of whom God would bring in his kingdom; for they took seriously the promise to David (II Sam. vii. 16) that his house mould "be established for ever." In the New Testament Jesus is called "son of David" and "Messiah," showing that the Christians believed that in him the promises to Abraham and David had been fulfilled and that the rule of God had come, though the form of these promises was sharply redefined.

DAVID I (c. 1082–1153), king of the Scots from 1124 to 1153, brought Scotland to a zenith in its power. The sixth and youngest son of Malcolm III and St. Margaret. he spent much of his early life at the court of Henry I of England, who married his sister. He is said to have been left southern Scotland by his brother King Edgar when the latter died in 1107. but it was probably a few years later that David. with Anglo-Norman help, secured from another brother, King Alexander I. the right to rule Cumbria, Strathclyde and Lothian south of Lammermuir. Through his marriage with Matilda, daughter of Waltheof. earl of Northumbria, he was already earl of Huntingdon and held extensive lands in that county and in Northamptonshire. When Alexander I died in April 1124. David succeeded as king of Scots.

His relations with England were governed by the oath he took in 1126 or 1127 recognizing the empress Matilda as heir to Henry I. David seized Cumberland and Northumberland in 1136 and his subsequent warfare on behalf of Matilda was an attempt both to secure the English throne for her and Northumberland for the king of Scots. He was prepared to sacrifice the former to the latter aim; a short-lived peace with King Stephen in 1136 gave him Cumberland and the earldom of Huntingdon for his son Earl Henry. He again invaded in 1137, and was defeated at the battle of the Standard at Northallerton (Aug. 22. 1138). but in the following year Northumberland was also conceded to Earl Henry by King Stephen. David again entered the war on Matilda's side in 1141, and her son Henry Plantagenet (afterward Henry II) was knighted by him at Carlisle in 1149. acknowledging David's right to Northumberland. The claims of Earl Ranulf of Chester to Cumberland were bought off when King David conceded to him the honour of Lancaster. acquired by unknown means in 1141.

In Scotland David I effected a revolution. Probably at his enthronement he granted to Robert de Bruce, a Yorkshire baron, the territory of Annandale. Already many men of Anglo-Norman extraction had come to serve David as ruler of Cumbria, and their numbers grew after he became king. Not all stayed. and of those who did, not all founded Scottish families. But although the native aristocracy was not apparently dispossessed. by marriage to them and by grant from the royal demesne a new Anglo-French aristocracy was established in Scotland. Bruce, Stewart, Melville, Corbet. Riddel, Gifford. Oliphant. Comyn are family names whose earliest bearers came to Scotland from England in the time of David I; they had come to England a generation or so earlier from northern France. Most received lands, usually scattered rather than consolidated, south of the Forth, and some at any rate held them in return for military service. None was made earl, but so pervasive was French culture as a result of this peaceful invasion that by the end of the 12th century the Celtic and Anglian mere indistinguishable from the French aristocracy in speech, manners and life. Royal castles were built and in them appeared the first sheriffs, around them grew the first burghs. A rudimentary central administration was created and, perhaps the most significant feature of Scotland's emergence from the dark ages, a Scottish royal coinage made its first appearance.

In the ecclesiastical field, David restored the bishopric of Glasgow and probably several others including Dunkeld and Aberdeen. He cannot be shown to have founded any new sees, but most were void of pastors on his accession and held by clerics of non-Scottish origin on his death. The priory of Dunfermline existed but was perhaps deserted at his accession; the priories of Scone and Inchcolm had been founded by Alexander I, and the abbey of Selkirk was founded by David as earl. There were no other non-Celtic religious foundations in Scotland in 1124. King David founded the priories or abbeys of Coldingham (on earlier endowments), Melrose, Holyrood, Newbattle, Cambuskenneth. Dundrennan, Kinloss, St. Andrews and several others, mainly cells of lesser importance.

His only surviving son, Earl Henry, called "designated king" from 1144, died in 1152, leaving three sons. Of these the oldest became king of Scots as Malcolm IV, and the second, William (also later king), was earl of Northumberland when King David died at Carlisle on May 24, 1153. (A. A. M. D.)

DAVID II (1324–1371), king of Scots, son of Robert I the Bruce by his second wife, Elizabeth de Burgh, was born at Dunfermline on March 5, 1324, and on July 17, 1328, in accordance with the treaty of Northampton he married Joanna, sister of Edward III, at Berwick-on-Tweed. He succeeded his father on June 7, 1329, and was crowned at Scone in Nov. 1331, the first Scottish king to receive unction. The success of Edward Balliol and the disinherited barons at the battle of Dupplin (Aug. 1332), followed by Edward's coronation and the English victory at Halidon Hill (July 1333) led to his spending seven years in France, where Philip VI lodged him at Château Gaillard, contributing large sums for his maintenance. He joined Philip's fruitless campaigns of 1339 and 1340 against Edward III. By 1341 Scotland was liberated sufficiently for his return, but he showed little capacity for government, preferring to make futile raids into England. During the siege of Calais he responded to Philip's appeal for a diversion by leading a large army to disaster at the battle of Neville's Cross (Oct. 1346). Wounded and captured, he remained a prisoner, chiefly in the Tower of London, at Newcastle and at Odiham (Hampshire) until released in 1357 for a ransom of 100.000 marks to be paid in 10 years. This proved beyond the resources of Scotland, and David. now on cordial terms with Edward III, made several visits to London, partly for pleasure, partly in successful attempts to postpone payment. In 1363 he proposed the cancellation of the ransom in return for a son of Edward being declared successor to the Scottish throne, but this was repudiated by the Scottish parliament. Ultimately 76,000 marks were paid altogether. At home David had trouble with the nobles, especially with Robert Stewart, his nephew and heir, and the royal officials provoked complaints. His extravagance led in 1368 to some appropriation of supply by parliament, which in 1370 cancelled a proportion of his debts. In his reign parliament developed the use of judicial and legislative committees and burghal representation became regular. He built David's tower in Edinburgh castle and St. Monan's church in Fife. Having married, secondly, Margaret Drummond, widow of John Logy, in 1363, he divorced her six years later. Her appeal to the pope was pending when he died in Edinburgh castle on Feb. 22, 1371. (E. W.-M. B.-M.)

DAVID, the name of three Welsh princes, near descendants of Prince Owen Gwynedd, all of whom ruled in Gwynedd, the principal Welsh lordship which covered the greater part of North Wales.

DAVID I (d. 1203) was a son of Owen Gmynedd. When Owen died in 1170, David seized Gwynedd, entered into alliance with England, and in 1174 married Emma, half-sister to Henry II. This, however, did not shield him from the enmity of kinsmen who by Welsh custom had claims to portions of Gwynedd. He died c. May 1203, in England where he had been exiled since 1194 after the triumph of his nephew Llewelyn ap Iorwerth the Great.

DAVID II (*c.* 1208–1246) was a son of Llewelyn ap Iorwerth, and

through his mother Joan a grandson of King John. Although Gruffydd, a son by an earlier marriage. had a claim to at least a portion of Gmynedd, Llewelyn designated David as his sole heir in the hope of perpetuating the paramount position of his dynasty. Soon after his accession in 1240, however, David saw the achievements of his father's lifetime destroyed when his uncle, Henry III, forced him to submit on terms which included the transfer of Gruffydd from a Welsh prison to royal custody. But when Gruffydd broke his neck trying to escape from the Tower of London in 1244. David declared war on Henry. claimed to hold his lands in fee of the papacy, and assumed the title prince of Wales—the first recorded use of this style. David died on Feb. 25. 1246. at Aber, while hostilities were in progress, leaving no issue by his wife Isabella de Braose.

DAVID III (d. 1283) was a son of Gruffydd ap Llewelyn. David steadfastly opposed his brother Llewelyn who had assumed the mantle of Llewelyn ap Iorwerth. Rewarded by Edward I at the close of the Welsh war of 1277 with lands in northeast Wales David was so angered by the oppressive administration of English officials in adjoining territories that on Palm Sunday 1282 he attacked the English at Hawarden. thus precipitating the final struggle for independence. After Llewelyn's death (Dec. 1282) David continued to resist in Snowdonia until in the summer of 1283 he was betrayed and taken to Shrewsbury where he was executed on Oct. 3, 1283. All his children by Elizabeth Ferrers died in captivity. David was the last of three native Welsh princes, all successive rulers of the house of Gwynedd, to claim the title prince of Wales.

DAVID. FÉLICIEN CÉSAR (1810–1876), French composer who introduced oriental elements into French music. Born at Cadenet, Vaucluse, on April 13, 1810, he received his early musical education at the Jesuit college at Aix-en-Provence where, in 1829, he was appointed chapelmaster at the cathedral of St. Sauveur. In 1830 he studied at the Paris Conservatoire under Henri Réber and F. J. Fétis. In 1831 he joined the socialist brotherhood of the Saint-Simonians where he was associated with Père Barthélemy Enfantin (*q.v.*). David became their main artistic figure and in 1830 published a series of religious chants. *Menilmontnnt,* which were sung at their ceremonies. When the sect was dispersed David spent two years (1833–35) preaching their doctrines in the middle east. Recollections of music heard in Jerusalem, Cairo and Syria were incorporated in the works he wrote on his return. In 1844 he produced *Le Dksert,* a descriptive choral and orchestral work in three sections on words by Auguste Colin and embodying Arabian melodies. Described as a symphonic ode, *Le Désert* was more properly an oratorio bordering on the style of opera and resembling the *opéra de concert* of Berlioz. David's later works in this style, *Moïse au Sinai* (1846), *Christophe Colomb* (1847) and *Éden* (1848), were less well received. Of his five operas. *Lalla Roukh* (1862), based on the tales of Thomas Moore. was the most original. He died at St. Germain-en-Laye on Aug. 29, 1876. Neglected in the 20th century, David's work was admired by Berlioz and Saint-Saens and it also foreshadowed oriental influences in later romantic opera, notably in Bizet's *Djamileh,* Delibes' *Lakmk* and Verdi's *Aida.*

David et du Père Enfantin," *Mercure de France* (May *1,* 1910); R. Brancour, F. *David* (1910). (E. LR.)

DAVID, GERARD (d. 1523), Netherlandish painter, born at Oudewater, in Holland, was the last great master of the Bruges school. He was rescued from complete oblivion in 1860 by W. H. J. Weale, whose researches in the archives of Bruges brought to light the main facts of the master's life. David went to Bruges, presumably from Haarlem, where he is supposed to have formed his early style under the tuition of A. van Ouwater: he joined the guild of St. Luke at Bruges in 1484, and became dean in 1501. He married. in 1496, Cornelia Cnoop. daughter of the dean of the goldsmiths' guild, and became one of the leading citizens of the town: being admitted in 1515 to the Antwerp guild. He died on Aug. 13, 1523, and was buried in the Church of Our Lady at Bruges.

In his early work he had followed the Haarlem tradition as represented by Ouwater and Geertgen tot Sint Jans, but already gave evidence of his superior power as colourist. To his early period belong the "Christ Nailed to the Cross" (National gallery, London; wings at the Antwerp museum) and the "Nativity" at Budapest. In Bruges he studied and copied masterpieces by the Van Eycks, R. van der Weyden and H. van der Goes. and came under the influence of Hans Memling. To this period belong the Madonna triptych in the Louvre. Paris, the "Enthroned Madonna With Angels" at Darmstadt (Ger.). the "Deploration" at Philadelphia (wings in the Lehman collection) and the Munich "Epiphany." But the works on which David's fame rests most securely are his great altarpieces—the "Judgment of Cambyses" (two panels, 1498) and the triptych of the "Baptism of Christ" at Bruges; the "Virgin and Child With Saints and Donor" at the National gallery, London; the triptych of the "Madonna Enthroned and Saints" in the Palazzo Bianco at Genoa; the St. Anna altarpiece in Washington, D.C. (predella in the C. Loyd collection); the "Annunciation" on two panels in the Metropolitan museum. New York; and, above all, the documented altarpiece of the "Madonna With Angels and Saints" at Rouen (1509). In Antwerp, he became impressed by the life and movement in the work of Quentin Massys, who had introduced a more intimate and more human conception of sacred themes. David's "Pietà" in the National gallery. London. and the "Crucifixion" at Genoa were painted under this influence and are remarkable for their dramatic movement.

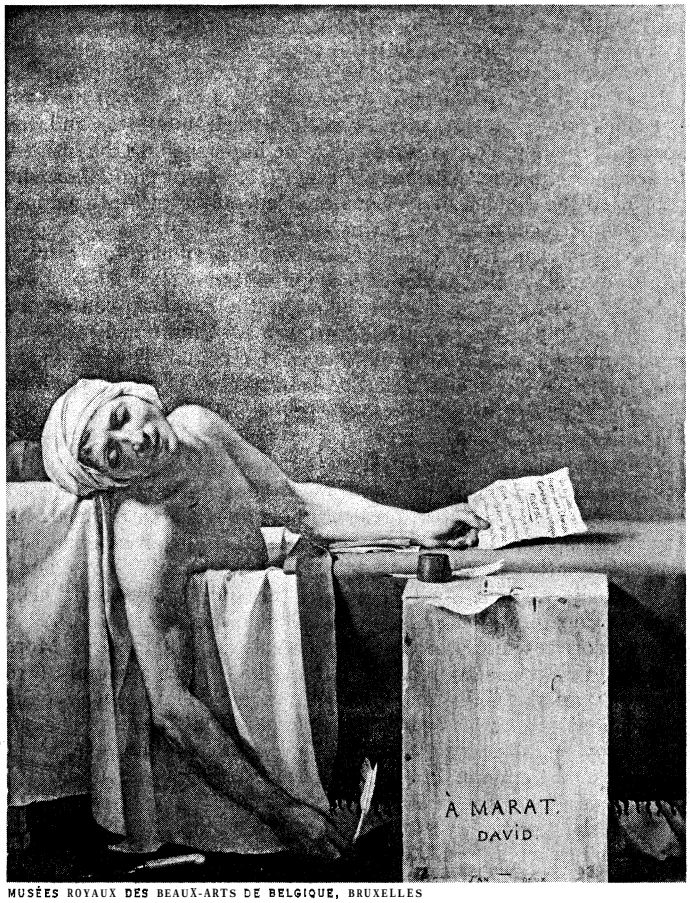
DAVID, JACQUES LOUIS (1748–1825), chief French painter of the period of the French Revolution. consulate and first empire, was born in Paris on Aug. 30, 1748. of a prosperous bourgeois family. He entered the Académie Royale in 1766, studying under J. M. Vien, and remained there until 1774, when, at his third attempt, he won the Prix de Rome with the rather rococo "Antiochus Dying for the Love of Stratonice" (École des Beaux-Arts, Paris). Once in Italy David fell under the spell of High Renaissance and, especially, of antique art; he was also interested in the ideas of neoclassicism that had been developed in Rome by Johann Winckelmann, Anton Mengs and Gavin Hamilton. Shaped by these influences, and more directly by Poussin, David quickly evolved a markedly individual style. This was first apparent in "Belisarius Asking for Alms" (Lille) which was exhibited in Paris in 1781. David had returned home in 1780, but was in Rome again 1784–85 to paint "The Oath of the Horatii" (Louvre, Parisj. "Belisarius" and "The Horatii" belong to a group of large historical paintings with Greek and Roman subjects: it includes "Andromache Grieving Over the Dead Hector" (1783; École des Beaux-Arts, Paris), "The Death of Socrates" (1787; Metropolitan museum, New York), and "The Lictors Bringing Home to Brutus the Bodies of His Sons" (1789; Louvre, Paris). These pictures firmly established the neoclassical style in France and made David's reputation. They were intended not for the court circle, but for an expanding educated middle class to whom the classical allusions were perfectly familiar. David was not concerned to entertain, but deliberately sought to preach a moral.

David's paintings had been an incitement to revolutionary activity and when in 1789 the revolution broke out he put his art at the service of the new regime. The unfinished "Oath of the Tennis Court" (1791; Versailles)' was intended to celebrate the parliamentarians' first defiance of royal authority, and in 1793 and 1794 David began a trilogy dedicated to the martyrs of the revolution: "Marat" (Brussels), "Lepeletier de Saint-Fargeau" (destroyed) and "Joseph Barra" (sketch at Avignon). These pictures are more realist than neoclassical in style. An intimate and associate of all the revolutionary leaders, many of whom he painted or sketched,



MUSÉES ROYAUX DES BEAUX-ARTS DE BELGIQUE, BRUXELLES

"DEATH OF MARAT" BY JACQUES LOUIS DAVID. 1793. IN THE MUSÉES ROYAUX DES BEAUX-ARTS DE BELGIQUE. BRUSSELS

David was elected to the national convention in 1792, and soon found himself directing the new republic's artistic affairs. His career was however sharply interrupted in 1794 with the downfall of his friend Robespierre and for some weeks David was threatened with trial and imprisoned in the Luxembourg palace. The painting of the Luxembourg garden (1794, Louvre) is one of his rare landscapes. For several years David's fame was in eclipse, and during this time he painted "The Rape of the Sabine Women" (1799; Louvre), a neoclassical composition, dominated by the figure of Hersilia begging her husband and her father to stop fighting, that is clearly a plea for an end to internecine strife. With the rise to power of Napoleon in 1799, David won popularity once again and became first painter to the consul and (after 1804) emperor. In a number of pictures, among them "Bonaparte Crossing Mont Saint Bernard" (1800; Versailles), "The *Sucre:* Napoleon Crowning Josephine" (1805–07; Louvre) and "The Distribution of the Eagles" (1810; Versailles), he recorded Napoleon's public life. The problem of depicting contemporary events and figures in contemporary dress had led David to a new tableaulike manner of composition, very different from the earlier neoclassical works, and lacking something of their conviction.

With the fall of Napoleon and the restoration of the monarchy David was exiled to Brussels, where he lived from 1816 until his death on Dec. 29, 1825. In his old age he returned to the mythological subject matter of his youth, painting "Amor and Psyche" in 1817 and "Mars Disarmed by Venus" (Brussels) in 1824. Throughout his career David had painted portraits remarkable for their honesty and penetration. Among the most important are the portraits of Leroy (1783; Montpellier); of M. and Mme. Pécoul (1784; both Louvre); of the chemist Lavoisier with his wife (1788; Rockefeller institute, New York); of himself (1794; Louvre); of M. and Mme. Sériziat (1795; both Louvre); of Mme. Récamier (1800; Louvre); and of Pope Pius VII (1805; Louvre). The portraits reflect, albeit less directly than the history paintings, the evolution that his style underwent. The attribution to David of a number of well-known works—the "Maraichbre" (Lyon), the so-called "Gerard and his Family" (Mons), and the "Three Women of Ghent" (Louvre)—has been questioned: the last two may have been painted by or in collaboration with David's Belgian pupil, François Joseph Navez.

David bridges the gap between the rococo art of the 18th century and the realism of the 19th century. His bourgeois origins led him in early career to avoid the declining aristocratic circles and to seek instead to create a new art for the rising middle classes. This he did with remarkable success, and the development of his personal style closely echoes the rapidly changing revolutionary situation at the turn of the century. The neoclassicism of the early period is itself imbued with romanticism and gives way to a realism that is entirely 19th century in spirit. David's influence on his younger contemporaries was enormous and the roots of the art of painters as different as Th. Géricault, Eugbne Delacroix, J. D. Ingres and A. J. Gros can often be found in his work. He seems to have been an excellent teacher, anxious that his pupils should develop naturally, but his precepts were subsequently made the excuse for much of the worst academic teaching of the 19th century. DAVID D'ANGERS, PIERRE JEAN (1789–1856), French sculptor, who revolted against the prevailing neoclassic style of early 19th-century French sculpture, was born at Angers on March 12, 1789. The son of a carver, he went to Paris at 17 with 11 francs in his pocket to study under Philippe Laurent Roland. After a year and a half's struggle he received a small annuity from the municipality of Angers. In 1811 he won the Prix de Rome and was sent to Italy, where he worked for some time in Antonio Canova's studio. Returning to Paris in 1816, after a short visit to London, he received many important commissions. One of his first works in Paris, the "Condé" at Versailles, showed the new tendency toward a more realistic method. In 1827 he visited England, and in 1828 and 1834 Germany. Always a Radical in politics, he had to leave France for a short period after the *coup d'état* of Dec. 1851. Many of the most famous men and women of his time sat to David for busts or medallions. A nearly complete collection, originals or copies, is to be seen in the Musée David at Angers. Among David's most important works are: the sculptures on the pediment of the Panthéon, showing the principal personages in France since the Revolution grouped round a figure of "La Patrie"; the Gutenberg monument at Strasbourg; the monument to General Gobert in Pbre Lachaise, the "Philopoemen" in the Louvre, and the bust of Goethe, presented by him to the poet in 1831, in the public library at Weimar. David died at Paris on Jan. 4, 1856.

DAVIDOVIC, LJUBOMIR (1863–1940), Yugoslav statesman who was twice prime minister, was born at Vlasko Polje, Serbia, on Dec. 24 (new style; 12, old style), 1863. He entered parliament in 1901, was one of the founders of the Independent Radical party in 1902 and became minister of education in 1904, speaker of the *skupstina* in 1905 and lord mayor of Belgrade in 1909. Elected leader of his party in 1912, he served as minister of education (1914–17) in Nikola Pasic's coalition cabinet and in the first Yugoslav government (1918). As leader of the newly formed Democratic party (1919), he presided over the Democratic-Socialist coalition government (1919–20). In July 1924 he again became prime minister at the head of a short-lived coalition of Democrats, Slovene Clericals and Bosnian Moslems, supported by the Croatian Peasant party. He led the Democratic party until his death, in Belgrade, on Feb. 19, 1940. He actively opposed the regime introduced by King Alexander in 1929. Brought up in Serbia's liberal and democratic traditions, he believed that a thorough democratic government within a centralist constitution would gradually weld Serbs, Croats and Slovenes into one unified nation. After experiencing the complex Yugoslav realities, Davidovic revised his constitutional ideas and promoted a popular movement advocating a federalist state organization

based on Serbian-Croation-Slovene agreement and parliamentary constitution. (K. ST. P.)

DAVIDSON, ANDREW BRUCE (1831–1902), Scottish Old Testament scholar, one of the first to introduce historical methods of Old Testament study in Scotland, mas born in 1831 at Kirkhill, Aberdeenshire. He graduated from Aberdeen university in 1849 and in 1852, after three years as a schoolmaster. entered New college, Edinburgh. He was licensed to preach (Free Church of Scotland) in 1856. In 1858 he became assistant professor of Hebrew and in 1863 professor of Hebrew and oriental languages at New college. Davidson also served as a member of the Old Testament revision committee. He died on Jan. 26, 1902.

Among Davidson's published works were commentaries on Job, Ezekiel and Nahum, Habakkuk and Zephaniah; an *Introductory* Hebrew Grammar, widely used as a textbook; a Bible-class primer on The Exile and Restoration; and lectures on Old Testament Prophecy, published after his death. He also contributed a mass of articles to the Imperial Bible *Dictionary,* the Encyclopedia *Britannica,* Hustings' Bible Dictionary and the chief religious reviews.

See J. Strahan, Andrew Bruce Davidson (1917).

DAVIDSON, JOHN (1857–1909), British poet whose vigorously written verse expresses a fin de *siècle* despair, was born at Barrhead, Renfrewshire, on April 11, 1857. As a boy he worked in a chemical laboratory and later attended Edinburgh university for one session. He taught at various Scottish schools for six years, during which period he published the plays Bruce (1886), Smith (1888) and *Scaramouch* in *Naxos* (1889). Although these showed his ability as a writer of blank verse. they failed to gain him a reputation, and in 1890 he went to London to devote himself wholly to writing. He contributed to several papers and wrote novels and short stories for a living, but it was his Fleet Street Eclogues (1893) that established him. This was followed by Ballads and Songs (1894), a second series of eclogues (1896) and other volumes of verse which revealed Davidson's mastery of the narrative lyrical ballad. He continued to write novels and plays, and toward the end of his life published a series of *Testaments,* expressing his philosophical belief in man as the measure of the universe, created to express himself to the utmost. He planned a trilogy of plays with this theme, to be called God and *Mammon,* of which only The Triumph of *Mammon* (1907) and *Mammon* and His Message (1908) appeared. In 1908 he went to live at Penzance, Cornwall. Although he received a small civil list pension he was troubled by poverty, and also by ill-health. On March 23, 1909, he drowned himself in the sea at Penzance.

DAVIDSON, THOMAS (1817–1885), British paleontologist noted for his exhaustive *Monograph* of British Fossil *Brachiopoda,* was born in Edinburgh on May 17, 1817, and educated partly in the Edinburgh university and partly in France, Italy and Switzerland. Besides his Monograph—published (1850–70) by the Palaeontographical society (6 vol., containing 250 plates done by Davidson himself)—he also prepared an exhaustive memoir on *Recent Brachiopoda,* published by the Linnean society. Davidson was elected fellow of the Royal society in 1857. He died at Brighton on Oct. 14, 1885.

See biography with portrait and list of papers in Geological Magazine, p 145 (1871).

DAVIDSON OF LAMBETH, RANDALL THOMAS DAVIDSON, 1ST BARON (1848–1930), for 25 years (1903–28) archbishop of Canterbury and an ecclesiastical statesman who was prominent in debate in the house of lords on moral and national questions at home and on the welfare of the underprivileged and persecuted abroad. He was born in Edinburgh on April 7, 1848, and educated at Harrow school and Trinity college, Oxford. He studied for holy orders nith C. J. Vaughan and was ordained in 1875. In 1877 he was appointed resident chaplain to the archbishop of Canterbury, A. C. Tait, whose daughter he married. Davidson won the confidence of Queen Victoria and her influence secured his appointment to the deanery of Windsor in 1883 and successively to the sees of Rochester (1891) and Winchester (1895). Both in the ritualist controversy and in the disputes over religious instruction in schools between 1902 and 1906 he attempted to reconcile the extremists. In Feb. 1903 he succeeded Frederick Temple as archbishop of Canterbury.

Davidson's strength as archbishop lay not in brilliance of intellect but in sound common sense. He was often consulted on questions quite outside normal ecclesiastical interests, and his speech in the house of lords was decisive in persuading the bishops to accept Asquith's Parliament bill in 1911. In foreign affairs, he supported the League of Nations and led public protests against religious persecution in Russia in 1922.

Davidson was responsible for promoting efforts to forward Christian unity. He succeeded in winning the confidence of English Free churchmen, and as president of the Lambeth conference in 1920 he helped to frame the "Appeal to All Christian People" to make greater efforts for church unity. He personally expounded the Appeal to the Church of Scotland and to the United Free Church of Scotland and he was kept informed of the Malines conversations (1921–25) between Anglicans and Roman Catholics. He encouraged closer relations with the Eastern Orthodox churches, some of which recognized Anglican ordinations, and he pressed successfully for the retention of the ecumenical patriarchate in Constantinople. Davidson's influence was also often extended on behalf of native peoples, and his advice was always considered particularly valuable by workers in the missionary field. His archiepiscopate was marked by doctrinal disputes and in 1922 a commission was set up to consider the existing differences. More important was the setting up in 1919 of the Church assembly (see CONVOCATIONS OF CANTERBURY AND YORK), and Davidson as chairman guided the new assembly through its early years. The rejection by the house of commons of proposals for the revision of the Book of Common Prayer (see COMMON PRAYER, BOOK OF) was a severe blow to Davidson.

Davidson's activities led to an increase of the Church of England's influence abroad, and his sincere piety, open mind and loyalty to truth won him recognition at home. He was created a baron on his retirement in Nov. 1928; he died in London, May 25, 1930.

His published writings include Life of Archbishop Tait, 2 vol. (1891), and The Character and Call of the Church of England (1912).

See G. K A. Bell, Randall Davidson, 2 vol. (1935). (H. M. W.)

DAVIES, ARTHUR BOWEN (1862-1928). U.S. painter, one of the "Ash Can" school and a leader in the modern movement, was born at Utica. N.Y., on Sept. 26, 1862. He was a pupil of Dwight Williams at Utica. afterward studying in New York and Chicago. He became an adherent of the romantic school of painting and made notable contributions in the fields of etching and colour lithography. His later work showed influences of Cubism, though it never lost its idyllic quality.

In 1908 Davies organized an exhibit of artists who came to be known as The Eight, also called the Ash Can school. (See PAINTING: Modern Painting [*Late* 19th and 20th Centuries]: National *Development*). As president of the Society of Independent Artists. Davies was a major figure in the organization of the famous Armory show of 1913, which brought the works of European and American modernists to the attention of the U.S. public. He died in Italy on Oct. 24, 1928.

See Phillips Memorial Gallery, Arthur B. Davies: Essays on the *Man* and His Art (1924); R. Cortissoz, Arthur B. Davies (1931).

DAVIES, DAVID (1818–1890), Welsh industrialist, was born at Llandinam, Montgomeryshire, on Dec. 18, 1818, the eldest of nine children of a tenant farmer. From farming and sawing timber on commission he turned to contracting and built eight lengths of railway in Wales. In 1864 he sank for coal in the upper Rhondda valley, and his success led to the formation of the Ocean Coal company. Because of the inadequacy of Cardiff docks for the growing coal trade he took the lead in a parliamentary struggle for a new dock at Barry, begun in 1884. He was a Liberal member of parliament for Cardiganshire from 1874 to 1886. He died at Llandinam on July 20, 1890. Dairies was characteristic of the British Industrial Revolution, hard working but fair minded, a Calvinistic Methodist of puritan habits, with a rugged sense of humour.

See Ivor Thomas, *Top Sawyer: a Biography of David Davies of Llandinam* (1938). (*I. B.-T*)

DAVIES, DAVID DAVIES, 1ST BARON, OF LLANDINAM (1880–1944), who pleaded the cause of internationalism between World Wars I and II, was the only son of Edward Davies of Plas Dinam, Llandinam, Montgomery, where he was born on May 11, **1880.** He was educated at Merchiston Castle school, Edinburgh, and at King's college, Cambridge. In 1906 he entered the house of commons from Montgomeryshire. Me fought in World War I and at its conclusion became parliamentary private secretary to David Lloyd George, obtaining his peerage in 1932. He was actively interested in university education in Wales and was also closely associated with the work of the League of Nations union. After the failure of the Disarmament conference in 1933, he founded and acted as treasurer of the New Commonwealth society, which aimed to produce a more effective League of Nations, with a police force and an impartial tribunal with a wide jurisdiction to settle international disputes. He wrote many books and pamphlets on this theme, including *The Problem of the Twentieth Century (3rd* ed., **1938).** Lord Davies died on June **16,** 1944. (G. W. K.)

DAVIES, (SARAH) EMILY (1830–1921), pioneer in the movement to secure university education for women and chief founder of Girton college, Cambridge, was born at Southampton, Eng., on April **22, 1830.** Educated at home, she joined the campaign for the emancipation of women with Mme Bodichon (Barbara Leigh Smith) and Elizabeth Garrett (Mrs. Garrett Anderson). With Dorothea Beale and Frances Mary Buss she gave evidence before the schools inquiry commission (1864–68). Her aim was to secure the admission of women to university examinations, but, unlike her friends, she insisted that women should be admitted on the same terms as men. As a consequence of her advocacy, University college, London, admitted women to classes in 1870. In **1869** Miss Davies and her friends opened a women's college at Hitchin; this moved to Cambridge in **1873** as Girton college. During 1870–73 she served on the London school board till she went to Girton as mistress (1873–75). From **1867** to 1904, except for an interval as treasurer, she was honorary secretary of the college. Her chief publications were *The Higher Education of Women* **(1866)** and *Thoughts on Some Questions Relating to Women, 1860–1908* (1910). She died at Hampstead, London, July 13, 1921.

See Barbara Stephen, *Emily Davies and Girton College* (1927). (S. J. C.)

DAVIES, SIR HENRY WALFORD (1869–1941), English organist and composer, who exerted a wide influence on musical education was born at Oswestry, Shropshire, on Sept. **6, 1869,** and was educated privately. In **1882** he became a chorister at St. George's chapel, Windsor, and in **1885** assistant organist to Sir Walter Parratt there. During **1890-94** he was pupil and scholar at the Royal College of Music, where, in **1895,** he became a teacher of counterpoint. In **1898** he was appointed organist to the Temple church. London. a post which he held until **1923.** He was conductor of the London Bach choir from **1903** to **1907** and professor of music in the University college of Wales at Aberystwith from **1919** to **1926.** During World War I, with the rank of major. he worked for the organization of music among the troops, and in **1917** was made director of music to the R A.F. He was appointed director of music and chairman of the National Council of Music, University of Wales, in **1919** and Gresham professor of music in **1924.** He was organist of St. George's chapel, Windsor, from **1927** to **1932.**

His compositions include a Symphony **(1911);** "Solemn Melody" for strings and organ; and in the way of choral works, *Everyman,* a felicitous setting for chorus and orchestra of the old morality play, which enjoyed wide favour; "Ode on Time" **(1908)** ; *Five Sayings of Jesus* **(1911);** "Fantasy" on a text of Dante **(1914);** and *Heaven's Gate* **(1917);** in addition to a quantity of church music, chamber music and songs. Over and above his creative work Walford Davies was for many years one of the most potent and stimulating forces (not least by means of his immensely popular radio talks) in musical education in England. He wrote *Music and Worship* (1935), with Harvey Grace, and *The Pursuit of Music* **(1935).** and edited several song books. He was knighted in **1922.** He died at Wrington, Somerset, on March **11, 1941.**

See H. C. Colles, *Walford Davies* (1942). (**F.** S. H.)

DAVIES, SIR JOHN (1569–1626), English poet and lawyer whose *Orchestra, a Poem of Dancing* reveals a typically Elizabethan pleasure in the contemplation of the correspondence between the natural order and man's activity. Born in **1569,** he was baptized at Tisbury, Wiltshire, on April **16.** Educated at Winchester college and Queen's college, Oxford, he entered the Middle Temple, London, in **1588** and was called to the bar in 1595. He was disbarred in 1598 for having hit his "very friend, Master Richard Martin," with a cudgel during a quarrel in the hall of the Middle Temple, but was restored in **1601** after apologizing to Martin. In the same year he sat for Corfe Castle in parliament, and on Queen Elizabeth I's death he was one of the messengers who carried the news to James VI of Scotland.

James received him with great favour, sent him to Ireland as solicitor-general and conferred a knighthood on him. In **1606** Davies was made attorney-general for Ireland and created serjeant-at-law. He took an active part in the Protestant plantation of Ulster and wrote several tracts on Irish affairs, including *A Discoverie* of *the True Causes why Ireland was never entirely subdued . . . untill the beginning of his Maiesties happie raigne* **(1612)** and *Le Primer report des cases & matters en ley resolues & adjudges en les courts del roy en Ireland* **(1615).** He entered the Irish parliament and was elected speaker, in which capacity he delivered an address reviewing the history of Irish parliaments, and on his resignation in **1619** he returned to England and sat in the English parliament of **1621** for Newcastle-under-Lyme. He was appointed lord chief justice in **1626,** but before he could take up office he died suddenly on Dec. **8. 1626.** With Sir Robert Cotton he was one of the founders of the Society of Antiquaries.

Much of Davies' early poetry consisted of epigrams published in various collections. *Epigrammes and Elegies by J. D. and C. M.* (1590?) contained posthumous work of Christopher Marlowe and was one of the books which the archbishop of Canterbury ordered to be burned in 1599. *Orchestra* **(1596)** is a poem in praise of dancing set against the background of Elizabethan cosmology and its theory of the harmony of the spheres. *Nosce teipsum* **(1 599)** was written during the year after his disbarment, and is a lucid account of his philosophy on the nature and immortality of the soul. In the same year he published *Hymnes of Astraea in Acrosticke Verse,* a series of poems in which the initials of the first lines form the words "Elisabetha Regina." His last poetic works were two dialogues contributed to Francis Davison's *Poetical Rhapsody* **(1602).** He published a collected edition of his poetry in **1622.**

Davies' *Works* were edited by A. B. Grosart, 2 vol. (1869–76) and by H. Morley **(1889)** and his *Poems* by C. Howard (1941). *Orchestra* was edited with a useful introduction by E. M. W. Tillyard (1945). For Davies' work in and tracts on Ireland, *see* G. Chalmers (ed.), *Historical Tracts* **(1 786).**

See M. Seemann, *Sir John Davies, sein Leben und seine Werke* (1913); *E. H.* Sneath, *Philosophy in Poetry* (1903).

DAVIES, JOHN, OF HEREFORD (*c.* 1565–1618), English poet and writing masker whose chief work was *Microcosmos* (1603), a didactic treatise modeled on Joshua Sylvester's translation of Du Bartas' *Le Sepmaine.* He was born at Hereford *c.* **1565.** He settled in Oxford and became known as the best penman of his day. As well as other religious verse treatises, he wrote *Wittes Pilgrimage (c.* 1605), a collection containing some good love sonnets; *Humours Heav'n on Earth; With the Civile Warres of Death and Fortune,* a description of the plague **(1609)** ; and *The Scourge* of *Folly (c.* 1611), containing epigrams to literary contemporaries, including Shakespeare. Davies was also the author of a popular writing manual, *The Writing Schoole-Master* (16th ed., **1636).** He died in London in **1618.**

DAVIES, JOHN LLEWELYN (1826–1916), English clergyman. educator and promoter of education for women, was born at Chicheiter on Feb. **26. 1826.** He was educated at Repton and Trinity college, Cambridge, where he was made a fellow in 1851. He was ordained in the same year, and held successively

several London livings, including the crown living of Christ church, Marylebone, and in 1889 became vicar of Kirkby Lonsdale. Westmorland, where he remained until 1908. Davies was closely associated with John Frederick Denison Maurice in the foundation of the Working Men's college (1854), where he taught for many years. He was elected to the first London school board in succession to Huxley, and from 1873 to 1874 and 1878 to 1886 was principal of Queen's college. Harley street. founded by Maurice in 1848 for the advancement of women's education. Davies was an advocate of the higher education of women, a cause in which his sister. Emily Davies (*q.v.*), was also prominent. and favoured the granting to women of university degrees and the parliamentary franchise. He died at Hampstead on May 17, 1916. With David James Vaughan he produced in 1852 a well-known translation of Plato's *Republic.*

DAVIES, SIR LOUIS HENRY (1845–1924), Canadian politician and jurist, chief justice of Canada's supreme court from 1918 to 1924, was born in Charlottetown, P.E.I., on May 4, 1845. He studied law at the Inner Temple, London, and was called to the English bar in 1866 and the provincial bar in 1867. In 1872 he was elected a member of the legislative assembly of Prince Edward Island, and from 1876 to 1879 was prime minister of the province. He was elected to the Canadian house of commons as a Liberal in 1882; and from 1896 to 1901 he was minister of marine and fisheries in the Laurier administration. In 1897 he was a joint delegate to Washington with Laurier on the Bering sea seal question, and in 1898–99 a member of the Anglo-American joint commission at Quebec. In 1901 he was appointed a judge of the supreme court of Canada, and in 1918 he became its chief justice. He was knighted in 1897 and appointed to the imperial privy council in 1919. He died at Ottawa on May 1, 1924.
(W. S. WA.)

DAVIES, SAMUEL (1723–1761), American religious and educational leader, preacher, champion of religious dissenters and hymn writer, was born in New Castle county, Del., on Nov. 3, 1723. He was educated at Samuel Blair's "log college" and ordained minister of the Presbyterian Church in 1747. Davies became a leader of the southern phase of the religious revival known as the Great Awakening, his work centring at Hanover, Va. The Virginia struggle between established church leaders and nonconformists found in Davies one of the dissenters' chief defenders; he argued their cause before the Virginia general court and enlisted the support of prominent English and Scottish dissenters. On the outbreak of the French and Indian War the government became too preoccupied to concern itself with checking Davies' activities, especially since his war sermons helped rouse the populace of tidewater Virginia to the defense of the frontier, and his influence in favour of religious rights and freedoms became decisive. When the state constitution was being formed, at the time of the Revolutionary War, the lobbying of Presbyterian leaders helped defeat a provision for an established church.

Davies was one of colonial America's greatest preachers, if not the greatest. This was evidenced not only by the extent of his following and the praises of his contemporaries but also by the popularity of his printed sermons, about 20 editions of which were published. He was also the first American hymn writer.

In 1753 the synod of New York sent Davies and Gilbert Tennent to England to win support for American dissenters and to raise funds for the College of Sew Jersey (now Princeton university). They were highly successful in both missions. Davies in 1755 became the first moderator of the first presbytery of the south, Hanover presbytery. In 1759 he became the fourth president of the College of New Jersey, instituting during his short regime a number of important changes. He died on Feb. 4, 1761.

See George *H.* Bost, "Samuel Davies, the South's Awakener," *Journal of the Presbyterian Historical Society,* 33:135–156, and sources listed in the footnotes. (G. H. BT.)

DAVIES, WILLIAM HENRY (1871–1940), British poet born at Newport, Monmouthshire, on July 3, 1871. The truth and simplicity of his lyrics distinguishes his work from that of his Georgian contemporaries. After serving as apprentice to a picture-frame maker he tramped through the United States, crossed the Atlantic many times on cattle boats, became a peddler and street singer in England, and, after several years of this life, published his first volume of poems, *The Soul's Destroyer, and Other Poems* (1905), from a common lodginghouse in London. *The Autobiography of a Super-Tmmp* (1908)—the best known of his prose works—appeared with a preface by Bernard Shaw, followed by *Nature Poems and Others* (1908). His poetry includes *Forty New Poems* (1918), *Poems 1930–31* (1932) and *The Loneliest Mountain* (1939); the first of the collected editions appeared in 1916. He also published a novel. *A Weak Woman* (1911), and volumes of nature studies. including *Later Days* (1925) and *The Adventures of Johnny Walker, Tramp* (1926). Davies was something of a recluse and the man was never as well known to the general public as his work, which achieved great popularity. He died at Nailsworth, Gloucestershire, on Sept. 26, 1940. His *Collected Poems,* with an introduction by Sir Osbert Sitwell, appeared in 1943. (J. SP.)

DAVILA, ENRICO CATERINO (1576–1631). Italian historian who was the author of a widely read history of the civil wars in France. His ancestors had been constables of the kingdom of Cyprus. In 1570 the island was taken by the Turks. and Antonio Davila, his father. had to leave, despoiled of all he possessed. He traveled into Spain and France, and finally returned to Padua. and at Sacco. Oct. 30, 1576, Enrico Caterino was born. About 1583 Antonio took him to France, where he became a page in the service of Catherine de Medicis, wife of King Henry II. He subsequently became a soldier, and fought through the civil wars until the peace in 1598. He then returned to Padua, and there and later at Parma, he led a studious life until, when war broke out: he entered the service of the republic of Venice. He never lost sight of his early design of writing the history of those civil wars in France in which he had borne a part. The success of the *Historia delle guerre civili di Francia* (1630) was immediate and enormous. Over 200 editions followed. of which perhaps the best is the one published in Paris in 1644. Davila was murdered, while on his way to take over Cremona for Venice, at San Michele in Campagna. near Verona, May 26, 1631.

The *Historia* was translated into English by Sir Charles Cotterell and William Aylesbury (1647–48), and by Ellis Farnesworth (1758). The best French translation was by G. Baudouin (1642).
See E. Allodoli, "*E.* C. Davilo," in *Pegaso* (Sept. 1929).

DAVIS, ALEXANDER JACKSON (1803–1892), U.S. architect, a pioneer figure in U.S. architecture during the 19th century, was born in New York on July 24. 1803. He studied in New York and in Boston. and in 1827, with Ithiel Town of New Haven, Conn., founded the firm of Town and Davis. He was unusually inventive in the many revival styles of the time, but particularly favoured the Gothic. His illustrations for the publications of the horticulturist A. J. Downing helped establish the familiar types of American rural "carpenter Gothic" of the mid-19th century. (C. J. W.)

DAVIS, CHARLES HAROLD (1857–1933), U.S. painter, whose romantic interpretations of the landscape excelled in their cloud effects. was born at East Cambridge. Mass., Feb. 2, 1857. A pupil of the schools of the Boston Museum of Fine Arts, he was sent to Paris in 1880. Having studied at the Academy Julian under Lefebvre and Boulanger, he went to Barbizon and painted much in the forest of Fontainebleau. He became a full member of the National Academy of Design in 1906, and received many awards. including a silver medal at the Paris exhibition of 1889. He is represented by important works in leading museums throughout the U.S. He died in Mystic. Conn.. on Aug. 5, 1933.

DAVIS, CHARLES HENRY (1807–1877), U.S. naval officer and scientist. was born in Boston. Mass., Jan. 16. 1807. He had spent two years at Harvard before becoming a midshipman, and he returned there for the study of mathematics between sea cruises. He made the first comprehensive survey of the coasts of Massachusetts, Rhode Island and Maine, including the intricate Nantucket shoals area, and was a prime mover in establishing the *American Nautical Almanac* (1849), supervising its preparation for several years. A tireless worker for scientific progress, Davis was one of the founders of the National Academy of Sciences in

1863. He was one of the board which recommended building the "Monitor," and was with Adm. Samuel F. du Pont (*q.v.*) at Port Royal. Then he commanded the Union gunboat flotilla on the upper Mississippi for several months after Commodore Andrew Hull Foote was injured in Feb. 1862. He became a rear admiral in 1863. Davis was a practical officer as well as a lover of literature, a man of science and author of scientific books, and was the father-in-law of Sen. Henry Cabot Lodge and of Brooks Adams the historian. He died Feb. 18. 1577, at Washington, D.C. (J. B. HN.)

DAVIS, ELMER HOLMES (1890–1958), U.S. radio commentator and author, was born in Aurora, Ind.. Jan. 13, 1890. He was a Rhodes scholar at Queen's college, Oxford, where in 1912 he received a B.A. degree. Prior to 1924 he worked as a reporter and editorial writer for the **New** *York* Times. For 15 years thereafter he devoted his time chiefly to writing fiction, plays and essays. He became a radio news analyst for the Columbia Broadcasting system in 1939 and won a wide following for his dry humour and incisive comments on the news. In 1942 he became director of the United States Office of War Information and served in this capacity during World War II, after which he returned to radio broadcasting with the American Broadcasting company until 1953. He died in Washington. D.C., May 18, 1958. (H. J. SG.)

DAVIS, HENRY WINTER (1817–1865), U.S. congressman and a leader of the opposition to President Lincoln's policies during the American Civil War. was born at Annapolis, Md., Aug. 16, 1817. He graduated from Kenyon college, O., in 1837, and from the University of Virginia in 1841 with a degree in law. In 1854 he was elected from Baltimore to the national house of representatives, where except for the years 1861–63 he served until 1865.

Davis was important chiefly in terms of Lincoln and the Civil War. An ardent and forceful antislavery spokesman, although from a slave state, he strongly supported the president until 1861. Then, as chairman of a committee on reconstruction, he helped to write and pass the Wade-Davis bill curbing Lincoln's conciliatory policies by placing reconstruction in the hands of congress. The president's refusal to sign the bill led Davis to make a bitter attack on him in the New *York Tribune,* Aug. 5, 1864. Known as the "Wade-Davis manifesto." it charged Lincoln with exceeding his executive powers and of political opportunism. But after Lincoln's renomination'three months later, Davis turned again to his support. Although Davis had inherited slaves he fought hard both for abolition and for universal suffrage. He died at Baltimore, Dec. 30, 1865.

See *Speeches and Addresses by Henry Winter Davis* (1867); B. C. Steiner, *Life* of *Henry Winter Davis* (1916). (E. J. N.)

DAVIS, JEFFERSON (1808–1889), U.S. statesman and only president of the Confederate States of America (*q.v.*), was born June 3, 1808, in southwestern Kentucky on the present site of Fairview. He was the fifth son and last of ten children of Samuel Emory Davis, a Georgia-born planter and horse breeder who had fought in the American Revolution. On his father's side the family was Welsh. His grandfather, Evan Davis, who moved to Georgia, had been a man of property in Philadelphia. His mother, Jane Cook, from South Carolina, was of Scottish stock and reputedly related to the Revolutionary War officer, Gen. Nathanael Greene.

When Jefferson Davis. who mas named for Thomas Jefferson, was still a baby the family moved again to the deep south. His memories began in Woodville, Wilkinson county, Miss., where Samuel Davis settled on a farm that came to be known as "Rosemont." Realizing the boy's potential abilities, his Baptist father sent him to an excellent school, St. Thomas's, near Springfield, Ky., run by Dominican monks. At the age of seven, he made the long journey on pony back in the company of family friends. When he was nine he returned home by one of the recently invented steamboats. Four years later he entered Transylvania university in Lexington, Ky.. and made a high record. At 16 he accepted an appointment to the U.S. military academy.

Both at Transylvania and at West Point his best friend was Albert Sidney Johnston, five years his senior. In the class behind him at West Point were two others who were to serve the Confederacy in battle, Robert E. Lee and Joseph E. Johnston, each a year and some months older than he. Davis was a fun-loving youth who got many demerits and who read widely in world literature instead of studying for examinations. In the class of 1828 he finished 23rd in a class of 33. His army service lasted seven'years, the major part being spent as a lieutenant in the wilds of Wisconsin. Here during a winter of unprecedented cold an attack of pneumonia left him with facial neuralgia, which sometimes almost blinded him with pain. His life was saved by the devoted nursing of a faithful Negro body servant named James Pemberton.

While in Prairie du Chien, Wis., Davis fell in love with Sarah Knox, second daughter of Col. Zachary Taylor, the commanding officer. In 1835, after two years in Arkansas, he resigned his commission to marry her. He then settled as a cotton planter in Mississippi south of Vicksburg on delta land given him by his eldest brother, Joseph, 20 years his senior. Three months after the marriage his bride died of malarial fever and the young man's world collapsed about him. The shock of his wife's death changed his disposition. According to a contemporary record, Davis at 25 was "a witty, sportful, humorous and captivating gentleman." Now learning to bear an insufferable grief brought a stoicism which was later interpreted as coolness. For seven years he stayed largely in seclusion, creating a cotton plantation out of a wilderness and reading the classics and constitutional law in his brother's excellent library. The Davises were noted for model plantations, where the slaves themselves held the trials, and by their own testimony, were "hardly aware of slavery."

In 1845 Jefferson Davis, a stanch Jeffersonian Democrat, entered politics. Earlier that same year he married 19-year-old Varina Howell (1826–1906) of Natchez whose paternal grandfather had been governor of New Jersey. In December. Davis went to Washington as a member of the house of representatives. With his good looks, forceful dignity and oratorical gifts he made an immediate impression. When war with Mexico broke out in 1846 he resigned his seat to become colonel in command of the First Mississippi volunteers. At Monterey (Sept. 1846) he proved a hero, and at Buena Vista (Feb. 22, 1847) he saved the day for Gen. Zachary Taylor with an inspired V-formation, which won him military notice even in Europe. Severely wounded, he returned to Mississippi and was shortly named U.S. senator. In the senate he became chairman of the committee on military affairs. In 1851 the Democrats of Mississippi misguidedly persuaded him to resign as senator and run for governor. Here, by a narrow margin, he met his only defeat in politics.

When Franklin Pierce was inaugurated president in 1853, Davis was made secretary of war, and in this office he functioned brilliantly. He expanded the army, introduced improvements at West Point and at army posts, raised soldier's pay, boosted morale generally, built up coastal defenses, and directed three valuable surveys for future railroads to the Pacific. He engineered the Gadsden Purchase (*q.v.*). He also urged buying a strip of land in Panama and building a railroad for transshipment of freight from merchant ships.

When Pierce went out of office in March, 1857, Jefferson Davis again entered the senate, and there exerted more influence on legislation than any senator of his time. While recuperating from an illness in Maine in the summer of 1858, Davis was feted and pressed to make speeches. Bowdoin college conferred upon him an honorary degree. Everywhere he went Davis proved a winning ambassador of good will for the South. He spoke in Faneuil hall, Boston, advocating a strict construction of the federal constitution. In New York he warned the electorate of the danger of pushing the South too far, and was resoundingly cheered. When he returned to Mississippi he tried to "harmonize the views" of his constituents, and spoke for union. When the antagonism between the sections grew more acrimonious, Davis insisted that disunion should not come except as a last alternative. Repudiating Stephen **A.** Douglas's doctrine of "squatter sovereignty," he asserted that congress had no right to deny admission to the Union of any territory because of slavery. In 1860 he opposed Douglas's nomination as the Democratic presidential candidate and supported John C. Breckinridge. Though Davis did not attend the conven-

tion in Charleston and declined to be a candidate, Benjamin F. Butler, head of the Massachusetts delegation, voted for him in 57 successive ballots. Butler contended that if Davis had been the nominee he might well have defeated the Republican candidate, Abraham Lincoln, and avoided a war between the states.

Jefferson Davis was a reluctant secessionist even after the withdrawal of South Carolina on Dec. 20, 1860. He was among the few who believed that the North might coerce the cotton states. In South Carolina's behalf he intervened unsuccessfully to persuade President Buchanan to remove the Federal garrison from Charleston harbour. On Jan. 21, 1861, twelve days after Mississippi seceded, Davis made a moving farewell speech in the senate and pleaded eloquently for peace. Before he reached "Brierfield," his plantation, he was commissioned major general to head Mississippi's armed forces and prepare for its defense. But within two weeks the Confederate convention at Montgomery, Ala., unanimously chose him provisional president of the Confederacy. Davis was both surprised and saddened; he would have preferred to head the army of defense. But there was no other candidate whose record and qualities for leadership, political and military, equaled his.

On Feb. 18, 1861, Davis was inaugurated in Montgomery and again, under the permanent constitution, in Richmond, Va., on Feb. 22, 1862. As president of the Confederate States his first act was to send a commission to Washington, D.C., to negotiate amicably with the Federal government and prevent armed conflict. Though President Lincoln refused to receive the commissioners, Davis still had hope of peace because the secretary of state. William H. Seward, the head of the army. Gen. Winfield Scott. and the foremost northern Democrat. Stephen A. Douglas. all advocated peace, as did most private citizens in the North. Even leading abolitionists urged the administration to let the southern states go. The South warned Washington that sending armed ships into Charleston harbour could not be tolerated. But President Lincoln decided to send supplies to the Federal garrison of Ft. Sumter and so notified the governor of South Carolina. Only when the ships were off the bar did President Davis give Gen. P. G. T. Beauregard discretionary orders to reduce the fort rather than let in the enemy flotilla. On April 13, after a terrific bombardment, Ft. Sumter surrendered with the loss of but a single life, that of a Federal gunner killed in an accident. Davis mas relieved that no Federal troops had been killed by Confederate fire. Two days later President Lincoln called for 75,000 volunteers. This move brought about the secession of four more states: Virginia, Tennessee, North Carolina and Arkansas. (See AMERICAN CIVIL WAR.)

Jefferson Davis was a president without precedent: he molded a new nation within the caldron of a war. With only one-fourth the white population of the northern states, with a small fraction of the North's manufacturing capacity, with no navy. no powder mill, and an appalling lack of arms and equipment, the South was in poor condition to withstand invasion. Its only resources seemed to be cotton and courage. But at Bull Run (Manassas). Va., on July 21, 1861, the Confederates routed the invading Union forces, and sent them back to the Potomac. In the meantime, with makeshift materials, Davis created factories for producing powder, cannon, side arms and quartermaster stores. In restored naval yards gunboats were fashioned. Davis sent agents abroad to secure arms and ammunition. Purchases from Europe began slipping through a tightening Federal blockade. The inadequate southern railroads and rolling stock were patched up repeatedly. In the first months of 1862, after a series of Union victories in the west and the death of the irreplaceable Gen. Albert Sidney Johnston at Shiloh, a tremendous Federal drive was launched by Gen. George B. McClellan against the forces defending Richmond. When Gen. Joseph E. Johnston was wounded at Seven Pines, Davis named Robert E. Lee commander of the army of northern Virginia, June 1, 1862. It was an inspired decision, though few in the South believed in Lee at the time. In the Seven Days' Battle, which ended July 2, 1862, the Federals were beaten back to the James river. Lee became the South's hero.

After a second Confederate victory at Manassas in Aug. 1862, with Gen. Thomas J. ("Stonewall") Jackson conspicuously brilliant, Davis backed the audacious Lee in an invasion of Maryland. General McClellan, who had been removed, was recalled by Lincoln to save Washington. By accident Lee's entire battle plans fell into McClellan's hands; Lee's outnumbered forces fought a drawn battle at Sharpsburg near Antietam creek and returned to Virginia. England, which was nearly ready to recognize the Confederacy, became cautious. Lincoln, without constitutional authority. issued a proclamation freeing the slaves in those states over which he had no jurisdiction, and thus changed the battle cry of "War for Union" to "War for Emancipation."

When Davis at last persuaded a squabbling congress to pass an act of conscription. it aroused the extreme states' rights men, including the vice-president. Alexander H. Stephens, and two state governors, J. E. Brown of Georgia and Zebulon Vance of North Carolina. The conscript law raised an opposition to Davis which continued to war's end. Davis made trips about the South encouraging his people and counteracting the bad influence of self-seeking politicians and disgruntled generals. The year 1862 ended with a Union defeat at Fredericksburg by Lee and Jackson. In early May of 1863 a powerful invading Federal army under Gen. Joseph Hooker was defeated at Chancellorsville. Va.. by Confederate forces half its size. But the engagement cost the life of the invaluable "Stonewall" Jackson. Meanwhile affairs looked dark in the west Davis had reluctantly made Gen. Joseph E. Johnston commander of the western department, and Johnston now stood still arguing with the administration while Gen. Ulysses S. Grant vigorously assailed Vicksburg. commanded by Gen. John C. Pemberton. To draw Union forces out of Virginia. Lee persuaded Davis to let him invade Pennsylvania. though Davis thought it better strategy to crush Grant at Vicksburg. Disaster came to Lee at Gettysburg on July 3. The next day Vicksburg fell; the Federals controlled the Mississippi river and the Confederacy was cut in two.

Despite these crushing defeats, unrelieved tensions. distressing lack of manpower and armaments, skyrocketing inflation, profiteering, and malicious newspaper criticism from friends of Gen. J. E. Johnston and Gen. P G. T. Beauregard. Davis stood resolute, with Lee in agreement by his side. Even after Braxton Bragg's failure at Chattanooga in late November, Davis counted strongly on the organized armies still in the field, supply ships running the blockade, and a growing peace party in the war-weary North. In December. Davis sent an emissary, Dudley Mann. to Pope Pius IX to beg His Holiness to try to halt the vast emigration of impoverished Irish and German Catholics. whom Federal agents were luring by land grants and cash bounties to fight against the Confederates.

In 1864 Lee's depleted army of northern Virginia successfully withstood the onslaughts of the most powerful Federal army yet assembled. Grant. who had been made general-in-chief of all the Union forces. lost more in casualties than Lee possessed in total armed forces. Davis was continually on the Virginia battlefields, conferring with Lee and giving counsel. Lee declared Davis was "the best military adviser that he had ever consulted."

While Lee was making a brilliant defensive, J. E. Johnston was retreating before W. T. Sherman in Georgia. Davis had been persuaded to put Johnston in command of the army of Tennessee after Bragg's resignation Now when Johnston seemed determined to give up strategic Atlanta, the frightened Georgia authorities, along with Secretary of War J. A. Seddon and the entire cabinet. clamoured for his dismissal. Under pressure. Davis removed Johnston on July 17 and put the daring young Gen. John Bell Hood in command. Hood made three vigorous. if unsuccessful, attacks on Sherman. and held Atlanta until Sept. 1, 1864. When Sherman occupied the city, Lincoln's re-election in November, which had been doubtful, was assured. Now Davis was denounced for having removed Johnston. The governors of North Carolina and Georgia became increasingly antagonistic and threatened to return their states to the Union. But Davis urged the southern people to hold to their principles and fight on for the rights of sovereign states under the constitution. In Sept. 1864. in The Atlantic *Monthly*, appeared a candid interview with Davis by a northern writer named Edmund Kirke, who declared Davis "a man of peculiar ability."

"Our interview... explained why with no money and no commerce, with nearly every one of their important cities in our hands, and with an army greatly inferior in numbers and equipment to ours, the Rebels have held out so long. It is because of the sagacity, energy, and indomitable will of Jefferson Davis. Without him the rebellion would crumble to pieces in a day."

On Nov. 8, heading a Union party with a Democrat, Andrew Johnson, for vice-president, Lincoln was re-elected over McClellan by a popular majority of less than 500,000. This result was regarded as a mandate to continue the war. At the end of 1864 the Federals won a decisive victory over Hood at Nashville, and Sherman made his burning march through Georgia to the sea. On Feb. 6, 1865, at the instigation of the Confederate congress, Davis formally appointed Lee commander-in-chief of all the southern armies. Meanwhile, on Jan. 28, with Grant still besieging Petersburg, Davis sent three commissioners headed by Vice-President Stephens to hold informal peace talks with Lincoln, who had hitherto refused to talk with any Confederate emissary. The Hampton Roads conference, held on Feb. 3, came to naught because Lincoln demanded union as a basis for peace while Davis would accept only southern independence. Finally in April, with his army crumbling at Petersburg, Lee wired the president to evacuate Richmond. Davis moved the executive offices to Danville. Va., on April 3. Lee surrendered at Appomattox on April 9. Davis and his cabinet moved to Greensboro. N.C., and then farther south. Davis planned to reach the trans-Mississippi area and continue the struggle until better terms could be secured from the North. He never gave up because he foresaw the kind of Reconstruction the Radical Republicans might inflict on a South helpless without arms. But at dawn on May 10, 1865, Davis was captured near Irwinville, Ga.

Taken to Ft. Monroe, Va., he was put in a casement cell with one small barred window facing the moat. The commandant, Maj. Gen. Nelson A. Miles, had heavy shackles placed on his ankles and kept a lamp burning by his bedside all night. Shocked public opinion in the North caused the chains to be removed. But under the prison rigours and the ceaseless tramping of two guards in his cell, Davis's health was severely impaired. He was later assigned better quarters and was joined by his wife. In May of 1867, after two years imprisonment, he was released on bail bond; among the signers of the bond was the famous abolitionist editor, Horace Greeley. To Davis's regret, he was never brought to trial. The treason case was dropped on Dec. 25, 1868. In shattered health Davis went to Canada and later to England, where he was warmly received and entertained by many of the nobility who had favoured the southern cause. Altogether he made five trips to Europe in his remaining two decades. Because of the North's hostility he was thwarted in several attempts to become the American agent of various British business concerns.

Davis was offered the presidency of the University of the South at Sewanee, Tenn., but, because the salary was too small to support his large family, he had to decline. For a few years he served as president of an insurance company in Memphis. In 1877 he retired to "Beauvoir," the Gulf coast estate of a friend (Mrs. Sarah A. Dorsey) near Biloxi, Miss., and Mrs. Dorsey ultimately bequeathed the property to him. In 1881, he published his two-volume work *The Rise and Fall of the Confederate Government*. Though pressed by the Mississippi electorate to re-enter the U.S. senate, he eschewed politics and refused to ask for amnesty. He never regained U.S. citizenship. As the elected leader of his people he felt he must uphold the principle that under the original constitution sovereign states had the right to secede, although secession had proved impracticable. This attitude increased resentment toward him in the North, and many northern historians dealt unkindly with him. Some southerners made him the scapegoat for their defeat and for the humiliations of Reconstruction. But Sen. John Daniel of Virginia put the matter simply in 1890: "Had a man less sober-minded and less strong than Davis been in his place the Confederacy would not only have gone down in material ruin—it would have been buried in disgrace."

Dedicated to the principles of democracy, Davis by temperament was an aristocrat of the benevolent kind; he believed in the strong protecting the weak. The official records and holograph letters absolve him from the charge that he interfered with his generals. Too often he took the blame for others' errors and kept silent for the sake of unity. He was perhaps too loyal to friends when they were out of favour. He stood by Judah P. Benjamin, the first Jewish cabinet member in America, when powerful interests opposed him. Though diplomatic to a degree, Davis did not possess the pliancy of the professional politician, and he could not conceal his silent reproach of self-seeking men. His pervading compassion had its counterpart of over-sensitivity. While sometimes austere in his dignity, he was really the warmest of men. Few public figures have won the devotion of so many associates, and he kept his friends in the North. He was idolized by his family and greatly loved by his in-laws and his one-time slaves. He had the power to stir soldiers and citizens to their noblest behaviour. His integrity and probity were impeccable, as persistent enemies discovered. Though he did not join a church (Episcopal) until he was 52, throughout his life his simple faith in God's grace sustained him in his trials.

Davis's personality was exceedingly attractive. "Erect as a spear," he stood 5 ft. 11 in. tall and became ascetically thin. His features were sculptured and handsome His eyes were blue-gray, and in youth his hair was gold. His well-modulated speaking voice was said to be "of peculiar sweetness and resonance." Though when suffering excessive pain from facial neuralgia he was often irritable, he was noted for his courteous manner.

At "Beauvoir" in his last decade he continually received visitors from the North, the South, and abroad, and was generally acknowledged the leader of the South. On Dec. 6, 1889, at 81. Davis died in New Orleans of a complicated bronchial ailment. He was given the greatest funeral the South had ever seen when he was temporarily entombed in that city. On May 31, 1893, he was buried permanently in Hollywood cemetery in Richmond. Va.

DAVIS (DAVYS), JOHN (1 550?–160j), English navigator who was, apart from Martin Frobisher, the first to make a serious attempt to find a northwest passage through the Canadian arctic to the Pacific During the course of several voyages he explored much of the coasts of the strait that bears his name between Greenland and Baffin Island He was born at Sandridge near Dartmouth about 1550 and made several voyages with Adrian Gilbert. In Jan. 1583 he appears to have broached his design of a northwest passage to Sir Francis Walsingham (q v) and the mathematician John Dee, and in 1585 he started on his first northwestern expedition He began by striking the icebound east shore of Greenland, nhich he followed south to Cape Farenell; thence he turned north, and coasted the west Greenland littoral, and shaped a "course for China" by the northwest. In 66° N., however, he fell in with Baffin Island, and though he pushed some way up Cumberland sound, he turned back at the end of August. He tried again in 1j86 and 1587; in the last voyage he pushed through the straits still named after him into Baffin bay, coasting west Greenland to 73° N. Many points in arctic latitudes (Cumberland sound, Cape Walsingham. Exeter sound, etc) retain names given them by Davis. who ranks with Baffin and Hudson as the greatest of early arctic explorers.

In 1588 he seems to have commanded the "Black Dog" against the Spanish Armada, and in 1591he accompanied Thomas Cavendish on his last voyage. with the object of searching "that northwest discovery upon the back parts of America." The rest of Cavendish's expedition returned unsuccessful. and Davis continued to attempt on his own the passage of the Strait of Magellan. and discovered the Falkland Islands. After his return in 1593 he published a valuable treatise on practical navigation in *The Seaman's Secrets* (1594) and *Tize World's Hydrographical Descrip-*

tion (1595) dealing with the problem of the northwest passage. His inventions of backstaff and double quadrant (called a "Davis Quadrant") remained in use long after John Hadley's reflecting quadrant had been introduced in the 18th century. In 1596–97 Davis sailed nith Raleigh probably as master of Sir Walter's own ship to Cadiz and the Azores; and in 1598–1600 he accompanied a Dutch expedition to the East Indies as pilot. In 1601–03 he accompanied Sir James Lancaster as first pilot on his voyage in the service of the East India company: and in Dec. 1603 he sailed again for the same destination as pilot to Sir Edward Michelborne (or Michelbourn). On this journey he was killed by Japanese pirates off Bintang near Sumatra, on Dec. 29 or 30. 1605.

See Sir Albert Markham (ed), *The Voyages and Works of John Davis the Navigator* (1880) and Sir Clements Markham, *A Life of John Davzs* (1889).

DAVIS, JOHN WILLIAM (1873–1955), **U.S.** lawyer, diplomat and Democratic presidential candidate in 1924, was born at Clarksburg, W.Va., April 13. 1873, where he received his early education. He graduated from Washington and Lee university, Lexington. Va., in 1892, and from the law school there in 1895, being admitted to the bar in the same year. After a year as assistant professor of law at his alma mater, he returned in 1897 to Clarksburg, where he entered into an informal partnership with his father. also a lawyer, which continued until 1913. In 1899 he nas elected a member of the West Virginia house of delegates and in 1910 to the U.S. house of representatives.

In Aug. 1913. Davis was appointed solicitor general of the United States, an office he held until 1918. During these years he also served as counsel for the American Red Cross. In 1918 he was appointed U.S. delegate to a conference with Germany at Bern, Switz., on the treatment and exchange of prisoners of war, and in the same year succeeded Walter Hines Page as U.S. ambassador to Great Britain, retaining this post until 1921.

During the peace conference at the end of World War I, Davis was one of Pres, Woodrow Wilson's advisers and helped draft the form of allied control and government in the occupied Rhineland territory. In 1921 he returned from England and accepted a partnership in a New York law firm. Davis was nominated on the 103rd ballot as Democratic candidate for the presidency at the Democratic national convention held in New York city, July 1924. The ensuing election resulted in an overwhelming victory for Calvin Coolidge, the Republican candidate.

Returning to private law practice, Davis appeared in a great many cases before the U.S. supreme court. The capstone of his career was his victory in 1952 when the supreme court ruled that Pres. Harry S. Truman had exceeded his powers in seizing control of the nation's steel mills. Davis took many cases without fee and closed his legal career by defending physicist J. Robert Oppenheimer against the charge that he was a security risk. He died in Charleston, S.C.. Xlarch 24, 1955.

DAVIS, RICHARD HARDING (1864–1916), U.S. journalist and author whose romantic novels and short stories had notable success in his lifetime, was born in Philadelphia, Pa., April 18, 1864. He studied at Lehigh and Johns Hopkins universities. and in 1886 became a reporter on the *Philadelphia Record*. He then worked on various newspapers in Philadelphia and New York nrote short stories, and. in 1890, became managing editor of *Harper's Weekly*. On *Harper's* assignments he toured various parts of the globe, recording his impressions in *The West from a Car Window* (1892), *The Rulers of the Mediterranean* (1893), *Our English Cousins* (1894). *About Paris* (1895) and *Three Gringos in Venezuela and Central America* (1896). He nas a war correspondent reporting every war from the Greco-Turkish to World War I, and the best knonn reporter of his generation His tendencies toward sentimentality and the sensational made his writings immensely popular. His early fiction achieved immediate success, particularly *Gallegher and Other Stories* (1891) a collection of newspaper stories. and *Van Bibber and Others* (1892). Other short story collections were *The Lzon and the Unicorn* (1899). *Ranson's Folly* (1902) and *The Scarlet Car* (1907) He wrote seven popular novels including *Soldiers of Fortune* (1897), *The King's Jackal* (1898) *Captain Macklin* (1902) *The Bar Sinister* (1903), *Vera the Medium* (1908) and *The White Mice* (1909) Several of his 2 j plays were also very successful, notably *Ranson's Folly* (1904), *The Dictator* (1904), and *Miss Civilization* (1906). Harding was essentially the journalist in all his writings, treating subjects superficially while emphasizing the colourful and dramatic. He died near Mount Kisco, N.Y., April 11, 1916.

BIBLIOGRAPHY.—There have been several collected editions of Davis, the principal one being *The Novels and Stories of Richard Harding Davis* (12 vol., 1916). A collection of his best short stories, *From Gallegher to The Deserter,* was edited by Roger Burlingame in 1927. *See* also *The Adventures and Letters of Richard Harding Davis* (1917), edited by Charles B Davis, H C. Quinby, *Richard Harding Davis: A Bzbliography* (1924); and F. D. Downey, *Richard Harding Davis: His Day* (1933).

DAVIS, THOMAS OSBORNE (1814–1845), Irish writer and politician, the chief organizer and poet of the Young Ireland movement, was born at Mallow, County Cork, Oct. 14, 1814. At Trinity college, Dublin, he evolved his ideal of uniting all creeds and classes in a vigorous Irish nationalism. In 1842, with Charles Gavan Duffy and John Dillon, he founded the weekly *Nation,* which, while giving momentum to Daniel O'Connell's agitation for restoring an Irish parliament, also became the organ of many gifted writers, soon known as the Young Irelanders. He also formed study groups on Ireland's economic and social problems and wrote patriotic verses, including "A Nation Once Again" and "The Battle of Fontenoy." An Irish Protestant, he resented the tendency to identify Irish nationalism with Roman Catholic interests, and a rift arose between O'Connell and the Young Irelanders, before Davis died from overwork in Dublin, Sept. 16, 1845. His writings became almost the gospel of the subsequent Sinn Fein movement.

DAVIS, WILLIAM MORRIS (1850–1934), **U.S.** geographer, geologist and founder and acknowledged world leader of modern geomorphology, was born at Philadelphia, Pa., of Quaker stock on Feb. 12, 1850. After education at Harvard, he spent three years with the Argentine Meteorological observatory, Córdoba. Appointed to Harvard in 1876, he taught there until retirement (1912). To meteorology he contributed 42 papers, and *Elementary Meteorology* (1894). Turning to study of land forms, in the 18 jo's, he synthesized existing knowledge and illumined the entire field with his own penetrating analyses. He emphasized deductive reasoning, made rigorous field observations, and used drawings of unique clarity. Especially well known is his concept of the "cycle of erosion." His voluminous writings include *The Rivers and Valleys of Pennsylvania* (1889), *Physical Geography* (1898), *Geographical Essays* (1909), *Dze Erklarende Beschriebung der Landformen* (1912), *The Coral Reef Problem* (1928) and *Orzgin of Lzmestone Caverns* (1930–1931). He died on February 5, 1934. (F. M. FL.)

DAVISON, WILLIAM (*c.* 1541–1608), secretary to Queen Elizabeth I. is chiefly remembered in connection with the execution of Mary Stuart. Of Scottish descent, he went to Scotland as secretary to the English ambassador, Henry Killigrew, in 1566. He remained there for about ten years. He was then employed as agent in the Netherlands (1576–79), on missions to Scotland (1583, 1584) and again to the Netherlands in 1585, returning to England in 1586. That year he became member of parliament for Knaresborough, a privy councilor and on Sept. 30 Sir Francis Walsingham's colleague as principal secretary. As a privy councilor, he was a member of the commission appointed to try Mary Stuart but he took no part in its proceedings. It was Davison who obtained Elizabeth's signature to the warrant for Mary's execution On this occasion and also in subsequent interviews with her secretary. Elizabeth suggested that she would be glad to avoid the responsibility of the execution, but Mary's jailors, Sir Amias Paulet and Sir Drue Drury refused to take the hints thrown out to them. Meanwhile. the privy council, summoned by Lord Burghley, decided to carry out the sentence at once, and Mary was beheaded on Feb. 8, 1587. When the neus of the execution reached

Elizabeth she was extremely indignant, and her wrath was chiefly directed against Davison, who, she asserted, had disobeyed her instructions not to part with the warrant. The secretary was arrested and sent to the Tower of London. Charged before the Star Chamber (March 28, 1587) with misprision and contempt, he was acquitted by many of the commissioners of evil intention but was sentenced to pay a fine of 10,000 marks, and to imprisonment during the queen's pleasure.

However, Davison was released in Sept. 1589; he seems never to have paid the fine; his annuity as secretary, granted to him for life, was paid him until his death; and he continued to receive a secretary's share of the profits of the signet until Walsingham's death in 1590. Attempts were then made to secure his restoration to favour, but they failed, and he retired to Stepney, where he died. He was buried on Dec. 24, 1608. (R. B. WM.)

DAVISSON, CLINTON JOSEPH (1881–1958), U.S. experimental physicist and Nobel laureate, was born at Bloomington, Ill., on Oct. 22, 1881, received his doctorate at Princeton university and spent most of his career at the Bell Telephone laboratories in New York city. He did distinguished work in several fields of physics, notably in the thermionic emission of metals both clean and oxide-coated, and pioneering work in electron microscopy. His fame, however, is based chiefly on his relationship to Louis de Broglie's principle that electrons are of a dual character, having the qualities both of corpuscles and of waves. While studying the reflection of slow electrons from metals, he noticed singular phenomena which eventually he interpreted as signs of the diffraction of electron waves by the periodic arrangement of the atoms in the crystals of the metal. These phenomena consisted in the appearance of beams of diffracted electrons proceeding in specific directions calculable by De Broglie's theory, allowance being made for the refraction of the electrons in the metal. In this work he had as his associate L. H. Germer, and for the discovery of the diffraction of electrons he shared the Nobel prize in physics in 1937 with G. P. (later Sir George) Thomson of England. He died in Charlottesville, Va., on Feb. 1, 1958. *See* also ELECTRON: *Electron Wave Length;* ELECTRON DIFFRACTION. (K. K. D.)

DAVIS STRAIT separates Greenland from North America and connects Baffin bay with the Labrador sea. At its narrowest point, which coincides with the Arctic circle, it is 200 mi. wide. The strait is the site of a submarine threshold, showing maximum soundings of 330 fathoms, which separates the depths of Baffin bay from those of the Labrador sea. Along the eastern shore the west Greenland current carries relatively warm water northward. Along the western shore the Canadian current carries very cold water and masses of sea ice southward, joining the Labrador current beyond the strait. From the vast interior Greenland icecap, great numbers of icebergs are discharged into these waters. The largest icebergs eventually may be carried far south into shipping lanes by the Labrador current. The navigation season for the principal west Greenland settlements, which dot the coast from Cape Farewell to Disko Island, extends from midsummer to late fall, with great annual variations. The Baffin Island coast has few permanent settlements, and navigation is hazardous even in the best season. Shipping routes through the strait traverse the east side, near the Greenland coast. The strait takes its name from its discoverer, the explorer John Davis. *See* ARCTIC, THE: *Exploration: Northwest Passage.* (T. M. G.)

DAVITT, MICHAEL (1846–1906), Irish nationalist, the founder of the Land league, was born at Straide, County Mayo, on March 25, 1846. His father, a small tenant farmer, was evicted in 1852 and migrated to Lancashire, where Michael started work in a cotton mill in 1856. A year later he lost his right arm in a machinery accident. After a few years at school he became a newsboy and "printer's devil." He joined the new Fenian brotherhood in 1865, and was appointed organizing secretary of the Irish Republican brotherhood (I.R.B.) for England and Scotland in 1868. He was arrested at Paddington, London, on May 14, 1870, for sending firearms to Ireland, and was sentenced to 15 years penal servitude, but after serving 7 years he was released on ticket-of-leave.

Davitt at once rejoined the I.R.B. and went to the U.S. where his American mother had settled with her family. In prison, Davitt had conceived the plan of linking the revolutionary Fenian movement with the constitutional agitation which C. S. Parnell was actively promoting in parliament, and combining agrarian and political agitation. On his return to Ireland from the U.S. he secured Parnell's cooperation in organizing the Land league in 1879. His policy of the "new departure" in associating Fenian forces with Parnell's parliamentary campaign led to his expulsion from the supreme council of the I.R.B. in 1880. For his vehement speeches he was imprisoned in 1881–82, and again for four months in 1883. He had been elected member of parliament for Meath in 1882, but as a convict was disqualified from taking his seat.

During his stay in the U.S. Davitt had been deeply influenced by Henry George and his program of land nationalization. He campaigned on those principles in Ireland, but was repudiated by Parnell, and the final settlement of the land question on a basis of peasant ownership went against Davitt's convictions. In 1887–89 Davitt took a leading part in the defense of the nationalists before the Parnell commission. His five-day speech to the commission was published in 1890 as *The Defence of the Land League.* However, the commission's charge that Davitt brought the Irish parliamentary party in touch with the American Fenians was unanswerable. In 1890, when the Irish party split over Parnell's involvement in Capt. W. H. O'Shea's divorce case, Davitt was among the first to oppose his continuance as leader, mainly because Parnell had deceived his colleagues with assurances that O'Shea had no case against him.

Davitt was elected to parliament in 1892 and 1893 but was unseated on petition the first time, and for bankruptcy the second. He was elected member for West Mayo in 1895, but he was not at home in Westminster and resigned his seat in 1900 in protest against the South African War. He worked with William O'Brien in founding the United Irish league (1898) to reconcile the conflicting sections of the Irish party, but he strongly disapproved of the Irish Land Purchase act (1903), introduced by George Wyndham in co-operation with O'Brien, on the ground that the landlords were receiving compensation for property which belonged to the state.

Davitt died in Dublin on May 31, 1906. He had been a symbolic figure, representing the multitude of depressed tenants and labourers who had endured famine during his early childhood. He was a devout Roman Catholic, but, as a Fenian, opposed ecclesiastical authority in the state. His demand for land nationalization met with almost no support in Ireland; his political connections were rather with the radical elements of the rising Labour movement in Great Britain. His book, *The Fall of Feudalism in Ireland* (1904), is a valuable record of the period.

See F. Sheehy Skeffington, *Michael Davitt* (1908). (D. G.)

DAVOS (Romansch TAVAU), one of the chief winter sports centres in Switzerland, canton of Graubunden (the Grisons), comprises the villages of Davos-Dorf and Davos-Platz which take their names from the Davos valley, 5,015 ft. above sea level. Pop. (1960) 9,588. The facilities for winter sports are excellent, the Parsenn run from 8,700 to 5,100 ft. being one of the world's most perfect ski runs. There are ski schools, sanatoria (Davos is a great centre for the treatment of tuberculosis) and beautiful walks in winter and summer. The Davoser See is to the north of the villages. Davos is connected to Chur and the Engadine by narrow-gauge railway. Formerly the valley contained many iron mines. Tavaus or Tavauns is mentioned in 1160 and 1213 as a mountain "alp." At that time it was populated by Romansch-speaking people, but between 1260 and 1282 it was settled by German speakers from the upper Valais. In 1436 it became capital of the League of Ten Jurisdictions *(see* GRAUBÜNDEN) and from 1477 to 1649 it belonged to Austria. In 1860 the population was only 1,705; the town's growth as a holiday and health resort took place thereafter.

DAVOUT, LOUIS NICOLAS, DUC D'AUERSTÄDT and PRINCE D'ECKMÜHL (1770–1823), French marshal of the Napoleonic era, was born at Annoux in Burgundy on May 10, 1770. Though a cavalry officer and a noble, he opposed the *ancien régime,* headed a riot at his depot in 1790, went home and was elected to

command the local volunteers (2nd Yonne battalion). With them he fought in Belgium and on April 4, 1793, encountered the traitor general C. F. Dumouriez and fired on him. This act of "citizenship" made him a general at 23, but he obtained leave to retire to study for future service. In 1795–97, honever. he had a brigade on the Rhine. Then, with his friend L. C. A. Desaix, he went to Italy to see Napoleon and so to Egypt with a cavalry brigade. He returned in time to command Guillaume Brune's cavalry in Italy (Dec. 1800). Davout expressly took a line of absolute devotion to Napoleon and by marrying Louise Aimée Leclerc, Pauline Bonaparte's sister-in-law, became a member of his family and so a marshal in 1804.

At the Bruges camp he trained the III corps of the *Grande Armée* for the invasion of England, handling his 14 regiments (all but one of which he kept to 1812) with constant care and the strictest method. In central Europe in 1805 he had only one division at the battle of Austerlitz, but it held the vital point at the critical time. On the Saale river in 1806 the III corps was sent out with poor information and met the main Prussian army, twice its strength: the divisions of L. Friant. C. Gudin and C. Morand reached good positions in villages, and the Prussians were broken on them with such loss that the battle of Auerstadt (*q.v.*) was a greater victory than Jena. The III corps was now the corps *d'élite* and Davout the chief lieutenant of the emperor. They saved the day at Eylau in 1807; and in 1809 they brought the army out of danger on the Danube. fighting as only picked troops could the long battle of their flank at Eckmiihl which gave Davout his title of prince (1809; he received his ducal title in 1808). At Wagram (1809) and again on the Moskva during the campaign of 1812 in Russia their task was an obstinate frontal struggle which ended in success for the better troops. At last, however, at Vyazma (Nov. 3, 1812) the III corps broke. and at Krasnoe (Nov. 17) was held to have deserted Michel Ney and lost his renown as a leader in battle.

Napoleon meanwhile had also given Davout political posts: the control of Poland and Germany in 1807–09 and the governorship of the Hanseatic towns in 1810. In 1813 Davout was sent to recover Hamburg and to terrorize northern Germany. In the latter task he failed, though Europe long remembered his seizure of the bank of Hamburg as a war crime. Yet he held Hamburg till the peace of Paris by good organization, using his own resources.

It was as an organizer that Davout was employed by Napoleon in 1815. as minister of war during the Hundred Days. He collected the army for Waterloo. making mistakes. especially in the choice of generals, for his difficult character had isolated him and he did not know them From June 21 to July 27 he was commander in chief in Paris and on the Loire. in five painful weeks of undecided resistance On the second Restoration he was interned until 1817. He died of tuberculosis in Paris on June 1, 1823. (I. D. E.)

DAVY, SIR HUMBHRY, BART. (1778–1829), brilliant English chemist and exponent of the scientific method. inventor of the miner's safety lamp and discoverer of sodium and potassium, was born in Penzance, Cornwall, on Dec. 17, 1778. the elder son of middle-class parents with an estate nearby. He was educated at a preparatory school, the grammar school in Penzance and, in 1793, at Truro. In 1795, a year after the death of his father, Robert. he was apprenticed to J. B. Borlase, surgeon and apothecary (later physician), hoping eventually to qualify in medicine. An exuberant, affectionate and popular lad. of quick wit and lively imagination, he was fond of composing verses, sketching, making fireworks, fishing. shooting and collecting minerals. He loved to wander, one pocket filled with fishing tackle and the other with rock specimens; he never lost his intense love of nature and particularly of mountain and water scenery.

While still a youth, ingenuous and somewhat impetuous, Davy had plans for a volume of poems, but he began the serious study of science in 1797 and these visions "fled before the voice of truth." He was befriended by Davies Giddy (later Gilbert), who offered him the use of his library and took him to the Copper House at Hayle, Gornwall, where, with tumultuous delight, Davy first saw a well-equipped chemical laboratory. Though inexperienced, he held strongly independent views on topics of the moment. such as the nature of heat. light and electricity and the doctrines of A. L Lavoisier. In his small private laboratory he prepared and inhaled nitrous oxide (laughing gas), in order to test a claim that it was the "principle of contagion." On Gilbert's recommendation he was appointed (1798) chemical superintendent of the Medical Pneumatic institution, founded at Clifton by Thomas Beddoes to inquire into the possible therapeutic uses of various gases. Davy attacked this problem with characteristic enthusiasm, evincing an outstanding talent for experimental inquiry. He investigated the composition of the oxides and acids of nitrogen, as well as ammonia, and persuaded his scientific and literary friends, including S. T. Coleridge, Robert Southey and P. M. Roget, to report the effects of inhaling nitrous oxide. He nearly lost his own life inhaling water gas. The account of this work, published as *Researches, Chemical and Philosophical . . .* (1800), immediately established his reputation and he was invited to lecture at the newly founded Royal institution in London, where he moved in 1801, with the promise of help from Count Rumford, Sir Joseph Banks and Henry Cavendish in furthering his researches; *e.g.*, on voltaic cells. His carefully prepared and rehearsed lectures rapidly became important social functions and added greatly to the prestige of science and the institution. In 1802 he was styled professor. His duties included a special study of tanning: he found catechu as effective and cheaper than the usual oak extracts and his published account was long used as a tanner's guide. In 1803 he was admitted a fellow of the Royal society and an honorary member of the Dublin society and delivered the first of an annual series of lectures before the board of agriculture. This led to his *Elements of Agricultural Chemistry* (1813), the only systematic work available for many years. For his researches on voltaic cells, tanning and mineral analysis, he received the Copley medal in 1805. He was elected secretary of the Royal society in 1807.

Davy early concluded that the phenomena of simple cells resulted from chemical action and that combination occurred between substances of opposite charge. He therefore reasoned that electrolysis offered the most likely means of decomposing all substances to their elements. These views were explained in his Bakerian lecture of 1806 "On some Chemical Agencies of Electricity." for which he received Bonaparte's prize from the Institut de France. despite the fact that England and France were at war. This work led directly to the isolation of sodium and potassium from the alkalis (Bakerian lecture, 1807) and of the alkaline-earth metals (1808). He also discovered boron (by heating borax with potassium), hydrogen telluride and hydrogen phosphide (phosphine). He showed the correct relation of chlorine to hydrochloric acid and the untenability of the earlier name (oxymuriatic acid) for chlorine and of the oxygen theory of acids. He explained the bleaching action of chlorine (through its liberation of oxygen from water) and discovered two of its oxides (1811 and 1815). His views on the nature of chlorine were disputed, but experiments designed to reveal oxygen in the substance failed.

In 1810 and 1811 he lectured to large audiences at Dublin (on agricultural chemistry; the elements of chemical philosophy; geology) and received £1,275 in fees, as well as the honorary degree of LL.D. from Trinity college. In 1812 he was knighted by the prince regent (April 8), delivered a farewell lecture to members of the Royal institution (April 9) and married Jane Apreece, a wealthy widow well known in social anad literary circles in England and Scotland (April 11). He also published the first part of the *Elements* of *Chemical Philosophy*, which contained much of his own work; his plan was too ambitious, however, and no more appeared. Its completion, according to J. J. Berzelius, would have "advanced the science of chemistry a full century."

His last important act at the institution, of which he remained honorary professor, was to interview the young Michael Faraday, who became laboratory assistant there in 1813 and accompanied the Davys on an European tour (1813–15). By permission of Napoleon he traveled through France. meeting many prominent scientists, and was presented to the empress Marie Louise. With the aid of a small portable laboratory and of various institutions

in France and Italy. he investigated the substance "X" (later called iodine), whose properties and similarity to chlorine he quickly discovered; further work on various compounds of iodine and chlorine was done before he reached Rome. He also analyzed many specimens of classical pigments and proved that diamond was a form of carbon.

Shortly after his return he studied, for the Society for Preventing Accidents in Coal Mines, the conditions under which mixtures of fire-damp and air explode. This led to the invention of the safety lamp and to subsequent researches on flame, for nhich he received the Rumford medals (gold and silver) from the Royal society and, from the northern mine owners, a service of plate (eventually sold to found the Davy medal). After being created a baronet in 1818, he again went to Italy, inquiring into volcanic action and trying unsuccessfully to find a way of unrolling the papyri found at Herculaneum. In 1820 he succeeded Banks as president of the Royal society, a position he held until 1827. In 1823–25 he was associated with J. W. Croker in founding the Athenaeum club, of which he was an original trustee, and with Sir Stamford Raffles in founding the Zoological society and in furthering the scheme for zoological gardens in Regent's park, London (opened in 1828). During this period he examined magnetic phenomena caused by electricity and electrochemical methods for preserving copper sheathing on ships by means of iron and zinc plates Though the protective principles were made clear, considerable fouling occurred and the method's failure greatly vexed him. But he was, as he said, "burned out." His Bakerian lecture for 1826 "On the Relation of Electrical and Chemical Changes" contained his last thoughts on electrochemistry and earned him the Royal society's royal medal.

Davy's health was now failing rapidly; in 1827 he departed for Europe and. in the summer, was forced to resign the presidency of the Royal society, being succeeded by Davies Gilbert. Having to forego business and field sports, Davy wrote *Salmonia* (1828), a book on fishing (after the manner of Izaak Walton) that contained engravings from his own drawings, After a last short visit to England he returned to Italy, settling at Rome in Feb. 1829—"a ruin amongst ruins." Though partly paralyzed, he spent his last months writing a series of dialogues published posthumously as Consolations in Travel, or the Last Days of a *Philosopher* (1830). He suffered a further stroke and soon afterward was joined by Lady Davy from London and his brother, John Davy, then stationed at Malta. He made a slow recovery and insisted on moving to Geneva, where he died during the night after his arrival, on May 29, 1829. See also references under "Davy, Sir Humphry" in the Index volume.

DAWES, CHARLES GATES (1865–1951). US. vice-president, ambassador and author of the "Dawes plan" for managing Germany's reparations payments. He was a colourful and outspoken public figure and devoted a long career to finance and public service. Born in Marietta. O., on Aug. 27, 1865, he graduated from Marietta college in 1884. He entered the legal profession from the Cincinnati law school and practised in Lincoln. Neb., from 1887 to 1894. Becoming interested in midwestern public utilities, he made his permanent home in Evanston, Ill. Dawes worked prominently in the successful 1896 campaign of William McKinley for president and was rewarded with appointment as U.S. comptroller of the currency, an office he held from 1898 to 1902. In 1902 he returned to private business and organized the Central Trust Co. of Illinois, which became a powerful bank serving the middle west.

During World War I, Dawes became head of supply procurement for the American Expeditionary Force in France, where he remained to direct the disposal of surplus materials. He resigned as brigadier general in 1919 after gaining wide notice as a bluntly effective administrator. This reputation was expanded with Dawes' appointment in 1921 as the first U.S. director of the budget.

In 1923 the Allied Reparations commission, with unofficial encouragement from the U.S. department of state, appointed Dawes chairman of a board of financial experts to plan a solution for the problem of Germany's inability to pay reparations to the Allies. Dangerous European financial instability was revealed when Germany ceased payment of reparations and threatened a failure of Allied war debt payments to the United States. The Dawes plan, submitted in 1924. provided for a reorganization of German finances with the assistance of loans from U S. investors. This plan saved Europe from economic collapse but it was only a partial and temporary solution for the dilemma of world economic disorganization. (See REPARATIONS.) In 1925 Dawes nas awarded the Nobel peace prize jointly with Sir Austen Chamberlain.

As a popular public figure Dawes was nominated for the vice-presidency by the 1924 Republican convention after the nomination had been declined by F. O. Lowden. Dawes was more active than President Coolidge in the campaign and they were elected by a large majority. While vice-president and therefore president of the U.S senate, Dawes urged reforms in the senate rules, making them a public issue. but uithout result. After completing his term as vice-president, Dawes provided technical assistance in reorganization of the Dominican Republic's financial system and then represented the U.S as ambassador to Great Britain from 1929 to 1932. While in this post he also served as delegate to the London Naval conference in 1930. In 1932, when the economic depression was severe, he returned to the United States to direct the Reconstruction Finance corporation. which made loans to banks and other key enterprises. He resigned the same year and re-entered the banking business. He died in Evanston, Ill , on April 23, 1951.

Dawes contributed to several philanthropies, including the foundation of charitable lodging houses. He was the author of works on banking and several books of memoirs.

See Bascom N. Timmons, *Portrait of an American: Charles G. Dawes,* (1953). (J. H. SH.)

DAWES PLAN: see REPARATIONS.

DAWLISH, an urban district and seaside town of Devon, Eng., lies on a bay of the English channel sheltered by two headlands, 13 mi. S.S E. of Exeter by road. Pop. (1961) 7,807. The Lawn and Manor pleasure grounds are enhanced by an ornamental stream running through the centre of the town. The earliest recorded history is given in a document of 1044 signed by Edward the Confessor granting the royal manor of Dawlish to his favourite chaplain, Leofric. Because of the equable climate and the sandy beaches, flower growing and the tourist trade are the main industries.

DAWN, the time when light appears in the sky. The dawn colours appear in the reverse order from those of the sunset. When the sun is lowest in both cases the colour is deep red; this gradually changes through orange to gold and yellow as the sun leaves the horizon. This is their order of refrangibility in the spectrum; the blue rays usually are scattered in the sky. The colours of the dawn are purer and colder than the sunset colours as the reduced dust content of the atmosphere causes less sifting of the light rays. See also TWILIGHT.

DAWN REDWOOD (*Metasequoia*), the most abundant fossil conifer of the northern hemisphere, first appeared during the Age of Dinosaurs and became extinct in North America and Europe during the Miocene epoch, about 15,000,000 years ago. It lingered on into the Pliocene epoch in Japan, and in the 1940s was found living in remote valleys in Szechuan and Hupeh provinces, China. Groning with it are descendants of its forest associates of past ages, birch, oak, chestnut, maple and katsura. Only 1,000 dawn redwoods are known to have survived in central China, but since it was discovered its seeds and cuttings have been planted widely over most of the world. It requires moist soil with good drainage in a sunny environment; under favourable conditions, early growth is quite rapid.

Fossil dawn redwoods were long confused with the living California coast redwood, Sequoia *sempervirens.* Although dawn redwood is placed in the bald cypress family (Taxodiaceae) with modern redwoods, recent comparisons of fossil and modern foliage

and cones show marked differences: dawn redwood needles are borne in opposite pairs (decussate phyllotaxy) instead of alternately; its branches and cone scales are also opposite; its long-stalked cone is distinctive. Perhaps the most significant difference is the shedding of dawn redwood leaves in the autumn. a habit apparently necessary during the long winters of its original home in Alaska. Greenland and Spitsbergen. (R. W. CY)

DAWSON, GEORGE GEOFFREY (1874–1944), English journalist, editor of the *Times* from 1912 to 1919 and from 1923 until his retirement in 1941, was born at Skipton-in-Craven, Yorkshire. Oct. 25, 1874. His name was originally Robinson, but he changed it by deed poll in 1917, following an inheritance. Educated at Eton and at Magdalen college, Oxford, and elected a fellow of All Souls college, Oxford, in 1898, he entered the civil service and went to South Africa (1901) as private secretary to Lord Milner, then high commissioner. He became a journalist almost by accident, when Milner persuaded the owners of the *Johannesburg Star* to appoint him editor, to ensure continued support for the Milner policy after Milner's return to England. Dawson became Johannesburg correspondent of the *Times,* and by his dispatches attracted the personal interest of Lord Northcliffe, its new director, who invited him to extend its "Imperial side." In 1912 Dawson succeeded G. E. Buckle, whom Northcliffe had never liked, as editor and provided a valuable counterpoise to Northcliffe's erratic genius during World War I. By 1919, however, Northcliffe's increasing determination to run the paper as an instrument of his personal policy led to a break, and Dawson agreed to go. He was succeeded by Henry Wickham Steed (*q.v.*), but in 1923, after Northcliffe's death (1922), when John Jacob Astor (later Lord Astor) became chief proprietor, Dawson was invited to return, on terms which gave him authority over editorial policy.

As editor of the *Times* Dawson exercised great influence on affairs for more than a quarter of a century, yet in an important sense this influence was not primarily journalistic and certainly not one that his predecessors Thomas Barnes and J. T. Delane, who believed that the paper must not commit itself to any government or person, would have approved. For, although he had quarreled with Northcliffe for doing the same thing, he made the *Times* the instrument of his personal policy, rather than himself becoming the instrument of a journalistic policy based upon impartiality. A close intimate in turn of Stanley Baldwin, Neville Chamberlain and, to a lesser extent, Ramsay MacDonald, he was a leader in the group connected with the quarterly magazine, the *Round Table,* which sought, from the highest sense of duty, to influence national policies by intimate and private exchanges with leading statesmen; he saw himself as the "secretary-general of the Establishment." A firm believer in appeasement, he became, both through the *Times* and in personal relations with ministers, one of the chief instruments of the policy that reached its climax at Munich, and, in pursuit of ends which he honourably espoused, did not hesitate to censor the dispatches of his foreign correspondents when they disclosed facts which might, in his view, turn public opinion against that policy. He was too committed a man to be an editor of the highest rank, but according to his lights he served the *Times* well. He died in London, Nov. 7, 1944. (F. Ws.)

DAWSON or DAWSON CITY, a town of Yukon territory, Can., is best remembered for the fabulous tales about it as a boom town during the Klondike gold rush at the turn of the century. At the height of the rush, in 1899, the city had a population of 10,000. By 1911, however, there were only 3,000 in the settlement and after 1921 the population was less than 1,000.

Dawson occupies a narrow beach less than one mile wide on the east bank of the Yukon river just north of its confluence with the Klondike river. Owing to its latitude of about 64° N, Dawson has almost continuous daylight in late June. Garden vegetables grow well, and during the gold rush there were farms on nearby river benches. Although the average monthly temperature for July is 60° F., temperatures of 80° F. may be experienced. January average monthly temperatures are about —20" F., with extremes of —50° F. and below. The average annual precipitation is about 12 in. and there is comparatively little snowfall.

Dawson was the capital of Yukon territory from 1898 until 1951, when the administration was moved to Whitehorse. Dredges still operate in the Klondike river, extracting gold from the river gravels; this is the main occupation in the region. The town has a Royal Canadian Mounted Police detachment, schools, a hospital and a small false-fronted commercial section. The tourist trade, once important, faded with the decline of river traffic. *See* also YUKON TERRITORY: *History.* (J. L. R.)

DAX, a town of southwestern France in the Landes *département,* lies on the left bank of the Adour river, 142 km. (94 mi.) S.W. of Bordeaux by road and 80 km. (50 mi.) from Spain. Pop. (1954) 12,716. It is a well-known spa with thermal waters and mud baths for the cure of rheumatism. The Fontaine Chaude, a hot-water spring in the town centre, gives 454,600 gal. an hour at 147° F. Dax, on the southern edge of the forest of Landes *(see* LANDES, LES), is also a centre for tourists. The cathedral, rebuilt in the 17th century, has a magnificent 13th-century doorway. In the church of St. Paul les Dax (11th–12th century) is a Romanesque apse with curious bas-reliefs. The ancient Gallo-Roman fortifications are a promenade. There are a bull ring in a fine park, an archaeological and folklore museum and a military airfield. Pouy, 5 km. (3 mi.) away, is the birthplace of St. Vincent de Paul, and 9 km. off is Buglose, a sanctuary with a miraculous statue of the Virgin Mary. Around Dax are salt mines, coniferous plantations and farming land. Pinewood, resin, turpentine and cork are traded, and agricultural and poultry produce includes maize, geese, ducks and *foie gras.*

Dax, the ancient Aquae Tarbellicae and then Aquae Augustae, was the capital of the Tarbelli tribe in classical times, when its waters were already famous. In the 11th century its viscounty passed to the viscounts of Béarn and in 1177 it was annexed, to Gascony by Richard I of England. In World War II Dax was in German hands from June 1940 to Aug. 1944. (M. J. B.)

DAY, CLARENCE SHEPARD (1874–1935), U.S. writer, whose greatest popular success was his autobiographical *Life With Father,* was born in New York city. Nov. 18, 1874. He was educated at St. Paul's school, Concord, N.H., and at Yale, from which he graduated in 1896. Following in the footsteps of his father, a prominent Wall street broker, he became a member of the New York Stock exchange in 1897 and joined his father's firm as a partner. He enlisted in the navy the following year, but was soon stricken by arthritis, a disease that invalided him for the rest of his life. He died in New York city on Dec. 28, 1935.

In 1920 his first. book. *This Simian World,* a collection of humorous essays and illustrations. appeared. This was followed by *The Crow's Nest* (1921) and *Thoughts Without Words* (1928). He achieved great success with *God and My Father* (1932), *Lije With Father* (1935) and *Life With Mother* (1937). Drawn from his own family experiences, these were pleasant and gently satirical portraits of a late Victorian household dominated by a gruff, opinionated father and a warm, charming mother. *Life With Father* was dramatized by Howard Lindsay and Russel Crouse in 1939 and had a decade of almost phenomenal success on the American stage.

See H. S. Canby, "Clarence Day, Jr." in the *Saturday* **Review** of *Literature* (Aug. 24, 1935).

DAY, JOHN (1574–1640?), English dramatist of a peculiar delicacy of fancy and a dainty inventiveness, as shown by his six surviving dramas, was born at Cawston, Norfolk, in 1574, and educated at Ely. He became a sizar of Gonville and Caius college, Cambridge, in 1592 but was expelled in the next year for stealing a book. As early as 1598 he became one of Philip Henslowe's playwrights, collaborating with Henry Chettle. William Haughton, Thomas Dekker, Richard Hathway and Wentworth Smith, but his almost incessant activity seems to have left him poor enough. to judge by the small loans, of five shillings and even two shillings, that he obtained from Henslowe. The first play in which Day appears as part author is *The Conquest of Brute, with the Finding of the Bath* (1598), which, with most of his journeyman's work, is lost. *The Ile of Guls* (printed 1606), *a* prose comedy founded upon Sir Philip Sidney's *Arcadia,* contains much

satire in its light dialogue, but the meaning of it is no longer understood. In 1607 Day produced, with William Rowley and George Wilkins, *The Travailes of the Three English Brothers,* which detailed the adventures of Sir Thomas. Sir Anthony and Robert Shirley. Day's reputation chiefly rests on the *Parliament of Bees.* This exquisite masque, or rather series of pastoral eclogues, is occupied with "the doings, the births, the wars, the wooings" of bees. The bees hold a parliament under Prorex, the Master Bee, and complaints are preferred against the humblebee. the wasp, the drone and other offenders. This satirical allegory ends with a royal progress of Oberon, who distributes justice to all. Its beauty and ingenuity were praised by Charles Lamb. There is no earlier edition than that of 1641, but a persistent tradition has assigned the piece to 1607. In 1608 Day published two comedies. *Law Trickes or, Who Would Have Thought it?* and *Humour out of breath.* His death date is unknown, but an elegy on him by John Tatham, the city poet, was published in 1640.

BIBLIOGRAPHY.—A. H Bullen (ed), *Complete Works of John Day* (1881) and *A Collection of Old English Plays,* vol. 1 (1882) *The Parliament of Bees* and *Humour out of breath* were printed in *Nero and Other Plays,* ed *by A* Symons (1888). *See* also A. C. Swinburne, *Contemporarier of Shakespeare* (1919).

DAY (DAYE), **STEPHEN** (*c.* 1594–1668), credited with being the first printer in the English American colonies, was born in London and worked as a locksmith in Cambridge. It does not appear that he himself was a printer, but his two sons were probably apprentices in a Cambridge printing office. In July or August of 1638, he contracted with the Rev. José Glover of Sutton, England, a dissenting clergyman of some wealth, to set up the first printing plant in the English colonies. Although Glover died on the sea voyage, Day, with the help of Glover's widow, set up the plant at Cambridge, Mass., in the autumn of 1638, but it was not until March of 1639 that the shop mas in full operation. The first piece of printing from the press was *The Freeman's Oath* (Jan. 1639); the second was an *Almanack* by William Pierce, a mariner (1639); the third was *The Whole Booke of Psalms,* now known as the *Bay Psalm Book* (1640). Stephen Day's name does not appear in connection with the imprint on any of his publications. The name of his son Matthew, who was next in charge and apparently did the typesetting, appears on the title page of the *Almanack* (1647). When Glover's widow married Henry Dunster, president of Harvard college, the press of Stephen Day became the forerunner of the Harvard University Press, considered the oldest in the United States. Day died at Cambridge, Mass.. on Dec. 22, 1668. (W. V. HA.)

DAY, THOMAS (1748–1789), English philanthropist, follower of Rousseau and author of *Sandford and Merton* (1783–89), a moral story for children showing Day's belief in the power of reason and the practical wisdom of doing right. Born in London, June 22. 1748. Day was educated at Corpus Christi college. Oxford, and became a friend of Richard Lovell Edgeworth (*q.v.*). Having independent means he devoted himself to study and philanthropy. He brought up two foundlings, one of whom he hoped to marry, but neither acquired the quality of stoicism he looked for. and he married an heiress who agreed with his asceticism. He settled in 1781 at Ottershaw, Surrey. farming on philanthropic principles. His poem *The Dying Negro* (1773) struck the keynote of the antislavery movement. He died at Wargrave, Berkshire, on Sept. 28, 1789.

DAY, in astronomy, the interval of time that transpires during one revolution of the earth on its axis. Days are distinguished as solar, sidereal or lunar, depending on whether the revolution is taken relative to the sun, the stars or the moon. The solar day is the fundamental unit of time in civil life and in astronomical practice. In the latter case, where it is determined by observations of the sun, the day is taken to begin with the passage of the mean sun over the meridian of the location in question, or at mean noon, while the civil day begins at midnight.

The question of a possible variability in the length of the day is one of fundamental importance. One effect of the tidal retardation of the earth's rotation is gradually to increase this length. It is remarkable that the discussion of ancient eclipses of the moon, and their comparison with modern observations, show only a small and rather doubtful change, amounting perhaps to less than one-hundredth of a second per century. As this amount seems to be less than that which would be expected from the tides, it is probable that some other cause tends to accelerate the earth's rotation and thus shorten the day. (*See* CALENDAR; TIME MEASUREMENT.) (X.)

Legal Aspects.—In law the word day, unless qualified, means the natural day consisting of the 24 hours between midnight and midnight, rather than, *e.g.,* the daylight hours between sunrise and sunset. Most problems are concerned with the computation of time, as when a number of days or some other period is prescribed for the doing of an act. In general, when an act is to be done within a specified number of days from or after the occurrence of some event, the day on which the event occurs is excluded and the day on which the act is to be done is included. Thus, if an agreement is executed on Aug. 1 giving one of the parties the right to buy property from the other at a certain price, provided he signifies his acceptance within 30 days from the execution of the agreement, an acceptance or exercise of the option is timely if it is communicated on Aug. 31. If that date falls on a Sunday, the time will be extended to the following day. Parts of a day are not considered for such purposes; *e.g.,* if the option agreement is executed at noon on Aug. 1, the holder nevertheless has until midnight of Aug. 31 in which to exercise it. Thus, also, a person comes of age in the first minute of the 21st anniversary of his birth, regardless of the hour of his birth. These general rules are not universally accepted, and are subject to modification by contract or by statute.

Lay days are the time given the charterer of a vessel to load or unload cargo without paying demurrage. (B. CE.)

DAYAK (DYAK). The population of Borneo falls into two categories: the coastal peoples consisting predominantly of Malays, together with settlers (such as the Bugis, Javanese, etc.) from other parts of Indonesia and immigrant Chinese; and the indigenous peoples of the interior. Dayak is a general term (derived from the Malays) which is applied to any of these indigenous peoples. The Dutch variant Dajak has the same wide connotation, being used to refer to any non-Malay native inhabitant of Borneo. Dayak is thus a generic term with no precise ethnic or tribal significance.

All the native inhabitants of Borneo belong to the Mongoloid stock of the human race. Within Borneo two main strains have been distinguished: the first, less specifically Mongoloid, being termed Indonesian or Nesiot, *e.g.*, the Land Dayaks; and the second, more specifically Mongoloid, called Pareoean or proto-Malay; *e.g* , the Iban or Sea Dayaks. Although all may be classified as Mongoloid, they are divided culturally into many different peoples and, in terms of social and political organization, into numerous separate tribes. Among the most important of the major groupings are the Bahau tribes (including the Kayan and Kenyah) of central and eastern Borneo, the Ngadju tribes of southern Borneo, the Land Dayaks of southwestern Borneo and the Iban or Sea Dayaks of Sarawak. The total Dayak population of Borneo is probably between 1,000,000 and 1,250,000.

