Modern Greek poetry is mainly lyrical, and little satirical and hardly any dramatic verse of merit has been written. The satire of Andreas Laskaratos (1811–1901) and Georgios Souris (1853–1919)—who created a peculiar form of political satire in his weekly paper *Romios*—must be recorded, but it has lost much of its flavour.

3. Prose.——After the fall of Constantinople Greek scholars helped to spread the knowledge of Greek to the west and stimulated the study of ancient philosophy. Encouragement was given to Greek culture in the 16th and 17th centuries by the Ecumenical Patriarchate of Constantinople, by the founding of schools in Constantinople, Bucharest and Jassy (Rumania) and by the printing of works in Greek by the hospodars (rulers) of Walachia. In the 18th century this educational work was continued and modern Greece owes a debt of gratitude to the Greek clergy, to the great Phanariote families of Constantinople and also to wealthy Greek merchants, who fostered schools and issued educational works in Greek from the printing presses of Venice. Trieste and Vienna. 'This work had an important influence in preparing the Greeks for their emancipation from Turkey. Most of the literature of this period was theological, but a good many books of an educational character were also produced. Representative names are those of the ecclesiastics Elias Meniatis (1669–1714) from Cephalonia, who lived and wrote in Venice; and Kikephoros Theotokis (1736–1800) and Eugenios Vulgaris (1716–1806), both natives of Corfu, who wrote in the literary language in defense of Greek Orthodoxy, but also produced works of mathematics, physics, geography, archaeology and philosophy in addition to translations. These men rnay seem to lack originality and their language may be on the whole artificial, but their work was of inestimable value to the Greek people in the dark conditions surrounding them at the time. The greatest name, however, among the forerunners of the Greek revival is that of Adamantios Korais (1748–1833) who, though he spent most of his life in Paris, exercised an enormous influence on his Greek contemporaries, partly by his unwearying issue of editions of classical Greek authors accompanied by stirring patriotic introductions, and partly by his efforts to reform the written language by assimilating the literary tongue with the living idiom of modern Greece.

From the Liberation to 1888.—In the first decades that followed the liberation of Greece, prose was confined mainly to journalism and scholarship. The few writers of creative literature turned to the west for their models and were attracted first by Sir Walter Scott, whose reputation was paramount on the continent at the time, and later by Alexandre Dumas the Elder, some of nhose works were translated into modern Greek by Ioannis Skylitsis (1819–90). This accounts for the popularity in Greece of the historical novel between the years 1821 and 1888. Its most distinguished representatives, all of whom used a more or less austere *katharevousa*, were Alexandros Rizos Rangavis, Emmanouil Rhoidis (1835–1904), Spyridon Zambelios (1813–81) and Dimitrios Vikelas (1835–1908). Three novels call for special mention: Rangavis' *Avthentis tou Moreos* ("Lord of the Morea"), dealing with the Frankish occupation of the Morea, Rhoidis' vivid historical-satirical novel about Pope Joan (1865) and Vikelas' *Loukis Laras* (1879), an attractive romance dealing with the massacre of Chios in 1822. In addition, the short story in the *katharevousa* was cultivated in this and the subsequent period by a number of writers, perhaps the most important of whom are Georgios Vizyinos (1848–94) and Ioannis Kondylakis (1861–1920).

The same period witnessed the development of a remarkable classical style by certain distinguished scholars. Two works of major importance stand out: the history of the Greek revolution by Spyridon Trikoupis (1788–1873) and the history of the Greek nation by Konstantinos Pnparrigopoulos (1815–91), both of which are not only based on independent research arid scholarly accuracy but also are written in a balanced and flowing style. Alongside them may be mentioned the writers of memoirs of the Greek War of Independence, and especially Gen. Ioannis Makryiannis (1797–1864), who writes in a vivid and personal demotic idiom and shows a keen perspicacity and objectivity.

The 20th Century.—With the publication in 1888 of *To taxidi mou* by Ioannis Psycharis (1854–1929) and the development of the demotic movement, modern Greek prose underwent a momentous change. For the outcome of the resulting long and bitter linguistic and literary battle was complete victory for the use of the vernacular not only in poetry but also in all prose works of an imaginative character. The writers of that period, helped by the researches in modern Greek folklore of Nikolaos Politis (1852–1921), turned to their "living roots" for inspiration. finding them in the life of the Greek village. Greece in the 1880s was still mainly inhabited by agricultural and seafaring communities, and had no large towns, with the possible exception of Athens. So the character of this new prose, which turned to the Greek countryside for inspiration, became preponderantly "pastoral," and this tendency continued till the turn of the century, when a more developed urban life made itself felt. A forerunner of the pastoral trend can be found in Pavlos Kalligas (1814–96), the distinguished jurist, whose novel *Thanos Vlekas* (183'5) described in an austere *katharevousa* the unsettled conditions of the Greek countryside in the days following the liberation of Greece. But the novel found no successors till after the 1880s when Alexandros Papadiamantis (1851–1911) and Andreas Karkavitsas (1866–1923) distinguished themselves with their tales of villagers and fisherfolk. Papadiamantis. a native of Skiathos, is undoubtedly the greatest modern Greek short-story writer. In a personal and slightly archaic idiom he examined the psychology of the simple island people and described some moving incidents in their lives. His *Fonissa,* one of the outstanding books in modern Greek literature, is more of a short novel than a long short story, and deals with an old woman of Skiathos who suffered so much herself and saw her daughters and all the women of the island so full of misery that she decided to kill all baby girls she could lay her hands on. The short stories of Karkavitsas, though different in texture, are of an almost equal emotional power. But his greatest achievement is his realistic novel *Zitianos* ("The Beggar"). Another important contemporary work is the biographical novel of Konstantinos Theotokis (1872–1923), *Zoï kai thanatos tou Knrabela,* notable for its forceful realism and psychological insight. The "pastoral" short story also flourished in the hands of G. Drosinis (1859–1952), A. Eftaliotis (1849–1924), J. Vlachogiannis (1867–1945), C. Christovasilis (1861–1937), A. Travlandonis (1867–1943). D. Tangopoulos (1860–1926) and Z. Papandoniou (1877–1940). The great social and economic changes Greece underwent at the end of the 19th century soon found reflection in its literature. The expanding middle classes and the ensuing development of city life fostered the development of an "urban" literature hitherto unknown. This was also aided by Greek translations of French novels on big-city life, notably those by Émile Zola. Thus the urban novel was introduced into Greek literature by two writers of very different background and genius: first by Psycharis, whose cosmopolitan background was most appropriate for the development of such a literary genre, and second by Gregorios Xenopoulos (1867–1951j, the gifted and prolific writer from Zante. The novels of Psycharis (the most successful of which is *To Oneiro tou Yianniri;* 1897) undoubtedly exercised a great influence upon contemporary Greek writers, but they are faulty in construction, the heroes never come to life and the deep egotism of the author makes them difficult to enjoy. Xenopoulos, on the other hand, who had to earn a living out of his writing, serialized many of his works in Athenian newspapers, and so too often had to pander to the taste of his readers. His two best sellers were *Foteini Sandri* (*O kokkinos Vrachos*) and *Stella Violanti*. Psycharis and Xenopoulos were followed in their urban writings by Konstantinos Christomanos (1867–1911; the friend and secretary of the empress Elizabeth of Austria-Hungary), whose *Kerenia koukla* is full of delicacy and true feeling. At the same time Kostas Chatzopoulos (1871–1920) gave Greek literature its one symbolist novel before 1920, *Fthinoporo* ("Autumn"; 1917).

The end of World War I saw the rise of a group of young writers such as D. Voutieridis, Petros Pikros, Thrasos Kastanakis, Nikos Nikolaidis and Photis Kondoglou, who paved the way to the prose writers of the 1930s, when prose in the vernacular achieved maturity and novels of more than national significance appeared for the first time in Greek. Only a few of many important writers can be mentioned here. The first was Stratis Myrivilis, who took the literary scene by storm with his book *Zoï en tapho*, a series of war impressions from the Macedonian front in the form of letters from a dead friend of the author to a girl in Lesbos. Myrivilis writes in a lively and robust demotic, in which dialectal and lyrical elements abound. His second and more mature novel, *Daskala me ta chrysa matia*, connected with the Asia Minor campaign which ended in the Greek defeat of 1922, was followed by many shorter stories of power and originality. His long novel *Panagia gorgona* (1955) treats of the life of a group of Greek refugees from Asia Minor in a small village of Lesbos and concludes what modern Greek literary criticism calls the "war trilogy" of Myrivilis. Like Myrivilis, Elias Venezis (1904–) made his appearance with a striking book on his life as a prisoner of the Turks in 1922–23, called *Noumero 31328*. Other important longer and shorter publications followed, the most significant of which was his long novel *Aiolia*, full of childhood memories from Asia Minor. The style of Venezis is less arresting than that of Myrivilis, and his mood on the whole more nostalgic, but clarity, beauty and humanity abound in his writings. One of the most gifted authors of the 1930s was Kosmas Politis (P. Taveloudis; 1888–), who in his *Eroica* (1938), a book on the actions and reactions of a gang of children, as well as in his later novels *Lemonodasos* and *Gyri*, proved himself a master of the long narrative. His psychological analysis of his heroes and his descriptions of natural beauty rank high in modern Greek literature. Mention should also be made of Georgios Theotokas, whose long novel *Argo* (1936), together with his many other writings—essays, short stories, travel books, plays—show him to be a writer of ability acd versatility and one of the best handlers of a flowing and simple demotic. Other authors include A. Petsalis, A. Terzakis, P. Prevelakis, M. Karagatsis, T. Stavrou and Kleareti-Dipla Malamou.

After World War II the prewar generation remained the models for younger writers of both poetry and prose. Their continuing influence is exemplified in the striking achievement of Nikos Kazantzakis, who at an advanced age and after a long literary career — lyric and epic poetry, travel books, dramas, philosophic and critical essays — turned to the novel and achieved international recognition. His novels show outstanding creative powers and a full mastery of his medium. Most of them have been translated into the leading European languages. In spite of certain crudities, Kazantzakis is one of the great masters of Greek demotic Prose, whose wealth and vigour he deeply explored.

Real literary merit was in many instances achieved by the *Chronografema*, a column in certain Athens newspapers treating of some daily event in a humorous or lyrical manner. In the hands of writers like P. Nirvanas (Petros Apostolides; 1886–1937) or S. Melas (1883–) it transcended the boundaries of journalism, but again no new name deserves mention. A certain lack of originality in the younger generation was perhaps due to the unsettled condition of the country during the aftermath of the German, Italian and Bulgarian occupations and the civil war which caused such ravages in the 1940s. Of the authors who began to write after World War II, however, M. Lymberaki, A. Angeloglou, A. Kabbatzis. R. Roufos and S. Plaskovitis are the most notable.

GREEK MUSIC (ANCIENT). The literature of Greco-Latin antiquity and the Church Fathers, the plastic and graphic representations and the findings of archaeology indicate an ancient Greek musical culture extending over more than 2.000 years.

History. — Heroic Age (c. 2000–c. *1100 B.C.*).--The first Greek-speaking European peoples reached Greece about 2000 B.C., doubtless bringing their folk music with them. Greece thenceforth gradually came under the Minoan (Cretan', influence, with its Aegean and Egyptian elements. and about 1550 this influence promoted the first distinctively Greek culture, the Mycenaean. Greece early obtained from the Mediterranean area both instruments and musical and dance forms. Mycenaean remains include fragments of a lyre of Cretan type, while a smaller lyre (Phoenician type) and a bronze trumpet indicate Asiatic influence. Musical life was characterized by a strong ritual element.

Dark Age (c. *1100*–c. 850 *B.C.*).—The Mycenean and Minoan cultures suddenly declined with the invasion of the Dorians from Asia Minor, and myths indicate extensive new foreign influences. The legend in which the Greek Apollo days the Phrygian Marsyas embodies a memory of the early Greek preference for the lyre, the instrument of the Xpollo cult, above the *aulos* or reed pipe, a more emotional instrument associated with the cult of the wine-god Dionysus. The precedence of lyre over pipe would seem to foreshadow the supremacy of reason in the artistic life of classical times. The Asiatic influence was nonetheless substantial. Tradition says the Phrygian Olympus (c. 900 B.C.) introduced the dactylic metre. the enharmonic genus, the aulos and melody patterns called *nomos* (pl. *nomoi*).

Early Classical Period (c. 850–c. 600 *B.C.*).—From Homer's time. Greek music was closely based on poetry. Poet-musicians, the professional bards of noble families, chanted epics in recitative style, accompanying themselves on the cithara (lyre). The *nomos* on a prescribed melody pattern gave rise to solo (non-recitative) vocal compositions that were cyclic in form without strophic repetitions, had a prescribed number of movements and were accompanied by the reed pipe or the lyre. There was also a purely instrumental *nomos* for the reed pipe, with descriptive associations. The dithyramb was originally a strophic melody sung by Dionysus worshipers. It developed into a choral genre c. 600 B.C., when it was sung and danced to the reed pipe by a circular chorus of 50 men and boys. Hymns and dances were also performed chorally in other cults, and at weddings and funerals, and were sometimes accompanied by the bardic lyre. Music also figured in the competitive festivals: the Olympia from 776 B.C. and later the Delphic Pythia, the Spartan Carnea and the Panathenia. From the 7th century. after the Homeric epics were committed to writing, poets turned to more popular themes sung to a smaller lyre called *lyra,* whence modern "lyric" poetry derives its name: others wrote for choral performance. Important among lyric poet-musicians were Archilochus of Paros (fl. 716–676 B.C.), Tyrtaeus (fl. till 668), Alcaeus (fl. from 611), Sappho (fl. c. 600) and Anacreon (550–465).

Classical Period (c. *600*–c. 400 *B.C.*).—Greek culture now created the classical drama, developed certain basic attitudes to music and reached its zenith in Athens. The plays were essentially musicodramatic works written by poet-musicians, but descended from the cult rituals. *Tragoedia* (tragedy) means literally "goat song." after the ritual of the Dionysian dithyramb. while comedy kept the latter's ritual trappings (masks, etc.). 'Ihe drama was at first mainly choral, though the chorus also gave a semicircular dance (*orchesis*) on that part of the stage called *orchestra.* The single actor was earlier the leader of the dithyrambic dance choir. A second actor was introduced by Aeschylus (525?–456) and a third by Sophocles (495?–406). The spoken dialogue alternated with solo songs (with lyre) or choruses (unaccompanied, or with lyre or aulos).

Music, with the other arts, was regarded as inspired by the nine Muses. The Greek word *mousike* had two meanings: first, it meant the culture of the intellectual faculties. which, with *gymnastike,* or bodily culture, provided a liberal education; and second—a meaning more comparable with the modern one—it signified the poetic text, its melody and the accompanying dance. The morally uplifting influence of music was taught by the school of Pythagoras (c. 585–c. 479), which thought it possible. by means of sensual harmony, to re-establish the primary intellectual harmony of the soul; *i.e.,* the harmony inhabiting the heavens before animating human bodies. Hence the doctrines of the harmony of the spheres. the *ethos* or characteristic influence of the various musical modes and the efficacy of numbers.

Late Antiquity (c. 400 B.C. to the Fall of *the* Roman *Empire* in the *West,* A.D. *476*).—The 4th century B.C. saw the emergence of Greek science and the first formulations of music theory. The most practical approach was that of Aristoxenus (*fl.* late 4th century B.C.), while Euclid (c. 300) expounded Pythagorean theory and Plato (427–347) wrote on important musical themes. Theory received further serious attention only from the 1st century A.D., the most important work being that of Ptolemy, the neo-Pythagorean mathematician and astronomer (2nd century A.D.). Before the first theory was written, however, music and poetry had begun to diverge, and the styles of Aristophanes (c. 450–c. 385 B.C.), Miletus (d. c. 400) and Philoxenus (430–380) show a progressively popular trend, after which drama rapidly degenerated into pantomime.

The only surviving examples of Greek music belong to this late period, and it is little indeed compared with survivals from other arts. Of about 20 possible fragments, written variously in a "vocal" and an "instrumental" notation. two remain unauthenticated and three or more are probably Byzantine reconstructions (*see* BYZANTINE MUSIC). Of the remainder. three are important: the two Delphic hymns to Apollo, carved on marble at Delphi (late 2nd century B.C.), and the epitaph of Seikelos for his wife, chiseled on a tomb at Tralles (Aidin), Turk. (1st century B.C. or later). The rest, in papyri, are to be seen in Cairo, Berlin. Oslo, Michigan and Oxford; the oldest fragment of all, a few choral lines from Euripides' Orestes (408 B.C.), is in the Rainer papyrus in Vienna (3rd–2nd century B.c.).

Forms **and** Principles **of** Composition. — The fragmentary relics hardly allow structural analysis, though certain fundamental principles of construction are known: poetic metre, verbal contour and musical time.

The units of poetic metre (feet comprising short and long syllables) fell into three main groups, exemplified by the dactyl – ∪ ∪; *iamb* ∪ – (*cf. trochee* – ∪); and *paeon* – ∪ ∪ ∪ . The equivalent musical units comprised short and long notes: duple J ♫, 2/4; triple ♪J (or ♩ ♪), 3/8; and *multiple* ♩. ♩, 5/8, as found respectively in the "hymn to Helios," "hymn to the muse" and "first Delphic hymn."

Declaimed poetry also had verbal contours — inherent tonal elements represented by the three speech accents: *acute* (rising). *grave* (falling) and *circumflex* (rising followed by falling, or level) —which *melopoeia,* the Greek art of melody making, aimed to enhance.

The two principles. poetic metre and tonic accent. are seen in combination in the "hymn to Helios." with its strictly anapaestic metre and 12 out of 16 acute accents matched by a rising melodic contour.

Further! Greek poetry, conceived without any dynamic stress of its own, could hardly escape the influence of the accompanying instruments and dance, which, by their very nature. required strong and weak beats. or musical time. Thus the noisy *thesis* (downbeat) of the choral dance leader's foot clapper was inevitably followed by a silent *arsis* (lifting). Moreover, in postclassical times music already imposed its own formal patterns on poetic structure: the four metrically different lines of the "epitaph of Seikelos" are equally adjusted to a melody in 12/8 time. According to Dionysius of Halicarnassus, the *Orestes* of Euripides went still iurther toward purely musical form: its melody did not rise and fall with the speech accents; it was identical in two rhythmically paired strophes.

The Greek arts, whether plastic or dramatic, favoured linear form, hence rhythm took precedence over elements of colour. In music the latter were no doubt represented by occasional decorative two-note chords plucked on the lyre, by a drone on one of the *aulos* pipes accompanying the melody on the other, and by the accompaniment of a vocal melody in heterophonic variation. But the single line of melody remained paramount, and its intervals were classified in Greek music theory.

Theory. — The Greek. referred their music to the intervals of an octave (diapason), fifth and fourth, and they knew all the intervals of western music and more besides. The interval of a fourth was the practical unit of their tonal space, and when divided into four notes it was known as a tetrachord. Of these notes the outer two were fixed, the inner two movable; and the position of the latter determined one of three *genera* whose intervals (reading downward) were: tone, tone, leimma ("remainder" of the interval of a fourth after the subtraction of two tones) in the *diatonic*, as in the "epitaph of Seikilos"; minor third. semitone, semitone in the *chromatic;* and ditone, quarter tone. quarter tone in the *enharmonic*, as in the Orestes fragment. Still finer intervals were classified in subgenera called *chroai* ("shades").

Three primary (diatonic) modes correspond to the three possible (descending) orders in which the intervals of the tetrachord run: Dorian (tone, tone. leimma). Phrygian (TLT) and Lydian (LTT). Such structures occur respectively in the "second Delphic hymn," "epitaph of Seikelos" and an instrumental piece from J. F. Bellerman's *Anonymous* (of late date). Two tetrachords joined together formed a *harmonia* (octave scale). and in the diatonic genus the seven such scales in use (with notes reading downward, and as on the white keys of the piano but allowing for differences in tuning) were as follows: a to A, Hypodorian (Aeolian); g to G, Hypophrygian (Ionian); f to F, Hypolydian; e to E. Dorian; d to D. Phrygian; c to C, Lydian; and b to B, an Hyperdorian. These *harmoniai* are called "modes" today, but they were only the scaffolding for the true modes (*tropos*, pl. *tropoi*) or melodic styles or contours (perhaps comparable with the Indian raga [see INDIAN MUSIC] and Arabic *maqam*), each with its particular *ethos*, or characteristic effect. A five-note scale was also early introduced into Greece from Asia. It is found as late as the "second Delphic hymn."

To embrace all the notes of the seven *harmoniai* in each of their three genera within the compass of a single octave. the Greeks had a theoretical scale of 21 sounds ("greater perfect system"); the seven *harmoniai* they related to each other in a continuous two-octave scale (disdiupason) ; for modulation they used an 11-note series ("lesser perfect system") ; and to bring any scale within the limited compass (that of the Dorian *harmonia*) of the lyre, they had a transposing system.

The surviving musical fragments well illustrate certain aspects of classical theory and yet show differences that suggest only a frail link with the music of classical times. To what extent the theory represents musical practice at any one period may be legitimately questioned? for the theorists often disagree among themselves. with considerable confusion in terminology.

Instruments. — Ancient Greece appears never to have had a developed instrumental art. The role of its few instruments — all derived from non-Greek sources — was the accompaniment of poetry and the dance.

Strings. — The all-important national lyre existed in preclassical forms: *phorminx,* citharis, *chelys,* and in classical forms: *cithara* (professional), lyra (lyric poets, amateurs). *barbiton.* The harp was played by women: *magadis* (large), *pectis* (smaller), *psalterion* (later).

Wind.—The reed pipe (*aulos*), usually double and next in importance after the lyre, played *nomoi* and accompanied dithyramb and drama. The syrinx (shepherd's panpipe) was played to the flocks, and the *salpinx* (straight metal trumpet) had a military function. The *hydraulis* (water organ, Alexandria. 3rd century B.C.) became more popular in Rome.

Percussion Instruments.—These were introduced with the Dionysus and Cybele cults: *tympanon,* hand-beaten frame drum (Mediterranean) ; *crotala,* hand clappers; *croupala,* foot clappers; and *cymbala*, cymbals.

Heritage. — Though nothing remains of ancient Greek musical practice and few instruments survive. the influence of classical theory was wide and lasting. The Greek empire carried it to Egypt and the Asiatic coasts, and possibly as far as India. In early Christian times the Gnostics used the Greek scale in their incantations, and Byzantium adopted the Greek modes (see BYZANTINE MUSIC). The Romans acknowledged Greek musical leadership and transmitted Creek theory to Europe through Boethius (*c.* 480–524 A.D.), and the early church drew upon its modes. But Islam is the principal heir to Greek theory through the Persians, Arabs and Turks, whose writings further influenced Europe from the 9th century.

Thus Greek music, itself the heir to so much from the world's three most ancient civilizations. helped to create that of at least three more. See also AULOS; LYRE.

GREEK RELIGION.

The religion of the ancient Greeks is no longer absurdly abused nor foolishly idealized. and can be seen clearly for what it was. It contained savage and barbarous elements as well as elements of civilization, although the savagery and barbarism are still sometimes exaggerated. It was creedless, developing without any authoritative writing like the Bible or the Koran. and without any inflexible tradition to hamper or to guide it. It varied from age to age, from place to place and probably also from class to class, being now more backward, now more advanced, but always retaining certain characteristics. It was, first, an anthropomorphic polytheism, the worship of a number (not very large) of gods, thought of as human in form and largely human in mind. These gods were neither passionless nor without characteristics seen by the developed ethics of philosophy as moral faults. But as the history of this worship covers some 2,000 years, it can be seen that ideas, even popular ideas. on these matters were somewhat variable. The gods were normally, though not always, clear-cut figures, made concrete by poetry and art and surrounded by a large mythology. This. however. was not a body of dogma; the worshiper might believe; disbelieve or alter it to his taste.

The Greek religion was for the most part (but *see* MYSTERY) completely free from otherworldliness. It was a religion of everyday life. which sought for temporal blessings such as good crops. deliverance from enemies, health, or peace within the community. In historical times at least it was in its most conspicuous form an affair of the state, although family cult never ceased to exist, and individual religion developed strikingly as the importance of the Greek city-states declined from the 4th century B.C. onward.

Origins. — The people who in historical times called themselves Hellenes (Greeks) came to Greece from an unknown district, perhaps by way of Asia Minor. They brought with them only one deity whose name and native origin are certain: namely Zeus. It is likely that they also had a corn-goddess. whether or not they already called her Demeter. and she may by then have had a daughter. Kore ("the maiden"). The Greeks probably had additional names of deities such as Pluton ("the rich one"). who may well have been the deity of the earth's wealth, *i.e.,* of its crops. Only later. perhaps. was he identified with Hades, the god of the dead, an older form of whose name is Aides. perhaps meaning "the unseen." In any case Hades is not a god of the living. who therefore do not worship him. The dead likewise are no longer in the charge of the gods worshiped on earth. and presumably do not worship them. Similarly, the name Helios (Halios. Eelios) refers not only to the visible sun but also to the sun-god. He had no cult in Greece proper, however, nor had Selene, the moon; gods of the heavens are no concern of people who move on the earth. Zeus is a deity of the weather-sky, that is, of meteorological phenomena such as rain and snow. No other god or goddess of any importance has a name demonstrably Greek. Kronos' name is certainly un-Hellenic; Apollo's yields no convincing Greek etymology. Athena is a pre-Hellenic goddess. adopted by the incoming Greeks in

Mycenaean times as the protectress of their chieftains' castles. Artemis, or Artamis, has a name possibly connected with *artamŏs*. This word, however, means "slaughterer" or "butcher," whereas Artemis is a huntress, a helper in childbirth and on occasion the sender of sudden and painless death to women. The name Hera, if Greek, is the feminine form of *hērōs*, a nobleman or gentleman; it thus means "lady"—a title, not a proper name. The name of Hermes (Hermeias) may be etymologically connected with *hĕrma*, stone or rubble; he may have begun as the power haunting cairns put up to mark holy spots or to delimit paths, but this is uncertain. Ares is stated by the Greeks themselves to be Thracian; in any case, the origin of his name is obscure. Aphrodite is certainly oriental. Persephone (her name has several forms) assuredly is not of Greek origin. Hecate comes from Caria, Hephaestus from the volcanic regions of Asia Minor, and Dionysus is a later arrival of Thracian or Thraco-Phrygian origin. There remain only a few minor powers. The Muses (Mousai) are supposed to derive their name from hypothetical Montiai, meaning "prompters" or "reminders." Pan (Pa-on, "feeder") is the little god of Arcadian goatherds. There are also the Nymphs ("nymph" means marriageable young woman or bride) and their like. It is not known when the cult of any of these powers began.

Some of the gods composing the classical pantheon were taken from the cults existing in the regions invaded by the Greeks. This occurred through the characteristic Greek power of adapting and naturalizing foreign influences, and there was little or no realization of the different origins of the gods, The great civilization of Minoan Crete had an elaborate religion, an outstanding feature of which was the worship of goddesses. Clear traces are to be found also of gods who are born, grow to maturity and die, probably every year, with the growth and decay of the seasonal vegetation. Both those elements influenced Greek cult and myth. In Greece proper are to be found deities with names that are not Greek and that show the characteristic suffixes (found also in place-names, etc.) of the pre-Greek language. Examples are *-nth-*, as in Hyakinthos. *-na-*, as in Athena, and *-ss-*, as in Phersephassa (Persephone). Also in Greece are fairly clear traces of an ancient cult of one or more goddesses. There is an ingenious modern theory that one of these, probably an earth goddess, was named or nicknamed "Da" (a word occurring in classical Greek as an ejaculation). It is contended that this syllable blended with Greek elements to compose two or three divine names, as in Demeter or Damater, "mother Da," and Posei-da-on, "husband of Da." For Poseidon was not originally a sea-god, nor were his earliest worshipers acquainted with the sea. He was a deity of the waters which fertilize the soil, and also, for some obscure reason, a god of horses.

It has been said that these deities are usually anthropomorphic. However, there are traces, probably very early. of their having taken bestial shape. Hera is *boōpis* in Homer; the word probably meant, to the poet, that she had large, cowlike eyes. It could, however, mean "cow-faced," and it is relevant that Hera's priestess Io is said to have been changed into a heifer either by the goddess or by Zeus. Athena is *glaukōpis*, a word used by Homer and other writers to mean "gray-eyed" or '(bright-eyed"; but the bird with which Athena is associated, a kind of owl, is called *glaux*, and the epithet may originally have meant "owl-faced." Poseidon is said occasionally to have taken the form of a horse, while Zeus and Dionysus appeared under various animal guises. The latter commonly manifested himself as a serpent or a bull; a hymn sung in his honour at Elis actually calls him "noble bull." But such cases as these are comparatively rare and abnormal. In any event they have nothing to do with totemism, a wholly non-European phenomenon, but are examples of theriolatry, which is found in many parts of the world (*see* H. J. Rose, *Primitive Culture* in *Greece*, p. 47 ff.).

Growing knowledge of the near east gradually reveals the extent to which the early Greeks were influenced by the cults and beliefs of the great oriental civilizations bordering their district. It is justifiable to say, at least, that some Greek myths were related to certain myths current among these peoples, for example, the Hittites. Egyptian and other foreign influences probably entered Greece by way of Crete, but details are still lacking with regard to this and other aspects of the early history of the eastern Mediterranean. The place of origin of the worship of Apollo, for instance, is still unknown, although it is certain that he had connections with Asia (*see* W. K. C. Guthrie, *The Greeks and Their Gods*, p, 74 ff.). A popular and sometimes locally important cult was that of the heroes, literally gentleman; *i.e.*, powerful and worshipful ghosts of real or imaginary men (sometimes women, *heroinai*), the most famous being Heracles. Minor and half-forgotten ("faded") gods were often confused with these beings. (*See* L. R. Farnell, *Greek Hero-Cults.*)

Development.—At some time earlier than the earliest evidence, earlier, that is, than the Homeric poems, the Greeks had combined most of their deities into one divine clan, the head or "house-father" of which was Zeus. Zeus was represented as the begetter of most of the younger deities, and as being himself the son of Kronos and the husband and brother of Hera. His position is that of a chieftain of the heroic age among his relatives and vassals. But this does not mean that he was the chief god in the cult of every community. At Athens, for instance, his festivals, which had increased in number to include some that were not his originally. were dwarfed in importance by those of Athena. Greek worship throughout the Archaic and Classical periods was essentially communal, although nothing prevented an individual from approaching any deity he chose on his own behalf. Every family had its observances, including the worship of the hearth-goddess Hestia, who scarcely achieved the status of a personal deity but always maintained close relations with the sacred fire from which she came. The larger groups, whether supposedly of kin, like the phratries or clans, or merely local, like the demes (townships) into which Attica was divided, had also their own worship; but the most important and impressive rites were naturally those conducted by the state. The nearest approach to a common governing religious body was the oracle of Apollo at Delphi; and even that, though it lent its sanction to innovations on occasion, was often content to tell inquirers that they would be well advised to "worship according to ancestral custom." The oracle had neither a recognized orthodoxy to enforce, nor a disciplined and obedient clergy to support it in any state that might prove recalcitrant. If Apollo were directly and materially concerned, strong measures might indeed be taken. The four "sacred" wars were all fought, nominally at least, in consequence of violation of the god's rights to certain territories; but this was hardly more than vindication of the divine proprietor's lawful claims. In general Delphi confined itself to giving advice. The inquirer, if he rejected this, did so at his own risk, and numerous tales pointed the moral that his consequent peril was real; but the effectiveness of such warnings depended on the degree of respect in which the oracle was held.

Under such a system, the nature of the cults and their distance from savagery varied greatly. In Arcadia and similar backward districts the simple people might perform archaic or grotesque ritual around a shapeless block of stone or a plank of wood, called perhaps only by some such laudatory epithet as "the good god." In a centre of culture, such as Athens, however. the holy places would be marked by stately and beautiful temples, each the dwelling of a deity represented, perhaps, by an ancient cult-statue, but probably also by a masterpiece of sculpture.

The ritual would be orderly and elaborate, comprising hymns, prayers and sacrifices. The hymns were often written by celebrated poets and musicians, although prayer does not seem often to have taken the form of long and invariable liturgical texts. Sacrifice might involve the killing of many beasts before the temple and a general feast on their meat. Normally there would be a procession for the carrying of sacred objects and the leading of victims for sacrifice. w

It is evident that the reactions of those present would vary from simple trust that the time-honoured ritual would win the favour of the deity to deep reflection upon the nature of the po er addressed, or oi divinity itself. From the latter point of view. different deities were very variously adaptable to the growing interest in ethical and theological speculation. After Zeus himself, Apollo, whose title Phoebus. "pure one." represented his concern with purifications. was thought to be sympathetic to a developed and enlightened morality; anecdotes and alleged oracles were current in support of this idea. Artemis, originally in all probability a mother-goddess, developed into a sort of personification of chastity; Athena became wisdom in person. On the other hand. many minor deities such as Pan, the Nymphs, or Hermes showed no moral development, at least in normal Greek thought. The unpopular Ares. too. remained simply a god of violent death and destruction, usually from war. but sometimes from other causes such as plague. The forms of worship were, as usual, conservative, and retained some features obviously dating from early days and comparatively low stages of culture; but even they tended to shed characteristics that advancing morality regarded as objectionable. The practice of human sacrifice, for instance, is attested by numerous legends, by an occasional ritual simulacrum of manslaughter and by the substitution, certain in some cases, merely probable in others. of an animal victim for one originally human. The actual rite was very occasionally revived in historical times; but the idea of human sacrifice became so repugnant to general sentiment that it was practically abandoned from about the 6th century B.C.

The general attitude of the Greek toward his gods was respectful but not servile. Like many Europeans, he would on occasion jest with the objects of his worship. The "Homeric" hymn to Hermes bears witness to this trait, with its humorous tales of Hermes' early rogueries. So does the comic appearance of Dionysus, Heracles and other popular deities on the Attic stage, as in the *Frogs* of Aristophanes.

Personal Religion. — The very fact that the great public cults were managed by city-states gave them a certain artificiality. They were in many cases originally connected with 'the operations of farming. and therefore belonged to those times of the year at which these operations took place. But the festivals were regulated by the state calendar and this by no means always corresponded with the real seasons. Thus, for example. a ceremony connected with plowing might be held when no farmer was actually plowing his fields. Country dwellers, no doubt, found some compensation for this defect in the worship of their little local powers such as the Nymphs; but, even so. the greatest and most conspicuous forms of worship must have seemed somewhat detached from real life.

In addition to this feeling there was a growing idea that the destiny of the individual was of importance, at least to him. and that the state cults existed rather for the benefit of the community. Hence the immense popularity. from about the end of the jth century B.C., of the cult of Asclepius, whose powers were exerted on behalf of individuals seeking cure for their diseases rather than to avert some public calamity as was the office, for example, of Apollo. There were also the movements such as Orphism (*see* ORPHEUS), which made eschatological speculations regarding the individual, and the philosophic schools. not least that of Platonism. with their ideas on ethics. the government of the universe and the destiny of the soul. Ethics were not divorced from the conventional worships. but those involved no moral code that might direct conduct in detail. All these tendencies toward regard for the individual were reinforced in Hellenistic times by the passing of the old city-states as important political units. This rendered the ordinary man much more helpless in public affairs than his ancestors had been. The geocentric theory of the universe, too, imperfect though it was, made the earth an insignificantly small place. while astrology. which was generally believed in. represented man as the victim of mechanical and irresistible fate. It is no wonder that in early Hellenistic days the cult of Tyche (Chance, Fortune) was widespread both in public and in private. and that later any system promising relief to man's helplessness was sure of adherents. Broadly speaking, such systems were of two kinds. both depending on knowledge, or *gnosis,* alleged to be supernatural and revealed (though Gnosticism, as such. is the name given to a Christian heresy). The first kind of system was the mystery religion. Mysteries were usually. though not always, of oriental origin, and claimed to secure for their initiates the favour of a particular deity. Isis or Mithra for example. who would care for their well-being. especially after death. Such patrons. being gods, were. according to the generally received theory, exempt from the centripetal influence of the stars. being above and beyond them, and thus beyond the reach of fate. The second system was the higher form of magic. "theurgy." which actually constrained the deities to help their clients. The lower forms of magic were also very popular. These aimed at compelling minor powers. notably the *biaiŏthanatoi* (ghosts of violently and prematurely deceased persons), to help the sorcerer in the desired way, for example. by revealing the future to him, by winning for him the favours of influential persons. by tormenting his enemies or by laming the horses he had bet against. One of the reasons for the ultimate triumph of Christianity over the more respectable of its rivals was the fact that, being unencumbered by fantastic myth and ritual of uncivilized origin. it dealt with the eschatological and other spiritual needs of the time in a more rational manner than did its rivals. What was left of Greek rationality contributed a logical and coherent theology to the new religion. The most stubborn opposition to Christianity came from the simple and unreflective worship of the countryside which had behind it the force of ancestral custom. Compromises were numerous; for example. the cult of Asclepius was replaced by that of miracle-working saints, and the small shrines of the little rustic deities by those of Christian powers. Indeed. traces of the old worship are still found in popular customs in Greece and other countries.

(H. J. R.)

GREELEY, HORACE (1811–1872). U.S. newspaper editor and political leader. was born near Amherst. N.H., Feb. 3, 1811. He was the eldest of the five children of Zaccheus Greeley, a poor farmer. Horace had an irregular schooling, but his precocity and an interest in printing became evident at an early age. In 1826 he entered the office of the *Northern Spectator* in East Poultney. Vt., where he remained for five years as an apprentice. Then, after visiting his parents. who had moved to Erie county in Pennsylvania, he went to New York to seek his fortune. He was then 20 years old. His New England background had given him a conditioning in religious piety. moral fervour and political conservatism. This last. together with the difficulties his family experienced in the depression of 1819–22, made him an ardent supporter of Henry Clay's protective tariff policies.

After a year and a half as a journeyman printer in New York. Greeley and an associate set up a small printing establishment. In 1834 Greeley became senior editor of a new literary magazine. the *Sew Yorker.* In 1836 he married Mary Youngs Cheney, a strong-minded schoolteacher. The *Sew I'orker* struggled along. never out of debt. through the depression that followed the panic of 1837. Gradually its editor's interest centred on political journalism.

Ardently patriotic. humanitarian in sentiment, but distrustful of radical solutions for the ills of society and disdainful of Jacksonian democracy. Greeley became a liberal Whig. His views, expressed in the *Sew Yorker,* caught the eye of New York state's Whig political boss, Thurlow Weed, who employed him to issue a campaign weekly, the *Jeffersonian,* in 1838, and a similar weekly, the *Log Cabin,* in the presidential campaign of 1840. These publications substantially aided the Whig cause in New York state, and marked the beginning of Greeley's political partnership with Weed and William H. Seward, governor of New York.

Greeley's success with the *Jeffersonian* and the *Log Cabin* encouraged him to a more ambitious newspaper venture. On April

10. 1841. he started the *New York Tribune,* a daily Whig paper dedicated to reform, economic progress and the elevation of the masses. The *Tribune* set a high standard among the papers of its day in news gathering. intellectual interest and moral fervour. It found a good clientele in New York city and a tremendous circulation as a weekly in the hinterland. Its editorial columns became a potent political influence.

For several years Greeley worked closely with Weed and Seward in liberalizing the Whig party in New York state and in exerting an influence upon Whig national politics. He helped make Seward governor in 1838 and played a part in elevating him to the U.S. senate in the winter of 1848–49. He aided Weed in battling for the antirenters, who opposed the perpetual leases that dated back to the colonial period. and against the conservative Whigs. But differences between Greeley and the other members of the triumvirate were always cropping up. They found him obstinate, mercurial and lacking in political sense, this last being especially evident when he was a member of the U.S. house of representatives for a few months in 1848–49. In his turn. he chafed over the political realism that led Weed to champion Gen. Zachary Taylor's nomination for president in 1848, and became increasingly bitter over the failure of his partners to support him for high public office. In 1854 he determined to take an independent course in politics and dissolved the partnership.

The *Tribune* had taken an antislavery stand in the 1840s. but became violent in its opposition to slavery in the next decade. Greeley was dubious about the Compromise of 1850 (*q.v.*), especially its fugitive slave law, but he blew hot and cold on the measure as a whole. The Kansas-Nebraska act of 1854 provoked his bitterest moral condemnation. He took a prominent part in organizing the Republican party in 1854–55, and supported its nominee, John C. Frémont, for president in 1856. He and his paper were now anathema among the slaveholders. He was publicly caned by Congressman Albert Rust of Arkansas in 1856 and threatened with violence if he ever entered the south. He constantly fed the rising antislavery excitement in the north, bitterly attacking the Dred Scott decision of 1857, the slave trade and southern manners and morals.

Greeley helped defeat Seward for the Republican presidential nomination in 1860. This started a feud with Weed that went on for years. The *Tribune*'s editor preferred the conservative Edward Bates of Missouri as a presidential candidate, and had no enthusiasm for Lincoln. He did, however, support the latter in the campaign of 1860.

As secession materialized after Lincoln's election, Greeley's position became obscure. He urged letting "the erring sisters depart in peace," apparently believing that absence of coercion would gain time and best guarantee the maintenance of the Union. His opposition to any compromise with slavery extension remained firm, but his dread of war was obvious.

Greeley pursued an erratic course during the Civil War. He early became convinced that, for military, social and economic reasons, the abolition of slavery was essential, and joined the radicals in urging emancipation. But he also wanted the war brought to a speedy end, and was greatly distressed by Union defeats and the mounting cost of the struggle in lives and treasure. This distress, together with his continued lack of confidence in Lincoln, produced fitful moods of defeatism. At times he was ready to restore the "Union as it was," never more so than in the summer of 1864 when he became involved in sterile peace negotiations with Confederate commissioners in Canada. Greeley opposed Lincoln's renomination in 1864, but as the end of the war came clearly in sight his spirits rose. He looked forward hopefully to the reconstruction of a nation entirely free.

Greeley's motto for reconstruction of the Union was "Universal Amnesty and Impartial Suffrage." This drew fire, for different reasons, both from the radical Republicans and the supporters of Pres. Andrew Johnson. Popular opinion in the North turned against Greeley when he signed the bail bond of Jefferson Davis. This ruined the theretofore large sale of his history of the Civil War, *The American Conflict.*

Greeley's interest in politics and political preferment remained keen after the war was over. Zealous for a large measure of Negro equality. he supported the 14th and 15th amendments and urged the impeachment of President Johnson. Repeatedly he sought state and national office. but was never elected. He supported Grant's campaign for the presidency in 1868. though without enthusiasm. He finally became convinced that Grant's attempt to maintain radical reconstruction in the south was a failure. He was also irritated by the administration's refusal to cut military expenditures and resume the redemption of paper money with gold or silver coin, and felt that Grant was thwarting his ambitions in New York state. Greeley broke away from the Republican party, joined the dissenters known as the Liberal Republicans, and accepted nomination for the presidency by them and by the Democrats in 1872.

In the dreary campaign of 1872 Greeley was so mercilessly attacked that, as he said, he scarcely knew whether he was running for the presidency or the penitentiary. Overwhelmed by the strain of the campaign, exhausted by his vigil at the bedside of his dying wife, harried by his debts and by the decline of his influence in the *Tribune* office, Greeley sank into a deep depression and died Nov. 29, 1872.

Horace Greeley was a strange mixture of liberalism and conservatism. A liberal nationalist, he believed in the inevitability of human progress and in America's leadership in the movement toward human freedom. He was for years an advocate of Fourierism (*see* FOURIER. [FRANÇOIS MARIE] CHARLES) and in the 1840s spent time and money in attempts to establish Utopian socialist communities. He urged a variety of educational reforms, and was an unrelenting foe of liquor: tobacco, gambling, prostitution and capital punishment. Personally generous, he also advocated using the power of government to promote the general welfare. He urged free common-school education and championed producers' co-operatives. He was always sympathetic with European struggles against despotism. On the other hand, his basic tendencies were conservative. He did not trust the wisdom of the proletariat, and had only scorn for such radical reformers as Frances Wright and Robert Dale Owen. Fourierism appealed to him because it mas a reform that promised all things to all men. rich and poor alike. His sympathies inclined more toward capital than toward labour, and he opposed woman suffrage.

Greeley was quick-tempered, and his judgment was often faulty. His desire for public office amounted to an obsession. But he was warmhearted, and his patience with his eccentric wife was exemplary. His clarity of utterance and the fervour of his convictions combined to produce some of the finest editorials in the history of American journalism. He was one of the great moral leaders of the United States and the greatest newspaper editor that has appeared on the American scene.

GREELEY, a city and the seat of Weld county, in northern Colorado, U.S., 53 mi. N.E. of Denver, at an elevation of 4.637 ft.. is the trading centre of an irrigated agricultural region. Production includes sugar beets and livestock, and food processing and canning are the principal industries. The city is the seat of the Colorado State College of Education (established in 1889).

Greeley was founded in 1870 as a co-operative agricultural colony by Nathan C. Meeker (1817–79), agricultural editor of the *New York Tribune,* with the active support of Horace Greeley, after whom it was named. Organized as a joint stock company in New York, the Union Colony purchased land, recruited colonists and transported them to the new settlement. They wrote into the charter and the land deeds a prohibition of intoxicating beverages. The town was organized ,in 1571 and incorporated as a city in 1885. In 1951 the city adopted the council-manager form of government. For comparative population figures *see* table in COLORADO: *Population.* (L. R. HA.)

GREELY, ADOLPHUS WASHINGTON (1844–1935), U.S. soldier, scientist and arctic explorer, was born at Newburyport, Mass., on March 27, 1844. Enlisting as a volunteer in the

Federal army he fought throughout the Civil War, rising from private to the rank of brevet major. After the war he joined the regular army as a lieutenant in the signal service becoming, in 1887, chief signal oflicer with the rank of brigadier general. During the first polar year. 1882–83, he commanded the United States station in Lady Franklin bay. the most northerly station for meteorological and magnetic observations. His party consisted of 24 officers and men of the U.S. army. and the station. Fort Conger. was built in latitude 81" 44' N. In addition to scientific observations, sledging parties reached latitude 83° 24' N. and explored the interior of Ellesmere Island. discovering Lake Hazen and reaching the west coast at Greely fjord. The relief ships failed to reach Fort Conger in 1882 and 1883 so the station was abandoned according to plan in Xug. 1883 and the party moved south, reaching Cape Sabine on Oct. 15. Shelters were improvised and the party faced a winter of 250 days before help could be expected. with rations for only 40 days. When the rescue party reached them on June 22. 1884. there were only seven survivors. Greely returned to army duties and pursued a distinguished career in Alaska, the Philippine Islands and elsewhere. He died on Oct. 20. 1935.

Greely published works on meteorological. electrical and geographical subjects. His main works were *Three Years oj Arctic Service* (1886); *American Weather* (1888); *Handbook of Polar Discoveries,* 3rd ed. (1925); *Handbook of Alaska* (1909); *Reminiscences oj Adventure and Service* (1927); and *The Polar Regions in the Twentieth Century* (1929). (L. M. Fs.)

GREEN, CHARLES (1785–1870), the most famous of Victorian balloonists, was born in London on Jan. 31, 1785. After leaving school. Green joined his father as a fruiterer, but left to take up ballooning as a profession, his first ascent being in 1821; between that date and 1852 he made over 500 ascents. On his first ascent, he introduced coal gas for ballooning as a cheaper substitute for hydrogen, a practice thereafter followed by most areonauts. His most outstanding achievement was the voyage in 1836 from Vauxhall gardens. London. across Europe to Weilburg in Nassau. Ger. Taking Monck Mason and Robert Hollond (who paid for it). Green completed this journey of about 480 mi. nonstop in 18 hours, a long-distance balloon record for trips out of England not beaten until 1907. Green also planned, but never attempted. an Atlantic crossing. The small working model of his proposed balloon. flown in 1840. incorporated the first mechanically driven propeller ever to power an aircraft. He died in London on March 26. 1870. (C. H. G.-S.)

GREEN, DUFF (1791–1875), U.S. political journalist, member of Pres. Andrew Jackson's inner circle of advisers and diplomatic agent. was born in Woodford county. Ky., Aug. 15. 1791. After education at a local academy he taught school, studied medicine and served in the War of 1812. He then became a U.S. government surveyor and mail contractor in Missouri. He studied law in his spare time. entered politics and served in the Missouri constitutional convention of 1819 and later in both houses of the state legislature. In 1823 he purchased the *St. Louis Enquirer* which. under his editorship, supported Andrew Jackson for president the following year.

In 1826 Green moved to Washington, D.C., where he established and edited the *Gnited States Telegraph* as the chief journalistic organ of the Jacksonian Democrats. After Jackson's election as president in 1828 Green was appointed printer to congress and became a member of Jackson's inner circle. the so-called "kitchen cabinet." He exerted considerable influence on the policies of the Jackson administration until he broke with the president in 1831 to support John C. Calhoun. In 1837 and 1838 he edited *The Reformer*, a free trade and state rights paper in Baltimore. Md., and in 1840, as editor of *The Pilot,* he supported the Whig candidates. William Henry Harrison and John Tyler. When Tyler became president after Harrison's death in April 1841 he appointed Green as his unoflicial representative to England where Green was warmly received by the English free traders. His articles in English papers on banking and currency. American business and internal improvements. the Anti-Corn Law league and English interests in Texas were n·idely read.

Green returned home in 1844 and founded and edited *The Republic,* a New York paper that advocated free trade, the building of roads and other internal improvements, civil service and postal reform, and the acquisition of Oregon, Texas and California. Later the same year President Tyler appointed Green as U.S. consul to Galveston, Tex. Green also went to Mexico and reported that that country would not surrender any territory to the United States. His letters concerning English antislavery activities in Texas helped precipitate the movement for the annexation of Texas that led in 1846 to war between the United States and Mexico.

Green had meanwhile become interested in several business enterprises, including coal and iron mines, canals, railroads and telegraph lines. He built a portion of the East Tennessee and Georgia railroad, acquired extensive ironworks in Tennessee and organized several railroads in Georgia. He formulated plans for financing railroad construction through government mail contracts, bonds and land grants. He secured charters for a Southern Pacific railroad and organized the Pennsylvania Fiscal agency, chartered by Pennsylvania in 1859, for constructing the road. but the secession crisis brought the work to a full stop. Though an opponent of secession: Green threw in his lot with the Confederacy and ran his ironworks at Jonesboro, Tenn., under contract with the Confederate government.

Green spent his last years writing books and pamphlets on finance, currency and other economic issues. and in trying unsuccessfully to recover his interests in the Pennsylvania Fiscal agency. The Pennsylvania legislature in 1864 had converted it into the Crédit Xlobilier of America (*q.v.*), which built the Union Pacific railroad. Green died at his home in Dalton, Ga.. on June 10, 1875.

See Fletcher *M*. Green, "Duff Green, Militant Journalist of the Old School," *Am. Hist.* ***Rev.***, vol. lii, pp. 247–264 (1947). (F. M. G.)

GREEN, GEORGE (1793–1841), English mathematician, who made contributions to mathematical physics, was born on July 14, 1793, at Sneinton, near Nottingham. He went into his father's business as a miller and his mathematics were practically self-taught. It was probably for this reason that Green used unusual methods of his own in solving the physical problems in which he was interested. In 1828 he published by subscription. at Nottingham, his *Essay on the Application of Mathematical Analysis to the Theory oj Electricity and Magnetism.* In this memoir he generalized and extended S. D. Poisson's electric and magnetic investigations. He introduced the term "potential," and used what is now known as Green's theorem to investigate its properties in the case of magnetic and electric fields. This memoir was practically unknown until Lord Kelvin had it reprinted in 1846; it was followed in 1832 and 1833 by papers on the laws of equilibrium of fluids, on attractions in n-dimensional space and on the motion of a fluid agitated by vibrations of a solid ellipsoid. At the age of 40 he went to Cambridge where he was fourth wrangler in 1837. He was elected to a fellowship at Caius college in 1839, but poor health compelled him to return to Sneinton, where he died on March 31, 1841.

His collected papers, *The Mathematical Papers of the Late George Green,* were edited by N. M. Ferrers (1871).

GREEN, HENRIETTA HOWLAND (1835–1916), known as Hetty, U.S financier, was born in New Bedford, Mass., Nov. 21, 1835. A fortune had been acquired by her family from shipping and trading interests. Her father, Edward Mott Robinson, and her aunt, Sylvia Ann Howland, both died in 186j and by their mills she received an estate valued at $10,000,000. Her shrewd personal management of her holdings and keen financial ability increased the size of her fortune and for a long period she was reputedly the richest woman in the United States. When she died July 2. 1916, at New York city, her son and daughter received from her an estate exceeding $100,000,000 in value. (H. J. SG.)

GREEN, JOHN RICHARD (1837–1883), English historian, the author of a popular social history of England. He was born at Oxford, Dec. 12, 1837, and educated at Magdalen College school and Jesus college. He took orders on leaving Oxford and in 1865 became the incumbent of St. Philip's, Stepney. His health, however, could not withstand the demands made upon it by this task and when offered the librarianship at Lambeth in

1869, he accepted. He held this post until shortly before he renounced orders in the autumn of 1877. Meanwhile Green had begun to write: between 1867 and 1874 he was a frequent contributor to the *Saturday Review* and from 1869 he was engaged on his *Short History oj the English People* (1874), which was an immediate success. requiring five reprints during 1875, and later expanded into a four-volume work (1877-So). Green was constantly a victim of ill-health and he died at Mentone, March 7, 1883. He had married. in 1877, Alice Stopiord, herself a historian, who was president of the Historical association, 1915–18, and was nominated to the Irish senate in 1922.

Green's reputation as a serious historian has suffered from the very popularity of his *Short History*. This work, which gave a liberal interpretation to the course of English history, and was deliberately written in a vivid and colourful prose style, possessed the inevitable defects of any attempt to compress the history of a nation into a single volume, and does not reveal Green as the careful and scientific historian that he was. In fact, his later books, *The Making* of *England* (1882) and *The Conquest oj England* (1883), mere valuable contributions to historical knowledge and through his friendship with W. Stubbs and E. A. Freeman he shares an interesting place in the development of English historiography.

GREEN, MATTHEW (1696–1737), English poet and author of *The Spleen* (1737; mod. ed. 1936), a gently satirical verse epistle describing "How I do myself demean. In stormy world to live serene." Little is known of him except that he was born and died in London, was a clerk in the customhouse and wrote occasional verse for the entertainment of his friends. *The Spleen* charms by its sincerity. ease and neatness of expression, in particular its apt use of literary allusion, the precision of its metaphors and the skillful handling of the octosyllabic couplet. Addressed to one of his friends, it was printed with a preface by another, and other minor poems were added in later editions. *The Grotto*, Green's only other considerable poem, was privately printed in 1733, and reprinted in *The Spleen and Other Poems,* ed, by R. K. Wood (192j), and in Hugh l'Anson Fausset's *Minor Poets of the 18th Century* (1930).

GREEN, THOMAS HILL (1836–1882), English philosopher. the typical English representative of what was in his time called Neo-Kantianism or Neo-Hegelianism. was born on April 7, 1836. at the rectory of Birkin. Yorkshire. He was educated at Rugby and at Balliol college. Oxford, of which he was. in 1860. elected fellow. His life thenceforth was devoted to teaching in the university: from 1878 until his death (at Oxford on March 26. 1882) he was White's professor of moral philosophy. His lectures form the substance of his two most important works: viz.. the *Prolegomena to Ethics* and the *Lectures on the Principles of Political Obligation,* published posthumously.

English philosophical thought in the third quarter of the 19th century was dominated by the naturalism of Herbert Spencer and by the sensationalism of J. S. Mill. Green reacted unfavourably to both. holding that the former precludes a satisfactory account of human action and the latter a satisfactory account of human knowledge. His metaphysics begins by raising again the question of man's relation to nature. To ask "What is man'" is. he argued, to ask "What is experience?" for experience means that of which I am conscious. The facts of consciousness. which alone we are justified in asserting to exist, are valid evidence for whatever is logically involved in them. Now the chief characteristic of man is *self*-consciousness. The simplest mental act, the act of sense-perception. is never merely a change, physical or psychical. but the consciousness of a change and of a distinction between the self and the object. Knowledge consists. in its simplest equally with its most complex constituents. of the work of the mind. To know is to relate. The assumption of John Locke and David Hume that the work oi the mind is arbitrary because not "given to" man is unjustified by the results oi exact science. with the distinction. universally recognized. which such science draws between truth and ialsehood, between the real and "mere ideas." This (obviously valid) distinction logically involves the consequence that the object of knowledge is an intelligible ideal reality, a system of thought relations. The existence of this ideal whole presupposes a "principle which renders all relations possible and is itself determined by none of them"; an eternal self-consciousness which knows in whole what we know in part. To God the world *is*, to man the world *becomes.*

The business of moral philosophy, according to Green, is to apply to the sphere of social life the results of the metaphysician's investigation into man's nature. The presupposition of ethics is the spiritual nature of man. Self-reflection reveals human capacity, human function. with, consequently. human responsibility. It brings out certain potentialities in the realization of which man's true good must consist. The idea of some "end" or "good," which man presents to himself as desirable for the realization of his true self, constitutes motive; and the determination to realize the seli in some definite way constitutes an "act of will," which is neither arbitrary nor externally determined. The identification of the self with such a motive is a self-determination, which is at once both rational and free. Freedom is not a supposed ability to do anything but the power to identiiy one's self with that true good which reason reveals as *one's* true good. This good consists in the realization of personal character; hence the final good—that is, the moral ideal, as a whole—can be realized only in some society of persons who, while retaining their individuality, find this perfection attainable only when their separate individualities are integrated as part of a social whole. Society is as necessary to form persons as persons are to constitute society.

'There is a natural transition from these ideas to Green's political philosophy. Moral goodness cannot be limited to the cultivation of self-regarding virtues, but consists in the attempt to realize in practice that moral ideal which self-analysis has revealed to us as *our* ideal. From this arises the ground of political obligation: the institutions of political or civic life are the concrete embodiment of our moral ideas and are valuable according as they develop the moral character of individual citizens. It is obvious that the final moral ideal is not realized in actually existing civic institutions; but the same analysis which demonstrates this deficiency points the direction for a true development. Hence arises the conception of rights and duties which ought to be maintained by law, as opposed to those actually maintained, with the further consequence that it may become occasionally a moral duty to rebel against the state in the interest of the state itself; that is, in order better to subserve that function which constitutes the *raison d'être* of the state. The state does not consist in any definite concrete organization formed once for all. It represents a "general will" which is a desire for a common good. Its basis is not an external coercive authority but the spiritual recognition, by the citizens, of that which constitutes their true nature. "Will, not force. is the basis of the state."

Green's teaching was, directly or indirectly, the most potent philosophical influence in England during the later part of the 19th century; the critical side of his work was especially effective. His constructive doctrines, however, though widely accepted at the time of publication, mere presently judged not merely to contain unresolved difficulties but also to be altogether too imprecise in formulation and argument to warrant serious consideration. By 1950 Green's purely philosophical impact was negligible. He retained. however, a considerable reputation in the field of politics. both because of the effects of his own activities in public life. which helped to bring the English universities into closer touch with practical affairs, and because of his efforts to reformulate the doctrines of political liberalism in a way which laid less stress on the negative rights of the individual and more on positive action by the state. His address on "Liberal Legislation and Freedom of Contract" (1881; *Works,* vol. iii) gives early expression to some of the main ideas which underlay the setting up of the 20th-century "welfare state."

Apart from the introduction to his edition of Hume (1874), Green's main works were all published posthumously: *Prolegomena to Ethics* (1883) was followed by the collected *Works,* 3 vol. (1885–88), vol. iii containing an extensive memoir by R. L. Settleship.

Lamont, *Introduction to Green's Moral Philosophy* (1934); H. A. Prichard, *Moral Obligation* (1949); J. Pucelle, *L'Idéalisme en Angleterre* (1955). (W. H. W.; X.)

GREEN, VALENTINE (1739–1813), British engraver, was born at Halesowen. He became a pupil of a line engraver at Worcester, and in 1765 he migrated to London and began work as a mezzotint engraver. He became a member of the Incorporated Society of Artists in 1767, and an associate engraver of the Royal Academy in 1775. During his career he produced about 400 plates after portraits by Sir Joshua Reynolds and other British artists, and by many old masters. He was one of the first to apply mezzotint to the translation of pictorial compositions and portraits.

GREEN, WILLIAM (1873–1952), U.S. labour leader, for many years president of the American Federation of Labor, was born March 3, 1873, at Coshocton, O. He was educated in public schools and began as a young man to interest himself in labouring conditions in Ohio coal mines. From 1900 to 1906 he was a subdistrict president of the United Mine Workers of America, and from 1912 to 1924 international secretary-treasurer of that union.

In 1913 he was appointed a member of the executive council of the American Federation of Labor. He was elected president of the A.F. of L. on Dec. 19, 1924, and was thereafter re-elected for many successive terms. After the formation of the Committee for Industrial Organization (later the Congress of Industrial Organizations) in 1935, he fought a bitter duel with John L. Lewis for leadership of U.S. labour. Later the C.I.O. broke away from the A.F. of L., not to be reunited with it until three years after Green's death, which took place on Nov. 21, 1952, at Coshocton, O.

GREENAWAY, KATE (1846–1901), English artist and book illustrator, known for her very original and charming children's books, was born in London March 17, 1846. She began to exhibit drawings in 1868, and her first published illustrations appeared in such magazines as *Little Folks*. In 1879 she produced her first successful book, *Under the Window*.

Then followed *The Birthday Book*, *Mother Goose*, *Little Ann*, and other books for children, which had an enormous success and became very highly valued. "Toy-books" though they were, these little works created a revolution in book illustration; they were praised by John Ruskin (*Art of England* and *Fors Clavigera*), by Ernest Chesneau and Arsène Alexandre in France, by Richard Muther in Germany, and by leading art critics throughout the world. In 1890 Miss Greenaway was elected a member of the Royal Institute of Painters in Water Colours, and in 1891, 1894 and 1898 she exhibited water-colour drawings, including illustrations for her books, at the gallery of the Fine Art society (by which a representative selection was exhibited in 1902). Miss Greenaway's use of the quaint costume of the beginning of the 19th century lent humour to her fancy and so captivated the public taste that it has been said that "Kate Greenaway dressed the children of two continents." From 1883 to 1897, with a break only in 1896, she issued a series of *Kate Greenaway's Almanacs*. Although she illustrated *The Pied Piper of Hamelin* and other works, the artist preferred to provide her own text. She had great charm of character, but was extremely shy of public notice. She died at Hampstead, London, on Nov. 6, 1901.

See M. H. Spielmann and G. S. Layard, *Life of Kate Greenaway* (1905).

GREENBACK PARTY, a minor U.S. political party that flourished during the period 1874 to 1884 following the hard times brought on by the panic of 1873. Initially called the Independent National party, it gave prime emphasis to the idea, expressed in its first platform (1876), that "United States notes, issued directly by the Government and convertible on demand into U.S. obligations (bonds) bearing a rate of interest not exceeding one cent a day on each $100, and exchangeable for U.S. notes at par, will afford the best circulating medium ever devised." Peter Cooper (*q.v.*), its presidential candidate in 1876, received 81,740 popular votes. Two years later the party merged with various labour groups and changed its name to the Greenback Labor party, winning in the congressional election of 1878 more than 1,000,000 votes and electing 14 congressmen. With the prospect of becoming a major party, the Greenbackers in 1880 broadened their appeal and adopted a platform calling, in addition to their money reform, for the abolition of the national banking system, the establishment of an 8-hour day, an end to the "importation of Chinese serfs," the regulation of interstate commerce, the adoption of a graduated income tax, unrestricted suffrage, the curbing of congressional committees and the regulation of "gigantic land, money and railway corporations." Despite this strategy, however, it received only 308,578 votes for its presidential candidate James B. Weaver and elected only eight congressmen. Four years later the Greenbackers and the Anti-Monopolists joined in the short-lived People's party and supported Benjamin F. Butler, who won only 175,370 votes. The Greenback Labor party then disintegrated. Many of its supporters later joined the Populist party.

From a broader perspective the Greenback party reflects, on a smaller scale, the same concern over "honest money" that marked Jacksonian democracy in the 1830s and the Bryan campaign in 1896. (J. A. V.)

GREENBACKS, a popular designation for a form of paper money in the United States, so named from the green colour used on the notes. Greenbacks, or U.S. treasury notes, were first issued in 1862 under authority of the act of Feb. 25, 1862. By this and two later acts of congress the secretary of the treasury was empowered to issue $450,000,000 in noninterest-bearing notes. U.S. notes were also known as "legal tenders" although they were not legal tender for all purposes. In 1870 the U.S. supreme court ruled in the case of *Hepburn* v. *Griswold* that congress had no constitutional authority to make greenbacks legal tender for contracts entered into before the act was passed. This decision was reversed in the Legal Tender cases (*Knox* v. *Lee* and *Parker* v. *Davis*) of 1871 after Pres. Ulysses S. Grant had appointed two new justices to the court.

The issues of greenbacks provided substantial revenue for the national government during the American Civil War, although they rapidly depreciated. The value of the notes in terms of gold declined to an average of 39 cents during July and August 1864, and remained at less than 90 cents until 1876. As the secretary of the treasury gradually accumulated a redemption fund in gold, their value rose in terms of gold. By 1879 greenbacks were made redeemable in gold. The quantity then outstanding amounted to approximately $347,000,000, and since that time the amount outstanding has remained at this figure with minor fluctuations. United States notes were made receivable in payments of customs duties on June 17, 1930, and became full legal tender under the act of May 12, 1933, as amended by public resolution no. 10 of June 5, 1933.

During the latter part of the 19th century, a minor political movement with inflationary aims took the name of Greenback party (*q.v.*) and nominated candidates for president, vice-president and a few other offices.

See W. C. Mitchell, *A History of the Greenbacks* (1903). (A. Kp.)

GREEN BAY, a city and the seat of Brown county, in northeastern Wisconsin, U.S., where the Fox river empties into Green bay, an inlet of Lake Michigan, is 112 mi. N.W. of Milwaukee.

The first European in the area was Jean Nicolet, who arrived from Canada in 1634. Nicolas Perrot began to trade on the site of De Pere in 1668, and Claude Allouez, a Jesuit, founded a mission there in 1669; from that time on white men probably always lived in the vicinity. The French built a fort at the mouth of the river in 1717, and this spot became the heart of a small French-Canadian community that handled furs from a large area until after the War of 1812. Its most distinguished figure was a famous 18th-century Indian fighter, Charles de Langlade. The fur trade finally expired about 1845. (*See* also Wisconsin: *History*.)

An American community began when the U.S. army built Ft. Howard in 1816 within the present limits of Green Bay. The first village plat was laid out in 1829, and Wisconsin's earliest newspaper, the *Green Bay Intelligencer,* appeared in 1833. Later, Brown county came to have large numbers of Germans, Belgians and Dutch. In the period from 1890 to 1910, the population increased from 9,069 to 25,236. It more than doubled in the following years, increasing to 52,735 by 1950; in 1960 it was 62,888. The Green Bay standard metropolitan statistical area (Brown county). pop. (1960) 125,082: includes the city of De Pere, 5 mi. S. of Green Bay, and the towns of Preble (parts of which were annexed to Green Bay in 1941 and 1943) and Allouez.

In the second half of the 20th century Green Bay hnd the largest wholesale distributing business in the state after Milwaukee and Madison. Its harbour received more than 3.000.000 tons of waterborne shipping a year. Its factories produce cheese, beet sugar, wood pulp and paper products, lumber, furniture and machinery. From 1919 the city supported a professional football team: the Green Bay Packers.

At West De Pere the Roman Catholic Order of St. Norbert (the Premonstratensian order) founded St. Norbert's college in 1898. A liberal arts college, it became coeducational in 1952.

(W. F. RY.)

GREENCASTLE, a city of western Indiana, U.S., near the Eel river about halfway between Indianapolis and Terre Haute; the seat of Putnam county. (For comparative population figures *see* table in INDIANA: *Population.*)

The city is in a bluegrass region which makes heavy shipments of grain and livestock. Dairying is also extensively carried on. Industries include lumber, zinc and steel mills and a bottling works. Limestone and other stones are also quarried in the vicinity and there is a large cement plant.

Greencastle was settled about 1820, laid out in 1822 and chartered as a city in 1861. It is the seat of DePauw university, a nonsectarian institution founded in 1837 by Methodists as Indiana Asbury university, after Francis Asbury (1745–1816), first bishop of the Methodist Episcopal Church consecrated in America. It was renamed in 1884 in honour of Washington C. DePauw (1822–87), a glass manufacturer, whose liberal gift of funds in 1883 permitted the university to remain open in a time of financial distress. In addition to the college of liberal arts. which still retains the Asbury name. DePauw has a school of music, founded in 1884, and a school of nursing (1955).

GREEN DRAGON *(Arisaema dracontium)*, a North American plant of the arum family (Araceae), found chiefly in low woods from Maine to Ontario and Minnesota and southward to Florida and Texas. It is a fleshy perennial rising from a cluster of acrid corms and bearing a single large leaf, $\frac{3}{4}$ ft. to 4 ft. long, which is divided into 5 to 17 oblong leaflets, and a single flower stalk (scape) ending in a spadix with a short basal flower-bearing portion and long. slender tip, sometimes 7 in. long. protruding beyond the green. tubular but not hooded ensheathing spathe. The fruit. a cluster of orange-yellow berries. ripens in the autumn. Because of its inconspicuous flowering parts, though abundant in many parts of its range. it is much less known thnn its showy relative. the jack-in-the-pulpit (*q.v.*). *See* ARACEAE; CALLA; GOLDEN CLUB.

GREENE, GEORGE WASHINGTON (1811–1883), U.S. historian. mas born at East Greenwich, R.I., on April 8, 1811, the grandson of Maj. Gen. Nathanael Greene. He entered Brown university, Providence, R.I., in 1824 but left in his junior year because of ill-health. He was in Europe during the next 20 years, except in 1833–34, when he was principal of Kent academy at East Greenwich. and was the U.S. consul in Rome from 1837 to 1845. He was instructor in modern languages at Brown university (1848–52); and in 1871–75 was nonresident lecturer in American history at Cornell university. He died at East Greenwich on Feb. 2, 1883. His works include *Historical View of the American Revolution* (1865); *Life of Nathanael Greene* (1867–71); *The German Element in the War of American Independence* (1876); and a *Short History of Rhode Island* (1877).

GREENE, GRAHAM (1904–). English novelist. journalist and playwright, whose outstanding powers as a storyteller are frequently devoted to the theme of the conflict between good and evil. was born at Berkhamsted, Hertfordshire. on Oct. 2, 1904. and was educated at Berkhamsted school and at Balliol college. Oxford. He became a Roman Catholic in 1926. His first three novels, *The Man Within* (1929), *The Name of Action* (1930) and *Rumour at Nightfall* (1931), showed the influence of Robert Louis Stevenson. Joseph Conrad and Virginia Woolf, but with the "entertainments" *Stamboul Train* (1932) and *Gun for Sale* (1936) and the novels *It's a Battlefield* (1934) and *England Made Me* (1935) he achieved an individual style. The reputation earned with *Brighton Rock* (1938), a study of the corruption of youth, enabled him in *The Power and tlze Glory* (1940), *The Heart of the Matter* (1948) and *The End of the Affair* (1951) to explore more deeply his favourite themes: the hunted man; the superiority of a knowledge of good and evil over a belief in mere right or wrong; and the operation of human and divine love in a fallen world. With *The Quiet American* (1955), a novel of political intrigue in Indochina. and *Our Man in Huvann* (1958), Greene left his familiar religious themes. In conjunction with *The Burnt-Out Case* (1961) he published the notes on a trip to the Congo (1959) from which it was written, entitled *In Search of a Character* (1961). Greene's first drama, *The Living Room* (1953), which uses an Ibsenesque technique of progressive revelation, was an immediate success, as were *The Potting Shed* (1957) and *The Complaisant Lover* (1959). He also published several children's stories (with Dorothy Craigiej, the travel books *Journey Without Maps* (1936) and *Lawless Roads* (1939), and critical essays in *The Lost Childhood* (1951).

GREENE, MAURICE (*c.* 1695–1755), English organist and composer known for his church music. Born in London. he was a chorister at St. Paul's cathedral, becoming organist there in 1718. In 1727 he was organist and composer to the Chapel Royal and in 1730 he mas elected professor of music at Cambridge university. In 1732 he composed what is probably his finest work—the oratorio *The Song of Deborah and Barak* on a text by John Hoadly, hrst published in 1956. In 1735 he became master of the king's Band of Music, cornposing new year and birthday odes, many of which were unfortunately lost. His *Forty Select Anthems* (1743) was long a standard work. Many of them have been republished in the 20th century. In 1750 he began a collection of old English church music that formed the nucleus of *Cathedral Music* published by his pupil William Boyce. He died in London on Dec. 1, 1755. A prolific composer, Greene shows both contrapuntal skill and musical scholarship. Among his instrumental works later republished are harpsichord pieces, orchestral overtures and organ voluntaries.

See R. Graves, "The Forty Anthems of Maurice Greene" in *The Musical Times* (Jan. 1950). (CS. CH.)

GREENE, NATHANAEL (1742–1786), American general, son of a Quaker farmer and smith, was born at Potowomut, in the township of Warwick, R.I., on Aug. 7 (not, as has been stated, June 6), 1742. At Coventry, R.I., where he went in 1770, he was the first to urge the establishment of a public school. In the same year he was chosen a member of the legislature of Rhode Island. to which he was re-elected in 1771, 1772 and 1775. He sympathized strongly with the Whigs and in 1774 joined the local militia. At this time he began to study the art of war. His zeal in attending to military duty led to his expulsion from the Society of Friends.

In 1775, in command of the contingent raised by Rhode Island, he joined the American forces at Cambridge, and on June 22 was appointed a brigadier by Congress. To him Washington assigned the command of the city of Boston after it was evacuated by Howe in March 1776. On Aug. 9, 1776 he was promoted to be one of the four new major generals and was put in command of the Continental troops on Long Island, but severe illness prevented his taking part in the battle of Long Island. Greene was placed in command of Ft. Lee, and on Oct. 25 succeeded Gen. Israel Putnam in command of Ft. Washington. Greene ordered Col. Magaw, who was in immediate command, to defend the place until he should hear from him again. and reinforced it to meet Gen. Howe's attack. Nevertheless, the blame for the losses of Fts. Washington and Lee was put upon Greene. but without his losing the confidence of Washington. who assumed the responsibility. At Trenton Greene commanded one of the two American columns: he commanded the reserve at Brandywine, and was prominent in the battle of Germantown, though his troops arrived late.

At the request of Washington, on March 2, 1778, he accepted the office of quartermaster general (succeeding Thomas Mifflin), and succeeded with it as well as anyone could under the circumstances, meanwhile continuing to command troops in the field. In August he resigned the office of quartermaster general, after a struggle with Congress over the interference in Army Administration by the Treasury board. On Oct. 4 he succeeded Gates as commander-in-chief of the Southern army, and took command at Charlotte, N.C., on Dec. 2. The army was weak and badly equipped and was opposed by a superior force under Cornwallis. Greene decided to divide his own troops, thus forcing the division of the British as well. This strategy led to Gen. Daniel Morgan's victory of Cowpens, S.C., Jan. 17, 1781, and to the battle at Guilford Court House, N.C., March 15, in which after having weakened the British troops by continued movements, Greene was defeated indeed, but only at such cost to the victor that Tarleton called it "the pledge of ultimate defeat." Three days after this battle Cornwallis withdrew toward Wilmington. Greene allowed Cornwallis to march north to Virginia and then turned swiftly to the reconquest of the inner country of South Carolina. This, in spite of a reverse sustained at Lord Rawdon's hands at Hobkirk's Hill (April 25) he achieved by the end of June, the British retiring to the coast. Greene then gave his forces a six weeks' rest, and on Sept. 8, with 2,600 men, engaged the British under Lieut. Col. James Stuart at Eutaw Springs; the battle, although tactically drawn, so weakened the British that they withdrew to Charleston, where Greene penned them during the remaining months of the war. Greene's Southern campaign showed remarkable strategic features that remind one of those of Turenne, the commander whom he had taken as his model in his studies before the war. He excelled in dividing, eluding and tiring his opponent by long marches, and in actual conflict forcing him to pay for a temporary advantage a price that he could not afford.

South Carolina and Georgia voted Greene liberal grants of lands and money. On the Georgia estate, Mulberry Grove, 14m. above Savannah, he settled in 1785, after twice refusing (1781 and 1784) the post of secretary of war, and there he died of sunstroke on June 19, 1786.

BIBLIOGRAPHY.—See the Life of *Nathanael Greene* (1867–71), by his grandson, George W. Greene, and the biography (1893), by Brig. Gen. F. V. Greene, in the "Great Commanders Series." His letters are in the University of Michigan library.

GREENE, ROBERT (1558?–1592), was one of the most popular English prose writers of the later 16th century, Shakespeare's most successful predecessor in romantic comedy, evidently the first writer in England who succeeded. at least for a short time, in deriving a livelihood from his dramatic and prose works, and one of the earliest English autobiographers.

Greene was probably born at Norwich, Norfolk, where he was baptized on July 11, 1558. He matriculated at St. John's college, Cambridge, on Nov. 26, 1575, as a sizar (which shows that his parents were not wealthy), received the B.A. degree in 1578, and became M.A. in 1583 from Clare hall, where he wrote the prefatory epistle to the second part of *Mamillia.* He had evidently begun already to frequent London literary circles, since the first part of *Mamillia* was entered in the Stationers' Register on Oct. 3, 1580. In 1588 Oxford conferred a degree, and thereafter Greene somewhat ostentatiously referred to himself on title pages as "Academiae Utriusque Magister in Artibus." About 1585 or 1586 he married, and had at least one child, but he soon deserted his wife and went to London. With his "jolly long red peake" he swaggered in bohemian society and, according to his own lurid accounts of his behaviour, became an intimate of cutpurses, rascals and prostitutes. Early in Aug. 1592, he tells us, he dined with his friend Thomas Nashe on pickled herring and Rhenish wine, and a month later, on Sept. 3, forsaken by his "quondam acquaintance," he died in London, attended only by a shoemaker and his wife and by his mistress. the sister of a rogue named Cutting Ball and the mother of Fortunatus Greene. On the day before his death he wrote to his "Sweet Wife" asked her to pay the bearer £10: "But for him I had perished in the streetes. Forget and forgive my wronges done unto thee, and Almighty God have mercie on my soule. Farewell till we meet in heaven, for on earth thou shalt never see me more."

Works.—Despite his early death Greene was a prolific writer and composed over 35 works between 1580 and 1592. Nashe observed that "In a night and a day would he have yarkt up a Pamphlet as well as in seaven yeare." Though his facility apparently amazed (and distressed) his contemporaries, it was a prerequisite for a man who expected to obtain an income from publication. Stationers paid small fees for manuscripts, and authors, in the absence of copyright laws, had no control over their books after they were published, profits from subsequent printings accruing to the publishers. A professional author like Greene had to write rapidly and to supply material attractive to the public. Hence, like most popular writers, Greene slavishly followed literary fashions. In his early prose writings he aped John Lyly's *Euphues,* modifying the excesses of the affected style but retaining Lyly's moral platitudes. In the later 1580s, he fashioned prose pastorals after Sir Philip Sidney's *Arcadia;* unrequited lovers penned interminable letters in balanced prose and pretended to dissect the subject of passion, though their comments have an amazingly unreal quality. Structurally these works resembled static operas; instead of conversations there were long speeches or letters (arias), there was little interaction between characters and no psychological reason for their conduct, and charming lyrics, not always organically related to the action, appeared unexpectedly, and give him a reputation also as a poet of metrical inventiveness and verbal felicity. Read aloud, as no doubt they were intended to be read, these pastoral romances were effective; like most Elizabethans, Greene had studied the precepts of classical and Tudor rhetoricians, and he and his audience both delighted in the traditional patterns and figures of speech characteristic of well-designed orations. Of these tales the most readable are *Tullie's Love* (1589), a nonhistorical account of Cicero's love for a woman of the upper class; *Menaphon* (1589), an implausible story of shepherds and shepherdesses, mistaken identities and complications which were suddenly resolved so that everything ended merrily; and *Pandosto* (1588), his finest romance and the direct source of Shakespeare's *A Winter's Tale.*

About 1590, probably because the literary climate had changed, Greene determined to abandon his lovesick heroes and heroines and to compose serious didactic works. In *Greene's Vision,* published after his death but written in 1590, he stated that Chaucer was no longer his guide, but the moral John Gower. Beginning with *Greene's Never Too Late* (1590), he related prodigal son stories, in which a youth invariably flouted the advice of his father, strutted off to sow his wild oats and then returned penitent and humble. Francesco, in *Francisco's Fortunes* (1590), abandoned his wife, succumbed to the lures of the strumpet Infida, who spurned him when he needed money, and eventually fell in with a company of actors who persuaded him to compose plays. That in these works Greene drew on his own experience is evident from two tracts printed posthumously in 1592, *Greenes Groatsworth of Wit, Bought With a Million of Repentance* and *The Repentance of Robert Greene, Maister of Artes.* The former purported to relate the story of Roberto, whose experiences were typical of Greene's other young profligates, but in the middle of his tale Greene suddenly dropped the disguise, "Heere (Gentlemen) breake I off Robertoes speach; whose life in most parts agreeing with mine." Hence the guilt of his characters and their terrors as to their prospects of salvation were his own. For Greene, particularly in his *Repentance,* blackened himself as the worst of sinners and set himself forth as an example to English youth, and particularly to his former acquaintances, Christopher Marlowe, Thomas Nashe and George Peele, who, he averred in *Groatsworth,* were destroying themselves through their immorality and jeopardizing their souls because of their atheism. These autobiographical pamphlets are perhaps Greene's most effective works, for, unlike his fiction, the story of "Robin Greene," who publicly affected bohemianism but inwardly was tormented by an uneasy conscience, is a moving study in pathos.

In the last year of his life Greene wrote a series of exposés of the Elizabethan underworld, beginning with *A Notable Discovery* *of Coosnage* (1591), in which he portrayed the deceptions of conycatchers and petty thieves. Though he asserted that he was serving a lofty patriotic function in rooting out these criminals, most of his material was not original, and the author, despite his protestations, was clearly more intent upon entertaining his readers than in reforming evil. The most successful and amusing of these tracts was *A disputation between a he conycatcher and a she conycatcher* (1592), a discussion between a male and a female thief over their respective merits in duplicity. Another noteworthy pamphlet was *A quip for an upstart Courtier* (1592), which succinctly outlined abuses in approximately 60 Elizabethan trades and professions, and which contained the celebrated attack on Gabriel Harvey and his brothers. John and Richard, probably inserted just before publication at the instigation of Nashe, who was to continue the feud with the Harveys for the next four years. In answering Greene's attack in *Foure letters and certaine sonnets* (1592), Gabriel Harvey, with accuracy but with repellent malice, supplied many details about Greene's death. The *Groatsworth of* Wit also aroused controversy, for not only did Greene urge repentance upon his three friends but also assailed "an upstart Crow, beautified with our feathers, that with his *Tygers hart wrapt in a Players hyde*, supposes he is as well able to bombast out a blanke verse as the best of you; and being an absolute *Johannes fac totum*, is in his omne conceit the onely Shake-scene in a countrey." This first reference in print to Shakespeare has evoked considerable discussion: earlier critics believed that Greene accused Shakespeare of plagiarism in **I** *Henry* VI, in which the italicized quotation appears: scholars were later of the opinion that the passage was a criticism of Shakespeare the actor, who, like many other players, rewrote the dramatist's words.

Greene's theatrical career presents numerous problems; the canon is disputed, the dates of the plays are conjectural, and his role as collaborator is a subject of much inconclusive discussion. One of his earliest plays appears to be *The Comicall Hzstorie of Alphonsus King of Aragon* (written *c.* 1588, publ. 1599), a weak imitation of Marlowe's mighty line. *The Historze of Orlando Furioso* (written *c.* 1591, publ. 1594) was an adaptation of Ariosto's poem. *A Looking Glasse for London and Englande* (written *c.* 1590, publ. 1594), written jointly with Thomas Lodge, aas a dramatic jeremiad to Englishmen, reminiscent of Lodge's *Alarum against Usurers* (1584) and Greene's own prodigal-son stories. *The Honorable Historie of frier Bacon, and frier Bongay* (written *c.* 1591, publ. 1594), though an attempt to vie with Marlowe's *Dr. Faustus*, was the first successful romantic comedy in English; here Greene for the first time realized his comic talent in drama. In *The Scottish Hzstorie of James the fourth* (written *c.* 1591, publ. 1598), probably his last play, Greene made use of one of Geraldi Cinthio's tales but drew upon native fairy lore for Oberon and Bohan, and delineated almost Wordsworthian English maidens in Dorothea and Ida. It was a uorthy forerunner of *As You Like It* and *A Midsummer Night's Dream*. As Marlowe anticipated the tragedies of Shakespeare, so in a lesser way Greene furnished a model in dramatic comedy and romance for the greatest genius of the age.

BIBLIOGRAPHY.—Greene's plays and poems were edited by Alexander Dyce, 2 vol **(1831)** and by J. C. Collins, 2 vol (1905). His complete writings were edited for the Huth Library by A. B Grosart, 15 vol. (1881–86) The critical studies, J C Jordan, ***Robert Greene* (1915)** and René Pruvost, *Greene et* ses ***romans*** (1938), both contain bibliographies (E. H. MR.)

GREENER, WILLIAM (1806–1869), English gunmaker and inventor, was born at Felling near Newcastle-on-Tyne in 1806 and began business in Newcastle in 1829. In 1844 he moved to Birmingham. His most important invention, the first expansive rifle bullet, consisted of an oval ball a diameter and a half in length, with a flat end, perforated. in which a cast metallic taper plug was inserted. *(See* AMMUNITION, ARTILLERY.) In 1843 he patented a process aith W. E. Stait for the manufacture of pencils from the hard graphite carbon deposited in the interior of gas retorts. Other valuable inventions followed, the most important being the cap rifle. *(See* SMALL ARMS. THE DEVELOPMENT OF.)

His son William Wellington Greener (1834–1921) invented the treble-wedgefast mechanism of modern shotguns in 1865—perfected in 1873.

GREENFINCH or **GREEN LINNET,** *Chloris chloris,* is a common European bird. The cock, in his plumage of yellowish-green and yellow, is finely coloured but heavily built, and his song is hardly to be commended. The hen is less brightly tinted. The species pervades almost the whole of Europe, and Northern Asia. It extends to Palestine, but is unknown in Egypt. It is. however, abundant in northwest Africa. In America, greenfinch is sometimes applied to the Texas sparrow (*Arremonops rufivirgatus*) of southern Texas and northeastern Mexico. (G. F. Ss.)

GREENHEART, one of the most valuable of timbers, the produce of *Ocotea rodioei,* family Lauraceae, a large tree, native of British Guiana and Surinam. The bark and the fruits of the tree contain bibirine, an antipyretic. Greenheart wood is of a dark green colour, sap wood and heart wood being distinguished only with difficulty. The heart wood is one of the most durable of all timbers, and its value is greatly enhanced by the fact that it is proof against the ravages of many marine borers which rapidly destroy piles and other submerged structures of most other kinds of wood.

Greenheart is one of the strongest of all woods, and has a high density, its specific gravity being about 1150. It is used for keelsons, beams, engine bearers and planking, etc., but its excessive weight makes it unfit for many purposes for which it might otherwise be suitable.

GREENHOUSE, a structure used to grow plants. The simplest greenhouse provides protection only from the extremes of hot and cold, while the greenhouse of the advanced amateur and the commercial grower tends to provide the superior plant environment necessary for the production of fruit, vegetables or flowers of market value.

The first step in obtaining this environment is location. The choice depends upon slope of land, which should be level, and upon convenience to other work areas. The placement of the greenhouse on the lot in relation to the sun is vital. In a properly situated greenhouse the sun follows a uniform path over the plants. Best growing results are obtained when the light is even and shadowless. All trees, buildings and anything else of height should be kept away from the adjacent area.

A year-round source of water for plant care is essential. In some areas it is possible to use lakes or streams; in others well water is the only source. The water must be chemically acceptable to the plants being grown. **A** water sample should be taken and a complete analysis made.

The next consideration is the style of greenhouse structure. The commercial grower uses either the span-type house or a modification called the ridge-and-furrow house. Most commonly used is the span house, in which the sides of the roof are of equal length and both side walls of equal height. The centre or the ridge of the house is generally 15 to 20 ft. high, and the rafters slope down to the sides about 8 ft. above the ground. The ridge-and-furrow house is nothing more than two or more span houses joined at the side wall. This saves money, as there are fewer walls and the heating costs are consequently less than for individual span houses totaling the same growing area. Another style of greenhouse seen in parks and large private estates is the circular conservatory house, which is more ornamental than functional in design.

The wood used in construction must be able to stand high moisture and humidity; some suitable woods are redwood, cedar and cypress. All nails, screws, pipe and other metal parts should be zinc-coated or made of aluminum or some other rust-resistant metal. The choice of glass also is important, as roughly 85% of the average greenhouse is glass. In some areas, because of strong winds, hailstorms or heavy snowfall, it is necessary to use double-weight rather than single-weight glass.

Benches or growing areas for the plants must be provided within the greenhouse. These are usually made of wood with two- or three-foot-wide walks, usually running the length of the greenhouse, between them. Most nurserymen, amateur or professional. try to keep the walk area to a minimum. In bench building, a level growing surface with drainage for excess water must be provided.

The heating system can be either steam or hot water, the choice most often depending on the size of the growing area. Since boilers for steam heat are expensive, the small grower uses the less expensive (initial cost) hot-water system. The pipes carrying steam or hot water are distributed through the house. The amount of piping needed to give an even growing temperature varies according to the climatic conditions.

The last important factor in a greenhouse is ventilation. Openings are usually near the peak of the roof — controlled by mechanical arms for easier opening and closing — or automatically operated by electricity according to temperature fluctuations.

(W. G. Mc.)

GREENLAND, which forms part of the Danish kingdom, is the world's largest island, lying mostly within the Arctic circle. Its area is 840,000 sq.mi.; 708,069 sq.mi. are ice-covered. It is situated between latitudes 59° 46' N. (Cape Farewell) and 83° 39' N. (Cape Morris Jesup) and longitudes 11° 39' W. and 73° 08' W. The extreme length of Greenland is about 1,650 mi. while its extreme breadth, at about 70° N., is nearly 800 mi. In the extreme north it is separated only by a 25-mi. wide strait from Ellesmere Island in the Canadian Arctic archipelago; a suboceanic ridge with soundings not exceeding 600 ft. connects it with North America. Greenland is thus situated on the American continental shelf. Another ridge joins northeast Greenland and Spitsbergen, and the Faeroe-Icelandic ridge unites Greenland with Iceland (across Denmark strait), the Faeroes and Scotland; both these ridges have soundings of about 2,000 ft.

PHYSICAL FEATURES

Geology. — The whole of Greenland is similar to, and probably part of, the Laurentian shield of Canada. It is a mountainous plateau in which Pre-Cambrian rocks predominate, but in the northern half of the island there are considerable areas of younger rocks. The Pre-Cambrian formations are mostly of granite and gneiss and are characterized by metamorphosed sedimentary and volcanic rocks. In the north and northeast there can be traced the continuation of the Caledonian foldings of Europe and Spitsbergen. These caused the high mountains of Peary Land and their westward continuation into Ellesmere Island, and are associated with an overthrust in the Franz Joseph fjord area on the east. Vertical faults, younger than Ordovician: occur in the north and, probably connected with them. are solfataras which are truncated cones of volcanoes without lava. The rocks underlying the solfataras are limestones containing Cambrian trilobites. Volcanic activity and much faulting took place in east Greenland at the close of the Palaeozoic period. In the Caledonian fold zone of the east a trough of Devonian rock was formed in which Old Red Sandstone and conglomerates were deposited. There are extensive Mesozoic sediments in the northeast. At about 70° N. on the east coast the lowest Mesozoic beds are Lower Triassic sandstones and shales, while later Triassic beds occur farther south on the same coast.. Jurassic beds are found only on the east between Jameson Land and Danmark harbour. Cretaceous beds occur on both east and west, but chiefly on the west where coal is found in the Cretaceous sandstones of the eastern edges of Disko Island and the borders of Nugsuakq peninsula. The abundant fossils in those rocks give clear indication of a warm temperate climate persisting until Tertiary times. Tertiary lavas, either surface flows or intrusive sills, are associated on both sides with rocks of that age and cover them in places. The sedimentary Tertiaries are chiefly sandstones with a little coal. Disko Island, Nugsuakq and Svartenhule peninsulas on the west, and Sabine and Kuhn islands and adjacent regions opposite on the east coast are the chief Tertiary basalt areas. The aftereffect of the volcanic activity in Tertiary times can be seen in warm springs in the Scoresby sound area in the east (temperature 140° F.), in the Julianehaab district in the south (104° F.) and in Disko Island 35.6°–64.4° F.).

Numerous raised beaches and terraces, containing shells of marine mollusca, etc., occur along the whole coast of Greenland, and indicate and that this large island has been raised, or the sea has sunk, in postglacial times. Their maximum elevation is about 600 ft. During recent-times Greenland has been sinking. Through exact measuring it was stated that the sinking of the land in proportion to the surface of the sea amounts to 0.4 in. a year at Godhavn. The sinking and rising of the land have made it possible to define several phases of climate in postglacial times: high arctic, arctic, high arctic, arctic, cold temperate, arctic.

Minerals. — The only known commercial source of natural cryolite is at Ivigtut and has been mined by a Danish company since 1865. Iron of meteoric and telluric origin is found on Disko Island, and from it the Eskimos got iron for their weapons. From Cape York R. E. Peary, in 1897, brought to New York city the largest nodule of meteoric origin ever found, weighing 90 tons. Graphite is abundant, particularly near Upernivik, and has occasionally been mined. Coal of poor quality is found in the district around Disko bay and is mined for Greenland's own use. Steatite or soapstone has long been used by the natives for making lamps and vessels. Copper has been observed at several places, but mining will not pay. Lead deposits, estimated at about 1,000,000 tons, were found by L. Koch in the Mesters Vig area on the east coast in 1948.

Natural Regions. — Greenland is divided into two natural regions; the ice sheet, which covers the whole of the middle of the country, and the coastal regions where the mountains rise out of the ice.

The Ice Sheet. — The interior of Greenland is covered by an enormous sheet of ice, burying all valleys and mountains far below its surface. Its area is 708,069 sq.mi., and it is by far the greatest glacier of the northern hemisphere. Occasionally there emerge lofty isolated rocks known as nunataks (an Eskimo word). The ice sheet rises in the interior to a level of about 6,234 ft. (the highest level is 10,302 ft. to the west of Scoresby sound on the east coast) and descends gradually toward the coasts or the bottom of the fjords. The biggest glacier. the Humboldt glacier. more than 62 mi. wide, terminates in the Kane basin on the north coast, rising to a height of 328 ft. **A** transverse section of the surface of the ice sheet from the west to the east coast would show a regular curve, approaching the arc of a wide circle but with greater elevation toward the east and south, where the snowfall is the heaviest. In the middle of Greenland the thickness of the ice sheet is estimated at about 4,593 ft., lying on a ground 3.000 ft. above the sea.

In the interior the surface of the ice is composed of loose dry snow, which never melts, but is transformed to ice by the pressure of the ever-increasing snow masses, which also carry the ice outward to the borders. Some of the snow is carried off the ice by the outward-blowing winds and is piled up in the valleys and on the ice-bare rims of the coasts. Near its margin the ice sheet is broken up by numerous crevasses, some of them being 100 ft. and 150 ft. deep. The steep ice-walls at the edge show a striation, called the blue bands. They are strata of compact, bright and bluish ice, formed from snow which was melted by the heat of friction when the glacier moved forward, and froze to ice.

The ice sheet of Greenland must be considered as a viscous mass which by the vertical pressure in its interior is pressed outward and slowly flows toward the coasts. There the ice converges into the valleys and moves with increasing velocity, in the form of glaciers, into the fjords, where the glaciers partly melt (the melting water running as glacier-rivers into the sea) and partly break off as icebergs. Several explorers — A. Helland (1875), K. J. V. Steenstrup, Captain Hammer (1879–80), Captain Ryder (1886–87), E. von Drygalski (1891–93) and several U.S. and Danish expeditions in later years--examined the velocity of the glaciers. The highest known velocities of glaciers averaged 97 ft. in 24 hr. and, over a shorter period, roo ft. in 24 hr. Both these velocities were measured in the Upernivik glacier (in 73" N.). There is, however, probably a great difference between summer and winter. There seem to be periodical oscillations in the extension of the glaciers and the ice sheet similar to those observed on the glaciers of the Alps and elsewhere. Numerous glacial marks, such as polished striated rocks, moraines, erratic blocks, etc., prove that the whole of Greenland. even the small islands and skerries of the coast, was once covered by the ice sheet. In the years after about

1930 the ice sheet began to recede inland due to a change of climate, and the glaciers were seen to be melting somewhat faster.

Coastal Regions.—The coasts of Greenland are deeply indented with fjords; the coasts of Melville bay and around Northeast Foreland are to some degree exceptions. The complete coastline of Greenland is estimzted at about 25,000 mi. Numerous small islands lie off the coasts. The largest is Disko (3,200 sq.mi.), off the west, at 70° N.

In some parts the interior ice-covering extends down to the outer coast; elsewhere its margin is situated farther inland, and the ice-bare coastland is deeply intersected by fjords extending far into the interior, where they are blocked by enormous glaciers which discharge icebergs into them. The west coast is the most intersected, the largest fjords being Tasermiut, Godthaab fjord, Arfersiorfik, Umanak fjord, Karrats fjord, Southern and Northern Stromfjord; the last of these has a length of 116 mi. The largest systems of fjords, however, are found on the east coast, where the Scoresby sound system has a length of about 185 mi. and a breadth of about 125 mi. Franz Josef fjord with its branch, King Oscar fjord, forms a system of fjords on a similarly huge scale. These fjords are very deep, and soundings indicate that they continue as deep submarine valleys on the coastal shelf. The fjords are drowned valleys caused by erosion and not by tectonic origin.

For 500 mi. down the east coast runs a belt of high mountains, exceeding 7,000 ft. in height; Mt. Gunnbjorn in 69° N. measures 12,300 ft. and is the highest mountain in Greenland. Along the west coast the mountains are not generally quite so high, though even there peaks of 5,000 and 6,000 ft. are not uncommon.

Climate.—Greenland lies north of the 10° isotherm and thus has a polar climate. The weather is uncertain and changes suddenly from bright sunshine to dense fog or heavy falls of snow and icy winds. The July mean at Ivigtut is 49.8' F. and at Thule 40.5° F. The January means are 18.5° F. and —21.1' F. A branch of the Gulf current flows north on the east side of Davis strait and accounts for relatively high temperatures in southwest Greenland. On the east coast temperatures are lower than on the west, for the polar current washes the coast. On the coasts, particularly the southwest, frost is rare in June, July and August, and the summer warmth is appreciable. Rainfall, which is mainly in summer, is heavy in the southwest, but light elsewhere. Snow may fall in any month of the year. In the lofty interior temperatures are always low. The Alfred Wegener expedition (1930–31) measured February mean —52.9' F. and July mean 12.8° F. The minimum temperature in the winter was −85° F. which occurred several times; the maximum temperature in the summer was 26.6' F. These low temperatures are caused by radiation from the snow surface. Over the interior lies a permanent anticyclone which is thought to be the source of many of the weather changes of the northern hemisphere. Cold winds glide outward from the inland ice and, heated by compression and blowing down valleys, sometimes give rise to warm, relatively dry, fohn winds. On the ice sheet, precipitation is slight; it is estimated at 8–10 in. a year. A change of climate set in about 1930, and the temperature of both the air and the sea has risen.

Flora and Fauna.—Of the 390 or so species of vascular plants found in Greenland about 316 probably came from America. About 50 of the rest may have been introduced by the early Norsemen and a few are survivals from the maximum glaciation. As the whole country lies north of the tree line there are no forests. but in the southwest, where the vegetation is less arctic and more abundant, there are groups of willows and birches up to ten feet in height. The birch *Betula nana* reaches its northern limit in Greenland and the mountain ash *Sorbus americana* has much the same distribution. The alder *Alnus crispa* replaces the birch inland, forming scrub more than 3 ft. high in some places. The climax communities are probably ericaceous heath consisting of *Vaccinium uliginosum, Cassiope tetragona, Empetrum nigrum,* andromeda, duarf willows, mosses and other plants. A steppe vegetation, dominated generally by *Carex supina,* is found on some level areas, while on the hillsides moss campion, saxifrages, *Pyrola grandiflora, Dryas integrifolia,* Iceland poppy and many other alpines grow among the lichen-covered rocks. Among the boulders on the beaches *Oxyria,* willow herb and *Cerastium* are found and in the marshy places *Alchemilla,* cotton grass, sedges and equisetums are common.

At Umanak (70° 40' N.) broccoli and radishes grow well; turnips. lettuce and chervil sometimes succeed, but parsley cannot be raised. At Jacobshavn (69° 12' N.), only about 15 mi. from the ice sheet, gardening succeeds well. In the Julianehaab district in the south flowering plants such as aster, nemophila and mignonette are cultivated.

The land mammals of Greenland consist of the musk ox, lemming and ermine in the north and east; reindeer, reintroduced from Scandinavia after being hunted almost to extinction; polar wolf and polar bear; and the arctic fox and arctic hare along most of the coast. The sea mammals—whales and seals—were formerly the chief food of the inhabitants. The six species of seal include *Phoca foetida* and *P. greenlandica,* which are the two commonest, and the walrus. Of the 60 species of birds breeding in Greenland, half are resident throughout the year and half are summer visitors. Of the visitors 60% come from America. Sea birds are very numerous and the northeast of the island is one of the few breeding places of the barnacle goose and the pink-foot goose. Among birds of prey are the white-tailed eagle, the Greenland falcon and the snowy owl, while the commonest land birds are the ptarmigan, snow bunting and raven. Fishing for cod, halibut, *nepisak* and shrimps is important; a shark is taken for the oil from its liver; sea trout and salmon are found in the streams and small lakes of the south. The invertebrates include crustacea, insects, mollusca, annelids and arachnids. In the west mosquitoes are a pest.

In the south a few goats, sheep and cattle have been imported. The dog is the most important domestic animal and is used for hunting and as a draught animal to haul sledges.

HISTORY

The history of Greenland is bound up with the history of arctic exploration. Since the 10th century men have not only settled on the coast but have visited and explored the island in the course of their journeys into the polar regions. It is therefore convenient to treat its history in two sections, one dealing with its discovery and exploration, the other describing its colonization and development.

DISCOVERY AND EXPLORATION

Exploration of the Coasts.—In the beginning of the 10th century the Norwegian Gunnbjorn Ulfsson (son of Ulf Kraka), is reported to have found islands to the west of Iceland. In 982 Eric the Red sailed from Iceland to find Gunnbjorn's land, and spent three years on Greenland's southwestern coasts. On his return in 985 he called the land Greenland in order to make people more willing to go there, and in 986 started again with 25 ships, of which 14 reached Greenland, where a colony was founded on the southwest coast. Communication between the Norse settlements and Norway was broken off in the 15th century, however. In the following century Danish and Norwegian expeditions tried in vain to re-establish the communication, and the rediscovery of Greenland was made by the English navigator Martin Frobisher, who landed on the west coast of Greenland in 1578. Other explorers, including Gaspar Corte-Real had meanwhile seen it, and the work of John Davis (1586–88), Henry Hudson (1610) and William Baffin (1616) afforded further knowledge of the west coast. The east coast was sighted by Hudson in about 73° 30' N. in 1607 and in 1617 by the Dutchman Joris Carolus in about 66° N. During the 17th century the coasts were probably visited by many whalers, who finished the rediscovery of the country's outline.

Exploration was impossible without bases on the coast, and was not started until 1721, when the Danish-Norwegian missionary Hans Egede founded a settlement near Godthaab on the west coast. Egede studied the nature and the people, travelling northward and southward from Godthaab, and in 1752 Peder Olsen Walloe reached a point in 61° N. on the east coast.

In the 19th century scientific exploration was accelerated. The southern west coast was mainly explored by Danes from the

Danish settlements there, but in the northern region of the west coast English and American explorers were leading. John Ross (1818) found the polar Eskimos at Cape York; E. A. Inglefield (1852) sailed into Smith sound; E. K. Kane (1853–55) worked northward through Smith sound into Kane basin, and C. F. Hall (1871) explored Kennedy strait and Robeson channels to the north of this. The first to give more accurate information of the east coast was the Scottish whaler W. Scoresby (1822) who made the first fairly trustworthy map of the coast between 69° and 75° N. Captains E. Sabine and D. Clavering visited this coast in 1823 and met the only Eskimo ever seen in this part of Greenland. The German C. Koldewey expedition reached 77° N. (Cape Bismarck) in 1870, and the duke of Orleans penetrated to about 78° 16' N. in 1905. The rest of the northern east coast was explored by the Danish L. Mylius-Erichsen—J. P. Koch expedition (1906–08), which discovered Northeast Foreland, the easternmost point. E. Mikkelsen (1909–12) mapped those regions. The southern part of the east coast was first explored by the Dane, W. A. Graah (1829–30), and other Danes, G. Holm and T. V. Garde (1883–85) and C. Ryder (1891–92) mapped respectively the coast from Cape Farewell to 65° 16' N. and the Scoresby sound. The Dane G. Amdrup (1899–1900) explored the still unknown coast between Angmagssalik and 69° 10' N., and the Swede A. G. Nathorst (1899) discovered the large King Oscar fjord.

Toward the close of the 19th century several explorers visited north Greenland, including L. A. Beaumont of the Nares expedition (1876); J. B. Lockwood of the Greely expedition (1882); and R. E. Peary on several journeys (1892, 1895 and 1901). *(See* ARCTIC REGIONS.) The Danish exploration of north Greenland began in 1910 with the foundation of the station of Thule in North Star bay (in 76° 32' N.) by K. Rasmussen. It was the base of five Danish expeditions under Rasmussen and L. Koch.

In 1924–34 expeditions under Rasmussen, Koch and Mikkelsen continued researches on the east coast, which was also explored by the English-Danish expedition under A. Courtauld and E. Munck (1935–36) and by E. Knuth's expedition in 1938–39. After World War II Koch and Knuth continued their work on the east coast. Great areas were mapped from aeroplanes.

Exploration of the Ice Cap.—Exploration of the great ice cap, or inland ice, which covers the whole of the interior of Greenland, was attempted in the 18th century, but failed, and so did E. Whymper's and R. Brown's attempt in 1867. Jens Jensen reached, in 1878, the Jensen Nunataks (5,576 ft. above the sea) about 45 mi. from the western margin in 62° 50' N. A. E. Nordenskiold penetrated, in 1883, about 80 mi. inland in 68° 20' N. and two Lapps of his expedition went still farther on skis to about 43° W., at an elevation of 6,600 ft. Peary and C. Maigaard reached in 1886 about 100 mi. inland, a height of 7,500 ft. in 69° 30' N. The Norwegian Fridtjof Nansen, with five companions, in 1888 made the first complete crossing of the inland ice, working from east to west. about 64° 25' N., and reached a height of 8,922 ft. Peary and E. Astrup, in 1892, crossed the northern part of the inland ice between 78° and 82° N. and determined the northern termination of the ice covering. Mylius-Erichsen crossed the northeastern corner of the inland ice in 1907 and E. Mikkelsen in 1910. In 1912 K. Rasmussen and P. Freuchen crossed from Inglefield gulf to Danmark fjord and back and verified that Peary Land is an integral part of Greenland and not, as supposed, separated by a strait. In 1913 the Swiss A. de Quervain, crossed the inland ice from Disco bay to Angmagssalik and J. P. Koch and A. Wegener crossed from Louise Land on the northeast coast to Upernivik on the west coast. The first crossings of the inland ice by aeroplane were made in 1931 by the German W. von Gronau from Scoresby sound to Godthaab and by the American Parker Cramer from Holstenborg to Angmagssalik.

The development of modern air traffic and the fact that Greenland weather is of fundamental importance for predicting conditions on the North Atlantic and in western Europe have meant that since about 1930 weather observations were an important reason for Greenland explorations. In 1930–31 a British expedition under H. G. Watkins made weather observations high on the inland ice 40 mi. north of the arctic circle; at the same time a German expedition under A. Wegener wintered 300 mi. farther north. In 1933 a University of Michigan and Pan American Airways group went up still farther. During World War II Allied military weather stations were at work, and after the war weather stations were to be found from south to the far north.

F. Johnstrup first advocated the foundation of a permanent geological survey of Greenland in 1944. Seven years later, in 1951, Gronlands Geologiske Undersogelse became a permanent institution.

COLONIZATION AND POLITICAL DEVELOPMENT

Early Settlement.—After discovering Greenland in 982, Eric the Red settled just north of the present Julianehaab in 986. Soon two colonies had been formed, Osterbygd in the present district of Julianehaab, and Vesterbygd, farther north, in the present district of Godthaab. At the height of their prosperity the colonists numbered about 3,000 in 280 farms. Numerous ruins indicate the location of these colonies. Somewhat later the colonists met the Eskimo farther north in the neighbourhood of Disko bay, where the Norsemen went to catch seals, walrus, etc. The Eskimo were probably migrating south at that time. Christianity was introduced by Leif Ericsson about 1000, and in 1126 Greenland got its own bishop, who lived at Gardar on Igaliko fjord. There were 12 churches, including a cathedral, a monastery and a nunnery in Osterbygd, and some churches in Vesterbygd.

Greenland was a republic until 1261, when the colonists swore allegiance to the king of Norway, who in return charged himself with supplying them with commodities. In a short time the trade became a Norwegian crown monopoly and was conducted by an annual ship (Knarren). In the 14th century the climate in Greenland deteriorated and this made it difficult to breed cattle, the colonists main livelihood. The colonists thereupon diminished in number and in the 15th century became extinct. The last vessel from Greenland returned to Norway in 1410, but vessels in the Icelandic fish trade may have visited Greenland until the end of that century. Excavations in the Norse burial grounds show 15th-century European influence in the style and texture of the clothes with little or no trace of Eskimo culture; there is no indication of absorption into the Eskimo race or of destruction by Eskimo onslaught. Skeletons which show malformation suggest extermination by excessive intermarriage and adverse conditions of life.

Recolonization.—Norway had been united with Denmark in 1380–81, and in the 16th and 17th centuries the Danish kings several times planned to resume communication with Greenland. The recolonization of Greenland was begun in 1721 with the voyage of the missionary, Hans Egede, to Godthaab. It was Hans Egede's idea that the economic activities of the colony were to be entirely subordinated to his missionary work. This, however, proved impossible, and a few years later the Danish state had to come to his assistance. Later the Greenland trade was assigned to private interests, but in 1774 it was again taken over by the state and was carried on as a government monopoly until 1951, when Greenland was opened to private Danish enterprise, the government-owned Royal Greenland Trading company still continuing its activities. During the period of the government monopoly Denmark aimed to aid the Greenlanders in cultural respects so as to enable them gradually to establish contact with the outside world without becoming subject to exploitation. Consequently Greenland was shut off from free contact with the outside world and all resources were reserved for the Greenlanders who were to sell their surplus production in return for goods required for maintaining and further developing their standard of life. Some aspects of the development may be seen from the following: the population increased from 6,046 persons in 1805 (the first census held in Greenland) to 22,581 in 1950; illiteracy was abolished; all Greenlanders became Christians, their church being Lutheran.

Establishment of Danish **Sovereignty.**—At the dissolution of the union between Norway and Denmark in 1814 Greenland mas retained by Denmark. Until 1916 Denmark's sovereignty extended only over the west coast between Cape Farewell and 74° 30' N. and the one trading station of Angmagssalik on the east coast, founded in 1894. In 1916, however, the United States declared that it had no objection to the extension of Denmark's political and economical interests to the whole of Greenland. Similar declarations were made by other countries including Great Britain, and in 1921 Danish sovereignty was extended to embrace the nhole island, which led to a dispute with Norway regarding hunting and sealing rights in the uncolonized areas of the east coast. In 1931 some Norwegian hunters, on their own initiative, occupied the east coast between 71° N. and 75° N. in the name of the Norwegian king, and after some hesitation the Norwegian government recognized the occupation. Denmark at once summoned Norway into the International Court of Justice at The Hague and in 1933 the occupation was found invalid, the premises stating that Danish sovereignty extended over both the colonized and the uncolonized areas of Greenland. In the meantime another colony had been founded on Scoresby sound on the east coast, and the privately founded colony of Thule in the far north was taken over by the government.

On April 9, 1941, a year after the German occupation of Denmark, Henrik de Kauffmann, Danish minister to the U.S., signed an agreement which made Greenland a temporary protectorate of the United States. Danish sovereignty was recognized, and the arrangement was to last oniy for the war emergency; the United States obtained the right to build bases for aircraft and radio and weather stations, and to "do any and all things necessary" to hold these positions. New York displaced Copenhagen as the key point for export and import arrangements; but local Danish officials and the existing Danish government system continued almost unaltered. Within a few months the United States was at war with Germany and was using Greenland's strategic position and resources. After World War II the communication between Greenland and Denmark was fully resumed but U.S. forces remained in some bases. On April 27, 1951, however, an agreement was signed in Copenhagen between Denmark and the United States for the joint defense of Greenland, concluded within the framework of the North Atlantic Treaty organization and replacing the provisional agreement of April 9, 1941. The naval station at Gronnedal was taken over by Denmark, but the United States and other NATO countries received certain rights of access to the port; defense areas would be established for joint operations by Denmark and the United States, the nationality of the commander being decided upon periodically by agreement. In the areas under U.S. command the United States would enjoy certain rights of use without impairing Danish sovereignty; all defense areas could be used by the ships, aircraft or armed forces of other NATO countries; U.S. forces in Greenland would respect Danish laws and administration concerning the indigenous population. In accordance with this agreement the United States, in 1951, started the establishment of a great air base at Thule in northwest Greenland. After World War II several measures were taken by the Danish government to modernize Greenland's political, social and economic life in accordance with the Greenlanders' desires and the necessity of bringing their way of life to conformity with the new epoch which had come to Greenland as a consequence of modern air strategy and air communications.

GOVERNMENT

Administration. — By an amendment to the Danish constitution (June 5, 19j3) the colonial status of Greenland was abolished. Greenland became an integral part of the kingdom of Denmark, and its inhabitants now enjoy equal political rights with all other Danish nationals. Greenland is divided into two constituencies and is represented in the Danish parliament by two members, elected by men and women who are Danish subjects — both Greenlanders and Danes living in Greenland — and are 23 or more years of age.

The administration of Greenland comes under the Danish prime minister's department, represented in Greenland by a governor *(landshovdingen)*.

For administrative purposes Greenland is divided into western, eastern and northern Greenland. Eastern and northern Greenland are under the direct administration of the prime minister's department, but councils elected by the Greenlanders perform the administrative work in western Greenland. These councils are: the Greenland council *(landsraadet)* with the governor as president; and the Greenland local councils. All government bills containing provisions solely applying to Greenland must. before submission in the Danish parliament, be placed before the Greenland council.

The right to vote at elections of councillors both to the Greenland council and to local councils is given to all who have the right to vote at parliamentary elections. Import duties procure funds required for the work assigned to the Greenland council and to the local councils.

SOCIAL AND ECONOMIC CONDITIONS

Population. — Probably in the 8th century the Eskimo immigrated to Greenland from the Canadian archipelago and then moved southward along the west coast during the Norse settlement and reached the east coast around Cape Farewell, the route by the north coast being almost impassable because of the lack of hunting grounds. The northernmost Eskimo settlement on the east coast in the Franz Josef fjord area was abandoned in the 19th century; there are only two colonies on the east coast, Angmagssalik and Scoresbysund, the latter having been founded in the 20th century. Most Eskimos live on the west coast; all have some Danish blood and are called Greenlanders. So also are the Eskimos on the east coast and in the far north; but in the far north one may still meet the pure Eskimo race. For an account of their customs and culture, *see* the article ESKIMOS. Both Danish and the Eskimo language are spoken.

From the beginning of the Danish colonization in 1721 until 1951 Greenland was closed territory, the only Danes there being officials and a very few private citizens. From 1951 Greenland mas opened to Danish subjects, and a number of Faroese and a few Danish fishermen settled there. Immigration presents great difficulties, however, due, *inter alia,* to a shortage of housing.

The native population of Greenland on Dec. 31, 1950, numbered 22,581, of whom 20,754 lived on the west coast, 1,489 on the east coast and 338 at Thule. At the same date there were 1,061 Danes in Greenland. The average birth rate during the period 1945–49 was 41.g; the average mortality rate was 25.5.

Religion, Education, Communications. — For ecclesiastical purposes Greenland is reckoned in the province of the bishop of Copenhagen. All settlements have schools, generally under native teachers, of whom there are more than 200. In 1951 there were 3 kindergartens, 163 primary schools with 4,156 pupils, 3 postprimary schools with 71 pupils, 1 secondary school with 13 students, 1 seminary with 9 students, 4 technical schools with 43 pupils, 1 commercial school with 15 pupils and 15 evening schools with 500 students. In 1951, 244 young Greenlanders mere undergoing training in Denmark. In 1951 there was a radio station at Godthaab, 12 movie theatres, a duplicated daily newspaper at Godthaab and a printed weekly newspaper, edited by a Greenlander and a Dane and published by the Greenland council and the Greenland department.

Social Services. — Greenland has a free health service, paid for by the Danish government and run mainly by doctors and nurses trained in Denmark. There are 17 medical stations with hospitals or infirmaries and 3 childrens' sanatoria. The commonest disease is tuberculosis against which a crusade was launched in 1953.

There is an old-age pension scheme for those over 55 who are no longer capable of supporting themselves and their families, and schemes for the care of children and for public relief. These are paid for and administered by the Greenlanders themselves.

Agriculture, Industry and Trade.—The original main trade of Greenland was hunting, especially seal hunting. After World War I seal hunting was, however, greatly reduced,, partly because of the change in climate and partly because of overintensive hunting. The change in climate at the same time created suitable conditions for fishing, particularly for cod which became the main trade oi Greenland. This change in the structure of Greenland's trades from hunting and domestic economy to fishery with a view to exports and the consequent introduction of a monetary economy has affected the traditional mode of habitation. Instead of living in scattered settlements, the people have tended to gather together into places where there are good harbours, repair shops, facilities for the purchase of goods and opportunities ior the sale of fish, and fish stores and canneries. This has meant that bigger towns have grown up and has given greater opportunities for building better houses, so that wooden houses have replaced the old-fashioned mud and snow cabins.

Although fishing has become the main trade, hunting is still important. In 1951–52, 11,000 sealskins, 6,000 fox furs, zoo walrus hides, roo polar bear pelts, 103,000 wolf-fish skins and 77 metric tons of eiderdown and feathers were exported. The export of fish products numbered 6,765 metric tons of salted and dried fish, 970 metric tons of blubber,. 390 metric tons of shark's liver, 458 metric tons of cod liver, 12 metric tons of medicinal cod-liver oil, 7 metric tons of sperm oil, 152 bbl. of salted sea trout, 497 bbl. of salted halibut and 150,000 tins of canned shrimps. There are 3 canneries, a deep-freezing plant and 82 fishery stations, where the codfish is made into salted fish. The Greenland fishermen numbered 2,200 with 406 motor boats in 1951.

Only a few stretches of land on the southwest coast can be utilized for sheep farming, cattle farming on a small scale and other animal husbandry of secondary importance. Grass is grown and dried for winter feed, and most sheep farmers grow vegetables for their own consumption. The stock of sheep numbered, in 1951, 14,000; there also were 7j Iceland horses, 40 goats, about 50 head of meat cattle and about 2,000 hens. In 1952, 300 tame reindeer were transported from Norway to Greenland to start reindeer husbandry.

Mining operations are carried on at Qutdligssat (coal) and Ivigtut (cryolite). In 1950–51 the output of the coal quarry amounted to 5,566 metric tons. At the cryolite quarry 110,000 metric tôns were produced, half of which went to Denmark and most of the rest to the United States. For mining of the lead deposits discovered in cast Greenland, a Dano-Swedish-Canadian company, Det Nordiske Mineselskab A/S (Nordic Mining Co., Ltd.) was set up in 1952, 55% of the share capital being in Danish hands. Greenland's first power plants began operations in 1949 and in 1952 seven diesel plants were operating, supplying about 1,600,000 kw.hr. a year.

In 1951 the government trading monopoly, administered in Copenhagen by a government board, was abolished, and so was the previous price policy. Previously several goods (for instance, certain foodstuffs and implements) were sold to the Greenland population at prices lower than the actual cost prices, whereas the prices paid to the Greenlanders for their products in periods of boom were somewhat lower than prices in the open world market. After 1951 the price level was adjusted to the world market level. This would encourage Greenland trade. To counteract the detrimental effect of a drop in prices of Greenland products, a Greenland Price Equalization fund was established. A Greenland Trade Loan fund was also established to promote Greenland trade and industry and increase exports by loans or subsidies to individuals or companies. Ships of all nations were to be allowed to call at Greenland. The right to fish in Greenland territorial waters was, however, still reserved for persons residing in Greenland and Danish subjects who had received special permission. In 1951 about 200 fishing vessels of Danish or Faroese nationality called at the fishery harbour Faringehavn. Four Danish commercial companies and one Faroese carried out trade in addition to the Royal Greenland Trading company of the previous government monopoly, which continued its trade in competition with the privately owned companies.

The value of goods imported into Greenland in 1951–52 amounted to 36,000,000 Kr.; the value of goods exported from Greenland in the same period was 49,475,989 Kr.

Finance. — Before World War II the Danish state had an annual deficit of about 1,000,000 Kr. on the administration of Greenland. After the war the deficit increased because of modernization programs a: it amounted in 1951–52 t 32,500,000 Kr., revenue being 22,300,000 Kr. .d expenditure 54,800,000 Kr. The budget ior 1953 estimated revenue at 32,271,000 Kr., expenditure at 44,779,200 Kr.

GREENLEAF, SIMON (1783–1853) U.S. legal educator, whose principal work, a *Treatise on the Law of Evidence* (3 vol., 1842–53) became a classic, was born at Newburyport, Mass., Dec. 5, 1783. He was educated at the Latin school there, read law with Ezekiel Whitman, and was admitted to the bar in 1806. The first reporter of the supreme court of Maine (1820), he was appointed Royall professor at the Harvard law school in 1833, succeeding Joseph Story (*q.v.*) as Dane professor of law and head of the school in 1846. The 16th edition of his *Treatise* (vol. 1) was prepared by John Henry Wigmore, who was thus led to his own monumental work in evidence.

Greenleaf, a noted practising lawyer, also wrote *A Collection of Cases Overruled, Denied, Doubted or Limited in Their Application* (1821) and *Examination of the Testimony of the Four Evangelists* (1846). He drafted the original constitution of the Independent Republic of Liberia. He died on Oct. 6, 1853, in Cambridge. Mass. (A. L. LN.)

GREEN MONKEY, a west African representative of the guenons, technically known as *Cercopithecus aethiops sabacus*. It is olive green above, with white whiskers and yellow tail.

GREEN MOUNTAINS are a part of the Appalachian system of North America extending from the Massachusetts border northward through the centre of the state of Vermont to the Canadian line. For two-thirds of the length of the state the range is only slightly broken, forming a water-parting between the streams which flow west or northwest into Lake Champlain or the Hudson river and those flowing southeast into the Connecticut river; but farther north the range is cut deep by the valleys of the Winooski and Lamoille rivers. The ranges, about 30 mi. wide in southern Vermont, narrow down to 1 mi. wide at Mount Mansfield and broaden again to the north. The crest line is generally more than 2,000 ft.; 32 summits are more than 3,000 ft.; and the following peaks exceed 4,000 ft.: Mt. Mansfield 4.393 ft., Killington peak 4,241 ft., Lincoln 4,013 ft. and Camel's Hump 4,083 ft. Smuggler's Notch, just north of Mt. Mansfield, is one of Vermont's wonders. There is a rocky wooded canyon with walls of solid rock on either side rising almost perpendicularly 1,000 ft. or more; the massive chin of Mt. Mansfield towers majestically 3,000 ft. above. The entire range, except four of the highest peaks, is heavily wooded with spruce, maple, beech and birch; a fact which probably suggested the name.

The region is made accessible to tourists by railways, highways, and within the mountains, by the "Long Trail" of the Green Mountain club which traverses the entire length of the range.

See W. C. O'Kane, *Trails and Summits of the Green Mountains* (1926); *Guide Book of the Long Trail*, 10th ed. (1935); and T. W. Dale in the *Annual Report of the U.S. Geological Survey* (1894–95).

GREENOCK, large and parliamentary burgh and seaport, Renfrewshire, Scotland. on the south shore of the Firth of Clyde, 23 mi. W.N.W. of Glasgow by road or rail, 21 mi. by the river and firth. Pop. (1961) 74,578. The town has a water frontage of nearly 4 mi. and rises gradually to the hills behind, in which are situated, about 2 mi. distant, Loch Thom and Gryfe reservoir, sources of the town's water supply. The older streets and buildings are on the comparatively level tract beside the firth. At the west end a fine esplanade extends from Princes pier to Fort Matilda, on the boundary between Greenock and Gourock. Shipyards stretch to Port Glasgow, 3 mi. E. At Greenock is the well-known anchorage, "the Tail of the Bank."

Public buildings include the municipal buildings; the McLean museum containing paintings by Sir James Guthrie, who was born in Greenock in 1859, and other artists; the custom house on the old steamboat quay; the sheriff courthouse; and the' Watt institution founded in 1837 by a son of the famous engineer James Watt, who was born in Greenock in 1736. The Watt institution buildings house the Watt scientific library and the Greenock library. The Watt Memorial School of Engineering, Navigation, Radio and

Radar stands on the site of the inventor's birthplace. The old North Kirk (1591), with its pre-Raphaelite windows, was moved to Seafield in connection with a proposed extension of the shipyards. A large cemetery in the southwestern district contains the tomb of Burns's "Highland Mary" removed in 1920 from the North Kirk graveyard. Parks and open spaces include Wellington park, Well park in the heart of the town, Whin hill and Lady Alice and Lady Octavia parks.

Greenock is under a town council consisting of 27 members including provost, bailies and councillors. There is a resident sheriff-substitute. It is a parliamentary burgh, represented by one member. The staple industries are shipbuilding, engineering, sugar refining (1765), worsted and woollen manufacturing and production of aluminum ware.

Greenock-built vessels have always been esteemed, and many warships and passenger liners have been constructed in the yards. Other industries include the manufacture of engines, marine and otherwise; the making of sailcloth, ropes, casks and barrels; and tin-printing. Ships and machinery are the chief exports and sugar the chief import. The first harbour (finished in 1710) has been periodically added to and improved and there are seven tidal harbours, Garvel graving dock and other dry docks, and the James Watt dock, the entrances to which are closed by caissons to keep in 30 ft. of water at low tide. The quay walls are more than 3 mi. in length.

In the early 17th century Greenock was a fishing village of one row of thatched cottages. In 1635 it was erected by Charles I into a burgh of barony under a charter granted to John Shaw, the government being administered by a baron-bailie, or magistrate, appointed by the superior. Its commercial prosperity received great impetus from the treaty of Union (1707), under which trade with America and the West Indies rapidly developed. The American Revolution suspended progress for a brief period, but revival set in in 1783 and within the following seven years shipping trebled in amount. Meanwhile Sir John Shaw by charter (dated 1741 and 1751) had empowered the householders to elect a council of nine members, which proved to be the most liberal constitution of any Scots burgh prior to the Reform act of 1832, when Greenock was raised to the status of a parliamentary burgh with the right to return one member to parliament. The town was considerably damaged by air action during World War II. On Lyle road above the town a cross of Lorraine and anchor commemorates the French sailors who lost their lives in the battle of the Atlantic.

GREENOUGH, HORATIO (1805–1852), U.S. sculptor, critic and author, was born in Boston, Mass., on Sept. 6, 1805. As a youth he was encouraged t~ study art by his family and by the painter Washington Allston. In 1824, on graduating from Harvard, he went to Italy for two years of study, and after returning to Boston he went again to Italy in 1829 to remain there until his final return to the U.S. in 1851. His principal works as a sculptor are both in Washington, D.C.: the statue of George Washington, designed to be placed in the rotunda of the U.S. capitol (now in the Smithsonian institution), and the group called "The Rescue," placed at the east entrance of the capitol. Greenough was the first American to receive an important commission for sculpture from the U.S. government and the first American sculptor of his time to go to Italy to study sculpture.

Greenough's principal importance today rests almost entirely upon his few brief essays on art because in them he outlined the basic ideas of the theory of functionalism which has had so much influence, especially on modern architecture. These essays were originally printed in 1852 in Greenough's book, *Travels, Observations and Experiences of a Yankee Stonecutter.* In 1947 they were reprinted with the title *Form and Function.* Greenough died in Somerville, Mass., on Dec. 18. 1852.

His younger brother, RICHARD SALTONSTALL GREENOUGH (1819–1904), was also a sculptor. His most famous work is the statue of Benjamin Franklin in Boston.

See Charles R. Metzger, *Emerson and Greenough* (1954); Albert T. E. Gardner, *Yankee Stonrcutters* (1945). (A. T. G.)

