They held assemblies with which he had to treat, for fear of provoking a new rebellion. This made difficulties between him and the Catholics, who were always anxious about favours granted to their adversaries. The king's great problem was to maintain equality and peace between the hostile factions.

Economic Rehabilitation; Sully.—The first necessity was to recover the prosperity of former days. The king's concern with this matter was prompted at once by pity for his subjects and by a desire to increase the revenue. His attitude is summed up in the famous dictum attributed to him: "Every family should have a fowl in the pot on Sunday." Since he was ill-informed on the subject of finance, Henry relied on his councillors, the most renowned of whom was Maximilien de Béthune, duc de Sully.

Sully was a Protestant gentleman who had served in the royal armies before being admitted to the *conseil* des finances. He was ambitious, and he contrived to get rid of his colleagues and to remain himself alone at the head of the financial administration with the title of surintendant. An unsparing worker, capable and honest, he exploited these advantages to win the king's confidence by every means and to make a considerable fortune for himself. He sought to enrich the kingdom by giving support to agriculture; he allowed the peasants a remittance of their arrears of taxes, prohibited the seizure of agricultural instruments and had marshlands drained and roads and canals built.

This renewal of prosperity made it easier for the peasants to pay the taille. The finances were also restored, by arbitrary measures liquidating the debts of the state and comparable in fact to a bankruptcy. One reform was above all disastrous because of its remote consequences: the Edict of La Paulette (1604) made it possible to hold as hereditary, in return for an annual payment of one-sixtieth of its estimated value, any of the offices that had hitherto been tenable for life only. This system was profitable for the treasury, but it finally established the heredity of offices which was to be disastrous for society and for the government. Its immediate result was however a success, since Sully could at last accumulate reserves of gold in the vaults of the Bastille after the poverty of the early years.

Besides the agricultural effort, to which Olivier de Serres contributed, there was the industrial policy inspired by Barthélemy Laffemas, who wanted "to set up manufactures in this kingdom" and to produce luxury articles for sale abroad, so as to prevent the export of currency. He proposed a customs policy that would exempt raw materials from tariff payment and prohibit the import of manufactured products. Thus began the mercantilism that Colbert was to develop. At the end of Henry IV's reign the kingdom was enjoying real prosperity again, largely a result of the government's efforts and above all to the peace kept since 1598.

Foreign Policy.—The treaty of Vervins did not bring lasting peace. Henry was still mistrustful of the power of Spain, with its Austrian alliance. Taking no account of the repeated setbacks that exposed the final exhaustion of Spain, he maintained a traditional hostility that was potentially dangerous for France. Officially neutral, he nevertheless continued, in association with England, to support the rebellious United Provinces against Spain and the German princes against the emperor.

In 1610 he was preparing for war against the Habsburgs on the Rhine to settle the Julich-Cleves succession—a serious venture that might have brought to nothing all the progress of the years of peace—when he was assassinated by François Ravaillac (May 14, 1610). The assassination may be regarded as symptomatic of a Catholic reaction in favour of Spain.

Louis XIII (1610–43).—With the accession of Louis XIII the unstable character of the monarchy was again made manifest. The organization of a regency in the name of a king who was a minor always proved a hazardous undertaking with the issue depending on the rivalry between factions. The queen mother, Marie de' Medici, who could not govern, was faced by the late king's servants, by rebellious nobles eager to recover their liberties, by an anxious Protestant party and by Catholics who wanted a rapprochement with Spain.

Proclaimed regent by the *parlement*, the queen mother yielded to the pressure of the Spanish party and renounced the now impracticable war. French policy was committed to the rapprochement with Spain, which culminated in two marriages, that of Louis XIII with the infanta Anne of Austria and that of his sister Elizabeth of France with Philip III's son, the future Philip IV.

For home affairs, Marie could think of nothing better than to distribute offices and money among the chiefs of both parties. Once the treasury was despoiled and Sully disgraced, she lost all her influence and became the tool of the ambition of a lowborn Florentine, Concino Concini (afterward maréchal d'Ancre). Thenceforward policy became a matter of petty artifice; after having made a show of drawing the sword against Condé, the leader of the great nobles, the queen regent opened her purse instead. The costly peace of Ste. Menehould (May 1614) marks the first abdication of power on the part of the monarchy.

To get support against the restless and hostile nobility, the regent convened the states-general, which met in Paris in Oct. 1614. The three orders, however, were represented by privileged persons concerned only with protecting their own interests. They quarrelled among themselves and could not reach any agreement on the proposals submitted to them; and when they refused to grant the desired subsidies the assembly was dissolved. The states-general had once more shown themselves to be powerless; and they were not to be summoned again before 1789.

For the next ten years the affairs of the kingdom were in the hands of intriguing favourites, as unworthy as they were incompetent; and policy swayed between the two forces that were emerging in Europe. On the one side was the party of the Counter Reformation, which sought to restore the Catholic Church's position against the Protestant churches by the union of the papacy with the Austrian and Spanish Habsburgs, abetted by the Jesuits; this in France was the policy of the *parti dévot*, which predominated in the circles surrounding the regent. On the other side the Protestant powers, that is to say the United Provinces and the German Protestant princes grouped in the Evangelical union, stood together against Spain and relied, in France, on the Protestant party headed by Henry IV's old followers, Henri. duc de Rohan, his brother Benjamin, seigneur de Soubise, and Philippe de Mornay, who feared that the religious liberties obtained with such difficulty might be lost. This party organized itself for resistance even by civil war: the country was divided into *cercles* and an army was raised on funds provided by the churches. It was, as Richelieu later called it, "a state within the state," keeping up its own relations with foreign powers.

This opposition—Protestants anxious about the *rapprochement* with Spain and nobles who wanted to supplant the favourites in high places—rose on several occasions. One rebellion ended in the peace of Loudun (May 1616), which granted governments and pensions to the nobles involved. Concini and his followers saw their power augmented, while Louis XIII grew up in the shadow, humiliated by their tutelage. Nevertheless, Louis was able to get rid of them by supporting a plot against Concini, who was murdered on April 24, 1617; and the regent and Richelieu, whom Concini had brought into the government, were thrust from power. New favourites were installed as ministers including Charles d'Albert de Luynes, a young nobleman who became a duke and then constable. Soon afterward new risings took place, with the complicity of the duc d'Épernon; these ended in the treaties of Angoulême (1619) and Angers (1620).

On the other hand, at the instigation of the militant Catholics, Luynes conceived the unfortunate idea of re-establishing the Catholic faith in Béarn, which had been Calvinist since 1563. But he was repulsed before Montauban, and his death in 1621 spared him the disgrace of his predecessor. His authority and intrigues were inherited, for the next three years, by Marie de' Medici. In those three years there were three different ministers, all mediocre men. In the background stood the subtle personality of the cardinal de Richelieu.

Richelieu.—Born into a family of the petty nobility, Armand du Plessis de Richelieu had at first been bishop of Luçon and had sat in this capacity in the states-general of 1614. Eaten up by ambition, he had pushed himself into Concini's circle; and when Concini fell he was removed from power. But he eventually insinuated himself again into the government and attained the prime ministership. which he held till his death 18 years after.

The situation called for a strong-willed man of foresight and energy who could restore order at home and intervene in the events that were troubling central Europe, In his *Testament* Richelieu revealed that the course of action followed by him with an indomitable determination had been planned at the time of his entry into the royal council. "I promise," he told the king, "to devote all my energy and all the authority that it may please you to place in my hands to destroying the Huguenots, to abasing the pride of the great nobles, to restoring all your subjects to their duty and to raising the name of your majesty among foreign nations to its rightful place."

The first objective was to command "the four square feet of the king's cabinet," which involved a permanent struggle. Richelieu had to remain in power—a difficult task with such a master as Louis XIII, who "liked to be governed yet bore being governed with impatience." Louis gradually came to trust his minister but never learned to like him. He was accustomed to listen to his mother, who accused the cardinal of ingratitude, and to his wife (too good a Spaniard), who reproached him with wanting to dismember her country. The heir presumptive to the throne, Louis' brother Gaston of Orléans (originally duke of Anjou), who posed as the beloved prince in all conspiracies directed against Richelieu and who each time played Judas in the end, had often to be reckoned with. These divisions within the royal family were naturally exploited by the nobles. Suspicious and irritable, Richelieu frequently believed himself to be threatened when he was not and, in identifying himself with the king, sincerely believed that he was defending the king's authority and not the cardinal's. As long as his position was uncertain he was forced to suppress court conspiracies, time and again displaying merciless severity: on Henri de Talleyrand. comte de Chalais, who sought to prevent the marriage of Gaston of Anjou with Marie de Montpensier (1626); on the brothers Michel and Louis de Marillac; and even on the two queens after the "day of dupes" when they believed that they had succeeded in securing his dismissal (1630). There were also armed re\ olts against Richelieu, for sharing in which Henri II de Montmorency, the governor of Languedoc, forfeited his head in 1632. Other rebels against the cardinal's authority summoned foreigners to their aid—notably François Auguste de Thou and the marquis de Cinq-Mars, who allied themselves with Spain but were overthrown and executed (1642).

The Protestant rebellion was shorter but more menacing. Richelieu, though a theologian and a churchman, was unwilling to use constraint to reduce the Protestants to orthodoxy; but he demanded their total submission from the political point of view. Although his first acts had shown a tendency to commit himself against Spain (on the question of the Valtellina), the Protestants, supported by England, rose against him. Richelieu, to settle the matter, took possession of La Rochelle after a year's siege (1627–28) and continued the war in Languedoc. When Rohan was defeated in the Cévennes, notwithstanding the help of Philip IV of Spain, Richelieu was able to impose the Edict of Alès (1629) on the Protestants, withdrawing their political privileges, their *places de sûreté* and the possibility of raising armies and leaving them only their religious liberty. This ensured total peace for the Reformed churches for more than half a century.

Richelieu's principal object was to rid himself of domestic problems so as to be able to intervene advantageously in European affairs, to halt the progress of Spain and to "make the king the most powerful monarch in the world." Now since 1618 the Thirty Years' War had been harassing Germany; the emperor Ferdinand II had subjugated the Bohemian Protestants and was trying to re-establish the imperial power as it had been in the previous century. Philip IV, on his part, was trying to maintain his position in Italy and in the Netherlands and to safeguard his communications between these remote possessions. The first campaigns had been favourable to the Habsburgs, who had defeated the Protestant leagues and their allies. Though this did not constitute any direct threat to France, the nation felt itself menaced and so obliged to take measures against encirclement. With this in mind Richelieu had from the start made his choice between the various available policies, that is, between *rapprochement* with Spain and the system of Protestant alliance; but for a long time the internal situation in France made intervention impossible and the Spanish party endangered his authority. He was restricted to indirect action in Italy: he restored French influence in the Valtellina, which connected the Milanese with Austria; by swift action at Susa he forced the duke of Savoy to make peace; and finally he obtained the succession to the duchy of Mantua for a French prince (1629).

Events in Germany called for more resolute action. After defeating the Bohemian Protestants, Ferdinand II had beaten Christian IV of Denmark at Lutter-am-Barenberge (1626); and the Edict of Restitution (1629) marked the Catholic victory, obliging the Protestant princes to surrender ecclesiastical property that had been secularized since 1552. Wallenstein, at the head of his army, enforced the edict and made ready to subject Germany to the emperor's authority. Richelieu put a stop to this advance at the diet of Regensburg (1630), where his closest adviser, Father Joseph, obtained the dismissal of Wallenstein and prevented the election of Ferdinand's son as king of the Romans. At the same time Richelieu was appealing to the king of Sweden, Gustavus II Adolphus, to intervene in Germany, in the hope that he would attack the emperor only, without threatening the Catholic princes. The Swedish army landed in Pomerania in 1630 and won resounding successes. Gustavus Adolphus, soon finding himself master of Germany, sought, in the face of Richelieu's opposition, to establish a great Protestant empire on the ruins of Catholicism. This ambition, even after the death of Gustavus at Lützen (1632), provoked a Catholic reaction just when the Protestant alliance was dissolving as a result of the defeat at Nördlingen (1634) and at the moment of the murder of Wallenstein, whom Richelieu had sought to set up as a rival to Ferdinand in Bohemia. In 1635 the emperor again dominated Germany.

France was obliged to intervene. It had already taken advantage of the Swedish victories by occupying Lorraine and by establishing itself at Trier, in Alsace and on the Rhine, so as to have bases for further operations. Simultaneously Richelieu mas negotiating with Sweden and with the United Provinces to get their collaboration and to ensure the liberties of the German princes. Finally, on May 19, 1635, France declared war on Spain and on the emperor. At the outset the war went badly for France. The capture of Corbie, near Amiens, by the Spaniards served to reveal the vulnerability of Paris, so dangerously near the frontier. But Spain was incapable of exploiting its success, and the situation was soon reversed; thanks to Bernhard of Saxe-Weimar and to the comte de Guébriant, Alsace was conquered. Faced with revolts in Portugal and Catalonia, Spain lost Artois in 1640 and Roussillon in 1642. These were Richelieu's last successes and he was considering negotiation to give France recognized possession of its conquests when he died, on Dec. 4, 1642. Five months later (May 14, 1643), Louis XIII died also.

Richelieu's ambitious policy necessitated 2 firmly grounded authority at home. The disorders of the previous years had shown the need for a resumption of absolutist methods. There was no meeting of the states-general, but only an assembly of notables (1626). The provincial estates were rarely convened and always kept off politics. An edict forbade the *parlement* to take cognizance of public matters. The press, only just created by Théophraste Renaudot, was forced into the service of the government as was the Académie Française. Provincial and municipal privileges met with the same treatment. Richelieu denied to the people the right of criticizing the acts of the government and killed the spirit of public opinion that had been revealed in the *Republic* of Jean Bodin, in J. A. de Thou's History, in Étienne de la Boétie's *Contr'un* and in the *Satire Ménippée*. He was not an enemy of the nobles, to whom indeed he assigned a predominant position in the state, but intended to impose a strict discipline on them, rigorously enforcing the edicts against duelling and demolishing the châteaux of the marauding gentry.

To ensure the submission of the nobles, Richelieu made general the system of intendants, the king's representatives in the prov-

inces, above the oficiers (whose independence was thus limited). In reaction against the decentralization that had gone together with the League, Richelieu fell into the opposite error of too great a concentration of power. By means of the intendants he began that transformation of the monarchy whereby civilians and bureaucrats were given influence, to the exclusion of soldiers and aristocrats.

Richelieu's policy imposed heavy burdens on the people, so that economic progress had to be a major concern of his. He had clear ideas on industrial and commercial development, and mercantilist principles underlay his projects. These projects however were for the future, and he saw no need to reform the administration of finances. He let the disorder subsist and mas satisfied with the worst sort of expediency in providing the treasury with the requisite funds. The resumption of war and the excessive taxation had disastrous results: after 1630, among the rural population, insurrections arising from sheer misery were frequent; the Croquants rose in the south, the Va-nu-pieds in Normandy. Even the rentiers of the Hôtel de Ville in Paris, ordinarily a peaceable people, were excited by the curtailment of their incomes and, in 1639 and 1642, were roused to fury. Despite the great work that was accomplished the treasury remained empty and the reforms a dead letter.

Altogether, Richelieu was a statesman rather than an administrator. He looked upon material concerns as of secondary importance; he could organize neither an army nor a navy, neither justice nor finance nor colonies, but at most a police system. His true greatness lay in the art of diplomacy. His work was wholly accomplished in the field of foreign policy, where he displayed most consistency and foresight.

Mazarin's Ministry for Louis XIV (1643–61).—*A pupil of Richelieu's, Jules Cardinal Mazarin continued and completed his work. But the task was not done without many setbacks. The crown fell to an infant, Louis XIV, only five years of age in 1643. The regent, Anne of Austria, was a Spaniard and the prime minister was again a foreigner, as Concini had been. Mazarin (Guilio Mazarini) did not have Richelieu's elevation of outlook but was highly intelligent and clever at dominating his adversaries. Unscrupulous in his methods, sometimes a trickster and avid for wealth, he justified the attacks made upon him by his enemies. But his talents, furthered by a favourable situation, allowed him resounding successes which made France the premier European power.*

Anne of Austria began by getting the parlement to annul Louis XIII's will and to commit into her hands "the entire administration of the kingdom," which she forthwith entrusted to Mazarin. Through his adroit diplomacy and the military genius of two young generals, the prince of Condé (Louis II de Bourbon) and the vicomte de Turenne, the great tree of the house of Austria was shaken to its very roots. At Rocroi (May 1643) Condé destroyed the famous Spanish infantry, afterward joining forces with Turenne in Alsace. The Rhineland was freed by the victory of Freiburg-im-Breisgau (1644), and the generals were again victorious at Nordlingen in Bavaria (1645). Meanwhile Mazarin laboured unceasingly to preserve the Swedish alliance. The Swedes were finally victorious at Zusmarshausen (May 17, 1648), three months before Condé, at Lens (Aug. j), for a second time defeated the Spaniards. At last the emperor Ferdinand III brought himself to sign the peace that had been under negotiation for seven years.

The Treaties of Westphalia (1648).—*The treaties signed at Munster and at Osnabrück settled questions that had been vexing for 100 years, fixed the political structure of the Holy Roman empire and put an end to several territorial disputes. The emperor recognized the liberties of Germany, which became a "republic of princes," guaranteed by France and Sweden. The states were to enjoy freedom of religion and a political freedom that would allow them to make alliances with foreign sovereigns.*

Numerous ecclesiastical territories were secularized and assigned to lay princes. Sweden received Pomerania. As for France, apart from the confirmation of its receiving the Three Bishoprics conquered in 1552, the acquisition of Alsace safeguarded the Rhine frontier and prevented the Spaniards from uniting Luxembourg to Franche-Comté. These treaties were regarded for 200 years as the charter of Europe and dispelled the Habsburg dream of an unitary Catholic and German empire.

The Fronde (1648–53).—*These military and diplomatic successes were achieved in the face of terrible difficulties within the kingdom. With the king a minor, Mazarin found himself confronted with the problems that Richelieu had been unable to solve, now become even more complicated. With his position hampered by his foreign birth and by the king's minority, the adversaries of Mazarin had had plenty of time to coalesce against him, while everyone was sick of government by ministers.*

Revolt was provoked by the constantly aggravated financial difficulties. Careless of the details of financial administration, Mazarin had left it in the charge of an Italian businessman, Michel Particelli d'Émery, who, as surintendant des finances, had recourse to the costly and occasionally dishonest expedients that had been employed in the past: to the creation of offices, to the curtailment of incomes, to taxes on houses built in the approaches to Paris, to forced loans. These levies roused public opinion against Mazarin, whom the oficiers moreover reproached with a further extension of the system of intendants. In addition the sovereign courts (e.g., the parlement and the chambre des comptes) made political claims, calling for "second powers" to moderate the sovereign power of the king.

The nobility added its turbulent disposition to resentment of these grievances. The prince of Condé, the duchess of Longueville (Anne Geneviève de Bourbon) and the archbishop of Paris' coadjutor Paul de Gondi (who became cardinal de Retz in 1651) led this aristocratic party, which joined with the bourgeoisie and the common people of Paris. All were influenced by the same fever that was raging in Catalonia, Portugal, Naples and England.

The malcontents however were incapable of co-ordinating their efforts. Events therefore proceeded in such chaotic fashion that their real significance is often hard to discern. The Fronde was in fact the beginning of a revolution that might have checked the advance of absolute monarchy.

It was the sovereign courts that took the initiative of the Fronde. The parlement of Paris made common cause with the chambre des comptes and the grand conseil and. in the declaration of July 27, 1648, sought to substitute constitutional for absolute monarchy. Since all her forces were at the war, Anne of Austria yielded; but when the victory of Lens set Condé's army free, she arrested some of the more violent members of the parlement. Insurrection followed, and barricades were put up in Paris. Anne capitulated once again and, fearing for her safety, fled nith the young king to St. Germain. Civil war broke out, involving in the general upheaval great lords, members of the parlements, generals, princes of the church, the common people and mercenaries from the Thirty Years' War.

This Fronde of the parlements had been a loyalist rebellion. Its armed protest was directed not against the king but against Mazarin; but it was soon disgusted with its allies — the princes and nobles and the Parisian mob that had been aroused by Paul de Gondi. When, therefore, a proposal was made in the parlement to receive a Spanish envoy, that assembly hastened to make terms with the court by the peace of Rueil (March 11, 1649). In the short respite (April 1649–Jan. 1650) that followed the treaty there ensued a scramble for power among the nobles, Condé, Gaston of Orléans, the prince de Conti (Armand de Bourbon) and the intriguing Longueville. The victor of Lens, thinking the world at his feet, assumed so dictatorial a manner that Anne of Austria and Mazarin, assured by Gondi of the support of the parlement and the mob, had him arrested. In defense of Condé a great conspiracy of court ladies sought vainly to arouse Normandy, Burgundy and Bordeaux. Turenne involved himself in dealings with the Spaniards and was defeated at Rethel. Unhappily Mazarin, as soon as he was victorious, forgot his promises, especially that of a cardinal's hat for Gondi. The nobles and the parlement made common cause and Mazarin fled to Bruhl in the electorate of Cologne, whence he continued to dominate the queen and the kingdom (Feb. 1651). But the leaders of the two parties, Condé and

Gondi, were soon engaged in a mortal rivalry. The exile of Mazarin and the attainment by the king of his majority (Sept. 1651) brought a temporary lull in the storm which broke out again on the return of Mazarin (Jan. 1652). Condé renewed the civil war with the help of Spain. Successful against the royal army at Bléneau, but nearly destroyed by Turenne at the Porte Ste. Antoine and saved only through the exertions of La Grande Mademoiselle (Anne Marie de Montpensier, daughter of Gaston of Orléans), Condé lost the support of Paris by permitting the massacre of citizens who were demonstrating in front of the Hôtel de Ville in favour of peace.

A general weariness of civil war gave a good opportunity to Mazarin's agents. In order that the way might be smoothed to a reconciliation, the cardinal pretended to exile himself to Bouillon (August). A collapse of the revolt ensued. Condé had taken refuge in Spain. Gaston of Orléans was in exile, the cardinal de Retz in prison and the *parlement* confined to its judicial functions. The field was thus left open for Mazarin who in Feb. 1653, four months after the king, returned in triumph to the Paris that had lately driven him forth with jeers and mockery.

The government had to make good the material and political losses of this war. Poverty was worse now than in the last years of the League and called forth a vast work of charity, animated by St. Vincent de Paul. The financial disorder, moreover, was irremediable as long as the war ment on. The *surintendant* Nicolas Fouquet did what he could to meet requirements, including the lavish upkeep of Mazarin's household.

As for the political rectification, attempts at revolution were over and done with. The rebels, Retz and Franqois de la Rochefoucauld, could henceforth give vent to their dissatisfaction only in their *Mémoires* or their *Maximes;* and the king kept the upheaval in mind with a view to preventing its recurrence. Louis XIV forbade the *parlement* to concern itself with state business, and Mazarin recruited the ministers of the new reign from the *bourgeoisie:* for example Michel Le Tellier, Hugues de Lionne and Colbert. Public opinion, weary of agitation, accepted without regret the return of absolutism.

The Treaty of the Pyrenees (1659).—Spain was still at war. It had even derived certain advantages from what happened during the Fronde, thanks particularly to the military talents of Condé, who had passed to its service. Mazarin applied himself to restoring the position with Turenne's help. For external support he turned to England, despite the royal government's distaste for Cromwell's regime. In Germany he was able to form the League of the Rhine, to keep the empire neutral and to prevent the emperor's helping Spain (1658). This was a step forward in the policy of intervening in the Rhine countries, which developed under the pretext of protecting the liberties of Germany. The recapture of Dunkirk after Turenne's victory at the dunes, which resulted in the conquest of Flanders, dealt the final blow to the Spaniards, who were compelled to make peace.

By the treaty of the Pyrenees (1659), France gained Roussillon and Cerdagne, Artois with certain posts in Flanders, Hainaut and Luxembourg. Louis XIV married the eldest of the Spanish infantas, Marie Thérèse, who renounced her claims to the Spanish throne in return for a dowry of 500,000 crowns. Mazarin had thus realized the policy of Henry IV and Richelieu—the destruction of the Catholic empire of Philip II and the stabilization of the monarchy. It remained to be seen whether France would be satisfied with this achievement or risk new ventures to complete the destruction or the absorption of a power henceforth negligible.

***Personal Government* of *Louis* XIV (1661–1715).**—The personal reign of Louis XIV began with Mazarin's death in March 1661. Louis's character was already formed. He was of average intelligence but had a certain practical sense, which however was sometimes misled by an ambition and a love of glory that obscured the true facts for him. His closely reasoned theory of government is expounded in his *Mémoires*. He found the elements of it in Richelieu's political writings, in Mazarin's teaching and also in his own experience. The Fronde had inspired him with a horror of revolutons, .parliamentary remonstrances and disorder in general. His projects were also informed with a love of order that reflects the classical spirit of the times. His theory was that of absolutism pushed to the extreme: the king is God's lieutenant, responsible to God alone, and can dispose of the property and even of the conscience of his subjects. The superior rights of the people and, with them, the states-general and the independent courts of justice, all these must be swept away; there could be no individual rights among his subjects; the sole remedy offered for their miseries was prayer and resignation. Thus did the nation identify itself with the person of the king.

Likewise, the king was not to share his authority with anyone. The function of a prime minister disappeared with hfazarin, and the king had the illusion of governing by himself, with ministers who were merely secretaries. These he chose from among the middle classes, leaving to nobles and to churchmen posts that were honorific but powerless. It was a bourgeois reign—to the indignation of the duc de Saint-Simon. The king moreover. applied himself unremittingly to his task, receiving ambassadors, presiding at the councils to the day of his death and enjoying the exercise of this *métier de roi.*

No one dared question this system of government. Never was there such a chorus of flattery round a sovereign. Jacques Bossuet justified the king's philosophy by citations from Scripture, and a troop of writers celebrated his virtues with an enthusiasm that was to capture later generations. The few dissidents incurred the royal displeasure: Franqois Fénelon, Sébastien de Vauban and the Jansenists, who were critical, brought disgrace without redress upon themselves.

The cult of the king had its temple at Versailles, which Louis caused to be so appointed as to enhance the brilliant majesty of his person by a sumptuous and artistic environment; he could live there surrounded by his court, far from the Paris that was made hateful to him by the presence of the people. The highest nobility competed for posts in the royal household. Attendance at court was the first and only duty in the eyes of a proud prince who noted everything, particularly absentees. Versailles became the centre of the national life and a model for foreign courts. If he thus played a part in the history of civilization, Louis also affected the social and political life of France. Through the insistence upon etiquette and the place hunting that were the guiding principles in the lives of the courtiers, Versailles sterilized the leisured upper classes, and the working classes were exhausted by the extravagant cost of its upkeep; moreover it separated the king more and more from his kingdom.

The reign witnessed no assembly either of the states-general or of the notables. Most of the provincial estates were not convened, and the provincial or municipal autonomies ceased to be respected. The municipalities were subjugated under the pretext of restoring their finances; and the function of mayor was turned into a hereditary office. The governors of provinces were reduced to representatives, and authority belonged to the intendants, the general system of the latter being henceforth the basis of the monarchical administration. The *parlements* themselves were confined to their judiciary functions. Only the assemblies of the clergy met regularly, because the king got subsidies and support against the total power of the popes from them. In administrative matters Louis introduced no innovation. Refusing to sanction any radical reform, he devoted himself to organizing in all its details the mechanical system inherited from his ancestors, both in the central and in the provincial administration.

This system moreover underwent changes. Louis's designs adapted themselves to circumstances. Thus two periods can be discerned, separated by Colbert's death (1683), the revocation of the Edict of Nantes (1685) and the English revolution (1688).

Colbert.—Louis's policy required a strong army and prosperous finances. It was Jean Baptiste Colbert who, for 22 years, gave himself up to this work of economic reorganization. He was of modest origin, from a family of Reims drapers. Beginning as secretary to Mazarin, he became *intendant des finances;* then he attained the foremost rank with the title of *contrôleur général des finances*, displacing Fouquet by extremely questionable manoeuvres, after which he was made minister of state, *surintendant des bâtiments* and secretary of state for the navy, having thus the entire internal administration of the kingdom assigned to him. If his ambition was unbounded, his capacity for work and his application were not less: in addition to his economic measures, ordinances on civil and on criminal procedure (1667–70) inaugurated the legal system of the Code Louis, which was to be superseded only by the Code Napoléon.

He sought to establish the greatness of the king on the increased wealth of the kingdom and to set up a stable finance that would provide resources for which there mould be no call. Colbert was against war and extravagance, that is, against the policy of magnificence to which he had to resign himself and which eventually caused the collapse of his work.

His first concern was to set France to work, to get that abundance of money which constitutes "the power and the strength of the state": a mercantilist system already practised and appreciated by his predecessors, but now so amply developed as to be described as *colbertisme*. He wanted every subject of the king to be obliged to work and to produce. He hated idleness and denounced as idle the rentiers, the *officiers*, the nobles and the churchmen. He deplored men's inclination to a life of ease and wanted to frustrate it by constraint. Likewise he sought to prevent any slackening by disciplining the workers. The corporate system was substituted for independent work, and detailed instructions were issued to ensure uniformity and high quality in products. As nevertheless the small artisans still produced little and proved recalcitrant to his discipline, Colbert endeavoured to substitute privileged and better-equipped manufactories. He thus created the royal manufactories of furniture and tapestries (Gobelin), of carpets, of mirrors and of cloth. The main difficulty was to set up companies and to find capital. Colbert was exacting and raged against opposition.

To complete this work he had to promote commerce and, above all, navigation. Envious of the Dutch, who enriched themselves by carrying the merchandise of other countries, he wanted to compete with them. He therefore had ships built and companies created and initiated a far-reaching colonial policy that was inspired by Richelieu's earlier efforts. He sought new markets and endeavoured to revive French interest in those enterprises in which it had been outstripped by the English and the Dutch trade. He extended New France from Canada to the Mississippi by supporting La Salle in Louisiana; he added to this the French tropical possessions in Guiana; he established the king's authority on the African coast from the Bay of Arguin to the shores of Sierra Leone; and he gained a footing in Madagascar and established the first French trading posts in India. A commercial monopoly of these territories was given to the great royal companies. To defend the colonies Colbert created a navy and for its accommodation Vauban constructed great arsenals at Brest, Le Havre, Dunkirk, Rochefort and Toulon. For the Atlantic fleet he introduced the system of maritime conscription that remained almost unmodified thereafter. As a result of his efforts the French navy, at least until 1692, was in perfect condition.

To support this activity Colbert set up a system of protectionist customs whereby manufactured goods imported into France were taxed while raw materials could be brought in free. The first, relatively liberal, tariff of 1664 was superseded by the tariff of 1667, which was frankly prohibitive and constituted one of the causes of the Dutch war. By this means a favourable balance of trade was to be established; *i.e.*, the kingdom would sell manufactured goods abroad without buying anything for its own consumption and receive in exchange the gold that all this economic activity was devoted to acquiring.

This new wealth gave the state the resources it required and paved the way for that restoration of finances which the destitution of the past 50 years necessitated. The first task was to get rid of a debt that was swallowing up all the state's revenue in interest. Colbert succeeded by the classic manoeuvres, practical but dishonest; he set up a *chambre* de justice, which terrorized businessmen into cancelling their credits and began by making an example of the surintendant Fouquet, in contradiction of all justice. This bankruptcy of the state led to the restoration of financial equilibrium. Subsequently, Colbert safeguarded this equilibrium by accumulating revenues; as he could not increase the income from the taille without overwhelming the poor and affecting the privileged classes, he preferred to develop the system of indirect taxation, the aides, which touched all consumers. He worked at the same time to reduce expenditure, adjuring the king to give up his extravagances. He could thus balance the budget as long as the king showed moderation. But at his death the equilibrium was already compromised, and the final reverse came with the advent to power of less clear-sighted ministers and with the mounting expenditure on the armed forces. Colbert had given the royal finances a moment of respite amid the series of disorders that were to lead to the fall of the regime.

The Army.—At the same time an effort was made to reorganize the army. This work had been begun by François Sublet des Noyers (under Louis XIII) and by Michel le Tellier and was taken over by Le Tellier's son François Michel, marquis de Louvois. The old army, commanded by undisciplined nobles, was replaced by an orderly organization. Its hierarchy of officers was fixed, and its strength was to be kept at its full complement, with volunteer recruits and, later? *miliciens* pressed into service. The commissariat was organized and armaments perfected, with plentiful artillery. Particular attention was paid to the capture and defense of fortresses, the concern of the engineers. This last corps was the creation of Vauban, who remained through the reign the great practitioner of siege warfare and encircled the kingdom with a belt of strongholds specially fortified against artillery fire.

Religious and Ecclesiastical Affairs.—Louis XIV, the "most Christian king and eldest son of the church," considered himself the ruler of the souls of his subjects. Thus he felt himself called upon to establish the unity of the faith and to repel with the hand of orthodoxy all dissenters, Huguenots, Jansenists or Quietists, whose independence was insupportable to him. Religious division, however, was impairing the structure of the state, which was ceasing to provide for the salvation of the people just as it was no longer the guardian of their material interests. It was now nothing but a kind of lay society, with part of its activity withdrawn from its rightful leaders. For these reasons, gently at first, then more violently as he became still more of a bigot, Louis's absolutism in religious matters asserted itself with the willing consent of a nation in love with the ideal of unity.

Since the peace of Alès, the Huguenots had enjoyed freedom of worship and had prospered in the fields of industry, agriculture and commerce. The clergy, under the influence of the Compagnie du Saint-Sacrement, sought from 1651 onward to unify matters at first by persuasion, later by a legal and narrow interpretation of the Edict of Nantes. His passion for absolutism, his religious zeal (the more active since he wished to make amends for his injuries to public and to private morals), the financial necessity of increasing the voluntary offerings of the clergy and of gaining their support in his quarrels with the papacy—all these led Louis to identify himself with this religious policy. Between 1661 and 1685 the Huguenots were successively excluded from the diplomatic service and from the municipalities and deprived of their hospitals, colleges, academies and schools. Fines proving inadequate, soldiers were quartered upon the recalcitrant under the system of dragonnades, which brought about mass conversions. Louis, thinking that an act of authority would settle the matter, revoked the Edict of Nantes (1685). There followed a mass emigration and later the terrible revolt of the Camisards, who held the royal armies in check in the Cévennes from 1703 to 1711, at a time when the kingdom was threatened with invasion. Nevertheless, Protestantism was not entirely destroyed.

The persecution of the Jansenists arose from the same principles. The theories of the founder, Cornelius Jansen, bishop of Ypres, revived those of St. Augustine on grace and predestination. Introduced into France and developed by the abbe de St. Cyran and by Antoine Arnauld, they inculcated a strict morality in reaction against contemporary licentiousness and against the servile spirit pervading society. The sect was recruited from the disillusioned followers of the Fronde and, because of the brilliance of its writers and thinkers (*e.g.*, Pascal and Racine), made a formidable body of opinion.. Its centre was Port Royal, near Paris, where the Solitaires had settled. Eventually, when the dispute over the *régale* reawakened the persecution, Port Royal was destroyed and the nuns dispersed, while the ashes of the dead were scattered to the four winds (1709–11). The bull *Unigenitus* (1713), which once again condemned their doctrine, reopened a dispute that survived the death of Louis and filled the 18th century with its reverberations. (*See* JANSENISM.)

The much less grave affair of the Quietists likewise arose from the desire for uniformity. That it was even for a moment serious was due to the fact that Madame de blaintenon and the ladies of St. Cyr were waging war upon the mysticism of Madame Guyon, who had abandoned dogmas and prayers and given herself up to the pure adoration of God. Fénelon, who had adopted her doctrines, was condemned in 1699; and the affair was important only because of his duel with the representative of the principle of authority, Rossuet.

The Libertins, philosophers such as Pierre Bayle, savants such as Bernard de Fontenelle and commentators apart from the main tradition such as Richard Simon, were exiled or kept under surveillance and their writings banned; but their doctrines were to appear again in the 18th century.

Despite his Christian attitude, Louis was constantly in conflict with the papacy through his wish to assert the independence of the temporal power from pontifical authority. This conflict had its origins in the distant past and had flared up in the time of the League; and under Louis XIII the Gallican principles expounded by Edmond Richer in his book De la puissance *ecclésiastique* et *politique* (1611) had caused long controversy.

Under Louis XIV the conflict was aggravated by political incidents which impaired relations between the two sovereigns: for example the affair of the Corsican guards (1662) and a dispute about 'the diplomatic immunity of the French ambassador's palace in Rome (1679–87). Rut the principal issue between them was in the matter of their rival jurisdictions, raised now by the question of the *régale*. Louis asserted, even more forcefully than his predecessors, his title to the usufruct of the temporal goods and spiritual rights of bishoprics that fell vacant—and that throughout the whole extent of the kingdom. Nicolas Pavillon and François Étienne de Caulet, bishops of Alet and Pamiers respectively, both of whom moreover were Jansenists, contested this claim and appealed to the pope.

The assembly of the clergy, to whom the question was referred, wanted to make a general pronouncement on "the usage of the power of the popes." Thence emerged the declaration of the Four Articles of 1682, which propounded the principles of Gallicanism, asserting that the pope has power over spiritual things alone, that general councils overrule him, that the rules of the Church of France are inviolable and that papal decisions on matters of faith are revocable only by consent of the church. This declaration widened a break that threatened to become a schism. The pope refused to consecrate the bishops nominated by the king. Louis, worried by the resistance that he was encountering all over Europe: had finally to yield (1693), without, however, withdrawing the Four Articles.

Foreign Policy.—Louis came into power at a time when all danger of a Spanish or imperial hegemony had been dispelled. "Peace was established for as long as I myself should wish it," he said. The traditions of Richelieu and Mazarin and the treaties of Westphalia and of the Pyrenees might have formed the basis of a policy of moderation. But Louis dreamed only of glory and "wanted business abroad," so as to make conquests. The treaties for him were the starting points of new projects, the seizure of the Spanish possessions and then of Spain itself and the domination of western Germany where he would take the place of the Habsburgs. The reinforcement of the army, the creation of the navy and the financial reforms were motivated only by the need to provide means of action.

As early as 1661 Hugues de Lionne encouraged Louis to use the treaty of 1659 to provoke a quarrel with Spain, and the king was exploiting the slightest incidents to threaten his neighbours. He claimed precedence for his ambassadors at foreign courts over those of other kings and refused to have his ships salute English ships in British waters. The dispute between his ambassador's escort and the pontifical guard in Rome led to a battle in the streets. Most serious was his claim to Spanish territories in the name of his aife Marie Thérèse, on the ground that her renunciation of her paternal heritage was not valid. This claim compromised the destiny of the Low Countries and disturbed the United Provinces. with whom an alliance had just been made. The purchase of Dunkirk, to which Charles II of England had agreed, likewise disturbed English public opinion; and while he wanted to keep alive the existing hostility between England and the United Provinces, Louis's policy had rather the effect of promoting their rapprochement in the face of French encroachment. At the same time political interventions in Lorraine and in Alsace roused the empire and the German princes against France.

The War of Devolutzon *(1667–68)*.—From 1659 Louis was thinking of spoil from the Spanish monarchy, which he accused of not complying loyally with the peace treaty. When Philip IV died (1665) Louis demanded the heritage of Marie Thérèse, invoking the right of devolution although it did not apply to public law. After military and diplomatic preparation, Turenne's army conquered part of the Low Countries (1667). In Feb. 1668 Condé occupied Franche-Comté in 14 days. These successes forced Spain to make peace but caused anxiety among the neighbouring powers, particularly among the Dutch. John de Witt organized the triple alliance between the Dutch, the English and the Swedes, which prevented any further French advance. The peace of Aix-la-Chapelle (1668) left France nith some strongholds in Flanders, which Vauban fortified. The war ended favourably to Louis, but the result warned him that his very allies were ready to coalesce against him.

The Dutch *War*.—Because it constituted an obstacle to his progress and was responsible for his recent humiliation, Louis wanted to destroy the Calvinist bourgeois power of the United Provinces, against which moreover Colbert had grievances on the commercial side. For several years Hugues de Lionne endeavoured to break up the triple alliance; and he contrived an alliance with England and Sweden again and even made sure of the emperor Leopold I's neutrality. Thus isolated, the United Provinces succumbed without much resistance (1672). In two months the French were at the gates of Amsterdam; but Holland was saved by inundation when the dikes were broken, and a revolution got rid of the republican party of the brothers De Witt, which was too much inclined to peace. Power was entrusted to the stadholder William of Orange, who broke off the peace negotiations. Louis's excessive demands alienated all the powers, and a coalition was formed between Charles II of Spain, the emperor Leopold, most of the German princes and even Charles II of England, who had to bow to the will of parliament. Louis had to withdraw his armies, and the war continued on the Rhine, in the Mediterranean and in Franche-Comté, which was again taken from the Spaniards. The victories of Condé and Turenne restored the situation. In 1678 the peace of Nijmegen secured the independence of the United Provinces—at the expense however of Spain, who had to surrender Franche-Comté and position in the Low Countries. Louis emerged with profits from a war that should have made him cautious.

French policy, on the contrary, became increasingly provocative. Claiming all the dependencies of his earlier conquests, Louis annexed a number of territories in consequence of decisions made by the chambres de *réunion* set up for the purpose in the Low Countries, in Lorraine and in Alsace, where Strasbourg was occupied (1681). Luxembourg surrendered after a siege (1684). All Europe felt the threat of these peacetime annexations. The king of Spain was rash enough to declare war, but had neither the allies nor the means to keep it up. In agreement with the emperor, he had to recognize Louis's acquisitions by the truce of Regensburg (1684). France seemed at the zenith of its prosperity, but hatred and hostility mere growing on all sides.

The War of *the* Grand Alliance (League of *Augsburg)*.—Circumstances increased the political tension. The revocation of the Edict of Nantes disturbed Europe, leading to a rupture with Brandenburg and making any understanding with the United Provinces impossible. When Louis intervened to get his protege the cardinal William of Furstenberg elected archbishop of Cologne, further aggression was to be expected. The powers concerned formed the League of Augsburg, comprising the emperor Leopold and all other sovereigns interested in the defense of Germany (1686). Its strength was increased when William of Orange, son-in-law of James II of England, on the appeal of the Protestant party took the English crown as William III (1688) and became the head of the coalition, from which was developed the Grand Alliance of Vienna (1689).

War had already begun; Louis had taken the opportunity of a dispute about the succession of the elector Charles of the Palatinate to invade the Rhenish provinces. The war spread over all the frontiers of France and developed particularly at sea, as the maritime powers, England and the United Provinces, were anxious to ruin French commerce. The conduct of the war was dominated by the economic interests of the belligerents, which gave it a character different from that of earlier conflicts.

Again the French armies found valuable leaders, in the duke of Luxembourg and Nicholas Catinat; and the fleet was under the comte de Tourville. The unity of the command gave Louis certain victories over the continually disunited allies: at Fleurus (1690), at Steenkirk (1692) and at Neerwinden (1693) in the Low Countries and at Staffarda (1690) and at Marsaglia (1693) in Italy. But Tourville, after the annihilation of his fleet at La Hogue (1692), lost the command of the sea, and this changed the position of the belligerents definitively.

Unable to destroy the coalition, Louis had to negotiate and to reduce his demands continually. The peace of Ryswick (1697) formulated these concessions. Louis kept Strasbourg, but gave back Lorraine and some of the territories incorporated in the kingdom, recognized William of Orange as king of England and renounced certain economic measures of reprisal. The moral setback was greater than the political.

The *War* of *the* Spanish Succession.—Louis's readiness to make peace resulted mainly from his interest in the question of the Spanish succession, which seemed likely to arise shortly. He had always asserted his rights to the Spanish heritage, bargaining meanwhile with the emperor, who made rival claims. He was aware that the European powers would not agree to Spain's being attached either to France or to Austria. To secure the support of the maritime powers he negotiated the treaties of The Hague (1698) and of London (1699) with William III, whereby certain territories were to go to the dauphin and the rest to a Bavarian prince or even to an Austrian archduke; the emperor, if he rejected this arrangement, would be forced to accept it by the contracting parties.

Charles II of Spain died on Nov. 1, 1700, having named as his sole heir Louis's grandson, Philip, duke of Anjou; and Louis, regardless of his undertakings, accepted the testament, risking a coalition of all the duped and disappointed powers. His decision would have been tolerated had he not added further provocations: he asserted the right of the new Spanish king Philip V to the crown of France (Dec. 1700) and expelled the Dutch forces from the towns that they were occupying in the Low Countries (Feb. 1701). This was a challenge to all the powers who reconstituted the Grand Alliance in the fall of 1701. At the same time Louis recognized the Stuart pretender James (III) as king of England.

France lacked the necessary financial resources: the budget had shown a deficit since 1672, and if the nation's armed forces were comparable to those of the coalition it yet had no commanders capable of standing up to Prince Eugene of Savoy or to the duke of Marlborough. Though from 1701 to 1703 fortune was equally balanced in Italy, Germany and the Netherlands, the successors of the duc de Villars (who had been sent against the Camisards) lost Germany at Blenheim (1704) after the treachery of the duke of Savoy. In 1706 the defeats of Ramillies and Turin led to the evacuation of the Netherlands and of Italy. In 1708 the disaster of Oudenarde left the northern frontier exposed. Nature allied herself with the enemy during the terrible winter of 1709. Louis was forced to ask for peace from the Dutch but, disgusted by their unwillingness to compromise, began a new campaign and was defeated at Malplaquet. Invasion followed, and Louis was saved from disaster only by his dauntless courage, by the strong will of his secretary of state the marquis de Torcy (Jean Baptiste Colbert. son of the great Colbert) and by the victory of the duke of Vendôme at Villaviciosa. The failure of the conferences at Gertruydenberg, which obliged the Whigs and Marlborough to resign their power into the hands of the Tories, now weary of the war and chiefly preoccupied in securing the mastery of the sea; the death (1711) of the emperor Joseph I, who had attempted to reconstruct the empire of Charles V for his brother, Charles VI; and the victory of Villars at Denain (1712)—all combined to make possible the treaty of Utrecht, which gave Italy and the Netherlands to the Habsburgs, Spain and its colonies to Philip V and royal crowns to the duke of Savoy and to the elector of Brandenburg. Gibraltar, Minorca, the gates of Canada and the commerce of the colonies fell to England, which, in affecting to defend the liberty of Europe, had always had the acquirement of these in view. For France the treaty put an end to the policy of glory and general conquest which Louis had substituted for the preservation of the advantages won by the treaties of 1648 and 1659. France, now weakened and destitute, faced the maritime powers who controlled the seas. It had roused the hostility of a Germany becoming conscious of unity and of a Prussia that was to find its fulfilment in the policy of realizing this unity against France.

End *of* the Reign.—Internal difficulties were as bad for France as were the military disasters. The royal family had suffered such losses that the succession seemed precarious: the dauphin Louis (le grand dauphin) and Louis, duke of Burgundy, and the duchess his wife Marie Adélaide of Savoy were all dead, so that the heir to the throne, in 1715, was Louis XIV's great-grandson, a five-year-old child. The great ministers of the early years, Hugues de Lionne, Le Tellier and Colbert had gone; Louvois had died in 1691; and their successors were the marquis de Seignelay and the marquis de Torcy (both Colbert's sons) and the far inferior comte de Pontchartrain (Louis Phelypeaux) and Michel Chamillart. The king had to undertake whatever was to be done—in consultation with Madame de Maintenon, whose influence was predominant from 1685.

The policy of grandeur had as its counterpart the ruin of the kingdom. The excessive governmental direction, the raising of the customs tariffs and the wars made industry and commerce waste away. Agriculture was affected, and years of bad harvests led to nation-wide famines, as in 1709.

Moreover, the general economy of the country was affected by the general fall in prices, which ruined producers and owners and paralyzed business. The population itself was declining, with the emigration of the Protestants depriving the kingdom of an especially industrious element. All this brought chaos into the royal finances: taxation could not meet the constantly increasing expenditure but crushed the poorer classes; new taxes were evolved, and the government resorted to such expedients as devaluation, borrowing and the sale of offices. It was the reign of contractors or partisans and bankers (*e.g.*, Samuel Bernard), who became the suppliers of the treasury.

Even the literary brilliance of the first years grew dimmer: the generation of Racine and Molière had passed. Writers now spent their time bitterly criticizing the government, and the bolder ones left France and published defamatory pamphlets abroad; the political literature of the 18th century was already making its appearance. Nothing remained of the splendours of the reign but its indestructible monuments, the Louvre, the Invalides and the château and park of Versailles.

Louis XIV died having ruined a kingdom that he had found at its apogee. He left it enlarged but exposed to the enemies called forth by his ambition. The enthusiasm that had greeted his earlier victories had died away, and his funeral was marked by the rejoicings of the people. (R. Dt.)

The **Regency of Orléans (1715–23)**.—By his will, Louis XIV entrusted the regency to his nephew, Philip, duke of Orléans, since his great-grandson, Louis XV, was a minor; but, as he disliked Orléans, he placed all the power in the hands of a council in which his illegitimate children, with Madame de Maintenon and the Jesuits. held the predominant position. In thus seeking to render the regent powerless, Louis only succeeded in making him powerful. For the regent, with a view to becoming king in the event of the premature decease of Louis XV, sought allies in the parlement of Paris. In return for its declaration that Louis's will was null and void, the regent restored to it the right of remonstrance which had been suspended since 1673. On the advice of Saint-Simon he replaced the secrétaires *d'état* by six councils, largely composed of the great nobles; he also abandoned Louis XIV's policy of sponsoring the bull *Unigenitus* against the Jansenists. Highly endowed but lacking the ability to use his talents, Orléans was presently forced to recognize the inconvenience of a hydra-headed government, the mistake of having restored to the parlement its political power and the vanity of his hope of achieving a religious peace. A reaction was accomplished, but not before Louis XIV's governmental machine had suffered gravely.

This reaction did not make an end of the financial crisis; only a strong government could have dealt with one of such magnitude. Adrien Maurice, duc de Noailles, who had contented himself with outworn expedients as *président* du *conseil* des finances, could accomplish nothing. Then recourse was taken to the "system" of the clever Scottish adventurer John Law (*q.v.*; and see below, Society and Progress), the sudden collapse of which in 1720 brought many fortunes to ruin and left much of the public debt unextinguished.

In the earliest phase of the Anglo-French "second Hundred Years' War" for maritime, colonial and commercial supremacy which may be considered to have begun in 1688 and was to last till 1815, England had won a great advantage by the treaty of Utrecht. From that time, France should have maintained peace on the continent and brought to bear against England its forces at sea and in the colonies. The necessity for this, however, did not at once present itself. Orléans was content to help England to preserve the treaty, partly because of his personal ambition, partly because of the Spanish menace.

Philip V of Spain and the emperor Charles VI, while they each accepted the portion of the Spanish inheritance assigned to them by the treaty of Utrecht, laid claim to the whole of what they had wanted. Moreover Elizabeth Farnese, second wife of Philip V, sought Italian thrones for her children and was abetted by the efforts of Giulio Cardinal Alberoni to revive Spain. To counter this, Guillaume Dubois (the regent's trusted minister, later a cardinal) signed the triple alliance with England and the United Provinces at The Hague in 1717 and, aided by Lord Stanhope, induced the emperor to participate in it (1718). The intrigue between the Spanish ambassador, Antonio Giudice, prince of Cellamare, and Louis XIV's bastard, Louis Auguste, duke of Maine. to exclude the house of Orléans from the French throne was discovered and repressed; a Spanish fleet was destroyed by Adm. John Byng and the dockyards at Pasajes burned by the duke of Berwick. The dreams of Alberoni were finally dissipated by the terms of the treaty of London (1720).

Ministerial Government for Louis XV **(1723–43)** Louis XV came of age and the regency ended in Feb. 1723. Power. however, was left in the hands of Orléans and Dubois. But Dubois died in August, Orléans in December, and their place was taken by Louis Henry, duke of Bourbon, who pursued his predecessors' foreign policy but let himself be led by the worthless marquise de Prie, thus inaugurating the long reign in diplomacy of publicly recognized mistresses. The couple tried to rid themselves of André Hercule de Fleury, the king's tutor, who had been the author of their fortunes. Bourbon hoped to maintain himself in power by marrying Louis XV to Marie Leszczynska. But the consequent dismissal of the Spanish infanta, who had been betrothed to Louis, strained relations with Spain, and discontent was aroused by the new tax of one-fiftieth imposed upon all classes of income and by the revival of persecution of the Jansenists and Huguenots. All this was cleverly exploited by Fleury. Acting on his advice the king dismissed Bourbon in 1726.

Fleury.—A soft-spoken, crafty septuagenarian, the new minister and cardinal was a pacifist by nature and conviction. His surly right-hand man Philibert Orry, whom he made *contrôleur général* des finances, reduced expenditure and restored order to the finances. Religious peace proved more difficult of attainment. Fleury took strong measures against the Jansenist agitation. By means of *lits* de justice and lettres de cachet he routed out the Flagellants and made an end of alleged miracles. In a few years his administration had re-established prosperity. In accord with Robert Walpole over foreign policy, he devoted himself to promoting general peace. First he reconciled the French and Spanish descendants of Louis XIV, divided among themselves since the Polish marriage, by the treaty of Seville (1729), to which England too was a party. Next the emperor Charles VI, in order to secure the imperial succession to his daughter Maria Theresa, was obliged now that Walpole and Fleury had detached his Spanish ally from the friendship set forth in the first treaty of Vienna (1725), to sign the second treaty of Vienna (1731), sacrificing the Ostend company (whose competition was arousing the anger of English and Dutch) and procuring the duchy of Parma for Philip V's son Charles.

But Fleury's peaceful policy was compromised in 1733, when Augustus II of Poland died and his son Augustus III and Stanislaus Leszczynski, father-in-law of Louis XV, were rival candidates for the throne. The Poles elected Stanislaus but could not support him against the empire and Russia. Fearing English action in support of the emperor, Fleury rendered no substantial assistance. Germain Louis de Chauvelin, the secretary of state for foreign affairs, who was supported by a public opinion enraged by Fleury's pusillanimity, made a diversion in Italy with the help of Spain and Sardinia. Yet Fleury's diplomacy restored the peace; by the third treaty of Vienna (1735–38) Louis XV gained the duchy of Lorraine for his father-in-law with reversion to himself and professed to recognize the rights of Maria Theresa. Chauvelin was sacrificed to the cabinets of Vienna and London.

Another French success was the mediation of the peace of Belgrade (1739) between Austria and Turkey. Russia thus lost Austria's support and had to renounce most of the advantages gained since its attack on Turkey in 1736. In 1740 the grateful Turks renewed the capitulations (religious and commercial concessions) granted to France.

In Oct. 1739 England attacked Spain. Knowing that France would be dragged into the war, Fleury sent, in the first place, two squadrons. But on Oct. 20, 1740, the emperor Charles VI died, and the question of the Austrian succession was opened. France no less than the rest of Europe had accepted the Pragmatic Sanction in favour of Maria Theresa, and Fleury was naturally inclined to abide by it; but the traditionalist party headed by the comte de Belle-Isle kept up the old outworn dispute between the French and Austrian houses. England thus acquired Austria and, from 1742, Saxony as continental allies; France, allied to the unreliable Prussia, was fully involved on the continent (see AUSTRIAN SUCCESSION, WAR OF THE). Fleury died in Jan. 1743, his views apparently confirmed by the French reverses in the first years of the war.

Personal Government of Louis XV **(1743–74)**.—Louis now declared that he wished to rule in person. but this he was incapable of doing. Handsome, intelligent, well-informed and generous-hearted. Louis was pathologically lacking in self-confidence and let himself be pushed and pulled in all directions by his family, by his mistresses (Pauline Félicité de Nesle, marquise de Vintimille, till 1741; then her sister, the duchesse de Châteauroux, till 1744; then the marquise de Pompadour, till 1764; and finally the comtesse du Barry, from 1769) and by his ministers and their followers. Mme. de Pompadour established her own political system, upset the time-honoured alliances of France, made and unmade ministers and chose the commanders for the army and navy. She was queen of fashion in a society where corruption bloomed luxuriantly and exquisitely; and in a century of wit, hers was second to none. In a reign of all-pervading satiety she alone managed to remain bewitching to the day of her death.

Foreign Policy.—The defeat at Dettingen (1743) was followed by a reassessment of France's interests in the War of the Austrian Succession and by a consequent improvement of her military fortunes. French armies conquered the Austrian Netherlands (Fontenoy, 1745), Savoy and the county of Nice. Nevertheless, by the treaty of Aix-la-Chapelle (1748) Louis surrendered everything; and in the colonies the status quo was restored. The indignation of France was roused.

The peace was no more than a truce. The rivalry between

French and English planters in the Ohio valley, fur traders round Hudson Bay and merchants in India led to fighting in 1755 and to the outbreak of the Seven Years' War (*q.v.*) in 1756. Once more the court allowed itself to be drawn into continental commitments. The "diplomatic revolution," inaugurated by the convention of Westminster (Jan. 16, 1756), whereby England and Prussia allied themselves, was consummated by the two treaties of Versailles (1756 and 1757, both May 1), whereby France committed itself to Austria. Hostilities in Europe dragged on; the French army lost prestige, notably in the Prussian victory at Rossbach (1757). The court ceased to care about the fleet and the colonies. Canada, ably defended by Montcalm and Lévis, was lost when Quebec (1759) and Montreal (1760) fell. Lally-Tollendal lost Pondicherry (1761) and India. Étienne François de Choiseul, secretary of state for foreign affairs from 1758, negotiated the "family compact" (Aug. 15, 1761) to bind together the external policies of the French and Spanish Bourbons, but this only involved Spain in the disaster. Under the treaty of Paris (Feb. 10, 1763) Louis surrendered Canada, the Ohio valley, the left bank of the Mississippi and several of the islands of the Antilles to England and Louisiana to Spain; renounced all political claims on India (where, however, he retained the settlements of Pondicherry, Chandernagore, Mahé, Yanaon and Karikal); and gave up the settlements in Senegal, with the exception of Gorée. He retained, however, the Newfoundland fisheries where his seamen learned their trade, as well as the principal islands of the Antilles. The great English victory, therefore, was not decisive.

At last the urgency of the situation was realized. Choiseul prepared for revenge, applied himself to developing the navy and bought Corsica from Genoa (1768). But neither he nor the duc d'Aiguillon, who succeeded him in 1770, could prevent the partition in 1772 of France's old ally Poland between Russia and the two newly reconciled powers whose long antagonism had cost France so much—Prussia and Austria.

This reverse was partly the result of the coexistence of official policy and the "king's secret." Whereas Choiseul trusted Austria, Louis realistically mistrusted it. The intrigues of Louis's agents counteracted Choiseul's diplomatic efforts toward getting Austrian support for the patriotic Confederation of Bar in Poland. The Turks, in their turn, were disastrously involved at the same time (1768). But French support for Gustavus III of Sweden led to the renewal of the Franco-Swedish alliance in 1773, after his coup d'état (1772).

Internal Affairs.—The absolute monarchy might have been saved from the catastrophe that was to come in the next reign if it had undertaken the requisite reforms. The aristocracy and first of all the aristocracy of the princes and the dukes should for instance have been broken. But, though the network of councils dominated by great nobles (la polysynodie) that the regent Orléans had substituted for the bourgeois ministers of Louis XIV had proved so manifestly inefficient that by 1718 it had become necessary to restore ministers, the great nobility nevertheless remained dangerous because of its intrigues at court, its numbers of dependents and its understanding with the parlernents.

The parlements, indeed, frustrated all attempts at reform. The right of making remonstrances, restored to them by Orléans in 1715 and occasionally restricted or suspended afterward, generally enabled them to delay the registration of royal edicts and to oppose financial reforms. Time and again, as the only solution to the financial problem aggravated by court expenditure, by wars and by peacetime rearmament, the king attempted to get all his subjects to make some contribution to the revenue, each according to his means. But to this the parlements, supported by the princes, the bishops, the provincial nobility and all privileged persons refused their assent. They frustrated the tax of one-fiftieth of eachincome (1725–27) and that of one-tenth (1733–36 and 1740–49; in force during the wars but so deformed as to weigh most heavily on the poor) and only registered under protest that of one-twentieth introduced by Jean Baptiste de Machault d'Arnouville (1749–54); they likewise defeated Étienne de Silhouette's *subvention générale* (1759). They gave countenance to all the enemies of the discredited king, for instance to the Jansenists against the Jesuits, whom Choiseul suppressed (1764) in the hope of conciliating them. The unprivileged classes, whom they often incited to rioting did not discern the selfishness of their motives. From time to time the king exiled and then recalled the *parlement* of Paris. Finally, by the coup of Jan. 19, 1771, the chancellor René Maupeou put an end to the sale of offices of justice and replaced the parlementaires by salaried judges—a reform further justified in view of the scandalous injustice that had been administered in such trials as those of Jean Calas and the comte de Lally (*qq.v.*).

The third member, with Maupeou and the duc d'Aiguillon, of the so-called *triumvirat* that governed France from 1771 to 1774 was the abbé Joseph Marie Terray, who began to reform the abuses of revenues and pensions but remained as unpopular as every other minister of finance. Louis XV died on May 10, 1774, and was succeeded by his grandson.

Louis XVI, to 1789.—Louis XVI, well-meaning, a skilled locksmith and a good family man who loved the people and seemed like a bourgeois on the throne, was notable primarily for the weakness of his character. His wife, the Austrian archduchess Marie Antoinette, was one of the most beautiful women at Versailles, passionately devoted to pleasure and delighting to free herself from the formalities of court life. When, however. she sought to play the part of a queen regnant, she very quickly earned herself considerable unpopularity.

Vergennes.—The new foreign minister, Charles Gravier, comte de Vergennes, had as his first object the reassertion of French prestige against England. His opportunity came when. in 1776, the English colonies in America revolted. Vergennes desired French intervention, but Louis XVI hesitated. yielding to the financial objections of Turgot and merely countenancing the assistance given to the Americans by volunteers under La Fayette until after the capitulation of Saratoga (1778). Then the French fleets established supremacy at sea and attacked at every point, in the Antilles. in India and at Gibraltar, and, together with Rochambeau's expeditionary force, contributed to the surrender of Yorktown (1781). Sir George Rodney's victory in the battle of the Saints (1782) made no difference to the outcome. England had to acknowledge the independence of the United States and to restore to France the settlements in Senegal, Tobago and St. Lucia (treaty of Versailles, 1783). For these enterprises overseas, France had needed stability on the continent. Vergennes had therefore refused to accept Austria's seductive offers in the Low Countries and in Egypt, made use of Frederick II and prevented Joseph II from conquering Bavaria (treaty of Teschen, 1779); and had quickly put a stop to an Austro-Russian attempt at the dismemberment of the Ottoman empire (1781–83). Joseph's second attempt on Bavaria (1784) was also prevented. Vergennes sought to crown his work by effecting a reconciliation between France and England in the commercial treaty of 1786, and when he died in 1787 his plans had been realized. To the people of France. however, these successes seemed inadequate compensation for the treaty of Paris; American democratic ideas excited them, and the financial crisis caused by the war paralyzed the monarchy.

Internal Affairs.—Of the reformers whom Louis summoned to his council at the very moment when, in a spirit of appeasement, he restored the reactionary parlements (1774) the most remarkable was Turgot. Physiocrat and contributor to the *Encyclopédie,* he wished to extend to the whole of France that experiment in liberty nhich had already succeeded in his own government of Limousin. He ordained the free circulation of grain throughout the kingdom, despite the "Flour War" (la guerre des farines) aroused by those who saw in this measure a threat of starvation. For the *corvée,* which had taken away the peasants from their aork in order to build roads, he substituted a territorial levy payable by all landowners. He established freedom of commerce and industry by abolishing the privileged trade corporations (1776). He offered himself as a minister of economics; there were to be no new loans and no new taxes. But public opinion that clamoured for reforms did not want to pay the cost, and the king nas too weak to put donn abuses or to refuse privileges. When, in order to decentralize administration, Turgot proposed to set up consultative bodies of landowners in each parish, town and province, Louis XVI sacrificed him to the intrigues of the prime minister Maurepas and to the American ambitions of Vergennes (1776).

Jacques Necker, the Genevan Protestant banker who succeeded him, abolished Turgot's edicts and proposed, as Law had done, a marvellous remedy: an unlimited loan. He succeeded in financing the American war, but at a grave charge upon the future. He transformed the municipal bodies set up by Turgot into provincial assemblies, heirs of the *parlements* and the intendants; and these immediately revealed themselves to be inspired with a reforming spirit. Opposition on the part of the privileged classes broke out again. Necker replied with his famous *compte-rendu*, purporting to show that there was an annual surplus of 10,000,000 livres. when in fact the deficit was close to 50,000,000 livres; but in 1781 he was overthrown by the reaction that he had helped to promote in attacking Turgot.

To the reforming ministers succeeded ministers who were courtiers only. But this reaction could not fill the empty coffers of the state, and in two years two ministers, Joly de Fleury and d'Ormesson, were discarded. Charles Alexandre Calonne (*q.v.*) feigned an optimism which nourished the confidence necessary to ensure the success of his loans; but like his predecessors, he experienced the enmity of the *parlements*. Seeing that Louis would never consent to a repetition of Maupeou's coup of 1771, Calonne sought the support of a quasi-representative body; and it was on his advice that the king summoned an assembly of notables, thus exposing the monarchy at a time when it was already compromised by the affair of the diamond necklace (*q.v.*).

Étienne Charles de Loménie de Brienne, archbishop of Toulouse, who followed Calonne in 1787, was no more successful. The notables referred him to the representatives of the people, to the states-general. But Loménie preferred to present to the *parlements* Calonne's projects for an extension of the stamp duty and a general land tax. He met with the same refusal and was referred again to the states-general. Louis XVI, at the royal session on Nov. 19, 1787, found himself in open warfare with the *parlement* of Paris. He suspended it in May 1788 and transferred the registration of edicts to a plenary court composed of reliable servants of the crown.

The *parlement* of Paris insisted on maintaining the so-called fundamental laws of the monarchy, on its right to a share in legislative power, on the king's obligation to respect covenants with the provinces drawn up in the late middle ages and on the necessity for taxes to be voted by the states-general. Its members, in league with the *noblesse d'kpke,* now supported the popular demands of the provincial *parlements.* The provincial estates of Dauphiné refused to pay taxes. On Aug. 8, 1788, the king was forced to convene the states-general for May 1, 1789. The Revolution was thus opened by a revolt of the privileged orders. (X.)

SOCIETY AND PROGRESS, 1715-89

France in the 18th century was still an agricultural country. The great bulk of its resources was then derived from the land; and the ownership of land, which was mainly in the hands of the nobility, formed the criterion of a man's place in society.

Noblesse d'Épée.—The landed aristocracy comprised the princes of the blood; the higher nobility, *ducs* and *marquis,* who resided for the most part at court and in Paris and seldom on their country properties (to which they retired when exiled); the archbishops, the bishops and the principal abbots; and the intermediate and petty nobility of the provinces. The landed nobility went by the name of *noblesse d'épée,* as having won its title originally by military prowess. The princes and the higher nobles were in a perpetual state of discontent. They resented the absolute monarchy's denying them all political action and likewise resented the king's policy of centralization which, through the intendants (*q.v.*) had deprived them of all provincial and local administrative powers (except in such provinces as Brittany and Languedoc, where assemblies or provincial estates were still maintained), leaving them with poaers only over their own manorial property. They demanded liberty, that is to say. government of France by the aristocracy. The petty nobility shared their views in regard to the administration of the provinces and joined with them also in protesting against the king's attempts to subject this privileged nobility to burdensome taxation; but they objected to the manner in which the higher nobility, in close touch with the king, monopolized all the honorific functions and pensions.

Almost all the nobles were in conflict with the other classes. As the *bourgeoisie* became increasingly important, the nobles asserted their privileges of birth more forcefully against it. The bishoprics were rigidly reserved for the younger sons of noble families. From 1757 efforts were made to reserve the commissioned ranks in the armed forces for the nobility, and in 1781 officer cadets were required to show four quarterings. The nobility was also in conflict with the peasants. The petty nobles, moreover, were poor and often brought ruin on themselves by service in the army, in which they fought heroically; they kept themselves respected for their military calling to the end. The general rise in prices and the fact that, for a long time past, the feudal dues had been fixed in money, forced the nobles to seek sources of revenue. They risked the forfeiture of their nobility by trading, by manufacture and even by cultivating their land in excess of the prescribed value workable by four plows. They sought too, especially during the last 30 years of the century, to exploit their feudal rights: experts searched the books of charters for forgotten legislation. The feudal regime became more oppressive. Both the higher and the intermediate nobility, moreover, tried to impinge on the common rights in the forests (which were decreasing in extent and increasing in value) and on the waste, with a view to converting them to arable land and pasturage. From 1760 the physiocratic school (*q.v.*) urged them on in the pursuit of this course. Certain nobles concluded contracts with village communities, either for *cantonnement,* which permitted them to enclose two-thirds of the commons, or for *triage,* which permitted one-third of the woodland to be enclosed. This movement toward enclosure, however, was restricted; France remained a country of small peasant holdings. Thus, in the latter years of the century, the nobles incurred the growing hatred of the peasantry.

In their opposition to the king, the nobles were provided by the philosophers with the doctrines of the social contract and of the rights ,of man and with the physiocratic theory. These gave them a clear conscience and the encouraging conviction of being in the right.

Noblesse de Robe.—The *noblesse d'kpke* was supported in its opposition by the *noblesse de robe; i.e.,* by the holders of the chief public appointments or offices (which the king continued to sell) and above all by the officials of the higher courts of justice, the *parlements.* The appointments held by the *noblesse de robe* were either inherited or put up for sale within the circle of a few families. The members of the *parlements* formed something like a caste; they despised the *noblesse d'épée* and were despised in their turn by it. But the *parlementaires* were just as much obsessed with their privileges and just as much landed gentry as was the *noblesse d'kpke* with which they allied themselves by marriage; and many of their sons also entered the military profession. They had, therefore, many interests in common with it. They claimed that they played a directing part in the affairs of state, as guardians of the "fundamental laws of the realm," which they interpreted according to their prejudices. In this capacity they exercised the right of making remonstrances, warning the king of any contradictions between proposed edicts and previous legislation or the fundamental principles of the constitution. They thus claimed that, by virtue of their judicial duties and political rights, they had the privilege of controlling the actions of the king; and they pursued a course of implacable opposition to every attempt at reform of the monarchy.

It was from these two classes that there issued the most violent pamphlets and the most scurrilous calumnies against the king, inspired by princes of the blood—the duke of Orléans, the prince of Conti or the duke of Enghien—and naively credited by romantic historians.

Bourgeoisie.—In spite of the nobility, the commercial and industrial *bourgeoisie* increased. Methods of payment and credit were developed. Kotwithstanding the prohibitions of the canon and civil laws, the practice of issuing loans at interest had perforce made its way. Even before Law, joint-stock companies. bearer bonds and forward dealing were known. John Law sought to quicken the circulation of money by the use of paper and thus to increase purchases and sales and to intensify production. His offer to the regent to take the place of the state in dealing with its creditors and gradually to settle Louis XIV's debt was accepted. He was thus able to found a private bank of issue in 1716 and the Compagnie d'Occident in 1717 and to group together in his system his own bank (raised to the status of royal bank in 1718), the Compagnie d'Occident (renamed Compagnie des Indes in 1719 and designed to exploit the Mississippi, Canada, the Antilles, Guinea, the Indian ocean and far east), the farmed-out tobacco revenues, the minting of currency and the collection of taxes—the whole constituting a vast state trust. Speculation in his shares caused a boom, followed by a crash. In Dec. 1720 Law was forced to flee. He had imbued the French with a dislike of banks and paper money but he had whipped up enthusiasm for commercial and industrial enterprise. After him trade brought about a gradual accumulation of the nation's reserves in specie. The Paris Bourse was opened in 1724; forward deals were authorized in 1780. Currency was stabilized in 1727 and remained stable until 1790. In 1776 a Swiss and a Scot founded the Caisse d'Escompte, which discounted commercial bills, accepted deposit accounts and issued notes. which hardly circulated outside Paris. In 1777 the Mont de Piété, to grant loans to clients on receipt of goods, was founded. From 1750 onward, especially after 1780, joint-stock companies became widespread, embracing coal mines (Société d'Anzin, 1757; Société d'Aniche, 1773), metallurgical works, spinning mills, banks and marine insurance. Hence followed a rise in prices, gradual from 1753 to 1760 and rapid, with periods of lower prices, between 1760 and 1770; this resulted eventually in increased profits and stimulated production.

Trade and industry were in a position to expand. Foreign trade grew from 215,000,000 livres tournois in 1716 (172,000,000 for Europe, 43,000,000 for the rest of the world) to 430,000.000 in 1740 (306,000,000 and 124,000,000) and to 616,000,000 in 1756 (412,000,000 and 204,000,000). After the Seven Years' War commercial activity revived. In 1777 the value of exports amounted to 259 000,000 livres, that of imports to 207,000,000; in 1789 the figures nere 354,000,000 and 301,000,000 respectively. Maritime trade mas the most profitable and employed more than 3,500 ships. All the ports—St. Malo, Lorient, Rouen, Le Havre, Nantes, La Rochelle, Bordeaux and Marseilles—were busy and prosperous, chiefly because of trade with the French colonies of the Antilles (particularly with Haiti in sugar and rum) and to the slave trade. Accumulated capital made possible a concentration of trade and industry in the vicinity of the ports; cotton goods at Rouen, linen at the Breton ports, cloth at Marseilles and at Sète. At Bordeaux and Nantes shipowners and merchants set up distilleries, refineries and shipyards; and throughout the kingdom there arose steelworks, paper mills and coal mines. It was their efforts that, toward the end of the century, gave rise to the first experiments in mechanization and in the concentration of industry. But the nobles followed the example of these bourgeois, investing capital in their enterprises, taking shares in their iron and coal mines and iron foundries and even competing with them: the marquis de Solage was part owner of the Carmaux coal mines.

Although home industries had shown a greater degree of expansion, there was a growing concentration of commercial enterprises. In the hosiery trade at Lyons 48 merchants employed 819 skilled workers in their small workshops. Concentration into factories came about. before any mechanization, where expensive and complicated outlay was required, and the same object was attained in a variety of ways; *e.g.,* the woollen textiles of Reims and Louviers and the printed calicoes of the Société Oberkampf (1789) and other houses. As for mining, the state after 1744 reserved to itself the subsoil, conceding its exploitation to large, well-equipped companies. In 1789 the Société d'Anzin was employing 4.000 workers, had sunk pits to a depth of 300 m. (instead of the original depth of 50 m.) and was producing 375,000 tons of coal. Gradually, mechanization was introduced from England. From 1732 Thomas Newcomen's engine was in use in some mines. For silk manufacture, Jacques de Vaucanson's machine made it possible to have 120 reeling basins in a single building at Aubenas. For cotton manufacture workmen and machinery were brought from England; in 1789 there were factories at Brives, Amiens, Orléans, Montargis and Louviers. The smelting of iron with coke was introduced (Le Creusot). The first Watt steam engine to be seen in France was the Chaillot "fire pump" intended to bring water to Paris (1779). In 1789 "fire pumps" were scarce in France; it was considered marvellous when the Société d'Anzin installed 12.

The *bourgeoisie* had, in fact, become the most important class. Society was turning bourgeois. The bourgeois spirit pervaded literature, art and a section of the nobility. After 1750 black suits were commonly worn, and the distinction between gentleman and bourgeois became less and less apparent. Under Louis XVI it came to be considered good taste for nobles to carry a simple bourgeois cane instead of a sword. Some gentlemen no longer wore perukes. Some affected an air of simplicity or *moeurs sensible* (the sentimental manner). A prince insisted on presenting his princess to his regiment with the words, "My lads, this is my wife."

The bourgeois sought freedom in the conduct of their affairs, suppression of the privileges of birth, a share in the formation of laws and control of the budget and of royal policy; they wished, however, to preserve many of the feudal rights and the enclosures, as many of them had purchased fiefs. The royal government did much for the *bourgeoisie.* The *bureau du commerce,* created in 1722, and the *conseil du commerce* provided them with information, assistance and guidance. By fits and starts the king directed the traditional mercantilist policy into liberal channels. Methods of communication were improved; the *corps des ponts et chaussées* was created under the regency; the *corvée royale,* or forced labour on the highways, was regularized in 1738; many new roads were constructed and the number of tollgates was reduced. Freedom to trade in grain, leading to increased production because of the certainty of sale at remunerative prices, was repeatedly proclaimed (1763, 1770, 1774 and 1787); this measure also benefited the peasant proprietors. After 1750, under the influence of the physiocrats, the king reduced the number of regulations relating to manufacture. Some of these regulations aere rescinded, others mere very sparingly applied. In 1776 Turgot, as *contrôleur général des finances,* for a short time caused the abolition of the trade guilds or *corporations de métiers* and of the *jurandes,* the guilds' special tribunals which obstructed the setting-up of new enterprises and the use of new processes. From 1779 efforts were made to give influential persons a share in administration by means of provincial assemblies.

But the guilds were soon reinstated. In: 1786 a ruinous trade treaty with England was signed; by lowering customs duties on English manufactured goods to 12%, it brought a flood of cheaper English goods into the country, causing a serious crisis. The bourgeois were allowed but little participation in local, provincial or national affairs; and they remained discontented.

Intellectual and Material Attainments.—General prosperity, the widening influence of the *bourgeoisie* and the rivalry between the classes gave a great impetus to intellectual life, in which bourgeois talent, rationalistic, positive and utilitarian, was the dominating factor. The intellectuals came, for the most part, from the middle classes; but the renaissance of a nobility battling for its pre-eminence and its very existence was evident in the number of gentlemen who took part in scientific and technical activity.

There was enthusiasm, amounting to infatuation, for the natural sciences, for "physics." Kings, dukes, magistrates, abbés, doctors, bankers, ladies, all had their *cabinets de physique,* attended public lectures and read pioneer books or simplified accounts and specialist periodicals. There was a "rage to learn," an "intellectual fever." Scientists were the object of ardent veneration. Buffon saw his estate raised by the king to the rank of a countship; he had ten poets singing his greatness; a statue of him was erected in his lifetime; and his house at Montbard became a place of pilgrimage. Louis XV instructed the Académie des Sciences to undertake the measurement of the meridian and the production of a general map of France. He sent scientific missions to Peru, Lapland, the Cape and elsewhere.

The mathematicians Alexis Clairault (1713–65), Jean d'Alembert (1717–83), Joseph Lagrange (1736–1813) and the marquis de Laplace (1749–1827) completed, proved and elucidated the propositions of Newton and Leibnitz regarding the infinitesimal calculus. They proved, developed and disseminated Newton's cosmology, applied the new calculus to mechanics and astronomy and constructed a system of celestial mechanics. The measurements of the meridian undertaken in 1735–36 by Charles de la Condamine and Pierre Bouguer in Peru and by Pierre de Maupertuis and Clairault in Lapland revealed the flattening of the earth at the pole. Gaspard Monge invented descriptive geometry. France enjoyed a royal supremacy in the field of mathematics.

In physics, René de Réaumur made one of the first thermometers in 1730. C. F. du Fay proved that all bodies may be electrified (1739), showed the analogy between electricity and lightning, demonstrated electrification by contact and distinguished the two kinds of electricity. Charles Coulomb showed that Newton's law is applicable to electric and magnetic attraction and repulsion (1785–89).

Antoine Lavoisier (1743–94) inaugurated modern chemistry with his method of weighing (1772) and his new nomenclature (1787). His *Traité élémentaire* de chimie appeared in 1789.

In the natural sciences, Buffon (1707–88), who belonged to the noblesse de robe, directed the compilation of a vast natural history, himself wrote the *Époques* de la nature, which laid the foundation of modern geology, and in his *Histoire* naturelle de *l'homme* established the bases of anthropology and of human geography. Michel Adanson (Familles naturelles des *plantes,* 1763) found the method of natural classification and demonstrated the variability of species. Lavoisier moreover explained the functions of respiration, perspiration and digestion. In comparative anatomy, Louis Daubenton and Félix Vicq d'Azyr demonstrated the unity of the plan of composition and the conformity of the structures and the genera of living creatures. Henri Duhamel du Monceau was the first to do animal grafting (1746). Maupertuis, Adanson and Buffon expounded the hypothesis of transformism.

In the scientific study of mankind, historical method was perfected (Louis de Beaufort, 1738). The east was unveiled: Abraham Anquetil-Duperron translated the Zend-Avesta (1771); the works of the French Jesuits of Peking, Prémare and Antoine Gaubil, were used by Jean Baptiste du Halde in his discovery of China. Voltaire began writing on the history of civilization (Sikcle de Louis *XIV,* 1751; *Essai sur* les moeurs, 1756). Sociological investigators included Montesquieu, a noble de robe who studied the necessary relationship of positive laws to every element of an environment (*L'Esprit* des *lois,* 1748); the physiocrats, Franqois Quesnay (Tableau e'conomique, 1758), Pierre du Pont de Nemours and Turgot, who believed that they had discovered the natural order of human society; and the abbé Jean Baptiste Dubos, who moreover was the originator of aesthetics (*Réflexions* critiques *sur* la *poésie* et *sur* la peinture, 1719).

The first results of this scientific research were embodied in a prematurely constructed synthesis, the "philosophy of the Enlightenment," which had as its *summa* d'Alembert's and Denis Diderot's Encyclope'die (1715–64) and as its breviary Voltaire's Dictionnaire *philosophique* (1764), in which the bourgeois ideal is formulated.

The whole of this middle-class society was bent on the practical application of its theories. The maréchals de Saxe and de Broglie and the comte de Guibert (Essai *général* de tactique, 1772) were building the army that Napoleon was to use, introducing individual fire, fighting in extended order, the column of assault and divisional organization. Guibert was the first to try the timing of fire. Jean de Gribeauval between 1764 and 1776 created the light standardized artillery. At sea, Pierre de Suffren Saint Tropez revolutionized tactics by instituting the natural order of battle and the fight to a finish (Indian campaign, 1782–83).

Claude Franqois, marquis de Jouffroy d'Abbans, launched the first paddle steamer (1783); Nicolas Joseph Cugnot drove the first steam automobile (1770); the monk Dom Gauthey made a successful experiment with an acoustic telephone in 1782; the abbé Claude Chappe began experiments in telegraphy; the brothers Montgolfier sent up the first balloons in 1783. Jean Franqois Pilâtre de Rozier and François Laurent, marquis d'Arlandes, were the first men to fly.

Frenchmen were pre-eminent in obstetrics. Antoine Petit removed gallstones. Jacques Daviel operated successfully for cataract and was summoned to all the courts of Europe. The French were perhaps the first to give technical education in such institutions as the École Royale Gratuite de Dessin (1767), the Bcole Royale des Ponts et Chaussées (1747), the École Royale Militaire (in Paris, 1777; attended by Napoleon), the École Royale d'Artillerie (at La Fère) and the École du Corps Royal du Génie Français (at Mézières; supplying Europe with artillerymen, engineers and skilled technicians).

Cultural Prestige.—French was the common European language. It had been the diplomatic language since the treaty of Rastatt (1714). Princes, courtiers, men of letters, all spoke and wrote in French. A number of Europeans wrote French extremely well and some of these, no less than the British Anthony Hamilton and even the German Leibnitz of the preceding generation, merit a place in French literature, for instance the Belgian prince de Ligne, the Italian abbé Galiani, the German publicist F. M. von Grimm, the Prussian king Frederick II, the tsarina Catherine II and J. J. Rousseau of Geneva. The literature of every country was made accessible to the rest of Europe by means of French translations and adaptations. The clarity and precision of the language, its strict logic and matchless order and the value of the observations and ideas expressed in French works were widely recognized.

European art was also French. In France art was still under the influence of the court and Versailles, but no longer exclusively so; the financial crisis of the monarchy had led to its becoming also Parisian and bourgeois. There is no doubt it had most influence as court art, but every branch of it pervaded Europe. Princes eagerly sought French cooks and tapestry weavers, Parisian furniture makers' and goldsmiths' work and the china and porcelain of Sbvres. Women adopted French coiffures and dress and anxiously awaited the doll from the Rue St. Honoré that would show them the latest Paris fashion every month. Music by French composers was played at all the German courts; Scarlatti, Handel and J. S. Bach were pupils of Franqois Couperin; Gluck applied Jean Rameau's principles to his compositions, and Mozart and Haydn were influenced by them.

Everywhere Frenchmen were to be found with appointments as chief painters, sculptors and architects for princes and kings; as directors of academies of the fine arts; as suppliers of plans and drawings; and as the publishers of those collections of engravings which made the work of Charles Augustin Daviler. Jacques Franqois Blondel, Jean Baptiste Alexandre Leblond and Jean de Jullienne an inspiration to Europe.

Everywhere imitations were made of the royal town and palace of Versailles and of the Place Louis XV (now Place de la Concorde) in Paris. Innumerable examples could be given: for instance the Arsenal in Berlin and the palaces of Potsdam and Sans Souci, with their sculptures. terraces and gardens and the equestrian statue of the great elector were all the work of Frenchmen or of men who had identified themselves with France. In Austria, the University of Vienna, the statue of Charles VI, the sculptures in the Schönbrunn gardens and the Belvedere palace were all modelled on Versailles; the Josef II Platz is a second Place Louis XV. In Russia the influence of Versailles is evident in Petersburg, in the imperial residences of Tsarskoye Selo, Pavlovsk and Peterhof, in Catherine II's Hermitage. The equestrian statue of Peter the Great was made by Étienne Falconet after a design for a statue of Louis XIV. Everywhere the characteristic plan of the Parisian hotel might be seen, as in the aristocratic mansions of the Wilhelmstrasse in Berlin, where the ornamentation recalls the theme of Antoine Watteau's *fêtes* galantes. The finest collections of French paintings of *fêtes galantes* are to be found in London, Berlin, Stockholm and Leningrad. The several series of portraits executed by French painters and sculptors constitute a splendidiconographic documentation on every royal court of Europe.

This success was due, above all, to an intrinsic superiority, though up to 1757 it also owed something to French military prestige. The French court was the model for all courts. Great noblemen, artists and writers were attracted to the Parisian salons held under the regency by the duchesse du Maine, by the marquise de Lambert and by the duc de Sully and afterward by the marquise du Deffand, by Mme. de Tencin and by Mme. Geoffrin. After 1750 there were the philosophical salons held by the baron d'Holbach, by Mlle. Quinault and by Mlle. de Lespinasse and the musical salon of A. J. le Riche de la Poplinière. The French, in their turn, swarmed over Europe. France, with a population higher even than Russia's (16,000,000 inhabitants in 1715; 26,000,000 in 1789), overflowed into a Europe converted to the cosmopolitan outlook of the philosophers, in which moreover nearly all the royal or princely families were allied to the Bourbons, whether by heredity, by marriage, by friendship or by obligation.

After 1760 a national and romantic reaction against French influence set in, especially in England and Germany. In France, the classical spirit declined into a collection of rules; and the cosmopolitan outlook had weakened French patriotism. The French fell, in their turn, under foreign and particularly under English influences. Tea, whist, horse racing, jockeys and the redingote invaded France about 1770. Salons gave way gradually to clubs. The language was loaded with English terms: budget, *convention,* humour, jury, *pamphlet, romantisme,* spleen. Romantic gardens in English style were laid out: that at Ermenonville (1763), the Bagatelle (1777–81), the Parc Monceau and the Petit Trianon (both 1778). By 1789 the decline had set in.

Colonization and Exploration. — Colonization in a France turned bourgeois was on commercial lines. The tropical colonies were intended to complement the temperate home country. Crown colonies had military governors of noble birth, civil intendants of bourgeois origin and a supreme council similar to the French parlements. The king also made use of trading companies that enjoyed monopolies and royal prerogatives and were controlled by the royal administration. The possessions regarded as indispensable were the Antilles (Haiti, Martinique, Guadeloupe, Marie Galante, Saintes, Désirade and, until 1763, Tobago, St. Lucia, St. Croix. Grenada, the Grenadines and St. Vincent), which produced sugar, rum and coffee, and the settlements in Senegal (Gorée), which supplied slaves for the West Indian plantations. There were also the colonies of Louisiana and in India. The Indian colonies carried the eastern trade as far as Canton. But there was no appreciation for the policy of the governors Benoît Dumas (1735–41) and Joseph Dupleix (1741–54), who equipped native battalions (sepoys) in European style, intervened in disputes between the princes with a view to promoting trade and ended by carving out a real empire, under the suzerainty of the great mogul, for the Compagnie des Indes. The colony of New France (Canada) was likewise underestimated, as it produced hardly anything but furs.

Before the Seven Years' War exploration was mainly by land, in America. In their search for the "western sea," Pierre de la Vérendrye and his sons explored Lakes Winnipeg and Manitoba, Saskatchewan and the prairie and, south of the Missouri, discovered the Rocky mountains (1743). Louis de Saint-Denis crossed Texas (1714–17), La Harpe reached to the Red river and Arkansas (1717–22), Bourmont explored Kansas (1723) and the brothers Mallet explored Kansas, Nebraska and Colorado (1739). After 1763, explorers turned their attention to the Pacific in their quest for the austral continent as compensation for the losses in India. Louis Bougainville discovered Tahiti, Samoa, New Hebrides and New Guinea (1768). Crozet took possession of New Zealand (1772). In his continuation of Cook's voyage, La Pérouse ascertained that there was no important stretch of land east of Paumotu and the Marquesas; he took bearings along the coast of America from 60° to 37° N. lat. and also on the Manchurian littoral; he was lost at Vanikoro (1785–89). (R. Mr.)

THE REVOLUTION OF 1789

The French Revolution is generally dated from the meeting of the states-general at Versailles on May 5, 1789. This body, the only institution in France which could claim to represent the nation, had last met in 1614. For 175 years the representatives of the clergy, nobility and bourgeois had not been consulted by the crown. If Louis XVI in Aug. 1788 decided to summon them, it was because this step was demanded alike by the 135,000 members of the clergy, many of whom wanted social and ecclesiastical reform, by the 400,000 nobles, who hoped to safeguard their privileges, and by the third estate. as they were called — the whole unprivileged commons of the realm, from merchants and professional men to farmers and labourers, 26,000,000 in all — who were determined to break down the monopoly of property and power in the hands of the privileged minority.

The king might have resisted this demand had not the prestige of the crown been weakened by his own lack of initiative, by the unpopularity of his Austrian queen, Marie Antoinette, by the lack of statesmanship in his chief minister, the honest and competent but slow-moving financier Necker, and by the bankruptcy of the treasury. Nor could he appeal to the army, as his predecessors might have done, since it was infected with democracy from the American war and with the revolutionary sentiments that were spreading throughout the country.

The states-general of 1789 comprised, in round numbers, 300 deputies of the clergy, 300 of the nobility and 600 of the third estate. In the old days there would have been 300 of each order, so that in every contest of opinion the privileged clergy and nobility could have outvoted the unprivileged third estate. The doubling of the number of the third estate's representatives — a concession to social facts and popular opinion made by Necker on behalf of the crown, against the wishes of the clergy and nobility, in Dec. 1788 — meant that if the states-general met as a single body and the deputies decided to vote individually (par *tête*), the third estate could, by winning a few supporters from the other orders, carry the day; and thus, because of the indirect method by which the third estate had been elected. the states-general would be controlled by the middle-class lawyers, professional men and businessmen who represented the mass of the people (suffrage, order by order, had been almost universal). These men were, apart from a minority of the clergy and nobility, the most intelligent class in the country. with the clearest idea of what reforms were required. They had expressed their views both in the cahiers de *doléances* (the credentials presented by each group of deputies, with the grievances and instructions of their constituents) and in the flood of political pamphlets which poured from the press at this time, notably Qu'est-ce que *le* Tiers *État?* by the abbé Emmanuel Joseph Sieyès, the most learned political theorist of the day, which claimed that the will of the nation should be expressed by the representatives of nine-tenths of its population.

The National Constituent Assembly. — For six weeks after its formal opening by the king the states-general met in three parts, each order in a separate place. But the third estate occupied the great *salle* des menus *plaisirs* du *roi,* the only one in which the whole assembly could sit together; and there it met daily. refusing to do any business until the clergy and nobility consented to join it and to constitute a single assembly. On June 17, under the leadership of Sieyès, Jean Joseph Mounier and Honoré Gabriel Riquetti, comte de Mirabeau, the members took the critical step of declaring themselves to be *l'assemblée nationale* and of ordering the payment of taxes to continue just so long as they were allowed to continue in session. The king prepared to quash this declaration at a *séance* royale, and ordered the salle to be closed meanwhile. The third estate anticipated him (June 20) by meeting in the local tennis court and taking a solemn oath to continue deliberations "until the constitution of the realm is set up and consolidated on firm foundations."

Fall of the Bastille. — On June 23, after ordering the three estates to sit separately and proposing a limited program of reforms to be carried out by the crown, Louis expected the third estate to disperse; they refused to budge, "except at the point of the bayonet." The king, who shrank from violence and could not trust his troops, gave way; he ordered the clergy and nobles to unite with the third estate (June 27), and thus in effect surrendered his prerogatives to a legislature in which representatives of all classes of society sat together as national deputies for the purpose of giving France a written constitution: an *assemblée nationale constituante*.

Paris was by geographical position, population and tradition the political and governmental centre of France. The Parisians had anxiously watched the contest at Versailles and applauded the victory of the third estate. When, a fortnight later (July 11) they heard that Necker was dismissed and that troops threatened the capital, they gathered in crowds and seized arms; and on July 14, led by soldiers who had broken prison, they stormed the Bastille, an antiquated fort and almost empty prison that seemed to the poor of the Faubourg St. Antoine a symbol of tyranny and feudalism. The appeal to force succeeded. Within three days the royal troops were withdrawn, Necker was recalled and the leaders of reaction at court, led by the king's youngest brother Charles Philippe de Bourbon, comte d'Artois, were in flight for the frontier. Louis himself visited the town hall, sported the city colours and approved the appointment of Jean Sylvain Bailly and the marquis de La Fayette as mayor and commandant of a bourgeois municipality and national guard. The first act of the Revolution was over.

The Foundation Deeds Enacted.—The constitution that the *cahiers* had demanded and that it was the business of the National Assembly to provide was supposed to make a change not from a monarchy to a republic but from an absolute monarchy to a limited one. Its fundamental principle was to be the sovereignty of the people, and the king—no longer *roi de France* but *roi des Français*—was to be the executive, but not (as he had been) the fount of legislation and the judicial court of appeal. The three powers of state were to be separated. as Montesquieu had mistakenly supposed they mere in the British constitution. But since the Revolution was not merely political but also social and ideological, the limiting of the prerogatives of the crown must go hand in hand with the abolition of class privilege and the safeguarding of human rights. So the National Assembly proceeded at once to enact the foundation deeds of the Revolution: the Declaration of Rights, the abolition of feudalism and the introduction of the suspensive veto. All three measures were hurried through within less than three weeks. partly because it was important not to give the king time to repent of his concessions and partly because the country people were beginning to pick the fruit of revolution before it was ripe—attacking the châteaux of their seigneurs. seizing the land, shooting the game and refusing to pay tithes or taxes.

1. The Declaration of the Rights of Man *(de l'homme et du citoyen;* Aug. *27)* was based on the American declaration of 1776 and laid down the "natural and imprescriptible" right of every citizen to liberty, equality, property and security; adding that it was the duty of every citizen to defend these rights, not for himself only but also for others, by sharing in the government, in the armed protection of the community and in the payment of taxes required by it. This declaration was a document of prophetic importance, expressing the "unconquerable hope" of humanity.

2. Feudalism was "abolished" by a few hours' debate on Aug. 4. Though the consequent legislation of Aug. 11 fell short of what the country had expected and though it took four years to complete the work of one night, yet that legislation was sufficiently drastic. The remains of serfdom were abolished; all feudal rights were made extinguishable by purchase; seigneurial privileges and monopolies were done away with; inequality of taxation ended; civil and military promotion was opened to all classes; justice was to be administered gratis; tithes and other clerical dues were abolished. It was not reform; it was a social revolution; it created modern France.

3. The third foundation deed, the limitation of the royal veto, might have been delayed indefinitely had not the king refused his sanction to the Declaration and to the measures of Aug. 4. The assembly was deeply divided between those who shrank from reducing the royal prerogatives and those who wished to deprive the crown of any veto on the will of the people. The suspensive veto (Sept. 11) was a compromise which left the executive with the power to delay and irritate the legislature without controlling it; and its use contributed no little to the fall of the monarchy three years later.

The Removal to **Paris.**—Meanwhile, still delaying acceptance of the measures of Aug. 4, the king had once more given way to the pressure of the reactionary party at court and summoned foreign mercenaries (the Flanders regiment) to Versailles, where the presence of the queen at a regimental dinner gave rise to anti-revolutionary demonstrations. The people of Paris—a capital now armed, discontented and short of food—once more intervened. On Oct. 5 a procession led by market women *(dames des halles)* set out for Versailles, followed by detachments of the national guard under La Fayette; their aim was to petition the king for bread and to demand his acceptance of the measures passed by the assembly. Late that night, after playing with the idea of flight, Louis gave way. Early next morning an unruly minority of the crowd, who had spent the night outside the palace. broke into the royal apartments and nearly succeeded in murdering the queen. The majority was not appeased until the royal family agreed to accompany them back to Paris to take residence in the Tuileries—as hostages, if not prisoners, of the Revolution. The court was follo ed by the assembly, except for about 300 of its more royalist members who feared the revenge of the Paris citizens. The capital now held within its grasp both executive and legislature; the views and interests of its citizens, six times more numerous than those of any other city in France, would sway the debates of the national representatives in the royal riding school (*manège*) on the north side of the Tuileries gardens. The politically minded members of its middle class would debate with those of the deputies who belonged to the Jacobin club *(amis de la constitution),* which met in the Dominican convent close by. Its papers would praise the friends and attack the foes of the "patriotic" program. In its clubs and cafés every measure would be debated; and if need be its spokesmen in the more unruly *faubourgs* could organize a riot or present a petition at the bar of the assembly.

Paris stood at the head of the Revolution; but it did not stand alone. At Lyons, Bordeaux, Marseilles, the great manufacturing and shipping centres of the south, and in the larger provincial towns all over France, bastilles were falling, feudal municipalities were being ousted by nominees of the *bourgeoisie* and royalist garrisons were giving place to national guards. The centralized system of local government, with its intendants and *généralités,* its military *gouvernements,* its judicial *bailliages* and *sénéchaussées,* was being swept away.

FALL OF THE MONARCHY, 1790–92

If Louis XVI had been a man of character and his wife, like the two previous queens, a political nonentity, he might have taken advantage of the overthrow of the privileged orders, whose alliance had compromised his position more than it had strengthened it. to put himself at the head of the Revolution; but he had no gift of leadership, no mind of his own and no ministers fit to advise him. He had read with interest the notes which Mirabeau—the ablest orator and politician in the assembly, but with more ideas than principles and handicapped by a disreputable life—addressed to him in 1790–91; but he did not act upon them. They advised a *rapprochement* with the revolutionary leaders (which he disdained), the organization of royalist support in the country (but the leading royalists were going into voluntary exile) or, as a last resort. retirement from Paris and an appeal to the provinces against the capital (which could mean nothing less than civil war). Louis had a horror of bloodshed. His courage was all passive, his patriotism all benevolent. He preferred to wait for a royalist reaction or for a split between the revolutionary parties, or for a war that might rally the nation behind the crown. Meanwhile the assembly extended its powers from legislative to executive functions. Through its financial, diplomatic, military and other committees it supervised and overruled the ministers; yet it found itself handicapped by royalist generals, by the old-fashioned tradition and personnel of the foreign office, by the passive resistance of local authorities and by the refusal of the people to pay taxes. The state of the country under the regime of 1789–91 was not anarchy. but it was decentralization ad *absurdum*.

An attempt was made to create a feeling of national unity by the Fête de la Fédération (July 14, 1790) held in Paris on the anniversary of the fall of the Bastille; but it would need a national emergency to make this feeling effective. The mass of the people were too busy exploiting the benefits of the Revolution to shoulder their responsibilities. In the countryside, the discontent of 1789 had been assuaged by the lightening of feudal burdens, by the occupation or purchase of seigniorial land and by the virtual abolition of tithes and taxes. The farmers and *métayers* (copartner tenants) were becoming small landowners with a stake in the country and supporters of the revolutionary regime—so long as it protected their newly won properties and profits. The workers in the big towns. particularly in Paris, were less contented. The year 1788 had brought a bad harvest and a bitter winter; in 1789 half a century's rise in prices reached a peak, especially in the necessities of the poor; and wages failed to keep pace with the rise in prices and rents. The emigration of so many rich people threw great numbers of domestics and workmen out of employment; and the loi Le *Chapelier* (June 14, 1791), which prohibited all professional associations, collective petitioning, strikes or workers' meetings, deprived them of any hope of improving their condition. But the inhabitants of the Paris slums, which lay mostly in the eastqrn and southeastern quarters of the capital, needed to be organized and led before they would attack a Bastille or burn down the house of a bad employer or hang a banker suspected of keeping back supplies. The Revolution at this moment was singularly free from mob violence.

The Civil Constitution of the Clergy.—The worst problem that the assembly had to face during its first two years was neither the opposition of the king nor the discontent of the workers but the bankruptcy of the treasury. How was the new regime to overcome the financial crisis that had proved fatal to the old? When Necker's loans were not subscribed, when the taxes were not paid and when forced contributions or voluntary gifts brought in too little to be worth collecting, only one remedy remained—a remedy long foreseen and justified by the theory of the monarchy: the nation would take over as its own the property and endowments of the French church. This was an immense and wealthy corporation, with 150 dioceses, 35,000 benefices and property in land and buildings reckoned as at least one-fifth of all such wealth in the country. Many bishops were very rich, most clergy very poor; the bishops out of touch with the people, the clergy at one with them by birth and way of life. The priest and the Mass, Catholic baptism, marriage and burial, were taken for granted by the common people, though increasingly slighted by the educated classes. Protestantism was disliked as un-French, and the Catholic church in its Gallican form was regarded as a necessary safeguard of public morals. To the middle-class majority in the assembly there would seem to be nothing but gain in nationalizing the church and in using its wealth to pay the way of the revolutionary government. The clergy themselves had, on Aug. 4, renounced their tithes and dues, expecting that the state would find them salaries. On Nov. 2, 1789, it had been decreed that "all church property is at the disposal of the nation." Land and buildings were to be sold by auction; clerical salaries (less for the bishops and more for the clergy than under the old system) to be paid by the treasury; and the other liabilities of the church—education, hospitals and the like—to be taken over by the state. This would involve much more than finance. The Constitution *civile* du *clergé* enacted on July 12, 1790, set up a new church establishment and raised political and ecclesiastical issues of vital importance to the course of the Revolution. The dioceses were rearranged to coincide with the *départements;* bishops and clergy were chosen, like civil magistrates and local officials, by popular election and took an oath of acceptance of the constitution. Regulations were laid down to prevent absenteeism, pluralism and neglect of duty. Some of these changes, long due, were intended rather to strengthen than to weaken the church; but even clergy who welcorned reform resented the highhanded may in which the assembly acted. They doubted whether the oath of allegiance to the constitution was consistent with their Catholic faith and duties; they waited to see what the pope would say about it. When the time came for taking the oath (Jan. 16, 1791) Pius VI's attitude was still obscure and nearly half the clergy in the country remained "nonjurors." When he finally decided to condemn the constitution (March 10, 1791) the church was split between "constitutional" and "refractory" clergy, the former, until 1794, receiving state support, the latter deprived of their livings and liable to penalties under a succession of punitive measures. This breach with the papacy strengthened the hands of the royalists and *émigrés,* dogged the footsteps of the revolutionary armies and deprived the government of its traditional support of the pulpit and confessional; the schism was not healed until the concordat of 1802.

The **Assignats.**—The sale of the nationalized church property was encouraged by the issue of government certificates entitling their holders to purchase houses and land. These assignats were soon given recognition as a paper currency and issued in such quantities, in order to meet the growing needs of government expenditure, that gold and silver were driven out of circulation and money values progressively depreciated; by 1793 the purchasing power of 100 fr. was but a quarter of what it had been in 1791. But the assignats saved the Revolution. National bankruptcy was staved off and business enterprise encouraged until the time came when the republican armies could refill the treasury with the indemnities and loot of the countries that they conquered or "liberated."

The Flight to **Varennes.**—By the end of 1790, after 18 months of revolution, there were signs that a new crisis was at hand. The country was being inundated with laws and decrees which the local authorities could not or would not put into practice. The church was divided into two antagonistic parties. The peasantry still suffered under feudal burdens which they could not afford to redeem. The townspeople complained of high prices, unemployment and food shortage. The assembly was increasingly hostile to the king and his ministers, who disliked and obstructed its policy; while Louis, who had never accepted his defeats in 1789, felt strong conscientious objections to the Civil Constitution of the Clergy. Mirabeau, failing in all his attempts to become a minister or to co-operate with Necker (who finally retired in Oct. 1790) or with La Fayette (whose wealth, popularity and command of the national guard, coupled with conceit and stupidity, made him cling to the status quo), now counselled Louis to leave Paris for Rouen, the centre of royalist Normandy, and there to raise the white banner of the Bourbons, even though it might lead to civil war. But the queen trusted none of these advisers and drew the king into plans. devised by the marquis de Bouillé, by the comte de la Marck and by her Swedish friend Hans Axel Fersen, for a flight toward the Rhine frontier, to end, if need be, in the arms of the emperor's troops and the *émigrés,* who would then march on Paris, dismiss the assembly and restore Louis to his throne.

Before his premature death on April 2, 1791, Mirabeau accepted this plan, for want of a better. The refusal of the Parisians, suspicious of some such intention, to let the royal family spend the Easter of 1791 at St. Cloud (April 18) finally determined the king's vacillating purpose, and on the night of June 20–21 he and the queen and their two children, disguised and with forged passports, escaped from the Tuileries and drove off on the road for Chblons and the frontier town of Montmédy. Their flight was not discovered till they were well away, and they would have escaped had they not been recognized at Ste. Menehould, pursued and eventually stopped, after 24 hours' journey, at Varennes. They were brought back ignominiously to Paris and practically imprisoned in the Tuileries.

During Louis' absence Paris had learned to do without a king. Less than a month after his return a mass demonstration organized by the left-wing club of the Cordeliers demanded his abdication and the setting-up of a new form of government, which could hardly (though the word was not used) be anything but republican. The petitioners were dispersed, with some loss of life, by the national guard (July 17) under the command of La Fayette, by order of the mayor (Bailly) and with the approval of the queen; the Jacobin club, which had halfheartedly supported the petition, lost its best members to the new club of the Feuillants and the leaders of the Cordeliers were proscribed. But the "massacre of the Champ de Mars" was not forgiven or forgotten; it was, with the flight to Varennes, an essential cause of the fall of the throne.

The Constitution of 1791.—Enacted bit by bit during two years of committee meetings, reports and debates, the constitution now came fully into being. The document headed *Décret de l'assemblée nationale du trois Septembre, 1791: La Constitution Française* opened with a revised Declaration of Rights and with a statement of the benefits won by the abolition of feudalism, which by now included the prohibition of religious vows and industrial guilds *(corporations)*. Title i added to the rights of man freedom to emigrate, freedom of petition and compensation for property confiscated by the state; it promised a poor law, an education bill. national festivals and a code of civil law. Title ii subdivided the old provinces and *généralités* (associated with feudalism and royal absolutism) into *départements*, districts, cantons and communes and defined civic status, with generous admission of foreigners. Title iii laid down the constitutional powers and functions of the *pouvoir exécutif* (the king and his ministers), the legislature (to be called *assemblée le'gislative)* and the judicature. Title iv dealt with the army, navy and national guard. Title vii provided a system of safeguards against any revision of the constitution so elaborate as to make a coup d'état the only hope of change. Yet was this constitution so perfect? Single-chamber legislation by 745 deputies who could not be dismissed under two years; a king who could not dissolve parliament, could not declare peace or war without its consent, could not choose his ministers from among its members, could not veto, even suspensively, constitutional or financial legislation, had no control over the army or the national guard (an armed force of about 2,000,000 men) and was financially dependent on a civil-list salary; a system of local government by a hierarchy of elected committees without central control; and a franchise (based on property and wages) confined to 4,000,000 out of 6,000,000 adult Frenchmen, with further discrimination against the working class in the great cities: was there not in these provisions material enough for further dispute, if the crown were to try to regain its prerogatives or the legislature to extend its powers or the workers to assert their rights against the political monopoly of the middle classes? Time was to show the futility of any attempt to impose a rigid form upon a growing organism.

The Legislative Assembly.—The defects and paradoxes of the new constitution were indeed hardly less important as factors of the general discontent than was resentment at the flight to Varennes and at the "massacre of the Champ de Mars." Thus when it was at last unwillingly accepted by the king (Sept. 18) and the Constituent was replaced by the Legislative Assembly, it became apparent that the sentiments which had created the constitution no longer existed to enforce it. One of the last acts of the outgoing deputies had been to pass a "self-denying ordinance" excluding themselves from re-election; consequently the Legislative Assembly contained none of the men who had initiated and carried through the Revolution, but many of its irresponsible critics and unsatisfied beneficiaries—men who, moreover, had the ungrateful task of implementing a constitution in which no class in the country fully believed. The majority of these new deputies, generally called the Girondists because their leaders came from the Gironde department, retained pre-Varennes and anti-Parisian views. They wished to keep the monarchy, but under the control of the propertied classes, and to discipline the city workers in the interests of economic monopoly and social order.

The minority, generally called the Jacobins and led by the Paris deputies, inclined toward destroying the monarchy and setting up a republic. Within a few months this quarrel was embittered by the approach of war. The king and queen, fearing not merely for the throne but for their lives, were again asking for foreign intervention and playing with the idea that war might bring the people back to the crown. The Girondists, led by Jacques Pierre Brissot, an impracticable idealist, preached the mission of the Revolution to emancipate Europe and the moralizing influence of war. The people grew alarmed at the presence of foreign and *émigré* troops on the Rhine frontier and the rumours of "second column" activities in the capital. On Jan. 14, 1792, Brissot brought matters to a head by demanding that the emperor should declare himself still the ally of France under the treaty of 1756, and ten days later made refusal to give such assurances equivalent to a declaration of war. The death of Leopold II (March 1) only postponed the crisis; his successor Francis II took up the challenge. A fortnight later Louis took a step which, if it had been taken earlier and *ex animo*, might have saved the throne: he appointed a new ministry nominated by the Girondists, including Charles François Dumouriez (their ablest soldier but an ambitious careerist) and Jean Marie Roland, the enemy of Paris. But now such a partnership was impossible; the king and his ministers were agreed upon nothing but war, and that for different reasons, neither of them patriotic. When, on April 20, Louis formally declared war upon the emperor, he was signing his own death warrant and inaugurating a period of hostilities between France and Europe which was to last almost without a break for 23 years.

The social and political effects of war are impossible to predict or to control. Within four months of the outbreak of hostilities the French monarchy, which had expected a revival of popularity, was overthrown; within a year the Girondists, who had counted on victory to establish their government, lost all political power and their leaders were proscribed; within two years the Jacobins, who replaced them, fell in their turn. Meanwhile the country was disrupted by civil war and the capital disgraced by the Terror. Reaction would follow, but it could only take one form, that of a dictatorship, committing France to a militarism foreign to its genius and fixing its character in that dual personality which has been its weakness ever since.

If war had been forced upon the country two years earlier. when the king was still popular, the assembly united and the people enthusiastic for its newly won liberties, victory might have established by national consent in 1792 the constitutional monarchy which was imposed by foreign arms in 1814. But now the court was known to be in sympathy with the *émigrés* and their foreign protectors, and the Tuileries was regarded as an outpost of the enemy; the assembly was divided between a majority which preached war with an eye to political power and a minority which opposed it as promising only military defeat, political revolution and perhaps the dictatorship of a reactionary or ambitious general. This party, Jacobin by name, Parisian in outlook and inspired by Maximilien Robespierre, whose platform was the Jacobin club and the *Défenseur de la Constitution*, was justified by events. The troops on the Belgian frontier, disorganized by revolutionary ideas and distrustful of their still largely aristocratic officers, were thrown back in their first offensive and murdered one of their generals. When Brissot's party tried to shift the odium of defeat onto the king, he dismissed the Girondist ministers. They attempted a more direct way to power by disbanding the household troops, establishing a camp of provincial volunteers (*fédérés*) under the walls of Paris and organizing a mass demonstration within the Tuileries (June 20). Louis was persuaded to don the cap of liberty *(bonnet rouge)* and to drink to the health of the nation; but his passive courage and the dignity of the queen defeated this attempt to coerce the crown. It was left to the Parisian Jacobins, led by an insurrectional committee from the more republican sections of the city, in conjunction with the *fédérés* of Marseilles, to organize an armed attack on the Tuileries (Aug. 10). The national guardsmen of the royalist sections, detailed to defend the palace, went over to their republican comrades who were attacking it; the royal family was persuaded to avoid bloodshed by taking refuge in the assembly; the attackers massacred most of the Swiss, whom Louis had ordered to cease fire; and the mob sacked the royal apartments. Forty-eight hours later the monarchy was once more "suspended," as it had been after Varennes, and the royal family were immured in the *petite tour* of the old Temple as prisoners of the Paris commune.

The Paris Commune.—Aug. 10, 1792, was as much a Paris affair as July 14, 1789. It was followed by an interregnum of six weeks during which the rump of the assembly was still the nominal legislature and the executive a provisional ministry appointed by the Girondist majority. In fact the Paris commune imposed its will on both, an episode which was never forgiven by its real enemies, the Girondists, or forgotten by its nominal friends, the Jacobins. What was the commune? For the elections of 1789 Paris had been divided into 60 districts, and these wards had acquired many of the functions of local government, while electing representatives onto a central *municipalité* (city council) popularly called the commune. By the municipal law of 1790 the 60 districts had been redistributed into 48 sections, with the intention of destroying their independence, but the 1,800 or so "active citizens" (*i.e.,* voters) in each section soon asserted their right to organize, to arm and to express their political opinions, to support the claims of the commune against the assembly or, if need be, to replace their own elected representatives by an insurrectional committee nominated to carry through a special plan (*e.g.,* Aug. 10, 1792; June 2, 1793). Yet, whatever its dangers and crimes, the communal regime inaugurated immense changes, working out the logical implications of the Revolution and imprinting upon it the character that it has borne ever since. For it was during these six weeks that the defense of the country was entrusted to an army of volunteers, that its government was put into the hands of a National Convention, that feudalism and privilege were finally destroyed, that the Catholic church was persecuted and in part proscribed, that the movement for the execution of the king and queen was set going and that "national justice" was exacted and political unity enforced by the Reign of Terror.

The leader in most of these movements was Georges Jacques Danton, the representative of the commune in the provisional executive and its most active member—a demagogue of unusual powers and a man who did not scruple to do what Robespierre only talked of doing; yet corrupt, unprincipled and inconsequent. It was Danton whose appeal to arms sent thousands of citizen volunteers to the front—the nucleus of the new army which in 1792–93 stopped the Prussian invasion at Valmy and pushed back the frontiers to the Netherlands and the Rhine; and Danton who invested with dictatorial powers a standing committee of the assembly which developed into the famous committee of public safety. But it was Danton too who inspired the peace overtures that followed the victory of Valmy; who joined Robespierre in his opposition to the anti-Catholic campaign of the Paris commune (*e.g.,* Pierre Gaspard Chaumette) and of some of the provincial agents of the Convention (*e.g.,* Joseph Fouché); and who endangered his party popularity by trying to save the life of the king and lost his own life in opposing the terrorist policy of the committee that he had originated.

The departure of volunteers for the front toward the end of August was made the excuse for the summary execution of about 1,200 priests. royalists, aristocrats and even criminals and prostitutes, whose presence in the prisons was alleged to be a danger to the unguarded civil population. The massacres were initiated by the *comité* de *surveillance* of the commune and were inspired by Jean Paul Marat, formerly a scientist and medical man with a Scotch degree, a royal appointment and a fashionable practice in prerevolutionary Paris, but now a Jacobin of the left, self-named *l'ami* des hommes, whose championship of the poor made him a ruthless terrorist; but Danton approved, Robespierre tried to proscribe Roland and neither assembly nor commune made any effective protest. The affair left a slur upon the Parisian Jacobins that kept their enemies in power for six months, embittered provincial feeling against the capital and inspired that fear of the people which was the underlying motive of the Reign of Terror.

THE FIRST REPUBLIC UNDER THE CONVENTION

The National Convention of 1792, elected under the influence of the fall of the throne, the prison massacres and the invasion of the northeastern frontier (the Prussians at the beginning of September were within 140 mi. of Paris), numbered 750 deputies, comprising lawyers, businessmen, merchants, manufacturers, tradesmen, a fair proportion of professional and literary men, a handful of aristocrats (including Louis Philippe Joseph, duke of Orléans, called Egalite), a very few members of the working class and one Englishman, Thomas Paine. Though one out of every three of its deputies had sat in the Constituent or Legislative assemblies and would too easily remember July 17, 1791, and Aug. 10, 1792, yet all were at the moment united in the defense of the country and in the founding of a republic. But no sooner had the first aim been attained, as it seemed. on the very day the convention met, by the victory of Valmy (Sept. 20) and the second secured, next day, by the laconic decree La convention *nationale décrète à l'unanimité que* la *royauté* est abolie en France, than the underlying differences between Jacobin and Girondist became apparent and a struggle began which ended in the destruction of both parties. This might not have happened if there had been any appeal from the free vote of a chance majority of deputies to a royal veto or to revision by an upper house; or if one of the two parties had constituted a government with power to act and the other an opposition ready to take its place when it failed. Without such safeguards parties dissolved into cliques, criticism became personal and irresponsible and important issues were decided by snap votes taken under some public or party pressure. In fact, the predominance of the Girondists in the convention, as measured by their success in the fortnightly elections of its president and in their majorities on its committees, lasted just so long as Dumouriez's invasion of Belgium went well (Jemappes, Nov. 6, 1792), the assignat did not depreciate too rapidly (its serious fall began at the end of the year) and the republic did not become involved with new enemies. The Girondists might have surmounted even these difficulties if they had not been worsted in three domestic controversies: the fate of the king, the new constitution and the claims of the commune.

The country had been of one mind in its rejection of the monarchy but was still royalist enough at heart to shrink from the logical sequel, the king's trial on charges that in any common case would involve the death sentence. To Robespierre, to Louis Antoine de Saint-Just and to the Jacobins of the Mountain (as the left-wing party came to be called, from their raised seats at one end of the mankge) Louis Capet was just another traitor, who had from the first been hand in glove with the enemies of the Revolution, who, under Mirabeau's advice (revealed by the discovery of the "iron chest" at the Tuileries, Nov. 20, 1792), had planned civil war and by whose orders patriot citizens had been shot down on July 17, 1791, and Aug. 10, 1792. Girondist deputies retorted that under the constitution of 1791 Louis was still inviolable or (alternatively) that he could not be held responsible for acts committed since the abdication implied in his flight to Varennes. There was no formal trial but after interrogation before the assembly Louis was found guilty by an almost unanimous vote. A Girondist proposal for a plebiscite, which was expected to evoke the royalism of the countryside, was defeated by a large majority. The final vote as to the sentence—exile, imprisonment, or death—was taken by *appel* nominal; *i.e.,* each deputy voted separately and might state reasons for his decision. A number of deputies spoiled their votes by qualifications, but 361 out of 721 declared for death sans phrase—a majority of one. A final proposal for postponement (*sursis*) of the death sentence was defeated by 70 votes. On Jan. 21, 1793, Louis was taken to the Place de la Révolution (modern Place de la Concorde) and there executed, amid cries of *Vive* la nation!

A king deposed by national consent and named a traitor by a National Convention would inevitably be a centre of intrigue, whether in prison or in exile. Public safety demanded the death sentence. But his execution could not remain a domestic affair. The Jacobin leaders, who had engineered it, thought of it as consolidating their party, uniting the country and challenging the crowned heads of Europe. Every deputy was now branded either as a regicide or as an *appelant* (one who had voted for the plebiscite with the hope of saving the king's life). The latter would soon fall under the charge of royalism; the former would have every motive for remaining in power and arming the republic against a monarchist reaction under which their property, if not their lives, would be forfeit.

Fall of the Girondists.—The weakness and disunity shown by the Girondists during the king's trial was matched by their failure to carry through the primary work of the National Convention, the creation of a French republic. Eight months after their first meeting the deputies had dealt with only 6 out of the 368 articles of the marquis de Condorcet's draft constitution, and this was known to be designed on such party lines that a Jacobin "shadow" constitutional committee was already preparing a rival document. This committee's proposals became the nucleus of the constitution of 1793—a skeleton plan on extremely democratic lines which never came into force but played an important part, at first as Jacobin and afterward as anti-Jacobin propaganda. The acceptance by the convention of the Jacobin constitution (June 24, 1793) was the coup de grâce to an already fallen victim. The constant attacks on the Paris commune by Roland, the minister of the interior, inspired by his Parisian-born but provincially minded wife Manon Phlipon, the political hostess of the party, had exasperated public feeling in the capital. When Dumouriez, the hero of Valmy and conqueror of Belgium, was defeated at Neerwinden (March 18), when, forced to retreat from the Netherlands, he planned with the connivance of the Austrians to march on Paris and set up a dictatorship and when, unable to carry his army with him, he went over to the enemy, it was easy for the more revolutionary sections of the capital to form an insurrectional committee and to organize another attack on the Tuileries—the seat (since the transference there of the assembly from the *manège* on May 10) of a Girondist majority that seemed to them to be once more betraying the country. But this was a bloodless revolution. On May 31 national guardsmen seized key positions in the capital. On June 1 they surrounded the Tuileries with arms and guns. On June 2 the convention sat all day, invested by thousands of armed and unarmed citizens who would not let the deputies go home till they had accepted a Jacobin resolution decreeing the suspension and arrest of 29 leaders of the Girondist party and of two ministers, Étienne Clavière and Pierre Marie Henri Lebrun-Tondu. Several of the expelled deputies (*e.g.,* Jean Baptiste Louvet and Maximin Isnard) escaped and survived; many (*e.g.,* Brissot, Armand Gensonné and Pierre Victurnien Vergniaud) were guillotined in the proscription following Charlotte Corday's murder of Marat (July 13). Some who escaped from detention and tried to raise revolt in Normandy were outlawed and perished by execution or suicide (*e.g.,* Jérôme Pétion and Charles Jean Marie Barbaroux). Of 63 leaders of the party only 25 survived the Revolution. The Girondists were the liberals of their age, presenting ideas which time has justified as the essence of the Revolution but which then carried no effective policy and were set aside by the necessity of national survival.

The **Jacobin** Regime.—The Jacobin party, which the coup of June 1793 substituted for the Girondists as the ruling group in the convention, took some time to establish a dictatorship that was to leave a mark upon the country in much the same way as did the Bourbon monarchy before it and the Napoleonic empire after. The main features of this regime were a small powerful executive, a legislature deprived of initiative, a centralized administration and a ruthless use of powers of summary arrest and execution. The committee of public safety (*comité* de *salut* public) took final shape with the exclusion of Danton on July 10 and with the addition of Robespierre on July 27, of Lazare Nicolas Marguerite Carnot and Claude Antoine Prieur-Duvernois (Prieur de la Côte d'Or) on Aug. 14 and Jacques Nicolas Billaud-Varenne and Jean Marie Collot d'Herbois on Sept. 6. All its members were deputies, re-eligible and re-elected monthly without change. They divided up among themselves the supervision of the army (Carnot, Jean Baptiste Robert Lindet and Prieur-Duvernois), of the navy (André Jeanbon Saint-André), of local administration (Collot, Billaud) and of foreign affairs (Bertrand Barère); while Georges Auguste Couthon, Antoine de Saint-Just, Marie Jean Hérault de Séchelles and Pierre Louis Prieur (de la Marne) were often away on special missions and Robespierre was responsible for expounding the policy of the committee and maintaining its liaison with the National Convention. But the whole committee met daily for conference and the signing of papers and in theory all its members were jointly responsible for the acts of each. It had no chairman or secretary. and if it was called "Danton's" committee before July 10 or "Robespierre's" after July 27 it was because Danton and Robespierre were in turn the dominating members—Danton by his patriotic reputation during the crisis of 1792 and Robespierre by his long experience in revolutionary party politics, his established position at the Jacobin club, his consistent championship of "the people" and the high moral tone of his speeches, backed by a reputation for incorruptibility and a flair for party intrigue.

This formidable committee soon succeeded by hard work and efficient centralization in extending its control over the ministries and administrative bodies, the judges, generals and commissaires of the republic. whom it appointed, purged or dismissed at will. Its dictatorship was exercised by leave of a diminished National Convention, the most active members of which were employed on missions away from the capital and which became increasingly subservient to its demands; it ruled by consent of the country and the commune, so long as there was fear of foreign invasion and a fair share of the benefits of the Revolution. In local government the Jacobins returned to the centralization of the prerevolutionary regime. The departmental and district directoires, still centres of Girondist *fédéralisme* (the "reactionary" theory which regarded Paris as no more than one of the 84 federated *départements*), were purged or overruled; while by an elaborate system of reports from *députés* en mission, commissaires and agents *nationaux* the committee of public safety kept itself informed as to what went on in the armies, the courts and the administrative bodies of the republic (in practice, however, no complete control or uniformity was secured until Bonaparte reinstituted, under the name of *préfets*, the intendants of the prerevolutionary regime). The authority of the committee rested ultimately upon its ruthless use of force: its travelling agents with power to dismiss, arrest or send to trial in Paris unsuccessful generals, officials who obstructed or opposed the government, dishonest contractors, profiteers and the like; its local or occasional courts (such as those dealing with armed revolt in the provinces), which might have power to inflict the death penalty; and the revolutionary tribunal in Paris, whose public prosecutor, Antoine Quentin Fouquier-Tinville, compiled dossiers concerning persons under arrest and presented them for trial and whose judges and jurymen, appointed and paid by the government, had personal as well as patriotic reasons for a ruthless interpretation of the wide laws against *incivisme* and *conspiration.*

Why did a regime so powerful and so efficient fail? First, because it had to fight constantly against opposition in the provinces because of traditional anti-Parisian feeling (particularly in the trading and manufacturing centres of the south) and the intrigues of royalist agents, nonjuror clergy and revengeful Girondists—opposition which flared up into civil war in the west and armed rebellion in the south, at Lyons, Marseilles and Toulon. In the Vendée massacre was answered by massacre; the rebel cities of the south were reduced, their buildings destroyed and their citizens subjected to mass execution. The lesson was learned, but the teachers were the more detested. The second reason for failure was economic. The depreciation of the assignats (the real value of 100 livres was 25 in July 1793 and not more than 30 a year later) discouraged farmers from selling their produce in the towns; the needs of the army necessitated wholesale requisitioning; in Paris (whose population of more than 500,000 was constantly on the edge of food shortage) bread and meat had to be rationed; a scheme to ensure supplies by enforcing the sale of consumer goods at fixed prices (the *maximum*) proved unworkable; and the coastal blockade enforced by the British fleet brought ruin to the ports and overseas trade. Munitions factories, no doubt, provided a living for many whom the liquidation of large fortunes and the closing-down of luxury trades had left unemployed; but this brought little improvement in wages or working conditions. Soon the grievances of the working class in Paris and the demand for the introduction of the democratic constitution of 1793 took shape in a movement to which Jacques René Hébert, who had replaced Marat as the most popular journalist of the time, gave his name. Its attempt to overthrow the committee was quashed; but the execution of 18 Hébertists on March 24, 1794, while it left the movement without leaders, also provided a fresh argument against the guillotine, most of whose victims were no longer priests or aristocrats but ordinary citizens accused of hoarding, profiteering or the various offenses included under the Law of Suspects. A new movement emerged from the ruins of he'bertisme—a movement to which Danton pledged his reputation (forgetting how short memories are in time of revolution) and Camille Desmoulins (in Le Vieux *Cordelier*) his clever pen. This movement again asked for the constitution of 1793, for a political amnesty for the Girondists and for a modification of what had by now become a Reign of Terror: the number of executions had risen every month (21 in September, 59 in October, 61 in November, 68 in December 1793, 61 in January, 77 in February and 121 in March 1794); and the Paris prisons contained about 8,000 prospective victims. But the committee saw in dantonisme an attack upon themselves and their monopoly of power; and within a fortnight Danton, Desmoulins and 13 of their associates followed Hébert and his 17 to the scaffold.

Thermidor and the Reaction. — During the next three months the dictatorship of the committee was intensified, but from fear, not from confidence; and differences between its members, hitherto concealed by their common front against *hébertisme* and *dantonisme,* became irreconcilable. Carnot quarrelled with Saint-Just over the conduct of the campaign in the Netherlands. The mainly anti-Robespierrist *comité* de *sûreté générale* was offended by the proceedings of the bureau de police *générale,* through which Robespierre and Saint-Just overrode its police functions. Robespierre's plan to nationalize religion in the form of a culte de *l'Être Suprème* (inaugurated on May 7) was disliked both by Catholics and anticlericals and contributed matter for attacks upon his too obvious pose as a prophet and martyr of republican idealism. The revolutionary tribunal struck out ferociously against supposed prison conspiracies and plots to assassinate the Jacobin leaders (the number of executions rose again from 258 in April 1794 to 345 in May and 688 in June). The enforcement of the maximum caused a degree of popular discontent that could not be assuaged by Saint-Just's unworkable plan (laws of Ventôse) to distribute the confiscated property of suspects to poor citizens or Barère's scheme for state pensions and sickness benefits (livre de la *bienfaisance nationale*). Robespierre's law of 22 Prairial, designed to speed up the work of the tribunal and (so they alleged) to remove the deputies' exemption from summary arrest, provided those who feared proscription (*e.g.,* Fouché) with arguments to win over the moderates in the National Convention and organize a movement against the committee. On July 26 (8 Thermidor), after six weeks' unexplained retirement from public life, Robespierre hit back in a speech full of appeals to those who would no longer hear them and of threats that he could no longer enforce. Next day the deputies shouted him down and decreed his arrest. The commune declared for him; the convention replied by a decree of outlawry. He was arrested at the town hall, with his brother Augustin. Franqois Hanriot, Couthon and Saint-Just. The same guillotine that on 9 Thermidor executed 45 anti-Robespierrists executed, in the following three days, 104 Robespierrists and brought the number of victims for the month up to the shocking total of 935. As Robespierre, for five years the champion of the people, was carried through the streets to his death on 10 Thermidor, he was greeted with derisive cries of *A* bas *le maximum!* The Jacobins were rejected by the class whose interests they had claimed to champion but whom in fact they had neither trusted nor consulted. Some of their leaders had used their power to save the country; some had thought to reform it; all had' punished and killed because they were afraid. The narrower the basis of their tyranny grew, the more easily it was destroyed.

The period following the fall of Robespierre is often regarded as a dreary and unimportant interlude between the revolutionary and Napoleonic eras, a period of political, military and economic decadence from which the country was rescued by the genius and energy of its greatest hero. It suited Bonapartist propaganda to publish this picture of the Thermidorian reaction and the Directory, but it is misleading. The period was one of exhaustion, during which France gradually absorbed the shocks and countershocks of Girondism and Jacobinism, royalism and republicanism, democracy and bureaucracy, liberty and compulsion, till it was too weak to oppose the regime of the consulate. The coup d'état of 18 Brumaire claimed at once to abolish and to consummate the Revolution. But the regime that ended in 1799 was not unfruitful, Napoleon owed more than he cared to admit to the men of Thermidor and the Directory. The coup of July 1794 was primarily a reassertion of the rights of the National Convention against the committee of public safety and of the nation against the Paris commune. It was followed by the disarming of the committee and the tribunal, the emptying of the prisons, the purging of the clubs and *sociétés populaires* that had been cells of Jacobinism and the recall of the extruded Girondist deputies. In Paris the *jeunesse dorée* staged anti-Jacobin demonstrations; in the provinces massacres of Jacobins under the white terror were hardly less bloodthirsty than the massacres of their opponents under the red. The abolition of the unpopular *maximum* (Dec. 1794) was followed, however, by just such a food shortage as it had been designed to prevent. The rump of the Jacobin party seized the opportunity to demand once more the constitution of 1793 (Germinal, March–April 1795). Their opponents retaliated by proscribing those members of the committee who had escaped at Thermidor (Barère, Billaud) and by executing Fouquier-Tinville and the judge of the revolutionary tribunal, M. J. A. Herman. The food and finance crisis, however, soon led to another outbreak (Prairial, May 1795), which was suppressed by the execution or suicide of the last few Jacobin leaders and followed by a renewal of the white terror in the Midi. This in its turn roused the royalists to a countereffort. They took advantage of discontent and disorganization in the republican army to land an *émigré* force in Quiberon bay, transported by British ships and joined by Chouan rebels. But they were met and annihilated by Lazare Hoche (July 20–21); and more than 700 of the invaders were summarily executed.

Constitution of the Year 111.—In the flush of this success the National Convention decided to introduce the constitution of the year III, a republican revision of the monarchical constitution of 1791 with a wider franchise, a second chamber (no longer dangerous now that the privileged orders had been destroyed) and an executive designed to prevent either dictatorship or democracy. The mistake (as it now seemed) that the deputies of 1791 had made in refusing re-election was to be avoided by a decree that required the re-election of two-thirds of the new legislature from the personnel of the old. This measure roused one more public revolt, that of 13 Vendémiaire, which was only suppressed by force and by the skilful use of artillery by a young Corsican officer, Napoleon Bonaparte. So (Oct. 26, 1795) ended the National Convention, which had founded the French republic and saved the country from civil war and foreign invasion at the cost, however, of antagonizing the civilized world.

THE DIRECTORY

The government of the Directory, as it is generally called from the executive of five directeurs set up by the constitution of the year III, lasted for just four years (Nov. 1795–Nov. 1799). This it was able to do because the two chambers—the anciens and the cinq-cents—included representatives of all parties in the country, from royalists to regicides; because the legislature had no control over the executive, and the executive none over the legislature; and because the treasury and the judiciary were independent of both. Thus the five directors (originally Louis Marie de La Révellière-Lépeaux, Jean Franqois Reubell, Paul Franqois Jean Nicolas Barras, Charles Louis Franqois Honoré Letourneur and Carnot), though inheriting many of the centralized powers of the committee of public safety (control of foreign policy, of the army, of the police and of local administration), yet had no funds to finance or courts to enforce their will. If they were to remain in power—the one ambition that they all shared—they must play off one rival interest against another, by a policy of political seesaw (bascule), or, in the last resort, appeal to arms. The pattern set by the recurrent crises of the past year would be preserved; a royalist revival would be met by concessions to Jacobinism; a Jacobin revival would bring better terms for the royalists. The Quiberon affair and Hoche's suppression of rebellion in the Vendée, coupled with the continued depreciation of the currency and a recurrence of food shortage, encouraged François Noel Babeuf, an eccentric Jacobin who had long entertained utopian designs for an equal distribution of land and income, to head a *conspiration* des kgaux, supported by leftist Jacobins such as Michel Philippe Buonarroti, who were by now beginning to revere Robespierre and Saint-Just as prophets and martyrs of socialism. Babeuf was executed (May 28, 1797); but in the anti-Jacobin reaction that followed the royalists won the elections of the year V, carried the constitutionalist Franqois marquis de Barthélemy onto the Directory in the place of Letourneur and brought forward measures in favour of the *émigrés* and counterrevolutionary clergy. The policy of *bascule* could not cope with this situation, and recourse was had to the argument which was to decide all political issues for the next 18 years—the army.

The Army and the Italian Campaign.—The emergence of the army as the decisive political factor was the most important event of the years 1794–99. How had it come about? The volunteers who, with a stiffening of veterans and the help of the royal artillery, had won the day at Valmy and Jemappes had virtually disappeared during the winter of 1792–93. The new army created by the Jacobin government in 1793–94 was formed by the compulsory enlistment (*réquisition permanente*) of all Frenchmen between 18 and 25; these recruits were amalgamated with the remains of the old army—one old soldier to every two new; and this meant the republic was able to put into the field no less than 13 armies, totalling about 750,000 men. On the whole they represented pre-Terrorist Jacobinism at its patriotic best, and their disciplined isolation lent itself to uniformity of opinion and a professional esprit de corps which the party politicians of Paris regarded with apprehension. Many officers of the new army had been elected from the ranks; many of its generals were appointed less for military experience than for patriotism and loyalty to the government—they had been politicians before they were soldiers. Supervised and spied upon by civilian *commissaires aux armées,* they chafed under governmental control; and a sufficiently successful general, such as Bonaparte in Italy, might shake it off and make the directors as afraid of him as he was of them.

Every victory of an army in the civil war (Lyons. Marseilles, Toulon) had increased the soldiers' dislike of the civilians who stabbed the country in the back; every victory on the frontiers increased their confidence in themselves and in their generals and their readiness to impose their will on a government which too often starved them of food and arms. As this danger of military intervention increased, so was the government itself tempted to call on the support of a successful general.

Napoleon Bonaparte's appointment to the army of Italy and the Alps (March 2, 1796) had been followed by a spectacular series of victories: Millesimo (April 13) and Dego, leading to an armistice with Sardinia (April 28); Lodi (May 10), followed by the occupation of Milan (May 15); an advance to Brescia (May 27) and Verona (June 3), securing all Austrian Lombardy; a fortnight's march into central Italy—Bologna, Livorno, Florence (June 30); Wurmser defeated at Castiglione (Aug. 5) and invested in Mantua (Sept. 1j); Rivoli (Jan. 14, 1797) and the capture of Mantua (Feb. 2); a second expedition into central Italy—Bologna (Feb. 1), Ancona (Feb. 9) and Tolentino, where a treaty was signed with the papacy (Feb. 19); and finally an advance on Vienna by Gorizia (March 22), Villach, Klagenfurt, Judenburg, Graz and Leoben (April 13), where Bonaparte signed preliminaries of peace with Austria (April 18). (See FRENCH REVOLUTIONARY WARS.)

Since then he had established his headquarters at Mombello, outside Milan, in a style almost royal, confident in the devotion of his troops and in the vast quantities of captured flags, money and works of art which, after providing for the upkeep of two armies, he had been able to send to Paris.

18 **Fructidor.**—When Hoche was dead, it was natural that Barras, La Révellière-Lépeaux and Reubell, when they were faced by the crisis of Sept. 1797, should remember the loyal addresses that Bonaparte had sent from the army at Milan and that his envoy Gen. Pierre Augereau should be put in command of the Paris garrison which enabled them to carry through the coup d'état of 18 Fructidor (Sept. 4), whereby Carnot and Barthélemy were expelled from the Directory and Philippe Antoine Merlin (de Douai) and Franqois de Neufchbteau appointed in their place.

Two years were yet to run before the second Directory, as it might be called, outlived its success of Fructidor and gave way to the consular government of Nov. 1799. It was a period of undisguised dictatorship, penalizing priests, royalists and *émigrés* (of whom hundreds were shot or deported to Guiana and thousands held in prison), suppressing opposition papers, purging and overriding local authorities, reducing the legislature to impotence and re-establishing the police regime of the Terror, though without its Law of Suspects, its tribunal or its guillotine. But it was a dictatorship that could remain effective only so long as the people were diverted from politics to war and found in victory abroad a compensation for hardship and repression at home. The last two years of the Directory laid down clearly enough the pattern of the Napoleonic dictatorship. France was indeed living on its frontiers. At sea the British blockade prohibited any but short-distance coastal traffic (cabotage), and privateering was soon countered by the introduction of the convoy system. But plans for the invasion of Ireland or England were constantly revived: an attack on the Channel Islands (1793), Hoche's fruitless attempt to land in Bantry bay (1796), the American Colonel Tate's few hours' Welsh invasion at Fishguard (1797) and J. J. A. Humbert's Irish expedition (1798) pointed the way to the invasion of England, which Bonaparte declared impossible in the spring of 1798 but seriously undertook in 1801–05. The French colonies in the West Indies had either fallen to the British navy or were prevented by the blockade from importing the sugar, coffee and other goods that Europe could not obtain elsewhere. On the continent the republican armies held firm in Holland, along the Rhine and on the crest of the Alps, till Bonaparte's seizure of Malta and Egypt in 1798 and his invasion of Syria roused Russian as well as Turkish hostility. With the appearance of a Russian fleet in the Adriatic and a Russian army in Lombardy in the spring of 1799 all the successes of the last three years were in jeopardy. The crisis was met by the introduction of conscription (loi Jourdan, Sept. 1798) and by a fresh stiffening of the Directory with Jacobins and generals on June 18, 1799 (30 Prairial), when La Rèvellière-Lépeaux, Merlin and J. B. Treilhard (who had taken Neufchbteau's place) were superseded by J. F. A. Moulin, L. J. Gohier and Pierre Roger Ducos, Reubell having already been replaced by Sieybs in May 1798. Defeat was at last turning to victory in Switzerland (Ziirich, Sept. 25, 1799) and Holland (Alkmaar, Sept. 18) when the return of Bonaparte from Egypt (Oct. 9) brought upon the scene the one man who was capable of finishing the war, reorganizing the government and exploiting the gains of ten years of revolution.

THE CONSULATE

When Napoleon Bonaparte got the title of first consul at the age of 30 he was more than five years older than William Pitt had been when he became prime minister; but he knew much more about life. He had come to Paris from Corsica with as remote claims to nobility as Boswell brought to London from the Highlands. But (though technically a Frenchman) he was not merely a foreigner; he was a poor man, with many poor relations; and his political background was suspect. There were several bad marks on his military pay sheet. Yet at Toulon, on the Riviera, on the secretariat of the committee of public safety, with the army of the Alps, in Italy and in Egypt he had proved himself the ablest young soldier and administrator of the day; and this was in a society that had discarded gentility and under a government whose existence depended upon the army.

18 **Brumaire.**—The situation that Bonaparte found in Paris in Oct. 1799 was very different from what he had left 18 months before. The new landowners wanted security of property against the threat of a royalist restoration; the clergy wanted recognition and reunion with the papacy and their parishioners wanted the priest, the Mass and the church bell; merchants, manufacturers and shopkeepers wanted peace and social order; and the politicians wanted a new constitution, which would somehow secure stability without

despotism and a republic without Jacobinism. Bonaparte set himself to sound public opinion and was soon convinced of what shrewd observers had foreseen at any time in the past ten years—that the Revolution could only be consummated in a military dictatorship. The coup d'état of 18 Brumaire (Nov. 9. 1799) got rid of the Directory and the constitution of the year III; and the law of 19 Brumaire made Sieyès, Ducos and Bonaparte consuls. The constitution of the year III (4 Nivôse; *i.e.,* Christmas day 1799) had been devised by Sieyks to provide a balance of powers, with no unchecked control; but by a stroke of the pen, which substituted an active first consul for a figurehead "grand elector" and gave him the last word on all policies and appointments, Bonaparte — abetted by the former episcopal Talleyrand and the anti-Catholic Fouché (the two ablest survivors of the Terror) and encouraged by the constitutional friends of Mme. de Stael (Necker's daughter, perhaps the cleverest and most talkative woman of the age) — transformed it into an instrument of autocracy.

Government and Administration. — The legislature was now divided into a tribunat which talked, a corps *législatif* which voted and a se'nat conservateur which "guarded the constitution." The executive was in effect the first consul, whose decisions were taken after consultation with his honorary associates the second and third consuls (Cambacérès and C. F. Lebrun from 22 Frimaire) and with a conseil d'e'tat consisting of ministers and others summoned at his will. There was no cabinet, Bonaparte finding it more effective to consult ministers individually. Sometimes he delegated semiministerial functions to members of the conseil. Legislation was initiated in the conseil and submitted to the tribunat and corps *legislatif;* but it was not long before Bonaparte found this process too slow and employed the se'nat to give his decisions force of law as *sénatus-consultes* or went over the head of the legislature by means of direct orders to his ministers. Legislation by decree, the Jacobin way of dealing with urgent issues, now became normal; political measures were dictated like army orders and diplomatic business dealt with in the same way as manoeuvres in the field.

This autocracy was erected upon a basis of universal suffrage. Six million Frenchmen elected 60,000 of themselves onto a liste communale, from which justices of the peace and local officials were chosen; the 60,000 were reduced to 6,000 (liste *départementale*) and 600 (liste nationale) by further elections within their own number, and from these lists of names the departmental and national representatives were chosen — the members of the legislature by the se'nat and the mayors of all large towns by the first consul or by his personally appointed and dismissed *préfets* and *sous-préfets,* who ruled the *départements* as the intendants had ruled the *généralités* of the prerevolutionary regime. Bonaparte counted on this pretense of representative government to keep the country content, and his coinage, as late as 1809, bore on the obverse his head, with "Napoléon Empereur," and on the reverse the inscription "République Française." It would add little to describe in detail the transition from the first consulship of 1799 to the life consulship of 1802 (16 Thermidor year X) and the empire of 1804 (see NAPOLEON I). Both steps were excused by attacks upon the head of the government and designed to substitute the guarantee of a de *jure* dynastic succession for the de facto insecurity of a self-appointed ruler. Neither did much more than regularize methods of government already established in practice.

But in fact the real security of the Napoleonic regime rested on its appeal to all parties, its legislative achievements, its solution of the church question and its military successes. From the first Bonaparte made a point of employing in his service men of energy and ability whatever their political past — a few irreconcilable Jacobins and royalists excepted. Of the first 29 members of the conseil d'e'tat, 10 were lawyers, 13 administrative officials, 4 generals or admirals. Having chosen the best men, he trusted them, and continuity of policy was secured by long tenure of office: 7 of the original members were still in office at the end of 15 years; 35 more served for 10–15 years. As the members of the committee of public safety had done, they specialized in finance, mar, the navy, justice, foreign policy or police; but all the sectional committees met in the first consul's apartments at the Tuileries. Bonaparte presided, took the sense of the meeting and made his own decisions.

Public opinion, which had feared Robespierre's committee and despised the Directory, soon came to respect the work of Bonaparte's *conseil.* No Frenchman much cared whether his franchise was effective so long as he was well governed, and the cleverly timed and worded plebiscites which confirmed the Napoleonic regime were genuine evidence of the loyal approbation of the people. Even Jacobins forgave the censoring of the press and the reintroduction of indirect taxation; even royalists regarded the empire as easing the way for a Bourbon restoration.

Bonaparte's administrative reforms were secured through the centralized system by which the pre'fet of each *département* was responsible for the supervision of *maires* and communes, for the maintenance of roads and bridges, for the distribution of food, for the suppression of brigandage and for the upkeep of schools, prisons and hospitals. Able men were appointed to these posts and supported by the personal interest and energy that Bonaparte himself gave to the work: letters answered, complaints considered and every detail mastered by a mind that could deal with small things as readily as great. It is good evidence of the success of this system that the de'partements, *préfets* and *maires* of France remained in the fourth republic essentially what they were under the consulate 150 years earlier. The administrative system was reinforced by a hierarchy of courts rising from *juges* de paix through tribunals of arrondissement and *département* to the *cour* de cassation; and most of the judges were appointed by the first consul. The judicial system had worked well under the republic: it worked even better under the empire.

The Code. — But neither courts nor officials could function effectively until the state of the law was known. There had been no codification of French law since the time of Colbert and the code of Louis XIV; and the Revolution had inconsiderately enacted thousands of additional laws and decrees with little reference to the principles or practice of the past. Bonaparte set a committee of lawyers to work to draw up a code of civil, criminal and rural law which should reduce this new legislation to order in the light of Roman principles and French tradition. The civil code, finally enacted in 1804 and known as the Code Napoléon (*q.v.*) from 1807, was logical and laconic, providing in about 120,000 words not merely a legal guide for French citizens but also a framework into which the laws of many other countries, European, American and even Asiatic, were later fitted. Only in some of its provisions, notably as to marriage, divorce and parental authority, it registered a reaction (which Bonaparte approved) against the liberal views of the Revolution.

The Concordat. — The other fundamental act of the consulate, upon which Bonaparte counted to reinforce the code, to add the sanctions of religion to those of reason and to enlist the authority of the church under the banners of the state, was the concordat signed in 1801. For ten years, from 1791, the French Church had been split into two parts: a "constitutional" church served by bishops and priests who took the oath prescribed by the Civil Constitution of the Clergy, and a "refractory" church whose bishops were mostly in exile and whose clergy, though some still worked in secret, had refused to conform. Since 1795 no state support had been given to either body. The papacy had anathematized the French Church settlement and refused to consecrate any bishops under it; its clergy were cut off from any communication with Rome. Bonaparte, an 18th-century sceptic and realist, was determined to enlist the clergy on the side of his regime. On his way back from Marengo in 1800 he made proposals to Pius VII for a reconciliation of the papacy and the French Church. After difficult negotiations, these took shape in the concordat of 1801 and in the *loi* des cultes of 1802, by which Bonaparte attached, without the pope's consent, the so-called "organic articles," strengthening the hold of the state over the church. From this time *départements* and dioceses coincided, and the exhortations of the bishops and clergy supported the orders of the prefect and his officials in the raising of recruits, the payment of taxes and the upholding of public order. There was even

a catechism in which Catholic children were taught that "to honour and serve the Emperor was to honour and serve God himself" and that those who did not do so "rendered themselves worthy of eternal damnation." The concordat not only gave Bonaparte the support of the clergy and their congregations: it also deprived the royalists of their chief argument and ally against his regime.

Education, Censorship and Police.—Behind code and concordat lay an educational system that picked out clever boys from the bourgeoisie to be trained in *lycées* (secondary schools) as officers or civil servants (the more liberal education of the *écoles centrales* was suppressed), though primary education was neglected and girls were trained only as housewives; a censorship that suspended all but a few government papers primed with official news and prescribed what operas and plays should be performed; and a police system that, under Fouché's expert control, relied more on careful espionage than imprisonment or execution, though in an emergency—the Opera plot (1802) or the conspiracy of Jean Charles Pichegru and the affair of the duc d'Enghien (1804)—punishment was quick and severe. Bonaparte spared no trouble to patronize art and literature, to conciliate merchants and manufacturers. and to entertain the canaille (which he always feared) by providing food and work for the poor, by beautifying Paris with new streets and triumphal arches, by exhibiting pictures in the Louvre and captured banners at the Invalides, by holding reviews and by *fêtes* and fireworks. Life was no longer dangerous for the man in the street.

THE FIRST EMPIRE

The culmination of Bonaparte's career was the joint celebration of the pacification of Europe (the peace of Amiens), of the appeasement of the church (the concordat) and the life consulship, by the ceremony at Notre Dame on Easter day 1802. The more magnificent coronations of Napoleon two years later, as emperor of the French in Paris (Dec. 2, 1804) and as king of Italy at Milan (May 26, 1805) already pointed to the causes of his fall: a state of war with England and therefore with the continent; an uneasy alliance with the papacy that would soon engender a fatal feud; the first move toward the divorce of Josephine; and the creation of an imperial court, whose formalities and flattery gradually degraded the character of the empire and of the emperor. This new orientation of French history is marked by the fact that, whereas for five years after Marengo (June 1800–May 1805) Napoleon seldom left Paris and never travelled outside French territory, one day out of every three during the next nine years was spent abroad, in the endless and fruitless pursuit of that complete control of the continental ports and capitals which would enable him to exclude English ships and subsidies from all Europe and to force London to accept terms of peace dictated from Paris. For such is the most rational explanation of a policy so tinged with personal and dynastic ambition and so cleverly publicized as a crusade for the liberation and enlightenment of Europe that historians have been unable to agree in their verdict upon it.

Napoleon's Campaigns.—The Marengo campaign in 1800 lasted less than two months (May 6–July 2); a bold crossing of the Alps, a failure to relieve André Masséna's force besieged in Genoa and Michael Melas' Austrian army defeated, when it had caught Bonaparte unprepared, by the opportune arrival of Louis Desaix de Veygoux. The treaty of Luneville with Austria was clinched by Jean Victor Moreau's victory at Hohenlinden (Feb. 9, 1801); and the treaty of Amiens with England, the result of exhaustion on both sides, followed (March 27, 1802). The renewal of war with England (May 18, 1803) intensified Bonaparte's preparations for the invasion of that country; and two years were spent in training an expeditionary force. building landing craft and planning naval movements to obtain command of the channel. When these finally failed in Aug. 1805, two months before the battle of Trafalgar (Oct. 21) made the whole enterprise impracticable, and when Austria was known to be arming, the Grande Armée was suddenly diverted to the Rhine. The incautious Karl Mack was surrounded and forced to surrender at Ulm (Oct. 15); Vienna was occupied (Nov. 14); and on Dec. 2 the combined Austrian and Russian armies were defeated at Austerlitz. Ten months later Prussia, which had missed its chance of intervening before Austerlitz, foolishly declared war; within a week its armies were destroyed at Jena and Auerstadt (Oct. 14, 1806). Russia remained, and checked Napoleon's winter advance into Poland at Eylau (Feb. 8, 1807); but next spring Napoleon marched again, won a lucky victory at Friedland (June 14) and concluded with Tsar Alexander I the treaty of Tilsit (July 7). At this moment Napoleon had achieved all that he might reasonably expect: Italy reconquered, Austria weakened (but antagonized, and its power of recovery underestimated), Prussia treated as a French dependency and Russia induced, by specious offers in the near east, to close the Baltic to British shipping—thus completing that retaliatory blockade of the sea from the land which already extended from the Adriatic to the North sea and was designed to exclude Great Britain's exports and ruin its economy. The one gap in the circle was the Iberian peninsula. Yet neither Spain nor Portugal offered so profitable a market for British goods as their possessions overseas, which were beyond Napoleon's reach and were thrown open to England by his attack. Napoleon could not bear to see Lisbon, Cádiz and Gibraltar in the hands of the British navy; and he needed subsidies from Spain, his nominal ally. So he embarked in 1808 on a campaign in the peninsula which dragged on for six years, absorbed about 300,000 of his best troops and discredited his fame by the capitulation of Bailén and the convention of Cintra (1808) and the forced abdication of the Spanish royal family. His own short visit to the country at the end of 1808 was ended by the news that Austria, helped by British subsidies (the fifth coalition), was again arming. There followed the war of 1809, which began with a minor but brilliant victory at Eckmiihl (April 22), a second occupation of Vienna (May 13) and a defeat at Aspern-Essling (May 21) and ended in a hard-won but decisive victory at Wagram (July 6). The treaty of Vienna the same year once more punished Austria without disabling it. Napoleon thought he had secured the emperor Francis' support when in March 1810, having divorced Josephine, he married his daughter the archduchess Marie Louise, in the hope that she would give him a son and heir to continue his dynasty. A year later (March 20, 1811) the king of Rome was born. Once more Napoleon seemed to be at a summit of power.

The Fall of Napoleon.—But the agreement of Tilsit, though reaffirmed at the conference of Erfurt a year later (Oct. 12, 1808), was breaking down under the pressure of the continental system, which deprived Russia of British goods without giving it any compensation in French markets; and while the tsar resented the continued presence of French troops in Prussia and feared Napoleon's designs on Poland, Napoleon remained apprehensive that Russia might support a fresh rearming of Austria. Moreover Napoleon's imperial claims, not those of an individual any longer but those of a dynasty, more than ever offended the Habsburgs and the Hohenzollerns, not to mention the deposed kings of Spain and Naples and the tributary princes of Germany; while his appeals to the precedent of Charlemagne embittered his relations with the papacy. The war with Russia upon which Napoleon now embarked (1812) epitomized faults that had been growing upon him for ten years: belief in war as a more effective argument than diplomacy; the desire to destroy a rival power disguised as a crusade to liberate Poland and rid Europe of the threat of a "barbarian invasion"; a megalomaniac's dream of an army of invincible size marching into the "mysterious" east; a blind trust in his "star" that disregarded the plain facts of the situation; an insensibility which could sacrifice 250,000 men so long as he himself returned safely; and at the back of it all, fear—fear that the Russian army might escape him, fear that Alexander might not treat for peace, fear that his own life was in danger and fear that revolution might break out in Paris before he could return home.

With the retreat from Moscow the Napoleonic edifice came toppling down. The defection of Prussia—a new Prussia, inspired by the patriotism of Queen Louise and the reforms of Heinrich Friedrich Karl, baron von Stein and Gerhard von Scharnhorst—enabled the Russians to seize in turn the lines of the Nieman, Vistula and Elbe. The tributary states of western Germany only waited for a safe moment to declare against their "liberator." Austria, for whom Metternich (priding himself on being the one man able to outwit Napoleon) had through five years of planning prepared just this opportunity for revenge, at last threw its armies into the fight. Even Bernadotte, now prince royal of Sweden, turned against his old commander. At Leipzig (Oct. 18, 1813) Napoleon's hastily recruited second army was surrounded and destroyed, and the remnants were driven across the Rhine. A year later his third army, striking right and left against the allied invaders, was put out of action by the surrender of Paris (March 31, 1814), and Napoleon signed his first abdication (April 11). His defeat was the result not merely of military failure, though that was what hurt him most; but of the damaging effect of his economic policy, which had sacrificed French commerce to the attempt to destroy British trade, and the industries of his allies to the promotion of those of France; to the burden of requisitioning, recruiting and taxation imposed upon every country that he had conquered or "liberated" (it made little difference which); to the five years' imprisonment and bullying of Pius VII, which sacrificed the benefits won by the concordat; and to the war weariness and disillusionment of the mass of the French people, who showed no enthusiasm either for national defense in 1814 or for a Napoleonic restoration in 1815. With the return of the Bourbons in the person of Louis XVIII, a brother of the former king, the Revolution came back to its starting point and France secured the constitutional monarchy based upon the bourgeois predominance that it had desired in 1789. The charter of June 4, 1814, known as la *Charte octroye'e* (as having been granted by the king to his subjects and not accepted from them), established a bicameral parliamentary system after the English model. The king was to appoint ministers, to convene and, when occasion arose, to adjourn or to dissolve the chamber of deputies and to sanction legislation passed by it and by the chamber of peers.

The Hundred Days.—Here the history of the Revolution should end. All that happened in 1815 was an anticlimax. The Napoleon who returned from Elba had lost the magic of victory. The veterans of the Grande Armée came to his call; but many of his generals refused to take up arms against what they had recognized as the legitimate government of their country. The clergy were content under a Bourbon king. The merchants hated the idea of another war. The constitutionalists did not believe Napoleon's protestations of liberalism (the *Acte Additionelle*) and suspected that a victory in the field would be followed by a restoration of the empire. As soon as the allies at Vienna (where the congress was still sitting and quarreling) heard of his return and of the flight of Louis XVIII, they acted with unexpected promptness and unanimity, declaring that Napoleon "had placed himself outside the pale" of society and recalling their armies for a fresh invasion of France. Napoleon struck first at Brussels, in front of which a Prussian army under Gebhard Leberecht von Blucher and a mixed British, German and Dutch-Belgian army under the duke of Wellington were caught almost unprepared. The Prussians retreated from Ligny and the British from Quatre Bras. Napoleon pressed on, but not quickly enough, being confident of isolating and destroying Wellington; and at Waterloo (June 18) he met with such stubborn resistance that Bliicher was able to come up in time to turn a defeat into a rout. Napoleon's second abdication followed four days later and on July 7 Louis XVIII entered again into his capital. (J. M. T.)

THE BOURBONS RESTORED

Louis XVIII, From 1815.—Although the events of the first restoration had raised doubts of the Bourbons' fitness to rule, the allies could not agree upon any alternative. Ten days after Waterloo, therefore, Louis XVIII was once more in France. The Hundred Days did much to complicate his task, since the allies were now resolved to punish the French people for the support that had been given to Napoleon. The second treaty of Paris (Nov. 1815) modified France's eastern frontier to its detriment, imposed an indemnity of 700,000,000 fr. and subjected its eastern *départements* to a period of occupation by allied troops. In France the rifts in society were widened and the bitterness engendered by Napoleon's adventure was reflected when the elections of Aug. 1815 returned an Ultraroyalist chamber known as la *ckambre introuvable,* and when Catholic Royalists in the south paid off old scores in a minor white terror. The forces of revolution and counterrevolution were no less opposed than before, and in spite of the liberalism of the charter of 1814, it would be far from easy for the king and his government to recreate a national unity and rally all Frenchmen to support the new Bourbon experiment in parliamentary monarchy.

The violence of the white terror was, however, a transitory phenomenon. Although malcontents in France, as elsewhere after 1815, formed secret societies and occasionally attempted insurrection, the main importance of the period lies in the parliamentary struggle and the gradual acclimatization of constitutional habits.

If England was taken as the chief pattern of constitutional government, the working of parliament in France was often very different. There were two chambers, that of peers and that of deputies, but members sat in a semicircle, an arrangement that made more for oratory and less for informal debate. The king was not obliged to choose his ministers from the majority and there were no disciplined parties, But there were three fairly definite groups whose struggle for power makes up most of the parliamentary history of this time. On the right, the Ultraroyalists (largely representing landed interests, the aristocracy, the clericals and former *émigrés*) may be called the party of the counterrevolution, because of their opposition to the egalitarian and secularizing principles of the great Revolution; but they did not aim at restoring the *ancien régime* with all that that implied, being rather concerned with manipulating the new constitutional machinery in order to regain an assured political and social predominance. On the left, at first very few in number, were the Independents, a miscellaneous group of Bonapartists, Liberals and Republicans, whose chief bonds were distrust of the Bourbons, dislike of clericalism and belief in the Revolution and national sovereignty. In the centre the Constitutionalists, opposed to revolution and to reaction alike and sincerely concerned to operate the regime of the charter, comprised many men of great intellectual distinction and enjoyed the support of the king, whom they provided with most of his ministers before 1820. Louis indeed saw the unwisdom of much of the Ultras' policy and knew that many of them had no conception of the real temper of the nation. This was shown in 1816 when he at length dissolved the *chambre introuvable* and when fresh elections gave the Constitutionalists a comfortable majority. For the next four years ministers and parliament worked more harmoniously, and much of the constructive work of the restoration was achieved. The finances were overhauled and credit restored, and financial buoyancy enabled France to pay the war indemnity and so to be rid of the army of occupation in the shortest possible time, namely three years. The last occupying soldier left French territory in Nov. 1818. In the same year the *loi Gouvion-St. Cyr* established the basis upon which France's army was recruited during the next half century. Henceforward it was essentially a small professional force, raised by the conscription of an annual levy chosen by lot—in the first place for six or eight years. A military spirit was carefully cultivated, and governments might hope to rely on such a force as a defense both against foreign invasion and against internal disorder; but, shy of putting arms into civilian hands, they omitted to provide for an effective trained reserve.

The Constitutionalists also legislated concerning the franchise and the press. Measures of 1817 and 1818 confined the vote to men over 30 years of age who paid 300 fr. a year in direct taxes and eligibility to men over 40 who paid considerably more; and the press laws of 1819, the most liberal of the restoration period, abolished the censorship as a restraint upon libel and allowed press offenses to be tried by jury instead of by special police tribunals. Yet the Constitutionalists' days of power were soon numbered. The great increase in the number of Independents elected in 1819 caused widespread alarm and helped to split the Constitutionalists' ranks. When in 1820 revolutions broke out in various parts of Europe and a fanatic assassinated Charles Ferdinand, duc de Berry, Louis XVIII's nephew and heir presumptive to the French throne (Feb. 13), the Ultras quickly exploited the situation and induced the aging king to dismiss his ministers and to form, under the duc de Richelieu, a cabinet much further to the right, which paved the way for their accession to power. The electoral laws were drastically revised: scrutin de liste, whereby the elector voted directly in the chief town of his *département* for as many deputies as were allotted to the *département,* was replaced by the system of scrutin *d'arrondissement,* its great rival throughout the 19th century, in which he cast a single vote in the chief town of the arrondissement; the wealthiest electors, who paid 1,000 fr. or more in direct taxation, were given a double vote. As a result, the 1821 elections were an Ultra triumph, and a new cabinet was headed by one of their ablest leaders, the comte de Villkle. In 1823, not content with this success, they rigged the electoral arrangements still further, made parliament septennial and secured a new chamber so zealous that it was dubbed *la* chambre retrouve'e.

Thus Louis XVIII had abandoned a middle-of-the-road policy and by the time of his death was much under Ultra influence. But despite the swing to the right the dynasty appeared to be firmly established. The country as a whole was economically prosperous; the activities of the Charbonnerie and other secret societies, notably in 1822, had been easily repressed; the regime had gained prestige from the speedy payment of the war indemnity and evacuation of foreign troops, from its subsequent admission to the Concert of Europe and from the success of the war undertaken in 1823 to restore the authority of Spain's Bourbon king, Ferdinand VII.

Charles X (1824–30).—Louis XVIII was succeeded by his brother Charles, hitherto the comte d'Artois, a man of much personal charm but far less political sense, who had long been the avowed chief of the Ultras. With him as king, the Ultras might be expected to fulfil their program and maintain their ascendancy for a long period. Clerical control of education, already largely secured, was confirmed when in 1824 a prelate, D. A. L. de Frayssinous, became minister of education and ecclesiastical affairs; in 1825 the *émigrés* who had lost their estates in the Revolution were compensated, on a nominal basis of 1,000,000,000 fr., with interest derived from a conversion loan. But an extraordinary law making sacrilege a crime punishable by death (1825) remained a dead letter, and the Ultras failed in their attempt to renew the territorial aristocracy by re-establishing the right of primogeniture (1826). In fact, although they had reduced opposition in the chamber, they were unable to stifle it outside. Villkle's conversion loan antagonized many middle-class investors, and people in all sections of society were alienated by the growing influence of the church. The reappearance of the Jesuits, the activities of other religious societies (in particular the sinister role erroneously attributed to the Congregation, a society founded in 1801 to revive religious life in France), the prominent part taken by the royal family in religious ceremonies, all helped to fan the flames of anticlericalism and to strengthen opposition. Furthermore Villèle's dismissal of François René Chateaubriand from his post as minister of foreign affairs split his own ranks and antagonized one of the most powerful writers in the country. The Royalists were divided still further when in 1826 the Gallican comte de Montlosier published a resounding attack upon clericalism. A violent press campaign ensued which Villkle could see no way to counter save by a more drastic press law, but this was virtually rejected by the chamber of peers, often notable for its sense and moderation during this period. Accordingly, by the end of 1827, when his government had incurred still more odium because of its peaceable foreign policy—the battle of Navarino in which the Turkish fleet was destroyed was fought against his instructions—and its dissolution of the Paris national guard, Villèle decided to pack the upper house and to dissolve the lower in the hope of securing a more disciplined chamber through new elections. But he was disappointed. The opposition gained a majority of 60, and after a brief attempt to continue in office Villkle resigned.

With an ill grace Charles X bowed to the storm and replaced Villkle by a cabinet headed by the vicomte de Martignac and recruited largely from the right centre. This cabinet pursued a conciliatory policy that relieved tension. But it never had the king's loyal support or confidence. Charles continued to intrigue with his old friends and, in 1829, replaced Martignac by the prince de Polignac and a cabinet still more fanatically Ultra and unpopular than that of Villèle. Such a choice was a challenge both to the chamber and to public opinion, tantamount, as Metternich declared, to a counterrevolution. As soon as the chambers met in March 1830 there was a clash. The king's speech from the throne implied that he would brook no opposition; but the deputies replied with an address of no confidence. Charles's answer was to dissolve the chamber and order new elections. Thus the problem whether or not the king must choose his ministers from the majority and part with them when they lost the confidence of parliament came to a head.

The dissolution was followed by intensive campaigning, but neither official pressure nor Polignac's ambitious foreign policy, with the brilliant capture of Algiers in June, was of any avail to win support for the ministry. The opposition returned still stronger from the elections of July. Nevertheless Charles remained obdurate. The result was disastrous for the monarchy.

The Revolution of 1830.—The act which precipitated revolution was the publication on July 26 of three ordinances: the chamber was once again dissolved; freedom of the press was virtually abolished; and the electoral law was modified so as to reduce the electorate to about 25,000 persons, almost all landed proprietors. In issuing the ordinances Charles invoked article xiv of the charter, which empowered him in case of need to make the necessary regulations and ordinances for the safety of the state. But his action was wholly contrary to the spirit of the constitution. Printers' strikes and journalists' protests were followed by armed demonstrations, and soon barricades were erected all over the capital. After three days' fighting (les trois glorieuses) the insurrection triumphed. Blind to the dangers of the situation, Charles had taken no serious precautions to ensure the success of his coup; and when he sought to preserve his throne by making concessions it was too late. When at last he abdicated in favour of his grandson the duc de Bordeaux, known to French Legitimists henceforward as Henry V but to others, generally, as the comte de Chambord (*q.v.*), the fate of the dynasty had been decided in Paris. The elder branch of the Bourbons was set aside, and the son of Philippe Egalité, Louis Philippe, duke of Orléans, who had fought at Jemappes in 1792, was now hailed as a citizen king devoted to the Revolution.

The July Monarchy (House of **Bourbon-Orléans**).—The revolution of 1830 was a victory of the bourgeoisie over the aristocracy, most of whom remained loyal to Charles X. It was a triumph for Paris and a vindication of the charter and of popular sovereignty. The upper middle class now secured the political and social ascendancy for which it had fought in 1789. The new king became not Philip VII, king of France, but Louis Philippe, king of the French, and the deputies themselves imposed upon him a revised charter (la Charte *bâclée*). The chamber of peers was transformed from a hereditary into a nominated house, the censorship and the special tribunals were abolished, the franchise was extended, the alliance of throne and altar came to an end, the white flag of the Bourbons was replaced by the tricolour and a law of 1833 was to provide for the establishment of state-aided primary schools in every commune. Yet, although these changes were generally accepted, the revolution of 1830 initiated a period of considerable unrest. At home economic difficulties, accentuated by the revolution and by the hard winter that followed, led to unemployment and to widespread distress, and numerous workers' demonstrations culminated in a veritable insurrection at Lyons in Nov. 1831. In Paris, too, there were violent political demonstrations against Charles X's unpopular ministers, as well as anticlerical riots in which the archbishop's palace was sacked. Moreover, there were sharp differences of opinion concerning the purpose of the revolution. While the moderates, soon known as the Party of Resistance, held that its aims had already been achieved, the Party of Movement, headed by Jacques Laffitte and others on the left, regarded it as the first step in the initiation of a new era of liberty and wished the government to pursue an active policy abroad as well as at home and to support the revolutions which, inspired by France's example, broke out in Poland, Italy and Belgium.

But Louis Philippe was opposed to rash adventures, and his prudence helped to consolidate his government's position in Europe. He agreed with Talleyrand that France must join with Great Britain in solving the Belgian question and in forcing the Dutch to recognize Belgian independence. He resisted all temptation to annex Belgian territory and refused the new Belgian throne for his son Louis, duc de Nemours. Thereby he secured England's friendship without diminishing French prestige. In Italy, too, while refusing to support revolution, he demonstrated France's abiding interest in Italian affairs and concern with the balance of power by sending French troops to occupy Ancona (1832–38) so long as Austrian soldiers remained in the Papal States.

But the Orléans government found that the task of establishing a regime acceptable to all Frenchmen was far from easy. Louis Philippe's assumption of the crown created a new schism, that of Orleanists and Legitimists, and it might have been better for the Royalist cause in France had he been content to act as lieutenant governor of the kingdom or regent for Henry V. As it was, his government faced insurrectionary fire from two flanks. On the right there were the irreconcilable Legitimists who regarded him as a traitor and some of whom followed the duchesse de Berry in a futile attempt to raise the Vendée in 1832. On the left there was the Bonapartist pretender, Louis Napoleon, who made two equally futile attempts at insurrection in 1836 and 1840; and, much more formidable, there were the Republicans. These had gained, in the 1820s, many new adherents among workmen, students and others and, in the July revolution, had seized the Hôtel de Ville in Paris and made a bid for power. After a momentary acceptance of the new regime they resumed their opposition, intensified their propaganda and multiplied their secret societies. Confined mainly to urban areas, they were more formidable than the Legitimists as being more concentrated and better versed in insurrectionary technique; and their vigour attracted new recruits from among the discontented. Thus the government had to face several Republican outbreaks, of which the 1834 risings in Paris and Lyons were the most serious. Numerous attempts to kill the king were also a feature of the first decade of his reign. The consequence of such disturbances was that the government took repressive measures and identified itself increasingly with the Party of Resistance, to which Louis Philippe, by no means content to be a king who reigned but did not govern, a-as in any case, temperamentally inclined. The right of association was restricted in 1834 and the press laws were considerably revised. By the end of the 1830s opposition had been muzzled or driven underground, and during the ascendancy (1840–48) of the historian François Guizot some years of internal peace and prosperity ensued.

But this stability was illusory, since the basis of the regime was rapidly being undermined. A movement to extend the franchise had been set on foot without success before 1840, and Guizot was no less unyielding when a new campaign was launched in 1847. Thus the regime which claimed to represent the *juste milieu* kept the vote from an important and growing section of the middle class that included many educated men and confined it to the 200,000 wealthiest citizens, among whom the new aristocracy of the manufacturers was conspicuous. This failure to broaden the basis of the regime politically was the more serious because of the government's neglect of social problems.

Industrialization had gained considerable momentum since the late 1820s, especially in the cotton and textile industries of Alsace, Normandy and the Nord, the silk industry in and around Lyons and the metallurgical industries of the Loire basin and Lorraine. It led to the sudden growth of towns and of an urban population that lived a precarious existence in crowded and unsanitary conditions, subject to long working hours, to disease and to sudden unemployment. This new proletariat was primarily interested in the improvement of its living and working conditions, but successive governments pursued a rigid policy of *laissez faire*, holding that it was none of their business to interfere between employer and employed. The only significant social measure, the first Factory act of 1841, remained largely ineffectual for lack of a proper system of inspection. When the government and the majority of the employers gave no thought to their relief the workers naturally looked elsewhere. They found many prophets and teachers to give them encouragement, as this period of French history was conspicuous for the fertility of the ideas provoked by the new phenomenon of industrialization. While the ideas of the comte de Saint-Simon (1760–1825) were immensely important for their emphasis upon industrial power and its efficient organization, J. C. L. de Sismondi (1773–1842) attacked the principle of *laissez faire* and advocated state intervention to regulate the use of property, Louis René Villermé (1782–1863) and others investigated and made public the evils of working-class conditions, and a host of theorists and reformers put forward proposals for the regeneration of society. It was now that socialism for the first time became a factor of importance, with the pre-Marxian Communists, heirs of Babeuf, with the Christian Socialists influenced by the great liberal Catholics Hugues Lamennais and Jean Lacordaire, with the Fourierists, whose leader is regarded as the father of consumers' co-operatives, and with the supporters of state socialism such as Louis Blanc, who published his *Organisation du travail* in 1839. These movements and the writings of such people as Flora Tristan and P. J. Proudhon (whose famous *Qu'est-ce que la propriété?* appeared in 1841) did much to arouse a social conscience. They meant, moreover, that many who looked to a republic for salvation envisaged it now as a social democracy. Underneath the seemingly calm surface there was a great fermentation of ideas, which was strengthened by the presence. in Paris especially, of many foreign political exiles and by the existence of a new cheap press.

The turning point of the latter part of Louis Philippe's reign came with the economic crisis of 1846, which originated in the failure of the corn and potato crops over a great part of northern and western Europe. The price of wheat rose sharply—1847 was known as "the year of dear bread"--purchasing power declined and the agricultural depression was soon followed by an industrial one, on top of which came a financial crisis resulting largely from overspeculation in the first French railways and from shortage of investment capital. Thus Guizot had to face widespread discontent, which was aggravated by revelations of corruption in high places and by the setbacks and unpopularity of his foreign policy. During Adolphe Thiers' ministry of 1840 the Anglo-French entente had been virtually shattered by the eastern crisis, when France's championship of its Egyptian protégé Mohammed Ali had led to a rift in the Concert of Europe (*see* EASTERN QUESTION) and to a danger of war in which France risked complete isolation. Guizot had temporarily patched things up; but the question of the Spanish marriage in 1846—when Louis Philippe's son Antoine, duc de Montpensier, married the infanta Maria Luisa Fernanda (the heiress presumptive of Spain)—led Lord Palmerston to think that he had been tricked. This made the rupture final and encouraged Guizot and his master to align themselves more closely with the conservative powers. The unpopularity of such an alignment when the breezes of liberalism were once again stirring throughout Europe was not mitigated by the completion of the conquest of Algeria and even in parliament, in the manipulation of which he had shown himself a past master, Guizot's tenure of power looked less secure. It was in such an atmosphere that, in 1847, the new movement for parliamentary reform, the famous banquets campaign, was launched.

The Revolution of 1848.—The culminating banquet, arranged to take place in Paris on Feb. 22, 1848, was banned. Nonetheless on that day crowds gathered near the rendezvous and demonstrated against Guizot. Barricades and red flags also appeared in working-class districts, and Louis Philippe, alarmed by these signs of public feeling, at last dismissed his unpopular minister. It looked as though all trouble was over. Unfortunately, as the result of an incident in front of the ministry of foreign affairs on Feb. 23, troops fired upon a crowd of demonstrators. The temper of the populace at once changed, and peaceful manifestations became armed insurrection. On Feb. 24 Louis Philippe, now more than 74 years old and greatly discouraged by this new turn of events and by his lukewarm reception when he reviewed the national guard, abdicated in favour of his ten-year-old grandson Philippe, comte de Paris, and withdrew to exile in England where he died three years later. But his departure did not save his dynasty, for the revolutionaries ignored his grandson's claims and set up a republic.

Thus another attempt to found a permanent system of government after the English pattern had foundered, and a revolution in Paris was once again meekly accepted by the provinces. There was no attempt to raise the Orleanist standard. The house of Orléans had represented little more than a useful expedient of middle-class governance, and once the middle classes began to lose faith in it there were none to defend it.

THE SECOND REPUBLIC

While parliament would doubtless have accepted a regency for the comte de Paris, its authority was swept aside when the Palais Bourbon was invaded by crowds and when revolutionary leaders set up a republican government at the Hôtel de Ville. This proclamation of a second French republic aroused the gloomiest fears and the most extravagant hopes in France and Europe. Both were to prove unwarranted. The new rulers of France, most of them middle-class lawyers and journalists, might abolish slavery in the French colonies but were not the men to set Europe ablaze in a new revolutionary crusade for the emancipation of peoples; in spite of a good many fine words the second republic was eminently pacific. Nor on the other hand could they transform France into the blissful socialist utopia imagined by some of their supporters. In fact the new regime laboured from the outset under two serious disadvantages. Its leaders were themselves divided and they represented but a minority of the country at large. As in 1830, so in 1848 there were two opposing views of the purpose of the revolution, and the provisional government at the Hôtel de Ville represented an uneasy compromise between them. For the majority (Alphonse de Lamartine and others), the revolution was a political change whereby a monarchy with a restricted franchise was to be replaced by a free democratic republic based upon universal suffrage; but for the minority, men such as Louis Blanc and A. A. Ledru-Rollin, it also heralded a social and economic transformation. The clash between these two conceptions was at the outset symbolized by the unsuccessful attempt of the extremists to supplant the tricolour by the red flag. But although Louis Blanc and his friends were a minority in the government they had many supporters in the streets. and their colleagues were obliged to make important concessions to their ideas when they reduced working hours, proclaimed the right to work, appointed Louis Blanc chairman of a permanent commission to investigate labour problems and established *ateliers nationaux* (national workshops) to relieve the more acute unemployment. This was a radical departure from the *laissez faire* policy of the July monarchy. Equally radical politically was the decision to give all Frenchmen over 21 years of age the vote. The decree of March 5 fixing elections to a national constituent assembly brusquely increased the French electorate from about 200,000 to approximately 9,000,000, many of whom, in spite of the education law of 1833 and the growth of the press, were illiterate. However generous the gesture, it contributed to the undoing of the republic, for acceptance of the February revolution did not mean that the majority of Frenchmen had become convinced Republicans. Not only were they not so, but measures such as the addition of 45 centimes to direct taxation, rumours of Socialist threats to private property and reports of continued disturbances in the capital aroused their fear and distrust. Thus although most candidates called themselves Republicans, a great majority of the new deputies were returned as Conservatives and champions of order. The Radicals and Socialists won only 100 seats out of 876 and clearly still represented only an urban minority whose preoccupations were very different from those of France as a whole. The result was growing tension between the majority in the new assembly and the extremists in Paris, who on May 15 made a vain attempt to set up at the Hôtel de Ville a new government more to their liking.

The June Days.—The great clash occurred, however. over the problem of unemployment which the upheaval of the revolution had itself increased. The *ateliers nationaux* as set up by the provisional government and organized by Alexandre Thomas Marie and Pierre Emile Thomas were a travesty of those envisaged by Louis Blanc and became little more than a gigantic system of outdoor relief which attracted the idle and workless from far and near, demoralized them and increased the risk of disorders. The assembly therefore decided that the *ateliers* must be dissolved, young bachelors enrolled in the army and the rest given employment privately or sent to public works in the provinces. Toward the end of June the executive commission, which had succeeded the provisional government when the assembly came into being, implemented the decision, and dissolution was decreed. Thereupon the workers, furious at what they considered the government's treachery in ignoring its guarantee of the right to work, determined to resist, and the working-class districts of the capital rose in sympathy with them. The insurrection of the June days, unlike the earlier disturbances, was less a political affair than an outbreak of the class war, a rising of exasperated and often hungry workers in defense of what they believed to be their rights; and as such it was fought and repressed with great ruthlessness. But it had important political consequences. It thoroughly alarmed the middle and upper classes, it discredited the Socialists and it led to the restriction of many of the liberties granted earlier. The host of clubs, born of the February revolution, were placed under supervision, new press laws introduced and working hours again lengthened. "The Republic is dead," exclaimed Lamartine, and this was certainly true of the social republic, for the conservative tendencies of the assembly and temper of the country at large were immensely strengthened. Socially moreover, the June days laid bare and intensified the unhappy new cleavage between the proletariat and the rest of society in France.

The Prince-President and the **Coup d'État.**—The republic however, continued in name, and the constituent assembly proceeded with its main task of constitution making. The new constitution voted in November reflected the reaction against parliamentary monarchy after the English pattern and harked back to 1789. It insisted on the separation of powers and on a single chamber or legislative assembly elected by universal suffrage. But it provided that the president of the republic should also be elected by universal suffrage, it devised no machinery for resolving any conflict between executive and legislature and it made the constitution very difficult to revise. These were to prove grave defects.

The first part of the new dispensation came into being when the president of the republic was elected in December. The man elected was the enigmatic conspirator Prince Louis Napoleon, who had spent most of his life out of France but had been chosen deputy by a number of *départements* in by-elections earlier in the year. Many of those who knew him personally thought him a nonentity, but he bore a magic name which stood for order, glory and prosperity and which the growth of the Napoleonic legend and his own clever propaganda helped to popularize. He received an overwhelming majority, handsomely defeating such leading republicans as Lamartine, Ledru-Rollin and Louis Cavaignac. His election was to complete the overthrow of the republic, for he regarded it as his mission to restore the empire.

During the next three years Louis Napoleon worked for his ambition with patience and astuteness, building up a personal following, winning popularity by a series of tours in the provinces and putting his henchmen in control of the army; he also gained the support of the majority of French Roman Catholics by using French troops originally intended to defend the Roman republic against Austria for the restoration of Pope Pius IX and by supporting the *loi Falloux* of 1850, which gave to the free or private schools mainly run by religious orders the recognition for which they had been contending for 30 years. The main obstacle to his designs was the legislative body that had been elected in May 1849. The majority of the new deputies were Royalist, yet unable to restore the monarchy because the schism between Legitimists and Orleanists remained unhealed. Accordingly all that they could do was to try and resist the pretensions of their rivals. But their action in disfranchising a large number of Republican voters, in spite of Louis Napoleon's opposition, by a modification of the electoral law in 1850 and their refusal to amend the constitution to permit his immediate re-election as president enabled him to represent them as reactionary and obstructive. By the summer of 1851 relations between executive and legislature had become decidedly strained, and the political future appeared the more uncertain because the term of each was due to expire in 1852. Determined to retain his power but debarred by the assembly from doing so, the president had no recourse save to a coup d'état, which after careful preparations he carried out on the night of Dec. 1–2, 1851. The chief party leaders were arrested, the chamber was occupied by troops and the assembly was dissolved. Full universal suffrage was promptly restored, and the president announced that a new constitution would be promulgated and submitted for popular approval through the typical Napoleonic device of a plebiscite. Although not formally restored until Dec. 2, 1852, the empire was virtually in being from the day of the coup.

THE SECOND EMPIRE

Although he had broken his oath to the constitution and there was a show of Republican resistance in the south and elsewhere, Louis Napoleon's coup was widely popular. The plebiscite in Dec. 1851 approved it by an overwhelming majority, and the vote in favour of the restoration of the empire was almost as large. For most Frenchmen were tired of parliamentarism and of internal unrest and ready enough for a time to surrender constitutional liberties to a strong government if it could ensure continued order and increasing prosperity. It remained to be seen whether Napoleon III, as Louis Napoleon now became, could recreate a real unity among Frenchmen, rally them around an authoritarian government and establish a dynasty. During the first eight years the omens were good.

The Constitution of 1852.—Napoleon's system of government and the constitution of 1852 gave little scope for political activity. The upper house or senate consisted of nominated or ex officio members; the lower house or legislative body (corps lkgislatif) sat for only three months in the year and could neither choose its own president nor publish its debates. General elections occurred only once every six years and then were subject to strong official pressure and to the gerrymandering of constituencies. The press was strictly controlled and all members of parliament, magistrates and officials were required to take an oath of allegiance.

Thus political life was effectively stifled, the number of political daily papers dropped sharply and even in 1857 the elections returned only five opposition deputies, many opponents of the regime being either in exile or preferring to abstain from active politics if being a deputy meant taking the oath.

Economic and Social Affairs.—But the absence of political excitement was compensated by economic activity, splendour at home and prestige abroad. The great depressions that had started in 1846 and been aggravated by the disturbances of 1848 had come to an end. The Second Empire saw a great French economic development in which much of the economic structure of modern France was built. The railways, begun under Louis Philippe, were more than trebled in extent, and the fact that most of the big lines radiated from it made Paris more than ever the economic, social and intellectual capital of the country. Encouraged by the emperor, Saint-Simonians like the brothers Emile and Isaac Pereire founded great credit institutions such as the Crédit Mobilier or joint-stock banks such as the Société Générale. In consequence there was intense speculative activity and a big increase in the number of small investors. At the same time France's overseas trade was nearly quadrupled in value between 1851 and 1869, while the progress of industrialization had transformed the country by 1870 into a considerable industrial power. These developments had social and international significance. The growth of towns continued, while families, for example that of Paulin Talabot, built up financial empires extending well beyond the French frontiers. There was a greater concentration of wealth in the hands of a few and a still greater contrast between their wealth and the poverty of the many. But if France now counted much more as a financial and industrial power it must be remembered that these developments directly concerned only relatively small sections of the total population. Essentially France remained a land of artisans and peasants.

Splendour also entered into Napoleon's calculations. Whereas the July monarchy had appeared drab and humdrum and the second republic disorderly, the Second Empire shone by its magnificence, by its public ceremonies (in which the army often took a conspicuous part), by its great exhibitions (1855 and 1867) and, after the emperor's marriage in 1853 to the beautiful Spanish countess Eugénie de Montijo, by its sumptuous court *fêtes*.

Foreign Affairs, to 1867.—But the crucial issues depended now, far more than under the restoration or July monarchies, upon foreign policy, since his name, his ambitions and his system of government all impelled Napoleon to a forward policy abroad. There initially he obtained remarkable success. Suspect at the outset as a parvenu adventurer, he was by 1856 recognized as the foremost sovereign on the continent. A lifelong student of Napoleon I's career and his imitator in so much, he saw that his uncle's great blunder had been to antagonize England. So when in 1853 Russian intervention in a dispute concerning the Holy Places of Jerusalem reopened the whole eastern question and once again imperilled the existence of the Ottoman empire. he seized the opportunity to stand by Great Britain and engaged France to fight in the Crimea as an indispensable ally. This enterprise brought France no tangible gains but was of great importance diplomatically. The English alliance gave Napoleon respectability while the defeat of Russia and the holding of the peace congress at Paris in 1856 brought France prestige. Once again the empire shone in comparison with the two preceding regimes. Moreover, the birth of an heir, Napoléon Eugbne Louis Jean Joseph, the prince imperial, in 1856 enhanced the dynasty's prospects of continuance.

***The* Italian War of 1859.**—But this brilliant opening was soon clouded, for Napoleon's ambitions to overthrow the Vienna settlement and redraw the map of Europe led him into courses wholly contrary to France's traditional interests and impaled him upon the horns of a dilemma. As a Bonaparte and a former Carbonaro wha had taken part in the Romagna rising of 1831, he had particular sympathy with Italy; and many of his entourage urged him now that he was emperor to espouse the Italian cause. Felice Orsini's dramatic attempt upon his life in Jan. 1858, instead of deterring him, impelled him to action. In July, at a secret interview with Count Cavour at Plombières, he promised Sardinia France's aid for a war against Austria which should rid Italy of the Austrian yoke "from the Alps to the Adriatic" and regroup its states in an Italian confederation under the presidency of the pope. For its services France was to receive Nice and Savoy. Had all gone according to plan Napoleon might well have scored a signal triumph, earning the gratitude of the Italians for their liberation and the applause of his own people for an addition to his territory in defiance of the treaties of 1815 and for a solution of the Italian question that would have eliminated Austria and made the Italians grateful clients of France. Unfortunately, once the war had broken out in April 1859, events outran his control.

The reactionary Pius IX was highly unpopular, and a series of plebiscites in central Italy favouring union with Piedmont swept away Napoleon's papal confederation before it had begun to take shape. Moreover, the strength of Austria's resistance, Prussia's menacing attitude on the Rhine and criticism at home led him to make peace before he reached the Adriatic. The war was successful as far as it went, and Napoleon obtained Nice and Savoy; but it was at a high cost. He had disappointed the Italians by not completing the expulsion of the Austrians; he had given the impetus for the union of the whole of the peninsula under the house of Savoy in spite of his wish to keep it divided; and he had aroused the bitter hostility of the pope yet found himself obliged, in deference to French Catholic opinion, to maintain French troops in Rome to preserve what remained of the temporal power of the papacy. Moreover, by annexing Nice and Savoy in spite of public protestations that he had no designs on them he did much to alienate England.

The Italian war was also a turning point in the internal politics of the Second Empire. It estranged the French Catholics because of the diminution of the temporal power and thus impelled Napoleon to angle for the support of the left by granting an amnesty that led to the return of many political exiles, by relaxing control of the press and by extending the powers of the legislature. At the same time the Anglo-French commercial treaty of 1860 marked a step in the direction of greater freedom of trade and was a notable departure from the rigid protectionism characteristic of French economic policy since early in the Restoration. But these changes, instead of winning Napoleon fresh supporters, angered many manufacturing interests and encouraged his political opponents to take advantage of their greater freedom. Once again there emerged an opposition comprising both the left and the right: after ten years the emperor had failed both to disarm all the adherents of former regimes and to win the allegiance of the masses of the industrial workers, who were increasingly attracted by the Socialist theories of Proudhon, Marx and Mikhail Bakunin. In the elections of 1863 opposition candidates polled about 2,000,000 votes and gained 35 seats and, significantly, the big towns such as Paris, Lyons and Marseilles voted mainly Republican. This new opposition, which included such notable figures as the Legitimist A. P. Berryer, the Orleanist Adolphe Thiers and the Republican Jules Favre, pressed for further liberal reforms and a return to full parliamentary government. It was the opposition to the authoritarian empire that now attracted the main political and journalistic talent, and the regime was weakened by the lack of outstanding personnel.

The Seven Weeks' War.—In Europe after 1860 Napoleon seems to have cherished two main ambitions, to complete the liberation of Italy by inducing Austria to cede Venetia and to win territory in the Rhineland or Belgium for France as a reward for services in assisting either Austria or Prussia toward the unification of Germany. He achieved the first by devious means but failed ingloriously in the second. The German question was the crucial issue for the balance of European power in the 1860s, and in his handling of it Napoleon, now a victim of a painful disease and aging rapidly, fumbled disastrously. He negotiated with both Prussia and Austria but failed or neglected to secure from either binding agreements to further his own territorial designs. When the Seven Weeks' War began in 1866 he expected that it would be a protracted affair in which he could profitably intervene as mediator. He was completely taken aback by Prussia's swift and overwhelming victory over Austria at Koniggratz. Austria did indeed appeal for Napoleon's good offices and cede Venetia, which he proceeded to hand over to Italy; but as he hesitated to back his mediation by force Prussia could snap its fingers at his suggestion that France should be compensated for the alteration in the balance of power by an extension of its eastern frontiers. The fact that France was obliged to accept the unification of northern Germany under Prussian hegemony without any compensation was universally recognized as a grave blow to its influence and prestige. The simultaneous failure of the costly expedition to Mexico, where Napoleon had hoped to create a new French sphere of influence by setting up an empire under the Austrian archduke Maximilian, was a further blow.

Liberalism.—In consequence of these setbacks Napoleon found it necessary to appease French opinion by fresh liberal reforms. In 1867 he granted the legislative body the right of interpellation and relaxed the laws controlling the press and public meetings. In 1869, after general elections had increased the opposition votes to 3,000,000, he finally decided to restore parliamentary government. In Jan. 1870 Emile Ollivier, one of the five opposition deputies of 1857, formed the first ministry of the Second Empire that was responsible to parliament, and in May the French people were asked to pronounce in a plebiscite their approval of the reforms introduced by the emperor since 1860. This recourse to the plebiscite, denounced by the Republicans as a denial of parliamentary sovereignty, was a clever move, for it was an invitation to give a vote of confidence in the empire. As such, it was a signal success: more than 7,000,000 persons, nearly as many as had approved the coup d'état of 1851, once again voted "yes." In spite of a growing number of strikes, the multiplication of revolutionary societies and the 1,500,000 "nos" (mainly in the big towns), the empire seemed to have gained a new lease on life. Yet within four months an egregious blunder in foreign policy was to precipitate its downfall.

The Franco-German War.—Ever since 1866 French feeling against Prussia had been growing, and in July 1870 the news that Prince Leopold of Hohenzollern-Sigmaringen was candidate for the vacant throne of Spain aroused great excitement and fears of encirclement. When Vincent Benedetti, the French ambassador in Berlin, induced King William I of Prussia to secure the withdrawal of this candidature, France won a great diplomatic victory. But Ollivier and his foreign minister, the duc de Gramont, threw it away by proceeding to demand a formal guarantee that the candidature should never be renewed. This mas an insult to the Prussian king, who had given his word, and it gave Bismarck the desired opportunity to provoke France into a war that would enable him to complete Germany's unification. The famous Ems telegram goaded both French and German opinion, and the French government, in spite of the warnings of Thiers, declared war on July 19.