With the exception of the Punans and other forest nomads of the deep interior (who live by hunting and by gathering wild produce), most Dayak tribes have a number of characteristics in common. They are riverine peoples, living in long-house communities (of seldom more than a few hundred members) based on bilateral kinship. In general, their subsistence economies rest on the shifting cultivation of hill rice, with fishing and hunting as subsidiary activities. Their tools are of iron and their principal weapons the sword. the spear and the blowpipe. Their languages all belong to the Indonesian section of the Austronesian group. Their religions, animistic, polytheistic and with shamanistic cults, are highly developed and complex. Formerly intertribal warfare was rife, with head-hunting as one of its major aspects. Many Dayaks are still preliterate and pagan; however, with the establishment of education and other services, economic, social and political change has become widespread and rapid. ***See*** also BORNEO: *The People: The Dayak Peoples;* IBAN; KAYAN; PUNAN. (J. D. FN.)

DAYLIGHT, ARTIFICIAL. The wide use of artificial

light in civilization created a demand for lamps which show coloured objects truthfully; *i.e.,* which do not change colours from their hues as seen by daylight. The problem is thus one of producing an artificial light whose spectrum closely resembles that of sunlight. Artificial light always contains too high a proportion of red, orange and yellow rays.

A gas-filled electric lamp is employed, as its filament temperature is high and its form economical. The spectrum obtained from a black body, heated to 5,000° C., is approximately that of average diffused daylight. According to the temperature at which the filament of an incandescent electric lamp is heated, the amount of red and orange contained in the spectrum of its light varies, becoming relatively greater as the temperature is lower. *(See* BLACK BODY.) If the metal filament in an evacuated bulb is heated to 2,200" it radiates more red and orange than a gas-filled bulb, in which it may be heated to approximately 3,000'. Therefore, the gas-filled bulb is used in artificial daylight devices, but its light has still to be subjected to special treatment to correct its undue yellowness and redness.

Various means are employed for this purpose, such as filtering the light through a coloured transparent medium (*i.e.,* glass. talc, or varnish) or using coloured reflectors. The use of reflectors. however, absorbs a larger amount of the initial illumination than when transparent filters are used; hence filters are preferred.

The later development of fluorescent lamps from which the radiation is not due to heated filaments but from the ultra-violet excitation of phosphors on the interior of the glass tubes resulted in the possibility of obtaining light of almost any practically desirable spectral distribution. Such lamps can be made to approximate daylight for all practical purposes and also are of great luminous efficiency. *(See* also LUMINESCENCE; LIGHTING.)

Artificial daylight was at first mainly used for the purpose of matching colours It came into use for general illumination, however, as the value of artificial daylight for ease on the eyes became appreciated. Hospital staffs, dentists, physicians and surgeons find artificial daylight of great value. The method is also employed in dye and colour works. (H. B. LM.)

DAYLIGHT SAVING, a means of providing for the utilization of more daylight, especially in summer, by setting clocks ahead. It was suggested in 1784 in a whimsical essay by Benjamin Franklin, but was not put into practice until the 20th century.

Great Britain. — In 1907 an Englishman, William Willett, published a pamphlet entitled *Waste of Daylight.* He financed a campaign for putting the clock ahead by 80 min. in four moves of 20 min. each in the spring and summer months. In 1908, Robert (later Sir Robert) Pearce introduced a bill in the house of commons to put the clock ahead by law. The plan, as simplified, called for advancing the clock one hour in spring and returning to Greenwich mean time in autumn. The bill failed.

Conservation of fuel became doubly important during World War I, and Germany adopted daylight saving in 1915. In Great Britain a one-hour change became law on May 17, 1916, effective the following Sunday, May 21. In honour of its proponent, who had died a year earlier, the system was at first called Willet time; later the name adopted was British summer time. After World War I, summer time was renewed by acts of parliament; that of 1922 provided that summer time should begin on the Sunday following the third Saturday in April, or if that is Easter day the Sunday following the second Saturday in April, and end on the Sunday following the third Saturday in September. The act of 1925 altered the closing date to the Sunday following the first Saturday in October. The official time for altering the clock is always 2 A.M. Greenwich mean time.

After World War II began, it was found necessary to change the dates in order to aid war production, and emergency powers were granted under defense (summer-time) regulations. Later changes involved the adoption of double summer time; *i.e.,* two hours in advance of Greenwich mean time. In some years the customary period of about 5 months was lengthened to 7, 10 or even 12 months. The 12-month period was maintained for four years, 1941–44.

Objections to daylight-saving time took several forms. Complaint was made that cows were unable to adjust to a new milking time and that dew in the earlier hour was heavy enough to hinder farm work. Small children were said to lose an hour's sleep because, rising at the same time as their parents, they were reluctant to go to bed before sundown. By some the reform was called contrary to nature, by others contrary to tradition. and by still others contrary to the interest of distributors of lighting power and equipment. For better or worse, the new system was accepted as a war measure, and in many places it was retained in times of peace.

United States. — In 1916, largely as a result of World War I, a campaign for daylight saving was launched in the United States. In 1917 congress passed an act whereby the standard time would be advanced one hour on the last Sunday of March and set back on the last Sunday of October. The act was effective in 1918 and 1919. Opposition developed from farmers, and the law was repealed on Aug. 20, 1919, over the president's veto. In the years that followed, legislation on the subject was enacted by states or municipalities, but World War II again made it a matter of national interest. On Feb. 6, 1942, "war time," one hour in advance of standard time, was put into effect nationally, and continued to the end of Sept. 1945. Well into the third quarter of the 20th century, daylight saving was observed in about half the states (in some cases only locally), usually from the last Sunday in April to the last Sunday in September, as follows:

Alabama	Kentucky	Montana	*Pennsylvania
California	*Maine	Nevada	*Rhode Island
*Connecticut	Maryland	Iiew Hampshire	*Vermont
*Delaware	*Massachusetts	New Jersey	Virginia
*Illinois	†Minnesota	New Mexico	West Virginia
Indiana	Missouri	*New York	Wisconsin
Iowa			

*Last Sunday in April to last Sunday in October.
†4th Sunday in May to Tuesday following Labor day.

Other Countries. — After World War II, many countries abandoned the use of daylight-saving time. Among those retaining it, nation-wide or locally, are Canada, China, France (all year round), Iceland, Norway, Poland, Portugal and the United Kingdom.

DAY LILY, a common name for flowering plants of the genus *Hemerocallis,* commonly classed in the family Liliaceae (*q.v.*) although they have some botanical features that are characteristic of the Amaryllidaceae. Thus, in contrast to the true lilies (*Lilium*), the richly coloured sepals and petals that comprise the perianth of the flowers of day lilies are united at the base into a tube, but the ovary is superior as in the lilies.

Only about 20 authentic species of *Hemerocallis* have been named. All of these are native only in eastern and central Asia, where they collectively have a wide distribution especially in the temperate areas. All of the species are herbaceous perennials that have a crown of intermingled stems in the soil that spread by branching more or less widely as rhizomes. This gives long life to a seedling plant, provides for its natural spread and makes possible its propagation and multiplication as a natural or as a horticultural clone consisting of separated members that are merely branches of one plant. This is an advantage especially when a plant does not produce seeds or is a hybrid that does not breed true from seeds. From the buds of the stems of a crown there arises a mound of linear and grasslike leaves and scapes that bear flowers. Day lilies are different in appearance as well as in botanical characters from the plantain lilies of the genus *Hosta,* which have large broad leaves and strongly asymmetrical white, lilac or blue flowers.

J. HORACE MCFARLAND CO.

HEMEROCALLIS (H. FLAVA)

Two clones of *Hemerocallis* were brought from the orient into

Europe at an early date. These were described in 1570 and 1576 as *Asphodelus luteus liliflorus* and *Asphodelus phoeniceus.* Two hundred years later the botanist Linnaeus knew only these two clones to which he assigned, in 1762, the names *Henzerocallis flava* and *H. fulva.* In modern times, divisions of these same clones are known as the lemon day lily and the fulvous, tawny or Europa day lily respectively. Thus these two clones have been in propagation for at least five centuries and are cultivated widely in Europe and in North America. In numerous areas the Europa day lily has escaped from cultivation and become naturalized. without the production of seeds. At least a third distinct type (H. *minor*) was known in Europe late in the 18th century. Several new types or species and also noteworthy variants of the *H. fulva* group were brought into Europe during the 19th century. Later, Japanese botanists described new species and English and American botanists gave specific names to various new types that were obtained from the orient as living plants.

Hemerocallis shows noteworthy and conspicuous diversities, especially in features that have horticultural interest and value. Some species have foliage that is continuously green, and one species is evergreen in a subtropical area; but the foliage of most species naturally matures and dies in autumn and the plant is dormant during minter. There are dwarf species, as H. *nana,* with foliage and scapes scarcely a foot in height; but the scapes of *H. altissima* may be eight feet high. Other species collectively have rather complete gradations betueen these extremes in stature. An individual flower is open for only one period. But the flowers of several types and clones, as the Europa day lily. are day-blooming; for others as *H. citrina,* the flowers are night-blooming; and certain types (the lemon day lily) have sets of flowers that may remain open from one to three days.

Three main classes of pigments are involved in the colouring of the flowers. In the clear yellow flowers of certain species the carotenoid pigments predominate. In the clear orange-coloured flowers the xanthophyll pigments are abundant. In the group of fulvous day lilies there are also anthocyanin pigments that add fulvous, brownish-red and even rosy-pink shades and tones that are often strongly developed in the mid-zone of the petals or elsewhere to effect various patterns of colouring.

In respect to periods of flowering some species bloom early in spring, others flower during the summer and certain species bloom in late summer and early autumn.

The various species of *Hemerocallis* are surpassed as valuable horticultural subjects by seedlings that have been obtained by hybridization and further selective breeding. These have effected integrations, copigmentations, dilutions and intensifications of pigments, which have resulted in brilliant colouring in patterns not seen previously in the species. There are at least 500 suchhybrids; these bear such descriptive names as Mikado. Dauntless, Resolute and Painted Lady. Many commercial nurserymen in the United States specialize in day lilies and some of these grow hybrid seedlings in large numbers. Also there are many enthusiastic hobbyists who grow seedlings by selective breeding. Some of these are located in almost every section of the United States. 4s a result, it is now possible to obtain clones of day lilies in a diversity of habits of gronth, flower colours, and season of flowering that are suitable for culture in gardens throughout the entire United States and in southern Canada as well as in comparable areas in all the other continents.

The soil of any ordinary garden is suitable for day lilies. They are excellent for naturalistic plantings along ledges of rock and along brooks or ponds, but they develop best in sunny exposures and may not have flowers if grown in dense shade. Day lilies may be increased by dividing the clump in late summer or early spring. They have almost no fungous diseases and have none of the viruses that are very destructive of the true lilies.

There has evidently been little use of day lilies as flowering plants in Japanese and Chinese gardens and no noteworthy developments of them in oriental horticulture. But two double-flowered sorts (Kwanso and Florepleno), which have no seeds, arose and were propagated as clones. However, the flowers of day lilies are used as food in certain parts of the orient; locally in China day lilies are cultivated for the flower buds, which are collected when they are of full size. Two of the clones thus grown have been obtained in the United States and distributed under the names Hankow and Chengtu. For many years dried flowers of day lilies could be obtained in packages of one pound and one-half pound sizes in Chinese food shops in various cities in America under the names gum-tsoy, meaning golden vegetable, and gum-jum, meaning golden needles. The dried flowers are cut in segments, soaked in water until they become soft, pliable and gelatinous and added to soups that are already cooked and then the mixture is brought to a boil. Also the flowers may be used as a garnish with preparations of noodles or meat. (A. B. S.; X.)

DAY NURSERY, an institution for the care of infants and young children whose mothers work outside the home or are otherwise prevented from providing proper care. Such institutions, known as crbches (from the French *crèche,* "crib"), appeared in France about 1840 and the Société des Crèches was recognized by the French government in 1569. Crèches or day nurseries were established in most European cities and industrial centres during the second half of the 19th century, the first in Great Britain in 1860. In the United States, day nursery, day or child care centre and nursery school often are used interchangeably to identify various types of day care for children in their own homes and for preschool educational programs *(see* CHILD WELFARE: *Children* in *Their Own Homes: Day Care;* PRE-ELEMENTARY EDUCATION).

The prime function of day nurseries has been to care for children under school age while the mother is at work. But increasingly their significance to child health, especially in relation to nutrition, healthy surroundings and proper medical supervision, has been emphasized.

The modern day nursery movement in Great Britain developed during the 20th century largely through the leadership of the National Society of Day Nurseries (1906). World War I caused a great extension of the movement when day nurseries were set up throughout most industrial areas. At this time, as earlier, much of the work and expense was undertaken by voluntary committees. The board of education gave a grant in aid from the year 1915, and since 1918, when the Maternity and Child Welfare act was passed, day nurseries have been recognized for grant by the ministry of health. World War II had an even greater effect in extending the use of nurseries, when wholesale evacuation of children was accompanied by employment of women on an unprecedented scale. During World War II the full cost of nurseries was borne by the treasury, although the administration remained with the local authorities. Under the National Health Service act, 1946, charges could be made only for the cost of food. By an amendment act (1952) the cost of day nursery care could be passed on to the parent (due regard being held for his means); in some instances the full cost could be charged.

The alternatives to the public day nurseries are care in private or factory nurseries and child minding. These are regulated under the Nurseries and Child-Minders Regulation act, 1948, which requires all who are taking three or more children for daytime care to register with local authorities and to be open to inspection.

Many oppose nurseries on the ground that they interfere with family life. Psychiatrists particularly emphasize the psychological trauma which may result from separation of the young child from its mother. The day nursery should be looked upon as a response to adverse social and economic conditions in a society that favours married women's working. At the worst it is an alternative to a bad home or one in which the mother is absent for long periods; at the best it is a training establishment where young children learn to do things and to co-operate. Training in regular habits and a sound supervision of health are of great value. The nursery can provide relief to overcrowded households and it can greatly ease the burden of rearing a family; in times of sickness and pregnancy, for the widow and the unmarried mother, it may be a lifesaving factor.

Interesting work has been done in day nurseries where standards of spacing, equipment and staffing have been recommended by the ministry of health and accepted by local authorities. These stand-

ards include an over-all ratio of one staff member to five children, exclusive of domestic staff, with a matron trained in sick children, general or nursery nursing, and experienced in the group care of healthy children; a deputy matron (usually a nursery nurse with at least two years post-certificate experience); a warden uho is also a nursery nurse with experience of the play needs of young children; nursery nurses; nursery assistants; and. in training nurseries, nursery students. Standards of accommodation are based on floor spacing of not less than 40 sq.ft. for young babies and 25 to 30 sq.ft. for older children. Children are no longer grouped according to age. Efforts are made to assign a small group of children of varied ages to each trained member of staff and her assistant, a method which allows for individual and continuous care.

Nursery nurse training, regulated by the ministry of education and examined by a national nursery examination board, leads to a national nursery certificate. The course of training can be taken by girls 16 years old or over and lasts for two years. Training with children under and over two years is given at both nurseries and nursery schools and two days a week are spent in further education. The National Society of Day Nurseries, which changed its name in 1942 to the National Society of Children's Nurseries, publishes The Nursery Journal. (C. F. BN.)

DAYR AZ ZAWR (DEIR EZ ZOR), a town in eastern Syria and administrative centre of the *muhafaza* (governorate) of the same name, is situated on the west bank of the Euphrates. which at this point 175 mi. E.S.E. of Aleppo is about 250 yd. wide, with an average depth of 27 ft. Pop. (1959 est.) 57.641. The to n is 630 ft. above sea level, and $27\frac{1}{2}$ mi. above the confluence of the Khabur (Habur) and the Euphrates. The suspension bridge at Dayr az Zawr is the crossing-place for the Aleppo-Mosul and Damascus-Mosul routes, and a focal point for roads up the Khabur. It is also on the road from Aleppo to Baghdad via As Sabakha, Abu Kamal, and Ramadi. As a result of its position it is an important centre for cross-desert travel. The town is largely of modern construction, and most of the buildings are of mud brick; they include a barracks, civil and military hospitals, banks and a bazaar, and there are public gardens.

The governorate of Dayr az Zawr had a population in 1960 of 249,000. The area (12,765 sq.mi.) is largely desert, but borders on Al Jazirah (*q.v.*), which is being rapidly developed. Irrigation works have greatly increased the area under cultivation, water being supplied from the Euphrates.

The ruins of the ancient city of Azaura, from which Dayr az Zawr is reputed to have taken its name, are to the southeast of the modern town, which was built in 1867 by the Ottoman authorities to curb the Arab tribes of the Euphrates area. It was the capital of a *vilayet* under the Turks, the seat of the governor, and the centre for a series of Turkish outposts policing the surrounding country. It was occupied by the French in 1921 under the mandate, and became the seat of a large French garrison. In 1941 it was captured by a British force advancing from Baghdad, and in 1946 the town became part of the Republic of Syria.

(M. V. S.-W.)

DAYTON, a city of southwestern Ohio, U.S., and seat of Montgomery county, 52 mi. N. of Cincinnati. It is an industrial, communication and distributing centre, a port of entry, a leading centre of aviation research and the heart of a metropolitan area which includes the cities of Kettering (*q.v.*), Miamisburg. Xenia, Fairborn, Oakwood and Vandalia, embodying Montgomery and Greene counties. The population was 243,872 in 1950 and 262,332 in 1960 by federal census; that of the standard metropolitan statistical area was 518,642 and 694,623 for the two periods, respectively.

Once a favourite Shawnee Indian hunting ground of rolling hills at the junction of the Great Miami, Mad and Stillwater rivers and Wolf creek in a loop of the Great Miami, it was early regarded as a strategic site on the important Maumee-Miami trade route in western Ohio. Nothing materialized until removal of the Indian threat to settlement north of the Ohio river by Anthony Wayne in the Indian wars of the 1790s. The town was surveyed and platted by a small group of Revolutionary War veterans (including Jonathan Dayton from New Jersey, for whom the city was named), and the first settlers arrived by boat in the spring of 1796. The first house, Newcom tavern, built in 1796 by Col. George Newcom, is maintained as a historical museum. Dayton uas incorporated as a town in 1805 and had a population of 383 by 1810. It was used by William Henry Harrison in the War of 1812 as a base of supplies for his campaigns against British-held Detroit and Canada, and the Indians under Tecumseh. The opening of the Miami and Erie canal in 1828 made it a centre of agricultural and industrial prosperity. It was chartered as a city in 1841.

Dayton became the home of the cash register after the perfection of the mechanical money drawer by John H. Patterson in the 1880s. The solution of the problem of human flight with a heavier-than-air machine by Orville and Wilbur Wright in 1903 made it the birthplace of aviation. Charles F. Kettering's laboratories there produced fundamental contributions to automotive and aeronautical engineering and research.

The most disastrous of a series of floods in the history of the area occurred in March 1913, with staggering losses of lives and property. This provoked establishment in June 1915 of the Miami Conservancy district, the first comprehensive flood-control project in the United States, nhich constructed five huge dams and retarding basins to fully protect nine counties from recurrence of such disasters. Construction began in Jan. 1918 and was completed in 1922 at a cost of about $32,000,000. It was financed locally without resort to federal or state aid. This experience helped provoke adoption in 1913 of the first nonpartisan, democratically controlled commission-manager form of government for a large U.S. city. The Dayton plan was used extensively as a model for other cities.

During World Wars I and II experimental aviation laboratories of the U S. government were located in Dayton. The Wright Air Development centre is responsible for all equipment testing and research, and the Air Materiel command for all supply of the U.S. air force. Both are part of the Wright-Patterson air force base, one of the largest single air installations in the world. The Dayton air force depot (Gentile air force station) is a depot for electronic materials. In the heart of a large diversified industrial complex producing more than 800 precision products, such as aircraft instruments, machine tools, accounting machines, refrigerators and air conditioners, Dayton is also a leading graphic arts production centre, producer of rubber and paper products and of all U S. government stamped envelopes. Family income and percentage of home ownership are consistently high.

In the area are the Air Force Institute of Technology (1919), Antioch college (1852, at Yellow Springs), Central State college (1887, state supported, at Wilberforce), University of Dayton (Roman Catholic. formerly St Mary's college, founded 1850). Mt St. John Normal school (1911. Roman Catholic), St. Leonard Theological seminary (1890, Roman Catholic, at Centerville), Sinclair college (1887). United Theological seminary (Evangelical United Brethren, formerly Bonebrake Theological seminary, founded 1871) and Wilberforce university (1856). There are rnore than 300 churches and synagogues. Ten hospitals serve the area. Cultural facilities include the Air Force Central museum, Museum of Natural History, Carillon Park Outdoor Transportation museum. the house (preserved as a museum) of the Negro poet Paul Laurence Dunbar (*q.v.*), several other museums, public libraries, a philharmonic orchestra and the Dayton Art institute.

Its wide streets and spacious downtown area introduced on the original plat, the master city planning for parks, streets and landscaping, elimination of railroad grade crossings, absence of a factory district, as well as the attractiveness of its homes, modern business buildings and model industrial plants, help perpetuate Dayton's reputation of being a clean and progressive city. When the state supreme court invalidated its city income tax, its civic-minded citizens overwhelmingly restored it to finance needed local government services. Public recreation facilities include a city park system of more than 1,400 ac., three golf courses, numerous playing fields and a network of recreation centres. These are matched by similar privately sponsored facilities. (D. L. S.)

DAYTON, a city and seat of Rhea county in southeastern Tennessee, U S.. 38 mi. N N E. of Chattanooga. It is situated at

the foot of the Cumberland escarpment in a coal-mining region and is the site of several small industrial plants (hosiery, underwear, canneries and bottle works). Its population is about 3;000. The town was founded about 1884 and chartered in 1895. Dayton gained international fame in July 1925 as the scene, in Rhea county courthouse, of the Scopes evolution trial. The admirers of William Jennings Bryan (*q.v.*), the prosecution associate and fundamentalist witness against John Thomas Scopes, founded William Jennings Bryan university (1930) on a hill overlooking the town as a memorial to him. For a discussion of the case *see* SCOPES TRIAL. (K. K. B)

DAYTONA BEACH, a city of Volusia county. Fla.. U.S., 90 mi. S.E. of Jacksonville. It is situated on the Atlantic ocean and the Halifax river. a tidewater lagoon which parallels the ocean. The Halifax river is a portion of the Atlantic Intracoastal waterway, and dock facilities and yacht basins are numerous and are near the centre of the city. The original city, Daytona. was laid out in 1870 by Mathias Day of Ohio, incorporated and named after him in 1876. A commission-city manager form of local government has been in effect since 1922. In 1926 the cities of Seabreeze. Daytona and Daytona Beach were incorporated as Daytona Beach.

Boatbuilding, varied light manufacturing and tourism are the principal industries of the city, which is also a centre of the citrus industry. It is a popular resort with year-round outdoor recreational facilities. including water sports, swimming and fishing. The internationally famous beach of hard, white sand. 23 mi. long and 500 ft. wide at low tide, has been used for automobile speed trials since 1903. In 1935 Sir Malcolm Campbell (q v.) drove the "Bluebird" over the course at 276.82 m.p h. Automobile racing on the beach is now forbidden, but private cars are allowed on the entire length of the beach. The Daytona International speedway, which includes a $2\frac{1}{2}$ mi. racing trioval with steeply banked curves, a sports car racecourse and a lake for motorboat racing, is a principal test centre for automotive and boating equipment. The city is headquarters of the National Association for Stock Car Auto Racing (Nascar). Daytona Beach also has a greyhound racing track and a *jai alai* (*q.v.*) *frontdn.* Recreational opportunities are available at Riverfront park, nith its many exotic plants; Oceanfront park, with its large stadium and band shell; an oceanside promenade; and City Island park, an amusement area near the centre of the city.

Bethune-Cookman college for Negroes (1872), Daytona Beach junior college and the Volusia County Community college are located there. For comparative population figures *see* table in FLORIDA: *Population.* (J. E. Jo.)

DEACON, a member of the lowest rank of the threefold Christian ministry or, in various Protestant churches, a lay official who shares in the ministry. In churches where the diaconate exists there is a general continuity, at least in principle, with the early pattern of deacons as a basic but subservient ministerial order and as helpers responsible for the practical and charitable functions of the Christian community. In the Roman Catholic, Orthodox and Anglican churches, however, the diaconate has in practice almost entirely lost its original independent status as one of the major orders and has become in effect a transitional probationership for ordination to the priesthood, customarily lasting for a year. The introduction of a permanent diaconate has been raised, however, and in 1957 Pope Pius XII referred to the possibility of an independent lay order of the diaconate. (For cardinal deacons *see* CARDINAL.) At a high Mass one of the two priests assisting the celebrant is called deacon and the other subdeacon.

In Protestant bodies the diaconate takes several forms. In Congregational (independent) churches the diaconate is usually an elective body of lay officers in a local congregation responsible for financial and administrative affairs and the distribution of the elements at Holy Communion. Such deacons are, as in the New England Puritan tradition, actually the ruling elders of the churches. In Presbyterianism there is provision for deacons' courts, under the presbytery, for the management of church goods. Though in most Protestant churches deacons are local officials, American Methodism has had traveling deacons. On the continent of Europe, especially in Germany and Scandinavia, special diaconal institutes, first founded in Germany by J. H. Wichern in 1833, train deacons for social service and youth work in the parishes. In certain cases these deacons have wider responsibilities; for instance, in Sweden, after additional homiletical training, a *pastorsdiakon* is permitted to preach in the congregations of remote districts where the number of pastors may be insufficient. In some continental Lutheran churches, the term deacon is given to assistant ministers in a parish, even though they are fully ordained priests. Several Protestant churches in Asia and Africa have revived the permanent diaconate. In the constitution of the Church of South India provision is made for lifetime deacons, ordained not only to assist the presbyters in the church services and in "ministering in the temporalities of the church," but also to carry on catechetical, evangelistic and pastoral work. *See* also HOLY ORDERS; MINISTRY, CHRISTIAN.

DEACONESS, a woman devoted to the pastoral ministry of the Christian church. In the New Testament a deaconess of the church at Cenchraea is mentioned (Rom. xvi. 1), but little is known of the actual functions of such women until the late 4th century. According to the Syriac *Didascalia* and the Apostolic Constitutions they acted as doorkeepers in churches and as assistants to the clergy in the baptizing of women (for reasons of propriety). Their ordination, which resembled that of deacons, conveyed no sacerdotal powers or authority, yet it was partly fear that they would usurp priestly functions (*e.g.*, in Nestorian and Monophysite communities they gave Holy Communion to women and read the Scriptures in public) that led to their decline. Another reason was perhaps the decreasing number of candidates for adult baptism. The order of deaconesses was abrogated by the Councils of Epaon (517) and Orléans (533), but it lingered on for several centuries in other places. especially in the east, where it had always been stronger than in the west.

After the Reformation some deaconess work was introduced among certain Reformed groups in Holland (16th century), but it was not until the 19th century, when women were seeking emancipation, that the modern deaconess movement really began. In 1836 T. Fliedner founded the *Diakonissenanstalt* at Kaiserswerth, near Berlin. where nursing was the chief function of the deaconesses, who did not undertake life service. By 1861 Kaiserswerth had 13 daughter-houses and the movement spread rapidly to other countries, the first house in the United States being founded in Pittsburgh. Pa., in 1849. Florence Nightingale had her first practical experience of nursing with the Kaiserswerth deaconesses in 1851, Nursing remains their chief work. and in the 1960s they had more than 70 daughter houses. After World War II an international deaconess association called *Diakonia* was founded.

In the British Isles, where nursing sisters are not called deaconesses. the function of deaconesses (or church sisters as they are called in some denominations) is to serve under the local clergy or minister in parish work. They have pastoral and theological training, varying according to the church concerned. The first deaconess in the Church of England was dedicated in 1862, but deaconesses were not established as an order until the 1920s. In the 1880s deaconesses were introduced by the Church of Scotland and the English Methodists.

Pastoral or nursing deaconesses are found in most parts of the world where there are Protestant churches; their precise functions and powers, which vary from church to church and from country to country, are concerned in the larger question of the full-time professional service of women in the church.

DEA DIA, the goddess worshiped in a sacred grove near Rome by the priests known as the Arval Brothers (*q.v.*). She is known only from the minutes of the priestly college unearthed in

modern times at her shrine. The origin and nature of the deity are obscure. Even her name ("divine goddess") is not specific. Thus scholars have equated her with various goddesses, principally Ops (see BONA DEA), Ceres. Acca Larentia, Flora (*qq.v.*), Tellus, and Luna, probably none of them accurately. From the nature of the college and the rites in her honour she would seem to be concerned with the fertility of the fields. Her annual festival was celebrated on three days in May.

DEAD SEA, the lake into which the Jordan river (*q.v.*) flows. Its northern half belongs to Jordan; its southern half is divided between Jordan and Israel. The Jordan valley bounds the Dead sea on the north, where part of the shore Iine consists of deltaic salt marsh. There the valley is 12 mi. wide, with badlands and scrub bordering the delta. It is bounded on the east by the fault escarpment of the flat Moab plateau. The escarpment rises 3,000 ft. above sea level—an average ascent from the lake of 14 ft. per 100 ft. of horizontal distance. It is bounded on the west by the rolling surface of the Judean mountains and northern Negev highlands, where peaks rise to 2.300 ft. above sea level. It is bounded on the south by soft mud flats that gradually rise toward the central ridge of Ha'arava (Wadi al 'Arabah). The Dead sea has a maximum length of 51 mi., a width of 11 mi., an average of 1,080 ft. for its deeper portions and a surface area of 394 sq.mi. (1.020 sq.km.), three-quarters of which is Jordanian territory. Its surface level. which has a seasonal variation of from 10 to 15 ft., lies 1.302 ft. (397 m.) below the level of the Mediterranean sea and is the lowest sheet of water on the earth's surface.

In the summer the absence of rain and the high rate of evaporation cause water levels to drop from 10 to 15 ft. below those of winter. For centuries the level of the lake rose, because of increased rain, increased intake in relation to evaporation, depositional fill, increased flow of subterranean springs or combinations of such factors. From 1879 to 1929. however, the water level rose only 23 ft., and since then it has dropped a few feet. There is no commonly accepted explanation for this phenomenon.

Intake from the Jordan river is 6,500,000 tons daily. Other streams, numerous springs and underground seepage add another 500,000 tons. Four perennial streams—Wadis Hasa, Mawjib, Zerqa and 'Udhemi—flow into the lake. They all enter from the Moab plateau, which receives approximately 16 in. of rain in the winter from moisture-bearing Mediterranean winds that rise over the steep western-facing escarpment. The intermittent streams flowing into the lake from the west originate on the leeward side of the Judean plateau, which receives from 4 to 8 in. of rain in the winter. Rainfall in the Dead sea valley averages 3.4 in. annually in the north and 1.8 in, in the south. Seldom does it exceed 5 in. anywhere in the valley. There is no outflow from the lake. Instead, the water balance is maintained by evaporation. estimated at 120 in. annually (10 mm. daily). Blue-white clouds, which form a mist over the surface of the water, carry off this evaporated moisture.

Dividing the Dead sea nearly in two is Al Lisan ("the tongue"), a peninsula 6 mi. wide and 32 sq.mi. in area. It is covered with soft, white marls. Low, flat and barren, save for scrub on the east, Al Lisan lies exposed to erosion by wind and water. Parts of the plain are highly weathered and sculptured. Winter vegetables are sometimes planted by Bedouins on the peninsula's protected northeastern shore. The sea south of Al Lisan is shallow,, ranging from 3 to 30 ft. in depth. The port for the potash works on the southwestern shore is between 6 and 12 ft. deep. Waters reach maximum depths of 1,430 ft. (436 m.) in the northeastern comer of the lake.

Traversing the Dead sea shore clockwise from the Jordan delta one encounters badlands that terminate at the Moab escarpment. The cliff then hugs the shore with major indentations into the plateau's dark-coloured rocks at Wadi Zerqa and Wadi al Mawjib. Springs, wells, small patches of vegetation and tiny deltas built by perennial and intermittent streams break the escarpment's monotonous outline. The next expanse of level land after Al Lisan occurs at Ghawr as Safi. There, along the southeastern edge of the lake, is higher, well-drained land through which Wadi al Hasa flows. At the lake's southern end is soft, impassable mud, then badlands and then Mt. Sodom (or Jabal Usdum; modem Sedom or Sdom). The mountain rises 800 ft. above the lake and is separated from the rest of the Judean highlands by a 14-mi.-wide valley of broken limestone and sand. At Mt. Sodom is the rock formation said to represent Lot's petrified wife. Twenty miles to the north lies Masada (Metsada), a 1,700-ft. rock cut off from the rest of the Judean plateau by two wadis (river valleys). North of Masada the shore broadens into a sloping shelf pinched out by the Judean escarpment at Ein Gedi. A sheltered oasis on a terrace 300 ft. above the lake, Ein Gedi has three sweet-water springs pouring as waterfalls from heights of 2,000 ft. Hard-rock outcrops force streams into tortuous routes, rendering them almost useless as lines of communication from the Dead sea to Hebron. From Ein Gedi north to the saline mud flats of the northwestern shore, there is no beach. The mud flats are bordered by higher badlands which in turn drop down to the Jordan river.

Geology.—The Dead sea occupies the lowest part of the 350-mi.-long Jordan-Dead sea trench. This depression is a northern extension of East Africa's rift valleys. It is a down-dropped block confined by two parallel faults. The eastern fault of the Moab plateau is more readily visible from the lake than is the western fault that marks the gentler Judean upfold.

In the Jurassic and Cretaceous periods, before the creation of the trench, an extended Mediterranean sea covered Syria and Palestine. During the Miocene epoch of the Tertiary period, upheaval of the sea bed produced the upfolded anticlinal structures of the Transjordan highlands and the central range of Palestine, causing the fractures which formed the Dead sea depression. At this time, the Dead sea probably was the same size as now. During the Pluvial period it rose to a height 700 ft. (220 m.) greater than now. It was a vast inland sea, stretching 200 mi. from the Lake Hule area in the north to 40 mi. beyond its present southern limits. The lake did not spill over into the Gulf of Aqaba because the highest part of the Wa'arava, which is now about 800 ft. (240 m.) above sea level, acted as a dam. This higher elevation is an eastward extension of the central Negev highlands (Hills of Paran).

During the Early Pleistocene epoch of the Pluvial period, heavy stream flow into the lake brought thick sedimentary deposits of shale, clay, sandstone, rock salt and gypsum. In the Middle Pleistocene, calcareous strata of clay, marl, soft chalk and gypsum were dropped upon layers of sand and gravel. With evaporation prevailing over precipitation, as in the Recent epoch, the Pleistocene lake gradually shrank to its present form. In so doing it bared deposits that cover the Dead sea valley to a thickness of from 1 to 4 mi. (2,000 to 7.000 m.). These sediments are called the Neocene-Quaternary (Early Pleistocene) and Lisan (Middle Pleistocene) series. Their soft sediments contrasted with the older, harder Cretaceous-Eocene sandstones and dolomites of the bordering plateaus.

Al Lisan and Mt. Sodom are formations that resulted from young tectonic movements. Mt. Sodom's steep cliffs rise up from the southwestern shore. Its Neocene-Quaternary deposits of rock salt, gypsum, shale and clay lie on older Miocene sandstones. These deposits are the Sodom series. Al Lisan was formed in the Middle Pleistocene. Its strata consist of clay, marl, soft chalk and gypsum interbedded with sand and gravel. Both Al Lisan and beds of similar material on the western side of the Dead sea valley dip to the east. It is assumed that the uplifting of Mt. Sodom and Al Lisan formed a southern escarpment for the Dead sea, depressing the sea bed to the north and east. Later the sea broke through the western half of this escarpment to fill in what is now the shallow end of the Dead sea.

Salinity.—Dead sea water is intensely saline, with solid content of 25% as compared with from 4% to 6% for ocean water. Dead sea salts include magnesium chloride, sodium chloride, calcium chloride, potassium chloride, magnesium bromide and calcium sulfate. At the surface, each litre of Dead sea water contains 227–

275 g. of dissolved salts. At a depth of 360 ft. the water has 327 g. of salts. The high percentage of solids in solution makes the Dead sea extremely buoyant, keeping bathers continually afloat. Fish are not able to live in its waters.

The lake's salts come from saline streams and hot springs. The Jordan river contains a high proportion of sodium chloride and magnesium chloride. Streams that drain into the lake from the plateau leach salts from mountain racks and sediments in the basin. Additional sources are the numerous sulfur springs that rise from the foot of the escarpments, and hot springs on the bottom of the Dead sea. There is widespread occurrence of asphalt seepage along the shores and floating pieces of asphalt from submarine beds are found on the lake's surface.

History. — Other names for the Dead sea are Salt sea, Sea of the 'Arava, Eastern sea, The Sea, Asphalt sea, Sodomitish sea, Sea of Zoar, Sea of Overwhelming and Sea of Lot. History records the Dead sea in the biblical narratives of Abraham and Lot, and the destruction of Sodom and Gomorrah *(see* SODOM AND GOMORRAH) by earthquake and sulfurous rain. David took refuge at Ein Gedi. and Solomon praised its beauty. Jonathan Maccabeus built a fortress on Masada, and Herod improved it. In A.D. 73 Masada's fortress was destroyed by Romans. Its heroic Zealot defenders, led by Eleazar ben Jair, culminated a three-year defense by mass suicide. During this general period, the monastic group at Qumran managed to preserve the literature of the Dead sea scrolls (*q.v.*).

Navigation on the lake was chronicled by Tacitus and Josephus. Under the crusaders, new navigation dues were levied by Karak's lords. The first modern explorers who attempted to explore the Dead sea, R. Costigan (1835) and T. Molineux (1847), perished from exposure after sailing the lake's northern half. Lieut. (later Capt.) W. F. Lynch of the U.S. navy successfully led a survey party around the entire lake in 1848. A scientific research party sponsored by the sultan of Turkey was conducted by the geologist M. Blanckenhorn in 1908, the year that a party of French Dominican monks, including R. Abel, explored ancient sites.

No modern cities occupy the shores of the Dead sea. No trace remains of the five "plain cities" of Abraham's time (Sodom, Gomorrah, Admah, Zeboyim and Zoar) which occupied the Vale of Siddim (Dead sea area). Archaeologists differ as to their location, although a majority place them at the now-submerged southern end.

Resources. — The world's need for agricultural fertilizer in the 20th century opened a new epoch in Dead sea history. The mandatory government for Palestine and Transjordan (under the League of Nations) granted M. A. Novomeysky, a chemical engineer, the concession to exploit Dead sea minerals in the late 1920s. He formed Palestine Potash, Ltd., which began potash operations in 1930 at Kalya, at the northern end. A southern plant was established at Sodom in 1937. Annual production reached 110,000 tons of potash and 1,000 tons of bromine by 1945. The production process calls for pumping Dead sea brine (1%–1.5% potassium chloride) into shallow earthen pans. The sun's rays, the dry atmosphere and the strong winds of the area evaporate the brine, leaving impure white carnallite. This is pumped to the refinery for fractional recrystallization into a raw material, 97% potassium chloride. Further recrystallization produces magnesium chloride and magnesium bromide.

During the 1948 Arab-Israeli war, the Kalya plant was destroyed. Later in Jordanian territory, it had not been rebuilt by the early 1960s although the new 'Amman-Kalya road was expected to cause the industry's revival. At Sodom, in Israel. a new plant was built in 1955 by the Dead Sea Works, Ltd. A modern road connected Sodom to Beersheba, following Maavar Sodom (Sodom pass). Although most of the potash was exported from Haifa, an increasing quantity was being exported via Eilat. Potash production at Sodom was 110,000 tons in 1958–59. Another plant produced bromine and such compounds as ethylene dibromide and tetrabromoethyne. Lesser quantities of magnesium oxide and hydrochloric acid are also produced.

Relatively sweet water is needed for refining, pan leaching and drinking. At Kalya, water from the Jordan and Wadi Zerqa are adequate. At Sodom, ground-water sources must be used. Wells south of the plant, that tap the sands and gravels of the Lisan series, are the major source of supply.

Other Dead sea minerals that have been exploited include common salt (from brine) and asphaltite (from rocks containing bitumen or as bits that float on the water). The latter material is also used for skin salves. Oil prospecting has taken place on western Mt. Sodom and in the Lisan series, and natural gas discoveries have been made in the area. Other minerals, like rock salt, bituminous limestone, ochre, iron and sulfur occur, but not in exploitable quantities.

The tourist trade suffers from lack of facilities, such as hotels and roads, but both Israel and Jordan are interested in its development. The winter climate is warm and dry. January has a maximum mean temperature of 68° F. and minimum of 51° F. The average monthly rainfall is 1.2 in. and the relative humidity is 61%. Such a climate, added to historic associations, hot springs and awe-inspiring scenery, forms a favourable base for attracting tourists. See also PALESTINE.

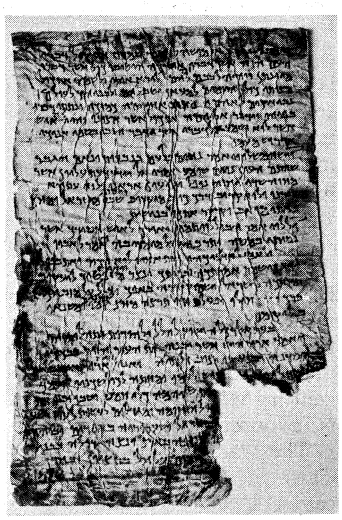
DEAD SEA SCROLLS, the popular name given to a number of Hebrew and Aramaic manuscripts found near the northwestern corner of the Dead sea, in the late 1940s and the 1950s. They shed new light on a previously little-known type of Judaism that existed during the time of Christ and that in many ways resembles early Christianity; it was the Judaism amid which Christ and his first followers lived, thought and wrote.

A Bedouin's accidental discovery of a cave containing some of the scrolls in 1947 or perhaps 1945 was the first of what proved to be numerous finds. In 1947 the scrolls were taken to Jerusalem and sold, some to E. L. Sukenik of the Hebrew university at Jerusalem and the rest to the Syrian Orthodox Archbishop A. Y. Samuel.

In 1950 and 1951 the American Schools of Oriental Research published three of the four documents Archbishop Samuel had purchased. The Hebrew university's collection was published between 1948 and 1954; and in 1956, after the archbishop's scrolls had been bought in the United States and taken to Israel, the last of them mas published there.



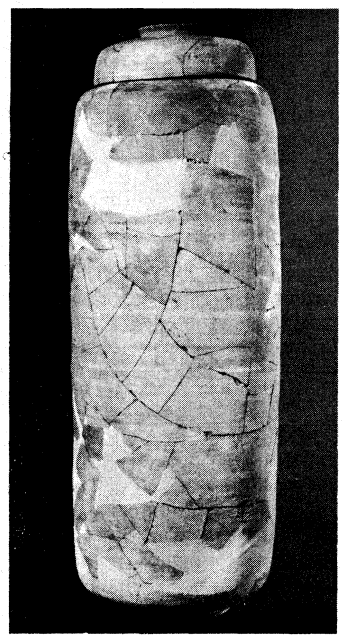
JOHN ALLEGRO

FRAGMENT OF COPPER SCROLL FROM QUMRAN

In 1949 the cave was excavated by the department of antiquities of Jordan, the French School of Archaeology at Jerusalem and the Palestine Archaeological museum of Jordanian Jerusalem. Hundreds of manuscript fragments were unearthed. Other pieces were purchased through antiquities dealers or directly from the Bedouins who found them. In 1952 and subsequently, ten more caves containing fragments of manuscripts were discovered within a few miles of the first

one, near a valley called Wadi Qumran. One cave held a few more or less complete scrolls like those found in the first cave. In another a scroll made of copper was found in two pieces. Another valley farther south, the Wadi Murabbaat, yielded an entirely distinct collection of fragments, somewhat later in date; others of still later date were found not far away at Khirbet Mird. The enormous mass of texts thus accumulated was deposited in the Palestine Archaeological museum, and sorting, study and preparation for publication were begun by an international team of scholars headed by J. T. Milik of the French School of Archaeology.

The search for manuscripts and for information to help in interpreting them led also to the excavation of a ruin called Khirbet Qumran, on the northern edge of the Wadi Qumran. A series of campaigns in 1951–56 under the direction of R. de Vaux, the head of the French school, uncovered the remains of a complex of buildings, the headquarters of the community that produced the manuscripts. A strong corner tower, a kitchen, halls for meals and meetings. the "scriptorium" where the scrolls were copied, cisterns, baths, mills and a potter's shop were among the principal features of the establishment. Nearby was a cemetery.



BY COURTESY OF THE ORIENTAL INSTITUTE OF THE UNIVERSITY OF CHICAGO

JAR OF THE HELLENISTIC-ROMAN TYPE USED TO STORE THE DEAD SEA SCROLLS. IT WAS FOUND IN CAVE I AT QUMRAN, PALESTINE

In 1960 further discoveries were made in the same general region, but farther south, in Israel. The texts found there do not belong with the Qumran manuscripts, but are of the same nature and date as those from the Wadi Murabbaat.

History of the Qumran Community. — The pottery and coins found showed that the settlement had been established in or about the time of Alexander Jannaeus (103–76 B.C.). A severe earthquake in 31 B.C. caused the abandonment of the site until about 4 B.C. A second period of occupation lasted until A.D. 68, when the community fell prey to fire and sword during the first revolt of the Jews against Rome. Two later phases of occupation attested by coins and pottery were of brief duration and minor importance. They had nothing to do with the religious community that had lived there during the last century B.C. and the first century A.D.

Nothing else is known of the community's history except what can be inferred from its literature, as preserved in the scrolls. This is meagre and indefinite. There mas a revered leader, possibly the founder of the group, who was called the Teacher of Righteousness. He was believed to have had a special revelation of the true meaning of the prophetic writings. Attempts to identify him have not succeeded; some scholars think that the title was borne by a succession of individuals.

The Teacher of Righteousness was persecuted by a man called the Wicked Priest. The outcome is not clear. A group called the House of Absalom failed to come to the Teacher's aid; there are references also to other persons. including the Man of the Lie and the Prophet of the Lie. The Wicked Priest may have been a high priest. Identifications proposed for him range from the early 2nd century B.C. to the years just before A.D. 70. Alexander Jannaeus is favoured by a number of interpreters.

The Damascus Document or Zadokite Document, discovered at Cairo in 1910 and represented also by fragments in the Qumran caves, speaks of a migration to "the land of Damascus" and of dwelling in camps under a form of organization similar to that of the Qumran community. The meaning of "the land of Damascus," the time of the migration and the relation of this group to that of Qumran are matters of debate among scholars. The place referred to may have been Qumran itself.

Identity of the Group and Its Relation to Other Forms of Judaism. — The location of the establishment calls to mind the Essenes, a Jewish sect whose settlement above the western shore of the Dead sea is described by the Roman naturalist Pliny. The ascetic, monastic type of religious life and organization represented by the Dead sea scrolls corresponds at many points to what is said of the Essenes by the Jewish writers Josephus and Philo. There are differences that make an outright identification questionable, but the Qumran sect and the Essenes, if not identical, belonged to the same general movement. (*See* also JEWISH SECTS DURING THE SECOND COMMONWEALTH.)

Other groups among the Jews of the period — Pharisees, Sadducees and Zealots, and even Christians — have been connected by scholars with the Qumran sect, but in each case there are prohibitive differences. Arising within the priesthood, in connection with the pre-Maccabean movement of the Hasidim, from which the Pharisees also came, the community of Qumran had evidently broken with the official priesthood. Theologically it belonged to the wing of Judaism that produced the apocalyptic literature. Existence was thought of in terms of a cosmic struggle between the forces of good and evil, "the lot of God" and "the lot of Belial." The group believed that it was already living in the last days, and that it was chosen to take an active, militant part in the war against Belial. The prophetic books of the Old Testament were interpreted as referring to the sect itself and its part in the cosmic drama.

Meanwhile the members lived together, eating and worshiping together, sharing their property, following a way of life strictly regulated by rules of discipline, practising rites of purification and preparing the way of the Lord by an assiduous study of the law. They were ruled by "the priests, the sons of Zadok," and they expected a priestly "Messiah of Aaron" as well as a lay "Messiah of Israel," the "Branch of David" foretold by the prophets.

The texts found in the Wadi Murabbaat come from the time of the second revolt against Rome (A.D. 132–135). They represent no such marginal group as the Qumran community; their writers were orthodox Jews. The name, perhaps even the personal signature, of the leader of the second revolt, Bar Cocheba, appears in letters in what was doubtless its original form, Simon ben Koseba.

Contents of the Scrolls and Fragments. — Biblical *Manu*scripts. — A considerable portion of the Qumran texts are manuscripts of the Old Testament books. Every book of the Old Testament except Esther is represented by at least a few fragments. Pieces of as many as a dozen different manuscripts of some of the books have been identified. Two manuscripts of Isaiah were among the scrolls found in the first cave; one is incomplete, but the other, which contains the whole book from beginning to end, is both the most complete and one of the oldest of all the manuscripts. It was made in the 2nd century B.C., perhaps before the community was established at Qumran. These manuscripts, though for the most part fragmentary, are very important for the reconstruction of the correct text of the Hebrew Old Testament because they exhibit forms of the text as much as 1,000 years older than the best manuscripts otherwise preserved.

By and large they demonstrate to a remarkable degree the accuracy of the later tradition, but there are notable exceptions. Some of the manuscripts present a text related closely to that of the Septuagint, the ancient Greek translation that was the Old Testament of the early Christian church. Various mixed forms of text appear also, providing much new material for tracing the history of the text. A useful basis of comparison is afforded by the 2nd-century biblical texts from the Wadi Murabbaat. They conform closely to the standardized Masoretic (traditional) text of the medieval manuscripts, showing that the process of standardization was being completed in the 1st century, between the stages represented by the texts from the Wadi Qumran and those from the Wadi Murabbaat.

In addition to the manuscripts of books of the Old Testament there are collections of passages selected from one or more books. More or less extensive quotations appear also in commentaries on

a number of books, especially the prophets. Two manuscripts, one of which has been named the Testimonia and the other the Florilegium, are collections of Messianic proof-texts.

Sectarian Literature.—The rest of the Qumran scrolls and fragments contain the nonbiblical works cherished by the community. They cover an extraordinary range of different types of material. Several of the books previously known as the Apocrypha and Pseudepigrapha appear among the Qumran texts. They include Tobit and Sirach (Ecclesiasticus) as well as Enoch and Jubilees. There are also many works not hitherto known at all. Most of them are in Hebrew. but a number are in Aramaic. Only a few examples to illustrate the scope of the material can be mentioned here.

A few texts consist of paraphrases of biblical material. The most extensive is the Genesis Apocryphon. one of the first scrolls found, which was for a while called the Lamech scroll. It presents the contents of several chapters of Genesis, freely retold in Aramaic. The fe columns of the badly deteriorated scroll that have been deciphered and published contain parts of the stories of Noah and Abraham, with interesting variations.

The commentaries mentioned above interpret Scripture as referring specifically to the history and doctrines of the sect. Of those published thus far, the most complete is the commentary on Habakkuk, but there are substantial portions of many others.

Some of the texts are of a legal nature. The Damascus Document. cited above in connection with the history of the community, gives strict regulations for the life of the camps. Very similar in many respects but containing also other material is the Manual of Discipline or Rule of the Community, of which one fairly complete copy and parts of others were found. The Rule of the Congregation is another work closely related to the Manual of Discipline but with significant differences at several points.

There are also liturgical works, including collections of hymns and prayers. Among these are the scroll of Benedictions, the Mishmaroth scroll giving directions for the successive assignments of the priestly families in the temple, and most remarkable of all the scroll of Thanksgiving Psalms found in the first cave.

Other texts contain apocalyptic material, dealing with the events of the last days or the conditions of the world to come. One, represented by fragments of several copies found in different caves, is a Description of the New Jerusalem written in Aramaic. Especially interesting in this group is the scroll concerning the coming War of the Sons of Light with the Sons of Darkness, in which are given detailed directions concerning weapons and tactics and predictions of the course of the war. A curious document which perhaps belongs to the same category is contained in the unique copper scroll. It lists places throughout the country where fabulous treasures are supposed to be hidden. (See also APOCRYPHA, OLD TESTAMENT.)

Significance for Christian Origins.—The Dead sea scrolls represent a type of Judaism. little known previously, which in some ways remarkably resembles early Christianity. The conception of the cosmic war of light and darkness, the sense of living in the last days and expecting momentarily the end of this world, the common meals and the sharing of property, the ritual baths or baptisms. and some details of organization are among the points of most obvious similarity.

Not a few scholars have thought it probable that John the Baptist had some direct connection with the community of Qumran, at least during his childhood. Parallels have been seen also between the careers and doctrines of Jesus and the Qumran Teacher of Righteousness, but these have been grossly exaggerated. Little is actually known about the life of the Teacher of Righteousness. There is no evidence that he was crucified or that his disciples expected him to rise from the dead.

Obviously John and Jesus were not members of the sect at the time of their public ministry. Not only similarities between John and the men of Qumran but also equally significant differences have been noted, the most important being John's sense of a mission to the whole nation. the lack of any evidence of a closely regulated organization of his followers, and his recognition of Jesus a5 the one greater than himself nho was to come after him.

The teaching and attitudes of Jesus stood in several respects at opposite poles from those of the Qumran community. He was not an ascetic; his attitude to the law differed radically from the rigid legalism of the Qumran sect; he had none of their concern for the matters of ritual observance; he did not establish an exclusive order of saints but proclaimed to all a warning of judgment and a gospel of salvation. In his stress on the conflict between the kingdoms of God and Satan he agreed with the men of Qumran, but unlike them he proclaimed that the victory was already won, and the imminence of the coming kingdom of God was already manifest.

In some particulars of organization and practice, theological vocabulary and perhaps doctrine, the early church may have been influenced, directly or indirectly, by the Qumran sect or by the Essenes living throughout Palestine. The evidence is insufficient to establish more than a possibility. What is most important for the understanding of Christian origins is that the Dead sea scrolls illuminate the religious background of Jesus and his first followers, their spiritual heritage, their common presuppositions and the language and concepts by which the gospel was communicated.

DEADWOOD, a city in the Black hills of western South Dakota. U.S., the seat of Lawrence county, lies in a canyon 4,533 ft. above sea level. During the 1876 gold rush thousands of miners struggled into Deadwood gulch, and the city gained a reputation, magnified by the "Deadwood Dick" dime novels, as a wide-open outpost of frontier violence. Wild Bill Hickok was killed in a Deadwood saloon Aug. 2, 1876. by Jack McCall and is buried in Mt Moriah cemetery beside Calamity Jane. Deadwood is a city of narrow streets, with houses clinging in layers to steep, wooded inclines. The economy, based principally on mining, forestry and tourist services. is influenced by the large Homestake gold mine at the city of Lead, about 4 mi. S W. An annual "Days of '76" celebration and a spirited summer-long melodrama, "The Trial of Jack McCall," portray the excitement of Deadwood's turbulent past. Tourist attractions include the Adams museum (historical items). a granite bust monument of Hickok by Korczak Ziolkowski and the Theodore Roosevelt monument. The population in the 1960s was about 3,000. (J. L. J.)

DEAF AND HARD OF HEARING, TRAINING AND WELFARE OF. The term deaf is frequently applied to those who are deficient in hearing in any degree. however slight, as well as to people who are unable to detect the loudest sounds. In this article the term deaf is applied to those who are so handicapped that they are unable to receive instruction through the sense of hearing. The hard of hearing are those in whom the sense of hearing, although defective, is functional with or without a hearing aid. (D. M. L.)

Children may be born deaf or may acquire deafness in early infancy. There is a serious interference with the normal course of mental and educational development when the deafness is so great as to prevent the hearing of the spoken word. It is through hearing that the normal child learns to appreciate the meaning of words. It is through hearing that the normal child obtains those sound patterns which guide his attempts at speech. The severely deaf infant who is unable to hear spoken language consequently fails to acquire a knowledge of uords or language and does not develop the power of speech. Devoid of these common means of communication, such children are isolated from the rest of society and sufier a major handicap in education. Such children

who are mute only through deafness — through failure to hear and imitate speech as do children with normal hearing — constitute a special class of handicapped children for whom special educational provisions are necessary. Muteness divorced from deafness is a rare condition and is not treated here. Medical aspects are discussed under DEAF-MUTISM. MEDICAL ASPECTS OF; and SPEECH DISORDERS. (See also EAR, ANATOMY OF; EAR, NOSE AND THROAT, DISEASES OF THE.)

The two main types of deafness are conduction deafness and nerve deafness, and they may occur singly or in combination. The former is due to some obstruction to the passage of sound to the inner ear while the latter is due to a defect of the inner ear or of the nerve fibres from this sensory organ. Infections of the middle ear give rise to many cases of conduction deafness found in partially deaf children, but considerable mystery surrounds the predominant cause of congenital deafness. Surveys show that among children in schools for the deaf and partially deaf about 60% are congenitally deaf. Causes of severe deafness of the acquired type include meningitis and maternal rubella during the first three months of pregnancy. Nerve deafness may be inherited, but the proportion of such cases is small. The incidence of deafness sufficiently severe to demand special education varies from place to place and country to country.

HISTORY OF THE EDUCATION OF THE DEAF

Early History. — The history of the education of the deaf begins properly in the 16th century. Before this time those born deaf were the subject of philosophic speculation but it was generally assumed that they were incapable of education. Pedro de Ponce (1520?–84) successfully taught some deaf pupils in Spain to speak, read and write, and it is assumed that his methods were followed by Juan Pablo de Bonet who in 1620 published the first book on the subject. This gave rise to a wider interest in the education of the deaf in western Europe.

In England John Bulwer (fl. 1654) wrote on teaching the deaf to speak and read the lips, and he was followed by William Holder (1616–98), John Wallis (1616–1703) and George Dalgarno (1626?–87).

In France similar work had been carried on by abbé Charles Michel Épée (*q.v.*) who made a most profound contribution in developing the natural sign language of the deaf into a systematic and conventional language to be used as a medium of instruction. His work was developed by the abbé Sicard (1742–1822) and gave rise to the manual system or silent method of teaching the deaf.

In Germany Samuel Heinicke (1727–90) educated deaf children orally and later Moritz Hill (1805–74), perhaps the greatest educator of the deaf of all time, developed this method. Thus arose the oral method of instruction which continued to influence the teaching of the deaf and in time became an accepted practice throughout the world.

Great Britain. — Thomas Braidwood (1715–1806) established the first school for the deaf in Great Britain, first in Edinburgh and later in London. This school was of a private nature but at this time the attention of the philanthropic public became focused on the needs of the deaf and funds were raised to establish schools for the deaf generally. The first school for the poor deaf was opened in the Old Kent road, London, in 1792 and later moved to Margate Edinburgh followed suit in 1810; Birmingham in 1814; Liverpool, 1825; Manchester, 1823; Exeter, 1827; and Doncaster, 1829. By 1870 ten residential institutions for the deaf had been established in England, four each in Scotland and Ireland and one in Wales. In these early institutions the method of instruction was generally a mixed one, and in certain cases an entirely silent mode of instruction was employed. The German oral system, however, was gaining ground rapidly, and the Yorkshire institution adopted it in 1876. From this time onward the oral method, in which lip reading replaces hearing and the children are taught to use speech as a normal means of communication, advanced in favour, and eventually became the accepted method for the instruction of the deaf in the United Kingdom. Elsewhere the oral method proved acceptable although in some schools a method in which oral techniques were combined with manual communication continued to be used with success.

During the greater part of the 19th century the education of deaf children depended entirely on the work of the charitable institutions, but following the Elementary Education act of 1870 further efforts to widen the field of state education gave rise to the Elementary Education (Blind and Deaf) act of 1893–94. This act (which had been anticipated in Scotland in 1890) made compulsory the education of deaf children from the age of 7 to 16 years. In consequence further residential institutions and day schools were opened. From this time onward the schools for the deaf, whether in establishments maintained by independent governing bodies or in schools maintained by local authorities, became an integral part of the state system of education. (E. S. G.)

United States. — The first recorded attempt to teach a deaf-mute in the United States was by Philip Nelson in Rowley, Mass., in 1679, but not until the early 19th century was concerted action taken to educate deaf children. Francis Green of Boston, Mass., whose deaf son was sent to Edinburgh to be educated at Thomas Braidwood's institution, became much interested in the problem. With some ministers he attempted a census of Massachusetts in 1803, when 75 deaf were found. They then estimated that there were 200 deaf persons in the United States and urged the creation of a special school.

In 1810 in New York city the Rev. John Stafford found several deaf children in the city almshouses and tried to instruct them, efforts which later resulted in the founding of the New York Institution for the Deaf (1818). A grandson of Thomas Braidwood, John Braidwood, began to teach a family of deaf children in Virginia in 1812, later establishing a school. In 1812 an investigation disclosed 84 deaf in the Hartford, Conn., area, an estimated 400 in New England and 2,000 in the United States. In 1813 a group of Hartford men organized a society to instruct the deaf. raised $2.278 and sent a young minister, Thomas Hopkins Gallaudet (*q.v.*), to Europe to learn methods of teaching the deaf. Gallaudet studied the sign-language method at the abbé Sicard's school in Paris, which influenced the whole course of the education of the deaf in America. When Gallaudet returned in 1816, he was accompanied by Laurent Clerc, himself deaf, one of the Paris institution's teachers. On April 15, 1817, the Hartford school was opened with subscriptions from other cities amounting to $12,000 and an appropriation of $5,000 from Connecticut, probably the first made in the United States for other than regular schools. This school used the sign language, the manual alphabet and writing as the basis of instruction. In 1819 the federal government granted 23,000 ac. of public land, the proceeds from which formed a fund of $339,000.

In May 1818 the New York Institution for the Deaf was opened with 62 pupils. After an exhibition by the students in 1819 the state legislature appropriated $10,000 and granted "a moiety of the tax on lotteries in the city of New York" which for 14 years formed a good income. In Philadelphia, Pa., David Seixas began teaching deaf children in his home in 1820. After an exhibition of results accomplished in 1821, he secured a charter and a per capita appropriation from the state of $160. The Hartford school lent him Laurent Clerc. New Jersey began at once to send pupils to the Pennsylvania institution, Maryland followed in 1827 and Delaware in 1835. Kentucky in 1823 was the fourth state to establish a school for the deaf, the Kentucky asylum at Danville, which was the first school established distinctly as a state enterprise. In 1863 there were 22 schools for the deaf with 2,012 pupils. Within 60 years of the first foundation, they were established in 31 states, great areas of public land being granted in several instances for such purpose. In all the institutions, up to 1867, the manual system of instruction held sway, though the oral method had been tried at the New York institution.

In 1867 the Clarke school, established at Northampton, Mass., and the Institution for the Improved Instruction of the Deaf, New York city, now the Lexington School for the Deaf, mere the first schools instituting oral instruction. Both schools exerted an influence on the early education of the deaf.

Educators of the deaf divided themselves into those who fa-

voured the manual (sign-language) system supplemented by articulation and those who taught speech and lip reading, vetoing the manual method. Manual teachers maintained that certain deaf-mutes would never learn to speak and to read lips; oral teachers considered it unjust to separate the deaf from the hearing because of lack of instruction in the use of the vocal organs Ednard Miner Gallaudet's stand for the teaching of speech to deaf children after his extended European tour of 1867 influenced many instructors. In 1886 tension had modified sufficiently to permit the convention of instructors of the deaf to pass noteworthy resolutions urging endeavours in the schools to teach every pupil to speak and read from the lips. The resulting combined system was defined in the American Annals of *the* Deaf, the instructor's official organ, as follows:

Speech and speech-reading are regarded as very important, but mental development and the acquisition of language are regarded as still more important. It is believed that in some cases mental development and the acquisition of language can be best promoted by the Manual method, and such method is chosen for each pupil as seems best adapted for his individual case. Speech and speech-reading are taught where the measure of success seems likely to justify the labor expended, and in some of the classrooms of most of the Combined-System schools the Oral method is strictly followed.

The combined and the oral systems came into increasing use. Yet even in 1904 the World's Congress of the Deaf at St. Louis, Mo., ruled that champions of the oral method were not friends of the deaf and that every teacher of the deaf ought to have a working command of the sign language. Oralism was helped forward by the establishment of day schools. The Horace Mann school at Boston was the first, starting Nov. 10, 1869, under Sarah Fuller, principal for 41 years, who gave Helen Keller (*q.v.*) her first lessons in speech. The number of day schools increased slowly up to 1894 when there were 15, and more rapidly thereafter. Pupils from oral schools passed on to high schools and colleges, holding their own with those who hear and graduating successfully. According to the National Research council survey of the three methods of education in practice—the oral, manual and combined—no one method is superior to the others, taking into account the educational achievement of the pupils and their basic intelligence.

THE 20TH CENTURY

Through the first half and increasingly in the second half of the 20th century, advances were made in the design, effectiveness and use of audiometers and other apparatus employed in early recognition and accurate diagnosis of hearing deficiency, in hearing aids, in teaching methods and devices used in teaching and in the training of teachers, therapists and other specialists. Increasingly greater stress was laid on the development of residual hearing, really an integral part of the oral method, so that sounds and language ideas are associated. Audiometer tests showed pupils to have from 5% to 85% of available acuity. Auricular training was emphasized to teach the child to perceive the sound of the human voice and to interpret it, giving a vocabulary, improving speech and increasing activity in the psychic acoustic centres.

United States.—The increasing emphasis on the oral method in the U.S. by the second half of the 20th century was breaking down the barriers that separated the totally or partially deaf from people with normal hearing. The teaching of speech and lip reading became generally prevalent so that the use of communication was available to nearly everyone. Provision had been made for the education of the deaf in local institutions in most states. Lacking a state school, the children were sent at public expense to a school outside the state.

All states have compulsory attendance laws for deaf children who are mentally competent. Admittance ages range from 3 to 8 and duration of attendance varies from age 16 to 25. More than half the states have day schools for the deaf in larger cities or a department for training deaf students within the existing school system. It has been estimated that 88.6% of the deaf in the United States have had some schooling. Every state requires periodic surveys for screening out children with hearing defects. Legal requirements vary from annual checks in some states to one survey every three years in others. In this way most children with hearing problems are recognized at least by school age. Students in residential schools for the deaf are given vocational training according to their aptitudes. If this is not sufficient or if facilities are limited, the vocational rehabilitation division of the U.S. department of health, education and welfare will assume the responsibility for further education providing the student's potential ability warrants the expenditure. The vocational rehabilitation division is a national agency with one or more regional offices in each state. This agency will also assist individuals who have sustained hearing impairment after the age of 14, 16 or 18, depending on the state.

Some states have mobile clinics which visit each section or community once a year. Parents may bring their children to be examined, and the specialists there refer them to their local physicians for further medical care. Many of the larger cities have audiology centres for diagnosis, hearing-aid fittings and some rehabilitative measures. Schools of higher education sometimes give concentrated courses for rehabilitating hearing-defective individuals, including speech correction, auditory training and lip reading. There are also summer camps which include speech therapists on the staff.

One of the most notable advances in the care of hearing-defective persons has been the establishment of hospital centres where an audiological service is maintained in the otolaryngology department or correlated with it. There the patient with impaired hearing receives not only complete audiological examination and medical care but also a plan of therapy or recommended procedures. The staff usually includes an otologist, psychologist, physicist. speech and hearing specialist and social worker, and often has access to a psychiatrist. Centres of this type include those at Johns Hopkins, Baltimore, Md., the State University of Iowa hospitals, Iowa City, and the Children's hospital, Los Angeles, Calif.

Higher Education.—A college of accepted standard for the deaf, awarding the usual master's and bachelor's degrees in art and science, was established in Washington, D.C., in 1864 as the highest department of the institution for the deaf founded by congress in 1857. First known as the National Deaf-Mute college, it was renamed Gallaudet college in 1893, and with the Kendall school (secondary) formed the Columbia Institution for the Deaf (renamed Gallaudet college in 1954). Its graduates successfully pursued special courses at many other institutions.

Teachers of the deaf are educated in most states. Degrees are awarded by recognized colleges and universities, and some teachers are enrolled in training programs in institutions for the deaf.

The Volta bureau for the increase and diffusion of knowledge relating to the deaf was founded in 1887 by Alexander Graham Bell (*q.v.*), who had taught his father's "visible speech" system at the Clarke school in 1872 and whose life was largely devoted to helping the deaf. The bureau also maintains a guidance service for parents of children with impaired hearing.

The 1930s saw the beginning of rapid and continuing strides in the development of hearing therapy with several organizations increasing in membership and national scope. Along with schools for the deaf and the U.S. office of education the following became sources of assistance to individuals with defective hearing. American Hearing society, Washington, D.C.; Council of Exceptional Children, National Education association, Washington, D.C.; National Society for Crippled Children and Adults Inc., Chicago, Ill.; John Tracy clinic, Los Angeles, Calif.; vocational rehabilitation division of the U.S. department of health, education and welfare, Washington, D.C.

Deaf-Blind.—By the second half of the 20th century there were six recognized schools with departments for educating deaf-blind children. Perkins institution, Watertown, Mass.; New York institute, New York city; Michigan School for the Blind, Lansing; Washington State School for the Deaf, Vancouver; Iowa State School for the Deaf, Council Bluffs; and California School for the Blind, Berkeley. Children from other states are sent to these schools on a tuition basis. The American Foundation for the Blind

acts as a disbursing centre and clearinghouse for acceptance of fee-basis students. This organization is an excellent source of material for parents seeking aid for deaf-blind children. (D. M. L.)

Great Britain. — The Education act, 1944, improved the position of deaf children and provided for the establishment of nursery schools for the deaf with optional attendance from the age of 2 years with the compulsory period continuous from 5 to 16 years. The act also allo ed for the establishment of schools for the partially deaf and for schools for education of a more advanced type.

Where deafness is so severe that the child is unable to acquire a knowledge of language and the power to speak in the natural way, special educational treatment is necessary, and such children are educated in special schools. In other cases the degree of hearing loss may not prevent the acquisition of normal speech and language but yet may constitute a serious handicap to normal educational progress. These children, known as partially deaf, also need special educational treatment which is provided in special schools for the partially deaf or in special classes in schools for the deaf. The policy in the United Kingdom is to segregate the two classes since the basic educational problems are different. In the schools for the deaf the essential task is to teach, by special methods, a knowledge of language and speech. In schools (or classes) for the partially deaf the main work is to carry on the normal process of education with the use of hearing aids and lip reading.

Where the degree of hearing loss is small, children may be trained in the use of individual hearing aids and taught to lip read, and their education successfully carried on in the normal schools. Such children are generally known as hard of hearing. There are three recognized categories of deaf children: grade i, where the hearing loss constitutes no threat to normal education; grade ii, divided into two categories, iia (hard of hearing) and iib (partially deaf), where the hearing loss has not prevented the natural acquisition of language and speech but where special assistance is necessary according to category as follows: in grade iia, by provision of hearing aids or lip-reading instruction, or both, and education in the normal schools; in grade iib, by provision of hearing aids and education in special schools or classes for the partially deaf; grade iii, where the hearing loss is severe and prevents the natural acquisition of language and speech. For children in groups iib and iii education is provided in special schools and attendance is compulsory.

In England schools for deaf children may be either residential establishments or day schools or a combination of both. They may accept severely deaf or partially deaf pupils or in special cases both types. In general the older institutions appear as the residential schools and these are managed by independent bodies of governors. Day schools and other schools established since the beginning of state education are almost entirely managed by local education authorities. In addition to the types of schools for the deaf already mentioned there exist in England two schools for deaf children with additional defects, a secondary grammar school for both deaf and partially deaf boys and girls established in 1946 and a secondary technical school for profoundly deaf boys established in 1955. Entry to the grammar and technical schools is by a national competitive examination and at both schools education is to university entrance level. Training in certain trades is given to deaf boys and girls between the ages of 16 and 19 years at a special department of the Royal Schools for the Deaf, Manchester. Education whether at day or residential schools in the United Kingdom is free.

Qualified teachers must obtain a second qualification to teach deaf children. This second qualification may be obtained by practising teachers by passing the examination arranged by the National College of Teachers of the Deaf or by successfully undertaking a course of one year, for graduates or qualified teachers, which is arranged by the department of education of the deaf at the University of Manchester. Teachers of the deaf are paid according to the standard scales in operation and in addition receive special allowances for the extra qualification.

Research. — Educational research into the many problems of deafness is carried on in various centres. In the University of Manchester department of education of the deaf the whole field of deaf education is studied and there is opportunity for post-graduate work. At other centres, and notably in London, special research is undertaken in relation to deafness in very young children. Deafness clinics have been established in the larger centres of population where early diagnosis is made and preschool training given to deaf infants and to their parents. From this work a new technique of auditory training arose which in the second half of the 20th century was being rapidly extended in all schools for the deaf and partially deaf. The Medical Research council also fosters research on a wider basis into all aspects of deafness as does the National Institute for the Deaf.

The Adult Deaf. — Defects of hearing in the adult population have created a problem of considerable social significance, particularly among the older age groups. In Great Britain, the state, through its national health service, assists such handicapped persons by the free issue of hearing aids while many local education authorities arrange for lip-reading instruction for adults. Clubs and societies of a voluntary nature have been established in most cities and towns to further the social and educational needs of that section of the population suffering from loss of hearing and these organizations are generally affiliated with the British Association of the Hard of Hearing which acts as a national body to further the interests of constituent members and to act as the mouthpiece and instrument of all hard-of-hearing persons in the United Kingdom.

The welfare of the adult deaf (often known as the deaf and dumb) is in the management of charitable organizations which were established in a manner somewhat similar to the older educational institutions (now residential schools) for the deaf. After the passing of the National Assistance act, 1948, in England these independent bodies received an increasing amount of public assistance but remained essentially charitable organizations, each peculiar to its locality. Such a mission, or institute, for the adult deaf is controlled by a local committee which appoints a missioner or superintendent, who may or may not be an ordained minister of religion, to organize its activities which are essentially of a social nature. Unlike schools for the deaf where the teaching method of communication is entirely oral (*i.e.*, by speech and lip reading), the means of communication of the deaf members is generally a combined or mixed one, speech, signs and finger spelling being used in varying degrees.

The National Institute for the Deaf in London is concerned with all aspects of the welfare of the deaf and works through its central headquarters and through its regional associations. It is the recognized source of information on matters relating to the deaf. Other national bodies are the Royal Association for the Deaf and Dumb and the British Deaf and Dumb association, an organization managed by the deaf to further their own cultural interests. The Central Advisory Council for the Spiritual Care of the Deaf and Dumb furthers the spiritual welfare of the deaf throughout England and Wales. (E. S. G.)

Other Countries. — In the Commonwealth of Nations the pattern of education of deaf children is copied largely from that in England, and many teachers in such schools are recruited from that country or trained in the University of Manchester. In Europe also the methods of education bear close resemblance to those in England and Scotland although in France and Spain schools will be found where the silent methods are followed to a much greater degree. A study conducted by the United Nations Educational, Scientific and Cultural organization, World Survey of Education (1955), indicated that a number of European countries, the German Federal Republic and Sweden, for example, provide special classes for the hard of hearing in addition to special schools for the deaf; facilities for the correction of speech defects; and require additional specialized training for teachers. Where programs are limited, emphasis is on primary education with some vocational training; boarding school or institutional care may be provided only for deaf-mutes. In many places the responsibility for the education and welfare of the deaf is left to private philanthropic and religious organizations and to private institutions.

In Asia, India and Pakistan provide for primary education and

vocational training for deaf-mutes in special institutions; Thailand maintains one school for the deaf and Indonesia instituted a training school for teachers of the deaf; in Japan the provision of special schooling has been compulsory since 1923 while attendance at such schools through the lower secondary level has been compulsory since 1956.

Argentina, Brazil and Peru in Latin America make some provisions for special education and remedial education for the deaf and hard of hearing.

DEAFNESS AND IMPAIRED HEARING. The word deafness is commonly used to mean any degree of impaired hearing, from a slight partial to a complete loss of the hearing function. In an effort to clarify terminology, the American Academy of Ophthalmology and Otolaryngology has recommended that use of the word deafness (anacousis) be restricted to losses of at least 82 decibels (American standard). The term implies a handicap sufficiently severe to prevent communication through the ear without some form of amplification. Impaired hearing (hypoacousis) implies a hearing loss of a moderate degree, which, according to the standards laid down by the academy, ranges from 20 decibels to the levels defined as deafness.

Distorted hearing (dysacousis) refers to any impairment of hearing that is not primarily a loss of auditory sensitivity. Such impairment is frequently the result of damage to the central auditory nervous system. Distorted hearing differs from deafness or impaired hearing in that simple amplification does not improve the individual's ability to understand words or sentences. Children suffering from this condition may fail to develop speech, may lose interest in listening and are frequently regarded as deaf. Adults complain that they can hear but cannot understand speech. In such cases amplification results only in increased confusion and is of no practical value.

Unbalanced hearing (diplacusis) is the condition in which the tonal pitch in one ear differs from that in the other.

Frequency of Occurrence of Hearing Impairment.—Statistical studies do not agree on the incidence of hearing impairment. Many data are of dubious accuracy because of variances in testing techniques and the lack of control over acoustic conditions in the testing environment. The better controlled studies indicate that approximately 5% of school-age children have some impairment in one or both ears. When temporary hearing impairment associated with colds is included the figure runs closer to 10%. About 10% of the adult population suffers from significant hearing loss in one or both ears. The incidence of severely handicapping hearing loss in the over-all population is rather difficult to estimate. Most surveys indicate up to 5% of the population is so affected.

Types of Hearing Impairment. — Traditionally, hearing impairment has been divided into three types: (1) conductive; (2) perceptive; and (3) mixed. In recent years four categories have come to be recognized, on the basis of anatomical and physiological studies: (1) conductive; (2) receptive; (3) transmissive; and (4) perceptive. Any combination of these latter four, which are discussed separately below. is referred to as a mixed type of hearing impairment. For a description of the structural features of the ear see the article EAR, ANATOMY OF. For a description of the physiology of hearing see HEARING.

Conductive hearing impairment results from mechanical interference with the passage of the energy of sound waves through the external ear canal. the tympanic membrane (drum membrane) and the three bones (ossicles) in the middle ear. Any such interference causes a damping of the movement of the stapes (stirrup) with resultant loss of fluid motion in the inner ear, where the end organ of hearing lies. Conductive impairment therefore simply diminishes the loudness of sound; it never causes total deafness.

Receptive. — The end organ of the auditory nerve known as the organ of Corti lies in the inner ear. This is the receptor mechanism of the nerve portion of the hearing apparatus. It is here that the mechanical energies of sound waves transmitted into the fluids of the inner ear give rise to nerve impulses. It is here, in other words, that mechanical energy is encoded into an electrical pattern. Injury to any portion of this receptor mechanism or to the nerve fibres and ganglion cells related to it in the inner ear can cause a loss of hearing for some tones. In receptive impairment, high tones are more commonly affected than low tones.

Transmissive. — The electrical pattern that originates in the inner ear is transmitted along the auditory nerve pathways from the organ of Corti in the inner ear up to the cortex of the brain. Interruption of this transmission system may cause a breakdown in the passage of nerve impulses and a scrambling of auditory perception.

Perceptive. — The auditory cortex is that portion of the brain where the complicated electrical signals originating in the inner ear and transmitted along the auditory pathways finally are decoded. It is at this point that conscious hearing takes place. Damage here causes difficulty in the recognition of sound patterns.

Hearing impairment may be the result of damage to either the mechanical portion or the nerve portion of the hearing apparatus. Damage to the mechanical portion results in a loss of loudness. Damage to the nervous portion results in loss of clarity and discrimination.

Etiology by Age Groups. — The most frequent causes of hearing loss in infants, school-age children, adults of middle age and adults of old age, rated according to age of patient at onset, are as follows:

Infancy. — Hereditary hearing loss may appear in generation after generation of a family, and the nature of the impairment in succeeding generations is frequently almost identical. This loss is the result of failure to develop certain neural elements in the neuroauditory mechanism.

Congenital deformities that result in partial or complete closure of the external canal of the ear and occasionally in deformities of the ossicular chain and middle ear itself cause a conductive-type hearing loss. These deformities, like cleft palates, can occur sporadically without a previous family history.

Infection during the first trimester of pregnancy by the viruses of German measles (rubella) and of chicken pox (varicella) (and several other less-well-defined strains) can cause damage to the developing inner ear. The virus passes from the infected mother into the circulating blood of the embryo. where it attacks the growing nerve cells. Such infections result in varying degrees of distorted hearing (dysacousis).

Syphilis, either congenital or acquired, may attack the nerve tissues of the ear and brain and cause perceptive deafness.

Incompatibility between the blood of the mother and the blood of the child (erythroblastosis fetalis) can cause a destruction of red blood cells in the child that results in severe anemia. Cells thus destroyed cause large amounts of the pigment bilirubin to deposit in the auditory nuclei of the brain stem. Both the reduction in the amount of oxygen in the blood as result of anemia and the pigment deposits can damage the auditory nerve pathways.

Interference with the infant's blood supply at the time of labour as result of undue pressure on the umbilical cord or of difficult birth presentation causes a decrease in circulating oxygen and resultant damage to the nerve portion of the hearing apparatus. Children born prematurely frequently have weak respiratory reflexes. This results in poor oxygen exchange in the lungs and decreased circulating oxygen.

Crushing of the brain by the passage of the head through the

birth canal during labour or as the result of instrumentation can cause multiple neurological lesions, including those that produce nerve-type hearing problems.

Children subjected to severe viral infections in the first year of life may develop hearing difficulties similar to those encountered in prenatal viral infections. Young children are most subject to attacks of meningitis (*q.v.*). These attacks may seriously damage or even completely destroy the hearing.

School Age.—This is the time when children are widely exposed to upper-respiratory infections and middle-ear infections. These may cause scars to form around the ossicles in the middle ear or may damage the drum membrane and thus interfere with the transfer of energy from the membrane into the fluids of the inner ear. Such conductive hearing losses are usually proportional in severity to the severity and duration of the infections.

Third to **Fifth** Decade.—The two most frequent causes of hearing impairment during this period are otosclerosis and high noise levels.

Otosclerosis is the condition that causes new bone to form in the middle ear in the region of the oval window. It is at the oval window that the inner ossicle, the stapes. comes into contact with the fluids of the inner ear and acts as a piston to conduct the energy of tympanic membrane vibrations into the fluids of the inner ear. In some individuals this new bone welds the footplate against the wall of the surrounding bone and immobilizes it.

Exposure to high noise levels in the range of 100 decibels or more for long periods of time or exposure to sudden concussive sounds such as a gun blast damage the organ of Corti. This damage usually reflects itself in a high tone loss.

Old Age.—Aging persons undergo degenerative processes. Failing circulation chronically decreases the amount of oxygen made available to the nerve tissues. These tissues normally require large quantities of oxygen for their metabolism. Hypoxia is particularly damaging to the nerve tissue in the cortex of the brain.

Prevention of Deafness.—In the 1940s and 1950s interest increased in the prevention of hearing loss through both conservation programs and medical prevention.

Many conservation programs are designed to find cases early so they can be given careful otological and medical examination; the objective of such programs is to correct factors predisposing to hearing loss. Case finding is employed principally in school populations and in large industries where routine testing of hearing is part of the health program. A few pilot studies, however, were being made in Europe and in the United States in the early 1960s of infants examined at well-baby clinics.

Serious attempts are made to control dangerous noise levels in industry and in military establishments. Noise levels of greater than 100 decibels or environments in which individuals are subjected to severe concussive sounds are of particular importance. When noise levels cannot be controlled measures are taken to protect exposed individuals by the use of ear defenders (*i.e.*, prostheses that can be placed in or over the external auditory canal). Protection against noise is more important to some individuals than others. Surveys have shown that individual ear sensitivity to noise varies a great deal in man.

Medical preventive measures include immunization of prospective mothers against all viral infections for which vaccines exist, improved obstetrical care and control of ear infections in children and adults by the removal of obstructing adenoid tissue around the mouth of the eustachian tube. In the geriatric group improved medical methods are needed to ameliorate vascular degeneration and failure of circulation. Finally, the public needs to be made aware of the fact that the use of certain chemicals or drugs, may damage the neuromechanism of hearing.

Restoration of Hearing.— Hearing can be improved by either surgical or prosthetic methods in many instances.

Surgical.—Marked progress was made in the decades immediately preceding the 1960s in the development of surgical techniques to improve hearing. These techniques reached a point where many individuals suffering from middle-ear (conductive) type hearing loss could look forward to an improvement of hearing to a usable level. The surgical objectives are: (1) to establish the continuity of the external auditory canal in persons with congenital closures or postinjury deformities of the canal; (2) to repair damaged drum membranes or replace destroyed drum membranes with new tissue (myringoplasty); (3) to re-establish the function of the ossicular chain and/or create a mobile connection between it and the fluids of the inner ear (tympanoplasty); (4) to eliminate chronic infection (mastoidectomy). No surgical or medical procedure devised by the 1960s was effective in restoring damaged inner ears or nerves.

Special mention should be made of the surgical restoration of hearing in individuals suffering conductive hearing impairment as a result of otosclerosis. In order to free the stapes so its piston-like action may be restored, surgery has been designed to break or remove the new bone that welds the stapes to the edge of the oval window. Such an operation is called a stapes mobilization. If the conductive link between the drum membrane and the stapes can be maintained after the stapes is freed, the hearing should return to the level of efficiency permitted by the functional ability of the auditory nerve. Such improvement will be maintained unless new bone forms again and immobilizes the stapes. **A** more recent surgical development known as stapedectomy is employed in many instances instead of the stapes mobilization. In this technique the stapes footplate (the piston) or the entire stapes bone is removed from the oval window. The window is then closed by a tissue graft (fascia, vein or fat) obtained from the patient. The stapes bone is replaced by a prostheses (plastic tubing or steel wire) that restores the continuity of the conductive link between the tympanic membrane and the fluids of the inner ear. When the stapes cannot be freed or removed, or when bone continues to re-form after a stapes mobilization, it is possible to create a new window into the inner ear to replace the closed oval window. This window is made in the lateral semicircular canal. It is covered with a thin graft formed by skin and tympanic membrane. Sound-wave energy can then be transmitted directly through the new window membrane into the fluids of the inner ear. Such a procedure is called a fenestration operation. In a few individuals, new bone formation may close the fenestra and reduce the hearing to its preoperative level.

Prosthetic.—Devices to aid hearing have been used for centuries to do one of two things: (1) to collect sound waves, amplify them and introduce them into the ear canal; or (2) to introduce the vibrations of sound directly into the skull.

The earliest form of a hearing aid was probably a hand cupped behind the ear. This was followed by placing a hollowed-out animal horn in the external ear. Complicated sound-collecting chambers made of metal and capable of a considerable amount of amplification eventually were devised.

Devices for introducing sound vibrations directly into the skull were useful only in cases of conductive deafness in which the neural mechanisms were in good condition. Setting the skull into vibration sets up fluid waves in the inner ear (bone conduction). In this manner the damaged middle ear can be bypassed. Devices such as fans have been used; when held between the teeth they act as diaphragms to collect and conduct the energy of the sound waves into the skull.

Alexander Graham Bell made the first electrical hearing aids. The advent of the small dry-cell battery and the electron tube (valve) made great improvements possible. By the 1960s highly efficient high-fidelity instruments had been developed by using mercury batteries and transistors. These were easily concealed and were capable of great amplification. Such prosthetic devices are very helpful to persons with conductive hearing losses and to a smaller number of persons whose impairment is due to damage to the inner ear. Hearing aids are widely used by children as well as adults. (See HEARING AID.)

Deaf-Mutism.—A child learns to talk because he hears and as he hears. Children with profound hearing impairments are unable to hear voices under normal circumstances and therefore do not develop speech. This condition is known as deaf-mutism. This lack of speech, contrary to ancient belief, is in no wise a measure of an individual's intellectual capacity. The relations between hearing, speech and language habits in general are so much

a part of growth and development that they are likely to be taken for granted. The mutism resulting from hearing impairment is rare, even in the deaf population, because most individuals born with or acquiring a severe hearing loss before learning to speak usually have some remnant of hearing in one or two octaves in the low tone range. While this is not enough to enable them to develop well-formed speech, it does, in most instances, give the individual an awareness of sound that results in the development of some primitive form of speech signal. Children with partial hearing loss, particularly if it involves one portion of the sound spectrum, develop distorted speech. True deaf-mutism does not occur in those individuals who have acquired speech before their hearing loss. Frequently other conditions, particularly aphasia, are confused with deaf-mutism. Aphasia is not the result of hearing impairment.

(J. E. Bo.)

DEÁK, FERENCZ (1803–1876), Hungarian statesman, known as "the Sage of the Nation," prominent throughout the three decades which saw the revolution of *1818* and the Austro-Hungarian "Compromise" of *1867,* was born at Sojtor, in the county of Zala, where his father had an estate, on Oct. 17, *1803.* After studying lam, he entered the administrative service of his county and in *1833* was chosen to represent it in the diet in the place of his brother who had resigned because of ill health. He attended the rest of the diet of *1832–36* and those of *1839* and *1841,* but although re-elected in *1843,* declined to sit because of the scandalous conduct of the election. By this time his integrity. good sense and legal acumen had made him, although not a flashy speaker, the most respected figure of the Liberal opposition. In questions of social and general internal reform, he was invariably on the side of sensible progress; he agreed with Lájos Kossuth in wanting more real independence for Hungary within the Habsburg monarchy, but wanted to achieve this by constitutional methods.

It was Debk who, in 1847, drew up for the "united opposition" the program which was the basis of the settlement sanctioned by the crown in March–April *1848 (see* HUNGARY: *History).* Because of ill-health he had not stood for election to the *1817* diet, but he joined Count Lájos Batthyány's cabinet on March *17, 1848,* as minister of cults and education and in the following months did everything possible to prevent the breach between the court and its Croatian supporters on the one hand and the Hungarian extremists on the other from becoming irreparable. He ceased to be minister when the Batthyány cabinet resigned on Sept. *28.* When the revolutionary war had broken out. Debk attempted to intervene with Prince Alfred von Windischgrätz and was arrested by the Austrians. After his release, he had to retire to his estate at Kéhida. where he stayed until the Hungarian revolution ended. A court martial afterward let him go free.

In *1854* Deák took to spending most of the year in a hotel in Pest and soon became the oracle of those who sought a practical policy for the future. He held unwaveringly to one simple proposition: the position created in March–April *1848,* and no other, was legally valid and practically acceptable. Any lesser offer from the crown must be rejected. Armed resistance was, however, impracticable; but all demands from the authorities should be answered by passive resistance, as illegal. As he did not abate his claims when Hungary's position was at its weakest, so he did not raise them when Austria's position was weakened, as after the Austrian defeat by Prussia in *1866.* His reward mas to see Francis Joseph gradually driven to accept his terms in the course of prolonged negotiations in which Dekk was increasingly accepted as the mouthpiece of Hungary. The more extreme Hungarian nationalists also bowed to the inevitable, although reluctantly, and the year *1867* brought the "Compromisen (*Ausgleich*). This in effect embodied Deák's view of a settlement which did justice to the claims of both Hungary and the cromn. Deák refused to take office in the responsible government created under the Compromise, but remained for some years the inspirer and unquestioned leader of the party. called after his name, which supported his work in the parliament. He died in Budapest on the night of July *28–29, 1876.* He had refused all honours and rewards. He had never married. An edition of his speeches, six volumes, by M. Kónyi, appeared in 1882–98.

See F. *A.* Forster, *Francis Deák, Hungarian Statesman* (1880).

(C. A. M.)

DEAKIN, ALFRED (1856–1919), Australian statesman who was the dominant figure of the Australian commonwealth's early years, was born at Melbourne on Aug. **3,** *1856.* He practised schoolteaching, law and journalism before entering the Victoria legislature in *1880.* By then he had already progressed far on a passionate and wide-ranging study of literature and philosophy, which was long to continue. Carlyle, Ruskin, Wordsworth and Swedenborg were among the great influences on his thought; his fervent interest in spiritualism reflected a desire to find a religion which promised the perfectibility of man. He was one of the outstanding products of the "golden age" in Victoria's cultural history. Deakin came into politics as a radical-liberal, which entailed hostility to large rural interests and support for the protection of secondary industry. Thus, the argument ran. the workingman would achieve a deckt standard of living and colonial society more rapidly become sophisticated. The development of irrigation and similar constructive policies were fostered by Deakin as a minister in several governments between *1883* and *1890.* Meanwhile he became an outstanding advocate of the federation of the Australian colonies and did much to consummate that policy *(1901).* In particular, he strove to iron out the many intercolonial differences of opinion and then played a major part in persuading Joseph Chamberlain to accept the Australian demand for near-absolute autonomy.

Deakin became a member of the first federal cabinet and subsequently prime minister *(1903–04, 1905–08. 1909–10).* Nobody played a larger part in establishing the nation's settled policies: protection, a judicial system of industrial arbitration, exclusion of coloured immigrants, the development of independent armed forces. His belief in imperial federation led Deakin to advocate trade reciprocity within the empire and the establishment of a central secretariat. Throughout, his mental agility, brilliant oratory and administrative finesse continued potent. He occasionally suffered the charge of political hypocrisy, and it would seem that his personal sense of rectitude could overcome more objective standards. He failed to maintain an independent Liberal party, finally coalescing aith the Conservatives against Labor. Few, however, would deny Deakin's claim to greatness. He always hoped to spend his retirement in writing and contemplation, but from *1910* his mind steadily weakened. He finally retired in *1912* and died at Melbourne on Oct. *7, 1919.*

See W. Murdoch, *Alfred Deakin* (1923). (O. M. R.)

DEAKIN, ARTHUR (1890–1955), British labour leader, who was the dominant figure in British trade unionism in the decade after World War II, was born at Sutton Coldfield. Warwickshire, on Nov. 11, *1890,* a cobbler's son. He began aork at *13* in a steel plant in south Wales. He became an active trade unionist during World War I. and a full-time union official in *1919.* In *1932* he was appointed national secretary of the General Workers' group of the Transport and General Workers' union and removed to London. He became assistant general secretary under Ernest Bevin in *1935,* and when Bevin joined the war cabinet in *1940,* Deakin took over the general secretaryship of the largest union in the country. In 1945, when it was clear that Bevin would never return to the union, Deakin was confirmed in his leadership by a large popular vote. From then until his death his dominance over British trade unionism was perhaps even greater than Bevin's had been in the 1930s. Deakin was a highly skilled wage negotiator,

but he stood firmly behind the Labour government's policy of wage restraint. His anti-Communism was always to the fore, and in 1948 he broke up the World Federation of Trade Unions, of which he was president at the time, rather than continue to associate with the Soviet unions. After the fall of the Labour government in 1951, his firm opposition to the Bevanite challenge did much to maintain both C. R. Attlee's leadership and the adherence of the Labour party to a strong western defense policy. Deakin was made a privy councilor in 1954. He died suddenly at Leicester on May 1, 1955, after addressing a May day meeting.
(R. J.)

DEAL, a member of the Cinque Ports (*q.v.*) confederation and a municipal borough in the Dover parliamentary division of East Kent, Eng., 8 mi. N.N.E. of Dover by road. Pop. (1961) 24,791. Opposite Deal and offering a natural harbour and good anchorage lie the Downs, a roadstead enclosed by the North and South Forelands and the infamous Goodwin sands (*q.v.*).

Deal claims to be the place where Julius Caesar landed in 55 B.C.; the 2,000th anniversary of this event was commemorated by a tablet. The town is recorded in Domesday Book as Addelam—a low open plain upon the seashore. During the period A.D. 410–1500 the inhabitants lived mostly at Upper Deal where the parish church of St. Leonard (c. 1280), half a mile from the shore, now stands. As a defense measure Henry VIII erected in 1539 Deal, Sandown (in the original borough) and Walmer castles. Walmer castle is the official residence of the lord warden of the Cinque Ports; Deal castle, damaged in World War II, was later restored; Sandown castle was destroyed by the action of the sea. With the building of these castles and the silting up of the rival Sandwich haven, Deal's prosperity grew apace. Merchants' houses, shops, taverns, playhouses and fishermen's cottages, all centred on sea business; arose in narrow streets on the shingle waste lining the shore, which became the haunt of smugglers. Lower Deal is still mainly a business area, but the narrow streets of houses remain. In the days of sailing, merchantmen and ships of war came into the Downs, and the town thrived on the victualing and servicing of these ships. The boatmen along the coast were then known, lauded and derided as "hovellers," and the Deal men, hovellers, pilots and lifeboat men, were reputed for their skill and daring. William Penn sailed from Deal in 1682 on his first voyage to America. Increasing in importance as one of the primary ports of 17th-century England, Deal was granted in 1699 its charter of incorporation which freed it from the jurisdiction of Sandwich, although under the Cinque Ports confederation it remains a limb of that Cinque Port. Deal has its own commission of the peace and is a quarter sessions borough. A navy yard for the supply of equipment and stores to ships of war was maintained in Deal from about the time of Elizabeth I. In 1864 it was demolished, and the Victoria town estate was built on the site with the rise of Deal's popularity as a seaside holiday town. The promenade pier. totally destroyed during World War II, was rebuilt. The borough, which now includes Walmer, Great Mongeham and part of Sholden, has a three-mile promenade. The town is Georgian in style, although retaining its maritime character, and has a large residential population. It is a well-known centre for deep-sea fishing and for golf; three championship courses are available. There are a number of light industries including brushmaking, plastics, precision engineering and boatbuilding; nearby is the Betteshanger colliery, the biggest of the East Kent coal mines. In Deal is the depot of the royal marines. (L. H. S.)

DEAL, a term commonly used to designate the soft woods derived from the Scots pine (*Pinus* sylvestris), which is called yellow or red deal, and the Norway spruce (*Picea* abies), which is called white deal. The former is by far the better timber. Deal is exported from Scandinavia and the U.S.S.R. See also PIKE; SPRUCE.

DEALFISH, the name applied to marine fishes of the genus *Trachypterus,* which, together with the oarfish (*q.v.*), comprises the family Trachypteridae, or ribbonfish. Dealfish inhabit the middle waters, probably not below 200 fathoms, and are characterized by a long, laterally compressed body, short head, narrow mouth and feeble dentition. The dorsal fin extends the length of the back, the anal is absent, the caudal, when present, is reduced; the pectoral fins are small. In young dealfish some of the fin rays (hornlike projections of the fin skeleton) are prolonged in an extraordinary way. Dealfish, which may reach a length of eight feet, have a world-wide distribution. All the specimens found at the surface of the sea have been more or less mutilated by the release from the enormous pressure under which they are accustomed to live. The commonest species is the northern dealfish, T. arcticus.

DE AMICIS, EDMONDO (1846–1908), Italian writer who was a follower of Alessandro Manzoni and the author of popular travel books and children's stories. He was born at Oneglia, Oct. 31, 1846. He began his career as an army officer closely associated with a military journal, and his first publication was a series of sketches of military life, La Vita *Militare* (1868). On retiring from the army he traveled widely and published several books on the cities and countries of Europe. Of his books for children, Cuore (1886), written in the form of a diary, is best known and was translated into more than 25 languages. De Amicis died at Bordighera, March 11, 1908.

See M. Martini, Edmondo de Amicis: L'homme, l'oeuvre, *le témoin d'une époque* (1950).

DEAN, originally a title of one of military rank possessing authority over ten (from late Lat. decanus, "one set over ten"); later of a civil judge over ten districts. Probably the earliest ecclesiastical use was by St. Benedict (c. 520), who, in founding the monastery of Monte Cassino, placed a dean over each group of ten monks. Since that time it has become the title of various ecclesiastic and lay officials.

In the Roman Catholic Church the dean of the Sacred College of Cardinals is the senior cardinal bishop who, in the absence of the pope, presides in the consistory. The chief cleric on the staff of a cathedral may be called dean, archpriest, archdeacon or provost. In some dioceses there are rural deans at the head of groups of parishes.

In the Church of England the dean of a cathedral of old foundation is president of the chapter of canons and prebendaries (see CATHEDRAL). Appointed by the crown, he is independent of and ranks next to the bishop. The cathedrals of later foundation (*e.g.,* Portsmouth) have for their head a provost (Lat. *praepositus*), who discharges much the same duties as a dean. A rural dean is a clergyman who has the oversight of a rural deanery which is a subdivision of an archdeaconry within the diocese. The collegiate churches of Westminster and St. George's, Windsor, are governed by a dean; the chapels royal are grouped under one dean, who is bishop of London; and the peculiars (Battle, Bocking, Guernsey and Jersey) each have a dean. The bishop of London by virtue of his bishopric is dean of the province of Canterbury. The dean of arches is a lay judge, and the only judge who possesses authority to pass sentence of deprivation upon a clerk in holy orders.

In Scotland the dean of the chapel royal and of the order of the thistle is always a minister of the Church of Scotland.

The president of a convocation is called a dean in the Protestant Episcopal Church of America.

The word dean in general secular use means the head or senior member of certain bodies, as for instance the dean (French doyen) of the diplomatic corps. In Scotland the president of the faculty of advocates is dean of the faculty, and the head of a merchant company or guild is its dean. In many British universities the senior professor in a faculty or the one acting as chairman is called the dean of the faculty. The dean in the colleges of Oxford and Cambridge is usually a fellow who supervises the conduct and discipline of the undergraduates, and is often assisted by a junior dean. (J. W. L.)

In the United States the dean of a college is in charge of educational operations, responsible for the selection of faculty members, curriculum, instruction, college entrance and graduation, and budget and equipment. The dean (sometimes chairman or head) of a division, department, college or school of a university has similar responsibilities, including, at the graduate level, the arrangement of instructional programs leading toward graduate degrees. A graduate dean may co-ordinate work leading toward

graduate degrees and involving more than one division or department, or a broad division, as arts and sciences. Most U.S. colleges and universities and some secondary schools have a student personnel service; often this is headed by a dean of students or by a dean of men and a dean of women in charge of student educational, vocational and personal counseling, extracurricular activities and other noninstructional programs and services. In some universities a dean of administration or dean of the faculty is administrative assistant to the president.

DEAN, FOREST OF, a district in the west of Gloucestershire, Eng., between the rivers Severn and Wye. It is oval in form, 20 mi. long and 10 mi. wide, and still retains its true forest character. The surface is undulating, its elevation ranging from 120 to nearly 1,000 ft., and its sandy soil renders it suitable for the growth of trees, mostly beeches and oaks. An ancient royal forest, it was made into a National Forest park in 1938, controlled by the Forestry commission, which directly administers 26.000 ac. The commoners of the forest still retain rights of sheep pasturage, and their verderers' court still meets at the historic Speech house, while Free miners operate small coal pits. There are also larger coal mines, some small industries at Lydney, Coleford and Cinderford, many small farms and extensive orchards. Roman antiquities include a well-preserved road, a villa and an iron ore working at Weston-under-Penyard (Ariconium). (H. L. EN.)

DEANE, RICHARD (1610–1653), English military commander who was one of the Commonwealth's generals-at-sea, was a younger son of Edward Deane of Temple Guyting in Gloucestershire, where he was baptized July 8, 1610. He joined the parliamentarian forces on the outbreak of the Civil War and held a command in the artillery under the earl of Essex in Cornwall in 1644, taking part in the surrender after Lostwithiel. Appointed comptroller of the ordnance, he commanded the artillery at Naseby and during the campaign in the west of England in 1645, and commanded Cromwell's right wing at Preston (Aug. 1648). He was one of the commissioners for the trial of Charles I and a member of the committee which examined the witnesses. He signed the death warrant. When, in Feb. 1649, the office of lord high admiral was put into commission, Deane, Edward Popham and Robert Blake were the first commissioners, with the title of generals-at-sea. Deane had a shore command, as major general, during the campaign against the Scots in the summer of 1651. He was ordered to rejoin the fleet in Dec. 1652 and took part in the battle with the Dutch off Portland in Feb. 1653. He was killed on June 2, 1653, at the outset of the battle off the North Foreland. Deane was given a state funeral and buried in Westminster abbey (June 24), but his remains were disinterred at the Restoration.

DEANE, SILAS (1737–1789), first American diplomat sent abroad, was born in Groton, Conn., on Dec. 24, 1737. He graduated from Yale in 1758, taught school, was admitted to the bar in 1761, entered trade and in 1767 plunged into politics to oppose Great Britain's Townshend acts. From 1774 to 1776 he served as a delegate from Connecticut in the continental congress. In March 1776 congress sent him to France as a secret agent to obtain financial and military assistance and to investigate the possibility of an alliance. Within a year of his arrival he sent at least eight cargoes of arms, valued at more than 6,000,000 livres, to America, an important contribution to the decisive victory over the British at Saratoga in Oct. 1777. In Paris Deane fell under the influence of Dr. Edward Bancroft, an old friend who had become an English spy. In Nov. 1777 congress recalled Deane, but before leaving Paris he signed the treaties of commerce and alliance on Feb. 6, 1778, that he and two other commissioners, Arthur Lee and Benjamin Franklin, had negotiated. In the United States Deane was confronted with charges of embezzlement and disloyalty. Although never proven, those charges led to his ruin.

Deane returned to France in 1780 as a private citizen and prepared letters to old friends in America attacking the French alliance and recommending a reconciliation with England. He placed the letters in the hands of the English, who pretended that they had been intercepted and had them published in *Rivington's Royal Gazette*, a Tory paper in New York, in the autumn of 1781, just when Americans were jubilant over the victory at Yorktown. Angry Americans now denounced him as a traitor. As the war ended, therefore, Deane began a lonely exile, first in Ghent and then in London, where in 1784 he published his defense in *An Address to the Free and Independent Citizens of the United States.* Five years later Deane decided to attempt to re-establish himself among his own people. He booked passage for America on the Boston packet but died on board. Sept. 23, 1789. under mysterious circumstances, in the harbour of Deal, England. Despite his alleged wrongdoing, Deane had helped bring about the French alliance that contributed to his country's independence. He never admitted doing wrong and died believing himself a victim of injustice.

BIBLIOGRAPHY.—The only biography, George L. Clark, *Silas Deane: a Connecticut Leader in the American Revolution* (1913), is inadequate. More reliable, mainly for Deane's diplomatic career, is Julian P. Boyd, "Silas Deane: Death by a Kindly Teacher of Treason?" *William and Mary Quarterly*, 3rd series, xvi, pp. 165–187, 319–342, 515–550 (April, July and Oct. 1959). *See* also Charles Isham (ed.), *The Deane Papers*, in the New York Historical Society, *Collections*, xix–xxiii, 5 vol. (1887–91). (A. DE C.)

DEARBORN, HENRY (1751–1829), American soldier and secretary of war under President Jefferson, was born at Hampton, N.H.. on Feb. 23, 1751. He attended local schools and then studied medicine with a physician. Upon hearing of the battle of Lexington, he left the practice of medicine to join the provincial forces and served as an officer at the battle of Bunker Hill, Arnold's expedition to Quebec (where he was taken prisoner and exchanged), battle of Saratoga, Valley Forge, battle of Monmouth, Sullivan's expedition against the Indians, and the siege of Yorktown. He kept a detailed journal throughout the war, which gives a valuable first-hand account of the principal campaigns of the Revolution. Upon the organization of the new U.S. government in 1789, President Washington designated Dearborn U.S. marshal for the District of Maine, and in 1792 he was elected to congress, where he served as a Republican for two terms. He was secretary of war through the administration of President Jefferson, 1801–1809. In 1803 he issued an order for "erecting barracks and a strong stockade" at "Chikago," "with a view to the establishment of a Post." The important part which this post, Ft. Dearborn, played in the early history of Chicago has given his name a lasting association with that city. In Jan. 1812 President Madison appointed him senior major general of the U.S. army. Upon the outbreak of the War of 1812 with England, he undertook to carry out an extensive plan of campaign, including an invasion of Canada at several points. After a long succession of delays and reverses, he was relieved of his command in July 1813. In 1822 President Monroe appointed him minister to Portugal. He died in Roxbury, Mass., June 6, 1829. (H. D. SM.)

DEARBORN, a city in Wayne county, Michigan, U.S., adjacent to southwest Detroit (*q.v.*) and traversed by the Rouge river. It was the birthplace of Henry Ford (*q.v.*), who played an inextricable part in the city's history and development, and is the home of the Ford Motor company.

Settlement of the area by homesteaders followed the War of 1812 and Pekin, Greenfield and Springwells townships (all now partially included in Dearborn) were established. Pekin township, later called Dearborn, then Bucklin, was renamed Dearborn to honour Gen. Henry Dearborn (*q.v.*). Dearborn village was incorporated in 1893 and chartered as a city in 1925. The city's industrial growth had its beginning with the construction of the United States arsenal in the 1830s (disbanded in 1875), and was accelerated by the building of the Ford-Rouge plant after World War I, the amalgamation with the city of Fordson (formerly Springwells) in 1928, and the post-World War II industrial boom.

Dearborn is also a residential community with mostly private homes. Apart from the Ford establishments, several factories of the Chrysler corporation and other industrial plants are located in the city. Cumulatively, business interests pay more than 75% of the local taxes and provide Dearborn's residents with one of the highest per capita incomes in the U S. The city has a highly rated, modern school system which includes the Henry Ford Community college. In 1956 Fairlane, the Ford estate, became the

Dearborn centre of the University of Michigan. Medical care is provided by Oakwood hospital, the Dearborn Medical centre and St. Joseph's retreat. Residents are provided with numerous recreational facilities including Camp Dearborn, a 626-ac. area located 35 mi. from the city.

Tourist attractions include the Ford Motor Company's Rotunda, one of the largest permanent industrial exhibition buildings in the world and the starting point for guided tours of the 1,200-ac. Rouge plant; the Edison institute, an educational corporation consisting of the Henry Ford museum with its notable collections of Americana, Greenfield Village which consists of about 100 historic buildings collected from all parts of the United States and from England, and the Greenfield Village schools; and the Dearborn Historical museum.

The population of Dearborn was 112,007 in 1960. For comparative figures *see* table in MICHIGAN: *Population.* (E. K. R.)

DEARNE, an urban district (1937) in the Hemsworth parliamentary division of the West Riding of Yorkshire, Eng., 9 mi. W. of Doncaster and 39 mi. S.S.W. of York by road. Pop. (1961) 26,453. The river Dearne, a tributary of the Don, flows through the southern end of the district and to the north are undulating moorlands. Bolton-upon-Dearne with its church dating from Saxon times, Goldthorpe with collieries, Thurnscoe on the Roman Icknield street and Thurnscoe East adjoining the Hickleton Main colliery make up the urban district. Mining has largely taken the place of agriculture, and other industries include hosiery and clothing factories.

DÉAT, MARCEL (1894–1955), French political leader who moved from socialism to fascism and collaborated fervently during the German occupation of France in World War II, was born at Guérigny (Nièvre) on March 7, 1894. After graduating in philosophy at the Ecole Normale, he became a school teacher. Entering politics, he was a Socialist deputy from 1926 to 1928 and was re-elected in 1932. Dissatisfied with the subtleties of Léon Blum, he advocated participation in bourgeois governments and a more active (and authoritarian) socialism, with the slogan "Order, Authority, Nation." In July 1933 he, Adrien Marquet and other dissidents from the Socialist party (Section Française de l'Internationale Ouvrière) formed the Parti Socialiste de France. He was air minister for a few months in 1936, in Albert Sarraut's cabinet. He lost his seat in June 1936 but won another early in 1939.