GREEN RIBBON CLUB, THE, had its meeting-place at the King's Head tavern in Chancery lane, and was originally known as the "King's Head club." Founded about the year 1675 as a resort for members of the political party hostile to the court, the name was changed about 1679 to the Green Ribbon club, in reference to the bow or "bob" of green ribbon which the members were in the habit of wearing in their hats, as a badge convenient for mutual recognition in street brawls. The president was either Lord Shaftesbury or Sir Robert Peyton, M.P. for Middlesex, who afterwards turned informer. Roger North tells us that "they admitted all strangers that were confidingly introduced, for it was a main end of their institutions to make proselytes, especially of the raw estated youth newly come to town." Thomas Dangerfield (*q.v.*) supplied the court with a list of 48 members of the Green Ribbon club in 1679; and although Dangerfield's numerous perjuries invalidate his unsupported evidence, it receives some confirmation from a list given to James II by Nathan Wade in 1685 (Harleian mss. 6845), while a number of more eminent personages are mentioned in *The* Cabal, a satire published in 1680, as also frequenting the club. Among those who appear to have been members are the duke of Monmouth, Halifax, Shaftesbury, Buckingham, Macclesfield, Cavendish, Bedford, Herbert of Cherbury; Scroop, Mulgrave and Shadwell; Falconbridge, Henry Ireton and Claypole; and rogues of the type of Dangerfield and Oates. An allusion to Dangerfield, notorious among his other crimes and treacheries for a seditious paper found in a meal-tub, is found in connection with the club in *The Loyal Subjects' Litany,* in which occur the lines—

From the dark-lanthorn Plot, and the Green Ribbon Club
From brewing sedition in a sanctified Tub,
Libera nos, Domine.

The genius of Shaftesbury found in the Green Ribbon club the means of constructing the first systematized political organization in England. North relates that "every post conveyed the news and tales legitimated there, as also the malign constructions of all the good actions of the government, especially to places where elections were depending, to shape men's characters into fit qualifications to be chosen or rejected." The club was responsible for promoting the Exclusion bill; and the popish plot was deliberately stimulated by members who went about in silk armour, supposed to be bullet proof, and carrying in their pockets the weapon of offence invented by Stephen College and known as the "Protestant flail." In the general election of Jan. and Feb. 1679, the Whig interest throughout the country was managed and controlled by a committee sitting at the club in Chancery lane; and the agitation of the petitioners in 1679 was engineered there. The petitions were prepared in London and sent down to every part of the country, where paid canvassers took them from house to house collecting signatures with an air of authority that made refusal difficult. The great "pope-burning" processions in 1680 and 1681. on the anniversary of Queen Elizabeth's accession, were also organized by the club. They ended by the lighting of a huge bonfire in front of the club windows; and, as they proved an effective means of inflaming the religious passions of the populace, it was at the Green Ribbon club that the *mobile vulgus* first received the nickname of "the mob." The activity of the club was, however, short-lived. The fiasco of the Exclusion bill damaged its influence, and after the flight of Shaftesbury, the confiscation of the City of London's charter, and the discovery of the Rye House plot. in which many of its members were implicated, it declined rapidly. In 1685 John Ayloffe, who was found to have been "a clubber at the King's Head tavern and a green-ribbon man," was executed in front of the premises on the spot where the "pope-burning" bonfires had been kindled; and although the tavern was still in existence in the time of Queen Anne, the club which made it famous did not survive the accession of James II. The precise situation of the King's Head tavern, described by North as "over against the Inner Temple gate," was at the corner of Fleet street and Chancery lane, on the east side of the latter thoroughfare.

See Roger North, *Examen* (1740); Anchitell Grey, *Debates of the House of Commons, 1667–84*, vol. viii (1769); Sir John Bramston, *Autobiography* (1845); Sir George Sitwell, *The First Whig* (Scarborough, 1894).

GREEN RIVER, the name of several U.S. rivers.

The GREEN RIVER, rising in the Wind River range of west-central Wyoming, flows southward until forced to detour around the bulk of the Uinta range into northwestern Colorado. There the Green enters Flaming gorge on the northern flank of the Uintas and continues into the Canyon of Ladore where it cuts through ancient red quartzites in the eastern edge of the Uinta uplift before it receives the Yampa in Pat's Hole (Echo park), Colorado. Leaving the Uintas at Split Mountain gorge in Dinosaur National monument, Utah, the Green continues southward through deep canyons cut into the Colorado plateau. It enters the Colorado river south of Moab, Utah, at Deadhorse Point.

Because of the youthful nature of the narrow, steep-walled canyons, there are only limited areas of extensive flood plains that can be developed through irrigation along the river itself. Within the 45,000 sq.mi. drainage basin of the Green, however, more than 500,000 ac. were under irrigation before the completion of the dam across the Flaming Gorge canyon. The Green supplies about 45% of the total water of the Colorado at the confluence of the two rivers, flowing about 4.793.000 ac.ft. per year, but is navigable only by special shallow-draft river boats and then only at high water.

The GREEK RIVER. which rises near Kings Mountain in central Kentucky. flows for 360 mi. generally westward through a well-defined gorge, then northwestward to the Ohio, which it enters just above Evansville, Ind. It receives the waters of Echo river, which flows underground through Mammoth cave. and drains numerous other underground caverns. Deepening of the channel of the Green to nine feet, dams and locks below Mining City dam allow small river boats to navigate a total of 200 mi. of the lower course through the western coal fields.

The GREEN RIVER, which rises in Lee county in north-central Illinois, enters Rock river east of Moline. Much of its broad, flat valley is swampy or artificially drained. Silted and sluggish, it is avoided by the Illinois-Mississippi barge canal, which parallels it for about 15 mi.

There are also two smaller Green rivers, one rising in the Cascade range of Washington and the other in the Green mountains of Vermont. (C. N. C.)

GREENSAND. A geological term having a double significance. Among the sedimentary rocks it is used to indicate a sand or sandstone with abundant grains of glauconite (*q.v.*). Greensand is mined in Maryland and New Jersey. It is used primarily as a water softening agent and finds some use as a soil conditioner and as a source of potassium.

Stratigraphically the name is used for several subdivisions of the Cretaceous system in England.

GREENSBORO, a city in the heart of the Piedmont region in north central North Carolina, U.S., is 75 mi. N.W. of Raleigh. Established in 1808 as the seat of Guilford county. it was named for Gen. Nathanael Greene, commander of American Revolutionary forces at the battle of Guilford Court House. Fought in hlarch 1781 near the city, the battle is commemorated there by a national military park.

The early settlers of Greensboro included Scottish Presbyterians from northern Ireland, German Calvinists and Lutherans and English Quakers. The population, which increased from 3.317 in 1890 to 10,035 by 1900. was 19,861 in 1920, 53,569 in 1930 and 74,389 in 1950. In 1960 it was 119.574. The population of the Greensboro-High Point standard metropolitan statistical area (Guilford county) was 246,520 in 1960. (For comparative population figures see table in NORTH CAROLINA: *Population.*)

Greensboro was chartered as a city in 1870 and in 1921 adopted council-manager government.

The city became an agricultural and trading centre and an important insurance headquarters; it is also a large wholesale distributing point and an industrial nucleus with more than 250 active plants, producing over 130 manufactured products in the second half of the 20th century.

Institutions of higher education in Greensboro include the Agricultural and Technical College of North Carolina, established in 1891 as a coeducational land-grant college for Negroes; Bennett college, a liberal arts school for women, founded in 1873 by the Methodist Episcopal Church as a coeducational school below college level and reorganized in 1926 as a Negro woman's college; Greensboro college, chartered in 1838 as a woman's college, opened in 1846 and coeducational from 1956; Greensboro division of Guilford college, a coeducational community institution, chartered in 1948 as the Greensboro Evening college but merged in 1953 with Guilford college, which borders Greensboro's city limits; Immanuel Lutheran college for Negroes (founded in 1903 and moved to Greensboro in 1905); and the woman's college of the University of North Carolina, a liberal arts school originally chartered in 1891. Bennett and Greensboro colleges each enrolled about 500 students; the Greensboro division of Guilford college, over 1,000; the Immanuel Lutheran college about 100; and the Agricultural and Technical college and the woman's college of the state university, each more than 2,600. William S. Porter (O. Henry) (1862–1910) was born in Greensboro. (E. S. AR.)

GREENSBURG, a city of southwestern Pennsylvania. U.S., and the seat of Westmoreland county since 1785, 27 mi. S.E. of Pittsburgh. was named for the American Revolutionary War general Nathanael Greene. It is within an area abounding in natural gas and bituminous coal; its inhabitants are employed largely in industries producing coke, brick, automobile tires, plumbers' supplies and steam fittings.

The first court to convene west of the Alleghenies opened in the nearby village of Hannastown in 1773. When a Seneca Indian raid destroyed that village the county government was moved to Greensburg. Within three miles of the route taken by the army of General Forbes in its march to Fort Duquesne in 1758 and on the Pennsylvania state road opened in 1784, the city from its earliest years was near Pennsylvania's major east-west transportation arteries. In 1852 the railroad reached the city. It was incorporated as a borough in 1799 and became a city in 1928. For comparative population figures see table in PENNSYLVANIA: *Population.*

Seton Hill college (a Roman Catholic school for women) was founded there in 1883 and became a four-year college in 1918. (J. A. RE.)

GREENSHANK (*Tringa* nebularia), one of the largest of the sandpipers. The long olive-coloured legs of this species distinguish it from two allied species (*T. totanus* and T. erythropus) having red legs and called redshanks. The greenshank is a native of the northern parts of the old world. but in winter it wanders far to the south from South Africa to Australia. Almost as bulky as a woodcock, it is of a more slender build. It breeds in Scotland, Norway, Sweden and Finland, and then to Kamchatka. The name is also used for the little greenshank (T. stagnatilis), of southern Russia to northern Mongolia, rather like the lesser yellowlegs (T. *flavipes*) of Canada. See REDSHAKK.

GREENSTONE, in geology, term used by many of the earlier writers to indicate fine-grained dark-coloured and often considerably decomposed and altered basic igneous rocks, either intrusive or extrusive. It is still—like "felsite" (*q.v.*)—a useful word in descriptive field geology. since it indicates the appearance and general character of the rock, but does not imply anything definite as to its exact nature and composition, which may be determined later by laboratory methods. For discussion of the latter, see PETROLOGY: *Methods of Investigation.*

GREENVILLE, largest city in the delta of the Yazoo and Mississippi rivers. in western Mississippi, U.S., is the most important port on the west side of the Mississippi river between Memphis, Tenn., and Vicksburg, Miss. (95 mi. S.). There is a $6,000,000 bridge across the Mississippi at Greenville. Old Greenville, an extinct town formerly south of the present city, became the seat of Washington county in 1827. Part of the old settlement caved into the river and the remainder of the town was burned by Federal troops during the American Civil War. During Reconstruction the new town was established at its present site, which was formerly Blantonia plantation; thereafter it was the county seat. The original incorporation of the town occurred in 1870; its charter as a city dates from 1886.

Greenville is surrounded by rich agricultural delta land which produces the bulk of the world's long staple cotton. Diversification brought substantial production of corn, oats, rice, soybeans and alfalfa, and there are herds of beef cattle and hogs. Principal manufacturing industries include agricultural chemicals, rugs, woodworking and metal products.

Like the entire delta area along the Mississippi river, the city is protected by huge levees. In 1927 a break in the levee north of Washington county inundated a 7,500-sq.mi. area around Greenville, producing one of the most devastating floods ever to hit the delta. Federal flood-control projects have prevented the recurrence of such floods. The *Greenville Delta Democrat-Times* was established in 1888; its editor Hodding Carter won a Pulitzer prize in 1946.

For comparative population figures *see* table in MISSISSIPPI: *Population.* (J. K. B.)

GREENVILLE, a city and seat of Greenville county in northwestern South Carolina, U.S., is on the Reedy river, about 100 mi. S.W. of Charlotte, N.C. First settled in the 1760s, the county of Greenville was created in 1786 with its seat at the village of Pleasantburg, a name soon changed to Greenville and so incorporated in 1831. Located in the foothills of the Blue Ridge mountains, Greenville prior to 1860 was a summer resort for many low-country planters. As western terminus of the Greenville and Columbia railroad it served as commercial centre for the piedmont and for entry into the nearby Appalachian mountains. Greenville provided strong opposition to nullification in 1832 and secession in 1860. Notable among unionists was Benjamin F. Perry, Greenville editor and later governor. After the Civil War, water power of the Reedy river was utilized to develop manufacturing that became the chief economic activity of the area.

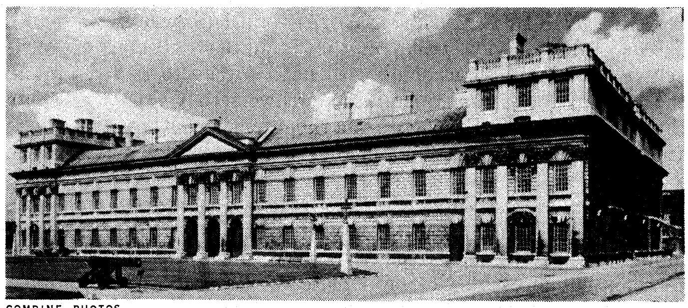
The population of the city was 8,607 in 1890 and 11,860 in 1900. It almost doubled by 1920 (23,127) and increased from 29,154 to 34,734 in the decade 1930–40; it was 58,161 in 1950 and 66,188 in 1960. The population of the standard metropolitan statistical area (Greenville county) was 209,776 in 1960. Chartered as a city in 1868, Greenville established council-manager government in 1951.

The city leads the state in retail sales volume and in manufacturing. Textile mills dominate industry although there was considerable growth by the second half of the 20th century in the chemical industry, food distribution, metal industries and industrial suppliers.

Greenville is the home of Furman university, opened in 1827 as a theological school at Edgefield and moved to Greenville in 1851 (Baptist, coeducational, about 1,300 students), and Bob Jones university, established in 1927 (nondenominational coeducational school emphasizing Bible study, about 2,000 students). There is a state park on Paris mountain $4\frac{1}{2}$ mi. from the city at an elevation of 2,054 ft. (L. P. J.)

GREENWICH, a southeastern metropolitan and parliamentary borough of London, bounded on the north by the river Thames, east by Woolwich, west by Deptford and south by Lewisham, part of the boundary between it and the latter being the Dover road (originally the Roman Watling street) running across Blackheath. The borough is connected with Poplar to the north by a foot tunnel to the Isle of Dogs, and to the neighboyrhood of the docks by the Blackwall tunnel, the lowest on the river. Pop, (1951) 89,846. Area 6 sq.mi.

The parish church is dedicated to St. Alphege, archbishop of Canterbury, who was martyred there by Danish raiders in 1012. The medieval building was replaced by the present one in 1718, Nicholas Hawksmoor being the architect and John James completing the tower. As a result of damage in World War II, the interior (the work of Sir James Thornhill and Grinling Gibbons) was redecorated. In the church are buried Gen. James Wolfe and Thomas Tallis the musician (d. 1585). Gibbons' work may also be seen at Morden college, originally an almshouse for "decayed Turkey merchants," built by Sir Christopher Wren about 1695. Other noteworthy buildings are the town hall, built of brick in a modern style, opened in 1939; the Ranger's house, originally the home of Lord Chesterfield (c. 1750); the Paragon (*c.* 1790); the Manor house (*c.* 1700); the Presbytery (*c.* 1630); and Charlton



COMBINE PHOTOS

ROYAL NAVAL COLLEGE, GREENWICH. THE QUEEN ANNE BUILDING

house (1612), the largest Jacobean building in London.

The most notable group of buildings is that formed by the Royal Naval college, the National Maritime museum and the Royal observatory. In 1423 Humphrey, duke of Gloucester, purchased the manor of Greenwich, enclosed what was later the park (185 ac.) and built a watchtower on the site of the present observatory. On his death the manor reverted to the crown, so that tenure of land from the crown "as of the manor of East Greenwich" became a formula in American colonial charters from that of Virginia in 1606. Humphrey also built a house named Placentia which was extended by the Tudor sovereigns into a royal palace running along the river bank. It was a favourite residence of Henry VIII (who was born there). He added a banqueting hall, armoury and tilt yard. There he married Catherine of Aragon, Anne Boleyn and Anne of Cleves; and his daughters Mary and Elizabeth were born there. Though James I did not use the palace he commissioned Inigo Jones to build the Queen's house, completed for Henrietta Maria in 1637; it was the first building in the Palladian style in Britain. After being used as the residence of the ranger of Greenwich park, the house was converted into a naval school in 1806 and the two wings joined to the original building by colonnades were added. In 1937, four years after the school had left, these were opened as the National Maritime museum.

The Tudor palace having fallen into disrepair, Charles II commissioned John Webb to design a new palace, of which only the present King Charles block mas built. In 1694, as a thank offering for the naval victory at La Hogue, William and Mary asked Wren to convert this into a naval hospital on the pattern of Chelsea hospital for soldiers. Wren had already built the observatory on the site of Humphrey's tower in 1675. He then designed the largest twin-domed baroque building in England, to accommodate 2,700 pensioners. Sir John Vanbrugh and Hawksmoor were responsible for the construction of the building, which was opened in 1705. The frescoes in the Painted hall were completed by Thornhill in 1726; the decoration of the present chapel (dating from 1789) is the work of James Stuart and William Newton, the original chapel having been burned in 1779. In 1873 the hospital was converted into the Royal Naval college, the infirmary (built by Stuart in 1764) being granted to the Seamen's Hospital society.

Astronomical work at the observatory began to be transferred in 1948 to Hurstmonceux (*q.v.*); but the public dial showing civil time and the prime meridian mark, from which all countries have reckoned longitude since 1884, can still be seen.

Two inns on the water front, the Ship and the Trafalgar, were famous in the 19th century for whitebait dinners. The former was bombed and its site is now occupied by the "Cutty Sark" clipper, preserved as a tribute to the merchant service in the days of sail. (C. C. L.)

GREENWICH, a township of southwestern Connecticut, U.S., and a prosperous suburb of New York city which is 28 mi. S.W., has been called the gateway to New England. Founded on Long Island sound in 1640 by the New Haven colony agents Robert Feaks and Capt. Daniel Patrick, who purchased land from four sachems for 25 English coats, it soon came under Dutch rule and finally, in 1650: under Connecticut's jurisdiction. During the American Revolution British troops under Gen. William Tryon overran Greenwich and looted freely. In organizing the town's defense Gen. Israel Putnam narrowly escaped capture by galloping down a precipice. After the war the little port town resumed its steady growth, reaching 3,790 in 1820, 6,522 in 1860, over 12,000 in 1900 and 40,835 in 1950; the population was 53,793 in 1960. (For comparative population figures *see* table in CONNECTICUT: *Population.)*

Greenwich capitalized upon its convenient location for commuters to New York city and is noted for its woods and hills rising gently from six miles of attractive coast line. Industries include the manufacture of marine engines, electrical generators, pumps, boats and sails, industrial felt, precision instruments, small castings, machine tools and magazine printing. Under strict zoning since 1927, the town has fine residential areas and high-ranking public and private schools. There are two large public libraries and a museum. Many authors and artists reside in the town. Public recreational facilities include three municipal beaches. over 400 ac. of parks, 300 mi. of bridle paths and a nature preserve. In 1933 the town adopted a representative town-meeting system of government. (A. E. V. D.)

GREENWOOD, FREDERICK (1830–1909), an English journalist and man of letters, was born in London. In 1862, when Thackeray resigned the editorship of the *Cornhill,* Greenwood became joint editor with G. H. Lewes. In 1864 he was appointed sole editor, a post which he held until 1868. Greenwood then conceived the idea of an evening newspaper, which, in addition to the news, should contain authoritative and impartial articles by outside contributors on literature, art and public affairs. Canning's *Anti-Jacobin* and the *Saturday Review* of 1864 were the joint models he had before him. The idea was taken up by George Smith, and the *Pall Mall Gazette* mas launched in Feb. 1865, with Greenwood as editor. Within a few years he had come to exercise a great influence on public affairs. His views ripened from what mas described as philosophic Liberalism into Conservatism. It was on the suggestion of Greenwood that Beaconsfield purchased in 1875 the Suez canal shares of the Khedive Ismail. It was characteristic of Greenwood that he declined to publish the news of the purchase of the shares in the *Pall Mall* before the official announcement was made.

Early in 1880 the *Pall Mall* changed owners, and the new proprietor required it to support Liberal policy. Greenwood at once resigned his editorship, but in May a new paper, the *St. James's Gazette,* was started for him by Henry Hucks Gibbs (afterward Lord Aldenham), and in the new paper Greenwood was a pungent critic of the Gladstone administration (1880–85) and an independent supporter of Lord Salisbury. His connection with the *St. James's Gazette* ceased in Aug. 1888, when the paper changed hands. The *Anti-Jacobin,* which he started in 1891, lasted for only a year. Toward the end of his life his political views reverted in some respects to the Liberalism of his early days. He died at Sydenham on Dec. 14, 1909.

GREENWOOD, JOHN (d. 1593), English Puritan and Separatist (the date and place of his birth are unknown), was educated at Corpus Christi college, Cambridge. By 1586 he mas the recognized leader of the London Separatists, many of whom had been imprisoned at various times since 1567. Greenwood was arrested early in Oct. 1586, and the following May mas committed to the Fleet prison. During his imprisonment he wrote some controversial tracts in conjunction with his fellow-prisoner Henry Barrowe. He was certainly at large in Sept. 1592, when he was elected "teacher" of the Separatist church. Meanwhile he had written (1590) "An Answer to George Gifford's pretended Defence of Read Prayers." On Dec. 5 he was again arrested; and the following March was tried, together with Barrowe, and condemned to death on a charge of "devising and circulating seditious books." After two respites, one at the foot of the gallows, he was hanged on April 6, 1593.

See B. Brook, *Lives of the Puritans* (1813) ; H. M. Dexter, *The Congregationalism of the Last Three Hundred years* (1880) and *The England and Holland of the Pilgrims* (1905) ; F. J. Powicke, *Henry Barrow and the Exiled Church of Amsterdam* (1900).

GREENWOOD, in northwest Mississippi. U.S., 100 mi. N. of Jackson and 134 mi. S. of Memphis, Tenn., is the largest city between those two points and is the seat of Leflore county. In 1834 John Williams traveled up the Yazoo river and settled close to the junction of the Tallahatchie and Yalobusha rivers. That place soon became an important shipping point for cotton on its may down the Yazoo and the Mississippi rivers to New Orleans. Williams' Landing was incorporated as a city in 1844 under the name of the last great Choctaw chieftain, Greenwood Leflore, who was a wealthy cotton planter and slaveholder. Greenwood is a Mississippi delta community where Negroes and nhites live in approximately equal numbers. (For comparative population figures *see* table in MISSISSIPPI: *Population.)* Primarily a trading centre, Greenwood is the home of diverse industries and it has grain elevators with a total storage capacity of almost 1,000,000 bu.

(E. H. Hs.)

GREETING CARD, an illustrated message that expresses, either seriously or humorously, affection, good will, gratitude, sympathy or other sentiments. Greeting cards are usually sent by mail in observance of a special day or event and can be divided into two general classifications, seasonal and everyday. Seasonal cards include those for Christmas, New Year's day, St. Valentine's day, St. Patrick's day, Easter, Mother's day, Father's day, graduation. Halloween and Thanksgiving day. Everyday cards include those commemorating birthdays, anniversaries. births or religious occasions, and cards of condolence. congratulations or friendship. as well as get-well cards, gift cards, *bon voyage* cards and thank-you cards.

The exchange of greeting cards in the United States is on a scale far beyond that in any other country although all English-speaking countries practise the custom to some degree and its popularity is growing in European and South American countries. In the latter 1950s nearly 300 greeting-card publishers in the U.S. annually produced about 5,000,000,000 cards having a wholesale value of about $275,000,000—a sixfold increase in volume in two decades. Approximately half of the total were Christmas cards; one-fourth were cards for other seasonal occasions; and one-fourth for everyday occasions. About $150 000,000 was expended annually for postage stamps on greeting cards.

Greeting cards are usually of stiff paper or cardboard but some are made of cloth, leather, Celluloid, vellum, metal and even wood, clay, cork or other materials. Size is determined by common usage, the availability of suitable envelopes, ease of mailing and the system of grading according to price and quality. Extreme exceptions are an inscribed grain of rice presented in 1929 as a Christmas greeting to the prince of Wales and a Christmas card sent to Pres. Calvin Coolidge in 1924 that was 21 × 33 in. The imprinted messages on cards may vary in length from a brief word or two to 100 words or more in prose or verse.

The exchange of illustrated greetings among friends dates from ancient times. In Egypt the new year was celebrated by the exchange of symbolic presents, such as scent bottles and scarabs inscribed *au ab nab* ("all good luck"). The Romans exchanged *strenae,* originally branches of laurel or olive, frequently coated with gold leaf. Symbols of seasonal good will, such as a Roman lamp impressed with the figure of Victory surrounded by *strenae,* were inscribed *Anno novo faustum felix tibi sit* ("May the new year be happy and lucky for you"). The acknowledgment of the new year with exchanges of good will continued in Europe through the early days of Christianity. In the 15th century master wood engravers produced inscribed prints which had the same intent as the modern Christmas and New Year's cards. One of these, by Master E. S., shows the Christ child with halo before a cross and holding a scroll on which appears *Ein guot selig ior* ("A good and happy year"). During the 18th and early 19th centuries copperplate engravers were producing prints and calendars for the new year, and greetings by organizations, merchants and tradesmen were common.

The valentine is also regarded as a forerunner of the greeting card. Its history is related to pre-Christian Rome when boys drew the names of girls from a love urn on the feast of the Lupercalia, Feb. 15. The custom was introduced to England by the Romans and continued through the Christian era. In order to adapt the practice to Christianity the church transferred it to the feast of St. Valentine, a bishop of Rome who was martyred on

Feb. 14, 270. The paper valentine with inscribed sentiment dates from the 16th century and the first printed valentine may have been the frontispiece of *A Valentine Writer*, a book of verses that offered assistance to the inarticulate and was issued as early as 1669. By 1800 hand-painted copperplates by such artists as Francesco Bartolozzi were in demand. These were followed by woodcuts and lithographs, all in quarto size, some further embellished with an embossed frame. With the introduction of penny postage and envelopes in England in 1840 the exchange of valentines increased and the use of lace paper, delicately ornamented, became popular. In the U.S. crude woodcut valentines were produced by Robert H. Elton and Thomas W. Strong of New York but gave way to the lace-paper delicacies imported from England. The less expensive creations of Esther Howland of Worcester, Mass., first appeared in 1850.

Recognized as the first Christmas card is one designed in England by J. C. Horsley in 1843 for his friend Sir Henry Cole. An edition of 1,000 copies was placed on sale at Felix Summerly's Home Treasury office in London. It was printed by lithography on stiff cardboard, $5\frac{1}{8} \times 3\frac{1}{4}$ in., in dark sepia and hand coloured. The design shows a family party in progress, beneath which is the greeting, "A Merry Christmas and a Happy New Year to You." Inside panels, formed by a rustic trellis, are representations of Christmas charity. A similar card was designed by W. M. Egley and produced as an etching in 1848. While this card is more elaborate its design suggests a relationship to the Cole-Horsley card. The same may be said of a U.S. Christmas card of the same period designed by R. H. Pease of Albany, N.Y., which bore the inscription, "Pease's Great Varety Store in the Temple of Fancy." Sentiment cards (approximately $3 \times 1\frac{1}{2}$ in.) were also exchanged and collected in the U.S. from 1830 to the Civil War period and many have survived, among them an "expanding heart" Christmas present or greeting card in purse form dating from about 1850, which may be one of the first U.S. Christmas cards.

Greeting-card production in commercial quantities started in 1860, the first offerings being valentines with applied Christmas ornaments and verses. These were followed by embossed or lithographed letter sheets and envelopes in multiple colours with matching cards. The latter were actually visiting cards with holiday sentiments, similar to the sentiment cards so popular earlier in the U.S. Visiting cards, which date in Europe from the 16th century, had long been used also to carry messages of affection, respect or condolence. A card with its corner bent gave the comforting assurance of personal interest. Early commercial greeting cards bore illuminations copied from manuscripts in the British museum. There were also small cards with embossed frames, similar to the visiting cards but bearing illustrations of robins and children. These were issued in sets of six and were collected and mounted in albums or scrapbooks. The cards also appeared in booklet form, attached to make a strip.

The colourful printed card ran a parallel course with the lace-paper valentine. One of the English publishers, Marcus Ward & Co., employed Kate Greenaway as a designer. Her productions, in sets of from two to six, were used for more than one occasion, the same designs being frequently used for Christmas, New Year's day, St. Valentine's day, birthday and everyday. Some of the designs appeared as book illustrations and others were used in annual four-subject calendars.

Louis Prang of Boston is called the "father of the American Christmas card." He started with sets of album cards (flora, birds, animals, etc.) and continued with Civil War scenes by Winslow Homer. He also printed advertising and visiting cards with floral designs and in 1875 added seasonal greetings. These were an immediate success. Prang cards were among the best in the market and were much admired abroad. He instituted design competitions in 1880, a practice continued later in England by Raphael Tuck and in the U.S. with Hallmark Cards Art awards. Prang's business flourished until 1895 when a decline of greeting-card production in England and the U.S. resulted from overwhelming competition from European printers whose product was so inexpensive that it could not be ignored. Cards were delivered in blank form and sentiments were applied by local printers, the same design being used for several purposes. From 1900 to World War I the greeting-card business was practically a German monopoly.

The U.S.-made greeting card reasserted itself about 1910 and was given enormous impetus by World War I with its resultant increase in transiency, a situation that was repeated during World War II. In the intervening years the custom of exchanging cards on both seasonal and everyday occasions became firmly established in the United States. U.S. greeting-card manufacturers also assumed world leadership during this period and brought many innovations to the design and manufacture of cards in the realm of novelties, animation, three-dimensional effects and visual and sound effects.

In the period after World War II, a new type of humorous greeting, usually called "studio" or "contemporary" cards, was popularized. The cards are distinguished mainly by the line drawings in modern art style with which they are illustrated and a brittle, ludicrous type of humour. Although humour from the beginning has gone hand in hand with sentiment as a greeting-card theme, studio cards constitute the most important single development in the field in recent times. They are thought to have originated in Greenwich Village art studios but their distribution spread through retail outlets in all parts of the U.S. and even abroad. While it is estimated that 80% of all greeting cards were formerly sent by women, the advent of the studio card has drawn an increasing number of men to the practice of exchanging cards.

Traditional greeting cards retained their lead in popularity, however, and serious sentiments continued to outsell the humorous. A shopper engaged in the selection of a greeting card at the stationery counter of a retail store may have as many as 1,000 different cards from which to choose. Foreign-language cards are produced for both domestic use and for export in a dozen languages. Fine art from both old masters and contemporary artists is reproduced on Christmas cards in increasing volume, and both original art and written sentiments are frequently commissioned by U.S. manufacturers from well-known artists and writers.

GREGOIRE, HENRI (1750–1831), French revolutionist and constitutional bishop of Blois, son of a peasant, was born at Vého near Lunéville, on Dec. 4, 1750. Educated at the Jesuit college at Nancy, he became curé of Embermenil and a teacher at the Jesuit school at Pont-à-Mousson. In 1783 he was crowned by the academy of Nancy for his *Éloge de la poésie,* and in 1788 by that of Metz for an *Essai sur la régénération physique et morale des Juifs.* He was elected in 1789 by the clergy of the bailliage of Nancy to the states-general, where he became conspicuous in the group of deputies of Jansenist or Gallican sympathies who supported the Revolution. He presided at the permanent sitting of 62 hours while the Bastille was being attacked by the people, and made a vehement speech against the enemies of the nation. He subsequently took a leading share in the abolition of the privileges of the nobles and the church. Under the new civil constitution of the clergy, to which he was the first priest to take the oath (Dec. 27, 1790), he was elected bishop by two *départements.* He selected that of Loire-et-Cher, taking the old title of bishop of Blois, and for ten years (1791–1801) ruled his diocese with exemplary zeal. In the first session of the National Convention (Sept. 21, 1792) he proposed the abolition of the kingship, asserting that "kings are in the moral order what monsters are in the natural." On Nov. 15 he demanded the king's trial, and was elected president of the Convention. During the trial of Louis XVI, being absent on a mission for the union of Savoy to France, he wrote a letter urging the condemnation of the king, but omitting the words *à mort;* and later proposed in the Convention that the penalty of death should be suspended.

When on Nov. 7, 1793, Gobel, bishop of Paris, resigned his episcopal office at the bar of the Convention, Grégoire refused to abjure either his religion or his office. His courage won the day and the hubbub subsided in cries of "Let Grégoire have his way!" Throughout the Reign of Terror. in spite of attacks in the Convention and in the press. he appeared in the streets in his episcopal dress and daily read mass in his house. Xfter Robespierre's fall he spoke in support of the reopening of the churches on Dec. 21, 1794. He initiated measures for restraining vandalistic fury against monuments of art, and devoted his attention to the reorganization of the public libraries and technical education. On the establishment of the new constitution. Grégoire was elected to the council of 500, and after the 18th Brumaire he became a member of the corps législatif, then of the senate (1801). He took the lead in the national church councils of 1797 and 1801, but was opposed to Napoleon's policy of reconciliation with the Holy See, and after the signature of the concordat he resigned his bishopric (Oct. 8, 1801). He voted with the minority in the senate against the proclamation of the empire, but he was subsequently created a count of the empire and officer of the Legion of Honour. During the later years of Napoleon's reign he traveled in England and Germany. but returned in 1814 and was concerned in the overthrow of the empire.

Grégoire, as a revolutionist and a schismatic bishop. was an object of double loathing to the clerical and ultraroyalist faction. He was expelled from the institute and forced into retirement. but his influence was still felt and feared. His work, *De la constitution française de l'an 1814* (1814), in which he commented on the charter from a Liberal point of view. reached its fourth edition in 1819. In that year he was elected to the lower chamber by the *département* of Isère. By the powers of the quadruple alliance this event was regarded as of the most sinister omen, and the question was even raised of a fresh armed intervention in France under the terms of the secret treaty of Aix-la-Chapelle. Louis XVIII decided on a modification of the franchise: the Dessolle ministry resigned; and the first act of Decazes. the new premier, was to carry a vote in the chamber annulling the election of Grégoire. From this time onward the ex-bishop lived in retirement, occupying himself in literary pursuits. He died on May 20, 1831.

Besides several political pamphlets. Grégoire was the author of *Histoire des sectes religieuses, depuis le commencement du siècle dernier jusqu'à l'époque actuelle* (2 vol.. 1810); *Essai historique sur les libertés de l'église gallicane* (1818): *De l'influence du Christianisme sur la condition des femmes* (1821); *Histoire des confesseurs des empereurs, des rois, et d'autres princes* (1824); *Histoire du mariage des prêtres en France* (1326). *Grégoireana, ou résumé général de la conduite, des actions, et des écrits de M. le comte Henri Grégoire,* preceded by a biographical notice by Cousin d'Avalon, was published in 1821; and the *Memoires . . . de Grégoire,* with a biographical notice by H. Carnot, appeared in 1837 (2 vol.).

GREGORAS, NICEPHORUS (*c.* 1290–1360), Byzantine scholar and statesman, was born at Heraclea in Pontus. He early settled in Constantinople in the household of his patron and teacher Theodore Metochites. He won the favour of Andronicus II. but was in disfavour for a short time when Andronicus n-as deposed by his grandson Andronicus III. On the elder Andronicus' death (1332) Nicephorus was again used in diplomatic missions and was appointed to treat with papal legates for the reunion of the Greek and Latin churches (1333). His reputation as a scholar stood high, and he publicly disputed with the Calahrian monk Barlaam. His opposition to the teaching of the hesychasts (*see* HESYCHASM), which was supported by Gregorius Palanias and by the emperor John VI Cantacuzenus. and recognized at the synod of 1351, brought him imprisonment in the monastery of the Chora in Constantinople. He was freed in 1355 by John V Palaeologus after John VI's abdication.

Nicephorus' many writings cover a wide range. The *Historia Romaike* ("Roman History"). which covers 1204 to 1359, supplements and continues the work oi George Pachymeres: it defends his point of view in the ecclesiastical controversy and is directed against John VI Cantacuzenus. His works include extensive correspondence; lives of his uncle John. metropolitan of Heraclea, and of various saints; funeral orations; and philosophical, scientific and literary treatises and commentaries. including suggestions for reforms in the calendar very similar to those introduced by Gregory XIII (1582).

GREGORIAN CALENDAR or NEW STYLE CALENDAR, the calendar substituted in March 1582 by Pope Gregory XIII for the ancient church calendar. which was founded on two erroneous suppositions. namely, that the year contains $365\frac{1}{4}$ days and that 23j lunations are exactly equal to 19 solar years. The Gregorian calendar was introduced into Spain. Portugal and part of Italy the same day as at Rome: France and Germany followed and it was subsequently adopted in almost all Christian countries. For the computation of the Greporian calendar *see* CALENDAR.

GREGORIAN MUSIC. The most famous division of the ecclesiastical monodic music of the early and medieval church, which is comprehensively known as plain song or plain chant. This is so called because of the part which Pope Gregory I (d. 604) took in reforming and standardizing it.

See GREGORY (SAINT GREGORY, surnamed the Great); MUSIC (sec 3): PLAINSONG.

GREGOROVIUS, FERDINAND (1821–1891), German historical writer best remembered for his history of Rome. was born at Niedenburg. Jan. 19. 1821. His work is the fruit of the fascination which Italy (his home during 1852–74) exerted upon him. His *Geschiclzte der Stadt Ront im Mittelalter* (8 vol.. 1859–72; Eng. trans., 1894–1900), is inaccurate in places and has been superseded. but retains value for its colour and vitality. He wrote a companion *Geschichte der Stadt Athen im Mittelalter* (2 vol., 1889) and planned a book on Jerusalem. Other works include *Wanderjahre in Italien* (j vol.. 1856–77) and *Lucrezia Borgia* (1874). He died in Munich. May 1, 1891.

See J. Honig, *Ferdinand Gregorovius,* 2nd ed. (1944).

GREGORY, SAINT, THE ILLUMINATOR (c. 260–330), the "Apostle of Armenia," the greatest though not the first missionary to his nation. and organizer of its distinctive national Christian tradition. Under his influence King Tiridates, formerly a persecutor. accepted Christianity and proclaimed Armenia a Christian nation about 303. Later legends confuse rather than clarify Gregory's reputation; they make him a Parthian noble, long imprisoned for the faith in a well by Tiridates, and connect him with an exiled Roman virgin, later martyr, Ripsime, and the (later) ecclesiastical centre of Armenia at Etchmiadzin. Gregory's church was in communion with the Greek Church through a special connection with the see of Caesarea, where he was consecrated to the episcopate, and it used Greek or Syriac, not yet Armenian, as its ecclesiastical language. But it possessed strong distinctive features, including a custom of hereditary succession in the episcopate which lasted for some time. Gregory's successor as *catholicos* (primate) was his son Aristakes. who took part in the Council of Nicaea in 325, and brought the Nicene creed to Armenia. Gregory is said to have died as a hermit some years later. His feast day is Sept. 30. *See* also ARMENIAN CHURCH.

BIBLIOGRAPHY.—A good account and discussion of sources may be found in Bardenhewer, *Geschichte der altkirchlichen Literatur,* vol. v, pp. 182–185 (1932). *See* also Butler-Thurston. *Lives of the Saints;* H. Gelzer, *Die Anfänge dev armenischen Kirche* (1895); M. Ormanian, *The Church of Armenia,* ch. 3–4, 2nd rev. ed. (1955). (E. R. HY.)

GREGORY, SAINT, OF NAZIANZUS (*c.* 329–*c.* 389), surnamed Theologus, one of the four great fathers of the Eastern Church. was born at or near Nazianzus, Cappadocia, where his father. also named Gregory. had lately become bishop. Xfter studying at the two Caesareas. Alexandria and Athens. he was induced by Basil (*q.v.*) to share his religious seclusion in Pontus, and there prepared the *Philokalia,* a sort of chrestomathy compiled with Basil's help from the writings of Origen. Gregory was ordained about 361, and though made bishop of Sasima, a small village near Tyana. about 372, he seems to have lived at Nazianzus, assisting his aged father, upon whose death (374) he retired to Seleucia in Isauria for some years. Toward 378–379 the small remnant of the orthodox party in Constantinople requested him to undertake the resuscitation of their cause, so long borne down by the Arians. His success was immediate, the famous five discourses on the Trinity delivered there earning for him the distinctive appellation of *theologus*. With the arrival of Theodosius in 380 came the visible triumph of the orthodox cause. The metropolitan see was then conferred upon Gregory, and after the assembling of the second ecumenical council in 381 he received consecration from Meletius. In consequence, however, of a spirit of discord which appeared at his promotion, he soon resigned his dignity and withdrew into retirement. The rest of his days were spent partly at Nazianzus in ecclesiastical affairs, and partly on his neighbouring patrimonial estate at Arianzus. His festival is celebrated in the Greek Church on Jan. 25, and in the western on May 9.

Gregory's extant works, which consist of poems, epistles and orations, were published by Hervagius (1550); by Billius (1609, 1611); by Caillau (1840) and by Migne in *Patrol. Graec.*, vol. 35–38. The *Theological Orations* (ed. by A. J. Mason) appeared separately at Cambridge in 1899. Of the poems, which include epigrams, elegies and an autobiographical sketch, the *editio princeps* is that of Aldus (1504). Partial English translations were made by Drant (1568), by Boyd (1836) and by Newman. A translation of selected orations and letters appeared in *Tlze Library of Nicene Fathers*, vol. 7.

Grégoire de Nazianze* (1911) and H. Pinault, *Le Platonisme de S. Grégoire de Nazianze* (192j); full bibliography in Herzog's *Realencyk.*

GREGORY, SAINT, OF NYSSA (*c.* 331–*c.* 396), one of the four great fathers of the Eastern Church, and younger brother of Basil the Great. was born probably at Neocaesarea. In 371 or 372 he was ordained by Basil to the bishopric of Nyssa, a small town in Cappadocia, and there parted from his wife Theosebia. who became a deaconess. His strict orthodoxy concerning the Trinity and the Incarnation made him peculiarly obnoxious to the Arians. and in 375 the synod of Ancyra, convened by Denietrius, the Arian governor of Pontus, condemned him for alleged irregularities in his election and in the administration of the finances of his diocese. In 376 he mas exiled! and did not return until the publication of the edict of Gratian in 378. Shortly afterward he took part in the synod which met at Antioch in Caria to consider the Meletian schism. At the council of Constantinople in 381. he was a conspicuous champion of orthodoxy, and in 382 he was commissioned to set in order the churches of Arabia: in connection with which mission he also visited Jerusalem. In 394 he mas present at the synod held in Constantinople under the presidency of Nectarius to settle ecclesiastical disorders in Arabia. The exact date of Gregory's death is unknown. His festival is observed by the Greek Church on Jan. ro, and by the west on March 9.

Gregory of Nyssa was not so able an administrator as his brother Basil, nor so magnificent an orator as Gregory of Nazianzus, but he excelled them both as a speculative and constructive theologian. His teaching. though strictly trinitarian. shows considerable freedom, and in many points, affinities with Origen, as in his Christology and his doctrine of final restoration.

Gregory's numerous works may be classified under five heads: (1) Treatises in doctrinal and polemical theology: the most important of which are that *Against Eunomius,* which defends the Nicene creed against Xrianism and vindicates the character of Basil: the *Catechetical Oration* in defense of Christianity against pagans and Jews; *On Faith,* against the Arians; *On Common Notions,* in explanation of the terms in current employment with regard to the Trinity; *Ten Syllogisms,* against the Manichaeans; *To Theophilus,* against the Apollinarians; *Against Fate* and *De anima ct resurrectione.* (2) Practical treatises! including the tracts *On Virginity* and *On Pilgrimages* and the *Canonical Epistle* upon the rules of penance. (3) Expository and homiletical works, including the *Hexaëmeron,* and the discourses On *the Creation* of *Man, On the Titles of the Psalms, On the Sixth Psalm, On Ecclesiastes.* (4) Biographical, consisting chiefly of funeral orations. (5) Letters.

The works were edited by Fronton le Duc (1615, 1618 and 1638), by Migne, *Patrol. Graec.*, vol. 44–46 and by W. Jaeear (1921 *et seq.*). G. *H.* Forbes edited the *Hexaemeron* and the *De opificio hominis* (1855 and 1861), and F. Oehler the *Opera dogmatica* (1865). There have been numerous editions of single treatises, *e.g.*, the *Oratio catechetica* (J. *G.* Krabinger, 1838; J. H. Srawley, 1903), and Eng. trans. of the Letters and select works in *The Library of Nicene Fathers,* vol. 5 (1893). Monographs cited in Hauck-Herzog's *Realencyk.* vii.

GREGORY, SAINT, OF TOURS (538–594), historian of the Franks, was born in the chief city of the Arverni (the modern Clermont-Ferrand) on Nov. 30, 538. His real name was Georgius Florentius. but he was called Gregory after his maternal great-grandfather, the bishop of Langres. Gregory belonged to an illustrious senatorial family, many of whose members held high office in the church and bear honoured names in the history of Christianity.

His father having died while Gregory was still young, the boy was taken to Clermont-Ferrand to be brought up by his uncle Gallus and by his successor, Avitus, and there he received his education. Among profane authors he read the first six books of the *Aeneid* and Sallust's history of the Catiline conspiracy, but his education mas mainly religious. The principles of religion he learned from the Bible, Sulpicius Severus and some lives of saints, but to patristic literature and the subtleties of theology he remained a stranger. In 563. at the age of 25, he was ordained deacon. Falling seriously ill. he went to Tours to seek a cure at the tomb of St. Martin. At Tours he lived with Euphronius, and so great was the young man's popularity that, on the death of Euphronius in 573, the people unanimously designated him bishop.

At that time Tours belonged to Austrasia, and Ring Sigebert hastened to confirm Gregory's election. After the assassination of Sigebert (575), the province mas ruled by Chilperic for nine years. during which period Gregory displayed the greatest energy in protecting his town and church from the Frankish king. He had to contend with Count Leudast, the governor of Tours; despite all the king's threats, he refused to give up Chilperic's son Merovech, who had sought refuge from his father's wrath at the sanctuary of St. Martin; and he defended Bishop Pretextatus against Chilperic, by whom he had been condemned for blessing the marriage of Merovech and hlerovech's step-aunt. Queen Brunhilda. In 580 Gregory was himself accused before a council at Berny of using abusive language against Queen Fredegund, but he cleared himself of the charge by an oath and was acquitted. On the death of Chilperic, Tours remained for two years (584–85) in the hands of Guntram, but when Guntram adopted his nephew Childebert, Sigebert's son, it again became Xustrasian. This change was welcome to Gregory, who often visited the court. In 586 he was at Coblenz, and on his return to Yvois (the modern Carignan) visited the stylite Wulfilaic; in 588 one hears of him at Rletz and also at Chalon-sur-Saône, where he was sent to obtain from King Guntram the ratification of the pact of Andelot; in 593 he was at Orleans, where Childebert had just succeeded his uncle Guntram. In the intervals of these journeys he governed Tours with great firmness, repressing disorders and reducing the monks and nuns to obedience. He died in 594, on Nov. 17, which is kept as his feast day.

Gregory left many writings, of which he himself gives an enumeration at the end of his *Historia Francorum.* He mentions here ten books of history, which are discussed below; seven books of miracles, which are divided into the *De gloria martyrum,* the *De virtutibus sancti Juliani,* four books of *Miracula sancti Martini,* and the *De gloria confessorum,* the last dealing mainly with confessors who had dwelt in the cities of Tours and Clermont; a *Vitae patrum* which consists of biographies of bishops, abbots and hermits belonging to Gaul; a commentary on the Psalms which is lost, except for the preface and the titles of the chapters; and a treatise *De cursibus ecclesiasticis,* discovered in 1853, which is a liturgical manual for determining the hour of divers nocturnal offices by the position of the stars.

Gregory also wrote the oldest extant Latin version of the story of the Seven Sleepers of Ephesus (*q.v.*), probably taken from a Syriac source.

His most important work, however, is the *Historia Francorum*, which is divided into three parts. The first four books, which were composed at one time, cover the period from the creation of the world to the death of Sigebert in 575. The first book, which is a mere compilation from the chronicles of St. Jerome and Orosius, is of no value. The second book, from 397 to 511, deals with the invasions of the Franks, and is based on the histories of Sulpicius Alexander and Renatus Profuturus Frigeridus, now lost; on the catalogues of the bishops of Clermont and Tours; on some lives of saints, *e.g.*, Remigius and Maxentius, now lost; on the annals of Arles and Angers, now lost; and on legends, either collected by Gregory himself from oral tradition, or cantilenes or epics written in the Latin and Germanic languages. In the third and fourth books the earlier part is based on materials collected from men older than himself; of the later events he was himself an eyewitness. The fifth and sixth books, up to the death of Chilperic (584), deal with matters within his own experience. The first six books are often separate in the manuscripts; and it was these alone that were used by the chronicler Fredegarius in his abridgment of Gregory's history. To the first six books Gregory subsequently added chapters on the bishops Salonius and Sagittarius, and on his quarrels with Felix of Nantes. The authenticity of these chapters has been undeservedly attacked by Roman Catholic writers. Books vii to x, from 584 to 591, were written in the form of a diary; of each important event, as it occurred, he inserted an account in his book. The last six books are of great historical value.

Gregory was at great pains to be an impartial writer, but in this he was not always successful. His devotion to Austrasia made him very bitter against, and perhaps unjust to, the sovereigns of Neustria, Chilperic and Fredegund. As an orthodox Christian, he had no good word for the Arians. He excuses the crimes of kings who protected the church, such as Clovis, Clotaire I and Guntram, but had no mercy for those who violated ecclesiastical privileges. This attitude, no doubt. explains his hatred for Chilperic. But if Gregory's historical judgments are suspect, he at least concealed nothing and invented nothing; and his judgments can be corrected by his own narrative. (C. PF.)

BIBLIOGRAPHY.—T. Ruinart brought out a complete edition of Gregory's works in 1699; reprinted in J. P. Migne, *Patrologia Latina*, vol. 71. The first critical edition is that of W. Arndt and B. Krusch in vol. i (1885) of *Monumenta Germaniae historica, scriptores rerum Merovingicarum;* 2nd ed. by B. Krusch and W. Levison of the *Historia Francorum*, in *op. cit.* (1951). English translation of the *Historia*, with notes and introduction, by O. M. Dalton (z vol., 1927). Gregory's hagiographic works were published by H. Bordier in the *Société de l'histoire de France, 4* vol., with French translation (1857–64). *See* also J. W. Löbell, *Gregor von Tours und seine Zeit*, 2nd ed. (1868); Max Bonnet, *Le Latin de Grégoire de Tours* (1890); B. Krusch, "Die handschriftliche Grundlagen der Historia Francorum Gregors von Tours," in *Historische Vierteljahrschrift*, xxvii (1932) and "Eine neue Handschrift der Miracula Gregors von Tours" in *Neues Archiv*, i (1933); Allan Temko, "Le Roi, l'Évêque et le Juif," in *Evidences*, a.6, no. 45 (1955); P. F. Fournier, "La persistance du gaulois au VI^e siècle d'apres Gregoire de Tours," in *Recueil de travaux offert à M. Clovis Brunel*, vol. i, pp. 448–53 (1955). (F. J. WE.)

GREGORY, the name of 16 popes and one antipope.

GREGORY I THE GREAT, SAINT (*c.* 540–604), pope from 590 to 604, one of the four greater Doctors of the Western Church, was born in Rome of a patrician family that had already given one pope to the church. In j73 he appears to have been holding the imperial office of prefect of Rome. Feeling drawn to the religious life, he resigned his post and allocated his estates to the endowment of six new monasteries in Sicily and of one, the famous abbey of St. Andrew (which he established in his family residence on the Clivus Scauri, now the Coelian hill), in Rome. Here he himself withdrew to live as a monk according to the Benedictine rule. He was dragged unwillingly from this retirement by Pelagius II, who made him a deacon and. in 579, dispatched him as *apocrisiarius* (resident ambassador) to the imperial court in Constantinople. After some years there, he returned to his monastery on the Coelian to live as a member of the community, apparently declining to accept the abbacy. In 590 Pelagius II died of the plague, and the clergy and people unanimously chose Gregory as his successor. He tried to escape the office by petitioning the emperor not to ratify the election; but his letter was intercepted by the prefect of the city, and he was consecrated on Sept. 3, 590. He never ceased to regret the lost tranquillity of the monastic life.

Gregory ascended the papal throne at a critical time. Gregory of Tours, a contemporary observer, described the panic atmosphere prevailing in Rome at the time of the election. The disaster of floods, followed by plague, was darkened by the Lombard peril at the gates. The exarch of Ravenna had insufficient forces at his disposal to give protection. In this crisis, Gregory took command and stepped into the place which the imperial power had abdicated. He assumed control of the militia, repaired the walls and aqueducts and fed the starving populace from the granaries of the church. The Lombard king Agilulf, advancing to lay siege to Rome, was bought off (593). and in 598 Gregory concluded an independent peace with him. Having delivered the Italian churches from the ravages of the Lombards, Gregory placed the temporal prosperity of the Roman Church on a firm basis by a re-organization of the vast estates in Italy, Sicily and Gaul which constituted the patrimony of St. Peter. Through his efforts, the papacy emerged as a great political and social power.

In the administration of the Roman Church and of the suburbican province, extending from Tuscany to Sicily, of which the pope was metropolitan, Gregory showed himself from the outset a strict disciplinarian. Clerical celibacy was enforced, offending prelates were deposed. and the canonical election of bishops was safeguarded by the scrutiny of papal visitors. Each year the bishops of the suburbican province were obliged to attend a provincial synod at Rome. Only the Sicilian hierarchy were excused on account of distance and allowed to meet under their own arrangements.

In the Western Church as a whole, Gregory's activity tended to extend the prestige and authority of the Roman see: Rome, threshold of the Apostles, was by divine right "head of all the churches"; and the decrees of councils would have no binding force "without the authority and consent of the Apostolic See." In Africa. he intervened with the imperial exarch to prevent the spread of Donatism and to maintain the Numidian bishops' right of appeal to Rome. He worked, though with limited success, to arrest simony and the laicization of the church in Gaul. He congratulated the Visigothic king of Spain on his conversion from Arianism and dispatched the pallium to Bishop Leander of Seville. Of his missionary enterprises, the most important was the dispatch of Augustine, prior of his own monastery of St. Andrew, to the heathen English in 596. After receiving a report that the mission had opened with spectacular success and that more than 10,000 of the English had been baptized on Christmas day, 597, Gregory sent reinforcements led by Mellitus and Paulinus. In 601 he conferred the pallium on Augustine, associating with it for the first time the right to create new episcopal sees.

An important feature of Gregory's work was his endeavour to spread the Benedictine rule, which he regarded as the most nearly perfect pattern for the monastic life. His biography of St. Benedict (the second book of the *Dialogues)* enjoyed great popularity and did much to encourage devotion to the rule. Considering, however, that monastic life was not compatible with pastoral duties, he decreed that any monk who received an ecclesiastical cure should lose his place in the monastery.

Gregory's reputation as one of the four classical Doctors of the Western Church rests mainly on his homilies on Ezekiel and on the Gospels. his *Moralia in Job* and his *Liber Regulae Pastoralis*. The homilies were preached to the clergy and people of Rome. The commentary (*Moralia*) on Job, begun as a series of conferences for the monks who had accompanied him to Constantinople, was finished when he was pope. In theology a pupil of St. Augustine of Hippo. Gregory was a master of "spiritual" exegesis, and the *Moralia* exercised a lasting and pervasive influence on mediaeval Bible studies, both as a fundamental textbook of moral theology and as a methodology: taught by it, exegesis concerned itself above all else with the "typical" (allegorical) and moral senses of Scripture and gave scant attention to the literal meaning. The Liber Regulae Pastoralis, which expounds the qualities needful for the pastoral office, likeuise enjoyed a wide diffusion, being translated into Greek and later, by King Alfred, into West Saxon.

Gregory's name is associated also with the reshaping of the liturgy and chant of the church. His authorship of the Gregorian sacramentary and antiphonal has been disputed; but there seems to be no reason to doubt the statement of his 9th-century biographer, John the Deacon, that Gregory revised the Gelasian sacramentary. It was a copy of Gregory's revised sacramentary which Pope Adrian I dispatched to Charlemagne. Subsequent amendments, however, make it difficult to establish the authentic Gregorian text. Similarly the assertion of Ecgbert of York (732–766) that Gregory compiled an antiphonal for the cantors at Rome seems worthy of credit. Gregory died on March 12, 604, and was buried in the portico of St. Peter's. In the present basilica, his remains rest in the chapel of Clement VIII.

BIBLIOGRAPHY —St Gregory's works are printed from the Benedictine edition in J. P Migne, *Patrologia Latina,* lxxv-lxxix. English translations include: J. Bliss, *Morals on the Book of Job* (Oxford, 1844–50); J. McCann, *St. Benedict by St. Gregory the Great* (Oxford, 1941); H. Davis, *St Gregory the Great: the Pastoral Care* (London, Westminster, Md., 1950) Gregory's liturgical work is discussed by E. Bishop, *Liturgica Historica* (Oxford, 1918).

Martin, *Histoire de l'Église,* with bibliography; also E. Caspar, *Geschichte des Papsttums,* vol. ii (Tubingen, 1933).

GREGORY II, SAINT, pope from 715 to 731, succeeded Constantine I, whom he had accompanied to Constantinople in 710. To spread Christianity in Germany, Gregory gave special encouragement to the mission of St. Boniface, whom he consecrated bishop in 722. He was a staunch adherent of the eastern Roman empire, which still exercised sovereignty over Rome, Ravenna and some other parts of Italy, and he impeded as far as possible the progress of the Lombards. He came into conflict, however, with the emperor Leo III the Isaurian, c. 726, on account of the excessive taxation of the Italians and, later, on account of his iconoclastic edicts. Leo endeavoured to rid himself of the pope by violence, but Gregory, supported by the people of Rome and by the Lombards, eluded the emperor and died peacefully on Feb. 11, 731.

GREGORY III, SAINT, pope from 731 to 741, condemned the iconoclasts at a council convened at Rome in 731 and, as Gregory II had done, stimulated the missionary labours of St. Boniface, on whom he conferred the pallium. He was the first pope to appeal to the Franks for aid against the Lombard king Liutprand.

GREGORY IV, pope from 827 to 844, is chiefly remembered for his attempted mediation in the quarrels between Lothair and Louis the Pious. He supported Lothair against Louis, and his presence in Lothair's camp was responsible for the general desertion of the emperor on the Liigenfeld (Field of Lies, 833) The institution of the feast of All Saints is usually attributed to this pope. He died on Jan. 25, 844.

GREGORY V (Bruno of Carinthia), pope from 996 to 999, a great grandson of the emperor Otto the Great. Until the council of Pavia (997) his rival was the antipope John XVI, whom the people of Rome, in revolt against the choice of the youthful emperor Otto III, had chosen after having expelled Gregory. His most memorable acts were those arising out of the contumacy of the French king, Robert, who submitted after a sentence of excommunication. Gregory died suddenly, not without suspicion of foul play, in Feb. 999.

GREGORY VI (Johannes Gratianus), pope from 1045 to 1046. As archpriest of St. John before the Latin Gate, he had earned a reputation for learning and probity, and in 1045 he bought the pontificate from his unworthy godson Benedict IX, seemingly in order to save the papacy from worse scandals. At a council held by the emperor Henry III at Sutri in 1046, he was accused of simony, deposed and banished to Germany. He died in 1048.

GREGORY VII (HILDEBRAND), SAINT, pope from 1073 to 1085, was born at Soana in Tuscany. *c.* 1015–20. In early youth he went to Rome and was educated at the abbey of St. Mary on the Aventine and at the Lateran palace. The statement that he came of humble parents derives from hostile sources. His education at the Lateran, the favour and confidence shown him by successive popes, the fact that he had an uncle who was abbot of the aristocratic monastery of St. Mary on the Aventine and his own early advancement to the government of the famous house of St. Paul's Outside the Walls all point to an illustrious and powerful family connection. It has been argued with much probability that he belonged to the great Tusco-Roman family of Ildebrandi-Stefaneschi (Aldobrandeschi). It is likely that, while at St. Mary's. he took monastic vows, for his enemies later charged him with being a renegade monk. As papal chaplain, he followed the deposed pope, Gregory VI, to Germany (May 1047) and was treated at the German court with special regard. He returned to Rome in the train of Bishop Bruno of Toul, who became the great reforming pope Leo IX (1048–54). Leo appointed Hildebrand subdeacon of the Roman Church (a distinction made by some historians between Gregory's appointment to the subdeaconate and to the cardinalate is based on a misunderstanding: the terms "cardinal subdeacon" and "subdeacon of the Roman Church" are used interchangeably at this period for the same office) and guardian of the abbey of St. Paul's Outside the Walls, where he first displayed his reformatory zeal. Toward the end of the pontificate he was dispatched to France as legate in connection with the Berengarian controversy. Sent to Germany in 1057 to obtain ratification of the election of Stephen IX, he returned in time to play a leading part in the election of Nicholas II (1058). He was appointed archdeacon of the Roman Church (*i.e.,* head of the Roman clergy) by Nicholas in 1059; and during this pontificate and that of Alexander II (1061–73) he was the dominating personality in the curia.

On April 22, 1073, the day after Alexander's death, Hildebrand was elected pope and took the name of Gregory VII. The validity of Gregory's election has been impugned by some historians on the ground that the procedure did not conform to the electoral decree of 1059. The vote of the cardinals was preceded and possibly influenced by the acclamation of the people. Moreover, it is not clear that the cardinal bishops took the primary part assigned to them by the electoral law, although the official record is ambiguous on this point. Nevertheless, the election was not challenged at the time, and Hildebrand was carried to the papacy by unanimous agreement.

During his years in the curia, Gregory had absorbed the ideas concerning ecclesiastical reform advanced by such men as St. Peter Damiani and Humbert, cardinal bishop of Silva Candida; and he had seen the prestige and authority of the papacy raised to a new level by Leo IX and by Nicholas II. He thus brought to the papacy a deep sense of mission: he would exalt the primacy which belonged to the Roman see by divine right, and by this means he would reform the church in all its members. His doctrine of the primacy is summarized in the 27 propositions called *Dictatus Papae* (1075). These propounded the divine origin of the Holy See and defined the powers entrusted to it by God. the Roman pontiff alone is rightly called universal (ii); he alone can depose or absolve bishops (iii); it is granted to him to depose emperors (xii); no synod can be called general without his assent (xvi); the judgments of all are subject to his correction (xviii), but he is judged by none (xix); the Roman Church has never erred, and, as Scripture testifies, it shall not err for ever (xxii). Probably this much-debated document, inserted in the papal register at the time of the synod of 1075, was intended by Gregory to provide a schema for the canonists who were then undertaking the researches which, at the end of the pontificate, were to produce such great compilations as that of Anselm of Lucca.

Although in Gregory's view the *imperium* was subordinate to the sacerdotium, he did not envisage any conflict with the empire. He had inherited from Alexander the dispute with Henry IV over the appointment to the see of Milan, but the rebellion of Saxony in Aug. 1073 made Henry eager to come to terms with the new pope, and Gregory gladly grasped the opportunity of pursuing his reforms with the co-operation of the emperor. The Gregorian reforms were inaugurated by the Roman synod of Lent of 1074: clerks who had obtained any benefice by a simoniacal transaction were to be deprived; married clerks and those guilty of fornication were to be disqualified from exercising their sacred functions; and legates were appointed to execute this legislation. But the attempt to enforce the decrees met with stiff resistance from the German Church, while in France they were blocked by King Philip I, for whom the traffic in bishoprics was too lucrative to be surrendered without a struggle. This failure converted Gregory to a more radical policy, and he determined to strike at the root of the abuses, namely at the lay control of spiritual offices by means of investiture (see INVESTITURE). In the Roman synod of 1075, he suspended a number of recalcitrant German bishops and published an investiture decree forbidding ecclesiastics to receive any spiritual office from the hand of a layman.

The investiture decree made a struggle with the emperor inevitable, for the great ecclesiastical principalities formed one of the keystones in the structure of imperial government, and Henry jealously guarded his right to nominate and invest bishops who were mighty vassals as well as pastors of the church. The struggle broke out over the archbishopric of Milan, to which Henry nominated Tedald, ignoring the existence of the pope's nominee Atto. This challenge Gregory could not ignore. He demanded the withdrawal of Henry's candidate. But Henry, who had crushed the Saxon rebellion at Hohenburg (June 9, 1075), was now prepared for a trial of strength. A national assembly was hastily summoned to meet at Worms on Jan. 24, 1076, at which 24 German bishops and the archbishops of Mainz and Trier subscribed an act declaring Gregory deposed, and Henry invited the Romans to choose another pope. Imperial envoys crossed into Lombardy and procured a similar act of deposition from the Lombard bishops in the synod of Piacenza. These decisions were conveyed to the pope in the Lenten synod of 1076 by Roland of Parma. The message provoked such an outburst of anger in the assembly that the envoy's life was only saved by Gregory's personal intervention. On the following day Gregory read an act deposing Henry, releasing his subjects from their oaths of allegiance and declaring him excommunicate. So for the first time the 12th proposition of the *Dictatus Papae* was realized.

Events in Germany at first worked for Gregory. The news of the papal sentence caused a growing number of the bishops to desert Henry, and the feudal opposition seized the chance to attack the royal despotism. In a meeting at Tribur (Oct. 16, 1076) the princes discussed the election of another king, and it was agreed to invite the pope to preside at a national assembly at Augsburg, where Henry should face his accusers. It was in order to forestall this danger that Henry secretly crossed the Alps and made his famous appearance before the castle of Canossa, where the pope was staying, on Jan. 25, 1077. After Henry had waited barefoot outside the gates for three days, Gregory readmitted the penitent to the fold. By this timely repentance Henry saved his throne and threw his enemies into confusion. But the German princes were bent on the destruction of the Salian dynasty and proceeded to the election of Rudolph of Swabia as antiking (March 1077). Thus a civil war was unleashed on Germany from which the monarchy never completely recovered. Both sides invoked Gregory's judgment, but neither showed any eagerness to facilitate his entry into Germany. When at last both Henry and Rudolph had been induced to admit a legatine inquiry. the tide of war had turned in Henry's favour, and he prevented the requisite assembly from meeting. In these circumstances, in the synod of 1080, Gregory renewed the excommunication and deposition of Henry and acknowledged Rudolph to be king. Rudolph. however, was already beaten, and on Oct. 15, 1080, he was mortally wounded in battle. Henry's answer to the papal sentence was the council of imperial bishops at Brixen (June 25, 1080) which declared Gregory deposed and elected in his place Archbishop Guibert of Ravenna, who assumed the name of Clement III.

In the spring of 1081 Henry entered Italy in triumph. Gregory, foreseeing the worst, had fallen back on an alliance with the Norman freebooters of southern Italy (treaties of Ceprano, 1080). Henry's army appeared before Rome on May 21, 1081, and a series of sieges culminated in the fall of the city on March 21, 1084. Three days later the antipope Clement III was enthroned in the Lateran; and on Easter Sunday he crowned Henry as emperor. Gregory, still holding out in the castle of St. Angelo, was relieved by the unexpected arrival of his Norman allies under Robert Guiscard. This intervention enabled him to escape, and he retired to Salerno, where he died on May 25, 1085.

The Gregorian program of reform demanded for its success an increasing degree of centralization in the government of the church: the bonds between Rome and the local churches must be drawn tighter. This was achieved by the holding of synods (which, except in years of crisis, met annually at Rome) and by the extensive use of legates. The Roman synods brought together not only the suburbican clergy but also the clergy of distant provinces, as in 1075, for example, when the German bishops were summoned to attend. The synods were a means by which reformatory legislation was promulgated: thus the decrees relating to simony and clerical discipline. first published in the synod of 1074, were re-enacted in that of 1078; and the decree forbidding lay investiture, published in the synod of 1075, was re-enacted in the assemblies of 1078 and 1080—on. the last occasion with the extension of ecclesiastical sanctions to the lay donors of spiritual benefices as well as to the recipients. With the same purpose in view, Gregory greatly extended the use of legates: in addition to temporary ad *hoc* commissions, permanent legates or vicars apostolic were now appointed to a number of territories, a member of the local hierarchy often being selected. By these expedients Gregory endeavoured to ensure that his reformatory decrees were published and enforced. The increasing activity of papal legates tended inevitably to diminish the powers of primates and metropolitans, whose place at the head of provincial councils was often taken by a papal representative. A further link between the local churches and Rome was strengthened by Gregory's insistence that metropolitans should come in person to collect the pallium from the tomb of St. Peter.

Gregory's claim to feudal suzerainty over a number of territories stands apart from the question of spiritual obedience. It was not a novel claim, being based on a practice already well established, by which secular princes seeking the protection and favour of the Roman see offered their lands as fiefs to the papacy and became papal vassals. The princes of Norman Sicily. of Croatia-Dalmatia and of Kiev acknowledged Gregory's suzerainty in this way. By appealing to precedents Gregory also extended the temporal sovereignty of the papacy to Spain and to Hungary and attempted, though unsuccessfully, to extend it to England, which had been conquered under the papal banner.

Diplomatic studies on Gregory's Register have opened the way in recent times for a re-appraisal of his character and aims. The figure which emerges from the documents is not that of a power politician but that of a humble and deeply spiritual man, oppressed by the greatness of his task but drawing strength from a lively faith in God. A more worldly man would not have absolved Henry at Canossa and thrown away the hard-won advantages of two years. But Gregory was a pastor first and a statesman afterward. He did not live to see the conclusion of his work. His doctrine of papal theocracy was carried to its logical consummation by the great popes of the 13th century; but his most enduring achievement is to be found in the new standards of pastoral zeal and spirituality which, as a result of his reforms, gradually penetrated and transformed the whole church. Though Gregory was never formally canonized, his cult was authorized at Salerno by Paul V in 1609, and his feast was extended to the whole church in 1728.

BIBLIOGRAPHY.—Gregory's *Register* was edited by P. Jaffé, *Monumenta Gregoriana* (Berlin, 1865), and with critical apparatus by E. Caspar, "Das Register Gregors VII," in *Monumenta Germaniae Historic~: Epistolae Selectae*, ii (Berlin, 1920–23). Earlier work on Gregory is superseded by A. Fliche, *La Réforme grdgorienne*, 3 vol. (Louvain, 1924–37), and *La Réforme grégorienne et la reconquête chrétienne* (Paris, 1940), vol. viii of Fliche and V. Martin (eds.), *Histoire de l'Église*. *See* also J. Whitney, *Hildebrandine Essays* (Cambridge, 1932); H.-X. Arquillière, St. *Gre'goire VII* (Paris, 1934); monographs ed. by G. Borino, *Studi Gregoriani,* 3 vol. (Rome, 1947-48).

GREGORY VIII, antipope from 1118 to 1121, had been archbishop of Braga. Suspended by Paschal II in 1114 on account of a dispute with the Spanish primate and papal legate, the archbishop of Toledo, he went to Rome and regained favour to such an extent that he was employed by the pope on important legations. He opposed the extreme Hildebrandine policy, and. on the refusal of Gelasius II to concede the emperor's claim to investiture, he was proclaimed pope by Henry V on March 8. 1118. He was excommunicated by Gelasius II in April 1118 and by Calixtus II at the synod of Reims (Oct. 1119). He died in exile at the convent of La Cava.

GREGORY VIII (Alberto de Mora), pope from Oct. 21 to Dec. 17, 1187, a native of Benevento and Praemonstratensian canon, successively cardinal deacon of Sant' Adriano al Foro, cardinal priest of San Lorenzo in Lucina and chancellor of the Roman Church, was elected to succeed Urban III. He died at Pisa while engaged in making peace between the Pisans and the Genoese in order to secure their help in the new crusade which he was urging for the recovery of Jerusalem.

GREGORY IX (Ugolino of Anagni), pope from March 19, 1227, to Aug. 22, 1241, was born at Anagni into the family of the counts of Segni. He was related in the third degree to Innocent III. After studying theology at Paris, where he was a regent master in that faculty, he studied law at Bologna. Innocent III appointed him papal chaplain, cardinal deacon of St. Eustace and, in 1206, cardinal bishop of Ostia. As a cardinal. he was instrumental in obtaining recognition for the first Rule of St. Francis. He was employed as papal legate in Germany and northern Italy under Innocent III and Honorius III and succeeded the latter in the papacy.

As Innocent III had done, Gregory held that the church exercised an eminent domain over the secular power and set his face against the efforts of the emperor Frederick II to reconstitute an Italian empire. He excommunicated Frederick for neglecting his crusading vows (Sept. 29. 1227) and, to bring him to submission. dispatched an army into the Regno di Sicilia (Naples) and encouraged insurrection in Germany. Under the treaty of San Germano (1230) Frederick made important concessions regarding the immunities of the Sicilian church. After a few years of uneasy peace, Frederick embarked on his design to restore imperial authority in Lombardy. After a crushing victory over the Lombard league at Cortenuova (1237), he invaded the Patrimony of St. Peter and laid claim to the sovereignty of Rome. Gregory's answer to this threat was the second excommunication of Frederick in March 1239. Both sides invoked European opinion, Gregory summoning a general council for Easter 1241. But the Pisan fleet, in Frederick's pay. attacked the Genoese transports bringing the bishops to the council, most of whom fell into the emperor's hands. Gregory died on Aug. 22, 1241, as Frederick was preparing the assault on Rome.

Alarmed by the spread of the Catharist heresies in France. Germany and Italy, Gregory had transferred the task of prosecuting heresy from the diocesans to a regular papal Inquisition which he entrusted to the Dominicans (1233). A scholar himself, he was an active patron of the universities. The bull *Parens Scientiarum* (1231) finally established Paris university as an independent corporation. In 1233 Gregory founded a new university at Toulouse. He permanently enriched the canon law by commissioning the Dominican, Raymond of Pennaforte, to compile an authoritative collection of all the decretals which had appeared since the time of Gratian. This compilation, in five books, known as *The Decretals of Gregory IX*, was promulgated in 1234.

BIBLIOGRAPHY.—Gregory's *Register* bas been published by L. Auvray, *Les Registres de Gre'goire IX* (Paris, 1896-1910). *See* also A. Fliche, C. Thouzellier and Y. Azais, *La Chrétienté romaine 1198-1274* (Paris, 1950), being vol x of A. Fliche and V. Martin, ed., *Histoire de l'Église,* with bibliography.

GREGORY X (Teobaldo Visconti), pope from Sept. 1, 1271, to Jan. 10, 1276, was born at Piacenza *c.* 1210 and became archdeacon of Liège. Elected pope while accompanying Edward of England on a crusade, he was consecrated on March 27, 1272. He summoned the 14th general council at Lyons in 1274, for the purpose of considering the Eastern schism, the condition of the Holy Land and the abuses in the church. The Greeks were persuaded to consent to a union for the time being, and Rudolph of Habsburg renounced at the council all imperial rights in the states of the church. Gregory issued the constitution determining for the first time the form of conclave at papal elections. He was on his way to Rome to crown Rudolph, whose election he had done much to procure, when he died at Arezzo on Jan. 10, 1276.

GREGORY XI (Pierre Roger de Beaufort), pope from Dec. 30, 1370, to March 27. 1378. born in the Limousin in 1329, was made canon of Rodez and of Paris at the age of 11 and was created cardinal-deacon of Sta. Maria Nuova at 19 by his uncle, Clement VI. He studied law at Perugia under the famous jurist Baldo Ubaldi. As pope, at Avignon, he showed himself an enthusiastic reformer of the religious orders and a vigorous prosecutor of heresy. He revitalized the Inquisition in Provence, in Germany and in Spain and ordered the English authorities to investigate the doctrines of John Wycliffe. In the political field, his efforts to bring about a lasting peace between France and England and to aid the Eastern Christians against the Turks were fruitless. The rebellion of the papal states, incited by Florence, in 1375, impressed on him the urgency of restoring the papacy to Rome. The rebellion was savagely suppressed by Cardinal Robert of Geneva, and on Sept. 13, 1376, disregarding the opposition of the cardinals and of the French court. Gregory sailed from Avignon. He entered Rome on Jan. 17, 1377, but died on March 27 of the following year. Gregory was a learned and zealous pope, and his untimely death was a disaster for the church.

GREGORY XII (Angelo Corraro or Correr), pope from Nov. 30, 1406, to July 4, 1415, was born of a noble family at Venice about 1325. Successively bishop of Castello, Latin patriarch of Constantinople, cardinal priest of San Marco and papal secretary, he was elected to succeed Innocent VII under the express condition that, should the antipope Benedict XIII at Avignon renounce his claim. he also would renounce his, so that the long schism might be terminated. As pope, he announced his readiness to comply with Benedict's suggestion that he should meet him at Savona, but King Ladislaus of Naples brought the negotiations to nought. Gregory had promised not to create more cardinals, and when he did so, in 1408, his former cardinals deserted him and, with the Avignon cardinals, convoked the council of Pisa, which deposed both popes on June 5, 1409, and elected Alexander V on June 26. Gregory, still supported by Naples. Hungary and Bavaria and by Rupert, king of the Romans, found protection with Ladislaus and, in a synod at Cividale del Friuli, banned Benedict and Alexander. John XXIII, having succeeded to the claims of Alexander in 1410, concluded a treaty with Ladislaus, by which Gregory was banished from Naples on Oct. 31, 1411. The pope presented his resignation to the council of Constance on July 4, 1415, which, in recognition of his service, named him cardinal-bishop of Porto. He died at Recanati on Oct. 18, 1417. (C. H. LE.)

GREGORY XIII (Ugo Boncompagni), pope from 1572 to 1585, was born on Jan. 7, 1502, in Bologna, where he studied and later taught law at the university. In 1539 he went to Rome, where his abilities won him various employments. He was prominent in the Council of Trent from '1562 to 1563, was made cardinal in 1565 and was appointed legate to Spain in the same year. His service there made him acceptable to King Philip II, and on May 13, 1572, he was elected unanimously to succeed Pius V. His papacy witnessed the beginning of the militant period of the Counter Reformation. Since, after the victory of Lepanto (1571), further endeavours to unite Christendom against the Turks broke down, Gregory turned his attention from the infidel to the heretic. Employing his abilities as an administrator and a lawyer to obtain the reversion of papal lands where the title was defective, he used the money accruing from this policy to support those secular rulers or pretenders who were willing to stand by the traditional religion. Philip II was encouraged to turn his attention from the Mediterranean to the Netherlands and to Ireland, where it was hoped that Elizabeth I could be successfully attacked. Gregory also subsidized the Catholic league in France. Nowhere did his policy enjoy a clear-cut triumph, and papal diplomacy became increasingly subjected to the interests of Spain, which in the opinion of Philip II demanded not an aggressive but a defensive policy. So the first of the Catholic counteroffensives died away. Gregory is popularly remembered for his reform of the Julian calendar in 1582 *(see* CALENDAR). He also produced in 1582 a revised edition of the *Corpus juris canonici,* upon which he had himself worked as a cardinal. The tradition, begun by Paul IV, whereby the pope's private life should at least appear to be irreproachable, was cemented by Gregory's personal practice over 13 years. He died on April 10, 1585.

GREGORY XIV (Niccolò Sfondrati), pope from 1590 to 1591, was born in Cremona on Feb. 11, 1535, became a cardinal in 1583 and was elected to the papacy on Dec. 5, 1590. He aided the Catholic league in France and excommunicated Henry of Navarre, threatening his adherents with the ban; the effect of his intervention was to rally the moderate Catholics to support of Henry and hasten his conversion. Gregory died Oct. 15, 1591.

GREGORY XV (Alessandro Ludovisi), pope from 1621 to 1623, was born on Jan. 9, 1554, in Bologna, where he taught. He was made archbishop of his native place and cardinal by Paul V, whom he succeeded as pope on Feb. 9, 1621. He aided the emperor in the Thirty Years' War and the king of Poland against the Turks and endorsed the claims of Maximilian of Bavaria to the electoral dignity. Gregory founded the Congregation of the Propaganda, encouraged missions, fixed the order to be observed in conclaves and canonized Ignatius Loyola, Francis Xavier, Philip Neri and Theresa of Avila. He died on July 8, 1623.

GREGORY XVI (Bartolommeo Alberto, otherwise Mauro, Cappellari), pope from 1831 to 1846, was born at Belluno on Sept. 18, 1765, and entered the order of the Camaldoli. Soon after the restoration of Pius VII, he became vicar-general of the Camaldoli, councillor of the Inquisition, prefect of the Propaganda, examiner of bishops and, in 1825, cardinal. On Feb. 2, 1831, he was chosen to succeed Pius VIII. His pontificate was spent in an endeavour to combat the rising forces of liberalism and nationalism, and he was for long dismissed by historians as an intransigent reactionary; but the 20th century has done much to rehabilitate Gregory. He was not as intransigent as his manner, developed during a long career in the cloister, made him appear. Thus he negotiated the re-establishment of the concordat with Prussia allowing Catholic priests to officiate at mixed marriages and so ended a five-year deadlock, which had involved the imprisonment of the archbishop of Cologne (1840). In ecclesiastical affairs. Gregory was much more of a reformer than a reactionary. His papacy saw the reorganization of the hierarchy, the reform of old orders and the foundation of new ones, together with the introduction of the conception of vocation in the recruitment for the regular clergy and the expansion of missions in pagan countries. Indeed, a reactionary policy was no longer a feasible proposition after the revolutions of 1830 had all but completed the destruction of the old conception of the alliance between throne and altar begun by the French Revolution. The choice for the church now lay between two different conceptions of liberty: should it. as F. de Lamennais suggested, ally itself with the people against the state in order to obtain freedom for all. or should it seek to escape from the control of the state while still retaining its monopoly over the spiritual welfare of the people by developing ultramontane ideas, by increasing the authority of the international papacy? By his condemnation of Lamennais in 1832, by his opposition to the ideas of the romantics, Gregory took the decision which eventually ensured the triumph of ultramontane ideas Yet in taking this stand he was out of sympathy with the political forces of his time, especially with those of the Risorgimento in Italy. When he died, on June 1, 1846, these forces were threatening the very existence of the papal states, and such was the alarm felt by the cardinals that, although they were all of Gregory's creation, they hastened to elect a liberal sympathizer to succeed him as Pius IX.

Gregorio al Celio, *Gregorio XVZ, Miscellanea commemorativa* (Rome, 1948). (I. F. B.)

GREGORY, ISABELLA AUGUSTA, LADY (1852–1932), Irish playwright and author, was born on March 5, 1852, the youngest ddughter of Dudley Persse of Roxborough, County Galway. In 1881 she married Sir William Gregory, a well-known Irish M.P. She produced many plays, essays, volumes of folklore, versions of ancient sagas and romances concerning early Irish heroes, and did much to popularize the Anglo-Irish dialect of English as spoken in the west. She translated for the Abbey theatre several of Moliere's plays into this dialect under the title of *The Kiltartan Molière* (1910). Her work as playwright and director of the Abbey theatre, in association with W. B. Yeats, was extremely fruitful. This theatre was opened in 1904 and Lady Gregory told its story in *Our Irish Theatre* (1914). Sir Hugh Lane, whose life she wrote, *Hugh Lane's Lije and Achievement* (1921), was her nephew. Lady Gregory died on May 22, 1932.

Among Lady Gregory's other works are: *Cuchulain of Muirthemne* (1902); *Gods and Fighting Men* (1904); *The Kiltartan History Book* (1909); *Irish Folk History Plays* (1912); *The. Golden Apple* (1916); *The Kiltartan Poetry Book* (1919); *The Dragon* (1920).

See also Lennox Robinson (ed.), *Lady Gregory's Journals, 1916–30* (1946).

GREGORY, JAMES (1638–1675), Scottish mathematician and astronomer, famous in his day as inventor of the Gregorian reflecting telescope, was educated at the grammar school of Aberdeen and at Marischal college of that city. In 1663 he published his treatise *Optica promota,* in which he described his great invention. About 1665 he went to the University of Padua, where he studied for some years, and in 1667 published *Vera circuli et hyperbolae quadratura,* in which he discussed infinite convergent series for the areas of the circle and hyperbola. In 1668 he published also at Padua *Geometriae pars universalis,* in which he gave a series of rules for the rectification of curves and the mensuration of their solids of revolution. He was professor of mathematics successively at the universities of St. Andrews (1669–74) and Edinburgh (1674–75). *James Gregory: Tercentenary Memorial Volume* (ed, by H. W. Turnbull; 1939) contains Gregory's letters and posthumous manuscript and shows that he had anticipated several mathematical discoveries in number theory and differential calculus; *e.g.,* Taylor's expansion.

Gregory died at Edinburgh in Oct. 1675. (O. OE.)

GREGORY THAUMATURGUS, SAINT *(c.* 213–*c.* 270), Greek church father, was born of noble pagan parents at Neocaesarea in Pontus. He studied law, but at Caesarea met Origen (*q.v.*) and became his convert (A.D. 233). He was consecrated bishop of his native town about 240 and, in spite of the Decian persecution, converted nearly the whole city during his office of 30 years. He was active at the first synod of Antioch (264–265), which condemned the heresies of Paul of Samosata (*q.v.*). His feast day is Nov. 17. His later fame was due to the stories of miracles which grew up around his missionary labours, hence the surname Thaumaturgus ("wonder-worker").

Gregory's works, which include the *Panegyricus in Origenem, Metaphrasis in Ecclesiasten, Epistola canonica* and *Expositio fidei,* throw light on the personality and method of Origen, on the organization of the church in Pontus and on Gregory's Trinitarian doctrine. approaching the Nicene type.

Editions of his works were published by G. Voss (1604) and others, and are reprinted in J. P. Migne, *Patrologia Graeca,* vol. x.

See O. Bardenhewer, *Geschichte der altkirchlichen Literatur,* vol. ii, pp. 315–332 (1914), for full bibliography; also Schaff-Herzog, *Encyclopedia of Religious Knowledge.* (E. R. HY.)

GREIFENBERG (GRYFICE), a town in the former Prussian province of Pomerania, on the Rega, 45 mi. N.E. of Stettin (Szczecin) on the railway to Kolberg (Kolobrzeg), after 1945 in Szczecin province, Pol. The official Polish name is Gryfice. Pop. (1950) 8,737. It has two ancient gateways and its church of St. Mary dates from the 13th century. Manufactures of cement, sugar and bricks are carried on.

Greifenberg possessed municipal rights as early as 1262, and in the 14th and 15th centuries had a considerable shipping trade, but it decayed during the Thirty Years' War.

GREIFSWALD, a town in the *Bezirk* (district) of Rostock, German Democratic Rep. (East). until 1945 in the former Prussian province of Pomerania, on the Ryk. 3 mi. from its mouth on the Baltic, and 20 mi. S.E. from Stralsund by rail. Pop. (1959 est.) 46.302. Greifswald was founded about 1240 by traders from the Netherlands. In 1250 it received a town constitution and Liibeck rights from the duke of Pomerania. In 1270 it joined the Hanse towns. It remained in the possession of the Swedes after the peace of Westphalia. In 1713 it was desolated by the Russians; and it came into the possession of Prussia in 1815.

The industries include the manufacture of surgical instruments and machinery (particularly for agriculture). and the commerce in the export of corn, wood and fish. Greifswald is, however, best known for its university, founded during the year 1456 and famous for its faculty of medicine.

GREISEN, a modification of granite found in the tin districts of Cornwall and Saxony, consisting essentially of quartz and white mica, and characterized by the absence of feldspar and biotite. In the hand specimen the rock has a silvery glittering appearance from the abundance of lamellar, or layered, crystals of muscovite, but many greisens have much of the appearance of a paler granite. The commonest accessory minerals are tourmaline, topaz, apatite, fluorspar and iron oxides; a little feldspar more or less altered may also be present and a brown mica which is biotite or lithionite. The tourmaline in section is brown. green. blue or colourless, and often the same crystal shows many different tints,. The white mica forms mostly large plates with imperfect crystalline outlines. The quartz is rich in fluid enclosures. Apatite and topaz are both colourless and of irregular form.

Greisen occurs typically in belts or veins intersecting granite. At their outer edges they pass gradually into the granite. The transition between the two rocks is perfectly gradual, a fact which shows that the greisen has been produced by alteration of the granite. Vapours or fluids rising through the fissure have been the agents which effected the transmutation. They must have contained fluorine, boron and probably also lithium, for topaz, mica and tourmaline, the new minerals of the granite. contain these elements.

The alumina for these minerals is supplied by the biotite and feldspar of the granite, but it is noteworthy that albite is not replaced by the soda white mica, paragonite. The change is pneumatolytic, induced by the vapours set free by the granite magma when it cools. Probably the rock was at a relatively high temperature at the time.

A similar type of alteration, the development of white mica, quartz and tourmaline, is found sometimes in sedimentary rocks around granite masses.

Greisen is closely connected with schorl rock both in its mineralogical composition and in its mode of origin *(see* SCHORL). The latter is a pneumatolytic product consisting of quartz and tourmaline, and often contains white mica, thus passing by all stages into greisen. Both of these rocks frequently carry small percentages of tin oxide (cassiterite) and may be worked as ores of tin, and the central filling of the fissure often contains much wolframite, the chief ore of tungsten, as in Cornwall, Saxony, Tasmania and other centres of tin mining. (J. S. F.; X.)

GREIZ, a town of Germany in the *Bezirk* (district) of Gera, on the White Elster river, 66 mi. by rail south of Leipzig. Pop. (1959 est.) 39,319. Greiz (formerly Grewcz) is apparently a town of Slav origin. From the 12th century it was governed by *advocati* ***(Vogte),*** but in 1236 it came into the possession of Gera, and in 1550 of the younger line of the house of Plauen. It was ravaged by fire in 1494 and in 1802. It became famous for its woolen goods.

GRENADA, an island and colony, former Windward Islands colony, of the West Indies, lies between 12° 30' and 11° 58' N. and between 61" 20' and 61° 35' W.; it is 90 mi. N. of Trinidad. In shape oval, it is 21 mi. long, 12 mi. broad at its maximum and has an area of 120 sq.mi. Including the island of Carriacou, a dependency in the Grenadines (*q.v.*), the area of the colony of Grenada is 133 sq.mi.

A mountain range traverses the island, and spurs from its centre form picturesque and fertile valleys. Highest point of the island is Mt. St. Catherine (2,756 ft.). Land in the southeast and northwest is devoted to cultivation and cattle raising. The island is of volcanic origin with raised limestone beaches in the extreme north. Red and grey sandstones, hornblende and argillaceous schist are found in the mountains, porphyry and basaltic rocks also occur; sulfur and fuller's earth are worked. In the centre, at the height of 1,740 ft. above the sea, is the Grand Etang, a circular lake, 25 ac. in extent, occupying the site of an ancient crater. Near it is a large sanatorium. In the northeast is a larger lake, Lake Antoine, also occupying a crater, almost at the sea level. The island is watered by several short rivers, mainly on the east and south; there are numerous fresh water springs, as well as hot chalybeate and sulfurous springs. The southeastern coast is much indented with bays. The temperature is equable and epidemic diseases are rare. In the low country the average yearly temperature is 82° F., but it is cooler in the heights. The rainfall is heavy. in some parts 200 in. a year. The rainy season lasts from May to December. but refreshing showers frequently occur during other parts of the year. The average annual rainfall at St. Georges is 79.07 in.. and at Grand Etang 164 in. Excellent climate and good sea-bathing have made Grenada a health resort. The soil is mainly of volcanic origin, and produces cocoa and spices, especially nutmegs. Other exports, principally to Great Britain, the United States and Canada. are bananas, lime products and cotton; small quantities of sugar and fruits are also produced. Erosion of the soil was a major problem in the 1950s. Elementary education was offered free in government and state-aided denominational schools; the government maintains a secondary school and subsidizes others. Grenada's legislative council was reconstituted in 1937, and again in 1951. In 1945 the office of administrator replaced that of colonial secretary, and adult suffrage was introduced in 1951. From that year the legislative council was comprised of the administrator (president with only a casting vote), two ex officio members, three nominated members and eight elected members. The governor of the Windward Islands was required normally to act with the advice of the executive council, which included colonial officials and representatives of the legislative council. In 1958 the colony became a member of the short-lived West Indies federation. The population of the colony was 88,677 (1960), most of them Negroes of African descent; there were small numbers of mulattoes and East Indians and whites. The Carib race, aboriginal inhabitants of Grenada, is quite extinct. The British government financed means to combat malaria and yaws, the principal diseases infecting the population and to spread health education.

The capital of the colony, St. Georges (pop. 1957 est. 5,632), in the southwest. is built upon a lava peninsula jutting into the sea and forming one side of its landlocked harbour. It is surrounded by an amphitheatre of hills, up the sides of which climb the red-brick houses of the town. At the extremity of the peninsula is Fort George, built in 1705–06, no longer used for military purposes. The ridge connecting the fort with Hospital Hill is tunnelled to give access to the two parts of the town lying on either side. There are four other towns—on the west coast Gouyave. or Charlotte Town, and 4 mi. N. of it Victoria, or Grand Pauvre; on the north coast Sauteurs; and Grenville, or La Baye, at the head of a wide bay on the east.

History.—Grenada was discovered in 1498 by Christopher Columbus. who named it Conception. Neither the Spanish nor the British, to whom it was granted in 1627, settled on the island. The governor of Martinique, Du Parquet, purchased it in 1650, and the French were well received by the Caribs. whom they afterward exterminated with great cruelty. In 1665 Grenada passed into the hands of the French West India company, and was administered by it until its dissolution in 1674, when the island passed to the French crown. Cocoa. coffee and cotton mere introduced in 1714. During the wars between Great Britain and France, Grenada capitulated to the British forces in 1762. and was formally ceded next year by the treaty of Paris. The French, under Comte Charles d'Estaing, recaptured the island in 1779, but it was restored to Great Britain by the treaty of Versailles in 1783. A rebellion against the British rule, instigated and assisted by the French, occurred in 1795, but was quelled by Sir Ralph Abercromby the next year. The emancipation of the slaves took place in 1837; by 1877 it was deemed necessary to introduce East Indian labour. Grenada, with cocoa as its staple, grown principally by peasant landholders, did not experience similar depression to that which overtook the sugar-growing islands of the West Indies.

See *Grenada Blue Book* and *Colonial Report* (annuals).

GRENADES, small explosive or chemical missiles used for attacking enemy troops, vehicles or fortified positions at close range. When designed to be thrown by hand they are called hand grenades, and when adapted for launching from a rifle or carbine, rifle grenades *(see* below). The term was also applied originally to any explosive shell fired from a gun. Most varieties of hand grenades are cheap and easy to manufacture and can be used effectively by troops with little training. Despite the steady 20th-century trend toward highly complicated instruments of war, the lowly grenade maintained its position as a valuable infantry weapon.

"Grenade" probably derived from the French word for pomegranate because of the resemblance to that fruit of early grenade shapes. In later years grenades were nicknamed "pineapples" because of the bulbous shape and rough exterior of the World War I models *(see* fig. 1), though they were in fact more nearly the size of a lemon. The rough exterior of the cast-iron grenade used during the first half of the 20th century was intended to make the case break into fragments about the size of a half lump of sugar when the explosive charge was detonated, but it did not always have that effect. Over the years grenades of many different shapes and sizes appeared, some spherical, others egg-shaped, still others cylindrical. One flat type with a handle resembled a hairbrush. and another was built like a wooden potato masher. Although there are historical references to grenades weighing as much as 6 lb., most have been much lighter, usually about $1\frac{1}{2}$ lb.

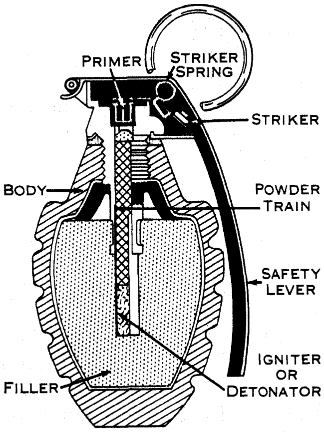

FIG. 1.— CROSSSECTION OF A HAND GRENADE (FRAGMENTATION TYPE) SHOWING PRINCIPAL PARTS

Grenades probably came into use as early as the 15th century and were found to be particularly effective when exploded among troops in the ditch of a fortress during an assault. So important did grenades become in European armies of the 17th century that soldiers specially selected for strength and courage were trained as grenadiers (*q.v.*). But, after about 1750, grenades were virtually abandoned as the range and accuracy of firearms increased. lessening the opportunities for close combat. They did not come back into use on an important scale until the siege of Port Arthur during the Russo-Japanese War (1904–05).

Hand Grenades.—In the trench warfare of World War I (1914–18) both sides found hand grenades and rifle grenades effective in attacking enemy positions. The German army was well supplied with grenades of many shapes and sizes at the start of the war and took the Allies by surprise with its grenade attacks. After resorting to makeshifts such as the "jam pot," a tin can filled with an explosive and scraps of iron, the British army developed and used large quantities of the Mills grenade, often called the Mills bomb, both for hand and rifle launching. It was shaped like a pineapple, and its fuze was activated by a spring-driven lever fitted close to the outside of the grenade. Before throwing the grenade, the soldier removed a safety pin, meanwhile holding the lever in place with a firm grip until the grenade left his hand. The delay train of the fuze was usually set for four or five seconds. long enough for the missile to reach its target but not so long as to permit the enemy to pick it up and throw it back again. Contact grenades that exploded when they struck their target were also employed but proved less safe and effective than those with time fuzes.

During World War II a wide variety of hand grenades appeared, including many improvised forms such as the "Molotov cocktail," a gasoline-filled bottle with a lighted wick in its top. It was often thrown at tanks to set them on fire. The standard fragmentation or defensive grenade of the U.S. army at the start of World War II was similar to the Mills grenade. It consisted of a serrated cast-iron body holding about 2 oz. of blank powder, the whole weighing 22 oz. Blank powder of the kind used to load small arms blank cartridges had been adopted in the mid-1920s because TNT shattered the case into fragments that were considered too small to be effective. But blank-powder grenades proved unsatisfactory in combat and were replaced in 1943 by TNT grenades. The standard hand grenade could be thrown about 35 yd. and the normal effective range of fragments was 10 yd. in all directions, though stray fragments might fly much farther. More than 50,000,000 were produced for the U.S. army in World War II.

During the Korean conflict, when grenades were freely used by both sides, the U.S. army adopted a new type of fragmentation hand grenade, smaller and lighter than the earlier model and with a smooth outer surface. The grooved body was abandoned because experience had shown that, when filled with a high explosive such as TNT, it did not result in effective fragmentation. The new smooth-case grenade contained a powerful explosive, threw out many fragments in a regular pattern and was far more effective than the older pineapple variety.

Offensive grenades are of a different type and of less importance. As they depend for effect on an explosive blast over a small area rather than flying fragments, troops using them continue to advance while throwing grenades before them. The blast effect is naturally greatest in a confined area such as a trench or pillbox. The body of the offensive grenade has usually been cylindrical in shape, like a huge firecracker, and made of pressed paper with sheet metal end pieces. Larger than the fragmentation grenade, it contains 6 or 7 oz. of TNT but still weighs less than 1 lb. in all. It has sometimes been employed as a demolition device or fitted with a special fuze and concealed to form a booby trap to blast an unwary soldier who happened to move the object it was attached to.

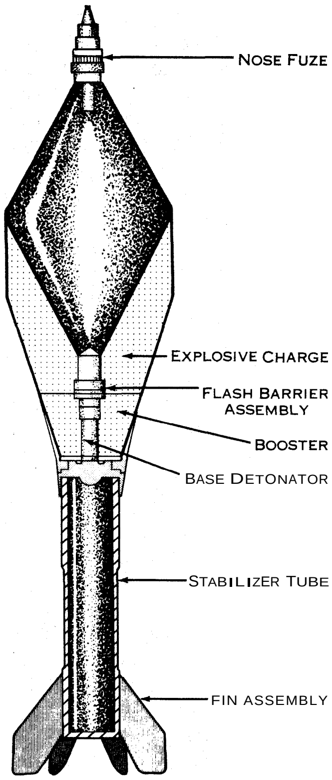

FIG. 9.— CROSS SECTION OF U.S. ANTITANK RIFLE GRENADE

Chemical Grenades.— Smoke grenades, similar in construction to offensive grenades, are used to lay down a local smoke screen to hide troop movements or for other tactical purposes. *(See* SMOKE: IN WARFARE.) For signaling to planes or to ground troops, smoke grenades come in a variety of colours. Illuminating grenades, as their name implies, put forth a short burst of light that may reveal the enemy's position at night. Incendiary grenades contain a mixture for starting fires, while other types of chemical grenades contain tear gas or other chemical agents. *(See* CHEMICAL WARFARE.) Tear gas grenades are used by police to disperse mobs or to force fugitives to come out into the open.

Rifle Grenades.— There are in the Tower armouries specimens of flintlock muskets used for grenade projection as early as the 17th century, but they were apparently not very successful. When grenades were revived in the early 1900s, efforts were made to project them from rifles and thus increase their range. The commonest practice was to attach to the hand grenade a metal rod that fitted tightly into the muzzle of the rifle and was ejected by firing a blank cartridge, Improved grenade launchers that could be fitted to the muzzles of standard rifles came into use during World War II. They permitted firing grenades without damage to the rifle, resulted in more accurate fire and launched the standard hand grenade to a distance of 100 to 200 yd., filling the gap between the ranges of hand grenades and small mortars.

Grenades designed specifically for rifle launching generally have long, streamlined bodies, with fins at the rear to stabilize their flight (*see* fig. 2). One of the most important new types in World War II was the antitank rifle grenade designed for close, point-blank fire at armoured vehicles. It contained a special armour-piercing explosive known as a "shaped charge." With such a grenade a foot soldier could knock out a tank if he got close enough for a good shot. It was as an outgrowth of early efforts to devise an antitank rifle grenade that the bazooka rocket was developed. *See* also BAZOOKA.

GRENADIER. The military employment of grenades (*q.v.*) necessitated the recruitment of men of exceptional physique to hurl them, but at the outset such troops were not organized in special units. The mid-17th century witnessed the formation within the battalion of special companies of powerfully built men to serve as grenadiers; they wore a mitre-shaped headdress of cloth or fur, this being more appropriate to the action of throwing the grenade than was the contemporary broad-brimmed hat. Grenadiers were more particularly employed in siege and trench warfare, and were armed with a heavy hatchet with which to cleave their way through barricades and other obstructions. After the gradual decline in the employment of the grenade in the 18th century, grenadiers were retained as storm troops, proudly taking the right of the battalion line on parade. Despite the depressive effect on the morale of the remainder of their units, the grenadiers from several line regiments—like the light companies—were frequently formed into special service battalions; this process was eventually rationalized by Sapoleon, who recruited whole formations of these exponents of a specialized type of fighting. In the British army the brigading of grenadier and light companies as special task forces remained common practice until about 1858. The gradual adoption throughout Europe of the four-company battalion progressively encouraged the recruitment of separate grenadier formations, but their duties had come to differ little from those of the ordinary regiments of the line. Horse grenadiers made a fugitive appearance in both the British and the Belgian forces. In World War I battalion subunits were trained in both the throwing of hand grenades and the firing of rifle grenades. In later years, the grenadier disappeared as a special type of infantryman, for nearly all ground combat troops were trained to use grenades. (R. C. H.)

GRENADINES, a chain of islets (about 600) in the Windward Islands group, West Indies. They stretch for 60 mi. from N.E. to S.W. between St. Vincent and Grenada. Some are a few square miles in extent, others are merely rocky hummocks. For purposes of administration they are divided between St. Vincent and Grenada. The total population of the St. Vincent group, according to the 1946 census, was 4,479; area, 17 sq.mi. Because of lack of water it is only slightly cultivated, but game is plentiful. Admiralty bay, on the west side, is a safe and commodious harbour. Carriacou, attached to Grenada, is the largest of the group, 7 mi. long, 2 mi. wide and 13 sq.mi. in extent. Pop. (1946) 6,495. A ridge of hills, rising to an altitude of 700 ft., runs from N.E. to S.W. There are two good harbours on the west coast, Hillsborough bay on which stands Hillsborough, the chief town, and Tyrell bay, farther south. The island is thickly populated, the Negro peasantry occupying small lots and working on the *métayage* system. Cotton and cattle are the chief exports.

GRENFELL, GEORGE (1849–1906), English Baptist missionary and explorer of the Congo, was born at. Sancreed, near Penzance, on Aug. PI, 1849, and educated at Birmingham. In 1874 he was sent, with Alfred Saker, by the Baptist missionary society to the Cameroons, where for some years he explored the rivers inland. In Jan. 1878 he joined the Rev. T. J. Comber in exploring the lower Congo. In 1884 he made an independent survey of the Congo up to the equator, at a point 18° E. longitude. From 1884 to 1887 he made five further voyages. In 1891 he acted as Belgian plenipotentiary in the Portuguese negotiations for the settlement of the frontier of the Lunda. In 1900 he began to explore the Aruwimi river and by Nov. 1902 had reached Mawambi. Grenfell died at Basoko on July 1, 1906.

GRENFELL, SIR WILFRED THOMASON, (1865–1940). British medical missionary, was born on Feb. 28. 1865 at Parkgate, Cheshire. He was educated at Marlborough and Oxford, where he took the degree of M.D., and studied medicine at the London hospital under Sir Frederick Treves. At his suggestion Grenfell, in 1889, joined the Royal National Mission for Deep Sea Fishermen and for three years cruised with it in the North sea as medical missionary. As a result of this experience he was chosen by the mission to start a pioneer service to the fishermen of the Labrador coast of Newfoundland, and left England on June 15, 1892. in the ketch "Albert." In his first two months Grenfell treated 900 patients, the beginnings of an immense work of relief along the Labrador coast. He won the confidence of fishermen and Eskimos by his selfless devotion to their welfare. In 1900 he was presented with the hospital ship "Strathcona." His dauntless journeys by dog sled and his adventures in the icy Labrador seas caught the imagination of generous friends in Canada. the U.S. and Britain. His hospital and children's home at St. Anthony's became the base of the Labrador work of the International Grenfell association of which Grenfell was superintendent. Through Grenfell's work the needs of the fishing communities of Labrador for schools. institutes and general welfare were also more adequately met by the government. He was created K.C.M.G. in 1927, and retired to his home on Lake Champlain in 1935. His books include *A Labrador Doctor* (1920).

See W. M. Comber, *Wilfred Grenfell, the Labrador Doctor* (London, 1950). (C. N.)

GRENOBLE, the ancient capital of the Dauphiné, a former province of southeastern France, and town of the *dkpartement* of Isère, 75 mi. by rail southeast from Lyons. Pop. (1954) 111,054. It was one of the most strongly fortified cities in Europe. Built at a height of 702 ft., the greater and newer part of the town rises on the left bank of the Isère and has wide thoroughfares and modern buildings. The original town (of but small extent) was built on the right bank of the Isère at the southern foot of the Mont Rachais, which is covered by a succession of ancient fortresses 885 ft. above the town.

Grenoble is the seat of a bishopric, founded in the 4th century. It was formerly a suffragan of Vienne and is now in the ecclesiastical province of Lyons. The most remarkable building is the late 1jth-century Palais de Justice, on the site of the old palace of the Parlement of the Dauphiné. Opposite is the church of St. André (13th century), formerly the chapel of the dauphins of the Viennois. The cathedral church of Notre Dame is a building dating in part from the 11th century. The church of St. Laurent is the oldest in the city (11th century) and has a crypt dating from Merovingian times. The town library has a rich collection of manuscripts (7,000) and printed books (250,000 vol.) which in great part belonged till 1793 to the monastery of the Grande Chartreuse. There is an art gallery, well known for its modern paintings, and a natural history museum containing geological specimens from Dauphine and Savoy. The university, which includes an *école supérieure d'électricité* and provides courses for foreign students, is a notable institution.

Grenoble occupies the site of Cularo, a village of the Allobroges, fortified by Diocletian and Maximian at the end of the 3rd century. Its present name is a corruption of Gratianopolis, in honour of Gratian (4th century). After passing under the power of the Burgundians (c. 440) and the Franks (532) it became part of the kingdom of Provence (879–1032). On the breakup of that kingdom a long struggle for supremacy ensued between the bishops of the city and the counts of Albon, the latter winning in the 12th century, taking the title of Dauphins of the Viennois in the 13th century. In 1349 Grenoble was ceded with the rest of the Dauphiné to France, but retained its municipal privileges. In 1562 it was sacked by the Protestants, but in 1572 the firmness of its governor saved it from a repetition of the massacre of St. Bartholomew. In 1590 Lesdiguikres (*q.v.*) took the town in the name of Henry IV and constructed its fortifications, quays, etc. In 1788 the attempt of the king to weaken the power of the *parlement* of Grenoble roused the people to arms, and the "day of the tiles" (June 7, 1788) is memorable for the defeat of the royal forces. In 1790, on the formation of the *département* of the Iskre, Grenoble became its capital. Grenoble was formerly much subject to floods, especially from the Drac. One of the worst took place in 1219, while that of 1778 was known as the *ddluge de la Saint Crépin.* The main industry is the production of turbines and electrical machinery for hydroelectric power plants. The making of kid gloves is less important than in former times. Other articles produced are cement, liqueurs, linen goods, leather goods and carved furniture. (M. PT.)

GRENVILLE, SIR BEVIL (1596–1643), Royalist soldier in the English Civil War was born on March 23, 1596, in St. Withiel, Cornwall, and was educated at Exeter college, Oxford. As member of parliament, first for Cornwall, then for Launceston, Grenville supported Sir John Eliot and the opposition, and his intimacy with Eliot was lifelong. In 1639, however, he appears as a royalist going to the Scottish War in the train of Charles I. The reasons of this change of front are unknown, but Grenville's honour was above suspicion. He was a valuable recruit to the royalist cause, being, says Clarendon, "the most generally loved man" in Cornwall. Under the command of Sir Ralph Hopton, Sir Bevil fought at Bradock Down and at Stratton (May 16, 1643) where the earl of Stamford was routed by the Cornishmen; he led one of the storming parties which captured Chudleigh's lines. Grenville was killed at the head of the Cornish infantry as it reached the top of the hill on July 5, 1643, at Lansdowne, near Bath, where stands a monument to him.

His son JOHN (1628–1701), created earl of Bath in 1661, was also a prominent royalist.

GRENVILLE, GEORGE (1712–1770), English statesman, second son of Richard Grenville and Hester Temple, and younger brother of Lord Temple, was born on Oct. 14, 1712. He was educated at Eton and at Christ Church, Oxford, and trained for the bar. In 1741 he entered parliament as member for Buckingham, and as one of the "cousinhood" of Grenvilles, Temples and Pitts in opposition to Robert Walpole. In 1744 he became a lord of the admiralty in the Pelham administration, and in 1747 a lord of the treasury. In 1754 he was appointed treasurer of the navy under the duke of Newcastle, and was dismissed the following year, along with William Pitt, for attacking Newcastle's foreign policy. He returned to the post in 1756 under Pitt and the duke of Devonshire, and resigned when Pitt and Lord Temple were dismissed the following year. In the same post again in the war ministry of Pitt and Newcastle in 1758, during the Seven Years' War, he improved the administration of the department. When Pitt and Temple resigned in 1761 Grenville remained in office and became leader of the house and secretary of state under Lord Bute. In 1763 he formed a ministry of his own, and became chancellor of the exchequer. This ministry was of importance because it saw the prosecution of John Wilkes, the passing of the Stamp act which precipitated conflicts between Britain and the American colonies, and the imposition of commercial duties which added to the discontent. Grenville retained office for two years, despite the hostility of George III, but his ministry was replaced by Rockingham's in 1765. He never again held office and died on Nov. 13, 1770.

BIBLIOGRAPHY.—The *Grenville Papers, Being the Correspondence of Richard Grenville, Earl Temple, and the Rt. Hon. George Grenville, Their Friends and Contemporaries,* ed. with notes by W. J. Smith, 4 vol. (London, 1852–53), is the chief authority for his life. *See* also Horace Walpole, *Memoirs of the Reign of George II,* ed. by Lord Holland, 2nd ed. (London, 1847) ; E. D. Adams, *The Influence of Grenville on Pitt's Foreign Policy 1787–98* (Washington, 1904). (D. TN.)

GRENVILLE, SIR RICHARD (1542–1591), English naval commander, was born of an old Cornish family in June 1542. He fought with the imperial army against the Turks in Hungary (1566–68). Next he took part in suppressing a rising in Munster (1568–69). Then, between 1573 and 1575, he and his friends were busied with a project which "was the first to put into shape the idea of an English empire in the southern seas" (A. L. Rowse, see *Bibliography).* They prepared an expedition to discover Terra Australis—the great continent that was believed to stretch diagonally across the southern Pacific—and to locate the western, Pacific, end of the North-West Passage. The voyage was not made, for the government was unwilling to endanger good relations with Spain, newly restored by the 1573–74 agreements. However, Grenville's twin purposes were to figure prominently in the original avowed aims of Sir Francis Drake's great voyage of 1577–80. For the next ten years, and again in 1587–88, Grenville was chiefly occupied in local affairs and in organizing the military defense of western England. In 1585, however, he commanded for his cousin, Sir Walter Raleigh, the fleet of seven vessels carrying colonists to Roanoke Island in the present North Carolina, and captured a Spanish vessel on his way back. In 1586 he carried provisions to Roanoke, and, finding the colony deserted, left a few men to maintain possession. After the defeat of the Armada, he went again to Ireland, where he had a considerable interest in the plantation of Munster.

In 1591, when Lord Thomas Howard was sent to intercept the homeward-bound treasure fleet of Spain, Grenville was sent with him as second in command on board the "Revenge," a ship of 500 tons which had been commanded by Drake against the Armada. At the end of August Howard, with 13 ships and 2 or 3 pinnaces, lay at anchor to the north of Flores in the Azores. On the 31st he received news that a Spanish fleet of 53 vessels was bearing up to meet the treasure ships. Being hopelessly outmatched, Howard gave orders to weigh anchor and stand out to sea. But, for some reason, the "Revenge" was delayed, and cut off from her consorts by the Spaniards. Grenville, though he could perhaps have escaped to the westward, resolved to try to break through the Spanish line. His ship was becalmed under the lee of a huge galleon, and after a hand-to-hand fight lasting 15 hours against 15 Spanish ships and a force of 5,000 men, the "Revenge" with her 190 men was captured. Grenville was carried on board the Spanish flagship and died a few days later. His exploit is commemorated in Tennyson's poem "The Revenge."

See A. L. Rowse, *Sir Richard Grenville of the Revenge* (London, Toronto, 1949). (R. B. WM.)

GRENVILLE, SIR RICHARD, BART., cr. 1630 (1600–1658), English royalist, grandson of the famous seaman of the same name, entered the army and served under Buckingham at Cadiz and in the La Rochelle expedition. He was ruined by lawsuits with his wife and her relations, and imprisoned. He escaped to Germany, returning to England to join the king's army against the Scots in 1639. From 1642 to 1643 he served in Ireland. On his return to England he was rearrested but, after joining the parliamentary army, soon made his way back to the king's side and servtd in the west of England. Many charges of abuse of power, misappropriation of war funds and insubordination were made against him, and in Jan. 1646 he was arrested. He then went to the Netherlands and was with Charles II in exile. until he had to leave the court after bringing accusations against Edward Hyde, afterward earl of Clarendon. He died in 1658 and was buried at Ghent.

Grenville's *Single Defence Against All Aspersions of All Malignant Persons* is printed in the Works of George Granville, Lord Lansdowne (London, 1736). *See* also Clarendon, *History of the Rebellion,* ed. by W. D. Macray, 6 vol. (Oxford, 1888) ; and R. Granville, *The King's General in the West* (London, New York, 1908).

GRENVILLE, THOMAS (1755–1846), English bibliophile, was born on Dec. 31, 1755. He was, with one interval, a member of parliament from 1780 to 1818, and for a few months during 1806 and 1807 president of the board of control and first lord of the admiralty. He is more famous as a book collector than as a statesman; he bequeathed his large and valuable library to the British Museum, where it is still preserved under his name.

He died in London on Dec. 17, 1846.

A catalogue of the Grenville library was published by H. J. Payne and H. Foss, *Bibliotheca Grenvilliana* (3 vols., 1842–48).

GRENVILLE, WILLIAM WYNDHAM GRENVILLE, BARON (1759–1834), English statesman, youngest son of George Grenville, was born on Oct. 25, 1759, and educated at Eton and Christ Church, Oxford. In Feb. 1782 Grenville was elected member for the borough of Buckingham, and in the following September he became secretary to his brother, Earl Temple, lord lieutenant of Ireland. He left office in June 1783, but in December he became paymaster-general of the forces under William Pitt, and in 1786 vice-president of the committee of trade. In 1787 he was sent on a mission to The Hague and Versailles with reference to the affairs of Holland. In Jan. 1789 he was chosen speaker of the House of Commons, but vacated the chair in the same year on being appointed secretary of State for the home department; about the same time he resigned his other offices, but he became president of the board of control, and in November 1790 was created a peer as Baron Grenville. In 1791 he was transferred to the foreign office, retaining his post at the board of control until 1793. Although his ability was appreciated by Pitt, the two often differed on important matters. In Feb. 1801 he resigned office with Pitt because George III. would not consent to the introduction of any measure of Roman Catholic relief, and in opposition he gradually separated himself from his former leader. When Pitt returned to power in 1804 Grenville refused to join the ministry unless his political ally, Fox, was also admitted thereto; this was impossible and he remained out of office until Feb. 1806, when, after Pitt's death, he became the nominal head of a coalition Government. Though unfortunate in its conduct of foreign affairs, this ministry deserves to be remembered for its passage of the act abolishing the slave trade (1807). Its influence, however, was weakened by the death of Fox. and in consequence of a minute drawn up by Grenville and some of his colleagues the king demanded from his ministers an assurance that in future they would not urge upon him any measures for the relief of Roman Catholics. They refused to give this assurance and in March 1807 they resigned.

Lord Grenville never held office again, although requested to do so on several occasions. He continued to take part in public life, supported Roman Catholic emancipation, and, during the remaining years of his active political career, which ended in 1823, he generally voted with the Whigs. He died on Jan. 12, 1834.

See the *Dropmore MSS.* for Grenville's correspondence, and the report on this publication by the Historical Manuscripts Commission.

GRENZMARK (Grenzmark Posen-West Preussen), Germany, an administrative district (*Regierungsbezirk*) of the Prussian province of Pomerania. From 1919 to 1939 it comprised what remained to Germany of the former provinces of Posen and West Prussia, with an area of 2,991 sq.mi. and a population in 1925 of 136,919. After Hitler's conquest of Poland in 1939, it was extended to include the former lands of Germany; Polish families were deported, and their houses and farms given to German-speaking settlers, many of whom were uprooted in the Baltic provinces and "brought home to the reich." The area of the enlarged Grenzmark was 4,421 sq.mi., and the population (1939) 478,521. The district is a low plateau, highest in the north, covered with glacial and related deposits, and dotted with small lakes. It is agricultural and pastoral, the chief crops being cereals and potatoes. and the industries are brewing and the manufacture of agricultural machinery and starch. A little tobacco is grown and manufactured, while there is some trade in timber and leather.

GRESHAM, SIR THOMAS (1519–1579), London merchant, the founder of the Royal Exchange, was descended from an old Norfolk family, and was the son of Sir Richard Gresham, a London merchant knighted by Henry VIII. He went to Caius college, Cambridge, and was apprenticed for eight years to his uncle, Sir John Gresham In 1543 he was admitted a member of the Mercers' Company, and went to the Low Countries, where he lived for some years, carrying on business and acting as an agent for Henry VIII. In 1551 owing to the mismanagement of Sir William Dansell, "king's merchant," Gresham was called in to advise the English Government. He was allowed to apply his own methods, many of them quite arbitrary and unfair, for raising the value of the pound sterling on the "bourse" of Antwerp, and in a few years nearly all Edward VI.'s debts were discharged. Except for a short period during Mary's reign, he remained financial agent of the crown until he was obliged to leave Antwerp on March 19, 1567, on the outbreak of the war in the Low Countries. He was at the time on embassy to the duchess of Parma at Brussels. He continued his business as merchant and financial agent of the Government, though living in London. Elizabeth kept Lady Mary Grey a prisoner in his house from June 1569 to the end of 1572.

In 1565 Gresham proposed to the court of aldermen of London to build at his own expense a bourse of exchange, if they would purchase a suitable piece of ground. He reimbursed himself by letting out the upper part of the building as shops. He died on Nov. 21, 1579. The bulk of his property was bequeathed to his widow with the stipulation that after her decease his residence in Bishopsgate street, and the rents accruing from the Royal Exchange should be vested in the hands of the corporation of London and the Mercers' Company for the purpose of instituting a college in which seven professors should lecture on astronomy, geometry, physic, law, divinity, rhetoric and music. The lectures were given in the original building from 1597 until 1768 when it was converted into an excise office. The Royal Exchange was then used for them until the present building was erected in 1843.

A notice of Gresham is contained in Fuller's *Worthies* and Ward's *Gresham Professors;* but the fullest account of him, as well as of the history of the Exchange and Gresham College is that by J. M. Burgon in his *Life and Times of Sir Thomas Gresham* (2 vols., 1839). *See* also a *Brief Memoir of Sir Thomas Gresham* (1833); *The Life of Sir Thomas Gresham, Founder of the Royal Exchange* (1845); and F. R. Salter, *Sir Thomas Gresham, 1518–1579* (1925).

GRESHAM, WALTER QUINTON (1832–1895), American statesman and jurist, was born near Lanesville, Ind., on March 17, 1832. He spent two years in an academy at Corydon, Ind., and one year at the Indiana State university at Bloomington, then studied law, and in 1854 was admitted to the bar. He was active as a campaign speaker for the republican ticket in 1856, and in 1860 was elected to the Indiana house of representatives. In 1861 he became colonel of volunteer infantry; in 1862 he commanded a brigade, and in 1863 he was appointed brigadier-general of volunteers. In 1864 he commanded a division in Sherman's Atlanta campaign, and before Atlanta, on July 20, he received a wound which forced him to retire from active service, and left him lame for life. In 1865 he was breveted major-general of volunteers. After the war he practised law at New Albany, Ind., and in 1869 was appointed by President Grant U.S. district judge for Indiana. In April, 1883, he succeeded Timothy O. Howe (1816–83) as postmaster-general in President Arthur's cabinet, taking an active part in the suppression of the Louisiana lottery, and in Sept. 1884, succeeded Charles J. Folger as secretary of the treasury. In the following month he resigned to accept an appointment as U.S. circuit judge. Gresham was a candidate for the republican presidential nomination in 1884 and 1888. Gradually, however, he grew out of sympathy with the republican leaders and policy, and in 1892 advocated the election of the democratic candidate, Grover Cleveland, for the presidency. From March 7, 1893, until his death at Washington on May 28, 1895, he was secretary of State in President Cleveland's cabinet.

GRESHAM'S LAW, in economics, the name suggested in 1857 by H. D. Macleod for the principle of currency which may be briefly summarized—"bad money drives out good." Macleod gave it this name, which has been universally adopted, under the impression that the principle was first explained by Sir Thomas Gresham in 1558. In reality it had been well set forth by earlier economic writers, notably Oresme and Copernicus. Macleod states the law in these terms: the worst form of currency in circulation regulates the value of the whole currency and drives all other forms of currency out of circulation. Gresham's law applies where there is underweight or debased coin in circulation with full-weight coin of the same metal; where there are two metals in circulation, and one is undervalued as compared with the other; and where inconvertible paper money is put into circulation side by side with a metallic currency. *See* further BIMETALLISM; MONEY.

GRESSET, JEAN BABTISTE LOUIS (1709–1777), French poet and dramatist whose narrative poem *Ver-Vert* (1734), describing with wit tinged with malice the adventures of a parrot, decorously brought up in one convent, when he visits another, was an immediate and lasting success. Born at Amiens, Aug. 29, 1709, Gresset was brought up by Jesuits and, a brilliant pupil, was encouraged to enter the society in 1726. He studied at Paris and taught in a number of Jesuit schools, but was meanwhile writing light occasional verse. In 1734 he published *Ver-Vert*, which made him famous, and followed it by *Le Carême impromptu* and *Le Lutrin vivant*. Returning to Paris in 1735 for a year's study of theology, he wrote there *La Chartreuse* and *Les Ombres:* these lively accounts of life in a Jesuit college, precise and pointed in detail. led first to his banishment to the provinces and then to his expulsion from the order: he had not yet taken his final vows and the anticlerical tendency of his poetry was rather the result of natural frivolity and a keen eye for absurdity exercised in the only world he knew than of deliberate impiety. He returned to Paris and was warmly received, being granted an official pension. In 1740 he wrote *Edouard III*, the first French tragedy in which a murder was enacted on the stage. Other plays were the verse comedies *Sidnei* (1745) and his dramatic masterpiece, *Le Méchant* (1747), a witty exposé of *salon* life, instantly successful and highly praised for its pithy dialogue. He was admitted to the Académie francaise in 1748. In 1749 he retired to Amiens, where he was offered official employment at the Académie, and where he married. He came to regret his literary career, and although he continued to write, in 1759 he renounced his work for the theatre in a *Lettre sur la comédie*. He died at Amiens, June 16, 1777. His poem. *Le Parrain magnifique,* written in 1758, remained unpublished until 1810.

See J. Wogue, *J. B. L. Gresset* (1894).

GRESSMANN, HUGO (1877–1927), German Old Testament scholar who was a prominent advocate of the religio-historical approach, was born in Mölln, Lauenberg, on March 21, 1877. After attending the University of Göttingen he was *Privatdozent* at Kiel (1902–06), where he wrote his first important book, *Der Ursprung der israelitisch-jüdischen Eschatologie* (1905), influenced by the methods of Hermann Gunkel's form criticism and by the *Religionsgeschichtliche Schule,* which applied to the Bible lessons learned from the history of comparative religion. In this work and in his posthumously published *Der Messias* (1929) Gressmann advanced the new theory that eschatology was not a late phenomenon in Israel but pre-exilic, and its popular form can be traced in many Old Testament passages. His works show the insights into the history and geography of Palestine gained by his association with the Deutsches Evangelisches Institut für Altertumswissenschaft in Jerusalem, which he visited in 1906 before going as professor to Berlin in 1907. After *Altorientalische Texte und Bilder* (1909; 2nd ed., 1926–27) he wrote *Die älteste Geschichtsschreibung und Prophetie Israels* (1910; 2nd ed., 1921) and *Die Anfange Israels* (1914; 2nd ed., 1922), both forming volumes of Gunkel's *Schriften des Alten Testaments.* Gressmann's other important works were *Moses und seine Zeit* (1913) and *Die Lade Jahves* (1920). He died in Chicago, Ill., while on a lecture tour, April 6, 1927.

See Zeitschrift für die Alttestamentliche Wissenschaft, vol. 5, pp. 1–xxiv (1927) for memoirs of Gressmann and vol. 69, pp. 211–228 (1957) for a list of his works. (A. S. K.)

GRETNA GREEN, a village in Gretna civil parish, Dumfriesshire, Scot., $9\frac{1}{2}$ mi. N.W. of Carlisle and $23\frac{1}{2}$ mi. E.S.E. of Dumfries by road, and $\frac{3}{4}$ mi. from the Sark river, there the dividing line between England and Scotland. The railway station at Gretna is on the English side. Pop. of Gretna village (1951) 2.057. It has long been famous as the goal of eloping couples seeking hasty marriage. Until 17.54, the date of Lord Hardwicke's act, such marriages had commonly been performed in the Fleet prison in London, but after that date runaways were obliged to cross the border, as it formerly sufficed under Scots law for couples merely to declare their wish to marry before witnesses. At Gretna Green the ceremony was usually performed by the blacksmith, although any person might officiate, and the tollhouse, the inn or (after 1826) Gretna hall were the scenes of many such weddings. As many as 200 couples were married at the tollhouse in a year. In 1856 the law required one of the contracting parties to reside in Scotland for three weeks before marrying, and after the Marriage (Scotland) act, 1939, these irregular marriages were abolished on July 1, 1940. During World War I a temporary manufacturing township for the provision of cordite was created on a tract of land about 10 mi. long and from 1 to 2 mi. wide, with Gretna Green in its centre. This land was sold in 1924. About 3 mi. N.E. is the site of the battle of Solway Moss, where in 1542 the English defeated the Scots under James V.

GRÉTRY, ANDRÉ ERNEST MODESTE (1741–1813), France-Belgian composer who was a prominent figure in the development of the *opéra comique.* Born at Liège on Feb. 11, 1741. he was a chorister at the church of St. Denis at Liège and studied the violin with Nicolas Rennekin and Henri Moreau. Having become acquainted with Italian music through visits of Italian musicians, he received in 1760 a grant to study at the Collège Liègeois in Rome. In Italy he worked with G. B. Casali and G. B. Martini, producing an intermezzo, *La Vendernmatrice,* in Rome in 1765. In 1766 he was in Geneva, where he wrote a French *opéra comique, Isabelle et Gertrude,* based on a tale of Voltaire. and in 1767 he settled in Paris, producing *Le Huron,* again on a tale of Voltaire, the following year. Two further works followed, *Lucile* and *Le Tableau parlant,* and thenceforth Grétry's position as the leading composer of *opéras comiques* was established. Between 1770 and 1803 he produced about 50 stage works, mostly *opéras comiques* written for the Comkdie Italienne but including some larger-scale works produced at the Paris Opéra. His best works are *Zémire et Azor* (1771), *L'Amant jaloux* (1778), *L'Épreuve villageoise* (1784) and *Richard Coeur de Lion* (1784), the last containing an aria, "Ô Richard, 6 mon roi, l'univers t'abandonne." which acquired significance during the French Revolution. His works were less often given after 1789, but he served the new regime faithfully and became inspector of studies of the Paris conservatoire. He died at Montmorency, near Paris, on Sept. 24, 1813. Grétry's music has great charm and vitality and reveals an undoubted melodic gift. Occasional revivals of his stage works in the 20th century were invariably successful. His ballet nlusic has a grace matched by few other 18th-century composers. Forty-nine volumes of his dramatic works were published by the Belgian government between 1883 and 1957.