Although such a war had been expected and was confidently accepted by the majority of Frenchmen, France was diplomatically and militarily ill-prepared. Napoleon's attempt after 1866 to form a triple alliance with Austria and Italy had broken down, largely because of his reluctance to abandon Rpme; and his wise proposals for military reforms had been frustrated largely because of the unimaginativeness of the high command and the parsimony of the legislative body, both of which completely underestimated Prussian power. The result was an overthrow almost as swift as that of Austria in 1866 and still more complete. (See FRANCO-GERMAN WAR.) The French armies fought with accustomed gallantry, but they were outgeneralled, outnumbered and outmanoeuvred. Defeat followed upon defeat, and with each new blow trust in the empire ebbed away. By the end of August Achille Bazaine was blockaded in Metz and the fate of the empire depended upon the only remaining force of any size, the army commanded by Marshal Marie MacMahon and accompanied by the emperor. It attempted a junction with Bazaine only to meet defeat in the great battle of Sedan. On Sept. 2 the whole army capitulated and, with it, the emperor. The empress Eugénie, who had acted as regent in Napoleon's absence from Paris, had no hope of maintaining a regime that had brought such disasters upon France. On Sept. 4 there was a bloodless revolution in Paris, and a republic was once again proclaimed. The empress fled to England and was later joined by Napoleon, who died there in 1873 a sick and broken man. The Second Empire like the first had ended in defeat and invasion. (J. P. T. B.)

THE THIRD REPUBLIC, TO 1914

The Government of National Defense.—The capitulation at Sedan on Sept. 2, 1870, left the deputies of the legislative body debating what sort of provisional government should take the place of the empire. The Republican opposition fell into two groups: the moderates led by Jules Simon and Jules Favre, and the radicals led by Léon Gambetta, whose electoral manifesto at Belleville of the previous year became the textbook of the new radicalism. As in 1830 and 1848, they decided to proclaim the new republic at the Hôtel de Ville. Favre and Gambetta did this on Sept. 4 and proceeded to set up an emergency government of national defense to keep at bay the revolutionary groups. It was headed by Gen. Louis Jules Trochu, governor of Paris, and was composed of the deputies for Paris and of those who had been elected in Paris but had chosen another constituency. Yet another French revolution had been made in Paris, and this time it was a bloodless one. It was the men whom Paris had chosen, including Favre, Simon and Gambetta, who now ruled France.

A fortnight later Favre, as minister for foreign affairs, met Bismarck at Ferrières. He failed to come to terms, so the government was confronted with the threefold task of defending Paris, seeking foreign support and rousing the provinces to defend the country. On Sept. 19 the German armies besieged the capital.

Thiers was sent on a tour of the European capitals to seek foreign help. As the government was shut up in Paris it had to maintain a delegation at Tours, headed at first by Isaac Moïse "Adolphe" Crémieux, minister of justice. On Oct. 7 Gambetta, as minister of the interior, escaped from Paris in a balloon, floated safely over the German lines and reached Tours. There he created virtually a personal dictatorship, designed to infuse fresh energy into the war effort of the provinces.

The government failed in all three tasks. The siege of Paris lasted four months, and the city endured great hardships. Thiers failed to gain foreign help. Gambetta raised large forces by a *levée* en masse, but they were sadly short of arms and supplies. On Oct. 27 Bazaine capitulated at Metz. Gambetta's new levies met with successive defeats. The winter was exceptionally severe. and the food supplies of the besieged capital ran out. On Jan. 18, 1871, the king of Prussia was crowned as emperor of Germany in the Hall of Mirrors in the palace of Versailles. Ten days later the French government was compelled to sign an armistice. Bismarck insisted that a national assembly be at once elected, competent to conclude a treaty of peace. General elections were arranged for Feb. 8, and the new assembly met at Bordeaux on Feb. 13 to accept the resignation of the government of national defense.

The "Government of M. **Thiers."**—The elections had been inevitably held in conditions of extraordinary confusion, and their central issue had been peace or war. Because the Bonapartists were discredited by Sedan and the Republicans were associated with carrying on the war, the electorate—which mainly wanted peace—turned to the Royalists. The national assembly was composed of about 180 Legitimist Royalists and 220 conservatives, predominantly Orleanist Royalists; 200 Republicans, divided almost equally between moderates and extremists; and about 30 Bonapartists. It thus had a Royalist majority and was by a large majority in favour of concluding peace with Germany. The veteran Thiers, on Feb. 17, 1871, was appointed "chief of the executive of the French Republic." He was to work "under the control of the national assembly and with the help of ministers, whom he shall choose and over whom he shall preside." In this way began the "government of M. Thiers" which undertook the formidable tasks of concluding peace, liberating France and restoring public order.

The Treaty of *Frankfurt.*—On March 1 the assembly affirmed the overthrow of Napoleon III and his dynasty and ratified by 546 votes to 107 the terms of the peace treaty that Thiers and Favre had negotiated with Bismarck. The terms were harsh and had both immediate and long-term importance for France. France undertook to pay an indemnity of 5,000,000,000 fr. and to maintain the cost of German forces of occupation in its northern provinces until the indemnity had been paid. The other two main provisions rankled even more than the indemnity: France gave up Alsace and Lorraine to Germany and agreed that German troops should make a formal triumphal march through Paris. The former provision bred in the next generation of Frenchmen a desire for revenge and for recovery of the lost provinces; the latter contributed, with other factors, to the outbreak of the Paris commune on March 18. The treaty was signed at Frankfurt on May 10.

The *Commune (1871).*—During the Franco-German War there had been several revolts, mostly led by the small but active class of professional revolutionaries such as Auguste Blanqui. The commune was the product of the social upheavals of the long siege of Paris, the aftermath of disastrous war and the social discontent bred by Bonapartist dictatorship. It was precipitated by a sense of outraged civic pride when German troops marched down the Champs Élysées and when it became known that the national assembly had decided to move from Bordeaux not to Paris but to Versailles. It seemed that a restoration of the kingdom might be proclaimed, by a Royalist assembly, from the palace of the kings. Many of the wealthier citizens of the capital had left it, and about 40,000 *évacués* and refugees from the German-occupied provinces had poured in. Paris, which had proclaimed the republic on Sept. 4, now tried, under more extremist Republican leadership, to provide once again the model of revolutionary action for the whole of France. It appealed to the traditions of 1793, just as on Sept. 4 the moderates had appealed to the traditions of 1830 and 1848. Its example was followed, by Lyons, Marseilles and St. Étienne, with fainter responses in Toulouse, Narbonne and Limoges. But it failed, and the government of Thiers retook the city by force of arms. On May 21 the troops of Versailles entered the city. The merciless repression that followed recalled the June days and for a time destroyed the revolutionary parties, as well as the leadership of Paris. The destruction of the commune paved the way for a more conservative republic. Meanwhile, the preliminary tasks, which Thiers undertook to fulfil without prejudging the constitutional issues of the new regime, were speedily and ably carried out.

Economic Recovery.—When Thiers in June 1871 floated his first loan to pay the first instalments of the indemnity, it was oversubscribed two and a half times. It was a remarkable tribute to the resilience of France and to the firm leadership of Thiers that there was such confidence in the new government. The second loan a year later for the remaining 3,000,000,000 fr. was oversubscribed 13 times. By getting Bismarck to agree to the earlier withdrawal of troops in proportion to payment of the indemnity, Thiers ensured that France was completely liberated by Sept. 1873, which was two years sooner than Bismarck had contemplated. By his overhaul of French military organization he laid the basis, at the same time, for the future military recovery of France.

The economic reasons for this remarkable recovery of France were that the two years after Sedan saw the climax of a phase of expansion which had begun in 1859. Between 1859 and 1869, French imports had increased in value from 1,640,000,000 fr. to 3,153,000,000 fr.; its exports from 2,266,000,000 fr. to 3,075,000,000 fr. Its total tonnage of shipping had increased in the same decade by more than one-third. Its industrial output, especially in the heavy industries and in textiles, had grown fairly steadily. In some respects the defeat at Sedan and the exacting terms of the peace gave an impetus to greater production. It stimulated public spirit and encouraged Frenchmen to work harder and more purposefully. The previous decade of railway building, rising prices and wages and agricultural prosperity laid the basis of a boom in the years 1870–73. During these years the factories were working at full speed; coal and steel output, in spite of the loss of the rich areas of Alsace and Lorraine, were on the upgrade; and prices and wages continued to rise. The index of prices, which had stood at 144 in 1869, stood at 159 in 1873, and wages tended to follow suit. Thiers used these economic opportunities wisely and well, and when he fell from power on May 24, 1873, he had earned the title of "liberator of the territory."

Republicanism Consolidated.—By that time, too, the balance of political forces which was to shape the constitution of the new republic had become clearer. Gambetta, after the elections of Feb. 1871, had carried out an intensive campaign of propaganda throughout the French countryside in favour of republicanism. It was he, by pen and spoken word, who taught the French peasant proprietors that they owed their land not to Bonapartism but to republicanism. The fruits of these labours were a series of gains by the Republican party at by-elections: of 158 contested by-elections to the national assembly between Feb. 1871 and Sept. 1874, the Republicans won 126. Gambetta co-operated with Thiers to ensure the erection of a conservative republic and founded the new "Opportunist" or moderate section of the Republican party. At the same time the forces of royalism were thrown into disarray by their repeated failure to amalgamate Legitimists with Orleanists. During the government of Thiers three successive attempts at fusion were attempted. but all in vain. The Legitimists were headed by the comte de Chambord ("Henry V"), grandson of Charles X; the Orleanists by Louis Philippe Albert. comte de Paris, grandson of Louis Philippe. Chambord had no heirs and was 51 in 1871, whereas the comte de Paris already had a son and was only 33. The purpose of fusion was an agreement to put Chambord on the throne, to be succeeded on his death by the comte de Paris. Chambord issued a series of ill-timed and stiff-necked manifestos, refusing to accept the tricolour flag and insisting on the white flag of the Bourbons. The combination of a growth of moderate and conservative republicanism with the obvious hopelessness of royalism convinced Thiers that the future lay with a conservative republic; and the national assembly, now comprising a more even balance between the two parties, proceeded to draft such a constitution.

The Constitution of 1875.—Thiers resigned in May 1873. He was succeeded by Marshal MacMahon, who on Nov. 20 was given the "presidency of the republic" for seven years. As early as Aug. 1871, Thiers had been accorded the title "president of the French republic." So a republic had long been formally accepted in principle. The issue was still whether it should be a conservative republic, so devised as to check the forces of radical democracy and perhaps even prepare the way for a restoration of constitutional monarchy, or whether it should be sufficiently radical to prevent a restoration. Around this issue the debates of the assembly in 1875 mainly revolved. Already the champions of conservatism had won a tactical victory by the appointment of MacMahon as president, and they regarded him as forerunner of a future monarch. Their leader was Jacques Victor Albert, duc de Broglie, a shre d politician and an astute parliamentarian, who became president of the council of ministers when Thiers fell and held office for a year with the support of the right-centre and left-centre parties in the assembly.

During the formation and early years of the third republic, France found itself on a downward curve of the economic cycle. A phase of economic depression began in 1873, in striking contrast to the preceding three years of boom. Its deepest impact was on France's chief national industry, farming. Development of railway and steamship brought grain from the rapidly expanding agriculture of the United States, Canada and Argentina to compete on favourable terms with that grown in the old world. *Phylloxera* was ravishing the vineyards and cattle disease was ruining French stock. The index of prices fell from 159 in 1873 to 130 in 1879. There were bad harvests in 1878 and 1879. French industry, too, ran into special difficulties. The loss of the highly industrialized districts of Alsace and the iron ore and metallurgical industries of Lorraine began to matter; and in 1878, when the Thomas and Gilchrist methods of smelting phosphorus ore were invented, it was Germany that reaped the benefits. France had lost about 1,500,000 persons, including many of its best miners and metalworkers. In addition, it had lost about 139,000 men killed and another 143,000 disabled in the war, as well as the heavy losses of the Paris commune. Industry was grievously weakened immediately before it suffered the shock of the depression. The remark "How attractive was the Republic under the Empire!" had an economic as well as a political significance.

Against this clouded economic background, the assembly passed the series of constitutional laws which together composed the constitution of the third republic.

The two chief characteristics of the constitution were its basic compromises and its piecemeal nature. Its makers did not set out to formulate general principles or doctrines, or to build an entirely new system. They redefined only those organs of government which the major political parties of the time considered to be in need of overhauling. As they were mostly somewhat conservative parties, they left almost intact whatever they could: for instance the system of central and local administration, mainly derived from Napoleon I; the judiciary, a blend of former royal and imperial regimes; and the arrangements between church and state. The basis of universal male suffrage, on which the elections of Feb. 1871 had been held, was also preserved.

By the constitutional law of Feb. 25, 1875, legislative power was vested in the national assembly. which consisted of a senate of 300 members (constitutional law of Feb. 24, 1875) and a chamber of deputies. At first 225 senators were elected for a term of nine years (one-third of their number retiring every three years) by electoral colleges representing mainly the municipal councils; the other 75 mere nominated for life by the assembly (organic law of Aug. 2, 1875). But by the law of Dec. 9, 1884 (made possible by the constitutional amendment of Aug. 14 of that year), the senate became totally elective, though still on a system of indirect election which gave the preponderance to the large number of rural communes as against the few large towns. The chamber of deputies, elected directly on universal male suffrage for a term of four years, at first rested on the *arrondissements* as single-member constituencies (organic law of Nov. 30, 1875). But in 1885 a system of *scrutin de liste* was established, with the *de'partement* as the constituency and with each elector having as many votes as there were seats ascribed to the *département;* then in 1889 single-member constituencies were restored; in 1919 a system of *scrutin de liste,* combined with a very restricted method of proportional representation, was again tried; but this too was abandoned in 1927, when single-member constituencies were again restored. Throughout, a system of second ballot was used. Article 18 of the law of Nov. 1875 laid down that "No one is elected on the first ballot unless he has won (1) an absolute majority of the votes cast; (2) a number of votes equal to a quarter of the electors on the register. At the second ballot a relative majority is sufficient." The interval of a week between the two polls left room for bargaining and shuffling on the part of the parties and their candidates. Though often criticized as encouraging sordid politics, this device was probably on balance an advantage in the very complex and fluid party system which grew up under the third republic. It prevented an excess of "wasted votes."

Since laws had to be passed by a majority of both the senate and the chamber, the two houses had nominally equal legislative power. In practice, a ministerial defeat in the chamber was more serious than one in the senate, and it was only in the last decades of the republic that a ministry felt obliged to resign if it was defeated in the senate alone. Money bills had to originate in the chamber.

The president of the republic, elected by a joint session of the national assembly for a period of seven years and subsequently re-eligible, had the initiative in proposing legislation, concurrently with the members of the assembly. He promulgated laws and ensured their execution and so had a suspensory veto on legislation. He presided at all state occasions and had the direction of the armed forces, the appointment to all civil and military offices and the right of pardon but not of amnesty. Ambassadors were accredited to him.

But every act of the president had to be countersigned by a minister, and it was ministers who were "collectively responsible before the chambers for the general policy of the government, and individually for their personal acts." This meant that the real executive power lay with the body of ministers. No specific provision was made for the office of prime minister, but it gradually established itself as a consequence of the law of March 1873. This law permitted the president to communicate with the assembly only by previous permission to appear before it and speak or by means of messages normally read in the assembly by a minister; nor could debate take place in the president's presence. Devised originally to gag Thiers, this arrangement was perpetuated in the constitutional law of July 16, 1875, which determined the relations between the organs of power, with the result that the bulk of the president's executive powers had to be wielded by the ministers, and the "vice-president of the council of ministers" (subsequently known as the president of the council of ministers) became the operative leader of the government.

However, by the constitutional law of Feb. 25, 1875 (article 5), the president of the republic could, with the agreement of the senate, dissolve the chamber before its four-year mandate had expired. But this power was used only once, by Marshal MacMahon in 1877, when it failed in its purpose. Thereafter by custom the chamber acquired immunity from dissolution and security for its full four years of existence. This fact, often lamented by parliamentary reformers of the third republic, weakened the ministry vis-à-vis the assembly, the executive vis-&-vis the legislature. But it is doubtful whether even if used the power of dissolution would have contributed to greater ministerial stability; ministries were to be weak not only because of constitutional principles but because they consisted of combinations of leaders from the various parties and groups in the assembly, who could neither command the support of a majority nor even be sure of controlling their own supporters.

The Party Politics in the 1870s and 1880s.—In the first general elections held under the new constitution, in Feb. 1876, a Republican majority of about two-thirds was returned to the chamber of deputies. Of the 36,000,000 citizens of France, only about 10,000,000 were qualified to vote, and only three-quarters of them actually voted in 1876. More than half this electorate lived by agriculture, a little more than 3,000,000 were engaged in industry and about 750,000 in business and trade. Democracy in France still meant a rural democracy, and political life centred ultimately on the 36,000 communes of the countryside. Gambetta, the most dynamic leader of the Republicans until his death in 1882, conceived a democracy of peasant proprietors and small businessmen. It was to these new social strata, given political power by universal suffrage and constitutional advantage by the composition and powers of the senate, that the Republicans especially appealed. And although these classes wanted a republic, they wanted the republic to be conservative in bias. By 1879 the Republicans had won a majority in the senate as well as in the chamber; and with the accession of the veteran Republican Jules Grévy to the presidency in that year there began what is known as "the Republic of the Republicans."

But in this year of its victory the Republican party, hitherto united under the leadership of Gambetta in a common front against both Royalists and Bonapartists, split into two halves. The moderate and conservative wing, led by Gambetta and Jules Ferry, became known as the Opportunists because its aim, as defined by Ferry, was to adopt "a political and parliamentary method which consists in not tackling everything at once, in limiting the scope of reforms and in avoiding disruptive issues." The wing that demanded more rapid reforms and took its stand on Gambetta's Belleville manifesto of 1869, was led by men like Georges Clemenceau and Charles Floquet. It became known as the Radicals and wanted such reforms as a revision of the constitution to make it more broadly democratic, the separation of church and state, the election of judges, a graded income tax and greater local communal self-government.

From 1879 onward, labour organizations also were to exercise influence on French politics. They had been forming in the 1870s, and the economic depression of the later years of that decade made them more active. Socialist congresses were held in Paris in 1876. at Lyons in 1878 and at Marseilles in 1879. At Marseilles it was decided to form a Socialist Labour party. Like the Republicans the Socialists soon split, between the more extreme Marxists and the more moderate opportunists or "Possibilists," led by Paul Brousse. Divisions within the Socialist ranks multiplied during the next 20 years, despite the repeated efforts of men like Jean Jaurès to unify them. But syndicalist organizations had established themselves in French economic and social life, they took part in the Socialist congresses and it is likely that the estimate of F. H. R. Allain-Targé, in a report to the chamber in 1881, that there were 500 unions with about 60,000 members, was an underestimate. Five years later the first national congress of trade unions was held at Lyons and decided to set up a national federation of unions. In 1884 trade unions were legally recognized, and sporadic strikes became an almost permanent feature of French life. The links between organized labour in industry and the Socialist movements in the country and assembly were never stable.

The instability thus induced in the parties of the left had its counterpart among the parties of the right. The failure of successive attempts at fusion on the part of the Royalists left Legitimists separated from Orleanists. The Bonapartists moreover remained a force that could not be neglected during the 1870s: they gained 75 seats in the chamber of 1876. Above all, the issue of clericalism revived, to cut across other live issues splintering French public opinion.

From 1876 the Royalists sponsored the cause of the church more actively. The ultramontane clericals, on their side, expected that a restoration of the monarchy would secure for them that control over policy which was denied them by the Republicans. The church was by now not only competing openly with the republic in the matter of education but also trying to make France the champion of papal interests both against the new Italian kingdom and against Bismarck's *Kulturkampf* in Germany. The crisis of May–June 1877 was indeed a twofold conflict: between Royalists and Republicans and between clericals and anticlericals. This crisis came about with the so-called *"coup d'état du Seize Mai,"* when President MacMahon, on May 16, 1877, sent to the Republican prime minister, Jules Simon, a letter reproaching him for his conduct of affairs in the chamber; whereupon Simon and his cabinet resigned. An *"union des gauches"* was forthwith formed in the chamber in protest against MacMahon's action; and in June, when the new prime minister, the duc de Broglie, asked the senate on MacMahon's behalf to dissolve the chamber, the chamber passed a resolution of no confidence in the ministry by 363 votes against 158. On the senate's dissolving the chamber, the 363 deputies of the left presented themselves en bloc to the electorate. Gambetta and Thiers once more co-operated, and when Thiers died (Sept. 3) in the midst of the electoral campaign, Paris turned his funeral into a Republican demonstration. The Republicans won 326 seats and, by the invalidation of about 75 of their opponents' elections—on the grounds that improper official pressure had been used during the polls—raised their strength in the chamber to about 400.

This Republican victory, great enough to check the monarchists' schemes against the constitution, was not great enough to dispel fear of clericalism. Gambetta's chief anxiety in foreign affairs was to win international recognition for the new republic—then the only republic in Europe apart from the Swiss—and to remain on good terms with the Italian kingdom. In 1877 he visited King Victor Emmanuel in Rome, but he had scarcely returned to Paris when the king died. A month later Pius IX died, and his successor, Leo XIII, adopted a more conciliatory policy. But the tradition of hostility between church and republic and the extent of clerical power and influence over education in France combined to make another two decades of strife inevitable. In 1880 decrees were issued disbanding the Jesuits, and twp years later Jules Ferry made primary education free, compulsory and secular.

Throughout the formative period of the parliamentary republic, therefore, a mixture of diverse issues split public opinion; and this split was reflected in the multiparty system that, more than any other single factor, determined the nature of the republic. Every ministry had to be a coalition of several groups—either a fairly cohesive *"union des gauches,"* as in the crisis of 1877, or a looser combination of centrist groups, as were most ministries of the 1880s. Any such coalition, being based on only a limited area of agreement, tended to be short-lived and to collapse as soon as one or two marginal elements deserted it. Ministerial instability became the most outstanding and decisive characteristic of the French parliamentary system; and 30 ministries held office during the first two decades of the new constitution.

Colonial Expansion.—A further issue which divided the ranks of the Republicans was that of colonial expansion. During the decade after Sedan French opinion was too much concerned with recovery and reconstruction at home and with the aim of *revanche* against Germany in Europe to countenance overseas expansion. Such adventures were associated with the kings and with Bonapartism; a big insurrection in Algeria in 1871 strengthened anticolonial sentiment; and in 1874 the duc de Broglie's government evacuated Tongking. The Radical wing of the Republicans remained opposed to colonial expansion, but the Opportunists, led by Jules Ferry and Gambetta, by 1880 began to favour it. In 1881 the bey of Tunis, Mohammed VI, after a short and inexpensive military campaign, was made to sign the treaty of Bardo, which turned his territories into a protectorate of France. By the end of the year the whole of Tunisia was virtually under French control. Ferry's ministry fell under the attacks of the Radicals and the right. But he returned to power between 1883 and 1885 and resumed his forward policy. He strengthened French control in Madagascar; the expeditions of Pierre Savorgnan de Brazza in the Congo basin led to the establishment of French Congo; and in Indochina Tongking was retaken and

Annam made a protectorate. Again, despite these remarkable gains, Ferry was swept from office in a tremendous outburst of parliamentary and popular hostility. But overseas expansion went on for the rest of the century, and the French empire in Africa and the far east became, next to the British, the most extensive in the world.

The background to this overseas expansion was economic boom and slump at home. The 20 years before 1873 had been a period of expansion and prosperity interrupted by short, sharp periods of crisis and slump. The 20 years after 1873 were a period of depression interrupted by short periods of sudden prosperity. The first of these periods came in the years 1880–82, when credit expanded, new companies were formed, railways were built and speculators were active. The output of pig iron jumped from 1,400,000 tons in 1877 to 2,069,000 tons in 1883. Agriculture prospered and grain crops were good. But the hectic speculation between 1880 and 1882 was followed by a flutter of bankruptcies and financial crises. The index of prices fell from 133 in 1880 to 122 by 1883 and to 111 by 1890. Ferry saw in Indochina a new market for French industry and a remedy for trade depression.

Although the development of the newly won colonies was hampered by shortsighted economy imposed from Paris, great administrators like Paul Doumer, who was governor general of Indochina, built roads and railways and developed the empire's economic resources, and Joseph Simon Gallieni strove to overhaul the life of Madagascar as Hubert Lyautey was soon to reorganize Morocco. The more conservative service families found an outlet for their energies in the colonial army and the colonial administrations, while the church found new fields for its missionary activities. One function of the new empire was to ease the pressure of Royalist hostility to the republic at home by opening new opportunities for the service of France overseas.

Boulanger.—By the 1880s the foundations of the parliamentary republic seemed to have been firmly laid. The constitution was working reasonably well; the party system had taken shape and the Republicans had consolidated their regime; the clerical issue, by no means dead, had almost reached a stalemate; the system of state secular education had been launched; a great new overseas empire had, despite popular hostility, been founded; and French industry and agriculture were on the whole making slow yet solid progress. The state clung to its protectionist and mercantilist traditions and was developing certain standards of industrial welfare. In 1874 the employment of children under 12 years old in factories had been prohibited, and factory inspectors had been appointed to enforce the law. The tariffs of 1881 cushioned farmers against the worst consequences of agricultural depression. But the sky was not clear, and the first big cloud to loom over the republic was the movement of Boulangism.

The Radical Republicans had allied themselves with the right and even with the extreme champions of revenge against Germany in opposition to Ferry's colonial policy. It was Georges Clemenceau, leader of the Radicals, who got Georges Ernest Jean Marie Boulanger included in the government in 1886 as "the only Republican general." Boulanger became minister of war and made himself popular both by his energetic execution of measures to reform and "republicanize" the army and by his dashing appearances at military reviews. No one since Gambetta had succeeded so well in capturing the hearts and imagination of the common people. But a people's army was valued mainly as a weapon of revenge, and Boulanger was given the enthusiastic backing of Paul Déroulède and his League of Patriots. When Bismarck, in his *reichstag* speech of Jan. 1887, named Boulanger as the greatest obstacle to good relations between France and Germany, popular opinion was left in no doubt: General Boulanger became "Général Revanche." He began to sponsor the demands of the Patriots for a revision of the constitution so as to produce a stronger and more directly popular executive. Thrown out of power when the ministry fell, in May, he was ready to conspire in order to further his own career. It was the Wilson scandal which gave him his chance.

It was discovered that Daniel Wilson, son-in-law of President Grévy, had conducted a thriving traffic in decorations and honours from the Élysée itself; and the scandal' implicated Gen. Jean Thibaudin, former minister of war and military governor of Paris. In the long crisis which ensued both the ministry and the president were forced to resign. The Royalists and Bonapartists began to pay court to Boulanger, and the royalist duchesse d'Uzès (Marie Clémentine de Rochechouart-Mortemart) lavished money upon his cause. He became the focus for all the forces hostile to the parliamentary republic. He was elected on the lists of several constituencies at once and in Jan. 1889 won a resounding triumph by getting elected for Paris itself. A coup d'état was staged. It failed mainly because Boulanger lost his nerve at the last moment. His incorrigible frivolity and laziness proved to be his downfall. The ministry, given breathing space as by a miracle, acted swiftly. It abolished the electoral device of *scrutin de liste* and the system of multiple candidatures which had made his successes possible. The new premier, Pierre Emanuel Tirard, took action against the League of Patriots and threatened to bring Boulanger to trial before the senate. Boulanger took fright, fled to Brussels on the appropriate date of April 1 and committed suicide on the grave of his mistress 30 months later.

The pattern of events, by which a dramatic revelation of parliamentary or ministerial corruption and weakness gave rise to a threat of insurrection and popular disorder, was to be repeated in later years. Boulangism was defeated, as MacMahon had been. by the formation of an "*union des gauches,*" a rally of the parliamentarians to save the republic. The regime was strengthened and its opponents weakened by the farcical failure of Boulangism. But the root causes of the crisis, a tendency to parliamentary corruption and to ministerial instability and the failure to reconcile many classes to the regime, remained. The years of Boulangism were also years of falling prices and wages, which induced an atmosphere of economic depression and considerable hardship. It was when such conditions coincided with a political crisis that the republic was most immediately in danger.

The Panama Scandal.—In 1889, when the Boulangist crisis reached its climax, the Panama Canal company failed. Eight years earlier the project had been launched for constructing a Panama canal by a company directed by Ferdinand de Lesseps of Suez canal fame. The difficulties of the undertaking had proved enormous, and it had received no official support until the end of 1888. By a succession of loans it had raised 1,040,000,000 fr., and when it went into liquidation the shareholders appealed to the government to safeguard their interests. Lesseps and some of his colleagues were charged with corruption, and although the charges were not proved the Boulangist deputies and their supporters in the country could again raise the cry of corruption in high places. In particular, it was alleged that deputies had been bribed by a Jewish financier, Baron Jacques de Reinach. When Reinach was found dead and another Jewish financier, Cornelius Hertz, who had been blackmailing Reinach, fled to England, a commission of inquiry had to be set up. Clemenceau, who had uncomfortably close associations with Hertz, was denounced as being in the pay of the British foreign office. Proceedings were started against five deputies and five senators, including five ministers or former ministers. Although in the end only a former minister of public works was convicted (on his own confession) and the allegations against Clemenceau rested mainly on forgeries, the whole affair came too soon after the Wilson scandal and the Boulangist scare to be comfortable for the regime. The short-range effects were to end the career of Charles Floquet and to check the career of Maurice Rouvier, to oust Clemenceau for a time from the chamber in which he had sat continuously since 1876 and to bring to the fore new and younger men such as Paul Deschanel and Théophile Delcassé, Jean Louis Barthou and Raymond Poincaré. Anti-Semitism, which had been growing since 1885, received fresh impetus. In the elections of 1893 the Radicals collaborated with the Socialists and drew further away from the right-wing Republicans, while Socialist deputies increased in number from 12 to 49.

Labour Organizations, to 1902.—Syndicalist organizations had grown faster after trade unions were legalized in 1884. Membership of legally constituted unions was only 140,000 in 1890, but grew to 420.000 by 1895; it reached a total of 589,000 by 1901. In 1892 the *bourses du travail* (labour exchanges), which had become local centres for syndicalist activities, formed themselves into the national Fédération. Three years later, in 1895, the trade unions formed the Confédération Générale du Travail (General Confederation of Labour), which competed with the Fédération for the support of workers and their unions. In 1902 the Fédération was merged into the C.G.T., which henceforth became the official national representative of organized labour movements.

The prevalent doctrine of the C.G.T. was direct action: that is, it sought to promote workers' interests not by political action and not by supporting Socialist parties in the assembly but by collective bargaining and use of the favourite revolutionary weapon of the general strike. In 1893 more than 3,000,000 man-days of labour were lost by stoppages. Within its ranks were included a wide variety of revolutionary doctrines, Marxist and anarchist and syndicalist, and there remained few links and often little sympathy between organized labour and the parliamentary Socialist groups. This profound cleavage within the ranks of left-wing movements weakened them while it also weakened the authority of parliament. The 19th century ended with a decade of strikes and the 20th began with another. The social legislation passed around the turn of the century was not far-reaching: a ten-hour factory act in 1900, accompanied by more thorough factory inspection; joint consultative councils of labour and employers, to advise the government and to mediate in labour disputes. But it was denounced as feeble bribery by the revolutionaries of the C.G.T. for whom the class war was an article of faith. These two decades were a period of rising prices and industrial expansion, coinciding with the influx of gold from South Africa. The aim of labour organizations was, partly, to ensure a larger share of the profits of expansion for the workers and to force up wage levels to keep pace with prices; but it was also to propagate revolutionary doctrines among the French working classes. This divergence of ends led to a conflict about means. While parliamentary Socialists like Jean Jaurès, Aristide Briand and Alexandre Millerand preached some reconciliation of classes within the state, the C.G.T. preached the class war. In consequence, material gains were sacrificed for ideological differences.

The Dreyfus Case (1894–1906).—It was against this background of mounting social tensions and political controversies that there occurred the most famous and far-reaching of all the sensational *affaires* of the republic: the Dreyfus case. In 1894 Capt. Alfred Dreyfus, of the staff of army headquarters, was accused of having sold military secrets to Germany. He was condemned, disgraced and sent to Devil's Island. Most Frenchmen accepted the verdict that the young Jewish officer was guilty, until in 1897 his family's efforts to prove his innocence received unexpected support from Col. Georges Picquart of the intelligence service. He found strong evidence that the memorandum which had served as the main documentary proof of Dreyfus's guilt had been forged by a shady artillery officer, M. C. F. Walsin Esterhazy. He reported this to the vice-president of the senate, Auguste Scheurer-Kestner, who joined with the Dreyfus family in bringing a formal charge against Esterhazy. The great novelist Bmile Zola and the formidable fighter Clemenceau took up their cause.

Esterhazy was duly acquitted by a secret court martial and hailed as a popular hero. But Zola, in an open letter to the president of the republic headed *J'Accuse*, threw down a challenge that no parliamentary government could ignore. He alleged an army conspiracy to condemn Dreyfus despite his innocence. When he too was tried and condemned, public opinion still showed itself to be against Dreyfus. Crowds shouted "Death to the Jews" and even "Death to Zola." It was 1898 before the tide turned.

In that year the new Radical minister of war, Jacques Marie Eugène Godefroy Cavaignac, disclosed in the chamber some of the evidence on which Dreyfus had been condemned. Picquart offered to prove that one of the documents produced did not refer to Dreyfus and that two of the others were false. Colonel Henry, who had been appointed to Picquart's post in the intelligence service and who had been involved in the conspiracy, committed suicide after confessing his own guilt. Esterhazy escaped to England. These events made a retrial inevitable, and now public opinion was wildly excited and swinging over to the Dreyfusard side. The rights and wrongs of Dreyfus as an individual dropped out of sight, and the affair became a highly explosive national controversy. Nationalists, clericalists and right-wingers tended to be anti-Dreyfusard; Republicans, anticlericals and Socialists tended to be Dreyfusard. Dreyfus became a symbol of the conflict between militarist, nationalist authoritarianism and civilian, republican concepts of individual rights.

All other events—such as the sudden death of the president of the republic, Félix Faure, in 1899, and the election of Émile Loubet instead of Jules Méline to succeed him—were interpreted as items in the *affaire Dreyfus*. It was only the formation of a new ministry headed by René Waldeck-Rousseau in 1899 that brought the matter to a culmination, for demonstrations and counter-demonstration~were threatening public order.

The new ministry, like its predecessors in the MacMahon and Boulangist crises, was an *"union des gauches"* for Republican defense. It took strong measures, arresting and punishing even Déroulède himself. The retrial of Dreyfus, which began at Rennes in Aug. 1899, attracted world-wide attention. He was again found guilty of "intelligence with the enemy," but "with extenuating circumstances"; and he was shortly after pardoned by President Loubet. It was 1906 before the Rennes verdict was also quashed and Dreyfus was restored to full rights by a resolution of the chamber of deputies.

Probably the reason why the Dreyfus affair was so disruptive in French life must be sought beyond the apparent battle of political forces which filled the stage at the time. The church was a weaker challenge to the republic after the period of *ralliement* inspired by Pope Leo XIII in 1892, and this weakness showed itself in the relative ease with which, by 1905, church was separated from state. Popular opinion lost interest in it when the issues became so complicated; and the affair played a very small part in the general elections of 1898. There is evidence that the middle-class centre parties were more anxious about the growing threat from the left than about the challenge of the right, and Waldeck-Rousseau undoubtedly helped to split the Socialists when he took Alexandre Millerand into his ministry. There is a background of economic unrest and social discontent to the Dreyfus case as much as to Boulangism. Moreover, in historical perspective the affair can be seen as one further reason for the slow advance of social reforms in the republic before 1914.

Church and Army, From 1890.—Conflict between the church and the republic, so active in the 1870s, became latent for a short time in the 1890s because of the movement known as the *ralliement.* It was the most serious and hopeful effort to reconcile Catholicism with the republic. Beginning in 1890, it took clear shape in 1892 when Pope Leo XIII ordered Catholics in France to obey the laws of the republic. It bore fruit in the work of Comte Albert de Mun and a new leniency in the application of the anticlerical legislation. But the bitterness aroused by the Dreyfus case undid most of its benefits. The quarrel entered upon a new phase in 1901 when the formation of free associations was, for the first time, fully allowed in France, but religious congregations could be formed only with special authorization and could be dissolved by decree. This measure was aimed especially at the Assumptionists and the Jesuits. Then Émile Combes, a high dignitary of Freemasonry, who succeeded Waldeck-Rousseau in 1902, suppressed nearly all the congregations and took away their right to run schools (1904). The conciliatory Leo XIII had died in 1903, and his successor, Pius X, upheld papal claims more inflexibly. The conflict revived quite suddenly with the conjunction of intractable leaders on either side, and separation of church from state was the inevitable result.

Accordingly, in 1904, Combes introduced a bill for the separation of church and state and for ending the concordat. Although he fell two months later (Jan. 1905), his successor Rouvier passed the bill into law in Dec. 1905. The republic guaranteed freedom of worship for all but ceased to give any official recognition or subsidy to any form of worship. Church endowments and revenues were to be handed over to new *associations cultuelles,* which would maintain religious services. But when the pope refused to countenance this, the state sequestered church property and handed over its funds to public charitable organizations. The separation was thus effected with more hardship and bitterness than was either intended or necessary. But it did much to kill the old anticlerical bitterness as a political force and freed the church itself from state interference.

To Republicans, clericalism and militarism were linked. There was substance in this connection, in that many families produced both priests and soldiers and clung to the traditions of monarchical France. The higher ranks of the army and navy mere traditionally held by men of Catholic traditions, and the Dreyfus affair brought this fact to notoriety. Since 1871 it had been a constant dilemma of Republicans that to defend French national security by conscription and by heavy military expenditures was also to undermine the republic by placing enormous influence and power in the hands of such men. Even a good "Republican general," as Bonaparte and Boulanger had shown, was prone to develop ambitions of caesarism. The problem of how to democratize the French army attracted the attention, in turn, of Gambetta. Clemenceau and Jaurks. The Dreyfus affair showed the strength of antimilitarism, which was bred of the boredom of conscription and of a military life in which no differentiation was made between the peasant and the scholar. The Radicals, intensely patriotic in the days of Gambetta, found themselves becoming antimilitarist. The Socialists, internationalist by doctrine and suspicious of a law of conscription that could permit the call-up of strikers to defeat a strike, were also strongly antimilitarist.

Jaurks, in his great work on *L'Armée nouvelle,* later tried to reconcile socialism with a democratic military organization. But a decade before 1914 the left parties were tending to be hostile to a large military establishment, whereas the right—identified with a policy of peace and of internationalism in the 1870s—was emerging as a more aggressively militarist and ultranationalist force in political life. This reversal of attitudes which occurred during the first half of the republic's existence was to be itself reversed again during the second half, when the right became defeatist or even "collaborationist" and the left the parties of "resistance" to Fascism.

International Relations (1870–1914).—The counterpart to the maintenance of a strong army and to preparation at first for a war of revenge against Germany and subsequently for self-defense against encirclement by Germany was a system of reliable alliances. Bismarck's aim after his triumphs of 1870 and 1871 was to keep France isolated in Europe and, if possible, embroiled in conflicts with its neighbours. For this reason he favoured a republic, as being least likely to find an ally among the monarchies of Europe, and welcomed French colonial expansion as likely to embroil it with Great Britain and Italy. For this reason too he sought alliances himself with Russia, Austria and Italy.

It was, therefore, the inevitable policy for the republic to win recognition for the regime, to settle colonial disputes with Great Britain and Italy and to win allies. Thiers did much to win European recognition for the republic. In 1893 France took the momentous step of entering into a treaty of alliance with Russia. Delcassé, minister for foreign affairs continuously from June 1898 until June 1905, was the main architect of French diplomacy. He strengthened the Russian alliance by lavish loans to the tsar. He made a commercial treaty with Italy in 1899 and allayed the fears that it had entertained about the French conquest of Tunis. In the same year he settled successfully the Fashoda incident, in which France and Great Britain fell into conflict about the Sudan, by agreeing to a definition of their spheres of influence there. In 1904 he crowned his work with the Anglo-French entente. The two countries defined their separate interests in Newfoundland, West Africa, Siam, Egypt and Morocco. Bismarck's plans were thus completely frustrated by 1904; but the price was the division of the European powers into two rival camps, for the triple alliance of Germany, Austria and Italy had been forged by 1882, and the triple entente of France, Russia and Great Britain was completed in 1907 by the agreement between Great Britain and Russia which French diplomacy helped to facilitate. The *entente cordiale* became the cornerstone of French foreign policy in the west, her alliance with Russia its counterpart in the east.

Once made, the entente was consolidated as much by German aggressiveness as by French diplomacy. When the German emperor William II visited Tangier in March 1905 and Delcassé advocated resistance, he was unsupported by his colleagues and resigned (June). But the fact that the French foreign minister had been forced out of office under German pressure only strengthened the entente. Likewise, the Algeciras conference of 1906, for which Germany pressed, mas in effect a victory for France because Germany gained little whereas it was agreed that France and Spain should police the Moroccan ports. By 1912 a French protectorate was formally set up in Morocco, and Great Britain entered into naval agreements whereby France concentrated its main naval forces in the Mediterranean and Great Britain transferred part of its Mediterranean squadron to the North sea. Although Great Britain was not bound by any formal alliance to defend France against German attack, these arrangements and the persistence of naval rivalry between Great Britain and Germany made it possible for France to rely on British help if need should arise.

The Political Scene in 1914.—The Radical ministry of Clemenceau and Joseph Caillaux, which came to power in 1906, set out an extensive program of reforms. It included provision for old-age pensions. income tax (hitherto not imposed in France), workmen's compensation, an eight-hour working day and governmental control of labour contracts and of the mines. It was the counterpart to the contemporary liberal reforms in England, but it mas obstructed at every stage and came virtually to nothing. The ministry ran into conflict with the C.G.T., and the decade before 1914 was a period of great social unrest. At the congress of Amiens in 1906 the C.G.T. formally dissociated the organized labour movement from any political party and so from parliamentary action and affirmed the general strike as the main weapon of revolutionary syndicalism. Strikes and riots in the big towns (Paris, Marseilles, Le Havre, Dunkirk) in 1907–08 spread to the countryside, and there was a strike among the vinegrowers of the south. A strike among post-office workers in 1909 was followed by a call from the C.G.T. for a general strike. It failed, but the need to repress such strikes split the Socialists from the Radicals and aggravated the already complex working of the multiparty system. Clemenceau had to rely more and more on his former enemies, the moderate and conservative Republicans, which was one reason why his original 17-point program of social reforms came to so little.

At the beginning of the 20th century it seemed as if the chronic ministerial instability of the republic was diminishing. Of the six ministries of the years 1899–1909, Waldeck-Rousseau's lasted three years, Combes's two and a half and Clemenceau's two and three-quarters. But between the fall of Clemenceau (July 1909) and the outbreak of World War I in 1914, ten ministries followed one another in quick succession, and only one (Briand's first ministry) lasted more than a year. So the political background to World War I was the reappearance of ministerial instability in an aggravated form. This weakness of the political leadership of France lasted throughout most of the war years, until Clemenceau formed his great ministry of Nov. 1917.

The main political triumph of the immediately prewar years was the passing of the three-year military service law under the leadership of Poincaré, who was elected president of the republic in Jan. 1913. In 1905, at the height of antimilitarist feeling engendered by the Dreyfus affair and by the growth of internationalist socialism, the length of compulsory military service had been reduced from three years to two and military expenditure drastically reduced. In 1912–13 Germany and Austria-Hungary increased the size of their armies, and the French military authorities, backed by Poincaré and Barthou, ielt compelled to restore the three-year period of service. But the measure was extremely unpopular. It met with energetic opposition from the Socialists and from most of the Radicals, who won striking victories in the elections of May 1914 by making opposition to the law one of the main planks in their policy. Only the stubborn persistence of the president and the actual outbreak of war in July saved the law from repeal.

As in Great Britain, the prewar years revealed signs of impending crisis in the parliamentary system and a decline of faith in constitutional methods of government. Outbreaks of violence, connected with the syndicalist movement, party conflicts and revolutionary anarchism, were becoming increasingly frequent. Parliamentary governments showed little sign of ability to deal with such developments. National finances were in grave disorder, the system of taxation defective and out-of-date.

Yet the pressure of local and sectional interests on deputies had increased, encouraging the lavish outlay of public funds on whatever projects were most likely to win votes. Issues irrelevant to the most pressing problems of the time, such as anticlericalism and controversies about proportional representation, still tended to oust more urgent matters from the attention of electorate, parties and parliament.

Cultural Prestige (1870–1914).—Whatever the shortcomings of the prewar political system, it had the supreme merit of allowing a high degree of freedom to the individual, and this made possible a remarkable flowering of French national genius in nearly every field of the arts and sciences. In literature, Anatole France, Émile Zola, Guy de Maupassant and Alphonse Daudet for prose and Paul Verlaine, Stephane Mallarmé and Charles Péguy for poetry; in philosophy, Henri Bergson; in science, Louis Pasteur, Pierre Curie and Marcellin Berthelot; in music Claude Debussy, Jules Massenet, Camille Saint-Saens, Georges Bizet, César Franck, Gabriel Fauré; in painting, Edouard Manet, Claude Monet, Auguste Renoir. Edgar Degas, Paul Cézanne and Paul Gauguin; in the social sciences, Georges Sorel, Gabriel Tarde and Émile Durkheim; on the stage, Sarah Bernhardt: these names are some index of the French contribution to European culture made by this era of freedom. Paris retained much of its old role as a fountainhead of European thought and progress. Writers, musicians, artists could find there a large and appreciative public eager to pay them respect. Even the tensions of French national life helped evoke some of the most original and persuasive writings of the period: those of Maurice Barrils and Charles Maurras, of Julien Benda and Robert de Jouvenel, of André Gide and the young François Mauriac. Some of the greatness was to depart after 1918, but at least before 1914 it was a veritable renaissance.

WORLD WAR I

The declaration of war by Austria-Hungary on Serbia on July 28, 1914, led to full mobilization by Russia and therefore to a declaration of war by Germany against Russia (Aug. 1). Germany declared war against France two days later and, on the next day, invaded Belgium. This precipitated Great Britain's declaration of war on Germany. Within a week, the two rival systems of alliances were brought into action, and the Anglo-French entente became a formal alliance.

The German plan, devised a decade earlier by Alfred von Schlieffen, was to deliver a knockout blow to the heart of France. German armies, advancing in a great hammer sweep through Belgium and northern France, were to envelop Paris. The Belgian army and the British expeditionary force took the first shock of the blow, but the German armies came perilously near to Paris. Only the cool courage of Joseph Joffre and his troops and the enterprise of Joseph Gallieni saved the capital. In the decisive battle of the Marne in September the Schlieffen plan was foiled. Both sides dug themselves in, and from the Vosges to the sea an improvised line of defenses became the French frontier. This deadlock on the western front was not much altered until 1917 and not broken until 1918. It meant prolonged occupation of France's northern provinces, much of which country was turned into a battlefield.

The crises of the war in the west were, for France, the checking of the initial German offensive, which was achieved by the end of 1914; the battle for Verdun (Feb.–Aug. 1916); the mutinies and unrest in the French armies (autumn 1917); and the checking of Ludendorff's offensive in 1918, which led to ultimate victory under Ferdinand Foch. The battle of Verdun originated in an attempt, not unlike that of the Schlieffen plan, to knock France out. The German chief of staff, Erich von Falkenhayn, hoped that, with an all-out offensive against so crucial a point as Verdun, he could "bleed France to death" by annihilating its best troops. It was a serious miscalculation to expect that a limited and local action could yield such decisive results, yet he succeeded in smashing several French divisions and inflicted heavier losses than he suffered. But, at heavy cost of life and material, the French held Verdun, and Gen. Henri Pétain became a national hero. The Franco-British offensive on the Somme, in July 1916, brought some of the fiercest fighting of the war. So, too, did the costly and unsuccessful offensive under Robert Nivelle in the spring of 1917. Disheartened by losses and prolonged strain and by the spread of pacifist feeling, sections of the French army mutinied. Pétain, as the hero of Verdun, was sent to quell the mutiny, and by severe measures he succeeded. The entry of the United States brought little relief immediately, whereas the withdrawal of Russia from the war, after the October Revolution, freed Germany from the burden of major offensives on two fronts. Both events made the battles of 1918 a desperate climax to the whole war.

Before these decisive battles, the western powers set up a supreme war council. The French forces, under Pétain, had to defend Paris; the British, under Douglas Haig, had to defend the channel ports. There was danger that the Germans by striking at the junction of the two forces might split them. At last, in April 1918, Foch was appointed commander in chief of the Allied armies. German offensives failed, and when Foch counterattacked on the Marne German retreat began. U.S. backing in men, equipment and supplies now became decisive. The simultaneous collapse of Germany's allies in Bulgaria, Turkey and Austria-Hungary forced it to sue for peace. An armistice was signed on Nov. 11, 1918, in Foch's railway carriage in the forest of Compiilgne.

France's northern industrial areas had been ravaged by 52 months of unbroken warfare. Towns and mines, factories and farms, were in ruins. About 1,400,000 Frenchmen had been killed and as many again disabled. Direct war expenditure had been about 150,000,000,000 fr. The economic dislocation and human misery caused by the war were incalculable. The war bequeathed to France vast tasks of reconstruction with a depleted labour force, a declining population and a public debt of about 219,000,000,000 fr. On the other hand the invader had been expelled and defeated, and France recovered the rich provinces of Alsace and Lorraine, lost in 1871; so that the menace which had haunted the previous 50 years seemed, for a time, to be removed. The mood of the French people in 1918 was a mixture of exhaustion and relief, combined with a resolve that from enemies and allies alike some reliable guarantee should be sought against any recurrence of the disaster.

The parliamentary republic, too, seemed to have been vindicated and, in the mood of optimism about the future of democracy that prevailed in 1919, was no longer the potential pariah among governments that Bismarck had tried to make it in 1871. Parliamentary governments, it was true, had not emerged brilliantly from the early years of the war. France's political leaders had been small and undistinguished men unworthy of leading a great nation in crisis, and it was to the generals and the millions of common soldiers that the nation had turned in time of need. But there was one exception: Clemenceau, who at the age of 76 had become the real organizer of victory in 1917 and had been mainly responsible for getting Foch made commander in chief. His ministry was formed mostly of nonentities whom he himself described as "the geese that saved the Capitol." With the simple maxim, *Je fais la guerre*, he had ruled almost autocratically and often arbitrarily. But drastic suspensions of normal parliamentary powers and civil liberties were widely accepted as unavoidable in wartime. The *union sacrée* in face of national peril, always more a psychological conception than a political reality, rested on the surrender of virtually dictatorial power to the government. The control of finance by the chambers practically lapsed, save for periodic outcries about extravagant expenditure.

The Conference of Paris (1919).—It was appropriate tribute to the part of France in the war that the peace conference should be held in Paris and that Clemenceau should serve as its president. The question which dominated the old man's thoughts was how the settlement could best serve the permanent interests of French security. The program, for France, was "restitution, reparation, guarantee." Restitution meant recovering the provinces of Alsace and Lorraine. The eighth of Pres. Woodrow Wilson's fourteen points of Jan. 1918 had declared: "All French territory should be freed, and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine ... should be righted ..." Reparation meant that Germany should contribute to the reconstruction of the devastated areas. Guarantee meant ensuring that Germany should fulfil its obligations and also establishing material and diplomatic guarantees from the allies for French security. Foch wanted control of the bridgeheads of the Rhine, and Clemenceau produced a plan for separating the whole Rhineland from Germany.

By the treaty of Versailles, signed on June 28, 1919, the left bank of the Rhine was demilitarized, along with a zone about 30 mi. E. of the Rhine, and allied armies were to occupy the left bank and the bridgeheads for a period of 15 years. The amount of reparations to be paid by Germany was to be decided by the Reparations commission. It was a much more flimsy guarantee than France had hoped; and instead of indefinite occupation or separation of the Rhineland, France mas given a joint Anglo-American promise of support if it were attacked by Germany.

As Great Britain and the United States rejected his plan, Clemenceau was placed on the horns of a dilemma at the conference. He had to choose between holding on to the material guarantees at the cost of diplomatic isolation and exchanging the material guarantees for diplomatic assurances. He chose the second course, but when the U.S. senate refused to ratify the treaty and renounced U.S. assurances, Great Britain also renounced its.

France was therefore left, in the end, with neither material nor diplomatic guarantees, save the hope of exacting crippling reparations from Germany and the general prospect of "collective security" provided by the covenant of the League of Nations (articles x, xvi, xvii). France entered the postwar years with an acute sense of insecurity aggravated by a feeling that it had lost some of the most precious fruits of the victory so dearly bought with French lives.

The remaining material securities had three defects from the French point of view. Germany was to pay reparations only for all damage done to civilians and their property, not for the whole cost of the war. The coal mines of the Saar were ceded to France not permanently, as Clemenceau had asked, but for only 15 years, at the end of which a plebiscite was to be held. Likewise the military occupation of the Rhineland areas was also to last for only 15 years. This, it could be argued, was just the time needed for German recovery and resurgence, so that these securities would expire at the very time when France might need them most.

French enthusiasm for the new League of Nations was, moreover, very restrained. During the discussions of the project Leon Bourgeois had produced a plan to give the League power to enforce military sanctions with an army of its own. This plan had been rejected by Great Britain and by the United States; and even the covenant itself was rejected by the United States, which did not become a member of the League. So the League was, in French eyes, most unlikely to provide the substantial security against war and against defeat in war that France needed. Yet the success of the League would now clearly depend on how far Great Britain and France together could give it leadership. Within or without the League, relations with Great Britain were to remain the crucial problem of French foreign policy after 1919, as they had been in the years before 1914.

INTERWAR PERIOD, 1919-39

In parliamentary life, peace brought a reaction against wartime discipline and a reversion to close parliamentary control over the executive. For the general elections of 1919 the method of *scrutin* de *liste* was revived, in conjunction with a restricted variant of proportional representation which favoured the most highly organized parties. The resulting *chambre bleu horizon* was dominated by ex-servicemen who constituted the conservative Bloc National, which cut across the Radicals but excluded the Socialists. Clemenceau, who was attacked for his failure to get better terms in the peace treaties, resigned in Jan. 1920, having held power for just more than two years.

He was succeeded as premier by Alexandre Millerand and failed to be elected president of the republic. His persistent anticlericalism put him out of sympathy with the right-wing majority of the chamber and senate, and his overthrow was in part a reassertion of parliamentary power against the man who had himself, before the war, smashed so many ministries.

Paul Deschanel, chosen as president in preference to Clemenceau, had a breakdown in Sept. 1920 and was succeeded by Millerand, whose place as premier was taken by Georges Leygues. Millerand's aim was to be strong with Germany and with the chamber at home. From 1922, when Poincaré became premier, French policy abroad became increasingly intransigent. Chamber, premier and president were agreed on a nationalistjc policy toward Germany. Briand had been forced by Millerand to resign, in Jan. 1922, because he showed signs of making concessions to Germany.

This showed a new authority and vigour for a president of the republic. But Millerand's attempt, after the victory of the Cartel des Gauches in 1924, to reassert the right of president and senate to dissolve the chamber was vigorously resisted by the Cartel, and he was forced to resign. It was almost a repetition of the MacMahon crisis of 1877 and ended similarly. No subsequent president repeated the attempt, and after 1924 the presidency reverted to the pattern of the prewar years.

The policy of the Bloc National was further discredited by the relative failure of its most drastic action against Germany, the occupation of the Ruhr in 1923. Germany was behind in its payment of reparations, and Poincaré decided to "put the bailiffs in," despite British disapproval. But he did not succeed in making Germany pay; the French troops met with passive resistance by the Germans; and the franc suffered from the additional financial burden and from the sharp decline of international confidence that resulted from the French action.

Poincaré was trying, in effect, to retrieve some of those material securities which Clemenceau at the conference had exchanged for diplomatic guarantees. But the choice had been made once and for all then, and France now had no real alternative but to cling to collaboration with Great Britain.

The reaction against this policy was embodied in Aristide Briand. A man of the left with a fervent and almost mystical belief in internationalism, he came to wield a curious power in the exhausted France of the postwar years. He became the main spokesman of France at Geneva and one of the leading figures in the League as the "apostle of peace" and rivalled the prewar Delcassé in his length of tenure of the ministry of foreign affairs. He was 11 times premier of France and, from April 1925 until Jan. 1932 (a few weeks before his death), he was except for one day continuously in charge of French foreign policy. He accepted, as Poincaré would not, the only alternative left to France: wholehearted support for the League, close co-operation with Great Britain and a policy of *rapprochement* with republican Germany. Thus, by 1924, foreign policy was in essentials fixed in the pattern that it was to follow, with occasional hesitations, until 1940.

There was, however, another aspect of it which was a consequence of French disappointment with the terms of the peace treaty. The postwar governments sought separate alliances to shore up the League's provisions for security. France made a military alliance with Belgium in Sept. 1920 and with Poland in Feb. 1921. In the course of the following years it was also to make alliances with the states of the little entente: with Czechoslovakia in 1924, with Rumania in 1926 and eventually with Yugoslavia in 1927. The Bolshevik Revolution in Russia had confronted the peacemakers with a new and mysterious terror; and the idea of a *cordon sanitaire* in the east, which should insulate Europe from Bolshevism, coincided with French desires to encircle Germany with a ring of friendly and allied states. It was felt that the new and the augmented states of central and eastern Europe, owing their frontiers to the postwar settlement, would inevitably be opposed to any revision of it and so would be reliable allies against a resurgent Germany. But these additional securities, it must be noted, were still in the nature of diplomatic rather than material guarantees and engaged France to extended commitments in eastern Europe.

The economic aftermath of war was, for France, even farther reaching. Its finances had been constantly neglected since 1914, and it had financed the war largely by borrowing at home and abroad. It had relied for revenue chiefly on indirect taxation. Income tax, in a complicated and inadequate form, had been introduced only in 1917. Excessive reliance on short-term loans and unbalanced budgets linked public confidence—and therefore the franc—with governmental prestige at home and national credit abroad. In 1918 the franc stood at half its prewar value. By 1920 real wages fell below the 1911 level, although by the next year they were in general higher. The peace therefore began with a return to the large-scale strikes which had marked the prewar years. In 1919 there were about 2,000 strikes involving many more than 1,000,000 workers. At the Socialist party congress at Tours in 1920 occurred the split between the adherents of the old second international and those of the new third international, centred upon Moscow. A new French Communist party was formed, and the same split occurred within organized labour, leading to the Communists' founding the Confédération Générale du Travail Unitaire (C.G.T.U.) in rivalry with the C.G.T.

The structure of French industry was greatly changed by the reorganizations and dislocations of wartime production. Heavy industries and mining developed faster than ever before, and postwar France was a much more highly industrialized nation than the France of 1914. A total of 100,000,000,000 fr. was spent on reconstruction of the devastated areas, and the recovery of Alsace and Lorraine augmented both the industrial resources and the industrial manpower of France. The size of units of production and the methods used were different. The silent French revolution of 1914–18 was the displacement of the prewar industrial worker, technically skilled, alertly intelligent and politically individualist, by the operatives of mass production, herded into the big towns and including in their ranks many foreign immigrants. The influx of foreign workers, welcomed because France's manpower was dwindling, went on until by 1931 there were more than 1,500,000 of them in France. Agriculture, prosperous outside the occupied areas in wartime, remained one of France's greatest sources of wealth. Protected fiscally from world depression and gradually adopting more scientific methods, it was still the greatest single industry. But the conflict of interests between farmers, who wanted high tariffs and high prices for food, and industrial wage earners, who—especially in times of inflation—wanted lower tariffs and lower prices for foodstuffs, was now more than ever acute.

Recovery and Crisis (1924–1936).—By 1924 the worst problems of the aftermath of war seemed to have been overcome. Most of the devastation had been made good, and newly equipped and modernized factories were producing more goods. The franc, still shaky because of the persistence of unbalanced budgets, had at least been stabilized for a time by Poincaré. The treaties of Locarno (1925) inaugurated the new phase of international conciliation identified with the reign of Briand at the Quai d'Orsay; and the Dawes plan for reparations payments restored allied unity on that issue. Germany became a member of the League in 1926. The Cartel des Gauches, led by Edouard Herriot, gained a large majority in the elections of 1924 and for the next two years Herriot, Paul Painlevé and Briand alternated in ruling France.

The major problem confronting these governments of the left was still the financial problem of inflation and the stability of the franc. The old anticlerical issue raised its head once more when secular education was introduced into Alsace and Lorraine, and the antimilitarist issue recurred in the form of left-wing hostility to military service and advocacy of disarmament. But the fiscal and financial problems were the most intractable. By 1926 the franc fell to 240 to the pound (as against 70 two years before), and the Radicals broke with their Socialist allies in the Cartel and rallied to Poincaré and the conservatives. The chamber granted Poincaré powers to deal with the crisis by decree laws—a power which it had denied both Briand and Caillaux six months before; and by the law of Aug. 10, 1926, the national assembly, convened at Versailles, modified the constitution to establish a sinking fund (caisse autonome . . . d'amortissement). Poincaré succeeded in checking the decline of the franc and restored confidence. By a policy of stringent economy and cheap money, combined with the sinking fund, he inaugurated another three years of relative calm and prosperity.

The Union Nationale of Radicals and Poincarists fell apart after the elections of 1928. Poincaré gave up the premiership in 1929 because of ill-health, and the stage was left free for a succession of younger but lesser men such as André Tardieu, Camille Chautemps and Pierre Laval: adept parliamentary politicians and party tacticians, but lacking the qualities of statesmanship needed in the gathering storm.

The difficulties confronting the nation called for supreme statesmanship. The world economic crisis broke in 1929. Its immediate effects on France, thanks mainly to its relatively well-balanced economy, were less catastrophic than in Germany, Great Britain or the United States. The nation depended less on foreign trade for its prosperity, and not until 1931 was it seriously affected. But in Germany the effects were startling and they nurtured the growing National Socialist party, which won more than 13,000,000 votes in the German presidential election of 1932. Laval, the French premier from Jan. 1931 to Feb. 1932 (and again from June 1935 to Jan. 1936), countered the economic crisis with a lavish use of decree laws at home and the international crisis by personal visits to Berlin, Washington, Rome, Warsaw and Moscow. He tried to win Italian support as a counterbalance to Hitlerite Germany and opposed League action against Italy when it attacked Abyssinia in violation of the covenant of the League.

It was a period of acute ministerial instability. Between the resignation of Poincaré in 1929 and the formation of the popular front government under Léon Blum in 1936, there were no fewer than 20 ministerial crises. No government could rely on a large majority, and neither the Union Nationale nor the Cartel des Gauches could re-form. It was the gloomiest phase in the history of the parliamentary republic and the period of most undistinguished leadership.

The Staoisky Affair.—In the midst of these difficulties the parliamentary regime was beset with a scandal reminiscent of the 19th century. In Jan. 1934, when the effects of the world crisis had at last begun to make themselves more acutely felt in France and unemployment figures were rising, the shady financier Serge Alexandre Stavisky, whom the police were pursuing, was found dying, It was widely believed that his alleged suicide had been "arranged" by the police, in conspiracy with the premier, Chautemps, and that the motive was to prevent revelations of corruption involving politicians, police, judiciary and eminent businessmen. The affair, coming at this moment of social discontent, evoked street demonstrations and riots and rumours of plots to overthrow the regime. Right-wing and paramilitary formations (Action Française, Jeunesses Patriotes, Croix de Feu), which had grown up in France, as in most other European countries after the war, staged protests: the left, led by the Communists, staged counterdemonstration~. Riots on Feb. 6, 1934, aroused echoes of earlier Paris revolutions, and within a week a general strike was proclaimed. Edouard Daladier, the alleged "strong man" of the Radicals who had become premier only a few days before, resigned. It looked as if the government was abdicating in the face of disorder, for it was the first time in the history of the republic that a ministry with support in the assembly had given way before extraparliamentary pressure. It was the lowest ebb of the third republic.

Gaston Doumergue was summoned, as veteran statesman, to form a new government of national union. It comprised all parties in the chamber save the Socialists and Communists. It restored confidence, quelled the disturbances and ruled by decrees. Again, the chamber saved itself by abdicating power, for the emergency, to the executive. But the armed right-wing leagues were not disbanded, and the deflationary policy of the government soon lost it the support of the Radicals.

The German Occupation of the *Rhineland.*—Meanwhile, the flimsy safeguards which France had won from the peace settlement disappeared one by one. The allied troops left the Rhineland in 1930 (five years before evacuation was due). A plebiscite held in Jan. 1935 in accordance with the treaty returned the Saar to Germany, whereupon Germany announced rearmament, in violation of it. Then. on June 18, 1935, came the Anglo-German naval agreement, which shook French confidence in Great Britain and strengthened Laval's argument that France must seek an understanding with Germany. When Hitler occupied the Rhineland on March 7, 1936, and denounced its demilitarization as well as the treaties of Locarno, France, which had no longer any reason to rely on the discredited League but had at this point both the means and the justification for independent action, did nothing against the aggressor. Thenceforward it was left facing a militant Germany, without faith in former allies (Belgium declared its neutrality in Oct. 1936, in departure from the alliance of 1920) and without any of the guarantees of security so laboriously sought since 1918.

The Popular Front (1936–38).—The elections of April–May 1936 were fought by the Radicals in collaboration with the Socialists and Communists within a new "popular front." The result was a decisive victory for the left, with antifascism replacing anticlericalism as the cement of this new version of the Cartel des Gauches. Although the Communists did not take part in the government formed by Léon Blum, the Socialist leader, the government was a much more broad-based left-wing coalition than any of its predecessors. Its program, moreover, on which it came into power, included a more comprehensive series of social and economic reforms than any previous one, and these reforms were supported by the Communists.

With 500,000 unemployed receiving relief and many others out of work, the economic crisis was at its most acute. Since 1919, despite two periods of left-wing rule, only two social measures of importance had been passed by the assembly. One, of 1928 and 1930, provided for a scheme of social insurance; another, of 1932, set up a system of family allowances. The popular front's program included schemes of public works, a national grain board, more extensive unemployment relief and old-age pensions, control of the Bank of France by the state, the nationalization of armaments industries and—most controversial of all—a reduction of the working week to 40 hours and a more steeply graded income tax. Faced from the outset with an epidemic of "stay-in" strikes, staged by the extreme left to "push the government," Blum managed to bring the C.G T. and the employers' representatives together in the Matignon agreement. This recognized collective bargaining contracts, an all-round wage increase ranging from 7% to 15% and the creation of workers' delegations to deal directly with factory managements. Léon Jouhaux, general secretary of the C.G.T., hailed it as "the greatest victory which the working class has won in its whole history." The agreement was confirmed by the Collective Bargaining act (June 1936). The 40-hour week and holidays with pay were also introduced by legislation. Within two years, the popular front government succeeded in implementing all major points in its electoral program. It was the most intense period of social reform in the history of the republic. None of its achievements, except the 40-hour week, was subsequently undone.

In June 1937 Blum gave way to a revised popular front government under Chautemps, a Radical, and the chamber gave him plenary powers to deal with the financial situation which had deteriorated under Blum. The gold stocks in the Bank of France had shrunk to a figure below the 50,000,000,000 fr. deemed essential for security. The franc was taken off the gold standard and was devalued. The rise in prices and wages, the expenditure on armaments, a decline in production and a deficit in the trade balance all conspired to create yet another financial crisis. At no period between the wars did France gain a position of financial stability.

During 1938 the popular front disintegrated. In January Chautemps remodelled his cabinet as a purely Radical ministry, but it was unsupported by the Socialists and Communists and lasted only two months. Its resignation coincided with the annexation of Austria by Hitler. Blum's attempt to establish another popular front ministry lasted less than a month. In April Daladier formed a new Radical ministry, which held power when World War II broke out in Sept. 1939.

The popular front experiment was not without its successes, nor was it overthrown. It was smothered by the looming clouds of war, and its greatest failures were in the field of foreign policy. Its policy of nonintervention during the Spanish Civil War, in which it was backed by Great Britain, and its failure to arrest the progress of Hitler's Germany toward the domination of Europe have been severely criticized. But it is arguable that after the German occupation of the Rhineland in March 1936 no decisive action to stop Hitler without war was practicable. Thereafter the helplessness of France in face of the relentless course of events and its inevitable drifting along in tow of Britain left it with little or no initiative.

The latter years of the republic were marked by open conflict between parliamentary forces on the one side and the forces of both fascism and communism on the other. The international tensions were reflected in its internal conflicts. Blum took vigorous action against the right-wing forces: in June 1936 he disbanded the Croix de Feu, Col. François de la Rocque's league (immediately revived as the Parti Social Français, it was again to be declared illegal in Dec. 1937); and in Nov. 1937 he exposed the monarchist conspiracy of the Cagoulards or Comité Secret d'Action Révolutionnaire (C.S.A.R.) under Eugène Deloncle, which aimed at overthrowing the republic by armed insurrection. Daladier took action against the Communists. defeating the attempt at a general strike in Nov. 1938 and arresting Communist leaders on the outbreak of war. But both fascism and communism were rooted in the recurrent economic crises and social distress of the period, and political action against them did nothing to destroy the roots from which they drew strength. One was to gain strength during the wartime governments at Vichy, the other was to revive with renewed power after the war.

WORLD WAR II

Though the length of compulsory military service and the strength of the professional army had been greatly increased in view of the growing international tension after 1934, France in 1938 found itself committed to a small professional army and static defenses—the Maginot line had been built along the Franco-German frontier—rather than to massive forces and mechanization. It maintained a strong fleet, but the air force in 1939 was pitifully small. Given the greater manpower resources of Germany, only complete solidarity with Great Britain could enable France to hold its own, even in defense. Daladier could do no other than follow the lead of Neville Chamberlain, the British premier, in making the Munich agreement which dismembered Czechoslovakia in 1938. In March 1939 he likewise followed suit in promising support to Poland if it should become the victim of aggression from Germany. In September, when Germany invaded Poland, the French declaration of war came about five hours after the British.

There followed, until May 1940, the phase known as "the phony war." At the outbreak of war France immediately mobilized all available manpower and manned the Maginot line. After Poland had been overrun by German and Russian forces and partitioned, France stood waiting for the attack. It did not come for eight months, and the strain of waiting was greater in France than in Great Britain. German propaganda seeped into many sections of French opinion, and boredom sapped morale. In May 1940 Paul Reynaud succeeded Daladier as prime minister; the German attack began on May 10, through the Netherlands, Belgium and Luxembourg. Five days later the Germans broke through the defenses of the Meuse and enveloped Sedan. Within two months this defeat led to the collapse of the French armies and to an Italian declaration of war on France. Deficient in armour and aircraft and ill-trained and ill-equipped for a war of fast movement and armoured weight, the French armies could not resist the German armoured divisions and air force. Great Britain could send only ten divisions and inadequate air cover. Reynaud's government fled to Bordeaux in confusion, and on June 16 Reynaud resigned and made way for

Marshal Pétain, who had throughout favoured coming to terms with Hitler before total collapse,

The Armistice (1940), Vichy and Resistance.—Pétain sought an armistice, and on June 22 it was signed in Marshal Foch's old railway carriage in the forest of Compiègne. Two days later a similar convention was signed with Italy. The French government was left in nominal control of the whole of France and its colonies except Alsace and Lorraine, which were annexed to Germany. But the Germans claimed the "rights of an occupying power" in all areas north and west of a line drawn across France from the Swiss frontier near Geneva through Bourges to a point east of Tours and then southward to the Spanish frontier at St. Jean-Pied-de-Port. The country thus fell into two zones, and the line of demarcation remained the limit of German military occupation until Nov. 1942. Paris and the main industrial areas of the north, as well as the channel and Atlantic coasts, were in German hands. The unoccupied zone was mainly agricultural but included the Mediterranean coast, which gave access to the North African colonies. Germany held about 2,500,000 French prisoners of war, required the French to pay the costs of occupation and allowed them a small army of 100,000 men and the whole of the powerful French fleet, though this was to be disarmed. The whole arrangement was designed to be a stopgap until Great Britain had been conquered.

Although France was taken out of the war by the armistice and was to be ruled for the next four years by the governments of Vichy under the name of Marshal Pétain, parts of the French nation continued the fight. Even before the armistice was signed Gen. Charles de Gaulle, who had recently been made undersecretary of state for war by Reynaud, escaped to London and founded the Free French movement. During the second half of 1940 the equatorial colonies of Chad and the Cameroun were led over to the Free French, and General de Gaulle found himself not only leader of a voluntary movement of Frenchmen to continue the war but responsible for administering a large colonial area. Inside France, by the end of 1940, various local movements of resistance had also formed, designed to frustrate the occupying forces. In course of time these movements not only grew and consolidated themselves but formed links with the external resistance of the Free French. When the battle of Britain had made it clear that calculations of British collapse were wrong and that the war in the west was by no means over, even some elements at Vichy found new possibilities for resisting the pressure of increasingly desperate German demands. Possession of the fleet and of the North African colonies and the right to administer the unoccupied zone without direct German interference gave Vichy certain foundations for independence. France therefore remained an important factor in World War II even after its military collapse.

Although not a member of the government when the armistice was signed, Pierre Laval joined it the following day and became the main architect of the Vichy regime. It was he who on July 10, 1940, persuaded the national assembly (summoned at Vichy to ratify the armistice) to grant Pétain authority to promulgate a new constitution (569 votes in favour, 80 against, 18 abstentions), so that Pétain was able, next day, to assume in his own name full legislative and executive powers in the "French state" (*état français*). The Vichy governments in fact survived for four years by never promulgating a new constitution. Their policy, and the elements moulding policy, changed in tune with the fortunes of the war. When the close collaboration adumbrated by the Montoire meetings of Pétain and Laval with Hitler and Ribbentrop in Oct. 1940 proved impracticable, a plot was formed at Vichy against Laval, who fell from power in Dec. 1940 and was succeeded as premier for a short time by Pierre Étienne Flandin and then by Adm. Jean Darlan. Backed by Charles Maurras's Action *française* (a paper that found in Vichy a chance to try out its traditionalist, semiroyalist doctrines inherited from the days when it had been founded to oppose the Dreyfusards), Pétain and Darlan embarked on a period of attentisme ("wait and see") in their dealings with Germany. Vichy became, at least superficially, a corporative state. The republican slogan of "Liberty, Equality, Fraternity" was replaced by "Work, Family, Fatherland." A labour charter was passed, and there was much talk of a Pétainist "national revolution." But in foreign relations Vichy looked to the United States for support and aimed at keeping Germany to the strict terms of the armistice.

In April 1942 Laval returned to power and contrived to convince the Germans that they could get more active collaboration from him. Germany was now engaged in massive war with Russia and with the United States and needed greater security in the west. But six months later the whole basis of Vichy's position was transformed. United States and British forces landed in North Africa, the main units of the French fleet were scuttled by their crews at Toulon, and Germany occupied the whole of France and disbanded the "armistice army" of Vichy.

Henceforth Vichy had no assets with which to bargain, except the cult of loyalty to Pétain (which still kept many Frenchmen, at home and overseas, obedient to the armistice) and the nimble wittedness of Laval. It became increasingly a tool of German policy and, by March 1944, included extreme collaborators such as the former Cagoulard Joseph Darnand and the National Socialist Marcel Déat. Admiral Darlan was assassinated in Dec. 1942 in Algiers, where he had aligned himself with the Allies.

Meanwhile the Free French movement had also been transformed in character. A French National committee, set up in 1941 under General de Gaulle, came to include spokesmen of various parties and resistance movements. In June 1943 it merged with the North African administration, under Gen. Henri Giraud, heir of Darlan, to form the French Committee of National Liberation. Its authority was enhanced by the creation of a provisional consultative assembly in Algiers, representing mainly the resistance movements of metropolitan France. After the Allied invasion of France on June 6, 1944, it moved to France and became the nucleus of a provisional government.

The internal resistance movements grew rapidly in strength and significance as large numbers of young men fled to the hills and open country to escape the German forced-labour laws. Living as outlaws in the *maquis* and aided by the country people and by supplies dropped by aircraft from Great Britain, they harassed German communications and transport in preparation for Anglo-American landings. The French forces of the interior were led by Gen. J. M. P. Koenig. The six months preceding D-day were a period of civil war in France, between the men of the maquis and the German gestapo aided by Vichy militias.

Thus the provisional government, based on resistance, took over from a regime in utter collapse immediately after a phase of acute civil strife. As operations against Germany continued for nine months after the liberation of Paris (Aug. 1944), it had to start rebuilding a regime in wartime conditions.

The Provisional Governments (1944–46).—In Sept. 1944 the provisional government was reorganized. It declared Pétain's "French state" abolished, together with all its laws, and announced that "legally the Republic has never ceased to exist." It won formal recognition by the Allies. The elections of Oct. 21, 1945, however, based on female as well as male suffrage, were not only to return new deputies to the assembly but also to decide whether the constitution of the third republic was to be maintained or not, and 95% of the electorate voted for the drafting of a new constitution. The constituent assembly contained three major parties almost equal in strength: the Communists, the Socialists and the Mouvement Républicain Populaire or Christian Democrats (M.R.P.). It had seven months of existence, in which to draft a new constitution and submit it to popular referendum. It proclaimed General de Gaulle head of the provisional government and entrusted him to form a ministry acceptable to the assembly. His ministry embarked on a program of immediate reforms which included the nationalization of credit, electricity and insurance and reform of the public services and civil service. But in Jan. 1946 he announced suddenly that he would resign. The Socialist Félix Gouin succeeded him.

Gouin's ministry was, in composition and policy, a continuation of General de Gaulle's. It was a coalition of the three largest parties. In May the draft constitution was rejected in the referendum, and a second constituent assembly was elected to try again. Georges Bidault now headed the ministry. In October the new draft was accepted by 9,120,576 votes against 7,980,333, but nearly one-third of the electorate abstained from voting. The new draft met with energetic criticism from General de Gaulle and his supporters and little enthusiasm from the country in general. It was accepted, like that of 1875, as the form of government that divided Frenchmen least.

THE FOURTH REPUBLIC

The electoral basis of the new regime was very different from that of the old. Women now had a vote. Proportional representation was adopted. The second chamber, now called the council of the republic, was granted very little power over legislation and was only a shadow of the old senate. But in all other major respects the constitution of 1946 was a continuation of the third republic. The centre of gravity of political power still lay in the lower chamber, now called the national assembly and elected for five years instead of four. Ministries were still perforce coalitions of parties and subject to the same bias toward instability.

The president of the republic, with the same tenure and functions as before, was still chosen by the chambers for his most unexceptionable qualities, and in Jan. 1947 the Socialist Vincent Auriol was elected the first president. The system of local administration through the *préfets* and of local elected assemblies remained substantially as before. (See *Government,* below.)

The most important differences arose not from the formal constitution itself but from the new balance of social classes and from the new alignment of political parties, which were more highly disciplined and organized than before. Postwar conditions in general favoured the agricultural interests as against the industrial workers. Inflation, shortages, a lag of wages behind prices and an endemic black market all tended to improve the standard of living of the countryman and depress that of the industrial wage earner and the salaried and professional classes.

Politically, the most important new factor was the power of the Communist party inside and outside parliament; a development closely connected with wage earners' plight in a period of rapid price rise and with the role of resistance movements in the period of liberation. From Nov. 1945, when De Gaulle first admitted Communists to the government, they had held for nearly two years some key posts in the national economy. This ministerial power was used to "colonize" large areas of industrial administration and management. At the same time, the party gained a strong grip on organized labour through the C.G.T. Throughout the first national assembly it was also the strongest single party, although after May 1947, when Paul Ramadier expelled the Communists from his cabinet, they were deprived of power. They relied increasingly on direct action to harass the government. and strikes were as much a feature of the early years of the fourth republic as they had been of the later years of the third.

In Dec. 1946 Léon Blum formed the only single-party ministry in modern French history. But his Socialist cabinet was designed as a caretaker one, pending the election of the president and completion of the new constitution; and lasted only six weeks. All subsequent ministries, until 1951, were variations on three-party coalitions of Socialists, Radicals and the Mouvement Républicain Populaire. with the addition of a few Independents and technicians

The M R.P. was mainly a creation of the resistance period and became the rallying ground for moderate opinion, including much Catholic opinion. In addition to Blum's ministry, there were ten such coalition cabinets during the life of the first national assembly (Nov. 1946–July 1951), an instability exactly comparable to that of the third republic, though with the same remarkable continuity and recurrence of personnel. The Socialist Jules Moch held an important post in every ministry, including Blum's, and in all ten cabinets foreign affairs remained with either Georges Bidault or Robert Schuman, both of the M.R.P.

These three-party coalitions came to be known as the "third force," because in April 1947 De Gaulle formed the Rassemblement du Peuple Français (R.P.F.), appealing to all forces of discontent with the existing system as well as to fear of communism. It made considerable gains in local elections and, in 1951, secured 120 seats in the new national assembly.

The "third force" governments had to meet a challenge both from the extreme left and from the extreme right but contrived, during 1947–49, to survive great strikes without help from the R.P.F. Meanwhile trade unionism was further split when the Force Ouvrikre, led by the veteran syndicalist Léon Jouhaux, left the Communist-controlled C.G.T.

The Monnet plan, designed to modernize and re-equip French industry within four years, made reasonably good progress. Production, both in industry and in agriculture, reached or surpassed the levels of 1939. Marshall aid from the United States assisted economic recovery. But financial instability, inflation and industrial unrest remained acute, and the war in Indochina, waged from the end of 1946. put constant strain on resources. The "third force" governments were too unstable and too much preoccupied to tackle these basic problems.

The general elections of June 2, 1951, opened a new phase in parliamentary politics, as the new national assembly was divided into six roughly equal groups. the Communists,; the Socialists; the M.R.P.; the Radicals and their allies; the Independent Republicans and their allies (the Conservative group); and the R.P.F. The Socialists passed into opposition, and the five ministries which held office between July 1951 and June 1954 moved steadily toward the right. In March 1952 a group of deputies of the R.P.F. seceded from the main body to support the conservative premiership of Antoine Pinay, and in May 1953 De Gaulle formally dissolved the movement as a parliamentary party, while preserving it as a movement outside parliament. This freed the Gaullist deputies to share in government and facilitated the drift toward the right.

When a new president of the republic had to be chosen by parliament at the end of 1953, the parties further discredited themselves by a prolonged deadlock; 13 ballots had to be taken before René Coty was elected on Dec. 23, by 477 votes to 329.

In June 1954 general exasperation gave a unique opportunity to Pierre Mendks-France, who was elected prime minister by the unusual majority of 419 in an assembly of 627. Choosing a ministry drawn mainly from new men of the right-centre and the right, he offered France a "new deal" and undertook to end the war in Indochina within a month before proceeding to tackle the problems of the European Defense Community and economic reforms. His prestige soared when he succeeded in ending the war and in substituting for the E.D.C. treaty, which parliament rejected, the wider project of western European union involving British military commitment in Europe.

Mendks-France was defeated over his North African policy in Feb. 1955, but was succeeded by his former minister of finance, Edgar Faure. Faure successfully concluded, on April 22, the Franco-Tunisian negotiations, but Algeria and Morocco were causing grave concern. In Morocco Mohammed V ben Yussef was restored and on Nov. 6 France proclaimed its resolve "to raise Morocco to the status of an independent state," united with France by the "permanent links of interdependence."

Elections held on a snap dissolution on Jan. 2, 1956, produced an even less coherent assembly and a series of left-centre governments whose failures to end the war in Algeria brought about the death of the fourth republic. Military operations against the nationalist rebels, which had continued since Nov. 1954, engaged nearly 500,000 French troops and induced unrest in the army. On May 13, 1958, when Pierre Pflimlin succeeded, after a prolonged political deadlock, in forming a new ministry, he was confronted with an ultimatum from the French generals in Algeria and the committees of public safety formed by the exasperated French *colons.* They demanded a new government headed by General de Gaulle, and were backed in this demand by the more extremist right-wing parties in France.

THE FIFTH REPUBLIC

Pflimlin, though invested with wide emergency powers, warned the national assembly that France was "threatened with civil war" and resigned. On June 1, 1958. General de Gaulle was installed in office with emergency powers for six months and authority to reform the constitution. On Sept. 28 his draft constitution was accepted by a huge majority in a popular referendum. Out of an electorate of 26,603,464, a total of 22,596,850 (84.9%) went to the polls and there were 17,668,790 "yes" votes (64.4% of the electorate, 79.2% of valid votes). The new constitution provided for a smaller and weaker national assembly, and gave wider powers to the president of the republic and to the government. It also gave overseas territories an opportunity to sever their links with France or to enter into a new Community, described as federal in character. In the referendum only French Guinea chose to sever all connections; elsewhere votes were overwhelmingly in favour of the new Community. In Algeria, where the army remained in power, 79.6% of the electorate went to the polls and 96.5% of valid votes went in favour of continued links with France.

On Nov. 23 and 30, 1958, elections were held for the new national assembly. The electoral system had been changed from proportional representation to a majority system of single-seat constituencies and two ballots. In the first ballot an absolute majority was necessary to be elected; in the second a relative majority was sufficient. The result was that in metropolitan France the Union pour la Nouvelle République (U.N.R.), a new party of the right, obtained 188 seats out of a total of 465. The Conservatives obtained 132 seats, the M.R.P. (split in two groups) won 57, the Radicals (split in four groups) won 35, the Socialists obtained 40 and the Communists only 10. De Gaulle was elected president for seven years on Dec. 21 and took office on Jan. 8, 1959. The municipal elections in March showed a swing in French opinion against the government, but despite such minor setbacks De Gaulle's program continued to make gains during 1959 and the early part of 1960. When Europeans in Algeria revolted in Jan. 1960 over De Gaulle's insistence on self-determination for the Algerians, the insurrection was subdued without bloodshed. Following this, on Feb. 13, France successfully tested its first atomic device in the Sahara desert. In May, Paris was the setting for a conference of the heads of state of France, Great Britain, the U.S. and the U.S.S.R. This "summit" conference never officially commenced because Soviet Premier Nikita S. Khrushchev refused to confer with Pres. Dwight D. Eisenhower when Eisenhower rejected his demands that the U.S. apologize for its high-altitude reconnaissance flights over the U.S.S.R. (D. Tn.; X.)

POPULATION

The population of France on Jan. 1, 1955, was estimated at 43,300,000. This figure represented an increase of 2,797,000 over that given by the census of 1946 and of 1,393,000 over that of 1936. The increase following World War II had more than made up for the losses sustained through causes peculiar to the war years and the yearly increment contrasted with the regular decrease of the immediate prewar period.

A principal cause for such increase in population was the financial assistance given by the state to encourage larger families, in the form of family bonuses, allowances and facilities for medical treatment.

The progress in Frsnce's population from the beginning of the 19th century is shown in Table II.

TABLE *11.—Population of France (with Corsica)*

Year	Area in sq. mi.	Population	Year	Area in sq. mi.	Population
1801	207,765	27,349,000	1896	207,135	38,517,000
1821	207,591*	30,461,000	1911	—	39,605,000
1841	—	34,230,000	1921	212,736§	39,209,518
1861	212,736†	37,386,000	1936	—	41,907,056
1866	—	38,067,000	1946	—	40,502,513
1876	207,135‡	36,906,000	1954	212,821‖	42,777,174¶

*After territorial losses under the treaties of Paris (1814). †After the cession of Savoy and Nice by the kingdom of Sardinia (treaty of Turin, 1860). ‡After the loss of Alsace-Lorraine to Germany (treaty of Frankfurt, 1871). §After the recovery of Alsace-Lorraine (treaty of Versailles, 1919). ‖After territorial gains on the Italian frontier (treaty of Paris, 1947) and border rectification on the Franco-Spanish frontier in 1949. ¶Excluding 187,000 military personnel and civilians temporarily abroad and 38,000 persons who were absent from their homes when the takers of the census called.

The totals of Table II are those of the habitually resident or de *jure* population. There were 2,454,000 resident foreigners in 1936, but their numbers fell to 1,671,000 in 1946 and to 1,451,752 in 1954, the reduction being explained mainly by naturalization.

In comparison with that of other countries, France's population was slow in growing. From 1800 to 1850 the country was, after Russia, the most populated in Europe. Thereafter the rate of increase slowed down considerably and was handicapped by the defeat of 1870, with the loss of Alsace-Lorraine, and by World War I (in which losses were equivalent to 1 in 31 or 10.5% of the young and middle-aged male groups).

Deaths exceeded births fairly frequently; even during years of peace (*e.g.*, between 1920 and 1938) this occurred during five years. An increase in population was, however, considerably assisted by immigration. It has been calculated that between 1850 and 1930 net immigration contributed 3,500,000 new inhabitants, as compared with a natural increase of 2,000,000. Between 1946 and 1951, however, these figures were reversed, and a gain of around 2,000,000 comprised 1,600,000 excess births over deaths and 400,000 immigrants.

Details (rounded to the nearest thousand) are shown in Table III.

TABLE *111.—Demographic Studies*

Year	Marriages	Divorces	Live births	Deaths	Excess or deficit of births
1913	312,000	15,000	790,000	731,000	+59,000
1922	383,000	33,000	760,000	689,000	+71,000
1938	274,000	23,000	612,000	647,000	−35,000
1942	256,000	14,000	542,000	632,000	−90,000
1947	423,000	57,000	863,000	533,000	+330,000
1953	306,000	30,000	797,000	550,000	+247,000

Despite this substantial increase of births over deaths, France remained a country whose population was aging. Already in 1936 it was the "oldest" country in the world, and this situation was accentuated in later years. The proportion of adults, despite the war losses, remained high. From 55.2% in 1936 it stabilized itself in postwar years around 54.5%. Age structure in detail at the beginning of 1949 (figures for 1936 in parentheses) was: 0–4 years, 8.5% (8.0%); 5–14 years, 13.1% (16.8%); 15–19 Years, 7.7% (5.5%); 20–29 years, 15.7% (15.3%); 30–39 years, 12.2% (15.8%); 40–49 years, 14.9% (12.6%); 50–59 years, 11.7% (11.5%); 60 and more years 16.2% (14.5%). Infant mortality in 1954 amounted to 37 in every 1,000.

Density. — Despite France's increase in population, the density of population was a low one when compared with some of the neighbouring countries. It reached 197 per square mile in 1936 and 201 in 1954.

As in most countries there was a gradual drift, after the middle of the 19th century, from rural areas (particularly mountainous regions such as Savoy and the Massif Central) to urban. In 1954 23,939,131 persons were urban dwellers as against 18,835,314 rural or 56% against 44% (cf. 80% against 20% in Great Britain). Approximately 50% of the inhabitants lived (1954) in small parishes of less than 2,000. Of the 38,000 odd communes, 31,407 had less than 500 inhabitants and 37,024 less than 2,000.

The greatest density of population was found (1) in the centre of the Paris basin, where the capital, its suburbs, outer suburbs and numerous satellite towns form the *départements* of the Seine and of Seine-et-Oise; and (2) in the industrial region of the *départements* of the Nord and the Pas-de-Calais which are studded with numerous and often adjacent towns.

Towns.—In 1886 there were only 10 towns with a population of 100,000 inhabitants or more (Paris, Lyons, Marseilles, Bordeaux, Lille, Toulouse, Nantes. Le Havre, St. Étienne and Rouen). The number of such towns had risen to 18 in 1936 and to 24 in 1954.

Racial Types.—The population of France is broadly composed of three principal types. First, there are the descendants of Mediterranean peoples who moved, c. 3000 B.C., into the south of the country and penetrated inland chiefly by way of the Rhône valley. They are chiefly found now along the Riviera and along the Rhône.

A second element is the Alpine or Celtic type (in many areas now intermingled with the Mediterranean and also with the Nordic), which came from the east by the Alpine valleys during the Neolithic and Bronze ages; its representatives now form the basic element of central and southwestern France and also of Brittany, into which Celts from Britain immigrated under pressure from the Anglo-Saxon invaders.

The Nordic type (at first chiefly represented by the Belgae) flowed into the northeast of the country in the centuries immediately before the Christian era but was reinforced early in the Christian era by the Saxons, the Visigoths and, particularly, the Salian Franks, who pushed into the far south and eventually became masters of the whole country; a final Nordic element arrived with the Norsemen, who carved out for themselves the duchy of Normandy in the 10th century.

Apart from these three types are the Basques of the western Pyrenees (about 700,000), who have succeeded in preserving to a large extent the racial entity.

Languages.—Following the subjugation of Gaul by Julius Caesar, the spoken Latin of the Roman conquerors gradually spread through the country and, by the 4th century A.D., had replaced the Celtic language. Later, barbarian invasions weakened the link between Gaul and Italy, so that the spoken Latin of Gaul developed certain peculiarities; moreover, local variations began to arise within the country itself.

Two main divisions (within which were numerous dialects) of the spoken language became the *langue d'oïl* of the north and the langue d'oc (see PROVENÇAL LANGUAGE) of the south. In the north the dialect of Paris and its district began inevitably, in the 10th century, to acquire a supremacy as both the written and the spoken vernacular.

Dialect differences were eliminated from the written language in the 17th century, under the influence of the educated classes, grammarians and authors. But uniformity or knowledge of standard French still remained generally unknown in some areas, particularly in country districts and in the south especially, even toward the end of the 18th century. Centralization of government during later years and other modern factors reduced the importance of dialects and spread a knowledge of the standard tongue. (See FRENCH LANGUAGE.)

Within France, however, there still remained in the middle of the 20th century a considerable number of nationals whose mother tongue was not French. Thus, in Corsica. the natives spoke Italian dialects; along the southern France-Italian border was an Italian-speaking area; Provençal was still heard in Provence; in Roussillon the Catalan language was still in use; in Gascony the Basque language held on with tenacity; in the western half of Brittany, Breton was still widely spoken; along the Franco-Belgian frontier Flemish still survived; and finally in Alsace and the Moselle *département* of Lorraine dialects of German were spoken as well as varieties of French patois.

RELIGION

Roman Catholicism.—France is the "eldest daughter of the church." There are 17 archbishoprics in metropolitan France; viz., Aix, Albi, Auch, Avignon, Besançon, Bordeaux, Bourges, Cambrai, Chambéry, Lyons, Paris, Reims, Rennes, Rouen, Sens, Toulouse and Tours. In addition to 68 suffragan bishoprics there are two bishoprics depending immediately on the Holy See; viz., Metz and Strasbourg. The archbishop of Lyons is styled primate of the Gauls. The number of clergy is around 51,000.

The association of the Roman Catholic Church with the French monarchy dates traditionally from the baptism (496) of **Clovis,** king of the Franks.

In succeeding centuries the church acquired extensive estates and great wealth and gained an exclusive hold on education. With the development of a stronger monarchy, relations between the French clergy and the papacy became at times difficult. The monarchy, often backed by the episcopate, claimed a certain independence of Rome in the matter of ecclesiastical jurisdiction. This tendency, known as Gallicanism (*q.v.*), reached a climax in 1764, when the Jesuits were expelled from the country. The Jesuits. however, had meanwhile triumphed over Jansenism (*q.v.*); but it was the bull Unigenitus (1713), which had originally served both their purposes and those of the Gallican and centralizing Louis XIV, that eventually provoked the reaction against their ultramontane spirit.

During the Revolution religious orders were suppressed and the property of the church confiscated. Some attempt was made to get the clergy to support a national established church. By the constitution of the year III, however, church and state were declared separate. In 1801, during the consulate, Napoleon negotiated a concordat, whereby the church surrendered its claim to former property and the state undertook to subsidize the clergy. This concordat lasted (except for one short suspension) until 1905.

With the Bourbon restoration in 1814, a closer collaboration was initiated between papacy and state, and this continued on Napoleon III's accession to power. Within the church itself, however, developed a more liberal Catholicism which encountered opposition from the pope and from French authoritarians.

In the first years of the third republic, the government rejected the policy of co-operation for one of secularization and neutrality. One important source of disagreement was education, in which, by the *loi Falloux* of 1850, the church had been given certain privileges. From 1880, measures were taken to restrict the church's influence in education and to limit religious orders, which were debarred, in 1886, from teaching in state schools. In 1901 religious congregations were forbidden unless authorized, and any member of an unauthorized congregation was banned from teaching. This ban, which was really aimed at the Catholic Church, was in 1904 extended by Émile Combes to any member of a religious congregation.

Such action led to an open breach with the papacy, and in 1905 the Act of Separation, while guaranteeing liberty of conscience and public worship, withdrew state recognition and subsidizing of religion. Property of the religious bodies was transferred to associations for public worship (associations *cultuelles*), which had to be self-supporting.

Such a step considerably reduced the standard of living for many clergy, but tended to throw them into a closer contact with the working classes. The return of Alsace-Lorraine added more Catholics (who had been unaffected by the anticlericalism of the third republic) and partly prompted the government to resume diplomatic relations with the Vatican. In the following years there was a gradual return of religious orders to the country. A Catholic political group of the left gained parliamentary representation.

The Vichy regime showed pro-Catholic tendencies. Pétain repealed the prewar disabilities. Clergy and religious orders took up teaching posts and religious schools were subsidized. Such a policy inspired the leaders of the church to support, at least initially, the new regime. But the less important clergy sided on the whole with the resistance.

On the liberation, the Vichy religious laws were abrogated. In the more Catholic areas (Brittany, La Vendée, Ille-et-Vilaine, Maine-et-Loire) this provoked serious unrest. The church, however, adopted a cautious attitude to politics. The rank and file and more liberal-minded of the upper hierarchy tended to favour the Mouvement Républicain Populaire (Christian Democrats); the church as a whole was resolutely opposed to Communists.

Catholics were easily the largest religious element of the country, but a clear distinction existed between practising and non-practising. About 80% of the population were baptized, married and buried by the church. The practising element amounted to around 25%. As a whole the masculine element of the petite *bourgeoisie* was indifferent or anticlerical.

Catholicism flourishes particularly in Normandy, Brittany, the central eastern *départements* and in those of the Pyrenees. It is least strong in the industrial areas.

Protestantism. — Luther, Calvin (himself a native of Picardy) and other reformers of the 16th century quickly gained adherents in France. In 1535 the extermination of "heretics" was ordered, and a long period of emigration began. Between 1563 and 1570 intermittent civil war broke out between the Catholics and the Reformers (Huguenots). By the treaty of St. Germain in this latter year, the Huguenots obtained liberty of conscience and worship with four fortified towns, La Rochelle, La Charité, Cognac and Montauban, as pledges.

In 1572 the massacre of Huguenots in Paris on St. Bartholomew's day initiated a widespread slaughter; by their desperate resistance the Huguenots gained in 1573 an amnesty and the promise of liberty of worship in a few towns. But hostilities again broke out and continued intermittently until Henry IV by the Edict of Nantes granted the Huguenots liberty of conscience and of worship and full civil rights, together with the possession of numerous fortified towns as a guarantee. *(See* above, *History.)*

On the murder of Henry IV in 1610 persecution was renewed, and during the next 20 years the Huguenot strongholds were gradually reduced and revolts crushed. But they were allowed liberty of worship. Under the centralizing policy of Louis XIV steps were taken to close Huguenot churches and schools, and in 1685 came the revocation of the Edict of Nantes. The result was a gradual and considerable emigration (estimated around 400,000) until 1801, when Napoleon restored to the Huguenots full political, civil and legal rights. In the first years of the 19th century they numbered around 700,000, of whom the majority were Calvinists.

During the 19th century the Reformed Church grew considerably, but various schisms took place. The total number of Protestants in the middle of the 20th century was around 1,000,000 (roughly 600,000 Calvinists, 350,000 Lutherans and small minorities of Baptists). In 1905 most groups of French Protestants were united into a single amalgamation, the Protestant Federation of France. Its chief elements were: the Evangelical Reformed Churches and the Reformed Churches (comprising most of the French Calvinists) ; the Evangelical Lutheran Churches; the Free Evangelical Churches; the Evangelical Methodist Churches; the Federation of Evangelical Baptist Churches; and two Alsace-Lorraine bodies, the Reformed Churches of Alsace-Lorraine and the Church of the Augsburg Confession (Lutheran). Various other independent churches and missionary organizations also were established.

Protestantism flourishes particularly in Alsace-Lorraine (around 300,000). Protestants in France belong for the most part to the middle classes and by reason of their affluence and probity played a role out of proportion to their numbers under the third republic, to whose institutions they gave strong support.

Judaism. — France granted Jews full equality by a succession of measures passed during the French Revolution. At first their assimilation was helped by this policy and by their relatively small numbers. Under Napoleon Jews were given a special consistorial system, which lasted until the Act of Separation in 1905. By 1910 there were about 95,000 Jews in France. Their number was considerably increased in the 1930s by refugees from Germany and eastern Europe and was about 250,000 in 1939 and 400,000 in 1940. During the German occupation of France they were treated at first with some moderation by the government, but by the middle of 1941 persecution had set in. They regained all their rights on the liberation and rapidly reassumed their prominence in certain commercial and industrial spheres and to a lesser extent in professional and intellectual circles.

EDUCATION

Before the French Revolution religious bodies and establishments, of whom by far the greater proportion were Catholic. controlled education. The Revolution, antagonistic to the church, broke its monopoly and established freedom of education. Napoleon in his turn made education a national public service with a highly centralized system. The Imperial university, constituted in 1808, trained all teachers and prescribed the nature of instruction in secondary and higher education. The concordat of 1801, however, enabled the church to teach under the inspection of the university; and primary education also remained free of the direct control of the state.

Under the succeeding regimes the church gradually secured its freedom in education from this control established by Napoleon. Thus in 1833, when primary schools were being brought under the authority of the state, private primary schools were allowed provided that their teachers had obtained the qualifying certificate. In 1850 the *loi Falloux* extended this freedom to secondary education, and membership of an authorized cult was considered sufficient qualification to teach. By 1875, when permission to establish Catholic universities was granted, freedom to instruct in all branches of education had been won.

Victor Duruy. who was minister of education from 1863 to 1869, wanted to make education free of charge and obligatory. He succeeded at least in widening the curriculum and in increasing the number of schools for girls.

With the increasing radicalism of the third republic the struggle between state and church was resumed. Royalists aligned themselves with clericals, and the church came to be regarded as a bulwark of monarchist tradition in France. To curtail its influence the government abandoned Napoleon's policy of co-operation and adopted one of secularization. Between 1880 and 1906 religious instruction was abolished in all types of state institutions. In 1904 members of religious congregations were forbidden to teach in any school, public or private.

Nevertheless religious schools continued to survive, especially in the more Catholic areas. In 1934 roughly 80% of pupils receiving primary education attended state schools, though only 58% receiving secondary education went to them. But from the end of 1934, when secondary education was made free of charge, Catholic institutions, which relied chiefly on pupils' fees, began to lose much of their attendance to the state secondary schools.

Under Vichy there was a reorganization of the educational system. The law forbidding clergy to teach was repealed. Voluntary schools were allotted a share of the funds hitherto confined to state schools, and their pupils became eligible for scholarships to higher education. After World War II, the main features of the prewar system were restored, but reforms were progressively introduced.

The educational system was highly centralized. Primary, secondary and university education were administered by the ministry of national education; technical education (together with youth and sports) by another department. The country (with Corsica and Algeria) was divided into 17 *circonscriptions acadkmiques;* viz., Paris, Caen, Lille, Nancy, Strasbourg, Besançon, Dijon. Lyons, Clermont-Ferrand, Grenoble, Aix, Algiers, Montpellier, Toulouse, Bordeaux, Poitiers and Rennes. Each *acade'mie* was administered by a rector appointed by the ministry and advised by a local council. The rector had control over all types of instruction, though for primary schooling the *préfet* of the *département* was responsible for certain routine matters. Under the rector were a varying number of inspectors, one of whom was usually in charge of a particular area *(dkpartement* and *arrondissement)* within the territory of the *acade'mie.* A further category of inspectors was responsible and reported to the ministry. Within each *dkpartement* there was also a council, headed by the *préfet* and composed of officials and teachers, which formed a general consultative and advisory body.

Schools were divided into three broad types: *premier degrd* comprising *écoles maternelles et enfantines* (nurseries and kindergartens) ; elementary schools and complementary classes ; *deuxibme degré* or secondary, with primary and advanced stages; and "apprentice centres" for technical training, technical colleges, professional schools, etc. Higher education was chiefly supplied by the 17 state-controlled universities, the seats of which coincided with the centres of the 17 academic circumscriptions. Competition for university places was keen. and even success at the *baccalauréat* (matriculation), taken usually in two parts in successive years as the culmination of secondary training, did not ensure entrance. The state universities were supplemented by a number of institutions for advanced study such as the Collège de France, by the *écoles normales* (for training teachers) and by numerous technical colleges specializing in agriculture, the sciences, engineering, etc. In addition there were a few free (Catholic) institutes devoted principally but not exclusively to theology, law and the humanities. Financial support of education was increasingly taken over by the state, and the contributions of the communes were largely devoted to maintenance of buildings. The question of state subsidies to Catholic schools still remained a considerable issue, the chief dpponents of such grants being the Radicals, the Socialists and the Communists.

Little local control or individual freedom was left in the matter of syllabus or teaching methods, which were almost entirely laid down by the ministry with a view to passing the examinations required by the state. The result was that French education tended to become inflexible and academic: but there came to be an increasing demand for a wider curriculum and more varied methods of teaching. Technical instruction, in which France was seriously deficient, was also more widely introduced. French parents and employers remained inclined, however. to look upon education as the academic means of supplying a pupil with a *brevet* or *certificat* at the age of 14 and with the *baccalaure'at* at 17.

In 1954–55 the numbers attending the various educational establishments amounted to about 8,000,000 (approximately 20% of the population). State nurseries and kindergartens looked after 1,056,000 infants, "private" (*i.e.,* religious) ones after 215,000; elementary schools and complementary courses were attended by 4,184,000 state and 795,000 private pupils, secondary (*deuxième degré*) schools by 530,500 state and 430,000 private and technical by 537,000 state and 150,000 private. There were 6,307,500 state and 1,590,000 private establishments. The attendance at universities (with Paris predominating) was approaching 150,000. Until 1950 the only subsidized confessional (Catholic) schools were in Alsace, where the interests of the church were still safeguarded by the concordat. In 1950, however, legislation was passed giving a certain measure of financial aid to confessional schools in other parts of the country.

LABOUR AND SOCIAL LEGISLATION

Trade Unionism. — The *loi Le Chapelier* of 1791, which forbade the combination of workers in pursuit of their common interests was abrogated in 1884, when the *loi Waldeck-Rousseau* legalized, with certain restrictions. the formation of trade unions Before this, labour organizations had existed more or less as secret associations. The early years of trade-union development were characterized by a syndicalism often of a revolutionary nature. The unions were in opposition to the government and to the employer, a policy inherited from their struggles against repression, which had been particularly severe after the failure of the Paris commune in 1871. The Association Internationale des Travailleurs. created in 1864 (before legalization), numbered about 300,000 members by 1870. Despite repressive measures, there were about 135 *chambres syndicales* in France by 1876, when the first workers' congress was held in Paris. Following the passage of the *loi Waldeck-Rousseau* two workers' associations were set up, the Fédération Nationale des Syndicats (heir to the former Association Internationale des Travailleurs) and the Fédération des Bourses du Travail. In 189j the Confédération Générale du Travail (C.G.T.) was formed from an amalgamation of these two bodies, though it was not until 1902 that a centralized constitution was created. In these early years two schools of opinion fought for control. The syndicalists rejected the idea that norking-class aims could be attained by the parliamentary process of persuasion and held that strike action and violence were indispensable to bring about the social revolution. The reformists on the other hand maintained that labour reforms should be by constitutional action. Some desired collaboration with the Socialist party in the chamber of deputies; others sought to repudiate any political connections and to concentrate solely on economic demands.

In 1906, at the congress of Amiens, the revolutionaries gained the day by forcing through a resolution, known as the charter of Amiens, which rejected dependence on any political party or doctrine and endorsed the opinion that the best results for the working classes could only be obtained by direct action, by means of the general strike. About the same lime the C.G.T. as a body began in addition to assume a pacifist and international character.

From 1914 the unions tended to accept the supremacy of the constitutional authority and to demand legislation for a better standard of living and of working conditions. though there were occasions when a minority rejected this policy. It was the outbreak of World War I, the "ordained opportunity" for revolutionary action, that had the effect of depriving the revolutionaries of the control of labour. Under the influence of Léon Jouhaux and the reformists. who had suffered defeat in 1906, the C.G.T. decided to co-operate with the government. With the advent of the Russian Revolution, however, there emerged an important minority both in the C.G.T. and in the Socialist party (with which that body had now allied itself) which adopted an antiwar policy and desired affiliation with the Moscow Trades Union International (the Profintern). The collaboration of the C.G.T. with the government was. however, confirmed in 1918 by the formulation of the C.G.T. "minimum program." This statement repudiated revolutionary tactics, renounced the use of the general strike and supported the League of Nations; in return it demanded more comprehensive rights for trade unions than those granted by the *loi Waldeck-Rousseau,* the acceptance of collective contracts and the constitution of a national economic council and regional councils on which there should be trade-union representation; and it further urged that monopolies should be taken over by public state boards or co-operatives representing the producer and the consumer and that individual enterprise should be regulated, as regards conditions of work and profits, by the state. As the government made no immediate response. the C.G.T. created in 1919 its onn national economic council, comprising representatives of the co-operative societies and the civil servants' association. as well as the unions. In 1925 the Herriot government officially adopted the idea of a national economic council, adding representatives of the employers to the existing unofficial one.

The elements sympathetic to communism remained strong, however. and their tactics led in 1921 to the exclusion by the C.G.T. of all affiliated organizations which were under revolutionary influence. The latter thereupon formed themselves into a new confederation, the Confédération Générale du Travail Unitaire (C.G.T.U.), which was affiliated to the Soviet-sponsored Profintern. Before this split the C.G.T. had attained a peak figure of about 2,500,000 members; but this was reduced to 1,500,000 during the year 1920 by the economic difficulties and resulting ineffective strikes, which disappointed the hopes of the workers. Until 1936 (in which year the C.G.T. and the C.G.T.U. fused) the membership of both confederations fluctuated but on the whole increased, that of the C.G.T. being usually twice to three times as strong as that of the C.G.T.U.

The first strongholds of trade unions were in the Nord and Pas-de-Calais *départements* and in and around the large towns. Recruitment was, however, hampered by the hostility of the big industrial concerns. which often introduced a rival paternalism in the shape of various benefits for their workers; and secondly by the spirit of individualism prevalent in the widespread small-scale industry of France, which made the organization of its employees very difficult. The C.G.T. drew its principal strength from government employees (civil servants, post-office officials, railwaymen, school teachers: local-government officials and workers in government establishments such as arsenals: dockyards, etc.), from the miners and from the employees of public utility industries. The C.G.T.U. members were mostly railwaymen, builders and metalworkers, particularly from the Paris and northern areas. As well as these two bodies. there existed the Confédération Française des Travailleurs Chrétiens (C.F.T.C.), founded in 1919 and based upon Catholic social and anti-Marxist principles. By 1936 this body claimed about 500,000 members, principally drawn from the black-coated workers and women employees in business or factories. Though the C.F.T.C. rejected the theory of class warfare, it nevertheless collaborated occasionally in strikes with the C.G.T. A fourth confederation, which began a brief life in 1936, was the Confédération des Syndicats Professionels Français (C.S.P.F.), inspired by the semifascist social doctrines of La Rocque. After the occupation of France the C.S.P.F. gave its support to Pétain.

The C.G.T. itself, despite the losses in membership after World War I, continued to exercise considerable influence among the workers. The spirit of "reformism" prompted it to seek reforms through parliamentary pressure, and it became increasingly the ally of the Socialist party. In industrial disputes the local unions tended to use the good offices of the ministry of labour, of the *préfets* and of other public bodies. The old institution of the conseils de *prud'hommes,* composed of elected representatives of employers and workers, was used also for the settlement of local disputes between employers and individual workers; and there was increasingly frequent resort to the expedient of mixed committees of workers and employers for the consideration of many other labour questions. In 1934, amplifying its "minimum program" of 1918, the C.G.T. called for the nationalization of credit and banking and of the key industries. It demanded also the 40-hour week, collective contracts and other concessions to labour. Many points of this program were incorporated in the platform of the Rassemblement Populaire of 1935, a coalition of left political parties which led to the formation of the popular front government in 1936. In 1936 also, after the alliance of the Socialist and Communist parties, the C.G.T. and the dissident C.G.T.U. were amalgamated. The new union, which was to last until 1939, had about 5,000,000 members: and, through co-operation with the popular front administration, gained many concessions for labour (*e.g.,* wage Increases, paid holidays, the right of creating the offices of shop stewards, the principle of collective bargaining and compulsory arbitration on labour disputes). On the outbreak of World War II in Sept. 1939, Communists within the C.G.T. came under attack hoth from the government and from the non-Communist majority of the federal bureau of the confederation; and within the month those who approved the action of the U.S.S.R. in invading Poland were expelled from the various unions. The Communist party itself, outlaued by the decree of Sept. 26, 1939, sought to continue its activity under the legal cover of the unions and to regain its hold upon them by the infiltration of its militants into the membership and by the clandestine proselytism of the unions' rank and file.

The German occupation of northern France and control of the Vichy government resulted in the dissolution of the central confederations, both of labour and employers. The individual federations and departmental unions themselves, however. were finally allowed to continue. The ranks of the C.G.T. were now split into three groups: a very small proportion became wholehearted collaborationists, embracing the social principles of National Socialism; the Belin group (around the Vichy minister of labour René Belin), though accepting the new regime, advocated the independence of trade unions from political activity and adhered to the labour policies of the former popular front; and finally a third group. led by Léon Jouhaux, organized some kind of underground resistance. Meanwhile, the Communist element was able to snipe effectively at the officially sanctioned federations and at the *Charte* du *Travail* permitted them by their German overlords. All the arguments of traditional syndicalism were employed against this Vichy Charte. When the Germans attacked the U.S.S.R., Communist policy was appropriately changed. Before that event it had consisted solely of conquering the syndicates in order to ensure a liaison with the labour masses, which meant opposition to all the former leaders of the C.G.T. who had demanded the expulsion of the Communists in Sept. 1939; now the indiscriminate attack against all reformist elements was abandoned, and the creation of a front unique, excluding only those acquiescent to the existing regime, mas preached on the basis of the Charte *d'Unité,* adopted at the Toulouse conference. But a syndical medium was required to mask the true political orientation of the campaign (in which the party acted, indeed, as a secret French government allied to the U.S.S.R.), so as not to alienate workers distrustful of Communist doctrines. Hence the creation of *comités populaires,* which were in effect local Communist cells but could appeal to the worker with an authority wider than the sectarian political one.

Meanwhile the strength of the resisting reformist elements of the unions was growing, and in the south there was created the Mouvement Ouvrier Français, an alliance of the C.G.T. and the C.F.T.C., which began to work in close collaboration, with the Gaullist resistance movement. Its activities were, however, far more cautious and less direct than those of the Communists. By the time of the liberation, then, the Communists had not only acquired among the workers a far greater prestige as being the effective architects of the resistance movement but had also succeeded in securing a dominating foothold in many of the labour organizations, particularly those of the C.G.T.

Two aims now Influenced the policy of the C.G.T.; to take the lead in voicing the inevitable demands of labour for higher wages, despite the opposition of the government; and on the other hand, as it was almost the official labour organization of the Communist party, to support the policy of a government in which Communists were participating.

Serious industrial unrest was, however, provoked initially by certain autonomous unions. At the first postwar congress in April 1946 representatives of individual syndicates and unions had complained that the confederal body was attempting to impose too rigid a supervision upon the component parts and to dictate a policy of a Communist nature. Within the ranks of the C.G.T. there existed increasingly rebellious elements which demanded independence of action and sometimes broke off into splinter groups to form autonomous unions. These later linked themselves together as the Confédération Nationale du Travail (C.N.T.).

At the same time the number of strikes continued to grow, despite the partial concessions granted by the administration. Then some leaders, who in Nov. 1947 had shown their desire to break away from Communist policy, brought C.G.T. Force Ouvrière into being. This body held its first conference in April 1948, when it numbered a total of 30 departmental unions and 35 federations, with an aggregate membership of about 1,000,000 (though it claimed considerably more).

The C.G.T. itself emerged from these strikes weakened in membership and in prestige. For a time, at the beginning of 1948, its policy was to avoid any serious agitation, to attract members of the Force Ouvriere and other splinter groups back to the fold and to restore the morale of its own disheartened followers. In the course of the year, however, it became clear that the rival unions could not hope to outdo its propaganda, backed by better organization and greater funds, by its control of the key industries of engineering, mining, building, etc., and by the Communist party's wholehearted support. Thenceforth the C.G.T. became self-avowedly synonymous with the Communist party; its chief policy was to hamper the economic and military revival of France and western Europe by opposition to the European Recovery Program, to western union and to the Atlantic pact.

The C.G.T. remained the largest, best organized, most energetic and effective confederation, with about 2,000,000 members in the early 1950s. Its main strength was among the miners, the workers in heavy industries and the dockers. The dissident Force Ouvrière probably numbered about 500,000 members, its strength being among the civil servants and clerical workers and including a big minority in the railways and textiles and a smaller one in engineering (it was weak in the mining industry and among the dockers). Though it had no official connection with the Socialist party, it was in fact its labour parallel. The Christian unions of the C.F.T.C. also had about 600,000 members, recruited chiefly among the clerical and distributive workers and the women employees in business and factories. On their left wing were an increasing number of industrial federations of manual workers. The Christians based their appeal on the spiritual as well as material defense of labour and tended to associate themselves politically with the M.R.P.

A fourth powerful confederation was the Confédération Générale d'Agriculture (C.G.A.), which, taking the place of the Corporation Paysanne (founded under the Vichy regime and dissolved after the liberation), became the sole peasant organization.

A fifth and much smaller organization was the Confédération Générale des Cadres, created after the liberation to safeguard the interests of senior staffs (such as foremen) and of the more qualified workers (technicians, etc.). The other confederations, who had their own special organizations for the cadres (senior staffs) and desired to increase their influence among them, were naturally hostile to the C.G.C.; and, on the ground that it was not sufficiently representative and, moreover, linked to the *patronat,* would not admit it into the mixed official bodies set up for the benefit of labour interests.

Still another organization came into being with the Gaullist labour-capital association. Under this scheme collaboration was between worker and employer, to take place within the framework of the factory and to be sealed by a deed of partnership; and a basic remuneration for workers and management and a basic rate of interest for capital were to be established. It failed, however, to secure a hold on labour and, with the decline of Gaullism, became a moribund organization.

Finally there were the autonomous unions, mostly small groups in separate factories. These were established in some cases by former members of the C.G.T. who had left that body before the split in Dec. 1947, chiefly because they objected to the increasing discipline imposed by the central authority (also, sometimes. because they disliked the Communist nature of the movement). Some had left during the split, but decided not to join the newly established C.G.T.F.O.

Other unions had been started by officials who had compromised themselves during the German occupation. For the most part they claimed to represent the pure nonpolitical and revolutionary tradition in French trade unionism. At the beginning of 1948 some of these autonomous unions were linked loosely by a committee; others were already members of the C.N.T. In Nov. 1948 a conference of all these autonomous bodies decided to establish a national federation of autonomous unions and a cartel for joint action. Toward the end of 1949 these unions formed the Confédération du Travail Indépendante, later entitled the Confédération Générale des Syndicats Indépendants. Numbering about 150,000 members and confined to a few areas and to certain large factories, they had little influence on the labour movement as a whole, being a small minority of extremists ready to exploit every grievance and to promise the workers the impossible.

Social Legislation. — Various legislation was passed after 1841 to govern labour conditions and promote social welfare in France. Laws limiting the hours of work were enacted in the second half of the 19th century, and a system of state inspection was established in 1883. Concurrently with the development of trade unionism, additional labour and social legislation mas introduced. Under a law of 1899 the state assumed the power to regulate conditions of work in factories engaged on government orders. In 1900 a further law provided for the progressive introduction of the ten-hour working day into factories. Six years later the ministry of labour was created to supervise industrial conditions.

The workers obtained in 1919 an eight-hour working day and a 48-hour working week despite considerable opposition from the employers. General application of the rule was slow, and it was not introduced into some trades until 1936. There was, however, an increasing collaboration between the government and the trade unions to promote better industrial conditions and relations. Disputes were submitted to the ministry of labour, to the *préfets* and to various official bodies. The *conseils de prud'hommes* or courts of elected representatives of employers and workers became widely used to judge differences on principles of equity, and appeal could be made from them to the civil courts.

The economic depression of the early 1930s stimulated industrial unrest, which produced further demands on the part of labour. With the advent into power of the popular front government in 1936, such claims as the right of collective bargaining, paid holidays, the institution of shop stewards and the introduction of the 40-hour (or five-day) working week were conceded. In addition the existing machinery for conciliation and arbitration over wages was reorganized. The innovations of the popular front were partly neutralized by the Daladier government in Nov. 1938.

The Vichy government introduced a stringent control, chiefly with the object of alleviating unemployment by directing labour into certain channels. Hours of work varied considerably from industry to industry. As the German grip on the country tightened there was a growing regimentation of labour.

After the end of the German occupation the rights of the worker to social benefits through legislation and to participation in fixing labour conditions and in the management of industry were laid down in general terms. But even before the new constitution of 1946 was passed the 40-hour working week had been reintroduced, with increased payment for any overtime and holidays with pay. The election of joint labour tribunals and of workers' delegates, which had been eliminated by the decree laws of 1938–40 or had fallen into disuse during the Vichy period, was restored, and they themselves were granted extended powers. Wages continued throughout the postwar years to be the subject of repeated claims to the administration by the trade unions as the cost of living increased. A minimum wage was usually demanded, plus varying bonuses. Wages were freed from state control in 1950, and the negotiation of collective agreements in various branches of industry was resumed. The government retained, however, the right to fix a national minimum.

The beginnings of social security had been introduced at the start of the 20th century by legislation to safeguard the worker and compensate him for accidents. Some tentative steps to provide for unemployed were taken in 1905, when the state first subsidized for that purpose the funds of trade unions; and in 1914 a national unemployment fund was created, through which contributions were granted to relief organized by many county and municipal councils. Meanwhile unofficial organizations, supported mainly by private subscriptions, were the chief sources of protection against sickness, old age and unemployment. Family allowances, which had been given by certain firms in the 19th century, were adopted by the state for its employees during World War I; and later pensions were added.

The question of social insurance came to the forefront after 1918, but a comprehensive measure was delayed by the unwillingness of the government and the assembly to incur the necessary expenditure. Finally, in 1930, a law was enacted which introduced some additional degree of social assistance. Insurance was made compulsory for all employed persons under a certain annual wage. Benefits for sickness, maternity and death were paid out of departmental funds or out of those of trade unions, mutual aid associations and employers' institutions. Old-age and disability benefits came from national or private funds. The scheme was financed by contributions from the insured and the employer, amounting to 8% of the basic wage, supported by state subsidies (already granted to cover liabilities under a previous scheme for workers and peasants in 1922), plus an additional grant. Maternity benefits were payable to insured women (who were also given sick pay) and to the wives of insured men. Invalidity allowances and treatment were granted to people incapacitated, and there was a pension for workers on retirement at the age of 60. Despite this measure, social insurance before 1939 remained piecemeal, limited in scope, inadequate in its benefits and largely left to local bodies whose efficiency varied considerably.

Thus, until the end of World War II the majority of French labour was very much at the mercy of the fluctuations of the economic situation. After 1945 the problem of extension, coordination and uniformity in the somewhat haphazard system was quickly tackled. The ministry of labour and social security was made responsible through a directorate-general, which prepared the necessary regulations of the scheme and supervised their execution. Under regional directorates local boards of two kinds were set up, one devoted to social insurance, the other to family benefits. The local offices were to collect and administer funds. To the boards for social insurance were elected workers (75%) and employers (25%); on those for family benefits, independent representatives were to take the place of a percentage of workers.

The burden of social-service expenditure borne by the state increased substantially after 1945. In 1938 the total figure had been 22,070,000,000 fr. (22% of the total expenditure); in 1953 it was 896,670,000,000 fr. (26.4%).

After World War II funds specifically for social insurance were entirely provided by the contributions of workers and employers (of whom the state was the largest). Benefits, now made far more comprehensive and generous, comprised the following: social insurance against sickness, against disablement preventing or handicapping employment, against old age, against retirement and against death, together with expenses for maternity and for injuries incurred at work; and family benefits varying according to the number of children. Grants were also made available for medical research toward the prevention of occupational diseases and for the maintenance of private hospitals belonging to individual firms, etc. Reciprocal agreements relating to medical treatment were concluded with many neighbouring countries.

Family Allowances.—Family allowances had been officially and partially introduced by the government after 1918, their object being to check the decline in the French population. They were at first developed voluntarily under both government and private auspices. In 1933, under an act of 1932, family allowances became compulsory for all employees in certain branches of industry (*e.g.*, textiles, mining and chemicals); they were later extended to other branches, to commerce and finally, in 1936, to agriculture. The amounts allotted were. however, insufficient to have any marked effect. In the Paris area, where the rate was the highest, the yearly allowance for nonstate employees in 1938 was 720 fr. for the first child, 1,200 fr. for the second, 1,680 fr. for the third and 2,400 fr. for any additional children; yet the population continued to decline. Then, in 1939, the government introduced the Code de la Famille, which inter *alia* gave a birth bonus of 2.000–3.000 fr. to the first child if born within two years of marriage. Allowances were also extended to cover independent workers. the liberal professions, etc. The rate of allowance became 10% of the average departmental income (with two scales, an urban and a rural) for the second child and of 20% for three children, with an additional 20% for every succeeding child. These allowances were increased somewhat by the Vichy government.

The first revision of the system to take place after World War II was that of May 1946. which made the rate of allowance a function of a hypothetical basic monthly salary; and this principle was maintained throughout the subsequent revisions. This basic monthly salary was fixed at 17,250 fr. for the Seine *département* in Oct. 1951 but was depreciable by as much as 20% elsewhere in France. By 19jj the family allowance was available to families including two or more children under school-leaving age (14 years; but see the modifications listed below), as follows: for two children, 20% of the basic salary per month; for three, 50%; and for every child after the third, 30%.

As well as this, wage earners and persons of equivalent status received (1) monthly sums of 934.3 fr. for two children and 1,437.5 fr. for every child after the second; and (2), provided that their household numbered only one wage earner, the single-salary allowance, calculated for two children as 40% of the basic salary and for three or more as 50%, with a supplementary 20% for the last child. Moreover, as single-salary allowances, childless couples of beneficiary status in the first two years of their marriage could receive 10% of the basic salary; families with an only child under five years old, 20%; and families with one between five and ten, 10%. The age limit for the children could be extended beyond the school-leaving age for children not gainfully employed (to 15 years), for apprentices (to 17) and for students, for invalids and for an elder daughter looking after younger brothers and sisters at home (to 20). Furthermore, an increase of 5% of the basic monthly salary was allowed every child over ten years old with the exception of the first.

Apart from this system, three other sorts of allowance were available: (1) antenatal allowances for mothers during pregnancy; (2) lodging allowances, for recipients of one of the above-mentioned allowances who were paying rent or debts incurred in taking possession of their dwelling; and (3) maternity allowances, a single payment made to persons of any status for live children of French nationality born (a) the first before the mother's 25th birthday or else within two years of the marriage; (b) the second within three years of the first or five years of the marriage (unless the mother was still under 25; and (c) the third within three years of the second, six years of the first or eight years of the marriage.

GOVERNMENT, POLITICS AND LAW

Constitution.—The constitution of the fourth republic, promulgated on Oct. 27, 1946, is an elaborate document when contrasted with the pragmatic set of laws which made up that of the third (see History, above). Its preamble reaffirms the rights of men and citizens set forth in the declaration of 1789 and adds certain economic, political and social principles, such as equal rights for women, the right to social security measures and, for the worker, the right to belong to trade unions, to strike and to participate in the regulation of labour conditions.

The basic principle of government lies in sovereignty exercised by all adults through elected representatives or by referendum. The composition, the functions and the procedure of parliament are defined at length. Parliament is to consist of two chambers, the national assembly and the council of the republic, the former elected for five years and the latter, by electoral colleges, for six (but with half its members renewed every three years). The method of voting for both chambers was from 1946 the subject of alteration, either a proportional or a mixed proportional and majority system (see *Electoral* Law and Representation, below).

The relative importance of the two chambers is made plain in the constitution. The national assembly is the sole lawmaking body. When bills have been passed at a first reading of the assembly, they are considered by the council of the republic. Should a divergence of opinion occur, the amendments of this latter body are considered by the assembly, which can override the wishes of the council. But a majority vote in the council requires a like one in the assembly to negate it. The collective and individual responsibility of ministers is to the assembly alone, and votes of confidence can only be put to and voted on in that body. Further provisions also stress the constitutional supremacy of the assembly. A premier designate must obtain its approval both for himself and his proposed administration. It secured a tighter grip on finance, and its speaker, the president of the assembly, assumes the duties of president of the republic or of prime minister in the event of an interregnum. In various other ways the privileges of the council fall short of those possessed by the pre-World War II senate. It acquired. for example, no judicial functions or powers; its share in the revision of the constitution was considerably curtailed.

The chief effect of all these changes was to create an upper body which could perform the duty of a *chambre* de *réflexion* and place in some degree a brake on the actions of the assembly. But no longer could disputed measures be shuttled endlessly, as under the third republic. between the two chambers, or the upper house bury the proposals of the lower as did the former senate, which had acquired the title of "the cemetery of laws."

The president of the republic is elected by an absolute majority jointly by the national assembly and council of the republic for a period of seven years, after which he can only once be elected again. He is the official representative of the state in diplomatic and international negotiations. He invites, after preliminary soundings among party leaders, a politician to form an administration and presides over the council of ministers (in a formal capacity), over the supreme council of justice and over the committee of national defense. Every action of the president must be countersigned by the president of the council of ministers and by another minister. Thus, the president of the republic is the representative of the most "permanent and immutable interests of the state."

The constitution of the third republic referred but briefly to the council of ministers and entirely ignored the office of the president of the council, that is to say, the prime minister. The constitution of 1946, however, devoted an entire chapter to the council of ministers. Before 1875 the chief minister had been considered the intermediary between the head of the state and the legislature and the choice rather of the former than of the latter. After 1875 the prime minister still remained the nominee of the president of the republic, though responsible to parliament. With the diminution of presidential authority, however, the influence of parliament upon his selection and continuance in office naturally increased.

The constituent assembly of the fourth republic hesitated upon this question as to who should choose the leader of the executive and finally compromised in two somewhat ill-drafted provisions. Article 45 of the constitution states that the president of the republic, "after the usual consultations," designates the president of the council of ministers at the beginning of each legislature or after any resignation, death or other cause. On a dissolution the assembly's president assumes interim power. The designate president of the council submits to the national assembly the program and the policy of the cabinet which he intends to constitute, and he and his ministers can take office only after he has himself been granted the confidence of the assembly by public vote and an absolute majority. Article 46 then states that the president of the council and the ministers chosen by this body are to be appointed by a decree of the president of the republic.

In fact the practice at mid-20th century was as follows. The president of the republic first invites a politician to explore his chances of forming an administration and then, if they appear favourable, designates him as president of the council of ministers. The designate must later secure in the national assembly an absolute majority for himself and for his policy, and this the assembly can at its will either refuse or else grant sa reluctantly that his tenure of office may plainly be of a stopgap nature only. A further trial which must then be endured by the president of the council is a vote of confidence (not requiring an absolute majority) in the ministerial team that he has chosen. There was in the constitution of 1946 no mention of this latter procedure (the established custom of the third republic); but it was used to reject a new government, and the successful imposition of it was evidence of the assembly's intention to keep a tight rein on the executive.

The powers of the president of the council of ministers are further defined by two subsequent articles. He is stated to be responsible for the execution of laws (article 47), and he makes appointments to all civilian and military posts except those of ambassadors, magistrates (excluding public prosecutors), generals, rectors of universities, *préfets,* etc., which are vested in the presidency of the republic. He controls in fact the armed forces and co-ordinates the work of national defense. Thus he became constitutionally possessed of certain powers which under the third republic belonged, in theory at least, to the president of the republic; viz., in his control of the civil executive power and of the armed forces.

In giving to the chosen leader of the administration the power of nominating the ministers of the council, whose appointment is then sanctioned by decree of the president of the republic, the constitution of the fourth republic formally enacted what had in practice become a long-standing tradition under the third. Moreover, the president of the council of ministers came in practice to have the liberty (strictly illegal) of creating new or abolishing existing offices within his cabinet.

Under the charter of 1814, ministers had been responsible to the king but could be impeached by parliament; a decree of Napoleon III had reasserted this principle in 1869; but in 1875 the ministers had been made collectively responsible, for the general policy of the government and for their individual actions, to the two chambers and liable to impeachment by the lower house and judgment by the upper. In 1946 government responsibility to the directly elected representatives of the nation was held to be the characteristic distinguishing a parliamentary regime from the presidential regime which it was desired to avoid. By article 48 of the new constitution, therefore, the collective responsibility of the ministers to the national assembly for the general policy of the cabinet and their individual responsibility for their personal actions was established, with a proviso, moreover, that they were not to be accountable to the council of the republic, which was an indirectly elected body.

The question of confidence can only be raised by the president of the council himself, and a public vote in the assembly takes place one clear day (to allow opportunity for reflection) after it has been put. A refusal of confidence, to the cabinet must be made by an absolute majority in order to entail its collective resignation (article 49). Similarly a vote of censure, originating only in the national assembly, must be adopted by an absolute majority by public vote, one day after it has been tabled, in order to entail the cabinet's resignation (article 50). These provisions were inserted to give greater stability to ministries. They contrasted with practice under the third republic, when a simple defeat on questions of confidence in either house meant the resignation of the administration.

The constitution of 1946 then proceeds to tackle the problem of dissolution of the national assembly. Under the third republic this power had been vested in the president of the republic and the senate, but after its use by MacMahon in 1877 had never been employed, so that the defeat of administrations had merely entailed a change or reshuffling of ministers without appeal to the electorate. Political groups or individuals were thus immune from the consequences of irresponsible action for defeating ministries.

The constitution of 1946 attempted to amend this state of affairs. If, during a period of 18 months, two cabinet resignations occur as a result of refusal of confidence or votes of censure, the dissolution of the national assembly may be decided by the council of ministers after consultation with the president of the assembly. Such a provision is applicable only at the end of the first 18 months of the legislature and if the defeated government has been in office for more than 15 days. It proved ineffective.

To safeguard against any excessive control by the central executive the constitution defines the procedure of legislating. The members of parliament have the equal right with the council of ministers to initiate legislation. The council of ministers has no power to secure precedence for its own bills in the assembly; and bills of individual members and bills of the administration are considered without distinction by various parliamentary commissions, which may drastically modify them. Finally, the executive was clipped of any right to legislate by decree laws or delegated legislation, a practice which was common in France between World Wars I and II.

In addition a series of legal safeguards (not always in the constitutional document itself) further strengthened, after 1946, the national assembly in its relations with the executive. Parliamentary control over foreign policy was extended. The national assembly, unlike the former chamber of deputies, acquired the power to fix its own session, the total length of whose interruptions cannot exceed four months, and it must meet annually on the second Tuesday of January for as long or as often as it wishes. Its own bureau, when the assembly is not sitting, "controlling the acts of the cabinet, can convene parliament" and must also do so at the request of one-third of the deputies as well as of the president of the council of ministers. Thus the principle of a permanent legislature was legally established and at least a minimum of eight months' parliamentary activity assured.

French constitutional and parliamentary practice tended. therefore, to take a different line from British. In Great Britain the democratic system was based on the predominance of the executive within parliament, offset to some extent by the tradition of permitting the expression of dissent and of coming sometimes to terms with the opposition. France, on the other hand, apprehensive from its past experience of relatively unfettered executives, preferred to entrust much of the duty of legislating to the deputies, either within the assembly or on its permanent commissions. The result was to increase the weakness of administrations—already somewhat insecurely based upon coalitions—and to make the executive machinery of government in many respects less effective than in other countries.

Revision of the Constitution.—The question of constitutional revision is dealt with in the penultimate chapter of the constitution of 1946. A resolution expressing the object of revision must be passed by an absolute majority of the national assembly. The resolution must then pass the council of the republic by a like majority. If it does not. the assembly must endorse again its first decision. The assembly then drafts a bill for implementing the object of the resolution, which is submitted and must pass both houses in the manner of ordinary legislation. If the bill is adopted by a majority of three-fifths in each house or, alternatively, by a two-thirds majority at a subsequent second reading in the assembly, it becomes law. Failing this, it must be submitted to a national referendum. If, however, any proposal for revision concerns the existence of the council of the republic, it must secure the required majority in that body or be submitted to referendum.

In order to safeguard against any infringement of the constitution by ordinary legislation, a constitutional committee was created. This committee comprises the president of the republic, the president of the national assembly and seven other persons elected annually by, but not members of, the assembly, and the president of the council of the republic and three other persons elected by, but not members of, the council. The committee examines legislation passed by the assembly that may have infringed the terms of the constitution. If in the opinion of the committee the legislation does entail some alteration of the constitution, it is returned to the assembly for a new reading. Should it still be accepted. it is then treated as a specific proposal for revising the constitution and is subject to the procedure set forth above.

For the constitution of the French union see *Overseas* Possessions, below.

Electoral Law and Representation.— Under the third republic France vacillated in a choice of electoral law between a majority system with the second ballot within single-member constituencies (scrutin d'arrondissement) and one using party lists for a varying number of seats within the de'partement (scrutin de *liste*).

After World War II a system of proportional representation was introduced. The first consultative assembly was elected, on Oct. 21, 1945, on a list system within the ddpartement, whereby seats were allotted according to the rule of the highest average (la *règle* de la plus forte moyenne), but no preferential voting (*i.e.,* altering the party order of the list) or panachage (*i.e.,* selecting candidates from more than one list) was allowed. In the following elections for the second consultative assembly and for the first national assembly, some modifications were introduced, such as preferential voting and panachage. This system tended to give an approximate reflection within the assembly of the party strengths in the country. If anything, the smaller parties were somewhat penalized, but by no means so much as they had been under the majority systems of the third republic. (These majority systems. however, continued to be used in municipal and cantonal elections.)

Election to the council of the republic was indirect. A complicated hybrid system of majority and proportional voting was used.

In the elections for the second national assembly in June 1951, the coalition parties of the government succeeded in forcing through a new electoral law, which was designed to clip the wings of the Communists, still the strongest single party in the country. This law established, for the metropolitan area, a simple majority vote with the de'partement as the constituency, except in the Paris area, where a full proportional system was preserved. The majority system was as follows: each de'partement was to have a varying number of seats according to its population; parties were to submit lists of candidates; parties that submitted lists in at least 30 *départements* might combine their lists; any list or combination of lists that obtained 50% of the votes was to take all the seats; when a combined list succeeded in taking all the seats they were divided in ratio to the votes cast among the partners; if no list or combination of lists obtained 50% of the votes the seats were divided on a proportional basis. This system naturally penalized the Communists and to a lesser extent the Gaullists, neither of whom could easily find allies. Eor a combined poll of 51% the parties supporting the government secured 64% of the seats. (For the distribution of the seats among parliamentary groups see Table V, below.)

For the national assembly elected in June 1951 the total of seats was increased to 627, the distribution being: France and Algeria (metropolitan France), 574; overseas ddpartements and territories, 53.

Parties and Parliamentary Groups.— Political parties in prance are not always well-organized national groups, nor are local executives and their policies closely linked or controlled by the central executives. Successful candidates, especially those of the centre parties, often show a great degree of individual independence or may even form parliamentary sections giving a varying allegiance to the party under whose aegis they have contested the election. The larger groups and minor sections often join in loose and temporary coalitions for the purpose of forming ministries. The loyalties which hold them together are often slender, and the differences, though temporarily sunk as an expediency, quickly emerge, particularly when some political advantage can be gained or unpopularity avoided.

The individualism and parochialism of the French elector exercises a further influence toward disunity on the deputies' part. Thus. within the broad divisions, right, centre and left, there exist many shades of opinion, each one conscious of the regional interests that it must satisfy and prepared, for reasons of political expediency, to sacrifice the life of a coalition or even to break the unity of a party in the hope of retaining support in the constituencies. In addition the post-World War II electoral laws were usually of such a character as to permit small parties to secure some representation. Thus there were 20 administrations between 1945 and 1955, all based on coalitions of parliamentary groups whose executive and leaders were unable to exercise a strict discipline over the rank and file.

The general distribution of the chief parliamentary groups in 1955 was as follows: on the right (1) the former Gaullist and dissident Gaullist groups (formerly linked in the Rassemblement du Peuple Français), (2) the Républicains Indépendants and their allies of the Parti Républicain de la Liberté and (3) the peasant groups; in the centre (1) the Radicals and the Union Démocratique et Socialiste de la Résistance, who together formed the Rassemblement des Gauches Républicains in the upper house, and (2) the Mouvement Républicain Populaire; on the left the Socialists; and on the extreme left, the Communists. The Radicals, the M.R.P. and the Socialists or two of the three groups in coalition formed the governments of the "third force," to which the Gaullists on the one hand and the Communists on the other constituted the principal opposition—the government being usually able to rely on the smaller parties of the right (who later contributed ministers) for some support. The characteristics of the groups were as follows:

Rassem*blement* du *Peuple Français* (R.P.F.).—The R.P.F sprang from the Union Gaulliste, which was officially founded in July 1946 by Gen. Charles de Gaulle and his adherents. De Gaulle had retired from the leadership of the provisional government in January and re-emerged in June to attack the text of the proposed constitution as hammered out by the first constituent assembly for approval by referendum. The Rassemblement, inaugurated in April 1947, was defined not as a political party but as a movement above parties working to accomplish its aims in the political field. In the constitutional sphere it desired the establishment of a strong executive under a president possessing wide powers, akin to the system of the United States. It was also directed against the power and ascendancy in French political life of the Communist party. Gaining strength steadily in 1947, it tried with varying success to ally itself with the parties of the centre and the right.

The first congress of the movement was held at Marseilles in April 1948. It now claimed to have about 1,500,000 supporters and had established a Gaullist intergroup within the national assembly, comprising about 50 members chiefly drawn from the P.R.L. and the U.D.S.R. At the congress it called for immediate elections to determine a new national assembly and attacked capitalism and communism alike.

The national elections for the second council of the republic in Nov. 1948 provided the movement with a "trial run" in the field of national politics. Its policy, which met with varying success, was not only to put its own candidates forward but also to persuade nominees of other parties (particularly of the smaller centre groups) to run under its aegis and to accept its program. The movement eventually claimed to have won a total of 127 out of 320 seats for itself and for its allies or protégés and took its place in the council of the republic under the title of the Action Républicaine et Démocratique (A.R.D.). Its claimed strength of 127 proved somewhat deceptive. Many of those elected, who as candidates had been willing to give some allegiance to the movement, as senators acquired a certain amount of independence or openly reverted to their original parties.

In the assembly itself the R.P.F. emerged after the election of June 1951 as the strongest single party, winning 121 seats out of 627. Each of the candidates pledged in writing his allegiance to General de Gaulle's leadership, but as early as March 1952 a split occurred in the Gaullist parliamentary group, 27 of its members revolting against their party's decision to abstain when Antoine Pinay, an Independent Republican, was a candidate for the premiership. Protesting against the sterile policy of negation, they formed a left-wing Action Républicaine et Sociale, which at the beginning of 1955 had 33 members. The right-wing Gaullists formed the Groupe des Républicains Sociaux, which had 73 members. Some of the former Gaullists remained independent. Meanwhile the R.P.F. itself was dissolved as a political factor by its founder on May 6, 1953.

To speak broadly, there were three groups among the electorate who supported the movement. The enthusiastic Gaullists, reduced in numbers since the end of World War II, formed an inner core around which gathered persons who believed that France needed a national leader to replace the ineffective and "discredited" party politicians. A second group, who were partially financing the movement, were the people of property and capital, drawn from the P.R.L. and its supporters and seeing in General de Gaulle the only reply to the Communist menace. The third and largest group were those who belonged to the petite bourgeoisie, the professional classes and skilled workmen, who, though good republicans and attached to parliamentary government, were now tired of the constant party strife and fearful of political and economic chaos.

Conservatives.—French Conservatives described themselves before World War I as "Left Republicans" and after World War II as "Independent Republicans." Before World War II the major Conservative party had been the Alliance Démocratique (founded in 1901), whose representatives adhered to several groups in the assembly. Its policy of appeasing Germany brought it into disrepute, and its members after World War II reappeared at first in two groups in the parliament, the Républicains Indépendants and the still more conservative Parti Républicain de la Liberté (P.R.L.). Both parties sought to revive the constitutional structure and parliamentary practice of the third republic and were opposed to the "third force" government's policies of dirigisme and nationalization. The P.R.L. had intended to become a great fourth party in French politics but was frustrated in this ambition by the emergence of the R.P.F., which gathered to itself much of the right-wing opinion that the P.R.L. had hoped to organize. It then allowed its deputies to join the Gaullist intergroup and its candidates to combine with the Gaullists in electoral lists; but to resist total absorption by the R.P.F. its representatives in the assembly of 1951 formed one group with the Républicains Indépendants, which had originally been a rather smaller body there (though always much stronger in the upper house).

Peasant Groups.—The Parti Paysan d'Union Sociale was founded after World War I and reorganized in 1946 with the intention of giving the small peasant proprietors some voice in the national representation. Too small to contest alone the election of Nov. 1946 without support, it had allied itself with other Conservative groups and secured seats for 14 of its candidates; only 8 of these, however, formed a Peasant group in the first national assembly, the remaining 6 joining other groups. Shortly before the election of June 1951, as the result of splits in other parliamentary formations, the Peasant group had grown to comprise 30 members; and in the second national assembly its numbers increased to 40. A split between pro-Gaullist and pro-M.R.P. Peasants occurred in Nov. 1951; but in June 1952 the two wings reunited under the name of Independent Peasant group. This fusion came to an end in Nov. 1953. By the end of 1955 there were two Peasant groups in the national assembly: one, with 14 members, representing the Peasant party; the other, with 23, being that of the Independent Peasant deputies.

Radical Socialists.—The Radical Socialists stood for the oldest republican tradition in French politics, the spirit of the Jacobins and of the men of 1848. They were the main political representatives of the secret freemasonry. Their policy, evolved from Louis Philippe's time (when their main points had been universal suffrage, the separation of church and state, compulsory secular education, liberty of the press, etc.), was a mixture of practical common sense and idealism, reflecting the conflicting desires of the small man of property brought up in the cult of the ideals of the great Revolution. Their official name, Parti Rkpublicain Radical et Radical-Socialiste, is a misnomer: they were "radical" only in their anticlericalism and were actually opposed to socialism as the defenders of private property.

Until 1940, except during the period of opposition to the right-wing Bloc National, the Radicals were a government party under the third republic. Having swung toward the right before 1934, they then once more turned to the Socialists and, after some hesitation, joined the popular front coalition in 1936. After World War II, however, the party was but a shadow of its former self and greatly inferior in strength to the rival parties on its left. It suffered from the association of its leaders with the policy of appeasement and with the debacle of 1940. On the constitutional question (1945–46), the Radicals wanted to maintain the third republic in being.

With the advent of the R.P.F. on the political scene the Radicals had to seek a line of policy that would define their attitude toward it. After the Communists had been expelled from the government in May 1947, the party had joined with the M.R.P. and the Socialists in various "third force" administrations. Their regret for the old constitution and their decided opposition to Communist and even to Socialist principles might have tempted them into some alliance with De Gaulle; but they mistrusted him as a possible dictator. Thus, while individual members did accept a double allegiance and though the party was prepared when convenient to form joint lists in elections, the Radicals as a body insisted upon preserving their individuality and safeguarding their republican traditions.

Their insistence on independence became more marked with a later increase in their electoral and representative strength. After their gains in the elections of Nov. 1948 to the council of the republic, where they and their allies now formed the largest single group (the Rassemblement des Gauches Républicaines), they enjoyed more influence in "third force" administrations; but their increasing insistence on economic principles antagonistic to the dirigisme of the M.R.P. and the Socialists often led to crises that threatened to and finally did break up the coalition.

Union *Démocratique et Socialiste* de la *Résistance* (U.D.S.R.).—The U.D.S.R., a small but influential group, seated to the right of the Radicals in the national assembly, described itself as a non-Marxist party of the left and belonged in fact rather to the centre. With the Radicals, it formed part of the Rassemblement des Gauches Républicaines. Generally sympathizing with the parties that advocated a more liberal economic policy (for example the rapid abolition of government controls and a root-and-branch reform of the nationalized industries), it came to be regarded as one of the moderate centre groups.

Mouvement Républicain Populaire (*M.R.P.*).—The M.R.P., formed after World War II, had its origin in resistance groups and in prewar Christian syndicalist or political movements such as the Dkmocratie Chrétienne and the Parti Démocrate Populaire. The Parti Démocrate Populaire, founded on Nov. 16, 1924, by Paul Champetier de Ribes, advocated proportional representation, votes for women and plural votes for heads of families, the reform of company law and the organization and control of credit. It adopted an attitude of moderation toward the popular front and gave support to most of its measures. In foreign affairs the Popular Democrats were inspired by a strong belief in the League of Nations. Deeply antifascist, they favoured throughout strong measures both in internal and external politics to deal both with the right-wing leagues in France and with Germany and Italy.

After World War II the M.R.P. contemplated in all innocence coming to some arrangement with the Communist party. But the religious nature of the movement and its antagonism toward the principles of Marxism constituted a ditch too wide to bridge. On the other hand the centre position held by the prewar Parti Dimocrate Populaire element became equally untenable for two reasons: the more advanced elements objected to the economic "injustices" of liberalism and the syndicalist elements desired as great a measure of nationalization in industry as was possible. Support for the M.R.P. came chiefly from the proletariat and from lower-grade office workers of more religious inclination. Thus it was in some measure a rival of the Socialist and, to a lesser extent, of the Communist party. But it could also count on a fair support from the Catholic bourgeois and also—though to a lesser extent, except in certain districts where faith was strong—from the peasants.

At the election of June 1951 the M.R.P. was the greatest loser: its total vote declined from 5,058,307 (Nov. 1946) to 2,353,544 and its seats from 164 to 94.

The members of the M.R.P. stood apart from their two fellow groups, the Radical Socialists and the Socialists, on the religious question, insisting as they did that the state should subsidize free (that is, Catholic) schools; they differed, moreover, from the Radical Socialists in offering a more advanced labour policy and in their acceptance of *dirigisme* and nationalization; and they competed with the Socialists for the working-class vote. Also, they had to suffer a cross fire from the Gaullists who, making their appeal in some measure to the same religious principles as the M.R.P. but being less advanced in constitutional or labour theories, concentrated upon detaching the more bourgeois and right-wing element of the party.

The Socialists (P.S., *S.F.I.O.,—Parti Socialiste,* Section *Francaise* de *l'Internationale Ouvrière*).—The French Socialist party was formed in 1905 as a party of class struggle and revolution, aiming to transform capitalist society into a communist association in accordance with Marxist doctrine. During World War I, however, Socialists participated in the government, though certain elements were pacifist. After 1920, when the left wing seceded to form the Communist party. the Socialists tended to ally themselves with their neighbours on the right, the Radical Socialists, until in 1933 a majority element forced the group to conclude a pact for united action with the Communists. At the elections of 1936 they secured 155 deputies (with 19.9% of votes), and their leader Léon Blum became prime minister. They later entered into other coalition governments with the Radicals, though their left-wing elements still preferred the Communist alliance.

In World War II the party took an active part in the resistance movement, both in France and under General de Gaulle. After World War II the Communists attempted to secure the alliance of the Socialists, whom they wished to transform into their junior partner. In the first elections of the fourth republic the party experienced a progressive decline. They preferred to associate themselves with their neighbours on the right rather than with the Communists. Thus they lost a certain amount of working-class support. This was offset in later years by the discredit that the Communists incurred from their near-revolutionary policy. At the election of June 1951 the Socialist vote fell from 3,431,954 (Nov. 1946) to 2,764,210, but, thanks to the revised electoral law (see above), they increased their seats from 101 to 107. The party showed an increasing reluctance to join in the "third force" administrations but continued to give them general but by no means constant support.

Communists.—The French Communist party was founded in Dec. 1920 after the Socialist congress at Tours by delegates who voted for affiliation with the newly constituted third international of Moscow. It had only a small parliamentary representation until the elections of 1936, when it gained 72 seats (15.5% of votes) in the chamber of deputies (cf. 10 seats in 1932). Its policy was mostly dictated by the Comintern executive. In 1936 the party entered into alliance with the Socialists to support but not to join the popular front government under Léon Blum. It attacked the Munich policy of the Edouard Daladier government. yet later defended the Soviet-German pact of Aug. 1939. Because of its opposition to the war after the Soviet invasion of Poland, the party was suppressed by decree on Sept. 26, 1939. After the Franco-German armistice the Communists for a time supported a policy of collaboration with Germany. When the latter declared war on the U.S.S.R. they took part in the movement of resistance and gained many adherents by their effective action and propaganda.

During the later stages of the war the party established contact with General de Gaulle's government and became associated with his administration. In elections after the liberation they secured at first enough seats to make them the most powerful single party. Their later subservience to the U.S.S.R. raised against them the opposition of the remaining parties. They also lost many supporters through disruptive economic tactics. The parliamentary strength of the party was severely reduced by this and by the effect of a new electoral law in 1951, but their support in the country was only slightly diminished.

The structure of the party in the early 1950s was briefly as follows: at the head was the bureau *politique;* under it. a larger *comité* central, elected by the congress of the party, meeting every two years. The congress itself was formed of delegates from departmental federations; these federations themselves were composed of sections; and the sections of cells. The membership of the French Communist party fell from more than 1,000,000 in 1946 to 506,250 in May 1954. They obtained 5,489,288 votes in the election of Nov. 1946 and 5,038,587 votes in that of June 1951, when, moreover, their seats were reduced from 190 to 106. The circulation of their main daily newspaper, *L'Humanité,* fell from 530,000 in 1946 to 121,000 in 1954; their evening newspaper, Ce *Soir,* with a circulation of 590,000 in 1946, was discontinued in 1953.

Table V shows the distribution of seats among the several groups in the parliament from 1919 to 1956.

*The Rassemblement du Peuple Français split in 1953 into Groupe des Républicains Sociaux and Action Républicaine et Sociale. Only the former claimed to be "Gaullist" in 1956. The latter allied itself with the Conservatives. †Republican Federation from 1919 to 1936. ‡Left Republicans irom 1919 to 1936. §In 1919 and 1924 the Christian Democrats joined the group of Republican Federation. After 1946 their official name was Mouvement Républicain Populaire. ‖From 1946, Union Démocratique et Socialiste de la Resistance, ¶This is the total of 544 deputies oi metropolitan France apd of 49 elected in the over-seas *départements* and territories. No election could be held in Algeria which was entitled to 30 deputies.

Local Administration.— French local government was by no means well developed, and much of the local administration is carried out by representatives of the central authorities. Though efforts were being made after World War II by local bodies to obtain a greater autonomy and though the constitution promised that special laws would be enacted to extend municipal and departmental liberties, little progress to this end was made. The post-World War II system was a legacy of the ancien *régime* and of the Revolution. To a certain extent it suited the habits of a people preferring local state-paid officials to the unpaid services of elected representatives.

By the last years of the ancien *régime,* France was divided into 32 *grands* gouvernements, corresponding roughly to the larger provinces or groups of provinces of the kingdom; and at the same time into a rather larger number of *généralités* or intendances (see INTENDANT). For these divisions the Constituent Assembly in 1789 substituted 83 de'partements. The new units, however, continued to be controlled by the central administration from Paris. Special problems of France's diverse regions tended to be ignored, and a uniform pattern of administration was applied to the whole country. In the 1950s the number of de'partements was go. They were divided into 281 arrondissements; further subdivisions were the cantons (3,028) and communes (38,014).

At the head of each *département* is the pre'fet (see below), who represents within his area all the government departments and is responsible for enforcing the national laws relating to the public services. He is assisted in his administration by an advisory body of civil servants (conseil de *préfecture*). He also conducts the domestic administration of the *département* with the help of an elected conseil *général;* this includes control of such matters as finance, police, highways, public assistance and health, education and many of the postwar social services. Finally he is responsible for supervising activities of the small units of administration.

The authority of the de'partement is the conseil *général* which is elected every six years, with half its personnel renewed every three, and meets as a whole usually twice a year (though its executive committee is virtually in constant session). The conseil *général* is a purely advisory body with no executive power; its resolutions can only be put into practice if approved by the pre'fet, who submits business to it, prepares its budget and drafts its regulations (many of which originate in decrees issued by the central ministries). Within the smaller division of the arrondissement is the subordinate of the pre'fet, the *sous-préfet,* who is assisted by a council composed of members elected by the cantons. The powers of this council are negligible. In theory its chief role is to allot to the various communes the incidence of taxation, but this has been taken over by treasury officials, and the various resolutions that it may pass cannot take effect without the approval of the pre'fet.

The commune is the basic unit of local administration. More than half of the 38,014 have less than 500 inhabitants and less than zoo have more than 20,000. Every commune elects its own municipal council (serving for six years) and its mayor. The mayor acts as the executive agent of the council and as the principal administrator of the commune (supervising the police, public works, etc.) and, as the immediate subordinate of the pre'fet, he is in charge of the execution of statutes and decrees. But the authority of the mayor and council is limited in the larger communes by the power of the professional civil servant. The pre'fet, moreover, approves the annual budget, appoints many of the civil officers and has power to suspend for a certain period both mayor and council. They can also be suspended by the minister of the interior and even dismissed by him or by the president of the republic.

The office of pre'fet had been created under the consulate in 1800, by the law of 28 Pluviôse year VIII, with a view to strengthening the power of the central administration as the intendants had strengthened it under the ancien re'gime. According to a statute of June 1950, which limited sources of recruitment, prkfets were to be nominated by the president of the republic after proposals by the minister of the interior. *Sous-préfets* were to be appointed by the president of the council on the recommendation of the same minister but had to be selected, in the proportion of eight out of ten, from the principal secretaries (chefs de cabinet) of *préfets.* The chefs de cabinet themselves were appointed by the ministry of the interior from its own staff or from persons who had passed through the official school of administration.

In April 1948, because of disturbances created by the Communists in the preceding winter, the government appointed eight "superprefects," with the title of inspectors general, who were each to assume administrative control of a particular group of de'partements in the event of further disturbances. They thus constituted civil authorities with powers corresponding to those of the commanders of the military regions into which the country was divided.

Legal System.—French law is largely codified, being based on the Code Napoléon (*q.v.*) and on the codes de *Procédure* civile, de Commerce, *d'Instruction criminelle* and *Pénal* by which it was followed. This body of law (1804–10) was, of course, supplemented and altered later by much statutory law and decree, and there came to exist also a certain proportion of judge-made law. But French legal tribunals rely in the main upon the codified law.

There are two categories of law, administered by two different sets of courts: the civil law and courts deal with all criminal offenses or noncriminal disputes concerning the individual; the administrative law and courts judge litigation to which public authorities are a party. In the case of a conflict between these jurisdictions or of doubt as to their respective competence, the matter is submitted to a *tribunal* des *conflits,* a joint body drawn in equal numbers from the highest civil court, the *cour* de *cassation,* and from the highest administrative court, the conseil d'e'tat.

The hierarchical structure dealing with civil and criminal cases (both of which most magistrates are competent to judge) is as follows: Courts of the lowest jurisdiction (tribunaux de simple police), one in each canton, are presided over by juges de paix and deal with petty offenses (contraventions) or disputes. Above them are tribunaux de *première* instance or *tribunaux civils,* collegiate bodies in the arrondissement, which judge more important cases (*délits* if criminal) or constitute a court of appeal against the decisions of the juge de paix. A third category is the collegiate *cours d'appel,* covering groups of de'partements and dealing on appeal with noncriminal disputes and with the less serious criminal offenses (*délits*). Serious criminal offenses (crimes) are judged in departmental *cours d'assise,* which are the only tribunals employing a jury and are specially constituted for each of their sessions. As a final court of appeal in civil and criminal jurisdiction is the *cour* de *cassation,* which deals with appeals only on points of law and of procedure, not on points of fact, but has the power to annul a judgment after which a new trial is held by the first court.

Criminal procedure in France dates back in some of its aspects to the ancien *régime.* Proceedings are begun by an inquiry (*l'instruction préparatoire*) before a juge d'instruction (investigating officer). Before the latter has been seized of the case, the police map, before but not after charging the suspect, hold an official interrogation (interrogatoire de *première comparution*) and inquiry, at which the statements taken form part of the dossier. If a prima-facie case is established by this an indictment is prepared (L'instruction *définitive*). In court itself the presiding judge interrogates the accused (who cannot refuse to give evidence) at length; and witnesses are heard and questioned by the judge, by prosecuting council and, through the judge, by defending council. Summing up is embodied in a series of questions put by the judge to the jury, which returns a majority verdict.

Administrative law is composed of statutes, decrees and decisions of the conseil *d'état.* This specialized tribunal, which comprises about 150 carefully selected specialists, had its origins in the ancien *régime* and is a markedly French institution. Its function is twofold: first, to advise the government and the executive upon the implications and validity of administrative regulations; second, to judge through its litigation department (section du *contentieux*) any disputes which may arise between the state or public bodies and the individual citizen. Regional councils covering a number of *départements* may deal in the first instance with certain types of cases, but an appeal lies from them to the conseil d'e'tat, which, moreover, deals in the first instance with matters outside their competence. In the execution of its duties the conseil d'e'tat is the defender as much of individual rights as of the rights of the state or of public bodies. Any person or group that considers an order or action affecting him to be outside the authority of a public service may bring the issue before the conseil d'e'tat, acts of parliament alone being excepted. On receiving a complaint the conseil calls upon the appropriate ministry for a justification of its actions and, if the ministry fails to reply, can put it en demeure (*i.e.,* summons it) or even passes judgment on the hypothesis that the plaintiff's allegations are correct. On receipt of a reply, the *conseil* inquires into its validity and can, if so minded, proceed to forbid any action or to quash any disputed regulation or order its amendment.

To make the judiciary less dependent on politics, a *conseil supérieur de la magistrature* was created under the constitution of the fourth republic. This body, responsible among other things for appointing all judges and magistrates, comprises the president of the republic, the minister of justice, six representatives chosen by the national assembly for six years, four representatives chosen by the magistrates themselves and two persons appointed by the president of the republic. Thus the minister of justice lost much of his former power to nominate members to the judicature. *(See* FRENCH LAW *AND* INSTITUTIONS for historical survey.)

Police. — *The* task of ensuring the internal security of the state is exercised under article 47 of the constitution by the president of the council of ministers. The minister of the interior is in fact the head of the various police bodies; under him, within the *départements,* the *préfet* is responsible for public security. Within communes of less than 5,000 inhabitants the mayor is head of the municipal police; in the larger communes the responsibility for police organization is assumed by the municipal councils. The chief executive of the *pre'fet* and the professional colleague of the mayor in the various districts is the *commissaire de police,* who is appointed by the ministry of the interior. He is responsible both to the *préfet* for the work of the administrative police and to the *procureurs généraux* of the courts of justice for that of the judicial police.

Police are divided into two classes; viz., the administrative and the judicial police. whose duties may sometimes overlap. Some officials may be also members of both the administrative and the judicial police as, for example, the *préfets,* mayors and *commissaires.* To speak broadly, the function of the administrative police is prevention of breaches of the law and of public order. either generally as regards the security of the whole territory, or locally as regards the commune; thus, a large element of the municipal police are administrative and perform the usual routine duties. The judicial police concentrate on the investigation of crimes and the collection of evidence for the courts. There are, however, repressive services of the judicial police such as *brigades territoriales* in the Paris area for tackling more serious crimes of violence, while the administrative police in other areas have attached to them *brigades mobiles,* which are concerned with criminal investigation.

The central police authority, whose control spreads over the whole country except the Paris area, is the Sûreté Nationale, a body immediately controlled by the ministry of the interior. Besides exercising a general supervision of the municipal police forces. and the active direction of the judicial police, the Sûreté Nationale is responsible for the security of the state in general measures against sabotage and espionage, in the control of foreigners and the supervision of frontiers, etc.

The Préfecture de Police, an autonomous body directly under the control of the minister of the interior. is responsible for the policing of the Paris district. It comprises both administrative (general and municipal) and judicial services, together with special departments dealing with such tasks as the suppression of fraud and the black market *(police économique).* The general administrative police is mostly concerned with foreigners and travellers; the municipal (divided into *arrondtssements)* deals with the maintenance of public order and with traffic. The judicial police are grouped into various brigades such as *la brigade criminelle* (for serious crime), *la brigade de voie publique* (crimes on the public highway), *la brigade mondaine* (prostitution, cabarets, etc.), *la brigade financière* (tax evasion, etc.) and the mobile *brigades territoriales,* each patrolling a certain section.

In addition to the above classes of police, there exist the *gendarmerie* (a body of about 33,000 in the 1950s), which, though part of the army, exercise police duties under the minister of the interior; the departmental *compagnies re'publicaines de sécurité* for special duties; the *police sanitaire* (health); and the *garde champêtre* (rural duties).

Two central and specialized organizations are the Service de Documentation, d'Enquêtes et de Contre-Espionnage (S.D.E.C.E.), a police body with the particular duty of guarding the security of the state against sabotage. spying and propaganda; and the Section Internationale, the French branch of the International Police.

DEFENSE

Army. — In France the transition from the feudal armies of the middle ages into those of more modern times began in the last decades of the Hundred Years' War. By an ordinance of 1439 Charles VII created out of the mercenary forces at his disposition permanent *compagnies d'ordonnonce.* These companies, whose strength and number varied at different times, constituted the foundation of a national standing army and became finally the cavalry units of later centuries. Charles VII also attempted to create a national infantry by forming in 1448 the francs-archers who were furnished and equipped by the parishes of the realm. He sought to establish the principle that only the monarch could raise troops; and he instituted a system of regular pay in order to improve discipline and loyalty.

With the wars in Italy during the early part of the 16th century came the formation of larger forces. To supplement the standing army, bodies of foreign mercenaries were once more recruited. The professional army became grouped under Charles IX and his successors into regiments and companies, and, though nominally royal troops. the greater part of these were mostly the property of their commanding officers. The royal army thus lost that uniformity and cohesion which it had begun to assume at the end of the previous century.

The reforms of the marquis de Louvois *(q.v.)* under Louis XIV were directed to creating a more efficient and homogeneous force. Louvois restricted as much as possible the proprietary system and increased the number of regiments. He also insisted on commanders' carrying out their military duties and introduced the practice of inspection of the forces. He attempted to standardize training, weapons. uniform, pay and promotion and paid particular attention to the development of the artillery and engineering arms, to the building of fortresses, depots and hospitals. His work gave France a force which until the middle of the 18th century was to be recognized as the first in Europe and which during the Revolutionary period was to provide an efficient nucleus for the people's army. Under Louis XIV the size of French forces in time of war attained a total of more than 300,000 when supplemented by levies of militia; the peacetime strength was nearly 200,000, a figure which was more or less maintained until the end of the *ancien régime.* In 1770 the division was introduced by Victor François de Broglie to replace the former tactical units of wings, advance guards, etc.

On the outbreak of the Revolution the militia system was suppressed, and in 1789 a national guard was created, to which, in theory, all able-bodied males between 16 and 60 belonged. The ranks of the professional army, particularly of officers, were seriously depleted; and. to supplement this, recourse was made—with no great success—to volunteers, who were organized in new battalions. As the threat of invasion increased, the Revolutionary leaders resorted to the *levée en masse.* The heterogeneous regiments of professional, volunteer and conscript soldiers were amalgamated and organized into trained, disciplined armies, chiefly through the energy and ability of Lazare Carnot. In the campaigns of 1794–96 these armies repelled the threats to the new republic. So depleted, however, became their numbers that in 1798 the Directory introduced, by the *loi Jourdan,* compulsory military service for males between 20 and 25. By the following year French forces (excluding those under Napoleon in Egypt) numbered about 170,000, divided into five armies.

Napoleon extended conscription to practically the whole of the able'-bodied male population. He replaced the existing army divisions by the larger *corps d'armée.* The divisional cavalry and most artillery were formed into separate corps troops. The services of the army were developed and perfected. Under Napoleon the size of French armies fluctuated considerably. With each recurrence of war there were more desertions and conscription was increasingly evaded; thus, more use was made of foreign elements, who were usually organized as national units. The Grande Armée in Oct. 1806, about the time of the battle of Jena, numbered about 225,000 men; and for his expedition into Russia Napoleon raised 640,000, half of whom were foreigners. An increasing dearth of men marked the final years of the first empire. In 1814 a *levée en masse* raised about 140,000 men, and during the Hundred Days Napoleon gathered together a first-line force of about 182,000 and a reserve garde mobile of 200,000.

Conscription was abolished on the restoration, but a modified kind was reintroduced within three years, under which those not required for the immediate demands of the service were given furlough. The national guard was, however, retained in certain larger towns. Under Louis Philippe the method of recruitment was again changed. At first a conscript could secure exemption by providing a substitute; later, exemptions could be bought by the payment of a certain sum to a fund out of which the state paid volunteers. By 1866, out of a total establishment of 400,000, only 120,000 were conscripts. Under Louis Philippe recruitment was first begun for the foreign legion.

Against the threat of Prussia, a measure for the reorganization of the army was introduced by Marshal Adolphe Niel which became law in 1868. By universal compulsory service it was hoped to create a first-line army of 800,000, half on active service and half in the reserve. But before this could have much effect war broke out in 1870. The French forces then numbered around 375,000, of whom about 250,000 were capable of being mobilized. A garde mobile, which was to have been composed of those exempted from military service, existed only on paper. After the first disasters of Metz and Sedan additional formations amounting to about 1,700,000 were hastily raised, but lack of equipment and training rendered them largely ineffective.

Under the third republic reorganization of the army was based upon obligatory universal service, to last long enough for a maximum of men to receive some training. The period was five years in 1875 (when the effective strength of the army was 430,703); it was reduced to three in 1889, to two in 1905 and increased to three once more in 1913. After their spell of training, the conscripts were classified according to aptitude, as fit for active service and for the active reserve or for the territorial army and its reserve (home service). In addition a colonial army, specifically for overseas service, was created, chiefly of professional soldiers.

This system of training allowed France to mobilize during World U'ar I a total of nearly 8,000,000 troops (supplemented by nearly 500,000 native colonials) without impairing the quality of the effectives too seriously. French casualties amounted to 1,357,000 dead and 4,266,000 wounded.

In 1928 came some major reorganizations of the French army. The total length of military service became 28 years. Of this, 1 year (on attaining the age of 21) was to be on active service, 3 years on furlough, 16 years in the first reserve and 8 in the second. In 1935 the period of active service was increased to two years. The active army was recruited by calling up the annual contingent and enlisting volunteers. This army of 25 infantry and 5 cavalry divisions was divided into the metropolitan forces (strength 465,000) stationed permanently in France; the colonial army (249,000) in French overseas possessions; and mobile reserves (50,000), normally stationed in France or North Africa.

On the outbreak of World War II, France mobilized 89 divisions, which comprised 1 armoured, 3 light mechanized, 5 cavalry and 80 infantry. The nation was, thus, very deficient in armoured and mobile forces, partly because its military strategy had since 1918 been dictated by defensive and traditional considerations. In May 1940 France had 115 divisions available, four-fifths of them in France.

Navy. — France's sea power was relatively late in developing, largely because during the middle ages so many of the maritime fiefs were often held by vassals strong enough to confine the authority of the crown to its inland demesne. Ships were usually hired to supplement the small royal fleet from such maritime nations as the Venetians and the Genoese. Until the time of Louis XIV the fleet was alternatively developed or neglected. The main theatre of maritime activity in the 15th century was the Mediterranean. With the discovery of the new world, the country, from its geographical position, had inevitably to pay attention to maritime strength. Yet Henry IV left no navy to his successors. Richelieu himself took the colonies and navy into his especial charge and built up a fleet of 20 men-of-war and 80 smaller ships.

Mazarin failed to continue Richelieu's work in this sphere. But Colbert enlarged the navy from 30 mostly small vessels (1661) into 107, of which one-fifth carried 120 guns (1683). In addition, the port and arsenal of Toulon was established and various ports were fortified and naval schools established. To provide recruits Colbert instituted the inscription maritime, which still survives. This was a list of Frenchmen exercising the calling of sailors who could be called on to serve and who were granted certain privileges and pensions.

After Colbert's death (1683) the navy was again neglected. By 1747, toward the end of the War of the Austrian Succession, it numbered 31 ships of the line, as against 136 British; then two naval defeats in that year virtually destroyed it. Its strength was again rebuilt to some extent during the Seven Years' War. In 1758 the navy numbered 77 ships of the line, but around half were soon lost in battle. Between 1763 and 1789 rebuilding again took place, and by 1778 ships of the line numbered 80. The British victories of the Revolutionary and Napoleonic periods reduced the French fleet to impotence and ended any further attempts to secure naval supremacy.

During the 19th century the navy kept abreast of such developments as the introduction of steam and the creation of ironclads. But after the Franco-German War construction lagged, and on the outbreak of World War I the fleet, though large, was to a great degree obsolescent. Its total tonnage was 816,000 (37% of the British), and its operations were chiefly confined to the Mediterranean and the channel. After 1918 financial difficulties hampered the building of capital ships; construction was chiefly devoted to light craft and submarines. Tonnage in 1939 was around 400,000 (surface craft). During World War II most of the fleet was destroyed or fell into British or German hands.

The home bases of the fleet, which were the core of the naval arrondissements, were Cherbourg, Brest, Lorient, Rochefort, Toulon and Bizerta (North Africa), where building and outfitting yards and arsenals were established. The areas came under the command of a *préfet* maritime (admiral). The fleet was chiefly manned by volunteers or selected conscripts, mostly Bretons.

Air Force. — The French air force came into existence in 1909, and a directorate of military aviation was established within the war ministry in 1912. During World War I, 40,000 aircraft were built and 17,000 pilots trained. In 1928 an air ministry was created, which assumed control of the existing military, naval and colonial arms. The number of aeroplanes at the outbreak of World War II was 3,205, when production was at the rate of 250 a month.

Defense After 1945.—Toward the end of World War II the reconstruction of French armed forces, particularly of the army, was pushed forward, and by the end of 1945 the effective strength of land forces in Europe and overseas was around 700,000. In the class immediately following, the period of military service was fixed at one year; this was extended in 1950 to 18 months. A major reorganization for the purpose of co-ordinating the three services more closely than before the war was made in 1948. This widened the powers of the ministry for national defense, to which the three service departments were subordinated, and created various interservice committees of high command.

By the provisions of the constitution of 1946 the president of the republic was made the titular head of the forces, while the president of the council of ministers was responsible for co-ordinating the military and civil aspects of defense throughout the French union. In this the latter was advised by the Comité Militaire Permanent (un *organe de décision*), and his executive was the general staff of national defense. Two other (advisory) bodies, the Conseil Supérieur de la Défense Nationale and the Comité de la Défense Nationale, presided over by the president of the republic, were also created.

The ministry of armed forces (later called ministry of national defense) was responsible for the training, mobilization employment, administration, etc., of the forces in metropolitan France. The minister was directly assisted by a Comité des Chefs d'États-Majors Généraux and its staff, which integrated representatives of the three services. Under him was also an Inspection Générale des Forces Armées, which controlled the training of all three services. The individual service departments themselves were each under the administration of a secretary of state.

Army.—France is divided into ten military regions, as follows: (1) Paris; (2) Lille; (3) Rennes; (4) Bordeaux; (5) Toulouse; (6) Metz; (7) Dijon; (8) Lyons; (9) Marseilles; (10) Algiers. By the middle of 1955 there were five more or less full-strength divisions and nine so-called M+30 divisions (*i.e.,* mobilizable within from 3 to 30 days, the state of their equipment and of their training being, however, doubtful). The effectives of all army units, including the gendarmerie and the colonial troops, amounted to 706,000.

Air Force (*Armée* de *l'Air*).—By 1955 there were five *régions aériennes*: (1) Dijon; (2) Paris; (3) Bordeaux; (4) Aix-en-Provence; (5) Algiers. There was also an independent command, part of the North Atlantic Treaty organization, called 1st CATXC (Corps Aérien Tactique), with headquarters in Germany, at Lahr in the Black Forest. The smallest operational unit was the *escadrille* (squadron); these were grouped into escadrons (wings) and escadres (groups). There were 38 fully formed escadrons in all (including 30 jet-propelled), with a total of 2,100 aircraft, 41 air bases and 130,000 effectives.

Navy (*Marine* de *Guerre*).—There were four territorial commands: (1) Cherbourg. covering the channel coast line from the Belgian frontier to Mont St. Michel; (2) Brest, covering the coast from Mont St. Michel to the Spanish frontier; (3) Toulon, covering the country's European coast line on the Mediterranean; (4) Algiers. By 1955 the navy comprised 2 battleships, 3 light fleet aircraft carriers, 1 escort carrier, 5 cruisers, 18 destroyers, 51 frigates and escort vessels, 14 submarines and a number of mine sweepers and other auxiliary vessels; in all. 430,000 gross tons of ships, as well as 900 aircraft. Effectives numbered 71,000.

Defense Budget.—The total defense budget for 1954 amounted to 1,100,000,000,000 fr. including 39,000,000,000 fr. for the common section, 280,000,000,000 fr. for the army, 270,000,000,000 fr. for the air force, 170,000,000,000 fr. for the navy and the rest for new armaments.

OVERSEAS POSSESSIONS

The French colonial empire of the ancien *régime* was largely lost during the second half of the 18th century (see History, above); and after the Napoleonic Wars the treaties of Paris (1814 and 1815) left France with Guadeloupe. Martinique, trading ports in Senegal and India, French Guiana and Réunion only.

However, succeeding governments expanded this remainder to create the second largest empire of the world. The conquest of Algiers in 1830 began the establishment of French rule on the Algerian coast and on the high plateaus. Trading ports mere set up in the Gulf of Guinea, a protectorate over islands near to Madagascar and in the South Pacific. The Second Empire established French rule in the Algerian Sahara; transformed the trading ports of Senegal into an important colony; acquired Obok and Amabo in Somaliland: began to gain a foothold in Cochin-China around the mouth of the Mekong; and took Cambodia under its protection. Finally, the third republic extended these acquisitions and co-ordinated them.

Tunisia was acquired as a protectorate in 1881, most of Morocco in 1906. Senegal served as a springboard for the occupation of west African territories. The small trading ports of Gabon were extended into a hold on what later became French Equatorial Africa. The conquest of the whole of the Sahara by 1900 knitted together on the banks of the Chad the three areas of North. West and Equatorial Africa. In the Indian ocean Madagascar was acquired in 1895 and its governor general's authority extended to the Comoro Islands in 1908. The footholds in Somaliland were consolidated after the foundation of Jibuti (Djibouti) in 1888. In Asia French control spread to the kingdoms of Annam, Tongking and Laos (1885–1903); in the Pacific, to the Society Islands with Tahiti (1903) and to the New Hebrides (1904).

After 1918, certain German possessions in Equatorial Africa, which had been taken irom France in 1911, were returned to it; and important parts of Togoland, the Cameroons, Syria and the Lebanon were acquired under mandate from the League of Nations. After World War II France relinquished its mandate over Syria and the Lebanon and handed Chandernagore over to India.

Constitutional Organization Before 1946.—Under the ancien *régime* and under the first republic the colonies were subject to laws applying to the metropolitan area; subsequently, until 1852, they were governed by the enactment of special laws. Then the Second Empire gave the senate the power to legislate on colonial matters, and in 1854 this body granted a constitution to the older colonies of Martinique, Guadeloupe and Réunion but left the other possessions to be governed by decrees of the emperor, pending a formulation of their status.

The constitution of the third republic remained silent on the position of the colonies, and throughout its existence France's increasing overseas possessions were controlled politically and economically by the central authority. Their population of about 70,000,000 in 1939 (of nhom only a very few were French citizens) continued for the most part to be governed by decree and largely administered by a central bureaucracy, though parliament could always discuss colonial questions and indeed legislate on them. Some of the colonies too were represented, through the suffrages of resident French citizens and a small minority of privileged natives. in the two houses of the central legislature. Yet the average Frenchman was seldom interested in the realities of his empire.

During the 20th century the increasing extent and diversity of France's possessions led to controversy upon governing by decree 1 The system was defended on the grounds that it offered a supple. rapid and appropriate method of administration according to the differing needs of the heterogenous areas; and attacked on the grounds that it could never bring unification to this growing and complex body. Another problem was the assimilation of the indigenous population within its territories, which French official policy encouraged. In the 20th century it was increasingly appreciated that some native cultures (*e.g.,* the Islamic) were too powerful to supplant. Moreover. an increasing dearth of manpower prevented France's sending enough colonists to influence local customs radically. Thus colonial administration was forced into a policy of "association." whereby local government was in some measure delegated to the influential local chiefs, and elements of the native civilization were retained. The ".assimilated" native was still encouraged to acquire French citizenship, though by 1939 only 2,500,000 (including those of European stock) had done so.

The French Union.—By 1939 many French politicians had come to see that a policy of complete assimilation was doomed to failure. Already local national parties were springing up in many territories. demanding political equality and some measure of self-government. The defeat of France in 1940, combined with the fact that resistance to Germany and Vichy conticued to flourish in many overseas possessions, placed the colonies in a strong position to demand some reform. The Brazzaville conference of 1944 between the Free French leaders and colonial notables made some attempt to meet native wishes. Although it rejected the principle of autonomy, the conference recommended a political reorganization to guarantee the unity of the French world and to encourage local self-government.

By the constitution of 1946, metropolitan France and its overseas possessions were linked together under the title of the French union. The organization of the union was complex. Three institutions seated in Paris, viz., parliament, the assembly of the French union and the high council of the French union, had each a voice in affairs. Each of the countries within the French union sent members to one or more of those bodies. In addition. the majority of them possessed local representative assemblies, while the territories forming French West Africa and French Equatorial Africa also elected territorial assemblies representing either group as a whole.

Of the national representative bodies, parliament had the right to pass legislation, while the assembly of the French union and the high council of the French union were purely advisory bodies. The assembly of the French union was composed half of delegates from overseas and half of representatives from the national assembly. It was thus a microcosm of the latter, with the addition of a strong coloured element; and its effective influence was small. The high council, composed of delegations from metropolitan France and from each of the associated states, did not play any significant role either. Thus, effective control of most parts of the union was exercised by parliament and by the ministries concerned with the various territories.

The countries of the French union, in addition to the metropolitan area, fell into five categories, each having a different political status. *(See* Table VI.)

First, there were the overseas *dkpartements* which included those colonies, Martinique, Guadeloupe, Guiana and Réunion, whose inhabitants are largely of French or mixed stock. Being relatively easy to administer, they were assimilated to the political system of the metropolis and given a French type of local government which consisted of a *préfet* and a *conseil général.* French laws were automatically applicable to these territories; and the inhabitants enjoyed full rights of French citizenship. The responsibility for their administration came under the minister of the interior. Algeria, as the oldest French possession in Africa with a numerous French minority, also belonged to this category, though with certain differences in status as provided in the Statute of Algeria of 1947. The degree of autonomy thus granted —by the creation of an Algerian government and assembly—was, however, relatively small.

The second category was that of French overseas territories, comprising the least advanced areas under French rule. These were French West Africa, French Equatorial Africa, Saint-Pierre and Miquelon, Madagascar, the Comoro Islands, French Somaliland, French India, New Caledonia and the French Pacific Islands. Their inhabitants enjoyed French nationality, though they did not necessarily exercise the rights of citizenship in the same way or to the same extent as the inhabitants of metropolitan France. French laws were automatically applicable in some spheres of legislation; in others the president of the republic made them so by decree. Government was carried on by a French governor general, who in some cases was bound to consult the local representative assembly. The powers of these local assemblies were very limited and mostly concerned details of tax collection and local finances. Ministerial responsibility for the overseas territories lay with the ministry of overseas France.

The third category was that of associated states. According to the French constitution, "the status of each associated state in the French Union is determined by agreement defining its relationship with France." Thus, an associated state was envisaged as a political unit enjoying some degree of internal sovereignty and linked to France by an instrument resembling an international treaty. Up to 1953 three states had been granted this status, Laos, Cambodia and Vietnam (including the former colony of Cochin-China). They were represented in the assembly of the French union and in the high council, but not in the parliament, since they possessed their own governments and parliaments, They formed part of the French union but, unlike the overseas *départements* and territories, not of the French republic. Their inhabitants retained their own nationality and enjoyed also a "citizenship" of the French union which was common to all the inhabitants of the union. French ministerial responsibility for relations with them belonged to the ministry of overseas France.

The final category of overseas possessions was that of associated territories, the former mandated territories of Togoland and the Cameroons (Cameroun), held under trusteeship from the United Nations. Their status was similar to that of the overseas territories, though their inhabitants did not possess French nationality. They had local representative assemblies and also sent representatives to the parliament and to the assembly of the French union.

The protectorates of Tunisia and Morocco did not form part of the French union and strongly resisted any attempt to incorporate them in it. Thus neither of the countries sent representatives to the various assemblies in Paris. Responsibility for their administration rested with the ministry for foreign affairs.

While local representative assemblies (admittedly with very little power) were created to meet their increasing desire for autonomy, the colonial peoples were at the same time encouraged to look, for the satisfaction of their political ambitions, to the various assemblies in metropolitan France. Thus the prestige—as well as the powers—of the local assemblies was very small, and the best talent of the native population was drawn toward the metropolis. This policy of political assimilation, which was reinforced by one of cultural, often resulted in a genuine loyalty to France, particularly among the more educated natives, who, however, sometimes became so French in outlook as to lose caste with their own people.

The traditional tendencies and future intentions of French colonial policy were expressed in the conclusions of the Brazzaville conference of 1944, on which the subsequent development of the French union was based. They read:

> The objectives of the work of civilization accomplished by France in the colonies exclude any idea of autonomy, all possibility of evolving out of the French colonial bloc. The establishment, even in the distant future, of self-government in the colonies is to be excluded. . . . It is essential that the representation of the colonies in the central administration of metropolitan France should be far more adequately and effectively ensured than in the past.

By offering to the native peoples representation in the political institutions of metropolitan France and thus a share in the government of the whole French union, the French hoped to induce them to renounce their ambitions for self-government. By 1952 the 627 seats in the national assembly were divided as follows: France and Algeria (metropolitan France) 574, overseas *départe-*

TABLE VI.—*The French Union, 1954*

Country	Area (sq.mi.)	Population* (in thousands)	Capital	Status

ments and territories 53. In Algeria (30 seats) and in the overseas territories, there were two electoral colleges, one for French citizens, the other for natives. In the council of the republic, out of 320, there mere 44 overseas members and 14 from Algeria; again, many of these were French. In the assembly of the French union half the members were nominated by the political parties in metropolitan France, but on the high council the overseas d&-*partements* and territories had no separate representation. Such representation failed to give overseas native peoples an effective voice in either local or union government. For the changes under the fifth republic *see* FRENCH COMMUNITY.

ECONOMY

France's economy has been assisted by the possession of certain natural resources and also by the characteristics of its geographical position. The soil is fertile, the climate equable and the river system far reaching. Mineral deposits are fairly varied, iron ore being notably plentiful. The physical conformation of the country makes internal communications easy; and coasts and estuaries offerample opportunity for the development of ports. Moreover, France occupies a central position between the old world and the new and has easy access to Africa and to the near east. Nevertheless, economic development has been constantly hampered or interrupted by disastrous foreign wars and civil strife.

During the 12th and 13th centuries the Capetian kings encouraged land reclamation in the shape of forest clearing. drainage and the improvement of the soil by the admixture of ashes, chalks and marl. The productive capacity of the country, especially in grains and wines (of which it became an early exporter), developed considerably. Industrial and commercial life flourished, particularly in the north and in coastal towns. By the beginning of the 14th century, it is estimated, France had around 23,000,000 inhabitants of whom 17,000,000 were rural.

This growing prosperity was ruined by the Hundred Years' War (*q.v.*), in the course of which vast areas fell into waste, towns and ports decayed, industrial life was halted and maritime trade was lost. Repeated campaigns by France's enemies, chiefly the English, and accompanying pestilences contributed to a large decrease in population. But rapid recovery took place in the latter half of the 15th century, chiefly because of the intrinsic physical advantages of the country. In the first part of the 16th century began the era of French expansion in the east and in the new world across the Atlantic; but again the tide of national prosperity was checked, this time by years of internal religious wars.

Early in the 17th century, Henry IV's government began to rehabilitate agriculture and commerce. Large areas were brought under production. manufactures were encouraged, roads and canals were built, commercial treaties concluded. Richelieu, under Louis XIII, continued the work of reconstruction, chiefly by building a navy and encouraging overseas expansion. Colbert, under Louis XIV, promoted the extension of France's maritime trade and conquests in North America, in the West and East Indies and in Africa and did much to stimulate manufactures and improve communications at home. Indeed he imposed on French industrial life a pattern which it continued thereafter to bear—that of the small specialized manufacture. But the later policy of Louis XIV and that of Louis XV in endeavouring to continue overseas expansion and at the same time to win territorial acquisitions in Europe proved too great a burden to allow France to resist the challenge of Great Britain; by 1763 most of the French possessions abroad and conquests in Europe had been lost. Internally the country had been considerably impoverished by excessive taxation of the commercial and lower classes.

Under Napoleon much mas done to promote industry and commerce (*e.g.,* the promulgation of the *Code* de *Commerce* in 1808); trade by land was considerable; and great progress was made in the development of public works. But France emerged from the Napoleonic era with its external trade seriously curtailed and the technical progress of the Industrial Revolution retarded. During the 19th century the nation was rapidly overtaken by Germany and Great Britain in population, industrial production and commercial wealth. In the middle decades, however, exploitation of the country's mineral potentialities and a mechanization of its industries did begin to make a tardy headway. But large-scale industrialization was slowed down at first by the existence of a widespread cottage industry, by the individualism of the French *patron,* who tended to oppose integration within large-scale organizations, and by the insufficiency of the country's coal resources. Thus, during the first part of the 19th century the urban working class in France did not grow at all rapidly; towns were slow in developing and few became very large. In industry the small *patron* or the family business remained a common unit; the craftsman resisted the transformation into the skilled or unskilled labour of large undertakings. The mechanization of French trades was, therefore, largely incomplete, and their output lagged behind that of more scientifically industrialized rivals.

Agriculture continued to be the predominant occupation and to provide a large stable and conservative element within the country. But toward the end of the 19th century the drift from rural into urban areas began to increase, and the rural population fell from 75% to 50% during its latter half. The causes for this were the reluctance of peasants in the more infertile regions to struggle against the relative unproductiveness of the soil; competition from abroad; mechanization. which deprived the labourer of employment; and the partial supplanting of the cottage industries by the more mechanized urban ones.

After the Franco-German War France went through a period of depression. Two of its richest provinces, constituting 2.5% of its territory, had been lost and a considerable war indemnity had to be faced. To stimulate essential economic activities a policy of stronger protection was introduced and commercial agreements were more widely sought. France also turned increasingly to the development of its existing overseas possessions and to the further expansion of its colonial empire. World War I again halted economic progress. In 1918 the country faced many problems created by heavy losses of manpower, by the devastation of its northern and eastern provinces and by its heavy debts to its allies, the U.S. and Britain. On the credit side of the balance sheet there was, however, the recovery of Alsace-Lorraine and the occupation of the Saar, whose coal was for several years to supplement France's own somewhat meagre resources.

After 1918 a more progressive policy in industry was adopted, particularly in the modernization of equipment; communications were improved; the integration of the country's colonial units was pursued.

When the economic depression of the late 1920s hit the world, France proved more capable of resistance than many other nations. The strength of its agriculture, the existence of small-scale industries. well-balanced production and a lesser reliance on international trade contributed to this. However. an attempt to maintain the franc on the gold standard. together with political dissension, corrupt and inefficient administration and strikes, began to weaken the country when other nations were beginning to recover. Unemployment (for which the country had an inadequate relief system) increased. The policy of wage increases, shorter hours and paid holidays introduced by the popular front government (1936) was only an attempt to appease the working classes and offered no solution to the economic ills. In 1938 a more resolute policy was adopted. Strikes were suppressed, hours of work increased and the franc was devalued.

After World War II France began a major reorganization and modernization of agriculture and industry. In addition a more thorough exploitation of the tremendous water resources of the country for hydroelectric power was undertaken, as well as the improvement of communications. Substantial progress was made in most economic spheres, though it was handicapped by the instability of administrations, tax evasion, strikes, high costs, lack of confidence in the franc, considerable sacrifices for the cause of European defense and the costly war in Indochina.

During this period the government was attempting to solve economic difficulties by more effective price .control and wage freezes, by budgetary economies, by reorganizing of the nationalized industries, by lengthening of the working week, by revision of credit policy, etc. For labour, see *Population,* above.

AGRICULTURE, FORESTRY AND FISHERIES

Climate, relief and soil have all contributed to assist the development of agriculture in France. The oceanic climate of the north and west produces a moderate temperature and adequate rainfall for all kinds of crops. In the centre and south an increased prevalence of sunshine, yet without serious drought, has added to the variety of produce. Though the mountainous areas occupy nearly a quarter of the country, only the highest are completely infertile. Cultivation has extended far up the Alpine, Pyrenean, Vosges and Jura valleys and over the lower plateaus of the Massif Central. The soil of the country is varied, but three main types predominate: the fertile loamy mixture of clay and sand (limon), which is widespread over the low plateaus and plains of the north and the northern centre and in parts of Alsace; the calcareous earths covering large stretches of Lorraine, of Champagne and of Burgundy in the east and of Saintonge, of Périgord and of Quercy in the central west and also the lower mountainous areas; and the third type, which includes the rich volcanic deposits in certain areas of the Massif Central, the alluvial deposits of the many river valleys, the poor acid soils of central Brittany and the sandy stretches of the Landes.

Serious development of cultivation began around the 11th century, with the clearing of forests and the foundation of villages; much of this work was inspired by the monastic orders. In later centuries (particularly in the early 17th) attention was turned to the draining of marshlands and then to irrigation. But until the 18th century French agriculture was in a relatively primitive state. Under British influence a more intensive and scientific cultivation was begun by the enclosure of common lands, by the introduction of fallow break, manures and better mechanical aids, by the cross-breeding of stock, etc.