Déat became a fervent advocate of Franco-German friendship. A satyr in appearance, but dynamic in manner and of great ability, he became a leader of French fascism. In 1939 he published his famous article "Mourir pour Dantzig?" in his journal *L'Oeuvre* and he opposed France's declaration of war on Germany. After the armistice of 1940 he remained in the German-occupied zone of France, where he denounced the leading Vichy ministers (other than Pierre Laval) for half-heartedness. He survived three attempts on his life by members of the resistance. Finally in March 1944 he became a minister in Laval's government; as secretary of state for labour and national solidarity he increased the speed at which French workers were deported to German factories. He fled to Germany as the Allies advanced and in Sept. 1944 formed a new government with Fernand de Brinon and other collaborators.

After the collapse of Germany, Déat disappeared. In June 1945 he was condemned to death *in absentia* for treason. It was later discovered that he had led a wandering life until 1947, when, under an assumed name, he became a school teacher in Turin, where he died on Jan. 5, 1955. (P. W. C.)

DEATH (BIOLOGICAL). The state of death has always been obscured by mystery and superstition and may only be truly defined biologically as the absence of potential life. More specifically, this means the lack of ability to synthesize new molecules in an integrated organized system. The usual criteria of life, such as respiration, reduplication and transportation of substrates and ions, are not in themselves necessary for potential life at any given time. For example, bacteria, which are the smallest integrated cellular units that contain the normal components of a cell, including a membrane and nuclear and cytoplasmic material, may be completely dehydrated at low temperatures to a dry powder. At a later time, in the proper environment, they may be brought back to a state in which they are able to perform their normal functions. Only when an irreversible rearrangement of the structural molecules has taken place, *i.e.,* one that forever prevents duplication, may it be said that death has occurred.

This article deals primarily with the biology of mammalian death. For a discussion of the legal aspects of death *see* DEATH (LEGAL ASPECTS).

It has long been of interest to speculate whether viruses are living or dead. Most viruses consist of two major components: a protein and a nucleic acid. The latter may be either deoxyribonucleic acid (DNA) or ribonucleic acid (RNA) and is considered to be the material responsible for carrying genetic information *(see* NUCLEIC ACIDS). A virus outside a host cell is completely inanimate, according to all the usual criteria. and must be considered dead. However, after a virus enters a cell it is able to utilize the cell's substrates and enzymes to replicate itself. The synthesis of new "life" with replication of virus particles often results in the rupture and "death" of the host cell.

Unicellular organisms such as bacteria, fungi, some plant cells and mammalian germ cells have the ability to perpetuate themselves indefinitely. However, this ability is dependent on the surrounding environment. The presence of an unfavourable temperature, pH, salt concentration or toxic substance, or the absence of an essential nutrient, may prevent reduplication or may even stimulate disintegration to the small organic compounds from which all macromolecular structures originally arose. Although almost all mammalian cells have the ability to divide in tissue culture, only the ovum and spermatocyte have the opportunity to leave the organism and thus escape the autolytic process that occurs following cessation of circulation and death of the whole organism.

Death of the Entire Organism.—The diagnosis of death in the mammalian organism is usually based on the following criteria: the absence of peripheral pulse and heartbeat, the absence of respiration, the lack of corneal reflex and the presence of a bluish colour (cyanosis) that results from a lack of oxygen in the blood. The discoloration is seen most easily in the mucous membranes of the mouth and lips and in the nail beds.

Other criteria of death can be noted much later. *Algor mortis,* the decrease in body temperature after death, occurs at a rate that depends on the temperature of the external environment; if the environmental temperature is known, the time elapsed following death may be easily calculated. *Rigor mortis* indicates the postmortem rigidity of the skeletal muscles, principally the muscles of the head, neck and lower extremities. *Livor mortis,* the purplish-red discoloration of the skin in the dependent portions of a cadaver, results from a settling of the blood due to gravity.

The essential components of most mammalian organisms include nervous, circulatory, respiratory, gastrointestinal, excretory, endocrine and supportive organ systems. In general, parts of one or more of these systems may be injured for variable periods of time without causing irreversible changes. However, there is a "hierarchy"; *i.e.,* some of these systems are much more essential than others. For example, large portions of bone may be lost forever and a kidney may cease functioning for several hours; but if organs such as the heart stop working for only a few minutes irreparable damage occurs. Once the heart stops beating and circulation ceases, the lack of essential nutrients, including oxygen, quickly causes the death of all other organ systems.

Death of Tissues.—Each tissue of the mammalian body is arranged in a manner and form that is consistent with its function. All tissues consist of a large number of different types of cells including blood cells, supportive muscles and connective tissue cells. nerve cells and extracellular substances such as collagen. However, each organ (group of tissues performing a special function) usually has only one main type of functioning cell. The basic heart cell, for example, is a muscle cell that contracts and, in synchrony with thousands of similar heart cells, pumps the blood through the circulatory system. The kidney tubule cell both secretes into and absorbs material from the excretory canalicular lumina. The liver cell synthesizes many essential body proteins,

including albumin. The lung endothelial and epithelial cells regulate the passage of oxygen and carbon dioxide across the alveolar septa. The nerve cell, through various chemical reactions, transmits a potential across its membrane and down its processes. The gastrointestinal cells first break proteins, lipids and carbohydrates into smaller fractions and then transport them into the circulatory system. Finally, the cells of the endocrine organs secrete various hormones that are important in the regulation of tissue function.

Each tissue consists of thousands of cells, only a small proportion of which are necessary for adequate functioning of the organ. This reserve capacity is well illustrated in the case of the kidneys. In unilateral disease, the diseased kidney may be surgically removed without impairing the total kidney function. One lung, large portions of the gastrointestinal tract, the entire spleen, theoretically two-thirds of the liver and all of many endocrine organs, if supplemental hormones are given, may be removed without resulting in obvious malfunctioning of the organism.

However, tissues vary markedly in their inherent ability to regenerate, once a portion of the tissue has been damaged. The cells of the hematopoietic system, the mucosa of the gastrointestinal and genitourinary system, and the skin are in a continual state of division. Damage to these tissues, however severe, usually is corrected by a rapid and complete regeneration of the injured portion. In a second group of tissues the cells are not dividing constantly but they will regenerate if given the proper stimulus. This second group includes the liver, lung, spleen, kidney, bone and connective tissue. In a third group are the tissues that rarely if ever regenerate in the adult state; the two outstanding examples in this category are the heart and the brain. Death of cells in these organs leads not to regeneration but to replacement by scar tissue or, in the case of the brain, by a cystic space.

Tissues, in addition to being characterized according to their ability to regenerate, may be placed in one of at least three grades according to their rate of autolysis, or self-destruction. Once the circulation of the blood has irreversibly ceased. degradation proceeds much more rapidly in some tissues than in others. In general, those tissues that have a high capacity for synthesizing proteins also are subject to a high rate of self-degradation; such tissues contain large amounts of hydrolytic proteolytic enzymes, called cathepsins, uhich take part in degradation. Tissues with a high rate of autolysis include the adrenals, testes, pancreas, gastrointestinal tract mucosa and malignant tissues. In a second group are those tissues that normally have a very high rate of metabolism and require large amounts of energy to maintain a steady state. These tissues include the liver, kidneys and endocrine glands. In a third group are those tissues whose rate of self-degradation is very slow, presumably because their inherently low rate of metabolism reduces the amounts of nutritional substrates and oxygen they require. These tissues include the skin, mesodermal tissue, muscle, bone, cartilage and blood vessels.

It thus becomes clear that the site of injury is of prime importance in the death of tissues. Localized physical trauma to organs that regenerate slowly or autolyze quickly is much more serious than damage to systems that regenerate quickly and autolyze slowly. The same conditions obtain when the injury is widespread, as in systemic diseases. Those organs that fail to regenerate, such as the heart, or autolyze quickly, such as the adrenals, are danger areas that should be protected with every therapeutic measure available.

Death of Cells.—Causes of Injury to the Cell.—A large number of agents, if present in certain concentrations and under certain circumstances, will kill cells either in vitro or in vivo. Among these agents are bacteria and viruses. Bacteria may act either directly by interfering with a cell's metabolism or indirectly by elaborating a toxin that inhibits the action of certain compounds (*e.g.*, deoxyribonuclease). Viruses act in one of three ways after they penetrate the cell wall. Many viruses presumably remain latent and have no measurable effect on the cell's metabolism; some stimulate cellular division, as exemplified by the production of tumours; others interfere sufficiently with cell metabolism to result in lysis and cell death.

Nutritional deficiencies also cause death of cells. Included in this group are deficiencies of vitamins, essential amino acids and essential fatty acids. Cells apparently are able to synthesize nucleic acids from degraded simpler molecules already present. Carbohydrates are also readily synthesized from two-carbon fragments, but a deficient carbohydrate supply seriously inhibits cellular reactions that require energy.

Many disease states in mammalian organisms are characterized by hormonal deficiencies or hormonal imbalances. An absolute deficiency of insulin will quickly cause death because of a lack of glucose in the cell for conversion to energy. Similarly, a lack of the hormones supplied by the pituitary, adrenal, thyroid or other endocrine glands causes serious disturbances in the cell's metabolism and eventually results in cell death. The lower organisms and most tissues cultivated in vitro contain sufficient numbers of adequate autoregulatory mechanisms and do not require extracellular hormones.

A large number of analogues and antirnetabolites are used in the study of cell metabolism. Most of these materials are synthesized in the chemistry laboratory for the purpose of blocking a specific intermediate reaction in the cell, thus causing a deficiency of a necessary product or the accumulation of a toxic compound during intermediate nucleic acid, protein, carbohydrate or lipid metabolism. It is thought that similar if not identical compounds accumulate in various disease states and contribute to cell death.

There are more than 100 known inborn errors of metabolism in mammalian physiology in which hereditary enzymatic deficiencies exist and result in injury either through the production of large amounts of toxic intermediates or by causing a deficiency of necessary products. These diseases include galactosemia, glycogen storage diseases, phenylketonuria and albinism.

One of the major causes of injury to the cell in the adult organism is the process of aging. It is a curious paradox that although an individual's gross appearance changes noticeably as he ages, few changes occur in his cells. Many of the gross characteristics of the elderly result from changes in water content, the appearance of scar tissue, the loss of elasticity in the skin, accentuation of blood vessels and general debilitation. Nevertheless, only an occasional abnormality such as the presence of lipochrome pigment is noted when cells are examined microscopically. This pigment, found usually near the nucleus and completely uncharacterized, mav be seen in the heart. liver and adrenal tissue. It may rewresent an abnormal product or merely a high concentration of a normal intermediate. In either case it probably produces a deficiency of an essential compound.

Part of the aging process may be ascribed to arteriosclerosis and the decreased oxygen and nutritional supply associated with narrowed vessel lumina. The cessation of hormone production by the gonads in late life probably contributes to the general process of aging; certainly heredity plays an important role. The primary cause of aging. however, remained unknown in the 1960s. See also GERONTOLOGY AND GERIATRICS: Biology of Senescence; PATHOLOGY.

Structure of a Cell.—Ultimately the death of an organism involves the death of all the cells in the tissues of the organism. In order to gain some appreciation of the mechanisms of cell death, it is first necessary to discuss the structure of the generalized type of cell. In specialized cells one or more components may be emphasized or reduced.

(For additional information on cell structure see the articles BIOLOGY: *The* Living Organism as a Natural Body: Cell Structure; CYTOLOGY; ZOOLOGY: Morphology.)

All cells consist of protoplasm (*q.v.*) bounded by a membrane and divided into two portions, a nucleus and cytoplasm. The nucleus in man contains 46 chromosomes, which can be seen with the light microscope at the time they undergo division. Each chromosome contains thousands of the hereditary unit called the gene (*q.v.*), which is composed principally of deoxyribonucleic acid (DNA) bound to a histone protein. The nucleic acid is a macromolecular structure, presumably arranged in a double-stranded helix and consisting of hundreds of nucleotides. Each nucleotide contains a purine (adenine or guanine) or a pyrimidine

(thymine or cytosine), a sugar (deoxyribose) and a phosphate molecule. Closely associated with the chromosomes are structures called nucleoli. The nucleoli contain principally ribonucleic acid (RNA) and function in the regulation of nucleic acid and protein synthesis in the nucleus. The ribonucleic acids differ from deoxyribonucleic acid in the substitution of uracil for thymine and ribose for deoxyribose. The sequence and order of the purine and pyrimidine bases presumably establishes a template whereby identical molecules are matched and replicated instantaneously by the pre-existing model. The synthesis of deoxyribonucleic acid, ribonucleic acid and proteins is thought to occur on such complicated templates. The nucleus has no mitochondria and thus no respiratory enzymes and to perform its functions must depend on energy generated in the glycolytic pathway or on adenosine triphosphate (ATP) molecules synthesized in the cytoplasm. The nucleus, in addition to directing cell division, serves the important function of synthesizing two important coenzymes. diphosphopyridine nucleotide (DPN) and triphosphopyridine nucleotide (TPN). The membrane of the nucleus consists of two protein components, each 75 A in width, separated by a space of approximately 150 A. At several intervals are numerous pores 200–300 Å in width through which, preaumably, nuclear-cytoplasmic communication occurs. The nuclear membrane is considered to be an extension of the endoplasmic reticulum, the main structural framework of the cytoplasm.

The endoplasmic reticulum consists of a series of intercommunicating canaliculi and cisternae that permeate the entire cytoplasm of the cell and provide a system of transportation within the cell. According to this concept, fluid within the cisternae deep in the cytoplasm is in direct continuity and equilibrium with the extracellular fluid. Small ions, substrates and water molecules may pass freely throughout the cell, but passage across the membrane, 75 Å in width, is thought to involve enzymatic carriers. The microsomes, the smooth membrane portion of the endoplasmic reticulum, may form pockets for storage of synthesized proteins (Golgi apparatus) or vacuoles (lysosomes) where macromolecules or phagocytized particles may be degraded by hydrolytic enzymes. The ribosomes, a second component of the endoplasmic reticulum, consist of granules 75 A in diameter attached to the outer surface of the smooth membrane and also free in the cytoplasm. These coarse granules have been found to consist principally of ribonucleic acid and protein and are believed to be the site of protein synthesis in the cell. The amino acid units that form proteins originate in the free pools of the cell, are activated by adenosine triphosphate (ATP) molecules, then are transferred to a soluble ribonucleic acid and finally are attached to the nucleic acid of the coarse granules, where a protein is synthesized by means of a specific template previously described.

The energy supply of the cell is largely provided by mitochondria, double-membrane structures with internal cristae. The adenosine triphosphate (ATP) synthesis reactions are largely localized in these structures. In addition, these organelles are the sites of oxidation of substrates, including lipid, to carbon dioxide and water.

Large vacuoles containing lipid, glycogen or pigment are seen occasionally in the cells and probably represent dilated cisternae of the endoplasmic reticulum. Situated between these various organelles is the soluble fraction of the cell containing free pools of amino acids, purines, pyrimidines, carbohydrates, fatty acids and soluble proteins. The structural interrelationships remained unelucidated in the early 1960s although several enzymes concerned with the degradation of glucose had been found in this fraction. The plasma membrane, the final extension of the endoplasmic reticulum, bounds the outside of the cell; the membrane is permeated by pores called the intracellularis caveolae, which in turn communicate with the cisternae of the endoplasmic reticulum. Occasionally, direct communications with other cells are noted and are called intracytoplasmic bridges.

It has been shown that the protein and nucleic acid of bacteria, yeast and mammalian cells in logarithmic growth are not turning over but are merely duplicating themselves coincident with cell division. In contrast, most cells of the adult organism are not undergoing rapid cell division (growth) but are changing the concentration of enzymatic proteins by constant degradation and synthesis in response to the extracellular environment. The materials involved in this "dynamic equilibrium" include lipids and to some extent carbohydrates, although the latter are principally degraded by oxidation in conjunction with the synthesis of high-energy compounds. This chemical stare of flux is well recognized and is a necessary regulatory mechanism that enables the cells of the body to adjust to the changing demands and environment of the organism.

Less well recognized but equally important are the movements that can be seen in all parts of the cell with the phase microscope. Certain portions of the cytoplasm become more fluid in nature while other parts attain a rigid stability. These transformations (formerly called sol-gel transformations) are known as reversible denaturation phenomena and are believed to represent folding and unfolding of the peptide chains in various proteins. Both the mitochondria and the coarse granules (ribosomes) of the endoplasmic reticulum move throughout the cell's interior. In particular, the mitochondria often migrate to those portions of the cell that require energy; *e.g.,* around the nucleus immediately preceding mitosis. The nucleus may also be seen rotating in a counterclockwise direction. The plasma membrane portion of the endoplasmic reticulum is often undulant, changing its form and shape according to the metabolic activity of the cell. Thus, in addition to a chemical flux, there exists a structural "dynamic equilibrium."

Sequence of Injury to the Cell.—The sites of synthesis in the cell appear to be the sites most susceptible to injury. Once a protein, for instance, is formed, it appears to be relatively invulnerable to damage. However, the site of synthesis, presumably a template composed of nucleic acid and protein, demands a spatial sequence of molecules that is easily disrupted; if the site is disturbed, all synthetic reactions are abruptly halted. Interference with protein synthesis eventually results in cellular protein deficiencies. Interruption of nucleic acid synthesis blocks all stages of cell division. The cell loses the degraded nucleic acid and protein products to the extracellular medium. Initially, glycogen or lipid accumulates but the cell is soon forced to oxidize these products for energy.

Many hours after the initial insult to the cell, structural alterations are noted. The canaliculi of the endoplasmic reticulum may become swollen with water, the mitochondria1 cristae are disrupted and the soluble protein structures are disorganized. The number of stored energy molecules in the form of adenosine triphosphate (ATP) decreases markedly from normal. The cytoplasm imbibes water and appears diffusely stained when examined with hematoxylin and eosin. This is called cloudy swelling. The nucleus may not stain in this manner, but it may rupture and release nuclear material to the cytoplasm (karyorrhexis), or it may become swollen (karyolysis), or the chromatin material may shrink to a small dark mass (pycnosis).

Following disruption of the cytoplasmic architecture and in particular the sites of energy synthesis in the mitochondria, the changes become irreversible and the cell is unable to maintain its normal ionic equilibrium. The normally high ratio of potassium to sodium is abruptly reversed, further large quantities of water are introduced in the cell along with sodium ions and eventually the cell bursts (cytolysis). The cell, as the final result of injury, becomes a conglomerate mass of denaturated proteins with small amounts of degraded nucleic acids found nithin.

Summary.—Since the maintenance of cellular metabolism depends on so many interrelated intermediates, the destruction of any one of the essential components of the cell (be it nucleic acid, porphyrins, ions, water. carbohydrate, fat or protein) will eventually result in the degradation of all other components and in cell death. Similarly, injury to any structural organelle of the cell (be it endoplasmic reticulum, mitochondria or nucleus) that cannot be quickly repaired will eventually result in cytolysis. As previously mentioned, it is believed that the sites of synthesis are most susceptible to injury—in particular the templates associated with the chromosomes and the coarse granules of the endo-

plasmic reticulum. Next most susceptible to injury are the substances that apparently are vulnerable because they are involved in so many reactions of the cell, including the energy process; these substances are the coenzymes diphosphopyridine nucleotide (DPN), triphosphopyridine nucleotide (TPN) and coenzyme A.

In the process of cell injury, the most important factor is the disturbance in the autoregulatory mechanism since this is the controlling factor in repair of the cell. Practically nothing was known in the early 1960s concerning it. The mechanism by which 19 different amino acids are directed to 19 different soluble ribonucleic acid molecules and further transferred to a complex template composed of purine and pyrimide bases lined up in an exact sequence is a feat never duplicated outside the cell. The control of high-energy phosphate molecules as a result of carbohydrate, lipid and even protein degradation involves a very complex system. Only a few of the numerous feedback mechanisms had been even slightly elucidated by the early 1960s. They were presumed to number in the thousands.

The death of a cell may be caused by a multitude of injurious agents. If the reserve capacities and synthetic potentialities of the cell are not badly interrupted, the autoregulatory mechanism will tend to repair and replace the damaged areas. If the injury is so severe as to preclude this compensatory response, structural and chemical disorganization quickly ensues; the fate of the cell is thereby determined and the process proceeds remorselessly, relentlessly to its inexorable conclusion.

DEATH (LEGAL ASPECTS). This article deals with certain legal aspects of death, particularly those relating to registration, presumption of death, and burial. For the law pertaining to the disposition of property after death, see ESTATE AND INHERITANCE TAXES; ESTATES, ADMINISTRATION OF; INHERITANCE; INTESTACY; WILL. Other legal aspects of death are treated in the articles AUTOPSY; CAPITAL PUNISHMENT; CORONER; EUTHANASIA; MEDICAL JURISPRUDENCE. For the burial practices of primitive peoples, ancient civilizations and the major world religions, see CEMETERY; FUNERARY RITES AND CUSTOMS.

REGISTRATION AND PRESUMPTION OF DEATH

United States.—It is generally provided that the state departments of health in the U.S. have charge of the registration of deaths, provide the necessary forms and blanks for obtaining and preserving such records and procure the faithful registration of each death. For this purpose the states, as a general rule, are divided into registration districts, in each of which there is a registrar charged with the registration of births and deaths. In Massachusetts and in some other states this duty was imposed upon each town clerk.

It was provided by statute in most states that the body of any person whose death occurs in the state should not be buried, cremated, deposited in a vault or otherwise disposed of or removed from or into any registration district, or be temporarily held pending further disposition, more than 72 hours after death unless a permit for burial, removal or other disposition had been properly issued by the registrar of the district. Whenever practicable, registrars were prohibited from issuing such burial or removal permits until a complete and satisfactory certificate of death had been filed. Death certificates of most states conform closely, in content and arrangement, to the standard form recommended by the United States public health service. Standard certificates are revised periodically, in consultation with state health officers and registrars, the medical profession and consumers of vital statistics. In general, the certificates contain: (1) the place of death, including state, county, city, town, etc., length of stay in place of death, name of hospital or institution; (2) usual residence of deceased, including state, county, etc.; (3) full name of deceased; (4) date of death—month, day, year; (5) sex; (6) colour or race—as white, Negro, Indian, etc.; (7) marital status; (8) date of birth; (9) age at death; (10) usual occupation and kind of business or industry; (11) birthplace, state or foreign country; (12) citizenship; (13) father's name; (14) mother's maiden name; (15) veteran status; (16) social security number; (17) informant's signature; (18) cause of death; (19) autopsy, if performed; (20) information regarding time, place, etc., if death was caused by accident, suicide or homicide; (21) certification of medical attendance on decedent, fact and time of death, including time last seen alive; (22) date, signature and address of physician or official making medical certification; (23) name and location of cemetery or crematory. and date of interment or cremation; (24) signature and address of funeral director; (25) signature of registrar, date certificate was received and registered number. The cause of death must generally be stated so as to show the disease or sequence of causes resulting in the death.

In nearly all states, fetal deaths are registered on a separate form entitled either "certificate of stillbirth" or "certificate of fetal death." A few states register a fetal death as a birth and also a death. The regulations in the majority of states require reporting of fetuses born dead after 20 weeks (or five months) of gestation. An increasing number of states adopted regulations which required reporting of all fetal deaths, regardless of gestation age. For deaths occurring without medical attendance, it was made the duty either of the funeral director or other person who learned of the death to notify the local health officer. The latter was required to investigate immediately and certify the cause of death. When, however, he had reason to believe that death might have been due to an unlawful act or neglect, he was required to refer the case to the coroner or medical examiner for investigation and certification, Funeral directors must file the certificate of death with the local registrar and obtain a burial or removal permit prior to any disposition of the body. They must deliver the permit to the person in charge of the place of burial. (H. L. D.)

Presumption of Death.—As in English law, the fact of death may be proved by presumptive evidence; *e.g.,* the unexplained absence of a person for seven years. Since such a finding of death is a finding of fact, the subsequent return of the absentee upsets all action based on his presumed death. Thus if a probate court has distributed all his property on a finding of his death, the acts of the court become void and the absentee may recover his assets from anyone into whose hands they have come. Many states sought to deal with this problem by statutes giving courts power to distribute property after unexplained absence for a prescribed period as well as after death, and the distribution of the property under such a statute may not be attacked by the returned absentee.

The common-law presumption of death permitted an inference as to the fact of death but not as to the time of death. Thus, in a common disaster such as an airplane or automobile accident, the common law had no procedure to determine who died first. Any person whose property interest depended on the order of death lost because of inability to make his case. Order of death is frequently important. The family home may be jointly owned property which passes to the survivor; the beneficiary of an insurance policy sometimes is entitled to the proceeds only if he survives the insured; in the case of a childless couple, order of death may determine whether the property passes from owner to spouse and then to her blood relations or to the owner's relations. The civil law established certain presumptions as to order of death based upon differences in age and sex. Most U.S. states adopted a uniform simultaneous death act which provides that, in the absence of proof of the order of death, the property of each deceased person is to be disposed of as if he survived; in other cases where order of death is important, such as those involving insurance policies or jointly held property, special rules are provided. The statute was made applicable only if the owner failed to provide his own rules in his will, and modern wills commonly provide for common disaster even where order of death is known.

(A. DM.)

England. — The registration of burials in England goes back to the time of Thomas Cromwell, who in 1538 instituted the keeping of parish registers. Statutory measures were taken from time to time to ensure the preservation of registers of burials, but it was not until 1836 (the Births and Deaths Registration act) that the registration of deaths became a national concern. Hence it is only from this date that vital statistics became reliable. The law for England was consolidated by the Births and Deaths Registration acts, 1874 and 1926. When a person dies in a house, information of the death and the particulars required to be registered must be given to the registrar within five days, by the nearest relative of the deceased present at the death, or in attendance during the last illness of the deceased, or by one of the other categories of persons defined in the act. If this information is given in writing, it is still necessary for the person giving the notice to sign the register within 14 days of the death. Penalties are prescribed for failing to give information and for giving false information.

It is also necessary to provide a medical certificate stating the cause of death; if this requirement cannot be satisfied, it is the duty of the coroner to authorize a post-mortem or to hold an inquest.

The body of the deceased cannot be disposed of before the certificate of the registrar, or order of the coroner, has been delivered to the person effecting the disposal; *i.e.,* the person by whom the register of burials in which the disposal is to be registered is kept, or, in the case of a burial in a churchyard or graveyard of a parish or ecclesiastical district under the Burial Laws Amendment act, 1880, the relative, friend or legal representative who is responsible for the burial of the deceased. Where, however, the disposal is by burial, the person effecting the disposal may proceed with the burial if satisfied by a written declaration in prescribed form by the person procuring the disposal that a certificate or order has been issued. The person effecting the disposal must, within 96 hours of the disposal, notify the registrar in the prescribed manner as to the date, place and means of disposal.

It is the duty of the father or mother of a stillborn child to give information to the registrar of the particulars required to be registered concerning the stillbirth.

The registration of deaths at sea is regulated by the Births and Deaths Registration act, 1874, together with the Merchant Shipping act, 1894.

Death can be proved by the production of a certified copy of the entry in the register of births and deaths, which is evidence not only of the fact of death but also of the date of death, the sex, rank or profession of the dead person and the cause of death.

Presumption of Death. — The fact of death may, in English law, be proved not only by direct but by presumptive evidence. When a person disappears and is not heard of for seven years, the presumption of law arises that he is dead (Nepean v. Doe, 1837, 2 M. and W. 894). Under the Matrimonial Causes act, 1950, any married person who alleges that the other party to the marriage is dead may, if domiciled in England, present a petition to the court to have the death presumed and the marriage dissolved. In such proceedings the fact that for a period of seven years the other party had been continually absent from the petitioner, and has given no reason to suppose that he or she is living, shall be accepted as evidence of death until the contrary is proved. In Scotland. by the Presumption of Life (Scotland) act, 1891, the presumption is statutory. In those cases where people disappear under circumstances which create a strong probability of death, the court may, for the purpose of probate or administration, presume the death before the lapse of seven years.

The question of survivorship, where several persons are shown to have perished by the same calamity, has been much discussed. The governing principle was laid down by s. 184 of the Law of Property act, 1925: where two or more persons have died in circumstances rendering it uncertain which of them survived the other or others, such deaths shall (subject to the order of the court), for all purposes affecting the title to property, be presumed to have occurred in order of seniority, and accordingly the younger shall be deemed to have survived the elder. This section has given rise to a number of questions of interpretation, and it has been laid down that, to exclude this presumption, there should be evidence leading to a definite and warranted conclusion that one died before the other (Re Bate: Chillingworth v. Bate, 1947 2 A.E.R. 418).

Air raids during World War II occasioned a series of such problems. For example, Re *Lindop:* Lee-Barber v. Reynolds (1942 2 Ch. 377), where the bodies of a husband and wife were found in a house that had been struck by an explosive bomb, the evidence showed that they must have both been killed instantly by the blast of the explosion. It was ruled by Justice Bennett that since it was impossible on the evidence to say that the two deaths must have been simultaneous, the statutory presumption was not rebutted and the wife, as the younger, was deemed to have survived her husband. In Re Howard: Howard v. The Treasury Solicitor (1944, P. 39), where a husband, wife and son were all killed in the same house on the same date but with the son in a different room from his parents, whose bodies were dismembered while their son's was not, it was held that the husband and wife died simultaneously but not the son. In *Hickman* v. Peacey (1945 A.C. 304), where four persons, two of whom had made wills benefiting some of the others, were killed by the explosion of a bomb bursting in a London house, there being no evidence whether any of the deceased survived the others, it was held, by a majority of the legal members of the house of lords that in the absence of such evidence the younger should be deemed to have survived the elder.

On the other hand, in Re Pringle: Baker v. *Matheson* (1946, Ch. 124), where a provision in a will was expressed to take effect on the simultaneous death of the testator and her sister, and both were, in fact, killed by the same bomb, the court gave effect to this provision irrespective of technical questions as to survivorship.

Civil Death. — This is an expression used in law in contradistinction to natural death. Formerly, a man was said to be dead in law (1) when he entered a monastery and became professed in religion; (2) when he abjured the realm; (3) when he was attainted of treason or felony. Since the suppression of the monasteries there has been no legal establishment for professed persons in England. The act abolishing sanctuaries (1623) did away with civil death by abjuration; and the Forfeiture act, 1870, that on attainder for treason or felony. (R. T. Ws.)

Canada. — The rules relating to the registration of deaths in Canada vary considerably from province to province. In general, whenever a death occurs, an appropriate person (normally a relative) is required to complete an official form setting out the deceased's personal particulars and to send it to a district registrar. At the same time, a certificate of the cause of death is required to be completed and sent to the district registrar either by a doctor or, where the death occurred in suspicious circumstances, by a coroner.

Upon receipt of these two documents the usual practice is for the district registrar to issue to the funeral director or person proposing to bury the body (1) an acknowledgment that the death has been registered and (2) a burial permit. Except in unusual cases, the rule is that no body may be disposed of without a burial permit or some similar authorization.

Presumption of Death. — As in England, a court may presume death to have occurred on indirect evidence and, in particular, after an unexplained absence in excess of seven years. No presumption. however, will be made as to when death occurred in that seven-year period. A litigant whose case depends on showing that a missing person died either before or after a particular event (as frequently happens in questions concerning inheritance) will have to produce more concrete evidence than a mere unexplained absence for seven years. Any distribution of property made upon a presumption of death will be inoperative if the supposed deceased reappears.

Canadian courts have generally refused to grant an order presuming death except as incidental to deciding a recognized dispute, such as one concerning the title to property or the validity of a marriage. In particular, no such order would be granted at the

instance of a petitioner whose only reason for asking for it was that he or she wished to remarry. In some provinces this restriction has now been abolished by statute. (A. Jo.)

BURIAL

Growth of Statutory Law.—England.—The right of the Englishman to burial in the parish churchyard was akin to his right to occupy his pew during church services. Both rights were subject to regulation by the church authorities. In consequence, prior to the middle of the 19th century, the English ecclesiastical courts exercised a legal secular authority over the burial of the dead which they had gradually absorbed from the ancient civil courts to which it originally belonged. While the right of burial became a common-law right, and thus a parson might be guilty of a misdemeanour for opposing the burial of a parishioner in the churchyard, his refusal to read the burial service was cognizable only in the ecclesiastical court. Except for the limited jurisdiction of religious societies, the control of burial has been statutory since the Burial acts of 1847 and 1852.

By the Cemeteries Clauses act, adopted in 1847, parliament set up a method whereby authorized companies could devote land to cemetery purposes for burial both of members and nonmembers of the Established Church and sell exclusive rights of burial therein. This innovation was followed, during the ensuing years, by 15 acts, 13 of which remain in force, in whole or part, and which constitute the English law of burial.

The comprehensive Burial act of 1852 provided for the restriction and discontinuance of metropolitan interment (expressly excluding St. Paul's cathedral and Westminster abbey) as well as means whereby a church vestry could appoint a "burial board," with corporate powers, authorized, with the approval of the secretary of state, to acquire land for a burial ground, to acquire an existing cemetery or to contract for burial rights in an established cemetery, to erect a chapel thereon, to embellish and manage the resultant cemetery, to sell exclusive burial rights therein, to fix fees for interments and the construction of vaults and monuments, etc. The act fixed fees for certain pauper burials and charged the secretary of state with over-all regulation of the cemetery.

The 1852 act was sporadically supplemented at various times by penal, public health and other allied acts, without disturbing the general scheme. By an act of 1900, the relevant powers and duties of the secretary of state were transferred to the Local Government board and, in 1919, by the Ministry of Health act, to the minister of health.

Some of the major provisions of the various burial acts are as follows: 1880: churchyard burial without religious rites was authorized, with the reservation that no such service should be held in a manner designed to "bring into contempt or obloquy the Christian religion"; and the use of the burial service of the Church of England was authorized for burial in unconsecrated ground; 1882: in lieu of the previous denial of churchyard burial to a suicide (who, prior to the prohibition of an 1823 statute, had been impaled in a public highway), interment, though without Christian burial rites, was required; 1900: burial authorities were authorized to have consecrated and to maintain a burial ground, or a part thereof, for particular religious denominations; 1902: burial authorities were empowered to erect and maintain crematories, subject to governmental approval.

United States.—While adopting the English common law, the American courts never considered themselves bound by the decisions of the ecclesiastical courts, and since English burial was largely governed by the latter and there was a paucity of English common-law material on the subject, the American courts were left free to frame their decisions influenced by the American objection to religious control of temporal affairs. To the extent that the English pattern of churchyard burial existed in the early colonies as a result of the control of churchyards by trustees of religious societies, the English ecclesiastic influence was felt. Generally, however, and particularly in the more sparsely settled portions of the country, secular regulation and control prevailed from the outset.

As in England, by the middle of the 19th century the need for greater governmental restriction of intramural burial asserted itself and, in 1847 in New York, for example, a comprehensive Rural Cemetery act was passed. During the subsequent years, state and local statutes throughout the country followed the pattern of protecting the health of the growing communities while ensuring decent burial to its members by authorizing the creation of cemeteries under lay ownership and control. In general, these laws were designed, as were the English acts, to restrict burial in populated centres and to authorize corporations to establish and maintain cemeteries and to regulate them for the protection of the dead and of the social and religious sentiments of the living. Such cemeteries may be sectarian or nonsectarian, and they may be owned and operated, in whole or in part, by religious, fraternal or benevolent societies for the burial purposes of their members.

The corporations that dedicate their lands to these purposes sell exclusive rights of burial in single graves or in plots containing space for a number of graves. Interments are made and the graves maintained under rules and regulations adopted by the cemetery corporation, which constitute the contract between the "lot owners" and the corporation. Such rules may restrict the use of the burial rights by race or creed (although the former restriction has been under growing attack).

The particular statute in force determines whether the cemetery may or may not be operated for the private profit of the owners of its stock. Generally, they are regulated by local or state statutes; in some cases, as in New York, a cemetery board administers the prevailing statutes and undertakes to regulate and protect clashing public and private interests.

The burial rights acquired by the lot owner are treated as real property; subject to the rules of the cemetery corporation, they may be transferred (at least before interment), and they pass, by operation of the law of inheritance, to the heirs of the holder in a manner usually regulated by local statute. The cemetery corporation "cares" for the graves and plots, as well as for the other portions of the cemetery affording access and egress; the lot owner pays an annual charge fixed by the rules or provides a "perpetual-care fund," held in trust by the cemetery corporation, the interest on which provides the funds needed to maintain the proper appearance of the cemetery.

Interment, by rule in some cemeteries, is limited to a single body in a grave; in others, multiple burials are permitted. Lot owners are also permitted to contract for the construction of vaults or mausoleums, gravestones and other monuments. In conjunction with conventional operation, some cemeteries maintain large public mausoleums and sell rights of single or multiple deposits in crypts. Others maintain crematories and, in connection therewith, columbaria, where the ashes of those cremated are marked and retained.

Right of Burial.—In every age, the public interest has commanded a disposition of human remains consonant with existing mores. The dictates of modern western civilization require burial or cremation, so that neither public sentiment nor public health be violated. But private sentiment also finds recognition: the right of the living to control the disposition of their bodies, when dead, in a manner not incompatible with the feelings of the survivors and the public; and the right of the survivors to exercise the privilege, in consonance with the wishes or beliefs of the dead. Generally, by statute or rule of substantive law, the deceased's wishes find fulfillment; then follows the priority of the desires of the surviving spouse and, in turn, those of the next-of-kin, in order of relationship. But in determining conflicting claims, the courts, exercising "a benevolent discretion, giving heed to all those promptings and emotions that men and women hold for sacred in the disposition of their dead, must render judgment as it appraises the worth of competing forces" (Justice Cardozo in *Yome* v. *Gorman*, 152 N.E. Rep. 126).

Duty of Burial.—English burial law charged the "householder," him "under whose roof the body lies," with the duty of promptly conveying the corpse, decently covered, from the place of death to a place of interment, and a willful violation of that duty was a common-law offense. The duty was paramount, as

against the surviving spouse (though, ordinarily, the surviving spouse would be the one under whose roof the body lies), the relatives and the authorities, unless the householder and the decedent's estate were indigent, when it would fall upon the public authorities. However, modern statutes generally provide for public intervention and payment of the necessary expense. The problem of who shall bear the costs, therefore, usually arises when the decedent's estate, which is primarily liable to those who have furnished the necessaries for decent burial, lacks the needed funds, although a surviving husband, parent or other close relative charged with the duty of maintenance and support during life may be held liable, even against the adequate estate of a wife or a minor child. Lacking any other source of payment, the common law imposed liability upon the unfortunate householder; under existing statutes, the public purse bears the burden.

Burial must be "decent," a standard that prescribes a minimum generally reflected by existing statutes. The definition of decent, however, is often contested by creditors of the deceased when the estate is insolvent, or by legatees or next-of-kin who do not want their legacies whittled away by undue burial expense. When such controversy arises, the courts hold the scope of decent to be variable, with the social standing of the deceased and particularly his financial condition at death the most important factors. Generally, the issue revolves about the extent of expenditure rather than its purpose, since, ordinarily, reasonable items such as the expense of preparing the body for burial, its transportation, the cost of a burial place and stone marker, religious services at the grave and needed mourning apparel for next-of-kin are deemed necessary and entitled to payment in preference to the decedent's debts and beneficences.

Disinterment. — Once a body is buried, the law guards the grave against unwarranted intrusion through the imposition of criminal penalties for unauthorized violation. However, local statutes invariably permit exhumation in the public interest, principally to aid in the detection of crime, and frequently regulate disinterment when sought for private reasons. In the latter cases, the reasons for disinterment generally must be compelling, although when removal is sought by next-of-kin for religious or sentimental reasons or the interment was intended to be temporary, and all concerned consent, removal will ordinarily be permitted.

Disinterment may be compelled. with adequate provision for reinterment, by the public authorities under the exercise of the "police power," as when a cemetery is abandoned or neglected, for reasons of health, or when other public benefit is involved, such as, for example, the location of highways.

In some countries (*e.g.,* France and the nations of Latin America), where it is the custom to rent rather than to sell burial rights, failure of survivors to pay the stipulated rentals results in disinterment by the cemetery authorities, and these cemeteries are often marked by piles of unidentifiable bones in remote corners of the cemetery grounds.

Other Regulations. — Provisions for medical death certificates, the proper transportation of bodies, burial permits and the supervision of burials and places of interment vary in detail from locality to locality, but generally are designed to detect criminal acts that have resulted in death, to ensure that communicable diseases are not transmitted. that bodies are unexposed and that even the friendless and indigent are given prompt and decent burial; also that bodies are not mutilated by autopsy, or otherwise, or used for dissection without the consent of those entitled to the privilege of burial. Again, for reasons of health and sentiment, local regulations aim to protect the graves of the dead from desecration and, in many cases, to protect the survivors from exploitation at the hands of those concerned nith the burial and safekeeping of the bodies of the dead. Underlying these various acts is adherence to standards of respect for the dead and protection of the health and sentiments of the living.

(P. E. JA.)

DEATH RATE. The death rate is usually measured by the annual number of deaths per 1,000 of the population. Thus, 1,702,000 deaths were registered in the United States during 1960; the population in 1960 was 179,323,175 (including Alaska, Hawaii and excluding armed forces overseas), the death rate was therefore 9.5 per 1,000 of the population. The corresponding rate for England and Wales in 1960 was 11.5 per 1,000.

TABLE I.— Average Annual Death Rates per 1,000 Population in Selected Countries for Specified Periods and I-ears, 1901–60

Period or year	U.S.	Canada	Eng. and Wales	France	Italy	Sweden	Mexico	Ceylon	U.S.S.R.
1901–10	15.5	*	15.4	19.4	21.6	14.9	32.7	*	29.7

International Comparisons. — Death rates for selected countries for various years are shown in Table I. During the period 1950–60 death rates of about 12 per 1,000 or less were recorded in all major countries of Europe, the United States, Canada, Australia, New Zealand and certain countries in Latin America and Asia. Death rates were higher in countries of retarded economic development where sanitary conditions and health facilities were relatively poor. In some countries in Latin America. Asia and Africa the death rate (except for the European minorities) is estimated at 20 or more per 1,000 population. In many countries, large numbers of deaths escape registration and the death rates obtained from official statistics are therefore too low. For instance, the official statistics of India show an average annual death rate of 14.1 per 1,000 in the years 1950–55, but it is believed that the rate was actually near 25 per 1,000.

The death rate is influenced by the age distribution of the population as well as the conditions of health and mortality. In the European countries, especially those in northwestern Europe, a comparatively large fraction of the population is made up of middle-aged and elderly people who, of course, are subject to higher mortality rates than young people. The middle-aged and the elderly are proportionately much fewer in the countries of Asia, Africa and Latin America. It is for this reason that Ceylon, for instance. has a louer death rate than England and Wales, although conditions of health in Ceylon are not so good as those in Britain. The very low death rate of the Jewish population in Israel (5.7 in 1960) is explained by the fact that this population consists largely of relatively recent immigrants, few of whom have yet reached an advanced age.

Expectation of Life.—A better measure of mortality than the death rate is the expectation of life at birth, also known as the average length of life. This figure represents the number of years the average newly born child would live if the risk of mortality at each age remained constant as of the year or period for which it is computed. As a measure of mortality, the expectation of life at birth has the advantage of being independent of the age distribution of the population. The lower the level of mortality, the greater is the expectation of life.

In the United States in 1958, the expectation of life at birth was 69.4 years. The figure for males was 66.4 years and for females, 72.7 years. The corresponding figures for England and Wales in 1959 were 68.1 years for males and 73.8 years for females. In most countries, females have a greater expectation of life than males, being subject to lower mortality rates at all or nearly all ages.

Data on the expectation of life in certain countries for various periods between 1941 and 1959 are shown in Table II. Expectations of life exceeding 65 years for males and 70 years for females are shown for Canada, Czechoslovakia, Denmark, France, east and west Germany, Italy, the Netherlands, Norway, Sweden, Switzerland, Australia. New Zealand and the Jewish population of Israel, in addition to the United States and England and Wales. Expectations of less than 60 years for both sexes were

the rule throughout most of Asia, Africa and Latin America, including many countries which are not listed in Table II for lack of exact information.

Trends. — There has been a steady decline of death rates in Europe and the main areas of European settlement overseas since about the middle of the 19th century (see Table I). In England and Wales, the average death rate from 1851 to 1870 was somewhat more than 22 per 1,000 population; during the years 1951–60 it averaged less than 12 per 1,000. The decline in France was from a level of about 24 during 1851–80 to slightly less than 12 in 1956–60. Italy experienced an even greater decline of the death rate, from an average of 30 in 1871–80 to 9.7 in 1960. In the United States, the death rate dropped from an average of 15.7 during 1901–10 to less than 10 in the decade 1951–60.

The improvement in mortality conditions is measured more exactly by increases in the expectation of life at birth. For white males in the United States, the expectation of life at birth increased from 46.6 years in 1900 to 66.4 years in 1958. The increase for white females was from 48.7 to 72.7 years. In England and Wales, the expectation of life at birth for males rose from 40.2 years in 1841 to 68.1 years in 1959; the increase for females was from 42.2 to 73.8 years.

It was only toward the middle of the 20th century that the progress of medical science and intensified public health activities brought about great reductions of death rates in Asia, Africa and Latin America. Before World War II, death rates in those parts of the world were almost universally high, but impressive declines were recorded in the death rates of many countries in these regions since 1946. The death rate in Mexico, which ranged between 22 and 26 from 1925 to 1944, dropped to 11.7 in 1960. In Ceylon, the death rate fell from 25.5 in the period 1921–30 to 9.1 in 1959. Equally great declines were experienced in Costa Rica, Malaya, Singapore and Formosa. Important reductions of death rates also took place in many other countries of Latin America, Asia and Africa. These changes have been attributed largely to the extensive use of insecticides, inoculations and antibiotics for the control of endemic and infectious diseases.

TABLE 11.—*Expectation of Life in Selected Countries*

Country	Year or period	Expectation of life at birth—years	
		Males	Females
Americas			
Argentina	1917	56.9	61.4
Canada	1955-57	67.6	72.9

Infant Mortality. — The greatest reductions have been achieved in the death rates of infants in the first year of life. Mortality at this age is usually measured by the ratio of deaths of infants under one year of age, during a calendar year, per 1,000 live births occurring in the same calendar year. This ratio is known as the infant mortality rate. During the 1870s in England and Wales, the infant mortality rate was approximately 150 per 1,000 live births; by 1960 it had been reduced to 21.7 per 1,000. Equally large or even larger reductions have occurred in other European countries since the last decades of the 19th century. Infant mortality rates during 1960 in different countries of Europe ranged from 16.6 per 1,000 in Sweden to 77.5 per 1,000 in Portugal and 87.3 per 1,000 in Yugoslavia. The infant mortality rate in the United States averaged 25.7 per 1,000 live births in 1960.

Official infant mortality rates are published for most countries of the world, but in many cases these statistics are unreliable. Infant mortality rates in the less developed countries of Latin America and Africa, and in some Asian countries. are believed to range upward from 100 infant deaths per 1,000 live births.

Economic and Social Classes. — There is a downward gradation of death rates in passing from the lowest to the highest economic and social classes of a community. For instance, a study based upon the United States census of 1930 and death statistics for ten states in that year showed the following death rates per 1,000 males between the ages of 15 and 64 years in various occupational groups: unskilled workers, 13.1; semiskilled workers, 9.9; skilled workers, 8.1; clerks, proprietors, managers and officials, 7.4; professional men, 7.0. The lowest death rate of occupational groups was that of agricultural workers; 6.2 per 1,000. There is evidence that these variations result primarily from differences in the environment associated with different occupations and that the occupational risks involved have only a relatively small influence.

The nonwhite population of the United States suffers higher mortality than the white population, primarily because of the inferior economic and social position of the nonwhites. Thus, the expectation of life at birth for nonwhite males in 1959 was 60.9 years, while it was 67.3 years for white males. The figures for nonwhite and white females were 66.2 and 73.9 years, respectively.

Causes of Death. — Death rates may also be computed according to the cause of death; in this case, the rates are usually expressed per 100,000 of the population. Thus, heart disease, the leading cause of death in the United States, claimed 659,410 deaths in that country during 1960, or 366.4 per 100,000 of the population. The 1960 death rates for other leading causes of death were, in order of rank: cancer, 147.1; cerebral hemorrhage, 107.1; accidents, 51.8; diseases of early infancy, 37.0; influenza and pneumonia, 36.6; general arteriosclerosis 20.3; diabetes mellitus, 17.1; congenital malformations, 12.0; and cirrhosis of the liver, 11.2. The ten causes mentioned were responsible for 85% of all deaths.

Striking changes in the death rates for certain causes have occurred in the United States since 1900. The death rate for tuberculosis was 201 per 100,000 in 1900, but only 5.9 per 100,000 in 1960. Preventive measures practically eliminated typhoid fever and diphtheria as causes of death; their death rates fell from 36 and 43, respectively, in 1900 to 0 in 1960. On the other hand, the rates for some causes of death increased. Mortality from heart disease in 1960 was more than 23 times that of 1900. The cancer death rate rose from 63 in 1900 to 147.4 in 1960. A large part of the increase in the death rates for heart disease and cancer may be attributed to the increase in the proportion of elderly persons in the population and to improvement in diagnosis. The death rate for diabetes mellitus rose gradually from 10 in 1900 to 17.1 in 1960. Automobile accidents claimed 20.6 of every 100,000 lives in 1960.

(J. D. D.)

DEATH VALLEY, in Inyo county Calif., is lower hotter, and drier than any other area in the United States. It is bounded on the east by the Grapevine. Funeral and Black mountains and on the nest by the Panamint range. Although genetically related to numerous other valleys in the arid southnest. Death valley is in many ways unique. Some 550 sq mi of the valley's floor lie belon sea level, culminating at Badwater (−282 ft). Summer temperature3 frequently exceed 120° F.. and on one occasion an extreme high of 134 6° was recorded Average annual precipitation is a little over two inches. In spite of the heat and aridity many species of plants are to be found especially in the higher sections, and several species of birds and mammals inhabit the valley throughout the year

Made a national monument in 1933, the valley affords much in the nay of scenic and historic interest. It was first seen by white men in 1849. when a party of emigrants crossed it on their way to California. The name "Death valley" is attributed to these early visitors, nho suffered many trials in crossing the desolate wastes of the valley floor. Except for occasional prospectors the area was seldom visited until the 1870s, when gold was discovered in the surrounding mountains and borax deposits were found in the valley. Borax production during the 1880s gave rise to the famous 20-mule team wagons, used to haul the product to Mojave, Calif. Later the valley became a major winter resort area.

Among the people associated with Death valley the best known is Death Valley Scotty, a legendary character nhose exploits were supposedly financed by gold taken from a mysterious secret mine. In reality his ventures mere financed by Albert Johnson, a retired Chicago business man.

See G. P. Putnam, *Death Valley and Its Country* (1946).

(C. R. Sr.)

DEATHWATCH, a popular name given to small beetles of two distinct families that often burrow and live in old furniture and produce a ticking sound commonly supposed by the superstitious to foretell the death of an inhabitant of the house. The name is often applied to *Xestobium rufovillosum* and *Anobium punctatum* (family Anobiidae) but belongs more properly to the former insect. The sound is a mating call and is produced by the adult beetle striking the front of the head upon a hard surface.

Certain book-lice (order Psocoptera [Corrodentia]) are sometimes known as lesser deathwatches. but the ability of such minute soft insects to produce audible sound is doubtful. The names *Atropos pulsatoria* and *Troctes divinatorius,* given to two of the common species, bear witness to the old superstition regarding the fateful significance of the sound.

DEAUVILLE, a seaside resort of northern France: in the *département* of Calvados, lies at the mouth of the Touques river opposite Trouville and across the Seine estuary from Le Havre, 89 km. (55 mi.) W. of Rouen by road. Pop. (1954) 5,211, increasing in summer to around 80,000. Because of its beautiful gardens Deauville is called the beach among the flowers. It is a fashionable resort in summer with many luxury hotels, a casino and two racecourses, and in winter it is an educational centre for students needing bracing air. Founded by the duc de Morny in 1866, Deauville was built on the checkerboard plan with wide avenues: In the Franco-German War the German advance stopped just short of the town; in World War II it was in German hands from June 1940 to Aug. 1944. (J. A. Va.)

DE BARY, HEINRICH ANTON (1831–1888), German botanist, whose researches were influential in the development of the modern concept of parasitism and infection and in the transition from the anatomical to the developmental approach to the study of fungi. Born at Frankfurt am Main on Jan. 26. 1831, he received a medical degree (Berlin) in 1853, but soon turned to research in botany. After teaching at Tübingen, Freiburg and Halle, he was professor of botany and rector at Strasbourg from 1872 to 1888. He died there on Jan. 19, 1888.

De Bary is regarded as a founder of modern mycology and plant pathology. In his *Untersuchungen iiber die Brandpilze* (1853), he maintained that the fungi associated with rust and smut diseases of plants were the cause of these diseases rather than the effect. His proof (1865) of the necessity of two hosts, wheat and barberry, in the life cycle of stem rust of wheat was the initial demonstration of heteroecism in rusts. He worked out the complicated life cycles of many other fungi and was among the first to study host-parasite interactions. His *Morphologie und Physiologie der Pilze,* etc. (1866) and *Vergleichende Morphologie und Biologie der Pilze,* etc. (1884) are basic mycologic reference works. De Bary summarized knowledge concerning bacteria in his *C'orlesungen über Bakterien* (1885) and published important papers on the slime molds and various algae. His essays on apogamy (1878) and symbiosis (1879) were provocative and influential. His classic *Vergleichende Anatomie der Vegetationsorgane der Phanerogamen und Farnen* (1877; English ed., 1884) had great effect on the development of concepts in plant anatomy. De Bary influenced botany not only through his own work but also through the many men who studied under him and afterward became distinguished.

Bibliography.—*Berichte der deutsche Bot. Gesell.,* vol. vi, pp. viii–xxvi (1888) and *Zeitschrift fur Bot.,* vol. xxiv, pp. 1–74 (1930), each with a listing of his publications; *Nature,* 37:297–299 (1888).

(J. W. Tt.)

DE BEER, SIR GAVIN RYLANDS (1899–), British zoologist, antiquarian and man of letters. whose main work concerned evolutionary problems. was born in 'London on Nov. 1. 1899, and was educated at the École Pascal, Paris. and at Harrow school and Magdalen college, Oxford. He remained at Oxford in the department of comparative anatomy until 1938 and during World War I1 served as Lieut. Col. in the Grenadier guards. He was professor of embryology at Cniversity college. London (1945–50) and then became director of the British museum (natural history). He was president of the 15th International Zoological congress held in London in 1958. De Beer showed the failure of the germ layer theory in Urodela. He analyzed the development of the skull in vertebrates and (with J. P. Hill) found vestiges of the egg tooth in marsupial embryos. He discovered the sternum in *Archaeopteryx* and showed the specialized, degenerate nature of Ratitae. Antiquarian interests are shown in his interpretation of the route of Hannibal's march across the Alps, the use of blood group data in tracing the origin of Etruscans from Asia Minor, the transcription of a first manuscript by Edward Gibbon and the discovery of manuscripts settling the first ascent of Mont Blanc.

De Beer's publications cover a wide range and comprise more than 350 books, monographs and papers. His zoological publications include the demonstration of the importance of pedomorphosis (retention'in the adult of juvenile or infantile characteristics) and the principle of clandestine evolution and of mosaic evolution. (Ed. He.)

DE BONO, EMILIO (1866–1944), Italian general, a marshal of Italy, notable especially under the Fascist regime, was born at Cassano d'Adda on March 19, 1866. He joined the Bersaglieri (light infantry) as a second lieutenant in 1887, fought in Eritrea and was on the general staff in the Italo-Turkish War. In World War I he first commanded a regiment of Bersaglieri and, earning rapid promotion, was a brigadier in the battle of Gorizia (1916) and a major general in command of the IX corps at the Piave (1918).

A strong nationalist, De Bono was an early convert to Fascism and took part as a *quadrumvir* with Mussolini in the march on Rome in 1922. He was given the post of chief of police and commander of the Fascist militia and was made governor of Tripolitania in 1925 and colonial minister in 1929. Appointed commander-in-chief when Italy invaded Ethiopia in 1935, he was replaced shortly after but rewarded with a marshal's baton.

During World War II, De Bono gradually detached himself

from the politics of Mussolini, and on July 24, 1943, he voted against him at the decisive meeting of the Fascist grand council. He was charged with treason, found guilty by the Fascist tribunal at Verona and executed on Jan. 11, 1944.

He wrote *La guerra come e dove l'ho vista e combattuta io* (1935) and *La preparazione e le prime operazioni* (1937).

DEBORAH (in the Douai version of the Bible, DEBBORA), the name of two women mentioned in the Old Testament.

Deborah, the nurse of Rebecca, was buried under the "Oak of Weeping" below Bethel (Gen. xxxv, 8). It has been suggested that this tree is connected with the "palm of Deborah," between Bethel and Ramah (Judg. iv, 5), the home of the second Deborah.

This latter is the famous prophetess and "judge," who, in company with Barak. son of Abinoam, delivered Israel from a Canaanite oppression. Two narratives of this exploit have been preserved, an account in prose in Judg. iv and a descriptive poem in Judg. v. They differ in one or two important details. The most obvious contrast is in the identity of the enemy overthrown. The prose narrative makes the enemy Jabin, king of Hazor. though a prominent part is played by his commander in chief, Sisera, who lived at Harosheth-haggoyim. In the poem Jabin does not appear and Sisera is an independent king. It is possible that the introduction of Jabin is due to the conflation of two traditions, one of which referred to Sisera while the other was parallel to the story of the defeat of Jabin, king of Hazor, by Joshua (Josh. xi, 1–9) at the Waters of Merom. Another contradiction is to be found in the manner of Sisera's death. In Judg. iv he is murdered in his sleep, in Judg. v he is struck down from behind while drinking a bowl of milk.

Assuming that the tradition preserved in Judg. v is the older, the actual history of the events can be reconstructed. Israel holds the nilder parts of the country, the hills and the forests, but the Israelite settlements in the central range are cut off from those in the northern hills by a chain of Canaanite (Egyptian?) fortresses down the plain of Esdraelon. For the time the plain dominates the hills; the Israelites are disarmed and their communications are cut. At the instigation of the prophetess Deborah, and possibly aided by her spells. Barak raises the clans of Ephraim, Benjamin, Machir (Manasseh), Zebulon, Issachar and Naphtali. Asher, Dan, Gilead (Gad) and Reuben hold aloof. Judah and Simeon are not mentioned. The Israelite clans fall on the enemy at Taanach; a thunderstorm, in which Israel sees the coming of Yahweh, strikes terror into the Canaanites; their chariots are useless on the sodden ground, and the Rishon. swollen by torrential rains. sweeps away the fugitives. Sisera escapes on foot, pursued by Barak; taking refuge in the tent of Heber the Kenite, he is treacherously slaughtered as he drinks.

The poem is one of the most important documents of ancient times. It is contemporary with the events to which it refers, and is therefore invaluable as a picture of the life of Israel in the early days of the settlement. Further, it is in itself a magnificent lyric outburst, and proves a very high standard of poetic skill in ancient Israel.

See G. A. Cooke, *History and Song of Deborah* (1892). (T. H. R.)

DEBRECEN, one of the most important towns of eastern Hungary, is about 138 mi. due east of Budapest by rail. Pop. (1960) 129.671 (mun.). It lies on the southwestern extremity of the sandy plains of the Nyírség region and has long been famous for its fairs and markets in livestock. It was founded in the 14th century and acquired prominence 200 years later, during and after the Turkish occupation. The walled city was a refuge for peasants fleeing from the Turks and developed into one of the remarkable Hungarian municipalities, urban in their great nuclei of settlements. rural in their interests. which remained semiautonomous under Turkish rule. The city acquired properties stretching into the Hortobágy steppe on the nest. It had a noted trade in horses. cattle and sheep during and after the Turkish regime, and was distinguished also in religion, culture and politics. It was long known as the Calvinist Rome because of its importance to the reformed creeds in east central Europe. (In 1939, 65% of the population was reckoned as Calvinist.) Debrecen housed Hungary's oldest printing press, built in 1561, and the 16th-century Protestant college, with its faculties of law and theology, was the nucleus of the later university. In 1849 Lajos Kossuth (*q.v.*) proclaimed in Debrecen the independence of Hungary from the Habsburgs, and the city fell to the Russians when their help eventually made possible the quelling of the revolt. In 1944, when the Germans were driven westward by the Soviet armies, Debrecen was for a while the centre of the provisional government of Hungary.

The city malls were long ago replaced by a roughly circular pattern of boulevards and gardens. The rail network, with seven lines converging on the city, and an even closer web of roads have maintained and developed trade and industry. (H. G. S.)

DEBS, EUGENE VICTOR (1855–1926), U.S. labour organizer and five times Socialist party candidate for president, was born in Terre Haute. Ind., on Nov. 5, 1855. At 14 he left high school to work for the Vandalia railroad. In 1875 he became an organizer and in 1880 a national officer in the Brotherhood of Locomotive Firemen. He became city clerk of Terre Haute and in 1888 a member of the Indiana legislature. After trying unsuccessfully to federate the various existing railroad brotherhoods he became president in 1893 of the ne ly established American Railway union, an industrial union. When the union began a strike in 1894 against the Pullman Car company, Debs assumed leadership and as a result served a jail sentence for contempt of court. This made him a national figure.

Debs became increasingly critical of traditional political and economic ideas, especially of capitalism. Sympathetic toward Populist doctrines, he campaigned for William Jennings Bryan in 1896 and supported an abortive co-operative colonizing project. In 1898 he led in establishing the Socialist party (name adopted in 1901). In 1905 he helped found the Industrial Workers of the World but soon withdrew because of its radicalism. In 1900, 1904, 1908, 1912 and 1920 Debs was the Socialist candidate for president. In 1912 he received 899,164 votes, about 6% of the total popular vote. In 1920 his vote exceeded 900,000 despite the imprisonment for wartime pacifism in violation of the 1918 Espionage act. His sentence was commuted by President Harding in Dec. 1921, but his citizenship was not restored.

Not an intellectual or a hard-headed politician, Debs won support through warmth of personality, integrity of character and sincerity of conviction. He earned his living primarily as a lecturer and as a contributor and editor for various periodicals. Among the best known of his many writings are the pamphlet *Unionism and Socialism* (1904) and the book *Walls and Bars* (1927). He died at Elmhurst, Ill., Oct. 20, 1926.

See Ray Ginger, *The Bending Cross: a Biography of Eugene Victor Debs* (1949); A. M. Schlesinger (ed.), *Writings and Speeches of Eugene V. Debs* (1948). (D. E. WY.)

DEBT, PUBLIC. This term is used to denote obligations of governments, particularly those evidenced by securities, to pay certain sums to the holders at some future time. Public debt is distinguished from private debt, which consists of the obligations of individuals, business firms and nongovernmental organizations. The debt owed by the national government is usually referred to as the national debt and is thus distinguished from the public debt of state and local government bodies. In the United States, bonds issued by the states and local governments are known as "municipals." In the United Kingdom, debt or loans incurred by local authorities are referred to as corporation or county loans, thus distinguishing them from central government debt, which is frequently referred to simply as funds. In the past, paper money was frequently regarded in the United States as a portion of the public debt, but in more recent years such money has been regarded as a distinct type of obligation, not a part of the public debt in the usual sense of that term. This change is partly the result of the fact that paper money is usually no longer payable in gold, silver or other specific items of intrinsic value. Public debt is an obligation of a government, and while individuals are called upon in their capacity as taxpayers to provide funds for payment of interest and principal on the debt, their own property cannot be attached to meet the obligations if the government fails to do so. Similarly, government property normally cannot be seized to meet these obligations. With sovereign governments the

debt holders can take only such legal action to enforce payment as the governments themselves prescribe.

This article is organized according to the following outline:

I. FORMS OF PUBLIC DEBT

Public debt can be classified in a number of different ways:

1. Long-Term and Short-Term Debt.—One simple way of classifying debt is on the basis of the length of time from issue until repayment. Long-term debt is that due at a relatively distant date in the future, such as ten years or more, and is normally evidenced by bonds. This category roughly coincides with the older term funded debt, although the latter concept includes debt with maturity from one to ten years as well. When the term funded debt originated in England, it was used to denote a debt whose interest was paid from specific funds or taxes. In time, however, it was extended to cover all debt due only after a relatively long period, or having no set maturity date. The "funds" were redeemable only at the option of the government.

Virtually all government debt in the United States has been issued for a definite time period, the lone exception being one $600,000,000 federal issue of 1900. However, some governments, particularly the British, have frequently issued bonds without a fixed maturity date but payable (technically, callable) after a certain date. These issues are known as consols (*q.v.*) because some of the early issues involved the consolidation of various separate debt issues.

The term intermediate debt is frequently used for obligations due in the period between five and ten years, although these issues are sometimes included in the long-term category. U.S. treasury notes (not to be confused with paper money, some issues of which were called treasury notes) usually fall within this category. In Great Britain, outstanding government debt having a period of five to ten years to run to redemption is considered short-term or medium-term. Treasury bills, which are essentially three-month promissory notes, are excluded from this classification.

Short-term debt is that with a maturity date of less than five years. Debt of this type that matures in one year or less constitutes floating or unfunded debt as distinguished from funded debt, noted above. In both the United States and Great Britain, extensive use of short-term debt began with World War I and became of particular importance during and after World War II. It was originally regarded as an emergency source of revenue only, to be repaid or funded as soon as possible. Ultimately it became a more or less permanent element in the debt structure, largely because of its lower interest cost and greater flexibility. In the United States there are two major forms: treasury bills, with maturity of one year or less, and certificates of indebtedness, due in one to five years. States, provinces and local governments usually employ short-term borrowing only in anticipation of tax revenues due in the near future, the credit instruments involved being known as tax anticipation notes. The principal forms of short-term debt in Great Britain are treasury bills (first authorized by statute in 1877) and ways and means advances from the Bank of England. Local authorities in Great Britain also carry a substantial volume of short-term debt secured on rates and revenues. Tax anticipation notes are unknown in the United Kingdom. The usual instrument evidencing such debt is the deposit receipt.

2. Direct and Contingent Debt and Revenue Bonds.—Direct obligations consist of securities issued by governmental units themselves, the governments being fully and directly responsible for payment of interest and principal. By contrast, contingent liabilities consist of securities issued by governmental corporations or government-owned corporations that are guaranteed as to principal and interest by the government. In the United States before 1941, for example, funds for the Reconstruction Finance corporation, Federal Housing agency and other governmental corporations were obtained by the issuance of bonds by these organizations, with guarantee by the federal government. In 1941 the government began to use direct obligations to finance these activities because of the lower interest rate. At times in the 1950s, however, the contingent method was again employed to some extent. In Canada, funds for the Canadian National railways, the Hydro-Electric Power Commission of Ontario and similar government-owned corporations are raised by bonds issued by these corporations and guaranteed by the respective governments. Similarly. in Great Britain loans have been guaranteed by the central government where the body raising the loan is one carrying out work deemed to be of public welfare, such as the North of Scotland Hydro-Electric board.

In the United States, at the state-local levels, substantial use is made of revenue bonds issued by various government-owned commercial enterprises such as toll highways, municipal power and transit systems, and are not guaranteed by the governments. By the early 1960s more than half of all state debt and 30% of local debt consisted of revenue bonds. These inevitably require a higher interest rate than direct obligations but they create no obligation for the taxpayers. Frequently they can be issued without regard to constitutional and other restrictions that require a popular vote on general obligations.

Reports of totals of debt outstanding may or may not include contingent liabilities and revenue bonds, and practice on reporting of these forms of debt varies from country to country.

3. Internal and External Debt.—Public debt, especially that of a national government, is frequently classified on the basis of whether it is owned within the boundaries of the issuing jurisdiction or outside. Sometimes the distinction is based on uhether the bonds are payable in the money of the issuing country or of a foreign country. While the classification on this second basis is similar to that on the former, it is by no means identical; bonds payable in the home currency may be owned outside, and vice versa. The external debt includes war debts and reparations owed to other governments (see INTER-ALLIED DEBTS; REPARATIONS). The United States has very little externally held debt, and all of it is payable in U.S. dollars. Canada, on the other hand, has a substantial external debt. some of it payable in U.S. dollars. Great Britain also has a substantial external debt, most of it payahle to the United States.

External debt is usually regarded as much more significant than internal debt because it represents a claim of foreigners against the real national product of the country. Payments of interest and principal can be made only by a transfer of goods to the foreign country through an excess of exports over imports. If the tariff policy of the debt-holding country prevents the debtor country from maintaining an excess of exports over imports, commitments cannot be kept, and international ill will and even armed intervention may result.

4. Marketability.—In terms of marketability, public debt takes three forms. First, debt may be represented by nonnegotiable notes executed directly between the government and lenders. Second, the debt may take the form of nonnegotiable securities of specific denominations widely distributed to the public, such as the U.S. savings bonds that were employed extensively to finance

World War II. Unlike the usual government obligations, these bonds were issued in small denominations, as low as $25. Since they could not be sold they could not depreciate in monetary value. They were redeemable at any time; interest was not paid on a periodic basis, as with the marketable securities, but accrued over the life of the bond and was paid at maturity along with the principal. The British equivalent was the national savings certificate, first introduced during World War I.

The great bulk of all government debt, however, consists of the third type — marketable securities. These securities are not negotiable and sell freely on the market. They are usually issued in relatively large denominations, $1,000 or higher, and interest is paid by check or coupon on a periodic basis. Since they are salable, the price fluctuates from time to time. The price will rise above maturity value when the current market interest rate falls below the interest rate which they bear; the price will fall below the maturity value when the current rate rises or when fear develops about the ability of the government to pay interest.

5. Other Bases for Classification. — Government debt can also be classified on several other bases:

Voluntary or Compulsory Character. — Under normal circumstances the purchase of securities is entirely voluntary, but in a few instances during war periods the purchase has been made compulsory. (See Debt Management section, below). In other instances features of the law have made purchase for all practical purposes imperative. This was true of the national banks in the United States from 1863 to 1936. They were required by lan to hold government bonds as security behind the national bank notes which they issued. In Great Britain, the holding of large blocks of government debt, as for example by each of the "big five" banks, is entirely voluntary, but supported by long tradition.

Interest Features. — Governments must, of course, pay interest on their obligations if they are to sell them in the market on a voluntary basis. But compulsory loans sometimes do not carry interest. When paper money was regarded as a part of the national debt, this element also did not bear interest.

Interest may be paid on a periodic basis through checks sent to the holders or through redemption of coupons attached to the bonds when they are issued. Savings bonds issued in small denominations, however, are usually handled on the discount basis; that is, they are sold for a smaller sum than the maturity value and the interest thus accrues over the years of their life and is received by the holder when he cashes in the bond.

Callable Features. — If government bonds are callable they are payable at the option of the government after some date prior to maturity, at maturity value or with some premium added. The callable feature enables governments to retire (redeem) the debt sooner than otherwise without having to pay substantially more than maturity value. It also enables governments to issue new bonds with a lower interest rate if the market rate falls.

Use of Funds. — The term dead weight debt is sometimes used, particularly in Great Britain, for debt incurred for the conduct of a war or the meeting of depression-induced deficits. Thus this debt is not represented by specific capital assets of equivalent value as is debt incurred to finance capital improvements.

II. DEVELOPMENT AND GROWTH OF GOVERNMENT BORROWING

The evolution of government borrowing was very slow. Extensive use of loans by governments became possible only after the ruler became differentiated from the state and after the continuity of the state became distinct from the persons of the rulers. Other factors were also necessary — the development of a regular revenue source for repayment of loans, a monetary system and an organized money market. The earliest loans of medieval and premedieval years were either forced loans or the personal borrowing of the sovereign. The first examples of government borrowing in its modern form occurred in medieval Genoa and Venice when the city governments borrowed on a commercial basis from the newly developed banks. But only with the commercial and industrial revolutions and the general development of the money markets did borrowing become a significant element in government finance.

1. Great Britain. — Government borrowing in Great Britain dates back to the end of the 17th century. In 1691, legislation pledged the receipts from beer and liquor taxes as security for a loan of £1,000,000. As Table I indicates, the trend of the debt was upward throughout the next 150 years largely because of wars; by 1802 it had reached £523,000,000, and by 1840, £827,000,000. The second half of the 19th century witnessed gradual reduction of the debt, to £610,000,000 in 1900, the significance of the debt being reduced still more by the growth of the economy over this period. World War I brought a tremendous increase, the 1920 figure being £7,828,000,000. The 1920s showed little reduction and the figure rose slightly during the depression years. World War II brought the level to £21,366,000,000 in 1945 and the figure rose in the postwar period — partly as a result of nationalization of industry — to over £27,000,000,000 in the early 1960s.

2. United States. — In the United States, when the federal government was formed in 1789. it assumed the debts of the states and various other obligations incurred during the American Revolution, which were funded into a single debt issue of $75,000,000. The government was highly successful in avoiding additional borrowing in the early years, except for the War of 1512, and during 1835 all federal debt was eliminated. (See Table I.) The years

◇The total gross debt of **U.S.** on Jan. 1, 1835, was $33,733.05.

△Sept. 30, 1944.

✦March 31, 1959.

1835–36 were the only ones in the history of the country in which there was no federal debt at all. The American Civil War, financed to the extent of only about 25% by taxation, pushed the debt to the total of $2,678,000,000 in 1865. Most of this debt was retired through budget surpluses during the following decades; debt reduction proceeded so far that the bonds available for security behind national bank notes became inadequate. The debt remained relatively constant in the 1890s and during the early 1900s. World War I brought an increase to $26,000,000,000~consisting in part of short-term and intermediate-term securities and in part of Liberty Loan bonds. In the 1920s the government was able to reduce the debt to a low point of $16~185,000,000in 1930, primarily by use of budget surpluses. Interest costs were materially reduced through replacement of old issues by new ones at lower interest rates.

The 1930s brought budget deficits because of the depression and the efforts to stimulate recovery. Despite extensive borrowing, which raised the total debt to $42,968,000,000 by 1940, interest rates fell sharply as a result of the surplus of money capital and federal reserve action. A substantial part of the borrowing was on a short-term basis, partly because the interest on such loans was extremely low. With the outbreak of World War II, borrowing rose sharply and by 1946 the debt had reached $269,-000,000,000. Substantial attention was given during the war to management of the debt with a view toward insuring a low interest rate, promoting the sale of bonds to individuals in order to minimize inflationary pressures, and obtaining an adequate supply of funds for the government. The treasury department sought to obtain maximum sales of savings bonds to individuals and stressed the payroll deduction system of sale. Interest rates were "pegged" for the war period, that is, the government essentially guaranteed that they would not rise, so that persons would not delay buying bonds in the hopes of higher interest rates in the future. Bond interest was held at 2.5%, except for the 2.9% figure on savings bonds and low rates on short-term securities. In practice it was necessary to borrow a substantial portion of the total (about 40%) from the banks and the federal reserve system, with consequent inflationary pressures.

In the postwar period the debt fell to a low of $252,000,000.000 in 1948, and then gradually rose to $296,500,000,000 by Dec. 1961. This increase was caused by budget deficits in a number of these years, arising primarily from a high level of defense spending and the unwillingness of congress to hold taxes high enough to meet this level. Some efforts were made to increase the portion of the debt represented by long-term bonds, but they were not pursued, largely because of the higher interest rates.

There were several controversial issues relating to the debt in the postwar years. One was the question of whether or not the federal reserve system should hold down interest rates in order to check an increase in government interest costs. Despite the fact that inflationary pressures called for higher interest rates! such a policy was followed until 1951, when, under an accord between the treasury and the federal reserve system, the rates mere permitted to rise. The long-term bond rate ultimately reached a high of 4.72% in Jan. 1960, compared with the 2.5% figure of the pre-1951 period. By 1959 the treasury found it impossible to sell long-term securities at the maximum figure set by law (4.25%), itself a subject of controversy after 1958. By early 1961, however, a way out of the impasse had been found by adopting the practice of selling bonds at a discount.

The states incurred substantial debts in the early part of the 19th century, largely for public improvements, and some found themselves in financial difficulties, As a result, borrowing came nearly to an end until after 1900; after that date there was further borrowing, particularly for highways. After 1945 the state debt increased sharply and reached a total of $18,500,000,000 by 1960. Much of this additional borrowing was for highway purposes. The local governments have traditionally borrowed more than the states, largely because of the nature of their functions. Local debt in the 20th century increased steadily and had reached $51,400,000,000 by 1960. Table II shows the growth of federal, state and local debt in the United States.

TABLE *11.—Government Debt in the United States, Selected Years, 1902–60*

3. Canada.—Canada's debt began with $75,000,000 at the time of confederation in 1867, when certain obligations were taken over from the provinces. The figure grew slowly until 1915, in contrast to the reduction in the United States, largely because of government railroad financing. World War I pushed the figure to $2,200,000,000 by 1920; the total rose as the Canadian National railways was developed. fell slightly in the late 1920s, rose to $5,000,000,000 with depression borrowing, and reached $18,000,-000,000 at the end of World War II. Some debt reduction was then attained and the figure fell to about $17,000,000,000 by 1950. By Jan. 1960 it had risen to $20,000,000,000 as a result of several years of deficits. The path of provincial and local borrowing in Canada was similar to that in the United States, though it had a much slower rate of growth.

4. Debt and National Income.—The absolute figures of growth in government debt tend to exaggerate the actual growth in the debt relative to the economy as a whole. In the first place, the general price level has increased significantly over recent decades; since the debt obligations are stated in fixed monetary terms, the relative magnitude declines as the price level goes up. The general rise in prices over a period thus reduces the problems created by the debt for the government, and the magnitude of the adverse effects of the interest payments on the economy. The gain occurs, of course, at the expense of the bondholders, whose real economic position is worsened by the change.

Secondly, the rise in national income reflecting an increase in output reduces still more the real significance of a fixed sum of debt for the economy, and the portion of national income which is affected by the interest payments. The combined effectsof the real and monetary influences can be illustrated by expressing the size of the debt as a ratio to gross national product over a period of years. Data for the United States are shown in Table III. The ratio fell from 87% in 1947 to 44% in 1958, although the

publicly held debt remained about the same in magnitude. The table excludes the debt held in government trust funds. The ratio of net interest payments to national income likewise fell, despite a rising interest rate level over this period. In Great Britain the ratio of national debt to gross national product fell from 221 in 1952 to 136 in 1958, although the size of the debt increased slightly over the period.

‡For 1957, except for those countries for which the debt figure is for a year prior to 1957; for these, the ratio is that of the year for which the debt figure is given.
§Under 1%.
Source: United Nations, *Statistical Yearbook* (1958). Detailed explanation of the items included in various countries can be found in this source.

Another measure of the relative magnitude of the national debt is that of the ratio of total national debt to all debt in the economy — governmental, corporate and private. The data for the United States from 1947 to 1958 are shown in Table IV; during these years the ratio of national debt to total debt fell almost by one-half.

5. Magnitude of Debt in Various Countries. — An adequate comparison of debt burdens in various countries is difficult to make. The reported figures are by no means entirely comparable because they vary in their treatment of debt incurred for various commercial enterprises, loans from foreign countries. special issues and the like. The relative importance of the national debt and the debt of subordinate units of government also varies, and figures for the latter are not available for many countries. Any comparison of absolute figures of debt in monetary terms is of limited value and may be very misleading because of problems of conversion to a common monetary unit. The only meaningful figure is the ratio of national debt to national income, and the significance of these figures is greatly lessened by the inaccuracy of national income data for many countries. In others the figures have never been compiled. Figures of national debt and of the ratios of debt to income are shown in Table V.

III. THE ECONOMICS OF PUBLIC DEBT

An understanding of the effects of government debt on the economy is essential as a basis for the evaluation of policies concerning borrowing, debt management and debt retirement. It is important to distinguish the effects of the borroming. as such, from the effects of the debt itself, once incurred, and from the effects of the retirement of the debt. Each aspect will be discussed in turn.

1. Effects of Borrowing. — The effects of borrowing are dependent in part upon the source of the funds; a sharp distinction must be made between borroming from the central banking system (the Bank of England in Great Britain and the federal reserve system in the Cnited States) and borrowing from other sources. The former, which essentially involves the creation of money and is closely related to the printing of paper money, mill be discussed below. The term borrowing as used in this section, unless otherwise indicated, refers only to borrowing from sources other than the central bank.

Borrowing transfers purchasing power in the form of cash or bank deposits from the lender to the government. Thus the act of borrowing is deflationary in that it tends to reduce total spending in the economy. The magnitude of this effect depends, of course, upon the extent to which the funds would have been spent, either on consumption or on business expansion, had the money not been borrowed by the government. If the funds would merely have been held idle, the borrowing has no contractionary influence. But if people reduce consumption to buy government bonds, as they may do if the government conducts an extensive savings bond drive, or if the effect of the government borrowing is to tighten the money capital market and reduce the funds for private investment. some reduction in total private spending in the economy will occur.

However, if comparison is made between the financing of government expenditures by borrowing and financing them by taxation, almost certainly the borroning method has less effect in reducing private spending than the taxation method. On this basis it is usually maintained that borroming is an inflationary method of financing government — relatively, that is. compared with taxation. There are two primary reasons for this difference. In the first place, taxation, by its compulsory nature, will force some persons to curtail consumption or spending for business expansion when they prefer not to and would not do so merely because the government was selling additional bonds. To a much greater extent government bonds will be purchased with funds which would have been saved in any event, and much of which would not have been used. at least directly, for business expansion. Secondly, the purchase of bonds does not reduce the net wealth of the lender, since he has merely substituted bonds for cash. Thus he does not feel himself poorer, as he would if he had been taxed an equivalent

amount, and is less likely to reduce his total spending. If the government borrows from commercial banks at a time when they have excess reserves, the banks can extend the loans to the government without any curtailment of private lending, and thus there is no net reduction in spending at all, although the banks' future lending capacity is reduced.

If the over-all effect of the government expenditure and borrowing program is considered, the net effect is likely to be expansionary, that is, to increase national income in real or monetary terms. The expenditure by the government represents a net addition, in full, to total spending, while, as noted, the borrowing is likely to reduce spending by an amount less than the total borrowed, since some will be absorbed from idle funds. On this basis, government borrowing is often said to be inflationary. However, it is important to note that it is not the borrowing that is inflationary but the expenditure of the funds obtained from borrowing.

There is one exception, however, to the rule that borrowing, in itself, is not inflationary. If the government borrows from the central banking system, the amounts involved are simply created by the central bank, being credited to the account of the government. When the government spends the money, the amounts will become reserves of the commercial banks, and thus the banks will be able to increase loans. This type of borrowing, as well as the expenditure of the money by the government, is inflationary. It is not basically different from the printing of additional paper money. Accordingly, in the United States, its use is specifically prohibited by law. By contrast, it has been widely employed in Great Britain. Even in the United States, however, when the government has sold bonds, the federal reserve system has often simultaneously bought government securities in the open market in order to prevent the interest rate from rising. This practice was common during World War II. The net effect is exactly the same as if the bonds were sold directly to the federal reserve system, the only difference being the one of appearance. By such a policy any effect that borrowing might have in checking business investment by lessening the supply of money capital is eliminated, and thus all or almost all of the anti-inflationary effect of the borrowing of the funds.

Two other effects of government borrowing may be of importance in certain periods. First, government borrowing, which involves an exchange of cash for bonds, lessens the liquidity of the lenders; it places their wealth in a form that is not so readily spent, even though their net wealth is not reduced. Secondly, if heavy government borrowing is regarded as undesirable and irresponsible, it may lessen confidence in the future and reduce both business and consumer spending. This effect is most likely to occur in a severe depression when pessimism about the future is widespread anyway.

In summary, a program of government expenditures financed by borrowing is almost certain to be expansionary. except in the unlikely case that the fear of the borrowing causes such a severe loss in business confidence as to offset the other influences. The expansionary effect is likely to be greater than that of a similar program of expenditures financed by taxation. Total spending will tend to rise; thus, in a depression, when unemployment exists, real national income will tend to rise. In a period of full employment the general price level will increase. However, the expansionary influence is less than would occur if the program were financed by the issuance of paper money or borrowing from the central bank, since these policies in no way reduce private spending, whereas usual borrowing will do so to a limited degree.

2. Economic Effects of the Debt Itself.—Distinct from the effects of borrowing on the economy are those of the debt itself. One basic principle must be noted initially; the existence of a domestically held debt does not reduce or increase the net wealth of the country. The debt may have certain effects on the operation of the economy, and thus may affect national income levels indirectly. But in itself it does not alter the over-all wealth. The bonds represent obligations of the government, and thus of the taxpayers. They constitute personal wealth of the bondholders. Thus they do not constitute a portion of the real wealth of the country, since their value as personal wealth is offset by the obligations against the taxpayer. Or, in reverse, the obligations of the taxpayers are offset, from the standpoint of society as a whole, by the personal wealth in the form of the bonds held by the bondholders. If the debt had never been incurred, and the government expenditures had been financed by taxes instead, the bonds would not exist, but neither would the obligations of the taxpayers. The real wealth of the country consists of material objects which convey benefits to the people of society and, in a broad sense, knowledge and skill of the people; the total amount is not affected, except indirectly, by the presence or absence of government debt outstanding.

However, the government debt does have important effects upon the functioning of the economic system. In the first place, since the bondholders consider the bonds as personal wealth, they regard themselves wealthier than they would if the debt had not been incurred and the expenditures had been financed by taxation. Thus they may be inclined to spend a higher percentage of their income on consumption; saving is less imperative because of the larger accumulated reserve which they feel that they have. If all persons regarded the sum of their future tax liabilities in the same fashion, the wealth element represented by the bonds would be offset by these. But they normally do not do so. The net effect is to increase somewhat the total percentage of national income spent on consumption, and to raise the real level of national income or the general price level.

Secondly. the existence of the bonds places the holders in a more liquid position because this portion of their wealth can readily be converted into cash. They can increase their spending quickly if they choose to do so. The existence of this liquid reserve is an important factor in lessening the decline in spending at the outbreak of a depression, and is in this sense a stabilizing element in the economy. It is one of the few significant advantages offered by the existence of the debt.

The debt also places financial institutions, and particularly commercial banks, in the position of having highly liquid assets that can be converted to cash in order to increase reserves and expand lending. Thus they can largely escape from central bank credit restriction policies, unless the central bank is willing to allow government bonds to drop well below par. But the existence of a large debt makes the government unwilling to see bond prices drop because it will have to pay a higher interest rate on new issues as old ones come due and must be refunded. From 1945 until 1950 in the United States the treasury department succeeded in ensuring that the federal reserve system did not allow bond prices to drop, and thus may have aggravated inflationary pressures during this period. After 1932, the year of the 3½% conversion loan, Great Britain pursued a policy of low long-term government rates. Such a structure was, however, essentially artificial and was abandoned in 1952 when the weapon of the bank rate was again brought into operation.

In contrast to these expansionary effects of the debt, in one respect a debt may have dampening effects on the economy, particularly during periods when there is some tendency toward unemployment. If fear of the possible adverse effects of the debt upon the economy becomes widespread, total spending, especially by business firms for expansion of plant, may be reduced. The fears may be vague and largely unfounded but nevertheless may have a significant influence upon the economy. They are most marked in a period of depression when businessmen are pessimistic anyway, as evidenced by attitudes during the 1930s. During prosperous periods, fears of the debt tend to disappear.

Other effects of the debt arise from the interest obligations to which it gives rise. The annual payments for interest on the national debt in the United States in the 1960–61 fiscal year were roughly $9,600,000,000 or 11% of the total budget; state and local government interest was about $1,300,000,000 in 1959. Great Britain's interest payments constituted 12% of the total ordinary budget expenditures in 1959; Canada's were 9%. These interest payments (unless met from continued increases in the debt, a practice normally considered to be undesirable if not disastrous) must be covered by higher tax revenues. There are three undesirable consequences. The additional taxes may have certain ad-

verse effects on the economy, particularly in impairing incentives for work and business development which are not offset by the receipt of the funds by the bondholders. The net effect of the payments is likely to have a dampening effect on total spending, since the bondholders are, on the average, likely to spend a smaller percentage of the sum than the taxpayers would have. This is an advantage, of course, in inflationary periods. Heavy interest charges tend to restrict government expenditures for other functions, which may be extremely important to the welfare of society.

On the whole, therefore, under most conditions the net effect of the debt is without question undesirable, particularly because of the effects in furthering inflation on the one hand and hampering incentives (through the taxes necessary for interest payments) on the other. The only significant merit is the cushioning effect on the decline in spending that occurs when a depression starts. This effect could, of course, be obtained in other mays. One additional merit has frequently been advanced: the existence of the government debt provides a particularly suitable outlet for the savings of persons in the lower income groups for whom security and liquidity are very important, and a secondary reserve for banks. These functions could, of course, be served by far less debt than most governments had outstanding in the early 1960s. Closely related is the argument that the existence of a large national debt facilitates the conduct of central bank credit control by providing suitable media for open-market activities, the ramifications of these activities being widespread when the debt is widely held.

3. Effects of Debt Retirement. — The effects of debt retirement are in large measure the reverse of those of borrowing. Retirement is possible, of course, only if tax revenues are sufficiently high to produce a surplus over current expenditures. The retirement in itself is expansionary, since purchasing power is transferred from the government to the bondholders. Some of this is likely to be spent, although the percentage thus used is not likely to be high. To the bondholders the repayment of the bonds does not represent income but merely a change in the form of their capital. The bulk of it will probably be reinvested in other securities rather than be used for consumption, though some holders are likely to use the money for consumption once it is returned to them. The exact effect depends, of course, upon the nature of the holders of the bonds that are repaid; if the holders are banks they naturally cannot spend the money on consumption. However, even if the money is not spent on consumption, the debt retirement may stimulate spending for business expansion. The funds repaid will be used in part to purchase other securities; this will tend to drive the security prices up and thus make borrowing cheaper. The general increase in the supply of money capital will tend to facilitate private borrowing. The only exception is the repayment of bonds held by the central bank; this has the effect of reducing bank reserves and thus in itself is deflationary.

If the over-all program of debt retirement and the budget surplus necessary to provide the funds for retirement are considered, the net effect is clearly deflationary. The taxes will exercise a dampening effect on total spending; as noted, the net expansionary effect of the receipt of the funds from the retirement of the bonds is limited at best. As a consequence total spending in the economy is almost certain to decline. The net effect depends upon the types of taxes imposed to provide the surplus, the nature and reaction of the bondholding groups to the use of funds, and the responsiveness of business expansion to increased availability of money capital.

4. Debt Burden on Future Generations. — It has long been argued that the financing of governmental activities by borrowing results in the transfer of the costs of the activities from present to future generations, since persons in these generations must pay higher taxes to meet interest and principal obligations. This argument is generally regarded by economists as invalid. Future generations inherit both the bonds and the obligations to pay them; they are thus neither richer nor poorer than they would be if the debt had not been incurred, except as a result of the difficulties incident to the debt and its retirement noted in preceding sections. The real cost of any governmental activity, war or otherwise, is borne in the form of reduced consumption and investment, harder work and the like during the period in which it is carried on, regardless of the methods of financing. The only burden on the future is that arising from the depletion of natural resources or slower rate of investment, and these are not affected by the method of financing used.

In recent years, question has been raised about this principle, and some writers have stressed the adverse effects on future generations arising from the effects of the taxes necessary to pay interest, and the inflationary influences. At least one economist, J. M. Buchanan, has gone beyond this to argue that there is a real burden on the future generations when the debt is repaid, because the taxpayers suffer a net loss, yet the bondholders experience no gain because they merely exchange their bonds for cash. But this argument ignores the fact that standards of living, as usually defined, depend upon actual goods and services available, and these are not reduced by the process of debt repayment, except from secondary effects as noted.

The argument of the two preceding paragraphs is applicable, of course, only to domestically-held national debt. Foreign-held debt gives a claim to foreigners against national output; payment of interest and principal requires export of goods and thus a reduced domestic standard of living. Similar reasoning applies to state or local debt held outside the community; payment of interest and principal constitutes a decline in the real incomes of the people of the area as a whole, and thus the burden was effectively shifted to future generations when the original activity was financed by borrowing.

IV. SHOULD GOVERNMENTS BORROW?

Traditionally, borrowing has been regarded as an exceptional source of revenue to be employed only when specifically justified by the circumstances of the case. By contrast, taxation has been considered to be the normal source of government revenue to be employed in all instances except when conditions warrant the use of borrowing. Accordingly, the case against borrowing will be discussed first.

1. Objections to Borrowing. — The traditional argument against borrowing is, of course, the interest burden to which it gives rise, an argument equally applicable to private and government borrowing. The interest obligations require either higher levels of taxes, with possible adverse effects upon the economy, or lower expenditures for other purposes. The payment of interest may easily result in a transfer of purchasing power in favour of the higher income groups, contrary to accepted standards of equity in income redistribution.

As noted in the preceding section, the financing of expenditures by borrowing instead of taxation, and the debt itself, once incurred, tend to produce inflationary effects in periods of full employment because they increase total spending. With full employment, any increase in government expenditures not offset by an equivalent decline in private spending for consumption or business expansion will lead to inflation. Thus, since borroming is less deflationary than taxation, the financing of the expenditures by borrowing will encourage inflation. This is the basic argument against the use of borrowing instead of taxation from the standpoint of the goal of economic stability. It is primarily relevant to national government borrowing because the national government must assume the primary responsibility for lessening economic instability. But state and local borrowing is, of course, equally inflationary.

Borrowing, if freely employed, can easily lead to increases in government expenditures beyond levels regarded by society as the optimum, and may reduce the pressures for efficiency and elimination of waste. As governments consider expenditure levels, the adverse reaction to taxation serves as an offset against the favourable response to the services and facilitates the attainment of a balance between government-produced services and privately-produced services. But if borrowing replaces taxation, and is generally accepted as a suitable routine method oi financing, the pendulum will swing in the direction of increased governmental

activity, and appropriate balancing is lost. The best evidence of this danger is to be found in the history of state and local government finance in the early 19th century in the United States when large sums of money were borrowed for purposes of limited usefulness to society. The basic trouble with borrowing is its relative painlessness, so long as people disregard the future consequences.

There is always the possibility that a government may accumulate so much debt that it will lose the confidence of the people and will possibly reach the point where it cannot meet its obligations. Loss of confidence mill make borrowing of additional funds in an emergency difficult, and may check economic development by lessening optimism on the part of businessmen toward the future. If a government goes so far into debt that it cannot meet its obligations, its credit is seriously impaired. A national government, with its extensive taxing potentialities and its control over the banking system, could scarcely find itself in a position where it could not meet interest obligations or be able to aell bonds. But if the debt exceeded certain levels the government might be unable to sell bonds extensively to individuals, and thus might be forced to resort to borrowing from the central bank, the most inflationary form.

These arguments constitute a very significant case against general reliance on borrowing. The case against it is particularly strong in periods of full employment; for the local governments beyond levels at nhich interest can be met easily from current sources; and in all circumstances in which governments are relatively irresponsible with regard to future problems created by present policies.

2. The Case for Borrowing. — There are three primary circumstances in which government borrowing is usually regarded as justifiable:

a. In a period of unemployment and depression, the basic argument against the use of the borrowing method — that it tends to generate inflation — is not relevant. Any expansionary effect which the financing of the government expenditures by borrowing instead of taxation may have will tend to bring about an increase in output rather than an increase in the general price level. Accordingly, the use of borrowing may be regarded as justifiable, in terms of the goal of lessening the severity of depressions and attaining greater economic stability. However, the other objections against borrowing remain, and suggest the need for keeping a restraint on the borrowing, particularly at the state and local levels. Some persons regard these objections as serious enough to overrule the justification for depression borrowing as a means of encouraging recovery. But this has become a minority point of view. Avoidance of borrowing in a severe depression would require sharp curtailment in activities and an increase in taxes. These would not only aggravate the depression but would be politically intolerable. Even if the point of view that governments cannot succeed in bringing recovery from depression by deliberate action is accepted, it must be recognized that some national government reliance on borrowing in depressions is inevitable and justifiable to avoid aggravating the depression.

Some persons have argued that in depressions the national government should not finance its expenditures by borrowing but should rely on the issuance of paper money. This method would avoid such limited contractionary effects as borrowing would cause and would avoid interest burdens and other difficulties created by the debt. However, this method of financing is such a painless one that once governments begin to rely upon it there is danger that they will not discontinue it after economic conditions have changed. The result would be disastrous inflation. Furthermore, the use of the method, even if not carried to the point of abuse, could easily cause general loss of confidence in the government, increase pessimism about the future and check business investment still more. Actually, the same advantages can be attained with much less danger by borrowing, directly or indirectly, from the central banking system.

b. The use of borrowing is regarded as inevitable in periods of major war. If taxes were increased sufficiently to finance all war costs they might seriously impede the war effort, both by impairing incentives to work and reducing over-all morale of the people. The limits of taxation that are economically and politically tolerable may well be below the sum that represents the maximum feasible allocation of resources to war effort. To go further would interfere with the primary goal of such a period, the winning of the war. Similarly, adequate tax increases would aggravate the inequities of the tax structure; an over-all level that would reduce total consumer spending to a level equal to the rate of output of consumer goods might well push some persons below subsistence levels and make it impossible for others to meet fixed commitments. Use of borrowing as a method of war finance makes the control of inflation more difficult. But there appears to be no escape from this policy.

c. When governmental activities require capital outlays far in excess of usual expenditures and of a nonrecurrent character, borrowing is not only virtually imperative if the outlays are to be made, but is entirely justifiable. This rule is of primary concern to the local governments because at the federal and state levels the ratio of nonrecurrent expenditures to total expenditures is such that tax financing is possible without undue fluctuation in tax rates or hardships to taxpayers in particular years. But local governments must often make expenditures far in excess of usual annual figures on projects that will last over a period of years. Failure to use the loan method will tend to reduce expenditures for such purposes below the optimum level because taxpayers will strongly fight such sharp increases in taxes, particularly when the capital outlay will benefit taxpayers in future years. The case is particularly strong for self-liquidating projects such as power or water system expansions, but is valid even when the outlays are to be paid off out of tax revenues. It must be emphasized that the characteristic feature justifying the use of borrowing is the nonrecurrent element; the mere fact that the object of a particular expenditure will last a number of years is not in itself a justification if roughly the same amounts will be spent each year. If a city is to repave 20 blocks of streets annually, there is no need for borrowing, and a good case can be made against it, even if each particular repaved street may last 25 years.

A final justification for borrowing, relevant only to short-term loans, is a lack of exact correlation in the time when revenues are received and expenditures made. Unless a government is to build up a surplus, it must borrow occasionally to meet expenditures at a date earlier than the receipt of the tax revenue.

3. Debt Limitation Laws. — Although excessive borrowing should be regarded with some anxiety, no limitations are imposed in Great Britain on the borrowing powers of the central government. In the United States, however, fear of excessive government borrowing has resulted in placing restrictions on the amounts the executive and even the legislative branches of government can borrow. Many states found themselves in financial difficulties after they borrowed heavily to provide funds for canals and railroads in the middle of the 19th century, and as a consequence provisions were written into the constitutions of nearly all states to prevent or restrict further borrowing. The provisions limiting borrowing vary widely. In most states a maximum, usually expressed as an absolute dollar sum and relatively low in terms of present-day expenditure levels, is set. Either this figure cannot be exceeded at all (except by amending the constitution), or it can be exceeded only with approval of the voters at an election. In some states all bond issues require approval by popular vote and in some instances more than a bare majority is required. Purposes for which funds are borrowed and the duration of the issue are also frequently restricted. These constitutional restrictions have unquestionably lessened state borrowing; in so doing they have, perhaps, reduced waste but they have also sometimes prevented urgently needed improvements. The limits have likewise greatly increased the use of revenue bonds, which are normally not subject to the restrictions. Unfortunately, the interest rate on these bonds is higher than the rate on other bonds.

Restriction on local borrowing is almost universal in the United States. The restrictions, established either in the state constitutions or by state legislation, limit the total sum to be borrowed by any particular unit to a certain percentage (from **2** to over 20)

of the total assessed value of its property. The limits vary for different types of local units (city, county, school district, etc.): They usually do not apply to debts incurred for self-liquidating enterprises. In many states every bond issue must be approved by popular vote, in some instances by a two-third majority. In other states the limits established may be exceeded by popular vote, often with a requirement beyond a mere majority. Legislation also controls the maximum interest rate, duration of the issues, purposes of borrowing, establishment of means of retiring the bonds, etc. Several states exercise review over local bond issues, but only North Carolina requires specific state approval of all issues. Like the states, the local governments have found means of escaping the restrictions. Special districts with their own debt limits are often formed when a city has reached its limit. Revenue bonds are also employed. In some states, such as Pennsylvania, there has been widespread creation of special authorities.

A special school building authority, for example. is established with the power to finance the building of schools by issuing revenue bonds. In turn, the authority pays interest and principal on the bonds from rentals obtained from the school districts for the use of the buildings.

There are no constitutional limits on federal borrowing powers in the United States. But for many years congress has restricted borrowing by the treasury department. Before 1917 borrowing was permitted only upon specific authorization by congress. After 1917 maximum figures were set, at first for each type of loan. and then, after 1938. as an over-all total. The 1938 figure of $45,000,000,000 was gradually increased to a high of $300,000,000,000 in 1945, and reduced to $275.000.000.000 in 1946. The limit remained at this figure until 1954; there was strong pressure in congress against an increase, under the philosophy that failure to raise the limit would check growth in government spending. But eventually pressure on the limit became so great that various government activities were forced to borrow on their own at higher interest rates, and finally an increase was made, ultimately, to $295,000,000,000, the figure in effect in the early 1960s. Experts differ in their estimates of the usefulness of the federal limit. Some believe that it curtails government waste and unjustified increases in expenditures while others argue that it reduces flexibility in meeting emergencies, checks needed increases in various activities, prevents quick action to stave off a depression and leads to uneconomical forms of borrowing.

In Canada, the dominion and provincial governments are not subject to debt limitations. The local government limits are comparable to those in the United States, and in several provinces bond issues must receive approval of a provincial agency. In Great Britain, borrowing by local governments is subject to control, specifically by the ministry of health, and limits are usually established in terms of a ratio of debt to total ratable value (assessed value of property). After World War II much local borrowing was channeled through the Public Works Loan board, and thus was subject to additional control.

V. DEBT RETIREMENT POLICY

The question of the desirability of debt retirement must be considered separately for the national government and for the state and local governments.

1. National Debt. — Retirement of the national debt has the obvious advantage of eliminating the undesirable features noted in an earlier section: the adverse effects of the taxes necessary to pay interest; the redistribution of income resulting from interest payments of a nature often regarded as undesirable; the inflationary effects of the debt under certain circumstances; and the confidence-disturbing effects, which are of particular importance in a depression. Furthermore. the over-all program of a budget surplus and debt retirement tends to exert a deflationary influence on the economy and aids in checking inflationary pressures. It is true that a program of accumulating a budget surplus without retirement of debt, the surplus merely being held, would exercise still more anti-inflationary pressure, but such a policy is not usually regarded as feasible, politically or otherxise. Furthermore, the accumulation of surpluses without debt retirement tends to bring increases in government expenditures; it is politically difficult for a government to maintain an accumulated surplus for any length of time.

Debt retirement is also likely to increase the rate of capital formation in the country. that is, the rate of growth in investment in business expansion, so long as full employment of resources is maintained. The taxes necessary to provide the funds for retirement will tend to reduce consumption to some extent, while the sums paid out to the bondholders will be made available, in large measure, as money capital for business expansion. The net effect is to reduce the percentage of total national product used for consumption and increase the percentage used for expansion of the economy.

However, retirement of the national debt is subject to certain objections. Because of the deflationary effect of the over-all program, maintenance of a rigid program of retirement regardless of business conditions could easily produce a decline in business activity, which, in turn, would make further repayment virtually impossible for the duration of the depression. If the goal of economic stability is regarded as important, substantial retirement is possible only in years of inflationary pressures. Thus, as a rule, no systematic, year-by-year program of retirement is now attempted by national governments, although occasionally arguments are advanced for this approach. The other objection is that if taxes are kept high enough to ensure a budget surplus for debt retirement each year, current activities of government may be held down below what may be regarded as the optimum level. The strong popular resistance to tax increases beyond certain levels may result in the debt retirement program being carried on at the expense of urgently needed current activities of government, rather than through higher taxes. Certain other arguments are advanced against retirement. The bulk of the debt in the U.S. was incurred for the conduct of wars; since the benefits from these wars extend indefinitely into the future, it may be argued that no one generation of taxpayers should be made to shoulder the burden of debt retirement. Closely related is the argument that continued expansion in the economy will gradually reduce the significance of the debt. and thus failure to retire it is no cause for alarm.

If a program of debt retirement is carried on as part of an anti-inflationary program, the net effectiveness of the program will be influenced by the nature of the debt retired. Maximum effect is obtained by retirement of debt held by the central banking system, since the repayment creates no inflationary influence at all and, by reducing reserves of the banks, will tend to check bank lending. Retirement of debt held by the commercial banks will produce the next best results; while the banks' reserve positions are improved by the retirement, it is likely that they may not extend new loans to the extent of the debt retirement because other investments will be less liquid than the government bonds and the banks will feel obligated to hold greater reserves.

An alternative to debt retirement at the national level is monetization of the debt; that is, payment of the debt by new monetary issues. This policy would, of course, seriously aggravate inflation in a period in which there is a tendency toward inflation. In a period of depression, however, business activity would be stimulated and the burdens created by the debt would be lessened. Such a policy is rarely endorsed for the same reasons that this alternative is not favoured as an initial source of revenue in lieu of borrowing noted in the preceding section. If there were complete assurance that governments would not overissue money and the policy of monetization would not cause general loss in confidence, this alternative would be worthy of consideration.

A final alternative for the national debt is direct repudiation. Since a sovereign government cannot be sued without its permission, it can cancel outstanding debt without legal interference if it wishes. Such a policy has, in fact, usually been followed only when a government has been overthronn by revolution and the new government has disavowed the debt of the old, as occurred after the fall of the tsarist regime in Russia. Gnder ordinary circumstances such a policy is not seriously contemplated, because of the injustice to the bondholders that would result: the loss of

prestige by the government, and the difficulty of selling bonds in the event of need for borrowing in the future.

2. State-Local Debt Retirement. — The question of retirement of the debt of units of government subordinate to the national level, such as the states and local governments, must be considered in light of somewhat different factors, and the case for retirement in a systematic fashion is much stronger. These debts are incurred primarily for the financing of capital improvements with a limited life. If they are not retired over the period of use of the improvements, burden will rest upon generations of taxpayers who no longer Enjoy the benefits of the improvements. Furthermore, failure to retire debt will soon get a state or local government into a position where it cannot borrow for new improvements because the total amount of debt has reached levels beyond the capacity of the government, at tolerable tax rates, to meet interest payments. The point may be reached at which actual default occurs. These levels of government are not faced with the same degree of responsibility for maintaining economic stability as is the national government.

In view of these factors, state and local bond issues normally provide for a systematic program of retirement; state lam generally requires that the local governments take this action. The length of life of the bonds is limited to the expected life of the improvements. There are two systems for retirement. The older, the sinking fund system, requires that during each year of the life of the issue the government make payments into a sinking fund; the interest on the accumulating sums, plus the original payments, will be sufficient when the bond issue matures to pay it off in full. But unfortunately sinking funds are sometimes tapped for other purposes, and payments into them are not always made. As a consequence, governments have tended to shift to the alternative, the serial bond system. The maturity dates of serial bonds are spread over a period of years, a certain amount falling due each year. The issue is thus redeemed gradually, without the establishment of a sinking fund. Originally investors were inclined to resist this approach, but by the 1960s it had become more or less standard in the United States and other countries.

The states of the United States have the power to repudiate debts if they wish, since they have inherent sovereign powers. On two occasions, the most significant being in the south after the ousting of the carpetbagger governments following the American Civil War, states have repudiated debts outright. The local governments. however, being technically corporations and not sovereign governments, have no sovereign powers and thus can be sued and cannot repudiate debt. If they attempted to do so, legal action could be taken to enforce payment.

Distinct from the question of outright repudiation is that of unintended default. In the 1830s and again in the 1930s, several states of the U.S. and provinces of Canada and large numbers of municipalities were unable to meet their obligations at tax rates that were politically acceptable. In 1935 in the United States over 3.000 municipalities were in default. So far as the states and the Canadian provinces were concerned, the bondholders could not take legal action and simply had to wait until tax collections improved. At the municipal level, legal action was possible, as provided by state law; in some instances bondholders could obtain a court order requiring the levying of additional taxes. In other instances this was either impossible or futile, given the depressed conditions of the period. In four states provision was made for a state agency to assume administrative receivership of municipalities in default to straighten out their finances. In 1934 congress enacted a Municipal Bankruptcy act that provided for a revision of local government debts under court supervision. with concurrence of various percentages of the debt holders. The original law was held unconstitutional but a new law enacted in 1936 was upheld.

Government bondholders can never foreclose on government-owned property in the event of default and normally cannot proceed against the property of taxpayers or municipal officials. except to a limited extent in the New England states. It is significant that in Great Britain in the 1930s. where the depression caused acute distress, no local authority defaulted.

VI. DEBT MANAGEMENT

Distinct from the question of the desirability of borrowing or of debt retirement is that of debt management, or the choice of policies relating to the composition and nature of the debt, as contrasted to the amount of the debt. Debt management involves two separate but related aspects. The first is that of the nature of new security issues; the second deals with conversion or refunding of existing securities.

1. Policies on New Borrowing. — Governments are confronted with a number of alternative courses of action when undertaking new borrowing. The basic general rule for subordinate governments is that of adjusting the borrowing in such a manner as to minimize interest and other costs. National governments must strike a balance between low interest costs and attainment of the goals of economic stability. The precise policies that must be followed in light of this objective will depend on the relative importance attached to the interest and economic stability goals, the relative effectiveness of monetary policy and other methods of attaining economic stability, and the state of business conditions. Policies appropriate for depressions are clearly different from those suitable for inflationary periods. While the principles themselves are widely accepted, there are serious problems of interpretation of them in specific cases.

One question, of concern only during a severe emergency such as a major war, is the choice between voluntary and compulsory loans. Canada. Great Britain and other countries used a compulsory lending program to some extent during World War II; the United States considered it but relied on the voluntary approach. The compulsory system is undoubtedly more deflationary, per dollar obtained, since a greater amount of the money comes from persons uho mould otherwise spend it. But it is much less acceptable politically.