GREUZE, JEAN BAPTISTE (1725–1805), French genre and portrait painter, was born at Tournus. in Burgundy. on Aug. 21, 1725, of a poor family. His precocious desire to paint and draw was not well received, but his father was eventually persuaded t~ send him as a pupil t~ Charles Grandon, a portrait painter in Lyons. Grandon's talent mas limited and the greatest service he performed for Greuze was to give him access to his collection of Dutch and Flemish engravings and to take him with him to Paris in the early 1750s. There Greuze enrolled at the academy and was befriended by the painter J. Sylvestre and the sculptor J. Pigalle. Greuze first exhibited at the Salon of 1755 and won an immediate success with his crowded and uplifting work "Un père de famille expliquant la Bible à ses enfants" (Dresden). Although Greuze's attention at this period was fixed on a simpler and more traditional type of genre painting in which the influence of 17th-century Dutch masters is clearly apparent (*e.g.*, "L'Écolier endormi," Montpellier), the congratulations he received for this faintly bogus morality turned his head and established the lines of his future career.

In Sept. 1755 he left for Italy; he lived there for two years, one of the few artists of the 18th century to remain impervious to the almost fatal attraction of Italian painting. In 1759 he became acquainted with Diderot who encouraged his inclination toward melodramatic genre, and throughout the 1760s Greuze reached ever new heights of popular acclaim with "L'Accordée de Village" (1761, Louvre), "La Mort du Paralytique" (1763, Leningrad) and the drawings "Le Fils Ingrat" and "Le Fils Puni" (1765, Lille).

These were undoubtedly fertile years, for Greuze was also painting portraits whose worth has not declined, and a certain number of those allegories of girls lamenting the loss of their sparrows with which his name is indissolubly linked. Stimulated by his success to a mood of almost hysterical pride which antagonized all those with whom he came into contact, Greuze in 1769 presented a dreary classical piece entitled "Sévère et Caracalla" (Louvre) which was to entitle him to be admitted to the Academy as a history painter. This claim was rejected, and in the storm of resentment which followed, Greuze resigned from the Academy and for the next 30 years exhibited his works to the public in his own studio.

Throughout the 1770s Greuze was kept busy painting moralities of an increasingly minatory nature ("Le Fils Puni," 1778. Louvre; "La Mauvaise Belle-Mkre." 1781) and was visited by many foreign dignitaries, notably the grand duke Paul Petrovich of Russia who commissioned from him a number of works. But his income was precarious, and by 1785, when he was reduced to painting bloated studies of girls, his once considerable talent was exhausted. He died in the Louvre on March 4, 1805, in great poverty.

Greuze abused his very real gifts in an attempt to give the public what it wanted. His large genre pictures, which are badly painted, were rapturously received by a public whose tastes had been formed by the novels of Samuel Richardson and Jean Jacques Rousseau. He is today remembered for his studies of girls in a state of calculated disarray; his fine portraits, his magnificent drawings are neglected. He had few pupils but many imitators and in his own lifetime was partially ruined by the vogue for sentimental genre painting which he himself had inaugurated.

GREVILLE, CHARLES CAVENDISH FULKE (1794–1865), whose diary remains the outstanding source for the history of British politics in the first half of the 19th century, was a distant cousin of Lord Warwick and, through his mother, the grandson of the 3rd duke of Portland (*q.v.*), who was twice prime minister. Greville was born on April 2. 1794. Through his grandfather, Greville was appointed to the reversion to the secretaryship of Jamaica when he was seven, a sinecure which was abolished in his lifetime. though he was recompensed with the emoluments until his death.

When he mas ten he was given the reversion to the clerkship of the privy council. He was educated at Eton and at Christ Church, Oxford, but he left without a degree in 1814 to work as private secretary to the secretary for war, Lord Bathurst. He became clerk of the privy council when he was 27, and he discharged the duties of this office for nearly 40 years. This work brought him into close touch with the royal family and the leading public men of the time, and gave him a clear insight into public affairs, though he regretted that his work precluded him from taking part in politics.

Starting somewhat spasmodically when he left Oxford, but with increasing regularity after 1818, Greville kept a diary recording all important political events, embellished with an extremely shrewd (though not always eulogistic) commentary on individuals. He wrote his diary at the time of the events he described. read it through regularly in after life, but did not materially vary what he had originally written.

The last entry was made in Nov. 1860 "with a full consciousness of the smallness of the interest or value" of the diary, a view not shared by posterity.

Another occupation of Greville's — his guidance of the policy of the *Times* of London — emerges from the official history of that journal published between 193j and 1952. His advice and suggestions were courted by successive editors; sometimes contributions from him were published over the pseudonym "C"; he also wrote obituaries of a few very eminent men.

He published several pamphlets, those on the corn laws (1846) and the precedence of Prince Albert (1840) meeting with considerable success.

Greville was a well-known personality on the turf. As a young man he managed the racing stables of George IV's brother, the duke of York. Later he raced in partnership with Lord George Bentinck and then with the duke of Portland. He once won the St. Leger, and he was unlucky not to win the Derby in 1845. He often laments in his diary the time he wasted in racing. Greville sold his horses in 1855. He was known as "Punch" and, behind his back, because of a rather sombre manner, as the "Gruncher." He never married.

At intervals between 1874 and 1887, his successor at the privy council, Henry Reeve, published the diary with many excisions and a certain softening of the text. It was widely enjoyed, though the publication was generally thought premature. In 1927 P. W. Wilson published further selections from the diary, using the copy made by Reeve. This copy is now in the Bodleian library at Oxford; the original manuscript is in the British museum. In 1938 a verbatim edition was published, edited by Lytton Strachey and Roger Fulford. (R. T. B. F.)

GRÉVIN, JACQUES (1538–1570), French poet and dramatist whose plays introduced classical forms into French drama, and also the author of medical treatises on antimony and poisons. He was born at Clermont-en-Beauvaisis in 1538 and became a doctor of medicine of Paris university. A friend and disciple of Ronsard and Du Bellay, he wrote love sonnets, *L'Olimpe* (1560) to Nicole Estienne, satirical sonnets, *La Gklodacrye* (1560), and was an innovator in drama, claiming to follow the precepts of Aristotle and Horace. His comedies imitate the regular form of Plautus and Terence but have a contemporary subject and Parisian setting. Their tone is licentious. *La Trésorière* was performed at the Collkge de Beauvais in 1559. *Les Esbahis*, and his regular tragedy, *Cksar* (based on Plutarch and on Muret's Latin tragedy), were also performed there and published in his *Théâtre* (1561). After the Conspiracy of Amboise (1560), Grévin, being a Protestant, fled to England, where he was received in audience by Elizabeth I. He soon returned to France but later went to Antwerp. He finally took refuge with the duchess of Savoy (Margaret of France), who made him her physician and counselor.

He died at her court in Turin on Nov. 5, 1570.

See Grévin's *Théâtre complet et poésies choisies*, ed. by L. Pinvert (1922); L Pinvert, *Jacques Grévin* (1899). (M. G. M.)

GRÉVY, FRANÇOIS PAUL JULES (1807–1891), French statesman, president of the republic, was born at Mont-sous-Vaudrey, Jura, on Aug. 15, 1807. An advocate by profession, and a strong republican, he was deputy for Jura to the constituent assembly (1848). Foreseeing the election of Louis Bonaparte as president. he proposed to vest the executive power in the president of the council, elected and removable by the assembly; *i.e.*, the suppression of the office of president of the republic. He mas consequently excluded from public life until 1868, when he took a prominent place in the Republican party.

Grévy was president of the national assembly (Feb. 16, 1871, to April 2, 1873), president of the chamber of deputies (1876–79) and, on the resignation of Marshal MacMahon, president of the republic (Jan. 30, 1879). He was an excellent president, but unfortunately, after accepting (Dec. 18, 1885) a second term of office, a serious scandal arose by the exposure of the traffic in the decorations of the Legion of Honour carried on by his son-in-law, Daniel Wilson. Grévy was not directly implicated, and did not fully realize his situation. Resignation was forced on him (Dec. 2, 1887).

He died at his native place on Sept. 9, 1891.

GREW, NEHEMIAH (1641–1712). English plant anatomist and physiologist who shares with M. Malpighi the credit for laying the foundations of the science of plant anatomy, was baptized at Mancetter, Warwickshire, on Sept. 26, 1641. He graduated from Pembroke hall. Cambridge, in 1661, and took his M.D. at Leyden in 1671. He first practised medicine at Coventry, but soon moved to London. In 1672 he published his *Anatomy of Vegetables Begun*, which Malpighi had translated into Latin, and in 1673 his *Idea of a Phytological History*. Grew had been elected a fellow of the Royal society in 1671, and in 1681, at the society's request. published *A Catalogue and Description of the Natural and Artificial Rarities . . . Preserved at Gresham College.* To this was appended *The Comparative Anatomy of Stomachs and Guts Begun,* being several lectures read before the Royal society in the year 1676. This last is said to be one of the most remarkable studies of the 17th century, and seems to involve the first use of the term "comparative," so favoured since that time. In 1682 Grew's famous *Anatomy of Plants* appeared. In this work. Grew was the first to point out that stamens are male organs, though he himself attributed the discovery to Sir Thomas Millington.

Grew died in London on March 25, 1712. His collection of seeds and plants was bought by Sir Hans Sloane.

GREY, ALBERT HENRY GEORGE, 4TH EARL (1851–1917), British administrator, the son of Gen. Charles Grey, Queen Victoria's private secretary, and grandson of the 2nd earl, the prime minister, was born on Nov. 20, 1851; he was educated at Harrow and at Trinity college, Cambridge, where he graduated with a first class in law and history in 1873. As his uncle, the 3rd earl, had no children! Albert Grey was the heir-presumptive to the earldom. He sat in parliament as a Liberal, first for South Northumberland and then for the Tyneside division, from 1880 to 1886. He was an enthusiastic social reformer and a whole-hearted imperialist. He was one of the 93 dissentient Liberals who by voting against the Liberal government decided the fate of the Home Rule bill of 1886. He lost his seat in the ensuing general election and did not reappear in parliament till he succeeded his uncle in the earldom in 1894. The interval had been largely filled with travel—chiefly along the byways of the British empire.

He was appointed in 1895, after the Jameson raid, administrator of Rhodesia in succession to Jameson. There he became a close friend and ardent admirer of Cecil Rhodes, and on returning to England he joined in 1899 the board of the chartered company.

He went as governor general to Canada in 1904, and his term of office was twice prolonged, until Oct. 1911. After his return to public life in England, he devoted himself to propaganda in favour of imperial federation and proportional representation.

Grey showed much interest in agriculture and endeavoured to assist licensing reform by the foundation of the Public House trust.

He died at Howick, Northumberland, on Aug. 29, 1917, leaving, by his wife Alice Holford, a son who succeeded him in the earldom.

See Harold Beebie, *Albert, **Fourth** Earl* **Grey**, *a Last* **Word** (1917).

GREY, CHARLES GREY, 2ND EARL (1764–1845), English statesman. closely associated with the passing of the great Reform bill in 1832, was the eldest surviving son of Gen. Sir Charles Grey, afterward 1st Earl Grey, and was born at Fallodon, near Alnwick, on March 13, 1764. General Grey (1729–1807), who was a younger son of the house of Grey of Howick, had already begun a career of active service which, like the political career of his son, covered nearly half a century. In 1801 he was rewarded by Henry Addington with a peerage, as Baron Grey of Howick, being created in 1806 Earl Grey and Viscount Howick.

Young Grey was returned for Northumberland in 1786 and came forward as a vigorous assailant of the government of William Pitt. He was hailed by the opposition. and associated with Charles James Fox, Edmund Burke and Richard Brinsley Sheridan as a manager in the Warren Hastings impeachment. Grey became the trusted lieutenant of Fox, whom he was destined to succeed in the leadership of the party. As time went on, some differences arose between the two men on the conduct of the war, but there mas never any open breach, and their personal relations remained those of close friendship. Grey was a pioneer of parliamentary reform. He joined in founding the Society of Friends of the People for promoting the reform of the franchise, he presented their petition to parliament. and in 1793 he moved the reference of this petition to a parliamentary committee. Fox did nothing to discourage this activity, but he did not support it. At a later date Grey passed some rather bitter criticism on the society, but at the time he had no doubts on the opportuneness of the agitation. Pitt suppressed the movement with a strong hand. In 1797 Grey again introduced proposals for parliamentary reform and. when these were rejected, promoted the foolish Secession. Since the parliament did not properly represent the nation and refused to reform itself, the opposition announced its intention of "seceding." or systematically absenting itself from parliament. This movement was originated by Grey. Lord Lauderdale and the duke of Bedford. Pitt easily defeated the secession manoeuvre?and Grey himself reappeared to protest against the Act of Union with Ireland: moved by his interest in Irish affairs.

When Pitt died in Jan. 1806 the All the Talents ministry was formed under Grenville, with Fox as foreign secretary and Grey (from April 1806 to Nov. 1807 styled Viscount Howick) as first lord of the admiralty. On Fox's death. in the following September, Grey became foreign secretary and leader of the house of commons. When the cabinet proposed to concede a portion of the Catholic claims, the king demanded of it an undertaking never to propose similar measures again. This was refused, and the Grenville-Grey cabinet retired in March 180;. In the same year Grey's father died. and Grey went to the upper house. Opposition united Grey and Grenville for a time. but the parties finally split on foreign policy. When Napoleon returned from Elba in 1815, Grenville followed the traditions of Pitt and supported the ministry in at once renewing hostilities. Grey followed those of Fox and maintained the right of France to choose its own governors and the impossibility of checking the reaction in the emperor's favour. Grenville and Grey gradually drifted apart. Grey was in a small minority in opposing the suspension of the Habeas Corpus act in 1817, and the part which he took in 1820 in opposing the bill for Queen Caroline's divorce, though it won for him the respect of the nation, sealed the exclusion of himself and his few friends from office during the king's life. When in 182; Grey came forth to denounce the ministry of George Canning. he declared that he stood alone in the political world. He scarcely exaggerated, for most of the Whigs followed the marquess of Lansdowne and supported Canning's and Lord Goderich's governments.

In 182j Grey seemed to stand forth the solitary and powerless relic of an extinct party. In 1830 that party was restored to its old numbers and activity, supreme in parliament. popular in the nation, and with Lord Grey at its head, The duke of Wellington's foolish declaration against parliamentary reform (Nov. 2, 1830) suddenly deprived him of the confidence of the country, and a coalition of the Whigs and Canningites became inevitable. Grey was sent for by William IV on Nov. 16, 1830. and formed a coalition cabinet, pledged to reform. The question of the place to be offered to the indispensable Lord Brougham (*q.v.*) nearly wrecked his cabinet making, but the king in the end consented to Brougham's taking the lord chancellorship. Grey then appointed a committee of four to study the question and prepare a moderate measure of reform. Grey himself was an old-fashioned Whig and, when he took office, did not foresee how far he would go in reform. But now, faced with a formidable agitation! he saved the country from revolution by driving through a bold measure. In his view a reform sweeping enough to give general satisfaction would restore the aristocracy's popularity and ensure its continued pre-eminence. He called the bill "the most aristocratic measure that ever was proposed in parliament."

The second reading (March 23, 1831) of the first Reform bill was carried in the commons by a majority of one. An opposition amendment mas also carried, however, and on April 22 parliament was dissolved. The second reading of a new bill was carried in the new parliament (July 7) by a majority of 136. When the bill had at length passed the commons after months of debate, it was Grey's task to introduce it to the lords. It was rejected (Oct. 8) by a majority of 41. Grey had the prudence and courage to remain in office, with the intention of introducing a third Reform bill in the next session. The last months of 1831 were the beginning of a political crisis such as England had not seen since 1688. The two extreme parties. the "ultra-radicals" and the "ultra-tories." were ready for civil war. Between them stood the ministry and the majority of intelligent, peace-loving Englishmen.

The new bill contained substantial alterations but was no less efficient than the old. The second reading of the third bill in the commons was passed in December by a majority of 162. On April 9, 1832, Grey moved the second reading in the lords. A sufficient number of the opposition temporized, and the second reading was allowed to pass by a majority of nine. The intention was to mutilate the bill in committee. On May 7 Lyndhurst secured a motion to postpone certain clauses by a majority of 35 against the government. Grey now reluctantly asked the king to give authority for the creation of peers to swamp the opposition. He greatly disliked demanding a creation; indeed but for his reluctance the demand would probably have been made months earlier; there was now no alternative. But William IV, at first favourable to reform, was alienated by the violent state of opinion. He rejected the proposal of his ministers and accepted their resignation on May 9, 1832. The duke of Wellington undertook the hopeless task, in which Sir Robert Peel declined to join, of constructing a ministry that would pass a restricted or sham Reform bill. After a week of the profoundest agitation throughout the country, the king, beaten and mortified, was forced to send for Grey and Brougham. He now angrily and reluctantly yielded to the creation of peers. The threat was sufficient, the necessary number of peers abstained, and the bill became law.

Grey took but little part in directing the legislation of the reformed parliament. Never anxious for power, he had executed the arduous task of 1831–32 rather as a matter of duty than of inclination, and he found an opportunity of retiring over the renewal of the Irish "coercion" bill. It became clear in the discussion on the bill that Lord Althorp, the leader of the house of commons, was privately opposed to retaining certain clauses which it was his duty to push through the house. Lord Althorp resigned, and Grey, who was now 70, resigned also (July 8, 1834). He was succeeded as premier by Lord Melbourne, who persuaded Lord Althorp to return to his post and to proceed with the bill in its milder form.

During most of his remaining years Grey continued to live in retirement at Howick, where he died on July 17, 1845, in his 82nd year.

(London, 1867); *Correspondence of Princess Lieven and Earl Grey, 1824–1834*, ed. and trans. by G. Le Strange (London, 1890); J. R. M. Butler, *The Passing of the Great Reform Bill* (London, 1914); G. M. Trevelyan, *Lord Grey of the Reform Bill*, 2nd ed. (London, 1929). (M. G. B.)

GREY, SIR GEORGE (1812–1898), British colonial governor and statesman, only son of Lieutenant-Colonel Grey of the 30th Foot, was born in Lisbon on April 14, 1812, eight days after the death of his father at the storming of Badajoz. He passed through Sandhurst with credit, and received his commission in 1829. His lieutenancy was dated 1833, and his captaincy 1839, in which year he sold out and left the army. In 1836 the Royal Geographical society accepted his offer to explore the northwest region of West Australia, and accordingly he landed at Hanover bay at the end of 1837. The surrounding country he found broken and difficult, and his hardships were aggravated by the tropical heat and his ignorance of the continent. In a skirmish with the natives, in which he was speared near the hip, he showed great courage, and put the assailants to flight, shooting the chief, who had wounded him. After a brave endeavour to continue his journey his wound forced him to retreat to the coast, whence he sailed to Mauritius to recruit. Next year he again essayed exploration, this time on the coast to the north and south of Shark's bay. He had three whale-boats and an ample supply of provisions, but by a series of disasters his stores were spoilt by storms, his boats wrecked in the surf, and the party had to tramp on foot from Gantheaume bay to Perth, where Grey, in the end, walked in alone, so changed by suffering that friends did not know him. In 1839 he was appointed governor-resident at Albany, and during his stay there married Eliza, daughter of Admiral Spencer, and also prepared for publication an account, in two volumes, of his expeditions.

In 1840 he returned to England, to be immediately appointed by Lord John Russell to succeed Colonel Gawler as governor of south Australia. Reaching the colony in May 1841, he found it in the depths of a depression caused by mismanagement and insane land speculation. By rigorously reducing public expenditure, and forcing the settlers to quit the town and betake themselves to tilling their lands, and with the opportune help of valuable copper discoveries, Grey helped the infant colony to emerge from the slough. In 1845, when the little settlements in New Zealand were involved in a native war, he was sent to save them. The Maori chiefs made their submission. The governor gained the veneration of the Maori tribes, in whose welfare he took a close personal interest, and of whose legends and myths he made a valuable and scholarly collection, published in New Zealand in 1855 and reprinted thirty years afterwards. Grey presently became involved in harassing disputes with the colonists, who organized an active agitation for autonomy. In the end a constitution, partly framed by Grey himself, was granted them, and Grey, after eight years of despotic but successful rule, was transferred to Cape Colony.

In south Africa Grey thwarted a formidable Kaffir rebellion in the eastern provinces, and pushed on the work of settlement by bringing out men from the German Legion and providing them with homes. He gained the respect of the British, the confidence of the Boers, the admiration and the trust of the natives. The Dutch of the Free State and the Basuto chose him as arbitrator of their quarrels. When the news of the Indian Mutiny reached Cape Town he strained every nerve to help Lord Canning, despatching men, horses, stores and £60,000 in specie to Bombay. He persuaded a detachment, then on its way round the Cape as a reinforcement for Lord Elgin in China, to divert its voyage to Calcutta. Finally, in 1859, Grey almost reached what would have been the culminating point of his career by federating South Africa. Persuaded by him, the Orange Free State passed resolutions in favour of this great step, and their action was welcomed by Cape Town. But the colonial office disapproved of the change, and when Grey attempted to persevere with it Sir Edward Bulwer Lytton recalled him. A change of ministry during his voyage to England displaced Sir Edward Bulwer Lytton. But though the duke of Newcastle reinstated Grey, it was with instructions to let federation drop.

In 1861 the colonial office sent him as governor to New Zealand, where an inglorious native war in Taranaki had just been succeeded by an armed truce. Grey did his best to avert war, but it came in 1863, and spread from province to province. Ten thousand regulars and as many colonial riflemen were employed to put it down. The imperial troops were badly handled, and Grey, losing patience, became involved in bitter disputes with their commanders. As an example to the former he himself attacked and captured Weraroa, the strongest of the Maori stockades, with a handful of militia, a feat which delighted the colonists, but made him as much disliked at the war office as he now was at Downing street. Moreover, Grey had no longer real control over the islands. New Zealand had become a self-governing colony, and though he vindicated the colonists generally when libellous imputations of cruelty and land-grabbing were freely made against them in London, he crossed swords with his ministers when the latter confiscated 3,000,000 acres of tribal land belonging to the insurgent Maori. Yet a condition of something like tranquillity had been reached in 1867, when he received a curt intimation from the duke of Buckingham that he was about to be superseded. The colonists bade farewell to him in 1868 in an outburst of gratitude and sympathy; but his career as a colonial governor was at an end. Returning to England, he delivered many able speeches advocating what later came to be termed Imperialism, and stood for Newark.

Discouraged, however, by the official Liberals, he withdrew and turned again to New Zealand. In 1872 he was given a pension of £1,000 a year, and settled down on the island of Kawau, not far from Auckland, which he bought, and where he passed his leisure in planting, gardening and collecting books. In 1875. on the invitation of the Auckland settlers, he became superintendent of their province, and entered the New Zealand house of representatives. He became premier of New Zealand in 1877. Manhood suffrage, triennial parliaments, a land-tax, the purchase of large estates and the popular election of the governor, were leading points of his policy. All these reforms, except the last, he lived to see carried; none of them were passed by him. For the fifteen years after the fall of his ministry in 1879 he remained a solitary and pathetic figure in the New Zealand parliament, respectfully treated, courteously listened to, but never again invited to lead. In 1894, he left New Zealand, and made his home in London, where he died on Sept. 20, 1898.

Lives of Sir George Grey have been written by W. L. and L. Rees (1892), Professor G. C. Henderson (1907) and J. Collier (1909).

(W. P. RE. ;X.)

GREY, HENRY GEORGE GREY, 3RD EARL (1802–1894), was an English statesman, born Dec. 28, 1802, at Howick. Northumberland, eldest son of the 2nd Earl Grey (*q.v.*). As Viscount Howick, he sat in the house of commons for Winchelsea, 1826–30, for Higham Ferrers, 1830–31, for Northumberland, 1831–41, and for Sunderland, 1841–45, when he succeeded his father. He became undersecretary for the colonies in his father's ministry in 1830. He belonged to the more advanced party of colonial reformers; sharing the views of Edward Gibbon Wakefield on questions of land and emigration. and he resigned in 1833 from dissatisfaction that slave emancipation was made gradual instead of immediate. In 1835 he entered Lord Melbourne's cabinet as secretary at war, but in 1839 he again resigned, disapproving of the more liberal views of some of his colleagues. He became secretary for war and the colonies in 1846, and the six years of his administration effected a revolution in the relations between England and its colonies. Grey was the first minister to proclaim that the colonies were to be governed for their own benefit as well as for that of England; the first systematically to accord them self-government so far as then seemed possible; and the first to introduce free trade into their relations with Great Britain and Ireland. The concession by which colonies were allowed to tax imports from the mother country *ad libitum* was not his; he protested against it, but was overruled. His greatest success was in Canada, where his appointment of Lord Elgin as governor general and wise support of Elgin's policy led to the recognition of responsible government (1847). He also drafted constitutions for the Australian colonies and for New Zealand, but the latter proved unworkable and had to be suspended, leaving the conduct of affairs in the masterful hands of Sir George Grey (*q.v.*). His policy in the West Indies and Ceylon was criticized as repressive, and he aggravated the difficult situation in the Cape Colony by an ill-judged attempt to settle convicts there. He resigned with his colleagues in 1852 and never again held office. In retirement he wrote a history and defense of his colonial policy in the form of letters to Lord John Russell, a dry but instructive book *(Colonial Policy of Lord John Russell's Administration,* 1853).

During the remainder of his long life, he exercised a vigilant criticism of public affairs. His principal parliamentary appearances were when he moved for a committee on Irish affairs in 1866, and when in 1878 he passionately opposed the policy of the Beaconsfield cabinet in India. He died at Howick on Oct. 9, 1894.

GREY, LADY JANE (1537–1554). for nine days queen of England, was the great-granddaughter of Henry VII. She was the daughter of Henry Grey, marquess of Dorset by his wife, Lady Frances Brandon, daughter of Princess Mary of England by her second marriage with Charles Brandon, duke of Suffolk.

She was born at Bradgate, Leicestershire in Sept. 1537. Her parents bestowed more than ordinary care upon her education, and she became the marvel of the age for her acquirements. She spoke and wrote Greek and Latin with an accuracy that satisfied even such critics as Roger Ascham and her tutor John Aylmer, afterward bishop of London. She also acquired some knowledge of at least three oriental tongues, Hebrew, Chaldee and Arabic. In his *Schoolmaster* Xscham records her devotion to her studies and the harshness she experienced from her parents. Learning was her solace: in reading Demosthenes and Plato she found a refuge from domestic unhappiness. When she was nine years old Thomas, Lord Seymour, obtained her wardship, and induced her parents to let her stay with him, even after the death of his wife, Queen Catherine Parr, by promising to marry her to his nephew, King Edward VI. Lord Seymour, however, was attainted of high treason and beheaded in 1549. Jane returned to her studies at Bradgate.

But the duke of Somerset was beheaded three years after his brother, and, the dukedom of Suffolk having become extinct by the deaths of Charles Brandon and his two sons, the title was conferred upon the marquess of Dorset, Jane's father. Jane was now constantly at court. Northumberland, who was all-powerful, endeavoured to secure his position by family alliances. His fourth son, Lord Guildford Dudley, was accordingly wedded to Lady Jane Grey on May 21, 1553. The bride went to live with her husband's parents, whom she disliked, and the misery of her marriage brought on a severe illness. The match had the full approval of Edward VI, who was now persuaded by Northumberland to break through his father's will and make a new settlement of the succession to the crown in favour of Lady Jane and her heirs. The document was witnessed (June 21) by the signatures of all the council and of all but one of the judges; but those of the judges were obtained only with difficulty by threats and intimidation.

Edward VI died on July 6, 1553, and it was announced to Lady Jane that she was queen. She was 16 years of age. The news was a most unwelcome surprise; she fainted and for some time resisted all persuasions to accept the fatal dignity, but eventually she yielded. The better to mature their plans the cabal had kept the king's death secret for some days; Queen Jane's proclamation was issued on the tenth. Mary, however, had received early intimation of her brother's death, and, retiring from Hunsdon into Norfolk, gathered around her the nobility and commons of those parts. The army with which Northumberland went to oppose her began to melt away. In London many of the councillors met at Baynard's castle, revoked their former acts as done under coercion and caused the lord mayor to proclaim Queen Mary. which he did (July 19) amid the shouts of the citizens. The duke of Suffolk told his daughter that she must lay aside her royal dignity; she replied that she relinquished most willingly a crown that she had only accepted out of obedience to him and her mother, and her nine days' reign was over.

Lady Jane and her father were committed to the Tower; but Suffolk procured a pardon. Lady Jane, her husband Dudley and others were arraigned for high treason at the Guildhall (Nov. 14). She pleaded guilty and was sentenced to death. The execution of the sentence was suspended, but the participation of her father in the Wyat rebellion sealed her fate. She and her husband were beheaded on Feb. 12, 1554, her husband on Tower Hill, and herself within the Tower an hour afterward, amid universal sympathy and compassion.

See Sir N H Nicolas, *Literary Remains of Lady Jane Grey* (London, 1825); R Davey, *The Nine Days' Queen* (London, 1909).

GREY, ZANE (1875–1939), U.S. writer of western fiction, was born in Zanesville, O., on Jan. 31. 1875. He practised dentistry in New Tork (1898–1904). In the latter year he published privately a story of pioneer life. *Betty Zane,* based on a journal by a maternal ancestor. Col Eb Zane. *The Spirit of the Border,* also based on Zane's notes. became a best seller. Grey wrote 54 novels. of which over fifteen million copies were sold. Most popular nas *Riders of the Purple Sage* (1912). Grey died at Altadena, Calif., on Oct. 23 1939 (F L. MT)

GREYHOUND RACING: *see* DOG RACING.

GREYMOUTH, a seaport of New Zealand, the principal port on the west coast of South Island, in Grey county. It stands on the small estuary of the Grey or Mawhera river, has a good harbour and railway communication with Hokitika to the south, Christchurch to the east and Westport to the north. The district is both auriferous and coal-bearing. The timber, wool and flax trade is well developed.

Pop (1961) 8,881.

GREY OF FALLODON, EDWARD GREY, 1ST VISCOUNT (1862–1933), English statesman, was educated at Winchester and at Balliol college, Oxford, and succeeded his grandfather, the 2nd baronet, at the age of 20. Sir Edward Grey entered the house of commons as Liberal member for Berwick-on-Tweed in 1885. He was a disciple of Lord Rosebery, and in the 1892–95 Liberal ministry he was undersecretary for foreign affairs. Outside of foreign affairs he played only a small part in the period of Liberal opposition between 1895 and 1905. When Campbell-Bannerman's cabinet was formed in Dec. 1905, he became foreign minister.

Grey had previously announced that the Liberal government would maintain Lord Lansdowne's policy of an ***entente*** with France and an alliance with Japan, and during the general election of Jan. 1906 he said that, if war were forced on France, which was being pressed by Germany about Morocco, he believed British public opinion would rally to France's support. In 1907 he concluded a convention with Russia about Persia, by which the integrity of that country was to be maintained, but Britain recognized that Russia had rights and interests in the northern zone and Russia recognized Britain's in the southern zone.

In 1908—the year in which Herbert Asquith, an intimate friend of Grey, became prime minister—the European situation was considerably modified by the assertion in October by Prince Ferdinand of the independence of Bulgaria and his assumption of the title of king, and the simultaneous annexation of Austria-Hungary of Bosnia and Hercegovina, which it had administered under the treaty of Berlin. These strokes of policy moved the indignation of both the Russian people and the Russian government; but the German emperor announced that he would stand by his Austrian ally in "shining armour." Grey, though he protested against the infraction of the public law of Europe, was unable to promise Russia anything more than diplomatic support. Grey's main preoccupation was British relations with Germany, which dispatched at the beginning of July 1911, the gunboat "Panther" to the northwest African coast at Agadir, to protect, it was alleged, German interests. In view of this further attempt to test, and if possible loosen, the ***entente,*** he issued a warning through Lloyd George that Britain intended at all hazards to maintain its place among the powers. The warning sufficed to make Germany lower its tone, and subsequently Grey explained to parliament that the foreign policy of the government was a continuation of Lord Lansdowne's and had got rid of the constant trouble with France and Russia; that British friendship with these powers, far from constituting a hostile encirclement of Germany. afforded a guarantee that none would pursue an aggressive policy toward it; but that, when a nation had the biggest army and was increasing its already big navy, it was natural that other powers should be apprehensive.

While a section of Radicals and Labour men were suspicious of Grey's policy. public opinion in general (including the Conservative opposition) supported him. In the following year he received the Order of the Garter, an unusual distinction for a commoner. In the meantime, nothing would content the German government but an absolute pledge of neutrality by Britain if Germany were engaged in war—a pledge which Grey naturally could not give.

As soon as Grey heard of the Austrian ultimatum delivered at Belgrade on July 23, 1914, he realized at once that Russia could not allow Serbia to be crushed Acting in the face of a lukewarm or hostile Germany, he indefatigably proposed various schemes for conciliation and conference; but Austria on the expiry of the time-limit of 48 hr. declared mar on Serbia. Hopeful negotiations which had been begun directly between Russian and Austria were wrecked by a German ultimatum to Russia to countermand its mobilization; and on Monday. Aug. 3, Germany declared war on France.

Grey with a cabinet rallying, with few exceptions, to his view, made an appeal in the house of commons on Aug. 3 for public and parliamentary support to a policy of action. The speech finally decided a wavering public opinion; with the exception of some Radicals and extremist Labour men, all parties, including the Irish Nationalists, accepted the necessity of war. Grey demanded next day that Germany should respect the neutrality of Belgium, and, on the German refusal, England went to war.

Much of his time and attention was occupied by difficult questions arising out of the blockade of Germany and the consequent interference with the trade of neutrals. Public opinion in Great Britain constantly complained that the blockade was not enforced with sufficient strictness; while the United States, as the principal neutral, harassed the British government by repeated notes, denouncing the methods of the British navy as unnecessarily prejudicial to U.S. trade and contrary to international law.

Credit must be given to Grey for facilitating, in the early summer of 1915, the entry of Italy—until May 3 a member of the Triple Alliance—into the war against the Central Powers. His warnings, however, failed to prevent Bulgaria from taking the field against the Allies in the autumn of the same year.

In July 1916 an affection of the eyes, made it advisable that he should have as much relief from work as possible, and he accepted a peerage. When a few months later, in December, Asquith was succeeded in the premiership by Lloyd George, failing eyesight and political comradeship both united to determine him to bring his 11 years' tenure of the foreign office to a close. He had served for a longer consecutive period than any predecessor, and in his official methods he carried out his own precept—that foreign policy required not striking effects or bold strokes but careful steering. With the exception of a three months' mission in 1919 to the U.S. to deal with questions arising out of the peace, he did not emerge from his retirement until 1922. It was the time of the decadence of the coalition government and Lord Grey urged that it was not trusted and should come to an end, which happened within a few months; he was also anxious to resuscitate the Liberal party. In foreign affairs he pressed for the re-establishment of good relations with France, and for the arrangement of an inclusive peace pact, beginning with France. When such a pact was concluded at Locarno in 1925 he welcomed it. The cause to which he devoted most of his energy was that of the League of Nations. In Aug. 1928 Lord Grey was elected chancellor of Oxford university. He died Sept. 7, 1933. (G. E. B.; X.)

See Viscount ***Grey, Twenty-Five Years,*** *1892–1916,* 2 vol. (1925); H. Lutz, ***Lord Grey und der Weltkrieg (1927;*** English trans. by E. W. Dickes, 1928).

GREY OF WILTON and **GREY OF RUTHYN.** The first Lord Grey of Wilton was SIR REYNOLD DE GREY (d. 1308) of Wilton, Herefordshire, and of Shirland, Derbyshire, who was summoned to parliament as a baron in or before 1290. From him descended successive generations of Lords Grey of Wilton, none of whom achieved distinction until WILLIAM (d. 1562), 13th lord, came of age in 1529. He held commands in France under Henry VIII, was a leader of the English army which defeated the Scots at the battle of Pinkie (1547) and helped to suppress the west country rebellion (1549). Imprisoned (1551) as a friend of the fallen Protector Somerset and afterward implicated in the attempt (1553) to put Lady Jane Grey on the throne, he was pardoned by Queen Mary and was entrusted with the defense of Guines. In Jan. 1558 he was forced to surrender the town to the French. He later served in Scotland and besieged Leith in May 1560 His son ARTHUR (d 1593), 14th lord, fought in France and Scotland with his father. As lord deputy in Ireland (1580–82) he reduced the Irish rebels to submission, but was afterward charged with having ordered the massacre of about 500 Italians and Spaniards at Smerwick (Nov. 1580). While in Ireland Grey was served as secretary by Edmund Spenser, and it is perhaps he nho figures as Artegall in the Faerie Queene. He was a commissioner for the trial of Mary, queen of Scots (1586). His son THOMAS (d 1614), 15th and last lord. became involved in the Bye plot and in Nov. 1603 forfeited his honours and was imprisoned in the Tower until his death. With him the male line of the family came to an end, but the title was revived (1784), in the archaic form Grey de Wilton, for a descendant of his sister BRIDGET (d. 1648). SIR THOMAS EGERTON (d. 1814), who was created Viscount Grey de Wilton and earl of Wilton (1801). The barony expired at his death.

In 1282 Edward I rewarded Reynold, Lord Grey of Wilton, for his services in the Welsh wars with a grant of the lordship of Ruthyn, Denbighshire. JOHN (d 1323), 2nd lord of Wilton, settled Ruthyn on his younger son, ROGER (d 1353), who in 1325 was summoned to parliament as LORD GREY OF RUTHYN. Roger's grandson REYNOLD GREY (d 1440), 3rd lord, was appointed lieutenant (1402) in north Wales to deal with the Welsh rebels, but was himself captured by Owen Glendower and was afterward ransomed. He was succeeded by his grandson EDMUND GREY (d. 1490), who deserted to the Yorkist cause while in command of the royal vanguard at the battle of Northampton (1460). He soon found favour with Edward IV, who appointed him treasurer of England (1463) and created him earl of Kent (1465). The title descended with the earldom of Kent until 1639 (*see* KENT, EARLS AND DUKES OF) and the barony passed to the families of Longueville (1639), Yelverton (1676), Rawdon-Hastings (1858), Clifton (1887) and Butler-Bowdon (1939). Edward Grey. a younger son of Reynold, 3rd Lord Grey of Ruthyn, married Elizabeth Woodville, afterward queen of Edward IV.

See Arthur Grey, *A Commentary of the Services and Charges of William, Lord Grey of Wilton, KG.*, ed. by P. de M. Grey Egerton (1847). (C. D R.)

GREYTOWN or SAN JUAN DEL NORTE, a port of Nicaragua on the Caribbean sea, at the mouth of the northern channel of the delta of the San Juan river, close to the Costa Rican border Pop. (1959 est.) 413. Greytown was once the chief port of Nicaragua on the Caribbean, and between 1850 and 1870 when the route across Nicaragua was the most comfortable and luxurious line of travel between eastern United States and California, was the terminus of the Atlantic steamers and the starting point of the river boats which carried travellers up the San Juan river, and across Lake Nicaragua, whence they took a 12-mi. stage ride to the Pacific port of San Juan del Sur, to continue their journey to San Francisco.

Bluefields was also, during the period of the British protectorate over the Mosquito coast. the leading port and the chief residence of the English; the name by which the town was still known in modern times, Greytown, is the English designation, the official Nicaraguan name being San Juan del Norte.

The loss of its prime position as a port was caused by the shifting sands of the San Juan river, which virtually closed the northern delta entrance and left the Costa Rican and border channels the chief means of entry and exit to the river. In 1850, the channel at Greytown was 25 ft deep, but by 1875 it had decreased to 5 ft., eliminating the site as a port of entry for seagoing vessels.

The harbour of San Juan del Norte was discovered by Columbus. and was linked with the traffic into Nicaragua by Capt Diego Machua, who in 1529 sailed down the San Juan river from the lake.

In 1796, San Juan was made a port of entry by Spanish royal charter, and new defenses were built just prior to the Independence, in 1821. The British seized the port in 1848, by virtue of their protectorate over the Mosquito coast, and held it until 1860, when, following the Treaty of Managua, the territory was turned over to Nicaragua.

GRIBEAUVAL, JEAN BAPTISTE DE (1715–1789), French artillery general, was born at Amiens on Sept. 15, 1715. He entered the French royal artillery in 1732, and in 1752 became captain of a company of miners. He was lent to the Austrian army on the outbreak of the Seven Years' War, and served as a general officer of artillery. After his return to France he was made inspector of artillery, but he had to wait until 1776 before he became first inspector and was able to carry out the reforms in the artillery arm which are his chief title to fame. *See* ARTILLERY; and for full details Gribeauval's own *Table des constructions des principaux attirails de l'artillerie . . . de M. de Gribeauval,* and the *règlement* for the French artillery issued in 1776.

See Henntbert, *Gribeauval, lieutenant-général des armées du roy* (1896).

GRIBOYEDOV, ALEXANDER SERGEYEVICH (1795–1829), Russian dramatic author, was born on Jan. 4, 1795, at Moscow, where he studied at the university from 1806 to 1812. He then obtained a commission in a hussar regiment, bat resigned it in 1816. The next year he entered the civil service. and in 1818 was appointed secretary of the Russian legation in Persia, whence he was transferred to Georgia.

He had commenced writing early. and had produced on the stage at St. Petersburg (Leningrad) in 1816 a comedy in verse, translated from the French, called *The Young Spouses,* which was followed by other pieces of the same kind. But neither these nor the essays and verses which he wrote would have been long remembered but for the immense success gained by his comedy in verse. Gore' *ot uma*, or *The Mischief of Being Clever* (Eng. trans. by B. Pares. 1925). A satire upon Russian society, or, as a high official styled it, "A pasquinade on Moscow," its plot is slight, its merits consisting in its accurate representation of certain social and official types — such as Famousov, the lover of old abuses, the hater of reforms; his secretary, Molchanin, servile fawner upon all in office; the aristocratic young liberal and Anglomaniac, Repetilov; contrasted with whom is the hero of the piece, Tchatsky, the ironical satirist, just returned from the west of Europe, who exposes and ridicules the weaknesses of the rest, his words echoing that outcry of the young generation of 1820 which reached its climax in the military insurrection of 1825, and was then sternly silenced by Nicholas. Griboyedov wrote this play during his stay at Tiflis (where he had come, on leave. in 1821) as diplomatic secretary to General Ermolov. *Goré ot uma* is undoubtedly one of the great comedies of European literature. He spent the summer of 1823 in Russia, completed his play and took it to St. Petersburg. There it was rejected by the censorship. Many copies were made and privately circulated, and Griboyedov read it to literary circles in St. Petersburg and Moscow, but the first edition was only printed in 1833, four years after his death. Only once did he see it on the stage, when it was acted by the officers of the garrison at Erivan.

He returned to Georgia to General Ermolov's headquarters, in 1825, and after the revolt of Dec. 14 was arrested as a notorious liberal and sent to St. Petersburg, where he succeeded in exculpating himself. He returned to serve with his relative Count Paskievitch-Erivansky during a campaign against Persia, negotiated the peace of Turkmanchai (Feb. 20, 1828) and took the treaty to St. Petersburg.

He considered devoting himself to literature and commenced a romantic drama, *A Georgian Night.* But he was suddenly sent to Persia as minister-plenipotentiary to supervise the execution of the treaty. Soon after his arrival at Tehran the Russian embassy was stormed because of the refuge given there to Russian subjects from Persian harems. Griboyedov was killed during this attack (Feb. 11, 1829).

GRID, in a vacuum tube such as is used in electrical communication, is an electrode having openings through which the electron stream, between cathode and anode, may pass. The relative potential of the grid controls the current flowing between the anode and the cathode.

GRID LEAK, is a resistor, usually of very high resistance, used in association with a condenser and connected directly or indirectly between the cathode and the grid of a vacuum tube in a radio receiving set.

GRIEG, EDVARD HAGERUP (1843–1907), Norwegian composer, was born on June 15, 1843, in Bergen, where his father, Alexander Grieg, was English consul. The Grieg (formerly Greig) family were of Scottish origin, the composer's grandfather having emigrated after Culloden. His mother, Gesine Hagerup, belonged however, to a pure Norwegian peasant family; and it is from her that Grieg appears to have derived his musical talent. She began to give her son lessons on the pianoforte when he was six and his first composition, "Variations on a German melody." was written at the age of nine. In the autumn of 1858, at the recommendation of Ole Bull (*q.v.*), young Grieg entered the Leipzig conservatorium, where he came under the influence of the Mendelssohn and Schumann Romantic school. From Leipzig he went, in 1863, to Copenhagen where he studied for a short time with Niels Gade and Emil Hartmann, both composers representing a sentimental strain of Scandinavian temperament, from which Grieg emancipated himself in favour of the harder inspiration of Richard Nordraak. "The scales fell from my eyes," said Grieg afterward of his acquaintance with Nordraak. "For the first time I learned through him to know the northern folk tunes and my own nature. We made a pact to combat the effeminate Gade-Mendelssohn mixture of Scandinavianism, and boldly entered upon the new path along which the northern school at present pursues its course." A kind of crusade in favour of Norwegian national music resulted, and in the winter of 1864–1865 Grieg founded the Copenhagen concert-society Euterpe for the production of the works of young Norwegian composers. During the winters of 1865–66 and 1869–70 Grieg was in Rome where he met Franz Liszt, who played his piano concerto at sight from the manuscript and gave it his enthusiastic approbation. In the autumn of 1866 he settled in Christiania. In 1872 the Royal Musical academy of Sweden made him a member; in 1874 the Norwegian Storthing granted him an annual stipend of 1.600 kronen. In 1888 he played his pianoforte concerto and conducted his "two melodies for strings" at a Philharmonic concert in London, and visited England again in 1891, 1894 and 1896. He died at Bergen on Sept. 4, 1907.

As a composer Grieg's strength lies in his strong nationalistic colouring, in his exquisite lyrical feeling and in his command of the picturesque and romantic, as exemplified in his lovely and world-famous music to Ibsen's *Peer Gynt*, or in the suite for stringed orchestra, *Aus Holbergs Zeit*, and hardly less so in the equally beautiful and well-known piano concerto. As regards his songs they may be said to be generally the more spontaneous the more closely they conform to the simple model of the *Volkslied*. Yet the much sung *Ich liebe dich* is a song of a different kind, which has hardly ever been surpassed for the perfection with which it depicts a strong momentary emotion; while such other familiar examples as *Solvejg's Lied* and *Ein Schwann* are equally beautiful and characteristic.

Bulow called Grieg the "Chopin of the North," and the phrase may pass though the range of appeal and the quality of the inspiration in Chopin are considered far greater; nor did the national movement inaugurated by Grieg show promise of great development. He may be regarded rather as the pioneer of a musical mission which was perfectly carried out by himself alone.

BIBLIOGRAPHY.—La Mara, *Edvard Grieg* (Leipzig, 1898); Henry T. Finck, *Edvard Grieg* (1906) and *Grieg and his Music* (1919); R. H. Stein. *Grieg* (1921).

GRIEG, (JOHAN) NORDAHL BRUN (1902–1943), Norwegian writer, who combined strong patriotic feelings with a wide cosmopolitan outlook, was born at Bergen on Nov. 1, 1902. After studying literature and languages in Oslo and later in Oxford he combined extensive traveling with journalism, and a strong social conscience was already evident in his first books, the sea poems *Rundt Kap det gode Haab* ("Round the Cape of Good Hope"; 1922), influenced by Kipling, and the novel *Skibet gaar videre* (1924; Eng. trans., *The Ship Sails on*, 1927).

Grieg's love for Norway, especially northern Norway, was expressed without reserve in the poems *Norge i våre hjerter* ("Norway in Our Hearts"; 1929). After publishing six highly personal essays on Keats, Shelley, Byron, Rupert Brooke, C. H. Sorley and Wilfred Owen, *De unge døde* ("The Young Dead Ones"; 1932), he spent two years in Moscow (1932-34). There his social consciousness turned communist. Russian theatre and above all the technique of the cinema inspired his most powerful social play, *Vår ære og vår makt* ("Our Honour and Our Power"; 1935). When Germany occupied Norway in 1940, Grieg escaped to Britain and in his war poems became the leading voice of free Norway. He was killed while on a bombing raid over Berlin on Dec. 2, 1943.

Collected works: *Samlede Verker*, 7 vol. (1947); *Samlede dikt* (1948). *See* also Harald Engberg, *Nordahl Grieg og Tidens Drama* (1946); Kjølv Egeland, *Nordahl Grieg* (1953). (To. S.)

GRIEN, HANS: *see* BALDUNG, HANS.

GRIERSON, SIR GEORGE ABRAHAM (1851-1941), Anglo-Irish linguist, notable for his researches into the languages of India, was born Jan. 7, 1851, at Glanageary, County Dublin, of an Anglo-Irish family of publishers and printers. He acquired his first taste for Indian languages at Trinity college, Dublin, where he took prizes in Sanskrit and Hindi. He qualified for the Indian civil service in 1871 and arrived in Bengal in Oct. 1873.

Grierson spent the next 26 years mostly in Bihar and western Bengal, where he held various posts as magistrate and collector of revenue.

Grierson's first book *Bihar Peasant Life* (1885) contains vast information on the language, techniques, usages and superstitions of the peasantry among whom he had lived. This book was followed by numerous monographs published in *The Indian Antiquary* and in *The Journal of the Asiatic Society of Bengal*, as Grierson's researches spread to Hindi, to the northwestern Dardic languages, which he termed Pisaca, and to Kashmiri. In 1898 he was appointed superintendent of the *Linguistic Survey* of India, a work which engaged his attention from 1898 to 1928, and in which he had the assistance of the Norwegian linguist Sten Konow. The *Survey* in 19 folio volumes furnishes vocabularies for 364 languages and dialects of India. For most of these a skeleton grammar and brief texts are given as well.

Grierson had also a deep interest in Indian popular literature and Indian religion.

Grierson was knighted in 1912, and received the honour of Order of Merit in 1928. A bibliography of his numerous works appears in the *Bulletin of the London School of Oriental and African Studies* for 1936. A brief memoir of his life has been printed in the *Proceedings of the British Academy*, vol, xxviii.

(D. H. H. I.)

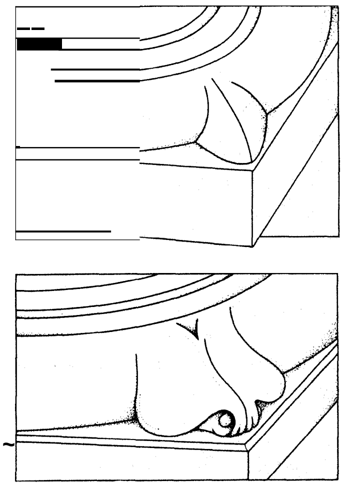
GRIERSON, SIR JAMES MONCRIEFF (1859–1914), British soldier, was born at Glasgow on Jan. 27, 1859, and joined the royal artillery in 1877. Noted from the outset as an exceptionally keen student of his profession, from 1896 to 1900 he was military attaché at Berlin. As a colonel he was with Lord Roberts during the advance from Bloemfontein into the Transvaal; but he was then transferred to China to act as British military representative on the staff of Count Waldersee, commander in chief of the Allied forces against the Boxers. In 1904 he was appointed director of military operations. He commanded the 1st division at Aldershot from 1906–10, and was in 1912 put in charge of the eastern command.

On the outbreak of World War I, Sir J. Grierson was selected for the command of the 2nd army corps. He proceeded to France, but died suddenly on Aug. 17, 1914.

See D. S. Macdiarmid, *Life of Sir James Moncrieff Grierson* (1923).

GRIESBACH, a German watering place in the *Land* of Baden-Wiirttemberg, in the valley of the Rench, 1,800 ft. above the sea, 6 mi. W. of Freudenstadt in Wiirttemberg. It is celebrated for its saline chalybeate waters which were used as early as the 16th century. Pop. (1959 est.) 948. From 1665 to 1805 Griesbach was part of the bishopric of Strasbourg.

GRIFFE, in architecture, a small ornament, generally triangular, which fills the space between the round torus of a column base and the square corner of the plinth below; sometimes known as a spur.



FROM VIOLLET LE DUC, "DICTIONNAIRE RAISONNE DE L'ARCHITECTURE FRANÇAISE"

TOP. BASE FROM THE 11TH CENTURY. BOTTOM: BASE FROM PARIS CATHEDRAL

The use of the griffe is particularly characteristic of the later Romanesque period; it usually takes the form of a group of leaves or a single curling leaf. Grotesque animals are occasionally found.

GRIFFENFELDT, PEDER, COUNT (PEDER SCHUMACHER) (1635–1699), Danish statesman, was born at Copenhagen on Aug. 24, 1635, of a wealthy trading family. He was a precocious child, and received an excellent education. In 1654 Schumacher was sent abroad to complete his studies. From Germany he proceeded to the Netherlands, staying at Leiden, Utrecht and Amsterdam, and passing in 1657 to Queen's college, Oxford, where he lived three years. In the autumn of 1660 Schumacher visited Paris, shortly after Cardinal Mazarin's death, when the young Louis XIV first seized the reins of power. Schumacher seems to have been profoundly impressed by the administrative superiority of a strong ,centralized monarchy; and, in politics, as in manners, France ever afterward was his model. The last year of his travels was spent in Spain, where he obtained a thorough knowledge of the Castilian language and literature. On his return to Copenhagen, in 1662, Schumacher found the monarchy established on the ruins of the aristocracy. He secured the protection of Kristoffer Gabel, the king's confidant, and in 1663 was appointed the royal librarian. A friendship with the king's bastard, Count Ulric Frederick Gyldenlove, consolidated his position. In 1665 Schumacher obtained his first political post as the king's secretary, and the same year he composed the memorable *Kongelov.*

On the death of Frederick III (Feb. 9, 1670) Schumacher was the most trusted of all the royal counselors. He alone was aware of the existence of the new throne of walrus ivory embellished with three silver life-sized lions and of the new regalia, both of which treasures he had, by the king's command, concealed in a vault beneath the royal castle. Frederick III had also confided to him a sealed packet containing the *Kongelov,* which was to be delivered to his successor alone. Schumacher had been recommended to his son by Frederick III on his deathbed. When, on Feb. 9, 1670, Schumacher delivered the *Kongelov* to Christian V, the king bade all those about him withdraw, and after being closeted an hour with Schumacher, appointed him his "Obergeheimesekreter." His promotion was rapid. In July, 1670, he was ennobled under the name of Griffenfeldt; in November: 1673, he was created a count, a knight of the Elephant and, finally, imperial chancellor. In the course of the next few months he gathered into his hands every branch of the government.

On May 25, 1671, the dignities of count and baron were introduced into Denmark "to give lustre to the court"; a few months later the order of the Danebrog was instituted as a fresh means of winning adherents by marks of favour. Griffenfeldt was the originator of these new institutions. To him monarchy was the ideal form of government. But he had also a political object. Griffenfeldt saw that, in future, the first at court would be the first everywhere. He promoted trade and industry by the revival of the *Kammer Kollegium,* or board of trade, and the abolition of some of the most harmful monopolies. Both the higher and the provincial administrations were reformed and centralized; and the positions and duties of the magistrates, who now also received fixed salaries, were exactly defined. In the last three years of his administration, Griffenfeldt gave himself entirely to the conduct of the foreign policy of Denmark. He aimed at restoring Denmark to the rank of a great power by carefully nursing her resources, and in the meantime securing and enriching her by alliances, which would bring in large subsidies while imposing a minimum of obligations. This policy demanded: first, peace, especially peace with Denmark's most dangerous neighbour. Sweden; and, secondly, a sound financial basis, which he expected the wealth of France to supply. Next, Denmark was to beware of making enemies of France and Sweden at the same time. An alliance on fairly equal terms between the three powers would, in these circumstances, be the consummation of Griffenfeldt's "system"; an alliance with France to the exclusion of Sweden would be the next best policy; but an alliance between France and Sweden, without the admission of Denmark, was to be avoided at all hazards. But, despite Griffenfeldt's open protests and subterraneous countermining, war was actually declared against Sweden in 1675, and his subsequent policy seemed so obscure and hazardous that his enemies found an opportunity to destroy him.

On March 11, 1676, Griffenfeldt was arrested in the king's name and conducted to the citadel, a prisoner of state. On May 3 he was tried by an extraordinary tribunal of ten dignitaries, and conducted his own defence on a variety of charges. For 46 days before his trial he had been closely confined in a dungeon without lights. books or writing materials. Every legal assistance was illegally denied him. Nevertheless he proved more than a match for his accusers. But he was condemned to degradation and decapitation. The primary offence of the ex-chancellor was the taking of bribes, which no twisting of the law could convert into a capital offence. while the charge of treason had not been substantiated. Griffenfeldt was pardoned on the scaffold, his sentence being commuted to lifelong imprisonment. Denmark's greatest statesman lingered out his life for 22 years in a lonely state prison, first in the fortress of Copenhagen, and finally at Munkholm on Trondhjem fiord. He died at Trondhjem on March 12, 1699.

GRIFFES, CHARLES TOMLINSON (1884–1920), U.S. composer of impressionistic music of pronounced melodic and harmonic originality, was born at Elmira, N.Y., Sept. 17, 1884. He studied piano in Berlin in 1903–07 but decided to compose. He returned to the U.S., took a position as music teacher in a school for boys at Tarrytown, N.Y., and wrote in his spare time. His works, all highly coloured, showed a succession of influences by German, French, Italian, Russian, American Indian and oriental sources. His best-known works include *The Pleasure Dome of Kubla Khan,* a symphonic poem after Coleridge; *Sho-Jo* and *The Kairn of Koridwen,* dance dramas; *The White Peacock,* an orchestral tone poem, and Sonata for piano. He died in New York city on April 8, 1920.

GRIFFIN (O'GRIOBTA, O'GREEVA), **GERALD** (1803–1840), Irish novelist and dramatic writer, was born at Limerick. Having written a tragedy, *Aguire,* which was highly praised by his friends, he set out in 1823 for London with the purpose of "revolutionizing the dramatic taste of the time by writing for the stage." In spite of the recommendations of John Banim, he had a hard struggle. *The Noyades,* an opera entirely in recitative, was produced at the English Opera house in 1826; and the success of *Holland Tide Tales* (1827) led to *Tales of the Munster Festivals* (3 vol., 1827), which were still more popular. In 1829 appeared his fine novel, *The Collegians,* afterward successfully adapted for the stage by Dion Boucicault under the title of *The Colleen Bawn.*

Griffin followed up this success with other novels, and a number of lyrics touched with his native melancholy. But he became doubtful as to the moral influence of his writings, and sought admission into a society of the Christian Brothers at Dublin, in Sept. 1838, under the name of Brother Joseph. He died at Cork of typhus fever on June 12, 1840. Before adopting the monastic habit he burned all his manuscripts; but *Gisippus,* a tragedy which he had composed before he was 20, accidentally escaped destruction, and in 1842 was put on the Drury Lane stage by Macready with great success.

GRIFFIN (GRIFFON or GRYPHON), a composite creature with lion body, winged or wingless, and bird (usually eagle) head. The name is from the Greek *gryps* via the Latin *gryphus.* Like the sphinx (*q.v.*), the griffin is a favourite motif in decorative arts in the ancient near east and classical lands. Probably originating in the Levant in the 2nd millennium B.C., it occurred on seals and ivories all over western Asia by about 1500 B.C.; it was common in Crete around the same time and by the 14th century B.C. was known in Greece also. The Asiatic griffin has a crested head, while the Minoan and Greek griffin usually has a mane of spiral curls. It may be recumbent or seated on its haunches, often paired with a sphinx; occasionally it acts as a beast of prey, leaping on another animal, but it may itself be the victim of a predator. The large griffins painted on the throne room wall of the palace of Minos in Crete suggest a protective function for the beast.

In the Iron Age the griffin again appeared in both Asia and Greece. At Carchemish on the upper Euphrates it is carved on a palace wall of the 10th century, and Assyrian reliefs of the next three centuries show griffin-demons. It occurred in the 8th century among the cast bronzes of Urartu in the Armenian mountains and apparently traveled westward through Anatolia to Greece. From the 8th to the 6th centuries (orientalizing and archaic periods) the griffin is common on Greek metalwork and ivories and occurs also on painted vases. Greek metalworkers evolved a handsome, stylized rendering. with the beak open to show the curling tongue and the head provided with horses' ears and a large knob on top. Often griffin heads ornamented the rims of huge bronze caldrons, and similar caldrons are known from Armenia, to the Etruscan tombs of Italy. Apparently the griffin was in some sense sacred, appearing frequently in sanctuary and tomb furnishings, but its precise meaning is unknown. The few references in the ancient authors give no clear idea of the nature of the creature or its role in cult and legend. (A. Ps.)

GRIFFITH, ARTHUR (1872–1922), Irish politician, was born in Dublin on March 31, 1872 and began his working life as a printer. When the Irish party was divided over the Parnell case, Griffith, like Dublin artisans in general, sided with Parnell and against the clergy. But the rancorous quarrels which then disfigured Irish politics disgusted young men and led them to despair of success along constitutional lines. New organizations came into existence in Dublin, the most important being the Gaelic League for the revival of the Irish language. Griffith joined this movement, but his main activities were with the Celtic Literary Society, the leading figure of which was William Rooney. Over and above all these minor groups there existed the Irish Republican Brotherhood or Fenian Society, of which Griffith became a member. He went to South Africa in 1896, owing to lack of employment in Dublin, but home-sickness brought him back to Ireland in 1898. In 1899 *The United Irishman,* a weekly paper, was established.

Early Writings and Aims.—At first Rooney counted for more in the new movement than Griffith, for he possessed that personal magnetism in which Griffith was lacking; yet after his death in 1901, the paper strengthened rather than weakened. No such journalism had appeared in Dublin since the time of Young Ireland. It was savagely political; but its politics had an idealism which was foreign to the agrarian revolution. Griffith cared passionately for the things of the mind; his own writing had the beauty of trenchant steel; and he welcomed contributions from the best writers in Ireland, W. B. Yeats, "A. E." and the rest. No contributor expected to be paid, for all knew that Griffith himself lived on a pittance.

Griffith's aim was both destructive and constructive. He sought first to divert his countrymen from the attempt to win self-government through parliamentary action at Westminster, and secondly to persuade them to work for it in their own country. Although all his intimate associates were Fenians, he recognized that the majority of Irish Nationalists did not think separation from Britain possible. He therefore resigned membership of the I.R.B., and aimed at winning over the separatists to work for a parliament in Ireland united to that of England only by the link of the Crown. As a means to this end, he proposed passive resistance and an appeal to moral force. Payment of taxes was to be refused. Members elected to parliament were to absent themselves from Westminster, and to sit in Ireland as a council and govern only by the assent of the nation. Tribunals were to be set up to which cases should be brought.

Rise of Sinn Féin.—This policy was first publicly announced at a meeting in Dublin in Oct. 1902. The body which met called itself Cumann na nGaedheal or "Society of the Gaels." But the name chosen to represent their policy was Sinn Féin, "Ourselves"—Irish words which in their proverbial use mean roughly "Stand together." The name was soon transferred from the policy to its adherents. Candidates were put forward at municipal elections and by 1906 there were 14 Sinn Féiners on the Dublin corporation. But Griffith's propaganda was mainly confined to the capital; and in 1907 a member of the Irish party, who resigning his seat, stood for re-election as a Sinn Féiner, was defeated.

The new policy at first did not make much headway. Resistance to taxation proved difficult because all taxation except income tax was indirect, and a large proportion of income tax payers were unionists. The only effective forces were the personality and the pen of Arthur Griffith. His paper changed its name in 1906 when damages for libel were awarded against the *United Irishman.* That journal disappeared, and re-emerged as *Sinn Féin.* In 1907, when the Parliamentary party had suffered a reverse, *Sinn Féin* appeared as a daily paper, but this experiment soon had to be abandoned, and after another bankruptcy *Eire* became its name. Griffith wrote no books: but he published in 1905 a pamphlet called *The Resurrection of Hungary* which described how an almost vanished language had been restored to national use, and how the elected deputies of an ancient nation, through a policy of abstention from the Austrian Assembly, gained full freedom under a dual monarchy.

The Volunteer Movement.—Griffith, during these years, taught the rising generation to despise and distrust not only the methods but the character of those who were then leading the main national movement and he was not too scrupulous in his modes of attack. Yet when it became clear in 1911 that a Home Rule Bill was seriously intended, he announced his intention not to hamper Redmond. But the measure proposed was wholly unlike his ideal and he condemned it root and branch, his most furious opposition being directed against that partition of Ireland which he was later constrained to accept. In the shaping of events, neither he nor his paper counted for much till the growth of the Ulster Volunteers revived the hopes of the physical force party. Griffith supported the counter-organization of the Irish Volunteers by word and deed. He was one of those who received the rifles landed at Howth in July 1914. At the outbreak of the World War the Volunteers split, nine-tenths of them adhering to Redmond in support of the British cause but the remainder, active and determined, remained in Ireland; and Griffith's paper was their main organ. The censorship attacked it, but instead of *Eire,* there came out *Scissors and Paste,* a journal consisting of extracts from war news arranged to give an impression very unfavourable to the Allies. It was only one of many journals Griffith had founded a school, a "mosquito press" and had set the example of tenacity and courage.

The Easter Rising.—The Easter Rising of 1916 was a surprise to the majority of Irishmen. Griffith took no part in it and thereby lost influence with the extremists. But the British authorities remedied this by putting him into Frongoch, the detention camp in Wales, which became a crowded academy of Sinn Féin. Yet when, in July 1917, the prisoners were released, de Valera was chosen as their leader. Griffith proposed this election at the convention of Sinn Féin, while he himself returned to his desk, re-issuing his paper as *Nationality:* this also was suppressed and re-appeared as *Eire Og.* He was again put in jail in 1918. At the general election after the armistice, Sinn Féin swept the board outside Ulster, and Griffith's policy was put into force. The elected members (such as were not in prison) assembled as Dail Eireann, the Irish parliament. But, going beyond Griffith's plan, they declared for an Irish republic, electing de Valera as president and Griffith as vice-president. Both these men were then prisoners; but after some months the president escaped and Griffith was liberated.

Griffith as Leader.—During de Valera's absence in America, from June 1919 to the close of 1920, Griffith acted as head of the "Irish Republic." His policy now was carried out in its entirety. The elected bodies, county councils and municipalities refused to take orders from the British authorities in Dublin castle; Sinn Féin courts were set up and functioned with notable success; income tax was withheld. But these forms of passive resistance were effective only because active resistance was in progress. Griffith neither launched nor controlled the guerrilla war, to the pressure of which England finally yielded. During that struggle, power rested with Collins and other young men. Yet Griffith had still a great part to play. When the truce was proclaimed and negotiations were opened in July 1921, de Valera refused to accept the responsibility of abating the full separatist demand. Griffith thereupon undertook the leadership of the delegation which finally secured the inclusion in the treaty of the substance of Sinn Féin's original demand.

Many of those who supported him would not accept the full consequences of the treaty; and when de Valera resigned, Griffith was elected president, not of the Irish Free State, but of the republic, and the army continued to be in theory the republican army. To meet the difficulty, Griffith set up a provisional government with Michael Collins as chairman to carry on until a general election should have ratified the treaty. This resulted in an illogical division of authority, and as months passed Griffith's public utterances as president were often contradicted by the action or inaction of the provisional government. During the final diicussions with the British government in June 1922, concerning the treaty, he interviewed the leading Irish unionists and pledged himself to secure them full representation in the public life of the Free State. His conception of Ireland was less narrowly Gaelic than that of Sinn Féin in general. After the elections on June 16, when a plain verdict was given for acceptance of the treaty, the government was at last forced to take action against the mutinous section of the army. Civil war began on June 27. In July the main bodies of the irregulars were everywhere decisively beaten, and on Aug. 11 a force sent around by sea occupied Cork, the last important town to be regained. On the morning of Aug. 12 Griffith fell dead suddenly on the way to his office in Dublin. Essentially he ranks as a publicist, an educator, an inspirer of action. (S. G.)

GRIFFITH, DAVID (LEWELYN) WARK (1875–1948), U.S. motion-picture director and producer, under whose direction the camera developed into a superb instrument for the expression of emotions and ideas, was born in Oldham county, By., on Jan. 22, 1875. After various jobs in Louisville, he played small parts with the Mefert stock company (1897–99) and later toured with other stock companies. In 1907 he sold his first play, *A Fool and a Girl*, for $1,000. The production was a failure, and he then turned to the new medium of motion pictures. He was hired for a leading role in *Rescued From the Eagle's Nest* (1907) and sold several stories to Biograph studios.

In 1908 Griffith went to work as a director for Biograph, continuing until 1913 when he became associated with Mutual Films. In 1914 he began work on a film based on *The Clansman*, a Civil War novel by Thomas Dixon. It was an epochal picture. Opening in New York city in March 1915 with the title *The Birth of a Nation*, it established motion pictures both as popular entertainment and as an art. The racial aspects of the picture aroused much controversy. In 1916 Griffith released *Intolerance*, an epic sermon against injustice and despotism. With Charlie Chaplin, Douglas Fairbanks and Mary Pickford, he formed United Artists Corp. in 1919.

Among Griffith's other famous pictures were *Broken Blossoms* (1919), *Way Down East* (1920) and *Orphans of the Storm* (1922). His two talking pictures were less notable. He retired from directing in 1932.

Griffith was a genius in the art of the film. He originated or improved upon the long shot, the close-up, the pan shot, high- and low-angle shots, the moving shot, the dissolve, soft focus, cross-cutting. the flashback. night photography and back lighting. His contributions to editing and his use of tempo, scenery and crowds were equally remarkable. He died in Hollywood, Calif., on July 23, 1948. (M. S. By.)

GRIFFITHS, JOHN WILLIS (1809–1882), U.S. naval architect, creator of the first notable clipper sailing ship, was born in New York city on Oct. 6, 1809. He was apprenticed to his father's trade of shipwright, and at the age of 19 laid the lines of the frigate "Macedonia." In 1835 he suggested the ram for the bow of warships; in 1836 he published a series of articles embodying his ideas on shipbuilding in the *Advocate* at Portsmouth, Va.; in 1842 he gave a series of lectures on naval architecture in New York city and elsewhere, the first notable discourses on the subject to be given in the United States. In the same year he opened a free school for instruction in shipbuilding. In 1841 he proposed departures from the accepted standards in ship construction and in 1843 began the construction of a ship embodying his proposals for William H. Aspinmall, a New York merchant engaged in the China trade.

This ship, christened the "Rainbow" and launched in 1845, was the first renowned clipper, and introduced a new era in shipbuilding. Expressing an important tenet of modern aesthetics (announced simultaneously by his contemporary Horatio Greenough), Griffith argued that form produced in accordance with functional needs not only sails fastest and carries large cargoes, but is beautiful.

Continuing his experiments. Griffiths invented. in 1848, iron keelsons for wooden ships. and exhibited a steamboat model at the 18jr London exhibition. Three years later he built for William Norris of Philadelphia a steamer that made a record for speed betneen Havana and New Orleans.

He became coeditor and associate proprietor of the *Nautical Magazine and Naval Journal* in 1856, but upon his appointment by the U.S. government as special naval constructer in 1858, the magazine ceased publication. He then built the U.S. gunboat "Pawnee," incorporating several new features including twin screws and a drop bilge, which was one of the widest and lightest draft vessels of similar displacement ever built. Then followed a series of inventions: bilge keels to prevent rolling (1863), a timber-bending machine which he used with success in the "New Era," Boston, 1870, and triple screws for great speed (1866). He was engaged by the U.S. government in 1871–72 to erect timber-bending machinery, and in 1872 built the "Enterprise" for the government at Portsmouth. N.H. In 1879–82 he was engaged in editorial work on the *American Ship*, a New York city weekly journal. He died in Brooklyn, N.Y., on April 29, 1882.

His *Treatise on Marine and Naval Architecture*, 2 vol. (1850), was republished in England, and brought him recognition from many maritime nations. He also published *The Shipbuilder's Manual*, 2 vol. (1853); *The Progressive Shipbuilder*, 2 vol. (1875–76). (A. B.-B.)

GRIGNARD, VICTOR (1871–1935), French chemist, who shared the 1912 Nobel prize in chemistry with Paul Sabatier (*q.v.*) for his discovery of the so-called Grignard reaction. Born at Cherbourg, May 6, 1871, he studied at Lyons under Louis Bouveault and Philippe Barbier. It was Barbier who in 1898 had Grignard repeat some experiments on the preparation of a tertiary alcohol from a mixture of methyl heptyl ketone, magnesium and methyl iodide. Grignard hit upon the idea of treating the iodide mith the magnesium first, and, following older experiments of Sir Edward Frankland on the preparation of zinc alkyls, carried out the reaction in ether.

This first of the Grignard reagents was a complete success, and by 1901 Grignard was able to obtain a doctor's degree on the synthesis of acids, alcohols and hydrocarbons. Other syntheses followed, including the discovery by Grignard's pupil Émile Blaise that organometallic compounds of other metals are most conveniently prepared from Grignard reagents. Grignard became professor of organic chemistry at Nancy in 1910 and at Lyons in 1919. He died Dec. 13, 1935.

For biographical details *see* H. Gilman, *J. Amer. Chem. Soc.*, Proc. 59, 17 (1937); C Courtot, *Bull. Soc chim.* Fr., vol. 3, p. 1434 (1936); H. Rheinboldt, J. *Chem. Educ.*, 27:476–488 (1950).

GRIGNARD REAGENTS are organic derivatives of magnesium, commonly prepared by the reaction of an organic halide (RX, where R represents an organic radical and X represents chlorine, bromine or iodine) in a solvent which is usually diethyl ether. They are usefully represented by the general formula RMgX, though they have somewhat complex constitutions (*see* below). Their very high chemical reactivity makes them one of the most valuable classes of synthetic reagents, a typical and simple reaction being the formation of ethyl phenyl carbinol from benzaldehyde and ethylmagnesium bromide:

$$C_2H_5MgBr + C_6H_5CHO \rightarrow C_6H_5CH(OMgBr)C_2H_5$$
$$\xrightarrow{H_2O} C_6H_5CH(OH)C_2H_5 + MgBrOH$$

They are named after Victor Grignard (1871–1935), who developed their chemistry in 1900 and the following years. Organomagnesium compounds (R_2Mg) had first been prepared. with some difficulty, by Auguste André Thomas Cahours in 1860. Grignard's contribution, for which he was awarded the Nobel prize for chemistry in 1912, was the discovery that organomagnesium halides could be prepared, and used for a great variety of synthetic purposes, from an organic halide and metallic magnesium provided that a suitable solvent is used. The solvent is normally diethyl ether, but other solvents which share the common characteristic of donor character can also be used.

The preparation, constitution and typical reactions and synthetic applications of Grignard reagents are briefly reviewed below.

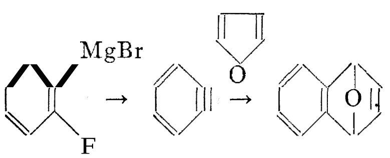
Preparation Using Ether as the Solvent. — Grignard reagents are normally prepared by the slow addition of a solution of the appropriate organic halide in ether to a stirred suspension of magnesium in the same solvent. Since Grignard reagents react very rapidly with oxygen and mith water, it is desirable that air should be excluded and that both reactants and apparatus should be dry.

Since metallic magnesium, once exposed to air, is always coated with a thin film of oxide, the reaction cannot start until this film has been broken down. The formation of a Grignard reagent is therefore slow at the beginning, but the reaction usually accelerates very markedly once an appreciable amount of reagent has been formed. One method for starting the reaction is to crush some of the metal (turnings are generally used) with a glass rod after a little halide has been added. Addition of a small crystal of iodine, or the use of magnesium which has previously been heated to about 200° C. in the presence of some iodine, are more favoured methods for starting reaction; these methods owe their efficacy to the attack of iodine on the magnesium affording ether-soluble magnesium iodide and exposing an active metal surface. Magnesium bromide and iodide also form ether-insoluble hydrates which have a most advantageous effect in further drying the ether present. A similar effect may be achieved by the use of a little ethylene dibromide, which attacks magnesium rapidly, forming ethylene and magnesium bromide. This method is especially recommended when there is any reason to suspect the dryness of the ether, and is generally preferred to the "entrainment method" whereby a particularly reactive halide such as methyl iodide or ethyl bromide is added to the magnesium along with the less reactive halide from which a Grignard reagent is desired. The disadvantage of the entrainment method is the simultaneous formation of two Grignard reagents, and later, necessarily, of two sets of products.

Organic halides vary greatly in their rates of reaction with magnesium. For example, alkyl iodides generally react very rapidly whereas most aryl chlorides react very slowly, if at all. The most reactive halides are liable to undergo side reactions such as the Wurtz reaction, or the formation of olefins by dehydrohalogenation. If a choice between a chloride, bromide and an iodide is possible, it is best to use the least reactive halide which reacts sufficiently rapidly.

The formation of Grignard reagents is a strongly exothermic reaction, so care is necessary to avoid the addition of too much halide before the reaction is well started. Halide is usually then added at a rate sufficient to maintain steady boiling of the ether. It is desirable to complete the preparation of a Grignard reagent in one operation, and the maintenance of steady boiling has the advantage that the atmosphere of ether vapour keeps air away from the reagent. If boiling is allowed to cease before the reagent is used, then an atmosphere of dry oxygen-free nitrogen should be provided.

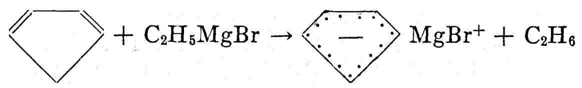
Di-Grignard reagents (XMgRMgX) have considerable synthetic value, but are obtainable as a rule only with difficulty. *Meta* and para aromatic dihalides have not been converted satisfactorily to di-Grignard reagents by any direct route, though, for example, paradibromobenzene affords paradilithiobenzene by reaction with n-butyl-lithium. *Ortho* dihalides such as o-hromoiodobenzene have afforded di-Grignard reagents which have found application in the synthesis of o-phenylene tertiary diphosphines (F. G. Mann). A peculiar complication in the case of o-dihalides is the side reaction resulting in elimination of magnesium halide and formation of the very reactive "benzyne" intermediate which immediately undergoes addition reactions (F. G. Mann, G. Wittigj, with furan for example:



Indirect methods for the preparation of Grignard reagents are not so widely used as the indirect methods for organolithium compounds. The metal-hydrogen exchange reaction is particularly useful for obtaining Grignard reagents derived from relatively acidic hydrocarbons. These hydrocarbons derive their acidity from the enhanced electronegativity of acetylenic carbon,

$$C_6H_5C{\equiv}CH + C_2H_5MgBr \rightarrow C_6H_5C{\equiv}CMgBr + C_2H_6$$

or from the formation of an aromatic from a nonaromatic system,



It is probable that both these types of Grignard reagent, the acetylenic and the cyclopentadienyl (both most useful synthetic reagents), hdve essentially ionic constitutions. Carbanions of these types are much less reactive than those derived from alkyl or simple aryl groups and do not attack ether. Acetylene itself affords a di-Grignard reagent,

$$C_2H_2 + 2C_2H_5MgBr \rightarrow BrMgC{\equiv}CMgBr + 2C_2H_6$$

but the mono-Grignard reagent has been prepared by the slow addition of ethyl magnesium bromide to tetrahydrofuran which is kept saturated with acetylene (E. R. H. Jones, L. Skatteböl and M. C. Whiting),

$$C_2H_2(\text{excess}) + C_2H_5MgBr \xrightarrow{\text{THF}} HC{\equiv}CMgBr + C_2H_6$$

Preparation Using Solvents Other Than Ether. — Grignard reagents are prepared and used in diethyl ether far more than in any other solvent. However, other solvents are preferred, (1) when high reaction temperatures are necessary; (2) when the reaction products have a volatility comparable with that of diethyl ether; and (3) when the use of ethers of more strongly donor character than diethyl ether is necessary to promote the formation of Grignard reagents from relatively unreactive halides.

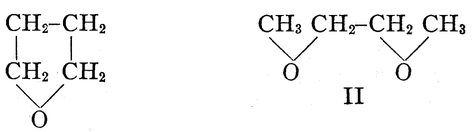
The first case is the simplest; the Grignard reagent may be prepared in ether in the usual way, the chosen reactant added, folloued by a higher boiling solvent such as benzene, xylene or di-n-butyl ether. The reaction mixture may then be heated well above the boiling point (b.p.) of ether, when much ether (but not all) will distill away. In carrying out such reactions subsequent working up is often facilitated if the ether distillate is returned to the cooled reaction mixture before the hydrolysis step.

The second case requires the absence of diethyl ether. The preparation of trimethylarsine (b.p. 50.4° C.),

$$AsCl_3 + 3CH_3MgI \rightarrow (CH_3)_3As + 3MgClI$$

is an example in which a difficult separation of the product from diethyl ether can be rendered quite easy by the use of di-n-butyl ether (b.p. 142° C.) as solvent.

The third case is perhaps the most interesting. It has been shown (H. Sormant) that vinyl halides (preferably chlorides or bromides) form Grignard reagents if the reaction is carried out in tetrahydrofuran. This cyclic ether (I) has a



I II

stronger donor character than diethyl ether on account of steric effects. The chelating di-ether (11), ethylene glycol dimethyl ether, also promotes the formation of Grignard reagents in difficult cases. The preferred reaction temperature is 40°–50° C. and a final concentration of just under a-molar is suitable. The use of tetrahydrofuran may be further illustrated by the formation of phenyl magnesium chloride from chlorobenzene and magnesium in that solvent; chlorobenzene does not react with magnesium in diethyl ether.

Estimation of Grignard Reagents. — The simplest method is the hydrolysis of an aliquot, the addition of a known amount of acid, followed by back-titration with alkali:

$$2RMgX + 2H_2O \rightarrow 2RH + MgX_2 + Mg(OH)_2$$

Often it is not sufficient to know on hydrolysis the total amount of alkali formed, and a few methods have been developed for measuring the amount of a specific Grignard reagent present. The most commonly used method has been reaction with carbon dioxide, followed by isolation of the resulting carboxylic acid:

$$RMgX + CO_2 \rightarrow RCO_2^-MgX^+ \xrightarrow[H_2O]{HCl} RCO_2H$$

Some reactive Grignard reagents can combine with the carboxylic salts, forming ketones after hydrolysis. This complication is reduced or avoided by adding the Grignard solution to a mixture of solid carbon dioxide and ether. There are several instances in which carbonation does not give a good indication of the amount of a Grignard reagent present, and the use of iododimethylarsine has been recommended (F. G. Mann).

$$RMgX + (CH_3)_2AsI \rightarrow RAs(CH_3)_2 + MgXI$$
$$RAs(CH_3)_2 + CH_3I \rightarrow RAs(CH_3)_3I$$

The tertiary arsine first formed may conveniently be converted into the quaternary iodide, which is insensitive to air and is usually easy to purify by crystallization.

A very useful method has been developed (H. Gilman and F. Schulze) for the detection of Grignard reagents or other reactive organometallic compounds. A small sample of the test solution is added to about an equal volume of a 1% solution of Michler's ketone in dry benzene; after hydrolysis, the reaction product is oxidized by the addition of a little 0.2% solution of iodine in glacial acetic acid. Development of a blue to green colour indicates the presence in the test solution of a Grignard reagent (or organometallic compound sufficiently reactive to add to a ketone). The test involves the formation of a di- or tri-phenylmethane-type dye. Thus phenylamagnesium bromide gives malachite green:

$$(p-Me_2N.C_6H_4)_2CO + PhMgBr \rightarrow (p-Me_2N.C_6H_4)_2PhCOMgBr$$
$$\downarrow H_2O$$
$$[(p-Me_2N.C_6H_4)_2PhC]^+I^- \xleftarrow{I_2} (p-Me_2N.C_6H_4)_2PhCOH$$

malachite green iodide

Constitution of Grignard Reagents.— Although normally given the formula RMgX, the Grignard reagents evidently have a rather complicated constitution; indeed, the more closely this has been studied the more involved has the picture become. Addition of dioxan to ether solutions of Grignard reagents results in the precipitation of dioxan complexes of magnesium halides, and subsequent evaporation of the solvents affords magnesium dialkyls, R_2Mg. This led to a suggestion that an equilibrium of the type:

$$2RMgX \rightleftharpoons R_2Mg + MgX_2 \text{ or } R_2Mg.MgX_2 \rightleftharpoons R_2Mg + MgX_2$$

is involved. Though most useful as a preparative method for the dialkyls (or diaryls), the various conclusions drawn from this reaction about the position of equilibria of the type:

$$2RMgX \rightleftharpoons R_2Mg + MgX_2$$

have been shown to be invalid.

Recent experiments indicate that scarcely any exchange takes place between Mg^xBr_2 and $(C_2H_5)_2Mg$ in ether solution, the Mg^xBr_2 being labeled with either Mg^{28} or Mg^{25}. Since the solutions obtained by mixing $(C_2H_5)_2Mg$ and $MgBr_2$ appear to be identical with the Grignard reagent prepared from magnesium and ethyl bromide, it appears that the Grignard reagent is better represented by a complex R_2Mg, MgX_2 than by RMgX.

Solutions of Grignard reagents become viscous on concentration and ether is tenaciously retained: this indicates some sort of association and also that ether is chemically combined, no doubt forming co-ordination complexes. The molecular weight of several Grignard reagents, in solutions of concentration less than molar, indicates an association of about two. Experiments on their electrical conductivity show that ionic species must be present and that magnesium is present in both anions and cations.

The electrolysis of solutions of Grignard reagents is consistent with the ion discharged at the cathode being basically RMg^+, which may be solvated or associated or both. The cathode process appears to produce free radicals, since the organic products formed are those expected to result from hydrogen abstraction (from solvent molecules) by the more reactive radicals, and from the dimerization of the more stable and long-lived radicals such as benzyl.

Experiments on the alkyl and aryl derivatives of sodium, compounds which evidently contain carbanions, show that these negatively charged hydrocarbon ions are so reactive that they rapidly attack ethers. Since Grignard reagents are often stable in ether for very long periods, carbanions cannot be present. Nevertheless, a carbon atom covalently bound to a much more electropositive magnesium atom will certainly bear at least a fractional negative charge, and most reactions of Grignard reagents are intelligible on the basis of attack of the anionic carbon atom $R_3C(\delta-)$ on the most positive part of the reactant; *e.g.,* the carbon atom of a carbonyl group $R_2\overset{\delta+}{C}=\overset{\delta-}{O}$.

REACTIONS OF GRIGNARD REAGENTS

With the exception of ethers and tert-amines there are very few organic functional groups which fail to react with Grignard reagents, though by no means all these reactions have achieved any notable importance.

Active Hydrogen.— Since such weakly acidic substances as acetylene and cyclopentadiene (see above) react with Grignard reagents, it is not surprising to find that all substances containing $-OH$, $-SH$ or $-NH$ groups also behave as'acids. For example, piperidine reacts as follows:

$$C_5H_{10}NH + CH_3MgI \rightarrow C_5H_{10}NMgI + CH_4$$

Volumetric measurement of the methane formed in such reactions is the basis of an analytical method for the determination of "active hydrogen."

Carbon Dioxide.— The formation of carboxylic acids has been mentioned earlier, in connection with the estimation of Grignard reagents:

$$RMgX + CO_2 \rightarrow RCO_2MgX \xrightarrow[H_2O]{HX} RCO_2H + MgX_2$$

Inorganic Halides.— The halides of the alkali or alkali earth metals do not react except for halogen exchange, with the further exception of the beryllium halides which afford organoberyllium compounds:

$$2CH_3MgI + BeCl_2 \rightarrow (CH_3)_2Be + MgCl_2 + MgI_2$$

This is an example of one of the most generally useful methods for the preparation of organometallic compounds. The reactions often proceed in stages, for example,

$$C_2H_5MgBr + HgBr_2 \rightarrow MgBr_2 + C_2H_5HgBr$$
$$C_2H_5HgBr + C_2H_5MgBr \rightarrow MgBr_2 + (C_2H_5)_2Hg$$

Most nonmetallic halides form organic derivatives on treatment with Grignard reagents. Thus phosphorus trichloride and phenylmagnesium bromide affords triphenylphosphine in good yield:

$$PCl_3 + 3C_6H_5MgBr \rightarrow (C_6H_5)_3P + 3MgClBr$$

The halides of metals which do not easily form organic derivatives also react with Grignard reagents, and the ultimate products of such reactions are usually consistent with the formation of unstable organometallic compounds and their subsequent decomposition. Most transition metal halides give hydrocarbons as the main organic product of reaction with Grignard reagents, the halides being in effect reduced to the metal:

$$AgCl + C_2H_5MgBr \rightarrow Ag + MgClBr + C_2H_4 + C_2H_6$$

The hydrocarbon products are usually those to be expected on the basis of the unstable organometallic intermediate decomposing to form organic free radicals, which are generally disproportionate or react with the solvent by hydrogen abstraction. Grignard reagents derived from cyclopentadiene and indene form a variety of organometallic compounds on reaction with certain transition metal halides.

$$2C_5H_5MgBr + FeCl_2 \rightarrow (C_5H_5)_2Fe + MgCl_2 + MgBr_2$$

Biscyclopentadienyliron is the most stable member of this large class of compounds, in most of which the metal atom is bound to the cyclopentadienyl ring by π rather than by a bonds.

Organic **Halides.**—Aryl and vinyl halides are not usually reactive to Grignard reagents. Alkyl halides can react in several ways and the course of reaction is not always easy to predict; several products are formed in many instances.

Only in special cases is reaction between a Grignard reagent and an organic halide a good preparative method.

Carbonyl Halides. — These usually react very rapidly to give, after hydrolysis and working up, tertiary alcohols:

$$RCOX + 2R'MgX \rightarrow RR'_2COH$$

By "reverse addition," *i.e.*, addition of the Grignard reagent to the solution of carbonyl halide, it is possible to obtain moderate yields of ketones:

$$RCOX + R'MgX \rightarrow RCOR'$$

The transference of a Grignard reagent from the vessel in which it is prepared to a dropping funnel must be carried out in an inert atmosphere and sometimes presents experimental difficulties. **A** much better method for ketone synthesis involves the addition of dry cadmium chloride to the Grignard reagent, whereby it is converted to an organocadmium compound:

$$2RMgX + CdCl_2 \rightarrow R_2Cd + MgX_2 + MgCl_2$$

Organocadmium compounds, being considerably less reactive than Grignard reagents, react only with the halogen of a carbonyl halide. The acid chloride may thus be added to the solution of cadmium compound:

$$R_2Cd + 2R'COX \rightarrow 2RCOR' + CdX_2$$

Aldehydes. — The normal product, after hydrolysis, is a secondary alcohol:

$$RMgX + R'CHO \rightarrow RR'CHOMgX \rightarrow RR'CHOH$$

Poor yields can result from condensation reactions. and by the Grignard compound acting as a reducing agent leading to primary alcohol formation.

Formaldehyde, of course, affords primary alcohols, often in rather poor yield:

$$H_2CO + C_2H_5MgBr \rightarrow nC_3H_7OH(\text{low yield}) + CH_2(OC_2H_5)_2$$
$$H_2CO + C_6H_5MgBr \rightarrow C_6H_5CH_2OH \text{ (about 70\%)}$$

The formaldehyde is commonly generated by thermal depolymerization of paraformaldehyde, or the polymer may be added to the Grignard reagent and the suspension boiled with reflux.

Ketones. — The normal reaction product is a tertiary alcohol:

$$RMgX + R'COR'' \rightarrow RR'R''COMgX \rightarrow RR'R''COH$$

The main complications of this synthesis are reduction to secondary alcohols and enolization.

Carboxylic Esters. — The reaction between esters and Grignard reagents is a common method for preparing tertiary alcohols:

$$RCO_2R' + 2R''MgX \rightarrow RR''_2COH + R'OH$$

The reactions of certain esters are of particular importance. Formic esters afford secondary alcohols, or aldehydes:

$$HCO_2C_2H_5 + C_2H_5MgBr \rightarrow (C_2H_5)_2CHOH$$
$$HCO_2C_2H_5 + C_6H_5MgBr \rightarrow C_6H_5CHO$$

Orthoformic esters (generally ethyl orthoformate) are used for the preparation of acetals or of the corresponding aldehydes:

$$HC(OC_2H_5)_3 + 2C_2H_5MgBr \rightarrow C_2H_5CH(OC_2H_5)_2$$

Cyanides. — Though rather less reactive to Grignard reagents than most substances already mentioned, cyanides are attacked in the usual way, the organic component of the Grignard reagent becoming bound to the carbon atom.

$$RMgX + R'CN \rightarrow RR'C{=}NMgX \xrightarrow{H_2O} RR'C{=}NH \xrightarrow{H_2O} RR'CO$$

GRIGNION DE MONTFORT, SAINT LOUIS MARIE DE: *sre* MONTFORT, SAINT LOUIS MARIE GRIGNION DE.

GRIJALVA, JUAN DE (1489– or 1490–1527), Spanish explorer and nephew of Diego Velbzquez. Born in Cuéllar, Spain, Grijalva followed his uncle to Hispaniola and Cuba and was chosen by him to pursue further the explorations of Francisco Hernández de Córdoba. In April 1518 Grijalva set out with four ships and reached the island of Cozumel off eastern Yucatin. He then proceeded along the coast of Campeche, where he learned of the Aztec emperor Montezuma. He was attacked and failed to disembark. At Rio Banderas, so called by Grijalva, the Spaniards obtained the first considerable amount of gold but the appearance of many canoes made Grijalva embark again from a site close to the present Veracruz. His failure to make a settlement in the land which he had called New Spain brought him dismissal when he reached Cuba in October. Grijalva accompanied Francisco de Garay to Mexico in 1523 and later took service with Pedrarias Dávila in Panamá. Grijalva was massacred with 19 other Spaniards by Indians on Jan. 21, 1527. (U. S. L.)

GRILLPARZER, FRANZ (1791–1872), recognized, belatedly. as the greatest Austrian dramatist, was born in Vienna on Jan. 15, 1791. His father, a reticent, patriotic lawyer who attached great importance to external forms, died in debt in 1809; his markedly neurotic mother belonged to the talented musical family of Sonnenleithner. In 1807 Grillparzer entered the University of Vienna to study law but, as the eldest son, was obliged to turn to private tutoring to help his family. Later he became a clerk in the department of revenue and. in 1818, poet to the *Hofburgtheater* and clerk in the exchequer. By 1832, when he was appointed director of the exchequer archives, it was clear that he would not be promoted to high office. In 1856 he retired from government service.

In 1817 the first performance of his tragedy *Die Ahnfrau* evoked public interest. Previously he had written many dramatic fragments, mainly on historical themes, and a play in blank verse, *Blanka von Castilien,* obviously modeled on Schiller's *Don Carlos* but already embodying the principal idea of several later works—the contrast between a quiet, idyllic existence and a life of action. *Die Ahnfrau,* written in the trochaic Spanish verse-form, has many of the outward features of the then popular "fate tragedy" (*Schicksalsdrama*), but the characters are themselves ultimately responsible for their own destruction. A striking advance was the swiftly written tragedy *Sappho* (1818), which is worthy of comparison with Goethe's *Tasso.* Here Sappho's tragic fate is attributed to her unhappy love for an ordinary man and to her inability to reconcile life and art, clearly an enduring problem for Grillparzer. Work on the trilogy *Das Goldene Vlies* (1821) was interrupted by the suicide of Grillparzer's mother and by illness. This drama. with Medea's assertion that life is not worth living, is the most pessimistic of his works and offers mankind little hope. Once more the conflict between a life of meditation and one of action seems to lead inevitably to renunciation or despair.

More satisfying, both aesthetically and emotionally, is the historical tragedy *König Ottoknrs Glück und Ende* (written 1823, but because of censorship difficulties not performed or published until 182j). Here the action is drawn from .Austrian history, and the rise of Rudolph of Habsburg (the first of Grillparzer's characters to avoid guilt and tragedy) is contrasted with the fall of the tyrant Ottokar of Bohemia, so that Ottokar's fate is not presented as representative of all humanity. In another historical tragedy, *Ein treuer Diener seines Herrn* (1826, performed 1828), the self-effacement of the hero Bancban in the name of duty is not suited to theatrical representation. Grillparzer was disappointed at the reception given to both these plays and became discouraged by the objections of the censor. Although he loved Katharina Frohlich (1800–79), whom he had met in the winter of 1820–21, he felt unable to marry, possibly because of a conviction that as an artist he had no right to personal happiness. His misery during these years is reflected not only in his diaries but also in the impressive cycle of poems significantly entitled Tristia ex Ponto (1835).

Des Meeres und der *Liebe Wellen* (1831), often judged to be Grillparzer's greatest tragedy because of the degree of harmony achieved between content and form. marks a return to the classical theme in treating the story of Hero and Leander. which is, however, interpreted with a psychological insight anticipating the plays of Friedrich Hebbel and Ibsen. Hero, the priestess, who lacks a true sense of vocation, forgets her vows in her blind passion for Leander and, when her lover is ensnared to his death, she dies of a broken heart. The following of vital instincts is shown to rob the individual of inner harmony and self-possession. Der Traum ein Leben (1834) owes most. particularly in form, to Grillparzer's intensive and prolonged studies of Spanish drama, especially the plays of Lope de Vega and Calderón. This Austrian *Faust* ends happily. for the ambitious young peasant Rustan only dreams the adventures which involve him in crime and awakes to a realization of the vanity of earthly aspirations. True contentment requires acceptance of one's lot and the avoidance of guilt. Grillparzer's only comedy, *Weh* dem, der *lügt!* (1838), was a failure, despite the humour of its situations and the brilliance of its dialogue. chiefly because the theme—the hero succeeds because he tells-the truth when everyone thinks he is lying—was too subtle and too serious for comic treatment.

Grillparzer wrote no more for the stage and very little at all after the 1840s. The honours which were heaped on him in old age came too late. In 1861 he was elected to the *Herrenhaus,* his 80th birthday was the occasion for a national celebration and his death in Vienna on Jan. 21, 1872, was widely mourned. Three tragedies, apparently complete, were found among his papers. Die *Jüdin von* Toledo, based on a Spanish theme, portrays the tragic infatuation of a king for a young Jewess. He is only brought back to a sense of his responsibilities after she has been killed at the queen's command. Ein *Bruderzwist* in Habsburg, a profound and moving historical tragedy, lacks the theatrical action which would make it suitable for successful performance and is chiefly remarkable for the portrayal of the emperor Rudolph II. Grillparzer's sympathetic attitude to Rudolph is sometimes regarded as a justification of Metternich's conservatism. Much of Grillparzer's most mature thought forms the basis of the third play, Libussa, in which he foresees human development beyond the rationalist stage of civilization. Its advent is foretold by Libussa who desires a natural community guided by intuition and ruled by love. She submits, however, to the views of her practical consort Primislaus who, although unselfishly devoted to the task of building the state, understands that justice based on reason is necessary in government.

Apart from the critical studies on Spanish drama and the autobiography published after his death, Grillparzer's finest prose work is Der arme *Spielmann* (1848), the story of a poor musician who cheerfully accepts life's failures and dies through his efforts to help others, an attitude to life which is encountered elsewhere in Biedermeier literature, *e.g.,* in *Kalkstein* by Adalbert Stifter (1805–68).

Features of the Biedermeier outlook are clearly traceable in Grillparzer's work: the looking back to the great classical and romantic achievements and the painful evolution from the disillusionment of idealism to a compromise with reality. Grillparzer is unusually gifted not only as a dramatic poet but also as a playwright capable of creating dramas suitable for performance. The influence of Shakespeare, Lope de Vega and Calderón and of the productions of the popular Viennese theatre is to be seen in the details of many of his dramas. Unlike his great predecessors, Goethe and Schiller, he distinguishes between the speech of the cultured person and that of the uneducated. Also he introduces colloquialisms, humour and elements from the popular farce. Although the central dramatic conflict is often rooted in his personal problems, it is presented objectively. Grillparzer's solution is renunciation rather than acceptance. He suffered undoubtedly from the restrictions imposed by the Metternich regime, but it is probable that his unhappiness originated principally in an inability to resolve his own difficulties of character.

Bibliography.—*Editions:* The critical edition of Grillparzer's works, letters and diaries by August Sauer, Reinhold Backmann *et al.* began to appear in 1909 (42 vol. up to 1944). Other reliable editions include those by Stefan Hock, 4 vol. (1911) and Reinhold Backmann, 5 vol. (1952). English editions include those of *Des Meeres und der Liebe Wellen* by *D.* Yates (1947); of *Konig Ottokars Glück und Ende* by *L. H.* C. Thomas (1953); and of *Der Traum ein Leben* by W. E. Yuill (1955). English translations of many works have been made by H. Stevens or A. Burkhard.

Life: Descriptions of Grillparzer and conversations with him by his contemporaries appeared in *Grillparzers Gespräche und die Charakteristiken seiner Persönlichkeit,* ed. by August Sauer, 7 vol. (1904–41). Biographies include: H. Laube, *Franz Grillparzers Lebensgeschichte* (1884); Marie von Ebner-Eschenbach, *Meine Erinnerungen an Grillparzer* (1916); *E.* Alker, *Franz Grillparzer* (1930); Douglas Yates, *Franz Grillparzer* (1946; in English, only first vol. published); J. Nadler, *Franz Grillparzer* (1948).

Criticism: E. Reich, *Franz Grillparsers Dramen* (1894; 4th ed. 1938); Friedrich Gundolf, in *Jahrbuch des Freien Deutschen Hochstifts* (1931); Ilse Münch, *Die Tragik in Drama und Persönlichkeit Franz Grillparzers* (1931); Gerhart Baumann, *Franz Gvillparzer. Sein Werk und das osterreichische Wesen* (1954); Walter Naumann, *Grillparzer. Das dichterische Werk* (1956). *See* also O. Katann (ed), *Grillparzer-Studien* (1924); K. Glossy (ed.), *Jahrbuch* der *Grillparzer-Gesellschaft* (1891–); and for bibliographies of the numerous publications on Grillparzer, Karl Goedeke's *Grundriss zur Geschichte der deutschen Dichtung,* vol. viii (1905) and vol. xi (1953).

(L. H. C. T.)

GRIMALD (Grimoald), **NICHOLAS** (1519–*c.* 1559), English poet, whose best-known work was contributed to the first edition of Tottel's *Miscellany,* was born in Huntingdonshire in 1519. He studied at Oxford and at Cambridge and became chaplain to Bishop Ridley. To the original edition (June 1557) of Songes and Sonettes (known as Tottel's *Miscellany*), which he may have edited, he contributed 40 poems and translations, only 10 of which were retained in the second edition (July 1557). Some of his pieces were in blank verse, in which he followed the style of the earl of Surrey. yet not without originality. He handles the metre competently and produces an occasional fine-sounding line.

His other works include two Latin tragedies—Christus redivivus (1543) and *Archipropheta* (1548)—and a translation of Cicero's De *Officiis* (1556). Grimald died about 1559.

GRIMALDI, JOSEPH (1778–1837), the "king of clowns," was born in London on Dec. 18, 1778, the son of an Italian Pantaloon player and a Columbine actress. He grew up in a world of tumblers, tightrope walkers and buffoons and was on the stage of Drury Lane at the age of two. At Drury Lane he scored his first great success as Punch in the Christmas pantomime for 1800–01, after he had already exhibited some of his finest drolleries at Sadler's Wells.

In 1806 he deserted Drury Lane for Covent Garden, where he endeared himself to London audiences as Clown in Mother Goose. When Grimaldi died in London on May 31, 1837, he left behind The Memoirs of Joseph Grimaldi, which Dickens edited (with little enthusiasm) in 1838. (A. M. N.)

GRIMALDI FOSSILS are a group of human remains from the caves carved out of a high cliff, the Baoussé-Roussé (the Red rocks), which borders the Riviera in Italian territory, 2 km. ($1\frac{1}{4}$ mi.) E. of Menton. These remains, totaling 16 individuals, were found in four caves called the Grotte des Enfants. the Grotte du Cavillon, the Barma Grande and the Baousso de Torre. They were found in excavations by E. Rivière, L. Julien, F. Xbbo and, to a greater extent, by L. de Villeneuve during his systematic excavations organized by the prince of Monaco in 1901. All were found in implementiferous Upper Paleolithic deposits (Aurignacian and Grimaldian) but at quite different levels, some being only about 6 ft. below the surface, others nearly 30 ft. and almost in contact with the adjoining Mousterian layers. They all date from the second half of the last glacial period, from about 30,000 to 40,000 years ago.

The major part of the remains are of the skeletons of very tall men of the Cro-Magnon race, of which many other specimens from the same epoch are known in Europe, and which is the ancestor of certain present-day Europeans. The skulls are elongated, with low vaults. short faces and orbits, and the bones are particularly robust. Quite different from these, the two skeletons from the lowest level of the Grotte des Enfants belong to a type of shorter stature and with facial prognathism — the race of Grimaldi which R. Verneau considered Negroid and which he thought preceded the Cro-Magnon race in this region. Verneau's ideas are often questioned because no other Negroid fossils have been found in Europe, and it seems that the prognathism of the so-called Negroids was essentially the result of a posthumous deformation; possibly they may be interpreted as primitive Cro-Magnons.

See also CRO-MAGNON MAN.

See L. de Villeneuve, M. Boule, R. Verneau and E. Cartailhac, *Les Grottes de Grimaldi* (1906–12). (H. V. V.)

GRIMKÉ, SARAH MOORE (1792–1873) and **ANGELINA EMILY** (1805–1879), U.S. antislavery crusaders and advocates of women's rights, were born in Charleston. S.C., Sarah on Nov. 26, 1792, and Angelina on Feb. 20, 1805. Both developed an early dislike of slavery. After several visits to Philadelphia, Sarah joined the Society of Friends in 1821; Angelina did the same in 1829. The sisters then moved to the north and became interested in the antislavery movement, with Angelina as the leader. After publication in the *Liberator* of her letter of approval to William Lloyd Garrison, the abolitionist leader, the sisters joined the American Anti-Slavery society. In 1836 Angelina published "An Appeal to the Christian Women of the South," in which she urged southern women to speak and act against slavery. Later in the year Sarah made a similar plea in "An Epistle to the Clergy of the Southern States."

The career of the Grimkés as antislavery speakers began when Angelina appeared before small groups of Philadelphia women in private homes. In 1836 the sisters moved to New York where both spoke to larger gatherings in churches and public halls. Their talks in New England before mixed audiences prompted a pastoral letter from the General Association of Congregational Ministers of Massachusetts against women preachers and reformers. As a result of such opposition the sisters became pioneers in the women's rights movement and were largely responsible for linking it to the antislavery crusade.

Following Angelina's marriage to the noted abolitionist Theodore Dwight Weld in 1838, both she and Sarah were expelled from the Society of Friends for breach of the "discipline." Ill-health forced Angelina shortly afterward to give up public speaking and Sarah followed her into retirement. The sisters helped Weld in the schools he started in New Jersey. The Welds and Sarah later moved to Hyde Park, Mass., where Sarah died on Dec. 23, 1873, and Angelina on Oct. 26, 1879.

GRIMM, FRIEDRICH MELCHIOR, BARON DE (1723–1807), Franco-German critic and diplomat, whose *Correspondance littéraire* played a considerable part in the dissemination of French culture in Europe, was born on Sept. 26, 1723, in Ratisbon (Regensburg). He was educated (1743–45) at Leipzig university where he came under the influence of the professor of poetry, Johann Christoph Gottsched (*q.v.*), who was then trying to create a German drama on the French classical model. Grimm's one and only tragedy, *Banise,* was published in Gottsched's *Deutsche Schaubühne* (1743). Grimm had to make his own way in the world and he accordingly attached himself to the powerful Schoenberg family. With a sound knowledge of the French language and already strongly attracted by French civilization, he eagerly seized, in 1748, the opportunity of escorting the second son to Paris, where he was appointed in turn reader to the prince of Saxe-Gotha. secretary to the count of Friesen and, in 1755, *secrétaire des commandements* of the duc d'Orléans.

At the same time he succeeded in gaining an entry into fashionable, progressive literary and philosophical circles through his acquaintance with J. J. Rousseau (*q.v.*) who introduced him to D'Holbach, Helvétius, Denis Diderot (*q.v.*) and, in 1750, to Mme d'Épinay (*q.v.*), whose lover he became three years later. When Mme d'fipinay went to Geneva in 1757 on account of her health, difficulties arose as to who should accompany her; this was the immediate cause of Grimm's quarrel with Rousseau, who unjustly blackened his former friend's character in his *Confessions.* Yet Grimm retained the esteem and affection of Diderot, with whom he formed a lifelong, devoted friendship. It is difficult to estimate precisely what each man owed to the other, but it would seem that whereas Diderot had by far the richer mind, Grimm often stimulated him to activity, particularly in the dramatic field, and sometimes tempered his exuberance with methodical sobriety. He certainly shared most of Diderot's ideas and wrote one article, Du *Poème lyrique,* for the *Encyclopédie,* which he helped to edit and advertised abroad through his many correspondents and friends.

The number and importance of Grimm's connections indeed grew rapidly, for he promoted his career with great astuteness. He quickly became a person of note in the Parisian literary world. Two letters to the *Mercure de France* (1750 and 1751) on German literature made little impression; but in 1753, during the famous controversy over the merits of French and Italian music *(guerre des bouffons)*, he achieved a certain notoriety with his *Petit Prophète de Boehmischbroda* in which, like Rousseau and Diderot, he extolled Italian to the detriment of French composers.

In this same year Grimm decided to establish a private news service for foreign princes anxious to keep in touch with life in Paris. Every fortnight after May 15, 1753, usually through diplomatic channels, subscribers received a manuscript newsletter, normally composed by Grimm who was, however, frequently helped by Mme d'Épinay and Diderot who contributed, for instance, his famous *Salons* (1759–81). The venture was successful, attracting subscriptions from many minor European rulers as well as from Catherine the Great of Russia. But in March 1773, increasingly absorbed by diplomatic work, Grimm handed over his task to Jakob Heinrich Meister.

Frank because confidential, Grimm's letters constitute a social and literary document of outstanding importance. They chronicle events of all kinds, transmit social and literary gossip, record songs, epigrams and parodies and divertingly analyze and evaluate new publications in all spheres. The impartiality and sureness with which Grimm appraised contemporary French writers, even Rousseau and Voltaire, is increasingly appreciated. The *Correspondance litte'raire,* first published in 1812, has been described as the first great work of modern criticism.

Grimm's correspondence and his acknowledged tact served him well in the furtherance of his ambitions. He was appointed to a number of minor diplomatic posts and created successively a baron of the Holy Roman empire (1772) and Russian councilor of state (1777). He acted as Paris agent for some of his patrons, particularly for Catherine II, for whom he bought works of art and the libraries of Diderot and Voltaire. His activities brought him opportunities to travel extensively in Germany, England (1771), Italy (1776) and Russia (1773–74, 1776–77).

The position Grimm had thus built up was wrecked by the French Revolution. Horrified, faithful to the *ancien régime* and therefore suspect to the republic, which confiscated his property and ruined him financially, Grimm left France in 1792. In 1793, generously supported by Catherine II, he settled in Gotha where he died, impoverished and embittered, on Dec. 19, 1807.

Cazes, *Grimm et les Encyclopédistes* (1933); J. R. Smiley, *Diderot's Relations With Grimm* (1950). (O. R. T.)

GRIMM, JACOB (LUDWIG CARL) (1785–1863) and **WILHELM (CARL)** (1786–1859), together were the collectors and editors of Grimms' *Fairy Tales* and were generally known as *THE BROTHERS* GRIMM; Jacob Grimm, the grammarian, was the formulator of "Grimm's law" *(see* below), and Wilhelm Grimm was the literary scholar. They were born little more than a year apart and spent their entire lives together in a happy community of interests. As children they were inseparable, at the university they studied and lived together, as mature scholars they worked together in the same room, and they were buried side by side in Berlin.

Lives.—Jacob was born on Jan 4, 1785, Wilhelm on Feb. 24, 1786. They attended the public school at Rassel and later studied at Marburg, where the lectures of Friedrich von Savigny awakened in both the love for antiquarian investigation which formed the real basis of all their later work. While still university students they laid plans for collaboration on medieval German literature, and in 1805 Jacob wrote irom Paris to Wilhelm that he hoped they would never again be separated. By a happy combination of good fortune and early recognition of their great talents they remained together and became the most distinguished brother-scholars of the German romantic period.

Following long periods of service in the Kassel library. the brothers moved in 1830 to Gottingen, where Jacob received the appointment of professor and librarian, Wilhelm that of under-librarian. Jacob lectured on legal antiquities, historical grammar, literary history, interpreted ancient Gcrmanic literature and commented on the *Germania* of Tacitus. The years at Gottingen were fruitful ones, despite the severe illness of Wilhelm; in 183j Wilhelm was named to a professorship and Jacob was given the title of *Hofrat* in recognition of their accomplishments. In 1837 however, the brothers being two of the seven professors who had signed a protest against the new king of Hanover's abrogation of the constitution, they were dismissed from their professorships and banished from the kingdom of Hanover. They returned to Rassel, but in 1841 went to Berlin. where they both received professorships and were elected members of the Academy of Sciences. They seldom lectured; but they worked assiduously together at the great dictionary of the German language. a task so large, even nhen first projected, as to make it impossible for the brothers to finish it themselves. The first volume was published in 1854; after the work had been apportioned among many other hands, the last volume was published, with some intermediate fascicles still to appear. just a century later, in 1954.

Wilhelm. never in robust health, died in Berlin on Dec. 16, 1859; Jacob. never ill. continued working until he died quite suddenly on Sept. 20, 1863.

Of the two. Jacob was the stronger, the more vigorous and the more strictly scientific; Wilhelm mas the weaker physically, the more sensitive and the more literary; Jacob became the great grammarian; Wilhelm gave literary form to the fairy tales.

Works.—The purely scientific side of Jacob's character developed slonly. Led by his careful study of Middle High German poetry to take up grammatical investigation, he apparently soon felt the need of a regular method of work in etymology, but he long grasped for scientific principles nithout finding them. He set himself against the use of logical concepts in the analysis of a language, and he called observation the soul of grammar; but his own almost exclusive interest in history. the variety of the evidence which he and his contemporaries collected and examined. and the necessarily slow evolution of a methodical procedure for dealing with very complex linguistic phenomena so controlled his talents as to make of him rather a careful collecter and arranger of data than a great intuitive expositor or inventive theoretician. Even the ordering of the correspondences among consonants in the Germanic and other Indo-European languages nhich bears his name had to wait 50 years for its final clear and simple treatment.

Jacob Grimm's *Deutsche Grammatik* (1819–22) was. moreover, the linguistic outcome of both brothers' previous philological nork. In 1811 Jacob published a work of purely literary character. *Über den altdeutschen Meistergesang* and Wilhelm brought out his volume of translations *Altdänische Heldenlieder, Balladen und Märchen übersetzt*. In 1812 the brothers jointly edited the two ancient fragments of the *Hildebrandslied* and the *Weissenbrunner Gebet*, and in 1812–1j they jointly brought out the first edition of the *Kinder-und Hausmärchen* (the *Fairy Tales*, of which one of many English translations was edited by Joseph Campbell in 1944) which have carried their name into every household of the civilized world. In 1816–18 an analysis of the oldest Germanic epic traditions appeared under the title *Deutsche Sagen*, and in 1815 one volume of an edition of the Poetic Eddas was published over both their names. This edition, however, was never completed; and Jacob, who had little taste for text-editing. about this time began to turn his mind to other things. Although he did occasionally bring out a new edition of an old text (*e.g., Reinhart Fuchs*, 1834), and although medieval literature and comparative mythology continued to interest him, more and more his activity became focused on grammar, lexicography and the history of the German language.

Grimm's Law.—Jacob had not at first intended to include languages other than German in his *Deutsche Grammatik;* but he soon found that Old High German postulated Gothic, that the later stages of German could not be understood without the help of the Low German dialects, including English, and that the evidence from the Scandinavian languages could likewise not be ignored. The first part of the *Grammar* appeared in 1819, a second revised edition in 1822. While the first edition gives only the inflections, in the second, phonology takes up no fewer than 600 pages, more than half of the whole work. The striking difference is evidence of the increasing interest in linguistic method which marked the early years of the 19th century. This advance must be credited mainly to the influence of Rasmus Rask (*q.v.*). To Rask belongs the credit for having first demonstrated the regularity of correspondence among sounds in genetically related languages, but the first full demonstration of the validity of this principle of regularity was made by Jacob Grimm in the long lists of correspondences of consonants in the Germanic and other Indo-European languages which he published in the second edition (1822) of his *Deutsche Grammatik*. It is the regularity in these correspondences which has come to be known as Grimm's law (*see* GERMANIC LANGUAGES). Thus, the initial sound of the inherited Indo-European word for "father" is represented in Latin writing by *p* and in English writing by f (Latin *pater;* English "father"). This correspondence is regular under conditions which can be clearly and certainly stated. Such regular correspondences for all consonants in all the Indo-European languages can now be given with similar certainty, only marginal problems remaining.

The question of who discovered what is known as Grimm's law is answerable only after much qualification. The correspondence of single consonants had been more or less clearly recognized by several of Jacob Grimm's predecessors; but the one who came nearest to the discovery of the complete law was the Swedish scholar J. Ihre who established a considerable number of *litterarum permutationes*, "changes of letters." Rask, in his essay on the origin of the Icelandic language, gives the same comparisons, with a few additions. As Grimm in the preface to his first edition expressly mentions this essay of Rask, there is every probability that it gave the first impulse to his own investigations. There is, however. a wide difference between the isolated oermutations of his predecessors and Grimm's comprehensive generalizations and massive assembling of evidence. The extension of the law to High German is also entirely Grimm's own. The importance of Grimm's generalization in the history of linguistics can hardly be overestimated, but much of the merit belongs to his predecessors. and some to his immediate successors; the completion of the solution, the demonstration of symmetry existent in complexity and the simple formulation which could finally be given to the discovery are, all taken together. a unique triumph and one large enough to be shared by many. Grimm's law proved that a simple, coherent and complete demonstration of order in the process of language was possible. Jacob Grimm and his contemporaries in the mid-19th century thus made the study of linguistic phenomena scientific.

The Fairy Tales.—The criticism and interpretation of the two brothers' fairy tales began early. Wilhelm himself in 1856 stated the brothers' theory that the Germanic folk tales were versions of Indo-European myths. Theodor Benfey, the Sanskritist, sought their origins in India. Joseph Bédier and others supported the view of polygenesis, the possibility of which had also been admitted by the Grimms. The Finnish school of folklorists attempted a strict historical and geographically limited approach—a procedure which may be said to have culminated in the unhistorical typological arrangement of Stith Thompson's *Motif-*

Index of Folklore Classification. A similarly unhistorical but otherivise totally different point of view is that of the psychoanalytic school of criticism which, following Freud's hypotheses, sees in fairy tales the dreams of the human race and thus interprets them as externalizings of unfulfilled wishes, of feelings of guilt and of profound anxieties deeply buried in the unconscious. Many essays expressing this view can be found in the pages of the periodical *Imago*. Still another judgment has been expressed by Albert Wesselski in his *Versuch einer Theorie des Märchens;* according to him the "people" never create; only storytellers, authors, create, and all collections of "folk stories," including the Grimms' fairy tales, come directly or indirectly from books.

Collaboration.— So harmonious was the collaboration of the brothers Grimm and so happy their life-long association that it is unjust to both to discriminate between them except only to show how perfectly their slight differences complemented each other. Wilhelm remained to the end of his life a literary scholar, historian and critic and, according to his brother, always loved the collections of fairy tales the most; while Jacob was occupied with grammatical problems and the history of the German language, Wilhelm continued his work on Germanic heroic legends and wrote beautifully, delightfully and learnedly about such matters as elves and children's games and customs. But these tasks for the last decade of R'ilhelm's life uere secondary or ancillary ones, the great work was the dictionary on which both brothers uorked always harmoniously together.

Jacob never married; Wilhelm was both a husband and a father. In a memorial address delivered in the Academy of Sciences in Berlin six months after his brother's death, Jacob said of himself that he in early youth had found an iron devotion to work which Wilhelm's weaker health denied him, but that Wilhelm's work was shot through with flashes of silver, as his own was not. Wilhelm, he also said. was fond of happy company, music and laughter, but of himself Jacob remarked that his joy arose from work itself.

The Grimm brothers' patriotism and love of historical investigation received full satisfaction in the study of the language, traditions, mythology, laws and literature of their countrymen and their nearest kindred. Both acted together for the sake of principle without bitterness and almost without complaint. Their work together was so harmonious that their genuine human kindness, which shows in their letters, made them both gently, modestly serene.

See the series of critical essays (entitled *Anmerkungen*) on the Grimms' iairy tales which were published by Johannes Bolte and Georg Polivka between 1913–31 A bibliography of the principal writings of both brothers and the principal critical works about them is given in Herman Gerstner's *Die Brüder Grimm* (1952) (My F.)

GRIMMELSHAUSEN, HANS JAKOB CHRISTOFFEL (JOHANN JAKOB CHRISTOPHER) **VON** (*c.* 1622–1676), German writer, author of *Simplicissimus*, the greatest German novel of the 17th century. The troubled times in which he lived, and which found expression in his work, are reflected in uncertainties about his birth, parentage and early life. Born probably at Gelnhausen, and certainly in Hesse, between 1610 and 1625, he lost his parents early, perhaps in the sack of Gelnhausen (1634), if one accepts the later date for his birth. Their circumstances are also uncertain; his father may have been a baker or an innkeeper, perhaps belonging to the unsuccessful branch of a noble family, but the "von" used by Grimmelshausen may have been only of his own bestowing. He certainly lived in Gelnhausen as a child. until swept up by the Hessian troops. His experiences with them can be inferred from his account of the adventures of "Simplicissimus" and from knowledge of the squalor, brutality and tragedy of the Thirty Years' War He may have entered the imperial army in 1635, but is first certainly identified in 1639 as secretary to Reinhard von Schauenburg, the commandant at Offenburg, on whose staff he served until May 1647. In 1648 he was with Johann von Elter, the commandant on the Inn, and soon after the war ended became steward of the Schauenburg estates. His marriage in 1649 may have been the occasion of his becoming a Roman Catholic: his parents and early education were certainly Lutheran. His stewardship was no sinecure in a divided family snd a despoiled countryside but he found time for writing, which he had begun in the army, and also opened an inn at Gaisbach near Oberkirch, probably to augment a meagre income. In about 1660 he entered the service of a Strasbourg physician and in 1668 became magistrate and tax collector at Renchen, a town belonging to the bishopric of Strasbourg. From 1674 onward his life mas again disturbed by invading armies. The district was occupied by the Lorrainers, the inhabitants fled and Grimmelshausen's household was broken up. He died at Renchen, perhaps after service on the imperial staff, Aug. 17, 1676.

His first published works, *Traumgesicht von dir und mir* (1658) and *Reisebeschreibung nach der obern Mondswelt* (1660) are mainly derivative: satiric in intent. yet lacking the singlemindedness of pure satire. In 1669 he published *Der abenteuerliche Simplicissimus, Teutsch, d.h. die Beschreibung des Lebens eines seltsamen Vaganten, genannt Melchior Sternfels von Fuchsheim,* in six books, of which the sixth was written first, with a later "key volume." It is the story of a "wild boy" brought into contact with life through experience of the Thirty Years' War. Modeled on the Spanish picaresque romances, it gives full rein to Grimmelshausen's power of narration, eye for realistic detail, creation of convincing minor characters, coarse humour and criticism of society. The religious allegory of the later part is sometimes obscure, and the Robinson Crusoe episodes of the last book lack coherence with the main plan, but it remains a masterpiece, as well as a valuable historical document for its vivid picture of 17th-century Germany. Its success was immediate, and led Grimmelshausen to write the so-called *Simplicianische Schriften*: *Die Erzbetrügerin und Landstörtzerin Courasche* (1669); *Der seltsame Springinsfeld* (1670); and *Das wunderbarliche Vogelnest* (1672) which he claimed as parts of the main work. He also wrote satires and "gallant" novels (*e.g., Dietwald und Amelinde,* 1670), but it is on *Simplicissimus* that his fame remains secure.

The leading modern edition of *Simplicissimus* is by J. H. Scholte (1938–39; 3rd ed. by K. Henniger, 1955), who also edited the *Simplicianische Schriften* (1923–43). There is an English translation (1912). A selection of Grimmelshausen's *Werke* was edited by H. H. Rorcherdt. 3 vol. (1921–22).

GRIMSBY, formerly called GREAT GRIMSBY, a municipal, county and parliamentary borough of Lincolnshire, Eng., on the south bank of the Humber estuary, $35\frac{1}{2}$ mi. N.E. of Lincoln by road. Pop. (1961) 96,665. Area 8.5 sq.mi.

Grimsby was a Danish settlement and is mentioned in the Icelandic sagas. The name derives from Grim the fisherman. foster father of Havelok the Dane in the legend of that name. King John granted the first royal charter to the town in 1201, and Henry III granted a further charter in 1227. These grants were confirmed and extended by later sovereigns, the last charter being given by James II in 1688. An annual fair and weekly market are held under charter rights.

The parish church of St. James contains Norman, Early English and transitional work; it was extensively restored after suffering severe war damage in 1943. Grimsby has a bishop suffragan in the diocese of Lincoln.

Up to the end of the middle ages, Grimsby was an important seaport, but it declined as the old haven silted up. In s796 a statutory company was formed by a private act of parliament to improve the harbour, and the first dock was built in 1800. The modern development'of the town is due largely to its favourable situation as regards the North sea and other fishing grounds. The docks were rebuilt and modernized after 1846, and fishing smacks began trawling in 1856. The use of the steam trawler from the 1880s extended the area covered by the fishing fleet as far as Greenland and the White sea. At the same time the increase in the population of England! the construction of railways and the use of ice for preserving fish made possible for the first time a supply of fresh fish in bulk to all parts of the country. Approximately one-third of the fish landed in Great Britain passes through Grimsby docks. The trade greatly developed with the introduction of modern methods of curing and quick freezing, and there is a considerable export trade in frozen fish. A second fish dock was built in 1900 and a third (35 ac.) with slipways and coaling facilities was opened in 1934. The total dock area is 139 ac., 64 ac. of which are fish docks.

After World War II, Grimsby became a centre of the heavy chemical industry, and several large modern plants were erected. The town is one of the greatest single manufacturing centres of titanium oxide in the world. The commercial docks handle imports of timber, food wood pulp and raw materials for the chemical industry. Coal and general merchandise are exported. There are regular commercial services to the Scandinavian countries.

Immingham (*q.v.*) dock, 6 mi. N., is the deepwater port for Grimsby. Grimsby was a minesweeper base in World War II.

GRIMTHORPE, EDMUND BECKETT, 1ST BARON (1816-1905), English lawyer, horologist, Gothic revivalist and public controversialist, was born near Newark on May 12, 1816, the eldest son of Edmund Beckett Denison, later 4th baronet. Educated at Eton and Trinity college. Cambridge, he was called to the bar in 1841 and became queen's counsel in 1854. Between 1877 and 1900 he was chancellor and vicar-general of York, receiving a peerage in 1886. He rapidly acquired a large practice, achieving the leadership of the parliamentary bar by 1860—a position he owed more to vigorous self-assertiveness than to legal erudition. After 1880 he withdrew from legal work. An expert, inventive horologist, Beckett designed. despite bitter opposition the clock for the houses of parliament (Big Ben), installed in 1859. Clocks at Leeds town hall and at Worcester, Lincoln and St. Paul's cathedrals were also designed by him on new principles.

He was passionately interested in the revival of Gothic architecture, publishing *Lectures on Gothic Architecture* (1855), designing churches and secular buildings at Doncaster and elsewhere. His magnum opus was the "restoration" of St. Albans cathedral, where, having virtually bought the faculty in 1880, he raised the roof pitch recast the west front in a new style, redesigned the transept windows and vestries. His ruthlessness aroused a storm of protest and did much, as a negative exemplar, to provoke those better, sensitive conceptions of restoration since prevalent Nevertheless, his Gothic designs there and elsewhere have a coarse vitality typical of the man. Throughout his life, in parliament, in the *Times,* pamphlets and libel cases, he was a famous controversialist Among subjects of his virulent, dogmatic outbursts were architects, doctors, trade unions and ecclesiastical affairs. Though clever, versatile and dynamic, he was brutal, insensitive and wrongheaded Leaving more than £2,000,000, he died at St. Albans on April 29, 1905. (P. T. A.)

GRINDAL, EDMUND (1519?–1583), successively bishop of London, archbishop of York and archbishop of Canterbury, was the son of a farmer of Hensingham, Cumberland. He was educated at Magdalene and Christ's Colleges and then at Pembroke Hall, Cambridge, where he was elected fellow in 1538. He proceeded M.A. in 1541, was ordained deacon in 1544 and was proctor and Lady Margaret preacher in 1548–49. Probably through the influence of Ridley, who had been master of Pembroke Hall, Grindal was selected as one of the Protestant disputants during the visitation of 1549. When Ridley became bishop of London, he made Grindal one of his chaplains and gave him the precentorship of St. Paul's. He was soon promoted to be one of Edward VI.'s chaplains and prebendary of Westminster, and in Oct. 1552 was one of the six divines to whom the Forty-two articles were submitted for examination.

The death of Henry VIII frustrated Grindal's proposed elevation to the episcopal bench. He abandoned his preferments on Mary's accession and made his nay to Strasbourg. and then to Frankfurt, where he endeavoured to compose the disputes between the "Coxians" (*see* Cox, RICHARD), who regarded the 1552 Prayer Book as the perfection of reform, and the Knoxians, who wanted further simplification He returned to England in 1559, was appointed one of the committee to revise the liturgy, and one of the Protestant representatives at the Westminster conference. In July he was also elected Master of Pembroke Hall in succession to the recusant Dr. Thomas Young (1514–80) and Bishop of London in succession to Bonner.