In the production of cereals there was a tendency to concentrate, where possible, on the superior grains (*e.g.,* wheat) or to extend the growth of fodder crops for the support of stock (particularly cattle and pigs).

The existence of a landowning peasantry dated from long before the French Revolution, by which time almost half the country belonged to small holders. who formed nine-tenths of the landowners. The policy of the Revolutionary and Napoleonic regimes was to establish the peasant freeholder as the backbone of the nation. Inheritance laws required the subdivision of land among the sons. Agriculture was and continued to be well guarded by tariffs. and the peasant was relieved of too heavy a taxation. Such a policy of protection had its disadvantages. Advanced methods of cultivation were slow in being introduced; productivity remained relatively low; and any considerable rise in the standard of living was hampered.

Despite the encouragement given to the peasantry, agriculture from the 1860s began to suffer from the increasing industrialization of the country and from overseas competition. Agriculture was the occupation of about 48% of the active population in 1866, of 42% in 1906, of 36% in 1931 and of less than 30% in 1954. The decline affected cultivated areas, at whose expense there was an increase in pasture. In 1892, 25,600,000 ha. were under cultivation; in 1934, 21,700,000; in 1937, 20,300,000; and in 1953, 18,-546,000. Corresponding figures for natural pasture were 5,900,-000, 10,800,000, 12,060,000 and 12,347,000. (See Table VII.)

*Incomplete returns. †Includes orchards, olive groves, horticultural and nursery gardens, etc., and waters.

Nevertheless, agriculture in the middle of the 20th century was still the major occupation of the people. Before 1945 technical progress had been only slightly encouraged by government assistance; but later the industry received considerable subsidies (6,340,000,000 fr. in 1948; 19,250,000,000 fr. in 1950; 9,550,000,-000 fr. in 1952) and loans (14,350,000,000 fr. in 1948; 53,600,-000,000 fr. in 1950; 18,000,000,000 fr. in 1952). More rural areas were electrified and modem amenities were made more widely available. There were also increased facilities for stocking and cold storage and more irrigation. Furthermore, various small and too unproductive areas were taken into larger and more economic units.

By far the greater proportion of land was divided among small cultivators, either owners or tenants. Only a few score of estates exceeded 1.000 ha.; about 100,000 were between 50 and 500 ha., 700,000 between 10 and 50 ha. and 4,500,000 less than 10 ha. The-larger estates were found in Normandy, Brittany, La Vendée and Flanders and around Paris. The smaller ones extended throughout the country, but were most numerous in the eastern provinces, in the southwest and in the south or along the river valleys. In the 1950s remembrement, the combining of small unprofitable holdings, was being increasingly practised. While the majority of the small holders cultivated their own land, usually with the assistance of their family or hired labourers, a certain number of farms were leased. In the Paris area, in the north and in the west, the tenant farmer predominated. A second system was that of *métayage* (a method more prevalent in previous centuries and found mostly in Berry, Limousin, La Vendée, Aquitaine and Provence), under which the owner (who supplied capital) and the cultivator (who supplied labour) took either half and half or one-third and two-thirds of the produce respectively.

French experts agreed at mid-20th century that, if agriculture were better exploited, it could support a population of 70,000,000. Yet France was then importing three times as much corn as it exported; and in 1952 agricultural imports were valued at 108,-000,000,000 fr. as against exports at 51,000,000,000 fr. In 1953 and 1954 there was, however, a marked development in agricultural production with a corresponding decrease of imports of foodstuffs; and by the middle of 1955 a favourable trading balance in agricultural produce had been created. Requirements were an increased use of fertilizer; more tractors and equipment; further extension of irrigation in such areas as Languedoc, Gascony and the western marshlands; the instruction of farmers in scientific methods; and a better system of marketing.

Cereals.—The effect of a warm temperature and moderate rainfall has assisted the cultivation of wheat over a large area of France. Somewhat more than half the area devoted to cereals produces wheat. The more important regions are in Flanders and in the Paris basin (Soissonnais, Brie and Beauce), where a thick covering of *limon* well mixed with azote and potash offers a soil capable of greater yields than any in Great Britain (*e.g.,* on an average, 35 cwt. of wheat, 15 tons of potatoes and 20 tons of beet to the acre). Other regions giving a high yield are the alluvial terraces of the Seine and its tributaries, the Charente district in northern Aquitaine, the coastal plains of Brittany and Normandy, the Alsace terracelands, the lava soils of Languedoc and the lower valleys of the Alps.

The area under wheat tended to decrease after the end of the 19th century, particularly in Normandy and in the southern districts (*e.g.,* from 6,542,000 ha., excluding Alsace-Lorraine, in 1913 to 4,319,000 in 1950), though it rose somewhat in the second half of the 20th (4,482,000 ha. in 1954) and the yield per hectare increased (1,240 kg. per hectare in 1840; 1,720 for the years 1896–1905; 1,960 in 1952; 2,346 in 1954). In the 20th century, as the demand for better bread increased, grain had to be imported, whereas formerly there had been a surplus for export.

Oats constitute the next important crop after wheat. They are most grown in the damper northern half of the country, particularly in the stock-raising areas. Barley is a less important crop, grown in parts of Alsace for brewing and in the northern areas as fodder. Rye is mostly confined to the poorer soils of the Massif Central, the Landes, central Brittany and the eastern Pyrenees. Maize is grown in the warm damp areas of the east and southwest, chiefly as a fodder crop. The production of main cereals is shown in Table VIII.

*1951–54 average.

Root Crops.—Potatoes are the most important root crop grown for human consumption and were increasingly and widely cultivated after their introduction into France in the 18th century. The crop provides a surplus for pig food and for the manufacture of alcohol and starch. A fair quantity of new potatoes is exported. Fodder beets are widely grown on the northern plain; sugar beets are more localized in the extreme north (Pas-de-Calais) and around Paris and are used by sugar refineries and by distilleries.

Vines.—France is the most important wine-producing country in the world. though Italy has a larger area under vineyards. The yield per hectare in France is almost double what it is in Italy and the production of superior vintages is far greater. Production considerably decreased after the end of the 19th century. The area of vineyards was 2,345,000 ha. between 1870 and 1880, for example. but only 1,454,600 ha. in 1953. This decrease was largely the result of wartime destruction. attacks of disease (which sometimes desolated extensive districts), lack of labour, restrictive tariffs abroad and foreign competition, which made many cultivators turn to dairy farming instead. Cultivation is mostly in the hands of small holders. Roughly half of the output comes from the southern part of the country, particularly from the lower RhBne and Hérault districts. A second area, producing high-grade vintages, lies in the southwest along the valleys of the Garonne, Dordogne and Charente; in the southwest too are the brandy-distilling districts of Cognac and hrmagnac. A third area lies along the Loire valley in Anjou and Touraine. Three smaller vine-growing districts, Cbte d'Or, Chablis and Beaujolais, are in Burgundy. Another area is in Champagne, particularly on the slopes of the Montagne de Reims and of the Côte des Blancs and in the Marne valley. There are also vineyards in Alsace-Lorraine (on the Vosges slopes) and in the Jura. Overproduction in post-war years forced the government to buy a substantial amount of wine and distribute it free to the "impoverished classes." Long-term plans were laid down for reducing the area under vines; this aroused the antagonism of the powerful winegrowing interests.

Miscellaneous Crops.—Minor crops include flax in the Scarpe and Lys valleys of the northeast, tobacco in the southwest and in Alsace, hemp along the Loire valley, hops in Alsace and in Burgundy, oilseeds, rape, poppy and olives in the south. (*See* Table IX.)

Market Gardening.—Market gardening is extensively practised in France, particularly in areas where a large urban population offers a good market. Moreover, the development of communications encouraged the growth of the more perishable fruits and flowers in the Midi. In some districts market gardening has replaced vine growing. Vegetables flourish in the sheltered areas of Brittany, Poitou and the Rhône valley and find a market in Paris, the industrial northeast and England. Fruit is grown extensively and in wide variety, and commercial production has been developed in many districts; for example, as well as canning, there is crystallizing in Gascony, bottling and sugaring in the RhBne valley. The cultivation of flowers, both for the cut-flower trade and for perfume, is a speciality of the Côte d'Azur.

Livestock.—Stock raising is carried on by itself or in conjunction with arable farming. Natural types of pasture are upland, lowland (*bocage*) and small areas of coastal salt marsh. The upland pastures include the *alpages* or *estibes* (between the permanent snow line and the tree line), whither stock is driven to graze from early summer until autumn under the system of transhumance (the migration of cattle from the artificial pastures to the higher natural ones), and the heath pasture of the 'Massif Central and its plateaus. The *bocage* type is found particularly in Normandy, Brittany and parts of La Vendée. Salt-marsh pasture occurs chiefly in the Crau and Camargue districts of the Rhône delta and along the Breton and Vendée coasts. In most other agricultural districts mixed farming is practised, with an emphasis upon dairy stock. In the number of stock to the hectare France is well below that of smaller countries such as Belgium and the Netherlands.

After the middle of the 19th century the number of cattle rose slowly because of their better economic value, and even in such poorer pasture areas as the Alps cattle tended to replace sheep and goats.

In the mountainous districts the overriding problem is to secure enough winter fodder for stock. Indeed, areas that might support some type of grain were devoted to producing fodder, particularly since it had become easier to transport food for human consumption from the lowlands. Transhumance is nidely practised in the Alps and Pyrenees. The period spent in the mountains usually averages about three months but may, according to conditions, be as short as one or as long as five. Within the zone of high pastures the herds move from place to place accompanied by drovers and others who form a small colony, milking and making cheese in addition to guarding them. Most of the pastures are the collective property of rural communities. (*See* Tables X and XI.)

Forestry.—About 20% of France is forested. Woodland is distributed widely but in a varying degree; *e.g.*, 37% in the Vosges, 34% in the Jura and less than 5% in some of the northern *départements*. It may be divided into several types: temperate forests in the northern areas, chiefly composed of oak and beech; temperate forests interspersed with Mediterranean as in the southwestern plain; Mediterranean in the Midi (deciduous and coniferous), where, because of widespread deforestation, a secondary growth of stunted thickets and shrubs has vegetated (usually called *garrigue* west of the Rhône and *maquis* to the east); and the upland forests of beech and ash, fir and pine and, finally, dwarf trees, with a tree line around 4,000–5,000 ft. or even up to 8,000 ft. in the Pyrenees.

Control of forests began to be widely exercised after the 17th century and reafforestation in the latter part of the 19th, by which time it was apparent that clearing had progressed too far. Replanting was particularly carried out in the Alps, in the Cévennes, in Limousin, in the Landes, in the Sologne district and in the dry Champagne area.

The more primitive forest crafts declined considerably, particularly with the disappearance of charcoal as an industrial fuel and with the use of mechanical instruments for woodcutting. Cooperage and the making of sabots decreased, though in some districts smaller wooden articles are still made in domestic workshops. Economic exploitation is chiefly occupied with wood for pit props, railroad ties, paper, resin and cork.

Fisheries. — France possesses a coast line, deeply penetrated by bays and estuaries, of about 1,925 mi. and faces on the North sea, the Atlantic and the Mediterranean. Fisheries support around 300,000 persons, of whom approximately 65,000 are actually fishermen. Of these, 47% are from Brittany, 25% from Flanders, the Boulonnais and Normandy, 15% from the area between the Loire and the Adour and 13% from the Mediterranean coast. The chief fishing ports are Boulogne, Dieppe and Fécamp in the north, Lorient, Brest, La Rochelle and Bordeaux in the west and Marseilles on the Mediterranean.

Two-thirds of the French catch is made up of cod, herring, mackerel, tunny and sardine, which, except for the first named, are mostly fished in the relatively shallow waters of the continental shelf. Exploitation of the deeper waters of the northern Atlantic decreased from the end of the 18th century, but the fishing of west African waters increased. Lobster and oyster fishing ultimately became more important than miscellaneous coastal catches.

INDUSTRY

The evolution of trades from small and often domestic and rural enterprises into larger and highly mechanized industries was far slower in France than in Great Britain or in Germany. Development in the 18th century (see History, above) took place largely in rural areas, where labour was cheap because of overpopulation and where restrictions applicable to the towns did not obtain. These restrictions were swept away at the fall of the ancien *régime,* after which industries became centred more and more in the localities which best supplied them with raw materials and power. Yet even in the first decades of the 19th century most textiles were made by hand in the home; charcoal was still commonly employed for blast furnaces; and the number of steam machines was around 600. By the middle of the 19th century the most common establishment was still the small workshop; only a few factories existed, each employing less than 100 workers. This slowness of evolution was partly the result of lack of fuel, partly of the large and cheap supply of labour and partly of the small employer's or individual craftsman's unwillingness to be absorbed within heavier or more highly organized trades. Thus the emphasis was placed on producing lighter machinery of specialized type, fine quality textiles and luxury goods.

The loss of the Lorraine iron fields and the textile industries of Alsace in 1871 proved a serious blow to the industrial production of France. During the next 40 years, however, some progress toward a more scientific industrialization took place, assisted by the development of inland communications. German occupation of the northeastern provinces in 1914 entailed widespread destruction of France's principal colliery and textile plant, and the opportunity for large-scale reconstruction on modem lines was not taken until after hostilities had ended. Moreover, the return of Alsace-Lorraine and the control (till 1935) of the Saar coal mines increased the industrial potentialities of the country enormously.

French industry proved at first less vulnerable to the economic crisis of the late 1920s and early 1930s than that of many other countries. The many small-scale industries surviving provided a more balanced and versatile economic structure that proved better capable of resisting the depression. Total production even increased until 1930, but by 1938 it had sunk by 25%.

In the first years of the German occupation during World War II an attempt was made by Germany to continue the activity of French manufactures and until 1941 about 60% of prewar production was maintained. But when raw materials became scarcer and French workers increasingly reluctant to collaborate, the country was despoiled on a large scale both of labour and of materials, and industry was concentrated on essential war equipment.

The promotion of industrial recovery was inaugurated after World War II by the Monnet plan (Premier plan de modernisation et *d'équipement,* named for Jean Monnet, adopted by the government Jan. 11, 1947) for modernizing equipment and increasing productivity, especially in the spheres of the coal, steel and textile industries and in transport and communications. Coal had been nationalized in 1944, gas, electricity and petroleum refining in 1946. Progress was, however, seriously handicapped, particularly in mining, by the strikes of the Communist trade unions in 1947 and 1948. Nevertheless. French industrial output tended to increase, despite rising costs and the traditional resistance of employers against the merging of smaller enterprises that was necessary for mass production. The "First Modernization plan" ended in Jan. 1954, and a second program was then begun. A peak of industrial production was reached early in 1952. After some setback late in 1953, production again began to rise, until in 1955 it reached a record figure.

Industrial Areas. — Two types of industrial area may be said, in general, to exist in France: the relatively extensive regions in the eastern half of the country; and the rather small and widely scattered pockets in the west. The development of these industrial areas was handicapped by the country's shortage of coal; but electrical power seemed likely to prove a factor of increasing importance.

The most important area is that of the northeast, chiefly composed of the two *départements* of Nord and Pas-de-Calais. There the dominating factor is the presence of France's largest coal field, which supports a large iron and steel industry. The fertile areas of Flanders and Artois also provide good soil for the cultivation of industrial crops such as flax and beets. An excellent system of communications by rail, road and waterway serves the locality. Within easy proximity are the ports of Dunkirk, Calais, Boulogne, Dieppe and Le Havre. A second well-developed area lies in the east, in Lorraine and Alsace. In Lorraine minette ores were exploited from the middle of the 19th century to form the basis of an important steel and iron industry. As supplies diminished, they were superseded by less rich ores. An extensive cotton industry flourished in the adjacent Vosges area and in the Alsace plain around Mulhouse. In Alsace itself occur two of the richest deposits of potash in Europe. A third area is composed of the Paris region, where various industries flourish, ranging from heavy engineering to luxury goods. A fourth area spreads on either side of the middle Rhône valley; it chiefly comprises metallurgical industries based on small coal fields to the east of the Massif Central and textile manufactures centred on Lyons but extending over a wide surrounding region.

Small industrial pockets occur principally in the north around Rouen and in the neighbouring valleys of the lower Seine (chiefly textiles) and in the Caen district of central Normandy (iron and steel); in the west centre around Mayenne, Le Mans and Angers (linen); and in the southwest, in the Garonne basin (metallurgy and chemicals). In addition certain towns form small local centres for a variety of trades; and over a large area of the country domestic cottage industries survive.

Fuel and Power. — Table XIII shows the development of French power resources.

Coal.—As stated above, France possesses one important coal field, comprising two adjacent basins, one in the Nord, the other in the Pas-de-Calais *département.* The whole coal field supplies about three-fifths of the country's output. It is a narrow belt,

*Consumption. In 1923 production was 7,490,000,000 kw.hr.

about 51,000 ha. (125,970 ac.) in area, with deposits lying generally in deep-seated irregular strata as much as 13,000 m. below the surface, a fact which explains the slow and costly nature of production. Seams are often thin (only one metre in breadth) and of a variable quality, though each of the two basins has its own characteristics, that of the later-discovered Pas-de-Calais being the richer. Conversion into metallurgical coke and "patent fuels" is common. Serious exploitation of the basins began only with the 19th century. They then produced about one-third of the national output. This proportion rose first. to more than half (8,500,000 tons in 1880; 27,030,000 in 1913), then to two-thirds (28,000,000 in 1938). Production after World War II was again increased, chiefly through mechanization. By 1955 it had reached about 33,000,000 tons.

A small coal field in the east is that of the Moselle district, the principal centres of the industry being around Forbach and St. Avold. Many seams of coal are too deep for easy exploitation, but production rose steadily from 1,137,000 tons in 1900 to 6,737,000 in 1938 and to 12,000,000 in 1954; equipment there was up to date and output reached 2,000 kg. per man daily. In the Massif Central coal measures are often seamed along the folds of the valleys; for example, around St. Étienne in the upper Loire basin (3,951,000 tons in 1900 and 3,274,000 in 1938) and around Le Creusot, Blanzy and Épinac in the Burgundy-Nivernais basin (2,010,000 and 2,634,000). Coal is also mined around Alès (Gard) and Graissessac (Hérault) at the foot of the Cévennes; in the Creuse *département* on the north of the Massif; in the central Puy-de-Dôme area; and to the west in the valleys of the Tarn and Lot. Most of these fields support local metallurgical industries. By 1954, however, the basins of the centre and of the south, with their poor coal and bad position, were lagging behind in production (around 12,500,000 tons in all).

Total coal output showed a steady rise between 1820 and 1920 (except for war years), increasing from less than 2,000,000 tom to more than 40,000,000,but dropped in 192j to around 25,000,000 tons. After World War II modernization of equipment and technique made possible by investments under the Monnet plan and by aid from the United States brought production to a peak of 57,000,000 tons in 1952. The industry. however, suffered in the following year from the abolition of import quotas (under the European Coal and Steel Community) and from the competition of other types of energy. Production had to be curtailed. During the latter part of 1954 conditions began to improve, and the industry was reducing its financial deficit (9,000,000,000 fr. in 1954). Daily output at the coal face per man was around 1,515 kg. in 1954, a record. The number of miners was around 33,000 in 1850, 330,000 in 1927, 245,000 in 1937 and 238,800 in 1953. Of the last total, 157,400 were working at the coal face. A fair proportion of miners were foreigners, chiefly Poles. Exports of coal in 1954 came to 11,300,000 tons, chiefly to Great Britain, to the Benelux countries and to Germany.

Coke was produced mainly in the Pas-de-Calais section of the northern basin, in some districts of the central region (particularly at St. Étienne) and, increasingly, in the Moselle field. Output of all types of coke, a crucial problem for France, fell below national consumption and considerable quantities (4,843,516 tons in 195j) had to be imported.

The French coal industry was taken into the European Coal and Steel Community, under what is commonly known as the Schuman plan, in 1952.

Petroleum.—Though still insignificant and far short of the country's needs, the indigenous output of petroleum was considerably larger than it had been before World War II and steadily increasing by the latter 1950s. (*See* Table XIII.) Before the war it had been confined to deposits at Péchelbronn in Alsace, which produced 60,000 tons annually; but later more oil was struck in Alsace, and a fairly important field was discovered in 1939 near St. Marcet (Haute-Garonne), which produced 63,000 tons in 1950 and 263,000 tons in 1952. Oil deposits were found at Lacq (Basses-Pyrénées) in 1949 and at Parentis in the Landes early in 1954. Importation of crude petroleum, chiefly from Iraq, Kuwait and Saudi Arabia, reached 24,737,000 tons in 1955 and in 1954 was valued at 176,525,000,000 fr. Refined products in 1954 (plus imports, less exports) were approximately: gasoline, 4,090,800 tons; gas oil, 1,738,680 tons; fuel oil, 8,509,200 tons. Another source of energy is natural gas, found at St. Marcet, which supplied 240,500,000 cu.m. in 1953.

Electric Power.—The production of electricity developed considerably in France during the 20th century. At first the output of thermic energy surpassed that of hydraulic (4,085,000,000 kw.hr. against 3,405,000,000 in 1923); but later the utilization of the country's ample water power resulted in a preponderance of the latter. In 1955 about 55% of the country's electricity was generated in hydroelectric stations. The industry was nationalized in 1946.

Thermal generating stations were for the most part established in the coal fields or around the large towns and ports. The chief sources of hydraulic power are in the Alps (particularly the Isère, Doron, Arc and Drac rivers); in the Massif Central (the Dordogne, Truyère and Tarn rivers and their tributaries; and in the Pyrenees (the Garonne and Ariège rivers and their tributaries). There are important hydraulic installations on the Rhône at Génissiat and at Donzkre-Mondragon. Tidal energy was also being harnessed at La Rance on the Breton coast. The application of atomic energy to produce electricity was also being undertaken. Power has been distributed practically throughout the whole of France by the grid system.

Iron and Steel.—Iron ore is found in many parts of France, and in numerous localities iron was processed with the aid of charcoal in very early times. On the introduction of steam power the principal metallurgical areas became centred on the coal fields; but most native ores capable of treatment were becoming exhausted (except for a small but rich yield in Normandy). The abundant phosphoric deposits of the Lorraine area, however, provided a new source of exploitation after the invention of the Thomas process in 1878; the area's output of ore grew from 976,000 tons in 187j to 3,080,000 in 1895, to 19,920,000 in 1913 and to 55,700,000 in 1929; it fell to 11,600,000 in 1938 as foreign demand slackened; but rose again after World War II (33,000,000 in 1951).

Within the Lorraine area itself there are several metallurgical districts, principally around Nancy, between Metz and Thionville, around Briey and around Longwy. The iron content of the local ores is not very high, but it is easily extracted and reduced. Both pig iron and steel are produced, with an emphasis upon the former. Lorraine, however, has insufficient coal, the output of ore being far in excess of the local industry's demands. The chief metallurgical districts of the north, which get their ore both from Lorraine and from abroad, lie around Valenciennes, Douai and Lens on the coal field itself, in the Sambre valley to the southeast of it and around Lille, Isbergues, etc. In 1953 the northern coal field produced 21.5% of the national output of iron and steel. The chief types of steel produced are those made by the Thomas and the Martin processes; the Bessemer product is much rarer. The northern area in 1952 produced around 2,341,000 tons of steel.

A third and smaller area lies in the Ardennes *département* along the Meuse valley, with Mézières and Charleville as its centre. There a long-established iron industry, based on local ores, wood and water supplies, flourished. Supplies of ore or metal are now chiefly drawn from Lorraine, of coal from Belgium.

In and about the Massif Central there are further scattered metallurgical areas, which at first depended on local ore but later survived thanks to the easy availability of coal (though much has to be imported) or of hydroelectric power and, moreover, to their strategically less vulnerable position. Pig iron or iron ore is mostly obtained from Lorraine. The principal centres are at St. Étienne, producing steel and high-class alloys as well as iron, which supply an armament, aeroplane, locomotive and light engineering industry; and at Le Creusot, specializing in armaments and locomotives. More isolated centres, where local supplies are supplemented by imports, are Thiers and Clermont-Ferrand within the Massif and *Montluçon* and Commentry on its northern edge. Farther north, the ores of Berry were originally responsible for the metallurgical industries of the Nevers, Bourges and Vierzon districts, which now draw supplementary ores from Lorraine.

A small Norman iron industry, based on local ores of a rich content, is centred chiefly on Caen. In Brittany there are isolated iron and steel industries mostly confined to the ports or to their immediate district;

e.g., Nantes, St. Nazaire (with Trignac), Lorient and Brest. Small deposits of haematite ore are mined in the Pyrenees (Ariège and Haute-Garonne *départements*) and support an industry of electric steel at Pamiers and at Tarascon. Electric steel and ferroalloys are also produced in the Isère and Arc valleys of the Alps.

In the mid-1950s exports oi iron and steel were valued at 165,777,000,000 fr. and 126,400 people were employed in the industry at the beginning ot 1954.

Nonferrous Metals.— France is on the whole poor in nonferrous metals with the exception of bauxite; nor does it import very large quantities for industry purposes. After World War II, however, nonferrous resources were increasingly exploited. Bauxite is found particularly in the southeastern *département* of Var. It is converted into aluminum at plants in the Alpine and Pyrenean areas where hydroelectric power is readily available. Scattered deposits of zinc, Iead and copper occur in the mountainous areas, but their metal content is often very poor. (See Table XIV.)

*35% metal content.

Chemicals.— The French chemical industry at mid-century (employing about 203,000 people) was based chiefly on the coal-producing regions, on coal-importing ports and on districts producing hydroelectric power. In the two former. waste products of the blast furnaces and coke ovens supplied gas, coal tar, ammonia and basic slag, to be turned into benzine, methyl and ethyl and resins. Dyestuffs were also manuiactured on the coal fields and near the textile areas as well as at Paris, Lyons and Rouen.

Chemical fertilizers were supplied by sulphate oi ammonia from the coal fields and basic slag both from there and from the smelters of Lorraine. Superphosphates were chiefly manuiactured at the ports from phosphates imported from North Africa. Sulphuric acid was derived from domestic copper pyrites or supplies from the Iberian peninsula. A fair proportion of potash, produced from deposits in Alsace, was exported, the rest chiefly turned into phosphatic fertilizers for the country's own agriculture. Common salt from rock salt, brine pumping or marine salt pans was produced in Lorraine, the Jura and the lagoons of the Mediterranean coast (2,639,000 tons in 1953; cf. 1,560,000 in 1938). Cheap hydroelectric power stimulated the growth of various electrochemical industries, producing calcium carbide, calcium cyanamide, synthetic nitrogen, etc. Works were oiten attached to the hydroelectric stations of the Alps and the Pyrenees. Vegetable oil was refined mostly at the ports (particularly Marseilles and Nantes) and in Paris and Lyons. From 9,878 tons in 1938, the production of plastics materials rose to 70,000 tons in 1954. Plastic manufactures were oiten the specialized occupation of craitsmen in hilly regions, such as the Jura. France ranked in 1954 fourth in the world as an exporter of chemicals.

Other minor industries included the making of artificial rubber (13,380 tons in 1954); the manufacture of synthetic perfumes; the distillation of alcohol irom beet root and potatoes; sugar refining in the northeast; and cement production, which was widespread because of the abundant distribution of limestone within the country.

Engineering.— By the middle of the 20th century, although supplies oi iron and electric energy were plentiful, France's coal and coke output had fallen short of the demand of the metallurgical and engineering industries. Moreover, except for aluminum, the nation relied mainly on imports for nonferrous metals. The engineering industry had been built up on a basis of supplying temporary demands, so that plants were neither large nor always up to date. Specialized equipment, metallurgical, electrical or agricultural, was mostly imported. ***(See*** Table XV.)

The engineering industry, chiefly composed of small firms and employing in 1954 about 600,000 persons, nevertheless covered a wide variety of branches, particularly in the lighter sort of product. In 1950 its products represented about one-sixth of the total value of European output, and their domestic value in relation to the figure for 1938 had increased to 128%. Most of the heavy engineering firms were located on the northern, eastern and central coal basins. Locomotives and rolling stock were produced at Lille and Denain, electric rolling stock and coaches at Jeumont, Maubeuge and Douai. Paris specialized in light locomotives and various types of rolling stock.

The central region, because of its relatively protected situation, had most of the armament industry, particularly at Le Creusot and St. Étienne The most important exports were rolling stock and other railway equipment and textile machinery. The total value of exports in 1954 came to 84,000,000,000 ir. (cf. 106,000,000,000 fr. for imports). Electrical engineering, a new- and thriving industry, was chiefly concentrated in Paris and to a lesser extent around Lyons. It employed in 1954 more than 200,000 people and exported goods to the value of 48,600,000,000 fr. (cf. 20,900,000,000 fr. for imports). Similarly, the aircraft industry, largely nationalized after World War II, made up ground lost after 1940, producing particularly military aircraft.

Shipbuilding in France has always been on a small scale. Output reached a maximum in 1921 (210,000 tons or 5% of world output). In 1951, however, 36,000 tons of French shipping were completed, and substantial orders were being undertaken for abroad. The chief centres are St. Nazaire and Nantes on the Loire estuary and Le Havre, Harfleur, Le Trait and other places on the Seine; and there are lesser centres on the Gironde and at Marseilles. Marine engineering was not always closely related to the shipyards. Besides works at St. Nazaire and Nantes, engines were produced at Paris, Cherbourg and Dunkirk.

The motor industry was chiefly concentrated in a few large firms, mostly situated in the Paris area: Renault (state owned), Citroën-Panhard, Peugeot, Simca-Ford. A feature of the industry was the increased number of agricultural tractors produced. Roughly 25% of the production of private and commercial vehicles was exported, chiefly to French overseas territories. (See Table XVI.) The industry employed 260,000 workers.

TABLE XVI.—*Motor* Industry

Type	1929	1938	1947	1952	1954	1955
Passenger cars	211,000	182,400	66,277	369,960	437,196	553,344

Chassis with motor	...	2.088	3,485	2,877	2,652	2,400

Textiles.— The French textile industry in the 1950s was still widely scattered throughout the country, but there were major concentrations in certain regions. These were: the northeast, particularly in and around Lille, producing chiefly cotton but also linen, woollen, rayon and mixed fabrics (in 1952 about 3,570 firms there employed 200,000 workers in all); Rouen and its district, chiefly cotton spinning; Alsace, producing cotton and calico; and the Lyons district producing silk and rayon. The industry as a whole tended to resist the integration of small units into larger concerns, and there was much local specialization in certain textiles. Whereas in 1840 French textile exports accounted ior 49.7% of the total value. in 1954 they constituted 15.8%. Import percentages were 24% (1840) and 15.2% (1954).

The woollen industry (with 99,883 employees in 1953), centred on Roubaix and Tourcoing near the Belgian frontier, began in the middle ages. In the early part of the 19th century the introduction oi steam power tended to throw an emphasis at first on the more easy production of cotton goods, but foreign competition led to a revival of the woollen industry. Roubaix specialized particularly in light cloths for women's wear, Tourcoing in carpets. In addition the district produced a variety of other woollen products and attracted certain allied industries. The woollen industry was also iound in Picardy, in Alsace (chiefly round Colmar and Mulhouse) and at Elbeui near Rouen. A number of towns also specialized in some class of woollens; *e.g.*, Reims and its district in flannels, Sedan in heavy cloth and Orleans in blankets. Supplies of wool were mostly obtained from the British commonwealth, from Argentina and from certain French overseas possessions. Barely one-tenth came irom domestic sources. Imports amounted to 89,127,000,000 fr. in 1954, with Australia the chief supplier.

The production of linen, once widespread in the north, largely withdrew into the valley of the Lys, around such centres as Lille and Armentières, which by the 1950s were producing more than 90% of French linen goods and giving employment to 10,000 workers. At first supplies of flax were drawn irom Flanders, but later there was a steady decline in this source. Manufactures ranged over a variety of products, with individual towns tending to specialize. The linen industry was also found in the Somme basin, Normandy and Brittany.

The cotton industry to a great extent supplanted the woollen and the linen and became by far the most important branch of textiles. It rapidly established itself at Rouen and in Flanders. Rouen became chiefly a spinning district and a producer of heavy cottons. Lille concentrated particularly on higher-quality products and also supplied adjacent towns with yarns. Cambrai, Tourcoing and Roubaix produced hosiery and knitwear, St. Omer, Cambrai and Valenciennes underwear, Armentieres coarser products. In the east, the cotton industry became localized in the Vosges valleys, in Alsace (particularly at Mulhouse and Colmar), in Lorraine (Epinal, St. Dié and Belfort). Cotton imports came to 96,251,000,000 fr. in 1954 with the U.S. and Egypt as chief suppliers.

Alsace tended to produce higher-quality piece goods such as zephyrs, twills and calicoes, the Vosges and Lorraine coarser goods. The industry was wholly dependent on imports of cotton, which came chiefly from the United States, India, Egypt and certain French possessions. It was largely composed of small undertakings, somewhat lacking in up-to-date machinery and producing a wide variety of goods within each area.

The silk industry was introduced into the lower Rhône valley by Italian immigrants during the 15th century. Thence sericulture rapidly spread as a cottage industry over Provence and Languedoc, while silk reeling and spinning became an occupation in the adjacent areas of Savoy and Auvergne and even extended farther into central France. From mid-19th century, however, the amount of cocoons greatly declined, despite state encouragement. Raw supplies were imported from Italy and China to make up the deficit. This was chiefly the result of competition from Italy and then from Japan and of the emergence of rayon as a substitute. By mid-20th century the manufacture of silk goods was largely concentrated in the Lyons and St. Étienne area, and the more elaborate articles were still produced by a cottage industry. Troyes also produced locally manufactured silk and spun silk for a considerable hosiery industry. Silk was also produced in the Vosges valleys, with Mulhouse and Barr as centres.

After World War I the rayon industry grew rapidly in France; by 1938 it was the sixth largest producer in the world, with 28,000 tons annually (*cf.* 4,000 in 1922). The industry is chiefly concentrated in the Lyons district, in Alsace and in the northeastern textile area, where the cotton and to a lesser extent the woollen industries became closely associated with it.

The jute industry was chiefly found in the northeast and in Alsace, where in many instances it was combined with the production of linen and hemp. Most of the raw jute was imported from India and used to make sacks, carpets and string.

Table XVII shows the state of the textile industry (which employed about 472,000 persons at the beginning of 1954) in France before and after World War II.

In late 1951 the industry encountered a severe crisis: the exports fell to less than half of the value that they had represented at the beginning of the year (10,000,000,000 fr. as against 21,500,000,000 fr. in February). The woollen trade, which normally exported 50% oi its output, suffered particularly severely. The setback was due to the rise of cost prices caused by wage increases, by expenses for social welfare and by the heavier charges for fuel and for transport and also to foreign competition and tariff discrimination, particularly on the part of Great Britain, Germany, Italy and South American countries. For 1954, however, the total value of the year's textile exports was 240,189,196,000 fr.; imports were valued at 232,762,632,000 fr.

COMMUNICATIONS

Posts, Telegraphs and Telephones.— In the later middle ages there were two postal services in France, that of the king and that of the University of Paris (used at first by students to communicate with their families and iriends, later by persons not connected with the university). Under Louis XI, Charles VIII and Francis I a system of relays was created on an international scale and some uniformity of postal tariffs was imposed. In 1j76 the royal post was placed at the service of the general public. Louvois established a *fermier des postes,* and in 1681 the private privileges of the university were abolished by decree, though its services continued until 1719, when they were fused with those of the royal post.

Under the Revolution, the *administration gdndrale des postes et messageries* was created. Use of stamps and unification of tariffs were introduced in 1848. The postal service incorporated the service of telegraphs in 1878 and that of telephones in 1889, and a special ministry was created.

The number of public telephone and telegraph posts in 1952 within the metropolitan area was around 1,496,000, with 947,000 supplementary posts. Private subscribers at the beginning of 1954 numbered 2,768,951. The volume of traffic represented a figure which existed in the U.S. in 1907 and in Great Britain in 1937.

Railways.— The first French railway for the transport of coal was opened in 1823 between St. Étienne and Andrézieux (13 mi.). Within the next two decades a few short stretches of industrial lines were opened; but with only 545 mi. of track in 1841, France was lagging behind the United States and Great Britain. A law of 1842 planned the construction of a series of railways radiating from Paris. The execution of the program was not achieved until 1870. The Paris-Rouen line was finished in 1843, the Paris-Strasbourg and the Paris-Bordeaux in 1853, the Paris-Lyons-Marseilles in 1856. By 1870 the network had reached a total of 10,830 mi. For a long time, however, the French system was lacking in international communications and in direct means of transit between provincial centres; and local lines, particularly in the more mountainous areas, did not exist.

By 1891 France had about 21,000 mi. of permanent way. Subsequently the rate of extension became slower, and in 1937 the total was only about 26,400 mi.; *i.e.,* 12 mi. to every 100 sq.mi. In 1938 the railways were nationalized and divided into five main regions. By 1954, when certain uneconomic lines had been abandoned, the total length of line amounted to about 25,600 mi. A major program of modernization was undertaken after World War II. This included technical developments for electrification of main lines and relaying tracks with rubber foundations. Staff was increasingly cut down (from 520,000 in 1938 to 380,000 in 1955). From June 3, 1956, the third class on French railways in Europe was abolished.

Electrification was begun on Paris suburban lines in 1901 and was extended to long-distance lines after 1945. By 1955 the total electrified distance was nearly 3,000 mi. In April 1955 trial runs on the electrified line between Bordeaux and Bayonne registered speeds of 205.6 m.p.h.

The railway system was increasingly integrated with state road transport, and many areas were supplied with motor transport, both long and short distance. By the middle of the 20th century railways were running about 320,000 motor vehicles for commercial and passenger transport.

Roads.—A road system existed in Gaul before the arrival of the Romans, who utilized, reorganized and extended it to link all the large centres together. Little further development took place until the 17th century, when the royal government attempted to strengthen the links connecting the provinces to Paris. Much of the work done in succeeding years was contributed by *corvée* (forced labour) of the peasantry.

By the time of the Revolution about 12,420 mi. of new roads had been added to the existing 18,375 mi, with towns such as Reims, Rouen, Lille, Lyons, Limogcs and Bordeaux as well as Paris serving as centres in the network. Napoleon devoted large sums to the upkeep of the system and extended it to cover the conquered countries of the empire; 229 imperial highways were enumerated in 1811. Local roads, however, were not very good until work to improve them and to build new ones was begun in 1836; by 1900 they had attained a length of more than 170,000 mi.

By 1950 the total length of French roads was 444,448 mi. of which 49,823 were *routes nationales,* 163,323 *routes départementales* or *communales,* 170,775 *chemins vicinaux* (local roads), the remainder comprising various minor sorts of thoroughfares.

Waterways.— The excellent river system of France was exploited by the Romans. Work for improving rivers as a means of communication was done in Flanders as early as the 11th century. Later the cutting of connecting canals was begun, and by the end of the 17th century the skeleton of a national system of linked waterways was created. By the early part of the 19th century an extensive network of about 2,900 mi, of canals alone had been constructed. Some destruction of waterways was incurred in World War I, and in later years reconstruction barely restored their former scope. In 1950 of a total length of 9,456 mi. (6,168 of rivers, 3,288 of canals) only 5,285 were in constant use. Traffic in 1954 comprised 52,740,000 metric tons of goods, of which 43,404,000 were loaded in France (including 36,996,000 in internal trade), and amounted to 8,270,400,000 ton-kilometres (cf. 8,256,000,000 in 1938).

Activity was most important on the Seine and in the Franco-Belgian and Franco-German areas; freight consisted chiefly of coal, coal products and petroleum.

Mercantile Marine.— The French merchant fleet increased from 662,000 tons in 1840 to 2,448,000 in 1914, to 3,000,000 in 1936 and to 3,571,967 at the beginning of 1955 when it comprised 89 passenger vessels (860,489 tons), 119 tankers (997,647) and 520 cargo ships (1,713,831). It could not, however, carry more than 50% of France's sea-borne trade. For goods traffic, Marseilles was the principal French port, followed by Le Havre, Rouen, Dunkirk, Bordeaux, Nantes and St. Nazaire, Caen, Sète, La Rochelle, Calais and Boulogne; for passenger traffic, Marseilles, Calais, Dieppe, Boulogne, Le Havre and Cherbourg. Shipping entered and cleared of all French ports came to 111,740,000 tons in 1937, to 68,500,000 in 1947 and to 83,317,000 in 1948.

Air Transport.— France's air communications, which serve particularly Europe, the widely dispersed overseas possessions and the new world, are chiefly in the hands of Air France, a state enterprise, though a certain number of private lines exist. On Dec. 31, 1954, Air France was operating with 83 four-engined and 51 twin-engined planes; the main private companies operating scheduled services possessed in July 1955 a total of 40 (chiefly twin-engined). The number of passenger-kilometres covered by Air France was 750,000,000 in 1947 and 2,043,600,000 in 1954; that by private lines, 170,000,000 and 667,100,000.

FOREIGN TRADE

At first, because of its largely self-sufficient agriculture and moderately developed industries, France did not need to import excessive quantities of raw materials. During the first half of the 19th century supplies for the textile industry accounted for nearly one-third of its imports and export trade consisted largely (50%) of textile manufactures, particularly silk. But later increasing industrialization, a falling-off in agricultural production and growth as a colonial power led France to take a greater share in world trade. By 1913 the increasing demands of a more varied industry were revealed by increasing imports of fuel, machinery, tools and metal goods. Exports had also become more diversified. Textiles had fallen to a sixth of the total value, while the products of heavy industries, iron, steel, machinery and chemicals, had become quite important.

After World War I the French export trade was helped by the modernization of the northern industrial area, by the recovery of Alsace-Lorraine and by the decline in the external value of the franc. Thus exports reached a value of 6,900,000,000 fr. in 1913 and of 8,800,000,000 fr. (in terms of 1913 gold value) in 1927; on the other hand there was no corresponding rise in the volume of imports. France particularly exploited its overseas possessions both as a source of raw materials and as a market for the metropolitan industries. An advantageous balance in total overseas trade was usually obtained before 1928. On the credit side also were considerable invisible assets such as tourist trade, foreign banking, insurance and other services. In later years any visible adverse trade balance was offset wholly or considerably by these invisible exports.

In the 1930s most classes of exports diminished, and imports of raw materials and manufactured goods also fell. One reason for the failure to sell was the high price of domestic goods, caused by the country's remaining on the gold standard while other countries devalued their currency, and by restrictions on the hours of labour and by increases in wages. On the other hand, the volume of imports was maintained—until it was reduced by a protectionist policy. In 1937, when world trade had revived considerably, the gold value of French exports was 29% of that of 1929. In 1938 there was some recovery, but French exports to foreign countries were paying only for about 66% of imports. Raw materials constituted the greatest proportion (in value) of imports; next came food and drink (chiefly cheaper wines); and finally, manufactured goods. The values of each category rose until 1930 and then began to diminish. In exports, manufactured goods, chiefly of a high quality, held the lead, followed by raw materials (largely iron ore, etc., from Lorraine) and finally food and drink.

Among imports of food and drink, cereals (chiefly maize and rice together with a small amount of wheat), fruit and coffee constituted the largest items. The raw materials imported were mainly higher-grade coal and other fuels, cotton and wool, etc., oilseeds and vegetable oils, nonferrous metals and special types of iron ore such as haematite. About half of the manufactured articles imported comprised machinery and metal goods, with chemical products forming another considerable item.

Among the exported foodstuffs, wines, spirits and liqueurs of a higher grade took prominent place. Refined sugar and sugar preparations had a good market; and various fruits, early vegetables and heavy produce were exported to the northern European countries. Raw materials sold were chiefly iron ore, iron, steel, bauxite and copper; and textile materials, of which carded wool, flax and rags were the most important. The chief class of exports comprised manufactured goods. Of these, textiles made up in value the greatest single group, chiefly yarns and tissues of various types. Highly fabricated metal articles and chemical products were also important; and miscellaneous smaller articles of a high grade or in the luxury class came to a considerable sum total.

After World War II France's trading position with foreign countries, particularly with the United States, was to its disadvantage. Former items of invisible trade were now seriously curtailed. On the other hand a continual surplus with the rest of the French union acted as a cushion to the deficits incurred. But the country's foreign trade showed an over-all deficit of 413,500,000,000 fr. in 1952; and the cumulative deficit of France with the European Payments union between July 1950 and June 1954 reached $312,000,000. A year later, however, this last figure had been reduced to $150,000,000, while measures taken against the trade deficit included the subsidizing of the export industries (10,000,000,000 fr. in 1952), the suspension of certain trade-liberalization measures, the encouragement of the tourist trade and more barter transactions. In 1954, then, the trade deficit had been greatly reduced. (*See* Table XVIII.)

The deficit with the dollar area amounted to 74,000,000,000 fr. and with the sterling area 199,500,000,000 fr. On the other hand there was a surplus of 120,400,000,000 fr. with members of the Organization for European Economic Cooperation outside the sterling area; 2,800,000,000 fr. with other countries and 134,800,000,000 fr. with the overseas territories of the French union. (*See* Tables XIX and XX.)

Commercial Policy.—During the first half of the 19th century France was a strongly protectionist country. Under Napoleon III many duties on raw materials and foodstuffs were reduced despite the opposition of French industrialists. This policy of freer trade was, however, abandoned on the establishment of the third republic, and a somewhat high tariff was instituted behind which industry developed more rapidly. In 1892 a tariff imposing a general and a minimum duty was applied, the former directed against countries with whom France had no agreement. Within trade agreements, a most-favoured-nation clause was often inserted, by which France extended to the signatory any tariff reduction granted to a third country in return for a similar concession.

After World War I France endeavoured to free itself of the most-favoured-nation clause, denounced existing commercial treaties and raised its general tariff. This policy came to be based for a time on reciprocal advantages, and commercial relations were maintained by bargaining. But by 1927 France was obliged once more to accept the most-favoured-nation principle and a stabilized system of tariffs and to abandon reciprocity.

Following the world depression which began in 1929, existing stabilization agreements led to an increasing disequilibrium in the balance of payments. Then, in 1931, in order to protect its own agriculture and industry and to improve its balance of payments, France inaugurated a policy of quotas to reduce imports at prices which were falling, first as an emergency tariff measure to meet abnormally large imports and later as a permanent instrument. Though quotas did succeed in limiting imports, they failed to benefit French export trade though used as a bargaining weapon

to gain special concessions. Moreover, they tended to raise the cost of living and inspired retaliatory measures.

Nor did the devaluation of the franc in the autumn of 1936 have the desired effect of stimulating exports and restricting imports, because the social reforms of the popular front government raised production costs. In the year before the outbreak of World War II an attempt was made to restore freedom of trade. In the years between World Wars I and II, the unfavourable gap between exports and imports widened.

The contraction of its export markets inspired France to concentrate increasingly on developing trade with its overseas possessions, and a policy of commercial assimilation was followed with some colonies, and of preferential treatment with others.

From 1909 to 1913 trade with the overseas possessions constituted only about 10% of France's foreign trade. By 1938 the proportion had risen to 27%, with imports and exports roughly balanced. But the low economic level of overseas possessions, of which Algeria was by far the most important, limited their capacity either to absorb imports or to deliver exports. After World War II, however, their potentialities as an export market mere increasingly developed.

Before 1914 the largest invisible credit item in France's balance of current payments was the interest and dividends from investments abroad. In 1913 the yield on these was about one-third of the value of merchandise exports. During the period 1918–39 fresh investments were made to compensate for losses during the war years, and by 1939 their total income was around 4,000,000,000 fr. Tourist trade was also a considerable item in invisible revenue, but was subject to considerable fluctuation. In the best days before World War II this source contributed about 10,000,000,000 fr. to the national income. Shipping freight, insurance and transit trade also furnished a fair amount of income.

Between 1940 and 1944 French trade was controlled by Germany. Its volume with overseas countries dropped to a low level. By the end of World War II a large part of the traditional markets had been lost, the capacity of industry had been seriously affected and the value of invisible exports, particularly as regards freight revenue, considerably impaired.

Before 1939 invisible exports had usually been sufficient either to compensate an adverse trade balance or to provide a substantial cushion for it; but now, despite encouragement of the tourist trade and the reconstruction of the merchant navy, there was no such financial advantage. It was estimated that France needed to import about 45,000,000 tons of raw materials, semifinished and finished products and food annually; but between 1945 and 1949 the nation could import only a yearly average of 23,000,000 tons (10,000,000 in 1945, 46,000,000 in 1949).

Up to 1948 France, like most other European countries, tried to protect its production by a system of quotas rather than tariffs. After the formation of the Organization of European Economic Cooperation in 1948 this policy was progressively and partially superseded by one of liberalization of exchanges, with a lowering of customs tariffs. But French economists placed special emphasis upon the international organization of resources and trade before the abolition of protection. Thus, while the country sponsored such schemes as the Schuman plan for the integration of the western European coal and steel output and the Pflimlin plan for the pooling of agricultural resources, tariffs were used to afford a considerable measure of protection to the "franc zone" (*i.e.,* France and the countries of the French union), with which trade was being actively developed in the 1950s.

In 1954 it was noticeable that more raw materials, more chemicals and more semifinished goods and less foodstuffs, less energy and less equipment were being imported than in former years. *(See* Table XXI.)

NATIONAL FINANCE

National finance suffered not only from the effect of disastrous wars, but also from an inefficient fiscal system, from the ineffective application of tax regulations and from the reluctance of the nation to accept additional impositions. Thus, an increasing resort was made to balancing budgetary deficits by borrowing. In the later 1920s the resolute measures of the Poincaré administration restored to some extent the financial position of the country. New taxation was voted, considerable economies in the public services were introduced and a general tightening up of the fiscal system was carried out. Budgetary surpluses were 2,715,000,000 fr. in 1929 and 2,439,000,000 fr. in 1930.

With the resignation of the Poincaré government in 1929 the financial situation again deteriorated. There was a demand for the reduction of taxation; the civil services were given increased allowances; and various schemes of social insurance were subsidized. Considerable expenditure was also undertaken on rearmament. Budgetary deficits became, because of the deteriorating commercial and industrial situation, the rule. Deficits were provided for by extra budgets, which raised additional expenditure. (For public debt, *see* Table XXII.)

*Revised estimate, July 1955. †Extraordinary expenditure was 169,443,000,000 fr.

Between 1946 and 1952 a budgetary deficit persisted and inflation increased. Attempts to solve these two problems comprised various measures whose effectiveness was only partial: economies in the national services; a more rigorous and better organized fiscal regime and additional taxation to balance the budget; and a policy of freezing available liquid assets, the raising of the bank rate, restrictions on credit facilities and the control of prices and wages to combat inflation. Nevertheless, prices continued to mount, accompanied by successful agitation by labour for increased wages. After 1950 financial recovery was further hampered by an increasing rearmament program and, till 1954, by the costly war in Indochina. Liberal contributions from the United States, both in the form of E.R.P. aid ($1,083,000,000 in 1948, $701,000,000 in 1949, $383,000,000 in 1950 and $327,000,000 in 1951) and as military subsidies did something to alleviate the position. But there was also a stubborn resistance within the country to increased taxation, to the freezing of credit and even to effective tax collection; and a chronic distrust of the franc continued.

Budgetary receipts for 1954 were 3,249,000,000 fr. and expenditure, 3,536,000,000 fr., of which 1,101,000,000 fr. were for defense. The resulting deficit was financed by net treasury borrowing of 580,000,000,000 fr. and by withdrawals from counterpart funds (representing United States grants and aid loans to provide foreign exchange resources) of 109,000,000,000 fr. This figure did not include exceptional grants to assist military operations in Indochina, amounting to 195,000,000,000 fr.

Banking and Currency.—The state bank is the Banque de France (*q.v.*), founded in 1800; it possesses the sole right to issue bank notes. Fiduciary money issued by the bank and script by various banking organizations came on Jan. 1955 to 5,239,000,000,000 fr. (*cf.* 2,678,000,000,000 fr. in Jan. 1950). In 1945 the Banque de France and four of the larger joint-stock banks, the Crédit Lyonnais, the Société Générale, the Comptoir National d'Escompte and Banque Nationale pour le Commerce et l'Industrie, were nationalized. The nominal capital of the metropolitan banks rose from 6,900,000,000 fr. in 1938 to 45,700,000,000 fr. in 1954. In addition to the national banks, there were still a number of independent deposit banks in the provinces.

Two national loan institutions continued to exist: the Crédit Foncier for making loans on urban and rural property, and an agricultural credit fund. Other types of banking institutions are the *banque d'affaires,* for providing credit on a large scale to industrial and commercial enterprises; and *banques populaires,* concerned with credit facilities for the smaller commercial businesses and tradesmen. Some degree of official control over all banks was established in 1945 by the appointment of the state *conseil national du crddit.*

The French currency unit is the franc (*q.v.*).

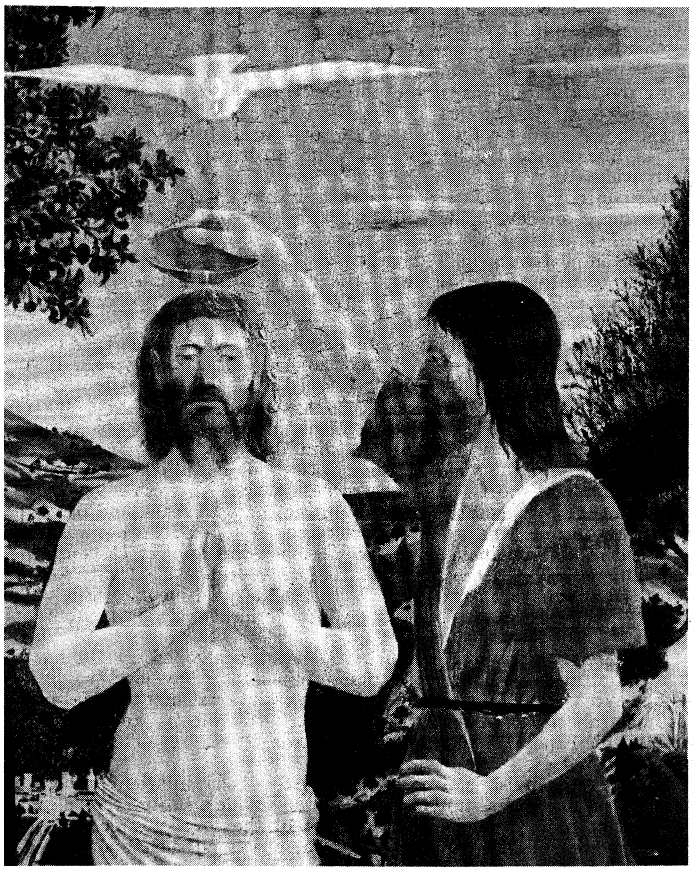
FRANCESCA, PIERO DELLA (PIERO DEI FRANCESCHI) (c. 1420–1492), Italian painter, one of the great masters of the Quattrocento. was born at Borgo San Sepolcro in Umbria between 1410 and 1420, probably nearer 1420. Throughout his life he retained a deep affection for his native place and spent much of his time there. although he worked in Florence, Arezzo, Ferrara. Rome and Urbino. The earliest record, Sept. 7, 1439, describes him as working in Florence with Domenico Veneziano—whether as pupil or partner is not clear—on frescoes in Sant' Egidio (Sta. Maria Nuova). These have almost entirely disappeared, so that nothing is known of the style of either at this date. During the 15th century Borgo San Sepolcro was dominated by Sienese art, and the "Baptism of Christ" (National gallery. London)—usually accepted as one of Piero's earliest works—shows marked affinities with Sienese painters like Stefano di Giovanni Sassetta. Probably his Florentine experience was decisive in the formation of Piero's style, for his strong mathematical bent enabled him to extend the researches into perspective of the Florentines Filippo Brunelleschi and Paolo Uccello. G. Vasari lays great stress on his mathematical abilities, and the intellectual climate of Florence in the first half of the 1 jth century was particularly favourable to a scientific and geometrical art. Kevertheless, Piero was back in Rorgo by 1442. On Jan. 11, 1445, the Company of the Misericordia of Borgo commissioned an altarpiece (now in the Pinacoteca there) to be completed within three years. In fact this work, in which his style is fully developed, may not have been finished before 1462. Certainly the polyptych contains a representation of San Bernardino, who was not canonized until 1450.

About 1449–50 Piero painted in Ferrara some frescoes, now lost. which contributed much to the development of the Ferrarese school, and in 1451 he signed and dated the fresco of "Sigismondo Malatesta before St. Sigismund" in S. Francesco at Rimini. This was formerly regarded as his earliest datable work but cleaning revealed a signature and the date 1450 on a "St. Jerome" in Berlin,



BY COURTESY OF THE NATIONAL GALLERY, LONDON

DETAIL FROM THE "BAPTISM OF CHRIST." ONE OF PIERO'S EARLIEST WORKS. IN THE NATIONAL GALLERY. LONDON

a crude work which is not an adequate prelude to the "Sigismondo" or to Piero's greatest achievement. the fresco cycle of the "Legend of the True Cross" in San Francesco at Arezzo, painted between 1452 and *c.* 1459 (certainly completed before 1466). These severely geometrical compositions show Piero at the height of his powers. Now among the most famous of 1 jth-century frescoes, they mere virtually unknown until late in the 19th century, when their pale colour and austere forms brought them back into favour among circles stressing the importance of aesthetic elements in wall decoration. It is precisely their inhuman calm, their lack of Florentine vigour. which led to four centuries of neglect but which is the essence of their attraction to modern sensibility. About this time Piero painted the "Resurrection" fresco in the Palazzo Comunale at Borgo. which combines these qualities with an awestruck dramatic sense. Critics as disparate as Vasari and Aldous Huxley have considered it his masterpiece.

Other works of this period of classical maturity include the diptych portraits of Federigo da Montefeltro. duke of Urbino, and Battista Sforza. his duchess (Uffizi. Florence). These are usually dated before 1466 on the inconclusive evidence of a poem by Ferabh of that year. but *c.* 1472 would seem to be more in accordance with the marked Flemish influence characteristic of Piero's later works. During 1459–60 he seems to have been working in Rome in the Vatican. but nothing survives, though a "St. Luke" in Sta. Maria Maggiore is not very convincingly ascribed to him. In the 1460s and 1470s Piero was frequently in Urbino and—perhaps partly on account of a lack of pictures ascribable to him—it has been suggested that he was in some way connected with the building of the palace there, perhaps the finest example of Italian architecture of its date. It is certainly imbued with the calm harmony of Piero's mathematical art. but the available evidence does not seem to justify more than a tentative connection. An altarpiece for Sant' Xpostino in Borgo San Sepolcro, commissioned in 1454, was apparently completed in 1469. This picture, dismembered and partly lost. was reconstructed by M. Meiss from extant parts in the

National gallery, London, the Frick collection, New York city, and the Poldi-Pezzoli museum, Milan; the subsequent rediscovery of a "St. Augustine" in Lisbon confirmed Meiss's original reconstruction. During the 1470s Piero probably had both Signorelli and Perugino as pupils and he painted the large "Madonna and Saints, with Federigo da Montefeltro" (Brera, Milan) and the "Senigallia Madonna" (Urbino). It has been suggested that the head and hands of Federigo in the "Brera Madonna" were added by the Spaniard Pedro Berruguete, but this is a very controversial point. The "Nativity" (National gallery, London) is probably Piero's last known work and his later years were taken up with mathematics. Of his two treatises, *De perspectiva pingendi*, on perspective, and *De quinque corporibus regularibus*, on the five regular bodies, the latter was written after 1482. There is a tradition that he was blind in his last years, but, even so, there is a long gap between the "Brera Madonna" of *c.* 1475 and the "Nativity," perhaps slightly later, and his death at Borgo on Oct. 12, 1492.

FRANCESCHI, the name of three generals of brigade in the Napoleonic Wars.

1. JEAN BAPTISTE, BARON FRANCESCHI (1766–1813), was born at Bastia, Corsica, on Dec. 5, 1766. He served in Italy from 1795 to 1799, again as a general officer in the campaign of Marengo, in the Naples campaign of 1805–06 and in the Peninsular War from 1807 to 1809. He served also in the Russian war of 1812 and died at Danzig on March 19, 1813.

2. JEAN BAPTISTE MARIE FRANCESCHI-DELONNE (1767–1810) served throughout the revolutionary campaign on the Rhine, took part in the campaign of Zurich in 1799 and escaped from and returned to Genoa, when in 1800 Masséna was besieged there. In the Peninsular War he won distinction as a cavalry general. He died, a prisoner of the Spaniards, at Carthagena on Oct. 23, 1810.

3. FRANÇOIS FRANCESCHI-LOSIO (1770–1810), born at Milan, served through the Italian campaign of 1796–97 and subsequently, like Franceschi-Delonne, with Masséna at Ziirich and at Genoa and at the headquarters of King Joseph in Italy and Spain. He was killed in a duel by the Neapolitan captain Carlo Filangieri in 1810.

FRANCESCHINI, BALDASSARE (1611–1689), Italian painter of the Florentine school, called Il Volterrano from his native Volterra, was the son of a sculptor. At a very early age he started as an assistant to his father and then studied under the Florentine painter Matteo Rosselli. From 1652–60 he was employed on paintings in the cupola of the Niccolini chapel in S. Croce, Florence, which constitute his most noted performance. Among his best oil paintings of large scale is the "St. John the Evangelist" in the church of S. Chiara at Volterra. One of his last works was the fresco of the cupola of the Annunziata. Florence, which occupied him for two years around 1683. Franceschini died at Volterra on Jan. 6, 1689.

FRANCESCHINI, MARCANTONIO (1648–1729), Italian painter, a leading artist of the Bolognese school of his time, was born in Bologna on April 5, 1648. His masters were G. M. Galli da Bibiena and Carlo Cignani (*qq.v.*). He worked in Genoa, Modena and Rome as well as in Bologna. He was made director of the Accademia Clementina in Bologna in 1721. Franceschini was the last important representative of the tradition of the Carracci, the works of Lodovico Carracci and Francesco Albani being the main sources of his style. His figures, brushwork and colouring are unimaginative and unoriginal but he had a gift for skillfully arranging an elaborate composition and considerable talent as a decorator. His paintings in both oils and fresco are very numerous, though little known; the most famous, which were done for the church of Corpus Domini. Bologna (1687–94), were unfortunately destroyed during World War II. He died in Bologna on Dec. 24, 1729. (M. W. L. K.)

FRANCESCO DI GIORGIO (FRANCESCO MAURIZIO DI GIORGIO MARTINI [or DI MARTINO]) (1439–1501), a versatile Italian painter, sculptor and architect of the Sienese school, was baptized in Siena on Sept. 23, 1439. Early works were manuscript illuminations, furniture panels, and two monumental altarpieces in the Siena gallery. By 1477 he was in the service of Federigo da Montefeltro, duke of Urbino; there he produced a series of brilliant bronze reliefs, probably participated in the design and decoration of parts of the great palace of Urbino, and built 136 military fortresses. His architectural masterpiece is S. Maria del Calcinaio, Cortona (1484). Later masterpieces are four brilliant bronze figures for the high altar of Siena cathedral. He also probably returned to painting after many years. His book on architecture discusses city planning and military architecture, and anticipates some of the architectural theories of the high Renaissance. He was remarkably versatile, a kind of Sienese Leonardo da Vinci, who combined the bold investigation of the Renaissance with the conservative lyricism of the Sienese school.

FRANCHE-COMTÉ, a region of eastern France, bounded on the east by Switzerland, on the south by Bresse and Bugey, on the north by Lorraine and on the west by Burgundy and Bassigny, and embracing the greater part of the Jura range and of the neighbouring low ground toward the Saône.

In antiquity, the region was occupied, from the 4th century B.C. onward, by the Celtic tribe of the Sequani, which built there several *oppida*, including Vesontio (Besanqon).

It became Roman in 52 B.C., after Julius Caesar's victory. From the invasion of the barbarians onward, the history of the region may be divided into four periods: from the 5th century A.D. to the end of the 13th it was first a part of independent kingdoms and then, when these disappeared in the 11th century, a territory more or less subject to the Holy Roman emperor; from the end of the 13th century to the end of the 15th its history was directly joined to that of the kingdom of France; at the end of the 15th century it passed to the house of Austria, within which it was assigned to the Spanish branch on Charles V's abdication; and finally it became French in 1678. (*See* also BURGUNDY.)

During the first period, what had been the territory of the Sequani was at first included in the original kingdom of Burgundy and was then joined, together with the latter, to the empire of Charlemagne, who divided it into the five countships of Ajoie, Portois, Varais, Amaons and Escuens, the archbishop of Besanqon having also his share in the administration. At the treaty of Verdun (843), these countships were included in Lothair's portion; and when this kingdom of Lotharingia broke up, a new kingdom of Burgundy was created, whose crown, at the end of the 9th century, passed to the German house of Welf.

Thus what was henceforth called *la comte'* (county; *comté* being then a feminine noun) of Burgundy was subject to this kingdom; but rivalries between the great families of the region disturbed it continually. The counts of the house of Salins, however, were powerful personages; and Guy (Guido), the brother of Raynald II, became pope as Calixtus II in 1119. In 1127 his nephew Raynald III refused to pay homage to the emperor. Lothair II (or III; of Supplinburg) had to fight for ten years before vanquishing his rival, Conrad of Zahringen. Thereafter he was the *franc-comte* ("free count"), whence the name of Franche-Comté de Bourgogne given to his territory. By marrying Raynald III's daughter Beatrix in 1156 the emperor Frederick I Barbarossa sought to secure the balance of power in his own country and to extend his influence. His successors, however, were unable to withstand the ventures of the kings of France in this area.

Finally, in 1295, the count Otto IV undertook to give his daughter Joan in marriage to Philip of Poitiers (later Philip V of France), the son of Philip the Fair, whom he left to govern the county and to collect its revenue. During all this period the country had not ceased to develop its potentialities. In the solitary recesses of the mountains Cluniac and then Cistercian monasteries sprang up; roads were put into repair, whereby northern Italy was connected with Champagne and Flanders; and towns expanded and attained their enfranchisements (Besanqon in 1184).

The first French period of the history of the Franche-Comté is far more simple (14th and 15th centuries). After a period of resistance to the king of France, who put it under the jurisdiction of a *bailli*, it was governed, as Philip V left no male heir, by his widow the sovereign countess Joan, whose elder daughter Joan of France married Odo (Eudes) IV, duke of Burgundy. Their grandson and heir Philip of Rouvre was thus both count and duke in succession to them (1350–61); but on his death without issue the county and the duchy were again separated, the county of Burgundy passing to the counts of Flanders.

On the death of Louis of Mâle (1384), however, Philip the Bold (*q.v.*) acquired the county by right of his marriage (1369) with Margaret, daughter and heiress of Louis and widow of Philip of Rouvre. Thereafter the county was under the dukes of Burgundy of the house of Valois. Through them the Franche-Comté (except Montbéliard, which belonged to the landgrave of Württemberg) was given its political organization; its capital was Dôle, the seat of a council, of a *parlement* and of estates (which were to meet 37 times from 1389 onward); and the province was divided into three military and judicial jurisdictions, the *bailliages* of Amont (Gray), of Aval (Salins) and of Dôle, which were themselves subdivided into several *chdtellenies.*

At the death of the duke Charles the Bold (1477), Louis XI of France took hold of the duchy of Burgundy and obtained that the dauphin Charles should receive the county and be betrothed to Charles the Bold's granddaughter Margaret of Austria, daughter of Maximilian I by his marriage with Mary of Burgundy. But, when Charles became king of France, as Charles VIII, he broke his engagement and married Anne of Brittany and consequently, at the treaty of Senlis (1493), had to surrender the Franche-Comté to the Habsburgs, under whom it was to remain for 185 years.

Margaret of Austria, now the widow of Philibert II the Fair of Savoy (for whose tomb she had the magnificent church of Brou erected at Bourg-en-Bresse), took over its administration, together with that of the Netherlands and Charolais, Malines included. Margaret proclaimed the neutrality of the Franche-Comté toward France in 1522, thanks to which the region remained apart from the political struggles between her nephew the emperor Charles V and the kings of France. Its towns were embellished by buildings in the contemporary Renaissance style, and their industries developed. In the reign of Philip II of Spain, under the administration of Antoine, cardinal de Granvella, and then of the archdukes, it even enjoyed a prosperity of which the neighbouring regions were jealous; this was especially true of Besançon, now the capital again and an imperial town. Only the wars of religion could disturb its tranquillity. The Huguenots from Switzerland did their utmost to gain adherents there and met with some success, particularly in the district of Montbéliard, but the main part of the people still clung to the Catholic faith. Again, with the struggles of Cardinal Richelieu and then of Louis XIV against the Habsburgs in the 17th century, the country had to suffer from war. Devastated in 1637 and in 1639 (during the Thirty Years' War) and conquered for the first time by the great Condé and his general the duc de Luxembourg in 1668, it was occupied anew by the French troops of Condé and annexed to France at the treaty of Nijmegen in 1678 (*see* DUTCH WARS).

Resistance to the French had been very strong. The feats of Lacuzon (Claude Prost, 1607–81) against them were outstanding. The region was peopled again quite rapidly by the influx of populations from neighbouring districts. Yet, for about half a century, all the Franc-Comtois remained faithful to the Spanish; only in the 18th century could they be considered as definitively assimilated to France. Louis XIV, at last, adopted measures to secure the country and to enable the people to live in peace. Besançon, formerly an imperial town, was the seat of a *parlement* and of a university; it was also the chief town of a commissariat and a *gouvernement militaire.* Vauban fortified the roads leading to the Swiss frontier. It was above all in the 18th century that the country assumed its present appearance. Whereas the old agricultural produce (especially the grape vines) prospered afresh, the exploitation of timber increased; metallurgical and textile industries settled in the north, and clock- and watchmaking appeared as a new craft. Thus, this region, one of the last to be included in the French patrimony, one of those whose history had been connected with that of Germany more closely than with that of France, one of the least favoured by its geography and climate, came eventually to hold a place of its own in the national life of France. After the Revolution, the *départements* of Jura, of Doubs and of Haute-Saône comprised, approximately, the old territory of the Franche-Comté.

(M. PAC.)

FRANCHET D'ESPEREY, LOUIS-FÉLIX-MARIE-FRANÇOIS (1856–1942), French soldier, was born at Mostaganem in Algeria on May 25, 1856. Commissioned to the infantry in 1876, he saw active service in Tunisia, Tonkin and N. China. In 1908 he became general of brigade. In 1913, as general of division, he fought in Morocco, after which he was appointed to the I army corps at Lille. This corps he commanded during the battle of the Frontiers, Aug. 1914, and on the eve of the battle of the Marne he succeeded Gen. Lanrezac as commander of the V army. In March 1916 he was advanced to command the eastern group of armies, and later the northern group. On the recall of Guillaumat in June 1918, Franchet d'Esperey was sent out to replace him as commander in chief at Salonika. Adopting and developing his predecessor's plan for an offensive in the Balkans, he skilfully denuded the rest of the front to concentrate an overwhelming preponderance on the narrow Sokol-Dobropolye sector, west of the Vardar. With their reserves pinned down by vigorous pressure elsewhere the Bulgarians were unable to repair the breach, and as the Serbian spearhead drove in deeper, the whole Bulgarian front collapsed, and on Sept. 29 Bulgaria capitulated—the first defection among the Central Powers. He cleared Serbia of the Austrian troops and later, on Jan. 5, 1919, took prisoner the German Marshal von Mackensen, in Hungary. He commanded the Allied forces in Turkey until Nov. 1920, and was created a marshal of France on Feb. 21, 1921. He was elected to the French academy in 1934. Franchet d'Esperey died on July 8, 1942, near Albi, department of Tarn.

FRANCIA (FRANCESCO DI MARCO DI GIACOMO RAIBOLINI) (c. 1450–1517?), the major Bolognese painter of the late 15th century. He was born, according to G. Vasari, in Bologna in 1450 and died there on Jan. 5, 1517 (or perhaps 1518, as Vasari says). He was trained as a goldsmith and entered the goldsmiths' guild in Bologna in 1482; later he became famous as an engraver of dies and nielli and was master of the mint under the Bentivoglio and also under Pope Julius II after the expulsion of the Bentivoglio. As a painter he was much influenced by the Ferrarese (*e.g.*, Cossa and Ercole de' Roberti) and was closely associated with Lorenzo Costa, but his later works clearly show the influence of Perugino and Raphael. He seems to have begun painting by 1486, but the earliest dated work by him is the "Felicini Madonna" of 1494 in the Pinacoteca, Bologna. A Madonna in the National gallery in London, once thought to have been composed in 1490 or 1492, is now regarded as a forgery. There is also a certain amount of doubt about his exact relationship with Raphael. Formerly it was said that Raphael wrote to Francia on Sept. 5, 1508, in the most polite terms extolling the devotional quality of his madonnas; while Francia was said to have addressed an enthusiastic sonnet, beginning "Non son Zeusi, nè Apelle . . ." to Raphael. Both these documents appear for the first time in C. Malvasia's *Felsina pittrice,* a notoriously unreliable source; nor has anyone been able to discover the original documents. Vasari speaks of letters passing between the two, and it would have been easy to supply the want of them. It is, however, clear that Francia was acquainted with Raphael's works, and later opinion has not excluded the possibility that Malvasia was substantially correct. According to Vasari, Raphael was indirectly the cause of Francia's death, for the "St. Cecilia" so impressed him on its arrival in Bologna that he died of depression at his own inferiority.

An altarpiece from the church of S. Frediano, Lucca, now in London, is one of his last works and clearly shows the Perugino-

Raphael influence on his later style. There are many works by him (including two silver paxes) in the Pinacoteca. Bologna, and in the churches there and in many other European and American galleries.

Hill, *Portrait Medals of Italian Artists of the Renaissance* (1912). The sonnet and the letter from Raphael are given in V. Golzio, *Raffaello nei documenti . . .* (1936). (P. J. MY.)

FRANCIA, JOSÉ GASPAR RODRÍGUEZ (*c.* 1766–1840), "El Supremo," dictator of Paraguay. was born in Asunción about 1766, probably the son of a Brazilian coffee grower. He studied at the university of Córdoba in Argentina and obtained there the degrees of master of philosophy and doctor of theology. Relinquishing his intention of taking holy orders, he studied law and practised in Asunción, where he acquired a reputation for ability, energy and integrity. Under the colonial government he filled several important posts, and when independence was declared in 1811, he became secretary to the national junta, exerting an influence far out of proportion to his position. In 1813, when a duumvirate replaced the national congress. Francia and Fulgencio Yegros, a gaucho, were chosen to fill the office. In 1814 he secured his election as dictator for three years, and in 1817 obtained the dictatorship for life. In his administration was found a strange mixture of farsighted statesmanship and petty despotism. Aware of his precarious position among powerful neighbours, he pursued a policy of strict isolation; realizing that he must make the country self-supporting, he carefully fostered internal industries. He banned foreign commerce; usurped the national revenues; organized and equipped an army; and introduced modern methods of agriculture. Imbued with the principles of the French Revolution, he abolished the Inquisition, suppressed the college of theology, swept away tithes and deprived the aristocracy of their social and political privileges. While practising republican simplicity in his private life, he exacted imperial deference wherever he went, isolated himself in the most stringent manner and punished with Draconian severity the slightest violation of his assumed prerogatives or hint of conspiracy against him. On Sept. 20, 1840, he was seized with a fit in Asunción, and died. Whatever may be the accusations brought against his rule, it is unlikely that except for him Paraguay could have escaped incorporation in either Argentina or Brazil. (W. B. P.)

FRANCIABIGIO (1482–152j), Florentine painter, best known for his portraiture, was probably born in Milan. His real name was Francesco di Cristofano. His father was a Milanese weaver, settled in Florence. According to Giorgio Vasari. Franciabigio when young worked in the company of Andrea del Sarto. He studied under Mariotto Albertinelli for a few months, and he was devoted to the study of perspective. One of his early works is the Madonna del Pozzo in the Uffizi gallery, Florence, which was for some time ascribed to Raphael. In the Atrium of the Annunziata in Florence he painted in 1513 the "Marriage of the Virgin," as a portion of a series wherein Andrea del Sarto was chiefly concerned. When the friars uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin, and some other heads; and the fresco, which would otherwise be his masterpiece in that method, was mutilated.

At the Chiostro dello Scalzo, in another series of frescoes in which Andrea was likewise employed, he executed in 1518–19 the "Departure of John the Baptist for the Desert," and the "Meeting of the Baptist With Jesus"; and, at the Medici palace at Poggio a Caiano, in 1521, the "Triumph of Cicero."

Franciabigio was a first-rate portrait painter. The Dresden gallery contains one of his masterpieces, the "Bath of Bathsheba" (1523).

FRANCIS, SAINT, OF ASSISI (GIOVANNI FRANCESCO BERNARDONE) (1181/82–1226), founder of the Franciscans (*q.v.*) and principal patron of Italy (with St. Catherine of Siena), was born at Assisi in Umbria, the son of Pietro di Bernardone, cloth merchant, and the lady Pica, perhaps of noble lineage. Nothing certain is known of the family background. Francis learned to read and write Latin at the school near the church of St. George and later acquired some knowledge of the French language and literature, especially of the troubadours. His youth does not seem to have been marked by serious moral lapses but by a general spirit of worldliness which made him a recognized leader of the young men of the town.

In 1202 he took part in a war between Assisi and Perugia, was held prisoner for almost a year and on his release fell seriously ill. Setting out once more to join the forces of Walter of Brienne, he had a vision at Spoleto that bade him return to Assisi. He began to give himself to solitude and prayer.

Several other episodes make up what is called his conversion: a vision of Christ while he prayed in a grotto near Assisi; an experience of poverty during a pilgrimage to Rome, nhere. in rags, he mingled with the beggars before St. Peter's and begged alms; the incident where he not only gave alms to a leper (he had always felt a deep repugnance for lepers) but also kissed his hand. One day at the ruined chapel of S. Damiano outside the gate of Assisi, he heard the crucifix above the altar command him: "Go, Francis. and repair my house which, as you see, is well-nigh in ruins." Taking this literally, he hurried home. gathered much of the cloth in his father's shop and rode off to Foligno, where he sold both cloth and horse. He then tried to give the money to the priest at S. Damiano. Angered, his father first kept him at home and later cited him before the civil authorities. When Francis refused to answer the summons, his father called him before the bishop. Before any accusations mere made. Francis "without a word peeled off his garments even down to his breeches and restored them to his father." Covered only by a hair shirt, he said: "Until now I have called you my father on earth. But henceforth I can truly say: Our Father Who art in heaven." The astonished bishop gave him a cloak, and Francis went off to the woods of Mt. Subasio.

Francis had renounced material goods and family ties to embrace a life of poverty. He repaired the church of S. Damiano, restored a chapel dedicated to St. Peter the Apostle and then the now famous chapel of St. Mary of the Angels, the Porziuncola. on the plain below Assisi There on the feast of St. Mathias, Feb 24, 1208 (1209?), he heard at mass the mission of Christ to the apostles. "Do not possess gold. nor silver, nor money in your purses. Nor scrip for your journey, nor two coats, nor shoes. nor a staff; for the workman is worthy of his meat. And into whatsoever city or town you shall enter, inquire who in it is worthy, and there abide till you go thence" (Matt. x, 9–11). Although a layman, he began to preach to the tonnspeople. Disciples joined him, and for them he cornposed a simple rule of life. In 1209 (1210?). when the group numbered 12, they went to Rome and obtained the approval of Innocent III for the rule (*see* FRANCISCANS for further development of the order).

This early rule. which has not survived, set as the aim of the new life, "To follow the teachings of our Lord Jesus Christ and to nalk in his footsteps." Probably no one in history has ever set himself so seriously as did Francis to imitate the life of Christ and to carry out so literally Christ's work in Christ's own way. This is the key to the character and spirit of St. Francis. To neglect this point is to show an unbalanced portrait of the saint as a lover of nature, a social worker, an itinerant preacher, a lover of poverty. Certainly the love of poverty is part of his spirit, and his contemporaries celebrated the "holy nuptials of Francis with Lady Poverty"; *e.g.,* in the fresco of Giotto at Assisi and in the allegorical prose-poem, the *Sacrum commercium* (Eng. trans., *The Lady Poverty,* by Montgomery Carmichael [1901], or *The Converse of Francis and Hzs Sons With Holy Poverty,* by Canon Rawnsley [1904]). However, it was not mere external poverty he sought, but the total denial of self (as in Phil. ii, 7).

He considered all nature as the mirror of God and as so many steps to God. He called all creatures his "brothers" and "sisters," and in his "Canticle of Creatures" (less properly called the "Praises of Creatures." "Canticle of the Sun," etc.) he referred to "brother Sun" and "sister Moon," the wind and water and even "sister Death." His long and painful illnesses were nicknamed his sisters, and he begged pardon of "brother Ass the body" for having unduly burdened him with his penances. Above all, his deep sense of brotherhood under God embraced his fellow men, for "he considered himself no friend of Christ if he did not cherish those for whom Christ died."

The Franciscan order spread from Umbria through Tuscany, the Marches and other regions of Italy. In 1212 Francis began his second order for nuns, giving the habit to a noble lady of Assisi, later known as St. Clara (*q.v.*). For those who could not leave their families and homes he eventually (*c.* 1221) formed the Third Order of Brothers and Sisters of Penance, a lay fraternity which, without withdrawing from the world or taking religious vows, would carry out the principles of Franciscan life (see TERTIARIES).

As the friars became more numerous, the order extended outside Italy. In the late spring of 1212 Francis set out for the Holy Land but was shipwrecked on the east coast of the Adriatic and had to return. A year or two later sickness forced him to abandon a journey to the Moors in Spain. In 1217 he proposed to go to France, but Cardinal Ugolino (later Pope Gregory IX) advised that he was needed to direct the order in Italy. He did go to Egypt, where the crusaders were besieging Damietta, in 1219. With Brother Illuminato he went into the camp of the Saracens and preached to the sultan, who, impressed, gave him permission (it is said) to visit the holy places in Palestine.

News of disturbances among the friars in Italy forced Francis to return there. To remedy the situation he appointed Peter Catani as his vicar to handle practical affairs; after Peter's early death in 1221 he chose Elias of Cortona (*q.v.*). He asked Pope Honorius III for legislation introducing a year of probation (novitiate) for new friars, and set about amplifying and revising the rule. After the rule was approved by Honorius III in final form on Nov. 29, 1223, Francis tended to withdraw more and more from external affairs. In the summer of 1224 he went to the mountain retreat of La Verna to celebrate the feast of the Assumption of Our Lady (Aug. 15) and to prepare for St. Michael's day (Sept. 29) by a 40-day fast. There he prayed that he might know how best to please God; opening the Gospels for the answer, three times he came upon references to the Passion of Christ. As he prayed one morning, about the time of the feast of the Exaltation of the Cross (Sept. 14), suddenly he beheld a figure coming toward him from the heights of heaven.

St. Bonaventura wrote:

As it stood above him, he saw that it was a man and yet a Seraph with six wings; his arms were extended and his feet conjoined, and his body was fixed to a cross. Two wings were raised above his head, two were extended as in flight, and two covered the whole body. The face was beautiful beyond all earthly beauty, and it smiled gently upon Francis. Conflicting emotions filled his heart, for though the vision brought great joy, the sight of the suffering and crucified figure stirred him to deepest sorrow. Pondering what this vision might mean, he finally understood that by God's providence he would be made like to the crucified Christ not by a bodily martyrdom but by conformity in mind and heart. Then as the vision disappeared, it left not only a greater ardor of love in the inner man, but no less marvelously marked him outwardly with the Stigmata of the Crucified.

Francis took the greatest care to hide those wounds in his lifetime. After the death of Francis, Brother Elias announced the stigmata to the order by a circular letter. Later Brother Leo, confessor and intimate companion of the saint, who left a written testimony of the event, said that in death Francis seemed like one just taken down from the cross. (See also STIGMATIZATION.)

Francis lived two years longer, in constant pain and almost totally blind (he had contracted an eye disease in the east). Medical treatment at Rieti was unsuccessful, and after a stay at Siena he was brought back to Assisi, where he died at Porziuncola on Oct. 3, 1226. He was buried temporarily in the church of St. George at Assisi. Francis was canonized on July 16, 1228, by Gregory IX; his feast day is Oct. 4. In 1230 his body was transferred to the lower church of the basilica being erected by Elias at the west end of the city.

The works of St. Francis, consisting of the rule (in two redactions), his testament, spiritual admonitions, prayers and letters, were first edited by Luke Wadding (1623). There are critical editions by Leonard Lemmens (1904) and by H. Boehmer (1904); and English translations by Paschal Robinson (1906), Countess de Ware (1907), James Meyer (1952) and others.

BIBLIOGRAPHY.—The chief sources on the life of St. Francis and the beginnings of the order are (1) two *Lives* by Thomas of Celano, with his treatise on the miracles following Francis' death (1228, 1246, 1250, respectively), Eng. trans. by A. G. Ferrers Howell (1908) and critical Latin edition by the Quaracchi Franciscans, *Analecta Franciscana,* tome x (1926–41); and (2) the *Life* or "Legend" by St. Bonaventure (1260–62), written at the request of the general chapter of Narbonne to compress the tomes of Celano. The legend, the work of a theologian, interprets the life of St. Francis in terms of speculative and mystical theology (critical edition, *Analecta Franciscana,* x, pp. 557–652).

Other writings important for the spirit of St. Francis rather than for the facts of his life are the *Mirror of Perfection* and the so-called *Legend of the Three Companions*. The former is from the 14th century; the latter is a misnomer, and the text as published is something of a puzzle (Eng. trans. of both, 1904 *et seq.*).

The *Fioretti* or *Little Flowers of St. Francis* (some nine or ten English versions and innumerable editions) is a treasure of 14th-century popular literature. While it breathes the spirit of St. Francis, it must be used cautiously as a historical source (*see* the Italian edition of R. Pratesi, 1958; and the Eng. trans. with excellent notes of R. Brown, 1958). The interdependence of these and other sources and their historical value made up the so-called Franciscan Question, which went out of vogue somewhat after 1940. *Cf.* J. H. R. Moorman, *The Sources for the Life of St. Francis of Assisi* (1940); and the review of M. Bihl in *Archivum Franciscanum Historicum,* 39:3–37, 279–287 (1946).

FRANCIS, SAINT, OF PAOLA (1416–1507), founder of the Minim Friars and patron of Italian seamen, was born of humble parents in Paola, Italy, on March 27, 1416. Devoted to his saintly namesake of Assisi, to whom he ascribed his eye cure in infancy, Francis spent his 13th year with nearby Franciscan friars in San Marco. At the age of 14 he began a hermit's life of prayer and penance near Paola. Around 1435, like-minded men joined him to form his first friary of Hermits of St. Francis of Assisi, which he renamed in 1492 Ordo Minimorum (Order of the Least) in contrast to the Franciscans or Ordo Fratrum Minorum (Order of Lesser Brethren). Besides poverty, chastity and obedience, Minim Friars vowed to observe a perpetual fasting diet without meat, eggs or dairy products. After papal approval in 1474, they spread to other parts of Italy. By 1506, when Pope Julius II approved the definitive Minim rule, France, Spain, Germany and Bohemia had friaries, and Francis had established a second order for nuns and a third order for married people in the world. Hoping for a miraculous cure, Louis XI, king of France, induced Pope Sixtus IV to send Francis to him. Arriving in 1483, Francis instead persuaded Louis to make his peace with God. Successive monarchs built monasteries for the saint, keeping him in France until his death at Plessis-les-Tours, April 2, 1507. Famous for miracles and prophecy, Francis was canonized in 1519; his feast is April 2. His relics were disinterred and burned by Huguenots in 1562.

See H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints,* vol. ii, pp. 10–13 (1956); B. Bauer, *Saints of the Missal,* vol. i, pp. 153–156 (1958). (A. B. WR.)

FRANCIS, SAINT, OF SALES (FRANÇOIS DE SALES) (1567–1622), bishop of Geneva, refuted the error prevalent in his day that spiritual perfection was impossible for those living in the world. Born Aug. 21, 1567, in the castle of Sales at Thorens in Savoy, he was the eldest son of the Boisy family. His education began at La Roche and Annecy, continued at the Jesuit college of Clermont in Paris (1580–88) and was completed at Padua by theological study and the acquisition of the doctorate in law (1591). After a brief practice of law he turned to the ecclesiastical state and was ordained priest at Annecy (1593).

Missionary activity leading to the conversion of the Chablais from Calvinism to Roman Catholicism occupied the years from 1594 to 1598. Appointed coadjutor to the bishop of Geneva (1599) by Pope Clement VIII, Francis was consecrated bishop of that see on Dec. 8, 1602.

Diocesan organization and reform, plus continued efforts against Calvinism, marked Francis' episcopal administration. In teaching that perfection was easy and possible for all, he was especially effective as author, spiritual director and preacher. In 1610, through Jeanne Françoise Frémiot, the widowed baronne de Chantal, he founded a religious order for women, the Visitation of Holy Mary *(see* CHANTAL, SAINT JANE FRANCES). Francis died at Lyons on Dec. 28, 1622. His beatification (1661) and canonization (1665) took place under Pope Alexander VII. The title of doctor of the church was conferred on him by Pius IX (1877), and he was named the heavenly patron of all writers by Pius XI (1923). His feast day is Jan. 29.

Various religious congregations, both of men and women, taking him as their patron have followed his principles of spirituality.

St. Francis' writings—which include controversies against the Calvinists, works on spirituality, letters, sermons and documents on diocesan administration — resulted in most part from his activity in the ministry. A 26-volume critical edition was issued under the auspices of the Sisters of the Visitation of Annecy (1892–1932). The folloning have been translated into English: *The Controversies; The Treatise on the Lone of God; Spiritual Conferences;* selections from the letters, by H. B. Mackey; and, in several versions. *The Introduction of a Devout Life,* which is recognized as a classic on spirituality.

FRANCIS I. (1708–1765), Roman emperor and grand duke of Tuscany, second son of Leopold Joseph, duke of Lorraine, was born on Dec. 8, 1708. He married in 1736 Maria Theresa (*q.v.*), daughter of the emperor Charles VI. He succeeded his father as duke of Lorraine in 1729, but the emperar, at the end of the Polish War of Succession, desiring to compensate Stanislaus Leszczynski for the loss of his crown in 1735, persuaded Francis to exchange Lorraine for the reversion of the grand duchy of Tuscany. His wife secured his election to the Empire on Sept. 13, 1745, in succession to Charles VII., and she made him co-regent of her hereditary dominions. Francis was well content to leave the reality of power to his able wife. He died at Innsbruck on Aug. 18, 1765. *See* MARIA THERESA.

FRANCIS II. (1768–1835), the last Roman emperor, and, as Francis I., first emperor of Austria, was the son of Leopold II., grand-duke of Tuscany, afterwards emperor, and of his wife Maria Louisa, daughter of Charles III. of Spain. He was born at Florence on Feb. 12, 1768. In 1784 he was brought to Vienna to complete his education under the eye of his uncle the emperor Joseph II. Joseph is said to have treated his nephew with an impatient contempt which confirmed his natural timidity; but after the marriage of Francis to Elizabeth of Wiirttemberg (1788) their relations improved. The death of his wife in childbirth on Feb. 18, 1790 was followed by the death of his uncle on the 20th; and Francis acted as regent with Prince Kaunitz until his father came from Florence. On Sept. 19, he married his first cousin Maria Theresa, daughter of Ferdinand, king of Naples, by whom he was the father of his successor Ferdinand I., of Maria Louisa, wife of Napoleon, and of the archduke Francis, father of the emperor Francis Joseph. After her death (1807) he married Maria Ludovica Beatrix of Este (1808), and when she died he made a fourth marriage with Carolina Augusta of Bavaria (1816)

He succeeded in his twenty-fifth year to the Austrian dominions and the empire on the death of his father on March 1, 1792. The dominions of the house of Austria, widely scattered in the Low Countries, Germany and Italy, were exposed to the attacks of the French revolutionary governments and of Napoleon. He was dragged into all the coalitions against France, and in the early days of his reign he had to guard against the ambition of Prussia, and the aggressions of Russia in Poland and Turkey. For long he had no adviser save such diplomatists as Prince Kaunitz and Thugut, who had been trained in the Old Austrian diplomacy. His own best quality was an invincible patience supported by reliance on the loyalty of his subjects, and a sense of his duty to the State. (For the general events of this reign till 1815 *see* AUSTRIA, EMPIRE OF; EUROPE; FRENCH REVOLUTIONARY WARS; NAPOLEON I; etc.) Seeing that the Empire was in the last stage of dissolution, and that, even were it to survive, it would pass from the house of Habsburg to that of Bonaparte, he in 1804 assumed the title of hereditary emperor of Austria, thus giving some semblance of unity to his complex dominions in Germany, Bohemia, Hungary and Italy, by providing a common title for the supreme ruler. His action was justified when, in 1806, the establishment of the Confederation of the Rhine forced him to abdicate the empty title of Holy Roman emperor.

In 1805 he changed the basis of his administration. He had hitherto been assisted by a cabinet minister who was in direct relation with all the "chanceries" and boards which formed the executive government, and who acted as the channel of communication between them and the emperor and was in fact a prime minister. In 1805 Napoleon insisted on the removal of Count Colloredo, who held the post. From that time forward the emperor Francis acted as his own prime minister, superintending every detail of his administration. In foreign affairs after 1809 he reposed full confidence in Prince hfetternich. But Metternich himself declared at the close of his life that he had sometimes held Europe in the palm of his hand, but never Austria. Francis was sole master, and the history of the Austrian empire under his rule and after his death bears testimony to both his merits and his limitations. His indomitable patience and loyalty to his inherited task enable him to triumph over Napoleon. By consenting to the marriage of his daughter, Marie Louise, to Napoleon in 1810, he gained a respite which he turned to good account. By following the guidance of Metternich in foreign affairs he was able to intervene with decisive effect in 1813. The settlement of Europe in 1815 left Austria stronger and more compact than she had been in 1792, and that this was the case was largely due to the emperor.

During the 20 years which preceded his death in 1835, Francis was wholly in sympathy with the policy of "repression" which came, in popular view, to be identified with the Holy Alliance; and though Metternich was primarily responsible for the part played by Austria in the "policing" of Europe, Francis cannot but be held personally responsible for the cruel and impolitic severities, associated especially with the sinister name of the fortress prison of the Spielberg, which made so many martyrs to freedom. He was denounced by Liberals throughout Europe as a tyrant and an obscurantist. Nevertheless he was always popular among the mass of his subjects, who called him "our good Kaiser Franz." His capital error as a ruler of Austria was that he persisted in a system of administration which depended upon the indefatigable industry of a single man. Government in Austria broke down under a successor who had not his capacity for work. Francis died on March 2, 183j.

See Wolfsgruber, *Franz I. Kaiser von Osterreich* (a vols., 1899). Ample bibliographies will be found in Krones von Marchland's *Grundriss der osterreichischen Geschichte* (Berlin, 1882). *See* also HABSBURG.

FRANCIS I. (1494–1547), king of France, son of Charles of Valois, count of Angoulême, and Louise of Savoy, was born at Cognac on Sept. 12, 1494. On the accession of Louis XII. in 1498, Francis became heir-presumptive. Louis invested him with the duchy of Valois, and gave him as tutor Marshal de Gié, and, after Gié's disgrace in 1503, the sieur de Boisy, Artus Gouffier. François de Rochefort, abbot of St. Mesmin, instructed Francis and his sister Marguerite in Latin and history; Louise herself taught them Italian and Spanish.

The Knight.—Francis showed a great love for violent exercises, such as hunting, which was his ruling passion, and tennis, and for tournaments, masquerades and amusements of all kinds. His earliest gallantries are described by his sister in the 25th and 42nd stories of the *Heptameron.* He married Claude, daughter of Louis XII., on May 18, 1514, and succeeded to the throne on Jan. 1, 1515. In the early years of his reign the government was chiefly in the hands of Louise of Savoy, Chancellor Antoine Duprat, Secretary Florimond Robertet, and the two Gouffiers, Boisy and Bonnivet. The royal favour then elevated Anne de Montmorency and Philippe de Chabot, and in the last years of the reign Marshal d'Annebaud and Cardinal de Tournon. Women had a great influence over Francis—his sister, Marguerite d'Angoulême, and his mistresses. Whatever the number of these, he had only two titular mistresses—at the beginning of the reign Françoise de Chbteaubriant, and from about 1526 to his death Anne de Pisseleu, whom he created duchesse d'Etampes and who entirely dominated him. It has not been proved that he was the lover of Diane de Poitiers, nor does the story of "La belle Ferronnière" appear to rest on any historical foundation. *(See* Paulin Paris, *Études sur le règne de François Ier*.)

The Statesman.—Circumstances alone gave a homogeneous character to the foreign policy of Francis. The struggle against the emperor Charles V. filled the greater part of the reign. In reality, the policy of Francis, save for some flashes of sagacity, was irresolute and vacillating. Attracted at first by Italy, he led the triumphal Marignano expedition (1515), which gained him reputation as a knightly king and as the most powerful prince in Europe. In 1519, in spite of wise counsels, he stood as candidate for the imperial crown. The election of Charles V. caused an inevitable rivalry between the two monarchs which accentuated the light and chivalrous temper of the king and the cold and politic character of the emperor. Francis's personal intervention in this struggle was seldom happy. He did not succeed in gaining the support of Henry VIII. of England in 1520; his want of tact goaded the Constable de Bourbon to extreme measures in 1522–1523; and in the Italian campaign of 1525 he proved himself a vacillating and foolhardy leader, and by his blundering led the army to the disaster of Pavia (Feb. 25, 1525), where, however, he fought with great bravery *(see* ITALY: *History)*. "Of all things," he wrote to his mother after the defeat, "nothing remains to me but honour and life, which is safe"—the authentic version of the legendary phrase "All is lost save honour." He strove to play the part of royal captive heroically, but the prison life galled him. He fell ill at Madrid and was on the point of death. For a moment he thought of abdicating rather than of ceding Burgundy. But this was too great a demand upon his fortitude, and he yielded and signed the treaty of Madrid (1526). After Madrid he wavered unceasingly between two courses: that of continuing hostilities, and the policy favoured by Montmorency of peace-and understanding with the emperor. At times he had the sagacity to recognize the utility of alliances, as was shown by those he concluded with the Porte and with the Protestant princes of Germany. But he could never pledge himself frankly in one sense or the other, and this vacillation prevented him from attaining any decisive results. At his death, however, France was in possession of Savoy and Piedmont.

Religion.—In his religious policy Francis showed the same instability. Drawn between various influences, that of Marguerite d'Angoulême, the du Bellays, and the duchesse d'Etampes, who was in favour of the Reformation or at least of toleration, and the contrary influence of the uncompromising Catholics, Duprat, and then Montmorency and de Tournon, he gave pledges successively to both parties. In the first years of the reign, following the counsels of Marguerite, he protected Jacques Lefèvre of Etaples and Louis de Berquin, and showed some favour to the new doctrines. But the violence of the Reformers threw him into the arms of the opposite party. The affair of the Placards in 1534 determined him to adopt a policy of severity. From that time, in spite of occasional indulgences shown to the Reformers, due to his desire to conciliate the Protestant powers, Francis gave a free hand to the party of repression, of which the most active and most pitiless member was Cardinal de Tournon; and the end of the reign was sullied by the massacre of the Waldenses (1545).

The Ruler.—Francis introduced new methods into government. In his reign the monarchical authority became more imperious and more absolute. His was the government *"du bon plaisir."* By the unusual development he gave to the court he converted the nobility into a brilliant household of dependents. The Concordat brought the clergy into subjection, and enabled him to distribute benefices at his pleasure among the most docile of his courtiers. He governed in the midst of a group of favourites, who formed the *conseil des affaires*. The states-general did not meet, and the remonstrances of the *parlement* were scarcely tolerated. By centralizing the financial administration by the creation of the *Trésor de l'Épargne*, and by developing the military establishments, Francis still further strengthened the royal power. His government had the vices of his foreign policy. It was uncertain, irregular and disorderly. The finances were squandered in gratifying the king's unbridled prodigality, and the treasury was drained by his luxurious habits, by the innumerable gifts and pensions he distributed among his mistresses and courtiers, by his war expenses and by his magnificent buildings. His government, too, weighed heavily upon the people, and he was less popular than is sometimes imagined.

Francis owes the greater measure of his glory to the artists and men of letters who vied in celebrating his praises. He was pre-eminently the king of the Renaissance. Of a quick and cultivated intelligence, he had a sincere love of letters and art. He holds a high place in the history of humanism by the foundation of the Collège de France; he did not found an actual college, but after much hesitation instituted in 1530, at the instance of Guillaume Budé (Budaeus), *Lecteurs royaux*, who in spite of the opposition of the Sorbonne were granted full liberty to teach Hebrew, Greek, Latin, mathematics, etc. The humanists Budé, Jacques Colin and Pierre Duchbtel were the king's intimates, and Clément Marot was his favourite poet. Francis sent to Italy for artists and for works of art, but he protected his own countrymen also. Here, too, he showed his customary indecision, wavering between the two schools. At his court he installed Benvenuto Cellini, Francesco Primaticcio and Rosso del Rosso, but in the buildings at Chambord, St. Germain, Villers-Cotterets and Fontainebleau the French tradition triumphed over the Italian.

Francis died on March 31, 1547. By his first wife Claude (d. 1524) he had three sons and four daughters: Louise, who died in infancy; Charlotte, who died at the age of eight; Francis (d. 1536); Henry, who came to the throne as Henry II.; Madeleine, who became queen of Scotland; Charles (d. 1545); and Margaret, duchess of Savoy. In 1530 he married Eleanor, the sister of the emperor Charles V.

BIBLIOGRAPHY.—For the official acts of the reign, the *Catalogue des actes de François Ier*, published by the Académie des Sciences morales et politiques (1887–1907), is a valuable guide. The Bibliothèque Nationale, the National Archives, etc., contain a mass of unpublished documents. Of the published documents, *see* N. Camuzat, *Meslanges kistoriques* . . . (Troyes, 1619); G. Ribier, *Lettres et mémoires d'estnt* (1666); *Lettres de Marguerite d'Angoulême*, ed. by F. Genin (1841 and 1842); the *Correspondance de Castillon et Marillac* (ed. Kaulek, 1885), of *Odet de Selve* (ed. by Lefèvre-Pontalis, 1888), and of *Guillaume Pellicier* (ed. Tausserat-Radel, 1900); *Captivité du roi François Ier*, and *Poésies de François Ier* (both ed. by Champollion-Figeac, 1847, of doubtful authenticity); *Relations des ambassadeurs vénitiens*, etc. Of the memoirs and chronicles, *see* the journal of Louise of Savoy in S. Guichenon's *Histoire de la maison de Savoie*, vol. iv. (ed. of 1778–80); *Journal d'un bourgeois de Paris*, ed. by Lalanne (1854); *Cronique du roy François Ier*, ed. by Guiffrey (1868); *Journal de Jean Barillon*, ed. by de Vaissière (1897–99); and the memoirs of Fleuranges, Montluc, Tavannes, Vieilleville, Brantôme and especially Martin du Bellay (coll. Michaud and Poujoulat). Of the innumerable secondary authorities, *see* especially Paulin Paris, *Etudes sur le règne de François Ier* (1885), in which the apologetic tendency is excessive; and H. Lemonnier in vol. v. (1903–04) of E. Lavisse's *Histoire de France*, which gives a list of the principal secondary authorities. There is a more complete bibliographical study by V. L. Bourrillp in the *Revue d'kistoire moderne et contemporaine*, vol. iv. (1902–03). The printed sources have been catalogued by H. Hauser, *Les Sources de l'histoire de France, XVIe siècle*, tome ii. (1907).

(J. I.; X.)

FRANCIS II. (1544–1560), king of France, eldest son of Henry II. and of Catherine de' Medici, was born at Fontainebleau on Jan. 19, 1544. He married Mary Stuart *(see* MARY, QUEEN OF SCOTS), daughter of James V. of Scotland, on Aug. 25, 1558, and ascended the French throne on July 10, 1559. During his short reign the young king, a sickly youth and of feeble understanding, was the mere tool of his uncles Francis, duke of Guise, and Charles, cardinal of Lorraine, into whose hands he virtually delivered the reins of government. After the failure of the conspiracy of Amboise, directed against the Guises the duke of Guise became lieutenant-general of the kingdom, but his Catholic leanings were somewhat held in check by the chancellor Michel de l'Hôpital *(q.v.)*. Francis II. died on December 5, 1560.

See Ernest Lavisse, *Histoire de France* (vol. vi. *by* J. H. Mariéjol, 1904), which contains a bibliography.

FRANCIS I. (1777–1830), king of the Two Sicilies, was the son of Ferdinand IV. (I.) and Maria Carolina of Austria He married Clementina, daughter of the emperor Leopold II. of Austria, in 1796, and at her death Isabella daughter of Charles IV. of Spain. Francis was appointed regent in Sicily in 1812. On the fa11 of Napoleon his father returned to Saples and suppressed the Sicilian constitution and autonomy. incorporating his two kingdoms into that of the Two Sicilies (1816); Francis then assumed the revived title of duke of Calabria On succeeding to the throne in 1825 he showed himself as reactionary as his father. He left the government in the hands of favourites and police officials, and lived with his mistresses, surrounded by soldiers ever in dread of assassination During his reign the only revolutionary movement was the outbreak on the Cilento (1828), savagely repressed by the marquis Delcarretto, an ex-Liberal turned reactionary.

FRANCIS II (1836–1894), king of the Two Sicilies, son of Ferdinand II and Maria Cristina of Savoy, was the last of the Bourbon kings of Naples. He ascended the throne on May 22, 1859. He at once appointed Carlo Filangieri (*q v*), as prime minister but did not take his sensible advice. and Filangieri soon resigned. On June 7 a part of the Swiss Guard mutinied. and while the king mollified them by promising to redress their grievances. General Nunziante collected other troops, who surrounded the mutineers and shot them down. Cavour repeated an earlier proposal for an alliance to divide the papal states betneen Piedmont and Naples, the province of Rome excepted, but Francis rejected an idea which to him savoured of sacrilege. Meanwhile the revolutionary parties were conspiring for the overthrow of the Bourbons in Calabria and Sicily. and Garibaldi was preparing for the conquest of Sicily (*see* GARIBALDI. GIUSEPPE). These events at last frightened Francis into granting a constitution, but its promulgation was followed by disorders in h'aples and the resignation of ministers, and Liborio Romano became head of the government. Garibaldi. who had crossed the straits of Messina. was advancing northwards Francis. after long hesitations and even an appeal to Garibaldi himself, left Naples (Sept. 6) with his wife Maria Sophia, the court, the diplomatic corps (the French and English ministers excepted), and went by sea to Gaeta, where a large part of the army was concentrated. The next day Garibaldi entered Naples, was enthusiastically welcomed, and formed a provisional government. Garibaldi's troops defeated the Neapolitan royalists on the Volturno (Oct. 1–2), while the Piedmontese under Victor Emmanuel captured Capua. The siege of Gaeta by the Piedmontese began on Nov 6, 1860. The fortress capitulated on Feb. 12, 1861, and Francis was driven from his kingdom. He died on Dec. 27, 1894 at Arco in Tirol.

BIBLIOGRAPHY.—R. de Cesare. La *Fine d' un regno,* vol. ii. (Città di Castello, 1900) gives a detailed account of the reign of Francis II., while H. R. Whitehouse's *Collapse* of *the Kingdom oj Naples* (1899) may *be* recommended to English readers; G. Nisco's *Francesco II.* (Naples, 1887) should also be consulted. *See* under NAPLES; GARIBALDI, GIUSEPPE; BIXIO, NINO; CAVOUR, CAMILLO BENSO; ITALY; FILANGIERI, CARLO; etc.

FRANCIS OF MEYRONNES (Lat. FRANCISCUS DE MAYRONIS) (d. *c.* 1328). Provençal Franciscan philosopher, known to the scholastics as *doctor illuminatus* or *acutus,* was a pupil of Duns Scotus, whose doctrine of *fortnalitates* he applied even to the Trinity. According to Francis, ideas belong to God's substance; variations in the intensity of qualities, rather than qualities themselves, mark off individuals. The new kinetic theory of *vis impressa* and that of the revolution of the earth are mentioned in his works. He advocated a universal temporal monarchy headed by the pope; and upheld the doctrine of the Immaculate Conception. As well as theological and political treatises, he wrote commentaries on Porphyry's *Isagoge,* Aristotle's *Categories* and *Physics* and Peter Lombard's *Sentences.* (L. M.-Po.)

FRANCIS, JAMES BICHENO (1815–1892), U.S. civil engineer best known for his development of the mixed-flow or Francis turbine, was born in Southleigh, Eng., May 18, 1815. He left school at the age of 14 to assist his father on hydraulic works connected with a small railway in Wales. In 1833 Francis moved to the United States where he was employed in construction of the Stonington (Conn.) railway under the supervision of G. W. Whistler. Francis later followed Whistler when the latter joined a group known as "Proprietors of the Locks and Canals on the Merrimack River" at Lonell, Mass. At the age of 22 Francis became chief engineer of the company, engaged first in locomotive design, then in the erection of cotton mills, and finally in management of water power facilities at Lowell. For 40 years he looked after the company's water power interests and acted as consulting engineer to factories using the power; he contributed greatly to the rise of Lowell as an industrial city.

Among technical matters to nhich Francis gave his attention were timber preservation, the testing and design of cast-iron girders and the design of fire protection systems. In addition to his development of the Francis turbine, he is probably best known for his formulas for the flow of water over weirs and his many other hydraulic studies. He was widely consulted on engineering projects; one of them took him as far as Minnesota. An original member and one-time president of both the Boston and American societies of civil engineers, he wrote more than 200 technical papers and, although unschooled, became known as one of the most scientific in outlook of the civil engineers of his day. He died at Lowell on Sept. 18. 1892. (W. E. HD.)

FRANCIS, SIR PHILIP (1740–1818), English politician and pamphleteer, the supposed author of the *Letters* of *Junius,* and the chief antagonist of Warren Hastings, was born in Dublin on Oct. 22, 1740. He was educated at a Dublin free school, privately. and at St. Paul's school, London. In 1756, immediately on his leaving school, he was appointed to a junior clerkship in the secretary of State's office by Henry Fox (afterwards Lord Holland), and this post he retained under the succeeding administration. In 1758 he was employed as secretary to Gen. Bligh in the expedition against Cherbourg; and in the same capacity he accompanied the earl of Kinnoul on his special embassy to the court of Portugal in 1760.

In 1762 he was appointed to a principal clerkship in the War Office. where he formed an intimate friendship with Christopher D'Oyly, the secretary of State's deputy, whose dismissal from office in 1772 was hotly resented by "Junius"; and in the same year he married Miss Macrabie, the daughter of a retired London merchant. In 1763 the great constitutional questions arising out of the arrest of Wilkes began to be sharply canvassed. It was natural that Francis, who from a very early age had been in the habit of writing occasionally to the newspapers, should be eager to take an active part in the discussion. though his position as a Government official made it necessary that his intervention should be carefully disguised. He is known to have written to the *Public Ledger* and *Public Advertiser,* as an advocate of the popular cause, on many occasions about and after the year 1763. His chief title to fame as a writer, however, is his supposed authorship of the *Letters* of *Junius,* of which the first appeared in Jan. 1769, and the series was continued till Jan. 21, 1772 (*see* JUNIUS).

In March 1772 Francis finally left the War Office, and in the following July started a continental tour which lasted until Dec. 1772. In June 1773 Lord North appointed him a member of the newly constituted supreme council of Bengal at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in Oct. 1774, and a long struggle with Warren Hastings, the governor-general, immediately began. These three formed a majority of the council in opposition to the governor-general's policy, accusing him of corruption, mainly on the evidence of Suncomar. The death of Monson (1776) and of Clavering (1777) made Hastings again supreme in the council, and a dispute with Francis, led in Aug. 1780 to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr. Francis by his experience of his private, which he had found to be void of truth and honour." A duel was the consequence, in which Francis received a dangerous wound (*see* HASTINGS, WARREN). His recovery was rapid and complete and he left for England where, on his arrival in Oct. 1781, he was received with little favour.

In 1784 Francis was returned by the borough of Yarmouth, Isle of Wight; and on the return of Hastings in 1785, did all in his power to bring forward and support the charges which ultimately led to the impeachment resolutions of 1787. He sympathized warmly with the French revolutionary doctrines, in 1793 supported Grey's motion for a return to the old constitutional system of representation, and was one of the founders of the "Society of the Friends of the People." The acquittal of Hastings in April 1795 disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, but was not offered the governor-generalship on the Whig success in 1806, though he accepted a K C B. He was not re-elected for Appleby in 1807 and the remainder of his life was spent in comparative privacy.

Among the later productions of his pen were, besides the *Plan of a Reform in the Election of the House of Commons,* pamphlets entitled *Proceedings in the House of Commons on the Slave Trade* (1796), *Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie* (1810), *Historical Questions Exhibited* (1818), and a *Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway* (1814). His first wife, by whom he had six children, died in 1806, and in 1814 he married his second wife, Emma Watkins, who long survived him, and who left voluminous manuscripts relating to his biography. Francis died on Dec. 23, 1818.

BIBLIOGRAPHY.—For the evidence identifying Francis with Junius *see* the article JUNIUS, and the authorities there cited. *See* also *Memoirs of Sir Philip Francis, with Correspondence and Journals,* by Joseph Parkes and Herman Merivale (2 vol., 1867).

FRANCISCANS (FRIARS MINOR; ORDO FRATRUM MINORUM; O.F.M.; in England called GREY FRIARS), an order of mendicant friars founded by St. Francis (*q.v.*) of Assisi. Francis heard the call to a life of poverty and preaching of penance (1209), and soon was joined by his first followers. He gave them a short and simple rule of evangelical maxims (the so-called "primitive rule") and in 1210 went with them, 11 others besides himself, to Rome, where he received verbal authorization from Innocent III. The brethren, who had no possessions of any kind and whose only centre was the little church, the Porziuncola, at Assisi, preached and worked at first in Umbria and then, as numbers grew, in the rest of Italy and abroad.

The character and message of Francis precipitated, so to say, a form of life that was already in the air in northern and central Italy, and recruits came in great numbers. For a time there were no fixed residences, but the brotherhood met each year in chapter at Assisi. In 1219, as a result of appeals and controversies, "ministers" for different regions were appointed and certain canonical ordinances were imposed by the pope. Francis himself renounced the official headship in 1220, but at the request of the general chapter composed a rule (the "second rule") which was found too strict and never applied. Unwillingly, with the aid of Cesarius of Speyer, he composed a third version (the "approved rule" or *Regula bullata),* which received papal confirmation when Honorius III gave formal approval of the order on Nov. 29, 1223. Finally, in 1226, Francis wrote his testament, in which he reaffirmed his deepest convictions as to poverty, the renunciation of all papal privileges and the sacrosanctity of the rule. understood literally. Francis, it seems clear, had originally no intention of founding an order. He had heard the call to follow Christ in evangelical poverty and simplicity, and he accepted this life as one to be shared with all—with his followers, with St. Clare and her sisters, and with all men and women of good will. He explicitly asserted the novelty of his brotherhood and his unwillingness to follow monastic precedent. When followers came in hundreds, neither he nor they could bring themselves either to insist fully upon or to renounce absolutely the primitive idea with Francis as its only accredited exponent. This inner conflict between the spiritual intuition of a saint, and the practical necessities of a large and miscellaneous body of men, remained unresolved for the first four centuries of the order's history and remains a problem of religious history.

Constitution. — When Francis died in 1226 the number of his friars was already great, but the rule gave no more than the skeleton of an organization, in which Francis and his vicar-general, Elias (*q.v.*) of Cortona, had had an almost monarchic position. In the years that followed there was a double tension: that of transforming a brotherhood of spiritual endeavour into a fully articulated and disciplined religious order, and that of translating the soaring vision of St. Francis into a body of doctrine that could be preached to and practised by a multitude of ordinary mortals. It was indeed the basic problem of Christianity focused upon a small body of medieval men.

The former process was at first delayed and later hastened by the autocratic and in some ways retrograde behaviour of Elias, who was himself neither learned nor in orders. Subsequently, under the generalate (1240–44) of Haymo of Faversham, an Englishman, the general chapter was used as a legislative body to sanction an elaborate constitution, based in part upon that of the Dominicans (Friars Preachers). The convents. each under a guardian, were grouped in regional provinces under ministers provincial, and the provinces under a minister general. Provincial and general chapters (the latter no longer an assembly of all the friars) were held triennially, and a system of education similar to that of the Dominicans was introduced. Friars not in orders were excluded from holding office, and gradually came to form a separate class. Meanwhile the pull of circumstances and the entry into the order of university masters and their pupils assisted in transforming a brotherhood of unlettered preachers of the Christian message into an order of highly trained clerical theologians. In two respects, however, the Friars Minor stood apart from the Friars Preachers: they remained nearer in heart and spirit to the common people, and the order was governed by its superiors rather than by elected committees *(see* also DOMINICANS: *History).*

The second of the two processes alluded to above was a longer and more difficult one, in which the victories of moderate men and practical statesmen were often counterbalanced by a lowering of ideals and by the harsh treatment meted out to those who might well seem to have preserved more faithfully the purity of their founder's ideal. In the process of change the papacy played a leading part; the friars were a valuable militia for the church; and the Curia, if appealed to on a question of law, could answer only in legal terms. The testament of Francis was soon (1230) declared to have no canonical force, and a succession of bulls reduced Francis' vision of poverty into a legal status in which the exigencies of the rule were preserved in word, but eluded, partly by the use of a third party to stand between the benefactor and these who in fact enjoyed the benefaction, and partly by the legal fiction of vesting the ownership of all property in the Holy See.

These decisions were not unchallenged, and a division showed itself between those who were familiar with the life and teaching of the founder and those, especially from countries beyond the Alps, who wished to see the order attain a maximum of freedom to pursue its work of learning and teaching. Something of an equilibrium was reached in the generalate (1257–74) of St. Bonaventura, who has sometimes been called the second founder of the order. By his life of St. Francis, his commentary on the rule and the constitutions promulgated under him at Narbonne (1260), as well as by his firm government and saintly personality, Bonaventura provided the framework and the inspiration for an interpretation of the message of St. Francis and a version of the Franciscan life that has remained ever since official and central in the order.

Meanwhile the friars had spread far and wide in Europe, while bands of missionaries had penetrated Syria and Africa. Simultaneously, the friars' houses in university towns such as Paris and Oxford were transformed into schools of theology which rapidly became the most celebrated in Europe, and both attracted and produced many of the greatest masters of the golden age of scholasticism. At Paris Alexander of Hales, Bonaventura, John Pecham and Matthew of Aquasparta, and at Oxford Adam Marsh, Thomas of York. Duns Scotus and William of Ockham, maintained the succession of genius for a century. After 50 years the contemporary controversies over Aristotelian philosophy brought the Dominicans and Franciscans into collision, and thenceforward the two orders were consistently and often bitterly opposed on all matters that were not part of the traditional faith.

Reform Movements.—Spirituals and *Conventuals*.—With the death of Bonaventura the internal dissensions of the order flamed up anew. The mantle of the first companions of Francis and the *zelanti* (zealots) was assumed by a school that gradually acquired the name of Spirituals, standing for the literal observance of the rule and testament, and the renunciation of papal dispensations. Opposed to them were the Conventuals, who stood for a less austere community life adapted to the exigencies of study and preaching. Among the 13th and 14th-century leaders of the Spirituals were Pietro Giovanni Olivi, Angelo of Clareno and Ubertino of Casale, and among their followers were those who formed for future generations in literature and in art—in the Fioretti ("Little Flowers"), the *Speculum* perfectionis ("Mirror of Perfection") and the poems of Jacopone da Todi—the romantic image of Francis and his first friars that has become part of the medieval legacy of beauty.

Yet the victory in law and practice was ensured to the Conventuals by the climate of the age, the fortunes of the other orders of friars, the needs of the faithful and the patronage of the papacy. Their advantages were increased by the extreme and ultimately rebellious and heretical opinions and conduct of many of the Spirituals. For a long time, however, the moral and what may be called the aesthetic superiority lay with the Spirituals, and their ultimate catastrophe is one of the tragedies of medieval history. After many vicissitudes. the controversy on poverty within the order, as also the claim of the Spirituals to form communities following their conception of the Franciscan life, was settled in 1322–23 in favour of the Conventuals by John XXII. His harsh treatment of dissidents led to a temporary schism in the order and the departure into rebellion and heresy of the extremists known as the Fraticelli Within a few decades, however, calamities of another sort had changed the face of the church. Both discipline and observance had suffered in the Conventual party during the strife, and the Minors felt also the disastrous effects of the great plague and the great schism, not to mention the nominalist movement in the schools, which had issued from their midst.

In the latter part of the 14th century the friars, and in particular the Franciscans, who were ubiquitous because of their great numbers and their active mendicancy, lost much of the esteem and popularity of earlier times. They became the target of satirists and reformers in every country, as readers of Boccaccio, Langland and Chaucer well know. Their theologians, already adepts in the subtleties of Scotus, were deeply infected with Nominalism (q v.) and as "Duns' men" (whence "dunces") they were regarded in the 16th century with distaste and hostility by Erasmus and the humanists in general.

Observants.—Throughout the 14th century a series of zealous reformers, the direct spiritual successors of Angelo and Ubertino, had initiated groups of friars of austere life existing apart from the main body of Conventuals. At last a clear separation was effected. A group of French and Burgundian friaries, vowed to the literal observance of the rule. were put by the Council of Constance in 1415 under a vicar-general mho owed obedience to the minister general alone. These mere known as Observants. Though several attempts were made by the papacy to align the whole order under the Observants' standard, the outcome was in fact a complete separation in 1517, when they became a separate religious order. Before that, the Observants under the leadership of St. Bernardino of Siena, St. John of Capistrano and St. James of the March had spread far and wide over Europe. They were introduced into England in 1482, and gained a name for strict discipline. The leading spirit of the Observants in early days was St. John (*q.v.*) of Capistrano, a preacher and wonder-worker of unparalleled genius and zeal, who died shortly after the victory over the Turks at Belgrade which was largely due to his inspiration. In Spain the great reforming statesman Cardinal Jimenez was an Observant. The English Observants as a body opposed both the royal divorce and the royal supremacy of Henry VIII, and were driven to death, prison and exile.

Between the Observants and the Conventuals a number of splinter groups came into existence, of which the "half-reform," a compromise sponsored (1430) by Martin V, was the most notable. Finally, in 1517 Leo X erected the Observants into an autonomous order, to which for a short time the Conventuals were subordinated. They spread widely and themselves gave birth to stricter groups, notably that of the Alcantarines or Discalced Friars Minor in Spain and Portugal, the work of St. Peter of Alcantara, remarkable for their extreme austerity.

Capuchins.—Meanwhile another important movement of reform had taken place that added an eremitical element to the literal interpretation of the rule. These friars. knoan as Capuchins (from their pointed cowl, *capuche*), were founded by Matteo da Bascio in 1525 and received papal confirmation and separate government under a vicar-general in 1535. Their constitutions prescribed absolute poverty, both corporate and personal, and great austerity of life. The Capuchins had a rough passage through the 16th century. They were harassed by the Conventuals and forbidden by the papacy to extend outside Italy. The defection (1542) to Protestantism of their second general, Bernardino Ochino, all but ruined them, and their leaders were not men of great ability. Nevertheless they increased rapidly, and by 1571 counted 17,000 brothers in Italy alone. In the following centuries, when allowed to expand freely, they reached a maximum of 33,000 in 1750. They played almost as important a part as the Jesuits in the later stages of the Counter-Reformation, appealing to the lower orders and to the country people as well as to courts and castles. Among notable Capuchins were St. Lawrence of Brindisi, a papal diplomatist; Ange de Joyeuse, a leader in the wars of religion: Père Joseph du Tremblay. the "gray eminence"; Benet Canfield, the English mystical writer; St. Fidelis of Sigmaringen; and Marco Cristofori of Aviana, who played a part in the victory over the Turks in 1683–88 similar to that of St, John of Capistrano two centuries earlier. In England a group staffed the chapels for the Catholic queens Henrietta Maria and Catherine of Braganza. They were active in missionary and social work all over the world, notably in America and Ireland.

After the French Revolution.—The Franciscans suffered, though not so severely as the endoned orders, in the French Revolution and the subsequent liberal and secularizing epoch; they have always been most numerous in the Latin lands, and on the missions they were never reduced to nonentity. They revived with the religious revival of the early 19th century and again spread widely; during the mid-19th century years they developed their activities in every missionary field of the old and new worlds. Since the 16th century the order had consisted of three main branches, but whereas the Capuchins were undivided, and the Conventual~had absorbed their largest offshoot (the so-called "improved Conventuals") in the 17th century, the Observants had consisted from early days of the Observants proper, the Reformed Observants. the Recollects, the Discalced and other smaller splinters. These were all united by Leo XIII in 1897 with new constitutions under a single minister general.

The Franciscans therefore form not one but three orders: the Conventuals (O.F.M. Conv.), the smallest group; the Observants (O.F.M.), the largest by far; and the Capuchins (O.F.M. Cap.). In 1960 the Observants had 37 provinces, including 5 in the United States, nith many friars of German origin; the Conventuals 21 provinces, including 3 in the United States; the Capuchins 45 provinces and other lesser groups, of which half are in Italy.

Five popes have been Franciscans: Nicholas IV; Sixtus IV; the two intensely dynamic 16th-century popes Julius II and Sixtus V; and Clement XIV, who suppressed the Jesuits. There have been numerous historians of the order since the Reformation, including the Irish friar Luke Wadding (1588–1657). In modern times the foundation (1879) of the College of St. Bonaventura at Quarrachi near Florence led to the establishment of a school of editors of the works of Bonaventura, Peter Lombard, Alexander of Hales, etc. A number of learned periodicals also have appeared, such as the *Analecta Franciscana,* the *Achivium Franciscanum historicum,* the *Antonianum* and the *Franziskanische Studien,* to say nothing of more popular productions in all languages.

Among Franciscan scholars may be mentioned P. M. Oliger, the historian of St. Francis, and A. Gemelli (d. 1959), founder and rector of the University of the Sacred Heart at Milan, both Observants. Among social workers may be mentioned Theobald Mathew (d. 1856), the Irish "apostle of temperance," and his contemporary Theodosius Florentini (d. 1865), the great Swiss philanthropist. In theology, the Franciscans have always taken St. Bonaventura and Duns Scotus as guides, and from the latter they received the legacy of propagating the doctrine of the Immaculate Conception. In the middle ages they introduced the Christmas crib, and since the 17th century they have popularized the devotion of the Way of the Cross, the indulgences of which they still distribute. In the 14th century the Franciscans were the first to establish charitable funds, *montes pietatis,* to grant interest-free loans to the poor.

The Observant habit is a dark brown tunic with rope girdle and round hood and sandals over bare feet; they wear a large tonsure. Conventuals wear a black tunic with white cord; a large, double, pointed hood; biretta, and shoes. The Capuchin habit is a coarse brown tunic with cord, pointed cowl, sandals and beard.

The Franciscan Aim.—The widespread modern predilection for St. Francis, the intensive work done by historians of every tongue on Franciscan origins, and the selection of the saint and his first followers as figures of ideal beauty and simplicity, heralds of the modern love of nature and of animals, have perhaps led many writers to a certain neglect of perspective. They have examined the original documents, have traced what seemed to them to be a decline from the original ideal, and have noted the lamentable divisions in the order in the late 13th century. As a consequence, those unfamiliar with the history of the church throughout the centuries have perhaps failed to appreciate the immense scope and the beneficent achievement of the Franciscans among the poor, the unfortunate and the heathen throughout the world from the time of St. Francis onward. They have been for centuries, and still are, by far the most numerous body of religious in the Roman Catholic Church, and in part at least their absence from the forefront of the world's stage is due to their fidelity to the message of simplicity and poverty which they have received from their founder.

Second Order.—The Second Order of St. Francis, known also as the Poor Ladies, Clarisses or Poor Clares, was founded at Assisi by St. Clare (*q.v.*), a daughter of a noble family of the town. She took the veil at the hands of St. Francis in the Porziuncola on March 18, 1212, and together with her sister Agnes and others was lodged by him in the church of San Damiano, where she was joined by relatives and friends and became abbess in 1216. Francis gave her only verbal counsel and a short "way of life," and the first rule, an austere monastic directory, was imposed by Cardinal Ugolino (later Gregory IX) in 1218–19. This was later modified to the second rule by Innocent IV in 1247. But Clare fought hard for union with the Friars Minor and the observance of full Franciscan poverty, and a third rule, largely that of St. Francis and embodying her wishes, was approved by Pope Innocent IV only two days before her death; the papal letter was found when her tomb was opened in 1893. Long before this papal act the Poor Ladies had founded convents in north Italy and beyond the Alps, and they continued to be very numerous until the Reformation, despite the severity of their rule.

The Second Order did not escape its share in the tribulations of the friars. Convents existed following each of the three rules, and a fourth became current in France. In 1263 Urban IV at the instigation of St. Bonaventura united all the Clares under the slightly mitigated (second) rule of 1247, but several reforms in the direction of primitive austerity took place. The Colettines, named after their founder, St. Colette (*q.v.*) of Corbie, represented one such (1417), the Conceptionists in Spain another (1489). In 1538 the Clare-Capuchinesses were founded in Italy; and finally the Clares of Strict Observance (Alcantarines) also in Italy, originated in 1630. The first and third of these multiplied greatly, particularly in France and Spain, respectively. All save the last-named still exist.

The Poor Clares have always ranked among the most austere and penitential of the religious orders, and in the 20th century they share with the Carmelites (*q.v.*) a reputation for the strict observance of a dedicated contemplative life. Despite (or perhaps because of) the severity of its rule, the order has always counted among its members. especially in France and Germany, many women of royal, noble and gentle families, and has never decayed. It remains flourishing in the mid-20th century, with more than 650 convents, chiefly in Spain and Italy but also throughout the world. including North and South America. Among the many saints, besides the foundress, her sister Agnes and St. Colette, may be mentioned St. Catherine of Bologna.

The Poor Clares' habit is brown, with cord girdle and black veil, and they go barefoot except for wearing sandals out of doors,

Third Order.—The Third Order of St. Francis, for men and women living in the world, was no more than a formalization of the message of St. Francis, who himself wrote a letter "to all Christians." Perhaps as early as 1221 brethren and sisters "of penance" (*i.e.,* pledged to a devout life) were in existence; certainly the Third Order was known as such in 1230. It met a need in the growing urban population of Europe that had hitherto been satisfied by semiorthodox associations and sects. Its members were distinguished by an exact observance of all the fasts and other precepts of the church, by a refusal to bear arms or to take oaths save in specified circumstances. Christopher Columbus and Isabella I were members of this order. The constitutions of the order for those in the world were revised and mitigated by Leo XIII in 1883, and by the 1960s there were more than 4,000,000 Franciscan "Tertiaries," both men and women, many of them given to works of charity and social service.

Early in Franciscan history there arose a "regular" Third Order of communities under vow. The male branch was all but extinguished at the Reformation and later during the French Revolution, but witnessed a revival after the mid-19th century, with numerous congregations, particularly in Holland and German-speaking countries, with derivatives in North America. Congregations of Franciscan women Tertiaries are numerous all over the Catholic world. Both men and women are devoted to teaching, nursing and the auxiliary missionary activities. A revised rule and constitutions were given them by Pius XI in 1927.

Minims.—The Minims (*Ordo Minimorum*) were founded by St. Francis (*q.v.*) of Paola in southern Italy about 1435, at first as a group of hermits. They were neither a reform of nor a revolt from the Franciscans, with whom they have never had organic connection. They were a separate institute, deriving their inspiration from St. Francis of Assisi, particularly in his encouragement of simplicity and the eremitical life. Their name, intended to set them below the Friars Minor, was a token of humility, and they received from their founder a life of the most austere penance, with emphasis on silence and on abstinence from all foodstuffs save bread, vegetables. fruit and oil. The order received papal approval in 1474 and spread rapidly in the 16th century, particularly in Italy, France, Spain and the New World, and has survived to the present day in Italy. The habit of the Minims is a wide-sleeved black or natural wool tunic, with cord girdle, and a cape with hood. The order is governed by a corrector general. *See* MONASTICISM; ORDERS AND CONGREGATIONS, RELIGIOUS; *see* also references under "Franciscans" in the Index volume.

FRANCISCO MORAZÁN, department in highlands of central Honduras. Area 3,068 sq.mi., pop. (1961) 283,607. About half of the inhabitants live in the *districto central,* which includes Tegucigalpa (*q.v.*) the national and departmental capital. The many fertile highland valleys and basins are important agriculturally producing poultry, corn, beans, potatoes, cotton, harvested forage grasses, cattle and swine. Mountain forests cover about 34% of the department. Gold and silver are mined. Industries include foodstuffs, beverages, textiles, cigarettes. soap, glass, china and other clay products, matches, shoes and other leather goods, and furniture. The department was called Tegucigalpa until 1943 when it was renamed in honour of the president of the Central American federation (1830–40). (C. F. J.)

FRANCIS FERDINAND (1863–1914), Austrian archduke whose assassination was the immediate cause of World War I, was born in Graz on Dec. 18 1863, the eldest son of the archduke Charles Louis, brother of Francis Joseph.

The death of the heir apparent, the archduke Rudolf. on Jan. 30, 1889, made Francis Ferdinand next in succession to the throne after his father. who died in 1896 To enlarge his knowledge he embarked in 1892 on a one-year cruise round the world. A severe lung complaint forced him, beginning in 1895, to spend several years in the south under medical supervision. During this period his younger brother Otto (father of the future emperor Charles I) was regarded as likely to succeed to the throne. This made Francis Ferdinand a deeply embittered man, full of contempt for the high society of Vienna. Through his desire to marry Sophie, Gräfin Chotek (1868–1914), a lady in waiting, he came into sharp conflict with the emperor and with the court. Only after he had renounced his future children's rights to the throne was the morganatic marriage allowed (July 1, 1900).

Francis Ferdinand's military interests centred chiefly on the navy In foreign affairs he considered the estrangement from Russia to be disastrous and tried. without endangering the alliance with Germany, to restore Austro-Russian understanding At home he had a clear eye for the difficulties that were bound to develop through the reckless policy of magyarization pursued by the Hungarians against the Slavs in their half of the dual monarchy. At first he thought of a "triadic" reorganization of the monarchy, with the Slavs as the third force beside the Germans and the Hungarians. Later, however, he formed the plan of enforcing universal suffrage in Hungary before eventually receiving the crown of that kingdom, so as to secure the rights of the southern Slavs. These plans were based not on any preference for the Slavs but rather on the realization that any nationalistic policy pursued by one section of the population would endanger the multinational state of Austria. His relationship with Francis Joseph I was exacerbated by his continuous pressure on the emperor, who more and more left things to take care of themselves but sharply resented any interference with his prerogative.

From 1906 onward Francis Ferdinand's influence in military matters grew (*see* CONRAD VON HÖTZENDORF, FRANZ), and in 1913 he became inspector general of the army. Though he thought out his plans carefully it is doubtful whether the irascible, temperamental prince. whose harshness roused fear rather than affection, could have mastered the problems that he would have had to face as emperor. On a visit to Bosnia-Hercegovina, he and his wife were assassinated by the Serbian student Gavrilo Princip on June 28, 1914, at Sarajevo.

See R. Kiszling, *Erzherzog Franz Ferdinand von Österreich-Este* (1953). (K. O. v. A)

FRANCIS JOSEPH I. (1830–1916), emperor of Austria and king of Hungary, was born on Aug. 18, 1830, eldest son of the archduke Francis Charles. second son of the reigning emperor Francis I., and Sophia, daughter of Maximilian I, king of Bavaria. Francis Joseph was educated in a severe and clerical atmosphere, his preceptors including Mrtternich himself. On the outbreak of the revolution of 1848 he served in Italy, under Radetzky; and when the revolution was crushed, as the leaders of the reaction, Schwarzenberg and Windischgratz, wished to start afresh with a monarch not compromised by any concessions or promises to the revolutionaries, Ferdinand was persuaded to abdicate in favour of his nephew (Dec. 2, 1848). During the first years of his reign (*sue* AUSTRIA, EMPIRE OF) Francis Joseph was nholly under the influence of Schwarzenberg, his mother, and his tutor, Cardinal Rauscher. His rule began unauspiciously with the suppression of liberty in Germany, in Italy and in Hungary, where Russian help was called in to crush the Magyars. Even in Austria, the parliament of Kremsier was suppressed, and on Dec. 31, 1851, the young sovereign revoked the constitution which he himself had enacted two years previously to establish a centralist absolutism in which the monarch assumed the entire weight and responsibility of government. After Schwarzenberg's death (April 1852), Francis Joseph appointed no successor, but acted as his own Minister President. His conscientious diligence was untiring, and this period of his reign, for all its lack of liberty, did not lack wise administrative reforms. Unfortunately, in his youth even more than his age, Francis Joseph was convinced both of the impossibility and the impiety of constitutional methods. While leaving his bureaucracy to control a docile people, he embarked himself on an ambitious foreign policy. The army was increased; and his natural piety heightened by his escape from an assassin's knife in 1853, and combined with visions of a revival of the old Holy Roman Empire, found vent in the conclusion of the Concordat of 1855. Francis Joseph dreamed of a brilliant autocracy, resting on the church and the sword; but the foreign ventures of his early years was as unlucky as they were ambitious. His vacillating policy in the Crimean War left Austria isolated, and earned him the personal antagonism of the Tsar; the war of 1859 ended ill; his most brilliant plan of all, the convocation of a *Fürstentag* in Frankfurt, under his own presidency, to discuss German affairs, was frustrated by the shrewdness of Bismarck in preventing the king of Prussia from attending. The hegemony in Germany passed definitively to Prussia at the end of the Seven Weeks War of 1866.

These 18 Years of misfortune constitute the first period of Francis Joseph's career—the period of hope, ambition and self-confidence at home and abroad. During this period he might have justly been called a militarist; acts of repression and severity amounting to cruelty were perpetrated in his name, and the responsibility for them must lie with him, since he claimed the right to autocracy. Hitherto, also, he had believed in his ability (he always believed in his right) to enforce an absolute system, and to be sole judge of his peoples' welfare. But the consistent failure of his ambitions, involving Austria, as it did, in a disastrous financial crisis, compelled him to come to terms with his subjects, first and foremost the Magyars, but also the Poles, Czechs and Germans. With the plainest reluctance and opposition, he was forced step by step into the path of constitutionalism. Francis Joseph's inner resistance to this necessity was manifested in the impatience and instability of his decisions. He was still far from the idea of letting the *people* govern; the idea of sharing responsibility with the centralizing German bureaucracy alternated in his mind with that of concessions to the politically less desirable, but socially intelligible Magyar magnates As each in turn disappointed him, and seemed intolerably distasteful. he flew to the extreme of the other; so that all the period 1859–67 was marked by extraordinary vacillations which revealed another of the Emperor's weaknesses; he never trusted his ministers fully or for long, and looking on the most faithful of them only as servants and instruments, he threw them aside without a second thought when he was done with them.

The years 1866–67 formed the turning-point in Francis Joseph's life. He had been forced to accept the constitutional principle, had come to terms with the Magyars, in token of which he was at last crowned king in Hungary, and to admit definitively a constitutional regime in Austria. The period of adventure was over at home, and to a large extent abroad, for if up to 1870 he dreamed of revenge on Prussia, the decisive step was never taken, and after the foundation of the German Empire, Francis Joseph accommodated himself—joylessly but without resistance—to his diminished rôle in the west. In his private life, too, a period was closed. His marriage (April 24, 1854) with the beautiful Elizabeth of Wittelsbach had been a true love-match; but the couple soon became estranged, partly owing to the Emperor's fault, and partly to his mother's intrigues. His brother Maximilian perished in Mexico in 1867; his only son Rudolph was no joy to him.

His word once pledged to Constitutionalism, Francis Joseph stood by it. In his heart he probably always looked on the Magyars as rebels; but he was socially sympathetic to their magnates, and held loyally by the compromise of 1867; the prolonged crisis of 1903 on was caused by Magyar endeavours to alter the basis of the compromise, particularly of that prerogative to which Francis Joseph held above all others—his undisputed control over the army. His natural sympathies were for the German race; but the leading German party was that of the Liberals—middle-class, anti-clerical and opposed to military expenditure — while the Slav districts were the stronghold of the feudal magnates. So Francis Joseph stood above party, at heart unsympathetic to all, and playing off one against the other with a sole eye to the integrity of the monarchy. So far did his indifference to parliamentarism go, that he was actually largely instrumental in the introduction of general suffrage into Austria, as a last attempt to play off a new factor against all the unsatisfactory parties alike.

His foreign policy became increasingly pacific. He did, indeed, seek some compensation for his early losses in the occupation, and later annexation, of Bosnia and the Hercegovina; but these measures, especially the latter, were far more defensive than is generally admitted. His personal influence was always on the side of peace, and although deeply shocked by the murder of the Archduke, he would probably have found some means of averting war with Serbia in 1914, had the conduct of foreign policy not slipped from his hands with advancing age. War once declared, he remained wholly loyal to his German ally, although he would gladly have seen peace restored. For his illusions regarding successful war were gone; and he declared now that Austria "would be lucky if she got off with a black eye."

His disillusionment was due in part to the unceasing bickering of his subjects, in part to the increasing loneliness of his private life; for his wife was assassinated in 1897, his son Rudolph (*q.v.*) committed suicide in 1889, his nephew and heir, Francis Ferdinand (*q.v.*), was unsympathetic to him. In his old age he consorted with few persons except his lifelong friend, Katharine Schratt, and his young grandchildren. The hostility between him and his subjects (to whose welfare he was always devoted) had vanished; but their reverence for him was too remote to become active affection.

Francis Joseph's invariable reserve, due partly to his consciousness of his exalted position, was such that character-sketches or even anecdotes of him are rare. In his old age his character softened; and he was always courteous, conscientious, industrious, and above all dignified. He had a prodigious memory and experience, but an intellect not above the average, and a cold and somewhat ungenial nature, with no taste for the arts. His only passion was the chase. His great failing as a rule was his distrust of ability. Two of his phrases are illuminating: to the citizens of Frankfurt, in 1866, he said: "I have an unlucky hand"; and to the Field Marshal Conrad, at the end of his life: "Believe me, this realm cannot be ruled constitutionally." He died peacefully on Nov. 21, 1916. (C. A. M.)

FRANCIUM, the heaviest of the alkali elements, is highly unstable, existing only in short-lived radioactive forms. Francium (symbol Fr, atomic number 87) occurs in uranium ores as actinium K, one of the decay products of uranium 235. As early as 1914, S. Meyer, V. F. Hess and F. Paneth observed that actinium 227, which disintegrates chiefly by emission of beta particles (electrons), sometimes emits an alpha particle (helium nucleus) instead. The emission of the alpha particle must produce atoms of element 87 with mass number 223.

In 1939 Marguerite Perey, of the Curie laboratory in Paris, isolated the daughter product, actinium K (francium) and studied its properties. She is credited with the discovery of the element, which she named francium in honour of France. Actinium K (symbol AcK) has a half life of only 21 min. for the emission of beta particles. It is produced from actinium in only 1.2% of the disintegrations of the parent element. AcK in turn exhibits branching decay since in about one disintegration in 10,000 it decays by alpha particle emission.

Several isotopes of francium have been produced artificially. Fr^{221} is a member of the U^{233} disintegration series. Isotopes with mass numbers 212 and 217 through 222 have been identified among the radioactive products observed when targets of thorium or uranium are bombarded in high-energy cyclotrons. All of these isotopes are more unstable than AcK. Francium cannot be isolated in visible or weighable amounts.

The chemistry of francium can be studied only by tracer methods. In all respects its behaviour is that to be expected of an alkali element filling a place just below cesium in the periodic chart of the elements. It can be coprecipitated with alkali perchlorates, chloroplatinates or silicotungstates. It is not coprecipitated with insoluble hydroxides, carbonates. sulfides or fluoride precipitates. Adsorption on cation exchange resin is a useful method of isolation.

FRANCK, CÉSAR (1822–1890), French musical composer, a Belgian by birth who came of German stock, was born at Liége on Dec. 10, 1822. After some studies at Liége he went to Paris in 1837 and entered the conservatoire. His early compositions date from this period and include four trios for piano and strings, besides several piano pieces. *Ruth,* a biblical cantata, was produced with success at the conservatoire in 1846. An opera entitled *Le Valet de ferme* was written about this time but has never been performed. For many years Franck led a retired life, devoting himself to teaching and to his duties as organist, first at Saint-Jean-Saint-François, then at Ste. Clotilde, where he acquired a great reputation as an improvisor. He also wrote a mass, heard in 1861, and a quantity of motets, organ pieces and other works of a religious character.

Franck was appointed professor of the organ at the Paris conservatoire in succession to François Benoist, his old master, in 1872, and the next year he was naturalized a Frenchman. A revival of his early oratorio, *Ruth,* had brought his name again before the public, and this was followed by the production of *Rédemption,* a work for solo, chorus and orchestra, given under the direction of M. Colonne on April 10, 1873. The unconventionality of the music rather disconcerted the general public, but the work nevertheless made its mark. The following is a list of his subsequent compositions: *Rebecca* (1881), a biblical idyll for solo, chorus and orchestra; *Les Béatitudes,* an oratorio composed between 1870 and 1880, perhaps his greatest work; the symphonic poems *Les Éolides* (1876), *Le Chasseur maudit* (1883), *Les Djinns* (1884) for piano and orchestra, *Psyche* (1888) for orchestra and chorus; symphonic variations for piano and orchestra (1885); symphony in D (1889); quintet for piano and strings (1880); sonata for piano and violin (1886); string quartet (1889); prelude, choral and fugue for piano (1884); prelude, aria and finale for piano (1889); various songs, notably "La Procession" and "Les Cloches du soir." Franck also composed two four-act operas, *Hulda* and *Ghiselle,* both of which were produced at Monte Carlo after his death, which took place in Paris on Nov. 8, 1890. The second of these was left by the master in an unfinished state, and the instrumentation was completed by several of his pupils.

César Franck's influence on his younger contemporaries was great. An inspiring teacher, who by the simplicity and beauty of his own nature won the love and devotion of all who came in contact with him, he numbered among his own actual pupils Vincent d'Indy, Henri Duparc, Ernest Chausson, J. G. Ropartz, Gabriel Pierné, Pierre de Bréville, Charles Bordes and Guillaume Lekeu. A more sincere, modest, self-respecting composer probably never existed. In the centre of the brilliant French capital he was able to lead a laborious existence consecrated to his threefold career of organist, teacher and composer. He never sought to gain the suffrages of the public by unworthy concessions but kept straight on his path, ever mindful of an ideal to be reached and never swerving therefrom. A statue was erected to his memory in Paris on Oct. 22, 1904, the occasion producing a panegyric from Alfred Bruneau, in which he spoke of the composer's works as "cathedrals in sound"

FRANCK, JAMES (1882–), German-born physicist who received the Nobel prize for physics in 1925 with Gustav Hertz, was born in Hamburg on Aug. 26, 1882. He studied in the universities of Heidelberg and Berlin and became head of a department in the Kaiser Wilhelm Institute of Physical Chemistry at Berlin-Dahlem and later (1920) professor of physics at Göttingen. In 1935 he was appointed professor in Johns Hopkins university, Baltimore, and in 1938 professor of physical chemistry at The University of Chicago, eventually becoming a citizen of the United States. His researches lay in the fields of photochemistry and atomic physics and include determinations from molecular band spectra of the energy levels of the dissociation of molecules. He was awarded the Nobel prize for researches on the changes of energy occurring on the collision of atoms with electrons, from which it appeared that an electron must have a certain minimum energy (measured in volts as ionization potential) in order to ionize an atom and that this potential varied for the different gases. This result gave experimental proof to the fundamental assumptions of Niels Bohr's theory of the atom, namely, that an atom can take up internal energy only in such discrete amounts as transform it from one stationary state to another stationary state. (D. McK.)

FRANCK or **FRANK** (latinized FRANCUS), **SEBASTIAN** (*c.* 1499–*c.* 1543), German freethinker, was born about 1499 at Donauworth, whence he styled himself Franck von Word. He entered the university of Ingoldstadt (1515) and proceeded thence to the Dominican College, incorporated with the university, at Heidelberg. Having taken priest's orders, he held in 1524 a cure in the neighhourhood of Augsburg, but in 1525 went over to the Reformed party at Nuremberg and became preacher at Gustenfelden. His first work was a German translation with additions (1528) of the first part of the *Diallage*, or *Conciliatio locorum Scripturae*, directed against Sacramentarians and Anabaptists by Andrew Althamer, then deacon of St. Sebald's at Nuremberg. On March 17, 1528, he married Ottilie Beham, whose brothers, pupils of Albrecht Durer, had got into trouble through Anabaptist leanings. In 1529 he produced a free version *(Klagbrief der armen Dürftigen in England)* of the famous *Supplycacyon of the Beggers,* of Simon Fish. In the autumn of 1529 he went to Strasbourg, and there began his intimacy with Caspar Schwenkfeld. There, too, he published his most important work, the *Chronica, Zeitbuch und Geschichtsbibel* (1531), largely a compilation on the basis of the Nuremberg Chronicle (1493). It is too much to call him "the first of German historians"; he is a forerunner of Gottfried Arnold, with more vigour and directness of purpose. Driven from Strasbourg by the authorities, after a short imprisonment in 1531, he tried to make a living as a soapboiler at Esslingen, moving in 1533 for a better market to Ulm, where (1534) he was admitted as a burgess.

His *Weltbuch,* a supplement to his *Chronica,* was printed at Tiibingen in 1334; the publication, in the same year, of his *Paradoxa* at Ulm brought him into trouble with the authorities, and after the publication of his *Guldin Arch* (with pagan parallels to Christian sentiments) (Augsburg 1338) and *Germaniae chronicon* (Frankfort 1538) he had to leave Ulm (1539). At Basel he found work as a printer, and there, probably, he died in the winter of 1542–43. He had published in 1539 *Kriegbiichlein des Friedens* (pseudonymous), *Schriftliche und ganz gründliche Auslegung des 64 Psalms,* and *Das verbütschierte mit sieben Siegeln verschlossene Buch* (a biblical index, exhibiting the dissonance of Scripture); in 1541 his *Spruchwörter* (a collection of proverbs, several times reprinted with variations); in 1542 a new edition of his *Paradoxa;* and some smaller works.

Franck combined the humanist's passion for freedom with the mystic's devotion to the religion of the spirit. His breadth of human sympathy led him to positions which the comparative study of religions has made familiar, but for which his age was unprepared. Luther contemptuously dismissed him as a "devil's mouth." Pastor Frecht of Nuremberg pursued him with bitter zeal. In his last year, in a public Latin letter, he exhorted his friend John Campanus to maintain freedom of thought in face of the charge of heresy.

FRANCKE, AUGUST HERMANN (1663–1727), German Protestant divine, was born on March 22, 1663. at Liibeck. He studied at Erfurt and at Kiel, where he came under the influence of the pietist Christian Kortholt (1633–94), then at Leipzig where he graduated and where, in 1685 he became a Privatdocent. A year later, by the help of his friend P. Anton, and with the approval and encouragement of P. J. Spener, he founded the Collegium Philobiblicum for the systematic study of the Bible, philologically and practically. Interdicted from preaching at Erfurt and Dresden, he found a place in the new university of Halle. first as professor of Greek and oriental languages, and then as professor of theology. There he continued to teach and preach for the next 36 years, until his death on June 8, 1727, and Halle became a centre of pietism.

At Halle in 1695 he instituted what is often called a "ragged school," supported by public charity. In 1698 there were roo orphans under his charge to be clothed and fed, besides 500 children who were taught as day scholars. The schools grew in importance and are still known as the *Francke'sche Stiftungen.*

See H. E. F. Guericke, *A. H. Francke* (1827 Eng. tr., 1837); A. Stein, *A. H. Francke* (3rd ed., 1894); Herzog-Hauck's *Realencyklopädie* (ed., 1899); Knuth, *Die Francke'schen Stiftungen* (2nd ed., 1903).

FRANCKE, MEISTER, German painter of altarpieces, was active in Hamburg during the first half of the 15th century. His name occurs in a contract with the travelers to England, dated 1424, in which the artist undertakes to paint an altarpiece for a chapel in the church of St. John at Hamburg. Nine separate portions of this work are now in the museum at Hamburg. Two represent scenes from the life of Thomas of Canterbury, and seven scenes from the life of Christ, including a fragment of "The Crucifixion." Besides these, few pictures can be ascribed to him with certainty. One of these is the "Christ as the Man of Sorrows" in the museum at Leipzig, an early work, and another is a later representation of the same subject in the museum at Hamburg. Meister Francke's style, though doubtlessly the product of the art of his time, is that of a strong personality, and all attempts to relate it to other schools have failed. With feeling for the decorative value of colour and for two-dimensional design, he combined a realistic rendering of detail and a somewhat exaggerated expression of emotions. To judge from numerous altarpieces in the north of Germany, which recall his style, his influence must have been widespread.

FRANCKEN. A number of Flemish painters of this name cultivated their art in Antwerp, Belg., during the 16th and 17th centuries. Several of them were related and some bore the same Christian name in succession. Hence, there is unavoidable confusion in the subsequent classification of paintings not widely differing in style or execution. Frans Francken the first, finding a rival in Frans Francken the second, described himself as "the elder," in contradistinction to his son, who signed himself "the younger." But when Frans the second was threatened with competition from Frans the third, he called himself "the elder," while Frans the third called himself "the younger." It is possible, though not by any means easy, to sift the works of these artists. The family stems from NICHOLAS OF HERENTHALS (*c.* 1535–1596), an artist, none of whose works has survived.

HIERONYMUS (JEROM) FRANCKEN (1542–1610), the eldest son of Nicholas, studied under Frans Floris. In 1566 Hieronymus was one of the masters employed to decorate the palace of Fontainebleau, and in 1574 he obtained the appointment of court painter from Henry III. In 1603, when Karel van Mander wrote his biography of Flemish artists. Hieronymus was still in Paris. Among his earliest works was a "Nativity" in the Dresden museum. executed in co-operation with Floris. Another of his important works is the "Abdication of Charles V" in the Amsterdam museum. Equally interesting is a "Portrait of a Falconer," dated 1558, in the Brunswick gallery, Germany.

FRANS FRANCKEN the first (c. 1542–1616), was the second son of Nicholas of Herenthals. He matriculated at Antwerp in 1567, and died in that city in 1616. He, too, studied under Floris. Several of his pictures are in the museum of Antwerp; another, dated 1597, in the Dresden museum represents "Christ on the Road to Golgotha."

AMBROSIUS FRANCKEN (1544–1618), the third son of Nicholas of Herenthals, left more specimens of his skill than Hieronymus or Frans the first. He started as a partner of Hieronymus at Fontainebleau, then returned to Antwerp, where he passed for his guild in 1573. He died at Antwerp on Oct. 16. 1618. His best works are the "Miracle of the Loaves and Fishes" and the "Martyrdom of St. Crispin," both in the Antwerp museum.

Frans Francken the first trained three sons to his profession, the eldest of whom, though he practised as a master of guild at Antwerp from 1600 to 1610, he left no trace of his labours.

HIERONYMUS (JEROM) FRANCKEN (1578–1623), the second son of Frans the first, took service with his uncle Ambrosius. He was born in Antwerp on Sept. 12, 1578, passed for his guild in 1607, and in 1620 produced a curious picture of "Horatius Cocles Defending the Sublician Bridge," which is in the Antwerp museum.

FRANS FRANCKEN the second (1581–1642), the third son of Frans the first, signed his pictures until his father's death in 1616 "the younger" and after 1630 "the elder." He was born on May 6, 1581 in Antwerp. In 1605 he entered the guild, of which he subsequently became president. He died in Antwerp on May 6. 1642. His earliest composition is the "Crucifixion," in the Belvedere at Vienna, dated 1606. His compositions include "Adoration of the Virgin" (1616) in the gallery of Amsterdam, "Woman Taken in Adultery" (1628) in Dresden, "Seven Works of Charity" (1630) at Munich, "Prodigal Son" (1633) at the Louvre.

FRANS FRANCKEN the third (1607–1667), the son of Frans the second, passed in the Xntwerp guild in 1639 and died at Antwerp on Aug. 21. 1667. His practice was chiefly confined to adding figures to the architectural landscapes pieces of other artists. He often introduced the figures into the works of Pieter Neefs the younger.

FRANCO, an expression in foreign commerce, meaning that a price quoted includes not only the cost of the goods, but all the costs entailed in delivering them to the purchaser's address; *i.e.,* cost, insurance. shipping freight, the import duty levied by the importing country, foreign carriage, etc. In U.S. practice the term "landed cost" comprises everything included in this term except land transportation charges from foreign customs to consignee's warehouse.

FRANCO BAHAMONDE, FRANCISCO (1892–), Spanish soldier and statesman. was born Dec. 4, 1892. at El Ferrol, Galicia. In 1907 he entered the military academy of Toledo, and in 1910 volunteered for military service in Morocco. By 1920 he was second in command of the Spanish foreign legion, and under Primo de Rivera was director of the General Military academy at Saragossa. Under the 1931 republic he was transferred to the Balearic Islands and later returned to Morocco. In 1936 he was sent to the Canary Islands.

On the outbreak of the civil war in July 1936 he flew to Tetuan, Spanish Morocco, and there organized the transport of troops to the Spanish mainland, where he soon followed. Upon the death of Gen. José Sanjurjo, General Franco became leader of the insurgents. (See SPAIN.) At the outbreak of World War II Franco issued a declaration of "strictest neutrality" in Sept. 1939, and again in May 1940, but on Italy's entry into the war he decided upon "nonbelligerency." On Oct. 23, 1940, he met Adolf Hitler and thereafter left no doubt of his proaxis sympathies. From June 1941 he sent "volunteers" to fight with Germany against the U.S.S.R., declaring that the Allies had lost the war already. But, as it became clear that they were winning, he changed his front, proclaiming himself in Oct. 1943 a "strict neutral" again, and, under pressure, expelling Germans from Tangier, cutting wolfram supplies to Germany and withdrawing his "volunteers" from the U.S.S.R. His pleas for a negotiated peace were ignored by the United Nations, as were his claims that Spain should have a place at the peace conierence. Internally, his chief concern was to check the growing power of the Falange and to restore traditional forms, such as the *Cortes* (July 1942). He also frequently hinted at a restoration of the monarchy. In April 1945 General Franco broke off relations with Japan. The 1947 Succession act confirmed him as head of the state for life and gave him the right to name his successor.

FRANCO-GERMAN WAR (1870–1871). The victories of Prussia in 1866 over the Austrians and their German allies (see SEVEN WEEKS' WAR) rendered it evident to the statesmen and soldiers of France that a struggle between the two nations could only be a question of time. Belated measures were initiated in France to place the armament and equipment of the troops on a level with the requirements of the times. The chassepot, a new breech-loading rifle, immensely superior to the Prussian needle-gun, was issued; the artillery trains were overhauled, and a new machine gun, the *mitrailleuse,* from which much was expected, introduced. Wide schemes of reorganization (due mainly to Marshal Niel) were formulated, but little was done to put them into effect. The emperor Napoleon III also nourished illusory hopes of an alliance with Austria and Italy. In the first week of June 1870, General Lebrun, as his confidential agent, was sent to Vienna to try to concert a plan of joint operations with Austria against Prussia. Italy was also to be included.

What grounds there were for Napoleon's trust in the project remains uncertain, but in any case they were discounted by the fact that Moltke's plans were based on an accurate estimate of the time it would take Austria to mobilize and on the effect of a series of victories on French soil. In strong contrast to the French, plans for the strategic deployment of the Prussian army were prepared by the general staff and kept up to date year by year as fresh circumstances (*e.g.,* the co-operation of the minor German armies) arose and new means of communication came into existence. The campaign was actually opened on a revise of 1868–69, to which was added on May 6, 1870 a secret memorandum for the general staff.

Strategic Deployment of German Armies.—Under the German organization then existing the preliminary to all active operations was of necessity full and complete mobilization Then followed transport by road and rail to the line selected for the "strategic deployment," and it was essential that no part of these operations should be disturbed by action on the part of the enemy. But no such delay imposed itself of necessity upon the French, and a vigorous offensive was so much in harmony with their traditions that the German plan had to be framed so as to meet such emergencies. On the whole, Moltke concluded that the enemy could not undertake this offensive before the eighth day after mobilization. At that date about five French army corps (150,000 men) could be collected near Metz. and two corps (70,000) near Strasbourg; and as it was six days' march from Metz to the Rhine, no serious attack could be delivered before the 14th day, by which day it could be met by superior forces near Kirchheimbolanden. As, however, the transport of the bulk of the Prussian forces could not begin till the ninth day, their ultimate line of detrainment need not be fixed until the French plans were disclosed, and, as it was important to strike at the earliest moment possible, the deployment was provisionally fixed to be beyond the Rhine on the line Wittlich-Neunkirchen-Landau. Of the 13 north German corps three had to be left behind to guard the eastern frontier and the coast, one other, the VIII, was practically on the ground already and could concentrate by road, and the remaining nine were distributed to the IX through railway lines available. These ten corps were grouped in three armies, and as the French might violate Belgian neutrality or endeavour to break into southern Germany, two corps (Prussian Guard and Saxon XII corps) were temporarily held back at a central position around Mainz. whence they could move rapidly up or down the Rhine valley. If Belgian neutrality remained unmolested, the reserve would join the III army on the left wing, giving it a two to one superiority over its adversary; all three armies would then wheel to the right and combine in an effort to force the French army into a decisive battle on the Saar on or about the 23rd day. As in this uheel the army on the right formed the pivot and was required only to stand fast, two corps only were allotted to it; two corps for the present formed the III army, and the remaining five were assigned to the II army in the centre.

When (July 16–17) the south German states decided to throw in their lot with the rest, their three corps were allotted to the III army, the guards and Saxons to the II army, while the three corps originally left behind were finally distributed one to each of the three German armies.

Positions of the French Forces.—On the French side no such plan of operations was in existence when on the night of July 15 Kriegs mobil was telegraphed all over Prussia. An outline scheme had indeed been prepared as a basis for agreement with Austria and Italy, but practically no details were fixed, and the troops were without transport and supplies. Nevertheless, as speed was the essence of the contract, the troops were hurried up without waiting for their reserves—whose mobilization was then a slow and complicated system—and the Prussian Intelligence Department was able to inform Moltke on the 22nd of July (seventh day of mobilization) that the French stood from right to left in the following order, on or near the frontier:

I. Corps	Marshal MacMahon, duke of Magenta (Strasbourg)
V. „	General de Failly (Saargemund and Bitche)
II. „	General Frossard (St. Avold)
IV. „	General de Ladmirault (Thionville)
With, behind them:	
III. „	Marshal Bazaine (Metz)
Guard	General Bourbaki (Nancy)
VI. Corps	Marshal Canrobert (Châlons)
VII. „	General Félix Douay (Belfort)

If therefore they began a forward movement on the 23rd (eighth day) the case foreseen by Moltke had arisen, and it became necessary to detrain the II. army upon the Rhine. Without waiting for further confirmation of this intelligence, Moltke, with the consent of the king, altered the arrangements accordingly, a decision which, though foreseen, exercised the gravest influence on the course of events. As it happened this decision was premature, for the French could not yet move. The French rear services were chaotic. Supply trains had to be organized by requisition from the inhabitants, and even arms and ammunition procured for such reserves as had succeeded in joining. Nevertheless, by almost superhuman exertions on the part of the railways and administrative services, all essential deficiencies were made good, and by July 28 (13th day) the troops had received all that was absolutely indispensable and might well have been led against the enemy, who, thanks to Moltke's premature action, were for the moment at a very serious disadvantage. But the French generals did not utilise this opportunity to concentrate upon the heads of the Prussian columns as they struggled through the defiles of the Hardt.

To meet the possible danger, which came to his knowledge during the course of the 29th, Moltke sent a confidential staff officer, Colonel v. Verdy du Vernois, to the III. army to impress upon the crown prince the necessity of an immediate advance to distract the enemy's attention from the I. and II. armies; but, like the French generals, the crown prince pleaded that he could not move until his trains were complete. Fortunately for the Germans, the French intelligence service not only failed to inform the staff of this opportunity, but it allowed itself to be hypnotized by rumours. In imagination they saw oncoming men behind every forest, and, to guard against these dangers, the French troops were marched and counter-marched along the frontiers in the vain hope of discovering an ideal defensive position which should afford full scope to the power of their new weapons.

As these delays were exerting a most unfavourable effect on public opinion not only in France but throughout Europe, the emperor decided on Aug. 1 to initiate a movement towards the Saar, for its moral effect.

On this day the French corps held the following positions from right to left:

I. Corps.	Hagenau
11 „	Forbach
111 ,	St. Avold
IV. ..	Bouzonville
V. ,	Bitche
1 ,	Châlons
1 ,	Belfort and Colmar
Guard	nearllietz

Saarbrücken.—The French II. corps was directed to advance on the following morning direct on Saarbriicken, supported on the flanks by two divisions from the V. and III. corps. The order was duly carried out, and the Prussians (one battalion, two squadrons and a battery), seeing the overwhelming numbers opposed to them, fell back fighting and vanished to the northward, having given a very excellent example of steadiness and discipline to their enemy. The latter contented themselves by occupying Saarbriicken and its suburb St. Johann, and here, as far as the troops were concerned, the incident closed. Its effect, however, proved far-reaching. The Prussian staff could not conceive that nothing lay behind this display of five whole divisions. and immediately took steps to meet the expected danger. In their excitement, although they had announced the beginning of the action to the king's headquarters at Mainz, they forgot to notify the close and its results, so that Moltke was not in possession of the facts till noon on the 3rd of August. Meanwhile, Steinmetz, left without instructions and fearing for the safety of the II. army, the heads of whose columns were still in the defiles of the Hardt, moved the I. army from the neighbourhood of Merzig obliquely to his left front, so as to strike the flank of the French army if it continued its march towards Kaiserslautern, in which direction it appeared to be heading.

Whilst this order was in process of execution, Moltke, aware that the II. army was behind time in its march, issued instructions to Steinmetz for Aug. 4, which entailed a withdrawal to the rear, the idea being that both armies should, if the French advanced, fight a defensive battle in a selected position farther back. Steinmetz obeyed, though bitterly resenting the idea of retreat. This movement, iurther, drew his left across the roads reserved for the right column of the II. army, and on receipt of a peremptory order from Prince Frederick Charles to evacuate the road, Steinmetz telegraphed for instructions direct to the king, over Moltke's head. In reply he received a telegram from Moltke, ordering him to clear the road at once, and couched in terms which he considered as a severe reprimand. An explanatory letter, meant to soften the rebuke, was delayed in transmission and did not reach him till too late to modify the orders he had already issued It must be remembered that Steinmetz at the front was in a better position to judge the apparent siiuation than was Moltke at Mainz, and that all through the day of Aug. j he had received intelligence indicating a change of attitude in the French army.

Battle of **Spicheren.**—The news of the German victory at Weissenburg on the 4th (see below) had in fact completely paralysed the French headquarters, and orders were issued by them during the course of the 5th to concentrate the whole army of the Rhine on the selected position of Cadenbronn. As a preliminary, Frossard's corps withdrew from Saarbriicken and began to entrench a position on the Spicheren heights, 3,000 yd. to the southward. Steinmetz, therefore, being quite unaware of the scheme for a great battle on the Saar about Aug. 9, felt that the situation would best be met, and the letter of his instructions strictly obeyed, by moving his whole command forward to the line of the Saar, and orders to this effect were issued on the evening of the 5th. In pursuance of these orders, the advance guard of the 14th division (Lieutenant General von Kameke) reached Saarbriicken about g A.M. on the 6th, where the Germans found to their amazement that the bridges were intact. To secure this advantage was the obvious duty of the commander on the spot, and he at once ordered his troops to occupy a line of low heights beyond the town to serve as a bridge-head. As the leading troops deployed on the heights Frossard's guns on the Spicheren Plateau opened fire, and the advanced guard battery replied. The sound of these guns unchained the whole fighting instinct carefully developed by a long course of Prussian manoeuvre training. Everywhere, generals and troops hurried towards the cannon thunder. Kameke, even more in the dark than Steinmetz as to Moltke's intentions and the strength of his adversaries, attacked at once, precisely as he would have done at manoeuvres, and in half an hour his men were committed beyond recall. As each fresh unit reached the field it was hurried into action where its services were most needed, and each fresh general as he arrived took a new view of the combat and issued new orders. On the other side, Frossard, knowing the strength of his position, called on his neighbours for support. and determined to hold his ground. Victory seemed certain. There were sufficient troops within easy reach to have ensured a crushing numerical superiority. But the other generals had not been trained to mutual support, and thought only of their own immediate security, and their staffs were too inexperienced to act upon even good intentions; and, finding himself in the course of the afternoon left to his own devices, Frossard began gradually to withdraw, even before the pressure of the 13th German division on his left flank (about 8 P.M.) compelled his retirement. When darkness ended the battle the Prussians were scarcely aware of their victory. Steinmetz: who had reached the field about 6 P.M., rode back to his headquarters without issuing any orders, while the troops bivouacked where they stood, the units of three army corps being mixed up in almost inextricable confusion. But whereas out of 42,900 Prussians with 120 guns, who in the morning lay within striking distance of the enemy, no fewer than 27,000, with 78 guns were actually engaged; of the French. out of 64,000 with 210 guns only 24.000 with 90 guns took part in the action.

Action of Weissenburg.—Meanwhile on the German left wing the III. army had begun its advance. Early on Aug. 4 it crossed the frontier and fell upon a French detachment under Abel Douay, which had been placed near Weissenburg, partly to cover the Pigeonnier pass, but principally to consume the supplies accumulated in the little dismantled fortress, as these could not easily be moved. Against this force of under 4,000 men of all arms, the Germans brought into action successively portions of three corps, in all over 25,000 men with 90 guns. After six hours' fighting, in which the Germans lost some 1,500 men, the gallant remnant of the French withdrew deliberately and in good order, notwithstanding the death of their leader at the critical moment. The Germans were so elated by their victory over the enemy, whose strength they naturally overestimated, that they forgot to send cavalry in pursuit, and thus entirely lost touch with the enemy.

Next day the advance mas resumed, the two Bavarian corps moving via Mattstall through the foothills of the Vosges, the V. corps on their left towards Preuschdorf, and the XI. farther to the left again, through the wooded plain of the Rhine valley. The 4th cavalry division scouted in advance, and army headquarters moved to Sulz. About noon the advanced patrols discovered MacMahon's corps in position on the left bank of the Sauer (see WÖRTH). As his army was dispersed over a wide area, the crown prince determined to devote the 6th to concentrating the troops, and. probably to avoid alarming the enemy, ordered the cavalry to stand fast.

At night the outposts of the I. Bavarians and V. corps on the Sauer saw the fires of the French encampment and heard the noise of railway traffic, and rightly conjectured the approach of reinforcements. MacMahon had in fact determined to stand in the very formidable position he had selected, and he counted on receiving support both from the VII. corps (two divisions of which were being railed up from Colmar) and from the V. corps, which lay around Bitche.

Battle of Worth.—At dawn on Aug. 6 the commander of the V. corps outposts noticed certain movements in the French lines, and to clear up the situation brought his guns into action. As at Spicheren, the sound of the guns set the whole machinery of battle in motion. The French artillery immediately accepted the Prussian challenge. The I. Bavarians, having been ordered to be ready to move if they heard artillery fire, immediately advanced against the French left, encountering presently such a stubborn resistance that parts of their line began to give way. The Prussians of the V. corps felt that they could not abandon their allies, and Kirchbach, calling on the XI. corps for support, attacked with the troops at hand. When the crown prince tried to break off the fight it was too late. Both sides we're feeding troops into the firing line, as and where they could lay hands on them. Up to 2 P.M. the French fairly held their own, but shortly afterwards their right yielded to the overwhelming pressure of the XI. corps, and by 3.30 it was in full retreat. The centre held on for another hour, but in its turn was compelled to yield, and by 4.30 all organized resistance was at an end. The débris of the French army was hotly pursued by the German divisional squadrons towards Reichshofen, where serious panic showed itself. When at this stage the tardy supports sent by de Failly from Bitche came on the ground they saw the hopelessness of intervention, and retired whence they had come. Fortunately for the French, the German 4th cavalry division, on which the pursuit should have devolved. had been forgotten by the German staff, and did not reach the front before darkness fell. Out of a total of 82,000 within reach of the battlefield, the Germans succeeded in bringing into action 77,500. The French, who might have had 50,000 on the field, deployed only 37,000, and these suffered a collective loss of no less than 20.100; some regiments losing up to 90% and still retaining some semblance of discipline and order.

Under cover of darkness the remnants of the French army escaped. When at length the 4th cavalry division had succeeded in forcing a way through the confusion of the battlefield, all touch with the enemy had been lost, and being without firearms the troopers were checked by the French stragglers in the woods and the villages, and thus failed to establish the true line of retreat of the French. Ultimately the latter, having gained the railway near Lunéville, disappeared from the German front altogether, and all trace of them was lost until they were discovered, about Aug. 26, forming part of the army of Châlons, whither they had been conveyed by rail via Paris. This is a remarkable example of the strategical value of railways to an army operating in its own country.

In the absence of all resistance, the III. army now proceeded to carry out the original programme of marches laid down in Moltke's memorandum of May 6, events having nullified the plan for a battle on the Saar, and marching on a broad front through a fertile district it reached the line of the Moselle in excellent order about Aug. 17, where it halted to await the result of the great battle of Gravelotte-St. Privat.

Movements on the **Saar.**—We return now to the I. army at Saarbrucken. Its position on the morning of Aug. 7 gave cause for the gravest anxiety. At daylight a dense fog lay over the country, and through the mist sounds of heavy firing came from the direction of Forbach, where French stragglers had rallied during the night. The confusion on the battlefield was appalling, and the troops in no condition to go forward. Except the 3rd, 5th and 6th cavalry divisions no closed troops were within a day's march; hence Steinmetz decided to spend the day in reorganizing his infantry, under cover of his available cavalry. But the German cavalry and staff were unequal to their task. The 6th cavalry division, which had bivouacked on the battlefield, sent on only one brigade towards Forbach, retaining the remainder in reserve. The 5th, thinking that the 6th had already undertaken all that was necessary, withdrew behind the Saar, and the 3rd, also behind the Saar, reported that the country in its front was unsuited to cavalry movements, and only sent out a few officers' patrols. These were well led, but were too few in number, and their reports were consequently unconvincing.

In the course of the day Steinmetz became very uneasy, and ultimately he decided to concentrate his army by retiring the VII. and VIII. corps behind the river on to the I. (which had arrived near Saarlouis), thus clearing the Saarbrucken-Metz road for the use of the II. army. But at this moment Prince Frederick Charles suddenly modified his views. During the 6th of August his scouts had reported considerable French forces near Bitche (these were the V., de Failly's corps), and early in the morning of the 7th he received a telegram from Moltke informing him that MacMahon's beaten army was retreating on the same place (the troops observed were in fact those which had marched to MacMahon's assistance). The prince forthwith deflected the march of the Guards, IV. and X. corps, towards Rohrbach, whilst the IX. and XII. closed up to supporting distance behind them. Thus, as Steinmetz moved away to the west and north, Frederick Charles was diverging to the south and east, and a great gap was opening in the very centre of the German front. This was closed only by the III. corps, still on the battlefield, and by portions of the X. near Saargemund, whilst within striking distance lay 130,000 French troops, prevented only by the incapacity of their chiefs from a decisive counter-stroke.

Fortunately for the Prussians, Moltke at Mainz took a different view. Receiving absolutely no intelligence from the front during the 7th, he telegraphed orders to the I. and II. armies (10.25 P.M.) to halt on the 8th, and impressed on Steinmetz the necessity of employing his cavalry to clear up the situation. The I. army had already begun the marches ordered by Steinmetz. It was now led back practically to its old bivouacs amongst the unburied dead. Prince Frederick Charles only conformed to Moltke's order with the III. and X. corps; the remainder executed their concentration towards the south and east.

During the night of Aug. 7 Moltke decided that the French army must be in retreat towards the Moselle and forthwith busied himself with the preparation of fresh tables of march for the two armies, his object being to swing up the left wing to outflank the enemy from the south. This work, and the transfer of headquarters to Homburg, needed time, hence no fresh orders were issued to either army, and neither commander would incur the responsibility of moving without any. The I. army therefore spent a fourth night in bivouac on the battle-field. But Constantin von Alvensleben, commanding the III. corps, a man of very different stamp from his colleagues, hearing at first hand that the French had evacuated St. Avold, set his corps in motion early in the morning of Aug. 10 down the St. Avold-Metz road, reached St. Avold and obtained conclusive evidence that the French were retreating.

Advance to the Moselle.—During the 9th after 48 wasted hours the orders for the advance to the Moselle were issued. These were based, not on an exact knowledge of where the French army actually stood, but on the opinion Moltke had formed as to where it ought to have been on military grounds solely.

Actually on Aug. 7 the emperor had decided to attack the Germans on the 8th with the whole Rhine Army, but this decision was upset by alarmist reports from the beaten army of MacMahon. He then decided to retreat to the Moselle, as Moltke had calculated, and there to draw to himself the remnants of MacMahon's army (now near Lunéville). At the same time he assigned the strictly executive command of the Rhine Army to Marshal Bazaine. This retreat was begun during the course of Aug. 8 and 9; but on the night of the 9th urgent telegrams from Paris induced the emperor to suspend the movement, and during the 10th the whole army took up a strong position on the French Nied.

Meanwhile the II. German army had received its orders to march in a line of army corps on a broad front in the general direction of Pont-8-Mousson, well to the south of Metz. The I army was to follow by short marches in échelon on the right; only the III corps was directed on Falkenberg, a day's march farther towards Metz along the St. Avold-Metz road. The movement was begun on the 10th, and towards evening the French army was located on the right front of the III. corps. This entirely upset Moltke's hypothesis, and called for a complete modification of his plans, as the III. corps alone could not be expected to resist the impact of Bazaine's five corps. The III. corps therefore received orders to stand fast for the moment, and the remainder of the II. army was instructed to wheel to the right and concentrate for a great battle to the east of Metz on the 16th or 17th. Before, however, these orders had been received the sudden retreat of the French completely changed the situation. The Germans therefore continued their movement towards the Moselle. On the 12th Bazaine had been definitely invested with the command-in-chief of the Army of the Rhine and next day the French took up a fresh position 5 m. to the east of Metz, where they were located by the cavalry and the advanced guards of the German I. army.

Battle of **Colombey-Borny.**—Again Moltke ordered the I. army to observe and hold the enemy, whilst the II. was to swing round to the north. The cavalry was to scout beyond the Moselle and intercept all communication with the heart of France (see METZ). By this time the whole German army had imbibed the idea that the French were in full retreat and endeavouring to evade a decisive struggle. When therefore during the 14th their outposts observed signs of retreat in the French position, their impatience could no longer be restrained; as at Wörth and Spicheren, an outpost commander brought up his guns, and at the sound of their fire, every unit within reach spontaneously got under arms (battle of Colombey-Borny), In a short time, with or without orders, the I., VII., VIII. and IX. corps were in full march to the battle-field. But the French, too, turned back to fight, and an obstinate engagement ensued, at the close of which the Germans barely held the ground and the French withdrew during the night under cover of the Metz forts.

Still, though the fighting had been indecisive, the conviction of victory remained with the Germans, and the idea of a French retreat became an obsession. To this idea Moltke gave expression in his orders issued early on the 15th, in which he laid down that the "fruits of the victory" of the previous evening could only be reaped by a vigorous pursuit towards the passages of the Meuse, where it was hoped the French might yet be overtaken. This order, however, did not allow for the hopeless inability of the French staff to regulate the movement of congested masses of men, horses and vehicles, such as were now accumulated in the streets and environs of Metz. Whilst Bazaine had come to no definite decision whether to stand and fight or continue to retreat, and was merely drifting under the impressions of the moment, the Prussian leaders, in particular Prince Frederick Charles, saw in imagination the French columns in rapid orderly movement towards the west, and calculated that at best they could not be overtaken short of Verdun.

In this order of ideas the whole of the II. army, followed on its right rear by two-thirds of the I. army (the I. corps being detached to observe the eastern side of the fortress), were pushed on towards the Moselle, the cavalry far in advance towards the Meuse, whilst only the 5th cavalry division was ordered to scout towards the Metz-Verdun road, and even that was disseminated over far too wide an area.

Later in the day (15th) Frederick Charles sent orders to the III. corps, which was on the right flank of his long line of columns and approaching the Moselle at Corny and Novéant, to march via Gorze to Mars-la-Tour on the Metz-Verdun road; to the X corps, strung out along the road from Thiaucourt to Pont-à-Mousson, to move to Jarny; and for the remsinder to push on westward to seize the Meuse crossings. No definite information as to the French army reached him in time to modify these instructions.

Meanwhile the 5th (Rheinbaben's) cavalry division, at about three in the afternoon, had come into contact with the French cavalry in the vicinity of Mars-la-Tour, and gleaned intelligence enough to show that no French infantry had as yet reached Rezonville. The commander of the X. corps at Thiaucourt, informed of this, became anxious for the security of his flank during the next day's march and decided to push out a strong flanking detachment under Caprivi, to support Rheinbaben and maintain touch with the III. corps marching on his right rear.

Battle of Vionville-Mars-la-Tour.—Alvensleben, to whom the 6th cavalry division had meanwhile been assigned, seems to have received no local intelligence whatsoever; and at daybreak on the 16th he began his march in two columns, the 6th division on Mars-la-Tour, the 5th towards the Rezonville-Vionville plateau. And shortly after 9.15 A.M. he suddenly discovered the truth. The entire French army lay on his right flank, and his nearest supports were almost a day's march distant. In this crisis he made up his mind at once to attack with every available man, and to continue to attack, in the conviction that his audacity would serve to conceal his weakness. All day long, therefore, the Brandenburgers of the III. corps, supported ultimately by the X corps and part of the IX., attacked again and again, despite repulse. The enemy was thrice their strength, but very differently led, and made no adequate use of his superiority (battle of Vionville-Mars-la-Tour).

Meanwhile Prince Frederick Charles, at Pont-à-Mousson, was still confident in the French retreat to the Meuse, and had even issued orders for the 17th on that assumption. Firing had been heard since 9.15 A.M., and about noon Alvensleben's first report had reached him, but it was not till after 2 that he realized the situation. Then, mounting his horse, he covered the 15 m. to Flavigny over crowded and difficult roads within the hour, and on his arrival abundantly atoned for his strategic errors by his unconquerable determination and tactical skill. When darkness put a stop to the fighting, he considered the position. Cancelling all previous orders, he called all troops within reach to the battlefield and resigned himself to wait for them. The situation was indeed critical. The whole French army of five corps, only half of which had been engaged, lay in front of him. His own army lay scattered over an area of 30 m. by 20, and only some 20,000 fresh troops—of the IX. corps—could reach the field during the forenoon of the 17th. He did not then know that Moltke had already intervened and had ordered the VII., VIII. and II corps[1] to his assistance. Daylight revealed the extreme exhaustion of both men and horses. The men lay around in hopeless confusion amongst the killed and wounded, each where sleep had overtaken him, and thus the extent of the actual losses, heavy enough, could not be estimated. Across the valley, bugle sounds revealed the French already alert, and presently a long line of skirmishers approached the Prussian position. But they halted just beyond rifle range, and it was soon evident that they were only intended to cover a further withdrawal. Presently came the welcome intelligence that the reinforcements were well on their way.

About noon the king and Moltke drove up to the ground, and there was an animated discussion as to what the French would do next. Aware of their withdrawal from his immediate front, Prince Frederick Charles reverted to his previous idea and insisted that they were in full retreat towards the north, and that their entrenchments near Point du Jour and St. Hubert (see map in article METZ) were at most a rearguard position. Moltke was inclined to the same view, but considered the alternative possibility of a withdrawal towards Metz, and about 2 P.M. orders were issued to meet these divergent opinions. The whole army was to be drawn up at 6 A.M. on the 18th in an échelon facing north, so as to be ready for action in either direction. The king and Moltke then drove to Pont-à-Mousson, ana the troops bivouacked in a state of readiness. The rest of the 17th was spent in restoring order in the shattered III. and X. corps, and by nightfall both corps were reported fit for action. Strangely enough, there were no organized cavalry reconnaissances, and no intelligence of importance was collected during the night of the 17th–18th.

Battle of Gravelotte-Saint **Privat.**—Early on the 18th the troops began to move into position in the following order from left to right: XII (Saxons), Guards, IX., VIII. and VII. The X. and III. were retained in reserve.

The idea of the French retreat was still uppermost in the prince's mind, and the whole army therefore moved north. But between 10 and 11 AM. part of the truth—viz., that the French had their backs to Metz and stood in battle order from St. Hubert northwards—become evident. and the II. army, pivoting on the I., wheeled to the right and moved eastward. Suddenly the IX. corps fell right on the centre of the French line at Amanvillers, where it had been imagined that the French flank rested, and a most desperate encounter began, superior control, as before, ceasing after the guns had opened fire. Prince Frederick Charles, however, a little farther north, again asserted his tactical ability, and about 7 P.M. he brought into position three fresh army corps for the final attack. The sudden collapse of French resistance, due to the frontal attack of the Guards (St. Privat) and the turning movement of the Saxons (Roncourt), rendered the use of this mass unnecessary, but the resolution to use it was there. On the German right (I. army), about Gravelotte, all superior leading ceased quite early in the afternoon, and at night the French still showed an unbroken front. Until midnight, when the prince's victory was reported, the suspense at headquarters was terrible. The I. army was exhausted, no steps had been taken to ensure support from the III. army, and the IV. corps (II. army) lay inactive 30 m. away.

Having let slip the great opportunity of August 16 and 17 which fortune had flung into his hands, Bazaine had now allowed himself to be driven back into Metz, where he was content to stay. His motives and the question of his conduct are discussed under BAZAINE.

[1]Of the I. army the I. corps was retained on the east side of Metz. The II. corps belonged to the II. army, but had not yet reached the front.

On the German side the victory at St. Privat was at once followed up by the headquarters. Early on the 19th the investment of Bazaine's army in Metz was commenced. A new army, the Army of the Meuse (often called the IV.), was as soon as possible formed of all troops not required for the maintenance of the investment, and, under the command of the crown prince of Saxony, marched on towards Châlons, where MacMahon was known to be reorganizing the remainder of the French field army. The III. army also continued its assigned course in the direction of Paris.

Campaign **of** Sedan.—The operations which led to the capture of MacMahon's army in Sedan call for little explanation. Given seven corps, each capable of averaging 15 m. a day for a week in succession, opposed to four corps only, shaken by defeat and unable as a whole to cover more than 5 m. a day, the result could hardly be doubtful. But Moltke's method of conducting operations left his opponent many openings which could only be closed by excessive demands on the marching power of the men. Trusting only to his cavalry screen to secure information, he was always without any definite fixed point about which to manoeuvre, for whilst the reports of the screen and orders based thereon were being transmitted, the enemy was free to move, and Moltke based his calculations of such movements on strictly military grounds.

Thus whilst the German army, on a front of nearly 50 m., was marching due west on Paris, MacMahon, under political pressure, was moving parallel to them, but on a northerly route, to attempt the relief of Metz.

So unexpected was this move and so uncertain the information which called attention to it, that Moltke did not venture to change at once the direction of march of the whole army, but he directed the Army of the Meuse northward on Damvillers and ordered Prince Frederick Charles to detach two corps from the forces investing Metz to reinforce it. For the moment, therefore, MacMahon's move had succeeded, and the opportunity existed for Bazaine to break out. But at the critical moment the hopeless want of real efficiency in MacMahon's army compelled the latter so to delay his advance that it became evident to the Germans that there was no longer any necessity for the III. army to maintain the direction towards Paris, and that the probable point of contact between the Meuse army and the French lay nearer to the right wing of the III. army than to Prince Frederick Charles's investing force before Metz.

The detachment from the II. army was therefore countermanded, and the whole III. army changed front to the north while the Meuse army headed the French off from the east. The latter came into contact with the head of the French columns, during the 29th, about Nouart, and on the 30th at Buzancy (battle of Beaumont); and the French, yielding to the force of numbers combined with superior morale, were driven northwestward upon Sedan (*q.v.*), right across the front of the III. army, which was now rapidly coming up from the south.

The morning of Sept. 1 found the French crowded around the little fortress of Sedan, with only one line of retreat to the northwest still open. By 11 A.M. the XI. corps (III. army) had already closed that line. and about noon the Saxons (Army of the Meuse) moving round between the town and the Belgian frontier joined hands with the XI., and the circle of investment was complete. The battle of Sedan was closed about 4.15 P.M. by the hoisting of the white flag. Terms were agreed upon during the night, and the whole French army, with the emperor, passed into captivity.

(F. N. M.)

Later Operations.—Thus in five weeks one of the French field armies was imprisoned in Metz, the other destroyed, and the Germans were free to march upon Paris. This seemed easy. There could be no organized opposition to their progress,[1] and Paris, if not so defenceless as in 1814, was more populous. Starvation was the best method of attacking an over-crowded fortress, and the Parisians were not thought to be proof against the deprivation of

[1]The XIII. corps (Vinoy), which had followed MacMahon's army at some distance, was not involved in the catastrophe of Sedan, and by good luck as well as good management evaded the German pursuit and returned safely to Paris.

their accustomed luxuries. Even Moltke hoped that by the end of October he would be "shooting hares at Creisau," and with this confidence the German III. and IV. armies left the vicinity of Sedan on the 4th of September. The march called for no more than good staff arrangements, and the two armies arrived before Paris a fortnight later and gradually encircled the place—the III. army on the south, the IV. on the north side—in the last days of September. Headquarters were established at Versailles. Meanwhile the Third Empire had fallen, giving place on Sept. 4 to a republican Government of National Defence, which made its appeal to, and evoked, the spirit of 1792. Henceforward the French nation, which had left the conduct of the war to the regular army and had been little more than an excited spectator, took the burden upon itself.

Although of the regular army units only six regiments of infantry and ten of cavalry were left—outside Metz and other beleaguered garrisons—a great number of regular recruits'and reservists were available. From these the government organized 280 battalions of infantry, or 280,000 men, 31 regiments of the Garde Mobile, framed by Marshal Niel in 1868, totalling 110,000 men, and 80,000 formed in battalions of the Garde Nationale, called into existence on Sept. 1 j, and including all able-bodied men of from 31 to 60 years of age. With cavalry regiments and corps of francs-tireurs the total was 583,000, and this initial figure was far exceeded before the war finished. The German staff had of course to reckon on the Garde Mobile, and did so beforehand, but they wholly underestimated both its effective members and its willingness, while, possessing themselves a system in which all the military elements of the German nation stood close behind the troops of the active army, they ignored the potentialities of the Garde Nationale.

Meanwhile, both as a contrast to the events that centered on Paris and because in point of time they were decided for the most part in the weeks immediately following Sedan, we must briefly allude to the sieges conducted by the Germans—Paris (*see* FRANCE: The Third *Repubuc*), Metz (*q.v.*) and Belfort (*q.v.*) excepted. Old and ruined as many of them were, the French fortresses possessed considerable importance in the eyes of the Germans. Strassburg, in particular, the key of Alsace. the standing menace to South Germany and the most conspicuous of the spoils of Louis XIV's Raubkrzege, was an obvious target. Operations were begun on Aug. 9, three days after Worth, Werder's corps (Baden troops and Prussian Landwehr) making the siege. The French commandant, Uhrich, surrendered after a stubborn resistance on Sept. 28. Of the smaller fortresses many, being practically unarmed and without garrisons, capitulated at once. Toul, defended by Major Huck with 2,000 mobiles, resisted for forty days, and drew upon itself the efforts of 13,000 men and 100 guns. Verdun, commanded by Guérin de Waldersbach, held out till after the fall of Metz. Some of the fortresses lying to the north of the Prussian line of advance on Paris, *e.g.*, Mézières, resisted up to January 1871, though of course this was very largely due to the diminution of pressure caused by the appearance of new French field armies in October. On Sept. 9 a strange incident took place at the surrender of Laon. A powder magazine was blown up by the soldiers in charge and 300 French and a few German soldiers were killed by the explosion. But as the Germans advanced, their lines of communication were thoroughly organized, and the belt of country between Paris and the Prussian frontier subdued and garrisoned. Most of these fortresses were small town enceintes, dating from Vauban's time, and open, under the new conditions of warfare, to concentric bombardment from positions formerly out of range, upon which the besieger could place as many guns as he chose to employ. In addition they were usually deficient in armament and stores and garrisoned by newly-raised troops. Belfort, where the defenders strained every nerve to keep the besiegers out of bombarding range, and Paris formed the only exceptions to this general rule.

The "Defense Nationale."—The policy of the new French government was defined by Jules Favre on the 6th of September. "It is for the king of Prussia, who has declared that he is making war on the Empire and not on France, to stay his hand; we shall not cede an inch of our territory or a stone of our fortresses." These proud words, so often ridiculed as empty bombast, were the prelude of a national effort which re-established France in the eyes of Europe as a great power, even though provinces and fortresses were ceded in the peace that that effort proved unable to avert. They were translated into action by Léon Gambetta, who escaped from Paris in a balloon on Oct. 7, and established the headquarters of the defence at Tours, where already the "Delegation" of the central government—which had decided to remain in Paris—had concentrated the machinery of government. Thenceforward Gambetta and his principal assistant de Freycinet directed the whole war in the open country, co-ordinating it, as best they could with the precarious means of communication at their disposal, with Trochu's military operations in and round the capital. His critics—Gambetta's personality was such as to ensure him numerous enemies among the higher civil and military officials, over whom, in the interests of La *Patrie,* he rode rough-shod—have acknowledged the fact, which is patent enough in any case, that nothing but Gambetta's driving energy enabled France in a few weeks to create and to equip twelve army corps, representing thirty-six divisions (600,000 rifles and 1,400 guns), after all her organized regular field troops had been destroyed or neutralized. It is claimed that by undue interference with the generals at the front, by presuming to dictate their plans of campaign, and by forcing them to act when the troops were unready, Gambetta and de Freycinet nullified the efforts of themselves and the rest of the nation and subjected France to a humiliating treaty of peace. But even the brief narrative given below must at least suggest to the reader the existence amongst the generals and higher officials of a dead weight of passive resistance to the Delegation's orders, of unnecessary distrust of the qualities of the improvised troops, and above all of the utter fear of responsibility that twenty years of literal obedience had bred. The closest study of the war cannot lead to any other conclusion than this, that whether or not Gambetta as a strategist took the right course in general or in particular cases, no one else would have taken any course whatever.