Compulsory lending offers several advantages over tax increases of equivalent amounts. Because the sums will eventually be paid back, the political opposition to the program and the possible adverse effects on incentives will be less than nith tax increases. The program may be more equitable than a tax increase for the lower income groups because the over-all final burden may be distributed to a greater extent on the higher income level than mould be possible nith the tax increase. The return of the funds might cushion a postwar depression. However, in neither Great Britain nor Canada was the wartime experience very satisfactory, largely because the taxpayers regarded the payments essentially as another tax, not as savings which they mould ultimately get back, and therefore the hoped-for advantages were largely lost.

Compulsory lending must be distinguished from a true compulsory savings program. The former method requires persons to place a certain amount of money (usually related to income) in government bonds each year. The latter method requires persons to save a certain amount during the year and place it in government bonds. A compulsory savings plan has not been attempted because of problems of enforcement. Liquidation of existing assets to offset the new saving and thus defeat the intent of the program would be very difficult to detect. But if the program could be made effective it would be much more anti-inflationary than even a compulsory lending system.

If borrowing is to be voluntary, is it desirable. in a period in which borrowing is necessitated by war or high defense spending, to appeal to persons to buy bonds on patriotic grounds? During and after World War II, the U.S. government followed this program extensively, particularly to get the bonds into the hands of individuals rather than banks and thus to minimize inflationary pressures. In a severe emergency such a program may have merit, but it is difficult to maintain the "crisis" atmosphere indefinitely. If. however, persons can be induced to commit themselves to buy bonds on a payroll deduction basis. the forces of inertia are placed on the side of recurrent bond purchases and the net effect may be to increase materially the total purchase of bonds by the lower-income groups, and reduce consumer spending.

The national government can influence to a considerable degree the extent to which the bonds are acquired by different types of purchasers. It may borrow directly from the central bank if it

wishes and the law permits; it may borrow from the commercial banks by direct sales of bonds to them, and can in fact exert strong pressure on them to buy if it wishes; it may sell to individuals, even restricting bank purchases of the issues. The choice of lender depends in large measure of the state of economic activity. In a period of depression, the goal is that of obtaining the funds with the least possible contractionary effect on individual and business spending. Thus sale of bonds to the central banking system is the most advantageous, although governments have been somewhat reluctant to follow this practice because it so closely resembles the issuance of paper money, and might cause loss of confidence in the government. Sale to commercial banks, which usually have excess reserves in depressions, is almost as good, hut gives rise to greater interest cost and places the banks in a highly liquid position when prosperity returns. This result makes control of their lending policies by the central bank difficult.

In a period of full employment and inflationary tendencies, the goal is the reverse—to borrow in such a manner as to restrict private spending to the maximum extent. Thus during World War II governments stressed their savings bond programs. Since it mas impossible to obtain adequate funds from these sources, some reliance on other sources was necessary. Sale to the banks tends to reduce their lending po er to private business under conditions of tight money and thus has some influence in reducing total spending. Sale of bonds to the central bank is in some ways the most objectionable since it not only does not reduce spending at all but actually increases commercial bank lending powers. Despite this effect, however, some persons have argued that this source of funds is preferable to sale of bonds to the commercial banks, because it avoids the heavy interest cost. Most of the profits of the central banking system revert to the government, and thus the net interest cost is minimized. In Great Britain substantial amounts of government bonds are held by some of the central government departments. These provide a further instrument for the control of the money market generally.

For subordinate units of government it is not usually possible to borrow substantial sums on a short-term basis, and thus borrowing is confined to the issuance of bonds, usually running for 10, 20 or more years. The only exception is a small amount of short-term borrowing in anticipation of tax revenue. But a national government has a much greater choice between the two methods. Traditionally, short-term borrowing was regarded as indicative of financial irresponsibility. However, beginning in the 1930s, the U.S. government and other national governments began to make increased use of this form of credit, primarily because of the much lower rate of interest. There is available, especially in depression periods, a substantial volume of loanable funds whose owners are willing to invest it only on a short-term basis, with maximum liquidity and minimum risk. Thus the amounts are available at substantially lower rates than those at which bonds can be sold.

The primary disadvantage of the short-term loan from the standpoint of economic stability is the greater degree of liquidity to the investor. In inflationary periods borrowing of this sort is less effective in reducing liquidity than is long-term borrowing. Short-term borrowing also creates a continuous problem of refunding the issues as they mature, increases the danger that large amounts of debt might come due in a period of financial stringency and embarrass the government, and renders the government's interest burden highly vulnerable to changes in the market interest rate. Short-term borrowing is particularly disadvantageous if interest rates are expected to rise in the near future.

When inflation continues for a period of time, many persons become reluctant to buy any type of fixed-money-return security. Accordingly, suggestions have been made for the issuance in such periods of bonds with fixed purchasing power; that is, interest and principal payments would be adjusted in terms of changes in the price level so that the holder would be protected from the effects of inflation. At least one city in the United States (Carlsbad, N.M.) has issued bonds of this type. But such a policy is not without difficulties if adopted by a national government. If there were strong fear of inflation, a great shifting from existing securities to the new ones would occur and would disorganize the bond markets. The change would serve as notice that the government expected inflation to continue; that in itself would be a spur to increased purchasing, which stimulates inflation. Payment of interest and principal on the basis of the higher prices would feed the inflationary pressures and increase the future financial problems of the government. One more "escalator" would be added to the economy, and inflationary pressures increased.

Most government bonds are salable and therefore may be transferred on the market and have a market price. On the other hand, they are not usually redeemable until maturity. However, in the United States, Canada, Great Britain and some other countries, at the outbreak of World War II (and to some extent in World War I), special issues known as savings bonds or savings certificates were placed on the market. They were issued in small denominations, down to $25, in order to attract the small investor. In addition, they were made nonsalable, primarily to insure the purchasers against any decline in market value such as occurred to the Liberty Loans after World War I. This feature also enabled the government to control the amounts individuals purchased and prevented a mass shift from regular issues to the higher-interest-rate savings bonds. But since they were nonsalable it was virtually imperative to make them redeemable at will in order to make them attractive to the purchaser. Persons were given an incentive to hold them, however, because the interest rate was higher the longer the bonds were held.

On most government bonds interest is paid on a periodic basis by check or by the cashing of the coupons attached to the bonds. With the savings bonds, however, the discount method was employed; the bonds were sold at less than maturity value and the interest was obtained when the bonds were redeemed. The original $25 bonds, for example, were sold for $18.75, and redeemed at $25 if held the full ten years. This technique avoided the need for making large numbers of very small payments, delayed the receipt of interest until after the major inflationary pressures were over, and facilitated the scheme of varying the rate according to the period the bonds were held in order to discourage persons from cashing them in.

Governments can borrow only at the market interest rates as determined by current demand and supply for loanable funds. A government will attempt to ascertain the rate at which a new issue can be sold by examining yields on existing issues and consulting investment banking firms. Normally an effort is made to set the rate at which the bonds will sell at par (maturity value). If the rate is set too low, the bonds will have to be sold at a discount and the effective rate will reflect the market figure; the net result of selling at a discount is often a net actual rate slightly higher than otherwise.

In a few instances governments deliberately set rates higher than the market in order to attract certain classes of investors. The primary example was the setting of an unnecessarily high rate on savings bonds during World War II in order to get as much of the debt as possible into the hands of individuals instead of the banks. Banks were not permitted to buy these issues.

In some instances the law sets a maximum interest rate that can be paid on bonds sold. If the market rate rises above this figure the sale of bonds becomes impossible and other types of borrowing must be relied upon. During World War I the maximum interest rate on federal bonds in the U.S. was set by congress at $4\frac{1}{4}\%$. This caused no difficulty until the late 1950s when market rates exceeded this figure and sale of long-term bonds became virtually impossible. Congress was reluctant to make an increase because of dislike of the federal reserve policies that had driven the market rate up in an effort to control inflation. In countries with the parliamentary form of government, such as Canada and Great Britain, interest ceilings are either completely absent or are of no significance because they can be changed at the will of the government.

While the states and local governments are completely at the mercy of the money market so far as interest is concerned, a national government can affect the rate of interest through its influence over the central banking system. The national government

can thus reduce its interest burden if it wishes, or can prevent an increase. Unfortunately, however, if such a policy is followed in an inflationary period it will interfere with effective anti-inflationary policies of the central banking system. From 1945 to 1950 in the United States interest rates mere kept lower than was probably desirable in terms of inflation control in order to keep the government's interest costs down. After 1951 the inflation control goal became dominant in federal reserve policy, but the interest goal was not completely lost sight of. Great Britain also permitted interest rate policy to dominate central bank action from World War II until after 1952. In periods of decline in business activity the interest-cost and stabilization goals coincide.

When the central banking system raises interest rates in periods of inflation, state and local borrowing is made more expensive. These governments then seek special assistance from the national government in obtaining funds more cheaply. Such aid was provided after World War II in Great Britain through the Public Works Loan board, which made loans to local authorities. There was extensive demand for this sort of assistance in Canada after 1955. The problem illustrates one of the basic difficulties of general credit control, namely, the nonselective restriction on borrowing.

A government can make its bonds more acceptable to the buyers, and thus obtain a lower rate of interest, by making the interest on the bonds tax-exempt. This was the practice by the U.S. federal government before 1941; after that date only state and local bond interest continued to be exempt from federal tax. Most other countries do not provide such an exemption.

For a particular level of government, if tax rates are progressive, the tax loss will exceed the gain from lower interest rates unless there is sufficient market among persons in the highest tax bracket to absorb all of the bonds. In this instance the interest rate savings would more or less offset the tax loss. But this is most unlikely to be the situation, and in all higher tax brackets than the one at which the two elements are in balance, the government mill lose in tax more than it gains through lower interest, while persons in lower brackets will not, presumably, buy the bonds. The shift in federal policy in the United States in 1941 was therefore desirable.

However, when the units of government involved are different, as with exemption of state and local bond interest from federal tax in the United States, the units whose bonds are exempt experience a net gain from lower interest and thus will oppose any effort by the other government to make the interest taxable. The United States originally exempted interest on state and local bonds because the 1894 income tax law had been held invalid in part because the supreme court considered the inclusion of state and local bond interest to violate the constitutional division of powers between the federal and state governments (see INCOME TAX). As the attitude of the supreme court has changed materially on this general question (federal taxation of the salaries of state employees having been held valid in 1939), it is likely that the court would accept the taxation of interest on state and local bonds. But the strong opposition of the states and local governments has prevented action by congress. although it is obvious that these governments gain less than the federal government loses. Furthermore, the exemption provides a simple avenue of tax avoidance and encourages wealthy persons to put their money into these safe investments instead of into business expansion.

Governments may sell bonds through investment banking firms in the same way that corporations do—the purchasers bidding on the issue, paying a lump sum and then reselling the bonds to their customers. This is the usual procedure for larger bond issues of state and local governments. Bonds may be sold directly to individuals, banks and business firms. Local governments sometimes sell their issues directly to local banks. The federal government sells savings bonds and other issues directly to the public; the banks and other institutions merely serve as agents. These bonds are sold on a continuous basis, the amount issued being adjusted in terms of volume purchased. Other federal bonds are sold primarily to financial institutions and banks. Treasury bills are sold at auction, largely to institutional investors. Normally, new federal issues (other than savings bonds) are "oversubscribed" in the sense that the orders exceed the amount of the issue, and are then allocated among the various purchasers.

2. *Management* of *Existing* Debt.—A major aspect of debt management is that of adjustment in the nature and structure of the existing debt, as, for example, replacement of short-term securities by long-term securities, refunding of maturing issues, transfer of securities from one type of investor to another (banks to individuals, for example), conversion of issues, and the like. This is a problem rarely faced by local and state governments because their debt is retired on a systematic basis and there is little opportunity to change the form before the date of maturity. About the only possibility of change is that of repayment before maturity if surplus funds are available or if replacement of an old issue by a new (at lower interest rates) is feasible. To facilitate such action without the necessity of buying the securities in the market, the issues are sometimes made callable so they can be paid off at maturity value (or with some premium) at any time beyond a certain year.

National governments, with their much greater variety of issues and greater responsibility for economic stability, have much more leeway in management of the existing debt. The major aspects of the policy are summarized below:

The treasury department can, if it wishes, materially change the relative size of the short-term and long-term elements in the debt. Even in the United States, control of the form of the debt rests largely with the treasury rather than with congress. Short and intermediate issues, which are constantly maturing in large volume, can be replaced by long-term bonds, or long-term bonds can be replaced by short-term issues, either as they mature or through purchase or call.

Replacement of short-term by long-term issues, advocated by many persons in the period after 1945 and attempted by the government on several occasions during that period, offers several advantages in periods of inflationary tendencies. First, it reduces the over-all liquidity of the debt structure, making it more difficult for investors to use funds in government securities for spending on consumption or business expansion. Second, increased use of long-term securities lessens the nuisance and cost of constant refunding operations and makes less frequent the danger that extensive refunding may coincide with a stringency in the money market, thus necessitating central bank action to support the government's borrowing. This action may run directly counter to the action needed in the interests of economic stability.

Distinct from the advantages of long-range lengthening of the structure of maturity of government debt are those of the change itself in the direction of greater reliance on long-term borrowing. The net effect is a tendency to raise long-term interest rates relative to those on short-term loans. This change should lessen inflationary pressures. But the actual magnitude of the effect is doubtful; direct monetary policy of the central banking system may be far more effective and simpler.

The primary disadvantage of increased reliance on long-term securities is the higher interest rate that must usually be paid. On rare occasions short-term rates may exceed long-term rates, but normally the reverse is true. It is this consideration that discouraged the government from continuing its program of lengthening the maturities of the debt in the late 1950s. Part of the difficulty lay in the reduced competitive position of long-term government bonds compared with other securities. The rapid fluctuations in government bonds, as monetary policy was used more intensively, made them less attractive investments, while private securities became more attractive as business activity remained at a high level. The increased supply of government-guaranteed mortgages also lessened interest in government bonds. It is particularly unfortunate for the government to increase the volume of long-term securities in a period in which interest rates have reached relatively high levels and are likely to fall.

In terms of cost considerations alone, the appropriate time for shift toward long-term issues is in depressions. While short-term funds become very cheap in such periods, it is more advantageous for the government to take advantage of the low rate level by

*United States savings bonds, Series A-F and J, are included at redemption value.
†Securities issued or guaranteed by U.S. government, excluding guaranteed securities held by the treasury.
‡Consists of commercial banks, trust companies and stock savings banks in U.S. and territories. Excludes securities held by trust departments.
§Holdings of federal land banks included under "miscellaneous investors" instead oi "U.S. government investment accounts" aiter 1947, when the proprietary interest of the U.S. government in these banks ended.
‖Includes partnerships and personal trust accounts. Nonprofit institutions and corporate pension funds included under "miscellaneous investors."
%Exclusiveof banks and insurance companies.
♀Consists of trust, sinking and investment funds of state and local governments and their agencies, and territories and island possessions.
δIncludes savings and loan associations, nonprofit institutions, corporate pension trust funds, dealers and brokers, and investments of foreign balances and international accounts. From Dec. 1946 on includes investments of International Bank for Reconstruction and Development and the International Monetary fund in special noninterest-bearing notes issued by U.S. government.
□Immediate postwar peak The all time end of month peak pnor to 1959 was $280,800,000 as of Dec 1955
Data taken from *U S Treasury Bulletin* (Sept 1956, p 34, Feb 1960, p 54) and *Annual Report of the Secretary of the Treasury on the State of the Finances,* p 510 (1957).

obtaining funds at the low figures on long-term issues. On the other hand, the short-term borroming keeps the lenders' investments highly liquid and facilitates their spending the sums for consumption or business expansion whenever they wish. Thus interest cost and stability considerations suggest opposite policies. The former requires shifting from short-term to long-term loans in depressions, while the former dictates this shift in periods of inflation. But the liquidity considerations are probably not very important in depression periods, nor is the gain from the shift toward long-term securities in inflationary periods. The much more important consideration is that the over-all length of issue be relatively long when inflation does arise. There is an increased trend toward a policy of relying on other policies than changes in debt maturity as a means of lessening economic stability, and of lengthening debt maturities in periods when interest rates are low.

The government may at times find it advantageous to shift the relative holdings of different types of investors. In periods of inflationary pressures, increased holdings of savings bonds and reduced holdings of the central bank and commercial banks would lessen spending in the economy and reduce the liquidity of individuals—the ability to increase spending sharply if they wish. It is for this reason that in inflationary years of the postwar period the U.S government continued to push the savings bond program even when it was not doing any net borroming. Table VI shows the changing ownership of the U.S. national debt between 1939 and 1959.

On the other hand, during a period of depression, the repayment of savings bonds through borrowing from the commercial banks and the central banking system would tend to increase total spending. Some of this effect will be attained automatically as persons cash in their savings bonds when they lose their jobs.

Government securities are held, apart from government trust funds and the central banking system, by three principal groups of investors—the commercial banks, other financial institutions and individual investors. In the United States, some tailoring of securities to the particular needs of the various investors has been undertaken through the use of the savings bonds, which hare been restricted to individuals. Some authorities have suggested that much more of this should be done, in the interests of stability and cost to the government. Edward Kevin, for example, has proposed three general forms of national debt *(The Problem of the National Debt,* 1954). The first, confined to the commercial banks, would consist of certificates without fixed maturity dates, payable at par on the option of the holder on a month's notice or by the government at any time. All of the nuisance and cost of constant refunding of short-term issues would thus be avoided. The interest rate mould be adjusted in terms of the operating costs of the banks. Second, institutional certificates would be provided for other financial institutions, with a higher interest rate, fixed maturity date and no redemption at will. Third, the securities for individuals would be roughly comparable to savings bonds and would pay a higher rate than the other two forms. These would be redeemable and nonsalable. In general the program would greatly reduce the volume of refunding and would thus free the central bank from constant concern with this problem to the neglect of credit control policy. The direct effect of debt management on stabilization would be increased through varying redemption and volumes of issues for various classes of investors.

Distinct from the question of adjustment in the structure of the debt is that of conversion designed simply to lower interest cost, without change in the nature of the debt involved. When the interest rate has fallen sharply, conversion may be highly advantageous. However, it is not possible unless the bonds are callable, except in the rare instance of forced conversion. This latter type of policy is in a sense partial repudiation and is not followed by democratic governments If the bonds involved are callable, and conversion is decided upon, the government will give the bondholders notice of conversion and give them the choice of repayment in cash if they wish.

As the term debt management is usually employed, it does not include central bank policy designed to influence the general interest rate level, which is regarded as a distinct form of stabilization policy. The two are, of course, closely related. Central bank policy controls the interest rate that the government must pay; the interest costs of the national debt can always be reduced by central bank action which increases the supply of money capital through credit creation. But such a policy may interfere with central bank attainment of the goal of increased economic stabilization. *See* also EXCHEQUER BILLS; WAR FINANCE: *Cost of World Wars I and II.*

DEBTOR AND CREDITOR LAW. The law of debtor and creditor is of narrower scope than the literal meanings of the key words might suggest. The first part of this article seeks primarily to generalize concerning the laws in the United States, but these rest on English practice to such an extent that the broad outlines are traceable throughout the Anglo-American world. The law of sales. negotiable interests, mortgages and suretyship largely has to do with the creation and delimitation of legal obligations that may be considered debts in a broad sense. Indeed, judgments for damages, *e.g.*, those arising out of automobile accidents, can produce judgment creditors and judgment debtors. The more specialized field of law discussed in this article relates primarily to the law of debt collection and the restraints imposed upon creditors from reaching the assets of debtors.

UNITED STATES

Appropriation. — Some special legal aspects of credit transactions are encountered where business is proceeding smoothly. When two parties have entered into a number of transactions with each other and one of them makes a payment, he is entitled to specify its application. Thus, if he owes a secured debt and an unsecured debt, he may elect to release the security. If the debtor does not specify the application at the time he makes the payment, the creditor is entitled to apply the payment to the unsecured debt. Indeed, it has been held that, failing instructions to the contrary by a debtor, a creditor may change his mind after having improvidently applied a payment to a secured debt and apply the payment to the unsecured debt. If neither the debtor nor the creditor appropriates a payment to any particular debt. the usual implication of law is that a payment will be applied to the oldest debt or debts outstanding.

Setoff. — Another aspect of the debtor-creditor relationship is the practice of offsetting debits and credits so as to leave a net balance, due from one party to the other. This point often fails to operate until litigation arises. The individual practice between two traders or the established custom of the market may determine whether they make numerous remittances back and forth or whether they simply have periodic accountings settled by remission of the net balances. If controversy arises, however, accounting procedures must be subordinated to legal precepts and the rules of court. A tenant, for instance, indebted to his landlord for rent may not be safe under the law of some jurisdictions in withholding rent to protect himself by reason of the landlord's breach of a covenant to repair. His action of damages for nonrepair, if he has one, may have to be handled separately, and may not be available as a setoff in a suit for rent or as a defense in eviction proceedings.

The law, however, commonly takes notice of business understanding that when parties have cross claims the debtor-creditor relationship may frequently be dealt with in terms of net balances. If one party goes into insolvent liquidation and equal cross claims are setoff, the other party suffers no loss. If setoff is disallowed. however, the solvent party will be liable to pay his debt in full and mill be allowed to rank as a creditor for a dividend from the insolvent estate. Since 1898 the federal Bankruptcy act of the United States has provided for a setoff of mutual debts and credits between the estate of a bankrupt and a creditor having a provable claim. The statute also provides against the manipulation of setoffs by debtors of the bankrupt buying up claims against him, although there is no parallel provision by which creditors are prevented from becoming debtors. Similar but somewhat different rules of setoff apply in other liquidation proceedings. Claims can be mutual in a sense to permit setoff even though they arise out of different kinds of transactions, but both parties must be acting in the same capacity on both claims. If a party with one claim is dealing in a representative or fiduciary capacity, a cross claim in his personal capacity is not available for setoff.

Collection Law. — The law outlined here is brought into active operation only in relation to the relatively small minority of credit transactions where payment is not forthcoming within commercially tolerable limits of time. After routine efforts at debt collection have proved fruitless, a claim will commonly be put into the hands of an attorney for collection. In some states of the U.S. his task will be much impeded by exemption laws.

Exemptions.—In the 19th century the pattern of exemption laws in the United States was comparatively logical and simple. Exemptions were low in the northeast and high in the south and west. The pattern has become more confusing, partly because of shifts in wealth and partly because many southern and western states which introduced exemptions with high monetary limits have failed to keep up with inflation. Few exemptions with a monetary limit dating from the 19th century constitute serious impediments to the collection of debts. Pennsylvania has no homestead exemption, while that of Illinois is limited to $1,000. The constitution of Florida exempts ½ ac. of urban property and 160 ac. of rural property, including improvements without monetary limit. The Kansas constitution extends these limits to a full acre of urban property, and part of the homestead may be rented out without losing its homestead character. Texas recognizes a "business homestead," a place used by the head of a family for business purposes. California is an example of a state that has retained monetary limits, but has frequently raised them and added new categories of exempt property. Exemptions of life insurance have been expanding broadly, even to shield the surrender values of insurance policies within the reach of the insured through reservation of power to change the beneficiary.

Creditors' Remedies. — A creditor, as such, has no rights in the debtor's property or in his earnings. Legal action to collect debts is ordinarily directed to acquiring such rights. It is sometimes possible to attach a debtor's property or to garnish his wages, bank account or other intangible rights against third persons ("on mesne process") at the outset of a suit. In the original 13 states, or most of them. such practice was routine, and still commonly exists in some, with the result that a plaintiff can sometimes tie up the resources that a defendant needs to conduct his defense. The modern trend is to limit attachment on mesne process to proceedings against the property of a nonresident or to complaints alleging various statutory types of fraud, evasion of process or actual or threatened absconding or concealment of property. The influence of the frontier upon the law of the new states was opposed to strengthening the creditor's hand, and attachments against other than nonresidents became strictly limited there. Garnishment is like attachment, except that the term is confined to proceedings against intangible assets, while an attachment on mesne process may issue against land or chattels. All collection process is statutory, although some of the interpretations of U.S. courts trace back to "common law statutes," adopted in England before the colonization of the country and woven into American legal concepts when not rejected as inapplicable to local conditions. Garnishment, particularly, is often treated as a formal matter not sufficiently flexible to meet various collection needs, so the creditor may have to rely upon other statutory or equitable remedies.

Liens by Legal Proceedings. — Apart from cases in which an alleged debtor contests and defeats an alleged creditor's claim, the effectof a judgment for a creditor may be considered here. The judgment itself may automatically constitute a lien (*q.v.*) upon any real estate of the defendant within the "bailiwick," which for trial courts of record is typically countywide. In some states further ministerial action such as docketing or recording is necessary. In others, a lien upon land can be obtained only by attachment or execution, and some further process is necessary everywhere to reach personal property. A common method is by issuing a writ of execution, whereby the clerk of the court attests an order directed to the sheriff to make of the goods and chattels of the defendant the amount of the plaintiff's judgment with interest and

costs. This is done by sale at public auction, but the creditor is often the only bidder, and he makes his purchase by setting off all or part of his claim against the purchase. He seldom bids more than his debt, interest and costs. To levy an execution it will frequently be necessary for a representative of the plaintiff, or his attorney. to accompany a deputy sheriff and point out property of the defendant. The sheriff is likely to exact indemnity from the creditor against liability on his official bond for a wrongful levy. Until a statute of 29 Charles II (1676), an execution created a lien on property in the bailiwick from the date of the official authorization of the writ, but the critical time was then made the delivery of the writ to the sheriff. Both rules have following in the United States. In some states there is no lien prior to levy. Any lien may become vulnerable as in fraud of other creditors or may be otherwise lost by undue delay in enforcement.

Executions have tended to become less effective than they were in the days of smaller populations. simpler business and less intangible property. An execution returned unsatisfied is sometimes a legal condition precedent to other forms of relief, but in many situations this has become merely a formal requirement met by the sheriff at the request of the creditor's attorney without any attempt to locate property. Garnishment or attachments may issue in aid of execution as well as upon mesne process.

Creditors' Bills.—Courts of equity several centuries ago developed the precept that equity would not suffer a right to be ithout a remedy, and the so-called concurrent jurisdiction was developed to operate where a complainant could show a legal right and a lack of adequate remedy of law. Two types of creditors' bills developed. A special creditors' bill was like an equitable execution in reaching assets which could not be reached at law. Upon a prayer for discovery a defendant could be compelled to disclose the nature and location of hidden or intangible assets. subject to the sanctions of perjury and contempt. **A** general creditors' bill mas developed commonly in connection with receiverships to administer all the assets of an insolvent debtor for the various classes of creditors as their interests might appear. The modern trend has been along lines by which law and equity are applied in a single court. A concurrent development has been statutory "supplementary process," where the power of the court to coerce debtors can be summarily applied in appropriate cases.

Fraudulent Conveyances.—Debtors have frequently tried to put their property into friendly hands for their benefit, or to be generous to their family and friends at their creditors' expense. Creditors may frustrate such attempts as fraudulent conveyances. The law on this topic was developed under the Statute of 13 Elizabeth I, c. 5 (1570). Such transfers can be valid between the parties (although a transfer with actual fraudulent intent upon a secret trust for the grantor may disqualify the parties from obtaining help of the court in carrying out their intent). In any case. if a debtor seeks to cover up his property by transfers or to be generous to donees rather than just to his creditors, the creditors may either levy upon the transferred property as if it still belonged to the debtor or bring a bill in equity to have the transfer set aside. Although some courts have held to the contrary, the clear language and intent of the Statute of Elizabeth and of most state statutes in the same tradition permit the character of the alleged fraudulent conveyance to be tried in an action to obtain possession after the property has been sold under an execution. At common law it was necessary for the creditor to obtain judgment and have his execution returned unsatisfied before he could bring a bill in equity, but the Uniform Fraudulent Conveyance act, in force in 20 states, and the Rules of Federal Procedure for the District Court of the United States permit a creditor to establish his claim and attack a fraudulent conveyance in a single proceeding.

Forced sales generally destroy going-concern values. When a business has such value, it may be advantageous to creditors to conserve it by working out some friendly adjustment under which the debtor can get an opportunity to discharge his debts at least in part. His creditors may agree to extend time, and while the promise of one creditor to accept less than full satisfaction of an undisputed claim would be legally unenforceable for want of consideration, the agreement of several creditors to settle on like terms without secret advantage to any will be upheld as an enforceable composition at common law. Creditors' committees are often formed to supervise a debtor's business during the performance of an extension or a composition agreement. Such arrangements do not bind nonassenting creditors at common lam, but the C.S. Bankruptcy act provides in ch. xi a procedure for binding minority creditors under arrangements approved by the court.

Receiverships.—Sometimes creditors initiate a general creditors' bill for the appointment of a receiver (*q.v.*) with a view to sheltering the business from destructive levies while a creditor's arrangement is being worked out. Receivers are sometimes authorized to carry on business under the protection of a court order and subject to general supervision by the court. Such a receivership may result in a reorganization of the debtor's business, with some readjustment of the proprietary interests as well as the debts. If the business does not prosper under the receiver's direction, it will probably have to be liquidated. If it can be sold as a going concern to another enterprise, however, it may produce a better price than piecemeal sales of assets.

Assignments for the Benefit of Creditors.—If a debtor finds it necessary to liquidate his business without the intervention of a bankruptcy court, he may try conveying all his nonexempt assets to assignees for the benefit of creditors, who will be responsible as trustees for distributing the assets. This may not achieve the purpose of avoiding bankruptcy, because such as assignment is an act of bankruptcy and, in the United States, any one of 11 creditors or less, or any three of 12 or more creditors "who have provable claims liquidated as to amount and not contingent as to liability . . . which amount in the aggregate in excess of the value of securities held by them, if any, to $500 or over," may upset the assignment by a petition in bankruptcy. Nevertheless, such assignments are sometimes achieved when the creditors trust the integrity of the debtor and the assignees, particularly in states where statutory regulations are not unduly burdensome. During the long periods when there was no bankruptcy act in force in the United States, assignments for the benefit of creditors regulated by state insolvency laws were frequently the best available means of liquidation.

Bankruptcy.—The entire subject of bankruptcy (*q.v.*) has an important bearing on the law of debtor and creditor. Security transactions must be conducted so as to withstand attack on possible bankruptcy proceedings. Since receiverships as well as assignments for the benefit of creditors are acts of bankruptcy, they are conducted under comparable limitations and may be short-lived. Liens by legal or equitable proceedings are voidable if the debtor's assets at a fair valuation are less than his liabilities and if bankruptcy proceedings ensue within four months. The trustee in bankruptcy may set aside any payments made or security given in respect of a debt that is wholly or partly unsecured when the purpose was to give one creditor an advantage over other creditors, at a time when the debtor was insolvent and the creditor had reasonable grounds for being aware of it. These possibilities must be weighed when credit is extended and again when the race for collection is on. The shadow cast by the Bankruptcy act may in some instances promote caution in the extension of credit. It may also serve to warn the aggressive creditor that if he destroys the debtor's going-concern value by a levy, he may not be permitted to retain the fruits of his diligence. Parties entering into friendly adjustments are well advised to take into account the potential operation of the Bankruptcy act.

(J. A. MacL.)

GREAT BRITAIN

In British law a debt exists when a sum of money is due from one person, a debtor, to another, a creditor. Not only is the debtor required to pay but the creditor has the right, which he can legally enforce, to receive payment.

Debts may arise in various ways, but by far the greatest number come into being under contract, either as specialty or simple contracts. The former may consist of a deed or other instrument

under seal such as a mortgage; but although a specialty debt at one time had the advantage of prior allocation of assets over debts created under a simple contract, this advantage no longer exists. Specialty debts do, however, possess an advantage as regards the right of action; the Limitations act. 1939, gave a time limit of 12 years for the settlement of a specialty debt as compared with 6 years under a simple contract.

A simple contract debt is one not provided for by deed or record. It is probable that the bulk of debts arising from the intricate ramifications of daily business life are simple contract debts.

Debts may also arise under statute, like those created by the Companies' act, 1948, dealing with calls on shares. They may be debts of record, the proofs of which are the records of a court. Judgment debts, which are among the most important of this class, are debts which come into being following a judgment or decree of a court of record. A simple example is the award of damages against a tort-feasor. Liability in damages is not a debt, but if there is a failure to meet it, a successful action to recover would result in a judgment constituting a judgment debt.

Debts due to the crown are known as crown debts. The crown holds a specially privileged position in Britain; thus, on the death of a debtor, crown debts have priority in repayment. Again, if a debtor becomes bankrupt but later receives his discharge from bankruptcy, liability for crown debts continues.

In law, debts may be assigned, and such assignment is valid if absolute and in writing. A bill of sale (*q.v.*) is the term usually applied to the act of assignment, which differs from pledging or pawning in that the creditor does not take possession of the goods assigned. A number of statutes under the general title Bills of Sale acts have been passed, of which only those of 1878 and 1882 need be mentioned. Both have as their aim the prevention of fraudulent bills of sale, the former being designed to protect the creditor, the latter the debtor.

Debts are sometimes referred to as secured debts and, as the term implies, the creditor has some measure of security over and above mere liability on the part of the debtor to pay. Such debts are by no means uncommon. Thus a loan on a house may be secured by a mortgage, loans by banks to their customers may be secured by guarantee, while a judgment by a court of record is an added and valuable security.

Just as a debt is a sum of money due, a debtor is the party who owes the debt; but curiously, he is difficult to define. The Bankruptcy act, 1914, has a somewhat complex reference to debtors, but essentially it embraces all persons who are resident in or transact business in Britain. This, however, does not restrict the term debtor to British subjects only, for an alien carrying on business in Britain is a debtor within the meaning of the statute when an act of bankruptcy is committed. This approach is not entirely satisfactory. The position might be considered from the angle of the creditor whose urgent problem is the ability to recover a debt. The relation of banker and customer has been held in Britain to be that of debtor and creditor, coupled of course with the obligation on the part of the banker to honour a customer's checks when the account is in credit. If, however, a customer overdraws his account, this will be regarded as a tacit request for a loan. In the case of a partnership, common law deems every partner to be liable for partnership debts to the full extent of his personal property. As between partners, each must contribute to the debt liability in the same proportion as his share of the profits. In the case of a company, debts cannot be recovered if they were contracted for a purpose outside the company's powers. Debts contracted by infants can be recovered only if incurred for necessities, a loose term dependent on the facts of each case. It will be seen from these few examples that a person from whom a creditor can effectively recover, if this is applied as a test of the meaning of debtor, may vary considerably both as to class and capacity.

A creditor is one to whom a debt is due. He will be described legally in differing terms according to the way in which the debtor-creditor obligation was established.

By the law of bankruptcy, or when a debtor dies insolvent, creditors claiming a share of the available assets may be grouped as secured and unsecured. For some purposes, a creditor will be deemed to be secured only for the part of the debt due to him after deducting his security. As a creditor in such circumstances may well incline to undervalue his security, the bankruptcy rules authorize the trustee or other official to purchase the security at the creditor's valuation. A creditor who presents a petition for adjudication in bankruptcy is known as a petitionary creditor, and he may take this action only if the debt amounts to £50 or more. If there are several creditors, the aggregate debt must total £50.

Almost all persons may be made bankrupt. These include a married woman, who for this purpose will be treated as a feme sole, and a convict. Various disabilities are imposed on bankrupt persons, such as limitations on incurring further debts and the holding of public office.

A liability for debt incurred by two or more persons may be joint and several, thus giving the creditor the option of suing either one or more of the debtors separately, or all jointly. If one of the debtors alone has to pay, he has a right of contribution from the others according to their respective shares.

The doctrine of fraudulent preference was evolved to prevent the voluntary distribution of a debtor's property among his creditors so as to defeat the rules of distribution under the Bankruptcy act. Therefore every distribution will be void if made within three months of the act of bankruptcy.

The position of creditors of those dying insolvent is governed by the Administration of Estates act, 1925, which lays down rules determining the distribution of an insolvent estate. *See* PRACTICE AND PROCEDURE: *England: Judgment and Execution; see* also references under "Debtor and Creditor Law" in the Index volume.

(GA. S.)

DEBUSSY, (ACHILLE) CLAUDE (1862–1918), French composer who expressed the musical ideals to which the painters and writers of his time aspired, and who was one of the principal figures in the evolution of music between Wagner and the middle of the 20th century. Born at St. Germain-en-Laye, near Paris, on Aug. 22. 1862, he was the son of a former soldier in the marines who intended that he should become a sailor. The works of his mature years, *Sirènes, La Mer* and the sea music in *Pelléas et Mélisande* show his nostalgia for the sea, which he evoked with great imagination and poetry. His musical gifts were discovered by Antoinette Flore Mauté, mother-in-law of the poet Verlaine, and he entered the Paris conservatory in 1872; there he studied the piano with Antoine Marmontel and composition with Ernest Guiraud. Though he lived in poverty, he cherished an innate sense of luxury, which he was able to satisfy, between 1879 and 1882, by engagements as chamber pianist at the Château de Chenonceaux and at the palatial residences in Switzerland. Italy and Russia of Nadezhda von Meck, the patroness of Tchaikovsky. In 1884 he won the Prix de Rome with the cantata *L'Enfant prodigue* and spent the following two years at the Villa Medici in Rome, where new horizons were opened by *Lohengrin* and the works of Orlando di Lasso and Palestrina, as revealed to him by Liszt.

From 1888 to 1892 Debussy developed under influences that ranged from *Tristan, Meistersinger* and *Parsifal,* all heard at Bayreuth, to Gregorian chant and the Javanese *gamelan* orchestra, introduced at the Paris exhibition of 1889. He was also attracted to the paintings of the Nabis, a group of Impressionists, and the many English associations of the *art nouveau* movement; this attraction was reflected in his setting of a French translation of D. G. Rossetti's *Blessed Damozel* (1887–89). Other early works were inspired by Edgar Allan Poe's "Fall of the House of Usher," left unfinished; Baudelaire's *Fleurs du mal;* and Henri de Regnier's *Scènes au Crépuscule,* later developed into the *Nocturnes* for orchestra (1892–99). The first concert of his works was given in Brussels on March 1, 1894, at the gallery of La Libre Esthétique, which was hung with the freshly painted canvases of Renoir, Gauguin, Sisley and other Impressionists. With the exception of the String Quartet (1893) and the late sonatas and piano studies, the whole of Debussy's work was enriched by pictorial or poetic themes. With his illustration of Mallarmé's *L'Après-midi d'un faune* (1894), he approached the realization of the ideal, common

to the poets of Mallarmk's circle, of the fusion of the arts.

In 1893 he was present with Mallarmk at the first performance of Maeterlinck's *Pelldas et Mélisande,* an allegory of innocence and guilt plunging far into the dream world. Over the following nine years, when the psychological theories of the dream, as expounded by Wagner, Poe and Freud, were increasingly taking root in the arts, Debussy gradually evolved an original musical style that enhanced the symbolism of Maeterlinck's allegory and established opera as an imaginary theatre of the mind. The first performance of *Pelldas et Mélisande* (Opéra Comique, April 30, 1902) met with some hostility; the adverse feeling was soon overcome, however, though by its nature this entirely poetic conception of opera was to remain unique.

The composition of *Pelldas* liberated Debussy's imagination on another plane, and he further developed his style in the orchestral triptych *La Mer* (1905), followed by the largest of his orchestral works, the *Images* (1906–09). These and other works of this period, which are largely parallel expressions of the aesthetics of Marcel Proust, consist of finely drawn musical images that arouse innumerable sensations and half-forgotten memories.

In 1904 he had abandoned his first wife, Rosalie Texier, for Emma Bardac, to whom his daughter, Claude Emma, was born in 1905, and whom he married in 1908. In the same year he dedicated to his daughter a group of piano pieces called *Children's Corner.* Afflicted with cancer and unable to meet his debts, he undertook concert tours throughout Europe and Russia from 1909 until 1913; his works of this period include the 24 *Préludes* for piano, incidental music for the mystery play *Le Martyre de Saint-Sébastien* by Gabriele d'Annunzio, and the ballet *Jeux* (1913). During World War I, he wrote some of his finest works, the twelve *Études* for piano and three sonatas for various instruments. He died in Paris, March 25, 1918.

In form, harmony and instrumentation Debussy greatly enriched the musical language. His free structures are in the form of sophisticated improvisations since his ideal was music "that should seem not to have been written down." In his orchestral works he explored little-used registers of instruments, sought novel combinations and gave to each instrument, even the divided strings, a role of its own in the manner of a vast chamber orchestra. In his piano works he created the most original style since Chopin by experimenting with new sonorities, contrasts of register and effects obtained by a subtle use of the pedals. His vocal music is in the form of a supple recitative alive to the inflections of French speech.

The significance of his work is twofold. First, by his use of the pentatonic and Gregorian modes and his development of the whole-tone scale. he enlarged the musical horizon to embrace the musical civilizations of the middle ages and of the orient. On the other hand, the distinctions that he challenged between consonance and dissonance became the basis of many new harmonic developments. He expressed the quintessential sensibility of the generation before World War I and also was a Janus-headed figure who faced both the remote musical past, which he was able to revive, and the stylistic eclecticism of later generations.

See L. Vallas, *Claude Debussy et son temps, 2nd* ed. *(1958)*; E. Lockspeiser, *Debussy: his Life and Mind,* vol. i (1962). (E. LR.)

DEBYE (DEBIJE), **PETER JOSEPH WILLEM** (1884–), Dutch physical chemist who received the Nobel prize for chemistry in 1936 for his contributions to the study of molecular structure. was born at Maastricht, Neth., on March 24, 1884. He was educated at the Technische Hochschule at Aachen (1900–05) and at the University of Munich, where he obtained his doctorate in 1910. After occupying chairs of physics successively in Ziirich, Utrecht, Gottingen and Leipzig, he was appointed director of the Kaiser Wilhelm institute for theoretical physics in Berlin in 1935, leaving there in 1940 for Cornell university, Ithaca, N.Y. His researches included the theory of salt solution, polar molecules, dipole moments and molecular structure, and he showed that substances could be used in powder form for X-ray crystallography, thus obviating the necessity of preparing good crystals. He successfully extended to the crystalline solid state S. A. Arrhenius' idea of the ionization of salts in solution; and in the previously anomalous cases of concentrated solutions he studied quantitatively the association of the solute with the molecules of the solvent. Debye's work on electrical polarity in molecules led to an increased knowledge of the arrangement of the atoms in the molecule and to the measurement of the distances between them.

DECALOGUE (TEN COMMANDMENTS; Heb. *'aseret ha-devarim,* Gr. *deka logoi,* "ten words"), a list of religious obligations divinely revealed to Moses on Mt. Sinai and engraved on two stone tables. The term is applied to two different collections, that of Ex. xx, 2–17 (= Deut. v, 6–21), sometimes called the '(ethical decalogue," and that of Ex. xxxiv, 14–26, called the "ritual decalogue." The latter prescribes ritual and cultic observances only and is probably to be assigned to the time of Solomon, though the practices themselves are much older.

The date of the Ten Commandments depends upon the view held of its purpose. If it is simply a brief summary of the legal and priestly traditions, it would have to be of relatively late date. It has been regarded as an epitome of prophetic teachings, and therefore placed after Amos and Hosea (*i.e.,* after 750 B.C.). In Hos. iv, 2 and Jer. vii, 9 there are lists of some crimes prohibited in the Decalogue.

On the other hand, it is also possible to argue for a very early date, even pre-Mosaic times. The traditions of Exodus and Deuteronomy connect the Decalogue with Moses and the Sinai covenant between Yahweh and Israel, and this becomes plausible in the light of the formal characteristics of international covenants in pre-Mosaic times. These covenants, known from Hittite and Canaanite and even Egyptian sources, were usually suzerainty treaties in which a "great king" bound to himself the king of a smaller state as a vassal. The written text of the covenant began nith an identification of the king who "gave" the covenant, continued with a historical prologue in which the great king described his benevolent deeds in behalf of the vassal, and then stipulated the obligations which the vassal bound himself to obey. Thus far, the Decalogue has exactly the same structure. though in far briefer extent. It is generally admitted that the commandments themselves have been considerably expanded; originally all of them were short, concise statements only two to four words in length (in Hebrew).

The Decalogue can thus be regarded as the text of a covenant between Yahweh and Israel that reflects Late Bronze Age covenant forms (1500–1200 B.C.). The purpose was to establish a lasting relationship between the two parties to the covenant, in which Israel was bound to obey the stipulations defined in the commandments and Yahweh became its suzerain and protector. Other parts of the old covenant form appear elsenhere in the historical and legal traditions as well. Covenants of this type were deposited in a sanctuary, just as the tables of stone were placed in the Ark of the Covenant (a portable sanctuary), and were supposed to be read publicly at stated periodic intervals. The covenant had witnesses, as did most legal forms in antiquity; the Hittite-Canaanite covenants were nitnessed by a list of gods. The Israelite traditions know of heaps of stones (Josh. xxiv, 27) or the people themselves (Josh. xxiv, 22) acting as uitnesses. Sanctions for the covenant were blessings and curses, which were exclusively acts of the gods in the form of material and social well-being or calamity respectively. Disease, war, famine, drought and destruction were especially connected with breach of covenant, as in Deut. xxvii–xxviii.

The commandments themselves contain little that was new to the ancient world. Prohibition of other gods is parallel to the stipulation of the Hittite treaties that the vassal commits breach of covenant if he enters into relationships with other kings. The prohibition of images of Yahweh may possibly be a later addition, but no image of Yahweh has been found in Palestinian excavations and no certain reference to such an image is found in the Old Testament. The "vain" use of the name of Yahweh is certainly a prohibition of false oaths. This, like the rest of the commandments, was common morality throughout the ancient near east. Disrespect for parents, murder, theft, adultery, false accusation

were in at least some respects punishable in most legal systems of which we have knonledge. The meaning and purpose of the Sabbath at this early date is unknown, though there are possible similarities to Old Babylonian customs.

From this point of view the Decalogue is not law strictly speaking. It is simply the description of the conditions accepted by the community in its relationship to Yahweh. The law collections such as Exod. xxi–xxiii provide the death penalty for violation of nearly every one of the Ten Commandments. for such violation endangered the relationship of the entire community to God. but the Decalogue itself makes no provision for punishment other than the presumed blessings and curses nhich probably were originally a part of the covenant itself.

The expansions of the original short stipulations and the differences between the Exodus and Deuteronomy versions of the Decalogue show that it was being reinterpreted in the process of transmission from generation to generation during the Old Testament period. The particularly sacred nature of the Decalogue to postbiblical Judaism is indicated by the Nash papyrus from Egypt. written about a century before the time of Christ, which consists of a single leaf containing the Ten Commandments, in a form identical to neither the Exodus nor the Deuteronomy version, and the Shema (the Jewish confession of faith; Deut. vi, 4–5). The purpose of this single sheet of writing is unknown.

The Decalogue was of no particular importance in Christian tradition until A.D. 1246 when it was for the first time incorporated into a manual of instruction for those coming to confession. The traditional division of the commandments into two "tables of duties" toward God and toward man made it possible to regard the second table as a succinct statement of the "law of nature" within the framework of medieval Christian theology. With the rise of Protestant churches new manuals for instruction in the faith were soon made available, and the Decalogue was incorporated into various catechisms as a fundamental part of religious training especially of the young.

There is no agreement concerning the enumeration of the ten commands. Jewish tradition makes the prologue, "I am the Lord your God" the first command and the prohibition of other gods and images the second. Medieval Roman tradition, followed also by Luther, regarded all this as the first command and divided the prohibition of coveting into two commands. The Greek Orthodox and Protestant Reformed traditions treat the prologue and prohibition of other gods as the first and prohibition of images as the second command.

DECAMPS, ALEXANDRE GABRIEL (1803–1860), one of the first French painters of the 19th century to turn from neoclassicism to romanticism, was born in Paris on March 3, 1803. In 1827 he traveled in Asia Minor and reproduced oriental life and scenery with a bold fidelity to nature, using a technique that brought out new effects of light and colour and made his works the puzzle of conventional critics. He was probably the first of European painters to represent scenes from Scripture history with their true and natural local background. Of this class were his "Joseph Sold by His Brethren," "Moses Taken From the Nile" and his scenes from the life of Samson, nine vigorous sketches in charcoal and white.

Decamps also produced a number of genre pictures, chiefly of scenes from French and Algerian domestic life. Probably the best known of all his works is "The Monkey Connoisseurs," a clever satire of the jury of the French Academy of Painting, which had rejected several of his earlier works because of their divergence from any known standard. He died at Barbizon on Aug. 22, 1860, in consequence of being thrown from a horse while hunting at Fontainebleau.

DECAPBLIS, a league of ten Greek cities of Coele Syria, probably established by Pompey as part of his eastern settlement in 63 B.C., from which year most of them date their civic eras. Most of the cities—Scythopolis (Beisan, *q.v.*), Hippos, Gadara (*q.v.*), Abila (or Raphana, in the list of the elder Pliny), Dium, Pella, Gerasa (*q.v.*, now Jerash) and Philadelphia (Amman, *q.v.*) formed a continuous block of territory bounding the Jenish principality on the east. Canatha lay detached to the northeast in Auranitis (the modern Hauran in Syria) and Damascus (*q.v.*), which was its capital, lay even further to the north. Capitolias, founded in A.D. 97 or 98, may have been a later accession. or was perhaps Pliny's Raphana under a new name. The league, which was probably religious in character. survived to the 2nd century. The cities nere all originally in the Roman province of Syria, but some were later temporarily annexed to the kingdom of the Herods. and some later still transferred to the province of Arabia in A.D. 106. *See* also SYRIA: *Hellenistic and Roman Syria.*

See H. Guthe, *Die griechisch-römischen Stadte des Ostjordanlandes* (1918). (A. H. M. J.)

DECATHLON, an athletic competition lasting two days in which contestants are required to take part in ten track and field events. It was introduced as a one-day event at the Olympic games in 1912 and the first U.S. championship was held in 1915.

Decathlon events are: (first day) 100-m. dash, broad jump, shot-put. high jump and 400-m. run; (second day) 110-m. hurdles, discus throw, pole vault, javelin throw and 1,500-m. run. Competitors are scored for their performance in each event according to a table established by the International Amateur Athletic federation. The table is changed periodically in order to keep pace with progress in individual events. The first table lasted from 1912 to 1936, at which time the decathlon became a two-day competition. Another adjustment to the table was made in 1950.

Hans Sievert of Germany set the world's record under the original tahle at 8,790.46 points in 1934. Fractional scoring was eliminated in 1936 and the first record holder under the new table mas Glenn Morris of the U.S. with 7,900 points. Robert Mathias of the U.S. raised this mark to 8,042 in 1950 and then set the first record under the 1950 table at 7.887 points in 1952.

After 1955, the record alternated between Rafer Johnson of the U.S. and Vasily Kuznetsov of the U.S.S.R. Johnson broke Mathias' record with 7.985 points in 1955 and Kuznetsov raised it to 6.013 in 1958, only to have Johnson score 8,302 the same year in a dual meet at Moscow. Kuznetsov reclaimed the record with 8.357 in 1959, but Johnson raised it again to 8.683 in 1960. Other 8.000-point men under the 1950 table have been Dave Edstrom of the U.S and C. K. Yang of the Republic of China. *See* also OLYMPIC GAMES. (E. J. G.)

DECATUR, STEPHEN (1779–1820), U.S. naval officer who held important commands during the War of 1812, was born at Sinnepuxent, Md., on Jan. 5, 1779. He entered the U.S. navy as midshipman in 1798, was promoted lieutenant and saw service in the short naval war with France (1798–1800). In 1803 he served in Commodore Edward Preble's squadron in the Mediterranean, and in Feb. 1804 led an expedition into the harbour of Tripoli to burn the U.S. frigate "Philadelphia," which had fallen into Tripolitan hands. He succeeded and made his escape under battery fire with only one man wounded. This exploit earned him his captain's commission and a sword of honour from congress. He was engaged in all the attacks on Tripoli during 1804 and 1805.

In the War of 1812 his ship the "United States" captured H.M.S. "hlacedonian." In 1813 he was appointed commodore to command a squadron in New York harbour, soon blockaded by the British. In an attempt to break out in Jan. 1815 his flagship the "President" was forced to surrender to a superior force. Subsequently he commanded in the hlediterranean against the corsairs of Algiers, Tunis and Tripoli with great success. He was made a Navy commissioner (Nov. 1815), an office which he held until killed in a duel with Commodore James Barron at Bladensburg, Md., on hlarch 22, 1820. A toast of his has become famous—"Our country! In her intercourse with foreign nations may she always be in the right; but our country, right or wrong.'!

DECATUR, a city of northern Alabama, U.S., 85 mi. N. of Birmingham, is the seat and trade centre of Morgan county. Stimulated by the Tennessee Valley authority (TVA) program, its location on the navigable Tennessee river has led to growing port traffic. recreational development and diversified manufactures.

Chief products are man-made fibre (Acrilan), air-conditioning equipment, copper and aluminum tubing, steel barges and boats and food and feed items. Incorporated in 1820 as Rhodes Ferry, it was chartered and named for Stephen Decatur in 1826. In 1832 it became a terminal for Alabama's first railroad from Tuscumbia. Occupied by both armies and practically destroyed during the Civil War, it was rebuilt in the 1870s and 1880s. The present city was formed in 1927 by the amalgamation of Decatur and Albany (formerly New Decatur). Several ante-bellum buildings in and near the city have much appeal to visitors: the Old State bank building (c. 1832), the McEntire house (1824), Rocky Hill castle (1820s) and Gen. Joseph Wheeler's home. For comparative population figures see table in ALABAMA: *Population.* (J. A. TR.)

DECATUR, seat of De Kalb county, Ga., U.S., and a residential suburb of Atlanta (*q.v.*). Originally it was a trade centre for small farmers with few slaves. Its urban growth was tied to the transportation hub 6 mi. W. of the town which became Atlanta. Decatur was incorporated as a town in 1823 and named for Stephen Decatur. It adopted a city-manager form of local government in 1921 and was chartered in 1922. With the declining importance of agriculture in the area, industry assumed some importance. Manufactures include foods, cameras and paints. Industrial plants and warehouses are zoned. The residential area is attractive in a wooded setting. Agnes Scott college, for women (Presbyterian, chartered 1889), and Columbia Theological seminary (also Presbyterian) are in Decatur. Stone Mountain memorial (*q.v.*), the largest mass of exposed granite in North America, is in De Kalb county. For comparative population figures see table in GEORGIA: *Population.* (Js. C. B.)

DECATUR, a city in central Illinois, U.S., seat of Macon county, is located 37 mi. E. of Springfield on a bend in the Sangamon river which was dammed in 1922–23 (and improved in 1956) to form Lake Decatur. In addition to providing an adequate water supply for home users and industry the lake has become a centre of recreational activity for the surrounding region.

The city, an important communication centre, has large corn and soybean processing plants and is also significant in the manufacturing of tractors and motor-driven graders, structural and sheet steel, iron castings, automatic transmissions and carburetor parts, plastic products and gas and water main equipment. The principal shops of the Wabash railroad and a U.S. army signal corps depot are located there.

The city was not incorporated until 1839 although it was named after Stephen Decatur and located at the time of the creation of Macon county in 1829. The Lincoln family settled 9 mi. S.W. of Decatur on the Sangamon river in 1830 and Abraham Lincoln was well known in the area. The old log courthouse (erected 1829), where he often transacted legal business. stands in Fairview park. It was at Wigwam Convention hall (now marked by a plaque) that Lincoln on May 9, 1860, received his first endorsement as presidential candidate. Following the Civil War the Grand Army of the Republic mas organized in Decatur on April 6, 1866.

Decatur's 1,300 ac. of public parks and playgrounds represent nearly 18 ac. per 1.000 population. almost double the standard recommended by the National Recreation association. Millikin university (Presbyterian, founded 1901) is an important factor in the cultural life of the community. In addition to its conservatory of music, it offers training in liberal arts and science, education. commerce and several vocational fields. Graduate study is offeredin music and education. Pop. (1960) city 78.004; standard metropolitan statistical area (Macon county) 118,257. For comparative population figures see table in ILLINOIS: *Population.*

(R. M. SU.)

DECAZES, ÉLIE, DUC (1780–1860), French statesman remarkable for his liberal policy in the early years of the Restoration, was born at St. Martin-de-Laye, in Guienne. on Sept. 28, 1780. He studied law, became a judge in the tribunal of the Seine in 1806 and was made a judge of appeal at Paris in 1811. After the abdication of Napoleon (1814), he declared himself a supporter of Louis XVIII, to nhom he remained faithful during the Hundred Days. Appointed prefect of the Paris police by Louis XVIII in July 1815, he succeeded Joseph Fouché as minister of police in September. His resolute measures to stop the excesses of the royalist reaction earned him the hatred of the Ultras. Elected deputy for the Seine in Aug. 1815, he became the leader of the Constitutionalists (moderate royalists) and, in Aug. 1816, persuaded the king (whose personal friend he had become) to dissolve the chamber of deputies, in which the Cltras had a majority. His skilful manipulation of the elections of Oct. 1816 gave the Constitutionalists a majority, and the new electoral law voted in Feb. 1817 further strengthened their control.

On the resignation of the duc de Richelieu (Dec. 1818), a new ministry was formed, nominally under Gen. J. J. P. A. Dessolle, but in fact under Decazes, the minister of the interior. His projects for reform met with the hostility of the chamber of peers, where the Ultras were in a majority. To overcome this, he persuaded the king, in March 1819, to create 60 new peers. The government then secured the enactment of its very liberal press laws, which included the abolition of the censorship. Further measures, including the reorganization of finances. the protection of industry and the carrying out of large-scale public works brought renewed economic prosperity to the country.

The other European powers, however, viewed the growth of liberalism in France with anxiety. Their alarm was increased when Henri Grégoire (*q.v.*), who had been a bishop under the Revolution's civil constitution of the clergy, was elected to the chamber of deputies. The threat of foreign intervention rather than the attacks of the Ultras forced Louis XVIII to urge a change in the electoral law which would make an election such as Grégoire's impossible in the future. Refusing to consider such a policy, Dessolle resigned. Decazes then became head of the new ministry (Nov. 19, 1819).

The exclusion of Grégoire from the chamber and the projected changes in the franchise embittered the left without conciliating the Ultras. When on Feb. 13, 1820, the duc de Berry (*q.v.*) was murdered, Decazes was loudly accused by the Ultras of being responsible for the crime. He offered his resignation and, under pressure from the royal family, the king reluctantly accepted it (Feb. 18).

Raised to ducal rank in the French peerage on Feb. 20 (he had already been granted the Danish title of duke of Gliicksbjerg in 1818), Decazes was appointed ambassador to Great Britain, but returned to France in 1821 to sit in the house of peers. After 1830 he gave his support to the July monarchy. In 1826 he had organized a society to develop the coal and iron of Aveyron, and in 1829 the name of Decazeville was given to the principal centre of the industry. He died at Decazeville on Oct. 24, 1860.

His son and successor as duc Decazes, LOUIS CHARLES ÉLIE (1819–1886), who used the title of duc de Glucksberg in his father's lifetime. was born in Paris on May 9. 1819. Entering the diplomatic service. he was minister plenipotentiary at Madrid and at Lisbon under the July monarchy. He retired to private life in 1848. but was elected a deputy to the national assembly by the Gironde *département* in 1871 and was minister of foreign affairs from 1873 to 1877. He died at the Château de Graves (Gironde) on Sept. 16, 1886.

For the elder Decazes *see* E. Daudet, *Louis XVIII et le duc Decazes* (1899) and *L'Ambassade du duc Decazes en Angleterre* (1910); *R.* Langeron, *Decazes, ministre* du *roi* (1960). (*G.* DE B. DE S.)

DECCAN (Sanskrit DAKSHINA, "the South") signifies strictly not the entire Indian peninsula south of the Narmada river, but only the high and relatively cool land of the Deccan plateau between the Narmada and the Tungabhadra-Krishna river, although it is sometimes also taken to include the Mysore plateau. From the Godavari southnard it corresponds to the ancient subdivision of India, Kuntala. From Nov 1, 1956. the region corresponding to the Deccan was divided, upon the dismemberment of the former Hyderabad (*q.v.*) state, primarily on a linguistic basis between the states of Mysore, Andhra Pradesh and Maharashtra (*q* v.).

The early history of the region is obscure. Paleolithic remains and Neolithic settlements abound, and in the south there are many stone cist and cairn burials of the south Indian Iron Age. While the coastal plains were always rich in paddy and thickly populated, the plateau, though climatically favourable to vigorous endeavour,

is less well watered and has arid regions. Until large-scale irrigation works were made in historical times, cultivation must have been arduous and uncertain, especially once the land had been deforested. Consequently. Deccan dynasties attempted to acquire more fertile land in the Konkan, Gujarat, Vengi (in Andhra Pradesh) and the Cauvery valley and near Kancheepuram in Madras. While the plains were rich in food. the Deccan was and remains rich in minerals. Ancient mines explain why such rulers of the plains as the Pallavas were eager to rule the Deccan and Mysore. Similarly explicable are the interests taken by Asoka and later Samudra Gupta in what were then geographically and culturally "border regions."

The Yadavas of Deogiri acquired, as successors of the Chalukyas (see CHALUKYA), a great part of the Carnatic in which, as Marathas, they were aliens; their contemporaries, the Kakatiyas of Warangal, resisted their westward movement. Like the Hoysalas these families accumulated riches and tempted the sultans of Delhi. Expeditions to loot and, if possible, to make converts culminated by 1333 in the political subjugation of the Yadava and Kakatiya empires, the Hoysala becoming a nominal tributary. Almost simultaneously, about 1347, Vijayanagar (*q.v.*) succeeded in the south and the Muslim Bahmani dynasty in the central Deccan. The prize attracted Muslim adventurers from overseas, rivalries developed and the five Muslim sultanates of Golconda, Bijapur, Ahmednagar, Bidar and Berar emerged from Bahmani territories and accretions thereto between 1482 and 1518. The defeat of the Vijayanagar army by the sultans at Rakshasi-Tangadi (Talikota) in 1565 prevented the revival of Hindu rule from the south. The emperors of Delhi reasserted a title over the Deccan from 1656, but were compelled to yield to the Marathas under Sivaji, whose power grew steadily from 1706, when they acquired nominal rights of sovereignty over all the Deccan. When Nizam ul-Mulk (Mir Qamr ud-Din) became independent in 1724, laying the foundations of Hyderabad state, they were faced by a rival whose hostility, exploited by Mysore and the European powers, led gradually to the absorption of the Deccan by the British, either by subsidiary alliance, conquest, cession or failure of heirs.

Haug (ed.), *Cambridge History of India,* iii, ch. xv–xvii (1928); G. Yazdani *et al., History of the Deccan,* i, part *8* (1952), *Early History of the Deccan* (1961). (J. D. M. D.)

DECEBALUS (late 1st and early 2nd century A.D.), king of Dacia (*q.v.*) during the wars under the Roman emperors Domitian and Trajan, a leader of considerable ability who unified his country after a long period of weakness. One tradition says the legal king Duras resigned in his favour in 85. Decebalus was certainly responsible for annihilating a Roman army in 86 or 87, and it was with him that Domitian made terms soon after a Roman victory at Tapae in 88. His capital, Sarmisegetusa or Sarmizigethusa, was occupied by Trajan in 102. He is accused by Roman historians of having violated the treaty then made and thus of bringing on himself the final catastrophic war of 105–106, after which he committed suicide. (G. E. F. C.)

DECELEA, in ancient Greece, a deme (township) in Attica, on the pass which led over the east end of Mt. Parnes toward Oropus and Chalcis (Khalkis), commanding the Athenian plain. Its eponymous hero, Decelus, was said in legend to have indicated to Castor and Pollux (*q.v.*) where Theseus had hidden their sister Helen at Aphidnae; hence there was a traditional friendship between the Deceleans and the Spartans. This, together with the advice of Alcibiades, led the Spartans to build a fort at Decelea as a base for permanent occupation in Attica during the later years of the Peloponnesian War, from 413 to 404 B.C. Its position enabled them to harass the Athenians frequently, encourage sedition and cut them off from the port of Oropus and their silver mines at Laurium. The royal palace of Tatoi was built on the site.

See A. Milchhofer in Pauly-Wissowa, *Real-Encyclopadie der classischen Altertumswissenschaft,* 2423 (1901).

DECEMBER, the 12th month of the modern calendar, has 31 days. As the name shows (from Lat. decem, "ten"), it was the tenth month of the early Roman calendar, which began with March. The Romans celebrated the Saturnalia in December, and the ancient Teutonic peoples had at this season a great mid-winter festival, yule; some features of both survive in the traditional observances connected with Christmas. Christmas itself seems not to have been recognized as a festival by the early Christian church, nor was there at first agreement as to the date of the nativity of Christ, Jan. 6 being generally preferred in the east (see CHRISTMAS). The winter solstice occurs about Dec. 21. See also CALENDAR. (F. R. WN.)

DECEMVIRI, "ten men," the name applied by the Romans to any official commission of ten, followed by a statement of the purpose for which the commission was appointed; *e.g.,* decemviri (or X viri) *stlitibus* judicandis, sacris faciundis, etc. (see below).

Usually, it signified the temporary commission which superseded all the ordinary magistrates from 451 to 449 B.C., in order to draw up a code of laws. In 452 B.C. at the demand of the plebs, decemviri were appointed to draw up a code; during their tenure of office all other magistracies were in abeyance, but they were bound to maintain the rights of the plebs. The first board of decemvirs (all patricians) held office during 451 B.C.; the chief man among them was Appius Claudius (see CLAUDIUS). The decemvirs ruled with singular moderation, and submitted to the *comitia centuriata* a code of laws in ten headings. So popular were the decemvirs that another board of ten was appointed in 450 B.C., some of whom may have been plebeians (some scholars however reject the second board as a later invention). These added two more laws less favourable to the plebeians, thus completing the Laws of the Twelve Tables (see ROMAN LAW). But their rule then became violent and tyrannical and they were forced to abdicate (449 B.C.).

The judicial board of decemviri *stlitibus* judicandis formed a civil court concerned mainly with the free status of individuals. They were originally a body of jurors under the presidency of the praetor (*q.v.*), but eventually became minor magistrates, part of the college of 26 (vigintisexviri) reduced to 20 (vigintiviri) by Augustus, who also made the decemviri presidents of the centumviral courts (see CENTUMVIRI).

The priestly board of decemviri sacris faciundis was half patrician and half plebeian. They were first appointed in 367 B.C., instead of the patrician duztnzviri who had hitherto performed religious duties. Their number was increased to 15 (quindecimviri) in the 1st century B.C. Their chief function was the care of the Sibylline books (see SIBYLLA) and the celebration of the games of Apollo and of the Secular games.

Decenzviri *agris* dandis adsignandis were also appointed occasionally to control the distribution of public land.

See A. H J. Greenidge, *Legal Procedure of Cicero's Time* (1901); H. *F.* Jolowicz, *Historical Introduction to the Study of Roman Law,* 2nd ed. (1952).

DÉCHELETTE, JOSEPH (1862–1914), French archaeologist best known for his *Manuel d'archéologie,* was born in Roanne, Loire, Jan. 8, 1862. Educated at Saint Chamond (Loire), he was at first associated with the textile factory of his family, but in 1899 he retired from business to devote himself to archaeology. His special interest was the Celtic and Gallo-Roman periods. He collaborated with his uncle, J. G. Bulliot, in the excavations of Mont Beuvray (anc. Bibracte; *q.v.*) and after his uncle's death he took over the exploration of the site. Author of about 120 books and articles, he was a constant contributor to *L'Anthropologie,* Revue Arche'ologique and other periodicals. Among his publications are: *L'Oppidum* de Bibracte (1903), Les Vases *céramiques ornés* de la Gaule romaine (1904) and La collection *Millon* (1913). Le *Manuel d'archéologie préhistorique, celtique* et gallo-romaine (1908–13) is an indispensable work which covers the entire field of French prehistory from the Paleolithic to the end of the Iron Age. Profusely illustrated, its bibliography, practically complete up to the dates of publication, is one of its most important features. Déchelette was curator of the Musée de Roanne. renamed the Musée Joseph Déchelette, and was killed in the Aisne action on Oct. 8, 1914. (H. KE.)

DECIMAL: see ARITHMETIC; FRACTION; NUMERALS AND NUMERAL SYSTEMS.

DECIMAL COINAGE. A country using a decimal coinage system issues its metallic and paper currency in denominations that are multiples of ten of the standard unit. The U.S. dollar, for example, is divided into 100 cents and the French franc into 100 centimes. These countries also issue intermediate denominations such as the U.S. 25-cent and 50-cent pieces and the $5 note because the gaps in the decimal progression are inconveniently large.

The United States was the first country to adopt the modern decimal system. The Articles of Confederation in 1781 gave to congress the sole and exclusive power of regulating the alloy and value of coin of the United States and of the individual states. The coinage plan adopted under this provision in 1785 was a decimal system based on the Spanish dollar. Gouverneur Morris (*q.v.*) and Thomas Jefferson were mainly responsible for its provisions. When the second congress under the constitution met, one of the famous reports it received from Alexander Hamilton dealt, among other things, with coinage. He recommended much the same system as had Jefferson. Actual coinage began in 1792 with denominations of $10, $5, $2.50, $1, $.50, $.25, $.10, $.05, $.01, $.005. Both gold and silver money was coined (see BIMETALLISM).

France was the first European country to adopt the decimal system. The rationalism of the French Revolution led to the adoption not only of decimal coinage but also a metric system of weights and measures and the 10-month calendar. The livre of the *ancien régime* was replaced by a decimal system based on the franc. The French system was extended to the countries of the Latin Monetary union formed in 1865 with France, Belgium, Italy, Switzerland and later Greece as members. The decimal system of coinage was also adopted by Germany (1873), the Scandinavian states (1875), Austria-Hungary (1870, developed in 1892) and Russia (1875). The Latin-American countries and Japan (1871) also adopted it.

The British system of pounds, shillings and pence is the only important exception to the general predominance of the decimal system. In addition to the United Kingdom it is in use in the British colonies and in some of the countries of the commonwealth. A number of countries of the middle east follow the British in designating their standard monetary unit as a pound but use a decimal system for their subsidiary coins. In Great Britain there have been numerous proposals for adoption of a decimal monetary system but the difficulties of the change-over and the multiplicity of proposals have prevented the reform.

There are two main advantages of a decimal monetary system: (1) the ease with which the relationship of the value of various coins can be computed, and more importantly, (2) the convenience for arithmetic manipulation of stating sums of money as multiples, tenths, hundredths and thousandths of the unit of account.

For the general question of monetary scales see MONEY, and for the decimal system in reference to weights and measures see WEIGHTS AND MEASURES: *The* Metric *System*. (R. R. E.)

DECIN (Ger. TETSCHEN), an ancient city of Czechoslovakia, lies in the gorge of the Elbe river near the Czechoslovak-East German frontier, 18 km. (11 mi.) N.N.E. of Usti nad Labem. Pop. (1957 est.) 34,802. The Elbe flows between steep cliffs with a thick ribbon of settlement on either bank and Decin lies at its confluence with the Ploucnice on the east bank opposite Podmokly (Ger. Bodenbach). The two towns are connected by a suspension bridge. To the south are the volcanic rocks of the Stredohori highlands and to the north, great reddish cliffs of Cretaceous sandstone. Decin was founded in the 12th century and has been for centuries one of the most active ports of this part of the Elbe. Up to the time of World War II it mas the headquarters of the boatmen's syndicate on the Elbe, which protected the interests of small-scale shipping, and from there in the early 20th century the *Decin* Scale was issued, the guide to navigational conditions on the Elbe throughout the year. Decin was almost wholly German up to the end of World War II, after which the towns and villages of the valley were almost emptied. The population is engaged partly in river trade and partly in metal, chemical, paper and textile industries.

DECISION PROCEDURE. In mathematics and logic, a decision procedure or algorithm for a class of questions is a method which enables one, after choosing any question of the class, to find the answer "yes" or "no" to that question by performing successively a finite number of steps determined by preassigned rules. In particular, the term is used of such procedures for finding whether a given formula is provable in a certain symbolic logic or formal mathematical system. See MATHEMATICS, FOUNDATIONS OF. (S. C K.)

DECIUS, GAIUS MESSIUS QUINTUS TRAIANUS (c. A D. 201–251), Roman emperor 249–251, mas born at Budalia near Sirmium (Sremska Mitrovica, Yugos.) in lower Pannonia about 201. His parentage and his social origin are not known, but he was certainly a senator and a consular before his accession. It is likely that his brother was also a consular, and his wife Herennia Cupressenia Etruscilla, who bore the names of consular families of the previous century, was honoured—apparently on her own estates—in Etruria. Thus Decius probably came from a senatorial background. About 245 the emperor Philip the Arabian entrusted him with a command on the Danube, where in 249 (or the end of 248) he was proclaimed emperor, allegedly against his will. Philip advanced against him and was killed near Verona. Decius had to take the field against the Goths, who crossed the Danube and overran Moesia and Thrace. The details of the campaign are obscure. The final engagement took place on swampy ground in the Dobruja in June 251 and ended in the defeat and death of Decius and his son.

Decius was the first Roman emperor to institute an organized persecution of the Christians throughout the empire, previous persecutions having been sporadic and local in character. About the beginning of Jan. 250 an imperial edict ordered all citizens to perform a religious sacrifice in the presence of duly appointed commissioners, nho were to issue a certificate (libellus) that they had done so. Several such certificates, written on papyrus and dated June or July 250, survive from Egypt. Many Christians obeyed the edict and were termed by Christian writers, such as Cyprian, "lapsed" (*lapsi*). Others forebore to sacrifice, but bribed the commissioners to issue a certificate; they were called "certificated" (libellatici). But a significant majority defied the government, and action was taken principally against the leaders of the Christians. The bishops of Rome, Jerusalem and Antioch lost their lives; the theologian Origen and many others mere arrested The effect was to strengthen rather than weaken the Christians, for public opinion condemned the government's violence and applauded the passive disobedience of the martyrs. Events justified the Christian boast that every martyr made ten converts, and persecution failed.

Early in 251, a few months before Decius' death, the commissioners seem to have ceased their activities. It appears that while absent from Rome. Decius selected the future emperor Valerian to direct the government in Rome, possibly with the title of censor or subcensor. He was succeeded by Gallus (*q.v.*).

DECKEN, KARL KLAUS, BARON VON DER (1833–1865). German explorer who, with the geologist R. Thornton (who had previously accompanied Livingstone), was the first European to climb Kilimanjaro up to 8.000 ft. and establish that it was glacier covered. Born on Aug. 8. 1833. at Kotzen, Brandenburg, he spent ten years in the military service of Hanover. but left in 1860 to explore east Africa. On his fourth expedition he and three other European members of the party were murdered by the Somalis near Bardera in late Sept. or early Oct. 1865, while attempting to navigate the Juba river. Only 11 members were able to escape to Zanzibar. Decken's collections went to the Berlin museums. The journal of his explorations was published posthumously.

See O. Kersten, *Baron* K. C. *v. der Decken's Reisen in Ost-Afrika* 3 vol. (1869–79); a biographical sketch in *Proc. R. Geogr. Soc.*, vol. x, pp 206–209 (1865–66). (K. A. S.)

DECKER, SIR MATTHEW, BART. (1679–1749), British merchant and writer on trade and commerce, who can be considered one of the forerunners of Adam Smith, was born in Amsterdam in 1679. In 1702 he went to London and established himself

there as a merchant. He was a director of the East India company for 30 years and a member of the house of commons for 4 years. Decker was the author of two important tracts: *Serious Considerations on the several High Duties which the Nation in general, as well as Trade in particular, labours under* (1743), and *An Essay on the Causes* of *the Decline of the Foreign Trade . . .* (1744). In these essays he took a strong stand against any restriction of trade and industry whether in the form of tariffs or monopolies. Decker also proposed tax reforms, basing his arguments on the tax canons of justice, convenience and economy. He died on March 18, 1749. (L. N.)

DECKS, SHIPS', serve purposes similar to those served by the floors and roof of a building; they provide working surfaces, impart strength to the ship's structure and form a cover to exclude water from the hull. Decks may be assigned numbers or letters of the alphabet, or may be given names derived from an associated function. On a passenger liner, for example, deck nomenclature includes the following (from highest to lowest): house top. sports deck, sun deck, promenade deck. upper deck, main deck, "A" deck, "B" deck. and so on down to the lowest deck, usually called the tank top. In a cargo ship there is the bridge deck. boat deck, shelter deck, 2nd deck. 3rd deck and tank top. In naval vessels, decks above the main deck are termed levels, the first deck above the main deck being designated the 01 level, the next higher the 02 level and so on. Below the main deck. naval designations are 2nd deck, 3rd deck and so on, in descending order.

A deck may have several designations according to the functions it performs. For example, the main deck may also be the "strength deck," by virtue of its contribution to the ship's structure; in addition it may be the freeboard deck if it is the highest deck that can be made permanently watertight. The nomenclature and definitions of various decks are:

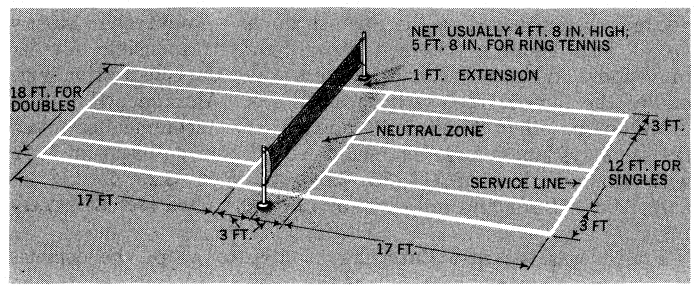
Awning deck, a complete deck on a light superstructure.
Berth deck, a deck with sleeping quarters for a ship's crew.
Boat deck, an upper deck on which lifeboats are carried.
Bridge deck, a partial deck approximately at a ship's midlength forming the top of a bridge house.
Bulkhead deck, the highest complete deck to which transverse watertight bulkheads are carried.
Damage control deck, in naval vessels, the lowest deck with access openings in the transverse watertight bulkheads.
Flight deck, on aircraft carriers, the deck where aircraft are launched or landed.
Forecastle deck, a partial deck above the main deck at the bow.
Freeboard deck, the highest complete deck having permanent means of closing all openings to the weather.
Gun deck, a deck on which guns are mounted.
Main deck, the principal deck on a ship having several decks; in a naval vessel, the highest complete deck contributing significantly to the strength of the ship.
Orlop drck, a partial deck in the lower part of a ship, or the lowest deck in a ship having four or more decks.
Platform deck, a partial deck below the lowest complete deck; when there are more than one, they are termed first, second, third, in descending order.
Poop deck, a partial deck above the main deck at the stern.
Promenade deck, an upper superstructure deck on passenger ships.
Protective deck, in naval vessels, a deck of extra thickness and special strength.
Quarter-deck, in sailing vessels, that portion of the upper deck between the mainmast and the stern; in naval vessels, an area of the weather deck reserved for officers.
Shelter deck, a complete deck on a light superstructure similar to an awning deck, but with at least one opening referred to as a "tonnage opening," not having permanent means for closure to the weather.
Strength deck, the highest complete deck contributing significantly to the strength of the ship; in naval vessels, the main deck.
Sun deck, the hirhest deck on large passenger liners.
Superstructure deck, a lightly constructed deck in the upper part of a ship, usually the first deck above the strength deck.
Tonnage deck, the deck from which a cargo ship's carrying capacity, or tonnage, is measured.
Upper deck, the highest complete deck having all openings fitted with permanent means for closure against sea and weather.
Watertight deck, any deck constructed to prevent water passing through it.
Weather deck, the highest continuous deck exposed to the weather.

(ED. C. T.)

DECK TENNIS is a recreation designed for the limited space on shipboard and has proved popular enough to have been translated to land use as a garden game, the principle being that a ring or quoit is thrown across a net and must be caught single-handed before it falls to the ground, and be returned immediately.

The size of the court and of the rubber (formerly rope) ring used and the rules of play are not standardized. The following practice seems to be widely acceptable.

The game can be singles (two players) or doubles (four players). The server, as in lawn tennis, serves first from behind the right-hand court into the court diagonally opposite. A point is gained by that side whose opponents fail to return the ring into the first side's ground. If the ring lands in the neutral zone *(see* fig.) or outside the court, the thrower loses the point.



DECK TENNIS COURT: DIMENSIONS MAY BE ADAPTED TO SPACE AVAILABLE

As in tennis points are scored only in service or. by agreement, the server may continue to score until he loses a point, when his opponent may either take the point for himself and allow the server to continue or forgo the point and take over the service. The first player (or side) to score 15 points wins a set—a match can be over the best of three or five sets. In the event of the score's becoming 14–14 it is necessary to win *2* successive points to take the set.

The game sometimes is known as ring tennis when played indoors or when the higher net (5 ft. 8 in. instead of 4 ft. 8 in. or 5 ft.) is used. (N. D. M.)

DECLARATION OF INDEPENDENCE, in the history of the United States, the famous document approved by the continental congress on July 4, 1776, which announced the separation of the 13 colonies from Great Britain and offered a justification therefor. It explained why the congress on July 2 "unanimously" by the votes of twelve colonies, with New York abstaining. resolved that "these United Colonies are, and of right ought to be Free and Independent States." Accordingly, the day on which final separation was officially voted was July 2, although the 4th, the day on which the Declaration of Independence was adopted, has always been celebrated in the United States as the great national holiday—the Fourth of July or Independence Day (*q.v.*).

When armed conflict began between the colonies and Britain on April 19, 1775 *(see* AMERICAN REVOLUTION), the American patriots claimed they sought only their rights within the British empire. At that time few of the colonists consciously desired to separate from Britain. It is apparent, however, that they were determined to secure their rights—which they were then describing as those of mankind as well as of Englishmen—whether within or without the empire. As the War of Independence proceeded during 1775 and Britain undertook to assert her sovereignty by means of large armed forces, making only a gesture toward conciliation, the patriots increasingly came to believe that they must secure their rights outside the empire. The losses and suffering that came from the war greatly widened the breach between the colonies and the mother country; moreover, it was necessary to assert independence in order to secure as much French aid as possible.

A royal proclamation of Aug. 23, 1775, declaring the colonies to be in rebellion, and the Prohibitory act of the following November, which withdrew from them the royal protection, spurred on the patriots. Before the end of that year George Washington and other high officers of the American army investing Boston were converted to independence. Early in 1776 Thomas Paine's *Common Sense* with its forthright denunciation both of Britain

and monarchy began to exercise a potent influence. On April 12 the Revolutionary convention of North Carolina specifically authorized the delegates of that colony in congress to vote for independence; and on May 15 the Virginia convention instructed its deputies to offer the motion which was finally adopted on July 2. It was brought forward in the congress by Richard Henry Lee on June 7. By that time the congress had already taken long steps toward severing ties with Britain. It had denied parliamentary sovereignty over the colonies as early as Dec. 6, 1775; and it had declared on May 10, 1776, that the authority of the king ought to be "totally suppressed," advising all the several colonies to establish governments of their own choice.

The passage of Lee's resolution was delayed for several reasons. Some of the delegates had not yet received authorization to vote for separation; a few were opposed to taking the final step; and several men, among them John Dickinson, believed that the formation of a central government, together with attempts to secure foreign aid, should precede it. However, a committee consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston was promptly chosen on June 11 to prepare a statement justifying the decision to assert independence, should it be taken. On July 1 nine delegations voted for separation. despite warm opposition on the part of Dickinson. On the following day, with the New York delegation abstaining only because it lacked permission to act, the Lee resolution was adopted. (The convention of New York gave its consent on July 9, and the New York delegates voted affirmatively on July 15.)

The Declaration of Independence was largely written by Jefferson, who had displayed talent as a political philosopher and polemicist in his *A Summary View of the Rights of British America,* published in 1774. At the request of his fellow committee members he wrote the first draft. The members of the committee made a number of merely verbal changes, and they also expanded somewhat a list of charges against the king which Jefferson had prepared. The congress made more substantial changes, deleting a condemnation of the British people, a reference to "Scotch & foreign mercenaries" (there were Scots in the congress) and a denunciation of the African slave trade (this being offensive to some southern and New England delegates). The result was an extraordinarily appealing document couched in melodious language superbly fitted to its purpose.

It can be said, as John Adams did. that the declaration contained nothing really novel in its political philosophy, which was derived from Locke, Sidney and other English theorists. It may also be asserted that the argument offered was not without flaws in history and logic. Substantially abandoning contention on the basis of the rights of Englishmen, the declaration put forth the more fundamental doctrines of natural rights and of government under contract. Claiming that parliament never truly possessed sovereignty over the colonies and that the crown of right exercised it only under contract. it contended that George III, with the support of a "pretended" legislature, had persistently violated the agreement between himself as governor and the Americans as the governed. A long list of accusations was offered toward proving this contention. The right and duty of revolution were then invoked, the delegates pledging their lives, honour and fortunes to the cause of independence.

Few will now claim that government arose among men as Locke and Jefferson said it did, and the contract theory has lost vogue among political scientists. It is likewise true from a British viewpoint that parliament and crown could not be separated, and that the history of the colonies after 1607 was not entirely consistent with the assertion that parliament had never as of right possessed sovereignty over them. Furthermore, the specific charges brought against the king were partisan and not uniformly defensible, and the general accusation that he intended to establish an "absolute Despotism" is hardly warranted. It should be added that several of the heaviest specific complaints condemned actions of the British government taken after the beginning of hostilities.

The defects in the Declaration of Independence are by no means sufficient to force the conclusion that the document is unsound. On the contrary, it was in essence morally just and politically valid. If the right of revolution cannot be established on historical grounds, it nevertheless rests solidly upon ethical ones. The right of the colonists to government ultimately of their own choice is hardly deniable. Moreover, close scrutiny of the behaviour of the British government and of the colonists after 1763 must persuade that the grievances of the Americans were neither trifling nor transient

Announcing to a "candid world" why it severed the bonds between America and Britain, the congress raised a noble standard to which the Americans could rally in the War of Independence and afterward. Some of the phrases of the declaration have steadily exerted profound influence in the United States, especially the proclamation that, "We

IN CONGRESS. JULY 4, 1776.

The unanimous Declaration of the thirteen united States of America,

When in the course of human events it becomes necessary for one people to dissolve the political bonds which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation. — We hold these truths to be self-evident, that all men are created equal, that they are endowed by their creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness. — That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed, — That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security. — Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world. — He has refused his Assent to Laws, the most wholesome and necessary for the public good. — He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them. — He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only. — He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures. — He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people. — He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within. — He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands. — He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers. — He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries. — He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our People, and eat out their substance. — He has kept among us, in times of peace, Standing Armies without the Consent of our Legislatures. — He has affected to render the Military independent of and superior to the Civil power. — He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended legislation: — For Quartering large bodies of armed troops among us: — For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States: — For cutting off our Trade with all parts of the world: — For imposing Taxes on us without our Consent: — For depriving us in many cases, of the benefits of Trial by Jury: — For transporting us beyond Seas to be tried for pretended offences: — For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies: — For taking away our Charters, abolishing our most valuable Laws, and altering fundamentally the Forms of our Governments: — For suspending our own Legislatures and declaring themselves invested with power to legislate for us in all cases whatsoever. — He has abdicated Government here, by declaring us out of his Protection and waging War against us. — He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people. — He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation. — He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands. — He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our British brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which, would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.

We, therefore, the Representatives of the united States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do. — And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our lives, our fortunes and our sacred Honor.

IN CONGRESS, JULY 4, 1776

THE UNANIMOUS DECLARATION of the thirteen united STATES OF AMERICA.

WHEN in the Course of human events it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.—We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.—Such has been the patient sufferance of these Colonies; and such is now the necessity which constrains them to alter their former Systems of Government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute Tyranny over these States. To prove this, let Facts be submitted to a candid world.—He has refused his Assent to Laws, the most wholesome and necessary for the public good.—He has forbidden his Governors to pass Laws of immediate and pressing importance, unless suspended in their operation till his Assent should be obtained; and when so suspended, he has utterly neglected to attend to them.—He has refused to pass other Laws for the accommodation of large districts of people, unless those people would relinquish the right of Representation in the Legislature, a right inestimable to them and formidable to tyrants only.—He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public Records, for the sole purpose of fatiguing them into compliance with his measures.—He has dissolved Representative Houses repeatedly, for opposing with manly firmness his invasions on the rights of the people.—He has refused for a long time, after such dissolutions, to cause others to be elected; whereby the Legislative powers, incapable of Annihilation, have returned to the People at large for their exercise; the State remaining in the mean time exposed to all the dangers of invasion from without, and convulsions within.—He has endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands.—He has obstructed the Administration of Justice, by refusing his Assent to Laws for establishing Judiciary powers.—He has made Judges dependent on his Will alone, for the tenure of their offices, and the amount and payment of their salaries.—He has erected a multitude of New Offices, and sent hither swarms of Officers to harass our people, and eat out their substance. He has kept among us, in times of peace, Standing Armies without the Consent of our legislatures.—He has affected to render the Military independent of and superior to the Civil power.—He has combined with others to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws; giving his Assent to their Acts of pretended Legislation.—For quartering large bodies of armed troops among us:—For protecting them, by a mock Trial, from punishment for any Murders which they should commit on the Inhabitants of these States:—For cutting off our Trade with all parts of the world:—For imposing Taxes on us without our Consent:—For depriving us in many cases, of the benefits of Trial by Jury:—For transporting us beyond Seas to be tried for pretended offences:—For abolishing the free System of English Laws in a neighbouring Province, establishing therein an Arbitrary government, and enlarging its Boundaries so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies:—For taking away our Charters, abolishing our most valuable Laws and altering fundamentally the Forms of our Governments:—For suspending our own Legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.—He has abdicated Government here, by declaring us out of his Protection and waging War against us.—He has plundered our seas, ravaged our Coasts, burnt our towns, and destroyed the lives of our people.—He is at this time transporting large Armies of foreign Mercenaries to compleat the works of death, desolation and tyranny, already begun with circumstances of Cruelty & perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the Head of a civilized nation.—He has constrained our fellow Citizens taken Captive on the high Seas to bear Arms against their Country, to become the executioners of their friends and Brethren, or to fall themselves by their Hands.—He has excited domestic insurrections amongst us, and has endeavoured to bring on the inhabitants of our frontiers, the merciless Indian Savages, whose known rule of warfare, is an undistinguished destruction of all ages, sexes and conditions. In every stage of these Oppressions We have Petitioned for Redress in the most humble terms: Our repeated Petitions have been answered only by repeated injury. A Prince, whose character is thus marked by every act which may define a Tyrant, is unfit to be the ruler of a free people. Nor have We been wanting in attentions to our Brittish brethren. We have warned them from time to time of attempts by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They too have been deaf to the voice of justice and of consanguinity. We must, therefore, acquiesce in the necessity, which denounces our Separation, and hold them, as we hold the rest of mankind, Enemies in War, in Peace Friends.—

WE, THEREFORE, the Representatives of the UNITED STATES OF AMERICA, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be FREE AND INDEPENDENT STATES; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.

THE DECLARATION OF INDEPENDENCE OF THE UNITED STATES

The text of the Declaration of Independence. The original document is shown in facsimile on the facing page

hold these truths to be self-evident that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness." While the meanings of these phrases, together with conclusions drawn from them, have been endlessly debited, the declaration has served to justify the extension of American political and social democracy. Appeals to it as "higher law" superior even to the federal constitution were frequent in the middle third of the 19th century and still continue. Abraham Lincoln emphatically asserted that his political philosophy was based upon it.

The Declaration of Independence has also been a source of inspiration outside the United States. It encouraged Antonio de Nariño and Francisco de Miranda to strive toward overthroning the Spanish empire in South America, and was quoted with enthusiasm by the Marquis de Mirabeau during the French Revolution. It must remain a great historical landmark in that it contained the first formal assertion by a whole people of their right to a government of their own choice. What Locke had contended for as an individual, the patriots proclaimed as a body politic; moreover, they made good the argument by force of arms.

Contrary to the inference which has often been drawn from the form of the document, the declaration was not signed by the delegates on July 4. Adoption of the declaration was celebrated on July 8 in Philadelphia, among other ways by the ringing of all the church bells, and the declaration was read before Washington's army on July 9. On July 19 the congress ordered the document to be engrossed as "The Unanimous Declaration of the Thirteen United States of America." It was accordingly put on parchment, probably by Timothy Matlack of Philadelphia. Members of congress present on Aug. 2 affixed their signatures to this parchment copy on that day, and others later. The last signer was Thomas McKean of Delaware, whose name was not placed on the document before 1777.

Not all of those who voted for the declaration on July 4 were later present to sign it; on the other hand, men who were not in congress on July 4 did put their names upon it. Fifty-six men in all, including John Hancock, signed. Printed copies of the document were authorized by congress and circulated after Jan. 1777.

For 101 years after the declaration was proclaimed it had no permanent home. During its wanderings it found shelter in ten cities and five states. twice narrowly escaped destruction by fire and in both the American Revolution and the War of 1812 was nearly captured by the British. In 1894, when the text of the manuscript had been dimmed by exposure to light and its signatures had been damaged by too frequent rolling of the parchment. the document was placed in a safe in the library of the U.S. department of state. In 1921 it was removed to the Library of Congress, where it remained until 1952; it was then placed in the National Archives exhibition hall in Washington, D.C.

(J. R. AL.)

DECLINATION, in terrestrial magnetism, is the angle between true north and magnetic north, *i.e.,* the variation between the true (geographic) meridian and the magnetic meridian. In 1596 at London the angle of declination was 11° E. of N., in 1652 magnetic north was true north. in 1815 the magnetic needle pointed $24\frac{1}{2}$° W. of N., in 1891 18° W., in 1932 12° 3′ W., and in 1956 8" 37′ W. The angle is gradually diminishing and the declination will in time again be 0°, then it will slowly increase in an easterly direction, the north magnetic pole oscillating slowly around the north pole. Magnetic storms cause irregular variations sometimes of one or two degrees. *(See* GEOMAGNETISM.*j*

In astronomy, the declination of a star is its angular distance north or south of the celestial equator, measured along the hour circle passing through the star, from 0° at the equator to +90° or −90° at the north or south celestial pole, respectively. There is an analogy between the declination of a star measured from the celestial equator and the terrestrial latitude of a station measured from the earth's equator. *See* ASTRONOMY: *Stellar Positions* and *Names.* (A. Po.)

DECOLORIZING, in practical chemistry and chemical technology, the removal of coloured impurities from a substance. Charcoal, sometimes made from blood, bones or sugar, but now usually made from wood, is frequently used. So-called "activated charcoal," which is especially effective as a decolorizing agent, is prepared by treating charcoal with superheated steam for several hours at 800°–1,000° C., or with air at 350°–400° C. When shaken with a coloured solution, charcoal often retains the coloured substances, leaving the solution colourless. Thus the red colour of wines may be removed by filtering the wine through charcoal; the dark-coloured impurities of crude sugar may be removed in the same way. Other decolorizers acting through purely chemical reactions are chlorine, sulfurous acid, permanganates and manganates, all of which have been used in the sugar industry. *See* CHARCOAL and ADSORPTION. (G. W. WD.)

DECONGESTANT DRUGS are compounds used to relieve the nasal congestion accompanying such conditions as colds and hay fever. When administered in nasal sprays or drops, or in devices for inhalation, such drugs shrink the mucous membranes lining the nasal cavity by contracting the muscle of blood vessel walls, thus reducing blood flow to the inflamed areas. The constricting action is chiefly on the smallest arteries, the arterioles, although capillaries, veins and larger arteries respond to some degree. Decongestant drugs are classified pharmacologically as sympathomimetic agents; they mimic the effects of stimulation of the sympathetic division of the autonomic nervous system. One of the chief drugs of the group is epinephrine, also called adrenalin, a hormone of the adrenal gland and the chemical effector substance released at sympathetic nerve endings when the nerves are stimulated. The decongestant action resembles the blanching of the skin that occurs with anger or fright, in which epinephrine released from the adrenal gland constricts the blood vessels of the skin. *(See* also ADRENALINE AND NORADRENALINE.)

The epinephrinelike effects of the other decongestant drugs result from their chemical similarity to epinephrine; all are amines. Oldest and most important is ephedrine, an alkaloid originally obtained from a plant drug. ma *huang,* which has been used in Chinese medicine for more than 5,000 years, but now made by chemical synthesis. Except for epinephrine itself, the others are all synthetic compounds. They include phenylephrine hydrochloride! amphetamine and several derivatives, and naphazoline hydrochloride. To gain a sustained effect, they must be used repeatedly, but too frequent use results in absorption into the blood stream, causing nervousness, insomnia, dizziness, headache or palpitations. (V. E.)

DECORATED PERIOD, in architecture, the name of the second of the three periods into which the English Gothic was usually divided, generally embracing the first three-quarters of the 14th century. It may itself be divided into two, the earlier half being known as the Geometric period. and the later as the Curvilinear, although no definite date separates these two parts. The Geometric Decorated style is characterized by window tracery based on the arch, the circle and the quatrefoil and trefoil, frequently much cusped. *(See* CUSP.) Windows of great width and height were thus treated. with two, four, six or even eight lights, or main subdivisions. In the later, or Curvilinear style, the ogee curve, or curve of double curvature, controls tracery design. Two main types thus developed; one in which the tracery bars form a net, the other in which flamelike or flowing forms predominate. *(See* TRACERY.) In the entire Decorated period molding profiles are heavy and complex; carved ornament is intricate and of great naturalism. The most famous examples are the east end of Lincoln cathedral and the crossing and western part of the choir of *Ely.* During the Decorated period, church vaulting

became much complicated and subdivided by the addition, first of tiercerons, which are additional vaulting ribs springing from the capital and rising to the ridge; toward the end of the period there also appeared liernes, which are smaller ribs of little structural value connecting the more important ribs and so forming star or network patterns. See also EARLY ENGLISH PERIOD; FLAMBOYANT STYLE. (T. F. H.)

DECORATION DAY: see MEMORIAL DAY.

DECORATIONS OF HONOUR: see MEDALS AND DECORATIONS.

DECORATIVE ART. The conception of a subsidiary category of art to cover the arts of design was a necessary consequence of the idea of a category of the fine arts (*q.v.*), with architecture as an ambivalent link between the two. The conception of decorative art, however, was arrived at just at the moment when the industrial revolution began to transform the "handmade" crafts; the first recorded use of the word "decorative" dates from 1791. It was soon extended from such productions as Josiah Wedgwood's Etrurian ware to cover the whole field of the mechanically produced minor arts of the 19th century. Gradually decoration came to be thought of as a kind of artistic varnish that could be transferred to any plain surface; at this stage the phrase "applied art" was commonly used. It then came to be considered as an element in the economical production of a salable product: a phase admirably represented by the phrase "industrial art." This view provoked a reaction in the arts and crafts movement (*q.v.*) inspired by William Morris. Between World Wars I and II it began to be realized that this element of acceptability by the buying public was of great commercial importance. It was named '.design," but during the period of shortage in and after World War II the word came to mean the adaptation of an object to mass production. A certain ambiguity in its use has remained. See INDUSTRIAL DESIGN; DESIGN, 19TH-CENTURY; DESIGN, 20TH-CENTURY; DISPLAY DESIGN; see also references under "Decorative Art" in the Index volume. (J. EV.)

DECRETALS, FALSE, a 9th-century collection of partially forged documents. the object of the falsification being to free the church from interference by the state and to maintain the independence of the bishops against the encroachments of the archbishops, who were at the time attempting to extend their power.

A party had been formed in the Frankish empire to combat the subjection of the church to the state. In synods and writings its members pleaded for the independence of the church and freedom from interference in its own field on the part of the state. Within this party was a group that became convinced that the use of legitimate means would never accomplish this purpose and determined to try to achieve it by illegitimate means. They conceived that a necessary positive legislation could be projected into the past by attributing it to popes and kings long dead. To this end they produced a number of falsifications of church law: the Hispana of Autun (*Augustodunensis*), which was a reworking of the Hispana collection widely used at the time; the *Capitula Angilramni;* the *Capitularia* Benedicti *Levitae;* and the best known of all, the False Decretals.

The False Decretals—also called the Decretals of Pseudo-Isidore because their compilers passed as St. Isidore of Seville, and sometimes the Collection of Isidore Mercator because they usually begin with the words *Isidorus Mercator,* servus Christi lectori *salutem* ("Isidore the merchant, a servant of Christ, salutes the reader")—purport to be a collection of decrees of councils and decretals of popes of the first seven centuries. The collection contains: (1) the letters of the ante-Nicene popes from Clement to Miltiades—all are forgeries, some of which antedate the collection; (2) a collection of the decrees of councils, most of which are genuine though the forged Donation of Constantine is included (see DONATION OF CONSTANTINE); (3) a large collection of letters of the popes from Silvester I (d. 335) to Gregory II (d. 731), among which there are more than 40 falsifications.

As a collection the False Decretals seem to have been used first at the Council of Soissons in 853. They were known at the end of the 9th century in Italy but had little influence there till the end of the 10th century. Thereafter they were generally accepted by canonists, theologians and councils as authentic. Petrus Comestor in the 12th, Marsiglio of Padua in the 14th and Nicholas of Cusa in the 15th century doubted their authenticity. In the 16th century they mere rejected by Erasmus, Cesare Earonius and Robert Bellarmine as well as by the Centuriators of Magdeburg (compilers of a church history published 1559–74). When Francisco Torres defended their authenticity against the Centuriators, David Blondel refuted him in his *Pseudo-Isidorus* et *Turrianus Vapulantes* (Geneva, 1628), which ended the controversy. Since that time research has concentrated on the origin, extent and purpose of the falsification.

Modern scholars do not believe that they were produced in Rome. Their place of origin was somewhere in France (Reims, Le Mans, Tours) and the time was about 850. The object of the forgers was not to extend papal authority; rather, in seeking to effect the purpose mentioned above, they attributed laws and customs to earlier times and earlier popes than the facts permit. To this end they insist on the canonical election of bishops, on the exemption of clerics from trial in civil courts and condemn the aiienation of ecclesiastical property. In order to stop the abuses of archiepiscopal power they maintained that the provincial council when summoned by the pope was the superior of the bishops. In so doing they put the centralization of the church in this matter further back in time than is acceptable.

It is untrue to say that the False Decretals revolutionized canon law by substituting a new code for the older one. But the forgers did have a considerable influence. They seem to have helped eliminate *chorepiscopi* (bishops in full orders who at this time were auxiliaries of diocesan bishops or administrators of dioceses). limit the power of archbishops, revive dormant privileges of the clergy, revive the right of appeal. etc. The False Decretals were also used extensively during the Gregorian reform in the 11th century.

DECURIO, a Roman official title, meaning literally "the head of a group of ten," with two applications, one civil, the other military.

The term was applied to a member of the local council or senate (*ordo decurionum*) of colonies and *municipia* in the Roman municipal system in Italy and the western provinces. Their number was regularly 100. but varied with the size of the town and the provisions laid down in the charter of the town. Usually they were appointed from former magistrates by the chief magistrates (*duumviri*) at the quinquennial census, but instances occurred of co-optation and of election by the assembly. Qualifications were laid donn regarding age (25 years), wealth, rank and character, but age was often waived for minors who were benefactors. New *decuriones* regularly paid a set sum for public purposes. They were convened by the chief magistrates as in Rome, and carried decrees by majority vote of a quorum. They had wide powers in local administration, authorized expenditure, carried out investigations, decided on petitions and deputations to Rome and to provincial governors, granted honours, statues and rewards, chose patrons. acted as an advisory board for magistrates in judicial proceedings, and heard appeals from magistrates' decisions. In the early empire the position was an honour and they contributed greatly to the development of the towns, but in the later empire, when prosperity declined and the demands of the central government increased, responsibility for tax collection and liability for deficits gradually made their position unbearable. It became a hereditary and compulsory service, at times assigned as a penalty, for the class that in the later empire became known as *curiales.*

In the army, decurio meant an officer in command of a squadron of cavalry (*turma*). In each cavalry division (ala) of the imperial army there were 24 or 16 squadrons according as its strength was 1.000 or 500, and similarly six or three in cohorts of mixed cavalry and infantry. They were also officers in the equites *singu-*

lares of the headquarters troops.

Cagnat, *L'armée romaine d'Afrique*, pp. 208–209 (1912); G. L. Cheesman, *The Auxilia of the Roman Imperial Army*, pp. 36 *et seq.* (1914). (T. R. S. B.)

DEDEKIND, JULIUS (WILHELM RICHARD) (1831–1916), German mathematician, renowned for his work on the theory of numbers, was born at Brunswick on Oct. 6, 1831, and died there Feb. 12, 1916.

He obtained his higher mathematical education at the University of Göttingen where he was the last pupil of K. F. Gauss, under whom he took his Ph.D. degree in 1852. He became professor at Zurich in 1858; in 1862 he returned to his native Brunswick as professor at the technical high school. He published much highly original work, including three classics: *Stetigkeit und irrationale Zahlen* (1872), *Was sind und was sollen die Zahlen?* (1888) and *Über die Theorie der ganzen algebraischen Zahlen* (1879, 1894). Each of these profoundly influenced current mathematics. In the first he defined and elaborated the "cuts" later named after him, which passed into the standard course in the real number system. In the third he created the modern theory of algebraic numbers in which unique factorization is restored to algebraic integers by means of the ideals (not to be confused with Ernst Kumnier's earlier ideal numbers) which he invented. The concepts of this theory permeate modern algebra.

Indicative of Dedekind's flair for what was to increase in general interest after his time, his works of 1897 and 1900 on dual groups anticipated parts of the current theory of lattices developed after 1933. Dedekind's collected works were published in three volumes, 1930, 1931, 1932. *Essays on the Theory of Numbers* was published in English (1924).

See also E. T. Bell, *Men of Mathematics* (1937).

(E. T. B.; O. OE.)

DEDICATION, FEAST OF: *see* JEWISH HOLIDAYS.

DEDUCTION, a word commonly used to stand for the process of subtracting or withholding something (usually a sum of money). or for that which is subtracted or withheld (as in "tax deduction"). The corresponding verb is "deduct" (from Lat. *deducere,* "to lead out from"). The verb "deduce" now has the quite different meaning of "infer." Thus, "deduction." in this important sense, is an approximate synonym for "inference." (The latter word, however. carries a stronger suggestion that the conclusion in question is true.) A deduction may be some *conclusion* drawn by reasoning from facts or from premisses (as in "a false deduction from the evidence"); or "deduction" may stand for the general process of reasoning ("deduction requires premisses"); or it may mean a particular specimen of reasoning ("a notable deduction").

In logic, "deduction" is used more narrowly, in opposition to induction (*q.v.*). A deduction, in this sense, is a rigorous proof, or derivation, of one statement (the conclusion) from one or more statements (the premisses); *i.e.*, a chain of statements, each of which is either a premiss or *follows from* a statement occurring earlier in the proof. If *A* "follows from" B in the sense intended, the conjunction of B and the negation of A (in symbols, $B.\sim A$) must be self-contradictory—a condition that does not apply to induction. (But an adequate analysis of what is meant by "following from" or "being rigorously implied by" is a difficult technical problem.) This modern use of "deduction" is a generalization of what Aristotle, in his *Prior Analytics,* called "syllogism." But a syllogism (*q.v.*) is now recognized to be merely a special case of a deduction. Also the traditional view that deduction proceeds "from the general to the specific" or "from the universal to the particular" has been abandoned as incorrect by most logicians. Some experts regard all valid inference as deductive in form, and for this and other reasons reject the supposed contrast between deduction and induction. *See* also references under "Deduction" in the Index volume. (M. BK.)

DEE, JOHN (1527–1608), English mathematician and astrologer, made considerable contributions to the scientific knowledge of his time, despite his dabblings in necromancy and alchemy. which drew the attention of royalty. He was horn in London on July 13, 1527, educated at St. John's college, Cambridge, and made a foundation fellow of Trinity college in 1546. After lecturing and studying at Louvain. Brussels and Paris between 1547 and 1550, he returned to England in 1551 and was granted a pension by Edward VI. The great maritime expansion was just beginning and the next 30 years of Dee's life were spent in giving advice and instruction to pilots and navigators. He also collected a large mathematical and scientific library. He enjoyed the favour of Elizabeth I, was asked to name a propitious day for her coronation and gave her lessons in the mystical interpretation of his writings. His preface to the English Euclid, translated by Henry Billingsley (1570), pointed out the practical applications of geometry and, together with several of his other works, fostered the revival in England of the mathematical arts. Dee spent the years 1583–89 in Poland and Bohemia with the astrologer and alchemist Edward Kelly, and became warden of illanchester college in 1595. He died in poverty at Mortlake in Dec. 1608.

See *The Private Diary of Dr. John Dee,* ed. by J. O. Halliwell for the Camden society (1842); E. G. R. Taylor, *The Mathematical Practitioners of Tudor and Stuart England* (1954). (O. J. E.)

DEE, a river in southern Aberdeenshire, Scot., flowing generally eastward from its source in the west of the county till it reaches the North sea at Aherdeen. Its sources are in the Wells of Dee on Ben Braeriach, one of the Cairngorms, at a height of almost 4.000 ft., and on Ben Macdhui. With its tributaries the river drains an area of about 1,000 sq.mi. Rapid and turbulent during the first half of its 87-mi. course, it broadens below Aboyne. After flowing through Kincardineshire for a short distance, it forms the boundary between the two counties. The channel toward its mouth was artificially altered in order to provide increased dock accommodation at Aberdeen, but above this the stream is navigable only for a few miles. It runs through beautiful scenery, especially in Braemar. About 2 mi. above Inverey it forms the spectacular rapids and cascades of the Linn of Dee. The principal places on it are Braemar (Castleton of Braemar), Ballater, Aboyne, Kincardine O'Neil, Banchory. Culter and Cults. The British royal family's Highland residence, Balmoral castle, lies between Braemar and Ballater. The river is famed for its salmon.

"Dee" is a common river name; it is said to mean "goddess."

(A. T. A. L.)

DEE (Welsh AFON DYFRDWY), a river of Wales and England, It rises below the peak of Dduallt, flows northeast for 7 mi. to Bala lake. Merioneth, Wales, and continues past Corwen, Llangollen and Overton. From there it meanders northward to Chester and thereafter through a great estuary into the Irish sea. In the Llangollen district the Dee crosses Denbighshire and then forms the boundary of that county with Shropshire, a detached part of Flint and Cheshire. From its source to Bala the river falls about 1,000 ft. and from Bala to Overton (35 mi.) about 330 ft. Its course then lies through a narrow. beautiful valley, enclosed on the south by the steep slopes of the Berwyn mountains and on the north by lesser ranges. The Vale of Llangollen, where an aqueduct (built in 1805 by Thomas Telford) of the Shropshire Union canal bestrides the valley, is especially famous. Below Chester the Dee follows a straight artificial channel to the estuary, and this is the only navigable portion. The estuary, which is 12 mi. long and 5¼ mi. wide at its mouth, between Hilbre point and Point of Air, is not a highway like the Mersey, for at low tide it becomes a vast expanse of sand and marsh through which the river meanders. The tide spreads with great speed over the sands, and their danger is illustrated in the ballad "The Sands of Dee" by Charles Kingsley. The Dee drains an area of 813 sq.mi.; its total length is about 70 mi.; and the total fall is 1,500 ft. The river is mentioned as Deoua by the geographer Ptolemy.