Grindal himself was, however, inclined to be recalcitrant from different motives. He had qualms about vestments and other traces of "popery" as well as about the Erastianism of Elizabeth's ecclesiastical government. His Protestantism was robust enough; he did not mind recommending that a priest "might be put to some torment." But he was loath to execute judgments upon English Puritans; he had not that firm faith in the supreme importance of uniformity and autocracy which enabled Whitgift to persecute with a clear conscience nonconformists whose theology was indistinguishable from his own. As it was, his attempts to enforce the use of the surplice evoked angry protests, especially in 1565, when considerable numbers of the nonconformists were suspended; and Grindal of his own motion denounced Cartwright to the Council in 1570.

In 1570 Grindal was translated to the archbishopric of York, where Puritans were few and coercion would be required mainly for Roman Catholics. By Burghley's influence he was chosen to succeed Parker as archbishop of Canterbury in 1576. Burghley wished to conciliate the moderate Puritans and advised Grindal to mitigate the severity which had characterized Parker's treatment of the nonconformists. Grindal indeed attempted a reform of the ecclesiastical courts, but his metropolitical activity was cut short by a conflict with the arbitrary temper of the queen. Elizabeth required Grindal to suppress the "prophesyings" or meetings for discussion which had come into vogue among the Puritan clergy, and she even wanted him to discourage preaching; she would have no doctrine that was not inspired by her authority. Grindal remonstrated, claiming some voice for the church, and in June 1577 was suspended from his jurisdictional. though not his spiritual, functions for disobedience. He stood firm, and in Jan. 1578 Secretary Wilson informed Burghley that the queen wished to have the archbishop deprived. She was dissuaded from this extreme course, but Grindal's sequestration was continued in spite of a petition from convocation in 1581 for his reinstatement. Elizabeth then suggested that he should resign; this he declined to do, and after making an apology to the queen he was reinstated toward the end of 1582. While making preparations for his resignation, he died on July 6. 1583, and was buried in Croydon parish church. He left considerable benefactions to Pembroke Hall, Cambridge. Queen's college, Oxford. and Christ's college, Cambridge; he also endowed a free school at St. Bees, and left money for the poor of St. Bees, Canterbury, Lambeth and Croydon.

Strype's *Life* of *Grindal* is the principal authority; *see* also *Dict. Nat Biogr.* and, besides the authorities there cited, Gough's General Index to Parker Soc Publ ; Acts of the Privy Council, Cal of Hatfield manuscripts; Dixon's *Hist.* of *the Church* of *England;* Frere's volume in Stephens' and Hunts series; *Cambridge Mod Hist.,* vol. iii; Gee's *Elizabethan Clergy;* Birt's *Elizabethan Religious Settlement;* and Pierce's *Introduction to the Marprelate Tracts* (1908).

GRINDELWALD, a valley in the Bernese Oberland and one of the chief summer and winter tourist resorts in Switzerland. It is shut in on the south by the Wetterhorn, Mettenberg and Eiger, betneen which are two famous ice streams known as the Upper and Lower Grindelwald glaciers. On the north it is sheltered by the Faulhorn range while on the east the Great Scheidegg pass leads over to Meiringen; and on the southwest the Little Scheidegg and Wengernalp (railway across) divide it from Lauterbrunnen The main village is connected with Interlaken by a rack railway (13 mi) while the Jungfrau railway ascends from there to the highest Alpine railway station in Europe — Jungfraujoch 111,342 ft) The First, the longest chair lift in Europe. also starts from Grindelwald.

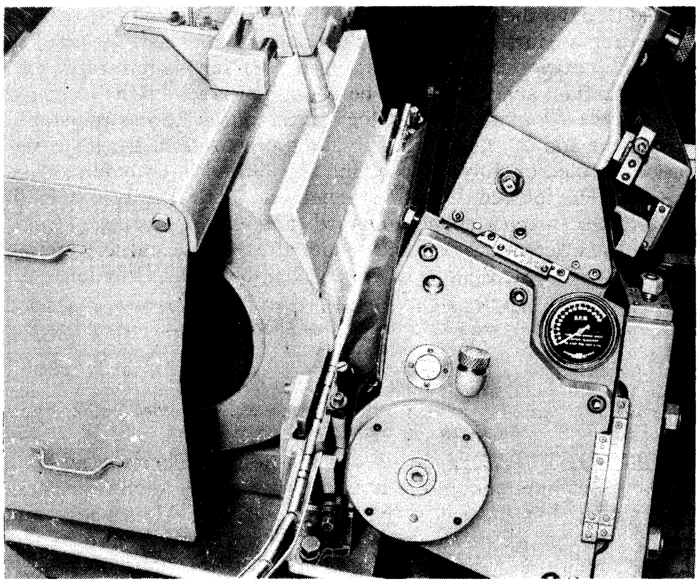
The valley possesses excellent pastures, as well as fruit trees, though little corn is grown. It is natered by the Black Liitschine, a tributary of the Aar. The parish church is 3,468 ft. above sea level. The population is practically all Protestant and German speaking.

The valley was originally inhabited by serfs of various great lords in summer for the sake of pasturage. A chapel in a cave was superseded about 1146 by a wooden church, replaced about 1180 by a stone church, which was pulled down in 1793 to make way for the present building. Gradually the Austin canons of Interlaken bought out all the other owners of the valley, but when that house was suppressed in 1528 by the town of Bern the inhabitants gained their freedom. (S. Ri.)

GRINDING MACHINE, a device using an abrasive wheel to produce a desired size, shape or surface finish on parts made of metal or other hard materials. The first cylindrical grinder was made in the 1860s in the United States by replacing the single-point tool of an engine lathe with a rotating abrasive wheel. At first the grinding wheel was made of natural sandstone, but later, for faster production and better control of quality, manufactured abrasives were formed into wheels by the ceramic process. By 1876 the universal cylindrical grinder had been developed to about its present state.

Many types of grinding machines have been developed for modern industry. They comprise a wide range of sizes and varieties, each designed to perform a particular type of work to best advantage. Polishing, buffing, lapping, honing and superfinishing are additional abrasive processes. each requiring a machine of special type. Some grinders use abrasive-faced belts instead of wheels.

Common Types of Grinders. — In cylindrical grinding of external surfaces. the work, with conically countersunk ends, is held rigidly on centres and rotated slowly, and the rapidly rotating wheel is fed against the work (for internal grinding, some form of chuck or clamp holds the work). When the surface to be ground is longer than the width of the wheel, the work is mounted on a cross slide and traversed slowly past the grinding wheel by hydraulic, mechanical or manual means. When the wheel face is as wide as the length of the surface being ground, the wheel may be fed in with no traversing movement; this is called plunge grinding. The wheel speed (usually about 6,000 ft. per minute), the wheel feed (about 0.001 in. per traverse), the work speed (50–100 ft. per minute), the table-traverse speed and the length of traverse are all independently adjustable to suit the machine and the type of work. The universal cylindrical grinder has a table mounted on a graduated base so that it may be swiveled for grinding tapered shapes.



BY COURTESY OF GRINDING MACHINE DIV., CINCINNATI MILLING MACHINE CO

WATER-PUMP SHAFTS BEING GROUND BY THE "THROUGH-FEED" METHOD ON A CENTRELESS GRINDING MACHINE

The plain cylindrical grinder has been modified to perform roll grinding on piston rods, turbine shafts and rolling-mill parts requiring great accuracy and superior finish. Other machines have been adapted for grinding the crank and main bearings of crankshafts: in these, the shaft is chucked so that its main journal bearings revolve in an orbit, while the crank pins being ground run concentrically. Camshaft-grinding machines are provided with master cams which cause a movement between the wheel and the cam being ground that evolves the desired contour of the cams. Other modifications are constructed for tool and cutter sharpening, drill pointing, saw and milling-cutter sharpening, etc.

The centreless grinding machine for external cylindrical or circular-section work consists of two abrasive wheels, each mounted on a horizontal axis with the wheel surfaces opposed to each other. An adjustable work-supporting blade is mounted between the two wheels. The smaller of the wheels, known as the regulating wheel, rotates slowly and acts as a brake to prevent the work from spinning as it is forced against the grinding wheel. For cylindrical shapes, the work is fed axially between the wheels. For formed work it is placed on the rest between the two wheels while the regulating wheel is fed forward.

Internal grinding machines have been developed for finishing holes to required sizes and surface conditions. These machines employ a small-diameter grinding wheel, rotating at high speed, which is traversed in and out of the hole as it is fed radially, to produce the correct diameter. Many grinding machines used for mass production have automatic measuring devices so that the grinding continues until the specified size is reached.

Several types of surface-grinding machines are available for grinding flat surfaces. One, with a reciprocating table carrying the work, moves under a straight wheel (which grinds on its periphery) mounted on a horizontal spindle or under a face-grinding wheel on a vertical or horizontal spindle. Other types have rotary tables employing a cup wheel on a vertical spindle or a straight wheel on a horizontal spindle. The rotary table supports the work in mechanical fixtures or on a magnetic chuck. There are also single- and double-opposed disk grinders in which the work is forced against the face of a single disk or fed between opposed disks to be ground to a desired thickness.

Special Grinding Machines. — Gear grinders finish gear teeth to an involute form. This is usually done after the gear teeth have been machined and hardened. One type of grinder uses a straight wheel formed to the desired tooth space. The wheel is traversed through the previously roughed-out tooth space as it is fed, at each stroke, to the depth that gives the desired tooth thickness. Another type of grinder uses a straight wheel with the faces dressed to straight bevel sides; the wheel simulates a tooth of a gear having a very large number of teeth. As the wheel traverses the rough tooth space it is fed gradually to a depth that gives the desired tooth thickness; and at the same time the wheel and gear are rolled back and forth together, just as one finished gear engages another.

Another gear grinder, using the generating process, employs a single large-diameter flat-face wheel with a thin edge tilted at an angle. The whole wheel is fed tangentially with its edge between two gear teeth as the gear is rolled, thus grinding one tooth face.

The thread grinder for finishing screw threads employs a wheel the face of which has the form of the thread space. The wheel is fed inward as it traverses back and forth along the axis of the screw, while the screw slowly rotates.

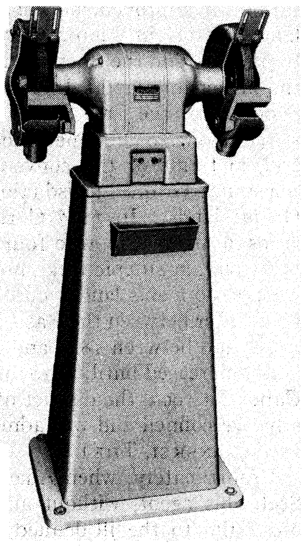
Finishing Operations. — The lapping or final finish of the teeth of spur, bevel or hypoid gears is done by running two gears together at crossed axes to provide a sliding action. An oil containing a fine abrasive is poured on the meshing gear teeth.

Polishing is done with an abrasive glued to the face of a flexible wheel, usually made of cotton or felt. Coarse or medium-size abrasive grain is used for fast metal removal with a resulting coarse finish, and fine grain for a good surface finish. Buffing follows finish polishing and involves a soft, pliable wheel with a very fine abrasive, such as tripoli powder mixed with grease, pressed against the wheel at intervals. This process produces a high lustre.

Honing involves the use of small honing stones supported in an adjustable head which is rotated slowly as it is reciprocated in, for example, the bore of a cylinder. The stones are forced radially against the cylinder wall so that a small amount of metal is removed. The bore is thus given a fine finish and accurate size. Superfinishing, quite similar to honing, uses fine honing stones supported flexibly and forced gently against slowly moving work, such as cylindrical bearings. This is done after grinding to give a smooth, accurate surface.

Grinding-Wheel Abrasives. — Abrasives for metal removal may be natural or manufactured. Natural abrasives such as sandstone (quartz), emery and corundum were used for centuries but have been largely replaced by manufactured abrasives, which are more uniform in composition and performance Diamonds are used for making up solid wheels and honing stones and as a powder for lapping very hard material.

The manufactured abrasives are of two principal compositions: silicon carbide is manufactured in an electric furnace, at about 4,000° F., from a mixture of a silica sand, petroleum coke, salt and sawdust; aluminum oxide is produced in an arc-type electric furnace by the fusion of the mineral bauxite mixed with ground coke and iron filings. Several hardnesses are available, each adapted to a specific class of uork. These abrasives are crushed and sorted into grains of various mesh size. A wheel of desired shape and size is produced by baking the grains, mixed uith a bonding agent.



BY COURTESY OF BLACK AND DECKER MANUFACTURING CO.

FLOOR-STAND GRINDER

The size, shape and bore diameter of the wheel, the abrasive type. grain size, bonding agent and structure are all part of the wheel specifications for each job. Wheels of silicon carbide are used generally to grind materials of low tensile strength (cast iron. brass, aluminum); aluminum oxide wheels are used for high strength materials, such as steel of all types. Grinding wheels must rotate at high speeds, and it is therefore important that they run true and are dynamically balanced and free of cracks. Adequate guards should be provided to minimize damage in the event of wheel breakage, and the operator should wear safety glasses.

(O. W. B)

GRINGORE (GRINGOIRE), **PIERRE** (*c.* 1475–*c* 1538), French poet, dramatist and satirist, was born in Normandy, perhaps at Thury-Harcourt (Calvados). His name, Gringore, found in acrostics in his poems, is the Norman equivalent of central French Gringoire, the latter form being already found in records of payments made to him at the court of Lorraine (*see* below). Fairly well educated by medieval standards, he enjoyed great popularity, particularly as an actor-manager and playwright between 1506 and 1512, in Paris where he helped to produce a play for the entry of Archduke Philip of Austria in 1501 and had other similar commissions, including the mimed *Sotie des Chroniqueurs* for the entry of Mary Tudor (1514). His first extant nork, *Le Chasteau de Labour* (1499; Eng. trans by Alexander Barclay, 1506; ed by A. W. Pollard, 1905), is an allegorical poem in which a despondent young husband learns how to overcome adversity by diligence. But Gringore is best known as a writer of satirical plays for the *Confrérie des Enfants Sans Souci* or *Sots,* uith their Prince and *Mère Sotte* the most famous guild of comic actors in France at the time. As *Mère Sotte* (a title which he kept until his death) he wielded great authority and enjoyed the favour of Louis XII, who "loved truth, even against himself" and employed Gringore and his fellow *Sots* as the mouthpiece of his antipapal policy. Gringore served Louis well, satirizing the Venetians and Saiss as well as condemning the temporal pretensions of Pope Julius II. He first attacked Julius II in his poem *La Chasse du cerf des cerfs* (1510), parodying the papal title of *Servus servorum Dei (le serf des serfs de Dieu)*; then on Shrove Tuesday. 1511 (old style; 1512, new style), when the dispute with the Pope was at its bitterest, he staged a trilogy (*sotie, moralité* and farce), *Le Jeu du Prince des Sots et Mère Sotte,* the Pope being *L'Homme obstiné* of the morality. but Holy Church, scathingly exposed in the *sotie,* being after all only *notre Mère Sotte*

Gringore's strikingly different *Vie Monseigneur Sainct Loys par personnaiges* (1514?), a piously conceived mystery play about Louis IX, sometimes considered his masterpiece, was written for the Paris guild of masons and carpenters. With Francis I's accession (151j), restrictions were imposed on playwriting, and royal favour passed to the Italian players. so Gringore moved to Lorraine in 1j18, to be herald to the duke with the title of Vaudémont, but also to continue to write and revise plays and to organize court festivities. In 1518, too, he married Catherine Roger (his poem *La Complaincte de Trop Tard Marié* may be earlier in date). His *Blazon des hérétiques* (1524), a tedious enumeration of heretics doun to Luther, whom he attacks, was dedicated to the duke. The exact date. place and manner of his death are unknown.

Gringore is best as a polemist and imitator: he is often laboured but he can be vigorous and witty, and his sound dramatic sense made him much sought after as a reviser of plays. His motto, *Tout par Raison, Raison par Tout, Par tout Raison,* framing *Mère Sotte* on the title page of several works, characterizes the love of order and good sense, rather than any corrective purpose, in his writing; and he was a good Catholic despite his difficulties with the Sorbonne over translations in his *Heztres de Notre-Dame* (1525). His other works include satirical poems and other satires such as *Les Folles Entreprises* (1505), *L'Entreprise de Venise* (1509), *Les Abus du Monde* (1jog), *L'Espoir de Paix* (1509?), *La Coqueluche* (1510), *L'Obstination des Suysses* (1512–13?); religious verse such as La *Quenouille spirituelle* (1524?) and *Chants Royaux* (1527); and collections of tales, *Les Fantasies de Mere Sotte* (1j16) and *Les Menus Propos et le Testament de Lucifer* (1521).

GRINIUS, KAZYS (1866–1950), Lithuanian statesman, prime minister and president of the republic during the period of liberal democracy, a key figure of the Lithuanian Peasant party, was born on Dec 17, 1866, near Marijampole He studied medicine in Moscow and then, from 1893, practised as a doctor in several Lithuanian towns. Before World War I his house at Marijampole was a gathering place of Lithuanian democrats. For his patriotic activity he was persecuted by the tsarist Russian government. A member of the Lithuanian constituent assembly he formed a cabinet on June 19, 1920, which on July 12, 1920, signed a peace treaty nith the U S.S.R He resigned on Feb. 1, 1922. On June 7, 1926, Grinius was elected president of Lithuania and served until the military *coup d'ttat* in favour of a Nationalist government on Dec. 17, 1926. He then resumed his medical and social work. He escaped the second Soviet occupation by fleeing to Germany in 1944 and went to the United States in 1947. He died in Chicago on June 4, 1950. (MA. G.)

GRINNELL, a city of east central Iowa. U S , 50 mi. E of Des Moines, the seat of Grinnell college A co-educational school, Grinnell was founded in 1846 by pioneer settlers in Iowa who were Congregationalists and graduates of Yale college and by the "Iowa band" of graduates of Andover (Mass.) Theological seminary who went west in 1843 as educational missionaries The college was opened at Davenport in 1848 as Iowa college and in 1859 moved to Grinnell, where it absorbed Grinnell university (founded 185j). Known popularly as Grinnell college the school did not officially change its name until 1909. The city was settled in 1854 and was named after one of its founders. Josiah Bushnell Grinnell (1821–91), a Congregational clergyman, abolitionist, congressman and railway promoter Grinnell was incorporated as a town in 1865 and as a city in 1882 It adopted the council-manager form of government in 1955 Manufactures include sporting goods, gloves, chemical fertilizers and shoes. For comparative population figures *see* table in IOWA: *Population.*

GRIPENBERG, BERTEL JOHAN SEBASTIAN, BARON (1878–1947), one of the most outstanding of the Finnish poets who wrote in Swedish, was born on Sept. 10, 1878, in St. Petersburg, the son of a senator. He studied law at Helsinki university, became a free-lance writer and spent the last years of his life on his estate at Saaksmaki in southwest Finland. Gripenberg's first collection, Dikter (1903), attracted attention for its richness of colour and sensualism. This and other early collections, of which the most important are Gullergrinden (1905) and Svarta sonetter (1908), show his proud individualism, love of beauty and skilful handling of the sonnet form in particular. He gradually found in the landscape of central Finland a solace for the feelings of loneliness and anger so apparent in Svarta sonetter. The collections Drivsno (1909), Aftnar i Tavastland (1911), *Skuggspel* (1912) and *Spillror* (1917) include more tranquil contemplative poetry, often dwelling on the idea of death. Later collections contain some fine patriotic poems, *e.g.,* on the events of the 1918 war of independence, but in some Gripenberg degenerates into theatrical attitudes and empty pathos. In his last collections, Vid gransen (1930), Livets eko (1932) and Sista *ronden* (1941), the tone is again calmer and more sombre.

He also published some prose works, including his memoirs, Det var de tiderna (1943), and translated into Swedish the "Ballad of Reading Gaol" by Oscar Wilde, whose influence is apparent in his own works. He died in Sweden at the Savsjo sanatorium on May 6, 1947.

(K. L. K L)

GRIQUALAND EAST AND GRIQUALAND WEST are historical divisions of the Cape of Good Hope province in the Republic of South Africa. Geographically they are widely separate: historically they are linked hy the fact that in 1861 Adam Kok III (1835–76) of Griqualand West sold his land rights in what is now the Orange Free State. He trekked thence with about 3 000 Griquas across the Drakensberg and settled south of Natal and east of Basutoland in the no man's land, now called Griqualand East, between the Cape, Natal and Pondoland.

Griqualand West lies north of the Orange river and stretches from the Cape plateau eastward across the junction of the Vaal and the Harts rivers, with Kimberley almost on its eastern frontier. Its foundation dates from 1803, when nandering groups of Hottentots and Bastaards (offspring of mixed marriages) under Barend Barends were induced by the missionaries William Anderson and Kramer to settle at Klaarwater (modern Griquatown). They were joined by Koranna and Bechuana. and by 1823 the settlement numbered about 4,000 who called themselves collectively the Criqua people.

By the 1830s there were three Griqua communities with some claim to rank as states. The oldest. at Griquatown, had elected as captain Andries Waterboer. of part Bushman, part Hottentot extraction. He rescued the Kuruman mission station from attack by the Mantatees in 1823 and the following year gave shelter to Moshesh of Basutoland. North and northeast of Waterboer's Iands lay Campbell, another mission station, where the Griquas were ruled by Cornelis Kok. Southeast of both, Adam Kok's group had settled round the London Missionary Society mission centre at Philippolis.

In Dec. 1834 Sir Benjamin D'Urban signed a treaty with Waterboer recognizing his territorial rights as far east as Ramah, and sent a British resident to Griquatonn. By 1835, when the great trek was launched by the Afrikaners. it was Adam Kok, farther to the east, who found himself in the path of the trekkers. In 1843 he concluded a treaty with Sir George Napier (governor of the Cape. 1838–44). Previously (in 1838) Adam Kok had concluded a treaty fixing the frontier as between himself and Cornelis Kok on the west, and he now thought that the Napier treaty nould cover his eastern line facing the Boers. An attempt to exercise the duties imposed by Britain in terms of the Cape of Good Hope Punishment act led to a clash with the Boers at Zwartkopjes (May 1845) In 1845 Sir Peregrine Maitland revised the Napier treaty. Adam Kok's lands were divided theoretically into an inalienable area south of the Riet river, and a leasable area north of that river. In 1848 Sir Harry Smith (1848–52) converted those Boer farms in the leasable area into freeholds in return for cash compensation to Adam Kok. and stipulated that the Griquas pay compensation for improvement when leases terminated in the inalienable land. Notoriously improvident, the Griquas rarely had the money to pay this. and the Boers either usurped or bought freehold even in the inalienable land. In 1854, when Britain recognized the independence of the Free State, no security for Griqua lands was insisted upon; so the quiet and quasi-legal expropriation continued, and, in terms of the convention of Bloemfontein (1854), Free State, not Griqua, jurisdiction extended to European farmers in Griqua lands. In 1857 Cornelis Kok bequeathed the Campbell lands to Adam Kok. who four years later sold his lands to the Free State and. in an epic trek. moved eastward to settle in Griqualand East. in no man's land, where the British hoped the Griquas would be a buffer between the Basuto and the Pondo. Adam Kok died in 1876; and between 1878 and 1879 the control of European magistrates increased until. in 1879, Griqualand East was annexed to the Cape. In 1903, the district of East Griqualand was established as a native council and was admitted into the Transkeian Territories (see TRANSKEI, THE).

Unfortunately, when Adam Kok's lands mere sold to the Free State. his agent, without authorization. included the very dubious claim to the ill-defined Campbell lands. which the Griquas said should have reverted to Waterboer. Thus the Free State and Waterboer were rival claimants of territory which had strategic importance because it lay across the missionary road to the north. The road was vital to traders and, after the discovery of the Tati gold fields, sectors of the road were claimed by the Transvaal. Because of this the road was the focus of dispute among Britain, which protected the missionaries; Waterboer and the Free State, which claimed the Campbell lands; and Marthinius W. Pretorius of the Transvaal, whose westward claim to territory swung right across the road. (See PRETORIUS.) The Keate award, published in 1871, determined against the Transvaal frontier claim and defined the north and west limits of Griqualand West.

Meanwhile, confusion was increased by the discovery of diamonds; first in the Klipdrift area between the Vaal and the Harts rivers. and then in dry diggings far to the south and on the fringe of the eastern boundary of Campbell territory claimed by Waterboer. At Klipdrift the diggers had established a republic under the presidency of a former sailor, Stafford Parker. There. and in the dry diggings of what is now Kimberley, each nf the interested powers—Britain. the Orange Free State and the Transvaal—claimed control they dared not exert without the risk of war, while the diggers appealed to each in turn as seemed opportune. When in 1870 Waterboer and Pretorius and J. H. Brand failed to make an agreement. Waterboer offered his land, about which there was no dispute, together with his disputed Campbell claims, to Britain. In 1871, following the Keate award (*see* SOUTH AFRICA, UNION OF; TRANSVAAL), Sir Henry Barkly annexed the full Waterboer claim as Griqualand West. Legally the decision was premature, as was revealed when a land court was set up to settle matters of title, and Andries Stockenstrom, as judge, ruled that Waterboer's sovereignty had not extended to the Campbell lands, though he did not establish the converse—that Free State sovereignty had so extended. Two factors must rank as extenuating circumstances. First, control was urgently needed to stop acceleration of the gun traffic, and the Langalibalele crisis *(see* NATAL) demonstrated this. Second, had the earl of Carnarvon's federation scheme matured (see CARNARVON, HENRY HOWARD MOLYNEUX HERBERT), Griqualand would have been one unit in a new state. In 1876 Britain paid £90,000 as a final settlement of Free State claims. Even so, the annexation crisis of 1871 exercised a profound and adverse effect on Afrikaner sentiment.

Though in 1871 the Cape had passed a permissive annexation bill, Griqualand West remained under the British crown until 1880. Order was restored and maintained first by Sir Richard Southey and then by Sir Owen Lanyon, both scrupulous and able administrators. Land was surveyed and the Griquas were settled. some on farms, some in rural villages. Unrestricted freehold, im-providence and drink led to systematic expropriation. By 1903, as landowners, the Griquas were almost extinct. (W. A. ML.)

GRIS, JUAN (real name JOSÉ VICTORIANO GONZÁLEZ) (1887–1927), major Spanish Cubist painter closely associated with Georges Braque and Pablo Picasso, was born in Madrid on March 23, 1887, and was given a scientific education before being allowed to follow his inclination and study art. In 1906 Gris moved to Paris, where he made drawings (in an art *nouveau* style) for papers such as Le Charivari and Le *Témoin.* He settled in Montmartre in the Bateau-Lavoir, an artists' dwelling where his compatriot Picasso also lived. During his vital prentice years, Gris was thus closely in touch with the gradual evolution of Cubism. His first paintings in an analytical manner (including a "Portrait of Picasso") were exhibited at the Salon des Indépendants and Section d'Or in 1912. In 1913–14 he arrived at a personal and mature version of synthetic Cubism in which the use of *papier collé* was all-important. Gris envisaged the basis of every painting as "a sort of flat coloured architecture." He was, however, equally aware that "the essence of painting is the expression of certain relationships between the painter and the outside world"; pictures "with no representational purpose" were for him "incomplete technical exercises." He created synthetically an image of reality out of purely pictorial elements, and his greatness results from his having been able to temper intellectual and mathematical calculation with intuition and sensibility. Gris's version of Cubism was more severe and classical, less spontaneous and instinctive, than that of Braque and Picasso; at the same time he was not the victim of a system or theory. Between 1921 and 1927, Gris transformed his synthetic Cubist idiom so that his style became increasingly free, bold and lyrical; formal rhymes abound, curves prevail over angles, the colours are lighter and softer and objects assume more volume. In 1925, his health began to fail and Gris died at Boulogne-sur-Seine on May 11, 1927.

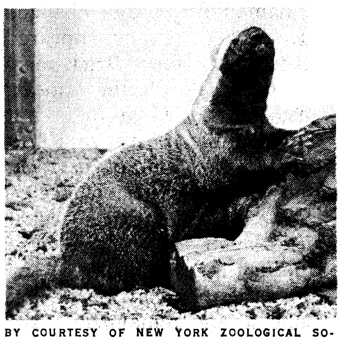
GRISAILLE is a kind of decorative painting done in a monochrome of grays, usually handled in severe or bold modeling in the manner of bas-reliefs. In French it is used as a general term to describe any painting technique that employs a completely developed monotone underpainting, in shades of gray or sometimes in brown, over which transparent or translucent oil colours are laid. It distinguishes between such a twofold method of colouring and the direct or alla *prima* method of putting down the final colours directly, but it does not include the type of painting in which transparent colours or glazes are applied over a multicoloured underpainting. Monochrome or single-toned paintings, or those in which two or three tones are used without regard for actual or realistic colour, intended as finished works in themselves are called *camaieu.* Among glass painters the term grisaille has still another meaning: it is the name of a gray vitreous colour or pigment used in the art of colouring glass for stained glass (*q.v.*). Neither the term grisaille nor the two technical procedures which it denotes are very widely used. Nevertheless monochrome decorations and monochrome underpainting methods are significant in the development of western art, and they have been practised to some extent in every period from Greek times to the present. See also OIL PAINTING, TECHNIQUE OF. (RH. M.)

GRISI, CARLOTTA (1819–1899) was the Italian ballerina who created the title role in Giselle in 1841. Born in Visinada, Italy, June 28. 1819, she studied at the ballet school of La Scala, in Milan. Dancing with Jules Perrot in Naples in 1834, she became his pupil and later his wife.

Following brilliant successes in Vienna and London, she was engaged at the Paris Opéra in 1841. She inspired the profound devotion of Théophile Gautier (*q.v.*), author of Giselle, who also wrote La *Péri* for her. She danced in Perrot's Pas de Quatre in London (1845), appeared in Russia, and at the age of 35 retired to Geneva, Switz., where she died, May 20, 1899. (LN. ME.)

GRISI, GIULIA (1811–1869), Italian opera singer, was born in Milan on July 28, 1811. Giulia was trained for a musical career, and made her stage debut in 1828 in Rossini's *Zelmira.* Later at Milan she was the first Adalgisa in Bellini's Norma, in which Pasta took the title part. Grisi appeared in Paris in 1832, as Semiramide in Rossini's opera, and had a great success. She played at the Théâtre Italien from 1832 to 1849, while in the summers from 1834 onward she appeared in London. Her voice was a brilliant dramatic soprano, and her established position as a prima donna continued for 30 years. Bellini wrote I *Puritani* for performance in 1835 by the great quartet of singers, Grisi, Rubini, Tamburini and Lablache, and the tradition of their peerless singing was long remembered in London and Paris. Later Giovanni Mario (*q.v.*) took the place of Rubini, and for them Donizetti wrote Don Pasquale. In 1854 Grisi toured with Mario in America. She died in Berlin on Nov. 29, 1869.

GRISON, a weasellike mammal (Grison vittata) found in Central and South America. It is about two feet long with an eight-inch tail. The small ears are broad. Grisons, skilled burrowers, climbers and swimmers, prefer to feed on flesh but will eat berries, nuts, etc. The lower parts are blackish, the back bluish-gray.



BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY
GRISON (GRISON VITTATA), NATIVE IN CENTRAL AND SOUTH AMERICA

A smaller species (*G. furax*) lives in southern Brazil. The least grison (*Lyncodon patagonicus*) occurs in Argentina; it is brown with a whitish crown, blackish nape and gray back. The tayra (*Eira bar*bara), about the size of an otter, with a long tail and ears, has been confused with the grison. *See* CARNIVORA. (J. E. HL.)

GRISONS: see GRAUBÜNDEN.

GRISWOLD, RUFUS WILMOT (1815–1857), U.S. editor who as literary executor edited the writings of Edgar Allan Poe (1850), was born in Benson, Vt., on Feb. 15, 1815. He was a Baptist clergyman for a time, then became a journalist in New York city, and succeeded Poe as literary editor of Graham's Magazine (Philadelphia). He died in New York city on Aug. 27, 1857.

See Honor McCusker, "The Correspondence of R. W. Griswold" More Books, vol. xvi, xviii (1941, 1943), continued by Zoltan Haraszti, Boston Public Library Quarterly, vol. i, ii (1949, 1950); Killis Campbell, "The Poe-Griswold Controversy," Modern Language Association Publications, vol. xxxiv, pp. 436–464 (1919); Joy Bayless, *Rufus Wilmot* Griswold, Poe's Literary Executor (1943).

GRIVET, an African guenon (*q.v.*), *Cercopithecus aethiops,* allied to the green monkey. The typical grivet lives in the Sudan and Ethiopia; related forms are found throughout the savanna country of Africa. The chin, whiskers, a band across the forehead and the underparts are white, the head and back olive green. (J. E. HL.)

GRIZZLY BEAR (*Ursus* horribilis) and its close relatives include some of the largest bears. The coat colour is brownish to buffy; the hairs are usually pale-tipped, producing a frosted, grizzled effect. A large animal may be nine feet long and weigh 1,000 lb. and can easily kill and carry a cow. The height of these bears at the shoulders produces a humped appearance. Because of their great bulk and long, straight claws, they seldom climb, even as cubs.

Formerly they occurred over western North America from northern Alaska to Durango, Mex., especially in open country. Because of their aversion to man, the disappearance of suitable food and relentless hunting they are almost extinct in the United States and Mexico and much reduced in numbers elsewhere. They are omnivorous, feeding on big game, rodents, fish, berries and occasionally even grass. Food is often cached in shallow holes and covered with brush or litter. The grizzly digs readily in search of rodents, often leaving a hillside thoroughly plowed. The home range of a grizzly may comprise several hundred square miles. A methodical animal, it prefers well-developed trails, each passing animal treading in the footsteps of its predecessor until the trail is deeply rutted. Despite their great bulk, grizzlies are surprisingly agile and when pressed run with a light gallop as fast as 30 m p h. When fleeing or charging, they can crash through brushy thickets or deep, matted grass with seeming ease. They are unpredictable. often sullen and ill-tempered and exceedingly dangerous when they feel themselves threatened. *See* also BEAR; CARNIVORA. (K. R. KN.)

GROCK (stage name of CHARLES ADRIEN WETTACH) (1880–1959), the clown whose blunders with piano and violin became proverbial, was born at Moulin de Loveresse, near Reconvilier, Switz., on Jan. 10, 1880. His father, a watchmaker, was an amateur acrobat, and his son grew up with such a love of the sawdust ring that he was allowed to spend each summer with a circus, where he performed first as a tumbler and then as a violinist, pianist and xylophonist. When he was 19 he clowned in a café. but the draw of the circus proved irresistible, though it brought him a wandering life of hardship from Hamburg to Bucharest. He then became the partner of a clown named Brick, and changed his name to Grock on Oct. 7, 1903. Together they appeared in France, North Africa and South America. When Brick married, Grock joined the celebrated Antonnet. At Berlin, appearing on a stage instead of in an arena, they failed at first; but by mastering the stage technique they obtained, through C. B. Cochran, an engagement at the Palace theatre, London, in 1911. Two years later Grock, with an anonymous partner, perfected those adventures of a simpleton among musical instruments that made audiences in many European cities laugh—at his wonder as to where the strings had gone when he held his fiddle the wrong side up, and at his labours to sit nearer the piano by pushing it toward the stool. In 1924 he left England and remained on the continent until his farewell at Hamburg in 1954. He died at Imperia, It., on July 14, 1959.

Grock wrote several books, among which is his autobiography, *Die Memoiren des Koenigs der Clowns* (1956), translated by Basil Creighton as *Grock, King of Clowns* (1957). (M. W. D.)

GROCYN, WILLIAM (1446?–1519), English scholar, was born at Colerne, Wiltshire. He was a scholar and fellow of New college, Oxford, reader in divinity in Magdalen college, and in 1485 became prebendary of Lincoln cathedral. About 1488 Grocyn left England for Italy, and before his return in 1491 he had visited Florence, Rome and Padua, and studied Greek and Latin under Demetrius Chalchondyles and Politian. As lecturer in Exeter college he found an opportunity of indoctrinating his countrymen in the new Greek learning

Erasmus says in one of his letters that Grocyn taught Greek at Oxford before going to Italy. He seems to have lived in Oxford until 1499, but when his friend Colet became dean of St. Paul's in 1504 he was settled in London. He was chosen by his friend to deliver lectures in St. Paul's. He also counted Linacre, William Lily, William Latimer and More among his friends, and Erasmus writing in 1514 says that he was supported by Grocyn in London, and calls him "the friend and preceptor of us all." He held several preferments, including the wardenship of All Hallows college at Maidstone, Kent. He died in 1519, and was buried in the collegiate church at Maidstone.

An interesting account of Grocyn written by Professor Burrows appeared in the Oxford Historical society's *Collectanea* (1890).

GRODNO, one of the former Lithuanian governments of western Russia, the northern part of which was the object of a dispute between Poland and Lithuania after World War I.

The government of the Polish republic occupied practically the whole area and created an administrative province of Bialystok.

Grodno's area under Russian rule was 14,926 sq.mi. and its population was somewhat under two million, mainly White Russians (54%), with large Jewish (17.4%) and Polish (10%) elements, also Lithuanians and Germans. Prior to 1795, when it was annexed by Russia, it had been Polish for centuries.

Grodno is called, by the Lithuanians, Gardinas. Immediately after the revolution of 1917 there was much shuffling of provinces and territories; for some years the districts and areas bordering on Russia were in *a* state of flux; by a system of gradual assimilation some of the territories were absorbed with the soviet union—others were simply annexed.

During the early part of World War II Grodno (that is, the northern part of the Polish province of Bialystok) was occupied by Soviet troops and, by the German-Russian partition agreement of Sept. 28, 1939, was allotted to the U.S.S.R. The small portion that had remained a part of Lithuania was also annexed to the Soviet Union when that nation absorbed the Baltic states in 1940.

After Germany attacked the U.S.S.R. Grodno came under German control and was held from 1941 until 1945.

Except for some hills (not exceeding 92j ft.) in the north, Grodno is a uniform plain, and is drained chiefly by the Bug, Niemen, Narev and Bobr, all navigable. There are also several canals, the most important being the Augustowo and Oginsky. Granites and gneisses crop out along the Bug, Cretaceous, and especially Tertiary, deposits elsewhere. The soil is mostly sandy, and in the district of Grodno and along the rivers is often drift sand. Forests, principally of Coniferae, cover more than one-fourth of the area. Among them are some of vast extent, *e.g.*, those of Grodno (410 sq.mi.) and Bialowieza (376 sq.mi.), embracing wide areas of marshy ground. In the last-mentioned forest the wild ox survived, having been jealously preserved since 1803. Peat bogs, sometimes as much as four to seven feet thick, cover extensive districts. Agriculture is the predominant industry, and over 2,250,000 ac. are arable. The principal crops are potatoes, rye, oats, wheat, flax, hemp and some tobacco. Horses, cattle and sheep are bred in fairly large numbers. There is, however, a certain amount of manufacturing industry, especially in woolens, distilling and tobacco. There are also factories which produce silk, shoddy and leather.

GRODNO (GARDINAS), town, formerly in Poland, in the Belorussian S.S.R., U.S.S.R., on the Niemen, 160 mi. N.E. of Warsaw. Population in (1959) was 72,000. It has two old castles and two churches. Tobacco factories and distilleries are important; machinery, soap and candles are also made. Once part of the principality of Lithuania, Grodno was frequently ravaged by the Teutonic Knights. After the union with Poland in 1569, it became one of the two meeting places of the Polish-Lithuanian diet. The second partition of Poland was signed at Grodno during the year 1792. In World War II Grodno was occupied by the U.S.S.R. from 1939 to 1941, when it was taken by German troops. It was again ceded to the U.S.S.R. in 1945.

GROEMER, WILHELM (1867–1939), German general, was born on Nov. 22, 1867, at Ludwigsburg, Wiirttemberg. In 1912 he was attached to the railway section of the general staff, and was its chief during the mobilization of 1914. From May 27, 1916 to Aug. 1917 he was departmental head of the War Office. He went to the eastern front as divisional commander and leader of an army corps in Aug. 1917, and in 1918 was chief of staff of the army group under the command of Linsingen and afterwards of Eichhorn. In Nov. 1918 he succeeded Ludendorff as quartermaster-general, but retired as a protest against the signature of the Treaty of Versailles. After the revolution he joined the Democratic Party. He was minister of communications (June 1920–Aug. 1923) and combated the proposals for the reversion of the state railways to private ownership. He wrote *Der Weltkrieg und seine Probleme* (1920). He was minister of defence, 1928–1932, and of the interior, 1931–32.

GROEN VAN PRINSTERER, GUILLAUME (1801–1876), Dutch politician and historian, was born at Voorburg, near The Hague, on Aug. 21,1801. He studied at Leyden university, and acted (1829–33) as secretary to King William I. of Holland. He became the leader of the so-called anti-revolutionary party, both in the second chamber, of which he was for many years a member, and outside. In Groen the doctrines of Guizot and Stahl found an eloquent exponent. They permeate his controversial and political writings and historical studies, of which his *Handbook* of *Dutch History* (in Dutch) and *Maurice et Barnevelt* (in French, 1875, a criticism of Motley's *Life of Van Olden-Barnevelt)* are the principal. Groen was violently opposed to Thorbecke, whose principles he denounced as ungodly and revolutionary. He died at The Hague on May 19, 1876. He is best known as the editor of the

Archives et correspondance de la maison d'Orange (12 vols., 1835–45), a great work of patient erudition.

See Bos, *Groen van Prinsterer en zijn tijd* (2 vols., 1886–91).

GROIN, in architecture, the edges formed at the intersections of two vaults at an angle to each other. If the vaults intersect at right angles and are of the same height and radius, these intersections will all lie on a vertical plane at 45° to the planes of the two vaults. If, however, one vault is lower than the other. or the curvatures are different, winding and distorted curves will result. Both the Roman and Renaissance constructors of vaults frequently regularized the rib shapes and slightly warped the surfaces of the vaults until they met at this regularized groin line. Thus in the coved, penetrated ceilings of the 16th century. where an elliptical vault was intersected by smaller vaults, the groins mould often be given simple segmental curves, meeting at a point in the centre of each penetration, and the smaller vaults forming the penetrations given a surface almost conical in order to meet this line. The term Welsh groin is often applied to the groin resulting from such an intersection of a smaller cross vault with a higher main vault. In the medieval period, when ribbed vaulting became common, the ribs under the groins (groin ribs or diagonal ribs), being built first, were usually on curves lying in a simple plane. The web. or filling in of small stones between the ribs, could be warped or twisted at will, so as to start correctly from the wall or cross ribs of different sizes and yet meet over the groin rib. *See* ARCH AND VAULT.

GROLIER, JEAN, VICOMTE D'AGUISY (1479–1565), French bibliophile, was born at Lyons, was the friend of Budé, the patron of Aldus, and was called the Maccenas of men of letters by his contemporaries. Of his great library of 3,000 volumes, dispersed in 1675, some 350 are known to be in existence. They are richly bound and bear their onner's *ex libris* "Grolerii Lugdunensis, et Amicorum." Grolier made the acquaintance of Aldus while he was French ambassador in Italy (1510–35).

See Leroux de Lincy, *Recherches sur Jean* ***Grolier*** (1866).

GROMATICI or **AGRIMENSORES,** the name for land-surveyors amongst the Romans, from Lat. *groma* or *gruma, a* surveyor's measuring appliance. The art of surveying was probably at first in the hands of the augurs, who from early times had made use of sighting instruments for marking out the rectangular consecrated space *templum* containing the *tabernaculum* in which the augur observed the omens given by birds. The first professional surveyor mentioned is L. Decidius Saxa, who was employed by Anthony in the measurement of camps (Cicero, *Philippics,* xi. 12, xiv. 10). The subsequent increase in the number of military colonies, the settlement of Italian peasants in the provinces, the general survey of the empire under Augustus, the separation of private from State domains, led to the formation of a recognized professional class of highly-paid surveyors, some of whom were even honoured with the title *clarissimus.* Their duties required not only geometrical but also legal knowledge, as their decisions were considered authoritative in matters relating to the distribution of lands. This led to the institution of special training schools and the growth of a special literature, chiefly between the 1st and 6th centuries A.D. The earliest of the gromatic writers was Frontinus (*q.v.*), whose *De agrorum qualitate,* written from A.D. 81–96, dealt more with the legal aspect of the art. Extracts of it are preserved in the commentary of Aggenus Urbicus, a Christian schoolmaster. Under Trajan a certain Balbus wrote a manual of geometry for land surveyors *(Expositio et ratio omnium formarum et mensurarum*). Also, under Trajan, Hyginus makes a definite reference to the use of the groma for laying out agricultural holdings. Later was Siculus Flaccus (de *condicionibus agrorum,* extant), while the most curious treatise on the subject, written in barbarous Latin and entitled *Casae litterarum,* is the work of a certain Innocentius (4th–5th century). The *Gromatici veteres* contains extracts from official registers (probably 5th century) of land surveys, lists and descriptions of boundary stones, and extracts from the Theodosian Codex. According to Mommsen, the collection had its origin during the 5th century in the office of a diocesan governor of Rome, who had a number of surveyors under him. The *agrimensores* have been known by various names, e.g., *decempedator* (with reference to the instrument used); *finitor, mensor castrorum* in republican times; *togati Augustorum* as imperial civil officials; *professor, auctor* as professional instructors.

GRONINGEN, most northerly province of the Netherlands, bounded south by Drente, west by Friesland and the Lauwers Zee, north and north-east by the North Sea and the mouth of the Ems with the Dollart, and south-east by Germany. German troops occupied the province in 1940. It includes the islands of Boschplaat and Rottumeroog, belonging to the group of Frisian islands (*q.v.*). Area, 867 sq.mi.; pop. (1957 est.) 467,712. The sandy tongue of the Hondsrug extends from the Drente plateau almost to the capital. West, north and north-east of this the province is flat and consists of sea-clay or sand and clay mixed, except where patches of low and high fen occur on the Frisian borders. Low fen predominates to the east of the capital. The south-east of the province is of high fen resting on diluvial sand largely reclaimed. The morass on the German border was long considered as the natural protection of the eastern frontier, and with the view of preserving its impassable condition neither agriculture nor cattle-rearing was permitted until 1824, and it was only in 1868 that the work of reclamation began. The gradual extension of the seaward boundaries ot the province owing to the process of littoral deposits may be traced by a triple line of sea-dikes marking the successive stages in this advance. The rivers of Groningen descending from the Drente plateau meet at the capital, whence they are continued by the Reitdiep to the Lauwers Zee (being discharged through a lock), and by the Ems canal (1876) to Delfzyl. The south-eastern corner of the province is traversed by the Westerwolde Aa, which discharges into the Dollart. The railways belong to the northern section of the State railways, and afford communication with Germany via Winschoten. Agriculture is the main industry and the proportion of landowners is a very large one. The ancient custom called the *beklem-recht,* or lease-right, doubtless accounts for this. By this custom a tenant-farmer is able to bequeath his farm, as he holds his lease in perpetuity.

The chief agricultural products are barley, oats, wheat, and in the north-east flax is also grown, and exported to South Holland and Belgium. On the higher clay grounds cattle-rearing and horse-breeding are also practised, together with butter and cheese making. Potatoes are cultivated. Coast fisheries are considerable. Groningen (*q.v.*) is the only large town. Delfzyl, formerly an important fortress for the protection of the ancient sluices on the river Delf, has benefited by the construction of the Ems (Eems) ship-canal connecting it with Groningen, and has a harbour, ordinarily importing wood. Appingedam and Winschoten are very old towns with cattle and horse markets.

GRONMGEN, a commune of the Netherlands, capital of the province of the same name, at the confluence of the two canalized rivers the Drentsche Aa and the Hunse (which are continued to the Lauwers Zee as the Reit Diep), 16 mi. N. of Assen and 33 mi. E. of Leeuwarden by rail. Pop. (1957 est.) 142,859 mun.

History.—The town of Groningen belonged originally to the *pagus,* or *gouw,* of Triantha (Drente), the countship of which was bestowed by the emperor Henry II. on the bishop and chapter of Utrecht in 1024. In 1040 Henry III. gave the church of Utrecht the royal domain of Groningen, and in the deed of gift the "villa Cruoninga" is mentioned. At first the bishops were too strong for the townsmen, and down to the 15th century an episcopal prefect, or burgrave, had his seat in the city, his authority extending over the neighbouring districts known as the Gorecht. Gradually, however, the burghers, aided by the neighbouring Frisians, succeeded in freeing themselves from the episcopal yoke. The city was walled in 1255; before 1284 it had become a member of the Hanseatic league; and by the end of the 14th century it was practically a powerful independent republic, which exercised an effective control over the Frisian Ommelande between the Ems and the Lauwers Zee. In 1440 Bishop Dirk II. finally sold to the city the rights of the see of Utrecht over the Gorecht.

The medieval constitution of Groningen, unlike that of Utrecht, was aristocratic. Merchant gild there was none; and the craft gilds were without direct influence on the city government, which held them in subjection. Membership of the governing council, which selected from its own body the four *rationales* or burgomasters, was confined to men of approved "wisdom," and wisdom was measured in terms of money. This Raad of wealthy burghers gradually monopolized all power. The bishop's bailiff (*schout*), with his nominated assessors (*scabini*), continued to exercise jurisdiction, but members of the *Raad* sat on the bench with him, and an appeal lay from his court to the *Raad* itself. The council was supreme and in 1439 it decreed that no one might trade in all the district between the Ems and the Lauwers Zee except burghers, and those who had purchased the *burwal* (right of residence in the city) and the freedom of the gilds. In 1536 the city passed into the hands of Charles V., and in the great wars of the 16th century suffered all the miseries of siege and military occupation. From 1581 onwards, Groningen, still held by the Spaniards, was constantly at war with the "Ommelanden" which had declared against the king of Spain. In 1672 the town was besieged by the bishop of Münster, but it was successfully defended, and in 1698 its fortifications were improved under Coehoorn's direction. The French Republicans were in control from Feb. 1795 until 1814. The fortifications of the city were destroyed in 1874. German troops occupied Groningen during the invasion of May 1940.

Buildings, et~. — Theancient part of the town is still surrounded by the former moat, and in the centre lies a group of open places. The chief church is the Martini-kerk, dating from 1477, and an organ constructed by the famous scholar and musician Rudolph Agricolo, who was born near Groningen in 1443. The Aa church dates from 1465, but was founded in 1253. The provincial museum of antiquities contains interesting Germanic antiquities, as well as medieval and modern collections of porcelain, pictures, etc. The old Ommelandcrhuis was built in 1509.

The university of Groningen, founded in 1614, has among its auxiliary establishments an observatory and a library which contains a copy of Erasmus' New Testament with marginal annotations by Luther. Groningen is the centre from which several important canals radiate. Hence steamers ply in all directions, and there is a regular service to Emden and the islands of Borkum and Schiermonnikoog. Groningen is the most important town in the north of Holland, with brick houses of the 16th and 17th centuries still standing. As capital of the province, and because of its natural position, Groningen ordinarily maintains a considerable trade, chiefly in oilseed, grain, wood, turf and cattle. The chief industries are flax spinning, sugar refining, book printing, and it also manufactures beer, tobacco, cotton and woollen stuffs, furniture and pianos; besides which there are numerous goldsmiths and silversmiths.

GROOTE, GERHARD (GEERT GROOT or GROETE; Lat. GERARDUS MAGNUS) (1340–1384), founder of the Brethren of the Common Life (*q.v.*) and also (through his disciple Florentius Radewyn) of the Windesheim Congregation of Canons Regular, was the father of the devotio *moderna,* the influential spiritual movement of the 15th century. Born of a wealthy family at Deventer, Neth., he was well educated (arts, canon and civil law, medicine. theology) at Aachen, Cologne, Paris and Prague. Influenced by a Carthusian friend, he abandoned the worldly life he was leading, renounced his two benefices (Utrecht and Aachen) and many possessions, gave over most of his home to devout women (first beginning of the Sisters of Common Life) and on the advice of Jan van Ruysbroeck (*q.v.*) went to a Carthusian monastery (c. 1375). Desiring apostolic activity, he left after two years, was ordained deacon (never a priest) and began zealously preaching the gospel in the diocese of Utrecht. His preaching was immensely fruitful, but he made enemies by rebuking lax priests and religious. They persuaded the bishop to retract his permission to preach. Groote obeyed but appealed to the pope. Before the response came, he died on Aug. 20, 1384. By preaching Groote gathered many disciples who became the nucleus of the Brethren of the Common Life, and from them was formed, at Groote's direction but after his death. the Windesheim congregation. Through these two groups he had his greatest influence, especially in spirituality. His spirituality was affective, practical, moderate and methodical. Some claim that Groote wrote The Imitation *of* Christ (*q.v.*).

See A. Hyma, ***Brethren of the Common Life*** (1950), with a biography of Groote, a history of the Brethren of the Common Life and the Windesheim congregation and a fine bibliography. (T. G. O'C.)

GROPIUS, WALTER (1883–), German-American architect, internationally famous for his leadership in modern architecture, was born May 18, 1883, in Berlin. After a brilliant early start, continued struggles against the German ruling taste made his life and career difficult. From 1903 to 1907 he studied at the institutes of technology in Berlin and Munich. He was Peter Behrens' chief assistant in Berlin from 1907 to 1910. In 1910 he set up his own architectural practice. In 1911 he built the Fagus works at Alfeld, Germany. through which, as Mies van der Rohe put it, Gropius "became with one stroke one of the leading architects of Europe." Today it is preserved as a national monument.

At the Werkbund exhibition at Cologne (1914), great architectural excitement was aroused by Gropius' model factory connected to an administration building, with its transparent staircase and glass-walled offices and roof terrace. Among his other exhibits were: the Paris exhibition's "Salon des Artistes Decorateurs" (1930) and the Pennsylvania Pavilion for the New York World's fair (1939). His famous Bauhaus at Dessau (1925–26) revealed the potentialities of new forms and spaces in a large building complex composed of two schools and a students' dormitory. The glass curtain wall, drawn around the corners of the main building, dominated the scene. The Impington Village college, Cambridge, England (1936), was designed to provide for the education of both children and adults. His most important work in the United States is the Harvard graduate center (1949–50).

Gropius' faith in teamwork is rooted in his qualities as a teacher. That the Bauhaus at Weimar and Dessau (1919–28) could stand up against its adversaries is a tribute to his talent for inspiring associates to cooperate in the service of an ideal. This emphasis on teamwork was largely responsible for his great influence as Chairman of Harvard's graduate school of design from 1937–52. In all his activities he sought to bridge the gulf between artistic form and industrial production. From 1934 to 1937 Gropius was a voluntary exile in London until he was summoned to Harvard. Beginning in 1946, as founder and member of The Architects' Collaborative, hc associated himself successfully with young American architects engaged in extensive building activity, including the American embassy in Athens (1957). The many honours accorded him include degrees from the Institute of Technology in Hanover (1929), and Harvard university (1953), the Grand Prix d'Architecture at São Paulo (1954), the Gold medal of the Royal Institute of British Architects (1956), the Goethe prize from the University of Hamburg (1957) and the Gold medal of the American Institute of Architects (1959).

See H. Bayer, W. Gropius, and I. Gropius, ***Bauhaus, 1919–1928*** (1952) ; and S. Giedion, ***Walter Gropius, Team and Teamwork*** (1954). (S. GN.)

GROS, ANTOINE JEAN, BARON (1771–1835), French (history) painter especially known for his pictures of Napoleon's campaigns, was born in Paris on March 16, 1771, the son of a miniature painter who gave him his first lessons in painting and drawing. Toward the end of 1785 he entered the studio of J. L. David; while revering him as a teacher, he was equally impressed by the works of Rubens, whose influence can be seen in his brilliant colouring and crowded compositions. In 1793, with David's help, Gros went to Italy, made his way to Genoa, and there met Joséphine de Beauhamais and through her his hero Napoleon. In 1796 he followed the French army to Arcole, and was present when Napoleon planted the flag on the bridge and commemorated the incident in his first major work, "Napoleon sur le Pont d'Arcole" (Louvre, Paris). Napoleon gave him the formal rank of *inspecteur* aux revues, which enabled him to accompany the army on its campaigns, and he also served on the commission to select works of art from Italy for the Louvre.

The Salon of 1804 saw the second of Gros's masterpieces, "Les Pestiférés de Jaffa" (Louvre), which shows Napoleon not only visiting the leper hospital but touching the sores in the way that former kings of France touched for the plague. This was followed two years later by "La Bataille d'Aboukir" (Versailles), of which the hero is Murat, and in 1808 by "La Bataille d'Eylau" (Louvre), in which Napoleon on the battlefield almost has the attributes of sanctity. Although he continued to paint large compositions containing passages of fine painting ("Départ de Louis XVIII," 1815. Versailles), Gros never repeated the great climaxes of Jaffa or Eylau. The decoration of the dome of Ste. Geneviève (1811), is a cold and disconnected work. After the fall of Napoleon, Gros's finest pictures were portraits, many of which are masterpieces; *e.g.*, "Jeune Fille au Collier de Jais" (Musée Magnin, Dijon), "Mme. Récamier âgée" (Zagreb).

Constantly worried by David's criticism of his work, Gros made an effort to paint in a more academic classical manner, in the ceiling of the Egyptian room of the Louvre in 1824. But it was too late; his brilliant crowded compositions of some 20 years earlier had already sown the seeds of the Romantic reaction to classicism. Eugene Delacroix and Théodore Géricault would not be possible without Gros. A sense of failure exacerbated his already strong tendency toward melancholia and on June 26, 1835, he was found drowned in the Seine.

BIBLIOGRAPHY.—E.J. Delecluze, Louis David, son *école* et son temps (1855); J. B. Delestre (pupil of Gros), Gros, sa vie et ses ouvrages (1867); G. Dargenty, Le Baron Gros (1887). (AA. B.)

GROSBEAK, a name indefinitely applied to many thick-billed birds. It is one of the names of the hawfinch (*q.v.*) but is generally used in combination. The pine grosbeak (Pinicola enucleator) is a finch (*q.v.*) inhabiting the coniferous woods of the new and old worlds, moving southward in large flocks with the approach of winter. In structure and habits it resembles a bullfinch, but is larger; in plumage it is much like a crossbill (*q.v.*). It has many smaller allies. The bright red cardinal or Virginia nightingale (Richmondena *cardinalis*), one of the grosbeak group, inhabits the eastern, central and southwestern U.S. Many other American birds are called grosbeaks, of which the best known are the rose-breasted grosbeak (Pheuticus ludovicianus); black-headed grosbeak (P. melanocephalus); eastern blue grosbeak (*Guiraca* coerulea); and the eastern evening grosbeak (*Hesperiphona* vespertina). For "sociable grosbeak" see WEAVERBIRD.

GROSE, FRANCIS (*c.* 1730–1791), English antiquary, was born at Greenford, Middlesex. Grose early showed an interest in heraldry and antiquities, and his father procured him a position in the Heralds' college. In 1763, being then Richmond Herald, he sold his tabard, and shortly afterwards became adjutant and paymaster of the Hampshire militia. The fortune left him by his father being squandered, he began to turn to account his excellent education and his powers as a draughtsman. In 1757 he had been elected fellow of the Society of Antiquaries. In 1773 he began to publish his Antiquities of England and Wales, completed in 1787. In 1789 he set out on an antiquarian tour through Scotland, and in the course of this journey met Burns, who composed in his honour the famous song beginning "Ken ye aught o' Captain Grose," and in that other poem, still more famous, "Hear, land o' cakes, and brither Scots," warned all Scotsmen of this "chield among them taking notes." He died in Dublin on June 12, 1791.

Grose was a sort of antiquarian Falstaff—at least he possessed in a striking degree the knight's physical peculiarities; but he was a man of true honour and charity, a valuable friend, an inimitable boon companion. His humour, his varied knowledge and his good nature all contributed to make him a favourite in society.

Grose's works include The Antiquities of England and Wales (6 vols., 1773–87); Advice to the *Officers* of the British Army (1782), a satire in the manner of Swift's Directions to Servants; A Guide to Health, Beauty, Riches and Honour (1783), a collection of advertisements of the period, with characteristic satiric preface; A Classical Dictionary of the Vulgar Tongue (1785); A Treatise on Ancient *Armour* and Weapons (1785–89); Darrell's History of Dover (1786); Military *Antiquities* (2 vols., 1786–88); A Provincial Glossary (1787); Rules for *Drawing* Caricatures (1788); The Antiquities of Scotland (2 vols., 1789–91); Antiquities of Ireland (2 vols., 1791), edited and partly written by Ledwich. The *Grumbler*, 16 humorous essays, appeared in 1791 after his death; and in 1793 *The* Olio, a collection of essays, jests and bits of poetry, highly characteristic of Grose was printed.

A capital full-length portrait of Grose by N. Dance is in the first volume of the Antiquities of Englund *and* Wales, and another is among Kay's Portraits. A versified sketch of him appeared in the Gentleman's Magazine, lxi. 660. See Gentleman's Magazine, lxi. 498, 582; Noble's *Hist.* of the College of Arms, p. 434; Notes and Queries, passim.

GROSSETESTE, ROBERT (*c.* 1175–1253), bishop of Lincoln, and one of the greatest of mediaeval statesmen and philosophers, was born of humble parents at Stradbrook, Suffolk. About 1197, he graduated at Oxford where he had become proficient in law, medicine and the natural sciences. Some ten years later he took his divinity degree, and soon after this event, as the outstanding teacher at Oxford, he was appointed Master of the Oxford Schools, a status which was first termed "Chancellor" in the Legatine Ordinance of 1214. In 1229 when the Franciscans established their first school at Oxford, Grosseteste was secured as their reader in theology. According to Roger Bacon, who was a severe critic, Grosseteste was pre-eminent among his contemporaries for his knowledge of the natural sciences and of mathematics. Between 1214 and 1231 Grosseteste held in succession the archdeaconries of Chester, Northampton and Leicester. In 1232, he resigned all his preferments except one prebend at Lincoln. But he retained the office of chancellor, and in 1235 accepted the bishopric of Lincoln, an appointment which he held until his death on Oct. g, 1253.

Grosseteste's scheme to reform morals and clerical discipline throughout his vast diocese, brought him into conflict with more than one privileged corporation, in particular with his own chapter, and it was only in 1245 that by a personal visit to the papal court at Lyons, he secured a favourable verdict. His zeal for reform led him to advance, on behalf of the courts-Christian, pretensions which it was impossible that the secular power should admit. He twice incurred a well-merited rebuke from Henry III. upon this subject; although it was left for Edward I. to settle the question of principle in favour of the state. The devotion of Grosseteste to the hierarchical theories of his age is attested by his correspondence with his chapter and the king. Against the former he upheld the prerogative of the bishops; against the latter he asserted that it was impossible for a bishop to disregard the commands of the Holy See. Where the liberties of the national church came into conflict with the pretensions of Rome he stood by his countrymen. Of royal exactions he was impatient.

It was, however, soon made clear that the king and pope were in alliance to crush the independence of the English clergy; and from 1250 onwards Grosseteste openly criticized the new financial expedients to which Innocent IV. had been driven by his desperate conflict with the Empire. While visiting Innocent in 1250, the bishop laid before the pope and cardinals a written memorial in which he ascribed all the evils of the Church to the malignant influence of the Curia. It produced no eifect, although the cardinals felt that Grosseteste was too influential to be punished for his audacity. In 1251 he protested against a papal mandate enjoining the English clergy to pay Henry III. one-tenth of their revenues for a crusade, and in 1253 against a command to provide in his own diocese for a papal nephew.

In literary and speculative activities, Grosseteste found some release from his ecclesiastical and political cares. He was familiar with the Neo-Platonic materials introduced into the West by the Arabians, with their scientific treatises and with the newly translated works of Aristotle. He himself contributed to the revival of learning by his commentaries on Aristotle, and by his Greek-Latin translations of the Ethics, of the works of the pseudo-Dionysius and of the De Fide Orth. of the Damascene; hence Grosseteste, rather than Albert the Great, must be credited with having introduced Aristotle into the West. The peculiar originality of his mind is further manifested by his profound interest in science, by his exaltation of mathematics, by his enthusiasm for the study of languages, by his treatises on husbandry and politics, by his poetical compositions and by his concern for music and ecclesiastical architecture. His philosophy, which represents the first attempt to reconcile the doctrines of Augustine and of Aristotle, is full of interest, especially in its denial of the eternity of the world, and in its doctrines of light as the origin of corporeity, of the stars as composed of the four elements, of the active intellect in man, of angelology and of the divine knowledge of singulars.

BIBLIOGRAPHY.—An account of the mss. and editions of Grosseteste's works is given in the preface to Baur's edition of the scientific opuscula published in vol. ix. of the series *Beiträge zur Gesch. der Phil. des Mittelalters* (Münster, 1912). The *Letters* were edited by H. R. Luard in the Rolls Series (1861) and the famous memorial to the pope is printed in the appendix to E. Brown's *Fasciculus rerum expetendarum et fugiendarum* (1690). A French poem, *Le Chastel d'amour,* was edited by R. F. Weymouth for the Philological Society in 1864. For Grosseteste's life and work *see* F. S. Stevenson, *Robt. Grosseteste* (1899) ; Baur, *Die Philosophie des Grosseteste* in Bd. xviii. of the *Beiträge* series (1917) ; *see* also A. G. Little, *The Grey Friars in Oxford* (1899) ; and "The Franciscan School at Oxford," *Arch. Fran. Hist.* (1926) ; P. Duhem, *Le Système du Monde* (5 vols. 1913, foll.) ; and Überweg, *Gesch. der Philosophie* (Bd. ii., 1928).

GROSSETO, a town and episcopal see of Toscana (Tuscany), capital of the province of Grosseto, Italy, 90 mi. S.S.E. of Pisa by rail. Population (1951) 24,640. It is 38 ft. above sea level. Fortifications constructed by Francis I (1574–87) and Ferdinand I (1587–1609) form a hexagonal enciente with projecting bastions, with two gates only. The small cathedral begun in 1190 and rebuilt in 1294, is of red and white marble, in the Italian Gothic style. The citadel was built in 1311 by the Sienese. Grosseto is on the main line from Pisa to Rome.

The town dates from the middle ages. In 1138 the episcopal see was transferred thither from Rusellae. In 1224, with the rest of the Maremma, of which it is the capital, it came under the dominion of Siena. By the peace of 1559, however, it passed to Cosimo I of Tuscany. In 1745 malaria had reduced the population to 648, though in 1224 it had 3,000 men who bore arms. Leopold I renewed drainage operations, and by 1836 the populatiop had risen to 2,392. Grosseto was bombed by Allied planes in World War II.

GROSSMITH, GEORGE (1847–1912), English comedian, noted for his roles in Gilbert and Sullivan productions, and for his authorship, with his brother, WALTER WEEDON GROSSMITH (1852–1919), of *The Diary of a Nobody* (1894), was born in London on Dec. 9, 1847. After several years of journalistic work he started about 1870 as a public entertainer, with songs and recitations. In 1877 he began a long connection with the Gilbert and Sullivan operas at the Opera Comique, London, in *The Sorcerer.* He appeared regularly thereafter at that theatre and from 1881 at the new Savoy Theatre, London. His capacity for "patter songs," and his humorous acting, dancing and singing marked his creations of the chief characters in the Gilbert and Sullivan operas as the expression of a highly original individuality. In 1889 he left the Savoy and again set up as an entertainer, visiting all the major cities of Great Britain and the United States. He died at Folkestone, Eng., March 1, 1912. His two sons, LAURENCE (1877–1944) and GEORGE Grossmith (1874–193j), were both actors.

See S. Naylor, *Gaiety and George Grossmith* (1913).

GROSVENOR, GILBERT HOVEY (1875–), U.S. geographer, writer and longtime editor of the *National Geographic Magazine,* was born in Constantinople, Turkey. Oct. 28, 1875. He was graduated from Amherst college, Amherst, Mass., and in 1899 became director and president of the National Geographic society, and, in 1900, editor of the *National Geographic.* Under his directorship the society membership grew from 900 to over 1,900,000. He resigned as editor in 1954 and became board chairman.

During Grosvenor's administration the society sent out numerous expeditions to the north and south poles, into the stratosphere, to the ocean depths, and conducted a myriad of other investigations. In addition to his articles in the *National Geographic Magazine* he wrote a history of the society, chapters on exploration for the Smithsonian institute report and Adm. R. E Peary's *The North Pole.* He was long a leader in the conservation and protection of wildlife.

GROS VENTRES, a name (Fr. "big bellies") applied to two distinct North American Indian groups:

1. The Hidatsa or Minitari, also known as the Gros Ventres of the Missouri. A Siouan-speaking tribe, linguistically related to the Crow and closely connected historically with the Mandan, they have been settled since the mid-19th century on Fort Berthold reservation, N.D. (*see* HIDATSA; MANDAN).

2. The Atsina, sometimes called the Gros Ventres of the Prairie (or Plains). An offshoot of the Algonkian-speaking Arapaho tribe, from which they may have separated as early as 1700, they were living in what is now northern Montana and adjacent regions of Canada in late historic times, and were culturally similar to other Plains tribes. Together with the Assiniboin, they were settled on Fort Belknap reservation, Mont., where the combined population totaled about 2,000 in 1950. (*See* also ARAPAHO; PLAINS INDIANS.)

The term Gros Ventres has been interpreted as a French-Canadian misunderstanding of Indian gestures designating the two tribes—possibly indicating hunger or greediness in the case of the Atsina and a pattern of body tattooing in the case of the Hidatsa.

See F. W. Hodge (ed.), *Handbook of American Indians North of Mexico,* part 1 (reprinted, 1959) ; A. L. Kroeber, *Ethnology of the Gros Ventre,* Anthropological Papers of the American Museum of Natural History, vol. i, part 4 (1908).

GROTE, GEORGE (1794–1871), English historian of Greece, was born on Nov. 17, 1794, at Clay Hill, near Beckenham, Kent, of a well-known family of bankers originating from Bremen. He was sent to the Sevenoaks grammar school and afterward to Charterhouse, but at the age of 16 he entered the bank in which his father was a partner.

Grote spent all his spare time in the study of classics, history, metaphysics and political economy, and in learning German, French and Italian. He became an intimate friend of Charles Hay Cameron, who strengthened him in his regard for philosophy, and George W. Norman. It was through the latter that Grote met Harriet Lewin, whom he married in 1820.

In 1817 Grote came under the influence of David Ricardo, and through him of James Mill and Jeremy Bentham. His first published work, the *Statement of the Question of Parliamentary Reform* (1821), was a reply to Sir James Mackintosh's article in the *Edinburgh Review* advocating popular representation, vote by ballot and short parliaments. In April 1822 he published in the *Morning Chronicle* a letter against Canning's attack on Lord John Russell, and edited, or rather re-wrote, some papers of Bentham, which he published as *Analysis of the Influence of Natural Religion on the Temporal Happiness of Mankind, by Philip Beauchamp* (1822). The book was published in the name of Richard Carlile, then in gaol at Dorchester. From 1826 to 1830 he worked with J. S. Mill and Henry Brougham in the organization of the new "university" in Gower street. He was a member of the council which organized the faculties and the curriculum of University college, London; but in 1830, owing to a difference with Mill as to an appointment to one of the philosophical chairs, he resigned his position. In 1849 he was re-elected to the council, in 1860 he became treasurer, and on the death of Brougham (1868) president. He became a member of the senate in 1850 and was vice-chancellor in 1862. He presented to the college the *Marmor Homericunt,* and finally bequeathed the reversion of £6,000 for the endowment of a chair of philosophy of mind and logic. He succeeded his friend Henry Hallam as a trustee of the British Museum in 1859, and took part in the reorganization of the departments of antiquities and natural science

At his father's death, in 1830, he became manager of the bank and took a leading position among the city Radicals In 1831 he published his *Essentials* of *Parliamentary Reform* (an elaboration of his previous *Statement),* and in Dec. 1832 entered parliament as one of the members for the City of London. He sat in the House of Commons until 1841, representing the Benthamite school of "philosophic radicalism." During these years of active public life his interest in Greek history and philosophy increased, and after a trip to Italy in 1842 he devoted himself to literature. In 1846 the first two volumes of the *History of Greece* appeared, and the remaining ten between 1847 and 1856. In 1847 he visited Switzerland to study a condition of things in some sense analogous to that of the ancient Greek States. This visit resulted in the publication in *The Spectator* of seven weekly letters, later collected in book form. *Plato and the Other Companions of Sokrates* (3 vols) appeared in 186j, but the work on Aristotle he was not destined to complete.. He had only finished the *Organon* (2nd ed.. 1880) when he died on June 18, 1871; he was buried in Westminster abbey. It is on his *History of Greece* that Grote's reputation mainly rests. It contains information collected from all sources, simply arranged and expressed in direct, forcible language.

BIBLIOGRAPHY.—The *History of Greece* passed through five editions, the fifth (10 vol., 1888) being final. It mas published in "Everyman's Library" (1907) and in a condensed form in the same year by J. M. Mitchell and M. O B. Caspari. Grote's *Minor Works* were published by Alexander Bain (1873). *See* Mrs. Grote, *Personal Life of George Grote* (1873), and article in *Dict. Nat. Biog. by G.* Croom Robertson.

GROTEFEND, GEORG FRIEDRICH (1775–1853), German epigraphist, who was instrumental in the decipherment of ancient Persian cuneiform script, was born at Münden in Hanover on June 9. 1775. He studied at Gottingen, became conrector of the Frankfurt *Gymnasium* and then director of the *Gymnasium* at Hanover. He published some important works on the Umbrian and Oscan dialects, on the coins of Bactria and other subjects. But it was in the east rather than in the west that Grotefend did his greatest work. The cuneiform inscriptions of Persia had for some time been attracting attention in Europe; exact copies of them had been published by the elder Niebuhr, who lost his eyesight over the work; and Grotefend's friend, O. G. Tychsen of Rostock, believed that he had ascertained the characters in the column. now known to be Persian, to be alphabetic.

At this point Grotefend took the matter up. His first discovery was communicated to the Royal Society of Gottingen in 1800 and reviewed by Tychsen two years afterward. In 1815 he gave an account of it in Arnold Heeren's great work on ancient history, and in 1837 published his *Neue Beiträge zur Erläuterung der persepolitanischen Keilschrift.* Three years later appeared his *Neue Beiträge zur Erläuterung der babylonischen Keilschrift.* His discovery may be summed up as follows: (1) that the Persian inscriptions contain three different forms of cuneiform nriting, so that the decipherment of the one would give the key to the decipherment of the others; (2) that the characters of the Persian column are alphabetic and not syllabic; (3) that they must be read from left to right; (4) that the alphabet consists of 40 letters, including signs for long and short vowels; and (j) that the Persepolitan inscriptions are written in Zend (which, however, is not the case). and must be ascribed to the age of the Achaemenid princes. The process whereby Grotefend arrived at these conclusions illustrated his persevering genius *(see* CUNEIFORM: *Decipherment).* He died Dec. 15, 1853.

GROTIUS, HUGO (HUIGH DE GROOT) (1583–1645), Dutch jurist and statesman, philologist, poet, theologian and historian, a "man of all-embracing learning" (R. Fruin) whose writings mere of fundamental importance in the formulation of international law, was born at Delft on April 10. 1583. His father a friend of men such as Simon Stevin and Justus Lipsius (*qq.v.*), had been burgomaster of Delft and curator of Leiden university and took a keen interest in his son's career. Grotius was a precocious but normal boy and became a student at Leiden in the faculty of letters at the age of 11. There his professor Junius imbued him with an undogmatic but profound religious outlook; and the great Joseph Scaliger was his preferred scientific mentor. At the age of 15 Grotius edited Martianus Capella's encyclopaedia and accompanied the leading statesman J, van Oldenbarnevelt (*q.v.*) on his embassy to Henry IV of France. Grotius was welcomed by the king of France as the "miracle of Holland." In a remarkable poem Grotius depicted the complicated international situation of the period and on his way back to Holland took the degree of doctor of law at Orleans. He became distinguished as an advocate in The Hague, moved in government circles and in 1601 was appointed historiographer of the States of Holland. His literary work at this time included the writing of two dramas in Latin and the editing of the literary remains of Xratus of Soli.

In 1604 the Dutch East India company. in order to justify the action of one of its admirals in seizing a Portuguese vessel, asked Grotius to write on the lawfulness of the capture of merchant ships. In his treatise *De iure praedae* ("On the Law of Prize and Booty"; published only in 1868) Grotius began by describing the law of mankind in general. The law of nature deriving from God's will contains four primary precepts: neither state nor individual may attack another state or individual; neither state nor individual may appropriate what belongs to another state or individual; neither state nor individual may disregard treaties or contracts; and neither state nor individual may commit a crime. These four precepts must be upheld by judges and, if there are no judges, by the states or individuals themselves in the form of a war or of private litigation. It follows from these precepts that because Portugal deprived the Dutch of the right to sail to the East Indies for commercial purposes, and as there was no judge, the East India company was entitled to capture Portuguese merchantmen in order to compensate itself for its losses, This is, in a nutshell, the content of Grotius' concise treatise, characterized by Jules Basdevant, a judge of the International Court of Justice. as "a triumph of juridical argument." Grotius thus maintains that the ocean is free to all nations, and one chapter of the *De iure praedae* was published in 1609 as the *Mare liberum.*

In his famous work *De iure belli ac pacis* ("On the Law of War and Peace"; 1625) Grotius describes (in the second book) the whole law of mankind, private, penal and constitutional as well as international. exactly based on the four precepts of the *De iure praedae.* In the case of nonobservance, any rule of that law may be upheld, if there is no judge, by mar or by individual action. The third book explains the rules of warfare. In the *De iure praedae* Grotius had already pointed out that the harsh rules of the law of warfare ought to be mitigated by equity. This statement is developed in the famous *temperamenta* ("moderations") of the third book, as well as in an analogous way at the end of the second book. The introductory first book contains general observations on law and wars and private litigation. The *De iure belli ac pacis* in fact constitures the second edition of the general part of the *De iure praedae,* as C. van Vollenhoven pointed out in the preface of its 1919 edition. In later years the *De iure belli ac pacis* was erroneously considered to be a book on international law and on a great number of things that have, in fact, nothing to do with international law. Van Vollenhoven showed that the book describes the whole law of mankind, of which international law is only a part. Giambattista Vico in 1719 rightly styled Grotius *generis humani iurisconsultus* ("the jurist of the human race"). Indeed, in the 20th century. international law has largely developed on the lines judged by Grotius to be positive lam.

In 1607 Grotius became *advocaat fiscaal* (attorney general) of the province of Holland and in the following year he married Maria van Reigersberch, the daughter of the burgomaster of Veere; she remained his courageous helpmeet until the end of his life. In 1612 he began his practical attempts to bring about the reunion of the Christian churches. He hoped that King James I would take the lead and to that end started a correspondence with Isaac Casaubon, the king's adviser in theological matters. In 1613 there was a great demand for Grotius' services from the town of Rotterdam, the high court of justice. the states-general and the States of Holland, who wished to keep him in their service. Oldenbarnevelt decided that Rotterdam should have him after he had first gone to London, where the states-general desired him to be the spokesman of an embassy whose purpose was the adjustment of difficulties between the two East India companies. The London conference 1%-asfollowed in 1615 by another at The Hague. As a pensionary of Rotterdam. Grotius now began his political career. He was one of the representatives of that town in the States of Holland and in that capacity he represented these states, together with Oldenbarnevelt, in the states-general, the government of the Republic of the United Provinces. When Oldenbarnevelt's health began to fail it was generally understood that Grotius would become his successor.

After the conclusion of a 12 years' truce with Spain (1609) the republic had been torn by a religious dispute. In its origin a theological difference about predestination between two Leiden professors. Jacobus Arminius and Franciscus Gomarus, it evolved into a quarrel between church and state and ended as a conflict between the provinces of Holland and Utrecht on the one hand and the orthodox Calvinist majority in the states-general supported by the head of the army, Prince Maurice, on the other *(see*

ARMINIANISM; DORT, SYNOD OF). While upholding the authority of the state over the church, the States of Holland tried to restore ecclesiastical peace. At last the schism in the republic ended in a show of force by Prince Maurice. Grotius had been the spokesman of the States of Holland, had drafted their peace resolutions and defended the policy of the states in his *Ordinum pietas,* although he did not always agree with Oldenbarnevelt. A short time before the final episode he proposed a skillfully drafted compromise solution of the problem at issue, but without success. Oldenbarnevelt and Grotius were arrested on Aug. 29, 1618. The latter was sentenced to life imprisonment (May 18, 1619) and taken to the castle of Loevestein. Through the resourcefulness of his wife Maria, however, he managed to escape from prison hidden in a chest. Grotius then made his way to Paris, where he mas well received as a statesman in exile by old friends and by the king, Louis XIII, who granted him a pension. Its irregular payment was attributed by Grotius to the fact that he was not prepared to become a Roman Catholic and accept a high position. Nor would he accept a position in commerce. which would probably do harm to Dutch interests and about which rumours reached Amsterdam.

Grotius continued to produce an extraordinary quantity of scientific and literary work in prison and exile. This included the *De veritate religionis Christianae* ("On the Truth of the Christian Religion"), *Annotations on the New and the Old Testament,* an *Introduction to the Jurisprudence of Holland,* an *Apology* on behalf of the States of Holland, the *De iure belli ac pacis* and a translation of Euripides' *Phoenissae* with an introduction on the subject of classical tragedy.

In 1631 Grotius made an attempt to return to his native country, but, after hot debates in the States of Holland and notwithstanding the intervention of his old friend Prince Frederick Henry of Orange, he was obliged to become an exile once more and went to Hamburg. An attempt was made to use his abilities outside his country by appointing him governor-general in the East Indies, but he refused. Until that time Grotius had also rejected overtures from foreign countries, which he considered incompatible with his Dutch nationality. However, when the Swedish chancellor, Oxenstierna, approached him in 1634 he accepted service under Sweden as ambassador to France, Sweden being at that time ally of the republic. The example of Joseph in the Old Testament who, as minister of Egypt, nevertheless served his Jewish people taught him that he was right to accept. In his drama *Sophompaneas* Grotius showed his gratitude to his mentor.

His hope that he would be in a position to promote the restoration of a general peace was not fulfilled; his task consisted mainly in insisting that France should give sufficient assistance to Sweden during the Thirty Years' War. It must be borne in mind that the great diplomatic centre of the two allies was neither Stockholm nor Paris but Hamburg, where permanent embassies mere installed. Grotius' letters to Oxenstierna are of great historic interest. When France's statesman Cardinal Richelieu met Grotius for the first time in 1625 in order to be informed about the political situation in the republic after the death of Prince Maurice, he pointed out that in matters of state the weakest must always be in the wrong. Grotius answered that God and time would show the truth, whereby Richelieu at once understood that he could not handle the Swedish ambassador as he used to do. It was a disappointment to Grotius when in 1643 he was not invited to become a member of the Swedish peace embassy. He equally deplored the fact that his persistent efforts to promote the reunion of the Christian churches were misinterpreted in Holland. In his testament of March 27, 1645, he prayed God "to unite the Christians in one church under a holy reformation." When France recalled its ambassador at Stockholm, Sweden recalled Grotius. He was then received in Sweden with great honour, but he refused to settle there as Queen Christina suggested. On his way back to Holland he died at Rostock on Aug. 28, 1645.

Grotius' varied interests included philology, poetry, theology and history. His Latin is splendid but often difficult, especially in his poetry; and his Latin translations of Greek poets are notable. His first drama, *Adamus Exul* (1601), has been called the greatest dramatic representation of the subject.

BIBLIOGRAPHY.—For a bibliography of the works of Grotius *see* J. ter Meulen and P. J. J. Diermanse, *Bibliographie des écrits imprimés de Hugo Grotius* (The Hague, 1950). Biographical works include: C. Brandt, *Historie van het leven des Heeren Huig de Groot, . . .* (Dordrecht, Amsterdam, 1727); W. S. M. Knight, *The Life and Works of Hugo Grotius* (London, 192j); W. J. M. van Eysinga, *Hugo Grotius. Eine biographische Skizze* (1952). His letters were collected by H. and J. de Groot in *H. Grotii . . . . epistolae quotquot reperiri potuerunt* (1687). Those addressed to Oxenstierna were published in 2 vol. as *Hugonis Grotii epistolae ad Axelium Oxenstierna* (Stockholm, 1889; 1890). A more recent collection of Grotius' correspondence: P. C. Molhuijsen (ed.), *Briefwisseling van Hugo Grotius,* 2 vol. (The Hague, 1928; 1936). Editions of Grotius' works on jurisprudence include: R. Fruin (ed.), *De iure praedae commentarius* (The Hague, 1868). This appeared in an English translation as: *De jure praedae commentarius. Commentary on the Law of Prize and Booty,* 2 vol. (London, Oxford, 1950). An essay by Fruin translated from the Dutch: *An Unpublished Work of Hugo Grotius's* in the Bibliotheca Visseriana, vol. 5 (Leiden, 1925). For the *De iure* see P. C. Molhuijsen (ed.), *Hugonis Grotii de Jure Belli ac Pacis libri tres* (Leiden, 1919). This was translated into English and appeared in "The Classics of International Law" with an introduction by J. B. Scott (Oxford, 1925). *See* also: C. ran Vollenhoven, *Verspreide geschriften,* pp. 349–602 (Haarlem, The Hague, 1934) and *The Franzework of Grotius' Book De Jzcre Belli ac Pacis, 1625* (Amsterdam, 1931); G. GROTTAFERRATA, a village of Italy, province of Roma, 13 mi. S.E. from Rome by electric tramway, and $2\frac{1}{2}$ mi. S. of Frascati. 1,080 ft. above sea level, in the Alban hills. The name (in its Latin form. Crypta Ferrata, *i.e.,* "the crypt with an iron grille") probably comes from an older building, perhaps an oratory, perhaps originally an ancient tomb, which served as the foundation for the campanile. Pop. (1957 est.) 7,659 (commune). The Greek monastery of Basilians founded by St. Nilus in 1002 under the emperor Otho III occupies the site of a large Roman ville. It was fortified (end 15th century) by Giuliano Cardinal della Rovere (afterward Pope Julius II), whose arms may be seen about it.

The church with its fine campanile belongs to the 12th century, and the original portal. with a mosaic over it, is still preserved, as is also the mosaic of the apse. The chapel of St. Nilus contains frescoes by Domenico Zampieri (Domenichino) of 1610, illustrating the life of the saint. The abbot's palace has a fine Renaissance portico, and contains local antiquities. An omophorion of the 11th or 12th century. with scenes from the Gospel in needlework. and a chalice of the 15th century with enamels are among its treasures. The library contains valuable manuscripts, among them one from the hand of St. Nilus (965); and a paleographical school, for the copying of manuscripts in the ancient style, is maintained.

See T. Ashby in *Papers of the British School at Rome,* v, 228 ff. (1910); F. Tomassetti, *Campagna Romana,* iv, 279 ff. (1926). (T. A.)

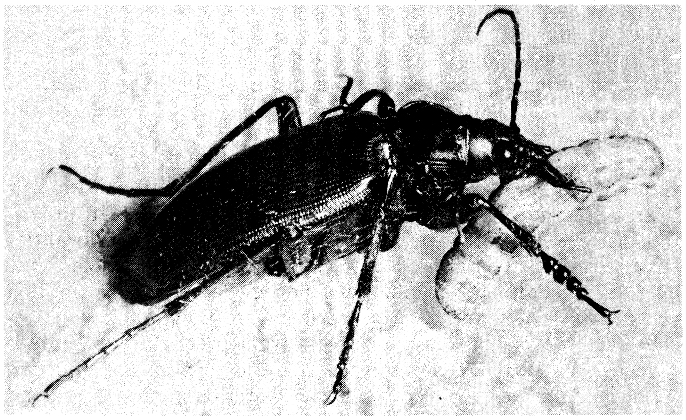
GROUCHY, EMMANUEL, MARQUIS DE (1766–1847), marshal of France, was born in Paris on Oct. 23, 1766, and entered the army. He served in La Vendée (1793), in the army of Ireland (1796–97) and in the campaign against the Russians and Austrians, being taken prisoner at Novi. On his release he returned to France and from 1801 was employed by Napoleon in important military and political positions. At the Restoration he mas deprived of the post of colonel general of *chasseurs à cheval* and retired. He joined Napoleon on his return from Elba and was made marshal and peer of France. In the Waterloo campaign he was appointed to command the right wing to pursue the Prussians (*see* WATERLOO CAMPAIGN, 1815). After the great disaster, Grouchy gathered up the wrecks of Napoleon's army and retired to Paris, where he resigned his command to Marshal Davout. He was court-martialed for his partial failure at Waterloo and exiled in America, till amnestied in 1821. On his return to France he was reinstated as general. In 1830 Louis Philippe gave him back the marshal's baton and restored him to the chamber of peers. He died at St. Etienne on May 29, 1847.

His publications include: *Observations sur* la *rélation de la campagne* *de 1815 par le général de Gourgaud* (1818) ; *Réfutation de quelques articles des memoires de M. le Duc de Rovigo* (1829) and other defenses of his military policy.

See his *Memoires,* ed. by Marquis de Grouchy (1873–74); Gen. Marquis de Grouchy, *Le Général Grouchy en Irlande* (1866); Le *Maréchal Grouclzy du 16 au 18 juin, 1815* (1864) ; *Appel à l'histoire sur les faits de l'aile droite de l'armée française; Sévère Justice sur les faits . . . du 28 juin au 3 juillet 1815* (1866).

GROUND BASS, in music, a form of bass which is repeated again and again unaltered, while the music above is constantly varied. The chaconne (*q.v.*) and the passacaglia are familiar forms of which this device constitutes an essential feature. (See VARIATIONS.)

GROUND BEETLE, any beetle of the family Carabidae of the order Coleoptera, comprising more than 25,000 species and forming the largest and most typical family of the suborder Adephaga. In many Carabidae the hind wings are reduced or ab-



ROSS E HUTCHINS

GROUND BEETLE FEEDING ON A CUTWORM

sent. and the elytra (modified fore wings) fused together along the suture, the hind legs being adapted for rapid movement. They are world-wide in their distribution, being represented in the arctic regions and on almost all of the oceanic islands. and can be traced back in fossil history to Lower Jurassic times (160,000,000 years ago). See BEETLE.

GROUND HOG: see WOODCHUCK.

GROUND-HOG DAY (Feb. 2). According to popular tradition in the United States, the ground hog or woodchuck comes out of his hole on this day after a long winter sleep to look for his shadow. If he sees 'it. he regards it as an omen of six more weeks of bad weather. and returns to his hole for that period. If the day is cloudy, and hence shadowless. he takes it as a sign of coming spring, and is content to stay above ground. The tradition, sometimes including the bear or badger, stems from similar beliefs associated with Candlemas (*q.v.*) (also Feb. 2) in England; according to an old English song: "If Candlemas be fair and bright. Come. Winter. have another flight: If Candlemas bring clouds and rain. Go. Winter, and come not again." (A. McQ.)

GROUND ICE, ice formed at the bottoms of streams while the temperature of the water is above the freezing point. It is also known as anchor ice and bottom ice. Radiation of heat from the stream bottom probably is the prime cause of the formation of ground ice. It is formed only under a clear sky, never in cloudy weather: it is most readily formed on dark rocks. never under any covering such as a bridge and rarely under surface ice. On a cold clear night the rocks on the bottom may radiate heat rapidly, cooling below the freezing point and resulting in the formation of loosely grown spongy masses of anchor or ground ice. On the next bright sunny day heat from the sun may detach them and they will rise to the surface with considerable force. Probably a thin film of stationary water rests upon the boulders and sand over which a stream flows, and this, becoming frozen; forms the foundation for the anchor ice and produces a surface upon which descending frazil ice (a canadian term for surface ice formed in spicules and carried downward in water agitated by winds or rapids) can lodge. The ice which rises to the surface has a spongy texture and frequently carries gravel with it. Ground ice often forms dams across narrow portions of rivers where the floating masses are caught.

GROUNDNUT (*Apios* tuberosa), a North American plant of the pea family (Leguminosae, *q.v.*), called also Indian potato, native to moist low grounds from New Brunswick, Canada, to Minnesota, U.S., and southward to Florida and Texas. It is a twining perennial, climbing to a height of several feet, with leaves composed of five to seven ovate leaflets, and bearing in late summer showy clusters of rather large, fragrant, chocolate-brown flowers. From the root are produced strings of starchy edible tubers, one to two inches long, with a somewhat nutty flavour. These tubers were used for food by the Delawares, Iroquois and other American Indians. Asa Gray (*q.v.*) observed that, except for the prior cultivation of the potato, the groundnut might have been developed into a food plant of high economic value. In Great Britain the name groundnut is given to the fruit of *Arachis hypogaea,* commonly known as peanut (*q.v.*) in the United States.

GROUND RENT. The accepted meaning of ground rent is the rent at which land is let for the purpose of improvement by building, *i.e.,* a rent charged in respect of the land only and not in respect of the buildings to be placed thereon. It thus conveys the idea of something less than a rack rent (see RENT); and accordingly, if a vendor described property as property for which he paid a "ground rent." without any further explanation of the term, a purchaser would not be obliged to accept the property if it turned out to be held at a rack rent. But while a rack rent is generally higher in amount than a ground rent, the latter is usually better secured, as it carries with it the reversionary interest in buildings and improvements put on the ground *after* the date at which the ground rent was fixed, and accordingly ground rents have been held a good investment.

A devise of "ground rent" carries not only the rent but the reversion. Where a tenant is compelled, in order to protect himself in the enjoyment of the land in respect of which his rent is payable, to pay ground rent to a superior landlord (who is of course in a position to distrain on him for itj. he is considered as having been authorized by his immediate landlord to apply his rent, due or accruing due, in this manner, and the payment of the ground rent will be held to be payment of the rent itself nr part of it A lodger should make any payment of this character under the Law of Distress Amendment Act 1908 (s. 3; and see RENT) Ground rents are apportionable.

In Scots law. the term "ground rent" is sometimes used in the above sense in relation to the rent stipulated for on building leases. but it has no technical significance. Owing to the limited nature of leasehold rights builders and other improvers of land in Scotland have generally insisted upon acquiring the right of property in the land taken by them in return for an annual payment economically equivalent to a ground rent. but legally distinct from rent. Where the land in question is not subject to prohibition against subinfeudation this has generally been done by a subfeu, the reddcndo or feu duty of which is the economic equivalent of ground rent. Where subinfeudation is prohibited the procedure in modern times has been by way of Contract of *Ground* Annual, a complex conveyancing device whereby the builder becomes proprietor. of and under the former feudal superior, in return for a payment to the fortner vassal of a ground annual economically equivalent, alone or in conjunction with an existing feu duty to a ground rent. "Ground rents" in the English sense do not seem to be in general use in the United States, but they obtain in Pennsylvania They are rent services and not rent charges—the statute Quza *Emptores* never having been in force in Pennsylvania. Ground rents are also found in Maryland and to a lesser extent in Ohio. A ground rent being a freehold estate, created hy deed and perpetual in duration, no presumption could, at common law, arise from lapse of time. that it had been released. But now. by statute (Act of April 27, 18jj, s. 7), a presumption of reiease or extinguishment is created where no payment, claim or demand has been made for the rent, nor any declaration or acknowledgment of its existence made or given by the owner of the premises subject to it, for

21 years. (A. W. R.; J. WA.; X.)

GROUNDSEL, Senecio *vulgaris,* an annual, glabrous, or more or less woolly plant of the family Compositae (*q.v.*), having a branched succulent stem 6 to 15 in. in height, pinnatifid irregularly and coarsely toothed leaves, and small cylindrical heads of yellow tubular florets enveloped in an involucre of numerous narrow bracts; the ribbed fruit bears a soft, feathery, hoary tuft of hairs (*pappus*). The plant is indigenous to Europe, whence it has been introduced into all temperate climates. It is often a troublesome weed, flowering throughout the year, and propagating itself rapidly by means of its light feathery fruits; it is used as a food for cage birds. The groundsel bush, Baccharis halimifolia, a native of the North American sea coast from Massachusetts southward to Florida and Texas, is a shrub of the same family attaining 6 ft. to 12 ft. in height, and having angular branches, obovate, somewhat scurfy leaves, and flowers larger than but similar to those of common groundsel. The long white pappus of the female plant makes it a conspicuous object in autumn. The groundsel bush is sparingly cultivated for ornament. See RAGWORT; SENECIO.

GROUND SQUIRREL. any burrowing member of the squirrel family (Sciuridae), but more commonly applied to the spermophiles. genus Citellus, rodents characterized by having cheek pouches, short ears, long front claws and generally a short tail. They are omnivorous, feeding upon vegetation, seeds, insects, etc. Although chiefly North American, one, known as the suslik (*q.v.*), reaches eastern Europe and others occur in Asia. The arctic species (C. *parryi*) is about 12 in. long, the tail j in.; it is yellowish brown, speckled with gray. Rock squirrels (C. *variegatus* and allies) are about the same size, with a longer tail and larger ears. The mantled ground squirrel (C. lateralis) is often confused with chipmunks, having black and white lateral stripes. The 13-lined ground squirrel (C. *tridecemlineatus*), often called gopher (the true gopher, however: is of a different family), is pale buff, marked with brownish lines and whitish spots.

Among the other ground-dwelling sciurids are the marmots (including the American woodchuck), chipmunks, prairie dogs and the spiny squirrels (*qq.v.*). See also RODENT; GOPHER.

(J. E. HL.; X.)

GROUND WATER. Water beneath the land surface that feeds wells and springs is called ground water. It maintains the dry-weather flow of streams. and helps maintain the levels of lakes and ponds after overland runoff from rain and melting snow has ceased. In western Europe and in North America, the near east, the Mediterranean basin, and Asia, water from wells or springs furnishes a substantial part of the supply for domestic, livestock, industrial, and irrigation uses. Many large cities draw their water from wells or infiltration galleries tapping vast reservoirs of ground water. Refrigeration is used for many industrial processes as well as for personal convenience, and ground water is especially valued for its uniform temperature.

History. — The initial use of ground water is lost in antiquity. In the arid and semiarid lands of the east, the near east, and the Mediterranean basin, men learned to tap vast reservoirs of ground water by digging wells. commonly several feet in diameter, and by driving tunnels called kanats into the alluvial ians festooning mountain chains such as the Atlas and the Himalayas. Ranats at Andamish, Persia (modern Dizful. Iran), yielded as much as 3,400 U.S. gallons per minute (gpm) each. Nineveh was supplied by kanats, and in 626 B.C. the city of Hamadan fell when the Medes destroyed the kanats that supplied its water. Tehran and Afarrakech are among the many modern cities supplied by kanats.

Water was drawn from ancient dug wells by hand. rope and bucket or various ingenious devices. In a large well at Orvieto, Italy, spiral ramps cut into the rock walls enabled donkeys to bring up water. The amount of water that could be obtained by such methods. even where the water was near the surface, was small by modern standards.

The Chinese nith primitive methods invented the art of drilling wells to tap artesian water that would flow at the land surface. Some of these are reported to have been 5,000 feet deep and to have taken many years to drill. Apparently the first drilled nells in Europe were sunk in the province of Artois. France (from which the term "artesian" is derived), and in Modena, in northern Italy. early in the 12th century. They aroused both popular and scientific interest in flowing wells, and they supplied copious quantities of nater for various uses.

Since these early days the use of ground water has increased steadily. but expansion was most rapid after 1900 as a result of: (1) increasing demands resulting from expansion of irrigation (*q.v.*) and industry, and rising standards of living; (2) improvements in construction and finishing of wells; (3) improvement of pumps; and (4) reduction in cost of power from electricity, gas and oil.

Use of Ground Water. — Most farms, villages and small cities draw their water from wells or springs. Many large cities, such as Berlin, Houston and San Antonio, Tex.. and Memphis, Tenn., are supplied almost entirely from wells. Others, such as New York, London, and Chicago, draw a part of their water from wells. About a fifth of all the water used in the United States in 1955 or 45,000,000,000 gallons a day, was ground water. In Germany before World War II, according to Carl Kiihne, more than 75% of the water supply was from ground-water sources, not even including springs which also are ground water. In India millions of acres are irrigated with ground water. In Holland nearly all the domestic water supply is from wells.

In some areas, such as certain parts of Texas, Arizona, and California, and in many cities, such as London, the ground water is being withdrawn more rapidly than it is replenished. In others, too many wells have been sunk locally, though other localities have large untapped ground-water supplies. On the whole, however, large additional supplies can be developed by distributing wells more widely and locating them where they will induce recharge to the ground-water reservoir from precipitation or from streams. or will recover water otherwise lost from the reservoir. Artificial recharge by spreading surface water on permeable ground or injecting clear water into wells will permit increased pumping in many places. To be practical all such improvements must be based on scientifically acquired information on the water resources of each area.

Better legal control is needed in nearly all countries to assure proper well construction. prevent waste of water, provide equitable distribution of available supplies and prevent overdevelopment. In New Mexico and several other western states of the U.S. the ground water, like surface water, is considered public property and may be appropriated for beneficial use, subject to prior rights. Thus with adequate quantitative information as to recharge and storage and proper legal control, ground-water supplies can be made perennially secure.

Ground-Water Reservoirs. — The upper crust of the earth is composed of a wide variety of rocks which in most places are covered by a mantle of soil. Soil is porous, and most rocks also contain open spaces which range in size from minute pores to huge caverns. Most of these openings are small, but collectively they may form an appreciable proportion of the total volume of rock material. The porosity, or percentage of open space, ranges from a fraction of 1% in very dense rocks to more than 80% in some water-laid deposits. 4 porosity of less than 5% may be regarded as small, between 5% and 20% as medium, and more than 20% as large. The porosity, however, shows only how much water the rock will hold, not how much it will yield. Of greater importance to water yield are the size, shape, and interconnection of the openings, ior they determine the permeability of the rock, therefore the rate at which water can move through it. Rock materials that have large or moderately large, interconnected openings, such as well-sorted sand and gravel, many limestones and fractured lava rock have high permeability and transmit water freely. Fine silt and clay have high porosity but small openings and low permeability and water moves, through them slowly or not at all. Mixtures of coarse and fine materials, such as glacial boulder clay and unsorted alluvial deposits. have relatively low permeability as do most igneous and metamorphic rocks, indurated sandstone. limestone, and shale, except where they are fractured.

A permeable stratum that lies below the water table will yield water to wells and springs and is called a ground-water reservoir, or aquifer. Some unstratified rocks also are aquifers—for example, the neathered zones at the top of many metamorphic and granitic rocks. Strata that are relatively impermeable allow little water to pass and are called aquicludes

Aquifers are of many different shapes and sizes. Among the most productive are the great deposits of sand and gravel laid donn by streams floning from high mountain ranges, especially the Himalayas, Alps. Atlas. Rockies, and Sierra Nevada, and from the continental ice sheets of the glacial or Pleistocene epoch, especially in northern North America and Europe. These materials may yield several million gallons a day to a single well. Fine sands generally yield only small supplies. There are many productive sands of various geologic ages, but also many that have lost their permeability by deposition of cementing mineral matter between their grains; these latter yield only small amounts of water from joints or solution openings. Soft shales are generally unproductive, but harder shales may yield small supplies from joint cracks—often less than a gallon a minute.

Limestones range to both extremes Lncompacted young limestones and compacted limestones that have become cavernous through solution by percolating water may yield large supplies to wells and springs For example, the Fontaine de Vaucluse in France and Silver springs of Florida each has an average discharge of about 500.000.000 gallons a day, and a flowing well at San Antonio. Tex., when completed had an artesian flow of 24,000,000 gallons a day On the other hand wells in limestone that do not encounter large openings may yield little water—for example, some nells only a few hundred feet from the productive well at San Antonio.

Most igneous and metamorphic rocks are of low permeability. Wells sunk in them may be unproductive, but most yield 1 to 10 gpm. The nater comes from cracks and from porous weathered rock near the surface. Basaltic lava rock may be broken and cavernous. and very permeable. Such rocks in Idaho. California and Oregon give rise to springs comparable to those in limestone. They also yield large supplies to wells notably in the Haaaiian Islands

Movement of Subsurface Water.—The tno principal forces that control movement of water in rocks are gravity and molecular attraction. Gravity causes the water to percolate vertically from the suriace into the zone of saturation and thence laterally to springs. wells. and streams at lower elevations.

Molecular attraction is a force that acts between neighbouring molecules, but only through very short distances. It is manifested in adhesion of films of water to rock surfaces and in the cohesion that holds water together. In very fine grained materials the openings between particles may be so small that the force of molecular attraction is exerted across the entire space; as this forct is greater than that of gravity, water is held tightly in the pore spaces. In coarser grained materials the openings are wider than the film of water held by molecular attraction, and though a film of water clings to the walls of the pores, the remainder moves downward by gravity until it reaches the zone of saturation where all openings are filled with water under hydrostatic pressure. The capacity of a permeable material to retain water against the pull of gravity is called its specific retention and is the ratio of the volume of water held in the material to the total volume of the material. The amount of water that will drain from the material, expressed as a ratio, is the specific yield. This is an important concept because when the water level is lowered in an aquifer the specific yield determines the water-yielding capacity of the aquifer per unit area.

Ground Water and the Hydrologic Cycle.—The movement of water, beginning with evaporation from ocean surfaces: bodies of fresh water and vegetation, progressing to the atmosphere, to precipitation and to surface- and ground-water runoff back to the sea, is known as the hydrologic cycle. Though described here in simple terms, the cycle is extremely complex in detail. *(See* HYDROLOGY.) We are concerned here only with that part of the water which passes beneath the land surface. When precipitation falls on the dry earth it is absorbed immediately. However, if rain continues long enough, the soil will become filled with water to the field capacity and can hold no more. Only when the soil has reached field capacity, at least in its uppermost layer, does overland runoff begin; and only when it has reached field capacity throughout does substantial ground-water recharge begin. The critical point at which runoff begins depends on the geology and the nature of the soil. In sandy areas considerably more rainfall is absorbed than in silty or clayey areas. For example, on Long Island, N.Y.. the soils are predominantly sand and they will absorb enormous quantities of precipitation. In fact. the heaviest rainfalls on record have been absorbed with no overland runoff whatever. The sand hills area of Nebraska likewise has no surface drainage because the soil absorbs all rainfall. On the other hand. the Badlands of South Dakota, adjacent to the sand hills, have tight. fine-grained soils which absorb relatively little water. Even moderate rains are sufficient to overtax their capacity to absorb water. causing overland runoff which erodes deep gullies and carries off huge quantities of sediment.

Water that enters the soil may penetrate only a few feet below the surface and thus may remain available to the roots of plants, which draw it up through their vascular systems and transpire it back to the atmosphere. This is known as soil water and is not available for use as water supplies. The zone in which it occurs is the upper part of the zone of aeration. in which at least the larger pores contain air, and in which the water is held by molecular attraction against the force of gravity except during occasional periods of abundant precipitation. At such times, if water enters the soil in excess of field capacity and if the earth materials are sufficiently permeable, the excess moves downward through an intermediate belt. where it is below the reach of roots of plants. and thence into the capillary fringe. The fringe, immediately above and connected to the zone of saturation. consists of water held up by capillary force. The thickness of the fringe depends upon the size of the pores and generally is inversely proportional to the permeability of the rock materials. Passing through the capillary fringe. the water enters the zone of saturation. The top of that zone is the water table—the level at which the water is at atmospheric pressure. Ground water lies below this table; the material for a short distance above may be saturated but the water is under less than atmospheric pressure and will not flow into a well. The water table is absent in many places because impermeable rock occurs at the junction between the zone of aeration and the zone of saturation. In such places the water in the aquifer beneath the impermeable zone is under artesian pressure and mill rise above the aquifer. There are infinite variations of the simple conditions described above.

Chemical Quality **of** Ground Water.—Ground water contains dissolved mineral matter, which when present in excessive amounts profoundly affects its usefulness. The commonest constituents are chloride, sulfate, bicarbonate, sodium, calcium, magnesium and potassium. Manganese. iron, silicon, boron and many other elements are present in small but sometimes significant amounts. All these materials are dissolved from the soil and underlying rocks as the water moves through them. Many mineral deposits were derived from waters issuing from hot magmas deep in the earth. Others may have been formed originally in this way but were greatly enriched by solution and redeposition after erosion thinned or removed the overlying rock and exposed the deposits to the action of atmospheric water *(see* also GEOCHEMISTRY: *Geochemistry of the Hydrosphere).*

Ground water that is highly mineralized is unfit for drinking by man or beast, for irrigation, and for most industrial uses. Water containing excessive amounts of calcium and magnesium is hard and not suitable for laundry or boiler use. In some aquifers these elements are exchanged for sodium and potassium and the water becomes soft as it moves through the rock. Iron and manganese cause stains on clothing and fixtures. Too much boron or too high a proportion of sodium is undesirable for irrigation. Iodine in small amounts tends to prevent goiter. Fluorine inhibits tooth decay in children if present in concentrations not exceeding one part per million, but causes mottling of their tooth enamel if present in larger amounts. Many industrial processes have exacting requirements as to mineral quality which cannot be met by some ground waters without expensive treatment. On the other hand, ground water is highly desirable in many processes because of its nearly uniform temperature and chemical quality. Bacterial pollution of ground water is of surface origin and can be largely prevented by proper construction and location of wells, but highly cavernous aquifers may be unsafe.

Head and Movement of Ground Water. — The water from rain or snow that percolates downward to the zone of saturation causes the water table to rise, as is shown by rising water levels in wells and increased discharge of springs during wet weather. Once in the zone of saturation, the water moves toward some area where ground water is being discharged through wells or springs, by evaporation and transpiration, or through subaqueous outlets. Its course may be short or as much as several hundred miles long, and the time may be brief or many centuries. The rate of flow, except in cavernous formations, is almost invariably slow, commonly ranging from a few feet per day to a few feet per year. The flow is caused by differences in head between the areas of intake and the areas of discharge. The flow is laminar, or viscous, that is, without the turbulence that characterizes surface streams. Hence, the rate of flow varies directly with the hydraulic gradient. *See* PERMEABILITY (FLUID).

In stratified rocks, the ground water moves chiefly through the more permeable strata, following their dips and folds. The flow is likely to be complicated by various structural features such as unconformities, faults, and dikes. If water-bearing strata are overlain by strata having low permeability, artesian conditions may result.

When a well is pumped, the head in its vicinity is lowered and a hydraulic gradient toward the well from all directions is created. The cone of depression thus formed increases in size and depth as pumping continues. The lowering of the water level in the well (drawdown) is greater nith increased rate of pumping and also greater with low than with high permeability, because in both cases steeper hydraulic gradients are required. The cone of depression expands slowly under water-table conditions because the ground water must be drained out of the rock in which the cone is created. Drawdown progresses more rapidly under artesian conditions because the rock is not drained, and the water must be derived from compression of the strata and slight expansion of the water itself as the head is reduced.

Methods have been developed for computing from pumping tests the theoretical drawdonn caused by pumping at any point at any time in the future. These methods have great practical value in appraising the quantity of water that may be drawn from the aquifer, in determining the optimum spacing of wells, and in forecasting their future interference with other wells.

Along seacoasts, fresh ground water under either artesian or water-table conditions may be balanced against sea water which has an average specific gravity of 1.025. If the water level in an aquifer is one foot above sea level, the interface between the salt and fresh water will be approximately 40 ft. below sea level. If the head of the fresh water is raised by recharge, the interface will be correspondingly depressed. If the fresh-water head is lowered by pumping or drought, the interface will rise and sea water will move toward the wells. This is called the Ghyben-Herzberg principle, after its discoverers.

GROUPER, various medium-sized to gigantic sea basses (Serranidae) of warm shore waters. Some attain a weight of several hundred pounds and are the prized quarry of adventurous skin divers. The groupers are particularly numerous both in species and individuals in the West Indian fauna, and several are common in the southern United States. Most of the species are classified in the genera *Epinephelus* and *Mycteroperca.* Examples are the red grouper (*Epinephelus morio*), the Nassau grouper (*E. striatus*) and the rock hind (*E. adscensionis*) in the Atlantic, and the broomtailed grouper (*Mycteroperca xenarcha*) in the Pacific. The jewfish (*q.v.*), one of the largest groupers, inhabits Caribbean waters. (C. L. Hs.)

GROUP INSURANCE, a 20th-century development of the insurance business, represents a substantial portion of all private life and health insurance in the United States and other countries. The group technique was first applied to life insurance, but subsequently was adopted in the annuity field and among most forms of health insurance.

Group insurance is characterized by one master contract, issued by an insurance company, the insurer, to a policyholder, usually an employer, providing insurance for insureds, usually employees, and often for the benefit of fourth parties, the beneficiaries named by the insured employees. The employer normally receives a master policy from the insurance company, and each employee receives a certificate of insurance outlining the benefits of the plan. Depending on state regulatory rules, group insurance may be available to employee groups as small as ten. Even smaller groups are sometimes underwritten.

Another basic characteristic of group insurance is that, with few exceptions, it is issued without medical examination or other evidence of individual insurability, thus permitting all active employees to receive coverage under the group policy regardless of the state of their health.

Group insurance is essentially low-cost, wholesale protection. Mass distribution and mass administrative methods afford economies of operation not available in individual insurance. Further, most group life and health insurance is temporary or current-cost insurance, with the consequent elimination of the necessary reserve element found in level premium insurance. Since active employees typically make up the group, there is a constant flow into the group of younger persons and a flow out of the group of the older and infirm persons. A trend in the second half of the 20th century is to retain retired employees under the plan, thus necessitating the building of some reserve element.

Although the majority of all group insurance is provided through contracts issued to individual employer groups, it may also be issued to multiple employer groups, labour union groups, creditor-debtor groups and such miscellaneous groups as associations of public employees, fraternal society members, state police, savings account plan depositors, professional associations and the like.

Group life insurance is the most popular form of group insurance, representing one-third of all life insurance. A benefit schedule, normally related to earnings, determines the amount of death benefit for each employee. The employee may or may not contribute to the cost of the coverage. Often a disability provision provides for continuance of coverage in the event of total disability. Group permanent or group paid-up life insurance has a reserve element accumulated during the life of the contract.

Group annuities typically are issued to employers for the purpose of financing retirement benefits of employees. Group methods of marketing and administration afford cost advantages over the individual annuity plan.

Group health insurance represents the application of group principles and practices to a variety of health insurance coverages. Group disability income insurance provides cash benefits to replace lost earnings in the event of disability. Benefits may be paid for total or partial disability, and for temporary or permanent disability. Benefits may be provided for a stated number of weeks, until a certain age or for life. Coverage may be limited to disability from accident only, or from accident and sickness. Group medical expense insurance provides cash benefits or service benefits to meet hospital charges, surgical bills, doctor's bills, drug and X-ray charges and similar costs. A great variety of coverages are available from insurance companies and the Blue Cross and Blue Shield organizations. Broad blanket coverage of medical expenses is provided under "comprehensive medical expense" and "major medical" policies. Group travel accident contracts typically provide death, dismemberment and disability income benefits for accidents experienced while traveling. Group accidental death and dismemberment insurance providing additional benefits for accidental death and dismemberment normally is used as a supplemental coverage to group life insurance.

GROUP MARRIAGE, the marriage of several men with several women. It has been found among various peoples who practise polyandry (*q.v.*)—in Tibet. India and Ceylon. In many of these cases it is said that if one of the brothers who have a wife in common brings a new wife. he shares, or has to share. her with his brothers. And that in the other cases, also. the group marriage has arisen as a combination of polygyny with polyandry may be inferred from the facts that both in Tibet and India polyandry is much more prevalent than group marriage; that the latter occurs there nowhere except side by side with polyandry; and that the occasional combination of polygyny with polyandry, when the circumstances permit it, is easy to explain, whereas no satisfactory reason has been given for the opinion held by some sociologists that polyandry has developed out of an earlier stage of group marriage.

While genuine group marriage has been found only side by side with polyandry, there are peoples—such as the Chukchee. the Herero in South-West Africa. the Masai and Akamba in East Africa, certain communities in New Guinea, and some Australian tribes — who have a kind of sex communism. in which several men have the right of access to several women, although none of the women is properly married to more than one of the men. Thus the *pirrauru* relation among the Central Australian Dieri and the *piraungaru* relation among their neighbours, the Urabunna, almost exclusively imply sexual licence. Yet these relations have been considered to give support to the hypothesis of ancient group marriage in Australia. according to which the men of one division or class had as wives the women of another division or class. Marriages of this sort no longer exist anywhere in Australia. No person becomes a *pirrauru* or *piraungaru* as a matter of course because of his or her status. An agreement must be made with the husband, the *pirrauru* may have to pay for it. and the relation may even be of short duration (in the case of a visitor); while the *piraungaru* requires the consent of the woman's elder brothers.

The existence of an early state of group marriage has been assumed from a variety of other customs. such as the lending or exchange of wives. the sexual intercourse to which a girl is subject before her marriage, the licence allowed at the performance of certain ceremonies when the ordinary rules of morality are more or less suspended, the levirate and the use of classificatory terms of relationship nhich group together under single designations many distinct degrees and kinds of relationship.

GROUPS. In the study of sets of mathematical objects such as numbers or transformations there are many cases of sets having the closure property that every pair of elements a and b of a set G may be combined to yield a unique result $a \times b$ in G. For sets of numbers the operation $a \times b$ may be either the sum $a + b$ or the product ab. For sets of transformations on the points of a geometric space $a \times b$ is usually the transformation obtained by applying the transformation b to the points which are the results of first applying the transformation a.

A set G having the closure property is said to form a group with respect to the operation $a \times b$ if every $a \times (b \times c) = (a \times b) \times c$ and if there exist solutions x and y in G of the equations $a \times x = b, y \times a = b$ for every a and b of G. Every group G has a unique identity element e such that $e \times a = a \times e = a$ for every a of G, and every element a of G has a unique inverse a^{-1} in G such that $a \times a^{-1} = a^{-1} \times a = e$.

A group G is called an abelian or a commutative group if $a \times b = b \times a$ for every a and b of G. The simplest abelian group is the cyclic group consisting of the powers a^k of a single element, powers being defined by $a^0 = e, a^{-k} = (a^{-1})^k, a^k = a^{k-1} \times a$ for every positive integer k.

If a subset H of a group G forms a group with respect to the same operation as that used in defining G then H is called a subgroup of G. Every element of a group generates a cyclic subgroup.

A group consisting of a finite number n of elements is called a finite group and the positive integer n is called its order. It can be shown that a subset H of a finite group G is a subgroup of G if and only if $h \times k$ is in H for every h and k of H. Moreover the order of a subgroup of a finite group C divides the order of G.

Examples of Groups. — The set of all ordinary integers forms an additive group; that is, a group under the operation of addition. This group is a subgroup of the additive group of all rational numbers, as well as of the additive group of all real numbers and the additive group of all complex numbers. The identity element of all these additive abelian groups is the number zero, and the additive inverse of any number a is $-a$. The additive nth power of any number a is na. This is the sum $a + a + \dots + a$ with n terms if n is positive, and if $-n = m > 0$ then na is the sum $m(-a)$.

The set of all nonzero complex numbers forms a multiplicative group; that is, a group with respect to the operation of multiplying complex numbers. It is customary to use the product notation ab instead of the more general notation $a \times b$ even in discussing abstract groups and the notation ab will be used in the remainder of this article.

The set of all rotations of axes in a plane forms an abelian group. Every rotation $r(A)$ depends upon an angle of rotation A and the product of two rotations is the result of applying them successively. Then $r(A)r(B) = r(A + B)$. This group has the finite cyclic subgroups of rotations through multiples of $1/n$ 360°, where n is a fixed positive integer.

The set of all rotations of axes in three-dimensional Euclidean space forms a noncommutative group. That this group is not commutative may be verified by taking a point on a co-ordinate axis and operating on it, in the two different possible orders. by a pair of rotations throuth 90° about two different co-ordinate axes.

The set of all n-rowed square matrices of nonzero determinant forms a noncommutative group with respect to matrix multiplication. (See MATRIX.)

Normal Divisors and Quotient Groups. — If H is a subgroup of a group G. and g is in G, the set Hg, consisting of all product; hg for h in H, is called the left coset of H and the set gH of all products gh the right coset of H defined by g. If the two sets gH and Hg are the same for every g of G then H is called a normal divisor of G. All subgroups of an abelian group are normal divisors. The product $Hg_1 \times Hg_2$ of tno cosets is then defined to be $H(g_1g_2)$ and it is a simple matter to shon that the set G_0 consisting of all cosets, forms a group. This group is called the quotient group of G relative to H and is usually designated by G/H.

The identity group **I**, consisting of the identity element of G alone. is a normal divisor of G. Also G is a normal divisor of G. When these trivial normal divisors are the only normal divisors of a group, the group is called a simple group.

A normal divisor H of G is called a maximal normal divisor of G if G/H is a simple group. A sequence of subgroups $G = G_0, G_1, \dots, G_r = I$, in which each G_i is a maximal normal divisor of its predecessor G_{i-1}, is called a composition series of G. Each composition series determines r simple quotient groups $G_0/G_1, G_1/G_2, \dots, G_{r-1}/G_r$. One of the most important theorems of group theory is that which states that if a group G also has a second composition series $H_0 = G, H_1, \dots, H_s = I$ then $s = r$ and the quotient groups $H_0/H_1, H_1/H_2, \dots, H_{r-1}/H_r$ are, when properly rearranged if necessary, mathematical equivalents of the quotient groups G_{i-1}/G_i. The result has immediate applications in the theory of the Galois group of an equation.

Permutation Groups.--Any rearrangement of the n integers $1, 2, \dots, n$ is called a permutation of these integers. The n

integers may be taken to represent any n ordered objects and the permutation is then a reordering of these objects. The two-rowed representation of a permutation P is

$$P = \begin{pmatrix} 1 & 2 & \dots & n \\ i_1 & i_2 & \dots & i_n \end{pmatrix},$$

where the second row is a rearrangement of the first row. For example, in case $n = 4$ the permutation

$$\begin{pmatrix} 1 & 2 & 3 & 4 \\ 2 & 1 & 4 & 3 \end{pmatrix}$$

states that 1 and 2 are to be interchanged, 3 and 4 are to be interchanged.

The result of applying two permutations successively is another permutation. The procedure of computing such products is illustrated in the example

$$P = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 3 & 1 & 4 & 2 \end{pmatrix}, \quad Q = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 4 & 3 & 1 & 2 \end{pmatrix}.$$

The columns of Q are first permuted so that the top row of Q becomes the second row of P, and P and Q are combined to form

$$\begin{pmatrix} 1 & 4 & 2 & 3 \\ 1 & 2 & 3 & 4 \\ 3 & 1 & 4 & 2 \end{pmatrix}.$$

Then the result of applying P and then Q is their product,

$$PQ = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 1 & 4 & 2 & 3 \end{pmatrix}.$$

The set of all permutations on n letters is a group called the symmetric group on n letters. It is a finite group and n factorial is its order. Its subgroups are called permutation groups. All finite groups are mathematically equivalent to permutation groups and there is an immense literature on permutation groups.

Other Topics.—Since most number systems are additive abelian groups, the theory of groups has applications in all parts of higher algebra. It forms a most important part of topology and analysis, and geometry has actually been defined by the great mathematician Felix Klein as the study of the invariants of geometric configurations under groups of transformations. The notion of a group is one of the basic concepts in all mathematics.

Particular attention should be called to the theory of continuous groups and the theory of groups of linear transformations. The first of these topics was investigated extensively by Marius Sophus Lie and forms a fundamental part of the theory of continuous functions. It has applications in quantum mechanics. The second topic is connected with the problem of representing any finite group by a multiplicative group of linear transformations or their equivalent, a group of matrices. This topic is connected with the theory of representations, linear algebras by matrices. The study of the projective group of linear transformations is the basis of projective geometry. The unitary and complex groups of linear transformations are continuous groups and are, in general, simple groups. There are many groups which arise in problems of analysis, geometry and topology and many fruitful results are obtained by investigating the normal divisors of these groups. Thus. the notions of abstract group theory provide an important tool for the study of many topics of mathematics.

GROUPS, CONTINUOUS. This subject comprises a fundamental branch of modern mathematics with applications to theoretical physics. The expression "continuous groups" has been employed since the 19th century for a variety of mathematical structures, some of which are not even groups (*q.v.*). Roughly speaking, the study arose from situations in which there is an infinite number of symmetries present. The set of symmetries is called "the group of transformations admitted by" the situation. In the early days of the theory, which was fathered largely by M. Sophus Lie, much of the research was devoted to applications to the theory of differential equations. As one might expect, the presence of symmetries serves to reduce many difficulties by drastically limiting possibilities. Toward the end of the 19th century, the work of E. Cartan shifted the course of investigation toward a deeper analysis, both algebraic and topological, of the continuous group itself. So fruitful were some of Cartan's ideas that they molded some of the basic notions of algebra and topology. The threefold structure of continuous groups—algebraic, topological and analytic—has attracted a variety of methods of attack, some of them marked by brilliant developments. The work of Lie and of Cartan had revealed many of the fundamental properties of continuous groups before the end of the 19th century. Rather than retrace their steps, this article will begin by introducing some 20th-century terms necessary for an adequate description of the basic ideas. The early developments in the relations between groups and differential equations will be presented later in the article.

Topological Groups.—A topological group G is a group G whose elements are the points of a *topological space (see* TOPOLOGY, GENERAL) for which the group operations are continuous. In greater detail, the elements of G satisfy the postulates for a *group:*

($G1$) There is *a* binary operation assigning to any two elements x and y in G an element in G denoted by xy and called the "group product" of x and y.

($G2$) There is an element e in G such that $ex = xe = x$ for all x in G; e is called the identity.

($G3$) For each element x in G, there is an element denoted by x^{-1} such that $x^{-1}x = e$; the element x^{-1} is called the inverse of x.

The condition that G is a topological space for which the group operations are continuous means that there is a notion of "nearness" among the various elements of G so that if x' is near x then x'^{-1} is near x^{-1} and if y' is near y then $x'y'$ is near xy.

The following are familiar examples of topological groups:

Example 1. G is the set of all real numbers with addition as the group product.

Example 2. G is the set of all complex numbers z with $|z| = 1$ and with multiplication as the group product.

Example 3. G is the set of all rigid motions in Euclidean space which keep some point O fixed. Here the group product is taken as *composition* of motions; that is, if T_2 and T_1 are in G, $T_2 \cdot T_1$ is the motion which takes any point p into $T_2(T_1(p))$.

Example 4. G is the group of all n . n matrices with complex coefficients and nonzero determinant, the group product being the usual matrix multiplication.

The groups in examples 1 and 2 above are abelian, that is $xy = yx$ for any two elements x and y. The groups in examples 2 and 3 above are compact, that is, any infinite sequence of elements $x_1, x_2, \dots, x_n, \dots$ contains a subsequence converging to an element of the group. The group in example 4 above is neither abelian nor compact, but it is *locally compact,* that is, each element has a compact neighbourhood. Each of the groups in the examples is locally Euclidean, that is, each point has a neighbourhood resembling topologically a solid ball in Euclidean space of dimensions 1, 1, 3 and n^2 respectively.

The theory of topological groups has developed in three principal directions: the theory of the algebraic structure, of the topological structure and of representations by transformation groups.

The algebraic structure of a topological group is especially accessible to investigation in case the group operations are analytic. In greater detail, in a topological space, one can define a continuous function as any real-valued function f with the property that $f(x')$ is close to $f(x)$ if x' is close to x. But one cannot speak of differentiable or analytic functions on a locally Euclidean topological space in a self-consistent fashion unless one is given a rule by which to pick out from the totality of continuous functions the differentiable and analytic functions. A locally Euclidean space with such a rule is called a differentiable or analytic manifold, as the case may be. For simplicity, this article deals with analytic manifolds.

An analytic co-ordinate system around a point p in an analytic manifold is a set of functions $(x_1, \ldots, x_k)$ defined near p with the property: a function f is analytic around p if and only if it is expressible as a convergent power series in $x_1, \ldots, x_k$ in some neighbourhood of the point p. In an analytic manifold M there is of course an analytic co-ordinate system around each point, but in general the co-ordinate system is not defined throughout the manifold.

If (x,, . . . , x_k) is an analytic co-ordinate system, the map Φ : $p \rightarrow (x_1(p), \ldots, x_k(p))$ is a map of a neighbourhood of p onto a neighbourhood in Euclidean k-space E^k and the map Φ is a topological equivalence or homeomorphism of some neighbourhood of p onto a solid ball in E^L.

A map ϕ (taking possibly many points into a single point) of a manifcld M into a manifold N is called an analytic map if for any analytic function f defined in a region of N, the composite function $f \circ \phi$ is analytic in M (recall $f \circ \phi(m) = f(\phi(m))$).

A ***Lie** group* G is a topological group of a special kind: the underlying space is an analytic manifold for which the group operations are analytic. That is, the map $(x,y) \rightarrow xy$ of the analytic manifold of ordered pairs G . G into G is an analytic map, and the map $x \rightarrow x^{-1}$ of G into G also is analytic.

Infinitesimal Transformations. — One of the basic notions in the theory of Lie groups is that of infinitesimal transformation. Let M be an analytic manifold and let m be a point of M. We wish first to speak of a tangent vector to M at m. In case M is a surface in Euclidean space, one regards, extrinsically, a tangent vector to a surface as a vector in the containing Euclidean space.