On the approach of the enemy Paris hastened its preparations for defence to the utmost, while in the provinces, out of reach of the German cavalry, new army corps were rapidly organized out of the few constituted regular units not involved in the previous catastrophes, the depot troops and the mobile national guard. The first-fruits of these efforts were seen in Beauce, where early in October important masses of French troops prepared not only to bar the further progress of the invader but actually to relieve Paris. The so-called "fog of war"—the armed inhabitants, francs-tireurs, sedentary national guard and volunteers—prevented the German cavalry from venturing far out from the infantry camps around Paris, and behind this screen the new XV. army corps assembled on the Loire. But an untimely demonstration of force alarmed the Germans, all of whom, from Moltke downwards, had hitherto disbelieved in the existence of the French new formations, and the still unready XV. corps found itself the target of an expedition of the I. Bavarian corps, which drove the defenders out of Orleans after a sharp struggle, while at the same time another expedition swept the western part of Beauce, sacked Châteaudun as a punishment for its brave defence, and returned via Chartres, which was occupied.

After these events the French forces disappeared from German eyes for some weeks. D'Aurelle de Paladines, the commander of the "Army of the Loire" (XV. and XVI. corps), improvised a camp of instruction at Salbris in Sologne, several marches out of reach. and subjected his raw troops to a stern régime of drill and discipline. At the same time an "Army of the West" began to gather on the side of Le Mans. This army was almost imaginary, yet rumours of its existence and numbers led the German commanders into the gravest errors, for they soon came to suspect that the main army lay on that side and not on the Loire, and this mistaken impression governed the German dispositions up to the very eve of the decisive events around Orleans in December. Thus when at last D'Aurelle took the offensive from Tours (whither he had transported his forces, now 100,000 strong) against the position of the I. Bavarian corps near Orleans, he found his task easy. The Bavarians, outnumbered and unsupported, were defeated with heavy losses in the battle of Coulmiers (November 9), and, had it not been for the inexperience, want of combination, and other technical weaknesses of the French, they would have been annihilated. What the results of such a victory as Coulmiers might have been, had it been won by a fully organized, smoothly working army of the same strength, it is difficult to overestimate. As it was, the retirement of the Bavarians rang the alarm bell all along the line of the German positions, and that was all.

Then once again, instead of following up its success, the French army disappeared from view. The victory had emboldened the "fog of war" to make renewed efforts, and resistance to the pressure of the German cavalry grew day by day. The Bavarians were reinforced by two Prussian divisions and by all available cavalry commands, and constituted as an "army detachment" under the grand-duke Friedrich Franz of Mecklenburg-Schwerin to deal with the Army of the Loire, the strength of which was far from being accurately known. Meantime the capitulation of Metz on Oct. 28 had set free the veterans of Prince Frederick Charles, the best troops in the German army, for field operations. The latter were at first misdirected to the upper Seine, and yet another opportunity arose for the French to raise the siege of Paris. But D'Aurelle utilized the time he had gained in strengthening the army and in imparting drill and discipline to the new units which gathered round the original nucleus of the XV. and XVI. corps. All this was, however, unknown and even unsuspected at the German headquarters, and the invaders, feeling the approaching crisis, became more than uneasy as to their prospects of maintaining the siege of Paris.

The Orleans Campaign. — At this moment, in the middle of November, the general situation was as follows: the German III. and Meuse armies, investing Paris, had had to throw off important detachments to protect the enterprise, which they had undertaken on the assumption that no further field armies of the enemy were to be encountered. The maintenance of their communications with Germany, relatively unimportant when the struggle took place in the circumstances of field warfare, had become supremely necessary, now that the army had come to a standstill and undertaken a great siege, which required heavy guns and constant replenishment of ammunition and stores. The rapidity of the German invasion had left no time for the proper organization and full garrisoning of these communications, which were now threatened, not merely by the Army of the Loire, but by other forces assembling on the area protected by Langres and Belfort. The latter, under General Cambriels, were held in check and no more by the Baden troops and reserve units (XIV. German corps) under Werder, and eventually without arousing attention they were able to send 40,000 men to the Army of the Loire. This army, still around Orleans, thus came to number perhaps 150,000 men, and opposed to it, about Nov. 14 the Germans had only the Army Detachment of about 40.000, the II. army being still distant. It was under these conditions that the famous Orleans campaign took place. After many vicissitudes of fortune, and with many misunderstandings between Prince Frederick Charles, Moltke and the grand-duke, the Germans were ultimately victorious, thanks principally to the brilliant fighting of the X. corps at Beaune-la-Rolande (Nov. 28), which was followed by the battle of Loigny-Poupry on Dec. 2 and the second capture of Orleans after heavy fighting on Dec. 4.

The result of the capture of Orleans was the severance of the two wings of the French army, henceforward commanded respectively by Chanzy and Bourbaki. The latter fell back at once and hastily, though not closely pursued, to Bourges. But Chanzy, opposing the detachment between Beaugency and the Forest of Marchenoir, was of sterner metal, and in the five days' general engagement around Beaugency (December 7–11) the Germans gained little or no real advantage. Indeed their solitary material success, the capture of Beaugency, was due chiefly to the fact that the French there were subjected to conflicting orders from the military and the governmental authorities. Chanzy then abandoned little but the field of battle, and on the grand-duke's representations Prince Frederick Charles, leaving a mere screen to impose upon Bourbaki (who allowed himself to be deceived and remained inactive), hurried thither with the II. army. After that Chanzy was rapidly driven north-westward, though always presenting a stubborn front. The Delegation left Tours and betook itself to Bordeaux, whence it directed the government for the rest of the war. But all this continuous marching and fighting, and the growing severity of the weather, compelled Prince Frederick Charles to call a halt for a few days. About Dec. 19, therefore, the Germans (II. army and Detachment) were closed up in the region of Chartres, Orleans, Auxerre and Fontainebleau, Chanzy along the river Sarthe about Le Mans and Bourbaki still passive towards Bourges.

During this, as during other halts, the French government and its generals occupied themselves with fresh plans of campaign, the former with an eager desire for results, the latter (Chanzy excepted) with many misgivings. Ultimately, and fatally, it was decided that Bourbaki, whom nothing could move towards Orleans, should depart for the south-east, with a view to relieving Belfort and striking perpendicularly against the long line of the Germans' communications. This movement, bold to the point of rashness with such raw troops, seems to have been suggested by de Freycinet. As the execution of it fell actually into incapable hands, it is difficult to judge what would have been the result had a Chanzy or a Faidherbe been in command of the French. At any rate it was vicious in so far as immediate advantages were sacrificed to hopes of ultimate success which Gambetta and de Freycinet did wrong to base on Bourbaki's powers of generalship. Late in December, for good or evil, Bourbaki marched off into Franche-Comté and ceased to be a factor in the Loire campaign. A mere calculation of time and space sufficed to show the German headquarters that the moment had arrived to demolish the stubborn Chanzy.

Le Mans. — Prince Frederick Charles resumed the interrupted offensive, pushing westward with four corps and four cavalry divisions which converged on Le Mans. There on Jan. 10, 11, and 12, 1871, a stubbornly contested battle, in which the Germans engaged 75,000 against 90,000 French "improvised" troops, ended with the retreat of the French, who owed their defeat solely to the misbehaviour of the Breton mobiles. These, after deserting their post on the battlefield at a mere threat of the enemy's infantry, fled in disorder and infected with their terrors the men in the reserve camps of instruction, which broke up in turn. But Chanzy. resolute as ever, drew off his field army intact towards Laval, where a freshly raised corps joined him. The prince's army was far too exhausted to deliver another effective blow, and the main body of it gradually drew back into better quarters, while the grand duke departed for the north to aid in opposing Faidherbe. Some idea of the strain to which the invaders had been subjected may be gathered from the fact that army corps, originally 30,000 strong, were in some cases reduced to 10,000 and even fewer bayonets. And at this moment Bourbaki was at the head of 120,000 men! Indeed, so threatening seemed the situation on the Loire, though the French south of that river between Gien and Blois were mere isolated brigades, that the prince hurried back from Le Mans to Orleans to take personal command. A fresh French corps, bearing the number XXV., and being the twenty-first actually raised during the war, appeared in the field towards Blois. Chanzy was again at the head of 156,000 men He was about to take the offensive against the 40,000 Germans left near Le Mans when to his bitter disappointment he received the news of the armistice. "We have still France," he had said to his staff. undeterred by the news of the capitulation of Paris, but now he had to submit, for even if his improvised army was still cheerful, there were many significant tokens that the people at large had sunk into apathy and hoped to avoid worse terms of peace by discontinuing the contest at once.

So ended the critical period of the "*Défense nationale.*" It may be taken to have lasted from the day of Coulmiers to the last day of Le Mans, and its central point was the battle of Beaune-la-Rolande. Its characteristics were, on the German side, inadequacy of the system of strategy practised, which became palpable as soon as the organs of reconnaissance met with serious resistance, misjudgment of and indeed contempt for the fighting powers of "new formations," and the rise of a spirit of ferocity in the man in the ranks, born of his resentment at the continuance oi the war and the ceaseless sniping of the franc-tireur's rifle and the peasant's shot-gun. On the French side the continual efforts of the statesmen to stimulate the generals to decisive efforts, coupled with actual suggestions as to the plans of the campaign to be followed (in default, be it said, of the generals themselves producing such plans), and the professional soldiers' distrust of half-trained troops, acted and reacted upon one another in such a way as to neutralize the powerful, if disconnected and erratic, forces that the war and the Republic had unchained. As for the soldiers themselves, their most conspicuous qualities were their uncomplaining endurance of fatigues and wet bivouacs during an unusually bitter winter, and in action their capacity for a single great effort and no more. But they were unreliable in the hands of the veteran regular general, because they were heterogeneous in recruiting, and unequal in experience and military qualities, and the French staff was wholly incapable of moving masses of troops with the rapidity demanded by the enemy's methods of war, so that on the whole it is difficult to know whether to wonder more at their missing success or at their so nearly achieving it.

Faidherbe's Campaign. — The decision, as we have said, was fought out on the Loire and the Sarthe. Nevertheless the glorious story of the *"Défense nationale"* includes two other important campaigns — that of Faidherbe in the north and that of Bourbaki in the east.

In the north the organization of the new formations was begun by Dr. Testelin and General Farre. Bourbaki held the command for a short time in November before proceeding to Tours, but the active command in field operations came into the hands of Faidherbe, a general whose natural powers, so far from being cramped by years of peace routine and court repression, had been developed by a career of pioneer warfare and colonial administration. General Farre was his capable chief of staff. Troops were raised from fugitives from Metz and Sedan. as well as from depot troops and the Garde Mobile, and several minor successes were won by the national troops in the Seine valley, for here, as on the side of the Loire. mere detachments of the investing army round Paris were almost powerless. But the capitulation of Metz came too soon for the full development of these sources of military strength, and the German I. army under hlanteuffel, released from duty at Metz, marched north-eastward, capturing the minor fortresses on its way. Before Faidherbe assumed command, Farre had fought several severe actions near Xmiens, but, greatly outnumbered. had been defeated and forced to retire behind the Somme. Another French general, Friand, had also engaged the enemy without success near Rouen. Faidherbe assumed the command on Dec. 3, and promptly moved forward A general engagement on the little river Hallue (Dec. 23), east-north-east of Amiens. was fought with no decisive results, but Faidherbe, feeling that his troops were only capable of winning victories in the first rush, drew them off on the 24th. His next effort, at Bapaûme (Jan. 2–3, 1871), was more successfu!, but its effects were counterbalanced by the surrender of the fortress of Péronne (Jan. 9) and the consequent establishment of the Germans on the line of the Somme. Meanwhile the Rouen troops had been contained by a strong German detachment, and there was no further chance of succouring Paris from the north. But Faidherbe, like Chanzy, was far from despair, and in spite of the deficiencies of his troops in equipment (50,000 pairs of shoes, supplied by English contractors, proved to have paper soles). he risked a third great battle at St. Quentin (Jan. 19). This time he was severely defeated, though his loss in killed and wounded was about equal to that of the Germans, who mere commanded by Goeben. Still the attempt of the Germans to surround him failed and he drew off his forces with his artillery and trains unharmed. The Germans, who had been greatly impressed by the solidity of his army, did not pursue him far. and Faidherbe was preparing for a fresh effort when he received orders to suspend hostilities.

The last episode is Bourbaki's campaign in the east, with its mournful close at Pontarlier. Before the crisis of the last week of November, the French forces under General Crémer, Cambriels' successor, had been so far successful in minor enterprises that, as mentioned above, the right wing of the Loire army, severed from the left by the battle of Orleans and subsequently held inactive at Bourges and Nevers, was ordered to Franche Comté to take the offensive against the XIV. corps and other German troops there, to relieve Belfort and to strike a blow across the invaders' line of communications. But there were many delays in execution. The staff work, which was at no time satisfactory in the French armies of 1870, was complicated by the snow, the bad state of the roads, and the mountainous nature of the country, and Bourbaki, a brave general of division in action, but irresolute and pretentious as a commander-in-chief, was not the man to cope with the situation. Only the furious courage and patient endurance of hardships of the rank and file, and the good qualities of some of the generals, such as Clinchant, Crémer and Billot, and junior staff officers such as Major Brugère (afterwards generalissimo of the French army), secured what success was attained.

The Campaign in the **East.**—Werder, the German commander, warned of the imposing concentration of the French, evacuated Dijon and Dôle just in time to avoid the blow and rapidly drew together his forces behind the Ognon above Vesoul. A furious attack on one of his divisions at Villersexel (Jan. 9) cost him 2,000 prisoners as well as his killed and wounded, and Bourbaki, heading for Belfort, was actually nearer to the fortress than the Germans. But at the crisis more time was wasted, Werder (who had almost lost hope of maintaining himself and had received both encouragement and stringent instructions to do so) slipped in front of the French, and took up a long weak line of defense on the river Lisaine, almost within cannon shot of Belfort. The cumbrous French army moved up and attacked him there with 150,000 against 60,000 (Jan. 15–17, 1871). It was at last repulsed, thanks chiefly to Bourbaki's inability to handle his forces, and, to the bitter disappointment of officers and men alike, he ordered a retreat, leaving Belfort to its fate.

Ere this, so urgent was the necessity of assisting Werder, Manteuffel had been placed at the head of a new Army of the South. Bringing two corps from the I. army opposing Faidherbe and calling up a third from the armies around Paris, and a fourth from the II. army, Manteuffel hurried southward by Langres to the Saône. Then, hearing of Werder's victory on the Lisaine, he deflected the march so as to cut off Bourbaki's retreat, drawing off the left flank guard of the latter (commanded with much *éclat* and little real effect by Garibaldi) by a sharp feint attack on Dijon. The pressure of Werder in front and Manteuffel in flank gradually forced the now thoroughly disheartened French forces towards the Swiss frontier, and Bourbaki, realizing at once the ruin of his army and his own incapacity to re-establish its efficiency, shot himself, though not fatally, on Jan. 26. Clinchant, his successor, acted promptly enough to remove the immediate danger, but on the 29th he mas informed of the armistice without at the same time being told that Belfort and the eastern theatre of war had been on Jules Favre's demand expressly excepted from its operation. Jules Favre, it appears, neglected to inform Gambetta of the exception. Thus the French, the leaders distracted by doubts and the worn-out soldiers fully aware that the war was practicaliy over, stood still, while Manteuffel completed his preparations for hemming them in. On Feb. 1 General Clinchant led his troops into Switzerland, where they were disarmed, interned and well cared for by the authorities of the neutral state. The rearguard fought a last action with the advancing Germans before passing the frontier. On the 16th, by order of the French government, Belfort capitulated, but it was not until the 11th of March that the Germans took possession of Bitche, the little fortress on the Vosges, where in the early days of the war de Failly had illustrated so signally the want of concerted action and the neglect of opportunities which had throughout proved the bane of the French armies.

The losses of the Germans during the whole war were 28.000 dead and 101.000 wounded and disabled, those of the French, 156,000 dead (17,000 of whom died of sickness and wounds, as prisoners in German hands) and 143,000 wounded and disabled. 720,000 men surrendered to the Germans or to the authorities of neutral states, and at the close of the war there were still 250,000 troops on foot, with further resources not immediately available to the number of 280,000 more. In this connection, and as evidence of the respective numerical yields of the German system working normally and of the French improvised for the emergency, we quote from Berndt *(Zahl im Kriege)* the following comparative figures:—

End of July .	French 250,000,	Germans 384,000 under arms.		
Middle of November	„ 500,000,	„ 425,000	„	„
After the surrender of Paris and the disarmament of Bourbaki's army .	„ 534,000,	„ 835,000	„	„

The date of the armistice was Jan. 28, and that of the ratification of the treaty of Frankfurt May 23, 1871.

BIBLIOGRAPHY.—The literature of the war is of immense volume, and the following list only includes a short selection of the most important works.

General.—German official history, *Der deutsch-französische Krieg* (Berlin, 1872–1881; English and French translations); monographs of the German general ,staff *(Kriegsgesch. Einzelschriften)*; Moltke, *Gesch. des deutsch-franzos. Krieges* (Berlin, 1891; English translation) and *Gesammelte Schriften des G. F. M. Grafen v. Moltke* (Berlin, 1900–); French official history, *La Guerre de 1870–1871* (Paris, 1902–) (the fullest and most accurate account); P. Lehautcourt (General Palat), *Hist. de la guerre de 1870–1871* (Paris, 1901–1907); v. Verdy du Vernois, *Studien über den Krieg . . . auf Grundlage 1870–1871* (Berlin, 1892–1896); G. Cardinal von Widdern, *Kritische Tage 1870–1871* (French translation, *Journées critiques*). Events preceding the war are dealt with in Bernhardi, *Zwischen zwei Kriegen;* Baron Stoffel, *Rapports militaires 1866–1870* (Paris, 1871; English translation); G. Lehmann, *Die Mobilmachung 1870–1871* (Berlin, 1905).

For the war in Lorraine: Prince Kraft of Hohenlohe-Ingelfingen, *Briefe über Strategic* (English translation, *Letters on Strategy)*; F. Foch, *Conduite de la guerre,* pt. ii.; H. Bonnal, *Manoeuvre de Saint Privat* (Paris, 1904–1906); Maistre, *Spicheren* (Paris, 1908); v. Schell, *Die Operationen der I. Armee unter Gen. von Steinmetz* (Berlin, 1872, English translation); F. Hoenig, *Taktik der Zukunft* (English translation), and *24 Stunden Moltke'schen Strategie* (Berlin, 1892; English and French translations).

For the war in Alsace and Champagne: H. Kunz, *Schlacht von Wörth* (Berlin, 1891), and later works by the same author; H. Bonnal, *Fröschweiler* (Paris, 1899); Hahnke, *Die Operationen der III. Armee bis Sedan* (Berlin, 1873; French translation).

For the war in the Provinces: v. der Goltz, *Léon Gambetta und seine Armeen* (Berlin, 1877); *Die Operationen der II. Armee an die Loire* (Berlin, 1875); *Die sieben Tage von Le Mans* (Berlin, 1873); Kunz, *Die Zusammensetzung der französ. Provinzialheeren;* de Freycinet, *La Guerre en province* (Paris, 1871); L. A. Hale, *The People's War* (London, 1904); Hoenig, *Volkskrieg an die Loire* (Berlin, 1892); Blume, *Operationen v. Sedan bis zum Ende d. Krieges* (Berlin, 1872; English translation); v. Schell, *Die Operationen der I. Armee unter Gen. v. Goeben* (Berlin, 1873; English translation); Count Wartensleben, *Feldzug der Nordarmee unter Gen. v. Manteuffel* (Berlin, 1872), *Operationen der Südarmee* (Berlin, 1872; English translation); Faidherbe, *Campagne de l'armée du nord* (Paris, 1872).

For the sieges: Frobenius, *Kriegsgesch. Beispiele d. Festungskrieges aus d. deutsch.-franz. Kg.* (Berlin, 1899–1900); Goetze, *Tiitigkeit der deutschen Ingenieure* (Berlin, 1871; English translation).

The most useful bibliography is that of General Palat ("P. Lehautcourt"). (C. F. A.)

FRANÇOIS, JEAN CHARLES (1717–1769), French etcher and engraver, one of the inventors of the crayon method in engraving, was born at Nancy. He studied art under Claude Charles at Nancy. He experimented in copper engraving, worked at Dijon and Lyons, where he published in 1740 the *Principes de dessein faciles,* with descriptions of a new process imitating the effect of crayon drawings in engraving. He later perfected this process and in 1758 he received a pension from the king. His most important work is the series of portraits for Saverien's *Histoire des Philosophes modernes* (1761–69). François' work is not artistic. Its importance is due to his claim of having introduced the crayon method. He stated in a letter addressed to Saverien (1760) that he made experiments in the method in 1740; and the fact that he attained recognition from the French Royal Academy in 1757 seems to substantiate his statement. Two other engravers claimed the honour of the discovery, Gilles Demarteau and L. M. Bonnet. *See* also STIPPLE AND CRAYON ENGRAVING.

FRANÇOIS DE NEUFCHÂTEAU, NICOLAS LOUIS, COUNT (1750–1828), French statesman and poet, was born at Saffais, Lorraine, on April 17, 1750, the son of a school-teacher. He studied at the Jesuit college of Neufchâteau in the Vosges, and at 14 published verses which were praised by Rousseau and Voltaire. Neufchâteau conferred on him its name, and he was elected member of some of the principal academies of France. From 1783 to 1789 he was *procureur-général* to the council of Santo Domingo. After the Revolution he was elected deputy *suppléant* to the National Assembly, organized the Department of the Vosges, and was elected later to the Legislative Assembly, as secretary and then president. In 1793 he was imprisoned for his drama *Pamela ou la vertu récompensée* (Théâtre de la Nation, Aug. 1, 1793), but was freed afterward at the revolution of the 9th Thermidor. In 1797 he became minister of the interior; he developed inland navigation; inaugurated the museum of the Louvre, and was one of the promoters of the first universal exhibition of industrial products. From 1804 to 1806 he was president of the Senate; in 1808 he was made count. He died Jan. 10, 1828. François de Neufchâteau edited the *Lettres Provinciales* and *Pensées* of Pascal (1822–26) and *Gil Blas* (1820). His principal poetical works are *Poésies diverses* (1765); *Ode sur les parlements* (1771); *Nouveaux Contes moraux* (1781); *Les Vosges* (1796); *Fables et contes* (1814); and *Les Tropes, ou les figures de mots* (1817).

FRANCOLIN, any of numerous partridges abundant in Africa and southern Asia, particularly the genus *Francolinus* with some 30 species and many races over Africa south of the Sahara and in western Morocco, and five in southeastern and southern Asia, including the black partridge (*F. francolinus*)—from the dark plumage of the male—which ranges west to Cyprus. It is about 13 in. long. The browner female lays 6 to 10 eggs in a well-concealed nest on the ground. The double-spurred francolin (*F. bicalcaratus*) is well known, as are *F. africanus, F. shelleyi, F. coqui* and *F. squamatus,* all widely distributed in Africa. The bare-throated partridge or red-necked francolin (*Pternistes afer*) and three allied species are common over Africa. *Anurophasis monorthonyx* of alpine grasslands high on the Oranje mountains of New Guinea, is closely related. (G. F. Ss.)

FRANCONIA, one of the stem-duchies of mediaeval Germany. It stretched along the valley of the Main from the Rhine to Bohemia, and was bounded on the north by Saxony and Thuringia, and on the south by Suabia and Bavaria. It also included a district around Mainz, Spires and Worms, on the left bank of the Rhine.

This territory, occupied by the most easterly portion of the Frankish people, formed part of the kingdom of Austrasia. After the treaty of Verdun in 843 it became the centre of the East Frankish or German kingdom, and remained for a time the most important of the duchies which arose on the ruins of the Carolingian empire. Its influence began to decline under the kings of the Saxon house *(see* GERMANY). It lacked political unity, had no opportunities for extension, and soon became divided into Rhenish Franconia and Eastern Franconia. The most influential family in Rhenish Franconia was that of the Salians, the head of which early in the 10th century was Conrad the Red, duke of Lorraine and son-in-law of Otto the Great. In 1024 his great-grandson Conrad, duke of Franconia, was elected German king as Conrad II. and founded the line of Franconian or Salian emperors. Rhenish Franconia gradually became a land of free towns and lesser nobles, and under the earlier Franconian emperors considerable portions passed to the count palatine of the Rhine, the archbishop of Mainz and the bishops of Worms and Spires, and the name Franconia was confined to the eastern portion of the duchy. Clerical authority was becoming predominant in this region. A series of charters dating from 822 to 1025 had granted considerable powers to the bishops of Wiirzburg, who, by the time of the emperor Henry II., possessed judicial authority over the whole of Eastern Franconia. The duchy was nominally retained by the emperors in their own hands until 1115, when the emperor Henry V., wishing to curb the episcopal influence in this neighbourhood, appointed his nephew Conrad of Hohenstaufen as duke of Franconia. Conrad's son Frederick took the title of duke of Rothenburg. instead of duke of Franconia, but in 1196, on the death of Conrad of Hohenstaufen, son of the emperor Frederick I, the title fell into disuse. Meanwhile the bishop of Würzburg had regained his formal power in the duchy. and this was confirmed in 1168 by the emperor Frederick I.

The title was assumed by John II, bishop of Wurzburg early in the 15th century, and retained by his successors until the bishopric was secularized in 1802. The name Franconia was revived in 1837, when Louis I, king of Bavaria, gave to three northern portions of his kingdom the names of Upper. Middle and Lower Franconia. When Germany was divided into circles by the emperor Maximilian I in 1500, the name Franconia was given to that circle which included the eastern part of the old duchy. The lands formerly comprised in the duchy of Franconia are now divided among Bavaria. Wurttemberg, Baden, Hesse and the Prussian province of Hesse-Nassau.

FRANCS-ARCHERS. The institution of the *francs-archers* was the first attempt at the formation of regular infantry in France. They were created by the ordinance of Montils-les-Tours on Aug. 28. 1448, which prescribed that in each parish an archer should be chosen from among the most apt in the use of arms; this archer to be exempt from the *taille* and certain obligations, to practise shooting with the bow on Sundays and feast days and to hold himself ready to march fully equipped at the first signal. Under Charles VII the francs-archers, numbering about 8,000, never gave complete satisfaction. During the succeeding reigns the institution languished. It finally disappeared in the middle of the 16th century. The francs-archers were also called *francs-taupins.*

FRANCS-TIREURS, irregular troops, almost exclusively infantry ("free-shooters"), employed by the French in the war of 1870–71. They were originally rifle clubs or unofficial military societies formed in the east of France at the time of the Luxembourg crisis of 1867. The members were chiefly concerned with the practice of rifle shooting, and were expected in war to act as light troops. While the existing system of conscription let the greater part of the nation's military energy run to waste, the francs-tireurs were not only popular but also efficient workers in their sphere of action. As they wore no uniforms, were armed with the best rifles and elected their own officers, the government made repeated attempts to bring the societies, which were at once a valuable asset to the armed strength of France and a possible menace to internal order, under military discipline. This was strenuously resisted by the societies, to their sorrow as it turned out, for the Germans treated captured francs-tireurs as irresponsible noncombatants found with arms in their hands and usually exacted the death penalty. In July 1870, at the outbreak of the war, the societies were brought under the control of the minister of war and organized for field service, but it a-as not until November—by which time the *levée en masse* was in force—that they were placed under the orders of the generals in the field. After that they were sometimes organized in large bodies and incorporated in the mass of the armies, but more usually they continued to work in small bands. blowing up culverts on the invaders' lines of communication, cutting off small reconnoitring parties, surprising small posts, etc. Their most celebrated feats were the blowing up of the Moselle railway bridge at Fontenoy on Jan. 22, 1871 and the heroic defense of Chbteaudun by Lipowski's Paris corps and the francs-tireurs of Cannes and Nantes (Oct. 18, 1870). Although the original members of the rifle clubs were joined by many bad characters, the patriotism of the majority was unquestionable. The severity of the German reprisals is itself the best testimony to their service.

FRANK, FRANZ HERMANN REINHOLD VON (1827–1894), German Lutheran theologian, was born on March 2j, 1827, at Altenburg. and educated at Leipzig university. After teaching at Ratzeburg and Altenburg, in 1857 he was appointed professor of theology at Erlangen. where he died on Feb. 7, 1894.

Frank's chief works are: *System der christlichen Gewissheit* (1870–73; 2nd ed.. 1881–83; Eng. trans., 1886), in which he discusses the basis of belief; *System der christlichen Wahrheit* (1878–80; 3rd ed.. 1893–94); *System der christlichen Sittlichkeit* (1884–87; Eng. trans., 1886); *Zur Theologie A. Ritschls* (3rd ed.. 1891), in which he attacks Albrecht Ritschls' theology; and *Gesch. und Kritik der neueren Theologie* (1894; 3rd ed., 1898).

FRANK, ILYA MIKHAILOVICH (1908–), Russian physicist awarded the 1958 Nobel prize for physics jointly with P. A. Cerenkov and I. E. Tamm. "for the discovery and interpretation of. the Cerenkov effect." was born in 1908. Cerenkov's discovery, made in 1934, was concerned with the light emitted by charged particles traveling at very high speed. Study of this effect resulted in the discovery of methods for detecting and measuring the velocity of high-speed particles. Frank, together with the noted Russian physicist Tamm, provided a theoretical interpretation of the Cerenkov effect in 1937. This work is of the greatest importance for research in nuclear physics and for the study of cosmic rays. Frank's work includes collaboration with Cerenkov and Tamm in research on electron radiation, for which all were awarded the Stalin prize in 1946. Frank also specialized in the study of gamma ray quanta and the problem of neutron fluxes. He was made a member of the Academy of Sciences of the U.S.S.R. (W. J. Bp.)

FRANK, JAKOB (1726–1791), a Jewish theologian, founded in Poland a sect which emanated from Judaism but ended by merging with Christianity. The sect, the outcome of the Messianic mysticism of Sabbetai Zebi, was an antinomian movement in which the authority of the Jewish law was held to be superseded by personal freedom. It posed as an anti-Talmudic protest in behalf of a spiritual religion. The Frankists in 1759 were baptized *en masse,* amid much pomp, but the church soon became convinced that Frank was not a genuine convert. He was imprisoned on a charge of heresy, but on his release in 1763 the empress Maria Theresa patronized him, regarding him as a propagandist of Christianity among the Jews. He thenceforth lived in state as baron of Offenbach. and on his death his daughter Eva succeeded him as head of the sect.

FRANK, JOHANN PETER (1745–1821), German physician, was born on March 19. 1745, at Rodalben, Bavaria, and studied at Heidelberg and Strasbourg. He became court and garrison physician in Rastadt (1769), professor in Göttingen (1784), in Pavia (1785), director of sanitation in Lombardy (1786). and in 1795 sanitary officer to the Vienna hospitals. In 1804, after a short time in St. Petersburg as ordinary physician and counsellor of state, he returned to practise in Vienna, where he died on April 24, 1821. Frank's fame rests on his *System einer Vollstandigen medicinischen Polizey* (1779), which covers the hygiene of all the stages of a man's life.

His autobiography was published in Vienna (1802). *See* Leona Baumgartner and Elizabeth Mapelsden Ramsey, "Yohann Peter Frank and his *System einer Vollstandigen Medicinischen Polizey,*" *Annals of Medical History (N.S.),* vol. v, p. 525 (1933).

FRANK, LEONHARD (1882–1961), German novelist and dramatist, mas born in Würzburg on Sept. 4. 1882, the son of a carpenter. He belongs to the German Expressionist movement in his criticism of middle-class society, his pacifism and his faith in a better future for mankind. This reputation, however, depends less on his zeal for reform than on his skill in depicting human emotions. His early novels. *Die Räuberbande* (1914; Eng. trans., *The Robber Band,* 1928) and *Die Crsache* (1916; Eng. trans., *The Cause of Crime,* 1928) caused a sensation by their revolutionary tendencies. He followed these with other books which present aspects of his political and social ideals, but add little to his reputation: *Der Mensch ist gut* (1918), *Der Biirger* (1924; Eng. trans., *The Middleclass Man,* 1930), a novel on the classless society. Later works include *Deutsche Novelle* (1951), *Michaels Rückkehr* (1950) and *Links wo das Herz ist* (1952; Eng. trans., *Heart on the Left,* 1954). a thinly disguised autobiography. Frank received a number of literary awards and was elected to the German Academy of Letters in 1927. He lived as an independent writer until 1933. After 1933 he lived in exile, mainly in the United States. until 1950 when he returned to Germany. Frank died in Munich on Xug. 18, 1961. (W. I. L.)

FRANK-ALMOIGN, in the English law of real property, a species of spiritual tenure, whereby a religious corporation, aggregate or sole, holds lands of the donor to them and their successors for ever. It was a tenure dating from Saxon times, held not on the ordinary feudal conditions, but discharged of all services except the *trinoda necessitas*. But "they which hold in frankalmoign are bound of right before God to make orisons, prayers, masses and other divine services for the souls of their grantor or feoffor, and for the souls of their heirs which are dead, and for the prosperity and good life and good health of their heirs which are alive. And therefore they shall do no fealty to their lord, because that this divine service is better for them before God than any doing of fealty" (Litt. s. 135).

It was the tenure by which the greater number of the monasteries and religious houses held their lands; it was expressly exempted from the statute 12 Car. II. c. 24 (1660), by which the other ancient tenures were abolished, and it is the tenure by which the parochial clergy and many ecclesiastical and eleemosynary foundations hold their lands at the present day. As a form of donation, however, it came to an end by the passing of the statute *Quia Emptores,* for by that statute no new tenure of frank-almoign could be created, except by the crown.

See Sir Frederick Pollock and F. W. Maitland, *History of English Law,* vol. i, 218–30.

FRANMEL, ZACHARIAS (1801–1875), German rabbi, scholar and theologian, was born in Prague on Sept. 30. 1801. He received a thorough Talmudic training, as well as an intensive classical education at the University of Budapest. After serving as rabbi in several German communities, he was called in 1854 to the presidency of the newly organized Jewish Theological seminary at Breslau, which became the most important modern institution for the training of rabbis in Europe and lasted until the Nazi persecutions nearly a century later.

Frankel's theology was known as positive-historical Judaism. This school of thought differed from Orthodoxy in its acceptance of the results of historical research and from Reform Judaism in its maintenance of the pattern of Jewish traditional ritual and its adherence to the national aspects of Judaism. Through the faculty and students of the Breslau seminary, Frankel's viewpoint became highly influential in central Europe. In the 20th century it found congenial soil in the United States, where, under the name of Conservative Judaism, it attained its greatest growth. Frankel died at Breslau on Feb. 13, 187j.

Frankel's scholarly works on the historical development of Talmudic literature and the influence of rabbinic thought on the Septuagint are of classic importance. They include: *Die Eidesleistung der Juden* (1840), a study of the oath in Jewish law; *Vorstudien zur Septuaginta* (1841); *Introduction to the Mishnah* (in Hebrew, 1859); and *Introduction to the Palestinian Talnzud* (in Hebrew, 1870); as well as other books and many articles.

(RT. GS.)

FRANKENTHAL, a town of Germany, in the Rhineland Palatinate, on the Isenach, connected with the Rhine by a canal 3 mi. in length, 6 mi. N.W. from Mannheim. Pop. (1925) 24,647; (1950) 25,417.

Frankenthal (Franconodal) is mentioned as a village in the 8th century. A house of Augustinian canons established there in 1119 was suppressed in 1562 by the elector palatine, who gave its possessions to Protestant refugees from the Netherlands. In 1577 this colony received town rights from the elector John Casimir, whose successor fortified the place, and under the elector Charles Theodore it became the capital of the Palatinate. It has a medieval town hall, two interesting old gates and remains of its former environing walls. Its industries include the manufacture of machinery, casks, corks, soap, dolls and furniture, iron founding and bell founding — the famous "Kaiserglocke" of the Cologne cathedral was cast there.

Frankenthal was formerly famous for its porcelain factory, making figures and groups, established there in 1755. In 1795 the factory was removed to Griinstadt.

FRANKENWALD, a mountainous district of southern Germany, connecting geologically the Fichtelgebirge and the Thuringian forest. It is a broad well-wooded plateau, about 30 mi. long, descending gently on the north and east sides toward the Saale, but more precipitously to the Bavarian plain in the west. Its highest point is the Dobraberg near Steinheid (2,608 ft.). Along the centre lies the watershed between the basins of the Main and the Saale, of the Rhine and Elbe systems, respectively. The principal tributaries of the Main from the Frankenwald are the Rodach and Hasslach; of the Saale, the Selbitz.

FRANKFORT, HENRI (1897–1954). Dutch archaeologist, pioneered in developing near eastern archaeology from a technique for the excavation and classification of material remains to a discipline reconstructing the significant aspects of ancient Egyptian and western Asian civilizations. Born Feb 24, 1897, in Amsterdam, Frankfort presaged in his formative years the breadth of his later interests. Study of history at the University of Amsterdam, Egyptian with Sethe at Berlin. and archaeology under Petrie at the University of London (M.A., London, 1924; Ph D., Leiden, 1927) was balanced by excavation in Egypt with Brunton (1922) and travel in the Balkans and near east (1922, 1924–25). This period culminated in *Studies in Early Pottery of the Near East,* 2 vol., (1924–27).

As director of the excavations of the Egypt Exploration society at Abydos, Tell el-Amarna and Armant (1925–29) and of the expedition of the Oriental Institute of The University of Chicago in Iraq (1929–37), Frankfort made discoveries and interpretations that filled major gaps in knowledge. Publications of those years ranged from Egyptian funerary texts and architecture to thoroughly documented reconstructions of Mesopotamian culture and art.

The appearance of *Cylinder Seals: a Documentary Essay on the Art and Religion of the Ancient Near East* (1939) marked the transition to the final phase of Frankfort's nork (1938–54), spent as professor at The University of Chicago and the University of London, where he headed the Warburg institute. No longer absorbed by the contingencies of excavation, Frankfort brought his far-reaching humanistic interests to bear on comparative studies between the two countries where he had worked. Egypt and Mesopotamia. He approached archaeological materials with keen regard for anthropological, aesthetic and philosophical problems and with rare understanding of religious phenomena. This gave added depth to the syntheses of religion and art which were the product of Frankfort's later years (*e.g., Kingship and the Gods: a Study of Ancient Near Eastern Religion as the Integration of Society and Nature* [1948]; *Ancient Egyptian Religion: an Interpretation* [1948]; *The Art and Architecture of the Ancient Orient* [1954]). He died in London on July 16, 1954.

See P. Delougaz and T. Jacobsen, "Henri Frankfort," and J. Vindenas, "Bibliography of Henri Frankfort," *Journal of Near Eastern Studies,* vol. xiv, pp. 1–13 (1955). (H. J. KA.)

FRANKFORT, capital city of Kentucky, U.S., and seat of Franklin county, on the Kentucky river, 52 mi. E. of Louisville, is in the Bluegrass region and surrounded by hills on both sides of the river. The city is a trading centre for the rich surrounding country, which produces tobacco and raises thoroughbred trotting horses. Natural gas and hydroelectric power are available. The manufactures include bourbon whisky, candy! furniture, electronic parts, shoes, clothing, rolled metal parts, ornamental iron rails and columns, store fixtures and cooperage products.

Frankfort was founded in 1786 by Gen. James Wilkinson and was chosen capital of the state in 1792 (when its population was less than 500) because of its central location. It was chartered as a city in 1839. Twice during Frankfort's early history the capitol burned, and both times the larger cities of Louisville and Lexington attempted to become the state capital but Frankfort was retained.

During the Civil War it was occupied for a short time (1862) by Gen. Braxton Bragg (Confederate), who was driven out by Gen. Don Carlos Buell.

In 1900 there was a bitter contest for the governorship, in connection with which the Democratic claimant. William Goebel, was assassinated. Daniel Boone and other national heroes are buried in the Frankfort cemetery. Frankfort was inundated during the Ohio river flood of 1937. Property damage was extensive, and the losses were estimated in millions of dollars.

The state capitol (built in 1905–09 at a cost of $2,000,000) is of granite and white limestone, 400 ft. long by 18j ft. wide, finished on the interior entirely in white marble. The old capitol

(1829) is occupied by the Kentucky Historical society. The state arsenal, the state board of health, Kentucky State college (established in 1886 for Negroes) and the Kentucky Training Home for feeble-minded persons are also there.

The Orlando Brown house and Liberty hall are noted examples of the many fine homes in the city's environs. The name Frankfort is a corruption of "Frank's Ford," which was in turn named for an early settler, Stephen Frank. For comparative population figures see table in KENTUCKY: Population. (J. W. CL.)

FRANKFURT AM MAIN (FRANKFURT-ON-MAIN), a town in the *Land* of Hesse, Germany, lies on both sides of the Main, about 22 mi. above its confluence with the Rhine at Mainz. Frankfurt, birthplace of the poet Goethe, was famous from the 9th to the 18th century as the town where the German kings were elected, and from the 13th century as a centre for trade and communications. It is one of Germany's leading industrial cities. Pop. (1950) 532,037, (1958 est.) 613,100.

The Town.—The stages of the city's development can still be seen in its general plan. The old fortified town grew up in the 12th century round the imperial castle of Pfalz, which was built on the cathedral mound. The limits of the old town are marked by the Main on the south and by street names ending in -graben (moat) from Hirschgraben on the west to Wollgraben on the east. (Sachsenhausen, the district south of the river, was also fortified, however.) The new town arose when the town boundaries were extended after 1333. Also fortified, its wails were demolished after 1806 and replaced by promenades, the Anlagen. The only surviving fortifications are the round tower of the Eschenheimer Tor, 155 ft. high (1426–28), the Rententurm (1455–56) on the bank of the Main and the Kuhhirtenturm (1490) in Sachsenhausen. After 1866 Frankfurt expanded and its area increased to nearly three times its original size. Air raids in 1943–45 largely destroyed the old town. The new town has been rebuilt in modern style.

BY COURTESY OF GERMAN TOURIST INFORMATION OFFICE

THE ESCHENHEIMER TOR, FRANKFURT AM MAIN. ONE OF THE LAST REMAINING LANDMARKS OF THE OLD MEDIEVAL CITY, STANDING IN MARKED CONTRAST TO THE MODERN POST OFFICE IN THE BACKGROUND

The cathedral, dedicated to St. Bartholomew, is of red sandstone and has a 300-ft. tower. It dates from about 1215, but stands on the site of an earlier church, the Salvatorkirche, built in 852 by Louis the German. The present church was originally a Romanesque basilica, but this was replaced by an early Gothic building in 1235–39 and was again reconstructed from 1315–1500, when the Pfarrturm was temporarily completed by a cupola. The building, including the tower, was only finished after a fire in 1867.

The Roman Catholic St. Leonhardskirche was built after 1219 on a site presented to the town by the emperor Frederick II. Also originally a basilica, it was reconstructed in the 15th and 16th centuries as a Gothic building of the hall type. Two Romanesque towers and two beautiful Romanesque portals still remain, however.

The Nikolaikirche, on the south side of the Romerberg square, dates from the 13th century. It served as church to the town council in the 15th century. Some time after the Reformation it was secularized but in 1847 was once more established as a Protestant church. The Katharinenkirche, in the town centre, was the first Protestant church to be built (1678–81). It stands on the site of a 14th-century church where the first Protestant sermon was preached in Frankfurt in 1522.

Other notable churches are the Roman Catholic Liebfrauenkirche, founded in the 14th century and reconstructed in the 15th and 16th centuries as a Gothic hall-type church; the Deutschordenskirche in Sachsenhausen, a Gothic building (1309), converted to the Baroque style (1747–51); the 9th-century Justinuskirche. which is the oldest remaining church; and the 18th-century Paulskirche. The last was the meeting-place of the 1848–49 German parliament and since the 1957 reconstruction has served as a hall for festive civic occasions. All these churches were damaged in World War II and have been restored. The Westend synagogue is once more open for worship.

In the heart of the town lies the Romerberg, a square once surrounded by picturesque old houses. Those on the north and southeast mere destroyed in 1944 and are to be rebuilt in modern style.

The patrician residence, Zum Romer, which gave the square its name, lies on the northwestern side. In 1405 it was bought by the town and converted into a town hall. Later the neighbouring houses were also acquired, and the five-gabled Gothic facade became famous. The exterior of the Romer and the two adjacent houses have been restored since 1944. Inside the Romer, however, the only room to be restored is the Kaisersaal, or royal hall, where the coronation banquet of the Holy Roman emperors was held, following their election and coronation in the city. The Fernmelde-Hochhaus, belonging to the post office and the most important news centre in western Germany, has replaced the palace of the princes of Thurn and Taxis (1731–36) which was destroyed in 1944. In this palace the German parliament met from 1816–66. Only the palace doorway and entrance pavilion now remain.

On the bank of the Main a 13th-century Romanesque chapel remains of the Saalhof, the castle built by the Hohenstaufen kings in about 1150. A new building replaced the castle in the 14th century and was given an imposing Renaissance façade in 1715. Rebuilt after World War II, it contains the town's historical museum; it was planned to rebuild the Leinwandhaus (linen-drapers' hall, 1396), near the cathedral, and to use it for the town archives. The house in the Grossen Hirschgraben where Goethe was born and spent his youth was burned to the ground in 1944. It has been faithfully restored and contains the original interior fittings, which had been saved. With the adjoining Goethe museum and library it is one of the town's chief attractions.

Notable modern buildings include the late 19th-century exchange, the Frankfurter Hof hotel and main station, the festival hall in the exhibition grounds (1907–08), the wholesale market hall (1927–28) and the former offices of I. G. Farben's chemical works (1928–30). After 1950 a series of skyscrapers was built, among them the offices of the electricity company AEG on the south bank of the Main.

Among the treasures saved after World War II from the municipal and university libraries are a 9th-century ivory diptych, a Gutenberg Bible, the Schopenhauer records and Gustav Freytag's collection of pamphlets.

The most famous of Frankfurt's museums is the Senckenberg museum which has one of the most important natural history collections in Germany. Its history began in 1763 when Johann Christian Senckenberg, the physician, bequeathed his large fortune to the citizens of Frankfurt for the endowment of a hospital, a botanical institute, chemistry and anatomy laboratories. At Goethe's instigation the Senckenbergische Society for Scientific Research was founded in his memory in 1817; this society set up the museum which since 1907 has possessed its own building near the university. The Städel art institute, Frankfurt's fine picture gallery on the south bank of the Main, was endowed in 1816 by one of the town's citizens; it contains Italian, German, French, Spanish and Dutch paintings from the 15th to the 18th centuries, as well as modern and contemporary works. The town's collection of sculpture, containing among many masterpieces the Myron Athena, is housed in the adjoining Liebieghaus. The idyllic moated castle (1727) of the von Holzhausen family contains Roman antiquities found in the Frankfurt area. The opera house (1875–80) stood in ruins after World War II, while the former Schauspielhaus (playhouse) was rebuilt to serve all kinds of theatrical performances, including opera.

The Johann Wolfgang Goethe university is one of the largest in Germany. It was founded in 1914 by an amalgamation of the existing institutions, including the Paul Ehrlich institute for serum research and the Senckenberg Society for Scientific Research. There are also colleges of art and music, and many learned institutions, among which is the Leo Frobenius institute for ethnography with its great library. The Palmengarten (palm garden), founded in 1868, is known throughout Germany for its large collections of flowers from all parts of the world.

Trade and Communications. — By the 14th century Frankfurt was already a great trading town. The half yearly fairs, before Easter and at the beginning of September, were frequented by merchants from all over Europe. As well as dealing in goods, therefore, Frankfurt also became a banking centre of the first importance, and it was there that the Rothschild (*q.v.*) family started business.

Besides the two international fairs there are now many specialized fairs (tobacco, clocks, jewelry, chemical apparatus) and among the exhibitions are the book fair, which takes place annually in September, and the international motor show. Up to the middle of the 19th century Frankfurt was a purely commercial town; it was only after 1866 that it became industrialized. Today Frankfurt with its suburbs (Hochst, Bockenheim, Fechenheim, etc.) has large chemical and pharmaceutical concerns, printing works and electrical and metal industries (machine construction, optical instruments, etc.), and it also manufactures leather goods, foodstuffs and drinks. It is the headquarters of many professional associations (motor industry, engineering, book trade, etc.).

Frankfurt's importance as a centre of communications has grown steadily since the 13th century. Up to 1844 there was only one bridge over the Main, and that had existed in 1222. Between 1844 and 1878 three road, one foot and two railway bridges were built. All these were destroyed in 1945. Of the new bridges the most important is the Friedensbriicke. By the construction of a large inland harbour in 1907–12 Frankfurt became a key point for inland shipping. It is the point of intersection of two autobahnen — from Berlin and the north to Munich and Salzburg, and from Cologne to Nuremberg. Similarly, after the opening of the first railway to Kastel in 1840, Frankfurt has been at the centre of west German rail communications. The Rhine-Main airport, 6 mi. from the city centre, is one of the focal points of world air transport.

History. — Excavations in the area of the former old town have produced evidence that there was already a Roman settlement in Frankfurt in the first century A.D. Where the suburbs of Heddernheim and Praunheim now stand was the great Roman camp Nida, the administrative centre for the hinterland (civitas *Praunensium*) of the Roman frontier wall, the Limes.

The name Frankfurt probably arose about A.D. 500 when the Franks drove the Alemanni south. The first written mention of it occurs in 793, when Einhard, Charlemagne's biographer, states that he spent the winter in the villa Frankonovurd.

In 794 Charlemagne held a western synod in the castle at Frankfurt; in the 9th century the east Frankish Carolingian kings chose the place as their residence. It was only in the 12th century, however, that the castle settlement developed into a town through the favour of the Hohenstaufens. Henry, the son of Conrad III, was elected German king in Frankfurt in 1147, but he died before his father and it was not until 1152, when Frederick Barbarossa was elected, that the first reigning king was elected in Frankfurt.

Between the end of the 12th and the beginning of the 14th century the city's constitution developed into the form which remained effective until 1806. A royal bailiff or magistrate replaced the governor of the castle as head of the town soon after 1200. Gradually a council grew up composed of junior magistrates, counselors and members of the guilds. In 1311 two mayors, annually elected, replaced the royal bailiff as head of the council and in 1372 the town became in fact a free imperial city.

The 14th century saw a remarkable advance in all spheres of Frankfurt's life. In the Golden Bull (*q.v.*) of 1356 Charles IV named Frankfurt as the town where the German kings were to be elected. The copy of the bull made specially for Frankfurt in the imperial chancellery is one of the town's treasures. From 1562–1792 the kings elected in Frankfurt were also crowned there.

During the Reformation, Frankfurt accepted the Reformed church and remained Lutheran, although the Catholics kept the cathedral and some other churches. In 1554 Frankfurt became the home of many Protestant refugees from England and the Netherlands. The English under John Knox, however, left Frankfurt after the Marian persecution in England ceased, but the Netherlanders remained in Frankfurt.

In the 17th century the autocratic rule of the council, whose members came from a small group of aristocratic families, led to a revolutionary movement among the citizens. An agreed constitution was reached under the leadership of Vincenz Fettmilch in 1612. But the revolution went further and was eventually put down in 1614 by imperial commissioners and in 1616 its leaders were put to death. The situation, however, did not improve. Only in 1705–32, following another popular uprising, was a case (Frankfurt v. Frankfurt) brought by the emperor in Vienna and judgment given for the citizens of the town. From that time the constitution of 1612, with a measure of popular representation, was in force.

When the empire broke up in 1806 Frankfurt lost its free status. It became the seat of government for the prince primate of the Confederation of the Rhine. In 1815, however, under the new order for Germany made by the congress of Vienna, it became once more a free city, and a sovereign member of the German Confederation. As the meeting place of the Bundestag, it was the real capital of Germany and so remained for over 50 years.

A commercial and maritime treaty was concluded with Great Britain in 1832. In 1848 the first German national assembly was held in the Paulskirche. After the war of 1866 Frankfurt was occupied by Prussian troops and forcibly incorporated into Prussia. It was only after this annexation that it developed into a big industrial city, its population rising from 91,000 in 1871 to 550,000 in 1939. At the end of World War II the town had to be almost rebuilt. Its face was much altered in the process but some striking monuments still bear witness to the inheritance of earlier generations. (H. MT.)

FRANKFURT AN DER ODER (FRANKFURT-ON-ODER), a town of Germany, in the district of Frankfurt, 50 mi. S.E. from Berlin by rail. Pop. (1950) 52,822; (1956 est.) 56,938. It owes its origin and name to a settlement of Franconian merchants, in the 13th century, on land conquered from the Lubuszanie, a Polish tribe.

In 1253 it was made a town by the margrave John I and borrowed from Berlin the Magdeburg civic constitution. In 1379 it received the right to free navigation of the Oder; it belonged (1368–*c.* 1450) to the Hanseatic League.

The university, opened in 1506, was moved in 1516 to Cottbus and restored again to Frankfurt in 1539. It was dispersed during the Thirty Years' War and again restored by the Great Elector, but finally transferred to Breslau (Wroclaw) in 1811.

In the 15th century Frankfurt successfully withstood sieges by the Hussites (1429 and 1432), by the Poles (1450) and by the duke of Sagan (1477). Also in the Thirty Years' War and the Seven Years' War (city's capture by the Russians on July 23, 1759) and Napoleonic Wars it suffered much.

The Evangelical Marienkirche (Oberkirche), a brick edifice of the 13th century with five aisles, and the Rathhaus dating from 1607, and bearing the device of a member of the Hanseatic League, are notable. Frankfurt an der Oder was long the seat of the court of appeal for the province, but of this it was deprived in 1879.

Its industries include the manufacture of machinery, metalware, chemicals, paper, leather and soap. It has an extensive system of water communication by means of the Oder and its canals to the Vistula and the Elbe. Trade in corn, cattle and wine was fostered by its three annual fairs, held respectively at Reminiscere (the second Sunday in Lent), St. Margaret's day and at Martinmas.

In 1945 Frankfurt an der Oder was captured by Russian troops during the Soviet advance to Berlin.

The town proper lies on the left bank of the Oder and was connected by a stone bridge goo ft. long with the former suburb of Damm-Vorstadt (after World War II a town of western Poland named Sluhice [pop., 1946, 1,689] in Zielona Gora province).

FRANKINCENSE or OLIBANUM, a gum resin obtained from certain species of trees of the genus *Boswellia* and natural order Burseraceae. Five species of *Boswellia* have been distinguished: one, indigenous to the mountainous tracts of central India and the Coromandel coast, and another, found in Ethiopia, though both thuriferous, are not known to yield any of the olibanum of commerce. B. Frereana, B. *bhua-dajiana* and B. carterii of the Somali country in east Africa, the last species including a variety found in Hadramaut, Arabia, are the sources of true frankincense or olibanum.

To obtain the frankincense a deep incision is made in the trunk of the tree, and below it a narrow strip of bark five inches in length is peeled off. When the milklike juice (called *spuma pinguis* by Pliny) which exudes has hardened by exposure to the air, the incision is deepened. In about three months the resin has attained the required degree of consistency. The season for gathering lasts from May until the first rains in September. The large clear globules are scraped off into baskets. and the inferior quality that has run down the tree is collected separately. Packed in sheep- and goatskins. in quantities of 20 to 40 lb., it is carried on camels to Berbera, for shipment either to Aden, Makalla or other Arabian ports, or directly to Bombay. At Bombay it is assorted, and is then packed for export to Europe, China and elsewhere. Olibanum is a reputed natural product of China.

Frankincense or olibanum occurs in commerce in semiopaque, round, ovate or oblong tears or irregular lumps, which are covered externally with a white dust, the result of their friction against one another. It has an amorphous internal structure and a dull fracture; is of a yellow to yellowish-brown hue, the purer varieties being almost colourless, or possessing a greenish tinge; and has a somewhat bitter aromatic taste and a balsamic odour, which is developed by heating. Immersed in alcohol it becomes opaque, and with water it yields an emulsion. It contains about 72% of resin soluble in alcohol; a large proportion of gum soluble in water, and apparently identical with gum arabic; and a small quantity of a colourless inflammable essential oil, one of the constituents of which is the body oliben. Frankincense burns with a bright white flame, leaving an ash consisting mainly of calcium carbonate, the remainder being calcium phosphate and the sulfate, chloride and carbonate of potassium. Good frankincense, according to Pliny, is recognized by its whiteness, size, brittleness and ready inflammability. That which occurs in globular drops, he says, is termed male frankincense; the most esteemed is in breast-shaped drops, formed each by the union of two tears. The best frankincense, Arrian wrote, was formerly exported from the neighbourhood of Cape Elephant in Africa (the modern Ras Fiel); and A. von Kremer, in his description of the commerce of the Red sea (1863), observed that the African frankincense, called by the Arabs *asli*, is of twice the value of the Arabian luban.

Frankincense was used by the ancient Egyptians in their religious rites. but not in embalming. It constituted a fourth part of the Jenish incense of the sanctuary and is frequently mentioned in the Pentateuch As a medicine it was in former times in high repute. Pliny mentions it as an antidote to hemlock. and Avicenna recommends it for tumours, ulcers of the head and ears, affections of the breast, vomiting, dysentery and fevers. In the east frankincense is used as an external application on carbuncles, blind boils and gangrenous sores, and it is given internally in the treatment of gonorrhea. In China it was an old internal remedy for leprosy and struma, and is accredited with stimulant, tonic, sedative, astringent and vulnerary properties. It is not used in modern medicine. being destitute of any special virtues.

Common frankincense (thus or abietis *resina*) is a term applied to a resin which exudes from fissures in the bark of the Norway spruce fir, Abies *excelsa;* when melted in hot water and strained it constitutes Burgundy pitch.

FRANKING. A term used for the right of sending letters or postal packages free (Fr. franc) of charge. The privilege was claimed by the English house of commons in 1660 in "a Bill for erecting and establishing a Post Office," their demand being that all letters addressed to or sent by members during the session should be carried free. The clause embodying this claim was struck out by the lords, but with the proviso in the act as passed for the free carriage of all letters to and from the sovereign and the great officers of state, and also the single inland letters of the members of that present parliament during that session only. The practice, however, apparently mas tolerated until 1764, nhen, by an act dealing with postage, it was legalized. every peer and each member of the house of commons being allowed to send free 10 letters a day, not exceeding an ounce in weight, to any part of the United Kingdom, and to receive 15. The act did not restrict the privilege to letters either actually written by or to the member, and thus the right was very easily abused, members sending and receiving letters for friends, all that was necessary being the signature of the peer or M.P. in the corner of the envelope. Wholesale franking grew usual. and M.P.'s supplied their friends with envelopes already signed to be used at any time On Jan. 10, 1840. parliamentary franking was abolished on the introduction of the uniform penny rate.

In the United States the franking privilege was first granted in Jan. 1776 to the soldiers engaged in the American War of Independence. The right was gradually extended till it included nearly all officials and members of the public service. By special acts the privilege was bestoaed on presidents and their widows. The vice-president, members of the house and senate and delegates, the clerk of the house and the secretary of the senate were given the privilege of sending and receiving free through the mail all public documents printed by order of congress, the written name of the official user, or a facsimile, and designation of the office appearing on the envelope or parcel. this privilege continuing until the 30th day of June following the expiration of their respective terms of office. The Congressional Record or any part thereof could, under the frank of a member or delegate to be written by himself, be carried free under regulations of the postmaster general. Seeds transmitted by the secretary of agriculture or by any member or delegate receiving seeds from the department for transmission could be sent free in the mails under frank, this privilege applying to former members and former delegates for a period of nine months after the expiration of their terms. The vice-president, members, members elect. delegates and delegates elect could send free through the mails. under their franks, any mail matter to any government official or to any person, correspondence not exceeding four ounces in weight, upon official or departmental business.

United States government agencies are entitled to use the so-called "penalty" statement ("penalty for private use to avoid payment of postage $300") in lieu of postage stamps. The equivalent legend in Great Britain is "O.H.M.S." ("on her majesty's service").

(G. B. GY.)

FRANKL, LUDWIG AUGUST, RITTER VON HOCHWART (1810–1894), Austrian poet, was born at Chrast, Bohemia. on Feb. 3, 1810. In 1838 he became secretary of the Jewish community in Vienna. In the revolutionary year of 1848 his poem, *Die Universitiit*, had an enormous circulation. He wrote lyrics, epic and many excellent critical works on his contemporaries. He is perhaps best remembered for his services to Jewish education. He established the first Jewish school in Jerusalem, and wrote an account of his eastern travels, *Nach Jerusalem* (2 vol., 1858).

See his *Briefwechsel* (1907), edited by Bruno Frankl; his *Erinnerungen* (1910), edited by St. Hock.

FRANKLAND, SIR EDWARD (1825–1899), English chemist and pioneer in the field of structural chemistry. was born at Churchtown, near Lancaster, on Jan. 18, 1825. He wished to enter the medical profession and so was apprenticed to a druggist. During this period of six years he became interested in chemistry and taught himself to make experiments and even to carry out rough analyses of water. In 1845 he entered Lyon Playfair's laboratory in London, subsequently working under R. W. Bunsen at Marburg for three months, and again in 1848. In 1847 he was appointed science master at Queenwood school, Hampshire, where he met John Tyndall. He received his Ph.D. at Marburg in 1849. In 1851 Frankland became the first professor of chemistry at Owens college, Manchester. He worked at Giessen, Ger., under Justus von Liebig for a time. Returning to London, he became lecturer in chemistry at St. Bartholomew's hospital, and in 1863 professor of chemistry at the Royal institution as successor to Michael Faraday. In 1865 he succeeded August Wilhelm von Hofmann at the School of Mines, where he remained for 20 years. In 1894 he received the Copley medal, the highest honour of the Royal society. He was made a knight commander of the Bath in 1897 and died while on holiday at Golaa, Nor., on Aug. 9. 1899.

Analytical problems, such as the isolation of certain organic radicals. attracted his attention to begin with, but he soon turned to synthetical studies. He was only about 25 years of age when he discovered the organometallic compounds. A consideration of these and other substances led Frankland, in 1852, to the conception that the atoms of each elementary substance can combine only with a certain limited number of the atoms of other elements. The theory of valency thus founded dominated the subsequent development of chemical doctrine, and formed the basis of modern structural chemistry.

In applied chemistry Frankland's great work was in connection with water supply. He was appointed a member of the second royal commission on the pollution of rivers in 1868, and in the course of six years he brought to light an enormous amount of valuable information respecting the contamination of rivers by sewage, trade refuse, etc., and the purification of water for domestic use. He also showed that the luminosity of a flame was not only connected with the presence of solid particles, but also with the pressure of the burning gas or vapour; even hydrogen at a pressure of 10 to 20 atm. burns with a luminous flame. Further. he showed that the spectrum of a dense ignited gas resembles that of an incandescent liquid or solid, and he traced a gradual change in the spectrum of an incandescent gas under increasing pressure.

An application of these results to solar physics in conjunction with Sir Norman Lockyer led to the view that at least the external layers of the sun cannot consist of matter in the liquid or solid forms, but must be composed of gases or vapours. Frankland and Lockyer were also the first to realize the existence of helium (*q.v.*).

See memorial lecture delivered by H. E. Armstrong before the London Chemical Society on Oct. 31, 1901; also H. McLeod, *Journal of the Chemical Society* (1905); *Autobiographical Sketches* (1902); W. A. Tilden, *Famous Chemists* (1902); J. Wislicenus, *Berichte der deutschen chemischen Gesellschaft* (1900). His original papers, down to 1877, were collected and published as *Experimental Researches in Pure, Applied and Physical Chemistry.*

FRANKLAND, PERCY FARADAY (1858–1946), British chemist, second son of Sir Edward Frankland. was born in London, Oct. 3, 1858. He was professor of chemistry at Dundee 1888–94; at Mason college. Birmingham. 1894–1900; and at the Imperial College of Science and Technology, South Kensington, 1900–18. His work in pure chemistry was concerned chiefly with optical activity and stereochemistry. He died Oct. 28, 1946.

FRANKLIN, BENJAMIN (1706–1790), American printer, author, publisher. inventor, scientist. public servant and diplomat, has been called "the first civilized American," "the apostle of modern times" and even "the immortal mentor. or, man's unerring guide to a healthy. wealthy, and happy life." Beyond question he was one of the best known and most admired men in the world during the latter half of the 18th century, and he has remained a prominent and symbolic figure in the American gallery of heroes. His life and his thought, however, were so complex and so marked by apparent contradictions that he has puzzled some of his most sensitive interpreters.

His contemporaries knew him as natural philosopher, moralist and diplomat, renowned for his identification of lightning with electricity, for his widely translated and reprinted *Way to Wealth* (the collected sayings of his fictional almanac maker, "Poor Richard" Saunders) and for his skillful furtherance of the welfare of the British colonies nhich became the United States of America. All educated Europeans knew the epigram of Turgot, the French economist — "He snatched the lightning from the skies and the sceptre from tyrants" — and a great many agreed.

Later generations, however. have known Franklin most directly through his posthumously published *Autobiography*. It is an account of his life to 1757, written at nide intervals between 1771 and 1788 and often inaccurate in details. Addressed to his natural son William. it preaches the gospel of getting ahead in the world by thrift, industry and shrewd use of the lessons of experience. Franklin displayed a keen eye for the main chance. and his book is a classic American example of the rags-to-riches story. To the officers of savings banks and other practical men Franklin has seemed the summation of good sense and morality. To others, those who rate caution below warm human sympathies and reverence for the mysteries of the human spirit, he has often appeared to be only a colourless and materialistic opportunist.

"God helps those who help themselves." one of Poor Richard's maxims, is doubtless typical of one facet of Franklin. Yet he was not an ungenerous, timid or self-centred man. He was often passionate and extravagant; he enjoyed whimsy and hoaxes; he looked at the world with a mixture of hope and cynicism. He loved men and women and thought highly of their potentialities, recognizing at the same time the credulity and inadequacy of mankind in the mass. Much of his political and scientific work was controlled by the world view expressed in a letter of 1780 to Joseph Priestley, the discoverer of oxygen. "The rapid progress true science now makes." Franklin wrote, "occasions my regretting sometimes that I was born too soon. It is impossible to imagine the height to nhich may be carried. in a thousand years. the power of man over matter. We map perhaps learn to deprive large masses of their gravity. and give them absolute levity. for the sake of easy transport. Agriculture may diminish its labour and double its produce; all diseases may by sure means be prevented or cured not excepting even that of old age, and our lives lengthened at pleasure even beyond the antediluvian standard. O that moral science were in as fair a way of improvement, that men would cease to be wolves to one another, and that human beings would at length learn what they now improperly call humanity!"

Birth and Ancestry. — Franklin was born in Milk street, Boston, Mass., on Jan. 17, 1706 (new style; Jan. 6, old style). His father, Josiah, a maker of soap and candles, had emigrated from Banbury Oxfordshire, Eng in 1683, aged 25. taking with him a wife. Anne, and three children. Before Anne died in 1689 she had four more children, tuo of them short lived. Josiah quickly remarried, his second wife being Abiah, daughter of Peter Folger, a Nantucket individualist aho had attacked in verse (*A Looking-Glass for the Times*, 1677) the persecutors of Quakers and Baptists Benjamin was the 8th of Abiah's 10 children, the 15th (and the 10th son) of Josiah's 17.

The *Autobiography* begins nith some genealogy. Franklin had learned from an uncle's notes that his father's family had lived for more than 300 years on a 30-ac. farm with a blacksmith's forge at Ecton in Northamptonshire. This parish lies about 70 mi. N.N.W. of London, in central England. Franklin, visiting Ecton in 1758, found parish records beginning in 1555 and learned that *he was the youngest son of the youngest son for five generations. The Franklins had been Anglicans from the time of Henry VIII, but Josiah became a Congregationalist.*

Early Boyhood *(1706–18)—Josiah's fondness for music, his handiness with tools and his good judgment are noted in the memoirs. Benjamin obviously respected his father, who presumably taught him to read, so early that he could not remember learning. An uncle, also named Benjamin, was a member of the household for some time after 1715; he and Josiah, both middle aged, gave much thought to this tenth son's future. For a time they dreamed of making him a clergyman, a tithe to the church, and he had a year in grammar school before Josiah decided he could not afford the cost of a college and theological education. Then George Brownell, a private teacher of such practical arts as writing. bookkeeping and navigation, took Benjamin on. "Under him I acquired fair Writing pretty soon, but I fail'd in the Arithmetic, & made no Progress in it. At Ten Years old I was taken home to assist my Father in his Business." (Franklin's Memoirs, ed. by Max Farrand, p. 20, University of California Press, Berkeley, 1949.)*

The boy's distaste for cutting wicks led Josiah, one of whose sons had already run off to sea, to walk Benjamin around Boston, observing the craftsmen at work and looking for a congenial trade. One cousin was a cutler, and that occupation was seriously considered. Then, on the ground of his fondness for books, Benjamin was persuaded to sign indentures with his elder brother James, who in 1717 had returned to Boston from London with a printing press.

Apprentice and Author (1718–23). *—Benjamin soon learned his trade; he also found time for self-education. He had already read Bunyan's Pilgrim's Progress (which has been compared with the Autobiography), some other religious and theological works owned by his father, Plutarch's Lives and two books which may have contributed to his penchant for social improvement: Defoe's Essay on Projects and Cotton Mather's Essays To Do Good. Now he took a fancy to poetry, and late in 1718 wrote two occasional ballads. One, "The Lighthouse Tragedy," was a popular success, but Josiah's ridicule discouraged further versifying. Friendships developed with other booklovers: Matthew Adams, a tradesman with a "pretty Collection" to lend (Farrand, p. 32), and John Collins. a youngster his own age with a fondness for argument. About 1719 he read some of the Boyle lectures directed against deism (probably William Derham's Physico-Theology, 1712), liked the refutations less than the views abhorred, and "soon became a thorough Deist" (Farrand, p. 146). Franklin years later regretted that his religious skepticism "perverted" others, among them Collins.*

Two books, however, provided experiences he never regretted. A volume of the Spectator was read repeatedly and the essays rewritten from memory, so that he might improve his style and increase his vocabulary. Thomas Tryon's Way to Health led him to a vegetarian diet—and to a bargain with James to feed himself for half the money paid for his board. Half of that Benjamin saved. and he could both buy books and get more time to read. He taught himself some of the mathematics he had missed and, exploring the art of logic, was "charm'd" by the Socratic method into dropping his habits of contradiction to become the "humble Enquirer & Doubter" (Farrand, p. 40), entangling others by hesitance and insidious question.

In 1721 James Franklin founded the New-England Courant, a newspaper remarkable both for its criticism of civic and religious leaders. then unaccustomed to such treatment. and for its literary content. Original essays were welcomed. among them Benjamin's first published prose, the "Silence Dogood" series of 1722, slipped surreptitiously under the officedoor. They intimated, among other things, that money was more valued in Harvard college than intelligence, that New England funeral elegies were hackneyed and ridiculous, and that the euphemisms of drunkards were weird and wonderful. Obviously imitative of the Spectator, they are still readable; clearly Benjamin Franklin was to be more than an ordinarily literate printer.

When James remarked late in 1722 that Massachusetts officials were slow in doing something about piracy he landed in jail for a month. Benjamin carried on the Courant. A few months later James was forbidden to print or publish the paper and Benjamin, his old indentures discharged, became the nominal publisher. The new indentures which he signed secretly he disregarded after quarrels with his brother. sure that James would not dare to produce them, even though his apprenticeship had nearly two years to run. "It was not fair in me," he was to recall years later, "to take this Advantage, and this I therefore reckon one of the first Errata [mistakes. in printing lingo] of my Life." (Farrand, p. 50.) James blocked employment elsewhere in Boston, so Benjamin persuaded a ship captain to give him passage to New York, hinting he "had got a naughty Girl with Child" (Farrand, p. 52)—a fabrication of no little irony. in the light of later events.

Hard-Earned Lessons (1723–26).—*At 17 Franklin had a trade, but he still had much to learn about men and women. He found no work in New York. but heard there might be some in Philadelphia. It took him a stormy 30 hours to get across Lower New York bay, three days and 50 mi. of walking to cross New Jersey, and he still had a cold, sleepless night lost along the Delaware river before he arrived on the Market street wharf. tired. hungry and all but penniless. A vivid passage in the Autobiography describes his walk that Sunday morning, a large puffy roll of bread under each arm and another being munched on, with Deborah Read, eventually to become his wife, watching with amusement from her doorway. A few weeks later he was solvent, employed in Samuel Keimer's printing shop and rooming at the Reads'. Within months, as the result of a chance remark by a brother-in-law. he was sought out by the provincial governor, Sir William Keith, who urged him to enter business for himself and sent him back to Boston with a flattering letter to his father. Josiah thought his son too young for such a venture and refused immediate support.*

On his second trip to Philadelphia Franklin picked up a companion, his old friend John Collins. Now a drinker and wastrel as well as an unbeliever, Collins borrowed money which Franklin was holding but which was not his own, and after some disagreeable scenes left for Barbados without returning it. Even more disillusioning was Sir William's cruelty. Refusing to accept Josiah's judgment, he offered to provide letters of credit and introduction if Franklin would go to England to purchase the equipment needed. He repeatedly postponed handing over the promised letters, finally saying they would be on the ship. Bidding Deborah farewell, probably with some promises. Franklin sailed, to find on his arrival that he had no letters and Sir William no friends. It was left to a shipboard acquaintance, Thomas Denham, a Quaker merchant, to explain that the governor was unreliable. Employment was no problem—Franklin was soon at work in a large printing house—but James Ralph was. He had left a wife and child to accompany Franklin to London and become a poet. Ralph borrowed about £27 before (he being away) Franklin "attempted Familiarities (another Erratum)" (Farrand, p. 112) with a pleasant milliner who had become Ralph's mistress. Another debt was unpaid and another friendship ended.

Franklin's temperance did not endear him to the beer-drinking workmen at the shop, but he showed some of them that it saved money and he was eventually accepted. Helping to set in type the second edition of William Wollaston's Religion of Nature, he was moved to write a deistical pamphlet. A Dissertation on Liberty and Necessity, Pleasure and Pain (1725). His argument that since man has no real freedom of choice he is not morally responsible for his actions later seemed still another erratum, but it brought him the acquaintance of a Dr. Lyons, who introduced him to Henry Pemberton, early popularizer of Newton's philosophy, and Bernard Mandeville, author of the Fable of the Bees. He also met Sir Hans Sloane, from whose collections grew the British museum, selling him a purse made of asbestos from Pennsylvania.

Franklin's most impressive talent at this time was swimming (he once swam the Thames from Chelsea to Blackfriars, about three miles). and he was considering starting a swimming school when his friend Denham urged him to return to Philadelphia. offering employment in his store. They sailed in July 1726. Franklin was not happy about facing Deborah, to whom he had written only once. On the voyage he kept a journal which shows an awakening interest in science and which originally contained a plan for his future conduct. This plan is not certainly extant. One would expect that it contained some resolutions about lending money to friends, accepting the word of would-be benefactors and making advances to women.

Achievement of Security (1726–48).—Franklin worked for Denham about four months before his employer died unexpectedly. He then returned to Keimer's printing shop, and was soon "quite a Factotum" (Farrand, p. 130), casting type, engraving and making ink, as well as helping train the apprentices. To Hugh Meredith, near the end of his term, he was particularly close, and early in 1728 the two set up in business for themselves. In July 1730 Franklin bought out his partner with borrowed money. At this point his private life was extremely complicated. Deborah Read had understandably not waited for him, but the man she married had deserted her and disappeared. Franklin's demand of a marriage settlement to pay off his business debt ended one matchmaking venture. A strong sexual drive, "that hard-to-be governed Passion of Youth" (Farrand, p. 178), as Franklin described it, was sending him to "low Women," and in the winter of 1730–31 he had a son, William, whose mother has never been identified. Franklin must have known that a baby was on the way when, his affection for Deborah having "revived," he "took her to Wife" (Farrand, p. 180) on Sept. 1, 1730. Their common-law marriage lasted until Dehorah's death in 1774. They had two children, a son who died at four and a daughter, Sarah, later Mrs. Richard Bache, who survived them both. The illegitimate William was brought up in the household.

As his own master and the head of a family, Franklin proceeded to make himself financially secure. He was able to retire from business in 1748, although he seems to have retained some hand in the almanacs published by Franklin and Hall, the firm nhich between 1748 and 1766 gave him an average annual income of almost £500. His retirement was the result of hard work, clever salesmanship and some good fortune. His shop dispensed not only printing, but also books, stationery, soap and occasionally fish. cheese, spices and other commodities; he bought rags for papermakers; he even dealt in slaves and the unexpired contracts of indentured servants.

Government printing was a major source of profit to the trade. Franklin and Meredith's first success was securing the job of printing paper currency for Pennsylvania. Characteristically, Franklin helped get this business by writing in favour of paper money; his *Modest Enquiry Into the Nature and Necessity of a Paper Currency* (1729) was his first venture into economic theory. For years thereafter Franklin was public printer not only of Pennsylvania, but also of New Jersey, Delanare and Maryland Another money-making venture was the *Pennsylvania Gazette,* a newspaper purchased from Keimer in 1729. It soon surpassed its competitors in liveliness and in advertising. Franklin was a skillful editor and publisher. Another success was the series of *Poor Richard* almanacs, published annually between 1732 and 1757 in issues as large as 10,000. The famous maxims, pillaged from the collections of proverbs and epigrams of the old world, but often Americanized by Franklin's hand, helped make Franklin known far beyond his town and province. Failures, of course, were inevitable for a publisher: a German-language newspaper collapsed in 1732 before it had really started, and in 1741 a monthly magazine lasted only six months. Franklin was generally prosperous, however; he made enough to invest capital in real estate and in partnerships or working arrangements with printers in the Carolinas, New York and the British West Indies.

His energy was not exhausted by business. More than ordinarily gregarious, and with a remarkable social conscience, he mas involved in numerous projects for social improvement by collective efforts The first of these was the Junto, or Leather Apron club, organized in 1727 to debate questions of morals, politics and natural philosophy, and to exchange knowledge of business affairs nhich might be valuable to the more enterprising members. More than one historian has noted the similarity of the Junto to the so-called "service" clubs of the 20th century, of which Rotary International is the prototype. Franklin worked through the Junto in many ways. The need of its members for easier access to books led in 1731 to the organization of the Library Company of Philadelphia, earliest of the many American subscription libraries. By his own account Franklin spent an hour or two there each day, mastering foreign languages and filling in the gaps in his general education. Through the Junto he proposed a paid city watch or police force, a suggestion eventually but not immediately followed; a paper read to the same group resulted in the organization of a volunteer fire company. In 1743 he called for a "constant correspondence" of virtuosos (men of scientific interests) throughout the colonies, and in the following year the American Philosophical society was modestly functioning. It is often described as an outgrowth of the Junto.

Franklin became, in short, a successful promoter. He noted that Pennsylvania had neither a college nor a militia. An academy was in his mind as early as 1743, but not until 1749 did he find the time ripe for his *Proposals Relating to the Education of Youth in Pennsylvania,* instrumental in founding the Academy of Philadelphia in 1751 and the best-known early American argument for advanced training in the useful arts and sciences. Although his ideas were not wholly followed, the institution which grew out of the academy — the University of Pennsylvania — made notable contributions to professional education. Another pamphlet, *Plain Truth; or, Serious Considerations on the Present State of the City of Phzladelphia and Province of Pennsylvania* (1747), written after French and Spanish privateers had invaded the Delaware river, helped enroll a volunteer militia of 10,000 men, despite the Quaker coolness toward armed defense. Eventually he became almost indispensable to those who had good works in mind. helping to raise money for church buildings and, in 1751, for Thomas Bond's project, the Pennsylvania hospital, a pioneer institution important to medical education in America.

Franklin's belief in association for useful ends made natural his joining St. John's lodge in 1731. It claims to be the first Masonic lodge in America. Franklin's loyalty to Freemasonry helped him years later with some of the anticlerical intellectuals in the court of Louis XVI. In 1782 he uas elected venerable master of La Loge des Neuf Soeurs, which has been called with some justice the UNESCO of the 18th century.

Before his retirement. moreover. Franklin also began his work as a servant of the public. Appointed clerk of the Pennsylvania assembly (legislature) in 1736, he retained that post until 1751, when he was elected a member. In 1737 he was appointed postmaster of Philadelphia. an unusually valuable office for a newspaper publisher; he held it until he became one of the two deputy postmasters general for the colonies in 1753.

Electrical Science (1748–52).—Franklin's curiosity about natural phenomena can be traced to his boyhood, but not until 1740 did it become more than desultory. In that year he invented the Pennsylvania fireplace, better known as the Franklin stove, a new kind of heating unit. This invention characteristically combined theoretical knowledge and practical advantages. He wrote a pamphlet about this stove in 1744, for his friend Robert Grace, who was manufacturing it, but refused to take out a patent because "as we enjoy great Advantages from the Inventions of others. we should be glad of an Opportunity to serve others by any Invention of ours" (Farrand, p. 794). By this time he was reading all the scientific literature he could find and had some contact with lecturers on natural philosophy *(cf.* I. Bernard Cohen's edition of *Benjamin Franklin's Experiments,* 1941, and the same scholar's *Franklin and Newton,* 1956). He certainly read with care the articles on electricity, at that moment the most novel subject in European science, by William Watson, published in the *Philosophical Tvansactions* of the Royal Society of London in 1745. Franklin and three friends — Thomas Hopkinson, Philip Syng and Ebenezer Kinnersley — acquired simple apparatus and, in the winter of 1746–47, began an exploration of electrical phenomena. The Philadelphia climate and apparatus makers, combined with Franklin's ingenuity, produced remarkable discoveries. reported by Franklin in a series of letters to a London friend, Peter Collinson. Many of the letters were read before the Royal society and some were printed in the *Gentleman's Magazine.* In April 1751 a collection was printed as *Experiments and Observations on Electricity.* This book, of 80-odd pages, made Franklin famous, first in France, where a translation appeared in 1752, and later throughout Europe. The experiment which Franklin suggested to prove the identity of lightning and electricity was first carried out in France. before Franklin is supposed to have tried the simpler expedient of flying a kite in a thunderstorm. His book stands first among the scientific contributions of 18th-century Americans. It appeared in four later English editions before 1769, usually with additional letters and papers by Franklin and others; there were two additional French editions; and it was also translated into German (1758) and Italian (1774).

Franklin's study of electricity has two noteworthy aspects. First, his "one fluid" theory or hypothesis accounted for more of the observable phenomena than did any previous hypothesis. Second, his suggestion that buildings might be protected from lightning by erecting pointed iron rods seemed both practical and highly dramatic. On the whole his originality was not as great as many of his admirers have thought (Cohen has shown that it decreased as he came into closer touch with his fellow experimenters in Europe). but he invented many of the terms which are still used in discussing electricity (positive, negative, battery, conductor, etc.) and he described his experiments with a clarity that commands respect from all orderly minds.

By 1752 he had made his most important contributions to science, including, outside of electricity, his observation (1743) that storms which apparently came from the northeast actually moved from the southwest. For the rest of his life he occasionally conducted experiments or theorized with his innumerable correspondents. Heat, light, sound and magnetism interested him, as did hydrodynamics. hydrostatics, chemistry, geology, physiology, psychology and oceanography.

Science gave him handsome rewards. In 1753 he received the Copley medal from the Royal society and honorary M.A. degrees from Harvard and Yale. William and Mary gave him an M.A. degree in 1756, Edinburgh an LL.D. in 1759 and Oxford the degree of doctor of civil law in 1762. He was an active, corresponding or honorary member of scientific societies in London, Edinburgh, Paris, Orléans, Rotterdam, Gottingen. Padua, Milan and St. Petersburg.

He has some interest as a social scientist as well (*cf.* L. J. Carey, *Franklin's Economic Views,* 1928). "Observations Concerning the Increase of Mankind, Peopling of Countries, etc." (1755, but written in 1751) speculated on the relation between population and the means of subsistence and states a belief in free trade. Later papers. notably "Positions to Be Examined, Concerning National Wealth" (1769), show a distrust of commerce and manufactures which he may have acquired from his friends among the French economists.

Public Servant (1753–85).—Politics encroached more upon his retirement than did science. From 1753, when he took charge of the mails in all the northern colonies, he tended to think in terms of the bonds of common interest which tied the separate commonwealths together. although it mas to be long before the average man in America thought of himself as an American first and a Virginian or Pennsylvanian second. For 20 years Franklin was America's chief spokesman, so far as there was an America to speak for. His base of operations for 16 years mas London, where he was thoroughly at home and might easily have settled except for his sense of responsibility. He became an American and a revolutionary almost in spite of himself, working until the last possible moment to reconcile conflicting interests, to interpret America to Englishmen and British politics to Americans. At one time or another he was *persona non grata* to extremists on both sides of the debate. Like most politicians he made mistakes and suffered for them, but he also had some triumphs.

The first of the latter was the adoption of his "Plan of Union" by the Albany congress. assembled in 1754 to make common cause against the French and Indians. It proposed a general council, with representatives from the several colonies, having the power to tax, organize the common defense and supervise Indian relations and new settlements. A president, appointed by the king. was to have the veto power, as was the king himself if he exercised it within three years, Neither the colonial legislatures nor the king's advisers found this scheme acceptable, each fearing some loss of power. The rejection of his scheme was his first lesson in a conflict between reason and justice on the one hand and the factor of power on the other, an antagonism which was probably the central feature of his political career (*cf.* Gerald Stourzh, *Benjamin Franklin and American Foreign Policy,* 1954). Noteworthy, too, was his assertion of the time-honoured principle that taxation should be the prerogative of representatives of the people—soon to become one of the major issues in the American Revolution.

The realities of political action nearly ruined Franklin in 1755, when he promised Pennsylvania farmers to stand good for any losses they might sustain if they used their horses and wagons to supply Gen. Edward Braddock's army in its expedition against Ft. Duquesne. For more than two months it appeared that he might have to pay almost £20,000 out of his own pocket. The government eventually paid, but Franklin was thereafter more cautious about his commitments.

The need of money for defense led the Pennsylvania legislature to seek to tax the lands of the Penn family, proprietors under the charter of the colony. Either their consent or a change in the form of government was required. Chosen to represent the assembly on this matter, Franklin was in London most of the time between July 1757 and Aug. 1762. With the help of a legal adviser, the "all-knowing" Richard Jackson, he eventually effected a compromise, by which the proprietors' improved lands could be taxed, but not those unsurveyed. This was not enough for Franklin, who detested Thomas Penn and wanted to oust the proprietary government altogether. His first mission was nevertheless remarkable for his continued use of his talent as an author to further his cause. and for his establishment of many close friendships. His most significant writing in London was *The Interest of Great Britain Considered With Regard to Her Colonies, and the Acquisitions of Canada and Guadaloupe* (1760), believed to have influenced the makers of the treaty of Paris (1763), which gave Canada to Great Britain as Franklin had hoped.

By then he was back in Philadelphia. where the conflict between legislature and proprietors continued. A petition to make Pennsylvania a crown colony was agreed on and by Dec. 1764 Franklin was again in London, just in time to testify that the proposed Stamp act was the wrong way to raise additional tax money in America. Nonetheless the act was passed. Franklin so greatly underestimated the probable opposition that he nearly ended his political usefulness. Determined to make the best of a bad situation, he meekly ordered stamps for the use of Franklin and Hall and nominated a friend for the post of stamp officer in Philadelphia. The feeling against him was so strong that his wife Deborah brought guns and male relatives into the house to defend it. Shocked by the violence reported from America. Franklin devoted himself to the campaign for repeal and regained his prestige by answering 174 questions before the house of commons in mid-Feb. 1766. The examination. during nhich he clearly and briefly answered both friends and enemies. gave Britons some understanding of how Americans ielt. Immediately published from a stenographic transcript his remarks made him the hero of the repeal. His real mission, the negotiation of a new charter. was unsuccessful, but the failure was forgotten in the excitement.

Pennsylvania kept him on as agent, and he was employed by three other colonies—Georgia (1768). New Jersey (1769) and Massachusetts (1770). With this support and that of the British Whigs, he rode through the succession of crises ending with the armed clashes at Lexington and Concord. Gradually he was forced to realize that there could be no reconciliation and that his dream of a British empire of self-governing nations would not come true. He did his best to present the American view to his friends and, through newspaper articles (126 between 1765 and 1775), to the British public. At the end he was bitter, in "Rules by Which a Great Empire May be Reduced to a Small One" and "An Edict by the King of Prussia," both first printed in the *Public Advertiser* in 1773. Taken together they are a capsule history of the long-drawn-out contest. In Jan. 1774, because of his writing and his share in the publication of the letters of Thomas Hutchinson, governor of Massachusetts, to his British superiors, Franklin was dismissed from the post office. In March 1775, aware that there might be war, he left England, three days before his friend Edmund Burke delivered his eloquent but futile speech to the commons on conciliation with America. A day after his arrival in Philadelphia he was a delegate to the second Continental Congress. There he served on committees for the organization of a postal system and for the drafting of the Declaration of Independence, and on a commission which vainly attempted to bring Canada into the war as an ally. He also found time to be presiding officer of the constitutional convention of Pennsylvania.

In Sept. 1776 Congress agreed to send a commission to France, hoping to secure economic and military assistance. Its members were Silas Deane, already in Paris, Arthur Lee (as a substitute for Thomas Jefferson, kept home by his wife's illness) and Franklin. He arrived in Paris just before Christmas; before the end of the year he and his colleagues were engaged in secret negotiations with the comte de Vergennes, minister of foreign affairs and. fortunately for the Americans, an enemy of Britain. These negotiations were enormously complicated by cloak-and-dagger intrigue, with spies and informers everyahere. As a diplomat, Franklin had the great advantages of French friends and disciples, a skin ailment which made it reasonable for him to wear a fur hat, and no shyness about his need for spectacles through ahich to see the world. Before long he mas the hero of France, the personification of the unsophisticated nobility of the new world, leading his people to freedom from the feudal past. His portrait was everywhere, on *objets d'art* from snuffboxes to chamber pots, his society sought after by diplomats, scientists, Freemasons, fashionable ladies. There was indeed a Franklin cult, not without its ridiculous side. Franklin rose to the occasion magnificently, however, displaying such wit and social grace as to endear him to the French for generations.

The sought-for treaties mere signed in Feb. 1778, after General Burgoyne and 6,000 men had surrendered at Saratoga and it was clear that Britain was not going to crush the rebellion easily. Very considerable loans were obtained for the United States, and without French military and naval aid the final victory at Yorktown in 1781 might not have been achieved. The marquis de Lafayette. the comte de Rochambeau and Admiral de Grasse are the best known of an estimated 12.000 soldiers and 32.000 sailors. including officers, who left France to support Washington in America. Despite the strong bonds thus established (and recalled by General Pershing's "Lafayette. we are here" in 1917), the peace was difficult. Spain had entered the war in 1779, hoping to recover Gibraltar but, aware of the conflict of interests in Florida and Louisiana, refused to recognize American independence. France had guaranteed that there would be no separate peace. Franklin worked with Vergennes until his fellow commissioners. John Adams and John Jay. overruled him on procedure, signing preliminary agreements with Britain late in 1781 without prior consultation with France. The formal treaty was signed Sept. 3, 1783.

Before the end of the year Franklin asked congress to be replaced. but he was retained for two more years to help make trade treaties. His popularity unabated, he occupied himself by observing the first balloon ascension and serving on a committee appointed by Louis XVI to report on the claims of a new marvel, "animal magnetism." which Franz Anton Mesmer thought would cure many if not all diseases.

The **Last Years (1785–90)**.—Franklin was 79 when he began his last journey home. He had a large stone in his bladder, which made carriage travel an agony. and other ailments of old age. Carried to Le Havre in one of Marie Antoinette's litters, he was comfortable enough on the voyage to write two scientific papers. "Maritime Observations" and "The Causes and Cure of Smoky Chimneys." In Philadelphia he was elected to the executive council of the state and a few days later chosen president, serving for three years. He lived as quietly as possible. interested himself in improving his property, but was still active in the American Philosophical society and in the new Society for Political Enquiries (1787). of which he was first president. A member of the Constitutional Convention of 1787. he was not able to convince his associates that the American government should have an executive committee at its head rather than a president. nor that there should be a single-chamber legislature. He spoke when the time came for compromise between the large states and the small ones. and his speech on the last day. read for him by James Wilson, was a plea that the objections, his own among them, be forgotten, and that the delegates unanimously support the instrument they had framed. This government, Franklin wrote, "is likely to be well administered for a course of years, and can only end in despotism, as other forms have done before, when the people shall become so corrupted as to need despotic government, being incapable of any other." His motion for adoption by unanimous consent was promptly carried. In the fight for ratification he took no active part. Except for supporting an effort to have the first congress of the United States consider the abolition of Negro slavery, he took no further part in public life.

For the last year he was bedridden, escaping severe pain only by the use of opium. He died on April 17, 1790, aged 84. Philadelphia gave him the most impressive funeral that city had ever seen. and in France. uhere Louis XVI was imprisoned in the Tuileries eulogy after eulogy poured forth to the man who to the French was the symbol of enlightenment and freedom.

Private Life.—Franklin, for all his fame, had many personal misfortunes. His son William, who became royal governor of New Jersey in 1763, chose to take his stand with the loyalists in the Revolution; he and his father were never fully reconciled thereafter. William Temple Franklin, William's natural son. was his grandfather's secretary in France and. after long delay. the first editor of the memoirs; he shoved no special talent for either task. Deborah Franklin, although a good manager of her husband's affairs and devoted to her family, nas far from his equal in intelligence or adaptability to social situations. Jane Mecom, the sister nith whom he was most in touch. norried him with a succession of family troubles grave enough to embitter any ordinary man. Franklin did a great deal for his relatives—and was criticized for it—but he had far from an ideal family life.

His most satisfying emotional connections may have come from outside his immediate family, with girls and women younger than he. The first such friendship (at first, perhaps, a flirtation) was nith Catharine Ray (later Mrs. William Greene), whom he met in 1754, when she was 23 and he 48. They corresponded for 35 years and met seven times. In 1757, rooming in Craven street, London, Franklin formed a similar attachment to Mary (Polly) Stevenson (later Mrs. William Hewson). They were close for more than 30 years, exchanging many letters, and during the last four years of Franklin's life. Mrs. Hewson was in Philadelphia, where she read to him on his deathbed. In Paris, after Deborah's death in 1774, Franklin was more or less seriously in love with Mme. Brillon de Jouy. the youthful wife of a public official. and with Mme. Helvétius, a widow to whom he proposed marriage. Much of his most polished nriting is to be found in the letters written to these women or in pieces written for their entertainment or instruction.

Modernity.—The most remarkable aspect of Franklin is perhaps the variety of ways in which he has remained interesting to his successors. In 1956. for example, the Franklin Institute of Philadelphia, with the co-operation of about 500 other societies and institutions. organized an international celebration of the 250th anniversary of Franklin's birth. Ten areas wherein Franklin's work or thought was believed relevant to the 20th century were defined. (1) education and the natural sciences; (2) international relations and the public service; (3) publishing, broadcasting and communications; (4) science and engineering; (5) medicine and the public health; (6) printing, advertising and the graphic arts; (7) finance. insurance, private enterprise; (8) religion, fraternal organizations and the humanities; (9) agriculture, horticulture and botany; and (10) music, entertainment and special events. The connections in some instances, such as the last two, are rather tenuous, but few other men of the 18th or any other century can even tenuously be related to so many fields. Of ail the founding fathers of the United States, Franklin, were there such a thing as reincarnation, would adapt himself most readily to the complexities of the latter half of the 20th century. His modernity is nothing less than astonishing.

BIBLIOGRAPHY.—A. H. Smyth's edition of Franklin's writings, 10 vol. (1907–10), has long been the best available. In 1954 the American Philosophical Society and Yale University announced their joint sponsorship of an edition of Franklin's papers, to include between 25,000 and 30,000 documents.

The fullest biography is Carl Van Doren, *Benjamin Franklin* (1938), the best brief one Verner W. Crane. *Benjamin Franklin and a Rising People* (1954). Both have useful bibliographies. Generally admired, also, is Carl Becker's article in the *Dictionary of American Biography* (1931), separately reprinted in 1946. The *Autobiography,* to be used, as has been suggested, with caution, presents an exceedingly complicated textual problem; see *Benjamin Franklin's Memoirs,* Parallel Text Edition, ed. by Max Farrand (1949), for its explanation.

A number of the numerous special studies have been cited in the present article. For a survey of Franklin scholarship, *see* Richard D. Miles, "The American Image of Benjamin Franklin," *American Quarterly* (summer 1957). (*T.* HR.)

FRANKLIN, EDWARD CURTIS (1862–1937), pioneer with H. P. Cady and C. A. Kraus in the field of chemistry of liquid ammonia solutions, was born on March 1, 1862, at Geary City, Kan. He was educated at the University of Kansas, Lawrence (B.S., 1888; M.S., 1890), and Johns Hopkins university, Baltimore, Md. (Ph.D., 1894). He was assistant in chemistry at the University of Kansas, 1888–93; associate professor, 1893–98; and professor. 1898–1903. In 1903 he became associate professor of organic chemistry at Stanford university, Calif., and in 1906 tvas made professor. He retired as emeritus professor in 1929. He served on the U.S. assay commission in 1906, in 1911–13 was professor of chemistry and chief of the division of chemistry at the Hygienic laboratory of the U.S. public health and marine hospital service. In 1918 he was a physical chemist at the bureau of standards. His honours included membership in the National Academy of Sciences and election to the presidency of the American Chemical society (1923). The chief significance of his work was in extending the horizons of inorganic chemistry as a result of his researches on the ammonia system of compounds and the use of liquid ammonia as an electrolytic solvent. He was the author of the classic monograph "The Nitrogen System of Compounds." (JB. KG.)

FRANKLIN, SIR JOHN (1786–1847), English rear admiral and explorer who discovered the northwest passage, mas born at Spilsby, Lincolnshire, on April 16, 1786. He served at the battles of Copenhagen and Trafalgar. In 1818 he commanded the "Trent" in Capt. D. Buchan's arctic expedition. From 1819 to 1822 he led the arctic overland expedition from Hudson bay to the Arctic ocean and surveyed part of the coast to the east of the Coppermine river. From 1825 to 1827 he commanded a second overland expedition and traced the North American coast from the Mackenzie to 149° 37' W. long., while John Richardson's party explored the coast between the mouths of the Mackenzie and Coppermine. The two expeditions together had added 1,200 mi. of coast line to the knowledge of the American continent. He published two books giving an account of these journeys: *Narrative of a Journey to the Shores of the Polar Sea* (1823) and *Narrative of a Second Expedition to the Shores of the Polar Sea* (1828). In 1828 Franklin married Jane Griffin, his second wife. The following year he was knighted. From 1836 to 1843 he was governor of Van Diemen's land (Tasmania).

On his return to England, Franklin took command of an expedition for the discovery of the northwest passage. The "Erebus" and "Terror," with 129 officers and men, sailed on May 19, 1845. They were last seen at the entrance to Lancaster sound on July 25. It was 14 years before the mystery of their subsequent movements was solved. From 1848 onward a series of expeditions organized by the government or by private individuals searched for them and in 1859 Capt. Leopold McClintock, sent by Lady Franklin, finally disclosed the fate of the expedition. Besides skeletons and various articles in King William Island, and reports from an Eskimo in Boothia, a record was found telling the history of the expedition up to April 25, 1848. In 1845–46 they had wintered at Beechey Island, having ascended the Wellington channel to latitude 77°, and returned by the west side of Cornwallis Island. They had navigated Peel and Franklin straits but had been stopped by ice coming down McClintock channel (then unknown). An addendum dated April 25, 1848, signed by J. Fitzjames and F. R. M. Crozier, said that the ships were deserted on April 22, 1848, having been beset since Sept. 1546. Franklin died on June 11, 1847, and by then 24 officers and men had perished. The record stated that they would start the next day for Back river. Strength must have failed; an Eskimo woman said that they fell down and died as they walked. Franklin's expedition is credited with having discovered the northwest passage, as the point the ships reached was within a few miles of the known waters of America.

FRANKLIN, WILLIAM BUEL (1823–1903), prominent Union general in the American Civil War, was born at York, Pa., on Feb. 27, 1823. He graduated with distinction from the G.S. Military academy, West Point, N.Y.; served in the Mexican War; and engaged thereafter in engineering work. After outbreak of the Civil War he was assigned to the army of the Potomac and served as brigadier-general in the campaign against Richmond in 1862. During the battle of Frayser's Farm he performed well in covering the retreat of Gen. George B. McClellan (*q.v.*). As major-general at Antietam (*q.v.*) his apparently sound advice that his fresh troops renew the battle was not heeded. Though Franklin was criticized by Gen. A. E. Burnside (*q.v.*) for inefficiency at Fredericksburg (*q.v.*) and was blamed by the congressional committee on the conduct of the mar for the loss of the battle. it should be pointed out that Burnside's orders to his subordinate were somewhat confusing. Franklin resigned from the army in 1866 and served as vice-president and general manager of the Colt's Patent Fire Arms Manufacturing company in Hartford, Conn., until 1888. He died at Hartford on March 8, 1903.

See James *H.* England, "William Buel Franklin," *Professional Memoirs, Corps of Engineers, United States Army and Engineer Department at Large,* vol. x, pp. 485–489 (1918); Kenneth P. Williams, *Lincoln Finds a General: a Military Study of the Civil War,* vol. 1 and 2 (1957). (H. H. SI.)

FRANKLIN, one of the three divisions of the Northwest Territories, Canada, extending from the Arctic circle to the north pole and including Baffin land south of the Arctic circle. It was formed into an organized district by order in council in Oct. 1895 and its boundaries were finally adjusted by an order in council March 16, 1918, in force Jan. 1, 1920, and includes islands and peninsulas, such as Banks, Prince Albert, Victoria. Wollaston, King Edward and Baffin land, Melville, Bathurst, Prince of Wales and Cockburn islands. Of these, Baffin Iand alone extends south of the Arctic circle. Area, 549,253 sq.mi. Pop. (1956) 4,408. Except for the mounted police and officials, there are a few Indians, Eskimos and fur traders. There are musk oxen, polar bears, foxes and other fur-bearing animals. District named after Sir John Franklin.

FRANKLIN, a city of Pennsylvania, U.S., the seat of Venango county, is located 65 mi. N. of Pittsburgh at the junction of French creek and the Allegheny river. Because of its strategic location, Franklin was an important pawn in the English-French struggle for North America after 1750. In 1752 a French expedition under Chevalier Pierre Paul Marin established Ft. Machault at that point. In December of the next year George Washington stopped at the new fort while delivering Governor Dinwiddie's "get out" message to the French commander. The French destroyed the fort during their retreat of 1758 but the British raised a new fortification (Ft. Venango) at the site. This in turn was destroyed by Indians during the uprising of 1763. The town, which derives its present name from Ft. Franklin, erected by the Americans in 1787 and named in honour of Benjamin Franklin, was platted in 1795, incorporated as a borough in 1823 and incorporated as a city in 1866.

Franklin's later history is closely associated with the rise of the American oil industry. The first successful oil well in America (Colonel Drake's well) was drilled in 1859 by William A. Smith of Franklin on an island in Oil creek, near Titusville. Within two years the Franklin-Titusville-Oil creek area was transformed into the "Oil Regions" with an annual production in excess of 2,000,000 bbl. About 2,000 craft of all descriptions transported this harvest downstream. Franklin became a financial, transportation and refining hub of the new industry until development of the Texas-Oklahoma oil fields after 1900 shifted the oil production centre to the southwestern United States. John Wilkes Booth was the owner of one of the early Franklin wells; he left the town in early April 1865, to assassinate Pres. Abraham Lincoln. The frantic atmosphere of this boom period that spawned such diverse characters as "Coal Oil Johnny" and John D. Rockefeller has been captured by Hildegarde Dolson, a native of Franklin, in her colourful history, *The Great Oildorado* (1959).

Franklin continues to bear the imprint of the prosperous oil years; expansive lawns provide a setting for many well-kept, ostentatious houses of the Victorian era. Its population in the 20th century remained fairly stable; for comparative population figures *see* table in PENNSYLVANIA: *Population.* (R. L. LE.)

FRANKLIN INSTITUTE: *see* MUSEUMS AND GALLERIES: *Industry Museums.*

FRANKLINITE, a member of the spinel (*q.v.*) group of minerals, consisting of oxides of ferric and ferrous iron, manganese and zinc in varying proportions. It is found in considerable amount, associated with zinc and manganese minerals (zincite and willemite) in crystalline limestone, at Franklin, N.J., where it is mined as an ore of zinc (containing 5% to 20% of the metal); after the extraction of the zinc, the residue is used in the manufacture of an alloy of iron and manganese (spiegeleisen) used in making steel. Franklinite occurs as octahedral crystals. often with rounded edges, and as granular masses. The colour is iron-black and the lustre metallic; hardness 6, specific gravity 5.2. The formula is $(Fe,Zn,Mn)(Fe,Mn)_2O_4$. It resembles magnetite, but is readily distinguished by the fact that it is only slightly magnetic. *See* also ZINC.

FRANKPLEDGE. The frankpledge system provided that all men not in the household of some great man, who would be responsible for their good behaviour and appearance in court in case of necessity, should be in frankpledge or tithing. The frankpledge was an association of men, generally twelve in number, the members of which were mutually responsible for the production of any one of them in court. If a man fled rather than pay for his crime the frankpledge of which he was a member had to pay, This idea of keeping the peace by a system of mutual responsibility goes back to very remote times. In the 12th century the greater efficiency of the central administration enabled the system to be regularly enforced. Originally the frankpledge was confined to free men, the unfree were left to their lord. By the time records began to be kept the system embraced all but persons of established position. The word frankpledge was not used uniformly all over England to describe these associations. In some parts they were known as tithings or *decennœ*. The custom ruling the arrangements of the frankpledges and tithings, too, varied considerably. Sometimes the frankpledge was known by the name of the chief member, the chief pledge or the tithing man. Sometimes it was known by the name of the village or hamlet. It is possible that the density of population had much to do with deciding the local practice. The View of Frankpledge was a bi-annual enquiry as to the proper observance of the law with regard to frankpledges; an enquiry whether everyone was in frankpledge, whether the frankpledges were of an adequate size, and were performing their duty. Originally the sheriff held the view of frankpledge in the shire court twice a year. It is clear that he made the view an occasion for extortion and in the 1217 issue of Magna Carta the holding of this court is regulated. In the 13th century this franchise, the view of frankpledge, was often in private hands. This did not prevent the law with regard to frankpledges being enforced, since the franchise was a valuable one and it paid the lords of the courts to conduct the enquiry.

See W. A. Morris, *The Frankpledge System* (1910). (D. M. S.)

FRANKS, SIR AUGUSTUS WOLLASTON (1826–1897), English antiquary, was born on March 20, 1826, and was educated at Eton and at Trinity college, Cambridge. In 1851 he was appointed assistant in the antiquities department of the British Museum. Here, and as director of the Society of Antiquaries, an appointment he received in 1858, he made himself the first authority in England upon mediaeval antiquities of all descriptions, upon porcelain, glass, the manufactures of savage nations, and in general upon all Oriental curiosities and works of art later than the Classical period. In 1866 the British and mediaeval antiquities, with the ethnographical collections, were formed into a distinct department under his superintendence; and the Christy collection of ethnography in Victoria street, London, afterwards transferred to the British Museum was also under his care. He retired in 1896, and died on May 21, 1897. His fortune was largely devoted to the collection of ceramics and precious objects of mediaeval art, most of which became the property of the nation, either by donation in his lifetime or by bequest at his death. The most famous of the objects bequeathed by him to the British Museum is the carved bone casket, Northumbrian work of the 8th century, known as the "Franks Casket."

FRANKS. The earliest mention in history of the name Franks is an entry on the *Tabula Peutingeriana,* "Chamavi qui et Pranci." The earliest occurrence of the name in any author is in the *Vita Aureliani* of Vopiscus, referring to the year 241.

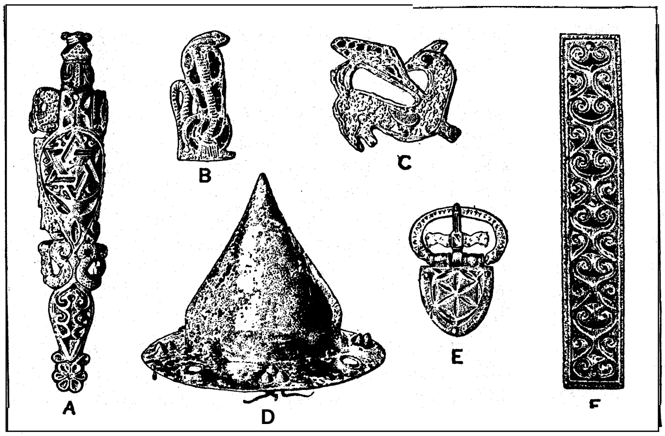
All the Germanic tribes, which were known from this time onwards by the generic name of Franks, doubtless spoke a similar dialect and were governed by customs which must scarcely have differed from one tribe to another—all they had in common. Each tribe was politically independent; they formed no confederations. Sometimes two or three tribes joined forces to wage a war; but, the struggle over, the bond was broken, and each tribe resumed its isolated life.

Of these tribes the Salians were to become most prominent. They are mentioned for the first time in 358, by Ammianus Marcellinus (xvii, 8, 3). At this time they occupied the region south of the Meuse, between that river and the Scheldt. The Caesar Julian defeated them completely, but allowed them to remain as *foederati* of the Romans. They perhaps paid tribute, and they certainly furnished Rome with soldiers; *Salii seniores* and *Salii juniores* are mentioned in the *Notitia dignitatum,* and Salii appear among the *auxilia palatina.*

At the beginning of the 5th century, when the Roman legions withdrew from the banks of the Rhine. the Salians installed themselves in the district as an independent people. The place-names became entirely Germanic; the Latin language disappeared; and the Christian religion suffered a check, for the Franks were to a man pagans. The Salians were subdivided into a certain number of tribes, each tribe placing at its head a king, distinguished by his long hair and chosen from the most noble family *(Historia Francorum,* ii. 9).

The most ancient of these kings, reigning over the principal tribe. who is known to us is Chlodio. Towards 431 he crossed the great Roman road from Bavay to Cologne, which was protected by numerous forts and had long arrested the invasions of the barbarians. He then invaded the territory of Arras, but was severely defeated at Hesdin-le-Vieux by Aetius, the commander of the Roman army in Gaul. Chlodio, however, soon took his revenge. He explored the region of Cambrai, seized that town and occupied all the country as far as the Somme. At this time Tournai became the capital of the Salian Franks.

After Chlodio a certain Meroveus was king of the Salian Franks. Perhaps the remarks of the Byzantine historian Priscus may refer to Meroveus. A king of the Franks having died, his two sons disputed the power. The elder journeyed into Pannonia to obtain support from Attila; the younger betook himself to the imperial court at Rome. "I have seen him," writes Priscus; "he was still very young, and we all remarked his fair hair which fell upon his shoulders." Aetius welcomed him warmly and sent him back a friend and *foederatus.* In any case, Franks fought (451) in the Roman ranks at the great battle of the Catalaunian fields,



FROM SEYMOUR DE RICCI, "THE J. P. MORGAN MEROVINGIAN COLLECTION"

FRANKISH METALWORK OF THE 4TH TO THE 8TH CENTURIES A.D.

A. Gilt silver plaque from spear with Seal of Solomon in centre; B. One of a pair of flat bronze sacred serpents (uraei) covered with red cloisonne paste; C. One of a pair of bird or dragon-shaped fibulae of bronze coated with gold; D. Iron umbo of a shield covered with gilt silver; E. Gilt silver belt buckle inlaid with niello; F. Gilt silver plaque from spear

which arrested the progress of Attila, and there is some evidence that Meroveus was among the combatants. Towards 457 Meroveus was succeeded by his son Childeric. At first Childeric was a faithful *foederatus* of the Romans, fighting for them against the Visigoths and the Saxons south of the Loire; but he soon sought to make himself independent and to extend his conquests. He died in 481 and was succeeded by his son Clovis, who conquered the whole of Gaul with the exception of the kingdom of Burgundy and Provence Clovis imposed his authority on the other Salian tribes, and put an end to the domination of the Ripuarian Franks.

These Ripuarians had settled in the 5th century on the left bank of the Rhine, but their progress was slow It was not until the middle of the century that they occupied Cologne, which was not permanently in their possession until 463. The Ripuarians subsequently occupied all the country from Cologne to Trier. Aix-la-Chapelle, Bonn and Zulpich were their principal centres, and they even advanced southward as far as Metz, which appears to hare resisted their attacks. The Roman civilization and the Latin language disappeared from the countries which they occupied; indeed it seems that the actual boundaries of the German and French languages nearly coincide with those of their dominion In their southward progress the Ripuarians encountered the Alamanni, who, already masters of Alsace, were endeavouring to extend their conquests in all directions The Ripuarians long remained allies of Clovis, the son of their king fighting under him at Vouillé in 507. Ultimately, however, Clovis destroyed the Ripuarian dynasty and was himself chosen as king of this people. Thus the Salian Franks united under their rule all the Franks on the left bank of the Rhine. During the reigns of Clovis' sons they again turned their eyes on Germany, and imposed their suzerainty upon the Franks on the right bank. This country, north of the Main and the first residence of the Franks, then received the name of *Francia Orientalis,* and became the origin of one of the duchies into which Germany was divided in the 10th century—the duchy of Franconia (Franken).

The Franks were redoubtable warriors, and were generally of great stature. Their fair or red hair was brought forward from the crown of the head towards the forehead, leaving the nape of the neck uncovered; they shaved the face except the upper lip. They wore fairly close breeches reaching to the knee and a tunic fastened by brooches Round the waist over the tunic was worn a leathern girdle having a broad iron buckle damascened with silver. From the girdle hung the single-edged missile axe or *francisca,* the *scramasax* or short knife, a poniard and such articles of toilet as scissors, a comb (of wood or bone), etc The Franks also used a weapon called the *framea* (an iron lance set firmly in a wooden shaft), and bows and arrows They protected themselves in battle with a large wooden or wicker shield, the centre of which was ornamented with an iron boss (*umbo*) Frankish arms and armour have been found in the cemeteries which abound throughout northern France, the warriors being buried fully armed.

FRANZ, ROBERT (1815–1892), German composer of songs in the tradition of Schubert and Schumann. The son of Cristoph Franz Knauth (known as Cristoph Franz), he was born at Halle, June 28, 1815. He studied the organ under J. C. F. Schneider at Dessau (1835–37), and on return to Halle became a friend of Wilhelm Osterwald, manv of whose poems he later set to music. In 1841 he was appointed organist at the Ulrichskirsche at Halle and in 1842 became director of the Singakademie. In 1843 he published his "Twelve Songs." Opus 1, the intimate character of which was admired by Schumann and also by Liszt who later transcribed a series of Franz's songs for the piano. In the same vear his hearing became affected and he mas later afflicted with nervous disorders. Obliged to relinquish his post at the Singakademie in 1868, he was supported for the rest of his life by the singer, Arnold von Pilsach. Franz devoted his later years to arranging works by Bach, Handel, Mozart and Schubert. He died at Halle, Oct. 24, 1892.

Franz wrote about 350 songs, remarkable for their sensitive musical prosody. "My music does not pretend to be much in itself," he told Liszt, by which he meant not to undervalue his work, but to indicate the subservience of his settings to the poetic texts. Heine's poems form nearly a quarter of his texts. Most of his songs are in strophic form and were written for mezzo-soprano of limited range. Among his most expressive songs are "Gewitternach," "Die Heide ist braun" and "Es hat die Rose sich beklagt." He also wrote a series of choral and religious works.

FRANZEN, FRANS MIKAEL (1772–1847), Finnish-Swedish poet, a forerunner of Swedish romanticism, was born on Feb. 9, 1772, at Uleåborg, Fin. He studied at Åbo, where, in 1798, he became professor of philosophy. After the annexation of Finland by Russia, Franzén went to Sweden (1811). In 1831 he was appointed bishop of Harnosand, where he died on Aug. 14. 1847. Franzén was a master of a new poetic style in Swedish literature. Shakespeare, Milton and Gray made a deep impression on him. His work consists chiefly of simple, idyllic lyrics, and his best poems embody the imaginative spirit of the romantic era. His images have the vividness of the bright, northern summer nights. His hymns breathe a quiet and cheerful confidence.

Franzén's collected poems were published in 7 vol. (1867–69). *See* also G. Castren, F. *M. Franzén in Finland* (1902); S. Ek, *Franzéns Abodiktning* (1916). *(S. E.)*

FRANZENSBAD (Czech FRANTIŠKOVY LÁZNĚ), a town in the Karlovy Vary region, Czechoslovakia. Situated about 1,500 ft. above sea level amid delightful mountain scenery, its springs have been known and used since the 16th century, though the modern town developed around the *Kurhaus,* built in the late 18th century. The springs, 18 in number, are rich in carbon dioxide, iron. Glauber's salt, lithium and radium, and are used for drinking and bathing cures; in addition there exist large quantities of ferruginous mineral mud in local peat swamps. The waters have an average temperature between 50.2° F. and 54.5° F. and are of healing value in the treatment of women's diseases. nervous disabilities, abdominal troubles and affections of the heart and blood.

Franzensbad rapidly developed importance as a principal centre of treatment and as a holiday resort for the population of nearby industrial areas. In 1938 the town came under German control as part of the Sudetenland. Pop. (1950) 2,945.

FRANZ JOSEF LAND, an arctic archipelago, belonging to the U.S.S.R., lying east of Spitsbergen and north of Novaya Zemlya. extending northward from about 80° to 82" N., and between 43° and 65" E. Area 7.313 sq.mi. The islands are all very similar in appearance and consist of platforms of fossiliferous clay, shales and sandstone rising to 400–600 ft. capped by 500–700 ft. of Tertiary basalt. Intrusive sills also occur. The basalts are related to those of Jan Mayen, Iceland. Greenland and west Scotland. The islands are clearly remains of a more extensive land surface that nas broken and partially submerged along lines of faults subsequent to the volcanic period. Raised beaches indicate recent elevations. The islands have caps of ice or névé and valley glaciers or sheer ice faces to the sea. vegetation is scanty and includes 14 flowering plants and some mosses and lichens. Pack-ice renders access difficult. but occasionally Norwegian trappers have nintered there. The bear and fox are the only land mammals; insects are rare; but the avifauna includes at least 22 species of which probably 15, including the ivory gull, nest there.

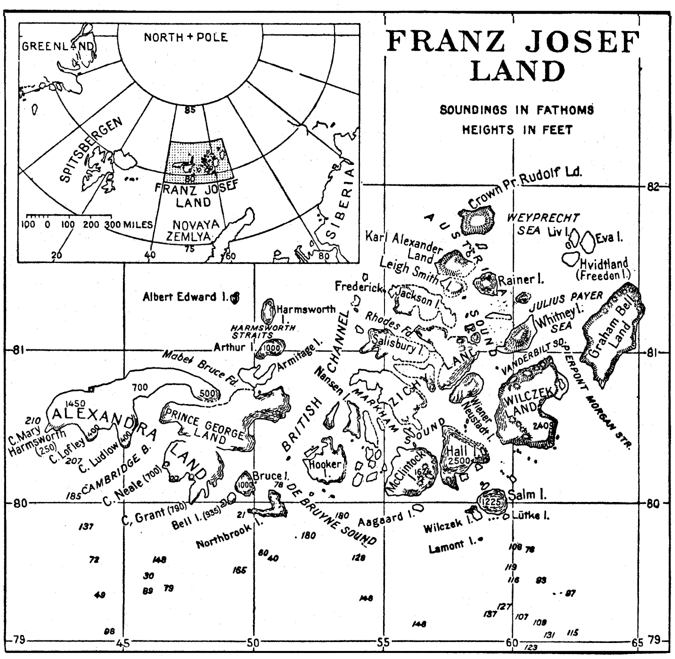
August Petermann expressed the opinion that Baffin may have sighted the west of Franz Josef Land in 1614, but the first actual discovery is due to Julius Payer. who was associated with Weyprecht in the Austrian polar expedition fitted out by Count Wilczek on the ship "Tegetthof" in 1872. On Aug. 31, 1873, the "Tegetthof" being then beset. high land was seen to the northwest. Later in the season. Payer led expeditions to Hochstetter and Wilczek islands. and after a second winter in the ice-bound ship, a difficult journey was made northward through Austria Sound, which was reported to separate two large masses of land, Wilczek Land on the east from Zichy Land on the west, to Cape Fligely, in 82° 5″ N. Cape Fligely was the highest latitude attained by Payer, and remained the highest attained in the Old World till 1895. Payer reported that from Cape Fligely land (Rudolf Land) stretched north-east to a cape (Cape Sherard Osborn), and mountain ranges were visible to the north, indicating lands beyond the 83rd parallel, to which the names King Oscar Land and Petermann Land were given.

In 1879 De Bruyne sighted high land in the Franz Josef Land region, but otherwise it remained untouched until B. Leigh Smith, in the yacht "Eira," explored the whole southern coast from 42° to 54° E. in 1881 and 1882. discovering many islands and sounds, and ascertaining that the coast of Alexandra Land, in the extreme nest, trended to north-west and north.

In 1894 Alfred Harmsnorth (afterwards Lord Northcliffe) fitted out an expedition in the "Windward," under F. G. Jackson, with the object of establishing a permanent base in Franz Josef Land, from which a journey should be made to the Pole. Jackson's base was at "Elmwood," near Cape Flora. at the western extremity of Northbrook Island. After a preliminary reconnaissance to the north, the summer of 189j was spent in extending discovery to the west. In 1896 the Jackson-Harmsworth expedition worked northwards and reached Cape Richthofen, whence an expanse of open water was seen to the north, which received the name of Queen Victoria sea. To the west of the British channel appeared glacier-covered land, and an island which was probably Payer's King Oscar Land lay to the northward. To north a water-sky appeared in the supposed position of Petermann Land. Thus Zichy Land itself was resolved into a group of islands, and the outlying land sighted by Payer was found to be islands also. Meanwhile Nansen, on his southward journey, had approached Franz Josef Land from the north-east, finding only sea at the north end of Wilczek Land. Nansen wintered near Cape Norway, Jackson Island, only a few miles from the spot reached by Jackson in 1895. He had finally proved that a deep oceanic basin lies to the north. On June 17, 1896, the dramatic meeting of Jackson and Nansen took place, and in the same year the "Windward" revisited "Elmwood" and brought Nansen home, the work of the Jackson-Harmsworth expedition being continued for another year. As the non-existence of land to the north had been proved. the attempt to penetrate northwards was abandoned. and the last season was devoted to a survey and scientific examination of the archipelago. especially to the west. by Jackson A. B. Armitage, R. Koettlitz, H. Fisher, W. S. Bruce and D. W. Wilton.

Further light was thrown on the relations of Franz Josef Land and Spitsbergen during 1897 by the discoveries of Captain Robertson of Dundee In August 1898 an expedition under Walter Wellman, an American, landed at Cape Tegetthof. The eastern limits of the archipelago were explored by E Baldwin and many new islands added to the map. Wellman reached 82° N. In June 1899 the duke of Xbruzzi in the "Stella Polare" succeeded in forcing his ship through the British channel to Rudolf Land, and wintered in Teplitz bay, in 81° 33' N. latitude. In March 1900, a sledge party of 13, under Captain Cagni. started northward. They found no trace of Petermann Land, but aith great difficulty crossed the ice to 86° 33' N. latitude. (See ARCTIC REGIONS.) Baldwin did some work again in 1901–02 and A. Fiala, in 1904, lost his ship in Teplitz bay. The Russian, G. L. Sedoff, used Hooker Island in 1913 as a base for a sledge journey to the Pole, but died near Rudolf Land.

Jackson, *A Thousand Days in the Arctic* (1899) (with appendices on geology and botany); Duke of Abruzzi, *On the Polar Star* (1903), *The Ziegler Polar Expedition 1903–5, Scientific Res.*, ed. *A.* Fiala (1907); L. Breitfuss, *Irrfahrten im Lande des Weissen Todes* (193j).



FRASCATI, a town and episcopal see of Italy. province of Rome. 1j mi. S.E. of Rome by rail and also reached by electric tramway via Grottaferrata. Pop. (1951) 10.895. The town is situated 1.056 ft. above sea level, on the northern slopes of the outer crater ring of the Alban hills. and commands a very fine view of the Campagna and of Rome. The cathedral contains a memorial tablet to Charles Edward. the Young Pretender, whose body for some while rested there; his brother, Henry, Cardinal York, was long bishop of Frascati. The villas of the Roman nobility, nith their beautiful gardens and fountains. are the chief attractions of Frascati. The earliest in date is the Villa Falconieri, planned by Cardinal Rufini before 1550; the most important of the rest are the Villa Torlonia (formerly Conti), Lancelotti (formerly Piccolomini). Rufinella (now belonging to Prince Lancelloti), Aldobrandini. Borghese and Mondragone (now a Jesuit school). Frascati seems to have arisen on the site of a very large villa (probably that of Passienus Crispus, the second husband of Agrippina the younger. who compassed his death for the sake of his property, which thus passed into the possession of her son Nero and remained imperial) about the 9th century. The medieval stronghold of the counts of Tusculum (*q.v.*), which occupied the site of the ancient city, was dismantled by the Romans in 1191, and the inhabitants put to the sword or mutilated. Many of the fugitives naturally took refuge in Frascati. For the greater part of the middle ages Frascati belonged to the papacy.

See T. Ashby in *Papers* of *the British School at Rome*, v. (1910), 301 sqq.; F. Tomassetti, *Campagna Romana*, iv. (1926), 346 sqq. (T. A.)

FRASER, CLAUD LOVAT (1890–1921), British artist who exercised a rejuvenating influence on English stage designs, was born in London on May 15, 1890, and was educated at Charterhouse. He began to follow his father's profession as a solicitor in 1908, but abandoned this three years later for art. After working with Walter Sickert for a time, he exhibited in 1913, being responsible in the same year for the decoration of the *Flying Fame* chapbooks and broadsheets.

His gift for spirited design and lively colour, based to a great extent on 18th-century conventions, developed rapidly, and he not only successiully illustrated many books, but produced designs for *The Beggar's Opera* (1920), *As You Like It* (1920) and *If* (1921). A career of great promise was cut short by his death, June 18, 1921.

See J. Drinkwater and A. Rutherston, *Claud Lovat Fraser* (1923).

FRASER, JAMES BAILLIE (1783–1856), Scottish traveler and author who, on his journeys through Persia (Iran), took astronomical observations that were of great service to the cartography of Asia Minor, was born at Reelick. Inverness-shire, on June 11, 1783. He went to India early in life, and in 1815 made a tour of exploration in the Himalayas, subsequently beginning his Persian travels. His *Narrative of a Journey Into Khorasan in the Years 1821 and 1822* (2 vol., 1825) contains detailed calculations of the latitude and longitude of various Persian cities. His other works on Persia include fiction of no great merit. Fraser went on a diplomatic mission to Tehran in 1833–34, and in 1835 was made responsible for two Persian princes on a visit to England. Having retired to cultivate his estate at Reelick, Fraser died there in Jan. 1856.

FRASER, JAMES EARLE (1876–1953), U.S. sculptor, mas born at Winona, Minn., on Nov. 4, 1876. Growing up on the Dakota prairies, he found friends among the Indians, which influenced his later Indian subjects—"The End of the Trail." equestrian statue shown at the Panama-Pacific exposition (San Francisco, Calif.) in 1915 and subsequently placed in Waupun, Wis.; and the United States buffalo five-cent coin, 1913. In 1894 he studied at the Art Institute of Chicago and then was the pupil of J. A. J. Falguière in Paris. assistant to Augustus Saint-Gaudens, 1898–1902, and instructor at the Art Students' league. New York city, 1906–11. In 1913 he married a sculptress and former pupil, Laura Gardin.

Until 1932 Fraser's work showed the romanticism and animation of Falguière, and some of the refinement and dignity of Saint-Gaudens. He changed his style to a more heroic, monolithic massiveness. however, after he mas summoned to Washington, D.C., to create several works for the capital. He did the groups in the pediments of the Commerce Department building (1932), the figures in the huge pediment of the National Archives building and two heroic statues by the entrance steps (1935), as well as two other allegorical figures by the steps of the Supreme Court building. Most of his other works are in Washington and New York city. In Washington are a full-length bronze statue of Alexander Hamilton, Treasury building; "Journey Through Life." Keep monument, Rock Creek cemetery; Ericsson monument, Potomac park; etc. In New York city are a bust of Saint-Gaudens, Hall of Fame; sarcophagus of Bishop Potter. Cathedral of St. John the Divine; equestrian group of Theodore Roosevelt, Museum of Natural History. Fraser also designed many medals. He died in Restport, Conn.. on Oct. 11, 1953. (J. W. Le.; X.)

FRASER, PETER (1884–1950), New Zealand government official,was born at Fearn, Ross and Cromarty, Scot., on Aug. 28, 1884. On leaving school he became a local officer of the Liberal party in Scotland and in 1908 joined the Independent Labour party. He went to New Zealand two years later and was active in the labour movement.

He was elected to the house of representatives for Wellington Central in 1918, and in 1935 was appointed minister of education, health, marine and police, and in 1939 deputy prime minister. In his government's program of social services he was responsible for the national health plan.

On April 1, 1940, on the death of M. J. Savage, Eraser became prime minister. His party was defeated in the general election of Nov. 1949, and he resigned in December. From 1943 he had been also minister of external affairs and minister of island territories. and from Dec. 1946 native minister (renamed minister of Maori affairs in 1947). He also held the portfolio of employment during 1946.

During World War II he attended meetings of the war cabinet in London, and in 1944, 1948 and 1949 attended the London meetings of the British commonwealth prime ministers. In 1945 he attended the United Nations meetings at San Francisco, Calif., and in 1948 led the New Zealand delegation to the third UN general assembly in Paris.

Fraser died at Wellington, N.Z., on Dec. 12, 1950.

FRASERBURGH, a small burgh on the northeastern coast of the county of Aberdeen, Scot., close by the Kinnaird head lighthouse at the southern entrance of the Moray firth and 43 mi. N. of Aberdeen by road. Pop. (1951) 10,444. It is the main seat of the herring industry in Scotland. After World War II the whitefish industry grew considerably and in the mid-1950s vied with the herring landings in value and quantity. The harbour has more than $2\frac{1}{2}$ ac. of wharfage and can accommodate vessels of 4.000 tons. Besides having engineering, canning and deep-freeze plants, Fraserburgh is a holiday resort with a fine beach and a golf course. Included in the burgh is the village of Broadsea with its centuries-old fishermen's cottages.

The burgh was granted a charter by Mary, queen of Scots, in 1546. In the 17th century. as a result of an outbreak of plague in Aberdeen, a university was instituted in Fraserburgh, but it fell into disuse when Marischal and King's colleges grew up in the county capital. (J. M. Be.)

FRASER RIVER, chief river of British Columbia, Can., drains about 90,000 sq.mi. of the Interior plateau and its perimeter of rugged mountains. It was named for Simon Fraser who first descended it to the sea in 1808. The Cariboo gold rush, which began in 1858, took place in the Fraser river basin. Rising near Yellowhead pass on the British Columbia–Alberta border the Fraser flows 850 mi. to its mouth on Strait of Georgia. From its mountain source, the river's course is initially northwestward, descending by gentle gradients along the Rocky mountain trench. Near latitude 54° N. the river makes a great bend southward to traverse the Interior plateau and then the Coast mountains. Entrenchment and gradients increase progressively downstream, and through the Coast mountains the raging waters traverse a canyon about 5,000 ft. deep. Below this canyon the Fraser turns westward to flow placidly across an alluvial plain to its debouchment near Vancouver. The Thompson river which enters the Fraser about 145 mi. from its mouth is the most important of numerous tributaries, many of which rise in extensive mountain lakes. Hydroelectric developments on the tributaries have been carried on, and it is estimated that the Fraser river system has a total potential of about 13,000,000 h.p. The Fraser is also the largest salmon-producing river in North America. Navigation is important only in the tidal estuary where New Westminster serves deep-sea ships. (G. A. W.)

FRATERNAL ORGANIZATION, a voluntary association of persons having certain ethnic, social, religious or economic characteristics in common, formed primarily for social, benevolent or economic purposes. Despite the fact that social purposes had come to predominate by the middle of the 20th century, most fraternal organizations still exhibited the strong ties developed to solve common problems or to meet common needs, and a good many still utilized secrecy and rituals.

Fraternal associations may be divided into three categories according to their primary purpose: (1) benevolent or protective associations, ordinarily with marginal social activities permitted by their bylaws, termed the fraternal benefit societies; (2) mixed social organizations, many of which marginally may support benevolent programs, termed mixed fraternal associations; and (3) social fraternal associations, which offer neither protective nor benevolent programs.

Purely social organizations, to be classed as fraternal associations, ordinarily have a legal charter providing for a secret ritual and initiation ceremony and often establish membership criteria. Those organizations include collegiate social fraternities and such groups as the International Associations of Lions clubs. This article is not concerned with them but only with fraternal benefit associations. (See FRATERNITY AND SORORITY.)

Fraternal associations perform a number of functions. The secret fraternity enables a group of individuals with common interests to associate exclusively. That is particularly important to minority groups in whom such associations engender a sense of belonging, a feeling that is strengthened through the ritual which helps to create a personal bond. In addition. through use of eligibility criteria, election for membership usually is controlled to provide greater unity in the organization. Ethnic minority groups, as the central and eastern European immigrants during the period of rapid American population growth, found strength and purpose as well as social satisfaction in a new environment through such associations. which led them to assist each other to adapt more rapidly to their new homeland.

Education to perpetuate past traditions, in many cases ethnic or moral in character, is another major purpose of fraternal organizations. The training process is oriented largely toward the new member and is designed both to promote his integration into the group and to assure the continuance of his group's culture, though no longer in contact with the homeland. While social functions predominate. the oldest functions of fraternal organizations mere to provide group secuiity through benevolent and later protective activities. These activities were designed to aid members and their families in case of sickness or death. The earliest payment noted in the United States was to a widow who received a $5 per month benefit payment beginning in March 1857 from the Czecho Slovak Society of America. founded in 1854

Later, such activities assumed larger dimensions, going beyond the parochial limits of the membership. The earliest attempts to provide group security took the form of direct personal aid. Later the groups tended to centralize the function and to provide it on a more or less standard basis In that context, the Ancient Order United Workmen, founded in 1868, is generally credited with being the first U.S. fraternal insurance society.

In later years the beneficial activities mere supplemented through adoption of insurance techniques which, however, were not always correctly used. With that program the risks and benefits were considerably standardized, and the risks of the loss of income to the member and his family from sickness and death were shared. In that pattern the beneficiary status became a right rather than a privilege, and benefits were related to contributions rather than need alone.

Origins of Fraternalism in the United States. — History is replete with examples of fraternal activity. Mystical, ritualistic associations have been identified as early as the early Egyptian period. In modern times the first legislation covering their activities nas written in Great Britain in 1793 and nas entitled "An Act for the Encouragement and Relief of Friendly Societies." It was intended to govern some of the risk-sharing functions of the early friendly societies not covered by the Act of 1776.

Other groups had developed on the European continent, but the predominance of the British influence in colonial America tended to force the associations into a form more or less parallel to that of their British counterparts. Among the organizations imported were the Free and Accepted Masons; Independent Order of Odd Fellows; Ancient Order of Foresters; a number of ethnic orders, e g., the Ancient Order of Hibernians in America; and the United Ancient Order of the Druids. These early imported associations were mainly of the beneficial society and mixed society type. The first native fraternal association, Actors' Order of Friendship, was founded in 1849.

In the period following the American Civil War, as the characteristics of immigrants changed, so also did the fraternal organizations. Minority groups found that close association with their countrymen seemed to make their adjustment to a nen world easier. The organizations provided a common meeting place for social activities and a medium for transmitting their common heritage to new generations. The social function was soon supplemented aith benevolent or protective activities. The ethnic character demonstrated by the names of the organizations and the dates of their founding are closely correlated with the successive waves of immigrants by country of origin. These were typified by the Lithuanian Roman Catholic Alliance of America (1886); Croatian Fraternal Union of America (1894); and the Brith Sholom (1905).

Mutual aid in the solution of economic and related problems for individuals with common interests or employment served as the basis for other fraternal organizations, such as the fraternal orders of police, firemen and mechanics. In general, these groups engaged in many types of social and benevolent activities.

Political or patriotic bases exist for the formation of some fraternal organizations. such as those for veterans of military service. Their activities are largely devoted to the support of national traditions and the establishment of a centre for social activities. (See AMERICAN LEGION; VETERANS OF FOREIGN WARS.)

A religious origin or basis for solution of social and economic problems is evident in some fraternal organizations that provide for indigent members, their wives and orphaned children. This is typified by activities of the Lutheran Brotherhood, established in 1917 as a mutual benefit order. The Knights of Columbus (*q.v.*) and many others are of the same type.

Membership Requirements. — Qualifications for membership are largely set within the ethnic. religious, economic and political tenets of the associations. Age and sex also enter into consideration as qualifications in many cases. The ethnocentric associations usually require birth in a certain country or direct descent from immigrants from that country. The religious associations require public confession of belief in a particular faith. In some cases this statement of faith is broad enough to admit almost anyone, as, for example, in the case of the Masonic Order, which merely requires belief in the Almighty God. The Knights of Columbus, on the other hand, requires belief in a particular theology and performance of a ritual of worship.

Employment in a particular occupation often is required, as in the case of the Firemen's Mutual Aid and Benefit association, established in 1897. In the political or patriotic orders, prior military service or descent from a particular group (*e.g.,* a revolutionary soldier) is required. As to age, most organizations require majority; some have a junior status, with age of admission falling as low as 15. Usually these groups require that the initiate be the child of an adult member, as in the Order of DeMolay.

The majority of fraternal organizations are true fraternities in the sense that only men are admitted to active status. A few specialized organizations exist for women, such as the Catholic Women's Benevolent Legion. Many of the men's organizations have women's auxiliaries, such as the International Order of the Eastern Star, established in 1876.

The requirements for introduction into the beneficial and mixed fraternal associations indicated above differ significantly from those of the social fraternal organizations. In the social fraternal association some requirements tend to be more catholic in nature, in many cases cutting across ethnic, racial and religious lines. In other cases they tend to be even more selective as in the case of the educational, professional and honorary Greek letter fraternities.

Growth and Decline. — From the colonial period to the Civil War the development of the fraternal system of the United States was marked primarily by the establishment of imported orders. The English, German, Irish, Scotch-Irish and Welsh origins are particularly identifiable in these groups. In the years following the Civil War the purposes were modified and increasing numbers of associations were founded annually. This was true for each of the three categories of fraternal associations. The largest number of fraternal benefit orders for any decade was founded between 1890 and 1900 when more than 65 societies were established. During that period the patriotic orders also showed a rapid growth. In the second quarter of the 20th century there were fewer foundings than in any earlier period, the formation rate being about one every four years.

As the numbers of benefit associations increased, the insurance function of providing protection to members was developed and specific legal regulations governing it were adopted. A class of membership frequently was provided that did not require contributions or carry any protection rights. During the period from the Civil War to the 1960s the number of insurance policies in force increased rapidly and the average value of the policies also rose. Many forces contributed to this result: the ethnocentrism of the immigrants; their economic insecurity; the need for low premium insurance; insurance company failures; the lack of low cost group and industrial insurance; the relative inaccessibility of ordinary insurance to the subject groups; and the immigrants' frequent suspicion of financial institutions.

The subsequent decline of these fraternal benefit associations was the result of other forces. The gradual assimilation of immigrants into the social, political, economic and ethnic patterns of the United States probably has been the most significant of these forces. With the increase in the security, flexibility and availability of insurance following the turn of the century, the need for group provision of personal security of the type provided by the fraternal has gradually diminished. Although a large volume of new insurance is written each year by fraternal associations, the rate of growth in the net total in force has declined. However, in 1959 there was more than $12,000,000,000 of insurance in force in fraternal associations on 9,300,000 certificates.

The Social Fraternal Association. — Prominent among the fraternal organizations in which ethnocentrism is lacking are the following with nationwide membership: the Fraternal Order of Eagles (founded 1898) and the Benevolent and Protective Order of Elks (1868); and the Loyal Order of Moose (1888). All of these provide ritualistic orders for social activities only. Altogether there were several hundred organizations of this type in the United States, having a total membership in the early 1960s of about 90,000,000. Much of this membership must be discounted because of the multiple membership held by many persons. Of this total more than 10,000,000 persons were members of fraternal organizations that provide member protection through insurance. *See* also FRIENDLY *SOCIETY*.

FRATERNITY AND SORORITY, social, professional or honorary organizations whose membership is drawn primarily from college or university students. Those for men are generally referred to as fraternities, while those exclusively for women are popularly called sororities. With few exceptions, fraternities and sororities use, combinations of letters of the Greek alphabet as names.

Social Fraternities. — The social fraternity is peculiar to America, although attempts have been made to compare it with student organizations in other areas of the world, such as the corps of German universities. Its function, although basically to serve as a collegiate "home" for its members, varies from school to school. At some universities fraternities are the nucleus of campus political and social life. and affiliation with a Greek-letter society is a prerequisite for positions of importance in student activities, while at other schools, where fraternities are barely tolerated, affiliation might be considered detrimental to anyone seeking class or campus office.

The college chapter, basic unit of a fraternity, consists of all its undergraduate members at a specific school. The chapter house is the centre of fraternity activity, serving as meeting place, dormitory and dining hall for members. Each chapter has its own alumni group and, in many metropolitan areas. there are organized alumni chapters whose members may come from different schools. Alumni chapters cannot elect new members, but serve as sponsors of collegiate chapters.

Members of social fraternities and sororities are usually, although not exclusively, chosen from first-year students by a system known as "rushing." This usually consists of the fraternity's inviting prospective members, or "rushees," to the chapter house for meals or special rushing parties. Each rushee who is acceptable to the fraternity members is then extended a bid, or invitation to join, which he may accept or decline.

The initial probationary membership, called "pledgeship," is followed by initiation into active membership. Eligibility for active membership is controlled jointly by the school and the fraternity. Active membership is held during the remaining college years, and upon leaving school or graduating the active member assumes alumni status. Membership is for life and initiation is considered a permanent bar to membership in any other social fraternity. Members are, however, eligible for membership in both professional and honorary fraternities.

Each national fraternity has a general headquarters, with governing and supervisory officers who assist collegiate chapters in their operation and in maintaining the ideals and standards of the fraternity and the college. There also are many fraternities and sororities with only one chapter, often organized for the purpose of later affiliation with one of the established national groups. Many of these locals. however, have deep-rooted traditions on a particular campus and do not wish to subordinate themselves by national affiliation.

Traditionally, each fraternity has characteristic insignia — a badge or pin, coat of arms. seal, flag, certain colours and a fraternity flower. The fraternity ritual, in most cases a secret document, is an exposition of the ideals and aims of the organization and contains an explanation of its symbolism. This may include a password, grip, motto and recognition sign. The ritual also contains formal ceremonies used on occasions such as pledging and initiation.

Criticism. — There have been charges that fraternities promote irresponsibility, pay too much attention to social life at the expense of scholarship and carry on dangerous hazing practices. The modern fraternity or sorority, however, if for no other reason than self-preservation, has had to stress high standards of scholarship; the development of leadership and loyalty; and participation in community and national service projects. In addition, universities have regulated hazing practices, and fraternities which violate hazing regulations are severely punished and even may be denied recognition by the school.

The rushing system, too, has often been denounced as undemocratic, since, in those fraternities using a blackball system, a minority of the members may prevent bidding someone of whom the majority approves. Other criticism has been directed against the restrictive nature of certain fraternities which automatically bar members of certain racial, religious, national or ethnic groups from consideration. In the second half of the 20th century, a number of universities ruled that fraternities with discriminatory policies could not operate on campus. This led many fraternities to drop restrictive clauses from their constitutions.

History of the Social Fraternity. — Social fraternities trace their origin to student clubs existing during colonial days. The most famous of these and the first to use Greek letters for its name was Phi Beta Kappa, organized on Dec. 5, 1776, at the College of William and Mary, Williamsburg, Va. Five students, meeting in the Apollo room of the Raleigh tavern, on that date formed a secret society, adopting as their insignia a square silver medal, bearing on one side the Greek letters Phi, Beta and Kappa; three stars; and an index. The stars represent the guiding principles of the society — friendship, morality and literature. On the reverse were the Roman letters *S* P., for *Societas Philosophiae.* In the course of time Phi Beta Kappa became an honour society rather than a social fraternity. Its secrets were revealed to the public following anti-Masonic agitation in the 1820s.

In 1812 four students at the University of North Carolina formed Kappa Alpha or Kuklos Adelphon. This group had over 15 chapters, but disintegrated prior to the American Civil War. In 1825 Kappa Alpha society the oldest social fraternity still in existence as such, was established at Union College, Schenectady, N.Y. Sigma Phi and Delta Phi were organized at Union in 1827. These three form the "Union Triad!'; also founded at Union were Psi Upsilon (1833), Chi Psi (1841) and Theta Delta Chi (1847). The fraternity idea spread to the midwest with the founding of Beta Theta Pi (1839), Phi Delta Theta (1848) and Sigma Chi (1855), at Miami university, Oxford, O. These constitute the "Miami Triad." After the Civil War, fraternities appeared on the west coast of the U.S. and in Canada when Zeta Psi, founded at New York university in 1847, established chapters at the University of California (1870) and at the University of Toronto (1879).

Although most fraternities are secret societies, in 1834 there was founded at Williams college, Williamstown, Mass., the Social fraternity, an antisecret group organized as a protest against the influence of the secret fraternities. Similar organizations were later formed at other colleges and in 1847 formed the Antisecret confederation. In 1864 the name was changed to Delta Upsilon and thereafter, except for its nonsecret nature, it functioned much like any other national fraternity.

The first women's fraternities. or sororities, were the Adelphean (1851), later Alpha Delta Pi; and the Philomathean (1852), later Phi Mu, established at Wesleyan college, Macon, Ga. These were followed by the I.C. Sorosis (1867), which became Pi Beta Phi; Kappa Kappa Gamma (1870) at Monmouth college. Monmouth, Ill.; and Kappa Alpha Theta (1870) at DePauw university, Greencastle, Ind. The expansion of the sorority system came at about the same time that women were accepted as students in state-supported universities. In some cases men's fraternities aided in the organization of early sororities. thus bringing about the official brother-sister relationship which exists between certain fraternities and sororities.

Professional Fraternities. — Professional fraternities are specialized organizations whose membership is limited to students and faculty members engaged in one field of educational specialization. These have broader membership qualifications than the social groups and emphasize activities designed to develop professional competency rather than social life.

Professional fraternities began at Transylvania college, Lexington, Ky., where medical students formed the Kappa Lambda Society of Aesculapius (1819). Phi Delta Phi (law) was organized in 1869; Nu Sigma Nu (medicine) and Delta Sigma Delta (dentistry) in 1882, all at the University of Michigan. Other professions represented include agriculture, commerce, education, engineering, pharmacy, foreign service, journalism, optometry, osteopathy, etc.

Honorary Fraternities. — Honorary fraternities recognize superior attainment in a given field of activity. There are three classes: (1) those with requirements for membership based upon scholastic excellence in all fields; (2) those recognizing outstanding achievements in both extracurricular activities and scholarship; (3) those recognizing excellence and achievement in a single field. All candidates for membership must be of exemplary character.

Honour societies include Phi Beta Kappa (general scholarship, 1776); Tau Beta Pi (engineering, 1885); Sigma Xi (scientific research, 1886); and Phi Kappa Phi (general scholarship, 1897). Other groups, of more recent origin, represent architecture, civil engineering, commerce, forensics, history, journalism, industrial engineering, leadership, music, medicine, pre-medicine, romance languages, etc.

Interfraternity **Relations.**—Although the first fraternity preceded the first sorority by 75 years, it was the women who first recognized the need for an organization in which Greek letter societies could exchange ideas and take united action on common problems. The first call for a meeting of women's groups in 1884 had no results, but discussions were held in 1891 and 1893. Nine years later, in 1902, representatives from seven sororities met in Chicago and the organization which became known as the National Panhellenic conference was born. Agitation for a men's interfraternity group began in 1907, and the first meeting, attended by representatives of 26 fraternities, was held in 1909. The following year a constitution and bylaws were adopted for the Interfraternity conference. The word National was added in 1931.

Among the problems with which the conferences concern themselves are rushing, pledge rules, fraternity-college and fraternity-community relations, hazing, scholarship. etc. In addition to these national groups, each campus has its own undergraduate Panhellenic and Interfraternity councils which exercise certain controls over the societies on that campus, and, in many cases, do liaison work between the college and the fraternities.

Professional and honorary fraternities and sororities have similar organizations which promote high standards and ethics within the individual organizations.

FRATICELLI, the name given during the 13th, 14th and 15th centuries to a number of religious groups in Italy, differing widely from each other but all derived more or less directly from the Franciscan movement.

The word is a plural diminutive of the Ital. *frate* and denoted, not any particular sect, but members of orders formed on the fringe of the church.

It was first used of heretics by John XXII in 1317, to designate the group which held that he had fallen into heresy and had lost all spiritual power by his decretal on the poverty of Christ. This group of exalted and isolated ascetics soon began to regard itself as the sole legitimate order of the Minorites and then as the sole Catholic Church. For the most part they lived in hiding and wore a shorter and poorer kind of Franciscan habit. Because of the confusion caused by the absence of the popes from Italy during the Avignon period and the great western schism, they spread widely in Italy and Sicily and were not unknown in Bohemia, Catalonia, Greece and Persia. Consequently, for nearly a century the Fraticelli were able to carry on an active propaganda throughout Italy, until pope Martin V, in 1426, appointed two of the strict and orthodox section of the Franciscans known as Observants, with orders to make a special crusade against the heresy of the Fraticelli and to extirpate it. In 1449 Pope Nicholas V renewed the measures taken against them. The sect gradually died out after losing the protection of the common people, whose sympathy was now transferred to the austere Observants and their miracleworker, St. John of Capistrano.

Paul II also energetically repressed the Fraticelli who had appeared again in the March of Ancona, in the Romagna, the Campagna and even in Rome itself. After this repression (1466–67) the name disappears from history.

Oliger, *Documenta Inedita* (Quaracchi, 1913), and in *Zeitschrift für Kirchengeschichte*, 45, 215–242 (1926); *Catholic Encyclopedia s.v.*, "Fraticelli"; L. von Pastor, *History of the Popes* (Eng. trans.), iv, 113 ff.; H. C. Lea, *History of the Inquisition of the Middle Ages*, iii, 129–180 (London, 1888).

FRAUD. Fraud, as a legal term, is a constituent of a number of statutory and common law offenses and is the basis of a number of civil actions. In civil law, fraud is actionable as the tort of deceit. Also it may vitiate a contract, if it is an ingredient, as would mere innocent misrepresentation, which is not a tort in itself. To sustain an action of deceit there must be proof of fraud and nothing short will suffice. Fraud is proved when it is shown that a false pretense has been made knowingly or without belief in its truth. or recklessly, careless whether it be true or false (*Derry* v. *Peek*, 14 app. cases 337).

It is probable that the action of deceit originated in England as a remedy for abuse of legal proceedings and is known to have existed as such in the 13th century. Early forms of tort depended upon an act with physical damage as a consequence, while the state of the wrongdoer's mind was practically disregarde . In the middle of the 14th century, it was developed by "an action on the case" so as to include a wider aspect of fraud; thus an action lay to a plaintiff who bought cattle from a man to whom they did not belong. So, by stages, it was developed until by modern times any false statement made wilfully so that the plaintiff acts to his detriment will probably be actionable (*Pasley v. Freeman*, 1789). The development of contractual liability was similar and was related to the economic development of the country. When property was retained by force, the remedy to fraud lay in the strength of the arm of the dispossessed person, but as trade developed it became essential that the standards of honesty which were required in business should be protected by the courts. In the 16th century there was a liability in contract if a warranty were included and that warranty were false, but in 1603 there was still some doubt as to whether a knowledge on the part of the defendent as to the veracity of the warranty was essential. By the 18th century, warranty was implied and thus there developed liability in contract for misrepresentation whether fraudulent or otherwise, but there was no corresponding extension in the action in tort of deceit. Even today the principle of *caveat emptor* (let the purchaser beware) applies in contract, so that every misrepresentation is not necessarily fraudulent but only if a warranty is implied.

In criminal law there is no such offense as fraud in itself, though it is an essential ingredient of many offenses. Of these the most important are: obtaining money by false pretenses (S. 32. Larceny act, 1916); fraudulent conversion (Ss. 20–21 Larceny act, 1916); obtaining credit by false pretenses or any other fraud (S. 13. Debtors act, 1869); and a number of offenses under the Companies act, 1948, and the Prevention of Fraud (Investments) act, 1939. In most of these cases, fraud or some similar expression is specifically an ingredient, but even in those offenses where no fraud is mentioned it is still to a lesser degree an ingredient, for with all criminal offenses there must be *mens rea*.

The history of criminal fraud is recent compared with that of offenses of violence which have always been crimes. The maintenance of public order free from violence was more important for the preservation of the king's peace than the fraudulent acquisition of private property. Hence to this day offenses entailing fraud are classified generally as misdemeanours, whereas larceny and crimes of violence are felonies. The distinction has in many ways lost its significance, but even today a man who has stolen sixpence may be arrested without a warrant whereas a man who has defrauded a large section of the community of thousands of pounds can only be arrested on the order of a magistrate.

Probably the first attempt to bring fraud within the criminal law was in the 16th century, when Britain's reputation in commerce was beginning to develop. Two statutes were passed in the reign of Elizabeth I dealing with conveyances in fraud of creditors and in fraud of purchasers which curtailed the current fraudulent practice of disposing of assets prior to bankruptcy.

An act had been passed earlier, in 1541, which made it an offense to issue a document in furtherance of fraud. This was later extended to any fraudulent writing; but a lie, however blatant, unless it was such as to affect the public at large, was not fraudulent. Thus, where a woman obtained money by stating that she had been sent by her mistress to obtain silks for the queen, and both statements were false, it was held that as no false document was given, no fraud was committed. This narrow interpretation of the law did not meet the needs of the developing community and, as a result, in 1757 it became an offense to obtain goods by false pretenses, and from this act (30. Geo. 2 C4) the present offenses of false pretenses have developed.

Ancient Frauds.—Frauds were common in remote antiquity. According to Herodotus, the mason who built the stone treasury of Rameses III contrived a secret entrance through which he passed nightly to steal a portion of the royal treasure. The Old Testament describes how Jacob defrauded his brother Esau of his birthright and how the Hebrews in bondage defrauded their Egyptian taskmasters of their jewels. Specimens of loaded dice have been found in Herculaneum.

Some Types of British Fraud.—The variations of fraud are as infinite as the ingenuity of the perpetrators, but some of the better known forms are "kite flying"; "teeming and lading"; "share pushing"; "bucket shops"; "long firm fraud"; and the "confidence trick."

"Kite flying" is the use, as credit, of the time taken in the course of banking machinery for a cheque to be cleared. Thus, if A pays a cheque drawn by B into A's account, it will be some days before it is debited against B's account. During these days it may be possible, under certain circumstances, to make use of the credit shown in A's bank account, by A's being allowed to draw on the "uncleared effects," namely B's cheque.

"Teeming and lading." which strictly means unloading and loading, is merely an accountants' term for the system of robbing Peter to pay Paul. Thus a cashier, having misappropriated part of one day's takings, appropriates part of the next day's takings to make up his deficiency, and so continues from day to day. He usually increases his appropriations until either the deficiency overtakes the total drawings of a day or, for some extraneous reason such as illness, his actions are discovered.

"Share pushing" is a colloquial expression for high-pressure salesmanship of shares in limited companies. It is probable that the provisions of the Prevention of Fraud (Investments) act. 1939, have curtailed this form of activity which was rife between World Wars I and II. The method was simple but the offense difficult to prove. Shares were bought at a low price in a company doing practically no business, then by balance sheets which failed to show the true position, eulogistic reports by experts on gold findings or other operations and careful circularization of potential speculators, the shares were run up to many times their original value. Having unloaded his supply of shares on the public. the fraudsman disappeared, probably to another continent. It became an offense under the 1939 act to circularize in this way, and dealing in shares generally was restricted. The offenses of publishing fraudulent balance sheets or prospectuses were so widened that a mere misleading statement or forecast might be an offense.

"Bucket shop" means the business of a sham share broker who gambles with his customers on the rise or fall in the prices of stock exchange securities without acquiring these securities at all. The origin of the name may well lie in the activities of small-time wheat dealers who dealt with odd lots which were described as "bucketsful." The expression is loosely used to describe any fraudulent financial firm but the true bucket shop is not necessarily fraudulent though its activities would probably be an offense under the Prevention of Fraud (Investments) act, 1939.

"Long firm fraud" is a term loosely used for any firm which fraudulently obtains goods on credit and sells these goods without attempting to pay for them. Strictly speaking, it is restricted to those cases where the person supplying credit is induced so to do by the production of false references. The goods are usually sold under cost to obtain a quick return and to enable the operator to make his money before the creditors and police become interested in his activities. Until 1948 the offense was usually dealt with as false pretenses, but, so far as companies are concerned, it is now more easily proved to be fraudulent trading under the Companies act.

The "confidence trick" is the cultivation of the confidence of the victim often by prompt repayment of small debts or by lavish entertainment until he is willing to part with a large sum.

Antiquarian Frauds.—Frauds for gain must be distinguished from those perpetrated for mischief. The catalogue of literary forgeries is long. The person who fabricated a grammar of the Formosan language in Samuel Johnson's time was a laborious practical joker. as were the joint authors of *Wanderings in New Guinea*, by "Capt. Lawson R.N." This book was accepted as authentic by all British learned societies except the Linnaean, because the wardroom officers of H.M.S. "Basilisk," who produced their book in advance of that projected by their unpopular admiral, knew less about insects than they did about fauna of fur and feathers. Thomas J. Wise (1859–1937) printed many supposedly first or private editions of Victorian writings which deceived collectors until the fraud was exposed by John Carter and Graham Pollard in 1934.

The ineptitude of some forgers is remarkable. Errors are made which, on examination, are obvious. A will purporting to be signed in 1862 was written on paper bearing an 1870 watermark. Envelopes addressed to celebrities in the 18th century have been offered for sale although envelopes were not made before 1842.

Red ink appears in documents of the 17th century though red ink was unknown before 1780. Stamps have been used on receipts and other documents purporting to be issued before the stamp was printed.

It was scarcely possible that the modern interest in archaeology should escape the attention of impostors. Scores of ancient documents alleged to have been found in tombs and in the sand of the Fayum are submitted to tourists year by year. Even Egyptian mummies have been fabricated with success. A Dresden doctor having purchased the corpse of a young woman, embalmed it and disposed of it as the mummy of the queen Nitocris for a considerable sum. Unfortunately his process was defective and when the mummy, which was supposed to have resisted the ravages of time for three millenniums, began to decompose, the fraud was discovered.

Like literary frauds, archaeological frauds are not always for pecuniary gain, as is exemplified by the Piltdown skull, which was classified as *Eoanthropus Dawsoni,* a remarkable aberrant type of early man. In 1912 a local archaeologist found part of a skull, a jaw, some animal remains, and other implements in a gravel pit at Piltdown in Sussex. The find was believed to be of great importance as it showed a variation of development of man which was out of line chronologically with other discoveries. The authenticity of the find was generally accepted though one or two eminent men of science were somewhat sceptical. The importance of the bones was such that no injury could be risked from experimental methods of investigation. and thus, for many years, the find had to be accepted as genuine; but gradually suspicion developed. principally because the cranium and the jaw seemed more and more irreconcilable. When safer methods of investigation were developed, the find was subjected to X-ray and radio-activity tests and it was found that the jaw almost certainly was that of a young orangutan. The canine tooth mas found to have been coloured with oil paint. Some bones were found to be genuine. but they had been "planted" at Piltdown from elsewhere. They were much younger than the gravel in which they were alleged to have been found. Thus a discovery which for about 40 years was an enigma was explained by the patient work of scientists from all branches.

The faking of works of art is almost as old as art itself and is recorded by Pliny. It has been stated that throughout the world there are 2.000 "Van Dykes." though Sir Anthony Van Dyke only painted 70 pictures Hans Van Meegeren was arrested in 1945 on a charge of collaborating with the Germans during the occupation and specifically for having sold a Vermeer painting to Hermann Goring. To save himself from such an accusation, Van Meegeren confessed that he had executed the painting himself, together with five others which had been sold for a total of about £700,000; all had been accepted as genuine by experts, including some at the leading museums. To prove his statement he painted a further picture under supervision but even then the forgeries were only conclusively proved by highly technical analysis of the paints, frames and canvasses. In 1947 he was sentenced to 12 months imprisonment. but died 19 days later. He stated that his only reason for executing the forgeries mas to avenge himself on various art critics by showing them that he was. in fact, a great painter

Fraudulent Claims. — Fraudulent claims to titles and estates have been common. In the early 17th century a Frenchwoman appeared in Limoges claiming to be Queen Henrietta Maria, the daughter of Louis XIII. uho at the moment was in London as consort of Charles I. Nevertheless, she played her part uith such distinction that she was widely accepted as a royal personage. A commission was sent down from Paris to examine her and she signed her interrogatory as Henriette de Bourbon. Nevertheless she was condemned to be whipped by the hangman and to be imprisoned till further orders. No fewer than seven pretenders claimed to be Louis XVII of France, though the death of the dauphin in the Temple on June 8, 1795, was testified to by responsible witnesses.

The impudent claim of Arthur Orton, a Wapping butcher, to the title and estates of Sir Roger Tichborne in May 1871 aroused greater public interest than any trial of this nature before or since. Sir Roger Tichborne was born in 1829 and educated at Stonyhurst. He was an officer in the carabineers for 33 years. He had become secretly engaged to his cousin. When this was discovered by her father, there was a stormy scene, and he sailed for South America in 1852. He was then presumptive heir to the baronetcy. On April 20, 1854, he sailed for Australia in the "Palma." A few days later wreckage from that vessel was picked up and none of the crew was ever heard of again. Roger Tichborne's will was proved and legal proof was given of his death. Meanwhile his mother, unwilling to believe in his death. had advertised a reward for his discovery. Thirteen years after the loss of the "Ralma" a solicitor in Wagga Wagga, N.S.W.. wrote to Lady Tichborne that her son was living in the town under the name of Castro. Funds having been provided for his journey, this man made a devious journey to Paris in the course of which he went to Wapping to inquire about the Orton family and to Tichborne where he was shown over the house as an ordinary visitor. Roger Tichborne had been a slight man: the claimant weighed nearly 20 stone (280 lb.). Nevertheless Lady Tichborne made an affidavit that she recognized her son and she allowed him £1,000 a year until the trial. She died before the claim came before the court. The trial took up the greater part of two years. England was divided between pro- and anti-claimants. But as the trial wore on and the claimant admitted that as far as he could remember Caesar and Virgil wrote in Greek, and went on to say that he had seduced the lady to whom Roger Tichborne had been engaged, there was a wave of sentiment against him. He lost his case and was sentenced to 14 years' penal servitude.

Company Frauds. — The list of company frauds is a very long one. The South Sea company was at first unwisely and aftenvard dishonestly managed. The South Sea bubble, as it was called, burst in 1720 ruining thousands of families. By fraudulent artifice the shares had been run up from £100 to £1,000. A parliamentary enquiry was held. and as a result John Aislabie, chancellor of the exchequer, and several members of parliament were expelled from the house (see SOUTH SEA BUBBLE). The crash had followed the collapse of John Law's (*q.v.*) bubble in France.

The London and Globe company frauds of the early 1890s were the work of Whitaker Wright, an Englishman who had spent many years as a mining engineer in Philadelphia. Pa. He returned to England in 1880 and began at once to float companies, concealing his frauds under a cloud of complicated details. The directors of the London and Globe company were puppets in his hands and believed everything that he told them. The crash came in 1903, when Wright was charged with issuing a fraudulent balance sheet. While the judge was passing sentence Wright swallowed cyanide of potassium.

A large fraud which occurred between 1919 and 1922 was the case in which Gerald Lee Bevan, a stock broker and director of the City Equitable Fire Insurance company, attempted to defraud the shareholders of that and subsidiary companies for several years by showing that the company nas in a sound financial position whereas it was hopelessly insolvent. He was charged with fraudulently converting more than £200,000 and. further, with obtaining sums on the false prospectuses which he issued.

Turf Frauds. — Conspicuous among the turf frauds was the case of Henry Benson. His father was a prosperous merchant, and he had an excellent education. Having already served a sentence for an impudent fraud in London, he advertised for employment as a linguist and was engaged by a certain William Kurr, who was concerned in dubious turf business. With the help of Benson's ingenuity and education, a criminal organization was built up. Kurr was under police suspicion, and therefore Benson set to work to suborn the police. He bought over three chief inspectors at Scotland Yard, all of whom were concerned in watching Benson's new activities in France. By means of a fabricated copy of a sporting paper. he induced French investors to trust him with their money. The French government pressed for the arrest of the snindlers. and the police warned Benson of his danger. It was too late; he. Kurr and his police confederates were arrested and sentenced. On release in 1887, Benson and Kurr crossed to America where they prospered as bogus company promoters. Subsequently Benson was found exploiting mines in Brussels, Belg., but, after a term in a Belgian prison, he went to Geneva as an American banker, So well did he play his part that he won the heart of the daughter of a retired Indian army officer whom he induced to part with all his capital in return for worthless scrip. He was arrested. but on his rélease he turned up in Mexico personating Madame Patti's agent and "netted" £5,000 in advance bookings. Arrested in New York city, he committed suicide. He was then still under 40.

An interesting example of this type of fraud was that attempted in July 1953 by a Maidenhead bookmaker with London offices, who with his three confederates endeavoured to scoop about £60.000 by substituting a tried sprinter for a mediocre racehorse in the Spa Selling Plate at Bath racecourse, a procedure called "ringing" in racing slang. Two horses similar in colour and size and unknown to English racegoers were purchased in France. The better horse. Santa Amaro. and the other horse, Francasal. a poor selling plater, were brought to England together; and, entered for the race in Francasal's name. Santa Amaro ran and won easily Starting price odds of 10 to 1 against were laid by the bookmakers because of Francasal's known poor form and because of the precautions taken by the "ringers" to conceal the large amount staked by spreading their bets over a great number of bookmakers off the racecourse. However. the severing of a main telephone cable just before the race (which prevented telephonic communication between bookmakers off and on the course that might have affected the starting price) aroused suspicion. and before the bets were settled the police began to make inquiries which led to the trial of the confederates at the Old Bailey in Jan. 1954. Their defense, that the switching of the horses was the mistake of a horse transporter, was not believed and they mere sentenced to varying terms of imprisonment.

Miscellaneous Frauds. — The Rev. William Dodd, a canon of Brecon and chaplain to George III. obtained funds from moneylenders by forging the signature of his former patron, Lord Chesterfield. Nothing might have been heard of the transaction had the document not been shown to Lord Chesterfield who denied its authenticity and allowed the forger to be arrested. In his extremity Dodd refunded the money. Nevertheless he was convicted. though with a strong recommendation to mercy. He was a fashionable clergyman of the day and a noted preacher and courtier. All London joined in a petition to the king, Dr. Johnson himself became his champion, but with King George III they cried to deaf ears. The poor chaplain was hanged at Newgate, pouring forth paeans of praise upon the king.

The Victory Bond scheme for which Horatio Bottomley was sentenced to a term of seven years' penal servitude in May 1922 was an ingenious method of exploiting patriotic enthusiasm and the gambling instinct at the same time. The Victory Bonds were issued by the government at £5: Bottomley invited subscribers at £1 or more, on the understanding that the interest should be drawn for as a lottery and the capital investment should remain intact. So strong was the bait that about 30.000 people trusted him with their money at the rate of £10,000 a day. He was forced to take action for criminal libel but on counsel's advice he offered no evidence at the trial. He was finally prosecuted for fraud and was found guilty on 23 out of 24 counts of the indictment for sums totalling £150,000, but he probably acquired a total of about £5,000,000 with the aid of his companies.

One of the most impudent frauds which amused the public considerably was that perpetrated under the pseudonym of D. S. Windell. In the autumn of 1908, 13 branches of one of the larger banks received an "advice transfer note" purporting to come from the Harlesden branch of the bank. This note advised each of the recipients that an account in the name of Davitt Stanley Windell was being transferred. The note was apparently genuine and was authenticated with a code number and suitable details. The following day, a smart young man called at 8 of the 13 branches, gave the name of D. S. Windell and drew cash It was only when the transfer failed to materialize that it was discovered that no such account existed at Harlesden and that the note mas a forgery. It mas realized that some party to the fraud must have an intimate knowledge of bank procedure and in due course a man was arrested who was in fact a cashier of another branch of the bank. He had considered that, in view of the poor pay which he alleged he received, he was entitled to obtain the money from his employers by any means.

Ivar Kreuger. the Swedish "match king." was responsible for fraud on an unprecedented scale. After World War I, when he was managing director of the Swedish Match company, he arranged loans, totalling more than £50,000,000, to many European states in exchange for match monopolies. To raise these loans, Kreuger resorted to bribery and downright forgery in order to make the bargains sufficiently attractive to his investors. At first his credit with the banks was excellent. but as he needed still more money and the banks needed greater security, Kreuger wrote up nonexistent assets and supported them by book transfers. He maintained dummy companies and even founded banks to deal with his transactions. He forged large quantities of scrip, but his most notorious forgery was of £28,500,000 Italian treasury bonds. Technically his forgeries were simple and of little interest. Kreuger was successful because no one doubted him. As his schemes grew greater, Kreuger became desperate for money. In 1932 the Swedish banks refused him further credit and Kreuger went to America in an attempt to raise £20,000,000. He failed, and in his absence the banks proposed a further credit on condition that they might investigate his affairs. Kreuger was finished and in March 1932 he shot himself, ruining thousands.

Possibly the largest single conspiracy in England was that brought to justice in the fire-raising trial in 1933. It was fraud in the grand style. More than 20 people were eventually convicted, 2 others committed suicide, and property worth hundreds of thousands of pounds was involved. The method was simple. One of the conspirators would acquire a business which was quickly stocked with goods, often of an inferior value. Insurance cover would be arranged, and in a short time the premises would be set on fire, and in due course an insurance claim followed. Salvaged stock would then be used at a new business where it was given the appropriate name of "old soldiers" because it had already been under fire. Again a fire would occur, and an insurance claim would follow, supported by fraudulent invoices so as to inflate the value of the stock held at the time of the fire. The conspiracy continued for several years, and investigation on behalf of the insurance companies was long and involved. The main trial of 17 conspirators lasted for 32 days, and the sentences ranged from 14 years' imprisonment downward.

Another famous fraud is that perpetrated in 1929 by a group of men led by an able financier who conducted a financial organization in the City of London which was approached by the councils of certain boroughs who wished to raise loans. The loans were raised by the group as required but, instead of restricting the issue of scrip to that covered by the loan, they issued duplicate certificates so that no less than £700,000 was acquired fraudulently.

Modern legislation tries hard to protect the fool from his folly; but it is always faced with the difficulty of doing so without interfering with legitimate trade. There is no protection from the wily fraudsman except an inquiring mind which demands confirmation of any story however plausible. New schemes for parting a man from his money are concocted every day, and though it might be thought that the story of a Spanish prisoner writing from a Spanish castle that he requires a little money to free a fortune had been sufficiently publicized in the press to prevent anyone believing such a story, in 1953 its modern version — of a chest of jewels behind the "iron curtain" — secured its victim.

UNITED STATES

More damage is done to the U.S. pocket and purse by so-called white-collar racketeers in a single year than by all of the armed thugs in a lifetime of violence. Few people have gone through life anywhere in the United States without having been mulcted or defrauded more than once.

Dubious investments, products and services are apparently marketed in the U.S. more expeditiously than anywhere else in the world. Perhaps because U.S. history contains so many success stories of persons grown fabulously rich from humble beginnings, the U.S. investor has seemed always ready to take a chance on a new "get rich scheme" or to give credence to a "something for nothing" offer. His innate gullibility and his generally high standard of living have also helped to make the American an especially easy and lucrative mark for the professional swindler.

While the word fraud, in its legal sense, has a strictly limited meaning applicable only in cases where guilt has been established under rules of evidence and law, the word may also be applied in its looser sense to the many types of ventures which, while not provable violations of law, depend nevertheless on guile and deceit to part the investor and consumer from his earnings and savings. These schemes, operating cleverly on the borderline of illegality but only rarely overstepping the line, are by far the more numerous, effective and widespread. In the sections below, both types of frauds will be discussed and illustrated.

MERCHANDISE FRAUDS

Rackets and frauds always follow the trend of the times and capitalize on people's natural desires. In the generation following the stock market crash of 1929, the investment boom declined. As the country lifted itself out of the depression of the 1930s and the American people began once again to accumulate extra savings, their interest shifted to the newly developed products which were being produced by fast-growing industry. Instead of seeking to put their money into stocks, bonds and other financial investments. they turned to automobiles, washing machines, refrigerators and television receivers, and the adaptable professional swindler turned with them. For this reason, merchandise frauds, some of which are described below, have grown substantially in extent and importance.

"Bait and Switch."—This type of scheme constitutes one of the most subtle and widespread merchandise frauds in the U.S. The scheme consists of advertising a product at a ridiculously low price simply as a lure to gain entrance into the prospect's home or to entice him to the advertiser's place of business. When the prospect responds to the advertisement, the salesman disparages the advertised product and makes a high-pressure attempt to switch him to a much more expensive one which is frequently an unknown, inferior and overpriced brand. If the prospect insists on the advertised product. the salesman may refuse to take his order or, if he does, delivery is rarely made.

"Bait and switch" tactics are used in the sale of a variety of products but particularly in connection with certain household appliances, which are often sold through demonstration in the home. In the case of the low-priced special "bargain" it has been found that the demonstration model was deliberately tampered with to impair its efficiency. One company, for example, followed the practice of removing a vital part from its demonstrator model, resulting in a reduction of performance to $ of its normal capacity. This was deliberately done so that the prospect would find the advertised machine so completely unacceptable as to be readily switched to the high-priced machine which the salesman "just happened to have in his car."

Fake Contests.—These have been widely used for promoting the sale of inferior merchandise at high prices. Such contests take many forms but are characterized by the fact that every contestant wins the "prize" and the award is usually a credit voucher applicable to the purchase of some piece of merchandise. One common type is the so-called "mystery melody" contest. Melodies are played on the radio and listeners are told, for example, that the first 25 persons who send in the name of the melody will receive a $50 credit applicable to the purchase of certain merchandise. The melodies played are simple, familiar tunes which are known to almost every schoolchild.

As a further indication of the falsity of the contest, tests have shown that persons sending in incorrect answers also "win" the prize. There is, of course, no limit on the number of "winners." In all of these cases, the price has been marked up in advance so that the application of the $50 credit would result in a price which is no lower and often higher than the normal selling price for the merchandise.

Door-To-Door Selling.—While the honest door-to-door salesman plays an important part in the distribution of goods and usually represents highly respectable and reputable companies, this method of selling has been subject to many frauds and abuses. The young salesman who is "working his way through college" or, as he grows older, is "working his way through medical school" was, after the end of World War II, joined by the "wounded war veteran" who uses this fictitious appeal to gain the sympathy of his potential victims. As the market survey became an important technique of business research, many door-to-door salesmen also adopted the guise of the survey taker. After going through the motions of taking a survey by asking the housewife some questions about the soap powder she uses or the magazines she reads, for example, the "survey taker" offers her a "gift" for her cooperation—merchandise "valued at" $150 for only $50. The actual value, however, may be less than half of $50.

Another common fakester is the door-to-door house-improvement salesman who claims that the prospect's house is the first approached in the area and that, if he will agree to have his home repaired or improved at a special bargain price and permit it thereafter to be used as a model for others in the neighbourhood to view, the property owner will receive a $50 bonus for every additional job done in that area. Such promises are never included in the formal contract and are seldom fulfilled.

Fake Jewellery Salesmen.—These have used a reprehensible method to sell watches to illiterate industrial, restaurant and hotel workers. They approach their victims during their lunch hours at their places of employment or after work and show them gaudy watches at "bargain" prices. The salesman suggests to the victim that he wear the watch a day or two and show it to his friends and family before making up his mind. All that is required, says the salesman, is the signing of an overnight receipt so that he can account for the watch to his employer. If the victim is gullible enough to sign the "receipt," he subsequently finds that what he has actually signed is a firm contract for the purchase of the watch on instalment payments and that the agreement also gives the firm the right to attach his wages if he does not keep up his payments.

"Going-out-of-business" Sales.—An old and time-worn trick of unscrupulous merchants is the fake going-out-of-business sale, Such tricks are used particularly by certain merchants located in sections of large cities frequented by out-of-towners who have no way of knowing that the merchant is perpetually closing out his business.

In many U.S. communities, laws have teen enacted requiring the special licensing of all "going-out-of-business sales," their duration being strictly limited.

Certain types of merchandise frauds which formerly enjoyed widespread success but were largely eliminated through legislation and special precautionary measures are worth mentioning for their historical interest in famous frauds. Two of these are described below.

Stuffed Flats.—Dealers in furniture, furs, jewellery, etc., rent an apartment and pose as private parties obliged to sell their furnishings and belongings at great sacrifice. The apartments are actually furnished from the dealer's own stocks. The merchandise is grossly misrepresented, exhorbitant prices are charged, and the flats regularly "restuffed."

Suit Clubs.—Suit club swindles require the payment to the promoter of $1 or $2 per week for 25 weeks or more for the "chance" of winning a suit in one of the weekly lucky drawings. It is understood that those whose numbers are not drawn are to receive a suit anyway upon the completion of their payments. Actually, very few legitimate drawings are held. The suit which the member of the club gets at the completion of his payments is made of the shoddiest material and is worth far less than the total amount paid in. Operators of the clubs often abscond before the end of the payment period.

COMMERCIAL FRAUDS

"Clip-and-paste" Schemes.—While possessed of greater business judgment and acumen than the ordinary consumer, the businessman himself is the victim of a surprising number of frauds and rackets, usually the result of his own carelessness. One of the most common promotions by which businessmen are duped is the "clip-and-paste" directory. In this scheme, a promoter of an obscure trade directory with little or no circulation clips a company's advertisement or listing from a well-known and recognized directory and pastes it on an invoice form of his own. The form is cleverly prepared and worded, usually cluttered with print and marked "Rush" and "Final Proof" in bold letters. In most respects, the form looks like a renewal invoice from the directory in which the advertisement was originally published. The careless businessman approves the invoice and sends his remittance in the belief that he is simply renewing his previous advertisement.

Homework Schemes.—An advertisement appears offering earnings as high as $50 per week for addressing envelopes at home or for doing home embroidery work. Persons who respond are asked to send in from $2 to $5 as evidence of their "good faith," or to cover the cost of a "working kit," this cost to be reimbursed to the respondent out of future "earnings."

In actual fact. these homework offerings usually involve the addressing of envelopes by the respondent as part of a plan whereby he attempts to sell merchandise which he must purchase from the advertiser, or an attempt on the part of the promoter to sell kits and equipment to respondents.

"Death Vultures," also known as "hearse chasers," victimize recently bereaved families by attempting to collect payment for items which they falsely claim had been ordered or purchased by the deceased just before his demise. In their grief. the family frequently fails to check the claim and pays the bill. Other "hearse chasers" send C.O.D. packages addressed to the deceased. The family pays for the goods believing the deceased had ordered them before his death.

Gardening Rackets.—Spring is the time of the year for gardening frauds—quack tree surgeons, fake seed salesmen and illegitimate humus peddlers. Housewives are approached by truckmen with loads of "fine humus" for lawns. The truckman offers to spread the material on the lawn at a cost of 75 cents a basket. Scattering some sample baskets as a demonstration of how little is needed, the truckman receives permission to proceed. The housewife goes about her chores and when the job is done she is presented with a bill of $150. Although greatly chagrined. she usually feels she has no choice hut to pay. In many cases, laboratory analysis of the "fine humus" discloses it to be entirely worthless as a lawn invigorator.

Radio and Television Repair Schemes.—Advertisers of television and radio receiver repair service in the home at ridiculously low prices often follow the practice of removing the receiver to their shops even when the repair is a simple one which can easily be performed in the home. They finally return the set with a large bill for repairs for work never needed and never done. Some unscrupulous service companies of this nature have been trapped by the police by calling them in to repair sets which had previously been prepared by experts so that one small tube and nothing more required replacement. Identification marks were placed on each of the tubes and parts. Subsequently. when the crooked company rendered a bill for the replacement of parts which examination of the set showed were never replaced, criminal proceedings were instituted.

Child Model Schemes.—Agents approach mothers with the tale that their children had been observed at play and appeared, in the opinion of the agent, to be remarkably precocious and attractive. The agent paints a picture of a large unsatisfied demand for child models to pose for advertisements which could easily make the child the family breadninner. An additional inducement is the enticing suggestion that the child may even find his way to Hollywood to star in motion pictures. For a $50 listing fee, the child's photograph is included in a catalogue which, states the agent, is circulated to all of the "right people." While the catalogue is actually produced and distributed, it carries no weight and receives little attention from persons in a position to employ child models. In only the rarest case does a child earn any money as a result of inclusion in the catalogue and in practically no case do the earnings even repay the cost of inclusion in the catalogue.

Song Sharks.—These are "song publishing" companies which, for a fee. will accept for publication any song submitted by a hopeful but, regrettably, untalented songwriter. The song shark fulfills his contractual obligation by obtaining copyrights and by printing a handful of copies of the song. It has been estimated that approximately 1% of all songs copyrighted and published in the United States ever achieve success. Legitimate publishers do not require the payment of a publishing fee.

Charity Frauds.—In the 1950s it was estimated that Americans were unknowingly contributing approximately $100,000,000 a year to corrupt and fraudulent appeals made in the name of charity. Using the mails. personal canvass and "boiler rooms" (batteries of telephones at which professional solicitors make calls to persons listed on carefully prepared "sucker" lists) the charity fraud became one of the most lucrative fields of endeavour for the white-collar underworld. Many of the erstwhile operators of financial swindles, with their financial operations restricted by government legislation, turned to the greener pastures of charity solicitations.

Charity frauds may be divided into two categories: those appeals conducted by crooked promoters in behalf of a nonexistent charity in which they pocket all of the funds collected; and the more subtle and widespread procedure of obtaining permission of an established charity to use its name, thus giving the solicitation an aura of respectability and legitimacy, in which the promoter turns over a small part to the charity instead of keeping all for himself.

In 1953 a joint legislative committee of the New York state legislature conducted public hearings into charity rackets The report issued at the conclusion of its investigation exposed a large organization of wounded veterans as having collected more than $21,000,000 in a three-year period. Of this sum, the report showed. $14,000,000 was used to pay promoters and to cover other fund-raising expenses. This organization had been using the names of the president of the United States and a farmer president in its fund-raising campaigns. A national organization which based its appeal on rendering assistance to children raised almost $4,000,000, of which $3,250,000 was consumed in fund-raising expense. A cancer hospital which existed purely in the mind of the promoter was able to collect $630,000 in its nation-wide solicitations. Another prevalent solicitations racket exposed by the committee was the operation of a self-styled "bishop" who sent six "nuns" out into the streets every day to solicit funds. No church received any benefit. The "bishop" received $2.50 a day from the "nuns" in return for which he gave them a certificate as evidence that they were solicitating funds for his church. None of the paid solicitors were actually nuns. They would come to the church in the morning in their street clothing, change into a nun's habit and then go out with little metal trays to solicit funds. At the end of the day they would come back to the church, change their clothes and go home. All they collected over $2.50 was clear profit to themselves.

FINANCIAL FRAUDS

In the period between the end of World War I and the stock market crash of 1929, financial frauds reached a volume and a degree of success never equalled before or after in the U.S. According to Andrew Mellon, secretary of the treasury during most of this period, the annual American loss in financial ventures alone in those years was $1,700,000,000. One flourishing business in itself was the marketing of "sucker lists" of persons who had already been victimized, on the theory that these were the best potential subjects for future "fleecing." In the aftermath of the 1929 collapse, the United States congress enacted a series of laws designed to protect the public from fraudulent and speculative investments. A federal agency, the Securities and Exchange commission, was established to administer the laws and to require the registration of security offerings. Many states adopted similar local requirements. The result was that while investment frauds still continued to appear from time to time, most of the free and easy stock swindles of the 1920s became extinct. No record of the subject of frauds would be complete, however, without some reference to two of the more famous frauds of the roaring 1920s.

The Ponzi Scheme.—During its relatively short existence, the swindle operated by Charles Ponzi was one of the most remarkable individual operations in the history of fraud. Beginning in Dec. 1919 Ponzi, who had served a previous prison sentence for forgery, produced a scheme involving the purchase of International Postal Reply coupons in countries where the exchange was low, trading them in for postage stamps at their face value in a country where the rate was high, and then selling the stamps at a great profit. International Postal Reply coupons were an instrumentality or device of the international bureau of the Universal Postal union which stipulated that the coupons were to be sold at a price not less than 28 centimes gold. The slogan of the swindle was 40% in 90 days. In its first month of operation, there were only 15 customers whose investment totalled $870. In the third month, there were 17 people contributing $5,290. In the fourth month, 110 customers invested a total of $24.724. In the sixth and last month the swindle reached its final fantastic proportions—20,000 individuals invested nearly $10,000,000. In fact Ponzi could not have done what he was promising to do even if he had bought the coupons. Actually, however, Ponzi made no purchases whatever of International Postal Reply coupons. When the bubble finally burst, the investors had lost all the money they had entrusted to Ponzi, and he himself was sentenced to a federal prison where he spent the next five years.

Tipster Sheets, of which there were at one time at least 50 in existence on the eastern seaboard alone, were publications put out by crooked stock promoters who pretended to furnish unbiased advice on investments. Almost everything in a tipster sheet was true and almost all of the advice obviously sound, thus creating an atmosphere of responsibility. The sole reason for publishing the sheet, however, was the advice it contained to buy a certain stock which the publisher was trying to unload. The most notorious and successful tipster sheet was the *Wall Street Iconoclast*, a biweekly publication of George Graham Rice, who subsequently served a term in a federal penitentiary in connection with one of the fraudulent stocks he successfully sold with the help of his tipster sheet. Among other things, the *Wall Street Iconoclast* attacked financial swindlers and warned its readers against them. So plausible were the writings contained therein that a professor in one university was found using it as a periodical for instruction in his classes on financial and economic subjects.

REAL ESTATE FRAUDS

The Free Lot Scheme.—In this scheme the victim is informed he has won a "free" lot, and he and his wife are taken by the salesman to see the new home site they have so luckily acquired. They find, however, that the lot they have "won" has a completely undesirable location. The salesman then persuades the victim to accept a $100 "allowance" on the "free" lot to be deducted from the sale price of a more desirable one. The price of the second lot is, of course, inflated to absorb the allowance and, frequently, much more.

Advance Fee Schemes.—Certain crooked real-estate firms demand a fee in advance to cover their "expenses" in selling their client's property. No real effort is made to sell the property, however, and the agent simply pockets the advance fee. This scheme has also had application in connection with attempts to locate living accommodations, especially in areas where housing is scarce. The applicant pays the "agent" a $50 advance fee for help in finding a suitable apartment or house. If the quest is successful, he is told, the $50 will be kept by the agent as his fee. If not, the applicant may at any time request the return of $40, the remaining $10 being retained by the agent for his troubles. The unscrupulous agent makes no bona fide effort to locate accommodations for his applicants, but nets the $10 "service" fees.

Development Frauds.—One of the most spectacular real estate frauds in history involved real estate at Muscle Shoals, Ala. During World War I a gigantic project to manufacture nitrates was started there by the government. together with the Wilson dam and its hydroelectric system. The project was not completed until the early 1920s—too late to be of any value in the war. Nevertheless, capitalizing on the publicity that accompanied the project, a group of promoters bought up surrounding farm land, divided it up into city lots, and proceeded to unload them on the public at prices far in excess of the actual value of the land. Thousands of unwary investors were victimized.

MIXED FRAUDS AND CONFIDENCE GAMES

The "Spanish Prisoner Fraud."—Many frauds. although exposed over and over again, continue to reappear, sometimes with slight variations. One which constantly recurs in different sections of the United States is the "Spanish prisoner" letter. This particular swindle is of historical interest as one of the oldest of international frauds and is said to have been started in 1588. The writer of the letter states he is a prisoner in Spain or Mexico and has $200,000 in cash which he will divide with the victim if he will advance the money necessary to purchase his release. Frequently, an alluring señorita is also a part of the bait.

Missing Heirs.—One of the most successful confidence swindles is based on a fortune allegedly left unclaimed at the time of the owner's death. The confidence man convinces his victim that he is the rightful heir to the estate and is usually able to extract substantial sums to cover the supposed expenses of establishing the rightful proprietorship. One of the best-known "missing heir" schemes revolved around Jacob Baker. For almost 100 years after his death, many persons named Baker were convinced by fakers that he had been the owner of most of the land on which Philadelphia was built and each of these Bakers was willing to pay to have their inheritance recovered. In 1937 a United States attorney established that Jacob Baker had died penniless. His alleged will. which fakers had used to dupe their victims, was proved a forgery.

Quack Doctors.—Fake medical men with counterfeit diplomas and quack cures are practitioners of one of the most dangerous of frauds, known to have produced the death of more than one gullible patient. What adds to the success of their masquerade is the willingness of their "patients" to speak of them in the most laudatory terms. Persons beyond middle age, for example, frequently develop harmless growths which are solemnly diagnosed by the quack as cancer. When simple caustics remove the growth, the patient goes home in fine health to serve henceforth as a living advertisement of an alleged cancer cure.

One of the most reprehensible frauds involving fake medical men is the "glimmer scheme" practised by quack eye doctors. The eye "doctor" and a confederate drive through rural areas and learn from talkative store keepers which farmers in the neighbourhood are having difficulty with their vision. The confederate, posing as a chauffeur, drives to the farmer's house and stops for water. Pretending to notice the farmer's eye condition he confides that he is driving a famous eye surgeon to a convention in a near-by city. The chauffeur persuades the "doctor" to examine the victim's eyes. The gullible victim is told he suffers from cataracts and his eyesight is in danger, but that this can be cured by a simple operation. The farmer pleads for the surgeon to save his sight. The surgeon agrees reluctantly, pointing out that he is not licensed in that state. The farmer, however, agrees to keep the operation a secret. A harmless fake operation is then performed and a piece of egg membrane displayed to the farmer as the removed cataract. Numerous persons have paid $100 to $2,500 for such "operations." (*See* also QUACKERY; SALE OF GOODS.)

FRAUENFELD, the capital of the Swiss canton of Thurgau, 27 mi. N.E. of Ziirich by rail, on the Murg stream a little above its junction with the Thur. Pop. 11,114. It has iron manufactures. The old upper town centres around the castle, of which the tower dates from the 10th century, though the rest is later. Both stood on land belonging to the abbot of Reichenau, who, with the count of Kyburg, founded the town, first mentioned in 1255.

FRAUENLOB, the name by which HEINRICH VON MEISSEN, a German poet of the 13th century, is generally known. He seems to have acquired the sobriquet because in a famous *Liederstreit* with his rival Regenbogen he defended the use of the word *Frau* (i.e., *frouwe,* "lady") instead of *Weib* (*wîp,* "woman"). Frauenlob was born about 1250 of a humble burgher family, but he gradually acquired a reputation as a singer at the various courts of the German princes. In 1278 we find him with Rudolph I in the Marchfeld, in 1286 he was at Prague at the knighting of Wenceslaus (Wenzel) II, and in 1311 he was present at a knightly festival celebrated by Waldemar of Brandenburg before Rostock. After this he settled in Mainz, and there according to the popular account, founded the first school of Meistersingers (*q.v.*). He died on Nov. 29, 1318.

Frauenlob's poems make a great display of learning; he delights in far-fetched metaphors, and his versification abounds in tricks of form and rhyme. They were edited by L. Ettmüller in 1843; a selection will he found in K. Bartsch, *Deutsche Liederdichter des 12. bis 14. Jahrhunderts,* 3rd ed. (1893). An English translation of Frauenlob's *Cantica canticorum,* by A. E. Kroeger, with notes, appeared in 1877. *See* A. Boerkel, *Frauenlob,* 2nd ed. (1881); Pfannmuller, *Frauenlobs Marienleich* (1913).

FRAUNCE, ABRAHAM (*c.* 1558–1633), English poet whose critical textbook *Arcadian Rhetorike* (1588) is original in illustrating each precept by a quotation from a classical, continental or English author. The English quotations are mainly from works by Sir Philip Sidney and from Spenser's *The Faerie Queene,* then unprinted, and show that these two poets had achieved fame while their chief works were still in manuscript.

A native of Shropshire, Fraunce was born between 1558 and 1560, and was educated at Shrewsbury school and St. John's college, Cambridge. He was called to the bar at Gray's Inn in 1588, and apparently practised in the court of the Welsh marches. His works include *Victoria,* a Latin comedy, edited by G. C. Moore Smith (1906); *The Lawiers Logike* (1j88); and *The Countess of Pembroke's Emanuell* (1591).

FRAUNHOFER, JOSEPH VON (1787–1826), German physicist, is best known for his study of the dark lines in the sun's spectrum, known by his name. He was born at Straubing in Bavaria on March 6, 1787. He gained experience as an optician and obtained work at the Utzschneider optical institute at Benedictbeuern, near Munich, of which he became sole manager in 1818; the institute was in 1819 moved to Munich. Fraunhofer acquired great skill in the manufacture of achromatic lenses and various optical instruments.

While measuring the refractive index of glass of various kinds, he noticed and made use of the D lines in the sodium spectrum, and continued work led to observation of "Fraunhofer lines." His researches were published in the *Denkschriften der Münchener Akademie* for 1814–1j. These dark lines had been noted earlier by W. H. Wollaston (*Phil. Trans.,* 1802), but were for the first time carefully observed by Fraunhofer. He mapped j76 of these lines, the principal of which he denoted by the letters of the alphabet from A to G; and by ascertaining their refractive indices he determined that their relative positions are constant, whether in spectra produced by the direct rays of the sun, or by the reflected light of the moon and planets. The spectra of the stars he obtained by using, outside the object glass of his telescope, a large prism through which the light passed to be brought to a focus in front of the eyepiece.

In 1823 he was appointed conservator of the physical cabinet at Munich, where he died on June 7, 1826.