DEED, in law, a written instrument for the transfer of title to real estate. At common law, the deed was a contract or obligation under seal, and a seal is still required in England (even if only a wafer), though no longer necessary in most places in the United States. Although customarily recited in a deed, neither consideration (the giving of something of value), witnesses nor acknowledgment before a public official is generally necessary to transfer title. Delivery is required but may be complete without manual

transfer of the deed; acts or words of the grantor indicating his intention to make the deed presently operative are sufficient. A deed may also be handed over conditionally as an escrow (*q.v.*), in which case it will not take effect until the specified conditions are fulfilled. A deed indented, or indenture (*q.v.*), so called because of its indented counterparts that can be fitted together for identification, is one between two or more parties who contract mutually; a deed poll (with a polled or smooth-cut edge, not indented) is a deed in which one party binds himself, with no corresponding obligations undertaken by another.

See also REAL PROPERTY AND CONVEYANCING, LAWS OF: *Conveyancing;* TITLE TO LAND; CONTRACT: History. (A. DM.)

DEER, any member of the mammalian family Cervidae of the order Artiodactyla, suborder Ruminantia, infraorder Pecora, the latter subdivision including also cattle and giraffes. The feature most commonly associated with deer is the presence of antlers; those few species that lack them have instead the'upper canine teeth much enlarged. Deer are widely distributed over Eurasia, the Americas, northern Africa and the East Indian archipelagos. They occur mainly in forests, but some dwell in open country (the caribou of the northern tundras, the pampas deer of the Argentinian grasslands) and some prefer marshy areas. All swim well and most species willingly enter water. They are hunted extensively wherever they occur and in North America are second only to the rabbit as the most hunted mammal (see HUNTING: Stag *Hunting).* The flesh, or venison, of most deer is esteemed as food. The hides, when properly tanned, produce a soft leather. Native peoples in colder climates have used deer hides as a source of clothing for centuries. Some kinds, notably the Laplander's reindeer, have been domesticated and, although migratory, are managed much as domestic cattle; they produce a beeflike meat, leather and milk, and serve also as draft and riding animals. At least one species, Père David's deer, of China, survives only in domestication and is on the verge of extinction.

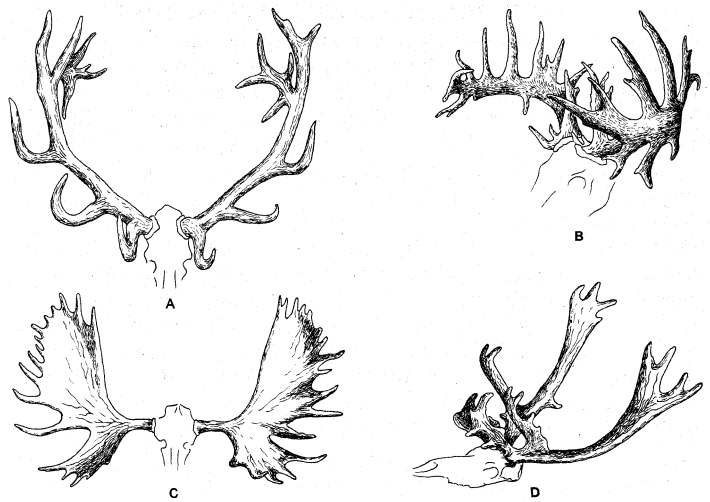
In certain areas of the world deer have occasionally become overabundant, with the result that they have spilled out of their natural habitats and have menaced crops. Earlier, when carnivores were more numerous—particularly coyotes, wolves, wild cats, bears—a natural check was kept on the deer population. Now, however, hunters are the check, and flexible game regulations tend to control the numbers of deer. Unless adequate numbers are harvested annually, disease and starvation often decimate local populations.

The terminology associated with the sexes of various cervids is an outgrowth of their importance as game: female deer are usually called does, but the female of the European red deer is a hind, and of the moose or elk a cow; males generally are called bucks, but the male of the red deer is a stag or, especially when mature, a hart, and of the moose or elk a bull. Several names are used for the fawns of various ages, *e.g.*, yearling, knobber, brocket, staggard, especially applied to male red deer; fawns of moose or elk are called calves.

GENERAL

Structure and Function.—Deer have lithe but compact bodies and short tails. The ears are large but usually slender. The legs are characteristically long and slender and are provided with paired hooves. In some deer lateral hooves are present but much reduced. Generally the fur is slightly harsh but has a smooth appearance. Some deer possess a shaggier coat, especially in the cold seasons, the longer. harsher fur tending to be more abundant on the foreparts. The colour is usually brownish to tawny, often with white on the chest and throat. In most kinds the coat of the young, or fawn, is spotted—a remarkably effective camouflage in the dappled lighting of forest glades—and in some, especially the smaller species, the spotting may be retained by the adult.

The antlers are solid bony outgrowths arising from the frontal bones. In most species they are borne only by the males, the caribou being an exception (see REINDEER). Antlers are shed and produced anew each year. The growth and shedding is under the control of the male sex hormones except in the caribou. The antlers originate as highly vascularized simple knobs covered with a soft, sensitive skin, the so-called velvet of the antlers. The growth of antlers is rapid, and ample calcium is required. As growth continues, a heavy deposit of bone at the base of the antler constricts the circulation, finally stops it entirely and the skin covering dries. The skin is then rubbed off and the hardened antler is fully developed as the rutting season begins.



E. T. SETON, "LIFE HISTORIES OF NORTHERN ANIMALS,", 1909. REPRINTED BY PERMISSION OF THE ESTATE

FIG. 1.—ANTLERS OF CERVIDAE: (A) AMERICAN ELK OR WAPITI (CERVUS CANADENSIS); (B) WHITE-TAILED DEER (ODOCOILEUS VIRGINIANUS); (C) AMERICAN MOOSE OR EUROPEAN ELK (ALCES ALCES); (D) AMERICAN CARIBOU OR EURASIAN REINDEER (RANGIFER)

The general form of the antler is characteristic of the various species. Some species have a main beam with one or more subsidiary tines; others show a dichotomous or even more complex branching. Maximum size and complexity of antlers is usually attained when the animal is in its prime; they tend to degenerate in older animals. Shedding of the antlers is caused by a resorption of bony material at their bases. This process of resorption, which irritates the animal, induces it to respond by rubbing the antlers against trees. When the base has been sufficiently weakened, the antler is shed.

In size, deer vary from that of a small dog (the pudu stands 13 in. at the withers) to that of a large horse (the American moose, known as the elk in Europe, stands about 90 in. at the withers and may weigh as much as 1,800 lb.). The cheek teeth have high crowns whose surfaces have sharp crescentic ridges—a type of tooth well suited to a varied vegetative diet. The upper incisors are absent or poorly developed except in the antlerless species. A gall bladder is usually absent. Most of the species have prominent facial glands below each eye, and some have tarsal, metatarsal or digital glands. The senses of sight, hearing and smell are very well developed.

Natural History.—Deer. like most browsing animals. are most active in early morning and late afternoon, resting at midday and at night. Most live in small bands comprising a family group although the males are prone to be solitary seasonally. In warm climates breeding takes place at any time of the year; in colder climates, in autumn or winter; and one or two (as many as seven in the water deer) young are born. The gestation period varies from 160 days (musk deer) to a year (marsh deer). Most deer are polygamous, the bucks collecting harems and battling other males for possession of the does. Occasionally the antlers of two fighting bucks become so firmly engaged that the struggle ends in both combatants dying of starvation.

Most deer are shy and furtive although the larger species are dangerous opponents and should not be approached closely even when tamed.

Especially in the rutting season deer are likely to be unpredictable. The American moose is justly known for its irascible disposition. Deer attack with either antlers or hooves, impaling with the former and slashing with the latter.

CLASSIFICATION AND DISTRIBUTION

The classification of the cervids is quite unsatisfactory. Although many fossils are known, they shed remarkably little light on the relationships of the living kinds, a matter on which scarcely any two authorities agree. They may be arranged in four subfamilies as follows: Moschinae, musk deer; Muntiacinae, muntjacs or muntjaks; Cervinae, typical, or true, deer; Odocoileinae, hollow-tooth deer including American deer, caribou and roebuck.

Musk Deer (Moschinae).—The subfamily Moschinae contains only one species, *Moschus* moschiferus, the musk deer (also called kastura or kabarga). Musk deer are the most primitive of living cervids, lacking antlers, facial and digital glands, but possessing a gall bladder, daggerlike canines and a preputial musk sac in the males. They resemble a large, dark-brown, stout hare with robust hind legs. The lateral hooves are well developed. The species occurs, usually solitarily, in rocky and hilly forests from Mongolia and Siberia to upper Burma and Assam. A small form occurs in Korea. Because the musk sac is sought for making perfumes, the animals have been hunted to near extinction.

Muntjacs (**Muntiacinae**).—The subfamily Muntiacinae contains only two genera, Muntiacus (muntjac, or barking deer) and *Elaphodus* (tufted deer, or Tibetan muntjac). These small deer lack a gall bladder, as do most cervids, and males possess small to tiny antlers. Unlike that of the typical deer, however, the antler arises from an extended bony basal stalk or pedicel. The upper canines are well developed.

Muntjacs.—The muntjacs have relatively large and conspicuous simple two-branched antlers with short tufts of hair at their bases. The coat of the several species varies from blackish to yellowish. They stand from 20 to 28 in. at the shoulders. Muntjacs are secretive animals, inhabiting wooded areas or thick underbrush from China and Formosa to many of the East Indian islands. The sharp cry remarkably resembles the bark of a dog.

Tufted Deer.—The tufted deer (E. cephalophus) has tiny antlers quite out of proportion to the length of the pedicels. Prominent tufts of hair between the ears are the origin of the common name. These dark-brown deer stand about 23 in. at the withers and weigh about 40 lb. They are found only in China.

True Deer (**Cervinae**).—The subfamily Cervinae includes the typical deer of which there are at least four genera, *Dama,* Axis (including Hyelaphus), Cervus (including Rusa, *Sika, Rucervus* and others) and *Elaphurus.* All possess well-developed antlers in the males and lack a gall bladder. The upper canines may be relatively well developed but are not tusklike.

Fallow Deer.—Two species of Dama, the fallow deer, are known: D. *dama,* originally occurring from southern Europe to Asia Minor but now established over most of Europe; and D. *mesopotamica,* occurring in Iran. The prominent antlers consist of a small brow tine and a main beam that branches at its end into short, stubby, fingerlike tines. The fallow deer stands 34 in. at the withers. The tan upper parts are marked with round whitish spots arranged more or less in longitudinal rows; the underparts are white. Fallow deer usually occur in small family groups. They eat a wide variety of vegetation. The rutting period occurs in early autumn and usually two spotted fawns are born the following spring.

Axis Deer.—The axis deer, also called chital or spotted deer, Axis axis, resembles the fallow deer in size and colour pattern, but the antlers are not palmated, the main beam terminating in two points. It is a jungle dweller of India and Ceylon.

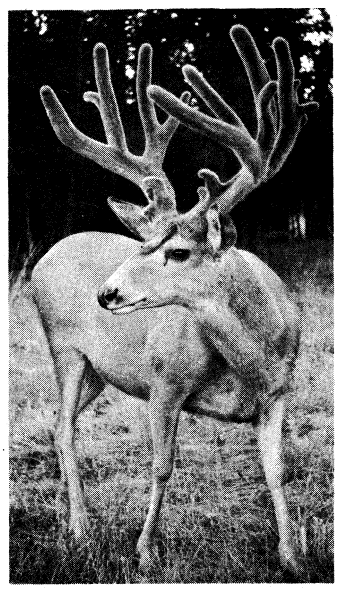
Also often included in this genus as the reddish-brown hog deer is Axis (*Hyelaphus*) *porcinus* of southeastern Asia and the Philippines. Hog deer have long, slender simple antlers, and are small, only about 28 in. at the withers.

Red Deer, Wapiti and Allies.—The genus Cervus, in the broad sense, includes a great number of species. The following are among the better-known members of the genus. *Cervus elaphus,* the European red deer or stag and the maral, occurs over most of Europe eastward to Iran. It stands 4 to 4½ ft. at the shoulders and has a russet coat. The American elk or wapiti (C. *canadensis, C. merriami* and C. nannodes) formerly occurred over most of North America south of the tundra. They are among the largest of the deer, standing more than five feet at the shoulder and bearing massive antlers. The sambar (C. unicolor and others) includes small to large deer having three-tined antlers. The several species occur from China to the East Indian islands. The usual form is the size of the red deer, and lives mainly in jungle-covered mountains. The coat is uniformly dark brown, even, usually, in fawns. The sika (C. *nippon*) is a medium- to small-sized deer having four- or five-tined antlers. It occurs on the eastern coast and offshore islands of Asia.

Père David's Deer.—The genus Elaphurus contains only Père David's deer (E. davidianus), known only in the domesticated state. This large deer with slender antlers is thought to have originated in northern China.

Hollow-Toothed Deer.—The subfamily Odocoileinae contains at least ten genera. The following are among the better known kinds.

White-Tailed Deer.—Odocoileus *virginianus* (not Dama of some authors, a name properly ascribed to the Eurasian fallow deer), the Virginia, or white-tailed, deer, occurs over most of North and Central America and in parts of South America. The antlers have one main beam with side tines. The underside of the tail is white and forms a conspicuous flag when the tail is raised, as in alarm. Its run is quite unlike the stiff-legged bouncing gait of its relative, the big-eared western American mule deer, O. *hemionus.*



BOB ROSE FROM NATIONAL AUDUBON SOCIETY

FIG. 2.—MULE DEER (ODOCOILEUS HEMIONUS) WITH ANTLERS IN VELVET

Andean Deer.—The Andean deer, or guemal, Hippocamelus antisiensis, occurs uncommonly in the Andes. It is said to hide in rocky places in the day and to emerge in the evening to feed on mosses, lichens and other low vegetation. It is smaller than the Virginia deer and has a speckled brown and tawny coat.

Swamp Deer.—The swamp deer. Blastocercus *dichotomus,* is the largest South American deer, being about four feet high at the shoulders. The antlers are small and simple. This deer is a reddish species inhabiting the shore of streams and swamps in dense jungles.

Pampas Deer.—The pampas deer (Ozotocerus bezoarticus) is smaller, being the size of a European roe deer (see below). The antlers are small and delicate; the coat, light reddish brown. It inhabits dry. grassy plains from Brazil to northern Patagonia, occurring usually solitarily.

Pudus.—The pudu, smallest of the deer, and bearing the improbable name Pudu *mephistophiles,* has a very restricted range in Ecuador. Its over-all colouring is a rich dark-brown, with face and legs blackish.

Moose.—The American moose (*A.* alces americana and other subspecies) and the European elk (*A.* alces alces), both of which are sub-Arctic, circumpolar in distribution, extending southward to Poland and to the central Rockies. They are the largest-antlered animals known. (See MOOSE.)

Caribous and Reindeer.—The caribou of North America and the reindeer of Eurasia are probably subspecies of a single species, *Rangifer* tarandus. Unlike other deer, both sexes of most *Rangifer* bear antlers. The colour varies from nearly white to blackish-brown. The preferred food is lichens, but leaves, grass and sedges are also eaten.

Brackets.-The Central and South American brockets or cariacus, genus *Mazama,* comprize several species of squat-bodied, small, forest-dwelling deer distinguished by the antlers being short, simple spikes. The pygmy brocket of central Brazil is,

next to the pudu, probably the smallest deer, standing less than 20 in. at the withers.

Water Deer.—The Chinese water deer. *Hydropotes inermis,* is about 20 in. tall. and has a coarse yellowish coat. It is found in China and Korea. in both marshy and dry land areas.

Roe Deer.—The roe deer, or roebuck. *Capreolus capreolus,* is a graceful three-foot-tall deer of Europe and western Asia. The colour is brown; the antlers are small and simple. It is a forest dweller. monogamous (mates for life), and is much hunted for its tasty flesh.

See RUMINANT; separate articles on various cervids including ELK: FALLOW DEER; RED DEER; REINDEER; ROEBUCK; WAPITI: see also references under "Deer" in the Index volume.

DEERE, JOHN (1804–1886), pioneer U.S. manufacturer of steel plows, was born at Rutland, Vt., on Feb. 7, 1804. After a public school education he became an apprentice to a blacksmith at the age of 17 and eventually set up his own smithy. In 1837 he moved to Grand Detour. Ill., where he opened a blacksmith shop in partnership with Maj. Leonard Andrus. In that year he and Andrus developed and manufactured a successful steel plow. He sold his interest to Andrus in 1347 and moved to Moline, Ill., where he founded his on-n firm: incorporated as Deere and Co. in 1868. He was active as president of this company until his death at Moline on May 17, 1886. (H. J. SG.)

DEERFIELD, a town (township) of Franklin county. Mass., U.S., on the Connecticut and Deerfield rivers. 33 mi. N. of Springfield. The population. n-hich numbers less than 5.000, is located principally in the villages of South Deerfield and Old Deerfield. The town is picturesquely situated amid broad meadows in the Connecticut valley. The surrounding region is primarily agricultural and the town is the site of several private schools, notably Deerfield academy, established in 1797.

Old Deerfield is celebrated for "The Street," a broad and tranquil thoroughfare lined with towering elms and charming restored homes dating from the early 18th century. Many of these are open to the public, as is a historical museum housing a collection of colonial and Indian relics.

Settled in 1669, Deerfield for years was the northwestern frontier outpost of New England and the target of several destructive Indian attacks. Scene of the famous Bloody Brook massacre in 1675, the town suffered its most devastating raid at the hands of the French and their Indian allies in 1704. From a forced march northward following this raid. the Rev. John Williams returned to write a harrowing account which has become a minor classic. *The Redeemed* Captive *Returning* to *Zion* (1707). (RI. H. B.)

DEER FLY, any of the banded-winged flies of the genus *Chrysops* of the family Tabanidae, order Diptera (*q.v.*). They are important because, in western North America. C. *discalis* is a painful biter which transmits tularemia (*q.v.*) to humans. In Africa *C. discalis* and C. *silacea* are vectors of the eye worm *Loa loa* (see FILARIASIS).

Deer fly is also a name applied to the parasitic deer botfly (*q.v.*) of western Sorth America, claimed to be the speediest insect on earth. (C. H. CN.)

DEERING, WILLIAM (1826–1913), U.S. manufacturer and philanthropist, was born in South Paris, Maine. April 25, 1826. After commencing the study of medicine, circumstances forced him to assist his father in managing a woolen mill. Later he invested in Illinois and Iowa farm lands. Returning east, he cofounded the textile firm of Deering. Milliken and Co. Subsequently he manufactured the Marsh harvester as successor to the reaper and resided in Evanston. Ill. Utilizing J. F. Appleby's invention, he added the twine self-binder and in 1900 he exhibited the first self-propelled farm machine. In 1902 Deering Harvester company united with the McCormick company and others to form International Harvester Co., Deering's son Charles becoming chairman of the board. For many years Deering was president of the boards of Garrett Biblical institute and Northwestern university; Chicago Wesley Memorial hospital was dedicated in memory of him and his daughter. He died in Coconut Grove, Miami. Fla., on Dec. 9, 1913.

See Wayne Andrews, *Battle for Chicago* (1946). (R. McC.)

DEFAMATION, in law, is the offense of injuring a person's reputation and good name by communicating to others an imputation concerning him which tends to diminish the esteem in which he is held by his fellow men. The allegation may be calculated to bring him into "hatred, contempt or ridicule" or have the tendency merely to cause him to be shunned and avoided, as by imputing to him a misfortune rather than dishonourable conduct. Either can be sufficient. taking men as they are with their prejudices and conventional standards. to impair the respect and confidence which he enjoys. But the imputation must tend to injure his character or reputation; a falsehood otherwise prejudicial. such as an allegation that he has gone out of business, falls outside the purview of defamation except under special legislation (as in Australia'). Likewise, mere vulgar abuse is not treated as defamatory when insulting rather than disparaging to reputation.

Whether an imputation is defamatory must be judged by reference to the reaction of the "ordinary decent citizen:" though it is sufficient that the allegation is calculated to incite adverse feelings among a substantial and respectable group of the community. So, depending on time and place, it may be defamatory to call someone a German, a Communist. a Jew, a Jew-hater or a scab. It is immaterial whether the imputation is conveyed by words of assertion or suggestion, or whether couched in declaratory or interrogatory form. The effect: the tendency of the language used, not its form. is the criterion. Reputation cannot be traduced with impunity by dexterity of style or other stratagems, such as resort to pseudonyms or the common blurb that "the characters or incidents in this book (or film) are fictional."

No expression is necessarily defamatory in all circumstances. However disparaging at first sight. it may admit of an innocent interpretation if explained in the light of its context and the circumstances attending its publication. Particularly, the meaning of spoken words can never be divorced from the gesture, tone of voice or facial expression of the speaker. Conversely, words apparently innocent in themselves may, with reference to special circumstances and to persons knowing them, be shown to carry a secondary and highly defamatory meaning. For example. an erroneous description of a woman as the wife of Mr. X is defamatory of X's real wife in so far as it suggests. to those knowing her, that she has been living in adultery. In such cases. the plaintiff must make the defamatory sense clear by an averment in his pleadings called an "innuendo," and at the trial he must prove that the words were understood in the defamatory sense averred, though not necessarily believed to be true, by persons having the necessary background knowledge.

After much turbulent political debate culminating in Charles James Fox's Libel act of 1792. it has come to be recognized as a basic guarantee of democratic liberty that the issue of "libel or no libel" should be within the exclusive preserve of the jury; and significantly. in actions for defamation, jury trial remains a matter of right despite the virtual disappearance of juries from civil actions in England. It is accordingly for the jury, not the judge, to determine whether the offensive imputation is defamatory, subject to the judge's power to direct a verdict if he is of the opinion that the words are clearly incapable of defamatory meaning.

Any living person may be defamed, but no civil action lies for defamation of the dead, however much distress might be involved for relatives or friends. Indeed, reputation is so personal an attribute that a cause of action for defamation does not survive for the benefit of the defamed person's estate.

Publication.— No civil action lies unless the defamatory statement was communicated to a third person: it must have been "published." not in the sense of being addressed to a large audience but of being made known to someone other than the victim of the calumny. The wrong consists in injury to reputation, *i.e.,* the respect and esteem entertained toward him by his fellows; rather

than in affront to personal pride and self-respect, though the latter may be taken into account in assessing damages. Liability attaches to every participant in the publication, whether he be the writer, speaker, printer or merely concerned in the process of distribution. In some circumstances it may even be incumbent to remove defamatory matter which someone else has originated, such as a writing on one's wall affixed by a trespasser.

Every republication of defamatory matter gives rise to a new cause of action. and it is no defense to a republisher that what he transmitted was a true report of what he had heard or read. The existence of a defamatory rumour is no justification for repeating it; otherwise, newspapers would be almost wholly outside the reach of liability. On the other hand, one who publishes a defamatory allegation is not responsible for any mischief caused by its repetition unless he published it to a person who was under a legal or moral duty to repeat it, or the repetition was authorized or intended by him, or perhaps where circumstances were known to him at the time of publication which gave him reason to expect such a repetition.

In order to attract liability, the publication must have been intentional or negligent. One who writes a libelous letter to the person defamed or charges him with discreditable conduct in his presence will escape responsibility if he guarded against the possibility that the letter would be opened or the accusation overheard by strangers. It is negligent, however, to communicate a libel on a post card and, if sent through the mail, publication to post-office employees and the like will be presumed.

Yet, though there is no liability for intentionally defamatory matter published accidentally, there is for accidentally defamatory matter published intentionally. Liability does not depend on the intention of the defamer but on the fact of defamation. Thus a publisher is liable for a statement, harmless on its face, nhich by reason of extrinsic facts unknown to him happens to be defamatory of the plaintiff. Not only does he shoulder the risk of an unintended defamatory meaning, but also of an unintended reference to the person defamed. "The question is not who was aimed at but who was hit." This stringent common-law liability was attenuated in England and Scotland (also in New Zealand and Tasmania) after 1952, whence a person who has "innocently." *i.e.*, unintentionally and without negligence, defamed another in such circumstances may make an offer of amends in the form of a published correction and suitable apology. Whether accepted or not, such an offer constitutes a good defense to any publisher (provided he can prove, if the offer has not been accepted, that the words were written by the author without malice in case he was not the author himself).

Apart from this legislative measure of relief, it has long been recognized that the strict liability for unintended defamation attaches only to those who are primarily instrumental in the publication, such as the writer, newspaper proprietor and publisher, editors and printer. Persons who play the more subordinate role of mere distributors, like news agents, booksellers and librarians, escape responsibility even at common law on proof that they were ignorant of the defamatory content and that there was nothing to indicate to a reasonable man that the matter might be defamatory.

Libel and Slander. — Somewhat fortuitously, English law became committed to a division of the law of defamation into the twin wrongs of libel and slander. The distinction is of singular importance in so far as slander, unlike libel, is not actionable without proof of "special damage"; *i.e.*, loss of some material advantage other than mere prejudice to reputation, except where the words (1) impute a crime that is punishable corporally (*e.g.*, by imprisonment); (2) impute a contagious and loathsome disease, such as leprosy or syphilis; (3) impute unchastity or adultery to a woman or girl; (4) are calculated to disparage the plaintiff in any office, profession, calling, trade or business held or carried on by him. These exceptions are the outcome partly of historical accident and partly of judicial policy aided by legislative reform.

The distinction between libel and slander is essentially that between written and spoken defamation or, more precisely, between communications addressed to the eye and the ear. According to another view, it depends on the permanence or transience of the medium of communication. Each of these theories has been rationalized on the ground that the potentiality for mischief inherent in visible or permanent form is infinitely greater than that of slander because of the larger area of dissemination, facility for repetition and the tendency to evoke a higher degree of credence, particularly among the less erudite sections of the community. The advent of radio and television acutely raised the problem of classification because, though akin to slander according to the conventional tests, these media of mass communication are invested with a capacity for mischief which might seem to favour the more stringent safeguards of libel traditionally applied to the press. In Australia, radio defamation has been held to be slander, but decisions in the United States are sharply divided. By legislation, defamation that is broadcast by means of wireless telegraphy was deemed to be libel in the United Kingdom (1952), Australia (1956) and Ontario, Can. (1958), though the trend in the United States favours the opposite conclusion.

The recommendation by a select committee of the house of lords in 1843 to assimilate the law of slander to libel, while not adopted in England, was translated into the statute book of New Zealand, a majority of Australian states and several Canadian provinces. But the Australian legislation retains a safeguard against frivolous actions for oral defamation by allowing the defense that the publication was made under circumstances where the person defamed was not likely to be injured thereby. In the United States, by contrast, all jurisdictions except Louisiana still adhere to the traditional dichotomy.

Several defenses are open to a defendant in an action for libel or slander.

Justification. — In English law, truth is a complete answer to a civil action for defamation. Damages are due to a deserved reputation traduced, not a false reputation exposed. This viewpoint is open to the objection that it condones even wanton exposures of a person's past unbalanced by social utility, and aggravates the absence in English, as contrasted with U.S., law of any redress for invasion of privacy as a distinct wrong. A recommendation by a select committee of the house of lords in 1843, that truth be recognized as a defense only if the publication was for the public benefit, received legislative endorsement in England with respect to criminal, but not civil, actions. It was, however, fully adopted in the majority of Australian jurisdictions and corresponds with a widespread requirement in the United States that the publication be made for an honest motive.

To succeed in this defense the defendant must prove that the defamatory statement was substantially true. A slight inaccuracy is not fatal, provided the justification "meets the sting of the libel." But, at common law, the defense failed unless all of several distinct allegations were so justified, even if an unproved charge could not have materially injured the plaintiff's reputation in view of the truth of the rest. This technicality was abrogated by statute in 1952.

Fair Comment. — One of the most important safeguards of democratic liberty is the right of fair comment upon matters of public interest. But however ample the protection thus afforded to the press and critics, the defense is subject to important limitations.

First, it shields only defamatory expressions of opinion, not statements of fact. The distinction between these is not always easy to draw, and much must depend on the context of the impugned expression: if the facts are set out and an opinion is expressed about them, the latter is clearly comment, but bare inference or allegations will generally be treated as statements of fact. To say that a man's conduct was dishonourable is a statement of fact; to say that he did specific things and that his conduct was dishonourable is a statement of fact coupled with a comment. It is not absolutely necessary, however, that the opinion be based on facts actually presented to the reader or listener, since criticism of a literary work would otherwise be confined to passages actually set out in the review. It is accordingly sufficient if the facts necessary to support the comment can be implied from the terms of the impugned expression.

Secondly, comment cannot be fair if based on facts which are distorted or invented. Truth is therefore material, not only to

justify such allegations of facts as are defamatory, but also as an essential step in establishing that any defamatory comment is fair.

Thirdly, the subject commented on must be a matter of public interest, such as the public conduct of a person holding or seeking public office, or any work of art, literature or play performed or exhibited in public. The defense does not, therefore. significantly impair the claim to privacy by citizens content with an anonymous existence. Moreover, a person's moral character is not a permissible subject of defamatory comment even if he occupies a position which makes his character a matter of public interest, because it is feared that public affairs would not be conducted by men of honour if the law were to sanction such attacks without opportunity for redress.

Lastly, the comment must be both fair and honest. Fairness, however, does not demand either reasonableness or balanced judgment. For the sake of wide freedom of discussion, even the unreasonable critic deserves tolerance; still less should a jury be at liberty to substitute its own opinion for that of the critic. Rather, the question is: "Would any honest man, however prejudiced he may be, however exaggerated or obstinate his views, have expressed this opinion?" Comment distorted by malice is never fair.

Absolute Privilege. — There are certain occasions on which public policy requires the complete removal of all restrictions on freedom of expression, even at the risk of thereby exposing reputations to defamatory assaults known to be false and made with the express intent to injure. Such an exceptional privilege is accorded principally for the sake of ensuring the efficient functioning of governmental institutions. Foremost is the absolute immunity attaching to all statements made by members of parliament in the course of proceedings of either house, to statements made by any person when giving evidence before a parliamentary committee, to petitions addressed to parliament and to all parliamentary papers published by authority. The same protection extends to any defamatory statement made in the course of proceedings before a court of justice or a tribunal having similar attributes (like the Discipline committee of the Law society), whether by judges, juries, parties, witnesses or their legal representatives.

Lastly, absolute immunity attaches to communications made by "high officers of state" in the course of their official functions, for the sake of protecting the fearless discharge of duties within the executive department of government. In the United States, there has been a tendency to extend this privilege farther down the executive hierarchy and, instead of linking it to a basis of rank, to look rather to the duties which the officer is authorized to perform. Accordingly, absolute immunity has been conceded to official communications (including, under federal law, even statements to the press) by such lowly officers as building inspectors, internal revenue agents and law-enforcement officers.

Communications between husband and wife have also been traditionally invested with absolute immunity in recognition of their confidential relationship, but a like claim for professional communications between solicitor and client (except in relation to prospective or pending litigation) is in doubt.

Qualified Privilege. — In a much larger range of situations, the law attaches a qualified privilege to defamatory publications, in recognition of certain necessities of social intercourse. In these cases, the immunity is conditional in the sense that it will be forfeited if the communication is made from a dishonest motive or for an improper purpose, foreign to the interest for the protection of which the privilege is recognized; *e.g.*, to gratify spite or to cover up a previous misstatement. It is in this extended sense that qualified privilege is frequently said to be defeated by "malice." Absence of any genuine belief in the truth of the statement automatically defeats the privilege.

Privileged occasions cannot be catalogued exactly, but their range may be comprehensively described as including all those situations "where the person who makes [the] communication has an interest or a duty, legal, social or moral, to make it to the person to whom it is made. and the [latter] has a corresponding interest or duty to receive it." Statutory modifications apart (as under certain Australian codes), reciprocity of interest or duty in both publisher and recipient is essential. so that a stranger would not be privileged to make disclosures to a wife reflecting on her husband's morals. for, though she has a legitimate interest in hearing about it, he has no corresponding duty or interest to communicate such information.

A common illustration of privilege is that attaching to information given in answer to an inquiry concerning an employee's character or tradesman's credit. But the person making the inquiry must have a legitimate interest, not merely an interest springing from idle curiosity; and in England, unlike the United States, it is doubtful whether commercial credit agencies are entitled to this protection. Sometimes a duty to speak may arise, though the information is not requested. Certain relations, such as that of employer and employee or father and child, justify volunteered statements by one to the other relevant to their duties and interests.

Privilege also attaches to statements made by a man for the bona fide protection of his own legitimate interest; *e.g.*, in reply to attacks upon his own character in a manner relevant to the matter in hand. Sometimes the speaker and recipient are privileged by a bond of "common interest," as in the case of interchange of information among shareholders, candidates and electors, and members of professional associations.

But no privilege arises merely because the publication is concerned with a matter of public interest. If it were otherwise, newspapers would have altogether too free a hand. As already seen, the defense of fair comment protects the discussion of matters of public interest in the form of criticism and comment based on a foundation of true facts, but defamatory allegations of fact are actionable unless true or entitled to privilege on some other ground. Thus, it is but rarely permissible to resort to the press as the proper medium for communicating privileged information. For, while a man attacked in public may legitimately reply to the same large audience in order to rehabilitate himself, the range of persons having a proper interest in receiving privileged information is ordinarily more restricted, and the method of publication must be adjusted so as not to exceed what is reasonably appropriate for protecting the particular interest which the defendant is entitled to assert.

Privileged Reports. — Fair and accurate reports of parliamentary and judicial proceedings are clothed with qualified privilege at common law, whether published by a newspaper or anyone else, because it is considered in the public interest that full information be available concerning the administration of public affairs. (By statute, fair and accurate newspaper reports of judicial proceedings are probably entitled to absolute privilege in England and in some commonwealth countries.) The report need not be verbatim because the protection would otherwise be illusory; a condensed summary is sufficient, provided it gives a correct and fair account of what took place.

The range of privileged reports has been substantially augmented by legislation which, inevitably, differs materially from one jurisdiction to another. In England, fair and accurate reports in newspapers or broadcasts dealing with a very wide range of subjects enjoy immunity, provided they are published without malice, the matter in question is one of public concern and its publication is for the public benefit. The relevant reports fall into two categories, the second being privileged only if a reasonable explanation or contradiction has been published on request. The first includes reports of proceedings in any legislature of the commonwealth, in any international or commonwealth court, in any court martial held outside the United Kingdom, or proceedings at a public inquiry in one of the self-governing commonwealth countries. The second comprises reports of lawful public meetings: general meetings of a public company and proceedings of any local authority; justices not sitting in court; any commission duly appointed to hold an inquiry by the crown, by parliament or a local authority; or any other tribunal, board, etc., functioning under an act of parliament — all in the United Kingdom. Also protected are copies and reports of official "handouts" issued by a government department, officer of state, local authority or chief officer of police.

Apology. — Except as previously noted (*e.g.*, in relation to "in-

nocent" defamation), an apology does not furnish a defense to an action for defamation, but may be given in evidence in mitigation of damages. To be effectual, an apology should be made promptly, should be both unequivocal and unconditional and should be given a publicity equal to that of the libel.

Moreover, in any action for libel contained in a newspaper or periodical. the defendant may plead that it was inserted without actual malice and without gross negligence and that. before commencement of the action or at the earliest opportunity afterward, he inserted in the newspaper or periodical a full apology. The defense must be accompanied by a payment of money into court by way of amends. The policy behind this measure of relief for the press is to save the publisher the necessity of incurring litigation expenses in connection with an unintentionally defamatory article; but he should not estimate the amount of suitable recompense with overdue refinement because, if the money paid into court is not accepted and the jury independently awards a larger sum, the defense fails altogether.

Damages.——In actions for defamation, juries are entrusted with the widest discretion in assessing damages. In addition to recovery for special damage, *e.g.*, loss of customers or employment, a plaintiff is entitled to an award of general damages for loss of reputation and affront to his dignity. This may range from contemptuous damages, if in the jury's opinion the plaintiff's reputation was worthless, to an award of exemplary or punitive damages against a defendant guilty of malice, wantonness or insulting conduct.

English courts are prepared to issue injunctions to restrain the publication or repetition of defamation, though only in the clearest cases where any jury would say that the imputation was defamatory and where, if it did not so find, its verdict would be set aside as unreasonable. This drastic power is disclaimed by U.S. courts, which adhere to the view, once shared in England, that the use of the injunction amounts to advance censorship contrary to constitutional safeguards and usurps the jury function which, since Fox's Libel act of 1792, has been regarded as a basic guarantee of free speech.

Insurance.— It is lawful to insure against the risk of liability for defamation. unless at the time of the publication the insured knows that the matter is defamatory and does not reasonably believe that there is a good defense to any action brought upon it.

Criminal Law.— Defamation is not only an actionable wrong but, if libelous, also a criminal offense punishable by fine and imprisonment. Slander, however, is not a crime (except in some jurisdictions; *e.g.*, in Australia and the United States) unless the offensive words are blasphemous, seditious or obscene.

A prosecution should not be instituted where the libel is so trivial as to be unlikely to provoke a breach of the peace or seriously affect anyone's reputation. Moreover, as a further safeguard against abuse, a criminal prosecution may not be commenced against any proprietor, publisher, editor or person responsible for the publication of a newspaper without the order of a judge in chambers, whose decision is final.

While the civil and criminal law of libel are in most respects identical, the following major discrepancies call for comment. It is of the gist of civil liability that the libel be communicated to some third person. for the wrong consists in injury to reputation. In contrast! the criminal law dispenses with the requirement of "publication." being essentially concerned with the prevention of public disorder, which is as likely to be provoked by direct insults as by exposing a person to the disrespect of others. Again, no civil action lies for what may be described as "group defamation"; *i.e.*, imputations vilifying not identifiable individuals but a class of persons distinguishable by race, creed, colour or vocation. The only sanction for vicious and unfounded attacks on particular sections of the community is provided by the criminal law, especially by prosecutions for seditious libel. Again, no civil remedy is available against defamation of the dead, unless perchance it involves a slur on the living; but this concession (which affords invaluable protection to historians and biographers who would otherwise be seriously embarrassed by the rigorous burden of having to prove the truth of matters long past) is circumscribed by the existence of a criminal sanction in cases where the attack was made with intent to injure and bring contempt on the deceased's posterity. Lastly, while truth of a defamatory imputation continues to furnish a complete defense to a civil action in England, the criminal law directed its attention to the insult offered and acted on the axiom "the greater the truth, the greater the libel." This stringent approach mas modified in 1843 when truth was admitted as a defense to criminal proceedings, provided it was for the public benefit that the matters charged should be published.

The publisher of a newspaper is civilly liable for any libel which appears in its columns, even though the libel was published in his absence, without his knowledge and contrary to his express orders. But a person is specifically exempted from criminal responsibility on proof that the publication was made without his authority, consent or knowledge and did not arise from want of due care or caution on his part.

Scotland.— Despite wholly disparate origins, the Scots law of defamation is in most respects identical with the English law. The only noteworthy differences of substance between the two systems are that in Scotland (1) no distinction is drawn between written and oral defamation, in other words, between libel and slander; (2) the term "slander" is reserved for statements, however published, which are calculated to injure the fame, reputation or honour of a person. In contrast, false statements which are prejudicial to the plaintiff in some other respect, *e.g.*, attributing to him unpopular sentiments so as to expose him to public hatred and contempt, constitute the distinct wrong of "verbal injury," which also includes what in England is known as slander of title or injurious falsehood. Unlike slander, "verbal injury" is not actionable without proof that the defendant intended to cause injury without lawful justification, that loss or damage was actually suffered (except when the words were calculated to cause pecuniary damage), and falsehood is not presumed but must be affirmatively established by the plaintiff; (3) publication to a third person is not essential, so that a defamatory letter sent to the person defamed or a slanderous statement made to him privately entitles him to reparation; (4) there is no criminal remedy for defamation though, as in England, slander may be enjoined in suitable cases by interdict.

United States.— Based on the heritage of the English common law, the modern law of defamation in the United States continues to adhere to the basic pattern formulated by English courts in the past. Deviations in matters of detail have inevitably emerged as the result of divergent legislation and, to a lesser extent, of judicial development. Besides, due to the legislative and judicial autonomy of the various states of the union! no less a measure of diversity is found within the United States itself—a factor which at once discourages a detailed summary of the law administered in the various jurisdictions and emphasizes the limitations inherent in any account of so-called U.S. law.

Most of the more significant trends in the United States have already been noted in the preceding account; and it will suffice here to recall the debate whether to classify radio defamation as libel or slander and the related question whether broadcasting or television stations are liable strictly or only for negligence with respect to defamatory utterances by outsiders who are permitted to use their facilities. On neither issue is there any clear preponderance of authority, save for an emerging legislative trend (opposed to that in the Commonwealth of Nations) which seems to reflect the industry's success in lobbying for protection rather than any policy choice based on more cogent criteria.

Perhaps the most notable departure from English precedent is a further refinement of the already complex and elusive distinction between libel and slander. A majority of G.S. courts treat as slander (and therefore not ordinarily actionable in the absence of "special damage") any libel which is not defamatory on its face and hence requiring proof of extrinsic facts to support an "innuendo." However dubious its origin, this development represents a considerable retreat from the rigours of the law of libel and undoubtedly owes its popularity to that fact.

A majority of U.S. courts have also broken with the English rule that the sale of each single copy of a libelous newspaper

constitutes a distinct publication and thus furnishes a sepzrate cause of action. Important for such purposes as venue and the period of limitation within which action must be brought, most courts favour the "single publication rule," which treats the entire edition of a newspaper, magazine or book as one publication. There has. however, been a reluctance to apply that rule where it is most needed, viz., in relation to interstate publications, so as to avoid the possibility of numerous actions based on divergent laws of different jurisdictions.

DEFENDER OF THE FAITH (Lat. *Fidei* Defensor), a title belonging to the sovereign of England in the same way as *Christianissimus* (Most Christian) belonged to the king of France. and *Catholicus* (Catholic) to the ruler of Spain. It seems to have been suggested in 1516, and although certain charters were appealed to in proof of an earlier use of the title. it was first conferred by Pope Leo X on Henry VIII. The bull granting the title is dated Oct. 11, 1521, and was a reward for the king's treatise against Luther.

When Henry broke with the papacy Pope Paul III deprived him of his designation. but in 1544 the title of "Defender of the Faith" was confirmed to Henry by parliament, and is still used by his successors on the English throne.

DEFENSE, DEPARTMENT OF: see GOVERNMENT DEPARTMESTS.

DEFENSE MECHANISMS. The idea of "defensive" mechanisms being active in the mind is derived from the psychoanalytic theory of mental functioning and constitutes an integral part of that theory.

The Mental Apparatus.— Psychoanalysis (*q.v.*) assumes that mental life is the function of an apparatus which can be imagined as being made up of several agencies. each of whose processes is governed by different laws and serves different purposes. The oldest of these realms in development contains what is inherited by the individual (*i.e.,* the drives and impulses which originate in the body and make their claims felt in the mind by means of tensions) and, in vien of its impersonal character, is called the id. Its sole purpose is the satisfaction of the organism's innate needs. and it pursues this aim blindly. oblivious of external conditions, influences or threats to the organism's existence The mental processes in the id are different from those which are familiar through conscious self-observation. They are not subject to any logical restrictions and are governed by the search for immediate wish-fulfillment.

The agency which develops next constitutes what we acknowledge as ourselves, the so-called ego (*q.v.*). It represents a portion of the mind which has undergone special development under the influence of the external world. It is equipped with the ability to deal with stimulation arising from uithout and from within the organism and, therefore, to act as intermediary between the id and the external world. The ego does not abandon the pleasure principle as a dominant force but adapts it to the exigencies of reality (reality principle).

There is a third agency, the superego, formed gradually within the ego. which is differentiated from it and at times opposed to it. It owes its origin to the child's identification with his first, most important love-objects, the parents; whose influence it perpetuates. and it contains also the racial, national and family traditions. Its functions are the setting up of ideals and the limitation of satisfactions through the action of a newly developed conscience which behaves as a moral arbiter.

With the normal adult, action (and all motor activity) should not be governed by the blind impulses of the id but controlled by the perceptive and intelligent ego. Action by the ego is considered beyond reproach if it satisfies simultaneously the demands of id, superego and reality by reconciling their claims with each other. As regards external reality. this can be done only if the ego acquires certain abilities. such as awareness of stimuli from without. storing up experience as memory, avoiding excessive stimulation through flight, dealing with moderate stimuli through adaptation and. finally. ability to bring about favourable changes in the environment through appropriate action. As regards internal events in the id, the ego has to learn to gain control over the drives and to decide which of them shall be allowed to obtain immediate satisfaction; those for which satisfaction has to be postponed; and those for which recognition of the drive activity and the accompanying affects have to be suppressed altogether.

While acting as intermediary between the inner and outer world, the ego is threatened equally by the dangers in external reality which might annihilate the whole organism and the danger of excessive drive activity from within; and it is to ward off this latter danger that the ego develops the defense mechanisms.

To summarize the definition of the term: defense mechanisms are activities of the ego which come into play whenever the ego experiences a drive activity, or its accompanying affect, as a danger. They work automatically. not accompanied by consciousness. For the ego to adopt a defensive attitude, the precise nature of the threat is immaterial. On the other hand, the particular type of danger against which defense is directed is important for determining which of the available mechanisms the ego will select.

Description of Defense Mechanisms.— Compared with the wide range of dangers by nhich the ego is faced, the number of defensive methods at its disposal is small. Following is a list of the major defense mechanisms and their description:

Repression.—This consists oi the withdrawal oi consciousness from an idea, affect or drive derivative unwanted by the ego. Such withdrawal results in withholding of the repressed matter from the conscious ego, or its expulsion from it.

Reaction Formation.—To secure the result of repression, an idea, affect, or drive derivative of the opposite order is fixed in consciousness and firmly held in place by the ego as a valuable part of its contents.

Projection.—This is another form of expulsion of an idea, affect or drive derivative from the mind. Consciousness is not withdrawn, but the unwanted internal content is displaced outward onto another person, where it impresses the individual as a threat from the external world.

Introjection.—The mental property of another person, or part of it, is appropriated by the individual and becomes, or is treated as, part of his own internal world.

Regression.—When dangers or conflicts arise at one of the later stages of development, the ego can institute a return to earlier stages and abandoned forms of gratification belonging to them. Regression can affect either drive development or ego development and, usually, precedes neurotic symptom formation.

Sublimation.—Sublimation is the giving up of a purely instinctual gratification for a noninstinctual one in conformity with social values; *i.e.,* under pressure of the environment or of the superego representing the values of the environment.

Isolation.—In the attempt to render an experience harmless, the ego separates the event from the affect which accompanied it originally.

Undoing.—This is an attempt by the ego to treat an undesirable experience, impression or affect as if it had not occurred.

Reversal.—Reversal is an attempt by the ego to substitute for a dangerous drive derivative its opposite; *i.e.,* to turn an active drive into its passive counterpart or vice versa.

Turning Against the Self.—An id impulse, usually of the aggressive kind, is withdrawn from its aim in the external world and employed instead against the self.

Intellectualization.—In the effort to master overpowering inner (instinctual) dangers, the ego overemphasizes its attempts at conscious,

intellectual, rational and logical control.

Other.—Not listed here are some other, minor mechanisms, such as identification with the aggressor (taking into the self as protection the threatening aspects of another person) or the ego's devices to deal with unwanted stimulation from the outer world, such as denial.

The foregoing enumeration has the drawback that it includes under one heading a number of heterogenous processes. Mere techniques and devices used by the ego (isolation and undoing) are listed side by side with important vicissitudes of drive activity, set in motion only by the ego (regression, drive reversal, turning against self). Some mechanisms (repression) master large quantities of drive or affect,while others deal with small quantities only or only complete what repression has failed to accomplish.

The History of the Concept of Defense.—The term defense is the earliest representation of the dynamic and economic vie - point in psychoanalysis. It expresses the hypothesis that there are forces in the mind, opposed to each other and battling with each other, and that the outcome of these conflicts is determined largely by quantitative elements; *i.e.*, by the superior strength of either the threatening. attacking id representative or the warding off, defending ego side. The term is used for the first time in Sigmund Freud's paper "The Defence Neuro-Psychoses" (1894), where conflicts of this nature are shown to be the pathogenic agents. In this and some following papers ("The Aetiology of Hysteria," 1896; "Further Remarks on the Defence Neuro-Psychoses," 1896) the term is employed to describe the ego's struggle against painful or intolerable ideas or affects. In Freud's subsequent writings the use of the term lapsed for more than 20 years; instead the concept of repression was used exclusively to cover all incidences of defense activity. It was only in an appendix to *Hemmung*, Symptom und *Angst* (1926; Eng. trans., Inhibition, Symptoms and Anxiety, 1936) that Freud reinstated the term defense, stating that it would be advantageous to use it "provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to neurosis, while we retain the word 'repression' for that special method of defence which the line taken by our investigation made us better acquainted with in the first instance." This new designation of repression as the first-described but not a unique method of defense opened up a general inquiry into the other methods which serve the ego as protection against instinctual demands and led to comparisons of their respective qualities and uses.

Since there are definite connections between special forms of defense and particular illnesses, the order of description of the various mechanisms followed the order in which the various clinical states came under study. It was the early investigation of hysteria (*q.v.;* 1895–96) which led to the theoretical preoccupation with repression, since repression of drive and affect (followed by conversion into bodily manifestations) is the main defense mechanism used in hysteria. The study of obsessional neurosis (1908–09; see NEUROSES), while confirming the importance of repression, threw light additionally on regression, which initiates symptom formation in such neuroses; isolation and undoing as techniques used by the ego; and reaction formations as means of stabilizing the neurotic structure and constructing what is known as the obsessional character. A study of the instincts (see INSTINCT) highlighted the processes of reversal and turning against the self (1915). Studies of pathological jealousy, paranoia and homosexuality (see PARANOID REACTIONS; HOMOSEXUALITY) yielded results for isolating the mechanism of projection (1911, 1922). Clinical investigations of the state of mourning and of melancholia clarified the working of introjection and identification (1916), while defenses such as sublimation and intellectualization were linked with the gradually accumulating insight into the processes of growth and development in infancy and adolescence.

Chronology of the Defense Mechanisms.—The order in which the various methods of defense made their appearance in the literature does not coincide with the chronology of their emergence in the development of the individual. The latter is a much debated point in psychoanalytic theory. Many accept the hypothesis that each defense mechanism is first evolved to master some specific situation and. thus, is associated with a particular phase of infantile development; another assumption states that before division into the three agencies (id, ego and superego) the mental apparatus uses different methods of defense from those which it employs after it has attained these levels of organization. In short, defense, as an activity of the ego, is inevitably corelated to the consecutive stages of ego and personality development. There are among the defense mechanisms enumerated above those regarded as primitive and others which bear the hallmark of complex higher organization. In fact, after some chronological orientation in the field has been established. the type of defense used by an individual at a given time of life can serve as a valuable diagnostic indication of the developmental level which has been reached, or to which the person in question has regressed.

Pre-Stages of Defense.—Before the ego has separated off from the id (or from the undifferentiated matter which forms the basis for id and ego development), the immature organism has no means of protecting itself from unpleasurable tensions and frustrations except by ineffective attempts at hallucinating absent satisfactions or by giving signs of distress which call for help from the external world. After motility has developed, the reactions of flight from and avoidance of external stimuli become protective measures. With the emergence of a primitive ego, denial (withdrawal of awareness, mental flight) becomes a major method of dealing with the unpleasant, painful or frustrating external world.

Stages of Defense.—The ability to protect the self against the inner world is tied to the next phase of ego maturation and development. In the period in which the infant makes first attempts to differentiate between its own self and the world around it (*i.e.*, in the first year of life), much of the mastery of tensions seems to be accomplished by means of projections and introjections. the infantile ego throwing out and ascribing to the environment whatever is painful and appropriating for itseif whatever is pleasurable. In the period in which ego and id become decisively separated from each other (the second year of life), repression comes into use as the main defense, to safeguard this newly established, all-important division. The defense of intellectualization also has its origin in the second year, in the period when the development of speech and logical thought serve to lift mental activity to the higher level of performance and mastery of the id which, from then onward, remains characteristic of the processes in the ego (secondary processes), in contrast to the primitive forms of mental functioning which reign in the id (primary processes). Reaction formations and sublimations appear later (sometime between three and five years of age), since they depend on the child's internalization of an external system of values, a step which presupposes the division between ego and superego.

It is less possible to assign a place in this chronology to mechanisms such as regression, reversal of drive or turning drive activity toward the self. As mentioned above. these represent alterations and modifications of drive activity which are inherent in the drives themselves and merely made use of by the ego in periods of danger. As such they seem to be independent of the stage of ego development and as old as the drives themselves, or at least as old as any conflict which arises between id impulses and any hindrance which they may encounter on their way to gratification.

Defense in Normal and Abnormal Development.—*Defenses* as a Means of Adaptation.—Taken all together, the defensive activities of the ego add up to a massive interference with drive activity; *i.e.*, with the free play of sexual and aggressive impulses. The result of this for the adaptation of the individual to his environment can hardly be overrated. Without a properly functioning system of defenses, there would be no way for the organism to maintain a tolerable mental equilibrium or even to maintain itself in the surrounding world and escape the danger of being destroyed while engaging blindly in the search for instinctual gratification.

Apart from maintaining the existence of the organism, the defenses also play a major role in building up the personality: projection and introjection in their interaction with the environment establish the individual's sense of identity; repression safeguards the conscious personality against inroads from the unconscious id, thereby guaranteeing sanity; sublimations and reaction forma-

tions ensure socialization. etc. Altogether, it is the curtailing of gratification. brought about by the defense mechanisms, which is responsible for changing primitive, infantile human beings into responsible members of the civilized community. (*See* also ADJUSTMENT [IN PSYCHOLOGY~; PERSONALITY.)

The Danger of Defense Action.—Although defense is undertaken in the service of self-preservation, reason, mental equilibrium and social adaptation, such major interference with the natural forces in the human mind cannot fail to have serious consequences for the individual's health and happiness. The effort of maintaining a constant defense system is in itself a strain on the ego and may deplete it of energies needed for other, constructive purposes.

Further, each defense action is paid for heavily by the ego. Projection, while easing the "unpleasure" caused by unwanted inner impulses, falsifies the picture of the external world, thereby creating new threats. Reaction formations act as an armour to the ego, but also hinder free expansion of interest. Turning aggression against the self socializes the individual but simultaneously weakens his efficiency and creates a self-destructive. masochistic attitude to life. Regression may promise momentary safety from conflict but interferes severely with growth and development. Repression. above all, is justly held responsible for damage to the personality. Although indispensable for securing the border against the id, it also limits man's enjoyment of sex and aggressive activity and also restricts the ego's sphere of influence by leaving all repressed matter permanently outside its jurisdiction.

Defense and Mental Illness.—*No* neurosis maintains its structure by employing one defense mechanism only, but always a combination of several. Although defense mechanisms are an integral part of every neurotic structure, the presence of defensive activity in the mind is in itself no sign of pathology. In cases where defense is successful in controlling tensions, no symptomatology develops, although the effect may be crippling for the ego and impoverishing for instinctual life. Where the defense mechanisms fail to ward off anxiety and "unpleasure" and where repressed matter returns to consciousness, the ego is forced to multiply and overintensify its defensive efforts and to overstress the use of the various mechanisms. It is in these instances that, finally, the formation of neurotic symptoms is resorted to. Such symptoms are compromise formations which express and represent at the same time the defensive tendencies of the ego and the pleasure-seeking tendencies of the id. Psychoses signify a severe breakdown in the defense system, characterized also by the preponderance of primitive mechanisms.

See *The Standard Edition of the Complete Psychological Works of Sigmund Freud* (1953–), especially *Outline of Psychoanalysis* (Eng. trans by J. Strachey, 1949); and A. Freud, *Das Ich und die Abwehrmechanismen* (1936; *Eng* trans, *The Ego and the Mechanisms of Defence*, 1937). (A FD.)

DEFFAND, MARIE DE VICHY-CHAMROND, MARQUISE DU (1679–1780), a leading figure in French society, famous for her letters to the duchesse de Choiseul, to Voltaire and to Horace Walpole, was born of a noble family at the château of Chamrond in Burgundy on Dec. *25, 1679,* and educated at a convent in Paris. From the beginning she was an unbeliever, whose skepticism the great Massillon himself was unable to shake. When, at a later date, the cardinal Melchior de Polignac, in an unguarded moment, spoke of the miracle by which St. Denis is said to have walked two miles with his head in his hands. she interjected: "Je n'ai pas de peine à le croire, Monseigneur. Il n'y a que le premier pas qui coûte" (I can easily believe it. my lord. It is only the first step which costs). She was married at 21 to her kinsman, Jean Baptiste de La Lande, marquis du Deffand, from whom she separated in *1722.* She was by that time taking part in the extremely dissipated life which characterized the entourage of the regent, Philippe, duc d'Orléans, whose mistress she became (*cf.* Walpole's letter to Thomas Gray, Jan. 25, *1766).* She was frequently seen at Sceaux, where the duchesse du Maine held court amid a brilliant company, which included Fontenelle, Houdar de la Motte, the marquise de Lambert (Anne Thérèse de Marguenat de Courcelles), Voltaire and the president Charles Hénault (*q.v.*) with whom she lived on intimate if not always friendly terms till his death in *1770.* When she set up her own salon, in the convent of St. Joseph, she attracted scientists, writers, wits and all that were of any consequence in the world of letters and in society. She was drawn to D'Alembert. but she never liked the *Encyclopédistes,* whom she seems to have tolerated only for his sake, and she spoke scathingly of Jean Jacques Rousseau. who did not spare her in his *Confessions.*

By *1754* Mme du Deffand had lost her sight and engaged Julie de Lespinasse (*q.v.*) to help her in entertaining. The wit and charm of the latter made some of the guests, D'Alembert among others, prefer her society to Mme du Deffand's. and she arranged to receive her friends for an hour before the appearance of her patron When this was discovered. Mlle de Lespinasse was dismissed (1764), and as a result the salon was broken up, for she took with her D'Alembert, Turgot and the *littérateurs* generally. From this time. Mme du Deffand rarely received any literary men. The principal friendships of her later years were with the duchesse de Choiseul (Louise Honorine de Crozat) and with Horace Walpole (*q.v.*). Her letters to the duchesse are full of life and have great charm. Those to Voltaire, extending over *43* years, dazzle by their wit. Her last letters addressed to Walpole, for whom she developed a tardy passion. are among her best. Her prose developed qualities of style and eloquence of which her earlier writings had given little promise. and her chronicle of events at court and at home form a fascinating and valuable document. There is something pathetic in this aging rationalist, hard, cold and egocentric, becoming truly infatuated for the first time at the age of *68* Her last years were sad, and she died in Paris on Sept. 23, *1780.* leaving her dog Tonton to the care of Walpole, who was also entrusted with her papers.

Editions of Mme du Deffand's letters are: *Correspondance inédite* . . . with D'Alembert, Hénault, Montesquieu and others, two volumes *(1809); Letters of the Marquise du Deffand to the Hon. Horace Walpole . . . 1766–1780,* edited by *M.* Berry, four volumes (1810); *Cosrespondance complète* . . . edited by M. de Lescure. two volumes *(1865); Correspondance inédite,* edited by the marquis de Sainte-Aulaire, three volumes *(1866); Lettres de Mme du Deffand à Horace Walpole,* with *18* of the supposedly lost letters of Walpole and nearly *500* previously unpublished. edited by Mrs. Paget Toynbee, three volumes (1912). There are also *Letters to and from Mme du Deffand and Julie de Lespinasse,* edited by *M'.* Hunting Smith *(1938);* and *Horace Walpole's Correspondence,* vol. iii–viii. *With Madame du Deffand and Wiart,* edited by *W.* S. Lewis and W. H. Smith *(1939).*

DEFINITION. *Nominal definition* is the act of stating, explaining or indicating the meaning or use of a *notation* (*i.e.,* word, phrase, symbol or expression); the act of introducing and fixing the meaning of a notation; or the sentence, in some language, by which such a statement or fixing of meaning is made. Under this broad head are included many things, not all closely related to one another, which are called or have been called definition. Here will be distinguished abbreviative definition, semantical definition, and ostensive definition.

In *abbreviative definition* a notation, the *dejiniendum,* is introduced as a mere abbreviation of another notation, the *definiens,* which it may be used to replace (the definiendum being ordinarily a shorter or otherwise more convenient notation than the definiens). The distinguishing feature is that an expression containing the definiendum must be understood as if it had the definiens in place of the definiendum—not only semantically, *i.e.,* in regard to its meaning, but also syntactically. For a fuller explanation and examples, *see* LOGIC.

In *semantical definition* a meaning is directly ascribed or assigned to a notation by a statement that mentions explicitly both the notation and the meaning; *e.g.,* "The word 'pentagon' means a polygon with five sides." In this example the definiendum is

"pentagon" and the definiens is "polygon with five sides."

In *ostensive definition* a proper name or a common name *(see* NAME [IN LOGIC]) is assigned to a concrete object by physically showing or pointing to the object and naming it. It is a common remark that without ostensive definition; and related methods of indicating rather than stating meanings, language cannot acquire objective reference at all. Yet. unlike other kinds of definition, the study of ostensive definition is not in the domain of logic; and objective reference. as acquired by ostensive procedures, is rather a presupposition for logic.

A familiar feature of natural language is the use of demonstrative words such as "you," "I," "here," "today," "yesterday:" a part of whose meaning is reintroduced by an implicit ostensive definition on each new occasion of their use—and which have as what may be called their secondary meaning the manner in which this implicit ostensive definition is to be understood. For example, "Yesterday was a fine day" may be true when uttered at one time and false when uttered at another, because of the different meaning of the name "yesterday." Such demonstrative words are a linguistic convenience but, unlike ostensive definition generally, are dispensable in principle. For purposes of logic, they must either be eliminated altogether, or treated as used on one fixed occasion in such a way that the meaning remains unchanged.

Real definition is distinguished from nominal definition as being the definition of a thing rather than of a notation. For Aristotle a definition is of what a thing is and of its essential nature or essence. By many this Aristotelian notion of real definition has now been abandoned or modified because of the difficulty of a precise account of what is meant by the essence of a thing, as distinguished from the meaning of some name of that thing or an analysis of some concept of it. *(See* LOGIC, HISTORY OF.)

Another kind of real definition is obtained if (without attention to essence) a nominal definition is paralleled by a corresponding statement of identity or equivalence, in which the definiendum is used rather than mentioned. For example, the semantical definition of "pentagon" which is given above has the parallel real definition, "A pentagon is a polygon with five sides," which is not about the word "pentagon" but about pentagons. Or again, in the article LOGIC the notation $p \vee q$ is introduced by abbreviative definition as standing for $\sim p \supset q$; for a different formulation of propositional calculus in which the signs $\vee$ and $\supset$ are both taken as primitive, we might state instead the real definition, $p \vee q \equiv \cdot \sim p \supset q$. However, it is held by some that such real definitions are not suitably called definitions at all, but should rather be characterized merely as statements that are true by definition. or otherwise analytically true.

DEFOE, DANIEL (1660–1731), English novelist and political pamphleteer. the author of *Robinson Crusoe,* was born in the parish of St. Giles. Cripplegate. London. probably in the latter half of 1660. His father, James Foe. was a tallow-chandler of Flemish descent and later became a member of the Butchers' company, as did (1688) Defoe himself. It is thought that the family name was originally "Du-foe" or some variant of it and from his middle thirties Daniel was calling himself Defoe. The family were Nonconformists but although the English universities were closed to dissenters Defoe received a good education, first at the Rev. James Fisher's school at Dorking and then (from about 1674 to 1679) at the Rev. Charles Morton's excellent academy at Newington Green. Stoke Newington. Morton (1627–98), who was an admirable teacher and later became first vice-president of Harvard college. may have influenced Defoe's literary style. though the Bible. Bunyan's writings and the pulpit oratory of the day also no doubt contributed.

Although intended for the Presbyterian ministry. Defoe decided against this and by 1683 had set up as a merchant. He called trade his "beloved subject" and it was one of the abiding interests of his life. He dealt in many commodities, traveled widely in Britain and on the continent and became an acute and intelligent economic theorist: in many respects ahead of his time; but misfortune. in one form or another, dogged him continually and in a couplet which, he says. sums up the scenes of his life, he wrote:

> No man has tasted differing fortunes more,
> And thirteen times I have been rich and poor.

As a result. mainly, of losses sustained in insuring ships during the war with France, Defoe went bankrupt in 1692. for £17,000. He dealt honestly with his creditors and in ten years had paid off all but £5,000; but he was never afterward entirely free from debt and much of his apparently equivocal political conduct in later years should be seen in the light of this. The existence of unsatisfied creditors was always a weapon that could be used against him by his enemies, while his political masters could use his need for protection to keep him toeing the line. Defoe suffered other severe losses in 1703, when his prosperous brick-and-tile works near Tilbury failed during his imprisonment for political offenses; his last years were clouded by legal controversies over allegedly unpaid bonds dating back a generation; and it is thought that he died in hiding from his creditors. His Moll Flanders, who was born in Newgate prison, speaks of poverty as "a frightful spectre," and it is a theme of many of his books.

With Defoe's interest in trade went an interest in politics, the first of his many political pamphlets appearing in 1683. As a dissenter he opposed the Catholic James II and joined the ill-fated Monmouth rebellion of 1685, managing to escape after Sedgemoor. In 1688 he rode to welcome the army of William of Orange—"*William,* the Glorious, Great, and Good, and Kind" as Defoe was to call him; and throughout William's reign Defoe supported him staunchly, becoming his leading pamphleteer. In 1701, in reply to attacks on the "foreign" king, Defoe published *The True-Born Englishman,* said to be the most widely sold poem that had appeared in English; vigorous and witty, it is still a valid and penetrating attack on the fallacies of racial prejudice. In the same year he wrote an outspoken tract, *The Succession to the Crown of England, Considered,* in which he asserts his belief that political power derives from the people, whose servants both king and parliament are.

Foreign politics also engaged Defoe's attention: since the treaty of Ryswick in 1697 it had become increasingly obvious to many observers that war would soon break out again over the Spanish succession; in 1701 five gentlemen of Kent presented a petition, demanding greater defense preparations, to the house of commons (now with a Tory majority) and were imprisoned. The following morning Defoe, "guarded with about 16 gentlemen of quality," presented the speaker, Robert Harley, with his *Legion's Memorial.* This famous document, containing such phrases as "Englishmen are no more to be slaves to Parliaments than to a King," was effective: the Kentish petitioners were released and Defoe was fêted by the citizens of London; but it undoubtedly branded him in the eyes of the extremer Tories as a dangerous man who must be brought down.

It is often difficult to separate religion from politics in this period. Both dissenters and low churchmen were mainly Whigs, and the high-church Tories—the "high-fliers"—mere determined to undermine their working alliance by preventing the practice of "occasional conformity"—that is. the practice of receiving the sacraments according to the rites of the Church of England, in order to qualify for public office, and then attending dissenting aorship services. This had long been a burning question and Defoe had written the first of his many pamphlets on it in 1698. With the change of government. pressure increased; violent attacks were made on the dissenters by such preachers as Dr. Sacheverell and in reply Defoe wrote perhaps the most famous of all his pamphlets, *The Shortest Way with the Dissenters* (1702). His method was ironic: to discredit the high-fliers by writing as if from their point of view, but reducing their arguments to violent absurdity. The pamphlet had a huge sale but the irony recoiled on Defoe, for dissenters and high churchmen alike took it seriously and alike were angry when the hoax became apparent. Defoe was prosecuted for seditious libel and arrested in May 1703 after a period of hiding. The advertisement offering a reward for his capture gives the only personal description we have of Defoe: "a

middle-sized spare man. about 40 years old, of a brown complexion, and dark-brown coloured hair, but wears a wig, a hooked nose, a sharp chin, grey eyes, and a large mole near his mouth." After being advised to plead guilty and rely on the court's mercy. Defoe was harshly sentenced: to a fine of 200 marks. to stand three times in the pillory and to find sureties for his good behaviour for seven years. It has been suggested that the prosecution was primarily political: that the earl of Nottingham, one of the two secretaries of state. had hoped to force Defoe into betraying certain Whig leaders who had supported William over the Second Partition treaty of 1699 *(see* ENGLISH HISTORY: *The Struggle Against Louis XIV*). While awaiting his ordeal. Defoe wrote his audacious *Hymn to the Pzllory* (1703); and this helped to turn a punishment into something of a triumph, with the pillory garlanded and the mob drinking his health.

Triumph or not, Defoe remained in Newgate. Nineteen years previously, in 1684, Defoe had married Mary Tuffley, who bore him eight children (of whom one died in infancy and another young); while he was in prison his Tilbury business had failed and he mas desperately concerned for the welfare of this already numerous family. He had appealed to Harley in May 1703, and by September Harley. appreciating Defoe's potential usefulness, set about securing his release, which finally took place in Nov. 1703. Thereafter Defoe was a pamphleteer in the cause of successive ministries, both Tory and Whig, until shortly before his death. He has, inevitably, been accused of "trimming," and there is little doubt that at times Defoe was able to equivocate successfully with his conscience; but a more sympathetic view may see him, as he always claimed to be. as an unswerving champion of moderation. skilfully helping those he advised and supported to steer a middle course.

Whatever his motives. Defoe was an energetic worker on behalf of the government. He traveled extensively. wrote reports, minutes of advice. pamphlets: "Intelligence," he told Harley, who employed him as a secret agent. "is the Soul of all Publick business." and Defoe was a valuable servant. He paid several visits to Scotland, especially at the time of the Union of 1707, and kept Harley closely in touch with public opinion. These trips bore fruit in a different way later: in 1724–27 the three volumes of his admirable *Tour Through the Whole Island of Great Britain* were published. for nhich he certainly drew on many of his observations of the earlier years.

Perhaps Defoe's most remarkable achievement during the reign of Queen Anne was his periodical, the *Review*. He wrote this, practically single-handed, as the main government organ from 1704 to 1713; at first a weekly, it became a thrice-weekly publication in 1705 and Defoe continued to produce it even when, for short periods in 1713, his political enemies managed to have him arrested and imprisoned again on various pretexts. The political line corresponded with that of the moderate Tories but, in addition to politics as such, Defoe discussed current affairs in general, religion. trade, contemporary manners and so on; some of this was presented through the medium of the "Scandalous Club," which probably influenced Addison and Steele. Defoe has been called "the father of modern journalism" and he was connected in one way or another with 26 periodicals.

With the accession of George I in 1714 the Tories fell; but the Whigs in their turn recognized Defoe's value and he continued to write for the government. He also served them in other ways, including the rather disreputable office of editing and toning down various Tory journals, such as the Jacobite *Mist's Weekly-Jozirnal*. Again, Defoe defended himself by claiming to work only for the public good: the ethics might not be wholly admirable, but for him the end—the prevention of the bitterness of party and religious strife—justified the means.

But not all the writings so far mentioned, nor his long political poem of 1706. *Jure Divino* (an attack, in 12 books. on the theory of the divine right of kings). would have procured for Defoe his undoubted literary immortality. It was not until 1719 that he turned his talents to an extended work of prose fiction and produced *Robinson Crusoe,* one of the most famous books ever written. A German critic has called it a "world-book," a label justified by the number of translations, imitations and adaptations that appeared and continue to appear. It was popular from the first, not, perhaps, with the "polite" public. who usually affected to despise Defoe, but certainly with the middle and lower classes. He followed up its success with Crusoe's *Farther Adventures* (1719) and *Serious Reflections* (1720), though neither of these is comparable to the first of the trilogy. Having struck this vein, he produced *The Life and Adventures of Duncan Campbell, Memoirs of a Cavalier* and *The Life of Captain Singleton,* all in 1720. His *annus mirabilis,* however, was 1722, which saw the publication of *Moll Flanders,* A *Journal of the Plague Year* and *Colonel Jack*. In 1724 he published *Roxana,* his last major work of fiction.

In *History of the Pzrates* (1724–28) Defoe wrote. "I am most entertained by those actions which give me a light into the nature of man." and the insight he shows into human nature is perhaps his greatest gift as a novelist. The men and women he writes about are, it is true. all placed in remarkable circumstances; they are all, in one sense or another, solitaries; they all struggle, in their different ways, through a life which is a constant scene of jungle warfare; they all become, to some extent, obsessives. But they are also all ordinary human beings of Defoe's own class and their creator. writing always in the first person. enters into their minds and analyzes their motives for behaving as they do. Defoe has been called the first social historian and, especially in the brilliant early chapters of *Moll Flanders* and *Colonel Jack,* he demonstrates unforgettably how the force of circumstances and the fear of poverty may drive one into a life of crime. *Robinson Crusoe* stands somewhat apart from the rest by reason of its subject and setting; but the same penetrating insight is at work and the book's success is largely due to the skill with which Defoe creates his hero, an ordinary man with whom his readers can identify themselves, and shows him overcoming the difficulties of life on his island—making things, planting crops, taming wild creatures, longing for human companionship, building his little "castle," experiencing spiritual doubt and physical fear—all the time seeking to preserve his integrity, all the time a living human being. The sense of fact is one of Defoe's great strengths, the vivid concreteness of detail with which he visualizes and presents his material. Where this material came from hardly matters: *Robinson Crusoe* was partly inspired by the adventures of Alexander Selkirk (*q.v*), but many other mariners and castaways have been brought together in Crusoe. For his other novels Defoe almost certainly uses such things as his memories of Newgate or the interviews with condemned criminals he conducted for Applebee's *Journal* in the 1720s; but he draws upon a lifetime of observation, of talking to people of all kinds, of preoccupation with statistical and mercantile detail. It may seem at first as if the detail is unselective and undifferentiated. but this is not the case: whether the selection was made consciously or not, in every novel Defoe uses detail to build up a particular morld. There are complaints to be made of him as a novelist: there is too much apparently extraneous moralizing for a modern taste, though fortunately the artist continually gets the better of the moralist; the novels are singularly shapeless, the attitudes sometimes naïve. His range is narrow; but within that range Defoe is a novelist of unquestioned power and his plain, direct style, as in all his writing, holds the reader's interest.

In the last decade of his life Defoe's health was failing, but he was still extremely active. Among his works of this period may be mentioned *The Complete English Tradesman* (1725–27), *Atlas Maritimus et Commercialis* (1728), *The Political History of the Devil* (1726) and *An Essay on . . . Apparitions* (1727). His last work was an expanded edition (1731) of A *Plan* of *the English Commerce,* first published in 1728. The total number of Defoe's writings is enormous: the canon must always, perhaps, remain uncertain, but in 1958 Professor J. R. Moore credited him with no fewer than 545 titles.

Defoe died in Ropemaker's Alley, Cripplegate. on April 24. 1731, and was buried two days later in Bunhill Fields. His wife, to whom he had been married 47 years, died in the following year.

BIBLIOGRAPHY.—The best modern editions of Defoe are: ***Novels*** and Selected *Writings, 14* vol. (Shakespeare Head edition, 1927); Ronzances

and Sarratiues, ed. by G. A. Aitken, 16 vol. (1895). The *Tour* was ed. by G. D. H. Cole, 2 vol. (1927) and the *Review* by A. *W*. Secord, 22 vol. (1938). A good selection from the *Review* is that by W. L. Payne (1951). The letters have been ed. by G. H. Healey (1955).

The most up-to-date and fully documented biography is J. R. Moore, *Daniel Defoe, Citizen of the Modern World* (1958); also recommended is James Sutherland, *Defoe* (1937; rev. 1950). Earlier lives include those of George Chalmers (1786), Walter Wilson (1830), William Lee (1869) and Thomas Wright (1894; rev. ed. 1931). Studies of the novels include: Paul Dottin, *Daniel De Foe et ses romans* (1924; Eng. trans. *Daniel Defoe and his Novels*, 1929); *A*. W. Secord, *Studies in the Narrative Method of Defoe* (1924): Virginia Woolf in *The Common Reader*, 2nd series '(1932); Ian Watt, *The Rise of the Novel* (1957). (R. *P*. C. M.)

DE FOREST, ALFRED VICTOR (1888–1974), U S. engineer who developed the magnaflux test. a method of discovering defects in steel. was born in New York city, April 7, 1888. He was educated at the Middlesex school in Concord, Mass.; the Massachusetts Institute of Technology. from which he received the B.S. degree in 1911; at Princeton and Columbia universities. While working for the American Chain company in Bridgeport, Conn.. he specialized in magnetic analysis in its correlation with metallography as these studies reveal the physical properties of steel. The magnaflux test which he developed was based upon a discovery by W. E. Hoke in 1918 that tiny iron particles placed on the metal surface tend to accumulate along cracks in magnetized steel parts. De Forest made significant improvements in the methods and obtained several patents. In 1934 he founded the Magnaflux corporation. That same year he became a member of the faculty of the Massachusetts Institute of Technology, a position he held until his death at Marlboro. N.H., on April 3, 1945. He published a number of technical and scientific papers and received many honours. (W. E HD)

DEFOREST, LEE (1873–1961), U.S. inventor of the audion. the elementary form of the modern radio tube, was born at Council Bluffs, Ia., Aug. 26. 1873, graduated from Yale Sheffield Scientific school in 1896 and received his Ph.D. in 1899. Almost immediately he started his career of invention and the promotion of radio communication. or wireless, as it was then called. The De Forest Wireless Telegraph company was organized but after several years it failed. Primarily an individualistic experimenter and inventor, De Forest spent several years on the important problem of devising a sensitive detector for the reception of radio waves. This work culminated in 1906 in the invention of the audion. Slowly the usefulness of these tubes as generators, amplifiers and detectors of radio waves mas established. However, it mas not until the radio communication needs of World War I arose that the audion, improved by the work of others, became an invaluable engineering device and was manufactured in large quantities.

In 1910 De Forest transmitted the singing voice of Enrico Caruso and thus was one of the pioneers of radio broadcasting. His many patents included the phonofilm, an early development in the field of talking motion pictures. He was honoured by medals and awards from several learned societies and served as president of the Institute of Radio Engineers. De Forest died at Hollywood, Calif., on June 30. 1961. (W. C. WH.)

DEFREGGER, FRANZ VON (1835–1921), Austrian genre painter, whose representations of Tirolese life had a wide and popular appeal, was born in Dolsach, in Tirol, on April 30, 1835. He spent his youth amid the mountains as a farm labourer, and then went to Innsbruck to study drawing and carving. His teacher, Franz Stolz, took him to Munich in 1861. In 1863 he went to Paris. and then, returning to Munich, studied under Karl von Piloty for five years. His works, whose popularity was the result principally of their subject matter, depicted the rustic life of the Tirolese and the struggle of Tirol, under Andreas Hofer, for freedom from foreign domination. Defregger died in Munich on Jan. 2, 1921.

DEGAS, HILAIRE GERMAIN EDGAR (1834–1917), one of the greatest of 19th-century French artists and a master of the human figure in movement, was born in Paris on, July 19, 1834. He came of the powerful upper bourgeoisie, his family having banking and business connections both in Italy and the Cnited States. and he was intended for the law, mhich he studied for a time after leaving the Lycée Louis-le-Grand. In 1855, however, he enrolled at the École des Beaux-Arts and entered the studio of Louis Lamothe, a pupil of Ingres, whose long-established position as defender of academic orthodoxy in draftsmanship and subject matter was being challenged by the realism of Courbet as well as by the romanticism of Delacroix.

It seems likely that as a young man Degas wished to succeed along orthodox lines as a painter of historical subjects in the grand French tradition. To further his aim he augmented his studies by visiting Florence, Xssisi, Rome and Naples and by closely observing and copying the work of Mantegna, Botticelli, Hans Holbein the Younger and Nicolas Poussin, all notable for their scrupulousness in figure draftsmanship. Before 1860 Degas had produced some splendid family portraits in which the effect of this discipline, though clear, is heightened by a taut, alert urbanity which belongs unmistakably to the mid-19th century. The "Duchess Morbilli" (Louvre. Paris, 1855–56) is typical of this group. It is broadly designed with large, simple surfaces rather flatly modeled in the manner of Ingres; the paint is solid, yet delicate, and the colours cool and restrained nith many black and neutral passages. In 1860 Degas made his debut as a painter of classical subjects with his "Young Spartans Exercising" (Louvre); but here the nude figures, though arranged in balanced groups, are those of real adolescents in a natural landscape instead of idealized nudes in an Arcadian setting.

After 1861, when Degas painted "Semiramis Founding a City." again with academic intentions. he seems to have abandoned historical painting and begun to seek his subject matter in the fast-moving city life of Paris. In this he was probably inspired by contemporaries like Courbet and Manet (whom he met in 1862), by contemporary novelists and by the discovery. late in the 1850s, of the astonishing formal yet documentary quality of Japanese graphic art. Nor did he overlook the brilliant work of contemporary French graphic artists like Gavarni and Daumier. It is not surprising that by 1862 he was painting the riders, their mounts and the smart spectators at Longchamp racecourse. soon afterward beginning the portrait groups of musicians and stage subjects, which. like all subjects in which the sitters were absorbed in practised movement, fascinated him throughout his life. Among the first of the latter is the "Mlle. Fiocre in the Ballet 'La Source'" (Brooklyn museum, c. 1867). His portraits of the 1870s show greater ease and naturalism than the very first group, but are still based on a firm discipline traceable right back to Holbein and the great north Italian portraitists.

Degas served in the artillery during the Franco-German War of 1870–71. On his return, he began to undertake ambitious figure groups, seen informally and in movement, and continued his studies of stage and orchestral groups. From these he passed to instantaneous renderings both of outdoor and indoor scenes, using displaced figure grouping and unorthodox cutting and perspective rather in the manner of a cameraman. Yet his magnificent formal sense and skill is always present to provide an equilibrium, however momentary, to these exacting subjects. The "Place de La Concorde (Viscomte Lepic and His Daughters)" (c. 1873) is a fine example and an outdoor counterpart to the ballet subjects which gave Degas endless scope for multifigure groups seen in fast intercepted movement. Degas visited the United States in Oct. 1872, staying for five months and painting one of his best-known scenes of figures in absorbed "occupational" movement. This was the "New Orleans Cotton Office" of 1873, now in the museum at Pau, France; it shows that although Degas had completely abandoned his early ambition of historical figure painting, he had nevertheless put to full use the structural principles of the formal tradition.

During the 1870s most of Degas' figure groups are arranged against fairly extended background space, in which the figures themselves are given plenty of room. By the end of the decade, however, he was becoming interested in the pictorial possibilities of more closely juxtaposed and superimposed groups and giving more attention to the formal qualities of the voids between them. The famous "Repasseuses" ("Women Ironing." Louvre) of 1884 shows this tendency at an advanced stage with an artificially shal-

"ABSINTHE" BY EDGAR DEGAS, 1876. IN THE LOUVRE, PARIS

low picture space and a reconciliation of solid form and surface reminiscent of Venetian mid 16th-century art in method but here applied nith a documentary eye to a casual workaday subject By this time Degas had begun to work in pastel. sometimes using a mixed technique nith volatile oil mediums, and his indoor series of women at their ablutions carries on the researches mentioned above. Some of the later ones reach an astonishing compromise between plasticity and surface pattern, the flesh colours being built up of strips of pure colour more closely knit than the *taches* of the impressionists. but like them merging at a certain distance to give the illusion of solid modeling. Though Degas was a consistent exhibitor nith the impressionists, his position mainly as a painter of closely calculated indoor figure groups places him slightly apart from his colleagues. He was, honever, very much concerned nith depicting the fleeting and momentary. while his subjects are those of the school nhich folloned Courbet. and his palette, moreover. becomes progressively more brilliant and divided. like that of the impressionists After about 1880 Degas was practising occasionally as a sculptor. and the group of small bronzes deriving from his models of dancers, bathing women and horses again shon his power of revealing the potentialities of the ordinary unobserved movements of human beings and animals. Degas. in fact perhaps for the first time in history, viened his animal and human models nith the same dispassionate eye nhen making these studies. He was interested in photography. and there is an affinity between his vision and that of a high-speed camera. Degas' eyesight failed in later life; he eventually became completely blind in one eye and nearly so in the other. He died Sept. 26. 1917, leaving an extremely important collection of the dranings and paintings of his contemporaries. He also left a notebook of poetic compositions, mostly in the sonnet form.

DE GASPERI, ALCIDE (1881–1954), Italian statesman and leader of the Christian Democratic party who mas prime minister as head of eight successive governments from Dec. 1945 to Xug. 1953 and was also one of the builders of the western European economic and political community, was born on April 3, 1881 at Pieve Tesino. in the then Austrian Trentino. After studies at the University of Vienna, he was elected in 1911 to the Austrian *Reichsrat* (parliament) as an Italian irredentist representative. The Trentino having been united with Italy after World War I. he was elected in May 1921 to the Italian parliament as one of the founders of the Partito Popolare Italiano led by Don Luigi Sturzo He opposed Mussolini's dictatorship, and in 1926 the Fascists suppressed the daily newspaper *Il Nuovo Trentino* that De Gasperi had edited for 20 years. He was arrested and sentenced to four years' imprisonment, but nas released after 16 months through the intervention of Pope Pius XI and. in 1929, was appointed an assistant in the Vatican library.

During World War II De Gasperi took part in the resistance movement and in June 1944 joined Ivanoe Bonomi's first cabinet as minister nithout portfolio. Having been minister of foreign affairs in Bonomi's second cabinet (Dec. 1944) and under Ferruccio Parri (June–Nov. 1945), he became prime minister on Dec. 10, 1945. He was to remain in office for more than seven years. In the same period he was also foreign minister again from Dec. 1945 to July 1946 and from July 1951 to Aug. 1953.

Early in 1946 De Gasperi was elected leader of the Partito Democratico Cristiano or Christian Democratic party. as the reconstructed Partito Popolare was now called. In the general election of June 1946 his party non 207 seats out of 556, but in that of June 1948 it won an absolute majority of 305 out of 574. De Gasperi nevertheless remained faithful to his principle of government by a coalition of the truly democratic parties. At the election of June 1953, honever, the Christian Democrats obtained only 262 seats out of 590, and. they and their allies failed by a narrow margin to gain an absolute majority. Deserted by the Republicans and by the right-wing Social Democrats. De Gasperi had to form, on July 16. 1953. his eighth government as a single-party Christian Democratic ministry and 12 days later he failed to win a vote of confidence (obtaining only 263 votes against 282). He resigned his ministry on Aug. 2, 1953, but remained secretary-general of his party till June 1954.

De Gasperi played a major part in restoring—with U.S. aid—his country's economy after the Italian defeat in World R'ar II. Under his guidance Italy became a member of the North Atlantic Treaty organization. In intimate collaboration with Robert Schuman (France) and Konrad Adenauer (German Federal Republic)—both Christian Democrats too—he contributed to the creation of the European Coal and Steel community (April 1951) and to the planning of the European Defense community (May 1952). The latter project, however, collapsed in Aug. 1954 because of the French opposition.

Faithful to his irredentist! tradition, De Gasperi insisted on maintaining Italy's frontier on the Brenner pass and worked to retain Trieste for Italy. Yet he was never really popular among the Italians. who judged him to be too strict in applying his own moral values to politics. He was also a rather poor speaker. He himself, however, cared little for personal popularity, believing that the achievements of his policies were eloquent enough.

De Gasperi died of a heart attack at Sella di Valsugana, Trentino, on Aug. 19, 1954, shortly after a telephone call from Mario Scelba, the prime minister, informing him of the French opposition to the European Defense community.

See G. Petrocchi, *De Gasperi e la Democrazia Cristiana* (1946); "Adstans," *Alcide De Gasperi nella politica estera italiana (1953).*

DE GAULLE, CHARLES ANDRE JOSEPH MARIE (1890–). French army officer and statesman. was born at Lille on Nov. 22, 1890, son of a professor of philosophy and literature at a Jesuit college. He passed with distinction through the École Militaire of St. Cyr and in 1913 joined the 33rd infantry

regiment commanded by Col. Philippe Pétain. He fought in the early campaigns of World War I. culminating in the battle of Verdun in March 1916. in which he was disabled and taken prisoner for the rest of the war.

When the armistice brought his release De Gaulle rejoined his old regiment. soon to be detailed to the Polish army formed in France. He was recalled to lecture at St. Cyr in 1921. Having graduated from the École Supérieure de Guerre in 1924, he was summoned by Marshal Pktain. then vice-president of the Conseil Superieur de la Guerre. to join his staff in 1925. In 1927, with the rank of major. he served at Trier in the army occupying the Rhineland. Two years later he was moved to the Lebanon. returning to Paris in 1931. His publications. *Le Fil de l'épée* (1931), *Vers l'armée de métier* (1934) and *La France et son armée* (1938), revealed him as a soldier of unusual intellectual powers and literary skill, and led him into conflict with orthodox military opinion. He urged a strategy of defense based on the mobility of tanks and aircraft rather than on the immobility of fortifications in depth, and pleaded for a highly mechanized professional army at a time when official opinion favoured reliance upon national conscription and the Maginot line.

When World War II began in 1939 De Gaulle, then colonel. commanded the brigade of tanks attached to the 5th army in Alsace. During the campaign of May 1940 Gen. Henri Giraud appointed him brigadier general in charge of the half-formed 4th armoured division. which fought effectively in desperate conditions. On June 6 the new premier. Paul Reynaud, appointed him to his first political post. undersecretary of state for war. In this capacity he visited London twice and met Winston Churchill. When Pktain. as Reynaud's successor. sought an armistice, Gen. de Gaulle returned to London and on June 18 broadcast his famous appeal to the people of France to continue the fight and put himself at the head of the new Free French movement. On July 7, 1940, at Toulouse. a French court-martial sentenced him to death.

As leader of the Free French and eventually president of the French Committee of National Liberation in Algiers. De Gaulle became at once the symbol of French resistance to occupation and an intransigent ally of the western powers. On Sept. 10, 1944. after the liberation of metropolitan France, he formed a provisional government. Two constituent assemblies mere elected to draft a new constitution. But when this was at last put to referendum in Oct. 1946 De Gaulle—who resigned as prime minister on Jan. 20. 1946—campaigned against it as likely to produce weak and unstable government. In April 1947 he formed the Rassemblement du Peuple Français (R.P.F.) which expressed popular discontent with the weak parliamentary system and exploited fears of Communism. Although it made gains in local elections and the parliamentary elections of 1951, it then lost ground and by 1953 was disbanded as a party. De Gaulle then retired into private life and wrote two volumes of his *Mémoires de guerre* (1954–56).

On May 13, 1958, when army leaders in Algeria defied the government in Paris, and France was threatened with civil war. the general again emerged as the only personality in national life capable of inspiring popular confidence. On June 1 he formed a government pledged to solve the Algerian problem and to make drastic revision of the constitution

In September the people of France and its overseas territories approved a new constitution supported by De Gaulle, and on Dec. 21 he nas elected president of the fiith republic. Under his leadership elections were held in nearly all French overseas possessions to determine their status with regard to the nen French community; a brief revolt by Europeans in Algeria was put donn without bloodshed in Jan–Feb 1960. and on Feb. 13 France became a nuclear power by exploding its first atomic bomb De Gaulle was host to the May 1960 summit conference in Paris which broke up in a dispute over violations of Soviet airspace by reconnaissance planes of the U S.

In March 1962 De Gaulle won an important victory when a cease-fire agreement was signed with the Algerian provisional government ending a seven-year war. The Secret Army Organization (O.A S.) in Algeria, however. announced its determination to carry on the fight against De Gaulle's Algerian independence plan and committed numerous acts of terrorism against the Muslims in Algeria. In April the peace accord was overwhelmingly approved by the voters in a French referendum. (D. TN.; X.)

DE GEER, LOUIS GERARD, BARON (1818–1896), Swedish statesman and nriter, was born on July 18, 1818, at Finspång castle. In 1855 he became president of the Gota *hovratt,* or lord justice of one of the Swedish higher courts. From 1858 to 1870 he was minister of justice (*i.e.,* prime minister). His greatest achievement was the reform of the Swedish representative system, whereby he substituted a bicameral elective parliament. on modern lines, for the existing cumbersome representation by estates. This great measure was accepted by the *riksdag* in Dec. 1865 and received the royal sanction in 1866. He retired from the ministry in 1870, but took office again, as minister of justice, in 1875. From 1876 to 1880 he was minister of state (a new office) and from 1881 to 1888 chancellor of the universities.

De Geer wrote a few novels and biographies (*H. Järta*, 1874; *A. J. von Höpken,* 1882, *B. B. von Platen*, 1887). His own memoirs (*Minnen,* 1892) are a valuable historical document. A selection of his letters (*Ur Louis De Geers brevsamling,* 1929) mas published by his son.

See Sven Eriksson, Carl XV (1954). (S. C. O. C.)

DEGGENDORF, a town of Germany which after partition of the nation following World War II was included in the *Lund* of Bavaria, Federal Republic of Germany. It is situated on the Danube. 4 km. (23 mi.) above its confluence with the Isar and 143 km. (89 mi) E.N.E. of Munich by road. Pop. (1959 est) 16.437 The Danube and the mountains of the Bavarian forest are there close together and form a beautiful setting for the tonn which retains its medieval pattern and part of its fortress. The town hall (1535) has a 14th-century tower. To the Grabkirche, built in 1337, a tall baroque tower was added in the 18th century; the church was built in atonement for an earlier violation of the Host and a pilgrimage to it takes place every year. The parish church. several times rebuilt, dates from 1748 and has a red and white marble altar in the baroque style. The history museum has a good prehistory collection. The Benedictine abbey of Metten (4 km. [2½ mi.] W.N.W.) was founded in 770 and that of Niederaltaich (10 km. [6 mi.] S.E.) in 731; both have rich art collections. Deggendorf is a market centre with textile industries, breweries and a small shipyard. Founded by Tekko about A.D. 750, Deggendorf came into possession of the dukes of Bavaria in 1242 and it was they who laid out the existing town. In World War II it fell to U.S. forces in April 1945. (WI. BR.)

DEGREE, ACADEMIC, a title conferred by a college or university at the completion of a course of study. The hierarchy of academic degrees, which is as old as the 13th century, had its direct counterpart in the medieval guild system. In its original meaning the bachelor's degree represented the first stage of academic life in the university, enabling the holder to proceed to the degree of licentiate, which permitted him to teach, and to that of master or doctor (then interchangeable terms), which admitted him into the teachers' guild and was in effect a certificate of fitness to teach at a university. Degrees in lam, medicine and theology still may carry with them a licence to practise the corresponding professions, but degrees in the arts are now no more than certificates of a certain measure of acquaintance with the subject. (*See* also BACHELOR; MASTER; DOCTOR.)

In general two practices are followed in the awarding of degrees. The European and South American countries have as a rule retained the degrees of the five traditional faculties : law, medicine, theology, arts and philosophy; academic work in newer fields of study is recognized by the granting of the degree of the faculty to which the new field most nearly approximates. With some exceptions, intermediate degrees, such as those of bachelor and master, have been abandoned in the universities of continental Europe. In France the usual degrees are the *licence* and *doctorat* according to the faculties. although a *baccalauréat* is conferred in law. The *licence* is based on four semesters' work in the university. The *doctorat,* taking from four to seven years, is awarded in two ways: the *doctorat d'Etat,* a state title, carries with it all professional rights and privileges, whereas the *doctorat d'uni-*

versité, awarded only by the university, does not carry any professional prerogatives. The French universities also award a variety of diplomas but these do not confer the rights and privileges common to state degrees. In Germany the doctorate of the various faculties is the only degree granted, but there is a tendency to add new signatures such as Dr. rer. nat. in natural sciences and Dr.-Ing. in engineering. For students not desiring to meet the doctoral requirements, diploma examinations are offered in specialized scientific and technical fields.

British universities grant the bachelor's as the first degree in arts or science. The second degree, M.A. or M.Sc., is obtained everywhere by examination except at Oxford and Cambridge, where it is granted after a period of residence and payment of prescribed fees. The degree of doctor of philosophy (Ph.D.) is offered by all faculties of British universities admitting advanced students. Other doctorates (D.Sc., D.Litt., LL.D., etc.) are available in most branches. In the U.S.S.R. diplomas are awarded on completion of a university course, and two postgraduate degrees, candidate and doctor, are recognized.

In U.S. colleges and universities the rapid expansion of specialization has produced a variety of almost 100 specific academic degrees in about 170 fields of study. Where once there were only four types of bachelor's degrees, there are now over 230. The commonest degrees, however, are still the B.A. and B.S., to which the signature of the special field is added. These special fields have their corresponding designations at the graduate levels, especially the master's degree, and although there is a tendency to retain the Ph.D. as the most advanced degree in arts and science, special signatures are found, as for example Ed.D. (education).

In addition to earned degrees, colleges and universities bestow honorary degrees, such as L.H.D. (doctor of humanities), Litt.D. (doctor of literature) and D.C.L. (doctor of civil law), as a recognition of distinction without regard to academic attainment.

In Canada, degree-granting institutions of higher learning are patterned after those in France and Great Britain, the latter bearing a resemblance to U.S. institutions granting bachelor's, master's and doctor's degrees. The *baccalaurkat ès arts* admits the student to the French-language universities, from which he receives a diploma upon completing the required course. Graduate work leads to a *maîtrise ès arts, licence* or a *doctorat.*

For medical degrees in various countries *see* MEDICAL EDUCATION. For abbreviations of degree titles *see* ABBREVIATION. *See* also EDUCATION, HISTORY OF; UNIVERSITIES.

DE HAVILLAND, SIR GEOFFREY (1882–), British aircraft designer, manufacturer and pioneer in long-distance and commercial jet flying, was born at Haslemere, Surrey, on July 27, 1882, and educated at St. Edward's school, Oxford, and Crystal Palace Engineering school.

He began work in the automobile industry, but in 1908 he designed a 50-h.p. airplane engine and, in conjunction with Frank Hearle, a pusher biplane to fit it. The aircraft crashed, but in 1910 he successfully built and flew a second machine with the same engine. He then joined the Army Balloon factory and originated the British Experimental (B.E.) series of tractor biplanes. During World War I he worked as chief designer and test pilot for the Aircraft Manufacturing company and produced a number of successful fighters and light bombers. In Sept. 1920 he formed the De Havilland Aircraft company. The success of the Moth, a light two-seater, set De Havilland Aircraft on its feet financially and started the flying club movement in Great Britain. In World War II the company's most successful product was the twin-engined Mosquito, a high-speed, all-purpose aircraft of plywood construction. De Havilland was early in the jet field, producing the Vampire and Venom jet fighters. After the war, he pioneered the Comet airliner and D.H. "Ghost" jet engines. There were early accidents due to metal fatigue, but the difficulties were overcome and later, improved models of the Comet were in service by the latter 1950s.

De Havilland was knighted in 1944. Two of his three sons were killed while testing his planes: John in the crash of a Mosquito in 1943 and Geoffrey Raoul in a D.H. 108 jet in 1946. (D. CR.)

DEKIWALA-MOUNT LAVINIA, an urban area in Ceylon, governed by an urban council and made up of Dehiwala, Galkissa, Mount Lavinia and other settlements lying along the west coast about 6–8 mi. S. of the centre of Colombo. Pop. (1953) 78,213. The whole area is essentially a residential suburb of Colombo, with which it is connected by road and rail services. It grew rapidly in area and population in the mid-20th century, but there are still paddy fields inside its boundary. Mount Lavinia is a seaside resort with fine beaches and a renowned hotel. Dehiwala has an attractive zoological garden. (B. H. F.)

DEHMEL, RICHARD (1863–1920), German poet of note whose work helped to bring about a revival of German poetry at the turn of the 19th century. He was born at Wendisch-Hermesdorf, Brandenburg, Nov. 18, 1863. Like his friend Detlev von Lilienkron, he wrote in an impressionistic style, and his poetry is extremely musical; at its finest, his work is sensitive, at its worst, sensational. Its vigorous, even tempestuous character is well suited to the frankness of his utterances. His refusal to cast his poetry into conventional patterns helped to liberate German verse from staleness. Closely associated with the naturalist movement, he was the first important poet to write about the misery of the working classes. His eroticism is also naturalistic, but his belief in the mystical power of love and of sex points beyond naturalism. The sensual relations between man and woman are, for him, the basis of a full development of the human personality and of a higher spiritual life. Following Nietzsche, he extolled the value of individuality and demanded an ecstatic mode of living. The main bulk of his lyrical work is found in *Erlosungen* (1891), *Aber die Liebe* (1893), *Weib und Welt* (1896), *Zwei Menschen* (1903), *Die Verwandlungen der Venus* (1907) and *Schöne wilde Welt* (1913). He was a volunteer in World War I but was soon disillusioned, and gave expression to this feeling in his war diary, *Zwischen Krieg und Menschheit* (1919). He died at Blankenese, near Hamburg, on Feb. 8, 1920.

See Julius Bab, *Richard Dehmel* (1926). (H. S. R.)

DEHRA DUN, a city and district in Uttar Pradesh, India. The city lies at an altitude of 2,200 ft., at the terminus of the Hardwar-Dehra Dun line of the Northern railway, 32 mi. N.N.W. of Hardwar. Pop. (1961) 158,599. It is the headquarters of the Survey of India and the forest department. The Forest Research institute for silvicultural research and the laboratory of the archaeological chemist are there, as are the Indian military college for all three services and the Rashtriya Indian Military academy for army cadet officers. There are two degree-granting colleges connected with Agra university, the Indian Forest college, six museums and many schools.

The cantonment lies northwest of the city which grew up around the temple built in 1699 by the heretical Sikh guru, Ram Rai, a leader of the Udasi sect of ascetics. The temple has a central block (in imitation of the emperor Jahangir's tomb at Lahore) containing the bed on which the guru died.

DEHRA DUN DISTRICT has an area of 1,201 sq.mi. Pop. (1961) 430,392. The Dun proper is a beautiful valley lying between the Siwalik range and the foothills of the Himalayas and crossed by the Ganges on the east and the Jumna on the west. The northern mountainous section rises to 7.000–8.000 ft. and the highest point of the Siwalik range is 6,345 ft. In 1951 the population was 362,005, the principal towns (pop. 1951) being Clement Town (7,720), Rikhikesh (7,495) and the hill station of Mussoorie (*q.v.*, 7,133). Rice, wheat and millets are the main crops. Tea is grown on the lower slopes, and other products are barley, maize, oilseeds, mangoes and timber. The district was ceded to the British after the Gurkha War in 1815 with other territory to the east. (S. S. BH.)

DEHYDRATION is the process of removing water from a solid, liquid or gas. The process involves chemical or physical changes, or both concurrently. Dehydration is of great importance in many industrial and research applications. Food and feed processing, air conditioning and the manufacture of liquefied gases (*see* NEON) are large-scale industrial operations requiring dehydration.

Gases containing water vapour may be dehydrated by compression. For more complete dehydration compression is accompanied by low-temperature refrigeration. For complete removal of water the chilled, compressed gases may be placed in contact with a solid water absorbent. The efficiency of the compression and refrigeration of air for air conditioning is dependent upon the removal of the water content of the circulated air.

Foods and medicinals may be dehydrated by the process of freezing. Sometimes the freezing process is accompanied by storage in a highly evacuated enclosure containing a water-absorbing chemical. Feeds, such as alfalfa. are dehydrated on a large scale by low-level heating in a fast-moving stream of hot air. This is done in order to attain a finished product that has lost none of its food value, but has been greatly reduced in weight.

Liquids, such as organic solvents. are dried by storage in contact with solid water absorbents such as granular barium oxide, dehydrated calcium sulfate, anhydrous calcium chloride. anhydrous magnesium perchlorate. calcined lime, calcined alumina or silica gel. Of these the most efficient dehydration results from the use of anhydrous magnesium perchlorate.

The great variety of equipment employed in dehydration processes includes laboratory desiccators, small- and large-scale electrically heated drying ovens and large rotatory kilns. (G. F. S.)

DEHYDRATION OF FOODS. One of the oldest known methods of food preservation is drying or dehydration. In fact, preservation by dehydration may be termed the natural method, since nature reduces the moisture content of seeds as they mature for their safekeeping. If properly protected or stored the seeds will keep for years. Early man first depended upon nature for his dehydrated foods and later copied the method by using sun and heat from fire to preserve his own stores. The American Indian preserved meat by slicing and drying it in the sun; the New England colonists depended on drying combined with salting and smoking for the preservation of meat and fish. Japan has long been known for its dried rice and fish. China for its dried eggs.

Foods which have been subjected to drying remain in a state of preservation primarily because of their low moisture content. The usual causative agents of spoilage. microorganisms (bacteria, yeasts and molds), are unable to carry on their activities without sufficient moisture. A dehydrated product. therefore, is preserved for as long a time as the water content is held at a low level. Some dehydrated products have a tendency to absorb moisture from the air and must be carefully protected to prevent early spoilage. Enzymes naturally present in the ram food are also detrimental to the quality of the dried product; the action of most enzymes may be inhibited by blanching, in the case of some foods, or by sulfite treatment.

Although drying is one of the simplest and cheapest methods of food preservation, commercial production in large quantities, except for fruits, has generally been undertaken only under the stimulation of wartime conditions. The weight and compactness of dehydrated foods make them ideal items in emergencies. especially when shipping space is at a premium. For example, 100 lb. of fluid milk in dry form weighs only 12 lb. and occupies approximately 3.1 cu.ft. of space; 30 doz. shell eggs packed for shipment occupy 2.5 cu.ft., but xhen dried they require only little more than half a cubic foot. On the average, 15 lb. of fresh food will yield 1 lb. of dehydrated food.

Great expansion in the commercial dehydration of foods took place during World War I, especially in the United States. Following that war. production decreased rapidly because shipping space was no longer a problem and dried foods were not acceptable to the civilian population. With the advent of World War II a tremendous increase in processing facilities for dehydrated foods occurred in the United States. After hostilities ended. production again decreased but the persistent need for shipping foods overseas helped prevent complete collapse of the industry. Continued interest by the C.S. armed forces in this type of food preservation stimulated extensive scientific studies which brought about improved quality through better understanding of drying and packaging techniques and other complex principles that affect colour. flavour and texture. These many technological advances brought about the development of new products such as dehydrated soup mixtures. potatoes, carrots. onions, desserts. cake mixes, cheese, fruit juices, ice cream mixes and soluble coffee nhich achieved high consumer acceptance, particularly in the U.S Simplicity of preparation was a point of special appeal of many of these products.

Generally. dehydration is the term applied to drying of foods by artificial means. especially when forced circulation of the drying air is accomplished by fans. Terms applied to dehydrated products are dried, sun-dried evaporated or dehydrated. The term sun-dried denotes using any means, uhile evaporated implies that artificial heat may have been applied, but air movement was by a natural draft. The expression freeze-drying, which suggests the initial process of freezing, includes dehydration in the frozen state without alloning the product to thaw. This method dries heat-sensitive materials with little or no damage.

Dehydrating equipment and drying methods vary with the nature of the product as illustrated by conventional designs used for years: tunnel driers, kiln driers, cabinet or compartment driers, rotary driers drum driers, vacuum driers vacuum shelf driers and spray driers Many so-called improved designs have been developed to produce a dehydrated food of the flavour, colour and texture of fresh food This has been accomplished through better contact between the product and the drying air, thereby shortening the drying time and improving the dehydrated food.

Sun-drying of fruits and nuts is possible in areas that are generally warm and sunny at harvest time, and where rain is scarce during the drying period. However, the use of kiln-type driers, with natural or forced draft and artificial heat, improves the quality of the product, is generally more efficient and eliminates losses from unseasonable weather. With continued emphasis on better fresh flavour and colour in dehydrated foods, increased quantities of fruits and vegetables are being dried under vacuum.

Dehydration, like other methods of preservation. does not make good foods from poor products. The careful selection of varieties of fruits and vegetables, and their size and maturity at the time of processing are essential considerations in producing satisfactory results. The handling should be rapid to prevent loss of vitamins, colour and flavour.

Fruit and vegetable juices introduced difficult problems because of the low softening or melting point and the hygroscopic nature of their solids. The use of vacuum dryers employing techniques to cause puffing of the solids, as well as entrapping the flavour components, resulted in greatly improved dehydrated juices. When these are packaged in vacuum or inert gas, and the moisture is held low (less than 1%), the juice is excellent.

The dairy industry is one of the largest processors of dehydrated foods. Large quantities of whole milk, cream, skim milk, butter milk, whey and malted milk are dried each year. Although drum driers have been used extensively for some of these products, spray drying came to be generally used. In spray drying, the fluid is atomized into a heated chamber in the form of fine mist where it comes into contact with heated air. The water is almost instantaneously removed from the milk, leaving a fine powder which drops to the bottom of the chamber or is carried in the air stream to collecting equipment. The rapid drying produces a powder of greater solubility than that from drum driers. Vacuum drum drying may be used for very hygroscopic products such as malted milk The moisture content of dehydrated dairy products should be maintained below 3%.

Dried milks generally have good solubility. but do not disperse readily in water unless mechanical agitation is used. During the mid-1930s, skim milk powders which would disperse rapidly in cold water were introduced. These powders were coarse and grainy, however, compared with the fine powder obtained by conventional spray drying; and modifications of equipment and techniques were required.

Eggs are usually dried with equipment designed for milk drying. Whites, yolks and whole eggs are dried. Dried eggs must also be packaged and stored in a manner which will keep the moisture content low.

Although meat has been dried for centuries, the rehydrated

product is unlike the meat in its fresh condition. Freeze-drying of meat yields a product with excellent stability, which upon rehydration closely resembles fresh meat.

Commercial freeze-drying or drying by sublimation of the water from a frozen state under high vacuum was developed during World War II. In the case of most food products, the cost of production in relation to the value of the product is prohibitive. However, by the early 1960s improvements in drying and packaging techniques had progressed to a point where the use of this method for the dehydration of meat approached commercial feasibility.

DEIOCES (8th–7th century B.C.) was the first king of the Medes according to Herodotus (book i, 96 ff.). Herodotus relates that when the Medes had won their independence from Assyria they lived at first in villages without any political organization. When they decided to elect a king they chose Deioces, a village judge, renowned for the justice of his decisions. Deioces united all the Median tribes, built Ecbatana (Hamadan) as their capital and ruled for 53 years (c. 727–675 B.C.).

It is now known, however, that Herodotus' story was ill founded and it appears probable that he confused Deioces with Khshathrita (possibly his son) who established a kingdom in Media and ruled from 673 to 652 B.C. The confusion is enhanced by the fact that he refers to Khshathrita as Phraortes (*q.v.*).

The historical Deioces (Assyrian, Dayukku) was a petty Median chieftain subject to the kingdom of Manna in modern Iranian Azerbaijan. He intrigued with the Urarteans and other enemies of Assyria, was captured by Sargon II in 715 and deported with his family to Hamath in Syria. The statement that the "house of Dayukku" is mentioned in Assyrian inscriptions after this date is based on a misreading. (I. M. D.)