However, it is possible to make a mathematically satisfactory intrinsic definition of a tangent vector to a manifold (*i.e.,* without reference to a containing Euclidean space) by means of the following consideration: a tangent vector X is completely determined once one knons how functions vary along it. that is, the directional derivative of functions along X. Hence for all purposes we can equate the notion of tangent vector X with the operation of taking the directional derivative along X. In this pragmatic spirit one adopts the definition: a tangent vector X to a manifold M at a point m is an operator with assigns to each real-valued function f analytic around m a real number Xf, called the directional derivative of f along X, such that

$$\begin{aligned} X(f+g) &= Xf + Xg \\ X(fg) &= (Xf)g(m) + f(m)X(g) \\ X(af) &= aXf \end{aligned}$$

where j and g are analytic functions around p, and a is a constant. It is easily proved that the set of all tangent vectors at a point m of a k-dimensional manifold constitutes a linear or vector space whose dimension is k (over the field of real numbers). This linear space is called the tangent space to M at m and is denoted by M_m. A vector field on a manifold M is a rule which assigns to each point m of M an element of M_m. To illustrate, let $(x_1, \ldots, x_k)$ be an analytic co-ordinate system on a neighbourhood V of manifold M. We denote by $\frac{6}{\delta x_i}(m)$ the operator which assigns to the analytic function $f(x_1, \ldots, x_k)$ the value of $\frac{}{\delta x_i}$ at the point m. Then $\frac{6}{\delta x_i}(m)$ is a tangent vector to M at m, and $\frac{6}{\delta x_i}(m), \ldots, \frac{6}{\delta x_k}(m)$ form a base for the vector space M_m. We denote by $\frac{6}{\delta x_i}$ the vector field $p \rightarrow \frac{6}{\delta x_i}(p)$ on the neighbourhood V. The most general vector field on V has the form $\Sigma_i A_i \frac{\delta}{\delta x_i}$, where $A_1, \ldots, A_k$ are functions on V. An infinitesimal transformation on an (analytic) manifold is a vector field X such that for any analytic function f on M, the function $Xf : p \rightarrow X(p)f$ is analytic. An infinitesimal transformation on the neighbourhood V above is any vector field $X = \Sigma A_i \frac{6}{\delta x_i}$ such that the functions $A_1, \ldots, A_k$ are analytic. If $(y_1, \ldots, y_k)$ is a second co-ordinate system, then $\frac{Sj}{\delta x_i} = \Sigma_i \frac{\delta f}{\delta y_j}\frac{\delta y_j}{\delta x_i}$, so that

$$\frac{\delta}{\delta x_i} = \frac{\delta y_1}{\delta x_i}\frac{\delta}{\delta y_1} + \frac{\delta y_2}{\delta x_i}\frac{\delta}{\delta y_2} + \ldots + \frac{\delta y_k}{\delta x_i}\frac{\delta}{\delta y_k}$$

An infinitesimal transformation X can also be equated with the operationj $\rightarrow Xf$ taking any analytic function f into the analytic function Xf. Indeed, any operation X assigning to any analytic functionf an analytic function Xj such that

$$X(f+g) = Xf + Xg \tag{1}$$
$$X(fg) = Xf \cdot g + fXg \tag{2}$$
$$X(af) = aXf \tag{3}$$

for any analytic functions f and g, a being any constant, determines a unique infinitesimal transformation.

A map ϕ of an analytic manifold M into an analytic manifold N induces a map oi the tangent space M_m into the tangent space $N_{\phi(m)}$ called the differential of ϕ at M and denoted by $d\phi_m$, as follows: $d\phi_m(X)f = X(f\phi)$ for any function f analytic in M around the point m. For example, if ϕ is an analytic curve in N, that is an analytic map of the manifold of real numbers (t) into N, then $d\phi_t(\frac{d}{dt_t})$ is the tangent vector at the point $\phi(t)$ which assigns to any function f on N the value $\frac{d}{dt}f(\phi(t))$. $d\phi_t(\frac{d}{dt_t})$ is called the tangent to the curve ϕ at the point $\phi(t)$. In case ϕ is a map of an analytic manifold into the real numbers; *i.e.,* ϕ is a real-valued function on M, then for any tangent vector X in M_m, d$\phi(X)$ is a numerical factor of the tangent vector $\frac{d}{dt_{\phi(m)}}$; the numerical factor is also denoted by $d\phi(X)$. By this convention, $d\phi$ becomes a real-valued function of tangent vectors in case ϕ is an analytic (or differentiable) real-valued function on 34; this $d\phi$ coincides with the classical definition of differential.

Suppose now that X is an infinitesimal transformation on an analytic manifold M. Then by the fundamental existence and uniqueness theorem of ordinary differential equations, there passes through each point p of M a unique trajectory to X with initial point p; that is an analytic curve $\phi(p,t)$ in M with $\phi(p,o) = p$ and the tangent to the curve at any point q coinciding with the tangent vector $X(q)$; more explicitly, $\frac{d}{dt}f(\phi(p,t)) = Xf(\phi(p,t))$ for any t and for any function f analytic in M. We denote by "exp tX" the map $p \rightarrow \phi(p,t)$; for any point p, exp tX is defined for suitably small values of t (but not necessarily all). We can think thus of an infinitesimal transformation as the velocity field of a steady flow on a manifold, and exp tX is the displacement of points after t units of time.

In the special case that M is the set of real numbers and $X = \frac{6}{\delta x}$ – $\frac{d}{dx}, \frac{d}{dt}x(\exp tX(p)) = \frac{dx}{dx} = 1$ and exp $tX(p) = p + t$. If $X = x^2\frac{d}{dx}$, then exp $tX(p)$ is the trajectory to $\frac{dx}{dt} = x^2$, and exp $tX(p) = \frac{p}{1 - pt}$, which is not defined for $t = 1/p$. The term "infinitesimal transformation" owes its origin to the fact that for small values of the parameter t, the transformation exp tX consists of the displacement

$$(x_1, \ldots, x_k) \rightarrow (x_1 + tA_1, \ldots, x_k + tA_k)$$

up to infinitesimals of order t^2 if $X = \Sigma_i A_i \frac{6}{\delta x_i}$. If X is an infinitesimal transformation on a manifold then $f(\exp tX(p)) = \sum_{n=0}^{\infty}(n!)^{-1}t^n X^n f(p)$ whenever both sides are defined. This identity can be stated in a more familiar form when we adopt the following notational convention: if ϕ is a map of a space M into a space N, we denote by $\phi(f)$ the composite function $f\circ\phi$ where f is a function on N. Thus by definition, $f(\phi(m)) = (\phi(f))(m)$. By this convention we regard ϕ not only as a map of points of M into points of N, but also as the equivalent indicated map of functions on N into functions on M. Adhering to this convention, the identity above states

$$\exp tX = \sum_{0}^{\infty}(n!)^{-1}t^n X^n \tag{4}$$

as operators on analytic functions on M, whenever both sides can be applied.

It is clear from (4) that a point m is fixed under the transformations $\exp tX$ for all t if and only if the point m is a zero of X; *i.e.*, $X(m) = 0$ or $Xf(m) = 0$ for any analytic function f.

Local (Pseudo-) Groups of Transformations.— Let G be a topological group and M a topological space. Let $P(M)$ denote the set of all permutations of M; *i.e.*, all transformations of M onto M which have inverses. An operation of G on M is a rule T which assigns to each g in G an element $T(g)$ in $P(M)$ such that

(T1) $T(g_1g_2) = T(g_1)\circ T(g_2)$.

(T2) The element $T(g)(m)$ depends continuously on g and m.

If G is a Lie group and M is an analytic manifold, an operation is called analytic if the point $T(g)(m)$ depends analytically on g and m. An important variation on this idea is that of a local pseudo-group (sometimes called simply local group) operating on a manifold. Briefly, a local Lie group is a structure which resembles a neighbourhood of the identity in a Lie group; products are not always defined but, when they are, the group postulates are fulfilled. The celebrated first and second fundamental theorems of Lie describe the relation between local Lie groups on a manifold and infinitesimal transformations.

Let N and M be analytic manifolds and let T be a one-to-one map of N into $P(M)$ such that $T(n)(m)$ depends analytically on n and m. Assume that for some n_o in N, $T(n_o)$ is the identity transformation of M. One considers the map T_n which assigns to each tangent vector $X\epsilon N_n$ an infinitesimal transformation $T_n(X)$ by the following rule:

$$T_n(X)(m) = d\phi_n(X) \tag{5}$$

where $\phi : p \rightarrow (T(p)\cdot T(n)^{-1})(m)$ maps N into M and n into m. Roughly speaking, the infinitesimal transformation $T_n(X)$ describes how $T(p)$ differs from $T(n)$ as the point p moves away from the point n along a path whose tangent vector at n is X.

Lie's first *fundamental theorem* states that $T_n(\dot{N}_n)$ is independent of the point n if and only if N is a local Lie group and T is an analytic operation of N on M. If this is the case, the family of infinitesimal transformations $T_n(\dot{N}_n)$ is called the infinitesimal generator of the local Lie group of transformations $T(N)$.

It is readily verified that if X and Y are infinitesimal transformations on M, the operator XY − YX satisfies conditions (1), (2) and (3), and is thus an infinitesimal transformation. $XY - YX$ is denoted by $[X,Y]$ and is called the Poisson bracket of X and Y. If $(x_1, \ldots, x_k)$ is an analytic co-ordinate system on a neighbourhood v, then $X = \Sigma_i A_i \frac{\delta}{\delta x_i}$, $Y = \Sigma_i B_i \frac{\delta}{\delta x_i}$ and $[X,Y] = \Sigma_{ij}(A_j \frac{\delta B_i}{\delta x_j} - B_j \frac{\delta A_i}{\delta x_j})\frac{\delta}{\delta x_i}$.

Directly from definitions, it may be seen that

$$[X,Y] = -[Y,X] \text{ and } [[X,Y],Z] + [[Y,Z],X] + [[Z,X],Y] = 0$$

the latter being the Jacobi identity.

Suppose now that $\mathcal{J}$ is a set of infinitesimal transformations. $\mathcal{J}$ is called a Lie algebra of infinitesimal transformations if (1) $\mathcal{J}$ is a linear family, that is, $\mathcal{J}$ contains any linear combination of its elements with constant coefficients; and (2) $\mathcal{J}$ contains the Poisson brackets of any of its elements.

Lie's second *fundamental theorem* states that a family of infinitesimal transformations $\mathcal{J}$ is the infinitesimal generator of a finite dimensional local Lie group of transformations if and only if $\mathcal{J}$ is a finite dimensional (over the field of constants) Lie algebra of infinitesimal transformations. The corresponding local Lie group of transformations is the set of all transformations of the form

$$\exp t_1X_1 \cdot \exp t_2X_2 \cdot \ldots \cdot \exp t_rX_r \tag{6}$$

where $X_1, \ldots, X_r$ is a base for $\mathcal{J}$ and $t_1, \ldots, t_r$ are any set of real numbers which are suitably small. The elements of the corresponding local group can also be described as the set of all transformations

$$\exp X \quad X\epsilon\mathcal{J} \tag{7}$$

It may happen that the corresponding local group G is indeed a genuine group. In that case neither the elements of the form (6) nor (7) necessarily exhaust G; they merely cover a neighbourhood of the identity in G in general.

In case the family $\mathcal{J}$ of Lie's second fundamental theorem is infinite dimensional, there arises a so-called "infinite Lie pseudo-group." These pseudo-groups were studied extensively by Cartan, but basic questions about the nature of such structures were left unanswered. In the 1950s several independent investigations into some of these questions were initiated. In this article, however, the term Lie group is reserved for the finite dimensional case alone.

With the help of his second fundamental theorem, Lie was able to determine all the local groups of transformations depending on a finite number of parameters which operate on the line, plane and, in certain cases, on higher dimensional spaces. For example, it is relatively easy to show that the only finite dimensional Lie algebras of infinitesimal transformations on the line which have no common zeros have in suitable co-ordinates one of the following three bases (a) $\frac{d}{dx}$; (b) $\frac{d}{dx}, x\frac{d}{dx}$; or (c) $\frac{d}{dx}, x\frac{d}{dx}, x^2\frac{d}{dx}$.

These are the generators of the

(a) one-parameter translation group: $x \rightarrow x + t$;

(b) two-parameter affine group: $x \rightarrow ax + b$;

(c) three-parameter projective group: $x \rightarrow \frac{ax+b}{cx+d}$, $\det\begin{vmatrix} a & b \\ c & d \end{vmatrix} \neq 0$.

These three are thus up to equivalence the only finite dimensional local Lie groups operating transitively on the line.

The last example shows clearly that a local group of transformations of the line need not be a piece of a global group of transformations of the line. However, it is true that any local Lie group has a neighbourhood of its identity which is *in* abstracto isomorphic to a neighbourhood of the identity in some genuine (global) Lie group.

The Lie Algebra of a Lie Group.— Consider now a Lie group G. For each g in G, let $T(g)$ denote the "left translation" map $x \rightarrow gx$ of G onto G. Then T is an analytic operation of G on G. By Lie's first fundamental theorem, the group $T(G)$ has an infinitesimal generator, and by Lie's second fundamental theorem, the infinitesimal generator is a Lie algebra of infinitesimal transformations; this infinitesimal generator is denoted by $\dot{G}$ and is called the Lie algebra of G. It is readily proved that $\dot{G}$ consists of precisely those infinitesimal transformations on G which are left unchanged by the right translations $x \rightarrow xg$ of G into G. It follows at once that each infinitesimal translation in G is uniquely determined by its value at the origin. Thus as a linear space, $\dot{G}$ is equivalent to $\dot{G}_e$, the tangent space of G at the identity element e. If X is an element of G_e, and $\bar{X}$ is the element of $\dot{G}$ determined by X, then one defines $\exp X = \exp \bar{X}(e)$. Also, one defines $[X,Y]$ to be the value at e of $[\bar{X},\bar{Y}]$, where $\bar{X}$ and $\bar{Y}$ are the elements of $\dot{G}$ with $\bar{X}(e) = X$ and $\bar{Y}(e) = Y$. In the special case that G is the group $GL(n)$ of all inversible linear transformations of an n-dimensional linear space V_n over the real numbers, the tangent space to G at the identity element can be identified with the set of all linear transformations of V,. Then for any $X \epsilon \dot{G}_e$, exp X coincides with the classical exponential of the transformation X; *i.e.*, exp X $= \Sigma_i \frac{X^i}{i!}$. Moreover, for any X and Y in $\dot{G}_e$, $[X,Y] = XY -$ YX, where the multiplication on the right is the usual multiplication of linear transformations.

If we abstract from Ġ its algebraic structure alone, we see that it is an algebra with Poisson brackets as multiplication. This multiplication is nonassociative, but the structure of such algebras is capable of a virtually exhaustive description. On the other hand, there is a very close connection between the algebraic structure of a Lie group and the algebraic structure of its Lie algebra. Indeed, there is a one-to-pne correspondence between the subalgebras of the Lie algebra G and the connected Lie subgroups of G, the correspondence being, a connected Lie subgroup H corresponds to the subalgebra of Ġ that is determined by the tangent suhspace $\dot{H}_e$ to H at the identity. A connected Lie subgroup H is normal in G if and only if the corresponding subalgebra H is an ideal in G; that is, $[G,\dot{H}]$ is contained in H. To the commutator subgroup of G generated by the elements of the form $xyz^{-1}y^{-1}$, there corresponds the "derived" subalgebra which is generated by the elements $[X,Y]$ with X and Y in G. In particular, a connected Lie group G is abelian if and only if $[X,Y] = 0$ for all X and Y in Ġ.

The most elementary type of Lie algebra is one wherein the multiplication is trivial; *i.e.*, $[\mathcal{G},\mathcal{G}] = 0$. Such a Lie algebra is called abelian. Next in complexity is a Lie algebra wherein the product of some finite number of any elements is zero; *i.e.*, if setting $\mathcal{G}^{(\prime)} = \mathcal{G}$, $\mathcal{G}^{(n+1)} = [\mathcal{G}^{(n)}, \mathcal{G}^{(\prime)}]$, then $\mathcal{G}^{(n)} = 0$ for some n. Such a $\mathcal{G}$ is called nilpotent. One step more complex are Lie algebras G which have a decreasing sequence of ideals, $\mathcal{G} \supset \mathcal{G}_1 \supset \ldots \supset \mathcal{G}_n \ldots$ with the quotient algebra $\mathcal{G}_i/\mathcal{G}_{i+1}$ abelian and $\mathcal{G}_n = 0$ for some n; such a Lie algebra is called solvable. The maximum solvable ideal of a Lie algebra is called its radical. If $\mathcal{G}$ is a Lie algebra and $\mathcal{R}$ denotes its radical, then $\mathcal{G}/\mathcal{R}$ has no nonzero radical; such a Lie algebra is called semisimple. If a Lie algebra has no nonzero properly smaller ideal, it is called simple. The basic theorems describing the structure of Lie algebras over any field of characteristic zero areas follows:

1. Any Lie algebra is a semidirect sum of its radical and a semisimple subalgebra.
2. Any semisimple Lie algebra is a direct sum of simple Lie algebras.
3. Any simple Lie algebra over the field of complex numbers is one of the following type:

A,: the Lie algebra of the group of all complex-valued matrices of determinant 1;

B,: the Lie subalgebra of A_{2n+1} which annihilates the quadratic form $X_1^2 + X_2^2 + \ldots + X_{2n+1}^2$;

C,: the Lie subalgebra of A_{2n} which annihilates the alternating bilinear form

$$x_1y_{n+1} - y_1x_{n+1} + x_2y_{n+2} - y_2x_{n+2} + \ldots + x_ny_{2n} - y_nx_{2n}$$

D,: the Lie subalgebra of A_{2n} which annihilates the quadratic form $x_1^2 + \ldots + x_{2n}^2$

The five "exceptional" simple Lie algebras G_2, F_4, E_6, E_7, E_8 discovered by W. Killing and of dimensions 14, 52, 78, 133, 248 respectively.

This remarkable classification is achieved by a study of the so-called root diagram of the Lie algebra.

Although each Lie group has a unique Lie algebra, a Lie algebra in the abstract (*i.e.*, divorced from its presentation as the infinitesimal generator of a Lie group) may arise from inequivalent or nonisomorphic groups. For example, the one dimension abelian Lie algebra over the field of real numbers is the Lie algebra of both example $G1$ and example G2 above. The problem of determining the relation between the various connected Lie groups having abstractly isomorphic Lie algebras was solved by Otto Schreier. The situation is: to each abstract Lie algebra g (over the field of real numbers), there corresponds a unique (up to isomorphism) simply connected Lie group G; that is, a connected Lie group in which every closed curve can be deformed continuously to a point; any other Lie group G_1 whose Lie algebra is isomorphic to g is obtained from G by a homomorphism with a discrete kernel. Thus G_1 is evenly covered by G, and all connected Lie groups whose Lie algebras are isomorphic to G have the same simply connected covering group.

The spin representation of physics provides another example of this phenomenon.

It should be emphasized, however, that in a neighbourhood of the identity, any two Lie groups having isomorphic Lie algebras are isomorphic. This can be seen from the Baker-Campbell-Hausdorff formula

$$\exp X \exp Y = \exp (X + Y - \tfrac{1}{2}[X,Y] + \ldots) \qquad (8)$$

the dots denoting an infinite sum of terms built from X and Y with Poisson brackets.

By a process known as "complexification" it can be proved that the classification of complex simple Lie algebras also applies to compact Lie groups.

The Topological Structure of Lie **Groups.**—We have seen that to a given abstract Lie algebra there may correspond Lie groups which are not topologically equivalent. Therefore, one cannot expect that the abstract Lie algebra $\dot{G}$ of a Lie group G determines the topological structure of G completely. However, one of the greatest contributions of E. Cartan to mathematics was his demonstration that the Lie algebra G determines the important topological invariants called Betti numbers of the group G in the very important case that the Lie group G is compact and connected. Cartan's researches on this problem led him to invent his theory of exterior differential forms and to conjecture the celebrated De Rham theorems, which were proved by his student, G. de Rham.

Exterior Differential Calculus.—If V is a vector space, then, by the exterior algebra over V me mean an associative algebra $E(V)$ generated by the elements of I' together with a unit element 1 such that the product of p elements $x_1 \cdot x_2 \cdot \ldots \cdot x_p$ is not zero in $E(V)$ if and only if $x_1, \ldots, x$, are linearly independent in V. Since $x^2=0$ for any x in V, it follows that $x \cdot y = -y \cdot x$ for any x and y in V. If 1^{7*} denotes the dual space of linear functions on V, then $E(V^*)$ can be identified in a natural way nith the set of skew-symmetric multilinear functions on V, the multiplication being

$$\phi_p \cdot \psi_q(X_1, \ldots, X_{p+q}) =$$
$$(p+q)!^{-1}\sum_\sigma(-1)^{\epsilon(\sigma)}\phi_p(X_{\sigma(1)}, \ldots, X_{\sigma(p)})\psi_q(X_{\sigma(p+1)}, \ldots X_{\sigma(p+q)}) \quad (9)$$

where ϕ_p and ψ_q are respectively p- and q-linear, $X_1, \ldots, X_{p+q}$ are any p+q elements of V, $\epsilon(\sigma)$ denotes the parity of the permutation σ, and σ ranges over all the permutations of $1, \ldots, p+q$. The algebra $E(V^*)$ is called the Grassmann algebra of V. An exterior differential p-form on an analytic manifold M is a rule which assigns to each point m of M an element of degree p of the Grassmann algebra $E(\dot{M}_m{}^*)$, $\dot{M}_m$ being the tangent space to M at m. In the language of tensors, an exterior diflerential p-form is a covariant skew-symmetric tensor field of degree p. The novel operation introduced by Cartan is "exterior differentiation" of exterior differential forms. This operation assigns to any exterior differential p-form w a $p+1$-form dw such that

(D1) d is linear.
(D2) d applied to a function or zero form is the usual difierential.
(03) $d(w_1 \cdot w_2) = dw_1 \cdot w_2 + (-1)^p w_1 \cdot dw_2$ where p is the degree of w_1.
(04) $ddw = 0$ for any form w.

The geometric significance of exterior differentiations is seen in the generalized Green-Stokes theorem:

If S is a p-dimensional hypersurface bounding the $p+1$ dimensional solid region R, then

$$\int_S w = \int_R dw \qquad (10)$$

For example, if $w = Pdx + Qdy +$ Kdz, $dw = \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y}\right)dxdy + \left(\frac{\partial P}{\partial y} - \frac{\partial Q}{\partial z}\right)dydz + \left(\frac{\partial P}{\partial z} - \frac{\partial R}{\partial x}\right)dzdx$; if $w = Rdxdy + Qdydx + Pdzdx$, then $dw = \left(\frac{\partial P}{\partial x} + \frac{\partial Q}{\mathrm{d}y} + \frac{\partial R}{\partial z}\right) dxdydz.$

Exterior differentiation has the fundamental property that it commutes with maps. That is, suppose ϕ is a map of a manifold M into a manifold N, and ω is an exterior differential p-form on N. Extending the notational convention adopted above, one denotes by ϕ (w) the p-form on M which is given by

$$\phi(\omega)(X_1, \ldots, X_p) = \omega(d\phi(X_1), \ldots, d\phi(Xp))$$

It follows from the properties $D1$ through $D4$ that for any analytic map ϕ,

$$\phi(d\omega) = d(\phi(\omega)) \tag{11}$$

In addition, since ϕ preserves the addition and multiplication of exterior forms, one can say that ϕ yields a differential algebra homomorphism.

An exterior differential form w is called closed if dw $= 0$; it is called exact if w $= du$. Since $d^2 = 0$, every exact form is closed. Conversely, if w is exact, then in any suitably small neighbourhood V there is a form u such that $du =$ w in V. But nevertheless a closed form need not be exact. The set of closed forms constitutes a vector space and the set of exact forms is a subspace. The quotient space of closed exterior p-forms by the exact p-forms is the p-dimensional Betti group, and the dimension of this space is the pth Betti number of M, denoted $\beta_p(M)$. Since locally, every closed form is exact, the number $\beta_p(M)$ must clearly depend on the global structure of M. Cartan showed that for a compact connected Lie group G, $\beta_p(G)$ is determined by the Lie algebra G.

This success of Cartan encouraged a closer study of the topological structure of Lie groups, in an attempt to determine for them the various finer topological invariants that were being introduced in topology.

The central position occupied by compact groups in topological questions concerning Lie groups was clearly established when it was discovered that any Lie group with a finite number of connected components is topologically a product of any of its maximal compact subgroups and a Euclidean space. Thereby the question of topological structure of Lie groups was reduced to the case of compact Lie groups, which are more amenable to topological treatment. The principal results on topological structure of compact groups are that the cohomology ring with real coefficients of a compact Lie group is isomorphic to the cohomology ring of a direct product of spheres; but a compact Lie group is not in general (even in the simply connected case) topologically equivalent to a direct product of spheres. This last result follows from a computation of the Steenrod reduced power operations in compact Lie groups that was carried out by A. Borel and J. P. Serre.

The torsion groups of nearly all compact Lie groups have also been determined. The compact Lie groups Su(n) and Sp(n) (the unitary unimodular group and symplectic group respectively) have no torsion; S pin (n), the two-sheeted covering group of the orthogonal group, has no torsion for $n \leq 6$. Su(n) ($n \geq 3$) and Spin (n) ($n \geq 7$) have 2-torsion and all their torsion coefficients are equal to 2.

Representation as Transformation **Groups.**—It is natural to compare general topological groups with special ones, and in particular much attention has been devoted to the study of homomorphisms of topological groups into groups of linear transformations or matrix groups. This study has achieved far-reaching results which throw fresh light on the classical Fourier transform and the theory of special functions. Only two results will be mentioned here.

1. The theorem of F. Peter and H. Weyl states that any compact Lie group is isomorphic to a subgroup of the unitary group.

2. The theorem of I. Ado states that any real Lie algebra is isomorphic to a Lie algebra of matrices. Thus any Lie group has a neighbourhood of its identity in which multiplication is isomorphic to multiplication in some matrix group.

Turning now to more general types of representations, there have been several investigations of the global relations between topological groups and the types of spaces in which they can operate as groups of continuous transformations, as well as special properties of the operations themselves. To indicate the scope of such investigations, we mention several results:

1. The only two-dimensional surfaces on which a Lie group can operate transitively (*i.e.*, carrying any point into any other point) are the plane, sphere, torus, projective plane, cylinder, Mobius band and Klein bottle.

2. A compact connected Lie group operating transitively and effectively (*i.e.*, so that each element other than the identity moves some point) on an even-dimensional sphere is simple; more generally if M is a manifold whose Euler-Poincaré characteristic $(= \Sigma(-1)^p\beta_p(M))$ is a prime number, then any compact connected Lie group operating on M is simple.

3. If a Lie group G operates transitively on a compact simply connected space M, then some compact subgroup of G operates transitively on M.

4. If a Lie group operates transitively on a space M having no "holes" (that is, all the homotopy groups are zero), then M is topologically Euclidean space.

5. If a compact Lie group G operates on a manifold M, then the operation is topologically equivalent to the operation of a group of rotations of some (higher dimensional) Euclidean space on a subspace that is topologically equivalent to M.

6. If a compact connected abelian Lie group operates on Euclidean space, then it must leave some point fixed, and the set of fixed points resemble a hyperplane topologically.

Hilbert's Fifth Problem.—Among the celebrated 23 problems for research that were proposed by David Hilbert in his address to the International Congress of Mathematicians of 1900 was the conjecture that any locally Euclidean topological group can be given the structure of an analytic manifold so as to become a Lie group. The first great inroad on this problem came with the discovery by A. Haar in 1932 that in any locally compact topological group one can introduce a measure and an integral which is invariant under all group translations x yx; that is, for any function f defined on a locally compact group G, the integral $\int_G f(x)dx$ satisfies, in addition to the usual rule of linearity, the condition

$$\int_G f(yx)dx = \int_G f(x)dx$$

In 1933 J. von Neumann was able to exploit Haar's integral by adapting the theory of integral equations on a Lie group that had been developed in 1927 by Peter and Weyl and thereafter succeeded in solving the Hilbert problem for compact groups. In 1934 L. Pontryagin was able to prove Hilbert's conjecture for abelian groups as a by-product of his theory of characters on locally compact abelian groups.

The final complete solution of Hilbert's fifth problem came in 1952 as a result of the work of A. Gleason, D. Montgomery and L. Zippin. Indeed, it was found that any locally compact topological group is a limit of Lie groups. This profound result affirmed the central position of Lie groups in the theory of continuous groups.

Algebraic Linear Groups.—An algebraic linear group is a subgroup of the group of all nonsingular n . n matrices $L(n)$ which is defined by the vanishing of polynomials in the matrix coefficients, that is a subgroup of $L(n)$ which is the intersection of $L(n)$ with an algebraic variety. If the underlying field is the field of real or complex numbers, then any algebraic linear group is a Lie group, but not conversely. On the other hand, most of the questions involving linear groups that arise in mathematics reduce to problems concerning groups which are algebraic. It is natural therefore to seek the special properties which characterize algebraic linear groups and their Lie algebras. This study was initiated by L. Maurer in the 19th century and resumed in mid-20th century by C. Chevalley and others.

The theory of algebraic linear groups has thrown fresh light on the relation between an arbitrary Lie group and the set of all its finite dimensional linear representations; this development was initiated by T. Tannaka in an effort to generalize Pontryagin's duality theory of characters, and was carried further by G. Hochschild and G. D. Mostow.

Chevalley's theory of algebraic groups was carried out for arbitrary ground field, even fields of prime characteristic p. This theory in characteristic p rested on very different considerations from the classical theory in characteristic zero but arrived at identical conclusions about the classification of simple groups. Moreover, Chevalley's work established a significant connection between finite simple groups and simple Lie groups.

Invariants of an Exterior Differential System.—The principal application of continuous groups to the solution of differential equations consists in forming first integrals of a system of differential equations from the infinitesimal generators of a group admitted by the system. The number of unknowns involved in the system is thereby reduced.

For simplicity of illustration, we consider only systems of the type

$$w_1 = \dots = w_n = 0 \tag{12}$$

where $w_1, \dots, w_n$ are independent differential 1-forms (*i.e.*, linear differential forms) on an $n+1$ dimensional manifold. The solutions of (12) are called integral curves, functions that are constant on solutions are called first integrals, and differential forms expressible in terms of first integrals and their differentials are called invariant forms. A first integral is thus an invariant 0-form. The system (12) is said to admit a transformation ϕ if ϕ carries solutions of (12) into solutions and to *admit the infinitesimal transformation* X if it admits the transformations $\exp tX$ for all small t.

The passage from groups of transformations admitted by (12) to first integrals of (12) is via invariant forms of (12). There are three simple principles for the formation of invariant forms out of given ones:

(A) If w is an invariant form, then dw is also invariant.

(B) If the system (12) admits the infinitesimal transformation X, and if w is an invariant iorm, then Xw is an invariant form.

(C) Under the hypotheses of (B), the form $\partial_X w$ is an invariant form, where, for any p-form w, $\partial_X w$ is the p − 1 form defined by $\partial_X w(X_1, \dots, X_{p-1}) = w(X, X_1, \dots, X_p)$.

Suppose the system (12) admits an n-dimensional Lie group of transformations G whose Lie algebra G has a base $X_1, \dots, X_n$ such that the determinant $w_i\,(X_j)$ is not zero.

We replace the forms $w_1, \dots, w_n$ by linear combinations $w_1', \dots, w_n'$ such that $w_i'(X_j) = \delta_{ij}$ – for $i,j = 1, \dots, n$. The linear forms $w_1', \dots, w_n'$ are invariant forms of (12) and are called the forms dual to $X_1, \dots, X_n$. If $(X_i,X_j) = \Sigma_s c_{ijs} X_s$, then $dw_s' = -\sum_{ij} c_{ijs} w_i' w_j'$. It follows that if G is solvable, then the equation (12) can be solved by n successive quadratures. This is an analogue of E. Galois's celebrated theorem on the solution of algebraic equations by radicals. For example, the equation

$$y\frac{d^2y}{dx^2} = F\left(\frac{dy}{dx}\right) \tag{13}$$

is invariant under the group G generated by translations along the x-axis and by uniform stretchings. The system (13) is put in form (12) by introducing the new variable y' and (13) then becomes

$$\begin{aligned} dy - y'dx &= 0 \\ ydy' - F(y)dx &= 0 \end{aligned} \tag{14}$$

The group G operates in (x,y,y')-space and its infinitesimal generators are $X_1 = \frac{\partial}{\partial x}, X_2 = x\frac{\partial}{\partial x} + y\frac{\partial}{\partial y}$ The dual forms are $w_1' = dx - \frac{x}{y}dy - \frac{y - xy'}{F(y')}dy'$ and $w_2' = \frac{dy}{y} - \frac{y'}{F(y')}dy$. Since $[X_1,X_2] = X_1$, we have

$$\begin{aligned} dw_2' &= 0 \\ dw_1' &= w_1'w_2' \end{aligned} \tag{15}$$

Thus w_2' is exact and gives by integration the first integral u_2 with $du_2 = w_2'$. On the surface $u_2 = C_1$, we have $w_1' = 0$ and thus $w_1' = 0$ can be integrated. The result of the two successive integrations are

$$\begin{aligned} y &= C_1 \exp \int \frac{y'dy'}{F(y')} \\ x &= C_1 \exp \left(\int \frac{1}{F(y')}\left(\exp \int \frac{y'dy'}{F(y')}\right)dy'\right) + C_2 \end{aligned} \tag{16}$$

The Poincare Invariant Integral and Cartan's Associated Form.—H. Poincaré has shown that for any Hamiltonian system

$$\frac{dp_i}{dt} = -\frac{\partial H}{\partial q_i} \tag{17}$$

$$\frac{dq_i}{dt} = \frac{\partial H}{\partial p_i} \quad i = 1, \dots, n$$

the form $w = \Sigma_i dp_i dq_i$ has the property that $\int_D w$ over any region in $(p_1, \dots, p_n, q_1, \dots, q_n t)$-space taken at a *simultaneous* time t is independent of t. A differential form with such a property is called a Poincaré integral invariant. If $F(x_1, \dots, x_k, t, dx_1, \dots, dx_k)$ is a Poincaré integral invariant of a system

$$\frac{dx_i}{dt} = A_i(x_1, \dots, x_k, t) \qquad i = 1, \dots, k \tag{18}$$

then $F(x_1, \dots, x_k, t, dx - A_1 dt, \dots, dx - A_k dt)$ is an invariant form of this system

$$\frac{dx_1}{A_1} = \frac{dx_2}{A_2} = \dots = \frac{dx_k}{A_k} \tag{19}$$

and it is called the associated Cartan form. The associated Cartan form of $\Sigma_i dp_i dq_i$ is thus $w' = \Sigma_i(dp_i + \frac{\partial H}{\partial q_i}dt)(dq_i - \frac{\partial H}{\partial p_i}dt) = \Sigma_i dp_i dq_i - dHdt$. This Cartan form is not only an invariant of the system

$$-\frac{dp_1}{\frac{\partial H}{\partial q_1}} = \dots = \frac{dq_n}{\frac{\partial H}{\partial p_n}} \tag{20}$$

but actually determines the system (20), namely, (20) is the first Pfaffian (or associated characteristic) system of w'. Any infinitesimal transformation admitted by the equations of motion leads to an invariant 1-form via the principle in (C) applied to w'. Quite frequently, such 1-forms are exact and by integration one gets first integrals. In this way one can derive the known first integrals of the n-body problem.

Poisson Parentheses and Contact Transformations.—A nondegenerate bilinear form B on a finite dimensional vector space V determines a one-to-one linear map B_1 of V onto its dual space of linear functions V^* by the rule $B_1(v)(w) = B(v,w)$. This map produces out of functions on V functions on V^*. In particular the function B produces the bilinear function B* in V^*

$$B^*(x,y) = B(B_1^{-1}(x), B_1^{-1}(y)) \tag{21}$$

for any elements x and y in V^*.

Now let M be a manifold (necessarily of even dimension) on which there is defined an exterior differential closed 2-form β which is nondegenerate at all points. If f and g are functions on M, set

$$(f,g) = \beta^*(df,dg) \tag{22}$$

The function (f,g) is called the Poisson parentheses of f and g with respect to β. In the neighbourhood of any point one can find co-ordinates $(p_1, \dots, p_n, q_1, \dots, q_n)$ such that $\beta = \Sigma_i dp_i dq_i$. A simple computation gives

$$(f,g) = \Sigma_i \frac{\partial f}{\partial p_i}\frac{\partial g}{\partial q_i} - \frac{\partial f}{\partial q_i}\frac{\partial g}{\partial p_i} \tag{23}$$

The function (f,g) is characterized by the identity

$$df \cdot dg \cdot \beta^{n-1} = (f,g)\beta^n \tag{24}$$

where the dot is exterior multiplication and $2n = \dim$ M. Transformations of a manifold of dimension $2n$ or $2n+1$ preserving an exterior 2-form β of maximum possible rank were called by Lie restricted nonhomogeneous contact transformations with respect to β. Lie studied more general nonhomogeneous contact transformations which preserve the equation $w = 0$ where w is a differential 1-form on 2n + 1 dimensional manifold such that $wdw^n \neq 0$; also, homogeneous contact transformations of a 2n-dimensional manifold preserving a 1-form w such that $dw^n = 0$. The best example of a one parameter group of restricted nonhomogeneous contact transformations is given by the movement of a wave front according to Huygens' principle.

Another important example is the motion of a conservative dynamical system in Hamiltonian form—the mathematical foreshadowing of quantum mechanics. If H is the Hamiltonian of a conservative dynamical system, then the infinitesimal transformation defined by equations (17) is the operator X_H, where X_g denotes the infinitesimal transformation defined by the operator

$$f \to (g,f) \tag{25}$$

parentheses being with respect to the Poincare integral invariant $\beta = \Sigma_i dp_i dq_i$. The most general (analytic) infinitesimal transformation of $(p_1, \ldots, p_n, q_1, \ldots, q_n)$-space which preserves β is of the form X_g with g an arbitrary analytic function. The Hamiltonian form (20) of the equations of motion is preserved by any contact transformation with respect to β, and the equations (20) admit the infinitesimal contact transformation X_g only if g is a first integral or if X_g preserves the associated Cartan form of β. Thus if g_1 and g_2 are first integrals of (20), then their Poisson parentheses is a first integral by the principle (B). Poisson parentheses are related to Poisson brackets by the identity

$$[X_f, X_g] = X_{(f,g)} \tag{26}$$

GROUPS, TRANSFORMATION. Transformation groups in geometry comprise a branch of theoretical mathematics that has received increasing attention in the 20th century and has close relations with important aspects of physics and with other phases of higher geometry.

Preliminary Definitions.—An abstract group (see GROUPS) is a system of elements in which a multiplication is defined satisfying certain simple rules (see below). A transformation group is always associated with a space of points and is an abstract group whose elements are one-one correspondences between the points; furthermore, the space has some kind of structure which is preserved by the correspondences. For example, the transformation group of principal interest in Euclidean geometry is the collection of congruences; these preserve distances between points and are called isometries. The correspondences, also called transformations, have this character: (1) to each point of space regarded as preimage they associate an image point; (2) each point is image of one and only one preimage. If T denotes a correspondence one writes $T(A) = A'$ to say that A' is image of A.

The set of all such transformations (and also certain subsets called subgroups) forms an abstract group; *i.e.*, an associative multiplication can be defined, there is an identity and each element has an inverse. Thus the *product* S . T of transformations S and T associates to A the image $A'' = S(T(A)) = S(A')$, nhere A' is $T(A)$. The inverse of T denoted by T^{-1} interchanges image and preimage: $T^{-1}(A') = A$ if and only if $T(A) = A'$. The identity, denoted by **I**, is defined by $I(A) = A$ for all A. If for two elements S and T, $S(A) = T(A)$ for all A, this means that $S = T$; in this sense $TT^{-1} = \mathrm{I} = T^{-1}T$, and for three elements R . ST = RS . T (associativity), as is easily verified.

S and T are said to commute, if ST = TS; if every pair commute, the group is called commutative.

Historical Survey.—High points in the development of this subject in the century (1830–1930) after the invention of group theory were as follows. (1) Discovery of Bolyai-Lobachevski plane geometry. This has distance-preserving transformations which give rise to "rigid motions" different from Euclidean motions. (2) Papers by B. Riemann and by H. L. F. von Helmholtz on the foundations of geometry; their investigations clarified the mathematical nature of space and motion and led to new geometries in all dimensions. (3) Studies by Arthur Cayley and by Felix Klein on the relation of metric geometries to subgroups of the projective group; the latter preserves collinearity (if A, B, C are on a line so are the images A', B', C') but distorts distance. (4) M. S. Lie's work on continuous transformation groups (now called Lie groups); here the group regarded as a spacelike structure (group manifold) plays a dominant role. (5) David Hilbert's axiomatization based on transformation groups of the two metric geometries on the plane. (6) Relativity theory with its emphasis on the principle of invariance—physical entities such as space-time intervals, forces, displacements, expressible in appropriate co-ordinate systems by some mathematical formalism. must keep their form after transformations of co-ordinates. In consequence the group of allowable transformations of co-ordinates reflects the nature of the physical world. This is the Lorentz group in relativity theory and the Newton-Galileo group in the older physics. (7) Studies by E. Cartan and H. Weyl on group manifolds whose structure is describable in local co-ordinate systems (Lie groups). (8) Studies by A. Haar, J. von Neumann and L. Pontryagin on the construction of co-ordinate systems in more general group manifolds.

General Concepts.—Let G denote a group acting on a space. The set of images of a point A under all elements of G is called the orbit of A, denoted by $G(A)$. Those elements S for which A is a fixed point, *i.e.*, $S(A) = A$, form a subgroup (possibly trivial; *i.e.*, consisting of the identity) called the stability group (also isotropy group) of A, denoted by G_A. G carries each point of $G(A)$ to every other point and is called transitive on the orbit. If G_A is the identity, G is simply transitive on $G(A)$; then each point can be associated to a unique element of G. In this case G and $G(A)$ have similar structure as spaces.

For example: (1) a line L can be reflected into itself across each point. The collection of these transformations and all their products forms a transitive group; each stability group has two elements. the identity and one reflection. G has a subgroup called the line-translation group, which is simply transitive on L. (2) the group of rotations of a circle is simply transitive on the circle, and is called a circle group.

Space is partitioned into distinct orbits each of which is a point in an abstract space called the orbit space. For example, if G is the group of rotations of the plane about a fixed origin, then all orbits (with one exception) are circles, and the orbit space is a half line whose end point corresponds to the one point left fixed by all elements of the group.

As this example shows, the stability groups associated with points on different orbits need not be similar. However, if A and B are on the same orbit, then G_A and G_B are actually conjugate groups; *i.e.*, there is an element T in G such that, for every element S in G_A, TST^{-1} is in G_B. It should be remarked for those familiar nith group theory that the orbit $G(A)$ is directly related to the coset space (either left or right) of G by G_A.

Euclidean Plane Geometry.—One of the simplest substantial illustrations of the foregoing is the Euclidean plane group. This can be defined on the basis of the first dozen or so propositions of Euclid's book i, as follows. Let ABC and A'B'C' be a pair of congruent triangles and let D be an arbitrary point in the plane. There is a unique point D' such that the distances AD, BD, CD equal AD', BD', CD' respectively. Thus the natural correspondence $T(A) = A'$, $T(B) = B'$, $T(C) = C'$ can be extended to a transformation of the entire plane: to each point D one simply associates the appropriate D'. The totality of all these transformations for all choices of a pair of congruent triangles constitutes the Euclidean group of isometries (distance-preserving transformations); let us call this G.

In the light of Euclid's fourth postulate (see L. W. Young, *Fundamental Concepts of Algebra and Geometry*, 1911, for a discussion of Euclid's geometry) that all right angles are equal, one sees that an ordered pair of perpendicular lines L_1, L_2 can be carried by an isometry into any other such pair. This corresponds to choosing reference axes in the plane, and is the first step in introducing rectangular co-ordinates.

It is instructive to see how other postulates of Euclid are related to properties of G and its subgroups. The third postulate, that to each pair of points A,B there is a circle with centre A passing through B, expresses the fact that stability groups G_A have circle orbits $G_A(B)$. The first and second postulates, covering the existence and uniqueness and extendibility of a line segment AB, express the fact that for each A,B there is in G a unique subgroup which is a line-translation group and for which A and B are on the same orbit.

The fifth and last, the "parallel" postulate, expresses the fact that for each of these line groups in G, the family of orbits is a system of parallel lines. The set of all elements on all of these line groups forms a commutative subgroup of G, called the translation group. It is the existence of this commutative, simply transitive subgroup which distinguishes Euclidean geometry from all other metric geometries and lends it a much simpler structure. This is also the group that. in applications to physics. gives rise to the "parallelogram law" of the addition of vectors.

Examples of Transformation Groups.— I. The affine group in the plane carries parallel lines to parallels but may distort shape (of triangles, for example) and size. To describe it, let x,y denote co-ordinates in the plane. Each transformation T is identified by six parameters (a,b,c,d,e,f) subject only to the condition (ad $-$ bc) not zero, to ensure that T^{-1} exists. T can be represented by

$$T: \begin{array}{l} \bar{x} = ax + by + e \\ \bar{y} = cx + dy + f \end{array}$$

Here x,y are co-ordinates of A; $\bar{x},\bar{y}$ are co-ordinates of A'; and $T(A) = A'$.

2. There is a corresponding affine group in n-dimensions whose elements depend on $n^2 + n$ parameters (also called co-ordinates).

3. The equiaffine plane group, with ad $-$ bc $= 1$, preserves area of triangles but alters shape.

4. If one regards T, above, as a substitution (transformation of co-ordinates) then one can find the Euclidean group as a subgroup of the affine by the requirement that the distance formula be left "invariant"; *i.e.,* $\sqrt{(\bar{x}_1 - \bar{x}_2)^2 + (\bar{y}_1 - \bar{y}_2)^2}$ goes over to $\sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$.

5. The group of homeomorphisms of a metric space M is defined as follows. An infinite sequence of points A_0, A_1, A_2, A„ . . . , is called fundamental if the distances $A_0A_1, A_0A_2, A_0A_3, \ldots$, grow smaller approaching zero. A transformation T is called topological if T and T^{-1} preserve fundamental sequences; T is also called a homeomorphism. The totality of these T constitutes the group.

6. In every metric space one can define the group of isometries, but in general this group will be trivial; *i.e.,* reducing to the identity.

7. Two metrics on a space M are said to be topologically equivalent if every sequence which is fundamental in one metric is also fundamental in the other. Thus the Bolpai-Lobachevski and the Euclidean metrics on the plane are topologically equivalent. However, the two groups of isometries are very different.

A Theorem of **Hilbert.**—A topological transformation of the plane distorts linearity; nonetheless the images of all lines and circles under a fixed transformation of this kind form a system of point sets (called open curves and closed curves, respectively) which can be interpreted as the new lines and circles of an abstract geometry in the plane. This system satisfies all the postulates of Euclid's geometry.

In 1903 Hilbert proved a theorem equivalent to the following. Hypotheses. (1) we are given the plane and a metric which is only topologically equivalent to the Euclidean metric: (2) in this new metric the group of isometries G is transitive; (3) the orbits G_A(B) are infinite sets (*i.e.,* not finite). Conclusions: (1) it is possible to define straight lines, circles, angles, etc., in terms of the subgroups of G; and (2) one obtains either the Euclidean or the Bolyai-Lobachevski geometry and nothing else.

Modern Developments.— In the early 1950s, as the culmination of work by A. M. Gleason. K. Iwasawa, D Montgomery, H. Yamabe and others on topological grounds and that of H. Busemann, H. Freudenthal, J. Tits, H. C. Wang and others on the geometry of transformation groups, the theorm of Hilbert was extended and generalized in many ways. The following theorem is most quotable, and in its way definitive.

Hypotheses: M is an abstractly given metric space which is locally compact and connected and the group G of isometries has this property: if the distances between points A,B,C equal corresponding distances between A',B',C' then the two triples are congruent under some element of G.

Conclusions: M is a manifold on which one can define lines, angles and circles, giving rise to one of the four types of metric geometries, and G is the group appropriate to that geometry.

A remarkable feature of this theorem is the following: each type of geometry has a representative in each dimension n, from n = 2 upward, so that the theorem is about a fourfold infinity of geometries. To distinguish a particular one from among the others, it is merely necessary to choose the desired dimension and type.

GROUPS AND ALGEBRAS, REPRESENTATIONS OF.

Since their formal introduction in the early 19th century, groups have been one of the principal objects of mathematical attention. Their widespread and profound applications to such physical subjects as crystallography, quantum mechanics and hydrodynamics and to such other mathematical regimes as number theory, harmonic analysis and geometry have demonstrated their importance.

The main general technique for studying groups is the method of "group representation." Technically, a representation of a group is a homomorphism of it into another group. most commonly, into the group of invertible linear transformations (or matrices) on some linear space. Less technically, this method amounts to comparing the given group with better known examples of groups. Representation theory plays a significant part in all branches of mathematics in various ways; it also is important in theoretical physics, particularly in quantum theory.

To sketch briefly, a group is a set on which a multiplication satisfying certain specific properties is defined. Corresponding to each pair of elements a, b (in a given order) is another element (written ab) and this law of combination has the properties: (1) $a(bc) = (ab)c$; (2) there is an element e, called the group identity element, such that ae = ea = a; and (3) for each a there is an element a^{-1} called the inverse of a such that $aa^{-1} = a^{-1}a =$ e. If in addition ab = ba for each a and b, the group is said to be abelian (also commutative). A homomorphism is a mapping (function, correspondence) f of one group G into another group H such that $f(ab) = f(a)f(b)$ for each a and b in G; i e., f "preserves" multiplication. The positive and negative integers with their usual addition provide an example of an infinite abelian group (here, addition plays the role of group multiplicatian, 0 is the group identity and, for example, -5 is the group inverse to 5). The two integers 0 and 1 with the usual addition as group multiplication (except that 1 is to combine with 1 to give 0) provide an example of a finite abelian group. as does the set of two integers $+1$ and -1 with the usual multiplication of integers. The mapping of an integer into 0 if it is even and into 1 if it is odd provides an example of a homomorphism of the group of integers onto the first two-element group. The function which assigns 0 to $+1$ and 1 to -1 is an example of an isomorphism (*i.e.,* one-to-one homomorphism) of the second two-element group onto the first. Structurally (as far as group theoretical properties are concerned). the existence of this isomorphism indicates that both two-element groups are the same—they are different (isomorphic) representations of the same abstract group. so to speak.

The process of group representation may be likened to measuring some physical object aith a ruler. By comparing the object to be studied with the knoun object (the ruler), special information is obtained. Spreading the object out completely along the ruler might be thought of as an isomorphic representation; but such a procedure may not be possible. For example, a polyhedron would have to be studied by applying a series of partial measurements and combining them (corresponding to combining information from homomorphic representations). It would be hoped that sufficiently many measurements could be made to give detailed information—corresponding to the case of sufficiently many (a separating family of) representations so that each pair of distinct elements is carried into a pair of distinct elements by at least one of the representations. An instance of "combining" information is afforded by the simple fact that a group which has a separating family of representations in abelian groups is itself abelian (ab and ba are identified by all such representations). It would help little to make measurements with an unmarked straightedge; and in the same way, the representations would be expected to take place in groups with some discernible structure. On the other hand, if the ruler is too specialized, for example, circular, it is available for only a limited type of measurement; and, by analogy. the class of groups in which the representations take place should remain broad enough to have general application. The so-called linear groups, groups of invertible linear transformations on a linear vector space, are well suited to this task. Representations in such groups often are referred to as "linear" representations, or simply as representations if confusion is unlikely. In particular, representations by unitary operators on Hilbert spaces, called unitary representations, and representations by operators on finite-dimensional linear spaces, called finite-dimensional representations, have proved very useful.

In applying the technique of representations to the study of groups, the allied method of associating an algebra, the so-called group algebra, with the group has a key function. (An algebra is a linear space with a multiplication satisfying certain specific conditions; see ALGEBRAS [LINEAR]). For finite groups and the complex group algebra, this amounts to associating with the group sums of formal complex multiples of the group elements and multiplying two such sums by distributing products in the usual may, "commuting" numbers past group elements and multiplying group elements by means of the group multiplication.

A linear representation of the group can be extended to the group algebra by assigning to each sum of multiples of group elements the same sum of multiples of the operators (matrices) corresponding to those group elements under the given representation. This extension is a representation of the group algebra (a mapping into the algebra of operators on the "representation space" which preserves both products and sums). The analysis of the algebra representation is somewhat simpler than that of the group representation and yields much information about the group representation. The process of extension can be reversed. for the group elements are found in a natural way among those of the group algebra; *i.e.,* a representation of the group algebra gives rise to a representation of the group.

There are several ways of constructing new representations from one or more given representations. The first, restriction of a representation, starts with a representation f of a group G (or algebra) and a subspace V of the representation space which is mapped into itself by each of the representing operators (a so-called reducing or invariant subspace). The restricted representation assigns to each g in G, the operator $f_V(g)$ on V which is f(gj restricted (in its action) to V. If V is not 0 or the full space, the representation f is said to be reducible. If no such "proper" invariant subspace exists, the representation is said to be irreducible. (In the case of representations on Hilbert spaces, "subspace" is understood to mean "closed subspace.") Representations of finite groups enjoy the important property of complete reducibility. If V is a reducing subspace, there is a complementary space V' which is also invariant (V and V' have only 0 in common and each vector in the representation space is the sum of one from V and one from V').

The representation f is said to be the direct sum of f_V and $f_{V'}$. This description of direct sum from an internal viewpoint has an external counterpart. If f and f' are representations of G on spaces V and V', respectively, a representation f $\oplus$ f', called the direct sum of f and f', on the direct sum V $\oplus$ V' of V and V' (*i.e.,* the linear space of pairs of elements, one from V and one from V') is defined by assigning to each group element g the operator on $V \oplus$ V' which transforms a pair (v,v') into the pair $([f(g)](v),[f'(g)](v'))$. In the case of reducing complementary spaces V and V' for a representation f, it is an easy matter to see that $f_V \oplus f_{V'}$ is f when the full space is viewed as V $\oplus$ V'. In a similar manner, direct sums of more than two representations can be defined. For finite groups, the process of decomposition of a representation may be continued on each of the restricted representations until a full reduction into irreducible representations is effected (the representation is a direct sum of irreducible representations and such a decomposition is unique).

A more complicated procedure for constructing representations from families of representations, the tensor product, stems from the tensor product of linear spaces (the space of sums of multiples of formal products of basis elements one from each space in a given order—the dimension is the product of the dimensions of the individual spaces as contrasted with that of the direct sum which is the sum of the dimensions). If f and f' are representations of G on spaces V and V', respectively, then f $\otimes f'$, their tensor product, assigns to each g in G the operator $f(g) \otimes f'(g)$ which transforms one of the generating elements $v \otimes v'$ of the tensor product $V \otimes V'$ of V and V' into $[f(g)](v) \otimes [f'(g)](v')$. In particular, the square of a representation consists of tensoring it with itself (similarly for higher powers).

A problem of some importance and difficulty is that of describing the irreducible representations which appear in the decomposition of the higher powers of irreducible representations of specific groups (these higher powers are not themselves irreducible, in general). Of course, the basic problem of the theory is the description of the irreducible representations of specific groups, for these are the basic representations not only of the general theory but of the fundamental physical situation to which the theory applies. Speaking of the possible occurrence of a representation which is reducible in the description of a general scheme for quantum mechanics. H. Weyl, one of the founders of modern representation theory, wrote, "Nature could hardly be expected to indulge in such a superfluous luxury."

In dealing with representations of a given group, there is clearly no additional information to be obtained by passing from one representation to a second whose space can be identified with that of the first in such a way that the operators corresponding to each group element under both representations act in the same way on the spaces (relative to the identification). In this case, the representations are said to be equivalent. (Technically, if f and f' are the equivalent representations of G on spaces V and V', there is a linear isomorphism P of V onto V' such that $Pf(g)P^{-1} = f'(g)$ for each g in G.) When a representation f of a group is expressed as the direct sum of irreducible representations and precisely n of these are equivalent to a given irreducible representation f', then f' is said to "occur in f with multiplicity n." If the group G has m elements the set of complex-valued functions on G is a linear space of dimension m (addition and scalar multiplication performed pointwise). A natural representation of G on this space is available—to the function a assign the function a, whose value at g is $a(g^{-1}g')$, and let f(g) be the transformation of the function space so defined. Then f is a representation of G (called the "left regular" representation of G). In a similar manner, there is the "reflected" situation of the right regular representation of G. The crucial property of the regular representations is that each contains every irreducible representation of G in its direct sum decomposition (with multiplicity equal to the dimension of the representation space—as a consequence of the reflection situation of the right and left regular representations). The regular representation is an isomorphic one! from which one concludes that the group G has a separating family of irreducible representations. If f is a representation of the finite group G as operators on a Hilbert space, then the function which assigns to a pair of vectors x,y in the space the number $\sum_g (f(g)x, f(g)y)$ is again an inner product equivalent to the original one and relative to which each $f(g)$ is a unitary operator (orthogonal transformation, in the real case), so that each such representation of G is equivalent to a unitary representation of G. If f and f' are a pair of inequivalent (irreducible) unitary representations of G, then

$$\sum_g (f(g)x,y)(f'(g^{-1})x',y') = 0,$$

where x,y and x',y' are orthonormal pairs of vectors in their respective spaces (the same holds when $f' =$ f and x',y',x,y is an orthonormal set such that not both $x =$ x' and $y =$ y'); while $\sum_g |(f(g)x,y)|^2 =$ the number of elements in G (called the order of G) divided by the dimension of the representation. These are the so-called orthogonality relations. The sum of the diagonal entries of the matrix corresponding to an operator on and a basis for some finite-dimensional space is called the trace of the operator. It is independent of the basis chosen. If f is a representation of the finite group G on a finite-dimensional space, the function which assigns to each element of G the trace of its representing operator is called the character of f. A critical result of the theory states that two such representations are equivalent if and only if their characters are identical—the study of such representations is reduced to the study of the characters of G. The character of a direct sum of representations is the sum of their characters and that of a tensor product is their product. The character of the n-dimensional "identity" representation (mhich assigns the identity operator on n-dimensional space to each grnup element) has the constant function n as its character, and that of the regular representation is 0 at each group element except the identity where it takes the value equal to the order of the group (this is easily checked on the basis consisting of functions which are 1 at some group element and 0 at all others). The characters of the irreducible representations are precisely those characters k such that $\sum_g |k(g)|^2$ is the order of G.

Schur's lemma, which states that the only operators that commute with a unitary irreducible representation are the scalar multiples of the identity operator, is a key result in the development of representation theory. (Since each representation of a finite group is equivalent to a unitary representation, Schur's lemma covers all such representations.) Applying this fact to abelian groups, it follows that each irreducible unitary representation of such a group is 1-dimensional—each group element is mapped into a complex multiple (having absolute value 1) of the identity operator. The function on the group which assigns to each element its corresponding complex number is the character of the representation. There is, of course, no need to distinguish between the representation and its character, in this situation. The complex conjugate of such a character is again a character as is the product of two such characters. With this multiplication, the characters form a group—the character or dual group (to the original group). If G is an abelian group and G' its dual, then each g in G gives rise to a character of G' which assigns to an element of G' its value at g. The duality theorem for abelian groups states that the mapping of G just described is an isomorphism of G onto the character group of G' (roughly speaking, G is the dual group of its dual group). A function a on G may be viewed as the element $\sum_g a(g)\cdot g$ in the group algebra of G; and each character g' of G has the extension to this group algebra which assigns to $\sum a(g)g$ the number $\sum a(g)g'(g)$. Denoting this number by $a'(g')$, the transformation which maps a onto a' is an isomorphism of the group algebra of G onto the function algebra of G' (the linear space of functions on G' with pointwise multiplication). For finite abelian groups, this function mapping is the counterpart of the Fourier transform, so important in mathematical analysis (see FOURIER SERIES).

The "symmetric group on n letters," S_n, is the set of all one-one transformations of n objects (letters) onto itself (*i.e.*, the set of all permutations or arrangements of the n objects) with iteration of transformations (or arrangements) as the group multiplication. Thus S_2 can be viewed as the permutations of the numbers 1, 2: one permutation (the identity) leaving 1 and 2 fixed and the other interchanging 1 and 2 (the square of this last is the identity). It follows that S_2 has 2 elements; S_3 has $1\cdot 2\cdot 3$ (= 6) elements, and quite generally, S , has $1\cdot 2 \ldots n$ ($= n!$) elements. The natural combinatorial character of the symmetric groups results in their dominance of representation theory for finite groups—wherever physical quantities exhibit combinatorial symmetries (*e.g.*, in the quantum mechanics of a system of several "identical" electrons) the symmetric groups make their appearance. Group-theoretically, their importance is obvious from the fact that each finite group is isomorphic with a subgroup of some symmetric group. In fact, if G has n elements, the mapping that assigns to each element g of G the permutation of the n elements of G effected by (left) multiplying each by g is an isomorphism of G with a subgroup of S_n. From the general theory, one sees that the study of the representations of S , can be carried out by a detailed analysis of its group algebra and, in particular, of the regular representation. For arbitrary finite groups. the number of inequivalent irreducible representation is the linear dimension of the centre of the group algebra (those elements of the group algebra which commute mith all others); and this is seen to be the number of distinct conjugate classes of group elements. (Two group elements a and b are "conjugate" if there is some group element g such that a $= gbg^{-1}$. A conjugate class in a group is the set of conjugates of some fixed element.) For symmetric groups each conjugate class can be associated mith a certain symmetry pattern. Each permutation on n letters permutes various disjoint subsets of the letters cyclically among themselves (*i.e.*, placing the letters of one subset along the rim of a wheel at equal intervals and in the proper order. the permutation affects these letters as would a rotation of the wheel carrying one into the next). Two permutations are conjugate precisely when the subsets of one can be matched with those of the other so that matching subsets have the same number of elements. Thus there are as many inequivalent irreducible representations of S_n as there are ways of expressing n as a sum of nonnegative integers (independent of order). The subsets corresponding to a partition of n constitute a particular symmetry pattern. Relative to these, a generalized process of symmetrization and alternation is defined which gives rise to special elements of the group algebra, the so-called Young symmetrizers, in terms of which the irreducible representation corresponding to the pattern can be described. If a particular pattern has $m_1, m_2, \ldots, m_k$ elements in the respective subsets (listed in decreasing order of size), the dimension of the space of the corresponding irreducible representation is the quotient of $s(n!)$ by (n,!) $(n_2!) \ldots (n_k!)$, where s is the product of all the differences n, $- n_h$ with h less than j and n, = m, + k $- j$. Applied to S_5, for example, these results assert the existence of seven inequivalent irreducible representations corresponding to the partitions 5, 4 + 1, 3 + 2, 3 + 1 + 1, 2 + 2 + 1, 2 + 1 + 1 + 1 and 1 + 1 + 1 + 1 + 1, with dimensions 1, 4, 5, 6, 5, 4 and 1, respectively. It is no accident that the sums of the squares of these dimensions (120) is the order of S_5—it is a consequence of the fact that the regular representation takes place on 120-dimensional space and each irreducible representation occurs in it with multiplicity equal to its dimension.

The applications of the theory of group representations to mathematical analysis and to physics entail. for the most part, the description of the representations of infinite groups which have a topological structure related to their group structure—the so-called topological groups. (The topological structure is a mathematical formulation of the concepts of "nearness." The topological groups are those in which nearness is so defined that the product of an element and the inverse of another element is near to the group identity provided both elements are themselves near the identity.) The most important and the most intensively studied of these groups are the Lie groups. These are the topological groups in which the topology near each point is like that of n-dimensional Euclidean space for some fixed n. A more general class of topological groups, the locally compact groups, have received some attention. These include the discrete groups (those in which no group element is "infinitely near" the others—every group can be given such a topology), the Lie groups, and those which can be constructed from these two classes by certain group-theoretic processes. The various Euclidean spaces mith vector addition as group multiplication and the complex numbers of modulus 1 (the circle group) with the usual multiplication of complex numbers each with its usual notion of nearness are examples of abelian Lie groups. The invertible operators on n-dimensional Euclidean space, with nearness described in terms of nearness of the images of a specific vector and group multiplication the multiplication of operators, is an example of a nonabelian Lie group (the general linear group of dimension n).

The crucial property of locally compact groups is the existence of a measure on them, Haar measure (a notion of "volume" for subsets), which assigns the same number (measure) to a subset of the group and to the subset obtained from it by left multiplying each element of the subset by a fixed group element (each "left translate" of the set). Those groups with finite total measure constitute an especially important subclass, the compact groups. The circle group and the subgroup of the general linear group consisting of those operators which preserve the lengths of vectors, the orthogonal group (unitary group in the complex case), are examples of compact Lie groups. The finite groups are compact (discrete) groups.

Several different possibilities for group algebras and regular representations present themselves in the case of locally compact groups, each shedding some light on the representation theory of these groups. The set of finite sums of complex multiples of group elements is a direct generalization of the group algebra for a finite group, but it takes no account of the group topology. The integrable functions on the group with multiplication like that in the finite case (each function thought of as the sum of the products of each group element by the function value at that group element) except that integration replaces ordinary summation is an effective generalization which respects the group topology. (This group algebra is the L_1 group algebra and its multiplication is convolution multiplication of functions.) The space of square integrable functions on G (*i.e.*, $L_2(G)$) is a Hilbert space which is available for the various regular representations. Assign to each group element the operator which left translates an L_2 function by g^{-1} (as in the finite group case). This operator is unitary, and the algebra of finite sums of multiples of these operators is the (left) regular representation of the "finite" group algebra. "Convolving" an L_1 function with L_2 functions associates a bounded operator on $L_2(G)$ with the given L_1 function. This association is the (left) regular representation of the L_1 group algebra of G. The algebra of operators so obtained is not closed in the various relevant topologies on the set of bounded operators, and the various closures of this algebra are reasonable candidates for a group algebra (in particular, the uniform and the weak closures are of special interest). It is not to be expected that a general unitary representation of G can be "extended" to the L_1 group algebra (an essentially topological construct) without some further topological restriction. The unitary representations which appear in practice are the "strongly continuous" representations—those which represent elements near the group identity by unitary operators (strongly) near the identity operator (equivalently: "weakly continuous" and "measurable" unitary representations), and these representations are so extendible to the L_1 group algebra. They are often but not always extendible to the uniform closure of this group algebra (in its regular representation on $L_2(G)$); and the question of just when they can be so extended is related to some of the most delicate problems of mathematical analysis. They are rarely extendible to the weakly closed group algebra (*i.e.*, to the weak closure of the regular representation of the L_1 group algebra).

The most satisfactory aspects of this general theory are to be found in its application to the classes of compact groups and of abelian (locally compact) groups. The theory of representations developed for finite groups is valid for continuous representations of compact groups on Hilbert spaces, once summation over the finite group (divided by the group order) is replaced by integration with respect to Haar measure (normalized so that the group has measure 1). The equivalence of such representations with unitary ones, the character theory, direct sum decomposition into irreducible representations, the orthogonality relations and the existence of a separating family of (finite-dimensional) irreducible unitary representations are valid for compact groups. The critical new fact which must be established in the general case is the finite dimensionality of each irreducible representation. The duality theory for finite abelian groups carries over intact to the general case. The dual (character) group of a compact abelian group is discrete (and that of a discrete group is compact). In particular, the character group of the circle is the additive group of integers—the correspondence between (L_2) functions on the circle and those on the integers (described for finite abelian groups) is the Fourier series expansion of periodic functions. The additive group of real numbers (*i.e.*, 1-dimensional Euclidean space) is its own dual and the function mapping, in this case, is the important Fourier transform.

A foreshadowing of the complexities of the theory of representations for more general locally compact groups is afforded by the decomposition problem for reducible representations of abelian groups which are locally compact but not compact. Here a direct sum decomposition into irreducible representations (*i.e.*, characters) is not always possible as such. Rather, a direct integral decomposition, which bears the same relation to a direct sum decomposition as integration does to summation (ordinary addition), replaces the direct sum decomposition.

The representations of the 3-dimensional rotation group, R_3, supply an excellent and physically significant illustration of the theory for compact groups. The group R_3 consists of linear transformations of (real) 3-dimensional space which preserve the lengths of vectors and have determinant 1. The rotations preserve area on the unit sphere about the origin (best described in terms of 3-dimensional polar co-ordinates), so that each such rotation induces a unitary transformation on the Hilbert space of square integrable functions over the sphere. The resulting unitary representation decomposes into a direct sum of irreducible, finite-dimensional unitary representations. From a direct analytical study this representation can be shown to decompose into a direct sum of spaces of odd dimension, one for each odd number. This decomposition is effected by means of the spherical harmonic functions on 3-space and their associated surface harmonics on the sphere. The orthogonality relations for the surface harmonics establish the fact that this decomposition yields all the irreducible representations of R,.

For general locally compact groups it is still possible to establish the existence of a separating family of strongly continuous irreducible unitary representations, and it is still possible to decompose reducible representations into a direct integral of irreducible representations; but much of the value of this fact is lost in the observation that the decomposition can often be performed in many totally distinct ways (*i.e.*, so that no irreducible component of one decomposition is equivalent to any component of the others). These developments have given rise to the opinion that the appropriate process is not decomposition into irreducible representations but rather into factor representations. (A unitary representation is said to be a factor representation when the weak closure of the sums of multiples of the representing unitary operators has only multiples of the identity operator in its centre. Such an algebra of operators is said to be a factor.) The factors have been broadly classified into types depending on the nature of a dimension function on the projections in the factor (its discreteness or nondiscreteness, its finiteness or infiniteness). The so-called factors of type I are the most manageable type, from the point of view of group representations. These are the factors isomorphic with the algebra of all bounded operators on some Hilbert space. The (direct integral) decomposition of a group representation into factor representations is essentially unique. When the resulting factors are of type I the decomposition of the representation into irreducible components is also essentially unique. The problem of the types of factor representations a specific group has (the so-called type problem) is central to the general theory. In particular, establishing that specific class of groups have only type I representations is of vital importance to the general theory.

The detailed investigation of a Lie group and its representations proceeds via the study of its associated Lie algebra. If the Lie group with its associated topology is thought of as a surface in 3-dimensional space (or, more generally, a manifold in n-dimensional space) each vector in the tangent plane (space) at the group identity determines a unique vector at each group element by means of (left) translation by that group element. Relative to (*i.e.,* in the direction of) the invariant vector field so obtained, (differentiable) functions can be differentiated to give another function on the group. If two such vector fields are involved, differentiation is performed with respect to each successively in both orders, and the result of one is subtracted from that of the other, the mapping on functions obtained by this process is the same as that due to differentiation with respect to some third invariant vector field. This third vector field is said to be the Lie product or bracket of the other two. These vector fields, or—what amounts to the same thing since each is determined by a tangent vector at the group identity e—the tangent space at e, with the Lie product is the Lie algebra of the group (it is a nonassociative algebra). Since differentiation is a local process. depending only on the points near a point at which it takes place, the Lie algebra of a group is in reality a construct associated only with that portion of the group near the identity—the so-called local Lie group. Several Lie groups which are distinct "globally" may have the same local structure and hence the same Lie algebra (*e.g.,* the circle group and the group of real numbers both have the real line with the Lie product of each pair of elements 0 as their Lie algebra). The distinction between Lie groups which have the same Lie algebra is a (global) topological one. Loosely speaking they differ in the number and relation of the "holes" in them. A particular one of them "covers" the other; *i.e.,* maps homomorphically onto the other by a mapping which is an isomorphism near the identity. For example. the circle has a hole, the real line does not, and the real line may be "wrapped" homomorphically around the circle. In the family of Lie groups with a given Lie algebra there is one which covers all the others—the so-called universal covering group of the others (also called simply connected covering group—the one which has no holes). The group of reals is the universal covering group of the circle. The rotation groups in dimensions 3 and higher are not themselves simply connected, but have a twofold universal covering group (*i.e.,* each point in the rotation group is the image of precisely two points in this covering group). These are the "spinor groups" (Spin(n) for the n-dimensional rotation group R,).

The Lie algebra of a Lie group may be thought of as a linear approximation to the local Lie group in the same sense that a tangent plane to a surface is the best planar approximation in the neighbourhood of the point of tangency. The multiplicative nature of the local group is made linear (additive) by the transition to the Lie algebra in much the same way that the logarithm converts multiplicative numerical problems into additive ones. In fact, there is a generalized logarithmic mapping (which preserves differentiability) carrying the local Lie group onto a neighbourhood of the origin in the Lie algebra—or, technically more manageable, an exponential mapping of the entire Lie algebra into the group. By means of this mapping (local) questions about the group can be transferred to questions about the Lie algebra (which are more easily handled because of the added linearity). A (differentiable) homomorphism f of a Lie group G into another H induces a mapping of the functions on H into those on G and consequently of the differentiations with respect to invariant vector fields on G into those on H; *i.e.,* f gives rise to a mapping df of the Lie algebra h of H into the Lie algebra g of G. The mapping df is a homomorphism of g into h; *i* e., a linear mapping which preserves the Lie product. Conversely, a Lie algebra homomorphism stems from a homomorphism of the local Lie group which may or may not be extendible to the full group. It is always extendible if the first group is simply connected. Applied to finite-dimensional representations of G (*i.e*, a homomorphism of G into the n-dimensional general linear group) this process yields a representation of g; for the Lie algebra of the general linear group can be viewed as the set of all n-dimensional operators nith the Lie product of two operators A and B as AB — BA. The n-dimensional rotation group (and so Spin(n)) have the skew-symmetric operators of trace 0 (with the same Lie product) as its Lie algebra, r. The study of the representations of r uncovers the existence of a representation corresponding to one of the local group which cannot be extended to all of R,. The "spin" representation of Spin(n) can be effected in terms of a construct known as the Clifford algebra. In the physically important case of R,, Spin(3) can be identified as the group of 2-dimensional unitary operators with determinant 1 and also as the group of unit quaternions; the representation theory, in this case, is related to the physical phenomena associated with electron spin.

The deeper analysis of the representation theory for Lie groups whose finite-dimensional representations are completely reducible (the semisimple Lie groups) involves a profound analysis of the semisimple Lie algebras and the so-called theory of weights associated nith their representations. It has been established for such groups that their unitary representations on Hilbert spaces are of type I.

Historical Development.—The general representation theory for finite groups was developed by G. Frobenius, I. Schur and W. Burnside at the end of the 19th and the beginning of the 20th century. Nothing of the deeper theory of finite groups developed by such later workers as E. Artin and R. Brauer has been discussed here. The extension of the finite group theory to compact groups is due in part to Schur. who developed the representation theory of the rotation group in those terms. The general extension to compact groups of the completeness and orthogonality of the finite-dimensional irreducible unitary representations is known as the Peter-Weyl theorem (published in 1927). Lie groups are named after M. Sophus Lie, who discovered their fundamental properties in the last decades of the 19th century. A deeper analysis of their properties and, in particular, the classification of the semisimple groups was carried out by E. Cartan in the early part of the 20th century. The general finite-dimensional representation theory for semisimple Lie groups was developed principally by Weyl in the mid-1920s as were the connections between group theory and quantum mechanics. The general representation theory for topological groups started with the discovery by A. Haar in the early 1930s of an invariant measure on locally compact groups. The existence of a separating family of irreducible unitary representations for locally compact groups was established by I. Gelfand and D. Raikov in the early 1940s. The decomposition of unitary representations of locally compact groups into irreducible and factor unitary representations was carried out by F. Mautner at the end of the 1940s. This decomposition was based on the powerful theory of operator algebras developed by J. von Neumann in collaboration with F. Murray in the 1930s and early 1940s. In particular, the theory of factors is their creation. A general duality and function transform theory based on the Murray-Von Neumann operator algebras was developed by I. Segal in the early 1950s. G. Mackey created a forceful technique for the analysis of representations of groups with type I representations by generalizing the Frobenius theory of induced representations. The detailed analysis of the infinite-dimensional representations of the semisimple Lie groups is the work of Gelfand, M. Neumark and Harish Chandra (carried out in the late 1940s and throughout the 1950s). The fact that these groups have type I representations is a consequence of Harish Chandra's results. J. Dixmier established this same fact for the so-called nilpotent Lie groups. Examples of Lie groups with representations not of type I are known. See also FIELDS; GROUPS; GROUPS, CONTINUOUS; GROUPS, TRANSFORMATION; ALGEBRAS (LINEAR); MATRIX; TOPOLOGY. ALGEBRAIC.

GROUP THEATRE, New York, was founded in 1931 for the purpose of establishing a permanent company of stage craftsmen under a unified policy in the choice of plays and in production. The group preferred plays it considered relevant to the American social scene. The technique of acting employed emphasized personal as well as artistic truth—a technique derived from the so-called Stanislavski method.

(See STANISLAVSKI.)

The three director-founders of the organization were Harold Clurman (sole director after 1937), previously an actor, stage manager and playreader for the Theatre Guild; Cheryl Crawford, who had been the Theatre Guild's casting director; and Lee Strasberg, an actor and occasional director of amateur productions at a New York city settlement house.

The Group Theatre's first two productions, Paul Green's *The Hozcse* of *Connelly* and *1931*— by Claire and Paul Sifton, were produced under the auspices of the Theatre Guild. Subsequent productions, 25 in all, were presented independently and financed piecemeal, the latter condition being the cause for the final breakdown of the enterprise.

Though the first plays were critically acclaimed for the quality of their performances, financial success was not achieved until 1933 with the presentation of Sidney Kingsley's *Men in White*. Other outstanding plays produced by the Group Theatre were by Clifford Odets, a member of the actieg company from its inception — notably *Awake and Sing, Waiting for Lefty* and *Golden Boy*. *Johnny Johnson* by Paul Green, music by Kurt Weill, and *My Heart's in the Highlands* by William Saroyan were also presented.

The Group Theatre exercised a considerable influence on the American stage in three ways: (1) its acting and production methods became virtually standard after 1945; (2) its emphasis on social themes was characteristic of the period and helped foster new writing talent; and (3) its personnel came to occupy prominent places in the years following the Group's demise (1941). Harold Clurman, Elia Kazan and Robert Lewis were among the leading directors of the American theatre in the 1950s. Stella Adler (Studio). Sanford Meisner (Neighborhood Playhouse school) and Lee Strasberg (Actors' Studio) were outstanding teachers of acting.

GROUSE, many well-known game birds belonging to the family Tetraonidae, plump-bodied, fowllike birds with strong, feathered legs and mottled plumage, lacking the brilliant colours of the pheasants but well adapted for concealment. They are of medium to moderately large size; fly swiftly for short distances; feed on or near the ground on seeds. berries and young plant shoots; and nest on the ground. usually laying six to ten or more eggs. They are confined to the northern hemisphere, six genera being found only in Sorth America, four only in the old world, and one—the ptarmigans (Lagopus)—circumpolar in distribution. The white-tailed ptarmigan (L. *leucurus*) is found in the mountains of western North America, while the willow ptarmigan (L. *lagopus*) and rock ptarmigan (L *mutus*) are circumpolar in range. The willow and the rock ptarmigan are remarkable for their seasonal changes in plumage; pure white in the winter blending with the snow, brown and black in the spring and more finely and more narrowly marked with brown and black in the summer, blending with the vegetation of their nesting grounds.

A very popular woodland game bird of North America is the ruffed grouse *(Bonasa umbellus)*, so named because it has a ruff of large feathers on the sides and back of the neck which are elevated somewhat in display. The cock's performance consists of posing rather stiffly erect and rapidly beating his wings to and fro to make a loud drumming sound. The bird has a favourite log from which it drums repeatedly in the spring and early summer. In the winter the scales on the toes grow out laterally forming a fringe nhich has been described as "snowshoes" and which may assist the birds in walking about in the snow.

The grouse of the British Isles is the red grouse (L. *scoticus)*, one of the four species of ptarmigan.

Two species of capercaillies *(Tetrao)*, two species of black grouse (*Lyrurus*) and two species of hazel hens *(Tetrastes)* occur in Europe and Asia. In North America there are tno species of prairie chickens or pinnated grouse (*Tympanuchus*), the sharp-tailed grouse (*Pedioecetes phasianellus*) and the large sage hen (*Centrocercus urophasianus*). The Canada spruce grouse (*Canachites canadensis*) is a less wary bird. as is its smaller relative. Franklin's grouse (*Canachites franklini*), also known as the fool hen. The sharp-winged grouse (*Falcipennis falcipennis*) of northeastern Asia is rather like the Canada spruce grouse. The sooty

GROUSE LOCUST, an insect of the orthopterous family Tetrigidae, related to the true grasshoppers or Acrididae *(see* Grasshopper). Grouse locusts are small (seldom over an inch long), commonly brown, gray or moss green and often blotched or lined with whitish. They are usually abundant on moist soil or among dead leaves along the edges of ponds. but are also found in dry places. Unlike the true grasshoppers their forewings are reduced to small pads or are absent, the folded membranous hind wings being protectively covered by a pointed prolongation of the thoracic shield. Many species are dimorphic—one form short, with reduced hind wings, the other long, with functional hind wings. Sound-producing and hearing organs are absent. The family is world-wide, but is best represented in the tropics, where are found bizarre forms with humped backs, spines or high crests. In North America 27 forms occur; in Europe there are about 10, and only 2 in Great Britain. The inheritance of form and coloration in species of the genus *Paratettix* has been much studied by geneticists. Although grouse locusts are vegetarians, they are not economically important pests.

See also Locust.

(T. H. Hi.)

GROVE, FREDERICK PHILIP (1871?–1948**j**, outstanding Canadian novelist, was the first to write realistically about the pioneers of the Canadian west. Born in northeastern Europe of a Swedish father and Scottish mother, he spent much of his youth traveling in Europe with his mother. He was stranded in Toronto in 1892, while on a pleasure tour, by the sudden death and bankruptcy of his father. For the next 20 years he led the life of a hobo in the American and Canadian west. In 1912 he became a schoolteacher in Manitoba. where he lived until 1929. In that year he moved to Ontario, first to Ottawa and then to Simcoe. where he owned a farm and wrote his later novels. He died at Simcoe on Aug. 19. 1948. Soon after his arrival in Canada, Grove began to write his realistic novels of prairie life, but they remained in manuscript for a generation. It was not until 1922 that he found a publisher for his first book. *Over Prairie Trails,* a series of descriptive and narrative sketches. A similar book, *The Turn of the Year,* appeared in 1923. His first novel, *Settlers of the Marsh,* when it finally was published in 1925, caused a sensation by its frankness and realism. He subsequently published seven more novels, of which the best known are *A Search for America* (1927), *Our Daily Bread* (1928) and *The Yoke of Life* (1930); a book of essays, *It Needs to Be Said* (1929); and his autobiography. *In Search of Myself* (1946).

Grove's novels are somewhat stiff in style and clumsy in construction, but they live by virtue of the honesty of his vision. His pictures of prairie life (often bleak and sombre) bring out the rugged perseverance of the pioneers and have great documentary value.

See D. Pacey, *Frederick Philip Grove* (1945), *Creative Writing in Canada* (1952). (D. P.)

GROVE, SIR GEORGE (1820–1900), English writer on music, was born at Clapham on Aug. 13, 1820. In 1849 he became secretary to the Society of Arts. and in 1852 to the Crystal palace. In this capacity he threw all the weight of his influence into the task of promoting the best music of all schools in connection with the weekly and daily concerts at Sydenham, which had a long and honourable career under the direction of August Manns. Without Sir George Grove that eminent conductor would hardly have succeeded in doing what he did to encourage young composers and to educate the British public in music. Grove's analyses of the Beethoven symphonies, and the other works presented at the concerts, set the pattern of nhat such things should be; and it was as a result of these, and of the fact that he was editor of *Macmillan's Magazine* from 1868 to 1883, that the scheme of his famous *Dictionary of Music and Musicians,* published from 1878 to 1889 (2nd edition, edited by J. A. Fuller Maitland. 1904–07; 3rd ed., 1927 and 4th with supplement, 1940, both edited by H. C. Colles [1879–1943]), was conceived and executed. When the Royal College of Music was founded in 1882 he was appointed its first director, receiving knighthood. He died at Sydenham May 28, 1900

See C. L. Graves, *Life and Letters of Sir George Grove* (1904).

GROVE does not appear in any other Teutonic language, and the *New English Dictionary* can refer it to no Indo-European root; Skeat connects it with "grave," to cut, and makes the original meaning a glade cut through a wood, a small group of trees smaller than a wood. groning naturally or planted in particular shapes in a park, etc. Groves have been connected with religious worship from the earliest times. (*See* TREE CULTS.)

"Grove" mas used by the authors of the Authorized Version to translate two Hebrew words: (1) *'ēshel,* Gen. xxi. 33, 1 Sam. xxii, 6, rightly given in the Revised Version as "Tamarisk"; (2) *asherah* in many places in the Old Testament. The *asherah,* a wooden post erected at the Canaanitish places of worship, and by the altars of Yahweh, may have represented a tree.

GROWTH. Scope **and** Interrelations of the Growth Phenomenon. — There are many different yet closely interrelated categories of growth, including growth of individuals and growth of populations, growth of animals and growth of plants, growth of unicellular organisms and growth of multicellular organisms, growth by cell division into the same and into different kinds of cells and growth by cell enlargement.

The phenomenon of growth is basic and very complex; therefore, it is investigated by, and is of great interest to, many

Fig. 1. — (A) The rapid decline in range of accommodation of vision at age 10 years substantiates Minot's theory that the aging rate is most rapid in the earliest years. The lens continues growth but at a declining rate with consequent decline in the relative amount of young tissue with increasing age. (B) Duration of life is directly proportional to the length of time to reach mature sire; or inversely proportional to the speed of maturation (k in equation 2)

Fig. 2. — The growth curves of individuals and populations (including human populations) are similar in design. indeed, they can be made to coincide for most of the curve. All growth curves consist of a segment of increasing slope in early growth and a segment of decreasing slope in late growth, joined together at puberty in animals, flowering in plants and "coming of age" in populations

specialists. For instance, embryologists specialize in the study of the embryonic period of growth, and investigate the mechanisms that make the embryo grow as it does, and how to modify it. Cytologists and histologists study the structure and function of individual cells in growth, how growth occurs by cell division, cell enlargement, differentiation and so on. hlorphologists are concerned with problems of organization, with the way different kinds of cells are produced, assembled into different organs and developed into bodies of different shape or form.

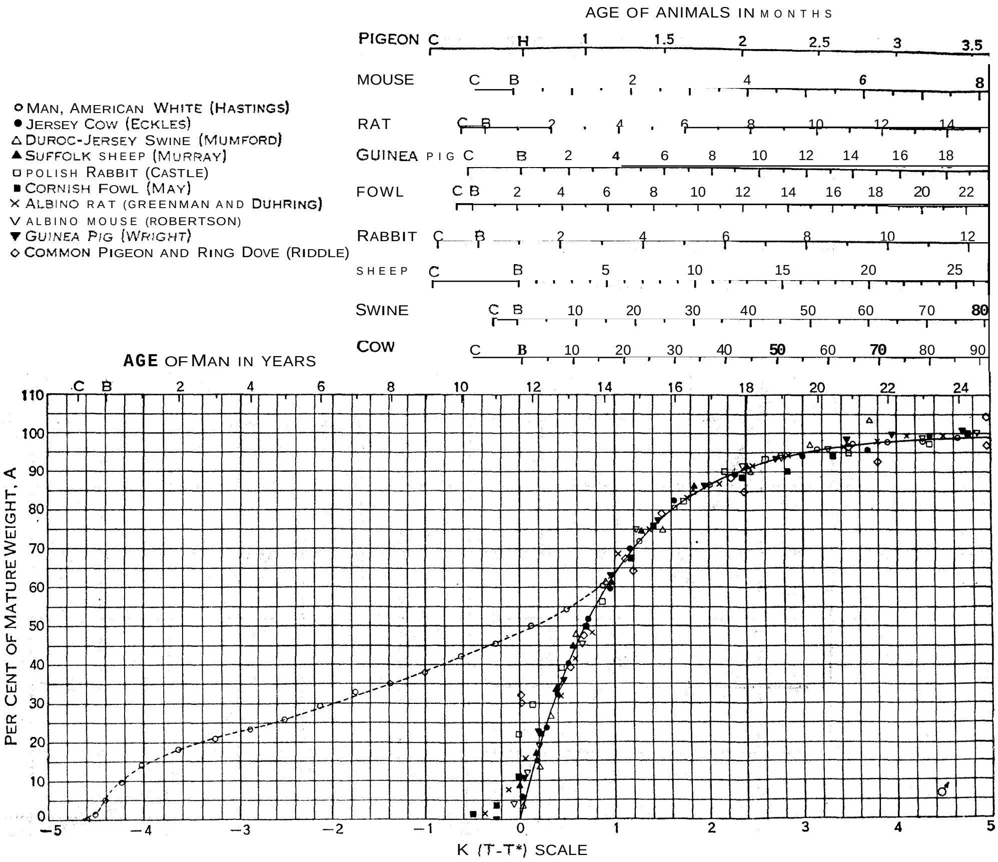
To the agriculturist, growth means efficient production of animals and plants to be used for food, shelter and work. To the educator and home economist, growth means promoting healthy development of children by good food and environment. To the cancer specialist, it means the study of the mechanisms whereby some cells flare up into a spurt of wild growth, overrunning, choking and finally killing the rest of the body. The cancer-growth specialist is also concerned with developing methods for the treatment of cancerous growth: Should it be surgical extirpation? Inactivation by radium or X-ray treatment? Changing the body chemistry by dietary and hormonal methods? The physician may be concerned with suppression of cancerous growths, with suppression of harmful bacteria, with stimulating growth of beneficial bacteria, with stimulating growth of stunted children or depressing growth of overfat or overgrown ones. The ecologist studies the rise and decline of populations and the mechanisms that actuate these rises and declines. Statesmen, military men and industrialists are interested in growth of the human population because they make long-range plans on the basis of predicted future population.

To the nutritionist, growth is a nutritional and metabolic process, and he analyzes foods and their fate and functions in the body, searches for unknown nutrients and investigates the influence of each nutrient individually and collectively on growth and metabolism. The endocrinologist likewise investigates the influence of hormones, individually and collectively, on metabolism and growth. The gerontologist views growth as the path to old age and to death, and death as the endpoint of all the antecedent events.

The student of reproduction and evolution views growth and maturation as preludes to reproduction, and reproduction as an evolutionary mechanism for replacing the aging and dying with new and possibly better individuals; for maintaining the social body young and crisp in spite of the aging and dying of its constituent members (*see* POPULATION ECOLOGY). Thus viewed, evolution is growth of the species (*see* EVOLUTION, ORGANIC) by a succession of growing, aging, reproducing, struggling, dying organisms, often overtaken by some catastrophe, analogous to the contemplated effects of atomic-bomb warfare.

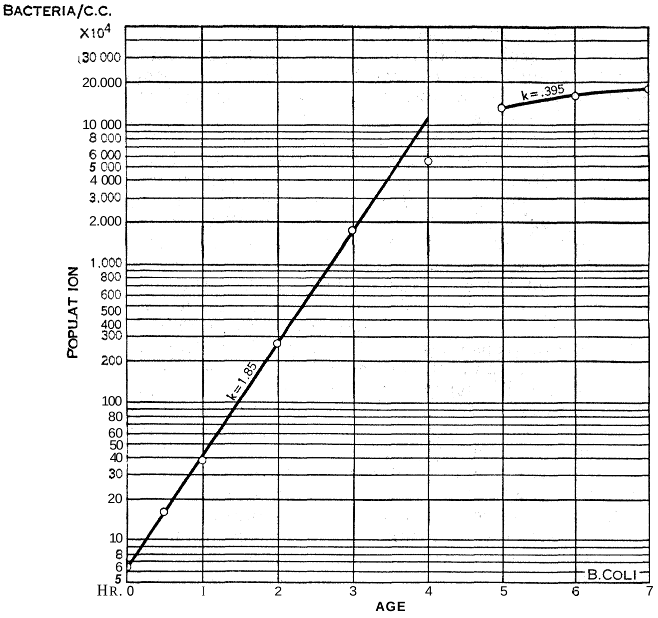
The frequency of such evolutionary catastrophes to species is demonstrated by the fact that of the 8,000 species of mammals that have been known to exist, about 4,000 have become extinct, often at the peak of their evolutionary glory, such as the extinction of the sabre-toothed tiger after it developed the most perfect sabre teeth, the extinction of the mastodon and mammoth after they developed the largest body size. These evolutionary illustrations on how success in evolution may lead to eventual failure suggest the idea that an important characteristic of many biological processes, including growth, is that success tends to develop the seeds of failure. Everything, including growth, seems pregnant with its contrary. For instance, growth develops a condition which may first retard growth in accordance with the law of diminishing returns, then finally stops it.

Growth is a transformation of one form of energy and matter into another. Living things are by definition transformers of



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 3. — With the exception of man, the growth curves of all species investigated are so much alike that they can be made to coincide. Man differs from other species in having a very long juvenile period (ages 3 to 13 years). In other species the termination of weaning almost coincides with sexual maturity, so they have little or no juvenile period



FROM BRODY. "BIOENERGETICS AND GROWTH,' (REINHOLD PUBLISHING CORP., 1945)

Fig. 4.—The growth curve of a bacterial population plotted on arithlog paper. The data for 3 hours are distributed about a straight line, indicating that growth during this time is exponential, or in geometric progression, or at compound interest rate; at the instantaneous rate or 185% per hour, the population is doubled in size every 0.4 hour. The inflection in the curve at 4 hours coincides with food limitation

energy and matter. Green and related coloured plants appropriate energy from the sun and matter from the air and soil, transforming the energy and matter into the energy-matter of plant tissue (*see* PHOTOCHEMISTRY); animals appropriate the energy-matter synthesized by the plant (or feed on animals that consumed plants), The student of transformation of energy and matter in living things investigates the expenses associated with growth processes, and with the division of the energy expenses between the cost of maintenance of the formed organisms and the cost of work of growth—the work or energy cost of transforming the energy in the form of light to the energy in the form of plant tissue, and the work of transforming the food energy that the animal eats into the tissue energy of the animal body (*see* NUTRITION). In brief. he is concerned with the efficiency of the growth process.

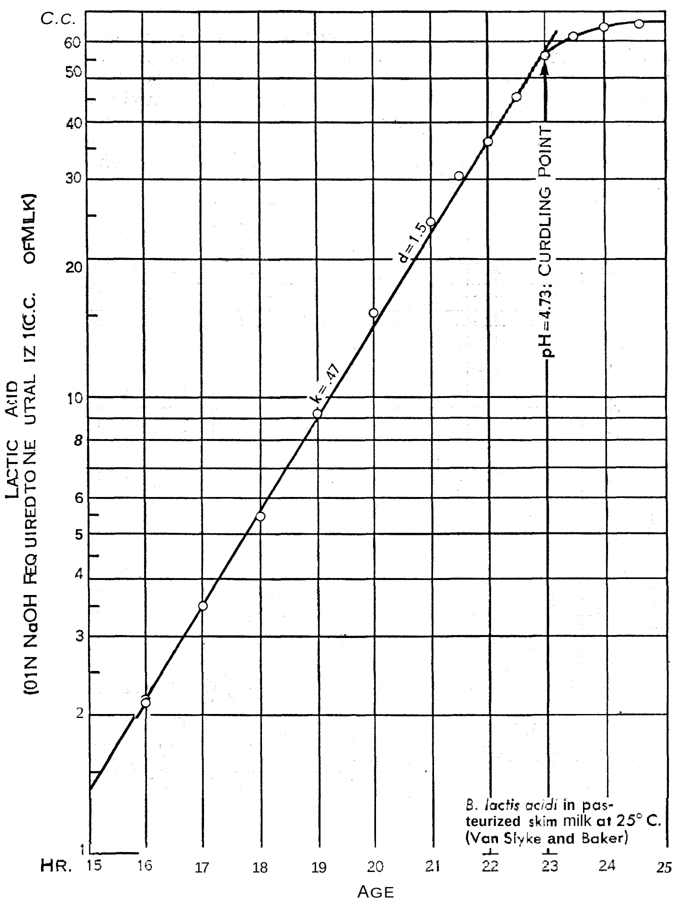
Growth is most spectacular in early embryonic life; one contemplates with amazement how a minute protoplasmic disc, as on the yolk of a bird's egg develops, for example, into a respectable chick within 21 days, containing billions of cells grouped into many different organs ranging from deeply sensitive brain and nerve to inert feathers (see VERTEBRATE EMBRYOLOGY). A reproductive cell of similar microscopic size—about 1/10 of one millimetre (1/250 in.) in diameter—may develop into whale, mouse or man, depending on its constitution; an egg of a given species may develop normally, or sometimes into a helpless monster (*q.v.*), often depending on the diet supplied to the mother. The potentialities of the tiny reproductive cells (*see* REPRODUCTION) are relatively much greater than of the tiny atomic bomb which now grips the world in terrified fascination. Indeed, the potentialities of the bomb were developed by the potentialities of the human egg.

Growth and Aging.—Growth is not confined to early life; on the contrary, it lasts as long as life. Life is growth, constant renewal. R. Schoenheimer and associates, employing isotopes of hydrogen and nitrogen as tracers, demonstrated about 1940 that living tissue—protoplasm (*q.v.*)—is forever exchanging some of its "building stones," such as amino acids. and taking in others from the food. The breaking-down or giving-up phase of life is *catabolism;* the building-up phase is *anabolism;* the combination of the two is *metabolism.* In early life, anabolism (growth) is predominant; in late life anabolism is recessive; aging is decrease in anabolism. There is perpetual renewal of the body, but at an ever decreasing rate, so that the proportion of young tissue in it declines with increasing age. The metabolic, especially anabolic, decline with advancing age is associated with the tendency for a deteriorating hardening of the vital structures.

In 1889 C. S. Minot suggested that "retardation of growth is old age and its cessation is death." Decline in growth—in renewal of body cells—in anabolism, leads to aging, to growing old, probably because the body tissues are colloids; and, like other colloids, they undergo with increasing time progressive dehydration, reduction in chemical reactivity and elasticity, that is, they increase in hardness. The loss of elasticity is reflected on the body surface by the appearance and feel of the skin and by the inability oi the eye to accommodate itself to near or far vision, necessitating the use of "reading glasses" by age 40 in the farsighted. The loss of elasticity of the eye, with increasing age, has been measured irom the age of ten years onward as shown in fig. 1a. The loss oi elasticity within the body is reflected by hardening of the arteries and related vital tissues! with consequent increasing frequency of death from heart and kidney failure. The aging rate is, as a rule, directly proportional to the maturation rate; that is, the sooner the cells "cease" multiplying, the sooner they get old (fig. 1b). The masimal duration oi liie is about five times the period taken to reach iull body size. For instance, the maximal duration of human life is about 100 years, which is about five times the period taken to reach iull body weight and height. There are, of course, individual and species variations in this respect.

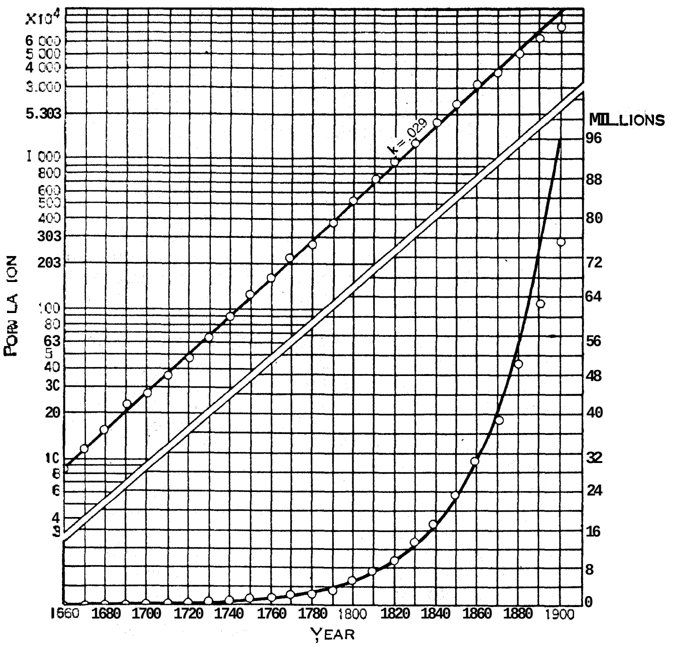
The nutritional relation between the rate of growth and the rate of aging, as measured by masimal longevity, was demonstrated by C. M. McCay and L. A. Maynard. They reported in 1941 that the maximum duration oi life in their rapidly maturing (richly-fed) male rats was 896 days and in their slowly maturing (underfed or starved) rats 1,02j days; in the rapidly maturing female rats 985 days and in the slowly maturing ones 1,320 days. These results do not imply that starvation of the young is desirable, because underfeeding also involves serious hazards; it does imply that the overieedine, leading to excessively rapid growth or fatness, is not desirable. Insurance companies are well aware of the lower expectation of life in overied adults. But, even in the young, excessive plumpness that mothers love so much in their children is not necessarily an indication of good nutrition.

Metamorphosis.—Growth continues from the time of conception



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

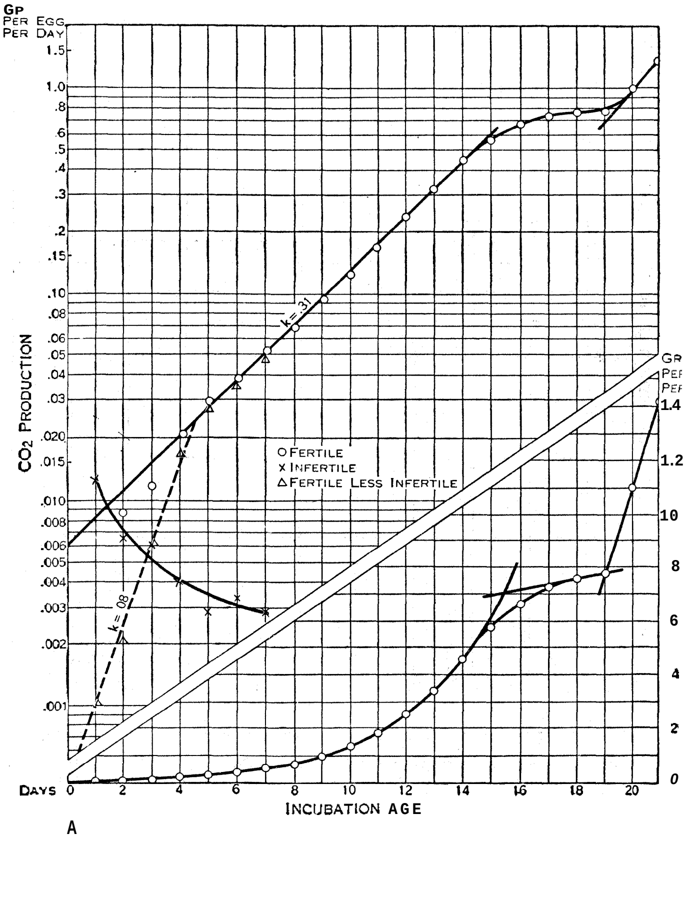
Fig. 5.—Increase in lactic-acid level in milk associated with the growth of milk-souring bacteria. Up to 23 hours growth occurred exponentially at 47% per hour, doubling its size every 1.5 hours. At 23 hours the accumulated acid curdled the milk and stopped the exponential type of growth



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 6.—The growth curve of the human population in the North American colonies and in the United States. The distribution of the data about a straight line of slope 0.029 indicates that the human population increased in geometric progression between 1660 and 1880 at the instantaneous compound interest rate of 2.9% per year, or doubled every 24 years. By 1880 the data points began to fall off from the straight line. The population "came of age" in 1880, and its present growth rate is rapidly declining in accordance with the sigmoid shape in Fig. 2. (The population increase in the United States was 17,000,000 during 1920-30, and only 8,000,000 during 1930-40)

to death. But, within this general continuity, there are many discontinuities. Individual organisms, and frequently populations of organisms. pass through metamorphosis-like critical periods. For instance, birth, the emergence into the outside world is an obvious shock, a critical period which many fail to survive; puberty, the advent of the reproductive function with its associated personality changes, is another obviously critical period. Prenatal growth curves show breaks



which may reflect similarly critical periods (see figs. 7 and 8). But the most dramatic critical periods are observed among insects when, for instance, the grub is transformed into a butterfly; and in amphibians, when the tadpole is transiormed into a frog. Such changes are called *metamorphosis*. Growth is, then, a continuous process but containing many discontinuities.

Regeneration.— It is possible to introduce critical growth periods or induce special kinds of growth experimentally. For instance, on removing a tadpole's tail, a new tail will grow out, in every way similar to the one removed. This is called regeneration. Regeneration occurs even if the animal is not supplied with food, when the tail grows at the expense of the building materials in the other parts of the body. The healing of wounds and recovery from starvation are other examples of regeneration. Some parts of the body, such as the outer layers of skin and the blood cells, die continuously and are made good by regenerative processes. Similar regenerative processes probably occur in other parts of the body, as illustrated by the results of Schoenheimer already noted. Growth (and life in general) is like a stream with rapidly changing water but fairly stable patterns of banks and whirlpools.

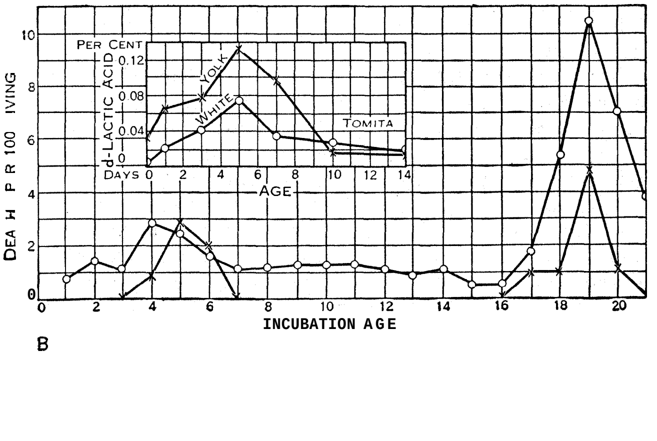
Definitions.— Growth is biological synthesis of living tissue, or protoplasm. Growth may be by cell enlargement (such as growth of nerve and muscle fibres), but it is mostly by cell division. Development is growth co-ordinated toward the production of the complete organism. Growth of tissue *in* vitro, of cancer, of teratomata, is without directive significance outside of self-multiplication; growth of an embryo is directive, developmental in the production of an organism in accordance with a predetermined design. The cells in a healthy embryo do not merely increase in number as cancer cells do, but they differentiate into different kinds of cells (liver cells, brain cells, etc.) forming different organs (liver, brain, etc.), and such differentiation occurs in an orderly fashion so as to produce a normal harmonious adult. The successive cleavages of the mother cells into the different kinds of daughter cells is differentiation, and the grouping of the cells into organs is *morphogenesis* and *organogenesis*. (See also DEVELOPMENT, ANIMAL.)

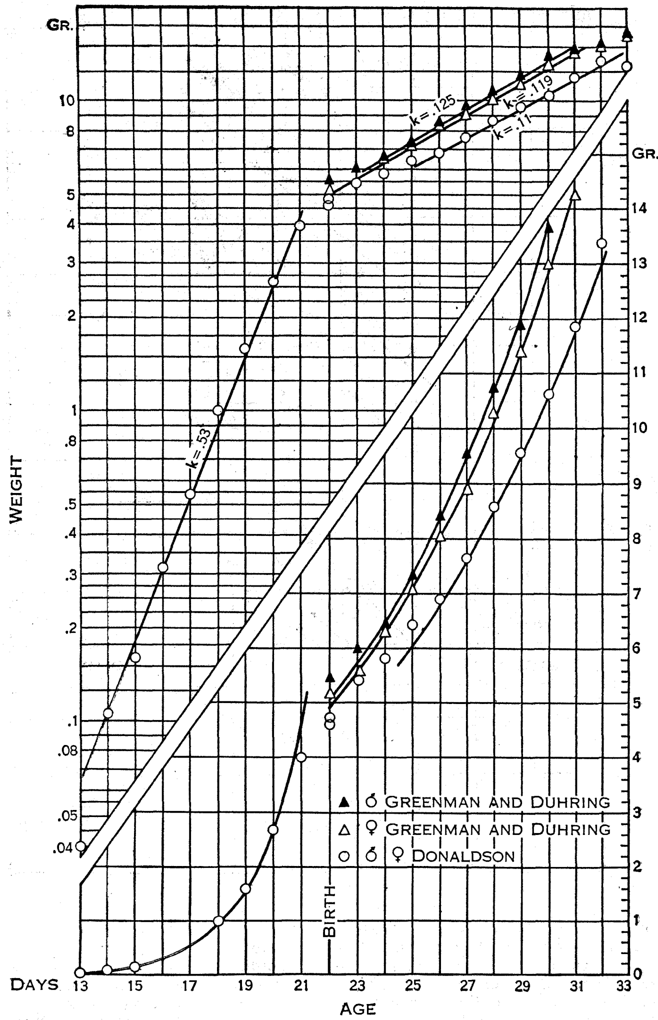
Anticipatory and Organismic Aspects.— One distinguishing feature characterizing normal developmental growth is its "purposiveness," "anticipation" of future needs not only of the individual but also of the species. For instance, the production and expulsion of the polar bodies by the egg prior to fertilization occurs as if it anticipated and prepared itself especially for the reception of the sperm to form the zygote (the first body cell which carries hereditary determiners or genes of both parents). A related example is that the plan for the development of the reproductive system is laid out anticipatingly in very early life, long before it is called upon to function reproductively in the evolutionary interest of the species; another example is that the mammary gland is developed in anticipation of the possible birth of an infant long before the occurrence of the anticipated event which may never occur.

There is no physical explanation for this anticipatory, apparently purposive or teleological, behaviour in growth and development. One may perhaps view the living system in somewhat the same light as a physicist views an electromagnetic field. Just as the "field" in physics is conceived to be a physical (*i.e.,* electromagnetic) integrative process, so the growth field in biology may be considered to be an integrative biological process, binding many components into a harmonious whole to achieve or to maintain a certain desirable state. For instance, disturbing a tadpole by removing its tail leads to the replacement of the lost tail by an almost identical new one, thus restoring the disturbed "field." Many types of healing, *i.e.,* restoration of the integrity of the field, occur so rapidly that they are unnoticed. Growth of a whole

Fig. 7.— (A) Prenatal growth of the chick on arithlog paper (upper part) and on arithmetic paper (lower part) as measured by metabolism (CO_2 production). The two segments represent growth at 98% and 31% per day, and the breaks at 5 and 15 days represent metamorphosis-like critical period as indicated by Fig. 9. (B) The changes in modes of respiration at 5 and 15 days are associated with mortality peaks. At 5 days there is a change in ability to oxidize lactio acid and at 15 days a change in mode of respiration

FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)





FROM BRODY. "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 8.—Early growth of the rat plotted on arithlog paper (upper curves) and arithmetic paper (lower curves). From 13 days after conception to 21 days (birth) growth is in geometric progression at 53% per day. There is a break at birth followed by 10 days of growth in geometric progression at about 11% per day

organism, like the regeneration of a tadpole's tail, proceeds as if the "normal" condition were that represented by the mature state. One may then say that the growth process is controlled by a powerful biological organismal "field."

The Shape of the Age Curve of Growth and its Mathematical Representation.— Perhaps unexpected is the fact that, as shown in fig. 2, the general shape of the time curve oi growth in volume, weight or population number (see POPULATION ECOLOGY), is virtually identical for the growth of individual animals and plants, and of populations of animals or plants. On second thought, the similarity between growth curves of multicellular individuals and populations is not surprising since ultimately both are collections of reproducing individuals. Reproducing cells make up the body of gro ing individuals and these individuals, in turn, make up the body of growing populations.

Fig. 2 shows that the age curve of growth may be divided into two principal segments, the first of increasing slope, designated *self-accelerating phase;* the second of decreasing slope, designated *self-inhibiting phase.* The shape of the curve may accordingly be said to be moulded by two opposing iorces, *growth-accelerating* and *growth-retarding.*

The growth-accelerating force maniiests itself, in the early history of the individual or population prior to the development of growth-restricting iorces in the environment, by the tendency of the reproducing units to reproduce exponentially, that is, at a constant *percentage* rate in a *geometric progression, i.e.,* one reproducing unit, such as a bacterium, divides into two bacteria, 2 to 4, 4 to 8, 8 to 16, 16 to 32, etc. This may the population is doubled at constant time intervals, and the number of new units is always proportional to the number of reproducing units, to the growth already made. Money invested at compound interest is also doubled at constant time intervals. Early increase in the size of a body or a population is like that of capital invested at compound interest. The equation

$$S=Ae^{kt} \qquad (1)$$

represents the course of such growth, in which S is the size of the body or population at age or time *t*, and rook is the percentage growth rate, assuming that the compounding is done not annually or quarterly but every instant. Such instantaneous compounding is added up for a conventional unit of time such as hour, day, year, and *rook* is, then, the *instantaneous* compound interest rate of growth per finite time unit.

It is evident, however, that growth at compound interest—that is, in the sequence 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, etc.—can not last very long either in financial or biological processes. Sooner or later sufficiently powerful restrictive iorces must develop in the internal or external environment to prevent such exponential growth because of the sheer limitation of the universe for population growth; and ior individual growth because of clogging of the transportation systems for nutrients and wastes, through progressive decline in relative surface areas with increasing size, with accumulation of inert tissue and progressive dehydration and decline in permeability. Sooner or later growth must change its course from being proportional to the growth already made, or to capital already accumulated, to being proportional to growth yet to be made, or to the available space and other resources required for growth. Here the environmental limitations or growth-inhibiting forces exert the limiting repressive influence on growth rate. The precise factors limiting growth will be presently noted.

Now just as in early life, during the self-accelerating phase of growth, the percentage growth rate is directly proportional to the growth already made, so in late life, during the seli-inhibiting phase of growth, the percentage gronth rate is directly proportional to the growth yet ta be made to reach the mature size. The course of such growth is represented by the equation

$$S=A-e^{-kt} \qquad (2)$$

in which *S* is the size at age or time *t* and *rook* is the instantaneous percentage growth rate with respect to the growth yet to be made to reach mature size *A*.

The junction or "major inflection" between the seli-accelerating phase of growth represented by equation (1) and of the seli-inhibiting phase represented by equation (2) occurs during puberty in animals, flowering (or equivalent stage) in plants, and "coming of age" in populations. The whole curve, as shown in fig. 2, thus has a sigmoid or s-like shape. The junction between the segments of increasing and decreasing slope, called the *major inflection,* reflects the development of a limiting critical situation in the internal environment of multicellular organisms or in the external environment oi populations.

The fact that the major segments of the growth curve may be represented by the simple equations (1) and (2) above does not mean that growth is a simple process; just as a simple statement by an accountant of a manufacturing concern does not imply that the manufacturing process is simple.

Fig. 3 demonstrates the similarity of shape between the age curves of different animal species. The human age curve differs from the others in having a very long juvenile period, a long interval between weaning and puberty (approximately from 3 to 13 years); this period is absent in laboratory and iarm animals. In these animals, weaning merges into puberty without the intervention of the juvenile phase found in man. The uniquely long juvenile period in man is oi great interest to students of evolution and education because, as John Fiske remarked in 1883, "If there is any one thing in which the human race is signally distinguished from other mammals, it is the enormous duration of their infancy . . . a period of plasticity . . . a door through which the capacity for progress can enter . . . power to modify . . . inherited tendencies."

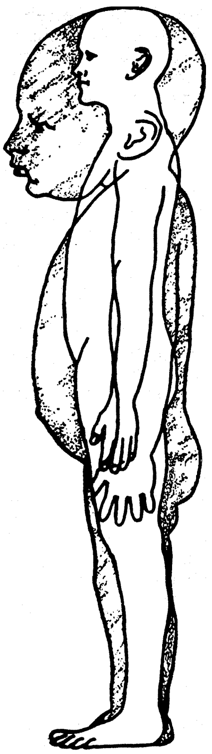
Curves of Early Growth of Populations and Multicellular Individuals.— Fig. 2 illustrates the general shape oi the entire growth curve as plotted on arithmetically divided paper. Fig. 4 shows early growth of a bacterial population as plotted on arithlog paper (horizontal axis is divided arithmetically, in the arithmetic progression 1, 2, 3, 4, etc., and the vertical axis is divided logarithmically, in the geometric progression 1, 2, 4, 8, 16, 32, etc.). Growth at compound interest (in geometric progression, according to equation 1) plots linearly about a straight line on arithlog paper. Fig. 4 shows that the early growth of a population of bacteria plots a straight line on arithlog paper. The slope of the line is 1.85, meaning that during the three hours in which growth proceeds in geometric progression, the population increases at the instantaneous rate of 185% per hour or that it was doubled every 0.4 hour. The break at 4 hours reflects the intrusion of a critical factor, which was a growth-limiting decline in the food supply, as demonstrated by adding food whereupon the preceding growth rate was resumed.

Milk-souring bacteria obtain their energy by transforming lactose (milk sugar) into lactic acid, and the rate of lactic acid accumulation is a good indication of the rate of growth of the bacterial population. Fig. 5 shows linear distribution of data for lactic acid accumulation for a period of 23 hours. The value of the slope (*k* in equation 1) is 0.47, meaning that during the 23 hours the lactic acid accumulated at the instantaneous compound interest rate of 47% per hour, or that the lactic acid level was doubled every 1.5 hours. The break in the curve at 23 hours indicates the development of a growth-inhibiting factor in the environment. On adding lime water to neutralize the accumulated lactic acid, the former growth rate was resumed, demonstrating that in this case the lactic acid was the growth-inhibiting factor.

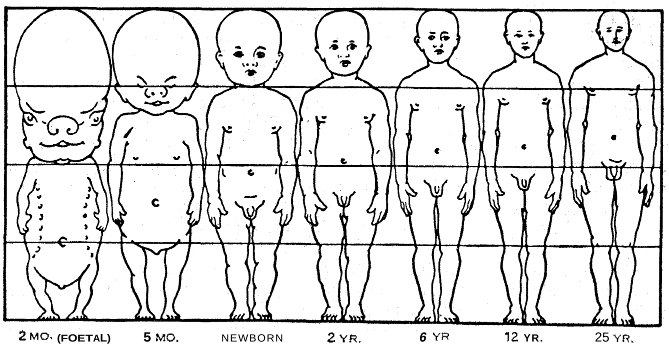
The reader may be surprised, perhaps shocked, to learn that, arithmetically speaking, human populations grow in accord with the same fashion, or "law" of growth, as bacterial populations. Fig. 6 shows that the human population, in what is now the United States, increased for a period of over two centuries, from 1660 to 1880, at the instantaneous constant percentage rate of 2.99% per year.

Whereas the bacterial population in fig. 4 was doubled every 0.4 hours, the human population was doubled every 24 years (fig. 6). Incidentally, about 1798 T. R. Malthus published a book which became famous for its pessimistic outlook for the future of man because of the discrepancy between the reproductive drive and capacity on one hand and the limited available land for food production on the other. Since the human population tends to be doubled every 25 years while the food supply tends to remain constant, eventual famine is inevitable. His statement about the doubling rate of population appears correct from fig. 6; but this holds only for the early history oi the population. Fig 6 shows the development of a deviaticn from the straight line by 1880.

This deviation about 1880 coincides with the end of the "free frontier land" era in the United States, with consequent gradual shiiting of the population from the farm (where wife and children are assets) to the city (where wife and children are liabilities) with consequent dampening of the child-bearing urge; it coincides with the increasing educational standards, with consequent delay in marriage; it coincides with the increasing wants for automobiles and other gadgets, with consequent delay in childbearing. Delay in childbearing means decline in population growth, not only by reducing the reproductive period but also because, as shown by R. Pearl in 1939, fertility in women declines following age about 20 pears. Since man is governed in his reproductive behaviour, as in other activities, by man-made psychological factors, such as traditions, more than by intrinsic biological drives, an explanation for one community may not hold for another. Nevertheless, in spite of the man-made fashions and sentiments in reproductive behaviour, the general shape of the curve of population growth of man is virtually identical with that of bacteria, or with any other species investigated.



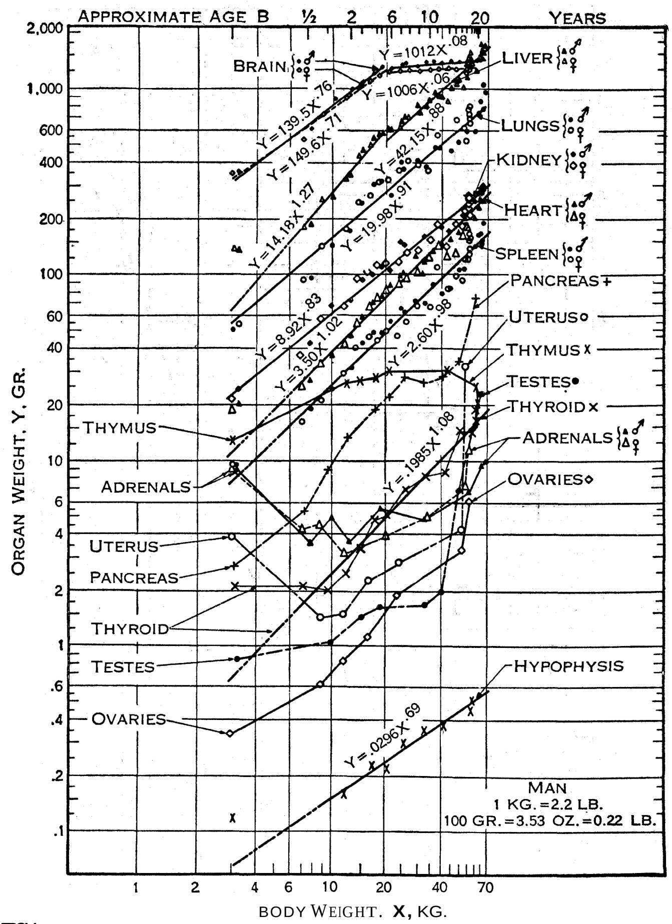
What was said about the shape of early growth curves of populations holds for individual multicellular organisms because, after all, multicellular animals are, ultimately, a collection of reproductive individuals (cells), and the general growth curve of the body of individual multicellular animals may be fashioned by the same basic factors as of populations. There is, however, one exception: the curves of individual multicellular organisms show breaks (figs. 7 and 8) associated with metamorphosis as previously explained. The "break" in the growth curve of the chick (fig. 7a) at 15 days is undoubtedly associated with a change in the respiration function, which is then transferred from the chorioallantoic membrane to the lungs; the chick is metamorphosed irom an aquatic to a terrestrial mode of respiration. The break at 5 days also appears to be caused by some change in oxygen utilization because there is a lactic-acid peak at 5 days. Mortality peaks at 5 and 19 days (fig. 7b) substantiate the idea that these periods represent metamorphosis-like transitions.



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 9.—Change in form with increasing age. Note the relative size of head in infant and adult

Relative Growth of Part to Whole.—Figs. 9 and 10 show that the form of animals changes with increasing size, that different parts grow at different rates. For instance, the head matures first and the muscles last. The terms *allometry*, or *heterogony*, and *relative* growth have been recently coined to represent such change.

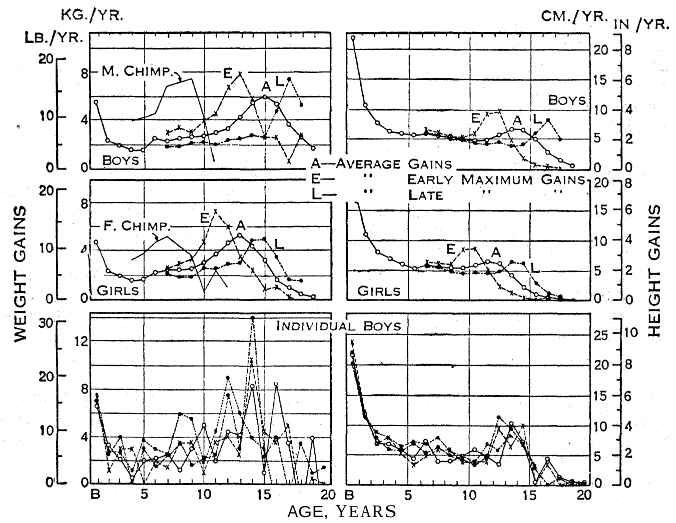


FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 10.—Relation of organ weight to body weight during growth in man; plotted on paper divided logarithmically according to equation (3) in the text. When the exponent is unity, the organs and total body grow at the same relative rates; when the exponent is less than unity, the organs grow at a lower rate; and if greater than unity, the organs grow at a higher rate than the whole body

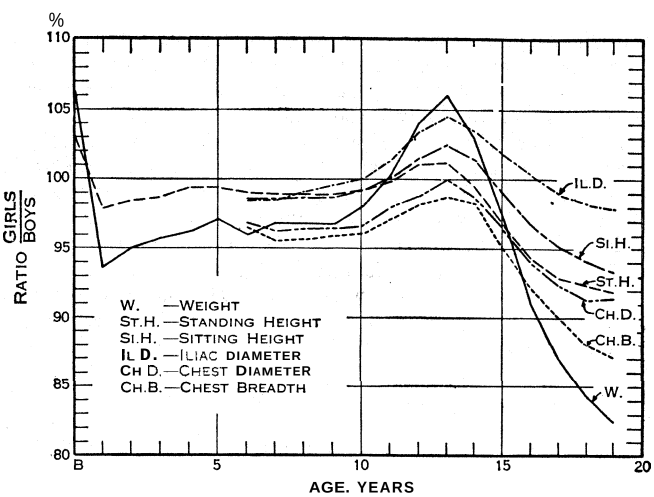
The relative-growth equation is the parabola

$$Y = aX^k \tag{3}$$



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 11.—Annual gains in weight and in height of children. The lower third represents individual boys; the centre third girls, "early maturing" (E), "late maturing" (L) and average (A) of all. "M. Chimp" represents gains in a male chimpanzee. The growth spurt at 12 to 13 years coincides with puberty and may. perhaps, be stimulated by the spurt in functional activity of the endocrine system



FROM BRODY, "BIOENERGETICS AND GROWTH" (REINHOLD PUBLISHING CORP., 1945)

Fig. 12.— There is a decided sex difference in growth during puberty as indicated by the ratio of growth of girls t~ boys, indicating differences in effects of sex hormones on growth

in which Y is the size of one part or function and X of another part or function, or of the whole body. The exponent k is the relative increase in part Y when the increase in the whole or in part X is 1. For instance, basal metabolism (heat production) Y, is related to body weight, X, by the equation $Y = 70.5X^{0.73}$, which indicates that an increase in body weight by 1% is associated with an increase of basal metabolism by 0.73%; or increasing body weight 100% increases basal metabolism 73%; and that the ratio of $Y/X^{0.73}$ is 70.5.

Change in form with increasing body size is a reaction to a developing instability. As a result, the organism changes geometrically (in form) so as to remain the same physiologically (in stability). For instance, the body weight increases with the cube of linear size while the strength of the supporting muscles increases with the square of linear size. Consequently, the body would become unstable unless growth of the supporting muscles is proportionately more rapid than of the body as a whole, and this actually occurs. The muscles become relatively larger while the visceral organs become proportionately smaller with increasing size; the value of the exponent k in equation (3) is, therefore, above unity for the supporting muscles and below unity for the visceral organs and the functions that they support such as metabolism (heat production), milk production, and so on. The value of the exponent k in equation (3) relating visceral organs, surface areas and function to body weight is near 0.7, indicating that increasing bcdy weight by 100% increases the size of such visceral organs as pituitary, kidney, etc., and such functions as basal metabolism and milk yield by about 70%.

Data on Growth.— It is not possible to cite the enormous body of data on growth of different species and races of animals and plants. But there may be space for the data on average growth of children shown in the table and in fig. 11. The data for 6 to 19 years are by F. K. Shuttleworth (1939) and birth to 5 years by B. T. Baldwin (1921). The growth spurt at puberty shown in fig. 11 and the sex difference in the spurt shown in fig. 12 suggests that sex hormones affect growth rate.

GROYNE, a framed structure of timber or a low wall of masonry or concrete run out over a foreshore into the sea, in a direction approximately at right angles to the coast line, for the purpose of arresting the lateral travel of sand and shingle and thus raising the foreshore level as a barrier against the encroachment of the sea. On the coasts of Holland and Belgium low groynes constructed of fascine mattress-work and rubble stone are commonly employed. Groynes similar in form to those used on sea-shores, and also, in many cases, built up of rubble or fascine work, are employed for training the flow of rivers, protecting their banks from erosion, and deepening their channels. Such groynes are built out over the river banks and bed transversely to the flow of the current and are termed spur-groynes (*see* RIVER AND RIVER ENGINEERING). The word groyne appears to have been used originally to denote any wall run out transversely to the shore. In the United States of America the word is spelt *groin* both in architecture and as applied to seadefense works.

See also BREAKWATER. (N. G. G.)

GROZNY, a city of the Chechen-Ingush A.S.S.R., U.S.S.R., the capital of the former Grozny region of the Russian Soviet Federated Socialist Republic. It is on the Zunzha river in 43° 20' N., 45° 42' E., and is on the railway from Makachkala (Petrovsk) to Orjonikidze (Vladikavkaz).

Its population (1959) was 240,000. The naphtha area to the northwest of the town began to be exploited in 1893 and another area to the southeast in 1913. Grozny has a much higher percentage of natural oil fountains than the Baku region, especially in the new area. Its oil differs in quality from that of Baku, giving less kerosene and more paraffin. It has naphtha and paraffin refineries and electric sawmills.

A pipe line to Tuapse has been constructed to cheapen the cost of export, and another to Poti. The new plant erected in Grozny and in Tuapse has considerably increased production. Grozny and Makachkala are also connected by pipe, and there are refineries in Makachkala.

The administrative offices for the Grozny region were situated in Grozny, and a training college for teachers is also in the town.

GRUDZIADZ (Ger. GRAUDENZ), a town of Poland in Bydgoszcz, on the Vistula. Pop. (1960) 65,000. It possesses three Roman Catholic and two Protestant churches, and a synagogue. It was founded by the Teutonic knights in the 13th century, and came under the rule of Poland by the peace of Thorn in 1466. In 1772 it was seized by Prussia at the first partition of Poland, and was returned to Poland in 1918.