FRAY BENTOS, a port on the Uruguay river and capital of the department of Rio Negro in Uruguay, was founded as Independencia in 1859. Pop. (1954 est.) 15,000. It became important when the first industrialized meat-packing plant in Uruguay was established there by G. C. Giebert in 1861, using the meat-extracting method invented by Baron Justus von Liebig. The industry grew rapidly, and Fray Bentos has a significant share of the nation's meat-packing trade, exporting the produce of its stock-raising hinterland. Its modern port is the deepest on the Uruguayan side of the Uruguay river. It has rail, road and air connections with Montevideo. (M. I. V.)

FRAYSSINOUS, DENIS ANTOINE LUC, COMTE DE (1765–1841), French prelate and statesman, was born of humble parentage at Curihres on May 9, 1765. He owes his reputation mainly to the lectures on dogmatic theology delivered in the church of Saint Sulpice, Paris, from 1803 to 1809. As court preacher and almoner to Louis XVIII., he later exercised great public activity and influence. In connection with the controversy raised by the signing of the reactionary concordat of 1817, he published in 1818 his *Vrais Principes de l'église Gallicane sur la puissance ecclksiastique.* The consecration of Frayssinous as bishop of Hermopolis "in partibus," his election to the French Academy, and his appointment to the grand-mastership of the university, followed in rapid succession. In 1824, he became minister of public instruction and of ecclesiastical affairs under the administration of Villèle; and about the same time he was created a peer of France with the title of count. In 1828 he, along with his colleagues in the Villhle ministry, was compelled to resign office, and the subsequent revolution of July 1830 led to his retirement to Rome. He died at St. Géniez on Dec. 12. 1841. His lectures were published in 1825 as *Défense du Christianisme* (15th ed. 1843, Eng. trans. 1836).

See Bertrand, *Bibl. Sulpicienne,* t. ii, 135 *sq.;* iii, 253, for bibliography, and G. A. Henrion, *Vie de M. Frayssinous* (1844).

FRAZER, SIR JAMES GEORGE (1854–1941), British anthropologist and classical scholar who specialized in folklore and mythology, was born at Glasgow on Jan. 1, 1854, of a wealthy family. Educated at Helensburgh, Glasgow university and Trinity college, Cambridge, he was elected a fellow of Trinity in 1879 and in the same year was called to the bar, but never practised. In 1907 he became professor of anthropology at Liverpool university.

His fame as an author was established with the publication in 1890 of *The Golden Bough; A Study in Magic and Religion* (reissued in 12 vol., 1907–1j; abridged edition in one vol., 1922). This was a comparative study of myths and rituals that drew equally from ethnology, ancient history and European and oriental folklore. Frazer's data on ethnology were second hand and often inaccurate, but his theories on religion were stimulating and his work on folklore prodigious. He was knighted in 1914 and received many academic honours.

He died on May 7, 1941, in Cambridge.

Among his many other works were *Totemism* (1887); *Adonis, Attis, Osiris, Studies in the History of Oriental Religion* (1906. 3rd ed. 1914); *Totemism and Exogamy* (1910); *Aftermath, a Supplement to the Golden Bounh* (1936).

FRÉCHETTE, LOUIS HONORÉ (1839–1908), French-Canadian poet noted for his patriotic poems, was born at Lévis, across the St. Lawrence from Quebec city, on Nov. 16, 1839. He studied law at Laval university, Quebec, and was admitted to the bar in 1864. After a year spent at Lévis in radical journalism. he chose political "exile" from 1866 to 1871 in Chicago. where he edited *Amérique* for Franco-Americans. In *Mes Loisirs* (1863) he had exhibited the spell of the nationalist school of Quebec, led by Octave Crémazie (*q.v.*). Now he was inspired by Victor Hugo; in *La Voix d'un Exile'* (1866–1868) he attacked political and clerical dealings in Quebec in that period of Canadian confederation and voiced patriotism for France idealized as a republic. Returning to Lévis to enter politics, he suffered defeat in several elections but represented LCvis from 1874 to 1878 in the federal house of commons. From 1888 until his death on May 31, 1908, he lived in Montreal, traveling frequently to Quebec city to act as clerk of the provincial legislative council.

Meanwhile he had made literary history. *Les Fleurs Borkales et Les Oiseaux de Neige* (1879) were acclaimed in France and awarded the Prix Montyon in 1880—the first time the work of a Canadian had been crowned by the French Academy. Famous now, and representative of liberal nationalism, Fréchette wrote *La Le'gende d'un Peuple* (1887), conceived as the epic of French Canada in the manner of Hugo's *La Le'gende des Siècles*. Popular success drew criticism from his rivals, but left him with many honours and a secure place in French-Canadian letters. Some admirable, less pretentious poems may be found in the volumes mentioned and in *Pêle-Mêle* (1877), *Feuilles Volantes* (1891) and *Poésies Choisies* (1908). Fréchette's prose stories were published in *Originaux et Détraqués* (1892) and *La Noël au Canada* (1900; Eng. trans., *Christmas in French Canada*, 1899). He also wrote the polemical *Lettres à Basile* (1872) and the dramas *Félix Poutrk* (1871), *Papineau* (1880) and *Ve'ronica* (1908).

FREDEGOND *(Fredigundis)* (d. 597), Frankish queen. Originally a serving-woman, she inspired the Frankish king, Chilperic I., with a violent passion. At her instigation he repudiated his first wife Audovera, and strangled his second, Galswintha, Queen Brunhilda's sister. A few days after this murder Chilperic married Fredegond (567). This woman exercised a most pernicious influence over him. She forced him into war against Austrasia, in the course of which she procured the assassination of the victorious king Sigebert (575); she carried on a malignant struggle against Chilperic's sons by his first wife, Theodebert, Merwich and Clovis, who all died tragic deaths; and she persistently endeavoured to secure the throne for her own children. Her first son Thierry, however, to whom Bishop Ragnemod of Paris stood godfather, died soon after birth, and Fredegond tortured a number of women whom she accused of having bewitched the child. Her second son also died in infancy. Finally, she gave birth to a child who afterwards became king as Clotaire II Shortly after the birth of this third son, Chilperic himself perished in mysterious circumstances (584). Fredegond has been accused of complicity in his murder, but with little show of probability, since in her husband she lost her principal supporter.

Henceforth Fredegond did all in her power to gain the kingdom for her child. Taking refuge at the church of Notre Dame at Paris, she appealed to King Guntram of Burgundy, who took Clotaire under his protection and defended him against his other nephew, Childebert II., king of Austrasia. From that time until her death Fredegond governed the western kingdom. She endeavoured to prevent the alliance between King Guntram and Childebert, which uas cemented by the pact of Andelot; and made several attempts to assassinate Childebert by sending against him hired bravoes armed with poisoned *scramasaxes* (heavy single-edged knives) After the death of Childebert in 595 she resolved to augment the kingdom of Neustria at the expense of Austrasia, and to this end seized some cities near Paris and defeated Theodebert at the battle of Laffaux, near Soissons. Her triumph, however, was short-lived, as she died quietly in her bed in 597 soon after her victory.

(C. PF.)

FREDERIC, HAROLD (1856–1898), U.S. journalist and author, whose novel *The Damnation* of *Theron Ware* gained him his greatest fame, was born in Utica, N.Y., on Aug. 19, 1856. He received a respectable education by the standards of the time although he went to work at an early age. His first interests were photography and journalism, and by the age of 20 he was a reporter for the *Utica Observer;* by 1882 he was editor of the *Albany Evening Journal.* In 1884 he went to London as the correspondent for the *New York Times,* and remained there as an expatriate for the rest of his life. As a reporter. Frederic was able and courageous. In 1884 he made a hazardous tour investigating outbreaks of cholera in certain districts of southern France and Italy. In 1891 he visited Russia to investigate the persecution of the Jews. His novels fall into certain natural groupings because of their subject matter. *Seth's Brother's Wife* (1887) and *The Lawton Girl* (1890) draw upon his memories of upper New York state; *The Return of O'Mahoney* (1892), a fantasy, reflects Frederic's lifelong interest in the Irish; In *the Valley* (1890) is about the American Revolution; and *The Copperhead* (1893) and *Marsena and Other Stories* (1894) are concerned with the American Civil War. In 1896 he combined his memories of the Mohawk valley uith his interest in the meaning of American history to produce his best novel *The Damnation of Theron Ware* (published in England as *Illumination),* the story of the decline and fall of a young Methodist minister.

Frederic wrote three other novels (two of which were published posthumously) concerned with English life: *March Hares* (1896), *Gloria Mundi* (1898) and *The Market Place* (1899).
(J. H. RH.)

FREDERICIA (FRIEDERICIA), a seaport of Vejle, Denmark, near the southeast corner of Jutland, on the west shore of the Little Belt opposite the island of Fyn. Pop. (1955) 27,910. It has good railway communication, and a steam ferry connects with Middelfart, a seaside resort on Fyn. There is a considerable shipping trade. Industries comprise a railway works and the manufacture of tobacco, salt, chicory and cotton goods. A small fort was erected on the site of Fredericia by Christian IV of Denmark, and his successor, Frederick III determined about 1650 to make it a powerful fortress. The town first bore the name of Frederiksodde, and received its present designation in 1664. In 1657 it was taken by the Swedes and in 1659, after the fortress had been dismantled, it was occupied by Frederick William of Brandenburg. It was refortified in 1709–10. Monuments in the town and vicinity commemorate the fighting of 1849 with the Prussians. The fortress was strengthened again in 1864 and stood a short siege before the Austro-Prussian occupation of that year.

FREDERICK, "king or lord of peace" (Ger. *Friedrich:* Ital *Federigo;* Fr. *Frédéric* and *Fédéric*). A Christian name borne by many European sovereigns and princes.

FREDERICK I (c. 1123–1190), Holy Roman emperor, called "Barbarossa" or "Redbeard" by the Italians, was the son of Frederick II of Hohenstaufen, duke of Swabia, and Judith, daughter of the Welf Henry IX, duke of Bavaria. When his father died in 1147 Frederick became duke of Swabia, and immediately afterwards accompanied his uncle, the German king Conrad III, on his disastrous crusade, during which he won the complete confidence of the king. In 1152 the dying king advised the princes to choose Frederick as his successor to the exclusion of his own young son. Frederick was chosen German king at Frankfurt on March 5, 1152, and crowned at Aix-la-Chapelle on the 9th, owing his election partly to his personal qualities, and partly to the fact that he united in himself the blood of the rival families of Welf and Waiblingen.

The new king saw clearly that the restoration of order in Germany was a necessary preliminary to the enforcement of the imperial rights in Italy. Issuing a general order for peace, he was prodigal in his concessions to the nobles. Abroad Frederick decided a quarrel for the Danish throne in favour of Svend, or Peter as he is sometimes called, who did homage for his kingdom, and negotiations were begun with the East Roman emperor, Manuel Comnenus. About this time he obtained a divorce from his wife Adela, on the ground of consanguinity, and made a vain effort to obtain a bride from the court of Constantinople. On his accession Frederick had communicated the news of his election to Pope Eugenius III, but neglected to ask for the papal confirmation. But a treaty was concluded between king and pope at Constance in March 1153, by which Frederick promised in return for his coronation to make no peace with Roger II, king of Sicily, or with the rebellious Romans, without the consent of Eugenius, and generally to help and defend the papacy.

The journey to Italy made by the king in 1154 was the precursor of five other expeditions which engaged his main energies for 30 years, during which the subjugation of the peninsula was the central and abiding aim of his policy. He was crowned emperor at Rome on June 18, 1155. He left Italy in the autumn of 11jj to prepare for a new and more formidable campaign. Disorder was again rampant in Germany, especially in Bavaria, but general peace was restored by Frederick's vigorous measures. Bavaria was transferred from Henry II Jasomirgott, margrave of

Austria, to Henry the Lion, duke of Saxony; and the former was pacified by the erection of his margraviate into a duchy, while Frederick's step-brother Conrad was invested with the Palatinate of the Rhine. On June 9, 1156 the king was married at Wurzburg to Beatrix, daughter and heiress of the dead count of Upper Burgundy, Renaud III., when Upper Burgundy or Franche Comté, as it is sometimes called, was added to his possessions. An expedition into Poland reduced Duke Boleslaus IV. to submission, after which Frederick received the homage of the Burgundian nobles at Besançon in Oct. 1157.

In June 1158 Frederick set out upon his second Italian expedition, during which imperial officers called *podestas* in the cities of northern Italy, captured revolted Milan, and the long struggle began with pope Alexander III., who excommunicated the emperor on March 2, 1160. During this visit Frederick summoned the doctors of Bologna to Roncaglia in November 1158, and as a result of their inquiries into the rights belonging to the kingdom of Italy he obtained a large amount of wealth. Returning to Germany towards the close of 1162, Frederick prevented a conflict between Henry the Lion, duke of Saxony, and a number of neighbouring princes, and severely punished the citizens of Mainz for their rebellion against archbishop Arnold In 1163 his plans for the conquest of Sicily were checked by a powerful league against him provoked by the exactions of the *podestas* and the enforcement of the rights declared by the doctors of Bologna. Frederick had supported an anti-pope Victor IV. against Alexander, and on Victor's death in 1163 a new anti-pope called Paschal III. was chosen to succeed him. At a diet at Würzburg in May 1165 he took an oath, followed by many of the clergy and nobles, to remain true to Paschal and his successors. A temporary alliance with Henry II., king of England, the magnificent celebration of the canonization of Charlemagne at Xix-la-Chapelle, and the restoration of peace in the Rhineland, occupied Frederick's attention until Oct. 1166, when he made his fourth journey to Italy. Having captured Ancona, he marched to Rome, stormed the Leonine city. and procured the enthronement of Paschal, and the coronation of his wife Beatrix; but the sudden outbreak of a pestilence destroyed the German army and drove the emperor to Germany. During the next six years the imperial authority was asserted over Bohemia, Poland and Hungary. Friendly relations were entered into with the emperor Manuel, and a better understanding was sought with Henry II., king of England, and Louis VII., king of France.

In 1174, Frederick made his fifth expedition to Italy. The campaign was a complete failure. The refusal of Henry the Lion to bring help into Italy was followed by the defeat of the emperor at Legnano on May 29, 1176, when he was wounded and believed to be dead. He concluded with Alexander the treaty of Venice (Aug. 1177), and at the same time a truce with the Lombard league was arranged for six years. Frederick, loosed from the papal ban, recognized Alexander, and in July 1177 knelt before him and kissed his feet. The possession of the vast estates left by Matilda, marchioness of Tuscany, and claimed by both pope and emperor, was to be decided by arbitration, and in Oct. 1178 the emperor was again in Germany. Henry the Lion was deprived of his duchy, and sent into exile; a treaty was made with the Lombard league at Constance in June 1183; and Frederick's son Henry was betrothed in 1184 to Constance, daughter of Roger II., king of Sicily, and heiress of the reigning king. William II. This betrothal, which threatened to unite Sicily with the Empire, made it difficult for Frederick, when during his last Italian expedition in 1184 he met Pope Lucius III. at Verona, to establish friendly relations with the papacy. The question of Matilda's estates was left undecided; and Lucius had refused to crown Henry or to recognize the German clergy who had been ordained during the schism. Frederick then formed an alliance with Milan, where the emperor, who had been crowned king of Burgundy, or Arles, at Arles on July 30, 1178, had this ceremony r'epeated (Jan. 27, 1186); while his son Henry was crowned king of Italy and married to Constance, who was crowned queen of Germany.

The quarrel with the papacy was continued with the new pope Urban III., and open warfare was begun. But Frederick was recalled to Germany by the news of a revolt raised by Philip of Heinsberg, archbishop of Cologne, and instigated by the pope. Hostilities were checked by the death of Urban and the election of a new pope as Gregory VIII. In 1188 Philip submitted, and immediately afterwards Frederick joined the Third Crusade. He left Regensburg in May 1189 at the head of a splendid army, and having overcome the hostility of the Eastern Roman emperor Isaac Angelus, marched into Asia Minor. On June 10, 1190, Frederick was either bathing or crossing the river Calycadnus (Geuksu), near Seleucia (Selefke) in Cilicia, when he was drowned. The place of his burial is unknown, and the legend which says he still sits in a cavern in the Kyffhauser mountain in Thuringia waiting until the need of his country shall call him, is now thought to refer, at least in its earlier form, to his grandson, the emperor Frederick II. He left by his wife, Beatrix, five sons, of whom the eldest afterwards became emperor as Henry VI.

Frederick encouraged the growth of towns, easily suppressed the few risings against his authority, and took strong and successful measures to establish order in Germany. His power rested upon his earnest and commanding personality, and also upon the support which he received from the German church, the possession of a valuable private domain, and the care with which he exacted feudal dues from his dependents. Even in Italy, though his general course of action was warped by wrong prepossessions, he in many instances showed exceptional practical sagacity in dealing with immediate difficulties and emergencies. From the beginning, however, he treated the Italians, as indeed was only natural, less as rebellious subjects than as conquered aliens.

In appearance Frederick was a man of well-proportioned, medium stature, with flowing yellow hair and a reddish beard. He delighted in hunting and the reading of history, was zealous in his attention to public business, and his private life was unimpeachable. Carlyle called him "a terror to evil-doers and a praise to well-doers in this world, probably beyond what was ever seen since."

The principal contemporary authority for the earlier part of the reign of Frederick is the *Gesta Friderici imperatoris,* mainly the work of Otto, bishop of Freising. This is continued from 1156 to 1160 by Rahewin, a canon of Freising, and from 1160 to 1170 by an anonymous author. The various annals and chronicles of the period are to be found in the *Monumenta Germaniae historica. Scriptores* (Hanover and Berlin, 1826–92); many valuable documents are found in the *Monumenta Germaniae selecta,* vol. iv., edited by M. Doeberl (Munich, 1889–90).

(1904). *See* further W. Stubbs, *Germany* in *the Early Middle Ages* (1908), and *Germany in the Later Middle Ages* (1908).

FREDERICK II. (1194–1250), Holy Roman emperor, king of Sicily and Jerusalem, was son of the emperor Henry VI. and Constance of Naples, daughter of Roger I., king of Sicily, and therefore grandson of the emperor Frederick I. Born at Jesi near Ancona on Dec. 26, 1194, and chosen German king at Frankfort in 1196, he was baptized Frederick Roger, and after his father's death crowned king of Sicily at Palermo on May 17, 1198. His mother, who assumed the government, died in November 1198, leaving Pope Innocent III. as regent of Sicily and guardian of her son. In 1208 he was declared of age, and in 1209 he married Constance, daughter of Alphonso II. king of Aragon, and widow of Emerich or Imre, king of Hungary. In September 1211, a number of influential German princes met at Nuremberg, declared Otto IV. deposed, and invited Frederick to come and occupy the vacant throne. He accepted the invitation; and having recognized the papal supremacy over Sicily, and procured the coronation of his son Henry as its king, he reached Germany in the autumn of 1212. Frederick was welcomed in Swabia, and the renown of the Hohenstaufen name and a liberal distribution of promises made his progress easy. He was chosen German king a second time at Frankfort on Dec. 5, 1212, and crowned Dec. 9, at Mainz. Anxious to retain the pope's support, Frederick promulgated a bull at Eger on July 12, 1213, by which he renounced all lands claimed by the pope since the death of the emperor Henry VI. in 1197, gave up the right of spoils and all interference in episcopal elections, and acknowledged the right of appeal to Rome. He again affirmed the papal supremacy over Sicily, and promised to root out heresy in Germany. He had allied himself with Philip Augustus of France against Otto, and the victory of his French allies at Bouvines on July 27, 1214 greatly strengthened his position. He was crowned the German king at Aix-la-Chapelle on July 25, 1215. In May 1218 the death of Otto left him undisputed ruler of Germany. His son Henry was brought to Germany and chosen by the princes German king at Frankfort in April 1220, though Frederick assured the new pope, Honorius III., that this step, which would involve the future union of Sicily with Germany, had been taken without his consent. In August 1220 Frederick set out for Italy, and was crowned emperor at Rome on Nov. 22, 1220; after which he repeated the undertaking he had entered into at Aix-la-Chapelle in 1215 to go on crusade, and made lavish promises to the Church. The clergy were freed from taxation and from lay jurisdiction, the ban of the Empire was to follow the ban of the Church, and heretics were to be severely punished.

But Frederick was occupied until 1225 in restoring order in Sicily. The island was seething with disorder, but by stern and sometimes cruel measures the emperor suppressed anarchy. Meanwhile the crusade was postponed again and again; until under a threat of excommunication, after the fall of Damietta in 1221, Frederick definitely undertook to set out in August 1227. On Nov. 9, 1225, he married his second wife Iolande (Yolande or Isabella), daughter of John, count of Brienne, titular king of Jerusalem. She died in 1227. Frederick then himself assumed the title of king of Jerusalem. He then summoned a diet at Cremona, but the cities, watchful and suspicious, renewed the Lombard league and took up a hostile attitude. Frederick's reply was to annul the treaty of Constance and place the cities under the imperial ban; but he was forced by lack of military strength to accept the mediation of Pope Honorius and the maintenance of the status *quo.*

After these events, which occurred early in 1227, preparations for the crusade were pressed on, and the emperor sailed from Brindisi on Sept. 8. A pestilence, however, which attacked his forces compelled him to land in Italy three days later, and on the 29th of the same month he was excommunicated by the new pope, Gregory IX. The greater part of the succeeding year was spent by pope and emperor in a violent quarrel. Alarmed at the increase in his opponent's power, Gregory denounced him in a public letter, to which Frederick replied in a clever document addressed to the princes of Europe. The reading of this manifesto, drawing attention to the absolute power claimed by the popes, was received in Rome with such evidences of approval that Gregory was compelled to fly to Viterbo. Frederick again set sail for Palestine, where he met with considerable success, the result of diplomatic rather than of military skill. By a treaty made in February 1229 he secured possession of Jerusalem, Bethlehem, Nazareth and the surrounding neighbourhood. Entering Jerusalem, he crowned himself king of that city on March 18, 1229. These successes had been won in spite of the hostility of Gregory, which deprived Frederick of the assistance of many members of the military orders and of the clergy of Palestine. But although the emperor's possessions on the Italian mainland had been attacked in his absence by the papal troops and their allies, Gregory's efforts had failed to arouse serious opposition in Germany and Sicily; so that when Frederick returned unexpectedly to Italy in June 1229 he had no difficulty in driving back his enemies, and compelling the pope to sue for peace. By the treaty of San Germano (July 1230), the emperor, loosed from the ban, promised to respect the papal territory, and to allow freedom of election and other privileges to the Sicilian clergy. Frederick then pacified Sicily. In 1231 a series of laws were published at Melfi which destroyed the ascendancy of the feudal nobles. Royal officials were appointed for administrative purposes, large estates were recovered for the crown, and fortresses were destroyed, while the church was placed under the royal jurisdiction and all gifts to it were prohibited. At the same time certain privileges of self-government were granted to the towns, representatives from which were summoned to sit in the diet. In short, by means of a centralized system of government, the king established an almost absolute monarchical power.

In Germany, an entirely different policy was pursued. The concessions granted by Frederick in 1220, together with the Privilege of Worms, dated May 1, 1231, made the German princes virtually independent. All jurisdiction over their lands was vested in them, no new mints or toll-centres were to be erected on their domains, and the imperial authority was restricted to a small and dwindling area. A fierce attack was made on the rights of the cities. Compelled to restore all their lands, their jurisdiction was bounded by their city-walls; they were forbidden to receive the dependents of the princes; all trade gilds were declared abolished; and all official appointments made without the consent of the archbishop or bishop were annulled. A further attack on the Lombard cities at the diet of Ravenna in 1231 was answered by a renewal of their league, and was soon connected with unrest in Germany. About 1231 a breach took place between Frederick and his elder son Henry, who appears to have opposed the Privilege of Worms and to have favoured the towns against the princes. After refusing to travel to Italy, Henry changed his mind and submitted to his father at Aquileia in 1232; and a temporary peace was made with the Lombard cities in June 1233. But on his return to Germany Henry again raised the standard of revolt, and made a league with the Lombards in December 1234. Frederick, meanwhile, having helped Pope Gregory against the rebellious Romans and having secured the friendship of France and England, appeared in Germany early in 1235 and put down this rising without difficulty. Henry was imprisoned, but his associates were treated leniently. In August 1235 a splendid diet was held at Mainz, during which the marriage of the emperor with Isabella (1214–1241), daughter of John, king of England, was celebrated. A general peace (*Landfrieden*), which became the basis of all such peaces in the future, was sworn to; a new office, that of imperial justiciar, was created, and a permanent judicial record was first instituted. Otto of Brunswick, grandson of Henry the Lion, duke of Saxony, was made duke of Brunswick-Lüneburg; and war was declared against the Lombards.

Frederick was now at the height of his power. His second son, Conrad, was invested with the duchy of Swabia, and the claim of Wenceslaus, king of Bohemia, to some lands which had belonged to the German king Philip was bought off. The attitude of Frederick II. (the Quarrelsome), duke of Austria, had been considered by the emperor so suspicious that during a visit paid by Frederick to Italy a war against him was begun. Compelled to return by the ill-fortune which attended this campaign, the emperor took command of his troops, seized Austria, Styria and Carinthia, and declared these territories to be immediately dependent on the Empire. In January 1237 he secured the election of his son Conrad as German king at Vienna; and in September went to Italy to prosecute the war which had broken out with the Lombards in the preceding year. Pope Gregory attempted to mediate, but the cities refused to accept the insulting terms offered by Frederick. The emperor gained a great victory over their forces at Cortenuova (Nov. 27, 1237); but his failure to take Brescia in October 1238, together with the changed attitude of Gregory, turned the fortune of war. The pope had become alarmed by the project of marriage between the heiress of Sardinia, Adelasia, and Frederick's natural son Enzio, who afterwards assumed the title of king of Sardinia. But as his warnings had been disregarded, he made an alliance with the Lombards, and excommunicated (Mar. 20, 1239), the emperor. A violent war of words ensued. Frederick, accused of heresy, blasphemy and other crimes, called upon all kings and princes to unite against the pope, who on his side used his emissaries, a crowd of wandering friars, to preach rebellion in Germany. It was, however, impossible to find an anti-king. In Italy, Spoleto and Ancona were declared part of the imperial dominions, and Rome itself was threatened. A number of ecclesiastics proceeding to a council called by Gregory were captured by Enzio at the sea-fight of Meloria, and the emperor was about to undertake the siege of Rome when the pope died (August 1241). Germany was at this time menaced by the Mongols; but Frederick contented himself with issuing directions for a campaign against them, until in 1242 he was able to pay a short visit to Germany, where he gained some support from the towns by grants of extensive privileges.

Gregory's immediate successor, Pope Celestine IX., died soon after his election; and after a delay of eighteen months, during which Frederick marched against Rome on two occasions and devastated the lands of his opponents, one of his partisans, Sinibaldo Fiesco, was chosen pope, and took the name of Innocent IV. Negotiations for peace were begun, but the relations of the Lombard cities to the Empire could not be adjusted, and when the emperor began again to ravage the papal territories Innocent fled to Lyons. Hither he summoned a general council, which met in June 1245; but although Frederick sent his justiciar, Thaddeus of Suessa, to represent him, and expressed his willingness to treat, sentence of excommunication and deposition was pronounced against him. Accused by Innocent of violating treaties, breaking oaths, persecuting the church and abetting heresy, Frederick replied by an open letter rebutting these charges, and denouncing the clergy and threatening the confiscation of their wealth. In vain the mediation of the saintly king of France, Louis IX., was invoked. Innocent declared Frederick deposed, and ordered the Germans to elect a new king. War soon became general in Germany and Italy. Henry Raspe, landgrave of Thuringia, was chosen German king in opposition to Frederick in May 1246, but neither he nor his successor, William II., count of Holland, could drive the Hohenstaufen from Germany. In Italy, during the emperor's absence, his cause had been upheld by Enzio and by the ferocious Eccelino da Romano In 1246 a formidable conspiracy of the discontented Apulian barons against the emperor was crushed with ruthless cruelty. Suddenly news reached Frederick that Parma, a stronghold of the imperial authority in the north, had been surprised, while the garrison was off its guard, by the Guelphs. He therefore concentrated his forces on the city, building over against it a wooden town which, in anticipation of the success that astrologers had predicted, he named Vittoria. The siege was protracted, and finally, in February 1248, during the absence of the emperor on a hunting expedition, was brought to an end by a sudden sortie of the men of Parma, who stormed the imperial camp. The emperor's forces were destroyed or scattered; the treasury, with the imperial insignia, together with Frederick's harem and some of the most trusted of his ministers, fell into the hands of the victors. Thaddeus of Suessa was hacked to pieces by the mob; the imperial crown was placed in mockery on the head of a hunch-backed beggar, who was carried back in triumph into the city.

Frederick's old confidence had left him; he had grown moody and suspicious, and his temper gave a ready handle to his enemies. Pier della Vigna, accused of treasonable designs, was disgraced; and the once all-powerful favourite and minister, blinded now and in rags, was dragged in the emperor's train, as a warning to traitors, till in despair he dashed out his brains. Then, in May 1248. the tidings of Enzio's capture by the Bolognese broke the emperor's spirit. He retired to southern Italy, and after a short illness died at Fiorentino on Dec. 13, 1250, after having been loosed from the ban by the archbishop of Palermo. He was buried in the cathedral of that city, where his splendid tomb may still be seen. By his will he appointed his son Conrad to succeed him in Germany and Sicily, and Henry, his son by Isabella of England, to be king of Jerusalem or Aries, neither of which kingdoms, however, he obtained. Frederick left several illegitimate children: Enzio has already been referred to; Frederick, who was made the imperial vicar in Tuscany; and Manfred, his son by the beloved Bianca Lancia or Lanzia, who was legitimatized just before his father's death, and was appointed by his will prince of Tarento and regent of Sicily.

The character of Frederick is one of extraordinary interest and versatility, and contemporary opinion is expressed in the words *stupor mundi et immutator mirabilis*. Licentious and luxurious in his manners, cultured and catholic in his tastes, he united in his person the most diverse qualities. His Sicilian court was a centre of intellectual activity. Michael Scot, the translator of some treatises of Aristotle and of the commentaries of Averroes, Leonard of Pisa, who introduced Arabic numerals and algebra to the West, and other scholars, Jewish and Mohammedan as well as Christian, were welcome at his court. Frederick himself had a knowledge of six languages, was acquainted with mathematics, philosophy and natural history, and took an interest in medicine and architecture. In 1224 he founded the university of Naples, and he was a liberal patron of the medical school at Salerno. He formed a menagerie of strange animals: and wrote a treatise on falconry (*De arte venandi cum avibus*) which is remarkable for its accurate observation of the habits of birds.[1] It was at his court, too, that—as Dante points out—Italian poetry had its birth. Pier della Vigna there wrote the first sonnet, and Italian lyrics by Frederick himself are preserved to us. His wives were kept secluded in oriental fashion; a harem was maintained at Lucera, and eunuchs were a prominent feature of his household. His religious ideas have been the subject of much controversy. Frederick's rule in Germany and Italy was a failure, but this fact may be accounted for by the conditions of the time and the inevitable conflict with the papacy. In Germany the enactments of 1220 and 1231 contributed to the disintegration of the Empire and the fall of the Hohenstaufen, while conflicting interests made the government of Italy a problem of exceptional difficulty. In Sicily Frederick was more successful. He quelled disorder, and under his rule the island was prosperous and contented. Hi's ideas of government were those of an absolute monarch, and he probably wished to surround himself with some of the pomp which had encircled the older emperors of Rome. His chief claim to fame, perhaps, is as a lawgiver. The code of laws which he gave to Sicily in 1231 bears the impress of his personality, and has been described as "the fullest and most adequate body of legislation promulgated by any western ruler since Charlemagne." Without being a great soldier, Frederick was not unskilful in warfare, but was better acquainted with the arts of diplomacy. In person he is said to have been "red, bald and short-sighted," but with good features and a pleasing countenance. It was believed in Germany for about a century after his death that Frederick was still alive, and many impostors attempted to personate him. A legend, afterwards transferred to Frederick Barbarossa, told how he sat in a cavern in the Kyffhäusser before a stone table through which his beard had grown, waiting for the time for him to awake and restore to the Empire the golden age of peace.

The contemporary documents relating to the reign of Frederick II. are very numerous. Many of the more important ones are given in the *Historia diplonzatica Friderici II.*, edited by M. Huillard-Bréholles (Paris, 1852–61); *Acta imperii selecta. Urkunden deutscher Könige und Kaiser*, edited by J. F. Bohmer and J. Ficker (Innsbruck, 1870); *Acta imperii inedita seculi XIII. Urkunden und Briefe zur Geschichte des Kaiserreichs und des Königreichs Sicilien*, edited by E. Winkelmann (Innsbruck, 1880); *Epistolae saeculi XIII. selecta e regestis pontificum Romanorum*, edited by C. Rodenberg, tome i. (Berlin, 1883); P. Pressutti, *Regrsta Hotzorii papae III.* (Rome, 1888); L. Auvray, *Les Registres de Grégoire IX.* (Paris, 1890).

The best modern authorities are M. Huillard-Bréholles, *Vie et corr. de Pierre de la Vigne* (1865); F. von Räumer, *Geschichte der Hohenstaufen* (vols. iii. & iv., 5th ed., 1878); C. Kohler, *Das Verhältnis Kaiser Friedrichs II. zu den Päpsten seiner Zeit* (Breslau, 1888); W. von Giesebrecht, *Gesch. der deut. Kaiserzeit*, vol. v. (Leipzig, 1888); G. Blondel, *Etude sur la politique de l'empereur Frédéric II. en Allemagne* (1892); K. Hampe, *Kaiser Friedrich II.* (Munich, 1899); A. Folz, *Kaiser Friedrich II. und Papst Innocenz IV. ihr Kampf 1244–45* (rqoj); W. Cohn, *Das Zeitalter der Hohenstaufen in Sizilien* (1925).

FREDERICK III. (1415–1493), Holy Roman emperor—as Frederick IV.. German king; as Frederick V., archduke of Austria,—son of Ernest of Habsburg, duke of Styria and Carinthia, was born at Innsbruck on Sept. 21, 1415. After his father's death in 1424 he lived at the court of his uncle and guardian, Frederick ISr., count of Tirol. In 1435, together with his brother, Albert the Prodigal, he undertook the government of Styria and Carinthia. but there were constant feuds between the brothers, which lasted until Albert's death in 1463. In 1439 the deaths of the German king Albert II. and of Frederick of Tirol left Frederick

[1]First printed at Augsburg in 1596; German edition by Schöpffer. (Berlin, 1896).

the senior member of the Habsburg family, and guardian of Sigismund, count of Tirol. In the following year he also became guardian of Ladislaus, the posthumous son of Albert II., and heir to Bohemia, Hungary and Austria. On Feb. 2, 1440 Frederick was chosen German king at Frankfort, but, owing to his absence from Germany, the coronation at Aix-la-Chapelle was delayed until June 17, 1442.

Disregarding the neutral attitude of the German electors towards the papal schism, and acting under the influence of Aeneas Sylvius Piccolomini, afterwards Pope Pius II., Frederick in 1445 made a secret treaty with Pope Eugenius IV. This developed into the Concordat of Vienna, signed in 1448 with the succeeding pope, Nicholas V., by which the king, in return for a sum of money and a promise of the imperial crown, pledged the obedience of the German people to Rome, and so checked for a time the rising tide of liberty in the German church. Taking up the quarrel between the Habsburgs and the Swiss cantons, Frederick invited the Armagnacs to attadk his enemies, but after meeting with a stubborn resistance at St. Jacob on Aug. 26, these allies proved faithless, and the king soon lost every vestige of authority in Switzerland. In 1451 Frederick, disregarding the revolts in Austria and Hungary, travelled to Rome where, on March 16, 1452, his marriage with Leonora of Portugal was celebrated, and three days later he was crowned emperor by pope Nicholas. He was the last emperor crowned in Rome. On his return he found Germany seething with indignation. His capitulation to the pope was not forgotten; his refusal to attend the diets, and his apathy in the face of Turkish aggressions, constituted a serious danger; and plans for his deposition failed only because the electors could not unite upon a rival king.

In 1457 Ladislaus, king of Hungary and Bohemia, and archduke of Austria, died; Frederick failed to secure either kingdom, but obtained lower Austria, from which houever. he was soon driven by his brother Albert, who occupied Vienna. On Albert's death in 1463 the emperor united upper and lower Austria under his rule, but these possessions were constantly ravaged by George Poděbrad, king of Bohemia, and by Matthias Corvinus, king of Hungary. A visit to Rome in 1468 to discuss measures against the Turks with Pope Paul II. had no result, and in 1470 Frederick began negotiations for a marriage between his son Maximilian and Mary, daughter and heiress of Charles the Bold, duke of Burgundy. The emperor met the duke at Treves in 1473, when Frederick, unwilling to bestow the title of king upon Charles, left the city secretly, but brought about the marriage after the duke's death in 1477. Again attacked by Matthias, the emperor was driven from Vienna (1490), and soon handed over the government of his lands to Maximilian, whose election as king of the Romans he vainly opposed in 1486. Frederick then retired to Linz, where he passed his time in the study of botany, alchemy and astronomy, until his death on dug. 19, 1493.

Frederick was a listless and incapable ruler, lacking alike the qualities of the soldier and of the diplomatist, but possessing a certain cleverness in evading difficulties. With a fine presence, he had many excellent personal qualities, is spoken of as mild and just, and had a real love of learning. He contributed to the aggrandisement of his family by the marriage of Maximilian with Mary of Burgundy, and delighted to inscribe his books and other articles of value with the letters A.E I.O U. (*Austriae es imperare orbi universo;* or in German, *Alles Erdreich ist Oesterreich unterthan*). His tomb, in red and white marble, is in the cathedral of St. Stephen at Vienna.

Chmel, *Geschzchte Kaiser Friedrichs IV. und seines Sohnes Maximilians I.* (Hamburg, 1840); A. Bachmann, *Deutsche Reichsgeschzchte im Zeitalter Friedrichs III. und Maximilians I.* (Leipzig, 2 vols., 1884–94); A. Huber, *Geschichte Österreichs* (Gotha, 1885–92).

FREDERICK II. (1534–1588), king of Denmark and Norway, son of Christian III., was born at Hadersleben on July 1, 1534. His mother, Dorothea of Saxe-Lauenburg, was the elder sister of Catherine, the first wife of Gustavus Vasa and the mother of Eric XIV. The two little cousins, born the same year, were destined to be lifelong rivals. At the age of two Frederick was proclaimed successor to the throne at the *Rigsdag* of Copenhagen (Oct. 30, 1536), and homage was done to him at Oslo for Norway in 1548. He married his cousin, Sophia of Mecklenburg, on July 20, 1572.

The reign of Frederick II. falls into two well-defined periods, one of war, 1559–70; and the other of peace, 1570–88. The period of war began with the Ditmarsh expedition, when the independent peasant-republic of the Ditmarshers of West Holstein, which had stoutly maintained its independence for centuries against the counts of Holstein and the Danish kings, was subdued by a Dano-Holstein army of 20.000 men in 1559, Frederick and his .uncles John and Adolphus, dukes of Holstein, dividing the land between them. Frederick was also victorious in the Scandinavian Seven Years' War. There were many causes of quarrel between Denmark and Sweden, but the detention at Copenhagen in 1563 of an embassy on its way to Germany, to negotiate a match between Eric XIV. of Sweden and Christina of Hesse, which King Frederick for political reasons was determined to prevent, precipitated hostilities The war was very unpopular in Denmark, and the closing of the Sound against foreign shipping, in order to starve out Sweden, had exasperated the maritime powers and all the Baltic states. On New Year's Day, 1570, Frederick threatened to abdicate; but the peace of Stettin (Dec. 13, 1570) reconciled all parties, and though Frederick had now to relinquish his ambitious dream of re-establishing the Union of Kalmar, he had at least succeeded in maintaining the supremacy of Denmark in the north.

After the peace Frederick aspired to the dominion of all the seas which washed the Scandinavian coasts, and before he died he suppressed the pirates who for so long had haunted the Baltic and the German Ocean. He also erected the fortress of Kronborg, to guard the Sound. Frederick gave free scope to ministers whose superiority in their various departments he frankly recognized, rarely interfering personally unless absolutely called upon to do so. His influence, always great, was increased by his genial and unaffected manners as a host. He was one of the few kings of the house of Oldenburg who had no illicit *liaison.* He died at Antvorskov on April 4, 1588. No other Danish king was ever so beloved by his people.

See *Lund (Troels), Danmarks og Norges Historie i Slutningen af det XVI. Aarh.* (Copenhagen, 1879); *Danmarks Riges Historie* (Copenhagen, 1897–1905), vol. 3; R. N. Bain, *Scandinavia,* cap. 4 (Cambridge, 1905).

FREDERICK III. (1286?–1330), surnamed "the Fair," German king and duke of Austria, was the second son of the German king, Albert I. In 1298, when his father was chosen king, Frederick was invested with some of the family lands (*see* HABSBURG), and in 1306, when his elder brother Rudolph became king of Bohemia, he succeeded to the duchy of Austria. In 1307 Rudolph died, and Frederick failed to obtain the Bohemian throne. Neither did he obtain the German crown on his father's death in 1308, and the relations between the new king, Henry VII., and the Habsburgs were far from friendly. Frederick asked to be confirmed in the possession of Austria, and be invested with Moravia, a demand which Henry refused; and the duke eventually agreed to renounce Moravia in return for a payment of 50,000 marks. Frederick then became involved in a quarrel with his cousin Louis IV., duke of Upper Bavaria (afterwards the emperor Louis IV.), over the guardianship of Henry II., duke of Lower Bavaria. He was defeated by Louis at the battle of Gammelsdorf (Nov. 9, 1313), and compelled to renounce his claim.

Meanwhile the emperor Henry VII. had died in Italy, and a stubborn contest ensued for the vacant throne. After a long delay Frederick was chosen German king at Frankfort by a minority of the electors on Oct. 19, 1314, while a majority elected Louis of Bavaria. Six days later Frederick was crowned at Bonn by the archbishop of Cologne, and war broke out between the rivals. Frederick drew his chief strength from southern and eastern Germany, and was supported by the full power of the Habsburgs. The struggle continued for seven years At Mühldorf (Sept. 28, 1322) Frederick was finally defeated and sent as a prisoner to Trausnitz, where he remained for three years. Then by the treaty of Trausnitz (March 13, 1325) Frederick acknowledged the kingship of Louis in return for freedom, and promised to return to captivity unless he could induce his brother Leopold to make a similar acknowledgment. As Leopold refused, Frederick, although released from his oath by Pope John XXII, returned to Bavaria.

It was agreed that Frederick should govern Germany while Louis went to Italy for the imperial crown. But this arrangement did not prove generally acceptable, and the death of Leopold in 1326 deprived Frederick of a powerful supporter. He returned to Austria, and died at Gutenstein on Jan. 13, 1330. He was buried at Mauerbach, whence his remains were removed in 1783 to the cathedral of St. Stephen at Vienna. He married Elizabeth, daughter of James I, king of Aragon, and left two daughters.

Frederick's voluntary return into captivity is used by Schiller in his poem *Deutsche Treue,* and by J. L. Uhland in the drama *Ludwig der Bayer.*

See E. M. Fürst von Lichnowsky, *Geschichte des Hauses Habsburg* (Vienna, 1836–44); H. Schrohe, *Der Kampf der Gegenkönige Ludwig und Friedrich* (1902); Vancsa, *Geschichte Nieder- und Oberosterreichs* (vol. 2, 19261.

FREDERICK III (1609–1670), king of Denmark and Norway, son of Christian IV and Anne Catherine of Brandenburg, was born on March 18, 1609, at Hadersleben. While still a lad he became successively bishop of Bremen, bishop of Verden and coadjutor of Halberstadt, while at the age of 18 he was the chief commandant of the fortress of Stade. In 1643 he married Sophia Amelia of Brunswick-Lüneburg. During the disastrous Swedish War of 1643–45 Frederick was appointed *generalissimo* of the duchies by his father; he quarrelled with the Earl-hlarshal Anders Bille, nho commanded the Danish forces, and the Danish nobility began to regard him with extreme distrust. The death of his elder brother Christian in June 1647 opened to him the prospect of the succession, but the question mas still unsettled when Christian IV died on Feb. 28, 1648. On July 6 Frederick III was acknowledged king, after he had signed a *Haandfaestning* or charter, by which the already diminished royal prerogative was still further curtailed.

Frederick lacked the brilliant qualities of his impulsive, jovial father, but he possessed compensating virtues of moderation, sobriety and self-control. He rightly regarded the accession of Charles X of Sweden (June 6, 1654) as a source of danger to Denmark. Charles's invasion of Poland (July 1654) came as a distinct relief to the Danes, who had feared an attack on themselves, but even the Polish War was full of latent peril to Denmark. Frederick resolved on a rupture with Sweden at the first convenient opportunity. The *Rigsdag* of 1657 granted subsidies for mobilization and other military expenses; on April 23 Frederick received the assent of the majority of the *Rigsraad* to an attack on Sweden's German provinces; in the beginning of May the still pending negotiations with Sweden were broken off, and on June 1 Frederick signed the manifesto justifying a war which was never formally declared. The Swedish king traversed ali the plans of his enemies by his passage of the frozen Belts, in Jan. and Feb. 1658 (see CHARLES X of Sweden). Frederick III at once sued for peace; and. persuaded by the English and French ministers, Charles finally agreed to be content with mutilating instead of annihilating the Danish monarchy (treaties of Taastrup, Feb. 18, and of Roskilde, Feb. 26, 1658). The conclusion of peace was followed by a remarkable episode. Charles X was the Danish king's guest for three days (March 3–5) at the castle of Fredriksborg, and friendship seemed to be established. But on July 17, without any reasonabie cause, without a declaration of war, in defiance of all international equity, Charles again attacked Denmark.

The main Snedish army landed at Korsör in Zealand. None had anticipated the sudden and brutal attack, and the Danish capital was inadequately fortified and garrisoned. The Danes had only three days' warning of the approaching danger; and the vast and dilapidated line of defense had at first but 2.000 regular defenders. But government and people displayed exemplary energy, under the constant supervision of the king, the queen and burgomaster Hans Nansen. Charles X began a regular siege, which he abandoned when, on Oct. 29, an auxiliary Dutch fleet. after reinforcing and reprovisioning the garrison, defeated, in conjunction with the Danish fleet, the Swedish navy of 44 liners in the sound. The traditional loyalty of the Danish middle classes was transformed into a boundless enthusiasm for the king personally, and for a brief period Frederick found himself the most popular man in his kingdom. He used his popularity to convert an elective into an absolute monarchy by the Revolution of 1660 (see DENMARK: *History).* Frederick III died on Feb. 6, 1670 at the castle of Copenhagen.

See R. N. Bain, "Scandinavia," in *Cambridge Modern History* (1905); Knud Fabricius, *Kongeloven* (1920).

FREDERICK VIII (1843–1912), king of Denmark, eldest son of Christian IX, was born at Copenhagen on June 3, 1843. As crown prince of Denmark he took part in the war of 1864 against Austria and Prussia, in which the duchies of Schleswig-Holstein and Lauenburg were lost. He then assisted his father in the duties of government. becoming king on Christian's death in Jan. 1906. In 1869 Frederick married Louise (1851–1926), daughter of Charles XV of Sweden, by whom he had four sons and four daughters. In 1907, during a visit to Iceland. Frederick appointed a mixed commission to draft a measure of home rule, but it was thrown out at the next election, when the island claimed full state independence, though "personal union" with Denmark was retained (see ICELAND). During his reign he gained the confidence of his people by his energetic interest in politics, his genial manner, and his simple mode of living. He died at Hamburg on May 14, 1912.

He was succeeded by his eldest son Christian X (*q.v.*) and his second son, Charles (b. 1872), who married his cousin Maud. daughter of Edward VII of Great Britain, became king of Norway as Haakon VII (*q.v.*) in 1905.

FREDERICK IX (1899–), king of Denmark, was born March 11, 1899, eldest son of Prince Christian. later King Christian X (1912–1947), and Princess, later Queen, Alexandrine, former duchess of Mecklenburg-Schwerin. Frederick came of the house of Schleswig-Holstein-Sonderburg-Gliicksbug and was christened Christian Frederick Franz Michael Carl Waldemar Georg. Following the pattern of his ancestors who from 1j13 had taken alternately the names Christian and Frederick, he became Frederick IX on the death of Christian X, April 20, 1947. In 1935 Frederick, crown prince after 1912, married Ingrid, only daughter of Crown Prince Gustav Adolf of Sweden. The royal pair had three daughters.

The king began to participate in state affairs as soon as he reached the age of 21, and served as regent during his father's illness in 1942 and during the last days of King Christian's life from April 8 to April 20, 1947.

Thirty-seven kings of Denmark had been army men; Frederick was the first to take his training in the navy, and by 1946 he had attained the rank of rear-admiral. He loved the sea from boyhood, sailed the royal yacht, and rowed with the students rowing club. He was fond of speed and activity in many forms, including bicycling, motoring and railroading, which became a hobby. He was the first to test-drive some of the new Diesel-electric expresses out of Copenhagen. His love of music also enabled him to conduct for the royal opera orchestra and the royal life guard band on certain occasions. In 1939 Frederick and Ingrid opened the Danish House at the New York World's fair.

Despite his royal rank the new king was trained to be a democratic monarch, first citizen among 4,000,000 Danish people.

(F. D. S.)

FREDERICK I (1657–1713), first king of Prussia, and (as Frederick III) elector of Brandenburg, was the second son of the great elector, Frederick William, by his first marriage with Louise Henriette of Orange. Born at Königsberg on July 11, 1657, he was educated and greatly influenced by Eberhard Danckelmann, and became heir to the throne of Brandenburg through the death of his elder brother, Charles Emil, in 1674. He appears to have taken some part in public business before his father's death; and the court at Berlin was disturbed by quarrels between the young prince and his stepmother, Dorothea of Holstein-Glücksburg. In 1686 Dorothea persuaded her husband to bequeath outlying portions of his lands to her four sons; and Frederick, fearing he would be poisoned, left Brandenburg determined to prevent any diminution of his inheritance. By promising to restore Schwiebus to Silesia after his accession he won the support of the emperor Leopold I; but eventually he gained his end in a peaceable fashion. After he became elector of Brandenburg in May 1688, his half-brothers renounced their rights under their father's will in return for a sum of money, and the new elector thus secured the whole of Frederick William's territories. He fulfilled his bargain with Leopold and gave up Schwiebus in 1695. At home and abroad Frederick continued the policy of the great elector. He helped William of Orange to make his descent on England; added various places, including Bonn, Quedlinburg, the principality of Neuchâtel, to his lands; and placed his large and efficient army at the disposal of the emperor and his allies (see BRANDENBURG). He was present in person at the siege of Bonn in 1689, but was not often in command of his troops. The elector sought to model his court upon that of Louis XIV and directed his main energies toward obtaining for himself the title of king. He gave Leopold, in return for a promise of military aid, the imperial sanction to Frederick's request in Nov. 1700; and the elector, hurrying at once to Konigsberg, crowned himself king of Prussia on Jan. 18, 1701. During the War of the Spanish Succession the troops of Brandenburg-Prussia rendered great assistance to the allies at Blenheim and elsewhere. Frederick, who was deformed through an injury to his spine, died Feb. 25, 1713. He founded the university of Halle, and the Academy of Sciences at Berlin; welcomed and protected Protestant refugees from France and elsewhere; and lavished money on the erection of public buildings. The king was married three times. His second wife, Sophie Charlotte (1668–1705), sister of the English king George I, was the friend of Leibnitz and one of the most cultured princesses of the age; she bore him his only son, his successor, King Frederick William I.

Heyck, *Friedrich* I und *die* Begründung des *preussischen Königtums* (Bielefeld, 1901); *Aus dem Briefwechsel König Friedrichs I von Preussen und seiner Familie,* ed. Berner (Berlin, 1901); H. von Hymmen, Der erste preusszsche *König* (1904).

FREDERICK II, known as "the Great" (1712–1786), king of Prussia, was born on Jan. 24, 1712. Two elder brothers having died in infancy, he became heir of his father, Frederick William I, who brought him up with extreme rigour, in the hope that he would become a hardy soldier, and "acquire thrift and frugality." The result was just the opposite. Encouraged by his mother, and under the influence of his governess Madame de Roucoulle, and of his first tutor Duhan, a French refugee, Frederick acquired a taste for literature and music, secretly learned Latin, which his father had forbidden, scoffed at religion, refused to ride or shoot, preferred the French language, literature and dress, and openly despised German habits and life. His discontent was heartily shared by his sister, Wilhelmina, a bright and intelligent young princess for whom Frederick had a warm affection.

Early Years.—Frederick William, seeing his son absorbed in frivolous and effeminate amusements, conceived for him an intense dislike, which had its share in causing him to break off the negotiations for a double marriage between the prince of Wales and Wilhelmina, and the princess Amelia, daughter of George II, and Frederick; for Frederick had been so indiscreet as to carry on a separate correspondence with the English court and to vow that he mould marry Amelia or no one. Frederick William's hatred of his son, openly avowed, displayed itself in violent outbursts and public insults, and so harsh was his treatment that Frederick frequently thought of running away and taking refuge at rhe English court. He at last resolved to do so during a journey which he made with the king to south Germany in 1730. He was helped by his two friends, Lieutenant Katte and Lieutenant Keith; but the secret was found out.

Frederick was arrested, deprived of his rank as crown prince, tried by court-martial, and imprisoned in the fortress of Custrin. Keith escaped; but Katte was captured and sentenced by court martial to imprisonment for life. This sentence the king changed to one of death and, to enforce the example, had Katte beheaded in Frederick's presence (Nov. 5, 1730). The object-lesson had some effect. The prison chaplain reported that Frederick's heart was changed, while the emperor himself interceded for him. His father released him from solitary confinement and sent him to work in the auditing office of the departments of war and agriculture at Custrin, pending the earning of a full pardon. "The whole town shall be his prison," wrote the king; "I will give him employment, from morning to night, in the departments of war, and agriculture, and of the Government. He shall work at financial matters, receive accounts, read minutes and make extracts. . . . But if he kicks or rears again, he shall forfeit the succession to the crown, and even, according to circumstances, life itself."

Frederick's submissive conduct under these conditions earned him gradual alleviations. On Nov. 30, 1731, he was allowed again to appear in uniform, and in 1732 was made colonel in command of the regiment at Neuruppin. On June 12, 1733, he married the princess Elizabeth Christina, daughter of the duke of Brunswick-Bevern, a niece of the empress and cousin of Maria Theresa. He was given the estate of Rheinsberg, near Neuruppin, and there he lived until he succeeded to the throne. These years were perhaps the happiest of his life, although the marriage, concluded by his father's orders, was unhappy. He seldom visited his wife, who was childless, treating her harshly and even brutally. His conscientious performance of his duties, however, at last earned his father's esteem. At the same time, he was able to indulge his personal tastes.

He carried on a lively correspondence with Voltaire and other French men of letters, and was a diligent student of philosophy, history and poetry. Two of his best-known works were written at this time—*Considérations sur l'état présent* du corps *politique de l'Europe* and his *Anti-Macchiavel.* In the former he calls attention to the growing strength of Austria and France, and insists on the necessity of some third power, by which he clearly means Prussia, to counterbalance their excessive influence The second treatise, which was issued by Voltaire in The Hague in 1740, contains a generous exposition of some of the favourite ideas of the 18th-century philosophers respecting the duties of sovereigns, which may be summed up in the famous sentence "the prince is not the absolute master, but only the first servant of his people." It was during this period that he became a freemason, and finally repudiated Christianity.

The Throne and Austria.—On May 31, 1740, he became king. He maintained all the forms of government established by his father, but ruled in a far more enlightened spirit; he tolerated every form of religious opinion, abolished torture, except for wholesale murder, conspiracy, lèse-majesté and high treason, was most careful to secure an exact and impartial administration of justice, and, while keeping the reins of government strictly in his own hands, allowed every one with a genuine grievance free access to his presence. The Potsdam regiment of giants was disbanded, but the real interests of the army were carefully studied. for Frederick realized that the two pillars of the Prussian state were sound finances and a strong army. On Oct. 20, 1740, the emperor Charles VI died. Frederick at once began to make extensive military preparations, with a view to asserting the ancient claims put forward by his house, but always denied by Austria, to the three Silesian duchies. Frederick undoubtedly believed in the justice of his claims, and the lawfulness of repudiating, for Silesia, his father's guarantee of the Pragmatic Sanction He confessed, however, himself, that his scheme was prompted by "the desire of glory, even curiosity," and "a means of acquiring reputation and of increasing the power of the State."

Frederick sent an ambassador to Vienna, offering, in the event of his rights in Silesia being conceded, to aid Maria Theresa against her enemies. The queen, who regarded the proposal as that of a mere robber, haughtily declined; whereupon Frederick immediately invaded Silesia with an army of 30,000 men. His first victory was gained at Mollwitz on April 10, 1741. Under the impression, in consequence of a furious charge of Austrian cavalry, that the battle was lost, he rode rapidly away at an early stage of the struggle—a mistake which gave rise for a time to the groundless idea that he lacked personal courage. A second Prussian victory was gained at Chotusitz. near Časlau, on May 17, 1742; and Maria Theresa was forced to conclude the Peace of Breslau (June 11, 1742), ceding Breslau to Prussia, Upper and Lower Silesia as far as the Oppa, together with the county of Glatz. Frederick made good use of the next two years, fortifying his new territory, and repairing the evils inflicted upon it by the war. By the death of the prince of East Friesland, without heirs. he also gained possession of that country (1744). In the same year, in view of Austria's increasing strength and determination to recover Silesia, Frederick formed the union of Frankfurt with Bavaria, the Elector Palatine and Hesse-Cassel, concluded a secret treaty with France (June 4, 1744) and suddenly invaded Bohemia, taking Prague. He nas forced to retreat, but in 1745 won a series of victories, and the Peace of Dresden (Dec. 2j, 1745) assured to Frederick a second time the possession of Silesia. *(See* AUSTRIAN SUCCESSION, WAR OF THE.)

Internal Administration. — Frederick was now, at the age of 33, the most conspicuous sovereign of his time. He was a thoroughly absolute ruler, his so-called ministers being mere clerks whose business was to give effect to his will. To use his own famous phrase, however, he regarded himself as but "the first servant of the State"; and during the next 11 years he proved that the words expressed his inmost conviction and feeling. All kinds of questions were submitted to him, important and unimportant, even questions of trivial detail. A keen judge of character, he filled the public offices with faithful, capable, energetic men, who were kept up to a high standard of duty by the consciousness that their work might at any time come under his strict supervision. The Academy of Sciences, which had fallen into contempt during his father's reign, he restored. infusing into it vigorous life; and he did more to promote elementary education than any of his predecessors. He did much, too, for the economic development of Prussia, especially for agriculture; he established colonies, peopling them with immigrants, extended the canal system, drained and diked the great marshes of the Oderbruch, turning them into rich pasturage, encouraged the planting of fruit trees and of root crops; and, though in accordance with his ideas of discipline he maintained serfdom, he did much to lighten the burdens of the peasants. All kinds of manufacture, too, particularly that of silk, owed much to his encouragement. To the army he gave unremitting attention, reviewing it at regular intervals, and sternly punishing negligence on the part of the officers. Its numbers were raised to 160.000 men, while fortresses and magazines were always kept in a state of readiness for nar. The influence of the king's example was felt far beyond the limits of his immediate circle. The nation was proud of his genius, and displayed something of his energy in all departments of life. Gotthold Lessing, who as a youth of 20 came to Berlin in 1749, composed enthusiastic odes in his honour, and Johann Gleim, the Halberstadt poet, wrote of him as of a kind of demigod. These may be taken as fair illustrations of the popular feeling long before the Seven Years' War.

Tastes and Character. — He despised the German language although it is remarkable that at a later period, in a French essay on German literature, he predicted for it a great future. He habitually wrote and spoke French, and had a strong ambition to rank as a distinguished French author. Nobody can now read his verses, but his prose writings have a certain calm simplicity and dignity, without, however, giving evidence of the splendid mental qualities which he revealed in practical life. To this period belong his *Mémoires pour servir à l'histoire de Brandebourg* and his poem *L'Art de la guerre*. The latter, judged as literature, is intolerably dull; but the former is valuable, throwing as it does considerable light on his personal sympathies as well as on the motives of important epochs in his career. He continued to correspond with French writers, and induced a number of them to settle in Berlin, Maupertuis being president of the academy. In 1752 Voltaire, who had repeatedly visited him, came at Frederick's urgent entreaty, and received a truly royal welcome. The famous Hirsch trial. and Voltaire's vanity and caprice, greatly lowered him in the esteem of the king, who, on his side, irritated his guest by often requiring him to correct bad verses, and by making him the object of rude banter. The publication of *Doctor Akakia,* which brought down upon the president of the academy a storm of ridicule, finally alienated Frederick; while Voltaire's wrongs culminated in the famous arrest at Frankfurt, the most disagreeable elements of which were due to the misunderstanding of an order by a subordinate official.

The king lived as much as possible in a retired mansion, to which he gave the name of Sans-Souci. The new palace, which was not built until after the Seven Years' War, was never a favourite residence. He rose regularly in summer at 5, in winter at 6, devoting himself to public business till about 11. During part of this time, after coffee, he would aid his reflections by playing on the flute, of which he was passionately fond, being a really skilful performer. At 11 came parade, and an hour afterward, punctually, dinner, which continued till 2, or later, if conversation happened to be particularly attractive. After dinner he glanced through and signed cabinet orders written in accordance nith his morning instructions, often adding marginal notes and postscripts, many of which were in a caustic tone. These disposed of, he amused himself for a couple of hours with literary work; between six and seven he would converse with his friends or listen to his reader (a post held for some time by Julien la Mettrie); at seven there was a concert; and at half-past eight he sat down to supper, which might go on till midnight. He liked good eating and drinking, although even here the cost was sharply looked after, the expenses of his kitchen mounting to no higher figure than £1.800 a year. At supper he was always surrounded by a number of his most intimate friends, mainly Frenchmen; and he insisted on the conversation being perfectly free. His wit, however, was often cruel, and any one who responded with too much spirit was soon made to feel that the licence of talk was to be complete only on one side. At Frederick's court ladies were seldom seen, a circumstance that gave occasion to much scandal. The queen he visited only on rare occasions, though he provided her with a generous income, half of which she gave away in charity. Although without charm, she was a woman of many noble qualities; and, like her husband, she wrote French books, some of nhich attracted a certain attention in their day. She survived him by 11 years, dying in 1797.

War and Reconstruction. — From 1756 to 1763 Frederick's energies were wholly taken up in the Seven Years' War (*q.v.*) in which virtually the whole continent was in arms against him. Although Prussia was fearfully exhausted by this struggle, and at times seemed on the verge of ruin, Frederick's tenacity and military genius carried him through, and the peace of Hubertushof (Feb. 15, 1763) restored the territorial *status quo ante bellum.* Morally, however, the Seven Years' War was a great victory for Prussia. It was now universally recognized as one of the great powers of the continent, and definitely took its place in Germany as the rival of Austria. From this time it was inevitable that there should be a final struggle between the two nations for predominance, and that the smaller German states should group themselves around one or the other.

Frederick's first care after the nar was, as far as possible, to enable the country to recover from its terrific losses; a task which he undertook nith genius and energy. Pomerania and Neumark were freed from taxation for two years. Silesia for six months. Many nobles whose lands had been wasted received corn for seed; his war horses were within a few months to be found on farms all over Prussia; and money was freely spent in the re-erection of houses which had been destroyed. The coinage, which had been debased, was gradually restored to its proper value, and trade received a favourable impulse by the foundation of the Bank of Berlin. All these matters were carefully looked into by Frederick himself, nho, while acting as generously as his circumstances would allow, insisted on the maximum of efficiency and economy.

Unfortunately, he adopted the French ideas of excise, and the French methods of imposing and collecting taxes—a system known as the Regie. This system secured a large revenue, but led to much petty tyranny, all the more intolerable because it was carried out by French officials. It was continued to the end of Frederick's reign, and nothing did so much to injure his otherwise immense popularity. He was quite aware of the discontent the system excited, and the good nature with which he tolerated the criticisms directed against it and him is illustrated by a well-known and well-authenticated incident. Riding along the Jager Strasse one day, he saw a crowd of people. "See what it is," he said to the groom who was attending him. "They have something posted up about your Majesty," said the groom, returning. Frederick, riding forward, saw a caricature of himself: "King in very melancholy guise," says Preuss (as translated by Carlyle), "seated on a stool, a coffee-mill between his knees, diligently grinding with the one hand, and with the other picking up any bean that might have fallen. 'Hang it lower,' said the king, beckoning his groom with a wave of the finger; 'lower, that they may not have to hurt their necks about it.' No sooner were the words spoken, which spread instantly, than there rose from the whole crowd one universal huzzah of joy. They tore the caricature into a thousand pieces, and rolled after the king with loud '*Lebe Hoch*, our Frederick for ever,' as he rode slowly away."

Frederick took particular interest in the proper administration of justice. He disliked the formalities of the law, and in one instance, "the miller Arnold case," where he thought injustice had been done to a poor man, he dismissed the judges, condemned them to a year's fortress arrest and compelled them to make good out of their own pockets the loss sustained by their supposed victim—really a violation of justice, but one springing from a generous motive. He once defined himself as "l'avocat du pauvre," and few things gave him more pleasure than the famous answer of the miller whose windmill stood on ground which was wanted for the king's garden. The miller sturdily refused to sell it. "Not at any price?" said the king's agent; "could not the king take it from you for nothing, if he chose?" "Have we not the Kammergericht at Berlin?" was the answer, which became a popular saying in Germany.

The Prussian Code.—Soon after he became king Frederick began to make preparations for a new code. In 1747 appeared the *Codex Fridericianus*, by which the Prussian judicial body was established. But a greater monument of Frederick's interest in legal reform was the *Allgemeines preussisches Landrecht*, completed by the grand chancellor Count Johann H. C. von Carmer (1721–1801) on the basis of the *Project des Corporis Juris Fridericiani*, completed in 1749–51 by the eminent jurist Samuel von Cocceji (1679–1755). The *Landrecht*, a work of vast labour and erudition, combines the two systems of German and Roman law supplemented by the law of nature; it was the first German code, but did not go into force until 1794, after Frederick's death.

Looking ahead after the Seven Years' War, Frederick saw no means of securing himself so effectually as by cultivating the good will of Russia. In 1764 he accordingly concluded a treaty of alliance with the empress Catherine for eight years. Six years afterward, unfortunately for his fame, he joined in the first partition of Poland, by which he received Polish Prussia, without Danzig and Thorn, and Great Poland as far as the river Netze. Prussia was then for the first time made continuous with Brandenburg and Pomerania.

Relations **With** Austria.—Joseph II greatly admired Frederick and visited him at Neisse, in Silesia, in 1769, a visit which Frederick returned in Moravia in the following year. The young emperor was frank and cordial; Frederick was more cautious, for he detected under the respectful manner of Joseph a keen ambition that might one day become dangerous to Prussia. Nothing came of these suspicions till, in 1777, the death of Maximilian Joseph (elector of Bavaria, without children) led ultimately to the War of the Bavarian Succession (the Potato war) in which Frederick invaded Bohemia (July 1778). No general engagement was fought, and after many delays the Treaty of Teschen was signed on May 13, 1779. Austria received the circle of Burgau, and consented that the king of Prussia should take the Franconian principalities.

Frederick never abandoned his jealousy of Austria, whose ambition he regarded as the chief danger against which Europe had to guard. He seems to have had no suspicion that evil days were coming in France. It was Austria which had given trouble in his time; and if its pride were curbed, he fancied that Prussia at least would be safe. Hence one of the last important acts of his life was to form, in 1785, a league of princes (the "Fürstenbund") for the defense of the imperial constitution, believed to be periled by Joseph's restless activity. The league came to an end after Frederick's death; but it is of considerable historical interest, as the first open attempt of Prussia to take the lead in Germany.

Last Years.——Frederick's chief trust was always in his treasury and his army. By continual economy he left in the treasury the immense sum of 70,000,000 thalers; the army, at the time of his death, numbered 200,000 men, disciplined with all the strictness to which he had throughout life accustomed his troops. He died at Sans-Souci on Aug. 17,1786; his death being hastened by exposure to a rainstorm during a military review. He died on the eve of tremendous events, which for a time obscured his fame; but now that he can be impartially estimated, he is seen to have been in many respects one of the greatest figures in modern history.

He was below middle size; inclined to stoutness in youth; lean in old age; and of vigorous and active habits. An expression of keen intelligence lighted up his features, and his large, sparkling gray eyes darted penetrating glances at every one who approached him. He was unclean in his personal habits. In his later years an old blue uniform with red facings was his usual dress, and, generally, on his breast was some Spanish snuff, of which he consumed large quantities. He shared many of the chief intellectual tendencies of his age, including its scepticism. Of Christianity he always spoke in the mocking tone of the "enlightened" philosophers, regarding it as the invention of priests; but after the Seven Years' War, the trials of which steadied his character, he sought to strengthen the church for the sake of its elevating moral influence.

In his judgments of mankind he often talked as a misanthrope. When a school inspector named Sulzer expressed to him the opinion that "the inborn inclination of men is rather to good than to evil," he replied. "Ah, my dear Sulzer, you don't know this damned race" *(Ach, mein lieber Sulzer, er kennt nicht diese verdammte Rasse)*. This fearful saying unquestionably expressed a frequent mood of Frederick's; and he sometimes acted with great harshness and seemed to take a malicious pleasure in tormenting his acquaintances. Yet he was capable of genuine attachments. He was extremely loyal to his mother and his sister Wilhelmina; his letters to the duchess of Gotha are full of a certain tender reverence; the two Keiths found him a devoted friend. In his lonely old age, his best-loved companions were his greyhounds, who slept in his bed; he erected monuments to them, and gave orders that he was to be buried near them. As a king, however, he laboured genuinely for humanity.

Taking the reign of Frederick II as a whole, it must be said that he looked upon his power rather as a trust than as a source of personal advantage; and the trust mas faithfully discharged according to the best lights of his day. He often has been condemned for doing nothing to encourage German literature; and it is true that he was supremely indifferent to it. Before he died a tide of intellectual life was rising all about him; yet he failed to recognize it, declined to give Lessing even the small post of royal librarian and thought *Götz von Berlichingen* a vulgar imitation of vulgar English models. But when his taste was formed, German literature did not exist; the choice was between Jean Baptiste Racine and Voltaire on the one hand and Johann Gottsched and Christian Gellert on the other. He survived into the era of Immanuel Kant, Johann Wolfgang von Goethe and Johann Christoph von Schiller, but he was not of it, and it would have been unreasonable to expect that he should in old age pass beyond the limits of his own epoch. It was better, indeed, that he let German literature alone, thus letting it become a thoroughly independent product. He promoted it indirectly by deepening the national life from which it sprang. At a time when there was no real bond of cohesion between the different states, he stirred among them a common enthusiasm; and in making Prussia great he laid the foundation of a genuinely united empire.

BIBLIOGRAPHY.—The main sources for the biography of Frederick the Great are his own works, which, in the words of Leopold von Ranke, "deal with the politics and wars of the period with the greatest possible objectivity, *i.e.,* truthfulness, and form an imperishable monument of his life and opinions." A magnificent edition of Frederick's complete works was issued (1846–57), at the instance of Frederick William IV, under the supervision of the historian Johann D. E. Preuss (1785–1868). It is in 30 volumes, of which 6 contain verse, 7 are historical, 2 philosophical, and 3 military, 12 being made up of correspondence. So long as the various state archives remained largely inaccessible historians relied upon this as their chief authority. Among works about this period may be mentioned Thomas Carlyle, *History of Frederick II of Prussia* (6 vols., 1858–65); J. G. Droysen, *Friedrich der Grosse* (2 vols., Leipzig, 1874–76, forming part V of his *Geschichte der preussischen Politik*); Ranke, *Friedrich II, König von Preussen (Werke,* vols. li and lii). A great stimulus to the study of Frederick's history has been given by the publication of collections of documents preserved in various archives. Of these the most important is the great official edition of Frederick's political correspondence (35 vols., Berlin, 1879–1911). Of later works, based on modern research, may be mentioned L. Paul-Dubois, *Frédéric le Grand, d'après sa correspondance politique* (1903); W. F. Reddaway, *Frederick the Great and the Rise of Prussia* (1904); E. Zeller, *Friedrich der Grosse als Philosoph* (1886); H. Pigge, *Die Staatstheorie Friedrichs des Grossen* (1904); T. von Rernhardi, *Friedrich der Grosse als Feldherr* (2 vols., 1881); Ernest Lavisse, *La Jeunesse du Grand Frédéric* (1891, 3rd ed., 1899; Eng. transl., 1891); R. Brode, *Friedrich der Grosse und der Konflikt mit seinem Vater* (1904); W. von Bremen, *Friedrich der Grosse* (Bd. ii of *Erzieher des preussischen Heeres,* 1905); *Dreissig Jahre am Hofe Friedrichs des Grossen. Aus den Tagebüchern des Reichsgrafen Ahasuerus Heinrich von Lehndorff, Kammerherrn der Konigin Elisabett Christine von Preussen* (1907). The great work on the wars of Frederick is that issued by the Prussian General Staff: *Die Kriege Friedrichs des Grossen* (15 vols. in three parts, 1890–1913). *See* also G. Kiinstel, *Politisches Testament Friedrichs des Grossen von 1752* (1911); G. Koser, *Geschichte Friedrichs des Grossen* (4 vols., 1912–14); N. Young, *The Life of Frederick the Great* (1919); Werner Hegemann, *Friedrich der Grosse* (1924, English trans. by Winifred Ray, *Frederick the Great,* 1929). For a list of other works *see* Dahlmann-Waitz, *Quellenkunde* (1912). (J. Sı.; X.)

FREDERICK III (1831–1888), king of Prussia and German emperor, was born at Potsdam on Oct. 18, 1831, being the eldest son of prince William of Prussia, afterward first German emperor, and the princess Augusta. He was carefully educated, and in 1849–50 studied at the university of Bonn. The next years were spent in military duties and in travels, in which he was accompanied by Moltke. In 1851 he visited England on the occasion of the Great Exhibition. He married Victoria, princess royal of Great Britain, in London on Jan. 25, 1858. On the death of his uncle in 1861 and the accession of his father, Prince Frederick William, as he was then called, became crown prince of Prussia. His education, the influence of his mother, and perhaps still more that of his wife's father, the Prince Consort, had made him a strong Liberal, and he disliked the course of events in Prussia after the appointment of Bismarck as minister. In June 1863, he publicly dissociated himself from the press ordinances which had just been published. He ceased to attend meetings of the council of state and was much away from Berlin. The opposition of the crown prince to the ministers was increased by Bismarck's refusal to support the claims of his friend the prince of Augustenburg to Schleswig-Holstein.

During the war with Denmark Frederick had his first military experience, being attached to the staff of Marshal von Wrangel; he performed valuable service in arranging the difficulties caused by the disputes between the field marshal and the other officers and was eventually given a control over him. After the war he continued to support the prince of Augustenburg and was strongly opposed to the war with Austria. During the campaign of 1866 he received the command of an army consisting of four army corps. He was assisted by General von Blumenthal, as chief of the staff, but took a very active part in directing the difficult operations by which his army fought its way through the mountains irom Silesia to Bohemia, fighting four engagements in three days, and showed that he possessed genuine military capacity. In the decisive battle of Königgrätz the arrival of his army on the field of battle; after a march of nearly 20 mi., secured the victory. During the negotiations which ended the war he persuaded the king to accept Bismarck's policy as regards peace with Austria. He was anxious to see the king of Prussia unite the whole of Germany, with the title of emperor, and was impatient of the caution with which Bismarck proceeded.

He played a conspicuous part in the year 1870–71, being appointed to command the armies of the Southern States, General Blumenthal again being his chief of the staff; his troops won the victory of Wörth, took an important part in the battle of Sedan and later in the siege of Paris. During the years that followed, little opportunity for political activity was open to him. He and the crown princess took a great interest in art and industry, especially in the royal museums; and the excavations conducted at Olympia and Pergamum were chiefly due to him. In 1878, when the emperor was incapacitated by the shot of an assassin, the prince acted for some months as regent.

His palace was the centre of all that was best in the literary and learned society of the capital. For many reasons the accession of the prince was looked forward to with great hope by a large part of the nation. Unfortunately he was attacked by cancer in the throat; he spent the winter of 1887–88 at San Remo; in January 1888 the operation of tracheotomy had to be performed. On the death of his father, (March 9), he at once journeyed to Berlin; but he came to the throne only to die. While the Liberals hoped the emperor would use his power for some signal declaration of policy, the adherents of Bismarck made bitter attacks on the empress. The emperor's most important act was a severe reprimand addressed to von Puttkamer, the reactionary minister of the interior, which caused his resignation; in the distribution of honours he chose many who belonged to classes and parties hitherto excluded from court favour. Queen Victoria visited Berlin to see her dying son-in-law. He died at Potsdam on June 15, 1888, after a reign of 99 days. After the emperor's death Professor Geffcken, a personal friend, published in the *Deufsche Rundschau* extracts from the diary of the crown prince containing passages which illustrated his differences with Bismarck during the war of 1870. The object was to injure Bismarck's reputation, and a very unseemly dispute ensued. The treatment of the crown prince's illness also gave rise to an acrimonious controversy, for which *see* MACKENZIE, SIR MORELL.

The empress Victoria, who, after the death of her husband, was known as the empress Frederick, died on Aug. 5, 1901, at the castle of Friedrichskron, Cronberg, near Homburg, where she spent her last years. Of the emperor's children two, Prince Sigismund (1864–1866) and Prince Waldemar (1869–1879), died in childhood. He left two sons, William, his successor as emperor, and Henry, who adopted a naval career. Of his daughters, the princess Charlotte was married to Bernard. hereditary prince of Meiningen; the princess Victoria to Prince Adolph of Schaumburg-Lippe; the princess Sophie to the duke of Sparta, crown prince of Greece; and the princess Margaretha to Prince Friedrich Karl of Hesse.

For his illness, *see* the official publication, *Die Krankheit Kaiser Friedrichs III.* (1888), and Morell Mackenzie, *The Fatal Illness of Frederick the Noble* (1888). Most of the copies oi the *Deutsche Rundschau* containing the extracts from the crown prince's diary were confiscated, but there is an English edition, published in 1889.

FREDERICK III (1272–1337), king of Sicily, third son of King Peter of Aragon and Sicily, and of Constance, daughter of Manfred. Peter died in 1285, leaving Aragon to his eldest son Alphonso, and Sicily to his second son James, When Alphonso died in 1291 James became king of Aragon and left his brother Frederick as regent of Sicily. The war between the Angevins and the Aragonese for the possession of Sicily was still in progress, and although the Aragonese were successful in Iraly James's position in Spain became very insecure owing to internal troubles and French attacks. Peace negotiations were begun with Charles II of Anjou, but were interrupted by the successive deaths of two popes; at last under the auspices of Boniface VIII, James concluded a shameful treaty, by which, in exchange for being left undisturbed in Aragon and promised possession of Sardinia and

Corsica, he gave up Sicily to the church, for whom it was to be held by the Angevins (1295). The Sicilians refused to be made over once more to the hated French whom they had expelled in 1282 and found a national leader in the regent Frederick. In vain the pope tried to bribe him with promises and dignities; he mas determined to stand by his subjects and was crowned king by the nobles at Palermo in 1296.

Although the second Frederick of Sicily, he called himself third, being the third son of King Peter. He reformed the administration and extended the powers of the Sicilian parliament, which was composed of the barons, the prelates and the representatives of the towns.

War with the **Angevins.**—His refusal to comply with the pope's injunctions led to a renewal of the war. Frederick landed in Calabria, where he seized several towns, encouraged revolt in Naples, negotiated with the Ghibellines of Tuscany and Lombardy and assisted the house of Colonna against Pope Boniface. In the meanwhile James married his sister Yolanda to Robert, the third son of Charles II. Unfortunately for Frederick, a part of the Aragonese nobles of Sicily favoured King James, and both John of Procida and Ruggiero di Lauria went over to the Angevins, and the latter completely defeated the Sicilian fleet off Cape Orlando. Charles's sons Robert and Philip landed in Sicily, but after capturing Catania mere defeated by Frederick, Philip being taken prisoner (1299). For two years more the fighting continued with varying success, until Charles of Valois, who had been sent by Boniface to invade Sicily, was forced to sue for peace, his army being decimated by the plague, and in Aug. 1302 the treaty of Caltabellotta was signed, by which Frederick was recognized king of Trinacria (the name Sicily was not to be used) for his lifetime and was to marry Eleonora, the daughter of Charles II; at his death the kingdom was to revert to the Angevins (this clause was inserted chiefly to save Charles's face), and his children would receive compensation elsewhere. Boniface tried to induce King Charles to break the treaty, but the latter was only too anxious for peace, and finally in May 1303 the pope ratified it, Frederick agreeing to pay him a tribute.

Later Struggles.— For a few years Sicily enjoyed peace, and the kingdom was reorganized. But on the descent of the emperor Henry VII. Frederick entered into an alliance with him, and in violation of the pact of Caltabellotta made nar on the Angevins again (1313) and captured Reggio. He set sail for Tuscany to cooperate with the emperor, but on the latter's death (1314) he returned to Sicily. Robert, who had succeeded Charles II in 1309, made several raids into the island. A truce was concluded in 1317, but as the Sicilians helped the north Italian Ghibellines in the attack on Genoa, and Frederick seized some Church revenues for military purposes, the pope (John XXII) excommunicated him and placed the island under an interdict (1321) which lasted until 1335. An Angevin fleet and army, under Robert's son Charles, was defeated at Palermo by Giovanni da Chiaramonte in 1325, and in 1326 and 1327 there were further Angevin raids on the island, until the descent into Italy of the emperor Louis the Bavarian distracted their attention. The election of Pope Benedict XII (1334), who was friendly to Frederick, promised a respite; but after fruitless negotiations the war broke out once more, and Chiaramonte went over to Robert, owing to a private feud In 1337 Frederick died at Paternione, and in spite of the peace of Caltabellotta his son Peter succeeded. During Frederick's reign the Aragonese dynasty became thoroughly national and helped to weld the Sicilians into a united people.

Speciale's "Historia Sicula" (in Muratori's *Script. rer. ital.* x) is the most important; for the first years of Frederick's reign see M. Amari, *La Guerra del Vespro Siciliano* (1876), and F Lanzani. *Storia dei Comuni italiani* (1882); for the latter years C. Cipolla, *Storia delle signorie italiane* (1881); also F. Testa, *Vita di Federigo di Sicilia* (1775). (L. V)

FREDERICK I (1676–1751), king of Sweden from 1720 to 1751, was born on April 28, 1676, the eldest surviving son of the landgrave Charles of Hesse-Kassel. His natural bent was toward scientific and military studies, and he became an exceptionally brave and resourceful officer, serving under William III of England (1695–97) and in the War of the Spanish Succession. He married Louise of Brandenburg (1700), but she died childless in 1705. In 1708 a more ambitious project was suggested; viz., that Frederick should marry the sister of Charles XII of Sweden, Ulrika Eleonora who, after the recent death of her elder sister, seemed likely to succeed her unmarried brother on the throne. After protracted negotiations (chiefly necessitated by Ulrika Eleonora's fears that her marriage to a Calvinist might prejudice her chances and benefit those of her Lutheran nephew, Charles Frederick of Holstein-Gottorp) the wedding took place in 1715.

Ulrika Eleonora became so devoted to her husband that his hopes of finally possessing the Swedish crown for himself seemed justified. Frederick got on well with Charles XII and took an active part both in the campaigns in Norway and in the organization of Swedish defenses against Russian attacks from the east. During the preparations for the big military offensive of 1718, however, he became increasingly preoccupied with safeguarding his wife's interests vis-à-vis the Holstein-Gottorp candidature in case Charles XII should die without having named his heir. He established contacts mith the antiabsolutist opposition to Charles XII, and it has been strongly suspected that the king's death (Dec. 11, 1718) was a murder arranged by Frederick in order to prevent the situation's moving in favour of his wife's rival. Opinion on this matter is divided, but it would seem that Frederick had neither the desire nor the need to plot Charles XII's death. He was, however, very well prepared for it and, by seizing the initiative. he secured Ulrika Eleonora's proclamation as queen, though at the cost of concessions to the antiabsolutist forces in the estates (riksdag).

He himself emerged as the real leader in foreign policy and made great efforts, both militarily and diplomatically, to get peace from Russia without making too many concessions. He was unsuccessful, largely because of circumstances beyond his control: he made sacrifices to Hanover, to Denmark and to Prussia in order to obtain help against Russia, but this help did not materialize on the scale arranged, so that Sweden was forced in 1721 to agree to the humiliating peace of Nystad. Frederick had ostensibly greater success in his personal aims in Sweden: in March 1720 the queen declared the estates freed from their oath of loyalty to her, and Frederick was proclaimed king of Sweden. In reality opponents of royal absolutism had taken advantage of both Frederick and the queen, and he took over the crown in a much more dependent position in relation to the estates than had Ulrika Eleonora.

Frederick's reign was a disappointment. He was given far less opportunity to govern than he had expected, and his gifts in the military and diplomatic fields were hardly used. In the enforced idleness to which the Swedish "age of liberty" thus condemned him, his intelligence rusted and his character deteriorated though his charm survived. He filled his time with hunting and love affairs. He had no children by Ulrika Eleonora (though he had two sons and two daughters by one of his mistresses, Hedvig Taube), and his hopes of having the succession fixed in the Hesse family were disappointed. From 1743 he was overshadowed by the heir to the throne. Adolphus Frederick of Holstein-Gottorp, who mas chosen in conformity to Russian wishes as a result of the disastrous war against Russia.

Frederick suffered the first of several strokes in 1748 and died in Stockholm on March 25, 1751.

See Walfrid Holst, *Frederik* I (1953). (R. M. **Ha.**)

FREDERICK I (1372?–1440), elector of Brandenburg, founder of the greatness of the House of Hohenzollern, was born at Nuremberg. a son of Frederick V, burgrave of Nuremberg, and first came into prominence by saving the life of Sigismund, king of Hungary. at the battle of Nicopolis in 1396. In 1397 he became burgrave of Nuremberg, and after his father's death in 1398 he shared Ansbach, Bayreuth and the smaller possessions of the family, with his only brother John, but became sole ruler after his brother's death in 1420. Loyal at first to King Wenceslaus, the king's neglect of Germany drove Frederick to take part in his deposition in 1400, and in the election of Rupert III, count palatine of the Rhine, whom he accompanied to Italy in the following year. In 1401 he married Elizabeth, or Elsa, daughter of Frederick, duke of Bavaria-Landshut (d. 1393), and in 1409 took service again with King Sigismund, whom he assisted in his struggle with the Hungarian rebels. The double election to the German throne in 1410 first brought Frederick into relation with Brandenburg. Sigismund, anxious to obtain another vote in the electoral college, appointed Frederick to exercise the Brandenburg vote on his behalf, and it was largely through his efforts that Sigismund was chosen German king. Frederick then restored a certain degree of order in Brandenburg, and was formally invested with the electorate and margraviate by Sigismund at Constance on April 18, 1417 (see BRANDENBURG). He took part in the war against the Hussites, but became estranged from Sigismund when in 1423 the king invested Frederick of Wettin, margrave of Meissen, with the vacant electoral duchy of Saxe-Wittenberg In 1427 he was one of the band of electors who sought to impose reforms upon Sigismund. An unsuccessful candidate for the German throne in 1438, Frederick was chosen king of Bohemia in 1440, but declined the honour He took part in the election of Frederick III as German king in 1440, and died at Kadolzburg on Sept. 21, of the same year. In 1902 a statue was erected to his memory at Friesack. Another one is in the "Siegesallee," Berlin.

See E. Brandenburg, *König Sigmund und Kurfürst Friedrich I. von Brandenburg* (1891).

FREDERICK III. (1515–1576), called "the Pious." elector palatine of the Rhine, eldest son of John II., count palatine of Simmern, was born at Simmern on Feb. 14, 1515. In 1537 he married Maria (d. 1567), daughter of Casimir, prince of Bayreuth, and in 1546, mainly as a result of this union, adopted the reformed doctrines. In 1557 he became count palatine of Simmern by his father's death. succeeding his kinsman, Otto Henry (1502–1559), as elector palatine two years later. Although inclined to the views of Calvin rather than to those of Luther, and as the breach between the followers of the two reformers became wider, he definitely adopted Calvinism. This form of faith was established in the Palatinate; in its interests the "Heidelberg Catechism" was drawn up in 1563; and Catholics and Lutherans were persecuted alike, while the churches were denuded of all their ornaments. The Lutheran princes wished to root out Calvinism in the Palatinate, but were not willing to exclude the elector from the benefits of the religious peace of Augsburg, which were confined to the adherents of the confession of Augsburg, and the matter came before the diet in 1566. Boldly defending his position, Frederick refused to give way an inch. and as the Lutherans were unwilling to proceed to extremities the emperor Maximilian II. could only warn him to mend his ways. The elector aided the Huguenots in France and the insurgents in the Netherlands with men and money; one of his sons, John Casimir (1543–1592), took a prominent part in the French wars of religion, while another, Christopher, was killed in 1574 fighting for the Dutch at Mooker Heath. Frederick sought in vain to prevent the election of a member of the Habsburg family as Roman king, to secure the abrogation of the "ecclesiastical reservation" clause in the peace of Augsburg, or to obtain for Protestants in the territories of the spiritual princes. He died at Heidelberg on Oct. 26, 1576.

See A. Kluckhohn, *Friedrich der Fromme* (Nördlingen, 1877–79); and *Briefe Friedrichs des Frommen,* edited *by* Kluckhohn (Brunswick, 1868–72).

FREDERICK V (1596–1632), elector palatine of the Rhine and king of Bohemia, was born on Aug. 26, 1596, at Amberg in the Upper Palatinate, the son of the elector Frederick IV and Louisa Juliana, daughter of William of Orange, the liberator of the Netherlands. He received a French education at Sedan and succeeded his father in Sept. 1610. He married Elizabeth, daughter of James I of Great Britain, in Feb. 1613, but was not declared of age until July 1614. Against the advice of his palatine councilors he accepted the election as king of Bohemia (Aug. 26, 1619) by the Bohemian estates who had revolted against the Habsburg king, the Holy Roman emperor Ferdinand II (*q.v.*). He was crowned in Prague on Nov. 4. 1619. but his reign lasted little more than a year—hence his nickname "the Winter King"—as his army was completely routed by the Catholic league under Tilly in the battle of the White Mountain near Prague on Nov. 8, 1620 (*see* THIRTY YEARS' *WAR*). Frederick and his family. including the newly born prince Rupert (*q.v.*), fled without further resistance. The Protestant union, of which Frederick was the nominal head, was restrained by French pressure from assisting him; the Lutheran elector of Saxony was non over by Ferdinand nith the cession of Lusatia; James I of England was bent on appeasing Catholic Spain. After two years Frederick's cause collapsed through lack of funds for the maintenance of his troops under Ernst von Mansfeld and Christian of Brunswick (*qq.v.*). The Palatinate was occupied by the league and the Spaniards, and the electoral dignity nas transferred to Maximilian I (*q.v.*) of Bavaria. Frederick spent the rest of his life as a pensioner of the Dutch states-general and a hanger-on of Gustavus Adolphus of Sweden. He died in Mainz on Nov. 29, 1632. Through his youngest daughter Sophia (1630–1714), the mother of George I, Frederick became the ancestor of the Hanoverian dynasty in Great Britain.

FREDERICK I. (1370–1428), surnamed **"the** Warlike," elector and duke of Saxony, was the eldest son of Frederick "the Stern," count of Osterland, and Catherine, daughter and heiress of Henry VIII., count of Coburg. He was born at Altenburg on April 11, 1370, and was a member of the family of Wettin. In the division of their father's lands in 1382 Frederick and his brothers shared Meissen and Thuringia with their uncles Balthasar and William. Frederick's brother George died in 1402, and his uncle William in 1407. A further dispute then arose, but in 1410 a treaty was made at Naumburg, when Frederick and his brother William added the northern part of Meissen to their lands; and in 1425 the death of William left Frederick sole ruler. In the German town war of 1388 he assisted Frederick V. of Hohenzollern, burgrave of Nuremberg, and in 1391 did the same for the Teutonic Order against Ladislaus V., king of Poland and prince of Lithuania. He supported Rupert III., elector palatine of the Rhine, in his struggle with King Wenceslaus for the German throne, probably because Wenceslaus refused to fulfil a promise to give him his sister Anna in marriage. He took a leading part in the war against the Hussites, receiving from the German King Sigismund, as a return for his services, various places in Bohemia and elsewhere in pledge, together with the vacant electoral duchy of Saxe-Wittenberg. He was formally invested at Budapest on Aug. 1, 1425. The elector was endeavouring to rouse the German princes to aid him in prosecuting the war against the Hussites when the Saxon army was almost annihilated at Aussig (1426). Frederick died at Altenburg on Jan. 4, 1428. In 1402 he married Catherine of Brunswick, by whom he left four sons and two daughters. He and his brother William founded the university of Leipzig for German students who had just left the university of Prague. Frederick's importance as an historical figure arises from his having obtained the electorate of Saxe-Wittenberg for the house of Wettin, and transformed the margraviate of Meissen into the territory which afterwards became the kingdom of Saxony. The ex-king of Saxony, the sovereigns of England and of the Belgians are his direct descendants.

See C. W. Bottiger and Th. Flathe, *Geschichte des Kurstaates und Königreichs Sachsen* (Gotha, 1867–73); and J. G. Horn, *Lebens- und Heldengeschichte Friedrichs des Streitbaren* (Leipzig, 1733).

FREDERICK II. (1411–1464), called "the Mild," elector and duke of Saxony, eldest son of the elector Frederick I., was born at Leipzig on Aug. 22, 1411. He succeeded his father as elector in 1428, but shared the family lands with his three brothers, and was at once engaged in defending Saxony against the attacks of the Hussites. He obtained the burgraviate of Meissen in 1439, and some part of Lower Lusatia after a struggle with Brandenburg about the same time. In 1438 it was decided that Frederick, and not his rival, Bernard IV., duke of Saxe-Lauenburg, was entitled to exercise the Saxon electoral vote at the elections for the

German throne. On the death of their cousin Frederick, margrave of Thuringia, the brothers Frederick and William divided Frederick's territory, but this arrangement was not satisfactory, and war broke out between them in 1446. After a struggle known as the *Brüderkrieg* peace was made in Jan. 1451, when William received Thuringia, and Frederick Altenburg and other districts. He died at Leipzig on Sept. 7, 1464. By his wife, Margaret (d. 1486), daughter of Ernest, duke of Styria, he left two sons and four daughters. In July 1455 occurred the celebrated *Prinzenraub*, the attempt of a knight named Kunz von Kaufungen (d. 1455) to abduct Frederick's two sons, Ernest and Albert. Having carried them off from Altenburg, Hunz was making his way to Bohemia when the plot was accidentally discovered and the princes restored.

See W. Schäfer, *Der Montag vor Kiliani* (1855); J. Gersdorf, *Einige Aktenstücke zur Geschichte des sächsischen Prinzenraubes* (1855); and T. Carlyle, *Critical and Miscellaneous Essays*, vol. iv. (1899).

FREDERICK III THE *WISE* (1463–1525), elector of Saxony from 1486 to 1525, was born at Torgau on Jan. 17, 1463, the eldest son of the elector Ernest and Elizabeth, daughter of Albert duke of Bavaria. His education was wide and strongly influenced by the Renaissance, his main early interests being music and German history. Succeeding his father as elector in 1486, Frederick retained the government of Saxony in his own hands but shared the possessions of his family in other parts of Germany with his brother John the Steadfast (1468–1532).

Frederick made his court at Wittenberg a centre of artistic activity, Albrecht Dürer and Lucas Cranach the elder being among the many artists patronized by him. He was also a great collector of religious relics, bringing many back from a pilgrimage to the Holy Sepulchre (1493) and housing them in the ducal chapel at Wittenberg. To add to the collection he maintained agents in Venice and in the Netherlands. He further took an interest in scholarship, being a friend of the humanist Georg Spalatin and founding, in 1502, the University of Wittenberg.

In 1495 Frederick had been among the princes who pressed the need for constitutional reform upon the German king Maximilian I, and in 1500 he became president of the newly formed imperial regency council (*Reichsregiment*). In 1519, however, he declined to stand as a candidate in the imperial election and assisted in procuring the election of Charles V, being the only elector to refuse a bribe.

Frederick, who had appointed Martin Luther professor of philosophy at Wittenberg in 1508 and Phillip Melanchthon professor of Greek there in 1518, refused to implement the papal bull against Luther in 1520. In 1521, after Luther had been placed under the imperial ban by the diet of Worms, Frederick had him conveyed to Wartburg castle and there protected him. He himself finally accepted Luther's reformed doctrines in 1524, but died shortly afterward at Langau, near Annaberg, on May 5, 1525.

BIBLIOGRAPHY.—There is a modern edition of Georg Spalatin's life of Frederick by C. G. Neudecker and L. Preller (1851). *See* also M. M. Tutzschmann, *Friedrich der Weise, Kurfürst von Sachsen* (1848); T. Kolde, *Friedrich der Weise und die Anfange der Reformation* (1881); W. Kalkofi, *Die Kaiserwahl Friedrichs IV. und Karls V.* (1925).

FREDERICK, a city of Maryland, U.S., 45 mi. W. of Baltimore and the same distance northwest of Washington, D.C., on a tributary of the Monocacy river; the seat of Frederick county. It is a trading, farming and manufacturing centre, with large flour and feed mills, brush and silo factories, creameries and corn-canning factories. Manufactures include chrome cooking utensils, stokers, pumps and electronic equipment.

Hood college for women, affiliated with the United Church of Christ, was organized as a college in 1893 but was originally founded as a ladies' seminary in 1839. Also located in Frederick is the state school for the deaf (1867); on its grounds is a stone barracks built in 1777, which quartered prisoners from Saratoga, N.Y., Trenton, N.J., and Yorktown, Va., during the American Revolution and served as a Union hospital during the Civil War. The town clock, in the tower of Trinity chapel, has been in constant service since 1796.

Frederick was the birthplace of Francis Scott Key and of Adm. Winfield Scott Schley. A number of beautiful colonial homes remain in and near the city. Settled by Germans in 1733 and laid out in 1745, Frederick was named for the last Lord Baltimore or the then prince of Wales, or possibly for Frederick the Great of Prussia. There in 1755 Gen. Edward Braddock prepared for his ill-fated expedition against Ft. Duquesne; and in the county courthouse on Nov. 23, 1765, the 12 county judges took official action (the first jurists of the country to do so) repudiating the British Stamp act. The city was incorporated in 1817. During the Civil War Frederick was occupied at different times by Union and Confederate troops. The battle of Monocacy (July 1864) was fought 3 mi. S. The flag-waving by Barbara Fritchie, which through John Greenleaf Whittier's ballad became a cherished national legend, took place, if at all, during "Stonewall" Jackson's march to Harpers Ferry, in 1862. A replica of Mrs. Fritchie's house serves as a museum for Civil War and early Frederick historical items. For comparative population figures *see* table in MARYLAND: *Population*. (R. M. LA.)

FREDERICK AUGUSTUS I. (1750–1827), king of Saxony, son of the elector Frederick Christian, was born at Dresden on Dec. 23, 1750. He succeeded his father under the guardianship of Prince Xavier in 1763, and was declared of age in 1768. In 1769 he married Maria Amelia, daughter of Duke Frederick of Zweibrücken, by whom he had one daughter, Princess Augusta. He was methodical and conscientious, and a good example to all his officials, whence his surname "the Just." He sided with Frederick the Great in the short Bavarian succession war of 1778 against Austria. At the peace of Teschen, which concluded the war, he received 6 million florins. In 1785 he joined the league of German princes (*Deutscher Fürstenbund*) formed by Prussia, but without prejudice to his neutrality. Thus he remained neutral during the quarrel between Austria and Prussia in 1790. In the following year he declined the crown of Poland. He refused to join the league against France (Feb. 7, 1792), but when war was declared his duty to the empire necessitated his taking part in it. Even after the peace of Basel (April 5, 1795) he continued the war. But when the French army, during the following year, advanced into the heart of Germany, he was compelled by General Jourdan to retreat (Aug 13, 1796). In 1806 he joined Prussia against France. After the disastrous battle of Jena he concluded peace with Napoleon at Posen (Dec. 11 1806), and, assuming the title of king, he joined the Confederation of the Rhine. But he did not alter the constitution and administration of his new kingdom. After the peace of Tilsit (July 9, 1807) he was created by Napoleon grand-duke of Warsaw, but his sovereignty of Poland was little more than nominal. In 1809 Frederick Augustus fought with Napoleon against Austria. On several occasions (1807, 1812, 1813) Napoleon was entertained at Dresden, and when, on his return from his disastrous Russian campaign, he passed through Saxony by Dresden (Dec. 16, 1812), Frederick Augustus remained true to his friend and ally. In April 1813 he made overtures to Austria, but he soon afterwards returned to the side of the French. He returned to Dresden on May 10 and was present at the terrible battle of Aug. 26 and 27, in which Napoleon's army and his own were defeated. He fell into the hands of the Allies after their entry into Leipzig; and, although he regained his freedom after the congress of Vienna, he was compelled to give up the northern part—three-fifths—of his kingdom to Prussia (May 21, 1814). He entered Dresden on July 7, and was enthusiastically welcomed by his people. The remainder of his life was spent in repairing the damages caused by the Napoleonic wars, in developing the agricultural, commercial and industrial resources of his kingdom, reforming the administration of justice, establishing hospitals and other charitable institutions, encouraging art and science and promoting education. He had a special interest in botany, and originated the beautiful park at Pillnitz. He died on May 5, 1827.

BIBLIOGRAPHY.—The earlier lives, by C. E. Weisse (1811), A. L. Herrmann (1827), Pölitz (1830), are mere panegyrics. On the other side *see* Flathe in *Allgemeine deutsche Biographie*, and Böttiger-Flathe, *History of Saxony* (2nd ed., 1867 ff.), vols. ii. and iii.; A. Bonneions, *Un Allié de Napoléon, Frédéric Auguste, premier roi de Saxe . . .* (1902); Fritz, Friedrich, *Politik Sachsens 1801–1803* (1898); P. Rühlmann, *Öffentliche Meinung . . . 1806–1813* (1902). There are many pamphlets bearing on the Saxon question and on Frederick Augustus during the years 1814 and 1815.

FREDERICK AUGUSTUS II (1797–1854), king of Saxony from 1836 to 1854, was born in Dresden on May 18, 1797, the eldest son of Prince Maximilian of Saxony and of Carolina of Parma. In Oct. 1819 he married the archduchess Caroline, daughter of the Austrian emperor Francis I. Nominated as joint regent of Saxony with his uncle King Antony in Sept. 1830 (as a consequence of the July revolution in Dresden), Frederick Augustus was partly responsible for the constitution of 1831, which introduced a measure of representative government. In May 1832 his first wife died, and in April 1833 he married Maria, daughter of Maximilian I king of Bavaria. On June 6, 1836, he became king in succession to his uncle Antony. At first he favoured the plan for German unity put forward at Frankfurt in 1848, though refusing to acknowledge the democratic constitution of the Frankfurt assembly. This attitude led to the May insurrection in Dresden in 1849, which was suppressed with the help of Prussian troops. F. F. von Beust, the minister who had called in the troops and who was also the leader of the reactionary pro-Austrian party in Saxony, then became the director of Saxon policy.

From that time Frederick Augustus took little part in government and devoted himself to the study of botany, in which he had long been interested, having already published Flora *Marien*badensis, oder *Pflanzen und* Gebirgsarten (1837) and traveled extensively in search of specimens. He died, childless, on Aug. 9, 1854, as a result of a carriage accident near Brennbühel in the Tirol.

See C. *W*. Böttiger and T. Flathe, *Geschichte des Kurstaates und Konigreiches Sachsen,* vol iii *(1873)*; H. Kretzschmar, "Die Sächsische Königtum in 19 Jahrhundert," *Historische Zeitschrift,* no. *70 (1950)*.

FREDERICK CHARLES (FRIEDRICH KARL NIKOLAUS), PRINCE (1828–1885), Prussian general field marshal, son of Prince Charles of Prussia and grandson of King Frederick William III., was born in Berlin on March 20 1828. He entered the army on his tenth birthday as second lieutenant in the 14th Foot Guards He studied at Bonn where he lived for two years, being accompanied throughout by Major von Roon, afterwards the famous war minister. He served in the Schleswig-Holstein War on the staff of Marshal von Wrangel. In 1849 he took part in the campaign against the Baden insurgents, and was wounded at the action of Wiesenthal while leading a desperate charge against entrenched infantry. In 1852 he became colonel, and in 1854 major-general and commander of a cavalry brigade. In this capacity he was brought closely in touch with General von Reyher, the chief of the general staff, and with Moltke. He married, in the same year, Princess Marie Anne of Anhalt.

In 1858 he visited France, where he minutely investigated the state of the French army, but was recalled when Prussia mobilized her forces during the Franco-Austrian war. The prince was made a divisional commander in the II. army corps with a liberty of action which had previously been denied to him. About this time (1860) he gave a lecture to the officers of his command on the French army and its methods, the substance of which (*Eine militärische Denkschrift von* P.F.K., Frankfort on Main, 1860) was circulated more widely than the author intended, and in the French translation gave rise to much indignation in France. In 1861 Frederick Charles became general of cavalry. He was then commander of the III. (Brandenburg) army corps. This post he held from 1860 to 1870, except during the campaigns of 1864 and 1866, and in it he displayed his real qualities as a troop leader. Ten years of his continuous and thorough training brought the III. corps to a pitch of real efficiency which the Guard corps alone, in virtue of its special recruiting powers, slightly surpassed. Prince Frederick Charles' work was to be tested when von Alvensleben and the III. corps engaged the whole French army on Aug. 16, 1870. In 1864 the Prussian contingent under Frederick Charles formed a corps of the allied army, operating against the Danes, and half of it was drawn from the III. corps. After the storming of the Duppel lines the prince succeeded Wrangel in the supreme command, with Moltke as his chief of staff. These two great soldiers then planned and brilliantly carried out the capture of the island of Alsen, after which the war ended.

In 1866 came the Seven Weeks' War with Austria. Prince Frederick Charles was appointed to command the I. Army, which he led through the mountains into Bohemia, driving before him the Austrians and Saxons to the upper Elbe, where on July 3, took place the decisive battle of Koniggratz or Sadowa. This was brought on by the initiative of the leader of the I. Army, which had to bear the brunt of the fighting until the advance of the II. Army turned the Austrian flank. After the peace he returned to the III. army corps, which he finally left, in July 1870, when appointed to command the II. German Army in the war with France. In the early days of the advance the prince's ruthless energy led to much friction between the I. and II. Armies (see FRANCO-GERMAN WAR), while his strategical mistakes seriously embarrassed the great headquarters staff. The advance of the II. Army beyond the Saar to the Moselle and from that river to the Meuse displayed more energy than careful strategy, though the "red prince" (as he was called from the colour of his favourite hussar uniform) was in thorough sympathy with the king's headquarters on the one hand and the feelings of the troops on the other. Then came the discovery that the French were not in front, but to the right rear of the II. Army (August 16). Alvensleben with the III. corps held the French to their ground at Vionville while the prince hurried together his scattered forces. He himself directed with superb tactical skill the last efforts of the Germans at Vionville, and the victory of St. Privat on the 18th was due to his leadership (see METZ), which shone all the more by contrast with the failures of the I. Army at Gravelotte. The prince was left in command of the forces which blockaded Bazaine in Metz, and received the surrender of that place and of the last remaining field army of the enemy. He was promoted at once to the rank of general field marshal, and shortly afterwards the II. Army was despatched to aid in crushing the newly organized army of the French republic on the Loire. Here again he retrieved strategical errors by energy and tactical skill, and his work was in the end crowned by the victory of Le Mans on Jan. 12, 1871.

He now became inspector-general of the 3rd "army inspection," and a little later inspector of cavalry, and in the latter post he brought the Germany cavalry to a high degree of perfection in manoeuvre and general training. His sternness of character kept him aloof from the court and from his own family, and he spent his leisure months chiefly on his various country estates. In 1872 and in 1882 he travelled in the Mediterranean and the Near East. He died on June 15, 1885, at Klein-Glienicke near Berlin, and was buried at the adjacent church of Nikolskoe. His third daughter, Princess Louise Margareta, was married, in March 1879, to the duke of Connaught. His *Denkwürdigkeiten* were edited by W. Foerster in 1910.

See Müller-Bohn, *Der Eiserne Prinz* (1902).

FREDERICK HENRY (1584–1647), prince of Orange, the youngest child of William the Silent and Louise de Coligny was born at Delft in Holland, on Jan. 29, 1584, that is, about six months before his father's assassination. In 1594 he went to the University of Leiden. In 1597 he joined the army under his brother Maurice and was present at the siege of Rijnberk. From Dec. 1597 to April 1599 he was in France with his mother, who wanted him to know and understand her country. On his return to the Netherlands, Frederick Henry again joined the army, becoming colonel of a Walloon regiment. In 1603 he was a member of the embassy sent by the estates of Holland to James I of England to congratulate him on his accession. During the conflicts which divided the Dutch republic in the 1610s Frederick Henry favoured the Remonstrants, but he did not actively support them since his brother Maurice, the stadholder, supported the Counter-Remonstrants.

The 12 years' truce with Spain ended in 1621 and Frederick Henry took a leading part in the war which followed (see NETHERLANDS: History). On Maurice's death in 1625 Frederick Henry succeeded him as stadholder of Holland, Zeeland, Utrecht, Gelderland and Overijssel and was also appointed captain-general and admiral-general of the United Provinces. Thenceforward his military genius—exemplified by the capture of Grol (1627), 'S Hertogenbosch (1629). Maastricht (1632) and Breda (1637)—his political skill and the tenacity with which he pursued his dynastic ambitions all combined to win him a semimonarchical prestige, and his court at The Hague became an international centre. In 1640 his position at home was made still stronger by his succession to the stadholderships of Groningen and Drenthe. In 1625, moreover, he had married Amalia of Solms, and the marriage of his son William to Mary, the daughter of Charles I of England, in May 1641 enhanced the standing of his house abroad.

In domestic affairs Frederick Henry used his great powers to stabilize the situation, as for example in his toleration of the Remonstrants, and this policy was fairly successful until 1644. After that year, however, weakened in mind and body, he was unable to resist the increasing opposition to the dynastic and pro-Stuart tendencies of his regime and to his reluctance to end the war with Spain by breaking the French alliance of 1635. In 1646 negotiations were begun which were to culminate in the treaty of Münster between Spain and the United Provinces in 1648, but meanwhile Frederick Henry had died on March 14, 1647. He left an account of his campaigns, which was published as *Mémoires de Frédéric Henri* in 1733.

See P. J. Blok, *Frederik Hendrik, Prins van Oranje* (1924); also G. Edmundson, "Frederick Henry, Prince of Orange" *Cambridge Modern History,* vol. iv *(1907).* (E. H. K.)

FREDERICK LOUIS (1707–1751), prince of Wales, eldest son of George 11, was born at Hanover on Jan. 20, 1707. After his grandfather, George I, became king of Great Britain and Ireland in 1714, Frederick was known as duke of Gloucester (though never actually created) and made a knight of the Garter. He had been betrothed to Wilhelmina Sophia Dorothea (1709–1758), daughter of Frederick William I, king of Prussia, and sister of Frederick the Great, but the match was prevented by the ill will between the parents. On the accession of George 11 in 1727 Frederick went to England and in 1729 was created prince of Wales; but the relations between father and son were unfriendly, and the king refused to make him an adequate allowance. In 1735 Frederick wrote, or inspired the writing of, the *Histoire du prince Titi,* a book containing offensive caricatures of both king and queen; "he made his court" says Lecky, "the special centre of opposition to the government, and he exerted all his influence for the ruin of Walpole." After a marriage between the prince and Lady Diana Spencer, afterward the wife of John, 4th duke of Bedford, had been frustrated by Walpole, Frederick married in April 1736 Augusta (1719–1772), daughter of Frederick 11, duke of Saxe-Gotha. George proposed to allow the prince £50,000 a year; but this sum was regarded as insufficient by the latter, whose appeal to parliament was unsuccessful. After the birth of his first child, Augusta, in 1737, Frederick was ordered by the king to quit St. James's Palace, and foreign ambassadors were requested to refrain from visiting him. In 1745 George 11 refused to allow his son to command the British army against the Jacobites. On March 20, 1751, the prince died in London, and was buried in Westminster Abbey. He left five sons and two daughters. The sons were George (afterward King George 111); Edward Augustus, duke of York and Albany (1739–1767); William Henry, duke of Gloucester and Edinburgh (1743–1805); Henry Frederick, duke of Cumberland (1745–1790); and Frederick William (1750–1765). The daughters were Augusta (1737–1813), wife of Charles William Ferdinand, duke of Brunswick; and Caroline Matilda (1751–1775), wife of Christian VII, king of Denmark.

See Lord Hervey of Ickworth, *Memoirs of the Reign of George II,* edited by J. W. Croker (1884); Horace Walpole, *Memoirs of the Reign of George II* (1847); and Sir N. W. Wraxall, *Memoirs,* edited by H. B. Wheatley, vol. i (1884).

FREDERICKSBURG, a city of Virginia, U.S., lies in Spotsylvania county but is politically independent of it. It is served by the Richmond, Fredericksburg and Potomac railway; it marks the head of navigation for the Rappahannock river. Fredericksburg's chief industry is a viscose company. Mary Washington college, the women's branch of the University of Virginia, is located in the city. (For comparative population figures *see* table in VIRGINIA: *Population.)*

Fredericksburg was laid out as a town in 1727 and named for the father of King George 111 of England. Its founders and earliest residents included Col. Henry Willis, Rev. James Marye, John Tennent, Susanna Livingston and William Lynn. William Paul, brother of John Paul Jones (*q.v.*), set up the first tailor shop there. In 1732 George Washington's father, who owned "Ferry Farm" across the Rappahannock, bought three lots in the town and became one of its trustees. Fredericksburg was incorporated as a town in 1781. Among Fredericksburg's historic sites are the homes of Mary Ball Washington, mother of George Washington; "Kenmore," the home of Washington's only sister; the law office of James Monroe (*q.v.*), the Hugh Mercer apothecary shop; and the Civil War battlefields.

The **Battle of Fredericksburg.**—A bloody engagement of the Civil War was fought at Fredericksburg on Dec. 13, 1862. In search of more aggressive leadership, the Lincoln administration had removed Gen. G. B. McClellan from command of the Army of the Potomac on Nov. 7 and appointed Gen. A. E. Burnside (*q.v.*) in his place. In the middle of November, Burnside began moving from Warrenton, Va., planning to cross the Rappahannock at Fredericksburg and advance on the southern capital at Richmond. Gen. R. E. Lee countered by taking a strong position on high ground behind Fredericksburg and extending his right about five miles south. His force numbered about 78,000. Burnside, with 122,000 men, held off attacking until his pontoon bridges arrived. When he finally began his assault on Dec. 13, he made it piecemeal. Gen. W. B. Franklin, commanding the Union left, interpreted Burnside's vague orders as restricting his action to a single division. At first this division made good headway against Gen. "Stonewall" Jackson on the heights below Fredericksburg. But, without support, it fell back about midafternoon. Troops brought across the river from Gen. Joseph Hooker's reserve arrived too late for another attempt. Meanwhile, at 1 o'clock, Burnside had sent Gen. E. V. Sumner with the troops on the right to strike behind Fredericksburg itself. Two Union divisions and then a third advanced over exposed ground in front of a stone wall below Marye's heights. Still more troops were added, but few ever got within 100 yd. of the wall. A final Union charge lost over 1,000 men in 15 min. Thus, Burnside's attack on the right proved as futile as that on the left and far more costly. In the end his casualties totaled 12,653 compared with only 5,309 for the carefully entrenched Confederates. And yet Burnside had to be dissuaded from renewing the attack next morning. During a storm on the night of Dec. 15, the army of the Potomac recrossed the Rappahannock and took up its bridges. For his conduct of this battle Burnside has been strongly criticized by students of military history. Lincoln relieved him of his command on Jan. 27, 1863. Like McClellan, and Gen. John Pope before him, Burnside had failed in what should have been the Union objective—destruction of the army of Virginia. Richmond seemed as far away as ever. For the south, the victory restored morale lost after Lee's retreat from Maryland following his unsuccessful Antietam (*q.v.*) campaign in October. *See* also AMERICAN CIVIL WAR.

FREDERICK WILLIAM I (1688–1740), king of Prussia, son of Frederick I by his second marriage, was born on Aug. 15, 1688. He was early imbued with a passion for military life, and this was deepened by acquaintance with the duke of Marlborough (1709), Prince Eugene, whom he visited during the siege of Tournai, and Prince Leopold of Anhalt (the "Old Dessauer"). In nearly every respect he was the opposite of his father, having frugal, simple tastes, a passionate temper and a determined will. His life was simple and puritanical, being founded on the teaching of the Bible. He was, however, fond of hunting and somewhat given to drinking. He intensely disliked the French, and highly disapproved of the imitation of their manners by his father and his court. When he came to the throne (Feb. 25, 1713) his first act was to dismiss from the palace every unnecessary official and to regulate the royal household on principles of the strictest parsimony. The greater part of the beautiful furniture was sold. His importance for Prussia is twofold: in internal politics he laid down principles which continued to be followed long after his death; he was one of the greatest administrators who have ever worn the Prussian crown. His foreign policy was less successful, though under his rule the kingdom acquired some extension of territory.

Thus at the peace of Utrecht (April 11, 1713), after the War of the Spanish Succession, he acquired the greater part of the duchy of Gelderland. By the treaty of Schwedt, concluded with Russia, he was assured of an important influence in the solution of the Baltic question, and Swedish Pomerania, as far as the Peene, was occupied by Prussia. But Charles XII. on his return turned against the king, though without success, for the Pomeranian campaign of 1715 ended in favour of Prussia (fall of Stralsund, Dec. 22). This enabled Frederick William I. to maintain a more independent attitude towards the tsar; he refused, for example, to provide him withtroops for a campaign (in Schonen) against the Swedes. When on May 28, 1718, in view of the disturbances in Mecklenburg, he signed at Havelberg the alliance with Russia, he confined himself to a defensive attitude, and. on the other hand, on Aug. 14, 1719, he also entered into relations with his former enemies, England and Hanover. By the treaty of Stockholm (Feb. 1, 1720), Frederick William succeeded in obtaining the consent of Sweden to the cession of that part of Pomerania which he had occupied (Usedom, Wollin, Stettin, Hither Pomerania, east of the Peene) in return for a payment of 2,000,000 thalers.

In order to secure the succession to the Lower Rhine duchies of Julich and Berg, Frederick William finally agreed to the treaty of Wiisterhausen (Oct. 12, 1726; ratified at Berlin, Dec. 23, 1728), in which he recognised the Pragmatic Sanction. In the War of the Polish Succession against France (1734–35), Frederick William remained faithful to the emperor's cause, and sent an auxiliary force of 10.000 men. The peace of Vienna, which terminated the war, led to a reconciliation between France and Austria, and so to a further estrangement between Frederick William and the emperor. In 1738 the western Powers, together with the emperor, insisted in identical notes on the recognition of the emperor's right to decide the question of the succession in the Lower Rhine duchies. A breach with the emperor was now inevitable, and this explains why in a last treaty (April 5, 1739) Frederick William obtained from France a guarantee of a part, at least, of Berg (excluding Dusseldorf).

But Frederick William's failures in foreign policy were more than compensated for by his splendid services in the internal administration of Prussia. He saw the necessity of rigid economy not only in his private life but in the whole administration of the state. During his reign Prussia obtained for the first time a centralized and uniform financial administration. It was the king himself who composed and wrote in the year 1722 the famous instruction for the general directory (Generaldirektorium) of war, finance and domains. When he died the income of the state was about seven million thalers (£1,050,000). The consequence was that he paid off the debts incurred by his father, and left to his successor a well filled treasury. In the administration of the domains he made three innovations: (1) the private estates of the king were turned into domains of the crown (Aug. 13, 1713); (2) the freeing of the serfs on the royal domains (March 22, 1719); (3) the conversion of the hereditary lease into a short-term lease on the basis of productiveness. His industrial policy was inspired by the mercantile spirit. On this account he forbade the importation of foreign manufactures and the export of raw materials from home, a policy which had a very good effect on the growth of Prussian industries.

The work of internal colonization he carried on with especial zeal. Most notable of all was his rktablissement of East Prussia, to which he devoted six million thalers (c. £900,000). His policy in respect of the towns was motived largely by fiscal considerations, but at the same time he tried also to improve their municipal administration; for example, in the matter of buildings, of the letting of domain lands and of the collection of the excise in towns. Frederick William had many opponents among the nobles because he pressed on the abolition of the old feudal rights, introduced in East Prussia and Lithuania a general land tax (the General hufenschoss), and finally in 1739 attacked in a special edict the *Legen, i.e.,* the expropriation of the peasant proprietors.

He did nothing for the higher learning, and even banished the philosopher Christian Wolff at 48 hours' notice "on pain of the halter," for teaching, as he believed, fatalist doctrines. Afterwards he modified his judgment in favour of Wolff, and even, in 1739, recommended the study of his works. He established many village schools, which he often visited in person; and after the year 1717 (Oct. 23) all Prussian parents were obliged to send their children to school (*Schulzwang*). Under him the people flourished; and although it stood in awe of his vehement spirit it respected him for his firmness, his honesty of purpose and his love of justice. He was devoted also to his army, the number of which he raised from 38,000 to 83,500, so that under him Prussia became the third military power in the world, coming next after Russia and France. There was not a more thoroughly drilled or better appointed force. The Potsdam guard, made up of giants collected from all parts of Europe, sometimes kidnapped, was a sort of toy with which he amused himself. The reviewing of his troops was his chief pleasure. But he was also fond of meeting his friends in the evening in what he called his Tobacco-College, where amid clouds of tobacco smoke he not only discussed affairs of state but heard the newest "guard-room jokes." He died on May 31, 1740, leaving behind him his widow, Sophia Dorothea of Hanover, whom he had married on Nov. 26, 1706. His son was Frederick the Great (see FREDERICK II., king of Prussia), who opposed him. This opposition became so strong in 1730 that the crown prince fled from the court, and was later arrested and brought before a court martial. A reconciliation was brought about, at first gradually. In later years the relations between father and son came to be of the best.

See the references *s.v.* Prussia; also *Hohenzollernjahrbuch,* viii. (1905), for particulars of Frederick William's education and death; letters to Prince Leopold of Anhalt-Dessau in the *Acta Borussica* (1905). There is a picturesque account of him in Thomas Carlyle's Frederick the Great.

FREDERICK WILLIAM II. (1744–1797), king of Prussia, son of Augustus William, second son of King Frederick William I. and of Louise Amalie of Brunswick, sister-in-law of Frederick the Great, was born at Berlin on Sept. 25, 1744, and became heir to the throne on his father's death in 1757. Although the prince had a numerous family, he was completely under the influence of his mistress, Wilhelmine Enke, afterwards created Countess Lichtenau, a woman of strong intellect and much ambition. He was a handsome man, and devoted to the arts — Beethoven and Mozart enjoyed his patronage and his private orchestra had a European reputation. Frederick the Great, who had employed him in various services — notably in an abortive confidential mission to the court of Russia in 1780 — openly expressed his misgivings as to the character of the prince and his surroundings.

The misgivings were justified by the event. Frederick William's accession to the throne on the death of the great Frederick (Aug. 17, 1786) was: indeed, followed by a series of measures for lightening the burdens of the people, reforming the oppressive French system of tax-collecting, and encouraging trade by the diminution of customs dues and the making of roads and canals. The educated classes were pleased by his removal of Frederick's ban on the German language by the admission of German writers to the Prussian Academy, and by the active encouragement given to schools and universities. But these reforms were vitiated in their source. In 1781 Frederick William, then prince of Prussia, had joined the Rosicrucians, and had fallen under the influence of the fanatical Johann Christof Wollner (1732–1800), and by him the royal policy was inspired. On Aug. 26, 1786 Wollner was appointed privy councillor for finance (Geheimer *Oberfinanzrath*). Though not in name, in fact he was prime minister, and the fiscal and economic reforms of the new reign were the application of his theories. Bischoffswerder, another Rosicrucian, was also called into the king's counsels; by 1789 he was already an adjutant-general. In 1788 Wöllner became privy councillor of state and of justice and head of the spiritual department for Lutheran and Catholic affairs. War was at once declared on what — to use a later term — we may call the "modernists." On July 9 was issued the edict forbidding ministers to teach anything not contained in the letter of their official books, proclaiming the necessity of protecting the Christian religion against the "enlighteners" (*Aufklärer*), and placing educational establishments under the supervision of the orthodox clergy. On Dec. 18, a new censorship law was issued, to secure the orthodoxy of all published books; and finally, in 1791, a sort of Protestant Inquisition was established at Berlin (*Immediat-Examinations-commission*) to watch over all ecclesiastical and scholastic appointments. The effects of this policy of blind obscurantism outweighed any good that resulted from economic and financial reform; and even this reform was but spasmodic and partial. Far more fateful for Prussia was the king's attitude towards the army and foreign policy. Frederick William, who had no taste for military matters! put his authority as "War-Lord" into commission under a supreme college of war (*Oberkriegs-Collegium)* under the duke of Brunswick and General von Möllendorf. It was the beginning of the process that ended in 1806 at Jena.

The Dutch campaign of 1787, entered on for purely family reasons, was indeed successful; but Prussia received not even the cost of her intervention. An attempt to intervene in the war of Russia and Austria against Turkey failed of its object; Prussia did not succeed in obtaining any concessions of territory from the alarms of the Allies, and the dismissal of Hertzberg in 1791 marked the final abandonment of the anti-Austrian tradition of Frederick the Great. For, meanwhile, the French Revolution had entered upon alarming phases, and in Aug. 1791 Frederick William, at the meeting at Pillnitz, arranged with the emperor Leopold to join in supporting the cause of Louis XVI. A formal alliance was signed on Feb. 7, 1792, and Frederick William took part personally in the campaigns of 1792 and 1793. A subsidy treaty with the sea powers (April 19, 1794) filled his coffers; but the insurrection in Poland that followed the partition of 1793, and the threat of the isolated intervention of Russia, hurried him into the separate treaty of Basle with the French Republic (April 5, 1795), which was regarded by the great monarchies as a betrayal, and left Prussia morally isolated in Europe on the eve of the revolutionary era. Prussia had paid a heavy price for the vast territories acquired at the expense of Poland in 1793 and 1795, and when, on Nov. 16, 1797, Frederick William died, he left the state in bankruptcy and confusion, the army decayed and the monarchy discredited.

Frederick William II. was twice married: (1) in 1765 to Elizabeth of Brunswick (d. 1841), by whom he had a daughter, Frederika, afterwards duchess of York, and from whom he was divorced in 1769; (2) in 1769 to Frederika Louisa of Hesse-Darmstadt, by whom he had four sons, Frederick William III., Louis (d. 1796), Henry and William, and two daughters, Wilhelmina, wife of William of Orange, afterwards William I., king of the Netherlands, and Augusta, wife of William II., elector of Hesse. Besides his relations with his *maîtresse en titre,* the countess Lichtenau, the king—who was a frank polygamist—contracted two "marriages of the left hand" with Fraulein von Voss and the countess Donhoff.

See article by von Hartmann in ***Allgem. deutsche Biog.*** (Leipzig, 1878) ; Stadelmann, ***Preussens Könige** in ihrer Tatigkeit fur die Landeskultur,* vol. iii. "Friedrich Wilhelm IT." (Leipzig, 1885); Paulig, *Friedrich Wilhelm II., sein Privatleben u. seine Regierung* (Frankfurt-an-der-Oder, 1896).

FREDERICK WILLIAM III. (1770–1840), king of Prussia, eldest son of King Frederick William II., was born at Potsdam on Aug. 3, 1770. His father, then prince of Prussia, was out of favour with Frederick the Great and entirely under the influence of his mistress, and the boy led a solitary and repressed life. As a soldier he received the usual training of a Prussian prince, obtained his lieutenancy in 1784, became a colonel commanding in 1790, and took part in the campaigns of 1792–94. In 1793 he married Louise, daughter of Prince Charles of Mecklenburg-Strelitz, whom he met at Frankfort. He succeeded to the throne on Nov. 16, 1797, and at once began to remedy the worst abuses of his father's reign. But he had neither the strength nor the ability to meet the difficult foreign situation. The consequences of his infirmity of purpose are written large on the history of Prussia from the treaty of Lunéville in 1801 to the downfall that followed the campaign of Jena in 1806. By the treaty of Tilsit (July 9, 1807) Frederick William had to surrender half his dominions, and what remained to him was exhausted by French exactions and liable at any moment to be crushed out of existence by Napoleon. Only the indomitable courage of Queen Louise helped the weak king not to despair of the state. She seconded the reforming efforts of Stein and the work of Scharnhorst and Gneisenau in reorganizing the army, by which the resurrection of Prussia became a possibility. When Stein was dismissed at the instance of Napoleon, Hardenberg succeeded him as chancellor (June 1810). In the following month Queen Louise died, and the king was left alone to deal with circumstances of ever-increasing difficulty. He was forced to join Napoleon in the war against Russia; and even when the disastrous campaign of 1812 had for the time broken the French power, it was not his own resolution, but the loyal disloyalty of General Tork in concluding with Russia the convention of Tauroggen that forced him into line with the patriotic fervour of his people.

Once committed to the Russian alliance, however, he became the faithful henchman of the emperor Alexander. He was one of the original co-signatories of the Holy Alliance, though he signed it with reluctance; and in the counsels of the Grand Alliance he allowed himself to be practically subordinated to Alexander and later to Metternich. At the various congresses, from Aix-la-Chapelle (1818) to Verona (1822), he showed himself in sympathy with the repressive policy formulated in the Troppau Protocol. The promise of a constitution, which in-the excitement of the War of Liberation he had made to his people, remained unfulfilled. But though reluctant to play the part of a constitutional king, Frederick William laboured assiduously at the enormous task of administrative reconstruction involved in welding the heterogeneous elements of the new Prussian kingdom into a united whole. He was sincerely religious; but his well-meant efforts to unite the Lutheran and Reformed Churches, revealed the limits of his paternal power; not till 1834, after a regime of coercion and confiscation, was outward union secured on the basis of common worship but separate symbols, the opponents of the measure being forbidden to form communities of their own. With the Roman Catholic Church, too, the king came into conflict on the vexed question of "mixed marriages," a conflict in which the Vatican gained an easy victory (*see* BUNSEN, CHRISTIAN CHARLES JOSIAS).

The revolutions of 1830 strengthened Frederick William in his reactionary tendencies; the question of the constitution was indefinitely shelved. and in 1831 Prussian troops concentrated on the frontier helped the task of the Russians in reducing the military rising in Poland. Yet, in spite of all. Frederick William was beloved by his subjects. who valued him for the simplicity of his manners. the goodness of his heart and the memories of the dark days after 1806. He died on June 7, 1840. In 1824 he had contracted a morganatic marriage with the countess Auguste von Harrach. whom he created Princess von Liegnitz. He wrote *Luther in Bezug auf die Kirchenagenda von 1822 und 1823* (Berlin, 1827), *Reminiszenzen* aus *der Kampagne 1792 in Frankreich,* and *Journal meiner Brigade* in *der Kampagne am Rhein 1793.*

The correspondence (*Briefwechsel*) of King Frederick William **III.** and Queen Louise with the emperor Alexander I. has been published (Leipzig, 1900) and also that between the king and queen (*ib.* 1903), both edited by P. Bailleu. *See* W. Hahn, *Friedrich Wilhelm III. und Luise* (3rd ed., Leipzig, 1877) ; M. W. Duncker, *Aus der **Zeit** Friedrichs des Grossen und Friedrich Wilhelms III.* (Leipzig, 1876) ; *Briefe und Aktenstücke zur Geschichte Preussens unter Friedrich Wilhelm III.* (ed. Rühl, 3 vols., 1899–1902).

FREDERICK WILLIAM IV. (1795–1861), king of Prussia, eldest son of Frederick William III., was born on Oct. 15, 1795. From his first tutor, Johann Delbruck, he imbibed a love of culture and art, but after a time Delbruck was dismissed, his place being taken by the pastor and historian Friedrich Ancillon, while a military governor was also appointed. By Ancillon he was grounded in religion, in history and political science, and his tutor impressed upon him his own hatred of the Revolution and its principles. This hatred was confirmed by the sufferings of his country and family in the terrible years after 1806, and his first experience of active soldiering was in the campaigns that ended in the occupation of Paris by the Allies in 1814. On his return to Berlin he studied art under the sculptor Christian Daniel Rauch and the painter and architect Karl Friedrich Schinkel (1781–1841), proving himself in the end a good draughtsman, a born architect and an excellent landscape gardener. At the same time he was being tutored in law by Savigny and in finance by a series of distinguished masters. In 1823 he married the princess Elizabeth of Bavaria, who adopted the Lutheran creed. The union, though childless. was very happy. A long tour in Italy in 1828 was the beginning of his intimacy with Bunsen and did much to develop his knowledge of art and love of antiquity.

On his accession to the throne in 1840 Frederick William reversed the unfortunate ecclesiastical policy of his father, allowing a wide liberty of dissent, and releasing the imprisoned archbishop of Cologne; he modified the press censorship; he promised the deputations of the provincial diets to create a central constitution, which he admitted to be required by the royal promises. But the idea of the sovereignty of the people was to him utterly abhorrent, and even any delegation of sovereign power on his own part would have seemed a betrayal of a God-given trust. "I will never," he declared, "allow to come between Almighty God and this country a plotted parchment. to rule us with paragraphs, and to replace the ancient, sacred bond of loyalty." His vision of the ideal state was that of a patriarchal monarchy, surrounded and advised by the traditional estates of the realm—nobles, peasants, burghers—and cemented by the bonds of evangelical religion. In Prussia, with its traditional loyalty and its old-world caste divisions, he believed that such a conception could be realized, and he stood half-way between those who would have rejected the proposal for a central diet altogether as a dangerous "thin end of the wedge," and those who would have approximated it more to the modern conception of a parliament. With a charter, or a representative system based on population, he would have nothing to do The united diet which was opened on Feb. 3, 1847, was no more than a congregation of the diets instituted by Frederick William III in the eight provinces of Prussia Unrepresentative though it was—for the industrial working-classes had no share in it—it at once gave voice to the demand for a constitutional system

The revolutionary outbreaks of 1848 rudely awakened Frederick William from his mediaeval dreamings; he even allowed himself to be carried a ay for a while by the popular tide. The loyalty of the Prussian army remained inviolate; but the king was too tender-hearted to use military force against his "beloved Berliners." and when the victory of the populace was thus assured his impressionable temper yielded to the general enthusiasm. He paraded the streets of Berlin wrapped in a scarf of the German black and gold, symbol of his intention to be the leader of the united Germany; and he even wrote to the indignant tsar in praise of "the glorious German revolution" But the united Germany which he was prepared to champion was not the democratic state of the Frankfort national parliament, but the old Holy Roman Empire, the heritage of the house of Habsburg. Finally, when Austria had been excluded from the new empire, he replied to the parliamentary deputation that came to offer him the imperial crown that he might have accepted it had it been freely offered to him by the German princes, but that he would never stoop "to pick up a crown out of the gutter."

In fact the German empire would have lost immeasurably had it been the cause rather than the result of the inevitable struggle with Austria. However that may be, Frederick William's refusal gave the deathblow to the parliament and to all hope of the immediate creation of a united Germany. For Frederick William the position of leader of Germany now meant the employment of the military force of Prussia to crush the scattered elements of revolution that survived the collapse of the national movement. His establishment of the northern confederacy was a reversion to the traditional policy of Prussia in opposition to Austria, which, after the emperor Nicholas had crushed the insurrection in Hungary, was once more free to assert her claims to dominance in Germany. But Prussia was not ripe for a struggle with Austria, and the result was the humiliating convention of Olmütz (Nov. 29, 1850), by which Prussia agreed to surrender her separatist plans and to restore the old constitution of the confederation. Yet Frederick William had so far profited by the lessons of 1848 that he consented to establish (1850) a national parliament, though with a restricted franchise and limited powers.

In religious matters Frederick William sought a *rapprochement* between the Lutheran and Anglican churches, the first-fruits of which was the establishment of the Jerusalem bishopric under the joint patronage of Great Britain and Prussia; but the only result of his efiorts was to precipitate the secession of J. H. Newman and his followers to the Church of Rome. In the summer of 1857 he had a stroke of paralysis, and a second in October. From this time, with the exception of brief intervals, his mind was completely clouded, and the duties of government were undertaken by his brother William (afterwards emperor), who on Oct. 7, 1858, was formally recognized as regent. Frederick William died on Jan. 2, 1861.

Selections from the correspondence (*Briefwechsel*) of Frederick William IV. and Bunsen were edited by Ranke (Leipzig, 1873); his proclamations, speeches, etc., from March 6, 1848 to May 31, 1851, have been published (Berlin, 1851); also his correspondence with Bettina von Arnim, *Bettina von Arnim und Friedrich Wilhelm IV., ungedruckte Briefe und Aktenstiicke*, ed. L. Geiger (Frankfort-on-Main, 1902). *See* L. von Ranke, *Friedriclz Wilhelm IV., Ronig oon Preussen* (works 51, 52 also in *Allgem. deutsche Biog.* vol. vii.), especially for the king's education and the inner history of the debates leading up to the united diet of 1847; H. von Petersdorff, *Konig Friedriciz Wilhelm IV.* (Stuttgart, 1900); H. von Poschinger (ed.), *Unter Friedrich Wilhelm IV. Denkwürdigkeiten des Ministers Otto Frhr. von Manteuffel, 1848–1858* (3 vols., 1902), and *Preussens auswärtige Politik, 1850–1858* (3 vols., *ib.*, 1902), documents selected from those left by Manteuffel; F. Rachfahl, *Deutschland, Konig Friedrich Wilhelm IV. und die Berliner Marzrevolution* (Halle, 1901), *Die deutsche Politik Konig Friedrich Wilhelm IV., im Winter 1848–49* (Munich, 1919).

FREDERICK WILLIAM (1620–1688), elector of Brandenburg, called the "Great Elector," was born in Berlin on Feb. 16. 1620, the son of the elector George William of Brandenburg and Elizabeth Charlotte, daughter of Frederick IV elector palatine. From 1634 to 1637 he was at the University of Leiden, where his outlook was strongly influenced by what he saw of the maritime and commercial strength of the Netherlands and of the policy of the house of Orange, conducted as it was in the shadow of the great powers Spain and Austria.

In Dec. 1640 Frederick William succeeded his father. He came to power at a time when Brandenburg, devastated already in the course of the Thirty Years' War (*q.v.*), was closely bound to Austria by the peace of Prague of 1635 but in fact still occupied by Swedish troops. In these circumstances a new ruler could attempt no sudden change of policy, and Frederick William's aim was to extricate himself gradually from the oppressive Austrian connection and to gain an armistice with Sweden. The latter he achieved in July 1641, thus terminating the fighting in Brandenburg without waiting for the general peace negotiations, which were not concluded till the peace of Westphalia (1648). By this treaty Frederick William had to abandon his designs on western (Swedish) Pomerania—with its control of the Oder estuary and the important harbour of Stettin—and to be content with eastern Pomerania together with the secularized bishoprics of Halberstadt and Minden and the reversion of Magdeburg.

During the Swedish invasion of Poland (1655–56) Frederick William, by unscrupulously breaking his alliance with the Poles, was able to assert Brandenburg's sovereignty over ducal Prussia (East Prussia), hitherto held as a fief of the Polish crown; and he won international recognition for this change at the peace of Oliva (1660). His growing activity in foreign affairs reflected the increasing military and financial strength of his lands. His widely scattered territories, hitherto united only by allegiance to the ruling house, were now integrated administratively. while the ruler made his revenues independent of the consent of the estates by developing a fixed system of direct and indirect taxation, thus laying the financial basis for a standing army. These developments provoked strenuous opposition from the estates, especially in Prussia, and entailed the abrogation of many traditional liberties, but Frederick William overcame all resistance. Thus under him the Hohenzollern state received the imprint of absolutism, and the foundation of the future strength of the Prussian monarchy was laid.

From his time the army was the focus of the developing state and its administrative organization, and the mercantilist economy, invigorated by increasing income from taxation. was orientated to meet the army's requirements. Under Frederick William, however. the strength of the army was still variable between peacetime and wartime. Moreover, it could not yet be maintained solely on the electoral and ducal revenues, so that foreign subsidies were also required, and these in turn restricted Brandenburg's freedom in the diplomatic field.

During the struggle between Louis XIV of France and the Habsburgs of Austria and of Spain the elector had alternately sought an alliance with France and with Austria, and the changeability of his policy demonstrated the relative weakness of a ruler not yet able to maintain an independent course between the great powers. This weakness was emphasized by the scant attention paid to Brandenburg in the various peace negotiations. Thus in spite of extreme military exertions he never achieved his ultimate aim, the acquisition of western Pomerania, and Brandenburg remained with no satisfactory seaport. Even after his brilliant victory over the Swedes at Fehrbellin (June 1675) and their final expulsion from Germany (Jan. 1679). Frederick William was obliged. under French pressure, to give up his conquests at the peace of Saint-Germain-en-Laye (June 1679). Thus he could never realize fully his plans to found a maritime and commercial power on the Dutch model. His establishment of a navy and his formation of an Africa company (1682), with the subsequent colonizing ventures along the Guinea coast, are a mere episode in Brandenburg-Prussian history.

Nevertheless by the edict of Potsdam (Nov. 8, 1685), which welcomed French Huguenot immigration, Frederick William introduced to his state a new population both shrewd and industrious, without which the industrial and commercial development of 18th-century Prussia would have been unthinkable. In this, the interests of the state and the elector's personal convictions combined as in no other of his undertakings. The protection of Protestantism in Europe was always an essential element in Frederick William's policy no matter how often it might have to give place to expediency. His tenacious political ambition drew much of its strength from his Calvinistic belief in predestination, which enabled him to regard himself and his state as the instruments of God.

Frederick William represented the best type of 17th-century continental ruler. For him as for Louis XIV the person of the monarch and the interest of the state constituted an inseparable unity. His dynastic-patrimonial view of the state and his belief in the traditionally religious nature of the princely office were expressed in his political testaments of 1667, 1680 and 1686. Frederick William died at Potsdam on May 9, 1688.

During his stay in the Netherlands Frederick William had made the acquaintance of Frederick Henry, prince of Orange, whose daughter: Louisa Henrietta, he married in 1646. Their eldest son Karl Emil had died in 1674, and it was the second son Frederick (III) who succeeded to the electorate on Frederick William's death. By his second wife, Dorothea of Holstein-Glückburg, whom he married in 1668, Frederick William had four other sons. who received territories from the family lands under his will. Frederick William's enactments have been published as *Urkunden und Aktenstücke zur Geschichte* dcs *Kurfürsten Friedrich Wilhelms* von *Brandenburg,* 23 vol. (1864–1929).

FREDERICTON, the capital of New Brunswick, Can., and the seat of York county. is situated on the banks of the Saint John river, about 85 mi. from its mouth. and is surrounded by wooded hills. A small city (1961 pop. 19,683), it is the site of the provincial University of New Brunswick, founded 1785, and the provincial Teachers' college, founded 1847, and is the episcopal seat of the Anglican diocese of Fredericton and the headquarters of the New Brunswick area of the Canadian army and of the Royal Canadian Mounted Police. There are many fine buildings including those of the university. the provincial legislature. the Lord Beavcrbrook Art gallery. the buildings of the dominion research station maintained by the federal department of agriculture, and the Anglican cathedral.

Originally settled by United Empire Loyalists under the name of St. Ann's Point in 1783, Fredericton was made provincial capital in 1785 and became a city in 1848. Primarily a centre of government and education. it also has some industrial and commercial importance: it is the shopping and distributive centre of central New Brunswick; it has several quality shoe 'factories; and it has a number of industries concerned with the processing of wood—a canoe factory, lumber mills and a plastics plant. But perhaps Fredericton's chief claim to distinction is its literary tradition: among its first Loyalist residents was the Rev. Jonathan Odell, the Tory satirist of the American Revolution; the first novel by a native Canadian, *St. Ursula's* Convent, or, *The Nun of Canada* (1824) was written there by Julia Catherine Hart; three of the leading Canadian poets. Charles (later Sir Charles) Roberts. Bliss Carman and Francis Sherman, were born there: and the city is the site of publication of two literary magazines—The *Fiddlehead* and *The Atlantic Advocate.* (D. P.)

FREDERIKSBERG, an independent municipality in the metropolitan area of greater Copenhagen (*q.v.*), Den. Pop. (1960) 114,285. Founded in 1651 by King Frederik III, it became completely encircled by Copenhagen early in the 20th century when the capital absorbed several former municipalities. It contains the Frederiksberg park, the Copenhagen zoo. the town hall (1953), the Royal Veterinary and Agricultural High school, the state broadcasting service. a commercial college and the military academy in Frederiksberg palace (*c.* 1700). The main industries include the Royal Copenhagen Porcelain factory and a cable and wireworks. (C. F. G. A.)

FREDERIKSBBRG *amt,* a county in northeast Zealand, Den.. named after the magnificent castle of Frederiksborg in the town of Hillerdd. Pop. (1960) 181.663. Area 519 sq.mi. Lying between Ise Fjord and the busy Øresund, its greatly undulating surface of glacial sands and clays is lake strewn and well wooded. The fertile loams support prosperous mixed farming. The port of Elsinore (*q.v.;* Helsingør) is the largest town (pop. 23,897 in 1955) followed by Hillerød (10.840). the county administrative centre. Kronborg castle near Elsinore once controlled the northern entry to Øresund. (HA. T.)

FREDHOLM, ERIK IVAR (1866–1927), Swedish mathematician, whose chief contribution to mathematics was on integral equations. was born at Stockholm. April 7, 1866, and died there Aug. 17, 1927. He took his doctor's degree at Uppsala in 1898, became an actuary and in 1906 was appointed professor of theoretical physics in Stockholm. He published his paper on integral equations in 1903, inaugurating the modern theory of this topic. For this he received the Wallmark prize of the Swedish Academy of Science and the French Academy's Poncelet prize.

See *Oeuvres complètes de Ivar Fredholm* (1955). (O. OE.)

FREDONIA, a village of Chautauqua county in western New York, U.S., 45 mi. S.W. of Buffalo. It mas settled in 1804 and incorporated in 1829. It is in the grape-growing region and manufactures grape products as its major industry. The first gas well in the C.S. to be harnessed for fuel was discovered nearby in 1821 and Fredonia soon boasted the nation's first gaslit street. General La Fayette visited Fredonia during his 1824–25 visit to the U.S. The first local unit of the Grange and one of the first local organizations that helped found the Woman's Christian Temperance union mere formed there. The village is served by excellent rail, highway and air transportation facilities, and ocean-going vessels serve Dunkirk, two miles away on Lake Erie. The State University of New York college of education is in Fredonia. For comparative population figures see table in NEW YORK: Population. (A. W. B.; X.)

FREDRIKSTAD, a town of Østfold *fylke* (county), Norway, located 58 mi. S. of Oslo. Pop. (1959 est.) 13.827. It lies at the mouth of the Glomma river on the eastern shore of Oslo fiord and has a first-class harbour that is kept open in winter. It is a lumber-milling and fishing town with a variety of manufactures. In 1957 a 2,700-ft. high-level bridge over the Glomma was opened. The town was founded by Frederick II in 1567, and its grass-covered ramparts and fortified gates date from that time. The environs of Fredrikstad are rich in rock carvings, monumental stones and grave barrows from the early centuries of the Christian era. (S. KN.)

FREEBENCH, in English lam, the interest which a widow had in the copyhold lands of her husband, corresponding to dower in the case of freeholds. It depended upon the custom of the manor. but as a general rule the widow took a third for her life of the lands of which her husband died seized, but it might be an estate greater or less than a third. Freebench disappeared with the abolition of copyhold tenures by the Law of Property act 1922 and the Administration of Estates act 1925.

FREE CHURCH FEDERAL COUNCIL, an organization that enables the free churches of England and Wales to act unitedly in matters of common concern, was formed in 1940 by the union of the National Council of the Evangelical Free Churches (founded 1896) and the Federal Council of the Evangelical Free Churches (formed 1919). It works through nearly 500 local councils, which send delegates to an annual congress and elect representatives to the national council; the associated free church denominations, which include the Methodists, Baptists, Congregationalists. Presbyterians and some others, send direct representatives to congress and council. The annual congress hears distinguished preachers and speakers and discusses matters of common concern. The council attends to continuing business, which includes encouragement of co-operation between the free churches, maintenance of rights, representation of the free-church viewpoint to parliament, negotiation with central and local authorities and the expression of free-church opinion on public questions. The council has a chaplaincy department, responsible with the ministry of health for free-church chaplains in hospitals, and a youth and education department. which co-ordinates youth work among the free churches and maintains contact with the ministry of education and the Church of England on religious instruction in schools.

The council is presided over by the moderator. who holds office for a year and is the representative leader of the free churches.

See E. K. H. Jordan, *Free Church Unity* (1956). (A. .

FREE CHURCH OF SCOTLAND. In one sense the Free Church of Scotland dated its existence from the Disruption of 1843, in another it claimed to be the rightful representative of the National Church of Scotland (see SCOTLAND, CHURCH OF) as it was reformed in 1560. In the ecclesiastical history of Scotland the Free Church saw three great reforming periods. In each of these the inherent scriptural right of the church to exercise a spiritual jurisdiction in which it is responsible to Christ alone was asserted and practically maintained. The first reformation extended from 1560, when the church freely held its first general assembly and of its own authority acted on the *First Book of Discipline,* to 1592, when its presbyterian order mas finally and fully ratified by the parliament. The second period began in 1638, when, after 20 years of suspended animation, the assemblv once more shook off episcopacy, and terminated in 1649, when the parliament of Scotland confirmed the church in its liberties in a larger and ampler sense than before. The Westminster standards were ratified, lay patronage was abolished and the coronation oath itself framed in .accordance with the principles of presbyterian church government. The Revolution settlement of 1690 was not so entirely favourable to the freedom of the church as the legislation of 1649 had been. Presbyterianism was re-established, and the old rights of patrons were again discontinued: but the large powers which had been conferred on congregations by the act of 1649 were not wholly restored. Nevertheless, the great principle of a distinct ecclesiastical jurisdiction, embodied in the Confession of Faith, was accepted without reservation, and a presbyterian polity effectively confirmed both then and at the ratification of the treaty of union. This settlement, however, did not long subsist unimpaired. In 1712 the Act of Toleration, restoring patronage to its ancient footing, was passed in spite of the earnest remonstrances of the Scottish people. For many years afterward (until 1784) the assembly continued to instruct each succeeding commission to make application, to the king and the parliament for redress of the grievance. But meanwhile a new phase of Scottish ecclesiastical politics commonly known as Moderatism had been inaugurated. during the prevalence of which the church became even more indifferent than the lay patrons themselves to the rights of the congregations with regard to the "calling" of ministers.

The "Veto" Act.—The result was a protracted struggle—identifiable as the third reforming period in the Scottish church, which lasted until the Disruption of 1843—which entered on its final stage with the passing in 1834 of the "Veto" act. This declared it to be a fundamental law of the church that no pastor should be intruded on a congregation contrary to the will of the people, and provided that the simple dissent of a majority of heads of families in a parish should be enough to warrant a presbytery in rejecting a presentee. The question of the legality of this measure soon came to be tried in the civil courts; and it was ultimately answered in a sense unfavourable to the church by the decision (1838) of the court of session that a presbytery had no right to reject a presentee simply because the parishioners protested against his settlement, but was bound to disregard the veto (see CHALMERS, THOMAS).

This decision elicited from the assembly of that year a new declaration of the doctrine of the spiritual independence of the church. The "exclusive jurisdiction of the civil courts in regard to the civil rights and emoluments secured by law to the church and the ministers thereof" was acknowledged without qualification. At the same time it was insisted that "in all matters touching the doctrine, discipline and government of the church her judicatories possess an exclusive jurisdiction founded on the Word of God." And it was resolved to assert, and at all hazards defend. this spiritual jurisdiction, and firmly to enforce obedience to the same upon the office bearers and members of the church. The decision of the court of session having been confirmed by the house of lords early in 1839, it was decided in the assembly of that year that the church should reaffirm the principle of "non-intrusion" as an integral part of the constitution of the Reformed Church of Scotland, and that a committee should be appointed to confer with the government with a view to the prevention, if possible, of any further collision between the civil and ecclesiastical authorities.

Yet the conference with the government had no practical result, and grave complications were arising over other cases where congregations objected to ministers "intruded" by patrons. In the circumstances it was resolved by the assembly of 1842 to transmit to the queen, by the hands of the lord high commissioner, a "claim, declaration and protest," complaining of the encroachments of the court of session. and also an address praying for the abolition of patronage. The home secretary's answer (received in Jan. 1843) gave no hope of redress.

Difficulties of the Church.—A final appeal to parliament by petition was made in March 1843, when, by a majority of 135, the house of commons declined to attempt any redress of the grievances of the Scottish Church. At the first session of the following general assembly (May 18, 1843) the reply of the non-intrusion party was made in a protest, signed by upward of 200 commissioners, to the effect that since, in their opinion, the recent decisions of the civil courts. and the still more recent sanction of these decisions by the legislature, had made it impossible at that time to hold a free assembly of the church as by law established they therefore "protest that it shall be lawful for us, and such other commissioners as may concur with us, to withdraw to a separate place of meeting, for the purpose of taking steps for ourselves and all who adhere to us—maintaining with us the Confession of Faith and standards of the Church of Scotland as heretofore understood—for separating in an orderly way from the Establishment, and thereupon adopting such measures as may be competent to us, in humble dependence on God's grace and the aid of His Holy Spirit, for the advancement of His glory. the extension of the gospel of our Lord and Saviour, and the administration of the affairs of Christ's house according to His holy word." The reading of this document was followed by the withdrawal of the entire nonintrusion party to another place of meeting, where the first assembly of the Free Church was constituted, with Thomas Chalmers as moderator. This assembly sat from May 18 to May 30 and transacted a large amount of important business. On May 23, 396 ministers and professors publicly signed their names to the Act of Separation and deed of demission by which they renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant and consenting to their being dealt with as such. By this impressive proceeding the signatories voluntarily surrendered an annual income amounting to fully £100.000.

The first care of the voluntarily disestablished church was to provide incomes for its clergy and places of worship for the people. Chalmers had already prepared a carefully matured scheme, according to which "each congregation should do its part in sustaining the whole, and the whole should sustain each congregation"; and at the first assembly it was announced that upward of £17,000 had already been contributed. Each successive year showed a steady increase in the gross amount of the fund. To provide for the erection of the buildings which, it was foreseen, would be necessary, a general building fund, in which all should share alike, was also organized, and local building funds were as far as possible established in each parish, with the result that at the first assembly a sum of 6104,776 was reported available.

At the end of four years considerably more than 700 churches had been provided. During the winter session 1843–44 the divinity students who had joined the Free Church continued their studies under Chalmers and David Welsh (1793–1845); and at the assembly of 1844 arrangements were made for the erection of suitable collegiate buildings. The New college. Edinburgh, was built in 1847 at a cost of £46,506; and divinity halls were subsequently set up also in Glasgow and Aberdeen.

The Nonintrusion Party. — During the conflict preceding disruption the nonintrusion party strenuously denied that in any one respect it was departing from acknowledged principles of the National Church. It continued to do so after the disruption. In 1846, however, it was found to have become necessary, "in consequence of the late change in the outward condition of the church," to amend the "questions and formula" to be used at the licensing of probationers and the ordination of office bearers

These were amended accordingly; and at the same time it was declared that, "while the church firmly maintains the same scriptural principles as to the duties of nations and their rulers in reference to true religion and the Church of Christ for which she has hitherto contended, she disclaims intolerant or persecuting principles, and does not regard her Confession of Faith, or any portion thereof when fairly interpreted, as favouring intolerance or persecution or consider that her office bearers by subscribing it profess any principles inconsistent with liberty of conscience and the right of private judgment."

The main difference between the "formula" of the Free Church and that of the Established Church (as at the year 1900) was that the former referred to the Confession of Faith simply as "approven by general assemblies of this Church," while the latter described it as "approven by the general assemblies of this National Church, and ratified by law in the year 1690, and frequently confirmed by divers Acts of Parliament since that time"; and the Free Church inserted an additional clause, "I also approve of the general principles respecting the jurisdiction of the church, and her subjection to Christ as her only Head, which are contained in the Claim of Right and in the Protest referred to in the questions already put to me"; and also added the words which are here distinguished by italics, "And I promise that through the grace of God I shall firmly and constantly adhere to the same, and to the utmost of my power shall in my station assert, maintain and defend the said doctrine, worship, discipline and government of this church by kirk-sessions, presbyteries, provincial synods and general assemblies, *together with the liberty and exclusive jurisdiction thereof;* and that I shall, in my practice, conform myself to the said worship and submit to the said discipline [and] government, *and exclusive jurisdiction*, and not endeavour directly or indirectly the prejudice or subversion of the same."

In 1863 a motion was made and unanimously carried in the Free Church assembly for the appointment of a committee to confer with a corresponding committee of the United Presbyterian synod, and with the representatives of such other disestablished churches as might be willing to meet and deliberate with a view to an incorporating union. Formal negotiations between the representatives of the two churches were begun shortly afterward, which resulted in a report laid before the following assembly. From this document it appeared that the committees of the two churches were not at one on the question as to the relation of the civil magistrate to the church. While on the part of the Free Church it was maintained that he "may lawfully acknowledge, as being in accordance with the Word of God, the creed and jurisdiction of the church," and that "it is his duty, when necessary and expedient, to employ the national resources in aid of the church, provided always that in doing so, while reserving to himself full control over the temporalities which are his own gift, he abstain from all authoritative interference in the internal government of the church," it was declared by the committee of the United Presbyterian Church that, "inasmuch as the civil magistrate has no authority in spiritual things, and as the employment of force in such matters is opposed to the spirit and precepts of Christianity, it is not within his province to legislate as to what is true in religion, to prescribe a creed or form of worship to his subjects, or to endow the church from national resources."

Thus in a very short time it had been made perfectly evident that a union between the two bodies, if accomplished at all, could be brought about only on the understanding that the question as to the lawfulness of state endowments should be an open one. The Free Church assembly, by increasing majorities, manifested a readiness for union, even although unanimity had not been attained on that theoretical point. But there was a minority which did not sympathize in this readiness, and in 1873, after ten years of fruitless effort, it was found to be expedient that the idea of union with the United Presbyterians should for the time be abandoned. Other negotiations, however, which had been entered upon with the Reformed Presbyterian Church at a somewhat later date, proved more successful; and a majority of the ministers of that church with their congregations were united with the Free Church in 1876.

Theological Developments. — The mind of the Free Church was not absorbed only in questions of ecclesiastical polity. The colleges of the church have been the home of the most active interest in theological and historical questions. There was a stormy period, however, when extreme conservatism appeared to gain a victory. In 1870 W. Robertson Smith *(see* SMITH, WILLIAM ROBERTSON) was ordained to the office of professor of oriental languages and Old Testament exegesis in the Free Church college, Aberdeen. There from the first he advocated views which though now widely accepted were then regarded with apprehension. In 1876 a committee of the Free Church reported so adversely on his writings that Smith demanded a formal trial. The indictment failed; but a vote of want of confidence was passed, and in 1881 he was removed from his chair. This event, however, was no adequate expression of the real mind of the church. During the last quarter of the 19th century the Free Church continued to be the most active, theologically, of the Scottish churches. The college chairs were almost uniformly filled by theologians and historians of progressive views, inspired more or less by A. B. Davidson of New college, Edinburgh. A. B. Bruce, author of *The Training of the Twelve,* etc., was appointed to the chair of apologetics and New Testament exegesis in the Glasgow college in 1875; Henry Drummond (author of *Natural Law in the Spiritual World*, etc.) was made lecturer in natural science in the same college in 1877 and became professor in 1884; and George Adam Smith (author of *The Twelve Prophets*, etc.) was called to the Hebrew chair in 1892. Attempts were made between 1890 and 1895 to bring all these professors except Davidson (similar attacks were also made on Marcus Dods, afterward principal of the New college, Edinburgh) to the bar of the assembly for unsound teaching or writing; but in every case these were abortive, the assembly never taking any step beyond warning the accused that their primary duty was to teach and defend the church's faith as embodied in the confession. In 1892 the Free Church, following the example of the United Presbyterian Church and the Church of Scotland (1889), passed a Declaratory act relaxing the stringency of subscription to the confession, with the result that a small number of ministers and congregations, mostly in the Highlands, severed their connection with the church and formed the Free Presbyterian Church of Scotland, on strictly orthodox lines. Meanwhile other changes were taking place. The standard of parochial and congregational activity was raised, a new method of operation devised. The use of instrumental music was sanctioned and special attention given to the promotion of edification, order and reverence in public worship. And the establishment principle was almost entirely abandoned.

Establishment of United Free Church. — During the last four or five years of the 19th century the Free and United Presbyterian Churches, which after the failure of their union negotiations in 1873 had been connected together by a Mutual Eligibility act enabling a congregation of one church to call a minister from the other, devoted their energy to the arrangement of an incorporating union. The synod of the United Presbyterian Church resolved in 1896 to "take steps toward union," and in the following year the Free assembly responded by appointing a committee to confer with a committee of the other church. The joint committee discovered a "remarkable and happy agreement" between the doctrinal standards, rules and methods of the two bodies, and with very few concessions on either side a common constitution and common "questions and formula" for the admission of ministers and office bearers were arranged. A minority, always growing smaller, of the Free Church assembly protested against the proposed union and threatened if it were carried through to test its legality in the courts; nevertheless the union was carried through. The supreme courts of the churches met separately for the last time on Oct. 30, 1900, and on the following day the union was completed, and the United Free Church of Scotland (*q.v.*) entered on its career. The protesting and dissenting minority at once claimed to be the Free Church. They met outside the Free assembly hall on Oct. 31 and, failing to gain admission to it, withdrew to another hall, where they held the remaining sittings of the assembly.

It was reported that between 16,000 and 17,000 names had been received of persons adhering to the antiunionist principle. At the assembly of 1901 it was stated that the Free Church had 25 ministers and at least 63 congregations. The character of the church is indicated by the fact that its office bearers were the faithful survivors of the decreasing minority of the old Free Church, which had protested against the disestablishment resolutions, against the relaxation of subscription, against toleration of the teaching of the Glasgow professors and against the use in worship of organs or of human hymns. Its congregations were mostly in the Gaelic-speaking districts of Scotland. It was confronted with a very arduous undertaking; congregations grew in number but were far from each other, and there were not nearly enough ministers. But the little church continued with indomitable courage and without any compromise of principle. The Declaratory act of 1892 was repealed after a consultation of presbyteries, and the old principles as to worship were declared. The desire of the Church of Scotland to obtain relaxation of its formula was declared to make union with it impossible.

The decision of the house of lords in 1904, which declared that the funds and property of the Free Church belonged to the minority who had opposed the union of 1900 (see UNITED FREE CHURCH OF SCOTLAND), did not bring the trials of the Free Church to an end. In the absence of any arrangement with the United Free Church, it could gain possession of the property only by an application in each particular case to the court of session, and a series of lawsuits began. The urgent task was that of supplying ordinances to congregations. The problem was faced with energy and enthusiasm, but remained serious.

In 1956 the Free Church of Scotland was constituted of 15 presbyteries, of which 12 were in northern Scotland and the Hebrides. It had foreign mission centres at Kingwilliamstown, South Africa; Lima, Peru; and Lakhnadan, Madhya Pradesh, India. Under its overseas missions it had congregations at Vancouver, B.C., Fort William and Toronto, Ont., Winnipeg, Man., Prince Edward Island and Detroit, Mich. For the training of its ministers it had maintained its own theological college in Edinburgh.

See SCOTLAND, CHURCH OF; UNITED FREE CHURCH OF SCOTLAND.

FREEDMEN'S BUREAU (officially the BUREAU OF FREEDMEN, REFUGEES AND ABANDONED LANDS), a bureau created in the United States war department by an act of congress (March 3, 1865), to last one year. but continued until 1872 by later acts. Its establishment was due partly to the fear entertained by the north that the southerners if left to deal with the Negroes would attempt to re-establish some form of slavery, partly to the necessity for extending relief to needy Negroes and whites in the lately conquered south, and partly to the need of creating some commission or bureau to take charge of lands confiscated in the south. At the head of the bureau was a commissioner, Gen. O. O. Howard, and under him in each southern state was an assistant commissioner with a corps of local superintendents, agents and inspectors. The officials had the broadest possible authority in all matters that concerned the Negroes. The work of the bureau may be classified as follows: (1) distributing rations and medical supplies among the Negroes; (2) establishing schools for them and aiding benevolent societies to establish schools and churches; (3) regulating labour and contracts; (4) taking charge of confiscated lands; and (5) administering justice in cases in which Negroes were concerned. For several years the former slaves were under the almost absolute control of the bureau. Whether this control had a good or bad effect is still disputed. Much necessary relief work was done, but demoralization was also caused by it. In educating the Negroes the bureau made some progress, but the instruction imparted by the missionary teachers resulted in giving the former slaves notions of liberty and racial equality that led to much trouble, finally resulting in the hostility of the whites to Negro education. When Negro suffrage was imposed by congress upon the southern states, the bureau aided the Union league (*q.v.*) in organizing the Negroes into a political party opposed to the whites. A large majority of the bureau officials secured office through their control of the Negroes. The failure of the bureau system, its discontinuance, in the midst of reconstruction, without harm to the Negroes, and the intense hostility of the southern whites to the institution, caused by the irritating conduct of bureau officials, are indications that the institution was not well conceived nor wisely administered.

FREEMAN, EDWARD AUGUSTUS (1823–1892), English historian, an authority on English history of the 11th and 12th centuries, was regius professor of modern history at Oxford from 1884 until his death. He was born at Harborne, Staffordshire, on Aug. 2. 1823, and educated privately. He went to Trinity college, Oxford, with a scholarship in 1841 and became a fellow there four years later. Thereafter he devoted himself to a life of study, publishing an enormous number, even by 19th-century standards, of books, pamphlets and articles in periodicals. A great controversialist, he campaigned actively in support of Gladstone, especially in condemning the "Bulgarian atrocities," and stood unsuccessfully for parliament on several occasions. He died while on holiday at Alicante, Spain, on March 16. 1892.

Freeman's cardinal virtue is insistence on the unity of history and on the use of original sources, but he was insufficiently critical to be a reliable interpreter of those sources he himself used and he brought to historical controversy acerbity, bias and intolerance, notably in his prolonged attack on J. A. Froude (*q.v.*) through the agency of the Saturday Review, in a degree which was harmful and misleading. Modern scholarship would hardly differ from the emphasis placed in Freeman's great work, History of the Norman Conquest (6 vol., 1867–79), on the continuity of Anglo-Saxon elements after 1066, but in detail the work exhibits many of the faults which its author was quick to criticize in others. In particular, Freeman's description of the battle of Hastings, or, as he with mistaken pedantry would have it. the battle of Senlac, was shown by J. H. Round *(Feudal England,* 1895) to be quite inaccurate.

FREEMAN, JOHN RIPLEY (1855–1932), U.S. civil engineer. was born in West Bridgeton. Me.. on July 27, 1855. Graduated from Massachusetts Institute of Technology in 1876, he spent about ten years in hydraulic engineering and another ten years as chief engineer of a fire insurance company. He became consultant for various water commissions in Massachusetts and Rhode Island (1895–1904) and for the New Tork Board of Water Supply from 1905 until his death. He served as consultant on the Panama canal (1905–08) and planned the Hetch Hetchy water supply for San Francisco (1908–10). He was adviser to the Chinese government on the improvement of the Grand canal (1917–20). In 1924 he was consultant for the Chicago sanitary district on the control of Great Lakes levels. Freeman was president of the Manufacturers Mutual Fire Insurance Co., Providence. R.I., from 189j. He wrote extensively on hydraulics, fire protection and earthquake damage.

Freeman died at Providence on Oct. 6, 1932. (S. C. HR.)

FREEMAN, MARY ELEANOR (née WILKINS) (1852–1930), U.S. writer whose best stories and novels are concerned with New England village life, was born in Randolph, Mass., Oct 31, 1852. In 1867 the family moved to Brattleboro. Vt. Mary graduated from high school there. had one year at Mount Holyoke seminary, South Hadley, Mass., and read omnivorously. She began writing stories and verse for children. When death took her immediate family, she returned to Randolph and lived with the John Wales family; in their house, in the 1880s and 1890s, she did her best writing.

In 1902 she married Charles M. Freeman of Metuchen. N.J.. where she lived till her death on March 13, 1930.

Though she produced a dozen volumes of short stories and as many novels. Mrs. Freeman is remembered chiefly for the first two collections of stories — *A Humble Romance* (188;) and *A New England Nun And Other Stories* (1891) and the novel *Pembroke* (1894). Her theme is pride within poverty. Typically, her upstanding characters ask more of life than could be had in their cramped New England villages. Defeated, they develop abnormalities of pride and will. This is a grim subject but it is handled deftly, at times humorously and with fine narrative art.

See Edward Foster, *Mary* E. *Wilkins Freeman* (1956), a full length study with bibliography. (E F.)

FREEMAN, SIR RALPH (1880–1950), British civil engineer, distinguished as the designer of great bridges. was born in London on Nov. 27, 1880. On leaving the Central Technical college, Kensington. in 1901 he joined a firm of consulting engineers, of which he was made a partner 11 years later. He became senior partner in 1921 and remained in active control of the firm, knonn later as Freeman, Fox and partners, until his death. He carried out important work in many parts of the world, including the Victoria falls bridge over the Zambesi river, the Royal Naval Propellant factory during World War II, the Furness shipbuilding yard and the five major bridges constructed in the Rhodesias for the trustees of Alfred Beit.

Freeman's best-known work was the Sydney harbour bridge, completed in 1932; its main arch span, 1,650 ft. long, is one of the largest in the world. Freeman prepared designs for the bridge over Auckland harbour, N.Z.; the Dome of Discovery for the Festival of Britain, 1951; and, as joint engineer, for the projected River Severn suspension bridge. He played an active part in the development of engineering science, being from 1923 to 1936 a member of the Steel Structures Research committee and chairman of the panel responsible for producing the committee's recommendations for design.

He was knighted in 1947 and died at Finchley. London. on March 11, 1950. (J. F. BR.)

FREEMAN, the term specifically applied to one who possesses the freedom of a city, borough or company. Before the passing of the Municipal Corporations act of 1835, each English borough admitted freemen according to its own peculiar custom and by-laws. The rights and privileges of a freeman, though varying in different boroughs, generally included the right to vote at a parliamentary election of the borough, and exemption from all tolls and dues. The act of 1835 respected existing usages, and every person who was then an admitted freeman remained one, retaining all his former rights and privileges. The admission of freemen is regulated by the Municipal Corporations act of 1882, whereby the term freeman includes any person of the class whose rights and interests are reserved by the act of 1835 under the name either of freemen or of burgesses. No person can be admitted a freeman by gift or by purchase; that is, only birth, servitude or marriage are qualifications. By the Honorary Freedom of Boroughs act, 1885, however, the council of every borough may admit persons of distinction to be honorary freemen.

A person may become a freeman or freewoman of one of the London livery companies by (1) apprenticeship or servitude; (2) patrimony: (3) redemption; (4) gift.

See W. C. Hazlitt, *The Livery Companies of the City of London* (1892).

FREEMASONRY is a word used to describe the beliefs and practices of Freemasons and the way in which local units. called lodges, are governed and linked together. A craft rather than an order, it is secret only in having rituals and other matters not to be divulged to nonmembers, a society with secrets but not a secret society. Its places of meeting are prominently identified, and its governing bodies publish annual proceedings. The membership is a matter of record and, particularly in the United States, public knowledge. In Communist and completely totalitarian countries Freemasonry is proscribed. The Roman Catholic Church forbids its members to be Freemasons. although many of that faith were active Freemasons in the 18th and early 19th centuries. In Great Britain, the commonwealth countries, Scandinavia, the United States and other nations with similar institutions, heads of government, dignitaries and distinguished citizens are Freemasons. Men from all walks of life meet together in their adherence to a moral code whose principles are largely conveyed through symbols and allegories connected with the art of building, emphasizing benevolence. A Mason. it was said in 1734–35, "is to be a Man of Benevolence and Charity, not sitting down contented while his Fellow Creatures, but much more his Brethren, are in Want, when it is in his Power (without prejudicing himself or Family) to relieve them" (William Smith, *A Pocket Companion for Free-Masons* [London, 1735]).

In order that the nature and development of Freemasonry may be explained, some account must be given of the following subjects: (1) the meaning of the word freemason; (2) the organization of mediaeval building operations; (3) the connection between operative and speculative masonry; (4) the foundation in 1717 of the grand lodge, from which orthodox Freemasonry in its modern form derived; (5) the relation of Freemasonry to religion; (6) Masonic ceremonies; (7) the diffusion of Freemasonry after 1717.

The Meaning of Freemason. — In all probability freemason originally meant a craftsman working with ax, mallet and chisel in freestone. That is suggested, first, by the occurrence of Latin and French terms such as *sculptor lapidum liberorum, mestre mason de franche peer* and *magister lathomus liberarum petrarum.* Second, the building accounts relating to Eton college in 1442 and 1445–46 and Kirkby Muxloe castle in 1481 distinguish between freemasons and rough masons or row masons, the latter including bricklayers. Third, there are other examples of workmen called after the materials in which they worked; such were hardhewers (working in the hard ragstone of Kent), marblers and alabasterers. It may well have been the case, however, that in later times the freemason was understood to be a mason who was free in the sense of being a member of a guild or company or one who was free to carry on his trade in a municipality.

The Organization of Mediaeval Masonry. — Such craftsmen differed from most others of the mediaeval period in several respects, and the organization of masons was determined to a large extent by these special characteristics. First, unlike the weaver or blacksmith, the ordinary mason was entirely a wage earner; second, he was commonly more mobile, travelling voluntarily in search of employment or further experience. or, as was often the case during the 13th and later centuries, being conscripted for work on the crown's large building operations, such as the castles of Caernarvon and Windsor. These and other works, such as Cistercian abbeys, were often carried on in remote parts of the country, and, for that and other reasons, the municipal craft guild was not a suitable form of organization for all masons. Such a guild did, indeed, exist in 14th-century London; but for many masons a nearer and more familiar association was the lodge connected with the building on which they were employed. The lodge mas not only a workshop but the place for a siesta in the middle of the day, for drinking at permitted times and also, no doubt, for the exchange of news and for airing grievances and discussing matters relating to the craft. Hence the stress on keeping secret, from nonmasons and from employers, what was said in the lodge.

The Old Charges.—*Of* the Old Charges. known also as the *MS. Constitutions of Masonry,* about 100 versions exist, and there is reason to believe that another 15 have existed (D. Knoop and G. P. Jones, *A Handlist of Masonic Documents*, p. 12 [Manchester, 1942]). The oldest surviving manuscript is almost certainly the *Regius MS.* (British Museum, Bibl. Reg. 17 A, 1), written probably about 1390, in verse, and the next oldest the so-called *Cooke MS.* (British Museum, Add. ms. 23198), dating from about 1400 or 1410, in prose. Nothing is certainly known about the circumstances in which either was written (for suggestions, *cf.* H. Poole, *The Old Chwges,* pp. 19–21 [London, 1924]), but it is probable that their main elements are older than the manuscripts. The masons' customs, or articles and points. there set out may be presumed to have been gradually developed over a comparatively long period, but the account given of the history of the craft may well have been supplied by a single, if unknown, author.

His curious legend deals first of all with the number of noblemen's children in early times who, not being provided with an income, had to find work "that they mygth gete here [their] lyuynge ther-by." Euclid was consulted and recommended "thys onest craft of good masonry"; thus the genesis of masonry is found in Egypt. Many years afterward it reached England "yn tyme of good kynge adelstonus (Aethelstan's) day." He called an assembly of dukes, earls, barons, knights, squires and burgesses, at which 15 points and articles were drawn up for the amendment and regulation of the craft. Some of them are addressed to master masons in charge of building operations and others to ordinary skilled workmen. Masters are to pay the workmen, or fellows, as they deserve and the fellows honestly to earn their pay; one master is neither to supplant another without cause nor to undertake work which he cannot complete, and he must come, when summoned, to the general assembly of the craft. Thieves are not to be harboured nor adultery committed. A mason is not to defame his fellow nor to decry his work but, at need, to help him to do better. Great stress is laid on the teaching of apprentices, who are to be whole of limb and not of servile origin. In short, the rules attempt to harmonize and further the interests of all parties: the person for whom building work is undertaken, the master in charge of it, the journeymen working upon it and the apprentices learning the trade.

There follows an account of the *Quatuor Coronati,* masons alleged to have been martyred for Christianity in Roman times. Their cult was widespread on the continent of Europe among workers in the building trades but, though known, never became very important among masons in England *(cf.* D. Knoop. G. P. Jones and D. Hamer, *The Two Earliest Masonic MSS.*, pp. 50–51) and is certainly no evidence that English freemasonry was derived from Germany. Then comes a longer account of the origin of masonry in which the tower of Babylon and Euclid are mentioned and the seven sciences, or seven liberal arts, including geometry, are enumerated and described. The compiler was apparently a priest, line 629 reading "And when the gospel me rede schal." The last 100 lines are evidently based upon *Urbanitatis (Cott. MS., Caligula* A 11) and John Mirk's *Instructions for a Parish Priest (Cott. MS.,* Claudius A 11), instructions such as lads and even men would need who were ignorant of the customs of polite society and of correct deportment in church and in the presence of their social superiors.

The simple narrative of the *Regius MS.* does not conflict with known historical fact. The authors of later manuscript versions of the same narrative, however, added embellishments and details which do not stand up under scrutiny, tending to make the legend or history of doubtful validity.

The major elements in these late mediaeval documents (*i.e.,* a legend or history. the craft regulations, including the injunction about secrecy, and a prayer) are found, in various arrangements, in the later versions of the *MS. Constitutions.* Particulars may be found in W. J. Hughan, *The Old Charges of the British Freemasons;* the more important ones and some others were reproduced in the six volumes of *Quatuor Coronatorum Antigrapha* and the *"Yorkshire" Old Charges of Masons* which were edited by H. Poole and F. R. Worts.

It may be presumed that some version of the history and charges was read or recited to operative masons in mediaeval times; and there is proof that this was also done in lodges of Freemasons in the 17th and 18th centuries, each lodge apparently having one or more copies kept for the purpose. The Aberdeen lodge, for instance, in 1670 ordered that the mason charter, which was a version of the Old Charges, should be read "at the entering of every entered prentice"; a similar order was made at Alnwick in 1701.

The Mason Word.—The second main element in the masonic tradition. the mason word, is more obscure in its origin and development than the Old Charges, but it was certainly a Scottish institution and it may have existed as early as 1550. In Scotland the organized craft contained, besides apprentices, a category of entered apprentices; *i.e.,* craftsmen who had learned their trade and might be allowed to undertake a limited amount of work by themselves but who were required to serve for several years before becoming masters of the craft, or fellows. The interests both of entered apprentices and fellows might, however, be harmed by cowans; *i.e.,* workmen who had not been apprenticed or had been inadequately or irregularly taught; and it is probable that the mason word originated as a method of distinguishing either between cowans and entered apprentices or between entered apprentices and fellows and that it consisted of a sign, either a word, a handgrip or both. communicated in such a fashion that unauthorized persons could not acquire it. By 1696. as the *Edinburgh Register House MS.* (text in D. Knoop, G. P. Jones and D. Hamer, *The Early Masonic Catechisms)* shows. whatever the original method may have been, the mason word was communicated in two steps or ceremonies, one for entered apprentices and a second for fellows.

Development of Speculative Masonry.—The lodges in which the mason word was given and the Old Charges were read during the 16th and part of the 17th centuries were, no doubt, for the mbst part lodges of working craftsmen—operative masons. Those of the 18th century, on the other hand, were nearly all lodges in which operative masons mere few or nonexistent. The intervening period, which has been called the age of Accepted Masonry, was one in which nonoperatives either joined existing lodges or formed new ones; and it was from these lodges, constituted increasingly or entirely of gentlemen masons (Adopted masons) or Accepted masons, that there developed symbolical or speculative Masonry—Freemasonry in the modem sense of the term.

The first nonoperative mason about whom we can be quite sure was John Boswell, laird of Auchinleck, who attended the Edinburgh lodge in June 1600. Others who joined the same lodge were Lord Alexander, Sir Anthony Alexander and Sir Alexander Strachan in 1634, Gen. Alexander Hamilton in 1640 and Quartermaster Gen. Robert Moray, who was initiated at Newcastle in 1641, while the Scottish army was in occupation. The famous mother lodge Kilninning had the earl of Cassillis for its deacon in 1672, and among his successors were Sir Alexander Cunningham and the earl of Eglinton. The oldest membership roll of the Aberdeen lodge contains the names of the earl of Finlater, the earl of Erroll, the earl of Dunfermline and Lord Pitsligo. Among English nonoperative masons were the famous antiquary Elias

Ashmole, admitted at a lodge held in Warrington in 1646, and Randle Holme, third of the name, the Chester genealogist, who belonged to a lodge in Chester. There is evidence to suggest that a duke of Richmond attended a lodge at Chichester in 1696. Sir George Tempest presided in 1705–06 over a York lodge in which, at Bradford in 1713, "18 gentlemen of the first families in that Neighbourhood were made Masons." There would, therefore, appear to be confirmation of the statement made by Robert Plot in 1686 in his *Natural History of Staffordshire* (Oxford) that the custom "of admitting Men into the *Society of Free-masons"* was "spread more or less all over the *Nation."* Especially in the Staffordshire moorlands he "found persons of the most eminent quality, that did not disdain to be of this *Fellowship."*

Evidence is too scanty to enable the nature of these lodges to be determined in every instance. Some of them, such as the one maintained in Warrington in 1646 and the one at Chichester in 1696, were perhaps of an occasional kind. The Aberdeen lodge (on which *cf.* A. L. Miller, *Notes on the Early History and Records of the Lodge, Aberdeen)* may have originated as far back as 1483 and was probably for long an operative lodge; though, by 1670, out of 49 fellows belonging to it only about 10 were operative masons. In the Chester lodge, about 1673, there were six masons (and 15 other tradesmen possibly connected with building and house decorating) out of 26 known members. Of the persons present at the Warrington lodge in 1646 not one was an operative mason.

There can be little doubt that in the transitional era Masonry was more organized in Scotland than in England. There is evidence of that for instance in the statutes promulgated in Dec. 1598 by William Schaw, master of work to the crown of Scotland, "with the consent of the masters after specified," whose names, unfortunately, have not been preserved. A year later, further statutes and ordinances were issued by the same authority, giving to the lodge of Kilwinning certain supervisory powers over others in lower Clydesdale, Glasgow, Ayr and Carrick. South of the border there is no very conclusive evidence of any effective link between lodges or of any district or central control, though it is asserted in a document of 1722 (text in D. Knoop, G. P. Jones and D. Hamer, *Early Masonic Pamphlets,* p. 71 ff.) that a general assembly was held on Dec. 8, 1663, at which new articles were agreed upon. Two of those imply the existence of some regional authority:

> I That no Person, of what Degree soever, be accepted a Free Mason, unless he shall have a Lodge of five Free-Masons at the least, whereof one to be a Master or Warden of that Limit or Division where such Lodge shall be kept, and another to be a Workman of the Trade of Free Masonry. . . .
>
> III. That no Person hereafter, which shall be accepted a Free Mason, shall be admitted into any Lodge or Assembly, until he hath brought *a* Certificate of the Time and Place of his Acception from the Lodge that accepted him, unto the Master of that Limit and Division where such Lodge was kept, which said Master shall enroll the same in Parchment in a Roll to be kept for that Purpose, and give an Account of all such Acceptions, at every General Assembly.

The last sentence implies a wider authority, as does another article:

> V. That for the future the said 'Society, Company and Fraternity of Free-Masons shall be regulated and governed by one Master, and as many Wardens as the said Company shall think fit to chuse at every Yearly General Assembly.

Even if, on the strength of a statement made nearly 60 years after the alleged event, the assembly of 1663 be accepted as a fact, there is no record of any further assembly nor any proof that the new articles, if made, were observed. It is, therefore, likely, on the whole, that 17th-century English Masonry was in some danger of developing haphazardly in a way that might well have given rise to irregularities. Sooner or later, therefore, an attempt was likely to be made to provide Freemasonry with a degree of unity and uniformity more in accord with its past traditions and its existing needs.

Foundation of the Grand Lodge (1717).—The main and perhaps the only independent evidence relating to the foundation of the grand lodge is that of the Rev. James Anderson (1679–1739), who included an account of the matter in the second edition (1738) of the *Book of Constitutions.* Anderson, who was not himself connected with the grand lodge at its foundations, is now regarded as a careless and uncritical historian; but there seems no reason to doubt that in 1716 a meeting was held at the Apple Tree tavern, near Covent Garden, attended by "some old Brothers" and by Masons from four separate lodges that met at the Goose and Gridiron alehouse in St. Paul's churchyard, the Crown alehouse in Parker's lane, the Apple Tree tavern and the Rummer and Grapes tavern in Westminster. As a result of the deliberations at this meeting, presumably, another was held at the Goose and Gridiron in June 1717, at which Anthony Sayer was elected grand master and installed. His high-sounding title implied, however, no extensive jurisdiction, the authority of the early grand lodge being limited to lodges in or near London and Westminster and the major purposes of the new authority being to arrange an annual feast, to establish a quarterly communication between lodge officers and generally to promote union and harmony among lodges.

Not long after its foundation, however, though there may have been some inertia and resistance at first, the authority and scope of the grand lodge increased considerably. The number of lodges in its jurisdiction rose from four in 1717 to 63 (in places as distant as Bath, Bristol, Carmarthen, Chester and Salford) in 1725 and 126 in 1733. Provincial organization had begun by 1725, when there existed a provincial grand master, provincial deputy grand master and provincial grand wardens in Cheshire. The collection of old writings relating to Freemasonry was started in 1719, and *The Constitutions of the Free-Masons,* an officially approved revision and restatement of the history and articles, was published by Anderson in 1723. Provision was made for an important part of Masonic activity by the establishment in 1730 of the Standing Committee for Charity.

One significant characteristic of Freemasonry in the period following 1721 was the aristocratic origin of its highest officials. a fact which no doubt conferred upon the craft a much greater degree of respectability than any order of merely operative masons could have achieved. It is indeed true that one of the four old lodges which set up the grand lodge may have consisted mainly of operatives, and that of the ten first grand wardens two were stonecutters, two were carpenters, one was a mason and one a blacksmith. But another of the four lodges, meeting at the Rummer and Grapes in Westminster, had the duke of Richmond for its master in 1723, at which time most of its members were titled persons or army officers. The first grand master, Anthony Sayer, before the end of his life was a recipient of charity; the second, who was also the fourth, George Payne, was probably a man of more wealth and at the time of his death was secretary to the tax office; the third, the Rev. Dr. J. T. Desaguliers, was a man of greater eminence, being a fellow of the Royal society and chaplain to the duke of Chandos and the prince of Wales. His successor, in 1721, was the duke of Montague. Thereafter Irish and Scottish peers shared with those of England the distinction of presiding over the grand lodge; and from 1782 to 1813 their royal highnesses the duke of Cumberland, the prince of Wales or the duke of Sussex occupied the Masonic throne. From 1753 to 1813 there existed a rival grand lodge, but, under the "ancient" grand master the duke of Kent, amalgamation was decided upon and the duke of Sussex became grand master of the united body. On the death of that prince in 1843 the earl of Zetland succeeded. and he was followed in 1874 by the marquess of Ripon, on whose resignation the prince of Wales became grand master. Soon after succeeding to the throne as King Edward VII he ceased to govern the English craft and his place was taken by the duke of Connaught. From 1737 to 1907 about 16 English princes of royal blood joined the brotherhood. The list of past grand masters up to mid-20th century includes the names of eight princes who later became monarchs: George IV, Edward VII, Edward VIII and George VI of England; Oscar II and Gustav V of Sweden; and Frederick VIII and Christian X of Denmark.

The premier grand lodge, formed in 1717, did not immediately acquire jurisdiction over all lodges in England. The extension of its authority was a gradual process throughout the remainder of the 18th century. Existing lodges independent of the grand lodge continued to work and to make Masons. The old lodge at York denominated itself the "Grand Lodge of All England," held assemblies and even created other lodges. Masonry at York did not come under obedience to the grand lodge at London until late in the century. In 1751 a group of Irish Masons in London formed a rival grand lodge in protest of alleged innovations practised by the 1717 grand lodge which they claimed departed from ancient tradition. The rival grand lodge became known as the Ancients and the original grand lodge as the Moderns. For a time, supported by the grand lodges of Ireland and Scotland, the Ancients were more active and influential than the Moderns, but by 1813 both united into the present United Grand Lodge of England.

Freemasonry and Religion.—During the third and fourth decades of the 18th century not only was the jurisdiction of the grand lodge extended geographically but the lodges were opened to men who, in an earlier period, would have been excluded because of their religious beliefs. Mediaeval operative masons were required "princypally to [loue] god and holy chyrche & alle halowis." By 1583 reference to the saints had disappeared and masons were bidden to be "trewe men to god and holly Churche and . . . vse no Errour nor heresye," an injunction which in England required membership of the established church and in Scotland of the kirk. These limits were removed by the first charge as that is given in Anderson's *Conststutions*:

"A *Mason* is oblig'd, by his Tenure, to obey the Moral Law; and if he rightly understands the ***Art,*** he will never be a stupid Atheist, nor an irreligious Libertine . . . 'tis now thought more expedient only to oblige them [masons] to that Religion in which all Men agree, leaving their particular Opinions to themselves; that is, to be good Men and true, or Men of Honour and Honesty, by whatever Denominations or Persuasions they may be distinguish'd."

In short, it is conceived that there exists a moral law, to be apprehended by human reason and binding upon all men alike; and adherence to this, if a man be acceptable in other respects, is sufficient for Masonic purposes. It should be clear that Freemasonry by no means requires a man to limit his beliefs to this minimum or to reject the faith in which he has been brought up or the established religion of his country. The Freemasonry of Anderson's day, that is, was not specifically deist; but it was, and thereafter remained, open to men of differing religions. Jews were, in fact, admitted not long after 1723. Atheists and agnostics were, of necessity, barred.

Masonic Ceremonies.—Experts have differed on the way in which the modern form of Masonic ceremonies was reached, and the matter remains obscure partly because of difficulty in deciding how far some of the evidence, the catechisms. can be trusted. It may, however, be regarded as almost certain, first, that the ceremonies were not simply invented or arbitrarily elaborated by Anderson and Desaguliers but were developed from the practices of lodges, possibly from practices known in the 17th century. Second, the changes came about under speculative influence, so that the Old Charges, of importance to operative masons, played a less important part. Third, though the development cannot be fully traced, it is likely that two ceremonies used by operative masons, often telescoped into one when nonoperatives sere admitted in Scotland, were elaborated into three ceremonies—one for each grade in what is now known as the trigradal system—namely the entered apprentice, the fellow of the craft and the master mason. These, and the ritual and secrets connected with them, are fundamental in modern Freemasonry. The ceremonies were carried out in a room representing a lodge. The grand lodge. no doubt, played an important part in bringing about uniformity in the ceremonies and acceptance of the trigradal system. It is believed to have been stimulated also by the wide circulation of Samuel Prichard's *Masonry Dissected,* first published in 1730. About 30 editions of it are known to have been printed in England and 8 in Scotland.

Diffusion of Freemasonry After 1717.—Within half a century of the foundation of the grand lodge. Freemasonry had spread not only to the European continent but also to America and Asia. In Ireland, nhere a Freemasons' lodge existed as early as 1688, a grand lodge was established perhaps in 1723 and certainly by 172j. and in 1726 there was a Munster grand lodge. The grand lodge of Scotland, formed on a similar basis to that of the grand lodge of England, dates back to 1736. In India, lodges were constituted at Fort William, Bengal (1729), Calcutta (1730), Madras (1752) and Bombay (1758) In the West Indies Freemasonry was practised in Antigua (1728), St. Christopher (1739) and Jamaica (1742). A "deputation" was issued in 1730 appointing one Daniel Cox provincial grand master in New York, New Jersey and Pennsylvania, but there is no proof that he ever constituted a lodge there.

There is a tradition that in 1725 the earl of Derwentwater founded a lodge in Paris, but the first in France to be constituted by the grand lodge was in 1732. Four years earlier. as the grand lodge minute book shows. one had been constituted in Madrid and in the next year another at Gibraltar. Others were also opened in Germany (1733) Portugal (1735), the Setherlands (1735), Switzerland (1740), Denmark (1745), Italy (1763), Belgium (1765), Russia (1771) and Sweden (1773). In most of these countries grand lodges were subsequently created and continued in existence except in states where Freemasonry was proscribed. In Germany, following suppression of Freemasonry by the nazis, the united grand lodge of that country was re-established in 1949, although in the Communist zone it remained proscribed.

In at least two continental countries there had been associations, of some importance, of operative masons, namely the *Steinmetzen* in Germany and the *compagnonnages* in France; but there would appear to be no evidence in either case of any close or continuous connection with speculative Masonry. In some respects the *compagnonnages* resembled organizations of English or Scottish operative masons, having arrangements to help journeymen traveling the country in search of employment or wider experience. They also had rituals for initiation and legends connected with Hiram, Solomon's master mason, who was murdered by three apprentices, with Maître Jacques, Hiram's colleague and the maker of two pillars, and with Père Soubise, also one of Solomon's master workmen. These legends, however, cannot be satisfactorily dated nor can their evolution be clearly traced. It is by no means impossible that the *compagnonnage* rituals were based on, or greatly influenced by, English Masonic catechisms (E. Martin St. Léon, *Le Compagnonnage,* p. 223 [Paris. 1901]), and it may have been the case that legends were borrowed as well. In any event, even if it be taken that French. English and Scottish operative masons had some common traditions. of mediaeval origin. it is also clear that in one important respect the *compagnonnages* differed from other organizations of craftsmen. They consisted of journeymen and excluded independent masters of the craft. Their primary concern was with the economic conditions of journeymen, a matter of little or no interest to French speculative masons, for whom, during the 18th and 19th centuries, provision could be made in lodges following the English grand lodge tradition. These lodges were, like the *compagnonnages,* subject to difficulties because neither the church nor the state, under the *ancien régime* and restored Bourbons, regarded them favourably. The theological faculty in Paris in 1645 declared the rituals of the *compagnonnages* to be blasphemous and the use of their watchwords to be mortal sin; and Popes Clement XII and Benedict XIV in 1738 and 1751 condemned Freemasonry in bulls which, however, the secular authority did not enforce. Nevertheless, under Louis XVIII and Charles X, Freemasonry was only barely tolerated; and it is therefore no wonder that French Freemasons tended to be hostile to both ecclesiastical and secular authorities. Finally the French *Grand Orient* became so anticlerical as to abolish what English Freemasons regarded as a fundamental condition of membership, the requirement to believe in the Great Architect of the Universe. For that reason the English grand lodge in 1878 severed relations with it and thereafter refused to recognize any variety of Freemasonry erring in the same way.