DEIOTARUS (1st century B.C.), a tetrarch of the Tolistobogii, and later king of all Galatia in Asia Minor. He was a faithful ally of the Romans. At the beginning of the third Mithradatic war (74 B.C.), he drove the invading troops of Mithradates VI of Pontus from Phrygia. Pompey, when settling the affairs of Asia (64 B.C.), rewarded him with the title of king and with part of east Pontus. The senate granted him Lesser Armenia and most of Galatia, perhaps in 52 or 51. Deiotarus naturally sided with Pompey in the civil war and after his defeat at Pharsalus escaped with him to Asia. In 47 Caesar arrived in Asia from Egypt and pardoned Deiotarus for having sided with Pompey. In consequence of the complaints of certain Galatian princes, Deiotarus was deprived of part of his dominions, but allowed to retain the title of king. In 45 Deiotarus was accused at Rome by his grandson Castor of having attempted to assassinate Caesar when the latter was his guest in Galatia. Cicero undertook his defense. but the assassination of Caesar prevented any final decision. After Caesar's death, M. Antonius (Mark Antony), for a large sum of money, announced that, in accordance with instructions left by Caesar, Deiotarus was to resume possession of all the territory of which he had been deprived. When civil war again broke out. Deiotarus was persuaded to support Brutus and Cassius, but after their defeat at the battle of Philippi he went over to the triumvirs *(see* ROME: *Ancient History).* He remained in possession of his kingdom till his death in 40.

DEIRA, the southern of the two Anglo-Saxon kingdoms which were united to form Northumbria (*q.v.*), stretched from the Humber to the river Tyne. The earliest English settlements were in the Yorkshire wolds and near York. The first recorded king of Deira, Aelli, is said to have reigned from 560. There is a tradition that when he died in 588 or 590. Deira was seized by Aethelric of Bernicia. whose son Xethelfrith ruled both kingdoms till 616, as did Aelli's son Edwin from 616 to 632. From 632 to 633 Deira was ruled by Edwin's cousin Osric, but was united with Bernicia in Oswald's reign (633–641). Osric's son Oswine held Deira from 641 until Oswiu. brother of Oswald, killed him in 651. After that Deira sometimes had subkings; *i.e.,* Oswald's son Oethelwald (till 654), who sought the protection of Penda of Mercia; Oswiu's son Alhfrith (last heard of in 664); and Alhfrith's brother Aelfwine, killed at a battle on the river Trent in 678.

DEIRDRE (Old Irish **DERDRIC),** the heroine of the story *Longes Mac n-Uislenn,* which may have been composed in the 9th century, and of the later version *Oidheadh Chloinne Uisneach,* which belongs to the early modern Irish period and has been combined mith two other stories to form *Trí Truaighe na Scéalaigheachta* ("The Three Sorrows of Storytelling"). The older version describes the strange circumstances of Deirdre's birth and upbringing; how she fell in love with the young Noisi (Old Irish Noísiu) and persuaded him to carry her away to Scotland from her intended husband Conchobar, king of the Ulstermen; and how Noisi, with his two brothers and Deirdre, was tricked into coming back to Ireland, where the three men were treacherously killed, while Deirdre took her own life to avoid falling into the hands of Conchobar. The later version omits the first half of the story and greatly expands the tragic ending by making Deirdre live for a year with Conchobar before killing herself. The story was immensely popular in Ireland and Scotland and survived down to the 20th century in Scottish oral tradition; its literary influence continued into modern times, when the Anglo-Irish school, notably W. B. Yeats and J. M. Synge, revived the theme. It may also be recalled that Darthula, in James Macpherson's Ossianic cycle, derives from Deirdre.

DEISM, as the word is customarily employed, describes an unorthodox religious attitude that found expression among a group of English writers beginning with Lord Herbert of Cherbury (1583–1648) and ending mith Henry St. John, Viscount Bolingbroke (1678–1751). Though an initial use of the term occurred in 16th-century France, the later appearance of the doctrine on the continent was stimulated by the translation and adaptation of the English models. The high point of deist thought occurred in England from about 1689 through 1742, during a period when, despite widespread counterattacks from the established church, there was relative freedom of religious expression following upon the Glorious Revolution. Deism did not take deep root in 18th-century Germany until after it had ceased to be a vital subject of controversy in England.

Sometimes in the 19th and early 20th centuries the word deism was used theologically in contradistinction to theism (*q.v.*), the belief in an immanent God who actively intervenes in the affairs of men. In this sense deism was represented as the view of those who reduced the role of God to a mere act of creation in accordance with rational laws discoverable by man; after the original act he virtually withdrew and refrained from interfering in the processes of nature and the ways of man. So stark an interpretation of the relations of God and man, however, was accepted by very few deists during the flowering of the doctrine, though their religious antagonists often attempted to force them into this difficult position. Historically, a distinction between theism and deism has never had wide currency in European thought. Diderot, for example. when he translated the works of the earl of Shaftesbury into French, often rendered "deism" as *théisme.* The term is not in current usage as a metaphysical concept, and its significance is really limited to the 17th and 18th centuries.

In 1754, when the deist controversy had passed its peak. John Leland. an opponent, wrote a historical and critical compendium of deist thought. *A view of the principal deistical writers that have appeared in England in the last and present century; with observations upon them, and some account* of *the answers that have been published against them.* This work, which began with Lord

Herbert and moved through Hobbes, Charles Blount, the earl of Shaftesbury, Anthony Collins, Thomas Woolston, Matthew Tindal, Thomas Morgan, Thomas Chubb and Viscount Bolingbroke, fixed the canon of who should be included among the deist writers. In subsequent works Hobbes usually has been dropped from the list and John Toland included, though he was closer to pantheism than most of the other deists were. Herbert was not known as a deist in his day, but Blount and the rest who figured in Leland's book would have accepted deist as an appropriate designation for their religious position. Simultaneously, it became an adjective of opprobrium in the vocabulary of their opponents. Bishop Edward Stillingfleet's *Letter to a* ***Deist*** (1677) is an early example of the orthodox use of the epithet.

In Lord Herbert's treatises five religious ideas were recognized as God-given and innate in the mind of man from the beginning of time: the belief in a supreme being, in the need for his worship, in the pursuit of a pious and virtuous life as the most desirable form of worship, in repentance, and in rewards and punishments in the next world. These fundamental religious beliefs, Herbert held, had been the possession of the first man and they were basic to all the worthy positive institutionalized religions of later times. Differences among sects and cults all over the world were thus mere modifications of universally accepted truths when they were benign and corruptions when they led to inhuman practices such as the immolation of human victims and the slaughter of religious rivals.

In England at the turn of the 17th century this general religious attitude assumed a more militant form, particularly in the works of Toland, Shaftesbury, Tindal, Woolston and Collins. Though the deists differed among themselves, and there is no single work that can be designated as the quintessential expression of deism, they joined in attacking both the existing orthodox church establishment and the wild manifestations of the dissenters. The tone of these writers was often earthy and pungent, but their deist ideal was sober natural religion without the trappings of Catholicism and the high church in England and free from the passionate excesses of Protestant fanatics. In Toland there is great emphasis on the rational element in natural religion; in Shaftesbury more worth is bestowed on the emotive quality of religious experience when it is directed into salutary channels. All are agreed in denouncing every kind of religious intolerance since the core of the various religions is identical. In general there is a negative evaluation of religious institutions and the priestly corps who direct them. Simple primitive monotheism was practised by early men without temples, churches and synagogues, and modern men could readily dispense with religious pomp and ceremony. The more elaborate and exclusive the religious establishment, the more it came under attack. A substantial portion of deist literature is devoted to the description of the noxious practices of all religions in all times, and the similarities between pagan and Roman Catholic rites were emphasized.

The deists who presented purely rationalist proofs for the existence of God, usually variations on the argument from design, were able to derive support from the vision of the lawful physical world Isaac Newton had delineated, and in the 18th century there was a tendency to convert Newton into a matter-of-fact deist—a transmutation that was contrary to the spirit of both his philosophical and his theological writings.

When deists were faced with the problem of how man had lapsed from the pure principles of his first forebears into the multiplicity of religious superstitions and crimes committed in the name of God, they ventured a number of conjectures. They surmised that men had fallen into error because of the inherent weakness of human nature. Or they subscribed to the idea that a conspiracy of priests had intentionally deceived men with a "rout of ceremonials" in order to maintain power over them.

The role of Christianity in the universal history of religion became problematic. For many religious deists the teachings of Christ were not essentially novel but were in reality as old as creation, a republication of primitive monotheism. Religious leaders had arisen among many peoples—Socrates, Buddha. Mohammed—and their mission had been to effect a restoration of the simple religious faith of early men. Some writers, while admitting the similarity of Christ's message to that of other religious teachers, tended to preserve the unique position of Christianity as a divine revelation. It was possible to believe even in prophetic revelation and still remain a deist, for revelation could be considered as a natural historical occurrence consonant with the definition of the goodness of God. The more extreme deists, of course, could not countenance this degree of divine intervention in the affairs of men.

Natural religion was sufficient and certain; the tenets of all positive religions contained extraneous, even impure elements. Deists accepted the moral teachings of the Bible without any commitment to the historical reality of the reports of miracles. Most deist argumentation attacking the literal interpretation of Scripture as divine revelation leaned upon the findings of 17th-century biblical criticism. Woolston, who resorted to an allegorical interpretation of the whole of the New Testament, was an extremist even among the more audacious deists. Tindal was perhaps the most moderate of the group. Toland was violent; his denial of all mystery in religion was supported by analogies among Christian, Judaic and pagan esoteric religious practices, alike condemned as the machinations of priests.

The deists were particularly vehement against any manifestation of religious fanaticism and enthusiasm. In this respect Shaftesbury's *Letter Concerning Enthusiasm* was probably the crucial document in propagating their ideas. Revolted by the Puritan fanatics of the previous century and the wild hysteria of the French exiles prophesying in London in 1707, Shaftesbury denounced all forms of religious extravagance as perversions of true religion. These false prophets were directing religious emotions benign in themselves into the wrong channels. Any description of God that depicted his impending vengeance, vindictiveness, jealousy and destructive cruelty was blasphemous. Since sound religion could find expression only among healthy men, the argument was common in deist literature that the preaching of extreme asceticism, the practice of self-torture. the violence of religious persecutions, were all evidence of psychological illness and had nothing to do with authentic religious sentiment and conduct. The deist God, ever gentle, loving, benevolent, intended men to behave toward one another in the same kindly and tolerant fashion.

Ideas of this general character were voiced on the continent at about the same period by men like Bayle, even though he would have rejected the deist identification. During the heyday of the French *philosophes,* the more daring thinkers—Voltaire among them—gloried in the name deist and declared the filiation of their ideas with those of rationalist English ecclesiastics such as Samuel Clarke, who incidentally would have repudiated the relationship. Diderot drew his inspiration from Shaftesbury, hence his early commitment to a more emotional deism. Later in life he shifted to the atheist materialist circle of Paul Henri Thiry, baron d'Holbach. When Holbach paraphrased or translated the English deists his purpose was frankly atheist; he emphasized those portions of their works that attacked existing religious practices and institutions, neglecting their devotion to natural religion and their adoration of Christ. The Catholic Church in 18th-century France did not recognize fine distinctions among heretics, and deist and atheist works were burned in the same bonfires.

English deism was transmitted to Germany primarily through translations of Shaftesbury, whose influence upon thought was paramount. In a commentary on Shaftesbury published in 1720 Leibniz accepted the deist conception of God as an intelligent creator. but refused the contention that a god who metes out punishments is evil. A sampling of other deist writers was available particularly through the German rendering of Leland's work in 1755 and 1756. Gotthold Ephraim Lessing's *Nathan der Weise* was noteworthy for the introduction of the deist spirit of religion into the drama; in the famous parable of the three rings, the major monotheistic religions were presented as equally true in the eyes of God. In Germany Lessing's rational deism was the object of violent attack on the part of pietist writers and the more mystical thinkers who followed J. G. Hamann. By the 1760s, however, the works of the early 18th-century English deists were supple-

mented by German translations of David Hume's Natural History of *Religion*. Witnesses attest that virtually the whole officer corps of Frederick II was infected with deism and that Collins and Tindal were favourite reading in the army.

By the end of the 18th century deism had become a dominant religious attitude among upper-class Americans. and the first three presidents of the United States held this conviction. as is amply evidenced in their correspondence. "The ten commandments and the sermon on the mount contain my religion," John Adams wrote to Thomas Jefferson in 1816.

DEKABRISTS (DECEMBRISTS), the first Russian revolutionaries, so named after the rising of December (Rus. *Dekabr*) 1825.

The Dekahrist rising was the culmination of a revolutionary movement that dated back to the second half of the 18th century and was influenced by French, American and German ideas. It was the product, not the cause, of mounting demands for national reforms. In 1816, however, a secret society, the Union of Salvation, had been founded to promote economic, social and political reforms, notably the abolition of serfdom and the attainment of some degree of representative government. Its members were predominantly young officers. This union was reorganized in 1818 as the Union of R'elfare and then, in 1821, divided into two. the Northern and the Southern societies. The Southern society, dominated by Col. Pavel Pestel, was the more radical: it desired to overthrow the monarchy, to institute a period of military dictatorship and finally to establish a Russian-dominated. centralized, democratic republic. The Northern society, founded by another officer, Nikita Muraviev, sought a liberal constitutional monarchy with regional autonomy and minority rights.

On the death of the emperor, Alexander I (Dec. 1, new style; Nov. 19, old style), Russia was temporarily without an emperor, as Alexander's eldest surviving brother, Constantine (*q.v.*), had secretly renounced his rights to the throne in favour of his brother Nicholas I, and the latter was hesitating to assume authority. The revolutionaries then took advantage of the confusion to agitate among the troops against Nicholas. Expecting the succession of Constantine, the troops had already pledged allegiance to him. When. on Dec. 26 (N.S., 14, O.S.), they were called on to pledge allegiance to Nicholas I. some of them, including the Moscow Guards regiment, aroused by the Dekabrists. refused to do so, demanding "Constantine and a constitution."

The Dekabrist rising was unsuccessful. Some troops failed to go over to the rebel side, and when the rebels could not be persuaded to disband! a few well-directed artillery salvos strewed the Senate square in St. Petersburg with the mangled bodies of about 80 recalcitrant soldiers and civilian spectators. Col. Prince Sergei Trubetskoi, who was to be provisional dictator. fled immediately. A rising in the south proved equally abortive. After an investigation in which Nicholas I himself took a prominent part the revolutionaries were tried and convicted. Five of the leaders, among them Pestel and the poet Kondrati Ryleev, were hanged; some were imprisoned; the others were banished to Siberia. Yet the spirit of their movement lived on. Not only the martyrdom but also many of the ideas of the Dekabrists inspired succeeding generations of revolutionaries.

DEKKER, EDUARD DOUWES (pseudonym, MULTATULI) (1820–1887), Dutch prose writer and moralist whose ideas on education, politics, society, the position of women, philosophy and religion were in advance of his time, was born on March 2, 1820, at Amsterdam. In 1838 he went to the Netherlands East Indies, where he held a number of government posts until 1856, when he resigned because. as assistant commissioner of Lebak, Java, he was not supported by the colonial government in his attempts to protect the Javanese from their own chiefs. He returned to Europe and described the Javanese situation in his autobiographical novel Max Havelaar (1860; Eng. trans.. 1927 and 1940). Translated into several languages, the book made an impression comparable to that made earlier by Uncle Tom's Cabin, but Dekker was not reinstated officially and, in straitened circumstances, had to earn a living by writing. Separated from his family, he led a bohemian life in Amsterdam, Brussels and elsewhere, finally settling in Germany.

Dekker's chief work. the seven-volume *Ideën* (1865–77), written under the motto "A sower went forth to sow," includes his didactic novel *Woutertje Pieterse* (Eng. trans., 1904) and the drama *Vorstenschool.* It contains innumerable aphorisms, parables and discussions with which he attempted to educate his contemporaries in his own advanced theories and to encourage them to think for themselves. His aphorism De *roeping* van de mens is mens *to zijn* ("Man's calling is to be a human being") became well known. An atheist, he particularly opposed the influence of the church and religion on the freedom of thought and on economic development. He died at Nieder-Ingelheim, Ger.. Feb. 19, 1887.

BIBLIOGRAPHY.—Dekker's widow published his collected works (1888–96) and letters, 10 vol. (1890–96); there was a new edition by G. Stuiveling and Henri A. Ett (1950–). *See* also *J.* de Gruyter, *Het lrven en de werken van E. Douwes Dekker,* 2 vol. (1920); E. du Perron, "De man van Lebak," in *Verzameld Werk,* vol. iv (1956); F. Mauthner, *Der Atheismus und seine Geschichte im Ahendlande,* vol. *4* (1924). (GD. W. HS.)

DEKKER, THOMAS (c. 1572–*c.* 1632), English dramatist and writer of prose pamphlets. who is memorable for the lively detail of his depictions of London life, was born in London and wrote consciously as a Londoner. Few facts of Dekker's life are certain: he is first mentioned as a playwright on Jan. 8, 1598, in "Henslowe's Diary" (see HENSLOWE, PHILIP) : in that year Philip Henslowe paid 40s. to obtain Dekker's release from imprisonment for debt, and he saved him from arrest in 1599. Writing for his living, he had a hand in at least 42 plays in the next 30 years. Dekker's dramatic invention and ability to construct a truly dramatic action were defective; it is therefore no wonder that in the dispute known as "the poets' war" or "the war of the theatres" (see JONSON, BEN), he was satirized in Jonson's Poetaster (1601) as Demetrius Fannius, "a very simple fellow . . . a dresser of plays." This anticipated Dekker's own attack on Jonson in *Satiromāstix,* written with John Marston (1601). Eleven more of the plays in which Dekker collaborated survive: in them he was associated with such well-known figures as Thomas Middleton, John Webster. Philip Massinger, John Ford and William Rowley. He was also responsible for a fragment of Sir *Thomas* More, the manuscript of which contains three pages widely believed to be in Shakespeare's autograph.

Of the five plays which are entirely Dekker's work, the most popular. and probably the best knonn, is *The* Shoemaker's Holiday (1600). It is typical of his work in its old-fashioned. forthright tone, in the rush of its prose, its boisterousness. its tenderness and pathos. and in the easy touch nith character. Rhatever his dramatic defects. Dekker had enormous facility; his eye for detail and his ear for the spate and flow of colloquial speech would have been best utilized in novel-writing or in first-class reportage in a later age He writes traditional drama, with situations which allow him to show virtue tested and triumphant. We delighted in the thought of honesty, uprightness and patience; yet there is a zest in his rogues and villains as in his lovable comic characters. Capable of satire, and never flinching from realistic portrayal of injustice, misfortune and malice, he writes in a tone which is idealistic and tolerant notwithstanding. His essentially generous nature shons itself in his pictures of London with its solid middle-class citizens, its comic servants who are not treated patronizingly, and its lack of servility toward the royal and the noble. Although he records details of the contemporary scene which were symptoms of deep economic and social changes, Dekker has no

sense of instability. Rather than fearing or hating upheaval and change, he relates what he sees to the age-old conflict between virtue and vice. To some extent the formlessness of his plays may derive from this unawareness of problems and implications. He fights vice. not change; and in this he is an old-fashioned moralist. He is never incompetent in blank verse, despite a tendency toward empty magniloquence; his couplets are deft and workmanlike.

There is zest and energy in the prose pamphlets which he began in 1603, with *The Wonderful Year,* which is also the first of those in which he wrote of London and the Plague. Dekker transcends the art of the journalist, reporting vividly, yet expressing his piety and religious confidence: he shirks nothing, and even dwells imaginatively on the horrors. Satire and denunciation do not destroy his tolerance and sympathy. Such works as *The Bellman of London* (1608) make use of material on roguery and crime borrowed from Robert Greene, John Awdeley and Thomas Harman, but read as if from personal experience. *The Gull's Hornbook* (1609) is possibly the best-known pamphlet and is especially valuable for its account of behaviour in the London theatres.

Between 1613 and 1619 Dekker was in prison for debt. This first-hand experience may be behind the six prison scenes included in the collection of *Characters* published in 1616 under the name of Sir Thomas Overbury. Dekker was also partly responsible for devising the street entertainment to celebrate the entry of James I into London in 1603; he provided the lord mayor's pageant in 1612. His verse is competent in the anonymous *News from Gravesend* (1604), usually attributed to him. Much less exuberant than his other work is the movingly pious *Four Birds oj Noah's Ark* (1609), in which the man who deplored the cruelty of bear-baiting showed his sympathy with all in misfortune. It is no longer certain that the lyrics in *Patient Grissil* (1603), a play he wrote together with William Haughton and Henry Chettle, are actually Dekker's, but they certainly express his sweetness of nature.

DE KOONING, WILLEM (1904–), U.S. painter, widely recognized as one of the leaders of American abstract art and identified with the movement known as Abstract Expressionism, or "Action" painting, was born at Rotterdam, Neth., on April 24, 1904. He emigrated to the United States in 1926 and supported himself for many years as a commercial artist. His first one-man show in New York city was not held until 1948, although he had long been a well-known figure in the avant-garde. De Kooning, somewhat in the manner of Jackson Pollock (*q.v.*), based his style on the expressionistic fury of his paint manipulation and on a broad spirit of improvisation. His paintings, however, have often retained traditional elements of design and figuration. In 1953 he held a one-man show in New York of perhaps his most controversial and powerful series of paintings, built around the theme of "Woman"; in these works recognizable anatomical features of a cult-image, female figure were clearly discernible, although violently distorted. He subsequently returned to abstract modes. (S. Hu.)

DE KOVEN, (HENRY LOUIS) REGINALD (1861–1920). U.S. composer, conductor and critic who largely established the style of the American light opera, was born at Middletown, Conn., on April 3, 1861. He graduated from Oxford university (1879) and studied composition in Germany, Austria and France. On his return to the U.S. he made his reputation as a composer of light operas and contributed music criticism to *Harper's Weekly* and the New York *World.* Between 1887 and 1913 he wrote 20 light operas, of which the most successful was *Robin Hood* (Chicago, 1890), partly derived from the style of the operas of Gilbert and Sullivan and given in London as *Maid Marian.* His two grand operas, *The Canterbury Pilgrims* (1917) and *Rip Van Winkle* (1920): were less successful. He also wrote more than 400 songs. ballets and piano pieces. He was known as a conductor and in 1902 founded the Washington Philharmonic orchestra, which he conducted until 1905. He died in Chicago on Jan. 16, 1920.

DE LA BECHE, SIR HENRY THOMAS (1796–1855), English geologist, originator and first director of the geological survey of Great Britain, was born in a London suburb in 1796 and was educated for the army. Following the peace of 1815 he joined the Geological Society of London and after a period of travel in Europe began a detailed investigation of the rocks of Cornwall and Devon. Thrown much into contact with the mining community, he conceived the idea that the nation ought to compile a geological map of the United Kingdom, to aid the scientific development of its mineral industries, and persuaded the government to give him an appointment in connection with the ordnance survey. This formed the starting point of the geological survey of Great Britain. which was officially recognized in 1835, when De la Beche was appointed director. Eventually parliament sanctioned the erection of a museum of geology and the organization of a staff of professors.

The establishment, in which were combined the offices of the geological survey, the Museum of Practical Geology, the Royal School of Mines and the Mining Record office, was opened in Jermyn street. London, in 1851.

De la Beche was elected to the Royal society in 1819. was president of the Geological society in 1848–49 and was knighted in 1838. His publications include *Report on* the *Geology of Cornwall, Devon and West Somerset* (1839); *Researches in Theoretical Geology* (1833); and *Geological Observer* (1851; and ed., 1853). He died on April 13. 1855.

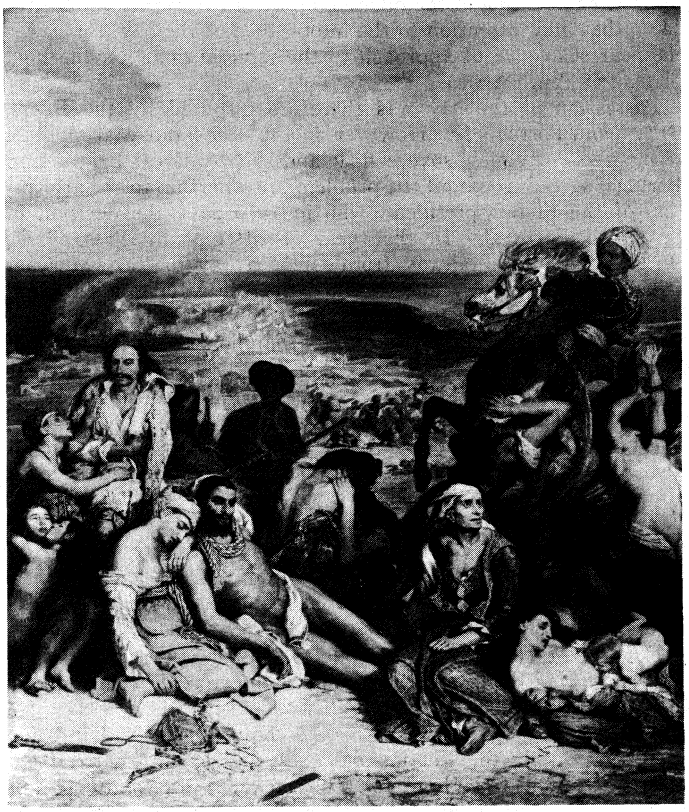
DELACROIX, (FERDINAND VICTOR) EUGÈNE (1798–1863), the most prominent of the French Romantic painters, was born at Charenton-St. Maurice, near Paris, on April 26, 1798. Though he was brought up as the youngest member of the family of a high-ranking official, it was believed by many that his real father was Talleyrand. This legend is given substance by the fact that Delacroix, though a constant opponent of academic orthodoxy, nevertheless received continuous and important patronage from the state. He was educated at the Imperial *lycée,* living with his mother until her death in 1815.

Though devoted from first to last to music, he began in 1816 to study painting under Pierre Guérin at the École des Beaux-Arts; his training therefore was in the formal neoclassical manner established by David and tinctured by his immediate successors with the heroics of the Napoleonic legend. Delacroix's training, moreover, began at the moment when the orderly, codified system of the first empire had collapsed and given place to a new era of faith and dogma ushered in by the re-establishment of the monarchy and the church. So complex was the artistic and personal make-up of Delacroix that it cannot be explained except against this background of rapid change and the turbulent aftermath of a European convulsion.

The artist himself seems to have retained, partly by virtue of his education, a deep respect for order and clarity proper to the French tradition. Yet his debut at the salon of 1822, when he exhibited his "Dante and Virgil in the Infernal Regions," is one of the landmarks in the development of French 19th-century romantic art. Its characteristics of colour, violence and passionate handling show that Delacroix had looked far beyond his master's example for inspiration. His chances for doing this had been exceptional, and it is certain that he would have taken the opportunity of studying the array of classical Italian, Dutch and Flemish works of art brought to the Louvre after Napoleon's great victories. The eclecticism of Delacroix, both in practice and theory, may owe something to these circumstances. Though certain early works—and particularly the "Dante and Virgil"—show the influence of Blichelangelo, that of Rubens is predominant, while the rich palette of Veronese and the chiaroscuro of Tintoretto obviously attracted him. Among his contemporaries, the influence of Thkodore Géricault, who studied before him at Gukrin's and was until his sudden death in 1824 Delacroix's closest friend, is su-

premely important. Meanwhile, the example of the English artist R. P. Bonington, who painted Venetian and medieval subjects in high-pitched, jewellike colours, should not be overlooked.

In his choice of subjects Delacroix shows from the beginning an affinity with the romantic poets of his time; scenes from Dante, Shakespeare, medieval history and. later, the orient are predominant. In 1824, however, Delacroix exhibited the "Massacre at Chios," which, besides being a piece of full-blooded Orientalism, was also a means of expressing his intense feeling on a topical political subject—in this case the Greek rising against the Turks. The same picture is said to reflect the influence of Constable's spontaneity and brilliant tonality, and there is every reason to believe that Delacroix was so inswired. However, it is worth noting



ALINARI

"MASSACRE AT CHIOS" BY DELACROIX. IN THE LOUVRE. PARIS

that through Constable he was discovering qualities which ultimately derive from the great landscapes of Rubens—an artist from whom Delacroix had already derived much and whose influence continued to grow.

He visited England in 1825, meeting Bonington, Etty. Wilkie and Lawrence, his portrait of Baron Schniter (National gallery, London) of 1836 reflecting the influence of the last (see PORTRAIT PAINTING). In England. as in France. Delacroix had made many studies of medieval and late antique manuscripts, mosaics, armour, costume. tombs and sculpture. while his sketchbooks contain many superb animal studies. Such material was employed in spectacular norks such as the "Death of Sardanapalus" of 1827 (Louvre, Paris), a violent Byronic subject in which animals. slaves women, jenels and rich fabrics are typically combined. His interest in the later years of the ancient world appears in the "Pandects of Justinian," ordered in 1826 for the Conseil d'État; it was the first of a continuing series of state commissions nhich indicate influential but concealed support Among the feu critics who applauded Delacroix's early masterpieces was the young Louis Thiers. Like his friend Géricault, Delacroix explored the new medium of lithography and his 19 Faust subjects date from 1828. In 1830, to commemorate the rising of that year, he painted "Liberty Guiding the People" (Louvre), a mixture of allegory and realism somewhat reminiscent of the nar pictures of Goya; in the following year he gained the Légion d'Honneur.

In 1832 he traveled to Algeria, Spain and Morocco. curiously omitting a visit to Italy. His colour thenceforward is still more rich and translucent. as can be seen in the "Algerian Women" of 1834 (Louvre). It was in works such as this, in which jewelry and rich stuffs predominate, that Delacroix began to juxtapose areas of complementary colours in such a way that each would intensify the other. His colour methods had considerable influence on both Impressionist and post-Impressionist painters. Delacroix continued to receive important state commissions. the most notable being the decoration of the libraries at the Palais Bourbon and the Luxembourg (1838–47), the ceiling of the Salon d'Apollon at the Louvre (1848–50), the Salon de la Paix at the Hôtel de Ville (1849–53; burned in 1871) and two large murals in the Chapelle des Anges, St. Sulpice (1857–61). He also painted many canvases on the largest scale, among the most famous being the "Entry of the Crusaders into Constantinople," painted for Versailles (1840, Louvre), and the "Justice of Trajan" (1840, Rouen). Among his later works are many superb animal and hunt scenes ("Lion Hunt," 1855, Bordeaux; "Fighting Horses," 1860, Louvre) and a group of marine subjects in which Delacroix's colour notation can be seen at its most advanced. His *Journals* are probably the most penetrating of artists' notebooks since those of Leonardo da Vinci. Delacroix died in Paris on Aug. 13, 1863.

DE LA GARDIE, JACOB PONTUSSON, COUNT OF LÄCKÖ (1583–1652), Swedish general and statesman, was born in Revel on June 20, 1583. Having served under Maurice of Orange (1606–08), he was mainly responsible for introducing Dutch military methods to the Swedes. He commanded the Swedish forces in Russia from 1608 to 1613. sustaining the disastrous defeat of Klushino (Kluszyn) in 1610; bore the brunt of the negotiations concerning the Swedish candidature for the Russian throne; and was the chief negotiator. of the peace of Stolbovo with Russia (1617). He took part in the campaigns in Livonia after 1621 and commanded in chief there from 1626 to 1628, but showed so little enterprise that he was recalled. Long an advocate of peace, he was one of the Swedish commissioners at the truce of Stuhmsdorf with Poland (1635). A member of the council from 1613, he was appointed to the office of marshal in 1620 and so became, in 1632, one of the five regents for Queen Christina during her minority. In 1636 the laxity in the marshal's office was severely criticized; but De La Gardie was an excellent businessman, who made handsome profits from leasing crown revenues and lending money to the king. His defeatist attitude to the war and his French sympathies did not commend him to the chancellor Axel Oxenstierna (*q.v.*) after 1632, but on the whole he supported Oxenstierna during the regency, at all events after their reconciliation in 1636. In 1618 he had married Ebba Brahe, after Gustavus Adolphus had been constrained by his mother not to do so. He died in Stockholm on Aug. 12, 1652.

See E. Grill, *Jacob de la Gardie . . . , 1608-1636* (1949). (MI. R.)

DE LA GARDIE, MAGNUS GABRIEL, COUNT (1622–1686), Swedish statesman, head of Charles XI's administration from 1660 to 1680, nas born at Revel on Oct. 15, 1622. After studying abroad he rose rapidly in the government. He became a councilor of state in 1647, a general in 1648 and treasurer in 1652. After being high in Queen Christina's favour, he fell into disgrace in 1653 and had to leave the court. During the reign of Charles X Gustavus he campaigned nithout success in the Baltic provinces. Politically, he came to the fore after Oct. 1660, when he was appointed grand chancellor and became head of the council of regency for Charles XI. Despite strong opposition he carried through the alliance nith France of 1672 His wavering financial policies had grave consequences. In 1647 he had married Maria Euphrosyne, a sister of Charles X Gustavus. and when Charles came of age in 1672 the chancellor became his foremost minister.

The outbreak of war with Denmark and Brandenburg in 1675 signified the failure of his foreign policy; and military preparations brought to light the financial disorder. De La Gardie was replaced as chief minister by Johan Gyllenstierna. After the war, in 1680, he was appointed to the sinecure office of *riksdrots*. At the same time, an inquiry into the regency's administration led to his being heavily fined. Formerly one of the country's richest men, he died quite poor. Though skilful in foreign affairs, De La Gardie was a mediocre leader, lacking in perseverance and somewhat irresponsible. As a patron of the arts and as chancellor of Uppsala university he made valuable contributions in the cultural sphere, being remembered for his gift to the university library at Uppsala of the *Codex Argenteus,* an early 6th-century version of the Gothic Gospels of Ulfilas. He died at Venngarn on April 26, 1686.

See R. Fåhraeus, *Magnus Gabriel de la Gardie (1936).* (N. G. R.)

DELAGE, YVES (1854–1920), French zoologist and biologist who had a profound effect on the development of zoology in France, was born at Avignon, on May 13, 1854. Having graduated in medicine, he took up the study of zoology under F. H. de Lacaze-Duthiers in 1881. He became professor of zoology at Caen in 1883 and director of the marine laboratory at Luc-sur-Mer in 1884. In 1886 he was made professor of comparative anatomy at the Faculté des Sciences, Paris. and in 1901 was elected to the Académie des Sciences. in that year also becoming director of the marine laboratory at Roscoff, Finistere, on the death of Lacaze-Duthiers. His earlier work included *L'Evolution de la sacculine* (1884), *L'Embryologie et la Classification des éponges* (1889), *L'Anatomie des cynthiadées* (1889) and *Les Baleinoptères.* In collaboration with his colleague E. Hérouard he compiled the *Traité de zoologie concrète* (1896–1903), of which five volumes were published. Later, Delage turned to general biological problems and wrote *La Structure du protoplasma, et les théories sur l'hérédité et les grands problèmes de la biologie générale* (1895). He also founded *L'Année biologique.* Even after becoming blind in 1904 he continued his biological studies. He made fundamental researches on artificial parthenogenesis summarized in *La Parthénogénèse naturelle et expérimentale* (1913) written with his pupil Marie Goldsmith. and also produced *Le Rêve, étude psychologique, philosophique et littéraire* (1919). He died at Sceaux on Oct. 8, 1920. (ED. HE.)

DELAGOA BAY is situated on the southeast coast of Africa at about 26° S., near the border of Portuguese East Africa (Mozambique) and the Republic of South Africa. The name may have originated from its use as a port of call on the return voyage from Goa, but more probably it derives from Baia da Lagoa meaning the "bay of the lagoon." It is known officially as the Baia de Lourenço Marques.

The bay is 19 mi. long and 16 mi. wide, its southern extremity consisting of the Inhaca peninsula and Inhaca Island, the latter being developed as a tourist resort. To the north of the island, shoals separate the outer bay from the Indian ocean. The inner bay. 7 mi. long and 1 mi. wide, is the site of the town and harbour of Lourenço Marques (*q.v.*), the capital of Mozambique and one of the most important ports on the east coast of Africa, accessible to large ships at all times of the year. The harbour has a depth of from 3 to 13 fathoms at low spring tide and is protected from the southeast gales. The Matola, Tembe and Umbeluzi rivers meet in the estuary called by the Portuguese the Espirito Santo, but generally known as the English river, which flows into the inner bay, while the larger Maputo and Komati rivers discharge into the outer bay.

Delagoa bay was discovered in 1502 by António do Campo, who commanded one of Vasco da Gama's ships, and was first explored in 1544 by Lourenço Marques. a Portuguese trader. In the same year a fortress was built near Catembe by the Portuguese and the bay was then visited periodically by vessels trading in slaves and ivory. The Dutch East India company held the bay from 1721 to 1730, but the attempt was disastrous and the settlement abandoned. Continued occupation of the bay by any European power was rendered extremely difficult by its unhealthy nature (fever was prevalent as a result of the low altitude and swampy nature of the surrounding countryside), attacks by pirates and local tribes, and the lack of an accessible hinterland. In 1771 an Austrian trading company tried to establish itself on the bay, but was expelled by the Portuguese, who in 1787 built a fortress on the left bank of the Espirito Santo from which the town of Lourenço Marques developed

In 1823 and 1824 rival treaties were drawn up by the British and Portuguese with native chiefs living round the bay. During the 1830s Portuguese forts in Mozambique were destroyed by the Shangaans, but they were then slowly reoccupied by the Portuguese. In 1838 the *voortrekker* leader Louis Trichardt and some of his followers died there. Another attempt mas made by the British to control the bay in 1861, the British flag being hoisted on Inhaca Island. It was the discovery of diamonds in 1867, and later of gold, culminating in the opening up of the Witwatersrand after 1886, that drew attention to the importance of the bay, for it was the nearest avenue of approach to the mineral fields on the high plateau of South Africa.

Possession of the bay nas therefore disputed by the Boers, British and Portuguese. However, in 1869 the Transvaal republic recognized Portuguese sovereignty, and in 1872 Great Britain and Portugal agreed to submit the problem of ownership to the arbitration of the French president, who in 1875 gave the decision in favour of Portugal. In that year an attempt by Pres. T. F. Burgers to build a railway from Delagoa bay to the Transvaal failed, and the railway only reached the Kitwatersrand in 1894. The Portuguese seized this railway in 1889, but in 1900 Portugal was forced to pay compensation to shareholders in the railway company.

For an account of the Delagoa hay arbitration proceedings *see* Sir E. Hertslet, *The Map of Africa by Treaty* (1909). (N. C. P.)

DELAINE (French for "of wool") originally meant a high quality women's wear dress goods and is still applied to a staple all-wool fabric made in plain weave and of compact structure. Fabrics and garments made from it are rather expensive. A better-known modern usage of the word is for a fine combing wool made into high-grade woolen and worsted fabrics. Delaine sheep, a Merino type, are raised in the United States, Australia, New Zealand, Saxony, Silesia and to a lesser extent in France. (G. E. L.)

DE LA MARE, WALTER (JOHN) (1873–1956), British poet and novelist with an unusual power to evoke the magic poetic moments in life. was born at Charlton. Kent. April 25, 1873. He was educated at St. Paul's cathedral choir school. and in 1890 went to work in the London office of the Anglo-American Oil company. From 1902, however, when his *Songs of Childhood* appeared under the pseudonym "Walter Ramal," he devoted himself increasingly to writing; his first novel, *Henry Brocken,* appeared in 1904, *Poems* in 1906. After 1908, on the advice of Henry (later Sir Henry) Newbolt, who had published his poems in the *Monthly Review,* he received an annual grant from the privy purse. and gave up office work. except for a short time as a civil servant during World War I. Outwardly the rest of his life was uneventful; his adventures were all of the spirit. His books continued to appear: poems and short stories for adults and children; novels, of which *Memoirs of a Midget* (1921) reached a height of poetic fantasy; a fairy play, *Crossings* (1921); essays, literary studies and anthologies (*Come Hither* [1923] is one of the best and most original selections in the language). He was made a companion of honour in 1948, received the Order of Merit in 1953, and died at Twickenham, Middlesex, June 22. 1956.

De la Mare's work falls into none of the categories of modern criticism. It is intelligent and subtle, but not "intellectual." All its varied phases are informed by the feeling that every experience is an object of wonder, existing in isolation. It was this immediacy of perception, which has been likened to that of Henry Vaughan, Thomas Traherne and William Blake, combined with his skill in catching the feel of the nursery rhyme, which gave his work for children its freshness and charm. A conscious technician, he broke no new ground as a stylist, but he used familiar poetic forms with a simple-seeming sureness of touch.

The deliberate beauty of De la Mare's work should not. however. make the reader forget its darker side. His stories, especially. are often macabre. and his dream world does not neglect

the nightmare. One poem, "The Feckless Dinner-Party," is an example of horror breaking into a theme treated with biting satire. and the preface to the anthology *Love* (1943) shows that his otherworldliness meets modern psychology at many points.

Collected Poems appeared in 1920, 193j and 1944; *Collected Rhynces and Verses* in 1944 and *Collected Stories for Children* in 1947. Later poetry included *The Burning Glass* (1945); *The Traveller* (1 946); *Inward Companion* (1950); and *O Lovely England* (1953). (S. H. SR.)

DELAMBRE, JEAN BAPTISTE JOSEPH (1 749–1822), French astronomer, prepared tables of the motion of Uranus. He was born at Amiens on Sept. 19. 1749. In 1771 he became tutor to the son of M. d'Assy, receiver-general of finances. He attended the lectures of J. J. Lalande. who induced d'Assy in 1788 to install an observatory for his benefit at his own residence. There Delambre observed and computed almost uninterruptedly. and in 1792 published *Tables du Soleil, de Jupiter, de Saturne, d'Uranus et des satellites de Jupiter* at Paris. He was admitted to the Institut de France on its organization in 1795. and became. in 1803, perpetual secretary to its mathematical section. He served from 1795 on the bureau of longitudes. From 1792 to 1799 he was occupied with the measurement of the arc of the meridian extending from Dunkirk to Barcelona. and published a detailed account of the operations in *Base du système métrique* (3 vol.. 1806, 1807, 1810). He succeeded Lalande in 1807 as professor of astronomy at the Collège de France, and was treasurer to the imperial university from 1808 until its suppression in 1815. Delambre died in Paris on Aug. 19, 1822. He wrote histories of ancient. medieval and modern astronomy. His *Tables écliptiques des satellites de Jupiter* were republished by the bureau of longitudes in 1817.

DELAMERE (DE LA MER), **GEORGE BOOTH,** 1ST BARON (1622–1684), English royalist who gave his name to an abortive revolt against the Commonwealth government in 1659, was born in Aug. 1622. He was returned for Cheshire to the Long parliament in 1645 and to the protectorate parliaments of 1654 and 1656. In 1655 he was appointed military commissioner for Cheshire and treasurer at war. He was one of the excluded members who tried and failed to regain their seats after the fall of Richard Cromwell in 1659. This sharpened his desire for a free parliament and brought him closer to those Presbyterian royalists who were soon to unite with the Cavaliers in effecting the Restoration. A rising was arranged for Aug. 5 in several districts, and Booth took charge of operations in Cheshire, Lancashire and north Wales. A declaration was issued, calling for a free parliament and a change of government, but it made no reference to restoring the monarchy. Booth seized Chester on Aug. 19, but the plot failed elsewhere and Gen. John Lambert defeated Booth's men at Nantwich bridge. Booth himself was captured at Newport Pagnell on Aug. 23 and was imprisoned in the Tower of London. He was soon liberated, sat in the parliament of 1659-60 and was one of the 12 members deputed to carry the message of the commons to Charles II at The Hague. In July 1660 he received a grant of £10,000 and in 1661 he was created Baron Delamere. He died in Cheshire on Aug. 8. 1684.

Delamere's second son and successor, HENRY (1652–94), was created earl of Warrington in 1690. He was implicated in the Rye House plot (1683) and received many honours from William III. (H. G. Ro.)

DELAND, MARGARET (MARGARETTA WADE DELAND, NÉE CAMPBELL) (1857–1945), U.S. writer noted in her time for her fiction based on small-town life, was horn in Allegheny. Pa.. Feb. 23, 1857. She studied at private schools and at Cooper union in New York, and for a time taught drawing. In 1886 she published *The* Old *Garden,* a collection of poems. Her first novel. *John Ward, Preacher* (1888), which dealt with religious and social questions after the manner of Mrs. Humphry Ward, attracted considerable attention. She achieved her greatest popularity with a series of nostalgic village chronicles. *Old Chester Tales* (1899), *Dr. Lavendar's People* (1903), *Around Old Chester* (1915) and *New Friends in Old Chester* (1924); but after the appearance of the more realistic small-town portrayals of Sherwood Anderson and Sinclair Lewis her fame declined. Her "problem" novels. such as *The Awakening of Helena Richie* (1906), *The Iron Woman* (1911), *The Rising Tide* (1916) and *The Vehement Flame* (1922), are perhaps her rnost interesting works. An autobiography. If *This Be I (As I Suppose It Be),* appeared in 1935. She died on Jan. 13, 1945.

DELANE, JOHN THADEUS (1817–1879), editor of the *Times* from 1841 to 1877 who gave the paper a political influence greater than that of any other, and a circulation ten times that of its nearest rival. Born in London on Oct. 11, 1817 and educated at King's college, London. and Magdalen college. Oxford. at the age of 23 he was appointed editor of the *Times* of which his father mas treasurer, although he was not given full editorial control until 1847. Unlike his predecessor. Thomas Barnes (*q.v.*), Delane was not a writing editor but. in a sense. the first of the modern managing editors. He n-rote few leading articles but supervised almost every word printed. claiming that "not a column has appeared that has not some of my handwriting on the margin." He had an extraordinary capacity for acquiring the confidence of ministers and obtaining private information: so much so that Lord John Russell complained to Queen Victoria that: "The degree of information possessed b>- the *Times* with regard to the most secret affairs of State is mortifying. humiliating and incomprehensible." Backed by John Walter III, the proprietor. and Mowbray Morris, the manager. he greatly extended the exclusive news services of the *Times* from its correspondents abroad. and in the Crimean War the dispatches of his war correspondent left all official sources far behind. His journalistic philosophy. and the source of his influence. was expressed in two famous leading articles written by Henry Reeve under his direction in Feb. 1852 in reply to charges of irresponsibility by Lord Derby. In these. he denied that the press should be bound hy the same limitations and responsibilities as governments. and stated as its first duty "to obtain the earliest and most correct intelligence of the events of the time and instantly, by disclosing them, to make them the common property of the nation." He died at Ascot Heath. Berkshire. on Nov. 22. 1879.

See the biographies by Arthur Irwin Dasent, 2 vol. (1908), and by Sir Edward Cook (1915); also *The History* of *The Times,* vol. 2: *The Tradition Established, 1841–1884* (1939). (F. Ws.)

DELANO, JANE ARMINDA (1862–1919), co-ordinator of professional nursing services in the U.S. and abroad, was born near Montour Falls. N.Y., March 12, 1862. After graduating from Bellevue hospital school of nursing in 1886 she occupied a series of responsible executive positions. She raised the standards of her profession, broadened its sphere of daily usefulness and organized it for effective emergency service. As superintendent of nurses in a hospital in Jacksonville, Fla., in 1888 she limited the spread of yellow fever by establishing use of mosquito netting. She then dealt with a typhoid fever epidemic in a Bisbee, Ariz., copper-mining camp. As instructor and assistant superintendent of nurses in the training school for nurses at the hospital of the University of Pennsylvania (1890-95), her many improvements, firm discipline and human sympathy won official commendation and infused students with enthusiasm and energy. She served with distinction as superintendent of the training school of Bellevue hospital (1902–06), president of the board of directors of the *American Journal of Nursing* (1908-1 1), president of American Nurses' association (1909–12) and superintendent of the U.S. army nurse corps (1909–12). As chairman of the national committee on Red Cross nursing service (1910-19) she devoted her attention to public health, disaster services, visiting nurses, volunteer nurses' aides and home-nursing manuals.

Miss Delano died at Savenay, France, April 15, 1919. and was interred in Arlington National cemetery. She characteristically allotted her estate chiefly to the Red Cross, but also established funds for relief of sick nurses at the Pennsylvania and Bellevue hospitals.

DELANY, MARY (née GRANVILLE) (1700–1788), Englishwoman who left an interesting picture of polite and literary society in her *Autobiography and Correspondence* (6 vol., 1861–62), was born at Coulston, Wiltshire, on May 14, 1700, a niece of the 1st Lord Lansdowne. In 1718 she was forced into marriage with Alexander Pendarves, a rich and elderly Cornish landowner, who died in 1725. During a visit to Ireland she met Dean Swift and his friend Patrick Delany, whose second wife she became in 1743. After his death in 1768 she spent every summer with her friend the dowager duchess of Portland, and when the latter died George III and Queen Charlotte, whose affection for their "dearest Mrs. Delany" seems to have been deep and sincere, gave her a small house at Windsor and a pension of £300 a year. At this time Mrs. Delany was a charming old lady with a reputation for making the ingenious "paper mosaiks" which have been preserved in the British museum, London. She had known many literary figures of her day, had corresponded with Swift and Edward Young, and was responsible for introducing Fanny Burney to the king and queen and obtaining for her a post in the royal household. Edmund Burke calls her "a real fine lady," "the model of an accomplished woman of former times." She died in London on April 15, 1788.

BIBLIOGRAPHY.—R. B Johnson, *Mrs. Delany at Court and Among the Wits* (1925), arranged from the *Autobiography and Correspondence;* Simon Dewes, Mrs. *Delany* (1940); C. E. Vulliamy, *Aspasia* (1935).

DE LA REY, JACOBUS HERCULES (1847–1914), Boer general, one of the most talented and popular of the Boer leaders in the South African War, was born near Winburg in the Orange Free State. but grew up in the Transvasl. He had little formal education but gained military experience in wars against Bantu tribes. In 1893, representing Lichtenburg. he entered the *volksraad* (parliament) of the South African republic. where he opposed Pres. Paul Kruger's *Uitlander* policy. On the outbreak of the South African War in 1899, De la Rey became a general. and fought in the western campaign. On July 1, 1900, he assumed full charge of operations in the western Transvaal. He was conspicuously successful in the guerrilla stage of the war, when he demonstrated that among the Boer generals only Louis Botha was his military superior. On March 7, 1902. at Tweebosch, he captured Lord Methuen. The British general was wounded in the action and De la Rey released him. being unable to provide proper medical assistance. Such humanity marked his conduct throughout the war. After the conclusion of peace in 1902, he visited Europe with other Boer generals to raise funds for reconstruction.

In the postwar years De la Rey supported Botha, and in May 1904 was elected to the head committee of Botha's party. Het Volk ("The People"). In the period of responsible government (1907–10) he represented Ventersdorp in the Transvaal legislative assembly. In 1908 De la Rey was chosen by Botha as a delegate to the national convention, in the hope that his presence would give the Boers confidence in its recommendations for union. From 1910 to 1914 he sat in the Union's first senate. On the outbreak of World War I, he laid plans for a rising in the western Transvaal, believing that a God-given opportunity to restore republican independence was at hand. Following discussions with Botha and J. C. Smuts (Aug. 13), he wavered, but after parliament had confirmed the decision to attack German South-West Africa, he determined to rebel. On Sept. 15, 1914, while traveling to Potchefstroom to start the rising, he was shot dead in Johannesburg by a police patrol. The rising did not take place; but the ill-feeling and suspicion aroused by the circumstances of his death helped foment the rebellion that broke out in October. (N. G. GA.)

DE LA RIVE, AUGUSTE ARTHUR: **see LA RIVE,** AUGUSTE ARTHUR DE.

DELAROCHE, HIPPOLYTE, commonly known as PAUL, (1797–1856), a popular French painter of painstakingly realistic historical subjects, was born in Paris on July 17, 1797. His father mas an art expert; his uncle was curator of the Cabinet des Estampes; and his brother was the painter Jules Hippolyte Delaroche. He studied under A. Gros and exhibited in the Salon of 1822 where his work was praised by J. Géricault. In 1832 he became a professor at the Ecole des Beaux-.Arts and was made a member of the Institute. He visited Italy in 1834, 1838 and 1843. and there married the daughter of Horace Vernet who mas in Italy as director of the French Academy. Delaroche's subjects, illustrating certain views of history dear to partisans, yet romantic in their general interest, were painted with a firm; solid, smooth surface. which gave an appearance of the highest finish. He held a course midway between the classicists and the romanticists. His long series of historical pictures had a great popular success and were made familiar in thousands of homes by engravings of them. After 1837 Delaroche turned more toward portraits and religious subjects. Often in developing his compositions he first made wax models of them.

In 1837 Delaroche received the commission for the great mural, 27 m. long, in the hemicycle of the lecture theatre of the Ecole des Beaux-Arts. This represents a history of art with the great artists of the modern ages assembled in groups on either hand of a central elevation of white marble steps, on the topmost of which are three thrones filled by the architects and sculptors of the Parthenon. The genii or muses, who symbolize or reign over the arts, lean against the balustrade of the steps. It was finished in 1841 and considerably injured by a fire in 1855. Delaroche immediately set himself to remedy the injury but he died on Nov. 4, 1856, before he had well begun.

DE LA ROCHE, MAZO (1879–1961), Canadian author whose series of novels about the Whiteoak family of Jalna made her one of the most popular "family saga" novelists of the period 1925–50. Born at Newmarket, Ont., on Jan. 15, 1879, the only child of a family of French. Irish and English descent. she studied art, but her talent for fiction predominated. In 1927 her fourth book. *Jalna*, won a $10.000 prize from the *Atlantic Monthly*. *Jalna* ended with the 100th birthday of Grandmother Adeline Whiteoak. a magnificently lusty character later celebrated in a long-run play. *Whiteoaks*, and a film (1935) starring Ethel Barrymore. From Gran's "century party" in 1924. the saga fanned out to include the family's tempestuous history from before the American Civil War to the 1950s.

Although the locale of *Jalna* is Ontario, the story was more popular in the United States, Britain and Europe than in Canada. Many Canadian readers. hoping for a faithful account of life in Canada, were disappointed, for the Whiteoaks really dwell in the timeless realm of romance. Gran Whiteoak's imperious need for human affection ("Somebody kiss me—quick!") is the keynote of the family's experience. Though the author feels life intensely, she cannot, finally, explain it; and because her situations often toy implausibly with the problems of the sexes, her saga is much less penetrating and serious than Galsworthy's *Forsyte Saga*, though frequently much livelier. *Jalna* (1927) and *Whiteoaks* of *Jalna* (1929) are noteworthy. Her other works include juveniles, travel, drama and fiction. Miss de la Roche died at Toronto, Ont., July 12, 1961.

See Desmond Pacey, *Creative Writing in Canada* (1952); Julian Park (ed.), *The Culture of Contemporary Canada* (1957).

(H. A. McP.)

DE LA RUE, WARREN (1815–1889), British astronomer and pioneer in celestial photography, was born in Guernsey. Channel Islands, on Jan. 18, 1815. He was educated at the Collbge Sainte-Barbe in Paris and entered the printing business. He invented. with Edwin Hill, the first envelope-making machine. As an amateur astronomer, he pioneered in the application of the collodion, or wet-plate, process to celestial photography and invented the photoheliograph for taking daily photographs of the sun's surface. His photographs taken at the solar eclipse of July 16. 1860. proved conclusively that the prominences belonged to the sun and not to the moon. With the collaboration of Hugo Müller he carried on many chemical and electrical experiments in his private laboratory, including some researches on Rangoon tar, which led to a profitable patent, and on electrical discharge through gases. which provided a valuable body of data for later work on the aurora borealis. De La Rue was elected president of the Royal Astronomical society and the Chemical society and received the gold medal of the former in 1862. He also received a

royal medal from the Royal society in 1864 and the Lalande prize of the French Academy of Sciences in 1865. He died in London on April 19, 1889. (O. J. E.)

DELATOR, in ancient Roman law meant "prosecutor" or "informer." Rome had no adequate police force and no public prosecutor; informers were therefore indispensable (Tacitus, Annals, iv, 30) both in criminal law and in regard to fiscal claims. They naturally required incentives; hence slaves were rewarded with freedom, foreigners with citizenship, citizens with honours, while under the empire pecuniary rewards were most common. These made delation a lucrative profession, and the term delator acquired an ill repute (as did the Greek sycoplzantes, "informer"). The law aimed at checking abuses; thus *calumnia* (vexatious accusation in bad faith) was penalized in early days by *infamia* (loss of many civic rights), branding and perhaps a fine, and later even by flogging, banishment or whatever punishment might have been due to the original defendant, if he had been convicted. The emperor Constantine I seems even to have ordered the punishment of any delator who did not prove his charge. But delation was prevalent, especially under emperors who feared conspiracy or who needed to replenish the treasury by confiscating condemned men's goods. Under the successors of such emperors delators were often punished on the assumption that their victims had been innocent (*e.g.* in A.D. 69, 79, 96–100), but the great political figures who had been prominent as accusers usually escaped even then.

See T. Mommsen, Droit *pénal romain,* vol. ii, 179–203 (1907); A. Berger, *Encyclopaedic* Dictionary of Roman ***Law,*** p. 429, with bibliography (1953). (P. A. BR.)

DELATOUR: see LA TOUR, GEORGES DE.

DELAUNAY, (JULES) ÉLIE (1828–1891), French painter, u-as born at Nantes on June 12, 1828. He studied under H. Flandrin and L. Lamothe at the École des Beaux-Arts, which he entered in 1848. In 1853 he made his debut at the Paris Salon. He worked in the classicist manner of J. A. D. Ingres until, after winning the Prix de Rome, he went to Italy in 1856, and abandoned the ideal of Raphaelesque perfection for the sincerity and severity of the quattrocentists. He was a pure and firm draftsman. After his return from Rome he was entrusted with many important commissions for decorative paintings, including the frescoes in the church of St. Nicholas at Nantes; the three panels of "Apollo," "Orpheus" and "Amphion" at the Paris opera house (together with P. Baudry); 12 paintings for the great hall of the council of state in the Palais Royal; and "Scenes From the Life of Ste. Geneviève," designed for the Panthéon but unfinished at his death. In the last decade of his life he achieved great popularity as a portrait painter. He died in Paris on Sept. 5, 1891.

DELAUNAY, ROBERT (1885–1941), French Cubist painter. was born in Paris in 1883'. At an early age Delaunay came under the spell of the Postimpressionist use of colour, especially by Seurat and Cézanne. By 1910 he made his own contribution to Cubism in a series entitled the "Eiffel Tower," which combined fragmented Cubist form with light and vibrant colour. His new and individual use of colour prisms was less cerebral than original Cubism and had a more immediate appeal to the senses. This style. called Orphism. had immediate effect on the work of the German Blue Riders. especially Franz Marc, Paul Klee and Lyonel Feininger. Delaunay, in turn, perhaps under Wassily Kandinsky's influence, found his way toward completely nonobjective painting when he did his famous colour disks in 1912. He also inspired Morgan Russell and S. Macdonald-Wright toward a related style—Synchromism—which was the first American movement in abstract painting. Between the wars Delaunay worked on large and most impressive abstract mural decorations in Paris. He died at Montpellier on Oct. 25, 1941. See also PAINTING: Modern Painting (Late 19th and 20th *Centuries*): Orphism, *Synchromism* and *Vorticism.* (P. H. S.)

DELAVIGNE, JEAN FRANÇOIS CASIMIR (1793–1843), French poet and dramatist whose patriotic compositions made him "national poet" in the years following Waterloo. Born at Le Havre on April 4, 1793, he was a brilliant scholar at the Lycée Napoleon in Paris. The patriotism shown in his early work, which won the emperor's approval. responded to the catastrophe of 1815 with Les *Messéniennes* (1816–22), stirring poems which brought him great popularity. Two plays, Les *Vêpres siciliennes* (1819) and *L'École* des *vieillards* (1823) were also successful and in 1825 Delavigne was elected to the Académie. A further crisis in French history—the revolution of 1830—stimulated him to write "La Parisienne," which, set to music by D. Auber, rivaled the "Marseillaise" in popularity. Under the July monarchy he produced a series of historical dramas—Louis XI (1832), Les *Enfants d'Edouard* (1833), Don Juan *d'Autriche* (1835), Une Famille au temps de Luther (1836) and La Fille du Cid (1839)—but they possess no great literary value. He died at Lyons, Dec. 11, 1843.

DELAWARE, known as the "First skate," because it was the first state to ratify the U.S. constitution, Dec. 7, 1787, is one of the original 13 states of the United States. It is also known as the "Diamond state" because of its worth in relation to its size. It is situated in the northeastern part of the peninsula formed by Chesapeake bay and the estuary of the Delaware river. The state has a length (north-south) of 95 mi. and a width (east-west) of 40 mi.; its total area is 2,057 sq.mi., of which 79 sq.mi. are inland water surface. Excepting Rhode Island, it is the smallest state in the union.

Delaware is bounded on the north and northwest by Pennsylvania, on the east by the Delaware river and Delaware bay, which separate it from New Jersey, and by the Atlantic ocean; and on the south and west by Maryland. The capital city is Dover (*q.v.*). The state flower is the peach blossom; the state bird is the Blue hen chicken; and the state tree is the American holly.

PHYSICAL GEOGRAPHY

Physical Features.— Delaware lies on the Atlantic coastal plain and is for the most part level and low, its average elevation being about 60 ft. above sea level. Topographically, the state is two unequal areas divided by a line following the general course of White Clay and Christina creeks. Northward of this line the country is rolling, with bold hills, moderately deep valleys and rapid streams. Southward, the country is level or gently undulating. The principal harbours are those of Wilmington, New Castle and Lewes. In Kent county there are more than 60,000 ac. of tidal marshland, some of which has been reclaimed by means of dikes; Cypress swamp, in the extreme south; has an area of 50.000 ac. In the north the prevailing soils are clays, sometimes mixed with loam. Next, to the southward, come the Cretaceous formations and clays suitable for terra-cotta manufacture. The soils of this region are mainly loams. The remainder of the state has a sandy soil resting on Tertiary white and blue clays.

Minerals of economic value are found only in the north part of the state. Kaolin, mined chiefly in the vicinity of Hockessin, New Castle county; granite, used for road making and rough construction work, found near Wilmington; and brick and tile clays are the products of greatest importance.

Climate.— The climate of Delaware is temperate and humid, with hot summers and mild winters. The mean annual temperature ranges from 55° F. in New Castle county to 56° in Kent and Sussex. The highest temperature on record is 110° and the lowest −11°, both at Millsboro. Temperatures of 90° or higher occur on 25 to 30 days per year at inland points but only 15 to 20 days in coastal areas—hence the popularity of the coast as a summer resort and vacation area. where on hot summer days the thermometer may register 10° to 15° lower than at points inland. Humidity averages from 60%-65% in February–March to 75%–80% in August–October. Annual rainfall varies from 44 in. in the north to 4*i* in the south. Precipitation is variable in the summer, and irrigation is increasingly employed downstate to safeguard crops from drought. The average length of the growing (frost-free) season is 175 to 195 days.

Vegetation and Animal **Life.**—When the white man came to Delaware he found the land heavily forested, with hardwoods predominating except in the south, where there was a plentiful stand of white cedar and bald cypress (*Taxodium distichum*) in the inland swamps and pine on higher ground. Though forests have been cut over and swamps drained or "mined" for timber, 42% of Sussex county is still (or has been returned to) forest, and half that

much in the other counties. Lumbering, though riot a large industry in modern times, has continued since colonial days. Holly is sufficiently plentiful to furnish employmenf at Christmas time for wreath-making. Bears, wolves and beaver, once plentiful! have been driven out; deer have returned to the state only in recent years. Foxes, raccoons and opossums are found throughout the state. Muskrats are trapped in the coastal marshes in considerable numbers. Delaware is in the path of the annual bird migrations and there is a rich bird fauna. There are probably as many species of fish as in the past.

Historic Sites and Parks. — Preservation of historic buildings and sites became an increasing state-wide interest during and after the 1930s. In 1931 the tercentenary of' the first white settlement was celebrated at Lewes, the Dutch Swanendael; in 1936 the tercentenary of the first permanent settle ent, Swedes and Finns at Wilmington; in 1951 the tercentenary of the founding of New Castle by Dutch settlers and their establishment of the first elements of self-government on Delaware soil. The colonial mansions of William Corbit at Odessa and John Dickinson (*q.v.*) near Dover have been restored and are open to the public. Many old houses in New Castle and Dover are opened annually on designated days. Henry Francis du Pont's collection of early American furniture and furnishings, housed in 100 period rooms at Winterthur, is a public museum. A new museum of early American industry, on the site of the original Du Pont powder mills on the Brandywine, was dedicated in 1957. The Delaware State museum at Dover was formally opened in 1950. Holy Trinity (Old Swedes) church in Wilmington, erected in 1698, is still in use

State parks include Ft. Delaware, on Pea Patch Island in the Delaware river, opened as a state park in 1954. During the American Civil War it was used as a place of confinement for Confederate prisoners. Ft. Christina, site of the first permanent settlement, in Wilmington, also has been made a state park. State parks with facilities for outdoor recreation include Brandywine Springs and Trapp Pond state parks and Indian River Inlet park in the Delaware dunes, which include miles of state-owned lands extending between the bays and the Atlantic ocean. State forests include Blackbird, Ellendale and Redden state forests and the Owens and Red Lion tracts. The state maintains a number of wildlife areas and the Bombay Hook federal waterfowl refuge is near Smyrna.

HISTORY

Exploration. — Before the coming of the white men, the present state of Delaware was inhabited by tribes of aborigines of the Leni-Lenape stock, later called Delaware Indians (*q.v.*). Henry Hudson discovered Delaware bay and river for the Dutch, in 1609. The following year, Capt. Samuel Argall of Virginia named the bay for Lord De la Warr, the governor of that colony. After the Dutch lost this, their "South river," the name Delaware survived.

The territory was more thoroughly explored in 1615–16 by Cornelis Hendricksen, whose reports did much to cause the incorporation of the Dutch West India company (*q.v.*) in 1621. In 1631, about the time the Puritans were establishing themselves in New England, the first settlement on Delaware soil was made by members of the Dutch company near the site of the present Lewes. The leaders. one of whom was Capt. David P. de Vries, wished "to plant a colony for the cultivation of grain and tobacco as well as to carry on the whale fishery in that region." The settlement, however, was soon completely destroyed by the Indians.

Dutch and Swedish Settlements. — When the Dutch West India company failed to meet the expectations of its founder, William Usselinx, he proposed plans for trade and colonizing to Gustavus Adolphus of Sweden. Swedish and Dutch interest resulted finally in a jointly financed company and an expedition to the Dutch South river, the Delaware, in charge of Peter Minuit, former Dutch governor of New Netherland. In 1638, hfinuit, who was an investor in the New Sweden company as well as expedition leader, established a settlement at what is now Wilmington, naming it Ft. Christina in honour of the child queen Christina, and naming the entire territory, bought by Minuit from the Minquas Indians and extending indefinitely westward from the Delaware river between Bombay hook and the mouth of the Schuylkill river, New Sweden. After the Swedish purchase of Dutch holdings in the New Sweden company, the next settlement was made by a group of Dutch, Swedes and Finns in 1641. In 1642 mature plans for colonization were adopted. A new company, officially known as the West India, American or New Sweden company, but also popularly known as the South company, was chartered, and a governor, Johan Printz (c. 1600–63), was sent out by the crown. He arrived early in 1613 and subsequently established settlements, including one on the island of Tinicum, at the site of Essington, Pa.; another at the mouth of Salem creek, N.J.; and another near the mouth of the Schuylkill river. Printz remained governor of New Sweden for a period of ten years; his mansion, fort and church were on Tinicum Island. Friction soon arose with New Netherland, although the Swedes and the Dutch, because of their common dislike of the English, and the common interests of Sweden and the Netherlands in the Thirty Years' War, had maintained a formal friendship. In 1651, Peter Stuyvesant, governor of New Netherland, and more aggressive than his predecessors, built Ft. Casimir, near what is now New Castle. In 1654 Printz's successor, Johan Claesson Rising, who had arrived from Sweden with a large number of colonists, expelled the Dutch from Ft. Casimir. In retaliation, Stuyvesant, in 1655, with seven vessels and several hundred men, recaptured the fort and also captured Ft. Christina (Wilmington). New Sweden thus passed into Dutch control and became a dependency of New Netherland. In 1656, however, the Dutch West India company sold the region including Ft. Casimir to the city of Amsterdam, which in the following year established a settlement called New Amstel at Ft. Casimir (New Castle). This settlement, badly administered, made little progress.

English Administration. — In 1663 the whole of the Delaware country came under the jurisdiction of the city of Amsterdam, but in the following year with New Netherland was seized by the English. For a brief interval, in 1673–74, the Dutch were again in control, but in the latter year, by the treaty of Westminster, the "three counties on the Delaware" again became part of the English possessions in America held by the duke of York, later James II. His formal grant from Charles II was not received until March 1683. In order that no other settlements should encroach upon his centre of government, New Castle, the northern boundary was determined by drawing an arc of a circle 12 mi. in radius with New Castle as the centre. This accounts for the curved boundary line between Delaware and Pennsylvania. However, in Aug. 1682, the duke of York conveyed the entire territory to William Penn by deeds of feoffment and leases for 10,000 years, a transfer later challenged by Maryland. But differences in national origin and religion, economic rivalry between New Castle and Pennsylvania towns, and petty political quarrels over representation and office holding, similar to those in the other American colonies, were so intense that Penn in 1691 appointed a special deputy governor for the lower counties.

Although reunited with the "province" of Pennsylvania in 1693, the so-called territories or lower counties secured a separate legislature in 1704 and a separate executive council in 1710; the governor of Pennsylvania, however, was the chief executive until 1776. A protracted dispute with Maryland was not settled until 1767, when the boundaries, surveyed by Charles Mason and Jeremiah Dixon, were adopted as a part of the territorial adjustment that included the Mason and Dixon line (*q.v.*). In the American Revolution Delaware furnished only two regiments to the Continental army, but they were among the best in the service. One of the companies of the first regiment carried a number of gamecocks said to have been the brood of a blue hen; hence the soldiers, and later the people of the state, have been popularly known as the "blue hen's chickens," though the state itself, as already mentioned, is popularly called the "Diamond state."

Statehood. — In 1776 a state government was organized, and the name Delaware state was first adopted. In the constitution of 1792 the title was changed to state of Delaware. One of the peculiarities of the government under the first constitution was that, in addition to the regular executive, legislative and judicial departments, there was a privy council without whose approval the gov-

ernor's power was little more than nominal. In 1786 Delaware was one of the five states whose delegates attended the Annapolis convention (*q.v.*), and it mas the first (Dec. 7, 1787) to ratify the federal constitution. The state was strongly Federalist for 30 years after the adoption of the federal constitution, and in several presidential elections stood almost alone in choosing Federalist electors. Sentiment in Federalist Delaware opposed going to war with Britain in 1812. James A. Bayard of Delaware led an unsuccessful fight in the senate to postpone action on Pres. James Madison's war message until the country was better prepared to fight a war.

The Civil **War** Period.— Delaware was a slave state. The closest it ever came to abolishing slavery of its own accord was in 1847, when a bill for gradual emancipation was lost in the legislature by one vote. In 1861 sentiment on the slavery issue divided the state along the same geographical lines as the country at large. Northern Delaware, dominated by the growing industrial city of Wilmington, and with much of its immigrant population coming from neighbouring free states and from abroad, was the centre of antislavery activity. Southern Delaware, rural and tied by family relationships to adjoining Maryland, favoured or at least condoned the "peculiar institution." Delaware was unique among the slave states in prohibiting the sale of its slaves outside the state (acts of 1787 and 1789). Negroes constituted about one-fifth of the population, but the proportion of slaves declined from 70% in 1790 to only 8% in 1860, two-thirds of whom were in Sussex, the southernmost and economically the most backward of the three counties. Though slavery was less rigorous in Delaware than in the deep south. the whites' attitude toward the Negro was typical of the slave states as a whole. He was considered an inferior being and could not vote: hold office or testify in court against whites (Revised Statutes. 1852). Intermarriage of Negroes and whites was prohibited by an act of 1829 which in the 1960s was still in force.

Delaware refused to join in the secession movement which followed the Republican victory in the national election of 1860 but sympathized with the southern states which chose that course. The general assembly endorsed the Crittenden compromise proposals of 1861 (see CRITTENDEN, JOHN JORDAN). They failed, and with the outbreak of hostilities saving the union became the paramount issue. Delaware rallied to the cause and. it is claimed, furnished more soldiers to the union armies in proportion to its population than any other state. The Delaware volunteers fought to preserve the union; not to free the slaves. On the other side, an uncounted number of men — probably several hundred — secretly left the state to join the Confederate forces. Smuggling of contraband goods (medical supplies, for example) to the enemy was a problem in the lower part of the state. Seaford remained a centre of this illicit traffic throughout the war. Early in the war President Lincoln sought to initiate his plan of compensated emancipation in Delaware. since it was the smallest of the slave states. The state was to enact a law for the gradual abolition of slavery (to be completed in ten years) on condition that congress would reimburse the dispossessed owners. In an informal poll of the legislature the plan failed by the narrow margin of one vote (Feb. 1862) and was abandoned.

In Delaware as elsewhere the Negroes' best friends were the Quakers. Outstanding among them was Thomas Garrett, a merchant of Wilmington, who, along with John Hunn, Harriet Tubman, and other underground railroad agents helped runaway slaves through Delaware on their way to free soil. Garrett was nearing the 3.000 mark when the dislocations of war rendered his further efforts unnecessary. No battles were fought on Delaware soil during the American Civil War, but throughout the four years of the struggle a kind of "cold war" subsisted between the supporters of the Lincoln administration and its Democratic critics, who had opposed coercion of the south from the outset and sought to restore peace at almost any price. New Castle, the northernmost of the three counties, supported the Republican administration in elections during the war years. It had slightly over one-half (46,000) of the state's 90,000 inhabitants but only one-third of the membership in each house of the legislature. and so was outvoted on Civil War policy by the combined strength of Democratic Kent and Sussex. In the presidential election of 1864 Delaware gave its electoral votes to George B. McClellan—one of the three states which he carried.

The Post-Civil **War** Period.— After the war the legislature remained under Democratic control for another quarter of a century. It rejected the 13th, 14th and 15th amendments to the constitution (these were not ratified by Delaware until 1901) and in 1873 proclaimed its "unceasing opposition" to any measure designed "to promote the equality of the negro with the white man in any of the relations of life." With the ratification of the 15th amendment h'egroes voted for the first time in the election of 1870, but enough white votes were switched to the Democratic side to keep the party' in control. Since only taxpayers could vote. the Democrats, by allowing local tax collectors to drop delinquent taxpayers from the rolls at their discretion, were able to keep considerable numbers of Republicans, white as well as Negroes: from the polls on election day. This practice was effective until the constitution of 1897 replaced the tax-paying requirement by a literacy test. Since then Negroes have voted freely and solidly Republican, until the era of Franklin D. Roosevelt. After mid-20th century the Democrats continued to get a share of the Negro vote.

In 1889 the Republicans for the first time since the Civil War secured a majority in the legislature; Anthony J. Higgins (Republican) was elected to the United States senate (senators at that time being chosen by state legislatures). Internal dissensions in the Republican party, arising out of a struggle between the so-called Regular Republicans and a personal "machine" built up by J. Edward Addicks, a Wilmington capitalist, prevented the election of a senator in 1895. The next election brought the Democrats into power, and the vacancy was filled by Richard R. Kenney. The struggle between the Republican factions continued, and with the expiration of Sen. George Gray's term in 1899 an election was again prevented. The state was wholly without representation in the United States senate from the expiration of Senator Kenney's term in 1901 until 1903, when a compromise was effected whereby two Republicans. one of each faction, were chosen. Again in 1905 the legislature adjourned without being able to fill a vacancy in the senate. The deadlock, however, was broken at a special session of the legislature called in 1906 when in June of that year Henry A. du Pont was elected senator.

Ebe W. Tunnell (1897–1901) was the last Democrat to be elected governor for 40 years. Under his Republican successors Delaware prospered through World War I, helped by the great profits accruing to the du Ponts and other Delaware explosives manufacturers who furnished munitions to the United States and its allies. The war made multimillionaires of millionaires in Delaware, and they spent their gains lavishly on projects beneficial to their state. Coleman du Pont built a state-long modern highway (1911–24) and presented it to the state. Alfred I. du Pont set up a private fund to pay old-age pensions and induced the legislature to establish an Old Age Welfare commission on a state-wide basis (1931), replacing the old county poor houses. Pierre S. du Pont spent millions on education (see below). The legislature withheld approval of the 19th (women's suffrage) amendment to the constitution but was prompt in ratifying the 18th (prohibition) amendment (March 1918) and equally prompt in helping to secure its repeal (1933). Pari-mutuel betting on horse races was authorized in 1935 and the first track, Delaware park, opened in 1937.

Richard C. McMullen (1937–41) was the first Democrat to be elected governor in the 20th century, aided by the New Deal, which made a dent in the wall of the solidiy Republican Negro vote. A Republican Walter W. Bacon. succeeded McMullen, and Bacon in turn was followed by another Democrat, Elbert Carvel. J. Caleb Boggs, a Republican, was elected governor in 1952 and re-elected in 1956 but had a Democratic legislature and was succeeded by Carvel in 1960. Underrepresentation in the legislature is a frequent cause of complaint in New Castle county, the centre of Delaware's business, industry and population. Downstate rural Delaware has always been able to outvote the northernmost county. Formerly the three counties were about equal in, population and had equal membership in the unicameral colonial assembly and the

bicameral legislature of the national period. With the increasing industrialization of the Wilmington area, New Castle county overtook the others by 1820 and has lengthened its lead ever since. The amended constitution of 1853 provided for proportional representation in the lower house but this constitution was rejected by the voters. By 1890 New Castle had 58% of the state's population — more than the other two counties combined. The constitution of 1897 gave additional representation to the city of Wilmington, so that membership in the legislature was thenceforth apportioned as follows:

County or rity	Senate	House of representatives
Wilmington	2	5
Rest of Sew Castle	5	10
Kent	5	10
Sussex	5	10
Total	17	35

Even at the time, this concession was only a gesture, since Wilmington's population was then over 60,000, compared with less than 40,000 for each of the county units listed in the table. The urban north, populous, wealthy and traditionally liberal, could then and can still be outvoted in the legislature by the rural and traditionally conservative south. This fact is important in understanding the legislature's attitude toward reform measures which have come before it.

GOVERNMENT

Constitutional Provisions. — The constitution by which Delaware is governed was adopted in 1897. Like the constitutions of 1776, 1792 and 1831, it was promulgated by a constitutional convention without submission to the people for ratification, and amendments may be adopted by a two-thirds vote of each house in two consecutive legislatures. The property qualification of state senators and the restriction of suffrage to those who had paid county or poll taxes were abolished; but suffrage was limited to adults who can read the state constitution in English and, unless physically disqualified, can write their names, and who have registered. In 1907 an amendment to the constitution was adopted which struck out from the instrument the clause requiring the payment of a registration fee of $1 by each elector. Important innovations in the constitution of 1897 were the office of lieutenant governor and the veto power of the governor, which extends to parts and clauses of appropriation bills; a bill may be passed over his veto by a three-fifths vote of each house of the legislature, and a bill becomes a law if not returned to the legislature within ten days after its reception by the governor, unless the session of the legislature shall have expired in the meantime.

The Executive Branch. — The governor's regular term in office is four years, and he is ineligible for a third term. All his appointments to offices where the salary is more than $500 must be confirmed by the senate; all pardons must be approved by a board of pardons. Elected officers in addition to the governor and lieutenant governor are: attorney general, state treasurer, auditor of accounts and insurance commissioner. Appointed by the governor are: the judges, the secretary of state, bank commissioner, liquor commissioner, adjutant general and other officers, boards and commissions.

The Legislative Branch. — Representation in the legislature is according to districts, there being ten districts in each county for the election of members in the lower house for two years; and five senatorial districts in each county for the election of members in the upper house for four years; in addition, the city of Wilmington, which is in New Castle county, has five representative districts and two senatorial districts. In Nov. 1906, the people of the state voted by legislative provision in favour of the provision of a system of advisory initiative and advisory referendum; and in March 1907, the general assembly passed an act providing initiative and referendum in the municipal affairs in the city of Wilmington.

The Judiciary. — In Delaware judges of the courts are appointed by the governor, in most cases for a term of 12 years and with the consent of the senate. Important changes have been made in the structure of the judiciary. It was not until 1951 that a separate supreme court, of three justices, was established by constitutional amendment. Prior to that time the supreme court consisted of judges "left over" from litigation in the lower courts. Also in 1951 the existing superior courts, which sit in each county, were given criminal as well as civil jurisdiction and the old courts of oyer and terminer were abolished. There is a resident judge for each county, who, with other state judges. holds sessions of the superior and orphans' courts in his county. Courts of common pleas were established for New Castle county in 1917, for Kent in 1931, and for Sussex in 1953. These courts meet frequently and relieve the superior courts of some of the burden of civil suits and of misdemeanors arising in the local courts of the justices of the peace. In the city of Wilmington these small cases come before the municipal court (established 1883). A family court was created for New Castle county in 1945, and another for Kent and Sussex, to handle cases of juvenile delinquency. Delaware is one of the few states which have a separate court of equity jurisdiction, the court of chancery, with a chancellor and a vice-chancellor.

Corporations. — These may be created under general law only, and no corporation may issue stock except for an equivalent value of money, labour or property. The well-interpreted "general corporation law of the state," kept broad in its provisions, combines liberal policy with stability and has proved so attractive that many out-of-state companies are incorporated in Delaware. Use of the word "trust" in the title of corporations is limited to those having trustee or banking business which are under the supervision of the bank commissioner and are required by law to make at least two reports each year to the commissioner.

Local Government. — The major units of local government are the counties, of which Delaware has only three: New Castle, Kent and Sussex. The colonial division of the counties into hundreds, derived from the English districts of King Alfred's day, persists, although these districts, formerly corresponding to the townships of Pennsylvania, have lost most of their governmental functions.

Penal System. — Delaware is well if not favourably known in penological circles for its retention of the whipping post. Until the time of the American Revolution the traditional European practice of using capital punishment for serious crimes and other corporal punishment for lesser offenses was universal in the English colonies. It was replaced in the new republic by a more humane penal objective: to reclaim the offender by confining him in a "penitentiary." The Delaware assembly could not be persuaded to incur the expense of a penitentiary in which to carry on the new penal program and, being without a penitentiary or a state prison, the state found it expedient to give up the gallows but keep the lash. Most of the former capital penalties were replaced by imprisonment with whipping, so that the lash was in constant use long after it had been discarded in other states. A break for the humanitarians came finally in 1883, when the courts were allowed to omit whipping in certain cases, but it was not until 1925 that this discretionary power was extended to cover all offenses. In the meantime the whipping of women had been abolished (1889) and the pillory outlawed (1905). In 1959 a bill to require whipping for robbery passed the general assembly but was vetoed by the governor. However, the same legislature voted in 1958 to abolish capital punishment entirely — a measure which received the governor's approval.

Delaware has never had a state prison, nor, until the second half of the 20th century, a unified system of penal administration. Prisoners served their terms in the county jails until the New Castle county workhouse was erected at Greenbank in 1901. That institution had some facilities for the rehabilitation of its inmates, and was available to the other counties, though not always used by them, for the reception of their long-term prisoners. Penal policy and administration remained with the individual counties until 1956, when a new state board of corrections, appointed by the governor, took over. Operating through a director which it appoints, the board has exclusive jurisdiction over all prisoners and the institutions to which they are committed.

supreme court in 1934 a long-standing boundary dispute between Delaware and New Jersey was settled. The court upheld Delaware's claim to territory as far as the low-water mark on the New Jersey shore within a 12-mi. radius of New Castle. Farther down the Delaware river, however, it decreed that the boundary should follow the centre of the ship channel and not, as Delaware had contended, the geographic middle of the river. New Jersey thus succeeded in establishing its right to certain oyster beds.

Finance and Taxation. — The fiscal system of the state is based upon operation from current revenues and serial bonds for permanent improvements. Modern budget procedure governs the biennial appropriations for the expenses of all regular agencies and departments. A state tax department provides an efficient system of tax collection. The chief sources of revenue are a graduated income tax, franchise, inheritance and estate taxes; business and occupation licences, permits and motor fuel taxes, taxes on cigarettes, alcoholic beverages, and race track admissions and betting, and federal grants. There is no state real-property tax and no sales tax. The influx of population in the mid-20th century with its consequent demand for more schools, more and better highways, and more social services, produced severe growing pains. Its bonded indebtedness, a nominal $4,000,000 to $5,000,000 during the years of World War II, leaped to $36,000,000 by 1950, and to $145,000,000 before 1960. In the 1950s Delaware's per capita income was the highest of all the states, and its "tax effort" (state and local taxes compared with income) was the lowest.

After 1950 the number of banks, including branches, rose steadily, reflecting a tendency of the large Wilmington banks to expand into the rest of the state by establishing branches (especially in the Wilmington suburbs) or by absorbing small local banks.

POPULATION

The population of Delaware in 1790 was 59,096; in 1830 it was 76,748; in 1870, 125,015; in 1910, 202,322; in 1940, 266,505; in 1950, 318,085; and in 1960, 416,292. In the decade 1950–60 Delaware was one of the fastest growing states in the nation, its population increasing by 40.3% in that interval. Industrialized New Castle county was the fastest-growing area. as it had been for over a century. Of the state's 1960 population 292,994 (65.7%) were classified as urban and 153,298 as rural. In 1960 the population was 82.9% native white, 3.2% foreign-born white, and 13.9% nonwhite, practically all Negro. The only large city (and the only standard metropolitan statistical area) was Wilmington (*q.v.*). Its population dropped from 110,356 in 1950 to 95,827 in 1960, reflecting the current nationwide exodus from city to suburbs, but suburban New Castle county nearly doubled; the total for the county in 1960 was 307,446, or 68.9% of the state's population.

Delaware: Places of 5,000 or *More* Population *(1960* census)*

Place	Census of Population				
	1960	1950	1940	1920	1900

EDUCATION

The Public School System. — The constitutional provision for the maintenance of a public-school system required separate schools for white and Negro children, with additional provision that no distinction be made in financing schools, because of race or colour. The first public-school law, passed in 1829, was based largely on the principle of local option, each school district being left free to determine the character of its own school or even to decide against having any school at all.

This system was replaced in 1875 by creation of a state board of education and a further step toward uniform administration under a state superintendent. Although the state temporarily reverted to decentralized administration in 1888 and the subsequent progress was halting and intermittent, the state was ready in 1919 and 1920 for the adoption of a modern school code. This code mas progressively amended, and the public school system developed rapidly to high rank among the states in administration and facilities, including scientifically designed buildings. Outstanding advances were a state program of vocational education, a uniform state supported salary schedule for all personnel from clerical to administrative and a unit plan of allocation of state funds.

In the 1920s a major contribution to the cause of Negro education was made by Pierre S. du Pont, Wilmington industrialist. When the general assembly showed no willingness to provide up-to-date school buildings for Negro children, he provided $2,000,000 for that purpose. Since then the Negroes have received a more generous share of public school money.

Higher Education. — Delaware college at Newark (an outgrowth of Newark academy dating back to 1743) opened its doors in 1834 and was the state's only institution of higher education until it closed, for lack of financial support, in 1859. Reopened as a land grant college in 1870, it became wholly state owned in 1913. Its progress was slow until after World War I, when Pierre S. du Pont began a series of gifts to the college, followed by H. R. Sharp, H. F. Brown, and others. At the same time regular appropriations for its maintenance began to be made by the legislature, which in 1913 had established a college for women, affiliated with Delaware college but with separate buildings, classes and student organizations. In 1921 the Women's college and Delaware college (including the agricultural experiment station, founded in 1888, and its extension service) were united to form the University of Delaware. The university was reorganized in 1944 to become completely coeducational. Delaware State college near Dover was opened in 1892 as a land grant college for Negroes. It is maintained by the state and awards bachelor's degrees.

Segregation and the Public Education System. — In 1948 the university's board of trustees voted to admit Delaware Negroes for work toward any degree for which Delaware State college offered no course of study. Some Negroes were enrolled, mostly graduate students. In 1950 a group of Negroes demanded the right to attend the university regardless of whether Delaware State college offered the courses they desired. The chancellor of the state ruled that they should be admitted (Parker *et al.* v. *U.* of *Del.*, Court of chancery, Aug. 9, 1950) and the university did not appeal his decision. At the same time Delaware State college ceased to be a school for Negroes only. Thus matter-of-factly and without commotion segregation came to an end in the public institutions of higher education in Delaware.

In the lower schools the segregation bars were let down first by the Roman Catholic Church, which decided to admit Negro children to its parochial schools in 1949–50. In 1952, when Negro parents in Claymont and Hockessin claimed that school facilities for their children were inferior to those for white, the chancellor ordered that the Negro children be admitted to the white schools. The state board of education appealed his decision to the state supreme court, which upheld the chancellor, and from there to the U.S. supreme court, which in its memorable decision declared segregation in the public schools unconstitutional (1954). The state's attorney general had already (1953) advised the admission of Negroes to white schools where "inequality is obvious." Integration was easier to accomplish in northern than in southern Delaware. It proceeded without great difficulty in Wilmington and with no difficulty at all in Newark, where the Negro school was closed in 1958. Downstate the process struck a snag in Milford when the school board was influenced to change its mind about admitting some Negro students in 1954. After long negotiation with the local federal court, an 11-year plan was worked out which went into effect in Sept. 1959 without incident in the schools where integration had not already begun.

HEALTH AND WELFARE

State agencies provide a broad program of health and welfare. Of major importance are the state board of health, state board of welfare (children), old age welfare commission, which grants old age pensions, operates the state welfare home (for aged and home-

less poor) and administers outdoor relief; Dela are State hospital (for the mentally ill), one sf the country's most advanced institutions; and the Governor Bacon health centre, a 320-ac. estate with buildings for the specialized care and treatment of spastics, cardiacs, alcoholics, the bedridden aged, and children and adults who are victims of infantile paralysis. Other state agencies care for the blind, deaf, dumb, tubercular and feeble-minded. Three state training schools provide academic and vocational education for delinquent children and youth. These are Ferris school for white and Negro boys, Kruse school for Negro girls and Woods Haven for white girls. Sterilization of the feeble-minded, epileptic and insane is provided for by law.

THE ECONOMY

Agriculture. — Delaware's population was chiefly rural and agricultural until 1920, when the urban population exceeded the rural for the first time. This change in population ratio was in a great measure due to rapid industrial development during World War I. The development of agriculture was also rapid. In 1929 the value of all farm crops and livestock sold, traded, or used by farm households amounted to $21,000,000. By the end of World War II, the total annual cash farm income was $90,000,000 and by 1960 it exceeded $110,000,000, over half of which came from a single item, broilers. The broiler industry, centred in Sussex county, got its start in Delaware in 1923 when Mrs. Wilmer Steele of Ocean View marketed 500 young chickens at the handsome price of 62 cents a pound (as compared with 16 to 18 cents in the 1960s). In a few years she and her imitators raised 10,000 to 25,000 young chickens a year. State production rose from 2,000,000 in 1928 to 24,000,000 in 1939 and 60,000,000 in 1944, making Sussex one of the highest agricultural income counties in the nation. Other livestock products are fluid milk (New Castle and Kent counties), eggs, cattle, turkeys and hogs. Crops include corn, truck crops, soybeans and potatoes. Peaches, for which Delaware was famous in the mid-19th century, almost disappeared, and apples and other tree fruits are of minor importance.

Industry. — The development of manufacturing in Delaware — centred largely within the northern part of New Castle county, including Wilmington and the river shore as far south as New Castle — had its origin in the abundant water power from the streams and easy access to the state's great waterway, the Delaware river. Wilmington, an active shipbuilding and shipping port and centre of mill industries from colonial days, expanded after the American Civil War into a notable centre for such special industries as carriage and car-building, fibre and paper making and machine-tool production with the growth of its regular gun-powder, textile, leather and iron manufacturing. Early industries along the millstreams of the adjoining county added to the Wilmington area's potential facilities for increased industrial importance during and following World War I. Throughout the state canning and other food processing developed into a major industry. Production of nylon, chemicals, motor vehicles and parts, aircraft, and steel and iron manufacturing and shipbuilding reached their peaks during and after World War II. During this period Wilmington became an outstanding chemical centre of the world with large experimental stations for basic and applied research by the du Pont company (founded in 1802) and its smaller offshoots, Hercules and Atlas, all three of which have expanded from explosives into the general chemical field. Industrial expansion southward after 1950 included an automobile assembly and tank plant at Newark, which turned out its first army tank in 1952, and a large oil refinery at Delaware City, which went into production in 1957.

Transportation. — Delaware's transportation facilities include the water-borne traffic of the Delaware river and the sea-level canal connecting the Delaware with Chesapeake bay; the marine terminal at the port of Wilmington with wharf facilities for the largest ocean vessels; airports with passenger and freight services (and a U.S. air force base — see DOVER); about 4,000 mi. of highways, over 2,000 of which are paved, the rest well-tended secondary roads; and about 350 mi. of railroads. Because of increasing competition from airplane, bus, and private motorcar transportation, railroad passenger service down the peninsula has been greatly reduced. The Delaware system of wide dual highways and good secondary roads connects with all adjoining state systems. A $45,000,000 suspension bridge across the Delaware river south of Wilmington, opened in 1951, meets the southern terminus of the New Jersey turnpike. The state pays about 85% of highway costs in Delaware. There are no toll roads.

The Chesapeake and Delaware canal cuts 14 mi. across the upper Delmarva peninsula. It is 27 ft. deep, tidal and toll free, owned and operated by the U.S. government as part of the eastern inland maternay system, and accommodates all but the largest ocean-going vessels. It is crossed by modern fixed-span bridges at St. Georges, Del., and Chesapeake City, Md. Such a waterway was talked of as early as 1661. In 1804 a company started work on a lock canal, somewhat farther north than the present one, but soon ran out of money. Another company, with an enlarged and relocated project, pushed it through to completion in 1829. It was a lock canal also, and continued to be operated as such until 1919, when the U.S. government, then the largest stockholder, bought the canal and converted it to its present form. The old canal had a life of its own. Showboats tied up along its banks to play the canal towns, and floating stores sold their wares from place to place. Passenger service between Baltimore and Philadelphia through the canal continued till the 1920s.

Lewes, with its 300 ac. of artificial harbour, provides pilot service for Delaware river shipping to and from Philadelphia.

DELAWARE INDIANS, village bands of Algonkian-speaking Indians that occupied the Atlantic seaboard from Cape Henlopen, Del., to western Long Island and especially the river valley of that name. To themselves they were *Leni Lenape,* or simpiy *Lenape,* "the people." American scholars following D. G. Brinton have divided their confederacy into three subtribes, each of which formed a clan or totem and a political subdivision:

Unalachtigo (Turkey). Unami (Turtle) and Munsee (Wolf). It appears that they comprised 30 or 10 autonomous communities and that the clans were distributed among them. The lands of each band included individual hunting territories measuring up to 200 sq.mi., the title to which was subject to band sanction. Their priority of occupation on the Atlantic coast is not clear: the Nanticoke of Maryland and the Mahican of the Hudson river termed them "grandfathers"; their linguistic affinity is to central Algonkian: and their migration legend. *Walam Olum*, brings them east. But archaeological evidence places them near the coast by A.D. 1000 and suggests earlier cultural antecedents in the area. The Delaware were the Indians most friendly to William Penn. and the Munsee were rewarded by the infamous "Walking Purchase," a treaty that forced them to settle on lands assigned by the Iroquois. Encroached on by whites and made "as women" by the rising Iroquois after 1690. they drifted westward in stages, stopping on the Susquehanna, the Allegheny. then the Muskingum in Ohio and the White river in Indiana: and. after 1800. to Missouri, Kansas. Texas and Oklahoma. After 60 years of displacement. their remnants and accretions rekindled a tribal fire beyond the Ohio. threw off the garb of women by defeating the English general Edward Braddock in the French and Indian War and asserted their manhood with vengeance for a half-century. They then had an eastern wing under Teedyuscung and a western pro-French wing under Shingas. For a time they supported the Americans during the Revolution but defected to the British for want of presents and because of the murder of White-Eyes and the invasion of their Ohio hunting grounds. These they ceded at the treaty of Greenville in 1795. Two Moravian missionaries. D. Zeisberger and J. Heckewelder, are the best sources on their history, movements and acculturation into the 19th century. In mid-20th century the Delaware numbered about 2.000, half of whom lived in Oklahoma, the rest in Wisconsin and Ontario.

DELAWARE RIVER, a stream of the Atlantic slope of the United States, meeting tidewater at Trenton, N.J., 130 mi. above its mouth. Its total length, from the head of the longest branch to the capes. is 410 mi. It constitutes in part the boundary between Pennsylvania and New York, the boundary between New Jersey and Pennsylvania and, for a few miles, the boundary between Delaware and New Jersey. The main or west branch rises in Schoharie county, N.Y., about 1.886 ft. above the sea, and flows tortuously through the plateau in a deep trough until it emerges from the Catskills. Other branches rise in Greene and Delaware counties. N.Y. In the upper portion of its course the varied scenery of its hilly and wooded banks is beautiful. After leaving the mountains and plateau, the river flows down broad Appalachian valleys, skirts the Kittatinny range. which it crosses at Delaware Water Gap between nearly vertical walls of sandstone, and passes through a quiet and charming country of farm and forest, diversified with plateaus and escarpments, until it crosses the Appalachian plain and enters the hills again at Easton, Pa. From this point it is flanked at intervals by fine hills, and in places by cliffs, of which the finest are the Nockamixon rocks, three miles long and more than 200 ft. high. At Trenton there is a fall of eight feet.

Below Trenton the river becomes a broad, sluggish inlet of the sea, with many marshes along its sides, widening steadily into its great estuary, Delaware bay. Its main tributaries in New York are the Mongaup and Neversink rivers and Callicoon creek; from Pennsylvania, the Lackawaxen, Lehigh and Schuylkill rivers; and from New Jersey, Rancocas creek and the Musconetcong and Maurice rivers. Major cities on the Delaware include Port Jervis, N.Y.; Easton, Philadelphia and Chester. Pa.; Trenton and Camden, N.J.; and Wilmington, Del. Commerce was once important on the upper river, but only before the beginning of railway competition (1857). Of the various early canals only two continued to be of any importance — the canal from Trenton to New Brunswick. uniting the waters of the Delaware and Raritan rivers, and the Delaware and Chesapeake canal, joining the waters of the Delaware with those of Chesapeake bay. The magnitude of the commerce of Philadelphia made the improvements of the river below that port of great importance. The Interstate Commission on the Delaware River Basin (INCODEL) was formed in 1936 by the four states in the watershed of the river, New York, New Jersey. Pennsylvania and Delaware, to control and prevent pollution, plan the conservation of water supply for the use of cities and plan development along the course of the entire river. At a cost of many millions of dollars to the U.S. government, a 32-ft. channel 600 ft. wide was opened from the deep water in Delaware bay to Philadelphia and a 12-ft. channel from there to Trenton.

On Christmas night of 1776, in a bad storm, George Washington and about 2,400 of his soldiers crossed the Delaware from Pennsylvania to New Jersey nine miles above Trenton and successfully surprised Hessian troops who had their winter quarters in Trenton (see TRENTON AND PRINCETON. BATTLES OF). In commemoration of this victory the site of Washington's landing was converted into a state park. (F. O. A.)

DE LA WARR (DELAWARE), **BARONS AND EARLS,** an English title, the holders of which are descended from SIR ROGER LA WARRE (d. 1320) who was summoned to parliament as a baron from 1299. His grandson ROGER (1326–70), 3rd baron, was a notable soldier who fought at Crécy and Poitiers. This male line became extinct with the death. on May 7. 1427, of THOMAS, 5th baron, who was succeeded by his nephew REGINALD WEST (1395–1450), 3rd Baron West and 6th (or 1st) Baron De La Warr. He was the second son of Thomas' half-sister Joan by her marriage with Thomas (1365–1405). 1st Baron West. Reginald was summoned to parliament in 1427 as Baron La Warr. His grandson THOMAS (d. 1525), 8th (or 3rd) baron, was a courtier and soldier during the reigns of Henry VII and Henry VIII, and the 8th baron's son THOMAS (d. 1554), 9th baron, was a person of some note during the reigns of Henry VIII and Edward VI. He died without issue on Sept. 25, 1554, when the baronies of West and De La Warr fell into abeyance.

The 9th baron had settled his estates on his nephew WILLIAM WEST (d. 1595), who was disabled by act of parliament (1550) from taking the titles for having tried to poison his uncle. However William was created by patent Baron De La Warr in 1570 and his son THOMAS (c. 1556–1602), 11th baron, was granted the precedence of the ancient barony De La Warr in 1597.

The 11th baron's son, THOMAS (1577–1618), 12th baron, was born on July 9, 1577. He fought in the Netherlands and in Ireland under the earl of Essex. He was imprisoned for complicity in Essex's revolt (1601), but was soon released. He became a member of the council of the Virginia company and was appointed (1610) governor and captain general of Virginia for life. Sailing in March 1610 with three ships, 150 settlers and supplies, he arrived at Jamestown on June 10, in time to intercept the colonists who had embarked for England and were abandoning the enterprise. Lord De La Warr's rule was strict but just; he constructed two forts near the mouth of the James river, rebuilt Jamestown, and in general brought order out of chaos. He returned in 1611 to London where he published, at the request of the company's council, his Relation (1611, reprinted 1858) of the condition of affairs in Virginia.. He remained in England until 1618, when the news of the tyrannical rule of the deputy, Samuel Argall, led him to start again for Virginia. He embarked in May, but died en route on June 7, 1618, and was buried at sea. Delaware bay and the state of Delaware were named in his honour.

In 1761 the 12th baron's great-great-grandson, JOHN (1693–1766), 16th baron, was created Viscount Cantelupe and 1st Earl De La Warr. He was a prominent figure in the house of lords, at first as a supporter of Sir Robert Walpole. He also served in the British army and fought at Dettingen, and he was governor of Guernsey 1752–60. His descendant GEORGE JOHN WEST (1791–1869), 5th earl, married Elizabeth Sackville in 1813, and

in 1843 he and his sons took the name of Sackville-West. The earl was twice lord chamberlain to Queen Victoria, and is celebrated as "Fair Euryalus" in the *Childish Recollections* of his schoolfellow, Lord Byron. His son, CHARLES RICHARD (1815–73), 6th earl, served in the first Sikh war and in the Crimea. His descendant HERBRAND EDWARD (1900–), 11th earl, was postmaster general from 1951 to 1955.

DELBRÜCK, BERTHOLD (1842–1922), German linguist. an Indo-Europeanist specializing in problems of syntax, was born at Putbus on the island of Rügen, on July 26. 1842. He was educated at Halle and Berlin, and mas professor of Sanskrit and comparative linguistics at Jena from 1870 until his retirement in 1912.

Delbriick was the first Indo-Europeanist to study comparative syntax; in his doctoral dissertation he investigated the usage of the Greek infinitive; soon after, he turned to the syntax of the dative in the Rigveda; and in 1871 he published his classic work on the subjunctive and optative in Sanskrit and Greek (*Syntaktiscke Forschungen*, vol. i, ed. by Delbriick and E. Windisch), the first thoroughly methodical and complete treatment of a problem in comparative syntax. The method which Delbriick used, of comparing, contrasting and classifying large numbers of similar utterances, although extended and refined, has never been fundamentally superseded. Delbriick was the author of the three volumes on Indo-European syntax in the *Grundriss der vergleichenden Grammatik der indo-germanischen Sprachen;* this great synthesis is his masterwork.

On a question much debated in his time, he took the stand that adherence to or denial of the principles of any school of psychology or philosophy or sociology need have no influence upon the linguistic work done by a scientifically trained linguist. The same position has since been held by others; Delbriick was the first great linguist to give it explicit statement. He died at Jena on Jan. 3, 1922.

A complete bibliography of Delbrück's work is published in E. Hermann, *Berthold Delbrück* (1923). (MY. F.)

DELBRÜCK, HANS GOTTLIEB LEOPOLD (1848–1929), German military historian and politician, was born at Bergen on the island of Riigen, on Nov. 11, 1848. He studied at Greifswald. Heidelberg and Bonn. Work on a biography of August Gneisenau first roused his interest in military history, and he wrote on both ancient and modern strategy. His strategical theories were by no means generally accepted. however, and it was not until 1895 that he was given a professional chair, succeeding Heinrich von Treitschke at Berlin a year later. Delbriick maintained that he entered politics as a historian. He sat in the Prussian lower house from 1882 to 1885 and in the *Reichstag* from 1884 to 1890. Calling himself an enlightened conservative, he was in fact a liberal with nationalist tendencies in foreign policy. In 1883 he became co-editor with Treitschke of the *Preussische Jahrbuch* (a monthly journal for politics, history and literature) and was sole editor from 1889 to 1919. During World War I he urged a policy of moderation. He died in Berlin on July 14, 1929.

Among his numerous works are *Geschichte der Kriegskunst im Rahmen der politischen Geschichte,* 7 vol. (1900–27) and *Weltgeschichte,* 5 vol. (1923–28).

DELBRÜCK, RUDOLF VON (1817–1903), Prussian statesman, chief executor of Bismarck's free-trade policy. was born at Berlin on April 16, 1817. On completing his legal studies he entered the government service in 1837; in 1848 he was transferred to the ministry of commerce. Both Germany and Austria had realized the influence of commercial upon political union. Delbriick in 1851 induced Hanover, Oldenburg and Schaumburg-Lippe to join the *Zollverein,* and the southern states, which had agreed to admit Austria to the union, found themselves forced in 1853 to renew the old union, from which Austria was excluded. Delbriick now began, with the support of Bismarck, to apply the principles of free trade to Prussian fiscal policy. In 1862 he concluded an important commercial treaty with France. In 1867 he became the first president of the chancery of the North German confederation and represented Bismarck on the federal tariff council *(Zollbundesrat).* In 1868 he became a Prussian minister without portfolio. In Oct. 1870, when the union of Germany under Prussian leadership became a practical question, Delbriick was chosen to go on a mission to the South German states, and he contributed greatly to the agreements concluded 'at Yersailles in November. In 1871 he became president of the newly constituted *Reichskanzleramt.* Delbriick, however, began to feel uneasy under Bismarck's leanings toward protection and state control. When Bismarck introduced a plan for state acquisition of the railways, Delbriick resigned office. pleading ill-health (June 1, 1876). In 1879 he opposed in the *Reichstag* the new protectionist tariff and then retired definitely from public life. He died at Berlin on Feb. 1, 1903.

See his *Lebenserinnerungen 1817–1867,* 2 vol., 2nd ed. (1905), with an additional section on the events of 1870.

DELCASSÉ, THÉOPHILE (1852–1923), French statesman, a principal architect of the *entente cordiale* between France and Great Britain and of Franco-Russian understanding in the years before World War I, was born at Pamiers on March 1, 1852, and educated locally. He contributed to the *République française* and entered politics as a supporter of Léon Gambetta and of the colonial policy of Jules Ferry. The unpopularity of colonialism in 1885 ensured his defeat in the elections of that year, but in 1889 he was elected deputy for Foix, in his native *département* of Ariege.

Having in 1887 married the widow of a wealthy man, he was freed from financial cares. Appointed undersecretary for the colonies in Alexandre Ribot's cabinet (Jan. 1893), he retained this post throughout Charles Dupuy's first ministry (April–Nov. 1893) and became minister of colonies on Dupuy's return to office (May 1894–Jan. 1895).

Delcassé belonged to the anticlericalist wing of the Radicals and, in 1898, attacked Jules Méline's ministry for its tolerance of clericalism. But throughout the Dreyfus affair he kept aloof, devoting his energies to colonial and foreign affairs. Méline fell as a result of the elections of 1898, and Delcassé's career reached its zenith when he accepted the office of minister of foreign affairs in Henri Brisson's ministry which succeeded Méline's. He held that office under the succeeding premierships of Dupuy, René Waldeck-Rousseau and Émile Combes and for the first part of that of Maurice Rouvier. This continuous tenure of seven years (June 1898–June 1905) was unprecedented in the third republic. They were years of crucial importance for French foreign policy, to the reshaping of which Delcassé brought remarkable consistency of purpose and pertinacity of will. France had already, in 1893, entered into an alliance with Russia. But since the making of the triple alliance of 1882 between Germany, Austria-Hungary and Italy, the balance of diplomatic power in Europe had tipped dangerously against France. Amid divided counsels as to whether France should pursue a policy of *de'tente* ("seeking better relations") with Germany or one of alliance with Great Britain, Delcassé resolutely worked for resistance to Germany and for alliance with Great Britain. It was an undertaking beset with difficulties and dangers, but he triumphantly overcame them all.

The first danger, which confronted him as soon as he took office, was of war with Great Britain over the dispute at Fashoda *(see* EGYPT: *Modern History).* It created acute tension between the two countries, but J. B. Marchand was recalled from the Nile in Nov. 1898 and the danger was removed mainly by Delcassé's tact and moderation. Germany's clumsy encouragement of the Boers in their conflict with the British helped Delcassé in his aims, for the experience of isolation during the South African War made Great Britain more receptive to overtures for an alliance. In 1904, however, the outbreak of war between Japan and Russia created fresh difficulties: Great Britain was an ally of Japan, France an ally of Russia. Again Delcassé's moderating influence smoothed out these difficulties. Through Paul Cambon, French ambassador in .London, he worked patiently for agreement with Great Britain about the two main areas of colonial tension, Egypt and Morocco. In April 1904 France and Great Britain signed a convention which became a landmark in European diplomacy: it not only removed all outstanding colonial frictions between the two countries, but also formed the foundation for a broad *rapprochement* covering

European affairs in general and grew into the *entente cordiale.* After Russian warships had fired on British trawlers off the Dogger bank (Oct. 1904), Delcassé was able to mediate between Great Britain and Russia and so to pave the way for the eventual triple entente of 1907 as counterpoise to the triple alliance.