Germany again seized it in the first week of World War II. It was returned to Poland in 1945.

GRUIFORMES, an order of birds, the best-known members of which are the cranes (*q.v.*). (*See* also BIRD; BUSTARD; COOT; FINFOOT; GALLINULE; KAGU; LIMPKIN; MOOR HEN; RAIL; SERIEMA; SUN BITTERN; TRUMPETER.)

GRUMBACH, WILHELM VON (1503–1567), German adventurer, born on June 1, 1503, chiefly known through his connection with the so-called "Grumbach feuds" (*Grumbachsche Händel*), the last attempt of the German knights to destroy the power of the territorial princes. He was attached to the court of Casimir, prince of Bayreuth (d. 1527), and fought against the peasants during the rising in 1524 and 1525. About 1540 Grumbach became associated with Albert Alcibiades, prince of Bayreuth, whom he served both in peace and war. After the conclusion of the peace of Passau in 1552, Grumbach assisted Albert in his career of plunder in Franconia and was thus able to take some revenge upon his enemy, Melchior von Zobel, bishop of Wurzburg. Grumbach held his lands in fief from the bishops of Wurzburg. and had held office at the court of Conrad of Bibra, who was bishop from 1540 to 1544. Albert's career, however, was checked by his defeat at Sievershausen in July 1553 and his subsequent flight into France, and the bishop seized Grumbach's lands. The knight obtained an order of restitution from the imperial court of justice (*Reichskammergericht*), but he was unable to execute it; and in April 1558 some of his partisans seized and killed the bishop. Grumbach fled to France. Returning to Germany he pleaded his cause, unsuccessfully, before the diet at Augsburg in 1559. He had found a new patron in John Frederick, (*q.v.*) duke of Saxony, whose father, John Frederick, had been obliged to surrender the electoral dignity to the Albertine branch of his family. Grumbach suggested to the duke a general rising of the German knights as a means to the recovery of the electorate. Magical charms were employed against the duke's enemies, and communications from angels were invented which helped to stir up the zeal of the people. In 1563 Grumbach attacked Würzburg, seized and plundered the city and compelled the chapter and the bishop to restore his lands. He was consequently placed under the imperial ban, but John Frederick refused to withdraw his protection. Meanwhile Grumbach planned the assassination of the Saxon elector, Augustus; proclamations were issued calling for assistance; and alliances both without and within Germany were concluded. In Nov. 1566 John Frederick was placed under the ban, which had been renewed against Grumbach earlier in the year, and Augustus marched against Gotha. A mutiny led to the capitulation of the town. Grumbach was tortured, and executed at Gotha on April 18, 1567. John Frederick was imprisoned for life.

GRUMENTUM, an ancient town in Lucania, 33 mi S. of Potentia by direct road through Anxia. and 52 mi. by the Via Herculia. at the point of divergence of a road eastward to Heraclea. It seems to have been native Lucanian, not a Greek settlement. In 215 B.C. the Carthaginian general Hanno was defeated under its walls. and in 207 B.C. Hannibal made it his headquarters. In the Social War its strong fortress seems to have been held by both sides at different times. Its site is a ridge on the right bank of the Aciris (Xgri) about 1.960 ft. above sea level, ½ mi. below the modern Saponara, which lies much higher (2,533 ft.). Its ruins (all of the Roman period) include those of its enceinte in *opus reticulatum,* with scanty traces of a large amphitheatre (arena 205 by 197 ft.). the only one in Lucania. except that at Paestum.

GRUN, HANS: *see* BALDUNG, HANS.

GRUNDTVIG, NIKOLAI FREDERIK SEVERIN (1783–1872), Danish poet. statesman and divine, was born at the parsonage of Udby in Zealand on Sept. 8, 1783. At the close of his university life at Copenhagen he made Icelandic his special study, until in 1805 he took the position of tutor in a house on the island of Langeland. The next three years were spent in the study of Shakespeare, Schiller and Fichte. His cousin, the philosopher Henrik Steffens, had returned to Copenhagen in 1802 full of the teaching of Schelling, and his lectures and the early poetry of Öhlenschläger opened the eyes of Grundtvig to the new era in literature. His first work, *On the Songs in the Edda,* attracted no attention. Returning to Copenhagen in 1808 he achieved greater success with his *Northern Mythology,* and again in 1809–11 with a long epic poem, the *Decline of the Heroic Life in the North.*

The boldness of the theological views expressed in his first sermon in 1810 offended the ecclesiastical authorities, and he retired to a country parish as his father's assistant for a while. From 1812 to 1817 he published five or six works, of which the *Rhyme of Roskilde* is the most remarkable. From 1816 to 1819 he was editor of a polemical journal entitled *Dannevirke,* and in 1818 to 1822 appeared his Danish paraphrases (6 vols.) of Saxo Grammaticus and Snorri.

In 1825 he published a pamphlet, *The Church's Reply,* against H. N. Clausen, who was professor of theology in the university of Copenhagen. Grundtvig was publicly prosecuted and fined, and for seven years he was forbidden to preach, years which he spent in publishing a collection of his theological works, in paying two visits to England, and in studying Anglo-Saxon. In 1832 he obtained permission to preach again, and in 1839 he became priest of the church of Vartov hospital, Copenhagen, a post he continued to hold until his death. In 1837–41 he published *Songs for the Danish Church,* a rich collection of sacred poetry; in 1838 he brought out a selection of early Scandinavian verse; in 1840 he edited the Anglo-Saxon poem of the *Phoenix,* with a Danish translation. He visited England a third time in 1843. From 1844 until after the first German war Grundtvig took a prominent part in politics. In 1861 he received the titular rank of bishop.

The chief characteristic of his theology was the substitution of the authority of the "living word" for the apostolic commentaries! and he desired to see each congregation a practically independent community. His patriotism was almost a part of his religion, and he established popular schools where the national poetry and history should form an essential part of the instruction. His followers are known as Grundtvigians. He was married three times, the last time in his 76th year. He died on Sept. 2, 1872.

Grundtvig holds a unique position in the literature of his country; he has been styled the Danish Carlyle. He was above all things a man of action, not an artist; and the formless vehemence of his writings, which have had a great influence over his own countrymen, is hardly agreeable or intelligible to a foreigner. The best of his poetical works were published in a selection (7 vols., 1880–89) by his eldest son, Svend Hersleb Grundtvig (1824–83), who was an authority on Scandinavian antiquities, and made an admirable collection of old Danish poetry (*Danmarks gamle Folkeviser,* 1853–83, 5 vols.; completed in 1891 by A. Olrik).

His correspondence with Ingemann was edited by S. Grundtvig (1882); his correspondence with Christian Molbech by L. Schroder (1888); *see* also F. Winkel Horn, *Grundtvigs Liv og Gjerning* (1883); an article by F. Nielsen in Bricka's *Dansk Biografisk Lexikon;* and F. Gronning, *R.F.S. Gruntvig* (8 vol., 1907–14).

GRUNDY, SYDNEY (1848–1914), English dramatist, was born at Manchester on March 23, 1848, son of Alderman Grundy. He was educated at Owens college, Manchester, and was called to the bar in 1869, practising in Manchester until 1876. He became well known as an adapter of plays, his early successes being *The Snowball* (Strand theatre, 1879) from *Oscar, ou le mari qui trompe sa femme* by MM. Scribe and Duvergne, and *In Honour Bound* (1880) from Scribe's *Une Chaîne.* Among his most successful adaptations was the charming *Pair of Spectacles* (1890) from *Les Petits Oiseaux* of MM. Labiche and Delacour. Grundy died on July 4, 1914.

GRUNDY, MRS., an imaginary English character who typifies the control of the conventional "proprieties" of society over conduct, the tyrannical pressure of the opinion of neighbours on the acts of others. The name first appears in a play by Thomas Morton, *Speed the Plough* (produced in 1798), in which one of the characters, Dame Ashfield, continually refers to what her neighbour Mrs. Grundy will say as the criterion of respectability. Mrs. Grundy does not appear in the play, but is a mythical character similar to Mrs. Harris, Mrs. Gamp's friend, in Dickens' *Martin Chuzzlewit* (1844).

GRÜNEWALD, MATHIAS (*c.* 1460–1528), the painter so named by J. von Sandrart in his *Teutschen Academie* (1675), the creator of the pictures on the leaves of the great Isenheim altarpiece, one of the greatest artists of his time. was in fact called Mathis Gothardt Neithardt and was born in Würzburg about 1460.

He was probably a pupil in a studio on the middle Rhine. In 1485 he was resident in Aschaffenburg; all the work belonging to this period has been lost. In 1490, he moved away and disappeared from sight for a decade. In 1501 he settled in Seligenstadt and lived in this specially privileged little town on the Main river until 1520. In 1503 he painted the "Mocking of Christ" (Pinakothek. Munich) for the cathedral at Aschaffenburg, and about the same time a small "Crucifixion" (art museum. Basel). Both pictures already show his bold composition. expressive drawing and dramatic colouring. In 1509 he became court painter to the archbishop of Mainz, Ulrich von Gemmingen. who lived in Aschaffenburg. As artistic and technical adviser, Grünewald had to supervise the rebuilding of the castle; at the same time. he reached great heights as a painter. In 1510 the Frankfurt patrician Jakob Heller commissioned him to paint a two-leaved standing screen for the altar in the Dominican church. Two of the panels. painted gray on gray, depicting St. Lawrence and St. Cyriacus, have been preserved in Frankfurt (Städel); two others, with St. Elizabeth and St. Lucy, are in the museum at Donaueschingen.

Griinewald created his masterpiece in Isenheim, Upper Alsace, for the monastery church of St. Anthony upon commission by Abbot Guido Guersi. In 1505, the Strasbourg sculptor Niklaus Hagnower had delivered a carved screen for the high altar in the church, which had been expanded; now, Grunewald was commissioned to paint the pictures for four movable and two fixed wings. His subjects were taken from the mystical world of Antonine thought: Christ's early years; the Passion; and St. Anthony (the saint's temptation and his conversation with Paul the hermit). The altar, preserved in the museum in Colmar, was finished about 1515–16. Later, but before 1519, Grunewald painted an altarpiece for the Maria-Schnee chapel in the church of SS. Peter and Alexander in Aschaffenburg; its central picture (the Mother of God as guardian of the church) is now in Stuppach, Württemberg, and its right wing (the miraculous foundation of Sta. Maria Maggiore) is in the museum in Freiburg im Breisgau. In 1520. Grunewald delivered various altar pictures for the cathedral in Mainz, all of which were destroyed in the Thirty Years' War.

GIRAUDON

"VIRGIN AND CHILD" BY MATHIAS GRÜNEWALD. IN THE COLMAR MUSEUM. FRANCE

In the years following, commissioned by the young archbishop of Mainz, Cardinal Albrecht von Brandenburg, he painted the great panel with the meeting of St. Erasmus and St. Mauritius (Munich); for an unknown patron he painted an altarpiece for the city church in Tauberbischofsheim ("Carrying of the Cross" and "Crucifixion" in Karlsruhe; predella with the "Lamentation of Christ" in Aschaffenburg cathedral). Apparently Griinewald soon had differences with Albrecht von Brandenburg, and in 1526 there was an open breach between them over the painter's support of the Reformation. He was dismissed from court service and went to Halle, dying there in 1528.

Griinewald depicted the suffering Christ with cruel naturalism, yet was the master of a transfiguring colour and a transcendental light. His drawings (only about 40 survive, most of them in Berlin, others in Dresden, Erlangen, Karlsruhe, Oxford, Paris and Stockholm) also grow out of light.

Grunewald always approached form as if he felt the necessity to translate it into light. Above all, however, his pictures are all the result of an introspective gaze which expressed itself in the objectivity of its religious content. Thus he became a visionary interpreter, which was in his time accounted to be the highest artistic achievement.

GRUNT, the name applied to perchlike marine fishes of the genus Haemulon, of which many kinds are abundant in the West Indies, north to Florida, probably by reason of the grunting sound they make when caught. Their mouths are large with a patch of red or orange in the corners.

Grunts are important food fish; some are brightly coloured, most are small, of pan-fish size. The name grunt or grunter is also sometimes used for the drum (*q.v.*) of a different family, the Sciaenidae. (J. T. N.)

GRUYERE (Ger. Greyerz), a district in the south-eastern portion of the Swiss canton of Fribourg, famed for its cattle and its cheese. It is composed of the middle reach (from Montbovon to beyond Bulle) of the Sarine or Saane valley, with its tributary glens of the Hongrin, the Jogne and the Trême. It forms an administrative district of the canton of Fribourg, its population being mainly French-speaking and Romanists. From Montbovon (11 m. by rail from Bulle) there are mountain railways leading S.W. past Les Avants to Montreux (14 m.), and E. up the Sarine valley to Saanen or Gessenay (14 m.), and by a tunnel to the Simme valley and Spiez on the Lake of Thun. The modern capital of the district is the small town of Bulle (Ger. Boll), with a 13th-century castle and 5,255 inhabitants in 1950. But the historical capital is the town of Gruyères, on a steep hill above the left bank of the Sarine, at a height of 2,713 ft. above sea-level and with an old castle. The town has 1,302 inhabitants. The castle was the seat of the counts of the Gruyère, first mentioned in 1073 The name is said to come from the word *gruyer,* meaning the officer of woods and forests, but the counts bore the canting arms of a crane (grue), which are seen all over the castle and the town. In 1555 the domains were sold to Bern and Fribourg. Bern took the upper Sarine valley, while Fribourg took the rest of the county, which it added to Bulle and Albeuve (taken in 1537 from the bishop of Lausanne), and to the lordship of Jaun in the Jaun or Jogne valley (bought in 1502–04 from its lords), in order to form the present administrative district of Gruyère.

GRYNAEUS, SIMON (1493–1541), German scholar and theologian, son of Jacob Gryner, a Swabian peasant, was born at Vehringen, and studied at Vienna. In 1524 he became professor of Greek at Heidelberg; from 1526 onwards he also held the chair of Latin. His religious views drove him from Heidelberg in 1529. After some years as professor of Greek at Basle, he reorganized the University of Tubingen, returning to Basle before 1536, when he assisted in drafting the so-called First Helvetic Confession. He represented the Swiss divines at the Worms Conference (1540) between Catholics and Protestants. He died of plague at Basle on Aug. 1, 1541. A brilliant scholar, a mediating theologian, and personally of lovable temperament, his influence was great and wisely exercised. Erasmus and Calvin were among his correspondents. His chief works were Latin versions of Plutarch, Aristotle and Chrysostom.

See Bayle, *Dictionnaire;* W. T. Streuber in Hauck's Realencyklopadie (1899); and for bibliography, Streuber, S. Grynaei *epistolae* (1847).

GRYPHIUS, ANDREAS (1616–1664), German lyric poet and dramatist, was born on Oct. 11, 1616, at Grossglogau, Silesia, where his father was a clergyman. The family name was Greif, latinized, according to the prevailing fashion, as Gryphius. Left early an orphan and driven from his native town by the troubles of the Thirty Years' War, he received his schooling in various places. In 1634 he became tutor to the sons of the jurist Georg von Schonborn (1559–1637), imperial count-palatine (*Pfalzgraf*), Schonborn, who recognized Gryphius's genius, crowned him *poëta laureatus,* gave him the diploma of master of philosophy, and bestowed on him a patent of nobility, though Gryphius never used the title. After Schonborn's death Gryphius went to Leiden, where he remained six years, both hearing and delivering lectures. Here he fell under the influence of the great Dutch dramatists, Pieter Cornelissen Hooft and Joost van den Vondel. After travelling in France, Italy and South Germany, Gryphius settled in 1647 at Fraustadt, where he began his dramatic work, and was syndic of Glogau from 1650 until his death on July 16, 1664.

Gryphius was a man of morbid disposition, and his melancholy temperament, fostered by the misfortunes of his childhood, is largely reflected in his lyrics, of which the most famous are the Kirchhofsgedanken (1656). His best works are his comedies, one of which, *Absurda Comica,* oder Herr Peter *Squentz* (1663), is based on the episode of Pyramus and Thisbe in The *Midsummer* Night's Dream Die geliebte Dornrose (1660). written in a Silesian dialect, is simple and graceful. and ranks high among the comparatively small number of German dramas of the 17th century. *Horribilicribrifax* (1663), founded on the Miles *gloriosus* of Plautus, is a rather laboured attack on pedantry. Besides these three comedies, Gryphius wrote five tragedies, modelled on Seneca and Vondel. They are *Carolus Stuardus* (1649), *Leo Armenius* (1646), *Katharina von Georgien* (1657), *Cardenio und Celinde* (1657), the only bourgeois tragedy earlier than Lessing, and *Papinianus* (1663). No German dramatic writer before him had risen to so high a level, nor had he worthy successors until about the middle of the 18th century.

A complete edition of Gryphius's dramas and lyric poetry was published by H. Palm in the Stuttgart Literarische Verein, 3 vol. (1878, 1882, 1884).

GSTAAD (3,450 ft.), a health resort and centre for winter sports in the canton of Bern, Switzerland, on the upper Saane. It has a station on the railway Montreux-Bernese Oberland. It is the starting point of the route over the Col-de-Pillon to Diablerets. Gstaad belongs to the commune of Saanen, which had a total pop. (1960) of 5,649, mostly Protestant and German-speaking.

GUADALAJARA, a province of central Spain, formed in 1833 of districts from New Castile; bounded north by Segovia, Soria and Saragossa, east by Saragossa and Teruel, south by Cuenca and west by Madrid. Population (1960 est.) 200,982; area 4,707 sq.mi.; density per sq.mi. 42.7. . The province forms part of the uptilted northeastern edge of the Meseta, and consequently the high ground is in the north, while the southern section of the province slopes into the plateau basin of New Castile. The northern highlands reach about 7,000 ft. in places, as in La Cebollera (6,975 ft.) and Ocejon (6,744 ft.) in the Guadarrama mountains. The Sierra de Albarracin form an important group on the extreme southeast of the province. The ways through the northern mountains are few, the main pass being over the Sierra Ministra, which carries the railway from Madrid to Calatayud and the north. The southern section, composing part of the Tagus basin, is watered by its tributaries, the Tajuna, Henares, Jarama and Gallo. The climate of this area, as of Castile, is continental in type, marked by the severity of its winter cold and summer sun. The soil varies very much in quality from place to place, but is fertile in many regions, notably in the cornlands of Alcarria toward the south. Few of the cork and oak forests which formerly covered the mountains have escaped destruction, and the higher lands are mainly pasture for sheep and goats. Grain, olive oil, wine, saffron, silk and flax are produced, but agriculture naturally suffersin this difficult country. Common salt and silver are mined, while deposits of iron, lead and gold were worked by the Romans. The manufacture of coarse cloth and pottery are a typical feature of the towns and villages. The Madrid-Saragossa railway traverses the province for 70 mi., but the roads are naturally difficult. Guadalajara (*q.v.*) is the capital, and the only town of any considerable size. Molina de Aragon, a fortified town built at the foot of the Parameras de Molina (2,500–3,500 ft.), and on the right bank of the Gallo, is of some importance as an agricultural centre. Sigüenza, on the railway, is an episcopal city, with a fine Romanesque cathedral dating from the 11th century.

Guadalajara is probably the ancient Segontia, founded in 218 B.C., by refugees from Saguntum. The province was the scene of bitter fighting in the civil war of 1936–39, and government forces won a brilliant victory over a nationalist army driving south from Sigüenza. A large proportion of the nationalist force was made up of Italian volunteers.

GUADALAJARA, the second largest city of Mexico and the capital of the state of Jalisco, is 27j mi. W.N.W. of Mexico City. It is in the Antemarac valley, near the Río Grande de Santiago, at an elevation of 5.092 ft. Except for the rainy season, which extends from about July 1 to September 15, its climate is dry and mild. The city is connected by rail with Nogales on the Arizona border and Mexico City. All-weather highways connect it with those two cities as well as with cities on the central and Pan-American highways. An excellent highway leads to Lake Chapala, a popular resort 23 mi. from the city. Guadalajara is served by major national airlines which provide connections with all major cities of the republic and with the United States.

The city was founded in 1531 by Nuño de Guzmán. During the first decade of its existence its site was changed several times under pressure from the Indians. From its beginning the city was the centre for Indian slave hunting and remained so throughout much of the 16th century. Father Hidalgo y Costilla, who initiated the independence movement in Mexico. occupied the city late in 1810, and it was there that he decreed the abolition of slavery in Mexico. On Jan. 17, 1811, he suffered a disastrous defeat at Calderón bridge near the city. During the French intervention of the 1860s, Guadalajara was occupied by the invading forces. The city suffered from severe earthquakes on May 31, 1818, and March 11, 1875.

Guadalajara has experienced a significant population growth in the 20th century; the population increased from 179.600 in 1930 to 734,346 in 1960. After 1940 Guadalajara added to its traditional roles of political capital and commercial entrepbt for an extensive agricultural region (devoted primarily to corn growing and livestock raising) that of a major industrial producer. In the second half of the 20th century it ranked as one of the republic's important industrial centres; manufactures included textiles. shoes. chemicals, building materials, tobacco products and soft drinks. Handicraft industries. carried on in Guadalajara and the suburbs of San Pedro (commonly known as Tlaquepaque) and Tonolá, include glass blowing, leather tooling, pottery making, silver- and coppersmithing and weaving.

Industrial and commercial establishments are often quartered in ultramodern buildings, and modern residential suburbs have attracted members of the upper classes and the rapidly expanding middle classes from the older parts of the city. The city was made the seat of a bishopric in 1549, and the cathedral, built between 1571 and 1618, is richly decorated. Many of the city's more than 50 churches also date from the colonial period.

During the summer months, religious processions bear the image of the Virgin of Zapopan, the patroness of the city, to each of the churches; afterward there are secular festivals with elaborate moving fireworks displays (*castillos*). The governor's palace, begun in 1743, is generally considered to be one oi the finest examples of Spanish architecture in Mexico. Guadalajara has two universities—the University of Guadalajara dating from 1792 and the Autonomous University of Guadalajara founded in 1935. The Teatro Degollado is one of the largest and most ornate theatres in Latin America.

Guadalajara was the home of the painter José Clemente Orozco (1883–1949), and among his numerous murals in the governor's palace, the Autonomous university, and the Hospicio (orphanage) are to be found some of his finest works. The family home is a museum.

Mariachis (strolling orchestras) specializing in Mexican folk music, and found throughout most of the republic, originated in Guadalajara. (J. J. J.)

GUADALAJARA, the capital of the Spanish province of Guadalajara, on the left bank of the river Henares, and on the Madrid-Saragossa railway, 35 mi. E.N.E. of Madrid. Pop. (1960 est.) 15,730 (mun.). Guadalajara is a picturesque town, occupying a somewhat sterile plain, 2,100 ft. above the sea. Under Roman and Visigothic rule it was known as Arriaca or Caraca; its present name, which sometimes appears in mediaeval chronicles as Godelfare, represents the Wad-al-hajarah, or "Valley of Stones," of the Moors, who occupied the town from 714 until 1081, when it was captured by Alvar Yaiiez de Minaya, a comrade of the more famous Cid. The church of Santa Maria contains the image of the "Virgin of Battles," which accompanied Alphonso VI of Castile (1072–1109) on his campaigns against the Moors. The palace of the ducal house del-Infantado is in the Mudejar style, and the *panteón* or mausoleum of the Mendoza family, added between 1696 and 1720 to the 13th-century church of San Francisco, is remarkable for the rich sculpture of its tombs. Manufactures of soap, leather and woollen fabrics superseded the original cloth-weaving industry for which Guadalajara was famous.

In March 1937 a nationalist force was defeated near Guadalajara. See Spanish Lib. of Information, *Spain* (Jan. 1942).

GUADALQUIVIR (ancient *Baetis,* Moorish *Wadi al Kebir,* "the Great river"), a river of southern Spain. What is regarded as the main stream rises 4,475 ft. above sea level between the Sierra de Cazorla and Sierra del Pozo, in the province of Jaen. It does not become a large river until it is joined by the Guadiana Menor on the left, and the Guadalimar on the right. Below Coria it traverses the series of broad fens known as Las Marismas, the grestest area of swamp on the Iberian peninsula. Below Sanlúcar the river enters the Atlantic after a total course of 348 mi. It drains an area of 21,865 sq.mi. In the time of the Moors it was navigable up to Cordova, but because of the accumulation of silt in its lower reaches it is now only navigable up to Seville by vessels of 1,200 to 1,500 tons. Navigation was facilitated by a cut, known as the Corte de Tablada, and swing-open bridge.

GUADELOUPE, twin islands in the French West Indies, constituting most of the French overseas *département* of the same name, lying between Montserrat on the north and Dominica on the south, at 16° 20′ N. and 61° 50′ W. The two islands are separated by a narrow arm of the sea, the Rivière Salée (Salt river), 100 ft. by 400 ft. in breadth and navigable for small vessels, and by two bays, the Grand Cul de Sac Marin on the north and the Petit Cul de Sac Marin on the south. These islands have an area of 584 sq.mi.; the entire *département* is 687 sq.mi.

The western and larger island, Rasse-Terre, is a rugged mass of ridges, high peaks and lofty uplands. In the northwest, sharp spurs radiate in all directions from Grosse Montagne (2,297 ft.); near the middle of the west coast the twin heights of Les Mamelles (2,395 ft. and 2,359 ft.) rise sharply. Farther south is La Soufrière. This 4.869-ft. volcano erupted quite violently in 1797 and again in 1843, causing widespread destruction. but thermal springs and *solfataras* are now its only activity. Jagged Caraibe (2,290 ft.) is in the extreme south. These cloud-capped mountains and the high, sinuous ridge which links them are clothed in luxuriant vegetation. Grande-Terre, the eastern island, is smaller and low-lying, with a maximum elevation of 450 ft. It is irregular in shape, with a long peninsula, Châteaux Point, stretching from its south-eastern extremity. Its plain is mainly limestone and *maçonne du bon dieu,* a conglomerate of sand and broken shells much used in buildings. It has extensive sugar plantations. Basse-Terre has several streams, which flood suddenly in the rainy season, but Grande-Terre has few springs and depends principally on ponds and cisterns for its water supply.

Basse-Terre has old eruptive rocks covered by recent great volcanic cones, together with deposits derived from denudation of the older rocks. Grande-Terre has nearly horizontal limestones conformable upon a series of fine tuffs and ashes, the whole belonging probably to the Eocene and Oligocene. Occasional late Pliocene marl and limestone rest unconformably upon these older beds; and near the coast there are raised modern coral reefs.

The temperature has an extreme range of from 61° F. to 101° F.. but is usually fairly constant between 75° and 88°. Rainfall is heavy from July through November, with an average annual precipitation of 86 in. on the coast and much more in the interior. The trade winds blow throughout the year, and hurricanes are frequent. In 1825 a hurricane destroyed the town of Basse-Terre, and Grand Bourg on Marie Galante suffered similarly in 1865.

The soil is rich and fruitful. Sugar is by far the most important crop and, with its derivative rum, accounts for most of the exports. Ste.-Anne, Pointe-à-Pitre, Le Moule and Basse-Terre have sugar *usines.* Bananas are second in importance, but production after World War II was only about one-fifth of normal. A wide variety of other tropical agricultural products is grown, including vanilla, coffee, cacao, citrus fruits and an increasing amount of cotton. The forests of Basse-Terre are valuable, but because of their inaccessibility have not been exploited, Salt and sulfur are the only minerals extracted. Except for rum and liqueurs. manufactured products are intended for local consumption.

Under the French constitution of 1958, Guadeloupe is an integral part of the French community, along with its outlying islands, which include nearby La Désirade, Marie Galante and the Saintes group and more distant St. Bartholomew (130 mi. N.N.W.) and French St. Martin (142 mi. N.N.W.). The prefect (governor) and some other officials are appointed by the central government, but legislative power is in the hands of an elected assembly.

Pop. (1954) 229.120. It is largely Negro and negroid except in Les Saintes Islands, whose inhabitants are mainly of French stock. Basse-Terre (pop. 11,837) is the capital, but Pointe-à-Pitre (pop. 26,160) is the largest city and the commercial centre, handling 85% of the islands' trade. Le Moule (pop. 12,002), on the east coast of Grande-Terre. is important as a sugar port.

Internal communication is principally by a network of more than 800 mi. of roads. The only railways are used exclusively for hauling freight. Education is free in state schools.

History. — Guadeloupe was discovered in 1493 by Columbus, who named it from the monastery of S. Maria de Guadalupe at Estremadura in Spain. In 163j L'Olive and Duplessis took possession in the name of the French Company of the Islands of America, and L'Olive exterminated the Caribs with great cruelty. Four chartered companies were ruined in their attempts to colonize the island, and in 1674 it passed to the French crown and long remained a dependency of Martinique. After failures in 1666, 1691 and 1703, the British captured the island in 1759 and held it for four years. Guadeloupe was finally separated from Martinique in 1775, but it remained under the governor of the French Windward Islands.

In 1782 Rodney defeated the French near the island, and the British again took it in April 1794, but in the following summer they were driven out by Victor Hugues with the assistance of slaves freed for the purpose. In 1802 Bonaparte, then first consul, sent an expedition to the island in order to re-establish slavery, but, after a heroic defense, many of the Negroes preferred suicide to submission. In 1810 the British once more occupied the island, but, in spite of its cession to Sweden by the treaty of 1813 and a French invasion in 1814, they did not withdraw until 1816. In 1816–25 the code of laws peculiar to the island was introduced.

Municipal institutions were established in 1837, and slavery was finally abolished in 1848. Guadeloupe, with much of the West Indies and Florida, was devastated by a tropical hurricane in the middle of Sept. 1928. Plantations were wrecked and buildings destroyed in the towns. The French government recorded 660 deaths in the island.

Guadeloupe adhered (1940–45) to the Vichy government of France under the high commissionership of Adm. Georges Robert.

GUADET, MARGUERITE ELIE (1758–1794), French revolutionist, was born at St. Emilion near Bordeaux on July 20, 1758, and became a lawyer. When the Revolution broke out, he had already gained a reputation as a leading advocate at Bordeaux. In 1790 he was made administrator of the Gironde and in 1791 president of the criminal tribunal. In that year he was elected to the legislative assembly as one of the group of deputies subsequently known as Girondins or Girondists.

As a supporter of the constitution of 1791, he joined the Jacobin club, and there and in the assembly became an eloquent advocate of all the measures directed against real or supposed traitors to the constitution. He bitterly attacked the ministers of Louis XVI and was largely instrumental in forcing the king to accept the Girondist ministry of March 15, 1792. An advocate of the policy of forcing the king into harmony with the Revolution, he remained a royalist, however. and with others even addressed a letter to the king soliciting a private interview. As president of the assembly, he vigorously opposed the insurrectionary commune of Paris on Aug. 10. As deputy to the convention (September) he voted for an appeal to the people at the trial of Louis XVI, and for the death sentence, but with a respite pending appeal. In March 1793 during the war in La Vendée he refused to cooperate with Danton, whom he held responsible for the September massacres. He was involved in the fall of the Girondists, and guillotined on July 17, 1794.

See J. Guadet, Les Girondins (1889) ; F. A. Aulard, Les Orateurs de *la législative* et de la convention, 2nd ed. (1906).

GUADIANA (anc. *Anas,* Moorish Wadi *Ana*), a river of Spain and Portugal. The Guadiana was long believed to rise in the lowland known as the Campo de Montiel, where a chain of small lakes, the Lagunas de Ruidera, are linked together by the Guadiana Alto or Upper Guadiana. This stream flows northwestward from the last lake and vanishes underground within 3 mi. of the river Zancara or Giguela. About 22 mi. S.W. of the point of disappearance, the Guadiana Alto was believed to re-emerge in the form of several large springs, which form numerous lakes near the Zancara and are known as the "eyes of the Guadiana" (*los* ojos de Guadiana). The stream which connects them with the Zancara is called the Guadiana Bajo or Lower Guadiana. It is now known that the Guadiana Alto has no such course, but flows underground to the Zancara itself, which is the true "Upper Guadiana." The Zancara rises near the source of the Jucar, in the east of the tableland of La Mancha; thence it flows westward, assuming the name of Guadiana near Ciudad Real, and reaching the Portuguese frontier 6 mi. S.W. of Badajoz. In piercing the Sierra Morena it forms a series of foaming rapids, and begins to be navigable only at Mertola, 42 mi. from its mouth. From the neighbourhood of Badajoz it forms the boundary between Spain and Portugal as far as a point near Monsaraz, where it passes into Portuguese territory, with a southerly direction. At Pomarão it again becomes a frontier stream and forms a broad estuary 25 mi. long. It enters the Gulf of Cadiz between the Portuguese town of Villa Real de Santo Antonio and the Spanish Ayamonte, after a total course of 509 mi. Its mouth is divided by sandbanks into many channels. The Guadiana drains an area of 23,455 sq.mi. Its principal tributaries are the Zujar, Jabalón, Matachel and Ardila from the left and the Bullaque, Ruecas, Botoa, Degebe and Cobres from the right.

GUADIX, a city of southern Spain, in the province of Granada; on the left bank of the river Guadix, a subtributary of the Guadiana Menor, and on the Madrid-Valdepeñas-Almería railway. Pop. (1950) 30,532 (mun.). Guadix occupies part of an elevated plateau among the northern foothills of the Sierra Nevada. Guadix el Viejo, 5 mi. N.W , nas the Roman Acci, and, according to tradition, the seat of the first Iberian bishopric, in the 2nd century. After 711 it rose to some importance as a Moorish fortress and trading station, and was renamed *Wad* Ash, "Water of Life." It was surrendered without a siege to the Spaniards, under Ferdinand and Isabella, in 1489. Guadix is surrounded by ancient walls, and was formerly dominated by a Moorish castle. It is an episcopal see of great antiquity. The cathedral was built in the 18th century on the site of a mosque. The city was once famous for its cutlery. It has some trade in wool, cotton, flax, corn and liqueurs. The warm mineral springs of Graena, much frequented during the summer, are 6 mi. west.

GUADUAS, a town of the department of Cundinamarca. Colombia, 53 mi. N.W. of Bogotá on the old road between that city and the Magdalena river port of Honda. Pop. (1951) 2.466. chiefly Indians or of mixed blood. It stands in a narrow and picturesque valley formed by spurs of the Eastern Cordillera, and on a small stream bearing the same name, which is that of the South American bamboo (guaduas), found in great abundance along its banks. Sugar cane and coffee are cultivated in the vicinity, and fruits of various kinds are produced in great abundance. The elevation of the town is 3,353 ft. above the sea, and it has a remarkably uniform temperature throughout the year.

Guaduas has a fine church facing upon its plaza, and an old monastery now used for secular purposes. Guaduas was founded in 1614.

GUAHIBAN, an independent linguistic stock of South American Indians. so called from the Guahibas, one of its most important tribes. The tribes composing this stock occupy or once occupied a large area in eastern Colombia, which extended from the Orinoco river westward between the Meta and Vichada rivers to the eastern slopes of the Andes. Some outlying tribes, houever, such as the Churoyas. Cofanes and Macas, were much farther south. extending as far as the upper Caqueta and Aguarico rivers. The Guahibas (Guaybas) and the closely affiliated Chiricoas are described as a purely nomadic hunting and fishing folk, going almost naked. They are wandering traders, thievish and adepts at cheating, and were likened by the early writers to gypsies. No adequate modern studies of these tribes appear to have been made.

See J. Rivero, *Historia* de *las Misiones* de *los* Llanos de Casanare, etc. (1736, new ed., 1883); J. Chaffanjon. *L'Orenoque* et *le* Caura (1889).

GUAIACOL, $CH_3.O.C_6H_4.OH$, the monomethyl ether of catechol and a constituent of beechwood tar.

GUAIACUM, a genus of trees belonging to the family Zygophyllaceae. the bean capers. The guaiacum or lignum vitae tree. G. *officinale,* is a native of the West Indies and the north coast of South America, where it attains a height of 20 ft. to 30 ft. G. sanctum grows in the Bahamas and Cuba, and at Key West in Florida. G. arboreum, the guaiacum tree of Colombia. is found in the valley of the Magdalena up to altitudes of 2,600 ft.. and reaches considerable dimensions. Guaiacum wood is of a yellow colour merging into green, and has an almost powdery fracture.

The lignum vitae of commerce, so named because of its high repute as a medicinal agent in past times, is procured from G. *officinale,* and in smaller amount from G. sanctum. It is exported in large logs or blocks, generally divested of bark. and presents in transverse section very slightly marked concentric rings of growth, and scarcely any traces of pith; with the aid of a magnifying glass the medullary rays are seen to be equidistant and very numerous. The outer wood is pale yellow and devoid of resin; the inner, which is by far the larger proportion, is dark greenish-brown, contains in its pores 26% of resin and has a specific gravity of 1.333, and therefore sinks in water. Ouing to the diagonal and oblique arrangement of the successive layers of its fibres, the wood cannot be split; and because of its hardness. density and durability it is much valued for the manufacture of rulers, mallets, etc.

Guaiacum resin is obtained from the wood as a natural exudation; by heating billets about three feet in length, bored to permit the outflow of the resin; or by boiling chips and raspings in water to which salt has been added to raise the boiling point. It occurs in rounded or oval tears, or in large brounish or greenish-brown masses. translucent at the edges; fuses at 8j° C.; is brittle, and has a vitreous fracture, and a slightly balsamic odour. increased by pulverization and by heat; and is at first tasteless when cheued, but produces subsequently a sense of heat in the throat. It is readily soluble in alcohol, ether, chloroform, creosote, oil of cloves and solutions of caustic alkalies; with glycerine it gives a clear solution, and with nitrous ether a bluish-green gelatinous mass. It is blued by various oxidizing agents; *e.g.,* ozone. The chief constituents are three distinct resins. guaiaconic acid (70%), guaiac acid, which is closely allied to benzoic acid, and guaiaretic acid Like all resins, these are insoluble in water. soluble in alkalies, but precipitated on neutralization of the alkaline solution.

Guaiacum wood was first introduced into Europe by the Spaniards in 1508 but the first edition of the London Pharmacopoeia in uhich the resin is mentioned is that of 1677. It was once popular as an alterative but is now little used medicinally. Guaiacum has been used as an antioxidant, especially in commercial lard. The active principle apparently is guaiaretic acid.

The tincture of guaiacum aas once used universally as a test for the presence of blood, or rather of hemoglobin, in urine or other secretions. but has been replaced by other tests.

GUALDO TADINO, a town and episcopal see of Umbria, It. (anc. Tadinum, on the Via Flaminia, 1 mi. to the W.), 1,755 ft. above sea level, province of Perugia, 22 mi. N. of Foligno by rail. Pop. (1951) 4,022. The cathedral has a good rose window, and the picture gallery contains 15th-century paintings by Umbrian artists. The town is still surrounded by walls. Art pottery is made there. In the plain below, near the ancient Tadinum, Narses defeated and slew Totila in 552.

GUALEGUAY, a town on the river of the same name in the province of Entre Rios, Argentina. 32 mi. above the confluence of the Gualeguay river with the Ibicuy branch of the Paraná, and about 120 mi. N.N.W. of Buenos Aires. The port of Gualeguay is

Puerto Ruíz, 5 mi. below, with which Gualeguay is connected by tramway. It is also on a branch railway. It is a stock-raising centre, its establishment dating from 1783. Pop. (1956 est.) 28,110. The town has tanneries and other factories.

GUALEGUAYCHÚ, a town and river port of the province of Entre Rios, Arg., on the river of the same name, 11 mi above its confluence with the Uruguay and about 130 mi. N.W. of Buenos Aires. The population according to 1956 estimate was 44.400 Gualeguaychti is the centre of an important cattle-raising country, and meat is chilled and beef extract manufactured in the town. There are also tanneries and shoe factories. Gualeguaychti is on a branch railway. (C. E. Mc)

GUAM, the largest and southernmost island of the Marianas, lies in the Pacific ocean at 13° 26' N. lat. and 144" 39' E long., about 5,100 mi. W. of San Francisco, 3,340 mi. W. of Honolulu and 1,500 mi. E. of Manila. Area 209 sq mi. The population was 59,498 according to the 1950 census. At the 1960 census, 66,910 persons were recorded in Guam, including military personnel. Agaña, the capital, had a population of 1,330 in 1950 arid 1,643 in 1960. Other important towns are Agaña Heights, Sinajana and Tamuning.

Physical Geography. — The island is sharply divided into a northern limestone plateau with a general elevation of about 500 ft. and an area of high, volcanic hills to the south. The plateau is covered with a thick growth of jungle; the volcanic hills support mainly sword grass. They rise over 1,000 ft. above sea level and their lower slopes to the east and, in part, to the west are covered with younger limestones, generally similar to those of the northern limestone plateau. The higher hills are found in the west central and southern parts of the island. Mt. Lamlam rises to an elevation of 1,334 ft.; Mt. Jumullong Manglo is 1,086 ft., Mt. Bolanos 1,220 ft. and Mt. Sasalaguan 1,109 ft.

Guam has a pleasant tropical climate. Temperatures range from 70° to go° F., being fairly even throughout the year. Average annual rainfall is about 95 in.. three-fourths of which falls during the wet season, generally starting in May or June and lasting through November. The climate is punctuated by destructive typhoons which occur at irregular intervals.

The People. — The native Guamanians, ethnically called Chamorros, are basically of Indonesian stock with a considerable admixture of Spanish, Filipino (Tagalog) and other strains. Their vernacular, called the Chamorro language. is not a Micronesian dialect but a distinct language with its own vocabulary and grammar. The word Chamorro is derived from Chamorri, or *Chanioli,* the ancient name for "chief." Pure-blooded Chamorros are no longer found on the island, but in every native family the Chamorro language is still the medium of communication. They are predominantly Roman Catholic.

At the end of World War II, the Guamanians were faced with the tremendous task of reconstructing the parts of their island which were levelled, of discovering and developing profitable home industries and of fulfilling Guam's potential position as an important new hub of Pacific activity. Agana, the seat of Guam's government and formerly a city of 12,000 inhabitants, was completely destroyed by bombardment.

Prior to World War II, the village was the social and economic unit, preserving conservatively the customs and traditions of 19th-century Europe. A family would work for a year, for example, in preparation for a costly wedding. The fiesta held in memory of a patron saint was the great social and religious event of the year in the village, for it was one of few occasions when people travelled from one village to another. Fiesta customs similar to those of earlier days continue to be followed in modern Guam. Changes in the social life and institutions of Guamanians, however, occur concurrently with the economic improvement of the people and their closer contacts with aestern civilization.

History. — Guam was discovered by Ferdinand Magellan in 1521. There mas no attempt to conquer the island until the latter part of the 17th century, when the Spaniards subdued it after considerable bloodshed. Guam remained a Spanish possession until 1898, when, in the course of the Spanish-American war, the U.S. warship "Charleston" steamed into the harbour of Apra and shelled the old fort. Guam was ceded to the United States and the other islands of the Marianas were sold by Spain to Germany in 1899.

After World War I, Japan which had occupied the German island possessions north of the equator, received the Marianas (except Guam) and the Caroline and Marshall groups. as a mandate under the League of Nations. Japan retained possession of the islands after she had quit the league in 1935.

The Japanese effected landings on Guam in the first days of World War II, and occupied the island by Dec. 12, 1941. Two and one-half years later U.S. marine and army forces returned to the Marianas, invading Guam on July 20, 1944; the island was again in U.S. hands by Aug. 9. Guam. turned into an air and naval base. was one of the major airfields for the squadrons of Superfortress bombers that attacked Japan in the last days of the war.

The U.S. department of the interior took over the administration of the island on Jan. 1, 1951, after 230 years of Spanish rule and 52 years of U.S. navy rule, interrupted only by the Japanese occupation. Guam served in the latter 1950s as the headquarters of the government of the Trust Territory of the Pacific Islands and of the U.S. air force's strategic air command in the Pacific.

Government. — Guam is an unincorporated territory of the United States and an organized sovereignty, governed under the Organic Act of Guam, passed by the U.S. congress and approved by the president on Aug. 1, 1950, and which took effect on Jan. 1, 1951. Although the Guamanians are citizens of the U.S., they cannot vote in national elections, nor do they have representation in the congress of the United States. The governor, who must be a civilian, is appointed by the president for a term of four years.

The second ranking member of the executive branch of the government is the secretary of Guam, who is likewise appointed by the president for a four-year term.

The legislature is a unicameral body with 21 members, popularly elected for four years. The legislature has the power to override the governor's veto by a two-thirds vote, but the governor may transmit the repassed bill to the president of the United States, who makes the final decision on legislation referred to him. The U.S. congress may vote to annul any act of the Guam legislature within one year of its passage.

The judiciary consists of the district court of Guam, whose judge is appointed by the president for four years. There is also an island court, police court and commissioners' court, whose judges are appointed by the governor to hold office at his discretion.

Each of the island's 15 municipalities is headed by a popularly elected native commissioner who serves for a four-year term. There is also a chief commissioner, appointed by the governor, who acts as liaison between the governor and the municipalities.

Finance. — All federal income taxes collected are remitted by the U.S. to the Guam government. Revenue and expenditures for the fiscal year ended June 30, 1955, were $10,190,000 and $9,873,-000 respectively. The value of imports in 1955 was $23,131,000 and of exports $4,597,000. Transshipments were valued at $2,-309,000.

Transportation. — Guam is served by scheduled and non-scheduled commercial air lines. The island is also a port of call for two major shipping lines: the American President line and the Pacific Far East line. The American President line's ships call at Guam on an average of one and one-half times a month. bringing cargo from both east and west coasts of the U.S., and the Pacific Far East line's ships call on an average of six times a month, carrying freight, including refrigerator cargo, and passengers from the west-coast ports of the United States. Both lines bring cargo to Guam from the orient. The American President line carries freight and a restricted number of passengers from Guam direct to the Philippines and Japan and back to Guam. while the Pacific Far East line carries freight and passengers from Guam to Japan, Korea and the mainland.

Guam is the home port of the Pacific Micronesian line, under contract to the Trust Territory of the Pacific Islands; the line carries cargo and passengers back and forth between those islands and Guam.

Agriculture and Industry.— The Chamorros live in villages from which they leave to cultivate their farms. Their traditional economy was. for the most part, still practised after World War II. However, modern agricultural methods were introduced by extension workers from the department of agriculture, and by the latter 1950s the economy of Guam had been expanded with increases in agricultural production and the establishment of new commercial and industrial enterprises. largely the result of the development of Guam as an important U.S. military base. The government aided economic development through the Guam Finance and Development agency, which made loans to farmers and businessmen.

By far the larger area of farmed land is near the coast in the southern, volcanic part of the island. On a representative farm, much like that of pre-World War II days, special attention is given to vegetables in areas near the new market among U.S. service personnel in the north. Three or four acres on a farm are generally cultivated, five or six times that amount being coconut forest, scrub. sword grass and wasteland. Corn, still the most important crop, is raised on one or two of the cultivated acres. Typically, a similar area is in pasture and an acre or so devoted to bananas, breadfruit. papayas, sweet potatoes, cassava, melons, pineapples and other vegetables.

Farmers raise a few scrub cattle for meat. oxen for draught animals and each generally has a carabao. Swine are native scrub stock, fed for the most part on swill, bananas and coconut pulp. Poultry are also predominantly native mongrel stock. Farm equipment usually includes a two-wheeled cart, a couple of machetes or bush knives and a *fosino* or scuffle hoe.

Fertilizers are little used. not even barnyard manure; it is not. in fact, readily available because livestock are rarely concentrated in one place. In accordance with long-established practice, new land is cleared by burning when the soil of cultivated areas becomes depleted.

Education.— There were 21 public elementary schools, a junior high school and a high school in the territory in the latter 1950s. The Territorial college was established in 1952, at Xgana.

GUAN, a tropical American chickenlike bird related to the chachalacas and curassows (*q.v.*) and with them constituting the family Cracidae of the order Galliformes. They comprise a number of genera of \\-hich *Penelope* and Ortalis are the largest. Nearly all have a bare throat. from which. in many forms. hangs a wattle. Except for a few which extend to Central and North America and the Antilles, the guans are confined to the South American continent. Like their allies, the omnivorous guans are most often seen hopping and flying about in the treetops. Attempts to domesticate these birds generally have been unsuccessful.

The noisy chachalaca (Ortalis *vetula macalli*) reaches the lower Rio Grande valley of Texas.

GUANABACOA, a city in Havana province, Cuba, 3 mi. E. of Havana. It is situated in a hilly section and is essentially a residential suburb of the capital, though a number of industries have been established. It is connected to Havana by highway and railway around Havana bay and by the Regla ferry. Pop. (1953) 32,490. Guanabacoa (meaning "site of waters") was an old Indian town. Established by the Spanish in 1617, it became a summer place for fashionable families in the colonial period because of its medicinal springs. Interesting old buildings include churches, monasteries and administrative buildings. (D. R. D.)

GUANABARA, a state of Brazil bounded north by Rio de Janeiro state, east by Guanabara bay, south by the Atlantic and west by Sepetiba bay. Area 524 sq.mi.; pop. (1950) 2,377,451, of which nearly all live in Rio de Janeiro (*q.v.*), now the state capital. Three massifs dominate the topography, occupying a third of the area and reaching a height of 3,360 ft. Guanabara was created from the former federal district in 1960, when Brasilia (*q.v.*) succeeded Rio de Janeiro as the national capital. The state's first governor and legislature were elected on Oct. 3, 1960. (R. M. M.)

GUANACASTE, a province of Costa Rica located on the Pacific coast and bordering Nicaragua. Area 4,015 sq.mi.; pop. (1950) 88,190, (1958 est.) 125,520. Shortly after independence from Spain this area separated itself from Nicaragua and in 1825 officially became a province of Costa Rica. As a result: Guanacaste was the source of ill-feeling between the two nations during the 19th century. It was also the centre of much of the warfare between the Central Americans and William Walker (*q.v.*) in the 1850s. Guanacaste, bisected by the Inter-American highway, has impressive agricultural prospects. Occupying 20% of Costa Rica it is a frontier of flat grassland with dry forests in the north. The chief income is from cattle, which are driven to market in Alajuela. About one-half of the beef, corn and rice consumed by Costa Ricans comes from Guanacaste province. The largest towns are Nicoya and Liberia, the provincial capital. (T. L. K.)

GUANACO (HUANACA), the larger of the two wild representatives in South America of the camel tribe, the other being the vicuiia. The guanaco (Lama guanicoe) stands nearly 4 ft. at the shoulder, with gracefully curved neck and long slender legs, the hind pair each with a naked patch. The hair is long,and soft, of a fawn colour above and white beneath. Guanaco are found throughout the southern half of South America, from Peru to Cape Horn. They live in herds, usually of from 6 to 30, and are exceedingly timid and difficult of approach. Their cry is something between the belling of a deer and the neigh of a horse. The chief enemies of the guanaco are the Patagonian Indians and the puma, as it forms the principal food of both. Its flesh is palatable although wanting in fat, while its skin forms the chief clothing material of the Patagonians. Guanaco are easily domesticated. They take readily to the water. They regularly deposit their droppings on the same spot, a habit appreciated by the Peruvian Indians, who use these deposits for fuel. Guanaco also have favourite localities in which to die, as appears from the great heaps of their bones found in particular spots.

GUANAJUATO, an inland state of Mexico; area 11,805 sq.mi.; pop. (1950) 1,328,712.

It lies wholly within the limits of the great central plateau of Mexico, and has an average elevation of about 6,000 ft. The northern half of Guanajuato is mountainous, but its southern half is covered by fertile plains, called the *Bajío,* largely devoted to agriculture. It is drained by the Rio Lerma and its tributaries, the Rio Turbio and the Rio de la Laja. The climate is semitropical and healthful, and the summer rainfall, 20 to 30 in., is sufficient to ensure good results in agriculture and stock raising. Indian corn, beans, barley and wheat are grown.

The principal industry of the state is mining, the mineral wealth being enormous. Among its mineral products are silver, gold, tin, lead. mercury. copper and opals. Silver has been extracted since the early days of the Spanish conquest. Some of the more productive mining sites are the Veta Madre (mother lode), the San Bernabi. lode and the Rayas mines of Guanajuato, and the La Valenciana mine, the output of which is said to have been $226,000,000 between 1766 and 1826. Industries include flour mills, tanneries and leather factories, cotton and woolen mills distilleries,, foundries and potteries.

The first Spanish settlement in the state was San Miguel de Allende, 1542, a picturesque colonial town now an art and study centre. The capital, Guanajuato city (*q.v.*), also has great colonial charm. As the silver mines poured forth their wealth Mexican baroque architecture flowered in this area. Miguel Hidalgo y Costilla (*q.v.*) began the Mexican War for independence in the village of Dolores Hidalgo in 1810. That same year his forces took the capital and looted it. Later. the Spaniards executed Hidalgo and his three lieutenants and displayed their heads on the Alhóndiga de Granaditas in Guanajuato for a period of ten years. Other important cities of the state are Leon (*q.v.*) and Celaya. Álvaro Obregón decisively defeated Pancho Villa at Celaya in 1915. Until 1824 Guanajuato with Querétaro was administered as a Spanish intendancy. (J. A. Cw.)

GUANAJUATO, capital of Guanajuato state, Mexico, is 1; j mi. N.W. of Mexico city. Pop. (1950) 23,389. It is served by a branch of the Mexican National railway, which joins the main line at Silao, and a paved road branching 13 mi. N.E. from that city. Guanajuato's dry climate is considered healthful.

Guanajuato is situated at an elevation of 6,835 ft. in the Caiiada de Marfil at the junction of three ravines. The city stands essentially as a foremost example of a Spanish colonial centre, whose location and mineral riches determined its plan and historical role. It gives the appearance of being crowded. The narrow tortuous streets (some are built as steps) rise steeply up the hillsides. Balconies which overhang the narrow streets are a distinctive feature of the city. There are a few modern buildings.

During the late 1520s and early 1530s Spaniards overran the area which remained little more than a military frontier until silver was discovered. Guanajuato was founded in 1554 and became a city in 1741. The town, along with Zacatecas to the north and Potosi in Bolivia, became one of the three greatest silver mining centres of the 16th century. Its celebrated Veta Madre (mother lode) was described as the richest in the world. The mineral wealth of Guanajuato--over 1,800 mines were in operation at one time—was largely responsible for making Mexico city the most splendid jewel in Spain's New World empire. In Guanajuato itself fabulous wealth was most manifest in the elaborate and richly endowed churches notably La Valenciana and La Parroquia. The only post-Spanish building of significance is the Teatro Juárez, built during the Díaz regime. and an excellent example of both the romanticism and the ostentation which characterized the era.

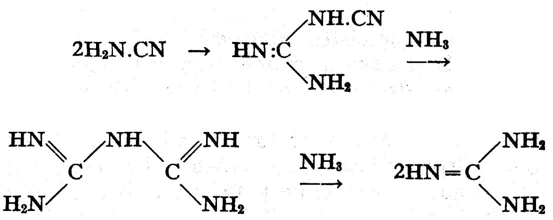
Guanajuato was the first major city to fall to the independence leader Hidalgo y Costillo in 1810. The plundering and destruction which accompanied the overrunning of the Alhóndiga de Granaditas (granary used as a fortress) were followed by subsequent struggles for control of the city which by 1822 had resulted in a greatly reduced output of the mines, through flooding, and the exodus of many wealthy families. Guanajuato entered a period of decline. which continued until the 1930s, when as a result of the increased tourist trade and federal support of mining and agriculture in the state, the city began a slow recovery which appeared to be continuing in the 1960s. It is the site of a national college. The Panteón, or public cemetery, has catacombs which contain mummies. (J. J. J.)

GUANCHES, the aboriginal inhabitants of the Canary islands. Now extinct as a distinct people, they were an offshoot of the Berbers of northern Africa, but were long isolated because of their lack of boats. The Carthaginians under Hanno found the archipelago uninhabited, but saw ruins of great buildings. This suggests that the Guanches were not the first inhabitants, and that this extreme westerly migration of Berbers took place between the time of which Pliny wrote and the conquest of northern Africa by the Arabs. The early Guanches lived in villages of stone houses and cultivated cereals and raised livestock. An hereditary class system distinguished nobles from commoners, and descent and inheritance of the chieftainship apparently was matrilineal. Studies of this extinct culture are of particular interest as suggesting the prototype of Berber culture before Arab influence was felt. Many of the Guanches fell in resisting the Spaniards in the late 15th century, many were sold as slaves and others conformed to the Roman Catholic faith and married Spaniards.

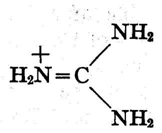
See also BERBERS.

See E. A Hooton, *Ancient Inhabitants of the Canary Islands,* Harvard African Studies, vol. 7 (1925); G. P. Murdock, *Africa,* chap. 15, with a bibliography (1959).

GUANIDINE is an organic compound of formula HN:C-$(NH_2)_2$. It was first prepared by Adolph Strecker in 1861 from guanine. which had been obtained from guano, and this is the origin of the name. The compound has been detected in small amounts in a variety of plant and animal products, but some of its derivatives are widely distributed and are of considerable importance, especially in the action of muscular tissue. It is closely related to urea. into which it is converted by hydrolysis. Guanidine is readily prepared from technical calcium cyanamide. This, when heated with water, gives dicyandiamide, which gives a good yield of guanidine when fused with an ammonium salt.



A variety of other syntheses are known, some of which (*e.g.*, the reduction of tetranitromethane and the action of ammonia on carbonyl chloride) give a simple indication of the constitution of the compound. Guanidine itself is a colourless crystalline solid that absorbs water and carbon dioxide from the air and is thus not easy to prepare pure, but the salts crystallize well, notably the carbonate and the nitrate. Guanidine as a base is much stronger than the majority of organic bases; its aqueous solutions have a conductivity approaching that of the alkali hydroxides and it forms stable salts even with acids as weak as boric and silicic acids. It behaves as a monacidic base only, and forms a cation — a positively charged ion — that can be written as



An X-ray crystal analysis of the iodide (W. Theilacker, 1935) shows, however, that, as might be expected, all three nitrogen atoms are identically linked in the ion and are symmetrically arranged in a plane around the carbon atom. This is caused by resonance between the three structures which can be written by allotting the positive charge to each of the three nitrogen atoms in turn. The resonance energy is the cause of the stability of the ion and hence of the strong basic character of the compound.

Uses.—Of the derivatives, nitroguanidine, obtained by the action of sulfuric acid on the nitrate, has been used to some extent as a constituent of explosives; its peculiarity is the low temperature produced in the explosion. Aminoguanidine and substituted aminoguanidine are intermediates in the synthesis of a variety of dyes and other heterocyclic compounds.

Two amino acid derivatives are of great physiological interest. Arginine, a guanidinyl-aminovaleric acid, $HN{:}C(NH_2).NH.$-$(CH_2)_3.CHNH_2.COOH$, is a constituent of proteins and particularly of protamines, but also plays an important part in nitrogen excretion in animals. With mammals this is largely excreted as urea, which is synthesized in the liver from ammonia and carbon dioxide by a series of reactions in which arginine is an intermediate. Creatine, methylguanidine-acetic acid, $HN{:}C(NH_2).NMe.CH_2.$-$COOH$, is present in large amounts in mammalian muscle, and its internal amide, creatinine, is excreted by mammals especially during growth. The contraction of muscle is known to derive its energy from the enzymatic hydrolysis of adenosine triphosphate and it is also known that one of the mechanisms whereby this substance is reformed in the muscle is by the action of creatine phosphate. The importance of the guanidine group in muscle is further shown by the fact that certain types of tetanus are associated with the occurrence of guanidine itself or of methylguanidine in the body, Other guanidine derivatives have proved to be of value as therapeutic agents. Synthalin (decamethylene-diguanidine) and related compounds have a specific effect in destroying trypanosomes; and sulfaguanidine, one of the least soluble of the sulfanilamide derivatives, is of great value in bacillary dysentery. Paludrine, the synthetic antimalarial, is a substituted biguanide (N_1-*p*.chlorophenyl-N_5-isopropyl-biguanide):

GUANO the accumulated excrement and dead bodies of birds, bats or seals. Bird guano is mainly from fish-eating cormorants. pelicans. and gannets which populate some islands off the west coast of Peru. Lower California, and Africa up to 5,600,000 per square mile and consume 1.000 tons of fish daily. Exports from the Peruvian deposits began about 1810 and reached 50,000 tons in 1856. The government protects the seafowls and processes the guano uhich contains about 11% to 16% nitrogen, 8% to 12% phosphoric acid, and 2% to 3% potash in fertilizer terminology. Bat guano is found in caves throughout the world with significant deposits in Missouri (16,000 tons) and in a cave of the Grand Canyon (100,000 tons). Seal guano has accumulated to 230 ft. on the Lobos Islands off South America and to a lesser extent on the Island of Tortuga. Bat and seal guano are lower in fertilizing value than Peruvian guano. See also FERTILIZERS AND MANURES; PERU: *Economic* Conditions. (S. R. A.)

GUANTÁNAMO, a city in Oriente province, Cuba, about 40 mi. E. of Santiago de Cuba and about 60 mi. from the eastern end of the southern coast. Pop. (1953) 64.671. It is 10 mi. N. of Guantánamo bay, one of the largest and best sheltered bays in the world, having a narrow entrance into a harbour about 4 mi. wide and 12 mi. long. capable of accommodating large vessels. The bay is served by the ports of Caimanera and Boquerón uhich are linked by rail to Guantánamo.

The strategic importance of the bay close to the Winduard passage. which is between Cuba and Haiti and links the Atlantic to the Caribbean and Panama. was recognized by the United States during the Spanish-American War, when American marines landed at the bay. A large U S. naval base, including fortifications and airfields, was established by treaty in 1903.

The city is the centre of an agricultural region in which sugar cane and coffee are the main products. The chief industrial activities are coffee roasting, sugar milling, and the manufacture of chocolate. liqueurs and salt. Air traffic is active, owing to the difficulty of land cbmmunications in the mountainous eastern region of Cuba.

Guantanamo bay was named Cumberland bay in 1741 when an English force landed and attacked Santiago. The town was founded in 1819 and was called Santa Catalina del Saltadero del Guaso until 1843. French refugees from Haiti aided in the colonization of the area and many cultural characteristics. such as architecture, stem from their influence, as well as from a number of Catalan settlers. The old French-Creole atmosphere of earlier days has been changed somewhat by the activity and industry of the 20th century. (D. R. D)

GUAPORÉ (Spanish ITÉNEZ), a river of northeast Bolivia, which, with the Paraguay river. rises in the mountains of the state of Mato Grosso, Brazil. It flows to the northwest marking the frontier with Brazil until its confluence nith the Mamoré river (*q.v.*) several miles above the town of Guayaremerin. Proceeding north, the Amazon (q v.) may then be reached by way of the Madeira river (q *v.*), formed by the juncture of the Mamoré and Beni (*q.v.*) near the river port of Villa Bella, and the Madeira-Mamoré railroad via Pôrto Velho. The Guaporé is the largest affluent of the Mamoré. and is navigable along its course of about 1,000 mi. at any season of the year. The town of Mato Grosso, lying less than 100 mi. from the source of the Guaporé, may be reached by river craft. The Guaporé constitutes the border between the Brazilian state of Mato Grosso and the federal territory of Rondônia to the east, and the Bolivian departments of Santa Cruz and Beni to the nest. It flows through a forested region having a hot and humid climate which is almost uninhabited except for occasional settlements of Indians and mestizos along the banks. The Guaporé, in contrast with the brown silt-laden Mamoré. is a beautiful river with unusually clear water. For several miles below their juncture, the identity of the two streams can still be readily perceived.

The upper tributaries of the Guaporé, flowing largely from the slopes of the Serra dos Parecis, include the Branco, the Corumbiari, the Colorado. the São Miguel and the Cautario. Its affluents flowing from the south and southwest comprise the Paraguá, the Baures and the Itonamas. Ports of the Guaporé are Principe da Beira, which may be reached by air, Versalles, Pedras Negras and Santa Isabel. Historically, the region was witness to numerous frontier conflicts between the Spanish and Portuguese and the struggles of both with hostile Indians. Forte Principe de Beira, constructed near the confluence of the Guaporé and Mamoré in the late 18th century, is a reminder of this era. (J. L. TR)

GUARANA, the plant *Paullinia cupana* (or *P.* sorbilis) of the natural order Sapindaceae, indigenous to the north and west of Brazil. It has a smooth. erect stem; large, pinnate, alternate leaves with five oblong-oval leaflets; narrow panicles of short-stalked flowers; and ovoid fruit about as large as a grape and containing usually one seed shaped like a minute horse chestnut. Guarana, guarana bread or Brazilian cocoa is prepared from the seeds as follows. In October and November, when ripe, the seeds are sun-dried, to allow the ready removal by hand of the white aril; ground in a stone mortar or deep dish of hard sandstone; the powder, moistened with water, is made into a paste with a certain proportion of whole or broken seeds and worked up usually into rolls 5–8 in. in length, and 12–16 oz. in weight. After drying by heat, the guarana is packed between broad leaves in sacks or baskets. Thus prepared, it is of extreme hardness, has a brown hue, a bitter astringent taste and an odour faintly resembling that of roasted coffee. An inferior kind is manufactured by admixture of cocoa or cassava. Rasped or grated into sugar and water, guarana forms a popular beverage in South America.

Guarana owes its stimulant properties to its caffeine content, and its astringent action to tannin. In addition, guarana yields the glucoside saponin, with starch, gum, three volatile oils and an acrid green fixed oil.

GUARANIS, a group of South American Indian tribes, forming an important subdivision of the Tupian (*q.v.*) linguistic stock. At the time of the first arrival of Europeans, the Guarani tribes were spread over the region east of the Paraguay river in what is now Paraguay and the adjacent Argentine states of Corrientes and Misiones. and extended eastward along the upper Uruguay river some distance into the Brazilian states of Santa Caterina and Rio Grande do Sul. In the early portion of the 16th century, in part at least because of Spanish attacks, a considerable body left their homes and migrated westward to Bolivia, where, as the Chiriguanos and Guarayos, they settled in the Andean foothills and edge of the Chaco, expelling the older Chane and other Arawakan tribes.

The Guaranis, originally a very numerous people, were sedentary agriculturists, living in large palisaded villages of wood and thatch houses, and presented a strong contrast to the nomad hunting tribes to the west and south. The Guaranis became widely known as a result of the activities of the Jesuit missions—the Doctrinas de Guaranies—founded among them in the early years of the 17th century. The missions comprised in all about 30 settlements, where the Jesuits, in spite of attacks by slave raiders from the Portuguese territories (who in 1628–30 alone carried off 60,000 Indians) built up a community of great interest, which lasted until the expulsion of the order in 1768. In their primitive state the Guaranis often went entirely naked, and wore as their most characteristic ornament a long pendant labret in the lower lip. Although essentially agricultural, raising corn, manioc and sweet potatoes, they had a bad reputation for killing and eating prisoners taken in war. They appear to have had trade with the border regions of the Inca empire, from which they secured small quantities of gold ornaments and metal objects, which through them reached the Atlantic coast, where a few examples were found in the possession of the people by the earliest European explorers.

GUARANTEE. In law, a guarantee is a contract to answer for the payment of some debt, or the performance of some duty, in the event of the failure of another person who is primarily liable for such payment or performance. In order that there may be a contract of guarantee there must be a primary liability, present or future, of a principal debtor, and a promise made for valuable consideration by a third party (called the "surety" or "guarantor") to the creditor to discharge that liability if the principal debtor does not. The promise of the surety must be such that liability only arises in the event of the failure of the principal debtor to meet his obligations.

A contract of guarantee must be distinguished from a contract of indemnity. If A says to B, who is about to sell goods to C, "Let C have the goods; if he does not pay you, I will," this is an offer of a guarantee on the part of A But if A says to B, "Let C have the goods; I will see you paid," A's promise to pay is an original liability to indemnify B against any loss which he may incur in letting C have the goods, and not a promise to answer for C s debt. *(Birkmyr* v *Darnell,* 1704, I Sm. LC. 12th ed p 335) So "if a man says to another, 'If you mill at my request put your name to a bill of exchange, I will save you harmless', that is a contract of indemnity. It is not a responsibility for the debt of another. It amounts to a contract by one that, if the other will put himself in a certain situation, the first will indemnify him against the consequences" *(per* Pollock, C.B. in *Batson* v. King, 1859, 4 H. & N at p 740). The distinction is important, for a contract of guarantee is not enforceable unless it is evidenced by some note or memorandum in writing, whereas no written note or memorandum of the agreement is required in the case of a contract of indemnity.

The common law requisites of a contract of guarantee in no way differ from those essential to the formation of any other contract. That is to say, they comprise the mutual consent of the parties, competency to contract, and, unless the guarantee be under seal, valuable consideration. The consideration may consist of some advantage given to, or conferred on, the principal debtor by the creditor at the surety's request, *e.g.,* an advance of money to the principal debtor. Or it may take the form of a forbearance on the part of the creditor at the surety's request to sue the principal debtor. In some guarantees the consideration is given once for all, as where a third person guarantees that, in consideration of a lessor granting a lease, he will be answerable for the lessee paying the rent and performing the covenants; in other cases it is supplied from time to time, as where a guarantee is given to secure the balance of a running account at a banker's, or a balance of a running account for goods supplied. *(See* the judgment of Lush, L. J. in *Lloyd's* v. *Harper,* 1881,16 Ch. D .at pp. 319, 320).

The statutory requisites of a contract of guarantee are prescribed by s. 4 of the Statute of Frauds 1689 (29 Car. II. c. 3), which provides that "no action shall be brought whereby to charge the defendant upon any special promise to answer for the debt, default, or miscarriage of another person . . . unless the agreemrnt upon which such action shall be brought, or some memorandum or note thereof, shall be in writing and signed by the party to be charged therewith, or by some other person thereunto lawfully authorized." A promise to give a guarantee is as much within the statute as the guarantee itself. But a promise to procure another person to sign a guarantee for the debt of another is not within the statute. though the guarantee would be. The statute does not invalidate a verbal contract of guarantee, but only renders it unenforceable by action. It may, therefore, be available in support of a defence to an action, and money paid under it cannot be recovered.

To satisfy s. 4 of the Statute of Frauds, the agreement, or the note or memorandum thereof, must set out all the material terms of the guarantee; it must name or unmistakably identify the parties thereto, and must also state the liability guaranteed and the time during which the guarantee is to continue. It is not necessary that the agreement, or memorandum, should contain any statement of the consideration given to the surety in return for the guarantee (Mercantile Law Amendment Act 1856, s. 3). The agreement, or memorandum, must be signed by the surety or by some duly authorized agent on his behalf. In the case of a joint and several guarantee all the sureties must sign the agreement or memorandum, otherwise none will be liable thereunder (*National Provincial Bank of England* v. *Brackenbury,* 1906, 22 T.L.R. 797).

The promise of a *del credere* agent (*q.v.*) which binds him in consequence of the higher consideration he receives to make no sale on behalf of his principal except to persons who are solvent, and renders him liable for any loss that may result from the nonfulfilment of his promise. is not within the statute, and need not be in writing, for, though such promise may terminate in a liability to pay the debt of another, that is not the *immediate* object for which the consideration is given (*Coutourier* v. *Hastie,* 1852, 8 Exch. 40, j6).

4 contract of guarantee may be limited to a single transaction, or may cover a number of transactions extending over a period of time—as where a guarantee is given in respect of money to be advanced, or goods to be supplied, to the principal debtor—and remains a standing security until it is revoked either by act of the parties or by death of the surety. It is then called a continuing guarantee. A cause of action thereon arises in respect of each item of account (whether principal or interest) as soon as that item falls due and is unpaid, and, consequently, the Statute of Limitations begins to run in the guarantor's favour in respect of each item from that moment (*Parr's Banking Co. Ltd.* v. *Yates,* 1898, 2 Q. B. 460).

Liability of Surety.—Before the surety can be rendered liable on his guarantee, the principal debtor must have made default. When, however, this has occurred, the creditor, in the absence of express agreement to the contrary, may sue the surety, without even informing him of such default having taken place, or requiring him to pay, and before proceeding against the principal debtor or resorting to securities for the debt received from the latter. The surety's liability is limited to the amount which he has undertaken to pay on default of the principal debtor. This amount may be equal to the sum due from the principal debtor, or it may be less than such sum. If the guarantee is one which the surety has entered into jointly with others, he is still liable to pay the whole amount he has agreed to pay on the debtor's default, unless the guarantee otherwise expressly provides. His right of contribution against his co-sureties may be a partial indemnity, but cannot, in the absence of agreement binding the creditor, compel the creditor to proceed against the other sureties. Should the surety become bankrupt. either before or after default has been made by the principal debtor, the creditor will have to prove against his estate. This right of proof is regulated by s. 30 of the Bankruptcy Act 1914, which is most comprehensive in its terms.

Rights of Surety Against Principal Debtor.—The surety can recover, with interest, from the principal debtor all money properly paid when due on account of the guarantee, provided of course that the guarantee was made with the principal debtor's consent. In the event of the principal debtor's bankruptcy, the surety can, if the. creditor has not already proved in respect of the guaranteed debt, prove against the bankrupt's estate, not only in respect of payments made before the bankruptcy of the principal debtor, but also, it seems, in respect of the contingent liability to pay under the guarantee. The surety is also entitled to enforce against the debtor the rights which the creditor enjoyed with respect to the debt in question. Moreover, a surety has the right *before* payment to compel the principal debtor to relieve him from his liability by paying off the debt, if the debt is actually due and the surety admits liability. In such a case it is not necessary to prove that the creditor has refused to sue the principal debtor *(Ascherson* v. *Tredegar Dry Dock and Wharf Co. Ltd.,* 1909, 2 Ch. 401).

Rights of Surety Against the Creditor.—The surety, on payment of the debt, is entitled to the benefit of the securities in the hands of the creditor. whether he knew of them or not at the time of contracting; including all securities which the creditor may have acquired since the date of contracting; and where, by the default or laches of the creditor, such securities have been lost or rendered otherwise unavailable, the surety is discharged *pro tanto.* If the surety is surety for part of the debt only. his rights to the securities also are but partial (*Goodwin* v. *Gray,* 1874, 22 *W.R.* 312). On this subject the Mercantile Law Amendment Act 1856, s. 5, provides that "every person who, being surety for the debt of another, or being liable with another for any debt or duty, shall pay such debt or perform such duty, shall be entitled to have assigned to him, or to a trustee for him, every judgment, specialty, or other security which shall be held by the creditor in respect of such debt or duty, whether such judgment, specialty, or other security shall or shall not be deemed at law to have been satisfied by the payment of the debt or performance of the duty, and such person shall be entitled to stand in the place of the creditor, and to use all the remedies, and if need be, and upon a proper indemnity, to use the name of the creditor in any action or other proceeding, at law or in equity, in order to obtain from the principal debtor, as the case may be, indemnification for the advances made and loss sustained by the person who shall have so paid such debt or performed such duty; and such payment or performance so made by such surety shall not be pleadable in bar of any such action or other proceeding by him; provided always, that no co-surety, co-contractor, or co-debtor, shall be entitled to recover from any other co-surety, co-contractor, or co-debtor, by the means aforesaid, more than the just proportion to which, as between those parties themselves, such last-mentioned person shall be justly liable."

Right of Surety Against Co-sureties.—A surety on payment of the debt, or more than his proportion, is entitled to contribution from his co-sureties in respect of the excess. This right is not founded originally upon contract, but upon a principle of equity, though it is now established to be the foundation of an action. It exists whether the sureties are bound jointly, or jointly and severally, and whether they are bound by the same or different instruments. If the principal debtor makes default, all must contribute equally, if each is a surety to an equal amount, and if not equally, then proportionately to the amount for which each is a surety (*Ellesmere Brewery Co.* v. *Cooper and Others* 1896, *Q. B.* 75). In counting the number of sureties for this purpose, those unable to pay are not reckoned. Thus where four sureties are jointly and severally bound in a surety bond, and one of them pays the amount of the bond, but one of the remaining three sureties is insolvent, the right of contribution against the two other sureties is for thirds, not for fourths, of the sum paid (*per* Lord Esher, *M.R.*, *ibid.*, at p. 80). But a surety is not entitled to call upon his co-sureties for contribution until he has paid more than his proportion, either of the whole debt or of that part which remains unpaid, even though his co-sureties have not been required by the creditor to pay anything (*Ex parte Snowdon,* 1881, 17 Ch. D. 44). And so where the debt guaranteed is payable by instalments, a surety cannot call on his co-sureties to contribute until he has paid more than his proportion of the entire debt. The fact that he has paid more than his share of the instalments which have come due will not entitle him to contribution (*Stirling* v. *Burdett,* 1911, 2 Ch. 418).

A surety against whom judgment has been obtained by the principal creditor for the full amount of the debt can, before paying the amount, maintain an action against his co-sureties to compel them to contribute towards the common liability, and where the principal creditor is a party to the action, the surety may obtain an order directing the co-sureties to pay their proportions to the creditor (*Wolmershausen* v. *Gullick,* 1893, 2 Ch. 514).

The right of contribution is not the only right possessed by a surety against his co-sureties; he is also entitled to a share in every counter-security which his co-sureties may have obtained from the principal debtor, and such security must be brought into hotchpot, in order that the ultimate burden may be distributed between the sureties equally, even though the co-sureties consented to become sureties only upon the terms of having the security (*Steel* v. *Dixon,* 1881, 17 Ch. D. 825).

Discharge of Surety.—The surety will be discharged on any of the grounds which suffice to terminate contracts in general, and also on the following which are peculiar to contracts of guarantee. In the case of a guarantee for the fidelity of a servant, the non-disclosure by the employer to the surety of the fact that the servant had previously been guilty of dishonesty in his employment will avoid the contract although such non-disclosure was not fraudulent (*London General Omnibus Co. Ltd.* v. *Holloway,* 1912, 2 K.B. 72). On the other hand, in the case of a guarantee given to a banker to secure an overdraft, the mere non-disclosure by the banker to the surety of the fact that, at the time when he signed the bond, the customer was already indebted to the banker for the full amount of the credit and payment had been requested by the banker, will not avoid the contract, for the bank cannot reasonably be taken as affirming, by mere silence respecting earlier dealings, the financial ability of the customer whom the surety is asked to guarantee (*Hamilton* v. *Watson,* 1845, 12 Cl. & F. 109). Fraud subsequent to the execution of the guarantee (as where, for example, the creditor connives at the principal debtor's default) will certainly discharge the surety. Again, a material alteration made in the terms of the contract between the creditor and the principal debtor, without the assent of the surety, will discharge the surety, unless it is self-evident that the alteration cannot prejudice the surety; the surety himself being the judge as to the materiality of the alteration (*Holme* v. *Brunskill,* 1878, 3 Q.B.D. 495).

Giving time to the principal debtor without the surety's consent will discharge the surety, and for this reason, because the creditor by giving time deprives the surety of his right to pay off the debt which he has guaranteed and to sue the principal debtor (*Samuel* v. *Howarth,* 1817, 3 Mer. 272). But to produce this result there must be a binding contract to extend the time for payment, not merely by a forbearance of the creditor to enforce his rights, and the contract must be with the principal debtor. A contract with a stranger, or even with a co-surety, to give time to the principal debtor, will not prevent the surety discharging the debt and pursuing his remedy over against the principal debtor, and will not discharge the surety from liability (*Frazer* v. *Jordan,* 1858, *8 E.* & B. 303; *Clarke* v. *Birley,* 1889, 41 Ch. D. 422).

To the rule that time given to a principal debtor discharges a surety there is an important exception. A surety is not released by an agreement to give time to the debtor if the creditor expressly reserves his rights against the surety. The reasons why the reservation by the creditor of his rights against the surety does not release the latter are (i.) because it rebuts the implication that the surety was meant to be discharged, and (ii.) because it prevents the rights of the surety against the principal debtor being impaired, for the principal debtor, by consenting to the creditor reserving his rights, impliedly agrees that the surety shall have recourse against him, and he may, notwithstanding the agreement, pay the creditor and enforce his rights against the debtor (*Kearsley* v. *Cole,* 1847, 16 M. & W. 128, at p. 135). The rule also does not apply where time is given to the principal debtor after a judgment has been recovered by the creditor against both the principal debtor and the surety; the judgment creates a new liability in respect of which the judgment debtors are in the same position (*in re a Debtor,* 1913, *3* K.B. 11).

An absolute release of the principal debtor will discharge the surety. But a covenant not to sue the principal debtor, qualified by a reservation of rights against the surety, allows the surety to retain all his remedies against the principal debtor and will not discharge him from liability (*Price* v. *Baker and Another,* 1855, 24 L.J.Q.B. 130). A release by the creditor of one of two or more co-sureties will discharge all (*Evans* v. *Brembridge,* 1856, 25 *L.J.* Ch. 334). This is not so, however, if the sureties contract severally (*Ward* v. *National Bank of New Zealand,* 1883, *8* App. Cas. 755).

A surety is discharged if the creditor takes a new security from the principal debtor in lieu of the original one, or by his wilful neglect or default loses the securities which he holds, or deals with the securities in such a way as to deprive the surety of the means of recouping himself by them.

A guarantee, the consideration for which is given once for all (as where a third person guarantees that in consideration of the lessor granting a lease, he will be answerable for the lessee paying the rent), cannot be determined by the surety, and does not cease on his death (*Lloyd's* v. *Harper,* 1881, 16 Ch. D. 290). On the other hand, when the consideration for a guarantee is fragmentary, supplied from time to time, and therefore divisible (as where a guarantee is given to secure the balance of a running account at a banker's), the surety may at any time terminate the guarantee, and notice of death of the surety will put an end to his liability (*Coultlzart* v. *Clementson,* 1880, 5 Q.B.D. 42). But the death of one of the co-sureties under a joint and several continuing guarantee does not by itself determine the future liability of the surviving cosureties *(Beckett & Co. v. Addyman,* 1882, *9* Q.B.D. 783).

A continuing guarantee given either to a firm or to a third person in respect of the transactions of a firm is, in the absence of agreement to the contrary, revoked as to future transactions by any change in the constitution of the firm (Partnership act, 1890, s. 18).

A surety who has executed a guarantee on the faith that another person will also become a surety is wholly discharged from liability if that other person refuses to do so, or for any other reason does not join in the guarantee *(Evans v. Brembridge,* 1853, 25 L.J. Ch. 334).

A discharge in bankruptcy of the principal debtor, or the acceptance by his creditors of a composition or scheme, will not release from liability a person who was surety for his debts (Bankruptcy act 1914, s. 28, subs. 4; s. 16, subs. 20).

The statutes of limitation bar the right of action against a surety after 20 years if the guarantee was under seal; and in the case of other guarantees, after six years from the date of the accrual of the cause of action, that is to say from the date on which the creditor might have sued the surety. Where, by the express terms of the guarantee, the surety is only liable to pay after demand, time does not begin to run until after demand to pay has been made upon him.

See Sir S. A. T. Rowlatt, *Law of Principal and Surety,* 2nd ed. (1926); T. Hewitson, *Suretyship, its Origin and History* (1927).

(C. GA.)

THE UNITED STATES

There have been repeated efforts by U.S. courts and legal writers to distinguish a surety from a guarantor; the effortshave failed, since hardly two of them find the same line of distinction; hence, in the United States as in England the two terms became substantially synonymous. But in some U.S. states a statement of the consideration in the memorandum of a contract of guarantee became a requirement if the contract is to be enforceable. Furthermore, laches in the creditor's dealing with any security he may hold, to be sufficient in U.S. law to discharge the creditor's claim against the surety, must either involve affirmative action, or must consist in failing to take simple, standard, businesslike precautions: such as recording a mortgage, or so presenting a negotiable note as to keep the endorsers from being discharged. But mere failure to enforce the security before it depreciates in value will not in the United States be considered such laches, the judicial view being that the surety's remedy is to pay off the debt and then realize on the security himself. It is hard to see why the surety should be forced thus to strain his resources; it is equally hard to reconcile the harshness against the surety of this rule with the extreme leniency found in discharging him by reason merely of extension of time to the principal. The two lines of precedent grew up separately, and did not come into contact until both were set.

Two other divergences from the English law as stated above need notice: the periods of the statute of limitations differ among the U.S. states; and the fact that a surety stipulated that a cosurety be procured, or other condition be fulfilled, will not, commonly, discharge him as against a creditor who has relied upon surety's signature without notice of stipulation or condition.

Corporate Suretyship.—In the United States a great and growing part of suretyship business is in the hands of professional surety companies, which write surety bonds for a premium calculated on loss-expectancies, and which in cases involving any considerable risk take measures to assure themselves of indemnity in advance of loss. In the case of such "compensated sureties" the courts tend distinctly to tighten up the law in favour of the creditor, so that the older tendency to construe the contract narrowly, and employ every possible loophole to let the surety out, is limited to the cases out of which it originally grew: those of the friend or family member who has lent his credit, without compensation, in an individual case. Hence the bonds of surety companies are approaching, in law as in social function, policies of insurance.

They are perhaps of peculiar importance in the field of guaranteeing the fidelity of trusted employes or of public officers (where the check-up system of the bonding companies goes some distance toward anticipatory prevention of frauds) and in that of contracts for building and public works. It should be noted that these bonding companies are not, like most corporations, without charter power to enter into binding contracts of suretyship; also that the larger modern business corporations are commonly being given charter power to become surety at least for their own subsidiaries. Hence guaranteed bonds are becoming familiar in the market. To be distinguished from suretyship, in law though not in function, is the growing practice among bankers of accepting negotiable paper *(see* BILL OF EXCHANGE) on behalf of their customers for a commission; this is not in strictness suretyship, not only because the customer's obligation in all probability ceases when the banker's is given, but because, in any event, the customer's liability must be conditional on prior dishonour by the banker.

Bail Bonds.—A field of suretyship, finally, which deserves special mention because of the abuses encountered in practice, is that of the bail bonds given to secure the supposedly temporary release of persons charged with crime.

The bail is forfeited if the accused disappears; this is supposed to force the bondsman to keep a constant eye on the accused. But the practice of allowing professional bondsmen to sign bonds totalling far in excess of their available assets, together with the difficulty of getting suit prosecuted against such as are politically influential, made this phase of suretyship a serious hindrance to convictions.

See E. C. Arnold, *Outlines of Suretyship and Guaranty* (1927), *Missouri Crime Survey,* part v (1926). (K. N. L.)

GUARAUNAN: *see* WARRAU.

GUARDA, an episcopal city of Portugal on the Guarda-Abrantes and Lisbon-Vilar Formoso railways. Pop. (1950) 7,704. It is 3,370 ft. above sea level, at the northeastern extremity of the Serra da Estrêla, overlooking the fertile valley of the river Côa. It contains a ruined castle, a fine 16th-century cathedral and a sanatorium for tuberculars. Its industries comprise the manufacture of coarse cloth. In 1199 Guarda was founded, on the site of the Roman Lencia Oppidana, by Sancho I of Portugal, who intended it to be a "guard" against Moorish invasion. The administrative district of Guarda coincides with northeastern Beira; pop. (1940) 294,166, (1950) 307,667; area 2,122 sq.mi.

GUARDI, FRANCESCO (1712–1793), Venetian landscape and figure painter, and his brother NICOLÒ (1715–86), were trained under their elder brother, GIOVANNI ANTONIO (*q.v.*) (1699–1760). By 1731 the brothers are recorded as collaborating in a studio which specialized in supplying paintings together with copies of others' works. About 1738 an uncle presented a group of religious and decorative paintings produced in this studio to the church at Vigo d'Anaunia (Trentino) of which he was the parish priest. Works of like character are also known, notably altarpieces at Belvedere di Aquileia (*c.* 1746) and Cerete Basso (*c.* 1755), the celebrated "Story of Tobias" panels in the church of the Angelo Raffaele in Venice (before 1750), two large allegorical figures in the Ringling museum, Sarasota, and two secular paintings, the "Ridotto" and the "Parlatorio" in the Museo Correr (Cà Rezzonico). Very few works of this type are signed, but a number of figure paintings, still-lifes, etc., have been attributed to the Guardi studio, though the individual contributions of Francesco and Gianantonio are hotly disputed, it would seem there was fairly extensive collaboration between them. Nicolb's part remains completely obscure.

Francesco does not appear to have adopted the practice of view painting, on which his fame rests, before the mid-1750s or later. Perhaps he was impelled by the approaching death of Gianantonio and the relative absence of competition in this profitable field except from the aging and then unproductive Canaletto. It is possible, but not certain, that he actually worked with Canaletto at this period. His earliest views are almost always signed or initialed as though to draw attention to his new artistic aims and seem inspired by Canaletto's own works of 30 years before. Francesco certainly copied Canaletto's compositions, notably in the "Feste Dogali" painted from engravings after Canaletto drawings; he often based capricious landscape compositions (like his earlier subject paintings) on the works of other artists.

In 1782 he depicted the official celebrations in honour of the grand duke Paul's visit to Venice, basing at least one of the compositions on commonplace contemporary engravings. Later in the year he was commissioned by the republic to make similar records of Pius VI's visit. the contract specifically forbidding such copying. He enjoyed considerable favour with the English and other foreigners and his late election to the Academy (1784) was doubtless, like Canaletto's. due only to the low esteem which landscape painting then enjoyed. His works are not easily datable, though the costumes occasionally provide a clue; his later landscapes are generally more sparkling and lighter than his first view paintings. He was an exceedingly prolific artist whose scintillating and romantic impressions of the declining city are in marked contrast to Canaletto's limpid photographic records of its architecture.

See G. Fiocco, *Fvancesco Guardi* (1923) ; J. Byam Shaw, *The Drawings of Francesco Guardi* (1951) ; A. Morassi, *Conclusioni su Antonio e Francesco Guardi* (1951) ; V. Moschini, *Francesco Guardi* (English trans. with full bibliography, 1957). (F. J. B. W.)

GUARDI, GIOVANNI ANTONIO (GIANANTONIO) (1699–1760), Venetian painter of religious and figure subjects, was born in Vienna in May 1699, the son of a modest painter, Domenico Guardi. in whose studio at Venice he was trained. After his father's death in 1716 Gianantonio worked for a time under Pittoni before opening his own studio. Here, he and his two brothers Francesco (*q.v.*) and Nicolò, specialized in paintings of religious and genre subjects as well as copies of earlier masters: frequently of minimal significance. Only one painting signed by Gianantonio. a "Death of St. Joseph" (Berlin), survives. though a few signed drawings are known. With his brothers he probably worked on the decoration of the sacristy of the parish church at Vigo d'Anaunia in the Trentino (1735–38).

There is still much dispute about the precise part played by each of the three brothers in these and other works, such as the now famous paintings on the organ loft in the church of the Angelo Raffaele at Venice with the story of Tobias (before 1750) and the altarpieces in the parish churches at Belvedere di Xquileia and Cerete Basso (*c.* 17jj). Gianantonio Guardi died in 1760 at SS. Apostoli.

See F. de Maffei, *Gian Antonio Guardi, pittore di figure* (1951) ; C. Donselli, I *Pittori Veneti del Setteconto* (1957), with up-to-date bibliography. (F. J. B. W.)

GUARDIAN, one who guards or defends another, a protector. The Old French *guarden, garden,* modern *gardien,* from *guarder, garder,* is of Teutonic origin, from the base *war-,* to protect; compare the O. H. German *warten* and the English "ward"; thus "guardian" and "warden" are etymologically identical, as are "guard" and "ward." Compare the use of the correlatives "guardian" and "ward," *i.e.* a minor, or person incapable of managing his affairs, under the protection or in the custody of a guardian.

For the position of guardians of the poor *see* POOR LAW and for the legal relations between a guardian and his ward *see* CHILDREN: PROTECTIVE LAWS.

GUARDS AND HOUSEHOLD TROOPS. From antiquity heads of state have maintained special troops who served as personal bodyguards. Such was the function of the praetorian guard, founded in 27 B.C. by Augustus Caesar, and of the housecarls of the Anglo-Saxon kings. Steady expansion in numbers of such picked troops led to their employment as a *corps d'élite* in battle. This occurred with the "Immortals" of Xerxes and Philip II of Macedon's *hetairoi,* and later the Mamelukes of Egypt and the Turkish Janizaries. (*See* JANISSARIES; MAMELUKE; STRELITZ.)

Early Bodyguards. — In the Hundred Years' War a contingent of Scottish archers was recruited in 1418 as an elementary *gnrde du corps* for the French monarch. When Charles VII formed his *maison du roi* in 1440, this company took senior rank. The second company of the *garde du corps* was enrolled by Louis XI in 1479, the third by Louis XII in 1514 and the fourth by Francis I in 1jqj. Sir Walter Scott's *Quentin Durward* gives a picture of life in the corps as it was under Louis XI. Only marshals of France could be captains of the *garde du corps.* As minister of state to Louis XIII, Cardinal Richelieu recruited a personal bodyguard of musketeers. In 1671 came the establishment of the *maison militaire du roi,* of which the senior corps was the *gendarmes de sa majestie.* Then came the *chevaux légers* (given the standing of household troops by Henry III), the *première* and *seconde compagnie* de *mousquetaires* a *cheval,* who provided their own equipment and were trained as dragoons. Lastly, companies of gendarmes were titularly commanded by the queen, the dauphin and the royal dukes. The duties of the *gardes de* la *porte* and the *cent Suisses* were more those of a personal bodyguard.

In England, the king's bodyguard or the yeomen of the guard (*q.v.*), raised by Henry VII in 1485, was not called upon to take the field. But the present-day honourable corps of gentlemen-at-arms. instituted as "the nearest guard" or "king's speres" by Henry VIII in 1509. accompanied the king to France and was actively engaged at Guinegate (the battle of the Spurs) in 1513 and in the siege of Boulogne in 1544. The corps was sometimes known as the gentlemen-pensioners. It last appeared under arms at the time of the Chartist disturbances in 1848. Reconstituted on a purely military basis in 1862, only officers entitled to a war decoration were eligible for appointment. 'The establishment consists of a captain, lieutenant. standard-bearer, clerk of the cheque and adjutant. subofficer and 39 gentlemen-at-arms. The office of captain is a political appointment, the holder (always a peer) relinquishing his post on a change of government.

The English gentlemen-at-arms and the pope's Swiss guard, founded in 1505 and still garbed in the uniform designed by Michelangelo, are the two oldest bodyguards surviving; the pontiff's noble guard was not founded until 1801. In 1527, when the Austrians invaded Rome, the Swiss guard perished to a man in covering the flight of Clement VII from the Vatican.

Mounted Guards. — During England's Great Rebellion, Charles I's life guard consisted of four companies of Cavalier gentlemen. Parliament also established a body of life guards, which was reviewed by Oliver Cromwell in Tuttle fields in April 16j6.

During Charles II's exile about 80 expatriate Cavaliers, under Lord Gerrard, served as the king's life guard. With the Restoration in 1660 these faithful followers formed the "1st or his majesty's own troop of guards." The 2nd troop was mostly made up of men who had soldiered as the "duke of Tork's guards" in the Spanish service. On the death of Gen. George Monk in 16jo his "duke of Albemarle's troop" became the 2nd or queen's troop, the duke of York's troop becoming the 3rd. In 168j the 1st and 2nd troops were styled Life Guards of Horse. Two years later the blue-coated Royal Regiment of Horse, a parliamentary "New Model" regiment disembodied in 1660 and immediately re-enrolled. was elevated to the status of a household cavalry corps. In 1690, while on station in Ireland with some of William III's Dutch "Blue guards," the name of the "Oxford Blues" was bestowed on the British formation, after the earl of Oxford, its colonel. The 1st troop (1693–1788) and Scots troop (1702–88) of Horse Grenadier guards were absorbed when the household cavalry was reorganized to form the 1st and 2nd regiments of Life guards and the Royal Horseguards Blue, the latter title being officially changed to that of the Royal Horse guards (the "Blues") in 1819. In 1922 the 1st and 2nd Life guards were amalgamated.

The "Tins" (Life guards) and the "Blues" wear a scarlet and a deep blue tunic respectively, white metal helmets with white or (for the "Blues") red horsehair plumes, steel cuirasses, buckskin breeches and jack boots with spurs. Their bands are arrayed in richly laced coats and wear blue velvet "jockey" caps. Their senior noncommissioned officers are known as corporal majors and corporals of horse. Since the battle of Dettingen in 1743 they have participated in all major wars; particularly distinguishing themselves at Waterloo.

Foot Guards. — In 1656, during his exile in Holland, Charles II of England recruited a small bodyguard of foot, which was merged in the regiment of guards enrolled at the Restoration in 1660. On St. Valentine's day, 1661, on Tower hill: what had been the

Lord General's Regiment of Foot guards, formed by Oliver Cromwell in 1650, took up its arms as an "extraordinary guard" for the sovereign. Having marched from Coldstream, near Berwick-upon-Tweed, it acquired the title of the Coldstream guards; and its motto of *nulli secundus* sufficiently denotes its denial of precedence to the 1st guards. The latter acquired their title of Grenadier guards and their bearskin headdress—subsequently adopted by the rest of the guards brigade—by virtue of their defeat of Napoleon's grenadier guards at Waterloo. The Scots guards, at one time known as the Scots Fusilier guards, were raised in 1662, being a re-creation of Charles I's Scottish Foot guards of 1643 They were put on the same footing as the other two guards regiments with the Act of Union of 1707.

No further addition was made to the brigade until 1900, when Queen Victoria was pleased to command that the Irish guards be formed. in tribute to the fighting quality of the Irish regiments in the South African War. In 1915 the representational nature of the brigade was rounded off by the formation of the Welsh guards.

The guards brigade serves as a personal bodyguard to the sovereign and as a *corps d'élite* in the field. There has been no major conflict in which it has not taken full part; and it can expand into machine-gun companies, armoured formations and other specialized units as occasion may demand. The battalions regularly take their turn of garrison duty overseas.

The governor general's bodyguard in Canada is furnished by a guards formation organized, equipped and uniformed on similar lines to the British guards brigade. In India, up to 1947, the viceroy's bodyguard consisted of scarlet-coated native lancers with British and Indian officers.

The Royal Company of Archers, the British sovereign's bodyguard for Scotland, derives from the ancient archer guard of the kings of Scotland. It was constituted in its present form in 1676.

Bodies of Guards Containing Both Cavalry and Foot.— Frederick William of Brandenburg (1620–88) scoured Europe for giants to lure into his regiment of household guards. But Frederick the Great substituted an effective fighting force for what hitherto had been largely an ornamental bodyguard. The tradition was preserved by imperial Germany. whose white-clad. silver-helmeted *Kürassier* headed the heavy cavalry in 1870 and. in Field gray, were again in action in 1914, as were the Prussian foot-guard regiments.

The national guard of revolutionary France. composed of citizen-soldiery, was neither a bodyguard nor a *corps d'élite*, but a kind of militia. Napoleon created a small corps of "guides" to act as a personal escort throughout his Italian and Egyptian campaigns. A consular guard was instituted in 1799, and out of this grew the formidable body of troops, representative of all arms of the service and including the veteran "old guard," the "middle guard" and the "young guard," that made up the emperor's imperial guard. In 1813 this totaled 81.000 officers and men. Napoleon III sought to revive the glories of the imperial guard, adding the decorative *cent gardes* to his household troops. The *garde républicaine* was made responsible for ceremonial duties about the French president.

There are Swedish, Danish and Monagasque royal guards, and a presidential guard in Italy, which includes a unit of cuirassiers in white uniforms and gilt helmets crowned with horsehair. Before World War I the Balkan kingdoms invariably boasted highly decorative bodyguard formations, although Rumania's Iron Guard developed into a partisan association of extreme political views. The emperor of Ethiopia recruits a large imperial guard.

(R. C. H.)

GUÁRICO, a state in central Venezuela: bordered on the north by outliers of the central highlands and on the south by the Orinoco river and two of its tributaries, the Xpure and the Portuguesa. Pop. (1950) 164,523. Area 25,637 sq.mi. A typical llanos region, Guarico is primarily cattle country. Corn, cotton and tobacco are grown along the rivers; coffee, cacao and sugar cane are produced in the north. Some oil has been discovered, but production is limited. The state capital is San Juan de los Morros (pop. 1950 est. 13,764). Calabozo (*q.v.*), the old capital, and Valle de la Pascua are trading and agricultural centres. (L. WE.)

GUARIENTO, (d. between 1368 and 1370), Italian painter who was, under the influence of Giotto, the first Paduan artist to detach himself from the Byzantine tradition. He is mentioned in Paduan records as early as 1338, In 1365 he was invited by the Venetian authorities to paint a "Paradise." and some incidents of the war of Spoleto, in the great council hall of Venice. These works were greatly admired at the time, but disappeared under over paintings of later periods. In 1903 the fresco of "Paradise" was uncovered. transferred onto canvas and exhibited at the Doge's palace. Guariento's works in Padua have suffered much. In the church of the Eremitani are allegories of the Planets. and. in its choir, some small sacred histories in dead colour. such as an "Ecce Homo"; also, on the upper walls, the life of St Augustine, with some other subjects. A few fragments of other paintings by Guariento are still extant in Padua. In the gallery of Bassano is a "Crucifixion" by him.

GUARINI, GIOVANNI BATTISTA (1538–1612), Italian poet author of *Il Pastor fido,* a pastoral dramatic poem which became very popular throughout Europe and reflected and influenced the manners of the age. He was born at Ferrara, Dec. 10, 1538 six years before Tasso whose friend he became, and whose poetic achievement he rivaled, at least in contemporary esteem. He studied at Pisa and Padua. and, before he was 20. became professor of moral philosophy in his native city In 1567 he entered the service of Alfonso II, duke of Ferrara. Guarini aimed at state employment as the serious business of his life, and was sent on various embassies and missions by the duke. But he spent his time and money to little purpose, suffered from the spite and ill will of two successive secretaries to the duke, quarreled with his old friend Tasso and at the end of 14 years of service found himself half ruined, uith a large family and no prospects. When Tasso was condemned to S Anna. the duke promoted Guarini to the vacant post of court poet. He found the position uncongenial, and retired in 1582, to his ancestral farm. the Villa Guarina, where he wrote *Il Pastor fido* In 1585 he was at Turin whence Alfonso recalled him to Ferrara, and gave him the office of secretary of state. This reconciliation did not last long Guarini moved to Florence. then to Rome. and back again to Florence, to the court of Ferdinand de Medici, and finally took refuge in Ferrara. His last years were passed in study. lawsuits and polemical disputes with his critics. until his death at Venice, Oct. 7, 1612.

Il Pastor fido, published in 1590 and first performed at the carnival at Crema in 1595, is a pastoral tragicomedy. set in an Arcadia of idyllic urbanity. It is occasionally reminiscent of *Aminta,* Tasso's earlier work in the same *genre,* but lacks his lyrical simplicity. The brilliant polish of its diction is sometimes flaned by the contemporary faults of frigid conceits and forced antitheses, and by sententious maxims revealing the moralist rather than the poet. Yet it lives as an expression of late 16th-century Italian society. and of an attitude toward life at once pagan, sensual and refined. proper to an age of social decadence. Its fame was widespread and its influence great, and for nearly two centuries it was regarded as a code of gallantry and shared with *Aminta* a prominent position in European literature, becoming a guide to manners as well as their mirror. It was several times translated into English. most notably by Sir Richard Fanshawe (1647). Contemporaries criticized its departure from Aristotelian rules of dramatic structure, against which Guarini wrote an able defense, in *Compendio della poesia tragicomica.* He also wrote a comedy in prose, *L'Idropica,* miscellaneous *Rime,* and some polemical works.

BIBLIOGRAPHY.—Guarini's works were published in 4 vol. (1737–38) The best contemporary edition of *Il Pastor fido* was the 20th (1602); there is a modern critical edition, *Il Pastor Fido e Il Compendio della poesia tragicomica,* by G. Brognoligo (1914). *See* also V Rossi, *G B. Guarini ed il Pastor Fido (1886)*; G. Grillo, *Poets at the Court of Ferrara* (1943).

GUARINO (GUARINUS) DA VERONA (1370–1460), one of the Italian restorers of classical learning. was born in 1370 at Verona, and studied Greek at Constantinople, nhere for five years he was the pupil of Manuel Chrysoloras. On his return to Italy he brought back a number of Greek mss. He supported himself as a teacher of Greek: in 1436 he became, through the patronage of Lionel marquis of Este, professor of Greek at Ferrara; and in 1438 and following years he acted as interpreter for the Greeks at the councils of Ferrara and Florence. He died at Ferrara on Dec. 14, 1460.

His principal works are translations of Strabo and of some of the *Lives* of Plutarch, a compendium of the Greek grammar, of Chrysoloras, and commentaries on Persius, Juvenal, Martial, and on some of the writings of Aristotlc and Cicero. *See* Rosmini, *Vita e disciplina di Guarino* (1805–06); Sabbadini, *Cuarino Veronese* (1885); Sandys, *Hist. Class. Schol.* ii. (1908): *Epistolario de Guarino Veronese* (2 vols. and commentary) in *Miscellanea di Storia Veneta,* 8, 11, 14 (1915–19).

GUARNIERI or GUARNERIUS, a celebrated family of Italian violinmakers of the late 17th and early 18th centuries, the most famous of whom, "Giuseppe del Gesù," produced violins only surpassed by those of Antonio Stradivari.

ANDREA (*c.* 1626–1698), the first to work as a violinmaker, lived at Cremona, where, with Stradivari. he was a pupil of Nicolo Amati. His instruments are less highly finished than Amati's and have a fine orange varnish. His work is dated from the sign of "St. Theresa" in Cremona. Of his three sons PIETRO GIOVANNI (1655–1720), ("Peter of Mantua," where he lived, although born at Cremona), also worked *"sub* signo *Sanctae* Teresae." His violins are more original than his father's: the space between the soundholes is broader, the soundholes more rounded and perpendicular and the whole instrument more raised. His nephew, PIETRO (1695–1762), "Peter of Venice." copied his uncle closely at first, but his later, less well finished work shows Venetian influence.

Andrea's younger son. GIUSEPPE (1666–c. 1740) ("Josephi filius") was born and died at Cremona: and developed distinctive instruments, widening sharply from a narrow waist, with unusual souridholes and a brilliant varnish. His son was (BARTOLOMEO) GIUSEPPE (1698–1744), whose nickname "del Gesù" came from his use of the sacred monogram "I.H.S." (taken from the first three Greek letters of the name "Jesus": I, *Iota;* H, Eta; S, Sigma) on his labels.

Giuseppe was born at Cremona. Aug. 21. 1698, and died there, Oct. 17, 1744. Little is known of his life and the details of his birth and parentage were long disputed. His work owes more to the earlier Brescian makers,'Gasparo di Salb and Paolo Maggini, than to Xmati. Instead of sweetness of tone and symmetry of form, he aimed at a powerful sonority and the great variety of his instruments in size, shape and structure reflect his experimental approach. His violins are bold in outline. and often carelessly constructed. and it is clear from his materials that he was working for wandering fiddlers rather than for wealthy patrons. He chose his wood for its sonorous qualities. and many of his finest instruments are made from a particular piece of pine. as is shown by a stain or sapmark running parallel to the fingerboard on either side. His best work was done during 1730–35. The faulty construction of some of his later instruments gave rise to a legend that he spent some years in prison and was handicapped by lack of tools, and to the sale of many spurious "prison Josephs." It is more probable however that the faults are due to a shaky hand caused by heavy drinking.

Guarnieri's work was not fully appreciated until Nicolo Paganini (*q.v.*) chose a "Joseph" in preference to the more mellow Amati or Stradivarius. With Guarnieri the golden age of Italian instrument-making may be said to have ended.

See W. Hill *et al., Violin Makers of the Guarneri Family, 1626–1762* (London, 1931).

GUASTALLA, a town and episcopal see of Emilia-Romagna. Italy, province of Reggio, 18 mi. N. by rail of Reggio, on the south bank of the Po, 79 ft. above sea-level. It is also connected bv rail with Parma and Mantua (via Suzzara). Pop. (1951) 6,416. The cathedral dates from the 10th century. Guastalla was founded by the Lombards in the 7th century. In 1307 it was seized by Giberto da Correggio of Parma. In 1403 it passed to Guido Torello, cousin of Filippo Maria Visconti of Milan. In 1539 it was sold by the last female descendant of the Torelli to Ferrante Gonzaga. In 1621 it was made the seat of a duchy, but in 1748 it was added to the duchies of Parma and Piacenza.

GUATEMALA (REPÚBLICA DE GUATEMALA), the northernmost of the Central American republics, extending between the Caribbean sea on the northeast and the Pacific ocean in the south. Pop. (1950) 2,790,868. Area 42,042 sq.mi. The country has a coast line of about 70 mi. on the Caribbean (Gulf of Honduras) and 200 mi. on the Pacific.

Its boundaries on the north and west, which touch Mexico, were fixed by treaty, finally on May 8, 1899. which set the Suchiate river, from the Pacific inland, as the start of an irregular line which runs generally northwestward until it strikes the parallel of 17° 49' N., which it follows to the border of Belice (Belize) or British Honduras (*q.v*), to which Guatemala lays claim. The eastern border, with Belice, follows the meridian of 89° 20′ W. southward to the Sarstún (Sarstoon) river, which it follows eastward to the Gulf of Honduras on the Caribbean sea; this boundary was set by the treaty of July 9, 1893. The boundary with Honduras (*q.v.*) on the east was long in dispute but, by treaty in 1930, was submitted to the arbitration of the U.S., Chile and Costa Rica, and a final decision was rendered in 1933. The award was "essentially on the basis of status *quo* of operation," and made the Motagua river the frontier in most of the disputed area. The southeastern boundary with Honduras was never in serious dispute, and the southeastern line touching on El Salvador is accepted and marked, chiefly along natural lines.

VII. The Economy

Further aspects of Guatemala can be found in the article CENTRAL AMERICA and the short articles on the departments and more important cities.

I. PHYSICAL GEOGRAPHY

Geology and Surface Features.—Guatemala is located within the Central American-Antillean region of Charles Schuchert. This is a region of folded and faulted geologic structures running more or less fram west to east from Central America through the Greater Antilles to and beyond Puerto Rico. On the southwest, facing the Pacific coast of Central America from the Gulf of Fonseca to about latitude 20° N. in Mexico, there is much volcanic activity and the underlying west-east structures are buried under a deep accumulation of lava and ash.

The national territory of Guatemala includes four major surface divisions. These are: (1) the Pacific coastal lowland; (2) the highlands; (3) the valleys and ridges of central Guatemala; and (4) the plains of Petén, a part of the Yucatán peninsula.

The Pacific Coastal Lowland.—This is a southeastward continuation of the coastal lowland of Chiapas in Mexico. At the Mexico-Guatemala border it is about 25 mi. wide, and it continues for about 1 jo mi. across Guatemala into El Salvador. The coast is bordered by long sand bars and has few indentations. In back of the lagoons the land rises gradually toward the base of the mountains.

The Highlands.—These rise steeply from the inner edge of the coastal lowlands to elevations between 3,500 and 8,000 ft. Numerous cone-shaped volcanoes rise above this general level. The highest is Tajumulco (13,812 ft.), but there are at least six others nearby that are over 11,500 ft. Among the volcanic peaks there is a series of more or less isolated basins, deeply filled with volcanic ash In one such basin is the well-known and spectacularly beautiful Lake Atitlin.

The Valleys and Ridges of Central Guatemala.—These emerge from under the cover of volcanic material proceeding away from the Pacific coast. The buried structures of the Central American-Antillean region have been etched by the rivers draining toward the Caribbean into a series of more or less west-to-east deep valleys separated by steep, sharply crested ridges. Within the territory of Guatemala there are two major structural depressions. The northern one is occupied by the headwaters of the Chixoy river. The Usumacinta river, which forms the border between Mexico and northern Guatemala, has cut headward to capture the upper Chixoy and carry its waters northward. The lower part of the

BY COURTESY OF NATIONAL TOURIST BUREAU GUATEMALA CITY
ATITLÁN VOLCANO (11.565 FT) OVERLOOKING LAKE ATITLÁN (24 MI LONG). DEPARTMENT OF SOLOLÁ, GUATEMALA

structural valley in Guatemala is occupied by Lake Izabal and drains out through the Dulce river to the Gulf of Honduras.

The southern of the two structural valleys is occupied throughout its length by the Motagua river. The ridges that separate these deep structural depressions extend all the way to the Caribbean. Another but smaller, depression. parallel to the larger ones, is occupied by the Sarstun river, on the border between Guatemala and British Honduras.

The Plains of Petdn — These are a part of the peninsula of Yucatán and consist of a limestone tableland, honeycombed with sinks and underground channels with much of the water draining off through solution caverns.

Climate. — The pattern of climatic conditions, as in all mountainous lands, is quite complex. Along the Pacific coast and on the volcanic highlands there is a distinctive "monsoon" climate, with very heavy rainfall in summer (May to October) when the ninds are onshore from the south, and a very dry season in wmter (Sovember to April) when the prevailing wind is offshore from the north. On the Caribbean side however, rainfall is heavy throughout the year on east-facing slopes. There are dry pockets in the rain shadow of the mountains, such as, for example, the middle part of the Motagua valley. Temperature varies with altitude but is never cold. At sea level the average annual temperature is about 78° F.. nith very little difference between summer and winter. 'Ihe old concept of steaming jungles refers to the high humidity rather than high air temperature. At Guatemala City *(4,872* ft. above sea level) the average annual temperature is about 65°, ranging from an average of about 61° in December to about 69" in May just before the beginning of the rainy season. In the higher basins of western Guatemala, between 5,000 and 10,000 ft. above sea level. average temperatures are between 65° and 55°. There is seldom much variety in the day-to-day weather, although occasionally hurricanes reach the Caribbean coast of Guatemala in September or October.

Vegetation. — The vegetation cover of Guatemala exhibits two basic characteristics of mountain geography: a general zoning by altitude and an intricacy of detail that makes the vertical zoning in places difficult to identify. Along the wet coastal lowlands on the Caribbean and on the lower east-facing mountain slopes there is a heavy tropical rain forest which comes as close to exhibiting the popular idea of a jungle as any place in the tropics. Along the Pacific lowland and the lower slopes of the south-facing volcanic highlands there is very little rain and the vegetation cover is a tropical semideciduous forest with patches of tall-grass savanna. Some of the species of trees in the forest, like all the species in the rain forest on the Caribbean side, are evergreen. During the dry season some of the trees in the semideciduous forest shed their leaves which reappear when the rains come again. The colour of the forest changes from dark green in the rainy season to grayish in the dry season and that of the savannas from green to brown.

As one ascends the mountains, contrasts in vegetation appear in what Alexander von Humboldt described as "vertical zones." The lowland species of trees give way to evergreen forests of oak and cypress. Above 5,000 ft. the oak is mixed with Sorth American species of pine. However, the vegetation reflects the lack of rain wherever there are dry pockets in the mountain valleys. In the dry middle part of the Motagua valley the vegetation is xerophytic, with many species of cactus and other drought-resistant plants.

Above 10,000 ft. the pines become thinner and grow only in patches in sheltered places. The trees are then replaced by a cover of mountain tall grass, similar to the paramos of the northern Andes. In no part of Guatemala are the mountains high enough to rise above the mountain grasslands. At these latitudes (between 14° and 16° N. of the equator) the zone of permanent snow is between 14,000 and 15,000 ft., and none of the Guatemalan volcanoes reaches such an altitude.

Animal Life.—Apart from domesticated cattle, sheep, pigs and mules. deer, monkeys and peccaries are common, especially in the less settled areas. Jaguars, tapirs and pumas are rarer. Crocodiles are found in the Polochic river and manatees in Lake Izabal and elsewhere. The bird life of the country is remarkably rich—wild turkeys and ducks, doves and pheasants abound; one almost extinct parrot oi magnificent plumage. the quetzal (*Pharomachrus mocinno)*, has been chosen as the national emblem.

II. GEOGRAPHIC REGIONS

There are two major geographic divisions of Guatemala: the highlands and the lowlands. But because of human action each of these two divisions is subdivided-the highlands into tno parts, the lowlands into three.

The Highlands. — Including the volcanic region and the ridges and valleys of central Guatemala, these are the most densely populated sections of the country. The highlands are sharply marked off into two distinctive regions—one region occupied by Indians, the other by people of Spanish and Spanish-Indian ancestry.

The Indian region is that part of the highlands that stands more than 5,000 ft above sea level. It begins a short distance west of Guatemala City and includes the whole western part of the country. The Indians are descendants of the Mayas Although there are a few large commercial towns, such as Quezaltenango and Huehuetenango. there are also many smaller village communities with less than 500 inhabitants

In some areas the people live in towns and villages and go out daily to work their farms—a pattern of living well developed around Lake Atitlán In other areas the individual farmer lives on the land he is cultivating The land is sometimes held in common and cannot be sold, although it can be used by the farmer as long as he continues to live on it. The chief Indian crop is maize, which can be grown up to elevations of about 9.500 ft. It yields well and makes up the greater part of the Indian diet, along with beans, chili and other vegetables. The one crop above the upper limit of maize is the potato, which can be cultivated up to 10,500 ft. Still higher. there are a few Indian communities that are supported only by the pasture of sheep on the high grasslands. But even in the more productive wheat and maize-growing parts of the highlands, the Indian farms are too smali to provide adequate support for farm families.

The other part of the highlands was divided up long ago among the Spanish conquerors. Most of the properties are large, and in many cases only partly utilized. The largest area is used for the pasture of cattle. But the chief commercial crop, which ordinarily provides over 70% of Guatemala's exports, is coffee. This crop grows well at altitudes of between 1,000 and 5,000 ft. The chief coffee-growing section of the country is westward from Guatemala City to Lake Atitlán and down to the coast below Quezaltenango. To the east of the gap where the Chixoy river turns northward to form the Usumacinta river, there is another coffee-growing district centring on the town of Cobán. This area was developed by German planters, most of whom lost their properties by expropriation during World Wars I and II.

The two highland regions are connected by the Inter-American highway which is completed, except for several bridges, as far as the Mexican border.

The Lowlands. — These were never utilized by people of Spanish ancestry until after the development of the banana plantations by the United Fruit company. The first banana plantations were created in clearings carved out of the rain forest in the lower Motagua valley, and Puerto Barrios was built as a banana-shipping port. When disease hit the banana plantations on the Caribbean side in the 1920s and '30s, the company moved its operations to the Pacific lowland. The conipany also built a railroad to connect Guatemala City with Puerto Barrios and later from the capital to the Pacific port of San José. The line was extended along the Pacific base of the highlands to connect with the Mexican railroads. Another line reaches El Salvador. The banana plantations of the United Fruit company were in part expropriated by the government during the early 1950s; but when the government again became more friendly. the company began to rebuild its plantations in the late 1950s. (See *The* Economy, below.) The plantations on the lower Motagua continued to decline and new planting was extended along the rail line on the Pacific lowland.

The third part of the lowlands — more than a third of the total area of Guatemala — is in the plains of Petén. This is a very thinly populated area. There are few permanent settlements. Most of the inhabitants are engaged in the work of gathering and shipping chicle, the major ingredient in chewing gum. A maze of foot trails winds through the forest over which porters carry the chicle to collecting stations. Some is brought out by mules or canoes, some by small airplanes. Petén is isolated from the rest of the country by vast stretches of empty, forest-covered area. (P. E. J.)

III. THE PEOPLE

More than half of the population of Guatemala is Indian (*cf. Population,* below), and most of the remainder is composed of Ladinos, who are europeanized in culture and usually of mixed Spanish-Indian ancestry. The two groups are not always physically distinguishable, but are demarcated by speech — whether an Indian language or Spanish — by dress — whether native or western — and by community membership.

The Indian cultures of Guatemala are remarkable for the high degree of native custom retained. The modern Indians of Guatemala come, in general. from the Maya or the kindred Quiché strain. The Indian settlements are predominantly in the highlands (see *Geographic Regions,* above). It is estimated that about 18 different Indian languages are spoken in Guatemala. Costume and dialect vary from one village to another. although Quiché serves as a trade language to some extent. and Spanish is a second language learned by some of the Indians. Traditional arts and crafts pursued in the villages include pottery, basketry, hand-tooled leather articles and colourful textiles. The social life of the Indians is centred in markets and *fiestas.*

The Indians differ but slightly among themselves. being of dark copper skin, stocky build, with coarse, straight black hair, high cheekbones and low foreheads. Formerly the Indians. who are the chief labour supply for the large coffee plantations at harvest time, were treated in almost feudal fashion by the coffee planters. With the constitutions of 1945 and 1956, which guaranteed many basic liberties. and the enactment of the labour code of 1947, which abolished the so-called vagrancy laws. the situation of the Indians was considerably ameliorated, although some abuses undoubtedly were continued.

The cultural isolation of the Indians results in their underrepresentation in the national life: Ladino leadership in public affairs is predominant. However, since the tno groups, Indian and Ladino, are distinguished mainly by speech, dress and community membership, Spanish-speaking Indians can and sometimes do become "ladinoized," particularly in the cities.

Religion. — The prevailing form of religion in Guatemala is Roman Catholic, the church claiming virtually 90% of the population as communicants. The archbishop of Guatemala is the primate of Central America and church influence is not inconsiderable. There are some Protestant missionaries and mission schools. The Indians are nominally Roman Catholic, but retain elements of native religions such as deities and ceremonies associated with soil fertility. Much of the white population is notably religious, and while there is sometimes a division on political lines, and the church has at times been accused of opposing the prevailing liberal government with serious consequences, the religious attitude of the people of the higher classes has not been greatly affected. (X.)

IV. HISTORY

Since the European conquest of the new world, Guatemala has been a colony of Spain (1524–1821), a part of the Mexican empire set up by Agustín de Iturbide (1822–23), a state in the Central American Federation (1823–47) and an independent republic (since 1847) Its history has been coloured by the fact that Europeans settled among Indians whom they dominated but whose culture has kept them a people apart.

The territory which is now Guatemala was inhabited at the time of the European conquest by a sedentary, agricultural, highland people of Mayan stock organized in tribal societies headed by "kings" who frequently warred on each other. For reasons not definitely established, the brilliant Mayan culture, which once flourished in the tropical forests that bordered the central plateau on the north, had declined, and the magnificent cities, possibly as a result of drought and soil erosion, were deserted. Trade and conquests from the west had already brought the area under strong Mexican influences which were strengthened by the presence of Mexican Indian allies among the forces of the conquering Spaniards.

Guatemala was conquered (1524) by Pedro de Alvarado (*q.v.*), one of the principal officers of Hernán Cortés, who was sent from Mexico in command of a force of Spaniards and Indian allies to punish and subdue the rebellious natives of the south. The invaders defeated in sequence the warriors sent out by the chiefs of the disunited local tribes, reduced many Indians to vassalage and appropriated the more accessible lands. The conquest completed, Alvarado was appointed the first captain general of an area which included modern Central America and the adjacent portions of contemporary Mexico.

The origin of the name Guatemala is certainly Indian, but its derivation and meaning are undetermined. Some hold that the original form was Quauhtemallan (which indicates an Aztec rather than a Mayan origin), meaning "land of trees," and others hold its origin was Guhatezmalha, meaning "mountain of vomiting water," referring no doubt to the so-called volcano of water which destroyed Ciudad Vieja, the first permanent Spanish capital of the captaincy general.

Colonial Period. — The colony was organized in the typical Spanish pattern. The conquerors mere assigned lands and Indians to support them, the capital was eventually established at Antigua (*q.v.*) and Spanish officials, subject in some matters to the viceroy of Mexico but in local affairs independent, were appointed to administer the area. Public buildings, churches and monasteries were constructed, and a university was established under clerical control. The capital achieved a certain magnificence and the major towns acquired some aspects of Spanish culture, but the outlying areas were only lightly affected by Spanish domination. When Antigua was razed by an earthquake in 1773, the capital was moved by royal order to the site of modern Guatemala City (*q.v.*).

The colony developed no great degree of economic prosperity. The cultivation for export of agricultural staples, principally cacao and indigo, by Indian or Negro labour was the major economic activity, exclusive of production for subsistence. Commerce, however, was never extensive; a satisfactory port was never discovered, internal transportation was difficult and pirates harassed the coasts and preyed'on shipping.

Independence. — Successful termination of the war for independence in Mexico led to a declaration in Guatemala City of Central American independence from Spain on Sept. 15, 1821. Shortly thereafter, the former captaincy general, which included the modern republics of Guatemala, El Salvador, Honduras, Costa Rica, Nicaragua and Chiapas state (Mexico). joined the empire which Agustín de Iturbide. the successful general of the Mexican independence movement. proclaimed in that country. When Iturbide fell from power in 1823, Central America determined upon separate nationhood, and the Republic of the United States of Central America (Central American Federation) was formed with its capital in Guatemala City.

The federation had a brief and stormy life. Manuel José Arce, the first president. came into conflict with the Liberal state authorities in Guatemala and El Salvador, and was overthrown (1829) by a military force under Francisco Morazán, who was shortly elected to the presidency. Morazán's government, with the cooperation of friendly authorities in some of the states, attempted to carry through the Liberal program of reform, one feature of which was subordination of the church to the civil authorities. The rapid and drastic changes produced a reaction which, coupled with other divisive factors, threw the union into civil war, and by 1838 the federation had, for practical purposes, ceased to exist. The Guatemalan government functioned independently after 1839. Morazán was defeated decisively and exiled in 1840, and his attempt to regain power in 1842 ended in his execution.

The principal factor in the overthrow of Morazán was the backcountry uprising in Guatemala of which Rafael Carrera assumed leadership. This astute but illiterate rustic established himself as the military arbiter of the state (1838) and, from the executive's chair or from behind it, controlled policy until his death in 1865. The formality of elections was dispensed with in 1854 when the presidency was conferred upon him for life. He completely dominated the political life of Guatemala during the mid-19th century.

Carrera, with the support of the Conservatives, returned Guatemala to a regime similar to that which had prevailed during the colonial period. He restored the church to its position of privilege and power and catered to the aristocracy He followed a nationalistic policy and in March 1847 formally declared Guatemala an independent and sovereign nation. In 1859 he made a treaty with Great Britain defining the status and boundaries of British Honduras (Belice), the interpretation of which is still an issue between the two governments.

In 1871 a revolution headed by Miguel Garcia Granados and Justo Rufino Barrios overthrew Gen. Vicente Cerna. Carrera's Conservative successor in office, and inaugurated a period of "Liberal" ascendancy that extended almost unbroken to 1944. After a brief period in the presidency, Garcia Granados ceded to Barrios (1873), nho became known as the "Reformer" because of the sweeping changes he introduced.

With the approval of the assembly Barrios broke the power of the local aristocracy; brought the church under civil control and confiscated its properties; instituted lay education; promulgated a new constitution (1876); fostered the construction of improved rneans of communication including roads. railways and telegraph lines; encouraged development by private initiative of the resources of the country; and opened the country to foreign capital. He stimulated the cultivation of coffee to replace the declining trade in cochineal, and enacted legislation designed to assure producers of a ready supply of labour. He was an ardent exponent of the idea of Central American union and, when persuasion failed to produce the ends he desired. he invaded El Salvador and lost his life at the battle of Chalchuapa (1885) in an attempt to accomplish them by force.

After the death of Barrios, Manuel Lisandro Barillas occupied the presidency and was succeeded by José María Reina Barrios, nephew of the Reformer, who was elected in 1892 and assassinated in 1898. Manuel Estrada Cabrera became provisional president. regularized his status by an election and by repeated re-elections (1904, 1910, 1916) maintained himself in power until leaders of the opposition Unionist party. nith the co-operation of some former adherents of the dictator, forced him from office by the novel expedient of having the assembly declare him inssne (1920).

During his long tenure in power, Estrada Cabrera fostered economic development and progress along the lines established by Barrios. He encouraged improvements in agriculture. continued to build roads, supported railroad construction and had the satisfaction of seeing the railroad to the Atlantic completed. Health conditions were improved and education stimulated, especially in practical fields. His political policies were less admirable. He persecuted political opponents, disregarded individual rights and liberties, muzzled the press and summarily disposed of his enemies.

After the fall of Estrada Cabrera, the presidency was held by Carlos Herrera, Gen. José M. Oreilana, Lázaro Chacón, Baudilio Palma, Gen. Manuel Orellana and José María Reina Andrade, for periods ranging from a fen days to nearly a full six-year term. In 1931 Jorge Ubico mas elected president and began the fourth of the extended dictatorships that covered a century of Guatemalan history.

Contemporary **Period.**—Ubico stressed economic development and, in particular, improvement and diversification of agriculture and the construction of roads. He balanced the national budget and transformed a deficit into a surplus. In part his financial achievement was due to economies, in part to the efficiency and honesty of his administration. Although his vagrancy law (1934) made workers, especially Indians, liable to periods of forced labour at critical seasons. Ubico's paternalistic policies toward the natives established him as their patron. During his motorcycle tours of the country, or in his office, he listened to their complaints and dispensed immediate "justice." Their reverence for him was expressed in their custom of addressing him as Tata, "father." This relationship deluded Ubico into stating that Guatemala no longer had an Indian problem.

Education, which had received considerable emphasis under preceding Liberal regimes, was of but slight interest to Ubico. He closed several of the few institutions of secondary level outside the capital, allowed teachers' salaries to remain at levels incompatible with decency and, as a final disparagement, militarized the schools and required teachers and students to march in his parades and festivals.

Ubico's administration dramatized the degree to which Liberal thought had lost its idealism and was concerned principally with material progress. The new socioeconomic groups that had been brought into existence by such innovations as lay education, mechanized transportation and industrial development found no stimulation and no hope in the dreary materialism and military repression which had come to characterize Liberal regimes.

These latent sources of opposition were solidified and focused by the increasing disregard which the dictator showed for individual rights and liberties. The familiar trappings of military dictatorship became increasingly evident, and the reorganized national police came to be regarded as an espionage force. Protests were answered by sterner restrictions and even by violence. The discontent was increased by the economic dislocation incident to World War II, and by the unfavourable contrast between the idealistic pronouncements of Allied war leaders and conditions in Guatemala. Guatemala declared war on Japan Dec. 8, 1941, and on Germany and Italy Dec. 11, 1941.