While Freemasonry was thus being carried to the ends of the earth it was also developing additional activities and manifestations. In addition to the three fundamental degrees, others were at various times established. Among them are those of the Royal Arch, connected with a legend of Zerubbabel and the rebuilding of the Temple (Ezra iii, 2; iv, 2–3; v, 2), and governed by the supreme grand chapter of Royal Arch Masons, whose authority by 1952 was recognized by 2,450 chapters in the world. Others are those respectively of the Mark grand lodge, the grand priory of Knights Templars and the Ancient and Accepted Rite. Only

Freemasons may proceed to these degrees but they are optional and many members of the craft do not seek admission to them. The organizations named are mutually complementary and intimately connected in England and more or less so in Ireland, Scotland, North America and wherever the degrees are worked on a similar basis. European countries in which Masonry is permitted also have their own *hautes grades.*

Some idea of the strength of modern Freemasonry may be based on the fact that there were in 1952, within the jurisdictions of the three oldest authorities, nearly 9,000 lodges (English grand lodge. 6,510; Irish grand lodge, 1,014; Scottish grand lodge, 1,463) in parts of the world as distant from each other as London and Shanghai or Aberdeen and Trincomalee. In addition there were. in many of the same countries. grand lodges with jurisdictions of their own; for instance, seven in Australasia and nine in Canada. There were 49 autonomous grand lodges recognized by the grand lodge of England in the United States, 5 in Central America and Mexico, 11 in South America and 2 in the West Indies. In Europe there were one each in Denmark, Finland. France. Greece. Iceland. the Netherlands, Norway, Sweden and Switzerland; and there was one in the Philippines.

BIBLIOGRAPHY.—An invaluable source of information on the historical and other aspects of Freemasonry is *Ars Quatuor Coronatorum (A.Q.C.)* (Margate, 1887–), the transactions of the Quatuor Coronati lodge, London, No. 2076. Other general works of reference are: A. Wolfstieg, *Bibliographie der freimaurerischen Literatur* (Burg, 1911); A. F. A. Woodford, *Kenning's Masonic Cyclopaedia and Handbook* (London, 1878).

Histories: D. Knoop and G. P. Jones, *The Mediaeval Mason* (Manchester, 1933), gives an account of operative masonry. Among histories of the craft R. F. Gould, *The History of Freemasonry,* 6 vol. (London, 1884–87) is still useful. *See* also W. Begemann, *Vorgeschichte und Anfange der Freimaurerei in England,* 2 vol. (Margate, 1889–1913). (W. J. H.; G. P. J.; R. B. Hs.)

UNITED STATES

As the organizational structure of Freemasonry in the United States is not exactly duplicated elsewhere in the world, its evolution deserves particular attention.

Freemasonry was planted in the American colonies by English. Scottish and Irish Masons during the early decades of the 18th century. In 1734 Benjamin Franklin. then 28 years of age, was elected grand master of Masons in Pennsylvania; and in the same year he published the first Masonic book printed in America, a reprint of Anderson's The *Constitutions* of *the Free-Masons.* At this time it was estimated there were about 6,000 Masons in all the colonial states from Maine to Georgia. Individual lodges had small memberships, ordinarily about 15, and a lodge with 25 or more members was considered quite large.

During the colonial period a majority of the lodges worked under English constitutions. Ancient or Modern, a few receiving their charters from the grand lodges of Scotland or Ireland. They were governed by provincial grand lodges, and the provincial grand masters were authorized or appointed from Great Britain. At the culmination of the Revolutionary War these provincial grand bodies set themselves up as independent grand lodges, their sovereignty becoming everywhere recognized within a few years. Each confined itself within the geographical area corresponding to state boundaries. a custom followed by all grand lodges subsequently organized in the United States. This was the origin of the now firmly established American Masonic doctrine of "exclusive jurisdiction," the point of which is that each grand lodge is sole and sovereign in Masonic matters within its own acknowledged territory; invasion of such territory by another Masonic body is grounds for discontinuing fraternal recognition. Accordingly, there were 49 independent grand lodges in the United States by 1956, with a total membership of approximately 4,000,000 Belief in God, the presence of the Holy Bible on the altar. the forbidding of any political activity or discussion within the lodge, strict nonsectarianism in religion and cognizance of the moral law are among the fundamentals adhered to by all grand lodges.

In the latter part of the 18th century, and at intervals thereafter, efforts were made to establish a general grand lodge for the United States. All these attempts failed, and each of the grand lodges remained independent without a national governing body. In 1912 a co-operative undertaking among the grand lodges to erect in Alexandria, Va., a George Washington Masonic National Memorial led to annual meetings and to a separate annual conference of grand masters of North America and the conference of grand lodge secretaries. These conferences became forums for the exchange of ideas and information but exercise no administrative authority over any grand lodge. A majority but not all of the grand lodges participate in another national body, the Masonic Service Association of the United States. As its name implies, this association, with headquarters in Washington, D C., acts for the participating grand lodges in matters of service, relief and education but is in no sense a governing body over any grand lodge.

The York Rite. — During the 18th century Masonic degrees beyond those of the first three were being devised in Great Britain and Europe and becoming known in America, but throughout this time they remained degrees only and lacked organizational form. In America, as in England, the Royal Arch degree was conferred in lodges of Master Masons or by lodge authority. By the end of the century Royal Arch chapters had begun to appear, leading to the establishment of the Capitular Rite. That rite consists of local chapters conferring four degrees: Mark Master, Past Master (Virtual), Most Excellent Master and the Royal Arch. Chapters are governed by grand chapters in the same form and jurisdictional pattern as lodges and grand lodges. Applicants must be Master Masons in good standing. There is also a general grand chapter in which the grand chapters of Pennsylvania, Texas, Virginia and West Virginia do not participate.

In America the earliest surviving written record of the conferral of the Knights Templar degree is in St. Andrew's lodge, Boston, 1769. Like the Royal Arch degree, it was conferred in a lodge or by authority of a lodge, until the appearance of local commanderies. In 1816 earlier efforts culminated in the formation of the General Grand Encampment of Knights Templar and the Appendant Orders for the United States, now known as the Grand Encampment of Knights Templar of the United States of America. The point of entrance is the local commander~and applicants must be Royal Arch Masons in good standing. The commandery confers three orders: Red Cross, Knights of Malta and Knights Templar, and is governed by grand commanderies under the grand encampment. The Templar Rite is exclusivelv Christian.

Prior to 1870 the Scottish Rite of Freemasonry conferred three side or optional degrees: Royal Master, Select Master and Super-Excellent Master. In that year these degrees were relinquished by the Scottish Rite and thereafter conferred in local councils of Royal and Select Masters, governed by grand councils, a general grand council, and known as the Cryptic Rite. The grand councils of Pennsylvania, Texas, Virginia and West Virginia do not participate in the general grand council, Capitular and Cryptic work being combined in those grand jurisdictions.

The term "York Rite" is merely a name and has no separate organizational substance. It is an over-all name for the bodies of the Capitular, Cryptic and Templar rites and is symbolic of antiquity in Freemasonry. As the Knights Templar is the culminating degree of the York Rite, the Cryptic Rite follows the Capitular and precedes the Templar degrees. The Cryptic degrees have retained their optional character and are not a requirement for applicants in the commanderies. Since the Capitular, Cryptic and Templar Masonry evolved in this form and sequence in the United States, and is not exactly duplicated elsewhere, it has frequently been proposed that these bodies should be named the American Rite, but the term York Rite persists through long usage.

The Scottish Rite.—The degrees of the Ancient and Accepted Scottish Rite first evolved on the continent of Europe, and its conception as an organization was set forth' in what are known as the Grand Constitutions of 1762 and 1786, the latter traditionally believed to have had the sanction of Frederick the Great in Germany, himself a Mason. The "Scottish" appelation is obscure, possibly derived from the influence of early Scottish Freemasonry in Europe, particularly in France. Transmitted through Jamaica to the American mainland, the first supreme council of the Scottish Rite was established at Charleston, S.C., in 1801. French Masons had brought some of the Scottish Rite degrees to America in the late 18th century, and local lodges of perfection had conferred them; but the organization of the Scottish Rite began with the formation of the supreme council at Charleston, and all regular supreme councils in the world descended from it.

The Grand Constitutions provide for only one supreme council in any one country, but difficulties of travel in the colonial states led in 1813 to the establishment of a second American supreme council. The Charleston supreme council authorized a supreme council for the northern jurisdiction, to govern the rite in a territory consisting of all states north of the Ohio river and east of the Mississippi river; and retained, as the supreme council for the southern jurisdiction, the remaining states and territorial possessions of the United States.

A supreme council is the parent body, elects its own members and is self-perpetuating. Unlike the grand bodies of the York Rite, a supreme council is not composed of representatives from the subordinate bodies. It charters the subordinate local bodies. These are four in number and, in the southern jurisdiction, are called Lodge of Perfection, conferring the 4° through 14°; Chapter of Rose Croix, conferring the 15° through 18°; Council of Kadosh, conferring the 19° through 30°; and the Consistory, conferring the 31° and 32°. Applicants must be Master Masons in good standing. The names of these four local bodies, the degrees conferred by each, as well as the names and character of the degrees, vary somewhat under different supreme councils. In the late 19th century, Albert Pike (1809–91) rewrote the degree rituals of the southern jurisdiction. While the Pike versions are widely used they are not universal throughout the rite under other supreme councils.

The supreme council confers the 33rd degree, which is honorary, in recognition of outstanding services, and may not be requested. In the United States, under both supreme councils, there were by the latter 1950s approximately 900,000 Scottish Rite Masons; and of this number there were approximately 6,000 of the 33rd degree (honorary). A supreme council itself is composed of "active" 33rd degree Masons, and each of these Masons is the highest officer of the Scottish Rite in his respective jurisdiction (states being referred to as orients). In states where there is no "active" 33rd degree Mason, the highest officer of the rite is a deputy of the supreme council.

In addition to the two American supreme councils, there were, by the latter 1950s, supreme councils in 31 other countries. Those which existed in Poland, Czechoslovakia and Rumania had been suppressed by the Communists. All Freemasonry had likewise been proscribed under Franco in Spain. but a supreme council of Spain in exile had been set up in Mexico.

Appendant Orders.—The masonic bodies properly so called are those of the symbolic lodges of the first three degrees (oiten referred to in the United States as "blue lodges," for the official colour) and the bodies of the York and Scottish rites. This main body of Freemasonry should not be confused with a large number of independent, primarily social organizations predicating their membership upon good standing in a lodge or body of the York or Scottish rites. Notable among these many appendant groups are: the International Order of the Eastern Star, admitting Master Masons and the wives, daughters or sisters of Master Masons; the Ancient Arabic Order of Nobles of the Mystic Shrine, in which applicants must be either 32nd degree Masons or Knights Templar (the "Shrine." so-called, is well known to the general public because of its colourful costumes and parades and the events it sponsors to support the organization's 1j hospitals ior the care of crippled children of all races and creeds); the Royal Order of Scotland, in the United States composed of those who have been five years or longer a 32nd degree Mason; the Red Cross of Constantine, with a membership limited in number and to Royal Arch Masons; the Mystic Order of Veiled Prophets of the Enchanted Realm, and the Tall Cedars of Lebanon, open to Master Masons; the Order of DeMolay for boys; the Order of Job's Daughters, for girls; and many others. In addition to these there are several hundreds of Masonic clubs, most of them local, social and benevolent in character, some independently organized. Many of these clubs are chartered by the National League of Masonic Clubs, the province of which is sufficiently indicated by its title. Again, these appendant orders are a United States development in Freemasonry not duplicated on the same scale elsewhere.

Bibliography.—The most generally used U.S. work of reference on Freemasonry is A. G. Mackey, *Encyclopedia of Freemasonry*, rev. and enlarged ed., 3 vol. (1946). *Other General References:* R. F. Gould, *History of Freemasonry Tkvoughout the World*, rev. ed., 6 vol. (1936); Albert G. Mackey, *Symbolism of Freemasonry* (1945) and *Jurisprudence of Freemasonry* (1927); Roscoe Pound, *Masonic Address and Writings* (1953); Harold V. B. Voorhis, *Masonic Organizations and Allied Orders and Degrees* (1952).

Scully, *History of the Grand Encampment of Knights Templar of the United States of America* (1952).

On the Colonial Period: J. H. Tatsch, *Freemasonry in the Thirteen Colonies* (1933).

All the Masonic grand bodies in the United States publish annual *Proceedings*, and most of them have published histories of their respective jurisdictions; the general grand bodies publish triennial *Proceedings;* the supreme council, southern jurisdiction, publishes biennial *Transactions*, and the supreme council, northern jurisdiction, publishes annual *Proceedings*. The Conference of Grand Masters of Masons in North America and the Conference of Grand Lodge Secretaries publish annual *Proceedings*, and many of the separate grand lodges publish official magazines or bulletins. (R. B. Hs.)

FREEPORT, a city in northern Illinois, U.S., 110 mi. W. of Chicago and seat of Stephenson county, is located in a prosperous dairy-farming area where corn, oats and wheat are major crops.

Founded by William Baker in 1835, the town was first settled by Pennsylvania Germans disappointed with conditions in the Galena lead-mining district, where they had planned to live. Freeport was designated the county seat in 1837 and changed its name from Winneshiek at that time. It was incorporated as a city in 1855. Manufactures include batteries, food products, oil burners, hardware, toys, medicines and toilet preparations. (For comparative population figures see table in Illinois: *Population*.)

Freeport was the site of the second Lincoln-Douglas debate on Aug. 27, 1858. There Abraham Lincoln asked Stephen A. Douglas to answer four questions, the second being: "Can the people of a United States Territory, in any lawful way, against the wish of any citizen of the United States, exclude slavery from its limits prior to the formation of a state constitution?" Douglas' affirmative answer pointed out that in spite of contrary supreme court decisions "... the people have the lawful means to introduce it or exclude it as they please, for the reason that slavery cannot exist ... unless it is supported by local police regulations." This Freeport doctrine was generally accepted by Illinois Democrats but was attacked savagely in the south. So profound mas its effect on the south that it is cited as one of the reasons Douglas could not control the Democratic party in the presidential campaign of 1860. "Lincoln the Debater," a statue by Leonard Crunelle, in Taylor park, commemorates the debate. (C. C. W.)

FREE PORTS. This term is more accurately applied to zones within port$ rather than to port units as a whole. In mediaeval times, when the nature and scale of international trade was limited, free ports grew out of the practice whereby certain cities granted foreign merchants privileges which approached freedom of trade. With the rise of the mercantile system, however, it became normal for a country to impose many restrictions upon overseas imports. It was realized that these restrictions might seriously impede trade and as a result some maritime cities were granted exemption, thus becoming free ports. The increased volume and variety of goods handled by the large ports commonly led to the tariff concessions being limited to a zone within them.

A free port or free zone within a port is an area within which goods may be landed, handled, manufactured and reshipped without the intervention of the customs authorities. It follows that the normal facilities of a port will exist, for instance, for lading and unlading; supplying the water, fuel and other requirements of ships; for storage of goods; for providing transport within the port or zone; and alloning contact with inland areas. The defined area is subject to all the usual laws concerning health, labour conditions, inspection of vessels, immigration and postal service but is entirely exempt from customs. It is only when the goods are moved to consumers within the country in which the free port zone is located that they become subject to the prevailing customs duties.

The primary purpose of a free port or free port zone is to facilitate consignment and transshipment trade. It has been for long a system by which an attempt has been made to remove from a port with many geographical advantages for trade those hindrances to trade caused by high tariffs and complex customs regulations. Hamburg and Bremen, both admirably situated for trade between highly developed areas of Europe and the rest of the world, have long been associated with the practice. Hamburg was one of the most famous of Hanseatic towns and, from the period of freedom of trade associated with the Hanseatic league, retained the principle so that, through a free zone within this great port, the advantages of geographical location for transshipment were strengthened and the range and variety of commodities handled much increased. Many ports of northwestern Europe (*e.g.*, Copenhagen, Danzig, Stockholm, Gothenburg and Lübeck) and other ports along the Adriatic coast (*e.g.*, Trieste and Rijeka [Fiume]) have had long experience with the system and through its application may well have both maintained and extended their trade. From the end of the 19th century several additions were made to the list of free ports or free port zones, including Singapore, Penang, New York City, Puerto Mexico and Salina Cruz. The primary objectives in creating a free port zone are not always the same; for example, when the scheme was put in motion in Colon, Panama, in 1950 much emphasis was placed on the values to be obtained through encouraging the manufacture of commodities as well as from amplifying the transit trade. Thus an area was deliberately set aside as a free-zone industrial area, and a number of industries have been established.

Although the free port system became more widespread, it was not universally adopted. Several important trading countries, including Great Britain. did not adopt the practice. In the United States, with the passing of the Celler Foreign Trade Zones act in 1934, it seemed that several free ports might come into being; but only limited developments followed as, for example, in the ports of New York City and New Orleans. Among the advantages of the system that have been emphasized are the quicker turn-round of ships through the reduction in the formalities of customs examinations and the ability to display and often fabricate goods freely. Any increase in trade attributable to the existence of a free port zone must lead to greater receipts for the port authority and to the provision of additional employment. Yet in many instances there is no strong case for believing that an increase in trade would result from the introduction of the system. On the other side it has been stated that the free port zone system tends to allow the dumping and holding duty-free of goods which are later released on the market at a critical time to the detriment of the nianufacturers of the country concerned. Furthermore the physical features and built-up character of some ports do not allow the setting aside of a distinct and closely supervised free port zone. Suggestions have been made that free zones should be created in Britain (particularly within the ports of south Wales) and in Canada; but in these countries: as elsewhere, the location of the port, the political and geographical conditions that apply and the extent to which advantages would be given to re-export trade and to manufacturing must be taken into account in deciding whether the system should be introduced.

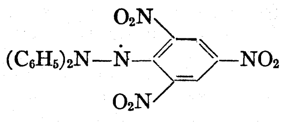
FREE RADICALS. According to 19th-century chemical nomenclature a radical is a group of atoms which, in combination with another radical or atom, forms a stable molecule. Thus a free radical may be defined as a molecule in which one of the atoms has one of its valences unoccupied; *i.e.*, a molecule in which one of the atoms exhibits a valence one unit lower than normal. In a free radical. therefore, carbon appears to be trivalent rather than quadrivalent. nitrogen bivalent rather than trivalent. Numerous unsuccessful attempts to prepare free radicals at one time led to the belief that free radicals were incapable of existence. However a number are now recognized as stable entities. and others play important roles as transient intermediates in chemical reactions. An alternative definition of a free radica! derives from the theory of chemical valence developed by G. N. Lewis (1916 and later. see VALENCE). Most molecules contain an even number of electrons. The chemical bond. or valence. which holds together two atoms consists of a pair of electrons shared by the two atoms. The free valence of a free radical consists of a single unshared electron. and the radical is an odd molecule containing an odd number of electrons (Lewis, 1923). If consideration is restricted to molecules containing only the elements most commonly encountered in organic chemistry (*i.e.*, carbon, hydrogen, nitrogen, oxygen, the halogens and the like) the two definitions are equivalent. However, if one wants to consider also compounds containing atoms of the transitional groups of the periodic system (see PERIODIC LAW. THE). this is no longer true. Thus. although ferric ion Fe^{+++}, contains an odd number of electrons. it is not ordinarily considered a free radical. Further, complex organic molecules may be imagined having two unsatisfied valences but an even number of total electrons. Examples of such diradicals are also known.

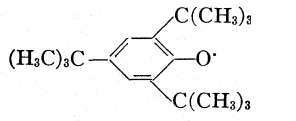
Radicals of Appreciable Stability. — The history of this field of chemistry begins in 1900 with M. Gomberg's discovery of rriphenylmethyl with the structure I. In this compound the central carbon

$(C_6H_5)_3C\cdot$ **I** $\qquad (C_6H_5)_3C—C(C_6H_5)_3$ II

is trivalent since it is combined with three phenyl groups instead of four, and its unshared electron is represented by a dot. By withdrawing chlorine from triphenylchloromethane, $(C_6H_5)_3CCl$, Gomberg expected to obtain hexaphenylethane II as a result of the cornhination of two triphenylmethyl radicals I. The product obtained (in solution) was. however, a mixture of I and II. Actually, solution I and II are in rapid equilibrium with each other, hexaphenylethane forming by the dimerization of two triphenylmethyl radicals. a process in which the two odd electrons become paired to form the central carbon-carbon bond. and the free radicals are continuously being regenerated by dissociation of the hexaphenylethane. Free radicals of this type are stable only in certain organic solvents. and are rapidly destroyed by irreversible reactions in the presence of air. water or strong acids. The degrees of dissociation of compounds such as hexaphenylethane vary ,considerably when the phenyl groups are replaced by other aromatic groups. Thus, when each phenyl. C_6H_5. is replaced by biphenyl. $C_6H_5.C_6H_4$. dissociation into free radicals is practically complete. In an analogous manner, free radicals are formed to a small extent by the breaking of the nitrogen-nitrog'en bond in aromatic hydrazines of the general structure $R_2N—NR_2$. or, to a greater extent. by the breaking of the central nitrogen-nitrogen bond in aromatic tetrazanes. $R_2N—RN—NR—NR_2$. Thus. the radical diphenylpicrylhydrazyl III exists as a stable violet solid. showing no tendency to dimerize to a tetrazane even in the solid state. Examples of free radicals with the odd electron on oxygen are also known, *e.g.*, the 2, 4. 6-tri-*t*-butylphenoxy radical IV, a blue substance which is also unknown in the dimeric form.

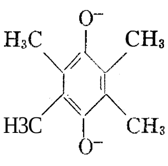


III

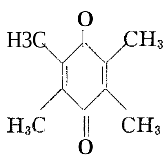


IV

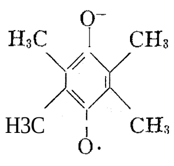
Another free radical is typified by the semiquinones. If the dianion of durohydroquinone V (existing in alkaline solutions of durohydroquinone) is treated with oxidizing agents, it loses two electrons and is converted to duroquinone VI. An intermediate stage of oxidation is possible in which a single electron has been lost to yield the free radical semiquinone ion VII. Actually,



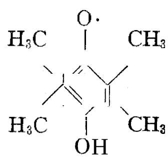
V



VI



VII



VIII

in partially oxidized systems all three species are in mobile equilibrium, and mixing solutions of V and VI immediately gives rise to detectable quantities of the yellow semiquinone. Semiquinones of a variety of types are known, and in some cases may be obtained in pure form in the solid crystalline state. However, they are usually in rather unfavourable equilibrium with the completely oxidized and reduced forms of the molecule, so that for many years their existence was overlooked.

Another type of stable radical ion, a metal ketyl, forms when a substance such as benzophenone, $(C_6H_5)_2C=O$, is treated with metallic sodium to give the coloured ketyl $(C_6H_5)_2\dot{C}—O^-$. The reaction involved is essentially a reduction, the sodium being oxidized to sodium ion, Na^+. Rather similarly, in certain solvents such as tetrahydrofuran sodium reacts with complex aromatic hydrocarbons such as naphthalene $C_{10}H_8$ converting it to the highly coloured radical ion $C_{10}H_8^-$.

A final class of relatively stable organic free radicals are those containing the group >NO. Such a group necessarily contains an odd electron (apparently distributed between the nitrogen and oxygen) and the resulting molecule is thus a free radical. An example is diphenylnitrogen oxide. $(C_6H_5)_2NO$, which is obtained by the oxidation of diphenylhydroxylamine, $(C_6H_5)_2NOH$, and which shows no tendency to dimerize or to disproportionate to products of higher and lower oxidation state. A somewhat similar behaviour of nitrogen is found in nitric oxide, NO, and nitrogen dioxide. NO_2, which are also odd molecules.

Structural Requirements for Stable Radicals.—Certain structural features appear to be requirements for the existence of stable free radicals. One condition of particular importance is shown by the semiquinone radical ion VII. As depicted, the upper oxygen atom has a negative charge, and the lower one an odd electron. However, this assignment is arbitrary, and the same molecule nould be represented if the charge and odd electron were interchanged. A7hen a situation of this type is encountered, the actual average distribution of electrons within the molecule is presumed not to be that of either of the structures just described. but to be intermediate between the two. This ambiguity is called delocalization or resonance (see RESONANCE, THEORY OF); according to quantum mechanics the resonance increases considerably the stability of the molecule, and, in this case, the probability of existence of the semiquinone ion. When the oxidation of durohydroquinone is conducted in an acid medium, so that the semiquinone anion would be converted to the neutral radical VIII, this ambiguity as to structure disappears, and under such conditions no semiquinone can be detected.

Similar arguments account for the stability of the other free radicals discussed above. In the case of triphenylmethyl I, it is considered that the odd electron is in effect distributed over the three phenyl groups as well as the central carbon atom. In addition, the dissociation of hexaphenylethane may be considerably facilitated by repulsive forces between the three bulky phenyl groups on one carbon atom and those on the other. As a measure of the magnitude of these two phenomena, dissociation of the carbon-carbon bond in the simple molecule ethane, $H_3C—CH_3$, requires an energy of 84 kg. cal. per mole of ethane. In hexaphenylethane only 12 kg. cal. are required.

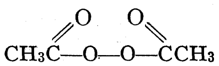
Magnetic Properties of Free Radicals.—The magnetic properties of free radicals provide a powerful tool for their detection and study. Molecules with even numbers of paired electrons are diamagnetic; *i.e.*, they are slightly repelled by a magnet. However, free radicals are paramagnetic and attracted by a magnet because of the spin of the odd electron (see QUANTUM MECHANICS: *Electron Spin)*, the spins of the remaining paired electrons effectively canceling each other. The magnetic property of a substance which is commonly studied is its magnetic susceptibility, effectively its behaviour in an inhomogeneous magnetic field, and the extent of its paramagnetism is described in terms of its magnetic dipole moment, expressed in Bohr magnetons. The magnitude of this dipole moment is the same for all free radicals, and, when arising from the spin of a single electron, amounts to $\sqrt{3}=1.73$ Bohr magnetons. This value has been confirmed experimentally with free radicals which may be obtained in the solid state, or at known concentrations in solution. Magnetic susceptibility measurements also may be used to demonstrate the existence of free radicals and to measure the position of equilibrium between radicals and their dimers or disproportionation products (see also MAGNETOCHEMISTRY). Diradicals, with even numbers of electrons two of which are, however, not paired, are also paramagnetic, the oxygen molecule, O_2, being probably the simplest example.

The paramagnetic resonance spectra of free radicals provide another technique for their detection and study. According to quantum mechanics, the spin of the odd electron of a free radical, when placed in a magnetic field, may have two, and only two, orientations, one with and the other against the field. These two orientations differ slightly in energy by an amount proportional to the strength of the magnetic field, and the majority of the electrons have the orientation of lowest energy. If a system containing free radicals is placed in a magnetic field and exposed to electromagnetic radiation (usually in the microwave region of very short radio waves), molecules with the lower energy orientation absorb radiation of a frequency corresponding to an energy just sufficient to flip over the electron into its higher energy state. This phenomenon was first observed by E. Zavoisky in 1945, and, in the simplest case, gives rise to a paramagnetic resonance absorption spectrum consisting of a single sharp absorption line. The technique is sensitive, and will detect extremely small concentrations of free radicals, examples of as little as one part in 10^7 having been reported. In many organic free radicals, interaction of the odd electron with the magnetic moments of the nuclei of different atoms in the molecule (most commonly with the nuclei of hydrogen atoms) gives rise to a more complicated system of energy levels. and an absorption spectrum consisting of a series of lines. The nature of the spectrum observed permits the identification of particular free radicals, and also gives information about their electronic structure. As an example, the simple semiquinone radical ion. $\cdot OC_6H_4O^-$ (analogous to VII, but with the CH_3 groups replaced by hydrogen atoms), exhibits a spectrum of five equally spaced lines, indicating that the odd electron spends part of its time near the hydrogen nuclei. Accordingly it is not only associated with the two oxygen atoms, but is effectively delocalized over the entire molecule. Similarly, the triphenylmethyl radical I shows a complex spectrum, consistent with the idea that its stability arises from the spreading of its odd electron over all three phenyl groups.

Unstable Radicals of Short Life.—Simple free radicals such as methyl, $\cdot CH_3$, are also capable of existence, and play important roles as transient intermediates in many chemical reactions. The existence of the methyl radical was first demonstrated by F. Paneth and W. Hofeditz in 1929 by the following experiment. The vapours of tetramethyl lead, $Pb(CH_3)_4$, mixed with gaseous hydrogen, H_2, were passed through a silica tube at low pressure. When a portion of the tube was heated to about 800° C. the tetramethyl lead was decomposed and a mirror of metallic lead deposited on the internal surface of the tube. The gaseous products of the decomposition were found capable of causing the disappearance of a second lead mirror, deposited at a more distant cool point in the tube. Since none of the recognized stable products of the decomposition was able similarly to dissolve a lead mirror, the inference was drawn that methyl radicals. formed in the high-temperature decomposition. reacted with lead at the cool mirror to regenerate tetramethyl lead. The methyl radicals obtained in this way proved to be highly reactive and short-lived. They not only reacted with lead and other metals, but disappeared rapidly and spontaneously, largely by dimerization to ethane, CH_3CH_3. In hydrogen at a total pressure of 2 mm.; *e.g.*, the concentration of methyl radicals was estimated to decrease to half its original value in about 0.006 seconds. In subsequent years, techniques for producing reactive free radicals in the gas phase have been greatly extended by Paneth and his co-workers and many other investigators. It has been found that a variety of unstable species such as ethyl. $\cdot C_2H_5$, propyl, $\cdot C_3H_7$, and hydroxyl, $\cdot OH$. can be obtained by several methods which include: (1) the thermal or photochemical decomposition (see PHOTOCHEMISTRY) of a wide variety of organic and inorganic materials; (2) the reaction between sodium vapour and an alkyl halide; (3) the discharge of electricity through a gas at low pressure. Atoms which arise from dissociation of a diatomic molecule (such as the chlorine atom, $\cdot Cl$, from the dissociation of the chlorine molecule Cl_2) can also be obtained, and have the properties of short-lived radicals of this type.

The existence of the various known unstable free radicals, like that of methyl itself, is most commonly demonstrated by the reactions which they undergo. Thus, ethyl radicals, formed from tetraethyl lead. $Pb(C_2H_5)_4$, dissolve zinc and antimony mirrors. The resulting ethyl derivatives of zinc and antimony, $Zn(C_2H_5)_2$ and $Sb(C_2H_5)_3$, have been isolated and identified by the usual chemical and physical tests. In a few instances, unstable radicals also have been identified spectroscopically. Here the important technique of flash photolysis, the use of a single, intense flash of light to produce a momentary high concentration of free radicals, has been developed by R. G. W. Norrish and G. Porter.

Transient unstable free radicals also may be produced in the liquid phase (*e.g.*, in solution in a liquid solvent) by several means. A number of molecules, of which organic peroxides are typical, possess such weak chemical bonds that they decompose irreversibly into free radicals on warming in solution. The behaviour of diacetyl peroxide,



has been studied by M. S. Kharasch, M. Szwarc and others, and it is considered to decompose, at least in large part, into carbon dioxide. CO_2, and methyl radicals.

These in turn rapidly attack most organic solvents, often by abstracting hydrogen to give methane, CH,, together with other products. Irradiation of solutions of many organic substances with ultraviolet light leads to the absorption of sufficient energy to disrupt chemical bonds and produce free radicals, and in fact most photochemical processes are at present thought to involve free radical (sometimes diradical) intermediates. The chemical changes which occur when solutions (and also gases) are exposed to high-energy radiation (α, β, and γ rays from nuclear reactions, X-rays, electron beams. etc.) also frequently appear to involve the transient formation of free radicals. Thus, a major consequence of passing high-energy radiation into water. H_2O, is believed to be its dissociation into hydroxyl radicals. $\cdot OH$, and hydrogen atoms, $\cdot H$. Short-lived radicals are also formed in some oxidation-reduction processes. Organic hydroperoxides of the general formula R—OOH react rapidly with ferrous ion. Fe^{++}, the first step being the formation of ferric ion, Fe^{+++}, hydroxide ion, $OH-$, and an alkoxy radical, $RO\cdot$.

An interesting method for prolonging the lifetime of highly reactive radicals is to produce them in a glassy or solid medium where they are unable to diffuse together and disappear by dimerization and similar processes. The technique was first developed by G. N. Lewis who irradiated various organic molecules, chiefly dyes, in glassy solvents at liquid air temperatures and was able to observe the colours of the resulting unstable radicals, mhich, in some cases, could be preserved for days. Similarly, the irradiation of organic plastics (and many other solid organic materials) with high-energy radiation at ordinary temperatures can produce high concentrations of trapped radicals which may be detected and studied via their paramagnetic resonance spectra.

Radicals as Intermediates in Chemical Reactions.—It is commonly believed that free radicals are transient intermediates in many high-temperature reactions such as combustion and the thermal cracking of hydrocarbons, in many photochemical processes, and in a number of other important reactions in organic chemistry, although their concentrations are in general too low for direct detection. One class of free radical reaction is of particular importance, and is illustrated by the following example. Methane. CH,, reacts with chlorine, Cl_2, by an over-all process which gives methyl chloride. CH_3Cl, and hydrogen chloride. HCl. The reaction is enormously accelerated by light, and apparently involves the following steps:

$$Cl_2 \xrightarrow{\text{light}} 2Cl\cdot \qquad (1)$$

$$Cl\cdot + CH_4 \longrightarrow \cdot CH_3 + HCl \qquad (2)$$

$$\cdot CH_3 + Cl_2 \longrightarrow CH_3Cl + Cl\cdot \qquad (3)$$

$$2\,Cl\cdot \longrightarrow Cl_2 \qquad (4)$$

Chlorine atoms are produced in (1) and destroyed in (4), while the products which are actually isolated arise from (2) and (3). Since chlorine atoms consumed in (2) are regenerated in (3). a single atom of chlorine can lead to the production of many (actually many thousand) molecules of methyl chloride. Such processes, in which an intermediate is continually regenerated, are known as chain reactions and their study constitutes an important branch of chemical kinetics (for further details see articles on CATALYSIS; REACTION KINETICS; and POLYMERIZATION). Similar chains involving transient free radicals are involved in the halogenation of many other organic molecules, in many of the polymerization reactions employed in the manufacture of plastics and synthetic rubber, and in the reaction of molecular oxygen, O_2, with a great number of organic molecules. In general these chain processes occur with great rapidity—a typical lifetime of a chain may be of the order of a second. during which many thousands of individual steps such as (2) and (3) may occur—although at any one time perhaps only one molecule out of 10^9 in the system exists as a free radical. Since a relatively small number of free radicals can produce significant chemical reaction in this manner, the initiation of typical radical chain processes (such as polymerization of certain unsaturated molecules) provides one of the best demonstrations of the existence of transient free radicals in chemical systems.

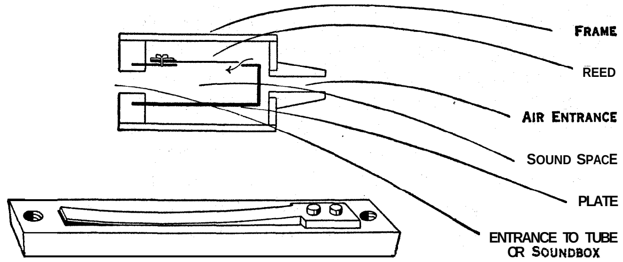
While most reactions of molecular oxygen with organic molecules appear to involve free radical intermediates, the situation in other oxidations and reductions depends much upon the particular system involved. Thus, the oxidation of isopropyl alcohol, $(CH_3)_2CHOH$, to acetone, $(CH_3)_2C{=}O$, by ferrous ion and hydrogen peroxide apparently involves the intermediate radical $(CH_3)_2\dot{C}-OH$. On the other hand, there is good evidence that when chromic acid, H_2CrO_4, is the oxidizing agent, the oxidation occurs in one step without the intervention of any intermediate radical. Basically, the presence or absence of intermediate free radicals in oxidations and reductions depends upon whether the reactions involve the transfer of single electrons (which necessarily produces an odd molecule as an intermediate), or involve two-electron transfers (which do not produce odd molecules). In many reactions, including most of the important oxidation-reductions occurring in biochemical systems, which sort of path is followed is not yet known.

Hine, *Physical Organic Chemistry* (1956). (C. WG.)

FREE REED VIBRATOR, in musical instruments, a thin metal tongue fixed at one end and vibrating freely either in surrounding space, as in the accordion and concertina, or enclosed in a pipe or channel, as in certain reed stops of the organ or in the harmonium.

Air under three different conditions must be dealt with in considering the acoustics of the sound produced by free reeds: (1) the stationary column in pipe or channel containing the reed, nhich is normally at rest; (2) the wind or current of air fed from the bellows with a variable velocity and pressure, which is broken up into periodic air puffs as its entrance into pipe or channel is alternately checked or allowed by the vibrator; (3) the disturbed condition of no. 1 when acted upon by the metal vibrator and by no, 2, whereby the air within the pipe is forced into alternate pulses of condensation and rarefaction.

The most valuable characteristic of the free reed is its power of producing all the delicate gradations of tone between forte and piano by virtue of a law of acoustics governing the vibration



FROM DUFF, "TEXT-BOOK OF PHYSICS" AND HELMHOLTZ, "THE SENSATIONS OF TONE"
DIAGRAM ILLUSTRATING ACTION OF THE FREE REED VIBRATOR (ABOVE) SHOWING DIRECTION OF AIR CURRENT WHICH CAUSES VIBRATION OF FREE END OF REED; AND (BELOW) PERSPECTIVE OF ORGAN REED

of free reeds, whereby increased pressure of wind produces a proportional increase in the volume of tone. The sound produced by the free reed itself is weak and requires to be reinforced by means of an additional stationary column or stratum of air. Free reed instruments are therefore classified according to the nature of the resonant medium provided: (1) free reeds vibrating in pipes, as in organs; (2) free reeds vibrating in reed compartments and reinforced by air chambers of various shapes and sizes. as in the harmonium (*q.v.*); (3) free reeds set in vibration through a valve. but having no reinforcing medium, as in the accordion and concertina. The quality of tone of free reeds is due to the tendency of air set in periodic pulsations to divide into aliquot vibrations or loops, producing the phenomenon known as harmonic overtones or upper partials, which may, in the highly composite tone of free reeds, be discerned as far as the 16th or 20th of the series. For the history of the application of the free reed to keyboard instruments. see HARMONIUM.

FREESIA, a genus of South African herbs belonging to the Iris family (Iridaceae), containing three species but scores of horticultural forms. The plants grow from a bulblike corm (as in *Gladiolus*) which sends up a tuft of long narrow leaves and a slightly branched stem bearing a few leaves and loose! one-sided spikes of fragrant. narrowly funnel-shaped. but slightly irregular flowers, which are typically yellow, but white, pink or red in some of the horticultural forms. They form pretty greenhouse plants which are readily increased from seed. They are extensively grown for the florists, as their fragrance is much desired. By potting successively throughout the autumn a supply of flowers is obtained through winter and spring.

The culture of freesias in the United States is extensive. Corms are planted in a rich loam, somewhat sandy, about the middle of August and kept in a cool greenhouse. By planting every two weeks, bloom is extended until March or April, although they are normally winter-flowering. (N. TR.)

FREE-SOIL PARTY, a minor 19th-century U.S. political party which opposed the extension of slavery. The Free-Soilers later became one of the component elements in the Republican party on its organization in the mid-1850s.

Abolitionists were scarce in mid-19th century United States but opponents of the slave power as it dominated the national government were growing in numbers. When Pres. James K. Polk, in 1846, asked congress for an appropriation to be used in settling the Mexican boundary, Rep. David Wilmot moved that the money be granted provided that any territory bought with it be free soil. This Wilmot proviso was,defeated but it was to provide the fundamental principle of the emerging Free-Soil party.

In 1848, when over 500,000 sq.mi. were acquired from Mexico, Free-Soilers insisted that slavery be forever excluded from this land. They knew that otherwise states formed from it would strengthen the slave power with more senators, representatives and presidential electors.

In Aug. 1848 the Free-Soilers held their first national convention at Buffalo, the geographic centre of the zone of greater New England settlements, New England furnishing the strongest 19th-century opposition to the extension of slavery. Seventeen states sent delegates, among whom were antislavery Whigs, antislavery Democrats and the remnants of the declining Liberty party, all determined to fight extension of slavery. They were less exasperated with slavery as an institution than with the slave power which dominated the national government in the interest of cotton and tobacco to the neglect of important northern interests.

The ideology uniting Free-Soilers was not abolition of slavery but repugnance to the presence of the Negro and they wanted no Negroes, either free or slave, in the territories. "Let the soil of our extensive domains." as they put in their 1848 platform, "be kept free for the hardy pioneers of our own and the oppressed and banished of other lands, seeking homes of comfort and fields of enterprise in the New World." The final plank contained their historic slogan, "Free soil, free speech, free labor, and free men." They nominated former Pres. Martin Van Buren of New York for president and Charles F. Adams of Massachusetts for vice-president but polled only slightly more than 10% of the popular vote for president.

In 1852 the Free-Soil candidates were John P. Hale for president and George W. Julian for vice-president; they polled not quite 5% of the popular vote. In 1856 the Free-Soilers were absorbed by the new Republican party (*q.v.*), which had adopted the Free-Soil program. In terms of economic interests the Free-Soilers constituted a combination of small farmers, village merchants, household and mill workers and debtors.

See Theodore Clarke Smith, "The Liberty and Free Soil Parties in the Northwest," ***Harvard*** *Historical Studies,* vol. vi *(1897).*

(W. E. BY.)

FREESTONE, stone used in architecture for mouldings, tracery and other work required to be worked with the chisel. The oolitic stones (*i.e.,* limestones) are generally so called, although in some countries soft sandstones are used; in some churches an indurated chalk called clunch is employed for internal lining and for carving.

FREETOWN, the capital and main port of the independent state of Sierra Leone, west Africa, lies on the south side of the estuary of the Sierra Leone river, about 5 mi. E. of the cape of that name. Pop. (1957 est.) 80,000. It stands on the seaward tip of the range of wooded hills to which the Portuguese Pedro da Cintra gave the name Sierra Leona ("Lion Mountains") about the year 1460.

The climate is humid, wet tropical and trying for the white man, with an annual average rainfall of 138 in. Health conditions have, however, been greatly improved.

Freetown possesses one of the world's finest natural harbours, in which more than 250 ships sheltered at one time during World War II when it was an important naval base. The city extends along the water front for a few miles and rises inland on gently sloping ground. The historic buildings and places of interest include the Anglican St. George's cathedral (1852); the old Fourah Bay college building (1851); Fort Thornton, residence of the governor, first built in 1796 and modernized in 1952; the giant silk cotton tree (1787); and the stone bearing the name of the Dutch admiral Michel Adriaanszoon de Ruyter who landed there for uater in 1664. New modern buildings for the Fourah Bay University college (affiliated with the University of Durham, Eng.) on Mount Aureol, which overlooks the city, and new commercial offices (including the country's first seven-story building) are rapidly changing the town centre. In 1957 a museum was opened near the famous cotton tree. The main streets include Water street, along the water front; Westmoreland street. running through the central ward; and Kissy street, leading to the eastern suburbs and into the main trunk road to the provinces.

The airport of Lungi is 10 mi. N. on the sea coast across the estuary. Air services link Freetown with Europe and with other parts of west Africa and the world, and there is an internal air service between Freetown and provincial towns. The port has a deep-water quay, and there are regular shipping services between Freetonn and British and other overseas ports. A government-owned railway and a steadily expanding road system link the city with provincial centres.

Freetown is not an industrial city. As the chief port of Sierra Leone. the country's principal exports and imports pass through it, and many of the inhabitants are occupied in handling the merchandise. Many others, including women, are engaged in professional and public services. A large proportion of the merchants are Lebanese.

Freetown was founded as an attempt to atone for the horrors of the slave trade which made the area now occupied by the city and surroundings a raiding ground for about three centuries. In the movement to abolish slavery, Freetown was designed as a home for slaves freed and destitute in England. The first settlers were sent out in 1787; and in 1790 the enterprise was taken on by the Sierra Leone company, which was given a royal charter in 1799 Freetown acquired effective municipal government in 1893 and was, before independence in 1961, the oldest British colonial municipality in Africa. The descendants of the liberated Africans. known as Creoles, are a minority in the city. The majority of inhabitants are members of the country's two largest tribal groups, the Mende and Temne *See* also SIERRA LEONE. (T. A. L D.)

FREE TRADE, the antithesis of protection (*q.v.*), is a policy by which a government does not discriminate against imports in favour of national products or interfere with exports in order to favour consumers in the home market. This meaning became accepted usage in the struggle to abolish the English Corn laws (import duties on nheat and other grain) in 1846. Before then the term was used in other senses. Thus, early in the 17th century "free trade" bills were promoted by those seeking entry into the closed corporations of the chartered companies (such as the East India company). Later, "free trade" nas used to mean the right to trade in a foreign region without joining a company. It was sometimes used as a euphemism for smuggling.

Free trade does not mean that a government abandons all control and taxation of imports and exports; merely that this control and taxation is not used to protect the home producer against foreign competition or to favour the home against the foreign consumer. Thus, if an import tax is imposed for revenue, it is countervailed in a free trade system by an excise duty on home-produced goods. Export taxes formed an important part of the British protective system in the 18th century and mere so much resented by the American colonists that section 9 of the constitution of the United States included export taxes among the poners denied to the federal government.

The Case for Free Trade. — There is a long history of the struggle for free trade in the broadest sense of absence of governmental restraint upon the freedom of traders to move and to transact business within a country and between countries. It was widely discussed by the French Physiocrats, an 18th-century school of economists who coined the phrase *laissez faire, laissez aller* (let them act, let them go) still used to describe free enterprise. *(See* PHYSIOCRATIC SCHOOL.) Freedom of movement and trade was deduced from the philosophic principle of natural liberty.

The Scottish philosopher Adam Smith applied the principle to economic activity, and particularly to trade. in his *Inquiry Into the Nature and Causes of the Wealth of Nations,* published in 1776. The economic case for free trade is still based on his argument that division of labour leads to specialization, efficiency and greater production. Each country will specialize upon producing those goods for which it has natural advantages and therefore cheaper costs of production. It will be driven by competition to efficient methods.

There is also a strong political case for which Adam Smith's work laid the foundation. If governments interfere with competition to protect local interests, there is great danger that small and inefficient producers will be subsidized at the expense, not of the foreigner, but of the majority of their fellow countrymen, who as consumers must pay higher prices. bloreover, the regulation of trade becomes expensive and cumbersome. Duties and regulations which serve no useful purpose survive and develop into a network of restrictions.

Adam Smith's argument was particularly effective on this political level. His economic argument was elaborated by the English school of classical economists headed by David Ricardo (1772–1823), who propounded the theory of comparative costs. This theory explained the advantages of specialization. The argument for free trade on a competitive private enterprise basis was systematized by John Stuart Mill (1806–73) and was accepted by the majority of economists well into the 20th century. After the turn of that century economic discussion centred not upon the case for securing the maximum of production by territorial division of labour, but upon the division of the gains between trading countries. It was shown that there are cases where governmental intervention may, in theory, secure to a country a greater share of the gain from its external trade than nould accrue under free competition. There are obvious administrative difficulties in timing such intervention and in judging its extent; but the theoretical argument weakened the economic case for free trade.

Economists since Adam Smith have always recognized that exceptions to free trade might be justified on noneconomic grounds. Smith himself made exceptions on grounds of defense, to countervail domestic taxation, to retaliate against other countries and on grounds of humanity when foreign competition might inflict hardship upon great numbers of norkers. Following the publication of J. M. Keynes's *General Theory of Employment, Interest and Money* in 1936. and the widespread acceptance of "full employment" as a criterion of economic policy, this latter exception became the main argument against free trade. It was reinforced in countries of backward industrial development by the argument that temporary protection is necessary to modernize production methods. It should be recognized, honever, that in practice much of the protection extended to local industries may be a device in which minority interests justify their action by invoking patriotic reasons that will not bear analysis. Despite theoretical refinements and exceptions, many economists claim that the broad economic case for free trade has never been refuted.

Adam Smith's criticism of arguments for protection and of the administrative abuses of protective practices quickly stimulated a movement toward freer trade. In 1786 William Pitt the Younger negotiated a commercial treaty with France, which lowered tariffs and removed prohibitions in both countries. War broke out in 1793 and further steps toward free trade were not possible until after the end of the Napoleonic wars in 181j.

METHODS OF PROMOTING FREER TRADE

There are three methods of achieving freer trade. The most direct and effective is the unilateral reduction of trade barriers by each country independently of the policy followed by other countries. This was the method advocated and carried to completion by the British free trade movement in the second quarter of the 19th century. A second method, not in conflict with but supplementary to the first, is the negotiation of bilateral commercial treaties or agreements in which a reciprocal bargain is struck to remove tariff and other trade barriers to an approximately equal degree in both countries. It is the oldest method, since commercial treaties have a very long history; but it was given new life by the Anglo-French treaty negotiated by Richard Cobden and Michel Chevalier in 1860. The method of bilateral negotiation was also used in the agreements made by the United States after the Reciprocal Trade Agreements act in 1934. The third method, folloned after the negotiation of the General Agreement on Tariffs and Trade at Geneva in 1947, is the multilateral negotiation of a simultaneous agreement among many countries.

Unilateral Free Trade. — After the Napoleonic wars, a strong free trade movement in Britain was directed and financed by manufacturers and merchants who tried to break the power of the landowners, so that food and raw materials might be imported more cheaply. The British tariff was then very complicated, partly because it was the result of special legislation accumulated over a long period, partly as a result of the additional duties imposed to finance the wars. When William Huskisson became president of the board of trade in 1823 he found no fewer than 1,500 statutes operative. He began to consolidate and simplify these statutes as well as the supporting regulations and customs procedures. The Navigation acts, which imposed heavy duties on a long list of enumerated articles if carried in foreign ships, were an important part of the protective system. In 1823 a Reciprocity of Duties bill relaxed the acts. Huskisson also reduced import duties on such materials as raw silk and wool, lowered the export duty on wool and gave artisans freedom to emigrate.

The main battle for free trade, however, was fought over wheat. With growing population and developing industrial manufactures, Britain had become a wheat-importing country. Prices, and with them the rent of agricultural land, rose during the Napoleonic wars as a result of inflation and restricted imports. In 1815 and 1822 import duties were raised in an effort to maintain prices, but deflation followed the wars and there was an outcry against high bread prices in recurring crises of unemployment and falling prices, notably in 182 j–26. The privy council was then authorized to suspend the wheat duties as an emergency measure, but in 1828 a Tory government imposed a sliding-scale tariff in which duties went up as prices went down. The landowners controlled parliament. Until the Reform bill of 1832 extended the franchise and redistributed seats, the manufacturing north of England had little political power. In 1837 another acute crisis brought an Anti-Corn-Law league into existence in London. Leadership, however, was taken over by the league formed in Manchester in 1838. Richard Cobden and John Bright, two cotton manufacturers, devoted themselves to a great campaign of education and agitation throughout the country. They identified free trade with the cause of peace, attacked the landowners and adduced practical examples of the costs of protection. Resistance was strong, but minor tariff concessions were obtained, notably in 1842. In 1845 the English harvest was short and the Irish potato crop failed almost completely. The league redoubled its efforts. In June 1846 Sir Robert Peel reduced the wheat duties immediately and abolished them as from 1849.

In 1849 also the Navigation acts were abolished. Successive budgets, notably those of W. E. Gladstone in 1853 and 1860, continued the process of tariff reduction. The latter incorporated the reductions negotiated in the Cobden-Chevalier treaty. By 1874, when some timber duties were abolished, the British tariff was reduced to a small number of revenue duties on such items as spirits, wine, beer and tobacco, countervailed by excise duties on competing domestic products. Shipping was freed of protective restraints and migration of persons was also freed. All export duties were abolished.

Britain, in its own interests, had adopted complete free trade and maintained it until World War I, when "safeguarding duties" were introduced. The principle was not abandoned until the great depression of the 1930s, when a protective tariff was again adopted. During the free trade era which lasted for nearly three-quarters of a century, Britain was the greatest manufacturing, shipping and investing country in the world, but became dependent upon imports for the bulk of its food and raw materials.

Not only the United Kingdom, but the dependent empire. including India, Burma, Malaya and the African and West Indian colonies, followed a free trade policy. Most of the self-governing colonies which later became dominions imposed protective tariffs for development; but the rest of the British empire was a solid free trade area until 1932.

Bilateral Commercial Treaties.—There is a long history of commercial agreements dating back to antiquity. They were common between towns and city-states in the middle ages. As nation-states developed, friendly states from time to time concluded trading agreements. Some British commercial treaties still in force in the 1950s date from the middle of the 17th century. The United States signed its first commercial treaty with France in 1778. Treaties with the Netherlands (1782), Sweden (1783) and Prussia (178j) preceded the important treaty with Britain (1794).

The 19th-century world trading system was built upon a commercial treaty network. The rights of private traders and of private property were guaranteed. A substantial body of international law in specific detail was accepted over the larger part of the trading world and gave legal security to international enterprise and investment. Traders were free to come and go, organize, invest and trade almost as freely and as safely abroad as at home. They travelled without passports or visas, could buy or rent property, employ labour and take legal proceedings on an equal footing with nationals. Customs formalities were simple. There were no monetary and few immigration controls at the frontiers. Exchange rates were stable because the national currencies were pegged on gold and freely convertible. The principle of "national treatment" by which an alien was placed on an equal footing with nationals was not only embodied in treaties of commerce and navigation but was defined in detail and supported by a growing body of case law.

This legal basis for trade was more important than the reciprocal tariff reductions sometimes embodied in commercial treaties. When Cobden and Chevalier negotiated the Anglo-French treaty of 1860. they were attacked by free trade advocates who maintained that each country should reduce its tariffs unilaterally and not clutter the treaties and endanger the continuance of their legal guarantees by injecting the tariff issue. However, the successful conclusion of this treaty initiated a chain of similar agreements incorporating tariff reductions among many European countries.

The effect of reduced tariffs was generalized by widespread adoption of the "most-favoured-nation clause." Before the end of the 18th century it had become common for the parties to a bilateral commercial treaty to guarantee to each other treatment as favourable as that accorded to any other country. The wording of this clause became standardized. Incorporated in the Anglo-French treaty of 1860 and copied in subsequent treaties, it became a powerful instrument of tariff reduction. Every reduction in any treaty immediately applied to imports from all countries enjoying most-favoured-nation treatment with the country making the reduction. Moreover, treaties ran for long periods and sometimes until denounced, so that it became more difficult to engage in tariff wars or retaliations since the lower duties were embedded in the treaty network. The general adoption of most-favoured-nation treatment is best described by the modern American phrase "equality of trading opportunity."

There were two forms of the clause—conditional and unconditional. The former accorded the lower duties only when there were reciprocal concessions by another trading country. The latter grants them, without any question of reciprocal concessions, to every country with which there is a treaty incorporating the clause. The United States adhered to the conditional form until 1923, when it adopted the practice, by then almost universal, of the unconditional form. It had proved difficult to define the reciprocal concessions that warranted application of the conditional clause.

The method of bilateral negotiation, incorporating most-favoured-nation treatment, was adopted by the United States in the Reciprocal Trade Agreements act of 1934. This act gave power to the administration for three years to negotiate executive agreements rather than treaties requiring the advice and consent of two-thirds of the senate. The act was renewed by congress at periodic intervals thereafter. Between 1934 and the entry of the U.S. into World War II in Dec. 1941, agreements were signed with 17 countries. By July 31. 1955, the United States was a party to trade agreements, including the General Agreement on Tariffs and Trade, with 44 other countries. Many of these had been amended. The original act in 1934 gave power to the administration to raise or reduce duties up to a limit of 50%. The 1945 renewal gave power to cut duties up to 50% of the existing level, even if they had already been cut 50% from the original levels of the 1930 (Hawley-Smoot) tariff. An effort was made to make the reduction in the agreement with the "principal supplier" of an import. but most-favoured-nation treatment generalized the reduction to all suppliers.

The United States had moved substantially toward a low-tariff policy, but foreign exporters pointed out that the tariff remained effective on competitive imports, that the complicated and restrictive regulations, particularly for valuation of imports, remained those of the Tariff act of 1930, and that other protective methods such as import prohibitions and quotas, export subsidies and excise taxes on imported raw materials had been used to nullify the effect of tariff reductions. The power of review given the bipartisan tariff board to investigate any reduction which might injure a domestic industry crippled the potentiality of the Reciprocal

Trade Agreements act. While there was evidence of gro ing support in big business and banking circles for free trade, there was widespread opposition from groups, including farm organizations, which feared import competition in the home market. No movement for unilateral tariff reduction had developed in the United States, and the limits of bilateral negotiations were narrowed after renewal of the Reciprocal Trade Agreements act in 1948.

The United States had taken the lead, however, in negotiating new bilateral treaties of commerce and development, designed to replace the older treaties of commerce and navigation. "National treatment" was worked out in regard to investment, transfer of profits, taxation, employment policies and other modern issues. The number of treaties negotiated along these lines grew slowly, primarily because it was difficult to reconcile the viewpoints of the developing countries with those of the creditor countries. Double taxation treaties were even more difficult to negotiate since no government likes to exempt its citizens from taxes even on income earned abroad and likes still less to exempt resident aliens from taxes on income earned in its own territory. The attempts made to negotiate such treaties, however, indicated that the nature of trade in the second half of the 20th century would be different from the 19th-century trade based on treaties of commerce and navigation. Large corporations rather than individual traders, complex manufacturing operations rather than simple mechanical processes, heavy capital investments rather than mercantile offices had created relations which were not foreseen by the earlier treaties. The negotiation of treaty bases upon which the new forms of trade might develop was hampered by extensive government intervention involving heavy taxes. Greatest progress had been made by the corporations themselves, negotiating directly with governments ,where they wish to expand.

Return to Protection. — The leaders of the 19th-century British free trade movement insisted that, whatever other countries might do. unilateral free trade would benefit Britain. They believed that other countries would realize this and follow the British example. The belief was not unreasonable in the first flush of success. There was a spurt of production and overseas trade in the 1850s, aided by rising price levels after the California (1849) and Australian (1851) gold discoveries. The competition of imported foodstuffs. mainly wheat from the United States. did not become serious until the extension of railroads and steam shipping poured a flood of cheap grain into European ports in the 1870s. This coincided with the collapse of inflationary price levels following the Civil War in the United States and the German wars in Europe — Denmark (1864). Austria (1866) and France (1870). During the 1860s there had been a widespread movement toward free trade among European countries. The proclamation of the German empire at Versailles in 1870 disturbed the European balance of power and checked this movement. The increasing volume of cheap American grain endangered agricultural stability and reinforced the demand for a return to protection in France and most other European countries. Britain sacrificed its agriculture and concentrated on manufacturing for export. The freedom of the London money market and the great volume of commerce and finance cleared through London made it the commercial capital of the world. where transactions were financed and cleared. As Germany, the United States and Japan challenged British manufactured exports in world markets, these commercial and financing functions became more important to the British economy. Only a few small western European countries to which trade was important — Belgium, Denmark. the Netherlands and Switzerland—followed the British free trade example.

Until World War I, the main challenge to British supremacy in world trade came from Germany. Manufacturing capacity of the United States expanded rapidly but was mainly absorbed by the domestic market. During the Civil War high tariffs to countervail the multiplicity of direct taxes imposed by the North to finance the war were maintained after domestic controls and taxes were abolished. Support for free trade had been concentrated in the cotton-exporting South, which lost its political influence after the war. But neither the United States nor the self-governing British colonies competed seriously with British manufactures in export markets. Japan built its manufactures with government aid behind a protective tariff and was beginning to compete particularly in the markets for cheap textiles. but did not establish its shipping and trade on a world basis until after World War I.

There had been a strong free trade movement in Prussia after the Napoleonic wars. The Prussian tariff of 1818. under the influence of *Smithianismus,* reduced duties heavily. A combination of this free trade movement with German nationalism led in 1834 to the formation of the most famous of all customs unions. the *Zollverein.* All trade restrictions were abolished. so that there was complete free trade among the German states. The British free-traders applauded this development and opposed Palmerston's manoeuvres designed to prevent or delay the customs union. Externally. also, the Zollverein pursued a low-tariff policy. which was continued in the first years of the German empire. Both the industrialists of the Rhineland and the large landholders (Jrrnkers) of eastern Germany. who exported grains mainly to Britain. supported free trade. However, when France reverted to protection after 1870 and the free trade movement in Europe was checked. Bismarck negotiated in 1879 a new political agreement upon a basis of protection both for industry and for agriculture. This was known as the compact of iron and rye. By this time American grain exports had conquered the British market and were landing in German ports. After 1879 Germany pursued an active policy of state encouragement to industry and agriculture behind a high protective tariff. Externally also state aid was given to the drive for world trade, shipping and investment in the form of consular services, language training, subsidies and credit facilities. The applied science and technical training which was a feature of German universities and industrial laboratories gave leadership in the new chemical and electrical industries as well as metallurgy and dyes. German world trade and investment were expanding and the mark was becoming a world currency competing with sterling, when resort to arms in 1914 resulted in complete defeat.

German experience threw light upon the possibility that regional customs unions might be used as an approach to world-wide free trade. A customs union eliminates duties within the union. The price is usually adoption by all parties of the tariff of one protectionist participating country. This was the case with the United States, which based its first tariff on Pennsylvania's. The German Zollverein had a low-tariff policy for more than 40 years, but when it adopted protection it was a formidable cause of protectionism elsewhere. There is no assurance that the regional route to free trade (or peace) will not end in creating larger units of economic warfare. The only promising route is by unilateral tariff reduction on the part of the great trading and creditor countries.

After World War I Britain's position had been weakened and its vulnerability demonstrated. Other countries continued the reinforced protective policies adopted during the war. In 192j Britain returned to a gold basis for sterling at the prewar parity and was involved in deflation at home and intensified competition in export markets. When the great depression was signalled by the collapse of the New Tork stock market in Nov. 1929, financial difficulties in Europe led to the depreciation of sterling in Sept. 1931. At this point Britain reverted to a protectionist tariff and simultaneously adopted both imperial preference, with lower duties on empire goods, and protective tariffs in the dependent colonies.

Later Methods *of* Trade *Regulation.*—After the breakdown of the international gold standard and Britain's reversion to protection in the great depression of 1929–33, a new array of protective trade restrictions was developed. At first these were emergency devices to check swollen imports from demoralizing national markets, prevent panic flights of capital and safeguard national currency systems from inflationary risks consequent on unbalanced external payments. These devices were ad *hoc.* Each country in the panic of 1931 dealt with its own trading unbalance as best it could. The methods fell mainly into two groups — direct restrictions on the quantities of particular imports, and restrictions on the use of foreign exchange. however acquired. After years of experiment and negotiation it became clear before the outbreak of World War II that exchange control had become the effective overriding technique of trade regulation. Import quotas, price controls and bilateral commodity agreements in various forms were supplementary techniques. The ultimate control was the power of a government to centralize dealings which resulted in its citizens' acquiring or losing purchasing power in other countries Such dealings might be in the form of trade, exporting goods for sale or importing precious metals or other valuables to hoard; or they might be monetary and speculative. Once embarked on the regulation of external transactions, governments were forced to extend their control over all payments entering and leaving the country. Such control was systematically centralized in monetary authorities.

War financing, together with the organization of economic warfare, increased the effectiveness of these systems of state regulation, gearing the external with the internal controls over national economies. When the war ended in 1945, there had been something approaching a codification of these restrictive trade and monetary practices, together with an evolution and rationalization of bargaining procedures in a succession of bilateral and multilateral conferences. A generation of officials and businessmen had grown up with no experience of free competitive trading on the basis of stable convertible currencies. A generation of economic theorists had come to regard restrictive trade practices as normal, From 1914 through 1955 there had been an approximation of exchange stability and free trading for only four years—between 1925 when Britain and many other countries returned to the gold standard and 1929 when the stock market crashed in New York.

The Bretton Woods agreements negotiated among the western Allies in 1944 were intended to set up funds adequate to provide exchange reserves that could be drawn upon by countries which needed temporary support when their external payments were freely resumed on a basis of competitive trade. It was recognized that exchange controls and their supplementary devices could not be abolished immediately. A transitional period was envisaged. But the countries which agreed to set up the International Monetary fund and the International Bank for Reconstruction and Development did so with the understanding that after this transitional period exchange controls and quantitative import restrictions would be abolished. (*See* BANK FOR RECONSTRUCTION AND DEVELOPMENT, INTERNATIONAL.) The final act of the Bretton Woods conference urged national governments to create "in the field of international economic relations conditions necessary for the attainment of the purposes of the Fund and of the broader primary objectives of economic policy." Earlier. in the financial agreements providing for lend-lease aid. each of these governments had pledged itself "to the elimination of all forms of discriminatory treatment in international commerce, and to the reduction of tariffs and other trade barriers."

Nevertheless, the discriminatory and restrictive practices of exchange control a-ere extended and consolidated after the war ended. Greater emphasis was placed by most governments. and particularly by the British government, upon the principle of full employment. This had also been written into the master lend-lease agreements, into the charter of the United Nations and into many other international agreements. Conflict developed between the attainment of domestic stability at full employment on the one hand and external stability on the other. There was a considerable liberalization of trade between the western European countries, members of the European Payments union created in 1950. At the same time preparatory steps were taken in the United Kingdom to relax restrictions on sterling convertibility into currencies other than the dollar. In the latter 1950s, however, most countries still employed import quotas and exchange control regulations.

Multilateral Tariff Negotiations.—Economic nationalism after the 1930s made bilateral negotiations less effective. Tariff duties became less important as compared with other kinds of government intervention. Most-favoured-nation treatment had been applied in tested detail to tariff duties, but no formula could be found to assure it in respect of exchange and quota allocations, government purchases and price controls. Moreover, trade and payments are not bilateral. The transactions between two countries affect other countries, so that there is a chain of payments among all trading countries. When World War II ended in 1945, it became clear that multilateral action was necessary both to restore the treaty basis and to attack the new discriminatory obstacles to trade, such as quotas and exchange control.

The United States in 1944 initiated negotiations aiming at creating an International Trade organization (I.T.O.) as a United Nations agency comparable with the International Monetary fund. The charter of the I.T.O. was designed as a pledged statement of the rules for freer trade. In successive conferences at London (1946), Geneva (1947) and Havana (1947–48), the charter mas elaborated with so many exceptions and escape clauses that Pres. Harry S Truman decided not to submit it to congress for ratification. It therefore did not become operative.

At the Geneva conference, however, a group of 23 nations signed a General Agreement on Tariffs and Trade (G A.T.T.), incorporating the substance of the charter as originally proposed by the Cnited States. The secretariat of G.A.T.T. called successive conferences and secured new adherents At each conference further tariff reductions were negotiated multilaterally. At the end of 1955, there were 35 members of G.A.T.T. Proposals had been made in that year for the creation of an Organization for Trade Cooperation (O.T.C.) to administer the existing agreements and call annual conferences

BIBLIOGRAPHY.—The best understanding of Adam Smith is to be gained by reading *The Wealth of Nations* itself, especially part iv. For the classical theory *see* Jacob Viner, *Studies in the Theory of International Trade* (New York, London, 1937). The free trade movement is discussed by J. B. Condliffe in *The Commerce of Nations* (New York, 1950; London, 1951). Developments after World War II can be studied theoretically in Donald Bailey Marsh, *World Trade and Investment* (New York, Toronto, 1951), and Paul T. Ellsworth, *The International Econonzy* (New York. London, 1950), and from a policy standpoint in Condliffe, *op. cit.*, and in William Adams Brown, Jr., *The United States and the Restoration of World Trade* (Washington, D.C., London, 1950). (J B CE.)

FREE VERSE is a prosodic term used in so many ways that it has almost lost any useful meaning, but it was originally a literal translation of the French *vers libre*. When Francis Vielé-Griffin declared in his preface to *Joies* (1888–89), "Le vers est libre," he gave a name to a kind of poem being written in France in the 1880s on novel prosodic principles. The French language does not havc accent or stress on fixed syllables as in English, and until about 1880 metrists believed that the number of syllables was the basic principle of French versification, which used mainly the alexandrine (*see* ALEXANDRINE VERSE). Victor Hugo began the loosening up of the rigid alexandrine and the Symbolist poets continued the process. Gustave Kahn, an early vers libre poet, believed that the French language as actually spoken has accent, its position being dependent upon the meaning of the phrase and the emotion of the speaker, the intervals constituting the rhythm of the verse. This belief was confirmed by phoneticians in scientific laboratory experiments. Vers libre theory. therefore, called for the disregarding of number of syllables and observance only of the musical cadence. The prosodic unit was the phrase, not the foot or the line, and the complete sentence became the strophe. Rhyme was optional. Kahn, Francis Jammes and André Spire developed controlled techniques for handling this new verse form.

The first English poets to be influenced by vers libre were close students of French poetry. The most important were T. E. Hulme, F. S. Flint, Richard Aldington, Ezra Pound and T. S. Eliot. The movement called Imagism, started in England in 1912 by Aldington, Pound, Flint and Hilda Doolittle (H.D.), was concerned with more than versification. but one of its principles was "to compose in sequence of the musical phrase, not in sequence of the metronome." But almost from the beginning the free-verse movement split into two separate groups. a formal one led by Pound, and a popular and confused one led by Amy Lowell. Eliot's early verse was influenced by the disintegrating blank verse of 17th-century English dramatists and by the vers libre of Jules Laforgue, but by 1920 he turned back to formal metrics, though henceforth the iambic metre was to be used in the English language with more variety and subtlety. By mid-20th century most of the younger poets had followed the example of Eliot, and even Pound had become more metrical, but some of the older poets, especially Carl Sandburg. William Carlos Williams, Marianne Moore and Wallace Stevens, continued to write some variety of "free verse." The versification of Williams and Moore most closely resembled the techniques of the vers libre poets of France.

BIBLIOGRAPHY.—The best general discussion of vers libre is by Mathurin Dondo, *Vers Libre a Logical Development of French Verse* (1922); by a phonetician, Robert de Souza, *Du Rythme en français*

(1922); in English, T. S. Eliot, *New Statesman*, vol. viii, pp. 518–519 (March 3, 1917); Karl Shapiro, "English Prosody and Modern Poetry," *Journal of English Literary History*, vol. xiv, pp. 77–92 (June 1947). *See* also Gustave Kahn, *Premièrs Poèmes, avec une préface sur le vers libre* (1897); André Spire, "Le Vers Français d'après la phonétique expérimentale," *Mercure de France*, vol. cx, no. 410, pp. 308–321 (July 16, 1914); E. Dujardin, *Les Premièrs Poètes du vers libre* (1922).

(G. W. A.)

FREE WILL. The problem of free will, or of the freedom of the will, is complicated for various reasons. In the first place, the traditional formulation of the problem, its very name, is misleading. To ask whether the will is free assumes that there is such a thing as a will, which may or may not be free in its activities. This is a relic of the old and generally discredited faculty psychology (*q.v.*). Will is really a general term describing certain sorts of events (volitions) and not the name of an agent which performs them. As John Locke said, "We may as properly say that the singing faculty sings and the dancing faculty dances as that the will chooses." (Essay on the *Human* Understanding, book 2, ch. XXI, 1). It would be better to speak of the freedom of the self, that is of the person, than of an abstract will. But the term free will is too well established to be dislodged. Moreover the expression freedom of the self (or personal freedom) might suggest the problems of political liberty rather than the philosophical and psychological problems traditionally associated with the term free will.

The problem is complicated too because of the various points of view from which it may be approached. The psychologist and the epistemologist are mainly interested in the apparent conflict between freedom of choice and the usual scientific assumption that all things, including mental events, are subject to law and necessity. The moral philosopher is primarily interested in free will as a postulate of the moral life. For if a man is compelled by past circumstances to do what he does and no alternative action is open to him, how can we say he ought to have done otherwise or blame him for what he did? "I could not help it" is a complete defense. The jurist is concerned with the relations between free will and responsibility. Can punishment be justified if the criminal had no choice but to commit the crime? Lastly, the theologian has an interest in the problem, since free will seems to involve the denial of God's omniscience and omnipotence or of his justice. For if men are truly free to choose then God cannot foreknow their actions or control their choice; but if men are not free then God cannot be justified in punishing or rewarding them for their deeds.

The central problems were accurately formulated by Henry Sidgwick. "Is my voluntary action at any moment completely determined by (1) my character as it has been partly inherited partly formed by my past actions and feelings, and (2) my circumstances, or the external influences acting on me at the moment? or not? Could the volition I am just about to originate be certainly calculated by anyone who knew my character at this moment and the forces acting upon me? Or is there a strictly incalculable element in it?" (Methods *of* Ethics, p. 46.)

The Scientific Problem.—By the beginning of the 19th century there had developed a sharp opposition between science and free will. No scientist indeed would defend the crude fatalistic theory that my action, or my fate, is determined by forces wholly independent of me, so that it is bound to come no matter what I do to prevent it. Nowhere in nature is the fate of any object determined wholly by factors independent of the object itself. Its own nature must always contribute to the result.

But scientists had worked for three centuries on the assumption that all observable events can be brought under the law of universal causation. Their triumphs had been continuous and unchecked. Could it be possible then that the behaviour of a single species on a minor planet in one of the countless solar systems should escape a type of determination which had been found to apply to the smallest particles of matter and the largest and most distant heavenly bodies? Everywhere nature showed itself to be the playground of irresistible forces and subject to complete and exact scientific prediction. To explain an event was to give the causes whose conjunction rendered it inevitable. It was true that until 18jo these claims had been justified only in the world of inanimate matter. But Charles Darwin in biology, Karl Marx in sociology, and Ivan Pavlov and Sigmund Freud in psychology were now to advance causal explanation across the frontiers of life and mind. It could surely be only a matter of time before life was synthesized in a laboratory and human action was predicted and thus controlled by the same techniques as had tamed the elements. Some scientists continued to make these claims for science and many ordinary men to think of science as presenting this solid front against free will.

From the beginning of the 20th century, however, the scientific atmosphere completely changed. There came to be little talk of irresistible forces in science or indeed of any forces at all. To say that a magnet attracts iron filings is unscientific: for this attraction is completely unobservable. What can be verified and therefore should be said is that, in the vicinity of a magnet, iron filings move in certain paths or arrange themselves in certain patterns. There is no compulsion here. What is observed is regular conjunction and no more. Again, in this regularity there is no observable necessity. Scientists no longer claimed to explain why events occur. They describe how they occur. And since no one can see why events are conjoined as they are, the only evidence for such a conjunction is repeated observation of its occurrence. Moreover the predictions based on such observations are only probable, just as the measurements which the observations involve are only approximate. No scientist will claim to say why any event happens; no scientist will even claim to predict with certainty *that* it will happen. Finally, it was shown that scientific laws cannot be applied with complete exactness to the behaviour of the electrons which are the ultimate constituents of matter. It has been well said that this "principle of indeterminacy" is not a "principle of indeterminism." It says that the position and motion of an electron cannot be precisely determined (discovered by measurement or predicted). But this does not mean that the position or motion is not determined (*i.e.*, correlated with pre-existing conditions of the electron and its environment according to a set of laws). In particular it does not justify us in attributing to the electron anything corresponding to free will or to talk of it as suddenly deciding, for no special reason, to jump from one orbit to another. Nevertheless, if it is true that certain facts about electrons cannot be disco ered by measurement or predicted from no matter what evidence, this underlines the conclusion that all scientific prediction is based on observed statistical regularities and can never yield more than a probable result.

Even if these admissions were all that science would make, they would suffice to render free will possible. For, as will be argued below, no free will theory need claim that a man can choose in complete independence of his past and his environment, nor deny that decisions of a certain kind are probable,—for example, that a man who has resisted a certain temptation frequently mill probably resist it next time.

There are, however, some special features of human conduct which make even the milder claims of modern science doubtful when applied here. There are three features of scientific method which seem essential for any close approximation to accurate prediction. The first is measurement. There are always differences between the specimen whose behaviour is to be predicted and those other specimens on whose observed behaviour the law was based—differences of mass, of distance from other bodies, of proportions of elements, etc. When the scientific law is applied to the new specimen, these differences have to be represented by giving quantitative values to the variables in the law. For example, in order to predict from the law of gravity how much body x will attract body y we must insert the distdnce between them as a quantity in our calculations. Now the psychological phenomena from which human conduct would have to be predicted are not measurable. While it makes sense to say that I am in greater pain or less angry than I was, it does not make sense to ask whether my pain has trebled or my anger been reduced by 9%. The only hope of measuring psychological phenomena is to measure their physiological accompaniments. But to predict conduct wholly from physiological conditions results in denying either the existence or the causal relevance of psychological states. The former denial (that involved in materialism or behaviourism) became generally discredited. The view of psychological states as "epiphenomena"—events accompanying but not making any difference to physiological processes—is difficult to reconcile with evolutionary theory. For such epiphenomena1 states would be useless to the organisms which manifested them and should therefore have atrophied and disappeared long ago, instead of increasing in number and complexity as they clearly have.

If these psychological phenomena are not quantitatively measurable, prediction is impossible. For example, a psychologist may establish that a child who is shut up in a dark cupboard will subsequently tend to fear the dark. But he cannot give any quantitative value to this fear and can therefore do nothing to predict whether, in a particular case, the rival forces will defeat this fear if it appears in conscious form or be able to repress it altogether so that it shows itself only in dreams.

The other two features of scientific method which may make it inapplicable in full rigour to human conduct are analysis and repetition. By analysis is meant the power to concentrate on certain features of an object—*e.g.,* its mass and motion, or its chemical constitution, or its spectroscopic behaviour—and to regard others of its features as irrelevant. Not that every one of its features can be dealt with in isolation; for mass and motion are both involved in the laws of physics, and chemical constitution is found to be connected with spectroscopic behaviour. But if no feature of a substance could be excluded as irrelevant to the establishment of a lam concerning its behaviour then no such laws could be established. Two bodies may have the same mass and different acceleration, the same chemical constitution and different shape or size or weight. If this mere not so, no experimental work would be possible in science. Now there are good grounds for holding that this kind of abstraction is impossible (or possible only for very general classes of events and in a very rough and ready fashion) in regard to human beings and their psychological states. The traits of a man's chardcter are so interwoven that none of them would be what it is without the others; and these traits correspond to the force or features which determine the behaviour of a scientific object. His quick temper helps to determine his kind of courage, his wit gives his quick temper its peculiar edge, his intelligence lightens his nit, his sensitivity broadens his intelligence, his imagination extends his sensitivity; and so on. Similarly his psychological state at a given moment defies analysis into anger plus fear plus shame plus jealousy, etc. The unity of the self and of its psychological states makes the attempt to study one motive or element in isolation from the others a falsification of the facts. Such dissection spells death.

The third feature of scientific prediction is repetition. By this is meant the assumption that the set of factors isolated by analysis can be trusted to recur in other specimens, and that most differences between the specimens will be irrelevant, while those that are relevant can be expressed as quantitative values of the variables in the scientific law in question. But each human personality is unique. Study of a number of pieces of sodium provides good evidence for the behaviour of the next piece of sodium. But study of the behaviour of Smith, Jones and Brown is poor evidence for the behaviour of Robinson. It is just this irruption of uniqueness of personality which has made authorities on aesthetics, on textual criticism, on strategy and on education deny that these studies can ever be adequately dealt with by scientific method or ever achieve scientific standards of predictive accuracy.

There is also one special difficulty in regarding human conduct as completely determined and completely predictable. Human thought is part of human conduct; and the scientific or philosophical views of any man would have to be regarded as predictable consequences of his causal situation. While this kind of explanation is welcomed by any thinker as accounting for the errors of his opponents, he can never accept it as applicable to the truth of his own view. A Marxist maintains that all human conduct is determined by economic processes, by the class structure of society. A man may think he is deciding on a course of conduct because it is right. This is an illusion; all his decisions are determined by class interest. What he calls morality is that set of rules which enables the class in power in his society to preserve its domination. The Benthamite laissez-faire theory of economics has no rational validity; it merely reflects the interests of the bourgeois industrialists among whom it arose. But, if so, Marxist economic determinism itself has no rational validity. It also is an illusion, a mere by-product of local and temporary class interests, bound to be superseded as history develops. It was bound to be believed by 19th-century working men. but there is no need for any other people at any other time to accept it. Its claim to truth is as much an illusion as the moral values it tries to undermine, the religious dogmas it opposes, or the rival economic doctrines it attacks.

It may be said that any attempt to shut off an area as impervious to scientific treatment is a counsel of despair. Whenever this has been tried before it has failed. Science has swept in and conquered. The area of human conduct, too, is an insignificant one on a world scale. Why in this remote corner should laws not hold and prediction fail? Perhaps an answer is that only in this remote corner, so far as we know, can such questions even be asked. Knowledge of the universe is already so astonishing an exception to the general pattern that it would be surprising indeed if other special features did not distinguish man's life. It is surrender to sheer size that tempts men to think the spiral nebulae a more impressive wonder than the minds of Sir Isaac Newton and Albert Einstein.

Moreover the argument so far does not shut off any area from scientific inquiry. Psychology, sociology and economics are entitled to try any methods they like. All that is said is that their predictions will have a lower probability than predictions in other fields. They will succeed so far as quantitative physiological behaviour is found to provide an accurate clue to psychological processes, so far as elements in the self have a nature of their own in isolation from the rest, so far as men resemble each other in the characteristics relevant to the inquiry and so far as their differences do not seriously affect the result. There is good reason to believe that in all the parts of human conduct which matter most to man (parts other than blinks and knee-jerks) these conditions are largely unfulfilled. Nevertheless for large-scale statistical purposes, such as insurance or advertising, prediction may yield a result both generally informative and practically useful.

The Ethical Problem.—So far the argument has concerned the second half of the problem as posed by Sidgwick in the passage quoted near the beginning of this article: "Could the volition I am about to originate be certainly calculated?" It may be said, however, that determinism does not require predictability. A man's act may be completely determined by his character and circumstances even if his character is so unified as to be unanalysable and so unique that no one else resembles him; so that prediction remains impossible. The first half of Sidgwick's question is still to be answered: "Is my voluntary action completely determined by my character and my circumstances?"

It was previously supposed that nothing could stand against the deterministic march of science except our direct awareness of free choice and the fact that free choice is required for moral responsibility. Various attempts have been made to show that moral responsibility, far from requiring indeterminism or free will, really requires determinism. For when we praise or blame an action we praise or blame a man for his action; that is, we commend the self or character from which the action issues. But then it must issue from the self or character. If it were the case that, given my self as it is now, two alternative actions were possible (a brave and a cowardly one) then neither could issue from my self, nor be connected with anything else. Choice is equivalent to chance, caprice or chaos. If I give a reason why I acted (that I admire Bach or that I was hungry) this cannot be the reason; for, given exactly that degree of hunger or admiration, I could still have acted otherwise. Mental life for the indeterminist is a mere sequence of isolated decisions.

Now the determinism which these criticisms invoke is something different from determinism as understood by science. Historically the first and most influential of such theories was propounded by Immanuel Kant. Kant held that, if science could give a complete causal account of human conduct, moral experience mould be inexplicable, The scientist must go ahead with his determinist assumptions and his causal explanations. But the whole sequence of causes and effects which he unfolds is merely appearance. Human conduct must also be regarded as determined by moral laws. Man, as appearance, is subject to causal law: man, as reality, is subject to moral law. Moral law is the command of man's reason and in obeying this law man is free. Now this view is unsatisfactory as an account of freedom. It leads to the view that good or dutiful actions are determined (non-causally) by moral law and that bad actions are determined (causally) by scientific law, and that only the good actions are free. But it is essential for moral responsibility that bad actions should be free just as much as good actions. It is also essential for morals that man as a moral agent should be "under" or "obliged by" moral law but not *determined* by it. For the meaning of "ought" excludes "must."

From this Kantian view of freedom many related theories developed. A man was held to be free only when his higher or rational self, or his ideal personality, determined his action. Thus, in politics law and liberty could be reconciled, and a man could be forced to be free when the law of his state imposed on him actions which his higher self would approve, but which desire would otherwise have compelled him to shirk. Or again, a good chess player will see alternative moves which an inferior player confronted with the same position does not see. And one is tempted to say that the skilled player has more freedom than the unskilled and thus to link freedom with intelligence. These tendencies often arise from the demand that some *positive sense* should be given to freedom. The self which is free must be of a different kind from the unfree self. So we hear of "the true self," "the real self." "my real will" and, in the prayer, the phrase "whose service is perfect freedom." Freedom and service are of course compatible provided that the service is chosen, and the right and reasonable action may be freely done. But these identifications are fatal to responsibility. It is essential to maintain the compatibility of freedom with desire and with the primrose path. Service of the devil must be perfect freedom too.

There is a different version of self-determinism, which allows both good and bad acts to issue from the self. I have various *motives* and among these are desires and the sense of duty. When I do my duty this shows that the motive called sense of duty is stronger than alternative motives (desires). The process called "deliberation" is how the conflict of motives appears to the agent at the stages when no one motive is yet strong enough to win in the face of all the rest. "Choice" is the appearance to the agent of the final sning-over by which duty (or desire) defeats its rivals.

Now in addition to the difficulty of analyzing the self into motives (noted above) there are two special difficulties about this account. Firstly, the term motive was required because desire and duty are so different in character. It is an abuse of language to say that there is a desire to do one's duty and then to maintain that the strongest desire always wins. We are too well aware of cases where we know we ought to sacrifice what we most desire. But the term motive has its own difficulties. Suppose I want to see a play and am also comfortable by the fire and am aware of a conflict; but finally I go off to the play. It would be absurd to call this a conflict of motives; for then desire for warmth and comfort would have been one of my motives; and if on my way to the theatre I had been asked what my motives had been I should have had to say I had two, a desire to see the play and a desire to stay by the fire. We only call anything a motive if in fact it did lead to action. So to say that any motive whatever wins the day is a tautology. If to avoid this we coin a new name to cover all the competitors, say "psychode," we may now say that the strongest among the psychodes will win. But the only evidence I can possibly have that this psychode was the strongest is that it did win. So here again is a tautology which does nothing to assist determination, just as the fact that the candidate with most votes is the winner does nothing to inhibit the freedom of the electors.

The failure of any such analysis of the self may lead to another version of determinism, according to which the self-as-a-whole is the cause of its actions. Such a view (represented in English by F. H. Bradley) will refuse to dissect the self or treat it as a case under a general law. Yet it will maintain that unless the self is the cause of its acts, these acts are contingent, capricious, irrational and irresponsible. There are two independent routes to this goal. One starts from the facts of praise and blame, reward and punishment, which are supposed to require freedom of will. The difficulty is to find any criterion of freedom of will to distinguish acts for which me hold a man responsible from acts for which we do not, so that we can determine, before we praise or blame or punish, whether we are entitled to do these things. The argument starts from punishment. It is admitted that there still lingers in the minds of many people a retributive attitude to punishment, the idea that a man should be made to pay for his sin. But it is held that this attitude is retrograde and barbaric and is anyhow on the decline. It has been almost entirely replaced by the view that punishment is deterrent and reformative. This latter view is utilitarian and justifies punishment by its consequences. If we now ask which acts we are justified in punishing they are those from which men can be deterred by punishment. And here is one criterion for responsibility. A man is responsible for a theft if punishment would have deterred him from doing it and will deter him from doing it again. We do not punish the kleptomaniac because punishment will not deter him. We say he was not free or responsible for his action. But this is not an additional reason for not punishing him. It is the same reason over again. To say he was not responsible is to say punishment would not have deterred him. The same theory is applied to praise and blame. The *only* justification for praising or blaming anyone is to encourage or discourage him and others in that course of action. That the man has freely done the thing for which he is praised or blamed is not *another* justification for praise or blame. It is only another way of saying this is an action which praise and blame could have affected. Now this is obviously a determinist theory of conduct. For the distinction it draws between free and unfree action is not a distinction between uncaused and caused action but a distinction between actions whose causes can include praise, blame, reward, and punishment and those whose causes exclude these. (Similarly deterrence and reform theories of punishment imply a determinist view of human conduct.)

Now this ingenious theory seems to miss an essential feature in punishment and blame. A deterrence or reform theory of punishment is quite compatible with punishing a man for something he did not do. And this is felt by most people to be the worst fault in any punishment. That this is no retrograde or barbaric survival, "on the way out" in modern times, is shown by the ever-increasing care that guilt should be confirmed beyond question, that *mens rea* should be established, and also by our repugnance to the "framed case" or the "confession trial," whose objects are indubitably (and perhaps very successfully) deterrent.

The second line of argument which maintains a necessary connection between self-determinism and responsibility is that mentioned earlier in this article. When we praise an action, we praise a man for the action. "That is a brave deed" and "That is the deed of a brave man" are equivalent, and the latter expresses more explicitly what we want to say. But if so the act must issue from the self and give a clue to its nature. If, given my self as it is now and the circumstances as they are now, two or more alternative actions are possible, then none of them can be said to be caused by the self as it is now or give a clue to its nature. Further, it is said, this determinism does not offend our natural dignity as human beings. If anyone predicts my action on the grounds that budget estimates show conclusively how much beer or tobacco I shall consume in the coming year, I laugh at him. If he says: "I know what you will do because I have calculated the strength of the rival forces. your desire for praise, your love of your family, your passion for bridge; and the answer comes out as follows," I laugh louder still. Or he says: "I know what you will do, because I know what people of your class and profession do when put in this kind of position"; and I am offended. But suppose he says: "I *knew* you well enough to know you could not have done that";

or, "You are one of our most reliable members; I was sure: *knowing* yon, that you would be here." I accept and welcome this prediction because it is based not on statistics, not on comparisons or on abstractions, but on knowledge of me.

Now it seems true that this theory is the only one of all determinist theories which comes within sight of doing justice both to the nature of human personality and to the demands of moral experience. Yet it too has serious difficulties. It claims that a prediction of my action based on knowledge of my character is both legitimate and acceptable to any self-respecting person. But it is acceptable only if the action predicted is a good one. If a man says: "I knew you well enough to know you would not have done that—you are too afraid of unpopularity"; or, "You are one of our most reliable members; I was sure, knowing you, that you would keep us all waiting." I shall not be likely to accept or welcome such predictions. When I accepted and welcomed those other predictions I was confusing prediction based on character with praise for a good choice and approval of a good character. It mas these I welcomed. Moreover prediction from character has its own pitfalls as a rational process. It implies that character cannot be changed by action. But it is obvious that all a man does makes a difference to him. There can be no adequate evidence from others what this difference will be nor what the new self will do, as it will have been in the making right up to the moment of action. Winston Churchill described how the German ainbassador to London was recalled for not having foreseen David Lloyd George's Mansion house speech of 1911. Churchill comments: "How could he know what Mr. Lloyd George was going to do? Until a few hours before, his own colleagues did not know. Working with him in close association, I did not know. Until his mind was definitely made up, he did not know himself." Nevertheless the self-determinist theory has a very strong case in demanding a connection between the self and its acts even if prediction is still held to be impossible. even on the basis of the agent's own character as deduced from his previous actions.

Indeterminism on the other hand need not deny all connection between character and actions. The free choice it defends must be a choice between *presented* alternatives; and the alternatives that occur to a man will obviously reflect his character and his desires. Indeterminism need not reject probability. It is indeed improbable that a drunkard will resist temptation, for the possibility of yielding to it will present itself to him with great attractiveness, Some indeterminists find the only evidence for free will in choices mhich go against the strongest desire, choices which require an effort of will. While these cases certainly provide the strongest evidence for free will, it seems unwise to maintain that only in these cases is free will exercised. For a man must be free to put forth or to refrain from such efforts, and the drunkard must be as free when he succumbs as when he resists. It is once more the search for some positive sense of freedom and for a link between freedom and moral goodness which has tended to conceal this requirement.

Here perhaps is the place to refer to the evidence for freedom gained from direct experience. It is possible to hold that me might be directly aware of the efficiency of our will; we might see directly that our volition was a cause or part-cause of our thoughts or images. This is doubtful, but even if granted it is not enough. What free will requires is that our volition should be uncaused; and it is hard to see how we could directly experience an event as uncaused. It is true that we have an ineradicable belief in our own freedom and in open alternatives for our choice. This might be an illusion, for its survival could well be a tribute to its biological utility. As Sir David Ross said, a man is more likely to work for an examination and therefore to pass it if he thinks it is uncertain whether he will pass or fail. If he thought either was certain he might well slacken his efforts. Yet we also saddle ourselves with burdens of guilt and remorse and these beliefs would seem to hinder effective action and to be useless illusions and therefore biologically puzzling.

The arguments' for self-determinism (without prediction) and for indeterminism both seem powerful and neither can wholly answer the other or wholly satisfy the demands of moral experience. In such a situation no quick and easy solution is to be expected. Most philosophers who have given full and careful consideration to free will describe it as the most difficult problem in philosophy and themselves show dissatisfaction with their own tentative solutions. But when two opposing cases seem equally strong and yet both seem open to fatal objections it might be that something was wrong with the question to mhich both were answers. The question was "Given my self as it is now and the circumstances as they are now, is only one action possible or are alternative actions open to me?" Now what may be wrong here is the absence of any indication of the time of the action or actions in question. There are two possibilities. The problem may be "Given. . . . etc.. is only one action possible for me *now?*" or "Given. . . . etc., is only one action possible for me at some future-time?" Careful scrutiny of the passage from Sidgwick quoted near the beginning of this article will show that in the first sentence Sidgwick adopts the first alternative ("My action *at any moment*" . . . . "influence acting on me *at the moment*") and in the second sentence the second alternative ("the volition I am *just about* to originate" . . . "character *at this moment*"). Let us take the first alternative "Given my self as it is *now,* is only one action possible *now?*" Yes, because the action in question is the volition (and not any physical movement) and the volition *is* the state of myself now. If I see a man frowning and ask him to describe his self "as it is *now*" he may say: "I am trying to understand this article on free will." If I ask him what action he is performing *now*, he will reply: "Trying to understand this article on free will." So the question cannot be put in the first form without becoming a tautology. We pass to the second alternative. "Given myself as it is *now*, is only one action possible *at some future time?*" No, because what my self will do and accordingly how it will change in the time intervening between "now" and the "future time" is not specified and, unless it is, alternatives cannot be eliminated. An attempt may be made to meet this difficulty by shortening the interval between the date of the "given self" and the date of the "action." But so long as there is any interval the objection holds and when the interval completely disappears we are back with the first solution and its tautology.

This emphasis on the time factor finds support in more careful analysis of the one strong argument for self-determinism. When we praise an action we praise the self whose action it is; and we are therefore committed to a necessary connection between the self and the action, and this is determinism. But what self do we praise? Not his *past* self; not even his very recently past self. R e praise a man's character—his courage, his integrity, his sense of humour. Now these are dispositions. Elasticity is a disposition of rubber. We say: "It is elastic so it will stretch or compress." But it is not because the rubber *was* elastic that it *now* stretches. Those who have built on these facts about praise and blame a determinist theory have confused the relation between a cause and its effect with the relation between a disposition and its manifestations. It is not the courage of a man in the immediate past which explains his present prowess. If it were, there would be time (however short a time) for it to dwindle. The connection between the self and its action is more like that between the hammer and its weight; the hammer is not the cause of the weight. But this removes the one remaining argument for determinism, and free will seems to hold the field.

The Juridical Problem.—It was mentioned above that the deterrence and reform theories commonly acceptzd as best explaining punishment imply a determinist view of human conduct; but, on the other hand, the one essential feature of punishment is that only the guilty should be punished and this implies responsibility and freedom of will. This raises the other juristic problem in this field, that of deciding when a man is responsible. The difficulties arise over the plea of insanity. Though they cannot be fully dealt with here; it may be said, in relation to the central problem, that no jurist would propose to abolish altogether the distinction between responsibility and insanity. A man will be held responsible unless there is special evidence that rebuts this assumption and indicates that the impulse to action was irresistible. But on the determinist theory of action, every impulse from which a man does in fact act is irresistible. Thus, though the difficulties of deciding which acts are free are serious, their existence is an argument for and not against free will.

The Theological Problem.— During the middle ages the problem of free will was urgent because of its seeming conflict with the omniscience and omnipotence of God. If man is free, his action is not under God's control; nor can God foretell it. These are still major problems of theology and only possible approaches to them can be considered here. If omnipotence required determinism, men would be like well-constructed automatons producing results foreseen and intended by God. There could then be no moral value in any human action. Good men and bad alike (as Spinoza held) would be the channels of God's purpose. A slaveowner can do what he likes with his slaves, including setting them free. Of course, after they are free he loses power over them. But he could have avoided this limitation only by accepting that other (not to be able to set them free).

As to omniscience, the claim would be that an event must be determined if it is to be predictable. This assumes that God's foreknowledge is a scientific calculation from prior observation. But God's knowledge must be timeless; it does not move from observation of one phase to prediction of another. We know the past partly from present observation and inference involving causal laws and partly by memory which does not involve causal laws. Memory and observation have a better claim to be called knowledge than the probable inferences which rest on them. God's foreknowledge should be assimilated to these higher types. The fact that we can observe and remember does not require that what we observe and remember should be causally determined. So no such conclusions need follow from the foreknowledge of God.

FREGE, GOTTLOB (1848–1925), German mathematician and logician, was born at Wismar. After attending the *gymnasium* there he studied in the universities of Jena and Göttingen, and then taught mathematics at Jena as *privatdozent* (1871), associate professor (1879) and titular professor (1896). Not content with what had been achieved in the arithmetization of analysis, he made it his life's work to exhibit arithmetic itself as a development of logic.

In his *Begriffsschrift* (1879) Frege began by expounding a new *calculus philosophicus et ratiocinator* such as Leibniz had projected, and gave the first clear account of a propositional function, the first set of axioms sufficient for the restricted calculus of propositional functions and the first definition of the so-called ancestral relation. Discouraged by the poor reception of this effort towards logical rigour, he then tried to win favour for his main thesis by writing *Die Grundlagen der Arithmetik* (1884) in plain German. Apart from criticisms of rival views, this contains a definition of natural numbers by use of the notion of one-to-one correlation between the objects falling under various concepts. But in his *Grundgesetze der Arithmetik* (1893 and 1903) he returned to his ideal of rigour. Though this work employs the same logical symbolism as the *Begriffsschrift,* it contains new doctrines about meaning first expounded in his three Papers, *Funktion und Begriff* (1891), *Begriff und Gegenstand* (1892), and *Sinn und Bedeutung* (1892). At this period he wrote also *Über die Zahlen des Herrn H. Schubert* (1899).

One of the few readers of the first volume of the *Grundgesefze* was Bertrand Russell, and in an appendix to the second volume Frege ruefully admitted that this young philosopher had derived from his system a paradox about the class of all classes which are not members of themselves, but he said that he was still convinced of the possibility of deriving arithmetic from logic, and he made some suggestions for evading the difficulty. After this he wrote a few papers on logic, but did not contribute further to the controversy about the foundations of arithmetic. The importance of his achievements in mathematical logic was not fully recognized until some time after his death, probably because his symbolism had been superseded by that of Guiseppe Peano, A. N. Whitehead, and Bertrand Russell.

The *Grundlagen* was translated by J. L. Austin as *The Foundations of Arithmetic* (Oxford, 1950), and there are also *Translations from the Philosophical Writings of Gottlob Frege by* P. Geach and M. Black (Oxiord, 1952). (W. C K.)

FREGELLAE, an ancient town of Latium on the Via Latina, 11 mi. W.N.W. of Aquinum, near the left branch of the Liris. It is said originally to have been occupied by Opici and Volscians and later to have been destroyed by Samnites. In 328 B.C. a Latin colony was established there. Captured by the Samnites in 320 but recaptured by Rome in 312, it remained loyal to Rome during the Pyrrhic and Hannibalic Wars, hampering Hannibal in 211 and leading the loyal colonies in 209. It flourished because of its command of the crossing of the Liris and its fertile territory. In 125 it revolted against Rome, but was captured by treachery and destroyed. In 124 B.C. Fabrateria Nova was founded 3 mi. S.E. on the opposite bank of the Liris, and a post station Fregellanum (mod. Ceprano) grew up; Fregellae itself, however, continued to exist as a village even under the empire. The site is about half a mile east of Ceprano, but the remains are very scanty.

See G. Colasanti, "Fregellae,"in *Biblioteca di geografia storica,* vol. i (Rome. 1906).

FREIBERG or Freyberg, a town of Germany in the *Land* of Saxony, on the Münzbach, near its confluence with the Mulde, 19 mi. S.W. of Dresden by rail. Pop. (1939) 35,847. It owes its origin to the discovery of silver mines (*c.* 1163). The town, with the castle of Freudenstein, was built in 1175, and its name, which first appeared in 1221, is derived from the extensive mining franchises granted to it about that time. From the end of the 13th century until 1485 Freiberg remained common property. The Reformation was introduced in 1536 by Henry the Pious, who resided there.

The town suffered severely during the Thirty Years' War, and again during the French occupation from 1806 to 1814. A part of its ancient walls still remains; the other portions have been converted into public walks and gardens. Freiberg is the seat of the general administration of the mines throughout the reich, and its mining academy (*Bergakademie*), founded in 1765, is famous. Among its distinguished scholars were Abraham Werner (*q v.*), who was also a professor there, and Alexander von Humboldt.

Freiberg has manufactures of gold and silver lace, woollen cloths, ironwares, china, sugar and cigars. In the vicinity are its famous silver and lead mines, of which the principal ones became state property in 1886. The castle of Freudenstein or Freistein, rebuilt by the elector Augustus in 1572, has been used as a military magazine. The cathedral, rebuilt in late Gothic style after its destruction by fire in 1484 and restored in 1893, was founded in the 12th century. Of the original church a German Romanesque doorway, known as the Golden Gate (*Goldene Pforte*), survives. Henry the Pious and several of his successors are buried there.

The town hall dates from the 15th century.

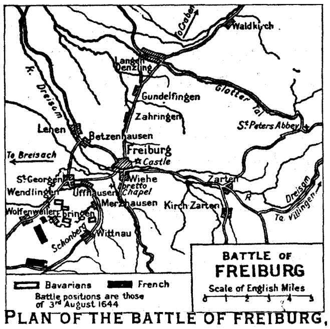
FREIBURG, a town of Germany in Prussian Silesia, on the Polsnitz, 3; mi. S.W. of Breslau, by rail. Pop. (1933) 9,137. Its industries include watchmaking, linen weaving and glassmaking. In the neighbourhood are the old and modern castles of the Fürstenstein family from which the town is sometimes distinguished as Freiburg unter dem Fiirstenstein.

FREIBURG IM BREISGAU, archiepiscopal see and city of Germany in the *Land* of Baden, situated on the Dreisam at the foot of the Schlossberg, 40 mi. N. of Basle by rail. Pop. (1939) 111,860.

In 1120 Freiburg became a free town, with privileges similar to those of Cologne; but in 1219 it fell into the hands of a branch of the family of Urach. It purchased its freedom in 1366; but, unable to reimburse its creditors, it was, in 1368, obliged to recognize the supremacy of the house of Hapsburg. In the 17th and 18th centuries it played a considerable part as a fortified town. Since 1821 it has been the seat of an archbishop with jurisdiction over the sees of Mainz, Rottenburg and Limburg. The waters of the river flow through the streets in open channels; and the old fortifications have been replaced by public walks and vineyards. It possesses a famous university, the Ludovica Albertina, founded by Albert VI., archduke of Austria, in 1457. The Freiburg minster is considered one of the finest Gothic churches in Germany. It was probably erected between 1122 and 1252; but the choir was not built till 1513. The tower is 386 ft. in height. In the interior of the church are some beautiful stained glass windows and paintings by Holbein and by Hans Baldung (*c.* 1470–1545). The palaces of the grand duke and the archbishop, the old town-hall and the *Kaufhaus* or merchants' hall, a 16th-century building with a handsome façade, are noteworthy. On the Schlossberg above the town there are ruins of two castles destroyed by the French in 1744; and about 2 m. N.E. stands the castle of Zahringen. Situated on the ancient road which runs by the Hollenpass between the valleys of the Danube and the Rhine, Freiburg early acquired commercial importance, and it is still the principal centre of the trade of the Black Forest. It manufactures buttons, tobacco, silk thread, paper, sugar, surgical and musical instruments.

See Schreiber, *Geschichte und Beschreibung des Münsters zu Freiburg* (1820 *and* 1825); *Geschichte der Stadt und Universität Freiburgs* (1857–59); *Der Schlossberg bei Freiburg* (1860); and Albert, *Die Geschichtsschreibung der Stadt Freiburg* (1902).

Battles of **Freiburg,** Aug. 3, 5 and 10, 1614.—During the Thirty Years' War the neighbourhood of Freiburg was the scene of a series of engagements between the French under Louis de Bourbon, duc d Enghien (afterwards called the great Condé), and Henri de la Tour d'Auvergne, vicomte de Turenne, and the Bavarians and Austrians commanded by Franz, Freiherr von Mercy. At the close of the campaign of 1643 the French "Army of Weimar," having been defeated and driven into Alsace by the Bavarians, had there been reorganized under the command of Turenne, then a young general of 32 and newly promoted to the marshalate. In May 1644 he opened the campaign by recrossing the Rhine and raiding the enemy's posts as far as Überlingen on the lake of Constance and Donaueschingen on the Danube. The French then fell back with their booty and prisoners to Breisach, a strong garrison being left in Freiburg. The Bavarian commander, however, revenged himself by besieging Freiburg (June 27), and Turenne's first attempt to relieve the place failed. During July, as the siege progressed, the French Government sent the duc d'Enghien, who was ten years younger still than Turenne, but had just gained his great victory of Rocroy, to take over the command. Enghien brought with him a veteran army, called the "Army of France," Turenne remaining in command of the Army of Weimar. The armies met at Breisach on Aug. 2, by which date Freiburg had surrendered. At this point most commanders of the time would have decided not to fight, but to manoeuvre Mercy away from Freiburg; Enghien, however, was a fighting general, and Mercy's entrenched lines at Freiburg seemed to him a target rather than an obstacle. A few hours after his arrival, therefore, without waiting for the rearmost troops of his columns. he set the combining armies in motion for Krozingen, a village on what was then the main road between Breisach and Freiburg. The total force immediately available numbered only 16,000 combatants. Enghien and Turenne had arranged that the Army of France was to move direct upon Freiburg by Wolfenweiter, while the Army of Weimar was to make its way by hillside tracks to Wittnau and. thence to attack the rear of Mercy's lines while Enghien assaulted them in front. Turenne's march (Aug. 3, 1644) was slow and painful as had been anticipated. and late in the afternoon, on passing Wittnau, he encountered the enemy. His men carried the outer lines of defence without much difficulty, but as they pressed on towards Merzhausen the resistance became more and more serious. Turenne's force was little more than 6,000, and these were wearied with a long day of marching and fighting on the steep and wooded hillsides of the Black Forest Thus the. turning movement came to a standstill far short of Uffingen, the village on Mercy's line of retreat that Turenne was to have seized, nor was a flank attack possible against Mercy's main line, from which he was separated by the crest of the Schonberg. Meanwhile, Enghien's army had at the prearranged hour (4 P.M) attacked Mercy's position on the Ebringen spur. A steep slope, vineyards, low stone walls and abatis had all to be surmounted, under a galling fire from the Bavarian musketeers, before the Army of France found itself, breathless and in disorder, in front of the actual entrenchments of the crest. A first attack failed, as did an attempt to find an unguarded path round the shoulder of the Schonberg. The situation was grave in the extreme, but Enghien resolved on Turenne's account to renew the attack although only a quarter of his original force was still capable of making an effort. He himself and all the young nobles of his staff dismounted and led the infantry forward again, the prince threw his baton into the enemy's lines for the soldiers to retrieve, and in the end, after a bitter struggle, the Bavarians, whose reserves had been taken away to oppose Turenne in the Merzhausen defile, abandoned the entrenchments and disappeared into the woods of the adjoining spur. Enghien hurriedly re-formed his troops, fearing at every moment to be hurled down the hill by a counterstroke; but none came. The French bivouacked in the rain, Turenne making his way across the mountain to confer with the prince, and meanwhile Mercy quietly drew off his army in the dark to a new set of entrenchments on the ridge on which stood the Loretto Chapel. On Aug 4 the Army of France and the Army of Weimar met at Merzhausen, the rearmost troops of the Army of France came in, and the whole was arranged by the major-generals in the plain facing the Loretto ridge. This position was attacked on the 5th. Enghien had designed his battle even more carefully than before, but as the result of a series of accidents the two French armies attacked prematurely and straight to their front, one brigade after another, and though at one moment Enghien, sword in hand, broke the line of defence with his last intact reserve, a brilliant counterstroke, led by Mercy's brother Kaspar (who was killed), drove out the assailants. It is said that Enghien lost half his men on this day and Mercy one-third of his, so severe was the battle. But the result could not be gainsaid; it was for the French a complete and costly failure.



PLAN OF THE BATTLE OF FREIBURG, AUGUST 3RD, 5TH AND 10TH, 1644

For three days after this the armies lay in position without fighting, the French well supplied with provisions and comforts from Breisach, the Bavarians suffering somewhat severely from want of food, and especially forage, as all their supplies had to be hauled from Villingen over the rough roads of the Black Forest. Enghien then decided to make use of the Glotter Tal to interrupt altogether this already unsatisfactory line of supply, and thus to force the Bavarians either to attack him at a serious disadvantage, or to retreat across the hills with the loss of their artillery and baggage and the disintegration of their army by famine and desertion. With this object, the Army of Weimar was drawn off on the morning of Aug. 9 and marched round by Betzenhausen and Lehen to Langen Denzling. The infantry of the Army of France, then the trains, followed, while Enghien with his own cavalry faced Freiburg and the Loretto position.

Before dawn on the 10th the advance guard of Turenne's army was ascending the Glotter Tal. But Mercy had divined his adversary's plan, and leaving a garrison to hold Freiburg, the

Bavarian army had made a night march on the 9–10th to the Abbey of St. Peter, whence on the morning of the 10th Mercy fell back to Graben, his nearest magazine in the mountains. Turenne's advanced guard appeared from the Glotter Tal only to find a stubborn rearguard of cavalry in front of the abbey. A sharp action began, but Mercy hearing the drums and fifes of the French infantry in the Glotter Tal broke it off and continued his retreat in good order. Enghien thus obtained little material result from his manoeuvre. Only two guns and such of Mercy's wagons that were unable to keep up fell into the hands of the French. Enghien and Turenne did not continue the chase farther than Graben, and Mercy fell back unmolested to Rothenburg on the Tauber.

The moral results of this sanguinary fighting were, however, important and perhaps justified the sacrifice of so many valuable soldiers. Enghien's pertinacity had not achieved a decision with the sword, but Mercy had been so severely punished that he was unable to interfere with his opponent's new plan of campaign. This, which was carried out by the united armies and by reinforcements from France, while Turenne's cavalry screened them by bold demonstrations on the Tauber, led to nothing less than the conquest of the Rhine Valley from Basle to Coblenz, a task which was achieved so rapidly that the Army of France and its victorious young leader were free to return to France in two months from the time of their appearance in Turenne's quarters at Breisach.

FREIDANK (VRÎDANC), the name by which a Middle High German didactic poet of the early 13th century is known. It has been disputed whether the word, which is equivalent to "free-thought," is to be regarded as the poet's real name or only as a pseudonym; the latter is probably the case. Little is known of Freidank's life. He accompanied Frederick II. on his crusade to the Holy Land, where, in 1228–29, a portion of his work was composed; and it is said that on his tomb at Treviso there was inscribed, with allusion to the character of his style, "he always spoke and never sang." Wilhelm Grimm originated the hypothesis that Freidank was to be identified with Walther von der Vogelweide; but this is no longer tenable. Freidank's work, *Bescheidenheit, i e.,* "practical wisdom," consists of a collection of proverbs, and moral and satirical reflections, arranged under general heads. Its popularity till the end of the 16th century is shown by the great number of mss. extant.

Sebastian Brant published the *Bescheidenheit* in a modified form in 1508. Wilhelm Grimm's edition appeared in 1834 (2nd ed. 1860), H. F. Bezzenberger's in 1872. A later edition is by F. Sandvoss (1877). The old Latin translation, *Fridangi Dzscretzo,* was printed by C. Lemcke in 1868; and there are two translations into modern German, A. Bacmeister's (1861) and K. Simrock's (1867). *See* also F. Pfeiffer, *fiber Freidank* (*Zur deutschen Literaturgeschichte,* 1855), and *H.* Paul, *Über die ursprüngliche Anordnung von Freidanks Bescheidenheit* (1870).

FREIENWALDE, a town of Germany in the Prussian province of Brandenburg, on the Oder, 28 m. N.E. of Berlin by rail. Pop. (1939) 12,567. It has a small palace, built by the Great Elector, and manufactures machinery and pianos. It is a favourite summer resort of the inhabitants of Berlin. Freienwalde, as distinguished from the smaller town of the same name in Pomerania, first appears as a town in 1364.

FREIESLEBENITE, a rare mineral consisting of sulphantimonite of silver and lead $(PbAg_2)_5Sb_4S_{11}$. The monoclinic crystals are prismatic in habit, with deeply striated prism and dome faces. The colour is steel-grey, and the lustre metallic; hardness $2\frac{1}{2}$, specific gravity 6·2. It occurs with argentite, chalybite and galena in the silver veins at Freiberg, Saxony, where it has been known since 1720. The species was named after J. K. Freiesleben, who had earlier called it *Schilf-Glaserz.* Groups of large crystals have come from Hiendelaencina near Guadalajara in Spain.

FREIGHT: *see* AFFREIGHTMENT.

FREILIGRATH, FERDINAND (1810–1876), German poet, was born at Detmold on June 17, 1810. He was educated for a commercial career. The years from 1831 to 1836 he spent in a bank at Amsterdam, and 1837 to 1839 in a business house at Barmen. In 1838 his *Gedichte* appeared, and he abandoned commerce. His repudiation of the political poetry of 1841 and its revolutionary ideals induced Frederick William IV., to give him a pension of 300 thalers a year. He married, and, to be near his friend Emanuel Geibel, settled at St. Goar. Before long, however, Freiligrath was himself carried away by the rising tide of liberalism. In the poem *Ein Glaubensbekenntnis* (1844) he avowed his sympathy with the political movement led by his old adversary, Georg Herwegh; the day, he declared, of his own poetic trifling with romantic themes was over; romanticism itself was dead. He sacrificed his pension, went to Switzerland, and then after the publication of his *ça ira!* (1846), for greater safety, to London, where he resumed the commercial life he had broken off seven years before. When the revolution of 1848 broke out, it seemed to Freiligrath, as to all the liberal thinkers of the time, the dawn of an era of political freedom; and in his *Politische und soziale Gedichte* (1849–1851), he welcomed it with unbounded enthusiasm. He returned to Germany and settled in Diisseldorf; but the publication of his poem, *Die Toten an die Lebenden* (1848) led to his arrest on a charge of *lèse-majesté.* He was acquitted, but his association with the democratic movement rendered him suspect, and in 1851 he returned to London, where he lived for 17 years. In 1868 he returned to Germany, settling first in Stuttgart and in 1875 in the neighbouring town of Cannstatt, where he died on March 18, 1876.

Literary Significance.—Freiligrath was the most gifted poet of the German revolutionary group. His own purely lyric poetry re-echoes for the most part the familiar thoughts and imagery of his romantic predecessors; but at an early age he had been attracted by the work of French contemporary poets, and he reinvigorated the German lyric by grafting upon it the orientalism of Victor Hugo. In this reconciliation of French and German romanticism lay Freiligrath's significance for the development of the lyric in Germany. Freiligrath, when he is at his best, displays a vigour and strength, a power of direct and cogent poetic expression, not to be found in any other political singer of the age. He translated many English and Scottish ballads, and much contemporary English verse (*Englische Gedichte aus neuerer Zeit,* 1846; *The Rose, Thistle and Shamrock,* 1853, 6th ed. 1887); he also translated Shakespeare's *Cymbeline, Winter's Tale* and *Venus and Adonis,* as well as Longfellow's *Hiawatha* (1857).

Freiligrath's *Gedichte* have passed through some 50 editions and his *Gesammelte Dichtungen,* first published in 1870, have reached a considerable number. *Nachgelassenes* (including a translation of Byron's *Mazeppa*) was published in 1883. A selection of Freiligrath's best-known poems in English translation was edited by his daughter, Mrs. Freiligrath-Kroeker, in 1869; also *Songs of a Revolutionary Epoch* were translated by J. L. Joynes in 1888. Cf. E. Schmidt-Weissenfels, *F. Freiligrath, eine Biographie* (1876); W. Buchner, *F. Freiligrath, ein Dichterleben in Briefen* (2 vols., 1881); G. Freiligrath, *Erinnerungen an F. Freiligrath* (1889); P. Besson, *Freiligrath* (Paris, 1899); K. Richter, *Freiligrath als Übersetzer* (1899); E. G. Gudde, *Freiligrath Entwicklung als politischer Dichter* (Berlin, 1922).

FREISCHÜTZ, in German folklore, a marksman who by a compact with the devil has obtained a certain number of bullets destined to hit without fail whatever object he wishes. As the legend is usually told, six of the *Freikugeln* or "free bullets" are thus subservient to the marksman's will, but the seventh is at the absolute disposal of the devil himself. Stories about the Freischiitz were especially common in Germany during the 14th, 15th and 16th centuries; but the first time that the legend was turned to literary profit is said to have been by Apel in the *Gespensterbuch* or "Book of Ghosts." It formed the subject of Weber's opera *Der Freischiitz* (1821). The name by which the Freischiitz is known in French is Robin des Bois.

See Kind, *Freyschützbuch* (Leipzig, 1843); *Revue des deux mondes* (Feb. 1855); Grasse, *Die Quelle des Freischiitz* (Dresden, 1875).

FREISING, a town of Germany, in the *Land* of Bavaria, on the Isar, 16 mi. by rail N.N.E of Munich. Pop. (1939) 19,456. The cathedral, which dates from about 1160 is famous for its crypt. Noteworthy also are the old palace of the bishops, later a clerical seminary, and the town-hall. Near the town is the site of the Benedictine abbey of Weihenstephan, which existed from 72j to 1803. Freising is said to have been founded by the Romans.

Destroyed by the Hungarians in 955, it was fortified by the emperor Otto II in 976 and by Duke Welf of Bavaria in 1082. A bishopric was established here in 724 by St. Corbinianus, whose brother Erimbert was consecrated second bishop by St. Boniface in 739. In the 17th century the bishops became princes of the Empire. In 1802 the see was secularized, the bulk of its territories being assigned to Bavaria and the rest to Salzburg, of which Freising had been a suffragan bishopric. There are iron-foundries and trade is in corn and cattle.

FRÉJUS, a town in the department of the Var in S.E. France. Pop. (1954) 6,101. It is 18 mi S E. of Draguignan. It has fine Roman remains. Since the 4th century it has been a bishop's see, in the ecclesiastical province of Aix en Provence. In modern times the neighbouring fishing village at St. Raphaël (2½ mi. S E. by rail and on the seashore) has become a town of 6,711 inhabitants (1946). In 1799 Napoleon disembarked there on his return from Egypt and re-embarked for Elba in 1814, while nowadays it is much frequented as a health resort, as is also Valescure (2 mi. N.W. on the heights above). The cathedral church in part dates from the 12th cent., and small portions of the mediaeval episcopal palace are now visible, as it was rebuilt about 1823. The ramparts of the old town can still be traced for a long distance, and there are fragments of two moles, of the theatre and of a gate. The amphitheatre, which seated 12,000 spectators, is better preserved. The ruins of the great aqueduct which brought the waters of the Siagnole, an affluent of the Siagne, to the town, can still be traced for a long distance. The town of Forum Iulii was founded by Julius Caesar on this site, formerly the capital of the Oxybii, to secure a harbour independent of Marseilles. The buildings, of which ruins exist, were mostly built by Caesar or by Augustus, and show that it was an important naval station and arsenal. But the town suffered much at the hands of the Arabs and Barbary pirates, and its inhabitants have used the ruined Roman buildings as a quarry. The old harbour (really a portion of the lagoons) is now completely silted up.

Corks, bricks, tiles and fine pottery are made, and rushes are woven. There are mines of coal and bituminous shale.

FRELINGHUYSEN, FREDERICK THEODORE (1817–1885), American lawyer and statesman, of Dutch descent, was born at Millstone, N.J., on Aug. 4, 1817. His grandfather, Frederick Frelinghuysen (1753–1804), was an eminent lawyer, a soldier in the American Revolution, and a member (1778–79 and 1782–83) of the continental congress, and in 1793–96 of the U.S. Senate; and his uncle, Theodore (1787–1862), was a U.S. senator from New Jersey in 1829–35, the Whig candidate for vice-president on the Clay ticket in 1844, chancellor of the University of New York in 1839–50 and president of Rutgers college in 1850–62. Frederick Theodore, left an orphan at the age of three, was adopted by his uncle, graduated at Rutgers in 1836 and studied law in Newark with his uncle, to whose practice he succeeded in 1839. He became attorney for the Central railroad of New Jersey, the Morris Canal and Banking company and other corporations, and from 1861 to 1867 was attorney-general of New Jersey. In 1861 he was a delegate to the peace congress at Washington, and in 1866 was appointed by the governor of New Jersey, as a republican, to fill a vacancy in the U.S. Senate. In the winter of 1867 he was elected to fill the unexpired term, but a democratic majority in the legislature prevented his re-election in 1869. From 1871 to 1877 he was again a member of the U S. Senate, in which he was prominent in debate and in committee work, and was chairman of the committee on foreign affairs during the Alabama claims negotiations. In 1881 he was appointed secretary of state by President Arthur to succeed James G. Blaine, and served until the inauguration of President Cleveland in 1885. He died in Newark, May 20, 1885.

FREMANTLE, a city and the principal seaport of Western Australia, on the Swan river, 12 mi. S.W. of Perth. Pop. (1954) 22,795. The principal industries of the city are those connected with the port. There are also wool warehouses, oil refineries, steel roller mills and engineering works. There is an industrial estate covering 400 ac. three miles from the city. This is one of the most important industrial centres in Western Australia and has attracted industries from overseas and from the eastern states of Australia. Inland is an area of about 1,600 ac. devoted to market gardening. Fremantle handles 72% of the state's trade. It is the first Australian port of call for ships from Europe and is related to the South African. Asian and European trade routes. Two moles, prolonging the banks of the Swan river seaward, provide a safe approach 5,000 ft. long and 450 ft. wide. The inner harbour has more than 10,000 lineal feet quay space and a low-water depth of 36 ft. The port is connected by rail with the state's chief wheat- and wool-producing areas, and is the terminus of the Australian Trans-Continental railway.

FRÉMIET, EMMANUEL (1824–1910), French sculptor who devoted himself chiefly to animal sculpture and to equestrian statues in armour, was born in Paris on Dec 6, 1824. Though he was a nephew and pupil of Jean François Rude, the detailed naturalism of his sculpture was closer to the art of Antoine Louis Barye, whom he succeeded as professor of animal drawing at the Natural History museum of Paris. Frémiet's first employment was making lithographs of comparative anatomy for a painter of natural history. After initial success with his animal studies, he won a medal of honour at the 1887 salon with the representation, in bronze, of a gorilla carrying off a Negro woman (Nantes)

In imposing equestrian statues, with accoutrements carefully rendered, Frémiet achieved convincing portrayals of warriors such as "Jeanne d' Arc" (second version. 1899; Place des Pyramides, Paris) and "Du Guesclin" (1902; Dinan). For Mount Vernon square, Baltimore, he made "Colonel Howard" (1903) and for Bogotá, Colombia, "Bolívar" (1910). Frémiet ascended the ladder of honours to membership in the Académie des Beaux-Arts in 1892, but his fame did not aithstand the later shift of taste away from his chosen subject matter, despite his acknowledged mastery there. He died in Paris on Sept. 10, 1910. (J. W. F.)

FRÉMONT, JOHN CHARLES (1813–1890), American explorer, soldier and political leader, was born in Savannah, Georgia. His father, a native of France, died when the boy was in his sixth year, and his mother, a member of an aristocratic Virginia family, removed to Charleston, S C., where Frémont's youth was spent. In 1828 he entered the junior class of the College of Charleston, where he displayed marked ability, especially in mathematics. His degree was withheld because of irregular attendance but finally conferred in 1836. Joel R. Poinsett's influence secured his appointment in 1833 as teacher of mathematics on board the sloop-of-war "Natchez" and Frémont sailed with that vessel on a cruise along the South American coast which lasted two and a half years. Upon his return he declined an appointment as professor of mathematics in the United States navy and chose instead to serve as assistant engineer of a survey undertaken to find the best pass for a proposed railway from Charleston to Cincinnati. Following this Poinsett secured for him an appointment as second lieutenant of topographical engineers in the United States army, and for the next three years he was an assistant to the French explorer, Jean Nicholas Nicollet, employed by the war department to survey and map a large part of the country lying between the upper waters of the Mississippi and Missouri rivers. In 1841 Frémont alone headed an expedition to survey the Des Moines river to complete Nicollet's map. These years under Nicollet furnished invaluable training and experience for use in his later career and gave him a desire for further western adventure. Upon his return he married Jessie Benton, daughter of Senator Thomas Hart Benton of Missouri, and it was in no small measure Benton's great interest in the West and his influence with the Government that enabled Frémont to accomplish within the next few years the exploration of much of the territory between the Mississippi valley and the Pacific ocean.

When emigration over the Oregon trail to the Oregon country began to be important in 1842, Frémont was sent at the head of a party to explore the route beyond the Mississippi as far as South pass in Wyoming. He surveyed the trail thoroughly and his excellent descriptions greatly aided the emigrants of following years. He ascended to the summit of the second highest peak of the Wind River mountains, since known as Frémont's peak. The year following he was sent to complete the survey of the trail to the mouth of the Columbia. His guide on this as well as on the previous expedition was the famed and picturesque Christopher (Kit) Carson (*q.v.*). The Oregon settlements mere quickly reached, and then Frémont turned south and east via the Klamath lakes to northwestern Nevada, continuing to the Truckee and Carson rivers. This portion of the journey over previously untravelled country added greatly to geographical knowledge of the west. Frémont then accomplished with his entire expedition an extremely difficult and rash crossing of the Sierra Nevada in midwinter—an exploit which added greatly to his fame—and spent the winter near Sutter's Fort on the Sacramento river in California. His return was round the southern end of the Sierra Nevada and across to Great Salt lake mainly via the old Spanish trail from Santa FC to California.

Thousands of copies of his report of this expedition were printed and eagerly read. War with Mexico over the annexation of Texas seemed imminent, and in the spring of 1845 Frémont was dispatched on a third expedition for the professed purpose of further exploring the Great basin and Pacific coast, but with secret instructions for action in case of a war with Mexico. He and his party of 62, after traversing the Great basin by a new route directly west from Great Salt lake and down the valley of the Humboldt. reached California. in Jan. 1846. after a second winter crossing of the Sierras. The Mexican authorities became suspicious and ordered Frémont out of the province. Frémont refused to leave at once and fortified his position, but later thought better of this indiscreet action and led his party toward the Oregon border. He was overtaken by a messenger direct from Washington and at once turned about and led his force back into California. The official documents delivered gave Frémont no excuse for hostile actions. but what orders the private letters and verbal instructions contained is unknown. While Frémont's men were in camp the Americans in northern Mexico revolted from Spain and created the Bear-Flag republic. Frhmont took no part in the hostilities but certainly gave his moral support. When news of the declaration of mar with Mexico did reach California all the northern region was already in American hands. Frémont was appointed by Commodore R. F. Stockton major of a battalion made up mainly of American volunteers, and by Jan. 184; he and Stockton had completed the conquest of the future state. Gen. Stephen W. Kearny. in the meantime. entered California from the southeast with orders similar to those of Stockton. namely to conquer the region and establish a government. This conflict of orders led to a conflict of authorities between which Frémont was caught. Stockton had already appointed him governor of California, hut Kearny would not recognize the appointment. Frémont, obeying the officer from whom he had received his commission, disregarded Kearny's contradictory orders and was arrested by the latter, who by this time, unknown to Frémont, had received later orders from Washington establishing his authority without contradiction. Frémont was tried by court-martial in Washington. found guilty of mutiny, disobedience and conduct prejudicial to military discipline. and sentenced to be dismissed. Pres. James Polk approved of the verdict except as to mutiny, but remitted the penalty. Frémont, in a bitter mood, resigned.

The explorer now intended to establish his home on an estate which he had purchased in California. and on his way thither decided to lead, at his own and Senator Benton's expense, a fourth expedition to find passes for a Pacific railroad which he was eager to see built. Kit Carson not being available, Frémont employed the eccentric "Bill" Williams as guide. Westward from the headwaters of the Rio Grande the party tried to penetrate the massive San Juan range in December. Williams led them into a high, unknown pass where they mere caught by a blizzard. After weeks of intense cold and the loss of 11 men and the entire outfit, the exhausted party in retreat reached the first settlements in the upper Rio Grande. Frémont continued by the southern route to California and was greeted with news of the discovery of gold. Rich veins were discovered on his great 40.000 ac. estate on the Mariposa river at the base of the Sierras. and he spent the next few years developing mines which quickly made him a multimillionaire. In Dec. 1849 he was elected one of the first two senators from California, but, drawing the short term, he served only from Sept. 1850 to March 1851. He was defeated for re-election by the proslavery party. His opposition to slavery. however, and the popularity his explorations and his part in the conquest of California had won for him. led to his nomination for the presidency in 1856 by the newly formed Republican party. In the election he was defeated by Buchanan by 174 to 114 votes.

Soon after the Civil War began, Frémont was appointed major general and placed in command of the western department with headquarters at St. Louis, Mo. The task of organizing an effective army with insufficient arms, insufficient supplies and only a few thousand untrained men in a slave state which needed policing at all points proved too much of a task for Frémont's ability. Political and military enemies made the most of his failures, and he was blamed for several distressing defeats, though it is doubtful if they could have been avoided. Furthermore, on Aug. 30, 1861, he issued a proclamation in which he declared the property of Missourians in rebellion confiscated and their slaves emancipated. Pres. Abraham Lincoln regarded this proclamation as premature, fearing that it might alienate the border states whose loyalty he still hoped to keep. The adverse reports of agents sent by Lincoln to investigate Frémont's management led to his removal by the president. Out of consideration for the "radicals" who backed Frémont, he was placed in command of the mountain department of Virginia. Kentucky and Tennessee in 1862 but was ineffective and seemingly dazed by the rapid manoeuvres of "Stonewall" Jackson, his opponent. When his army was united with the army of the Potomac to form the army of Virginia, which was placed under the command of his old enemy in Missouri, Gen. John Pope. Frémont resigned. He was still popular enough to be nominated for the presidency in 1864 by the radical wing of the Republican party, but when he saw that he had no chance and would possibly only split the party to defeat Lincoln, he withdrew. He retired from public life and devoted himself to building a railroad by the southern route to the Pacific. The finances of the enterprise were unsound and in the collapse in 1870 Frémont lost the fortune he had made in California. In his embarrassment he welcomed the relief and change of occupation that came with an appointment as governor of Arizona territory in 1878, an office which he occupied until 1881. He died in New York city on July 13, 1890.

It is for the splendid achievements of his early life as an explorer that Frémont will be particularly remembered. It is true that trappers had long before travelled where he followed, but he first surveyed and described the routes. If he was not a pathfinder he was a path marker. "From the ashes of his campfires have sprung cities."

Bibliography.—Frémont's *Report of the Exploring Expedition to the Rocky Mountains, 1842, and to Oregon and North California, 1843–44* (1845), and *Memories of My Life* (1887); biography by Allan Nevins, *Frémont, the West's Crratest Adventurer,* 2 vol. (New York, 1928); H. Bashford and H. Wagner, *A Man Unafraid, thr Story of John C. Frémont* (San Francisco, 1927). Frémont's own account of "The Conquest of California" is in the *Century Magazine* (April 1890).

FREMONT, a city of California. U.S., in Alameda county on the southeastern shore of San Francisco bay. 25 mi. S. of Oakland and a part of the San Francisco-Oakland standard metropolitan statistical area. Incorporated Jan. 10, 1956. and named in honour of John Charles Frémont, the city was formed by joining the five communities of Centerville. Irvington. Niles. Mission San Jose and Warm Springs. The Nimitz freeway, extending from Oakland to San Jose through Fremont. was important in helping to transform Fremont from an agricultural area into one of varied industries. In the city is Mission San José de Guadalupe, founded in 1797; it was 14th in the chain of the 21 California missions. For comparative population figures see table in California: *Population.* (*H.* B. Me.)

FRÉMY, EDMOND (1814–1894), French chemist, made important contributions in a wide range of areas. He was born at Versailles on Feb. 28. 1814. He entered Joseph Louis Gay-Lussac's laboratory in 1831. and became *préparateur* at the École Polytechnique in 1834 and at the Collège de France in 1837; he was *répétiteur* at the École Polytechnique, where in 1846 he became professor.

In 1850 he succeeded Gay-Lussac in the chair of chemistry at the Muséum d'Histoire Naturelle, of which he was director, in succession to M. E. Chevreul, from 1879 to 1891. He died at Paris on Feb. 3, 1894.

His work included investigations of osmic acid, of the ferrates, stannates. plumbates, etc., and of ozone; attempts to obtain free fluorine by the electrolysis of fused fluorides; and the discovery of anhydrous hydrofluoric acid and of a series of *acides sulphazote's,* the precise nature of which long remained a matter of discussion.

He also studied the colouring matters of leaves and flowers, the composition of bone, cerebral matter and other animal substances, and the processes of fermentation, in regard to the nature of which he was an opponent of Pasteur's views. In the field of technical chemistry he contributed to the knowledge of the manufacture of iron and steel, sulfuric acid, glass and paper, and in particular worked at the saponification of fats with sulfuric acid and the utilization of palmitic acid for candlemaking.

In the later years of his life he applied himself to the problem of obtaining alumina in the crystalline form, and succeeded in making rubies identical with the natural gem not merely in chemical composition but also in physical properties.

He wrote a *Traitk de chimie gkne'rale* in six volumes.

FRENCH, ALICE ("OCTAVE THANET") (1850–1934), U.S. author of novels and short stories, wrote under the pseudonym "Octave Thanet." Though her fiction, the background of which was often Arkansas and Iowa, was very popular at the beginning of the 20th century, her works are not considered important contributions to American literature.

She was born in Andover, Mass., on March 19, 1850, and studied at Abbott academy in that town. She later lived in Arkansas and Davenport, Ia.

She participated in the activities of various clubs and organizations and was president of the Iowa Society of Colonial Dames. She was also interested in certain contemporary labour problems of the west.

Novels by Alice French, whose style was clear and simple, include *Knitters in the Sun* (1887); *Expiation* (1890); *The Man of the Hour* (1905); and *A Step on the Stair* (1913).

Her short stories! for which she probably was best known, were collected in a number of volumes, including *Stories of a Western Town* (1893); *A Captured Dream, and Other Stories* (1897); and *Stories That End Well* (1911).

She also published By *Inheritance* (1910) and *And the Captain Answered* (1917).

Alice French never married. She died at Davenport on Jan. 9, 1934.

FRENCH, DANIEL CHESTER (1850–1931), U.S. sculptor whose work is more profoundly American than that of any other American sculptor, was born at Exeter, N.H., April 20, 1850. His father, Judge Henry Flagg French, was assistant secretary of the treasury through three presidential administrations. French studied anatomy with William Rimmer in Boston, worked for one month with J. Q. A. Ward in New York city, and then two years under Thomas Ball in Italy.

His first important commission came when he was 22, from the town of Concord, Mass., where he lived, for the statue of "The Minute Man." Unveiled by Ralph Waldo Emerson at the Old North bridge on the centennial of the Concord fight, April 19. 1875, it later became the symbol for defense bonds, stamps and posters of World War II, and copies of the statue may be seen in many New England towns.

This commission launched the artist on a career unparalleled in American sculpture. Fifty years later, in 1922, he witnessed the dedication of his great marble—the seated Lincoln in the Lincoln memorial in Washington. D.C.

Between these two triumphs there poured from his studio a constant stream of sculpture.

Among his better-known works are "Death and the Sculptor." Forest Hills cemetery, Boston, 1893; the equestrian statues of Gen. U. S. Grant, Philadelphia, 1898, and General Washington. Paris, 1900; three pairs of bronze doors for the Boston Public library, 1902; the groups of the "Four Continents" for the New York customhouse, 1907; the "Standing Lincoln," Lincoln, Neb., 1912; the statue of Emerson in the Public library, Concord, 1914; the "Alma Mater" at Columbia university, 1915; and the 1st division memorial, Washington, D.C., 1924.

(M. F. CN.)

FRENCH, NICHOLAS (1604–1678), bishop of Ferns, Ire., was an Irish political pamphleteer, born at Wexford. He was educated at Louvain, and before 1646 was appointed bishop of Ferns. His political activities made it prudent for him to leave Ireland in 1651.

French acted as coadjutor to the archbishops of Santiago de Compostella and Paris, and to the bishop of Ghent. and died at Ghent on Aug. 23, 1678. His most important historical works were published by S. H. Bindon (Dublin, 1846).

See Irish Manuscripts Commission, *Commentarius Rinuccinianus . . .,* ed. by J. Kavanagh, 6 vol. (Dublin, 1932–49), *De Praesulibus Hiberniae,* ed. by J. F. O'Doherty, 2 ool. (Dublin. 1944); T. Carte, *Life of James, Duke of Ormonde,* 6 vol., new ed. (Oxford, 1851).

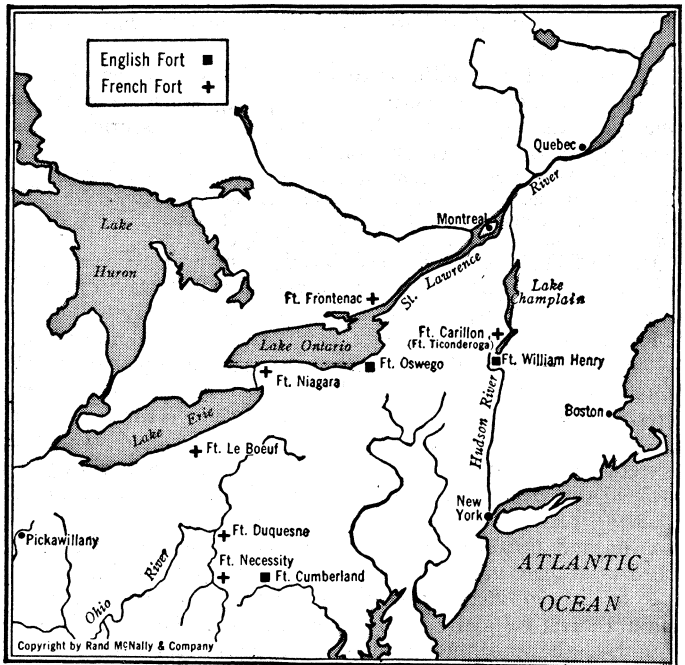
FRENCH AND INDIAN WAR. This war was the American phase of a world-wide, nine years' war that was waged between 1754 and 1763. It was called by contemporary writers the "Maritime War" or the "Great War," the "Late Glorious War" or simply the "Late War," but it is most accurately termed the "Great War for the Empire." It involved at first only the empires of Great Britain and France. Later the electorate of Hanover, of which the king of England was head, and two other western German states, Brunswick and Hesse-Cassel, closely associated with Hanover, were drawn into it when France attacked Hanover.

Spain and Portugal became participants when in 1762 Spain, allied to France, invaded Portugal, allied to Great Britain. This is to be distinguished from the Seven Tears' War (*q.v.*) that began in central Germany in 1756 over issues having nothing to do with those that precipitated the war already in progress. The participants in the Seven Years' War were, on the one hand, Prussia, allied to Great Britain by a subsidy treaty, and. on the other hand, Austria, Russia, Sweden and most of the southern German states, all of whom were allied to France likewise by subsidy treaties but with none of whom Great Britain was at war. The two wars were, moreover, terminated by distinct treaties, one at Paris and the other at Hubertusburg, and no nation was a signatory of both.

Conflicting British and French Claims.—The Great War for the Empire began over the specific issue as to whether the upper Ohio valley was a part of the British empire and therefore open for trade and settlement on the part of the inhabitants of Pennsylvania and Virginia, or whether it was part of the French empire. But behind this issue loomed an infinitely greater one—nothing less than the question as to which nation with its peculiar civilization. including language, forms of government and social mores, was to dominate the heart of the continent of North America.

British territorial claims rested upon the John and Sebastian Cabot discovery of the North American continent in the latter part of the 15th century and the grant by English royal charter in the early part of the 17th century, to both the Virginia company and the Grand Council for New England, of all the land within certain limits between the Atlantic and Pacific oceans. Further, in 1663 there was created to the south of Virginia the province of Carolina that also received a sea-to-sea grant and out of which were later formed North Carolina. South Carolina and Georgia. Thus all the lands to the south of French Canada and to the north of Spanish Florida stretching from sea to sea were claimed by England. In conflict with this was the claim of France to the whole of the Mississippi valley. including that of the Ohio, based upon the discoveries of René Robert Cavalier, sieur de la Salle, who, starting from Canada, moved through the Great Lakes and then, after descending the Mississippi river in 1682, took possession in the name of the king of France of all lands drained by this river and its tributaries.

For about 60 years the issue as to which nation had the better right to the lands in the great Mississippi basin was to remain in abeyance. The English gradually settled all along the Atlantic seaboard to the south of the Gulf of St. Lawrence where about 14 colonies—including British Nova Scotia, founded in 1749—came into existence and flourished. The inhabitants of these colonies in the course of time pushed westward from the tidewater to establish themselves in the piedmont country. By the middle of the 18th century the small cabins of the Virginians were to be found even to the west of the Applachians on the upper waters of



FRENCH AND INDIAN WAR: GENERAL AREA OF FIGHTING, INCLUDING SOME OF THE SITES OF MAJOR BATTLES

such streams as the New and the Holston. By that period hundreds of Pennsylvania traders had likewise settled in the villages of Indian tribes of the upper Ohio valley with whom Great Britain was in alliance.

On the other hand, the French. firmly in control of Canada from the early 17th century, gradually began, through trade, the exploitation of the Great Lakes region. They established permanent settlements at Detroit, in the so-called Illinois country, at the mouth of the Mississippi and at Biloxi and Mobile bay. By 1750 they had, in addition, many trading posts among those Indian tribes with whom they were in alliance.

Beginning of **Hostilities.**—A conflict between the two nations over their rival North American claims was doubtless inevitable, but it might have been delayed for many years, since their areas of trade exploitation were widely separated, had not the governor general of New France forced the issue.

Although the French had developed no trade relations in the neighbourhood of the Allegheny river and the upper Ohio where Pennsylvania traders were concentrated, the governor general ordered Pierre Joseph Céloron de Blainville in 1749 to go into this region and compel the traders to lower the British flag flying over their trading houses and, as trespassers on the king of France's lands, to retreat to the eastern slopes of the Appalachians. Since this move did not have the desired effect, force was applied in 1752 when the important British colonial trading centre at Pickawillanp on the upper Great Miami river was destroyed.

This was followed by the plundering, capture or killing of every English-speaking trader in the upper Ohio valley that the French and their Indian allies could find.. These actions not only struck directly at the people of Pennsylvania but at those of Virginia as well.

In fact. the government of Virginia took the position that the lands of the upper Ohio were clearly included in the charter grant of 1609 to that colony—a grant which gave the colony a more valid claim to them than that of New France, based upon La Salle's much later journey down the Mississippi. In harmony with this point of view the governor and council had by the end of 1752 granted conditionally about 1,500,000 ac. of Ohio valley land with the result that almost every important Virginia family, including members of the SVashington. Lee and Randolph families, was vitally interested in the fate of the Ohio area. When, therefore. the news reached Williamsburg, the capital of the province, that the French were not only driving out the English traders but were building forts on the headwaters of the Allegheny river in order to consolidate their positions, it was determined late in 1753 to send young George SVashington to the French Ft. Le Boeuf, located near the upper waters of the Allegheny, to warn the garrison there that it was occupying lands that belonged to Virginia. After that daring mission had failed. the Ohio company of Virginia, which had received. under certain stipulations a special royal grant of upper Ohio valley land, was encouraged to build a fort at the forks of that river—that is, at the place where the Allegheny and Monongahela rivers join to create the Ohio river and where Pittsburgh now stands—with the understanding that Virginia troops would support the undertaking.

The French, however, were too quick. Descending the Allegheny river in numbers in the spring of 1754, their troops, under the command of French regular officers: overwhelmed the little force of woodcutters and carpenters busy constructing the palisaded log fort before the Virginia troops and the company of South Carolina Independents coming to their support under Col. Joshua Fry and Lieutenant Colonel Washington had arrived. Upon the death of Fry, Washington took command and, in view of the strength of the French at the forks, decided to entrench himself at Ft. Xecessity. There he was attacked and in the face of great odds compelled to surrender.

While hostilities between the two nations had preceded the action at Ft. Necessity, it was this clash between British and French armed forces that precipitated the Great War for the Empire. Ultimately the war was to spread from the Ohio valley to every part of the world where either of the two nations had territorial interests.

The government of Virginia appealed to the king for assistance, particularly for two British regiments so that regulars could be pitted against regulars in this wilderness contest. Fearing the outbreak of a new war with France, after having as recently as 1748 made peace with the latter, George II at first stubbornly refused to consider the request, agreeing with the position taken by his minister, the duke of Newcastle, who said: "Let Americans fight Americans" in distant new world clashes. But when it became clear from further reports sent by the government of Virginia that ram Virginia militia could not be expected to make headway against seasoned French regulars, George finally agreed to order Gen. Edward Braddock to go to Virginia with a force to clear the forks of the Ohio of the French invaders. Moreover, Adm. Edward Boscawen was sent into the region of the Gulf of St. Lawrence with a powerful fleet to prevent further reinforcements of French troops from arriving in Canada.

Spread of the War.—The war thus begun to defend British territorial claims in the Ohio valley spread like wildfire to other parts of the world. It became a contest between the two greatest maritime powers.

France, however, was far superior to Great Britain in land forces. This superiority was soon used against King George's electorate; Hanover, which as a German state was not interested in Anglo-French rivalry in the new world. The war thereupon presented two facets: one a struggle for empire in North America, the West Indies, the African coast and India; the other an effort on the part of the British to prevent Hanover's being used as a pawn in this territorial rivalry.

Early French Successes.—During the first four years of the fighting the over-all advantage was with the French. especially in North America. It seemed to most contemporaries that they would succeed in enclosing the British colonials firmly to the east of the Appalachian mountains, thus condemning them to remain simply a seaboard people—like modern Chile with a long coast line and a narrowly restricted interior. For in those years the British regulars and American colonials suffered one stunning reverse after another.

Braddock's army was defeated and scattered in 1755 when approaching the new Ft. Duquesne that the French had erected at the forks of the Ohio. In 1756 the defenders of Ft. Oswego on Lake Ontario were obliged to surrender, as were the defenders of Ft. William Henry near Lake Champlain in 1757. Lord Loudoun's amphibious expedition from New York city against the great French fortress Louisbourg on Cape Breton Island ended in that year in dismal failure, and Gen. James Abercrombie, attacking the French Ft. Ticonderoga in 1758, had his army almost destroyed. Moreover, the frontier settlements in what is now central New York, central Pennsylvania, western Maryland and western Virginia were deserted while thousands of families fled eastward in panic from the torch, sword and tomahawk carried by the French and their Indian allies.

During these years of defeat the only notable success scored by the British and New England forces was the capture in 1755 of the well-fortified Ft. Beauséjour. The French had built the fort in 1749 on the narrow isthmus connecting the peninsula of Nova Scotia with the mainland—a region held by British authorities to be a part of Nova Scotia, ceded by France in 1713 in the treaty of Utrecht—chiefly for the purpose of reviving the loyalty to the king of France of the French-speaking Acadians in Nova Scotia. This design so far succeeded that these numerous, hardy people not only steadfastly refused to take an oath of loyalty to the British crown but provided the Beauséjour garrison with provisions and a large labour force to aid it in consolidating its foothold on the isthmus.

Since no large contingent of British soldiers was available to hold in awe the Acadians, who had thrown off their former attitude of neutrality as between the British and the French, it was decided by the authorities at Halifax to disperse them as a war measure. In line with this resolve, transports were provided and most of the Acadians were carried away from their villages in western Nova Scotia and distributed among the inhabitants of the British colonies to the southward.

British Advantages.—In a conflict of this character, which involved such a tremendous stake as the future of a continent, factors other than the series of early French victories were to play a decisive role. First of all, there was William Pitt at the head of the British ministry. He saw correctly that, despite the spread of the Anglo-French war to other parts of the world, the winning of it in North America was the supreme task in hand. With almost fanatical zeal he dedicated himself to that end. He found in such men as Jeffrey, Lord Amherst, James Wolfe and John Forbes first-class military officers.

Pitt recruited new regiments of regulars to replace or to reinforce the old, shattered ones, drawing heavily upon that martial people, the Highland Scots; he persuaded parliament to grant him almost unlimited funds; he promised the colonies a liberal reimbursement of their expenses, were they to do their part in the effort by furnishing men for the colonial line; finally, every important detail with respect to operations in North America came under his personal scrutiny so as to guard against further fiascoes. Pitt, in a very true sense, was the organizer of victory in the Great War for the Empire.

In Pitt's favour were other factors that were destined to permit him to overwhelm his opponents. One was the growing superiority of the British navy which slowly but relentlessly swept not only French merchantmen but also French ships of war and troop transports from the seas, thus shutting off the means of bringing reinforcements of troops and munitions from France to Canada.

In this connection two great naval battles must be mentioned. The destruction, as a fighting unit, of the French Mediterranean fleet under Admiral de la Clue was accomplished by Boscawen off Lagos in Portugal in 1759, as the French sought to gain the seaport of Brest. The virtual annihilation of the main French fleet brought about later that same year in the decisive battle of Quiberon bay, when Adm. Sir Edward Hawke's fleet bore down upon it with devastating effect.

Moreover, there were available in Great Britain vastly greater financial and industrial resources than in France, which before the end of the struggle was faced with national bankruptcy and economic paralysis. The British colonies also had great quantities of food supplies of all sorts for provisioning the armed forces in the new world, while the inhabitants of French Canada faced almost famine conditions when the blockades off the coasts of France and in the Gulf of St. Lawrence made it virtually impossible to secure food from outside. Nor could the soldiers fighting under the fleur-de-lis in North America be supplied any more easily with vitally needed munitions.

Finally, both British regulars and the American colonial line became seasoned wilderness fighters. It should at the same time be pointed out that the Indian or bushranger method of waging war, most successfully employed by the French, brought no great decisions in the desperate contest. In the main, both sides tended to observe well-established principles of strategy and tactics. The war, in other words, witnessed the transfer to America of European methods of fighting, modified, of course, to meet peculiar local conditions. Thus, the domination of the high seas by the British royal navy and the capacity, therefore, to provide the field forces in America with an inexhaustible supply of munitions and provisions, together with growing morale and capacity for achievement of the battle-seasoned soldiers, both Brilish and American, fighting there, were factors of the utmost importance in determining the outcome of the war.

British Victory.—Under these circumstances the French tide in North America reached its crest by the end of 1757. In 1758 Amherst captured Louisbourg. Soon afterward John Bradstreet compelled the garrison of Ft. Frontenac to capitulate and the same year Forbes and Henry Bouquet brought about the fall of Ft. Duquesne. The following year Sir William Johnson forced the surrender of Ft. Niagara. Amherst pushed the French out of Ft. Ticonderoga and Crown Point. Further, Wolfe won the vastly important battle of the heights of Abraham that led to the surrender of Quebec. Faced by hopeless odds, the governor general, the marquis de Vaudreuil, was obliged on Sept. 8, 1760, to surrender not only his last stronghold, Montreal, but all of Canada. Thus the North American phase of the Great War for the Empire came to a close. The capture of Spanish Havana by British and American colonial forces in 1762 must, however, also be mentioned by reason of its implications.

Peace Treaty of 1763.—France and Spain, faced with disastrous defeats in the new world, were ready by 1763 to negotiate a treaty of peace. The signing took place in Paris on Feb. 10. By the treaty France was compelled to cede Canada to Great Britain and relinquish to it all claims to the lands lying east of the Mississippi, outside of the environs of New Orleans. Spain, in order to recover Havana, was obliged to give up Florida, for which loss France compensated Spain by the cession to it of Louisiana, including New Orleans. Thus France, which at the beginning of the war and during the first four years held a dominating position over most of North America, had disappeared from that continent as a political and military power. In contrast, all along the Atlantic seaboard from the northern reaches of Hudson bay to the Keys of Florida the British union jack waved without a rival.

American Colonial Reactions.—On the surface it seemed that, with the triumphant outcome of the war, the British empire would for generations determine the future of North America. However, the very magnitude of the victory of British arms there undoubtedly played a major part in undermining the loyalty of the American colonials to the British crown. Before the war the value of their connection with Great Britain was obvious. With its conclusion this no longer was true—it now seemed that a continued dependence upon the mother country, instead of bringing benefits, would involve most onerous obligations. When the Americans—by reason of the outcome of the Great War for the

Empire—no longer had to live in fear of powerful enemy neighbours on their borders. they understandably sought to narrow as much as possible the range of authority exercised over them by king and parliament. When there was resistance to this, friction developed and reached a white heat in 1775 in the American Revolution.

In 1783. just 20 years after the peace of Paris had signaled the consolidation of all of eastern North America, Great Britain was obliged to agree to the independence of the 13 colonies, although it had been to guarantee their future within the empire that the Great War for the Empire had been waged.

FRENCH ANTILLES (ANTILLES FRANÇAISES), Caribbean islands in the Lesser Antilles, comprise two overseas *départements* of France: Guadeloupe and Martinique. Guadeloupe (*q.v.*) is in the Leeward Islands and lies between Montserrat and Dominica. Its dependencies include the nearby islands of Marie-Galante, La Désirade, Îles des Saintes and Îles de la Petite Terre to the southeast and, about 135 mi. N.W., Île St. Barthélemy and the French part of St. Martin. Martinique (*q.v.*), in the Windward Islands, lies between Dominica and St. Lucia. Total area 1,118 sqmi.; pop. (1960 est.) 542.000. (D. R. H.)

FRENCH BROAD RIVER, western North Carolina and eastern Tennessee, U.S., drains nearly two-thirds of the high southern Appalachians in North Carolina. Rising in the Blue Ridge mountains of southwestern North Carolina, near the South Carolina border. it flows generally north through the upland Asheville basin. Turning northwestuard at Asheville and descending 714 ft. in 14 mi., it continues to the Tennessee state line. From there it turns westward to Knoxville where it unites with the Holston to form the Tennessee river (*q.v.*). Total length 210 mi. Principal tributaries include the Pigeon and Nolichucky rivers. Douglas dam of the Tennessee Valley authority forms Douglas Lake reservoir about 30 mi. above the river's mouth. Originally navigable for about 50 mi. upstream, the river was used only by sand dredges in its lower reaches in the second half of the 20th century. (L. DD.)

FRENCH COMMUNITY, an association of states known in French simply as the COMMUNAUTÉ. In 1958 it replaced the French union, itself the successor of the former French colonial empire.

History.—The first French colonial empire, created in the 17th century, comprised Canada, Louisiana (the whole Mississippi valley), St Domingue (Haiti) and most of the Lesser Antilles, Guiana. two agencies of Senegal, five agencies in India with zones of influence. the Mascarene Islands (Reunion. Mauritius and Rodrigues) and the Seychelles. Between 1763 and 1815. France lost most of this empire. retaining only Martinique, Guadeloupe, Guiana, the agencies of Senegal and India (deprived of their hinterlands) and Réunion Island.

In the course of a century France formed a second colonial empire, which in 1919 consisted of the following lands (1) in north Africa: Algeria. Tunisia and Morocco (protectorates); (2) in west-central Africa: two colonial federations, French West Africa and French Equatorial Africa and two territories mandated by the League of Nations. Togo and Cameroun; (3) in the Indian ocean: French Somaliland. Madagascar and its dependencies (Comoro and the Southern Lands), the five agencies in India (Pondicherry, Chandernagore, Yanaon, Karikal and Mahé) and Réunion Island; (4) in the Pacific ocean: French Indochina (the colony of Cochin-China and the protectorates of Tongking, Annam, Cambodia and Laos), New Caledonia and the French *établissements* of Oceania (all eastern Polynesia); (5) in America: St. Pierre and Miquelon, Martinique, Guadeloupe and French Guiana; (6) in the Levant: the two mandated territories of Syria and Lebanon, which were autonomous republics. The inhabitants of the countries acquired before 1815 were French citizens and elected their representatives to the French parliament. Elsewhere the colonial peoples were subjects without political rights, and the chiefs were subordinate. in lam or in fact, to the French governors.

After World War II the Levantine states gained their independence. In 1944 a conference held at Brazzaville (capital of the former French Equatorial Africa) accepted the right of the colonies to be represented in parliament. The constitution of 1946 created the French union. composed of associated states (the former protectorates1 and of the French republic which consisted, in addition to France. of the overseas *départements* (Algeria, Antilles and Reunion). the overseas territories (the former colonies) and the associated territories (Cameroun and Togo). All the inhabitants were citizens and represented in the French parliament. The territories and Algeria were also granted a local assembly. The union had a president (who was that of the French republic) and a high council and an assembly which were purely consultative.

Developments within this system were somewhat rapid. In 1952 the Indian agencies were transferred to the government of India. The nar in Indochina. launched by communist Vietminh, resulted, in 1954. in the independence of the four states. North Vietnam, South Vietnam, Cambodia and Laos. Tunisia and Morocco gained their independence in 1956. The territories received in 1957, under the "cadre-law," governing councils elected by their assemblies. In Algeria the revolt of certain Muslims who demanded independence, and the determination of the 1,000,000 French colonists to oppose separation, prevented the working out of a constitution. On May 13. 1958, the colonists formeda "committee of public safety"; parliament yielded and called to power Gen. Charles de Gaulle. The constitution of Oct. 5, 1958, ratified by the vote of all the territories (except Guinea, who thus broke with France), created the French Community.

Constitution.—The principle of the community is that of "free determination." The constitution was ratified by universal suffrage. this vote being considered as adherence on the part of each territory. The local assemblies then had to choose between the status of a territory and that of a state. Only the smallest territories chose the status quo. The status of the territories can be modified and every state can become independent.

The French Republic comprises: (1) European France: (2) the overseas *départements,* their administration and legislation being in principle those of the metropolis, but each of which can receive an individual constitution; (3) the overseas territories, which have their onn individual organization nith a territorial assembly elected by universal suffrage; the assembly appoints a governing council, its president being the governor appointed by the central power.

The republic is "one and indivisible"; all the inhabitants are French citizens; those citizens who have a special civil status (in respect. for example, of the Muslim faith or of local customs) retain the benefit of this. All citizens take part in the election of the president of the republic and of the French parliament.

The States do not form part of the French republic; they are independent and work out their own constitution. They may create unions among themselves.

The Community is the association formed between the French republic and the other states. There is only one "citizenship of the community." The community's sphere of competence includes foreign policy, defense, currency and common economic and financial policy.

The President of the Community is the president of the French republic and the states take part in his election. He has a representative (high commissioner) in each state. President de Gaulle reccived in 1958 an absolute majority in all the states.

The Executive Council of the Community meets several times a year. in one or other of the capitals, on the summons of the president who assumes the chair. It is composed of the chiefs of the governments of the different states and the ministers responsible for common affairs.

The Senate of the Community is composed of members of the local assemblies designated by them in numbers proportional to the population of the state. After holding two sessions it was abolished in March 1961.

A Community Court of Arbitration, composed of seven judges nominated by the president, gives decisions in disputes between member states.

Agreements of Association may be made by the community with other states.

There are no longer any associated territories, since Togo and Cameroun have, at the instance of France. had their mandatory status terminated by the United Nations, their independence dating from 1960.

The French Republic. — The French republic consists of the following countries (each of which, as well as the other states, is the subject of a separate article):

(1) European France, including Corsica.

(2) The overseas de'partements, former colonies that were part of the first French colonial empire. The inhabitants are white, black or of mixed race and all are French citizens, subject to French law. These lands are organized in the same way as the *départements* of France, with a *préfet* (the agent of the central government) and an elected general council. Their budget is that of the metropolis and individual dispositions in certain respects may be made by law with regard to them. They are, in the Rest Indies: Martinique, Guadeloupe and its dependencies; in South America: French Guiana; and in the Indian ocean, Réunion.

(3) Algeria and Sahara. These areas, considered an integral part of France, are divided into de'partements, 13 in Algeria and 2 in Sahara. All the inhabitants are French citizens. but the Muslims preserve their former juridical status. All send representatives to the French assemblies and elect municipalities. The particular situation of Algeria has demanded special measures pending the definitive establishment of its status. integration and federation each having its partisans, in addition to the insurgents who demanded independence.

(4) The overseas territories. These are small and very scattered countries which, while participating in the institutions of the republic, enjoy a certain autonomy and have their own budget. They comprise the following in North America: the islands of St. Pierre and Miquelon, remnants of French Canada; in east Africa: French Somaliland; in the Indian ocean: the Comoro Islands, and the Southern (Kerguelen and other islands) and Antarctic territories. administered directly from Paris; in the Pacific ocean: New Caledonia. Wallis and Futuna Islands and French Polynesia. France also has, with Great Britain, the condominium of the New Hebrides, which has no representative institution and does not form part of the republic.

Other Member States. — These were the following, by geographical distribution:

(1) In uest Africa (formerly l'Afrique Occidentale Française, less Guinea:: the republics of Senegal, Mali, Mauritania, Upper Volta, Dahomey, Ivory Coast and Niger. Senegal and the Sudanese republic in 1959 united to form the short-lived Federation of Mali, which in 1960 divided to form two republics, Senegal and Mali. Ivory Coast. Upper Volta. Dahomey and Niger have created the Sahel-Benin entente. All the states agreed to form a customs union. (2) In equatorial Africa (formerly l'Afrique Equatoriale Française): Central African Republic and the republics of Gabon, Congo (former Middle Congo) and Chad.

(3) The Malagasy (in French Malgache) Republic (Madagascar).

Evolution. — The system set up overseas by the constitution of 1958 survived only in Algeria, the Sahara, the overseas *départements* and the overseas territories. Among the states the community functioned only during 1959 when six sessions of the executive council were held in various capitals. Immediately after the sixth session. held in December at Dakar. President de Gaulle agreed to Mali's claim for national sovereignty.

In 1900 the powers of the community were transferred to the various republics. In April agreements were signed between France and Mali and France and Madagascar, recognizing the independence of those two countries. At the same time they made agreements to receive military, economic and cultural aid from France. In July the Ivory Coast, Upper Volta, Niger and Dahomey received their independence and so did the four republics of the former French Equatorial Africa. A similar agreement mas made with Mauritania in October. By 1961 only Senegal. Gabon, Congo. the Central African Republic, Chad and the Malagasy Republic still belonged to the community. The constitutional bodies, however, no longer continued to function and the relations between these member states and France showed no difference from the relations between France and the other formerly French states.

This new system is based purely on contractual agreements. The states are fully independent. with their own flags, their own national anthems, their own representation abroad and their own armed forces. They were admitted as members of the United Nations in Sept. 1960 (except for Mauritania, whose independence came slightly later and was admitted to the UN in 1961). Their new constitutions, for the most part, tended to give increased executive power to the presidents. In the African republics, where dialects are numerous, French remains the official language. The Malagasy Republic allows French alongside Malagasy.

In Sept. 1960, when Senegal broke away from the Federation of Mali, the Sudanese republic took the name of Mali, and declared its previous agreements with France void. The two states, Senegal and Mali, were admitted separately to the United Nations.

Some of the overseas territories demanded a constitution that would give them greater autonomy. A cease-fire agreement ending the Algerian war was announced on March 18, 1962, and De Gaulle's program for an independent Algeria was given overwhelming support by the French people in a referendum held on April 8. 1962. Independence, now a permanent collaboration with France, was approved by the Algerians in the referendum of July 1, 1962. (See ALGERIA: History.)

Economy. — All the states of the former community, as constituted in 1958, with the exception of French Somaliland but with the addition of Tunisia, Togo and Cameroun. form the "franc area" (zone franc) inside which currencies are freely transferable and which is recognized as a monetary unit by the world. European France sends about 35% of its exports to the other countries of the franc area and receives from them 24% of its imports. Of the exports of these countries 75% is absorbed by France, who supplies 74% of their imports.

Algeria is the principal customer of France and its third supplier. France has more trade with west Africa than with Great Britain. The economic ties that are created by the franc area, by customs tariffs and by French enterprises therefore have considerable importance.

The countries of the 1958 community have a surplus of soft wheat. barley, bananas, cocoa. wine, iron, nickel, lead, phosphates and potash. They can normally supply their own requirements of soft wheat, peanuts. rice, citrus fruits, coffee. vegetable oil and sugar. They have to import in quantity cotton, wool, coal and petroleum, though production of the last-named item in the Sahara would limit the necessity for its importation. The commercial exchanges are largely carried in French ships and aircraft. The franc area and the agreed preferences for the products of the community assure the sale of these goods and, in the case of certain products, at rates higher than world prices. European France, for its part, finds an assured market for its manufactured goods in the other countries of the community. The trade balances of the overseas countries, almost everywhere in deficit, are stabilized by the common funds of the franc area.

Furthermore. the still rudimentary economy of most of the overseas countries is stimulated by the investment of European France. These exceed $1,000,000,000 a year. more than three-quarters of which is supplied by French public funds. More than one-half is devoted to the construction of railways, roads, ports, etc., the rest is divided between the improvement of production (agriculture, irrigation, etc.), and social services (health, education). A fund for aid and co-operation (F.A.C.) and a central treasury for economic co-operation (C.C C.E.), as well as a special ministry for community relations assure the implementation by France of the necessary technical assistance. Another ministry is responsible for the overseas *départements* and territories and for the Sahara The prime minister himself has the responsibility for Algeria, which was the object of a special effort (the Constantine plan) to meet the serious problems arising from the rapid increase of the population in a country of limited resources. France also absorbs a considerable part of the surplus of Algerian workers.

French aid to the newly independent states and the solidarity of the franc area constitute an effective formula for co-operation and assistance to the underdeveloped countries.

See H. Deschamps, The French Union (1956); F. Luchaire, Droit d'outremer (1959). (Hu. De.)

FRENCH CONGO, the official name of the French possessions in equatorial Africa from 1888 to 1910. In the last-named year these possessions were renamed *l'Afrique Équatoriale française*, abbreviated to A.É.F. See French Equatorial Africa.

FRENCH EQUATORIAL AFRICA, the former federation in central Africa of French overseas territories, comprised of Gabon, Middle Congo (renamed Republic of Congo), Ubangi-Shari (Central African Republic) and Chad. The four territories became autonomous republics within the French Community in 1958 and independent republics in Aug. 1960. French Equatorial Africa covered 974,130 sq.mi. and, according to the census of 1950, had a population of 4,406,502.

In the west, French Equatorial Africa bordered on the Atlantic ocean between Rio Muni and Kabinda. From the northeastern corner of Rio Muni the boundary ran eastward along Cameroun for more than 300 mi., then roughly north, following Cameroun's eastern border to Lake Chad, where French Equatorial Africa had a short common border with Nigeria. The boundary continued northward along the Republic of Niger until it reached Libya, which formed the northern border. In the east the country adjoined Sudan, and in the southeast it was coterminous with the Republic of The Congo (former Belgian Congo), the border following more or less the courses of the Congo and its chief tributary the Cbangi.

Physical Features.—The area of the former French Equatorial Africa falls within the Congo and Chad basins, toward which all rivers except those of the coastal region flow. The two basins are separated by a low plateau ridge averaging 2,000–3,000 ft., reaching its greatest height in the Bongo massif (4,593 ft.). The Chad basin is closed off from the sea by Cameroon mountain, the Congo basin by the Crystal mountains (4.921 ft.). While the latter basin is naturally drained by the Congo, which has broken through the Crystal mountains near Stanley pool, the Chad basin is not directly drained. Lake Chad absorbing the rivers of this area. The drainage to the sea is incomplete, but the Benue river, the great tributary of the Niger, is cutting through the Cameroon mountain divide and has already captured some streams of the Chad basin. Both basins have an average altitude of 3,000 ft. Lake Chad. the lowest region, is 922 ft. above sea level. The greatest elevations of the territory are in the northeast, where the Tibesti mountains rise 11,204 ft. (Emi Koussi).

The most important rivers belonging to the Congo system are the Ubangi and its tributaries (Kwango, Lobaye), the Sanga and the Alima; the only river of importance ending in Lake Chad is the Shari (*q.v.*), with its tributaries Bahr Salamat and Logone; the chief rivers flowing to the Atlantic are the Ogowe (Ogooué) the Nyanga and the Niari-Kwilu (Kouilou). The four political divisions of the former federation follow approximately the country's configuration. Gabon, extending along the Atlantic coast, falls within the basin of the Ogowe river; the Republic of Congo occupies the region draining to the Congo; the Central African Republic covers most of the plateau between the Congo and Chad basins; Chad lies almost completely within the Chad basin.

Vegetation Zones.—Three dissimilar zones of vegetation are easily discernible. The southern section (Gabon and the greater part of the Republic of Congo) belongs to the tropical rain forest or selva, characterized by close groupings of high trees, averaging more than 100 ft. Where the annual rainfall is less than 50 in., as in some parts of the lower Congo basin, park savanna takes the place of the rain forest. In higher altitudes. above 2,000 ft., the forests are less dense. The rain forest is always densest along the course of rivers, where sunlight can reach the underbrush and smaller trees and give them the luxuriance which is not always characteristic of tropical forests. The forests of Equatorial Africa are its greatest economic asset, although the sporadic way in which valuable trees occur and problems of transportation make commercial exploitation difficult. There are some hardwoods, such as different types of mahogany, ebony: coral wood, ironwood and African walnut. The commonest export woods are those of the okoumé, a light mahogany, the silk cotton and the tulip trees. Commercially important also are the different species of palms, such as the oil palm (Elaeis *guineensis*), the fan palm, the raffia palm (*Raphia Ruffia*) and the piassava palm (Attalea *funifera*) from which fibre is obtained. Among the rubber-bearing plants the landolphia vine and the ireh tree (Funtumia *elastica*) are characteristic of the forest zone.

The Central African Republic belongs to the zone of savanna. In its southern sections the density of trees indicates the proximity to the rain forest which along the course of rivers extends deep into the savanna area. Although well wooded in the south, treeless savanna prevails in the north. Different varieties of acacia, the baobab, the monkey bread tree, and the cotton tree are the typical trees; the wild coffee tree occurs. The open savanna, with a rainfall of from 18 in. to 40 in., is well suited for agriculture. In addition to sorghum and millet: cotton, introduced in 1929, has become an important crop throughout this zone.

The southern districts of Chad fall within the zone of treeless savanna, the northern extend into the Sahara desert where, except for some desert shrubs, vegetation is limited to a few oases. In the lake and swamp area there is a dense growth of hydrophytic grasses, varying in height from 3 ft. to 12 ft.; the ambatch tree occurs. About 28% of Chad's area (140,000 out of 490,733 sq.mi.) is desert.

Animal Life.—The dense forest zone is not particularly inviting to larger animals; it is the home of arboreal creatures such as birds, insects (butterflies, bees. wasps, red ants and mosquitoes), bats, giant squirrels, snakes (cobra, python, puff adder, viper) and monkeys. Most notable among the forest animals are the gorilla (first found in Gabon by Paul du Chaillu in 1856) and the chimpanzee. Land animals are represented by dwarf antelopes, duikers, short-horned okapi, red buffaloes, forest elephants and leopards. Numerous fish, crocodiles and hippopotamuses abound in the rivers. The savanna is inhabited by grazing animals, particularly by many species of antelope; hyena are numerous; the lion occurs sporadically. The savanna region of the Central African Republic is famed as a hunting ground. In the semideserts of Chad ostriches may be seen.

Climate.—The rain forest area of Gabon, Republic of Congo and southern Central African Republic belongs to the region of equatorial heat and humidity. The temperature remains even, seldom varying more than 10° F. throughout the year. The average temperature is close to 80° F. (average in Libreville, 79° F.; Brazzaville, 78° F.). The daily ch'anges of temperature are greater than the annual, amounting to 15°–20°. The rainfall, normally about 60 in., is distributed over the whole year, but since the heaviest rains fall shortly after the apparent northward or southward movement of the sun, rainfall reaches its maximum in different areas at different times. At the equator the heaviest rains fall in April (after the sun has passed the zenith in its movement to the north) and October (when the sun moves to the south). The rainfalls come normally in the afternoon and are accompanied by a temporary dropping of the temperature of as much as 20" F.

The climate in the savanna zone, often called the Sudan type, is also hot. During the warmest months (usually May), the average temperature exceeds 90° F.; in the cooler months, when the diurnal range is great, the average temperature is still above 70° F. From October to March the northeast trade wind, called harmattan, blows across the savanna; it brings dry air into the region. which is very humid during the other seasons of the year. but desiccates vegetation and is loaded with fine particles of dust. During the summer the southwest monsoon blows; it brings the rains, which last from June to October.

The duration of the rainy season decreases toward the north. Also the annual precipitation diminishes from south to north; 50 in. is the average near the forest zone, 10 in. in the fringe of the desert. The northern sections of Chad have desert climate. Since precipitation is practically negligible except for the Tibesti mountains. the humidity is low. Summer temperatures are frequently above 120" F., winter temperatures even below 60° F. Since the diurnal range is frequently around 50°, night frosts are not unusual.

History. — The history of these parts of Africa prior to the French occupation is little known. The coastal region had been visited occasionally by Europeans after the mouth of the Congo was discovered in 1484 by Diogo Cam.

Several African kingdoms existed, of which Loango (*q.v.*) and the Bateke state, called Anzico, were the most prominent. Between 1517 and 1822, the coast was one of the chief centres of the slave trade to the new world. Europeans called at coastal slave depots but did not penetrate into the interior.

French interest in this part of Africa was, in its initial stages, accidental. When, during the first half of the 19th century. the French, like the British, combated the slave trade along Africa's west coast, they desired a supply station for their patrolling warships. On Feb. 9, 1539. Capt. L. E. Bouet-Willaumez obtained, by agreement with Denis. a Seke chief, the right of residence in two small places on the left bank of the Gabon estuary. and in 1843 he secured the right bank by treaty with the Seke chief Louis. Similar agreements were made with other native chiefs, so that by 1862 French authority had extended almost along the whole coast. The first large settlement was established in 1849 with slaves captured from the slaver "Elisia" and was symbolically called Libreville, which became the capital of Gabon. The hinterland was gradually opened by adventurous individuals exploring the Ogowe and other rivers flowing into the Xtlantic. Of the many explorers a few are outstanding: Paul du Chaillu. A. M. A. Aymès, A. Marche. the marquis de Compiegne. A. Bastian and O. Lenz. Yet by the end of the 1860s no one had gone farther inland than the boundaries of the Gabon territory or even all the way up the Ogowe.

France took greater interest in its equatorial possessions after the Franco-German War. The activities of Pierre Savorgnan de Brazza (*q.v.*) created the French empire north of the Congo river. After H. M. Stanley had discovered (1874–77) the course of the Congo, Brazza signed treaties with African chiefs in the interior of the continent and placed them under French protection. Most important was the treaty with King Makoko of 1880, placing the Bateke state, which extended to the southern bank of the Congo. under French control.

In 1880 Brazzaville. the future capital of French Equatorial Africa, was founded near Stanley pool on the Congo. In 1885 the French-held territory south of the river, including the settlement of Kinshasa, was ceded to the Congo Free State.

The General act of the conference of Berlin (1885; see AFRICA) established an "open door" policy for'trade in the Congo basin and rules for the future occupation of the coast of Africa. France in the next 25 years pursued its Airican expansion with great vigour. Between 1885 and 1891 most of Gabon and Middle Congo were secured, and French expeditions began to extend into the Cbangi-Shari and Chad areas, signing treaties with native chiefs according to the rules agreed upon at the Berlin conference. French expansion was aimed in two directions, toward the upper Nile valley and toward the French possessions in north Africa. Expansion toward the Nile failed. By 1896 Victor Liotard had made progress in the Bahr el Ghazal area; and J. Marchand's expedition, which left the Congo in March 1897, reached Fashoda on the Nile in July 1898. But Great Britain objected to the presence of French troops in an area regarded as a British zone of influence and forced the evacuation of Fashoda. In hfarch 1899 the boundary between the French territory and the Anglo-Egyptian Sudan was settled except on the borders of Wadai and Darfur. In 1919 this area was divided, and in 1924 the frontier was demarcated. Expansion toward the north was partially successful.

The conquest of the Chad area, where powerful Negro kingdoms had existed since the middle ages. took several decades. At the time when the French began their expansion, many of these states had been conquered by Rabah Zobeir (*q.v.*), a follower of the mahdi of the Egyptian Sudan. The many expeditions which were sent against this region either iailed or ended in disaster. Émile Gentil, however, succeeded in reaching Lake Chad in 1897; he signed a treaty with the sultan of Baguirmi (*q.v.*), who had been ousted by Rabah and who placed himself under French protection. Although Gentil established himself in the capital of Bagirmi, the following years were filled with bloody fighting against Rabah. Rabah was finally defeated and killed in the battle of Koussri on April 22. 1900. when Gentil's forces were strengthened by those of A. Foureau and F. J. A. Lamy coming across the Sahara from Algeria and by the mission of .Paul Joalland and O. F. F. Meynier arriving from Senegal. Commander Lamy was also killed in this engagement (the capital of Chad, Fort Lamy, was named after him).

The complete pacification of the areas north of the lake, which had been conceded to France by Great Britain in 1899, was not easily accomplished. The state of Wadai was conquered after hard fighting in 1911; and Borku (*q.v.*) in the north of the Chad territory, was finally occupied in 1913. The conquest and organization of the Chad territory was principally the work of Col. Emmanuel Largeau. This northward expansion of French Equatorial Africa succeeded in establishing a junction with the Niger colony of French West Africa and thus secured a continuous French empire extending from the shores of the Mediterranean to the banks of the Congo. In 1911, in return for recognizing French predominance in Morocco, Germany obtained two corridors of land giving access to the Congo and to the Cbangi from the German Cameroons (*q.v.*). But these areas were recovered with the occupation of the Cameroons in 1916; and the treaty of Versailles (1919) restored the unity of the French possessions.

Administrative changes were frequent in the years between the Berlin conference and the end of World War I. The name Congo Français was substituted for that of Ouest Africain as French influence spread over the interior of the continent, but the problem of unification was complicated (1) by Gabon's being outside the area to which the "open door" commercial policy had to be applied and (2) by the fact that conditions naturally differed widely between those areas where European predominance had long been recognized and those where it n-as still precarious. Thus Gabon was at first separate from the rest of the Congo Franqais (1886–89), then merged into it (till 19043 and then made one of three colonies (the other two being Middle Congo and Ubangi-Shari-Chad). In 1905 the commissioner general for the Congo Franqais was raised to the status of governor general; and by a decree of Jan. 15. 1910. the name French Equatorial Africa was given to a *gouvernement général* comprising the three colonies, each of which had its own lieutenant governor and its own budget. Chad, having been detached from the Ubangi-Shari-Chad colonial unit and made a "territory" in 1914, was finally given full colonial status in the *gouvernement général* in 1920.

Vast in area, sparsely populated and lacking easy means of communication, the country was difficult to develop economically and so was long known as the Cinderella of the French colonies. In 1890 Eugène Étienne, undersecretary of state, favoured the establishment of monopoly companies which had worked with success in Belgian and British territories. Although the first attempts failed, they were renewed in 1899. when large concessions (256,865 sq.mi.) were granted to 40 companies for periods of 30 years. Each company had the exclusive right of exploiting the concession area in return for certain payments to the state and colony. The many abuses against the natives (revealed in such trials as the Toqué-Gaud affair of 1903), the international disputes resulting from the companies' interference with the principles of the Act of Berlin and the disappointing financial returns brought an end to this concession system sooner than had been expected. The conflicting stories of the concession system were not unraveled. Savorgnan de Brazza. sent out to investigate conditions in the concession areas?died in 1905 on his way home, and his report was not published. In 1910 most of the companies exchanged their huge land grants for smaller ones; during the following 20 years the government gradually recovered a great share of the original concessions. leasing them again only under more humane and more profitable conditions than had been done theretofore. The concessionnaire companies were finally deprived of their privileges on Aug. 24, 1930; they were given contracts as industrial and development concerns.

The chief obstacle to the development of French Equatorial

Africa after World War I was a continuous budget deficit: but in 1930 the French government voted a 45,000.000-fr. subsidy for a public works program, to be followed by other substantial subsidies. The government began to encourage native production of those goods (such as cotton and coffee) which were in demand in France. An agricultural credit fund was to aid local native production.

On June 30, 1934, the federal constitution of French Equatorial Africa was replaced by unitary administration from Brazzaville, with one single budget; but the four-part zonal division subsisted, to be emphasized by a new process of decentralization from 1937.

In World War II, after the Franco-German armistice of June 1940, the governor of Chad, Félix S. Eboué, a Negro, proclaimed on Aug. 26 that his territory would continue the war on the side of Gen. Charles de Gaulle and the Free French; and the other territories, as well as the mandated territory of Cameroun, followed his example. Brazzaville became the capital of Free France in Africa, and Eboué was appointed governor general of the territory in Nov. 1940. French Equatorial Africa became an important supply base for the Western Allies and the Chad territory became a subsidiary base for the campaigns in North Africa and the near east. The airport of Fort Lamy formed a vital link in the U.S. and British air lines from west Africa to Cairo. From Chad, French troops attacked the Italian station of Kufra in 1941 and 1942; and the French force under Gen. Jacques Leclerc, which in 1943 conquered Fezzan and joined the Allies in North Africa, began its operations in the desert of the Chad region.

Eboué, who died on May 17, 1944, introduced a new policy into French Equatorial Africa. In circulars of Jan. 19. 1941, and Nov. 8, 1942, he expressed himself in favour of increased decentralization and the incorporation of traditional native institutions into the administrative organization. The Brazzaville conference of Jan.-Feb. 1944, when the governors of all French African territories met to discuss the future of the French African empire, was largely the result of his inspiration.

The constitution of 1946 made all the indigenous peoples French citizens, and in the 1950s notable progress was made through the Fund for Economic and Social Development. The territories, which became autonomous republics in 1958 and independent republics in 1960, remained uithin the French Community. In 1960 Chad, Republic of Congo and the Central African Republic formed a confederation known as the Equatorial union (dissolved in the same year).

Population. — The great majority of Africans are Negroes, but there are a few other groups. In the Gabon and Republic of Congo forest a few hordes of Pygmies, first discovered there in 1865 by P. du Chaillu, have survived. North of Chad is inhabited by black Arabs, who occupied large areas after the middle of the 15th century. The Negroes of Gabon and the southern part of the Republic of Congo belong to the Bantu-speaking group, whereas those of the remaining republics are Sudanic-speaking. Most prominent among the former are the Fang (*q.v.*); Pangwe, Pahouin, Bakalai. Bakota and Bateke; while the Sanga. Baya, Banda, Mandya, Azande (*q.v*) and Sara are the larger groups among the latter. As a result of the various Arab and Fulani invasions into the region around Lake Chad, the ethnic situation was greatly changed: the invaders, although adopting the native Sudanic language, intermingled with the Negroes, introduced Islam as a religion and established large states. Within the republics the most important are the sultanates of Wadai, Baguirmi (*qq.v.*) and Kanem. In the northern desert region of Chad live the Tibbu or Teda, who are perhaps a mixture of Negroes and Hamites. The great majority of Kegroes, with the exception of those living in the areas adjacent to the sultanates, are non-Moslems. They have retained their traditional beliefs, mostly centring around ancestor and spirit worship.

According to the 1950 census, the republics had a population of 4,406,520 (4.5 per square mile), including 20,120 Europeans. Population is densest in the Republic of Congo (5.2 per square mile) and thinnest in Gabon (4.0).

The group of territories had 900 primary and 12 secondary schools in 1953, with about 123,000 pupils, of whom 58,000 were receiving education from Christian'missions. In the Moslem areas there were numerous Koranic schools, giving religious training only; and there was a Franco-Moslem secondary school at Abeshr (Abéché) in Chad. A number of students received higher education in France.

Administration. — At the head of the former French administration was a high commissioner, who was responsible to the French ministry of the overseas territories and who was assisted by a secretary-general. The four territories, each of which was under a governor, were divided into *régions*, which were in turn subdivided. The administrative centre of the *gouvernement général* was Brazzaville (pop. [1959 est.] 96,000), in the Middle Congo; the capital of the territory of Middle Congo, however, was Pointe Noire (pop. [1950] 21,400), while that of Gabon was Libreville (pop. [1957] 19,113). that of Ubangi-Shari was Bangui (pop. [1959 est.] 79.634) and that of Chad was Fort Lamy (pop. [1961] 58,179). The native chiefs were appointed by administrators. All the inhabitants were made French citizens in 1946.

There was an elected territorial assembly in each territory; these assemblies elected the members of the grand council of French Equatorial Africa, voted the budget and controlled the administration. French Equatorial Africa was represented in Paris by five deputies in the national assembly, by eight senators in the council of the republic and by seven councillors in the assembly of the French union.

Economy. — This area of central Africa has great natural resources, primarily in forest products and in minerals. Still largely undeveloped up to the outbreak of World War II, the country thereafter was more rapidly developed, since its oilseeds, fibres and minerals were urgently required by Great Britain and by the United States.

Forest products include timber, rubber, oilseeds, copal gum and wax. The Central African Republic and Chad produce considerable quantities of cotton. Coffee is also grown extensively.

Of the minerals, gold is the most important in terms of value. Others found in the territories are lead, zinc, copper, titanium apd diamonds, as well as manganese, of which there is a very large deposit in Gabon.

Communications. — The chief port for the area is Pointe Noire; Port Gentil and Libreville are of less importance. The harbour of Pointe Noire, completed in 1940, was equipped to handle ships of all sizes, thus enabling the republics to become independent of Matadi, the Belgian port used in former years. Pointe Noire is connected with Brazzaville by the Congo-Ocean railway (320 mi.) which was completed in 1930.

FRENCH GUIANA (Guyane Française): *see* Guiana: *French Guiana.*

FRENCH GUINEA, a former territory of French West Africa and from Oct. 1958 the independent republic of Guinea, is bounded on the west by the Atlantic ocean and Portuguese Guinea, north by Portuguese Guinea and Senegal, northeast by Mali, east by Ivory Coast and south by Liberia and Sierra Leone. With a seaboard running north-northwest and south-southeast from 10° 50' N. to 9° 2' N., Guinea extends east 475 mi. in a straight line and attains a maximum width north to south of nearly 325 mi., covering 94,925 sq.mi. Pop. (1959 est.) 2,726,888.

Physiography. — Though in one or two places rocky headlands jut into the sea. the coast is in general sandy. low and much broken by rivers and deep estuaries, dotted with snampy islands, giving it the appearance of a vast delta. In about 9° 30′ N., off the promontory of Conakry. lie the Los Islands (*q.v.*), forming part of the territory. The coast plain, formed of alluvial deposits, is succeeded about 30 mi. inland by a line of cliffs, the Susu (Soussou) hills, which form the first step in the terracelike formation of the interior, culminating in the massif of Fouta Djallon (Futa Jallon), composed chiefly of Archaean and granite rocks. While the coastlands are either densely forested or covered with savannas or parklike country, the Fouta Djallon tableland is mainly covered with short herbage. This tableland. the hydrographic centre of west Africa. is most elevated in its southern parts, where heights of almost 5,000 ft. are found.

Near the Sierra Leone frontier this high land continues westward to within 20 mi. of the sea, where Mt. Kakulima rises about 3.688 ft. East and south of Fouta Djallon the country slopes to the basin of the upper Niger river, the greater part of which is included in Guinea. The southern frontier is formed by the Nimba mountains. which separate the Niger basin from those of the coast rivers of Liberia. Besides the Niger, Gambia and Senegal (*qq.v.*), a large number of streams running direct to the Atlantic rise in Fouta Djallon.

Climate. — The climate of the coast district is hot and moist, with a season of heavy rain lasting from May through October, during which time variable winds, calms and tornadoes succeed one another. There is also heavy rainfall in the Fouta Djallon highlands. but the Niger basin is some\\-hat drier.

Vegetation and Animal Life. — The seashore and the river banks are lined with mangroves, but the most important tree of the coastal belt is the oil palm. The dense forests contain many varieties of rubber vines, while the summits of the higher land are covered mostly with Guinea plum (*Parinarium excelsum*). Gum-producing trees are abundant. and there are many fruit trees, the orange and citron growing well in the Susu and Fouta Djallon districts. The coffee plant is indigenous; banana plantations surround the villages. The baobab and the karité (shea-butter tree) are common only in the Niger districts.

The fauna is not so varied as was formerly the case, large game having been to a great extent driven out of the coast regions. The lion is now common only in the northern parts of Fouta Djallon; leopards, hyenas and wildcats are more common and there are civet cats. Hippopotamus and wild boar are numerous; wart hogs are common in the central region. Black duikers occur in the forests but other antelope, though widespread, are rather rare. Serpents are very common, both venomous and nonvenomous; the pythons attain a great size. Crocodiles infest all the rivers. Birds are very numerous and varied; they include the egret, the marabou and the pelican; touracos and parrots are common.

History. — This part of the caast was made known by the Portuguese voyagers of the 15th century. Largely in consequence of the dangers attending its navigation, it was not visited by the European traders of the 16th-18th centuries as frequently as other regions north and east; but in the Rio Pongo, at Matakong (a diminutive island near the mouth of the Forécariah) and elsewhere, slave traders established themselves; and ruins of the strongholds that they built (and which they defended with cannon) still exist. When driven from other parts of Guinea the slavers made this difficult and little-known coast one of their last resorts. and many barracoons were built in the late years of the 18th century. Not until they had recovered Gorée at the close of the Napoleonic Wars did the French show any marked interest in this region. At that time the British, from their bases at the Gambia and Sierra Leone, were devoting considerable attention to the rivers south of Senegal and also to Fouta Djallon.

On the French side, René Caillié started his journey to Timbuktu from Boké in 1827. From 1838 onward French naval officers, L. E. Bouet-Willaumez and his successors, made detailed studies of the coast. Col. Louis Faidherbe was appointed governor of Senegal in 1854, and under his direction vigorous efforts were made to consolidate French influence in the region. Already in 1848 treaty relations had been entered into with the Nalu, and between that date and 1865 treaties of protectorate were signed with several of the coast tribes. During 1876–80 new treaties were concluded with the chief tribes, and in 1881 the almamy (or amir) of Fouta Djallon placed his country under French protection, the French thus effectually preventing the junction, behind the coastlands, of the British colonies of the Gambia and Sierra Leone. The right of France to the littoral as far south as the basin of the Melakori was recognized by Great Britain in 1882; Germany (which had made some attempt to acquire a protectorate at Conakry) abandoned its claims in 1885; and in 1886 the northern frontier was settled in agreement with Portugal, which had ancient settlements in the same region. (See PORTUGUESE GUINEA.) In 1904 the Los Islands (off the coast of French Guinea) were ceded by Great Britain to France, in part return for the abandonment of French fishing rights in Newfoundland waters.

Until 1890 the newly gained territories were administratively part of Senegal; they were then formed into a separate colony called Rivières du Sud. a name changed about five years later to Guinée Française. In 1895 the colony came under the supreme authority of the newly constituted governor generalship of French West Africa (*q.v.*). It retained administrative and financial autonomy and was administered by a governor. In 1946 all the inhabitants mere made French citizens. At a referendum in Sept. 1958 French Guinea rejected the new French constitution and on Oct 2 the Republic of Guinea was proclaimed. In 1959 Kname Nkrumah, prime minister of Ghana. and Pres. Sékou Tour6 of Guinea, agreed upon a union (not legally defined) of the two states.

Population. — On the banks of the Cogon dwell the Tendas, who are allied to peoples of Portuguese Guinea. The Baga, the Nalu, the Landuman and the Timne, regarded as typical Negroes, migrated southward before the 17th century. Today the Baga occupy the coastland between the Cogon and the Rio Pongo, and the Landuman the country immediately behind that of the Baga. The coastal region south of the Nuñez and all the interior up to Fouta Djallon is occupied by the Susu (Soussou), a tribe of the great Mandingan race, which forced its way seaward about the beginning of the 18th century and pressed back the Timne into Sierra Leone. Fouta Djallon is peopled principally by Fulani (*q.v.*), and the other districts by Malinké and other tribes of Mandinga (*q.v.*). The Mandinga, the Fulani and the Susu are Mohammedans, though the Susu retain many of their ancient rites and beliefs. In the northwestern part of Fouta Djallon are found remnants of the aborigines, such as the Tiapi, the Koniagui and the Bassari. On the Liberian frontier the Kissi and Guerze peoples are found.

The principal towns, in order of their size, are Conakry, the capital, which had 40.000 inhabitants in 1959; Kankan, the terminus of the railway and a principal airport; Labé, the chief town of Fouta Djallon; Siguiri, on a navigable stretch of the Niger, the centre of the gold industry; Kindia, a banana centre; Kouroussa, where the Niger and the railway cross; Beyla; Dinguiraye; Boké; Mamou; and Benty.

Conakry, in 9° 29' N.. 13° 42' W., is the one important port of entry on the coast. It is built on the little island of Tombo which lies off the promontory of Conakry, the town being joined to the mainland by an iron bridge.