Meanwhile, however, his position was becoming untenable because of resistance to his policy within the government. Maurice Rouvier, the financier who became premier in Jan. 1905, sought to ease Franco-German relations by economic co-operation and by resisting the completion of alliance with Great Britain. In this he was supported by other members of his ministry. Parliamentary opinion, too, was alarmed by the menacing diplomacy of Germany and by German armed strength and afraid that Delcassé's policy of defiance would lead to war. In the session of the chamber on April 18 he was criticized from all sides. When it became apparent that Rouvier was acting behind his back to seek reconciliation with Germany, Delcassé resigned after a stormy meeting of the council of ministers on June 6, 1905. Since Germany had been pressing for the summoning of an international conference about Morocco and had been attacking him personally, it seemed that France's foreign minister had been ousted under German pressure. **As** a result Franco-German relations deteriorated, and in Great Britain the entente with France won new sympathy and support. When Delcassé left the foreign ministry the international position of France had been completely transformed by his labours. Agreement had been reached with Italy about Tunisia and Tripolitania in 1902 and with Spain as well as with Great Britain about Morocco in 1904. The triple entente, which was to be completed by the Anglo-Russian treaty of Aug. 1907, was virtually his achievement.

Delcassé remained out of office for six years and made no political pronouncement for two years after his resignation. He was active in parliament, however; and when, in Jan. 1908, he took the opportunity of a debate on Morocco to make a speech vindicating his policy he was warmly acclaimed. He returned to prominence in 1909, when he was appointed chairman of a parliamentary committee to inquire into French naval weakness: the report that he produced resulted in the resignation of Georges Clemenceau's ministry. Appointed minister of marine under Ernest Monis, in March 1911, he retained that office for nearly two years, under Joseph Caillaux and Raymond Poincaré. In 1912 he was responsible for the exchange of letters between Pierre Paul Cambon and the British foreign secretary, Sir Edward Grey, which approved French naval concentration in the Mediterranean and British naval concentration in the North sea and in the English channel. The two governments, as Grey could insist in 1914, were still not bound together by any formal alliance; but such a disposition of naval forces for mutual defense cemented the entente and ensured formal alliance when World War I broke out in 1914.

In Feb. 1913 Delcassé was sent by Aristide Briand to the post of ambassador at St. Petersburg. He enjoyed, to a unique degree, the confidence of the tsar Nicholas II and of his foreign minister, S. D. Sazonov, and used his influence to strengthen the Franco-Russian alliance, which had weakened in the interval since his tenure of the foreign ministry. He urged moderation on Russia in its disputes with Turkey and with Austria-Hungary and on France in its extension of commitments in Syria, which he feared might revive Franco-British dissensions.

After 1914 Delcassé lost the sureness of touch and grip which had been so conspicuous in his previous career. He was minister of war in Alexandre Ribot's short-lived cabinet of 1914. Returning to the ministry of foreign affairs under René Viviani in Aug. 1914, in World War I, he approved the treaty of London with Italy in April 1915 (this finally disrupted the triple alliance), but resigned in Oct. 1915 in protest against the Salonika expedition. In Balkan affairs, it must be acknowledged, he lacked clearness of vision and proved to be as persistent in errors as he had previously been consistent in success. Delcassé retired into private life in 1916 and expressed repeated disapproval of the policy followed by the French and British governments in 1918 and 1919. He urged preservation of the Franco-British alliance and keeping the Rhineland as a bulwark against Germany. He died in seclusion, at Nice, on Feb. 21, 1923. In spite of his later failures. he remains one of the greatest foreign ministers of modern France.

See C. *W.* Porter, *The Career* of *Théophile Delcassé* (1936); Albéric Neton, *Delcassé* (1952). (D. TN.)

DELEDDA, GRAZIA (1875–1936), Italian novelist, an outstanding writer of the *verisrno* school in Italian literature, who was awarded the Nobel prize for literature in 1926, was born at Nuoro, Sardinia, on Sept. 27, 1875. She married very young and moved to Rome, where she lived quietly, frequently visiting her native island, which remained the source of her literary inspiration. She died in Rome on Aug. 15, 1936.

Almost without formal schooling. she wrote her first stories when she was 17. They were based on sentimental treatment of themes from folklore, but with *Il vecchio della montagna* (1900) she began to write about the tragic effects of temptation and sin within the conscience and consciousness of primitive human beings. Her masterpieces are *Elias Portolu* (1903), the story of a mystical former convict in love with his brother's bride, whom he refuses to marry when she becomes a widow, deciding to consecrate himself to the priesthood; *Cenere* (1904; Eng. trans., *Ashes,* 1910) in which an illegitimate son causes his mother's suicide; *L'edera* (1908), which tells of a servant who kills to save her master from financial ruin and later finds in marriage with him only expiation for her sin; *La madre* (1920; Eng. trans., *The Woman and the Priest* [*The Mother*], 1923), the tragedy of a mother who realizes her dream of making a priest of her son only to see him yielding to the temptations of the flesh. Nearly 50 other novels developed similar themes, an exception being *Cosima* (1937), an autobiographical account of her early life.

Grazia Deledda's conception of Sardinian psychology resembled Giovanni Verga's idea of the Sicilian peasant, and she is considered, after him, the greatest representative of *verismo,* the Italian offshoot of French naturalism, which is distinctive in its evocation of regional life.

DELEHAYE, HIPPOLYTE (1859–1941), Belgian scholar and Bollandist, the foremost exponent of biographical church history from the archaeological as well as the documentary viewpoint. was born in Antwerp on Aug. 19, 1859. He became a Jesuit in 1879, was ordained priest in 1890 and then identified himself with the work of the Bollandists (*q.v.*), becoming head of their group in 1912. He died in Brussels on 'April 1, 1941.

Delehaye took a decisive part in the census of extant lives of saints, both printed and manuscript, specializing in the early Christian centuries, with a predilection for the Greek and other Byzantine sources; he edited the *Bibliotheca hagiographica Greeca* (1895; 2nd ed., 1909). His fame rests on half a dozen books directed to historians in general on the critical method as applied to the lives of saints. The best known are: *Les Légendes hagiographiques* (1905; best ed. 1927; Eng. trans. 1962); *Les Origines du culte des martyrs* (1912); *Les Passions des martyrs et les genres littéraires* (1921); *Sanctus* (1927). He edited the Constantinople *Synaxarium* (1902), explained word by word the *Martyrologium Hieronymianum* (1931), and took the leading part in the Bollandists' commentary on the *Martyrologium Romanum* (1940). He was a constant contributor to *Acta Sanctorum* and to *Analecta Bollandiana,* as well as to other learned journals.

See P. Peeters' notice, with bibliography, in *L'Oeuvre des Bollandistes,* new ed (1961), and *Figures Bollandiennes contemporaines* (1948). (PL. GN.)

DELESCLUZE, LOUIS CHARLES (1809–1871). French republican journalist and a leading member of the Paris Commune of 1871, was born at Dreux (Eure-et-Loir) on Oct. 2, 1809. Though still a law student. he fought in the revolution of 1830 and, adopting extreme republican views, took part in the insurrection of June 1832. Because of his continued opposition to Louis Philippe, he was forced to leave France in 1836. On his return in 1840 he settled at Valenciennes, becoming editor of *L'Impartial du Nord.* After the revolution of 1848, he was appointed commissioner of the republic in the Nord and Pas-de-Calais *départements.* Resigning his post on the meeting of the

national assembly, he went to Paris, where, in his journal *La Révolution démocratique et sociale,* he denounced the government's increasing conservatism. Through a society called Solidarité RC-publicaine, he intended to champion the republic against its enemies. When the radical uprising of June 1849 failed, he had to flee to England, but he returned in 1853. Betrayed by an informer, he was banished to a convict settlement in Guiana, from which he returned in 1859 broken in health *(see* his *De Paris à Cayenne: journal d'un transporté,* 1869). He resumed journalism and was again imprisoned but escaped to Belgium in 1870, returning on the fall of the second empire. Though personally hostile to Auguste Blanqui, he was deeply influenced by his ideas: neither a socialist nor an internationalist, he was commonly described as a "Jacobin." Elected a member of the national assembly and also of the Paris Commune in 1871, he chose to sit in the latter. His seniority, ability and administrative experience gave him authority in the Commune, and he was its most capable and disinterested leader. On May 9 he was appointed civil delegate for war by 42 votes to 2, but the troops from Versailles broke into Paris on May 22, and the Communard forces scattered to their local sections. For three days Delescluze tried to reorganize the defense and fought with reckless courage, but on May 25, he sensed that defeat was inevitable: alone and unarmed, he climbed a barricade off the boulevard Voltaire under heavy fire and was killed.

DELESSERT, (JULES PAUL) BENJAMIN (1773–1847), French banker who began the first savings bank in France, was born at Lyons, Feb. 14, 1773. He became manager of his family's discount bank in 1795. In 1801 he founded the first cotton factory in France, and in 1802 France's first sugar factory, for which he was made a baron of the empire. For many years he was a member of the chamber of deputies and a regent of the Bank of France. He founded many learned and philanthropic societies. By avocation he was an eminent botanist and the author of several books. He died in Paris, March 1, 1847. (J. R. LT.)

DELFICO, MELCHIORRE (1744–1835), Italian economist, was born at Teramo in the Abruzzi on Aug. 1, 1744. and was educated at Naples. He devoted himself specially to the study of jurisprudence and political economy, and his numerous publications exercised great practical influence in the correction and extinction of many abuses. Under Joseph Bonaparte, Delfico was made a councilor of state, an office which he held until the restoration of Ferdinand IV, when he was appointed president of the commission of archives, from which he retired in 1825. He died at Teramo on June 21, 1835. (FK. L. K.)

DELFT, a town of South Holland province, Neth., is situated in flat polder country 9 km. (53 mi.) S.S.E. of The Hague by road and 18 km. N.W. of Rotterdam. Pop. (1957 est.) 69,865 (mun.). The old inner town is threaded by picturesque canals. The Gothic Oude Kerk, founded in the 13th century, dates in its present form from about 1500 and contains memorials to the admirals Martin Tromp and Piet Heyn and to the microscopist Anton van Leeuwenhoek, a native of Delft. The Gothic 14th-century Nieuwe Kerk (formerly St. Ursula's) has a tall tower with a carillon; the members of the house of Orange-Nassau are buried there (the tomb of William the Silent was executed by Hendrik de Keyser and his son in 1614–21) and there too is the tomb of Hugo Grotius, a native statesman whose statue is in the market place. The Renaissance town hall was built about 1618 round a medieval tower. West of this, in the Oude Delft, which runs right down the old town on the west side, is the Prinsenhof where William the Silent was assassinated in 1584; it was a nunnery before it became his residence and is now the town museum where an antique fair is held. The assembly hall of the Technical university, which was founded in 1842 as the Royal academy, in 1864 became the Polytechnic and in 1905 assumed its present status. is a 15th-century chapel. In the Oude Delft are many ancient houses, among them the headquarters of the Hoogheemraadschap (Union of Inland Polders) with a late Gothic façade. The Lambert van Meerten museum, near the Prinsenhof, has a remarkable international collection of tiles, while the Armamentarium is a 17th-century armoury of the states of Holland. The town archives are in a 16th-century house, Oude Delft 169. The Museum Paul Tetar van Elven, at the Koornmarkt, has rooms in different styles.

Delft is on the railway from Rotterdam to The Hague and Amsterdam. The making of pottery, cables, yeast, spirits and penicillin are the chief industries. Delft received its charter from Count William II in 1246 and in 1536 was largely destroyed by fire. In 1654 it was heavily damaged when a powder magazine blew up. Jan Vermeer (1632–75) is the greatest of the many painters born in Delft. The production of beautiful faïence pottery. known as Delft, flourished in the 17th century but declined subsequently. Only one firm continues production, using modern techniques. (D. P. O.)

DELHI, the site of several capital cities of India including New Delhi, formerly (1912–47) the capital of British India and now of the Republic of India, is situated on the west bank of the river Jumna (Yamuna). The cities and surrounding areas of Dilli (the earlier cities before the Moguls), Delhi (the present city popularly known as "Old Delhi") and New Delhi, and the cantonment comprise the Union territory which covers an area of 573 sq.mi. and had a population (1961) of 2,644,058. The population of Old Delhi was 2,051,622 and that of New Delhi 260,272. Delhi occupies an almost central position in the Indian subcontinent, equidistant from the great commercial cities of Calcutta. Bombay and Karachi. It is a pivotal point in the network of national railways, highways and airways. Geographically it is unique because of its central position in the whole of the eastern hemisphere.

The site of Delhi is a natural fortress in the shape of a triangle, the western side of which is formed by the famous Delhi ridge that is the northernmost extremity of the Aravalli range. The eastern side is formed by the river Jumna which meets the Delhi ridge at Wazirabad in the north and forms the apex. The base is an eastern offshoot of the ridge, branching off from the main body near Mahrauli about 11 mi. S. of Wazirabad.

It is within the triangular area that at least 15 different cities of Delhi are believed to have emerged at different times, but all except the last two, Old and New Delhi, have perished. Each conqueror, having destroyed the city of his predecessor. built a new one on the triangular plain, and so Delhi successively changed its location, its character and even its name, yet it preserved its continuous existence.

HISTORY

The earliest-known city of Delhi, Indraprastha, flourished in the 15th century B.C. In the epic of *Mahabharata,* where it is described. it mas built by Yudhistra, a Pandava king, and it was situated on a huge mound on the western bank of the Jumna, now occupied by the Purana Kila (old fort). There are no visible remains of Indraprastha but according to legend it was a great city.

It is believed that in the first century B.C. Raja Dillu built a city about 7 mi. S.W. of Indraprastha, on the site where the Kutb Minar now stands, and named it Dilli, the first appearance of this name. The next big city to emerge in the Delhi plain was Surajkund, built on a rocky spur about 6 mi. S.E. of Dilli by a Tomar Rajput, Raja Anangapala, in A.D. 1020. A few years later it was moved to the old site of Dilli. Anangapala and his successors, who reigned for about a century, converted the town into a fine walled city called Lal Kot. It had a large tank. Anangtal, many temples and the famous Iron Pillar which still stands as the memorial of that city. The Tomars were displaced by the Chauhans, and when Prithvi Raja (the last Hindu ruler of Dilli) ascended the throne in 1170, he expanded the city four times. He built fine temples, on the lines of well-developed Rajput architecture, and also a high tower. He enclosed the city with a high wall and it came to be known as Kila Rai Pathora.

The Muslim Invasion.— In 1191 came the invasion of Mohammed of Ghor (Mohammed Ghori) who, defeated on this occasion, returned two years later. overthrew the Hindus and killed Prithvi Raja. Mohammed Ghori returned to Ghor leaving Qutb-ud-Din Aibak (his general and slave) in charge. Qutb-ud-Din proclaimed himself independent in 1206 and became the first sultan of Dilli (Delhi). Although he retained the old capital he destroyed 27 Hindu temples to make a grand mosque, Kuvvat-ul-Islam

(meaning "might of Islam"). The big tower was altered and converted into the Kutb Minar. The life of Dilli centred on these buildings for the next century and the limits of the old capital sufficed for the Muslim kings.

'Ala-ud-Din Khalji (1296–1316) built a new city at Siri about 3 mi. N.E. of Dilli. It was a big fortress town with a palace of 1,000 pillars and a huge tank, Hauz Khas.

Another capital was built at Tughlakabad by Ghiyas-ud-Din Tughlak in 1321 about 5 mi. S.E. of Lal Kot. The city hardly survived the death of its builder, who was succeeded by his son Mohammed ibn Tughlak (1325–51). Cnder him the Dilli sultanate attained its maximum growth. He built a new capital called Jahanpannah at a site between Dilli and Siri, the fourth of the seven Islamic cities of the Delhi plain. His successor, Firuz Shah Tughlak, transferred the capital in 1354 to a new town. Firuzabad, about 8 mi. N. of Dilli (Lal Kot). The new city was built on the western bank of the Jumna, 2 mi. N. of Indraprastha (the first city). It covered a large area, spreading fanwise from the palace. With the death of Firuz Shah ended the glory of the Tughlak dynasty. In Dec. 1398 Timur (*q.v.*) invaded India and captured Dilli. Enraged at a surprise attack by the Tughlaks under Mallu Khan, he ordered the massacre of 100,000 Hindu captives and the looting of the city. Regular government was not established until 1414 under a Sayyid dynasty which was ousted in 1451 by the Lodis who transferred the capital to Agra (*q.v.*). (See also DELHI, SULTANATE OF.)

The **Mogul** Period.—In 1526 Babur (*q.v.*), a descendant of Timur, invaded India, defeated and killed the king, Ibrahim Lodi, at Panipat and proclaimed himself emperor of Hindustan. Babur continued to have Agra as his capital but his son and successor, Humayun. began building a new capital at the old site of Indraprastha, which he called Dinepannah. Before the new city could be completed Humayun mas defeated and expelled by the Afghan Sher Shah Sur who rebuilt the city, enclosing and fortifying it with a strong wall. Parts of this wall can be seen in Purana Kila. In 1555 Humayun recovered his kingdom but he died within six months and was succeeded by his son, the famous Akbar (*q.v.*).

During Akbar's reign and that of his son Jahangir the capital was either at Agra or at Lahore (*q.v.*). Akbar's grandson, Shah Jahan, was cronned at Agra in 1628 and between 1638 and 1658 he built a new city, about 2 mi. N. of Firuzabad, which he named Shahjahanabad. This city survives as the present city of Delhi. The royal palaces and the fort were completed first and the emperor moved to Shahjahanabad in 1618. Delhi in Shah Jahan's time, and for some years after, was the centre of the Mogul empire at the height of its glory and power. Its fame and grandeur spread far and wide and created the legend of "the Great Mogul."

Shah Jahan was deposed in 1658 by his son Aurangzeb (*q.v.*) during whose reign the empire began to decline. After the death of Aurangzeb in 1707 chaos and anarchy supervened for many years and in 1739 Nadir Shah of Persia invaded India and sacked Delhi. He departed with a vast booty including the famous Peacock throne and the Koh-i-nor diamond. Delhi was plundered again by Ahmad Shah Abdali of Afghanistan in 1757 but by then Muslim power had become very weak and the Marathas began to exert their influence. In 1771 Shah Xlam, great-grandson of Aurangzeb. was raised to the throne. as the nominal head. by the Marathas who were in turn thrown out by Gen. Gerard Lake's forces in 1803. Delhi was again attacked by the Marathas in 1804 but they were defeated and the city with its surrounding area passed under British administration.

The 19th Century.—After that the city flourished steadily except for the year of the mutiny in 1857 (*see* INDIAN MUTINY, THE). Promised that his life would be spared, Bahadur Shah II, the last of the Moguls, surrendered to Maj. William Stephen Raikes Hodson and was banished to Rangoon, Burma. Delhi remained under military authority for several months and in 1858 the British civil authorities took over the administration of the country, with their headquarters at Calcutta. Nevertheless, Delhi played an important role. It was chosen as the venue for the imperial proclamation when Queen Victoria was proclaimed empress of India on Jan. 1, 1877, and for the great durbars held in Jan. 1903 for the proclamation of King Edward VII and in Dec. 1911 for the coronation of King George V.

The latter half of the 19th century saw some of the most important developments in Delhi. The advent of the railways and the building of the metaled roads connecting Delhi with other towns in India had a tremendous effect. Delhi became a prosperous city and a big commercial centre. (See also INDIA: History.)

The Growth of New **Delhi.**—The transfer of the capital from Calcutta to Delhi was first announced by King George V at the Delhi coronation durbar on Dec. 12, 1911. A town planning committee was formed who chose a site 3 mi. S. of the existing city of Delhi, around Raisina hill, for the imperial capital. This was a well-drained, healthy area between the ridge and the river and provided ample room for expansion. The Raisina hill, which commanded the view of the entire area, stood 50 ft. above the plain, but the top 20 ft. were blasted off to make a level plateau for the great buildings and to fill in depressions. With this low acropolis as the focus of the city, Sir Edwin L. Lutyens laid out his plan which was as ambitious in scale as that for Washington, D.C. His central mall and his diagonal avenues may owe something to P. C. L'Enfant's plan for Washington and to Sir Christopher Wren's plan for London after the Great Fire, but the total result was quite different. The plan of New Delhi followed the garden-city pattern based on a series of large hexagons with wide avenues having double rows of trees on either side, thus creating vistas, connecting various points of interest.

The main buildings of the acropolis are the two secretariat blocks, designed by Sir Herbert Baker, and the former viceroy's palace, now Rashtrapati Bhawan (the residence of the president of the Indian republic), with its beautiful Mogul gardens, designed by Lutyens. Northeast of the acropolis, on the plain below, is a circuiar building with a continuous open colonnade one-half mile in diameter uhich contains the two houses of parliament, the council of states (rajya sabka) and the house of the people (lok sabha). These four buildings stand out most prominently and are splendid contributions combining the Roman classical architecture with Indian architectural details. Immediately to the east of the secretariat blocks is the Great place (now called Vijay Chauk), the centre of the road system, based on a diagonal pattern. The main axis leads to the ancient site of Indraprastha about two miles to the east. The northeast axis radiates from there at an angle of 60° and is focused on the Jamma Masjid, or Great mosque, in the city. The southeast axis, at an angle of 30°, leads to other ancient. monuments to the south. The central vista on the main axis is a great parkway lined with canals and adorned with fountains. From the eastern portion of the central vista, there is a magnificent view of the War Memorial arch (popularly known as the India gate). A graceful marble statue of Kng George V, with its high canopy: stands a few yards to the east of the arch.

The original site covered about 10 sq.mi. and was planned for the residence of 70,000 persons. Now the area extends to 34 sq.mi. Most of the original plan and its important buildings were completed between 1920–30 and the formal inauguration took place on Feb. 8, 1931. In the 1930s the Lakshmi Narain temple (popularly known as the Birla Mandir)—a splendid temple with a well laid out garden—was built on the eastern slope of the ridge. Important additions to the city in the 1940s were the modern All India Radio building and the National stadium.

The partition of the Indian subcontinent in 1947 brought in about 500,000 refugees to Delhi and many suburban colonies were developed as rehabilitation centres. Important among them are Rajinder Nagar, Patel Nagar, Jangpura, Nizamuddin and Lajpat Nagar. Because of the considerable expansion of central government activities after independence, many buildings were constructed for office accommodation and more than a score of residential colonies were built for the government employees. In addition, many buildings of national importance, such as the National museum, supreme court, National Physical laboratory, Reserve Bank of India, Ashoka hotel, All India Institute of Medical Sciences, were constructed during the 1950s. A new Zoological

garden on the western bank of the Jumna near the site of Indraprastha was laid out in the late 1950s. Asaf Ali road and Parliament street are the two newly developed commercial localities with large modern buildings which house the increasing commercial enterprises. The main shopping centre of New Delhi is Connaught place, which forms a complete circle.

On the western bank of the Jumna near Delhi gate is the hallowed spot, Raj Ghat, where Mahatma Gandhi was cremated on Jan. 31, 1948. An impressive *samadh* was built at this site which has become a national shrine and regular place of pilgrimage. Thousands of persons, including foreign dignitaries, pay homage there to the memory of Gandhi.

The Delhi public library in Queens road was established in association with UNESCO as a model for public library development in southeast Asia. The latest development is the growth of the Diplomatic enclave or the Chanakyapuri, a colony specially planned and developed by the government of India for the offices and residential accommodation of the diplomatic missions. Specimens of modern architecture can be seen here, designed by architects of various foreign countries.

OLD BUILDINGS AND MONUMENTS

Old **Delhi.**—The city of Delhi occupies the northern part of the Delhi triangular plain. The greater portion of the city is still confined within Shah Jahan's walls, which were originally 6,664 yd. long. 4 yd. wide and 9 yd. high. They had 27 towers and 14 gates of which Kashmiri gate, Delhi gate, Turkman gate and Ajmiri gate still stand and the sites of the others can easily be identified. Most of the original walls have been pulled down but some portions near Kashmiri gate and Delhi gate remain intact.

The Lal Kila, or the Red fort, is one of the important buildings of the city with its 75-it.-high massive red sandstone walls. Within the fort are palaces, gardens, military barracks and other buildings. The two most famous of these are the Diwan-i-Am and Diwan-i-Khas. The Diwan-i-Am (hall of the public audience) is a magnificent building with 60 red sandstone pillars supporting a flat roof. Its royal balcony contains some of the finest pietra dura works. The Diwan-i-Khas (hall of the private audience) is smaller and has a pavilion of white marble in the interior of which the art of the Moguls reached perfection in its jewellike decoration. There stood the famous Peacock throne, inlaid with sapphires, rubies, emeralds and other precious stones and pearls of different colours.

Another Mogul creation (1650) was Chandni Chauk (Silver street), once supposed to be the richest street in the world. It was 1,520 yd. long and 40 yd. wide and is still a long and imposing avenue and the principal shopping centre of Old Delhi. During the course of its history it was sacked four times. A short distance south of Chandni Chauk is the Jamma Masjid built on a rocky eminence in 1644–58 by Shah Jahan. The mosque, approached by a magnificent flight of stone steps, is paved with marble, and three domes of white marble rise from its roofs with two tall minarets at the front corners.

The other mosques in Delhi are the Kali Masjid, or the Black mosque, built about 1380 by Firuz Shah, and the Moti Masjid, or the Pearl mosque, Aurangzeb's private place .of prayer.

The northern part of the city beyond Kashmiri gate was developed during the British period and is known as the civil lines. The impressive old secretariat buildings (now occupied by the Delhi administration) and the old viceregal lodge (now Delhi university) were built in 1912 to accommodate the government of India offices when New Delhi was being built.

New **Delhi.**—About 8 mi. S. of New Delhi, at the earliest site of Dilli, stands the Iron Pillar, unrusted despite centuries of exposure to wind and rain, with clear inscriptions. It is one of the most curious monuments in India and testifies to the metallurgical skill of the Hindus of the 4th century. Weighing about six tons, the pillar is a solid shaft of wrought iron with an ornamental top. It is 23 ft. 8 in. in length, with its diameter increasing from 12.5 in. at the top to 16.4 in. at the ground. The inscription of six lines describes the conquests of King Chandra Gupta II Vikramaditya (A.D. 375–413) and another inscription mentions the name of Raja Anangapala (1052–1109).

A few yards east of the Iron Pillar stands the famous Kutb Minar, regarded as one of the most perfect towers in the world. It is 238 ft. high with a base diameter of 47 ft. 3 in. and consists of 5 stories of red sandstone and white marble enclosing a spiral staircase of 376 steps leading to the top, which is 9 ft. in diameter. A bold projecting balcony, richly ornamented, runs round each story, and the dark bands of Arabic writing round 'the three lower stories contrast with the red sandstone. After much controversy over the origin of the Minar, it is now clear that it was originally a Hindu tower and a part of the temple that contained the Iron Pillar. The temple was later converted into the Kuvvat-ul-Islam mosque and the tower into the Kutb Minar. The alterations in the tower were started by Qutb-ud-Din in 1200 and completed by Iltutmish (Altamash) in 1220. It was struck by lightning in 1368 and almost entirely rebuilt by Firuz Shah who added one story. Damaged by earthquakes in 1782 and 1803, it was restored in 1829.

KUTB MINAR, BEGUN LATE 12TH CENTURY. NEW DELHI, INDIA

Among the hundreds of tombs lying to the south and the southeast of the city, the tomb of

Humayun, the second emperor of the Mogul dynasty, is the most imposing. It was built in 1565 by his widow, Haji Begum, who had shared his exile in Persia. This fine tomb in Persian style. standing in the middle of the spacious walled garden, was the first example of Mogul architecture and was a model for the Taj Mahal at Agra. In the centre stands a platform about 20 ft. high by 200 ft. square, supported by arches, and above it rises the mausoleum with a great dome of white marble. Beautiful in symmetry and proportion, this noble monument is built of rose-coloured sandstone inlaid with marble.

The Jantar Mantar (astronomical observatory) is a Rajput relic erected in 1710 by the astronomer king, Maharajah Jai Singh II of Jaipur. Built on the plan of Ulug-Beg's observatory of Samarkand and situated opposite New Delhi Municipal hall in Parliament street, it contains six stout masonry instruments devised to determine and study the location and movements of the sun, the moon and other celestial bodies.

THE UNION TERRITORY

The Union territory of Delhi consists of 304 villages and 10 towns. The district of Delhi was first constituted in 1819 in the Northwestern province of India. In 1858 it was transferred to the Punjab, but Delhi remained the divisional headquarters till 1912 when it became the capital of British India and a province with a chief commissioner under the direct control of the central government. In 1952 it was made a state and on the reorganization of the states in 1956 it was constituted a Union territory.

Administration and Population. — The territory is administered directly by parliament through the home minister, who has an advisory council. The chief executive officer is the chief commissioner. The municipal functions are covered by three local bodies: the Delhi Municipal corporation, New Delhi Municipal committee and the Delhi Cantonment board.

According to the census of 1961 the population of the Union territory has increased by 51% since 1951 when the figure was 1,744,072. This included 1,467,854 Hindus, 137,096 Sikhs and 99.501 Muslims. In the years 1950–60 literacy increased from 38.4% to 51%.

The people of Delhi have preserved the past in their festivals. The Hindu festivals of Dasehra and Diwali and the Muslim Id are celebrated as they were centuries ago. The latest national festivity, the Republic day celebrations on Jan. 26, is a big state event with its armed forces parade and colourful pageantry.

The University. — Delhi university, founded in 1922 as a residential university, has developed into a teaching and affiliating body with faculties of arts, science, law. medicine, education, social sciences. technology and music. There are numerous institutions affiliated to it, including the Lady Hardinge Medical College for Women, the College of Nursing, the Central Institute of Education, the Central College of Agriculture, the Delhi Polytechnic. the School of Economics, the School of Social Work, the School of International Studies and the Lady Irwin College for Women.

Industries. — The modern city of Delhi (with New Delhi) forms a large commercial and industria! centre. It is also famous for its handicrafts, particularly ivory-carving, jewelry, gold and silver-thread embroidery, metal work in brass and copper, and pottery. Two new areas have been developed for large-scale industries, the Okhla Industrial estate in the south and Najafgarh Industrial area in the west of the city. The main industries are cotton-milling, hand and power-loom weaving, flour-milling and the manufacture of hosiery, wire netting, rubber and leather goods, paints and varnishes and vegetable oil. Cottage industries have developed considerably since the partition (1947) and there are a large number of work centres mostly run and managed by refugee women

Agriculture mainly consists of growing millets, wheat, barley, sugar cane, fruits and vegetables.

Communications. — Delhi is one of the biggest railway junctions in India and the principal interstate roads also converge on the city. The Delhi Transport service is responsible for local bus and tram services. Delhi is linked with the rest of the world by air services operated through its two airports, Safdarjang and Palam.

DELHI, SULTANATE OF, the principal Muslim kingdom in north India from Sulta'n Iltutmish (1211–36) until its submergence in the Mogul empire under Akbar (1556–1605). It was made possible by the campaigns of Mohammed of Ghor and his lieutenant Qutb ud-din Aibak between 1175 and 1206 and particularly by the victories of Tara'in in 1192 and of Chandamar in 1194. The Ghorid Turk and Khalji soldiers of fortune in India did not sever their political connection with Ghor and Ghazni until Iltutmish had made his permanent capital at Delhi, had repulsed attempts by other former slaves of Mohammed of Ghor to take over the Ghorid conquests in India and, in the 1220s, had withdrawn his forces from contact with the Mongol armies which had, by then conquered the area of Afghanistan. Iltutmish also grasped firmly the main urban strategic centres of the north Indian plain, from which he could keep in check the refractory Rajput chiefs. A decade (1236–46) of factional struggle was succeeded by nearly 40 years of stability under Ghiyas ud-din Balban, first as na'ib of the kingdom and then as sultan (1266–87), when Delhi remained on the defensive against the Mongols and undertook only holding actions against the Rajputs. Under the Khalji sultans (1290–1320), however, the Delhi sultanate became an imperial power. 'Ala ud-din Khalji (1296–1316) conquered Gujarat (1297), the principal fortified places in Rajasthan (1301–12), and reduced to vassalage the principal Hindu kingdoms of southern India (1307–12). His forces also defeated (1297–1306) very serious Mongol onslaughts by the Chagatays of Transoxiana.

Mohammed ibn Tughlak (1325–51) attempted to settle a Muslim military. administrative and cultural elite in the Deccan with a second capital at Daulatabad (*q.v.*), but the Deccan Muslim aristocracy threw off the overlordship of Delhi and set up (1347) the Bahmani (*q.v.*) sultanate.

Firuz Shah Tughlak (1351–88) made no effort to reconquer the Deccan. The power of the Delhi sultanate in north India was shattered by the invasion in 1398–99 of the Turk Timur (*q.v.*), when Delhi itself was sacked. Under the Sayyids (1414–51) it was reduced to a country power continually contending on an equal footing with other petty Muslim and Hindu principalities. Under the Lodi Afghans (1451–1526), with the aid of large-scale immigration from Afghanistan, the Delhi sultanate partially recovered its hegemony. The Mogul Babur (*q.v.*) destroyed the Lodi sultanate at Panipat in 1526, but after 15 years of Mogul rule the Afghan Sher Shah Sur re-established the Afghan sultanate in Delhi until, in 1555, Humayun re-entered India to restake that Mogul claim to empire which his son Akbar was to make good.

The Delhi sultanate made no break with the political traditions of the later Hindu period; namely, that rulers sought paramountcy rather than sovereignty. It never reduced Hindu chiefs to unarmed impotence or established an exclusive claim to allegiance. The sultan was served by a heterogeneous elite of Turks, Afghans, Khaljis and Hindu converts; he readily accepted Hindu officials and Hindu vassals. Threatened for long periods with Mongol invasion from the northwest and hampered by indifferent communications, the Delhi sultans perforce left a large discretion to their local governors and officials.

DELIA, an ancient quadrennial festival of the Ionians, held on Delos (hence the name) in honour of Apollo. The local title was Apollonia, which seems always to have been used for the corresponding yearly festival. After great brilliancy in early times, it declined with the political importance of Ionia, but was revived in 426 by the Athenians as part of their imperial policy.

See M. P. Nilsson, *Griechische Feste,* pp. 144 ff. (1906).

DELIAN LEAGUE, a confederacy of Greek states under the leadership of Athens, with headquarters at Delos, founded in 478–477 B.C. after the repulse of the Persians from Greece. It was dissolved in 404 when Athens at the end of the Peloponnesian War capitulated to Sparta, but it was revived in a modified form in 377 and lasted until the defeat of the Athenians and their allies by Philip II of Macedonia at Chaeronea (338).

Background. — When in 499 the Ionian Greek cities of Asia Minor revolted against Persian rule, Aristagoras, tyrant of Miletus, appealed for help to the mainland Greeks. King Cleomenes I (see CLEOMENES) of Sparta refused help, but at Athens. traditionally the mother-city of the Ionians, the assembly agreed to send 20 ships and the Eretrians of Euboea sent 5. After sacking Sardis, the Persian governor's capital, the Ionians were defeated at Ephesus and the Athenians withdrew. The revolt was crushed within five years. The first Persian attempt to punish Athens failed at Marathon (490), and in 480 Xerxes led the full imperial levy, including Greeks from Asia Minor, to conquer Greece. This great expedition was unexpectedly but overwhelmingly defeated at Salamis and Plataea in mainland Greece and Mycale in Asia Minor (480–479). The Spartans had commanded by land and sea, but the Athenian navy, now considerably the largest in Greece, had turned the scales. In 478 a fresh force, led by Pausanias the Spartan regent, victor of Plataea, sailed first to Cyprus to drive out Persian garrisons from the Greek cities, and then to Byzantium, which commanded one of the easiest crossings from Asia to Europe and the entrance to the Black sea. At Byzantium Pausanias became increasingly overbearing and was recalled to Sparta; the allies led by Chios, Samos and Lesbos appealed to Aristides (*q.v.*), the Athenian commander, to lead them and the Delian League was formed. The Spartans, always reluctant to commit themselves heavily overseas, accepted the situation. (For a detailed narrative of this period see GRAECO-PERSIAN WARS.)

Organization. — The original organization of the league is sketched briefly but clearly by Thucydides (bk. 1, ch. 96). All Greeks were invited to join a confederacy to protect themselves from Persia and to retaliate for the damage done by the Persians. The Athenians were to supply the commanders-in-chief, who would also preside over meetings to discuss policy. They were to decide which states were to provide ships, and which money, and the money was to be received and controlled by Athenian treasurers, ten *hellenotamiae* ("treasurers of the Greeks"). Representatives of all member-states were to meet (probably annually) to discuss policy and every state was to have an equal vote. These meetings were to be held at Delos and there, in the temple of Apollo, the treasury was to be kept, for Delos had long been an Ionian religious centre familiar to the Athenians, the islanders and the Greeks of Asia Minor. Simple oaths of loyalty were taken by the allies to Athens and the alliance and by Athens to the allies. The autonomy of members was assumed rather than made explicit, for fear of Athenian dominance was quite alien to the mood. The original membership probably included most of the Aegean islands except Aegina, Melos and Thera, most of the cities of Chalcidice, the shores of the Hellespont and Bosporus, some of Aeolia (in north est Asia Minor), most of Ionia and a few eastern Dorian and non-Greek Carian cities. The assessment of tribute was entrusted to Aristides who, because of his fairness, remained popular. Thucydides says that the first total was 460 talents. His figure is widely considered too high, in view of later recorded assessments, but it is not impossible.

History. — The first task of the league was to drive Pausanias from Byzantium, which he had privately reoccupied when officially discredited. Next (476) the league forces under Cimon (*q.v.*) expelled the Persian garrison from Eion at the mouth of the Strymon river (Struma) in Thrace and won over the cities of the Thracian coast. Doriscus, unsuccessfully attacked, was the only Persian garrison left in Europe; Eion was occupied by Athenian settlers, as was the island of Scyros, cleared of its non-Greek piratical inhabitants in 475. Little is heard in our meagre sources of further action against Persia in the first 10 years, but no doubt further attacks were made on isolated Persian pockets and league membership was extended more widely into Caria and the Dorian cities of Asia Minor. But there were also warnings of Athens' later imperialism. In 472 Carystus, at the southern tip of Euboea, was forced into the league; a little later when Naxos wished to secede it was reduced and "subjugated" — Thucydides quotes this as the first occasion for such treatment of an ally. But these disturbing signs were eclipsed by the spectacular victory of the Eurymedon river (c. 467–466). Cimon sailed at the head of a large confederate fleet along the south coast of Asia Minor, driving out Persian garrisons and bringing the coastal cities into the league The Persians mobilized an army and naw at the mouth of the Eurymedon river (Kopru) in Pamphylia and were expecting reinforcements from Cyprus, which they had partly regained. Cimon struck fast and hard; the Persian fleet was destroyed, the camp sacked, and the reinforcements from Cyprus mere also defeated. In the following years small task forces sailed east of the Chelidonian (Besaldalar) isles (west of the Eurymedon, recognized by the Peace of Callias as a boundary mark for the Persian fleet) without opposition.

The great victory of the Eurymedon could not be more fully exploited, because a quarrel developed with the north Aegean island of Thasos (465). The Athenians' desire to extend their economic power in the Strymon area clashed with Thasian mining interests. The Thasians revolted, withstood a long siege, but after two years were reduced: they had to surrender their fleet and pay tribute instead, dismantle their walls, pay an indemnity, and give up their mainland possessions. But the attempt to settle a large colony of Athenians and allies at Ennea Hodoi ("Nine Ways," later Amphipolis) on the Strymon failed disastrously; the colonists were annihilated by the Thracians.

League policy entered on a new phase shortly afterward as a result of the eclipse at Athens of Cimon and the political triumph of the radical democrats led by Ephialtes (*q.v.*). In 461 relations between Athens and Sparta broke down and the Athenians were committed to war with the Peloponnesian league (460–445). At the same time, however, they launched a large-scale eastern offensive. They had already sent a large league force to win over Cyprus (460) when they accepted the appeal of Inaros, a Libyan prince who had raised Egypt in revolt. The league fleet was diverted to Egypt and from 460–454 attempted to secure control of Cyprus, Egypt and the eastern Mediterranean. After initial successes the league force was virtually destroyed in Egypt (though it is possible that a large part of the original fleet had been withdrawn to home waters). Meanwhile the Athenians at home, with allied contingents, had been campaigning successfully against the Peloponnesians. They had reduced their old trade rival Aegina to tribute-paying subjection and had extended their control over Boeotia and central Greece. The Egyptian disaster was a severe check to Athenian expansion. Cyprus as well as Egypt was lost and the Persians could reasonably be expected to mount an offensive. The Athenians used this argument to justify their transfer of the league treasury from Delos to Athens (454); the consequences were to be important. This act probably added to the unrest already caused by defeat; there is evidence of anti-Athenian movements about this time in Miletus, Erythrae, and Colophon. Hostilities in Greece were broken off, Cimon was specially recalled from ostracism and a five years' truce was made with Sparta (451). In 450 (or perhaps 451) Cimon again led a league force into the eastern Mediterranean; but Cimon died and the fleet withdrew after limited successes in Cyprus. This withdrawal marked the end of fighting against Persia; it is almost certain that hostilities were soon formally ended by the Peace of Callias *c.* 449. By this the Persian king Artaxerxes I guaranteed autonomy to the Greek states in Asia and undertook not to send his fleet into the Aegean, nor his troops into the territory of the Greek cities.

The Peace of Callias marks a decisive turning point; a league which had during the 450s become increasingly dominated by Athenian interests now became an acknowledged empire. The allies' independence was already undermined. Only Chios, Samos and Lesbos retained their fleets; the remainder had already converted ship contributions to tribute. It is probable that with the ending of war with Persia the league council ceased to meet. The Athenians after an abortive attempt to call a conference on a

general rebuilding program decided to use the league reserves to rebuild the Athenian temples destroyed by the Persians. Athenian siiver coinage, weights and measures were made compulsory throughout the empire. Tribute collection was tightened. These measures mere unpopular but Athens did not compromise. Athenians nere settled in cleruchies *(see* CLERUCHY) at strategic points; revolts were suppressed. In *446* when the truce with Sparta expired Boeotia regained its independence, Euboea revolted, and the revolt might have spread, but Pericles (*q.v*) reacted vigorously. Euboea was reduced and stiff terms were imposed; the Spartans acted only half-heartedly and were content to make a thirty years' peace with Athens recognizing the Athenian right to control the allies; even Aegina had to continue paying tribute, though the Aeginetans were formally guaranteed freedom in their internal affairs. Samos revolted in *440* but after stubborn resistance was reduced and Athens entered the Peloponnesian War (*q.v.*) with the empire intact, apart from the beginnings of trouble in Chalcidice.

The war *(431–404)* imposed serious strains on the allies. The Athenians demanded increased tribute to finance the war, and increased military support to replace their own losses. But the allies remained more loyal than the Spartans expected. The revolt of Mytilene was crushed *(428–427)*. There was widespread revolt in Chalcidice when the Spartan Brasidas (*q.v.*) intervened and Amphipolis was lost *(424)* but other areas remained secure until the defeat of the Athenians in Sicily *(413)*. Thera and Melos were forcibly incorporated into the empire After the Sicilian disaster revolt spread more widely but Athens was still supported by the democratic parties in most of the cities and Samos remained stubbornip loyal even after the decisive defeat at Aegospotami *(405)*.

Political Control. — Athens' iong hold over the allies is chiefly to be explained by the support of democracy. Oligarchs on the other hand were normally hostile and led the revolts of Samos, Mytilene and other states. When the Athenians suppressed revolts they normally imposed democracies and garrisons. Athenian political residents were stationed in many cities of the empire, and good use was made of local supporters, who were honoured as *proxenoi* and relied on for political intelligence.

Jurisdiction. — The evidence is difficult to interpret but it is clear that the Athenians interfered increasingly in jurisdiction and eventually made the allies bring cases involving the penalties of death, exile, loss of rights or total confiscation of property to Athenian courts. They also encouraged informers to bring cases at Athens against suspected oligarchs. In ordinary non-political cases, however. they seem not to have taken advantage of their power, but to have made procedural agreements (*symbolai*) individually with the cities according to current interstate custom.

Tribute. — The tribute was reassessed in the years of the Great Panathenaic Festival at Athens *(450, 446,* etc.), with certain exceptions *(443, 428,* 425), and adjusted according to the economic condition of the allies and the financial and political needs of Athens. So in the crisis of *446* a large number of reductions were made to conciliate the empire which were largely revoked after the Samian revolt had been crushed. More money was needed in wartime and higher assessments were imposed in *428* and in *425* when the total rose sharply to nearly 1,500 talents. In 414/413 the tribute was replaced by a 5% import and export tax but after the victory of Cyzicus *(410)* tribute was reimposed.

The Second League. — After the Peloponnesian War the Spartans inherited the Athenian opportunities for empire and squandered them. For political control they relied on narrowly based oligarchies in the cities arid purges without trial. Their commanders were ineffectual and unpopular. Meanwhile Athenian influence revived. The fortifications of Athens were restored and powerful allies were found in Corinth, Arpos and Boeotia. The Persian fleet, helped by Conon, defeated the Spartan fleet at the battle of Cnidus (394). War broke out with Sparta, bdt was concluded *(387–386)* by the Peace of Antalcidas, the terms of which were dictated by the Persian king Artaxerxes II *(see* ANTALCIDAS). In the following years the Spartans attempted to recover their supremacy and the Aegean world turned increasingly to Athens. The opportunity came when the Spartans, while campaigning in Boeotia, raided Attica in *378*. The Athenians with a small nucleus of allies, Chios, Mytilene, Methymna. Rhodes. and Byzantium devised terms for a new naval league which were published in *377*. They were soon joined by Thebes.

The terms of alliance were deliberately designed to show that the Athenians had learnt the lessons of the Delian league. There were to be no Athenian political residents in the cities and no garrisons. The Athenians undertook not to acquire property, publicly or privately, in any ally's territory. The allies' representatives were to meet under their own president and the agreement of both Athens and the allies, voting separately, was required beiore action could be taken. The autonomy of members was guaranteed and instead of tribute (*phoros*) imposed by Athens there were to be contributions *(syntaxeis)* made by the cities. The objective was by joint action to preserve the peace and prevent Spartan agression. The terms were popular and allies were quickly won. The main cities of Euboea joined at once, followed by many of the Aegean islands. A Spartan attempt in *376* to break Athens' growing naval power was defeated at the battle of Naxos. Naval demonstrations by Chabrias in the Aegean and by Timotheus in western waters led to the enrolment of many new members. By *371* at least *50* states had joined and the alliance had reached the peak of its effectiveness.

The defeat of the Spartans by the Boeotians under Epaminondas at Leuctra *(371)* marks the beginning of decline. There was no longer a common fear of Sparta to keep the allies together; the Thebans developed imperial ambitions and broke away; the Athenians, reacting to apathy or discontent among members, began again to interfere in jurisdiction and to use pressure to enforce the payment of contributions. New allies joined in the Peloponnese and the total swelled to *75* but many of the new allies soon lapsed. In *357* Mausolus, the satrap of Caria, stirred up an island league against the Athenians, who had to face war against Chios, Rhodes and Cos, joined later by Byzantium, Perinthus and Selymbria. The war was indecisive but expensive; in *355* peace was made and the Athenians recognized the independence of the rebels. The league continued to exist but with little effectiveness. When peace was negotiated with Philip II of Macedonia in *346* the allies' council passed a resolution, but it was ignored. Philip's crushing victory at Chaeronea *(338)* meant the end of the league.

BIBLIOGRAPHY.—The first league: most of the original sources are collected in G F. Hill, *Sources for Greek History, 2nd* ed (1951). *See* also B D. Meritt, H. T. Wade-Grey, and M. F. McGregor, *The Athenian* Tribute *Lists, 4* vol. (1939–53). The second league: F. H. Marshall, *The Second Athenian Confederacy* (1905); *A.* Accame, *La Lega Ateniese del sec. IV A C.* (1941). (R ME.)

DELIBES, (CLÉMENT PHILIDOR) LÉO (1836–1891), French composer of operas and ballets who. as a follower of Adolphe Adam, reflected the spirit of the second empire and who contributed to the 20th-century vogue for the ballet. Born at Saint-Germain-du-Val (Sarthe), on Feb. 21, *1836*. he studied at the Paris Conservatoire under Felix Le Couppey, Franqois Benoist, Franqois Bazin and Adolphe Adam, and in *1853* became accoinpanist at the Théâtre-Lyrique. He came before the public with a one-act operetta, *Deux Sous de charbon* or *Le Suicide de Bigorneau (1856)*. described as an *"asphyxie lyrique."* This was followed by a series of amusing operettas, parodies and farces in which Delibes was associated with Offenbach and other composers. They include *L'Omelette à la Follembuche* (1859), *Les Musiciens de l'orchestre* (1861), a parody of Auber's *Muette de Portici* in which Offenbach was one of his collaborators, *Les Eaux d'Ems* (1861), written for production in Germany, and *Le Boeuf Apis* (1865), a parody of Rossini's *Mosè*. In *Malbrouk s'en va-t-en guerre (1867)* Bizet was one of his collaborators. A new sphere was opened to Delibes by his appointment in 1863 as accompanist at the Paris Opéra. Here he collaborated with Ludwig Minkus in the ballet *La* Source (1866), and was commissioned to write his successful large-scale ballets, *Coppélia* (1870), based on a story of E. T. A. Hoffmann, and *Sylvia (1876)*. In the meantime he developed his gifts ior opera. *Le Roi l'a dit* was produced at the Opéra Comique in *1873* and was followed by *Jean de Nivelle (1880)* and *Lakmé* (1883), his masterpiece. His last opera.

Kassya, was completed by Massenet and produced in 1893. He was appointed professor of composition at the Conservatoire in 1881 and a member of the French Institute in 1884. He died in Paris on Jan. 16, 1891.

Delibes' work falls into three categories: operettas. ballets and operas. The wit of his operettas is found also in the music of his ballets, the original orchestration of which inspired Tchaikovsky. Among his operas *Jean de Nivelle,* written following a visit to Bayreuth, was overambitious, but in *Lakmé,* known by its coloratura "Bell Song" ("Où va la jeune indoue"), he illustrated oriental scenes with music of a novel exotic character. Delibes also wrote some picturesque songs, among which "Les Filles de Cadix" suggests the style of Bizet.

See H. de Curzon, *Léo Delibes (1926).* (E. LR.)

DELILAH (in the Douai version of the Bible, DALILA), in the Old Testament, the heroine of Samson's last love story (Judg. xvi). She was a Philistine who, bribed to entrap Samson, coaxed him (after several failures) into telling her the secret of his strength (his long hair), whereupon she took advantage of his confidence and betrayed him to his enemies. *See* SAMSON.

DELILLE, JACQUES (1738–1813), French *abbe'* and writer, greatly venerated by his contemporaries, was born at Clermont-Ferrand on May 27. 1738. He was educated at the College de Lisieux in Paris, became a teacher and meanwhile acquired gradual recognition as a poet. The publication in 1769 of his translation of the *Georgics* of Virgil made him famous, and in 1774 he was elected to the Academy. Shortly afterward he became professor of Latin poetry at the College de France and was given a valuable benefice—the abbey of Saint-Séverin—by the comte d'Artois, later Charles X. The outbreak of the Revolution caused the loss of these posts and he retired to St. Dié to complete his translation of the *Aeneid.* Later he emigrated, first to Switzerland, then to Germany and finally to London, where he translated *Paradise Lost.*

In 1802, having returned to France, he resumed his professorship and his chair at the Academy, but lived in retirement. He died at Paris on May 1, 1813.

Delille's original poems, of which the most notable are in *Jardins* (1782), *L'Homme des champs* (1800) and *Les trois règnes de la nature* (1808), show a great love of nature and, with his translations, enjoyed an enormous popularity during their author's lifetime. His reputation, however, did not long survive his death; and posterity has accepted Sainte-Beuve's verdict that not only was Delille not a great poet, but that he was scarcely a poet at all.

See V. Z. Örs, *Jacques Delille* (1936).

DELIQUESCENCE is the property of some substances of attracting and absorbing moisture from the atmosphere. The reverse is termed efflorescence (*q.v.*).

Some cornpounds are capable of forming hydrates by weak chemical union with water. When moderate heat is applied, they expel water vapour into the surrounding air and are dehydrated. Under subsequent exposure to moist air at ordinary temperatures the water is reabsorbed by deliquescence.

The effectiveness of calcined calcium chloride in settling road dust is a result of its deliquescence. When spread in the form of a powder or flakes, it absorbs more than its own weight of water and forms a liquid. (G. F. S.)

DELIRIUM is a mental disturbance marked by a specific kind of confused thinking (called disorientation) in which the patient incorrectly comprehends his surroundings. A patient in the hospital may think he is at home. Because of a disturbed sense of equilibrium he may think he is aboard ship. He is dronsy, restless and fearful of imaginary disasters. He may see imaginary animals that terrify him, and may think the building is on fire. Maniacal excitement may follow

Delirium usually results from some intoxication or other physical disorder. such as fever or heart failure or a blow on the head. that affects the brain It often results from the abuse of sedatives, especially bromide, and can be provoked by the too abrupt discontinuance of barbiturates in addicts. Alcoholic delirium—called delirium tremens because of the characteristic tremor—is due not merely to excessive consumption of. alcohol but to a complicating exhaustion, inanition and dehydration; prior to the outbreak of delirium the patient has usually been deteriorating physically owing to vomiting and restlessness.

Bewildering changes of scene facilitate the onset of delirium. When a patient is on the verge of delirium, transfer from home to hospital is therefore a threat. which can be lessened if members of his family stay with him. To be surrounded by familiar rather than strange faces and things is a protection.

Delirium usually, but not always, clears up fairly soon after the physical causes have been checked. Recovery depends not only on riddance of poisons but also on the extent of the damage they have done to the brain and on the capacity of reparative mechanisms to undo it. *See* also PSYCHOSES. (MX. L.)

DELIRIUM TREMENS, a type of delirium (*q.v.*) characterized by trembling! great anxiety. mental distress. sweating and pain over the heart or stomach. It usually occurs as result of excessive use of alcohol. *See* ALCOHOLISM: *Nature of Addiction.*

DELISLE, GUILLAUME (1675–1726), French cartographer who led the reform of map making in his own country, was born at Paris on Feb. 28, 1675. He was the son of the geographer and historian Claude Delisle (1644–1720), and brother of the astronomer Joseph Nicolas Delisle (1688–1768). As a pupil of G. D. Cassini. Delisle was able to incorporate in his maps the positions of many places accurately fixed by astronomical observations at the Paris observatory, with the resulting reformation of cartography in France. His earliest works. published in 1700, were a pair of globes. maps of the continents and a world map in hemispheres. Revised editions of these were published later in Delisle's career. and his output amounted to about 100 maps. While Delisle had little new material for the interiors of the continents. he was able to draw their outlines with much greater accuracy and to reduce the gross errors in longitude found in earlier maps. Delisle was the first to run longitudes from a prime meridian 20° W. of Paris. He was the author of treatises on mensuration and ancient geography. In 1702 he became a member of the Académie des Sciences. and in 1718 was appointed first *premier géographe du roi.* Delisle died at Paris. Jan. 25, 1726. (R. A. SN.)

DELISLE, JOSEPH NICOLAS (1688–1768), French astronomer who proposed in 1715 the diffraction theory of the sun's corona, was born in Paris on April 4. 1688. He visited England and was received into the Royal society in 1724, and left Paris for St. Petersburg on a summons from the empress Catherine in 1725. Having founded an observatory there. he returned to Paris in 1747, was appointed geographical astronomer to the naval department and installed an observatory in the Hôtel Cluny. He died of apoplexy at Paris on Sept. 12, 1768.

Delisle is also remembered as the author of a method for observing the transits of Venus and Mercury by instants of contacts. which was first proposed by him in a letter to J. Cassini in 1743. His *Mémoires pour servir à l'histoire et au progrès de l'astronomie* (1738) gave the first method for determining the heliocentric coordinates of sunspots.

DELISLE, LÉOPOLD VICTOR (1826–1910), French bibliophile and historian whose close study of medieval history, paleography and printing, and untiring industry made him an outstanding administrator of the Bibliothkque Nationale. He was born at Valognes (Manche), Oct. 24. 1826. and studied at the École des Chartes. His early works dealt with the history of his native province; and his study (1851) of the conditions of agriculture and the agricultural labourer in Normandy in the middle ages. which condensed material from local archives, showed the nature of his gifts and became a classic. He entered the manuscript department of the Bibliothkque Impériale (later Nationale) in 1852 and became administrator in 1874. There he brought order into the arrangement of manuscripts. and was responsible for starting the general catalogue (1897) and for many important acquisitions, notably valuable manuscripts from the Ashburnham collection. He also inaugurated the holding of exhibitions. In 1857 Delisle was elected to the Académie des Inscriptions et Belles Lettres and became a member of the staff of the *Recueil des historiens de la France,* editing entirely vol. 24, a primary source for 13th-

century social history. He also worked on the *Histoire littéraire de la France.* After his retirement (1905) he prepared a descriptive catalogue of the Musée Condé at Chantilly, where he died. July 21, 1910. His numerous published works include edited collections of documents on the reigns of Innocent III (1857), Charles V (1874) and Henry II of England (1909), and on the financial transactions of the Templars (1889).

See P. Lacome, *Bibliographie des travaux de L. Delisle* (1902; suppl. 1911); R. L. Poole, "Leopold Delisle," in *Proc. Brit. Acad.* (1911–12).

DELITZSCH, FRANZ (1813–1890), German biblical scholar, one of the foremost Old Testament exegetes of the 19th century and the leading Christian student of Judaica of his day, was born at Leipzig on Feb. 23, 1813. He was educated at the University of Leipzig and began his teaching career there in 1844. After teaching at Rostock and Erlangen, he returned to Leipzig in 1867. Delitzsch was a staunch Lutheran and combined deep piety with great learning. As some of his commentaries and other works were translated, he had a great influence on Old Testament studies in England and America before the critical school arose. Of Jewish descent, he was greatly interested in furthering the conversion of Jews. To this end he translated the New Testament into Hebrew and founded an Institute for Jewish Studies at Leipzig. At first averse to the "higher criticism," he made large concessions to it in his last years. He died at Leipzig on March 4, 1890.

Delitzsch's commentaries on Genesis (Eng. trans. 1888), Psalms (Eng. trans. 1886) and Isaiah (Eng. trans. 1890) deserve special mention. Of abiding interest are his attempts to bring to life the Jewish background of New Testament times, in such writings as *Jesus und Hillel* (1867); *Handwerkerleben zur Zeit Jesu* (1868; Eng. trans. 1902); *Ein Tag in Capernaum* (1871); and *Iris* (1888; Eng. trans. 1889).

FRIEDRICH DELITZSCH (1850–1922), son of Franz Delitzsch. a great Assyriologist and teacher of most of the men who developed that science up to the time of his death, was born at Erlangen on Sept. 3, 1850. and educated at Leipzig. He taught at Leipzig, Breslau and Berlin. His grammars, chrestomathies and dictionaries of Assyrian and Sumerian were of fundamental importance. Twice in his life Delitzsch created great sensations. His lectures *Babel und Bibel* (1902–03; Eng. trans. 1903), in which he claimed heavy dependence of the Old Testament on Babylonian prototypes, caused world-wide repercussions, but also had a profound effect in furthering excavations. His *Die Grosse Tauschung* (2 vol., 1920–21) expressed a disillusionment with the Old Testament heritage in Christianity and brought him the accusation of furthering anti-Semitism. Delitzsch contributed importantly to Hebrew lexicography and biblical geography. His *Assyrische Lesestücke* (5th ed. 1912), *Assyrisches Handwörterbuch* (1896) and *Assyrische Grammatik* (1889; Eng. trans. 1889) may be mentioned. He died on Dec. 19, 1922.

For Friedrich Delitzsch's theological views *see* E. G. Kraeling, *The Old Testament Since the Reformation* (1955). (E. G. KR.)

DELITZSCH, a town of Germany which after the partition of the nation following World War II became a regional capital in the *Bezirk* (district) of Leipzig of the German Democratic Republic. It is situated on the Lobe, a tributary of the Zwickauer Mulde, 30 km. (19 mi.) N. of Leipzig and 50 km. (31 mi.) S. of Dessau. Pop. (1959 est.) 22,793. One of the largest sugar beet-raising regions of the country surrounds Delitzsch; consequently there are a number of sugar and candy factories. In addition there are a refined-steel mill, a shoe factory, railway repair shops. tobacco and chemical plants. The town grew out of a Sorbian Wendish settlement and has a 14th-century castle. Later a possession of the bishops of Merseburg and the Saxe-Merseberg family, it was incorporated with electoral Saxony in 1738 and passed to Prussia in 1815.

DELIUM, BATTLE OF. The battle of Delium in 424 B.C. ended the Athenians' attempt to conquer Boeotia during the Peloponnesian War (*q.v.*). The plan to attack Boeotia at three points miscarried, and a Boeotian army of 7,000 hoplites, 1.000 cavalry and 10,000 light-armed troops caught as many Athenian hoplites and cavalry at Delium (the modern village of Dhilesi). The Boeotian commander, Pagondas, placed a mass of Theban hoplites, 25 ranks deep, on his right wing, which, crossing a ridge and charging downhill. overwhelmed the Athenian left wing, which was in the usual formation, 8 ranks deep. Meanwhile the Athenian right wing was victorious, but Pagondas moved all his cavalry thither and took the Athenians in the flank. Victory was complete, the Athenians losing 1 000 hoplites. (N. G. L. H.)

DELIUS, FREDERICK (1862–1934), British composer, one of the most distinctive figures in the revival of English music at the end of the 19th century, was born at Bradford, Yorkshire, Jan. 29, 1862, the son of Julius Delius, a German manufacturer who had become a naturalized British subject in 1860. The younger Delius was educated at Bradford grammar school and the International college. Isleworth, London. After a period as a traveler for his father's firm, he went in 1884 to Florida as an orange planter, but devoted his spare time to musical study with a friend. Thomas Ward, an organist. In 1886 he left Florida for Leipzig and there underwent a more or less regular training from Salomon Jadassohn and became a friend of Edvard Grieg. Two years later he went to live in Paris and after his marriage in 1901 to the painter Delka Rosen he made his home at Grez-sur-Loing (Seine-et-Marne). Some songs, an orchestral suite *(Florida)* and an opera *(Irmelin)* were all written before he had a work published, the first published work being *Legend* for violin and orchestra (1893). These were followed by more ambitious works which aroused considerable interest, especially in Germany, during the first decade of the 20th century. Three of his six operas *(Koanga,* 1895–97; *A Village Romeo and Juliet,* 1900–01; and *Fennimore and Gerda,* 1908–10) and several of his larger choral and orchestral works *(Appalachia,* 1902; *Sea Drift,* 1903; *Paris: the Song of a Great City,* 1899) were first heard in Germany. Later his reputation spread to England, mainly through the persuasive advocacy of Sir Thomas Beecham, who was his finest interpreter.

Even after he was stricken blind and paralyzed in his early 60s, Delius continued to compose, working with an amanuensis, Eric Fenby. His other major works included *A Mass of Life* (1904–05) and a *Requiem* (1914–16). both to texts by Nietzsche; *Brigg Fair* (1907) for orchestra; four concertos for various instruments; three sonatas for violin and piano; and many smaller orchestral pieces and songs. He was created a Companion of Honour in 1929. He died at Grez-sur-Loing on June 10, 1934.

In distinction and originality of idiom Delius' music can hold its own with that of his contemporary Elgar, and for a time he was considered by many to be a composer of equal stature. But his expressive range was more limited and his invention less vigorous than Elgar's. His miniatures, such as the haunting orchestral tone poem *On Hearing the First Cuckoo in Spring* (1912), are the works that have held their place best.

DELLA CRUSCANS, THE, a group of insignificant English versifiers led by R. Merry, who was actually a member of the Florentine academy *della* Crusca—hence the name, and Hannah Cowley (1743–1809; wrote as Anna Matilda). Their first production was a *Florentine Miscellany* (1785) to which Mrs. Piozzi (*q.v.*) contributed. Returning to England in 1787, Merry began to publish verses in *The World,* and the collected poems of the group appeared in *The British Album* (1789, four editions). In 1794 William Gifford (*q.v.*) fell upon them in *The Baviad,* giving quotations which amply justify the severity of his satire. He renewed the attacks in *The Maeviad* (1795) and there are references to the Della Cruscans in T. J. Mathias' *Pursuits of Literature* (1794–97). The Della Cruscan manner came merely to stand for a particular kind of fantastic and insipid verse.

DELLA ROBBIA: *see* ROBBIA, DELLA.

DELLO JOIO, NORMAN (1913–), U.S. composer, one of the most successful exponents of neoclassicism in the United States. was born in New York city on Jan. 24, 1913. A member of a musical Italo-American family, he studied organ with his father and with Pietro Yon, and composition with Bernard Wage-

naar and Paul Hindemith. He developed a technique of practical modernism; his works are often played in the U.S. They include two operas on the life of Joan of Arc, *The Triumph of Saint Joan* (1950) and *The Trial at Rouen* (1956); an opera on an American historical subject, *Blood Moon* (1961); *Ricercari* for piano and orchestra (1946); *Three Symphonic Dances* (1947); sextet for three recorders and string trio (1943); several ballets. sacred and secular choruses, various chamber works, three piano sonatas, and songs. In 1957 he received the Pulitzer prize in music for *Meditation on Ecclesiastes* for string orchestra. (N. SY.)

DELMARVA PENINSULA, a part of the Atlantic coastal plain of the United States, bordered on the west by Chesapeake bay, on the east by Delaware bay and the Atlantic ocean. It derives its name from the three states (Delaware, Maryland, Virginia) among which its area is divided. The peninsula is a lowland 176 mi. long and up to 70 mi. wide. Its smooth ocean coast line is dotted with beach resorts; on its deeply indented Chesapeake bay shore lie several small fishing ports. Rural industries include poultry farming, livestock raising and vegetable farming. The commercial centre of the peninsula is Salisbury, Md.

(F. O. A.)

DELMEDIGO, a Cretan Jewish family prominent during the Renaissance. Its most important members are:

ELI-AH DELMEDIGO (*c.* 1460–1497), philosopher, who was born and died in Candia (modern Iraklion), Crete, taught in several Italian centres of learning (Pico della Mirandola was one of his pupils). He translated some of Averroes' commentaries into Latin and wrote a Latin commentary on Aristotle's *Physics*. His principal work, *Behinat ha-Dat* ("Investigation of Religion"), departs from the scholastic identification of religion and philosophy. He strongly criticized the Cabala.

JOSEPH SOLOMON DELMEDIGO (1591–1655), a great-grandson of Elijah Delmedigo and a pupil of Galileo, wrote many books on science and philosophy. In his *Masref le-Hokhmah* he defends the Cabala against Elijah Delmedigo's strictures, but his attitude toward both mysticism and philosophy wavers considerably. Born in Candia, he traveled extensively in Europe, practising medicine in several cities. He died in Prague.

DELMENHORST, a town of Germany which after partition of the nation following World War II was included in the *Land* (state) of Lower Saxony, Federal Republic of Germany. It is situated on the Delme about 5 km. (3 mi.) from its confluence with the Ochtum, a tributary of the Weser, and 15 km. (9 mi.) W. of Bremen by road. Pop. (1959 est.) 55,238. Delmenhorst is an industrial town but has wide streets and the feeling of a garden city. The parish church has burial vaults of the dukes of Oldenburg Fitger house was the birthplace of the painter-poet Arthur Fitger in 1840. Wool, jute, linoleum, cork products, metalwork, food, luxury goods, clothing and chemical articles are produced Delmenhorst was first mentioned about 1260. A branch of the family of the dukes of Oldenburg lived there in a massive moated castle, in the shadow of which the town developed. It reached civic status in 1371. In World War II Delmenhorst was captured by the Allies in April 1945.

DELONEY, THOMAS (1j63?–1600), English writer of ballads, pamphlets and prose stories which form the earliest English popular fiction. By trade a silk weaver, probably of Norwich, Deloney wrote topical ballads and. through his pamphlets, took part in religious controversy. For alleged sedition he was proscribed in London and. as an itinerant weaver and ballad seller, collected material in the provinces for his prose stories. His "many pleasant songs and pretty poems to new notes" appeared as *The Garland of Good Will* (1593). *Strnnge Histories of Kings, Princes, Dukes, Earls, Lords, Ladies, Knights, and Gentlemen*, in verse, and a long poem. *Cnnnan's Calamity,* are undated. His *Jack of Newbury* (1597), *The Gentle Craft,* parts i and ii (1597–*c.* 1598) and *Thomas of Reading* (1599?) furnished plots for such dramatists as Thomas Dekker. Deloney died in March 1600.

Though widely read. Deloney was condemned by the university-educated writers as a mere ballad maker and purveyor of plebeian romance: and his literary merits went unrecognized until the 20th century. There is poetry as well as patriotism in his ballads. and while in his fiction he glorifies common life and the English artisan, he portrays people with humour and some irony. achieving both simple comedy and simple tragedy. Long Meg of Westminster, in *The Gentle Craft,* is especially lifelike and entertaining: Deloney excels at reproducing women's artless conversation. His power as a narrator is shown in the horror of the coid-blooded murder of Thomas of Reading (typically he relieves the tension with a report of wry gossip on the event). Although the structure in each book is episodic. coherence. with climax, can be found; and on this rests his claim to the invention of the English popular novel.

See the *Works* of *Thomas Deloney,* ed. *by F.* O. Mann (1912); A. Chevalley, *Thomas Deloney. Le roman des métiers au temps de Shakespeare* (1926); *R.* G. Howarth. *Two Elizabethan Writers* of *Fiction: Thomas Nashe and Thomas Deloney* (1956). (R. *G.* HH.)

DE LONG, GEORGE WASHINGTON (1844–1881), U.S. explorer whose disastrous arctic expedition confirmed the theory of transarctic drift, was born in New York city on Aug. 22, 1844. He graduated from the U.S. Naval academy in 1865 and entered the U.S. navy, attaining the rank of lieutenant in 1869, and lieutenant commander in 1879. In 1873 he sailed in the "Juniata" from Upernavik, Greenland to search for and relieve the American arctic expedition in the "Polaris." In 1879 he again set out for the arctic in the "Jeannette," but the ship was caught in the polar ice pack on Sept. 5, 1879, and drifted until it was finally crushed on June 13, 1881. About 14 members of the expedition survived, one of whom was De Long. He succeeded in reaching the mouth of the Lena river in one of the boats. only to die of starvation at the end of October or the beginning of November of 1881. His journal, in which he made regular entries until the day of his death, was edited by his wife and published in 1883 under the title of *Voyage of the "Jeunnette."* Three years after the ship was sunk, several articles belonging to the crew of the "Jeannette" were found on an ice floe on the southwest coast of Greenland. This discovery gave new support to the theory of a continuous ocean current passing along the then unknown polar regions.

DELORME (DE L'ORME), **PHILIBERT** (*c.* 1510–1570), French architect, one of the great masters of the Renaissance, was born at Lyons. the son of the master mason Jehan Delorme. From about 1533 to 1536 he lived in Rome. where he made excavations, was a member of the Académie Vitruvienne and was employed by Pope Paul III. In 1536 he built a mansion at Lyons for the finance minister of Brittany, who appointed him controller of fortifications for the province in 1540, and during 1541–47 he built the chdteau of St. Maur near Paris for Cardinal Jean du Bellay, whom he had known at Rome. In 1545 he became architect to the dauphin, who succeeded as Henry II in 1547 and appointed him overseer of buildings in 1548 and abbé of Ivry in 1549. His chief works for the king were the tomb of Francis I at St. Denis (1547); the royal arsenal (1547–50); the royal stables (1554); the chapel at Vincennes (1548–56); additions to the palace of Fontainebleau (1548–58); the chapel in the park of Villers-Cotterets (15jj); and the new chdteau at St. Germain-en-Lnye (1556). For Diane de Poitiers he built the magnificent chdteau at Anet (1547–56) and part of Chenonceaux (1556–59). He fell from royal favour after the death of the king (1559) but was called by Catherine de Medici in 1564 to build for her the Tuileries. He was also responsible for work at Notre Dame, of which he was a canon. He died in Paris, Jan. 8. 1jjo.

A man of independent mind and vigorous originality, and an ardent humanist and student of antiquity. Delorme successfully grafted the spirit of Renaissance new learning onto the classic French tradition. The theory behind his practice is expounded in two books written during his retirement from court, *Nouvelles inventions* (1561) and *Architecture* (1567, revised in 1568).

(L. HR.)

DELOS (mod. Gr. DHILOS, sometimes distinguished as Little

Delos [Mikra Dhilos] as opposed to Great Delos [Megali Dhilos], the uninhabited adjacent island now called Rinia), a Greek island in the Aegean, is the smallest but most famous of the Cyclades and, according to ancient belief, the island round which the group arranged itself in a nearly circular form. It is a rugged mass of granite, about 3 mi. long and ½ to 1 mi. broad, about ½ mi. E. of Rinia and 2 mi. W. of Mikonos. Toward the centre it rises to a height of 350 ft. in the steep and rocky peak of Mt. Cynthus, which, though overtopped by several eminences in the neighbouring islands, is very conspicuous from the surrounding sea. A museum m s built to contain the antiquities found in the excavations on the island; otherwise Delos is largely uninhabited.

Archaeology. — Excavations were made by the French school at Athens slowly but systematically from 1873. The sacred precinct of Apollo was recovered, as well as the commercial quarter of Hellenistic and Roman times, the theatre, the temples of the foreign gods, the temples on the top of Mt. Cynthus and interesting private houses. Sculpture of all periods was found, and extensive series of inscriptions throwing light upon temple administration.

The ancient mole faces the channel between Delos and Rinia. The precinct is approached by an avenue flanked by porticoes, that upon the seaside bearing the name of Philip V of Macedonia, who dedicated it about 200 B.C. This was the usual approach for sacred embassies and processions; but Nicias of Athens, on the occasion of his embassy, built a bridge from a reef known as the island of Hecate to Delos, that the Athenian procession might not miss its full effect. Facing the avenue were the propylaea, the chief entrance, with a projecting portico of four columns. The sacred road continued across an open space, with the precinct of Artemis on its west side and, on its east side, a terrace on which stood three temples. The southernmost of these was the temple of Apollo, but only its back was visible from the west. The other two faced west and were either dedicated to heroes or minor deities or were treasuries. Beyond them the road sweeps round to the front of the temple of Apollo. The outer side of this curve is bounded by a row of treasuries, similar to those at Delphi and Olympia, to house the offerings of various islands or cities. The temple of Apollo could also be approached directly from the entrance, through a passage with a porch at either end. Just to the north of this is the basis of the colossal Apollo dedicated by the Naxians, with its well-known Archaic inscription and two large fragments of the statue itself.

The temple of Apollo, the centre of the whole precinct, was of Doric style, begun in the mid-5th century B.C. but not finished until the 3rd. Its sculptural decoration was scanty. The metopes were plain. The acroteria were taken to the national museum at Athens. At the one end was Boreas carrying off Oreithyia, at the other Eos and Cephalus, the centre in each case being occupied by the winged figure. To the east of the temple was an oblong prytaneum or other official building with a colonnade on each side. Beyond it is the most interesting and characteristic of all the monuments of Delos, a long narrow hall, entered by a portico at its south end. At the north end was the famous altar, built out of the horns of the victims, which was sometimes reckoned among the seven wonders of the world. The rest of the room is taken up by a paved space surrounded by a narrow gangway; and on this it is supposed that the *geranos,* or stork dance, took place. The most remarkable architectural feature of the building is the partition that separated the altar from this long gallery. This is distyle in antis, with capitals of a very peculiar form, consisting of the fore parts of bulls set back to back. From these the whole building is sometimes called the sanctuary of the bulls. Beyond it, on the east, was a sacred wood filling the space up to the wall of the precinct, and at the south end of this was a small open space with the altar of Zeus Polieus.

At the north of the precinct was a broad road, flanked with votive offerings and exedrae, and along the boundary were porticoes, reception chambers and two entrances through broad propylaea. At the northwest corner is a building of limestone, often mentioned in the inventories of treasures. South of it is the precinct of Artemis, containing within it the old temple of the goddess. Her more recent temple was to the south, opening into the precinct of Apollo. The older temple is mentioned in some of the inventories as "the temple in which were the seven statues"; and close beside it was found a series of Archaic draped female statues, the most important of its kind until the discovery of the finer and better preserved set from the Athenian acropolis. Outside the precinct of Apollo, on the south, was an open place; between this and the precinct was a house for the priests, and aithin it, in a kind of court, a set of small structures identified as the tombs of the Hyperborean maidens. To the east was the temple of Dionysus, of peculiar plan. On the other side of it was a large court. forming a commercial exchange. with a temple to Aphrodite and Hermes.

To the north. between the precinct and the sacred lake, are extensive ruins of the commercial town including a sort of club or exchange and the new and the old palaestra. The shore of the channel facing Rinia is lined with docks and warehouses, and behind them are private houses of the 2nd or 3rd century B.C. Each consists of a single court surrounded by columns and often paved with mosaic; various chambers open out of the court, including usually one of large proportions, the andron or dining room for guests. The theatre, set in the lower slope of Mt. Cynthus, has the wings of the auditorium supported by massive substructures. The skene consisted of an oblong building of two stories surrounded by a low portico reaching to the level of the first floor. This was supported by pillars, set closer together along the front than at the sides and back. An inscription showed that this portico, or at least the front portion of it, was called the proscenium or logeion, two terms the identity of which was previously disputed. On the summit of Mt. Cynthus, above the primitive cave-temple which has aluays been visible, is a small precinct dedicated to Zeus and Athena. Some way down the slope of the hill, between the cave-temple and the ravine of the Inopus, is a terrace with the temples of the foreign gods Isis and Sarapis, and a small odeum. Between the theatre and the harbour is the main excavated area of houses, many with fine mosaics. Near the northern tip of the island are the gymnasium, the stadium and an early synagogue. *(See* also GREEK ART for works of art found on Delos.)

History. — Of the various traditions that were current among the ancient Greeks regarding the origin of Delos, the most popular describes it as drifting through the Aegean till moored by Zeus for the wandering Leto as a birthplace for Apollo and Artemis. Excavations have shoan that the island was occupied in the Mycenaean period, possibly by "Carians." It first appears in history as the seat of a great Ionic festival to which the various Ionic states, including Athens, were accustomed annually to dispatch a sacred embassy, at the anniversary of the birth of Apollo on the 7th of Thargelion (about May). In the 6th century B.C. the influence of the Delian Apollo was at its height; Polycrates of Samos dedicated the island of Rinia to his service and Pisistratus of Athens caused all the area within sight of the temple to be cleared of the tombs by which its sanctity was impaired. After the Persian Wars the predominance of Athens led to the transformation of the Delian league into the Athenian empire. (See DELIAN LEAGUE.) In 426 B.C., in connection with a reorganization of the festival, which henceforth was celebrated in the third year of every Olympiad, the Athenians instituted a more elaborate lustration, caused every tomb to be removed from the island and established a law that ever after anyone who was about to die or to give birth to a child should be at once conveyed from its shores. Even this was not accounted sufficient, for in 422 they expelled all the secular inhabitants, who were, however, permitted to return in the following year.

At the close of the Peloponnesian War (*q.v.*) the Spartans gave to the people of Delos the management of their own affairs, but the Athenian predominance was soon after restored and survived an appeal to the amphictyony (*q.v.*) of Delphi in 345 B.C. During Macedonian times, from 322 to 166 B.C., Delos again became independent, and the temple and its possessions were administered by officialscalled *hieropoioi.* After 166 B.C. the Romans restored the control of Delian worship to Athens, but granted to the island various commercial privileges which brought it great prosperity. In 87 B.C. Menophanes, the general of Mithradates VI of Pontus

(see MITHRADATES), sacked the island, which had remained faithful to Rome. From this blow it never recovered. The Athenian control was resumed in 42 B.C., but Pausanias mentions Delos as deserted except for a few Athenian officials and several epigrams of the 1st or 2nd century A.D. attest the same fact. though the temple and worship were probably kept up until the official extinction of the ancient religion. *See* also references under "Delos" in the Index volume.

(J. Bo.)

DELPHI, a place in ancient Greece in the territory of Phocis (near the modern village of the same name in the *nomos* of Phthiotis and Phocis), famous as the seat of the most important temple and oracle of Apollo *(see* ORACLE). It lies on the steep lower slope of Mt. Parnassus with the *Phaedriades* or "shining rocks" rising high above. From a cleft between these rocks, near the sanctuary, flows the Castalian spring. The site'resembles a theatre, looking out southward across the valley of the Plistus river to Mt. Cirphis The Gulf of Corinth, 6 mi. away, is not visible from the sanctuary.

Delphi was considered by the Greeks to be the centre of the earth. The story was told of how Zeus released two eagles, one from the east, the other from the west and caused them to fly toward the centre. They met at Delphi, and the spot was marked by a stone in the temple known as the *omphalos* ("navel").

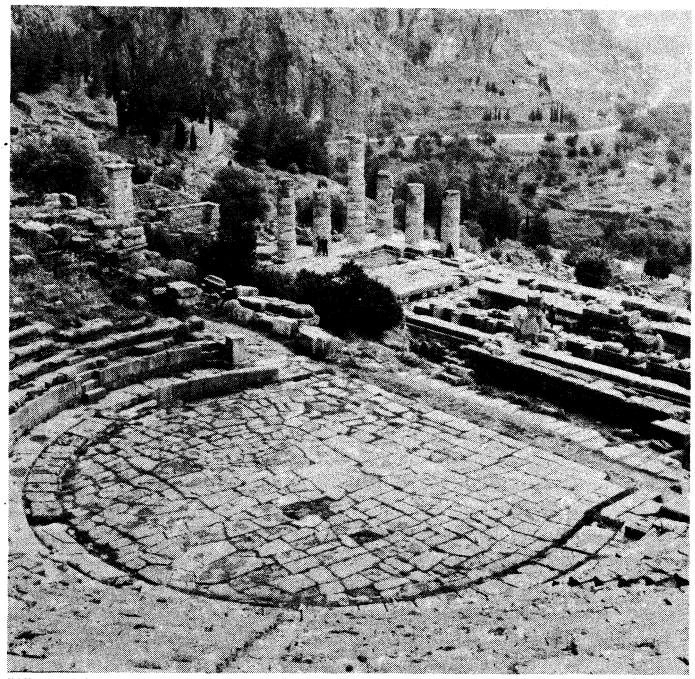
According to legend the Delphians originally lived on the plateau above the cliffs at a place called Lycorea near the Corycian cave and later moved down to Delphi, then called Pytho. The oracle originally belonged to the Earih Goddess and was guarded by a serpent, Python. It was later taken over by Apollo, who slew the Python.

Excavations have shown that Delphi has been continuously inhabited since the 14th century B.C., that is, from Late Mycenaean times, but remains of this and subsequent periods are scanty. The history of Delphi really begins in the 6th century B.C. The Sacred War of about 590 B.C. destroyed the nearby town of Crisa, which had been taxing pilgrims, and opened free access to Delphi *(see* AMPHICTYONY). Delphi joined the Amphictyonic league and soon became one of its chief centres. The Pythian games were reorganized in 582 B.C. and raised to Panhellenic status, being celebrated every four years, in the middle of each Olympiad (the four-year period between Olympic festivals). The prestige of the oracle was now at its height. It was consulted not only on private matters but on affairs of state, and its utterances often swayed national policy. It mas also consulted whenever a colony was to be sent out, and so its fame spread to the limits of the Greek world. Between 356 and 346 B.C. the Phocians forcibly occupied Delphi, appropriated the temple treasure, and melted down many valuable offerings. They were driven out only when Philip II of Macedonia joined the coalition against them. This was Philip's first appearance on the Greek scene which he was soon to dominate. In early Roman times Delphi was frequently pillaged; Nero is said to have removed 500 statues.

With the triumph of Christianity the old pagan sanctuary fell into decay. Constantine the Great removed the tripod support of intertwined serpents dedicated by the Greek cities after the battle of Plataea (479 B.C.); this still exists in the Hippodrome in Constantinople. Julian the apostate (emperor A.D. 361–363) afterward sent his quaestor, the doctor Oribasius, to restore the temple, but the oracle responded to the emperor's enthusiasm with nothing but a wail over the glory that had departed.

The site of Delphi was occupied by the modern village of Castri until 1890. when the village was moved to a site nearby and renamed Delphi. Systematic excavation by the French school of archaeology began in 1892. The plan of the precinct is now easily traced, and with the help of Pausanias' travel-book of the 2nd century A.D. many of the buildings have been identified.

The sanctuary was a large, roughly rectangular area enclosed by a wall. The sacred way, lined with monuments and treasuries, wound up through it to the temple. The monuments were offer-



TONI SCHNEIDERS

ANCIENT THEATRE AND TEMPLE OF APOLLO IN THE SACRED PRECINCT OF DELPHI. TO THE RIGHT IS THE VALLEY OF THE PLEISTUS

ings to Apollo erected by states or individuals in thanks for favours bestowed by the god. Some celebrated victories of Greeks over barbarians: the trophies of Marathon were displayed beside the Athenian treasury; the cables of Xerxes' bridge over the Hellespont were hung on the great polygonal wall, protected by a *stoa* (colonnade). Other monuments celebrated victories of Greeks over Greeks: the Spartans over the Athenians at Aegospotami (405 B.C.); the Arcadians over the Spartans (369 B.C.).

Treasuries, small temple-like buildings, were erected by many Greek states. The treasury of Siphnos, built about 525 B.C., was a richly decorated Ionic building with caryatids instead of columns and with a beautiful sculptured frieze most of which is preserved. The Athenian treasury is Doric and has been rebuilt with the original blocks. It has sculptured metopes depicting the adventures of Theseus and Heracles. The famous inscriptions with hymns to Apollo accompanied by musical notation are on the wall of this building.

At the heart of the sanctuary is the great temple of Apollo; its altar, given by the people of Chios. stands in front. The existing temple dates from the 4th century B.C. Only the foundations and some steps are preserved; a few columns have been re-erected. The temple had 6 columns across the ends and 15 along the sides. The oracle was in a chamber at the rear but the existing remains reveal nothing about its interior arrangement or working. Two earlier temples are known from actual remains. Of the first, about 600 B.C., some archaic capitals and wall blocks are preserved. This temple was burned in 548 B.C. The second temple was begun in limestone and finished in marble at the end of the 6th century by the Alcmaeonidae (*q.v.*) exiled from Athens. Pediment sculptures and many blocks of this temple are preserved. It was destroyed by an earthquake in 373 B.C. Above the temple is the theatre, and higher still is the stadium. The gymnasium lies below the Castalian spring to the east and beyond it is the sanctuary of Athena Pronaia nith two temples, two treasuries and the *tholos,* a remarkable round building of unknown purpose.

DELPHINIA, a festival of the Delphic Apollo (Delphinius) held annually on the 6th (or 7th) of the month Mounichion (April) at Athens. All that is known of the ceremonies is that a number of girls proceeded to Apollo's temple (the Delphinium) carrying suppliants' branches and seeking to propitiate him, probably as a god having influence on the sea. It was at this time of the year that navigation began again after the storms of winter. According to a story in Plutarch, the festival was instituted by Theseus to commemorate his voyage to Crete.

See L. Deubner, *Attische Feste,* p. 202 (1956). (H. W. PA.)

DELPHINIUM: *see* LARKSPUR.

DELPHINUS, a small constellation appearing in the northern hemisphere not far from Altair, the brightest star of the constellation Aquila. As its name signifies, it was supposed by the ancients to represent a dolphin. γ Delphini is a double star, the yellowish component being of magnitude **4,** and the bluish component of the 5th magnitude *(see* CONSTELLATION).

DELTA, the land form produced by deposition of alluvium where a stream enters a body of quiet water, the decrease in velocity causing the stream to drop its load of sediment. ,The name is derived from the shape; many deltas resemble the Greek (Δ) letter of that name. Most deltas are very flat, the highest points being less than 50 ft. above sea level. On many deltas because of extreme flatness the river develops several discharge channels called distributaries; commonly some of the distributaries are used only during flood periods.

The detailed form of a delta is determined partly by the character of the river and partly by conditions in the body of water into which the river discharges. In deltas where active deposition is occurring at the mouth of several distributaries, lobes are formed at each of the distributary mouths; the lobes and the main delta mass look on a map or aerial photograph like a bird's foot. and are called "bird's foot deltas." Where wave erosion is active the areas between the lobes develop a cuspate form. Rounded deltas develop where the delta edge is being continuously modified by waves and currents. Where marine erosion is extremely active no delta develops.

The Mississippi delta is the largest in the world. *See* also RIVER AND RIVER ENGINEERING. (W. C. C.)

DELTA AMACURO, federal territory in northeast Venezuela, area 15,521 sq.mi., pop. (1961) 33,760. It consists of the swampy Orinoco river (*q.v.*) delta. The American steel companies operating at El Pao and Cerro Bolivar transport iron ore to the Atlantic via the Río Grande del Orinoco and the Boca Grande, two of the Orinoco's distributaries, which are dredged and made usable 24 hr. a day for vessels drawing 30 ft. of water. The climate is hot and rain falls throughout the year. Several forest products are collected, including gum. balata. divi-divi and mangrove bark. A little farming is carried on: bananas, corn, rice, coconuts and sugar cane are produced. Native Indians ply the various distributaries, subsisting mainly on fish. The territorial capital is Tucupita (pop. 8,172). (L. WE.)

DELTA RAYS, a stream of slowly moving electrons emitted when α particles impinge on matter. *See* RADIOACTIVITY, NATURAL: *Nature and Properties of α Rays.*

DELUC, JEAN ANDRÉ (1727–1817), Swiss geologist, meteorologist and physicist especially remembered for his invention of the dry pile (a type of voltaic pile), was born on Feb. 8, 1727, at Geneva. For the first **46** years of his life he was engaged in local commerce and politics and in making scientific excursions among the Alps. In 1773, however, he settled in England, was made a fellow of the Royal society and appointed reader to Queen Charlotte; and this gave him means and leisure to pursue his scientific interests.

Deluc's principal geological work, *Lettres physiques et morales sur les montagnes et sur l'histoire de la terre et de l'homme* (1778; **6** vol., 1779), explained the six days of the Biblical account of creation as so many epochs preceding the actual state of the globe. In physics, Deluc discovered that water was more dense at about 40° F. (4° C.) than at higher and lower temperatures and that heat was required in the melting of ice—an observation on which Joseph Black founded, at about the same time (1761), his concept of latent heat. Deluc was also the originator of the theory, readvanced in 1801 by John Dalton and subsequently known under the latter's name. that the quantity of water vapour which any space can contain is independent of the presence of any other gas in the space. He invented a new hygrometer (though this was not of lasting importance) and advanced the first correct and most important rules for measuring height by means of the barometer, *i.e.,* that the logarithm of the pressure decreases proportionately with increase of height and with the inverse of the temperature of the air (see *Philosophical Transactions* of *the Royal Society,* p. *158,* 1771).

Deluc's invention of the dry pile is a device consisting of a series of parallel plates, alternately of different material, between the ends of ahich there is developed a difference of voltage. The nature of the action of this pile was the subject of much controversy. but the pile itself was widely used in early electrical experiments by physicists and has been regarded as his chief discovery. Deluc died at Windsor, Eng., on Nov. 7, 1817.

Among Deluc's works are: *Recherches sur les modifications de l'atmosphère,* 2 vol. (1772), which contains accounts of many physical experiments; and *Traité élémentaire de géologie* (1810; Eng. trans. by H. de La Fite, *An Elementary Treatise on Geology,* 1809).

See also the *Philosophical Transactions of the Royal Society* and the *Philosophical Magazine* for papers by him. (P. A. SH.)

DELUGE is the name given to a great flood of water submerging the whole or a large part of the earth's surface, legends of which occur in the traditions of many peoples. *See* DEUCALION; FLOOD *(IN* RELIGION AND MYTH) ; GENESIS; GILGAMESH, EPIC OF.

DELUSION, a false belief that is not susceptible to correction by reason or logic. Paranoia and the paranoid states are characterized by fixed delusional systems. *See* PARANOID REACTIONS: PSYCHOSES: *Symptoms of Psychosis; Schizophrenia.*

DEMADES (*c.* 380–318 B.C.), Athenian orator and diplomat. From humble beginnings he rose to a leading place in Athenian politics by his vigorous oratory and his shrewd understanding of the people's mood. He opposed the attempt of Demosthenes to arouse the Athenians in support of Olynthus against Philip II of hlacedonia. and called the theoric fund. which Demosthenes hoped to use for war, "the glue which binds the democracy." He fought against the Macedonians at Chaeronea and was taken prisoner. On his release he helped to negotiate peace between Macedonia and Athens. He continued to be in the favour of Philip's successor Alexander the Great, and having been prompted by a bribe, saved Demosthenes and the other anti-Macedonian Athenian orators from his vengeance. It was also chiefly owing to him that Alexander, after the destruction of Thebes, treated Athens so leniently. In 324 he proposed divine honours for Alexander, but during the winter of 324–323 was found guilty of accepting bribes against Alexander from Harpalus; he was heavily fined and lost his citizenship. He remained in disfavour after Alexander's death, but was reinstated (322) to negotiate with Antipater after the Lamian War (323–322). Before setting out he persuaded the citizens to pass sentence of death upon Demosthenes and his followers, who had fled from Athens. The result of his embassy was the conclusion of a peace greatly to the disadvantage of the Athenians. In 319 he was again sent to the court of Antipater. Either Antipater or his son Cassander, learning that he had intrigued with Perdiccas, put him to death. None of Demades' speeches survive. (R. ME.)

DEMAND refers to the volume of consumer purchases that can be expected for a given commodity at each of a series of alternative prices. If the price of a commodity increases, individual consumers generally cannot continue to buy it in undiminished quantities without cutting into their expenditures for other goods so deeply as to sacrifice some of their relatively important uses. They will prefer to give up some relatively unimportant uses of the commodity which has increased in price and will therefore reduce their purchases of it. Given this proposition, it is possible

to draw up a so-called "demand schedule" relating, for any given commodity, a specific volume of sales to each price. Lower prices will be associated with higher sales, higher prices with lower sales. A graphical representation of this relationship would yield a "demand curve."

The demand schedule or curve clears up an ambiguity in the usage of the term "demand." The proposition that "a fall in price will increase demand" clearly refers to a given demand schedule. The higher demand corresponds to the increased sales which arise when the price is reduced. However, the proposition that "an increased demand will raise the price" is of a different nature. It does not relate to a single demand schedule and it is not possible here to substitute "sales" directly for "demand." Rather the increased demand must refer to an upward shift in the demand curve as a whole. It then follows that a greater volume of sales than before is associated with each price; and a higher price than before corresponds to each volume of sales. It is in this sense that an increased demand raises price.

Such a shift in the demand curve may be due to, *e.g.*, an increase in personal incomes, when consumers may feel they can afford greater quantities of a given commodity at any one price. Alternatively, a change in their tastes may cause them to purchase more of a given commodity in preference to another at any given set of prices. Or, an increase in the prices of other commodities may induce consumers to shift their purchases to a certain product. A given demand schedule must imply, therefore, that prices of other goods, tastes and incomes remain unchanged. If they vary, a new demand schedule will have to be drawn up after every change.

On any given demand curve, the extent to which a change of price affects the quantity of a commodity which can be sold is called the "price elasticity" of demand. The ratio of the proportionate change in potential sales volume to the proportionate change in price is called the coefficient of elasticity. In general, the demand for necessities — for goods for which there are no substitutes (salt) and for goods the use of which creates a habit (tobacco) — is relatively inelastic. A rise in price is not likely to reduce by much the quantity demanded and the coefficient of elasticity must therefore be small.

Similar coefficients can be worked out for shifts in the demand curve due to changes in incomes or in the prices of other goods. The ratio of the proportionate change in the quantity demanded to a proportionate change in income is called the "income elasticity" of demand, and the ratio of the proportionate change in the quantity demanded of one good to a proportionate change in the price of another, the "cross elasticity" of demand between them.

These propositions refer in the first instance to the behaviour of individuals only. It is often assumed that aggregate demand curves are simply the sum of the demand curves of individual consumers. This is true only as long as the consumption behaviour of one individual is not affected by the consumption of others. It may be, however, that as prices fall and consumption rises for some, others will find their tastes change against the commodity. Alternatively, as prices rise and consumption falls, "conformists" may shy away from the commodity. Such snowballing effects on the tastes of consumers make the derivation of aggregate demand curves difficult. *See* also ECONOMICS; PRICE; SUPPLY AND DEMAND. (H. O. Sc.)

DEMARATUS (6th–5th century B.C.), Spartan king of the Eurypontid line, succeeded his father Ariston at some date before 506 B.C. In this year the other king, Cleomenes I, led an army from all the states in the Peloponnese against Athens, intending to make Isagoras tyrant, but at Eleusis the Corinthians mutinied, and Demaratus supported them. He also frustrated Cleomenes' attempt to take hostages in 491 from the people of Aegina, who had offered submission to Darius I of Persia. Cleomenes then bribed the Delphic oracle to declare Demaratus illegitimate and he was replaced by his cousin Leotychides. Soon after, he fled to Persia and was given certain small cities in northwestern Asia Minor, which his descendants held in Xenophon's time. Herodotus has several stories of his advice and warnings to Xerxes, whom he accompanied on his expedition to Greece in 480.

See Herodotus, v, 75, vi, 50–70, vii; Xenophon, Anabasis ii, 1.3, vii, 8.17; *Hellenica,* iii, *1.3. See* also bibliography to CLEOMENES. (A. As.)

DEMAVEND, MOUNT (QOLLEH-YE DAMAVAND), an extinct volcano in the Elburz mountains (*q.v.*), about 40 mi. E. of Teheran. Iran. With its steep cone covered with ice and snow and an elevation of about 18,580 ft., it dominates the surrounding ranges by 3.000–8,000 ft. The cone is formed of andesitic lava flows and ash. On its top is a small crater with sulfuric deposits; a little lower are two small glaciers. Fumaroles, hot springs and travertine deposits occur. The Heraz (Lar) river skirts its eastern flank in a deep gorge and some villages (Pelur, Rehneh, Ab Garm, Ask) began to develop into summer resorts following construction of a motor road connecting them with Teheran. Demavend occurs in Persian legends. The first European to reach the summit was seemingly W. Taylor Thomson in 1837. It was later climbed many times.

The town of DEMAVEND (Damavand) lies 17 mi. to the south in a pleasant and fertile valley with mineral springs, at an elevation of 7,500 ft., two or three miles from the Mazanderan road. Pop. (1956) 4,528. It is a popular summer resort with a lively bazaar. (H. Bo.)

DEMENTIA is a term used in medicine meaning a reduction in mental capacities, a permanent irreversible loss of intellectual efficiency due to structural disturbance or degeneration of cerebral tissue. This does not include the functional or temporary disorganizations which may simulate a dementia. It also is distinguished from amentia. which refers to a primary failure of normal mental development *(see* MENTAL DEFICIENCY).

The causes of dementia may be grouped as follows: (1) atrophic changes of the brain resulting in senile dementia; (2) vascular disorders of the brain, including arteriosclerosis and hypertension; (3) inflammatory disorders of the brain. especially syphilis and encephalitis; (4) degenerative diseases of the brain. notably Alzheimer's disease, Pick's disease (lobar atrophy) and Huntington's chorea; (5) deficiency diseases. including Korsakoff's psychosis (usually based on chronic alcoholism). Wernicke's encephalitis (acute hemorrhagic polioencephalitis), pellagra, pernicious anemia and vitamin B-12 deficiency; (6) tumours of the brain; and (7) injuries.

Most dementias are also referred to as chronic organic brain disorders or chronic brain syndrome. They may be mild and may vary in degree and process, but some impairment of memory, orientation, judgment, intellectual function and affect persist permanently. From the usually mild senescent changes there is a sliding scale to the extreme impoverishment of mental reserves that characterizes dementia.

One clinical picture applies to all forms of dementia, and they are often difficult to differentiate as far as cause is concerned. The presenile psychoses such as Alzheimer's and Pick's disease are relatively rare iorms which may occur in the fourth decade. As a result of public health measures, inflammatory diseases of the brain, as well as deficiency diseases. are much less prevalent now than they once were. The arteriosclerotic dementias may be seen from the age of 50 upward, while uncomplicated senile dementias seldom appear before the age of 60. Persons with the last two forms constitute the bulk of the total group of patients with dementia. With the increase in the number of older people that is characteristic of modern western society the problems of this group have become vitally important. Treatment once was almost solely custodial, but as the significance of psychotherapy has been re-evaluated attitudes have changed. In determining the prognosis, current therapeutics take into account the interplay of brain damage. the life pattern of adaptational strivings and the exigencies of the environment.

Biological, social and psychological factors contribute to the personality changes of old age. In the normal aging process there is a gradual wearing down of energy, a decline in responsiveness, a waning of initiative and of creative imagination. a narrowing of interests and increase in egocentricity and a certain warping of

personality. With advancing age there is a progressive loss of physical and mental resources, a loss which tends to arouse feelings of helplessness. These feelings serve to create anxiety which the person tries to overcome by methods which he has long employed in making his adjustments. As a person grows older, therefore, he "grows more like himself." The stress of increasing physical and mental limitations, loneliness resulting from the loss of friends and relatives and perhaps rejection by children produce an anxiety which may evoke various protective mechanisms. Among these may be a turning to and perhaps embellishment of the past, paranoid feelings or self-assertiveness to the point of being domineering. Other old people, through feelings of insecurity or inadequacy, become irritable and contentious and regress to a dependent state. All these, in turn, increase the distance between the person and his environment. friends and family.

These changes may begin even toward the end of the fourth decade. The physical agility, endurance and strength of people in such occupations as athletics, truck driving and mining begin to lessen. accounting for early retirement. There is difficulty in assimilating new information or decreased keenness of memory. Constriction and preoccupation with the past account for frequent misplacing of belongings and forgetting of recent events. Apathy, irritability, rigidity, stubbornness and unmillingness to deviate from accustomed patterns all become manifest in varying degrees. Unresolved interpersonal and intrapersonal problems of infancy, childhood, adolescence and early adulthood reappear in new guises, such as May–December marriages, food idiosyncracies, etc.

The dividing line between the process of normal aging and more pathological changes is often a matter of individual opinion. The patient with senile or arteriosclerotic dementia frequently is a person who has never felt secure and whose pattern of life has always been constricted. In general, the predementia personality is characterized by rigid and static habits; these are people who always have had difficulty in adjusting to the demands of life and who react very strongly to such situations as retirement from business or profession, deaths of friends and relatives: and the loosening of family and social ties that accompanies old age.

The general changes in the brain associated with dementias are a result of deficiency in blood flow to the brain, with associated decrease in available oxygen and metabolic function. In many cases, intracellular chemical changes are not related to interference with blood supply. There may be predisposing constitutional factors and. of course, the psychological trends noted above. One of the most significant changes is reduction in the number of cells. Severe brain changes may be seen in patients who have had no dementia. however, indicating that there is not always a correlation between degree of anatomical change and degree of intellectual impairment.

A number of changes in intellectual function are revealed in the chronic brain syndrome of dementia. There is a loss of memory for recent events and difficulty in establishing new memory of material recently presented. The person cannot focus attention on the past, and there is lack of full awareness of events going on in the environment. If the impoverishment is only slight it may be manifested by defective self-criticism, impairment of fine discrimination in decisions involving delicate moral issues and inability to employ abstract ideas. As dementia progresses. there is an increasing poverty of initiative, restriction of interests and blunting of concern. Impressions are taken in and assimilated slowly. with difficulty and often inexactly; there is. therefore, a failure to profit from experience. Aptitude and learning capacity are reduced. It becomes increasingly difficult. even impossible. for the patient to understand and follow conversations. Questions are not answered or answered only after several repetitions. Disorientation and confusion may exist. There is poverty of the imagination. The content of consciousness is reduced. both in number and in variety of associations, with the result that new associations are formed mith difficulty, imperfectly or not at all. The person's capacity for integrating his past experience with his present is reduced, and judgment becomes defective. Emotions are unstable, and previously unacceptable impulses can no longer be inhibited. There is a tendency toward lability of mood, nith vacillation from tears to laughter within seconds or minutes. Personality is altered. and traits such as suspiciousness, worrisomeness and pessimism may dominate the patient's behaviour. Moral and social values may be abandoned. creating numerous legal and social difficulties. There is resentment of interference by younger persons. and feeling of great neglect. Some patients show a hostile but anxious and fearful dependence. Affections become blunted and may turn to hatred, and a tendency to isolation is seen. The person is careless in habits of toilet and dress, and pride of appearance is forgotten. Hoarding and delusions of theft, poisoning, poverty and not being wanted are common.

When orientation becomes defective, the patient may. in his confusion, wander away and become lost. Hazards of traffic and other situations are not recognized. Frequently the patient forgets where he has placed articles. and accuses other persons of having stolen them. Gas jets may be left burning, and there is much carelessness with matches and fire. Night restlessness and wanderings may lead to destructive results. Sleep reversals are quite common, particularly when there is much confusion as to time and place.

As these situations prevail there are physical changes in accordance. The skin is often thin. atrophic and wrinkled, the special senses may change in acuity. weight is lost, the muscles are wasted. the gait becomes unsteady and shuffling, the voice harsh and speech slow. The handmriting becomes tremulous. while tremors of head and hands are common. Neurological changes such as paralysis. speech disturbances or paresthesias depend upon associated involvement of special structures within the nervous system.

A number of various clinical types may be noted, such as simple deterioration, delirious and confused states, depressed and agitated states. paranoid episodes or a mixture of all of them. In the latter stages of dementia the person is quite helpless and unable to look after personal hygiene and needs. Loss of control of excretory functions is a late development and usually an ominous sign.

Patients nith dementia show deterioration or decompensation of ego function. Ego function represents the capacity to organize and control thinking and behaving and to perceive, test, anticipate and interpret reality. The tragedy in the older person is that he must meet new demands and changes at a time when his ego capacity is failing because of some form of brain change.

The demented or psychotic reaction often represents a regression to some degree of infantile magic control, and thus serves as a defense against overwhelming anxiety. Cerebral frailty and inimical life situations act together to upset psychologic balance. The dilemma lies in the fact that the combined symptoms help the patient to deny reality in order to avoid the anxiety that reality produces. At the same time, he is separated from the life in which he has invested his mental and emotional energies. The basic progressive organic pathology diminishes the control of anxiety, reactivating latent fears concerned aith separation, loss of familiar objects and loss of self-esteem. The patient's personal disorganization is hastened by that feeling of futility and panic which comes from some appreciation that he is slipping, losing his grip and is no longer a useful, effective member of society. Many early dementias are speeded by such factors as cessation of work This may mean the loss of personal usefulness and importance in living. as well as loss of opportunity to gratify many instinctual needs in an acceptable manner. Loss of relatives and friends further threatens the equilibrium. Changes in the physical environment mean loss of familiar objects which serve as guides and reminders of the past. Reversal of roles with children means an increased and intolerable awareness of unconscious resentment of the children, who may encourage regression by insisting that patients do nothing but vegetate and await death. Diminished perceptual acuity, intellectual capacity and sexual potency, and intercurrent physical disease, are all evidences of decline and approaching death. The patient becomes increasingly dependent on what seems to him a hostile environment.

The outlook for the advanced dementia patient is manifestly hopeless, and the course is progressive. However, it is highly desirable that the person be accorded a feeling of emotional security and attention. Patients with the milder forms can be cared for in

the home if it is there that the patient's roots are deeply planted. Unless circumstances are such that the safety of either the patient or the family is endangered, it is well to attempt to care for him in the familiar environment. Hospital care becomes necessary when such situations arise as nocturnal restlessness, disturbing responses to paranoid delusions, assaultiveness, sexual play with children, exhibitionism or ill-considered plans for the future. Impaired judgment in business affairs may make the appointment of a legal guardian necessary. Care must be exercised to prevent the confused patient from setting fire to clothes or furniture, or to prevent wandering from the home or falling with subsequent injury. Depressed, agitated or suicidal patients should receive hospital care. Nursing care and the judicious use of drugs may make the patient more comfortable and allay many symptoms. See also GERONTOLOGY AND GERIATRICS. For the condition formerly called dementia praecox, see SCHIZOPHRENIA.

(L. P. L.)

DEMERARA, a river of British Guiana, rises in the central forested area and flows without important tributaries 215 mi. to the Atlantic at Georgetown. Its narrow estuary and rapid flow (about seven knots with the ebb) keep clear a 16–20 ft. channel over the bar. Ocean-going steamers ascend 65 mi. to Mackenzie for bauxite; smaller ships reach Malali, 105 mi. up. Beyond are numerous rapids.

The old Dutch colony of Demerara was part of Essequibo until 1773 and was reunited with it in 1784 The joint colony united with Berbice in 1831 to become British Guiana. Demerara county, or region. has no modern political significance; the name Demerara is often applied to British Guiana as a whole. (G. LN.)

DEMESNE, that portion of a manor not granted to freehold tenants but (1) retained by the lord for his own use and occupation or (2) occupied by his villeins or leasehold tenants. When villein tenure developed into copyhold (*q.v.*) and leaseholders became protected against premature eviction, the "lord's demesne" came to be restricted to sense (1) and usually denoted the lord's house and the park and surrounding lands. Demesne of the crown. or royal demesne, was that part of the crown lands not granted to feudal tenants but managed by crown stewards until it was surrendered to parliament in return for an annual sum (see CROWN LAND).

Ancient demesne was land vested in the crown in 1066, the tenants of such land having a number of privileges, such as freedom from tolls and duties and from sitting on juries.

See also MANOR. (R. E. MY.)

DEMETER, in Greek mythology, daughter of Cronus and Rhea, sister of Zeus and goddess of agriculture. Her name has been explained as (1) "grain mother," from *dēai,* the Cretan form of *zeiai,* "barley," or (2) "earth-mother," or rather "mother earth," da being regarded as a pre-Hellenic name of Ge. the earth-goddess. She is rarely mentioned in Homer, nor is she included among the Olympian gods, but she must have been very old; her name appears to occur on a tablet from Pylos of the 13th century B.C.

The centre of her legend was the story of her daughter Persephone. After Persephone was carried off by Hades (see PERSEPHONE), Demeter revealed to the people of Eleusis, where she had been hospitably received, her secret rites (see TRIPTOLEMUS). This is the legendary origin of the famous Eleusinian mysteries (see MYSTERY). The Eleusinia, sometimes confused with them. were a distinct festival.

Demeter is a mother goddess. Besides Zeus. she has a consort Iasion, who, says Homer, "lay with her in a thrice-plowed field" and to whom she bore Plutus, "Wealth" (*i.e.,* abundant produce of the soil). The story is compared by Sir James Frazer in The Golden Bough with the West Prussian custom of the mock birth of a child on the harvest field, the object being to ensure a plentiful crop for the coming year. In Hesiod the scene is laid in Crete, and may well represent part of the ritual or mythology of the Cretan goddess.