In June 1944 a general strike forced Ubico to resign. Labour was allowed to organize, political parties were formed and a presidential electoral campaign was begun in which Juan José Arévalo soon emerged as the most popular candidate. When Gen. Federico Ponce Vaides, head of the interim government, gave indications that he intended to maintain himself in power, he was ousted on Oct. 20, 1944, by a popular uprising headed by students and teachers, workers and younger elements of the military. A revolutionary junta presided over the drafting of a new constitution, the electoral campaign and, in March 1945, the inauguration of Arévalo, the successful candidate.

The Arévalo administration consolidated the social revolution of which the October uprising had been an expression. A favourable labour code was enacted and a social security system was inaugurated which promised progressive extension of benefits. Under this fostering legislation urban labour increased in strength, and organization of agricultural workers began. Public-school education was expanded and improved. teachers' salaries were increased and the university was granted autonomy. These measures were tangible evidence of the intent of the administration to place the instruments of culture within reach of the masses.

In many respects Arévalo manifested the nationalism inherent in the revolution of October. He pressed the Belice issue with Great Britain, subjected foreign enterprises to regulation that he conceived to be in the national interest and attempted to guarantee to Guatemalan labourers a larger share of the benefits produced by their toil and improved status in comparison with foreign employees of foreign corporations operating in the country. The policies followed by Arévalo consolidated the revolutionary elements of 1944 into a politically effective group prepared to support any government of like orientation. Thus the revolution and the Arévalo regime accomplished the transfer of political power in Guatemala from the military to a popular group of which organized labour was the most important single element.

This development Guatemalan Communists turned to their peculiar advantage. Lack of leadership from the rank and file allowed Communists to organize the labour movement and use it for their own ends. Arévalo was not friendly to their activities, but his nationalistic bent gave them opportunity to establish themselves as his most enthusiastic and reliable backers on issues for which he badly needed support. In this fashion they won for themselves a degree of toleration which permitted them to operate.

The most likely candidates to succeed Arévalo were Francisco Arana and Jacobo Arbenz Guzmán, but Arana was removed from contention by assassination. Arbenz Guzmán became the official candidate, was elected, with Communist support, over Gen. Miguel Ydigoras Fuentes, and assumed office in March 1951. Arbenz Guzmán made agrarian reform the central project of his administration. With strong Communist support, the assembly passed a measure providing for the expropriation of unused portions of landholdings in excess of a specified acreage, and the distribution of the land, title to which remained with the government, among landless peasants. Most sober observers admitted that land reform was necessary, but many criticized specific details of the Arbenz Guzmán law and the fact that administration officials made it less an instrument for achieving reform than a weapon against the interests and the classes they wished to destroy.

The growth of Communist influence in Guatemala became the most controversial issue of the Arbenz Guzmán regime. The president's toleration allowed the party to operate openly. and individual Communists to hold key posts in government, official agencies and organized labour. In the minds of many individuals, the crucial issue was not social reform but Communist domination of Guatemala. Internal opposition to the trend was eventually stifled by increasingly terroristic means, but exiles and foreign recruits headed by Col. Carlos Castillo Armas planned outside the country to overthrow the government. When the blow fell, military officers informed Arbenz Guzmán that the army would not fight in his defense and forced him to resign (June, 1954).

Castillo Armas emerged from a military junta as provisional president in September and a plebiscite subsequently regularized his status. His attempts to extirpate Communist influence, moderate the extreme social reforms inaugurated by his predecessors and restore the confidence of foreign investment capital were cut short when he was assassinated in the presidential palace by one of his guards, July 26, 1957. After two temporary governments and an election which was nullified by the assembly, Ydígoras Fuentes (National Democratic Reconciliation party) was declared elected to the presidency and took office March 2, 1958.

V. POPULATION

The population of Guatemala has increased, according to census figures, from 2,004,900 in 1921 to 2,790,868 (1,410,775 males; 1,380,093 females) in 1950, or 66.4 inhabitants to the square mile. The official 1957 estimate placed the figure at 3,453,264. Population is concentrated in the highlands paralleling the Pacific, but clusters occur in the lowlands on either side and particularly on the Pacific slope. About 25% of the population is urban, the rest

*More than 93% Indian. $More than 70% Indian. †More than 50% Indian.

is rural.

On the basis of cultural traits (not ancestry). inhabitants are classified locally as Indian (54%) and Ladino (see The People, above). Less than 5% of the population is white, and about 5% is Negro or mixed Negro and Indian (such as the "Black Caribs" of the Caribbean coast). Indigenous highland communities, particularly those in isolated locations, tenaciously maintain their traditional tribal customs and language and their distinctive village dress and mode of life. These characteristics keep Indian groups apart from European (Ladino) culture. as well as from each other. This division of the population into two distinct culture groups has consistently been a basic national problem. (W. J. G.)

VI. ADMINISTRATION AND SOCIAL CONDITIONS

Constitution and Government. — The constitution of Guatemala which became effective on March 1. 1956, was preceded by those of 1851, 1876, 1879 and 1945. The government is divided into three equal branches, executive, legislative and judicial.

Executive power is vested in the president, who is elected for a term of 6 years by popular vote and is ineligible for re-election for 12 years after leaving office. The president must be a native Guatemalan over 35 years of age. He appoints and presides over the council of ministers or cabinet whose members are responsible to him, although congress may under certain conditions bring about the dismissal of one or more of them. They have the right to participate in congressional debates and are obliged to appear and answer questions put to them by members of congress.

Legislative power is delegated to the congress, which is unicameral and composed of one deputy for each 50,000 inhabitants or fraction thereof in excess of 25,000, each department having the right to elect at least one deputy. Deputies are elected by popular direct suffrage for a term of four years, with half the congress being elected every two years. A nine-member permanent committee composed of eight members elected by congress and the president of congress acts during recesses. Deputies must be native Guatemalans over 21 years of age and may be re-elected.

The judicial power is exercised by the judges of the tribunals of the republic. The judges of the supreme court of justice and of the court of appeals, which may be composed of one or more chambers. are elected by congress for terms of four years and may be re-elected. Judges of first instance and lower judges are appointed and removed by the supreme court.

Guatemala is divided for administrative purposes into 22 departments, each headed by a governor appointed by the president. The departments in turn are divided into municipalities which are controlled by popularly elected municipal corporations

The constitution contains broad guarantees of rights to citizens, including life, liberty, equality and security of person. honour and property, freedom of movement in or out of the country. freedom of religion, the right of association and peaceful assembly and freedom of speech, but outlaws the Communist party. Detailed social guarantees are established for labour, public employees, the family and culture. Certain guarantees may be suspended by the president in agreement with the council of ministers, subject to ratification by congress.

All males over 18 years of age may vote but only those women over 18 who can read and write Spanish may vote. Male illiterates may hold municipal but not national office. Voting is compulsory for literate males and optional for women and illiterates.

Living Conditions. — The Guatemalan cost-of-living index showed a steady rise in the 1950s (1953 = 100, 1958 = 109) although living standards were low. The gross national product remained about U.S. $170–$180 per person. Approximately 1,000,000 Guatemalans were gainfully employed. During the revolutionary period from 1944 to 1954, the Guatemalan government placed heavy emphasis on labour reforms. A labour code adopted in 1947, designed to stimulate the growth of trade unions, provided for collective bargaining, settlement of labour disputes in labour courts and compulsory arbitration of disputes involving public services. Amendments in 1948 required severance pay and permitted farm workers to join unions, regardless of the size of the enterprise in which they worked. Despite these and other similar measures, only about 5,000 Guatemalan workers remained members of internationally affiliated labour unions in the mid-1950s.

Welfare Services. — Guatemala's social security coverage was also expanded during the period 1944–54. Laws passed in 1946 provided cash and medical benefits for both occupational and nonoccupational injuries, insurance being compulsory for employers of five or more persons. Benefits are financed by employer, employee and government contributions. Severe problems characterize health and sanitation conditions in Guatemala. In the late 1950s, the infant mortality rate averaged about 100 per 1,000 births; there were about 6,000 persons per physician, and 30,000 people per dentist; and fewer than three hospital beds existed for every 1,000 Guatemalans. As a result of its strained relations with the United States, particularly during the administration of Arbenz Guzmán, Guatemala curtailed its participation in bilateral technical assistance programs designed to cope with these health and sanitation problems, although the country continued its contracts for the multiiateral programs of the United Nations. After the revolution of 1954, Guatemala resumed interest in the bilateral programs.

Education. — Education is in theory free. secular and compulsory. According to the 1950 census 72.2% of persons seven years old and over were illiterate. Some progress has been made in combating illiteracy by extending the school system but there are handicaps such as the language barrier (with non-Spanish-speaking Indians).

The University of San Carlos of Guatemala (originally founded in Antigua, Jan. 31, 1676. as the University of San Carlos de Borromeo) was re-established May 2, 1918, with seven faculties and schools. The 1956 constitution provided that the university receive no less than 2% of the annual national budget. The National library and government archives contain more than 83,000 volumes.

Defense.—Military service is legally compulsory between the ages of 18 and 50 but not observed. The size of the armed forces is limited by agreement with the other Central American nations. There is a small air force. The president is chief of the armed forces. (G. I. B.)

VII. THE ECONOMY

Agriculture. — The economy of Guatemala is basically dependent upon agriculture. The country is exceptionally well suited both in soils and climate to a diversified agricultural development. In the late 1950s about 3,500,000 ac. were devoted to field and tree crops and 1,500,000 ac. to pasture, Maize and beans. the leading crops for domestic use, are grown everywhere. Other crops mainly for home consumption are rice, wheat, sugar cane, tobacco, potatoes, fruits and vegetables.

Coffee, the chief export crop, is grown between 1 000 and 5,000 ft. above sea level. There are about 12,000 producers. but 80% of the crop comes from 1.500 larger coffeefarms. Production consists largely of the Arabica and Bourbon types. Bananas, the second export crop, are grown on large plantations in the region of Tiquisate on the Pacific coast and in the valley of the Motagua river on the Atlantic coast. The United Fruit company, by far the largest producer, handles almost all banana exports. Export crops of lesser importance include essential oils (mainly citronella and lemon grass), cotton, abaci, chicle. and cacao.

Annual production of coffee in the late 1950s was about 1,800,000 quintals (1 quintal = 101.43 Ib.) with exports averaging 1 300,000 quintals. Banana exports, reduced sharply by plant disease, labour disputes and hurricanes, mere about 3,000,000 quintals yearly in the late 1950s.

In the late 1950s the livestock population numbered well over 1,000,000 cattle; about 750,000 sheep; more than 400,000 pigs; 250,000 horses, mules and asses; and 80,000 goats.

An extensive land-reform program was authorized by an agrarian reform law of June 17, 1952, which gave the government power to expropriate uncultivated lands on large estates and on the *fincas nacionales* ("national farms'). estates taken over from German nationals during World War II. Owners were to be compensated by government bonds and the lands leased in small holdings of about 25 ac. Expropriations were halted after the change of government under a statute of July 27, 1954, and the 1952 legislation was replaced by a new agrarian law in 1956 under which the program of providing small holdings was resumed at a reduced rate.

A substantial portion of the extensive holdings of the United Fruit company on the Pacific coast had been expropriated under the 1952 law but these holdings were returned to the company by the government of Castillo Armas. By an agreement signed Dec. 27, 1954, the United Fruit company was to return to the government about 17j sq.mi. of land along the southern coast and to pay a 30% tax on profits. Under a revised contract signed Dec. 11, 1956, the company was also obligated to invest at least $5 000,000 within five years to bring an additional 5,500 ac. under cultivation.

Mining. — Major known mineral resources include gold, silver, lead, zinc. copper, chromium and sulfur. The leading mining area is near Cobán where lead and zinc are produced. Lead is also produced near San Miguel Acatán in the department of Huehuetenango. By the late 1950s around 11,000 tons of lead concentrate and 16,000 tons of zinc concentrate were being produced annually. Petroleum deposits may exist in northeastern Guatemala, particularly in the Petén, Alta Verapaz and Izabal. A new petroleum code in 1955 was followed by applications by 29 international and local companies for exploration permits, chiefly in the Petén.

Forest Resources.--Nearly two-thirds of the country is forested. including about 15,000,000 ac. of hardwood and 3,000,000 ac. of softwoods, but forest resources remain relatively unexploited because of their inaccessibility. The Petén is particularly rich in mahogany and dyewoods. Production of chicle. Guatemala's most important forest derivative, dropped sharply after World War II because of destructive harvesting practices and the competition of synthetic substitutes and natural latex from chilte trees. Nevertheless, exports of chicle showed some recovery by the late 1950s.

Industries. — Manufacturing occupies a comparatively minor place in the national economy. Production is chiefly for the domestic market and enterprises tend to be small. Products include textiles, alcoholic beverages, soft drinks, food products, cement, shoes, soap, candles, cigarettes, furniture and Indian handicrafts. Production of brown sugar (*panela*) and molasses is significant on the southern coast. The first tire factory in Central America was opened. with U.S. capital, in 19j8.

Industrial expansion is hampered by the lack of power which is relatively expensive, since coal and oil must be imported. There is, however, a large potential supply of hydroelectric power, nith suitable installation sites, on the rivers running to the Pacific and the Caribbean.

Foreign Trade. — The U.S. is Guatemala's best customer, followed by the German Federal Republic, Mexico and the United Kingdom. Coffee is the most important export product and usually accounts for more than 75% of the total value of all exports. Bananas, whose share in the late 1930s amounted to nearly 30%, represented less than 10% in the 1950s. Some diversification of exports took place during and after World War II and Guatemala became for a time the world's leading producer of essential oils.

Table 11.—Foreign Trade of Guatemala (in $000)

Item	1947	1950	1953	955	1956	1957
Imports	$57,319	$71,222	$79,538	$104,318	$137,700	$159,900
Exports	52,033	67,605	88,922	98,699	116,291	108,796

In the 1950s cotton, a crop new to Guatemala, enjoyed a mild boom.

The U.S. usually takes about 75% annually of the exports and supplies about 80% of the imports. The latter include machinery, motor vehicles, petroleum, textiles, flour, chemicals and iron and steel manufactures.

Finance. — The monetary unit is the quetzal, at par with the U.S. dollar. The 1958–59 budget estimates balanced revenue and expenditure at $113,100,000. In 1957–58 revenue totaled $124,630,300; expenditure $123,192,900. The national debt was officially reported to be $48,237,400 on March 31, 1958, of which $9,917,500 mas external. National income was estimated at $559,200.000 in 1957.

Communications. — Railway service in Guatemala is provided by the International Railways of Central America, a company controlled by the United Fruit company, its principal user. The main line runs from Puerto Barrios on the Caribbean to Guatemala City, nith branch lines into El Salvador, to San José on the Pacific and to Ayutla, a point for connection with the National Railways of Mexico. United Fruit company operates two private banana railways; 6jz mi. out of a total of 720 are operated by the International railways. There are about 5,000 mi. of highways and roads, mostly unpaved with the exception of the highway from Guatemala City to San José and sections of the Pan American, Pacific Coast and Atlantic (Guatemala City-Puerto Barrios) highways. Puerto Barrios (*q.v.*) on the Atlantic is the most important port and three ports of lesser significance are Santo Tomás on the Caribbean, and San José and Champerico on the Pacific coast.

Air transport service is supplied by three international lines—Pan American Airways, Transportes Aereo Centro-Americanos (Taca) and Royal Dutch Airlines (KLM)—and by a government-owned line (Aviateca) which provides the principal domestic service.

Most of the domestic telecommunications facilities, including telephone, telegraph and radio, are owned by the government. They provide contact between the principal points in the country, but equipment and service are inadequate and good local telephone networks are almost nonexistent except in the capital. International cable services connect with the government telegraph lines.

(G. E. Bl.)

(L W. Be ; M L M , L. Ll)

GUATEMALA, a department in central Guatemala. Area 821 sq mi. Pop. (1950) 438.913. A volcanic highland region, it extends northward to the Motagua river. In the southern part, in the midst of volcanoes, is Lake Amatitlán, a popular resort area with picturesque Indian villages on its shores and also the chief coffee-growing region of Guatemala. Other crops include maize, beans and sugar cane. There is much land in pasture for beef cattle.

Guatemala City (q *v.)* is both the departmental and the national capital and is connected by paved highway and railroad to the lake district. Roads and railroads provide communications with Mexico to the west and El Salvador to the east, and also with the Pacific port of San José and the Caribbean ports of Puerto Barrios and Santo Tombs. (P E. J.)

GUATEMALA CITY is the largest city in Central America (pop., 1950, 284,276), the political and social capital, the cultural centre and the economic heart of Guatemala. It is also the capital of Guatemala department. The city is situated in an intermountain valley at an elevation of slightly less than 5.000 ft , and enjoys the temperate climate and invigoratingly fresh atmosphere characteristic of high altitudes in the tropics

Guatemala City was founded (1776) to replace Antigua (q v.), ruined by an earthquake in 1773, as the capital of the captaincy general of Guatemala. After independence from Spain was declared (1821), it served successively as the capital of the province of Central America under the Mexican empire of Agustin de Iturhide (1822–23), the Central American Federation (1823–33), the state and, finally, the independent republic of Guatemala. The tradition of government from Guatemala caused distrust of the city in other areas of Central America that was a factor in the demise of the federation and the failure of subsequent attempts to revive it.

The modern city was largely rebuilt after the disastrous earthquakes of 1917–18. The characteristic appearance created by low, massive structures has been somewhat modified by the erection of steel and concrete multistoried hotels and office and apartment buildings of modern design. Elegant residential districts have grown up on the borders of the old city, particularly toward the south in the direction of La Aurora airport, and low-cost housing units have been constructed in various parts of the urban area. Most streets are well paved and well lighted, and their cleanliness has become proverbial.

In addition to the government offices and services concentrated there, Guatemala City employs nearly half of the capital invested in the country, accommodates more than half of the industrial establishments and accounts for a like proportion of the industrial production of the republic. It is the focus of transport, both local and international, by highway, railroad and air, and is the commercial and banking metropolis of the country.

The cultural role of the city is equally dominating. It is the seat of the principal faculties of the University of San Carlos; the major institutions for artistic, commercial, vocational and military education; the Society of Geography and History; and several of the important museums and related institutions of the country. Most performances by the national orchestra and the national ballet company and those of foreign artists on tour are given in the capital.

Public buildings of note include the National palace. the post office, police headquarters, the National Archives and the National Library. Among the major religious structures are the cathedral and the churches of San Francisco, Santo Domingo and La Merced. Other points of interest include the remarkable relief map of the country in Minerva park (constructed in 1905 by Francisco Vela), the archaeological and historical museums, the colonial aqueduct, the central market and the Olympic city.

In the environs of Guatemala City are the villages of Chinautla, famous for hand-formed pottery, and Mixco, which supplies the capital with fruits and vegetables. Nearby are the Indian towns of San Pedro and San Juan Sacatepéquez. (W. J. G.)

GUAVA, in Spanish *guayaba,* is the name applied to the fruits of numerous trees and shrubs of the genus *Psidium* (family Myrtaceae), all of which are natives of tropical America. Horticulturally the two important species are the so-called common guava, P. *guajava,* and the cattley or strawberry guava, P. *cattleianum,* which occurs in two forms, one with maroon-red fruits and the other with bright yellow ones. The latter is sometimes listed botanically as P. *lucidum.*

The common guava is a large shrub or small tree with quadrangular branchlets, oval to oblong leaves about three inches in length and white four-petaled flowers an inch broad. The fruits are round to pear shaped, sometimes as much as three inches in diameter though usually less; the flesh, which is white to salmon red in colour. contains numerous small. hard seeds — more abundant in primitive forms of the fruit than in the modern improved varieties. The musky, at times pungent, odour of the sneet flesh is characteristic and not always appreciated.

While useful in many ways, guavas are pre-eminently suited for the preparation of jellies, jams and preserves, highly popular in many tropical countries and exported from a few, notably Cuba. Fresh guavas are rich in vitamin C; they are eaten out of hand or may be sliced and served with sugar and cream as a dessert.

The common guava resists little frost. hence is not cultivated in many parts of California but is successfully grown throughout southern Florida; in several tropical regions it grows so abundantly in a half-wild state as to become a pest.

Propagation of the plant is usually by seeds, but the fine varieties which have been developed in Florida, California and a few other parts of the world must be perpetuated by some vegetative means. Because of its hard, dry wood and thin bark, propagation by cuttings and by conventional methods of grafting are not practical, but veneer grafting, using as rootstocks young plants in vigorous growth, and covering the grafts with strips of polyethylene plastic, gives excellent results. A method known as modified Forkert budding has been recommended in Hawaii.

The cattley or strawberry guava is considerably more frost resistant and is popular in many subtropical regions. It is a large shrub, attractive for its thick, glossy-green oval leaves and its white flowers. The fruits are round, occasionally as much as two inches in diameter, and contain numerous hard seeds like those of the common guava. The flavour of the soft whitish flesh has been likened to that of the strawberry, hence one of the common names. This species is frequently planted in gardens throughout southern California and several other subtropical regions; nowhere has it attained commercial importance.

Other guavas which are used to a limited extent in parts of tropical America include the cis of Costa Rica (P. *friedrichsthalianum*) and the guisaro (P. molle), both of which yield highly acid, not very pungent. fruits. (W. Po.)

GUAYAMA, a town and municipality on the southeastern Caribbean coast of Puerto Rico. Town pop. (1960) 19,152; municipality pop. (1960) 33,685. The town is located on a broad and fertile plain about j mi. from the coast. Extensive irrigation facilities have made the area around Guayama rich in sugar production. Five large *centrales* or sugar factories grind the cane which directly or indirectly supplies the livelihood for about 85% of the population in the area. The sugar is shipped from tno small ports, Arroyo and Puerto Jobos. Guayama is connected by highways to the west with Salinas and Ponce, to the east with Humacao, and with Cayey to the north by the scenic Spanish-built military highway.

The central plaza of Guayama, dominated by San Antonio church and adorned by carefully pruned trees, is one of the most beautiful on the island. Textiles, optical products and soft drinks are manufactured. In the mountains to the north of Guayama are important hydroelectric plants which service the southeastern section of Puerto Rico. The town was founded in 1736 as San Antonio de Padua de Guayama. (T. G. Ms)

GUAYAQUIL, chief port and largest city of Ecuador, capital of the province of Guayas (*q.v.*), located on the west bank of the Guayas river (*q.v.*) about 45 mi. upstream from the Gulf of Guayaquil. Pop. (1950) 258.966; (1955 est) 304,571. The main part of the city is on high ground at the foot of a hill which has two humps called Cerro Santa Ana and Cerro Santa Carmen, about 30 ft. above sea level, and stands above the highest floods of the river although the lower town is at times inundated.

The climate of Guayaquil is equatorial but temperatures are never extreme: the average of the warmest month (April) is 80.4° F., and for the coldest month (July), 75.4°. Rainfall is heavy from January to May, but there is little rain during the rest of the year. Violent storms and heavy uinds are unknown. but the humidity is high, especially in the rainy season. The average annual rainfall is 38 8 in.

A settlement was established near modern Guayaquil in 1535 by Sebastibn de Benalcazar. This site, at the mouth of the Babahoyo river, was subject to flooding and disease. The location was moved, and finally in 1538 Francisco de Orellana established the town in its present location. naming it Santiago de Guayaquil to honour both the saint on nhose day it was founded and the Indian chief Quaya and his wife Quila. The city has survived attacks by buccaneers, fires. earthquakes and pestilence. For many years Guayaquil, uhich is slightly more than 2° south of the equator, was regarded as a plague spot. In the 20th century notable engineering and hygienic achievements were accomplished by the government in co-operation with the Rockefeller foundation, and after 1920 health hazards were reduced to a minimum. In 1822 Guayaquil was the scene of the conference that took place between Simón Bolivar and José de San Martín, after which Bolivar emerged as sole leader of the South American liberation movement.

Traditionally the products of the Guayas lonland are brought to Guayaquil by river boat. Even in the dry season, shallow-draft steamboats are able to ascend the Guayas river for about 80 mi. to Babahoyo and to navigate the Daule river for about 40 mi A branch of the Inter-American highway descends from the highlands to Durán on the left bank of the Guayas river opposite Guayaquil. This is also the western terminal of the Guayaquil-

Quito railway (288 mi.). Passengers and goods cross the river in ferries. An all-weather highway runs from Guayaquil to Quevedo and thence up into the highlands at Latacunga, connecting there with the Inter-American highway; another highway connects Guayaquil with Salinas to the west. In the early 1960s a new highway was being built from Quevedo more directly to Quito by way of Santo Domingo de los Colorados. Guayaquil is served by both international and domestic airlines.

The port of Guayaquil can accommodate ships of up to 22-ft. draft. Larger ships, however, anchor about 40 mi. below Guayaquil at Puná Island and are met there by lighters and ferries. A new port on the Salado estuary, about 10 mi. S.W. of Guayaquil, was being built. Most of the exports and imports of Ecuador pass through the port. The decline in the importance of cacao. however, means that no longer is Guayaquil filled with the odour of the drying cacao kernels, which once were spread on the streets in the dry season and gave the city a distinctive aroma.

Guayaquil has numerous industrial plants, producing leather goods, alcohol, soap, candles, textiles, beer and cement. There are sugar refineries. iron foundries, machine shops, tanneries and sawmills. It has one of Ecuador's two leading universities, founded 1867, and among its older buildings are some notable examples of colonial architecture. Since the earthquake of 1942 much of the city has been rebuilt. (P. E. J.)

GUAYAS, a coastal province of Ecuador, bounded west by the Pacific ocean, north by Manabí, Pichincha and Los Rios. east by Los Rios, Cañar and Azuay and south by El Oro. Area 8,208 sq mi. Pop. (1950) 582,144. The provincial capital is Guayaquil (*q.v.*). The greater part of the province is a lowland surrounding the Gulf of Guayaquil. It is rainy and covered with tropical forest in the north, and becomes drier toward the south.

The flood plains of the Guayas river (*q.v.*) system and along the Guayas itself below Guayaquil, including the swampy Puná Island at the mouth of the river, are inundated each year during the rainy season from December to May. Above the flood plains, plantations produce cacao, bananas, rice, cotton, coffee and fruit. Much of the land, including the flood plains, is used for the pasture of beef cattle.

At the end of the Santa Elena peninsula. 7j mi. W. of Guayaquil. is Ecuador's only oil field. At the town of Salinas, in the midst of the oil field, there are salt-extracting works and a rapidly growing seaside resort. Salinas enjoys an arid climate, with blue skies and comfortable ocean winds, and sandy beaches.

The Galápagos Islands (q *v.*), which form a separate territory of Ecuador. are administered from Guayas province. (P. E. J)

GUAYAS RIVER, a river in the coastal region of Ecuador. Its tributaries rise on the western slopes of the Western Cordillera and descend to drain the wet lowland, upstream from Guayaquil. Chief among these are the Daule, the Vinces. the Chimbo (Yaguachi in its lower course) and the Babahoyo. These tributaries join to form the Guayas which carries all this water about 37 mi. to the Gulf of Guayaquil.

The whole length to the end of the longest tributary is about zoo mi. Steamers drawing 22 ft. can ascend even in the dry season to Guayaquil (*q.v.*), where the river is 2 mi. wide, and smaller river steamers can reach Babahoyo. In the rainy season small steamers can navigate to Zapotal, go mi. S.W. of Quito. The river enters the Gulf of Guayaquil through an estuary on either side of Puna Island. (P. E. J.)

GUAYCURUAN, an independent linguistic stock of South American Indians, so called from the Guaycurus, its best known tribe. The tribes of this stock lived in the Argentine Chaco in the region west of the Paraná and Paraguay rivers, from a little above Santa Fé nearly to the mouth of the Pilcomayo and extending westward north of the Salado river, nearly to the foothills of the Andes. After the early period of Spanish settlement, the Guaycuruan tribes expanded eastward some distance across the Paraná below Corrientes and, farther north, penetrated into southern Mato Grosso in Brazil. The Toba are the best known tribe of the stock today, the Abipones (*q.v.*), made famous by the missionary Dobrizhoffer in the 18th century, being extinct.

See D. G. Brinton, "The Linguistic Cartography of the Chaco Region," *Proc. Amer. Phil. Soc.,* vol. xxxvii; L. Kersten, "Die Indianerstämme des Gran Chaco," etc., *Internat. Archiv. für Ethnographic,* vol. xvii, pp. 1–75.

GUAYMI, an Indian tribe who inhabit the mountains of western Panamá between the Chiriqui volcano and the Belén river, and linguistically allied to the Chibcha of South America. During the Spanish colonial epoch they were dominated by missionaries, but later reverted to their natural living conditions.

The ancestors of the Guaymi are regarded as the makers of gold images and ceramics found in ancient graves throughout western Panamá.

See H Pittier, "Little-Known Parts of Panama," *National Geographic Magazine,* vol. xxiii, no. 7 (1912).

GUAYULE (*Parthenium argentaturn),* a rubber-bearing desert shrub of the Compositae (*q.v.*) family, native to the north central plateau of Mexico and the Texas Big Bend area. Prehistoric Indians are believed to have obtained the rubber by chewing the bark. The modern method is to macerate the shrub mechanically. Rubber mas extracted in Mexico from wild plants during the first half of the 20th century, and vigorous efforts were made to cultivate guayule in southwestern United States during World War II. Commercial production of guayule rubber ceased soon after the end of the war, but research plantings were continued in Spain, Turkey and the United States.

See Alton I. Moyle, *Bibliography and Collected Abstracts on Rubber Producing Plants (Other Than Species of Hevea),* Texas Agricultural Experiment Station *Circular* 99 (Nov 1942) ; K. W. Taylor, "Guayule—An American Source of Rubber," *Econ. Bot.,* 5:255 (1951). (L G. P.)

GUBBIO, a town and episcopal see of Umbria, Italy (anc. IGUVIUM [*q.v.*]; med. EUGUBIUM), province of Perugia. 23 mi. N.S.E. from Perugia by road; by rail 13 mi. N.W. of Fossato di Vico (on the line between Foligno and Ancona) and 70 mi. E.S.E. of Arezzo. Pop. (1951) 8,7j6. Gubbio is at the foot and on the steep slopes of Monte Calvo, 1,568 to 1,735 ft. above sea level, at the entrance to the gorge which ascends to Scheggia, probably on the site of the ancient Umbrian town. The Palazzo dei Consoli, on the north side of the Piazza della Signoria, is a huge two-storied Gothic edifice with a tower (1332–46). It contains the famous *Tabulae Iguvinae,* and a collection of paintings of the Umbrian school, of furniture and of majolica. Being on the slope, palace and piazza are raised on arched substructures. On the south side of the piazza is the Palazzo Podestà. begun in 1349.

Above the Piazza della Signoria, at the highest point of the tonn, is the Palazzo Ducale, erected by the dukes of Urbino in 1474–80; the Palazzo Beni is lower donn. The Palazzo Accoramboni is a Renaissance structure, with a fine entrance arch.

Opposite the Palazzo Ducale is the 12th-century cathedral of SS. Mariano e Jacopo. The interior contains some good pictures by Umbrian artists. a fine episcopal throne in carved wood and a fine Flemish cope given by Pope Marcellus II (1555) in the sacristy. The town is full of specimens of medieval architecture. On May 1j three colossal wooden pedestals. each over 30 ft high, and crowned by statues of SS. Ubaldo, Antonio and Giorgio. are carried through the town, and then, in a wild race, up to the church of S Ubaldo on the mountainside (2,690 ft.). (*See* H M. Bower. *The Elevation and Procession of the Ceri at Gubbio,* 1897.)

After its reconstruction nith the help of Narses (*see* IGUVIUM) the town remained subject to the exarchs of Ravenna. and, after the destruction of the Lombard kingdom in 774, formed part of the donation of Charlemagne to the pope. In the 11th century struggles it was generally on the Ghibelline side. In 1151 it repelled an attack of several neighbouring cities, and formed from this time a republic governed by consuls. In 11jj it was besieged by the emperor Frederick I, but saved by the intervention of its bishop. S Ubaldo. and was granted privileges by the emperor. In 1203 it had its first podesta. In 1387, after various political changes. it came under the dukes of Urbino until, in 1624, the whole duchy was ceded to the pope

Gubbio was the birthplace of Oderisio, a famous miniature painter (1240–99), mentioned by Dante as the honour of his native town. In the 14th and 15th centuries a branch of the Umbrian school of painting flourished here, the most famous masters of which were Guido Palmerucci (1280–1345) and several members of the Nelli family, particularly Ottaviano (d. 1444), whose best work is the "Madonna del Belvedere" in S Maria Nuova at Gubbio (1404). Another work by him is the group of frescoes including a large "Last Judgment," and scenes from the life of St. Augustine, in the church of S. Agostino.

Gubbio occupies a far more important place in the history of majolica. In a decree of 1438 a *vasarius vasorum pictorum* is mentioned, who probably was not the first of his trade. The art was brought to perfection by Giorgio Andreoli, generally known as Maestro Giorgio *(see* POTTERY AND PORCELAIN).

See A. Colasanti, Gubbio (Bergamo, 1905); L. McCracken, *Gubbio* (1905).

GUBEN (now WILHELM-PIECK-STADT), a town of Cottbus *Bezirk,* Ger.. at the confluence of the Lubis with the Neisse. 28 mi. S.S.E. of Frankfurt-on-Oder. Pop. (1959 est.) 22,479. Guben, of Wendish origin, is mentioned in 1207 and received civic rights in 1235. It was surrounded by walls in 1311, about which time it came into the possession of the margrave of Brandenburg, from whom it passed to Bohemia in 1368. In 1635 it passed to the elector of Saxony, and in 1815 it was united to Prussia. After 1945 part of the city on the right bank of the river passed to Poland; it is called Gubin; population in 1950 was 4,329. The principal industries are the spinning and weaving of wool, dyeing and the manufacture of pottery ware, hats, cloth, paper and machinery.

GUCHKOV, ALEXANDER (1862–1936), Russian politician, was born in Moscow. He studied at the universities of Moscow and Berlin. He helped to found the Russian "Octobrist" party. In 1910 Guchkov was elected president of the Duma, but as Stolypin became more reactionary, the Octobrisrs lost their *raison d'être,* and Guchkov eventually resigned the presidentship of the Duma. During World War I he was in charge of the Red Cross organization on the German front. When the March Revolution of 1917 broke out Guchkov became minister of war, but resigned on May j. Later, he took refuge in Paris.

GUDBRANDSDAL, a geographic and cultural district of south central Norway, comprising the valley of the Laagen R. from Lake Mjosen to its source in Lake Lesjeskogen, together with tributary valleys and the vast stretches of the encircling fjells. Though the fjells (including the famed Dovre-fjell) are barren and rugged and the mountains are covered with eternal snow, the narrow valley and its slopes, where arable, are richly fertile. The crude forest economy of the 17th and 18th centuries has disappeared, but the region still produces much timber. Lillehammer, at the southern end, is a thriving town; other communities are small. The district offers excellent fishing and hunting, especially for fowl. A railway and motor road through the valley connect Oslo with Trondheim, and from Dombas both rail and road lead to Andalsnes. Like the other valleys of the country, Gudbrandsdal has developed its own culture and dialect but has long possessed a deeply national sentiment.

GUDERIAN, HEINZ (1888–1954), German army officer, an outstanding tank expert in World War II, was born at Kulm (Polish Chelmno) on June 17, 1888, the son of an army officer. After serving as a staff officer in World War I, he vigorously advocated development of armoured forces. In 1935 he attracted Hitler's attention and was promoted rapidly. Designated chief of mobile troops in Nov. 1935, he proved the soundness of his tank warfare theories in the Polish campaign (1939) and in the conquest of France (1940). Following his unsuccessful drive on Moscow in Oct. 1941, he was temporarily out of favour with Hitler, but in March 1943 he became inspector general of Panzer troops with authority to establish priorities in the production of armoured vehicles as well as to direct their employment. After the attempted assassination of Hitler on July 20. 1944, Guderian became acting chief of staff, a position he held until March 28, 1945.

Guderian was a highly competent officer of the Prussian school who accepted Hitler's leadership as a matter of duty. Of special interest among his several books are *Achtung! Panzer!* ("Attention, Tanks," 1937) and *Erinnerungen eines Soldatcn* (1951), published in English as *Panzer Leader* (1952). Guderian died in West Germany on May 14, 1954. (P. N. T.)

GUDGEON *(Gobio gobio,* sometimes called *G. fluviatilis*), a cyprinid fish inhabiting Europe and northern Asia. It rarely exceeds a length of eight inches; it has a barbel at each corner of the mouth, and a row of blackish spots along the side of the body; it frequents sandy or gravelly shallows. Other species of *Gobio* inhabit-China and Japan.

GUEBRIANT, JEAN BAPTISTE BUDES, COMTE DE (1602–1643), marshall of France, was born near St. Brieuc on Sept. 2, 1602, of an old Breton family. In the Thirty Years' War he commanded (1638–39) the French contingent in the army of Bernard of Saxe-Weimar. Upon the death of Bernard he received the command of his army, and tried, in conjunction with J. Baner (1596–1641), the Swedish general, a bold attack upon Regensburg (1640). His victories of Wolfenbüttel (1641) and Kempen (1642) won for him the marshal's baton. He was mortally wounded at Rottweil on Nov. 17, 1643.

GUELDER-ROSE, so called from Guelderland, its assumed source, is commonly called snowball or snowball bush in the United States. It is *Viburnum opulus sterile,* a sterile-flowered variety of the cranberry tree (V. *opulus*) which is native throughout temperate Eurasia. The guelder-rose is much cultivated for its showy, spring-flowering, ball-like clusters of white, sterile flowers; but. lacking fruit, it does not have the showy autumnal colour of the red drupes of the cranberry tree. In England the term guelder-rose is more often applied to the cranberry tree *(V. opulus)* which is there also called rose elder. An American form of it, sometimes known as V. *americanum,* contains in its bark several fatty acids of which an aqueous solution was once thought to be effective in uterine cramps, hence its common name of cramp bark. *See* VIBURNUM. (N. TR.)

GUELPH, a city and the seat of Wellington county southeastern Ontario. Canada, is 28 mi. N W. of Hamilton and 45 mi. W. of Toronto. On the Canadian National and Canadian Pacific railways, it is in one of the more densely populated areas of Canada —within 13 mi. of the cities of Kitchener and Galt and the towns of Fergus, Elora, Acton, Hespeler and Preston. Founded by the Scottish writer John Galt in 1827 at a power site on the Speed river. a tributary of the Grand, the settleinent was named after the British royal family, Guelph was incorporated as a village in 1851, a town in 1856 and a city in 1879. The Ontario Agricultural college and the Ontario Veterinary college helped mske Guelph an important centre for research and training in scientific agriculture. Among products manufactured are electrical apparatus. hardware, stoves, flour, biscuits, pharmaceutical supplies, leather goods and textiles. Pop. (1961) 39,336. (G. FN.)

GUELPHS AND GHIBELLINES, originally the names of two German parties formed in the 12th century around the families to which respectively belonged the dukes of Saxony and Bavaria and the lords of Hohenstaufen. The rivalry between these two families determined much of the history of Germany in the 12th century, and the names in question were employed at an early date in Italy, where the Ghibellines formed the party of the emperor Frederick I and the Guelphs formed the party opposed to him. In the next century the terms acquired a wider sense; the Ghibellines still formed the imperialist party, but the term Guelph lost all trace of its original association with dynastic rivalries in Germany and became applied to the supporters of the papacy in its struggle against the empire. Long after this struggle had become a matter of history these names survived in Italian civic politics, often denoting factions whose origin had no real connection with the rivalry of empire and papacy in an earlier age. Of the terms themselves, Guelph represents the old German personal name *Hwelp,* originally perhaps a nickname (it corresponds to the English word "whelp"), but borne by many persons of rank, notably Welf, duke of Bavaria in the 11th century. Ghibelline is a form of the place name Waiblingen, an ancient possession of the lords Hohenstaufen and not far from the castle of that name.

GUENEVERE, the wife of King Arthur. Geoffrey of Monmouth, who calls her Guanhumara, makes her a Roman lady, but the general tradition is that she was of Cornish birth and daughter to King Leodegrance. Wace, who, while translating Geoffrey, evidently knew and used popular tradition, combines these two, asserting that she was of Roman parentage on the mother's side but cousin to Cador of Cornwall, by whom she was brought up. The tradition relating to Guenevere is decidedly confused: the Welsh *Triads* know no fewer than three Gwenhwyfars. Giraldus Cambrensis, relating the discovery of the royal tombs at Glastonbury, states that the body found was that of Arthur's second wife. The prose *Merlin* gives Guenevere a bastard half-sister of the same name, who strongly resembles her, and the prose *Lancelot* relates how this lady, trading on the likeness, persuades Arthur that she is the true Guenevere, and the queen the bastard supplanter. This episode of the false Guenevere is very perplexing. The relations with early Irish tradition, where the name appears as Findabhair (Guenevere) add another element to the confusion.

To the majority of English readers Guenevere is best known in connection with her liaison with Lancelot, a story which forms no part of the early Arthurian tradition. The Lancelot-Guenevere romance took form and shape in the latter part of the 12th century, amid the artificial atmosphere encouraged by such patronesses of literature as Eleanor of Aquitaine and her daughter Marie, Comtesse de Champagne (for whom Chretien de Troyes wrote his *Chevalier de la Charrette,* where Lancelot first appears as Guenevere's lover), and reflects the low social morality of a time when love between husband and wife was declared impossible. The tradition of Guenevere's infidelity is, however. of much earlier date, and probably formed part of the genuine Arthurian tradition. The stories vary; sometimes she is the unwilling victim of an abduction, sometimes she figures in a guilty flight with her lover. The *Vita Gildae* relates how she was carried off by Melwas, king of Aestiva Regis (Somerset), to Glastonbury, whither Arthur, at the head of an army, pursued the ravisher. A fragment of a Welsh poem seems to confirm this tradition, which certainly lies at the root of the story of her abduction by Meleagant, told by Malory. In the *Lanzelet* of Ulrich von Zatzikhoven the abductor is Falerin, a magician. The story in these forms represents an other-world abduction. A curious fragment of Welsh dialogue, printed by Sir John Rhys, appears to represent Kay as the abductor. In the chronicles, and the romances based upon them, the abductor is Mordred. and the queen is no unwilling victim. On the final defeat of her lover she retires to a convent, where she takes the veil and is no more heard of.

Layamon says that she was reported to have drowned herself, and that her memory and that of Mordred were hateful in every land. so that none would offer prayer for their souls.

The truth seems to be that we are dealing here with a mixture of mythic elements and pseudo-historic tradition. The story of Guenevere's abduction belongs to the former, that of her betrayal of her husband, with a near relative, and consequent flight, to the latter.

See Sir *J. Rhps, Studies on the Arthurian Legend* (1891); *J.* L. Weston, *The Legend of Sir Lancelot* (1901); *R.* S. Loomis, *Celtic Myth and Arthurian Romance* (1928). (J. L. W.)

GUENON, any of the long-tailed African monkeys (*Cercopithecus)* with hair many-banded, dark and light. They are more slender than the macaques, but like them have cheek pouches. (J. E. HL.)

GUÉRANGER, PROSPER LOUIS PASCAL (1805–1875), French Benedictine monk, restorer of Benedictine monachism in France and pioneer in the modern liturgical revival, was born on April 4, 1805. Reacting while still a theological student against the lingering Gallicanism (*q.v.*) of his day. he was ordained priest in 1827. Although strongly sympathizing with the views of Hugues Felicité Robert de Lamennais (*q.v.*), he never identified himself intimately with the views of that erratic genius. His studies in Christian antiquity and the history of Christian institutions led to a strong feeling for the Roman liturgy and to the beginning of a campaign for the abolition of the various local liturgies then flourishing in France. It was not long before the idea of restoring Benedictine monachism. extinct in France as a result of the Revolution and the legislation of the Napoleonic era, took hold of him. In Dec. 1832 he acquired the monastic buildings and lands of Solesmes, an 11th-century foundation. In spite of numerous difficulties. within five years Solesmes was confirmed as an abbey by the Holy See with Guéranger as first abbot and head of the Benedictine Congregation of France. A great advance had been made. and in spite of recurring administrative problems, studies long interrupted could now be resumed.

In 1840 appeared the first volume of Guéranger's *Institutions liturgiques*, an ambitious project never carried to completion, but of extraordinary effectiveness in restoring the Roman liturgy in dioceses in which it had been supplanted by unauthorized compositions of the 17th and 18th centuries. The second volume appeared in 1841, the third ten years later. The historical sections of the work must be pronounced defective, at times seriously so, but the second volume is still important for the history of the liturgy in France in the 17th century and in the two centuries following. When the three volumes were re-edited after the author's death, a fourth was added (1885) containing several controversial letters, written in reply to criticisms uhich the work had evoked. Of quite a difierent character — that is, strictly devotional — is another work which began to appear in the same year as the *Institutions*, the *Année liturgique*, of which nine volumes — from Advent through Paschaltide — were published in the author's lifetime. Six volumes, the work of Dom Lucien Fromage, who dealt with the period after Pentecost, completed the series (1878–1901), which was frequently reprinted, not only in the original but also in more than one of the languages into which it had been translated. A complete list of Gueranger's works is to be found in the *Bibliographie des bénédictins de la Congrégation de France,* 2nd ed., 55–71 and 167–168 (1906). Guéranger died on Jan. 30. 1875.

GUERCINO, the name given to GIOVANNI FRANCESCO BARBIERI (1591–1666), Italian baroque painter, because of his squint. He was born on Feb. 8. 1591, at Cento, near Ferrara, and received his earliest training locally. But the formative influence on his style came from Bologna, especially from the work of Lodovico Carracci. His first pictures (*e.g.,* the "Madonna in Glory With Saints and a Donor:" at the Brussels museum) have large, rather uncouth forms, strong colour, unbalanced compositions and broad, vigorous brushwork. The lights are scattered over the surface in patches. leaving much of the picture in shadow *(cf.* Carracci's Cento "Madonna" of 1591). This method of using light and shadow was unrelated to the discoveries of Caravaggio and was derived from Bologna and Venice, which Guercino visited in 1618; the tendencies toward realism in his style were general in 17th-century Italy.

In 1621 Guercino went to Rome, and there, among many other commissions, decorated the Casino Ludovisi. The main fresco, "Aurora," on the *gran' salone* ceiling. is a spirited. romantic work; yet it already reveals something of the crucial experience of his stay in Rome, which was his contact with Pope Gregory XV's private secretary, Monsignor Agucchi, a propagandist for the classicism of Annibale Carracci's Roman style. Guercino seems to have tried to make his own style conform with Carraccesque principles, an effort reflected in his "Sta. Petronilla" (Vatican gallery).

On the death of Gregory in 1623, Guercino returned to northern Italy, continuing to smooth out the unclassical features of his style. The result was not entirely happy and Guido Reni's unassailable position in Bologna as heir to Annibale Carracci increased his difficulties. But Guercino was continually employed by ecclesiastical and private patrons. Some of the later works—*e.g.,* the "Death of Dido" (Spada gallery. Rome) and the "Hercules and Antaeus"

(Palazzo Zampieri, Bologna), both of 1631—are considerable achievements; others are weak and empty. In 1642 Guido died and Guercino settled in Bologna, where he died on Dec. 22, 1666.

See D. Mahon, *Studies in Seicento Art and Theory* (1947).

(M. W. L. K.)

GUÉRET, a town of central France, capital of the *département* of Creuse, situated 48 mi. N.E. of Limoges on the Orleans railway. Pop. (1954) 8,700. Guéret grew up around an abbey founded in the 7th century, and in later times became the capital of the district of Marche. The Hôtel des Monneyroux (used as a prefecture), a mansion of the 15th century, is the only building of importance.

It is the seat of a prefect and a court of assizes, and has a tribunal of first instance, and a chamber of commerce. The industries include leathermaking and the manufacture of basketwork, tiles, hosiery and wooden shoes, and there is trade in agricultural produce and cattle.

GUEREZA, a long-tailed black and white Ethiopian monkey, *Colobus abyssinicus,* often called bishop monkey from the attractive robelike mantle of fine, silky white hair; the name is sometimes extended to embrace all the darker thumbless monkeys of the genus *Colobur* They resemble the langurs (*q.v.*) with which they agree in their slender build. These gentle herbivores seldom leave the tops of tall trees.

GUERICKE, OTTO VON (1602–1686), German natural philosopher, notable for his studies of air pressure, was born at Magdeburg, in Prussian Saxony, on Nov. 20, 1602. Having studied law and mathematics in Germany and at Leyden, he visited France and England. and in 1636 became engineer-in-chief at Erfurt. In 1627 he was elected alderman of Magdeburg, and in 1646 mayor of that city and a magistrate of Brandenburg. His leisure was devoted to scientific pursuits. especially in pneumatics. Incited by the discoveries of Galileo, Pascal and Torricelli, he attempted the creation of a vacuum.

After a number of partially successful experiments he invented the air pump (1650). Besides investigating other phenomena connected with a vacuum, he constructed an electrical machine which depended on the electrification of a rotating ball of sulfur; he also made successful researches in astronomy, predicting the periodicity of the return of comets. In 1681 he gave up office, and retired to Hamburg, where he resided until his death on May 11, 1686.

His principal observations are given in his work, *Experimenta nova, ut vocant, Magdeburgica de vacuo spatio* (1672). He is also the author of a *Geschichte der Belagerung und Eroberung von Magdeburg. See* F. W Hoffmann, *Otto von Guericke* (1874).

GUÉRIDON, a small table to hold a lamp or vase, supported by a tall column or a human or mythological figure. This piece of furniture, often very graceful and elegant, originated in France toward the middle of the 17th century.

In the beginning the table was supported by a Negro or some exotic figure, and there is some reason to believe that it took its name from the generic appellation of the young African groom or "tiger," who was generally called "Guéridon," or, in English, "Sambo."

GUERILLA: *see* GUERRILLA WARFARE.

GUÉRIN, PIERRE NARCISSE, BARON (1774–1833), French painter, the teacher of both E. Delacroix and J. Géricault, was born at Paris on May 13, 1774. He had an early success with his topical "Marcus Sextus" (1799, Louvre). "Phèdre et Hippolyte" (1802, Louvre) and "Andromaque" (1810, Louvre) are melodramatic and highly calculated pieces. His best painting, the only one to show feeling for colour and atmosphere, is "Enée racontant à Didon les malheurs de Troie" (1817, Louvre). He died in Rome on July 16, 1833. (AA B.)

GUÉRIN DU CAYLA, GEORGES MAURICE DE (1810–1839), French poet. was born at the château of Le Cayla in Languedoc. He joined for a short time the group formed by Lamennais (*q v.)* at La Chênaie. Early in 1833 he went to Paris, where he taught at the Collège Stanislas. In Nov. 1838 he married a Creole lady of some fortune. He died on July 19, 1839. In the *Revue des deux mondes* for May 15, 1840, there appeared a notice of Maurice de Guérin by George Sand, to which she added two fragments of his writings—one a composition in prose entitled the *Centaur,* and the other a short poem. His *Reliquiae* (2 vols., 1861), including the *Centaur,* his journal, a number of his letters and several poems, was edited by G. S. Trébutien, and accompanied with a biograpical and critical notice by Sainte-Beuve. A new edition, with the title *Journal, lettres et poèmes,* followed in 1862; an English translation of it was published at New York in 1867.

Though Maurice de Guérin was essentially a poet, his prose is more striking and original than his poetry. Its peculiar and unique charm arises from his strong and absorbing passion for nature, a passion of pagan intensity.

The name of EUGÉNIE DE GUÉRIN (1805–48), sister of Maurice de Guérin, was closely associated with her brother's work. Her *Journals* (1861, Eng. trans., 1865) and her *Lettres* (1864, Eng. trans., 1865) indicated the possession of giits of as rare an order as his, though of a different kind. In her case mysticism assumed a form more strictly religious, and she continued to mourn her brother's loss of his early Catholic faith. She died on May 31, 1848.

See the notices by George Sand and Sainte-Beuve referred to above; Sainte-Beuve, *Causeries du lundi* (vol. xii) and *Nouveaux Lundis* (vol. iii); G. Merlet, *Causeries sur les femmes et lès livres* (1865); Selden, *L'Esprit des femmes de notre temps* (1864); Marelle, *Eugénie et Maurice de Guérin (1869)*; Harriet Parr, *M. and E. de Guérin, a monograph* (1870); and Matthew Arnold's essays on Maurice and Eugenie de Guérin, in his *Essays in Criticism.*

GUERNIERI or WERNER (fl. 1350), a celebrated mercenary captain, was a member of the family of the dukes of Urslingen. He served the Pisans (1340–43), but afterward collected a troop of adventurers which he called the Great Company, and with which he plundered Tuscany and Lombardy. He then entered the service of Louis I the Great, king of Hungary and Poland, whom he assisted to obtain possession of Naples. When dismissed from this service his ravages culminated in the sack of Anagni in 1358. He is said to have worn a breastplate with the inscription, "The enemy of God. of pity and of mercy."

GUERNSEY, the second largest of the Channel Islands, and the westernmost of the important members of the group, its chief town, St. Peter Port, on the east coast (in 2° 33' W., 49° 27′ N.) being 30 mi. from the nearest French coast to the east. The island, roughly triangular. is $9\frac{3}{4}$ mi. long from northeast to southwest and has an extreme breadth of $5\frac{1}{4}$ mi. and an area of 24.46 sq.mi. Pop. (1951 census) 43,547, excluding about 100,000 annual visitors. The island was occupied by German forces from June 30, 1940, to May 9, 1945.

The island is flat and low in the north, but rises gradually to a plateau (height more than 300 ft.) in the south. The fracturing of the granitic rocks resulted in steep-sided valleys and bays, separated from one another by rocky headlands. The scenery of the south coast, with the bays of Moulin Huet, Saints and Petit Bot, is notable. The west side of the island has a gradual slope and longer, wider valleys with a low rocky coast and open bays (Rocquaine, Perelle, Vazon, Cobo, etc.) exposed to the Atlantic. On the sheltered eastern side are the two ports, St. Peter Port and St. Sampson, the harbour of St. Sampson being the remnant of an arm of the sea, which formerly isolated the Vale and L'Ancresse in the northeast from the rest of the island.

Soil structure ranges from heavy loam in the south to pure sand in the north. Seaweed, or vraic, has been used for centuries as manure, and large quantities are still incorporated in the soil annually, the cutting and harvesting of vraic being regulated by law. The climate is mild and equable and the annual sunshine record is high, averaging 1,905 hr. In consequence, the island is popular as both a winter and summer resort.

The typical form of settlement in Guernsey is that of the smallholder, agriculture proper having largely given way to horticulture and domestic building. Initial permanent colonization of the island was by militant monks from the duchy of Xormandy prior to the conquest of England. It is a region rich in megalithic monuments of Armorican type and most of the churches are definitely on sites of prehistoric sanctity. Celtic saints have left their trace in legend and dedication; there is also a Norse element in the population. About the 11th century most of the land was apportioned to Norman manors, but the usual organization became modified because of absentee lords. Fishing supplemented cultivation, and in the 17th and 18th centuries Guernsey developed maritime adventure, including privateering for the English kings against the French during the frequent wars. The introduction of a root crop (parsnips) brought agricultural prosperity: but the end of privateering with the peace of 1815 meant a crisis for Guernsey in spite of its ships and shipyards and its use as a place for the storage and maturation of southern wines. In the middle of the 19th century a great local effort led to the building of harbours, a prelude to the development of rapid communications. There is also an excellent airport on the island. Because of its slope northward and its somewhat exposed position, Guernsey is not warm enough in summer to grow grapes and tomatoes intensively in the open. It therefore specializes in cultivation under glass, the area of which covers about 1,000 of its total 15,560 ac. Guernsey has a separate herd of dairy cattle of great value. 'In the middle of the 19th century granite was the island's main export and was quarried at its northern end, but this trade declined.

Guernsey is united with Alderney, Sark, Herm and the adjacent islets to form the bailiwick of Guernsey, separate from Jersey (*see* CHANNEL ISLANDS for constitution). Guernsey is divided into ten parishes, with St. Peter Port, its chief town, as one. The population of St. Peter Port in 1951 was 16,799. There is good Romanesque work in the church of St. Michael, Vale, and the church of St. Peter Port is a notable building. Remains of monastic buildings are seen at Yale and on Lihou Island, north of Rocquaine bay.

See C. P. Le Huray, *The Bailiwick of Guernsey* (1952); B. C. de Guerin, *The Norman Isles (1948)*. (B. C. DE G.)

GUERRAZZI, FRANCESCO DOMENICO (1804–1873), Italian patriot and writer of historical novels through which he expressed his political opinions. Born at Leghorn on Aug. 12, 1804, he was educated for a legal career at Pisa, where in 1821 he met Byron. In 1829, with Guiseppi Mazzini and Carlo Bini, he founded at Leghorn a political journal, the *Indicatore livornese*, which was soon suppressed. Several times imprisoned for his activity in the cause of Young Italy, he wrote his most famous novel, *dssedio di Firenze* (1836), in prison. He became a liberal leader at Leghorn, and in 1848 was made a minister. In 1849, on the proclamation of the republic of Tuscany and the flight of the grand duke, he was one of the triumvirate, with Mazzini and Guiseppi Montanelli, and then became dictator, but after the restoration he was arrested and imprisoned. and exiled to Corsica. He was later allowed to live at Genoa and, after 1862, became a deputy at Turin. He died near Cecina, Sept. 23, 1873. His many romantic novels, in which artistic and historical truth is sacrificed to political enthusiasm, reveal the fieriness of temperament which made him an effective political speaker.

See R. Guastalla, *La vita e le opere di F. D. Guerrazzi* (1903); P. Miniati, F. D. *Guerrazzi* (1927).

GUERRERO, FRANCISCO (c. 1528–1599), Spanish composer, was born at Seville about 1528. He became a pupil of Morales and was one of the most important of the Spanish group who came under Italian influence in the second half of the 16th century. At 18 he was made maestro de capilla at Jaen. His next appointment was at Malaga, and in 1554 he became maestro de capilla of Seville cathedral. He died on Nov. 8. 1599. Many of his works have been preserved, the most important being: a volume of *Sacrae cantiones* for four and five voices (1 j55); *Magnificats* (Louvain 1563); *Liber primus Missarum F. Guerrero Hispalensis Odei phonasco autore* (Paris, Du Chemin 1566), containing lour masses in five parts, five masses in four parts, motets and five and six parts and a *Pater noster* in eight parts (a copy of this is in the Imperial library. Vienna); motets. published in Vienna 1570, 1589; masses, published in Rome 1$82. Eslava's famous collection: *Lira sacrohispana* (1869) contains Guerrero's Passion according to St. Matthew for four voices and the Passion according to St. John for five voices, three motets for five voices and a four-part mass. For a complete list, *see* Robert Eitner's *Quellenlexikon. See* also the article *Guerrero* by J. R. Sterndale-Bennett in Grove's Dictionary.

GUERRERO, VICENTE (1783–1831), Mexican independence hero born at Tixtla, began his military career in 1810. José Maria Morelos commissioned him to promote the revolutionary movement in the south. By 1817 the movement was virtually suppressed, but Guerrero continued guerrilla warfare until he accepted (1821) Agustín de Iturbide's invitation to consummate Mexican independence.

When Iturbide had himself crowned emperor (1822), Guerrero participated in the military and political struggles which followed. In March 1829 he was chosen president but the tenacious soldier proved less adept at political administration. The troops of Antonio López de Santa Ana rebelled and Guerrero was betrayed, tried and executed in Chilapa on Feb. 14, 1831.

(S. R. R.)

GUERRERO, a Pacific coast state of Mexico, bounded northwest by Michoacán, north by México (state) and Morelos, northeast and east by Puebla and Oaxaca and south and west by the Pacific. Area 24,887 sq.mi. Pop. (1950) 919.386, largely composed of Indians and mestizos. The state is roughly broken by the Sierra Madre del Sur and its spurs, which cover its entire surface with the exception of the Pacific coastal plain. The valleys are usually narrow, fertile and heavily forested. but difficult of access. Guerrero is divided into two distinct zones—the *tierras calientes* of the coast and lower river courses where tropical conditions prevail, and the *tierras templadas* of the mountain region, celebrated for its agreeable, productive and healthy climate The principal river is the Balsas. Agricultural products include cotton, coffee, tobacco and cereals, and the forests produce rubber, vanilla and various textile fibres. Mineral resources include silver. gold, mercury, lead, iron. coal, sulfur and precious stones.

Guerrero became a state in 1849, and was named after Vicente Guerrero, a leader of Mexico's war for independence. Chilpancingo (pop. 12,662). the capital, is an agricultural centre. Two well-known cities are Taxco (pop. 10 025) and Acapulco (*q.v.*), a famous colonial port now a fashionable resort. Taxco's silver industry, which dates from the 1520s when Hernán Cortes established a mining community, has been revived, largely through the efforts of William Spratling. Taxco, because of its colonial character, has been declared a national monument, and is a great tourist and art centre. Its baroque church of Santa Prisca is one of the most famous in Mexico. (J. A. Cw.)

GUERRILLA WARFARE, a form of warfare carried on by independent. quasi-military groups in connection with a regular war. generally in the rear of or on the flanks of the enemy. The term guerrilla, of Spanish origin, means literally "small war"; in English, when used as a noun, it denotes a person engaged in the kind of warfare just described. The term partisan is synonymous with guerrilla, as is "irregular."

A guerrilla or partisan is, in the literal meaning of the word, an "irregular"; he is never a regular soldier and his irregularity is his trade-mark. In the Peninsular War of the early 1800s the Spanish guerrillas called themselves *partidos* or "partisans"; during World War II the Soviet irregulars called themselves partisans or "fighters for freedom." The Germans termed these same partisans *Banditen* or "bandits." In general, a regular war may be defined as the attempt to take terrain from an enemy and hold it or deny it to him; an irregular war. or warfare by guerrillas, partisans or nonregulars, may be defined as the attempt to prevent or avoid exploitation of terrain by an enemy. In its broadest sense, guerrilla warfare is the projection behind enemy lines of all elements of a war fought between regular armies.

Guerrilla warfare and guerrilla-type warfare are not the same thing. Tribal warfare, for example, consisting of operations carried out by relatively primitive groups not in connection with a regular war. cannot be considered guerrilla warfare. The campaigns waged by Iberian, Gallic and Germanic tribes against Rome were regular wars in that the tribes, no matter what their composition, strategy or tactics, represented the only striking forces opposing the legions. They were the armies of the tribes defending their land against invasion or occupation. Similarly, the long series of tribal wars fought by native groups against the British army and the Indian wars in America cannot be considered guerrilla warfare. The armies of the Russian Reds in the period 1917–21 and the Chinese Communists in the period 1927–40 have been called "guerrilla armies of movement" by their leaders because of their loosely knit constitution and type of operations. But these were not true guerrilla armies and the warfare they waged was not true guerrilla warfare, though it was the only warfare they were organizationally and logistically capable of waging.

Generally speaking. guerrilla warfare may take any one of several forms. It may be a rebellion of an indigenous populace synthetically instigated and supported from without; it may be a popular revolt against enemy occupation with some organization and central direction by a recognized authority; or it may be the activity of sizable groups of troops bypassed by an invader in a rapid offensive. The activity of the Spanish guerrillas against the Napoleonic armies in the Peninsular War was a combination of a popular rising against an invader and occupier and a revolt supported and sustained by the British from without. as was the French resistance to German occupation during World War II. The Arab revolt of 1916–18 against the Turks and Germans was synthetic both in conception and execution; it was bought of the Arabs with promises of national independence, arms and supplies, advice and leadership and several million British pounds sterling. The Soviet partisan movement against the Germans in World War II was a combination of a popular revolt and the activity of bypassed regular army groups brought into a cohesive effort by a central authority.

For guerrilla warfare to start and develop into an effective force, certain basic premises must be satisfied. If it is to have a chance of success it must take place in a broad expanse of terrain sufficiently broken and difficult to give security to its bases, cloak its operations and discourage continued pursuit. It must have at least the passive support of the population. It must have motivation. It must be waged by tough, independent people inured to hardship. It must have more than a modicum of organization and discipline. It must have logistical support and some professional leadership and advice from regular soldiers. And it must be conceived in combination with a war carried on by a regular army, and both waged according to a plan encompassing the operation of the whole.

Tactics.—The term guerrilla tactics is a misnomer. The tactics of the ambush, the hit-and-run, infiltration and attack from the rear or at night are neither new nor peculiar to irregular warfare. They mere evolved in early tribal warfare, and for many years have been standard elements of infantry tactics. They may be modified to suit the particular people or terrain involved or adapted to new weapons or means of communication, and refinements based on experience may be added, but basically they remain the same. *(See* TACTICS.)

Strategy.—Guerrilla units are by their very nature strategic rather than tactical forces. Being irregular, not part of a regular army, they are too loosely knit and widely spread for concentrated efforts. and too poorly organized and disciplined to be of value in formal combat with regular units. They can aid a regular force in winning a war, or perhaps prevent an enemy from winning it. but they can never win a war by themselves. They can undermine an enemy. but only a regular force can overthrow one. The value of guerrillas lies in the talents they inherently possess—speed, mobility, endurance, independence of arteries of supply and familiarity with the country—not in their hitting power, not in occupying and controlling territory, not in fighting battles. The guerrillas' only practical line is to wage a war of detachment, containing the enemy and modulating his action by their mere existence, forcing him to spread out in occupation and thus weakening him, then striking his flanks and rear. interrupting his lines of communication, destroying his matériel, turning the indigenous population against him and acting in conjunction with the regular force opposing him.

Guerrillas and International Law.—As early as the U.S. Civil War cognizance was taken of the status of guerrillas as legal or extralegal combatants. Following the doctrine formulated by Francis Lieber, pioneer in the codification of international law, the United States government set the policy that men or bands of men who committed hostilities without being part of the organized hostile army and who did so intermittently were not public enemies and were not entitled to the privileges of prisoners of war. The Hague conferences of 1899 and 1907 and later 20th-century thinking followed closely along this line. Guerrillas are considered lawful belligerents and are entitled to be treated as prisoners of war only if they meet the following requirements: they must be commanded by a person responsible for his subordinates; they must wear a fixed distinctive sign or uniform recognizable at a distance; they must carry arms openly; and they must conduct their operations in accordance with the laws and customs of war. If they fail to fulfill all these conditions, they may be tried and sentenced to imprisonment or execution. *(See* LAWS OF *WAR.)*

PRE-WORLD WAR II GUERRILLA ACTIVITY

American Revolution.—In the American Revolution the guerrilla bands operating in the southern colonies waged an irregular campaign that indirectly exercised a decisive effect on the course of the war. Following the British occupation of Charleston. S.C., in 1780, the threat of French aid to the colonies and the strategy of completely subduing the southern colonies and then pressing the war northward into Virginia necessitated the enlistment of active help from the loyalist elements of the populace and the elimination of all thought of resistance from the remainder. Consequently, Cornwallis, the British commander, immediately garrisoned the country at strategic points in an attempt to cow the rebels and draw the loyalists to him as a reservoir of replacements. This move, combined with the inept British policy of attempting to force the colonists into arms against their countrymen or lay open their property to confiscation, almost immediately sowed seeds of discontent.

The hardy, independent men of the back country, heretofore largely neutral, began openly to swing to the Continental cause. Under the able leadership of men like Francis Marion (*q.v.*), Thomas Sumter (*q.v.*) and others, they gathered into small bands and began striking sharply at Tory groups and British outposts. Defeating the Tories in several engagements and keeping the British garrisons under constant pressure, they forced Cornwallis to continue and even expand his garrisoning of the countryside, which weakened him and made the Tories aware of the guerrillas' striking power. This latter factor impeded Cornwallis' recruiting from Tory ranks.

Both Marion and Sumter understood the kind of warfare they were waging and the type of forces they had at their command. Knowing that men are influenced by action and that to hold an irregular group together it must be kept busy, they kept their bands almost constantly in motion. They also realized that their untrained men could not face the British regulars in battle. Thus they retreated swiftly in the face of odds and changed their bases regularly. harrying their enemy on the fringes and forcing him into fruitless miles of pursuit. This guerrilla action, combined with the sudden, one-time rising of the mountain men and their crushing defeat of the British and the Tories at King's Mountain, completed the loss of indigenous support for Cornwallis and thus frustrated his policy and hastened the end of the war. Although the British won almost every battle in the south, each victory resulted in losses which the Tory elements mould not replace for fear of the guerrillas, and Cornwallis was forced to withdraw. The irregulars did not win the war in the Carolinas, but certainly it is fair to say that they prevented the British from doing so.

Spain, 1808–14.—The Spanish rising against French invasion and occupation during the Napoleonic Wars was a popular revolt sustained by abundant native enthusiasm and a powerful foreign ally. It was an uprising born of shame of their country's weakness and hatred of a foreign invader. It was aided and abetted by Great Britain. It exercised a considerable influence on the outcome of the regular war being waged at the same time.

Both the Spaniards and their country were well suited for guerrilla warfare. The Spaniards were a rough. hardy people living in a hard land, inured to hardship and poverty, highly independent and inattentive to comforts beyond their reach. Much of their land was rugged, broken and relatively trackless, cut by barren mountain ranges and many rivers, with few roads. When Wellington was preparing his campaign against the French in Spain and Portugal, he saw the possibility of supplementing the strength of his small army by actively aiding, advising and supplying the guerrilla bands which had risen after the French had taken over the land. He saw that the French army had its limits; that the more ground it had to occupy the weaker it would be at any given point; that it could not control a thoroughly disaffected country and still provide a field army strong enough to defeat him. He therefore detailed an experienced officer to maintain close liaison with the bands, to supply them. to improve their organization and discipline and co-ordinate their actions with those of the British.

The guerrilleros, irregular as they were, became efficient in their o n cause only to the degree that they became organized and disciplined. With help and encouragement their bands grew in numbers and in boldness, and several outstanding leaders appeared. In the northern provinces, where terrain and the guerrillas' knowledge of it worked against the French, the country was soon completely out of hand. French garrisons were cut off from each other and from their headquarters at Madrid; supply convoys were regularly attacked and often destroyed; and couriers seldom got through unless heavily guarded. Heavy flying columns of French veterans continually struck at the bands, but found them difficult to locate and more difficult to maintain contact with.

During the five years of the war, half the French force was continually employed in the ceaseless and fruitless task of guerrilla hunting; others were forced into the idleness of passive occupation. As a result, with more than 300,000 men under arms, there were never more than 70,000 available to face the British. In the last analysis, it was the drain of French soldiers to the peninsula that made Napoleon too weak to fight the powers of central Europe successfully in 1813. For five years the hardiness of the Spanish guerrillas and the skill and drive of Wellington detained in the peninsula the French army with which Napoleon might have completely conquered Europe.

The American Civil War.—In the American Civil War the government of the Confederate States made a formal attempt to legislate a guerrilla resistance into existence. With one exception, the attempt failed because of the difficulty of centralized control and direction of the irregular groups that mere formed. Although authorized by the Confederate congress. so many of the bands became filled with men who merely desired to escape the rigours and dangers of regular campaigning and so often did more damage to friends than to enemies that they had to be absorbed into the regular army. The one exception was the band of John S. Mosby (*q.v.*), which operated in northern Viriginia. An officer of J. E. B. Stuart's cavalry, Mosby demonstrated considerable ability as an irregular leader. Starting early in 1863 with a small group, he almost immediately turned the fringes of the winter-quartered Federal army into a state of confusion with his raids. One of these carried several miles inside the Union lines and resulted in the capture of a general officer in his headquarters aithout casualty to the raiders. In addition to his guerrilla activity, Mosby proved himself highly valuable as an intelligence medium, sending regular reports to Confederate headquarters.

Although the discipline of his command was far better than that of most irregular units, his band was still irregular, loosely knit and spread over a wide area. Conscious of his own strengths and weaknesses, he stayed for the most part within his own limitations. He struck at no large bodies of enemy troops; he quickly withdrew when faced with too much pressure. He saw that by remaining on the aggressive he could compel his adversary to guard against him at a hundred points while he attacked where he chose. This constant threat impelled the Federals to detach large bodies of troops as guards for supply trains and depots. At one point the strategy forced a Union commander to ask for 5,000 additional men to replace soldiers placed on special duty to guard against his raids. After the war, Gen. Philip Sheridan stated that Mosby drained his line-of-battle strength with this strategy to the extent of possibly prolonging the war several months.

Finally, the Federal cavalry so laid waste his zone of operations that his bases and sources of supply mere destroyed and his raiding was brought to an end. Mosby was an excellent guerrilla leader. He was tough, resourceful, and had an excellent understanding of what he was about. Had he been many rather than one, the northern forces would have suffered far more than they did.

Lawrence and the Arab Revolt.—As noted above, the Arab revolt (1916–18) and the resultant guerrilla warfare were almost wholly synthetic in both conception and execution. The Arab people were a heterogeneous spread of tribes, politically frivolous and more prone to fight among themselves than to combine against a single enemy. Their revolt against the Turks and Germans during World War I was largely brought about through British leadership, support and open subsidy. The leading spirit of the revolt was T. E. Lawrence (*q.v.*), a former archaeologist who had acquired a unique knowledge and understanding of the near east and its peoples. How effective a leader he was has always been in some dispute, but the achievements of the revolutionary movement he virtually led are facts. Taking over as titular head soon after the first rising, Lawrence early demonstrated his understanding of guerrillas and their potentialities. Not a professional soldier but deeply read in military history, he saw that irregulars such as the Arabs, because of their lack of organization and discipline, would not and could not attack places held in strength and thus remained incapable of forcing a decision; that they were as unable to defend a point or line as they mere to attack it; that their military value lay in depth, not in front. His strategy was to dispose his force in such a manner as to impose on the enemy the widest possible passive defense, and thus weaken him the most. This Lawrence did by widespread attacks on lines of communication and constant pressure on outposts. Soon the British commander saw that there were more Turks and Germans facing the Arab irregulars than fighting the British army. In conjunction with the final British offensive against Damascus. Lawrence and his Arab bands were ordered to give the illusion that the bulk of Allied strength lay east of the Jordan river and that the attack would come from that direction. By artful maneuver and timely demolitions, they were able to create this effect. As a result the British regular army, as it had been enabled to do by the Spanish guerrillas in the peninsula a century earlier, was able to concentrate all its strength against only a part of the enemy and a relatively easy victory resulted. As irregular as they were, the Arab guerrillas were able to contain about 25,000 Turkish and German soldiers for a considerable period and at a critical time to draw off one entire Turkish army and some reserves from another, immediately prior to the final, all-out British offensive.

WORLD WAR II

During World War II guerrilla warfare became more prevalent and came into more prominence than in all previous history. In Europe the change from the positional warfare of World War I to the war of movement instituted by the Germans, in which large masses of fast-moving armoured and motorized units operated over great distances on loose and fluid fronts and with lengthened communication lines, gave guerrilla forces an opportunity to develop and effectively operate to a far greater extent than in the past. Improvements in, aircraft and radio contributed to this development. Similarly, the mountainous terrain of the Balkans, the jungles of the Pacific and the swamps and forests of the Soviet Union fostered the growth of guerrilla movements as never before. Yet throughout this conflict, guerrilla warfare remained essentially irregular, as in the past, with all the strengths and weaknesses that that implied.

The Philippines.—On the surrender of the Philippine Islands to the Japanese in 1942, many groups of U.S. and Philippine military personnel refused to obey the surrender order. They moved into the mountains and jungles of the interior of the islands to form guerrilla bands and continue the war. Although they had the support of a majority of the population and were generally familiar with the country, these bands at first were seriously hampered by a lack of supplies and matériel, especially communications equipment. and their effectiveness suffered for some time for the want of centralized control and a regular army with which to work. Within a few months several of these bands were able to establish radio contact with Gen. Douglas MacArthur's headquarters in Australia and gain recognition as bona fide units. This brought active American liaison and badly needed supplies. Many bands, however, were unable to establish such contact for some time, and as a result their development was seriously restricted.

Following abortive attempts by some groups to operate actively against the Japanese. MacArthur, fearing the loss of even this tenuous contact with the islands, ordered them to desist from such activity and confine themselves to gathering and transmitting information on Japanese movements and dispositions and organizing and training themselves so that they might actively aid in the eventual U.S. reinvasion. In some areas the bands were well led and made excellent progress in executing their assigned mission. The leadership of other groups was taken over by political opportunists. and in one case by active Communists. and results were correspondingly poor. In some cases the bands of rival leaders waged open narfare for control of an area or island. Other bands were little more than bandit groups and used their position to carry out systematic pillaging.

Gradually, in most areas, however, firmer hands prevailed, and before MacArthur's return in late 1944, most of the islands were under firm organizational control, with regiments. divisions and military districts established and operating. At the time of the U.S. landings and during succeeding operations against the Japanese defenders, many of these guerrilla units gave excellent accounts of themselves, operating alongside or in close conjunction with the regular army.

The Balkans. — When the Germans invaded and occupied the Balkans in 1941 they entered an area peculiarly suited to guerrilla warfare. The terrain of most of the peninsula was wild and mountainous. with few good roads and rail lines, and its people were hardy and independent. The divergent nature of several national groups there, however, had the effect of tempering these natural advantages somewhat.

To free German troops for operations in Russia, the occupation of the Balkans was planned primarily as a responsibility of the Italians. The Germans were to secure only the communication routes and certain areas of economic importance. The Italians were poorly suited to the task. Their policy was wavering and irresolute; troop units were slow to react to guerrilla raids; and individual soldiers showed a distinct reluctance to fight. Their poor showing in previous campaigns earned them the disdain of the population and encouraged the guerrillas. Before the Italian surrender in 1943 the Germans gradually were forced to take over their ally's responsibilities.

In Yugoslavia there were two principal guerrilla organizations betneen which there was sharp cleavage from the start: the Chetniks, organized and led by the pro-royalist and anti-Communist Drazamihajlovic ahose policy called for the organization of strong underground forces in Serbia for eventual co-operation with Allied landings; and the Partisans, organized by the Communist Tito who looked to the expulsion of the invaders as an opportunity to re-establish the nation as a Communist country. A fratricidal conflict within a conflict soon developed with these groups fighting one another as well as the enemy. The Partisans were the more aggressive of the tno, and it was to them that the Germans directed most of their attention. The Greek guerrillas were also divided along political lines between the pro-royalist E.D.E.S. (National Republican Greek league) and the Communist-led and Communist-backed E L.A.S. (National Popular Liberation army).

Guerrilla activity in Yugoslavia started in 1941 and in Greece early in 1942. Bridges were blown up, communication lines destroyed. military vehicles and convoys attacked and isolated garrisons assaulted. As a result. the Germans and Italians undertook positive corrective measures with a series of antiguerrilla actions. While most of these were tactical successes in that they inflicted many casualties on the irregulars and cost them heavily in equipment, they generally failed in a strategic sense in that the bulk of the bands almost always slipped through the attackers and escaped. This pattern continued generally throughout the war. By the end of 1942 the Partisans and Chetniks were well organized and were receiving quantities of supplies from the British. Allied efforts to induce the two groups to work together for a common cause. however, failed, and the fratricidal war continued. Even before the defection of Italy in Sept. 1943, it became evident to the Germans that they would have to cope with the irregulars in the Balkans themselves. and they prepared and executed a number of medium- and large-scale antiguerrilla actions. In Yugoslavia most of these actions were directed against the more aggressive Partisans, because the Chetniks were showing themselves to be increasingly ineffective as irregulars, in several cases openly collaborating with the Italians. As before, these antiguerrilla operations mere tactical successes and strategic failures. The Partisan organization remained unbroken and their actions required the withdrawal of large German troop units from other fronts. When Italy surrendered to the Allies, the Italian army in the Balkans literally fell apart, greatly to the benefit of the irregulars. Many Italian units went over to the guerrillas in *toto* with all of their arms and stores. The Germans were forced to bring in large additional bodies of troops to fill the vacuum thus created. During the last year and a half of the war. the Germans operated under increasing difficulties, but throughout they were able to dominate the situation and retain the initiative. They regularly struck at the guerrillas, inflicting heavy casualties on them and keeping them continually off balance. When the Germans were finally forced to withdraw from the peninsula by the pressure of Russian advances from the east, they were able to do so in good order. On the other hand, the guerrillas made a not inconsiderable contribution. With material assistance from the Allies, they were able to aid the breakup of German power by tying down large bodies of German troops in occupation and preventing their commitment on more active fronts.

French Resistance. — The French resistance movement cannot be viewed as a simple revolt against the enemy. Opposition to the Germans was the prime motive, but there were widely divergent political opinions including Communism in the resistance groups. There were those who saw that whoever controlled the underground would be in an excellent position to control the nation after liberation. This political rivalry between bands combined with the relatively flat and open terrain of the country, which was anything but conducive to large-scale guerrilla organization and activity, precluded resistance along nationally unified lines. An attempt under the aegis of Gen. Charles de Gaulle was completely broken by the Germans in 1943. As a result, under direction of a headquarters in London, the movement was fostered and supported as a formal weapon with only nominal national unity, operations being controlled and directed on regional or group bases through separate communications channels. Air drops of arms and demolition equipment a-ere stepped up and radio operators and liaison agents were sent in to the bands under the over-all concept of developing the resistance into a strategic weapon to be employed in conformity with the Allied master plan. Priority was given to railway sabotage, and rail demolitions were stepped up sharply in the months prior to the invasion. Rail demolitions in direct support of post-D-day operations were highly successful. During June 1944 rail cuts totaled 486, and on the day after D-day 26 trunk lines were unusable, all suffering multiple breaks. One German *Panzer* division was seriously delayed in reaching the beachhead at this critical time by road sabotage. Although the effectiveness of an irregular force can never be accurately assessed. the French resistance furnishes an excellent example of how intelligent organization and direction can achieve positive results in irregular narfare even with rival and divergent groups.

The Soviet Partisan Movement. — The Soviet partisan movement set up in the wake of the German armies invading the U.S.S.R. in 1941 was probably the largest and certainly the most elaborately organized guerrilla movement in the history of warfare. It combined all the classic elements of guerrilla movements of the past with modern means of communication and transportation and modern weapons. At its peak it probably included more than 150,000 men in organized units. The Russians had the more important requirements for waging guerrilla warfare: they were a hardy people living in a hard land; with the exception of the flat eastern and central Ukraine, the terrain of their land was either swampy or heavily forested or both, and was cut by numerous rivers; both the rail and road nets were sparse. making any interdiction of them doubly effective; and they had motivation beyond the fact of an invasion of their country by a foreign power.

The German leaders made a number of errors in their planning for the invasion which had very positive and direct effects on the rise and growth of the partisan movement. The military leaders, counting on a quick victory, made inadequate provision for control of their rear and for protection of their lines of communication. The political leaders planned an occupation of pure repression and exploitation in which no attempt was to be made to win the people over to collaboration. Force was to be used in its most brutal form, and extreme economic exploitation practised no matter how much the natives suffered.

The partisan movement was formed after the start of the German attack from the pro-Soviet elements of the populace and scattered Soviet army personnel bypassed in the invasion. Although soon brought under a desultory sort of control exercised from Moscow, these partisans accomplished little of a positive nature during the first year of the war. The organization of the bands was anything but good; their morale was poor; and their leadership, too often political, left much to be desired. Further, they seldom showed any aggressiveness. In large part igiiored by the Germans. the movement improved considerably during the next 18 months. It was reorganized along formal lines and brought under closer Moscow direction, and a system of controls for co-ordinating its actions with those of the Soviet army was set up. Trained leaders were sent to the bands and large quantities of arms and equipment were furnished them. Despite this aid, during 1942 their activity had little or no detrimental effect on German military operations. Considerable inroads were made on German economic activity, however, and by the end of 1942 much of the planned economic exploitation had been frustrated.

By the opening of the 1943 campaigning season, the reorganization of the movement was complete and the bands were in a good position to exercise a really decisive effect on the battles to come. In conjunction with the main Soviet army effort they were to wait until the Germans were forced to withdraw and then strike heavily at the rail lines in their rear, thus blocking them in the forward areas without prepared defenses where they might be destroyed. For this mission in the area of the main effort, there were about 62,000 partisans in units identified by the Germans and probably another 40,000 in unidentified units. On signal from Moscow the bands set off demolitions on the rail lines in more than 15,000 places during August and added nearly 5,000 more in September. Yet because the demolitions were poorly executed and too often did no damage, and the heaviest attacks were not followed up, the partisans failed to block the German lines of retreat; the withdrawals never became routs but were carried out on schedule and according to plan. Most partisan activity aimed at the German army followed this pattern.

German antipartisan strategy and countermeasures were well conceived and had much to do with the failure of the bands to carry out their missions. Wisely, the Germans, too short of troops to attempt to control all the country, pulled themselves in defensively on their major supply lines to guarantee the continued supply of the field armies and let the partisans take over the rest. When line troops were available and the situation demanded action, they launched large-scale attacks against the bands. In between times they sent a steady stream of small, mobile raiding parties after them to keep their concentration areas in a constant state of flux. Although the large-scale actions were generally tactical rather than strategic successes, when combined with the smaller actions they kept the bands continually moving, prevented them from getting set for raiding of their own and often completely dispersed them for weeks at a time.

The greatest weaknesses of the partisan movement were its basic irregularity and the problem of over-all control. The partisans were far from being regular soldiers, despite the great amount of energy spent on the movement by Moscow. and they were never able to stand up to the Germans even on ground and in circumstances of their own choosing. When the Germans saw the need to clear them from an area they were almost always able to do so. The problem of effectively controlling their large numbers far behind the German lines was insoluble.

POST-WORLD WAR II

In the decade following World War II there was no true guerrilla warfare with the exception of a halfhearted attempt by the North Koreans and Chinese Communists in the rear of the United Nations lines during the Korean war. The repeated and continuous Communist campaigns of subversion and ideological infiltration, principally in Greece and southeast Asia, were guerrilla in type but they cannot be considered as guerrilla warfare in the sense of the definition given at the start of this article. They had as their goals the subversion of the indigenous peoples to the extent that the governments of their countries might be seized by Communists and brought within the Soviet circle of influence, rather than the support of a regular army in formal warfare. In Greece there was actual open warfare, but it was fought between regular Greek forces and a loosely knit Communist army formed of dissident elements of the Greek populace. In Korea the attempt of the North Koreans and Chinese to establish an effective guerrilla force behind the United Nations lines mas never more than a desultory sort of effort. At one time there were estimated to be 10,000 to 15,000 Communist guerrillas in southeast Korea, but they accomplished little of note, pulled few United Nations troops from the front to guard against them and exercised no effect on the outcome of the struggle.

In conclusion, we may say that guerrilla warfare can be a valuable adjunct to the operations of a regular army, but too much should never be expected from it. Because guerrilla bands are loosely knit, poorly disciplined, and must remain so. they can never overthrow an enemy or win a war. But under wise direction by leaders who understand them and their limitations they can go far toward undermining an enemy and materially aid in his defeat. *See* also INSURGENCY.

GUESDE, JULES (legal name, MATHIEU BASILE) (1845–1922), organizer and early leader of the Marxist wing of the French labour movement, was born in Paris, Nov. 11, 1845. Guesde began his career as a radical journalist, and in 1877 founded one of the first modern socialist weeklies, *Égalité*. Guesde consulted with Karl Marx and Paul Lafargue (a son-in-law of Marx) in 1880 on a socialistic program of French labour action. Adopted by a national labour congress in 1880, the program called on workers to elect representatives sworn to "conduct the class struggle in the halls of parliament"; *i.e.*, to stand uncompromisingly for the establishment of the socialist state. Guesde was opposed by labour opportunists — in French usage, the "possibilists"—who sought labour's gains by tactics of economic and political pressure-group action — aggressive collective bargaining. strikes and the promise of workingmens' votes to favourable political candidates regardless of their party affiliations. The split between "Guesdists" and "possibilists" is an early French manifestation of a fundamental line along which the labour movements of the western world continue to be divided. Guesde served in the chamber of deputies beginning in 1893 and as minister without portfolio in 1914 and 1915. A fertile author and powerful orator, he died July 28, 1922, at St. Mandé, Seine.

GUEST, EDGAR ALBERT (1881–1959), U.S. writer of verse, was born in Birmingham, Eng., on Aug. 20, 1881. He was brought to the United States in 1891 and went to work for the *Detroit Free Press* four years later. After working as a police reporter, he began to write rhymes daily; they became so popular that his "poems" were syndicated in newspapers throughout the country. His first commercially published book. *A Heap o' Livin'* (1916), became a best seller. But he won no critical acclaim for his optimistic rhymes on subjects such as home, mother and the virtue of hard work. Guest, who became a U.S. citizen in 1902, published a number of other books and appeared on radio and television. He died Aug. 5, 1959, in Detroit, Mich.

GUEST, EDWIN (1800–1880), English antiquary. born in 1800, was educated at King Edward VI's grammar school, Birmingham, and at Gonville and Caius college, Cambridge. where he graduated as 11th wrangler, subsequently becoming a fellow of his college.

Called to the bar in 1828, he devoted himself, after several years of legal practice, to antiquarian and literary research. In 1838 he published his exhaustive *History of English Rhythms*. He also wrote a large number of papers on Roman-British history, which, together with a mass of fresh material for a history of early Britain, were published posthumously under the title *Origines Celticae* (1883).

In 1852 Guest was elected master of Caius college, becoming LL.D. in the following year: and in 1854–55 he was vice-chancellor of Cambridge university.

Guest was a fellow of the Royal society and an honorary member of the Society of Antiquaries.

He died on Nov. 23, 1880.

GUEST, one who receives hospitality in the house of another (Ger. *Gast,* cognate with Lat. *hostis,* originally a stranger; in Class. Lat. an enemy; *cf.* host). Guest is also applied in biology to a parasite.

GUETTARD, JACQUES ETIENNE (1715–1786), French naturalist and mineralogist, was born at Étampes, Fr.. on Sept. 22. 1715. In boyhood he gained a knowledge of plants from his grandfather, who was an apothecary, and he later qualified as a doctor in medicine.

Pursuing the study of botany in various parts of France and other countries, he began to take notice of the relation between the distribution of plants and the soils and subsoils. In this way his attention came to be directed to minerals and rocks. In 1746 he communicated to the Academy of Sciences in Paris a memoir on the distribution of minerals and rocks, and this was accompanied by a map on which he had recorded his observations. He therefore, as remarked by W. D. Conybeare. "first carried into execution the idea, proposed by [Martin] Lister years before, of geological maps."

In the course of his journeys he made a large collection of fossils, but he had no clear idea about the sequence of strata. He made observations on the degradation of mountains by rain, rivers and sea, and he was the first to ascertain the existence of former volcanoes in the district of Auvergne.

His publications include *Observations sur les plantes,* 2 vol. (1747); *Histoire de la de'couverte faite en France de matières semblables à celles dont la porcelaine de la Chine est composée* (1765); *Mémoires sur différentes parties des sciences et arts,* 5 vol. (1768–83); *Mémoire sur la minéralogie du Dauphine',* 2 vol. (1779).

He died in Paris on Jan. 7, 1786.

GUEUX, LES or "THE BEGGARS," a name assumed by the confederacy of nobles and other malcontents who in 1566 opposed Spanish tyranny in the Netherlands. The leaders of the nobles, who signed a solemn league known as "the Compromise," by which they bound themselves to assist in defending the rights and liberties of the Netherlands against the civil and religious despotism of Philip II, were Louis, count of Nassau, and Henry, count of Brederode. They drew up "the request." petitioning against Philip's religious edicts and the Inquisition, and on April 5, 1566, about 250 nobles marched to the palace to present it to the regent, Margaret, duchess of Parma. Seeing her alarm at such numbers. Charles, count of Berlaymont. one of her councillors, exclaimed. "What, madam, is your highness afraid of these beggars (*ces gueux)?"* At a great feast held by about 300 confederates at the Hôtel Culemburg three days later. Brederode in a speech declared that if need be they were all ready to become "beggars" in their country's cause. The words caught on. and the hall resounded with loud cries of *"Vivent les gueux!"* ("Long live the beggars!"). The name became thenceforward a party appellation. The patriot party adopted the emblems of beggarhood, the wallet and the bowl, as trinkets to be worn on their hats or their girdles.

The original league of Beggars was short-lived, crushed on land by the duke of Alva, but in the following years the name *Gueux de mer,* Sea Beggars. was given to malcontents who took to the sea and were joined by desperadoes of many nationalities. Granted letters of marque in 1569 by the prince of Orange, who was now openly the head of the party of revolt, and animated at once by a bitter hatred of Catholics and a love of plunder, these fierce corsairs preyed on shipping and raided monasteries and churches near the coasts, under the command of a succession of daring and reckless leaders, the best known of whom is William de la Marck, lord of Lumey. Until 1572 they were able to refit and dispose of their booty in English ports, but then Queen Elizabeth I suddenly refused to admit them to her harbours any longer. They therefore seized Brielle by surprise in the absence of the Spanish garrison on April 1, 1572, and Flushing was also taken by a *coup de main.* The capture of these two towns gave the signal for a general revolt, and is regarded as the real beginning of the War of Dutch Independence. In spite of their indiscipline and the cruelties and excesses in which they at first engaged, the Sea Beggars played an indispensable part in rousing Holland and Zeeland to revolt, and their command of the sea did much to thwart the Spaniards in the war itself. (K. H. D. H.)

GUEVARA, ANTONIO DE (*c.* 1480–1545), Spanish chronicler and moralist. He held successively the offices of court preacher, court historiographer, bishop of Guadix and bishop of Mondoiiedo.

His first authorized publication, *Libro llamado Relox de Principes, en el qual va encorporado el muy famoso libro de Marco Aurelio* (1529). a didactic novel after the manner of Xenophon's *Cyropaedia,* was often reprinted and before the close of the century had been translated into Latin, Italian. French and English, one English translation being by Lord Berners (1534) and another by T. North (1557). John Lyly was much indebted to it, but its thought now seems neither just nor profound. its style stiff and affected. It gave rise, however, to a literary controversy of great bitterness and violence, the author having ventured without warrant to claim for it a historical character, appealing to an imaginary "manuscript" in Florence.

Other works of Guevara (1539) are the *Década de las vidas de los diez Césares;* the *Epístolas familiares,* sometimes called *The Golden Letters;* the *Menosprecio de la corte y alabança de la aldea;* and the *Libro de los inventores del arte de marear.*

GUEVAWA, LUIS VÉLEZ DE: *see* VÉLEZ DE GUEVARA, LUIS.

GUGGENHEIM, the name of a family of U.S. industrialists founded by Meyer Guggenheim (1828–1905) who, together with his seven sons, developed world-wide mining interests. Meyer Guggenheim, born in Lengnau, Switz.. Feb. 1. 1828, emigrated to the U.S. when he was 19. settling in Philadelphia, Pa. In 1872 he established the firm of Guggenheim and Pulaski, importers of Swiss embroideries, later reorganized as Guggenheim and Sons, with the four oldest sons as partners. In 1888 the company sold its lace business and entered copper mining and smelting. forming the Philadelphia Smelting and Refining Co. in 1888. Smelters were built at Philadelphia and in Colorado and Mexico, and ore deposits were acquired throughout the world. Alliances with mine owners were established in an attempt to integrate and control both mining and processing operations. The Guggenheims defeated the American Smelting and Refining Co. in a struggle for control of the industry, and took control of that company in 1901. Meyer Guggenheim died March 15, 1905; his sons continued the management.

DANIEL GUGGENHEIM (1856–1930) was largely responsible for the smelting operations of the firm, and his operations were international in scope. He developed tin mines in Bolivia, gold mines in Alaska, diamond fields in Africa, copper mines in Utah, nitrate fields in Chile and rubber plantations in the Congo. The firm established smelting and refining plants all over the world. SIMON GUGGENHEIM (1867–1941) was United States senator from Colorado (1907–13). In 192; he and his wife established, as a memorial to their son, the John Simon Guggenheim Memorial foundation "to further the development of scholars and artists by assisting them to engage in research. . . under the freest possible conditions." HARRY F. GUGGENHEIM (1890–), industrialist and foundation executive, was horn Aug. 23, 1890, son of Daniel Guggenheim. He graduated at the University of Cambridge. He was associated with the company properties and headed the Daniel and Florence Guggenheim foundation for research in aeronautics and the Solomon Guggenheim foundation. In 1929–33 he was United States ambassador to Cuba. (J. R. LT.)

GUHAYNA: see ARABS.

GUIANA (probably "land of waters"), the region between the Amazon and the Orinoco, northeast South America. comprising the territories of British Guiana, Netherlands or Dutch Guiana (Surinam) and French Guiana (Guyane française) and also the adjacent parts of Brazil and Venezuela. This article deals uith the British. Dutch and French sections.

The region, once known as the Wild Coast, was unattractive to Spanish and Portuguese colonization because of swamp and forest, natural obstructions in the rivers and lack of gold. Its possession was contested by the French. Dutch and English for 200 years and the territories in their present form only took shape after the Napoleonic Wars. They remained unaffected by the Ibero-American liberation movements of the 19th century and have only moved away from a strictly colonial status by peaceful evolution in recent years.

This article is divided into the following sections:

I. PHYSICAL GEOGRAPHY

1. Geology and Structure. — The main structural features are similar to those of eastern Brazil. The central parts of the region consist of an ancient crystalline plateau, generally not rising more than 500 ft. above sea level. This platform supports an immense, almost horizontal mass of sandstones and conglomerates, of Mesozoic age, with a thickness of up to 1,500 ft. which is greatly exaggerated in many places by igneous intrusions. This formation is known as the Kaieteurean, from the great Kaieteur falls (*q.v.*) by which the Potaro river descends its eastern face. It occupies a relatively small part of the surface of the three territories.

The ancient crystalline platform reaches sea level for the most part at some distance inland from the existing coast line. It appears to have been depressed well below its present level in Late Tertiary and Early Quaternary times during which it was covered with great thicknesses of alluvium, while granite islands crumbled to form the white sands which overlie the platform inland of the coast alluvium. The platform was upraised and given a slight seaward tilt in geologically recent times. The coast series form an artesian system of great value to the agriculturalist. Important features of the ancient platform are veins of gold and diamonds and the bauxite deposits of British and Dutch Guiana derived from lateritic earths under conditions of intense weathering.

The sedimentary series of the coast areas show few unconformities. They consist of a fairly regular succession of clays, shales, silts, sands, lignites and semilignites. The principal modes of accumulation are clearly visible. Large quantities of liquid mud, brought there by the current setting along the coast from the Amazon. are moved in and out by the tides and much is caught and anchored by vegetation. Decayed vegetation in lagoons produces peaty deposits. Accumulations of shelly material break down and mix with clay and sand to form light soils.

2. Relief and Drainage. — The massive sandstones of the interior form typically savanna-covered plateaus, uniform over large areas. The most striking features are the steep. almost vertical faces which form the edges of blocks at different levels and down which streams plunge in immense falls, cutting deep canyons. The savanna is a region of light rainfall. Though a great number of streams rise there, none is large. The more prominent heights include the Serra Acarai (Akarai mountains) and Tumuc-Humac mountains of the southern frontiers at about 2.500 ft., but the series rises to much greater heights in the Serra Pacaraima (*q.v.;* Pakaraima mountains), which are outliers of the Guiana highlands (*q.v.*), on the western frontier of British Guiana, culminating in the great massif of Roraima at 9,432 ft. The ancient rock platform forming most of the territory was intensely folded. The general strike of the rocks is east-southeast–west-northwest. Hard elevated portions of the platform are sometimes sufficiently distinctive to have separate names, like the Makarapan and Kanuku ranges of British Guiana.

The crystalline platform is heavily forested, but there are exceptional areas of savanna in the southwest of British Guiana on either side of the western Kanuku mountains. There the flat surface is covered with heavy clays and boulders of conglomerate, with sandy hillocks. The drainage is poor, with the headstreams of Amazon and Essequibo tributaries often confused. The ill-defined Lake Amuku may be the site of Manoa, the city of Eldorado.

The rivers of the central forested area do not, with the exception of the Essequibo, form large basins but run seaward fairly directly and with few tributaries, separated from their neighbours only by low divides. Even the Essequibo has few right-bank tributaries. All rivers on the crystalline rocks have numerous rapids, often extending in great series, where they cross intrusive bars of igneous rock, but since the average gradient is one foot to one mile, the stretches between rapids are usable by canoes and motorboats and form'the only routes over most of the area. See COURANTYNE; MARONI; SURINAME; DEMERARA.

Except for remnants of sand dunes and shell ridges, the coast is exceptionally featureless. A large part is a few feet below sea level and subject to heavy rains, so its natural drainage is very poor. Many of the coast rivers, especially in the northwest districts of British Guiana and in Dutch Guiana, have long northwesterly courses because of marine deposition by currents. A narrow strip, 3 to 6 mi. deep, close to the sea and discontinuous, has been turned into valuable plantation land by damming back the swamp waters inland and erecting a dike against the sea. The superfluous water drains seaward through sluices in the sea dam, which can be opened only as the tide recedes. Parts of this elaborate and expensive system of artificial drainage have become ruinous in periods of decline of plantation agriculture. The main wealth of British and Dutch Guiana depends on the efficient exploitation of the relatively few miles of drained land remaining, In French Guiana there was never much and now there is almost none.

3. Climate.—Guiana as a whole is very close to the equator and has the characteristic rather high temperatures, heavy rainfall with only small seasonal breaks, high humidity and high average cloud cover of lowlands in these latitudes. Temperatures are remarkably uniform. At Georgetown, British Guiana, the average monthly temperature varies from 79.3° to 82.2° F. and from day to day the shade temperature varies from 75°–78° to 85°–88°. The unpleasant effects of continuous high temperature and high humidity are mitigated near the coast by the northeast trade winds but these have little direct effect on the interior.

Rainfall mainly arises from the movement of the intertropical front, though the reasons for its seasonal distribution are not alnays clear. It is heavy everywhere in the forested zone and on the coast, with a tendency to increase eastward. Thus the annual average at Georgetown is about 89 in. and at Cayenne, French Guiana, 130 in. Two net seasons are usual though their incidence differs somewhat in difierent parts of the Guianas. On the coast of British Guiana a long wet season from April to August and a short wet from December to early February are sufficiently well marked on the average. In the southern savannas, however, the short wet season is not experienced. Total annual rainfall is variable and years of drought occur at intervals when only 60–70 in. fall.

4. Vegetation.—Along the coast a diversity of plants maintain themselves in the shallow brackish sea water where tides and currents are not too strong, and they are valuable for coast protection. The black mangrove (*Avicennia nitida* and associated plants) has roots spreading widely and throwing up peglike breathing projections; salt-water grasses extend stolons rapidly underground, throw up new shoots and send deep roots downward; mangrove (*Rhizophora*), in the estuaries, sends strong roots downward through the air into the mud. The undrained coastal areas or wet savanna support coarse grasses (Andvopogon, *Pennisetum,* etc.) and a wide scattering of trees, notably the coconut, truli and manicole or assai palms.

The high forest or selva which covers most of the Guianas is magnificent in its size and luxuriance. Among its most prominent members are the greenheart (Ocotea rodioei) and the wallaba (*Eperua jalcata*), which are among the most gregarious of the forest trees and favour especially the sandy soils on the northern edge of the forest zone; the giant mora (*Mora* excelsa) and crabwood (Carapn *guianensis*), which favour swampy sites; the bulletwood tree (*Manilkara* bidentata), which produces balata latex, and a number of rubber-producing trees; and a great variety of trees producing handsome cabinet woods. The forest trees are draped with parasitic lianas or bushropes, epiphytes, fungi and orchids. The luxuriant vegetation extends to the still waters where the water lily Victoria regia with its beautiful flower and huge leaf is the most prominent of many aquatic plants.

In the interior savannas open grassland is interspersed with much bare rock, termite hills and clumps of the ita palm (*Mauritia flexuosa*). All the coast villages produce a great variety of tropical fruit and vegetables. Peppers, cassava (manioc) and maize, originally characteristic products of the forest and savanna Indians, are also widely grown on the coast.

5. Animal Life.—Although only the insects and birds are ordinarily visible, animal, reptile, fish and insect life is immensely varied and teeming. The fiercer mammals include the ocelot, the haka tiger or yaguarundi and the jaguar. The largest land animal is the tapir, which is fairly rare. The manatee is a herbivorous aquatic mammal. Other exotic creatures are the sloth, the great anteater! the capybara or bush pig and the armadillo. Monkeys and deer are among the commonest of the wild mammals.

The birds of the coast include vultures, some species of which are useful scavengers. the chicken hawk, finfoot (*Heliornis*), the muscovy duck, snipe, teal, plover, pigeon and heron. The kiskadee is the "sparrow of Guiana." The blue sacki and the hummingbird are very common. The kingfisher and the beautiful scarlet ibis are seen on the rivers. In the forests bird life is indescribably rich in variety and plumage. It includes the tinamou, the gorgeous cock of the rock, the marudi or bush turkey, the vividly coloured macaw and the bellhird with a note like a silver gong. Flocks of parrots are common in the savannas.

The alligator (cayman) is the most frequent of the larger water creatures. It infests the fresh waters of the coastlands, particularly the great rivers. There are many varieties of snake, of which the giant anaconda or water boa is the biggest and the bushmaster the most vicious. Lizards are extremely numerous; the larger types include the iguanas of the lower rivers; smaller ground and arboreal forms are found also.

Fish life abounds in the sea and rivers. Shark and sting rays are iound offshore. Snapper and grouper are the most esteemed of the sea fish commonly landed. River fish include the voracious predatory piranha (*Serrasalmo*) and the lukanani (*Cichla*) Invertebrate life is the most abundant of all. Especially obvious are mosquitoes. sand flies, grasshoppers. termites. ants and spiders.

II. NATURAL RESOURCES

1. Land Use.—The pattern of partly poldered coast. heavily forested and little-developed interior and savanna margins is continued through the three countries though only British Guiana has any considerable area of savanna.

Coastlands.—These were developed on a common pattern from the 17th century. Many parts of the coast were subject to changes of sovereignty but there was also much co-operation between settlers of the three competing nations Originally they preferred sites a little nay up the estuaries where they were less obvious to pirates and privateers. In the 18th century they began to polder the coasts and trade grew until ports were needed in the second half of the century. Some of the rivers, notably the Essequibo, nhich is the largest. had no suitable site for a port; nor was there ever sufficient trade to warrant many.

The drainage of the coast soils was initially achieved with slave labour and maintained later only under a heavy financial burden. The soil won from the snamp and the sea is very fertile though acid. and a great variety of crops has been tried on it. Of commercial crops, indigo, tobacco, cocoa, rice, cotton and sugar have been produced at different times. Sugar reigned supreme for well over a century and though its importance is much reduced in Dutch Guiana and it has vanished from French Guiana there are no immediate signs of its being displaced in British Guiana. The wetness of the climate reduces the sucrose content of the juice somewhat, and the maintenance of the drainage system is an expense from which most of these countries' competitors are free. The planters of Guiana one much to their readiness to adopt new methods. to their support of research in producing new varieties of cane and combating plant diseases, and to the rationalization of the industry into fewer and larger units. In the early 1960s, though there was more land abandoned than in cultivation the combined sugar industry produced more than ever before. Rice growing, relieved from Asiatic competition in the mid-20th century, is the second industry of the coast in British and the first in Dutch Guiana. It is mainly in peasant hands. The narrow coastal belt, incompletely drained and still offering the most obvious scope for settlement, amounts to only 10% of the total area of the whole region and directly supports about 90% of the population.

Forest *and* Savanna.—The forest areas have. on the whole, poor soils. Their magnificent timbers are mostly difficult to cut and transport economically because of their high density and the non-gregarious habit of growth of most species, while curing is difficult in the humid atmosphere. Nevertheless, the several forestry departments are striving with slowly increasing success to make better use of this great resource. The collection of balata is a minor but persisting occupation. The savanna regions also have generally poor soils. They are used for cattle rearing on the open-range system. Tobacco is grown for local consumption.

2. Minerals.—Within the forest area gold is obtained in relatively small quantities, mainly from river deposits. Diamonds are steadily produced on a small scale. A number of other minerals are known to exist, but only bauxite, manganese. kaolin, columbite and low-grade iron are present in workable quantities. In the late 1950s bauxite was the only one of these being worked, but in bauxite all three Guianas have a resource of world importance. The mining of manganese was also being undertaken in the northwest district of British Guiana.

III. THE PEOPLE

The indigenous peoples, collectively known as Amerindians, are only numerous in British Guiana. where their numbers were estimated at 20,830 in 1957, when they appeared to be on the increase after centuries of decline. They include the Warraus, Arawaks, Caribs. Wapisianas. Arekunas and Makusis, the mixed "Spanish Arawaks" of the Moruka river and many more. The Cariban and Arawakan languages are widely spoken. but neither group corresponds to a single distinctive culture. The Warrau language is distinct from these. The Warraus seem to have inhabited the northwest coast continuously since first met in 1595, and to have been responsible for the shell heaps of the Pomeroon.

The two main cultures correspond, though not absolutely, to savanna and forest environments, the latter characterized by pottery and a better developed agriculture. The earliest pottery, from Mabaruma in the northwest of British Guiana, is tentatively dated between A.D. 1200 and 1400 and no remains definitely earlier than this are known. The first explorers found Caribs and Arawaks alternating along the Guiana coasts. Caribs are now, in general, inland of Arawaks and Warraus but extend to the coast in French Guiana. The Makusi are the most prominent of the savanna peoples.

Until the 19th century the forest peoples had in common the manufacture of polished stone implements and coil pottery, weaving (including bead decoration and the manufacture of hammocks), cassava cultivation, the use of the blowpipe. vegetable poisons for hunting and fishing and fish traps. Throughout the interior of the Guianas are scattered rocks inscribed with hieroglyphics known as *timehri* which have not been deciphered. They may have some distant connection with the Andean civilizations.

The Amerindians are very rarely seen in the more populous parts of the coasts. In British Guiana they were after 1953 given important rights in reservations totaling over 6,000 sq.mi., but are not confined to them. They are useful workers in the cattle, logging and gold industries. The other permanent forest dwellers are the Djuka or Bush Negroes of Dutch Guiana. They are descendants of escaped slaves, organized into five groups, only two of which are large. Their common language is an extraordinary form of English compounded with Dutch and several African dialects. They appear to be on the increase, and are responsible for about 75% of an important logging industry. The other major elements in the population of the Guianas are all predominantly coast dwellers.

Descendants of African slaves form the principal single group in Dutch and French Guiana and the second group in British Guiana. Former slaves abandoned the plantations in large numbers after emancipation and became independent peasantry or town dwellers. They are strong and enterprising and make their mark in town and forest industries and the professions.

The "East Indians" of British Guiana and the "British Indians" of Surinam came predominantly as indentured labour from India to replace the Africans in plantation work. They now form the largest racial group in British Guiana and the second in Surinam and in both countries are increasing more rapidly in numbers than any other. They remain largely in agriculture, being the mainstay of plantation labour in British Guiana. They have done well in trade, and are well represented among the professions. The large majority speak Hindi or Urdu. The Chinese and the Portuguese also entered originally as agricultural labourers but are now rarely found outside the major towns. They have done well in business and the professions and their influence is disproportionate to their numbers, but they do not increase. In Surinam there is a noteworthy large group of Indonesians (almost all Javanese or their descendants) who were still arriving up to 1939. They have remained agriculturalists and are predominantly Moslem.

Europeans other than Portuguese in the Guianas are few and most are short-term inhabitants. While every kind of racial mixture may be found, the descendants of white and Negro crosses are much the commonest. The larger part are in the chief towns and a high proportion are in clerical and professional work. See also *Population* under each country, below, and the articles ARAWAK; CARIB; WARRAU; SOUTH AMERICA: Ethnology; SOUTH AMERICAN LANGUAGES; INDIAN, LATIN-AMERICAN. (G. LN.)

IV. HISTORY

In the 16th century "Guiana" meant the coast from the Orinoco to the Amazon, with an undefined extent of country behind it. Christopher Columbus had sighted it in 1498 but both Spaniards and Portuguese found other regions more attractive, and partly for this reason Guiana appealed to explorers and adventurers of other European nations who could hope for security among its intricate waterways and profit from its fertile coastlands. A still greater lure was the legendary Eldorado (*q.v.*), a man or town of gold in the interior, whose story was brought back by Sir Robert Dudley from his exploration of the mouth of the Orinoco in 1595. Sir Walter Raleigh who followed him heard of a great gold mine which appeared to confirm the tale. This led to Raleigh's last expedition of 1617–18, but before that settlements were established for trade and the cultivation of tobacco. In 1604–06 Charles Leigh made an abortive attempt to found a colony on the Wiapoco, now the Oyapock river of French Guiana. In 1609 Robert Harcourt annexed the whole Guiana coast in the name of King James I. but his patent was revoked in 1619 in favour of the Amazon company, the latter's patent in turn being canceled after Spanish protests. In 1627 the Guiana company was set up by a joint patent in favour of Harcourt and Roger North, but its main settlement on Tocujos Island was captured in 1629 and its activities ended by 1635.

Characteristic of this period was the considerable degree of co-operation between English, Dutch and French settlers on the one hand. and on the other the joint action of the Spanish and Portuguese which in 1623 swept away most of the foreign settlements in the lower estuary of the Amazon, including those of the Dutch on the Xingu, which may well have been founded before the end of the 16th century. The French established a small settlement on the Cayenne but the Dutch, with their colonies on the Essequibo (1616) and the Berbice (1627), constituted the only formidable challenge to the Hispanic powers in Guiana up to the mid-17th century.

The first English attempts in Guiana had been made by amateurs. but that of Lord Willoughby of Parham in Surinam in 1651 was made by experienced colonists. By now, however, the Dutch were rivals of the English and this thriving colony was captured by the Dutch in the spring of 1667. In October of that year it was recaptured by an English force, which had occupied Cayenne in September; but by the treaty of Breda (July 21, 1667) colonies in French possession on Jan. 1, 1665, were restored to France and Anglo-Dutch claims were settled on the basis of possession as on May 21, 1667, Surinam thus passing to the Netherlands.

In 1682 the Dutch West India company received the grant of Guiana from the states-general. It sold a third of its holdings to the city of Amsterdam and another third to Cornelis van Aessens, lord of Sommelsdijk, who governed the colony with rare energy and foresight until his death in 1688. The three partners also formed the Chartered Society of Surinam. Berbice was given the status of a separate colony in 1732 and Demerara enjoyed the same status from 1773 to 1784, when it was reunited with Essequibo with Stabroek (now Georgetown) as the capital. The basis of the prosperity of these Dutch colonies was the production of sugar in the coastal districts. depending upon an ingenious but expensive system of dikes and canals; but they were also centres of considerable importance for both legal and illicit trade in the Caribbean. In 1781, following Adm. Sir George (later Lord) Rodney's capture of St. Eustatius, they fell into British hands, only to be captured (by the French) in 1782 and restored to the Netherlands by the treaty of Paris in 1783.

In the course of the French Revolutionary Wars the Netherlands was overrun by the French and with its overseas possessions became from the British point of view "occupied territory." The Netherlands Guiana colonies were occupied by British troops and held from 1796 to 1814. save for the brief period (1802–03) of the peace of Amiens. After the peace settlement of the congress of Vienna (1814–15) the colonies of Essequibo, Demerara and Berbice passed by purchase to Great Britain and the Dutch were left with only Surinam on the mainland of South America.

For the rest of the 19th century Surinam, though not unprosperous, was overshadowed by the far more rapid development of the Dutch colonies in the East Indies and, later, by the prosperity of the oil-refining island of Curaçao.

French Guiana (Cayenne), though the scene of occasional attempts at large-scale development, remained the Cinderella of the French colonial empire, its use as a penal colony (until 1949) giving it an unenviable if not wholly justified notoriety.

The history of Guiana after World War II was marked by radical constitutional adjustments in all three European-controlled territories (see *History* under each country, below).

V. BRITISH GUIANA

British Guiana lies between latitude 0° 30' and 8° 30' N. and longitude 56° and 61° 30' W. Its area is 83,000 sq.mi., with a seaboard of about 270 mi.; the coastal plain has an area of 6,250 sq.mi. of which approximately 46j sq.mi are cultivated. The three colonies of Essequibo, Demerara and Berbice came finally under British government as part of the settlement at the end of the Napoleonic Wars, and were united under one governor and the name of British Guiana in 1831. The main geographical features of the country were surveyed by Sir Robert H. Schomburgk (*q.v.*) in 1835–44, but a large proportion of the forested area of the east and southeast is still virtually unknown. (*G.* LN.)

History.—At the time when the three settlements—Essequibo, Berbice and Demerara—were united as one colony in 1831, British Guiana had the highest productive potentiality in the British Caribbean but, far more than the older colonies, it lacked an adequate labour force. The abolition of the slave trade in 1807 and of slavery in 1833 were heavy blows to its economy and a further setback was the withdrawal of the preference granted to British colonial sugar. The situation seemed desperate by the mid-19th century but was relieved by the work of Sir Henry Barkly (governor 1848–53) and by the evolution of a system of immigration from India. The colony had its share in the modest revival of prosperity in the British West Indies from the mid-1850s to the mid-1870s. but its comparative lack of alternative crops made it particularly susceptible to the increasing and subsidized competition of European beet sugar and the situation was grave enough by 1897 to warrant the appointment of a royal commission. The principle of free trade was still strong in British domestic politics, and a preference granted to colonial sugar in 1919 was not fully realized before 1931 and was insufficient to meet the fall in world prices in 1929–34. As in most of the British Caribbean colonies a period of acute economic depression led to inevitable strikes and disturbances. The report of the Moyne commission (1938) provided the basis for the Colonial Development and Welfare acts of 1940, 1945 and 1949. By the end of 1950 grants of over £3,000,000 ($8,400,000), nearly two-thirds of which was for drainage and irrigation. had been approved for British Guiana. The refugee commission of 1939 suggested settling a large number of European refugees in the interior and the settlement commission of 1948 recommended extensive settlements for the surplus population of such colonies as Barbados. Neither of these reports was favourably received in British Guiana. where the natural increase of population in the 1940s and 1950s was rapid. Opinion in British Guiana also rejected participation in a British Caribbean federation. (See WEST INDIES (FEDERATION), THE.)

The British inherited from the Dutch, and did not greatly alter, a singularly complicated constitutional structure which, with one major change in 1891, lasted until 1928 when a single-chamber legislature with a minority of elected members was created. The crisis of 1953 which followed the electoral success of the extreme left-wing party led to rapid constitutional developments (see *Government* and *Administrution*, below). (*W.*L. EN.; X.)

Population. — At the census of April 9, 1946. the population totaled 375,701; the estimated figure on Dec. 31, 1958, was 539,-940, including 21,590 Amerindians. All but a small proportion of the people live east of the Pomeroon river on the coastal plain and the lower rivers. Georgetown has an estimated population (1958) of 92.808, and New Amsterdam of 14,150.

Medical and sanitary improvements have resulted in a rapid increase of the population since 1931, when there was a total of 311,000. By 1946 it increased by 21% and by 1946–58 by more than 30%. In 1931 East Indians formed 42% of the population; in 1946, 44%; in 1958, 48%; and they were considered likely to constitute more than half the population by 1963. In 1946, 221,-697 persons belonged to Christian denominations, including 85.329 Anglicans, 43.474 Roman Catholics, 25,210 Presbyterians, 19,658 Methodists and 18,827 Congregationalists; and there were 115,574 Hindus and 29,351 Moslems.

Government and Administration. — A revised constitution, providing for universal adult suffrage, a bicameral legislature and a ministerial system, was introduced in 1953. The elections of that year brought into power the extreme left-wing People's Progressive party led by Cheddi Jagan. The British government thought that the actions of the new government would lead to Communism and threaten the welfare of the country. The new constitution was therefore suspended in Oct. 1953 and military forces were sent to maintain order. A wholly nominated interim legislative council took office until June 1957. Meanwhile there was dissension in the People's Progressive party and the more moderate group seceded and became the People's National congress. At the general election of Aug. 12, 1957, the People's Progressive party secured nine seats, the People's National congress three seats and the United Democratic party and the National Labour front one each.

The new legislative council consists of a speaker. 3 official members (the chief secretary, the attorney general and the financial secretary). 6 nominated members and the 14 elected members. The governor presides over the executive council, which consists of the 3 official members and j members of the elected majority party each holding a portfolio.

The constitution as amended in 1956 allows for the nomination of not more than 11 members of the legislative council and the election of not fewer than 14 members. the total (excluding the speaker but including the 3 official members) not to exceed 28.

The country is divided into six coastal (East Berbice. West Berbice. East Demerara, West Demerara, Essequibo Islands and Essequibo) and three interior (North West. Mazaruni-Potaro and Rupununi) divisions, each under a district commissioner who provides advice and assistance to the local authorities and coordinates government action. The six coastal divisions are subdivided into 46 villages and 48 country districts for the purposes of local government. The central authority is the local government board, nominated by the governor. This body appoints one-third of the members of each village council, the remainder being elected, and appoints all the members of the country district councils. The local authorities are responsible for the maintenance of roads other than main roads, and of irrigation and drainage canals and dams not under the control of the drainage and irrigation board. They have functions relating to drinking water, lands, sanitation, abbatoirs and cemeteries.

The three interior divisions have a total area of about 70,000 sq.mi. and a population of only 28.500. They are directly administered by the department of the interior. Ten "Amerindian districts" have been demarcated for the sole occupation of the native Indians. In some of them local district councils have been formed.

Georgetown, the capital, and New Amsterdam form municipalities outside the above schemes. Each has a mayor and a council with an elected majority. On each sit three councilors nominated by the governor.

Taxation. — The principal sources of public revenue are income tax and customs and excise taxes. Much the larger part of the latter comes from import taxes. The rate of duty payable on most articles imported is 20% ad valorem (preferential tariff) and 36% ad valorem (general tariff).

Wages and Employment. — The official policy is to foster the principles of trade unionism. In the chief industries collective bargaining is the rule and machinery exists for the settlement of disputes and for arbitration if necessary. Government has powers to regulate wages in any employment but has reserved these powers for the regulation only of unorganized trades.

In the sugar industry wages are paid on a piece-rate basis to field workers. The rates vary greatly between plantations because of different conditions of soil and types of work. There are a number of incentive schemes aiming particularly at inducing regularity of work. The sugar industry is the largest employer of labour in the country. The amount of labour employed is being steadily diminished by increased mechanization and the policies pursued to produce a higher level of employment per individual worker. Factory labour (including field-equipment operators and field mechanics) is also substantial in the sugar industry. The workers have an 8-hour day and a 48-hour week. Rice cultivation is mainly in peasant hands. Rice milling is chiefly done at small. privately owned mills, though there are several large modern mills erected in connection with government irrigation schemes. The bauxite industry produces the second most valuable export but is a relatively small employer of labour. The timber industry is the only other large employer of labour besides the government.

As sugar and rice are seasonal occupations, there has always been a fair amount of unemployment, underemployment and casual labour. The rapid rise of population has aggravated the problem. Very strenuous efforts are being made to make more land available for rice growing and other forms of peasant farming, and to introduce new local industries.

Social Conditions. — Formerly, houses were universally built of wood. with galvanized iron roofs. and raised on piles, but concrete construction is becoming common. Before 1945 there was a great deal of urban and rural overcrowding, but after 1946 housing and town planning legislation was in force and was vigorously implemented. Concurrently, the sugar industry provided new homes or helped workers to build their own.

Government-promoted community services include youth work, women's work and a variety of self-help schemes in rural areas, and voluntary societies flourish in Georgetown. Experimental community projects also exist, nhich are attempting to bring about the unified development of particular areas through education and the encouragement of self-help. There is an old-age pension scheme and assistance is given to other aged persons, the infirm and destitute children.

Public Health. — There are five public general hospitals and a number of smaller private or specialized hospitals, many run by the sugar estates. Malarial control is very efficient and the disease has almost been eliminated. A similar campaign is being planned against the carrier of filaria, *Culex fatigans.* Pneumonia and bronchitis are the principal causes of death among adults. The standard of health is in general good. Low dietary standards are slowly being raised by education and economic improvement.

Justice. — The supreme court consists of a chief justice and five puisne judges. Two or more judges constitute a "full court," which is almost entirely a court of appeal. The supreme court has unlimited jurisdiction in civil matters, which are tried by a single judge without a jury. It has jurisdiction in criminal matters brought before it by indictment. and in these the judge is assisted by a jury. Appeals lie to the court of criminal appeal of the supreme court. Magistrates hold courts of summary jurisdiction throughout the country, and make preliminary inquiries into indictable cases. The rules of procedure in all courts are substantially the same as in their English counterparts.

Education. — Most schools are denominational and grant-aided. There are also many nondenominational government schools and others provided by sugar estates and mining companies and several private schools. Education is free and compulsory from j to 14 years and a few schools take pupils up to 16 years, but enrollment and attendance, especially in rural areas. are considerably below the maximum possible. The teachers' training college has an average output of 60 per annum. There is a well-organized schools' broadcasting service. The government maintains Queen's college, a boys' grammar school in Georgetown founded in 1844. and the Bishops' High School for Girls; and assists two other grammar schools. one in New Amsterdam. A technical institute has made much progress since 1945, and the Carnegie Trade school for women has a long and distinguished history. Many students pursue courses of higher education in the U.K.. Canada, Jamaica and the U.S. Adult education is also promoted by the British council.

Economy. — Domestic trade is mainly in foodstuffs. About half the milled rice produced is consumed locally. The cattle raised in the Rupununi savannas are slaughtered at Lethem or are driven along the Annai-Takama trail to be fattened on the coast pastures. Local production of a number of products for home consumption is encouraged, including meat and fish processing, furniture, sawmilling, brewing, milk pasteurization and the manufacture of cigarettes, soft drinks and tobacco. Coconuts, the third most important crop, occupy about 32,000 ac. but do not produce enough oil to cover local requirements. The oil is an important item in cooking, and is also processed in a modern soap and margarine factory. A considerable amount of gold is retained and worked by goldsmiths.

The principal exports are sugar. bauxite, rice, rum, timber and lumber, diamonds, medicinal, pharmaceutical and toilet preparations, gold and balata. The principal imports are machinery, food (especially cereals. dairy products and wheat flour). fuels and lubricants. About 40% of total trade is with Great Britain, 22% with Canada, 13% with other commonwealth countries (principally in the West Indies) and 12% with the U.S. Great Britain takes about 40% of exports and Canada 38%.

Finance. — The money of account is British West Indian dollars and cents, with the dollar exchangeable (1959) at $4.80 to the pound sterling or B.W.I. $1.70 to U.S. $1. United Kingdom coinage was replaced by a local coinage after 1955; notes issued by the government and the two commercial banks until 1952 were replaced by those issued by the currency hoard for the eastern Caribbean. Heavy investment in development and welfare projects normally produced unfavourable balances after the end of World War II. Apart from administrative costs, the main items of expenditure are on social services. public works and economic development.

Communications. — Trade is hampered by difficulties of internal communication. There are about 370 mi. of motor roads; of these about 75 mi. are asphalt surfaced and the remainder of burnt clay. The system radiating from Bartica on the Essequibo into the Mazaruni and Potaro areas has 244 mi. of earth road. There are about 400 mi. of trails in the interior, principally in the Rupununi savannas. Surveys were being made in the mid-20th century for roads from Parika to Bartica and from the Potaro to the Rupununi. The coast railways have been reconstructed. Internal airway services, using a number of landing strips and the quieter stretches of rivers, are run by the government. Some meat is flown from the Rupununi and diamonds from the Mazaruni. Passengers and equipment are the chief freight. Water transport still has by far the greatest mileage. It is used coastwise. on the canals of the sugar estates, on the government and private ferries and services of the lower rivers and by light craft in the forest areas. British Guiana is linked by radiotelephone with the British West Indies, Great Britain, the U.S.. Canada and other countries.

VI. FRENCH GUIANA

French Guiana (Guyane française), an overseas *département* of the French republic, lies between 1° 30' and 5° 50' N. and 51° 40' and 54° 30' W. It is bounded on the north by the Atlantic, on the west by the Maroni river. on the south by the Tumuc-Humac mountains and on the east by the Oyapock river. Its area is approximately 35,135 sq.mi., with a seaboard of zoo mi. and a depth of 250 mi. Numerous small islands lie off the coast, notably the fles du Salut (Royale, St. Joseph and Devils islands). The frontiers, long the subject of disputes, were fixed along the Maroni (French Guiana-Dutch Guiana) by the arbitration of the emperor of Russia in 1891, and along the Oyapock (French Guiana-Brazil) by the arbitration of the Swiss confederation in 1900. The southern boundary with Brazil follows the line of the water divide.

Population. — The 1954 census showed a total of 27,863 inhabitants, the majority living in the coastal communes: 11,458 at the capital Cayenne, and 2.185 at St.-Laurent-du-Maroni. The vast majority are Creoles. In the forested interior (Inini) there are about 2,000 gold prospectors (particularly Creoles from the British West Indies), 2,000 Negroes and 1,000 Amerindians. The population was on the decline until 1948 but the fight against yellow fever and malaria has resulted in a slight increase since that date though there is still less than one person to the square mile.

The appellation Creole is given to all those, whether white. Negro or of mixed blood, who have preserved or adopted a more or less European mode of life. Their language is French, or the Guiana Creole dialect, and they are Roman Catholic. The "refugee Negroes," escaped from the plantations in the 18th century, form three tribes on the Maroni: Djuka, Paramaka and Boni. They live partly by farming and more especially by river transport, and they speak *taki-taki,* derived partly from English. The Galibi Indians live on the coast, mingled with the Creoles. In the interior the Roucouyenne or Ouayana (on the upper Maroni), the Palikour and the Oyampi (on the Oyapock) have preserved their tribal customs and live by cultivating burned forest land and hunting. The Palikour belong to the Aramak group, the Galibi and Roucouyenne to the Carib group and the others to the Tupi-Guarani group.