Products and Industry. — Guinea possesses a moderately fertile soil, and the area is rich in tropical produce, notably bananas, palm kernels. orange essence, kola nuts and peanuts. Gold exists in alluvial and fluvial deposits and bed lodes. Siguiri being the centre of the industry. Diamonds are mined in the vicinity of Macenta. There are important deposits of iron ore in the Kaloum peninsula and of bauxite in the Los Islands.

Stock raising is practised extensively in Fouta Djallon and in the valley of the upper Niger, and cattle are sent in considerable numbers to Sierra Leone and to Liberia. Guinea's agricultural and mineral products include cereals (mainly rice), palm oil, peanuts, gold and diamonds. The principal exports in the early 1950s were palm kernels, bananas, coffee and bauxite.

(F. R. C.; T. C. WN.; HU. DE.)

FRENCH INDOCHINA (INDOCHINE FRANÇAISE), the territory in southeast Asia which. apart from Japanese partial occupation during World War II. was until 1954 held by France and included the countries now known as Cambodia, Laos, North Vietnam and South Vietnam. The French, from their capital at Saigon, dealt with the so-called Union of Indochina in four separate political units: Cochin China, a directly administered colony now forming the greater part of South Vietnam; the empire of Annam (which included the province of Tongking), indirectly administered as a protectorate and now largely included in communist North Vietnam; and the two kingdoms of Cambodia and Laos, also protectorates, which are now again independent territories under their own names. The territory of Kuang-Chou Wan (*q.v.*), on the east of the Luichow peninsula, leased to France by China for 99 years in 1898–99 and now the municipality of Chan-Chiang (*q.v.*), was returned to China in 1945. See INDOCHINA; VIETNAM; CAMBODIA; and LAOS.

(E. H. G. D.)

FRENCH LANGUAGE. French is one of the Romance languages (*q.v.*). In particular, the name refers to the standard literary language that is taught to natives and foreigners and that is understood and used, albeit with unequal efficiency. by all speakers of French. French also subsumes a number of dialects. These have, however, been losing currency and prestige ever since the middle ages and are now mere local patois.

French uses the same (Latin) alphabet as English, but some letters may be provided with diacritic marks. The vowels may bear an acute accent (*é*), a grave accent (8, *à*) or a circumflex accent (*â, ê, î, ô, û*). The spelling *é* indicates a so-called close pronunciation (as in English "bait," but without the diphthongal, gliding effect), 8 and ê an open pronunciation (as in English "bet"). Other accent marks do not significantly change vowel pronunciation, except that some speakers have a tendency to lengthen circumflexed vowels. The c, which is pronounced k before vowels other than e and i (where it is pronounced s), may by means of a cedilla, written *ç*, be converted into an s sound. . French orthography is not entirely phonetic; pronunciation is not certain from spelling alone, as it is in Spanish, Italian. Russian and other languages, but it is almost so. French orthography is not nearly so unpredictable as English.

French is the native language of some 40,000,000 persons in metropolitan France. About 2,500,000 more speakers (native and non-native) are naturalized French citizens and resident foreigners, and some 500,000 Frenchmen reside abroad. Of about 42,000,000 persons inhabiting French possessions, about 13% speak French, the percentages varying from 2% in French possessions in western Africa to 95% in Martinique. About one-fourth of Canada's inhabitants, mainly in the province of Quebec, speak French. In the U.S. at mid-20th century, there were more than 100,000 French-born persons. American native speakers of French, mostly bilingual, were mainly located in Maine and Louisiana, but their number was diminishing.

French is also one of the official languages of Belgium (see BELGIUM: Population) and of Switzerland (see SWITZERLAND: Population *and* Social Conditions).

HISTORY

The homeland of French (in the wider sense) is the Roman province of Gallia (Gaul), conquered by Caesar in the middle of the 1st century B.C. (except the Provincia, now Provence, which became Roman in 122 B.C.); it corresponds largely to modern France. Before its latinization the country was mainly of Celtic speech, although there is some evidence that in Aquitania (the modern Gascogne) and along some stretches of the Riviera other languages were spoken, by some scholars called Iberian and Ligurian, respectively. But Iberian is virtually unknown, unless Modern Basque, which cannot with confidence be historically or structurally connected with any other known language, is a continuation of Iberian; and Ligurian is little more than a geographical name. The Greeks also had settlements along the Mediterranean coast in Gaul before the Romans; linguistic evidence for this can be found in local names of the Riviera: Nice < Nicaea (Greek Nikeia); Antibes < Antipolis; Port-Vendres < Portus Veneris, a Latin translation of the earlier Greek name Aphrodisias. Otherwise this Greek substratum left no traces. The linguistic inheritance from Celtic, however, extends not only to local names in France (Lyon < Lugdunum; Verdun < Virodunum; names ending in *-ac, -ai,* -i) but also to a number of words, of which some (about 180) are typical of Gaulish Latin and French only. The Celtic of Gaul (Gaulish), poorly attested, was not a uniform language but was spoken in several dialects (surely more than three corresponding to the partes tres into which Caesar divided Gaul). Latinization was speedy and thorough (although the Romans made no concerted effort to impose their language), and Celtic dialects were not long continued and were rarely written: Latin enjoyed all the psychological and material advantages of the idiom of the stronger and politically and economically more advanced conquerors. (The Breton language of Brittany, now dying out owing to the social and cultural pressure exerted by the national French language, is Celtic imported in the early middle ages from Britain, not a native speech of Gaul.)

Although the evidence is defective, it can be safely presumed that. outside the spoken and written Latin lingua franca of the Roman empire, the spoken Latin of the various regions of Gaul continued the dialectal diversities of the Celtic substrata. These were the bases of the emerging Romance dialects. (For the relation between spoken and written Latin see ROMANCE LANGUAGES.)

After a period of peace and prosperity, Gaul was, like the rest of the weakening Roman empire, subject to foreign invasions, particularly by Germanic tribes. In the course of the 5th century the Visigoths settled in the south, the Burgundians in the Rhône valley area, the Saxons along the channel and the Atlantic coast, whence they soon moved to Britain. But the most important contingent was the Franks who, in 486, under their king Clovis, liquidated the kingdom of Syagrius, the Roman governor who was autocratically holding a Roman province in the north, isolated from the empire by the invaders. The Franks moved south, defeated the Visigoths (507) and absorbed the Burgundian kingdom (534). Clovis had himself baptized; the Franks became Christians and acquired Latin as their new language. They bequeathed about 200 Germanic words to the Latin vocabulary, and it is claimed that their habits of articulation caused certain changes typical for the Romance of Gaul (especially the diphthongization of vowels—see below). On the whole, their linguistic influence, though larger than that of other Germans in Gaul, was small. But France (Francia) owes to them its name.

The dynasty of Clovis, the Merovingians, divided the state among the heirs according to Germanic custom, thus producing progressive fragmentation of the land and weakening the monarchy. From the 7th century, the maior *domus* ("mayor of the palace"), originally the first official of the royal household, began usurping something like the duties and powers of a prime minister or regent of the realm, until one of them, Charles Martel. having saved the state from Arab conquest (in the battle of Poitiers, 732), became the virtual ruler. His son, Pepin the Short, actually came to the throne in 751 and established the dynasty of the Carolingians. among whom Charlemagne (768–814) was the most eminent. Under him occurred what is generally called. somewhat exaggeratedly, the Carolingian renaissance. which included a premature and largely ephemeral attempt, for political and ecclesiastical ends, to revive classical Latin. Charlemagne himself mas crowned "Roman" emperor in 800. But the Latin of Cicero had passed away and could not be resuscitated by monarchic fiat. In fact, a return to classical standards estranged Latin even more from the common man, whose Latin had actually become. owing to the passage of time and the influence of Celtic substrata and Germanic superstrata, quite a different language. It could be called Latin at this point only in deference to its earlier form. The church, recognizing this. permitted through the Council of Tours (813) the use of the "rustic" and "vulgar" native tongues for preaching so that everyone could really understand what the priests (many of whom were poor Latinists in any event) were saying.

The new language, thus attaining some prestige and being soon reduced to writing, though not for learned matters, may be called Old French. The oldest available text is that of the oaths of Strasbourg (842), an agreement uniting Louis the German and Charles the Bald. two of Charlemagne's grandsons, against the third, Lothair. in a quarrel over the division of the empire. These oaths, preserved by the historian Nithard, were pronounced in both German and French so that anyone concerned on either side could fully understand their wording. This first written source does not, of course, mark in any sense the birth of French: it had been preceded by a continuous unrecorded development of the speech of Gaul.

The subsequent Old French texts are all literary: the *Cantilène* de *sainte Eulalie* (880), the Passion de Christ, a *Vie* de Saint *Léger* and a fragment of a homily on the prophet Jonas (all of the 10th century), followed by a great flowering of literature in various dialects. The most famous work of the age is the *Chanson* de *Roland,* of the middle of the 11th century, narrating the battle of Charlemagne's nephew (or so he is identified in the Chanson) Roland against the Moslems and his death at Roncesvalles.

In the 9th and 10th centuries: marauding Vikings plagued the northwest of France. They were eventually pacified and their energies usefully employed when land (which they had already conquered) was assigned to them, and they became romanized forthwith. These Northmen, or Normans, gave their name to the province of Normandy. Invading England in 1066 and carrying their language there. they became responsible. if not for the romanization of England, at least for the bulk of the more than 50% of the English vocabulary that is of Romance origin.

After the death of the last Carolingian in 987, Hugh Capet came to the throne. Under him and his successors, although monarchic power was restored in the Île-de-France, the decentralization of the administration of France as a whole and the breaking up of the country into many quasi-independent units. which had commenced after Charlemagne's death, continued. Feudalism came to full flowering. The linguistic consequence was a commensurate linguistic fragmentation and the development of literature in a number of dialects. On their evidence, supported by knowledge of later and current patois, the dialects may be classified thus: (1) eastern — Bourguignon, Franc-Comtois, Lorrain, Champenois; (2) northeastern — Picard, Wallon: (3) northwestern—Normand; (4) western—Poitevin, Angevin, Saintongeais; (4) north-central (Île-de-Francei — Francien.

In the southeast. approximately covering the former Burgundian kingdom, exists an idiom called Franco-Provençal, which some claim to be sufficiently distinct from the others to warrant calling it a separate language. It is so named because in many respects it takes a position intermediate between French and the various southern dialects subsumed under the title Provencal language (*q.v.*), which are spoken in the remainder of France.

From all these. Francien mas to emerge as the standard language of France, with the other idioms becoming gradually substandard patois. This favoured position of Francien, eventually called Français, was not due to any intrinsic excellence (all dialects are potentially equal) but to historic and cultural circumstances. In large part these were provided by the resumption. during the 13th and 14th centuries, of the reins of state by stronger monarchs. residing in Paris, the core of the Francien-speaking region. who managed to concentrate once more in their own hands the power which had eluded their predecessors. Paris became also the artistic, religious and intellectual centre of the realm (the Cniversity of Paris was founded in the middle of the 13th century). The catastrqphe of the Hundred Years' War (1337–1453), though leaving France prostrate, contributed to the prestige of the throne: produced a national French conscience even among the ordinary people and thus helped the establishment of a national language fashioned after the speech of Paris.

From the 13th century, Romance dialects gradually supplanted Latin not only in literature but also in nonliterary documents. It was inevitable that Francien should be favoured, first in official papers of national concern, eventually also in those of local importance. The treaty of Paris, ratified in 1259, was the first document of its type in Francien, or French.

Thanks to great literary productivity, the language of France also acquired extensive renown abroad, especially in Italy. Brunetto Latini, Dante's teacher, wrote (*c.* 1260) his *Trésor,* a kind of medieval encyclopaedia, in French; and Marco Polo dictated his memoirs in French (1298). Again this was due not so much to an intrinsic superiority of French over other European languages (although Brunetto Latini and many others ascribed their predilection for French to this), but rather to the fact that France led other European countries in developing something of a standardized, supraregional, national literary language.

The terms Middle French (15th and 16th centuries) and Modern French (from the 17th century on) refer customarily to the developing Francien dialect. The other dialects of France, including Provencal, once the carrier of a brilliant and influential literature, were henceforth in continued retreat. Jean Froissart (1338–1410?) is the last important author to use a language other than Francien.

The Renaissance, the greatest phenomenon in the cultural history of France of the late 15th and 16th centuries, implies in linguistic history the adoption of Latin and Greek words and expressions. and also, more ephemerally, the cultivation of a somewhat ponderous, solemn, rhetorical latinizing style whose 'long periods ill fitted the grammatical structure of Seo-Latin. Many of the words then borrowed from Greek and Latin, though at first the property of the learned few, have over the centuries become common property; only linguistic analysis uncovers their origins.

The influence of Italy had much to do with the return to Latin sources. In 1494 Charles VIII set out to conquer Italy. He returned beaten, hut he introduced Italy and. above all, the Italian Renaissance: to France. In 1533 Prince Henry (later Henry II) married; at the age of 14, Catherine de' Medici, who brought into France Italians, Italian mores and Italian culture. All these imports, however, were adapted and absorbed, and, regardless of the influence of Latin and Italian (there are about 1000 words of Italian origin in the French lexicon), the French language remained essentially the same.

Under Francis I, the ordinance of Villers-Cotterêts (1j39) banished Latin from its last stronghold in royal jurisdiction. And Calvin's own French translation (*Institution de* la *religion chrétienne,* 1541j of his Latin *Institutio christianae religionis* (1536) brought French into theology. But the Roman Catholic Church now opposed the popularization of the Scriptures; it was, this time, initiated by Protestants and was therefore violently and bloodily combatted. The Sorbonne was on the side of the church, and soon the schools of France found themselves involved, paradoxically, in an anti-French movement. But French did become the language of the Protestant church.

Calvin, although he was not, like his German counterpart Luther, instrumental in the establishment of the national standard language, was a master of prose and therefore influential in the development of literary French. The style of his works and those of his so dissimilar contemporary, Rabelais (1495–1553), served later authors as a model. Rabelais is memorable for the luxuriance of his vocabulary. He not only introduced into the French language neologisms of his own making but also, more importantly, enriched the somewhat formalized and conservative standard language by numerous technical terms and dialectal expressions which had hitherto been shunned as vulgar. There was no word that Rabelais would not use or, indeed, make up, if it fitted his context.

In the domain of poetry, the authors of the Pléiade maintained that if French was not already as good as any other language, it could surely become so if properly cultivated and enriched through borrowing from the classical languages. They issued their manifesto. *La Défense et illustration de la langue française,* written by Joachim du Bellay, in 1549. Grammarians. generally much more interested in Latin than in its modern "corruptions," now also turned their attention to French. The French language was emancipating itself practically and theoretically from the tutelage of Latin. It did so, however, with an *élan* and an exuberance which was soon to call forth, in a new, more sedate and less Rabelaisian cultural climate, a reaction.

In the 17th century, after the freedom, fullness and licence of Renaissance life, and after the upheavals of religious warfare, France entered upon an era of order, rule, restraint and *raison,* of political centralization and autocracy, culminating in the persons of Louis SIII. Louis XIV, Richelieu and Mazarin. In language also, this was a period of contraction and pruning. The riotous growths of Renaissance language were to be weeded out. Franqois de Malherbe battled successfully against archaism, regionalism and neologism in poetry, extolling the norm, restraint and *le bon usage* as practised by the upper classes. In prose, Jean Louis Guez de Balzac advanced similar views. And Claude Favre, Seigneur de Vaugelas was the contemporary grammarian who made usage the proper guide for speaking and writing—albeit the usage of the court and the *honnêtes gens.* In 1635, Richelieu, the severe exponent of monarchic autocracy, officially established the seat of French linguistic autocracy. the Académie Franqaise. which had the task of watching over the French language and preventing its corruption. The first edition of the dictionary of the Académie appeared in 1694 (the eighth in 1932–3j); its purpose was normative rather than descriptive. But arresting the natural development of a language and adding frills known only to a small minority always comport dangers of mummification. French escaped this fate. perhaps because of the very excesses of the fashion and its concomitant restriction to a thin layer of society. Molière (1622–73) lampooned it (in the Femrnes savantes, for example), and his dialogue shows how little the common people were affected, no matter how the learned, the ladies, the young fops and the old fools strained to abide by the rules. This was, moreover, an age in which the court, the aristocracy and high society not only talked themselves but also lived themselves out of contact with the rest of the people, a willful isolation for which the privileged classes paid during the Revolution.

La *raison,* reason as expounded in the philosophy of Descartes (1596–1650), was about to become the watchword of the time; and orderliness and reason, and immutability were the bonds with which some proposed to fetter the literary language. The great classical authors, above all the dramatists Corneille (1606–84) and Racine (1639–99), with their regular Alexandrine metre, their trois unite's (the three unities of time, place and action, which, in the name of reasonableness and verisimilitude, did not allow the drama to occupy more than one day's time or greater space than was encompassed by the presentation on the stage), their classical plots and their restricted vocabulary, partly renounced their linguistic freedom.

Paradoxically, the real and considered enthronement of reason actually brought about liberation from some of the linguistic and literary canons rashly and falsely imposed in its name. For the awakening scientific studies of the 18th century. exemplified by the Encyclopkdie and its founders and writers, by Diderot (1713–84) and by Voltaire (1694–1778), could not develop freely under the restrictions imposed upon the written language in the preceding century. Scientific discourse about new things and new thoughts required new technical terms; localisms and popular words from farm and workshop were employed if they served a purpose. At the same time. the church, the aristocracy and the court. despite the external splendor of Louis XIV's establishment. had lost confidence and prestige among the people. Hence the main pillars of le bon usage were cracking, and the *honnêtes* gens were losing influence. Voltaire and Rousseau (1712–78), both masters of prose and both severe critics of contemporary society, though altogether different in ideas and manners, were alike in rejecting the authority and restraints upon linguistic usage, which the 17th century had favoured.

The French Revolution (beginning in 1789), which attempted to gather the strength of the uhole nation for nationalistic effort, spoke out against patois and "foreignism" in language. But this phase mas soon countered by the literary movements of the 19th century, romanticism, realism and naturalism, whose very names suggest hospitality toward the exotic. the historic and the realistic. and enmity against the traditional, the hidebound and the artificial.

These changes and veerings of fashion concerned mainly vocabulary and style. The structure of the French language was scarcely affected; it remained essentially the same from the Middle French period.

At the present time, linguistic currents and fashions are the same in French as, *mutatis mutandis,* in other languages. The literary standard language spreads continually at the expense of local dialects, leaving only local peculiarities of pronunciation; the process is immeasurably speeded by increased literacy and the penetration of the press, radio and television into regions that were until recently isolated. There is also a spread of an international scientific and technological vocabulary. which is virtually intruding into the nursery. Finally, there is the slow gain, under the impact of linguistic studies of the past century, of an attitude that considers language more a social instrument than a national monument.

INTERNAL DEVELOPMENT

Phonology. — The stressed vowels of late spoken Latin, distinguished from one another by quality and not, as in classical Latin, by quality and quantity (i ẹ ę a ǫ o u: the dot indicates close, the semicircle open, pronunciation) developed in Old French according to their quality and position within the word. The ẹ (continuing both classical Latin ē and ĭ) ẹ o (continuing both classical Latin ō and ŭ) o, when standing at the end of a syllable, in free position, became diphthongs; when within a syllable, in checked position, they remained unchanged. Some think that the free position lengthened the vowels and thus prepared for diphthongization; but this assumption is not essential (tela > teile [Mod. Fr. toile]; *pędem* > pied; *flọrem* > *flour* [Mod. Fr. *fleur*]; *cǫrem* > cuer [Mod. Fr. coeur]; *vĭrga* > verge; *cęruum* > cerf; *rŭpta* > rote [Mod. Fr. route]; *pǫrtam* > porte). Generally ị remained unaltered (Latin infinitives in -ire > French *-ir*); ụ always became *ü,* pronounced like the umlaut in German and spelled *u* (luna > lune), regardless of position. Free a became e; checked a remained (mare > *mer; partem* > part).

Old French also had diphthongs *ai,* ei, oi, *ui,* originating from a combination of a, *e,* o or *u* with a primary or a secondary *i;* the latter having developed, for example, from a palatal or palatalized consonant (factum > *fait; tectum* > teit [Mod. Fr. *toit*]; *gaudium* > *joie; fructum* > fruit) or sometimes from an earlier triphthong (noctem > nueit > *nuit;* but iei is monophthongized: *lectum* > *lieit* > lit). When combined with the *u* resulting from the vocalization of *l* before a consonant, a, ẹ and o also appeared as diphthongs (altum > aut [Mod. Fr. haut]; *feltrum* > feutre; *multum* > *mout*); and ę appeared as a triphthong (*bellus* > bels > beaus [Mod. Fr. *beau*]). The pronunciation of these was diphthongal in Old French, whereas Modern French has reduced most of them to monophthongs while retaining the older spelling.

All these developments. however, may be neutralized or altered in certain phonemic surroundings. The nasalization of vowels before *m* and *n,* with eventual absorption of the consonant, should be noted (*pontem* > *pont; manum* > *main*). Many inconsistencies with the rules here outlined, as well as with those to be mentioned for the consonants, are due to analogical reformation, whereby the sound appearing in a word conforms not to the rules of regular phonemic substitution but to the leveling influence of a paradigm (*fīnīre* became fenir, but then developed into *finir* in analogy with forms in which the first *i* is accented and therefore stable; amo uith stressed free a regularly gives *aime,* but *amare,* where the same a is unstressed, should become amer and not aimer, which is due to analogy).

Nonstressed vowels developed according to their position in the word. They were never diphthongized. The completely unstressed posttonic vowel of a proparoxytone (word accented on the third-from-last syllable) was invariably dropped in French (*populum* > *peuple*). All final unstressed vowels were also dropped (*quando* > *quant* [Mod. Fr. *quand*]), with the exception of a, which evolved into the so-called silent e. It is not always silent but may be pronounced as the schwa sound, which is phonetically transcribed ə (luna > lune). Other final vowels were also retained if they were needed to support a preceding consonant cluster which cannot terminate a French word (*populum* > *peuple;* febrenz > *fièvre*); in Modern French such words sometimes, when the speaker does not pronounce the final -3, also lose the sound of the preceding consonant (peup; *fièv'*).

The vowel of the pretonic syllable behaved like that of the final; hence it is sometimes called counterfinal (*ornamentum* > *ornement; liberare* > *livrer*). The vowel of the initial syllable was generally weakened when unstressed (in particular, a > a); when bearing the secondary stress it remained unchanged.

The development of the consonants was determined more by their position (initial, intervocalic, final or part of a cluster) and their phonetic surroundings than by their quality. The most pervasive phenomenon was palatalization of consonants, by which the sounds k, g, yod (the first sound in "yes") and d plus yod, if followed by e, *i* or yod, became s, ts, sh, dz and zh (*cęruum* > cerf; *civitatem* > citet [Mod. Fr. cite']; gentent > *gent; iungere* > *joindre; diurnum* > *jorn* [Mod. Fr. *jour*]). In French alone of all the Romance languages. k and g became *sh* and zh also before a, nhich, if stressed. became ie (*caballum* > *cheval; caput* > chtef [Mod Fr. *chef,* borroned into English while in its O F. form]). Initial *qu,* although unchanged in spelling, lost the *u* element (quando > *quand*) becoming k in sound. Initial *s* folloued by another consonant got a prothetic e, which remained while the *s* was dropped (*stella* > esteile > Ctoile).

In intervocalic position, voiceless consonants (produced without accompanying vibrations of the vocal cords) generally became voiced (produced with accompanying vibrations of the vocal cords) in late spoken Latin. In Old French they, as also the original voiced consonants, tended to become fricatives or to be dropped (*videre* > *veeir* [Mod. Fr. voir]; vita > vie; jaba > *fève; ripa* > *rive;* plaga > *plaie; securum* > *seür* [Mod. Fr. *sûr*]; *placere* > *plaisir*). Double medial consonants except *ss* and *rr* became simple, although in Modern French the etymological spelling may be resumed without effect upon the pronunciation (*cappa* > *chape;* gutta > gote [Mod. Fr. goutte]; belle > bele [Mod. Fr. belle]; *flamma* > *flame* [Mod. Fr. *flamme*]; terra > *terre; missa* > *messe*). The cluster *mn* became m (*dom(i)na* > *dame*).

Final consonants were largely retained in Old French but were dropped later in pronunciation, though not necessarily in spelling. Final *m* was dropped early in Latin speech, except in monosyllables, where in French it appeared as n (*rem* > *rien*). Final *s* lasted through the Old French period. Voiced finals tended to become unvoiced and eventually were lost, together with the original ones; for example, *quand(o)* > *quant,* then the t was dropped. Modern French qztand shows restoration of the etymological d in spelling but not in pronunciation.

Morphology. — The most important consonantal phonemic signals in the Latin declensional system, that is, the so-called case endings, are *m* and s. Final *-m* disappeared early. Also the vocalic declensional signals lost their significance, because of the loss or blurring of older quantitative and qualitative distinctions in the unstressed vowels. With many cases thus bereft of significant markers. the whole paradigmatic system was doomed. But as long as Old French retained the final *s*, the cases ending in *s* (mostly nominative singular and accusative plural) could be distinguished from others without *s*. According to this new paradigm. *s* was often added by analogy even to forms that had none in Latin, and was dropped from forms nhere it had become disturbing. The new device, however. was capable of continuing not six cases. as in Latin. but only a two-case declension — one subject and one nonsubject case. When the latter fulfilled other than direct object (accusative) functions. it was generally preceded by a preposition. Once final *s* also had become silent, the majority of the subject-nonsubject distinctions could no longer be formally signaled. Prepositional phrases became indispensable, except for the subject-direct object relation, in which rigid word order (subject — verb — direct object) became the rule.

It is difficult, however, to be sure exactly which came first. the phonetic decay of case endings or their functional replacement by these other devices. The two tendencies probably occurred together and reinforced one another. In general (but there are exceptions) Modern French continues the nonsubject case in both singular and plural. Acoustically, the difference between singular and plural. though shown in spelling, resides in most cases in the accompanying article (la table — les tables; une table — des tables). Only the pronouns still retain audible vestiges of case distinctions (le, *lui, les, leur,* je, me, *tu,* te, etc.).

The three genders of Latin were reduced to two. neuters being transferred into either of the other genders (the plural in -a often becoming a French feminine singular). Not all nouns retained their Latin gender.

Adjectives developed in a manner similar to nouns as regards cases and genders. The comparison of adjectives and the formation of the adverb were accomplished through composition rather than inflection: *calidum, calidius, calidissimum, calide* appear as *chaud, plus chaud,* le *plus chaud, chaudement* < *calida mente* (literally "with a warm mind"). There are few remnants of older nays in Modern French. more in Old French (*meliorem* > *meilleur; peius* > pis; *maiorem* > *majeur; fortiorem* > O. F. *forzor; pessimum* > O. F. *pesme*).

The morphology of the verb partook of all changes that the conjugational system underwent in late spoken Latin (see ROMANCE LANGUAGES). The most striking of them and of later ones in French itself were (1) replacement of several simple tense forms by compositions (some forms still being felt as compounds: il a donne'; others again as simple forms: *donare* habeo > *donare* aio > je *donnerai;* colloquially often replaced by a new compound: je vais donner); (2) the loss of all simple passive forms (*amafur* > *il* est aime'); (3) the reduction of subjunctive forms in number and frequency of use; (4) the formation of a conditional mood (*donare habebat* > *il donnerait*).

Of the four Latin conjugational types (infinitives in -are, -ere, -ĕre, -ire) only three remain (but four infinitives *-er, -oir, -re, -ir*); not all verbs. however. stay in their original classes (rire < *ridēre* not *ridĕre;* choir < *cadēre* not *cadĕre*). Some irregular Latin infinitives become regular on the analogy of the main types (*pouvoir* < *potere* for posse, *vouloir* < *volēre* for *velle, être* < essere for esse). But such analogical leveling which pervades the whole verbal system, is capricious; it can be described and classified, but not predicted.

Syntax. — Many of the changes from Latin to French syntax are explained through phonological and morphological history. French is not as highly inflected as Latin, and, therefore, certain functions of Latin inflection must be expressed by other means in French: prepositional phrase, word order, subject pronoun (*chante, chantes, chante,* chantent sound alike without pronoun). In Old French. with vestiges of Latin inflection still remaining, word order was freer, and the use of the subject pronoun was optional. Also, the grammatical rules of Latin mere applied with laxness while the new language had not yet been rigidly codified. Hence one gets the impression of irregularity and lawlessness. but in truth there were just different rules. It must not be claimed that the syntactical development from Latin to French implies either improvement (greater logic, economy or orderliness) or deterioration (greater rigidity of word order, reduction of distinctions or loss of wealth of inflections). There is merely change, each stage of the language using the material available.

The most important changes of the Middle and Modern French periods have already been indicated in the preceding sections: monophthongization of diphthongs; end of the two-case system; regularization of word order; regularization of the use of definite, indefinite and partitive articles (derived from the Latin demonstrative pronoun. the numeral "one," and the preposition de plus the demonstrative pronoun. respectively); obligatory use of the subject pronoun; codification and stabilization of grammar. By the beginning of the 17th century the language had essentially attained its modern stage in structure. and the literature of the period can be read easily by one who knows Modern French.

In conclusion. a few words may be said on the often vaunted logic. clarity and general superiority of French over other languages. This idea was expressed as early as the 13th century by Brunetto Latini; it was dogmatized and enshrined by Rivarol in his *Discours sur l'universalité* de *la langue française* (1784); and it has since been endlessly reiterated (even in some books cited in the bibliography below). "What is not clear is not French; what is not clear is still English, Italian, Greek, or Latin." says Rivarol. What is not clear is not good French, true: nor is it good anything else. Clarity, logic, skill and all other linguistic excellence reside not in the language but in the user. Language is a mere instrument which can be employed in such a way as to fulfill any linguistic task at the bidding of the user, and he can use it well or ill. Statements on linguistic quality almost invariably refer to style and not to language structure. Style is the individual linguistic behavior of the user superimposed upon the systematic pattern of language. Viewing the performance of the many excellent practitioners of French who have produced over many centuries a great literature, linguistically uninformed persons have ascribed some of this excellence to the language itself (thereby unwittingly detracting from the authors' onn merits). If French was, for a long time, the vehicle of international diplomacy and of elegant discourse among international society. this mas due not to the excellence of the language. but to the intellectual and political role which Frenchmen played in these domains. and to the skill (learned in school) nith nhich they employed their own language. That French has lost some of its international currency to English and Russian is no more due to a deterioration of the language than its ascendency was due to an intrinsic superiority; it is, rather, the consequence of new political. cultural and economic alignments.

FRENCH LAW AND INSTITUTIONS. In the historical evolution of French institutions, those of the Celts of Gaul are of little importance. None of them are known to have survived in later law. It was Roman rule which really formed Gaul. The institutions of Roman Gaul became identical with those of the Roman empire, provincial and municipal government undergoing the same evolution as in the other parts of the empire. The law for the Gallo-Romans was that which was administered by the *conventus* of the magistrate; there were only a few peculiarities, mere Gallicisms, resulting from usage, which were pointed out by Roman jurisconsults of the classical age.

The administrative reforms of Diocletian and Constantine applied to Gaul as to the rest of the empire. The Gallo-Romans became Christian with the other subjects of the empire; the church extended thither its organization framed on the administrative model, each *civitas* having a bishop. just as it had a *curia* and municipal magistrates. The church had the right of acquiring property; of holding councils, subject to the imperial authority; and of the free election of bishops. But only the first germs of ecclesiastical jurisdiction are to be traced in the bishop's powers of arbitration and in his disciplinary supervision of the morals of clergy and laity. After the fall of the western empire. there was left to the Gallo-Romans a body of written law which consisted of the imperial constitutions and the writings of the five jurists Gaius, Papinian. Julius Paulus, Ulpian and Herennius Modestinus (*see* ROMAN LAW).

THE FRANKISH MONARCHY

The invasions and settlements of the barbarians opened a new period. The various barbarian kingdoms in Gaul were established under different conditions. Under the Burgundians and Visigoths, the owners of the great estates, which had been the prevailing form of landed property in Roman Gaul. suffered partial dispossession, according to a regular system. It is doubtful whether a similar process took place in the case of the Frankish settlements, for their first conquests in the north and east seem to have led to the extermination or total expulsion of the Gallo-Roman population. In each case, however, the barbarian king wished to use rather than destroy the existing Roman administrative systems. The kings of the Visigoths and Burgundians were at first actually representatives of the western empire, and Clovis himself was ready to accept from the emperor Anastasius the title of consul.

The **Merovingians.**—The first administrative change which folloued the Merovingian conquest was the replacement of the *provincia* by the *civitas* as the fundamental unit. The *civitas*, generally known under the name *pagus*, was placed under a count (*comes*), and several *pagi* could be united under a *dux*. The *pagus* was generally divided into "hundreds" (*centenae*). But the Roman administrative machinery was too delicate to be handled by barbarians. Thus the Merovingians tried to levy the same direct taxes as the Romans had done, but the levies ceased to be imposts reassessed periodically and became fixed annual taxes on lands or persons. They disappeared at last as general imposts, continuing to exist only as personal or territorial dues. In the same way the Roman municipal organization survived for a considerable time under the Merovingians but was used only for the registration of written deeds; under the Carolingians it disappeared, and with it the old senatorial nobility. The administration of justice seems to have been organized on a system borrowed partly from Roman and partly from Germanic institutions. Justice was administered by the count (*comes*) or his deputy (*centenarius* or *vicarius*), but on the verdict of notables called *boni homines* or *rachimburgii*. This took place in an assembly, the *mallus*, which every free man was bound to attend a certain number of times a year, and in which were promulgated the general acts emanating from the king. The latter could issue commands or prohibitions, the violation of which entailed a fine of *60 solidi;* he also administered justice, assisted by the officers of his household, his jurisdiction being unlimited and undefined. He could hear all causes but was not bound to hear any. except, apparently, accusations of deliberate failure of justice and breach of trust on the part of the *rachimburgii*.

But what proved the great disturbing element in Gallo-Roman society was the fact that the conquerors were all warriors. whose normal state was that of war. It is true that under the Roman empire all the men of a *civitas* had been obliged, in case of necessity, to march against the enemy, and under the Frankish monarchy the count still called together his *pagenses* for this object. But the condition of the barbarian was very different; he lived essentially for fighting. Moreover, this military class, though not an aristocracy (for among the Franks the royal race alone was noble), was to a large extent independent, and the king had to attach these *leudes* or *fideles* to himself by gifts and favours. At the same time the authority of the king gradually assumed the personal character which, among the Germans, marked most of the relations between men. The household of the king gained in political importance. because the chief officers in the palace became also high public officials; and the king's bodyguard, the *antrustions,* remained a class apart.

The Frankish monarch had also the power of making laws (*decreta, edicta*), after consulting the chief men of the kingdom, both lay and ecclesiastical, in *placita*, meetings apparently modelled on the councils of the church. But throughout the kingdom in many places the direct authority of the king over the people ceased to make itself felt. The *immunitates,* granted chiefly to the great ecclesiastical landowners, limited this authority in a curious way by forbidding public officials to exercise their functions in the precinct of land which was *immunis*. Judicial and fiscal rights frequently passed to the landowner, who became of necessity the intermediary between the supreme power and the people. Other principles contributed toward the weakening of the royal power. The monarch had all the rights of the Roman emperor, whose place he had taken; but whereas the emperor had represented the state, the barbarian king considered the kingdom as his property. administered under the rules of private law. Hence the Frankish king could grant concessions of royal rights to individuals. and this principle justified the partition of the kingdom between the sons of the king, as in the division of an inheritance in land. This proved one of the chief weaknesses of the Merovingian monarchy.

In order to rule the Gallo-Romans, the barbarians had sought the help of the church. the representative of Roman civilization. Further, the Merovingian monarch and the Catholic Church had come into close alliance in their struggle with the Arians. The church therefore gained new privileges, but at the same time became to a certain extent dependent.

Under the Merovingians the election of the bishop by clergy and people was only valid if it obtained the assent of the king, who often directly nominated the prelate. But the church retained its full right of acquiring property, and its jurisdiction was partially recognized. It not only exercised more freely than ever a disciplinary jurisdiction, but the bishop, in place of the civil power, administered civil and criminal justice over the clergy. The councils had for a long time forbidden the clergy to cite one another before secular tribunals; they had also, in the 6th century, forbidden secular judges under pain of excommunication to cite before them and judge the clergy, without permission of the bishop. A decree of Clotaire II (*614*) acknowledged, if only partially. the validity of these claims.

The Carolingian Period. — The Merovingian dynasty perished amid increasing anarchy. The crown passed, with the approval of the papacy, to an Austrasian mayor of the palace and his family. Under these conditions there developed a number of institutions which were the direct precursors of feudalism. One was the royal benefice (*beneficium*) of which the church provided both the model and, in the first instance, the material. The model was the *precaria,* a form of concession by which it was customary for the church to grant the possession of its lands to free men; this practice the church itself had copied from the five-year leases granted by the Roman exchequer. Gradually, however, the *precaria* had become a grant made, in most cases, freely and for life. As regards the material, when the Austrasian mayors of the palace wished to secure the support of the *fideles* by fresh benefits, the royal treasury being exhausted, they turned to the church and took lands from it to give to their warriors. In order to disguise the robbery it was decided that these lands should be held as *precariae* from the church which had furnished them. Later, uhen the royal treasury was reorganized, grants of land made by the kings naturally took a similar form, the *beneficium,* as a free grant for life. The *beneficium* inevitably crystallized into a perpetual and hereditary right. Another institution akin to the *beneficium* was the *senioratus.* By the *commendatio,* a form of solemn contract, a man swore absolute fidelity to another man. who became his *senior.* It became the generally accepted idea that it was natural and normal for every free man to have a *senior.* At the same time a benefice was never granted unless accompanied by the *commendatio* of the beneficiary to the grantor. As the most important *seniores* were thus bound to the king and received from him their benefices, he expected through them to command their men; but in reality the king disappeared little by little in the *senior.* The capitulary of Kiersy-sur-Oise (877) clearly recognized this. The king granted as benefices not only lands, but also public offices such as those of count or *dux,* which thus became possessions, held first for life and later as hereditary properties.

Charlemagne, while sanctioning these institutions, reorganized the administration of justice, fixing the respective jurisdictions of the count and the *centenarius,* substituting for the *rachimburgii* permanent *scabini,* chosen by the count in the presence of the people, and defining the relations of the count, as the representative of the central authority, with the *advocati* or *judices* of *immunitates* and *potestates.* He reorganized the army, determining the obligations and the military outfit of free men according to their means. Finally, he established those regular inspections by the *missi dominici* (*q.v.*) and founded two general assemblies in the year, one in the autumn, the other in the spring, which mere attended by the chief officials, lay and ecclesiastical. It was in these assemblies that the capitularies (*see* CAPITULARY) and all important measures were first drawn up and then promulgated. The revenues of the Carolingian monarch consisted chiefly in the produce of the royal lands. There were also the free gifts which the great men were bound, according to custom, to bring to the *conventus;* the regular personal or territorial dues into which the old taxes had resolved themselves; the profits arising from the courts; and numberless requisitions in kind, a usage which had without doubt existed continuously since Roman times. The church added a fresh prerogative to its former privileges. namely, the right of levying a real tax in kind, the tithe. Since the 3rd century the church had tried to exact the payment of tithes from the faithful, and from the reign of Pippin the Short onward the civil law recognized and sanctioned this obligation. Ecclesiastical jurisdiction extended farther and farther, but Charlemagne, the protector of the papacy, maintained firmly his authority over the church. He nominated its dignitaries, both bishops and abbots, who were true ecclesiastical officials, parallel with the lay officials. In each *pagus,* bishop and count owed each other mutual support, and the *missi* on the same circuit were ordinarily a count and a bishop. In the first collection of capitularies, that of Ansegisus, two books out of four were devoted to ecclesiastical capitularies.

Criminal and Private Law.—What then, was the private and criminal law of this Frankish monarchy which had come to embrace so many different races? Men of Roman descent remained under Roman law, and the conquerors could not hope to impose their customs upon them. As to the barbarians. they had hitherto had nothing but customs, and these customs, of which the type nearest to the original is to be found in the oldest text of the *Lex Salica,* were nothing more than a series of tariffsof compensations, that is to say, sums of money due to the injured party or his family in case of crimes committed against individuals. They also introduced barbarous systems of trials, that by compurgation (*i.e.,* exculpation by the oath of the defendant supported by a certain number of *cojurantes*) and that by ordeal, later called *judicium Dei.* In each new kingdom the barbarians naturally kept their own laws, and when these men of different races all became subject to the Frankish monarchy, there evolved a system (called the *personnalité des lois*) by which every subject had, in principle, the right to be tried by the law of the race to which he belonged. When the two adversaries were of different race, the law of the defendant had to be applied. The customs of the barbarians had been drawn up in Latin. At this period only these written documents bore the name of "law" (*lex, leges*), and at least the tacit consent of the people seems to have been required for these collections of laws, in accordance with an axiom laid down in a later capitulary: *lex fit consensu populi et constitutione regis.* It is noteworthy, too, that in the process of being drawn up in Latin, most of the *leges barbarorum* were very much romanized.

In the midst of this diversity, a certain number of causes tended to produce a partial unity. The capitularies, which had themselves the force of law, when there was no question of modifying the *leges,* constituted a legislation which was the same for all; often they inflicted corporal punishment for grave offenses. which applied to all subjects without distinction. The Gallo-Romans and even the church itself, to a certain extent, adopted the barbarous methods of trial introduced by the Germans. On the other hand, written acts became prevalent among the barbarians. and at the same time they assimilated a certain amount of Roman law; for these acts continued to be drawn up in Latin, after Roman models. During this period, too, the Gallican Church adopted the collection of councils and decretals by Dionysius Exiguus, which was sent to Charlemagne in 774 by Pope Adrian I.

All the subjects of the Frankish monarchy were not of equal status. There was, strictly speaking, no nobility. both the Roman and the Germanic nobility having died out; but slavery continued to exist. The church, however, was transforming the slave into the serf, by giving validity to their marriages, at least when the master had approved of them, and by protecting the slave's *peculium.* But between the free man and the slave lay many persons of intermediate status. There was, to begin with, the Roman colonist (*colonus*), a class of which there is no clear mention in the laws before the 4th century; he and his children after him were attached perpetually to a certain piece of land, which they were allowed to cultivate on payment of a rent. There were, further, the *liti,* a similar class of Germanic origin. Many free men who had fled to the great landowners for protection accepted a similar position. Under the Merovingian regime and especially under the Carolingians, the occupation of land tended to assume the character of tenure; but free ownership of land continued to exist under the name of *alod,* and the capitularies contain numerous complaints and threats against the counts, who endeavoured by the abuse of their power to obtain the surrender of small properties held by free men.

THE EARLY CAPETIANS

The Rise of Feudalism.—The 10th and 11th centuries were a period of profound anarchy, during which feudalism took a more definite shape. The first Carolingians had striven to re-establish the king's authority, but the power of the state had again collapsed in the face of invasions from outside the kingdom. The sovereigns no longer made laws, the old capitularies and *leges* fell into disuse, and in their place territorial customs arose which were at first ill defined and strictly local. Apart from the influence of the church, government rested on brute force. No longer protected by the sovereign, men adopted new principles for their security, setting up a hierarchy of protection and submission depending on the possession of land; and a system of tenures came to replace the old system of ownership. The centre of the feudal nucleus was a chief, around whom gathered men capable of bearing arms, who commended themselves to him according to the old form of vassalage. They owed him fidelity. assistance and the support of their arms; he owed them protection. Some of them lived in his castle or fortified house, receiving their equipment only and eating at his table; others received lands from him! which became the fiefs of a later time. The fief was generally held for life and did not become universally hereditary till the second half of the 11th century. All these conditions had existed previously in much the same form; but that the chief was no longer merely an intermediary between his men and the royal power was a new development. The group had become in effect independent, so organized as to be socially and politically self-sufficient. It constituted a small army. led, naturally, by the chief and composed of his feudatories, supplemented in case of need by the *rustici*. It also formed an assembly in which common interests were discussed, the lord, according to custom, being bound to consult his feudatories and they to advise him to the best of their power. It also formed a court of justice. in which the feudatories gave judgment under the presidency of their lord: and all of them claimed to be subject only to the jurisdiction of this tribunal composed of their peers. Generally they also judged the villeins (*villani*) and the serfs dependent on the group, except in the rare cases where the latter obtained as a favour judges of their own status. Under these conditions a nobility was formed, those men becoming nobles who were able to devote themselves to the profession of arms; and this nobility could be indefinitely recruited by the granting of fiefs and admission to knighthood.

The state of anarchy was by now so far advanced that the custom of private war arose. Every man claimed the right of making war to defend his rights or to avenge his wrongs. Later on. this was a privilege of the noble, but the texts defining the limits which the church endeavoured to set to this abuse, namely. the Peace of God and the Truce of God, show that at the outset it was a power possessed by men of all classes. Even a man who had appeared in a court of law and received judgment had the choice of refusing to accept the judgment and of making war instead.

In this state of political disintegration each part of the country which had a homogeneous character tended to form itself into a higher unit. In this unit there arose a powerful lord, generally a duke, a count or a viscount, either a former official of the monarchy. whose function had become hereditary, or a usurper. He laid claim to an authority other than that conferred by the possession of real property: his court of justice was held in the highest honour, and to it were referred the most important affairs, More or less powerful lords with as yet no particular feudal title might commend themselves to him by doing homage.

Yet the kingship continued to exist. By the end of the Carolingian period it had in fact become elective. as is shown by the elections of Odo and Robert before that of Hugh Capet. The electors were the chief lords and prelates of the *regnum Francorum*. Each king during his lifetime secured the coronation of his eldest son; so that the first of the Capetians revived the principle of heredity in favour of the eldest son while establishing the hereditary indivisibility of the kingdom. But the only real authority of the king lay where his own possessions were, or where there had not arisen a duke. a count or a lord to compete with him. He maintained, however. a court, the jurisdiction of which seems to have been universal: though the parties in a suit could accept or reject the judgment given. The king dispensed justice surrounded by the officers of his household. who formed a permanent council. Periodically, at the great yearly festivals. he called together the chief lords and prelates of his kingdom, thus carving on the tradition of the Carolingian *placita* or *conventus;* but little by little the character of the gathering changed: it was no longer an assembly of officials but of independent lords. This was the origin of the *curia regis*.

The Growth of the Church.—While the power of the state was almost disappearing. that of the church continued to grow. Not only was the privilege of clergy, by which accused clerks were brought under jurisdiction of the church, almost absolute. but it had cognizance of a number of causes in which laymen only were concerned: marriage and everything nearly or remotely affecting it, wills, crimes and offenses against religion, and even contracts when the two parties wished it or when the agreement was made on oath. The church, moreover, remained in close connection with the crown, while the royal prerogatives with regard to the election of bishops were maintained more successfully than other rights of the crown. though in many of the great fiefs they nonetheless passed to the count or the duke. It was at this time too that the church tried to break the remaining connections which still kept it more or less dependent on the civil power (*see* INVESTITURE).

Final Organization of Feudalism.—The period of the true feudal monarchy is embraced by the 12th and 13th centuries. It was at this time that the crown again assumed real strength and authority. but so far it had no organs and instruments save those which were furnished by feudalism. now organized under a regular hierarchy. of which the king was the head. This new position of affairs was the result of three great factors: the revival of Roman law. the final organization of feudalism and the rise of the privileged towns. Roman law spread rapidly in the French schools and universities, except that of Paris, which was closed to it by the papacy; and the influence of this study was so great that it transformed society. It contributed largely to the reconstitution of the royal power, modelling the rights of the king on those of the Roman emperor; and it wrought a no less profound change in private law. From this time dates the division of France into the *pays de droit écrit* (the southern provinces), where Roman law, as codified by Justinian, was received as the ordinary law; and the *pays de coutume* (the northern provinces), where it played only a secondary part, being generally valid only as *ratio scripta* and not as *lex scripta*. In this period the customs also took definitive form, and over and above the local customs properly so called there were formed customs known as *general*, which held good through a whole province or *bailliage* and were based on the jurisprudence of the higher jurisdictions. (For the privileged towns *see* COMMUNE [MEDIEVAL].)

In the final organization of feudalism, the chief lord. the duke or count, had beneath him a whole hierarchy and was himself a part of the feudal system of France (*see* **FEUDALISM**). Doubtless in the case of lords like the dukes of Brittany and Burgundy, the king could not actually demand the strict fulfilment of feudal obligations; but the principle was established. Free and absolute property, the ancient *allodium*, continued to exist in most districts, though by way of exception. In the administration of justice, the feudal hierarchy had absolute sway. The fiefs themselves became hereditary, and the rules of succession were established. The most salient features of feudal succession were the right of primogeniture and the preference given to male heirs; but from the 13th century onward the right of primogeniture, which had at first involved the total exclusion of the younger members of a family, tended to be modified. except in the case of the chief lords, the eldest son obtaining the preponderant share or *préciput*. Nonnoble (*roturier*) tenancies followed a similar development, except that in their case there was no right of primogeniture nor any privilege of males.

The King's Government, 12th–13th Centuries.—The chief instruments of the crown in government were its great officers, the seneschal, butler. constable and chancellor; who were to become irremovable officials. At the end of the 12th century, however, one finds also the title of peers of France. applied to the king's principal vassals and to certain dignitaries of the church; but the regulation of the peerage did not take place till later, when this description no longer fitted it. Originally there had been six lay peerages and six ecclesiastical; but the latter proved to be the only stable ones, the lay peerages continually changing as time went on. In so far as it took part in the business of government, the court of the peers was a court of justice and, as such, was soon dominated by lawyers. Indeed, in this sense it was not separate from the *curia regis*, nor yet, later. from the *parlement* of Paris, of which the peers of France were by right members. From this time, too, dates the institution of the *maîtres des requêtes*.

The legislative power of the crown again began to be exercised during the 12th century, and in the 13th century had full authority over all the territories subject to the crown. The kings of this century were able narrowly to limit the custom of private war. But the most appreciable progress took place in the administrative and judicial institutions. Under the first Capetians the royal domain had been administered by *prévôts;* but as this system came to be corrupted by abuses Philip Augustus appointed *baillis (see* BAILIFF AND BAILIE) and seneschals above the *prévôts* as the king's representatives in the provinces and as superior judges. At the same time the form of the feudal courts tended to change, as they began more and more to be influenced by the Romano-canonical law. Saint Louis had striven to abolish trial by combat, and the Lateran council in 1216 condemned other forms of ordeal. Of the seignorial jurisdictions there soon remained only the *hautes* or *basses justices* (in the 14th century arose an intermediate grade, the *moyenne justice),* all of which were considered to be delegations of the royal power. As a result of the application of Roman and canon law, there arose the practice of appeal from seignorial justice to the royal court. In the 13th century too appeared the theory of crown cases *(cas royaux)* which were reserved for the royal court. Finally, the *curia regis* was gradually transformed into a regular court of justice, the *parlement* (*q.v.*), as it was already called in the second half of the 13th century. At this time the king no longer appeared in it regularly, and before each session (for it was not yet a permanent body) a list of properly qualified men was drawn up in advance to form the *parlement,* only those whose names were on the list being capable of sitting in it. Its main function had come to be that of a final court of appeal. At the various sessions, which were regularly held at Paris. appeared the *baillis* and seneschals, who were called upon to answer for the cases they had judged and also for their administration. The accounts were received by members of the *parlement* at the Temple and this was the origin of the *chambre des comptes.*

At the end of this period the nobility became an exclusive class. It became an established rule that a man had to be noble in order to be made a knight and even in order to acquire a fief; but in this latter respect the king made exceptions in the case of *roturiers,* who were licensed to take up fiefs, subject to a payment known as the *droits de franc fief.* The church maintained its privileges; a few attempts only were made to restrain the abuse, not the extent, of its jurisdiction. This jurisdiction was during the 12th century to a certain extent regularized, the bishop nominating a special functionary to hold his court; this was the *officialis* (Fr. *official*), whence the name of *officialité* later applied in France to the ecclesiastical jurisdictions. On one point, however, the former rights of the church were diminished. It preserved the right of freely acquiring personal and real property, but though it could still acquire feudal tenures, it could not keep them; it must alienate the property again within a year and a day. The reason for this new rule was that the church is a proprietor who does not die and in principle does not surrender its property; consequently, the lords had no longer the right of exacting payments on the alienations of those tenures which it acquired. In this period the form of the episcopal elections underwent a change, the electoral college coming to consist only of the canons composing the chapter of the cathedral church.

During the same period criminal law was profoundly modified. Under the influence of Roman law a system of arbitrary penalties replaced those laid down by the customs, which had usually been fixed and cruel. The criminal procedure of the feudal courts had been based on the right of accusation vested only in the person wronged and his relations; for this was substituted the inquisitorial procedure which had developed in the canon law at the end of the 12th century and was to become the *procédure à l'extraordznaire* of the *ancien régime,* which was conducted in secret and without free defense and debate. Of this procedure torture came to be an ordinary and regular part.

The customs, which at that time contained almost the whole of the law for a great part of France, were not fixed by being written down. In that part of France which was subject to customary law *(la France coutumière*) they were defined when necessary by the verdict of a jury in what was called the *enquête par turbes;* some of them, however, were, in part at least, authentically recorded in seignorial charters. *chartes de ville* or *chartes de coutume.* Their rules were also recorded by experts in private works or collections called *livres coutumiers,* or simply *coutumiers* (customaries). The most notable of these are *Les Coutumes de Beauvoisis* of Philippe de Beaumanoir; the *Très ancien coutumier de Normandie* and the *Grand coutumier de Normandie;* the *Conseil à un ami* of Pierre des Fontaines; the *Établissements de Saint Louis;* and the *Livre de jostice et de plet.* At the same time the clerks of important judges began to collect in registers notable decisions; thus the old decisions of the exchequer of Normandy and the *Olim* registers containing the earliest decisions of the *parlement* of Paris are still extant.

THE LIMITED MONARCHY OF THE VALOIS

The 14th and 15th centuries were the age of the limited monarchy. In this period certain rules for the succession to the throne were fixed by precedents: the exclusion of women and of male descendants in the female line and the principle that a king could not by an act of will change the succession of the crown. The former *curia regis,* with its universal jurisdiction, was divided into sections, each competent in its own sphere: the *parlement,* for matters of justice; the *chambre des comptes,* for finance; and the *conseil du roi,* an administrative and governing council, not at all of a feudal character. The number of members of the *conseil* was at first small, but soon the brevet of *conseiller du roi en ses conseils* was given to numerous representatives of the clergy and nobility, the great officers of the crown becoming members by right. Side by side with these officials, whose power was then at its height, there were gradually evolved more subservient ministers who could be dispensed with at will. From the 14th century *clercs du secret* and *secre'taires des finances* were descended the 15th-century *secre'taires des commandements du roi,* who in the 16th century developed into the *secre'taires d'e'tat.* The college of peers of France was continually being changed as the great fiefs were annexed to the crown. While the six ecclesiastical peerages remained unalterable, Philip the Fair raised the duchies of Brittany and Anjou and the countship of Artois to the rank of peerages of France; eventually the peerage, considered as a title of honour, ceased to be attached to the major fiefs, and there was a constant increase in the numbers of lay peers.

The Rise of the States General.—At the beginning of the 14th century appeared the states-general *(états ge'ne'raux),* the origin of which can be traced to the assemblies of barons. prelates and bourgeois which used to meet in the vicinity of the *curia regis* to offer the king "counsel" and "help" *(aide).* Their power reached its height at the crisis of the Hundred Years' War during the reign of King John II. Then they were frequently convened, to vote the subsidies that the king needed for the war; and they sought to establish their control over the government. With the return of peace, they were no longer summoned; indeed they were not convened at all between 1484 and 1560. As their powers were never defined, they remained an instrument devoid of authority to which the government turned in times of stress. At the same time there arose the provincial estates, which were in miniature for each province what the states-general were for the whole kingdom. Later it became a privilege for a province to have its own assembly; those which did so were never rightfully subject to the royal *taille* and kept, at least formally, the right of sanctioning, by means of the assembly, the subsidies which took its place. Hence it became the endeavour of the crown to suppress these provincial assemblies, which in the 14th century were to be found everywhere; from the outset of the 15th century they began to disappear in central France.

Royal Taxation.—The most characteristic feature of this period was the institution of universal taxation by the crown. Hitherto, the king's sole revenues were those which he exacted in his capacity of feudal lord together with the income arising from certain crown rights which he had preserved or regained. But these revenues, known later as the income of the royal domain and later still as the *finances ordinaires,* became insufficient in proportion as the royal power increased; it became a necessity for the monarch to be able to levy imposts throughout the whole extent of the provinces annexed to the crown, even upon the subjects of the different lords. This he could only do by means of the cooperation of those lords, lay and ecclesiastical, who alone had the right of taxing their subjects; the co-operation of the privileged towns, which had the right to tax themselves, was also necessary. It was in order to obtain this consent that the states-general, in most cases, and the provincial assemblies, in all cases, were convoked. In some cases, however, the king adopted different methods; for instance, he sometimes utilized the principle of the feudal aids. In cases where his vassals owed him, as overlord. a pecuniary aid, he substituted for the sum paid directly by his vassals a tax levied by his own authority on their subjects. It is in this way that for 30 years the necessary sums were raised. without any vote from the states-general, to pay the ransom of King John II. But in principle the taxes were sanctioned by the states-general in the 14th century. Whatever form they took, they were given the general name of *aides* or *auxilia* and were considered as occasional and extraordinary subsidies, the king being obliged in principle to "live of his own." Certain *aides,* it is true, tended to become permanent in the reign of Charles VI; but the taxes were at first the sole resource of Charles VII. With the consent of the states-general, an *aide* was levied, from 1435, on the sale of certain consumer goods (particularly wine) and also a *taille,* from 1439, for the maintenance of a regular army. These imposts continued to be levied in peacetime, and Louis XI, far from suppressing them, augmented them so powerfully that they became the treasury's chief resource up to the end of the *ancien re'gime.*

Together with the taxes there was evolved the system of their administration. For the administration of the subsidies which they granted, the states-general nominated from among their own numbers *surintendants généraux* or *généraux des finances* and further, for each diocese or equivalent district, *e'lus.* Both had judicial as well as fiscal powers. the latter constituting courts of first instance and the former courts of final appeal. After 1360 both *généraux* and *e'lus* were nominated by the king. The *e'lus,* or *officiers des élections,* only existed in districts which were subject to the royal *taille;* hence the division, so important in old France, into *pays d'élections* and *pays d'états.*

This dual system of financial administration. for revenue from the royal domain *(finances ordinaires)* and for imposts *(finances extraordinaires),* led to the creation of two distinct administrative bodies: for the former, there was that of the *receveurs du domaine* under four *trésoriers de France* and a *changeur du trésor;* for the latter, there were the *élus,* seconded by the *receveurs des tailles,* with four *généraux des finances* and four *receveurs généraux.* The *trésoriers* and the *généraux des finances* formed a kind of ministry of finance to the 1 jth-century monarchy. Their subordinates had both administrative and judicial functions; but two courts of law, the *cour du trésor* for the domain and the *cour des aides* for imposts, dealt with contentious matters at a higher stage.

The New Army. — The army also was reorganized. Moreover, the military service attached to the fiefs was transformed for the profit of the king. who alone had the right of making war; it became the *arrière-ban,* a term which had formerly applied to the *levée en masse* of all the inhabitants in times of national danger. Before the 14th century the king had only had the power of calling upon his own immediate vassals for service; henceforth all possessors of fiefs owed him, whether within the kingdom or on the frontiers, military service without pay and at their own expense. Charles VII's army comprised the *,francs-archers* furnished by the parishes, a militia which was only summoned in case of war, and companies of *gendarmerie* or heavy cavalry which were called *compagnies d'ordonnance.*

The new army led to the institution of the governors of provinces, who were to command the troops quartered there. At first they were only appointed for the frontiers and fortified places, but later the kingdom was divided into *gouvernements généraux.* There were at first 12 of these, which were called in the middle of the 16th century the *douze anciens gouvernenzents.* Although strictly speaking. they had only military powers, the governors. always chosen from among the great lords. became in the provinces the direct representatives of the king and caused the *baillis* and seneschals to take a secondary place.

The Courts Under the **Valois.**—The courts of law continued to develop on the lines already laid down. The *parlement,* which had come to be a judicial committee nominated every year, but always consisting in fact of the same persons, changed in the course of the 14th century into a body of magistrates who mere permanent but as yet subject to removal *(see* PARLEMENT). The provincial *parlements* had arisen after and in imitation of that of Paris and had for the most part taken the place of some superior jurisdiction which had formerly existed in the same district when it had been independent (like Provence) or when it had formed one of the great fiefs (like Normandy or Burgundy). It was during this period also that the *parlements* acquired the right of opposing the registration (that is to say. the promulgation) of laws. of revising them and of making representations to the king when they refused registration. The other royal jurisdictions were completed *(see* CHÂTELET). Beside them arose another of great importance, which was of military origin, but later came to include all citizens under its authority. This was that of the provosts of the marshals of France *(prévôts des mare'chaux de France),* who were officers of the *maréchaussée* (the gendarmerie of the time); they exercised criminal jurisdiction without appeal over crimes committed by vagabonds and by fugitives from justice and over a number of crimes of violence, whatever the rank of the offender. Further, another class of officers came gradually into being in connection with the lam courts: the "king's men" *(gens du roi),* the *procureurs* and *avocats du roi,* who were at first simply those lawyers who represented the king in the law courts or pleaded for him when his interests were involved. From the 14th century onward the *procureurs du roi* had full control over public prosecutions. In this period, too, appeared what was afterward called *justice retenue,* that is to say. the justice which the king administered, or was supposed to administer, in person. It was based on the idea that, since all justice and all judicial power reside in the king, he could not deprive himself of them by delegating their exercise to his officers and to the feudal lords. Consequently he could. if he thought fit, take the place of the judges and call up a case before his own council. He could reverse even the decisions of the courts of final appeal and, in some cases, used this means of appealing against the decrees of the *parlements.* In these cases the king was supposed to judge in person; in reality they were examined by the *maîtres des requêtes* and submitted to the *conseil du roi,* at which the king was always supposed to be present and which had in itself no power of giving a decision. For this purpose there was soon formed a special committee of the council, which was called the *conseil privé* or *de jzcstice.* The king frequently. by means of *lettres de justice,* intervened in the procedure of the courts, by granting *bénéfices,* by which rules which were too severe were modified, and judgments were given in cases not covered by the common law. By *lettres de grâce* he granted reprieve or pardon in individual cases. The most extreme form of royal intervention was made by means of *lettres de caclzet* *(q.v.),* which ordered a subject to go without trial into a state prison or into exile. In other cases the king. as supreme judge, would set up extraordinary judicial commissions to hear suits in which his own interests were involved.

The Ecclesiastical Settlement. — The condition of the church changed greatly during this period. The jurisdiction of the *officialités* was very much reduced. even over the clergy. The development of jurisprudence gradually removed from the *officialités* causes of a purely secular character in which laymen only were concerned, such as wills and contracts; and in matrimonial cases their jurisdiction was limited to those in which the *foedzcs matrimonii* was in question. For the acquisition of real property by ecclesiastical establishments the consent of the king was always necessary.

In ecclesiastical patronage, from the 14th century onward the papacy encroached more and more upon the rights of the bishops over the inferior benefices, and of the electors, who usually conierred the superior benefices; at the same time it exacted from newly appointed incumbents heavy dues, which were included under the generic name of annates *(q.v.).* During the Great Schism these abuses grew. until by a series of edicts, promulgated with the consent and advice of the *parlement* and the clergy, the Gallican Church was restored to the possession of its former liberties, under the royal authority. Thus France was ready to accept the decrees of reform issued by the council of Basel (*q.v.*), which it did, with a few modifications, in the Pragmatic Sanction of Charles VII, adopted after a solemn assembly of the clergy and nobles at Bourges and registered by the *parlement* of Paris in 1438. It suppressed the annates and most of the means by which the popes disposed of the inferior benefices. For the choice of bishops and abbots, it restored election by the chapters and convents. The Pragmatic Sanction. however, nas never recognized by the papacy, nor was it consistently and strictly applied by the kings.

THE ABSOLUTE MONARCHY

From the 16th century to the Revolution was the period of the absolute monarchy. The reigns of Francis I and Henry II clearly laid down the principle of the absolute power of the crown. The states-general were not assembled under these two reigns. though they reappeared in the second half of the 16th century thanks to the political disturbances of the period: they were summoned in 1560 at Orléans, in 1561 at Pontoise, and in 1576 and 1588 at Blois; and the League even convoked them once at Paris in 1593. But the states-general of the 16th century in spite of their good intentions and the great talents which were at their service. were no more effective than their predecessors. They were. however, to be called together yet again, as a result of the troubles that followed the death of Henry IV; but their dissentions and powerlessness were again strikingly exemplified, and they did not reappear until 1789. Other bodies, however, created by the royal power, were to carry on the struggle against it. There were the *parlements,* the political rivals of the states-general. Thanks to the principle according to which no law came into effect so long as it had not been registered by them, they had won the right of refusing registration, explaining their reasons to the king by means of the *remonstrances.* Before the end of the 17th century they had lost this power. The ordinance of 1667 on civil procedure and. above all. a declaration of 1673 ordered the *parlement* to register the laws as soon as it received them and without any modification. It was only after this registration that they were allowed to draw up *remonstrances,* which were henceforth futile. The nobles. as a body, had also become politically impotent. At the same time the central government underwent changes. The great officers of the crown disappeared one by one. Of those in the first rank only the chancellor survived till the Revolution. Apart from him, the king's real ministers were the secretaries of state. generally four in number, who were always removable and were not chosen from among the great nobles. For purposes of internal administration, the provinces were divided between them, each of them corresponding by despatches with the areas which were assigned to him. Any other business (except legal affairs. which belonged to the chancellor, and finance) was divided among them according to convenience. At the end of the 16th century. however, were evolved two regular departments. those of war and foreign affairs. From the time of Francis I, the administration of the finances underwent many changes. The control exercised over it by the *trésoriers de France* and the *généraux des finances* jointly was suppressed, and new systems were set up instead. For a time there was a *trésorier de l'Épargne;* then he was superseded by the *surintendant des finances.* Meanwhile the *trésoriers de France* and the *généraux des finances* were becoming provincial officers. and their powers were distributed among several officers with equal authority. These constituted the *bureaux des finances* which were responsible for large areas known as *généralités.* The fall of Nicolas Fouquet led to the suppression of the office of *surintendant;* but Jean Baptiste Colbert soon again became practically a minister of finance, under the name of *contrôleur général des finances,* both title and office remaining until the Revolution.

The *conseil du roi* was an important organ of the central government. and for a long time included among its members representatives of the nobility and clergy. Besides the councillors of state (*conseillers d'e'tat),* its ordinary members. the great officers of the crown and secretaries of state, princes of the blood and peers of France were members of it by right. Further, the king was accustomed to grant the brevet of councillor to a great number of the nobility and clergy who could be called upon to sit in the council and give an opinion on matters of importance. But in the 17th century the council tended to differentiate its functions, forming three principal sections. one for political, one ior financial and the third for questions of administration and justice. Under Louis XIV it took a definitely professional, administrative and technical character. The *conseillers à brevet* were all suppressed in 1673, and the peers of France ceased to be members of the council. The political council, or *conseil d'en haut,* had no *ex officio* members, not even the chancellor; the secretary of state for foreign affairs, horrever. necessarily had entry to it: it also included a small number of persons chosen by the king and bearing the title of ministers of state (*ministres d'e'tat).* The other important sections of the *conseil du roi* mere the *conseil des finances,* organized after the fall of Fouquet, and the *conseil des dépêches,* in which sat the four secretaries of state, dealing with everything concerned with internal administration (except finance), including the legal business connected with this administration.

The chief authority in the provincial administration belonged in the 16th century to the governors of the provinces. But at the end of that century commissioners were charged with temporary duties there: and these commissioners became regular. in the 17th century. under the name of *intendants.* The *intendants,* after a period of conflict with the governors and the *parlements,* became absolute masters of the administration wherever there were no provincial estates. Each one was at the head of a *généralité,* enjoying full administrative authority. (*See* INTENDANT.)

The towns having a municipal organization preserved in the 16th century a fairly wide autonomy. Under Louis XIV their independence rapidly declined. They were placed under the tutelage of the *intendants,* whose sanction or that of the *conseil du roi* was necessary for all acts of any importance. In the closing years of the 17th century. the municipal officials ceased, even in principle, to be elective. Their functions ranked as offices which were, like royal offices: saleable and heritable.

The Sale of Offices.—The sale of royal offices is one of the characteristic features of the *ancien régime.* In the 16th century, under Francis I at the latest. the crown itself began officially to sell offices. taking a fee from those upon whom they were conferred. In the judicial system, the practice had a favourable result, assuring security of office to the judges; for the king could not reasonably dismiss an official arbitrarily without refunding the fee which he had paid. On the other hand. it contributed to the development of the dues paid by litigants to the judges. The system was extended to all official functions. even to financial posts. It was completed by the recognition of the rights in the sale of offices as hereditary; the right of resigning the office on payment of a fee. either in favour of a competent descendant or of a third party, passed to the heirs of an official who had died without having exercised this right himself. Through this development there arose a class of men who, though bound in many ways to the crown, were actually independent. Hence the tendency in the 18th century to create new and important functions under the form. not of offices, but of simple commissions, as had been done in the case of the *intendants* in the 17th.

Public Law in the 16th Century.— In this period the essential principles of public law were defined. There were, in the first place. the fundamental laws of the realm, which were true constitutional principles, considered as binding the king himself: so that. although he was sovereign, he could neither abrogate nor modify nor violate them. There was, however, some discussion as to what rules actually came under this category, except in the case of two series about which there was no doubt: those which dealt with the succession to the crown and forbade the king to change its order: and those which proclaimed the inalienability of the royal domain against which no title by prescription was valid. This last principle admitted only two exceptions: the formation of appanages, and the sale of land to meet the necessities oi war. with a perpetual option of redemption and the ever-present possibility that the transaction would be revoked by the king. as in many instances it was.

There was in the second place the theory of the rights, franchises and liberties of the Gallican Church. This body of doctrine rested chiefly on three principles: firstly, that the temporal power was absolutely independent of the spiritual power; secondly, that the pope had authority over the clergy of France in temporal matters and matters of discipline only by the consent of the king; thirdly, that the king had authority over and could legislate for the Gallican Church in temporal matters and matters of discipline. The old public law provided a safeguard against the violation of these rules in the process known as the *appel comme d'abus,* definitely established during the 16th century. It was heard before the *parlenzents,* but could, like every other case, be evoked before the royal council. Its effect was to annul any act of the ecclesiastical authority due to abuse or contrary to French law. The Pragmatic Sanction had been abrogated and replaced by the concordat of 1516, which preserved many of the enactments of the Pragmatic Sanction, notably those which protected the collation of the inferior benefices from the encroachments of the papacy; on the other hand the greater benefices. bishoprics and abbeys were in the king's gift and were awarded as he pleased (this power weighed heavily on clerical life up to the end of the *ancien rkgime).* The *parlement* of Paris was unwilling to register the concordat, but the crown easily overcame its resistance.

In the 16th century also, contributions to the public services drawn from the immense possessions of the clergy were regularized. Since the second half of the 12th century at least, the kings had in times of urgent need asked for subsidies from the church, and ever since the Saladin tithe of Philip Augustus this contribution had assumed the form of a tithe. Such tithes were fairly frequently granted by the clergy of France. After the conclusion of the concordat. Leo X granted the king a tithe *(ddcime)* under the pretext of a projected war against the Turks. The concession was several times renewed until, by force of custom, the levying of these tithes became permanent. But in the middle of the 16th century the system changed. The crown was heavily in debt, and its needs had increased. The property of the clergy having been threatened by the states-general of 1j60 and 1561. the king proposed to them to remit the bulk of the tithes and other dues in return for the payment by them of a sum equivalent to the proceeds of the taxes which he had mortgaged A formal contract to this effect was concluded at Poissy in 1j61 between the king and the clergy of France. In 1580 a new assembly of the clergy renewed the agreement, which was henceforward always renewed every ten years. Thus every ten years a great elective assembly of the clergy became necessary. There were two stages in the election, a preliminary one in the dioceses and a further election in the ecclesiastical provinces, each province sending four deputies to the general assembly, two of the first rank. that is to say, chosen from the episcopate, and two of the second rank. which included all the other clergy. The *dons gratuits* (benevolences) voted by the assembly comprised a fixed sum equivalent to the old tithes together with supplementary sums levied for some particular occasion. The church, on its side, profited by this arrangement in order to obtain the commutation or redemption of the taxes affecting ecclesiastics considered as individuals. This settlement only applied to the "clergy of France." that is to say, to the clergy of those districts which were united to the crown before the end of the 16th century. The provinces annexed later, called *pays étrangers,* or *pays conquis,* had in this matter, as in many others, an arrangement of their own.

At the end of the 16th century a reasonable balance had been established among the Christians of France. The Edict of Nantes. in 1598, granted the Protestants full civil rights and liberty of public worship in many places and notably in all the royal *bailliages,* though restrictive clauses made it possible to regard it as a temporary concession: a measure of tolerance, the edict did not proclaim the right to freedom of conscience. The Catholics, whose religion was essentially a state religion, had never accepted this arrangement as final, and at last. in 1685, under Louis XIV, the edict was revoked and the Protestant pastors expelled from France. Their followers were forbidden to leave the country, but many succeeded nevertheless in escaping abroad. The position of those who remained behind was peculiar. Laws passed in 1715 and 1724 established the legal theory that there were no longer any Protestants in France. but only *vieux catholiques* and *nouveaux convertis.* The result was that henceforth they had no longer any regular civil status, the registers containing the lists of Catholics enjoying civil rights being kept by the Catholic clergy.

The Parlements, 1715–89.—The form of government established under Louis XIV was preserved without any fundamental modification under Louis XV. The *parlements* had regained their ancient rights in consequence of the *parlement* of Paris having. in 171j, set aside the will of Louis XIV as being contrary to the fundamental laws of the kingdom, in that it laid down rules for the composition of the council of regency and limited the power of the regent. This newly revived power they exercised freely, and all the more so since they were the last surviving check on the royal authority. They became at this period the avowed representatives of the nation; they contested the validity of the registration of laws in the *lits de justice,* asserting that laws could only be made obligatory when the registration had been freely endorsed by themselves. Before the registration of edicts concerning taxation they demanded a statement of the financial situation and the right of examining the accounts. Finally, by the theory of the *classes,* which considered the various *parlements* of France as parts of one and the same body, they established among them a political union. These pretensions the crown refused to recognize. Louis XV solemnly condemned them in a *lit de justice* of Dec. 1770, and in 1771 the chancellor René Maupeou took drastic measures against them. The magistrates of the *parlement* of Paris were removed, and a new *parlement* was constituted, including the members of the *grand conseil,* which had also been abolished. The *cour des aides* of Paris, which had made common cause with the *parlement,* was also suppressed and many of the provincial *parlements* were reorganized. These actions, the coup d'état of the chancellor Maupeou, as they were called, produced an immense sensation.

Organization of the Army.—The permanent army was further developed. The *gendarmerie* or heavy cavalry was continuously increased in numbers. On the other hand, the *francs archers* fell into disuse after Louis XI; and, after a fruitless attempt had been made under Francis I to establish a national infantry, a system of voluntary enlistment was introduced. The system of purchase underlay the uhole military organization. Each regiment was the property of a great lord; the captain was. so to speak, owner of his company, or rather a contractor, who, in return for the sums paid him by the king, recruited his men and gave them their uniforms, arms and equipment. Up to the end of the 17th century, the army had consisted exclusively of mercenary volunteers. Then a far-reaching change was made with the introduction of compulsory recruiting, on which the organization of the militia (*milices*) was based. Thereafter the two systems existed side by side. Each parish had to furnish one recruit to the militia, but the force was very rarely raised from the towns. The purpose for which these men were employed varied from time to time. Sometimes, as under Louis XIV, they were formed into special active regiments. Under Louis XV and Louis XVI they were formed into *régiments provinciaux,* which constituted an organized reserve. But their chief use was during the war, when they were individually incorporated into various regiments to fill up the gaps.

Under Louis XV, the duc de Choiseul suppressed what he called the "farming of companies" *(compagnie-ferme)*; recruiting became a function of the state, and voluntary enlistment a contract between the recruit and the state. Arms, uniforms and equipment were furnished by the king. Choiseul also equalized the numbers of the military units, and his reforms, together with a few others effected under Louis XVI, produced the army which fought the first campaigns of the Revolution.

Taxation, 17th–18th Centuries.—One of the most distinctive features of the *ancien régime* was excessive taxation. The taxes imposed by the king were numerous, and, moreover, hardly any of them fell on all parts of the kingdom. To this territorial inequality was added the inequality arising from privilege. Ecclesiastics, nobles and many of the crown officials were exempted from the heaviest imposts. In the 17th and 18th centuries certain important new taxes were established: between 1695 and 1698 the *capitation,* and in 1710 the tax of the *dixième,* which became under Louis XV the tax of the *vingtièmes.* These two imposts had been intended to affect every subject in proportion to his income; but so strong was the system of privilege, that as a matter of fact the chief burden fell upon the *roturiers.* The income of a *roturier* who was not exempt was thus subject in turn to three direct imposts, the *taille,* the *capitation* and the *vingtikmes,* and the apportioning or assessment of these was extremely arbitrary. In addition to indirect taxation strictly so called, France under the *ancien re'gime* was subject to the *traites,* or customs, which were not only levied at the frontiers on foreign trade, but also included many internal customhouses for trade between different provinces. Their origin mas generally due to historical reasons; thus, among the *provinces reputées étrangères* were those which in the 14th century had refused to pay the *aides* for the ransom of King John II, also certain provinces which had refused to allow customs offices to be established on their foreign frontier. Colbert had tried to abolish these internal duties, but had only succeeded to a limited extent.

The indirect taxes, the *traites* and the revenues of the royal domain were farmed out by the crown. At first a separate contract had been made for each impost in each *élection,* but later they were combined into larger blocks, as is shown by the name of one of the customs districts, *l'enceinte des cinq grosses fermes.* From the reign of Henry IV the levying of each indirect impost was farmed en bloc for the whole kingdom, a system known as the *fermes générales;* but the real *ferme ge'ne'rale,* including all the imposts and revenues which were farmed in the whole of France, was only established under Colbert. The *ferme générale* was a powerful company, employing a vast number of men, most of whom enjoyed various privileges. Besides the royal taxes, seigniorial imposts survived under the form of tolls and market dues. The lords also often possessed local monopolies or *banalités; e.g.,* the right of the common bakehouse *(four banal).*

Decline of the Ecclesiastical Courts. — The ecclesiastical jurisdictions survived to the end of the *ancien re'gime,* but with diminished scope. A series of ingenious legal theories had gradually deprived them of most of the cases which they had formerly entertained. In the 18th century civil suits in which the clergy were defendants were normally taken before secular tribunals, and ever since the first half of the 17th century, for all grave offenses, the royal judge could pronounce a sentence of corporal punishment on a guilty cleric without this necessitating his previous degradation. The inquiry into the case was, it is true, conducted jointly by the royal and the ecclesiastical judge, but each of them pronounced his sentence independently. All cases concerning benefices came before the royal judges. Finally, the *officialités* only possessed a very limited jurisdiction over laymen, even in the matter of marriage. The parish priests, however, continued to enter declarations of baptisms, marriages and burials in registers kept according to the civil laws.

Law and Legislation. — The general customs of the *pays coutumiers* were almost all officially recorded in the 16th century. Drafts were prepared by the officials of the royal courts in the chief town of the district and were then submitted to the government. The king then appointed commissioners to visit the district and promulgate the customs on the spot. For the purpose of this *publication* the lords, lay and ecclesiastical, of the district, with representatives of the towns and of various bodies of the inhabitants, were summoned for a given day to the chief town. In this assembly each article was read. discussed and put to the vote. Those which were approved by the majority were thereupon decreed *(décrétés)* by the commissioners in the king's name; those which gave rise to difficulties were put aside for the *parlement* to settle when it registered the *coutume.* The *coutumes* in this form became practically written law; henceforward their text could only be modified by a formal revision carried out according to the same procedure as the first version.

Legislation by *ordonnances, édits, déclarations* or *lettres patentes,* emanating from the king, became more and more frequent; but the character of the *grandes ordonnances,* which were of a far-reaching and comprehensive nature, underwent a change during this period. In the 14th, 15th and 16th centuries they had been mainly *ordonnances de réformation* (*i.e.,* revisions of previous laws), which were most frequently drawn up after a sitting of the states-general, in accordance with the suggestions submitted by the deputies. The last of this type was the ordinance of 1629, promulgated after the states-general of 1614 and the assemblies of notables which had followed it. In the 17th and 18th centuries they became essentially *codifications,* comprising a systematic and detailed statement of the whole branch of law. The first series of codifying ordinances under Louis XIV, inspired by Colbert and carried out under his direction, included the ordinance of 1667 on civil procedure; that of 1670 on the examination of criminal cases; that of 1673 on the commerce of merchants; and that of 1681 on the regulation of shipping (the last two form between them a complete code of commerce by land and sea). The second series, under Louis XV, due to the chancellor d'Aguesseau, led chiefly to the regulation, by the ordinances of 1731, 1735 and 1747, of deeds of gift between living persons, wills and property left in trust. Under Louis XVI some mitigation was made of the criminal law, notably the abolition of torture.

Land Tenure. — The system of land tenure which prevailed in the 18th century preserved many features of feudalism. The fief, although it still implied homage from the vassal, no longer involved any service on his part (excepting that of the *arridre-ban* due to the king); but when a fief changed hands the Iord still exacted his *profits.* Tenures held by *roturiers* were generally subject to periodical and fixed contributions for the profit of the lord. Serfdom had disappeared from most of the provinces of the kingdom; among all the *coutumes* which were officially codified, not more than ten or so still recognized this institution. An edict of Louis XVI of 1779 abolished serfdom on crown lands and mitigated the condition of the serfs who still existed on the domains of individual lords. By 1789 the number of serfs in the kingdom was insignificant.

THE FRENCH REVOLUTION

The Revolution destroyed the *ancien re'gime.* The Constituent Assembly suppressed nobility and forbade any one to bear its titles, emblems and arms. The Legislative Assembly eliminated, without indemnity, all feudal rights for which the original deed of concession could not be produced. The Convention entirely abolished all feudal rights. though it maintained, subject to redemption, those tenures and charges which were solely connected with landed property and not feudal.

Administrative Reorganization. — The Constituent Assembly gave to France a new administrative division, into departments, districts, cantons and communes; and this division, which mas intended to make the old provincial distinctions disappear, had to serve all purposes, the department being the unit for all public services. Apart from certain changes in detail, this settlement was definitive and exists to the present day. But there was a peculiar administrative organism depending on this arrangement. The constitution of 1791, it is true, made the king the titulary head of the executive power; but the internal administration of the kingdom was not actually in his hands. It was deputed, under his orders, to bodies elected in each department, district and commune. The municipal bodies were directly elected by citizens duly qualified; other bodies were chosen by the method of double election. Each body consisted of two parts: a council, for deliberative purposes, and a *bureau* or *directoire* chosen by the council from among its numbers to form the executive. These were the only instruments for the general administration and for that of the direct taxes. The king could, it is true, annul the illegal acts of these bodies, but not dismiss their members; he could merely suspend them from exercising their functions, but the matter then went before the Legislative Assembly, which could maintain or remit the suspension as it thought fit. The king had not a single agent chosen by himself for general administrative purposes. This was a reaction, though a very exaggerated one, against the excessive centralization of the *ancien re'gime,* and resulted in an absolute administrative anarchy. The organization of the revolutionary government partly restored the central authority; the councils of the departments were suppressed; the Committee of Public Safety and the "representatives of the people on mission" were able to remove and replace the members of the elected bodies; and also, by an ingenious arrangement, national agents were established in the districts. The constitution of the year III continued on these lines, simplifying the organization established by the Constituent Assembly, while maintaining its principle. The department had an administration of five members, elected as in the past. but having executive as well as deliberative functions. The district was suppressed. The communes retained only a municipal agent elected by themselves; the actual municipal body, the importance of which was considerably increased, was removed to the canton, and consisted of the municipal agents from each commune and a president elected by the duly qualified citizens of the canton. The Directory was represented in each departmental and communal administration by a commissary appointed and removable by itself and could dismiss the members of these administrations.

Judicial System.—The Constituent Assembly decided on the complete reorganization of the administration of justice. This was accomplished on a very simple plan, which realized that ideal of the two degrees of justice which we have noticed under the *ancien régime*. In the lower degrees it created in each canton a justice of the peace *(juge de paix)*, the idea and name of which were borrowed from England, but which differed very much from the English justice of the peace. He judged, both with and without appeal, civil cases of small importance; and, in cases which did not come within his competency, it mas his duty to try to reconcile the parties. In each district was established a civil court of five judges. For cases coming under the district court, the assembly had preserved the right of appeal in cases involving sums above a certain figure.

With regard to criminal prosecutions, there was in each department a court which judged crimes with the assistance of a jury; it consisted of judges borrowed from district courts and had its own president and public prosecutor. Correctional tribunals, composed of *juges de paix*, dealt with misdemeanours. The assembly preserved the commercial courts, or consular jurisdictions, of the *ancien re'gime*. There was a *tribunal de cassation*, the purpose of which was to preserve the unity of jurisprudence in France; it dealt with matters of law and not of fact, considering appeals based on the violation of law, whether in point of matter or of form, and if such violation were proved. sending the matter before another tribunal of the same rank for retrial. All judges were elected for a term of years. The Constituent Assembly required proof of professional qualifications from all judges except the *juges de paix*. But the system was really the same as that of the administrative organization. The king appointed the *commissaires du roi* attached to the district courts, criminal tribunals and the court of cassation but could not revoke an appointment once made. The Convention did not change this general organization; but it suppressed the professional guarantees required in the case of candidates for a judgeship, so that henceforth all citizens were eligible; and it also caused new elections to take place. Moreover, the Convention not infrequently removed and replaced judges without further election. The constitution of the year III preserved this system, but introduced one considerable modification. It suppressed the district courts and in their place created in each department a civil tribunal of 20 judges.

The Army.—The Constituent Assembly suppressed the militia and maintained the standing army, essentially according to the old type. The assembly proclaimed, however, the principle of compulsory and personal service, under the particular form of the national guard, to which all qualified citizens belonged and in which almost all ranks were conferred by election. This institution, with many successive modifications and long periods of inactivity, lasted till 1871. For purposes of war the Convention, in addition to voluntary enlistments and the resources furnished by the national guard and apart from the forced levy of 300,000 men in 1793, decided to call on the communes to furnish men, thus reviving the principle of the militia. The Directory's law of 6 Fructidor, year VI, established compulsory military service for all, under a strict form of conscription: Frenchmen aged from 20 to 25 *(de'fenseurs conscrits)* were divided into five classes, each including the men born in the same year, and were liable until they were 25 years old to be called up for active service, the whole period of service not exceeding four years; no class was called upon until the younger classes had been exhausted, and the sending of substitutes was forbidden. This law, with a few later modifications, provided for the French armies up to the end of the empire.

Taxation.—The Constituent Assembly abolished nearly all the taxes of the *ancien re'gime* except the stamp duty and that on the registration of acts (the old *contrôle* and *centième denier*). The customs were maintained only at the frontiers for foreign trade. One change was thought to be extremely important: imposts sanctioned by the sovereign power were now described as "contributions," to mark each citizen's desire to share in the state's expenditure. But this purely formal modification made no difference' to the way in which public liabilities were distributed. In the establishment of new taxes the assembly did away with indirect taxation on objects of consumption and made the principal direct tax the tax on land. Next in importance were the *contribution personnelle et mobilière* and the *patentes*, which, though considerably modified later, are still essentially the basis of the French system of direct taxation. Under the Directory there was a partial reappearance of indirect taxation in the *octrois* of the towns, which had been suppressed by the Constituent Assembly.

Religious Liberty.—The Constituent Assembly gave the Protestants liberty of worship and full rights; it also gave Jews the status of citizen and political rights. With regard to the Catholic Church, the assembly first abolished tithes and then nationalized the church lands, at the same time providing salaries for the clergy. Next it suppressed the religious orders, granting pensions to their former members. Finally, however, it enacted the civil constitution of the clergy, setting up an entirely new system for the organization of the church. Under this, the departments were taken as the chief regional units in the place of the old dioceses; and the bishops were elected by the electoral assembly of the department and the *cure's* by the electoral assembly of the district. This unfortunate piece of legislation, together with the civic oath imposed on the clergy, was a source of endless troubles. The constitutional church was, however, abolished as a state institution by the Convention. The laws of the years III and IV, in proclaiming the liberty of worship, declared that the republic neither endowed nor recognized any form of worship.

Civic and Criminal Law.—The assemblies of the Revolution, besides the laws which, by abolishing feudalism, altered the character of real property, passed many others concerning civil law. The most important are those of 1792, passed by the Legislative Assembly, which organized the registers of the *état civil* kept by the municipalities and laid down rules for marriage as a purely civil contract. Divorce was admitted to a practically unlimited extent; it was possible not only for causes determined by law and by mutual consent, but also for incompatibility of temper and character proved, by either husband or wife, to be of a persistent nature. Next came the laws of the Convention as to inheritance, imposing perfect equality among the natural heirs and endeavouring to ensure the division of properties. Illegitimate children were considered by these laws as on the same level with legitimate children. In criminal law their work was still more important. In 1791 the Constituent Assembly gave France its first penal code. It was inspired by humanitarian ideas, still admitting capital punishment, though accompanied by no cruelty in the execution; but none of the remaining punishments was for life. Long imprisonment with hard labour was introduced. Finally, as a reaction against the former system of arbitrary penalties, there came a system of fixed penalties determined. both as to its assessment and its nature, for each offense, which the judge could not modify. The Constituent Assembly also reformed the procedure of criminal trials and, taking English law as model, introduced the jury, with the double form of *jury d'accusation* and *jury de jugement*.

THE CONSULATE AND THE EMPIRE

The constitutional changes of the consulate and empire, though all, either in their full text or in principle, were submitted to popular vote by means of a *plébiscite,* had all the same object: to assure absolute poner to Napoleon, while preserving the forms and appearance of liberty. Popular suffrage became universal; but the citizens in effect merely nominated the candidates, and it was the senate which chose from among them the members of the various so-called elected bodies, even those of the political assemblies. According to the constitution of the year VIII, the first consul possessed the executive power in the widest sense of the word, and he alone could initiate legislation. There were three representative assemblies in existence. but one of them, the *corps législatif,* passed laws without discussing them and without the power of amending the suggestions of the government. The tribunate, on the contrary. discussed them, but its vote was not necessary for the passing of the law. The senate was the guardian and preserver of the constitution; its chief function was to annul laws and acts submitted to it by the tribunate as being unconstitutional. This original organization was naturally modified during the course of the consulate and the empire; and a whole body, the tribunate, which was the only one which could preserve some independence, disappeared, without resort to a plebiscite. The importance of another body, on the contrary, the *conseil d'e'tat,* which consisted of members appointed by Napoleon, continually increased. It was this body which really prepared and discussed the laws; and it was its members who advocated them before the *corps législatif,* to which the tribunate also sent orators to speak on its behalf. The ministers, who had no relation with the legislative power, were merely the agents of the head of the state, freely chosen by himself. Napoleon, however, found these powers insufficient and arrogated to himself others: thus he frequently declared war upon his own authority, in spite of the provisions to the contrary made by the constitution of the year VIII; and similarly, under the form of *dkcrets,* he made what were really laws. These were afterward called *décrets-lois,* and those that were not indissolubly associated with the political regime of the empire, and survived it, were subsequently declared valid by the court of cassation, on the ground that they had not been submitted to the senate as unconstitutional.

Administrative Changes. — The period saw the rise of a whole new series of great organic laws. For administrative organization, the most important was that of 28 Pluviôse, year VIII. It established as chief authority for each department a prefect, and side by side with him a *conseil général* for deliberative purposes; for each *arrondissement* (nearly corresponding to the old *district)* a subprefect (*sous-préfet*) and a *conseil d'arrondissement;* and for each *commune,* a mayor and a municipal council. But all these officials, both the members of the councils and the individual agents, were appointed by the head of the state or by the prefect, so that centralization was restored more completely than ever. Together with the prefect there was also established a *conseil de préfecture,* having administrative functions and generally acting as a court of the first instance in disputes and litigation arising out of the acts of the administration; for the Constituent Assembly had removed such cases from the jurisdiction of the civil tribunals and referred them to the administrative bodies themselves. The final appeal in these disputes was to the *conseil d'e'tat.* In 1807 was created another great administrative jurisdiction, the *cour des comptes,* after the pattern of the *chambre des comptes* of the *ancien régime.*

Judicial Changes. — Judicial organization had also been fundamentally altered. The system of election was preserved for a time in the case of the *juges de paix* and the members of the court of cassation, but finally disappeared there, even where it had already been no more than a form. The magistrates were in principle appointed for life, but under the empire a device was found for evading the rule of irremovability. For the judgment of civil cases there was a court of first instance in every *arrondzssement,* and above these a certain number of courts of appeal, each of which had within its province several departments. The separate criminal tribunals and the *jury d'accusation* were abolished in 1809 by the *Code d'Instruction Criminelle,* and the right of pronouncing the indictment was transferred to a chamber of the court of appeal. The correctional tribunals were amalgamated with the civil tribunals of the first instance. The *tribunal de cassation,* which took under the empire the name of *cour de cassation,* consisted of magistrates appointed for life and still kept its powers. The *ministère public* (consisting of imperial *avocats* and *procureurs)* was restored in practically the same form as under the *ancien régime.*

The former system of taxation was preserved in principle, but with one considerable addition: Napoleon re-established indirect taxation on articles of consumption, which had been abolished by the Constituent Assembly; the chief of these were the duties on liquor *(droits réunis,* or excise) and the monopoly of tobacco.

The Concordat. — The concordat concluded by Napoleon with the papacy on 26 Messidor, year IX, re-established the Catholic religion in France as the form of worship recognized and endowed by the state. It was in principle drawn up on the lines of that of 1516 and assured to the head of the French state in his dealings with the papacy the same prerogatives as had formerly been enjoyed by the kings; the chief of these was that he appointed the bishops, who afterward had to ask the pope for canonical institution. The territorial distribution of dioceses was preserved practically as it had been left by the civil constitution of the clergy. The state guaranteed the payment of salaries to bishops and *cure's;* and the pope agreed to renounce all claims referring to the appropriation of the goods of the clergy made by the Constituent Assembly. Later on, a decree restored to the *fabriques* (vestries) such of their former possessions as had not been alienated, and the churches which had not been alienated were restored for the purposes of worship. The law of 18 Germinal, year X, ratifying the concordat. reasserted, under the name of *articles organiques du culte catholique,* all the main principles contained in the old doctrine of the liberties of the Gallican Church. The concordat did not include the restoration of the religious orders and congregations; Napoleon sanctioned by decrees only a few establishments of this kind.

The University. — One important creation of the empire was the university. The Revolution had suppressed the old universities and the teaching congregations; the constitution of the year III had proclaimed liberty of instruction and commanded that public schools, both elementary and secondary, should be established; and the Directory had set up in each department an *école centrale,* in which all branches of human knowledge were taught. Napoleon, by laws and decrees of 1806, 1808 and 1811, founded the Université de France, which provided and organized higher, secondary and primary education; this was to be the monopoly of the state, carried on by its *facultés, lyckes* and primary schools. No private educational establishment could be opened without the authorization of the state.

The Codes. — Chief among the documents dating from this period are the codes, which are still in force in France. These are the *Code Civil* oi 1804, the *Code de Proce'dure Civile* of *1806.* the *Code de Commerce* of 1807, the *Code d'lnstrziction Criminelle* of 1809, and the *Code Pénal* of 1810. These monumental works, in the elaboration of which the *conseil d'e'tat* took the chief part, contributed, to a greater or less extent, toward the fusion of the old law of France with the laws of the Revolution. It was in the case of the *Code Civil* that this task presented the greatest difficulty *(see* CODE NAPOLÉON). The *Code de Commerce* was scarcely more than a revised and emended edition of the *ordonnances* of 1673 and 1681; while the *Code de Proce'dure Civile* borrowed its chief elements from the *ordonnance* of 1667. In the case of the *Code d'Instruction Criminelle* a distinctly new departure was made. While the procedure introduced by the Revolution into courts where judgment was given remained public and oral, with full liberty of defense. the preliminary procedure before the examining court *(juge d'instruction* or *chambre des mises en accusation)* was borrowed from the *ordonnance* of 1670; it was the procedure of the old law, without its cruelty, but secret and written, and generally not in the presence of both parties. The *Code Pénal* maintained the principles of the Revolution but increased the penalties. It substituted for the system of fixed penalties, in cases of temporary punishment, a maximum and a minimum, between the limits of which judges could assess the amount. Even in the case of misdemeanours, it admitted the system of extenuating circumstances, which allowed them still further to decrease and alter the penalty.

THE RESTORED MONARCHY

The Restoration and the monarchy of July, though separated by a revolution, form one period in the history of French institutions. It was a period of constitutional monarchy, with a parliamentary body consisting of two chambers, a system imitated from England. The revolution of 1830 took place in defense of the charter granted by Louis XVIII in 1814, which Charles X had violated by the *ordonnances* of July. The two chambers then acquired the initiative in legislation, which had not been recognized as theirs under the Restoration but from this time on belonged to them equally with the king. The sittings of the house of peers were henceforth held in public; but this chamber underwent another and more fundamental transformation. The peers were nominated by the king, with no limit of numbers, and according to the charter of 1814 their appointment could be either for life or hereditary. Under Louis XVIII, during the Restoration they were always appointed under the latter condition, but under the July monarchy their tenure of office was for life, and the king had to choose them from among 22 classes of notables fixed by law. The franchise for the election of the chamber of deputies had been limited by a system of money qualifications; but while, under the Restoration, it had been necessary, in order to be an elector, to pay 300 fr. in direct taxation, this sum was reduced in 1831 to 200 fr., while in certain cases even a smaller amount sufficed. In order to be elected as a deputy under the charter of 1814, it was necessary to pay 1,000 fr. in direct taxation; under that of 1830, only 500. From 1817 onward there was direct suffrage, the electors directly electing the deputies. The charter of 1814 had been framed to give the chief influence to the great landed proprietors; that of 1830 to give it to the middle and lower-middle classes.

In another respect also the Restoration and the July monarchy were at one, viz. in maintaining in principle the civil, legal and administrative institutions of the empire. The preface to the charter of 1814 sanctioned and guaranteed most of the legal rights won by the Revolution; even the alienation of national property was confirmed. Judicial and administrative organization, the system of taxation, military organization, the relations of church and state remained the same, and the university also continued to exist. The government did. it is true, negotiate a new concordat with the papacy in 1817, but did not dare even to submit it to the chambers. The most important reform was that of the law concerning recruiting for the army. The charter of 1814 had promised the abolition of conscription, in the form in which it had been created by the law of the year VI. The law of March 10, 1818, established a new system. The contingent voted by the chambers for annual incorporation into the standing army was divided up among all the cantons; and, in order to furnish it, lots were drawn among all the men of a certain class, that is to say, among the young Frenchmen who arrived at their majority that year. Those who were not chosen by lot were definitely set free from military service. The sending of substitutes, a custom which had been permitted by Napoleon, was recognized. This was the type of all the laws on recruiting in France up to 1867.

The Restoration produced a code, the *Code Forestier* of 1827, for the regulation of forests *(eaux et forêts)*. In 1816 a law had abolished divorce, making marriage indissoluble, as it had been in the old law. But the best laws of this period were those on finance. Now, for the first time, was introduced the practice of drawing up regular budgets, voted before the year to which they applied and divided since 1819 into the budget of expenditure and budget of receipts.

Together with other institutions of the empire, the Restoration had preserved the exaggerated system of administrative centralization established in the year VIII. It was only relaxed under the July monarchy. The municipal law of March 21, 1831, made the municipal councils elective and extended widely the right of voting in the elections for them; the *maires* and their assistants continued to be appointed by the government, but had to be chosen from among the members of the municipal councils. The law of June 22, 1833, made the general councils of the departments also elective and brought the *adjonction des capacités* into effect for their election. The powers of these bodies were enlarged in 1838, and they gained the right of electing their president. In 1833 was granted another liberty, that of primary education; but in spite of violent protestations, coming especially from the Catholics. secondary and higher education continued to be a monopoly of the state. A law of June 11, 1842, established the great railway lines. In 1832 the *Code Pénal* and *Code d'Instruction Criminelle* were revised, with the object of lightening penalties; the system of extenuating circumstances, as recognized by a jury, was extended to the judgment of all crimes. There was also a revision of Book III of the *Code de Commerce*, treating of bankruptcy. Finally, from this period date the laws of May 3, 1841, on expropriation for purposes of public utility, and of June 30, 1838, on the treatment of the insane. Judicial organization remained substantially unaltered.

THE SECOND REPUBLIC

From the point of view of constitutional law, the second republic and the second empire were each in a certain sense a return to the past. The former revived the tradition of the assemblies of the Revolution; the latter was obviously and avowedly an imitation of the consulate and the first empire.

Republican Constitution of 1848.—The provisional government set up by the revolution of Feb. 24, 1848. proclaimed universal suffrage, and by this means was elected a constituent assembly, which sat till May 1849 and passed the republican constitution of Nov. 4, 1848. This constitution gave the legislative power to a single permanent assembly, elected by direct universal suffrage and entirely renewed every three years. The executive authority, with very extensive powers, was given to a president of the republic, also elected by the universal and direct suffrage of the French citizens. On the other hand, the president was not immediately eligible for re-election on giving up his office. Now Louis Napoleon, who was elected president on Dec. 10, 1848, by a huge majority, wished to be re-elected. The result was the coup d'état of Dec. 2, 1851.

A detail of some constitutional importance is to be noticed in this period. The *conseil d'e'tat,* which had remained under the Restoration and the July monarchy an administrative council and the supreme arbiter in administrative trials, acquired new importance under the second republic. The ordinary *conseillers d'e'tat (en service ordinaire)* were elected by the legislative assembly, and consultation with the *conseil d'e'tat* was often insisted on by the constitution or by law. During its short existence the second republic produced many important laws. It abolished the penalty of death for political crimes and suppressed Negro slavery in the colonies. The election of *conseillers généraux* was thrown open to universal suffrage, and the municipal councils were allowed to elect the *maires* and their colleagues. The law of March 15, 1850, established the liberty of secondary education, but it conferred certain privileges on the Catholic clergy, a clear sign of the spirit of social conservatism which was the leading motive for its enactment. Certain humanitarian laws were passed, applying to the working classes.

Constitution of 1852.—With the coup d'état of Dec. 2, 1851, began a new era of constitutional plebiscites and disguised absolutism. The proclamations of Louis Napoleon on Dec. 2 contained a criticism of parliamentary government and formulated the wish to restore to France the constitutional institutions of the consulate and the empire. Napoleon asked the people for the powers necessary to draw up a constitution on these principles; the plebiscite issued in a vast majority of votes in his favour, and the constitution of Jan. 14. 1852, was the result. It bore a strong resemblance to the constitution of the first empire after 1807. The executive power was conferred on Louis Napoleon for ten years, with the title of president of the republic and very extended powers. Two assemblies were created. The conservative senate was charged with the task of opposing the promulgation of unconstitutional laws and of receiving the petitions of citizens; it had also the duty of providing everything not already provided but necessary for the proper working of the constitution. The second assembly was the *corps législatif,* which was elected by direct universal suffrage for six years and passed the laws, the government having the initiative in legislation. Its powers were very limited, and it could only discuss and put to the vote amendments approved by the *conseil d'e'tat;* the ministers did not in any way come into contact with it and could not be members of it, being responsible only to the head of the state, and only the senate having the right of accusing them before a high court of justice. The *conseil d'état* was composed in the same way and had the same authority as it had possessed from the year VIII to 1814; and it was the members of it who supported projected laws before the *corps ltgislatif.* To this was added a Draconian press legislation; press offenses were judged not by a jury but by the correctional tribunals: and political papers could not be founded without an authorization. They were subject to a regular administrative discipline and could be warned. suspended or suppressed without a trial by a simple act of the administration. The constitution of Jan. 1852 was still republican in name, though less so than that of the year VIII. The period corresponding with the consulate was also shorter in the case of Louis Napoleon. The year 1852 had not come to an end before a *senatus consulte,* that of Kov. 10, ratified by a plebiscite, re-established the imperial rank in favour of Napoleon III.

(J. P. E.; R. DT.)

THE SECOND EMPIRE

Numerous legislative reforms were introduced by the second empire, aiming at the development of commerce, industry and agriculture and the material prosperity of the country in general. Such were the decrees and laws of 1852 and 1853 relating to landbanks *(établissements de crédit foncier),* that of 1857 on trademarks, that of 1858 on general stores *(magasins généraux)* and warrants, those of 1863 and 1867 on commercial companies, that of 186; on cheques and that of 1866 on the mercantile marine. Economic treaties were also concluded by the emperor with foreign powers, the chief of these being concluded with Great Britain on Jan. 23, 1860. In another direction, the law of May 25. 1864, recognized for the first time the right of strikes among workmen and employees, while the superannuation fund *(caisses des retraites pour la vieillesse)* created by the law of June 18, 1850, was reorganized and perfected, and a law of July 11, 1868, established, under the guarantee of the state, two funds for voluntary insurance, one in case of death, the other against accidents occurring in industrial or agricultural employment.

Criminal law was the subject of important legislation. Thus the total loss of civil rights which hitherto accompanied condemnation to imprisonment for life was abolished in 1854, and in the same year transportation to the colonies was substituted for the system of convict prisons in France. The law of July 17, 1856, increased the power of independence of the *juges d'instruction,* and useful improvements were introduced by the laws of 1856 and 186j as regards precautionary detention and provisional release with or without bail. Finally a general revision of the *Code Pénal* took place in 1863.

In civil legislation may be noted the law of March 23, 1855, on mortgages; that of July 22, 1857, which abolished seizure of the person *(contrainte par corps)* for civil and commercial debts; and finally the law of July 14, 1866, on literary copyright.

The system of taxation was hardly modified at all, except for the establishment of a tax on the income from investments (shares and bonds of companies) in 1857 and a tax on carriages (1862). In Feb. 1868 an important military law was promulgated which asserted the principle of universal compulsory military service in time of war, but preserved the system of drawing lots to determine the annual contingent to be incorporated in the standing army. The term of service was fixed at five years, and it was still permissible to send a substitute. Able-bodied men who were not included in the annual contingent formed a reserve force, called the *Garde Nationale Mobile.*

The "Liberal Empire."—The constitution of 1852 underwent certain changes before the fall of the empire. Reforms of detail were made from 1860 onward and to a considerable extent transformed the character of the institutions affected. In the hope of disarming the liberal opposition, Napoleon III promulgated decrees that gave the *corps législatif* a larger share in the business of government: parliamentary debates were to be in public and uninhibited; ministers could be criticized; and more direct participation in voting the budget was conceded. The result was that in 1870 a ministry could be set up that was both collectively responsible and answerable to the parliament; the empire had, in fact, become a parliamentary regime.

THE THIRD REPUBLIC

The third republic had at first a provisional government set up by the people of Paris. But immediately after the capitulation of the capital and in order to treat with Germany, a national assembly was elected in accordance with the electoral law of 1849, which had been revived for the occasion with a few modifications, and met at Bordeaux on Feb. 13, 1871. Its majority was frankly monarchist, though divided as to the choice of a monarch, and pending a settlement of this question it ruled the country until 1875, with one man elected by it as head of the executive power. Louis Adolphe Thiers was the first to be elected in 1871; after his fall on May 24, 1873, he was succeeded by Marshal Patrice de MacMahon, on whom the assembly conferred, in November, the position of president of the republic for seven years when it was clearly no longer possible to restore the monarchy. However, the recognition of the republic by the assembly did not become definitive until Jan. 30, 1875, when an amendment was adopted providing for the election of an indefinite succession of presidents of the republic.

For the constitution of 1875 *see* the detailed account of its origin, of its provisions and of its modifications in the article *FRANCE: Hzstory: The Third Republic, to 1914.* Of the reforms of public law subsequently carried out, it is necessary here to mention only those of a really organic character, made to safeguard and to regulate the freedom of the individual. The law of June 30, 1881, modified by that of March 28, 1907, established the right of holding public meetings, whether for ordinary or for electoral purposes. without preliminary authorization; they were not to be held, however, in the public highway, but in an enclosed space. The law of July 29, 1881, on the press, as subsequently modified in 1882, 1889, 1895, 1908 and 1919, was one of the most liberal in the world. by it, all offenses committed by any kind of publication were submitted to a jury, and only slander, libel, defamation, incitement to crime and, in certain cases, the publication of false news, were punishable. The law of July 1, 1901, established the right of forming associations, the objects of which were not contrary to law or to public order or morality; on the condition of a simple declaration to the administrative authority, it granted them a civil status in a wide sense of the term. Religious congregations on the other hand, unless authorized by a law, were forbidden by this law.

The "Secular State."—A law passed in 1875 established the liberty of higher education; that of primary education was confirmed and reorganized by the law of Oct. 30, 1886, which simply deprived the clergy of the privileges granted them by the law of 1850, though the latter remained in force with regard to the liberty of secondary education. The law of March 22, 1882, made primary education obligatory, though it alloued parents to send their children either to private schools or to those of the state; the law of June 16, 1881, established secular *(laique)* education in the case of the latter. Secondary education was also organized for girls in *lycdes* or special colleges (*collèges* de *filles*). Finally, a law of July 10, 1896, dealing with higher education and the faculties of the state, reorganized the universities as distinct bodies enjoying a fairly wide autonomy.

A law of Dec. 19. 1905, abrogating that of 18 Germinal, year X, which had sanctioned Napoleon's concordat. proclaimed the separation of the church from the state. It is based on the principle of the secular state *(dtat lazque)* which recognizes no form of religion, though it respects the right of every citizen to worship according to his beliefs; and it aimed at organizing associations of citizens, the object of which was to collect the funds and acquire the property necessary for the maintenance of worship, under the form of *associations cultuelles,* differing in certain respects from the associations sanctioned by the law of July 1, 1901, and having a wider scope. It also handed over to these regularly formed associations the property of the ecclesiastical establishments formerly in existence. while taking precautions to ensure their proper application, and allowed the associations the free use of the churches and places of worship belonging to the state, the departments or the communes. If no *association cultuelle* was founded in a parish, the property of the former *fabrique* should devolve to the commune. But this lam, was condemned by the papacy, as contrary to the church hierarchy; and almost nowhere were *associatzons cultuelles* formed, except by Protestants and Jews. After many incidents but no church closures, a new law of Jan. 2, 1907, was enacted. It permitted the public exercise of any cult, by means of ordinary associations regulated by the law of July 1, 1901, and even of public meetings summoned by individuals. Failing all associations, either *cultuelles* or otherwise, churches, with their ornaments and furniture, were left to the disposition of the faithful and ministers for the purpose of exercising the religion; and, on certain conditions, the long use of them could be granted as a free gift to ministers of the religion.

Administrative Organization.—Among the organic laws concerning administrative affairs, that of Aug. 10, 1871, on the *conseils généraux,* considerably increased the powers and independence of these elective bodies, which subsequently became important deliberative assemblies; this law also created a new administrative organ for the departments, the *commission départementale* elected by the *conseil général* of the department and associated with the administration of the prefect. The municipal lam of April 5, 1884, effected a widespread decentralization; the *maires* and their adjoints were to be elected by the municipal council.

Military Service.—The war of 1870–71 had necessarily led to a modification of the military organization. The law of July 25, 1872, established the principle of compulsory service for all, first in the standing army, the period in which was fixed at five years, then in the reserve and finally in the territorial army. However, the system of conditional engagement for a year allowed young men for the purposes of study or apprenticeship to their professions to serve only a year with the active army. A new law of July 15, 1889, reduced the term of service in the active army to three years, while at the same time reducing the number of men liable for only one year's service. Later, the law of March 21, 1905, reduced the term of service in the active army to two years but made it equal for all, admitting of no exemption but allowing only certain facilities as to the age at which it had to be accomplished. In 1913, the chamber voted the return to the former term of service of three years; this was just being put into force when World War I broke out. After the war, the law of April 1, 1923, reduced the term in the active army to $1\frac{1}{2}$ years, and a law of July 14, 1927, completely reorganized the army for time of peace and for time of mar.

Judicial and Fiscal Systems.—In 1883 the judicial personnel was reorganized and reduced in number, and except for a few modifications the main lines of judicial organization remained the same until the law of Sept. 3, 1926, mhich, for purposes of economy, suppressed a large number of *tribunaux d'arrondissement.*

The system of taxation remained practically unaltered until 1914, with the exception of the financial law of 1901 which rearranged and increased the transfer fees and established a system of progressive taxation. A law of July 1j, 1914, created income tax; after the war, a tax on turnover and a tax on commercial and industrial profits were also imposed, while the rate of the taxes themselves and stamp duties were increased all around. In view of the rapid growth of fiscal legislation it was felt necessary to codify the various texts, which was done through a decree of Dec. 28. 1926.

Labour Legislation, to World War I.—Labour laws, which generally partook of the nature both of public and of private law, were very numerous under the third republic. The most notable of those passed before 1900 were the law of March 21, 1884, on professional syndicates, which introduced the liberty of association in matters of this kind before it became part of the common law; the law of Dec. 22, 1892, on conciliation and arbitration in the case of collective disputes between employers and workmen; that of June 29, 1893, on the hygiene and safeguarding of workers in industrial establishments, and the laws which regulate the work of children and women in factories; that of July 1j, 1893, on free medical attendance; and that of April 9, 1898, on the liability for accidents incurred during work, with those which have completed it. On Dec. 30, 1910, a *Code du Travail et de la Pre'voyance Sociale* was promulgated, codifying the previous legislation, dealing particularly with contracts for work, imposing special rules and regulations as to conditions of work, Sunday rest, precautions to be taken for the safety of workmen, industrial diseases, etc., and creating work inspectors. A law of June 21, 1924, added a new part to this code, reorganizing the long-standing system of *conseils de prud'hommes,* to which disputes between employers and workmen were to be referred.

Criminal Law.—As to criminal law, there were more than 50 enactments (mostly involving important modifications resulting from modern theories of penology), as a result of which it was almost entirely recast. For instance, separate systems were applied in cases of preventive detention and in those of imprisonment for short periods; liberation before the expiry of the term of sentence was introduced, subject to the condition that no fresh offense be committed within a given time; habitual offenders were transported to the colonies; the penalty was remitted in the case of first offenders; greater facilities were given for the rehabilitation of condemned persons; and the law of Dec. 8, 1897, made the examination before the *juge d'instruction* a real hearing on both sides, and the appearance of counsel for the defense practically compulsory.

Private Law.—As to private law, both civil and commercial, hundreds of laws were passed between 1871 and 1940 modifying it, sometimes profoundly. Among the more important there was the law of July 27, 1884, and those which re-established divorce, prohibited since 1816, but only permitted it for certain definite causes determined by law. On the other hand the law of Feb. 6, 1893, increased the liberty and independence of a woman who was simply judicially separated, in order to encourage separation as opposed to divorce, when the conditions allowed it. The law of March 25, 1896, on the succession of illegitimate children who were recognized by the parents, did not treat them in the same way as legitimate children but gave them the title of heirs in the succession of their father and mother together with much greater rights than they had hitherto possessed under the *Code Civil.* The law of July 24, 1899, on the protection of children who were ill-treated or morally neglected, also modified some of the provisions of the law as applied to the family with a view to greater justice and humanity. The formalities of marriage were simplified and marriage itself made easier through the laws of June 20, 1896, and July 1, 1914. The law of Dec. 30, 1915, made the legitimation of adulterine children possible; that of March 20, 1917, allowed women, who had hitherto been debarred from so doing, to act as guardians of infant children. Consent to marriage was facultative by the law of Feb. 28, 1922, and under the law of April 28, 1922, ceased to be required for parties above 25 years of age. The law of Aug. 10, 1927, codified the various dispositions concerning acquisition and loss of French nationality and permitted French women marrying foreigners to retain their nationality of origin instead of acquiring as heretofore that of their husbands.

Commercial Law.—The law as to cheques was altered by laws of Dec. 30, 1911, and Aug. 12, 1926; a law of July 4, 1914, completed that of July 10, 1885, on maritime mortgage. A law of March 18, 1919, created a commercial registry *(registre du commerce),* reinforcing the existing measures of publicity imposed on traders, and that of Aug. 25, 1919, created the *Office Nattonal du Commerce Extérieur.* Finally life-insurance companies were regulated and placed under strict supervision on the part of the state (law of March 17, 1905, as modified by that of May 21, 1921). (F. AL.; R. DT.)

Economic and Social Legislation, 1919–39.—The political and social upheavals that followed World War I caused a series of reforms to be enacted in the last years of the third republic. The increasing influence of Socialist parties and the trend toward state intervention in economic affairs and ton-ard a controlled economy induced the legislature to re-examine earlier measures on particular aspects of the questions involved with a view to establishing a general principle. This tendency was especially marked in the 1930s, under the combined stress of economic difficulties and of political pressure reacting against the threat of dictatorship; it was intensified from 1936 onward, in the iace of the epidemic of strikes and after the iormation of the Popular Front.

Great changes were made in social legislation. The law of March 11, 1932, reorganized the system of iamily allowances, which since 1920 had been eclectic and futile in its operation. Henceiorth all employers were obliged to subscribe to it, all workers with a family to support getting increased wages. Maternity allowances were added, to check the fall in the birth rate.

The iarthest-reaching changes were those made by the laws of 1936: the law of June 21 reduced the working week to 40 hours in all industrial and trading establishments; that of June 20 instituted yearly holidays with pay for all employees and workers, including domestic and agricultural wage earners; that of June 24 gave universal validity to the system of collective bargaining contracts; and that of Dec. 31, an especially forceful example of state intervention, prescribed how labour disputes had to be settled by arbitration, with representatives of the state taking part. The application of these laws, together with the increased activity oi the trade unions, was transforming the conditions of liie in France when World War II broke out. In 1940 the third republic mas overthrown. It must be remarked, however, that the democratic and representative character of the third republic had already been compromised for some years by the use of *décrets-lois* instead of the normal machinery for legislation.

THE "FRENCH STATE" AND THE PROVISIONAL GOVERNMENTS

Hardly had the armistice with Germany been signed when the republic itself was eliminated and Marshal Pétain, by what must be described as a coup d'état, secured a practical dictatorship for himself, which lasted throughout the four years of German occupation. The very name of "republic" was abandoned for that of "French state," which was vague enough to cover the absence of any definite regime. Supposed to be drawing up a constitution for the nation to ratify, Pétain instead merely issued from Vichy his 12 "constitutional acts," settling certain details and not constituting any real system of government. At the same time, being radically hostile to 19th-century liberal individualism and anxious moreover to win the adhesion of the working classes, the new regime gave signs of readiness to complete its predecessor's labour legislation by setting up a system oi co-operation, based on professional organizations, in the place of the old conflict of interests. This was the significance of the *Charte du Travail* of 1941.

The Vichy regime, however, was challenged from the outset by the rival system that set itself up in London in 1940 under the name of "Free French committee," later changed to "French national committee" (1941). This committee moved to Algiers in June 1943 and provided itself with a consultative assembly; then, being equipped with all the necessary organs, it took the style of "provisional government'of the republic" on June 3, 1944. Transferred to Paris on the liberation, it forthwith annulled Pétain's "constitutional acts" and proclaimed the lawful regime to be that of the third republic.

However, the revival of the constitution of 1875 was submitted to a referendum (Oct. 23, 1945), in which women were for the first time allowed to vote. This extension of the franchise, which raised the electorate to 25,000,000, was permanent. The result was against the revival of the old constitution, and a constituent assembly was elected to draw up a new document. Its proposals were likewise rejected in a new referendum (May 5, 1946), and a second such assembly was elected. An emended iorm of the previous draft was accepted in a referendum and promulgated on Oct. 27, 1946. This was the constitution of the fourth republic.

THE FOURTH REPUBLIC

The legislation of the fourth republic was even more markedly concerned with social questions than that of its predecessors had been. It put increased emphasis on the policy of maintaining a controlled economy, as was natural in a critical period and particularly so in view of the devaluation of the currency, which would otherwise have brought chaos into the wage-and-price structure It nationalized several private industries—banks, mines and the production of pas and of electricity. Finally it fixed the price of certain primary products, wheat, milk and beets. A corollary of this legislation was that the government should grant subsidies, give priority to exports and purchase surplus commodities irom producers (whose organizations occasionally brought pressure to bear with the threat of unrest.)

Labour legislation was completed with the fixing of minimum wages (which was in iact a means of fixing prices) and with the ruling that employees should be represented on the executive of all industrial and commercial undertakings (*ordonnance* of Feb. 22, 1945). (R. DT.)

THE FIFTH REPUBLIC

In May 1958 revolt broke out in Algeria, and France was threatened by civil war. On June 2 Gen Charles de Gaulle obtained full powers from the national assembly, restored calm and pushed through a new constitution under which the assembly could overthrow the government by a vote of censure, but only by an absolute majority of the members If such a motion were defeated, its sponsors could not introduce another at the same session The fifth republic constitution provided that French overseas territories could decide their own status *See* FRANCE; FRENCH COMMUNITY. (X)

FRENCH LICK, a resort town of Orange county, in southern Indiana, U S., 50 mi N. of Louisville. Ky. Natural resources and agricultural products include coal. sandstone mineral water, corn and livestock. A buffalo trail which passed the mineral springs in the present town was used by early travelers. including George Rogers Clark in 1786 Evidence indicates that he named the area French Lick for land by that name in Tennessee. In 1835 William A. Bomles built the first hctel and in 1857 he platted the tonn. Thomas Taggart (1856–1929), later chairman of the Democratic national committee, purchased the hotel in 1901. Through his efforts French Lick became a popular year-round health resort and convention centre. The resident population in the 1960s was about 2,000. (R. W. HA.)

FRENCH LITERATURE. Literature proper began to be cultivated in France, in the vernacular, during the 10th and 11th centuries. The earliest writings are *cantilenae,* or songs in the vulgar language (*e g.,* on St. Eulalia), a *Life of St. Leger* and a *Life of St. Alexis* (perhaps about 1050), but the first real monument of French literature is the *Chanson de Roland,* which remains the greatest achievement of that literature until the Renaissance. The *Chanson de Roland* is the masterpiece of a flourishing type of epic poetry, the *chansons de geste,* of which we possess about 100 specimens.

Chansons de Geste.—These deal with subjects of traditional French history. The line generally used is of 10 syllables, and in later poems of 12; there is a regular caesura. The lines are arranged in *laisses* or *tirades* of very irregular numbers. The earlier poems are assonanced, only the vowel sound of the last syllables being identical. Later the poems are rhymed in a regular manner. In subject matter there are three chief groups: one dealing with Charlemagne, one with Doon of Mayence, one with Garin de Monglane. There are other groups on the Lorrainers, on the crusades, etc.

The earliest versions alone of the various poems would amount to more than 300,000 lines. The successive development of the *chansons de geste* may be illustrated by the fortunes of *Huon de Bordeaux,* one of the most lively. varied and romantic of the older epics, and one which is interesting from the use made of it by Shakespeare, Wieland and R'eber. In the oldest form now extant, though even this is probably not the original, *Huon* consists of more than 10,000 lines. A subsequent version contains 11.000 more, and lastly, in the 14th century, a later poet amplified the legend to the extent of 30.000 lines. When this point had been reached *Huon* began to be turned into prose, being, with many of its fellows, published and republished during the subsequent centuries and retaining, in popular forms and garbs, the favour of the country districts. But the best period of the *chanson de geste* was the 11th and 12th centuries. The *Chanson de Roland* is the earliest we possess and belongs in its present form to the early 12th century. Two classes of persons are chiefly associated with the *chansons de geste.* There was the *trouvère,* who composed them, and the *jongleur,* who carried them about in manuscript or in his memory from castle to castle and sang them intermixing frequent appeals to his audience for silence, declarations of the novelty and the strict copyright character of the *chanson,* revilings of rival minstrels and frequent requests for money in plain words.

Not a few of the manuscripts that exist today appear to have been actually used by the *jongleurs.* But the names of the authors are known only in very few cases, the names of copyists, continuators and mere owners of manuscripts having often been mistaken for them.

The characters of a *chanson* of the older style are somewhat uniform. There is the hero who is unjustly suspected of guilt or sore beset by Saracens, the heroine nho falls in love with him, the traitor who accuses him or delays help. There are friendly paladins and the subordinate traitors. There is Charlemagne, in the later *chansoizs* an incapable and venal dotard, in the earlier still the great emperor; and with Charlemagne the Duke Naimes of Bavaria, invariably wise, brace, loyal and generous. In the *Chanson de Roland* the love interest does not appear at all except in the incident of Aude's death when she hears of Roland's fall. Even in the later *chansons* the love interest is very little marked. Fighting, counsels and religion hold the literary field. In a few *chansons* appears a very interesting class: the man of low birth or condition who rescues the high-born hero from his enemies. Thus, Rainvart in *Aliscans,* Gautier in *Gaydon*, Robastre in *Gaufrey,* etc. The subjects are handled with great uniformity and even monotony of style, with constant repetitions. But the verse is generally harmonious and often stately. Some passages rise to high poetry. The most remarkable of the *chansons* are *Roland, Aliscans, Gérard de Roussillon, Ami et Amile, Raoul de Cambrai, Garin le Loherain, Les Qzcatre Fils Aymon, Les Saisnes.* The series of *Le Chevalier au Cygne* deals with the first crusaders, and a remarkable group centres round William of Orange, dealing with the defense of the south of France against Mohammedan invasion.

Arthurian Romances. — The second class of early French epics consists of the Arthurian cycle, the *Matière de Bretagne,* the earliest-known compositions of which are at least a century junior to the earliest *chanson de geste* but which soon succeeded the *chansons* in popular favour and obtained a vogue both wider and far more enduring. It is not easy to conceive a greater contrast in form, style. subject and sentiment than is presented by the two classes. In both the religious sentiment is prominent, but the religion of the *chansons* is of the simplest, not to say of the most savage character. To pray to God and to kill his enemies constitutes the whole duty of man. In the romances the mystical element becomes on the contrary prominent and furnishes, in the Holy Grail, one of the most important features. In the Carlovingian knight the courtesy and clemency which we have learned to associate with chivalry are almost entirely absent. The *gentix ber* contradicts, jeers at and execrates his sovereign and his fellows with the utmost freedom. He thinks nothing of striking his *cartoise moullier* so that the blood runs down her *cler vis.* If a servant or even an equal offends him, he will throw the offender into the fire. knock his brains out or set his whiskers ablaze. The Arthurian knight is far more of the modern model in these respects. But his chief difference from his predecessor is undoubtedly in his amorous devotion to his beloved. who, if not morally superior to Bellicent, Floripas. Esclairmonde and the other Carlovingian heroines, is somewhat less forward. Even in minute details the difference is strongly marked. The romances are in octosyllabic couplets or in prose, and their language is different from that of the *chansons* and contains fewer of the usual epic repetitions and stock phrases. The earliest romances, the *Saint Graal,* the *Quite du Saint Graal, Joseph d'Arimathie* and *Merlin* bear the names of Walter Map and Robert de Borron. *Artus* and part at least of *Laizcelot du Lac* appear to be the work of unknown authors. *Tristan* came later and has a stronger mixture of Celtic tradition. At the same time as Walter Map, or a little later, Chrétien (or Chrestien) de Troyes turned the legends of the Round Table into octosyllabic verse of a singularly spirited and picturesque character. The chief poems attributed to him are the *Chevalier au Lyon* (Sir Ewain of Wales), the *Chevalier à la Charette* (one of the episodes of *Laizcelot)* and *Erec, Tristan* and *Percivale.* These poems, independently of their merit, which is great, had an extensive literary influence. They were translated by the German minnesingers Wolfram von Eschenbach, Gottfried of Strasbourg and others.

With the romances to which we have already referred, Chrétien's poems complete the earlier forms of the Arthurian story and supply the matter of it as it is best known to English readers in Sir Thomas Malory's book. Nor does that book, though far later than the original forms, convey a very false impression of the characteristics of the older romances. Indeed: the Arthurian knight. his character and adventures. are so much better known than the heroes of the Carlovingian *chansons* that there is less need to dwell upon them.

The romances had, as has been already pointed out, great influence upon their rivals, and their comparative fertility of invention, the much larger number of their *drainatis personae* and the greater variety of interests to which they appealed sufficiently explain their increased popularity. The ordinary attractions of poetry are also more largely present in them than in the *chansons;* there is more description, more life and less of the mere chronicle. They have been accused of relaxing morality, and there is perhaps some truth in the charge. But the change is after all one rather of manners than of morals, and what is lost in simplicity is gained in refinement and the beginnings of a sense of literary form.

Romances of Antiquity. — There is yet a third class of early narrative poems, differing from the two former in subject but agreeing, sometimes with one, sometimes with the other, in form. These are the classical romances — the *matière de* Rome — which are not much later than those of Charlemagne and Arthur. The chief subjects mere the conquests of Alexander and the siege of Troy, though other classical stories come in. The most remarkable of all is the romance of *Alixandre* by Lambert le Tort and Alexander of Bernay.

Alexander is made in many respects a prototype of Charlemagne. He is regularly knighted. he has 12 peers, he holds tournaments, he has relations with Arthur and comes in contact with fairies, he takes flights in the ai , dives in the sea and so forth. There is perhaps more avowed imagination in these classical stories than in either of the other divisions of French epic poetry. Some of their authors even confess to the practice of fiction. while the *trouvères* of the *chansons* invariably assert the historical character of their facts and personages.

The *chansoizs de geste* had shown the creative power and independent character of French literature. There is. at least about the earlier ones, nothing borrowed, traditional or scholarly. They smack of the soil, and they rank France among the very few countries which. in this matter of indigenous growth. have yielded more than folk songs and fireside tales. The Arthurian romances. less independent in origin, exhibit a wider range of view, a greater knowledge of human nature and a more extensive command of the sources of poetical and romantic interest. The classical epics superadd the only ingredient necessary to an accomplished literature; *i.e.,* the knowledge of what has been done by other peoples and other literatures already, and the readiness to take advantage of the materials thus supplied.

Romans **d'Aventures.**—There remain to be mentioned a considerable number of narrative poems, written after the 13th century, which cannot be brought into any one of the three previous categories. As literary taste spread, *romans* were written about any possible subject, and in many various forms. Thus *Guillaume de Palerme* deals with the adventures of a Sicilian prince who is befriended by a werewolf; *Le Roman de l'escoufle* with a heroine whose ring is carried off by a sparrow hawk; *Guy of Warwick, Meraugis de Portlèguez, Cléomadès, Partenopeu de Blois* and *Floire et Blanchefleur* are among the best known. To this category may be added a number of early romances and fictions in prose. *Aucassin ef Nicolette* (13th century) is written partly in prose and partly in verse and is called a *chantefable.*

Such was the literature produced for the enjoyment of the higher classes from the 11th to the 13th century. The habit of private wars and of insurrection against the sovereign supply the motives of the *chanson de geste,* the love of gallantry, adventure and foreign travel those of the romances, Arthurian and miscellaneous. On the other hand, the gradual spread of learning, inaccurate and ill-digested perhaps, but still learning, not only opened up new classes of subjects but opened them to new classes of persons. The thousands of students who flocked to the schools of Paris nere not all princes or nobles.

Hence there arose two new classes of literature. The first consisted of the embodiment of learning of one kind or other in the vulgar tongue. The other, one of the most remarkable developments of sportive literature which the world has seen, produced the second indigenous literary growth of which France can boast, namely, the fabliaux. and the almost more remarkable work which is an immense conglomerate of fabliaux, the great beast epic of the *Roman de Renart*.

Fabliaux.—There are few literary products which have more originality and at the same time more diversity than the fabliau. The epic and the drama, even when they are independently produced, are similar in their main characteristics all the world over. But there is nothing in previous literature which exactly corresponds to the fabliau. The story is the first thing, the moral the second. and the latter is never suffered to interfere with the former. These observations apply only to the fabliaux, properly so called, but the term has been used with considerable looseness. The collectors of those interesting pieces, *Barbazan, Méon, Le Grand d'Aussy*, have included in their collections large numbers of miscellaneous pieces such as *dits* (rhymed descriptions of various objects, the most famous known author of which was Baudouin de Condé, 13th century) and *débats* (discussions between two persons or contrasts of the attributes of two things), sometimes even short romances, farces and mystery plays. Not that the fable proper—the prose classical beast story of Aesop—was neglected.

Marie de France—the poet to be mentioned again for her more strictly poetical work—is the most literary of not a few writers who composed what were often, after the mysterious original poet, named *Ysopets*. Aesop, Phaedrus, Babrius were translated and imitated in Latin and in the vernacular by this class of writer, and some of the best known of "fablers" date from this time. The fabliau, on the other hand, according to the best definition of it yet achieved, is "the recital, generally comic, of a real or possible incident occurring in ordinary human life." The comedy, it may be added, is usually of a satiric kind, and occupies itself with every class and rank of men, from the king to the villein. There is no limit to the variety of these lively verse tales, which are invariably written in eight-syllabled couplets. Now the subject is the misadventure of two Englishmen, whose ignorance of the French language makes them confuse donkey and lamb; now it is the fortunes of an exceedingly foolish knight, who has an amiable and ingenious mother-in-law; now the deserved sufferings of an avaricious or ill-behaved priest; now the bringing of an ungrateful son to a better mind by the wisdom of babes and sucklings.

Not a few of the *Canterbury Tales* are taken directly from fabliaux; indeed, Chaucer, with the possible exception of Matthew Prior, is the nearest approach to a fabliau writer in England. At the other end of Europe the prose novels of Boccaccio and other Italian tale tellers are largely based upon fabliaux. But their influence in their own country was the greatest. They were the first expression of the spirit which thereafter animated the most national and popular developments of French literature. Simple and unpretending as they are in form, the fabliaux announce not merely the *Cent nouvelles nouvelles* and the *Heptameron, L'Avocat Patelin* and *Pantagruel*, but also *L'Avare* and the *Roman comique, Gil Blas* and *Candide*. They indeed do more than merely prophesy the spirit of these great performances—they directly lead to them. The prose tale and the farce are the direct outcomes of the fabliau, and the prose tale and the farce once given, the novel and the comedy inevitably follow.

The special period of fabliau composition appears to have been the 12th and 13th centuries. It signifies on the one side the growth of a lighter and more sportive spirit than had yet prevailed, on another the rise in importance of other and lower orders of men than the priest and the noble, on yet another the consciousness on the part of these lower-orders of the defects of the two privileged classes and of the shortcomings of the system of polity under which these privileged classes enjoyed their privileges. There is, however, in the fabliau proper not so very much of direct satire, this being indeed excluded by the definition given above and by the thoroughly artistic spirit in which that definition is observed. The fabliaux are so numerous and so various that it is difficult to select any as specially representative. We may, however, mention, both as good examples and as interesting from their subsequent history, *Le Vair palefroi*, treated in English by Leigh Hunt and by T. L. Peacock; *Le Vilain Mire*, the original consciously or unconsciously followed in *Le Médecin malgré lui; Le Roi d'Angleterre et le jongleur d'Eli; La Houce partie; Le Sot chevalier*, an indecorous but extremely amusing story; *Les Deux bordeors ribaus*, a dialogue between two *jongleurs* of great literary interest, containing allusions to the *chansons de geste* and romances most in vogue; and *Le Vilain qui conquist paradis par plait*.

Roman de **Renart.**—If the fabliaux are not remarkable for direct satire, that element is supplied in more than compensating quantity by an extraordinary composition which is closely related to them. *Le Roman de Renart*, or *History of Reynard the Fox*, is a poem, or rather series of poems, which. from the end of the 12th century to the middle of the 14th, served the citizen poets of northern France not merely as an outlet for literary expression but also as a vehicle of satirical comment—now on the general vices and weaknesses of humanity, now on the usual corruptions in church and state, now on the various historical events which occupied public attention from time to time. The enormous popularity of the subject is shown by the long vogue which it had and by the empire which it exercised over generations of nriters who differed from each other widely in style and temper. Nothing can be further from the allegorical erudition, the political diatribes and the sermonizing moralities of the authors of *Renart le contrefait* than the sly naïveté of the writers of the earlier branches. Yet these and a long and unknown series of intermediate bards the fox-king pressed into his service, and it is scarcely too much to say that, during the tno centuries of his reign, there was hardly a thought in the popular mind which, as it rose to the surface. did not find expression in an addition to the huge cycle of *Renart*.

The French poems which we possess on the subject amount in all to nearly 100 000 lines, independently of mere variations but including the different versions of *Renart le contrefait*. The separate branches are the work of different authors, hardly any of whom are known, and. but for their community of subject and to some extent of treatment, might be regarded as separate poems. The history of Renart, his victories over Isengrim the wolf Bruin the bear and his other unfortunate rivals. his family affection. his outwittings of King Noble the Lion and all the rest are nell knonn. It is perhaps in the subsequent poems, though they are far less known and much less amusing, that the hold which the idea of Renart had obtained on the mind of northern France, and the ingenious uses to which it was put, are best shown. The first of these is *Le Couronnement de Renart*, a poem of betneen 3,000 and 4,000 lines, attributed, on no grounds whatever. to the poet Marie de France, and describing how the hero by his ingenuity got himself crowned king. This poem already shows signs of direct moral application and generalizing. These are still more apparent in *Renart le nouvel*, a composition of about 8.000 lines, finished in the year 1288 by the Fleming Jacquemart Gelée. Here the personification, of which, in noticing the *Rornun de la rose*, we shall soon have to give extended mention, becomes evident. Instead of or at least besides the lively personal Renart who used to steal sausages. set Isengrim fishing with his tail or make use of Chanticleer's comb for a purpose for which it was certainly never intended, we have *Reaardie*, an abstraction of guile and hypocrisy, triumphantly prevailing over other and better qualities. Lastly, as the *Roman de la rose* of Guillaume de Lorris is paralleled by *Renart le nouvel*, so its continuation by Jean de Meung is paralleled by the great miscellany of *Renart le contrefait*, which, even in its existing versions, extends to fully 50,000 lines. Here me have, besides floods of miscellaneous erudition and discourse, political argument of the most direct and important kind. The wrongs of the lower orders are bitterly urged.

Early Lyrics.—The song literature of mediaeval France is extremely abundant and beautiful. From the 12th century to the 15th it received constant accessions, some signed, some anonymous, some purely popular in their character, some the work of more learned writers, others again produced by members of the aristocracy. Of the latter class it may fairly be said that the catalogue of royal and noble authors boasts few if any names superior to those of Thibaut de Champagne, king of Navarre at the beginning of the 13th century, and Charles d'Orléans. the father of Louis XII, at the beginning of the 15th. Although much of this lyric poetry is anonymous, the most popular part of it almost entirely so, yet we are able to enumerate hundreds of French *ckansonniers* between the 11th century and the 13th.

The earliest song literature is mainly sentimental in character. The collectors divide it under the two heads of romances and *pastourelles,* the former being usually the celebration of the loves of a noble knight and maiden and recounting how Belle Doette or Eglantine or Oriour sat at her windows or in the tourney gallery, or embroidering silk and samite in her chamber, with her thoughts on Gerard or Guy or Henry, the latter somewhat monotonous but nai've and often picturesque recitals, very often in the first person, of the meeting of an errant knight or minstrel with a shepherdess and his cavalier but not always successful wooing. With these, some of which date from the 12th century, may be contrasted, at the other end of the mediaeval period, the more varied and popular collection dating in their present form from the 15th century and published in 1875 by Gaston Paris. In both alike, making allowance for the difference of their age and the state of the language, may be noticed a charming lyrical faculty and great skill in the elaboration of light and suitable metres. Especially remarkable is the abundance of refrains of an admirably melodious kind. It is said that more than 500 of these exist.

Among the lyric writers of these four centuries whose names are known may be mentioned Audefroi le Bastard (12th century), the author of the charming song of *Belle Idoine* and others no way inferior, Quesnes de Béthune, the ancestor of Sully. whose song writing inclines to a satirical cast in many instances, the vidame de Chartres, Charles d'Anjou, King John of Brienne, the châtelain de Coucy, Gace Buslé and Colin Muset; while not a few writers mentioned elsewhere—Guyot de Provins, Adam de la Hale. Jean Bodel and others—were also lyrists. But none of them, except perhaps Audefroi, can compare with Thibaut IV (1201–53), nho by his possessions and ancestry had a connection with the north and the south and who employed the methods of both districts but used the language of the north only. Thibaut was supposed to be the lover of Blanche of Castille, the mother of St. Louis, and a great deal of his verse is concerned with his love for her. But while knights and nobles were thus employing lyric poetry in courtly and sentimental verse, lyric forms were being freely employed by others, of both high and low birth, for more general purposes. Blanche and Thibaut themselves came in for contemporary lampoons, and both at this time and in the times immediately following a number of writers composed light verse, sometimes of a lyric, sometimes of a narrative kind, and sometimes in a mixture of both. By far the most remarkable of these is Rutebeuf (*q.v.*).

Rutebeuf is among the earliest French writers who tell us their personal history and make personal appeals. But he does not confine himself to these. He discusses the history of his times, he composes pious poetry too, and in at least one poem takes care to distinguish between the church which he venerates and the corrupt churchmen whom he lampoons. Besides Rutebeuf the most characteristic figure of his class and time (about the middle of the 13th century) is Adam de la Hale, commonly called the Hunchback of Arras. The earlier poems of Adam are of a sentimental character, the later ones satirical and somewhat ill-tempered; such, for instance, is his invective against his native city. But his chief importance consists in his *jeux,* the *Jeu de la feuillée,* the *Jeu de Robin et Marion,* dramatic compositions which led the way to the regular dramatic form. Indeed the general tendency of the 13th century is to satire, fable and farce even more than to serious or sentimental poetry. We should perhaps except the *lais,* the chief of which are known under the name of Marie de France. These *lais* are exclusively Breton in origin, though not in application, and the term seems originally to have had reference rather to the music to which they were sung than to the manner or matter of the pieces.

The subjects of the *lais* are indifferently taken from the Arthurian cycle, from ancient story and from popular tradition, and, at any rate in Marie's hands, they give occasion for some passionate and in the modern sense really romantic poetry. The most famous of all is the *Lay of the Honeysuckle,* traditionally assigned to Sir Tristram.

Roman de la Rose.—A work of very different importance from all these, though with seeming touches of the same spirit, a work which deserves to take rank among the most important of the middle ages, is the *Roman de la rose.* The author of the earlier part was Guillaume de Lorris, who lived in the first half of the 13th century; the author of the later part was Jean de Meung, who mas born about the middle of that century and whose part in the *Roman* dates at least from its extreme end. This great poem exhibits in its two parts very different characteristics which yet go to make up a not inharmonious nhole. It is a love poem, and yet it is satire. But both gallantry and raillery are treated in an entirely allegorical spirit. The lover meets all sorts of obstacles in his pursuit of the rose. though he has for a guide the metaphorical personage Bel-Accueil. The early part, which belongs to Guillaume de Lorris, is remarkable for lts gracious and fanciful descriptions. Forty years after Lorris's death, Jean de Meung completed it in an entirely different spirit. He keeps the allegorical form, and indeed introduces two new personages of importance, Nature and Faux-semblant. In the mouths of these personages and of another, Raison, he puts the most extraordinary mixture of erudition and satire. At one time we have the history of classical heroes, at another theories against the hoarding of money, about astronomy, about the duty of mankind to increase and multiply. Accounts of the origin of loyalty, nhich would have cost the poet his bead at some periods of history, and even communistic ideas, are also to be found here. In Faux-semblant we have a real creation of the theatrical hypocrite. All this miscellaneous and apparently incongruous material in fact explains the success of the poem. There are to be found in the *Roman de la rose* the characteristics of the later middle age, its gallantry, its mysticism, its economic and social troubles and problems, its scholastic methods of thought. its naive acceptance as science of everything that is written and at the same time its shrewd and embracing criticism of much that the age of criticism has accepted without doubt or question. The *Roman de la rose,* as might be supposed, set the example of an immense literature of allegorical poetry, which flourished more and more until the Renaissance.

Satiric and Didactic Work. — Direct satire began early in the 13th century with Guyot de Provins and Hugues de Brégy. Travesties of the romances of chivalry were written in which the chief heroes and situations were mercilessly parodied. The disputes of Philippe le Bel with the pope and the Templars had an immense literary influence. partly in the concluding portions of the *Renart,* partly in the *Roman de la rose* and partly in other satiric allegories of which the chief is the romance of *Fauvel,* attributed to François de Rues. The hero of this is an allegorical personage, half man and half horse, signifying the union of bestial degradation with human ingenuity and cunning. Fauvel (the name, it may be worth while to recall, occurs in Langland) is a divinity in his may. All the personages of state, from kings and popes to mendicant friars, pay their court to him. The abuse of usury at the time, and the exactions of the Jews and Lombards, were severely felt, and Money itself, as personified, figures largely in the popular literature.

An example of early didactic verse is the *Bestiary* of Philippe de Thaun. a Norman *trouvkre* who lived and wrote in England during the reign of Henry Beauclerc. Besides the *Bestiary,* which from its dedication to Queen Adela has been conjectured to belong to the third decade of the 12th century, Philippe wrote also in French a *Liber de creaturis,* both works being translated from the Latin. These works of mystical and apocryphal physics and zoology became extremely popular in the succeeding centuries and were frequently imitated. A moralizing turn was also given to them, which was much helped by the importation of several miscellanies of oriental origin, partly tales, partly didactic in character, the most celebrated of which is the *Roman des sept sages,* which, under that title and the variant of *Dolopathos,* received repeated treatment from French writers both in prose and verse. Art, too, soon demanded exposition in verse, as well as science. The favourite pastime of the chase was repeatedly dealt nith, notably in the *Roi Modus* (1325), mixed prose and verse; the *Déduits de la chasse* (1387) of Gaston de Foix, prose; and the *Trésor de vénerie* of Jean Hardouin (1394), verse.

Very soon didactic verse extended itself to all the arts and sciences. Vegetius and his military precepts had found a home in French octosyllables as early as the 12th century; the end of the same age saw the ceremonies of knighthood solemnly versified, and *napes* (maps) *du monde* also soon appeared. In 1245 Gautier of Metz translated from various Latin works into French verse a sort of encyclopaedia, while another incongruous work, known as *L'Image du monde,* exists from the same century. Profane knowledge was not the only subject which occupied didactic poets at this time. Religious handbooks and commentaries on the Scriptures were common in the 13th and following centuries. and, under the titles of *castoiements, enseignements* and *doctrinaux,* moral treatises became common. The most famous of these. the *Castoiement d'un père à sons fils,* falls under the class of works attributable to oriental influence, being derived from the Indian *Panchatantra.*

In the 14th century the influence of the *Roman de la rose* helped to render moral verse common and popular. The same century, moreover, which witnessed these developments of well intentioned if not always judicious erudition witnessed also a considerable change in lyrical poetry. Hitherto such poetry had chiefly been composed in the melodious but unconstrained forms of the romance and the *pastozirelle.* In the 14th century the writers of northern France subjected themselves to severer rules. In this age arose the forms which for so long a time were to occupy French singers — the ballade, the rondeau. the rondel, the triolet, the *chant royal* and others. These received considerable alterations as time went on. We possess not a few *Artes poeticae,* such as that of Eustache Deschamps at the end of the 14th century and that of Thomas Sibilet in the 16th. giving particulars of them, and these particulars show considerable changes. The earliest poets who appear to have practised them extensively nere born at the close of the 13th century and the beginning of the 14th. Of these, Guillaume de Machault (*c.* 1300–80) is the oldest. He left about 80.000 verses. Eustache Deschamps (*c.* 1340–*c.* 1410) was nearly as prolific. Jean Froissart the historian (1338–1410?) was also an agreeable and prolific poet. Less known but not less noteworthy, and perhaps the earliest of all. is Jehannot de Lescurel, whose personality is obscure and most of whose works are lost but whose fragments are full of grace. Froissart appears to have had many countrymen in Hainaut and Brabant who devoted themselves to the art of versification; and the *Livre des cent ballades* of Jean Boucicault (*c.* 1366–1421) and his friends — c. 1390 — shows that the French gentleman of the 14th century was as apt at the ballade as his Elizabethan peer in England was at the sonnet.

Beginnings of Drama. — The mysteries (subjects taken from the sacred writings) and miracle plays (subjects taken from the legends of the Saints and the Virgin) are of very early date. The mystery of the *Foolish Virgins* (partly French, partly Latin), that of *Adam* and perhaps that of *Daniel* are of the 12th century, though the work of unknown authors. Jean Bodel and Ruteheuf, already mentioned, gave, the one that of *Saint Nicolas* at the confines of the 12th and 13th, the other that of *Théophile* later in the 13th itself. But the later moralities, *soties* and farces seem to be also in part a very probable development of the simpler and earlier forms of the fabliau and of the *tenson* or *jeu parti,* a poem in simple dialogue. Of the *jeux partis* there are many examples, varying from very simple questions and answers to something like regular dramatic dialogue; even short romances, such as *Aucassin et Nicolette,* were easily susceptible of dramatization. But the *Jeu de la feuillie* (or *feuillée*) of Adam de la Hale seems to be the earliest piece. profane in subject, containing something more than mere dialogue. The poet has not indeed gone far for his subject. for he brings in his own wife, father and friends, the interest being complicated by the introduction of stock characters (the doctor, the monk, the fool) and of certain fairies — personages already popular from the later romances of chivalry. Another piece of Adam's the *Jeu de Robin et Marion,* also already alluded to, is little more than a simple throwing into action of an ordinary *pastourelle* with a considerable number of songs to music. Nevertheless later criticism has seen, and not unreasonably, in these two pieces the origin in the one case of farce, and thus indirectly of comedy proper, in the other of comic opera.

For a long time, however, the mystery and miracle plays remained the mainstay of theatrical performance, and until the 13th century actors as well as performers were more or less taken from the clergy. It has, indeed. been well pointed out that the offices of the church were themselves dramatic performances and required little more than development at the hands of the mystery writers. The occasional festive outbursts, such as the Feast of Fools, that of the Boy Bishop and the rest, helped in the development. The variety of mysteries and miracles was very great. A single manuscript contains 40 miracles of the Virgin, averaging from 1,200 to 1,500 lines each, written in octosyllabic couplets, and at least as old as the 14th century, most of them perhaps much earlier.

The mysteries proper, or plays taken from the Scriptures, are older still. Many of these are exceedingly long. There is a *Mystère de l'Ancien Testament* which must have taken weeks to act in its entirety. The *Mystère de la Passion,* though not quite so long, took several days and recounts the whole history of the Gospels. The best apparently of the authors of these pieces, which are mostly anonymous, were two brothers, Arnoul and Simon Gréban (authors of the *Actes des apôtres,* and in the first case of the *Passion), c.* 1450; and a certain Jean Michel (d. 1493) is credited with having continued the *Passion* from 30 000 lines to 50 000. But these performances. though they held their ground until the middle of the 16th century and extended their range of subject from sacred to profane history — legendary as in the *Destruction de Troie,* contemporary as in the *Siège d'Orléans* — were soon rivalled by the more profane performances of the moralities, the farces and the *soties.* The palmy time of all these three kinds is the 15th century, while the Confrérie de la Passion itself, the special performers of the sacred drama, obtained the licence constituting it only by an ordinance of Charles VI in 1402. In order to take in the whole of the mediaeval theatre at a glance. however, we may anticipate a little. The Confraternity was not itself the author or performer of the profaner kind of dramatic performance. This latter was the work of two other bodies, the clerks of the Bazoche and the Enfants sans Souci. As the Confraternity was chiefly composed of tradesmen and persons very similar to Peter Quince and his associates, so the clerks of the Bazoche were members of the legal profession of Paris, and the Enfants sans Souci were mostly young men of family. The morality was the special property of the first. the *sotie* of the second. But as the moralities were sometimes decidedly tedious plays, and by no means brief, they were varied by the introduction of farces, of nhich the *peux* already mentioned nere the early germ and of which *L'Avocat Patelin,* dated by some about 14€j and certainly about 200 years subsequent to Adam de la Hale, is the most famous example.

The morality was the natural result on the stage of the immense literary popularity of allegory in the *Roman de la rose* and its imitations. The *sotie* was directly satirical and assumed the guise of folly only as a stalking horse for shooting wit. It was more Aristophanic than any other modern form of comedy and, like its predecessor, it perished as a result of its political application. Encouraged for a moment as a political engine at the beginning of the 16th century, it was soon absolutely forbidden and put down and had to give place in one direction to the lampoon and the prose pamphlet, in another to forms of comic satire more general and vague in their scope.

The farce, on the other hand, having neither moral purpose nor political intention, was a purer work of art, enjoyed a wider range of subject and was in no danger of any permanent extinction. Farcical interludes were interpolated in the mysteries themselves: short farces introduced and rendered palatable the moralities, and the *sotie* was itself but a variety of farce; all the kinds were sometimes combined in a sort of tetralogy. It was a short composition, 500 verses being considered sufficient, whereas the morality might run to at least 1,000 verses, the miracle play to nearly double that number and the mystery to 40.000 or 50,000.

Of the pieces represented, one only, that of *Maître Patelin,* is now much known; but many are almost equally amusing. *Patelin* itself has an immense number of versions and editions. Other farces are too numerous to attempt to classify; they bear, however, in their subjects as in their manner, a remarkable resemblance to the fabliaux, their source. Conjugal disagreements, the unpleasantness of mothers-in-law, the shifty or, in the earlier stages, clumsy valet and chambermaid, the mishaps of too loosely given ecclesiastics, the abuses of relics and pardons, the extortion, violence and sometimes cowardice of the seigneur and the soldiery, the corruption of justice, its delays and its pompous apparatus, supply the subjects. The treatment is rather narrative than dramatic in most cases, as might be expected, but makes up by the liveliness of the dialogue for the deficiency of elaborately planned action and interest. All these forms, it will be observed, are directly or indirectly comic.

Tragedy in the middle ages is represented only by the religious drama, except for a brief period toward the decline of that form when the "profane" mysteries referred to above came to be represented. These were, however, rather "histories," in the Elizabethan sense, than tragedies proper.

History. — For a time the French chroniclers contented themselves with Latin prose or with French verse, after the fashion of Robert Wace and the Belgian Philippe Mousket (1215–83). These, after a fashion universal in mediaeval times, began from fabulous or merely literary origins; and just as Andrew of Wyntoun later carries back the history of Scotland to the terrestrial paradise, so does Mousket start that of France from the rape of Helen. But soon prose chronicles, first translated, then original, became common. Then came French selections and versions from the great series of historical compositions undertaken by the monks of St. Denys, the so-called *Grandes chroniques de France* from the date of 1274, when they first took form in the hands of a monk styled Primat, to the reign of Charles V, when they assumed the title just given. But the first really remarkable author who used French prose as a vehicle of historical expression is Geoffroy de Villehardouin, marshal of Champagne, who was born about the middle of the 12th century and died in Greece in 1213. Under the title of *Conquête de Constantinople* Villehardouin has left a history of the fourth crusade. The *Conquête de Constantinople* has been well called a *chanson de geste* in prose, and indeed in the surprising nature of the feats it celebrates, in the abundance of detail and in the vivid and picturesque poetry of the narration it equals the very best of the *chansons.* But it is now felt that Villehardouin was putting up a specious plea for one of the worst misdeeds of the middle ages, the wrecking of the Byzantine empire, and he was one of the chief criminals.

The rhymed chronicles of Philippe Mousket and Guillaume Guiart belong to the next half-century; and in prose the most remarkable works are the *Chronique de Reims,* a well-written history having the interesting characteristic of taking the lay and popular side, and the great compilation edited (in the modem sense) by Baudouin d'Avesnes (1213–89). Jean Joinville (1224?–1317), whose special subject is the life of St. Louis, is shrewd, practical, has political ideas and antiquarian curiosity, and his descriptions are often very creditable pieces of deliberate literature.

What Villehardouin is to the 12th and Joinville to the 13th century, so Froissart is to the 14th. His picture is the most famous as it is the most varied of the three, but it has special drawbacks as well as special merits. Society is still to him all knights and ladies, tournaments, skirmishes and feasts. He depicts these, not like Joinville, still less like Villehardouin, as a sharer in them, but with the facile and picturesque pen of a sympathizing literary onlooker. As the comparison of the *Conquête de Constantinople* with a *chanson de geste* is inevitable, so is that of Froissart's *Chronique* with a *roman d'aventure.*

Poetry in the 15th Century. — Christine de Pisan (1364–c. 1430) was the daughter of an Italian astrologer who was patronized by Charles V. She was born in Italy but brought up in France, and she enriched the literature of her adopted country with much learning, good sense and patriotism. She wrote history, devotional works and poetry; and though her literary merit is not of the highest, it is very far from despicable. Alain Chartier (*c.* 1385–*c.* 1430), best known to modern readers by the story of *Margaret of Scotland's Kiss,* was a writer of somewhat similar character.

A very different person is Charles d'Orléans (1394–1465), one of the greatest of *grands seigneurs,* for he was the father of a king of France and heir to the duchies of Orléans and Milan. Charles was an admirable poet. He is the best-known and perhaps the best writer of the graceful poems in which an artificial versification is strictly observed and helps by its recurrent lines and modulated rhymes to give to poetry something of a musical accompaniment even without the addition of music properly so called. His ballades are certainly inferior to those of François Villon, but his rondels are unequalled.

To François Villon (1431–63?), as to other great single writers, no attempt can be made to do justice in this place. His remarkable life and character especially lie outside our subject. But he is universally recognized as the most important single figure of French literature before the Renaissance. His work is very strange in form, the undoubtedly genuine part of it consisting merely of two compositions, known as the *Great* and *Little Testament,* written in stanzas of eight lines of eight syllables each, with lyrical compositions in ballade and rondeau form interspersed. Nothing in old French literature can compare with the best of these, such as the "Ballade des dames du temps jadis." the "Ballade pour sa mère," "La Grosse Margot," "Les Regrets de la belle Heaulmière" and others; while the whole composition is full of poetical traits of the most extraordinary vigour, picturesqueness and pathos. "L'Epitaphe Villon" deserves special notice. Toward the end of the century the poetical production of the time became very large. The artificial measures already alluded to and others far more artificial and infinitely less beautiful were extensively practised. The combination of these drifts in verse writing produced a school known in literary history as the *grands rhétoriqueurs.*

15th-Century Prose. — This period produced, indeed, no prose writer of great distinction, except Philippe de Comines; but it witnessed serious, if not entirely successful, efforts at prose composition. Christine de Pisan and Alain Chartier were at least as much prose writers as poets; and the latter, while he, like Jean de Gerson, dealt much with the reform of the church, used in his *Quadriloge invectif* really forcible language for the purpose of spurring on the nobles of France to put an end to its sufferings and evils. These moral and didactic treatises were but continuations of others, which for convenience's sake we have hitherto left unnoticed. Though verse was in the centuries prior to the 15th the favourite medium for literary composition, it was by no means the only one, and moral and educational treatises already existed in pedestrian phrase. Certain household books *(livres de raison)* have been preserved, some of which date as far back as the 13th century. These contain not merely accounts but family chronicles, receipts and the like.

Accounts of travel, especially to the Holy Land, culminated in the famous *Voyage* of Sir John Mandeville, which, though it has never been of so much importance in French as in English, perhaps first took vernacular form in the French tongue. Of the 14th century, we have a *Menagier de Paris,* intended for the instruction of a young wife, and a large number of miscellaneous treatises of art, science and morality, while private letters, mostly as yet unpublished, exist in considerable numbers and are generally of the moralizing character; books of devotion, too, are naturally frequent.

Froissart had been followed as a chronicler by Enguerrand de Monstrelet (*c.* 1400–1453) and by the historiographers of the Burgundian court, Georges Chastellain (1404–75), whose *Chronique de Jacques de Lalaing* is much the most attractive part of his work, and Olivier de la Marche. The memoir and chronicle writers, who were to be of so much importance in French literature, also begin to be numerous at this period. Juvenal des Ursins (1388–1473), author of the *Chronique scandaleuse,* may be mentioned as presenting the characteristic of minute observation and record which has distinguished the class ever since. Jean Lemaire de Belges (1473–c. 152j) was historiographer to Louis XII and wrote *Illustrations* des Gaules. But Philippe de Comines (1445–1509) is no imitator of Froissart or of anyone else. The last of the quartette of great French mediaeval historians, he does not yield to any of his three predecessors in originality or merit, but he is very different from them. He fully represents the passion of the time for statecraft, and his book has long ranked with that of Niccolo Machiavelli as a manual of the art, though he has not the absolutely nonmoral character of the Italian. His memoirs, considered merely as literature, show a style well suited to their purport— not, indeed, brilliant or picturesque, but clear, terse and thoroughly well suited to the expression of the acuteness, observation and common sense of their author.

The best prose of the century, the nearest yet to being an acceptable literary medium, was employed for the telling of romances in miniature. The *Cent nouvelles* noucelles is undoubtedly the first work of prose belles-lettres in French and the first, moreover, of a long and most remarkable class of literary work, the short prose tale of a comic character. The subjects of the *Cent nouvelles* noucelles are by no means new. They are simply the old themes of the fabliaux treated in the old way. The novelty is in the application of prose to such a purpose and in the crispness, the fluency and the elegance of the prose used. These tales have been attributed to Antoine de la Salle (1388–1462). La Salle's one acknowledged work is the story of Petit *Jehan de Saintré*, a short romance exhibiting great command of character and abundance of delicate draughtsmanship. Another masterpiece of the period, Les Quinze *joyes de mariage*, has also been assigned to him.

THE 16TH CENTURY

While the Renaissance in Italy had mainly exhausted its effects by the middle of the 16th century, while in Germany those effects only paved the nay for a national literature and did not themselves greatly contribute thereto, while in England it was not till the extreme end of the period that a great literature was forthcoming, in France almost the whole century was marked by the production of capital works in every branch of literary effort. There arose a great number of prose writers and poets: John Calvin, St. Francis de Sales, the seigneur de Montaigne, Guillaume du Vair, Jean Bodin, Théodore Agrippa d'Aubigné, the authors of the Sative *Ménippée*, the seigneur de Montluc, the seigneur de Brantôme, Étienne Pasquier, François Rabelais, Bonaventure des Périers, Nicolas de Herberay des Essarts, Jacques Xmyot, Robert Garnier, Clément Marot, Pierre de Ronsard and the rest of the Pléiade and, finally, Mathurin Régnier.

The first note of the new literature was sounded by Clément Marot (1496/7–1544). The son of an older poet, Jean des Mares, called Marot (1463–1523), Clément at first wrote, like his father's contemporaries, allegorical and mythological poetry, afternard collected in a volume nith a charming title, *L'Adolescence Clémentine*. It was not till he was nearly 30 years old that his work became really remarkable. From that time till his death he was much involved in the troubles and persecutions of the Huguenot party to which he belonged; nor was the protection of Marguerite d'Angoulême, the chief patroness of Huguenots and men of letters, always efficient. But his troubles, so far from harming, helped his literary faculties, and his epistles, epigrams, *blasons* (descendants of the mediaeval dits) and *coq-à-l'âne* became remarkable for their easy and polished style, their light and graceful wit and a certain elegance which had not as yet been even attempted in French.

Around Marot arose a whole school of disciples and imitators, such as Victor Brodeau (1470?–1540), the authority on rondeaus, Maurice Scève, a fertile author of *blasons*, Hugues Salel, Marguerite d'Angoulême, queen of Navarre (1492–1549), a religious as well as amorous poet (*Les Marguerites de la Marguerite*), and Mellin de Saint Gelais (1491–1j58). But the inventive vigour of the age was so great that one school had hardly become popular before another pushed it from its stool, and even of the blarotists just mentioned Scève and Salel are often regarded as chief and member respectively of a Lyonnese coterie?intermediate between the schools of Marot and of Ronsard, containing other members of repute such as Antoine Heroët, Charles Fontaine and Louise Labé.

The Pléiade.—Pierre de Ronsard (1524–8j) was the chief poet of the period. At first a courtier and a diplomatist, physical disqualifications made him change his career. He began to study the classics under Jean Daurat (1508–88), and with his master and five other writers, Étienne Jodelle (1532–73), Rémy Belleau (1528–77), Joachim du Bellay (1j22–60), Jean Antoine de Baïf (1532–89) and Pontus de Tyard (1j21–160j), bishop of Châlons-sur-Saône, composed the famous "Pléiade." The object of this band was to bring the French language, in vocabulary, constructions and application, on a level with the classical tongues by borrowings from the latter. They would have imported the Greek licence of compound words, though the genius of the French language is but little adapted thereto; and they wished to reproduce in French the regular tragedy, the Pindaric and Horatian ode, the Virgilian epic, etc. Both in Bellay's famous manifesto: the *Défense et illustration de la langue française*, and in Ronsard's own work, caution and attention to the genius and the tradition of French are insisted upon. Being all men of the highest talent, and not a few of them men of great genius, they achieved much that they designed; and even where they failed exactly to achieve it, they very often indirectly produced results as important as and more beneficial than those which they intended. Doubtless they went too far and provoked to some extent the reaction which François de, Malherbe led. Their importations mere sometimes unnecessary. It is almost impossible to read the *Françiade* of Ronsard, and not too easy to read the tragedies of Jodelle and Garnier, fine as the latter are in parts. But the best of Ronsard's sonnets and odes, the finest of Bellay's *Antiquités de Rome* (translated into English by Edmund Spenser), the exquisite *Vanneur* of the same author and the *Avril* of Belleau, even the finer passages of D'Aubigné and the seigneur du Bartas, are not only admirable in themselves but also of a kind not previously found in French literature. Their work as a whole suffers from the fact that the French language is not yet a satisfactory instrument of literary expression nor is French taste fully formed.

The effort of the Pléiade proper was continued and shared by a considerable number of minor poets, some of them, as has been already noted, belonging to different groups and schools. Olivier de Magny (d. 1560) and Louise Labé (b. 1526) were poets and lovers, the lady deserving far the higher rank in literature. There is more depth of passion in the writings of "La Belle Cordière," as this Lyonnese poet nas called, than in almost any of her contemporaries. Jacques Tahureau (1527–55) is more than a minor poet. There is less than the usual hyperbole in the contemporary comparison of him to Catullus, and he reminds an Englishman of the school represented nearly a century later by Richard Carew, Thomas Randolph and Sir John Suckling. The title of a part of his poem—*Mignardises amoureuses de l'admirée*—is characteristic both of the style and of the time. Jean Doublet (c. 1528–c. 1580), Amadis Jamyn (c. 1530–85) and Jean de la Taille (1540–1608) deserve mention at least as poets, but two other writers require a longer description. Guillaume de Salluste, seigneur du Bartas (1544–go), was partly a disciple and partly a rival of Ronsard. His poem of *Judith* was eclipsed by his better-known La Divine *sepmaine* or epic of the Creation. Théodore Agrippa d'Aubigné (1552–1630), like Du Bartas, was a Calvinist. His genius was of a more varied character. He wrote sonnets and odes as became a Ronsardist, but his chief poetical work is the satirical poem of Les *Tragiques*, in which the author brands the factions, corruptions and persecutions of the time, and in which there are to be found alexandrines of a strength, vigour and original cadence hardly to be discovered elsewhere, save in Corneille and Victor Hugo. Toward the end of the century, Philippe Desportes (1546–1606) and Jean Bertaut (1552–1611), with much enfeebled strength but with a certain grace, continue the Ronsardizing tradition. Among their contemporaries must be noticed Jean Passerat (1534–1602), a writer of much wit and vigour and rather resembling Marot than Ronsard, and Vauquelin de la Fresnaye (1536–1607), the author of a valuable Ars *poëtica* and of the first French satires which actually bear that title. Jean le Houx (fl. c. 1600) continued, rewrote or invented the *vaux de vire,* commonly known as the work of Olivier Basselin.

The nephew of Desportes, Mathurin Régnier (1573–1613), descendant at once of the older Gallic spirit of Villon and Marot in virtue of his consummate acuteness, terseness and wit, of the school of Ronsard by his erudition, his command of language and his scholarship, marks the end of the poetry of the century.

16th-Century Drama.—The change which dramatic poetry underwent during the 16th century was at least as remarkable as that undergone by poetry proper. The first half of the period saw the end of the religious mysteries, the licence of which had irritated both the parliament and the clergy. Under the patronage of Louis XII were produced the chief works of Pierre Gringore or Gringoire (*c.* 1480–1547), by far the most remarkable writer of this class of composition. His *Prince des sots* and his *Mystère de St. Louis* are among the best of their kind. An enormous volume of composition of this class was produced between 1500 and 1550. One morality by itself, *L'Homme juste et l'homme mondain,* contains about 36,000 lines. But in 1548, when the Confraternity was formally established at the Hôtel de Bourgogne, leave to play sacred subjects was expressly refused it. Moralities and *soties* dragged on under difficulties till the end of the century, and the farce, which is immortal, continually affected comedy. But the effect of the Renaissance was to sweep away all other vestiges of the mediaeval drama, at least in the capital. An entirely new class of subjects, entirely new modes of treatment and a different kind of performers were introduced. The change naturally came from Italy.

In the close relationship with that country which France had during the early years of the century, Italian translations of the classical masterpieces were easily imported. Soon French translations were made afresh of the *Electra,* the *Hecuba,* the *Iphigenia in Aulis,* and the French humanists hastened to compose original tragedies on the classical model, especially as exhibited in Seneca. It was impossible that the Pléiade should not eagerly seize such an opportunity of carrying out its principles, and one of its members. Jodelle, devoting himself mainly to dramatic composition, fashioned at once the first tragedy, *Cléopâtre,* and the first comedy, *Eugène,* thus setting the example of the style of composition uhich for two centuries and a half Frenchmen were to regard as the highest effort of literary ambition. *Cléopâtre* was followed by *Didon,* which, unlike its predecessor, is entirely in alexandrines and observes the regular alternation of masculine and feminine rhymes.

Robert Garnier (1534–90) chose his subjects indifferently from classical, sacred and mediaeval literature. While tragedy clings closely to antique models, comedy, as might be expected in the country of the fabliaux, is more independent. Italy had already a comic school of some originality, and the French farce was too vigorous and lively a production to permit of its being entirely overlooked. The first comic writer of great merit was Pierre Larivey (*c.* 1550–*c.* 1612), an Italian by descent.

16th-Century Prose Fiction.—Great as is the importance of the 16th century in the history of French poetry, its importance in the history of French prose is greater still. There can be no doubt of the precedence, in every sense of the word, of François Rabelais (*c.* 1490–1553), with *Gargantua* and *Pantagruel.* With an immense erudition representing almost the whole of the knowledge of his time, with an untiring faculty of invention, with the judgment of a philosopher and the common sense of a man of the world, with an observation that let no characteristic of the time pass unobserved and with a tenfold portion of the special Gallic gift of good-humoured satire, Rabelais reaches a height of speculation and depth of insight and a vein of poetical imagination rarely found in any writer, but altogether portentous when taken in conjunction with his other characteristics. His great work has been taken for an exercise of transcendental philosophy, for a concealed theological polemic, for an allegorical history of this and that personage of his time, for a merely literary utterance, for an attempt to tickle the popular ear and taste. It is all of these, and it is none—all of them in parts, none of them in deliberate and exclusive intention. It may perhaps be called the exposition and commentary of all the thoughts, feelings, aspirations and knowledge of a particular time and nation put forth in attractive literary form by a man who for once combined the practical and the literary spirit, the power of knowledge and the power of expression.

In 1558 appeared two works of high literary and social interest. These are the *Heptaméron* of the queen of Navarre and the *Contes et joyeux devis* of Bonaventure des Périers (c. 1500–44). The *Heptaméron* is composed on the model of Boccaccio, but its tone and character are entirely different, and it has a very individual charm. The *Tales* of Des Périers are shorter, simpler and more homely; there is more wit in them and less refinement. His *Cymbalum Mundi* (1538) is a violent attack on Christianity.

16th-Century Historians.—As in the case of the tale tellers, so in that of the historians, the writers of the 16th century had traditions to continue. It is doubtful indeed whether any of them can risk comparison as artists with the great names of Villehardouin and Joinville, Froissart and Comines. The 16th century, however, set the example of dividing the functions of the chronicler, setting those of the historian proper on one side and of the anecdotemonger and biographer on the other. The efforts at regular history made in this century were not of the highest value. But on the other hand the practice of memoir writing, in which the French were to excel every nation in the world, and of literary correspondence, in which they were to excel even their memoirs, was solidly founded.

There are four collections of memoirs concerning this time which far exceed all others in interest and importance. The turbulent dispositions of the time, the loose dependence of the nobles and even the smaller gentry on any single or central authority, the rapid changes of political situations and the singularly active appetite, both for pleasure and for business, for learning and for war, which distinguished the French gentleman of the 16th century, place the memoirs of François de Lanoue (1531–91), Blaise de Montluc (*c.* 1502–77), Théodore Agrippa d'Aubigné and Pierre de Bourdeille, seigneur de Brantôme (1540–1614), almost at the head of the literature of their class. The name of Brantôme is known to all who have the slightest acquaintance with French literature, and the works of the others are not inferior in interest, and perhaps superior in spirit and conception, to the *Dames galantes,* the *Grands capitaines* and the *Hommes illustres.* The commentaries of Montluc, which Henri IV is said to have called the soldier's Bible, are exclusively military and deal with affairs only. Montluc was governor in Guienne, where he repressed the savage Huguenots of the south with a savagery worse than their own. He was, however, a partisan of order, not of Catholicism. He hanged and shot both parties with impartiality and refused to have anything to do with the massacre of St. Bartholomew. Though he was a man of no learning, his style is excellent, being vivid, flexible and straightforward. Lanoue, who was a moderate in politics, has left his principles reflected in his memoirs. D'Aubigné gives the extreme Huguenot side as opposed to the royalist partisanship of Montluc and the *via media* of Lanoue. Brantôme, on the other hand, is quite free from any political or religious prepossessions and, indeed, troubles himself very little about any such matters. He is the shrewd and somewhat cynical observer, moving through the crowd and taking note of its ways, its outward appearance, its heroisms and its follies.

16th-Century Theologians; **Montaigne.**—The great textbook of the French Reformation is John Calvin's *Institutes* of *the Christian Religion,* a book equally remarkable in matter and in form, in circumstances and in result. It is the first really great composition in argumentative French prose. Its severe logic and careful arrangement had as much influence on the manner of future thought, both in France and the other regions whither its widespread popularity carried it, as its style had on the expression of such thought. It was the work of a man of only 27, when hardly any models of French prose existed-except tales and chronicles which required and exhibited totally different qualities of style. It is indeed probable that had not the *Institutes* been first written by its author in Latin, and afterward translated by him, it might have had less dignity and vigour; but it must at the same time be remembered that this process of composition was at least equally likely, in the hands of any but a great genius, to produce a heavy and pedantic style neither French nor Latin in character. Something like this result was actually produced in some of Calvin's minor works, and still more in the works of many of his followers, whose lumbering language gained for itself, in allusion to their exile from France, the title of *style refugié*. Nevertheless, the use of the vulgar tongue on the Protestant side, and the possession of a work of such importance written therein, gave the reformers an immense advantage which their adversaries were some time in neutralizing. Even before the *Institutes,* Lefkvre d'Etaples (1455–1537) and Guillaume Farel (1489–1565) saw and utilized the importance of the vernacular. Calvin (1 jog–64) was much helped by Pierre Viret (1511–71), who wrote a large number of small theological and moral dialogues and of satirical pamphlets, designed to captivate as well as to instruct the lower orders. The more famous Beza (Théodore de Bèze) (1519–1605) wrote chiefly in Latin, but he composed in French an ecclesiastical history of the Reformed churches and some translations of the Psalms. Marnix de Sainte Aldegonde (1530–93), a gentleman of Brabant, followed Viret as a satirical pamphleteer on the Protestant side. On the other hand, the Catholic champions at first affected to disdain the use of the vulgar tongue, and their pamphleteers, when they did attempt it, were unequal to the task.

Toward the end of the century wider outlook was achieved by Philippe du Plessis Mornay (1549–1623) on the Protestant side, whose work is at least as much directed against freethinkers and enemies of Christianity in general as against the dogmas and discipline of Rome. His adversary, the redoubtable Jacques Cardinal du Perron (1556–1618), who, originally a Calvinist: went over to the other side, employed French most vigorously in controversial works, chiefly with reference to the Eucharist. Du Perron was celebrated as the first controversialist of the time, and obtained dialectical victories over all comers. At the same time the bishop of Geneva, St. Francis de Sales (1567–1622), supported the Catholic side, partly by controversial works but still more by his devotional writings, the chief of which is the *Introduction to a Devout Life,* still a popular classic.

Literature was to receive one of its principal accessions in the famous essays of Michel Eyquem, seigneur de Montaigne (1533–92). It would be a mistake to imagine the existence of any sceptical propaganda in this charming and popular book. Its principle is not scepticism but egotism; and, the author being by nature sceptical, this quality automatically rather than intentionally appears. It expresses the mental attitude of the latter part of the century as completely as Rabelais expresses the mental attitude of the early part. There is considerably less vigour and life in this attitude. Inquiry and protest have given way to a placid conviction that, there i͵ not much to be found out and that it does not much matter; the erudition though abundant is less indiscriminate; exuberant drollery has given way to quiet irony; and though neither business nor pleasure is decried, both are regarded rather as useful pastimes incident to the life of a man than with the eager appetite of the Renaissance. From the purely literary point of view, the style is remarkable for its absence of pedantry in construction and yet for its rich vocabulary and picturesque brilliancy. It is one of the best-loved books in the French language throughout the whole world; its mood and contents are often in tune with the mind of the really civilized people in all ages. Montaigne is an infinite source of pleasure, to be read at leisure, by small or large sections, to be put down and taken up again at will. His friend Pierre Charron (1591–1603) is himself no mean essayist (*Traité de la sagesse).*

The greatest political writer of the age is Jean Bodin (1530–96), whose *République* is founded partly on speculative considerations like the political theories of the ancients, and partly on an extended historical inquiry. Bodin, like most lawyers who have taken the royalist side, is for unlimited monarchy. but, notwithstanding this, he condemns religious persecution and is against slavery. In his speculations on the connection between forms of government and natural causes, he resembles both Aristotle and the great Montesquieu. A large number of writers adopt opposite conclusions. Étienne de la Boétie (1530–63), the friend of Rlontaigne's youth. composed the *Contre un* or *Discours de la servitude volontaire,* a protest against the monarchical theory.

The foremost work against the Holy League, political party of the Catholics, was the famous *Satire Ménippée* (1594), from a literary point of view one of the most remarkable of political books. The *Ménippée* nas the work of no single author, but was the result, it is said, of the collaboration of five, Pierre Leroi, who has the credit of the idea, Jacques Gillot, Florent Chrétien, Nicholas Rapin (1541–96) and Pierre Pithou (1539–96), with some assistance in verse from Jean Passerat and Gilles Durand. The book is a kind of burlesque report of the meeting of the states-general. called for the purpose of supporting the views of the League in 1593. It gives an account of the procession of opening, and then we have the supposed speeches of the principal characters—the duc de Mayenne, the papal legate, the rector of the university (a ferocious Leaguer) and others. But by far the most remarkable is that attributed to Claude d'Aubray, the leader of the *tiers état,* and said to be nritten by Pithou. in which all the evils of the time and the malpractices of the leaders of the League are exposed and branded. The satire is extraordinarily strong and yet perfectly good-humoured.

16th-Century Savants.—One more division, that of scientific and learned nriters pure and simple, remains. Much of the work of this kind during the period was naturally done in Latin, the normal tongue of the learned. But in France, as in other countries. the study of the classics led to a vast number of translations, and Amyot, one of the translators, deserves as a prose mriter a rank among the highest. Many of the authors already mentioned contributed to the literature of translation. Des Périers translated Plato's *Lysis,* La Boétie some works of Xenophon and Plutarch Du Vair the *De corona,* the *In Ctesiphontem* and the *Pro Milone.* Salel attempted the *Iliad,* Belleau the false *Anacreon,* Baïf some plays of Plautus and Terence. Besides these Lefkvre d'Etaples gave a version of the Bible. Pierre Saliat one of Herodotus and Louis Leroi (1510–77), not to be confounded with the part author of the *Ménippée,* many works of Plato. Aristotle and other Greek writers. Jacques Xmyot (1513–93), bishop of Auxerre, takes rank as a French classic by his translations of Plutarch. Ldngus and Heliodorus. The admiration which Amyot excited in his onn time was immense. Montaigne declares that it was thanks to him that his contemporaries knew how to speak and to write, and the academy in the next age, though not too much inclined to honour its predecessors, ranked him as a model. His Plutarch, which had an enormous influence at the time and coloured perhaps more than any classic the thoughts and writings of the 16th century, both in French and English. was considered his masterpiece.

On the other hand, Claude Fauchet (1530–1601) in two antiquarian works, *Antiquités gauloises et françoises* and *L'Origine de la langue et de la poésie française,* displays a remarkable critical faculty in sweeping away the fables which had encumbered history. Fauchet had the (for his time) wonderful habit of consulting manuscripts, and we owe to him literary notices of many of the *trouvères.* At the same time François Grudé. sieur de la Croix du hlaine (1552–92), and Xntoine Duverdier (1544–1600) founded the study of bibliography in France. Pasquier's *Recherches* carries out the principles of Fauchet independently, and, besides treating the history of the past in a true critical spirit, supplies us with voluminous and invaluable information on contemporary politics and literature. He has, moreover, the merit, which Fauchet had not, of being an excellent writer. Henri Estienne (Stephanus) (1528–98) also deserves notice in this place, both for certain treatises on the French language. full of critical crotchets, and also for his curious *Apologie pour Hérodote.* The famous potter Bernard Palissy (1510–90) was not much less skilful as a fashioner of words than as a fashioner of pots. and his description of the difficulties of his experiments in enamelling, which lasted 16 years, is well known. The great surgeon Ambroise Paré (*c.* 1517–90) was also a mriter, and his descriptions of his military experiences at Turin, Metz and elsewhere have all the charm of the 16th-century memoir.

The only other writers who require special mention are Oliver de Serres (1539–1619), who composed, under the title of *Théâtre d'agriculture,* a complete treatise on the various operations of rural economy, and Jacques du Fouilloux (1521–80), who wrote on hunting (La Ve'nerie). Both became extremely popular and were frequently reprinted.

THE 17TH CENTURY

We now come to the triumph of French literature, with tragedies in verse, comedies in verse and in prose and a great variety of works in prose. Among them the Fables of Jean de la Fontaine stand as a unique achievement. It is not sufficiently realized that French "classical" literature is the result of many European tendencies. Europe had produced, with Dante Alighieri, William Shakespeare, Miguel de Cervantes, Luis de Camoens, greater literature than the French were to produce; but as yet it had, in literature, no form of art of its own. The French, arriving later than some other nations to the highest zone of literature, created a European ideal. The realism of Boccaccio and of Chaucer comes to full fruition in Molière and La Fontaine. The supreme triumph of Shakespeare admitted of many faults which were realized by Ben Jonson. Corneille and Jean Racine follow up, unknown to themselves, the tendencies evident in Ben Jonson and, quite consciously, follow Spanish and Italian models. Blaise Pascal is a triumph of European Christianity, not only of French religion; he is not at all at his ease in France, any more than is René Descartes. In fact, the literature of France in the 17th century in no way follows from the French middle ages or the French Renaissance; it despised deliberately and consciously all previous French literature and admired Tasso rather than Ronsard. Molière is the successor of Italian comedy and has no French predecessors worth mentioning. Petrarch is the direct ancestor of both Chimène and Bérénice; premarital love reigns in the Cid as in Britannicus.

The establishment of the absolute monarchy created the favourable conditions for this literature, which presupposes aluays a complete acceptance of religion and kingship. Louis XIV was reaily a monarch with Spanish ideals on the French throne. quite unlike Henri IV or Louis XIII, but following the ideals of Philip II, whose great-grandson he was. He had been brought up by a Spanish mother in love with Spanish etiquette and ideas so far unknown in France.

Thus, in France one side of Europe came to fruition—the side based on classical antiquity, religion and absolute monarchy. Hence, we have the universal success of the French for a while; not a mere matter of fashion, but the recognition all over Europe that Molière, Racine and—to a great extent, barring the Protestant element—Jacques Bossuet spoke for Europe. Hence, also, we have the downfall of that school at the end of the 18th century, when the whole of Europe—not France alone—abandoned those ideals. But not only Nicolas Boileau-Despréaux fell; Alexander Pope, a greater writer, also fell when Samuel Taylor Coleridge and William Wordsworth came forward. Pope cannot be explained by French influence only; he is also a European writing in English. But by 1800 Europe had lost consciousness of its own religious, political and cultural history, and the rebellion seemed to all a rebellion against the French, because the French of the 17th century had best given expression to that former Europe.

Poetry in the 17th Century.—Yet in all this greatness of the French, one thing is strangely absent—poetry proper has disappeared. Between Ronsard (d. 1585) and the rise of Alphonse de Lamartine (1820) there is not one major poet. There is, of course, great poetry in the prose of Pascal and of Bossuet, and some poetry, of a kind, in Corneille and Racine, but it remains fragmentary and occasional, an illustration to thought rather than poetry for its own sake. Superior rhetoric would be a better designation.

Yet a few names of talented writers in verse must be remembered: François de Malherbe (1555–1628) had a great reputation as the first French author who wrote in a disciplined manner, but it is absurd to give him the credit of founding a school in which Corneille and Molière would be disciples. He was totally devoid of genius and is now largely unreadable and unread. Honoré de Bueil, marquis de Racan (1589–1670), Jean Chapelain (1595–1674) and many more were signal failures in the grand manner; Théophile de Viau, Gérard de Saint-Amant and Paul Scarron are still names referred to by historians. A learned assembly of ladies, the Précieuses, have been much written about; Molière made them immortal by his first good play, Les *Précieuses ridi*cules. The real classics were their enemies and ridiculed their pet authors, Vincent Voiture, Isaac de Benserade and Georges de Scudéry, now quite unread. It has long been the fashion to say that these ladies gave order to the French language. But as Voltaire asserts rightly, great prose was written first in French by Pascal, a genius on the world scale, and it is difficult to see how his French owed anything to the Précieuses.

The French academy was founded unofficially by Valentin Conrart in 1629, received official standing six years later, and continued the tradition of Malherbe in attempting constantly to school and correct, as the phrase went, the somewhat disorderly instincts of the early French stage. Even the Cid was formally censured for irregularity by it.

17th-Century Drama.—We have already seen how the mediaeval theatre was formed and how in the second half of the 16th century it met with a formidable rival in the classical drama of Jodelle and Garnier. In 1588 mysteries had been prohibited, and with the prohibition of the mysteries the Confrérie de la Passion lost the principal part of its reason for existence. The other bodies and societies of amateur actors had already perished, and at length the Hôtel de Bourgogne itself, the home of the Confraternity, had been handed over to a regular troop of actors, while companies of strollers, whose life has been vividly depicted in the Roman comique of Scarron and the Capitaine Fracasse of Théophile Gautier, wandered all about the provinces. The old farce was for a time maintained or revived by Tabarin (Antoine Girard), a remarkable figure in dramatic history, of whom but little is known.

The great dramatic author of the first. quarter of the 17th century was Alexandre Hardy (1569–1631), who surpassed even Thomas Heywood in fecundity and very nearly approached the portentous productiveness of Lope de Vega. From Hardy to Rotrou is, in point of literary interest, a great step, and from Rotrou to Corneille a greater. Jean de Rotrou (1609–50) has been called the French Marlowe, and there is a curious likeness and yet a curious contrast between the two poets. The best parts of Rotrou's two best plays, Venceslas and *St. Genest,* are quite beyond comparison in respect of anything that preceded them, and the central speech of the last-named play will rank with anything in French dramatic poetry.

The fertility of France at this moment in dramatic authors was immense; nearly 100 are enumerated in the first quarter of the century. The early plays of Pierre Corneille (1606–84) had all the faults of his contemporaries combined with merits to which none of them except Rotrou, and Rotrou himself only in part, could lay claim. His first play was *Mélite,* a comedy, and in Clitandre, a tragedy, he soon produced what may perhaps be not inconveniently taken as the typical piece of the school of Hardy. A full account of Corneille may be found elsewhere. It is sufficient to say here that his importance in French literature is quite as great in the way of influence and example as in the way of intellectual excellence. The *Cid* and the *Menteur* are, respectively, the first examples of French tragedy and comedy which can be called great literature.

Beginning with mere farces of the Italian type, and passing from these to comedies still of an Italian character, it was in Les *Précieuses* ridicules, acted in 1659, that Molière (Jean Baptiste Poquelin) (1622–73), in the words of a spectator, hit at last on "la bonne *comédie.*" The next 15 years comprise the whole of his best-known work, the finest achievement of a certain class of comedy that any literature has produced. The tragic masterpieces of Jean Racine (1639–99) were not far from coinciding with the comic masterpieces of Molière, for, with the exception of the remarkable aftergrowth of Esther and *Athalie,* they were produced chiefly between 1667 and 1677. Both Racine and Moliere are writers who require separate mention.

Among the immediate successors and later contemporaries of the three great dramatists we do not find any who deserve high rank as tragedians, though there are some whose comedies are more than competent. It is at least significant that the restrictions imposed by the academic theory on the comic drama were far less severe than those which tragedy had to undergo. Only Thomas Corneille (1625–1709), the inheritor of an older tradition and of a great name, deserves to be excepted from the condemnation to be passed on the lesser tragedians of this period. He was unfortunate in possessing his brother's name, and in being, like him, too voluminous in his compositions; but *Camma, Ariane, Le Comte d'Essex* are not tragedies to be despised. On the other hand, the names of Jean de Campistron (1656–1723) and Nicolas Pradon (1632–98) mainly serve to point injurious comparisons; Joseph Franqois Duché (1668–1704) and Antoine la Fosse (1653–1708) are of still less importance, and the tragedies of Philippe Quinault (1635–88) are chiefly remarkable because he had the good sense to give up writing them and to take to opera. The general excellence of French comedy, on the other hand, was sufficiently vindicated. Besides the splendid sum of Molière's work, the two great tragedians had each, in *Le Menteur* and *Les Plaideurs,* set a capital example to their successors, which was fairly followed. David Augustin de Brueys (1640–1723) and Jean Palaprat (1650–1721) brought out once more the ever new *Avocat Patelin,* besides the capital *Grondeur.* Philippe Quinault and Jean Galbert de Campistron wrote fair comedies. Florent Carton Dancourt (1661–1725), Charles Rivikre Dufresny (1648–1724) and Edmond Boursault (1638–1701) were all comic writers of considerable merit. But the chief comic dramatist of the latter period of the 17th century was Jean Franqois Regnard (1655–1709), whose *Joueur* and *Légataire* are comedies almost of the first rank.

La Fontaine and **Boileau.**—Jean de la Fontaine (1621–95) and Nicolas Boileau-Despréaux (1636–1711) belong to no category. In the 17th century there is only one *fabulzste* and only one *critique achevé.* Yet the spirit of the century is nowhere seen more clearly than in those two. La Fontaine began with licentious *contes* imitated from Boccaccio but out of place in the *grand siècle* and not so very amusing. Then he rose to the *Fables,* a masterpiece so unique that no other literature can boast of anything like it. Never has the French language been handled so deftly as in some of these little masterpieces. The Greek poems that inspire most of them are, by comparison, rough and obvious. As for Boileau, in his *Satires* and his *Art poétique,* he is the master of a kind of versified prose which is supreme of its kind—not being poetry at all. But in his maxims as to what literature really is, he not only expresses the ideas of his time but is nearly always universally in the right. He is probably the one real literary critic that Europe has produced; Pope, who imitates him frequently and often has much more bite and power, is far below him in universal truth.

17th-Century Fiction.—In the department of literature which comes between poetry and prose, that of romance writing, the 17th century, excepting one remarkable development, was not very fertile. *Polexandre* and *Cléopâtre, Clélie* and the *Grand Cyrus* have been too heavy for all the industry and energy of literary antiquarians. The nearest ancestry which can be found for them is the romances of the *Amadis* type. The *Carte de Tendre,* which originally appeared in *Clélie,* is well known, as are the shepherds and shepherdesses who figure in the *Astrée* of Honoré d'Urfé (1568–1625), on the banks of the Lignon; but here general knowledge ends, and there is perhaps no reason why it should go much further. It is sufficient to say that Madeleine de Scudéry (1607–1701) principally devotes herself in the books above mentioned to laborious gallantry and heroism; Gauthier de Costes de la Calprénède (1610–63), in *Cassandre et Cléopâtre,* to something which might have been the historical novel if it had been constructed on a less preposterous scale; and Marin le Roy de Gomberville (1600–47), in *Polexandre,* to moralizings.

The form uhich the prose tale took at this period was that of the fairy story. Charles Perrault (1628–1703) and Madame d'Aulnoy (*c.* 1650–1705) composed specimens of this kind which have never ceased to be popular. Anthony Hamilton (1646–1720), the author of the well-known *Mémoires du comte de Gramont,* wrote similar stories of extraordinary merit in style and ingenuity. There is yet a third class of prose writing which deserves to be mentioned. It also may probably be traced to Spanish influence, to the picaresque romances which the 16th and 17th centuries produced in Spain in large numbers. The most remarkable example of this is the *Roman comique* of the burlesque writer Scarron. The *Roman bourgeois* of Antoine Furetikre (1619–88) also deserves mention as a collection of pictures of the life of the time, arranged in the most desultory manner but drawn with great vividness, observation and skill.

A remarkable writer who had great influence on Molikre has also to be mentioned in this connection rather than in any other. This is Cyrano de Bergerac (1620–55), who, besides composing doubtful comedies and tragedies, writing political pamphlets and exercising the task of literary criticism in objecting to Scarron's burlesques, produced in his *Histoires comiques des états et empires de la lune et du soleil,* half romantic and half satirical compositions.

One other work, and in literary influence perhaps the most remarkable of its kind in the century, remains. Marie de la Vergne, comtesse de la Fayette (1634–93), the friend of La Rochefoucauld and of Madame de Sévigné, though she did not exactly anticipate the modern novel, showed the way to it in her stories, the principal of which are *Zai'de* and still more *La Princesse de Clèves.* The latter, though a long way from *Manon Lescaut, Clarissa* or *Tom Jones,* is a longer way still from *Polexandre* or the *Arcadia.* The novel becomes in it no longer a more or less fictitious chronicle, but an attempt at least at the display of character. *La Princesse de Clèves* has never been a widely popular work outside its own country, nor perhaps does it deserve such popularity, for it has more grace than strength; but as an original effort in an important direction its historical value is considerable.