It is as a corn goddess that Demeter appears most commonly. The name Ioulō (? at Delos), from *ioulos,* "corn sheaf." has been regarded as identifying the goddess with the sheaf, and as proving that the cult of Demeter originated in the worship of the corn mother or corn spirit, the last sheaf having a more or less divine character for the primitive husbandman. According to this view, held by Frazer, the prototypes of Demeter and Persephone are the corn mother and harvest maiden of northern Europe, the corn fetishes of the field. The influence of Demeter, however, was not limited to grain but extended to vegetation generally and to all the fruits of the earth. with the curious exception of the bean (the use of which was forbidden at Eleusis, and for the protection of which a special patron was invented). In this wider sense Demeter is akin to Ge, with whom she has several epithets in common, and is sometimes identified with Rhea-Cybele; thus Pindar speaks of Demeter the Bronze-Rattling, an epithet more suitable to Rhea-Cybele than to Demeter (see CORYBANT).

Another important aspect of Demeter was that of a divinity of the underworld; as such she is *chthonia* (earth-goddess) at Sparta and especially at Hermione in Argolis, where, at the festival Chthonia, a cow (representing perhaps the spirit of vegetation) that voluntarily presented itself was sacrificed by three old women. Those joining in the procession wore garlands of the flower called *hyakinthos.* The remarkable epithets Erinys ("avenger") and Melaina ("the black one"), as applied to Demeter, mere both localized in Arcadia, the first at Thelpusa (or rather Onkeion, close by), the second at Phigalia. According to the Thelpusan story, Demeter, during her wanderings in search of Persephone, changed herself into a mare to avoid the persecution of Poseidon. The god, however, assumed the form of a stallion. and the fruit of the union was a daughter of mystic name and the horse Arion. Demeter, at first enraged, afterward calmed down and washed herself in the river Ladon by way of purification. A similar story was current at Phigalia where, in a cave still called Mavrospelya ("black cave"), there was an image of the goddess as a female form seated on a rock, but with a horse's head and mane, to which were attached snakes and other wild animals. It was clothed in a black garment reaching to the feet and held in one hand a dolphin, in the other a dove.

Both Melaina and Erinys, according to L. R. Farnell, are epithets of Demeter as an earth-goddess of the underworld. The first has been explained as referring to the gloom of her abode or the blackness of the withered corn. According to Farnell, the meaning of the epithet is to be looked for in the original conception of Erinys, which was that of an earth-goddess akin to Ge, thus naturally associated with Demeter, rather than that of a wrathful avenging deity.

Various interpretations have been given of the horse-headed form of the Black Demeter: (1) that the horse was one of the forms of the corn spirit in ancient Greece; (2) that it was an animal "devoted" to the chthonian goddess; (3) that it is totemistic; (4) that the form was adopted from Poseidon Hippios, who is frequently associated with the earth-goddess and is said to have received the name Hippios first at Thelpusa, in order that Demeter might figure as the mother of Arion. In any case the association of Poseidon, representing the fertilizing element of moisture. with Demeter, who causes the plants and seeds to grow, is quite natural and it is possible that by derivation his name means literally "husband of Da."

Demeter also appears as a goddess of health, of birth and of marriage; and a certain number of political and ethnic titles are assigned to her, the most important being Amphiktyonis, at Anthela near Thermopylae, as patron goddess of the Amphictyonic league, subsequently so well known in connection with the temple at Delphi.

Brief mention may here be made of certain agrarian festivals held in honour of Demeter.

1. Haloa, apparently derived from *halōs* ("threshing floor"), begun at Athens and finished at Eleusis, where there was a threshing floor of Triptolemus, in the month Poseideon (December).

This date, which is confirmed by historical and epigraphical evidence, seems inappropriate, and it has been suggested that the festival, originally held in autumn, was subsequently placed later so as to synchronize with the winter Dionysia. Dionysus. as the god of vines, and (in a special procession) Poseidon as god of vegetation were associated with Demeter. In addition to being a harvest festival, marked by the ordinary popular rejoicings, the Haloa had a religious character. The first fruits were conveyed to Eleusis where sacrifice was offered by a priestess, men being prohibited from undertaking the duty. An initiatory ceremony of women by a woman also took place at Eleusis, characterized by obscene jests and the use of phallic emblems. The sacramental meal on this occasion consisted of the produce of land and sea, certain things (pomegranates, honey, eggs) being forbidden for mystical reasons. Although the offerings at the festival were bloodless, the ceremony of the presentation of the first fruits was probably acccompanied by animal sacrifice; the offerings, however, may have been pastry imitations. Certain games, of which nothing is known, terminated the proceedings. In Roman imperial times the ephebi (*q.v.*) had to deliver a speech at the Haloa.

2. Chloia. the festival of the corn beginning to sprout, held at Eleusis in the early spring (Anthesterion) in honour of Demeter Chloe, "the green," the goddess of growing vegetation. This is to be distinguished from the later sacrifice of a ram to the same goddess on the 6th of the month Thargelion. probably intended as an act of propitiation. It has been identified with the Procharisteria (sometimes called Proschaireteria), another spring festival, but this is doubtful.

3. Proerosia, at which prayers were offered for an abundant harvest. before the land was plowed for sowing. It was also called Proarktouria, an indication that it was held before the rising of Arcturus. According to the traditional account, when Greece was threatened with famine the Delphic oracle ordered first fruits to be brought to Athens from all parts of the country, to be offered by the Athenians to the goddess Deo (Demeter) on behalf of all the contributors. The most important part of the festival was the three sacred plowings — the Athenian, the Eleusinian on the Rarian plain, and the Scirian (a compromise between Athens and Eleusis). The festival itself took place. probably sometime in September. at Eleusis. In later times the ephebi also took part in the Proerosia.

4. Thalusia, a thanksgiving festival, held in autumn after the harvest in the island of Cos.

5. The Thesmophoria (*q.v.*), a women's festival meant to improve the fruitfulness of the seed corn.

6. The Skirophoria held in midsummer was a companion festival

The attributes of Demeter are chiefly connected with her character as goddess of agriculture and vegetation — ears of corn, the poppy, the mystic basket (*kalathos*) filled with flowers. corn and fruit of all kinds, the pomegranate being especially common. Of animals, the pig is her favourite, owing to its productivity and the cathartic properties of its blood. As a chthonian divinity she is accompanied by a snake; the myrtle, asphodel and narcissus (which Persephone was gathering when carried off by Hades, and which were commonly associated with death) also are sacred to her.

In Greek art, Demeter resembles Hera, but she is more matronly and of milder expression; her form is broader and fuller. She is sometimes riding in a chariot drawn by horses or dragons, sometimes walking, sometimes seated upon a throne, alone or with her daughter. The Demeter of Cnidus in the British museum, a masterpiece of the mid-4th century B.C., apparently shows her mourning the loss of her daughter.

DEMETRIA, an obscure festival or rite of Demeter, probably Athenian, in which the participants beat each other with whips of twisted bark, a well-known fertility charm. Also a name given to the Attic Dionysia in compliment to Demetrius I Poliorcetes, king of Macedonia, 294–283 B.C.

See Pauly-Wissowa, "Demetria," *Realencyklopädie* (1901).

DEMETRIUS (2nd century B.C.), king of Bactria, son of Euthydemus (*q.v.*). The historical evidence for his reign is slight and is open to varying interpretations. In the reconstruction proposed by W. W. Tarn he ruled from about 190 to 167 B.C., when he met his death at the hands of Eucratides (*q.v.*), having earlier made such extensive conquests in northern India that he for a brief time virtually re-formed the great Mauryan empire which had collapsed in about 184 (see INDIA: Ancient History). But according to A. K. Narain it was a younger Demetrius (likeise a Bactrian king but not directly related to the son of Euthydemus) who made conquests in India, of a less extensive kind, and lost his kingdom to Eucratides after a reign extending approximately from 180 to 165. The fact that one of these two men was the first to strike coins with a bilingual inscription in Greek and Prakrit suggests that he pursued a policy of treating the Indian peoples as equal subjects alongside the Bactrian Greeks. The foundations of Demetrias in Arachosia (on the road between Kandahar and Ghazni in southern and eastern Afghanistan respectively) and perhaps Demetrias in Sind may be cited to illustrate the spread of'the Bactrian kingdom at this time.

See works cited under BACTRIA. (R. H. SI.)

DEMETRIUS I POLIORCETES (336–283 B.C.), king of Macedonia 294–288, son of Antigonus I Monophthalmus (*q.v.*) in whose campaigns he commanded with distinction and whose empire he attempted to rebuild. In 321 or shortly afterward he married Phila, a daughter of Antipater, regent of Macedonia. His first important command was in defending the southern boundaries of his father's territory against Ptolemy, the satrap of Egypt (see PTOLEMIES). In this he had the support of specially chosen senior officers; but he suffered a heavy defeat at Gaza (312). In the same year he led unsuccessful expeditions against the Nabataeans (q v.) of Arabia and Seleucus in Babylonia (see SELEUCID DYNASTY). In 307 he was sent against Athens and liberated it from the garrison of Cassander (*q.v.*). For this he received from the Athenians the most extravagant honours, including deification. The next year he defeated Ptolemy by land and sea at Salamis (Cyprus), a victory which at last persuaded Antigonus to take the royal title for himself and Demetrius; but their expedition against Egypt, which followed at once, was a failure since gales prevented the fleet (commanded by Dernetrius) from effecting a landing. In 305 Demetrius was sent to compel Rhodes to join his father's alliance. The siege which ensued became famous for the vigour and ingenuity with which Demetrius conducted it, as well as for the valour of the defense; though unsuccessful, he became known thereafter as "the Besieger" (Poliorcetes). In 304 he landed in Greece. where he won important successes against Cassander in 303 and 302 and organized a new Greek league (League of Corinth). Before he could force a decision he was recalled by his father to Asia to take part in the campaign which culminated in the battle of Ipsus (301). Surviving the defeat, he sought to rebuild his father's empire. All that remained was the fleet and a few bases; but the disunity among the victors allowed him to nurse his strength and re-emerge after a few years as a major power. In 294 he reoccupied Athens and established himself as king in Macedonia. In the following years he fought many campaigns in Greece, successfully for the most part. It appeared that he had built up a strong kingdom. But in 288 the concerted

invasions of Pyrrhus and Lysimachus (*qq.v.*) drove him out of Macedonia. Instead of attempting its recapture from Greece, he passed into Asia Minor with a small force of mercenaries with the bold design of disrupting from within the kingdoms of Lysimachus and Seleucus. In the end, deserted by his followers and having lost contact with his fleet, he surrendered to Seleucus in Cilicia (285). He was retained in honourable captivity in Syria and died there two years later.

His soldierly qualities made Demetrius an invaluable assistant to his father, who relied heavily upon him. But after Ipsus he showed himself to be an adventurer rather than a responsible ruler (not unlike his younger contemporary and rival, Pyrrhus, another brilliant darling of fortune). In a life full of scandal he collected numerous wives and mistresses and gaily defied all convention in the pursuit of his pleasures.

See also references under "Demetrius I" in the Index volume.

See Diodorus Siculus, xix–xx; Plutarch, *Life of Demetrius,* with commentary by E. Manni (1953). (R. H. Si.)

DEMETRIUS II (c. 276–229 B.C.), king of Macedonia from 239 B.C., son of Antigonus Gonatas and Phila, had already gained distinction as a boy by defeating and dethroning Alexander of Epirus at Derdia during his father's lifetime, thus saving Macedonia (c. 263). His marriage to Nicaea, the widow of Alexander of Corinth, in 245 was a device to recover Acrocorinth for Antigonus and probably remained unconsummated. On his accession (239) he divorced his second wife, Antiochus I's daughter Stratonice, who had borne him no sons, and married the Epirote princess Phthia (also called Chryseis). In the same year he was faced by a coalition between the Aetolians, who were trying to annex Epirote Acarnania, and the Achaeans, who were set on expelling the Macedonians from the Peloponnese (see Achaean League; Aetolian League). His general Bithys defeated Aratus of Sicyon at Phylacia, and he himself entered Boeotia, detached it from the Aetolians and occupied Megara (237–236). In 231, however, a revolution in Epirus, which substituted a republican league for a monarchy and an alliance with the Aetolian and Achaean leagues for that with Macedonia, gravely weakened his position. He had scarcely formed an alliance with Agron of Illyria to defend Acarnania when a Dardanian invasion drew him northward. After a defeat there he died, leaving his son by Phthia, Philip, still a child. His failure seriously weakened both kingdom and monarchy.

DEMETRIUS, the name of three kings of the Seleucid dynasty.

Demetrius I, called Soter (c. 187–150 B.C.), king from 160 B.C., was sent to Rome as a hostage during the reign of his father Seleucus IV. There he was befriended by the Greek statesman and historian Polybius. When his uncle Antiochus IV Epiphanes died in 163, he sought permission of the Roman senate to return to Syria and assert his claim to the throne. Permission was refused; whereupon Demetrius, aided by Polybius, escaped and made his way home. A circumstantial account of the escape is recorded in the *History* of Polybius (xxxi, 11–15).

In Syria the people and the army welcomed Demetrius as the legitimate king. In Babylonia and Media, however, the satrap Timarchus had set himself up as king, and had even secured recognition from the senate in Rome. In his campaign against Timarchus (winter 161–160) Demetrius was completely successful, and took the title of *Soter* ("Saviour") for his victory. The senate now recognised him as king. In 160 the Jewish rebellion was also crushed, although some resistance continued in outlying districts under the surviving Maccabees (*q.v.*); but later in the reign the forces of secession in Judaea revived, and the Seleucid government compromised with them as before (*i.e.* by maintaining garrisons in Judaea but allowing freedom of worship).

In his foreign relations Demetrius incurred the enmity of the kings of both Pergamum and Egypt. With the connivance of the Roman senate, they gave their support to the pretender Alexander Balas. With their help, he was eventually able to supplant Demetrius, who lost his life fighting bravely in the final battle.

Demetrius II, called Nicator ("Victor") (*c.* 161–126 or 125 B.C.), king 145–139 and from 129, was the son of the above. Returning from exile to Syria in 147 with an army of Cretan mercenaries, he challenged Alexander Balas; in 145, having won the support of Ptolemy VI of Egypt. he became king. With both Balas and Ptolemy killed in the battle of Oenoparas in that year, Demetrius had a free hand; but he was faced with serious disorder throughout the kingdom, and he was too young to govern effectively. In 140, despite a civil war raging in Syria, he turned upon the Parthian invaders and drove them out of Babylonia; in the next year he was defeated and made prisoner by them (see Mithradates). In 129 he was released and returned to Syria. During his short second reign he never obtained more than a partial control of the kingdom. He was assassinated.

Demetrius III had a brief reign (95–88 B.C.) in the chaotic final period of the Seleucid kingdom, and died as a prisoner of the Parthians.

See H. Willrich in Pauly-Wissowa, *Real-Encyclopadie der classischen Altertumswissenschaft,* vol. iv, 2795–2802 (1901); *see* also works cited under Seleucid Dynasty. (R. H. Si.)

DEMETRIUS, a Greek sculptor of the early part of the 4th century B.C., who is said by ancient critics to have been notable for the life-like realism of his statues. His portrait of Pellichus, a Corinthian general, was admired by Lucian. He was contrasted with Cresilas (*q.v.*), an idealizing sculptor of the generation before. Since, however, the peculiarities mentioned by Lucian do not appear in Greek portraits before the 3rd century B.C., and since the Greek art of the 4th century consistently idealizes, there would seem to be a difficulty to explain. The date of Demetrius is confirmed by inscriptions found on the Athenian Acropolis. (P. G.)

DEMETRIUS (fl. 1st century A.D.), a Cynic philosopher with leanings, characteristic of his time, to Stoicism, taught in Rome during the reigns of Caligula, Nero and Vespasian, the last of whom deported him to an island. He was an intimate friend of Thrasea Paetus and much admired by Seneca. He was remarkable for personal austerity and for brutal outspokenness rather than for comprehensive or original thought. (F. H. Sh.)

DEMETRIUS PHALEREUS or of Phaleron (born at Phaleron, near Athens, *c.* 350 B.C.), Athenian orator, statesman and philosopher, was a pupil of Theophrastus and an adherent of the Peripatetic school. In 317 he was appointed by Cassander (*q.v.*) governor of Athens, enjoying much independent authority, though dependent in the last resort upon the Macedonian garrison. His administration favoured the upper classes, but he ruled with moderation. In the many new laws he introduced he gave effect to the ideas of earlier political theorists such as Aristotle; extravagance in funerals and entertainment and by women was curbed; a committee of seven "guardians of the laws" was set up to prevent the passing by the assembly of undesirable legislation; the liturgies (public services) which had borne so heavily upon the rich since the time of Pericles were transferred to the public account; and many minor uncontroversial improvements were made in Attic law. On the restoration of the old democracy in 307 Demetrius escaped to Thebes and later went to Egypt where he became prominent at the court of Ptolemy I; he is connected in tradition with both the library and the museum at Alexandria. He enjoyed a high reputation as an orator. Numerous philosophical, historical and miscellaneous writings, all lost, are attributed to him.

See W. S. Ferguson, *Hellenistic Athens* (1911). (R. H. Si.)

DEMIDOV, the name of a famous Russian family several members of which were outstanding benefactors and patrons of science, learning and art and remarkable travelers and collectors. Nikita Demidych Demidov (1656–1725), the founder of the family's wealth and fame, originally a blacksmith serf, made his fortune by his skill in the manufacture of weapons and established at Tula an iron foundry for the government. Peter the Great. with whom he was a favourite, ennobled him in 1720. His son, Akinfi Demidov (1678–1745), increased his inherited wealth by

the discovery and working of gold, silver and copper mines. The latter's nephew, PAVEL GRIGORIEVICH DEMIDOV (1738–1821), a great traveler and benefactor of Russian scientific education, was the founder of the Demidov lyceum in Yaroslavl (1805). Pavel's nephew, COUNT NIKOLAI NIKITICH DEMIDOV (1773–1828), raised and commanded a regiment to oppose Napoleon's invasion and carried on the accumulation of the family wealth from mining; he contributed liberally to scientific education in Moscow. His elder son, PAVEL NIKOLAEVICH DEMIDOV (1798–1840), founded an annual prize for Russian literature, awarded by the Academy of Sciences. The latter's brother, ANATOLI NIKOLAEVICH DEMIDOV (1812–1870), was a well-known traveler and patron of art; he lived many years in Italy, received the Tuscan title of principe di San Donato and married the princess Mathilde, Jérôme Bonaparte's daughter, in 1840.

DEMILLE, CECIL BLOUNT (1881–1959), U.S. motion-picture producer-director, best known for films with historical and religious themes, was born at Ashfield, Mass., Aug. 12, 1881, son of the playwright Henry Churchill DeMille (1853–93), a collaborator of David Belasco (*q.v.*). Educated at Pennsylvania Military college and the American Academy of Dramatic Arts, deMille began his career in the theatre as an actor in 1900. In 1902 he married Constance Adams. After appearing in several plays. notably with E. H. Sothern. he collaborated in playmriting with his brother William Churchill deMille (*see* below) and with Belasco.

In 1913 deMille entered the field of motion pictures, producing *The Squaw Man,* one of the early films that helped to establish motion pictures as a serious dramatic form. At first deMille drew largely upon stage plays for his material, never copying stage technique. however, but utilizing the flexibility of cinematic techniques around a core of sound dramatic construction. After World War I he produced and directed a cycle of sociological problem pictures, whose influence upon U.S. mores has often been noted. His first biblical film was *The Ten Commandments* (1923). In 1927 he produced and directed *The King of Kings,* which was seen by an estimated 800,000,000 persons. In later decades he concentrated upon large productions, usually historical or religious in theme, beginning with *The Sign of the Cross* (1932) and culminating in *The Greatest Show on Earth* (which won the award of the Academy of Motion Picture Arts and Sciences for the best picture of 1952) and the 1956 version of *The Ten Commandments,* his 70th film. DeMille also was active in banking and other businesses. His Mercury Aviation company (1929) was one of the first commercial airlines in the world, and from 1936 to 1945 he conducted the "Lux Radio Theatre." In the latter year he became president of the DeMille Foundation for Political Freedom. which campaigned for legislation to prohibit the union shop. He declined nomination to the United States senate in 1938. DeMille died at his home in Hollywood, Calif., Jan. 21, 1959.

Critical estimates of deMille's work vary; but his conspicuous success in the genre that he made distinctively his own brought to his films a vast audience, larger than that of any other single producer-director.

DeMille's *Autobiography* was published in 1959.

His brother, WILLIAM CHURCHILL DEMILLE (1878–1955), was a well-known playwright, among his plays being *Strongkeart, The Warrens of Virginia* and *The Land of the Free.*

The choreographer AGNES DEMILLE was the daughter of William Churchill deMille. (D. HE.)

DEMISE, an Anglo-French legal term for a transfer of an estate, especially by lease (*see* LANDLORD AND TENANT). The phrase "demise of the crown" is used in English law to signify the immediate transfer of the sovereignty, with all its attributes and prerogatives, to the successor in accordance with the maxim "the king never dies." At common law the death of the sovereign dissolved parliament, but this was abolished in 1867 by the Representation of the People act. Similarly the common-law doctrine that all offices held under the crown terminated at its demise was abrogated by the Demise of the Crown act, 1901.

DEMIURGE (Gr. *demiourgos,* "artisan" or "craftsman"). In Homer the term includes manual workers, heralds and physicians. In Attica the *demiourgoi* formed one of the three classes, with the eupatridae (*q.v.*) and the *geomoroi* or *agroikoi,* into which the early population was divided.

The word was used in the Peloponnese, with the exception of Sparta, for a higher magistrate. The *demiourgoi* represented Elis and Mantinea at the treaty of peace between Athens, Argos. Elis and Mantinea in 420 B.C. In the Achaean league (*q.v.*) the name is given to ten officers who presided over the assembly, and the Corinthians sent *epidemiourgoi* annually to their colony Potidaea.

Plato in *Tintaeus* uses *demiourgos* of the "creator of the world," and the word was so adopted by the Gnostics with reference to the creator of the material universe, when they wished to distinguish him from the supreme God. *See* GNOSTICISM.

DEMOCHARES (*c.* 355–*c.* 270 B.C.), Athenian historian, orator and statesman, was a nephew of Demosthenes (*q.v.*) and a supporter of the Demosthenic ideal of freedom. He is first recorded as having spoken, in vain, in 322 against the surrender of Demosthenes and of the anti-Macedonian orators, which Antipater was demanding. On the restoration of the democracy by Demetrius Poliorcetes (*q.v.*) in 307, he occupied a prominent position and favoured the suppression of the schools of philosophy. He was banished as hostile to Demetrius either in 303 or, according to K. J. Beloch's hypothesis, about 292. Recalled in 290 or 289 he took charge of the administration of the city of Athens. He dislodged the Macedonians from Eleusis.

In later years he retired from active politics and apparently spent some time cultivating the acquaintance of Zeno the Stoic. He died before 270 and was honoured by the citizens with a statue.

Democharas was the author of a history of his own times, written in an oratorical style; as a speaker he was noted for his freedom of language. Violently attacked by his contemporary the historian Timaeus, he was later defended by Polybius.

DEMOCRACY. The term democracy is used in several different senses. (1) In its original meaning, it is a form of government where the right to make political decisions is exercised directly by the whole body of citizens. acting under procedures of majority rule. This is usually known as direct democracy. (2) It is a form of government where the citizens exercise the same right not in person but through representatives chosen by and responsible to them. This is known as representative democracy. (3) It is a form of government, usually a representative democracy, where the powers of the majority are exercised within a framework of constitutional restraints designed to guarantee the minority in the enjoyment of certain individual or collective rights, such as freedom of speech and religion. This is known as liberal or constitutional democracy. (4) Finally. the word democratic is often used to characterize any political or social system which, regardless of whether or not the form of government is democratic in any of the first three senses, tends to minimize social and economic differences, especially differences arising out of the unequal distribution of private property. This is known as social or economic democracy.

To avoid misunderstandings, these various uses of the term should be carefully distinguished.

This article is divided into the following sections: *Ancient Greece; Origins of Modern Democracy; The United States; The French Revolution; Great Britain; Other European Countries; Totalitarian Democracy;* and *The 20th Century.*

Ancient Greece.—Direct democracy is one of the most obvious ways of organizing a political community. It is found in many of the primitive societies known to modern anthropologists, and its origins undoubtedly go back to prehistoric times. In the political tradition of the west, however, the beginnings of the idea of democracy are associated with the city-states of ancient Greece. The word itself is derived from the Greek *demokratia,* from *demos,* "the people," and *kratos,* "rule." Plato and Aristotle, in their pio-

neering attempts to create a systematic theory of politics, both recognized democracy as one of the five or six main types of government. The best definition is given by Aristotle:

> A democracy is a state where the freemen and the poor, being in the majority, are invested with the power of the state . . . The most pure democracy is that which is so called principally from that equality which prevails in it; for this is what the law in that state directs; that the poor shall be in no greater subjection than the rich; nor that the supreme power shall be lodged in either of these, but that both shall share it. For if liberty and equality, as some persons suppose, are chiefly to be found in a democracy, it must be so by every department of government being alike open to all; but as the people are the majority, and what they vote is law, it follows that such a state must be a democracy. (*Politics,* book iv, ch. 4, 1290b, 1291b.)

The democracy to which this definition refers was in many ways fundamentally different from that of modern times. It was direct democracy in which the whole citizen body formed the legislature, and in which the representative system was unknown. This was possible because of the limited size of the ancient state, which was generally confined to a city and its rural surroundings and seldom had more than 10,000 citizens. Furthermore, the citizen body was not identical with the whole adult population. Women were disfranchised and there was a numerous class of slaves who enjoyed no rights at all. Ancient democracy was not only compatible with slavery, it presupposed slavery, which alone permitted the necessary leisure for the citizens to devote themselves to public affairs. It recognized the equality of citizens, but failed to develop a general conception of the equality of all mankind.

In the ancient democracies, all citizens were entitled to attend the legislative assembly and to vote. They were also eligible for a large variety of executive and judicial offices, some of which were filled by election and others. in the interests of absolute equality, assigned by lot. The use of sortition (casting of lots) in preference to election was regarded by Aristotle as one of the characteristic features of democracy. There was no separation of powers, and all officials were fully responsible to the popular assembly, which was itself qualified to act in executive and judicial as well as in legislative matters.

The failure of the ancients to develop a representative system made it impossible for them to create large democratic states. The limited size of the ancient polis (city) enabled it, on the other hand, to develop a very intense and concentrated form of political life. All citizens had the opportunity to become actively interested in and highly conversant with every aspect of public affairs. As far as the citizen body was concerned, this was direct democracy in the fullest sense of the term. The nearest modem parallel is to be found in the New England town meetings and in some of the smaller Swiss cantons.

Democracy was widespread in ancient Greece, especially during the 5th century B.C. The political history of this period was largely occupied with the struggle between democratic and oligarchic states, of which Athens and Sparta were the representative examples. The Athenians were the first people to try to form a democratic empire, a league of free cities united under Athenian leadership in common devotion to the democratic way of life. As time went on, methods of voluntary co-operation broke down, and in the course of the Peloponnesian War Athenian relations with the empire became increasingly coercive. The experiment ended with the victory of Sparta. Although Greek democracy survived the fall of Athens, it never fully recovered from the blow. After a long period of decline, it finally disappeared with the triumph of Rome.

Greek democracy was a brief historical episode which had little direct influence on the theory or practice of modern democratic states. There is some evidence that democratic theories of politics were well developed at the time, anticipating many of the ideas put forth by the utilitarians, the social contract theorists and other exponents of modern democratic thought from the 17th century on. These ancient writings did not survive to become a part of the western political tradition. The leading philosophers of the 4th century, to whom we owe most of our knowledge of the political thought of antiquity, were strongly antidemocratic. Plato's Republic pictures democracy as being second only to tyranny in the scale of political corruption. Although Aristotle's Politics, being more encyclopaedic in character, presents a more balanced view, and repeats some of the standard arguments for democracy, his final verdict is hardly more favourable. The classical tradition, in its most influential form, did little to encourage any future resumption of democratic experiments.

Origins of Modern Democracy.— From the fall of the Greek city-state to the rise of modern constitutionalism, there is a gap of about 2,000 years in the theory and practice of democracy. Rome was an oligarchic republic which gradually turned into an autocratic empire. The successor states were tribal or feudal kingdoms which. in the course of the 16th and 17th centuries, became largely transformed into absolute monarchies. It is true that this general pattern of government was not universally followed. The English monarchy failed, in the course of the 17th century, to make good its claim to absolutism, and fell under the control of the landed gentry. The middle ages also saw the rise of a number of independent republics, but these generally were oligarchic rather than democratic in character. Although medieval and early modern writers, in deference to the authority of Aristotle, continued to list democracy as one of the three basic forms of government, it had long ceased to be a matter of anything more than theoretical or antiquarian interest. This was the situation down to the time of the American and French revolutions.

Poor as the period was. however. in actual democratic developments. it gave rise to ideas and institutions which did much to determine the distinctive character of modem democratic governments. Unlike the direct democracies of ancient Greece, the democratic states of our own day are all representative and constitutional states with a marked leaning toward economic democracy. Their basic organ of government is the representative legislature, or parliament. Their underlying ethical basis is the conception that all men are created equal, and that governments exist for the purpose of protecting them in the exercise of certain basic rights. All this would have seemed quite incomprehensible to the slave-owning, self-ruling citizens of ancient Athens. The difference can be understood only as the outgrowth of new ideas and institutions which gradually emerged in the course of the middle ages.

One of the most important of these new ideas is the modem conception of a constitution (see CONSTITUTION AND CONSTITUTIONAL LAW). The ancients generally regarded law as an expression of rather than as a restraint upon the exercise of political power. But for the barbarian successor kingdoms, as for many primitive peoples, law mas immemorial custom which no one had the power to alter. The function of kings was not to legislate, but to enforce existing laws, laws binding on the king no less than on his subjects. This idea was reinforced by the concept of natural law, as developed by the Stoic and Christian thinkers of late antiquity. To the Christian theologians, the universe was the creation of an omnipotent God whose perfect and unchanging will was binding on all his creatures. This will was known to men partly through revelation, as interpreted by the church, and partly through natural reason. Throughout the middle ages, therefore, kings were subject to three different kinds of law, the revealed law of God, the natural law of reason and the customary law of the land. These laws were not the product but the source of legitimate authority, and anyone who violated them was regarded as a tyrant, not as a lawful ruler. The modem view of the supremacy of constitutional law is directlv inherited from this medieval conception.

The modern practice of representation is also medieval in origin, arising as a consequence of the disintegration of state authority which followed the fall of Rome. The Roman empire had been a strongly centralized state, fully capable of imposing its will on the subject population. In the tribal and feudal monarchies which replaced it, power was much more widely dispersed. Feudal magnates, ecclesiastical authorities and chartered cities all acquired a po er and authority of their own. For many purposes, especially for the raising of new taxes, kings could act only with the consent of their subjects. The normal device for securing this consent was to summon a great council of the realm. At first the subjects thus assembled were temporal lords and ecclesiastics

rich and powerful enough in their own right to make important contributions. But there were also corporate groups, especially chartered cities. whose wealth was well worth tapping. Gradually it became customary to ask them to join the great council by sending representatives with authority to make financial commitments on their behalf. These gatherings ("estates") were the origin of modem parliaments.

This medieval political order disintegrated in the course of the 15th and 16th centuries as the power of monarchs increased and legal restrictions gave way to the idea of absolute sovereignty. This development naturally encountered a good deal of resistance. In the course of the 16th century there was even a brief revival of the medieval concept of politics. Many Christians, both Protestant and Catholic, reacted to the religious troubles of the period by denouncing all kings of the opposing faith as tyrants, and calling for their deposition at the hands of the lawfully constituted estates of the realm. Some of the adherents of this position, known as the monarchomachists, produced writings which subsequently played some part in the development of theories of popular sovereignty. In their own time, however, they were generally unsuccessful, and by the middle of the 17th century absolute monarchy was firmly established as the prevailing form of western European government.

The only important exception was England. where the tradition of medieval parliamentarianism was particularly strong. When, in the mid-17th century, conflict over religious and constitutional issues led to an open break between king and parliament, parliament won and beheaded the king. Although the attempt to found a republican commonwealth proved unsuccessful, the restoration monarchy was weaker than before. When a fresh assertion of royal authority went down before the Glorious Revolution of 1688. the power of the English monarchy was finally broken. Parliament thereafter exercised complete control in matters of legislation and finance. With the development of the principle of parliamentary responsibility, it also extended its authority into the field of executive action. By the middle of the 18th century it had become customary for the king, in choosing his cabinet, to confine himself to members of parliament who enjoyed the support of a parliamentary majority, and to dismiss them as soon as they lost that support. This deprived the monarchy of all effective power, and established the supremacy of parliament.

Seventeenth-century England produced many political writings, some of which rank among the classics of modern liberal thought. The most influential of these was John Locke's second treatise *Of Civil Government* (1690). This stated that property, defined as life, liberty and estate, is a natural right of man. (See also NATURAL RIGHTS.) Governments are created by a social contract designed for the preservation of that right, and when rulers violate the terms of the contract, society has a right to depose and replace them. The best way to prevent governments from becoming abusive is to separate the powers of government in such a way that the legislative and the executive powers can never fall into the same hands. Although this theory was obviously adapted to the particular needs of the English revolutionary movement, it was couched in such general terms that it was easy to apply it anywhere. Locke's theory of the separation of powers was popularized on the continent through the writings of Montesquieu, who added a third power, the judicial, to those that ought to be kept separate. These doctrines also gained aide currency in the British North American colonies, and provided much of the theoretical foundation for the American system of government.

Both in theory and in practice. the example of 17th-century England was destined ultimately to play a major part in the development of modem constitutional democracy. In its immediate consequences, however, the parliamentary revolution was in no sense democratic. Although the balance of power shifted from king to parliament, parliament itself was an oligarchic rather than a democratic institution. The landed gentry was the controlling force not only in the hereditary house of lords but also, because of a narrowly limited franchise and marked inequalities of representation, in the house of commons. During the Civil War there had been some protests against this situation. Many of the independents who, unlike the Presbyterians and Anglicans, had adopted democratic principles of church government, tried for a time to effect a similar democratization of parliamentary institutions. Starting from the principle that all government rests on the consent of the governed, they concluded that all Englishmen, or at least all property owners including the smallest, should have an equal voice in public affairs. The Levellers (*q.v.*), as this group was called, succeeded for a time in gaining considerable support, particularly in the lower ranks of the Cromwellian army. They also produced an interesting body of democratic thought. But the Levellers were quickly and thoroughly suppressed. and their ideas soon forgotten. Locke remained as the typical exponent of English revolutionary thought. Although his theory of natural rights could be, and ultimately was, interpreted as a defense of democratic equality, he himself did not intend it, nor did his contemporaries understand it, as a challenge to the existing parliamentary order. The oligarchic character of British politics was firmly established, and continued without substantial modification until the Reform act of 1832.

Down to the time of the American and French revolutions, there was only one major theorist who maintained a strictly democratic position, Jean Jacques Rousseau, whose work *The Social Contract* (1762) stands apart from all other writings of the period. A Genevan by birth and early upbringing, he was a proudly self-conscious republican at a time when absolute monarchy was still in the ascendant. Profoundly discontented with his own age, he turned for inspiration to the example of classical antiquity, although his preference there, curiously enough, was not for the democracies. Sparta and Rome, rather than Athens, were his models of political excellence. In his special terminology, however, monarchy, aristocracy and democracy were simply alternative ways of organizing the executive branch of government. When he expressed his doubts about democracy he was simply saying that a mass meeting is rarely capable of settling all the day-to-day problems of public administration. But when it came to the exercise of sovereign authority, Rousseau was a thoroughgoing exponent of direct democracy, though the term is one which he himself never used.

According to *The Social Contract*, no law is legitimate unless it is an expression of the general will, a consensus of the whole community. No man can enjoy full moral responsibility, and so be really a man, unless he participates in the formation of the consensus by which he is legally bound. This means that he must assemble with his fellow citizens at periodic intervals, and personally vote on each and every act of legislation. He must also assume the responsibility of voting for a government to carry out the laws. The government thus created must be wholly subordinate to the general will, as expressed in the popular assembly.

This conception of the nature and function of legislative assemblies was clearly a reversion to the practices of Greek democracy. Appropriate only to city-states, it was wholly unsuited to modern conditions. But even though Rousseau's proposed applications of the principle of the general will were unrealistic. the principle itself was important. If the assumption of moral responsibilities is of the essence of human dignity, it follows that no man can, without degrading himself beneath the level of humanity, be denied a personal share in the making of basic political decisions. Rousseau's eloquent and uncompromising defense of this proposition was a decisive contribution to the theory of modern democracy.

The United States.—The first major experiment in constitutional democracy was inaugurated as a consequence of the American Revolution, although this was not the primary purpose of the revolutionary movement. The grievances which led the colonies to separate from the home country were essentially the same as those which had led to the break between king and parliament in 17th-century England. The colonies had legislative assemblies which started out with very modest pretensions, but came in the course of time to demand a parliamentary plenitude of legislative and fiscal powers. When these claims were rejected by royal governors who tried. as agents of the British government, to enforce the Stamp act and other measures authorized by the British parliament, the result was a typically 17th-century constitutional

crisis. Taxation without representation was denounced as a tyrannical denial both of the natural rights of man and of the traditional rights of Englishmen. The political theory of the Declaration of Independence is strikingly similar to that of Locke's second treatise. Clearly it was a demand for constitutional, not for democratic government. and the colonial assemblies of the period, though based on a somewhat broader franchise than the British parliament, were far from being democratic bodies. It is hard, however, to maintain special privileges under the equalizing conditions of a pioneer society. The colonial gentry were much less firmly established than the gentry of the home country, and much more vulnerable to democratic pressures. When the controlling hand of Britain was removed, the democratic forces in Xmerican life were free to seek expression. What most Americans wanted in the long run was a government that was not only constitutional, but also democratic, and this was the ultimate significance of the American Revolution.

The democratic tendencies of the revolutionary movement were apparent from the beginning. One of the first acts of most of the newly independent states was to adopt new constitutions. Having long lived under colonial charters, Americans were familiar with the idea of governments limited by a written constitution. The reason for the change was that most of the states wanted constitutional documents less narrowly restrictive than the older charters had been. Although property qualifications were retained, the franchise was generally broadened, and the powers of the popularly elected assemblies were extended at the expense of the executive. The forces of democracy were beginning to be heard.

A desire to counteract this movement was one of the leading motives of the Constitutional Convention of 1787. Its immediate object was to replace the Articles of Confederation (*q.v.*) with a more effective form of federal union. But a majority of the delegates were conservative, some even aristocratic in temper. Disturbed by what had been going on around them, they tried not only to create a strong central government to counterbalance the power of the states, but also to limit the power of popular majorities to control that central government.

The constitution which emerged from these deliberations was a compromise between democratic and antidemocratic ideas. Although the states were left free in general to be as democratic as they liked, their capacity to interfere with property rights was restricted by giving a number of important economic powers exclusively to the federal government. The democratic principle was recognized in the house of representatives, directly chosen by the same voters who were qualified to vote in state elections; but the principle of indirect election was adopted for the presidency and the senate. Majority rule was also limited by the principle of the separation of powers (*q.v.*), and by an elaborate system of checks and balances. The permanence of these restrictions was guaranteed by the establishment of an uncommonly difficult amending procedure.

The best theoretical justification of these arrangements appears in *The Federalist* by James Madison; Alexander Hamilton and John Jay, all men of importance in the early history of the republic. Though not intended as a systematic theory of politics, it is the most comprehensive statement of the political thought of the period. While recognizing that all legitimate government must rest on popular consent, its authors were much concerned with the dangers of unlimited majority rule and the need for constitutional restraints.

The adoption of the constitution served to modify rather than to arrest the progress of American democracy, for with the emergence of the two-party system. which soon established itself as one of the basic traditions of American politics, some of the constitution's more restrictive features were wholly or partly overcome. The electoral college, designed to ensure the indirect election of presidents, became a meaningless formality when the parties began nominating electors committed in advance to the election of a designated party candidate.

Although the separation of powers was harder to overcome, its significance as a restraint on majority rule was considerably reduced on those occasions, by no means unusual. when a single political party was able to capture both the presidency and the two houses of congress. Party discipline in the United States has never been strong, and conflict between the legislative and executive branches remains a regular feature of American life. But with all its limitations, common party leadership had done much to give unified direction to the various organs of American government, and to make the complex constitutional system a reasonably effective vehicle for the expression of public preferences.

Of the two parties which first competed for the favour of the American electorate, the Democratic Republican or. as it later came to be known, the Democratic party (*q.v.*) soon won the upper hand. The Federalists *(see* FEDERALIST PARTY). who continued to reflect the predominantly antidemocratic mood of the Constitutional Convention. had many able leaders and a number of powerful theorists, but their fear and suspicion of the people as "a great beast" proved uncongenial to the American public. The ideas of Thomas Jefferson. with his confidence in the innate goodness and reliability of the common man. were more in tune with American sentiments. This attitude, though it never found expression in any one outstanding work of political philosophy, was the dominant force in American politics.

By the middle of the 19th century, the outcome of the Xmerican Revolution had been to create the first successful example of modern constitutional democracy. It is true that slavery still existed, and that the rise of the Negro to a position of full equality was destined to be a slow and painful process extending far into the future. At this time women's suffrage, too. was practically unknown. With these exceptions. however, the battle for political equality had already been won. By 184j adult male suffrage was the rule in all but one of the states. which did not abandon property qualifications until 11 years later. There was also a strong atmosphere of social equality which gave American life a quite distinctive flavour.

That the United States had succeeded in creating a new type of civilization was the burden of Alexis de Tocqueville's *De la démocratie en Amérique,* which appeared in tn-o parts, in 1835 and 1840. Although displeased with some aspects of that civilization, which he thought to be unduly ridden by mediocrity and the pressure for social conformity. he recognized American democracy as a rising force which soon would be of decisive world significance. This work, which attracted wide attention in England and on the continent of Europe, was a milestone in the history of democratic thought.

From 18jo onward the main changes in American democracy, apart from the emancipation of the Negro and the acceptance of women's suffrage, had to do with the rise of economic democracy. Although *laissez faire* liberalism. modified by tariff protectionism, had been the prevailing economic doctrine, the free market led, especially after the Civil War, to inequalities of fortune which struck many people as being basically undemocratic. Jefferson's belief in the superior virtues of the small property owner had long been a part of the American political tradition. When this tradition was threatened, Populism *(see* POPULIST PARTY), Progressivism *(see* PROGRESSIVE PARTY, U.S.) and other protest movements arose to denounce the evils of big business.

Unlike the social democrats of Europe, the leaders of American radicalism rarely went to the extreme of rejecting private property. What they did was to insist on equality of economic opportunity and on the duty of government to guarantee minimum standards of economic welfare. Antitrust legislation and regulation of the railroads were typical early products of the movement, which culminated in the New Deal and Fair Deal administrations of Franklin D. Roosevelt and Harry S. Truman and the rise of the so-called welfare state.

The effect of these developments was to place a considerable strain on the American tradition of constitutional government. In a time of rapid economic change, economic democracy produced ever new demands for government action, demands which could not be satisfied quickly within the existing constitutional system. This situation led to a certain amount of impatience with the whole idea of constitutional restraints. The supreme court (*q.v.*j was frequently attacked for its invalidation of legislative measures,

and state and federal legislatures and even the political parties on occasion suffered unpopularity for their slowness in responding to popular pressures, For a time there was a tendency to look to the methods of direct democracy as a radical solution to the problem. The adoption of various types of initiative and referendum: institution of the direct popular election of senators and the establishment of party primaries all reflected disillusionment with the traditional institutions of American democracy. (*See* RECALL; REFERENDUM AND INITIATIVE.)

In general, however, the American people showed little disposition to make radical changes in their established form of government, being generally willing to see the claims of democracy and majority rule asserted within a framework of powerful constitutional restraints. Despite the hindrances which it placed in the way of rapid majority action, the constitution of 1787 remained in the 20th century the basic symbol of American political loyalties. The United States is a constitutional democracy, with the accent on the word constitutional.

The French Revolution. — The second great landmark in the history of modern democracy was the French Kevolution. Unlike its American counterpart, this was not a movement based on an established constitutional tradition. Ever since tne 16th century France had been an absolute monarchy and although a few districts had retained their provincial states-general, little remained of the medieval parliamentary tradition and few of the revolutionists had any interest in reviving it. Their inspiration came from the philosophy of the Enlightenment, with its radical new conception of the rights of man.

Throughout the 18th century the leaders of French intellectual life, notably Voltaire and the Encyclopaedists, had been asserting the principle of natural equality and denouncing the legal privileges enjoyed by the aristocrats and other favoured classes as a violation of the law of reason. Except for Rousseau, who stood apart from the mainstream of the Enlightenment. they were not much interested in political democracy, but wanted only legal equality. They were perfectly content with absolute monarchy as long as they believed that monarchs could be persuaded to use their powers in the interests of enlightened reform, When that hope was disappointed, the reformers transferred their attention to the people and began supporting the principle of popular sovereignty. But this was only an expedient. Basically the revolutionists were legal reiormers, passionately interested in liberty, fraternity and equality and indifferent as to the political means used to accomplish that end. This accounts both for the extraordinary reformatory vigour of the French Revolution and for the extraordinary difficulties it encountered in founding a stable tradition of democratic politics.

The political instability of the movement was reflected in the rapid succession of regimes which followed one another from 1789 to 1804. In 1j years France ran the gamut from absolute monarchy to constitutional monarchy to absolute democracy to imperial dictatorship. The movement began with the calling of the estates-general. This was an attempt to revive the medieval parliamentary tradition, but the reformers immediately started changing the character of the institution. Although the three estates, like the two chambers of the British parliament, were supposed to exercise equal and concurrent powers. the reformers insisted on their meeting as a single assembly in which the popularly elected third estate, with twice the normal number of delegates, was able to outweigh the representatives of the nobility and clergy. This violation of the traditional constitution was justified on grounds of democracy, it being held that the third estate, which represented about 90% of the population. was the authentic representative of the French people and was therefore entitled to the decisive voice in French politics. This claim was quickly made good. When the monarchy. the last remaining restraint on the powers of the popular assembly, seemed obstructive to the cause of enlightened reform, it too was eliminated. Absolute majority rule did not long prove satisfactory, however, as a basis for enlightened action. When differences of opinion broke out in the assembly, the Jacobins, as representatives of the extreme reformist position, felt no hesitation in setting up a revolutionary dictatorship The Jacobins were replaced in turn by the Directory, which gave way to Napoleon. All during this period the revolutionists acknowledged the people in theory as the true source of legitimate authority, and even the empire was confirmed by a plebiscite based on universal male suffrage. But although everyone spoke in the name of the people, it was impossibie to reach any lasting agreement on concrete political institutions through which the people might be allowed to speak for themselves.

The French Revolution had a curiously mixed effect on the development of modern democracy. It was successful in undermining the traditions of the *ancien régime* and in fostering the ideal of a society based on liberty. fraternity and equality. This ideal was embodied in a series of basic legal reforms. from the Declaration of the Rights of Man to the Napoleonic code. which permanently altered the face of Europe. The philosophers of the Enlightenment. whose main interest, as has been pointed out. had always been in legal equality, were thereby vindicated. By proclaiming the sovereignty of the people and by holding occasional elections arid plebiscites based on universal male suffrage, the Revolution also gave powerful impetus to the idea of popular participation in government. But by associating this idea with the practices of Jacobin and Napoleonic dictatorship, the movement also served to inhibit the growth of democratic institutions. Although the Revolution, in its earlier stages, had shown a certain preference for absolute majority rule exercised through democratically elected assemblies. it had made no serious or lasting commitment to any particular form of government. Most revolutionists believed that legal and social equality was an end which justified the use of any political means, and this idea was one of the most powerful and persistent legacies of the French Revolution.

Great Britain. — Although France inaugurated the movement toward modern democracy. Great Britain was the country which provided the old world with its first and most widely influential model of an effective democratic state. At the time of the French Revolution. the British constitution was still the oligarchic svstem established by the revolution of 1688. But the British constitutional tradition, unlike the *ancien régime* of France, proved to be strong and flexible enough to adapt itself to democratic pressures without loss of continuity. The United States, starting from its own version of that tradition, had already shown how much could be done to develop it in a democratic direction, and in the course of the 19th century the British did likewise.

The resulting system of parliamentary democracy was quite different from but no less successful than the American system. Except in South and Central America, where democratic constitutions generally tended, as in the United States: to follow the presidential pattern, Britain was almost everywhere taken as the model of modern constitutional democracy, no country in history being thus so widely imitated.

The movement to democratize the British constitution was inaugurated and sustained by the ideas of political theorists, many of whom. especially the earlier ones, were very close to the philosophy of the Enlightenment. Like the French Encyclopaedists, Jeremy Bentham was primarily a legal reformer. Approaching problems from a standpoint of rationalistic hedonism, he tended to justify majority rule simply as the most expedient means of achieving desirable social ends, an argument characteristic of the first generation of English utilitarians. As time went on. however, English theorists began to place their defense of democracy on a rather broader basis. John Stuart Mill, the most influential of the later utilitarians, was less fully convinced than his predecessors of the inevitable rationality and wisdom of majority rule. In his *Representative Government* he justified it primarily as an institution indispensable to the moral self-education of mankind, and one which ought therefore to be encouraged in the face of a great variety of practical difficulties. Members of the idealist school went further in ascribing inherent moral value to the democratic process. Thomas Hill Green. whose *Lectures on the Principles of Political Obligation* acknowledged an important debt to Rousseau, was the exponent of a balanced rationalistic humanism which not only justified democracy as a logical consequence of the general human right to moral self-determination, but also laid the grounds

for acceptance of the 20th-century welfare state. Throughout the course of the 19th century, English writers played a leading role in the formulation of modern democratic thought.

In Great Britain the democratic movement was able, as it had not been in 18th-century France, to find expression through existing institutions. Parliamentary supremacy having already been established, the obvious course for political reformers was to gain control of parliament. This was not easy. The hereditary character of the house of lords and the limited electoral basis of the house of commons gave preponderant power to the landed gentry, who were generally opposed to the reformist movement. But the British tradition of civil liberties, though far from perfect, made it relatively safe to engage in political agitation. The haphazard nature of the existing representative system meant, moreover, that the franchise was much more widely extended in some constituencies than in others. Radical candidates were able to contest these seats successfully, thus gaining admission to parliament. Some members of the ruling class, particularly the more prosperous merchants, were favourable to radical ideas, and others could be made to give way in the face of popular pressures. The progress of the radical movement was slow, but never wholly discouraging. Its persistence was finally rewarded by the passage of the Reform act of 1832.

Even after 1833 the democratization of the British constitution still had a long way to go. The Reform act itself did no more than rationalize the basis of parliamentary representation and enfranchise a limited number of new voters, leaving untouched the still formidable powers of the hereditary house of lords. Democratization could not be regarded as complete until the suffragewas made, universal and full powers were concentrated in the house of commons. These changes came about by a succession of gradual stages which continued well into the 20th century. Although the franchise was greatly extended in 1867 and again in 1884, recognition of the right of all adult males to vote did not come until 1918, full women's suffrage was adopted only in 1928 and some minor anomalies, such as the right of plural voting, continued until 1948. Although the powers of the house of lords declined in practice during the course of the 19th century, its equality with the house of commons remained legally unimpaired until the Parliament act of 1911, which reduced it to a distinctly subordinate position, and its powers were still further reduced in 1948. All this took more than a century.

Partly as a result of its unusually gradual character, this long course of development ended in the firm establishment of one of the most unqualifiedly democratic of all modern constitutional states. In America belief in the principle of majority rule is counterbalanced by the belief that no agency of government can be trusted to exercise unlimited authority. The British constitution, on the other hand, recognizes no distinction between ordinary and constitutional law and insists on the complete legislative sovereignty of the king in parliament. The effect of this doctrine, under modern conditions, is to give practically unlimited powers to the leader of any party that is able to win an absolute parliamentary majority in a general election. Constitutional custom decrees that the king must invite him to form a cabinet with full control over the executive branch of government. Since the bonds of party discipline in England are exceptionally strong, the fact that the members of the cabinet are leaders of the majority party means that they will also be able to control the legislative branch, limited only by the almost negligible powers which still remain with the king or the house of. lords. When the British electorate. votes, therefore, it does so with the well-founded expectation that the government of its choice will have full power to carry out its mandate. No country has ever gone further toward accepting the principle of absolute majority rule.

This does not mean that England ceased to be a constitutional state. In Britain no less than in the United States, commonly shared respect for the constitution has always been a major force in the life of the country. Had they not considered it constitutional, and therefore deserving of loyal acceptance, the British people would hardly have adjusted themselves so peaceably to the enormous social change involved in their own particular version of the modern welfare state. But the constitutional tradition of Britain, though comparable with that of other constitutional states, has one distinguishing feature: having long been associated with the idea of parliamentary sovereignty, it is conceived in moral rather than in legal terms. Most Englishmen would agree that the majority, acting through proper parliamentary channels, has a legal right to do anything it wishes, but would also agree that there are many things a majority has no moral right to do, and that if those things were attempted, even by act of parliament. they would still be in violation of the principles of the constitution. Civil liberties, for example, are at least as secure in England as in any other country, not because they are legally guaranteed against infringement by parliamentary majorities, but because the tradition of respect for British liberties is so widely shared that it would be morally unthinkable for a majority to violate them. The principles of the British constitution are so deeply engrained in the moral consensus of the community, without legal safeguards. that it has been possible for England fully to accept the democratic principle of majority rule without sacrificing its devotion to constitutional government.

Other European Countries. — The main impetus to the establishment of democracy in Europe came from the ideas of the French Revolution and from the various nationalist movements which followed in its wake. Since the revolutionists had failed, however, to establish a political tradition of their own, it was to the model of the British constitution that the continent generally turned in its search for democratic institutions. To this general rule Switzerland was the only notable exception. Before the French Revolution the Swiss had been governed by a loose confederation of small republics, most of which had been oligarchic in character. Their response at mid-19th century to the democratic and nationalist forces of the times was to create a more strongly centralized federal state which, in its organization of federal-cantonal relations, owed something to the American example and, in its conception of legislative-executive relations, struck out on original and effective lines of its own. The result was one of the stablest and most efficient of modern constitutional democracies. But the Swiss example, though widely admired. was little imitated. Until World War I monarchy remained the normal form of government throughout the continent. As the British example showed that a monarchy could be both constitutional and democratic, the British constitution became the primary inspiration for European democratic government.

Paradoxically, the imitation of British institutions was initiated not by the supporters but by the opponents of the democratic movement. Although the purpose of the 1815 congress of Vienna was to restore the prerevolutionary and pre-Napoleonic system of royal legitimacy, after nearly a generation of revolutionary experience the ideas of revolutionary democracy were too strong to be disregarded. Realizing the impossibility of any total reversion to the practices of the *ancien régime,* the restoration monarchies tried to find a formula which would allow some concessions to popular feeling without impairing the power of the older ruling classes. The oligarchic constitution of Great Britain, which up to that time had successfully resisted the pressure of democratic forces, seemed to provide the answer. When Louis XVIII returned to France. he issued a constitution, the charter of 1814. Although he carefully maintained the position that this document was an expression of his own absolute authority, with no concession to the principle of popular sovereignty, this was little more than a legal fiction. The practical consequence was to convert France into a constitutional monarchy, with institutions closely modeled on those of contemporary Britain. Similar charters were adopted by most of the other restoration monarchies.

Although differing from country to country, the course of events thereafter was much the same as in Britain itself, leading through parallel stages to the increasing democratization of European politics. The fiction of absolute monarchy was gradually replaced, sometimes as a result of further revolutionary disturbances, by the principle that the people are the source of all constitutional authority. There was also a general tendency to move in the direction of universal suffrage, and to concentrate legislative and

executive powers in the hands of cabinets responsible to the popularly elected branch of the legislature.

The te'mpo of these developments was quite uneven, and often it was the continent rather than England that took the lead. When it came to broadening the franchise and to the adoption of social welfare measures! the continent was apt to move more rapidly, while in the establishment of cabinet responsibility it lagged behind. Even under the French charter of 1813, for example, the right to vote was less narrowly restricted than in pre-Reform act England, and the principle of universal male suffrage was adopted in the fundamental laws which formally established the third French republic in 1875. In this France had been anticipated by the constitution of the new German empire, which also soon proceeded to outdistance the world in welfare legislation. It was only in 1875, on the other hand. that the principle of parliamentary responsibility became finally established in France, and in some countries, such as Germany and Denmark, it was not fully accepted until the early 20th century.

By the 1920s these inequalities of development had been largely evened out. The constitutional states of Europe were all democratic monarchies or republics with political institutions fully comparable with those of Great Britain. There was one important respect, indeed, in which they conformed to the American rather than to the British example: rejecting the idea of absolute legislative sovereignty, they all had written constitutions that to some extent restricted the powers of parliamentary majorities. The process of constitutional amendment, though never as difficult as in the United States, was distinguished from ordinary legislation by the requirement of special majorities, and often by provisions calling for some sort of direct popular vote.

In other respects, however, the system of government was British rather than American in character. Based not on the separation but on the fusion of legislative and executive powers, it entrusted executive responsibilities to a cabinet of party leaders backed by a parliamentary majority. The democratic character of parliament itself was guaranteed by periodic general elections in which all adult citizens. usually including women, possessed the right to vote. This became the standard form of modern European constitutional democracy.

But in spite of these close similarities of governmental structure, democracy on the continent proved in practice to be quite unlike democracy in Britain. as a consequence mainly of quite different systems of party organization. The British voter normally gives his support to one of two major parties. When he goes to the polls, therefore, he is reasonably certain that one or the other of them will win a majority and form the next government. When voting in a presidential election the American voter likewise knows that the successful presidential candidate! though subject to congressional opposition, will at least exercise the powers of the presidency for the next four years. In both cases. the existence of a two-party system ensures a direct connection between the expressed preference of the electorate and the actual control of government. The European voter has no such assurance. The loyalties of the electorate are traditionally divided between so many different parties that it is rarely possible for any one party to win an absolute majority. By establishing various systems of proportional representation, many European constitutions helped to encourage and perpetuate this fragmentation of the electorate.

There were, of course, exceptions. Following World War II social-democratic and Christian-socialist parties occasionally acquired majorities of their own, and some signs even appeared in west Germany of a polarization of voter preferences into something resembling a two-party system. But as a general rule governments in Europe have always had to be formed by the coalition of two or more parties. Coalitions between rivals are hard to form, and even harder to hold together. Thus the voter, no matter how successful his party may be at the polls. cannot be sure that it will be included in the next government or that. being included, it will stay in office long enough to carry out any substantial part of its mandate.

The experience of many European countries showed, however, that the difficulties of the multiparty system are not insuperable. If the leaders of the several parties are reasonably co-operative, and if their followers are willing to moderate their claims in the interests of collaboration, coalition cabinets may provide a stable and effective form of democratic leadership. This is not impossible. Some of the smaller constitutional monarchies, most notably the Netherlands and the Scandinavian countries, were especially successful in combining effective constitutional democracy with a multiparty system.

The difficulties encountered. however, have kept a large part of the continent from ever being won over completely to the cause of constitutional democracy. Democracy was, in the second half of the 20th century, 'a powerful force in Europe, but it remained haunted by the spirit of the French Revolution, strong in ideas and weak in institutions. The Jacobin tradition still found expression in a widespread tendency to vote for ideologically congenial parties, whether their programs had a chance of being realized or not, and to encourage them to maintain intransigent positions without regard for the practical consequences. This is one of the reasons for the multiplicity of parties in most European countries. But when cabinet after cabinet is voted out of office without having had a chance to accomplish anything, the voter is apt to lose faith in the significance of parliamentary elections and to look elsewhere for the satisfaction of his political needs. Both before and after World War II an appreciable minority and even, on occasion, an actual majority of the electorate in many countries regularly expressed disaffection by voting for totalitarian parties. Constitutional democracy was still a long way from having won general acceptance.

Totalitarian Democracy. — During the 19th and early 20th centuries the idea of democracy was associated primarily with liberal constitutionalism. That is what Pres. Woodrow Wilson had in mind when he stated that "making the world safe for democracy" was the object of United States participation in World War I One of the principal consequences of that war, however, was the establishment of the communist regime in Russia. Although the L.S.S.R. did not aspire to be a liberal state, it laid great emphasis on what it claimed was its popular and democratic character, a claim which was held to be spurious by upholders of traditional types of democracy. The satellite governments it set up after World War II were officially designated "people's democracies," and it was in this rigorously restricted form that "democracy" became familiar at mid-20th century to much of the human race.

The theoretical origins of this new conception of democracy go back to the period of the French Revolution, and the ideas of economic democracy which emerged as a minor but persistent phase of the revolutionary movement. Although the revolutionists were mainly preoccupied with the problem of legal equality, there was a minority wing which claimed that economic equality was also one of the basic rights of man, and that the Revolution would be meaningless unless its legal reforms were accompanied by a drastic reformation of the existing economic order. The outstanding proponents of this position were the Société des Égaux, a group of dissident Jacobins under the leadership of François Babeuf. Having conspired against the Directory, they were detected and thoroughly suppressed in 1796. Their ideas were not forgotten, however. Socialism continued throughout the 19th century as a living part of the revolutionary tradition, especially in France. Expounded in a variety of versions by many notable writers, including Étienne Cabet, Louis Blanc and Pierre Joseph Proudhon (*qq.v.*), it attracted wide attention and played some part in the revolutionary movements of 1848.

This tradition found its most effective expression in the works of Karl Marx. A German profoundly influenced by the French revolutionary tradition, he developed a social and economic theory which soon gained wide currency. Marxism, as presented in *Das* Kapital and other major writings. is a much elaborated development of the earlier socialist position. Starting from the assumption that all men have a right to enjoy the fruits of their own labour, it tries to demonstrate, by abstruse and largely fallacious economic arguments, that capitalism rests on the expropriation of the surplus values created by and properly belonging to labour.

Private ownership of the instruments of production is therefore intrinsically incompatible with economic justice.

Marx believed that economic relationships are the decisive factor in human life. Politics, law and religion are but superstructures erected on the basis of economic power in the interests of the propertied classes. From this it follons that liberal constitutionalism is not in fact democratic in any meaningful sense of the term. Although legal and political rights may, as a matter of form, be extended to the unpropertied masses, decisive power will always rest with the owners of the instruments of production. As long as this economic inequality continues, democracy is impossible. The historic function of the proletariat is to overthrow the bourgeois state and, by liquidating the capitalist class, to lay the foundations of a truly just and classless society. This is the great unfinished business of the democratic revolution. (See SOCIALISM; COMMUNISM; PROLETARIAT.)

In his attitude toward the problem of politics. Marx clearly belongs in the Jacobin tradition. To his way of thinking, equality, conceived now in economic rather than in legal terms, is the essence of democracy, and he pays little attention to the political means used for the attainment of that end. He believes that the proletariat, at the time of the proletarian revolution. will be vastly more numerous than the capitalists. To that extent his theory of revolution is majoritarian. But he allows for the existence of other classes which are neither capitalist nor proletarian, and his theory never specifies whether the revolutionary activists the "vanguard of the proletariat," ought to secure the support of a majority of the whole population, or even a majority of the proletariat, before beginning the revolution. Nor do his writings throw much light on the question of the political institutions to be established during and after the revolution. Passionately concerned with the achievement of economic democracy as he conceived it, he had no real interest in or comprehension of the problems of democratic politics.

Because of Marx's silence on most of the basic questions of political theory. his followers were free to adopt a wide variety of political positions. In western Europe most Marxists gradually adjusted themselves to the prevailing standards of constitutional government and pursued the ends of economic democracy by parliamentary means. Socialist parties were able. under conditions of universal suffrage, to send many representatives to parliament in various western European countries and to press successfully toward the adoption of socialist reforms. Since this was hard to reconcile with Marx's theory of inevitable revolution, orthodox Marxists long resisted the idea of collaborating fully in the parliamentary process. The Marxist attitude of Jacobin intransigence, though much modified in the course of time, was never wholly lost. By the end of the 19th century, however, the possibility of achieving socialist reforms by parliamentary rather than by insurrectionary action had become too clear in practice to be denied in theory. The revisionist movement, which included such figures as the German socialist Eduard Bernstein and the French socialist leader Jean Jaurès, was an attempt to persuade Marxists that earlier ideas of revolution were out of date, and that socialism under modern conditions could best be achieved within a framework of constitutional democracy. Although revisionism was not immediately accepted. it was widely influential, and provided a theoretical justification for the practice of social-democratic parties. These parties played an important part in the evolution of the modem welfare state.

In Russia the development of Marxist political theory took a radically different turn. At the beginning of the 20th century the tsarist empire was still an absolute monarchy, and it never developed very far in the direction of modern constitutional democracy. This, together with the numerical weakness of the industrial proletariat in an as yet unindustrialized country, meant that Russia offered little scope for social-democratic action. Lenin, the leader of the Bolshevik faction of Russian Marxists, refused to be discouraged (see BOLSHEVIKS). Stressing the revolutionary side of Marxist theory, he reinterpreted it in such a way as to emphasize the role of minorities as the true agents of revolutionary action. He developed the idea of the dictatorship of the proletariat, a phrase rarely used by Marx himself, to show that even a small and undeveloped proletariat would be justified, under certain circumstances, in taking over power.

Lenin's theory of democracy was essentially the same as that of the Jacobin dictatorship. For him, as for his French predecessors, the revolution was so important to the furtherance of popular interests as to outweigh all considerations of popular consent. The true spokesman of the revolution was not the nonproletarian majority, or even the proletariat itself, but the "vanguard of the proletariat." a group of properly qualified revolutionary leaders. The role of vanguard was reserved for Lenin's own party. which was converted, under his leadership, into a small but highly efficient and disciplined body of professional revolutionaries. In 1917 it succeeded in gaining control over the greater part of the former Russian empire.

The result was the creation of a new type of political regime, one best described as totalitarian democracy. It is exemplified, in its fully perfected form, by the Soviet constitution of 1336. Many of its features are derived from the standard repertory of constitutional democracy. Promulgated in the name of the people, designated as "the working people of town and country," it provides for a bicameral legislature elected by universal suffrage, a federal distribution of powers between the union government and member republics and many other familiar features. It also includes a very complete bill of rights.

The peculiarity of the constitution does not lie in such formal provisions, which in many cases reflected an ideal of legality rather than practice, but in the position which it ascribes to the Communist party. This position is such as actually to negate traditional western concepts of democracy. Instead of being, like a political party in a constitutional democracy, one association among many competing for popular acceptance, the Communist party of the U.S.S.R. is constitutionally recognized as the only legitimate source of political action. No candidates may stand for election without its approval. and no civil or political rights are valid except insofar as they coincide with its purposes. The leading role of the party is total. being exercised not only in strictly political contexts, but also in trade unions, cultural organizations and all other forms of association. The party itself, moreover, is entirely exempt from popular control. A self-perpetuating and highly selective elite, whose membership usually fluctuated at mid-20th century at somewhere around 5% of the population. it is kept under close supervision and discipline by a still narrower elite of party leaders The purpose of this whole system is to guarantee the continuing success of the revolution by placing total authority in the hands of a small minority of its most ardent and able supporters.

In any normal sense of the word democracy, a form of government which provides no opportunity for the legitimate expression of popular preferences and which confines the right of significant political action to a small minority of the population is the reverse of democratic. The communists insist. however. that the constitution of 1936 is the most democratic in the world, and that liberal constitutions by comparison are nothing more than facades masking the realities of a basically undemocratic society. This conclusion follows logically from the premises of the Marxist conception of democracy. If democracy is primarily a question of political rights. the democratic claims of the U.S.S.R. are nonsense. Even if democracy is primarily a question of economic equality, those claims are still dubious, since many other countries, including Britain and the United States, have gone a good deal further than communist Russia in equalizing incomes. In the special terminology of Marxism, however. the necessary and sufficient condition of democracy lies simply in the elimination of private ownership of the instruments of production. There is no private capital in the U.S.S.R. From this it follows that, in the very special Marxist sense of the word, the U.S.S.R. is far more democratic than any liberal state.

The **20th** Century. — One of the most striking features of the 20th century was the rapid diffusion of the idea of democracy. Totalitarians and constitutionalists may differ as to the proper meaning of the term, but it was in the mid-20th century a rare

government which would admit that it was not democratic in some sense or other, or striving to become so. Down to World War I the incidence of governments claiming to be democratic was much more restricted, being confined almost entirely to Europe and to those parts of the world. notably the two Americas and Australia, which had been settled by populations preponderantly European in origin. After World Wars I and II the number of self-styled democracies, whether totalitarian or constitutional, steadily increased. It is true that, in the period between the two wars, ideological movements based on the denial of democratic principles of equality enjoyed a temporary popularity in western Europe, culminating in the short-lived triumphs of Nazi Germany. and antidemocratic tendencies also appeared elsewhere, notably in the Union of South Africa. By the middle of the 20th century, however, there were few parts of the globe where democracy of one sort or another was not the generally recognized principle of political legitimacy. Few concepts had ever moved so rapidly from obscurity to all but universal acceptance.

This development was the outgrowth of two separate but closely associated phenomena, the decline of colonialism and the rise of nationalism. Prior to World War I the spread of western civilization had characteristically involved the division of the rest of the world into colonial empires or, as in the case of China, into western-dominated spheres of influence. Although the more successful colonial powers were constitutional democracies, they did not immediately or fully extend their own principles of government to their overseas possessions, but ruled them as subordinate dependencies. In the western world itself, however, the rise of democracy soon became associated with the principle of national self-determination and, like all western ideas, this principle spread to the colonial world and became a powerful revolutionary force.

Rapid population growth and rising urbanization did much to upset the traditional bases of colonial society and to foster the dissemination of western influences, including nationalism. Before long, the more westernized sections of the native populations everywhere were challenging colonialism in its name. The result was a progressive disintegration of the various colonial empires, a process much accelerated by the World War II Japanese conquest of southeast Asia. Soon after the end of the war the greater part of Asia broke loose from the colonial system, and the movement toward independence in all colonial areas was greatly stimulated. By this time, however, the westernization of the non-European world had progressed so far that there was rarely any question of restoring the precolonial forms of native government. What the nationalists wanted, with rare exceptions, were modern governmental regimes capable of raising their countries to a position of equality with other modern nations. That meant democracy.

But what form of democracy? The modern world offered two working models, the constitutional and the totalitarian. The first was the older and better established form. and the one which was still characteristically associated with the more advanced types of industrial society. The second was exemplified by the U S S R., which had become an object of emulation and inspiration to all economically underdeveloped nations by its unprecedentedly rapid growth as an industrial and military power. The question of which model the newly liberated nations mould follow was one of the most momentous issues of 20th-century politics.

The choice was not wholly free. Almost immediately after the end of World War II, rivalry between the western world. led by the United States, and the communist world, led by the U.S.S.R., became the outstanding factor in world affairs. This rivalry expressed itself in an attempt by both the principals to draw the largest possible number of allies and dependencies into their respective camps. Such efforts did not necessarily include an attempt to dictate the form of government adopted by the country in question. U.S. aid, for example. went to Arab principalities that were far from being constitutional democracies, while the U.S.S.R. lent its support to countries which, like Gamal Abdel Nasser's Egypt, were in no sense communist. Whenever possible. however, it was tempting to strengthen the bonds of association by imposing a congenial type of political regime. This could most effectively be done in those areas which, in the years following World War II, were under military occupation. The governments of eastern and central Europe were accordingly rapidly transformed into people's democracies. while uest Germany and Japan were remodeled as constitutional governments. Even in the absence of direct military control, moreover, pressures could still be exerted. Interventions of this sort undoubtedly played a large part in determining the political complexion of the postnar world.

But when all due allowance had been made for the effect of external pressures, the fact remained that many countries of the one-time colonial world showed a marked affinity for one or the other of the two rival systems. As a general rule, areas which, under the tutelage of a preceding colonial authority, had been long and conscientiously schooled in the exercise of political responsibilities tended to opt for constitutional democracy. while others gravitated to totalitarianism. Thus China. which had never been fully subjected to colonial control and had recently been ruled by a nationalist government with strong totalitarian leanings, became a full-fledged communist state shortly after the end of World War II. This was accomplished with a minimum of Russian intervention, and in the face of substantial U.S. support for the opposing nationalists. The Philippine republic, on the other hand, adopted a democratic constitution closely patterned after that of the United States, and began operating it uith considerable success.

Especially notable were the developments uhich took place within the overseas territories of Great Britain. In the second half of the 19th century Britain had already begun the process of converting its colonies into a commonuealth of freely associated nations *(see* COMMONWEALTH OF NATIONS). This process was completed, so far as the English-speaking dominions were concerned. with the passage of the Statute of Westminster in 1931. After the end of World War II the policy was rapidly extended to other parts of the empire, beginning with India, Pakistan and other Asiatic possessions and continuing in such areas as Ghana and the British West Indies. All of these new countries adopted forms of government based more or less closely on the British model. From the standpoint of constitutional democracy, this was one of the most promising developments of the postwar period.

At the middle of the 20th century, hoaever, constitutional and totalitarian democracies were still very far from having reached a state of stable equilibrium. In the 1950s serious popular uprisings in Hungary and east Germany, though quickly suppressed by Russian military intervention, were evidence that the people's democracies had yet to succeed in winning general acceptance among the nations of central and eastern Europe. The electoral successes of the Communist party in India and the long persistence of communist-inspired guerrilla movements in the Philippines and Burma were typical of the difficulties that many of the new constitutional democracies were likewise encountering. Nations which have long been agitating for independence usually develop unified nationalist parties nhich come in the course of time to regard themselves as the only true representatives of the national interest. Such parties find it easier to slip into totalitarian nays of government than to adjust themselves to the constitutional pattern of party competition. Although many nationalist groups, such as the Congress party of India, made serious and generally successful efforts to behave like constitutional parties, it was by no means certain that all of the nenly established constitutional states would remain true to constitutional principles. In the face of popular discontents, on the other hand, the stability of many totalitarian states uas also open to question. Thus the political situation, in many parts of the world, remained in a highly fluid state. Democracy was in the ascendant everynhere. but only the future could tell nhether the prevailing form of democracy would prove to be constitutional or totalitarian.

DEMOCRATIC PARTY (U.S.). The party began in 1792 as a national group of voters supporting Thomas Jefferson and using at times the title "Republican," derived in part from their emphasis on the newly established "republic" as contrasted with "monarchy." The party continued under various designations with such leaders as James Madison and James Monroe until, during the presidency of Andrew Jackson. it came to be known under its present name. The basis for its appeal was laid in the Constitutional Convention of 1787 and in the ensuing debate upon the powers of the national government. In accord with Jeffersonian philosophy, there was eventually established a party which adopted the following political principles: popular control of government; wide extension of suffrage and the fullest measure of personal liberty consistent with law and order; strict interpretation of the constitution and preservation of the rights of the states: opposition to centralized power in the federal government; religious liberty, free speech and a free press.

Although from the outset this party was a strong opposition force in the congress, it did not obtain direction of the administration until Jefferson became president in 1801. Throughout the next 40 years, except in 1825–29 during the administration of John Quincy Adams, the party was in almost continuous control. Madison and Monroe, both close friends and disciples of Jefferson, served in the presidency a total of 16 years.

Although Jefferson had established the Democratic party on the principle of popular government, as opposed to the Hamiltonian idea of direction by national economic groups, the members of the so-called Virginia school of presidents were aristocrats in birth, breeding, education and environment. It was not until the election in 1828 of Andrew Jackson. a frontiersman from Tennessee, that a "man of the people" entered the White House to become the second great figure in the party's annals. The Jeffersonians in effect had held the party in trust for the people, whereas Jackson would turn it over to them.

Jackson emphasized Jefferson's original principle of strict interpretation of the constitution. Jackson's great political battle, which he won. was to deny a renewal of charter to the United States bank, inasmuch as he feared the weight of its influence in national affairs. Yet, when South Carolina threatened to nullify federal tariff legislation and if necessary to secede from the union, it was Jackson who issued the nullification proclamation declaring that no state had a constitutional right to withdraw from the federal union.

Between 1837, when Jackson retired, and 1860, four Democratic presidents were elected—Martin Van Buren, James K. Polk, Franklin Pierce and James Buchanan. Although the Democrats lost to the Whigs in 1840, the death of Pres. William Henry Harrison in 1841 brought to the presidency John Tyler, who had been and was more of a Democrat than a Whig.

The real party history of this period is concerned with the futile struggle of politicians and statesmen to ignore or compromise the slavery issue. The Democratic party during the Van Buren administration came to be more completely under the dominance of the south, which was unshakablp convinced that its economic, social and political interests were bound up in the preservation and extension of slavery. The south demanded the right to extend slavery into new territories and states as the only way to prevent the great industrial states of the north from becoming too strong in the federal government.

By 1850 the slavery issue had assumed such aggravated form that it was impossible to ignore or compromise it, as had been done in the Missouri compromise of 1820. A final effort, horvever, was made in the compromise of 1850, which was proposed by Henry Clay and accepted by majorities in both the Whig and the Democratic parties. On the basis of this arrangement, the Democratic conventions of 1852 and 1856 assumed that the issue had been settled.

Such an assumption was proved erroneous by subsequent events. No matter how the politicians side-stepped the question in their speeches and platforms. the absorbing issue nevertheless rvas slavery. The party did not recognize nor reckon with such political propaganda as Harriet Beecher Stowe's novel *Uncle Tom's* Cabin. The final crack-up came in 1860, when the delegates assembled for the Democratic convention in Charleston, S.C.

The majority plank in the platform of this convention declared that each new state or territory must have the right to enter the federal union on its own terms. as expressed in a constitution adopted by vote of its residents, whether prohibiting or recognizing slavery. Pending adoption of a local constitution, the platform declared for free settlement in new states and territories, which meant that southerners could establish themselves there with their "property," including slaves.

When the convention rejected this resolution and adopted a minority report ignoring any specific slavery declaration, the southern delegates withdrew. The northern Democrats adjourned to Baltimore. Md., and nominated Stephen A. Douglas of Illinois as presidential candidate. The southern faction. reconvening in Richmond, Va., adopted the rejected majority report on slavery and then met in Baltimore where it nominated John C. Breckinridge of Kentucky as its presidential candidate.

Inevitably, this north-south split was disastrous to the Democrats. The newly formed Republican party, which had been organized in 1854 on an antislavery basis, won its first national victory in 1860. Although its nominee. Abraham Lincoln, did not obtain a majority of the popular vote. he received a majority in the electoral college because of the Democratic split. Not until 1884 did the Democrats again elect their candidate.

From 1860 to 1932, the Democratic party was in administrative power for only 16 years. Its defeat in 1876, however, when Samuel J. Tilden of New York, an anti-Tammany reformer, was the nominee. was questioned by those who believed that he had actually defeated Rutherford B. Hayes (*q.v.*). In 1884 the Democrats elected Gov. Grover Cleveland of New York to the presidency. They lost with him in 1888, but elected him again in 1892. In 1896 the party once more split disastrously. this time on the free and unlimited coinage of silver as advocated by their candidate. William Jennings Bryan of Nebraska. Through their addiction to economic radicalism under the Bryan leadership, the Democrats after 1896 became again a minority party in the nation. The large business, industrial and financial interests developing at the time preferred the party of William McKinley at the turn of the century.

The Democrats returned to power in 1913 with Woodrow Wilson, former governor of New Jersey, mainly because the 1912 Republican vote was divided between William Howard Taft and the Progressive party candidate, Theodore Roosevelt. (*See* PROGRESSIVE PARTY, THE.) Wilson, under the slogan of the New Freedom, urged and obtained legislation for more complete federal regulation of banking and industry, including establishment of the federal reserve system and the Federal Trade commission, strengthening of the antitrust statutes and a drastic revision of the tariff laws. Under the 19th amendment, women gained the right to vote during Wilson's second administration. Wilson had been re-elected in 1916 in a closely contested election. In his second term, he mobilized the country's resources for the defeat of Germany in World War I and was hailed throughout the world as the saviour of democracy. He inspired the creation of the League of Nations.

*Popularly called "Republicans" up to the time of Andrew Jackson. ?Electors chosen by legislatures in many states. ‡Contest decided in house of representatires. §Because of the death of Horace Greeley before electoral votes nere cast, Democratic electors scattered their votes. Elected. ¶One Alabama elector cast his vote for a third person. ♀Based on *Statistics of the Presidential and Congressional Election of November 8, 1960,* compiled under direction of the clerk of the house of representatives. δ15 electoral votes were cast for Sen. Harry F. Byrd of Virginia.

Sote: Authorities differ on the popular vote for president in some elections, particularly during the 19th century. For a discussion of the problems involved, see Edgar E. Robinson, *The Presidential Vote, 1896–1932* (1934) and *They Voted For Roosevelt, 1932–1944* (1947); W. D. Burnham, *Presidential Ballots, 1836–1892* (1955).

A Democratic setback occurred in 1920 with the election of the Republican nominees, Warren G. Harding and Calvin Coolidge, over the James M. Cox-Franklin D. Roosevelt ticket. The voters had become disillusioned with the war's sacrifices, division among the victorious Allies and the bitter debate over the entrance of the United States into the League of Nations, which had ended in defeat for the League's advocates. The Democrats had found no inspiring leadership after the illness and virtual retirement of Wilson in 1919, and lacked unity on national problems at the end of the war. The issue of prohibition. provided in the 18th amendment adopted in 1919, split the party into urban and rural factions. The backwash of war and the temporary but spectacular prosperity of the 1920s kept the party out of power during the period from 1921 to 1933.

In 1932, however, the Democrats rode to victory with Gov. Franklin D. Roosevelt of New York. Hard times under Herbert Hoover contributed to a triumph in which Roosevelt carried all but six states. In 1936 the party's achievement at the polls was overwhelming, only Maine and Vermont voting Republican. Roosevelt in 1940 was a third-term candidate and won the election. He carried all but ten states and received a plurality of 4,900,000 votes over Wendell L. Willkie, the Republican candidate. Roosevelt won a fourth time in 1944, defeating Gov. Thomas E. Dewey of New York. Roosevelt had 432 electoral votes to Dewey's 99. Roosevelt's domestic program, known as the New Deal, provided collective bargaining for labour unions under federal protection, subsidy payments to farmers in return for government control of production, stricter regulation of banking and investments, increasing government ownership and operation of utilities, a social security and unemployment insurance system, guarantee of bank deposits and federal loans for home building.

These reforms were denounced as socialistic by Roosevelt's opponents, but their popularity was reflected in his four victories. Two great factors in the Democratic successes were the nation's heavy relief expenditures throughout the depression years, and large federal expenditure for the participation of the United States in World War II—all of which stimulated the national economy.

Domestic reform was pushed aside for the time being when the Japanese attack at Pearl Harbor on Dec. 7, 1941, brought the United States into World War II. Roosevelt had already transformed the U.S. into an "arsenal of democracy," and now became the leader of the Allied forces. He died on April 12, 1945, before the end of the war, and was succeeded by Vice-Pres. Harry S. Truman, former senator from Missouri.

On his accession to the presidency, Truman proposed to expand his predecessor's New Deal into what he described as a Fair Deal. He proposed to congress compulsory health insurance, an enlarged farm program, a broad civil rights program and federal aid to education. On most of these issues he was thwarted by a coalition of Republicans and "Jeffersonian" Democrats, most of the latter from southern states.

Foreign problems, especially Russian expansion and aggression, occupied President Truman from 1947 on. Accepting the Soviet challenge in what was described as a "cold war," he sponsored huge loans and grants for the restoration of Europe's economy, shattered by World War II, and for the rearming of the North Atlantic Treaty organization members. In June 1950 he ordered U.S. forces in Japan to resist a Communist invasion of South Korea, and led the United Nations in resisting this "aggression" in the ensuing Korean war.

Meanwhile, having served out Roosevelt's unfinished term, Truman was elected president in 1948, defeating Republican candidate Thomas E. Dewey by 303 electoral votes to 189 in a remarkable upset victory. The party was divided in its search for a successor to President Truman when in March 1952 he declined to stand for re-election.

The choice of Adlai E. Stevenson, governor of Illinois, was not satisfying to many of the elements of the party. Stevenson waged an aggressive campaign and raised many questions to a high level of discussion. but carried only 9 states, and won 89 electoral votes to 442 for Dwight D. Eisenhower, the Republican candidate.

The Democrats throughout the four years 1952–56 were divided in the country, in the congress and, particularly, in several of the states. Protection of civil rights, with special reference to a decision of the United States supreme court in 1954 on desegregation in the public schools, became an issue that divided both southern and northern factions of the party.

Former President Truman continued to share leadership honours with Adlai Stevenson after the latter announced that he would be a candidate in the 19j6 campaign. Sen. Estes Kefauver of Tennessee campaigned in the presidential preference primaries, and later in the preconvention canvass. Gov. Averell Harriman of New York also became a candidate. The declaration of Truman in favour of Harriman did not prevent the renomination of Stevenson.

The candidates waged an aggressive campaign, during which Stevenson issued several statements of program—dealing with education and social services—to which a general title "New America" was affixed. In the latter part of the campaign period, Stevenson sharpened his criticism of the Eisenhower administration and of the president himself by advocating an end to the testing of hydrogen bombs and termination of the Selective Service draft. Successive crises in foreign relations weakened the appeal of the Democratic candidate and Stevenson was overwhelmingly defeated. The Democrats: however, won majority control of both houses, and in the elections of 1958 increased their control.

At its 1960 convention in Los Angeles, Calif., the party nomi-

nated Sen. John F. Kennedy of Massachusetts for president and Sen. Lyndon B. Johnson of Texas for vice-president. The campaign was noted for television appearances by Senator Kennedy and the Republican candidate, Vice-Pres. Richard M. Nixon, on a series of programs styled "The Great Debate." In a vigorous campaign, Senator Kennedy accused the Republican administration of deficiencies in leadership abroad and at home, and called for increases in the rate of economic growth, in welfare benefits and in military strength in his "New Frontier" program. In the November elections, Kennedy, despite a close popular vote, carried most of the southern states and most of the industrial states of the north and east. winning a majority of the electoral vote.

DEMOCRITUS, probably the greatest of the Greek physical philosophers, one of the founders of the atomic theory, was a native of Abdera in Thrice, or as some say — probably wrongly — of Miletus. Knowledge of his life is based almost entirely on tradition of an untrustworthy kind. The date of his birth is disputed: some writers place it as early as 470 B.C., others at 460, others even later. Diodorus Siculus says that he died at the age of 90; others make him as much as 20 years older. He inherited considerable property, nhich enabled him to travel widely in the east in search of information; in Egypt he studied the mathematical and physical systems of the ancient schools. The extent to which he was influenced by the Magi and the eastern astrologists is a matter of pure conjecture. His works, according to Diogenes Laertius, numbered 72 and were characterized by a purity of style which compares favourably with that of Plato. In the variety of his knowledge and in the importance of his influence on both Greek and modern speculation, Democritus was the Aristotle of the 5th century, while the sanity of his metaphysical theory has led many to regard him as the equal, if not the superior, of Plato.

His chief views may be treated as follows:

The Atoms and Cosmology. — The physical and cosmological doctrines of Democritus were elaborated and systematized from those of Leucippus (*q.v.*). While agreeing with the Eleatics on the eternal sameness of Being (nothing can arise out of nothing; nothing can be reduced to nothing), Democritus followed the physicists in denying its oneness and immobility. Movement and plurality being necessary to explain the phenomena of the universe and impossible without space (not-Being), he asserted that the latter had an equal right with Being to be considered existent. Being is the Full (*pleres* or plenum); not-Being is the Void (*kenon* or vacuum), the infinite space in which moved the infinite number of atoms which in his system replaced the single Being of the Eleatics. These atoms are eternal and invisible; absolutely small, so small that their size cannot be diminished (hence the name *atomon,* or "indivisible"); absolutely full and incompressible, they are without pores and entirely fill the space they occupy; and homogeneous, differing only in shape (as A from N), arrangement (as AN from NA), position (as N is Z on its side) and magnitude (and consequently in weight, although some authorities dispute this). But while atoms thus differ in quantity, differences of quality are only apparent, due to the impressions caused on our senses by different configurations and combinations of atoms. A thing is hot or cold, sweet or bitter, hard or soft only by convention; the only things that exist in reality are the atoms and the void. John Locke's distinction between primary and secondary qualities is here anticipated. Thus, the atoms of water and iron are the same, but those of water, being smooth and round and therefore unable to hook onto one another, roll over and over like small globes, whereas those of iron. being rough, jagged and uneven, cling together and form a solid body. Since all phenomena are composed of the same eternal atoms it may be said that nothing comes into being or perishes in the absolute sense of the words (compare later ideas of the "indestructibility of matter" and "conservation of energy"), although the compounds made out of the atoms are liable to increase and decrease — appearance and disappearance — in other words, to birth and death. As the atoms are eternal and uncaused, so is motion. For the love and hate of Empedocles and the *nous* (intelligence) of Anaxagoras, Democritus substituted fixed and "necessary" laws (not chance; that is a misrepresentation due chiefly to Cicero). Everything can be explained by a purely mechanical (but not fortuitous) system, in which there is no room for the idea of a providence or an intelligent cause working with a view to an end. The origin of the universe was explained as follows. The original motion of the atoms was in all directions; it was a sort of "vibration"; hence collisions came about, and in particular a whirling movement (dine) resembling the rotation of Anaxagoras, whereby similar atoms were brought together (as in the winnowing of grain) and united to form larger bodies and worlds. This happened not as the result of any purpose or design, and thus resembles the working of "chance," but actually it is merely the result of "necessity"; *i.e.,* it is the normal manifestation of the nature of the atoms themselves. Weight was a derivative quality of the atoms, depending upon their size. and it came into play only through the action of the dine: the "heavier" atoms were those which could resist the force of the rotation and so move toward the centre. Atoms and void being infinite in number and extent, and motion having always existed, there must always have been an infinite number of worlds, all consisting of similar atoms, in various stages of growth and decay.

The **Soul.**—Democritus devoted considerable attention to the structure of the human body, the noblest portion of which he considered to be the soul, which everywhere pervades it, a soul atom being intercalated between two corporeal atoms.

Although, in accordance with his principles, Democritus was bound to regard the soul as material (composed of round, smooth, specially mobile atoms, identical with the atoms of which fire consisted), he admitted a distinction between it and the body. These all-pervading soul atoms exercise different functions in different organs: the head is the seat of reason. the heart of anger, the liver of desire. Life is maintained by the inhalation of fresh atoms to replace those lost by exhalation, and when respiration, and consequently the supply of atoms, ceases, the result is death. It follows that the soul perishes with, and in the same sense as, the body.

Three books by Democritus on zoology and physiology are recorded, and there is a good deal of evidence for his views on these subjects. Men, he believed, originally arose from "water and mud"; he compared the production of worms from moist earth. There remain records of his views on embryology, and on various matters relating to animals; *e.g.,* the growth of horns, spiders and spiders' webs, the eyes of owls, etc. Another treatise was entitled The *Causes* of Seeds, Plants and Fruits.

Perception and Knowledge. — Sensations are changes produced in the soul by external objects and are the result of contact, for the atoms of the soul can be affected only by the contact of other atoms. But sensations such as sweet and bitter are not as such inherent in the atoms, for they result from effects caused merely by the size and shape of the atoms; *e.g.,* sweet taste is due to round and not excessively small atoms. Such sensations are therefore subjective. In the case of sight, eidola or effluences (aporrhoiai), thrown off from the surfaces of objects, produced an impression or "stamp" in the air, and entered the eye as an "image" (emphasis).

It is in Democritus that we find a first real attempt to explain colour, which again is not an objective quality as such: it is due, he thinks, to the "position" rather than to the shape of the constituent atoms of compounds. He regards black, red, white and green as primary. The sensation of white is caused by atoms which are smooth and flat so as to cast no shadow; in crumbling white objects the atoms are aslant; the sensation of black is caused by rough, uneven atoms. The other colours are derived from various mixtures of the primary four and are infinite in number. Thought is fundamentally the same as sensation; it is caused by change or alteration. The mind consists of closely packed soul atoms, and in consequence can be affected by certain very subtle eidola which penetrate directly to it without having disturbed the soul atoms in the sense organs. Democritus distinguished between obscure or bastard cognition, obtained through the senses only, and genuine cognition, obtained through the mind though the data were pro-

vided by the senses; the latter is concerned with atoms and the void exclusively, which are the only real existences.

Theology. — The popular belief in gods mas attributed by Democritus to the desire to explain extraordinary phenomena (thunder, lightning. earthquakes) by reference to superhuman agency. The origin of the belief he accounted for by the entry into men's minds of *eidola,* some beneficial. some harmful, which were visible and audible, and foretold the future: the ancients thought these indicated the existence of gods. The notion of *eidola* was adopted by Epicurus, who asserted that they emanated from divine beings; but it is doubtful whether Democritus believed this.

Ethics.—Democritus' collection of ethical precepts is the first which deserves the name of a moral system, though it appears to be founded upon a practical rather than a theoretical basis. Just as there is in the field of knowledge an ultimate truth (namely atoms and the void), as contrasted with the "conventional" objects of sensation such as sweet and bitter, so there is in the moral field an ultimate good, namely "cheerfulness," as contrasted with "the pleasant." "Cheerfulness" is "a state in which the soul lives peacefully and tranquilly, undisturbed by fear or superstition or any other feeling." In this, Democritus differs from Epicurus, who made the bodily pleasures his starting point, though he anticipates Epicurus' "imperturbability." The right choice of pleasures can conduce to "cheerfulness"; these will be pleasures of the soul, not sensual pleasures. True pleasure is a mean between excess and defect, and "cheerfulness" comes through moderation. Prudence. which is the outcome of nature and education, enables the right choice to be made.

DEMOGRAPHY. This word has become current, with rising interest in population studies. as a name for this field of inquiry. In its French form the word (from the Greek "people" and "to write") was first used by Achille Guillard in his *Éléments de statistique humaine ou démographie comparée* (1855). It was applied in French academic circles to statistics concerning the life conditions of people, especially those affecting health and mortality. In modern usage it is sometimes restricted to the more formal aspects of population study; *i.e.,* the quantitative analysis of population structure and trends. *See* POPULATION.

(F. Lo.)

DE MOIVRE, ABRAHAM (1667–1754), English mathematician of French Huguenot extraction, was a pioneer in the development of analytic trigonometry and in the theory of probability. He was born at Vitry, Champagne. on May 26, 1667. Upon the revocation of the Edict of Nantes he was jailed as a Protestant; upon his release he left for England. In London he became a close friend of Sir Isaac Newton and Edmund Halley; in 1697 he was elected to the Royal society and later to the Berlin and Paris academies. Despite his distinction as a mathematician. De Moivre never succeeded in securing a permanent position but eked out a precarious living by tutoring and consultations on gambling and insurance. He died, nearly blind. on Nov. 27, 1754.

The majority of his papers appeared in *Philosophical Transactions.* A fundamental theorem in trigonometry (*q.v.*) bears his name. His first work in probability. *De Mensura Sortis* (1711), was later expanded into *The Doctrine of Chances* (1717), which appeared in several editions. His contributions to actuarial mathematics are found in *Annuities on Lives* (1724).

De Moivre was the discoverer of the normal probability curve, *Approximatio ad Summam Terminorum Binomii* (1733), often erroneously ascribed to Karl Friedrich Gauss.

(O. OE.)

DEMON (from Gr. *daimon,* "supernatural being" or "spirit") has come to mean an evil or hostile spirit below the rank of a god, although originally the word had a good as well as a bad connotation (*see* DAEMON). Socrates, for example. was thought to have a *daimon* or familiar spirit that warned him when he was about to make a wrong decision. Among primitive peoples the line between good and evil spirits is not clearly drawn; even the usually benevolent spirits may have their malicious moments, and those that are generally hostile may be persuaded by appropriate rites to become friendly.

In the history of the west a shift of meaning came with the rise of Christianity, which condemned the spirits of the pagan world as evil and in league with the Devil. It is therefore common English usage to confine the word demon to spirits that bring upon men the evils they most dread. It is well therefore to distinguish, as most languages do, between the souls or ghosts of the dead, supernatural beings of a higher and nobler order such as the gods, and malevolent spirits such as devils and demons. (*See* further ANIMISM; ANCESTOR WORSHIP; DEVIL.)

Demons of Europe. — In European countries with Celtic, Teutonic and Slavic backgrounds, the coming of Christianity caused the suppression of belief in innumerable supernatural beings; yet many of these survived in popular belief as demons or evil spirits. Generally nameless and shifty of movement, these appeared in forests and dark places or by night, and often took bodily form in animals and birds; some were goblins and could assume male or female shape; others were wraiths or ghosts and specters. The leprechauns of Ireland were rather fairies than demons, but alongside them were other phantoms that mere malevolent. The belief of the ancient Teutons that the souls of the dead often returned by night or in wind and storm to harass the living as incubi (demonic spirits tormenting people in sleep) led to the survival in central Europe during medieval times of terrifying "night-riders" or "night-mares" (Ger. *mahre;* Scand. *mara*) that rode on animals. swayed in trees and sat suffocatingly on human breasts or sucked the milk of women and cows. They were part of a group of *hexen* (witches) that had an "evil eye," cast spells upon people and caused animals to sweat unaccountably, wheeze and lose blood; they could also assume the forms of toads, ravens and bears. Their male counterparts were the werewolves (man-wolves) so famous in European legend (*see* LYCANTHROPY). Besides these evil spirits of human origin were the nonhuman demons that lived in forests, on mountains and in lakes, streams and wells, such as the Teutonic nix and the Slavic *rusalkas.* The Slavic demons hid in the growing crops, kidnaped children, hung on branches and bushes, and frightened or put spells on passers-by; they crouched on men's shoulders, unseen, and brought them bad luck.

Greek and Roman Beliefs. — Among the ancient Greeks it was believed that the ghosts of the dead who had come by death tragically sought vengeance; one must pass their tombs in silence or attract their fury. Other avenging demons afflicted generation after generation of families that had come under a curse; such were the Furies (*Erinyes; q.v.*), fearful winged maidens, often considered to have been commissioned by the gods to exact justice on erring men. More clearly malicious were the Harpies (*q.v.*), revolting monsters with bird bodies and the heads of women. who darted down to snatch away or defile food and to carry away persons and destroy them. Illness and insanity were explained as demonic possession. and Hippocrates. the great physician. had to counter this erroneous notion. The Romans regarded the spirits (numina) as helpful to mankind if correctly approached and held in honour, but they feared the larvae, a species of lemures (ghosts), for they were the souls of wicked men that now wandered about

at night in the dreaded form of spectres.

Judaeo-Christian Tradition. — The early Hebrews feared few of the spirits except the demons of the "waste places" and of the thickets where wild beasts lurked. Among these were Azazel, a wilderness demon, to whom on the Day of Atonement a goat laden with the sins of the people was sent, and Lilith (*q.v.*), a vampirish female night spirit. But when the Jews became acquainted with Zoroastrian conceptions of the spirit world, especially during the Babylonian exile, they elaborated their earlier notion that God had an "adversary" into a belief that an archdemon, Satan, had under his direction many lesser demons. *(See* SATAN.)

Oriental Conceptions. — India and the far east provide countless examples of hostile spirits of many kinds. In India. the *nagas* are snake spirits, the *pisachas* demons haunting the scenes of violent death, the *yakshas* fairies whose women are often malevolent, the *asuras* true lords of mischief on the level of deity, and the *rakshasas* goblins or ogres of a multiheaded sort. most dangerous to men because of their great strength and ability to take on rapidly many differing shapes. A special class of demon is the *vetala* or vampire. *Bhutas* and *pretas* are neglected souls of the dead become violent and unruly. The Buddhists have added to these dread powers Mara, a Satanlike tempter. who with his enticing daughters, Desire. Pleasure and Restlessness, sorely tempted Gautama at the time of his attainment of buddhahood. To these the Tibetans have added still other demons, beyond count, haunting every corner of their forbidding land.

The demons of historic China are numberless. To the Chinese of all periods the night hours mere made fearsome by multitudes of *kuei*, the general name given to evil spirits. These thronged about every human dwelling after the fall of night, and infested all roads. There were demons in water, soil, air, forest, mountains; demons in many wolves, tigers, foxes, dogs. cats, birds. fish, snakes; demons even in plants and inanimate things. Horrible were the man-eating spectres, the ghouls and vampires, and the gigantic devils with horned foreheads. long fangs and fuzzy red hair. Fortunately these demons dreaded light and fled to their hiding places at the rise of the sun. The Chinese used bonfires, candles, torches and especially firecrackers to scare off the *kuei* and by these means effected a house cleaning of their homes and villages on New Year's day.

(J. B. N.)

DEMONETIZATION, a term in economics that denotes either the divestment of a coin or metal of its standard monetary value or its withdrawal from circulation. When demonetization has occurred in the former sense, it has been associated frequently with a bimetallic monetary standard where one or the other of the metals identified with the standard of value has lost this equivalence. *(See* BIMETALLISM.)

Two illustrations will suffice. both involving the demonetization of silver. This metal was the standard of value in England from 1663 to 1717, during which period gold coins were exchanged at their market value. Debasement of the silver coinage. however. resulted in the substitution of gold for silver as the standard of value.

A more recent suspension of silver from its role as a monetary standard of value came on a broader scale during the latter half of the 19th century. A general oversupply of this metal in relation to gold developed in both Europe and America with the result that the price of silver as expressed in terms of gold declined. Silver coins therefore became mere token moneys. In the United States the Coinage act of 1573 demonetized silver and was denounced by its opponents as "the crime of '73." (J. W. HA.)

DEMONSTRATION. According to Aristotle, a demonstration (*apodeixis*) is a valid argument, the premisses of which are true, necessary. immediately evident, better known than the conclusion and expressive of the grounds for the conclusion. He regarded such arguments as productive of knowledge. The Stoics, similarly, defined a demonstration as a valid argument which has true premisses and reveals a nonevident conclusion. In modern times the word has become virtually synonymous with "proof" or "exact proof," as these terms are employed in mathematics. *(See* LOGIC; MATHEMATICS, FOUNDATIONS OF.) (B. MS.)

In the natural sciences. demonstration is the manipulation, in a laboratory, of certain substances under certain conditions in order to show that they have in fact the properties ascribed to them by physicists and chemists. In jurisprudence, the demonstration is the preliminary exposition of a plaintiff's case as the basis on which a suit is to be argued (Lat. *demonstratio*, "that part of the *formula* in which the plaintiff advanced his facts"; *see* ROMAN LAW: *Procedure*). In practical politics, a demonstration is a show of force or of indignation, as when warships are sent to take up a menacing position off a coast controlled by an unfriendly or unco-operative government; or when large crowds are assembled to protest against some official action or attitude.

DEMOPHON, the son of Celeus, king of Eleusis. The goddess Demeter, wandering in search of her daughter Persephone under the guise of an old woman, became Demophon's nurse. As an act of kindness to those who had sheltered her, she attempted to immortalize him by burning out his mortal parts, but was surprised in the act by his mother, who thought that the nurse was harming the boy. In some accounts Demophon died as a result of the interruption of the ordeal. (H. W. PA.)

DE MORGAN, AUGUSTUS (1806–1871), English mathematician, logician and bibliographer, whose name is given to De Morgan's law in logic, was born in June 1806 at Madura, Madras presidency, India, and educated at Trinity college, Cambridge. His scruples concerning theological tests prevented him from proceeding to a fellowship. In 1828 he became professor of mathematics at the newly established University college in London. He taught there until 1866. except for a break of five years from 1831 to 1836. He was the first president of the London Mathematical society, which was founded in 1866.

De Morgan's aim as a mathematician was to place the subject on a more rigorous foundation. As a teacher he was unrivaled, and no topic was too insignificant to receive his careful attention. One of his earliest works was his *Elements of Arithmetic* (1831), which was distinguished by a simple yet thoroughly philosophical treatment of the ideas of number and magnitude. In 1838 he introduced the term "mathematical induction" to differentiate between the hypothetical induction of empirical science and the rigorous method, often used in mathematical proofs, for advancing from n to $n+1$.

De Morgan was in general sympathy with those Cambridge mathematicians, led by George Peacock, who recognized the purely symbolic nature of algebra; and he was aware of the possibility of algebras which differ from ordinary algebra. His treatise *The Elements of Algebra* appeared in 1835, and his memoirs "On the Foundation of Algebra" were published in the *Transactions of the Cambridge Philosophical Society* between 1841 and 1847. He made a useful contribution to mathematical symbolism by proposing the use of the solidus (oblique stroke) for the printing of fractions.

It was as a reformer of logic, however. that De Morgan made his greatest contributions to knowledge. Indeed, the renaissance of logical studies which began in the first half of the 19th century was due almost entirely to the writings of the two British mathematicians De Morgan and G. Boole. De Morgan always laid much stress upon the importance of logical training. His importance in the history of logic is. however, primarily due to hii realization that the subject as it had come down from Aristotle was unnecessarily restricted in scope. By reflecting on the processes of mathematics, he was led, like Roole, to the conviction that a far larger number of valid inferences were possible than had hitherto been recognized. His most notable achievements n-ere to lay the

foundation for the theory of relations and to prepare the way for the rise of modern symbolic, or mathematical, logic. His name is commemorated in De Morgan's law, which is usually presented in the concise alternative forms: $\sim (p \vee q) = \sim p \wedge \sim q$; and $\sim (p \wedge q) = \sim p \vee \sim q$. These may be read: not (p or q) equals not p and not q; and not (p and q) equals not p or not q. These statements assert that the negative (or contradictory) of an alternative proposition is a conjunction in which the conjuncts are the contradictions of the corresponding alternants; and that the negative of a conjunctive is an alternative proposition in which the alternants are the contradictories of the corresponding conjuncts.

De Morgan's witty *Budget of Paradoxes* (1872; 2nd ed., ed. by D. E. Smith with new introduction by E. Nagel, 1954), a classic collection and exposure of the writings of circle-squarers and similar cranks, remains popular. This unique work reveals his immense erudition. He was a true bibliophile who treated bibliography as an important science. His views on cataloguing, presented to the royal commission on the British museum in 1850, correspond with those afterward adopted by A. Panizzi in the *British Museum Catalogue*.

In 1866 De Morgan left University college owing to a dispute involving sectarian freedom. He died in London on March 18, 1871. *See* also LOGIC, HISTORY OF: *The Algebra of Logic*.

See also Sophia E. De Morgan, *Memoirs of Augustus De Morgan* (1882). (G. J. Ww.)

DE MORGAN, WILLIAM FREND (1839–1917), English ceramic artist and novelist whose power to create character and convey atmosphere ensure him a continued, if minor, literary popularity, was born in London, Nov. 16, 1839, son of Augustus de Morgan (*q.v.*). Educated at University College school, University college and the Academy art schools, he became a member of the Pre-Raphaelite circle and experimented with various forms of decorative art. He set up his own kiln, and, rediscovering the secret of the brilliant blue and green glazes of earlier potters, formed a firm to make tiles and other pottery. A talented inventor, he designed most of the appliances for the factory, and although it was not a commercial success, it produced work of great beauty, much of it preserved in the Victoria and Albert museum, London.

After retiring in 1905, De Morgan began a second career as a writer. *Joseph Vance* (1906), *Alice for Short* (1907), *Somehow Good* (1908), *It Never Can Happen Again* (1909), *An Affair of Dishonour* (1910), *A Likely Story* (1911), *When Ghost Meets Ghost* (1914) and two unfinished works, published posthumously by his wife, *The Old Madhouse* (1919) and *The Old Man's Youth* (1921), brought him financial success and considerable literary reputation. He died in London, Jan. 15, 1917.

DEMOSTHENES (d. 413 B.C.), son of Alcisthenes, Athenian general, was an imaginative strategist and not closely tied to any political group. In 426 B.C. he attacked the Corinthian colony of Leukas; but he abandoned the siege for an attempt to invade Boeotia through Aetolia. His allies, the Ozolian Locrians, who knew the country, failed him, but he advanced without them. The result was the collapse of his hoplites on ground completely unsuited to them and a severe defeat, in which he lost 120 Athenians. He was able, however, to defend successfully Naupactus, the Athenian naval base in the Gulf of Corinth, against a Spartan land attack, though he could not prevent the Spartans from joining the Ambraciots who had invaded the territory of Amphilochian Argos on the southeastern shore of the Gulf of Arta. Demosthenes, summoned by the Acarnanians, won two decisive victories, at Olpae near Argos and Idomene in the hills to the north of it, which ended Peloponnesian campaigning in northwestern Greece. Having redeemed his early failure, he could now return to Athens. In 425 he was authorized to use the fleet sailing to Sicily on operations round the Peloponnese, and fortified the promontory of Pylos (*q.v.*) in Messenia. While the fleet sailed on Demosthenes remained with five ships at Pylos and successfully resisted Spartan attacks. The Spartans occupied Sphacteria, but when the Athenian fleet returned the Spartan fleet was driven off and the Spartans on Sphacteria were besieged. Their defeat and capture was the joint work of Cleon (*q.v.*) and Demosthenes.

The year 424 saw him engaged in the abortive attack on Megara and the equally unsuccessful invasion of Boeotia, which resulted in the defeat of Delium. In 413 he was sent with Eurymedon to reinforce Nicias before Syracuse. As soon as he arrived he conducted a night attack on Epipolae, the high ground overlooking Syracuse. When this failed he advised immediate retreat, but was overruled by Nicias. When at last the retreat began, the division under Demosthenes fell behind, was cornered in an orchard and surrendered. Demosthenes was put to death by the Syracusans. (R. ME.)

DEMOSTHENES (384/383–322 B.C.), the Athenian statesman who stirred the Greeks to resistance against Philip II of Macedonia and whose speeches provide valuable information on the political, social and economic life of 4th century Athens, has been universally recognized in ancient and modern times as the greatest of the Greek orators. His father, also called Demosthenes, was a prosperous industrialist of the deme (township) Paiania. His mother, Cleobule, was alleged to have Scythian blood, and Demosthenes was taunted by political opponents with being a "barbarian." When he was seven years old his father died, and his father's two nephews, Aphobus and Demophon, and a friend Therippides were appointed his guardians and trustees of the estate. They took unscrupulous advantage of their position, and when Demosthenes came of age and claimed his patrimony, they employed various pretexts to frustrate him. Attempts at arbitration were followed by protracted legal processes in which Demosthenes pleaded his own case. He was eventually successful, but by this time the estate had been largely dissipated. From these actions three speeches by Demosthenes against Aphobus (the authenticity of one has been questioned) and two against Onetor, Aphobus' brother-in-law, have survived.

Speeches in Private Suits.—Having lost the greater part of his patrimony Demosthenes was compelled to earn a living. He became a professional speech-writer for contestants in private suits, in some cases appearing himself in the courts. He had had a hard struggle to become a speaker. Various stories survive of the measures he took to overcome physical infirmities. There can be no doubt about the resolute determination which enabled him to triumph over natural weaknesses and the difficult circumstances of his early life. According to ancient tradition he learned the theory of legal oratory from Isaeus (*q.v.*) whose influence is apparent in his works. The report that he taught rhetoric himself may not be true; he certainly had no formal school.