Administration and Social Conditions. — The *dkpartement* is governed by a prefect, assisted by an elected general council and represented by one deputy and one senator in the French parliament. The administrative services depend directly upon the metropolitan ministries. The coastal region forms one *arrondissement* divided into communes, each administered by an elected municipal council. The interior constitutes the *arrondissement* of Inini. In addition to courts of first instance there is a court of appeal. The budget and taxes have been merged into those of the parent country. The transformation of the colony, on March 19, 1946, into a *département* marked the beginning of a new era, the development of French Guiana being henceforward assured by the budget of France. French Guiana, in the constitution of 1958, remains an overseas *département* within the French republic,

Primary schools exist in all the communes and there is a secondary school at Cayenne (*q.v.*), the departmental capital. The Institut Pasteur at Cayenne carries on an effective war against yellow fever. malaria and leprosy; and a service for the protection of the Indians has been established.

Economy. — Cultivation occupies less than 3.000 ha. ($11\frac{1}{2}$ sq.mi.) and French Guiana has to import meat. The chief crops are cassava, bananas and sugar cane. Since 1948 the Institut Français d'Amérique Tropicale, the Bureau Agricole et Forestier Guyanais and the Bureau hlinier Guyanais, set up at Cayenne, have been engaged in a survey of the resources of the country, geological, agricultural, water and forest, and in soil research and experimentation. The lowlands, especially those lying east of Cayenne, could be used for the cultivation of rice. The raising of buffalo is successful in the coastal savannas, and sawmills have been established.

Alluvial gold is no longer a profitable enterprise, but discoveries have been made of tantalite, diamonds and above all of bauxite in the coastal region, especially the strata at Kaw, where the reserves represent 42,000,000 tons of ore with a yield of 41% of aluminum. The largest exports are gold and timber. The unit of currency is the metropolitan French franc.

Communications.—A road has been built from St. Laurent to Cayenne. Silting hampers the development of a port, but there are two monthly shipping services to France (Bordeaux and Havre). The airport at Cayenne is served by French and American airlines and some airfields have been constructed in the interior. The Maroni, Mana, Sinnamary, Mahoury, Approuague and the Oyapock rivers provide means of communication with the interior, interrupted though they are by rapids.

History. — In 1604 a French expedition under the command of Daniel de La Ravardière, sent on the quest for Eldorado, landed at the river where Cayenne now stands, and subsequently several companies tried to establish white and Negro colonies there. In 1686 the privateer Jean Baptiste Ducasse led the colonists in an expedition against Surinam. where they were decimated. Thereafter, peace and administrative continuity (one dynasty of governors, the Orvilliers, kept the title from 1700 to 1763) brought some progress. Sugar cane, roucou, coffee and indigo were cultivated and there were village colonies, totaling about 10,000 Indians, established by the Jesuits.

In 1763 the prime minister, the duc de Choiseul, tried to colonize Guiana, and 14,000 emigrants, recruited by false propaganda, were disembarked at Kourou without any preparation and without food supplies. Within two years 11,000 died from fever and 2,000 returned to France. To add to this, the Jesuits were driven out and their work abandoned. The administrator Pierre Victor Malouet then took over the task of saving Guiana. He brought back from Surinam a French engineer, who constructed polders, and spice cultivation was introduced. In 1788 the colony had about 1,300 whites, 400 free Negroes and 10,500 slaves. The Revolution brought the emancipation of the slaves and the government of the Directory deported to Guiana certain politicians including Charles Pichegru (*q.v.*). Under the consulate Victor Hugues re-established slavery but he had to yield in 1809 to an Anglo-Portuguese attack. In 1817 Guiana was restored to France. From 1827 to 1846 Mother Anne Marie Javouhey, superior of St. Joseph of Cluny, founded on the Mana a prosperous colony for freed slaves. The abolition of slavery in 1848 brought ruin to the plantations. Several thousand Hindus, introduced into the colony, were decimated by sickness, and in 1852 it was decided to send convicts to Guiana. In 1855 the discovery of gold stripped agriculture once more of labour; the Indians made off to Brazil and Dutch Guiana. The convict settlement, established at St. Laurent, brought no benefit to the colony. Its abolition, decided on in 1936, was effected in 1940.

The explorations of Jules Crevaux (1877–82) and Henri Coudreau (1884–96) covered not only French Guiana but a portion of the Amazon basin.

VII. SURINAM

Surinam (Suriname), Dutch Guiana or Netherlands Guiana lies between latitude 1" 50′ and 6° 7 N. and longitude 53° 59' and 58° 2' W. Its area is 54,144 sq.mi. with a seaboard about 240 mi. long. The cultivated area is about 12 j sq.mi., perhaps 1% of the potential of cultivable land. Of the area cultivated, 20.25 sq.mi. are under plantations, the remainder under medium or small farms.

Surinam was the scene of the first effective colonization by English settlers in Guiana, when from 1651 to 1667 experienced colonists from Barbados were introduced by Lord Willoughby of Parham. Toward the end of this period it had about 500 plantations and 40 sugar works. It was captured by the Dutch under Crijnssen, and ceded by the British at the treaty of Breda as from May 21, 1667, in exchange for New Netherlands (now New York). By 1900, 90% of all agricultural products were grown on plantations and 10% on small farms, but these figures were completely reversed, and coffee, sugar, cocoa and cotton were replaced in importance by rice and fruit. The plantation system and the maintenance of the poldered land both declined during the 19th century, partly because of the difficulties of the sugar industry, partly because of the diversion of Dutch energies from the West to the East Indies. After 1945 there was a notable influx of financial and technical resources and though Surinam still depends excessively on its exports of bauxite, there are a number of movements afoot to revive the economy. (G. **LN.**)

History.—The political history is uneventful after the periods described in the general history of Guiana. In 1828 Surinam and the Dutch West Indian islands were placed under a single governor, who resided at Paramaribo, but were separated again in 1848. Slavery was abolished in 1863, and an arrangement with the British for control of the coolie traffic was drawn up in 1870. The interest of the home government, which had waned with the decline of sugar in the 19th century, was renewed. Expeditions for scientific study, laboratories and establishments for agricultural research and expositions of products from Surinam in the Netherlands were evidence of this interest. For post-World War II changes see *Administration and Government,* below. (X.)

Population.—The population in the 1950 census was 183,681 exclusive of about 26,000 Indians and Negroes living in tribes. The population of Paramaribo was 74,337. At least seven-eighths of the people live on the coast. The proportion of the whole in Paramaribo (43%) is remarkable; the next town in size is Nieuw Nickerie (3,400). About 70% of the inhabitants of Paramaribo are Creoles (Negro and mixed peoples).

As in other tropical areas, the increase of population has been very striking. In 1900 the total was under 70,000; it was expected to reach 260,000 by the early 1960s. Bush Negroes have tended to increase for many years. The Amerindians appear to be reviving; their number in 1942 was estimated at just over 2,000. As in British Guiana, Indians from Asia are the most rapidly increasing group, comprising in the late 1950s about 35% of the total population. In 1942 they formed about 30%. Religious affiliations (1953) were: Reformed and Lutheran, 18,000; Moravians, 41,000; Roman Catholics, 39,000; Jews, 400; Moslems, 59,000; Hindus, 52,000; Confucians, 3,000; others, 6,000.

Government and Administration.—Under the act of Sept. 3, 1948, Surinam became part of the kingdom of the Netherlands. By an interim order operative from Jan. 20, 1950, Surinam obtained self-government except in foreign affairs and defense. The present constitution was defined by the Realm statute, effective from Dec. 29, 1954, which confirmed the interim situation and added certain rights of choice regarding international commitments. The governor, representing the sovereign, is head of the government. He appoints a ministry of nine ministers and an advisory council of five. The ministers are responsible to the legislative council (*Staten*) of Surinam, which is a body of 21 members, elected for a term of four years by adult suffrage. The country is divided into seven districts, of which Paramaribo (*q.v.*), the capital, is one, each administered by a commissary.

The principal sources of public revenue are import and export taxes, royalties on mining production, taxes on houses and estates, and income taxes.

Social Conditions and Education.—Of a total labour force of about 80,000, more than half are engaged in agriculture. On the average, unskilled workers earn 3 guldens ($1.55 or 11*s.* 3*d.*) a day and skilled workers 6 guldens. The country was considered by U.S. observers to be remarkably healthy by the standards of underdeveloped countries. It has also a literacy rate of 70%, there having been compulsory education for children of 7–12 years since 1876. The government aids both denominational and nondenominational schools. In 1959 there were 203 schools for elementary education (135 denominational), including 36 bush schools; and a medical school, a law college, 2 technical schools, 2 teachers' training colleges, 11 agricultural courses, 2 domestic science schools and 2 special schools. Other forms of social welfare are mainly run by voluntary bodies, subsidized by the government.

Economy.—Domestic trade is preponderantly in foodstuffs. The principal exports in 1957 were bauxite, plywood and rice. The U.S. takes 75% of the exports by value. The larger of the two bauxite mining concerns is the American Alcoa company. Imports, chiefly machinery, fuel oil and foodstuffs, are mostly from the U.S. and the Netherlands. The principal advances in production have been in logging and rice and the organization of a modern clothing industry.

Communications.—These are still poor in spite of extensions of the road system; there are about 600 mi. of main road, mainly in and around Paramaribo. The sole railway is a semiderelict 83 mi. single-track construction from Paramaribo to Kabel Station and Dam, built 1905–11 in the abortive hope of serving a gold-mining area. The system of water communication on the coastal plain is singularly complete because of the numerous streams flowing east-west. Boats can travel from the French to the British border on natural waterways with the single artificial link of the Saramacca canal.

Currency and Finance.—The currency unit is the Surinam gulden (florin or guilder). One Netherlands gulden = 0.5013 Surinam gulden (1959). Notes of 1 and 2.5 guldens are issued by the government, and notes of 5 guldens and upward by the Central bank. The Central bank was established in Oct. 1956, with a capital of 3,000,000 guldens, to supervise banking and act as a clearinghouse and to promote stability of the monetary unit. There are seven commercial banks.

In 1955 a ten-year development plan was launched, envisaging the investment of 256,000,000 Netherlands guldens of which one-third was to be raised locally, one-third granted by the Netherlands and one-third loaned by the Netherlands. One-quarter of the outlay was to be on agricultural development and 23% on transport. The development fund of 1947–55 spent 40,000,000 Netherlands guldens, all from grants.

GUIANA HIGHLANDS, are located mainly in the Guiana region of South America, north of the Amazon and south of the Orinoco river. Consisting of a heavily forested plateau, they cover the southern half of Venezuela, all of the Guianas except for the low coastal plain, the northern part of Brazil and a part of southeastern Colombia. These highlands are similar in geology and surface form to the Brazilian highlands, from which they are separated by the narrow eastern part of the Amazon lowland. The rocks are geologically ancient granites and gneisses, covered in places by more recent sandstones and lava flows. The terrain is made up of a mixture of three elements: a basement of rolling hilly upland, standing mostly less than 1,000 ft. above sea level; surmounted in places near the stream divides by low mountains that stand above the hilly upland between 2,000 and 3,000 ft. above sea level; and surmounted by tabular plateaus where the sandstones and lava flows cover the crystalline rocks. The highest elevations are formed by these tabular uplands, such as Mt. Roraima (9,432 ft.) where the boundaries of Brazil, Venezuela and British Guiana come together. The highlands extend westward across the upper Orinoco (and across the Casiquiare canal, a torrential stream that connects the Orinoco with the Amazon via the Negro river) and in southeastern Colombia reach the eastern front of the Andes, thus separating the Orinoco lowland from the Amazon lowland. The whole region receives an abundance of rainfall and no season is really dry. The vegetation is mostly tropical rain forest, but there are certain parts of the area with savanna. Much of southern Venezuela is a mixture of semideciduous forest and woodland savanna. From the forests come valuable cabinet woods, balata, chicle, vanilla, divi-divi, insecticides and medicinal plants. The crystalline rocks carry a wealth of minerals, but exploration is difficult due to the plant cover. Gold and diamonds are mined, and the Sierra Imataca of Venezuela is a major source of iron ore. *See* also GUIANA: *Physical Geography; Natural Resources;* VENEZUELA; BRAZIL; COLOMBIA; SOUTH AMERICA. (P. E. J.)

GUIART or GUIARD, **GUILLAUME** (d. *c.* 1316), French chronicler and poet, was probably born at Orléans, and served in the French army in Flanders in 1304. He lived at Arras and then in Paris, thus being able to consult the large store of manuscripts in the abbey of St. Denis, including the *Grandes chroniques de France.* Afterward he appears as a *ménestrel de bouche.* Guiart's poem *Branche des royaulx lignages* was written and then rewritten between 1304 and 1307, in honour of the French king Philip IV., and in answer to the aspersions of a Flemish poet. Its 21,000 verses deal with the history of the French kings from the time of Louis VIII.; but it is only really important for the period after 1296 and for the war in Flanders from 1301 to 1304, for which it is a high authority. It was first published by J. A. Buchon (Paris, 1828), and again in tome xxii. of the *Recueil des historiens des Gaules et de la France* (1865).

See A. Molinier, *Les Sources de l'histoire de France,* tome iii. (1903).

GUIBERT or **WIBERT** (c. 1030–1100), of Ravenna, antipope under the title of Clement III. from June 25, 1080 until September 1100, was born at Parma between 1020 and 1030 of the noble imperialist family, Corregio. He was appointed by the empress Agnes, chancellor and, after the death of Pope Victor II. (1057), imperial vicar of Italy. He strove to uphold the imperial authority during Henry IV.'s minority, and presided over the synod at Basel (1061). Guibert lost the chancellorship in 1062. In 1073, through the influence of Empress Agnes and the support of Cardinal Hildebrand, he obtained the archbishopric of Rsvenna and swore fealty to Alexander II. and his successors. He seems to have been at first on friendly terms with Gregory VII., but soon quarrelled with him over the possession of the city of Imola, and henceforth was recognized as the soul of the imperial faction in the investiture contest. He allied himself with Cencius, Cardinal Candidus and other opponents of Gregory at Rome, and, on his refusal to furnish troops or to attend the Lenten synod of 1075, he was ecclesiastically suspended by the pope. He was probably excommunicated at the synod of Worms (1076) with other Lombard bishops who sided with Henry IV., and at the Lenten synod of 1078 he was banned by name. The emperor, having been excommunicated for the second time in March 1080, convened 19 bishops of his party at Mainz on May 31, who pronounced the deposition of Gregory; and on June 25 he caused Guibert to be elected pope by 30 bishops assembled at Brixen. Guibert was installed in the Lateran and consecrated as Clement III. on March 24, 1084. One week later, on Easter Sunday, he crowned Henry IV. and Bertha in St. Peter's. Clement survived not only Gregory VII. but also Victor III. and Urban II., maintaining his title to the end and in great measure his power over Rome and the adjoining regions. Excommunication was pronounced against him by all his rivals. He was driven out of Rome finally by crusaders in 1097, and sought refuge in various fortresses on his own estates. St. Angelo, the last Guibertist stronghold in Rome, fell to Urban II. on Aug. 24, 1098. Clement, on the accession of Paschal II. in 1099, prepared to renew his struggle but was driven from Albano by Norman troops and died at Civita Castellana in September 1100.

J. von Hefele, *Conczliengeschichte,* vol. v. (2nd ed.); F. Gregorovius, *Rome in the Middle Ages,* vol. iv., trans. by Mrs. G. W. Hamilton (London, 1900–02); and O. Kohncke, *Wibert von Ravenna* (Leipzig, 1888). (C. H. H.)

GUIBERT, JACQUES ANTOINE HIPPOLYTE, COMTE DE (1743–1790), French general and military writer, was born at Montauban, and at the age of 13 accompanied his father, Charles Bénoit, comte de Guibert (1715–1786), chief of staff to Marshal de Broglie, throughout the war in Germany, and won the cross of St. Louis and the rank of colonel in the expedition to Corsica (1767). His *Essai général de tactique* (1770) appeared in numerous subsequent editions and in English, German and even Persian translations (extracts also in Liskenne and Sauvan, *Bibl. historique et militaire,* 1845). His *Défense du système de guerre moderne,* a reply to his many critics (Neuchâtel, 1779) is a reasoned and scientific defence of the Prussian method of tactics, which formed the basis of his work when in 177j he began to co-operate with the count de St. Germain in a series of much-needed and successful reforms in the French army. In 1777, however, St. Germain fell into disgrace, and his fall involved that of Guibert, who was promoted to the rank of *maréchal de camp* and relegated to a provincial staff appointment. In his semi-retirement he vigorously defended his old chief St. Germain against his detractors. On the eve of the Revolution he was recalled to the War Office, but in his turn he became the object of attack and he died, practically of disappointment, on May 6, 1790.

See Toulongeon, *Eloge véridique de Guibert* (1790); Madame de Stäel, *Eloge de Guibert;* Bardin, *Notice historique du général Guibert* (1836); Flavian d'Aldeguier, *Discours sur la vie et les écrits du comte de Guibert* (Toulouse, 1855); Count Forestie, *Biographie du comte de Guibert* (Montauban, 1855); Count zur Lippe, "Friedr. der Grosse und Oberst Guibert" (*Militär-Wochenblatt,* 1873, 9 and 10).

GUIBERT OF NOGENT (1053–1124), historian and theologian, was born of noble parents at Clermont-en-Beauvoisis, and studied at the Benedictine abbey of Flavigny (Flaviacum) or St. Germer, where he devoted himself at first to the secular poets, and later changed to theology, through the influence of Anselm of Bec, afterwards of Canterbury. In 1104, he became head of the abbey of Notre Dame de Nogent. Of his works which appeared at Paris in 1651 and in Migne's *Patrol. Lat.,* vols. 156 and 184, the chief are his interesting autobiography, *De vita sua, sive monodiarum,* and his history of the first crusade, *Gesta Dei per Francos.* The former was translated into English by C. C. Swinton Bland (1926).

See H. von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, *1881);* B. Monod, *Le Moine Guibert et son temps* (1905); and *Guibert de Nogent; histoire de sa vie* (ed. G. Bourgin, 1907).

GUICCIARDINI, FRANCESCO (1483–1540), Italian historian and statesman, was born at Florence on Mar. 6, 1483. He studied at the universities of Ferrara and Padua, and at that time contemplated a career in the church. Owing, however, to the opposition of his father, he turned his attention to law, and at the age of 23 was appointed by the Signoria of Florence to read the *Institutes* in public. He advanced his political prospects by his marriage with Maria Salviati. In 1512 the Signoria sent him on a mission to the court of Ferdinand of Spain, and Guicciardini issued from this first trial of his skill with an assured reputation for diplomacy, which in the Italy of that time implied an ability to meet plot with counterplot, and parry force with sleight of hand.

In 1515 Leo. X. took him into service, and made him governor of Reggio and Modena. In 1521 Parma was added to his rule, and in 1523 he was appointed viceregent of Romagna by Clement VII. Guicciardini was thus virtual master of the papal States beyond the Apennines, during a period of great difficulty. In 1526 Clement made him lieutenant-general of the papal army. In this capacity he witnessed from a distance the sack of Rome and the imprisonment of Clement, without being able to rouse the duke of Urbino into activity. Clement did not withdraw his confidence, and in 1531 Guicciardini was advanced to the governorship of Bologna, the most important of all the papal lord-lieutenancies. This post he resigned in 1534 on the election of Paul III., preferring to follow the fortunes of the Medicean princes.

It may here be noticed that though Guicciardini served three popes through a period of 20 years, he hated the papacy with a deep bitterness, attributing the woes of Italy to the ambition of the church. The same discord between his private opinions and his public actions may be traced in his later conduct. Guicciardini believed that the best form of government was a commonwealth administered upon the type of the Venetian constitution; and we have ample evidence to prove that he had judged the tyranny of the Medici at its true worth. Yet he did not hesitate to place his powers at the disposal of the most vicious members of that house for the enslavement of Florence. In 1527 he had been declared a rebel by the Signoria on account of his well-known Medicean prejudices; and in 1530, deputed by Clement to punish the citizens after their revolt, he revenged himself with a cruelty and an avarice that were long and bitterly remembered. When he returned to Florence in 1534, he did so as the creature of the dissolute Alessandro de' Medici, and he pushed his servility so far as to defend this infamous despot at Naples in 153j, before the bar of Charles V., from the accusations brought against him by the Florentine exiles (*Op. ined.* vol. ix.). He won his cause; but he justified the reproaches of his contemporaries, who describe him as a cruel, venal, grasping seeker after power, eager to support a despotism for the sake of honours, offices and emoluments secured for himself by a bargain with the oppressors of his country. Varchi, Nardi, Jacopo Pitti and Bernardo Segni are unanimous upon this point; but it is only the publication of Guicciardini's private mss. that has made us understand the force of their invectives. After the murder of Duke Alessandro in 1537, Guicciardini espoused the cause of Cosimo de' Medici, a boy unused to the game of statecraft, hoping to rule Florence as grand vizier under this inexperienced princeling. But Cosimo displayed the genius of his family for politics, and dismissed him. Guicciardini spent his last years in the composition of the *Storia d'Italia.* He died at Florence on May 23, 1540.

The Storia d'Italia (1561–64) dealt with the period 1494–1532; it was translated into most European languages. It is a masterpiece of scientific history, and is remarkable for treating the history of Italy for the first time as a national whole, and not as the accumulation of separate principalities and republics. The whole tangled skein of Italian politics, in that involved and stormy period, is unravelled with a patience and insight that are above praise. The *Storia d'Italia* was undoubtedly the greatest historical work that had appeared since the beginning of the modern era, though it owes its greatness in part to the importance of the period with which it deals. It remains the most solid monument of Italian reason in the 16th century, the final triumph of that Florentine school of philosophical historians which included Machiavelli, Segni, Pitti, Nardi, Varchi, Francesco Vettori and Donato Giannotti.

Though Guicciardini Iived through that agony of the Italian people, he does not seem to be aware that he is writing a great historical tragedy, and never ceases to be an impartial spectator—a cold and curious critic. He maintained that the explanation of historical events could only be traced in the detailed study of human character and motive. His writing is therefore overburdened with detail which, although it tends to destroy the proper perspective of his work, very accurately portrays the principles underlying his method.

Up to the year 1857 the fame of Guicciardini as a writer, and the estimation of him as a man, depended almost entirely upon the *Storia d'Italia,* and on a few ill-edited extracts from his aphorisms. At that date the Guicciardini family entrusted to Giuseppe Canestrini the publication of his hitherto inedited mss. The works thus brought to light include (1) the *Ricordi politici,* consisting of about 400 aphorisms on political and social topics, which illustrate Guicciardini's conviction that man is naturally actuated by the basest motives; (2) the observations on Machiavelli's *Discorsi,* which very clearly show his lack of political idealism; (3) the *Storia Fiorentina,* an early work; (4) the *Dialogo del reggimento di Firenze*, also probably an early work, in which the forms of government suited to an Italian commonwealth are discussed, and illustrated by the vicissitudes of Florence up to the year 1494; and (j) *Discorsi politici,* composed during his Spanish Iegation. Taken in combination with Machiavelli's treatises, the *Opere inedite* furnish a comprehensive body of Italian political philosophy anterior to the date of Fra Paolo Sarpi.

GUICHARD, KARL GOTTLIEB (1724–1775), soldier and military writer, known as QUINTUS ICILIUS, was born at Magdeburg in 1724, of a family of French refugees. He was educated for the church, but sought and obtained a commission in the Dutch army, making the campaigns of 1747–48 in the Low Countries. In 1757 his *Mémoires militaires sur les Grecs et les Romnins* appeared at The Hague; and in Jan. 1758 he entered the service of Frederick the Great, remaining for nearly 18 months in the royal suite. Guichard's Prussian official name of Quintus Icilius was the outcome of a friendly dispute with the king. He was appointed to the command of a free battalion. This corps he commanded throughout the later stages of the Seven Years' War. his battalion, as time went on, becoming a regiment of three battalions, and Quintus himself recruited seven more battalions of the same kind of troops. His command was almost always with the king's own army in these campaigns, but for a short time it fought in the western theatre under Prince Henry. When not on the march he was always at the royal headquarters, and it was he who brought about the famous interview between the king and Gellert on the subject of national German literature. He was made lieutenant colonel in 1765, and in 1773, in recognition of his work *Mémoires critiques et historiques sur plusieurs points d'antiquités militaires,* dealing mainly with Caesar's campaigns in Spain (1773), was promoted colonel. He died at Berlin on May 13, 1775.

GUICHEN, LUC URBAIN DE BOUEXIC, COMTE DE (1712–1790), French admiral, was born at Fougeres on June 21, 1712, and entered the navy in 1730. When France had become the ally of the Americans in the War of Independence, he hoisted his flag as rear admiral in the channel fleet, and was present at the battle of Ushant (July 27, 1779).

In March of the following year he was sent to the West Indies to fight Rodney. In the action to Ieeward of Martinique (April 17), Guichen narrowly escaped disaster. He gave no further opportunity of bringing him to close action, and brought his fleet back to Brest for repairs. In Dec. 1781 Guichen was sent to the West Indies with stores and reinforcements. On the 12th Admiral Kernpenfelt, who had been sent out by the British government to intercept him, sighted the French admiral in the Bay of Biscay through a temporary clearance in a fog, and attacked the transports, 20 of which were captured and the rest put to flight. Guichen died on Jan. 13, 1790.

GUIDI, CARLO ALESSANDRO (1650–1712), Italian lyric poet, was bom at Pavia on June 14, 1650. As chief founder of the well-known Roman academy called L'Arcadia, he had a share in the reform of Italian poetry, which had been corrupted by the extravagances of the poets Marini and Achillini and their school. Guidi's most celebrated song is that entitled *Alla Fortuna* ("To Fortune").

In 1681 he published at Parma his poems, his lyric tragedy *Amalasunta* in *Italy,* and two pastoral dramas, *Daphne* and *Endymion.*

His poetical version of the six homilies of Pope Clement XI proved to be the indirect cause of the author's death. Guidi was on his way to present a copy to the pope when he found a serious typographical error; he took it so much to heart that he was seized with an apoplectic fit at Frascati and died (June 12, 1712).

GUIDICCIONI, GIOVANNI (1500–1541), Italian diplomat and poet of the school of Petrarch, was born at Lucca, Feb. 25, 1500. His *Lettere* afford valuable observations on the political life of his time. His best work is a set of 14 sonnets contrasting ancient and Renaissance Rome. He died at Macerata, July 26, 1541.

Guidiccioni's works were published in 2 vol. (1867). *See* also E. Chiorboli, *Giovanni Guidiccioni* (1907).

GUIDO DA SIENA (active *c.* 1250–1275), Italian painter, who, if certain assumptions regarding him may be accepted as true, is the earliest representative of a new school of neo-Byzantine art that flourished in Siena in the 13th century. A large painting of the "Virgin and Child Enthroned," once in the church of S. Domenico at Siena and later moved to the Palazzo Pubblico, bears a rhymed Latin inscription, giving the painter's name as "Gu . . . o de Senis," with the date 1221. Milanesi alleged that the inscription had been tampered with and should read 1281, while Wickhoff maintained that the date 1221 was genuine. Later art criticism inclined toward the latter view. Milanesi thought that the work in S. Domenico was due to Guido Graziani, of whom no other record remains earlier than 1278, when he is mentioned as the painter of a banner.

GUIDO OF AREZZO (c. 990), a musician who lived in the 11th century, is also known as Guido Aretinus, Fra Guittone and Guy of Arezzo. He has been called the father of modem music, and a portrait of him in the refectory of the monastery of Avellana bears the inscription *Beatus Guido, inventor musicae.* Of his life little is known, and that little is chiefly derived from the dedicatory letters prefixed to two of his treatises and addressed respectively to Bishop Theodald of Arezzo and Michael, a monk of Pomposa and Guido's pupil and friend. At his first appearance in history Guido was a monk in the Benkdictine monastery of Pomposa, where he taught singing and invented his educational method, by means of which, according to his own statement, a pupil might learn in five months what formerly it would have taken him ten years to acquire. Envy and jealousy, however, drove him from the monastery and he went to live at Arezzo, where, about 1030, he received an invitation to Rome from Pope John XIX. He obeyed the summons, and the pope himself became his first and apparently one of his most proficient pupils. In Rome he met again his former superior, the abbot of Pomposa, who seems to have induced him to return to Pomposa. Thenceforward the particulars of his life are scanty but it is known that at one period he worked in the Benedictine monastery of St. Maur des Fosses where he invented his novel system of notation and taught the brothers to sing by it. In codex 763 of the British museum the composer of the "Micrologus," which gives an account of his method and other works by him, is always described as Guido de Sancto Mauro.

But whatever the details of his life there is no room for question as to the importance of his musical reforms and innovations. He it was who for the first time systematically used the lines of the staff, and the intervals or *spatia* between them. There is also little doubt that the names of the first six notes of the scale, *ut, re, mi, fa, sol, la,* still in use in France and Italy. were introduced by him. They were derived from the first syllables of six lines of a hymn addressed to St. John the Baptist, the initial notes of each line of which happened to form the scale, C, D, E, F, G, A, the lines in question being as follows:

Ut queant laxis *re*sonare fibris
*Mi*ra gestorum *fa*muli tuorum,
*Sol*ve polluti labii reatum,
Sancte Joannes.

Further, Guido is generally credited with the introduction of the F clef and with writings on music which are amply sufficient to account for the high esteem in which he was ultimately held by his contemporaries. The precise year of his death is unknown.

The most important of Guido's treatises, and those which are generally acknowledged to be authentic, are *Micrologus Guidonis de disciplina artis musicae,* dedicated to Bishop Theodald of Arezzo, and comprising a complete theory of music: in 20 chapters; *Musicae Guidonis regulae rhythmicae in antiphonarii sui prologum prolatae,* written in trochaic decasyllabics of anything but classical structure; *Aliae Guidonis regulae de ignoto cantu, identidem in antiphonarii sui prologum prolatae;* and the *Epistola Guidonis Michaeli monacho de ignoto cantu,* already referred to. These are published in the second volume of Gerbert's *Scriptores ecclesiastici de musica sacra.* A very important manuscript unknown to Gerbert (the *Codex bibliothecae Uticensis,* in the Paris library) contains an antiphonarium and gradual undoubtedly belonging to Guido. *See* TONIC SOL-FA.

See L. Angeloni, *G. d'Arezzo* (1811); Kiesewetter, *Guido von Arezzo* (1840); Kornmüller, "Leben und Werken Guidos von Arezzo," in Habert's *Jahrb.* (1876); Antonio Brandi, *G. Aretino* (1882); G. B. Ristori, *Biografia di Guido monaco d'Arezzo* (1868); and a life by Gastoué in the *Dict. d'archéologie* (1924). *See* also HEXACHORD; MUSIC; and MUSICAL NOTATION.

GUIDO RENI: *see* RENI, GUIDO.

GUIENNE, an old French province which corresponded roughly to the Aquitania Secunda of the Roman period. In the 12th century it formed, with Gascony, the duchy of Aquitaine (*q.v.*), which passed under the dominion of the kings of England by the marriage of Eleanor of Aquitaine to Henry II. But. in the 13th century, through the conquests of Philip Augustus, Louis VIII and Louis IX, it was confined within the narrower limits fixed by the treaty of Paris (1259). It was at this point that "Guienne," a vulgar form of "Aquitaine," was substituted as the name of the whole territory which, in southwestern France, belonged to the Plantagenets under the suzerainty of the French king. These territories formed a duchy which included not only the Bordelais, the Bazadais, part of Périgord, Limousin, Quercy and Rouergue but also Gascony (*q.v.*) properly so called, between the lower Garonne and the Pyrenees, and, later on, the Agenais. ceded by Philip III the Bold to Edward I in 1279. In 1296, 1324 and 1337 this duchy was confiscated by the kings of France on the ground that there had been a failure in the feudal duties. At the treaty of Brétigny (1360) Edward III acquired the full sovereignty of the duchy of Guienne, enlarged by the territories which formed the principality of Aquitaine. Some years later the treaty was broken on the initiative of Charles V of France, and French troops reconquered a large part of the country (1369–79). After alternating successes and defeats during the first half of the 15th century, the English troops were compelled to leave the whole country, first in 1451, then finally in 1453. It was then united to the French crown by Charles VII. In 1469 Louis XI gave it in exchange for Champagne and Brie to his brother Charles, duke of Berry, after whose death in 1472 it was again united to the royal dominion. Guienne then formed a government which from the 17th century onward was united with Gascony. The government of Guienne and Gascony, with its capital at Bordeaux, lasted until the end of the *ancien régime.* Under the Revolution the *départements* formed from Guienne proper were those of Gironde, Lot-et-Garonne, Dordogne, Lot, Aveyron and the chief part of Tarn-et-Garonne.

BIBLIOGRAPHY.—C. Jullian, *Histoire de Bordeaux* (1895); R. Boutruche, *La Crise d'une société. Seigneurs et paysans du Bordelais pendant la Guerre de Cent Ans* (1947); C. Dartigue, *Histoire de la Guyenne* (1950).

GUILBERT, YVETTE (1868?–1944), French *diseuse,* born in Paris. won an immense vogue by her rendering of songs drawn from Parisian lower-class life and from the humours of the Latin Quarter. Her adoption of an habitual yellow dress and long black gloves, her studied simplicity of diction and her ingenuous delivery of songs charged with risqué meaning made her famous. She owed something to Xanrof (Léon Fourneau), who for a long time composed songs especially for her, and perhaps still more to Aristide Bruant, who wrote many of her argot songs. She is also remembered as the subject of a famous poster by H. Toulouse-Lautrec.

Her publications include *La Vedette* and *Les Demi-vieilles,* both novels (1902), and *Song of My Life: My Memories* (1927; Eng. trans., 1929).

GUILDFORD, municipal borough and county town of Surrey, Eng., in the Guildford parliamentary division, 28 mi. S.W. of London by road. Pop. (1951) 47,496. Area 11.2 sq.mi. It is situated on the river Wey in a gap in the North Downs through which pass also the London-Portsmouth road and the railway. A possession of King Alfred, it was a royal borough throughout the middle ages. It is first mentioned as a borough in 1130. Charters of Henry III (1257) granted among other privileges that Guildford should be the seat of the county court and the Surrey assizes "for ever." After the spring assizes in 1930 they were, however, moved to Kingston-upon-Thames. Of 12 other charters before 1686 the most important were those of Edward III in 1366 (fee farm), Henry VII in 1488 (incorporation) and James I in 1603 (commission of the peace). A fair at Trinity, almost immediately moved to Whitsun, was granted by Edward III. It was superseded under Henry VII by two, held on the feasts of St. Martin and St. George. Fairs. in May for the sale of sheep and in November for cattle, are still held; there is a cattle market on Tuesdays and a fruit and vegetable market on Fridays and Saturdays. St. Mary's church has a Saxon tower; there are the ruins of a Norman castle; Tudor buildings include the Royal Grammar school, founded in 1507 and refounded by Edward VI in 1553; among 17th–18th century buildings are Trinity hospital, founded by Archbishop Abbot in 1619, and the front of the Guildhall (1683). The staple industry during the middle ages was the cloth trade: it is now extinct. Later the town's prosperity was based on its markets, which, with a motor works and other industries, still contribute largely to its wealth. Guildford was constituted a diocese in 1927, and in 1936 the foundation stone of the cathedral church of the Holy Spirit, designed by Edward Maufe. was laid on Stag hill. The Rev. C. L. Dodgson (Lewis Carroll) died in Guildford in 1898 and is buried in the cemetery on the Mount.

GUILDS. (The spelling *guild* is now the common English spelling, but there are many reasons for preferring the older spelling *gild).* Mediaeval gilds were voluntary associations formed for the mutual aid and protection of their members. Among the gildsmen there was a strong spirit of fraternal co-operation or Christian brotherhood, with a mixture of worldly and religious ideals—the support of the body and the salvation of the soul. Early meanings out of the root *gild* or *geld* were expiation. penalty, sacrifice or worship, feast or banquet, and contribution or payment; it is difficult to determine which is the earliest meaning, and it is not certain whether the gildsmen were originally those who contributed to a common fund or those who worshipped or feasted together. Their fraternities or societies may be divided into three classes: religious or benevolent, merchant and craft gilds. The last two categories, which do not become prominent anywhere in Europe until the 12th century, had, like all gilds, a religious tinge, but their aims were primarily worldly, and their functions were mainly of an economic character.

Origin.—Various theories have been advanced concerning the origin of gilds. Some writers regard them as a continuation of the Roman *collegia* and *sodalitates,* but there is little evidence to prove the unbroken continuity of existence of the Roman and Germanic fraternities. A more widely accepted theory derives gilds wholly or in part from the early Germanic or Scandinavian sacrificial banquets. This view does not seem to be tenable, for the old sacrificial carousals lack two of the essential elements of the gilds, namely, corporative solidarity or permanent association and the spirit of Christian brotherhood. Max Pappenheim ascribed the origin of Germanic gilds to the northern "foster-brotherhood" or "sworn-brotherhood," which was an artificial bond of union between two or more persons. After intermingling their blood in the earth and performing other peculiar ceremonies, the two contracting parties with grasped hands swore to avenge any injury done to either of them. The foster-brotherhood seems to have been unknown to the Franks and the Anglo-Saxons, the nations in which mediaeval gilds first appear; and hence Pappenheim's conclusions, if tenable at all, apply only to Denmark or Scandinavia.

No theory on this subject can be satisfactory which wholly ignores the influence of the Christian Church. Imbued with the idea of the brotherhood of man, the church naturally fostered the early growth of gilds and tried to make them displace the old heathen banquets. The work of the Church was, however, directive rather than creative. Gilds were a natural manifestation of the associative spirit which is inherent in mankind. The same needs produce in different ages associations which have striking resemblances, but those of each age have peculiarities which indicate a spontaneous growth. It is not necessary to seek the germ of gilds in any antecedent age or institution. When the old kin-bond or *maegth* was beginning to weaken or dissolve, and the state did not yet afford adequate protection to its citizens, individuals naturally united for mutual help.

Gilds are first mentioned in the Carolingian capitularies of 779 and 789, and in the enactments made by the Synod of Nantes early in the 9th century, the text of which was preserved in the ecclesiastical ordinances of Hincmar of Reims (A.D. 852). The capitularies of 805 and 821 also contain vague references to sworn unions of some sort, and a capitulary of 884 prohibits villeins from forming associations "vulgarly called gilds" against those who have despoiled them. The Carolingians evidently regarded such "conjurations" as "conspirations" dangerous to the State. The gilds of Norway, Denmark and Sweden are first mentioned in the 11th, 12th and 14th centuries respectively; those of France and the Netherlands in the 11th.

Many writers believe that the earliest references to gilds come from England. The laws of Ine speak of *gegildan* who helped one another pay the *wergeld,* but it is not quite certain that they were members of gild fraternities in the later sense. These are more clearly referred to in England in the second half of the 9th century, though we have little information concerning them before the 11th century. To the first half of that century belong the statutes of the fraternities of Cambridge, Abbotsbury and Exeter. They are important because they form the oldest body of gild ordinances extant in Europe. The thanes' gild at Cambridge afforded help in blood-feuds, and provided for the payment of the *wergeld* in case a member killed anyone. The religious element was more prominent in Orcy's gild at Abbotsbury and in the fraternity at Exeter; their ordinances exhibit much solicitude for the salvation of the brethren's souls. The Exeter gild also gave assistance when property was destroyed by fire. Prayers for the dead, attendance at funerals of gildsmen, periodical banquets, the solemn entrance oath, fines for neglect of duty and for improper conduct, contributions to a common purse, mutual assistance in distress, periodical meetings in the gildhall—in short, all the characteristic features of the later gilds already appear in the statutes of these Anglo-Saxon fraternities. Some Continental writers, in dealing with the origin of municipal government throughout western Europe, have, however, ascribed too much importance to the Anglo-Saxon gilds, exaggerating their prevalence and contending that they form the germ of mediaeval municipal government. This view rests almost entirely on conjecture; there is no good evidence to show that there was any organic connection between gilds and municipal government in England before the coming of the Normans. It should also be noted that there is no trace of the existence of either craft or merchant gilds in England before the Norman Conquest. Commerce and industry were not yet sufficiently developed to call for the creation of such associations.

Religious Gilds after the Norman Conquest.—Though we have not much information concerning the religious gilds in the 12th century, they doubtless flourished under the Anglo-Norman kings, and we know that they were numerous, especially in the boroughs, from the 13th century onward. In 1388 parliament ordered that every sheriff in England should call upon the masters and wardens of all gilds and brotherhoods to send to the king's council in Chancery, before Feb. 2, 1389, full returns regarding their foundation, ordinances and property. They throw much light on the functions of the gilds. Their ordinances are similar to those of the above-mentioned Anglo-Saxon fraternities. Each member took an oath of admission, paid an entrance fee, and made a small annual contribution to the common fund. The brethren were aided in old age, sickness and poverty, often also in cases of loss by robbery, shipwreck and conflagration; for example, any member of the gild of St. Catherine, Aldersgate, was to be assisted if he "fall into poverty or be injured through age, or through fire or water, thieves or sickness." Alms were often given even to non-gildsmen; lights were supported at certain altars; feasts and processions were held periodically; the funerals of brethren were attended; and masses for the dead were provided from the common purse or from special contributions made by the gildsmen. Some of the religious gilds supported schools, or helped to maintsin roads, bridges and town-walls, or even came, in course of time, to be closely connected with the government of the borough; but, as a rule, they were simply private societies with a limited sphere of activity. They are important because they played a prominent rôle in the social life of England, especially as eleemosynary institutions, down to the time of their suppression in 1547. Religious gilds, closely resembling those of England, also flourished on the Continent during the middle ages.

The Gild Merchant.—The merchant and craft fraternities are particularly interesting to students of economic and municipal history. The gild merchant came into existence in England soon after the Norman Conquest, as a result of the increasing importance of trade, and it may have been transplanted from Normandy. Until clearer evidence of foreign influence is found, it may, however, be safer to regard it simply as a new application of the old gild principle, though this new application may have been stimulated by Continental example. The evidence seems to indicate the pre-existence of the gild merchant in Normandy, but it is not mentioned anywhere on the Continent before the 11th century. It spread rapidly in England, and from the reign of John onward we have evidence of its existence in many English boroughs. But in some prominent towns, notably London, Colchester, Norwich and the Cinque Ports, it seems never to have been adopted. In fact it played a more conspicuous rôle in the small boroughs than in the large ones. It was regarded by the townsmen as one of their most important privileges. Its chief function was to regulate the trade monopoly conveyed to the borough by the royal grant of *gilda mercatoria.* A grant of this sort implied that the gildsmen had the right to trade freely in the town, and to impose payments and restrictions upon others who desired to exercise that privilege. The ordinances of a gild merchant thus aim to protect the brethren from the commercial competition of strangers or non-gildsmen. More freedom of trade was allowed at all times in the selling of wares by wholesale, and also in retail dealings during the time of markets and fairs. The ordinances were enforced by an alderman with the assistance of two or more deputies, or by one or two masters, wardens or keepers. The *Morwenspeches* were periodical meetings at which the brethren feasted, revised their ordinances, admitted new members, elected officers and transacted other business.

Historians have expressed divergent views regarding the early relations of the craftsmen and their fraternities to the gild merchant. One of the main questions in dispute is whether artisans were excluded from the gild merchant. Many of them seem to have been admitted to membership. They were regarded as merchants, for they bought raw material and sold the manufactured commodity; no sharp line of demarcation was drawn between the two classes in the 12th and 13th centuries. Separate societies of craftsmen were formed in England soon after the gild merchant came into existence; but at first they were few in number. The gild merchant did not give birth to craft fraternities or have anything to do with their origin; nor did it delegate its authority to them. In fact, there seems to have been little or no organic connection between the two classes of gilds. As has already been intimated, however, many artisans probably belonged both to their own craft fraternity and to the gild merchant, and the latter, owing to its great power in the town, may have exercised some sort of supervision over the craftsmen and their societies. When the king bestowed upon the tanners or weavers or any other body of artisans the right to have a gild, they secured the monopoly of working and trading in their branch of industry. Thus with every creation of a craft fraternity the gild merchant was weakened and its sphere of activity was diminished, though the new bodies were subsidiary to the older and larger fraternity. The greater the commercial and industrial prosperity of a town, the more rapid was the multiplication of craft gilds, which was a natural result of the ever-increasing division of labour. The old gild merchant remained longest intact and powerful in the smaller boroughs, in which, owing to the predominance of agriculture, few or no craft gilds were formed. In some of the larger towns rhe crafts were prominent already in the 13th century, but they became much more prominent in the first half of the 14th century. Their increase in number and power was particularly rapid in the time of Edward III., whose reign marks an era of industrial progress. Many master craftsmen now became wealthy employers of labour, dealing extensively in the wares which they produced. The class of dealers or merchants, as distinguished from trading artisans, also greatly increased and established separate fraternities. When these various unions of dealers and of craftsmen embraced all the trades and branches of production in the town, little or no vitality remained in the old gild merchant; it ceased to have an independent sphere of activity. The tendency was for the single organization, with a general monopoly of trade, to be replaced by a number of separate organizations representing the various trades and handicrafts. In short, the function of guarding and supervising the trade monopoly split up into various fragments, the aggregate of the crafts superseding the old general gild merchant. This transference of the authority of the latter to a number of distinct bodies and the consequent disintegration of the old organization was a gradual spontaneous movement—a process of slow displacement, or natural growth and decay, due to the play of economic forces—which, generally speaking, may be assigned to the 14th and 15th centuries, the very period in which the craft gilds attained the zenith of their power. While in most towns the name and the old organization of the gild merchant thus disappeared and the institution was displaced by the aggregate of the crafts towards the close of the middle ages, in some places it survived long after the 15th century either as a religious fraternity, shorn of its old functions, or as a periodical feast, or as a vague term applied to the whole municipal corporation.

On the Continent of Europe the mediaeval gild merchant played a less important rôle than in England. In Germany, France and the Netherlands it occupies a less prominent place in the town charters and in the municipal polity, and often corresponds to the later fraternities of English dealers established either to carry on foreign commerce or to regulate a particular part of the local trade monopoly.

Craft Gilds.—A craft gild usually comprised all the artisans in a single branch of industry in a particular town. Such a fraternity was commonly called a "mistery" or "company" in the 15th and 16th centuries, though the old term "gild" was not yet obsolete. "Gild" was also a common designation in north Germany, while the corresponding term in south Germany was *Zunft,* and in France *métier*. These societies are not clearly visible in England or on the Continent before the early part of the 12th century. With the expansion of trade and industry the number of artisans increased, and they banded together for mutual protection. Some German writers have maintained that these craft organizations emanated from manorial groups of workmen, but strong arguments have been advanced against the validity of this theory (notably by F. Keutgen). It is unnecessary to elaborate any profound theory regarding the origin of the craft gilds. The union of men of the same occupation was a natural tendency of the age. In the 13th century the trade of England continued to expand and the number of craft gilds increased. In the 14th century they were fully developed and in a flourishing condition; by that time each branch of industry in every large town had its gild. The development of these societies was even more rapid on the Continent than in England.

Their organization and aims were in general the same throughout western Europe. Officers, commonly called wardens in England, were elected by the members, and their chief function was to supervise the quality of the wares produced so as to secure good and honest workmanship. Therefore, ordinances were made regulating the hours of labour and the terms of admission to the gild, including apprenticeship. Other ordinances required members to make periodical payments to a common fund, and to participate in certain common religious observances, festivities and pageants. But the regulation of industry was always paramount to social and religious aims; the chief object of the craft gild was to supervise the processes of manufacture and to control the monopoly of working and dealing in a particular branch of industry.

We have already called attention to the gradual displacement of the gild merchant by the craft organizations. The relations of the former to the latter must now be considered more in detail. There was at no time a general struggle in England between the gild merchant and the craft gilds, though in a few towns there seems to have been some friction between merchants and artisans. There is no exact parallel in England to the conflict between these two classes in Scotland in the 16th century, or to the great Continental revolution of the 13th and 14th centuries, by which the crafts threw off the yoke of patrician government and secured more independence in the management of their own affairs and more participation in the civic administration. The main causes of these conflicts on the Continent were the monopoly of power by the patricians, acts of violence committed by them, their bad management of the finances and their partisan administration of justice. In some towns the victory of the artisans in the 14th century was so complete that the whole civic constitution was remodelled with the craft fraternities as a basis. A widespread movement of this sort would scarcely be found in England, where trade and industry were less developed than on the Continent, and where the motives of a class conflict between merchants and craftsmen were less potent. Moreover, borough government in England seems to have been mainly democratic until the 14th or 15th century; there was no oligarchy to be depressed or suppressed. Even if there had been motives for uprisings of artisans such as took place in Germany and the Netherlands, the English kings would probably have intervened. True, there were popular uprisings in England, but they were usually conflicts between the poor and the rich; the crafts as such seldom took part in these tumults. While many Continental municipalities were becoming more democratic in the 14th century, those of England were drifting towards oligarchy, towards government by a close "select body." As a rule the craft gilds secured no dominant influence in the boroughs of England, but remained subordinate to the town government. Whatever power they did secure, whether as potent subsidiary organs of the municipal polity for the regulation of trade, or as the chief or sole medium for the acquisition of citizenship, or as integral parts of the common council, was, generally speaking, the logical sequence of a gradual economic development, and not the outgrowth of a revolutionary movement by which oppressed craftsmen endeavoured to throw off the yoke of an arrogant patrician gild merchant.

Two new kinds of craft fraternities appear in the 14th century and become more prominent in the 15th, namely, the merchants' and the journeymen's companies. The misteries or companies of merchants traded in one or more kinds of wares. They were preeminently dealers, who sold what others produced. Hence they should not be confused with the old gild merchant, which originally comprised both merchants and artisans, and had the whole monopoly of the trade of the town. In most cases, the company of merchants was merely one of the craft organizations which superseded the gild merchant.

In the 14th century the journeymen or yeomen began to set up fraternities in defence of their rights. The formation of these societies marks a cleft within the ranks of some particular class of artisans—a conflict between employers, or master artisans, and workmen. The journeymen combined to protect their special interests, notably as regards hours of work and rates of wages, and they fought with the masters over the labour question in all its aspects. The resulting struggle of organized bodies of masters and journeymen was widespread throughout western Europe, but it was more prominent in Germany than in France or England. This conflict was indeed one of the main features of German industrial life in the 15th century. In England the fraternities of journeymen, after struggling a while for complete independence, seem to have fallen under the supervision and control of the masters' gilds; in other words, they became subsidiary or affiliated organs of the older craft fraternities.

An interesting phenomenon in connection with the organization of crafts is their tendency to amalgamate, which is occasionally visible in England in the 15th century, and more frequently in the 16th and 17th. A similar tendency is visible in the Netherlands and in some other parts of the Continent already in the 14th century. Several fraternities—old gilds or new companies, with their respective cognate or heterogeneous branches of industry and trade—were fused into one body. In some towns all the crafts were thus consolidated into a single fraternity; in this case a body was reproduced which regulated the whole trade monopoly of the borough, and hence bore some resemblance to the old gild merchant.

In dealing briefly with the modern history of craft gilds we may confine our attention to England. In the Tudor period the policy of the Crown was to bring them under public or national control. Laws were passed, for example in 1503, requiring that new ordinances of "fellowships of crafts or misteries" should be approved by the royal justices or by other Crown officers; and the authority of the companies to fix the price of wares was thus restricted. The statute of 5 Elizabeth c. 4 also curtailed their jurisdiction over journeymen and apprentices (*see* APPRENTICESHIP).

The craft fraternities were not suppressed by the statute of 1547 (1 Edward VI.). They were indeed expressly exempted from its general operation. Such portions of their revenues as were devoted to definite religious observances were, however, appropriated by the Crown. The revenues confiscated were those used for "the finding, maintaining or sustentation of any priest or of any anniversary, or obit, lamp, light or other such things." This has been aptly called "the disendowment of the religion of the misteries." Edward VI.'s statute marks no break of continuity in the life of the craft organizations. Even before the Reformation, however, signs of decay had already begun to appear, and these multiplied in the 16th and 17th centuries. The old gild system was breaking down under the action of new economic forces. Its dissolution was due especially to the introduction of new industries, organized on a more modern basis, and to the extension of the domestic system of manufacture. Thus the companies gradually lost control over the regulation of industry, though they still retained their old monopoly in the 17th century, and in many cases even in the 18th. In fact, many craft fraternities still survived in the second half of the 18th century, but their usefulness had disappeared. The mediaeval form of association was incompatible with the new ideas of individual liberty and free competition, with the greater separation of capital and industry, employers and workmen, and with the introduction of the factory system. Intent only on promoting their own interests and disregarding the welfare of the community, the old companies had become an unmitigated evil. Attempts have been made to find in them the progenitors of the trade unions, but there seems to be no immediate connection between the latter and the craft gilds. The privileges of the old fraternities were not formally abolished until 1835; and the substantial remains or spectral forms of some are still visible in other towns besides London.

GUILD SOCIALISM, the name of a school of socialist thought which became prominent in Great Britain in the early 20th century (*see* SOCIALISM). Its governing idea was that of self-government in industry—the application of democratic principles to industrial as well as to political affairs—and the organization of the economic life of the community on a "functional" basis. As the name implies, guild socialism had, in the minds of its founders, a relation to the forms of industrial organization which existed throughout the medieval world, and was based on an attempt, in some measure, to apply medieval ideas to the solution of modern problems. This does not mean that guild socialists wished to restore the medieval guild system, or to revive handicraft in place of machine production. This element was indeed present in the early stages, but had dropped away before it acquired any wide influence.

Origin.—The origin of the movement is to be found in the work of an architect, Arthur J. Penty, who published *The Restoration of the Guild System* in 1906, and of A. R. Orage, for many years editor of the *New Age*, in which journal the new doctrine gradually developed in the next few years. The fruit of this development was the book *National Guilds*, written by S. G. Hobson and edited by A. R. Orage, first published in the *New Age* in 1912. In this work, guild socialism first assumed its distinctive form as an attempt to convert the trade unions to the idea of "workers' control" in industry, and to create, with their aid, self-governing functional organizations for the government of industry in conjunction with the state.

So far the guild movement had not spread beyond a small circle of theoretical adherents. But in the years before 1914 a great wave of labour unrest spread over Great Britain. There were many strikes, and a new spirit of economic revolt entered into the trade-union movement. At the same time the doctrines of industrial unionism were imported from America (*see* INDUSTRIAL

WORKERS OF THE WORLD, THE), and those of syndicalism (*q.v.*) from France; and both these doctrines found numerous adherents among the younger trade unionists and excited vigorous controversy. Guild socialism was influenced by these movements and was more and more presented as a reconciliation of syndicalist and socialist doctrines. Like the syndicalists it denounced bureaucracy and state control. Unlike them. it repudiated anarchism, and recognized the necessity of the state as an instrument of political organization and control. It was not, however, until a group of the younger men began, in 1913, regularly to advocate guild socialism in the newly founded *Daily Herald* that the movement attained any widespread influence. And it was not until 1915 that it assumed, with the foundation of the National Guilds league by G D. H. Cole, W. Mellor, M. B. Reckitt and others, an organized form.

World War I and After.—The industrial situation during World War I undoubtedly helped the growth of the new movement. For the war, by making necessary large and frequent changes in industrial organization, profoundly stirred the trade unions, and created in the minds of trade unionists a keen desire for control and self-government in industry. During the war the influence of guild socialism was nidely felt in the shop stewards' movement and in the redrafting of many trade-union programs so as to include the demand for "workers' control." Thus, the Miners' federation, which before the war had demanded nationalization and state administration of the mines, changed its program in 1918 to a demand for national ownership and democratic control by the workers, and put forward its new guild socialist claim before the famous Sankey commission of 1919. The socialist bodies, such as the Independent Labour party and the Labour party itself, also altered their programs so as to include the demand for some measure of workers' control in industry.

Immediately after the war guild socialism spread still more rapidly, and entered on a new phase with the formation of actual working guilds, under trade-union auspices. in the building and other industries. The National Building guild and its local centres executed, between 1920 and 1922, a number of important housing contracts and were generally agreed to have done excellent work. But the guild had no capital, and the abandonment of the Addison housing scheme in 1921 was fatal to it. Driven to depend on bank and commercial credits. it overtraded and got into financial difficulties which in 1922 led to its collapse. Certain of its local centres survived and were still active for several years longer, as were the tailoring guilds in Glasgow and Leeds, the piano workers' guild in London and certain others.

Guild Socialism and Collectivism.—These practical ventures, however, were, from the standpoint of the main body of guild socialists, only of minor importance. For the guild was for them essentially a part of the mechanism of a socialist community, and "guilds" formed in a capitalist society could be guilds only in a quite incomplete sense. Guild socialism involves the ownership of industries by the whole community, as well as their administration by the "workers by hand and brain" (a phrase originally coined by the guild socialists) engaged in them. It is essentially a socialist doctrine, accepting the socialist idea of public ownership, and differing from the collectivist or state socialist school of thought only in its insistence on the idea of industrial self-government and its hostility to bureaucracy and political control of industrial affairs. Guild socialists differed, indeed, in their views about the form and structure of the state in a guild society. Some believed in the continued supremacy of the state as the political organ of government, while others held that the state in its present form is destined to disappear and to be replaced by a sort of federal authority representing the community in its various functional aspects. This latter view has been associated with the philosophical ideas of political pluralism. It must not be confused with proposals for "industrial self-government" under capitalist control.

Industrial self-government was, for the guild socialists, the application to economics of a general principle that is of far wider significance. They believed that democracy can be real only if it is "functional"—that is, if it is specifically related to each of the main activities of society. It is absurd, they held, to speak of political democracy where industry is organized on autocratic lines, for the conditions of a man's daily work will inevitably affect his attitude and status as a citizen. Moreover, the existing economic system fails because it does not call out what is best in men. Instead of a co-operative fellowship of service we have contending groups of masters and men, alike wasted by "the sickness of an acquisitive society" (R. H. Tawney). It is necessary so to organize the economic and social system as to make each service a responsible fellowship, whose members are "on their honour" to do their best in the interest of all. (G. D. H. C.)

Appraisal.—Guild socialism as such lost appeal in Great Britsin, and elsewhere had no theoretical or practical impact. The reasons became manifest as critical thought was brought to bear on the ideas of guild socialism in the decade after 1919.

It became clear that the division of economic power, political power and representation in sovereign legislatures is not as distinct as guild socialists had implied. Legislatures that represent territorial divisions in which each voter has one vote tend, indeed, to be overly general in their representation, but the consultation, formal and informal, by both legislatures and administrative bodies with various interest groups steadily remedied this weakness; and the suggestions of guild socialists had nothing to do with the remedy. In Germany. France and Italy native and traditional needs and ideas produced special formal "corporative" advisory bodies. (See CORPORATE STATE.) If political representation of the voters was not everywhere as incessantly active as guild socialists thought it ought to be in a guild organization, political parties. the mediums of democratic representation, improved themselves in the techniques of continuous operative linkage between people, groups, legislatures and the executive. Workers' control of industry was contrived in part through trade unions which brought direct pressure on employers, or through the establishment of some form of workers' elected councils in the workshops with some rights of joint determination of business policy. It became apparent that the vesting of sovereign power in numerous guilds must lead to insoluble disputes over the xi-eight of representation to be accorded to each guild. Also, the number of guilds (each a segment of the national economy) must be so large as virtually to substitute a multiplicity of parties, each based on an economic interest, for a usually much smaller number of conventional political parties (in some nations, only two), with a consequent grave divisive effect on society. The belief that workers would more actively share in guild operation than in the activities of political parties could not be proved; but their demonstrated passivity in their own trade unions and consumers' co-operative societies engendered skepticism of the faith of guild socialists.

The essence of guild socialist doctrine, that political representation in great societies is a gross wholesale process that needs remedies, however, remained valuable. French syndicalism, German *Standestaat* ("estate") or "corporative" theories and Latin state "corporativism" and institutions contained this germ and were variant answers to the anxieties which guild socialism expressed. (H. Fi.)

GUILFORD, BARONS AND EARLS OF. FRANCIS NORTH, 1st Baron Guilford (1637–85), was the third son of the 4th Baron North (*see* NORTH, BARONS), and was created Baron Guilford in 1683, after becoming lord keeper in succession to Lord Nottingham. He had been an eminent lawyer. solicitor general (1671), attorney general (1673) and chief justice of the common pleas (1675), and in 1679 was made a member of the council of 30 and. on its dissolution. of the cabinet. He was a man of wide culture and a staunch royalist. In 1672 he married Lady Frances Pope, daughter and co-heiress of the earl of Downe, who inherited the Wroxton estate; and he was succeeded as 2nd baron by his son Francis (1673–1729), whose eldest son Francis (1704–90), after inheriting first his father's title as 3rd baron, and then (in 1734) the barony of North from his kinsman the 6th Baron North, was in 1752 created 1st earl of Guilford. His first wife was a daughter of the earl of Halifax, and his son and successor Frederick was the English prime minister, commonly known as Lord North, his courtesy title while the 1st earl was alive.

FREDERICK NORTH, 2nd earl of Guilford, but better known by his courtesy title of Lord North (1732–92), prime minister of England during the important years of the American War, was born on April 13, 1732, and was educated at Eton and Christ Church, Oxford. At 22 years of age he was elected M.P. for Banbury, of which town his father was high steward, and he sat for the same town in parliament for nearly 40 years. In 1759 the duke of Newcastle made him a lord of the treasury, and he held this office under Lord Bute and George Grenville till 1765. On the fall of the first Rockingham ministry in 1766 he was sworn of the privy council, and made paymaster general by the duke of Grafton. In Dec. 1767, on the death of the brilliant Charles Townshend, he was made chancellor of the exchequer. North succeeded Grafton as premier in March 1770, and continued in office for 12 of the most eventful years in English history. George III had at last overthrown the ascendancy of the great Whig families, and found in North a pliant instrument. The path of the minister in parliament was a hard one; he had to defend measures which he had not designed and of which he had not approved, and this too in a house of commons in which all the oratorical ability of Burke and Fox was against him, and when he had only the purchased help of Thurlow and Wedderburne to aid him. The most important events of his ministry were those of the American War of Independence. He cannot be accused of causing it, but one of his first acts was the retention of the tea duty, and he introduced the Boston Port bill in 1774. When war had broken out he earnestly counseled peace, and it was only the earnest solicitations of the king not to leave his sovereign again at the mercy of the Whigs that induced him to defend a war which from 1779 he knew to be both hopeless and impolitic. In March 1782 he insisted on resigning after the news of Cornwallis' surrender at Yorktown. He had been rewarded for his assistance to the king by honours for himself and sinecures for his relatives, but in April 1783 North formed a famous coalition with C. J. Fox (*q.v.*), and became secretary of state with him under the nominal premiership of the duke of Portland. The coalition ministry went out of office on Fox's India bill in Dec. 1783, and North, who was losing his sight, gave up politics.

He succeeded to his father's earldom in 1790 and died on Aug. 5, 1792.

GUILLAUMAT, MARIE LOUIS ADOLPHE (1863–1940), French soldier, was born at Bourgneuf, Charente Maritime, Jan. 4. 1863. He left the military school of St. Cyr in 1884, and became a captain in 1893. He served for three years in Tongking with the foreign legion, and during the Boxer rising in 1900 was in Tientsin. In 1903 he was appointed professor of military history at St. Cyr and in 1908 lecturer on infantry tactics. After being director of infantry at the ministry of war from 1911, he became *chef de cabinet* to the minister of war in 1914. At the outset of World War I Guillaumat, who had already taken part in 12 campaigns, commanded a division at the battle of the Marne and later in the Argonne. Subsequently, in command of the 1st army corps, he took a notable part in the battles of Verdun and the Somme. In Dec. 1916 he was given the command of the 2nd army in front of Verdun and directed the attack of Aug. 20, 1917, which succeeded in freeing the position.

In Dec. 1917 he was sent to Salonika as commander in chief of the armies in the east (*see* SALONIKA CAMPAIGNS, 1915–18) but was recalled in July 1918 to take command of the entrenched camp at Paris in face of the enemy advance. He urged the launching of an offensive in Macedonia both at the inter-Allied war council at Versailles and before the British war cabinet; on Sept. 4, 1918, at the London conference, his advice was adopted. In Oct. 1918 Guillaumat was given the command of the 5th army on the Aisne for the final advance. After the war he was president of the commission of inquiry into the surrender of the frontier fortresses and later a member of the *conseil supérieur da la guerre.* After being entrusted with a mission to Athens. where he drew up a plan for the reorganization of the Greek army, he took command of the army of occupation in the Rhineland at the end of 1924. He was minister of war in June 1926.

GUILLAUME, CHARLES ÉDOUARD (1861–1938), French physicist. awarded the Nobel prize in physics in 1920 for his discovery of the anomalies of nickel-steel alloys. He was born at Fleurier, Switz., Feb. 15, 1861. Educated at Neuchâtel. he became a *docteur-ds-sciences* and devoted himself to the study of practical physics. He is principally known for his invention of the metal Invar, an alloy of nickel and steel which, having a coefficient of linear expansion of only .0000008 for 1° C., is in general use as a material for standard measures and instruments of precision. In 1920 he became director of the international bureau of weights and measures.

GUILLAUME, JEAN BAPTISTE CLAUDE EUGÈNE (1822–1905), French sculptor. was born at Montbard on July 4, 1822, and studied at the École des Beaux-Arts, Paris, which he entered in 1841. and where he gained the *prix de Rome* in 1845 with "Theseus Finding on a Rock His Father's Sword." He became director of the École des Beaux-Arts in 1864, and director general of fine arts from 1878 to 1879, when the office was suppressed.

Guillaume died in Rome on March 1, 190j.

His monuments are to be found in the public squares of the chief cities of France.

GUILLAUME D'ORANGE, also known as Fierabrace, St. Guillaume de Gellone, and the Marquis au court nez, was the central figure of the southern cycle of French romance, called by the *trouvères* the *geste* of Garin de Monglane. This cycle has a measure of unity. the poems being episodic rather than independent. Ms. Royal 20 D xi. (British Museum) contains 18 *chansons* of the cycle. Guillaume, son of Thierry and Alde, daughter of Charles Martel, was born in the north of France about the middle of the 8th century. He became one of the best soldiers of Charlemagne, and in 790 Charles's son Louis the Pious was put under his charge. He subdued the Gascons, and defended Narbonne against the infidels. In 793 Hescham, the successor of Abd-al-Rahman II., proclaimed a holy war against the Christians, and collected an army of 100.000 men. half of it against the Asturias, half against France. Guillaume met him at Villedaigne, and was defeated, but only after a resistance which so far exhausted the Saracens that they were compelled to retreat to Spain. He took Barcelona from the Saracens in 803, and in the next year founded the monastery of Gellone (now Saint Guilhem-le-Desert), of which he became a member in 806. He died there in the odour of sanctity in 812.

No less than 13 historical personages bearing the name of William have been thought to have their share in the formation of the legend. William. count of Provence, son of Boso II., delivered southern France from a Saracen invasion by his victory at Fraxinet in 973, and ended his life in a cloister. William Towhead (*Tête d'étoupe*), duke of Aquitaine (d. 983), showed a fidelity to Louis IV. paralleled by Guillaume d'Orange's service to Louis the Pious. The cycle of *chansons* which form the *geste* of Guillaume reposes on the traditions of the Arab invasions, from the battle of Poitiers (732) onwards, and on the French conquest of Catalonia from the Saracens. In the Norse version Guillaume appears in his historical environment, as a chief under Charlemagne; but plays a leading part in the *Couronnement Looys*, describing the formal association of Louis in the empire at Aix (813. the year after Guillaume's death), and after the battle of Aliscans it is from the emperor Louis that he seeks reinforcements. This anachronism arises from the fusion of the epic Guillaume with the champion of Louis IV.. and from the fact that he was a general of Louis the Pious. who was titular king of Aquitaine under his father. The inconsistencies between the real and epic Guillaume are often left standing in the poems. The personages associated with Guillaume in his Spanish wars belong to Provence, and have names common in the south. The most famous are Beuves de Comarchis, Ernaud de Girone, Aïmer le chétif, so called from his long captivity with the Saracens. The separate existence of Aïmer, who refused to sleep under a roof, and spent his life in warring against the infidel, is proved. He was Hadhemar, count of Narbonne, who in 809 was one of the leaders sent by Louis against Tortosa. No doubt the others had historical prototypes. In the hands of the *trouvères* they became all brothers of Guillaume, and sons of Aymeri de Narbonne, grandson of Garin de Monglane. Nevertheless when Guillaume seeks help from Louis he finds all his relations in Laon, in accordance with his historic Frankish origin.

The central fact of the geste is the battle of the Archant or Aliscans, in which perished Guillaume's heroic nephew, Vezian or Vivien. At the eleventh hour he summoned Guillaume to his help against the Saracens. Guillaume arrived too late, was himself defeated, and returned alone to his wife Guibourc. This event is related in a Norman-French transcript of an old French *chanson* de geste, the *Chançun* de *Willame*—brought to light in 1901 at the sale of the books of Sir Henry Hope Edwardes—and in the *Covenant* Vivien, a recension of an older French chanson. *Aliscans* continues the story, telling how Guillaume obtained reinforcements from Laon, and how, with the help of the comic hero, the scullion Rainouart, he avenged his nephew's death. Rainouart turns out to be the brother of Guillaume's wife Guibourc, who was before her marriage the Saracen princess and enchantress Orable. Two other poems are consecrated to his later exploits, La Bafaille Loquifer, the work of a French Sicilian poet, Jendeu de Brie (*fl.* 1170), and Le *Moniage Rainouart*. The starting-point of Herbert of Dammartin (*fl.* 1170) in *Foucon* de *Candie* (Candie = Gandia in Spain?) is the return of Guillaume from the battle; and the Italian compilation I Nerbonesi seems in some cases to represent an earlier tradition than the later of the French chansons, although its author Andrea di Barberino wrote towards the end of the 14th century. The minnesinger Wolfram von Eschenbach based his *Willehalm* on a French original which must have differed from our versions. The variations in the story of the defeat of Aliscans, and the numerous inconsistencies of the narratives have occupied many critics. Aliscans (Aleschans, Elysii Campi) was, however, generally taken to represent the battle of Villedaigne, and to take its name from the cemetery outside Arles. Wolfram von Eschenbach even mentions the tombs which studded the field of battle. Indications that this tradition was not unassailable were not lacking before the discovery of the *Chançun de Willame,* which, although preserved in a very corrupt form, represents the earliest recension of the story, dating at least from the beginning of the 12th century. It seems probable that the Archant was situated in Spain near Tortosa, and that Guillaume started from Barcelona, not from Orange, to his nephew's help. The account was modified by successive trouvkres, and the uncertainty of their methods may be judged by the fact that in the *Chançun* de Wil-*lame* two accounts (II. 450–1326 and II. 1326–2420) of the fight appear to be set side by side. Le *Couronnement* Looys, Le *Charroi* de *Nîmes* (12th century) in which Guillaume enumerates his services to the terrified Louis, and *Aliscans* (12th century), with the earlier *Chançun,* are among the finest of the French epic pcems. The figure of Vivien is among the most heroic elaborated by the *trouvères,* and the giant Rainouart has a touch of Rabelaisian humour.

The *chansons de geste* of the cycle are: *Enfances Garin de Monglane* (15th century) and *Garin de Monglane* (13th century), on which is founded the prose romance of *Guérin de Monglane,* printed in the 15th century by Jehan Trepperei and often later; *Girars de Viane* (13th century, by Bertrand de Bar-sur-Aube), ed. P. Tarbé (Reims, 1850); *Hernaut de Beaulande* (fragment 14th century); *Renier de Gennes,* which only survives in its prose form; *Aymeri de Narbonne* (*c.* 1210) by Bertrand de Bar-sur-Aube, ed. L. Demaison (Soc. des anc. testes fr., 2 vols., 1887); *Les Enfances Guillaume* (13th century); *Les Narbonnais,* ed. H. Suchier (Soc. des anc. textes fr., 2 vols., 1898), with a Latin fragment dating from the 11th century, preserved at The Hague; *Le Couronnement Looys* (ed. E. Langlois, 1888), *Le Charroi de Nîmes, La Prise d'Orange, Le Covenant Vivien, Aliscans,* which were edited by W. J. A. Jonckbloet in vol. i. of his *Guillaume d'Orange* (The Hague, 1854); a critical teat of *Aliscans* (Halle, 1903, vol. i.) is edited by E. Wienbeck, W. Hartnacke and P. Rasch; *Loquifer* and *Le Moniage Rainouart* (12th century); *Bovon de Commarchis* (13th century), recension of the earlier *Siège de Barbastre,* by Adenes li Rois, ed. A. Scheler (Brussels, 1874); *Guibert d'Andrenas* (13th century); *La Prise de Cordres* (13th century); La *Mort Aimeri de Narbonne,* ed. J. Couraye de Parc (Soc. des Anciens Textes fr. 1884); *Foulque de Candie* (ed. P. Tarbé, Reims, 1860); *Le Moniage Guillaume* (12th century); *Les Enfances Vivien* (ed. C. Wahlund and H. v. Feilitzen, Uppsala and Paris, 1895); *Chançun de Willame* (Chiswick Press, 1903), described by P. Meyer in *Romania* (xxxiii. 597–618). The ninth branch of the *Karlamagnus Saga* (ed. C. R. Unger, 1860) deals with the *geste* of Guillaume. *I. Nerbonesi* is edited by J. G. Isola (Bologna, 1877, etc.).

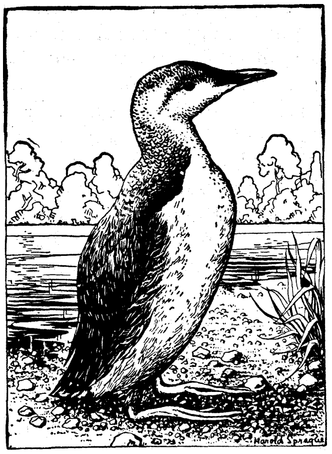
GUILLAUMIN, JEAN BAPTISTE ARMAND (1841–1927), French landscape painter and engraver, an important member of the Impressionist movement, was born in Paris, Feb. 16, 1841. He spent his boyhood at Moulins-sur-Allier and at the age of 17 went to Paris, there earning his living as an employee in the administration of the city. In his spare time he studied drawing under the sculptor Caillouette, and he painted views in the neighbourhood of Montmartre and Meudon and on the banks of the Seine. He also worked on portraiture and still life. In 1874 Guillaumin took part in an exhibition of Impressionist paintings with C. Pissarro, C. Monet and Sisley. By 1892 he was in a position to give up his post and to concentrate entirely on his art. After that date, he painted many seascapes on both the Atlantic and Mediterranean coasts. His execution is direct, bold and sometimes vehement, his colour harmonious. He is represented in the Boston Museum of Fine Arts, the National Gallery of Arts (Washington, D.C.), the Luxembourg and Petit Palais in Paris and at galleries in Rouen, Limoges, Brussels, Munich and Moscow.

GUILLEMOT, or, as it is usually called in U.S.A., MURRE, a sea-bird breeding on the rocky coasts of the North Atlantic in vast numbers. This bird, *Uria* aalge, is a member of the auk family and, like the rest of the Alcidae, it winters in the open sea. A second species, Briinnich's guillemot (U. lomvia), inhabits the Atlantic coasts of North America with *U.* aalge. Each has a race in the cold North Pacific and the west coast of Korth America and elsewhere. The black guillemot, *Cepphus grylle,* known to sailors as the dovekie, is almost entirely black in summer plumage. Unlike the common form. which lays a single egg, the black guillemot produces two or three in a clutch. The so-called bridled or ringed guillemot is a variety of *U. aalge* with a white mark resembling a bridle round its eye. It is worth mention as a good example of a quite distinct variation found in considerable numbers in nature, but not intergrading with the normal. It is probably due to a Mendelian mutation.



GUILLEMOT. A SEA-BIRD THAT BREEDS ON THE BRITISH COAST AND FLIES SEAWARD FOR THE WINTER MONTHS

GUILLOTINE, the instrument for inflicting capital punishment by decapitation, introduced into France at the period of the Revolution. It consists of two upright posts surmounted by a cross beam, and grooved so as to guide an oblique-edged knife, the back of which is heavily weighted to make it fall swiftly and with force when the cord by which it is held aloft is let go. Previous to the period when it obtained notoriety under its present name it had been in use in Scotland, England and various parts of the continent. There is still preserved in the antiquarian museum of Edinburgh the rude guillotine called the "maiden" by which the regent Morton was decapitated in 1581. The last persons decapitated by the Scottish "maiden" were the marquis of Argyll in 1661 and his son the earl of Argyll in 1685. It would appear that no similar machine was ever in general use in England; but until 1650 there existed in the forest of Hardwick, which was coextensive with the parish of Halifax, West Riding, Yorkshire, a mode of trial and execution called the gibbet law, by which a felon convicted of theft within the liberty was sentenced to be decapitated by a machine called the Halifax gibbet. A print of it is contained in a small book called *Halifax and its Gibbet Law* (1708), and in Gibson's edition of Camden's *Britannia* (1722). In Germany the machine was in general use during the middle ages, under the name of the *Diele*, the *Hobel* or the *Dolabra*. Two old German engravings, the one by George Penez, who died in 1550, and the other by Heinrich Aldegrever, with the date 1553, represent the death of a son of Titus Manlius by a similar instrument, and its employment for the execution of a Spartan is the subject of the engraving of the 18th symbol in the volume entitled *Synzbolicae quaestiones de universo genere*, by Achilles Bocchi (1555). From the 13th century it was used in Italy under the name of *Mannaia* for the execution of criminals of noble birth. The *Chronique de Jean d'Anton*, first published in 1835, gives minute details of an execution in which it was employed at Genoa in 1507; and it is elaborately described by Père Jean Baptiste Labat in his *Voyage en Espagne et en Italie en 1730*. It is mentioned by Jacques, viscomte de Puységur, in his *Mémoires* as in use in the south of France, and he describes the execution by it of Marshal Montmorency at Toulouse in 1632. For about a century it had, however, fallen into general disuse on the continent; and Dr. Guillotin, who first suggested its use in modern times, is said to have obtained his information regarding it from the description of an execution that took place at Milan in 1702, contained in an anonymous work entitled Voyage *historique et politique de Suisse, d'Italie, et d'Allemagne*.

Guillotin, who was born at Saintes, May 28, 1738, and elected to the constituent assembly in 1789, brought forward on Dec. 1 of that year two propositions regarding capital punishment, the second of which was that "in all cases of capital punishment it shall be of the same kind—that is, decapitation—and it shall be executed by means of a machine." The reasons urged in support of this proposition were that in cases of capital punishment the privilege of execution by decapitation should no longer be confined to the nobles, and that it was desirable to render the process of execution as swift and painless as possible. After satisfactory experiments had been made with the machine on several dead bodies in the hospital of Bicêtre, it was erected on the Place de Grève for the execution of the highwayman Pelletier on April 25, 1792. While the experiments regarding the machine were being carried on, it received the name *Louisette* or *La Petite Louison*, but the mind of the nation seems soon to have reverted to Guillotin, who first suggested its use; and in the *Journal des révolutions de Paris* for April 28, 1792, it is mentioned as *la guillotine*, a name which it thenceforth bore both popularly and officially.

GUIMARÃES, a town of northern Portugal, 36 mi. N.E. of Oporto by the Trofa-Guimarães branch of the Oporto-Corunna railway. Pop. (1950) 18,294. Guimarães is a very ancient town with Moorish fortifications. It occupies a low hill, skirted on the northwest by a small tributary of the river Ave. The citadel founded in the 11th century by Count Henry of Burgundy, was in 1094 the birthplace of his son Alphonso, the first king of Portugal. The font in which Alphonso was baptized is preserved, among other interesting relics, in the collegiate church of Santa Maria da Oliveira, "St. Mary of the Olive," a Romanesque building of the 14th century, which occupies the site of an older foundation. The convent of São Domingos, now a museum of antiquities, has a fine 12th–13th century cloister; the town hall is built in the blend of Moorish and Gothic architecture known as Manueline. Guimarães has trade in wine and farm produce; it also is engaged in the manufacture of cutlery, linen, leather and preserved fruits. Near the town are Citania, the ruins of a prehistoric Iberian city, and the hot sulphurous springs of Taipas.

GUIMARD, MARIE MADELEINE (1743–1816), French dancer, was born in Paris on Oct. 10, 1743. For 25 years she was the star of the Paris Opéra, and became even more famous by her love affairs, especially by her long liaison with the prince de Soubise. Her magnificent house at Pantin had a private theatre, where Collé's *Partie de chasse de Henri IV* which was prohibited in public, and most of the *Proverbes* of Carmontelle (Louis Carrogis, 1717–1806), and similar licentious performances were given to the delight of high society. In 1772, in defiance of the archbishop of Paris, she opened a gorgeous house with a theatre seating 500 spectators in the Chaussée d'Antin. In this Temple of Terpsichore, as she named it, the wildest orgies took place. In 1786 her property was sold by lottery for her benefit for 300,000 francs. After her retirement in 1789 she married Jean Etienne Despréaux (1748–1820), dancer, song writer and playwright.

GUINEA is the coastal region of West Africa and also the name of the gulf formed by the great bend of this coast eastward and then southward. The term has often been loosely used and may cover any part of the coast between Cape Verde (15° N.), near Dakar, and Mossâmedes, Angola (15° S.). There is a general distinction between Upper and Lower Guinea, westward and southward respectively of the line of volcanic peaks marked by Mt. Cameroon (13,350 ft.) and the islands of Fernando Po, Principe, São Tomé and Annobon. In a restricted sense Guinea most commonly refers to the coast between Cape Palmas and the Gabon (Gabun) estuary, though until the time of Gomes Eanes de Zurara (*q.v.*), a 15th-century Portuguese historian, the term appears to have applied only to coastal areas north of Cape Verde.

The name did not come into general use in Europe until the late 15th century, although it occurs on maps from about 1350 onward. It may be derived from the important trading town and kingdom of the upper Niger basin known variously as Ghinea, Genni, Jenné or Djenné and dating from the 8th century, or from Ghana (or Ghanata), the oldest known state of the western Sudan. Ghana, "the land of gold," was first mentioned by the astronomer Al Fazari, writing shortly before A.D. 800 Between 1914 and 1951 there were important excavations at Koumbi Saleh, the most probable site of Ghana's capital.

Much controversy surrounds the first European contacts with Guinea. The French claim that ships from Dieppe reached this coast in 1364–65 and that their merchants established trading posts as far south as São Jorge da Mina (Elmina in the Gold Coast) until their withdrawal in 1410; but there is no documentary evidence to prove this With the encouragement of Prince Henry the Navigator the Portuguese seaman Gil Eannes rounded Cape Bojador in 1434. Several years later Antam Gonçalves brought back to Lisbon the first cargo of slaves and gold. and a papal bull reserved to the Portuguese exclusive rights of dominion on the west coast of Africa. Further voyages were made by Nuno Tristam, Diniz Diaz, Cadamosto and others. In 1469 Fernão Gomes was granted a monopoly of traffic on this coast for five years provided that in each year he explored 300 mi, of new coast. The equator was reached in 1471 and the Congo estuary by Diogo Cam (*q.v.*) in 1482 or 1483.

For another half-century the Portuguese enjoyed the monopoly of trade, but after 1530 the English, Dutch, French, Danish and Brandenburgers showed interest in the Guinea coast and established companies and trading posts or forts. Sections of the coast were named according to their chief products. The Grain coast from Sierra Leone to Cape Palmas took its name from the peppery seeds known as grains of paradise, Guinea pepper or malagueta. Beyond Cape Palmas stretched the Ivory Coast where the natives traded elephants' tusks. The Gold Coast, mainly east of Cape Three Points, was often referred to as "Mina," and a great castle was built at São Jorge da Mina. Beyond the Volta river lay the Slave coast, the least known of all these areas and extending as far as the Niger delta, for long known as the Oil rivers.

European contact with, and penetration of, Guinea was greatly influenced by the nature of the relief and climate. The whole area is constantly hot and receives very heavy rainfall at certain seasons. Europeans could trade only during the dry so-called "Guinea season" (October–April). There were special navigational problems along the surf-bound coast which has few natural harbours. Access inland was difficult because of the dense natural vegetation (equatorial rain forest) and because the rivers were seldom navigable very far inland.

See West Africa; Dahomey; Ivory Coast; Liberia; etc.

GUINEA, a gold coin at one time current in the United Kingdom. It was first coined in 1663. in the reign of Charles II, from gold imported from the Guinea coast of West Africa by a company of merchants trading under charter from the British crown — hence the name. Many of the first guineas bore an elephant on one side, this being the stamp of the company; in 1675 a castle was added. Issued at the same time as the guinea were five-guinea, two-guinea and half-guinea pieces. The current value of the guinea on its first issue was 20 shillings. It was subsidiary to the silver coinage, but this latter was in such an unsatisfactory state that the guinea in course of time became over-valued in relation to silver, so much so that in 1694 it had risen in value to 30 shillings. The rehabilitation of the silver coinage in William III's reign brought down the value of the guinea to 21s. 6d. in 1698, at which it stood until 1717, when its value was fixed at 21 shillings. This value the guinea retained until its disappearance from the coinage. It was last coined in 1813. and was superseded in 1817 by the sovereign. In 1718 the quarter-guinea was first coined. The third-guinea was first struck in George III's reign (1787). To George III's reign also belongs the "spade guinea," a guinea having the shield on the reverse pointed at the base or spade-shaped. The guinea is now chiefly used in reckoning professional fees: and subscriptions to a society or institution; the prices obtained for works of art, racehorses and sometimes landed property are also stated in guineas in the United Kingdom. *(See* also NUMISMATICS.)

GUINEA, REPUBLIC OF: see FRENCH GUINEA.

GUINEA FOWL, a well-known gallinaceous bird, so called from the country whence it was brought to Europe. It was known to the Romans but was probably reintroduced by the Portuguese in the 16th century.

The ordinary guinea fowl of the poultry yard *(see* also POULTRY AND POULTRY FARMING) is *Numida meleagris.* Under domestication few varieties have arisen. We may mention total and partial albinism and forms with legs bright orange instead of grayish brown. The sexes are alike. The West African race (*N. m. galeata),* from Senegal and Aïr to. Cameroon, is probably the ancestor of the domestic bird; it occurs in the Cape Verde Islands, and has been introduced into the West Indies. Some 20 other races over Africa include, in South Africa, *N. m. coronata* which is numerous from the Cape Colony to Ovampoland, and *N. m. papillosa* which replaces it in the west as far as the Zambesi. Madagascar has N. *m. mitrata,* distinguishable by its red crown and extending to East Africa. This bird has been introduced to Rodriguez. Abyssinia is inhabited by N. *m. meleagris,* which differs from the foregoing by the absence of red about the head. Darwin (*Anim. and Pl. under Domestication,* i, 294), gives this as the original stock of the modern domestic birds, but obviously by an accidental error. The finest species known is *Acryllium vulturinum* of East Africa, conspicuous by the bright blue in its plumage, the hackles in the lower part of its neck, and its long tail. All these guinea fowls except the last are characterized by having the crown bare of feathers and elevated into a bony "helmet," but there is another group in which a thick tuft of feathers ornaments the top of the head. This contains three species, the best known being *Guttera edouardi* from Guinea and Tanganyika to Natal. This bird is remarkable for the structure of its *furcula,* or merry thought, where the head is a hollow cup opening upwards, into which the trachea dips, and then emerges on its may to the lungs. Allied to the genus *Numida,* but distinguished therefrom by the possession of spurs and the absence of a helmet are *Agelastes* and *Phasidus,* from western Africa. Guinea fowls constitute the family Numididae. Polygamous and gregarious, guinea fowls lay many eggs on the ground. The flocks are noisy. The birds feed on the ground but normally roost in the trees. (G. F. Ss.)

GUINEA PIG (*Cavia porcellus*), the domestic form of a species of cavy (*q.v.*). This rodent was domesticated by the Indians of Peru, Ecuador and Colombia. long before the arrival of the Spaniards. Guinea pigs were kept for their meat, which was prized as a delicacy, and were first introduced into Europe for the same purpose soon after the discovery of America. Now these animals are rarely eaten but are kept as pets or used as valuable experimental subjects in medical and biological research.

The two sexes are much alike, about 10 in. long and weighing about 2 lb. There is no external tail, although internally there are seven caudal vertebrae. The ears are naked, rounded and relatively small. The fore feet have four toes, the hind feet only three; all toes are armed with broad claws, although guinea pigs are not fossorial in habit. They walk on the entire sole and palm. The legs are short, the body stout, and the head larne The several varieties differ nreatly in colour: black. tan, cream, chocolate, reddish, and white animals are common, as well as tortoise-shell, Dutch belted and Himalayan types. Some are "agouti," that is, they have banded hairs, black and ochraceous or buff, like the wild cavies. Size also varies somewhat in the different breeds. Long-haired cavies with silky pelage are called Peruvians. The so-called Abyssinian cavies have no connection with the East African country but have coarse hair forming odd whorls or rosettes. Short-haired varieties are usually called English or Bolivian cavies. Guinea pigs feed largely on grass and other green vegetation. If plenty of this is supplied, they can get along without water. In captivity they may be kept on rabbit or rat iood, but then they need water.

Wild cavies breed only once a year and only one or two young are born at a time, but guinea pigs have litters of 2 to 8 or more, twice or three times a year. The young are born after 63 to 75 days' gestation and are highly developed even at birth, furry, with their eyes open, and able to eat solid iood. In a few hours they can run with the mother; they are weaned at about two weeks. Females may reproduce at the age of 4 or 5 months, but it is better to wait until they are fully grown, at about 9 months. The life span may be as much as 6 or 7 years. (J. E. HL.)

GUINEA-WORM INFECTION (DRACONTIASIS, DRACUNCULOSIS) involves the viscera, with subsequent manifestations in the subcutaneous tissues and the skin. The causative agent is *Dracunculus medinensis,* a distant relative of the filaria worms *(see* FILARIASIS). The disease is endemic in India, the middle east and tropical Africa. The adult worms. minute males and cordlike females which attain the length of a metre, mature in the viscera and deeper tissues. The pregnant female then migrates through the subcutaneous tissues to the skin, usually of an extremity. where a small blister is produced. On contact with fresh water the blister bursts. discharging a swarm of larvae into the water. If these are ingested by the water flea *(Cyclops)* they migrate into the body cavity of the *Cyclops* and become infective for man when the water flea is accidentally swallowed in raw drinking water. The disease may become epidemic following annual holy pilgrimages of Hindus and Moslems, who wade into sacred streams and rinse out their mouths with the polluted water, accidentally swallowing some of the infected *Cyclops* and simultaneously contributing a new supply of larvae for the *Cyclops.*

Clinical manifestations, including hypersensitization, which develop as the females migrate from the deeper tissues to the skin, are readily controlled by the administration of epinephrine. The long, patent sinuous tunnel in which the worm resides becomes readily infected with bacteria. The worm resists attempts to pull it out intact. and if too much traction is produced it breaks off. Since the days of Moses natives have contented themselves with winding a small length of the worm each day on a stick at the site of the open blister. until finally the entire worm has been withdrawn. Introduction of phenothiazine ointment into the tissues immediately around the tunnel stupefies the worm and allows it to be removed intact.

Plankton-feeding fish, when stocked in infested waters, will eat the *Cyclops* and thus break the vicious cycle.

GUINGAMP, a town of northwestern France, capital of an *arrondissement* in the *département* of Côtes-du-Nord. on the right bank of the Trieux, 20 mi. W.N.W. of St. Brieuc on the railway to Brest. Pop. (1954) 6.51j. Guingamp was the chief tonn of the countship (subsequently the duchy) of Penthièvre. The Gothic chapel of Grbces is near Guingamp. Its chief church, Notre-Dame de Bon-Secours, dates from the 14th to the 16th centuries; two towers rise on each side of the richly sculptured western portal and a third surmounts the crossing. A famous statue of the Virgin, the object of one of the most important "pardons" or religious pilgrimages in Brittany, stands in one of the two northern porches. The central square is decorated by a graceful fountain in the Renaissance style, restored in 1743. Remains of the ramparts and of the Château of the dukes of Penthièvre, which belong to the 15th century, still survive. Guingamp is the seat of a sub-prefect and of a tribunal of first importance. It is an important market for dairy cattle, and its industries include flour-milling, tanning, leather-dressing, furniture making and the manufacture of wool, wax, hosiery, wooden-shoes and sheet iron. Guingamp is a tourist centre.

GUINNESS, the name of a family of Irish brewers. The firm was founded by ARTHUR GUINNESS, who about the middle of the 18th century owned a modest brewing-plant at Leixlip, a village on the river Liffey. In or about 1759 Arthur Guinness (d. 1855), purchased a small porter brewery at St. James's Gate, Dublin. By careful attention to the purity of his product, coupled with a shrewd perception of the public taste, he built up a considerable business. But his third son, BENJAMIN LEE GUINNESS (1798–1868), may be regarded as the real maker of the firm, of which about 1825 he was given sole control. The trade in Guinness's porter and stout had been confined hitherto to Ireland, but Guinness established agencies in the United Kingdom, on the continent, in the British colonies and in America. The export trade soon assumed huge proportions; the brewery was continually enlarged, and Guinness, who in 1851 was elected first lord mayor of Dublin, became the richest man in Ireland. He spent some of his wealth on the restoration of St. Patrick's cathedral, Dublin. He represented Dublin city in parliament as a Conservative from 1865 till his death, and in 1867 was created a baronet. He was succeeded in the control of the business by Sir Arthur Edward Guinness (b. 1840), his eldest, and Edward Cecil Guinness (b. 1847), his third, son. Sir ARTHUR EDWARD GUINNESS was in 1880 raised to the peerage as Baron Ardilaun, and disposed of his share in the brewery to his brother Edward Cecil Guinness. In 1886 EDWARD CECIL GUINNESS disposed of the brewery, the products of which were then being sent all over the world, to a limited company, in which he remained the largest shareholder. Edward Cecil Guinness was raised to the peerage in 1891 as Baron Iveagh, created Earl of Iveagh (*q.v.*) in 1919 and died in 1927, was succeeded by his son, Rupert, Viscount Elvedon.

GUIPUZCOA, a maritime Basque province of northern Spain bounded north by the bay of Biscay, west by the province of Vizcaya (Biscay), south and south-east by Alava and Navarre and north-east by the river Bidassoa, here the frontier of France. The area is 728 sq.mi.; population in the 1950 census was 371,024 or 509.6 per sq.mi. Situated on the northern side of the Cantabrian mountains at their junction with the Pyrenees the province has a deeply dissected and highly picturesque surface with a much indented coastline and numerous harbours none of which are of the first importance, the chief are San Sebastian, Pasajes, Guetaria, Deva and Fuenterrabia. The rivers, Deva, Urola, Oria, Urumea, Bidassoa are all short, rapid and unnavigable. The climate is mild and moist and the soil is mostly rather infertile clay in the valleys; in spite of this cultivation is careful, but the province has to import grain. Gorse and heath occur on the windswept areas and there are forests of oak, chestnut, pine, with a good deal of holly and arbutus. Apple orchards are numerous and much cider is made. The province is rich in minerals such as iron, lignite, lead, copper, zinc and cement, zinc being important. Fisheries are important; cod, tunny, sardines and oysters being procured. There are ferruginous and sulphurous springs in many places, and these and the mild climate attract summer visitors. The province is concerned with international trade *via* the French frontier and its custom house on the Bidassoa is the most important in Spain, but it is chiefly remarkable for its development of local industries. Cotton and linen stuffs are made at Irun, Renteria, Villabona, Vergara and Azpéitia, baskets at Zumarraga, arms and gold work at Eibar, Plasencia and Elgoibar, chemicals at San Sebastian, Onati and Irun. Paper and timber-work are developed at San Sebastian, Irun, Onati and Tolosa. The Pasajes district is famed for its wines and liqueurs and large numbers are employed in this industry. The main railway line from Madrid northward to the French frontier runs through the province and it has loops to most of the important industrial centres. In consonance with the development of industries, roads are numerous and on the whole good in this province which, after Madrid, Barcelona and Vizcaya, is the most densely peopled in Spain. On the steep Cantabrian slopes roads are difficult and in rural areas there the ox cart is still widely used. The capital is San Sebastian (officially Guipúzcoa), with a pop. (1950) of 90,846. There is much emigration but the birth rate is high, and there is also immigration from other parts of Spain. The province is fairly prosperous industrially. Basque Nationalists (not the Nationalists under Franco) were strongly Loyalist in 1936, but were subdued in April and May 1937, by an enemy column under Gen. Emilio Mola. Many escaped to France. *See* Th. Lefebvre, *Les modes de vie dans les Pyrénées atlantiques* (1933).

GÜIRALDES, RICARDO (1886–1927), Argentine novelist and poet, famous for his poetic interpretation of the Argentinian gaucho, was born in Buenos Aires on Feb. 13, 1886, the son of a wealthy landowner. He died in Paris on Oct. 8, 1927. His masterpiece. *Don Segundo Sombra* (1926; English trans. by Harriet de Onís, 1935), is a poematic novel recreating the mythical gaucho that all Argentinians worship as a national symbol. This book combines the objectivity of country life and the subtlety of a poetic vision; it shows Guiraldes' twofold personality—the cosmopolitan spirit of an insatiable traveler well acquainted with French literary circles and the devoted admirer of his native land. A double view of the gaucho is presented, one through Don Segundo, the mature centaur, who is a model of manliness, and the other through the emerging personality of a young man, who follows undauntedly the footsteps of his friend and mentor.

Guiraldes was also a forerunner of post-World War I literary innovations in Argentina. Imbued with an audacious spirit, he found little receptiveness for his first volume of verses. El *cencerro de cristal* (1915). Two early novels, *Raucho* (1917) and *Xaimaca* (1923), are important as records of his literary convictions. *Rosaura* (1922), a poignant love story, shows the author's dramatic power and insight into human motives. (E. N.-S.)

GUISBOROUGH, a market town and urban district in the Cleveland parliamentary division of the North Riding of Yorkshire, Eng., 9 mi. E.S.E. of Middlesbrough by road. Pop. (1951) 8,611. Area 29.6 sq.mi. It lies in a fertile valley at the foot of the Cleveland hills. $4\frac{1}{2}$ mi. from the sea. Robert de Bruce, an ancestor of Bruce the Scottish king, founded a rich Augustinian priory there in 1119. Dissolved at the Reformation. all that now remains is the gateway and a finely carved east window. The parish church of St. Nicholas occupies the site of a church built before the priory and contains some ancient stained glass from the priory. Henry III granted a charter to hold markets, and Tuesdays and Saturdays are market days. On Tuesdays a cattle market is also held. In the town centre is a market cross, restored in the 19th century. Guisborough urban district includes the parishes of Kirkleatham (where are 17th-century almshouses), Hutton Lowcross, Morton, Pinchinthorpe, Newton, Upleatham. Tocketts and Wilton. Although much agriculture is carried on, there are also chemical works, steelworks and a clothing factory.

GUISE, a town of northern France, in the *département* of Aisne, on the Oise, 31 mi. N. of Laon by rail. Pop. (1954) 5,846. The scene of the German stand of Oct. 1918 is near Guise, which suffered much damage during World War I. The town was formerly the capital of the district of Thiérache and afterward of a countship. There is a château dating in part from the middle of the 16th century, which was converted into barracks during World War I. Camille Desmoulins was born in the town in 1762. The chief industry is the manufacture of iron stoves and heating apparatus, carried on on the co-operative system advocated by Fourier. in works founded by J. B. A. Godin.

(For an account of the battle of Guise *see* **FRONTIER.** BATTLES OF THE.)

GUISE, HOUSE OF, a cadet branch of the house of Lorraine. René II, duke of Lorraine (d. 1508). united the two branches of the house of Lorraine. From his paternal grandmother. Marie d'Harcourt, René inherited the countships of

Aumale, Mayenne, Elbeuf, Lillebonne, Brionne and other French fiefs, in addition to the honours of the elder branch, which included the countship of Guise, the dowry of Marie of Blois on her marriage in 1333 with Rudolph or Raoul of Lorraine. René's eldest surviving son by his marriage with Philippa, daughter of Adolphus of Egmont, duke of Gelderland, was Anthony, who succeeded his father as duke of Lorraine (d. 1544), while the second, Claude, count and afterwards duke of Guise, received the French fiefs. The Guises, though naturalized in France, continued to interest themselves in the fortunes of Lorraine, and their enemies were always ready to designate them as foreigners. The partition between the brothers Anthony and Claude was ratified by a further agreement in 1530, reserving the lapsed honours of the kingdoms of Jerusalem, Sicily, Aragon, the duchy of Anjou and the countships of Provence and Maine to the duke of Lorraine. Of the other sons of René II., John (1498–1550) became the first cardinal of Lorraine, while Ferri, Louis and Francis fell fighting in the French armies at Marignano (1515), Naples (1528) and Pavia (152j), respectively.

Claude of Lorraine, count and afterwards 1st duke of Guise (1496–1550), was born on Oct. 20, 1496. He was educated at the French court, and at 17 allied himself to the royal house of France by a marriage with Antoinette de Bourbon (1493–1583) daughter of François, count of Vendôme. Guise distinguished himself at Marignano (1515), and was long in recovering from the 22 wounds he received in the battle; in 1521 he fought at Fuenterrabia, when Louise of Savoy ascribed the capture of the place to his efforts; in 1522 he defended northern France, and forced the English to raise the siege of Hesdin; and in 1523 he obtained the government of Champagne and Burgundy; defeating at Neufchâteau the imperial troops who had invaded his province. In 1525 he destroyed the Anabaptist peasant army, which was overrunning Lorraine, at Lupstein, near Saverne (Zabern). On the return of Francis I. from captivity, Guise was erected into a duchy in the peerage of France, though up to this time only princes of the royal house had held the title of duke and peer of France. The Guises, as cadets of the sovereign house of Lorraine and descendants of the house of Anjou, claimed precedence of the Bourbon princes. Their pretensions and ambitions inspired distrust in Francis I., although he rewarded Guise's services by substantial gifts in land and money. The duke distinguished himself in the Luxemburg campaign in 1542, but for some years before his death he effaced himself before the growing fortunes of his sons. He died on April 12, 1550.

He had been supported in all his undertakings and intrigues by his brother John, cardinal of Lorraine (1498–1550), who had been made coadjutor of Metz at the age of three. The cardinal was archbishop of Reims, Lyons and Narbonne, bishop of Metz, Toul, Verdun, Thérouanne, Luçon, Albi, Valence, Nantes and Agen, and before he died had squandered most of the wealth which he had derived from these and other benefices. Part of his ecclesiastical preferments he gave up in favour of his nephews. He became a member of the royal council in 1530, and in 1536 was entrusted with an embassy to Charles V. Although a complaisant helper in Francis I.'s pleasures, he was disgraced in 1542, and retired to Rome. He died at Nogent-sur-Yonne on May 18, 1550. He was extremely dissolute, but as an open-handed patron of art and learning, as the protector and friend of Erasmus, Marot and Rabelais he did something to counter-balance the general unpopularity of his calculating and avaricious brother.

Claude of Guise had 12 children, among them Francis, 2nd duke of Guise; Charles, 2nd cardinal of Lorraine (1524–74), who became archbishop of Reims in 1538 and cardinal in 1547; Claude, marquis of Mayenne, duke of Aumale (1526–73), governor of Burgundy, who married Louise de Brézé, daughter of Diane de Poitiers, thus securing a powerful ally for the family; Louis (1527–78), bishop of Troyes, archbishop of Sens and cardinal of Guise; René, marquis of Elbeuf (1536–66), from whom descended the families of Harcourt, Armagnac, Marsan and Lillebonne; Mary of Lorraine (*q.v.*), generally known as Mary of Guise, who after the death of her second husband, James V. of Scotland, acted as regent of Scotland for her daughter Mary, queen of Scots; and Francis (1534–63), grand prior of the order of the Knights of Malta. The solidarity of this family, all the members of which through three generations cheerfully submitted to the authority of the head of the house, made it a formidable factor in French politics.

Francis of Lorraine, 2nd duke of Guise (1519–1563), "le grand Guise," was born at Bar on Feb. 17, 1519. As count of Aumale he served in the French army, and was nearly killed at the siege of Boulogne in 1545 by a wound which brought him the name of "Balafrit." Aumale was made (1547) a peerage-duchy in his favour, and on the accession of Henry II. the young duke, who had paid assiduous court to Diane de Poitiers, shared the chief honours of the kingdom with the constable Anne de Montmorency. Both cherished ambitions for their families, but the Guises were more unscrupulous in subordinating the interests of France to their own. Montmorency's brutal manners, however, made enemies where Guise's grace and courtesy won him friends. Guise was a suitor for the hand of Jeanne d'Albret, princess of Navarre, who refused, however, to become a sister-in-law of a daughter of Diane de Poitiers and remained one of the most dangerous and persistent enemies of the Guises. He married in Dec. 1548 Anne of Este, daughter of Ercole II., duke of Ferrara, and through her mother Renée, a granddaughter of Louis XII., of France. In the same year he had put down a peasant rising in Saintonge with a humanity that compared very favourably with the cruelty shown by Montmorency to the town of Bordeaux. He made preparations in Lorraine for the king's German campaign of 1551–52. He was already governor of Dauphin&, and now became grand chamberlain, prince of Joinville, and hereditary seneschal of Champagne, with large additions to his already considerable revenues. He was charged with the defence of hletz, which Henry II. had entered in 1551. He reached the city in Aug. 1552, and rapidly gave proof of his great powers as a soldier and organizer by the skill with which the place, badly fortified and unprovided with artillery, was put in a state of defence. Metz was invested by the duke of Alva in October with an army of 60.000 men, and the emperor joined his forces in November. An army of brigands commanded by Albert of Brandenburg had also to be reckoned with. Charles was obliged to raise the siege or, Jan. 2, 1553, having lost, it is said, 30,000 men before the walls. Guise used his victory with rare moderation and humanity, providing medical care for the sick and wounded left behind in the besiegers' camp. The subsequent operations were paralysed by the king's suspicion and carelessness, and the constable's inactivity, and a year later Guise was removed from the command. He followed the constable's army as a volunteer, and routed the army of Charles V. at the siege of Renty on Aug. 12, 1554. Montmorency's inaction rendered the victory fruitless, and a bitter controversy followed betneen Guise and the constable's nephew Coligny, admiral of France, which widened a breach already existing.

The conclusion of a six years' truce at Vaucelles (1jj6) disappointed Guise's ambitions. and he was the main mover in the breach of the treaty in 1558, when he was sent at the head of a French army to Italy to the assistance of Pope Paul IV. against Spain. Guise, who perhaps had in view the restoration to his family of the Angevin dominion of Naples and Sicily, crossed the Alps early in 1557, and after a month's delay in Rome. where he failed to receive the promised support. marched on the kingdom of Naples, then occupied by the Spanish troops under Alva He seized and sacked Campli (April 17), but was compelled to raise the siege of Civitella. Meanwhile the pope had veered round to a Spanish alliance, and Guise, seeing that no honour was to be gained in the campaign, wisely spared his troops, so that his army was almost intact when, in August, he was hastily summoned home to repel the Spanish army which had invaded France from the north, and had taken St. Quentin. On reaching Paris in October Guise was made lieutenant-general of the kingdom, and proceeded to prepare for the siege of Calais. The town was taken after six days' fighting, on Jan 6, 1558, and this success was followed up by the capture of Guines, Thionville and Arlon, when the war was ended by the treaty of Câteau Cambritsis (1559)

Although his brother, the cardinal of Lorraine, was one of the negotiators, this peace was concluded against the wishes of Guise, and was regarded as a triumph of the constable's party. The Guises were provided with a weapon against Montmorency by the bishop of Arras (afterwards Cardinal Granvella), who gave to the cardinal of Lorraine at an interview at Péronne in 1558 an intercepted letter proving the Huguenot leanings of the constable's nephews.

On the accession in 1559 of Francis II., their nephew by marriage with Mary Stuart, the royal authority was practically delegated to Guise and the cardinal, who found themselves beyond rivalry for the time being. They had, however, to cope with a new and dangerous force in Catherine de' Medici, who was now for the first time free to use her political ability. The incapacity, suspicion and cruelty of the cardinal, who controlled the internal administration, roused the smaller nobility against the Lorraine princes. A conspiracy to overturn their government was formed at Nantes, with a needy Périgord nobleman named La Renaudie as its nominal head, though the agitation had in the first instance been fostered by the agents of Louis I., prince of Condé. The Guises were warned of the conspiracy while the court was at Blois, and for greater security removed the king to Amboise. La Renaudie, nothing daunted, merely postponed his plans; and the conspirators assembled in small parties in the woods round Amboise. They had, however, been again betrayed and many of them were surrounded and taken before the coup could be delivered; one party, which had seized the château of Noizay, surrendered on a promise of amnesty given "on his faith as a prince" by James of Savoy, duke of Nemours, a promise which, in spite of the duke's protest, was disregarded. On March 19, 1560, La Renaudie and the rest of the conspirators openly attacked the chbteau of Amboise. They were repelled; their leader was killed; and a large number were taken prisoners. The merciless vengeance of the Guises was the measure of their previous fears. For a whole week the torturings, quarterings and hangings went on, the bodies being cast into the Loire, the young king and queen witnessing the bloody spectacle day by day from a balcony of the chbteau.

The cruel repression of this "conspiracy of Amboise" inspired bitter hatred of the Guises, since they were avenging a rising rather against their own than the royal authority. They now entrenched themselves with the king at Orleans, and the Bourbon princes, Anthony, king of Navarre, and his brother Condé, were summoned to court. The Guises convened a special commission to try Condé, who was condemned to death; but the affair was postponed by the chancellor, and the death of Francis II. in December saved Condé. Guise then made common cause with his old rival hfontmorency and with the Marshal de Saint André against Catherine, the Bourbons and Coligny. This alliance, constituted on April 6, 1561, and known as the triumvirate, aimed at the annulment of the concessions made by Catherine to the Huguenots. The cardinal of Lorraine fomented the discord which appeared between the clergy of the two religions when they met at the colloquy of Poissy in 1561, but in spite of the extreme Catholic views he there professed, he was at the time in communication with the Lutheran princes of Germany, and in Feb. 1562 met the duke of Württemberg at Zabern to discuss the possibility of a religious compromise.

The signal for civil war was given by an attack of Guise's escort on a Huguenot congregation at Vassy (March 1, 1562). Although Guise did not initiate the massacre, and although, when he learned what was going on, he even tried to restrain his soldiers, he did not disavow their action. When Catherine de' Medici forbade his entry into Paris, he accepted the challenge, and on March 16, he entered the city, where he was a popular hero, at the head of 2,000 armed nobles. The provost of the merchants offered to put 20,000 men and two million livres at his disposal. In September he joined Montmorency in besieging Rouen, which was sacked as if it had been a foreign city, in spite Guise's efforts to save it from the worst horrors. At the battle of Dreux (Dec. 19, 1562) he commanded a reserve army, with which he saved Montmorency's forces from destruction and inflicted a crushing defeat on the Huguenots. The prince of Condé was his prisoner, while the capture of Montmorency by the Huguenots and the assassination of the Marshal de Saint-André after the battle left Guise the undisputed head of the Catholic party. He was appointed lieutenant-general of the kingdom, and on Feb. 5, 1563, he appeared with his army before Orleans. On the 19th, however, he was shot by the Huguenot Jean Poltrot de Méré as he was returning to his quarters, and died on the 24th of the effects of the wound. Guise's splendid presence, his generosity and humanity and his almost unvarying success on the battlefield made him the idol of his soldiers. He attended personally to the minutest details, and Monluc complains that he even wrote out his own orders. The mistakes and cruelties associated with his name were partly due to the evil counsels of his brother Charles, the cardinal, whose cowardice and insincerity were the scorn of his contemporaries. The negotiations of the Guises with Spain dated from the interview with Granvella at Péronne, in 1558, and after the death of his brother the cardinal of Lorraine was constantly in communication with the Spanish court, offering, in the event of the failure of direct heirs to the Valois kings, to deliver up the frontier fortresses and to acknowledge Philip II. as king of France. His death in 1574 temporarily weakened the extreme Catholic party.

Of the children of Francis "le Balafré" five survived him: Henry, 3rd duke of Guise; Charles, duke of Mayenne (1554–1611) (*q.v.*), who consolidated the League; Catherine (1552–96), who married Louis of Bourbon, duke of Montpensier, and encouraged the fanaticism of the Parisian leaguers; Louis, second cardinal of Guise, afterwards of Lorraine (1555–88), who was assassinated with his brother Henry; and Francis (1558–73).

Henry of Lorraine, 3rd duke of Guise (1550–1588), born on Dec. 31, 1550, was 13 years old at the time of his father's death, and grew up under the domination of a passionate desire for revenge. Catherine de' Medici refused to take steps against Coligny, who was formally accused by the duchess of Guise and her brothers-in-law of having incited the murder. In 1566 she insisted on a formal reconciliation at Moulins between the Guises and Coligny, at which, however, none of the sons of the murdered man was present. Henry and his brothers were, however, compelled in 1572 to sign an ambiguous assent to this agreement. Guise's widow married James of Savoy, duke of Nemours, and the young duke at 16 went to fight against the Turks in Hungary. On the fresh outbreak of civil war in 1567 he returned to France and served under his uncle Aumale. In the autumn of 1568 he received a considerable command, and speedily came into rivalry with Henry of Valois, duke of Anjou. He had not inherited his father's generalship, and his rashness and headstrong valour more than once brought disaster on his troops, but the showy quality of his fighting brought him great popularity in the army. In the defence of Poitiers in 1569 with his brother, the duke of Mayenne, he showed more solid abilities as a soldier. On the conclusion of peace in 1 j70 he returned to court, where he made no secret of his attachment to Margaret of Valois. His pretensions were violently resented by her brothers, who threatened his life, and he saved himself by a precipitate marriage with Catherine of Cleves (daughter of Francis of Cleves, duke of Nevers, and Margaret of Bourbon), the widow of a Huguenot nobleman, Antoine de Crog, prince of Porcien. Presently he ended his disgrace by an apparent reconciliation with Henry of Valois and an alliance with Catherine de' Medici. He was an accomplice in the first attack on Coligny's life, and when permission for the massacre of Saint Bartholomew had been extorted from Charles IX he roused Paris against the Huguenots, and satisfied his personal vengeance by superintending the murder of Coligny.

Henry was now the acknowledged chief of the Catholic party, and the power of his family was further increased by the marriage (1575) of Henry III. with Louise of Vaudémont, who belonged to the elder branch of the house of Lorraine. In a fight at Dormans (Oct. 10, 1575), the only Catholic victory in a disastrous campaign, Guise received a face wound which won for him his father's name of Balafré and helped to secure the passionate attachment of the Parisians. He refused to acquiesce in the treaty of Beaulieu (May 5, 1576), and with the support of the

René II. (who united the two branches of the house of Lorraine), duke of Lorraine, and Philippa of Geldcrland, had (besides two older boys who died in childhood. and four unmarried daughters)

- Antoine, duke of Lorraine, †1544, ancestor of the dukes of Lorraine and the house of Mercoeur.
- Claude, 1st duke of Guise, †1550, =Antoinette of Bourbon.
  - Francis, 2nd duke of Guise, †1563, =Anne of Este.
    - Henry, 3rd duke, †1588 = Catherine of Cleves (and had 14 children),
      - Charles, 4th duke of Guise, †1640.
        - Henry, archbishop of Reims, and 5th duke, †1664.
        - Marie, called Mlle. de Guise, succeeded to the duchy in 1675 and sold her rights to Louis Augustus, duke of Maine.
        - Louis, chevalier of Guise and duke of Joyeuse, †1654.
          - Louis-Joseph, 6th duke of Guise, †1671.
            - Francis-Joseph, 7th and last duke of Guise, †1675.
        - And 8 more.
      - Claude, duke of Chevreuse, =Marie de Kohan, widow of the duke of Luynes.
      - Louis, 3rd cardinal of Guise, †1621.
      - And 11 more.
    - Charles, duke of Mayenne, †1611.
      - Henry, duke of Mayenne, †1621.
    - Louis, 2nd cardinal of Guise, †1588.
    - Catherine = Louis de Bourbon, duke of Montpensier.
    - And 5 others.
  - Charles, 2nd cardinal of Lorraine, †1574.
  - Claude, marquis of Mayenne and duke of Aumale, †1573, =Louise de Brézé
    - Charles, duke of Aumale, †1631.
  - Louis, 1st cardinal of Guise, †1578
  - Francis, grand prior.
  - René, marquis of Elbeuf, †1566.
    - Charles, duke of Elbeuf, †1605.
  - Marie= (1) duke of Longueville, (2) James V, of Scotland.
    - Mary Stuart, queen of Scots.
  - And 5 others.
- John, 1st cardinal of Lorraine.
- Ferri, killed at Marignano.
- Louis, killed at Naples.
- Francis, killed at Pavia.

†Date of death

Jesuits proceeded to form a "holy league" for the defence of the Roman Catholic Church. The terms of enrolment enjoined offensive action against all who refused to join. This association had been preceded by various provincial leagues among the Catholics, notably one at Péronne. Condé had been imposed on this town as governor by the terms of the peace, and the local nobility banded together to resist him. This, like the Holy League itself, was political as well as religious in its aims, and was partly inspired by revolt against the royal authority. In the direction of the League Guise was hampered by Philip of Spain, who subsidized the movement, while he also had to submit to the dictation of the Parisian democracy. Ulterior ambitions were freely ascribed to him. It was asserted that papers seized from his envoy to Rome, Jean David, revealed a definite design of substituting the Lorraines, who represented themselves as the successors of Charlemagne, for the Valois; but these papers were probably a Huguenot forgery. Henry III. eventually placed himself at the head of the League, and resumed the war against the Huguenots; but on the conclusion of peace (Sept. 1577) he seized the opportunity of disbanding the Catholic associations. The king's jealousy of Guise increased with the duke's popularity, but he did not venture on an open attack, nor did he dare to avenge the murder by Guise's partisans of one of his personal favourites, Saint-Mégrin, who had been set on by the court to compromise the reputation of the duchess of Guise. This incident supplied Alexandre Dumas *père* with the subject of his *Henri III. et sa cour* (1829).

Meanwhile the duke had entered on an equivocal alliance with Don John of Austria. He was also in constant correspondence with Mary of Lorraine, and meditated a descent on Scotland in support of the Catholic cause. But the great riches of the Guises were being rapidly dissipated, and in 1578 the duke became a pensioner of Philip II. When in 1584 the death of the duke of Anjou made Henry of Navarre the next heir to the throne, the prospect of a Huguenot dynasty roused the Catholics to forget their differences, and led to the formation of a new league of the Catholic nobles. At the end of the same year Guise and his brother, the duke of Mayenne, with the assent of other Catholic nobles, signed a treaty at Joinville with Philip II., fixing the succession to the crown on Charles, cardinal of Bourbon, to the exclusion of the Protestant princes of his house. In March 1585 the chiefs of the League issued the Declaration of Péronne, exposing their grievances against the Government and announcing their intention to restore the dignity of religion by force of arms. On the refusal of Henry III. to accept Spanish help against his Huguenot subjects, war broke out. The chief cities of France declared for the League, and Guise, who had recruited his forces in Germany and Switzerland, took up his headquarters at Châlons, while Mayenne occupied Dijon, and his relatives, the dukes of Elbeuf, Aumale and Mercoeur, roused Normandy and Brittany. Henry III. accepted, or feigned to accept, the terms imposed by the Guises at Nemours (July 7, 1585). The edicts in favour of the Huguenots were immediately revoked.

Guise added to his reputation as the Catholic champion by defeating the German auxiliaries of the Huguenots at Vimory (Oct. 1587) and Auneau (Nov. 1587). The protestations of loyalty to Henry III. which had marked the earlier manifestoes of the League were modified. Obedience to the king was now stated to depend on his giving proof of Catholic zeal and showing no favour to heresy. In April 1588 Guise arrived in Paris, where he put himself at the head of the Parisian mob, and on May 12, known as the Day of the Barricades, he actually had the crown within his grasp. He refused to treat with Catherine de' Medici, who was prepared to make peace at any cost, but restrained the populace from revolution and permitted Henry to escape from Paris. Henry came to terms with the League in May, and made Guise lieutenant-general of the royal armies. The estates-general, which were assembled at Blois, were devoted to the Guise interest, and alarmed the king by giving voice to the political as well as the religious aspirations of the League. Guise remained at the court of Blois after receiving repeated warnings that Henry meditated treason. On Dec. 25 he was summoned to the king's chamber during a sitting of the royal council, and was murdered by assassins carefully posted by Henry III. himself. The cardinal of Lorraine was murdered in prison on the next day. The history of the Guises thenceforward centres in the duke of Mayenne (*q.v.*).

By his wife, Catherine of Cleves, the third duke had 14 children: among them Charles, 4th duke of Guise (1571–1640); Claude, duke of Chevreuse (1578–1657), whose wife, Marie de Rohan, duchess of Chevreuse, became famous for her intrigues; Louis (1585–1621), 3rd cardinal of Guise, archbishop of Reims, remembered for his liaison with Charlotte des Essarts, mistress of Henry IV.

CHARLES, 4th duke of Guise (1571–1640), was imprisoned for three years after his father's death. He married Henriette Catherine de Joyeuse, widow of the duke of Montpensier. His eldest son predeceased him, and he was succeeded by his second son HENRY (1614–64), who had been archbishop of Reims, but renounced the ecclesiastical estate and became 5th duke. He made an attempt (1647) on the crown of Naples, and was a prisoner in Spain from 1648 to 1652. A second expedition to Naples in 1654 was a fiasco. He was succeeded by his nephew, LOUIS JOSEPH (1650–1671), as 6th duke. With his son, FRANCIS JOSEPH (1670–75), the line failed; and the title and estates passed to his great-aunt, Marie of Lorraine, duchess of Guise (1615–88), daughter of the 4th duke, and with her the title became extinct. The title is now vested in the family of the Bourbon-Orleans princes.

BIBLIOGRAPHY.—A number of contemporary documents relating to the Guises are included by L. Cimber and F. Danjou in their *Archives curieuses de l'histoire de France* (1834, etc.). Vol. iii. contains a soldier's diary of the siege of Metz, first published in Italian (Lyons, 1553), accounts of the sieges of Calais (Tours, 1558), of Thionville (1558); vol. iv. an account of the tumult of Amboise from the *Mémoires* of Condé, and four accounts of the affair of Vassy; vol. v. four accounts of the battle of Dreux, one dictated by Guise, and accounts of the murder of Guise; vol. xi. accounts of the Parisian revolution of 1558; and vol. xii. numerous pamphlets and pieces dealing with the murder of Henry of Guise and his brother. An account of the murder of Guise and of the subsequent measures taken by Mayenne, which was supplied by the Venetian ambassador, G. Mocenigo to his Government, is printed by H. Brown in the *Eng. Hist. Rev.* (April 1895). For the foreign policy of the Guises, and especially their relations with Scotland, there is abundant material in the English *Calendar of State Papers* of Queen Elizabeth (Foreign Series) and in the correspondence of Cardinal Granvella. The memoirs of Francis, duke of Guise, covering the years 1547 to 1563, were published by Michel and Poujoulat in series 1, vol. iv. of their *Coll. de mémoires*. Among contemporary memoirs *see* especially those of the prince of Condé, of Blaise de Monluc and of Gaspard de Saulx-Tavannes. *See* also J. B. H. du Trousset de Valincourt, *La Vie de F. de Lorraine, duc de Guise* (1681); A. de Ruble, *L'Assassinat de F. de Lorraine, duc de Guise* (1897), where there is a list of the ms. sources available for a history of the house; R. de Bouillé *Hist. des ducs de Guise* (4 vols., 1849); H. Forneron, *Les Guise et leur époque* (2 vols., 1887); H. M. Williams, *The Brood of False Lorraine: the History of the Ducs de Guise, 1496–1588* (2 vols., 1918).

GUITAR (Fr. guitarre, Ger. *Guitarre,* Ital. *chitarra*), a musical instrument strung with gut strings twanged by the fingers, having a body with a flat back and graceful incurvations in complete contrast to the members of the family of the lute (*q.v.*), whose back is vaulted.

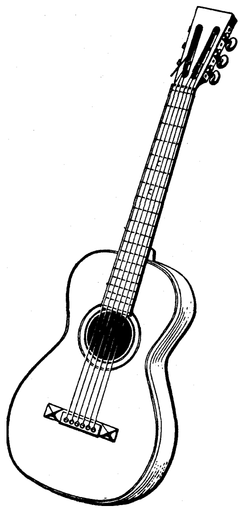
The construction of the instrument is of paramount importance in assigning to the guitar its true position in the history of musical instruments, midway between the cithara (see LYRE) and the violin. The mediaeval stringed instruments with neck fall into two classes, characterized mainly by the construction of the body: (1) those which, like their archetype the cithara, had a body composed of a flat or delicately arched back and soundboard joined by ribs; (2) those which, like the lyre, had a body consisting of a vaulted back over which was glued a flat soundboard without the intermediary of ribs.

The latter method of construction predominates among oriental instruments and is greatly inferior to the first. A striking proof of this inferiority is afforded by the fact that instruments with vaulted backs, such as the rebab or rebec, although extensively represented during the middle ages in all parts of Europe by numerous types, have shown but little or no development during the course of about 12 centuries, and have dropped out one by one from the realm of practical music, leaving only the mandolin as survivor.

The guitar must be referred to the first of these classes, having been derived from the cithara.

One of the earliest representations of a guitar in western Europe occurs in a Passionale from Zwifalten, A.D. 1180, acquired by the Royal Library at Stuttgart. St. Pelagia, seated on an ass, holds a rotta or cithara in transition! while one of the menservants leading her ass holds her guitar. Both instruments have three strings and the characteristic guitar outline with incurvations, the rotta differing in having no neck.

GUITAR FIDDLE (TROUBADOUR FIDDLE): a modern name bestowed retrospectively upon certain precursors of the violin, possessing characteristics of both guitar and fiddle. The name "guitar fiddle" is intended to emphasize the fact that the instrument, in the shape of the guitar, which during the middles ages represented the most perfect principle of construction for stringed instruments with necks, adopted at a certain period the use of the bow from instruments of a less perfect type, the rebab and its hybrids.



BY COURTESY OF MESSRS. CARL FISCHER, INC.

A MODERN SIX-STRINGED GUITAR

The use of the bow with the guitar entailed certain structural changes in the instrument. The large central rose sound hole was replaced by lateral holes of various shapes; the flat bridge, suitable for instruments whose strings were plucked, gave place to the arched bridge required in order to enable the bow to vibrate each string separately. The arched bridge, by raising the strings higher above the sound board! made the stopping of strings on the neck extremely difficult if not impossible — a matter which was adjusted by the addition of a finger-board of suitable shape and dimensions. At this stage the guitar fiddle possesses the essential features of the violin, and may justly claim to be its immediate predecessor. not so much through the viols (which were the outcome of the Minnesinger fiddle with sloping shoulders) as through the intermediary of the Italian *lyra*, a guitar-shaped bowed instrument with from 7 to 12 strings. From such evidence as is now possessed, it would seem that the evolution of the early guitar with a neck from the Greek cithara took place under Greek influence in the Christian East. *See* GUITAR.

GUITRY, the name of two French actors, father and son, the latter being also a producer and playwright.

LUCIEN GERMAIN GUITRY (1860–1925) was born in Paris on Dec. 13, 1860. Immediately after leaving the Conservatoire he first appeared at the Gymnase in *La Dame aux Camélias* (1878). His style of acting, sparing in gesture and theatrical effects, at first surprised rather than pleased the public and the critics. Sarah Bernhardt asked him to play at the Théâtre de la Renaissance, and it was there that he achieved his first successes.

He appeared in plays of the most varied character, from Charles Maurice Donnay's *Amants* (1895) to Anatole France's *Crainquebille.* He succeeded in representing the utmost frenzy of passion with the greatest economy of method. From 1918 onward he frequently acted in the plays of his son Sacha Guitry; he was remarkably successful in creating the principal parts in *Pasteur* and *Mon Père avait raison.*

He died in Paris, June 1, 1925.

SACHA GUITRY (1885–1957), dramatist, actor and producer, was born at St. Petersburg, Russia! on Feb. 21, 1885, the son of the foregoing. He was only 21 when he achieved success with his first play *Nono.* This was followed by *Chez les Zoaques* (1906), *Petite Hollande* (1908), *Le Scandale de Monte Carlo* (1908), *Le Veilleur de nuit* (1911) — one of his best plays — and *Un Beau mariage* (1911).

Sacha Guitry generally acted in his own plays; it is difficult to draw an absolute distinction between his work as an actor and as a playwright, for his art was always to some extent in the nature of brilliant improvisation. His output was enormous; he had over 90 plays produced out of 130 that he wrote. Special mention is given to those more serious pieces which he wrote for his father to act in: *Debureau* (1918). *Pasteur* (1919) and *Béranger* (1920). He wrote, directed and acted in many motion pictures of which the best known was perhaps *Roman d'un tricheur* ("The Cheat"). His autobiography *Mémoires d'un tricheur* (translated into English as *If I Remember Right)*, appeared in 1935. He was promoted commander of the Legion of Honour in 1936 and elected to the Académie Goncourt in 1939.

Five times married, he taught all his wives. of whom Yvonne Printemps was the most celebrated, to act. He died in Paris on July 24, 1957.

See S. Guitry, *Lucien Guitry, sa carrière et sa vie* (1930); A. Madis, *Sacha* (1950). (*W. A.* **Ds.**)

GUITTONE D'AREZZO (*c.* 1230–1294), Italian poet. Fra Guittone, who belonged to the religious and military order of the Cavalieri di Santa Maria, wrote sonnets and love poems, which can be studied in a good modern edition, *Le rime di Fra Guittone* (1901), by Pelligrini. He is more famous as the writer of the earliest extant letters written in the Italian language.