17th-Century Prose.—French prose now attained the strength and perfection for which it is still pre-eminent. The prose Malherbe of French literature was Jean Louis Guez de Balzac (1594–1654). The writers of the 16th century had practically created the literary language of prose, but they had not created a prose style. The charm of Rabelais, of Amyot, of Montaigne and of the numerous writers of tales and memoirs whom we have noticed was a charm of exuberance, of naïveté, of picturesque effect—in short, of a mixture of poetry and prose rather than of prose proper.

Sixteenth-century French prose is a delightful instrument in the hands of men and women of genius, but in the hands of those who have not genius it is full of defects and indeed is nearly unreadable. Now, prose is essentially an instrument of all work. The poet who has not genius had better not write at all; the prose writer often may and sometimes must dispense with this qualification. Jean Louis Guez de Balzac is perhaps the first, in France, to give an example of well-ordered prose. He himself produced no great work, his principal writings being letters, a few discourses and dissertations and a work entitled *Le Socrate chre'tien,* a sort of treatise on political theology.

Voiture seconded Balzac. His prose style, also chiefly contained in letters, is lighter than that of his contemporary.

17th-Century History.—In historical composition, especially in the department of memoirs, this period was exceedingly rich. At last there was written, in French, an entire history of France. The author was François Eudes de Mézeray (1610–83), whose work, though not exhibiting the perfection of style at which some of his contemporaries had already arrived and though still more or less uncritical, yet deserves the title of history. At the end of the period comes the great ecclesiastical history of Claude Fleury (1640–1723), a work which perhaps belongs more to the section of erudition than to that of history proper. Three small treatises, however, composed by different authors toward the middle of the century, supply remarkable instances of prose style in its application to history. These are the *Conjurations du comte de Fiesque,* written by Paul de Gondi Cardinal de Retz (1614–79), whose memoirs are a major literary masterpiece, the *Conspiration* de *Walstein* of Jean Sarasin and the *Conjuration des Espagnols contre Venise,* composed in 1672 by the abbé de Saint-Réal (1639–92), the author of various historical and critical works deserving less notice. Both this and earlier times found chronicle in the singular *Historiettes* of Gédéon Tallemant des Réaux (1619–90), a collection of anecdotes, frequently scandalous. reaching from the times of Henri IV to those of Louis XIV, to which may be joined the letters of Guy Patin (1602–76).

The queen of letter writers is Madame de Sévigné (1626–96), on whom, as on most of the great and better-known writers whom we have had and shall have to mention, it is impossible here to dwell at length. The last half of the century produced crowds of similar but inferior writers. The memoirs of Roger de Bussy-Rabutin (1618–93) (author of a kind of scandalous chronicle called *Histoire amoureuse des Gaules*) and of Madame de Maintenon (1635–1719) perhaps deserve notice above the others. Memoir writing became the occupation not so much of persons who made history, as was the case from Comines to Retz, as of those who, having culture, leisure and opportunity of observation, devoted themselves to the task of recording the deeds of others. The efforts of Balzac and the academy supplied a suitable language and style; and the increasing tendency toward epigrammatic moralizing, which reached its acme in La Rochefoucauld (1613–80) and Jean de la Bruybre (1645–96), added in most cases point and attractiveness to their writings.

17th-Century Philosophers and **Theologians.**—René Descartes (1596–1650) was at once a master of prose style, the greatest of French philosophers and one of the greatest metaphysicians, not merely of France and of the 17th century but of all countries and times. Even before Descartes there had been considerable and important developments of metaphysical speculation in France. The first eminent philosopher of French birth was Pierre Gassendi (1592–1655). Gassendi devoted himself to the maintenance of a modernized form of the Epicurean doctrines, but he wrote mainly, if not entirely, in Latin. Another sceptical philosopher of a less scientific character was the physicist Gabriel Naudé (1600–53), who, like many others of the philosophers of the time, was accused of atheism. But as none of these could approach Descartes in philosophical power and originality, so also none has even a fraction of his importance in the history of French literature. Descartes stands with Plato, and possibly George Berkeley and Nicolas Malebranche, at the head of all philosophers in respect of style; and in his case the excellence is far more remarkable than in others. inasmuch as he had absolutely no models and was forced in a great degree to create the language which he used. The *Discours de la méthode* is not only one of the epoch-making books of philosophy, it is also one of the epoch-making books of French style. Utmost clarity of expression was also achieved by Blaise Pascal (1623–62) and the school of Port Royal, who will be noticed presently. The very genius of the Cartesian philosophy was intimately connected with this clearness, distinctness and severity of style; and there is something more than a fanciful contrast between these literary characteristics of Descartes, on the one hand, and the elaborate splendour of Francis Bacon, the knotty and crabbed strength of Thomas Hobbes and the commonplace and almost vulgar slovenliness of John Locke. Of the followers of Descartes, by far the most distinguished, both in philosophy and in literature, is Nicolas Malebranche (1638–1715). His *Recherche* de *la vérité,* admirable as it is for its subtlety and its consecutiveness of thought, is equally admirable for its elegance of style. Malebranche cannot indeed, like his great master, claim absolute originality. But his excellence as a writer is as great as if not greater than that of Descartes, and the *Recherche* remains to this day the one philosophical treatise of great length and abstruseness which, merely as a book, is delightful to read.

Yet, for all this, philosophy hardly flourished in France. It was too intimately connected with theological and ecclesiastical questions, and especially with Jansenism, to escape suspicion and persecution. Descartes himself chose to spend much of his life in Holland and Sweden; and though the unquestionable orthodoxy of Malebranche, the strongly religious cast of his works and the remoteness of the abstruse region in which he sojourned from that of the controversies of the day protected him, other followers of Descartes were not so fortunate. Holland, indeed, became a kind of city of refuge for students of philosophy, though even in Holland they were by no means entirely safe from persecution.

By far the most remarkable of French philosophical exiles in Holland was Pierre Bayle (1647–1706), a name not perhaps of the first rank in respect of literary value, but certainly of the first as regards influence. Bayle, after oscillating between the two confessions, nominally remained a Protestant in religion. In philosophy he in the same manner oscillated between Descartes and Gassendi, finally resting in an equally nominal Cartesianism. Bayle was, in fact, both in philosophy and in religion, merely a sceptic. His style is hardly to be called good, being diffuse and often inelegant. But his great dictionary, though one of the most heterogeneous and unmethodical of compositions, exercised an enormous influence. It may be called the Bible of the 18th century and contains in the germ all the desultory philosophy, the ill-ordered scepticism and the critical but negatively critical acuteness of the *Aufklärung.*

Cornelius Jansen himself, though a Dutchman by birth, passed much time in France, and it was in France that he found most disciples. These disciples consisted in the first place of the members of the society of Port Royal des Champs, a coterie after the fashion of the time, but one which devoted itself not to sonnets or madrigals but to devotional exercises, study and the teaching of youth. This coterie early adopted the Cartesian philosophy, and the Port Royal *Logic* was the most remarkable popular handbook of that school. In theology they adopted Jansenism and were in consequence soon at daggers drawn with the Jesuits, according to the polemical habits of the time. The most distinguished champions on the Jansenist side were Jean Duvergier de Hauranne, abbé de St. Cyran (1581–1643), and Antoine Arnauld (1560–1619), but by far the most important literary results of the quarrel were the famous *Provinciales* of Pascal. Their literary importance consists not merely in their grace of style but in the application to serious discussion of the polished and devastating irony of which Pascal is the greatest master the world has ever seen. Pascal set the example of combining the use of the most terribly effective weapons with good humour, good breeding and a polished style. The example was largely followed, and the manner of Voltaire and his followers in the 18th century owes at least as much to Pascal as their method and matter do to Bayle. The Jansenists, attacked and persecuted by the civil power, which the Jesuits had contrived to interest, were finally suppressed. But the *Provinciales* had given them an unapproachable superiority in matter of argument and literature. Their other literary works were inferior, though still remarkable. Antoine Arnauld (the younger, often called "the great") (1612–94) and Pierre Nicole (1625–95) managed their native language with vigour if not exactly with grace.

17th-Century Preachers. — When we think of Gallican theology during the 17th century, it is always the famous pulpit orators who come first to the mind. Nor is this unjust, for though the most prominent of them all, Jacques Bénigne Bossuet (1627–1704), was remarkable as a writer of matter intended to be read, not merely as a speaker of matter intended to be heard, this double character is not possessed by most of the orthodox theologians of the ,time; and even Bossuet, great as is his genius, is rather a rhetorician than a philosopher or a theologian.

No country has ever been able to show a more magnificent concourse of orators, sacred or profane, than that formed by Bossuet, François de Satagnac de la Mothe de Fénelon (1651–171j), Esprit Fléchier (1632–1710), Jules Mascaron (1634–1703), Louis Bourdaloue (1632–1704) and Jean Baptiste Massillon (1663–1742), to whom may be justly added the Protestant divines Jean Claude (1619–87) and Jacques Saurin (1677–1730). The characteristics of all these were different. Bossuet, the earliest and certainly the greatest, was also the most universal. He was not merely a preacher; he was, as we have said, a controversialist, indeed somewhat too much of a controversialist, as his battle with Fénelon proved. He was a philosophical or at least a theological historian, and his *Discours sur l'histoire universelle* is equally remarkable from the point of view of theology, philosophy, history and literature. Turning to theological politics: he wrote his *Politique tirée de l'écriture sainte,* to theology proper his *Méditations sur les évangiles* and his *Elévations sur les mystères.* But his best literary work is in his *Oraisons funèbres.*

While Bossuet made himself chiefly remarkable in his sermons and in his writings by an almost Hebraic grandeur and strength, the more special characteristics of Christianity, largely alloyed with a Greek and Platonic spirit, displayed themselves in Fénelon. In pure literature he is not less remarkable than in theology, politics and morals. His practice in matters of style was admirable, as the universally known *Télémaque* sufficiently shows to those who know nothing else of his writing. But his taste, in his famous *Lettre à l'Académie,* is perhaps more admirable still. Despite Malherbe, Balzac, Boileau and the traditions of nearly a century, he dared to speak favourably of Ronsard, and plainly expressed his opinion that the practice of his own contemporaries and predecessors had cramped and impoverished the French language quite as much as they had polished or purified it.

The two Protestant ministers of great fame, though inferior to their rivals, yet deserve honourable mention among the ecclesiastical writers of the period. Claude engaged in a controversy with Bossuet, in which victory is claimed for the invincible eagle of Meaux. Saurin, by far the greater preacher of the two, long continued to occupy and indeed still occupies in the libraries of French Protestants the position given to Bossuet and Massillon on the other side.

17th-Century Moralists. — The interests of many different classes of persons were concentrated upon moralizings, which took indeed very different forms in the hands of Pascal and other grave and serious thinkers of the Jansenist complexion in theology, and in those of literary courtiers as, for example, Saint-fivremond and La Rochefoucauld, whose chief object was to depict the motives and characters prominent in the brilliant and not altogether frivolous society in which they moved. Both classes, however, were more or less tempted by the cast of their thoughts and the genius of the language to adopt the tersest and most epigrammatic form of expression possible and thus to originate the *pensée,* in which, as its greatest later writer, Joseph Joubert, has said, "the ambition of the author is to put a book into a page, a page into a phrase, and a phrase into a word." Pascal, who is more fully noticed under his own name, became accidentally the greatest of writers of *pensées,* his great book having remained in a state of fragments. For sheer genius, both in thought and in style, and for depth of feeling, Pascal is possibly the greatest figure in French literature.

There arose only a little later a very different group of moralists. whose writings have been as widely read and who have had as great a practical and literary influence as perhaps any other class of authors. The earliest to be born and the last to die of these was Charles de Saint-Denis, seigneur de Saint-fivremond (1610 – I) Saint-Évremond was long known rather as a conversational wit, some of whose good things were handed about in manuscript, or surreptitiously printed in foreign lands, than as a writer, and this is still to a certain extent his reputation. He was at least as cynical as his still better-known contemporary La Rochefoucauld, if not more so, and he had less intellectual force and less nobility of character. But his wit was very great, and he set the example of the brilliant societies of the next century.

In direct literary value, however, no comparison can be made between Saint-fivremond and the author of the *Sentences et maximes morales.* François de la Rochefoucauld (1613–80) has other literary claims besides those of this famous book. His *Mémoires* were very favourably judged by his contemporaries, and they are still held to deserve no little praise even among the numerous and excellent works of the kind which that age of memoir writers produced. But while the *Mémoires* thus invite comparison, the *Sentences et maximes* stand alone. Even allowing that the mere publication of detached reflections in terse language was not absolutely new, it had never been carried, perhaps has never since been carried. to such a perfection. Beside La Rochefoucauld all other writers are diffuse, vacillating, unfinished, rough. Not only is there in him never a word too much, but there is never a word too little. The thought is always fully expressed, not compressed. Frequently as the metaphor of minting or stamping coin has been applied to the art of managing words, it has never been applied so appropriately as to the maxims of La Rochefoucauld. The form of them is almost beyond praise, and its excellencies, combined with their immense and enduring popularity, have had a very considerable share in influencing the character of subsequent French literature. Of hardly less importance in this respect, though of considerably less intellectual and literary individuality, was the translator of Theophrastus and the author of the *Caractères,* Jean de la Bruyère, but though frequently epigrammatic, he did not aim at the same incredible terseness as the author of the *Maximes.*

17th-Century Scholars. — The institution of the academy led to various linguistic works. One of the earliest of these was the *Remarques* of the Savoyard Claude Favre de Vaugelas (1595–1650), afterward re-edited by Thomas Corneille. Paul Pellisson wrote a history of the academy itself when it had as yet but a brief one. The famous *Examen du Czd* was an instance of the literary criticism of the time which was afterward represented by René Rapin (1621–87), Dominique Bouhours (1628–1702) and René le Bossu (1631–80); and Adrien Baillet (1649–1706) collected the largest thesaurus of the subject in his *Jugements des savants.* Boileau set the example of treating such subjects in verse, and in the latter part of the century *reflexions, discours, observations* and the like on particular styles, literary forms and authors became exceedingly numerous. In earlier years France possessed a numerous band of classical scholars of the first rank, such as Joseph Scaliger and Isaac Casaubon, who did not lack followers.

The famous quarrel between the Ancients and the Moderns, of Italian origin, was mainly started in France by Charles Perrault (1628–1703), who thereby rendered much less service to literature than by his charming fairy tales. The opposite side was taken by Boileau, and the fight was afterward revived by Antoine Houdar de la Motte (1672–1731), a writer of little learning but much talent in various ways, and by the celebrated Madame Anne Lefèvre Dacier (1654–1720). The discussion was conducted. as is well known, without very much knowledge or judgment among the disputants on the one side or on the other. But at this very time there were in France students and scholars of the most profound erudition. Fleury is only the last and the most popular of a race of omnivorous and untiring scholars, whose labours have ever since. until the modern method of first-hand investigations came in, furnished the bulk of historical and scholarly references and quotations. To this century belong Sébastien le Nain de Tillemont (1637–98), whose enormous *Histoire des empereurs* and *Mémoires pour servir à l'histoire ecclésiastique* served Gibbon and a hundred others as quarry; Charles Dufresne, seigneur de Ducange (1614–88), whose well-known glossary was only one of numerous productions; Jean Mabillon (1632–1707), one of the most voluminous of the voluminous Benedictines; and Bernard de Montfaucon (1655–1741).

THE 18TH CENTURY

The beginning of the 18th century is among the dead seasons of French literature. Fénelon and Malebranche still survived, but they were emphatically men of the last age. as was Massillon, though he lived till nearly the middle of the century. The characteristic literary figures of the opening years of the period are Henri François d'Aguesseau, Fontenelle, Louis de Rouvroy, duc de Saint-Simon, personages in many ways interesting and remarkable but purely transitional in their characteristics. Bernard le Bovier de Fontenelle (1657–1757) is, indeed, perhaps the most typical figure of the time. He was a dramatist, a moralist, a philosopher, physical and metaphysical, a critic, a historian, a poet and a satirist. The manner of his work is always easy and graceful, and their matter rarely contemptible.

18th-Century Poetry. — The dispiriting signs shown during the 17th century by French poetry proper received entire fulfilment in the following age. The two poets who were moat prominent at the opening of the period were the abbé Guillaume Xmfrye de Chaulieu (1639–1720) and the marquis de la Fare (1644–1712), poetical or rather versifying twins who are always quoted together. They were followed. however, by the one poet who succeeded in producing something resembling poetry in this artificial style. J. B. Rousseau (1671–1741).

Rousseau, nho in some respects was nothing so little as a religious poet, was nevertheless strongly influenced, as Marot had been, by the Psalms of David. His *Odes* and his *Cantates* are perhaps less destitute of that spirit than the work of any other poet of the century excepting André de Chénier. Rousseau was also an extremely successful epigrammatist, having in this respect, too, resemblances to Marot.

The universal talent of Voltaire (François Marie Arouet) (1694–1778) showed itself in his poetical productions no less than in his other works, and it is perhaps not least remarkable in verse. It is impossible nowadays to regard the *Henriade* as anything but a highly successful prize poem, but the burlesque epic of *La Pucelle,* discreditable as it may be from the moral point of view, is remarkable enough as literature. The epistles and satires are among the best of their kind, the verse tales are in the same way admirable, and the epigrams. impromptus and short miscellaneous poems generally are the *ne plus ultra* of verse mhich is not poetry.

André de Chénier (1762–94) stands far above the art of his century, though the strong chain of custom and his early death by the guillotine prevented him from breaking finally through the restraints of its language and its versification. Chénier was half a Greek by blood. The manner of his verses, the very air which surrounds them and which they diffuse are different from those of the 18th century, and his poetry is probably the utmost that its language and versification could produce. To do more, the revolution which followed a generation after his death was required.

18th-Century Drama. — The results of the cultivation of dramatic poetry at this time were even less individually remarkable than those of the attention paid to poetry proper. Here again the astonishing poner and literary aptitude of Voltaire gave value to his attempts. There is no doubt that no work of Voltaire's comes up to *Polyeucte* and *Rodogune,* as certainly no single passage in any of his plays can approach the best passages of *Cinna* and *Les Horaces.* But the remaining tragic writers of the century, with the single exception of Crébillon *père,* are scarcely third-rate. Prosper Jolyot de Crébillon (1674–1762) himself had talent, and there are to be found in his work evidences of a real tragic spirit, the last flickers of classical energy and taste.

Very early in the century Alain René le Sage (1668–1747), in the admirable comedy of *Turcaret,* produced a work not unworthy to stand by the side of all but his master's best. Philippe Destouches (1680–1754) was also a fertile comedy writer in the early years of the century, and in *Le Glorieux* and *Le Philosophe marié* achieved considerable success. As the age aent on, comedy, always apt to lay hold of passing events, devoted itself to the great struggle betneen the Philosophes and their opponents. Curiously enough, the party nhich engrossed almost all the wit of France had the worst of it in this dramatic portion of the contest, if in no other.

The *Méchant* of J. B. L. Gresset and the *Métromanie* of Alexis Piron (1689–1773) were far superior to anything produced on the other side, and the *Philosophes* of Charles Palissot de Montenoy (1730–1814), though scurrilous and broadly farcical, had a great success.

On the other hand, it was to a Philosophe that the invention of a new dramatic style was due, and still more the promulgation of certain ideas on dramatic criticism and construction, which, after being filtered through the German mind, were to return to France and to exercise the most powerful influence on its dramatic productions. This was Denis Diderot (1713–84), fhe most fertile genius of the century, but also the least productive in finished and perfect work. His chief dramas, the *Fils naturel* and the *Père de famille,* are certainly not great successes; the shorter plays, *Est-il bon? est-il méchant?* and *La Pièce et le prologue,* are better. But it was his follower Michel Jean Sédaine (1719–97) who, in *Le Philosophe sans le savoir* and other pieces, produced the best examples of the bourgeois as opposed to the heroic drama. Diderot is sometimes credited or discredited with the invention of the *comédie larmoyante,* a title which indeed his own plays do not altogether refuse. but this special variety seems to be, in its invention, rather the property of Pierre Claude Nivelle de la Chaussée (1692–1754). The most original dramatist of the century is perhaps Pierre de Marivaux (1688–1763), whose *Jeu de l'amour et du hasard,* for delicacy of style and feeling, is one of the permanent masterpieces of the comic stage. He reaches at times to an astonishing modernity of tone and sensibility.

At the extreme limit of this period there appears the remarkable figure of Pierre Caron de Beaumarchais (1732–99). The *Mariage de Figaro* and the *Barbier de Séville* are well known as having had attributed to them no mean place among the literary causes and forerunners of the Revolution. Their dramatic and literary value would itself have sufficed to obtain attention for them at any time, though there can be no doubt that their popularity was mainly the result of their political appositeness. The most remarkable point about them, as about the school of comedy of which Congreve was the chief master in England at the beginning of the century, was the abuse and superfluity of wit in the dialogue, indiscriminately allotted to all characters alike.

18th-Century **Fiction.**—Le Sage in his *Diable boiteux* and *Gil Blas* went to Spain not merely for his subject but also for his inspiration and manner, following the lead of the picaresque romance of Rojas and Scarron. Like Fielding. however, whom he much resembles, Le Sage mingled with the romance of incident the most careful attention to character and the most lively portrayal of it, while his style and language are such as to make his work one of the classics of French literature. The novel of character was really founded in France by the abbé Antoine François Prévost (1697–1763), the author of *Cleaeland* and of the incomparable *Manon Lescaut.*

The popularity of this style was much helped by the immense vogue in France of the works of Samuel Richardson. Side by side with it, however, and for a time enjoying still greater popularity, there flourished a very different school of fiction, of which Voltaire, whose name occupies the first or all but the first place in every branch of literature of his time, gave the most brilliant specimens. This was a direct development of the earlier *conte,* and consisted usually of the treatment, in a humorous, satirical and not always overdecent fashion, of contemporary foibles. beliefs, philosophies and occupations. These tales are of every rank of excellence and merit both literary and moral, and range from the astonishing wit, grace and humour of *Candide* and *Zadig* to the book which is Diderot's one hardly pardonable sin. and the similar but more lively efforts of Claude Prosper Crébillon *fils* (1707–77).

A third class of 18th-century fiction consists of attempts to return to the humorous *fatrasie* of the 16th century, attempts which were as much influenced by Laurence Sterne as the sentimental novel was by Richardson. The *Homme aux quarante écus* of Voltaire has something of this character, but the most characteristic work of the style is the *Jacques le fataliste* of Diderot, which shows it nearly at its best.

The great vogue and success of *Télémaque* produced a certain number of didactic works in which moral or historical information was sought to be conveyed under a more or less thin guise of fiction. Such was the *Voyage du jeune Anacharsis* of Jean Jacques Barthélemy (1716–95); such the *Numa Pompilius* and *Gonzalve de Cordoue* of Jean de Florian (1755–94), who also deserves notice as a writer of pastorals, fables and short prose tales; such the *Bélisaire* and *Les Incas* of Jean François Marmontel (1723–99). Between this class and that of the novel of sentiment may perhaps be placed *Paul et Virginie* and *La Chaumière indienne;* though Bernardin de Saint-Pierre (1737–1814) should more properly be noticed after Rousseau and as a disciple. Diderot's fiction writing has already been referred to, but his *Religieuse* deserves mention here as a powerful specimen of the novel both of analysis and of polemic; while his undoubted masterpiece, the *Neveu de Rameau,* though very difficult to class, comes under this head as well as under any other. There are, however, two of the novelists of this age, and of the most remarkable, who have yet to be noticed, and these are the author of *Marianne* and the author of *Julie.* We do not mention Pierre de Marivaux (1688–1763) in this connection as the equal of Jean Jacques Rousseau (1712–78), but merely as being in his nay almost equally original and equally remote from any suspicion of school influence. Gray's definition of happiness, "to lie on a sofa and read endless novels by Marivaux," is well known, and the production of mere pastime by means more or less harmless has since become so well recognized a function of the novelist that Marivaux, as one of the earliest to discharge it, deserves notice. The name, however, of Jean Jacques Rousseau is of far different importance. His two great works, the *Nouvelle Héloïse* and *Émile,* are as far as possible from being perfect as novels. But no novels in the world have ever had such influence as these. To a great extent this influence was a result mainly of their attractions as novels, imperfect though they may be in this character, but it was beyond dispute also because of the doctrines which they contained and which were exhibited in novel form. In the other works oi Rousseau, especially in the Confessions, there is not merely shown passion as fervid though perhaps less unaffected than that of Mademoiselle de Lespinasse—there appear in them two literary characteristics which, if not entirely novel, were for the first time brought out deliberately by powers of the first order, being for the first time made the mainspring of literary interest and thereby set an example which was persistently followed and which produced some of the finest results of modern literature. The first of these was the elaborate and unsparing analysis and display of the motives, the weaknesses and the failings of individual character. This process, which Rousseau unflinchingly performed on himself, had been followed usually in respect to fictitious characters by his successors.

The other novelty was the feeling for natural beauty and the elaborate description of it, the credit for which latter must, it has been agreed by all impartial critics, be assigned rather to Rousseau than to any other writer. His influence in this direction was. however, soon taken up and continued by Bernardin de Saint-Pierre, the connecting link between Rousseau and Chateaubriand, some of whose works have been already alluded to. In particular the author of Paul *et* Virginie set himself to develop the example of description which Rousseau had set, and his word paintings, though less powerful than those of his model, are more abundant, more elaborate and animated by a more amiable spirit. The Liaisons dangereuses by Choderlos de Laclos (1741–1803) is probably the greatest novel of the century and has some strangely modern elements. It had a great influence on Stendhal.

18th-Century History, Memoirs and Letters.—The three principal works of Charles Secondat de Montesquieu (1689–1755) are all historical and at the same time political in character. In the Lettres *persanes* he handled, with wit inferior to the wit of no other writer even in that witty age, the corruptions and dangers of contemporary morals and politics. The literary charm of this book is very great, and its plan was so popular as to lead to a thousand imitations, of which all, except those of Voltaire and Goldsmith, only bring out the immense superiority of the original. Few things could be more different from this lively and popular book than Montesquieu's next work, the Grandezrr et dkcadence des *Romains,* in which the same acuteness and knowledge of human nature are united with considerable erudition and with a weighty though perhaps somewhat grandiloquent and rhetorical style. His third and greatest work, the Esprit des *lois,* is again different both in style and character. and such defects as it has are as nothing when compared with the merits of its fertility in ideas, its splendid breadth of view and the felicity with which the author, in a manner unknown before, recognizes the laws underlying complicated assemblages of fact. The style of this great work is equal to its substance; less light than that of the Lettres, less rhetorical than that of the Grandeur des *Romains,* it is still a marvellous union of dignity and wit. Around Montesquieu, partly before and partly after him, is a group of philosophical or at least systematic historians, of whom the chief are Jean Baptiste Dubos (1670–1742) and G. Bonnot de Mably (1709–85).

Montesquieu was followed by Anne Robert Jacques Turgot (1727–81), whose writings are few in number, and not remarkable for style, but full of original thought. Turgot in his turn was followed by Marie Jean Antoine Nicolas Caritat, marquis de Condorcet (1743–94), whose tendency is somewhat more sociological than directly historical. Toward the end of the period, too, a considerable number of philosophical histories were written, the usual object of which was, under cover of a kind of allegory, to satirize and attack the existing institutions and government of France. The most famous of these was the *Histoire* des *Indes,* nominally written by the abbé Guillaume Thomas Franqois Raynal (1713–96), but really the joint work of many members of the Philosophe party, especially Diderot. Side by side with this really or nominally philosophical school of history there existed another and less ambitious school, which contented itself with the older and simpler view of the science. The abbé René de Vertot (1655–1735) belongs almost as much to the 17th as to the 18th century. In the same class, too, far superior as his literary power, must be ranked the historical works of Voltaire, Charles *XII,* Pierre *le* Grand, *Histoire* du *Siècle* de Louis XIV.

The *Mémoires* of the duc de Saint-Simon (1675–1755) are an extraordinary series of pictures of the court of Louis XIV and the Regency, written in a powerful style, with something of the irregular excellence of the great 16th-century writers, and most striking in the sombre bitterness of its tone. The subsequent and less remarkable memoirs of the century are so numerous that it is almost impossible to select a few for reference and altogether impossible to mention all. Of those bearing on public history the memoirs of Marguerite Delaunay, baronne de Staal (1684–1750), of Pierre Louis de Voyer, marquis d'Argenson (1694–1757), of Charles Pinot Duclos (1704–72), of Stephanie Félicité de Saint-Aubin, Madame de Genlis (1746–1830), of Pierre Victor, baron de Bésenval de Bronstatt (1722–91), of Jeanne Louise Campan (1752–1822) and of Franqois Joachim Cardinal de Bernis (1715–94) may be selected for mention; of those bearing on literary and private history, the memoirs of Louise d'Epinay (1726–83), those of Mathieu Marais (1664–1737), the so-called *Mémoires* secrets of Louis Petit de Bachaumont (1690–1770) and the innumerable writings having reference to Voltaire and to the Philosophe party generally. Here, too, may be mentioned a remarkable class of literature, consisting of purely private and almost confidential letters, which were written at this time with very remarkable literary excellence. As specimens may be selected those of Mademoiselle Aissé (1694–1757), which are models of easy and unaffected tenderness, and those of Julie de Lespinasse (1732–76) the companion of the marquise du Deffand de la Lande and afterward of Jean Le Rond d'Alembert. These latter, in their extraordinary fervour and passion, not merely contrast strongly with the generally languid and frivolous gallantry of the age, but also constitute one of its most remarkable literary monuments. It has been said of them that they "burn the paper," and the expression is not exaggerated. Madame du Deffand's (1697–1780) own letters, many of which were written to Horace Walpole, are noteworthy in a very different way. Of lighter letters the charming correspondence of Diderot with Sophie Voland deserves special mention.

18th-Century Philosophy.—The Philosophes, as a general rule, have but little claim to their title. There were some who manifested, however, an aptitude for purely philosophical argument, and one who confined himself strictly thereto. Among these the most remarkable are Julien Offroy de la Mettrie (1709–51) and Denis Diderot. La Mettrie in his works *L'Homme machine, L'Homme plante,* etc., applied a lively and vigorous imagination, a considerable familiarity with physics and medicine and a brilliant but unequal style to the task of advocating materialistic ideas on the constitution of man. Diderot, in a series of early works, Lettre *sur* les *aveugles,* Promenade *d'un sceptique, Pen*skes *philosophiques,* etc., exhibited a good acquaintance nith philosophical history and opinion and gave sign in this direction, as in so many others, of a far-reaching intellect.

But the least mediocre metaphysician of the period is Étienne Bonnot, abbé de Condillac (1714–SO), almost the only writer of the time in France who succeeded in keeping strictly to philosophy without attempting to pursue his system to its results in ethics, politics and theology. In the Tmitk des *sensations,* the Essai *sur l'origine* des *connaissances humaines* and other works Condillac elaborated and continued the imperfect sensationalism of Locke.

It has never been at all accurately decided how far what may be called the scoffing school of Voltaire represents a direct revolt against Christianity and how far it was merely a kind of guerrilla warfare against the clergy. Voltaire was not an atheist, and he did not approve of atheism. But his *Dictionnaire philosophique,* which is typical of a vast amount of contemporary and subsequent literature, consists of a heterogeneous assemblage of articles directed against various points of dogma and ritual and various characteristics of the sacred records. From the literary point of view, it is one of the most characteristic of all Voltaire's works, though it is perhaps not entirely his. The desultory arrangement, the light and lively style. the extensive but not always accurate erudition and the somewhat captious and quibbling objections are intensely Voltairian. But there is little seriousness about it and certainly no kind of rancorous or deep-seated hostility. With many of Voltaire's pupils and younger contemporaries, however, the case was altered. They were distinctively atheists and antisupernaturalists. The atheism of Diderot, unquestionably the greatest of them all, has been keenly debated; but in the case of Étienne Damilaville (1723–68), Jacques André Naigeon (1738–1810), Paul Heinrich Dietrich, baron d'Holbach, and others there is no room for doubt. By these writers a great mass of atheistic and anti-Christian literature was composed and set afloat. The characteristic work of this school, its last word indeed, is the famous *Système de la nature,* attributed to Holbach (1723–89) but known to be, in part at least, the work of Diderot. In this remarkable work, the climax of the metaphysical materialism or rather nihilism of the century, the atheistic position is clearly stated.

As the Revolution approached, and the victory of the Philosophe party was declared, there appeared for a brief space a group of cynical and accomplished phrase makers presenting some similarity to that of which, 100 years before, Saint-Evremond was the most prominent figure. The chief of this group were Nicolas Chamfort (1747–94) on the republican side and Antoine Rivarol (1753–1801) on that of the royalists. Like the older writer to whom they have been compared, neither can be said to have produced any one work of eminence, and in this they stand distinguished from moralists like La Rochefoucauld. The floating sayings, however, which are attributed to them, or which occur here and there in their miscellaneous work. yield in no respect to those of the most famous of their predecessors in wit and a certain kind of wisdom, though they are frequently more personal than aphoristic.

18th-Century Moralists and Politicians.— Not the least part of the energy of the period in thought and writing was devoted to questions of a directly moral and political kind, however. With regard to morality proper the favourite doctrine of the century was what is commonly called the selfish theory, the only one indeed which was suitable to the sensationalism of Condillac and the materialism of Holbach. The pattern book of this doctrine was the *De l'esprit* of Claude Adrien Helvétius (1715–71), the most amusing book perhaps which ever pretended to the title of a solemn philosophical treatise. There is some analogy between the principles of this work and those of the *Système de la nature.*

Luc de Clapiers, marquis de Vauvenargues (1715–47), produced maxims and reflections of considerable mental force and literary finish. He was a worthy friend of Voltaire and not unworthy to be compared with Saint-Bvremond. Between the moralists and the politicians may be placed Rousseau, who in his novels and miscellaneous works is of the first class, in his famous *Contrat social* of the second. All his theories, whatever their originality and whatever their value, were made novel and influential by the literary beauties of their form.

Political economy and administrative theories received much attention. The earliest writer of eminence on these subjects was the great engineer Sébastien le Prestre, marquis de Vauban (1633–1707), whose *Oisivetés* and *Dîme royale* exhibit both great ability and extensive observation. A more utopian economist of the same time was Charles Irénée Castel, abbé de Saint-Pierre (1658–1743), not to be confounded with the author of *Paul et Virginie.* Soon political economy in the hands of François Quesnay (1694–1774) took a regular form, and toward the middle of the century a great number of works on questions connected with it, especially that of free trade in grain, on which Ferdinand Galiani (1728–87), André Morellet (1727–1819), both abbés, and above all Turgot, distinguished themselves.

18th-Century Criticism and Periodical Literature.— Literary criticism assumes in this century a sufficient importance to be treated under a separate heading. Contributions were made to it of many different kinds and from many different points of view. Periodical literature. the chief stimulus to its production, began more and more to come into favour. Even in the 17th century the *Journal des savants,* the Jesuit *Jownal de Trévoux* and other publications had set the example of different kinds of it.

Just before the Revolution the *Gazette de France* was in the hands of J. B. A. Suard (1734–1817), a man who was nothing if not a literary critic. Perhaps, however, the most remarkable contribution of the century to criticism of the periodical kind was the *Feuilles de Grimm,* a circular sent for many years to the German courts by Friedrich Melchior, baron von Grimm (1723–1807), the comrade of Diderot and Rousseau, and containing a *compte rendu* of the ways and works of Paris, literary and artistic as well as social.

The most characteristic critic of the mid-century was the abbé Charles Batteux (1713–So), who illustrated a tendency of the time by beginning with a treatise on *Les Beaux arts réduits à un même principe* (1746); reduced it and others into *Principes de la littérature* (1764) and added in 1771 *Les Quatres poktiques* (Aristotle, Horace, Vida and Boileau). Batteux is a very ingenious critic, and his attempt to conciliate "taste" and "the rules," though inadequate, is interesting. Works on the arts in general or on special divisions of them were not wanting, as, for instance, that of Dubos. the *Essai sur la peinture* of Diderot and others. Critically annotated editions of the great French writers also came into fashion. Of these Voltaire's edition of Corneille was the most remarkable, and his annotations, united separately under the title of *Commentaire sur Corneille,* form not the least important portion of his works.

The method of much of the literary criticism of the close of this period was indeed deplorable enough. Jean François de la Harpe (1739–1803), who though a little later in time as to most of his critical productions is perhaps the most representative figure, shows criticism in one of its worst forms. La Harpe lays it down distinctly that a beauty, however beautiful, produced in spite of rules is a "monstrous beauty" and cannot be allowed.

18th-Century Savants.— In science and general erudition the 18th century in France was at first much occupied with the mathematical studies for which the French genius is so peculiarly adapted, which the great discoveries of Descartes had made possible and popular and which those of his supplanter Newton only made more popular still. Voltaire took to himself the credit, which he fairly deserves, of first introducing the Newtonian system into France, and it was soon widely popular, even ladies devoting themselves to the exposition of mathematical subjects, as in the case of Gabrielle de Breteuil, marquise du Chbtelet (1706–49), Voltaire's "divine Emilie." Indeed ladies played a great part in the literary and scientific activity of the century, by actual contribution sometimes, but still more by continuing and extending the tradition of "salons." The duchesse du Maine, Mesdames de Lambert, de Tencin, Geoffrin, du Deffand, Necker and, above all, the baronne d'Holbach (whose husband, however, was here the principal personage) presided over coteries which became more and more "philosophical." Many of the greatest mathematicians of the age, such as Abraham de Moivre and Pierre Simon, marquis de Laplace, were French by birth, while others such as Leonhard Euler belonged to French-speaking nationalities and wrote in French. The physical sciences were also ardently cultivated, the impulse to them being given partly by the generally materialistic tendency of the age, partly by the Newtonian system and partly also by the extended knouledge of the world provided by the circumnavigatory voyage of Louis Antoine de Bougainville (1729–1811) and other travels. P. L. Moreau de Maupertius (1698–1759) and C. M. de la Condamine (1701–74) made long journeys for scientific purposes and, duly recorded their experiences. D'Alembert, a great mathematician and a writer of considerable. though rather academic excellence, is principally known from his connection with and introduction to the *Encyclopédie,* discussed below. Chemistry was also assiduously cultivated, the baron d'Holbach, among others, being a devotee thereof and helping to advance the science to the point where, at the conclusion of the century, it was illustrated by Claude Louis Berthollet and Antoine Lavoisier.

During all this devotion to science in its modern acceptation, the older and more literary forms of erudition were not neglected, especially by the illustrious Benedictines of the abbey of St. Maur. Dom Augustin Calmet (1672–1757), the author of the well-known Dictionary of the Bible, belonged to this order, and to them also (in particular to Dom Rivet) was attributable the beginning of the immense *Histoire* litte'raire de la France, a work interrupted by the Revolution and long suspended, but diligently continued after the middle of the 19th century. The immense Natural History of Georges Louis Leclerc, comte de Buffon (1717–88), though not entirely his own, is a remarkable monument of the union of scientific tastes with literary ability. As has happened in many similar instances, there is in parts more literature than science to be found in it, yet many fruitful scientific ideas and theories are here propounded for the first time.

The *Encyclopédie,* unquestionably on the whole the most important French literary production of the century, if we except the works of Rousseau and Voltaire, was conducted for a time by Diderot and D'Alembert, afterward by Diderot alone. It numbered among its contributors almost every Frenchman of eminence in letters. It had, besides a considerable theological and political influence, an immense share in diffusing and gratifying the taste for general information.

1789–1820 — General Sketch. — The period which elapsed between the outbreak of the Revolution and the accession of Charles X has often been considered a sterile one in point of literature. Casimir Delavigne (1793–1843), the author of Les *Messéniennes,* is a writer of very great talent, and, according to the measure of J. B. Rousseau and Lebrun (Ponce Denis Ecouchard), no mean poet. It is usual to reckon Delavigne as transitionary between the classical and romantic schools, but in strictness he must be counted with the classicists. Dramatic poetry exhibited somewhat similar characteristics. Jean Franqois Ducis (1733–1816), who passes with Englishmen as a feeble reducer of Shakespeare to classical rules, passed with his contemporaries as an introducer into French poetry of strange and revolutionary novelties.

Comedy, on the other hand, fared better, as indeed it had always fared. Philippe Franqois Nazaire Fabre d'Eglantine (1755–94), the companion in death of Georges Jacques Danton, Jean Franqois Collin d'Harleville (1755–1806), Franqois G. J. S. Andrieux (1759–1833), Louis Benoît Picard, Alexandre Duval and Népomucène Lemercier (1771–1840) (the most vigorous of all as a poet and a critic of mark) were the comic authors of the period. Perhaps the most remarkable work in point of originality of the time was Xavier de Maistre's (1763–1852) Voyage *autour* de *ma chambre*, an attempt in quite a new style, which was happily followed up by other writers.

The chief philosophical writers were Pierre Paul Royer Collard (1763–1845), F. P. G. Maine de Biran (1776–1824) and Théodore Simon Jouffroy (1796–1842). Their influence on literature, however, was altogether inferior to that of the conservative school, of whom Louis Gabriel, vicomte de Bonald (1754–1840), and Joseph de Maistre (1754–1821) were the great leaders. As Bonald is royalist and aristocratic, so Maistre is the advocate of a theocracy pure and simple, with the pope for its earthly head and a vigorous despotism for its system of government. Joseph Joubert (1754–1824) is the most illustrious successor of Pascal and Vauvenargues, certainly above Vauvenargues in breadth and depth of thought. In pure literary criticism more particularly, Joubert, though exhibiting some inconsistencies because of his time. is astonishingly penetrating and suggestive. Étienne Pivert de Sénancour (1770–1846), with Obermann (1804). had an extraordinary influence on his own and the next generation in the direction of melancholy moralizing.

We have already alluded to some of the beginnings of periodical and journalistic letters in France. For some time, in the hands of Pierre Bayle, Jacques Basnage, P. des Maizeaux and Pierre Jurieu, periodical literature consisted mainly of a series, more or less disconnected, of pamphlets, with occasional extracts from forthcoming works, critical *adversaria* and the like. Of a more regular kind were the often-mentioned Journal *de Trévoux* and *Mercure* de France, and later the *Année littéraire* of Louis Marie Stanislas Fréron and the like. The Correspondance of Grimm also, as has been pointed out, bore considerable resemblance to a modern monthly review, though it was addressed to a very few persons. Of political news there was, under a despotism, naturally very little. The year 1789, however, saw a vast change in this respect. An enormous efflorescence of periodical literature at once took place and a few of the numerous journals founded in that year or soon afterward survived for a considerable time.

A whole class of authors arose who pretended to be nothing more than journalists, while many writers distinguished for more solid contributions to literature took part in the movement, and not a few active politicians contributed. Thus to the original staff of the *Moniteur,* or, as it was at first called, La Gazette nationale, La Harpe, Jean Charles Dominique de Lacretelle, Franqois Guillaume Jean Stanislas Andrieux, Dominique Joseph Garat (1749–1833) and Pierre Ginguené (1748–1815) were attached. Among the writers of the *Journal* de Paris André Chénier had been ranked. Louis de Fontanes contributed to many royalist and moderate journals. Franqois Pierre Guillaume Guizot and André Morellet, representatives, respectively, of the 19th and the 18th century, shared in the *Nouvelles politiques,* while Louis Franqois Bertin, Joseph Fievée and Julien Louis Geoffroy (1743–1814), a critic of peculiar acerbity, contributed to the Journal de *l'empire,* afterward turned into the famous Journal des de'bats. With Geoffroy, François Benoît Hoffman (1760–1828), Franqois Joseph Dussault (1769–1824) and Charles Marie Dorimond, abbé de Féletz (1765–1850), constituted a quartet of critics sometimes spoken of as "the *Débats* four," though they were by no means all friends. Of active politicians Jean Paul Marat (*L'Ami* du *peuple*), Honor6 Gabriel Riqueti, comte de Mirabeau (Courrier de Provence), Bertrand Barère de Vieuzac (Le Point *dü* jour), Jacques Pierre Brissot (Patriote *français*), Jacques René Hébert (*Père* Duchesne), Maximilien Franqois Marie Isidore de Robespierre (*Défenseur* de la constitution) and Jean Lambert Tallien (La Sentinelle) were the most remarkable who had an intimate connection with journalism. On the other hand, the type of the journalist pure and simple is Camille Desmoulins (1760–94), one of the most brilliant, from a literary point of view, of the short-lived celebrities of the time. Of the same class were Charles Durozoir (1790–1844), Elisée Loustalot (1762–90) and Jacques Coretin Royou (1745–1828). As the immediate daily interest in politics drooped, there were formed periodicals of a partly political and partly literary character. Such had been the De'cade *philosophique,* which counted Pierre Jean Georges Cabani Chénier and Antoine Louis Claude Destutt, comte de Tracy, among its contributors, and this was followed by the Revue *française* at a later period, which was in its turn succeeded by the Revue des deux mondes. On the other hand, parliamentary eloquence was even more important than journalism during the early period of the Revolution. Mirabeau naturally stands at the head of orators of this class, and next to him may be ranked the well-known names of Pierre Victor Malouet among constitutionalists; of Robespierre, Marat and Danton, the triumvirs of the Mountain; of Jean Siffrein Maury, Jacques Antoine Marie de Cazalès and André Boniface Louis Riqueti, vicomte de Mirabeau, among the royalists; and above all of the Girondist speakers Antoine Pierre Joseph Marie Barnave, Pierre Victurnien Vergniaud and Jean Denis, comte Lanjuinais. The last-named survived to take part in the revival of parliamentary discussion after the Restoration. But the permanent contributions to French literature of this period of voluminous eloquence are, as frequently happens in such cases, by no means large.

The union of the journalist and the parliamentary spirit produced, however, in Paul Louis Courier a master of style. Courier spent the greater part of his life, tragically cut short, in translating the classics and studying the older writers of France, in which study he learned thoroughly to despise the pseudoclassicism of the 18th century. It was not till he was past 40 that he took to political writing, and the style of his pamphlets and their wonderful irony and vigour at once placed them on the level of the very best things of the kind. Benjamin Constant de Rebecque (1767–1830), though mainly a politician and an orator, lives in literature by his *Adolphe* (1815), a model of the analytical pseudo-biographical novel.

Madame de Staël (1766–1817) on the other hand, as became a daughter of Necker, retained a great deal of the Philosophe character and the traditions of the 18th century, especially its liberalism, its *sensibilitd* and its thirst for general information; to these, however, she added a cosmopolitan spirit and a readiness to introduce into France the literary and social, as well as the political and philosophical, peculiarities of other countries. Her early writings were of the critical kind, half aesthetic, half ethical, of which the 18th century had been fond and which their titles, *Lettres sur J. J. Rousseau, De l'influence des passions, De la littérature considérée dans ses rapports avec les institutions sociales,* sufficiently show. Her romances, *Delphine* and *Corinne,* had immense literary influence at the time. Still more was this the case with *De l'Allemagne,* which practically opened up to the rising generation in France the till then unknown quantities of literature and philosophy which during the most glorious half century of its literary history Germany had, sometimes on hints taken from France itself, been accumulating. The literary importance of François René, vicomte de Chateaubriand (1768–1848), is far greater, while his literary influence can hardly be exaggerated. Chateaubriand's literary father was Rousseau, and his voyage to America helped to develop the seeds which Rousseau had sown. In *René* and other works of the same kind, the nature worship of Rousseau received a still further development. But it was not in mere description that Chateaubriand was to find his most fertile and most successful theme. It was, on the contrary, in the rehabilitation of Christianity as an inspiring force in literature. This theme he develops with the most splendid language and with every conceivable advantage of style in the *Génie du Christianisme* and the *Martyrs.* His *Mémoires d'outre-tombe,* however, are his lasting masterpiece; in power of style, in psychological penetration and even occasionally in depth of thought they rank among the very best things in the French language.

THE 19TH CENTURY

The literary work of the 19th century and of the great romantic movement which began in its second quarter was to repeat on a far larger scale the work of the 16th, to break up and discard such literary forms as had become useless or hopelessly stiff, to give strength, suppleness and variety to such as were retained, to invent new ones where necessary, to enrich the language by importations, inventions and revivals and, above all, to bring into prominence the principle of individualism. Authors and even books, rather than groups and kinds, demand principal attention.

The result of this revolution is naturally most remarkable in the belles-lettres and the kindred department of history. Poetry, not dramatic, was revived; prose romance and literary criticism were brought to a perfection previously unknown; and history produced works more various and more remarkable than at any previous stage of the language.

Before the accession of Victor Hugo, three new writers were of remarkable eminence. These three were Pierre Jean de Béranger (1780–1857), Alphonse de Lamartine (1790–1869) and Hugues Félicité Robert de Lamennais (1782–1854). The first belongs definitely in manner, despite his striking originality of nuance, to the past. He has remnants of the old periphrases, the cumbrous mythological allusions, the poetical "properties" of French verse. His astonishing popularity makes it necessary to mention him, but very little of value remains of his work. Béranger's talent was still too much a matter of individual genius to have great literary influence, and he formed no school. It was different with Lamartine, who was, nevertheless, like Béranger, a typical Frenchman. The *Me'ditations* and the *Harmonies* exhibit a remarkable transition between the old school and the new. In going directly to nature, in borrowing from her striking outlines, vivid and contrasted tints, harmony and variety of sound, the new poet showed himself an innovator of the best class. In using romantic and religious associations and expressing them in affecting language, he was the Chateaubriand of verse. But with all this he retained some of the vices of the classical school. His versification, harmonious as it is, is monotonous, and he does not venture into the bold lyrical forms which true poetry loves. He has still the horror of the *mot propre;* he is always spiritualizing and idealizing, and his style and thought have a double portion of the feminine and almost flaccid softness which had come to pass for grace in French.

The last of the trio, Lamennais, represents an altogether bolder and rougher genius. Strongly influenced by the Catholic reaction, Lamennais also shows the strongest possible influence of the revolutionary spirit. His earliest work, the *Essai sur l'indifférence en matière de religion* (1817 and 1818) was a defense of the church on curiously unecclesiastical lines. It was written in an ardent style, full of illustrations and extremely ambitious in character.

In Lamennais's prose, especially as afterward developed in the apocalyptic *Paroles d'un croyant* (1839), are to be discerned many of the tendencies of the romantic school, particularly its hardy and picturesque choice of language and the disdain of established and accepted methods which it professed. The signs of the Revolution itself were, as was natural, first given in periodical literature. The feudalist affectations of Chateaubriand and the legitimists excited a sort of aesthetic affection for Gothicism, and Walter Scott became one of the favourite authors in France Soon was started the periodical *La Muse française,* in which the names of Hugo, Vigny, Deschamps and Madame de Girardin appear. Almost all the writers in this periodical were eager royalists, and for some time the battle was still fought on political grounds. There could, however, be no special connection between classical drama and liberalism; and the liberal journal, the *Globe* with no less a person than Sainte-Beuve among its contributors, declared definite war against classicism in the drama. The chief "classical" organs were the *Constitutionnel,* the *Journal des de'bats* and, after a time and not exclusively, the *Revue des deux mondes.* Soon the question became purely literary, and the romantic school proper was born in the famous *cénacle* or clique in which Hugo was chief poet, Sainte-Beuve chief critic and Gautier, Gérard de Nerval, the brothers Émile (1791–1871) and Antony (1800–69) Deschamps, Petrus Borel (1809–59) and others were officers. Alfred de Vigny and Alfred de Musset stand somewhat apart, and so does Charles Nodier (1780–1844), a versatile and voluminous writer, the very variety and number of whose works have somewhat prevented the individual excellence of any of them from having justice done to it. The objects of the school were, briefly stated, the burning of everything which had been adored and the adoring of everything which had been burned. They would have no unities. no arbitrary selection of subjects, no restraints on variety of versification, no academically limited vocabulary, no considerations of artificial beauty and, above all, no periphrastic expression. The *mot propre*, the calling of a spade a spade, was the great commandment of romanticism; but it must be allowed that what was taken away in periphrase was made up in adjectives. The performance of *Hernani* in 1830 was the culmination of the struggle, and during a great part of the reign of Louis Philippe almost all the younger men of letters in France were romantics. The performance of the *Lucrèce* of François Ponsard (1814–67) in 1843 is often quoted as the herald or sign of a classical reaction.

Romantic Drama and Poetry. — Although the immediate subject on which the battles of classics and romantics arose was dramatic poetry, the dramatic results of the movement have not been those of greatest value or most permanent character. The principal effect in the long run has been the introduction of a species of play called *drame,* as opposed to regular comedy and tragedy, admitting of much freer treatment than either of these two as previously understood in French and lending itself in some measure to the lengthy and disjointed action, the multiplicity of personages and the absence of stock characters which characterized the English stage in its palmy days. All Victor Hugo's dramatic works are of this class, and each, as it was produced or published *(Cromwell, Hernani, Marion Delorme, Le Roi s'amuse, Lucrèce Borgia, Marie Tudor, Ruy Blas* and *Les Burgraves),* was a literary event and excited the most violent discussion — the author's usual plan being to prefix a prose preface of a very militant character to his work. A still more melodramatic variety of *drame* was that chiefly represented by Alexandre Dumas (1802–70), whose *Henri III* and *Antony,* to which may be added later *La Tour de Nesle* and *Mademoiselle de Belleisle,* were almost as much rallying points for the early romantics as the dramas of Hugo, despite their inferior literary value. Alfred de Vigny's *Chatterton* is perhaps the best single drama produced by the romantic movement.

A special variety of drama of some literary importance was also cultivated under the title of *sc*è*nes* or *proverbes,* slight dramatic sketches in which the dialogue and style are of even more importance than the action. The best of all of these are those of Alfred de Musset (1810–57), whose *Il faut qu'une porte soit ouverte ou fermée, On ne badine pas avec l'amour,* etc., are models of grace and wit.

In poetry proper, as in drama, Victor Hugo showed the way. In him all the romantic characteristics were expressed and embodied — disregard of arbitrary critical rules, free choice of subject, variety and vigour of metre, splendour and sonorousness of diction, abundant "local colour" and that irrepressible individualism which is one of the chief, though not perhaps the chief, of the symptoms. A deficient sense of the ludicrous which characterized many of the romantics was strongly apparent in their leader, as was also an equally representative grandiosity and a fondness for the introduction of foreign and unfamiliar words. especially proper names, which occasionally produces an effect of burlesque. Victor Hugo's earliest poetical works, his chiefly royalist and political *Odes,* were cast in the older and accepted forms, but already displayed astonishing poetical qualities. But it was in the *ballades* (*e.g.,* the splendid *Pas d'armes du roi Jean,* written in verses of three syllables) and the *orientales* (of which may be taken for a sample the sixth section of *Navarin,* a perfect torrent of outlandish terms poured forth in the most admirable verse, or *Les Djinns,* where some of the stanzas have lines of two syllables each) that the grand provocation was thrown to the believers in alexandrines, careful caesuras and strictly separated couplets. *Les Feuilles d'automne, Les Chants du crépuscule, Les Voix intérieures, Les Rayons et les ombres,* the productions of the next 20 years, were quieter in style and tone but no less full of poetical spirit. The revolution of 1848, the establishment of the empire and the poet's exile brought about a fresh concentration of his genius on lyrical subjects. *Les Châtiments* and *La Légende des siècles,* the one political, the other historical, reach perhaps the high-water mark of French verse; and they were accompanied by the philosophical poems *Dieu, La Fin de Satan* and by *Les Contemplations,* and followed by the lighter *Chansons des rues et des bois,* the *Année terrible,* the second *Le'gende des siècles,* etc. The literary productiveness of Victor Hugo himself has been the measure and sample of the whole literary productiveness of France on the poetical side. At 25 he was acknowledged as a master, at 75 he was a master still. He is the one single universal literary genius whom France can recognize as its representative, and to be set in world literature on the level of Dante, Cervantes, Shakespeare and Goethe. By his highest achievements, in such poems as *Dieu* and *La Fin de Satan,* he takes his place among the religious prophets of mankind.

Hugo's poetical influence has been represented in different schools, from which very few of the poetical writers of the century can be excluded. Alfred de Musset, a writer of great talent, felt part of the romantic inspiration very strongly, but was on the whole unfortunately influenced by Byron, and partly out of wilfulness, partly from a natural want of persevering industry and vigour, allowed himself to be careless and even slovenly in composition. Notwithstanding this, some of his lyrics are among the finest poems in the language, and his verse, careless as it is, has extraordinary natural grace. Auguste Barbier (1805–82), whose *Iambes* shows an extraordinary command of nervous and masculine versification, also comes in here. Alfred de Vigny (1799–1865) is a great poet of little bulk and somewhat over-fastidious, but possessing one of the strongest styles to be found in French with a curious restrained passion and a complicated originality, rising to the greater heights of philosophical poetry. Madame hckermann (1813–90) is the philosophical poetess of the romantic period; but for actual poetical powers, Marceline Desbordes-Valmore (1786–1859) perhaps excelled her, though in a looser and more sentimental fashion. Théophile Gautier (1811–72) is one of the best poets in point of form that France has produced. The *Comédie de la mort,* the *Poésies diverses* and still more the *Emaux et camées* display a distinctly classical tendency — classical, that is to say, not in the party and perverted sense, but in its true acceptation. The tendency to the fantastic and horrible may be taken as best shown by Petrus Borel (1809–59), a writer of singular power almost entirely wasted. Gérard de Nerval (Labrunie) (1808–55) adopted a manner also fantastic but more idealistic than Borel's and distinguished himself by his oriental travels and studies and by his attention to popular ballads and traditions; and his style has an exquisite but unaffected strangeness hardly inferior to Gautier's. Théodore de Banville (1823–91), adopting the principles of Gautier and combining with them a considerable satiric faculty, composed a large amount of verse, faultless in form, delicate and exquisite in shades and colours but so entirely neutral in moral and political tone that it has found fewer admirers than it deserved. Charles Marie René Leconte de Lisle (1818–94) (*Poèmes antiques, Poèmes barbares, Poèmes tragiques*), carrying out the principle of ransacking foreign literature for subjects, went to Celtic, classical or even oriental sources for his inspiration, and despite a science in verse not much inferior to Banville's, and a far wider range and choice of subject, diffused an air of erudition, not to say pedantry, over his work which tried some readers and a pessimism which displeased others, but has left poetry inferior only to that of the greatest of his countrymen. Charles Baudelaire (1821–67) in *Les Fleurs du mal* gives the first poems in which the "modern" note is struck. His influence on the 20th century was greater than Victor Hugo's, and perhaps even than that of Mallarmé. He revealed the inner beauty of things — and feelings — until then accounted ugly or sinful. His verse often reaches unprecedented felicity of vocabulary and rhythm, but unfortunately never stays for very long at its highest. Hugo, whom he revered, aptly and generously described him as having discovered a *frisson nouveau.* Many critics see in him the greatest and the most human of all French poets. Ohe cannot judiciously go so far, but he is undoubtedly one of the finest.

Postromantic Poetry. — In 1866 a collection of poems, entitled after an old French fashion *Le Parnasse contemporain,* appeared. It included contributions by some of the poets just mentioned, but the mass of the contributors were previously unknown to fame. A similar collection appeared in 1869 and was interrupted by the German war but continued after it, and a third in 1876.

The first *Parnasse* had been projected by Xavier de Ricard (1843–1911) and Abraham Catulle Mendès (1841–1909) as a sort of manifesto of a school of young poets; but its contents were largely coloured by the inclusion among them of work by representatives of older generations — Gautier, Laprade, Leconte de Lisle, Banville, Baudelaire and others. The continuation, however, of the title in the later issues, rather than anything else, led to the formation and promulgation of the idea of a *Parnassien* or an *Impassible* school nhich was supposed to adopt as its watchword the motto of "Art for art's sake," to pay especial attention to form and also to aim at a certain objectivity. As a matter of fact the greater poets and the greater poems of the *Parnasse* admit of no such restrictive labelling, which can be regarded only as mischievous, though (or very mainly because) it has been continued. Another school, arising mainly in the later '80s and calling itself that of symbolism, has been supposed to indicate a reaction against Parnassianism and even against the main romantic tradition generally, with a throwing back to Lamartine and perhaps Chénier. This idea of successive schools (decadents, naturists, etc.) has even been reduced to such an *absurdum* as the statement that "France sees a new school of poetry every 15 years." Those who have studied literature sufficiently widely, and from a sufficient elevation. know that these systematizings are alnays more or less delusive. Parnassianism. symbolism and the other things are merely phases of the romantic movement itself—as may be proved to demonstration by the simple process of taking, say, Hugo and Verlaine on the one hand, Delille or Escouchard Lebrun on the other, and comparing the two first mentioned with each other·and with the older poet. The differences in the first case will be found to be differences at most of individuality, in the other of kind.

We shall not try to list the so-called schools but simply give the names and mention the chief works of the important poets of the period. Among the most remarkable were Sully Prudhomme (1839–1907), François Coppée (1842–1908) and Paul Verlaine (1844–96). The first *(Stances et poèmes,* 1865; *Vaines tendresses,* 1875; *Bonheur,* 1888; etc.) is a philosophical and rather pessimistic poet, the second *(La Grève des forgerons,* 1869; *Les Humbles,* 1872; *Contes et vers,* 1881–87; etc.) a dealer with more generally popular subjects in a more sentimental manner and the third *(Sagesse,* 1881; *Parallèlement,* 1889; *Poèmes saturniens,* including early work, 1867–90), by far the most original and remarkable poet of the three. starting with Baudelaire and pushing further the fancy for forbidden subjects, but treating both these and others with wonderful command of sound and image suggestion. Verlaine in fact (he was actually well acquainted with English) endeavoured and to a small extent succeeded in the endeavour to communicate to French the vague suggestion of visual and audible appeal which has characterized English poetry from Blake and Coleridge onward.

Arthur Rimbaud (1854–91), an extraordinary personality who gave up writing before he was 20, must be mentioned for his influence, which ranks with that of Baudelaire and Verlaine. His *Le Bateau ivre* is a short masterpiece. Stéphane Mallarmé (1842–98), afterward chief of the symbolists, was a great poet in his way, though somewhat barren. His technique and his ideals dominated the best in all later poetry not only in France, but all over the world, down to Paul Valéry and T. S. Eliot. This movement, started by Baudelaire, Rimbaud and Mallarmé, was helped later by the influence of three peculiar writers, all of whom suffered from bad health and died young. Isidore Ducasse, nho adopted the title of comte de Lautréamort, died at 24 in 1870 and his *Chants de Maldoror* became famous only in the 20th century; Tristan Corbiere (1845–75) acquired a late reputation after 1890 with *Les Amours jaunes;* Jules Laforgue (1860–87) brought into the Symbolist movement a German metaphysical element. José Maria de Hérédia (1842–1905) was a very exquisite practitioner of the sonnet but with perhaps more art than matter in him. A. Villiers de l'Isle-Adam was another eccentric with but a spark of genius; Léon Dierx, after producing even less than Mallarmé, succeeded him as symbolist chief.

Yet another flight of poets may be grouped as specially representing the last quarter of the century and (whether Parnassian, symbolist or what not) the latest development of French poetry. Verlaine and Mallarmé were in a manner the leaders of these. The whole tendency of the period was to relax the stringency of French prosody. Albert Samain (1859- goo), a musical versifier; Jean Moréas (Papadiamantopoulos) (1856–1910), who began with a volume called *Les Syrtes* in 1884; Laurent Tailhade (1854–1919) and others are more or less symbolist, and contributed to the symbolist periodical (one of many such since the beginning of the romantic movement which would almost require an article to themselves), the *Mercure de France.* Jean Richepin (1849–1926) harked back somewhat to the type of early romanticism—*La Chanson des gueux, Les Blasphèmes,* etc. Edmond Rostand brilliantly revived the romantic drama in verse in *Cyrano de Bergerac* (1897) and other plays. Henri de Régnier (1864–1936) received very high praise for work in *Lendemains* (1886) and other volumes such as *Les Jeux rustiques et divins* (1897) and *Les Médailles d'argile* (1900). His later writings cover a larger field.

Fiction After 1830.—The novel during this period took two different directions—the first that of the novel of incident, the second that of analysis and character. The first was that which, as was natural when Scott was the model, was formerly most trodden; the second. because of the genius of George Sand, of Balzac and of Stendhal, became predominant. The novels of Victor Hugo are novels of incident, with a strong infusion of purpose and considerable but rather ideal character drawing. They are in fact lengthy prose *drames* rather than romances proper, and they have found no imitators. They display. however, the powers of the master at their fullest. On the other hand, Alexandre Dumas originally composed his novels in close imitation of Scott, and they are much less dramatic than narrative in character. The best of them, such as *Les Trois mousquetaires, Vingt ans aprds, La Reine Margot,* are probably the best specimens extant of their kind. Of somewhat the same kind, but of a far lower stamp, are the novels of Eugène Sue (1804–57). Dumas and Sue were accompanied and followed by a vast crowd of companions, independent or imitative. Alfred de Vigny had already attempted the historical novel in *Cinq-Mars.*

By degrees, however, the taste for the novel of incident. at least of a historical kind, died out till it was revived in another form, and with an admixture of domestic interest, by Erckmann-Chatrian. The last and one of the most splendid instances of the old style was *Le Capitaine Fracasse,* which Théophile Gautier began early and finished late as a kind of *tour de force.* The last-named writer in his earlier days had modified the incident novel in many short tales, a kind of writing for which French has always been famous and in which Gautier's sketches are masterpieces. His only other long novel, *Mademoiselle de Maupin,* belongs rather to the class of analysis. With Gautier, as a writer whose literary characteristics excel even his purely tale-telling powers, may be classed Prosper Mérimée (1803–70), one of the most exquisite 19th-century masters of the language. Already, however, in 1830 the tide was setting strongly in favour of novels of contemporary life and manners.

The great master of the novel of character and manners as opposed to that of history and incident is Honoré de Balzac (1799–1850). With him George Sand and Stendhal must be studied. Henri Beyle (1798–1865), who wrote under the nom de plume of Stendhal, stands by himself. His chief books in the line of fiction are *La Chartreuse de Pavme* and *Le Rouge et le noir,* exceedingly powerful novels of the analytical kind, and he also composed a considerable number of critical and miscellaneous works. Of little influence at first (though he had great power over Mérimée), he exercised ever-increasing authority as a master of pessimistic analysis. Indeed much of his work was never published till toward the close of the century. George Sand (1804–76) began with books strongly tinged with the spirit of revolt against moral and social arrangements, and she sometimes diverged into very curious paths of pseudophilosophy, such as was popular in the second quarter of the century. At times, too, as in *Lucrezia Floriani* and some other works, she did not hesitate to draw largely on her own personal adventures and experiences. But later on she devoted herself rather to sketches of country life and manners and to novels involving bold if not very careful sketches of character and more or less dramatic situations. She was one of the most fertile of novelists, continuing to the end of her long life to pour forth fiction at the rate of many volumes a year. Of her different styles may be mentioned as fairly characteristic *Lélia, Lucrezia Florinni, Consuelo, La Mare au diable, La Petite Fadette, François le champi* and *Mademoiselle de la Quintinie.* In view of the shorter length of his life the productiveness of Balzac was almost more astonishing, especially if we consider that he left great stores of fragments and unfinished sketches. His early work was worse than unsuccessful, it was positively bad. After more than a score of unsuccessful attempts, *Les Chouans* at last made its mark, and for 20 years from that time the astonishing productions compoiing the so-called *Comédie humaine* were poured forth successively. The subtitles which Balzac imposed upon the different batches. *Scènes de la vie parisienne, de la vie de province, de la vie intime,* etc., show like the general title, a deliberate intention on the author's part to cover the whole ground of human, at least of French, life. Such an attempt could not succeed wholly; yet the amount of success attained is astonishing. Balzac has, however. with some justice been accused of creating the world which he described, and his personages, wonderful as is the accuracy and force with which many of the characteristics of humanity are exemplified in them, are sometimes not altogether human. Balzac stands as the foremost novelist of France, and in the opinion of many as the greatest of all novelists.

The so-called realist side of Balzac was developed (but, as he himself acknowledged, with a double dose of intermixed if somewhat transformed romanticism) by Gustave Flaubert (1821–SO), who showed culture, scholarship and a literary poaer over the language inferior to that of no writer of the century. No novelist of his generation attained a higher literary rank than Flaubert. *Madame Bovary* and *L'Éducation sentimentale* are studies of contemporary life; in *Salammbô* and *La Tentation de Saint Antoine* erudition and antiquarian knowledge furnish the subjects for the display of the highest literary skill. Eugéne Fromentin (1820–76), best known as a painter. wrote a novel, *Dominique,* which is highly appreciated by good judges.

The "naturalists" proper chiefly developed or seemed to develop one side of Balzac, but almost entirely abandoned his romantic element. They aimed first at exact and almost photographic delineation of the incidents of modern life and second at still more uncompromising nonsuppression of the essential features and functions of that life which are usually suppressed. This school may be represented in chief by four novelists (really three, as two of them nere brothers who wrote together till the rather early death of one of them), Émile Zola (1840–1903), Alphonse Daudet (1840–97) and Edmond (1822–97) and Jules (1830–70) de Goncourt. The first. of Italian extraction and Marseillais birth, began with work of undecided kinds and was alnays a critic as well as a novelist. Of this first stage *Contes à Ninon* (1864) and *Thérèse Raquin* (1867) deserve to be specified. But after 1870 Zola entered upon a huge scheme (suggested no doubt by the *Comédie humaine*) of tracing the fortunes in every branch, legitimate and illegitimate, and in every rank of society of a family, *Les Rougon-Macquart,* and carried it out in a full score of novels during more than as many years. He followed this with a shorter series on places, *Paris, Rome, Lourdes,* and lastly by another of strangely apocalyptic tone. *Fécondité, Travail, Vérité,* the last a story of the Dreyfus case, retrospective and. as it proved, prophetic. Between Flaubert and Proust. Zola emerges (with only Anatole France as a possible competitor) as the most important and influential of French novelists. *L'Assommoir* (1877) and *Germinal* (188;) are generally considered his best novels. His pessimistic realism is tempered by a powerful sympathy for human suffering. moral as well as physical.

The Goncourts. besides their work in naturalist (they would have preferred to call it "impressionist") fiction, devoted themselves especially to study and collection in the fine arts and produced many volumes on the historical side of these, volumes distinguished by accurate and careful research. This quality they carried, and the elder of them after his brother's death continued to carry into novel writing (*Renée Mauperin, Germinie Lacerteux, Chérie,* etc.), nith the addition of an extraordinary care for peculiar and. as they called it, "personal" diction. On the other hand. Alphonse Daudet (who with the other three, Flaubert to some extent. and the Russian novelist Ivan Sergeyevich Turgenev formed a sort of *cénacle* or literary club) mixed with some naturalism a far greater amount of fancy and wit than his companions alloned themselves or could perhaps attain; and in the *Tartarin* series (dealing with the extravagances of his fellow Provençaux) added not a little to the gaiety of Europe. His other novels (*Fromont jeune et Risler aîné, Jack, Le Nabab,* etc.), also very popular, have been variously judged. there being something strangely like plagiarism in some of them. and in others in fact in most an excessive use of that privilege of the novelist which consists in introducing real persons more or less under disguise. It should be observed in speaking of this group that the Goncourts, or rather the survivor of them, left an elaborate *Journal* of much importance for the appreciation of the personal side of French literature during the last half of the century.

Barbey d'Aurevilly (1808–1889) with *L'Ensorcelée* and *Le Chevalier Destouches* has a place of his own and many passionate admirers. He is in his own way a master of fiction and a master of prose. The tales of Villiers de l'Isle-Adam (1838–89) also deserve to be at least mentioned. Léon Bloy (1846–1917) in *Le Désespéré* and *La Femme pauvre* reaches a violent and unequal but real kind of genius.

In 1880 Zola, who had by this time formed a regular school of disciples. issued with certain of them a collection of short stories, *Les Soire'es de Médan,* which contains one of his own best things. "L'Attaque du moulin," and also the capital story "Boule de suif" by Guy de Maupassant (1850–93), who in the same year published poems, *Des Vers,* of very remarkable if not strictly poetical quality. Maupassant developed great powers in a series of longer novels (*Une Vze, Bel-Ami, Pierre et Jean, Fort comme la mort*) and shorter stories (*Monsieur Parent, Les Soeurs Rondoli, Le Horla*), but they were distorted by pessimism. J. K. Huysmans (1848–1907), also a contributor to *Les Soirées de Médan,* who began a little earlier nith *Marthe* (1876) and other books, gave his most characteristic work in 1884 with *A Rebours* and in 1891 with *Ld-bas,* stories of exaggerated and "satanic" pose. Afterward, by an obvious reaction, he returned to Catholicism. Of about the same date as these two were two other novelists of note, Julien Viaud ("Pierre Loti") (1850–1923), a naval officer who embodied his experiences of foreign service with a faint dose of story and character interest. a far larger one of description and chiefly of lyrism in a series of books (*Aziyadé, Le Mariage de Loti, Madanze Chrysanthème,* etc.), and Paul Bourget (1852–1935), an important critic as well as novelist—*Crztelle Énigme* (1885), *Le Disciple, La Terre promise, Cosmopolis.* As a contrast or complement to Bourget's "psychological" novel may be taken the "ethical' novel of Edouard Rod (1857–1910)—*La Vie privée de Michel Teissier* (1893), *Le Sens de la vie, Les Trois coeurs.*

Contemporary nith these as a novelist, though a much older man and occupied at different times of his life with verse and with criticism, came Anatole France (1844–1924; real name Jacques Anatole Thibault), who in *Le Crime de Sylvestre Bonnard, La Rôtisserie de la reine Pédauque, Le Lys rouge, Les Dieux ont soif, La Révolte des anges* and others made a kind of novel as different from the ordinary styles as Pierre Loti's, and of the highest appeal in its wit, its subtle fancy and its perfect French. Maurice Barrès (1862–1923), famous already in the 19th century (*Le Jardin de Bérénice*), like Anatole France, wrote his masterpieces in the 20th *La Colline enspirée* (1913) and *Un jardin sur l'Oronte* (1922).

Periodical Literature After **1830:** Criticism.—One of the causes which led to this extensive composition of novels was the great spread of periodical literature in France and the custom of including in almost all periodicals, daily, weekly or monthly, a *feuilleton* or instalment of fiction. Of the contributors to these periodicals who were strictly journalists and almost political journalists only, the most remarkable after Armand Carrel were his opponent in the fatal duel, Émile de Girardin, Lucien A. Prévost-Paradol (1829–70), Jean Hippolyte Cartier, called De Villemessant (1812–79), and, above all, Louis Veuillot (1815–83), the most violent and unscrupulous but by no means the least gifted of his class.

The same spread of periodical literature, together with the increasing interest in the literature of the past. led also to a very great development of criticism, and the most distinguished of the critics was Charles Augustin Sainte-Beuve (1804–69). Sainte-Beuve's first distinguished work (his poems and novels we may leave out of consideration) was the sketch of 16th-century literature which he contributed to the *Globe.* But it was not till later that his style of criticism became fully developed and accentuated. During the first decade of Louis Philippe's reign his critical papers, united under the title of *Critiques et portraits littéraires,* show a gradual advance. During the next ten years he was mainly occupied with his studies of the writers of the Port Royal school. His *Histoire de Port Royal* is considered by a large public as Sainte-Beuve's main title to fame. But it was during the last 20 years of his life, when the famous *Causeries du lundi* appeared weekly in the columns of the *Constitutionnel* and the *Moniteur,* that his most remarkable productions came out. Sainte-Beuve's style of criticism (which is the key to so much of French literature of the last half of the 19th century that it is necessary to dwell on it at some length), excellent and valuable as it is, lent itself to two corruptions. There is, in the first place, in making the careful investigations into the character and circumstances of each writer which it demands, a danger of paying too much attention to the man and too little to his work, and of substituting for a critical study a mere collection of personal anecdotes and traits, especially if the author dealt with belongs to a foreign country or a past age. The other danger is that of connecting the genius and character of particular authors too much with their conditions and circumstances, so as to regard them as merely so many products of the age.

These faults, and especially the latter, were very noticeable in many of Sainte-Beuve's successors, particularly perhaps in Hippolyte Taine (1828–93), who, however, besides his work on English literature, did much of importance on French, and has been regarded as the first critic who did thorough honour to Balzac in his own country. Beginning with philosophical studies, and always maintaining a strong tincture of philosophical determinism. he applied himself later, first to literary history and criticism in his famous *Histoire de la litte'rature anglaise* (1864), and then to history proper in his still more famous *Origines de la France contemporaine* (1876).

Edmond Scherer (181j–89) and Paul de Saint-Victor (1827–1881) represent different sides of Sainte-Beuve's style in literary criticism, Scherer combining with it a martinet and somewhat prudish precision, while Saint-Victor, with great powers of appreciation, is the most flowery and "prose-poetical" of French critics. In theatrical criticism Francisque Sarcey (1827–99), an acute but somewhat severe and limited judge, succeeded to the good-natured sovereignty of Jules Gabriel Janin. The criticism of the *Revue des deux mondes* played a sufficiently important part in French literature to deserve separate notice in passing. Founded in 1829, the *Revue,* after some vicissitudes, soon attained, under the direction of François Buloz, the character of being one of the first of European critical periodicals. Its style of criticism, on the whole, inclined rather to the classical side; *i.e.,* to classicism as modified by, and possibly after, the romantic movement. Besides some of the authors already named, its principal critical contributors were Gustave Planche (1808–57), an acute but somewhat truculent critic, Saint-René Taillandier (1817–79) and Émile Montégut (182 5–95).

Not only did the critical work in various ways of Renan, Taine, Sarcey and others continue during the latter part of the century, but a new generation, hardly in this case inferior to the old, appeared. The chiefs of this were Anatole France, fimile Faguet (1847–1916), Ferdinand Brunetiiire (1849–1906) and Jules Lemaître (1853–1914). The last, however, though a brilliant writer, was but an "interim" critic, beginning with poetry and other matters, and after a time turning to yet others, while, brilliant as he was, his criticism was often ill-formed. So too Anatole France, after compiling four volumes of *La Vie littéraire* in his own inimitable style and with singular felicity of appreciation, also turned away.

Philosophy and History: 1830–90.—In philosophy proper France has been more remarkable for attention to the historical side of the matter than for the production of new systems; and the principal exception among French philosophical writers, Auguste Comte (1793–1857), besides inclining, as far as his matter went, to the political and scientific rather than to the purely philosophical side (which indeed he regarded as antiquated), was not very remarkable merely as a man of letters. Victor Cousin (1792–1867), on the other hand, almost a brilliant man of letters and for a time regarded as something of a philosophical apostle preaching "eclecticism," betook himself to biographical and other miscellaneous writings. Similar phenomena, not so much of inconstancy to philosophy as of a tendency toward the applied rather than the pure branches of the subject, are noticeable in Edgar Quinet (1803–75), in Charles de Rémusat (1797–1875) and in Ernest Renan (1823–92), the first of whom began by translating Herder while the second and third devoted themselves early to scholastic philosophy, De Rémusat dealing with Abélard (1845) and Anselm (1856), Renan with Averroes (1852). Renan is one of the greatest of prose writers of all time, for purity, elegance and fluidity. Outside his historical work, his *Souvenirs* and his *Drames* and *Dialogues philosophiques* are imperishable masterpieces. His original ideas are best expressed in *L'Avenir de la science.* More single-minded devotion to at least the historical side was shown by Jean Philibert Damiron (1794–1862), who published in 1842 a *Cours de philosophie* and many minor works at different times; but the inconstancy recurs in Jules Simon (1814–96), who, in the earlier part of his life a professor of philosophy and a writer of authority on the Greek philosophers (especially in *Histoire de l'école d'Alexandrie,* 1844–45), began before long to take an active and, toward the close of his life work, all but a foremost part in politics.

Political philosophy and its kindred sciences naturally received a large share of attention. Toward the middle of the century there was a great development of socialist and fanciful theorizing on politics, with which the names of Claude Henri, comte de Saint-Simon (1760–1825), Charles Fourier (1772–1837), fitlenne Cabet (1788–1856) and others are connected. As political economists Frédéric Bastiat (1801–50), L. G. L. Guilhaud de Lavergne (1809–So), Louis Auguste Blanqui (1805–81) and Michel Chevalier (1806–79) may be noticed. In Alexis de Tocqueville (1805–59) France produced a political observer of a remarkably acute, moderate and reflective character.

The brothers Thierry devoted themselves to early French history, Amédée Thierry (1797–1873) producing a *Histoire des Gaulois* and other works concerning the Roman period, and Augustin Thierry (1795–1856) the well-known history of the Norman conquest, the equally attractive *Récits des temps mérovingiens* and other excellent works. Philippe de Ségur (1780–1873) wrote a history of the Russian campaign of Napoleon and some other works chiefly dealing with Russian history. The voluminous *Histoire de France* of Henri Martin (1810–83) is an impartial work dealing in detail with the whole subject. A. G. P. Brugiiire, baron de Barante (1782–1866), after beginning with literary criticism, turned to history and in his *Histoire des ducs de Bourgogne* produced a work of capital importance. As was to be expected, many of the most brilliant results of this devotion to historical subjects consisted of works dealing with the French Revolution. No series of historical events has ever perhaps received treatment at the same time from so many different points of view and by writers of such varied literary excellence. among whom it must, however, be said that the purely royalist side is hardly at all represented. One of the earliest of these histories is that of François Mignet (1796–1884), a sober and judicious historian of the older school, also well known for his *Histoire de Marie Stuart.*

About the same time was begun the brilliant if not extremely trustworthy work of Adolphe Thiers (1797–1877) on the Revolution, which established the literary reputation of the future president of the French republic and was at a later period completed by the *Histoire du consulat et de l'empire.* The passing of the July monarchy and the early years of the empire witnessed the publication of several works of the first importance on this subject. Barante contributed histories of the Convention and the Directory, but the three books of greatest note were those of Lamartine, Jules Michelet (1798–1874) and Louis Blanc (1811–82). Lamartine's *Histoire des Girondins* is written from the constitutional-republican point of view and is sometimes considered to have had much influence in producing the events of 1848. It is, perhaps, rather the work of an orator and poet than of a historian. The work of Michelet is of a more original character. Besides his history of the Revolution, Michelet wrote an extended history of France, and a very large number of smaller works on historical, political and social subjects. His imaginative powers are of the highest order, and his style stands alone in French for its strangely broken and picturesque character. its turbid abundance of striking images and its somewhat sombre magnificence, qualities which, as may easily be supposed, found full occupation in a history of the Revolution. Edgar Quinet (1803–75), like Louis Blanc a devotee of the republic and an exile for its sake, brought to this subject a mind and pen long trained to literary and historical studies; but *La Révolution* is not considered his best work. And Taine, after distinguishing himself, as has been mentioned, in literary criticism, and attaining less success in philosophy *(De l'intelligence).* turned in *Les Origines de la France moderne* to an elaborate discussion of the Revolution, its causes. character and consequences. Franqois Pierre Guillaume Guizot (1787–1874), like his rival Thiers, devoted himself much to historical study. His earliest works were literary and linguistic, but he soon turned to political history, and for the last half century of his long life his contributions to historical literature were almost incessant and of the most various character. The most important are the histories *Des Origznes du gouvernement représentatif, De la révolutzon d'Angleterre, De la civilisation en France* and a *Histoire de France,* which he was writing at the time of his death.

In the last quarter of the century, under the department of history. the most remarkable names were still those of Taine and Renan. Indeed it may be here proper to remark that Renan, in the kind of elaborated semipoetic style which most characterized the prose of the 19th century in all countries of Europe, takes preeminence among French writers even in the estimation of critics who are not enamoured of his substance and tone. The chief work of his life is the *Histoire des origines du Christianisme,* which includes the celebrated *Vie de Jésus.* But. under the influence of Taine to some extent and of a general European tendency still more. France during this period attained or recovered a considerable place for what is called "scientific" history—the history which while, in some cases. though not in all, not neglecting the development of style attaches itself particularly to "the document," on the one hand, and to philosophical arrangement on the other. The chief representatives of the school were probably Albert Sorel (1842–1906) and Fustel de Coulanges (1830–89) *(La* Cite' *antique, Histoire des institutions de l'ancienne France).*

(D. S.; X.)

THE 20TH CENTURY

The first half of the 20th century was a period of considerable production and immense diversity. Schools and movements followed each other in rapid succession, but none of them changed the whole course of literature, as Romanticism had done roo years earlier. Surrealism and existentialism, the two most important, represented attitudes to life rather than a conception of literature. Literary groupings were replaced to an increasing extent by philosophical or political affiliations, but personal convictions often counted for more than formal attachments to any school of thought. The term "existentialist," for instance, could be applied to different persons holding the most divergent views, and the many Catholic writers prominent throughout the period varied considerably in outlook.

During the early years of the century, no significant tendency prevailed, except a fairly general reaction against naturalism. The influence of symbolism was felt for some time, chiefly in poetry and drama, but also in fiction. Paul Bourget, Anatole France and Pierre Loti remained in high esteem, but declined in reputation from the 1920s onward, perhaps too sharply. Maurice Barrbs, however, continued to attract many followers, in right-wing circles particularly. It seemed characteristic of the age to turn to certain writers for leadership, and various authors in turn established an ascendancy in different sections of opinion. Charles Maurras dominated right-wing nationalism for many years; Henri Bergson, in an entirely opposite direction, helped to create the philosophic atmosphere in which many writers grew up. Alain (Émile Chartier; 1868–1951) was a humanist, essayist and moralist who exercised a remarkable hold over several generations of Frenchmen. Charles Péguy, killed in action in 1914, was later to become a symbol of the integrity and vision which had characterized his life and writings; Antoine de Saint-Exupéry, who lost his life in an air mission in 1944, was another writer whose spiritual influence grew with the years. André Gide, André Malraux and Jean Paul Sartre all left a considerable mark on the outlook of their contemporaries.

The intellectual curiosity of the age was reflected in many branches of literature. One sign of this activity was the starting of an unparalleled number of periodicals, expressing every shade of opinion. Péguy founded the first of these reviews with his famous *Cahiers de la Quinzaine* (1900–14), in which he waged a ceaseless battle against materialism, corruption and injustice, opening his columns to various authors then unknown. The *Nouvelle Revue Française,* in which much of the new writing of the century was to appear, was founded by Gide, with Jean Schlumberger and Jacques Copeau, in 1909; two gifted editors, Jacques Rivière and Jean Paulhan, were in charge of it from 1919 to 1925 and from 192j to 1940 respectively.

French literature in the 50 years from 1900 tended more and more to reflect the problems and uncertainties of the time. Men of letters took an increasing part in public affairs and in the discussion of conflicting ideologies.

Fiction.—The range of the novel was constantly being extended, but many of its characteristics were developments of earlier tendencies rather than complete innovations.

Few authors limited themselves to fiction alone: Jean Giraudoux and Henry de Montherlant gained a second reputation in the theatre when already well-known as novelists. Autobiographical works of various kinds, including, in some cases, extensive collections of correspondence, throw considerable light on the authors concerned. The *Cahiers* of Maurice Barrbs, the *Journal* of Gide and those of Jules Renard; of Franqois Mauriac and of Julien Green are particularly noteworthy.

Biographies and works of criticism were produced by many novelists. The generous ideals and lofty internationalism of Romain Rolland (1866–1944) found expression in his lives of Tolstoy, Gandhi, Péguy, etc., and especially in his major work, *Beethoven: les grandes époques cre'atrices* (7 vol., 1927–46). These uritings complement his masterpiece in fiction, *Jean Christophe,* a novel-cycle of a composer of genius (published in Péguy's *Cahiers,* 1904–12). Many other works could be cited which help to illustrate the attitude of the novelists in question—for instance Marcel Proust's translations of John Ruskin, Gide's *Dostoïevski,* Mauriac's biographies of Racine and St. Margaret of Cortona, etc.

For some time, vast novel-cycles were in favour. Marcel Proust (1871–1922) wrote the finest of these, *A la recherche du temps perdu* (1913–28). He created a world of unforgettable characters, but gave considerable emphasis to the portrayal of anomalies in human nature. A merciless exposure of fashionable society, it is the work of a poet with an acute sense of comedy. Increasingly an invalid, Proust sought to recapture his youthful happiness before it vanished from his mind. He made time present and time remembered appear simultaneous, elaborating these themes with an infinity of parenthesis and a beauty of cadence which make his style unique. *Jean Santeuil,* an earlier draft of this work, discovered long after Proust's death, was published in 1952; a series of critical essays, entitled *Contre Sainte-Beuve,* appeared in 1954. Both these works aroused considerable interest.

Georges Duhamel (1884–) served as an army doctor in World War I. In *La Vie des martyrs* (1917) and *Civilisation* (1922) he stressed the suffering and futility of war. He will also be remembered for his Salavin chronicles (1920–32) and for the *Chronique des Pasquier* (1933–44). He does not resort to easy optimism, but regards humanity with sympathy and understanding. Roger Martin du Gard (1881–) wrote an excellent novel, *Jean Barois* (1913) on the effects of the Dreyfus case. His clear-sighted, dispassionate observation is also apparent in *Les Thibault* (1922–40), a family cycle reflecting the social history of France from the later decades of the 19th century up to World War I.

Jules Romains (Louis Farigoule; 1885–), a novelist of considerable descriptive power, based much of his writing on the theory of "unanimism," the idea that one unifying principle may be found in all human activities. His panorama, Les *Hommes* de bonne *volonté* (1932–47), ranges over many aspects of life in France between 1908 and 1933. Novel-cycles were also written by René Behaine, Paul Vialar and Henri Troyat, the last-named giving a picture of revolutionary Russia from 1888 onward. The "proletarian" novel, militantly left-wing in character, was represented by Charles Plisnier and Louis Aragon; Jean Richard Bloch wrote Et *Cie* (1913), a powerful Jewish story; Louis-Ferdinand Céline, author of Voyage au bout de la *nuit* (1932), went on to develop vehemently anti-Semitic opinions; Louis Guilloux foreshadowed existentialism in Le Sang noir (1935).

The lower levels of society were depicted by Charles Louis Philippe (1874–1909; La *Mère* et l'enjant, 1900; Marie *Donadieu,* 1904). Pierre Hamp, André Thérive, Léon Lemonnier, Eugène Dabit, Maxence Van der Meersch and Jean Prévost (1901–44) described industrial scenes or working-class conditions. Prévost was also an excellent literary critic. Philippe Hériat (Raymond-Gérard Payelle; 1898–) described French middle-class life (La Famille Boussardel, 1947). André Maurois (Émile Herzog; 1885–) wrote many kinds of fiction. essays and other miscellaneous works. His light-hearted sketches of British army life in World War I, followed by his lives of Shelley, Disraeli, etc., brought him considerable popularity. His more searching biographies of Proust, George Sand and Victor Hugo added greatly to his reputation.

André Chamson (1900–) showed himself to be a sincere, thoughtful writer with faith in the essential decency of human nature. He began as a regional novelist and widened his range to discuss many pressing topics of the day (*L'Année* des *vaincus,* 1934; La Neige et la *fleur,* 1951; etc.). C. F. Ramuz gave authentic descriptions of Vaud in Switzerland; Jean Giono admirably conveyed the atmosphere of Provence, but after World War II adopted a new style of writing (*Un* de Baumugnes, 1929; Regain, 1930; *Que* ma joie demeure, 1935; Le Hussard sur le *toit,* 1951).

Many authors made their own corner of France part of the literary scene: Alphonse de Chateaubriant (La *Brière,* 1923), Maurice Genevoix (Raboliot, 1927), Henri Bosco (Le *Mas* Thkotime, 1945), etc. Louis Hémon's Maria Chapdelaine (1916) is a moving story of French Canada. The restless cosmopolitanism of the 1920s was represented by Paul Morand; the brothers Jérôme and Jean Tharaud, writing in partnership, were skilled in descriptive travel-fiction. Lighthearted novels were rare, but Gabriel Chevallier's Clochemerle (1934) was a riotous skit on village politics. Other amusing writers were Pierre Mille in his colonial novels, Henri Duvernois in his descriptions of Paris, and Raymond Queneau in a number of books. The sardonic humour and the fantasy of Marcel Aymé (1902–) made him a highly individual observer of the social scene. He was successful both in novels and short stories (La Jument verte, 1933; Uranus, 1948; Le *Passe*-muraille, 1943). The revival of the short story was a feature of the period, with Marcel Arland, Jean Cassou, Elsa Triolet, "Vercors" (Jean Bruller), Pierre Courtade, Marc Blancpain and Jules Supervielle. Supervielle, Saint-Exupéry, Aymé and Maurois also wrote stories for children.

Colette (Sidonie-Gabrielle Colette; 1873–1954) stands preeminent among woman writers. Her novels, which inculcate no doctrine, are largely concerned with the pleasures and pains of love and the senses. She recalls her childhood in a countryside astir with life in its minutest forms, recorded with fidelity and affection in a rich and faultless prose (Chkri, 1920; La *Maison* de Claudine, 1922; Sido, 1928; *Duo,* 1934; etc.). Jean Giraudoux (1882–1944) also belonged to no literary school. He blended poetry, humour, fantasy and reality in a very personal style (Simon *le* pathktique, 1918; Siegfried et le Limousin, 1922).

Individual problems and emotional conflicts—traditional themes in French fiction—were much discussed. Highly personal issues were raised by André Gide (1869–1951). Impatient of constraints in life, he subjected his art to rigorous discipline, attaining a style of classical lucidity. From the 1920s onward, he was recognized as one of the leading figures of the century (Les *Nourritures* terrestres, 1897; La Porte dtroite, 1909; Les Faux-Monnayeurs, 1926). His influence was seen in Valery Larbaud (1881–1957; *Journal d'A. O.* Barnabooth, 1913) and in Jean Schlumberger (1877– ; Saint-Saturnin, 1931).

Analytical novels, in great variety, were written by Jacques Chardonne, Jacques de Lacretelle, Émile Henriot, Jean Cassou, Marcel Arland. Pierre Bost and Raymond Radiguet; and later by Hervé Bazin, José Cabanis, Gilbert Cesbron, Jacques Lemarchand (Genevikve, 1944), Michel Mohrt, etc. The influence of modern psychological theories was often apparent; novelists were also indebted to Stendhal and to the 18th-century analysts. The novel of adolescence, a form characteristic of the period, was represented by two masterpieces in complete contrast, Le *Grand Meaulnes* (1912) by Alain-Fournier (Henri Alain Fournier; 1886–1914) and Le *Diable au* corps (1923) by Raymond Radiguet (1903–23). Jean Cocteau also wrote a distinguished novel of adolescence (Les Enfants *terribles,* 1929).

The position of the individual in the world of temporal or eternal values was constantly debated. Sin and redemption form the themes of the Catholic writers, among whom François Mauriac (1885–) is pre-eminent. His best stories are set in his native Bordelais. He conveys with intensity the oppressive atmosphere in which his characters live out their unhappy, withdrawn existence (Le Baiser *au lépreux;* 1922; Thdrkse Desqueyroux, 1927; Le Noeud de *vipères,* 1932; La Pharisienne, 1941). From 1944, he turned increasingly to political journalism, with the uncompromising independence that marked his prewar condemnations of fascism.

Georges Bernanos (1888–1948), like his predecessor Léon Bloy, was a visionary, for whom the forces of good and evil were real presences. The vehement integrity of his polemical writings (La *Grande Peur* des bien-pensants, 1931; Les Grands Cimetikres *sous* la lune, 1938) characterizes his novels *Sous le soleil* de Satan (1926) and Journal *d'un* curd de campagne (1936), his masterpiece. Julien Green (1900– ; of Anglo-American parentage) depicted characters obsessed by disquietude and irrational impulses, in a strangely nightmarish world (Adrienne Mesurat, 1927; *Minuit,* 1936; *Moïra,* 1950). Marcel Jouhandeau (1888–) mingled spirituality and emphatic realism in his stories about "Monsieur Godeau"—largely a self-portrait—and "Chaminadour," the name given to his native town of Guéret.

Other writers wrote from a humanistic standpoint, laying stress on individual attainment. Henry de Montherlant (1896–), a successor of Barrès, blended exaltation and cynicism: He showed a considerable command of language (Les *Bestiaires,* 1926; Les Cklibataires, 1934; Les Jeunes *Filles,* 1936–39).

The struggle for self-realization in a common cause is the theme of Andre Malraux (1901–), one of the major writers of the century. His experiences of revolution in the far east and of civil war in Spain give his novels a singularly authentic quality (La *Voie* royale, 1930; La Condition humaine, 1933, an outstanding work; Le Temps du *mépris,* 1935; and *L'Espoir,* 1937). After completing the first volume of Les Noyers de *l'Altenburg* (1945), Malraux embarked on a vast survey of art throughout the world, to show that humanity's greatest triumph lies in artistic achievement (Les Voix du silence, 1951).

Self-sacrifice and community of effort were also the ideals of Antoine de Saint-Exupéry (1900–44). Flying gave him an elevation of mind and a sense of poetry, expressed in works of a largely autobiographical character (*Courrier* sud, 1928; Vol de *nuit,* 1931; Terre des hommes, 1939). Pilote de guerre (New York, 1942) ranks among the best records of World War II. The Resistance movement produced Lettres *à un* ami *allemand,* by Albert Camus, Angleterre, by "Argonne" (Jacques Debu-Bridel), and *Le Silence* de la mer by "Vercors" (Jean Bruller).

Albert Camus (1913–1960), sometimes classed with the existentialists, parted company with them after publishing his essay, *L'Homme révolté* (1951). He emphasized the apparent absurdity of life, but also the need for common effort. *L'Étranger* (1942) and La Peste (1947) gave him first place among younger novelists.

From the 1930s, many French novels tended to emphasize the least prepossessing aspects of human nature. It was perhaps not surprising that there should be a new *mal* du *siècle,* more sombre and violent than that after the Napoleonic wars. The influence of Franz Kafka and of the modern American novelists accentuated this tendency. The writings of the existentialists showed many of these characteristics. The term existentialism covers two separate streams of thought: Christian existentialism, represented by Gabriel Marcel (see below, Drama); and atheistic existentialism, headed by J. P. Sartre (1905–). Sartre and his followers utilized many forms of literature to expound their views. They discussed what the individual should do to work out his salvation in an apparently purposeless world, unfettered by conventional morality: his decisions must be his own, but he assumes a responsibility to the community through them. At first Sartre's existentialism appeared to be compounded of negation and despair (La *Nausée,* 1938, followed by the short stories of Le Mur, 1939); but a more positive attitude seemed to be developing in his cycle Les *Chemins* de la *liberté* (1945 ff.). Simone de Beauvoir showed psychological insight in *L'Invitée,* 1943. and Lcs Mandarins, 1954; her essay Pour *une* morale de *l'ambiguïté* (1947) and her defense of feminism, Le *Deuxième* Sexe (1949), were also notable.

The circumstances arising from World War II were graphically described by many of the younger novelists, Francis Ambrière (Charles Letellier), Jean Louis Curtis (Les *Forêts* de la *nuit,* 1947), David Rousset, Pierre Gascar, Robert Merle, Romain Gary, Roger Vailland (*Drôle* de jeu, 1945), Roger Nimier, and others. Other talented novelists of the period were Emmanuel Robliis. Jean Malaquais, Jean-Jacques Gautier, Maurice Druon, Louis Parrot, Félicien Marceau, Roger Peyrefitte, Antoine Blondin and Béatrix Beck.

Maurice Blanchot, Julien Gracq, Henri Thomas and Raymond Queneau—all very different—were highly praised for their originality in theme or technique.

The story of adventure has flourished, with Claude Farrère, Pierre Benoît, Joseph Kessel, Pierre MacOrlan, Francis Carco, Blaise Cendrars, Edouard Peisson, Roger Vercel and others. Henri Barbusse and Roland Dorgelès are remembered for their accounts of World War I. Georges Simenon gave a new status to the "thriller" of crime and detection. Pierre Boulle, Jean Hougron—an excellent story-teller—and Pierre Courtade wrote stirring narratives of the far east. The historical novel, comparatively neglected. reached a high literary standard with Zoe Oldenbourg and Marguerite Yourcenar.

The Theatre and **Drama.**[1]—From the end of World War I, the French theatre showed considerable vitality. There had been little evidence of this in the first part of the century, except in comedy. Tristan Bernard (1866–1947) was a gay humorist, Georges Courteline (1860–1923) made more Frenchmen laugh at themselves than any dramatist since Molière, and Georges Feydeau (1862–1921) proved to be the best vaudevilliste of modern times. Many "problem" plays of the earlier period dated considerably; *e.g.,* those of Paul Hervieu, Eugène Brieux, Henry Bataille, Henri Bernstein, Georges de Porto-Riche and François de Curel. The works of Maurice Maeterlinck led on to the symbolism of Paul Claudel (1868–195j) and other later writers. Claudel's first two masterpieces, *L'Annonce* faite *à* Marie and *L'Otage,* were staged in 1912 and in 1914 respectively. The works that brought him to the height of renown, Le Soulier de satin and *Partage* de midi, were however not performed till 1943 and 1948, respectively, though both had been written much earlier.

From the 1920s onward, theatrical productions increased greatly in variety. There were comedies of every kind—the latest frivolity by Sacha Guitry; Le *Cocu magnifique* (1921) by F. Crommelynck; Dr. Knock (1923) by Jules Romains, an extremely successful satire on doctoring; Topaze and *Marius* in 1928, by Marcel Pagnol, both immensely popular; and works by Jacques Deval, Henri Duvernois, Édouard Bourdet, Jean Sarment (Jean Bellemiire) and Marcel Achard.

In the serious theatre new talents were coming into view. Plays relying on implication and suggestion rather than on outright statement were written by Charles Vildrac (Le Paquebot Tenacity, 1920), Paul Géraldy, Denys Amiel and Jean Jacques Bernard (Martine, 1922). The action in general was simple, the characters those of everyday life.

More vehement, often declamatory plays were written by H. R. Lenormand, Paul Raynal and Stève Passeur. Raynal made a stir with his play about a returning soldier, Le *Tombeau sous l'Arc* de *Triomphe* (1924), but achieved a much deeper note in Le *Matériel humain* (written 1935, produced 1948). Three very different authors who became increasingly well-known—Marcel, Salacrou and Cocteau—also began their careers in the theatre at this time.

Gabriel Marcel (1889–) was a philosopher more than a dramatist: the chief exponent of Christian existentialism, he introduced Soren Kierkegaard to France about 1925 and published some of the most substantial writing of the age in his Journal *métaphysique* (1928) and *Être* et avoir (1935). His best play was Le Dard (1936).

Armand Salacrou (1899–) developed increasing mastery from the mid-1930s in many different types of plays and came to stand, with Anouilh, in the front rank of postwar dramatists (*Atlas-Hôtel,* 1931; Une Femme *libre,* 1934; La Terre est ronde, 1938; Les *Nuits* de la *colère,* 1946, an outstanding play on the Resistance; *L'Archipel* Lenoir, 1947; etc.).

Jean Cocteau (1889–) produced dramatic entertainments of endless variety—adaptations of Shakespeare. mime, ballet, films (Orphe'e), versions of ancient myths (Antigone, La *Machine infernale,* etc.), a remarkable psychological study (Les Parents terrible~,1938) and much else besides.

The 1930s saw a renaissance in tragedy, with Claudel and Giraudoux pre-eminent. A typical feature was the use of classical legends or historical subjects with a bearing on contemporary events. Religious tragedy, particularly through the genius of Claudel, regained a place it had not known since Racine. Often unwieldy and not primarily suited to the theatre, Claudel's plays have a transcendental quality which makes them both lyrical and epic.

Giraudoux became a dramatist in 1928, with Siegfried, adapted from one of his own stories. His reputation mounted steadily (Amphitryon *38,* 1929; Intermezzo, 1933; La Guerre de Troie n'aura pas lieu, 1935; etc.). His technique was entirely original, blending poetic unreality or myth with urgent topical issues.

Jean Anouilh (1910–) was, like Salacrou, primarily a man of the theatre. Now flippant, now sardonic, he took disillusionment and frustration for his themes and treated them with acrid wit. Le Voyageur sans *bagages* was performed in 1937, and Anouilh came into full fame with *Antigone* (1942), followed by several other much discussed plays, *Ardèle* (1948), La *Valse* des *toréadors* (1952), *L'Alouette* (1953) and *Ornifle* (19jj).

Mauriac gained a reputation with his first play, *Asmodée,* in 1937; Les *Mal-Aimés* followed in 1945, but later dramatic works were less successful. Henry de Montherlant stood high among postwar dramatists, with a remarkable grasp of technique, construction and dialogue (La Reine morte, 1942; Le *Maître* de Santiago, 1948; Port-Royal, 1954).

The leading existentialists were prominent in the theatre. Sartre achieved fame in 1943 with Les *Mouches;* and *Huis-clos* (1944), Les Mains sales (1948), Le Diable et le Bon *Dieu* (1951), etc., all provoked controversy by their frank discussion of painful topics. Simone de Beauvoir with Les Bouches *inutiles* (1945) and Camus with Le *Malentendu* and *Caligula* (1944) added notably to the existentialist repertoire.

The problems of World War II and its aftermath were discussed by Emmanuel Robliis (Montserrat, 1948), Maurice Clavel, Thierry Maulnier and others.

During and after the war, serious plays predominated. *Sud* (1953) and *L'Ennemi* (1954) were two notable psychological studies by Julien Green, striking out on a new career as dramatist. Comedy, however, was not neglected. Jacques Audiberti (1899–) covered philosophical intentions under the guise of comic extravagance (Quoat-Quoat, Le *Mal* court); and André Roussin (1911–) wrote some very diverting plays (La Petite Hutte, Les *Oeufs* de *l'autruche,* etc.). Marcel Aymé made a success with *Clérambard* (1950). Henri Pichette (1924–) was

[1]All dates of plays given in this section refer to the first performances of the plays concerned, unless otherwise stated.

a lyrical surrealist of much promise *(Les Epiphanies,* 1947).

Poetry. — The first half of the 20th century was not an age of outstanding achievement. Present-day poetry has derived much of its inspiration from 19th-century authors, particularly from Charles Baudelaire, Paul Verlaine. Stephane Mallarmé, Jean Rimbaud, Gérard de Nerval and Lautréamont (Isidore Lucien Ducasse). The influence of poets from outside France- mile Verhaeren, Walt Whitman, Rainer Maria Rilke—was also frequently apparent.

Poetry during this period tended to live in a somewhat rarefied atmosphere and to be concerned with highly personal forms of self-expression, not always very accessible to the general reader.

Paul Valéry (1871–1945) was the chief discipline of Mallarmé in this respect. His *Introduction à la méthode de Léonard de Vinci,* published at the age of 24, was followed a year later by *Une soirée avec M. Teste:* these were prose essays, revealing his philosophical preoccupations and his great gifts for intellectual self-analysis. He published little for 20 years, then sprang into fame as a poet in 1917, with *La Jeune Parque. Le Cimetikre marin* followed in 1920 and a collection entitled *Charmes* in 1922. Thereafter Valéry reverted to prose, his Socratic dialogue *Eupalinos* (1923) and five volumes of essays entitled *Variété* (1924–44) being especially memorable.

In the first quarter of the century Claudel and Péguy were the other leading poets. The comtesse de Noailles (Anna Elisabeth de Brancovan, 1876–1933: *Le Coeur innombrable,* 1901; *L'Honneur de souffrir,* 1927) and P. J. Toulet *(Les Contrerimes,* 1921) were attractive but less notable writers. Paul Fort (1872–) was a popular poet who drew much of his material from provincial legend *(Ballades françaises,* 1897–1953) and printed his verse as if it were prose. The prose-poem was much in favour in different forms throughout the period. and there was a constant tendency to break further and further away from traditional forms of versification. Claudel showed the resources of prose-poetry in his *Connaissance de l'est* (1900). Péguy, Max Jacob, André Breton. Leon-Paul Eargue, René Char and Henri Michaux all used this form extensively.

Religious themes were especially prominent. Claudel was converted to Catholicism during a sudden mystical experience in 1886. His *Cinq grandes odes* (1910) reflect his fervent sense of the supernatural. Often diffuse or obscure, his writing combines lyrical power with a sometimes jovial humour. He invented a special *verset* of his own, based on the style of the Bible. Francis Jammes (1868–1938) returned to Catholicism through Claudel's influence. His poetry, with a simplicity not devoid of artifice, is often genuinely touching. Péguy also returned to Catholicism. His writing has something of the naïveté of mediaeval legend. It is prolix and repetitive but contains many lines of great beauty, especially those dealing with death and sacrifice *(Le Mystbre de la charité de Jeanne d'Arc,* 1910; *Le Porche du mystère de la deuxibme vertu,* 1911; *Eve,* 1913).

The change-over to what may be called "modern" poetry began before World War I and became particularly apparent in the works of the surrealists during the early 1920s. Surrealism often led to exaggeration and straining after novelty. It produced, perhaps, few masterpieces in its own right, but many poets were influenced by it. Some of its characteristics went back to 19th-century sources; a fiercely grotesque, antibourgeois farce called *Ubu-Roi* (1896) by Alfred Jarry (1873–1907) was also important. The surrealists, however, chiefly turned to Guillaume Apollinaire (Wilhelm Apollinaris de Kostrowitzki, of Polish-Italian descent; 1880–1918). Keenly interested in the cubist painters, especially Pablo Picasso, he showed in his poetry a brilliant, often artificial modernity, but his work also reflects genuine feeling *(Alcools,* 1913; *Calligrammes,* 1918). Max Jacob and Blaise Cendrars were associated with him. Léon-Paul Fargue (1876–1947) and Pierre Reverdy (1889–) were attached to no particular school. Their poetry, individual and sincere, prepared the way for many later developments.

Surrealism was founded by André Breton, with Philippe Soupault, Paul Cluard and Louis Aragon. Breton, its most staunch and persuasive advocate, had become acquainted with Freudian psychoanalysis during the war. Surrealism embodied these new themes of the subconscious—hence its insistence on "automatic" writing. Soon, however, various poets associated with this movement went their separate ways (*e.g.,* Cocteau). Several surrealists swung over to Communism, notably Aragon and also Éluard (Eugkne Grindel; 1895–1952), whose idealism, simplicity and depth of feeling make him one of the outstanding poets of the period. During World War II. they both took part in the Resistance and wrote poignant verse expressing the pent-up feelings of the time: Aragon was the author of *Le Crkve-coeur* and *Les Yeux d'Elsa,* while Éluard's poetry was collected under the title *Poésie et vérité* and *Au rendez-vous nllemand.* The outburst of poetic activity which took place during the war led many to believe that a revival was at hand. for the time being the widening gap between poets and the general reader was bridged by the expression of feelings in which both could share. This tendency did not long survive the war.

Pierre-Jean Jouve (1887–), a complex, pessimistic writer, strongly influenced in turn by unanimism, Freudism and Catholicism, exercised a considerable influence on such younger poets as Pierre Emmanuel (1916–), Jean Cayrol. Luc Estang and Patrice de la Tour du Pin (the three latter all born in 1911).

Two very original poets are Saint-John Perse (the diplomat Alexis Saint-Léger Léger; 1887–) and Jules Supervielle (1884–1960). Perse is an extremely intellectual writer; his poetry is highly disciplined, subtly contrived and rich in imagery. Supervielle, on the other hand, is deliberately uncomplicated: his qualities of observation, sentiment, wit and fantasy make his writings particularly attractive.

Among later poets, we may mention Jacques Prévert (1900–) and Raymond Queneau (1903–), both endowed with wit and verbal dexterity. Henri Michaux (1899–) and René Char (1907–) were both much discussed in the 1950s, showing considerable depth of thought and feeling.

Philosophy and Scholarship. — Notable contributions were made in many sectors of these fields. Some of these have been mentioned earlier; here it is only possible to give a brief list.

Henri Bergson (1859–1941) held a foremost position in philosophy for many years *(Essai sur les données immédiates de la conscience,* 1889; *Les Deux Sources de la morale et de la religion,* 1932; etc.). He emphasized the importance of intuition and took his stand against the scientific determinism of the naturalists; his theory of time as a matter of personal experience rather than actual physical duration was also of much interest to literature. His views were countered by the rationalists Léon Brunschvicg and Julien Benda (1867–1956) and others. Sartre's major treatise of existentialism, *L'Être et le néant,* was published in 1943; so also was Camus' argument against suicide, *Le Mythe de Sisyphe.*

Noted Catholic writers were Léon Bloy (1846–1917); the philosopher Maurice Blonde1 (1861–1949); Jacques Maritain (1882–), interpreter of St. Thomas Aquinas; Étienne Gilson (1884–). a world authority on the Christian philosophy of the middle ages; the abbé Henri Bremond (1865–1933); Daniel-Rops (Henri Petiot; 1901–), author of *Jésus en son temps* (1945).

Political discussion occupied many writers. Charles Maurras (1868–1952) had gifts as poet and critic which are often overlooked in the animosities provoked by his violent nationalism. Jean Jaurès (1859–1914) voiced the ideals of international socialism. These were given a philosophic content by Léon Blum, also an acute moralist and literary critic *(Stmdhal et le heylirme.* etc.). Henri Lefebvre (1910–) began a Marxist survey of philosophy in 1947 Maurice Merleau-Ponty (1908–61) was a left-wing existentialist. André Siegfried (1875–1959), Raymond Aron (1905–) and Thierry Maulnier were prominent, in widely different directions, among those who studied the social. economic or political issues of the time. The events of World War II and the lessons to be learned from them provided material for many authors, Léon Blum's *A l'échelle humaine,* Marc Bloch's *L'Etrange défaite* and Gen. Charles de Gaulle's *Mémoires de guerre* (1954–56) being particularly noteworthy.

The leading historian was Ernest Lavisse (1842–1922). Other

1. François Rabelais (c. 1495-1553). 2. Michel de Montaigne (1533-92). 3. Molière (Jean Baptiste Poquelin) (1622-73). 4. Blaise Pascal (1623-62). 5. Jean Racine (1639-99). 6. François Marie Arouet de Voltaira (1694-1778). 7. Madame de Stall (1766-1817). 8. Honor6 de Balzac (1799-1850). 9. Stendhal (Marie Henri Beyle) (1783-1842). 10. Victor Marie Hugo (1802-85). 11. George Sand (Amandine Dupin Dudevant) (1804-76). 12. Charles Pierre Baudelaire (1821-67). 13. Gustave Flaubert (1821-80). 14. Stéphane Mallarmé (1842-98). 15. Anatole France (Jacques Anatole Thibault) (1844-1924). 16. Romain Rolland (1866-1944). 17. Marcel Proust (1871-1922). 18. André Gide (1869-1951)

FRENCH REVOLUTION

LEADING FIGURES IN THE FRENCH REVOLUTION

1. Maximilien François Isidore de Robespierre **(1758-94)**
2. Georges Jacques Danton **(1759-94)**
3. Louis XVI, king of France **(1754-93)**
4. Marie Antoinette, queen of France (1755–93)
5. Jacques Necker **(1732-1804)**
6. Jeanne Manon Phlipon, Madame Roland **(1754-93)**
7. Jean Paul Marat **(1743-93)**
8. Honor6 Gabriel Victor Riqueti, comte de Mirabeau (1749-**1791)**
9. Jacques Pierre Brissot (1754–93)
10. Pierre Victurnien Vergniaud (1753–93)
11. Emmanuel Joseph Sieyes (Abbé) **(1748-1836)**
12. Lazare Nicolas Marguerite Carnot (1753–1823)
13. Général Louis Lazare Hoche **(1768-97)**
14. Charles Maurice de Talleyrand-Périgord, prince de Bénévent (1754–1838)
15. André Masséna, duc de Rivoli, prince d'Essling **(1756-1817)**
16. Faul Francois Jean Nicolas, vicomte de Barras **(1755-1829)**
17. Marie Joseph Motier, marquis de La Fayette **(1757-1834)**
18. François Christophe Kellermann, duc de Valmy (1735–1820)
19. Général Charles Francois Dumouriez (1739–1823)
20. General Jean Victor Marie Moreau **(1763-1813)**

notable historians were Lucien Febvre, Jacques Bainville, Charles Seignobos, Élie Halévy, Georges Lefebvre, Louis Madelin, Pierre Gaxotte and Marc Bloch. Émile Mâle wrote the standard work on French religious art; Élie Faure combined the study of art and civilization; Daniel Mornet and Paul Hazard surveyed 18th-century thought; P. Vidal de la Blache made geography literature; Ferdinand Brunot recorded the history of the French language.

Literary History and Criticism.—Gustave Lanson (1857–1934) brought a new discipline to the study of literary history. Many traditional assessments were revised in the course of the period. In literary criticism there was much diversity of opinion. Valéry, Gide and Péguy made criticism a notable part of their activity. Alain became famous for his *Propos*, short essays dealing with a great variety of topics; his longer works (*Avec Balzac*, 1937; etc.) were equally stimulating. Remy de Gourmont and Paul Souday were prominent in the first part of the century, and Albert Thibaudet (1874–1936) was the leading critic of his day (*Histoire de la littérature française de 1789 à nos jours*, 1936; *Réflexions*, 1938–41; etc.). Charles du Bos (1882–1939; *Approximations*, 1922–37; etc.), like Valery Larbaud, did much to make English authors known in France; Edmond Jaloux, Benjamin Crémieux and André Suarès were also gifted interpreters of foreign literature. Émile Henriot was an excellent guide to current literary production for more than 25 years (in his *Courrier littéraire*, etc.). Many different tendencies were expressed by other critics of repute: Pierre Abraham, Marcel Arland, Maurice Bardèche, Gérard Bauer, André Bellessort, André Billy, J. Boulenger, Roger Caillois, Ramon Fernandez, Yves Gandon, Jean Guéhenno, Daniel Halévy, Jean Hytier, Paul Léautaud, Thierry Maulnier, Henri Mondor, Léon Pierre-Quint, Marcel Raymond, André Rousseaux, J. Schlumberger, A. Thérive, Marcel Thiébaut and others. Among postwar writings, Georges Poulet's *Études sur le temps humain*, 2 vol. (1950–52), were outstanding. Other original critics of the later period were R. M. Albérès (*La Révolte des écrivains d'aujourd'hui*, 1949), Albert Béguin, Maurice Blanchot (*Faux-pas*, 1943; *La Part du feu*, 1949), Pierre de Boisdeffre (*Métamorphose de la littérature*, 2 vol., 1950–51), Armand Hoog, Robert Kanters, Claude-Edmonde Magny, Robert Mallet, Claude Mauriac, Maurice Nadeau, Gaëtan Picon and Pierre Henri Simon (*L'Esprit et l'histoire*, 1954). Dramatic criticism has been well represented by Robert Kemp, Gabriel Marcel, Jacques Lemarchand, Francis Ambrière and Jean-Jacques Gautier. Two well-known histories of modern French literature were written by René Lalou and Henri Clouard respectively; Pierre Brodin studied 47 contemporary authors with much discrimination in his *Présences contemporaines*, 2 vol. (1954–55). (*See* also biographical articles on various writers.)

FRENCH REPUBLICAN CALENDAR, a calendar substituted in France during the Revolution in place of the prevailing Gregorian system. Something of the sort had been suggested in 1785 by a certain Riboud, and a definite scheme had been promulgated by Pierre Sylvain Maréchal (1750–1803) in his *Almanach des honnêtes gens* (1788). The objects which the advocates of a new calendar had in view were to strike a blow at the clergy and to divorce all calculations of time from the Christian associations with which they were loaded, in short, to abolish the Christian year; and enthusiasts were already speaking of "the first year of liberty" and "the first year of the republic" when the national convention took up the matter in 1793. The business of drawing up the new calendar was entrusted to the president of

the committee of public instruction, Charles Gilbert Romme (1750–95), who was aided in the work by the mathematicians Gaspard Monge and Joseph Louis Lagrange, the poet Fabre d'Églantine and others. The result of their labours was submitted to the convention in September; it was accepted, and the new calendar became law on Oct. 5, 1793. The new arrangement was regarded as beginning on Sept. 22, 1792, because it was the day of the proclamation of the republic, and, in this year, the day of the autumnal equinox.

By the new calendar the year of 365 days was divided into 12 months of 30 days each, every month being divided into three periods of ten days, each of which were called *décades*, and the tenth, or last, day of each decade being a day of rest. It was also proposed to divide the day on the decimal system, but this arrangement was found to be highly inconvenient and it was never put into practice. Five days of the 365 still remained to be dealt with, and these were set aside for national festivals and holidays and were called *Sans-culottides*. They were to fall at the end of the year, *i.e.*, on the five days between Sept. 17 and 21 inclusive. and were called the festivals of virtue, of genius, of labour, of opinion and of rewards. A similar course was adopted with regard to the extra day which occurred once in every four years, but the first of these was to fall in the year III., *i.e.*, in 1795, and not in 1796, the leap year in the Gregorian calendar. This day was set apart for the festival of the Revolution and was to be the last of the *Sans-culottides*. Each period of four years was to be called a *Franciade*.

Some discussion took place about the nomenclature of the new divisions of time. Eventually this work was entrusted to Fabre d'Églantine. Beginning with the new year on Sept. 22, the autumn months were *Vendémiaire,* the month of vintage, *Brumaire,* the month of fog, and *Frimaire,* the month of frost. The winter months were *Nivôse,* the snowy, *Pluviôse,* the rainy, and *Ventôse,* the windy month; the spring months, *Germinal,* the month of buds, *Floréal,* the month of flowers, and *Prairial,* the month of meadows; the summer months, *Messidor,* the month of reaping, *Therrnidor,* the month of heat, and *Fructidor,* the month of fruit. To the days Fabre d'Églantine gave names which retained the idea of their numerical order, calling them Primedi, Duodi, etc., the last day of the ten, the day of rest, being named Décadi. The new order was soon in force in France and the new method was employed in all public documents, but it did not last many years. In Sept. 1805 it was decided to restore the Gregorian calendar, and the republican one was officially discontinued on Jan. 1, 1806.

The connecting link between the old and the new calendars is slight and the expression of a date in one calendar in terms of the other is a matter of some difficulty. A simple method of doing this, however, is afforded by the table on the preceding page, which is taken from the article by J. Dubourdieu in *La Grande Encyclopédie*.

Thus Robespierre was executed on 10 Thermidor An II., *i.e.*, July 28, 1794. The insurrection of 12 Germinal An III. took place on April 1, 1795. The famous 18 Brumaire An VIII. fell on Nov. 9, 1799, and the *coup d'état* of 18 Fructidor An V. on Sept. 4, 1797.

For a complete concordance of the Gregorian and the republican calendars *see* Stokvis, *Manuel d'histoire,* vol. iii. (Leyden, 1889); also G. Villain, "Le Calendrier républicain," in *La Révolution Française* for 1884–85.

FRENCH REVOLUTION, THE. There have been several revolutions in France, but when the French Revolution is spoken of without qualification it means the great revolutipn, by which, towards the close of the 18th century, the old order in France was overthrown. Though the Revolution passed through many phases and its beginnings must be set far back in the history of France, one event was from the first held to mark its decisive moment. When, on the afternoon of July 14, 1789, the Duc de La Rochefoucauld-Liancourt brought to King Louis XVI. at Versailles the news of the capture of the Bastille, the king exclaimed: "Why, thia is a revolt!" "No, Sire," replied the duke, "It is a revolution." Three days later the tidings reached Arthur Young at Nancy; he noted in his journal that he had just received the news of the "complete overthrow of the old order." To this day the anniversary of the fall of the Bastille, July 14, is celebrated by the French as the birthday of their national liberties.

It is not proposed here to explain why the capture by the populace of an old castle-prison, garrisoned by a handful of pensioners, was at once taken as marking the downfall of the old autocratic *régime* in France; an account of the Revolution which this heralded, of its antecedent causes, and of its later developments will be found in the article FRANCE: *History*. But the great Revolution was of epoch-making importance, not for France only, but for the whole world; for it set in motion those revolutionary forces—democracy, nationalism, socialism—which have changed the face of Europe and of the world, and are not yet spent. To say this, is not to belittle the importance of the American Revolution, which preceded the French Revolution and to a great extent inspired it. July 4, 1776, was certainly also an epoch-making date. The American Declaration of Independence first laid down the principle that governments derive their just powers from the consent of the governed, and so for the first time authoritatively proclaimed democracy as the only legitimate foundation of civil society. But the American Revolution was not so revolutionary as at first it seemed. Though a breach was made with England, no breach was made with English traditions of government and law. Of those who signed the Declaration of Independence but very few were democrats at heart. They subscribed to the revolutionary principles embodied by Jefferson in the preamble, but they had no idea of giving them a logical and universal application. That was reserved for the French. The Americans first established modern democracy. The French made it a militant creed.

There had been revolutions in Europe before 1789; but these revolutions had been strictly limited in their aims, and there had been no idea of setting up one form of constitution as absolutely superior to all others. Before 1789 the words "republic" and "democracy" conveyed no suggestion of revolutionary peril. Though Rousseau declared the ultimate sovereignty of the people to be inalienable, and all governments not established on this basis usurpations, he agreed with blontesquieu that republicanism and democracy were suitable only to small States, and were therefore peaceful in their tendencies. Even when a great new Republic was founded beyond the Atlantic, the monarchs watched its rise without misgiving, and even assisted in its foundation. "Time is necessary for the creation of a conquering people," said a contemporary diplomatic report, "It is more difficult to produce the spirit of conquest in a republic than in the head of a government which is entrusted to a single person."

This was an illusion which the history of the French Revolution should have dispelled, though it still persists. It serves partly to explain the apathy displayed at the outset by the Continental monarchs towards the troubles of their brother of France, which they even regarded as providential, since they prevented him from interfering with their plans for the final partition of Poland. It was only gradually that they awoke to the fact that the triumph of the Revolution in Paris had introduced a wholly new factor into international politics, and one very perilous to themselves. For the principles of the Revolution had an application far beyond the borders of France, since the doctrine of the sovereignty of the people as the only legitimate foundation of government challenged the right to exist of every State in Europe. This was the new thing which the crusading spirit of the Revolution revealed to the world: political idealism in arms, war waged, not in the name of the State for purposes of conquest, but in the name of humanity to set up everywhere on the ruins of the old order the theoretically perfect State. There were those, even at the time, who could read the meaning of the portent. Goethe was present when, at Valmy on Sept, 20, 1792, the ragged levies of the nascent French Republic withstood the attack of Brunswick's Prussian veterans. "From this place and this day," he noted in his diary, "dates a new epoch in the history of the world, and you will be able to say: I was there."

Characteristics of the Revolution.—The French Revolution, by the challenge thrown down to all the old world, had revealed itself as different to any revolution that had hitherto been.

In what did this difference consist? and what were its causes? The essential difference was that the French Revolution, increasingly as overturn succeeded overturn, represented not so much an effort to remedy admitted evils in the body politic, as an effort to recreate it on an ideal basis. "What does this mysterious science of government and legislation amount to?" said Robespierre, "To putting into the laws the moral truths culled from the works of the philosophers."

In holding this view Robespierre was not singular, though he was the most rigid in upholding it. Of the 1,200 deputies who met in the States-General at Versailles, in May 1789, but few had any experience of the practical problems of government, or had learned politics in any other school than the conversations of the *salons* and the writings of the philosophers. So far as they were not merely conservative, the champions of outworn prerogatives and privilege, they were for the most part—as Talleyrand was to put it—"builders of theories for an imaginary world." The voices of those who, like Mirabeau, realized the force of tradition in human affairs, and tried to hold fast what was good and useful in the old order, were soon silenced by the eloquence of the ideologues and—the roar of the Paris mob. And so, beginning with the "orgy" of Aug. 4, 1789, the old order was swept away before a new order was ready to take its place. The internal history of France during the Revolution is mainly that of successive attempts to build up an ideal order on the ruins.

Divergent Tendencies.—The process, of course, was not simple. The Revolutionists might agree on the principles embodied in the Declaration of the Rights of Man, but they differed about their application. The Constitution of 1791 was ostensibly an effort to apply them logically; but its framers tempered their logic with a *bourgeois* caution; for them "equality" meant at most equality before the law, not equality of opportunity, and they limited the franchise in the interests of the possessing classes. The Constitution was overthrown, with the monarchy, on Aug. 10, 1792; but the rift it had created in the revolutionary ranks continued, and widened, in the National Convention.

The struggle between the Girondins (*see* GIRONDISTS) and the Mountain (*q.v.*), as M. Albert Mathiez has now shown, was no mere struggle of rival groups for power, nor was it primarily a revolt of the provinces against the predominance of Paris and the Paris mob. Though the border-line between the factions was never very clearly marked, the essential difference between them was that the Girondins, though republicans and idealists, were champions of the rights of property, while the Mountain, which depended for its power on the organized mob of Paris, tended more and more in the direction of what is now called Socialism. It is a question how far this tendency was deliberate, or how far the socialistic laws (Law of the Maximum, etc.) put in force under the Terror were merely "war measures." But, at least in the case of Robespierre and his party, it now seems clear that they represented a conscious attempt to realize the ideal of the Socialist Republic. Socialists, from Buonarotti onwards, have claimed him, not without reason, as the apostle and protomartyr of their economic creed.

The Revolution and Nationalism.—If modern democracy, in its various developments, received its first great impulse from the Revolution, this is also true of nationalism, which during the 19th century was to prove the most powerful solvent of the established order. The principle of nationality was not, indeed, originally part of the revolutionary gospel, which was beautifully cosmopolitan. The orators of the Constituent Assembly held up the ideal of universal peace, and asserted with confidence that regenerated France would never again wage wars of conquest; and those who later, in the Legislative Assembly, clamoured for war spoke of carrying "liberty" to oppressed peoples. But already the mood was changing. The threat of foreign invasion had aroused in the French themselves an intense natiohal consciousness, and Danton was not alone in urging that the great object of the war should be to gain for France the frontiers "fixed by nature"—the Rhine, the Alps and the Pyrenees. And so, almost insensibly, the war of defence and revolutionary propaganda developed into a war of conquest, till in the end the rights of man were forgotten, blotted out by the splendour of the man, Napoleon, who had become the incarnation of a Revolution now identified with all the glories of France.

The sparks from the conflagration in Paris had meanwhile been carried far and wide, and had started fires even in places unexpected and remote, where they glowed under the surface, to burst into flame later. But though the agitations, which were in the end to lead to the rise of a whole series of new nations in eastern Europe, were sometimes inspired at the outset by French revolutionary doctrines, it was not so much these doctrines which gave its mighty impulse to the new spirit of nationality in Europe at large as the example of French nationalism, and the reaction against it when it became a conquering force. In Italy Napoleon, for his own purposes, deliberately awakened a national consciousness which had slumbered for a thousand years. In Germany, which like Italy had become little more than "a geographical expression," the humiliations he inflicted stirred up memories of ancient greatness and a new passion for national unity. When Spain set the example of national resistance, and with success, all Europe recognized that a new force had come into the world; that war was no longer a mere ordeal by battle, to be fought out according to fixed rules by professional armies, but a trial of strength between nations in arms. And so it was that, in their final struggle against the revolutionary doctrine of conquest, as embodied in Napoleon, the monarchs themselves appealed to the new-born national sentiment of the peoples, and not in vain. The battle of Leipzig, which practically sealed Napoleon's doom, is rightly known as "the Battle of the Nations."

The processes of national segregation and national expansion, then, which during the century that followed changed the face of Europe, received their first great impulse from the French Revolution. The result has been a complete change in the substance of the old order, even where the outward semblance has remained unaltered. Everywhere before the World War, except in the Austrian and Ottoman empires, sovereignty had ceased to be territorial and become national; even in Germany, where territorial sovereignties continued to exist, these were overshadowed by the power and prestige of the German emperor, whose title implied not a territorial but a national authority. The World War, a world-wide battle of the nations, completed the process, so far as the principle of national sovereignty is concerned; for Luxembourg, Liechtenstein and Monaco are insignificant exceptions which serve to emphasize the rule. Above all, the disappearance of the Habsburg monarchy, the last great purely territorial dominion, proclaimed the World War as the most stupendous phase of the Revolution which started with the capture of the Bastille. That it was the last phase cannot be said. In their internal affairs the nations are still experimenting in the application of the democratic principles proclaimed by the Revolution, except where—as in most Latin countries—the experiment has conspicuously broken down. As for the social revolution, dreamed of by Robespierre, this has to a large extent been realized even in countries reputed conservative—in universal free education, the duty of the State to provide work or the maintenance of those out of work, and so on. In the matter of international relations, too, some return has been made to the revolutionary ideal of the brotherhood of man; and the League of Nations represents an attempt to put into the laws the moral truths culled from the works of the philosophers. But the jealous and mutually exclusive sentiment of nationality remains the most fateful legacy of the Revolution, the forces of which for good or evil are not yet spent.

BIBLIOGRAPHY.—Albert Sorel, *L'Europe et la Révolution française* (1903–05), though characterized by French bias, remains the most authoritative work of the reaction of the Revolution on contemporary Europe and vice versa. For the significance of the Revolution for France itself *see* Godfrey Elton, *The Revolutionary Idea in France* (1923). (W. A. P.)

FRENCH REVOLUTIONARY WARS (1792–1800), the general name for the first part of the series of French wars which went on continuously, except for some local and temporary cessations of hostilities, from the declaration of war against Britain in 1792 to the final overthrow of Bonaparte in 1815. The most important of these cessations—viz., the peace of 1801–03—

closes the "Revolutionary" and opens the "Napoleonic" era of land warfare, for which *see* NAPOLEONIC CAMPAIGNS, PENINSULAR WAR and WATERLOO CAMPAIGN. The naval history of the period is dated somewhat differently; the first period, treated below, is 1792–99; for the second, 1799–1815, *see* NAPOLEONIC CAMPAIGNS.

MILITARY OPERATIONS

France declared war on Austria on April 20, 1792. But Prussia and other pouers had allied themselves with Austria in view of war, and it was against a coalition and not a single power that France found herself pitted, at the moment when the "emigration," the ferment of the Revolution, and want of material and of funds had thoroughly disorganized her army. The first engagements were singularly disgraceful. Near Lille the French soldiers fled at sight of the Austrian outposts, crying *"Nous sommes trahis,"* and mur'dered their general (April 29). The commanders-in-chief of the armies that were formed became one after another "suspects"; and before a serious action had been fought, the three armies of Rochambeau, Lafayette and Liickner had resolved themselves into two commanded by Dumouriez and Kellermann. Thus the disciplined soldiers of the Allies had apparently good reason to consider the campaign before them a military promenade. On the Rhine, a combined army of Prussians, Austrians, Hessians and *émigrés* under the duke of Brunswick was formed for the invasion of France, flanked by two smaller armies on its right and left, all three being under the supreme command of the king of Prussia. In the Netherlands the Austrians were to besiege Lille, and in the south the Piedmontese also took the field The first step, taken against Brunswick's advice, was the issue (July 2j) of a proclamation which, couched in terms in the last degree offensive to the French nation, generated the spirit that was afterwards to find expression in the "armed nation" of 1793–94, and sealed the fate of Louis XVI. The duke, who was a model sovereign in his own principality, sympathized with the constitutional side of the Revolution, while as a soldier he had no confidence in the success of the enterprise. After completing its preparations in the leisurely manner of the previous generation, his army crossed the French frontier on Aug. 19. Longwy was easily captured; and the Allies slowly marched on to Verdun, which was more indefensible even than Longwy. The commandant, Col. Eeaurepaire, shot himself in despair, and the place surrendered on Sept. 3. Brunswick now began his march on Paris and approached the defiles of the Argonne. But Dumouriez, who had been training his raw troops at Valenciennes in constant small engagements, with the purpose of invading Belgium, now threw himself into the Xrgonne by a rapid and daring flank march, almost under the eyes of the Prussian advanced guard, and barred the Paris road, summoning Kellermann to his assistance from Metz. The latter moved but slowly, and before he arrived the northern part of the line of defence had been forced. Dumouriez, undaunted, changed front so as to face north, with his right wing on the Argonne and his left stretching towards Châlons, and in this position Kellermann joined him at St. Menehould on Sept. 19.

Valmy.—Brunswick meanwhile had passed the northern defiles and had then swung round to cut off Dumouriez from Châlons. At the moment when the Prussian manoeuvre was nearly completed, Kellermann, commanding in Dumouriez's momentary absence, advanced his left wing and took up a position between St. Menehould and Valmy. The result was the world-renowned cannonade of Valmy (Sept. 20, 1792). Kellermann's infantry, nearly all regulars, stood steady. The French artillery justified its reputation as the best in Europe, and eventually, with no more than a half-hearted infantry attàck, the duke broke off the action and retired. This trivial engagement was the turning-point of the campaign and a landmark in the world's history. Ten days later, without firing another shot, the invading army began its retreat. Dumouriez's pursuit was not seriously pressed; he occupied himself chiefly with a series of subtle and curious negotiations which, with the general advance of the French troops, brought about the complete withdrawal of the enemy from the soil of France.

Meanwhile, the French forces in the south had driven back the Piedmontese and had conquered Savoy and Nice. Another French success was the daring expedition into Germany made by Custine from Alsace. Custine captured Mainz itself on Oct. 21 and penetrated as far as Frankfurt. In the north the Austrian siege of Lille had completely failed, and Dumouriez now resumed his interrupted scheme for the invasion of the Netherlands. His forward movement, made as it was late in the season, surprised the Austrians, and he disposed of enormously superior forces. On Nov. 6 he won the first great victory of the war at Jemappes, near Mons, and, this time advancing boldly, he overran the whole country from Namur to Antwerp within a month.

Such was the prelude of what was called the "Great War" in England and the "Épopée" in France. Before going farther it is necessary to summarize the special features of the French army —in leadership, discipline, tactics, organization and movement—which made these campaigns the archetype of modern warfare.

The French Army **1792–1796.**—At the outbreak of the Revolution, the French army, like other armies in Europe, was a "voluntary" long-service army, augmented to some extent in war by drafts of militia. One of the first problems that the Constituent Assembly took upon itself to solve was the nationalization of this strictly royal and professional force, and as early as October 1789, the word "conscription" was heard in its debates. But it was decreed, nevertheless, that free enlistment alone befitted a free people, and the regular army was left unaltered in form. However, a national guard came into existence side by side with it, and the history of French army organization in the next few years is the history of the fusion of these two elements. The first step, as regards the regular army, was the abolition of proprietary rights, the serial numbering of regiments throughout the army, and the disbandment of the *Maison du roi*. The next was the promotion of deserving soldiers to fill the numerous vacancies caused by the emigration. Along with these, however, there came to the surface many incompetent leaders, favourites in the political clubs of Paris, etc., and the old strict discipline became impossible owing to the frequent intervention of the civil authorities in matters affecting it, the denunciation of generals, and especially the wild words and wild behaviour of "Volunteer" (embodied national guard) battalions.

When war came, it was soon found that the regulars had fallen too low in numbers and that the national guard demanded too high pay, to admit of developing the expected field strength. Arms, discipline, training alike were wanting to the new levies, and the repulse of Brunswick was effected by manoeuvring and fighting on the old lines and chiefly with the old army. The cry of *"La patrie en danger,"* after giving, at the crisis, the highest moral support to the troops in the front, dwindled away after victory, and the French Government contented itself with the half-measures that had, apparently, sufficed to avert the peril. More, when the armies went into winter quarters, the volunteers claimed leave of absence and went home. But in the spring of 1793, confronted by a far more serious peril, the Government took strong measures. Universal liability was asserted, and passed into law. Yet even now whole classes obtained exemption and the right of substitution as usual forced the burden of service on the poorer classes, so that of the 100,000 men called on for the regular army and 200,000 for the volunteers, only 180,000 men were actually raised. Desertion, quite usually regarded as the curse of professional armies, became a conspicuous vice of the defenders of the Republic, except at moments when a supreme crisis called forth supreme devotion.

Amalgamation and Universal Service.—While this unsatisfactory general levy was being made, defeats, defections and invasion in earnest came in rapid succession, and to deal with the almost desperate emergency, the ruthless Committee of Public Safety sprang into existence. "The levy is to be universal. Unmarried citizens and widowers without children of ages from 18 to 25 are to be called up first," and 450,000 recruits were immediately obtained by this single act. The complete amalgamation of the regular and volunteer units was decided upon. The white uniforms of the line gave place to the blue of the national guard *in all arms and services. The titles of officers were changed, and in fact every relic of the old régime, save the inherited solidity of the old regular battalions, was swept away. This rough combination of line and volunteers, therefore— for the "Amalgam" was not officially begun until 1794—must be understood when we refer to the French army of Hondschoote or of Wattignies. It contained, by reason of its universality and also because men were better off in the army than out of it— if they stayed at home they went in daily fear of denunciation and the guillotine— the best elements of the French nation. To some extent the political arrivistes had been weeded out, and though the informer, here as elsewhere, struck unseen blows, the mass of the army gradually evolved its true leaders and obeyed them. It was, therefore, an army of individual citizen-soldiers of the best type, welded by the enemy's fire, and conscious of its own solidarity in the midst of the revolutionary chaos. After 1794 the system underwent but little radical change until the end of the Revolutionary period. Its regiments grew in military value month by month and attained their highest level in the great campaign of 1796. In 1795 the French forces (now all styled national guard) consisted of 531,000 men, of whom 323,000 were infantry (100 3-battalion demi-brigades), 97,000 light infantry (30 demi-brigades), 29,000 artillery, 20,000 engineers and 59,000 cavalry. This novel army developed novel fighting methods, above all in the infantry. This arm had just received a new drill-book, as the result of a long controversy (see* INFANTRY*) between the advocates of "lines" and "columns," and this drill-book, while retaining the principle of the line, set controversy at rest by admitting battalion columns of attack, and movements at the "quick" (100–120 paces to the minute) instead of at the "slow" march (76). On these two prescriptions, ignoring the rest, the practical troop leaders built up the new tactics little by little, and almost unconsciously.*

Tactics.— The earlier battles were fought more or less according to the drill-book, partly in line for fire action, partly in column for the bayonet attack. But line movements required the most accurate drill, and what was attainable after years of practice with regulars moving at the slow march was wholly impossible for new levies moving at 120 paces to the minute. When, therefore, the line marched off, it broke up into a shapeless swarm of individual firers. This was the form, if form it can be called, of the tactics of 1793— "horde-tactics" as they have quite justly been called— and a few such experiences as that of Hondschoote sufficed to suggest the need of a remedy. This was found in keeping as many troops as possible out of the firing line. In other words, the bravest and coolest marksmen were let loose to do what damage they could, and the rest, massed in close order, were kept under the control of their officers and only exposed to the dissolving influence of the fight when the moment arrived to deliver, whether by fire or by shock, the decisive blow.

The cavalry underwent little change in its organization and tactics, which remained as in the drill-books founded on Frederick's practice. But except in the case of the hussars, who were chiefly Alsatians, it was thoroughly disorganized by the emigration or execution of the nobles who had officered it, and for long it was incapable of facing the hostile squadrons in the open

In artillery matters, this period, 1792–96, marks an important progress, due above all to Gribeauval (q.v.) and the two du Teils, Jean Pierre (1722–94) and Jean (1733–1820), who were Bonaparte's instructors. The change was chiefly in organization and equipment— the great tactical development of the arm was not to come until the time of the Grande Armée—and may be summarized as the transition from battalion guns and reserve artillery to batteries of "horse and field."

The engineers, like the artillery, were a technical and non-noble corps. They escaped, therefore, most of the troubles of the Revolution— indeed, the artillery and engineer officers, Bonaparte and Carnot amongst them, were conspicuous in the political regeneration of France— and the engineers carried on with little change the traditions of Vauban and Cormontaigne (see FORTIFICATION AND SIEGECRAFT*). Both these corps were, after the Revolution as before it, the best in Europe, other armies admitting their superiority and following their precepts.*

In all this the army naturally outgrew its old "linear" organization. Temporary divisions, called for by momentary necessities, placed under selected generals and released from the detailed supervision of the commander-in-chief, soon became, though in an irregular and haphazard fashion, permanent organisms, and by 1796 the divisional system had become practically universal. The next step, as the armies became fewer and larger, was the temporary grouping of divisions; this, too, in turn became permanent as the army corps.

New System of War.— This subdivision of forces was intimately connected with the general method of making war adopted by the "New French," as their enemies called them. What astonished the Allies most of all was the number and the velocity of the Republicans. These improvised armies had, in fact, nothing to delay them. Tents were unprocurable for want of money, untransportable for want of the enormous number of wagons that would have been required, and also unnecessary, for the discomfort that would have caused wholesale desertion in professional armies was cheerfully borne by the men of 1793–94. Supplies for armies of then unheard-of size could not be carried in convoys, and the French soon became familiar with "living on the country." Thus 1793 saw the birth of a new system of war— rapidity of movement, full development of national strength, bivouacs and requisitions, and force, as against cautious manoeuvring, small professional armies, tents and full rations, and chicane. The first represented the decision-compelling spirit, the second the spirit of risking a little to gain a little. Above all the decision-compelling spirit was reinforced by the presence of the emissaries of the Committee of Public Safety, the "representatives on mission" who practically controlled the guillotine. There were civil officials with the armies of the Allies too, but their chief function was not to infuse desperate energy into the military operations, but to see that the troops did not maltreat civilians. Such were the fundamental principles of the "New French" method of warfare, but it only reached maturity after a painful period of trial and error.

CAMPAIGNS IN THE NETHERLANDS

The year 1793 opened disastrously for the Republic. As a consequence of Jemappes and Valmy, France had taken the offensive both in Belgium, which had been overrun by Dumouriez's army, and in the Rhine countries. But the execution of Louis XVI. raised up a host of new and determined enemies. England, Holland, Austria, Prussia, Spain and Sardinia promptly formed the First Coalition. England poured out money in profusion to pay and equip her Allies' land armies, and herself began the great struggle for the command of the sea (see Naval Operations, below).

Neerwinden.—*In the Low Countries, while Dumouriez was beginning his proposed invasion of Holland, Prince Josias of Saxe-Coburg, the new Austrian commander on the Lower Rhine, advanced from the region of Cologne and drove in the various detachments that Dumouriez had posted to cover his right. The French general thereupon abandoned his advance into Holland, and, with what forces he could gather, turned towards the Meuse. The two armies met at Neerwinden (q.v.) on March 18, 1793. Dumouriez had only a few thousand men more than his opponent, instead of the enormous superiority he had had at Jemappes. Thus the enveloping attack could not be repeated, and in a battle on equal fronts the old generalship and the old armies had the advantage. Dumouriez was thoroughly defeated, the house of cards collapsed, and the whole of the French forces retreated in confusion to the strong line of border fortresses, created by Louis XIV. and Vauban.*[1] *Dumouriez, witnessing the failure of his political schemes, declared against the Republic and, after a vain attempt to induce his own army to follow his example, fled (April 5) into the Austrian lines. The leaderless Republicans streamed back to Valenciennes. There, however, they found a general. Picot (comte de) Dampierre was a regimental officer of the old army, who, in spite of his vanity and extravagance, pos-*

[1]For *following operations see map in* SPANISH *SUCCESSION, WAR OF THE.*

sessed real loyalty to the new order of things, and brilliant personal courage. At the darkest hour he seized the reins without orders and without reference to seniority, and began to reconstruct the force and the spirit of the shattered army by wise administration and dithyrambic proclamations.

France was, however, for a time defenceless, and the opportunity existed for the military promenade to Paris that the allied statesmen had imagined in 1792. But Coburg now ceased to be a purely Austrian commander, for one by one allied contingents, with instructions that varied with the political aims of the various governments, began to arrive. Soon the idea of restoring order in France became little more than a pretext for a general intrigue amongst the confederate powers, each seeking to aggrandize itself at France's expense. Coburg's plan of campaign was limited to the objects acceptable to all the Allies alike. He aimed at the conquest of a first-class fortress—Liile or Valenciennes—his reason being largely that he might gain a depot as near as possible to the front to save the customarily exorbitant hire of transport for supplies. As for the other governments which Coburg served as best he could, the object of the war was material concessions, and it would be easy to negotiate for the cession of Dunkirk and Valenciennes when the British and Austrian colours already waved there. The Allies, therefore, instead of following up their advantage over the Frehch field army and driving forward on the open Paris road, set their faces westward, intending to capture Valenciennes, Le Quesnoy, Dunkirk and Lille one after the other.

Dampierre meanwhile grew less confident as responsibility settled upon his shoulders. Quite unable to believe that Coburg would bury himself in a maze of rivers and fortresses when he could scatter the French army to the winds by a direct advance, he was disquieted and puzzled by the Austrian investment of Condé. And the result of skirmishes around Valenciennes gave him little confidence in the troops. But the representatives on mission bade him relieve Condé at all costs. On May 1, Coburg's positions west of Quiévrain were attacked. The French won some local successes by force of numbers and surprise, but the Allies recovered themselves, and drove the Republicans in disorder to their entrenchments. Dampierre's discouragement now became desperation, and, urged on by the representatives (who, be it said, had exposed their own lives freely enough in the action), he attacked Clerfayt, who was covering the siege of Condé, on the 8th at Raismes. The troops fought far better in the woods and hamlets west of the Scheldt than they had done in the plains to the east. But in the heat of the action Dampierre risked and lost his life in leading a storming party, and his men retired sullenly, though this time in good order, to Valenciennes. Another pause followed, Coburg awaiting the British conticgent under the duke of York, and the Republicans endeavouring to assimilate the reinforcements of conscripts, who now arrived. Mutiny and denunciations augmented the confusion in the French camp. Plan of campaign there was none, save a resolution to stay at Valenciennes in the hope of finding an opportunity of relieving Condé and to create diversions elsewhere. These came to nothing, and before they had even started, Coburg, resuming the offensive, had stormed the lines of Famars (May 24), whereupon the French army retired to Bouchain, leaving not only Condé, but also Valenciennes to resist as best they could. Here, surrounded by streams and marshes, the French generals thought that their troops were secure from the rush of the dreaded Austrian cavalry. Coburg refrained from a regular siege of Condé. He wished to gain possession of the fortress in a defensible state, intending to use it as his own depot later in the year. He therefore reduced it by famine. During the siege of Valenciennes the Allies appear to have been supplied from Mons.

Many Commanders.—Custine next took charge of the dispirited army, the fourth commander in two months. His first task was to institute a severe discipline, and his prestige was so great that his mere threat of death sentences for offenders produced the desired effect. As to operations, he wished for a concentration of all possible forces from other parts of the frontier towards Valenciennes, even if necessary at the cost of sacrificing his own conquest of Mainz. But the generals of the numerous other armies refused to give up their troops, and on June 17 the idea was abandoned in view of the growing seriousness of the Vendéan insurrection (see VENDÉE, WARS OF THE). Custine, therefore, could do no more than continue the work of reorganization. Coburg, who had all this time succeeded in remaining concentrated, now found himself compelled to extend leftwards towards Flanders, for Custine had infused some energy into the scattered groups of the Republicans in the region of Douai, Lille and Dunkirk—and during this respite the Paris Jacobins sent to the guillotine both Custine and his successor La Marlière before July was ended. Both were "ci-devant" nobles and, so far as is ascertainable, neither was guilty of anything worse than attempts to make his orders respected by his soldiers. By this time, owing to the innumerable denunciations and arrests, the confusion in the Army of the North was at its height, and no further efforts were made for the relief of Valenciennes and Condé. Condé, starved out as Coburg desired, capitulated on June 10, and Valenciennes, which held out bravely until the civil population began to plot treachery, on July 28. Shortly after this the wreck of the field army retired on Arras. By this they gave up the direct defence of the Paris road, but placed themselves in a "flank position" relatively to it. Thus ended the second episode of the campaign of 1793. Military operations were few and spasmodic, on the one side because the Allied statesmen were less concerned with the nebulous common object of restoring order in France than with their several schemes of aggrandizement, on the other owing to the almost incredible confusion of France under the *régime* of Danton and Marat. The third episode shows little or no change in the force and direction of the allied efforts, but a very great change in France. Thoroughly roused by disaster and now dominated by the furious and bloodthirsty energy of the Terrorists, the French people and armies at last set before themselves clear and definite objects to be pursued at all costs.

Jean Nicolas Houchard, the next officer appointed to command, had been a heavy cavalry trooper in the Seven Years' War. His bravery, his stature, his bold and fierce manner, his want of education, seemed all to betoken the ideal sans-culotte general. But he was incapable of leading an army, and knowing this, carefully conformed to the advice of his staff-officers, Berthelmy and Gay-Vernon, the latter of whom, an exceptionally capable officer, had been Custine's chief of staff and was consequently under suspicion. At one moment, indeed, operations had to be suspended altogether because his papers were seized by the civil authorities, and amongst them were all the confidential memoranda and maps required for the business of headquarters. It was the darkest hour. The Vendéans, the people of Lyons, Marseille and Toulon, were in open and hitherto successful revolt. Valenciennes had fallen and Coburg's hussar parties pressed forward into the Somme valley. Again the Allies had the decision of the war in their own hands. Coburg, indeed, thought an advance on Paris hazardous. But, hazardous or not, it would have been attempted but for the English. The duke of York had definite orders from his government to capture Dunkirk—at present a nest of corsairs which interfered with the Channel trade, and in the future, it was hoped, a second Gibraltar—and the English and Hanoverians marched away to besiege the coast fortress. Thereupon the king of Prussia in turn called off his contingent for operations on the middle Rhine. Coburg, therefore, was brought to a complete standstill, and the scene of the decision was shifted to the district between Lille and the coast.

Thither came Carnot, the engineer officer who was in charge of military affairs in the Committee of Public Safety and who is known to history as the "Organizer of Victory." He went no further than to recommend an inroad into Flanders on the ground that no enemy would be encountered there. This, however, in the event developed into an operation of almost decisive importance, for at the moment of its inception the duke of York was already on the march. Fighting *en route* a severe but successful action at Lincelles, to extricate the Dutch, the Anglo-Hanoverians entered the district—densely intersected with canals and morasses—around Dunkirk and Bergues on August 21 and 22.

On the right, by way of Furnes, the British moved towards Dunkirk and invested the east front of the weak fortress, while on the left the Hanoverian field-marshal von Freytag moved via Poperinghe on Bergues. The French detachments were easily dispersed. Houchard was in despair at the bad conduct of his troops. But one young general, Jourdan, anticipating Houchard's orders, had already brought a strong force from Lille to Cassel, whence he incessantly harried Freytag's posts. Carnot encouraged the garrisons of Dunkirk and Bergues, and caused the sluices to be opened. The morale of the defenders rose rapidly. Houchard prepared to bring up every available man of the Army of the North, and only waited to make up his mind as to the direction in which his attack should be made. The Allies themselves recognized the extreme danger of their position. It was cut in half by the Great Morass, stretches of which extended even to Furnes. Neither Dunkirk nor Bergues could be completely invested owing to the inundations, and Freytag sent a message to King George III. to the effect that if Dunkirk did not surrender in a few days the expedition would be a complete failure.

As for the French, they could hardly believe their good fortune. Generals, staff officers and representatives on mission alike were eager for a swift and crushing offensive. "'Attack' and 'attack in mass' became the shibboleth and the catch-phrase of the camps" (Chuquet), and fortresses and armies on other parts of the frontier were imperiously called upon to supply large drafts for the Army of the North. Gay-Vernon's strategical instinct found expression in a wide-ranging movement designed to secure the annihilation of the duke of York's forces. Beginning with an attack on the Dutch posts north and east of Lille, the army was then to press forward towards Furnes, the left wing holding Freytag's left wing in check, and the right swinging inwards and across the line of retreat of both allied corps. On Aug. 28, consequently, the Dutch posts were attacked and driven away by the mobile forces at Lille, aided by parts of the main army from Arras. But even before they had fired their last shot the Republicans dispersed to plunder and compromised their success. Houchard and Gay-Vernon began to fear that their army would not emerge successfully from the supreme test they were about to impose on it, and from this moment the scheme of destroying the English began to give way to the simpler and safer idea of relieving Dunkirk. The place was so ill-equipped that after a few days' siege it was in *extrcmis*, and the political importance of its preservation led not merely the civilian representatives, but even Carnot, to implore Houchard to end the crisis at once. An army of 37,000 men was left to watch Coburg and to secure Arras and Douai, and the rest, 50,000 strong, assembled at Cassel. Everything was in Houchard's favour could he but overcome the indiscipline of his own army. The duke of 170rk was more dangerous in appearance than in reality and Freytag's covering army extended in a line of disconnected posts from Bergues to Ypres.

Hondschoote.—Against the left and centre of this feeble cordon 40,000 men advanced in many columns on Sept. 6. A confused outpost fight, in which the various assailing columns dissolved into excited swarms, ended, long after nightfall, in the orderly withdrawal of the various allied posts to Hondschoote. The French generals were occupied the whole of next day in sorting out their troops, who had not only completely wasted their strength against mere outposts, but had actually consumed their rations and used up their ammunition. On the 8th, the assailants, having more or less recovered themselves, advanced again. They found the enemy entrenched on either side of the village of Hondschoote, the right resting on the great morass and the left on the village of Leysele. Houchard, now concerned more with the relief of Dunkirk than with the defeat of the enemy, had sent away one division to Dunkirk, another to Bergues, and a third towards Ypres, and left himself only some 20,000 men for the battle. The enemy, however, had only 13,000. Houchard despatched a column, guided by his staff officer Berthelmy, to turn the Hanoverians' left, but this column lost its way in the dense country about Loo. The centre waited motionless under the hre of the allied guns near Hondschoote. In vain the representative Delbrel implored the general to order the advance. Houchard was obstinate, and ere long the natural result followed. Though Delbrel posted himself in front of the line, conspicuous by his white horse and tricoloured sash and plume, to steady the men, the bravest left the ranks and skirmished forward from bush to bush, and the rest sought cover. Then the allied commander ordered forward one regiment of Hessians, and these, advancing at a ceremonial slow march, and firing steady rolling volleys, scattered the Republicans before them. At this crisis Houchard uttered the fatal word "retreat," but Delbrel overwhelmed him with reproaches and stung him into renewed activity. He hurried away to urge forward the right wing while Jourdan rallied the centre and led it into the fight again. Once more Jourdan awaited in vain the order to advance, and once more the troops broke. But at last the exasperated Delbrel rose to the occasion. "You fear the responsibility," he cried to Jourdan; "well, I assume it. My authority overrides the general's and I give you the formal order to attack at once!" Then, gently, as if to soften a rebuke, he continued, "You have forced me to speak as a superior; now I will be your aide-de-camp," and at once hurried off to bring up the reserves and to despatch cavalry to collect the fugitives. This incident, amongst many, serves to show that the representatives on mission were no mere savage marplots, as is too generally assumed. They were often wise and able men, brave and fearless of responsibility in camp and in action. Jourdan fell wounded, but Delbrel headed a wild irregular bayonet charge which checked the Hanoverians, and Houchard himself, in his true place as a cavalry leader, came up with 500 fresh sabres and flung himself on the Allies. The disciplined Hanoverians soon re-formed after the shock, but by this time the fugitives collected by Delbrel's troopers, reanimated by ne hopes of victory, were returning to the front in hundreds, and a last assault on Hondschoote met with complete success.

Hondschoote was a psychological victory. Materially, it was no more than the crushing of an obstinate rearguard at enormous expense to the assailants, for the duke of York was able to withdraw while there was still time. But it established the fact that the "New French" mere determined to win, at any cost and by sheer weight and energy. It was long before they were able to meet equal numbers with confidence, and still longer before they could freely oppose a small corps to a larger one. But the nightmare of defeats and surrenders was dispelled. Having missed the opportunity of crushing the English, Houchard turned his attention to the Dutch posts about Menin, which he overwhelmed (Sept. 12–13). After this engagement, won by immensely superior forces, Houchard pushed still further inland, but missed his target—the Austrian general, Beaulieu—while his own detachments suffered a series of pin-prick defeats. Houchard's offensive died away completely, and he halted at Gaverelle, half-way between Douai and Arras, a prey to conflicting rumours from which emerged the conclusion that Coburg was about to join the duke of York in a second siege of Dunkirk. In consequence he began to close on his left. But his conclusion was entirely wrong. The Allies were closing on *their* left inland to attack Maubeuge.

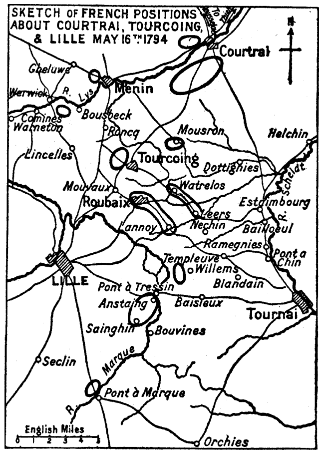
Houchard was now denounced and brought captive to Paris. Placed upon his trial, he offered a calm and reasoned defence of his conduct, but when the intolerable word "coward" was hurled at him by one of his judges he wept with rage, pointing to the scars of his many wounds, and then, his spirit broken, sank into a lethargic indifference, in which he remained to the end. He was guillotined on Nov. 16, 1793. After Houchard's arrest Jourdan accepted the command, though with many misgivings. The new levies, instead of filling up the depleted ranks of the line, were assembled in indisciplined and half-armed hordes at various frontier camps, under elected officers who had for the most part never undergone the least training. But an enthusiasm equal to that of Hondschoote, and similarly demanding a plain, urgent and recognizable objective, animated it, and although Jourdan and Carnot (who was with him) began to study the general strategic situation, the Committee brought them back to realities by ordering them to relieve Maubeuge at all costs.

Wattignies.—The Allies disposed in all of 66,000 men around the threatened fortress, but 26,000 of these were actually employed in the siege, and the remainder, forming the covering army, extended in an enormous semicircle of posts facing west, south and east. Thus the Republicans, as before, had two men to one at the point of contact (44,000 against 20,000) on Oct. 15, and though the Allies' right and centre held their ground, on their left the plateau of Wattignies (*q.v.*) was stormed on the second day, Carnot, Jourdan and the representatives leading the columns in person. Coburg, indeed, fell back in unbroken order, added to which the Maubeuge garrison had failed to co-operate with their rescuers by a sortie, and the duke of York had hurried up with all the men he could spare from the Flanders cordon. But the Dutch generals refused to ad ance beyond the Sambre, and Coburg broke up the siege of Maubeuge and retired whence he had come, while Jourdan, so far from pressing forward, was anxiously awaiting a counter-attack, and entrenching himself with all possible energy. The episode gives a perfect picture of the character, at once intense and spasmodic, of the "New French" warfare in the days of the Terror.

To complete the story of '93, it remains to sketch, very briefly, the principal events on the eastern and southern frontiers of France. It was not merely on the Sambre and the Scheldt, nor against one army of heterogeneous allies that the Republic had to fight for life, but against Prussians and Hessians on the Rhine, Sardinians in the Alps, Spaniards in the Pyrenees, and also (one might say, indeed, above all) against Frenchmen in Vendée, Lyons, Marseilles and Toulon. On the Rhine the advance of a Prussian-Hessian army, 63,000 strong. rapidly drove back Custine from the Main into the valleys of the Saar and the Lauter. An Austrian corps under Wurmser soon afterwards invaded Alsace. Here, as on the northern frontier, there was a long period of trial and error, of denunciations and indiscipline, and of wholly trivial fighting, before the Republicans recovered themselves. But in the end the ragged enthusiasts found their true leader in Hoche, and, though defeated by Brunswick at Pirmasens and Kaiserslautern, they managed to develop almost their full strength against Wurmser in Alsace. On Dec. 26 the latter was driven by main force from the lines of Weissenburg, after which Hoche advanced into the Palatinate and delivered Landau, and Pichegru moved on to recapture Mainz, which had surrendered in July. On the Spanish frontier both sides indulged in a fruitless war of posts in broken ground. The Italian campaign of 1793, equally unprofitable, will be referred to below. Far more serious than either was the insurrection of Vendée (*q.v.*) and the counter-revolution in the south of France, the principal incidents of which were the terrible sieges of Lyons and Toulon.

Campaign of 1794.—For 1794 Carnot planned a general advance of all the northern armies, that of the North (Pichegru) from Dunkirk-Cassel on Brussels, the minor Army of the Ardennes to Charleroi, and the Army of the Moselle (Jourdan) to Liége. He counted upon little as regards the two armies near the Meuse, but hoped to force on a decisive battle by the advance of the left wing towards Ypres. Coburg, on the other side, intended, if not forced to develop his strength on the Ypres side, to make his main effort against the French centre about Landrecies. This produced the siege of Landrecies, which need not concern us, a forward movement of the French to Menin and Courtrai which resulted in the battles of Tourcoing and Tournai, and the campaign of Fleurus, which, almost fortuitously, produced the long-sought decision. The first crisis was brought about by the advance of the left wing of the Army of. the North to Menin-Courtrai, where it found itself between two hostile masses, the main body of the allied right wing about Tournai and a secondary corps at Thielt. Common-sense, therefore, dictated a converging attack for the Allies and a series of rapid radial blows for the French. In the allied camp common-sense had first to prevail over routine, and the emperor's first orders were for a raid of the Thielt corps towards Ypres, which his advisers hoped would of itself cause the French to decamp. But the duke of York formed a very different plan, and Clerfayt, in command at Thielt, agreed to co-operate. Their proposal was to surround the French on the Lys with their'two corps, and by May 15 the emperor had decided to use larger forces in order to accomplish the same object.

On that day Coburg himself entered Tournai and took up the general command. Orders were promptly issued for a general offensive. Clerfayt's corps was to force its way, on the 16th, across the Lys at Werwick and connect with the main army. The main army was to advance in four columns. The first three, under the duke of York, were to move off, at daylight on the 17th, to the line Mouscron-Tourcoing-Mouvaux. The fourth and fifth under Kinsky and the archduke Charles, were to defeat the French corps on the upper Marque, and then, leaving Lille on their left, to march rapidly forward towards Werwick, thus completing the investing circle around Souham's and Moreau's isolated divisions. Picked volunteers to clear away the enemy's skirmishers were to precede the heads of the columns. Then came at the head of the main body the artillery with an infantry escort. All this might have been designed by the Japanese for the attack of some well-defined Russian position in the war of 1904. But in 1904 the Russians stood still, which was the last thing that the Revolutionary armies of 1794 would or could do. Souham, who commanded in the temporary absence of Pichegru, had formed his own plan. Finding himself with the major part of his forces between York and Clerfayt, he had decided to impose upon the former by means of a covering detachment, and to fall upon Clerfayt near Rousselaer with the bulk of his forces. But the appearance of fresh allied troops (Kinsky) on his right at once modified these arrangements. Divining Coburg's intentions from the arrival of the enemy near Pont-à-Marque and at Lannoy, he attempted a fresh concentration against the left flank of the columns on the move towards Tourcoing, which his weak centre (12,000 men at Tourcoing, Mouscron, Roubaix) was to stop by frontal defence. No rôle was as yet assigned to the principal mass (50,000 under hforeau) about Courtrai.



This second plan failed like the first, because the enemy's counter-will was not controlled—as Napoleon usually sought to ensure. All along the line Coburg's advance compelled the French to fight as they were without any redistribution. But the French were sufficiently elastic to adapt themselves readily to unforseen conditions, and at the end of the first day's operations, the "annihilation plan" of the Allies had already undergone a serious check. The archduke did not arrive at Orchies till dawn on the 17th, and had to halt there for rest and food. Thence, moving across country in fighting formation, he made his way no farther than Pont-&-Marque. Kinsky, after forcing the passage of the Marque at Bouvines, had made little headway in face of a French covering detachment. On the other flank, the right column (Hanoverians) under von dem Bussche, had been driven back from Mouscron. Only the duke of York and Otto had done their share in the centre, and they now stood at Mouvaux and Tourcoing respectively, isolated in the midst of the enemy's main body, with no hope of support from the other columns and no more than a chance of meeting Clerfayt, who had met an unexpected all-day check at Werwick. Coburg's entire force was, without deducting losses, no more than 53,000 for a front of 18m., and only half of the enemy's available 80,000 men had as yet been engaged. Matters did not, of course, present themselves in this light at Souham's headquarters, where the generals met in an informal council. The outposts, reinforced though they were from the main group, had everywhere been driven in, and the subordinate leaders sent in the most despondent reports. "Councils of war never fight" is an old maxim, justified in 99 cases in 100. But this council determined to do so, and with all possible vigour. The scheme was practically that which Coburg's first threat had produced and his first brusque advance had inhibited. Vandamme was to hold

Clerfayt, the garrison of Lille and a few outlying corps to occupy the archduke and Kinsky, and in the centre, Moreau and Bonnaud, with 40,000 effectives, were to attack the Tourcoing-Mouvaux position in front and flank at dawn with all possible energy.

Battle of **Tourcoing.**—The first shots were fired on the Lys, where Clerfayt's infantry had effected its crossing in the night. Vandamme's troops were, by the chance of a fatigue-enforced halt near Menin, massed on the flank of Clerfayt's subsequent line of advance. Vandamme used his advantage well. He attacked Clerfayt's columns as they moved on Lincelles with perhaps 12,000 men agninst 21,000. Clerfayt stopped at once, turned upon him and drove him towards Roncq and Menin. Still, fighting, rallying and fighting again, Vandamme's regiments managed to spin out time and to commit Clerfayt deeper and deeper to a false direction till it was too late in the day to influence the battle elsewhere. Von dem Bussche's column at Dottignies, still shaken from the day before, did nothing, and actually retreated to the Scheldt. On the other flank, Kinsky and the archduke Charles practically remained inactive. There remained the two centre columns, Otto's and the duke of York's. The orders of the emperor to the duke were that he should advance to establish communication with Clerfayt at Lincelles as a preliminary to a general advance to crush the French Courtrai group, thereby isolated. These airy schemes were destroyed at dawn on the 18th. One of Moreau's brigades carried Tourcoing at the first rush, another brigade swarmed round the duke of York's entrenchments at Mouvaux, while Bonnaud's mass from the side of Lille lapped round the flanks of the British posts at Roubaix and Lannoy. The duke had used up his reserves in assisting Otto, and by 8 A.M. the positions of Roubaix, Lannoy and Mouvaux were isolated from each other. But the Allies fought magnificently, and by now the Republicans were in confusion, excited to the highest pitch and therefore extremely sensitive to waves of enthusiasm or panic. Otto was able to retire gradually, though with heavy losses, to Leer , before he could be cut off, and thither the English fell back, not without confusion, to join him.

With the retreat of the two sorely tried columns and the suspension of Clerfayt's attack, the battle of Tourcoing ended. It was a victory of which the young French generals had reason to be proud. The main attack was vigorously conducted, and the two-to-one numerical superiority which the French possessed at the decisive point is the best testimony at once to Souham's generalship and to Vandamme's bravery. As for the Allies, those of them who took part in the battle at all, covered themselves with glory, but the inaction of two-thirds of Coburg's army was the bankruptcy declaration of the old strategical system. But Souham's victory, owing to his geographical position, had merely given him air. The Allies, except for the loss of some 5,500 men, were in no way worse off. The plan had failed, but the army as a whole had not been defeated, while the troops of the duke of York and Otto were far too well disciplined not to take their defeat as "all in the day's work." Souham was still on the Lys and midway between the two allied masses, able to strike each in turn or liable to be crushed between them in proportion as the opposing generals calculated time, space and endurance accurately. Souham, therefore, as early as the 19th, had left Bonnaud to hold the main body of the Allies on the side of Tournai, while he concentrated most of his forces towards Courtrai. This move had the desired effect, for Clerfayt retired without a contest, and on May 21 Souham issued his orders for an advance on Coburg's army, which, as he knew, had meantime been reinforced. Vandamme alone was left to face Clerfayt, and this time with outposts far out so as to ensure his chief, not a few hours', but two or three days', freedom from interference.

Pichegru now returned and took up the supreme command, Souham remaining in charge of his own and Moreau's divisions. On the extreme right, from Pont-à-Tressin, only demonstrations were to be made; the centre, between Baisieux and Estaimbourg, was to be the scene of the holding attack of Bonnaud's command, while Souham, in greater strength, delivered the decisive attack on the allied right by St. Leger and Warcoing. The battle opened in the early morning of the 22nd and was long and desperately contested. The demonstration on the French extreme right was soon recognized by the defenders to be negligible, and the allied left wing thereupon closed on the centre. There Bonnaud attacked with vigour, dislodging the Allies from Nechin. The defenders of Templeuve then fell back, and the attacking swarms—a dissolved line of battle—fringed the brook beyond Templeuve, on the other side of which was the Allies' main position, and even for a moment seized Blandain. Meanwhile the French at Nechin pressed on towards Ramegnies in concert with the main attack. Macdonald's and other brigades had forced the Espierre rivulet and driven von dem Bussche partly over the Scheldt, partly southward. The main front of the Allies was defined by the brook that flows between Templeuve and Blandain and empties into the Scheldt near Pont-&-Chin. Here, till close on nightfall, a fierce battle raged. Pichegru's main attack was still by his left, and Pont-&-Chin was taken and retaken by French, Austrians, British and Hanoverians in turn. Between Blandain and Pont-à-Chin Bonnaud's troops more than once entered the line of defence. But the attack was definitively broken off at nightfall and the Republicans withdrew slowly towards Lannoy and Leers. They had for the first time in a fiercely contested "soldier's battle" measured their strength, regiment for regiment, against the Allies, and failed, but by so narrow a margin that hencefor ward the Army of the North realized its own strength and solidity.

The Moselle Army.—But the actual strategic decision was destined by a process of evolution to be given by Jourdan's Army of the Moselle, to which we turn. The Army of the Moselle had been ordered to assemble a striking force on its left wing, whiie maintaining its cordon in Lorraine, and with this striking force to operate towards Liége and Namur. Its first movement on Arlon, in April, was repulsed, but early in May the advance was resumed though the troops were ill-equipped and ill-fed, and requisitions had reduced the civil population to semi-starvation and sullen bostility. At this moment the general situation east of the Scheldt was as follows: The Allies' centre under Coburg had captured Landrecies and now (May 4) lay around that place, about 65,000 strong, while the left under Kaunitz (27,000) was somewhat north of Maubeuge. Beyond these again were the detachment of Beaulieu (8,000) near Arlon, and another, 9,000 strong, around Trier. On the side of the French, the Army of the Moselle (41,000 effectives) was in cordon between Saargemünd and Longwy; the Army of the Ardennes (22,000) between Beaumont and Givet; of the Army of the North, the right wing (38,000) in the area Beaumont-Maubeuge and the centre (24,000) about Guise. In the aggregate the Allied field armies numbered 139,000 men, those of the French 203,000. Tactically the disproportion was sufficient to give the latter the victory, if, strategically, it could be made effective at a given time and place. But the French missed their opportunity, as Coburg had missed his in 1793. Pichegru's right was ordered to march on Mons, and his left to master the navigation of the Scheldt so as to reduce the Allies to wagon-drawn supplies, while Jourdan's task was to conquer the Liége or Namur country without unduly stripping the cordon on the Saar and the Moselle. Jourdan's orders and original purpose were to march through the Ardennes as rapidly as possible, living on what supplies he could pick up from the enemy or the inhabitants.

The movement began on May 21 from Longwy through Arlon towards Neufchbteau. Irregular fighting, sometimes with the Austrians, sometimes with the bitterly hostile inhabitants, marked its progress. On the 28th the French, after a vain détour made in the hope of forcing Beaulieu to fight, reached Ciney, and there heard that the enemy had fallen back to a strongly entrenched position on the east bank of the Meuse near Namur. Jourdan was preparing to attack them there, when considerations of quite another kind intervened to change his direction, and thereby to produce the drama of Charleroi and Fleurus—which military historians have asserted to be the foreseen result of the initial plan. At the same moment (29th) Jourdan received new orders from Paris—(a) to take Dinant and Charleroi and to clear the country between the Meuse and the Sambre, and (b) to attack Namur either by assault or by regular siege. From these orders and from the action of the enemy the campaign at last took a definite shape.

Charleroi.—When the Army of the Moselle passed over to the left bank of the Meuse, it was greeted by the distant roar of guns towards Charleroi and by news that the Army of the Ardennes, which had already twice been defeated by Kaunitz, was for the third time deeply and unsuccessfully engaged beyond the Sambre. The resumption of the march again complicated the supply question—for the system of "living on the country" had broken down in the Ardennes, and Jourdan had been dependent on intermittent convoys—and it was only slowly that the army advanced towards Charleroi. But at last, on June 3, the concentration of parts of three armies on the Sambre was effected. Jourdan took command of the united force (Army of the Sambre and Meuse) with a strong hand, the 40,000 newcomers inspired fresh courage in the beaten Ardennes troops, and in the sudden dominating enthusiasm of the moment pillaging and straggling almost ceased. Troops that had secured bread shared it with less fortunate comrades, and even the Liégois peasantry made free gifts of supplies. Meanwhile, Tourcoing and Tournai had at last convinced Coburg that Pichegru was his most threatening opponent, and he had therefore, though with many misgivings, decided to move towards his right, leaving the prince of Orange with not more than 45,000 men on the side of Maubeuge-Charleroi-Namur. Jourdan crossed the Sambre on June 12, practically unopposed. Charleroi was rapidly invested and the covering army extended in a semicircular position. Although forced to recross the Sambre on June 16, it was back again two days later, and this time the prince of Orange gave up the effort to interfere with his irrepressible antagonists.

Charleroi, garrisoned by less than 3,000 men, was intimidated into surrender (25th); thus the object of the first operations was achieved. As to the next, neither Jourdan nor the representatives seem to have had anything further in view than the capture of more fortresses. But within 24 hours events had decided for them. Coburg had quickly abandoned his intention of closing on his right wing, and (after the usual difficulties with his Allies on that side) had withdrawn 12,000 Austrians from the centre of his cordon opposite Pichegru, and made forced marches to join the prince of Orange. On June 24 he had collected 52,000 men at various points round Charleroi, and on the 25th he set out to relieve the fortress, of whose surrender he did not know until in the midst of the battle next day.

Fleurus.—On the 26th Jourdan's army (now some 73,000 strong) was still posted in a semicircle of entrenched posts, zom. in extent, round the captured town, but Coburg was still more widely extended. Inferior in numbers as he was, he proposed to attack on an equal front, and thus gave himself, for the attack of an entrenched position, an order of battle of three men to every two yards of front, all reserves included. The Allies were to attack in five columns, the prince of Orange from the west and north-west towards Trazegnies and Monceau wood, Quasdanovich from the north on Gosselies, Kaunitz from the north-east, the archduke Charles from the east through Fleurus, and finally Beaulieu towards Lambusart. The scheme was worked out in such minute detail and with so entire a disregard of the chance of unforeseen incidents, that once he had given the executive command to move, the Austrian general could do no more. If every detail worked out as planned, victory would be his; if accidents happened, he could do nothing to redress them, and unless these righted themselves (which was improbable in the case of the stiffly organized old armies) he could only send round the order to break off the action and retreat. In these circumstances the battle of Fleurus is the sum rather than the product of the various fights that took place between each allied column and the French division that it met. The prince of Orange attacked at earliest dawn and gradually drove in the French left wing to Courcelles, Roux and Marchiennes, but somewhat after noon, the French, under the direction for the most part of Kléber, began a series of counterstrokes which recovered the lost ground, and about five, without waiting for Coburg's instructions, the prince retired north-westward off the battlefield. The Quasdanovich column and part of Kaunitz's force pressed the French centre division back on Gosselies, but the brook west of Mellet was a serious obstacle to the rigid order of the Allies and had to be bridged before their guns could be got over, Kaunitz's column and Championnet's division met on the battlefield of 1690. The French were gradually driven in from the outlying villages to their main position between Heppignies and Wangenies. Here they were so hard pressed as to need the intervention of Jourdan's slender reserves, and the attackers only gave way to this counterstroke at the moment they received Coburg's orders for a general retreat.

On the allied left wing the fighting was closer and more severe than at any point. Beaulieu on the extreme left advanced upon Velaine and the woods to the south in several small groups of all arms. Here were the divisions of the Army of the Ardennes, markedly inferior in discipline and endurance to the rest, and only too mindful of their four previous reverses. For six hours, more or less, they resisted the oncoming Allies, but then, in spite of the example and the despairing appeals of their young general Marceau, they broke and fled, leaving Beaulieu free to combine with the archduke Charles, who carried Fleurus after obstinate fighting, and then pressed on towards Campinaire. Beaulieu took command of all the allied forces on this side about noon, and from then to 5 P.M. launched a series of terrible attacks on the French about Campinaire and Lambusart. The Austrians came on time after time over ground that was practically destitute of cover. Villages, farms and fields of corn caught fire. The French grew more and more excited—"No retreat to-day!" they called out to their leaders, and finally, clamouring to be led against the enemy, they had their wish. Lefebvre seized the psychological moment when the fourth attack of the Allies had failed, and (though he did not know it) the order to retreat had come from Coburg. The losses of the unit that delivered it were small, for the charge exactly responded to the moral conditions of the moment, but the proportion of killed to wounded (jj to 81) is good evidence of the intensity of the momentary conflict. So ended the battle. Coburg had by now learned definitely that Charleroi had surrendered, and while the issue of the battle was still doubtful—for though the prince of Orange was beaten, Beaulieu was in the full tide of success—he gave (towards 3 P.M.) the order for a general retreat. This was delivered to the various commanders between four and five, and these, having their men in hand even in the heat of the engagement, were able to break off the battle without undue confusion. The French were far too exhausted to pursue them (they had lost twice as many men as the Allies), and their leader had practically no formed body at hand to follow up the victory, thanks to the extraordinary dissemination of the army.

Tourcoing, Tournai and Fleurus represent the maximum result achievable under the earlier Revolutionary system of making war and show the men and their leaders at the highest point of combined steadiness and enthusiasm they ever reached—that is, as a "Sans-culotte" army. Fleurus was also the last great victory of the French, in point of time, prior to the advent of Bonaparte, and may therefore be considered as illustrating the general conditions of warfare at one of the most important points in its development. The sequel of these battles can be told in a few words. The Austrian government had, it is said, long ago decided to evacuate the Netherlands, and Coburg retired over the Meuse, practically unpursued, while the duke of York's forces fell back in good order, though pursued by Pichegru through Flanders. The English contingent embarked for home, the rest retired through Holland into Hanoverian territory, leaving the Dutch troops to surrender to the victors. The last phase of the pursuit reflected glory on Pichegru, for it was conducted in midwinter through a country bare of supplies and densely intersected with dykes and meres. The crowning incident was the dramatic capture of the Dutch fleet, frozen in at the Texel, by a handful of hussars who rode over the ice and browbeat the crews of the well-armed battleships into surrender. It was many years before a prince of Orange ruled again in the United provinces, while the Austrian whitecoats never again mounted guard in Brussels.

The Rhine campaign of 1794, waged chiefly by the Prussians, was not of great importance. Mollendorf won a victory at Kaiserslautern on May 23, but operations thereafter became spasmodic, and were soon complicated by Coburg's retreat over the Meuse. With this event the offensive of the Allies against the French Revolution came to an inglorious end. Poland now occupied the thoughts of European statesmen, and Austria began to draw her forces on to the east. England stopped the payment of subsidies and Prussia made the Peace of Basle on April j, 1795. On the Spanish frontier the French were successful in almost every encounter, and Spain, too, made peace. Only the eternal enemies, France and Austria, were left face to face on the Rhine, and elsewhere of all the Allies, Sardinia alone (see below under *The* War in Italy *1793–97*) continued the struggle in a half-hearted fashion. The operations of 1795 on the Rhine present no feature of the revolutionary wars that other and more interesting campaigns fail to show. Austria had two armies on foot under the general command of Clerfayt, one on the upper Rhine, the other south of the Main, while Mainz was held by an army of imperial contingents. The French, Jourdan on the lower, Pichegru on the upper, Rhine, had as usual superior numbers at their disposal. Jourdan combined a demonstrative frontal attack on Neuwied with an advance in force via Diisseldorf, reunited his wings beyond the river near Neuwied, and drove back the Austrians in a series of small engagements to the Main, while Pichegru passed at Mannheim and advanced towards the Neckar. But ere long both were beaten, Jourdan at Hochst and Pichegru at Mannheim, and the investment of Mainz had to be abandoned. This was followed by the invasion of the Palatinate by Clerfayt and the retreat of Jourdan to the Moselle. The position was further compromised by secret negotiations between Pichegru and the enemy for the restoration of the Bourbons. The meditated treason came to light early in the following year, and the guilty commander disappeared into the obscure ranks of the royalist secret agents till finally brought to justice in 1804.

THE CAMPAIGN OF 1796 IN GERMANY

The wonder of Europe now transferred itself from the drama of the French Revolution to the equally absorbing drama of a great war on the Rhine. France's policy was no longer defensive. She aimed at invading and "revolutionizing" the monarchies and principalities of old Europe, and to this end the campaign of 1796 was to be the great and conclusive effort. The "liberation of the oppressed" had its part in the decision, and the glory of freeing the serf easily merged itself in the glory of defeating the serf's masters. But a still more pressing motive for carrying the war into the enemy's country was the fact that France and the lands she had overrun could no longer subsist her armies. The Directory frankly told its generals, when they complained that their men were starving and ragged, that they would find plenty of subsistence beyond the Rhine. On her part, Austria, no longer fettered by allied contingents nor by the expenses of a far distant campaign, could put forth more strength than on former campaigns, and as war came nearer home and the citizen saw himself threatened by "revolutionizing" and devastating armies, he ceased to hamper or to swindle the troops. Thus the duel took place on the grandest scale then known in the history of European armies. Apart from the secondary theatre of Italy, the area embraced in the struggle was a vast triangle extending from Diisseldorf to Basle and thence to Ratisbon, and Carnot sketched the outlines in accordance with the scale of the picture. He imagined nothing less than the union of the armies of the Rhine and the Riviera before the walls of Vienna.

Jourdan and **Moreau.**—The scheme took shape only gradually. The first advance was made partly in search of food, partly to disengage the Palatinate, which Clerfayt had conquered in 1795. "If you have reason to believe that you would find some supplies on the Lahn, hasten thither with the greater part of your forces," wrote the Directory to Jourdan (Army of the Sambre-and-Meuse, 76,000) on March 29. He was to move at once, before the Austrians could concentrate, pass the Rhine at Dusseldorf and do his utmost to break them up completely. A fortnight later Moreau (Army of the Rhine-and-Moselle, 78,000) was ordered to take advantage of Jourdan's move, which would draw off the Austrian forces, to enter the Breisgau and Suabia. "You will attack Austria at home, and capture her magazines. You will enter a new country, the resources of which, properly handled, should suffice for the needs of the Army of the Rhine-and-Moselle." Jourdan, therefore, was to take upon himself the destruction of the enemy, Moreau the invasion of south Germany. Jourdan crossed at Ddsseldorf and reached the Lahn, but the Austrians, now commanded by the archduke Charles, concentrated against him very swiftly and he had to retire over the river. Still he enabled Moreau to cross at Strasbourg without much difficulty. On hearing of Moreau's progress, the archduke returned to the Neckar country with 20,000 men, leaving Wartensleben with 36,000 to observe Jourdan. In later years he admitted himself that his own force, weakened by the usual numerous detachments, was far too small to deal with Moreau, who, he probably thought, would retire after a few manoeuvres.

The Archduke's Plan. — But Carnot had indicated a decisive battle as the object. Jourdan was instructed, if the archduke turned on Moreau, to follow him up and bring him to action. Moreau, too, was not retreating but advancing. The two armies, Moreau's and the archduke's, met in a straggling and indecisive battle at Malsch on July 9, and soon afterwards Charles learned that Jourdan had recrossed the Rhine and was driving Wartensleben before him. He thereupon retired both armies from the Rhine valley into the interior, hoping that at least the French would detach large forces to besiege the river fortresses. Disappointed of this, he determined, in his own words: "to retire both armies step by step without committing himself to a battle, and to seize the first opportunity to unite them so as to throw himself with superior or at least equal strength on one of the two hostile enemies." This is the ever-recurring idea of "interior lines." It was not new, for C. Claudius Nero in the Metaurus campaign (207 B.C.) had given the earliest example, and Frederick the Great had used similar means in similar circumstances, as had Souham at Tourcoing and even Dampierre at Valenciennes. Nor was it differentiated, as were Bonaparte's operations in this same year, by the deliberate use of a small containing force at one point to obtain relative superiority at another. The point to be observed is not the expedient, which was dictated by the circumstances, but the courage of the young general, who, unlike Wartensleben and the rest of his generals, unlike, too, Moreau and Jourdan themselves, surmounted difficulties instead of lamenting them. On the other side, Carnot, of course, foresaw this possibility. He warned the generals not to allow the enemy to "use his forces sometimes against one, sometimes against the other, as he did in the last campaign," and ordered them to go forward respectively into Franconia and into the country of the upper Neckar, with a view to seeking out and defeating the enemy's army. But the plan of operations soon grew bolder. Jourdan was informed on July 21 that he was not to hesitate to advance to Ratisbon and even to Passau if the disorganization of the enemy admitted it, but in these contingencies he was to detach a force into Bohemia to levy contributions. "We presume that the enemy is too weak to offer a successful resistance and will have united his forces on the Danube; we hope that our two armies will act in unison to rout him completely. Each is, in any case, strong enough to attack by itself, and nothing is so pernicious as slowness in war." Evidently the fear that the two Austrian armies would unite against one of their assailants had now given place to something like disdain.

This was due in all probability to the rapidity with which Moreau was driving the archduke before him. Wartensleben was similarly falling back before Jourdan. Hitherto an independent leader, he resented the loss of his freedom of action, and beside lamentations opposed a dull passive resistance to all but the most formal orders of the prince. Many weeks passed before this was overcome sufficiently for his leader even to arrange for the contemplated combination, and in these weeks the archduke was being driven back day by day, and the German principalities were falling away one by one as the French advanced and preached the revolutionary formula. But their operating armies had seriously diminished in numbers, Jourdan disposing of not more than 45,000 and Moreau of about 50,000. The archduke had now, owing to the arrival of a few detachments from the Black Forest and elsewhere, about 34,000 men, Wartensleben almost exactly the same, and the former suddenly turned and fought a long, severe and straggling battle above Neresheim (Aug. 11). This did not, however, give him much respite, and on the 12th he began to retire over the Danube. At this date Wartensleben was about Amberg, almost as far away from the other army as he had been on the Rhine, owing to the necessity of retreating round instead of through the neutral principality of Bayreuth (Prussian). Hitherto Charles had intended to unite his armies on the Danube against Moreau. His later choice of Jourdan's army as the objective of his combination grew out of circumstances and in particular out of the brilliant reconnaissance work of one of Wartensleben's cavalry brigadiers, Nauendorff. This general's reports induced the archduke, on the 12th, to begin a concentration of his own army towards Ingolstadt; the 13th showed that the main columns of the French were swinging away to the east against Wartensleben's front and inner flanks, and on the 14th he boldly suggested the idea that decided the campaign, "If your Royal Highness will or can advance 12,000 men against Jourdan's rear, he is lost." When this message arrived at headquarters the archduke had already issued orders to the same effect. Latour, with 30,000 men, was to keep Moreau occupied—another expedient of the moment, due to the very close pressure of Moreau's advance, and the failure of the attempt to put him out of action at Neresheim. The small remainder of the army, with a few detachments gathered en route, in all about 27,000 men, began to recross the Danube on the 14th, and slowly advanced north on a broad front, its leader being now sure that at some point on his line he would encounter the French, whether they were heading for Ratisbon or Amberg. Meanwhile, the Directory, still acting on the theory of the archduke's weakness, had ordered Moreau to combine the operations with those of Bonaparte in Italian Tirol, and Jourdan to turn both flanks of his immediate opponent, and thus to prevent his joining the archduke, as well as his retreat into Bohemia. And, curiously enough, it was this latter, and not Moreau's move, which suggested to the archduke that his chance had come. The chance was, in fact, one dear to the 18th century general, catching his opponent in the act of executing a manoeuvre.

Amberg and Würzburg.—The decisive events of the campaign can be described very briefly, the ideas that directed them having been made clear. The long thin line of the archduke wrapped itself around Jourdan's right flank near Amberg, while Wartensleben fought him in front. The battle (Aug. 24) was a series of engagements between the various columns that met; it was a repetition in fact of Fleurus, without the intensity of fighting spirit that redeems that battle from dullness. Success followed, not upon bravery or even tactics, but upon the pre-existing strategical conditions. At the end of the day the French retired, and the next morning the archduke began another wide extension to his left, hoping to head them off. This consumed several days. In the course of it Jourdan attempted to take advantage of his opponent's dissemination to regain the direct road to Wiirzburg, but the attempt was defeated by an almost fortuitous combination of forces at the threatened point. More effective, indeed, than this indirect pursuit was the very active hostility of the peasantry, who had suffered in Jourdan's advance and retaliated so effectually during his retreat that the army became thoroughly demoralized, both by want of food and by the strain of incessant sniping. Defeated again at Würzburg (*q.v.*) on Sept. 3, Jourdan confined his retreat to the Lahn, and finally withdrew the shattered army over the Rhine. In the last engagement on the Lahn the young and brilliant Marceau was mortally wounded. Far away in Bavaria, Moreau had meantime been driving Latour from one line of resistance to another. On receiving the news of Jourdan's reverses, however, he made a rapid and successful retreat to Strasbourg, evading the prince's army, which had ascended the Rhine valley to head him off, in the nick of time.

This celebrated campaign raised the reputation of the archduke Charles to the highest point, and deservedly, for he wrested victory from the most desperate circumstances by the skilful and resolute employment of his one advantage. But this was only possible because Moreau and Jourdan were content to accept strategical failure without seeking to redress the balance by hard fighting. The great question of this campaign is, why did Moreau and Jourdan fail against inferior numbers, when in Italy Bonaparte with a similar army against a similar opponent won victory after victory against equal and superior forces? So far as it is possible to summarize the answer in one phrase, it lies in the fact that though the Directory meant this campaign to be the final word in the Revolutionary War, for the nation at large this final word had been said at Fleurus. In default of a cause, however, soldiers will fight for a man, and this brings us by a natural sequence of ideas to the war in Italy.

THE WAR IN ITALY 1793-97

Hitherto we have ignored the operations on the Italian frontier, partly because they were of minor importance and partly because the conditions out of which Bonaparte's first campaign arose can be best considered in connection with that campaign itself. It has been mentioned that in 1792 the French overran Savoy and Nice. In 1793 the Sardinian army and a small auxiliary corps of Austrians waged a desultory mountain warfare against the Army of the Alps about Briançon and the Army of Italy on the Var. That furious offensive on the part of the French, which signalized the year 1793 elsewhere, was made impossible here by the counter-revolution in the cities of the Midi. In 1794, when this had been crushed, the intention of the French government was to take the offensive against the Austro-Sardinians. The first operation was to be the capture of Oneglia. The concentration of large forces in the lower Rhone valley had naturally infringed upon the areas told off for the provisioning of the Armies of the Alps (Kellermann) and of Italy (Dumerbion); indeed, the sullen population could hardly be induced to feed the
